The principal researcher believes few national programs have impact without translation to the local environment, including either regional, state, or local government level. Much progress has been made in developing computer based information systems ranging from data on transportation systems to the quantity of a resource. Given a geographic dimension, these information systems provide an invaluable vehicle for sharing information over the various levels of government and even facilitate the integration of disparate data. The work of this project is needed to transfer this technology to state and local governments whose limited training budgets and sometimes isolated location make it difficult to use the latest technology. The technology developed in this program is useful in improving the management of our natural resources. While concentrating on issues related to agriculture, the independent, non-profit nature of the National Center for Resource Innovations facilitates linkages across disciplinary and institutional barriers, make it possible to use work at the state and local levels which was initiated at the Federal level. While the early phases of GIS concentrated on building information systems related to rural physical and natural resources, the current challenge is to integrate human economic, social and demographic information to better understand the relationship of human communities to the landscape. There is a need for this to better understand the technology consumer. In addition, there is a need for integrated information about other biological systems including insects, plants, and animals as we extend our work to include whole farm management within an ecosystem-based environment.

PART 1

1009

In this context, newer high capacity technologies are also beginning to provide other dimensions—those of high level time related phenomena, including weather-associated transport of biological materials and their relationship to food producing systems. CSREES has funded seminal research in integrated pest and animal management in the 1970's and 1980's. At the other end of the spatial scale, the role of the public sector in geographic information system based precision farming technologies, data capture, and information synthesis as the subject of a current study group. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this grant. At the discretion of the State, Hatch Act or other funds could be used to support this research.

The original goal of this work was to serve as a pilot project for the transfer of geographic information systems technology to local governments as related to natural resources. It has carried out this function in a useful way. With impetus from this project and similar efforts economic and biological data are being presented in maps fashion useful to state and local governments and individuals. This project has provided the impetus and linkages to facilitate planning work done in South Georgia with some assistance given to local tax assessment and parcel identification by a Department of Commerce sponsored Economic Development Authority. The Chesapeake Bay project has linked seven state conservation entities in an effort to develop better watershed models and decision support systems. The Arkansas portion of the project has focused on training to educate county employees with regard to the technology of geographic information systems and geographic positioning systems. The University of Wisconsin has continued to simultaneously support the high technology end of the evolution of new tools and seek new ways to implement change while measuring the impact of such implementation. The work in North Dakota has continued to focus on geographically referenced real time weather information for payments and others. And, in the smallest of the efforts under this program, the efforts at Central Washington have provided training for a number of State personnel and others from various levels and institutions on how to utilize geographic information systems. It is anticipated that the fiscal year 1997 grant will support work under this program through March 1998. The proposal for this work in 1996 has been received and reviewed.

Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$494,000; fiscal year 1991, \$747,000; fiscal years 1992 and 1993, \$1,000,000 per year; fiscal year 1994, \$1,011,000; fiscal year 1995, \$877,000; fiscal year 1996, \$939,000; and fiscal year 1997, \$844,000. A total of \$6,912,000 has been appropriated.

For fiscal year 1990 through fiscal year 1996, to date, the work in this program had \$4,553,252 in non-federal support. In fiscal year 1990 non-federal support was \$714,940 consisting of equipment, data bases, and other miscellaneous contributions from foundations, city, and state governments. In fiscal year 1991 non-federal support was \$25,000 from county government. In fiscal year 1992 non-federal support was \$366,016 from county government, computer companies, and state governments consisting of equipment, software, facilities, and miscellaneous support. In fiscal year 1993, non-Federal support was \$713,900 consisting of financial and miscellaneous support from foundations, county and state governments. In fiscal year 1994, the non-Federal support was \$713,643. In fiscal year 1995 the non-Federal support was \$987,000. In fiscal year 1996 it was \$567,173. It is anticipated to be \$456,582 in fiscal year 1997.

The National Center for Resource Innovation Chesapeake Bay is located in Rosslyn, Virginia. This group is working under a memorandum of understanding with several states of the Chesapeake Bay watershed project. The southeastern center, in Valdosta, Georgia, in affiliation with the South Georgia Regional Development Center, has developed a comprehensive plan for the City of Adel as a model for other urban centers in their ten-county region. The southwestern center, in Fayetteville, Arkansas serves local governments through its training facilities at the University basing its technical approach on their expertise and past experience with the federally developed system known as GRASS. They have developed pilot projects for some local jurisdictions and state level data bases which they have provided online. Central Washington University focuses on training in ARC/INFO for state planning and in three local governments and the Yakima Nation in the Yakima watershed. The north central center in Grand Forks, North Dakota, in affiliation with the University of North Dakota, focuses on relating real time weather data to other spatial attributes. In addition, this center has sought to implement ideas developed in other centers in the distance learning concept. The University of Wisconsin-Madison, functioning as the Great Lakes center, continues a long history of involvement

PART 1

1010

in the application of this technology at the local level with strong focus on soils/land-use and the institutional aspects of the integration of a new technology.

The original objectives are to build new institutional frameworks for developing and disseminating geographic and related information to local decisionmakers has been largely completed. Each site has developed unique approaches to solving the greatest needs in their region for applications of these modern technologies and many innovative applications of these techniques have been implemented. New technologies, including Internet based educational and information exchange have created tremendous demand among National Center Resource Innovations' customers to expand its program to include these new technologies in order to bring their primarily rural users into new eras of public education and information management. Last year, the National Center Resource Innovation became a valued educator about the public roles in and information needs for precision farming. The Center's view is that information that can sustain individual farmer's decisions can also be extended to the needs of the local public agencies. Integrating temporal information, such as weather and satellite imagery, is needed by everyone who needs to model future effects of their decision upon land processes. The Center is moving forward into these new territories to facilitate many of the newest initiatives of federal agencies who must work together to build modern systems for public policy. As resources continue to be used and planning continues to be required, and as technology continues to evolve, systems, knowledge and decisions must continue to get better. It is reasonable to assume that while the need exists for the latter, a definitive completion date for the Center's work may not exist. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

No formal evaluation of this project has been developed by CSREES. In addition, each Center site prepared a cost-effectiveness study. Each site developed the study using the help of external users. The study found that for each federal dollar expended on this program, \$7.40 in value was realized. The analysis will be repeated for fiscal year 1997. However, in keeping with the administration's policy of awarding research grants competitively, no further Federal funding for this program as currently positioned is requested. Research could be continued at the state's discretion using formula and other public and private funding sources.

GULF COAST SHRIMP AQUACULTURE

Work under this program has addressed important research necessary for the development of a U.S. marine shrimp farming industry. Studies have been conducted on growout intensification, prevention and detection of diseases, seed production, and the development of high health and genetically improved stocks. Performance trials on selected stocks in various production systems have been conducted. Seed production systems have reached commercial feasibility. Protocols for viral detection have been improved and have led to the development of specific pathogen free stocks of commercial importance. A number of important viral pathogens of marine shrimp have been identified. Researchers have responded rapidly to viral infections that have severely impacted the U.S. shrimp farming industry. Researchers will intensify efforts aimed at preventing new introductions of exotic viral pathogens. In fiscal year 1997, emphasis will be placed on the industry seed supply, disease control, environmental quality, and production systems. The principal researcher indicates that there is potential to enhance domestic production of marine shrimp through aquaculture in order to reduce the annual trade deficit in marine shrimp, which is approximately \$2 billion. Research could improve the supply of high quality seed, improve shrimp health management, and enhance production efficiency in shrimp culture systems. The U.S. has the opportunity to become a major exporter of shrimp seed and broodstock, and disease control technologies, products and services. Increased efforts are needed to prevent the introduction and spread of a number of exotic viral pathogens of shrimp. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal was to increase domestic production of marine shrimp through aquaculture. Studies have been conducted on growout intensification, prevention and detection of diseases, seed production, and the development of specific pathogen free stocks. Commercially viable shrimp seed production systems have been developed. Diagnostic techniques for a number of important viral pathogens have been developed. High health genetically improved stocks are being developed and evaluated under commercial production conditions. Researchers have responded to severe disease outbreaks caused by the introduction of exotic viral pathogens into U.S.

PART 1

1011

shrimp farms. In addition, scientists are currently developing biosecurity protocols to prevent additional introductions of viral disease agents.

Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$1,050,000; fiscal year 1986, \$1,236,000; fiscal year 1987, \$2,026,000; fiscal year 1988, \$2,236,000; fiscal year 1989, \$2,736,000; fiscal year 1990, \$3,195,000; fiscal year 1991, \$3,365,000; fiscal years 1992–1993, \$3,500,000 per year; fiscal year 1994, \$3,290,000; fiscal year 1995, \$2,852,000; fiscal year 1996, \$3,054,000; and fiscal year 1997, \$3,354,000. A total of \$35,394,000 has been appropriated.

The U.S. Marine Shrimp Farming Consortium estimates that non-federal funding for this program approaches 50 percent of the Federal funding for fiscal years 1991–1996. The source of non-federal funding is primarily from state and miscellaneous sources. In-kind contributions from the industry were not included in this estimate, but are substantial as the program is dependent upon industry cooperation to carry out large scale commercial trials.

The work is being carried out through grants awarded to the Oceanic Institute, Hawaii and the Gulf Coast Research Laboratory in Mississippi. In addition, research is conducted through subcontracts at the University of Southern Mississippi, Tufts University, the Waddell Mariculture Center in South Carolina, the Texas Agricultural Experiment Station, and the University of Arizona. The anticipated completion date for the original specific research objectives was 1987. The original specific objectives have been met, however broader research goals have not been met. Researchers anticipate that the specific research outlined in the current proposal will be completed in fiscal year 1998. Keeping with the Administration's policy of awarding research grants competitively, no further funding for this grant is requested.

The agency evaluates the progress of this program on an annual basis. The institutions involved in this program submit a detailed accomplishment report each year prior to the submission of the new grant proposal. In addition, the agency conducts an in-depth on site review of the program every three years. The 1997 review of the program indicates that the process during the last twelve months has been well documented; close linkage between the research and the U.S. shrimp farming industry has greatly enhanced the commercialization of research findings; and the proposed research represents a logical progression of previous work conducted under the program.

MISSISSIPPI VALLEY STATE UNIVERSITY

Funds were used to strengthen academic programs, including accreditation and reaccreditation. Of the ten programs eligible for accreditation, nine have been accredited. Assessment of the criteria has begun for the remaining eligible program. Academic programs have been broadened to include more agriculture-related courses consistent with the needs of students from the Mississippi Delta, students from other parts of the State, as well as out-of-state students. Curriculum additions have had a positive impact on student enrollment. Courses continue to be modified to reflect the needs of graduates as well as employers in the Mississippi Delta, with particular emphasis on those areas that employers have the greatest need. The funds continue to provide enhancements related to other program and administrative support areas that positively impact program delivery and administration at Mississippi Valley State University. The primary need for this project is to satisfy a local need. The need is for strengthening university capacity and curriculum development at Mississippi Valley State University. Degree programs in Accounting, Mass Communications, Music and Public Administration have been added since the 1988 plan was developed. The Criminal Justice program has been developed into a departmental unit with social work in order to provide for improved administration and academic counseling. A master's program in Criminal Justice is now offered. The baccalaureate major in chemistry and the master's program in Elementary Education have been reinstated. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal was to provide funding to strengthen the academic programs of the university. The academic programs have been strengthened as evidenced by student recruitment, which has improved to show a positive ratio between applications received and students admitted. Approximately one half of the applicants are enrolled. Increased quality of instruction and programs have benefited students. This is reflected in the higher graduation rate, increased student enrollment, enriched faculty and improved community relationship.

PART 1

1012

This program was initiated in fiscal year 1987. Grants have been awarded from funds appropriated as follows: fiscal year 1987, \$750,000; fiscal years 1988 and 1989, \$625,000 per year; fiscal year 1990, \$617,000; fiscal year 1991, \$642,000; fiscal years 1992 and 1993, \$668,000 per year; fiscal year 1994, \$93,000; fiscal year 1995, \$544,000; fiscal year 1996, \$583,000; and fiscal year 1997 \$583,000. A total of \$6,898,000 was appropriated.

Mississippi Valley State received State and private funding during the period of this grant. The State figures provided here are for enhancement funds provided in addition to the University's standard formula generated funds. The sources and amounts are as listed:

SOURCE

Fiscal year	State	Private	Total
1987		\$168,640	\$168,640
1988		186,036	186,036
1989	\$68,658	190,258	258,916
1990	207,879	369,358	577,237
1991	333,263	337,700	670,963
1992	349,427	470,220	819,647
1993	35,750	358,680	394,430
1994	590,890	568,970	1,159,860
1995	841,654	530,300	1,371,954
1996	1,197,917	590,824	1,788,741

These funds are intended to strengthen programs at Mississippi Valley State University. The program has been carried out on the campus at Itta Bena and at off-campus sites in Anguilla and Greenville and the Greenwood Center since the Spring Semester of 1996. The objectives of the current grant will be completed by September 30, 1997. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The program has been evaluated on an annual basis by the agency. The annual progress report for fiscal year 1996 revealed steady progress in the academic programs. For example, the Social Work Department had significant positive changes in the quantity and quality of the faculty. The Business Department offered a component dealing with Agricultural land lease in the business law classes and the other classes had topics on input and output analysis, agricultural stimulations and initial farm planning.

NATIONAL EDUCATION CENTER FOR AGRICULTURAL SAFETY, IOWA

CSREES has requested the college to submit a grant proposal that has been received. The proposal is currently being reviewed. The Northeast Iowa Community College is requesting funding for a national center for agricultural safety education. The center will conduct a safety training needs assessment of workers and employees involved in production agriculture, plan, implement, and evaluate training on safety and health issues derived from the needs assessment, and provide hands-on training for farm accident rescue. The National Safety Council estimated that 800 agricultural work deaths occurred in 1995. Of these deaths 55 percent resulted from unintentional injuries suffered in farm tractor overturns. Another 140,000 disabling injuries were recorded in 1995 in agricultural work incidents. Many of these injuries resulted from farm machinery entanglements, working with livestock, and highway collisions between farm machinery and vehicles. Emergency medical services personnel are often exposed to the same hazards as the victims they are attempting to rescue. Emergency medical services personnel must be prepared to deal with these hazards under stressful environmental conditions. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The goal of this research is to provide on-site, hands-on training of emergency response personnel who may be called on to respond to a wide range of agriculture related accidents and emergencies. Participants in the short courses offered by the center would then be prepared to pass on their knowledge to others when they return to their communities. There are no accomplishments to date.

The work supported by this grant begins in fiscal year 1997 and the appropriation for fiscal year 1997 is \$300,000. The non-federal funds and sources provided for this

PART 1

1013

grant are as follows: \$1,000,000 state appropriations, and \$65,802 miscellaneous in fiscal year 1997.

Research will be conducted at the Northeast Iowa Community College, Peosta, Illinois. The anticipated completion date for the original objectives is September 30, 1997. Keeping with the administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

There has been no evaluation of this project yet as it is to be newly funded in 1997.

PM-10 STUDY, CALIFORNIA AND WASHINGTON

The research on PM-10 is being conducted by scientists at the University of California, Davis and Washington State University. The California program has focused on developing and refining methods to accurately measure and detect the sources of PM-10 emissions from various agricultural practices, and to investigate alternative practices for reducing potential air pollution on susceptible California crops and soils. In addition, the California project is also measuring PM-2.5 and even more refined size distributions, as well as identifying the constituents in all emissions samples in order to better characterize the size distribution and possible sources of the emissions. The Washington State University scientists are using refined instruments on field sites to measure and predict the effects of wind erosion and agricultural practices in the Columbia River Basin region on PM-10 emissions, with the assistance of a portable wind tunnel. Alternative cropping systems, tillage practices, rotations, and weed control practices are being developed and compared for control of PM-10 emission pollution under Columbia River Basin conditions. The principal researcher believes there has been growing national concern over the potential health and safety aspects of air pollution from dusts and suspended particulate matter, resulting in passage of the 1990 Clean Air Act which requires the monitoring and control of such pollution. Because of particular problems from PM-10 emission in the arid regions of the Western United States, more accurate information is needed on the role of agricultural operations in intensively cultivated soils in California and the Columbia River Basin, as sources of PM-10 pollution, in order to assist growers to develop alternative agricultural management practices to control PM-10 emissions. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this grant. At the discretion of the state, Hatch Act or other funding sources could be used to support this research.

The original goals of this research were to measure the PM-10 emission rates from significant crop and tillage practices, to determine the source of PM-10 emissions on soils in agricultural regions of southern California and the Columbia River Basin in the Pacific Northwest, and to explore cost-effective alternative agricultural practices to control these emissions. The third year of field measurements are being completed on PM-10 emissions on production practices on almonds, figs, walnuts, wheat, and from dairy far-farms and feedlots in California, and on a number of agricultural practices in the rainfed and dryland croplands in the Columbia River Basin. Susceptible climatic and soil conditions and tillage and cropping practices have been identified and are being used to develop prediction tools to assist growers to adopt alternative practices to reduce potential air pollution by PM-10 particulate emissions. Measurements continue to be taken in these areas. In addition, preliminary efforts are underway to collect ammonia samples. This is important because the peaks in PM-10 emissions in California occur in December and January. Plans have also been developed to study the impacts of land preparation techniques on emissions.

The work supported by this grant began in March 1994. The appropriation for fiscal year 1994 was \$940,000; fiscal year 1995, \$815,000; and for fiscal years 1996 and 1997, \$873,000 per year. A total of \$3,501,000 has been appropriated. The program is matched by State funds in the form of salaries, benefits, and operating costs.

This work is being directed by participating scientists at the University of California, Davis, and at the Washington State University. The anticipated completion date of the original objectives of this project is 2000. The first four objectives of the project on soil particle characterization are nearing completion. The objectives on field control will continue. Quarterly reports on the entire project to date are available. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The agency's Program Manager annually reviews the research progress reports and proposed new research, and attends the annual meetings of the program to assess progress. The program is also evaluated each year by technical, administrative, and agency personnel. Progress is reported at research review meetings three times

PART 1

1014

a year. Printed reports are available from each, meeting. Grower and public advisory committees are consulted for input on research progress and objectives.

RURAL PARTNERSHIPS, NEBRASKA

The Rural Partnership Project is a comprehensive effort to transform the way that Federal, State, and local institutions deliver education and services to rural constituents. It is designed to address the issues of mandates; community strategic planning and project implementation, impact of devolution on local governments; profiling of rural constituents as to challenges, gaps in services, and opportunities; impact modeling; and sustaining development organizations. The principal researchers believe delivery and evaluation of programming delivered by Federal agencies is undergoing significant transitions. Research needs to direct the most effective and efficient means of program delivery and impact. This project is designed to provide insights and experience in alternative delivery formats in conjunction with partners at local, state, regional, and federal levels. In view of significant needs for research in high priority national interest topics, such as improved pest management programs, funds are not proposed to continue this grant. At the discretion of the State, Hatch Act or other funding could be used to support this research. The original goal of this research was to provide guidance in the delivery of information, technical assistance, and strategy related to rural economic development. Nebraska has transformed many of its education and service delivery formats based on this applied research activity. This project received Vice-President Gore's "Hammer Award" in December 1996.

The work supported by this grant began in fiscal year 1996 and the appropriation for fiscal year 1996 and fiscal year 1997 was \$250,000. A total of \$500,000 has been appropriated. Non-Federal funds were limited to staff and researcher support.

Research is being conducted at the University of Nebraska. This is an on-going research activity. The project which was begun in 1996 is now demonstrating early impacts of restructured delivery and implementation approaches for programs. The existing project is scheduled for completion September 30, 1998. However, in keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant.

The agency evaluates merit of research proposals as submitted. No formal evaluation of this project has been conducted.

WATER QUALITY—ILLINOIS

The Illinois Groundwater Consortium grew out of a fiscal year 1990 appropriation of \$500,000 to Southern Illinois University at Carbondale to focus on the short-and long-term effects of agricultural chemical contamination on the environment, the ground water, and ultimately, human health and welfare. As a result of this appropriation, the University joined forces with the Illinois State Geological Survey, Illinois State Water Survey, University of Illinois Cooperative Extension Service, and the University of Illinois Agricultural Experiment Station to create the Illinois Groundwater Consortium. The Consortium's primary mission, then and now, is to effectively work toward providing a scientifically-valid basis upon which meaningful agricultural chemical management and regulatory decisions can be based. The Consortium has worked to address the concerns of the agricultural and agrichemical industries as well as the valid concerns of the agencies charged with protection of environmental quality. Examples of topics currently under study include:

1. Flood-Induced Loading of Agricultural Chemicals to Public Water Supply Wells in Selected Reaches of the Illinois River
2. Development of a Conceptual Framework for Sustainable Ecosystem-Based Management of Floodplains Along the Mississippi River
3. The Impact of Flooding on the Water Quality of an Alluvial Aquifer at Henry, Illinois: First-Year Progress
4. Conservation Compliance and Agricultural Producers in the Corn Belt: Implications for Strategic Planning and Policy Implementation
5. Transport and Fate of Agrichemicals in an Alluvial Aquifer During Normal and Flood Conditions: A Preliminary Study
6. Nitrogen Dynamics of Agricultural Watersheds in Central Illinois
7. Assessing the Reliability and Stability of Policies to Reduce Agricultural Chemicals in Public Water Supplies.

The principal researcher believes that, as the Consortium enters its seventh year, the fiscal year 1997 appropriation is targeted to research pertaining to the impacts, recovery, and remediation of the Midwestern region after flooding. The 1993 and 1995 flooding of the Mississippi, Missouri, and Illinois Rivers, and their tributaries, created devastating effects on the farm lands, communities, and natural resources

PART 1

1015

of the area. These effects have major implications for agricultural practices, water quality, and public policy decisions. This natural catastrophe has resulted in a need for further studies examining the impact of the flooding on surface/ground water, soils and their rehabilitation, biodiversity, and on economic and public policy in the region. In addition, there is the need to disseminate results to the public to enable the Consortium findings to be beneficial in the near term to those needing the information. To facilitate this work, the Consortium expanded its participant institutions in 1995 to include Southern Illinois University at Edwardsville. Southern Illinois University at Edwardsville's strategic location in the heart of the flood damage area, as well as its qualified research scientists who work in the Consortium's high priority research areas, will strengthen the capabilities of the Consortium. The highest priorities of the Consortium is the funding of research upon which public policy-makers working on land use or ground water protection issues in flood plain areas can base decisions, and the broad dissemination of this information. In view of significant needs for research in high priority national interest topics such as pest management systems, funds are not proposed to continue this grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The Illinois Groundwater Consortium was established to coordinate and support research on agricultural chemicals in Illinois ground waters. The research team has accomplished an improved understanding of the fate and movement of agricultural chemicals under Illinois crop production conditions. A publication supported by the Consortium entitled, "Buried Treasure: 50 Ways Farmers Can Protect Their Groundwater," has received widespread acceptance and use for lay audiences. The Illinois Groundwater Consortium has accomplished a major step toward coordination and exchange of information-nation/research results relating to ground waters in Illinois. The Groundwater Bulletin reports research results from the Consortium. The Bulletin reports on atrazine studies, nitrogen management, farming practices for more efficient chemical use, geological impacts and policy options to safeguard ground waters. The Consortium investigators took an active role in monitoring and investigating herbicide, pesticide and coliform impacts during and after the Mississippi River Flood of 1993. The research continues today on the long-term impacts of flooding and management of the affected areas. The findings from this study will be useful in restoring the flooded cropland to full productivity and in establishing a base upon which policy management decisions can be made. The Consortium annually publishes a proceedings of its annual conference. The 1996 Proceedings of the Sixth Annual Conference contains 320 pages of research results. The Consortium represents an exceptionally productive cooperative effort involving several universities and agencies.

Research grants have been awarded from funds appropriated as follows: fiscal year 1990, \$494,000; fiscal year 1991, \$600,000; and fiscal years 1992-1993, \$750,000 per year; fiscal year 1994, \$666,000; fiscal year 1995, \$460,000; and fiscal years 1996 and 1997, \$492,000 per year. A total of \$4,704,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$255,891 state appropriations in 1991; \$447,237 state appropriations in 1992; \$644,054 state appropriations in 1993; and \$623,124 state appropriations in 1994. Non-federal and state funds for 1995 and 1996 have exceeded the federal funds.

The work is being carried out by the Illinois Groundwater Consortium and coordinated by the, Carbondale campus of Southern Illinois University. The research is being conducted by staff at the University of Illinois, Southern Illinois University, the Illinois State Geological Survey and the Illinois Water Survey at locations across the State.

This project was planned as a five-year study of the impacts and recovery of flooding in the Midwest. The original proposal and subsequent proposals identified both short-term objectives which are project goals that could be accomplished within one to two years and long-term objectives which are project goals that could be accomplished within two to five years. In calendar year 1996, two years of studies involving 26 projects were completed, and in calendar year 1997, eight new projects will begin. These projects are spread across areas identified as high priority, including studies of flood impacts on soil productivity and remediation, movement of chemicals in water and soils, bacteria and microbial life, plants and aquatic life, and on public policy impact. Progress in meeting short-term and long-term objectives has been excellent. The most complex task is coordinating research projects on flood issues involving multiple issues, such as biological, social, economic and political issues, where effective solutions await the expansion of research databases. It is anticipated that the projects will be completed in the year 2000. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

PART 1

1016

From its beginning, the projects funded through the Illinois Groundwater Consortium involve reviews by at least three faculty/researchers drawn from 27 different universities, state and federal labs and surveys, USDA research laboratories, and other research centers. This review system enables the IGC Advisory Committee to select projects with scientific merit from the group of proposals submitted for funding consideration. The titles, principal investigators names and affiliations, and budgets are submitted to USDA for review along with the IGC proposals for funding.

WATER QUALITY—NORTH DAKOTA

The overall objective of the research is to develop an understanding of the occurrence, transport and fate of agricultural chemicals found in representative field settings in the Northern Great Plains region of the United States. The ultimate goal is to provide a scientifically valid basis for management and regulation of these chemicals. This past year, the scope of the program was expanded to include water management issues in the Red River of the North drainage basin. The Red River Water Management Consortium, a partnership between public and private sectors, was established to address critical water quality and quantity issues in an area where agriculture is the predominant industry. A major objective of the Consortium program is to utilize results from the initial phases of this research program to find economical, practical, and timely technological solutions to water supply and water quality problems. By providing cofunding for the program, Red River Water Management Consortium members become active stakeholders in the research. This partnership ensures the practicality of the research performed and provides a model for the wise stewardship of water resources in other drainage basins in the United States. The principal researcher believes that the nation needs a scientifically valid basis upon which meaningful agricultural chemical management and regulatory decisions can be made. Chemicals in ground water present both a public health problem and an environmental quality problem of significant short-term and long-term importance on a local, regional and national scale. In addition, the principal researcher has established a water management consortium consisting of industry, municipalities, and other entities in partnership with state and Federal governments as a mechanism for transferring the results of this research program to the public. However, in view of the significant need for research in high priority national interest topics, such as improved pest management systems, funds are not proposed to continue this grant. At the discretion of the state, other funding could be used to support this research.

The original goal of the research program was to understand the occurrence, transport, and fate of agricultural chemicals in representative field settings in the northern Great Plains region so that scientifically valid decisions could be made for their management and regulation. Work on five of the seven sites originally instrumented under this program has been completed. Research at the two remaining sites is directed toward answering questions that have arisen during the course of this research program, specifically to determine the long-term trends in nitrate concentrations in a surficial aquifer under irrigated agriculture and to determine the source and trends for sulfate in a similar setting. Results from this program have been reported in journals, conference proceedings, and through presentations at national, state, and local meetings. To date, more than 40 presentations or publications have been made. In addition, two doctoral dissertations and one master's thesis have resulted from this program. Examples of important results obtained from this research include the following:

1. An understanding of agricultural chemical occurrence in ground water as determined by physical, chemical, and biological processes, transport mechanisms, management practices, and climatic factors.
2. Nitrate contamination of ground water in the northern Great Plains region of the United States is of even greater concern than pesticide contamination.
3. Biological denitrification is an extremely important process that determines the occurrence and distribution of nitrate and sulfate in aquifers in the northern Great Plains region.
4. Preferential flow mechanisms control the movement of water and contaminants in glaciated settings. Widely used flow models that do not account for preferential flow can severely underestimate the travel time and depth of contaminants.
5. Transport of pesticides on airborne particulate matter may present a major health threat and is an extremely important and poorly understood mechanism for the movement of pesticides to ground water recharge areas.

Finally, the researchers have established the Red River Water Management Consortium as a mechanism for transferring the results of the initial research to vested

PART 1

1017

stakeholders in the region and to the general public in order to address water quantity and quality problems resulting from agricultural practices and agricultural development. Sustainable agricultural development throughout the United States must rely on a far better understanding of our water resources and the application of new water management technologies to address changes in the agricultural industry.

In 1989, \$1.0 million was appropriated under the ground water research program. Beginning in 1990, funds have been earmarked under the Direct Federal Administration program. Work supported by this grant was initiated in fiscal year 1990 with an appropriation of \$987,000. Subsequent appropriations have been \$750,000 in fiscal year 1991, \$500,000 per year in fiscal years 1992–1993; \$470,000 in 1994; \$407,000 in fiscal year 1995; and \$436,000 in fiscal years 1996 and 1997. A total of \$5,486,000 has been appropriated for this water quality research program.

Red River Water Management Consortium members provide cofunding to support their participation in the program. Cofunding provided by Red River Water Management Consortium members for fiscal year 1996 totaled \$59,700. Interest in this program is growing, and it is anticipated that at least \$80,000 in cost-share will be obtained during the 1997 fiscal year through membership fees. These funds are provided directly to the program and do not include in-kind costs incurred by the participants. In-kind costs incurred by the participants are estimated to be several hundred thousand dollars, although this estimate cannot be verified at this time. Field activities to determine the long-term trends of nitrate and sulfate and to determine the source of sulfate are being conducted in cooperation with the North Dakota State Water Commission. Water samples collected at the Elk Valley field site are being analyzed at the North Dakota State Water Commission laboratory. For this 3-year effort, 1996–1998, they have estimated a cash-equivalent funding in the amount of \$33,660. In addition, the North Dakota State Water Commission will conduct field sampling for the Energy and Environmental Research Center in the summer of 1997 to investigate the source of sulfate found in ground water in the Elk Valley aquifer. They have estimated the cash equivalent cost of these services to be approximately \$12,000.

Research is being conducted at the University of North Dakota through its Energy and Environmental Research Center and at field sites in North Dakota and Montana. In addition, a portion of the pesticide research was conducted at North Dakota State University. Cooperative efforts have resulted in work also being performed at cooperative institution locations such as, University of Waterloo, Victoria University, University of Montana, the Red River Resource Conservation and Development Council offices, and the North Dakota State Water Commission. The anticipated completion date for the original objectives of the project, specifically the field related research, was fall 1995. This research has been completed and the sites have been decommissioned, with the exception of those relating to long-term nitrate and sulfate monitoring and analysis. Work on nitrate and sulfate trends and occurrence such as activities resulting from initial findings of this research program, is scheduled for completion in 1999. The Red River Water Management Consortium was established in 1996 as a mechanism for transferring the information derived from this research program to the technical community and to the public for use in addressing water quality and quantity issues relating to agriculture and agricultural development. It is anticipated that Red River Water Management Consortium activities will continue for several years in order to meet the objectives as defined by the non-federal sponsors and the agency. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested.

The last agency evaluation of this project was conducted in September 1996. The U.S. Department of Agriculture Technical Project Officer attended a meeting of the Red River Water Management Consortium to evaluate and determine the status of this effort, which is currently the focus of research program activities. The Project Officer was impressed with the progress made by the Red River Water Management Consortium during its first year and believes this program is an excellent example of how federal and state agencies, research and academic institutions, private industry, and the general public can work together to solve problems in an economical manner to benefit people, communities, and the nation.

BEEF IMPROVEMENT—ARKANSAS

The Arkansas Beef Improvement Program utilizes beef cattle farms to demonstrate cost-effective management practices. An Arkansas Beef Improvement Program Executive committee provides overall direction for the program. A second aspect of the Arkansas Beef Improvement Program is to inform all Arkansas cattle producers of the knowledge gained from the program. This project addresses pri-

PART 1

1018

marily local needs by setting goals, evaluating resources and selecting the management practices that will help the cattle producer achieve those goals in the decision-making process. In view of significant needs for Extension efforts in high priority national interest topics, such as improved pest management systems, funds are not proposed to continue this program. At the discretion of the state, Smith-Lever formula or other funding could be redirected to support this program.

The original goal of the Arkansas Beef Improvement Program was to enhance the profitability and efficiency of Arkansas cattle producers. Accomplishments to date include the establishment of demonstration farms, collection of benchmark data including soil tests, production information, forage analyses and budgets, and renovation of pastures to increase grazing capacity. Identification of mineral deficiencies in beef cattle have been detected and corrected through proper supplementation and ration balancing. Three of the ten farms averaged a 32 percent increase in pounds of beef sold per animal unit. Various management changes including parasite control and forage/pasture management have been instituted. Use of a cow-calf enterprise budget has helped the producers identify both efficient and inefficient management practices and take corrective actions. Additional accomplishments for the Beef Improvement Program:

- Increased the net calf crop percentage from 85.6 percent to 96.0 percent—an increase of 10.4 percent
- Supplemental feed costs decreased by \$23.93 per animal resulting in a total farm saving of approximately \$3,000
- 205-day adjusted weaning weights have increased 7.6 percent—from 478 to 514 pounds
- Preweaning average daily gain has increased 7.5 percent—from 1.87 pounds to 2.01 pounds
- Weaning weight efficiency increased 5.1 percent—from 45.4 percent to 47.7 percent
- Production costs decreased 36.9 percent, with the break-even cost per pound of beef sold decreasing from \$.60 to \$.50.

\$184,000 was appropriated each fiscal year for this project from fiscal year 1993 through 1996. In fiscal year 1996 and 1997, \$197,000 was appropriated each year. A total of \$946,000 has been appropriated. \$95,000 has been provided by the state of Arkansas.

Ten Arkansas demonstration farms were selected, one in each of ten counties, to reflect the different types of cattle operations and cattle producers in the area. Farm sizes ranged from 140 to 920 acres with an average of 360 and herd sizes ranged from 20 to 170 head, averaging 66 head per farm. The Arkansas project started with 6 demonstration farms in 1992 and added 4 more farms in 1993. When the farms were selected, it was agreed the Extension team would work with the Arkansas cattle producer for 5 years.

Therefore, the first 6 demonstration farms completed the program at the end of 1996, and the remaining 4 farms will complete the program at the end of 1997. Data from the final year will be collected and summarized for evaluation. The objective of the Arkansas program was to demonstrate cost-effective management practices. The Arkansas Beef Improvement Program has been very successful with achieving its objectives. Keeping with the Administration's policy of awarding grants competitively, no further Federal funding is requested for this grant.

A CSREES review of the project is conducted annually. The 1996 review noted the project is taking a sound approach to improving beef production efficiency and profitability in Arkansas. The review complimented the approach by the project to disseminate the results widely through publications and educational programs for the benefit of other producers in Arkansas and beyond.

DELTA TEACHERS ACADEMY

The Delta Teachers Academy, which operates out of offices located in New Orleans, Louisiana, is conducted by the organization known as the National Faculty, headquartered in Atlanta, Georgia. It should be noted that our State Extension partners are not involved in this project. The National Faculty Delta Teachers Academy was launched in 1992 with a pilot grant of \$500,000 from the United States Department of Education. The United States Department of Agriculture's funding for the project began in 1994. The Delta Teachers Academy project is providing approximately 645 teachers at 40 sites throughout the seven Lower Mississippi Delta states with development opportunities by teaming them with university scholars in on-site sessions and residential summer institutes. The subjects focused on during these training opportunities are English, geography, history, mathematics, and science. According to the grant recipient, the 219-county area comprising the Lower

PART 1

1019

Mississippi Delta region has been cited in reports by the Educational Testing Service and the National Center for Education Statistics as notably lagging in student performance in core academic areas. In 1989, Volunteers in Service to America characterized the area as the poorest region in the country. According to the Southern Regional Education Board, at least five of the Delta states have 20 percent or more of their school-age populations in poverty, with Mississippi topping the list at 34 percent. In its report to Congress in 1990, the Delta Development Commission cited serious educational problems including poor student performance in core content areas, demoralized teachers with little or no opportunity for academic development, and region-wide difficulty in recruiting and retaining qualified teachers. The Commission also stressed the links between these problems and the pervasive poverty and depressed economic conditions that characterize much of the seven-state Delta region. The Commission's report also cited that 75 percent of the region's work force lacks the basic reading skills necessary for technical training and specifically cites the need for improved teacher training as one means for breaking the cycle of poverty and economic noncompetitiveness. In view of the significant need for research and extension in high priority national interest topics such as integrated pest management systems, funds are not proposed to continue this grant.

The original and continuing goal of the project is to address the problem of insufficient professional development opportunities for the elementary and secondary teachers of the seven-state region. The Academy project has focused on the core subjects of English, geography, history, mathematics, and science. Humanities, language arts, social studies, reading, civics, and interdisciplinary subjects are also covered by some sites. The Delta Teachers Academy began by offering educational development activities for 100 teachers from approximately 50 rural districts at 10 sites. Training has now been expanded to include 645 teachers at 40 sites across the entire seven-state region. The project has improved teacher recruitment and retention in the region.

A total of \$13.661 million dollars has been appropriated to the Department of Agriculture for this project, including \$2 million dollars in fiscal year 1994, \$3.935 million dollars in fiscal year 1995, \$3.876 million dollars in fiscal year 1996, and \$3.850 million dollars in fiscal year 1997. There are no non-federal funds identified for this project.

The Delta Teachers Academy project is coordinated out of The National Faculty's Southern Region office in New Orleans, Louisiana. The project is being conducted at 40 sites selected from within the seven-state Lower Mississippi Delta region including the states of Arkansas, Kentucky, Illinois, Louisiana, Mississippi, Missouri, and Tennessee.

The original objective was to provide three full years of training to each faculty team established by the Delta Teachers Academy program. Training consists of four two-day academic sessions and one two-week summer institute for each team. This objective has been met for the original 24 faculty teams first funded under the fiscal year 1994 Department of Agriculture grant. The 15 additional teams established in 1995 have received two years of in service training, and the one new team established in fiscal year 1996 has received one year of training. By the end of the current fiscal year 1997 grant, 39 of the 40 faculty teams established by the Delta Teachers Academy will have met the original objective of the program. Objectives for the fiscal year 1997 grant include completing training for the 240 teachers at the 16 sites established during 1995 and 1996 and expanding professional development activities to an additional 340 teachers at 19 new sites throughout the seven-state Delta region. Additional objectives include sustaining professional development activities for the 350 teachers at 27 former Delta Teachers Academy sites through a new Academy Fellows Program and cultivating 15 to 20 potential sites for establishing new programs in fiscal year 1998. The anticipated completion date for any new program sites established in fiscal year 1997 would be at the end of the year 2000. Keeping with the Administration's policy of awarding grants competitively, no further Federal funding is proposed for this grant.

An assessment of the short-term impact of the Delta Teachers Academy by Westat, Inc. of Rockville, Maryland was completed in May 1995. Westat's study found that the vast majority of participants reported that the Academy had met their personal and professional needs by renewing their enthusiasm for teaching, improving their self-confidence, increasing their sense professionalism, improving their knowledge of specific content areas, enhancing their teaching methods, and providing opportunities to interact with peers. The study also provided considerable evidence that teachers are applying what they have learned from the Academy in their own classrooms. For example:

—86 percent said Academy activities had enhanced their knowledge of the academic subjects they teach;

PART 1

1020

- 88 percent said the Academy had helped them develop new teaching skills and strategies;
- 95 percent said they were now better equipped to pursue further professional development;
- 8 percent said the Academy had prepared them to assume leadership roles in their schools;
- 89 percent noted changes in their students' work habits, attitudes, aspirations, and achievements.

United States General Accounting Office review of the Academy's programs was also conducted in fiscal year 1995. The General Accounting Office report—GAO/RCED-95-208 included summary statistics on over 1,000 teacher evaluations of Academy sessions as well as the General Accounting Office's own survey of participants. The General Accounting Office found that on average, participants reported that the Academy was more effective than any other teacher development program they had participated in, was very effective in renewing or enhancing knowledge in one or more academic subjects, and was generally effective in enhancing the teaching skills and strategies required for teaching challenging academic content.

In addition, a site visit of the Delta Teachers Academy offices in New Orleans, Louisiana and of the National Faculty's Summer Institute at Tulane University was conducted by the Cooperative State Research, Education, and Extension Service's National Program Leader for Higher Education and Evaluation, during July 1996. The site visit confirmed that participating teachers are very enthusiastic about the Delta Teachers Academy program, that the instruction provided by The National Faculty's university scholars is on target and appropriate to the K-12 teachers' needs, and that the facilities are very well suited to program requirements. The site visit further confirmed that the Delta Teachers Academy has strengthened the participating teachers' ability to teach by improving their content knowledge base, helped them become leaders of other teachers by requiring them to conduct staff development back at their home schools, and had a positive impact on student learning. School superintendents report greater student enthusiasm, more homework, and higher test scores for students whose teachers were in the Delta Teachers Academy program.

EXTENSION SPECIALIST (AR) (EXTENSION FARM MANAGEMENT EDUCATION PROJECT)

The Federal funds support a small/family farm management and marketing education program, headquartered at the South Central Family Farm Research Center, a USDA-ARS facility in Booneville, Arkansas. The program takes research generated at the Center and adapts it to management and marketing education programs to meet the needs of small family farmers and provides support to county and state extension personnel who actually deliver these programs. According to the grant recipients, nearly three fourths of all U. S. farms have gross sales less than \$50,000. In the 10 state area served by the Booneville Center this percentage is even higher. Both the research and extension programs are targeted to the needs of this small, family farm audience. The eight specific objectives of this project cover a variety of management and marketing needs of smaller farm operators to help them improve family income through improved management and marketing skills. However, in view of significant need for extension efforts in high priority national interest topics, funds are not proposed for this project. At the discretion of the State, Smith-Lever formula or other funds could be used to support this project. The original goal of the program was to develop a small/family farm management and marketing education program based on the research program of the Booneville Research Center, which considers the limitations and potentials faced by small family farmers as they decided how to improve farm efficiency and technology use, how to minimize risk under severe capital constraints, and how to combine farm enterprises on limited acreage to best utilize available family labor while minimizing capital investment.

This project began in fiscal year 1992 with an appropriation of \$92,000. Subsequent federal funds were \$92,000 in fiscal year 1993; \$92,000 in fiscal year 1994; \$92,000 in fiscal year 1995; \$99,000 in fiscal year 1996 and \$99,000 in fiscal year 1997. Appropriations to date total \$566,000.

The Arkansas Cooperative Extension Service has provided the following state funds: \$59,040 in fiscal year 1992; \$55,680 in fiscal year 1993; \$55,446 in fiscal year 1994; \$55,446 in fiscal year 1995; \$54,446 in fiscal year 1996; and \$46,364 in fiscal year 1997. Nonfederal funds provided to date amount to \$324,422.

The Arkansas Extension Farm Management Program is headquartered in Booneville, Arkansas, and serves the 10 south central states included in the service area of the ARS South Central Family Farm Research Center. The original proposal

PART 1

1021

in 1992 was for a 12 month period; however the emphasis of the program has shifted as the educational needs of the target audience and as the research program of the Center have changed. During the current fiscal year, program emphasis is on provision of information about alternative farm enterprises and updating farm management application software. The current phase of the program runs through February of 1998. No further federal funding is requested.

CSREES performed a merit review of this program in January 1997 as we reviewed the proposal for 1997. The review concluded the project has been successful in meeting the specific educational needs of an underserved clientele group. The review also pointed out this program serves as an excellent example of cross-agency, and public-private, coordination and cooperation.

EXTENSION SPECIALIST, MISSISSIPPI

The Basic Weather Service and Extension project is a two phase program. The first year funding will be used to gather and disseminate critical agricultural weather data for producers and researchers in Mississippi and surrounding states. The grant proposal states that the Ag Weather Service facility was closed recently at Stoneville, Mississippi. This action has created a void in the availability of and access to critical weather data that producers and researchers use to make management decisions and formulate research projects, respectively. This is a first year project and the goal is to collect, maintain, and disseminate weather information for producers and researchers in Mississippi and surrounding states. In view of the significant high priority national interest extension topics such as IPM, funds are not proposed for this project. At the discretion of the state, Smith-Lever formula or other funds could be used to support this project.

This is a new program which is being planned and initiated this year. The first year appropriation is \$50,000. The State of Mississippi through the Mississippi Cooperative Extension Service and Delta Research & Extension Center is providing \$41,350 in state appropriated funds to support this project in 1997.

The project will be conducted at the Delta Research & Extension Center in Stoneville, Mississippi. This project is expected to continue into a Phase II program. Keeping with the administration's policy of awarding grants competitively, no further Federal funding is proposed for this grant.

This is a new project being initiated this fiscal year and for this reason no evaluation has been conducted yet.

INCOME ENHANCEMENT DEMONSTRATION, OHIO

The Federal funds support the Agricultural Business Enhancement Center which plays a major role in the development of the agricultural sector of Northwest Ohio. The Center provides a variety of management training programs, helps farms and other agribusinesses develop comprehensive business plans, and facilitates business networking. This grant is targeted to local Northwest Ohio needs. Farmers and other agribusiness firms must be able to adapt to a large number of major changes affecting the entire food system from the farmer to the consumer. These include changes in farm programs, globalization of markets, new technologies, information systems, consumers' concerns for food safety and nutrition, and society's concern for protecting the environment. Individuals, families, firms and communities in Northwest Ohio need to understand the changes, develop and implement effective strategies for managing change. In view of significant need for extension efforts in high priority national interest topics, funds are not proposed for this project. At the discretion of the State, Smith-Lever formula or other funds could be used to support this project. The original goal of the project was to help people develop new businesses and restructure and expand existing businesses in order to enhance incomes in Northwest Ohio. Recent accomplishments include several workshops to improve the management and marketing capacity of local farms and agribusiness firms. At the close of a special workshop for women in agriculture, 75 percent said their participation would improve management of the family farm. The Center has a major role in examining the feasibility of a new tomato processing plant in the region. The Center continues to conduct economic research on market opportunities, provide a variety of management training programs, help individual farms and other agribusinesses develop comprehensive business plans, and facilitate networking with businesses in other regions of the United States and around the world.

The project began in fiscal year 1991. Appropriations have been as follows: \$145,000 in fiscal year 1991; \$250,000 in fiscal years 1992 through 1995; and \$246,000 in fiscal years 1996 and 1997. Appropriations to date total \$1,637,000. The State of Ohio has appropriated the following funds: \$35,100 in fiscal year 1991; \$72,368 in fiscal year 1992; \$56,930 in fiscal year 1993; \$30,547 in fiscal year 1994;

PART 1

1022

\$49,935 in fiscal year 1995; \$51,432 in fiscal year 1996; and \$48,664 in fiscal year 1997. Non-federal funding provided to date totals \$344,976.

The Agricultural Business Enhancement Center is located in Bowling Green, Ohio and serves eight counties in the Toledo Metropolitan Area. Project leadership and data analysis is being provided by the Department of Agricultural Economics, Ohio State University, Columbus, Ohio. The original proposal in 1991 was for a period of 12 month. The current phase of the program will be completed in September 1997. No further Federal funding is requested for this grant.

CSREES performed a merit review of the project in January 1997 as it evaluated the project proposal for 1997, and concluded that it plays a major role in enhancing the competitiveness of the agricultural sector in eight counties of Northwest Ohio and that it has been effective in stimulating economic development in that area.

INTEGRATED COW/CALF MANAGEMENT—IOWA

CHIPS is an integrated cow-calf resource management (IRM) program which originally targeted an eleven county area in southeast Iowa. The intent of the program is to improve the area's rural economy by maximizing the profit potential of individual livestock operations. The CHIPS concept was also initiated to promote the development of forage systems which utilize highly erodible land (HEL), including land to be released in the CRP program. The geographical area where CHIPS services are offered systematically expanded to over 20 southeast and south central Iowa counties through fiscal year 1995. Expansion of the CHIPS program in area covered, services offered, and cooperator numbers continued to increase in 1996, with technical support expanding to an additional 14 counties in east central and southwest Iowa. Southeast Iowa contains extensive areas of marginal lands which are highly erosive (HEL) and should not be intensively farmed with row crops. These rolling hills are capable of producing high quality forages and are supportive to the cattle industry. 1996 marks the beginning of the release of Conservation Reserve Program (CRP) contracts—with thousands of these acres categorized as HEL. CHIPS is instrumental in assisting producers as sound management decisions are finalized regarding these CRP acres. CHIPS's long-term sustainable approach supports cow-calf production on this marginal ground and provides one-on-one assistance as economic and production decisions are made. The importance of the CHIPS program is highlighted by the current depressed economic state of the cow-calf industry. Negative financial returns have been a reality over the past 18 months and most economists predict this financial environment will continue in 1998. However, in view of significant needs for Extension efforts in high priority national interest topics, such as improved pest management systems, funds are not proposed to continue this program. At the discretion of the state, Smith-Lever formula or other funding could be redirected to support this program.

The overall goal of CHIPS is to have a positive effect on the area's economy by improving the long-term profit potential of the local cattle industry. To address this broad project goal, CHIPS has set forth the following objectives:

- Improve profit potential of cooperator farms
- Identify issues and trends in management data.
- Raise the awareness and understanding of over 2,000 agricultural producers in southeast Iowa about cow-calf production on highly erosive land and the integrated resource management concept.
- Provide over 130 producers with intensive technical assistance to develop goals and individualized farm recommendations, including management areas such as pasture and forage production, rations, utilization of resources, record systems, and government farm program compliance. During 1997, the number of operations served is expected to increase to approximately 200.
- Help producers develop management skills to improve efficiency and reduce costs of production as CHIPS recommendations are implemented.

Over 130 cooperators, involving approximately 11,000 beef cows, are currently enrolled and participating in the CHIPS program. Four full-time technicians and one part-time specialist have conducted over 600 farm/office consultations during fiscal year 1996 to develop specific on-the-farm recommendations and assist with the problem solving and decision making process. These contacts involved a wide variety of technical assistance, with primary emphasis on nutrition, cost-effective ration development, genetic evaluation, value added practices, and cow production concerns. Over 60 cooperators have incorporated the Cow Herd Appraisal of Performance Software (CHAPS) and Standardized Performance Analysis (SPA) programs in their operations. During fiscal year 1996, 3000 head of beef animals were permanently identified to facilitate record and data collection. More than 7500 cattle were weighed and monitored to evaluate performance and production levels. Over 250 forage sam-

PART 1

1023

ples were collected and analyzed, with the information being utilized in over 300 individualized ration recommendations. Selected management recommendations are highlighted by CHIPS technicians on a monthly basis. These financial and/or performance impacts are summarized in a report prepared and distributed quarterly.

Two networking projects are being developed through the efforts of the staff involved with the CHIPS program. A CHIPS Heifer Development Program was initiated in November, 1996, coordinating the management of over 200 breeding heifers from 10 CHIPS cooperators. The goal of this project is (1) to incorporate technological advances in the area of heifer development, and (2) to improve the genetic base of these ten operations through the use of artificial insemination, genetic evaluations, and nutritional management. A CHIPS Feedlot Program is also being developed which will provide cooperators, regardless of the size of the operation, an opportunity to retain ownership of their animals from birth to market. This value-added approach will expand the marketing opportunities for individual cow-calf operations and improve the profit potential for cooperators with Genetically superior animals. A state-wide bull test evaluation is also being monitored by CHIPS personnel in conjunction with the Iowa Cattlemen's Association.

\$138,000 was approved for fiscal year 1992; \$138,000 was approved for fiscal year 1993; \$276,000 for fiscal year 1994; \$350,000 for fiscal year 1995; \$345,000 for fiscal year 1996; and \$345,000 for fiscal year 1997. Federal funding through fiscal year 1997 totals \$1,592,000.

CHIPS participants pay client fees of approximately \$3.00 per cow. This fee structure is on a sliding scale which adjusts for cow herd size. To date, approximately \$60,000 has been collected from CHIPS cooperators.

The CHIPS program is currently being operated in southeast and south central Iowa and involves the following counties: Van Buren, Davis, Jefferson, Wapello, Appanoose, Monroe, Mahaska, Keokuk, Washington, Henry, Des Moines, Louisa, Wayne, Marion, Lucas and Lee in southeast Iowa and Clarke, Decatur, Ringgold, Union, Adair, Adams, and Taylor in the south central area. The fiscal year 1996 expansion effort extends CHIPS services to the following counties in east central and southwest Iowa: Jackson, Dubuque, Jones, Cedar, Clinton, Scott, Linn, Johnson, Fremont, Page, Mills, Montgomery, Pottawattamie, and With this expansion effort CHIPS is offering program services to approximately 60 percent of the state's cow-calf operations.

The CHIPS program was initially projected to address the goals and objectives of the project in a three year time frame. The objectives and goals of the CHIPS program will continue to be modified to meet the needs of the cooperators and to adjust to the rapidly changing cattle industry. The level of technical assistance and method of program delivery will require adaptation to meet the new objectives which emerge. Expansion of value added services is an area of increased interest by cooperators. Discussion with Precision Beef Alliance, a value added pasture-to-plate program, is scheduled. Keeping with the administration's policy of awarding grants competitively, no further Federal funding for this grant is requested.

A CSREES review of this project is conducted annually. The CSREES project liaison met with the project leader during 1996 to discuss plans for expansion of the CHIPS program. The 1996 review found a comprehensive approach to enhancing the cow-calf industry in Iowa with a strong educational effort in addition to hands-on assistance with records and management decision making. The review noted activities to make CHIPS self-supporting and to evaluate its impact on producers.

PILOT TECHNOLOGY PROJECT, WISCONSIN

Primary industrial extension activity of the Manufacturing Technology Transfer program is the delivery of technical assistance to manufacturing companies. Executive direction in determining the assistance required will be provided by the Stout Technology Transfer Institute with direct consultation and long-term in-plant assistance delivered primarily through the efforts of university Project Managers and Co-op students. Direct assistance may be delivered through staff of the University of Wisconsin System (both two-and four-year institutions, and Extension services); the Wisconsin Technical College System; secondary schools; the private sector; professional societies, and private consultants, or attendance at state or national seminars. The projects also draws on many other state resources to add expertise and capacity to network facilitation and in-plant extension activities. American's manufacturers continue to face tremendous global competition. There are enormous pressures to improve the quality of products; reduce the time consumed to bring new products to market; and there remains an ever increasing demand to reduce the cost of products. Currently there is a strong movement in manufacturing to use speed-to-market combined with new product introduction as a tool to obtain a competitive

PART 1

1024

advantage. While high quality and cost efficiencies continue to be mandatory commitments for today's manufacturers, great value is now being placed on speed-to-market. Large companies are not the only ones influenced by these trends. Small and medium size manufacturers often supply larger firms. Hence, they must be able to quickly process large amounts of information and solve complex problems. However, in view of significant needs for research in other high priority national interest topics, funds are not proposed to continue this grant. At the discretion of the State, other funding could be used to support this research.

The Manufacturing Technology Transfer program's principal objective is the development of a competitive, secure manufacturing base through the mechanism of industrial extension. The program principally targets small and medium size manufacturers in rural Wisconsin. This funding will: (1) continue to provide valuable industrial extension service to the target audience; (2) support the continued empirical development of an industrial extension model, and (3) investigate the use of super computer technologies to support global competitiveness of manufacturers. Specific accomplishments have been to:

- Perform plant evaluations.
- Identify opportunities for productivity improvements.
- Implement new organizational and operational methods.
- Investigate new manufacturing technology, with focus on super computing.
- Establish quality assurance/total quality systems.
- Establish ongoing training programs.
- Deliver on-site instruction in new technologies, improved methods and processes.

This project has been underway since fiscal year 1992 and was funded for \$165,000 in fiscal year 1992, fiscal year 1993, fiscal year 1994, fiscal year 1995, and for \$163,000 in fiscal year 1996 and fiscal year 1997 a total of \$986,000. No non-federal funds have been provided for this project.

The work will be carried out by the University of Wisconsin-Stout. The original proposal in 1992 was for a period of 12 months. However, the Manufacturing Technology Transfer Program was developed as a continuously evolving industrial extension strategy for serving the needs of the manufacturing community. As an ongoing project, the Manufacturing Technology Transfer Program is measured by success in meeting the objectives of the past five years' proposals, including the delivery of modernization assistance and development of an industrial extension model. The current phrase of the program will be completed in 1997. In keeping with the Administration's policy of awarding grants competitively, no further Federal funding is requested for this grant.

To measure the success of the project, a client evaluation process has been developed which includes an evaluation questionnaire. At the conclusion of interaction, each client is asked to evaluate services by completing a survey which reflects the program's stated goals and results are available annually. Evaluations indicate significant forward strides in creation, new businesses, expanded productivity, and enhanced international competitiveness.

RANGE POLICY DEVELOPMENT, NEW MEXICO

The project is collecting economic data on a statewide basis. The data is being used to build an economic model that will allow policymakers to better understand how local and state economies are tied to primary industries, notably those industries using public lands. In New Mexico and throughout the western states, local economies are frequently tied to the use and management of public range and forest lands. By describing how local industries provide personal income as well as local, state, and Federal tax revenues, we may be better prepared to estimate the impacts of proposed legislation and to craft policies that will enhance, rather than detract, from local economies. However, in view of the significant high priority national needs for extension projects such as IPM, additional funding is not proposed for this grant. At the states discretion, Smith-Lever b&c funding could be used to continue this project. Each New Mexico county will have a detailed input/output model developed from state and county tax revenue data. The results of the economic model forecasts will be shared with county decisionmakers in public forums across the state.

This project was initiated in December 1994. It has been funded year-to-year to accomplish annual objectives. The first tier of objectives were met in 2 years. The project objectives are being revised for fiscal year 1997, and we anticipate another 2 years to complete the second phase of the project in September 1998. The total appropriation has been \$594,000. The project budget does not indicate any non-federal support. However, the economists working with this project have initiated a re-

PART 1

1025

gional research project to follow up with the model, and the regional project includes investments from universities in seven western states.

According to the project coordinator, most of the original objectives have been accomplished. The investigators are currently collecting data to allow incorporation of other industry and government sectors into the model. These objectives should be accomplished in 2 years. Keeping with the Administration's policy of competitively awarding grants, no further Federal funding is proposed.

The proposal for continuing funding underwent merit review by a team of CSREES National Program Staff in June 1996 and a review of progress by the project liaison in November 1996. Both reviews were positive and returned recommendations that the project receive the funding earmarked for it in fiscal years 1996 and 1997.

RURAL CENTER AIDS/STD PREVENTION, INDIANA

This program created the Rural Center for AIDS/STD Prevention, formerly named the Rural Center for the Study and Promotion of HIV/STD Prevention, jointly between Indiana University, Bloomington, Indiana and Purdue University, West Lafayette, Indiana. The Center is headquartered at Indiana University. The purposes of the Rural Center for AIDS/STD Prevention are (1) the development and evaluation of innovative educational material and approaches designed to reduce HIV/STD risk behavior and incidence in rural areas, and (2) the investigation of the social and behavioral barrier to HIV/STD prevention, the findings from which can be applied to the creation of prevention programming. The grant request states that many perceive that HIV/STD is only a problem in large urban areas. However, HIV/STD are found everywhere, including small towns and rural areas, suburbs, and large cities. HIV/STD are becoming increasingly serious in non-urban areas. In view of significant needs for extension efforts in high priority National interest topics such as improved pest management systems, funds are not proposed to continue this program. At the discretion of the State, existing Smith-Lever funding could be redirected to support this program.

The goals of this project are (1) the development and evaluation of innovative educational material and approaches designed to reduce HIV/STD risk behavior and incidence in rural areas, and (2) the investigation of the social and behavioral barrier to HIV/STD prevention, from which findings can be applied to the creation of prevention programming. Information has been compiled on the incidence and costs of rural HIV/STD; educational materials have been developed for field testing and evaluation; a national rural HIV/AIDS videoconference has been conducted; and a newsletter established. Accomplishments in fiscal year 1996 included the development of computer software and peer educational material; expansion of the Prevention Resources Library; analysis of selected HIV/STD-related determinants of rural adolescents, adults, and migrant farmworkers; needs assessments of women and children with HIV; modeling of the HIV epidemic; and caregiver/persons with AIDS/community linkages. In fiscal year 1997, proposed projects include assessing the health and family correlates of HIV/STD-risk behavior, development of HIV/STD prevention education material, modeling the effects of multiple drug therapies, and assessing the HIV education needs of rural special education students.

This is the fourth year of funding for this program. Work began on January 3, 1994. The fiscal year 1997 funding for this program is \$246,000. Total funds appropriated to date are as follows: \$250,000 in fiscal years 1994 and 1995; and \$246,000 in fiscal years 1996 and 1997 for a total amount of \$992,000. The source of non-federal funds for this program is state of Indiana appropriated funds to Indiana University. The amount of non-federal funds are \$145,406 in fiscal year 1994; \$83,141 in fiscal year 1995; \$91,979 in fiscal year 1996; and \$115,166 in fiscal year 1997 for a total non-federal funding amount of \$435,692.

The work is being carried out jointly in the Department of Applied Health Science, and the Center for AIDS Research, Indiana University, Bloomington, Indiana, and the Department of Sociology, Purdue University, West Lafayette, Indiana. The Center was established to provide leadership, particularly in the Midwest, in efforts toward stopping the spread of HIV infections and sexually transmitted diseases in rural areas since no other such center existed. The first year's objectives were to develop a rural AIDS education needs assessment, develop innovative youth educational material, develop a resources center, evaluate a new school-based curriculum, develop family intervention strategies for decreasing adolescent risk behaviors, to assess the clinical and psychological needs of rural women and children with HIV, assess the needs of family caregivers for rural persons with AIDS, and examine the financial impact of HIV/STD on rural families. Since these projects are funded on an annual basis, the completion date for project objectives has been the end

PART 1

1026

of each fiscal year. Keeping with the Administration's policy of awarding grants competitively, no further Federal funding for this grant is requested.

The agency receives quarterly and annual progress reports on the project. Based on these reports, the agency has found that the Center has consistently met its objectives in educational material development and educational program delivery. The Center has become the primary source of HIV, AIDS, and other STD educational materials and programs for rural America.

RURAL DEVELOPMENT, NEBRASKA

The Center for Rural Community Revitalization and Development, Nebraska Cooperative Extension Service has supported an on-going applied research/outreach effort to improve the delivery and impact of land grant programming to small and rural communities and businesses. The grant has allowed the institution and other State and Federal agencies to refine the delivery and efficiency of programming within the state of Nebraska. It has supported the development of program partnerships and alternative means of providing technical support to rural constituencies. The Center is providing cutting-edge approaches in the development and delivery of technical assistance to rural constituencies. Information age technology is being incorporated into the delivery of both university and Federal/State agency programming. In view of significant needs for research in high priority national interest topics, funds are not proposed to continue this project. At the discretion of the State, Smith-Lever formula or other funding could be used to support this project. The original goal was to provide improved technical assistance to distressed rural businesses and/or emerging businesses in distressed communities. Through a series of 72 workshops in 67 communities over 1,341 business owners/managers were provided technical assistance. Currently, new strategies are being developed to provide technical assistance in a more cost efficient method.

The project has been operating since October 1978 and Federal appropriations through fiscal year 1993 were \$1.74 million. For fiscal years 1994 and 1995, \$400,000 was appropriated each year, for fiscal year 1996 and 1997, \$386,000 was appropriated each year. Total funding to date is \$3,326,000. All Federal funds have been matched by an equivalent amount of non-federal funds each year of operation through fiscal year 1995. The fiscal year 1995 amount was \$99,305. The non-federal support has been primarily in the form of staff for the past two fiscal years.

Research is being conducted at the University of Nebraska. The original completion date was September 30, 1989. The original objectives of the research project have been met. The completion of additional objectives is scheduled for September 30, 1998. However, in keeping with the Administration's policy of awarding grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

The agency evaluates merit of research proposals as submitted. No formal evaluation of this project has been conducted.

RURAL DEVELOPMENT THROUGH TOURISM, NEW MEXICO

The Rural Economic Development Through Tourism Project is a rural-based economic development activity to create new jobs and sources of income in small and rural communities in a seven county area of New Mexico. The focus of the development is on tourism and related businesses. The program supports training, strategic planning, and technical assistance for communities and tourism businesses. This is a pilot project to demonstrate the effective development and implementation of training, education, and technical assistance related to rural tourism. Tourism development is a strong area of interest to many small and rural communities throughout the United States. However, in view of significant needs for extension efforts in high priority National interest topics, funds are not proposed to continue this program. At the discretion of the State, other funds such as Smith-Lever could be used to support this effort. The New Mexico Cooperative Extension was to spearhead a comprehensive program to assist small and rural communities in increasing economic development opportunities through tourism. A regional task force composed of extension representatives and community leaders from business, industry, education, and government at the federal, state, and local levels guides the development and implementation of effective and efficient programming to support rural tourism development. The results of REDTT include a video, a public relations program, an image study, a regional tourism map and guide, a regional tourism bus package, festival planning workshops, development of a regional agricultural tour, and development of a mini-grants funding program.

In fiscal years 1992 through 1995, \$230,000 was appropriated each year. In fiscal year 1996, \$227,000 was appropriated. For fiscal year 1997, \$227,000 has been ap-

PART 1

1027

propriated for a total funding amount of \$1,374,000. In fiscal year 1992, \$38,764 of state matching funds were provided. For fiscal years 1993, 1994, 1995, and 1996, \$39,360 of state funds were provided. Fiscal year 1997 funds of \$39,040 are being provided.

Research/programming is being supported at the New Mexico State University. The original completion date was September 30, 1993. The original objectives of the research project have been met. The completion of additional objectives is scheduled for March 31, 1993. Keeping with the Administration's policy of awarding grants competitively, no further Federal funding is requested for this grant.

The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted.

RURAL DEVELOPMENT, OKLAHOMA

This program provides technical assistance to small business in support of job creation. It provides evaluation of new products and processes that may result in new industries or that may be applied to improve existing manufacturing processes. The program has resulted in job creation and industrial development through the operation of business incubators, new product and process fairs, marketing assistance to rural entrepreneurs, and financial assistance for plant expansion and new business starts. The operation of the rural incubator program that provides a stable and nurturing environment that small businesses need to grow into profitable concerns. These incubators consist of buildings designed for the specific purpose of starting a new manufacturing or technology-based company. Also small business needs access to technical assistance, worker training, technology transfer, financial aid, and business management assistance in order to stay competitive in domestic and world markets. However, in view of significant needs for research in other high priority national interest topics such as improved pest management systems, funds are not proposed to continue this grant. At the discretion of the State, other funding could be used to support this research, such as Smith-Lever.

The original goal of the program was to assist rural business in Southeast Oklahoma to get systematic access to improved technology, training, financial and business management assistance. Many accomplishments have resulted including financial assistance. Rural Enterprise, Inc., is a Certified Development Corporation for the Small Business Administration. As a result, Rural Enterprise, Inc., has obtained financing for entrepreneurs and businesses totaling \$66,392,855. Specific technical assistance efforts have included: working with a company regarding different ways to cut a radius in a board to allow a forklift to pick up pallets from the side making it a 4-way unit; working with a technology transfer center to assist a client in the design of a muffler for air tools to provide statistical data on decible reduction and frequency harmonics reductions; working with a company to identify and solve an engineering problem they were having with a new product.

Appropriations to date are as follows: \$433,000 in fiscal years 1988 and 1989; \$430,000 in fiscal year 1990; \$431,000 in fiscal year 1991; \$300,000 in fiscal years 1992 through 1995; and \$296,000 in fiscal years 1996 and 1997. Appropriations total \$3,519,000. No non-federal funds have been provided for this project.

The work is being carried out at Rural Enterprises, Inc., in Durant, Oklahoma. The original proposal in 1988 was for a period of 12 months. However, the objectives of Rural Enterprises, Inc., are on-going because of the nature of the activity. The clientele is diverse and decentralized. The engineering and management consultation model being pursued with individual clients results in a situation where hundreds of problems are being pursued simultaneously and when solved are replaced by new issues resulting from international competition, regulations, training needs, and changeover costs. The next phase of the program will be completed in 1997. In keeping with the administration's policy of awarding grants competitively, no further Federal funding is requested for this grant.

CSREES staff responsible for project liaison have conducted on-site visits and have formed evaluations through the agency's merit review process. Rural Enterprises itself conducts in ongoing evaluation process to measure the organization's effectiveness and efficiency in accomplishing its objectives and this is documented on a quarterly basis through our reporting system. Significant numbers of jobs and new businesses have resulted from this program.

RURAL REHABILITATION, GEORGIA

The program has tested the feasibility of providing satellite-based adult literacy education, in association with vocational rehabilitation services, to handicapped adults in rural Georgia. The program has developed curriculum, tested and adapted technology, established student recruitment and retention strategies, expanded to

PART 1

1028

Statewide coverage, and provided successful adult literacy education. A state task force has estimated that 25 percent of Georgia's adult population is functionally illiterate. Illiteracy is regarded as a form of disability in Georgia. In view of significant needs for extension efforts in high priority National interest topics such as improved pest management systems, funds are not proposed to continue this program. At the discretion of the State, existing Smith-Lever funding could be redirected to support this program. The original goal of this program was to prove that distance learning can be an effective tool for reaching and teaching functionally illiterate adults in rural areas. This program has demonstrated that satellite-based literacy training, in cooperation with vocational rehabilitation services, can successfully provide adult literacy education designed to improve critical reading, writing, and thinking skills for handicapped rural adults. The program now enrolls about 640 students per quarter, with approximately 70 percent expected to complete the full eight quarters of literacy education. Over the past eight years, test scores and attendance rates of students in the satellite based program have shown that distance learning is an effective delivery system for instructing low-level readers and non-readers. Test scores and attendance rates of students in this program have been comparable to those of students in traditional, urban classes.

Funding for this program was initially appropriated in fiscal year 1989, and the program has been in operation since March 1989. Through fiscal year 1997, appropriations for this program have been as follows: \$129,000 in fiscal year 1989; \$256,000 in fiscal year 1990; \$256,000 in fiscal year 1991; \$256,000 in fiscal year 1992; \$250,000 in fiscal year 1993; \$250,000 in fiscal year 1994; \$250,000 in fiscal year 1995; \$246,000 in fiscal year 1996; and \$246,000 in fiscal year 1997. Funds appropriated to date total \$2,139,000.

The fiscal year 1997 source of non-federal funds provided for this program are state appropriated funds is from the Georgia Department of Adult Education. Prior years' sources also included private contributions from the Woodruff Foundation and other local foundations. Through fiscal year 1997, the total amount of non-federal funds provided the project has been \$6,697,581. The breakdown by fiscal year is \$164,000 in fiscal year 1988; \$270,500 in fiscal year 1989; \$809,675 in fiscal year 1990; \$656,765 in fiscal year 1991; \$65,000 in fiscal year 1992; \$1,019,821 in fiscal year 1993; \$20,000 in fiscal year 1994; \$872,500 in fiscal year 1995; \$1,500,000 in fiscal year 1996; and \$1,319,320 in fiscal year 1997.

The Georgia Tech Satellite Literacy Project is sponsored and operated by four organizations: Georgia Institute of Technology's Center for Rehabilitation Technology, the Center for Rehabilitation Technology (CRT), Inc., Literacy Action, Inc. and the Georgia Department of Technical and Adult Education. The program grantee is CRT, Inc., a private, not-for-profit business advisory board to the Center for Rehabilitation Technology, College of Architecture, Georgia Institute of Technology, from which the literacy instruction is provided.

The 100 classes at 77 adult literacy classroom sites, dispersed throughout the State of Georgia and one site in Virginia, include 18 technical schools, 42 adult learning centers, 8 high, middle or elementary schools, 3 universities, 3 libraries, 2 rehabilitation centers, and one other site.

It was anticipated that it would take three years to demonstrate that distance learning can be an effective tool for reaching and teaching functionally illiterate adults in rural areas. That original objective was met in fiscal year 1991. Additional objectives since fiscal year 1991 have been to expand the outreach of the satellite based adult literacy program to enough additional sites throughout the state of Georgia so that all potential participants have reasonable access to the program; to continually upgrade the quality of class programming and the technical capacities of the system. It is anticipated that the latest technological upgrades, expanding the capacity of the program more than twenty-five-fold (from seventy-seven to over 2,000 downlink sites), and a six-fold increase in broadcast hours, and making materials available as supplemental tools to all Georgia literacy classes, will be completed by the end of the current project period, February 28, 1998. Keeping with the Administration's policy of awarding grants competitively, no further Federal funding is requested for this project.

The agency receives annual reports on the project. Based on these reports, the agency has found that the project has made progress in demonstrating the feasibility of utilizing distance learning technology and teaching methods to provide adult literacy education programs to handicapped adults throughout the state of Georgia. The project has been successful in applying the latest distance education technology to both control the program cost per participant and, most recently, to expand the availability of the program.

PART 1

1029

TECHNOLOGY TRANSFER PROJECTS, OKLAHOMA AND MISSISSIPPI

The original work plans involved the transfer of uncommercialized technologies from Federal laboratories and universities to rural businesses and communities. Over time, the objectives have evolved to providing more one-on-one assistance to small manufacturers. This type of assistance responds to the stated needs of the small manufacturing community and fills a recognized gap in the existing service provider community. Manufacturing extension programs throughout the country have identified one-on-one engineering technology assistance as a critical need for small manufacturers as they attempt to become more competitive and profitable. Oklahoma State University and Mississippi State University are the only public service providing organizations that have the demonstrated capability to provide such assistance in their respective areas. However, in view of significant needs for research in other high priority national interest topics such as improved pest management systems, funds are not proposed to continue this grant. At the discretion of the State, other funding could be used to support this effort, such as Smith-Lever. The primary goal of these programs is to contribute to an increase in business productivity, employment opportunities and per capita income by utilizing technology and information from Federal laboratories; Rural Enterprises Development Corporation and Industrial Technology Research and Development Center in Durant, Oklahoma; Mississippi State Food and Fiber Center; Vocational-Technical Education System; Center for Local Government Technology; Cooperative Extension Service; and other university departments and non-campus agencies. Specific program objectives are to:

- Develop greater profitability of existing enterprises.
- Aid in the acquisition, creation or expansion of business and industry in the area.
- Establish an effective response process for technological and industrial related inquires.
- Devise effective communication procedures regarding the program for the relevant audiences.

Funding appropriated to date is as follows: \$350,000 in fiscal years 1984 and 1985; \$335,000 in fiscal year 1986; \$333,000 in fiscal years 1987 through 1990; \$331,000 in fiscal years 1991 through 1995; and \$326,000 in fiscal years 1996 and 1997. Appropriations to date total \$4,674,000.

Although no non-federal funds have been required, Oklahoma State University and Mississippi State University have provided considerable amounts of matching support from state funds over the life of the project. For the past four years, for example, support has included a significant portion of engineering faculty salaries as well as the administrative support of county and district extension staff.

The work is being carried out at Mississippi State University and Oklahoma State University which are providing on-site assistance to small manufacturers. The original proposal in 1984 was for 12 months. The original objectives have been, and continue, to be met. Although individual client projects have a beginning and end, the technology transfer process is continuous. Over the past years, specific and measurable annual objectives and the achievement of objectives have been documented in annual reports. The objectives of both programs have been to: (1) continue the delivery of high-quality engineering assistance and technology transfer services to small manufacturers; (2) conduct joint workshops, client referral, and joint research and application projects; and (3) demonstrate a value of service to clients. The current phase of the program will be completed in 1997. In keeping with the Administration's policy of awarding grants competitively, no further Federal funding is requested for this grant.

Site visits and merit reviews have been conducted annually on these projects as well as client surveys by project staff themselves. Survey results have documented significant job creation, productivity enhancement, and local community economic activity.

WOOD BIOMASS, NEW YORK

The objective of this program is to expand, implement, and gain acceptance of wood biomass as a sustainable, renewable and environmentally friendly fuel source. Moreover, the program is viewed as a means of stimulating alternative forest products for the Nation's Central and Northern hardwood forests regions. The principal researchers believe that the project is of national interest. Biomass research studies through the U.S. Department of Agriculture and the Department of Energy span 20 or more years. As a result, the Nation is in a position to scientifically produce alternative fuels for power generation systems. Moreover, the Department of Agriculture and the Department of Energy research can provide information on the value of tree

PART 1

1030

plantings to carbon sequestration, rural economic development, and soil erosion and sedimentation associated with conventional agriculture. However, in view of the significant research needs on national high priority issues, funding for this project is not proposed. At the State's discretion, Hatch Act or other funding could be used to support this effort. The goal of this project is to promote, via applied research and technology transfer: wood biomass for energy as an alternative farm product; the wise stewardship of land resources; the use of domestic, renewable and sustainable energy; and enhanced farm profitability. To accommodate this, scientists at the State University of New York are planting willow trials on several sites and under several conditions. Site preparation occurred during the spring and summer of 1996. Some planting occurred during the fall of 1996, and more is scheduled for the spring of 1997. Cornell University has hired a person to coordinate technology transfer resulting from this and predecessor projects.

This aspect of the program began with an appropriation of \$200,000 in fiscal year 1995; \$197,000 was appropriated in fiscal years 1996 and 1997 for a total of \$594,000. Four state partners and approximately 18 private partners contribute resources at a ratio of approximately 1.5 to 1 for this project.

The field work is being conducted near Syracuse, New York. Electronic and print media allows Cornell's technology transfer activities to extend far beyond that point. The scope of this project has local, state, regional, national, and international implications. The completion date for the original objectives of the project, willow cultivar planting, was September 30, 1996. With the addition of some new dimensions to the project, the completion date is now April 1, 1998. Because of the timing of one of the awards and some weather-related problems, not all of the original objectives have been met. Most of the unmet objectives should be completed by early summer. Keeping with the Administration's policy of awarding grants competitively, no further Federal funding is requested for this grant.

This project is reviewed annually through a merit examination of the annual proposed plans of work. In addition, the Project Administrator monitors progress through the reading of a series of required reports, plus frequent phone and e-mail contacts. The Project Administrator also met with the Principal Investigator in his office to discuss the project during the investigator's travels to the Washington, DC, area.

DATA INFORMATION SYSTEM

Question. Please provide a description of system development activities that have been funded.

Answer. The Cooperative State Research, Education, and Extension Service—CSREES—is in the process of funding a cooperative agreement with the University of Arkansas to provide national leadership in coordinating the efforts of our university partners in helping us determine appropriate content for a Research, Education, and Economics Information System—REEIS—wide information system. In addition, the University of Arkansas will provide essential services in managing and coordinating a national Steering Committee responsible for overseeing the overall design, development, testing, and implementation of REEIS. Similarly, funds have been allocated to employ a technical services manager and a program analyst to oversee contracting with outside sources to design and launch REEIS and to comply with the necessary clearances and regulations applicable to information technology systems. In addition, funds have been allocated to secure a temporary director through the Intergovernmental Personnel Act—IPA—to coordinate and guide the overall aspects of development, testing, and implementing REEIS. Remaining funds are being allocated for contracting with a private sector firm to conduct a strategic audit of available data and a national needs assessment.

Question. What is the national, regional or local need for this activity?

Answer. USDA's Research, Education, and Economics—REE—mission agencies and their university partners lack a central, integrated, user-friendly electronic information system capable of providing a knowledge base of the thousands of programs and projects for which they are responsible that focus on food, agriculture, natural resources, and rural development. Such an information system is increasingly needed to enable the Department and its partners to readily conduct both comprehensive baseline and ongoing assessments as well as evaluations of research, education, extension, and economics programs and projects. In recent years, this need has become more urgent for several reasons. First, the United States needs a visionary public funded research and development program to produce essential knowledge and innovations for meeting growing competition in a global market—which is largely attributable to the expanding research and development efforts of foreign nations. Second, a comprehensive information system is needed to serve as

PART 1

1031

a primary reference source for development of new research and education projects on such diverse issues as increasing productivity in agriculture and processing, improving the safety and quality of food, and enhancing the sustainability of the environment and rural communities. Third, Federal/State policy makers and administrators are requiring empirical analyses to account for historical, current, and future use of public funds and to provide a basis for redirecting funds to higher priority problems. Fourth, the Government Performance and Results Act—GPRA—has imposed reporting demands which current, decentralized information systems are not prepared to adequately satisfy.

Question. What was the original goal of this initiative and what has been accomplished to date?

Answer. The original goal of this initiative was to develop an information system that can provide real-time tracking of research, extension and education projects and programs; has the capability to communicate vertically between field, state and Federal locations; will enable the REE agencies and their partners to conduct rapid and comprehensive policy assessments and program evaluation analyses; facilitates assessment of technologies and practices employed in extension, education, economics and research activities at the field and/or regional levels; provides clear and transparent public access to relevant parts of the information; and provides information management tools to enhance the timeliness and accuracy of REE-wide responses to inquiries about program objectives and expenditures.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1997?

Answer. Congress first appropriated \$0.4 million for REEIS in fiscal year 1997 to begin planning its design and development. We are in the process of establishing a National Steering Committee to provide advice and guidance throughout the development and implementation process. The Steering Committee will be chaired by a notable administrator of extension and research at a key land-grant university. It will be comprised of both users and producers of Research, Education, and Economics agencies' data, including program officials and program leaders, information system managers from other Federal agencies, representatives from Federal oversight agencies, program/project leaders representing partner institutions, and private sector users of REE data. Ultimately, this body will be responsible for recommending work specifications and for assessing the quality of work performed by an experienced and successful private contractor specializing in public-sector information systems.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funding does not apply at this time.

Question. Where is this work being carried out?

Answer. Leadership responsibility for REEIS resides within the Cooperative State Research, Education, and Extension Service's Science and Education Resources Development division. This provides for effective integration of the Current Research Information System, the Food and Agricultural Education Information System, and appropriate extension data bases. CSREES is working closely with all REE agencies and with the university system via a cooperative agreement with the University of Arkansas. We hope also to use the Intergovernmental Personnel Act to secure an IPA from another university to carry out REEIS essential management responsibilities. In addition, a process is underway to engage a private sector firm specializing in public-sector information systems to design, develop, test, and implement REEIS.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It is anticipated that REEIS can be operational by the year 2000. The current appropriation of \$400,000 will cover start-up costs such as establishment of a National Steering Committee, preparation and specifications for contracting with an outside firm, selection of a contractor, a needs assessment, identification of functional requirements, a draft plan for designing and developing the system including recommendations for in-house hardware, operating system, and software programs. The \$600,000 increase request for fiscal year 1998 will allow for implementing, testing, and refining a prototype, including preparation of an operations manual and a full-scale implementation and maintenance plan. The Research, Education, and Economics Information System meets a high priority national need for a continuing national information system. REEIS is being designed to meet the data information needs of all REE agencies and their university and private sector cooperators. It will link data systems on research, education, extension, and economics. Therefore, annual maintenance costs will be ongoing.

PART 1

1032

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An evaluation of Research, Education, and Economics Information System is not appropriate at this early stage of development.

TRAVEL

Question. Please provide the Committee with a breakdown of your actual travel costs in fiscal year 1996.

Answer. In fiscal year 1996, the CSREES cost for Domestic travel was \$1,693,795 and the cost for Foreign travel was \$44,858.

Question. Please identify foreign travel obligations for fiscal years 1994, 1995, and estimates for fiscal years 1996 and 1997.

Answer. The information follows.

CSREES foreign travel obligations

<i>Fiscal year</i>	
1994	\$65,054
1995	33,506
1996	44,858
1997 (estimate)	79,848

Question. How many CSREES personnel were engaged in foreign trips in these years [fiscal years 1994, 1995, 1996, and 1997] and for what purposes?

Answer. The information follows.

FOREIGN TRIPS

Purposes of foreign trips	Fiscal year	No. of CSREES personnel
External CIP Review—Science Policy Presentation for NE Division of Agronomy—FAO's Meeting and IPM—Project development, site visits, and project reviews of International Programs projects.—5th World Congress on Genetics Applied to Livestock Production—40th International Congress of Meat Science and Technical Conference—International Society of Animal Genetics Conference—Meeting of the Society for Nutrition Education—NC-119 Meeting—NE-103 Meeting—Participate in the North American Association for Environmental Education and Manage two auxiliary meetings of Extension Environmental Education faculty—USDA Water Quality Project Review	1994	21
U.S. Delegate to International Council of IUFRO-XX World Congress—Project development, site visits, and project reviews of International Programs projects.—Biodiversity Convention—International Symposium on Nutrition & Health—Presentation on Agricultural Biotechnology Technology Transfer and Workshop—CIP Review—Chair Report of CIP Review—Aquaculture Policies Information Exchange—CGIAR Meeting—Caribbean Basin Agricultural Research Meeting—Presenting papers on Policy Options on Plant Protection and Pesticides—Horticultural Society Meeting—Poultry Science Association and Collateral Meeting—Lead U.S. Delegation and Case Study OECD Conference—"Patron of Congress" presenting a paper—To present invited papers—Regional IPM Project Meeting	1995	14
Review of Forestry Programs with Advisory Council of the Pacific Islands—International Workshop on Soil and Water Quality at Different Scales—NCR-59—Soil Organic Matter—Regional Research Committee—Project development, site visits, and project reviews of International Programs projects.—Farm Privatization Project Review—Scientific Exchange—Joint Meeting—American and International Evaluators' Association—U.S. Scientific Exchange Team on Biotech Applications—Seafood Sciences and Technology Society Meeting—Kenaf and Allied Fibers UNFAO—World Aquaculture Society meeting—External Panel, U.S. A.I.D. Funded Pond—ADAP Directors Meeting—Taule'ile Center for Tropical Agricultural Research—Ag CATIE on Horticultural Extension, Research, and Education—World's Poultry Congress and Exhibition—3rd Symposium on Industrial Crops and Products—IPM Project—International Congress of Meat Science and Technology—Caribbean Food Crops Society and CBAG Meeting—Paper on American Evaluation Association—NCR-22 Meeting—NADP/NTN Meeting—Conduct Workshop on GPRA of 1993—American Evaluation Association Meeting—Present selected paper "The Institutional Evolution of the Modern Polish Ag System"—Regional IPM project—National Extension Leadership Development—NELD—Seminar—Expert Consultation on Rural Youth Program	1996	22

PART 1

1033

FOREIGN TRIPS—Continued

Purposes of foreign trips	Fiscal year	No. of CSREES personnel
Global Conference on Sorghum Ergot—ADAP and Western Regional Joint Meeting—Project development, site visits, and project reviews of International Programs projects.—Caribbean Food Crops Society and Tstar CBAG Meeting—Asian Center for Livestock Waste Management Meeting—2nd Symposium on the Epidemiology and Control of Salmonella in Pork—43rd Congress of Meat Science and Technology—2nd International Workshop on Transgenic Animals and Food Production—XV Panamerican Congress of Veterinarian Science Meeting—Guest Lecturer Bodles Research Station—USDA representative to co-convene the South African Binational Commission—Scientific Conference for SERD—The International Biotech Risk Assessment Symposium—American Society of Plant Physiology—CSREES Administrative and Financial Review of University of Guam and American Samoa University—International Congress of Plant Molecular Biology—Review of the Forest Science Department of the University of British Columbia, Canada—Meeting of the Society for Nutrition Education—Meet with State counterparts and participate in paper sessions in food safety, health, and nutrition.—The VII Meeting of International Grassland Congress—Present paper at the International Soil Erosion Congress	1997	28

QUESTIONS SUBMITTED BY SENATOR BOND

FUND FOR RURAL AMERICA

Question. For fiscal year 1997, the Fund for Rural America is structured in such a way that, in effect, it excludes large, visionary and ambitious projects such as the National Corn Genome Initiative—NCGI—from participation. The focus and the funding limits make it infeasible. I believe that this project is of vital interest to our efforts to retain our leadership position in agricultural research and to ensure that our producers have the tools necessary for environmentally responsible and sustainable agricultural production into the next century. Some day, someone in some country will develop this research and I feel strongly that it must be us. If not, we will likely risk much of the competitive advantage that visionary leaders of the past have earned for us today.

This project was specifically mentioned in Farm Bill report language and is precisely the kind of basic science that will be the basis for us being competitive into the next century. While I understand that many Fund for Rural America projects may yield early and visible benefits and are important, we should also have the vision to provide the tools that will be the key to success in the future.

I have started a dialogue with Dr. Gibbons of the Office of Science and Technology Policy and Dr. Lane at the National Science Foundation to see if another agency is willing, better funded or better suited to take this on.

I understand some modest efforts are underway but we know that an unfocused, underfunded or piecemeal approach will not do the job.

Does the Department have any intention of reconsidering its approach to the Fund for Rural America for fiscal year 1998 and fiscal year 1999 so that a project of this nature could become eligible?

Answer. The Department will evaluate fiscal year 1997 Fund operations in developing guidelines for fiscal year 1998 and fiscal year 1999 programs. It is unlikely, given the original mandate provided for in the 1996 Federal Agriculture Improvement and Reform Act, that the Fund will shift dramatically in focus to emphasize more fundamental research. This suggests that to be competitive, projects such as the National Corn Genome, would need to emphasize outcome-oriented research projects that include the end user through technology transfer.

This likely continued emphasis on applied research and related education and extension does not mean that the Fund is unresponsive to the need to “retain leadership in agricultural research” and “ensure . . . environmentally responsible and sustainable agriculture production.” The Fund was designed to further these goals by combining the knowledge generated from fundamental research with limited support for applied activities that lead to faster and hopefully larger payoffs on research dollars.

USDA has been very active in pursuing ways to increase Federal support of genomic mapping and sequencing activities including the sequencing of corn. However, prior to proceeding with a program designed to map one specific commodity, a number of scientific and administrative issues must be addressed. USDA has taken the lead in bringing together the National Science Foundation and the De-

partment of Energy to discuss how to determine what should be the focus of a genome program for agriculturally important species. As a result, USDA asked the National Academy of Science, National Research Council-Board on Agriculture in collaboration with the Board on Biology to conduct a discussion of this issue at the April 26th Academy meeting. Over 60 participants, including representatives from universities, private industry, commodity groups, and Federal agencies, engaged in a daylong discussion entitled "Designing an Agricultural Genome Program." An abbreviated draft report of this discussion will be released in May. Conclusions of the meeting included: (1) Strong support for continued and increased funding of investigator initiated individual efforts in genomic research, as is supported currently by the USDA, CSREES, National Research Initiative Competitive Grants Program—NRI, (2) A recommendation for the development of a genome program that would include both broad and more specific objectives of a) 100,000 Expressed Sequence Tags—EST's—for forty agricultural species—plant, animal, and microbe—that would provide important base-level genomic information, and b) a more specific sequencing activity on corn and sorghum, (3) A recommendation to resolve the proprietary issues of genomic research prior to proceeding on an extensive publically funded genomic effort. For example, the entire set of expressed corn genes may likely be isolated by private industry by the year 2000. Will the genomic information be in the public domain or will the Federal government find it necessary to fund the genome effort itself to assure public access? Because of the proprietary nature of industry efforts in genome sequencing, USDA is bringing together industry and Federal agencies to discuss this issue so that duplication of effort can be minimized. An interagency task force also is being established under the National Science and Technology Council (NSTC) to develop an initial plan, with the NRI Chief Scientist serving as chair.

Further science-based discussions of the genome issue will occur at a June National Academy Colloquium in Irvine, California entitled "Protecting Our Food Supply: The Value of Plant Genome Initiatives."

QUESTIONS SUBMITTED BY SENATOR BUMPERS

SPECIAL RESEARCH GRANTS

Question. Would you provide me an update on the following CSREES special grant items: Farm and Rural Business Finance; The Food Safety Consortium; Forestry (UAM); Global Marketing Support Service; The Institute for Food Science and Engineering; and Rice Modeling?

Answer. The information for these special research grants follows:

Farm and Rural Business Finance.—This program, which has a fiscal year 1997 appropriation of \$106,000, focuses on three principal areas. One is the financial management and performance of rural businesses. The second area includes research on financial markets and credit institutions serving rural America. The third area addresses the impact of public policies and programs on the financial health of rural America. The work is carried out at the University of Illinois and the University of Arkansas. The program has completed projects on the financial structure and efficiency of grain farms, risk and financial implications of coordination in hog production, commercial bank access to agency market funds through government-sponsored enterprises, and competitive challenges for bankers in financing agriculture.

The Animal Science Food Safety Consortium.—Research for this grant program, which has a fiscal year 1997 appropriation of \$1,690,000, focuses on developing detection, prevention, and monitoring techniques that will reduce or eliminate the presence of food borne pathogens and toxic substances from the Nation's red meat and poultry supplies. The consortium is organized and operated along institutional lines with a coordinator and directors managing the research program. Research is conducted at the University of Arkansas at Fayetteville, the University of Arkansas for Medical Science at Little Rock, Arkansas Children's Hospital, Iowa State University, and Kansas State University. Researchers under this grant studied Salmonella infection in infants and children, the application of polymerase chain reaction technology to detect and differentiate *Campylobacter jejuni* and the more prevalent *campylobacter coli* in pork, and demonstrated under commercial conditions that electronic identification systems to track and determine contamination points in beef cattle are feasible from an implant retention, operational, and retrievability standpoint.

Forestry Research.—Research supported by this grant, which has a fiscal year 1997 appropriation of \$523,000, offers programs of teaching and research to the

PART 1

1035

landowners of Arkansas and the surrounding region by the Arkansas Forest Resources Center. The Center includes one of only three Arc View learning centers for natural resources, and has a staff well versed in the use of advanced technologies. This research is being conducted at the School of Forest Resources, the University of Arkansas at Monticello. Significant progress has been made in several areas, such as developing intensive fiber farming systems as alternatives to soybeans for Mississippi farmers, taking the first step toward biological control of the Southern pine beetle by discovering the nutrient needs of predators of the beetle so they can be grown and studied in artificial cultures, and conducting the first survey of nonindustrial landowners in Arkansas for 15 years. Ongoing projects include a broad array of topics concerned with best management practices, ecological characteristics, effects of different management intensities, and streamside buffer zone effectiveness.

Global Marketing Support Services.—This grant program, which has a fiscal year 1997 appropriation of \$92,000, provides research and service to agribusinesses. The objective of the university research is to identify potential foreign markets for Arkansas products and to conduct and disseminate foreign market assessment evaluation studies to agribusiness firms. This research is being conducted at the University of Arkansas in Fayetteville. Some of the recent results include, twelve “Industry/Company Opportunity Reports” that provided local businesses with information about potential export markets; a report on consumer attitudes in Mexico and Columbia toward imported products; an evaluation of the food system in China, with emphasis on poultry sector; two new fact sheets; and additions to an electronic export information database that is accessed by local firms.

Institute for Food Science and Engineering.—Research for this grant program has a fiscal year 1997 appropriation of \$750,000. As the flagship center for the Institute for Food Science and Engineering, the Center for Food Processing and Engineering facilitates and encourages value-added research and improves the efficiency and effectiveness of processing agricultural products. This research will be conducted at the University of Arkansas at Fayetteville. Research demonstrated promise for a high pressure water spray to remove phomopsis decay and brown rot tissue from peaches for processing. Progress was also made in modifying commercially-produced rice hull silicate to create silica gel. Other research results indicated that holding green and ripe peaches in elevated carbon dioxide atmosphere could reduce acidity and decay, possibly allowing fruits to ripen prior to processing without excessive losses to decay. The Institute also provided information to new food business entrepreneurs on food regulations, safety, labeling, ingredients, packaging, and financial aspects of starting a food business and on market products.

Rice Modeling.—Research for this grant program, which has a fiscal year 1997 appropriation of \$395,000, is used to develop a rice industry model with domestic and international components to aid U.S. farmers, millers, and policymakers in making production, investment, marketing, and public policy decisions. This research is being carried out at the University of Arkansas, Fayetteville, and the University of Missouri, Columbia, and is needed to assist both the U.S. rice industry and national policymakers in assessing the impact of existing and proposed changes in public policies for rice. This research enables improved analysis of both international and domestic policy changes on rice production, stocks, prices of substitute crops and consumption.

FEDERAL ADMINISTRATION

Question. Would you provide me an update on the Geographic Information System funded through CSREES Federal Administration?

Answer. This program, which has a fiscal year 1997 appropriation of \$844,000, is designed to transfer evolving geographic information systems technologies to state and local governments. This technology includes Internet access for information, databases, and telecommunication for cooperative system development. This research is being carried out by the National Center for Resource Innovation Chesapeake Bay located in Rosslyn, Virginia, with regional centers in Georgia, Arkansas, Wisconsin, North Dakota, and Washington. This project has provided the impetus and linkages to facilitate planning work done in South Georgia with some assistance given to local tax assessment and parcel identification by a Department of Commerce-sponsored Economic Development Authority. The Chesapeake project has linked seven state conservation entities in an effort to develop better watershed models and decision support systems. The Arkansas portion of the project has focused on training to educate county employees with regard to the technology of geographic information systems and geographic positioning systems. The Wisconsin portion has continued to simultaneously support the high technology end of the evolution of new tools and seek new ways to implement change while measuring the

PART 1

1036

impact of such implementation. The work in North Dakota has continued to focus on geographically-referenced real time weather information for payments and others. The efforts in Washington have provided training for a number of state personnel and others from various levels and institutions on how to utilize geographic information systems.

EXTENSION PROGRAMS

Question. Would you provide me an update on the following CSREES Extension items: Beef Producers Improvement (Arkansas), and Delta Teachers Academy?

Answer. The information on these Extension programs follows:

Beef Producers Improvement, Arkansas.—The Arkansas Beef Improvement Program, which has a fiscal year 1997 appropriation of \$197,000, utilizes beef cattle farms to demonstrate cost-effective management practices. This project addresses primarily local needs by setting goals, evaluating resources, and selecting the management practices that will help the cattle producer achieve those goals in the decisionmaking process. This work is being carried out at ten Arkansas demonstration farms, one in each of ten counties, to reflect the different types of cattle operations and cattle producers in the area. Research to date include the establishment of demonstration farms, collection of benchmark data, including soil tests, production information, forage analyses and budgets, and renovation of pastures to increase grazing capacity.

Delta Teachers Academy.—The Delta Teachers Academy, which has a fiscal year 1997 appropriation of \$3,850,000, provides approximately 645 teachers at 40 sites throughout the seven Lower Mississippi Delta states with development opportunities by teaming them with university scholars in on-site sessions and residential summer institutes. The Delta Teachers Academy is coordinated out of The National Faculty's Southern Region office in New Orleans, Louisiana. The project is being conducted at 40 sites selected from within the seven-state Lower Mississippi Delta region including the states of Arkansas, Kentucky, Illinois, Louisiana, Mississippi, Missouri, and Tennessee. The Academy project has focused on the core subjects of English, geography, history, mathematics, and science. Humanities, language arts, social studies, reading, civics, and interdisciplinary subjects are also covered by some sites. The Delta Teachers Academy began offering educational development activities for 100 teachers from approximately 50 rural districts at 10 sites. Training has now been expanded to include 645 teachers at 40 sites across the entire seven-state region. The project has improved teacher recruitment and retention in the region.

QUESTIONS SUBMITTED BY SENATOR LEAHY

INTEGRATED PEST MANAGEMENT

Question. How much funding is the Department directing towards Integrated Pest Management and environmentally friendly techniques? What is the status of the USDA's goal to have 75 percent of U.S. agriculture using IPM? What research activities are being undertaken to help farmers reach this goal? What research activities are USDA undertaking to develop alternatives to comply with the Food Quality Protection Act?

Answer. The President's budget for fiscal year 1997 includes \$34.9 million for the Department's IPM Initiative and an additional \$119.5 million for the broad category of "IPM and Biocontrol."

The Department's National Agricultural Statistics Service is currently conducting national surveys of major field crops and selected fruits and vegetables to measure levels of IPM adoption. Much more work is needed to refine and implement a sound measurement methodology. Since the ERS report was published in 1994, additional studies have been completed by Department analysts and outside experts, and most support ERS' conclusion that 50 percent or more of the nation's crop acreage is currently managed under a "low" level of IPM but this varies significantly by crop and part of the country. Several analyses, including the one published by Consumers Union in "Pest Management at the Crossroads," have concluded that considerable more work is needed to help producers move along the IPM continuum to the "medium" and "high" levels. We believe that an accelerated effort is needed, and warranted, to help growers reduce reliance on high-risk pesticides and enhance the sustainability of farm operations.

The IPM programs supported and conducted by the Department and its land-grant university partners develop and deliver solutions to the pest management problems faced by our Nation's farmers and urban residents. These programs incor-

PART 1

1037

porate fundamental knowledge of pest biology into education and training programs for farmers and other pest managers. In many cases, land-grant university scientists use the basic or fundamental knowledge generated by Agricultural Research Service scientists or through support from the National Research Initiative as the basis for further applied research, research validation trials, and finally disseminate this information to agricultural producers through Cooperative Extension. The Department's IPM programs are designed to develop and help farmers and other pest managers implement new pest management approaches to critical pest problems, increase profitability and protect the environment. The Agricultural Research Service's Areawide IPM Program is demonstrating the effectiveness of new technologies over large areas. Areawide projects are participatory programs that blend ARS resources and expertise with those of CSREES and its land-grant university partners to get IPM methods widely implemented in a production region. The Regional Integrated Pest Management Grants Program provides a science basis for the development of alternative approaches for managing pests including insects, mites, weeds, plant pathogens, and ectoparasites. Research supported by this program includes the development of individual pest control tactics and the integration of multiple tactics into an IPM system. The Pest Management Alternatives Program is designed to develop alternative pest management tactics to replace those lost through EPA cancellation or voluntary withdrawal. Research supported by this program develops new and environmentally-friendly tactics for the highest priority needs.

The Department's IPM research programs will play a critical role in developing pest management alternatives that comply with the "Food Quality Protection Act of 1996." A special program addressing Food Quality Protection Act Issues will address pest management on food and feed crops impacted by implementation of the Food Quality Protection Act. USDA and EPA will support projects that result in: 1) a better understanding of how these pesticides are used, how important each particular use pattern is and the attributes and constraints of existing alternatives and/or how a significant reduction of risk to human health or the environment that would result from replacement or mitigation technologies; 2) identification of situations where no current viable alternatives exist and documentation of evidence of significant potential losses; 3) significant producer involvement; 4) natural controls as partial or effective solutions to pest management problems; and 5) solutions capable of being rapidly brought to bear on critical problems. The goal of this program is to develop or identify alternatives for critical needs to insure that crop food producers have reliable methods of managing pest problems.

QUESTIONS SUBMITTED BY REPRESENTATIVE FAZIO

PM-10 RESEARCH

Question. The subcommittee approved \$873,000 for fiscal year 1997 through the CSREES budget for PM-10—research about particulate matter and air quality that is critical both to California and the rest of the nation. The need in our state is great but, unfortunately, this research money is currently being split between California and Washington State. Describe the nature of research going on at the institutions in both states and any other states under this research program, tell us how they complement one another, and what your proposal in the fiscal year 1998 budget is in this area?

Answer. As directed by Congress in establishing the PM-10, California and Washington special grant, the funding from CSREES is divided equally between the two states. Research both by the University of California at Davis, and Washington State University address serious public concerns related to particulate emissions and resulting effects on air quality and potential effects on human health. The overall objectives of both the California and Washington program is to determine the role of agricultural land and production and management practices as sources and causes of particulate emissions, and to develop alternative or improved practices to reduce these emissions. Because of quite different climatic and soils conditions and types of cropping systems and management practices, some specific research objectives differ quite distinctly between the two states' programs. However, a number of significant collaborative projects are being jointly conducted by California and Washington on PM-10 air quality problems that are critical to both states, and to other Western states.

The PM-10 research in California is centered around the intensive production of cotton, grain crops, and fruit and nut crops, such as almonds, figs, and other high-value crops. Production of these crops requires intensive tillage, cultivation, and harvesting operations which can create potential problems for dust or particulate

PART 1

1038

emissions. Research by scientists at the University of California at Davis is developing sampling and monitoring programs to determine the source and extent of PM-10 particulates in these agricultural production areas, and are collaborating with Washington scientists on developing unique biological "fingerprinting" techniques to more precisely pinpoint the sources of origin. In addition, the California research is developing knowledge on the PM-10 emission-potential of various field crop operations to be used as a basis for developing new control methods for PM-10 emissions from California agriculture. In addition, the data from these studies have already been incorporated into San Joaquin Valley air authority implementation plans. Two computer models, CALMET and CALGRIO, developed by California scientists for urban air quality assessment, will be extended for region-wide assessment and planning of agricultural impacts on air quality in both California and Washington.

In Washington, the production of the major crops of dryland wheat and grain in low rainfall areas requires the extensive use of crop-fallow rotations to conserve soil moisture. This results in leaving large acreages of soils with no crop cover, with potential for periodic severe wind erosion and severe air pollution problems. Other PM-10 particulate emission problems are related to the practice of crop residue burning in grass seed production fields to control pests and permit efficient operation of planting equipment. Research by Washington State University and USDA scientists is developing new data on the sources of PM-10 emissions during wind events, and the sources of such emissions as a basis for effective and economic control practices. These studies include work with turners and scientists in Oregon and Idaho on alternative conservation or no-tillage cropping systems to increase water intake and reduce soil loss by wind, and to conserve crop or vegetative residue cover on soils susceptible to wind erosion. Washington scientists are also finalizing a wind erosion and dust emission prediction model adapted to the western U.S. This prediction tool along with a new Manual of Best Management Practices for reduction and control of PM-10 emissions is expected to be incorporated into recommended air authority state implementation plans in Washington, and subsequently in most other western states.

The PM-10 research in both California and Washington includes strong collaboration between federal and state scientists in other states with similar PM-10 concerns, and with other ongoing research that is complementary. For example, both states have cooperative wind erosion and PM-10 emissions research underway using specialized field dust samplers and laboratory wind tunnels, with federal and state scientists in Texas and Kansas who have extensive experience and laboratory.

Question. Do you intend to keep or alter the state distribution in the future—what would make you consider doing so?

Answer. The research in both California and Washington is providing information that may prevent agricultural losses and protect human health. However, in keeping with the Administration's policy of awarding research grants competitively, no other federal funding for this program as currently positioned is requested. Research could be continued at the state's discretion using formula funds, or the principal investigators could apply for the competitive grants program under the National Research Initiative.

PEST CONTAINMENT AND QUARANTINE FACILITY

Question. I was impressed by the emphasis in each of the testimonies by Undersecretary Woteki, Dr. Knipling, and Dr. Robinson about the fight against pests and the fight for integrated pest management and for food safety. The continuing emphasis on these technologies, bioengineered pest-resistant plants, and monitoring pesticide levels under the Food Quality Protection Act will have increasing importance in the years to come.

Those missions just happen to dovetail with the mission of the Pest Containment and Quarantine Facility at UC-Riverside and UC-Davis. We need about \$7 million to complete the federal share for this project. Although USDA traditionally does not request funds for these CSREES projects, I think you are aware of the value of this facility for exactly the priorities you have laid out in your testimony. Perhaps you could outline for the committee just how a facility like Riverside/Davis facility can complement some of the missions you have emphasized today.

Answer. Plant pest management, including pests such as insects, nematodes, bacteria, fungi, viruses and weeds, is in a state of transition. Traditional pest control strategies based on use of synthetic chemical pesticides are being phased out. This is due to several factors including: pest populations that have developed resistance to chemical pesticides; public pressure to avoid pesticide contamination of food and the environment; discovery that some pesticides thought to be safe may in fact be

PART 1

1039

carcinogenic; and high costs of multiple pesticide applications. The most attractive alternative to synthetic chemicals is biological pest control. This strategy includes use of parasites; microorganisms; predators; and genetically-engineered insects, microorganisms, or resistant plants. Sophisticated biological pest control methods are made possible by the development in recent years of recombinant DNA technology, which allows cloning of genes and stable insertion of such genes into the insects or microorganisms. To assay the efficacy of exotic or genetically-engineered bio-control agents, quarantine and physical containment facilities may be needed to insure safety before field releases are made.

Question. How would USDA accomplish some of these missions without this facility—I understand that the containment level offered by the proposed Davis facility for this type research is available at very few installations throughout the U.S.?

Answer. Currently, there are a limited number of facilities with Biosafety level 3 capability available for biological control experimentation with recombinant germplasm and with exotic pests that can be used to undertake this research. The facilities at the University of California-Davis and the University of California-Riverside could significantly accelerate the efforts to develop new, innovative, and environmentally-compatible pest control technologies.

SUBCOMMITTEE RECESS

Senator COCHRAN. This concludes today's hearing. Our next hearing will be on Thursday, May 1, at 10 a.m., in room 124 of the Dirksen Senate Office Building. At that time we will hear from witnesses on the budget request for the Commodity Futures Trading Commission and the Food and Drug Administration. Until then, the subcommittee stands in recess.

[Whereupon, at 12 noon, Tuesday, April 22, the subcommittee was recessed, to reconvene at 10:08 a.m., Thursday, May 1.]

PART 1

PART 1

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

THURSDAY, MAY 1, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:08 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran and Bumpers.

COMMODITY FUTURES TRADING COMMISSION

STATEMENT OF BROOKSLEY BORN, CHAIRPERSON

ACCOMPANIED BY MADGE BOLINGER, DIRECTOR, OFFICE OF FINANCIAL MANAGEMENT

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order. Today we continue our hearings on the fiscal year 1998 budget submitted by the President. This morning we will consider the budget request for the Commodity Futures Trading Commission and the Food and Drug Administration. We are pleased to welcome the Chairman of the Commodity Futures Trading Commission, Brooksley Born. We invite you to come sit at the witness table with your assistant.

We will put your entire statement, which we have, in the record. We thank you for that and we encourage you to make any summary comments or remarks that you think would be helpful to the committee in understanding the budget request. Then we will have an opportunity to discuss the issues raised or ask questions.

You may proceed.

STATEMENT OF BROOKSLEY BORN

Ms. BORN. Thank you very much, Mr. Chairman.

The Commodity Futures Trading Commission very much appreciates this opportunity to discuss the President's fiscal year 1998 budget request for the Commission. With me today is Madge Bolinger, who is the Director of the Commission's Office of Financial Management.

The CFTC is a small agency with an important mission. It oversees the Nation's 11 futures and option exchanges and supervises 64,000 commodity professionals who trade on the floor of these ex-

PART 1

1042

changes or represent customers. These markets are growing rapidly, having more than doubled in trading volume during the past decade.

The President's fiscal year 1998 budget request for the Commission is \$60,101,000, with a staffing level of 600. This request represents an increase of \$5 million and 20 staff persons over the fiscal year 1997 appropriation. About \$4 million of the request is required for the Commission to sustain its current level of services; \$1 million is to fund the requested 20 additional staff-years.

The Commission's tasks are to ensure the integrity of the U.S. futures and option markets, protect customers from fraud and other trading abuses, monitor the markets to detect and prevent price distortion and manipulation, and maintain the competitive strength of the Nation's exchanges.

The requested increase will be used to continue enhancement of the Commission's enforcement and surveillance programs and slightly to expand the Commission's industry oversight function. Approximately 75 percent of the requested dollar increase above the current level of services will be dedicated to enforcement efforts to increase our investigative activities, litigation support, and cooperative law enforcement efforts. The Commission's goal is to send a strong message that fraudulent activity and other violations of the Commodity Exchange Act will be promptly and thoroughly investigated and proceeded against vigorously.

The increase will also enhance the ability of the Commission to use its new integrated market surveillance system, which will assist Commission staff in monitoring systemic risk in the marketplace. This increase will also provide the resources to sustain the necessary level of oversight over the compliance programs of the Nation's futures and option exchanges and the National Futures Association.

The increase in funding and staffing is well justified and will benefit agricultural producers and processors, financial services firms, energy concerns, and many other sectors of the economy that depend on the important price-discovery and risk-shifting functions of the futures and option markets.

The Commission remains committed to the elimination of unnecessary regulatory burdens and is currently reviewing and amending its regulations to streamline them as appropriate in light of the Commission's mandate to protect the public interest.

The Commission is also committed to working with Congress to improve and update the Commodity Exchange Act through legislative amendments. Bills to amend the act have been introduced in Congress which would result in the pervasive deregulation of our futures and option markets and thus would pose grave dangers to the public interest. Our current regulatory system has allowed our futures markets to become the strongest and most respected in the world by convincing market participants from around the world that they are safe, fair, and transparent.

The Commission is strongly opposed to the provisions of the bills which would eliminate Government regulation of much of our exchange trading in futures and options and would leave those who use and rely on the integrity of our markets exposed and unpro-

PART 1

1043

tected. Even if those provisions were enacted, the Commission's funding needs for fiscal year 1998 would not decrease.

The Commission recognizes that this subcommittee faces difficult appropriations decisions this year. Nonetheless, we believe that the increase that the President has requested for fiscal year 1998 is essential for the Commission to fulfill its congressional mandate and to keep pace with a growing, complex, and dynamic marketplace.

Thank you very much, Mr. Chairman. I would be happy to answer any questions that you or other members of the subcommittee may have.

PREPARED STATEMENT

Senator COCHRAN. Thank you very much, Ms. Born. We have your complete statement and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF BROOKSLEY BORN

Mr. Chairman and Members of the Subcommittee: I appreciate the opportunity to discuss with you the President's fiscal year 1998 budget request for the Commodity Futures Trading Commission ("CFTC" or "Commission").

CFTC'S BUDGET REQUEST

As you know, the President's fiscal year 1998 budget request for the Commission is \$60,101,000, with a staffing level of 600. This request represents an increase of \$5 million over the fiscal year 1997 appropriation. Approximately \$4 million of that request is required for the Commission to sustain its current services level, and \$1 million is to fund the requested 20 additional staff years.

The Commission recognizes that this Subcommittee and Congress face difficult fiscal decisions this year. Nonetheless, we believe that the increase the President has requested for fiscal 1998 is not only justified but essential if the Commission is to continue to strengthen its enforcement and market surveillance programs as well as to carry out its other statutory responsibilities fully and effectively.

OVERVIEW OF FUNDING LEVELS AND OPERATIONAL EFFECTS

The Commission enforces the requirements of the Commodity Exchange Act ("Act" or "CEA"). It is responsible for ensuring the integrity of the U.S. futures and option markets, protecting customers from fraud and other trading abuses, monitoring the markets to detect and to prevent price distortions and manipulation, and maintaining the competitive strength of the nation's exchanges. We continue to work to protect the vital economic functions of hedging and price discovery performed by our futures and option exchanges. Prices established by domestic futures exchanges affect what we pay at the grocery store, the service station, and copper plumbing and our lumber. Similarly, prices on the exchanges assist producers and processors in obtaining fair prices for their commodities.

The Commission oversees 64,000 commodity professionals who trade on the floor of the exchanges or represent customers. Our goal is to ensure that these firms and individuals meet standards of fitness and maintain financial integrity, use proper sales practices and provide adequate risk disclosures to their customers.

These responsibilities have become more challenging in the face of dramatic market growth and innovation. Examples of this growth and the great expansion of the Commission's oversight and regulatory responsibility include the following:

Increased exchange trading volume.—The CFTC supervises all trading of futures and option contracts on eleven U.S. futures exchanges. The commodity futures and option markets have experienced and continue to experience dramatic growth. They have expanded from agricultural markets to markets in futures and options on financial instruments, such as interest rates, stock indices and foreign currencies, and commodities of global significance, such as energy and metals. Exchange futures and option trading has more than doubled in the last decade (from 216 million to 495 million contracts)—an increase of 131 percent. This growth is expected to continue with a volume of 562 million contracts projected for 1998 (an increase of 160 percent over 1986). CFTC's programs have encouraged this healthy growth by

PART 1

1044

assuring market participants around the world that our markets are safe, fair and transparent.

Growth of over-the-counter derivatives.—The CFTC, along with other financial regulators, exercises general oversight of the rapidly growing and evolving over-the-counter market in derivative instruments. It has responsibility to address fraud and manipulation in significant portions of that market. The CFTC also works with the international regulatory community to address disclosure and market integrity issues in the market. This enormous market, currently estimated to be in excess of \$50 trillion world-wide, has developed in the past decade.

Growing managed funds.—The CFTC regulates commodity pool operators and commodity trading advisors. Funds committed to professional management for futures trading have grown exponentially, from \$115 million in 1975 to over \$25 billion today, not counting hedge funds also registered as commodity pools. This area of financial investment includes a growing number of pension and mutual funds. The Commission has worked with industry groups and other regulators to improve and to simplify disclosure requirements which allow customers to make informed investment decisions.

Rapid innovation.—The CFTC approves all contracts traded on futures and option exchanges and all rules of such exchanges and the National Futures Association. Since 1986, the CFTC has approved over 400 new contracts for trading on exchanges. Many of these new, innovative contracts have brought new market users within CEA protection for the first time. The CFTC has worked closely with both the exchanges and industry representatives to make certain new contracts will create hedging opportunities and enhance price discovery and price basing of the underlying commodities.

Expanded Congressionally mandated responsibilities.—The CFTC's authority and responsibilities have grown substantially since the Commission was created in 1975. After three years of intense Congressional scrutiny, Congress passed the Futures Trading Practices Act of 1992 giving the CFTC a number of new responsibilities to ensure market integrity. Ongoing activities include enforcing the heightened audit trail standards for exchanges and improving the CFTC's oversight and enforcement programs. In 1995 Congress reaffirmed these obligations by adopting a reauthorization of the Commission, which authorized appropriations through fiscal year 2000.

Growing internationalization of the markets.—Financial and commodities markets are becoming increasingly global, further increasing the complexity of the CFTC's oversight responsibilities. The agency must respond promptly and effectively to international developments, such as the collapse of Barings Plc. and the issues surrounding Sumitomo Corporation's copper trading. The agency has ongoing responsibilities to ensure that its regulatory framework is capable of responding to the domestic implications of problems arising anywhere in the world. It has become a leader in encouraging international cooperation and improvement of regulation abroad.

Technology developments.—The exchanges, commodity professionals and users of the markets are turning to newly developed technology to cope with the huge growth in this industry. Likewise, the CFTC has had to augment its staff as well as its hardware and software to keep pace with the growth in the markets. Technology also presents some increasing regulatory challenges to the CFTC, including the need to police futures and option trading advice and sales offered illegally via the Internet.

CFTC RESOURCES

Despite its increasing responsibilities, the CFTC's budget remained essentially flat from fiscal year 1992 through fiscal year 1994. Consequently, the Commission reduced personnel, substantially cut non-staffing expenses, and delegated additional duties to self-regulatory organizations. The CFTC also deferred computer upgrades and systems development for important market surveillance and other activities. In short, the Commission and its staff were stretched very thin, and it became extremely difficult to provide the oversight and enforcement presence on which market users and the economy at large depend.

Over the past three years, the Administration and Congress have recognized the need for a stronger CFTC and have provided for an increase in staffing, particularly in enforcement personnel. The budgetary support of the agency in recent years has reflected the recognition of the critical need to supervise the futures and option markets effectively and to enforce the laws against fraud and manipulation in those markets.

In fiscal year 1998, the requested increase will be used to continue enhancing the Commission's enforcement and surveillance programs and slightly to expand its in-

PART 1

1045

dustry oversight activities. Approximately 75 percent of the program increase will be dedicated to enforcement activities to increase its investigative activities, litigation support and cooperative law enforcement efforts.

Additional funding will also allow the Commission to continue the efforts started in fiscal year 1996 to redesign and implement an integrated market surveillance system which will assist Commission staff in monitoring systemic risks in the marketplace. One of the major enhancements of the system will be the ability to obtain and analyze daily option large trader data along with daily futures large trader data. Currently, we receive futures large trader data daily, but options data is only available on a weekly basis. The system will reduce the overall reporting burden of certain commodity professionals, who will report large trader data only to the CFTC rather than to multiple exchanges.

This increase will also provide the resources to sustain the necessary level of oversight over the compliance programs of the futures and option exchanges and the National Futures Association.

The President's fiscal year 1998 budget request will increase the Commission's staffing level by about 3 percent. This slight increase would restore some of the erosion in staffing in the early 1990's and would put the CFTC at an authorized staffing level 3 percent lower than its fiscal year 1992 authorized staffing level.

The requested increase in funding and staffing is well justified and will benefit agricultural producers and processors, financial services firms, energy concerns and many other sectors of the economy that depend on the price discovery and risk-shifting functions of futures and option markets.

HIGHLIGHTS OF FISCAL YEAR 1996

ENFORCEMENT

As mentioned earlier, the majority of the budgetary increases that the Commission has received since fiscal year 1995 have been for the enforcement program. In fiscal year 1995, the Commission began restructuring and enhancing its Division of Enforcement, and that effort continues today. A strong, effective enforcement program is one of the Commission's top priorities. Our goal is to send a strong message that fraudulent activity and other violations of the CEA will be promptly and thoroughly investigated and proceeded against vigorously. As a result of the Commission's civil injunctive actions in fiscal year 1996, approximately \$6.4 million in customer funds and other assets were placed under the protection of receivership.

Case Highlights

During fiscal year 1996, resources were devoted to significant cases which not only addressed the specific wrongdoing alleged in a particular complaint, but also communicated to the public the Commission's concern with a specific area or highlighted the Commission's view regarding the significance of acts and practices that have the potential to cause significant harm to markets, customers, and market participants. Those cases include the following:

- The filing and simultaneous settlement of an administrative action against Deloitte & Touche and one of its former partners. The Commission's order found that the partner failed to conduct an audit of a futures commission merchant ("FCM") in accordance with generally accepted auditing standards and failed to investigate properly and to report on material inadequacies in the FCM's internal controls. Deloitte was held liable for the partner's violations. Deloitte agreed to pay a \$100,000 civil penalty and to comply with certain undertakings. The partner agreed to the entry of a cease and desist order and a Commission censure. *In re Deloitte & Touche*, CFTC Docket No. 96-10 (filed September 26, 1996).
- The filing and simultaneous settlement of an administrative action against Fenchurch Capital Management, Ltd. The Commission's order found that Fenchurch attempted to manipulate and did manipulate the value of its position in ten-year U.S. Treasury note futures contracts by cornering the available supply of the cheapest-to-deliver notes. According to the Commission's order, Fenchurch increased its position in the issue through a series of repurchase transactions at a time when the notes were in tight supply. Fenchurch exacerbated the tightness in the supply of the cheapest-to-deliver notes by increasing its position and intentionally withholding the notes from the market. Fenchurch's conduct took place after expiration of trading on the futures contract, while those holding short positions in the market were preparing to make delivery. The Commission's action and its underlying investigation were coordinated with the Securities and Exchange Commission ("SEC") and the Chicago Board of Trade ("CBT"), both of which filed related charges. The Federal Re-

PART 1

1046

serve Bank of New York also assisted the Division in its investigation. In settling the CFTC's action, Fenchurch consented to the entry of a cease and desist order and to various undertakings related to its Treasury market trading. Fenchurch also agreed to conduct a review of its policies and procedures and, if necessary, to formulate and to implement reforms of those policies and procedures. Fenchurch agreed to pay a civil monetary penalty of \$600,000, which also satisfied Fenchurch's obligations under the SEC's consent order of permanent injunction. *In re Fenchurch Capital Management, Ltd.* [Current Transfer Binder] Comm. Fut. L. Rep. (CCH) ¶26,747 (CFTC July 10, 1996).

Also, resources were devoted to enhance a "quick strike" enforcement response capability. This effort has resulted in instituting injunctive actions within weeks, or even days, of discovering suspected illegal activity. To date, examples of notable cases brought by the Commission using this new capability include the following:

—The filing of an injunctive complaint against Donald Chancey and a firm controlled by him alleging violations of the anti-fraud and registration provisions of the CEA and Commission regulations in connection with an unregistered commodity pool operator. According to the complaint, the defendants solicited individuals to invest in a pool by making misrepresentations that the funds would be invested in silver futures and that the past trading of the pool had been profitable. The complaint alleges that the defendants placed few actual trades and that those resulted in losses. The defendants allegedly used some of the funds solicited to pay purported interest to certain earlier investors and converted the majority of the funds to their own use. The day the complaint was filed, the federal district court entered an ex parte order freezing the defendants' assets and protecting and granting the Commission access to books and records. The court also appointed a temporary equity receiver. The Division used the Internet to inform the public about this enforcement action and to solicit information concerning the whereabouts of Chancey, who disappeared before the Commission filed its action against him. The Division posted a picture of the defendant on its home page and later posted notices publicizing the court sanctioned auction of the defendants' property. *CFTC v. Donald B. Chancey, et al.* No. 7:96-CV-61 (M.D. Ga. filed July 1, 1996).

—An injunctive action filed against Ken Willey. Willey allegedly defrauded pool participants by distributing account statements which misrepresented the changes in net asset value and income and loss realized by individual participants. According to the complaint, the defendant illegally received investor funds in a name other than that of a commodity pool and commingled pool property with assets of other persons. The day the complaint was filed, the federal district court entered a consent order of preliminary injunction freezing Willey's assets, protecting and granting Commission access to books and records, and enjoining future violations of the nature alleged. Subsequently, the court entered an order finding Willey in contempt and ordering him jailed until he complied with the preliminary injunction. After six months of incarceration, Willey was released from jail without ever complying with the order to produce books and records. In the interim a receiver was appointed, and a motion for summary judgment was filed by the Commission on all counts except fraud. The Commission is awaiting the outcome of the summary judgment motion and a distribution of assets to investors by the receiver. *CFTC v. Ken Willey*, Civ. No. 96-0200 (E.D. Wash. filed April 19, 1996).

FRAUD IN FOREIGN CURRENCY FUTURES AND OPTIONS

An important part of the Commission's Enforcement program in recent years has focused on the fraudulent off-exchange sales of foreign currency futures and option contracts to the public. These cases typically involve boiler room operations that seek to lure in the vulnerable through high-pressure sales tactics and false promises of quick riches. In recent years, we have seen a rise in cases of "affinity fraud," in which members of particular ethnic or religious groups are targeted as victims of the fraudulent activity.

The Commission has brought 19 cases involving the illegal sale of foreign currency futures or option contracts to the general public since 1990. In those cases, more than 3,200 customers invested over \$250 million in foreign currency schemes, much of which was lost.

One of these cases, *Dunn v. CFTC*, U.S. (1997), *rev'g* 58 F.3d 50 (2d Cir. 1995), was decided by the Supreme Court in February of this year. In that case the Commission alleged that the defendants had solicited and accepted funds from approximately 400 customers and that Dunn had informed customers that they had suffered losses of at least \$95 million at the time the defendants ceased operations. The

PART 1

1047

Supreme Court decided the narrow issue of whether futures and options are treated the same under the so-called Treasury Amendment, which exempts from the CEA some transactions in foreign currencies that would otherwise be covered by the CFTC's jurisdiction. The Court concluded that options are treated in the same manner as futures under the Treasury Amendment.

Our enforcement experience demonstrates that fraud of the retail public is rampant in this area and will require a strong enforcement presence for the foreseeable future. The Commission strongly believes that, whether through judicial interpretation of the existing statutory provisions or through the legislative initiatives now pending before both Houses of Congress, its authority vigorously to pursue the investigation and prosecution of foreign currency futures and option scams targeted at public customers should be affirmed.

EXCHANGE CONTRACT DESIGNATION

In fiscal year 1996, the Commission approved 92 new futures and option contracts—an approval rate of one every 2.7 work days. Many of the innovative new contracts approved by the Commission were designed to meet specialized hedging needs of firms in the agricultural sector. For example, the Commission approved five CBT corn yield insurance futures contracts based on the states of Illinois, Indiana, Nebraska and Ohio as well as the U.S. as a whole. These contracts were designed to provide a vehicle for crop insurance companies and other commercial and agricultural entities to hedge financial risk related to fluctuations in the yields of corn.

Early in fiscal year 1997, the Commission proposed rules for new “fast-track” procedures for processing exchanges’ contract designation applications and rule changes. Those rules were adopted by the Commission on February 27, 1997. Under the rules, certain contract applications may be approved within 10 days following receipt by the Commission, while other contracts may be approved within 45 days. Most exchange rules will go into effect within 10 days after they are filed with the Commission.

HEDGE-TO-ARRIVE CONTRACTS

Recently, a number of agricultural producers have used various grain contracts referred to as hedge-to-arrive (“HTA”) contracts. High grain prices experienced in fiscal year 1996 and the “rolling forward” of these contracts created financial strains on some grain elevators and producers. As a result, on May 15, 1996, the Commission’s Division of Economic Analysis released statements of policy and guidance regarding HTA contracts. In the first statement the Division stated that it would not base a determination of the legality of any such contracts existing as of May 15, 1996, under the forward contract exclusion of the CEA solely on the fact that the parties entered into a subsequent agreement to use cash payments to unwind these contracts. The second statement provided guidance regarding the risk implications of particular features of these contracts. On November 13, 1996, the Commission filed three administrative complaints involving HTA contracts, which are currently pending before the CFTC’s administrative law judges.

MARKET OVERSIGHT

The CFTC’s mandate requires it to oversee the activities of futures and option exchanges, the National Futures Association (“NFA”), an industry self-regulatory organization, and commodity professionals. These oversight activities are designed to protect customer funds, to prevent trading and sales practice abuses, and to ensure the financial integrity of regulated firms. The CFTC’s ongoing oversight activities include the following: financial and sales practice audits; rule enforcement reviews; trade practice investigations; review of margin, clearance and settlement rules; and activities ensuring that firms carrying customer funds are adequately capitalized and have properly segregated customer funds from firm funds.

EXCHANGE AUDIT TRAIL STANDARDS

The Commission has devoted considerable effort to encouraging compliance with the enhanced exchange audit trail standards that became effective in October 1995 for high volume exchanges. The enhanced audit trail standards, which were mandated by the Futures Trading Practices Act of 1992, require these exchanges to demonstrate that their trade records are unalterable, continuous, independently timed, and properly sequenced to the extent practicable. In late 1994 and early 1995, the Commission tested each high volume exchange’s audit trail system and provided recommendations for system improvements. The exchanges were informed that adoption of the recommendations would place them within a “safe harbor” for good

PART 1

1048

faith efforts to comply with the enhanced standard. Two of the four exchanges tested adopted all of the recommendations, and the Commission determined that they are in the safe harbor. In fiscal year 1996, the Commission staff re-tested the audit trail systems of the other two exchanges, the Chicago Mercantile Exchange (CME) and the CBT, to determine whether they were in compliance with the heightened standards.

On August 12, 1996, the Commission issued a report which addressed exchange compliance with the heightened audit trail standards. The report outlines further steps to be taken by the exchanges and the Commission to assure future compliance and to address pending exchange dual trading petitions. The Commission has been proceeding with the plan set forth in the report to address those petitions.

The Commission has recently re-tested the Comex Division of the New York Mercantile Exchange and is currently testing the New York Cotton Exchange (NYCE). NYCE recently qualified as a large-volume exchange subject to the heightened audit trail standards under the Act.

THE CLOSE OF CBT'S MARCH WHEAT FUTURES CONTRACT

On March 20, 1996, in the final few minutes of trading on the CBT March 1996 wheat futures contract, the price rose an unprecedented \$2.30 per bushel to \$7.50. Regulatory reviews of the March wheat expiration were conducted by CFTC and CBT staff, which reviewed records and conducted interviews to determine whether the CBT properly enforced its rules and whether any violations of the CEA may have occurred. On November 26 1996, the Commission made public a staff report which included a detailed analysis of the matter. Based on the report, the Commission instituted a review of the adequacy of six disciplinary actions initiated and settled by the CBT and made a number of recommendations to the CBT to improve its procedures which is still ongoing.

CHICAGO BOARD OF TRADE DELIVERY POINTS

On December 18, 1996, the Commission notified the CBT that, in the Commission's view, its corn and soybean contracts no longer met requirements under Section 5a(a)10 of the CEA of providing delivery terms which "tend to prevent or diminish price manipulation, market congestion, or the abnormal movement of such commodity in interstate commerce." This action was prompted by the failure of the CBT to respond to changes in the cash grain markets, including a number of warehouse closings at its primary delivery point in Chicago. During 1995 the delivery capacity in Chicago was reduced by about 50 percent as three of the six regular elevators at that location ceased normal operations. In late 1996 a fourth warehouse announced intentions to cease operation. Nevertheless, in October 1996, the CBT membership rejected proposals of CBT's Board to expand delivery capacity under the futures contracts. Problems in the expiration of CBT's 1996 grain futures contracts (other than March 1996) were avoided only as a result of intensive monitoring of the markets by the CFTC and the CBT.

Following the requirements of the CEA, the CBT had until March 4, 1997, to adopt and submit contract amendments to correct the deficiency. The CBT has formed a task force to formulate contract changes. This task force made recommendations to the Exchange's executive committee on March 3, 1997, and on March 4 those recommendations were approved by the entire Board for submission to CBT's membership. The CBT membership voted on those recommendations on April 15, 1997, and approved the changes by a 2-1 margin. In addition, CFTC published the highlights of the CBT's proposal in the Federal Register and has requested public comments on the proposal. CBT made a formal submission to CFTC on April 17, 1997, for approval.

The Commission's December 18, 1996 letter also requested the CBT to review the terms of its wheat contract and to report back to the Exchange by April 18 (120 days). We understand that this matter is also under study at the CBT.

INTERNATIONAL ACTIVITIES

The Commission continued its coordination and cooperation with foreign regulators during fiscal year 1996. Major international activities of the Commission included the following:

—Coordination and cooperation with foreign regulators concerning Sumitomo Corporation's copper trading.

Co-sponsorship of a conference with Japan's Ministry of International Trade and Industry (MITI) and the U.K. Securities and Investment Board (SIB) on November 25-26, 1996, concerning regulatory issues posed by commodity futures markets. Seventeen countries responsible for the supervision of the world's leading commodity fu-

PART 1

1049

tures markets issued the London Communiqué at the conclusion of the conference. The Communiqué sets out the proposal of the authorities to strengthen the supervision of these markets world-wide, particularly in the areas of the contract design, market surveillance including large trader reporting mechanisms, and information sharing. The CFTC is actively engaged in the work program the authorities agreed to undertake to accomplish that goal.

- Active participation in the International Organization of Securities Commissions' ("IOSCO") Technical Committee and its Working Parties.
- The conduct of the CFTC's sixth annual training seminar for foreign futures regulators, covering the operation of U.S. futures markets and the U.S. regulatory system governing futures trading. This seminar brought together 79 participants from 29 foreign nations.
- The adoption of a multilateral understanding, Declaration on Cooperation and Supervision of International Futures Exchanges and Clearing Organizations ("Declaration"), by eighteen international futures regulators as a result of a joint CFTC-SIB initiative.
- The execution of a Memorandum of Understanding with New Zealand on September 19, 1996, concerning consultation and mutual assistance in the exchange of information in connection with enforcement matters.
- Continued information sharing and cooperation with foreign authorities. In fiscal year 1996, the CFTC made over 50 requests for assistance to 38 foreign authorities. The CFTC also responded to over 55 requests for information from more than 25 foreign authorities.

REGULATORY COORDINATION AND REFORM

Regulatory coordination and reform remain an important part of the CFTC's agenda. The CFTC is a member of the President's Working Group on Financial Markets along with the Treasury Department, the SEC, and the Federal Reserve Board of Governors. The Working Group continues to meet regularly to coordinate regulatory policy. The CFTC also works closely with other agencies, including the U.S. Departments of Agriculture and Energy.

The Commission is committed to the elimination of unnecessary regulatory burdens and is currently reviewing its regulations to streamline them as appropriate in light of the Commission's mandate to protect the public interest in our futures and option markets. The new fast-track approval procedures adopted last week and described above are part of this effort.

PENDING LEGISLATION

Bills to amend the CEA have been introduced in Congress, S. 257 and H.R. 467. In testimony before the Senate Committee on Agriculture, Nutrition and Forestry on S. 257, the Commission presented its view that the bill would result in the pervasive deregulation of our futures and option markets and thus would pose grave dangers to the public interest. The changes included in the bill would radically alter the regulatory system that has allowed our futures exchanges to become the strongest and most respected in the world and would leave those who use and rely on the integrity of those markets exposed and unprotected. For these reasons, the Commission strongly opposes the provisions of the bill which would eliminate federal oversight and regulation of futures and option exchange trading.

The CFTC was created in 1975 because Congress recognized the need for an expert, independent agency to protect the important national interests that are served by futures and option markets and to ensure market integrity through oversight of the exchanges and the thousands of intermediaries who invest individual, pension and corporate funds in these markets. The price-discovery and risk-shifting functions of these markets, long utilized by agricultural producers and processors, are now essential to the economic well-being of many sectors of the U.S. economy. While the safety and integrity of the futures markets are as important as ever to agricultural processors, producers, and consumers, they are now equally important to financial institutions, multinational corporations, mutual fund advisors and participants in the cash markets for energy, metals and many other products. These bills would adversely affect the safety and integrity of our markets.

We do not yet know whether the outcome of the legislative process will result in any significant changes in the Commission's mandate. Any major changes in its legislative authority would likely take a period of time to implement. As to fiscal year 1998, the Commission believes the demands on its resources would actually be greater if the legislation were to pass since many rule changes and other Commission actions would be necessary to implement the more significant proposals in the draft legislation. Furthermore, a major shift in emphasis and resources from market

PART 1

1050

oversight and supervision of regulated persons to enforcement activities would likely be necessary.

The Commission recognizes the need to ensure that the CEA adapts to changes in the market place and thus continues to provide an effective level of regulation and public protection. We are committed to working with Congress to improve the Act through legislative amendments.

CONCLUSION

The CFTC is committed to building on the achievements of the last several years to fulfill its Congressional mandate and to keep pace with a complex, dynamic marketplace. To accomplish this goal and to make essential improvements to our enforcement, surveillance and oversight programs, the Commission requires the proposed increase in its fiscal year 1998 appropriation. This increase will enable the Commission to heighten its surveillance of major market centers and to ensure that its surveillance system upgrade stays on schedule. It will sustain the necessary level of oversight over the compliance programs of the exchanges and the NFA. Additional funding also will enable the Commission's enforcement program to respond more quickly to fraud, manipulation and other wrongdoing in the marketplace, to provide a greater level of customer protection and better to promote market integrity.

Thank you, Mr. Chairman. I would be happy to respond to any questions.

PROPOSED LEGISLATION TO DEREGULATE MARKETS

Senator COCHRAN. Ms. Born, the legislation that you mentioned being considered by the Senate Agriculture Committee now for reforms in the law authorizing the CFTC's regulatory powers, if enacted, you say would not have any effect on your budget needs for the fiscal year. Did I understand that correctly?

Ms. BORN. For fiscal year 1998, I believe that is correct. It would have a long-term impact on the Commission's operations. In the short term, we feel that the need for rule changes and alteration of the methods of policing these markets would require the same amount of appropriations.

In the long term, we would need to shift all of our activities or most of our activities from our current oversight and surveillance activities that are designed to deter and to detect manipulation and fraud before they occur, and have to shift our resources and emphasis to enforcement, since we would no longer have the ability to detect these activities early on and to deter them.

TRADING ACTIVITY

Senator COCHRAN. There has been, I am told, a good bit of shift and change at the Board of Trade in Chicago and at the Merc in terms of business going elsewhere or people trading bypassing these exchanges. What affect, if any, does that trend have on your budget needs?

Ms. BORN. Well, in fact last year, 1996, was the biggest year CBOT ever had. It had its highest trading volume and it had an increase in its profits of 26 percent. Overall last year, 1996, was the second largest trading volume for all of our exchanges put together.

We do not see any significant falloff in the trading volume or activity on these markets. Almost 500 million contracts were traded last year.

PART 1

1051

PROPOSAL TO ALTER DELIVERY SPECIFICATIONS FOR CORN AND SOYBEAN FUTURES CONTRACTS

Senator COCHRAN. The supplemental which we are considering now in the Senate, and the House as well, contains some language regarding the Chicago Board of Trade's proposal to alter the delivery provisions of its corn and soybean futures contracts which was put in on the House side, and we have language that was approved by our committee yesterday on this subject, too. I would like to have your comments about it just for clarification.

You have indicated to us that the House language would conflict with the Commission's statutory obligation to approve or initiate disapproval proceedings with respect to the Chicago Board of Trade's rule amendments within 180 days of their submission. Could you explain to us what the problem is and do we need to address that in legislation?

Ms. BORN. I do not think any legislative action is needed on this issue. Let me explain what the current situation is.

The Commission notified the Chicago Board of Trade in December 1996 that its corn and soybean contracts no longer met the provisions of the act with respect to delivery under section 5a(a)(10) of the act in that they did not tend to prevent or diminish the likelihood of manipulation or price distortion. This was because Chicago was a primary delivery point, and four out of the six remaining grain elevators in Chicago had closed down last year, leaving virtually no delivery capacity there.

That started a statutory procedure under section 5a(a)(10) that gave the Chicago Board of Trade 75 days to make a proposal to the Commission to amend the delivery provisions. They made that proposal on the 16th of April, and we currently have that out for public comment through the 15th or 16th of June.

The Commission's statutory obligation at this point is to determine whether the new proposal meets the delivery requirements of the act. If it does, we would then approve it. If it does not, we would have the statutory responsibility and authority to amend it or supplement it to impose appropriate delivery standards.

The House Appropriations Committee report language recommended that we delay action until a GAO study goes into effect. The problem that we have with that language is that, within 180 days of the submission to us by CBOT on April 16, if we have not acted to approve, disapprove, or amend, as is our statutory responsibility, CBOT's proposal might go into effect automatically and we might lose all statutory oversight power at that point.

We believe that the Appropriations Committee put that language in the report not realizing that the likely implications of the language was that the CBOT proposal would go into effect, because I think that the motivation for that language was a concern about the CBOT proposal.

Senator COCHRAN. That language is in the House report. The Senate yesterday included language in its report which reflects the fact that the Commission has solicited public comment on the Chicago Board of Trade's proposal and indicates that, after consideration of public comments and using appropriate criteria, the Commission should complete the process and make a decision.

PART 1

1052

So you would prefer, as I understand it then, the Senate report language? When we get to conference we will have an opportunity to discuss this and in our statement of managers we can express the sense of Congress on this subject. We should, since there are conflicting provisions now between the House and Senate reports.

Ms. BORN. I have not seen the specific language that you just referred to, but from your description it sounds as though it would be more consistent with our statutory obligations under the act and what we would prefer to do.

Senator COCHRAN. Let me read it so we are sure that the record is correct here on what our committee report says:

The committee is aware that the Commodity Futures Trading Commission has solicited public comment on the Chicago Board of Trade's proposal to amend its delivery specifications for corn and soybeans. The provisions of the Commission Exchange Act require futures delivery points that "will tend to prevent or diminish price manipulation, market congestion, or the abnormal movement of such commodity in interstate commerce." Giving due regard to public comments received and using the appropriate criteria, the Commission should complete the process and render a decision after taking into account the analysis available to it.

Ms. BORN. That seems completely acceptable and appropriate, Mr. Chairman.

Senator COCHRAN. Thank you very much.

Senator Bumpers.

STATEMENT OF SENATOR BUMPERS

Senator BUMPERS. Mr. Chairman, I must confess that this whole issue is immensely complex to me.

Senator COCHRAN. Yes, it is. It is enough to give us all a headache.

Senator BUMPERS. I visited Ms. Born and I visited with people on the other side of the issue, and I do not understand the Board of Trade's proposal on contract delivery proposal on corn and soybeans. I will do my very best to educate myself before I have to deal with it if I do have to deal with it.

But let me ask you this. Have you testified before the Senate Agriculture Committee on the bill? I guess it is on reauthorization, is it not?

Ms. BORN. It is not on reauthorization, Senator Bumpers. It is on amendments to the CEA.

Senator BUMPERS. Does it include corn and soybeans?

Ms. BORN. It does not.

Senator BUMPERS. That is not a part of it?

Ms. BORN. No; the Commission is reauthorized until the year 2000. I did testify on S. 257, which would amend the Commodity Exchange Act, in February before the Senate Agriculture Committee.

PROPOSED PROFESSIONAL MARKETS EXEMPTION

Senator BUMPERS. What is it that the so-called Harkin-something bill does? What does it do?

Ms. BORN. Well, it does a number of things. It is a very broad-reaching bill. The provision that most directly deals with exchange trading, as opposed to over-the-counter trading in derivatives, is called the professional markets exemption, which would exempt

PART 1

1053

from Federal oversight and regulation any futures exchange which chose to restrict trading on the exchange to business entities with \$1 million or more of net worth.

The exchanges have said that at least 90 percent of their current trading volume is on behalf of such eligible entities, and therefore with very simple rule changes they would be able to eliminate Federal oversight of those markets.

Under the Senate bill, the Commission would still have the ability to bring enforcement actions after the fact for fraud and manipulation. We would, however, lose all the requirements for record-keeping and reporting by the exchanges. There would be no standards for their contracts like these delivery provisions. There would be no audit trail requirements. There would be no standards for their rules or for their governance.

Also, if the commodity professionals we regulate, of which there are 64,000, chose to deal solely on the exempted exchanges, we would lose all oversight power over those people. They would no longer have to register. There would not be any fitness standards. There would not be any net capital requirements or other financial integrity standards.

So, in effect, we would lose the current ability we have to detect and prevent manipulation and fraud in these markets, although once manipulation and fraud, in fact, occurred we would be able to start an enforcement investigation and bring a suit against that. However, up until now, for the last 70 years the major thrust of futures and option regulation has been on prevention and detection of these abuses, rather than allowing the abuses to go ahead and occur, because of the enormous disruption to our economy that that might involve.

Senator BUMPERS. The Chicago exchanges say that they have grown 10 percent over the last several years and their competitors have grown 500 percent, and they attribute that to the fact that they have to comply with literally dozens or hundreds of onerous, unnecessary regulations of the CFTC. And they think it is time to eliminate a lot of that.

As you said, right now I assume any new trading that they devise, that they want to do, they have to get your approval on, do they not?

Ms. BORN. That is right, and we have a fast track approval where—

Senator BUMPERS. How fast?

Ms. BORN. Ten days for cash-settled contracts that are not agricultural. For agricultural contracts or for physical delivery contracts, like a copper contract that required physical delivery, we have a 45-day time period because we put that out for public comment so that the industry, the commercial interests that rely on these markets, the agriculture producers and processors, the copper industry, will have an opportunity to comment publicly about how this would impact on their marketplace.

Senator BUMPERS. How does Cargill and Archer Daniel and people like that feel about the Harkin bill? Do you know?

Ms. BORN. A number of the agricultural groups, including specifically Cargill, but a number of the agricultural trade organizations

PART 1

1054

as well, have come out and expressed grave concern about the professional markets exemption.

Senator BUMPERS. Thank you, Mr. Chairman.

CFTC ENFORCEMENT ACTIVITIES AND STAFFING

Senator COCHRAN. Thank you, Senator.

Ms. Born, we noticed that the budget request is \$5 million over the level of this current fiscal year. Your testimony indicates that \$4 million of that would be to allow the CFTC to sustain its current services level and \$1 million is requested to fund 20 additional staff-years. We have tried over the years to add funds as needed for enforcement activities and your testimony indicates that 75 percent of the program increase requested for 1998 will be dedicated to enforcement activities.

I am wondering whether the funds that we have previously been adding to the budget for enforcement activities have been used to add staff resources in the enforcement area over the last 3 years? And I am curious to know what new enhancements are proposed with the funds that you say will be needed this year, for this next fiscal year.

Ms. BORN. We have had about a 10-percent increase in our enforcement onboard staff between fiscal year 1995 and fiscal year 1996. We currently have about 157 people onboard in enforcement, and we are authorized to have 169 people. There are hiring processes under way to hire the other 12—that is, we are recruiting and interviewing people for those positions.

In terms of the future use of this additional funding, of the 20 people who would be hired 10 would be new enforcement personnel, one would be an additional person for the Office of General Counsel to assist the Commission in the additional adjudicatory proceedings that our beefing up of the enforcement activities has generated, and one would be for the Office of Proceedings, which is our adjudicatory process, staffing again required because of the increase in the enforcement activities of the Commission.

That means that 60 percent of the new staffing we are requesting is enforcement related. The funds relating to those 12 positions happen to represent 75 percent of the additional \$1 million in programmatic increase, because the enforcement-related people would be paid more highly than some of the other people we are hiring.

INCREASED EFFECTIVENESS OF CFTC'S ENFORCEMENT DIVISION

Senator COCHRAN. We notice that part of the reason for the additional funding is to continue the restructuring and effectiveness of the Enforcement Division. Has that been the result? Have you been able to draw a conclusion as to whether effectiveness has been increased as a result of these new expenditures?

Ms. BORN. In my view it has been very greatly increased. There has been a complete reorganization of our Enforcement Division. We have a new Director of Enforcement. He has been onboard for a year and a half now. We also have new heads of the enforcement activities in our three major regional offices, Chicago, New York, and Los Angeles.

There has been an enormous enhancement of the ability of the Enforcement Division to deal with extremely complex financial

PART 1

1055

fraud activities, which are a major part of our enforcement activities at this point. There has also been a great enhancement of the ability to have very quick strike force ability. A number of our cases are frauds where money is being siphoned offshore or otherwise secreted, and it is terribly important for our enforcement staff to be able to quickly investigate a matter, institute an injunctive proceeding in a Federal district court, and obtain an immediate temporary restraining order and then a preliminary injunction freezing the assets and freezing the availability of books and records and other documents.

OFFICE SPACE LEASING COSTS

Senator COCHRAN. One thing that stands out in the budget request is the increase for the Commission's office space leasing costs. Compared to this year's level, the next fiscal year will require \$1.592 million more to pay those costs. What is the reason for that?

Ms. BORN. Fiscal year 1998 will be the third year of our lease on our Washington space. We were required to move our offices 2 years ago into a new building and were very lucky to be able to negotiate leasehold improvement funds that could be applied against our rent for the first 2 years to the extent that we did not expend them in leasehold improvements.

Because of prudent management by my predecessors, a great deal of money was saved, and therefore we got substantial rebates against the first 2 years of the rent. Next year will be the first year that we will have to pay the full amount. We have run out of our leasehold improvement funds.

TECHNOLOGY INVESTMENTS

Senator COCHRAN. Technology investments are another item you discuss in the submitted testimony. There are increases reported for enhancements of the system. What are these enhancements and are they necessary to maintain current service levels, or are you trying to keep pace with the growth in the markets? For what reason are these investments necessary?

Ms. BORN. The amount that is an increase is an amount that is just to continue our ordinary activities. It is for computer processing and programming services that we ordinarily need, but were able to obligate in fiscal year 1996, and therefore they appear as an increase for fiscal year 1998, but are in fact a continuation of our ordinary level of costs.

Let me just ask Madge Bolinger if that is correct.

Ms. BOLINGER. That is correct.

Ms. BORN. So while we have expended or will expend approximately that same amount this year for our ongoing computer programming and processing services, we were able to obligate that money in fiscal year 1996 and therefore did not have to use this year's funds to do that.

RISK MANAGEMENT EDUCATION

Senator COCHRAN. The Department of Agriculture, according to the Secretary of Agriculture, has begun a new effort to teach farm-

PART 1

1056

ers how to use new types of crop insurance and agricultural futures and options to help manage risks. Is the Commission involved in this in any way, and, if so, could you tell us what part you are playing in this new effort?

Ms. BORN. Certainly we have been actively involved with the Agriculture Department in this effort. Section 192 of the FAIR Act called on the Secretary of Agriculture to provide risk management education opportunities to agricultural producers because of their increasing needs for risk management as Government price supports diminish. That same provision states that the CFTC would cooperate with the Secretary of Agriculture in his design and implementation of this program.

That is now well under way under the Agriculture Department's leadership. We are part of a group that the Agriculture Department has put together to design and implement an educational program, and there is going to be a summit meeting with various groups who we hope will play an active role in the teaching process in September.

Commissioner Joseph Dial of our office has been appointed by me to be the liaison to that group and is our point person on this effort. We feel it is very important.

COMPETITIVENESS OF U.S. EXCHANGES

Senator COCHRAN. There is, I am told, concern among the exchanges that, in spite of your statements about the growth in the markets over the last decade and the volume of trading that occurred on the exchanges in this last year, that they are losing ground to foreign and over-the-counter markets, and that some of this may be due to the burden of the regulatory restraints that are imposed on the exchanges by the CFTC.

What is your reaction to this? Is overregulation a reason that U.S. exchanges claim they are losing market share to overseas exchanges and are those claims correct?

Ms. BORN. We do not believe so. At Congress' request in the 1992 amendments to our act, our staff conducted a study in 1994 of competitiveness between U.S. and foreign exchanges, which concluded that regulatory differences did not put our exchanges at a competitive disadvantage.

That study was recently updated in a summary way by our staff, and I would be happy to provide those reports to members of this subcommittee.

But let me say beyond that that the Commission is committed to streamlining our regulation to the extent possible consistent with protecting the public interest. The Commission has only been up to full strength, all five members, since last September, after several years of not having a full complement. Currently all five Commissioners are very committed to reducing unnecessary regulatory burdens. We have taken a number of steps already in amending our rules that we think streamline the regulation and modernize it, and are currently working with the exchanges to find other areas in which the regulatory burdens can be reduced.

We clearly feel that healthy, competitive markets in the United States are very much in the public interest and very important.

PART 1

1057

PROPOSED PROMARKET EXEMPTION

Senator COCHRAN. My concluding question is on the subject of the promarket exemption in the reform legislation, or the deregulation proposal, that is pending here in the Senate. You have expressed opposition to this provision, which would exempt professional markets from regulation. Would you tell us why you think that exemption should not be approved by the Congress? Would it really impair the integrity and security of the futures markets?

Ms. BORN. We believe that it would. It would eliminate all the Federal standards under which these markets have been operating since the 1920's. Because more than 90 percent of the current volume of trading is represented by the eligible entities for a professional market, we believe that the exchanges would adopt professional markets in a broad-based way and suggest that small traders enter the markets only through commodity pools and mutual funds and otherwise.

So we think that the provisions would have very broad effects. They would eliminate such things as the requirements of competitive trading, open pricing, large trader reports, which the Commission uses to determine who the large players in the market are and whether their activities in the markets are explainable by normal economic forces or whether a squeeze is under way by large institutions.

We would no longer have for commodity professionals who trade on these markets any standards, such as the fitness standards which say that if you are convicted of a felony you are statutorily disqualified from trading on the markets. There would be no net capital requirements for commodity professionals who have client money. There would be no requirement of customer funds segregation.

We do not have insurance for customer funds in this industry, unlike the securities industry, and therefore segregating those funds is necessary to protect customers against broker insolvency.

We would no longer have the tools to prevent or detect fraud on the floor of the exchanges, like the audit trail provisions for example.

We think this would be a very pervasive deregulation. As I said, our only powers that would remain would be enforcement powers after fraud or manipulation occurred, and the Senate bill, unlike the House bill, also allows us to keep emergency powers. The problem is we would be unable to detect an emergency in its incipency, and therefore we do not think those emergency powers would give us the powers we need.

Senator COCHRAN. Senator Bumpers, do you have any other questions or comments?

COMPETITIVENESS OF U.S. EXCHANGES

Senator BUMPERS. Mr. Chairman, not to belabor the point and take too much time, but to pursue the very line of questioning you were pursuing.

Ms. Born, if the Chicago Board of Trade, for example, is correct in their assertion that unregulated competition is driving them out of business and that they have, in fact, only grown 10 percent

PART 1

1058

while their competitors have grown 500 percent, would that not be an indication that something needs to be addressed?

Ms. BORN. I would be concerned if that were true. In fact, as I said, they have grown 130 percent over the last 10 years, more than doubled.

Senator BUMPERS. 130 percent of what? Volume, trades, or what?

Ms. BORN. Volume of trades. Over the last 10 years nationwide our exchanges have gone up to 500 million contracts. CBOT had its biggest year ever last year, and its profits were up by 26 percent in 1996, to \$19 million.

Senator BUMPERS. Do they file all that with you? Do they file their annual financial statement with you?

Ms. BORN. We receive a financial statement, yes.

Senator BUMPERS. And what was their profit? What was the increase in their profit last year?

Ms. BORN. Twenty-six percent. And they also built a \$183 million new trading floor last year, that just opened this spring.

Senator BUMPERS. Well, they argue two things. No. 1, it is not just their domestic competitors. They say this is now a global business and that some exchanges have moved to London because London, because of the time zones, can do more business in more time zones than they can do here, and that is how competitive. There is not anything unusual about that, I guess. Maybe other companies do that, too. But in any event, I did not understand it either, Ms. Born.

Ms. BORN. I do not understand. That is the first time I have heard that particular argument.

Senator BUMPERS. You have heard that they are moving people to London?

Ms. BORN. I know the London markets have for a long time been very dynamic markets. There is a very large market there called LIFFE, the London International Financial Futures Exchange. And there is also a very old market called the London Metal Exchange. They are two of the largest in the world.

Where much of the growth has been internationally has been in a number of other countries, a lot of emerging countries included, that in the past decade have recognized how valuable to the U.S. economy our futures exchanges have been in providing hedging against interest rate risk and stock index risk. A number of European, South American, and Asian countries have in the last decade set up futures exchanges that are focused on their domestic underlying cash markets. That is, the German exchange, for example, has a contract on the interest rates of the German Government securities, their German bond. They also have, I think, a contract on the German stock market stock index.

Our staff study found that the vast majority of these foreign contracts do not compete on a head-to-head basis with U.S. contracts because they are focused on the domestic markets of the foreign country.

All these markets are regulated by their domestic governments, and indeed all the major markets in the world have more government oversight and regulation than would be possible under the professional markets exemption.

PART 1

1059

For more than a decade the Commission has been working with these foreign regulators to raise the level of foreign regulation. We have had some very bad scandals abroad because foreign regulators have lacked some of the basic tools we have.

For example, the Sumitomo matter last year in London occurred because the London governmental authorities did not have large trader reporting and therefore could not detect Sumitomo's large position. I think it likely that Sumitomo went from NYMEX, our market, to the London Metal Exchange in order that it could trade in the manner in which it was in an undetected way. Since the Sumitomo matter, the London regulators have required large trader reporting and made a number of other significant improvements.

We hold annual international regulators seminars for foreign regulators because the U.S. regulations and statute are the model for the world. Last fall we had our sixth annual international regulators meeting, where 80 participants from 30 foreign countries came to Chicago for a week to be trained by CFTC staff on our regulatory regime. And we are working with the principal regulators in the 17 countries with the largest exchanges to adopt international best practice standards for how futures markets should be regulated, to make sure that all these markets are safely regulated.

We cannot really do our job here if there are systemic risks coming from foreign markets.

Senator BUMPERS. Thank you, Mr. Chairman.

ROLE OF THE CFTC

Senator COCHRAN. Well, I think we have been educated a little bit this morning, or a lot, in terms of the role of the CFTC and the issues that are being considered by our legislative committees. I am on the legislative committee and I had the opportunity to attend some hearings on this subject and to listen to the arguments on both sides of some of these issues, and it is a very complex and highly technical set of facts that we are all having to work with and trying to understand.

It may be over all of our heads, to be real honest.

Ms. BORN. It is very complex.

Senator COCHRAN. But we are working very hard to come to grips with all of this and make correct decisions, well-informed decisions. So we appreciate very much your patience and your willingness to discuss these things with our committee.

Senator BUMPERS. When I was Governor I was down at the penitentiary one time and I said: You know, it seems to me that these guys need a little more opportunity to do things to occupy their minds. He said: They occupy their minds. I said: How do they do it? And he said: They gamble.

I said: What do they gamble on? He says—he looked up at a telephone line along the highway and he says: They will stand out in this field and bet which one of those blackbirds will fly first on that. I said: That sounds like the exchange markets. [Laughter.]

Senator COCHRAN. Thank you very much for being here and for your cooperation with our subcommittee. We appreciate it very much.

PART 1

1060

Ms. BORN. Thank you very much, Mr. Chairman, and I would be very pleased to provide any information on any of these subjects at any time to you or other members of the subcommittee.

SUBMITTED QUESTIONS

Senator COCHRAN. Thank you. We may very well submit some questions on some of the specifics in the budget that we did not touch on this morning, and we would appreciate your responding to those questions in a timely way.

Ms. BORN. We would be delighted to do so.

Senator COCHRAN. Thank you.

Ms. BORN. Thank you very much.

[The following questions were not asked at the hearing, but were submitted to the agency for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

MARKET SURVEILLANCE SYSTEM AND TECHNOLOGY INVESTMENTS

Question. The testimony submitted for the record indicates that additional funding is proposed in the fiscal year 1998 budget to allow the Commission to continue efforts started in fiscal year 1996 to redesign and implement an Integrated Market Surveillance System. What enhancements of this system are included in the fiscal year 1998 budget request? Is this amount included in the increase to maintain current service levels? What other technology investments are included in the fiscal year 1998 request?

Answer. No enhancements are budgeted for this system in fiscal year 1998, and there is no amount included in our current services level or program level for enhancement to the integrated market surveillance system. The "additional funding" statement in the testimony refers to three additional FTE's for the Market Surveillance program, a portion of whom will be used to analyze the additional large trader data that the redesigned integrated market surveillance system will be handling.

TECHNOLOGY INVESTMENTS

Question. What technology investment has the Commission made in each of the last five years to keep pace with the growth in the markets and what future investments are planned?

Answer. In fiscal year 1992, we established a separate operating environment on our existing mainframe computer to begin testing for conversion to a new operating system. The new operating system was needed to improve the efficiency of the mainframe and thereby to accommodate the increased processing capacity resulting from the growth in the markets. We also upgraded our local area network communications infrastructure in Chicago and New York to keep pace with staff utilization of computers and to provide greater stability and better performance. We also expanded the scope of our correspondence tracking system to allow more staff members to keep pace with a growing level of correspondence. In addition, the Commission installed an imaging system for use in expediting the processing, distribution and use of a variety of printed information including storage and retrieval of market-related news events.

In fiscal year 1993, we developed systems to simplify several difficult functions. One system, used in conjunction with the imaging system, resulted in accelerating the flow of information related to the Commission's legal opinions and interpretations and decisions of administrative law judges in futures cases. Another system was designed and implemented for tracking the Commission's review of exchange rule change proposals, thereby allowing quicker response to exchange and public inquiries regarding outstanding reviews. We also developed a system to support the investigations of trade practice abuses and other illegal market activities. As we did in New York and Chicago the year before, we upgraded our local area network communications infrastructure in Los Angeles to provide greater stability and better performance. We also began operation of the new mainframe operating system that was tested on our existing mainframe in fiscal year 1992.

In fiscal year 1994, we undertook several modernization steps to accommodate market growth and to allow the Commission to keep pace with the evolving migration to network-based applications. Specifically, capacity of communications links

PART 1

1061

between CFTC locations was upgraded, allowing Commission staff interactively to access and manipulate shared information, thereby allowing intra-office collaboration. We upgraded the Commission's network servers and replaced older personal computers to accommodate the higher-performance computing requirements. The Commission moved toward adopting a client-server based software development and application platform standard which offers the opportunity for creation and maintenance of highly effective applications for shared use by all Commission staff regardless of physical location. We began design of a system for managing and tracking the reparations process—the first application of the client-server architecture. We also developed a new version of the Exchange Database system which processed additional data elements, provided enhanced search and retrieval capabilities and provided new reports to assist in detecting market aberrations. The Commission also conducted reviews of several emerging automated systems being developed by or for the exchanges including the New York Mercantile Exchange's ACCESS system and the joint Chicago Board of Trade and the Chicago Mercantile Exchange AUDIT system.

In fiscal year 1995, as part of our modernization program, we continued with the routine replacement of the oldest personal computers allowing the Commission more effectively to utilize sophisticated software. We also upgraded the communications interface between our mainframe computer and our personal computers, thereby facilitating the direct manipulation and importing of mainframe data by staff with their personal computers. We also upgraded the local area network communications infrastructure of our headquarters office in Washington. We implemented the Reparations Case Tracking System designed in fiscal year 1994. We developed enhancements to the existing (old) market surveillance system to allow for easier analysis of extremely complex trading data. We also prepared a Computerized Trading Report which analyzed the Chicago Mercantile Exchange's GLOBEX trading system and the New York Mercantile Exchange's ACCESS system. The report focused on the potential for enhancing access by market participants, improving the Commission's ability to audit the markets, and reducing the opportunity for trading abuses.

In fiscal year 1996, the Commission awarded a contract and began work on a multi-year effort for redevelopment of mission-critical surveillance systems. The re-engineering and relocation of these systems from the mainframe to a client/server environment offered a number of advantages. Financially, the Commission would avoid an inevitable upgrade of our mainframe computing facilities which would be necessary to accommodate a six-fold increase in data storage and processing requirements. Furthermore, since the surveillance system was responsible for about 80 percent of our mainframe utilization, this project was instrumental to our larger cost-saving goal of closing our mainframe data center in compliance with OMB Circular 96-02, Consolidation of Data Centers, by our deadline of June 2000. In fiscal year 1996, the Commission also established a website. The website includes background information about the Commission, press releases, speeches, and reports such as the Commitments of Traders and Bank Participants in Futures and Option Markets, Commission Orders and Advisories. The website also includes information about public programs such as Reparations. The Reparations program provides a method for the public to seek compensation for money lost to illegal futures schemes. The Commission also continued with its routine replacement of the oldest personal computers to the more efficient and serviceable industry standard models.

Regarding future investments, the Commission intends to continue with our modernization program in a number of areas. Each year we will replace a number of personal computers from the oldest stock with computers representing current technology. Likewise, we will maintain the required level of performance of network servers to service these higher-performance personal computers and our increased use of client/server applications instead of mainframe applications. Accordingly, we will use network servers with large amounts of magnetic storage, thereby eliminating our reliance on magnetic tape for storage of massive amounts of data. Within the next two years we plan to select and install new operating systems on all personal computers and network servers enabling a web-browser-like interface, thereby improving the ease with which our staff will be able to access and manipulate the increasing volume of information. In combination with our evolving Internet and the ever-increasing expansion in global use of the Internet, staff will be able to access all relevant information through a single interface. In addition, we will adopt the use of higher speed communications in both our local and wide area networks. We also plan a low-cost upgrade of communications interface cards with our servers and other key equipment to address the additional capacity required as we migrate our mainframe applications to the client/server environment and continue to automate other office procedures. With regard to our wide area network, we plan to increase

PART 1

1062

our use of electronic receipt and transmission of information in place of magnetic tapes, diskettes and paper.

While these technology infrastructure enhancements are made, work will continue on the development and phased implementation of the Commission's new surveillance system. The new system will provide for the collection and integration of daily options with futures data to permit more complex analyses of activity in our markets. This will greatly enhance our ability to detect and deter market manipulation. Additionally, migration of systems from the mainframe environment to the Commission's client/server architecture will continue until all systems are operational in the client/server architecture and the mainframe data center will cease operation.

All new systems are being developed for operation in the new architecture. It is anticipated that this action will be completed by June, 2000.

INTERNET, TECHNOLOGY AND REGULATORY CHALLENGES

Question. Chairperson Born, you indicate in your prepared testimony that technology presents increasing regulatory challenges to the CFTC, including the need to police futures and option trading advice and sales offered illegally via the Internet. What is the CFTC doing to meet these new regulatory challenges?

Answer. The CFTC is meeting the challenges posed by new technology in various ways. First, the Division of Enforcement established an Internet monitoring and surveillance program in fiscal year 1996. Under the program, Enforcement staff monitors futures related "web sites" and "homepages" on the Worldwide Web, as well as messages posted on Internet bulletin boards. Staff also monitors various news groups and chat rooms relating to commodity futures and visited by Internet users. This monitoring of the Internet has generated enforcement inquiries concerning issues such as possible registration violations, possible misrepresentations of the success of trading programs and the offer of potentially illegal off-exchange products.

To date, the monitoring program has generated dozens of referrals for Enforcement staff and has resulted in the filing of a number of enforcement cases. For example, in September 1996, the Commission filed and simultaneously settled two cases resulting from this surveillance. In both cases, the Commission issued orders pursuant to which the respondents agreed to stop providing advisory services to Internet subscribers until they register as CTA's and comply with applicable regulatory requirements. *In re Brown*, CFTC Docket No. 96-8 and *In re Marks*, CFTC Docket No. 96-9. Enforcement staff was able to move quickly against Brown and Marks; both had agreed to enter into consent orders with the Commission within weeks of the time they first engaged in activities on the Internet. As a result of early detection, Brown had not successfully solicited any customers at the time his page was withdrawn. Marks agreed to refund all money received from subscribers and to transmit an electronic mail message over the Internet to all former subscribers notifying them of the action.

Second, the Commission is using the Internet both to disseminate and to gather information. Enforcement's homepage provides a brief summary of the types of abuses commonly investigated and prosecuted by the CFTC, provides descriptions of recently filed cases and encourages the public to report suspected abuses by providing an electronic questionnaire that can be filled out by visitors to the website. Enforcement has also used the Internet to obtain information from the public regarding particular matters. An example is the case of *CFTC v. Chancey*, Civ. No. 7:96-61 (M.D. Ga. filed July 1, 1996), an injunctive action against Donald Chancey and a firm controlled by him alleging fraud and registration violations in connection with the activities of an unregistered CPO. Enforcement is using its homepage to solicit information concerning the whereabouts of Chancey, who disappeared before the Commission filed its action against him. The Division has also posted on its homepage a picture of the defendant, as well as notices publicizing the court-sanctioned auction of Chancey's property.

ENFORCEMENT FUNDING

Question. Please tell us what additional funding and staff resources have been allocated to the Commission's enforcement efforts in each of the last three fiscal years, what enhancements are proposed for fiscal year 1998 and what future resources, funding and staff years, will be required to bring these efforts up to the level you believe is required to enable the Commission to effectively supervise the futures and option markets and to enforce the laws against fraud and manipulation in those markets.

Answer. In fiscal year 1995, the Commission obligated \$17.9 million and used 198 FTE's, and in fiscal year 1996, the Commission obligated \$19.0 million and used 202

PART 1

1063

FTE's for enforcement related efforts. In fiscal year 1997, the Commission allocated \$21.9 million and 225 FTE's for enforcement related efforts.

It is difficult to project with any great precision what future resources the Commission will require in order effectively to supervise the futures and option markets and to enforce the anti-fraud and anti-manipulation laws applicable to those markets; many of the factors that dictate the Commission's specific future use of resources are beyond its control. For example, factors such as market events or the development of new financial products can require a quick response by the Commission, which, in turn, can require the reallocation of resources. However, the passage of proposed legislation reducing the Commission's regulatory tools to prevent and to detect fraud and manipulation would require substantial additional resources for enforcement activities. At the core of the Commission's supervisory efforts is a strong and fully staffed Division of Enforcement which enables both quick detection of wrongdoing and timely prosecution of administrative and injunctive actions when necessary. The Commission remains dedicated to using its resources as efficiently as possible to ensure that its enforcement efforts keep pace with the demands placed on it by the markets.

PROGRAM AND STAFFING INCREASES OTHER THAN ENFORCEMENT

Question. In addition to the Commission's enforcement activities, please indicate what other program and related staffing increases are proposed in the fiscal year 1998 request and the importance of the increased resources requested for each of these activities.

Answer. The Commission is requesting a net program increase of \$263,000 for all other programs. This net increase covers the compensation cost of three FTE's in the Contract Markets program, two FTE's in the Audit and Review program, and three FTE's in the Market Surveillance program. The three FTE's requested for the Contract Markets program will allow the Commission to keep pace with workload stemming from the Futures Trading Practices Act of 1992 as well as allow the Commission responsibly to respond to innovation in the marketplace. The two FTE's requested for the Audit and Review program will allow the Commission effectively to continue its oversight of the compliance programs of the self regulatory organizations and to conduct selected audits and examinations of registrants. The three FTE's requested for the Market Surveillance program will enhance the surveillance of exchange markets by developing additional software for complex analyses used for special reports. The increases will also enable the program to analyze a twofold increase in the number of large trader reports received, resulting from the collection of option large trader reports, as well as facilitate the change from a mainframe to a client-server environment for the surveillance system. The increase will also allow the surveillance staff to develop appropriate surveillance procedures to deal with intermarket analysis.

CURRENT SERVICES

Question. I understand that of the \$4 million increase requested to enable the Commission to sustain its current services level, 42 percent is for mandatory pay increases, 40 percent is for leased office space, and the remaining 18 percent is for systems analysis and other costs. (a) What mandatory pay increases does the fiscal year 1998 budget include? (b) Please provide a breakdown of the systems analysis and other costs required for the Commission to maintain current services in fiscal year 1998.

Answer. Mandatory pay increases include an anticipated cola/locality increase effective in January 1998, which is estimated to be on average approximately 3.1 percent, and the annualization of the January 1997 cola/locality pay increase which averaged 3.3 percent. Also included are costs for within-grade increases for fiscal year 1998 and the annualization of fiscal year 1997 within-grade increases. Other mandatory pay increases include increased costs in the agency contribution for personnel benefits. The total cost of all mandatory pay increases for fiscal year 1998 is \$1,678,000.

The \$659,000 requested for systems analysis is comprised of \$534,000 for applications programming support and \$125,000 for systems programming support. Other costs required for the Commission to maintain current services include \$1,592,000 for rental of office space for headquarters and regional offices and a net increase of \$60,000 for all other object classes.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

FOOD AND DRUG ADMINISTRATION

STATEMENT OF MICHAEL A. FRIEDMAN, M.D., LEAD DEPUTY COMMISSIONER

ACCOMPANIED BY:

ROBERT J. BYRD, DEPUTY COMMISSIONER, MANAGEMENT AND SYSTEMS

WILLIAM B. SCHULTZ, DEPUTY COMMISSIONER, POLICY

DENNIS P. WILLIAMS, DEPUTY ASSISTANT SECRETARY, BUDGET, DEPARTMENT OF HEALTH AND HUMAN SERVICES

MARY K. PENDERGAST, DEPUTY COMMISSIONER/SENIOR ADVISOR TO THE COMMISSIONER

INTRODUCTION OF WITNESSES

Senator COCHRAN. Our next subject is the budget of the Food and Drug Administration. We are pleased to welcome to our subcommittee Dr. Michael Friedman, who is the Lead Deputy Commissioner of the Food and Drug Administration; along with Robert J. Byrd, Deputy Commissioner, Management and Systems; William B. Schultz, Deputy Commissioner for Policy; and Dennis P. Williams, Deputy Assistant Secretary for Budget of the Department of Health and Human Services.

We know that you have others with you and if you would like to introduce any of them, please feel free to do so.

We will ask Dr. Friedman to make whatever comments or remarks he thinks might be helpful to our committee's understanding of the budget request. We do have your full statement and it will be printed in the record in full.

Dr. Friedman, welcome. You may proceed.

DR. FRIEDMAN'S OPENING REMARKS

Dr. FRIEDMAN. Thank you very much, Mr. Chairman. We do appreciate this chance to spend some time providing you with information this morning.

You have introduced and kindly allowed to accompany me, my colleagues. There are, as you pointed out, other agency key staff who will be available to answer questions after my opening remarks.

Sir, as you well recognize, the mission of our agency is to promote and to protect the public health of Americans, and today I serve as a spokesman for an agency deeply committed to ensuring that our citizens have confidence in the quality of their food, the medicines, the devices that are crucial to their health care, and the tens of thousands of other FDA-regulated products which we use daily.

PART 1

1066

We recognize this is an enormous responsibility. My written statement describes in far greater detail our performance, a performance that demonstrates a capacity for self-critical evaluation and a pragmatic striving for improvement. Our performance also reflects a commitment to our mission, our responsiveness to the public and to Congress, and our stewardship of every tax dollar that is entrusted to us.

In the interest of conciseness, I would like to just briefly overview some aspects of our activities over the past year and to focus on three top priority requests which we have highlighted in our budget and which we are prepared to discuss more fully: The first is our food safety initiative to counter the threat of foodborne illnesses; the second, a sensible regulatory program to protect our youth from the diseases caused by the use of tobacco products; and third, reauthorization of two terribly important existing major user fee programs, the Prescription Drug User Fee Act [PDUFA] and the Mammography Quality Standards Act, both of which are set to expire in October 1997.

There are of course a number of difficult budget issues to be addressed in this environment of deficit reduction. We recognize this. We want to work with you and others to help resolve these issues.

Now, while time does not permit me to fully or properly convey the achievements of the various parts of our agency, I would like to highlight if I may some achievements from each of our centers, to set the framework for what sorts of successes we have had this past year which will justify and support our request for financial support for those activities this year.

Let me begin with the Prescription Drug User Fee Act. In 1992 this was designed by the appropriations and authorizing committees of both the House and the Senate, in conjunction with representatives of the drug industry and FDA, as an experiment. In this experiment, industry supplied additional resources to FDA in the form of user fees, which would be used specifically to improve application review for new drug and biologic products for humans.

Four years later, we judge this to be nearly a universal success. Patients get new drugs sooner, with better quality and length of life. Companies are able to market their products sooner. And we have gained the resources necessary to better perform our job.

The first chart demonstrates that since the initiation of this program we have consistently met and most often exceeded PDUFA's demanding and aggressive annual performance goals, and last year's were the best results so far. For example, drugs called new molecular entities are widely regarded as potential breakthrough products. The number of these approvals serves as an indicator of progress in medicine, and in this sense last year was outstanding.

PART 1

1067

PRESCRIPTION DRUG USER FEE ACT		
On-Time Review Performance—Fiscal Year 1995 Submissions		
	Percent—	
	Goal	Actual
Original NDA's/PLA's/ELA's	70	95
Efficacy supplements	70	93
Manufacturing supplements	70	89
Resubmissions	70	96

Our Center for Drug Evaluation and Research approved 53 NME's. Last year's median time to approval was 14.3 months. Basically what happened was we approved twice the number of products in one-half the time, a really outstanding achievement for this center.

[CLERK'S NOTE.—The information appears as chart No. 1 accompanying Dr. Friedman's prepared statement.]

In the first year of PDUFA, we approved 70 drugs overall in a median time of about 24.1 months. Last year the agency approved 131 new drugs, including the NME's, in a median time of 15.4 months—a far larger number of products in a shorter period of time.

Another outstanding achievement last year was the approval by our Drug Center of 118 efficacy supplements. These are very important reviews and approvals. This was an unprecedentedly large number.

I fear that these will be seen as sterile statistics and they should not be viewed in that regard. These are issues of enormous personal importance to family members, to our friends, to everyone who needs new treatments.

This record of achievement can only be maintained with adequate resources and consequently reauthorization of what we think is a spectacularly successful user fee program is a top priority for us.

However, lest you think this sort of performance is an isolated exception, let me just briefly share with you representative data from some of our other centers. Our biologic center had a very, very productive year, approving some very important new products, including vaccines, blood products, diagnostic products, and therapeutic products.

If one looks at our Device Center, the number of premarket approvals went up dramatically. As you can see, between 1993 and 1996 the increase is really substantial.

[CLERK'S NOTE.—The information appears as chart No. 5 accompanying Dr. Friedman's prepared statement.]

That is a small but important part of our Center for Devices. A much larger component of the activity of the Center for Devices are the so-called 510[k] products. Here you can see that our timeliness in dealing with these products has improved dramatically. Now, in excess of 90 percent of these products are reviewed within a statutory review cycle.

PART 1

1068

This work represents roughly 98 percent of all the activities of the Center for Devices.

[CLERK'S NOTE.—The information appears as chart No. 6 accompanying Dr. Friedman's prepared statement.]

A topic of importance to this committee is the entire reengineering process that is taking place in our Center for Veterinary Medicine. With last year's legislation, working very closely with Congress, working very closely with the involved industries, a major reinvention effort has been initiated so that we review these products in a more timely, more complete way, and we think in a more efficient way. This is a very important experiment that we are very committed to seeing succeed.

[CLERK'S NOTE.—The information appears as chart No. 8 accompanying Dr. Friedman's prepared statement.]

Now, Mr. Chairman, I describe these highlights of last year's performance not as an exercise in self-congratulation, but rather I want to make the case, based I hope on what will be convincing evidence, that with your continued support, with a sufficient budget, and with our determination to improve ourselves, we are prepared to meet the public health challenges ahead.

One of the most important and significant public health challenges ahead for us is to protect the public against foodborne illness by implementing the Presidential food safety initiative. Americans rightfully expect their food to be wholesome and safe and, with rare exception, it is. We do, however, know that problems exist.

Millions of foodborne illnesses occur each year and perhaps as many as 9,000 Americans die as a result. The total estimated costs involved may be \$5 billion, and these costs both in terms of lives and economic consequences are unacceptable.

FOOD SAFETY INITIATIVE

PROBLEM: INCREASED INCIDENCE OF FOODBORNE ILLNESS, PARTICULARLY OF MICROBIAL ORIGIN

- Estimated 6.5 to 33 million illnesses and up to 9,000 deaths annually
- Estimated total costs of foodborne illness are \$5.6 billion
- Food product recalls for life threatening bacteria (Class I) increased from 79 in 1988 to 378 in 1995
- Microorganisms becoming resistant to traditional control measures and developing pathogenic characteristics
- More retail establishments are processing foods on-site
- Increase in imported foods
- Vulnerable populations are growing in size (e.g., the elderly, immuno-compromised)

When an outbreak of foodborne illness is recognized, we act quickly and vigorously. We act in cooperation with other Federal—such as USDA, CDC, NIH, and EPA—State, and local public health authorities, and with members of the industry. We need to recognize in a timely way the problem and then to have the scientific tools to ascertain the cause of the problem and to initiate the means to stop the problem from spreading.

Last year, for example, thanks to such teamwork we were able to limit the public's exposure to apple juice contaminated with an

PART 1

1069

E. coli 0157–H7. The manufacturer promptly recalled the unsold product, a national warning was issued, and many consumers did not drink it. Even so, 66 North Americans were made ill and, sadly, one little girl died of complications of this foodborne illness.

A more recent example has been the hepatitis A outbreak associated with frozen strawberries, and this is another example of how Federal agencies working together can cooperate in a more effective way. Both USDA and the Food and Drug Administration were notified in March by the State of Michigan of a possible link between hepatitis A and frozen strawberries from a processor in California. We began working in cooperation with the State of California Health Department and we inspected the processor's facility, conducted a full inspection, and began an investigation of the product's distribution.

CDC was integrally involved in working up the epidemiology of this outbreak. Working together, we identified that 13 specific lots were of concern. A decision was reached to administer gamma globulin to schoolchildren who had consumed the strawberries within 14 days from those lots, and we proceeded to recall the product with the cooperation of those industrial processors.

So far during the course of the outbreak investigation, the source of the contamination has not yet been determined. Contamination could have occurred anywhere from harvest to consumption. Despite the complexity of this situation, cooperation among FDA, CDC, and USDA, State and local authorities helped greatly to contain the outbreak.

It may not be possible to identify the specific cause of the outbreak of hepatitis A in these strawberries. To date we are pleased that there are no confirmed cases of hepatitis A occurring outside of Michigan associated with the consumption of these particular berries.

These outbreaks underline for all of us the need for a strengthened interagency cooperation in surveillance, inspection, consumer and foodworker, from field to retail education, risk assessment, and the supporting research, as we request in our budget.

FOOD SAFETY INITIATIVE

- Surveillance—Enhance the early warning system
- Inspections
- Risk Assessment
- Research
- Education
- Coordination—USDA, CDC, EPA, NIH and State/local officials

Now, sir, another major task we face in the coming year is to begin implementing our tobacco rule, which is designed to better protect our most precious resource, the youth of the country, against the devastating effects of tobacco. The President announced the rule last August and, as the members of the committee are aware, last Friday the U.S. District Court in North Carolina upheld the agency's jurisdiction to regulate cigarettes and smokeless tobacco as combination drug-device products, although the court limited the agency's authority to regulate advertising.

PART 1

1070

While both sides will appeal aspects of the ruling, the court has permitted the agency to continue to implement the requirement that retailers not sell to persons under the age of 18.

This regulation we believe is critical to protection of the public health because every year smoking causes the premature death of more than 400,000 Americans, a number of people which is greater than those who die each year from AIDS, from alcohol, car accidents, murders, suicides, illegal drugs, and fires combined.

The agency's rule is premised on the fact that most tobacco users begin use during childhood and that the most effective public health strategy is to prevent children from starting to use tobacco products. In fact, at present 3 million American youngsters use tobacco products. An additional 3,000 children and young people start smoking every day. We know that one-third of these individuals will die prematurely as a result of smoking.

YOUTH TOBACCO PREVENTION INITIATIVE

- 3,000 Young People Become Regular Smokers Each Day
- Average Teenage Smoker Starts at 14½ Years Old and Becomes a Daily Smoker by 18
- Every Year 1,000,000 Young People Become Regular Smokers
- One-Third of These Children and Adolescents Will Die Early from Their Use of Tobacco
- 5,000,000 Children Alive Today Will Die Prematurely from Smoking
- Tobacco Kills More than 400,000 Americans Each Year
- Smoking Rates of 8th Graders Increased 50 Percent in 6 Years

We have begun implementing the access provisions upheld by the court in cooperation with State and local authorities as the first step in a program that is aimed at reducing tobacco use by minors by a total of, we hope, 50 percent in 7 years.

Our budget request will focus on outreach to educate retailers and others about these new rules, and on contracts with State officials to begin enforcing this new program.

YOUTH TOBACCO PREVENTION INITIATIVE

- Outreach
 - Retailers
 - Tobacco Manufacturers, Distributors and Other Affected Parties
 - State and Local Officials
 - Community and Public
- Enforcement and Evaluation
 - Cooperative Federal and State Enforcement
 - Possible Demonstration Projects with States
 - Evaluation—CDC Collaboration

Mr. Chairman, in addition to these three priority tasks—the food safety initiative, the restriction of access to tobacco products by minors, and the reauthorization of two existing user fee programs—we face many longer term challenges to which we will have to find solutions in order to continue to protect the consumer and to promote the public health.

PART 1

1071

FDA CHALLENGES

- New Scientific Knowledge
 - Xenotransplantation
 - Genetic Revolution
 - Tissue/Biomaterial Engineering
 - Microsurgery
 - Cell Biology
- Public Access to Useful Health Information
- Partnership with the International Community

These challenges include the need to appreciate and utilize the rapidly growing scientific information with which we are confronted, to make meaningful health facts more accessible to the public and to their health care providers, and to advance global efforts for harmonization and the sharing of public health standards in order to safeguard the quality of imported products regulated by FDA.

FDA faces a number of challenges. The greatest challenge is to achieve these goals despite the fact that our workload will continue to increase and that it will outstrip our resources. Pragmatically, we recognize that it is not enough for us simply to work harder; we must also work smarter and we must work more effectively and cooperatively with others, especially our sister agencies USDA, CDC, NIH, and the State and local officials.

We believe that we can meet these challenges in the very best tradition of our nine-decades-old agency, and more than anything else, sir, we want to do so.

Again, we appreciate this opportunity to provide you with this information and we certainly are ready to answer questions.

PREPARED STATEMENT

Senator COCHRAN. Thank you very much, Dr. Friedman. We have your complete statement and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF MICHAEL A. FRIEDMAN

Mr. Chairman, members of the Committee, I appreciate the opportunity to appear before you and present the 1998 Food and Drug Administration budget proposal.

As a background for our 1998 budget request, I would like to begin with a description of the FDA's Congressional mandates and the expectations of the American public, and how we are accomplishing our mission.

FDA'S CORE MISSIONS

The American people have come to expect and rely on the FDA for many services that contribute to their sense of security and enable them to lead productive lives—protection of the safety and wholesomeness of our food supply, maintenance of the high standards of effectiveness and safety of our drugs and medical devices, and assurance of the safety of our blood supply and vaccines, etc. We are committed to upholding those standards and meeting those expectations.

The promotion and protection of the public health is our principal mission. FDA's responsibilities annually cover more than \$1 trillion worth of products, many of which are vital for human health. Our diverse activities include—but are not limited to—licensing blood banks, monitoring clinical investigations, as well as reviewing and approving prescription drugs, generic drugs, animal drugs, vaccines, biologicals, medical devices, devices that emit X-rays, and food additives.

PART 1

1072

Our mission, as the nation's oldest consumer protection agency, is to provide the basic public health protection for the foods we eat and the drugs we take. The assurance that FDA is present, everyday, doing its job, is so fundamental to what we know and expect as public health protection, that we almost take it for granted. Americans have the luxury of not needing to worry about thousands of products including breakfast cereal, pain relievers, contact lenses, vaccines, and cough medicine.

When we inspect manufacturing establishments to make sure they use the materials and processes necessary to produce safe and effective products, and when we monitor imported products to make certain they meet the same high standards as domestic products, we help sustain the American public's confidence and peace of mind.

We have been protecting consumers against an ever-growing number of potential public health risks for more than nine decades. As significant advances are steadily made in science and technology, FDA is continually presented with complex new questions, for which we are committed to seeking and finding new answers. At the same time, we are also committed to improving the FDA's many operations so that all of its work is done as efficiently and effectively as possible.

In this testimony, I would like to summarize some of our recent achievements and actions that have enabled us to protect and promote the public health more effectively than ever before, and to describe some future opportunities and challenges.

DRUG APPROVALS

Recently, no area of FDA's responsibility has been more closely scrutinized by Congress, industry, health professionals and the public than the approval process for new drugs—or, more specifically, the speed with which new therapies of proven effectiveness and safety are made available to those who need them.

Let me therefore begin this report by citing our most recent achievements under the Prescription Drug User Fee Act of 1992. As you know, PDUFA has given us additional resources in exchange for our commitment to meet demanding review goal deadlines without sacrificing high public health standards. This important five-year authorization will expire later this year.

After more than four years' experience with PDUFA, there is no doubt that this approach works. The Agency has consistently succeeded in meeting its annual performance goals—in fact, it has exceeded them in almost every category. When combined with our internal management initiatives, the additional resources provided by PDUFA bring important products to patients with unprecedented speed and assurance.

Last year's record of drug approvals by the Center for Drug Evaluation and Research (CDER) illustrates why reauthorization of PDUFA is a top priority for FDA.

All drugs approved by FDA are important, but perhaps none are as meaningful in bringing new hope to patients as new molecular entities (NME's). These are products that include active ingredients never before marketed in this country. The number of NME's approved each year is regarded as one indication of real and meaningful medical progress. Last year, that progress was exceptional: FDA approved 53 NME's submitted by the pharmaceutical industry, nearly twice as many as the year before.

Let me put last year's figures into perspective by referring back to the passage of the Kefauver-Harris amendments. The average annual total of NME's in the decade of the 1960's was 13.7. In the 1970's, the corresponding figure went up to 17.3. In the 1980's, the average was 21.7 NME's, and in the first half of this decade, the average was 25.6 NME's. In 1996, the 53 NME approvals were a doubling.

Last year's approvals also were much faster than in the past. In the late 1980's, the median times for NME approval approached 30 months. The median time to approval for the 53 drugs approved in calendar year 1996 was 14.3 months, less than half the time it took as recently as the late 1980's. [Chart 1]

New cancer drugs approved last year were notable for their effectiveness against a broad spectrum of cancers: Hycamtin is used for the treatment of patients with metastatic carcinoma of the ovary; Camptosar for those with colorectal cancer; Taxotere for women with advanced breast cancer; Gemzar for patients with cancer of the pancreas; and Nilutamide for men with cancer of the prostate.

The NME category also included Accolate, the first of a new class of drugs for asthma sufferers; Aricept, the second treatment for patients with Alzheimer's disease; and Copaxone, a treatment for those with relapsing-remitting multiple sclerosis.

Nine of the NME's approved last year, including two drugs for cancer and three for HIV, were approved in six months or less. Crixivan, a protease inhibitor for the

PART 1

1073

treatment of HIV, was approved in just 1.4 months. Twelve of the NME's, including three protease inhibitors, were developed—from the first commercial Investigational New Drug submission to marketing approval—in less than six years.

Moreover, the total number of new drugs and biological products—including NME's—approved in the last calendar year was 139, which is 63 percent more than the total the year before. [Charts 2-3] New Drug Applications (NDA's) accounted for 131 of these products, and their median time to approval was 15.4 months, 7 percent faster than the 16.5 months the year before.

BIOLOGICS AND BLOOD SAFETY

Our Center for Biologics Evaluation and Research (CBER) last year made decisions that represent important contributions to the safety of the blood supply, including two new test kits for the detection of HIV infection. One of these kits is designed for screening of donated blood for HIV-1 antigen, a substance that in most cases is detected before the virus antibodies. By reducing the so-called "window" period, when donors may be HIV-infected but their tests are still negative for HIV antibodies, the antigen screening could prevent an estimated 5-10 transfusions of HIV-infected blood a year.

The other HIV test kit approved last year was the first system that includes collection of blood samples at home. It was developed to facilitate blood testing by the more than 60 percent of Americans who are at risk of HIV, but do not visit a medical facility to have their health status checked. In addition, FDA also approved the Amplicore HIV-1 monitor test, the first test approved for the quantification of the HIV-1 virus in human blood.

In all, CBER last year completed 17 major biological approvals, as compared with 12 such approvals the year before. Last year's major biological approvals included Raspigam, the first medication to protect infants against respiratory syncytial virus, a potentially fatal disease; Avonex, the second interferon product for multiple sclerosis; and Verluma, a new diagnostic imaging agent that can determine the extent of small cell cancer in different parts of the body at one time. The median approval time for the 17 biological products was 14.9 months, 15 percent faster than in 1995.

The public health has also been well served by the approval of the acellular pertussis vaccine, which is safer than the traditional whole-cell pertussis vaccines. Another notable approval, issued earlier this year, was for a new recombinant Factor IX for treating people with Factor IX deficiency hemophilia. This product does not contain any pooled plasma derived proteins, and therefore presents no risk of transmitting viral infection.

COMPARISON WITH FOREIGN REGULATORY BODIES

There are many other ways to measure our performance in drug review. One of them—which is frequently used by the media and some critics of our Agency—is comparing our performance with that of our counterparts abroad.

We have checked this performance gauge before, and last year we took another look, this time by comparing all new drugs that were approved last year by both the FDA and the new centralized drug approval process of the European Union. There were 15 of such drugs, and their median time for FDA review and marketing approval was 5.8 months. The median time for review by the Committee for Proprietary Medicinal Products and final EU authorization for a company to sell those 15 common drugs in Europe was 12.2 months. In four instances, the EU authorization came first—in one case, just three days ahead of FDA. In 11 instances, the drugs were first approved in the U.S.

These results are another illustration of FDA's commitment to improve the quality of life of citizens. Nonetheless, our goal is not to compete with any foreign regulatory authority, but rather with time itself. Our goal is to continue to challenge ourselves to constantly improve our own performance—patients, those that care for them, everyone expects no less.

While these improvements could not have been made without the resources added by PDUFA, there has also been a concerted effort to streamline and optimize our entire management system. A substantial reorganization of parts of the Agency has been taking place in the last few years. As a result, all FDA Centers last year achieved notable results.

MEDICAL DEVICES

As a striking example, the Center for Devices and Radiological Health (CDRH) improved its premarket approval reviews (PMA's) while maintaining the review times for abbreviated application—510(k)s. This latter category of applications—which accounts for the vast majority of all submissions to CDRH—covers devices

PART 1

1074

that are substantially equivalent to devices already on the market. In fiscal year 1996, CDRH approved 43 PMA's, a six year high, and 24 major new products, an all-time high. [Chart 4]

One of the notable products approved in 1996 was the Thoratec Ventricular Assist Device System that serves as a bridge to cardiac transplantation. The Center also approved many first-of-a-kind products such as the Ultramark 9 High Definition Ultrasound System, an aid in differentiating benign from malignant breast lesions; the Septrafilm Bioresorbable Membrane, used for reduction of postsurgical adhesion; and the Reliance Urinary Control Insert, a device intended for the management of stress urinary incontinence in adult women. [Chart 5]

Eight of the 15 PMA's submitted to the agency in the first half of fiscal year 1996, received a first action within the 180-day deadline. This was a significantly better performance than in 1994 or 1995.

Even though we are approving more PMA's for increasingly complex devices, and we have improved the time to first action, the PMA approval time is coming down only slowly. It takes too long—more than two years—to complete the entire process. CDRH and the agency are focusing now on innovative ways of bringing down the PMA review times, just as we have done for NDA's. But, here again, much depends on the level of resources available to do the work.

CDRH has also successfully managed the review times for 510(k) applications. In fiscal year 1996, the median review time for these devices that received a finding of substantial equivalence was 85 days. At their peak in 1993, the reviews were almost 70 percent longer—144 days. Even accounting for applications that had to be returned to the manufacturer for more information, the average 510(k) review time in fiscal year 1996 was 110 days, down from the peak of 184 days in fiscal year 1994. Overall, CDRH has done a remarkable job in solving review problems that had plagued the Center for years. They have significantly shortened review times without sacrificing the increased scientific and medical rigor of the reviews. We are not satisfied with our performance, but we are steadily moving in the right direction. [Chart 6]

We also take real satisfaction in the high standards for mammography facilities achieved under the Mammography Quality Standards Act (MQSA) of 1992. Since the law was passed CDRH, working with the American College of Radiology and state authorities, has set standards, and inspected and certified more than 10,000 facilities. The first year's inspections after the program went into effect showed that 80 percent of the facilities had only minor violations, if any at all. A recent report by the General Accounting Office found that second-year inspections revealed "considerable reduction in the proportion of facilities" with violations.

The performance of our drug and device Centers deserves special attention because of the public health importance of their work, and high interest in their achievements. Other FDA Centers, however, also had results last year that reflected gains in efficiency and positive effects on the public health.

FOOD AND VETERINARY MEDICINE

The Center for Food Safety and Applied Nutrition (CFSAN) has implemented several initiatives to speed up the food additive petition review process and reduce the inventory of pending petitions. The Center brought in scientists from other program areas; allocated additional resources to modernize its electronic information processing infrastructure, and to contract the technical services of "third party" reviewers; instituted changes in its Office of Premarket Approval to better respond to legislative mandate and industry demands; and used various means—from one-on-one meetings to the World Wide Web—to provide guidance to petitioners on how to improve the quality of their submissions to the Agency.

The effort has paid off in reduced petition inventory and faster reviews. In June, 1995, there were 295 petitions in the CFSAN inventory, including food and color additive petitions, GRAS affirmation petitions, and citizen petitions. By the end of last fiscal year, the Center had received an additional 82 petitions, but the inventory was 60 petitions below the total in June 1995. During calendar year 1996, CFSAN took final action on 88 petitions, 54 of which were approvals—the highest number in any year in a decade. [Chart 7] Moreover, the median time from receipt to approval of food and color additive petitions decreased from 37 months for petitions approved in fiscal year 1993 to 27 months for petitions approved in the last fiscal year. Again, we have not yet achieved the results we want, but we are continuing to advance toward them.

CFSAN has also authorized health claims providing information on the relationship between food components and health. Last year, FDA issued a final rule covering health claims that associate adequate dietary intake of folic acid and the re-

PART 1

1075

duced risk of neural tube birth defects, which in this country affect approximately 2500 children each year. In August, 1996, a claim was authorized on the relationship between sugar alcohols and reduced risk of dental caries. In January, 1997, the Agency authorized health claims stating that foods containing soluble fiber from whole oats may under certain circumstances reduce the risk of heart disease.

Our Center for Veterinary Medicine has been working closely with animal drug manufacturers, producers, and veterinarians designing a new and more flexible animal drug approval process that reduces the time and cost necessary for meeting the requirements for a new animal drug approval. [Chart 8] Full implementation of the changes was made possible by the enactment of the Animal Drug Availability Act of 1996. Among other improvements, the ADAA eliminates the need for dose titration and optimization, and provides the Agency with the latitude to redefine the statutory term "substantial evidence" of drug effectiveness. The changes are evidence of the remarkable achievements that become possible when government and the private sector work together.

ACHIEVEMENTS OF THE OFFICE OF REGULATORY AFFAIRS

One of the most demanding tasks of our Office of Regulatory Affairs, whose inspectors and investigators operate in offices throughout the United States and Puerto Rico, is surveillance of the rapidly mounting number of imports of FDA-regulated products. While the number of our port-of-entry personnel has increased by only 285, the number of shipments with products within FDA purview has increased from 500,000 in 1970 to nearly 3.7 million last year.

Last year, ORA began implementing a new automated system—called Operational and Administrative System for Import Support (OASIS)—that greatly speeds up FDA's handling and clearance of imported products by maintaining electronic communications between the agency and the brokers. With OASIS, the broker receives FDA's initial admissibility determination on every shipment within eight minutes after the broker submits the necessary data to the agency. For eight out of ten shipments, the initial FDA clearance is final. The paper-less system, whose implementation will be completed by the end of September, will cover every U.S. port of entry where FDA-regulated products arrive by sea, land and air.

Another major responsibility of ORA's regional, district and field offices and laboratories is to maintain a round-the-clock vigilance against hazards to the public health. A typical example of this demanding duty is the recent action by FDA's field office in Los Angeles against several products that were supposed to be mildly intoxicating but instead were implicated in cases of nausea, vomiting and respiratory arrest among mostly young people who had ingested them at a New Year's Eve concert.

FDA field office launched investigation within hours after the incident, and on January 1, we issued a public statement warning consumers against the so-called "fx" products—"CHERRY fx BOMBS," "LEMON fx DROPS" and "ORANGE fx RUSH"—which apparently had been distributed for free to the concert goers. Subsequently, FDA took possession of more than 9,000 vials with the fx potion and notified the distributor that the products present an unreasonable risk of illness or injury to those who consume them.

Mr. Chairman, I have mentioned the highlights of FDA's performance last year as evidence that our agency is dedicated to its public health mission, competently staffed, and steadily advancing in its scientific skills while introducing flexible, less burdensome but no less valid regulatory procedures.

We have taken important strides forward, and we are well positioned to make even more effective use of day-to-day operating resources as well as to strategically plan for managing new responsibilities.

In addition to our important ongoing efforts, there are three major tasks that we perceive to be fundamental for the fulfillment of our public health mission in fiscal year 1998.

First of all, we must implement—in cooperation with federal, state and local public health authorities—the Administration's food safety initiative.

FOOD SAFETY INITIATIVE

Americans rightfully expect their food to be wholesome and safe, and with rare exceptions, it is. We know, however, that problems do exist. According to the Council for Agricultural Science and Technology, up to 33 million foodborne illnesses occur each year, and as many as 9,000 people—mostly the very young and the elderly—die as a result.

Hospital stays associated with microbial foodborne illnesses are estimated to cost more than \$3 billion a year, and the estimated total expenditures due to foodborne

PART 1

1076

illnesses are at least \$5.6 billion. These costs, both in lives and economic consequences, are unacceptable.

Last year's outbreak of *E. coli* 0157:H7 contaminated apple juice on the West coast is another example of why we need to improve our system for protecting food. We were first alerted when one of our food scientists spotted on the Internet a reference to a previously unreported *E. coli* outbreak in the state of Washington. After a diligent inquiry he found the person associated with the Internet notice—a University of Washington physician who had uncovered a cluster of patients with Hemolytic Uremic Syndrome, an extremely serious illness caused by *E. coli* in which blood cells dissolve and the kidneys suffer severe damage.

The first clue to the cause of the outbreak was provided by state and local officials in Seattle who had interviewed the patients and found that they all had consumed the same brand of apple juice. Samples of the suspected product were brought to FDA's Seattle laboratory, which began testing them for the presence of *E. coli* 0157:H7.

Commissioner Kessler was notified and he initiated a conference call beginning at 9 o'clock that night with experts from FDA, CDC, state and local health authorities, and representatives of the manufacturer. After the call was concluded, at 4 a.m., the manufacturer of the apple juice recalled all of the already distributed contaminated products, and a press release was issued warning the public against consuming the juice they had already bought. As a result of this rapid intervention, the outbreak was limited to 66 Americans and Canadians. Tragically, one of them—a little girl in Colorado—died of complications of this foodborne disease.

We were able to help contain this outbreak thanks to the fast reaction and cooperation from federal, state, and local public health officials as well as from the juice manufacturer, who instituted an immediate recall of the unsold products and warned the public against consuming the juice they had already bought.

But we also were fortunate. First, Kings County in Washington has a disease surveillance system similar to the FoodNet system supported by CDC, FDA, and USDA. If the same outbreak had taken place in other areas of the country, we might not have made the connection until many more people had become ill.

Second, Federal health officials took charge of the situation rapidly and received prompt cooperation from all the relevant federal, state, local and industry participants in the incident. But this was a fairly exceptional experience. For the emergencies that take place under less favorable circumstances, we need to have effective and consistent coordination in place before the outbreak takes place.

Similarly, if we knew more precisely how this deadly form of *E. coli* grows and multiplies, how it infects the food and how it is transmitted to humans, we could act more quickly and decisively when events of this sort take place. Our research and risk assessment work will bring us closer to the knowledge we need to devise educational programs to teach consumers and food processors how to avoid and combat such contaminants. And we must have additional inspectors if we are to ensure that food safety standards are being met.

In recent years, we have taken several significant steps to improve food safety. We are now implementing the Hazard Analysis and Critical Control Point (HACCP) system for seafood, and the U.S. Department of Agriculture is doing the same for meat and poultry. FDA and USDA have supported the efforts of the Centers for Disease Control and Prevention to create a system of FoodNet Sites for identifying disease outbreaks. And Congress enacted new legislation last year aimed at protecting the public—particularly children—from pesticides. But our system is still largely outmoded, and it is time to bring food safety into the contemporary world of automation and modern science.

We are therefore asking your support for new resources to carry out FDA's share in the Administration's food safety initiative which is described in detail in the budget.

PREVENTION OF TOBACCO USE BY MINORS

A second major task is our public health and legal obligation to protect our most vulnerable population—our youth—against the devastating effects of tobacco.

For the past three years, our agency conducted an extensive investigation into public health aspects of the use of tobacco, which kills more than 400,000 Americans each year—more than acquired immune deficiency syndrome, alcohol, car accidents, murders, suicides, illegal drugs, and fires combined.

We found evidence that nicotine is addictive; that it produces pharmacological effects which are the primary reason why people use tobacco; and that manufacturers know these facts.

PART 1

1077

The most striking discovery, however, was the overwhelming evidence that the enormous public health burden linked with tobacco products originates when the users are young, a stage of life that's most carefree and susceptible to risk-taking. Eighty-two percent of adults with any history of smoking had their first cigarette before the age of 18, and more than half of them had already become regular smokers by that age.

Each year, one million youngsters in this country become regular smokers—and one-third of them will die prematurely of lung cancer, emphysema, and similar diseases linked to their addiction. About three million of our adolescents smoke, and another one million boys use smokeless tobacco. Tobacco use and nicotine addiction can be properly called a “pediatric disease.”

Based on these findings, FDA last year determined that it has jurisdiction over cigarettes and other tobacco products, and issued regulations restricting their sale and distribution to children and adolescents.

This year, we—together with our sister public health agencies and state and local authorities—are embarking on an enforcement program designed to reduce young people's use of tobacco products by 50 percent in seven years. It is an enormous undertaking: despite the fact that it is against the law in all 50 states to sell cigarettes and smokeless tobacco to minors, our young people purchase an estimated 1.26 billion dollars' worth of tobacco products each year. Recent surveys have shown that adolescent smoking, after several years of decline, is again on the rise.

As a public health agency we feel a deep obligation to see this program carried out. Earlier, I mentioned our implementation of the Mammography Quality Standards Act, the most important advance in the public health protection for the nation's women. Protecting their children—our youth—from nicotine and tobacco is an equally urgent and deserving task whose future benefits will far outweigh the current funding needs.

PDUFA AND MQSA REAUTHORIZATION

Our third important task is to achieve reauthorization of two user fee programs—PDUFA and MQSA, both of which expire on October 1 of this year. Both of these programs set demanding performance goals and provided the additional resources necessary to accomplish the agreed-upon objectives. As I have discussed earlier, the principle of linking higher productivity, through performance measures and goals, and the collection of user fees to finance specific program activities has been a success, and there are important opportunities for these existing programs. The Administration has proposed expanding the use of that principle to other FDA activities which I will address in more detail shortly.

THREE LONG-RANGE CHALLENGES

Beyond these immediate tasks, FDA faces longer-term challenges for which we must find solutions if this country's public health is to continue to be as well served as Americans expect and merit.

One of the most demanding problems—as well as the greatest opportunity—is the prodigious outpouring of new scientific knowledge that directly impacts on our responsibilities as a public health agency. Scientific information is growing far more rapidly than could be foreseen even a decade ago, and the sheer volume of new insights is nearly unimaginable.

While our agency scientists, such as those at the National Center for Toxicological Research, are hard at work to keep abreast of these developments, we face a constantly expanding task. At any particular moment, we have to be thoroughly competent in understanding such disparate issues as the biology of genetically altered tomatoes, the safety and effectiveness of eye surgery with a laser beam, and the effectiveness and side effects of new unique classes of highly toxic drugs. Our mission involves therapeutics, restoratives, diagnostics, nutritionals, and many other scientific disciplines whose complexity is constantly growing. We must devise additional ways of making the best use of the cutting edge of new knowledge. In order to properly oversee the translation of basic science observations to applied practical application, we must have this facility.

Another challenge we will have to meet is improving accessibility to meaningful health information. Accurate product information is absolutely vital to patients and health care professionals. In many ways, information is our new currency. Having a new drug or a new food or a new medical device, without having the information how to use it properly or safely, is to no one's advantage. We must struggle not just to get new products on the market, but to make sure that there is information about their benefits and risks, so that the health care provider and individual can make informed decision about proper use. We have learned from our experience with the

PART 1

1078

new food label and with prescription drug information leaflets that well-presented and accessible information may be the most powerful tool we have to improve the public health. With the cooperation of the industry, we are about to institute major improvements in the labeling of non-prescription drugs, but more remains to be done.

Finally, I must include one more important long-range challenge that FDA has to address in order to continue maintaining this country's traditional standards. With the globalization of manufacturing, trade, and consumption, members of the international community—including ourselves—recognize the value of harmonized regulatory standards and, possibly, shared compliance surveillance. It is our only realistic option for ensuring the standards of foreign-made regulated products, whose imports to this country have increased seven-fold in the last 25 years.

For FDA, this is an expanding mission that calls for the development of international contacts, knowhow and negotiating skills within a scientific framework. Moreover, we find that—as one of the world's oldest consumer protection agencies—we are expected to do our full share. To advance our country's national interests, we are doing our best to meet these expectations.

A good example of our contribution is the International Conference on Harmonization of Technical Requirements for Registration of Pharmaceuticals for Human Use (ICH), the most important international effort in the regulatory field that seeks to harmonize submission data for drugs in the U.S., Europe and Japan. Less than five years' old, ICH is completing the adoption of more than 40 consensus guidelines, many of which are based on our standards. We also are providing leadership for similar international efforts to harmonize the standards for veterinary drugs, and for medical devices.

All of these challenges are even more formidable because we realize that the growth of our work load will continue to exceed our resources. The prescription drug and medical device industries maintain a growth rate of more than 8 percent a year, as measured by the value of manufactured shipments. Research and development in the same industries increases by more than 12 percent each year, and imports of all FDA-regulated products are increasing at a rate greater than 7 percent a year. We are determined to meet this challenge by increasing our cooperation with others, whether in government, academia or industry; by not only working hard but also by employing novel solutions when old practices no longer meet the need.

BUDGET OUTLINE

Turning to FDA's fiscal year 1998 budget, the Administration's request is a total of \$1,064,388,000, including \$820,116,000 in budget authority and \$244,272,000 in user fees. A total program level of this amount will enable us to carry out the core activities of premarket review and postmarket surveillance as well as move forward with new initiatives to promote and protect the health of the American people.

Food Safety Initiatives—\$24 Million

For FDA's portion of the collaborative effort with CDC, EPA, and USDA, we are requesting \$24,000,000 to begin implementation of activities aimed at reducing the incidence of foodborne illnesses and resultant economic losses by enhancing the safety of the nation's food supply. This funding would provide the elements pivotal to food safety such as seafood inspection efforts, consumer and industry education (particularly at the retail level), surveillance, including in particular the establishment of a new national early warning system for outbreaks of foodborne disease, risk assessment and research. The activities would lay a foundation of cooperation and communication to rapidly deal with emerging public health hazards.

Youth Tobacco Prevention Initiative—\$34 Million

On August 23, 1996, President Clinton approved FDA's final rule that limits the availability and appeal of tobacco products to adolescents. For our part of this effort, FDA's budget request includes \$34,000,000 for the costs associated with implementing this regulation. The funding will be used for outreach to retailers, manufacturers, state and local officials and communities, and enforcement and program evaluation.

Buildings and Facilities—\$14.6 Million

The budget request includes \$14,550,000 for the second phase of construction of the Arkansas Regional Laboratory facility for FDA's field operation in Jefferson, Arkansas. Construction of this laboratory is a cornerstone of FDA's Field Lab Consolidation Plan, and will provide state-of-the-art analytical services that are currently carried out at four laboratory facilities.

PART 1

1079

User Fees—\$244.3 Million

A total of \$244,272,000 is proposed in the budget for user fees. The proposal includes \$91,204,000 in connection with the reauthorization of the Prescription Drug User Fee Act of 1992 and \$13,966,000 in connection with the reauthorization of the Mammography Quality Standards Act of 1992, both of which sunset on October 1, 1997. The request also includes \$7,459,000 in already authorized user fees for export certification and the certification of insulin and color additives.

In addition, the proposed budget includes new user fees of \$131,643,000. These new fees would partially cover premarket and postmarket activities costs in most of FDA's major program areas—foods, human drugs, biologics, animal drugs, and medical devices. These industries derive great benefits from consumers' confidence in FDA's review processes and product surveillance.

The Administration believes that FDA provides a vital public health service by protecting consumers from unsafe and impure regulated products, and that industry—which greatly benefits from FDA's assurance of the quality of such products—should help pay for a portion of the agency's costs. FDA will work with Congress and the agency's many constituencies, including the regulated industries, to implement the proposed fees in conjunction with agreed-upon performance measures and goals that are linked with the provided resource levels.

BIOGRAPHICAL SKETCH

MICHAEL A. FRIEDMAN, M.D.

As Lead Deputy Commissioner, Michael A. Friedman, M.D. provides leadership and management of high-priority Agency initiatives aimed at addressing important public health issues. He oversees the work of the FDA Centers and the field offices. He works in concert with the Commissioner, the Center Directors, and the other Deputy Commissioners to maximize the efficiency and effectiveness of the FDA's efforts. He also represents the Agency in interaction with the public, other Federal agencies and the regulated industry, and foreign governments on issues related to the broad mission of the Food and Drug Administration.

Dr. Friedman received a B.A. degree in English from Tulane University, New Orleans, Louisiana in 1965 and an M.D. degree from the University of Texas, Southwestern Medical School, Dallas, Texas in 1969. His postgraduate medical training was at Stanford University, Stanford, California and the National Cancer Institute, Bethesda, Maryland, and he has Board Certification in Internal Medicine and Medical Oncology.

Prior to his October 1995 FDA appointment, Dr. Friedman served as the Associate Director of the Cancer Therapy Evaluation Program from 1988-1995 and as Chief of the Clinical Investigation Branch from 1985-1988 within the Division of Cancer Treatment at the National Cancer Institute and the National Institutes of Health. From 1975 to 1983, Dr. Friedman was a faculty member at the University of California San Francisco Medical Center serving as an Associate Professor in the Department of Medicine, and the Director of Clinical Affairs and the Interim Director of their Cancer Research Institute. Dr. Friedman's professional activities at the local and national level have included appointment to the various posts in the American Society for Clinical Oncology, as well as membership in the American Cancer Society, American Society for Cancer Research and the Western Society for Clinical Investigation. His scholarly activities include authorship of numerous scientific articles and book chapters as well as editorial board responsibilities for books and journals.

Dr. Friedman has been a career Public Health Service Commissioned Corps member and currently holds the rank of an Assistant Surgeon General. He has received the PHS Commendation Award in 1992, the EEO Special Achievement Award in

PART 1

1084

1993, and the PHS Distinguished Service Medal in 1997. He is a member of Phi Beta Kappa and Alpha Omega Alpha honor societies.

USER FEES

Senator COCHRAN. Dr. Friedman. I am going to ask a couple of questions and then yield to my friend from Arkansas.

Let me ask you first of all about the user fees that are contemplated in the budget submission. We notice that the total is \$131,643,000 for proposed user fees on subjects such as foods, human drugs, biologics, animal drugs, and devices—all new user fees. So your budget request is offset, in effect, to the extent of almost \$132 million by the assumption that user fees will be authorized by Congress.

We do not have the power in this committee to authorize those user fees. We are an appropriations committee and not a legislative committee. So unless the legislative committees in both Houses agree to recommend that and report legislation out to do this and it is passed by both Houses and signed by the President, we do not have the authority to direct that those user fees be paid into the Treasury.

So what if the legislative committees do not approve this offset? What are you going to do when we approve a budget that is \$132 million less than what you need because of the new user fees you have requested? What is going to happen to your functions and the contemplated things that you outline here that you are going to use all this money for?

Dr. FRIEDMAN. It is a very important question, sir, and one that we are focusing on. You recognize that this budget is an attempt, along with other parts of Government, to deal with everyone's interest in reducing the deficit and at the same time providing a level of public health protection. We think the bottomline figure that we have identified is fully supportable and appropriate.

But to answer your question, if those funds, if that \$132 million, is not available, the impact on the agency would be very, very serious. Our ability to act in a timely way and in a complete way on many of our activities would be seriously compromised.

Senator COCHRAN. One thing that comes to our mind here is that such a level of funding would be 8 percent below this current year's level for FDA's ongoing activities.

Dr. FRIEDMAN. Yes, sir.

Senator COCHRAN. So to put it in perspective for everybody, with this amount contemplated in new user fees—

Dr. FRIEDMAN. Sir, my understanding is it could be up to a 17-percent reduction. But the point you are making is exactly the same, which is this is a large, serious impingement and would have very dire consequences on all of our activities.

TOBACCO REGULATION FUNDING

Senator COCHRAN. Well, it will be an interesting set of choices that you will have to make if those user fees are not approved. For example, you are requesting increases for food safety and tobacco youth prevention programs. When you add that in, you get to about a 15- to 17-percent reduction below the current year's funding level.

PART 1

1085

Well, my next question is on the tobacco regulation issue. You mention the North Carolina case and the new authorities that you have under the decision, and we know, as you suggest, that that will be appealed and we do not know how that appeal will be decided. But what is your view now about the impact that that decision and the new regulatory powers you are assuming for tobacco regulation, what the impact of that will be on your budget needs for the next fiscal year?

Dr. FRIEDMAN. I believe, sir, that the budget needs for the next fiscal year that we have outlined are still entirely appropriate. I believe that the kind of program that we envision, one which involves activities largely delegated to States with a relatively small investment in activities within the FDA here, not only is a prudent policy from a fiscal point of view, but we think also is the most efficient way in which to do this.

Senator COCHRAN. Well, if there will not be any impact on those regulations, then you are going to have to shift money from salaries and expenses or other parts of the budget to pay for it unless the new user fees are approved, will you not?

Dr. FRIEDMAN. If we are able to achieve the bottomline figure by working with your committee and others, by working with industry, if we are able to achieve that total budgetary figure, then we believe that there is a great deal that can be accomplished for the public health. If it is a smaller number than that, for whatever reason, then you are quite right, sir. We will have to make some very difficult choices, not just with respect to those programs, but other very important programs that we are involved in.

Senator COCHRAN. Senator Bumpers.

USER FEE AUTHORIZATION

Senator BUMPERS. Mr. Chairman, you certainly hit the nub of the problem here and I will not pursue it except to ask you this, Dr. Friedman. Have the authorizing committees approved these new user fees?

Dr. FRIEDMAN. I will ask Mr. Byrd, if you would, please.

Senator BUMPERS. Is that just in the generic legislation that you have?

Mr. BYRD. There is generic legislation, but the authorizing committees have not approved it as of this time.

Senator BUMPERS. They have not?

Mr. BYRD. They are considering, but they have not approved it.

Dr. FRIEDMAN. That is correct.

Senator BUMPERS. So you are going to have to get that authority before you can collect those fees, are you not?

Mr. BYRD. That is correct.

Dr. FRIEDMAN. That is correct, sir.

Senator BUMPERS. Have you testified before the appropriate committees on that issue?

Mr. BYRD. Yes.

Senator BUMPERS. The authorizing committees?

Mr. BYRD. We have appeared before those committees.

Senator BUMPERS. I am not sure I understand those user fees well enough to state that I favor them or do not favor them. But certainly I am really troubled, because I have been a strong sup-

PART 1

1086

porter of FDA. I want to support your budget. But I just know the way things go around here. I mean, everything can come unraveled in a moment's notice.

Dr. FRIEDMAN. It is a very difficult year in that regard, sir, and we recognize that. Our job here is really twofold, in a way. One is to show you that we are responsible and careful managers and that what we are doing has value, and I think we can certainly do that, and invite your questions in that regard.

The second issue, the parallel issue, involves how the Government will pay for all the important functions. You have many competing interests that petition your attention and these are worthwhile, good interests, and we understand what a difficult job you have. This is not something that is unique to us. It is true for many parts of the Government—USDA, Transportation, Commerce, a number of parts of the Government. All are wrestling with this same thing.

We recognize the difficulty of that and just want to work as productively as we can with you in that regard, sir.

Senator BUMPERS. Do you want to comment on that?

Mr. BYRD. Just, if I may, clarify a statement. A moment ago I mentioned that in our appearances before the authorizing committees we had discussed user fees. We have discussed PDUFA with the authorizing committees, but we have not testified with regard to this generic user fee bill yet. That user fee bill has been submitted by the White House, but we have not testified about that user fee bill at this time.

Senator BUMPERS. What assurance, if any, do you have that those committees will authorize these new fees?

Mr. BYRD. We have no assurance.

Senator BUMPERS. I hate to say this, use this word—we have ignored the authorizing committees sometimes on setting budgets around here when we probably should not have. But there is likely to be an outcry if we mark up this bill and we give you the billion something you are requesting and it includes those user fees, the chairmen of those authorizing committees may say nothing or they may say a lot, and that could create a real firestorm in the Senate, on the floor.

Dr. FRIEDMAN. We have certainly heard, sir, from a variety of different groups their concerns or opposition to these fees, and we know that those interests have made their concerns known to various Members of Congress.

ARKANSAS REGIONAL LABORATORY

Senator BUMPERS. Needless to say, Dr. Friedman, I have a deep and abiding concern about NCTR, and you have asked for \$14 million some, I think with last year's \$13 million something, to complete phase two.

Dr. FRIEDMAN. Correct, sir.

Senator BUMPERS. Is that correct?

Dr. FRIEDMAN. Phase one is initiated. This \$14 million would be for phase two.

Senator BUMPERS. And you feel comfortable that that amount will be able to complete phase two?

PART 1

1087

Dr. FRIEDMAN. I have asked that question and have been assured that that is very true, and that all of the scientific and regulatory activities that we hope to nest within that new facility are also moving to confluence on exactly the same timetable. This represents a very important scientific-regulatory fusion at that location. It is part of our field reorganization and downsizing and consolidation, and I think both the administrative, the scientific, and the physical, the building itself, are all flowing together in an appropriate way, sir.

Senator BUMPERS. Phase one is under construction, is it not?

Mr. BYRD. That is right, phase one is under construction.

Senator BUMPERS. Do you have any idea what the phase three costs will be?

Mr. BYRD. Phase three runs about \$9.8 million. That is for the administrative and office areas.

Senator BUMPERS. Would you be asking for that money for 1999 or not?

Mr. BYRD. We probably will be asking for it in 1999.

Dr. FRIEDMAN. Yes.

Senator BUMPERS. Have any field lab consolidations taken place yet?

Mr. BYRD. Yes; we have started some field laboratory consolidations. As Dr. Friedman mentioned, the consolidation associated with the Arkansas regional laboratory will consolidate six laboratories down into Arkansas, and that is cost effective. We anticipate that that will save the agency about \$56 million over a 20-year period.

Senator BUMPERS. You anticipated my next question.

Dr. FRIEDMAN. Not only that, but I believe that the group that is most skilled at doing research and analyses for dioxin has already moved down to the Arkansas facility, I believe from Chicago. So there is real research, there is real collaboration going on now, sir.

Senator BUMPERS. I know that you have in the past 2 or 3 years had to reduce the FTE's at all of these labs. I thought it was just NCTR, but I realize that is across the board now. But I notice you are holding steady this year now.

Dr. FRIEDMAN. Yes.

SAFETY AND EFFICACY OF APPROVALS

Senator BUMPERS. Now, let me just make a topical comment on that point, not just on that particular matter, but, for example, I applaud your obviously tremendous efforts to approve drugs and devices in a much more expeditious way than in the past.

Let me just voice my concern. If you would care to comment on it, by all means do. My concern is there has been tremendous political pressure. I have sat in this committee year after year and I have heard some of my colleagues browbeat Dr. Kessler about speeding up the approval process. And while that is a highly desirable goal, that standing alone is not a justification.

If you can speed up the process and be as certain as you would have otherwise if you had longer time, that is fine. But I just want to say that this is one Senator who would really be terribly disturbed to think that we were hastening the process just in order

PART 1

1088

to be as competitive with Germany and Italy and some of the other countries who have a little faster approval time than we do, or have had in the past. I do not know that that exists any more.

And I know you have done a great job, as you pointed out this morning and Dr. Kessler did last year, about approving new items and drugs in a much more expeditious manner. But as I say, I just want to be sure that these drugs are safe. I think the ordinary citizen has no idea how much illness there is in this country because of a misuse of drugs or because of side effects that had not been anticipated, because two drugs do not match with each other when you put them in your body. I think that, as I say, I know from talking to doctors that is a massive problem for them.

Dr. FRIEDMAN. If I may, let me respond with just a couple of comments, sir. One is that the tension you describe is exactly right. We recognize that no product is ever totally safe and no product is ever totally effective, and so what we must do is try and see developed and then promulgated information about what risks and benefits a product offers to a particular individual.

We want to provide excellent information, so that patients can make choices, so that doctors can help patients make choices, so that reimbursers and insurance companies can reimburse appropriately for those choices. To the extent that we are an information purveyor, that is a crucial role for us in the future. That is based on science, and what we must do is to try and integrate all the new science in the most effective way possible.

We are balancing. We are dealing with this tension you describe. We want to have as much of the information as we can, but we do not want to be ponderous or delay getting an important product to the public. We want to be as right as we can be, but we cannot be perfect. We know that, and this is a balance.

Please.

Mr. SCHULTZ. If I could just add something, in the new drug area it is important to distinguish between typical drugs that are maybe at most slight advances over what is available and truly breakthrough drugs for very sick people. In the first area, which is the largest number and is what those charts largely reflect, the theory of the Prescription Drug User Fee Act was that the agency could go faster with more resources. And I think we are very confident there has been no diminution of the standards or of safety and efficacy. There are a lot of difficult decisions and so on, but I think we are very confident there has been no change.

The harder issue is where you have a drug for a disease where there is nothing else available and at what point in time do you give people access to that product? This does not tie into so much the desire to speed up the approval as trying to balance the issue of when do you have the right amount of information to allow a company to promote a drug. And it is one that has been debated and we worry about it, and I think we share your concerns. We feel like we have struck the right balance, but it needs to be continued to be discussed.

The other point I want to make is, some of these issues are going to come up in terms of so-called FDA reform legislation both for drugs and devices, and we share your concerns there as well. We

PART 1

1089

want to be very careful so that any legislation that is enacted does not undercut the agency's ability to assure safety and efficacy.

MEDICATION GUIDES

Senator BUMPERS. One further point, Mr. Chairman, and I will conclude with this. Last year we had considerable debate and discussion about FDA's role in developing these—I forget what you call them. It is what they give you at the drugstore about the contraindications of the drug and so on.

Dr. FRIEDMAN. Med guide, medication guide.

Senator BUMPERS. Yes; last year I think we gave you some authority, did we not, to elaborate and cooperate with the pharmaceutical companies in developing those?

Dr. FRIEDMAN. That is right.

Mr. SCHULTZ. You basically set up a system where there would be a voluntary program until about the year 2000 with FDA doing surveys and setting standards. But the market will be allowed to work until 2000, and then at that point we are to come and do a survey and see if 75 percent of people who buy prescription drugs get adequate information. And then, if they do not, you gave us authority to take action.

Senator BUMPERS. OK.

Dr. FRIEDMAN. We think it is a very satisfactory proposal.

Senator BUMPERS. You all are happy with that?

Dr. FRIEDMAN. Yes, sir.

Mr. SCHULTZ. It is interesting. What happened is all the different groups got together as a result of the legislation and came up with a plan that then went to the Secretary, and the Secretary adopted. So our sense is there is now, as a result of the legislation, a much broader agreement on what the right steps are.

Senator BUMPERS. I am not critical of the pharmaceutical companies. When you buy a prescription drug now you get one of those things. They just peel them out of a computer. They are extremely helpful. They may not be as comprehensive as they ought to be. A layman has no earthly idea whether he is getting all the information he needs on that or not. So I think when FDA weighs in on it we will all feel just a tad safer on the information we are getting being accurate.

Thank you very much, Mr. Chairman.

BLOOD SUPPLY SAFETY

Senator COCHRAN. Thank you, Senator.

Last year, we provided direction to the Food and Drug Administration to move forward aggressively, in consultation with the Centers for Disease Control and Prevention, in taking measurable steps to prevent and respond rapidly and effectively to cases of viral and pathogenic contamination of blood products. The hemophilia community remains on the frontline in exposure to viruses contaminating our Nation's blood supply. We still think the FDA needs to pursue all measures required to assure safe blood products, including instituting a patient notification and product recall and withdrawal system.

Last year, we discussed this in this budget hearing and we were assured that there would be cooperation and action by the FDA on

PART 1

1090

this subject. There was a meeting held, but there has been no action that I know of taken by the FDA to institute a patient notification system. And a lot of questions that we raised at that hearing are still unanswered.

It is my understanding that in November a meeting was held with the National Hemophilia Foundation and others who were interested to discuss these issues, but no further action to my knowledge has been taken to develop a process to respond to the concerns or to these cases.

Many of the issues this subcommittee sought to address last year were identified in a 1995 report by the Institute of Medicine entitled "HIV and the Blood Supply." Two years later, many of the concerns were cited in an extensive report on FDA oversight of the blood supply completed by the General Accounting Office. That report reinforces my concern that serious confusion continues to exist over the informal system of communication between FDA and manufacturers and manufacturers and their distributors of blood products.

GAO recommended the publication of guidelines that clarify FDA's intentions when issuing memoranda and other communications to manufacturers and when recommending product recall and withdrawal. It seems to me we have an ongoing problem that is not being addressed in a vigorous and committed way.

The question is, Can we expect the FDA to take any action to develop a document, a well-defined guidance document, that spells out the decisionmaking procedures for initiating a blood product recall or withdrawal following an adverse event, and when can we expect FDA to institute a patient notification system that fully protects people with hemophilia and other bleeding disorders, as well as the general public?

Dr. FRIEDMAN. I appreciate the chance to respond to this really important question. We do take these very seriously and I am pleased to give you updates and what has occurred since last year.

Deputy Commissioner Mary Pendergast has been very involved in this area and I would ask her to please begin.

Ms. PENDERGAST. Thank you, Senator. I would agree that you raised a very important question. We have taken steps that perhaps you are not aware of. In the first instance, we have switched the organizational structure within the FDA as to how to respond to instances where there is bacterial or viral contamination of products. It is now handled by our field force and by our Division of Emergency Operations. So the same kind of emergency response team that we would have sent in because of E. coli in apple juice will be triggered in the blood industry as well. So we have a whole group of people, a decisionmaking tree, a rapid mobilization response.

We have also given the lead authority for the initiation of recalls to our field force. That is the way we do it in the rest of the agency and we have moved the plasma fractionation and blood industry model into our normal model, which is where the field force has the responsibility for initiating recall recommendations and following through.

We have met with industry. We have, shall we say, reminded them in a very stern way of their obligations under our longstand-

PART 1

1091

ing rules that when there is a class 1 recall they have an obligation to work with their distributors to get information to the final consumer of the product. In the case of plasma fractionation products, that would mean the users of the product, the hemophiliacs.

We have met with the hemophiliac organizations, with the national organization, the National Hemophilia Foundation and the Committee of 10,000. We have met with each of them. We have scheduled additional meetings to see what else we can do.

We have put all FDA recalls of blood and plasma products on the Internet immediately, on a fax-on-demand system, and on another system where you can call in and get the information.

We are also forcing the companies to take more seriously their obligation to immediately classify these situations as a recall. When you call it a recall, everyone knows, whether it is patient, doctor, or distributor, that there is something potentially wrong with the product. For too long the companies were calling these voluntary market withdrawals, giving people the false sense that there was nothing wrong with the product. We have gotten much stricter in terms of holding the companies' feet to the fire to make sure that at the first instance they correctly characterize these situations as a recall.

So we are taking steps and we will continue to do so with the appropriate consumer and other groups.

Senator COCHRAN. Thank you very much. I am encouraged by that report, and I hope that you have an opportunity to put that in a form that we can make available to those who have called us and written us complaining that they do not think enough has been done. This does seem to be an important step in the right direction and we appreciate that very much.

Ms. PENDERGAST. Thank you.

LOU GEHRIG'S DISEASE

Senator COCHRAN. There is also a continuing concern about amyotrophic lateral sclerosis [ALS], a fatal neurological disorder known as Lou Gehrig's disease. Approximately 20,000 Americans, I am told, are affected. The NIH recently discovered that an inherited form of ALS involves a gene that produces aberrant forms of superoxide dismutase. I ought to check that out, how to say it.

Dr. FRIEDMAN. You said it perfectly.

Senator COCHRAN. It has come to my attention that the FDA's Peripheral and Central Nervous System Drugs Advisory Committee will conduct a hearing on May 8 on a new drug application for Amyotrophin which may be helpful to ALS patients.

My reason for bringing this up is to try to bring this to the attention of the highest levels of the FDA and encourage you to look very carefully at any new drug applications and to tell us, if you can now, what your expectations are for the approval of drugs that are approaching the stage where they can be approved by FDA to deal with this very serious and debilitating disease.

Dr. FRIEDMAN. You are quite right, Mr. Chairman, this is really a devastating disease and a disease that is not satisfactorily treated with current products. The agency did approve a product recently and that was an important first step, but this was not an

PART 1

1092

entirely satisfactory product. It does not cure the disease. The patients still have an inexorable course that we are unsatisfied with.

It would be inappropriate to predict how the advisory committee will act on that, and I know you are not asking for that at all. What I can tell you is that these are the sorts of diseases, sorts of situations, where the agency is most committed to working with patient groups and companies to generate the clinical data as rapidly and completely as possible, so that products can be approved for these situations.

There has been a considerable amount of discussion about the testing of this product in the past and the data in the past have not been entirely consistent, sometimes looking favorable, sometimes not. I think that there is information that will be reviewed at this meeting that will be very important.

ACCOUNTING FOR PDUFA FUNDS

Senator COCHRAN. I know that we have on the books a law that permits user fees to be collected for pharmaceutical applications, licensing, and other activities to, in effect, accelerate and avoid delays from occurring through FDA's system. That is up for reauthorization and we are encouraging our friends on the legislative committee to look at that and provide new authority to continue that program. The industry seems anxious to see that is continued as well.

I would hate to get in a position to know that the FDA is taking money from that process and using it to check ID's of 27-year-olds who are buying tobacco products. That is part of, as I understand, your tobacco regulatory procedure. I am hearing from people who own grocery stores, who own other businesses where tobacco products are sold, and they hear about this new regulation that you are going to enforce, requiring them to check the ID's of anybody who is 27 years old or younger?

Dr. FRIEDMAN. You ask two important—

Senator COCHRAN. Although the law applies to 18-year-olds. Is that what I understand?

Dr. FRIEDMAN. You ask two important questions, sir. Let me respond to the first one, and then I would ask Mr. Schultz to please respond to the second.

Your point that there has to be scrupulously careful and transparent accounting for funds is something that we absolutely agree with and believe in. So that the whole purpose of the user fee program was to have money allocated for review functions identified and trackable for certain products, and we have been very careful to make sure that those funds are used only for those activities.

So one of the concerns you have—and it is a very appropriate concern—is, as more pressure is placed on the financial resources of the agency, can we continue to assure this committee that we will be as careful and as scrupulous and as transparent about our accounting as we have in the past? I absolutely commit to that, sir. That is required by the law.

EXPENDITURE PRIORITIES

Senator COCHRAN. I do not want you to be that scrupulous, because you have not been very scrupulous at all in my view. I can

PART 1

1093

show you where we have outlined in categories of importance and priorities where we think the FDA dollars ought to be spent, and then you come up and show us where you did spend them and they are totally different from what we have outlined in our bill and in our committee report.

That is one of the hardest things to get the FDA to do, and that is to stick by its word on how it is going to use the funds when we appropriate them, and even to the point of, I think, callous disregard of the views of the Congress on where the funds are appropriated, as to how the funds are spent by FDA. We cannot find out how you are using the money. Until this year, we could not find out what you are spending on rent. We have a rental account and you also take money out of salaries and expenses and spend it on rent.

I would like for you to tell us in the budget request, an amendment, submit an amendment and tell us how much you need next year for rental or office space expenses. We cannot find that clearly indicated in the budget, and every year we get a runaround when we try to find out these and other FDA costs.

Dr. FRIEDMAN. Sir, I am very sorry that there seems to be a miscommunication on this. We very much want to be responsive to your requests in this regard.

Each year we have submitted to Congress a formal accounting of our user fee activities, and I thought that was the initial thing that you were talking about. We very much would like to meet with you or your staff or any members of the committee to go through that in sufficient detail to be clear.

With respect to your second point, which is providing to the committee in a format that you find useful and helpful the information that you need to help make these decisions, let me assure you, sir, that we very much want to do that.

Mr. Byrd wanted to comment.

Mr. BYRD. Yes, Senator Cochran; we have attempted to provide the information that the committee has requested. We have redesigned our submission to this committee for fiscal year 1998 to identify the total required for rent. This total is \$69 million, \$46 million provided by the General Services Administration, and the remaining \$23 million from salaries and expenses. So we tried to provide the information that was requested.

Dr. FRIEDMAN. But the point is, sir, this is not to say that what we did was as helpful to you as you would like. What is more important to convey is our willingness and interest. We cannot ask you to make really hard decisions, we cannot ask you to be as helpful to the agency and the public health as you can be, if you feel like you are not getting the kind of information that is most useful to you. So this is very important to me.

Senator COCHRAN. I just have the impression that we are being intentionally misled by this agency on the issue of the budget. That is why last year we tried to spell out as clearly as we could what our views were about how the funds that we were appropriating should be spent in terms of emphasis, program area and office. That accompanied the appropriation. That has not seemed to work as well as we thought it might. So I think your invitation—

Dr. FRIEDMAN. I am sorry.

PART 1

1094

EXPENDITURE PRIORITIES

Senator COCHRAN. I think your invitation for us to get together, have staff meet and talk about this and go over in some more detail our concerns and why I am a little aggravated by it all—because I do not have this problem, I do not know of this problem in any other agency under the jurisdiction of this committee.

But FDA every year seems to delight, seems to delight, frankly, in not cooperating in an open discussion of how funds are being used or how they will be used in the future that are appropriated by the committee.

So let us work on it.

Dr. FRIEDMAN. Thank you.

Senator COCHRAN. We cannot settle it right now, but I appreciate your listening to me.

Dr. FRIEDMAN. I appreciate the depth of feeling about this and the concerns that you are raising, and we take it very seriously.

Senator COCHRAN. Well, I appreciate that. This is going to be a tough year if we cannot get the reauthorization in a timely manner of the prescription drug user fees, and if you continue to assume things that you know are not going to happen, like \$132 million of new user fee authority. I do not think I am exaggerating when I am saying that is really a “pie in the sky” kind of assumption.

So what you are doing is you are putting this committee in a position of having to reduce the funds that you say you have got to have by \$132 million. We do not have the authority to grant you that request. And then you do not have any plan for dealing with that. Where is it going to come from?

So we have got serious problems. This agency has got serious problems, and that is another reason why I am concerned. We want to be helpful. You have got immense responsibilities under the law and by regulations you are making some new ones. Interesting.

Mr. SCHULTZ. Do you want us to talk a minute about the tobacco, the 27-year-old requirement, that was the other part?

Senator COCHRAN. Not really.

SUBMITTED QUESTIONS

There are others on the committee that may submit questions and we hope you will respond to them in a timely way, and we have additional questions as well that we will submit.

But let me thank you for your attendance and your submission of your request to the committee and your response to our questions today. Thank you very much.

Dr. FRIEDMAN. Thank you, sir.

[The following questions were not asked at the hearing, but were submitted to the agency for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FOOD SAFETY INITIATIVE

Question. The fiscal year 1998 request proposes a \$24 million increase over the fiscal year 1997 enacted level for the Administration's Food Safety Initiative. Of this amount, \$20 million is for the FDA's Foods program and \$4 million is for the Animal Drugs and Feeds program. What specific activities will be undertaken with the additional funds proposed for the Foods program and for the Animal Drugs and Feeds program as part of the Administration's Food Safety Initiative?

PART 1

1095

Answer. FDA is requesting \$24 million in the fiscal year 1998 budget to begin implementation of a series of initiatives to reduce, to the greatest extent possible, the annual incidence of foodborne illness and resultant economic losses to consumers and industry by enhancing the safety of the nation's food supply. Meeting this goal involves the collaborative efforts of several agencies, including the Food and Drug Administration, the Centers for Disease Control and Prevention, the Environmental Protection Agency, and the United States Department of Agriculture. The goal is in concert with the objectives of the HHS strategic goals, Healthy People 2000, the CDC emerging infectious diseases initiative, the Vice President's National Performance Review, and the Office of Science Technology Policy's, "Meeting the Challenge," as well as other Presidential directives focused on enhancing the health and well-being of children and the elderly. This funding will provide for the initial steps toward achieving the long-term national goal of reducing the annual incidence of foodborne illness, and setting the groundwork for this multi-year, collaborative undertaking.

The need for this initiative is constantly growing. Although the U.S. food supply is unmatched in quantity and quality, foodborne illnesses threaten public health and contribute significantly to the escalating cost of health care. Of all the hazards associated with foods, microbial hazards account for 90 percent of the confirmed foodborne outbreaks and cases. Among the various contaminants that may cause foodborne illness are *E. coli* 0157:H7, *Salmonella enteritidis*, *Campylobacter jejuni*, *Toxoplasma gondii*, *Cryptosporidium parvum*, Norwalk virus, and chemical hazards such as methyl mercury.

The Council for Agricultural Science and Technology—a private, nonprofit scientific organization—estimated in its 1994 report entitled, "Foodborne Pathogens: Risks and Consequences," that between 6.5 and 33 million illnesses and up to 9,000 deaths occur every year in the United States, because of microbial contamination of food. Chemical hazards, on the other hand, more commonly cause chronic health effects, which are difficult to estimate. Hospital stays associated with microbial foodborne illnesses are estimated to cost society more than \$3 billion a year. The estimated total costs of foodborne illness are at least \$5.6 billion. Since foodborne chemical hazards often present chronic rather than acute health threats, specific estimates of their impact on health and the economy are not as readily available.

The costs of foodborne illness are borne by those who become ill and their families, coworkers, and employers, as well as the food industries, and taxpayers. Costs to stricken individuals include medical bills, time lost from work, pain and inconvenience. Food industry costs include possible product recalls, establishment closings and cleanup, and higher premiums for product liability insurance. Perhaps most costly in the long term is the loss of product reputation and reduced demand when an outbreak occurs and is publicized. These and other "defensive" industry costs of foodborne disease run in the millions of dollars annually and are, for the most part, entirely avoidable. Taxpayer costs include medical treatment for those who cannot afford it and higher health insurance premiums.

One indicator of the breadth of the problem posed by foodborne hazards is the increased number of FDA-regulated food product recalls because of life threatening bacteria—Class I recalls due to microbial contamination. The number of these recalls climbed from seventy-nine in 1988 to 378 in 1995. These recalls also impose an economic burden on industry and consumers. FDA estimates that the total annual recall costs for FDA-regulated products to industry and indirectly to consumers are roughly \$42 million.

Further, the food supply, as well as consumer tendencies and preferences, is changing in many ways that could contribute to an increased risk of foodborne illness. A generation of consumers who have grown up with the freezer and a microwave, have neither the experience or knowledge to always recognize or correct potentially hazardous food handling and preparation behavior. Vulnerable populations, such as immuno-compromised persons and the elderly, are continuing to grow in size. By the year 2020, twenty-five percent of the U.S. population will be sixty-five or older. Adding to this number are infants, hospitalized people, individuals receiving immuno-suppressive treatments, chronically ill people with diseases such as cirrhosis, and people receiving antimicrobial therapies, such as antibiotics. Also, there are approximately fifty to sixty thousand new cases of HIV/AIDs every year, and the number of cancer patients has increased markedly in the last twenty years. As a result, today, more than thirty million people are likely to be at high risk from foodborne microorganisms. Microorganisms are adapting to their environments, developing pathogenic characteristics and resistances to conventional food preservation and disinfection techniques that contribute to the incidence of foodborne illness, and new pathogenic strains continue to emerge, such as *S. enteritidis* phagetype 4. The food industry has evolved into a relatively small number of large producers making

PART 1

1096

it possible for a contaminated product to be distributed nationally or even internationally. Also, the number of retail establishments processing foods on-site is growing rapidly.

In response to this growing problem, the Administration—through a coordinated FDA and CDC, USDA, and EPA effort—is planning a Food Safety Initiative to implement new, and bolster existing, food safety intervention measures. These efforts represent involvement by the key components of the Federal food safety system—Federal, State, and local public health agencies—and integrate elements pivotal to food safety such as surveillance, coordination, inspections, consumer and industry education, risk assessment, and research. The range of planned activities will lay a foundation of cooperation and communication to rapidly deal with emerging public health hazards. The overall benefit and outcome of this initial phase of the national Food Safety Initiative will be reduced incidences of foodborne illness and all of the benefits that carries with it, such as reduced health care costs for consumers and industry, reduced costs to industry in recalled product and loss of reputation, reduced productivity losses, and increased awareness and knowledge of appropriate behavior to combat foodborne illness.

I will provide, for the record, a table which outlines the specific activities and amount of funding for each.

[The information follows:]

Fiscal year 1998 budget—Food Safety Initiative

Foods Program:

Surveillance: Monitoring pathogen levels, support FoodNet foodborne illness surveillance sites	\$1,660,000
Coordination of outbreak response	550,000
Risk assessment: Risk assessment consortium, exposure assessment	3,950,000
Research: Analytical methods, pathogen control and preventive techniques, food handling	3,900,000
Inspections: Implement seafood HACCP, State partnerships, Lab certification	7,870,000
Education: Consumer/retail education	2,070,000
Subtotal, Foods	20,000,000

Animal Drugs and Feeds Program:

Surveillance	1,500,000
Research	2,500,000
Subtotal, Animal Drugs and Feeds	4,000,000

Total, FDA

Total, FDA	24,000,000
------------------	------------

Surveillance (\$3,160,000).—Surveillance and investigation of foodborne disease are powerful ways to detect new foodborne disease challenges, to determine what the specific food sources are, and to learn how best to prevent foods from becoming contaminated in the first place. The objectives of this funding are to: establish a new national early warning system for outbreaks of foodborne disease, enhance microbiologic monitoring and surveillance activities related to pathogen reduction, and improve the monitoring of layer hens and bulk liquid egg products for Salmonella contamination before pasteurization.

The effect of these efforts to detect foodborne illness outbreaks in combination with intervention efforts, such as product recalls, reduces the number of illnesses in the outbreak and generates health benefits as shown for the 1993 outbreak of *E. coli* 0157:H7 in hamburger. An estimated additional 800 illnesses were prevented because an in-place surveillance system detected the outbreak, which quickly triggered a recall of the implicated food and reduced the potential of health care costs.

FDA will expand the ongoing national surveillance of antimicrobial resistance from food producing animals to determine the impact of antibiotic drug use in animals.

—FDA's Center for Veterinary Medicine (CVM) in coordination with CDC, and USDA/ARS has developed a National Antimicrobial Susceptibility Monitoring Program for *Salmonella* and *E. coli* 0157:H7 isolates from both animals and humans. This monitoring program will be expanded with Food Safety Initiative, FSI, funds to include additional surveillance sites, new sources of isolates and *Campylobacter* isolates.

PART 1

1097

- FDA in collaboration with CDC and USDA will develop a protocol for response activities and information dissemination as a result of findings from the surveillance system.
- Immediate follow-up will include outbreak investigations and field studies in response to “red-flag” events.
- FDA will develop a comprehensive education program to disseminate the findings from the monitoring program to all stakeholders.
- FDA will initiate collaborative international technology exchange and assist in the development of relevant international databases.

Coordination (\$550,000).—The goal of improved coordination of foodborne illness response, particularly in emergencies, at federal, state and local levels of government, is to ensure that responses are rapid and effective, and ensure the best use of government resources, while avoiding unnecessary duplication of effort.

The objective of this initial phase is to create, at the Federal level, an emergency response system which improves existing channels of communication and develops new lines of communication between the Federal agencies responsible for investigating foodborne illness. FDA’s role in initiating control and prevention measures (e.g., working with industry to remove implicated products from the market) is critical to the success of any response system. As a result of the Federal-Level Interagency Coordination Group managing responses and improving communication of critical data and information, these efforts should result in a more rapid identification of foodborne illness outbreaks and implementation of control measures.

Risk Assessment (\$3,950,000).—The goal of risk assessment is improved health risk estimates associated with microbial and chemical foodborne hazards to facilitate the development and evaluation of surveillance plans, risk reduction strategies, regulations targeted to specific hazards, implementation of HACCP practices, and research programs to enhance food safety.

This initial phase will: 1) establish a Risk Assessment Consortium to provide leadership, consistency, and transparency in risk assessment; 2) improve data and modeling techniques to assess exposure to microbial and chemical hazards, including animal drug residues, in the food supply; 3) begin development of improved and more standardized risk assessments to facilitate the ranking of food safety concerns to provide for better health protection and more efficient utilization of resources; and 4) provide a science-based level playing field in support of U.S. positions in international trade.

Favorable outcomes would include providing a foundation for developing better risk assessments, which would result in more focused surveillance and research efforts, and regulatory initiatives. The ultimate result is identification of trends in causes and sources of foodborne illness, and development of methods to rapidly identify specific sources in an outbreak. These two factors will shorten the time to identify an outbreak and its source, speed control measures into place, and prevent growth of the outbreak, illnesses and possible deaths. Even modest improvements in the existing system can yield potential savings to both industry and consumers of thousands, and even millions of dollars.

Research (\$6,400,000).—The goal of research initiatives is new, improved tools, screening methods, and analytical methods to more rapidly and accurately identify and characterize foodborne hazards, evaluate the effectiveness of surveillance initiatives and control and prevention strategies, conduct risk assessments, and verify effectiveness of preventive techniques such as HACCP.

This initial phase will make available new, rapid, sensitive, and accurate screening and analytical methods for microbial and chemical hazards to do the following: detect and identify the source of foodborne illness outbreaks in surveillance and monitoring activities; verify critical control points in HACCP programs; support development of educational materials; and provide scientific underpinning for the execution of FDA monitoring, regulatory, and enforcement activities to reduce the incidence of foodborne illness.

These efforts should enhance capability for identifying and monitoring changes in microbial resistance to a wide range of factors (e.g., heat, cold, acid, high salt), and develop/evaluate preventive techniques for use during production, handling, distribution, and storage processes, and enhance capability to detect and identify microbial and chemical hazards in settings such as the processing environment and in distribution. (This capability can be a basis for formulating preventive strategies and verifying controls in HACCP programs.) Further, this capability would improve the ability to detect and identify resistant microorganisms and identify determinants that may affect susceptibility and around which analytical methods and preventive techniques, (such as new effective cleaning and disinfection methods for facilities and heat-sensitive foods and new feed and food processing parameters), may be designed. Finally, development of new or improved screening and analytical

PART 1

1098

methods to detect, identify, and quantify microbial and chemical hazards will permit rapid execution of the intertwined coordination, surveillance, inspection, education, and risk assessment elements of an efficient, effective food safety program.

Further, FDA will conduct research to better understand antibiotic animal drug resistance to limit the impact of antibiotic resistance on animal and human health:

- Identify and characterize the factors that led to the development of multiple drug (antibiotic) resistance in foodborne pathogens in farm and aquaculture animals;
- Investigate techniques for manipulating the microbial ecology of the intestinal tract of agricultural and aquaculture animals to prevent the development of antibiotic resistance or select for nonresistance.

FDA will expand research in the areas of prevention, reduction, and elimination of pathogens in animals and animal feeds. For *Campylobacter*, *Salmonella*, *Toxoplasma*, *E. coli* 0157:H7, and other Shiga-like toxin-producing *E. coli*, and *Cryptosporidium*, FDA and USDA, often in partnership with universities and industry, will:

- Expand research into the microbial ecology of foodborne pathogens and how initial colonization in animals can be prevented.
- Expand research on new methods to reduce or eliminate pathogenic microorganisms and mycotoxins from agricultural and aquaculture animals before slaughter or harvest, including the use of probiotics.
- Initiate research to develop new techniques for eliminating animal feeds as a source of foodborne pathogens.

Inspections (\$7,870,000).—The goal of inspections is more efficient and effective monitoring of the safety of the food supply.

This initial phase will: 1) more quickly implement the seafood HACCP regulations, expand the use of HACCP systems to non-seafood establishments, and work to apply HACCP principles to retail food service operations, as well as to the slaughter of animals used for food; 2) enhance Federal/State partnerships to ensure consistency in inspection technique across Federal, State, and local levels, to better coordinate with the States, and eliminate duplication of efforts; and 3) develop a laboratory certification program enabling private parties to test samples of food for adherence to food safety regulations.

Education (\$2,070,000).—The goal of education is to provide food safety education programs and materials to change unsafe food handling behavior used in the home and in retail and institutional food service operations.

This initial phase will: 1) develop more effective methods for providing food safety education materials and services to consumers and to food service operations, especially those providing food to populations at high risk in hospitals, nursing homes, assisted living facilities, child day care, and senior day care; 2) develop and initiate implementation of a national food safety education program for all segments of the retail food industry using the concepts set forth in the Food Code; 3) form an alliance, joining expertise of Federal, State and local health agencies, industry, and professional and trade associations to develop improved education activities on food safety issues, promotion of the Food code and/or the food safety parameters; and 4) develop education/communication techniques targeted to specific groups to overcome current barriers to communicating appropriate food safety behaviors to food service workers.

An estimated 50 million people are now reached with consumer information, only some of which is safe food handling information. It is anticipated that implementation of this phase of the initiative, along with the other elements of the initiative, will result in a significant increase in the number of consumers and food service workers being reached with food safety messages. But, more importantly, this initiative will target changed behavior as its goal rather than information dissemination as previous education initiatives have done.

Question. What is the fiscal year 1997 level of funds for FDA's food safety activities? Please indicate how much is currently being spent by program.

Answer. The \$24 million requested in the fiscal year 1998 budget would provide increased funding to FDA's Foods and Animal Drugs and Feeds programs, and their related field activities. For fiscal year 1997, the Foods program estimates expending nearly \$194 million on activities directly and indirectly related to the proposed Food Safety Initiative in the areas of chemical and microbiological safety of foods, and nutrient quality and food labeling. In the Animal Drugs and Feeds program, \$37.5 million is estimated to fund the traditional activities of preapproval evaluation and monitoring of marketed drugs and feeds which relate either directly or indirectly to the proposed Food Safety Initiative.

Question. The President's Food Safety initiative is described to involve the collaborative efforts of several agencies, including the Environmental Protection Agency,

PART 1

1099

the Center for Disease Control, and the USDA. Does the success of this initiative rely on each of these agencies receiving the funding increases requested in the President's fiscal year 1998 budget?

Answer. The success of the initiative does depend upon each Agency receiving the funding increases requested in the President's fiscal year 1998 budget. The anticipated benefits and outcomes cannot be achieved by implementing only one or a few of the elements. There are many causes of foodborne illness, many points at which foods can become contaminated, and many factors that make some groups of people more susceptible than others. Therefore, no single measure alone could ensure as completely, the safety of all foods. While minimal improvements could be made with partial funding, the goals of reducing the incidence of deaths and illnesses associated with foodborne pathogens, as set forth in the Food Safety Initiative, could not be achieved.

Question. The FDA justification indicates that "The overall benefit and outcome of this initial phase of the national Food Safety Initiative is a reduced incidence of foodborne illness and all of the resulting benefits such as reduced health care costs for consumers and industry, lower costs to industry in recalled products and loss of reputation, reduced productivity losses, and increased awareness and knowledge of appropriate behavior to combat foodborne illness." How will this initial phase of the Food Safety Initiative achieve the benefits and outcomes you indicate and how will you measure your success in these areas?

Answer. The goal of the Food Safety Initiative is to reduce the incidence of foodborne illness to the greatest extent feasible. The activities outlined in the initiative build on previous Administration steps to modernize our food-safety programs and respond to emerging challenges. Our understanding of many pathogens and how they contaminate food is limited. For some contaminants, we do not know how much must be present in food for there to be a risk of illness. For others, we do not have the ability to detect their presence in foods. The public health system in this country has had limited ability to identify and track the causes of foodborne illness. Federal, state, and local food safety agencies need to improve coordination for more efficient and effective response to outbreaks of illness.

The fiscal year 1998 budget provides the first steps in achieving the overall benefits and outcomes. The Administration will initiate a strategic planning process to develop a plan for improving the food safety system over the long term. The process will facilitate the participation of all interested parties and provide extensive, structured discussions to develop strategies for achieving change and ways for measuring progress. We anticipate that over the long term improved surveillance is going to result in higher, but more accurate, outbreak numbers. Ultimately, progress and goal achievement can be measured based on declines in the number of foodborne illnesses and deaths, and declines in the number of outbreaks using the more accurate figures. In addition, more effective prevention and intervention programs, more rapid responses to outbreaks, increased inspection coverage, changes in behavior, and better detection and quantification methodologies, could all be measured as a means of determining the effectiveness of our efforts.

Through this Food Safety Initiative, as well as other Administration activities, the groundwork for planning future activities will be available to tackle some of the more difficult public health, resource, and management questions facing federal food safety agencies. The Administration recognizes that these initial phase actions will significantly improve the safety of the nation's food supply, but that a longer term strategy is also needed. The President has requested further information regarding longer term goals of the multi-Agency initiative which will be available soon.

Question. If this is the initial phase, what additional phases are planned and what additional funding will FDA require to carry out each phase of the President's Food Safety Initiative?

Answer. Beyond fiscal year 1998, at minimum, a constant level of funding would be required to assure whatever progress was achieved with the initial phases of the Food Safety Initiative are not lost. However, we have not determined exact long-term budgetary requirements, but would operate under the fact that the federal food safety agencies are committed to continuing to meet with stakeholders and ultimately developing a strategic plan for continuing to improve the food safety system. At the President's request, each agency is participating in an interagency group to develop longer-term strategies which should be completed soon.

FDA FOOD SAFETY RESPONSIBILITIES

Question. How many food processing plants does the FDA inspect annually? How does this compare to ten years ago? to five years ago? How many FDA-regulated plants are there?

PART 1

1100

Answer. FDA uses a variety of establishment types to categorize the business activity of firms of regulatory interest in its Official Establishment Inventory. Since the term food processor is not one of these categories, we are defining food processors as plants categorized as manufacturers and repackers. In fiscal year 1987, FDA inspected 7,235 food processors, in fiscal year 1991 7,625, and in fiscal year 1996, 6,543.

There are almost 25,000 food and seafood manufacturers and repackers in FDA's Official Establishment inventory. Let me provide for the record, a table showing the historical numbers of repackers included in our inventory.

[The information follows:]

OFFICIAL ESTABLISHMENT INVENTORY—FOOD AND SEAFOOD MANUFACTURERS/REPACKERS NATIONAL TOTALS

Fiscal year	Food and seafood manufacturers and repackers count	Seafood manufac- turers and repack- ers count
1987	24,761	3,076
1991	24,059	3,286
1996	24,770	3,342

Question. Please describe FDA's inspection coverage of imported foods. Has the FDA enhanced its inspection coverage of imported foods over the past ten years? Is there increased concern over the safety of imported foods?

Answer. Commercial food products coming into the United States must be declared through Customs which automatically notifies FDA. FDA then takes one of several possible actions. First, the product may be released without examination, or second, FDA may physically examine the product at the dock, take samples for analysis in one of the agency's laboratories, or detain the product without physical examination. Products are detained without physical examination if we have previously had a specific problem with a product offered for import or with products from a specific firm in a foreign country.

In fiscal year 1996, FDA conducted approximately 55,142 wharf examinations and import sample collections, analyzed 19,515 samples, and detained approximately 6,872 products without physical examination.

The number of imported food products entering the United States has doubled over the last five years to approximately 2.2 million import entries per year. Meanwhile, wharf examinations and sampling of foods being offered for import into the United States have dropped by 50 percent in just the past four years. Given these changes, and the increased frequency of outbreaks such as hepatitis in frozen strawberries, there is increased concern over the safety of imported foods. The inter-agency Food Safety Initiative is the Administration's attempt to respond to this heightened concern.

Question. FDA is in the process of implementing a Hazardous and Critical Control Point (HACCP) system for the inspection of seafood. Would you please give us a status report on the implementation of this system. What level of funding is being allocated for this activity for fiscal year 1997? How much is included in the fiscal year 1998 budget request for implementation of seafood HACCP?

Answer. FDA's Seafood Hazard Analysis and Critical Control Point, or HACCP, regulations were published in December 1995 and become effective in December 1997. HACCP is a system of preventive controls for safety that is implemented by the industry. Each processor's HACCP system must follow several basic principles but otherwise may be tailored to the circumstances of that processor. FDA's role in this system is to issue minimum ground rules in the form of its seafood HACCP regulations, provide the industry and the public with information about the program, and technical assistance on how to develop and operate effective HACCP systems, verify through inspections that the industry is meeting its responsibilities as of the effective date, obtain corrections when those responsibilities are not being met, and evaluate the national program and fine tune it as necessary. I will provide, for the record, the status for each component of FDA's role in implementing Seafood HACCP.

[The information follows:]

The regulations.—The regulations were developed through a process involving extensive public input and comment. FDA's philosophy in developing the regulations was that (1) every commercial processor should be responsible for understanding the potential safety hazards associated with its products and maintaining reasonable

PART 1

1101

controls to eliminate or minimize those hazards; and (2) FDA's regulations should not be so burdensome as to make the achievement of (1) impossible. FDA will be monitoring the program closely to determine whether this is the case.

Public information.—The Agency has engaged in an aggressive public information program to help the industry and the public generally understand HACCP and what will be expected as of the effective date of the program. FDA held public meetings in Boston, Baltimore, Tampa, New Orleans, Oakland, and Seattle, and also in individual FDA district offices. The regulations and explanatory materials have also been placed on FDA's home page on the Internet (<http://www.fda.gov>).

FDA has also been active internationally. Over 50 percent of seafood consumed in the U.S. is imported. Both imported and domestic seafood are subject to the regulations. FDA has attended conferences and made presentations at such venues as the World Aquaculture Society Meeting and Seafood Show in Bangkok, at Bombay and Cochin, India, in the Philippines, Singapore, Indonesia, and elsewhere. The Agency made a presentation for the staffs of 37 embassies in Washington, D.C. Several workshops for importers are scheduled in the near future at various sites around the country.

Technical Assistance.—FDA has provided technical assistance to the industry through written guidelines and training.

Written guidelines.—The seafood HACCP regulations are relatively short and general to allow for flexibility in the design of HACCP systems. Alone, however, the regulations provide processors with little detail on how to actually develop, install, and implement a HACCP system. Consequently, FDA developed the "Fish and Fishery Products Hazards and Controls Guide," which provides the Agency's best advice on safety hazards that are likely to occur on a product-by-product basis and on controls that are available for those hazards. The Guide was first issued in draft form with a public comment period and has now been published as a "First Edition." Additional public comments are being received and FDA will update the Guide to reflect changes as a result of these comments prior to the effective date of the program. The Guide will be revised as needed to reflect future comments received.

Training.—The regulations require that, within each processing operation, certain HACCP functions be performed by a trained individual or by someone with equivalent knowledge obtained through on-the-job training. The "Seafood HACCP Alliance" consisting of Federal agencies, State regulatory officials, the Association of Food and Drug Officials, academia, and industry trade associations, was formed for the purpose of developing a uniform, core curriculum for seafood HACCP training and to develop a cadre of trainers to deliver this course. The Alliance developed a 2½ day training course in basic seafood HACCP, including how to write a HACCP plan. The course was first offered to prospective trainers ("train the trainers") and is now being provided by those trainers to the industry for nominal cost (not exceeding \$150). It has also been taught to FDA's seafood inspectors. FDA estimates that about 2,000 individuals have now taken this course.

FDA then developed a follow-up course, solely for regulators, on how to audit a processor's seafood HACCP system. It was initially presented on March 26 and March 27, 1997 by satellite down link to sites around the country. About 800 Federal and State inspectors and other personnel participated in this initial offering. The course was repeated recently in Maryland, primarily for state personnel in that region. It is an interactive course with facilitators at each site.

Verification and Evaluation.—Once the program becomes effective, FDA will be responsible for verifying compliance, obtaining corrections, and evaluating the program as a whole. Internal preparations are underway on these matters. One way that FDA is preparing is by inviting processors with HACCP systems in place before the effective date to have these systems reviewed by FDA as a non-regulatory aspect of an otherwise regulatory inspection. Processors will receive helpful feedback and FDA inspectors will obtain valuable experience.

Leveraging.—To the extent that HACCP becomes a "common language" for both seafood processing and for inspections, it provides an opportunity for the leveraging of inspection resources, both domestically and internationally.

Domestic.—FDA is in the process of developing a model partnership agreement for seafood HACCP inspection and beginning negotiations with states toward entering into partnerships. HACCP provides a new opportunity for inspection partnerships with states through which FDA and the state regulatory agency could divide the inspection workload between them and then combine the results in a common database. Such partnerships would help avoid duplication of effort and, by pooling results into a national database, greatly enhance the credibility of the U.S. seafood inspection system both domestically and internationally.

International.—Several countries have requested that FDA determine that their HACCP-based regulatory systems for seafood are equivalent to the U.S. system

PART 1

1102

based on the FDA seafood HACCP regulations. FDA is now reviewing whether equivalency does in fact exist for those countries. To the extent that HACCP becomes an international norm, it facilitates equivalency agreements between nations that trade in seafood. In essence, an equivalency agreement acknowledges that the regulatory systems of two countries provide the same level of protection to consumers, although the measures for achieving that level of protection may vary. Where equivalency has been determined to exist, consumers in an importing country have a better assurance of safety than would be realistically possible solely through sampling at ports of entry. Trade is also promoted because equivalent countries do not need to engage in rigorous sampling of each other's products. Finally, equivalency agreements allow countries to focus their limited regulatory resources toward countries where equivalency does not exist.

Molluscan shellfish.—Last year, the Interstate Shellfish Sanitation Conference adopted virtually the entire FDA seafood HACCP regulation for the purpose of applying it to the processing of raw molluscan shellfish. This year, the Conference is expected to complete that effort by revising its Manual of Operations to make it compatible with HACCP and HACCP-based inspection.

FDA estimates that during fiscal year 1997, approximately \$4.7 million will be spent on preparation activities for the implementation of Seafood HACCP. Actual implementation of Seafood HACCP will begin during fiscal year 1998. If the Food Safety Initiative is funded, FDA anticipates spending a total of \$26.8 million through this new source of funding plus a redirection of existing funds. With Food Safety Initiative funds, and the addition of new inspectors for Seafood HACCP, FDA estimates that approximately 1,000 high risk firms will be inspected in fiscal year 1998. The Food Safety Initiative will allow FDA to annually inspect the entire inventory of 3,300 firms by the year 2000. Significant results of the additional resources will not be seen during the first year of implementation, during which time, the new inspectors will be hired and trained.

Question. How often are seafood plants inspected by the FDA?

Answer. In fiscal year 1995 FDA inspected about 45 percent of the seafood inventory. In fiscal year 1996 FDA inspected about 46 percent or 1,546 facilities. This is a dramatic increase from the 28 percent of the 936 manufacturers or processors inventory that was inspected in fiscal year 1987.

Question. I understand that the FDA is considering the implementation of HACCP for other food commodities. Is this true? Has the industry been involved in FDA's plans?

Answer. FDA has published an Advance Notice of Proposed Rulemaking—ANPR—asking for public comment about whether and how the Agency should develop regulations that would establish requirements for a new comprehensive food safety assurance program based on a HACCP approach for both domestically produced and imported foods other than seafood. Our goals in establishing additional food safety regulations would be to make the food supply safer through prevention of food safety problems, enable FDA and its State and Local counterparts to make more efficient use of the existing resources devoted to ensuring food safety, and enhance the ability of the Federal Government to provide consumers with the assurance they seek that the U.S. food supply is safe. The comments received have been compiled and summarized, and are being considered by the Agency in determining the next steps in FDA's food HACCP program.

FDA invited the food manufacturing industry, through an announcement in the Federal Register, to participate in a voluntary HACCP Pilot Program. Seven volunteer firms met the stated criteria and were accepted into the pilot. The pilot program has been completed with five of the original participants. Several of these firms have advised FDA that they are adopting HACCP corporate-wide and have invited FDA to periodically review operations at the additional sites in conjunction with corporate audits. FDA is recruiting additional participants to ensure the pilot program will include a broad spectrum of food types, geographic locations, firm sizes, and types of food safety hazards.

In addition, FDA held a public meeting in December, 1996, to review the current science, including technological and safety factors, relating to fresh juices and to consider any other measures necessary to provide safe fruit and vegetable juices. Public testimony was provided and interested persons were given an opportunity to submit additional written comments. FDA intends to initiate rules providing procedures for the safe and sanitary processing in the manufacture of fruit and vegetable juice through the application of HACCP principles and to require firms to use HACCP systems in the manufacture of fruit and vegetable juices. A system of preventive controls is widely recognized as the most effective and efficient way to ensure that food products are safe.

PART 1

1103

YOUTH TOBACCO PREVENTION INITIATIVE

Question. Of the \$34 million proposed for fiscal year 1998 to implement FDA's final rule for the regulation of nicotine-containing tobacco products, how much is for outreach and how much is for enforcement?

Answer. Of the total \$34 million proposed for fiscal year 1998 to implement FDA's final rule for tobacco products, \$10 million will be used for outreach activities. The remaining \$24 million will be used for enforcement, the bulk of which will be provided to the states via contracts with state and local agencies.

Question. What specific outreach activities will be carried out and what is the cost of each?

Answer. In fiscal year 1998, we plan to intensify our outreach efforts to educate the retail community and the public about the age and photo ID provisions and to encourage retailers to comply with these measures. We plan to do a mailing to hundreds of thousands of retailers each quarter informing and reminding them of their responsibilities under the regulation. Further, in response to retailers' requests, we plan to print color posters for retailers to place in their stores explaining to customers the new requirements and urging customers under 27 to have their ID ready when buying cigarettes or smokeless tobacco. These posters will be printed in English and in Spanish and will be made available for free to retailers and others calling the hotline. FDA also will print, promote, and disseminate brochures for retailers and the general public and will develop and place exhibits at events attended by retailers, public health officials, and others. At the point at which FDA signs a contract with a new state to conduct compliance checks, FDA plans to alert retailers to the checks and remind them to comply with the age and photo ID provisions. Also, in states with whom FDA has contracted, FDA plans to place billboard, print, and radio ads in English and in Spanish informing retailers and the public that retailers must not sell to anyone under 18 and must card anyone under 27. Further, FDA will update the public on the extent of compliance it is achieving in different states. FDA also will develop materials for young people informing them about the new regulation and the serious public health problem it seeks to address. We will work with schools to disseminate videos, posters, brochures, and other materials to help discourage young people from attempting to purchase cigarettes or smokeless tobacco.

Approximately half of the outreach funding will be spent on educating retailers about their responsibilities via mailings to retailers, in-store posters, brochures, exhibits, videos and ads. The other half will be spent trying to discourage young people from buying cigarettes and smokeless tobacco and informing parents, teachers, state and local health officials about the new regulation.

Question. What specific enforcement activities will be conducted and what is the cost of each?

Answer. The bulk of the \$24 million will be spent on contracts with state and local officials for the enforcement of the final tobacco regulation. Remaining enforcement activities will primarily consist of follow-up actions based upon the compliance checks conducted under contract by state and local officials.

Question. What level of funding will be provided to State and local officials to enforce the rule? Will all State and local governments receive funds? If not, which State and local governments will receive funds? How will these be selected? What level of funding will each receive? What enforcement activities will these governments be required to carry out?

Answer. FDA has identified 10 states that have been asked to submit proposals for contracts. Money for the contracts has been set aside from the \$4.9 million allocated out of fiscal year 1997 funds. Other states will remain free to submit proposals and, if money is available after the first ten contracts are signed, additional contracts can be negotiated. With the money included in the fiscal year 1998 request, FDA expects to be able to contract with all states that submit proposals.

Question. The appropriations justification indicates that seven years after implementation of the rule, FDA's goal is a 50 percent reduction in the use of tobacco products by children and adolescents. How will FDA measure its success in meeting this goal?

Answer. In the preamble to the proposed rule, FDA indicated that it would measure smoking and smokeless tobacco rates by reference to the Monitoring the Future Project—MTFP—data, an annual survey performed by the University of Michigan, Institute for Social Research. The survey measures, among other things, cigarette and smokeless tobacco use by 8th, 10th and 12th graders. In addition, it looks at two measures: usage in the last 30 days, and regular usage. FDA intends to use some or an average of some of these data.

PART 1

1104

Question. The fiscal year 1998 budget indicates that FDA will spend \$4.9 million on tobacco in fiscal year 1997. How will this \$4.9 million be spent?

Answer. Of the \$4.9 million, \$2 million will be used to fund State Contracts, and \$1.9 million will be used for FTE support. The balance will be used to fund Outreach and Education efforts.

Question. Provide for the record an object class breakdown of FDA's \$4.9 million fiscal year 1997 level for tobacco and the \$34 million proposed for fiscal year 1998.

Answer. I would be happy to provide the requested object class information for fiscal years 1997 and 1998 for the record.

[The information follows:]

YOUTH TOBACCO PREVENTION INITIATIVE

[Dollars in thousands]

	1997 estimate	1998 estimate
Personnel compensation and benefits	\$1,713	\$1,801
Travel	50	50
Rent and utilities	60	40
Printing	500	500
Other services (contracts)	2,522	31,569
Supplies and materials	35	30
Equipment	20	10
Total	4,900	34,000

Question. What additional funding and staffing will be required to implement FDA's tobacco regulation in subsequent fiscal years? Please provide funding and staff year requirements by fiscal year.

Answer. FDA has not yet fully developed projections beyond fiscal year 1998.

ARKANSAS REGIONAL LABORATORY

Question. What is the status of Phase I construction of the Arkansas Regional Laboratory which was funded for fiscal year 1997?

Answer. Proposals for the construction of the Arkansas Regional Laboratory, or ARL, were received on April 30, 1997. It is anticipated that the Phase I construction contract will be awarded during the summer of 1997. Construction of the ARL Phase I would then begin in fall 1997. The fiscal year 1997 appropriation included \$13,000,000 for Phase I construction of the ARL. Phase I begins construction and provides the ARL building, foundation, substructure, superstructure, exterior enclosure, and roofing. Major building systems, such as fire protection, HVAC, electrical, and some site work, are also included.

Question. The fiscal year 1998 request includes \$14.550 million for Phase II construction of the Arkansas Regional Laboratory. What is the schedule for Phase II construction of this project? Will the funds requested be sufficient to complete Phase II of the project?

Answer. It is anticipated that the construction contractor will receive a Notice to Proceed on construction of Phase II of the ARL in the fall of 1997, with the completion scheduled in the fall of 1999. Occupancy is projected for early 2000. The fiscal year 1998 request for \$14,550,000 will complete the laboratory portion or Phase II of the construction of the ARL, by completing building systems and providing laboratory fit-out. The fiscal year 1997 appropriation of \$13,000,000 for Phase I of ARL will support construction of the building, foundation, substructure, superstructure, exterior enclosure and roofing as well as major building systems such as fire protection, HVAC, electrical and some site work. The construction bid process for Phase I is underway and will determine the exact amount needed to complete the ARL fit-out.

Question. How many additional phases of this project are planned? What is the cost of each phase and what funding will be required in each subsequent fiscal year to complete the project?

Answer. Phase III, initially estimated at \$9,800,000, will provide the renovation of the existing Building 50 in its entirety and completes the common ORA/NCTR administrative and support area. The complete ORA/NCTR project consists of a joint animal quarantine facility, renovated space located in NCTR Building 14 to accommodate ORA's dioxin analytical program prior to ARL construction, and construction

PART 1

1105

of Phases I, II, and Phase III to complete ARL, building 50 renovation and common area for ORA/NCTR administration and support.

The current cost projections are based on the Architect/Engineer estimate. The construction bid process is underway and when complete will provide an exact amount for the project. Additionally, FDA will fund an estimated \$2.43 million for ARL and Building 50 furniture as well as installing telecommunications, computers and security systems.

SALARIES AND EXPENSES REQUEST

Question. The fiscal year 1998 appropriations request for FDA's salaries and expenses account is \$820 million, \$67.5 million below the enacted fiscal year 1997 appropriations level. This net reduction does not include other offsetting reductions to accommodate the \$24 million increase proposed for the food safety initiative and the \$29.4 million increase proposed for tobacco. If these are considered, the reduction in appropriations for FDA's ongoing activities funded as part of the salaries and expenses account totals \$122.4 million—nearly a 15 percent decrease below the fiscal year 1997 level. This fiscal year 1998 salaries and expenses appropriations request will require the FDA to reduce staff by 1,120 full-time equivalent positions below the fiscal year 1997 level.

While the President's budget proposes that this reduction in the appropriation be offset by new user fees generating \$132 million in collections in fiscal year 1998, these new fees rely on the approval of the President's legislative proposals. In short, if the House and Senate authorizing committees do not recommend legislation establishing these fees, the FDA is going to be \$132 million short of the amount it proposes to need for fiscal year 1998. Those additional resources cannot be assumed by this Committee. In addition, collections assumed in the President's budget from two existing fees—the Prescription Drug User Fee Act and the Mammography Quality Standards Act—require reauthorization for fiscal year 1998. If the House and Senate authorizing committees fail to reauthorize these fees, an additional \$105,179,000 in collections assumed in the fiscal year 1998 budget request will not be available to the FDA.

What will be the impact on FDA's ongoing activities if this Committee approves the President's appropriations request for fiscal year 1998, which is 8 percent below the fiscal year 1997 enacted level and nearly 15 percent below the fiscal year 1997 level if the requested increases for food safety and tobacco youth prevention are approved?

Answer. The President's Budget assumes \$244 million in user fees, of which \$237 million would be new or re-authorized. The Budget was prepared on the reasonable assumption that those fees could be authorized, consequently allowing some budget authority savings to occur.

The Administration's budget for FDA should be viewed in total, keeping in mind that it fits in with the President's overall balanced budget plan by fiscal year 2002.

Question. If new user fees are not approved and the FDA's direct appropriation for its salaries and expenses account is frozen at the fiscal year 1997 enacted level, would FDA still propose that funding be shifted from its other activities to provide the increases requested for fiscal year 1998 for the food safety and youth tobacco prevention initiatives? If so, from which activities funded through the salaries and expenses appropriation would you suggest this funding be taken to accommodate these increases?

Answer. I am unable, at this time, to prioritize among the new funding included in the budget versus our traditional areas of concern. On the one hand, improving the safety of the food supply and keeping tobacco out of the hands of children are both initiatives of the utmost importance, and are very high priorities of the Administration. On the other hand, FDA's traditional activities of promoting and protecting the public health through premarket review and postmarket assurance are also of vital importance.

Question. Assuming an overall freeze on the salaries and expenses appropriation at the fiscal year 1997 level, please provide a breakdown of FDA's fiscal year 1998 spending requirements using the breakdowns contained in the Senate report on the fiscal year 1997 appropriations bill and adopted by the conference committee.

Answer. Because of the importance of the new funding requests and the need for continuing funding of our traditional programs, I am unable, at this time, to provide a breakdown of fiscal year 1998 spending requirements. We are now considering different possible scenarios involving the new initiatives included in the budget as well as our traditional areas of concern. The proposed new initiatives are of the utmost importance, and are very high priorities of the Administration, as are FDA's traditional activities of promoting and protecting the public health.

PART 1

1106

Question. The fiscal year 1998 request assumes the reauthorization of the Prescription Drug User Fee Act, assuming collections from these fees of \$91.204 million for fiscal year 1998, as compared with fiscal year 1997 fee collections of \$87.528 million. Is this estimate of Prescription Drug User Fee Act collections for fiscal year 1998 based on an extension of current law or does it assume changes in the current law authorizing these fees?

Answer. Since the present statute sunsets on September 30, 1997, the current law authorizing fees will expire. A new statute, either an extension of PDUFA or another statute, would be required for FDA to collect fees in 1998. That said, the estimate included in the fiscal year 1998 budget is based on the legislation as currently authorized.

Question. What is the current fiscal year 1997 base appropriations level for drug review and approval activities which are enhanced by collections from Prescription Drug Act user fees? What is the base level assumed in the fiscal year 1998 budget?

Answer. PDUFA, as currently authorized, provides that fees shall only be collected and available for increases in the costs for the process to review new human drug applications, defined in the Act, above the level of costs for the process in fiscal year 1992 multiplied by an adjustment factor. Using data from the fiscal year 1998 President's Budget historical tables for domestic discretionary budget authority, we have calculated the fiscal year 1992 base obligations multiplied by the appropriate adjustment factor to arrive at the base funding estimate necessary to collect fees. The base funding estimate necessary to collect fees is \$125,794,000 for fiscal year 1997, and \$128,833,500 for fiscal year 1998.

Question. What would be the consequences of not reauthorizing the Prescription Drug User Fee Act?

Answer. The consequences of not reauthorizing this program would include a serious erosion in the timeliness that safe and effective new therapies become available to the public. PDUFA has been a very successful program primarily benefiting the public. The Agency and industry have benefited substantially also from a commitment to excellence in the review of applications, and the predictability of improved Agency performance. Without reauthorization, FDA would be forced into a rapid downsizing of the program, would likely lose many of its most talented employees, and the morale of those remaining would be very low. Both would increase review times and backlogs substantially.

Question. What would be the consequences of not reauthorizing the Mammography Quality Standards Review Act?

Answer. FDA is charged with administering the provisions of the Mammography Quality Standards Act of 1992, or MQSA, which was passed with the primary objective of ensuring that all women have access to safe and effective mammography services. The MQSA requires uniform national quality standards for mammography facilities, and that these facilities be accredited by an approved accreditation body and certified by the Secretary of Health and Human Services—and carried out by delegation to FDA—as meeting quality standards. Under MQSA, facilities must be inspected at least annually by specifically trained and credentialed Federal or state inspectors. Inspections include assessments of image quality, beam quality, average glandular dose, and other measurements. MQSA also requires a National Mammography Quality Assurance Advisory Committee to advise FDA about mandatory minimum quality standards, standards for federally-supervised state or private non-profit accreditation programs, and certification and enforcement programs.

If MQSA is not reauthorized, the quality improvements made by FDA under MQSA to mammography will be lost. Mammography is the only proven means to detect breast cancer early and save a woman's life. Prior to MQSA, many states did not have standards for quality, nor did they inspect mammography facilities to ensure quality. Fourteen percent of facilities studied in 1992 did not pass image quality tests when surveyed jointly by FDA and the States. Under MQSA today, 99 percent of mammography facilities meet the requirements of this important test. In addition, all facilities now must meet baseline standards and are inspected by FDA trained inspectors. Accordingly, without reauthorization, the gains of mammography quality for American women may be lost and the effectiveness of mammography for early detection of breast cancer, in all likelihood, would substantially decrease. Moreover, the benefits to be gained from the new regulations to be published at the end of fiscal year 1997 would not be realized.

Since enactment, FDA has conducted numerous activities to implement MQSA. For the record, I would be happy to provide a list of activities undertaken during fiscal year 1996.

[The information follows:]

Trained and certified inspectors to bring the total number to 250.
Conducted 8,864 facility inspections.

PART 1

1107

Issued more than 5,000 facility certificates.
Fully implemented the inspection fee filing process to recover costs of MQSA non-governmental entity inspections.
Conducted three meetings of the National Mammography Quality Assurance Advisory Committee to share comments, revise the proposed final regulations, and pursue subcommittee goals.
Received and summarized over 8,000 comments by the end of the year.
Proposed final regulations which were published on April 3, 1996.
Implemented an Inspector Audit program developed as part of Inspector Quality Assurance.
Audited 65 percent of the inspectors by year's end.

To continue, in fiscal year 1997, FDA will analyze and consider all public comments received regarding the proposed final regulations published in the Federal Register and develop appropriate final regulations. FDA expects to publish the final regulations by the end of fiscal year 1997. If MQSA is reauthorized, fiscal year 1998 would be devoted to transitioning to implementation of the new regulations. For example, FDA would revise the facility inspection procedure to be in accordance with the final regulations and would train the inspectors on these changes. An outreach effort would also be developed to ensure that facilities are aware of the changes resulting from the implementation of the final MQSA regulations.

The General Accounting Office, or GAO, issued a report, in January 1997, concluding that FDA's inspection program is having a positive effect on the nation's more than 9,000 mammography facilities and that the facilities show a growing compliance with mammography standards. The first year's inspections showed that 80 percent of facilities had either no violations or minor ones, and that only two percent had violations serious enough to warrant a warning letter from the FDA. Second year inspections have shown further improvement. In particular, the serious violations identified during the first year have not recurred in the vast majority of facilities where they were initially found.

Mammography training workshops for mammography facilities organized by a team from FDA, the American College of Radiology, and program directors of the Conference on Radiation Control, were selected for Vice President Al Gore's Hammer Award on October 30, 1996. The award winning workshops, whose organization required exceptional effort and teamwork, were designed to improve the technical skills of mammography facilities' personnel, and thereby advance the goal of MQSA to make all mammograms taken in this country of the highest possible quality, in order to enhance breast cancer detection and treatment.

Question. Please provide for the record details on the specific new user fees proposed for each of the following areas: food additive petitions, generic drugs, over-the-counter drugs, animal drugs, medical devices, import inspection, and postmarket surveillance activities (foods and cosmetics, human drugs, biologics, animal drugs and feeds, and medical devices).

Answer. I would be happy to provide a summary of the new user fees proposed in the President's fiscal year 1998 budget request, plus some additional information regarding specifics on each of the user fees, where applicable. The information provided serves as a useful starting point for any upcoming negotiations on the proposed user fees among FDA, Congress, and the affected industries. These points are subject to change based on the direction of any discussions regarding these user fees.

[The information follows:]

Summary of proposed user fees—Fiscal year 1998 budget

Food additive petitions	\$12,543,000
Generic drugs	¹ 18,000,000
Animal drugs	10,100,000
Medical devices	25,000,000
Import inspection	15,000,000
Establishment postmarket surveillance activities	51,000,000
Foods and cosmetics	(19,024,000)
Human drugs	(7,508,000)
Biologics	(2,233,000)
Animal drugs and feeds	(2,493,000)

PART 1

1108

Medical devices	(19,742,000)
Total fees	131,643,000

¹In the fiscal year 1998 budget request, the estimate for Generic Drug user fees was \$13 million, and a separate \$5 million user fee for Over-the-Counter (OTC) drugs was included. However, because fees are already charged for NDA's for OTC switches under PDUFA, this \$5 million was moved to Generic Drugs in the Administration's proposed legislation for a new total of \$18 million.

The industries regulated by FDA derive valuable benefits from some FDA activities, including increased customer confidence in their products and significant protection from liability. FDA's reputation also improves the competitive position of American firms in overseas markets. The President's budget proposes that the regulated industries contribute a share of FDA's cost of ensuring the safety and effectiveness of their products. The following are the types of user fees, by program area, being proposed by the Administration. We intend to work with Congress, industry and other affected parties to develop these or other proposals to achieve informed consideration of proposed user fees, with appropriate performance measures and goals, and to ensure necessary funding for important FDA public health activities in fiscal year 1998.

Foods—\$46.6 million

Proposals include: premarket approval activities for food and color additive petitions submitted pursuant to sections 409, 721, 201(s), and 701(a) of the FD&C Act (\$12,543), to support FDA import monitoring activities (\$15,000), and to partially fund postmarketing regulatory activities (\$19,024), as covered by section 704 of the FD&C Act.

Premarket: Petitions filed pursuant to section 704 of the FD&C Act.
Imports: Support of FDA Import Monitoring Activities.

Drugs—\$25.5 million

Proposals include: review of original generic drug product applications (\$18,000), submitted pursuant to section 505(j) of the FD&C Act, and to partially fund FDA's Human Drug postmarketing regulatory activities (\$7,508), as covered by section 510 of the FD&C Act.

Generic Drugs: A one-time, comprehensive user fee for each original generic drug product application, for those applications submitted pursuant section 505(j) of the FD&C Act.

Biologics—\$2.2 million

Proposals include: partially funding postmarketing regulatory activities (\$2,233).

Animal Drugs—\$12.6 million

Proposals include: review of premarket applications (\$4,000), FDA activities which substantiate that industry's clinical and non-clinical investigations are properly conducted (\$6,100), as covered by section 512 of the FD&C Act, and to partially fund other postmarketing regulatory activities (\$2,493).

Premarket Approval of Animal Drugs and Feed Additives: Ensure new animal drugs and feed additives are safe, effective, properly formulated and manufactured.

Fees would be charged to applications submitted pursuant to section 512 of the FD&C Act.

Drug Experience Report Evaluations: Used to substantiate that industry's clinical and nonclinical investigations are properly conducted under section 512 of the FD&C Act.

Medical Devices—\$44.7 million

Proposals include: activities related to review and evaluation of premarket approval applications, premarket notification (510(k)'s), and investigational device exemptions (IDE's) for all medical and radiological devices to ensure that new devices meet the statutory requirements prior to commercial marketing (\$25,000), submitted pursuant to sections 510 and 515 of the FD&C Act, and to partially fund postmarketing regulatory activities (\$19,742), as covered by section 510 of the FD&C Act.

Premarket Approval of Applications and Notifications

Review and Evaluation of Premarket Approval Applications, Premarket Notification (510(k)'s) and Investigational Device Exemptions (IDE's) for all medical and radiological devices.

PART 1

1109

Ensure that new devices meet the statutory requirements prior to commercial marketing.

Postmarket Regulatory Activities—Across Programs

Based on the Agency's Official Establishment Inventory (OEI).

Used to Offset a Portion of FDA's Postmarket Activity Expenses.

For Postmarket Regulatory Activity Fees we have determined a fee of about \$550 per establishment, which would be applied as follows:

- 35,369 Food and Cosmetics Establishments
- 13,958 Human Drug Establishments
- 4,151 Biologics Establishments
- 4,635 Animal Drug and Feed Establishments
- 36,703 Medical Device Establishments

The amount of the fee to be collected in most cases will need to be determined in negotiation with FDA's many constituents, as well as the Congress. It would be premature for those negotiations to presuppose specific fee amounts at this time. However, where possible, we have made every effort to provide some of the information requested.

The fiscal year 1998 budget request includes a total amount of fees for medical devices of \$25 million. The split by application type, as contained in the Administration's legislation is: \$56,522 for premarket applications, \$7,717 for supplements with data required, \$4,891 for supplements without data required, and \$3,478 for 510(k) applications.

Consistent with current practices under PDUFA and MQSA, we would initially recommend similar timing of fee collections. For instance, any application fees would be collected at the time of submission, any import fees would be collected at the point of entry, and any establishment fees would be collected at the beginning of the fiscal year.

For postmarket activities, based on the Agency's Official Establishment Inventory (OEI), FDA determined the number of establishments by program area, excluding warehouses, and calculated that \$550 per establishment would be needed to reach the \$51 million figure estimated in the fiscal year 1998 budget request.

Below is a table reflecting the estimated fee amount from fiscal year 1998, including the approximate percentage of the existing program that the proposed user fee would cover divided into our core activities of premarket review and postmarket assurance:

Activity area for proposed fee	Estimated amount of fee (from fiscal year 1998 budget)	Estimated budget amount in fiscal year 1997 (rounded to nearest \$100,000)
Premarket:		
Food additive petitions	\$12,543,000	\$12,600,000
Generic drug applications	18,000,000	36,000,000
Animal drug applications	4,000,000	16,000,000
Medical device applications	25,000,000	50,000,000
Postmarket:		
Animal drug activities	6,100,000	18,300,000
Food imports	15,000,000	45,000,000
Establishments	51,000,000	153,000,000

Question. What performance goals will be established for each of the proposed new user fees listed above? For each, please describe how these performance standards differ from those FDA is now achieving and provide the fiscal year 1997 level of funding for each activity.

Answer. Many of the specifics for each of the new user fees will be determined as the result of negotiations among FDA, Congress, and the affected industries. To speculate on exact performance goals for these user fees would be premature at this point. FDA is, however, developing performance measures for its activities in total—as mandated by the Government Performance Results Act—for inclusion in the fiscal year 1999 budget.

Question. For each of FDA's existing user fees, please provide user fee collections and related obligations for each of the last five fiscal years.

Answer. I would be happy to provide that information.

[The information follows:]

PART 1

1110

USER FEE COLLECTIONS FOR FISCAL YEARS 1992–96

[In thousands of dollars]

	Fiscal year—				
	1992	1993	1994	1995	1996
Prescription Drug User Fee Act of 1992 (PDUFA) ¹		\$28,532	\$53,730	\$70,954	\$82,318
Mammography Quality Standards Act of 1992 (MQSA)	N/A			20	12,745
Certification Fund	4,320	4,075	3,867	4,875	4,490

¹ Reflects fees collected in fiscal year, including fees collected for applications received in previous years.

[In thousands of dollars]

	Fiscal year—				
	1992	1993	1994	1995	1996
Prescription Drug User Fee Act of 1992 (PDUFA)		\$8,949	\$39,951	\$74,064	\$85,053
Mammography Quality Standards Act of 1992 (MQSA)	N/A	N/A	N/A	N/A	8,577
Certification Fund	3,681	3,392	3,513	3,978	3,964

RENTAL OF SPACE

Question. The fiscal year 1998 request proposes the fiscal year 1997 level of \$46.294 million for FDA's payment to the General Services Administration for space rental and related costs. Why is no increase proposed?

Answer. Competition for increases in scarce Federal funding dollars has provided higher priority to public health program improvements. Again this year, the President's budget request is for an amount less than the actual GSA rent bill. If FDA's rent payments to GSA are not limited as they have been in recent years, FDA would have to divert further critical program resources to pay the rental charges unless Congress raises our Rental Payments appropriation level to meet our actual charges.

For your information we are providing a four-year chart of the bills associated with the Rental Payments, the FDA Appropriation, and the allowance for FDA's Building Delegation. These bills reflect the total amount the General Services Administration bills FDA for the buildings which fall under the Rental Payments FDA Appropriation. The chart further illustrates the importance of the limitation placed on the amount of annual rent paid by FDA to GSA.

[The information follows:]

AMOUNTS OF BILLS FOR RENTAL PAYMENTS TO GSA

[Dollars in millions]

Location	Fiscal year—			
	1995	1996	1997 *	1998 * 7
GSA Rent Bills:				
FDA direct	\$55.0	\$60.5	\$71.5	\$74.9
Parklawn Area ¹	7.5	7.6	8.7	8.9
Southwest Complex ²	0.7	0.7	0.7	0.7
Total GSA rent billed to FDA	63.2	68.8	80.9	84.5
Rental payments to GSA, FDA—Appropriations Account— and total paid to GSA ³	46.3	46.3	46.3	46.3

PART 1

1111

AMOUNTS OF BILLS FOR RENTAL PAYMENTS TO GSA—Continued

[Dollars in millions]

Location	Fiscal year—			
	1995	1996	1997 *	1998 * ⁷
Building delegation allowance included in Appropriations				
Account for buildings maintained by FDA	4 [4.0]	5 [4.0]	6 ** [4.6]	7 ** [4.8]

* Estimated Total GSA Rent.

** Includes MODULE II

¹A separate GSA rent bill which currently includes 5600 Fishers Lane (Parklawn), 12420 Parklawn (Park), and 370 WHSE (Tech Center) which is billed to FDA on a pro rata share by HHS/Program Support Center (PSC).

²A separate GSA rent bill which includes 330 C Street (Switzer) and 11400 Rockville Pike (Rockwall) which is billed to FDA on a pro rata share by HHS/PSC.

³GSA Rental Payments, FDA, appropriations account.

⁴Authorized allowance for reduction in GSA rent under Treasury, Postal Service, Executive Office of the President and Independent Agencies Appropriation Act, Public Law 103–329, Section 611.

⁵Authorized allowance for reduction in GSA rent under Treasury, Postal Service and General Government Appropriation Act, 1996, Public Law 104–52, Section 611.

⁶Authorized allowance for reduction in GSA rent under Omnibus Appropriation Act of 1997. Public Law 104–208, Section 611.

⁷Note the 1998 estimate for the total GSA Rent bill includes a three percent inflation plus an allowance for adjustments in projected space assignments. In addition, the estimate for the 1998 Building Delegation account includes 2.7 percent inflation based on a memo received from GSA/PBS, June Huber, Assistant Commissioner for Portfolio Management.

Question. Does this reflect the actual cost to the GSA for space rental and related costs for programs and activities of the FDA pursuant to Public Law 92–313? What does Public Law 92–313 provide?

Answer. The requested amount of \$46.3 million reflects the amount to be paid to GSA, but does not reflect the actual amount billed by GSA. Public Law 92–313, “The Public Buildings Amendments of 1972,” as amended, provides for the financing acquisition, construction, alteration, maintenance, operation, and protection of public buildings and for other purposes. For the record, I would be happy to provide a quote from the funding section:

[The information follows:]

“The financing mechanism for Public Building Service (PBS) activities is the Federal Buildings Fund, which began operations at the start of fiscal year 1975. The Public Buildings Amendments of 1972 (Public Law 92–313) authorized GSA to finance government real property management activities through user charges set at commercially-comparable rates and collected from agencies occupying space. This rental income is deposited into the Federal Buildings Fund, with income in excess of operating expenses used to finance new construction and repair and alteration projects. In recent years, construction funds have been supplemented by direct appropriations to the Federal Buildings Fund and by increases in GSA’s borrowing authority.”

“The fund is subject to Congressionally-imposed limitations on the amount of its revenue that can be spent on any of its authorized activities. Of the approximately \$5 billion in rent revenue that PBS receives, almost one-half is for payments to the commercial real estate market for leased space, which comprises 48 percent of the inventory.”

One example of the operation of this fund for buildings which GSA leases is the Parklawn Building in Rockville. GSA has leased this building for approximately 25 years from a commercial lessor, for occupancy by several agencies of the Public Health Service. In this case, the agencies each pay GSA their share of GSA’s rental rates, which for FDA is currently about \$8 million, and the majority of these funds are then paid by GSA to the building owner.

A different example is Federal Building 8 at 200 C Street in South West Washington. Originally envisioned as housing all of FDA, this building was constructed with Federal funds and occupied in 1962. It now houses the majority of the Center for Food Safety and Applied Nutrition. Under the principles of Public Law 92–313, FDA pays about \$14.6 million a year for this building, even though it was long ago paid for as part of FDA’s contribution to the Public Buildings Fund to enable GSA to construct or lease new facilities.

Question. The justification indicates that “as authorized by the annual Treasury, Postal Service and General Government Appropriations Act, payments under the fiscal year 1996 appropriation were reduced by \$3,957,000; payments for fiscal years 1997 and 1998 are expected to be reduced by an estimated \$4,075,000 and \$4,832,000 respectively.” What is the specific provision of the Treasury, Postal Serv-

PART 1

1112

ice and General Government Appropriations Act cited which requires these reductions?

Answer. These reductions referred to the amount paid to GSA from the rental appropriation and retained by the FDA to cover operations, maintenance and repairs of GSA facilities which GSA has delegated to FDA to operate and maintain. The specific provision of the Treasury, Postal Service and General Government Appropriations Act, 1996, that requires these reductions is Public Law 104-52, Section 611. For the record, I would be happy to provide a quote from the section.

[The information follows:]

“Any department or agency to which the Administrator of General Services has delegated the authority to operate and maintain or repair any building or facility pursuant to section 205(d) of the Federal Property and Administrative Services Act of 1949, as amended shall retain that portion of the GSA rental payment available for operation, maintenance or repair of the building or facility as determined by the Administrator, and expend such funds directly for the operation, maintenance or repair of the building or facility. Any funds retained under this section shall remain available until expended for such purpose.”

The amount determined in fiscal year 1996 was \$3,957,000. The funds provided by GSA were used to cover only the recurring services within a normal eight hour day for our delegated buildings which include the Crawford Building in Atlanta, Georgia, and Federal Building 8 at 200 C Street, SW, Washington, D.C., plus four other facilities in the National Capital Area.

For the record let me provide the specific provision from fiscal year 1997 which is in accordance with the Omnibus Appropriations Act, 1997, Public Law 104-208, section 611.

[The information follows:]

“For fiscal year ending September 30, 1997, and thereafter, any department or agency to which the Administrator of General Services has delegated authority to operate, maintain or repair any building or facility pursuant to section 205(d) or the Federal Property and Administrative Services Act of 1949, as amended, shall retain that portion of the GSA rental payment available for operation, maintenance or repair of the building or facility as determined by the Administrator, and expend such funds directly for the operation, maintenance or repair of the building or facility. Any funds retained under this section shall remain available until expended for such purpose.”

To date the total estimated amount for fiscal year 1997 is revised to \$4,561,834, which includes the buildings previously discussed and an estimated amount of \$956,924 for MODULE II which is being added to FDA's inventory of delegated facilities in fiscal year 1997.

Question. How is a fiscal year 1998 reduction required by this Act?

Answer. For the record, let me provide a citation from the Act.

[The information follows:]

The Omnibus Appropriations Act, 1997, Public Law 104-208, section 611 states, “For fiscal year ending September 30, 1997, *and thereafter*, any department or agency to which the Administrator of General Services has delegated authority to operate, maintain or repair any building or facility pursuant to section 205(d) or the Federal Property and Administrative Services Act of 1949, as amended, shall retain that portion of the GSA rental payment available for operation, maintenance or repair of the building or facility as determined by the Administrator, and expend such funds directly for the operation, maintenance or repair of the building or facility. Any funds retained under this section shall remain available until expended for such purpose”.

Question. Is the \$4,832,000 fiscal year 1998 reduction included in FDA's fiscal year 1998 “rental of space” request?

Answer. Yes, the \$4,832,000 is included in the \$46,294,000 request as found in the Rental Payments, FDA Appropriation.

Question. The justification indicates that any recurring reimbursable services provided by GSA over and above the normal eight hour day are paid by FDA out of the Salaries and Expenses appropriation. How much was paid out of the Salaries and Expenses appropriation in each of the last five fiscal years for these services provided by GSA? What is the current fiscal year 1997 estimate?

Answer. We will be happy to provide you with a chart which sets out the dollar amounts paid out of FDA's Salaries and Expenses appropriation for recurring reimbursable services provided by GSA over and above the normal eight hour day. Included in the chart is the current fiscal year 1997 estimate of \$7,019,000. The increase from fiscal year 1996 to fiscal year 1997 is primarily due to increased guard services and security system services mandated by the Department of Justice following the Oklahoma City bombing.

PART 1

1113

[The information follows:]

GSA Above Standard Reimbursable Services

<i>Fiscal year</i>	
1997	\$7,019,000
1996	6,719,000
1995	6,866,000
1994	4,925,000
1993	3,857,000
1992	3,599,000

Question. The Agriculture Appropriations Act provides that in the event the FDA should require modification of space needs, a share of the “salaries and expenses” appropriation may be transferred to the “rental of space” appropriation or a share of the “rental of space” appropriation may be transferred to the “salaries and expenses” appropriation, but such transfers shall not exceed 5 percent of the funds made available for rental payments to or from FDA’s “rental of space” account. Please indicate what transfers, if any, have been made to or from the rental of space account in each of the last five fiscal years pursuant to this authority, and indicate the amount and purpose of each funds transfer. What transfers have been made in fiscal year 1997 to date, in what amount, and for what purpose?

Answer. The only time GSA requested such a transfer was in fiscal year 1993. FDA requested and was approved a reapportionment from its “salaries and expense” appropriation to the “rental of space” appropriation for \$453,879. The \$453,879 was for FDA’s increase in GSA space of 47,496 square feet in fiscal year 1993 from September 15, 1992 through March 15, 1993. To date, no GSA requests nor FDA transfers have been made for fiscal year 1997.

Question. While the fiscal year 1998 budget identifies the amount requested for rent and related services in the “salaries and expenses” account, it ignores the Committee directive to consolidate these costs into the FDA “Rental of space” account. Why?

Answer. FDA included a separate line item in the budget titled “S&E Rent and Related” in response to the Committee’s concern regarding FDA’s facilities costs.

FDA is concerned that combining these expenses with GSA Rent in a separate appropriation would greatly limit FDA’s flexibility in meeting its obligations for building-related expenses that cannot always be predicted precisely during the budget process. Only about \$6.5 million of the “Rent and Related” line item is for rent for commercially-leased buildings—the rest is for building-related costs such as additional utilities for laboratory facilities, and additional guard services, where FDA’s needs may vary from time to time. Another complicating factor is that the timing of facility moves cannot be controlled precisely. There are often delays in occupying new facilities, which may cause FDA to incur greater costs than anticipated for the facility to be vacated. If all of these costs were in a separate appropriation, FDA would have to seek an appropriation transfer when such variations occurred, rather than having the ability to absorb them within the Salaries and Expenses Appropriation.

MEDICAL DEVICE APPROVALS

Question. Dr. Friedman, you indicate in your prepared statement the Center for Devices and Radiological Health (CDRH) and the agency are focusing now on innovative ways of bringing down the premarket approval reviews (PMA) review times, but this depends on the level of resources available to do the work. What ways are you exploring to bring time PMA review times?

Answer. FDA is examining and implementing various ways that will help reduce PMA review times. I would be happy to provide, for the record, information describing our activities in this area.

[The information follows:]

PMA’s

Expedited Review: FDA believes it is in the interest of the public health to review PMA’s and 510(k)’s for certain medical devices in an expedited manner. Initially established in October 1989 and expanded in May 1994, expedited review is generally available when a device offers a potential for clinically meaningful benefit as compared to the existing alternatives (preventative, diagnostic, or therapeutic) or when the new medical device promises to provide a revolutionary advance (not incremental advantage) over currently available alternative modalities.

Project Management: Formal scheduling of PMA events such as filing and panel meetings when the application is received.

PART 1

1114

Label and Interactive Review: Meetings face-to-face to quickly resolve labeling and other PMA issues.

Electronic Submissions: Allow for alternate ways of submitting and reviewing applications.

Internet: Provide greater access to FDA resource materials and reports which decreases reviewer time used to support Freedom of Information Act (FOIA) requests from the public.

Reengineering: FDA is establishing a PMA reengineering team to review all aspects of the PMA review process and implement needed improvements and enhancements.

Product Development Protocol (PDP): Through reengineering, FDA's CDRH is also seeking to shift certain PMA's into the Product Development Protocol (PDP) review model. Although this provision has been in the statute since 1976, PDP has not been used effectively. FDA is currently reengineering the PDP program. This new approach will incorporate PMA, IDE, and post-market requirements and will be designed to include a variety of tools to facilitate review and approval: a criteria-based segmented review; built-in procedures for product change; resources focused on safety and effectiveness issues; and panel review at the protocol phase only. This reengineering effort should allow "real-time" reviews during the product development protocol process and should eliminate obstacles that prevented effective use of the PDP approach in the past.

Reclassification: Reclassify, as appropriate, preamendments class III devices to class I or II.

Preamendment PMA's: When PMA's will be required, the Agency is working interactively, with preamendment class III submitters prior to the 515(b) call for the PMA's to discuss the studies and data that will be required for the PMA's.

PMA Supplements

"Real-Time" PMA Supplement Review Program: The purpose of this program is to conduct document reviews for certain PMA supplements in "Real-Time", with a face-to-face meeting, video conference, or telephone conference format and provide a decision letter to the company within five days after the meeting.

GMP Pilot: A new method of handling certain PMA supplements for manufacturing and sterilization site changes that speeds up agency review.

Triage: A new look at prioritizing the workload.

Question. What level of resources is included in the agency's fiscal year 1998 appropriations request to be able to do this work?

Answer. FDA is requesting the addition of \$5,207,000 to the Medical Devices budget to improve the quality and timeliness of its review process for Class III applications, PMA's, and PMA supplements. FDA expects a 15 percent increase in PMA workload from fiscal year 1997 to fiscal year 1998 due to requests for reclassifications and submissions of required preamendment PMA's for class III devices. While FDA has made great strides in reducing its review times and backlogs for medical device applications, continued improvement is needed to meet mandated goals with the increased workload. Additional resources will allow FDA to allocate more resources toward the PMA process and to limit the increase in pending PMA's without jeopardizing the recent performance gains made in the 510(k) program.

FDA knows that resources will continue to be scarce, and is beginning to re-engineer the medical device program to obtain maximum public health impact from the resources that will be available. The goal behind this effort will be to focus resources on high-risk, high-impact products while at the same time de-emphasizing areas that pose lower risk to the public, or where FDA involvement is not essential. The improvements and changes that arise from the re-engineering process will ensure that the medical device program is as effective and efficient as possible, and may increase productivity in the future.

We are providing a table that shows FDA's fiscal year 1998 performance goals for PMA workload at Base Resource levels and with additional resources.

[The information follows:]

PART 1

1115

ESTIMATED FISCAL YEAR 1998 PERFORMANCE GOALS FOR FDA

	Performance goals—	
	Base level re-sources (per-cent)	With \$5.2 mil-lion additional resources (per-cent)
PMA originals:		
Complete first actions on Standard PMA's within 180 days	35	50
Complete expedited first actions within 180 days	85	90
PMA supplements:		
Complete first actions within 180 days	55	80
Complete expedited first actions within 180 days	85	90

Question. Please provide an update on the third party pilot program for Class I and Class II devices. How many 510(k) products are eligible to be reviewed under the pilot program? What kind of products are these?

Answer. FDA's pilot program for third-party review of pre-market notifications, or 510(k)'s, for selected low and moderate risk devices was announced in the Federal Register on April 3, 1996 and began August 1, 1996. FDA has identified 251 types of devices for inclusion in the pilot. This consists of all Class I devices that are not exempt from 510(k)—a total of 221 device types—plus 30 Class II devices. Historically, FDA has received up to 1,500 510(k)'s per year for these 251 device types. All of the Class I devices and 6 of the Class II devices were immediately eligible for third-party review upon commencement of the pilot. Eight additional Class II devices were phased into the pilot in November 1996. The remaining 16 Class II devices will be eligible for review before the end of the first year of the pilot as FDA completes guidance documents for these devices.

Class I devices generally present low risk and their safety and effectiveness can be assured through general controls, such as good manufacturing practices requirements and pre-market notification. More than 70 percent of the 221 Class I devices that are eligible for third-party review are in vitro diagnostic devices—such as, for example, cholesterol test systems. Review of such devices focuses on the accuracy and precision of the test. Class II devices generally present moderate risk and require special controls—such as guidance documents or post-market surveillance—in addition to general controls. The 30 Class II devices that are in the pilot include a broad variety of devices, such as dental alloys, syringes, blood pressure measurement devices, and diagnostic ultrasound systems.

Question. What are your average review times for these products?

Answer. To date, FDA has issued substantial equivalence decisions for five 510(k)'s that were reviewed by third parties under the pilot program. I would be happy to provide a table showing review times for these submissions.

[The information follows:]

510(K) REVIEWS UNDER THE PILOT PROGRAM

Type of device	Class	Total elapsed time ¹	Cumulative review time (days) ²		
			3rd party ³	FDA	Combined
Low density lipo-protein reagent	I	51	8	16	24
Low density lipo-protein reagent	I	51	8	16	24
Operating table (electrohydraulic)	I	126	12	9	21
Transcutaneous electrical nerve stimulator (TENS)	II	103	40	8	48
hCG test strip	II	22	8	2	10

¹Total days from third party's receipt to FDA's final action.

²Includes third party and FDA review time only, i.e., excludes days when both FDA and third party review were suspended pending receipt of additional information from the submitter and days between mailing and receipt of correspondence.

³Based on preliminary information reported by the third party.

During the first seven months of the pilot program, from August 1996 through February 1997, FDA received more than 600 510(k)'s for third party-eligible devices which were not submitted to third parties. During this period, FDA's final actions

PART 1

1116

on 510(k)'s for these types of devices were taken in an average of 79 cumulative FDA review days, with an average total elapsed time from FDA's receipt to final action of 113 days, including time "on hold" awaiting additional information from the submitter.

Question. Are you planning to add more eligible products to this program?

Answer. Yes. Based on public comments FDA has received about the pilot, we intend to make substantially more Class II devices eligible for third-party review. We are currently preparing a list of at least 60 additional Class II devices for the pilot.

Question. How long will this take?

Answer. We expect to announce the list of additional Class II devices by early June 1997. These devices will be made eligible for third-party review as we complete guidance documents for these devices, which we intend to do as rapidly as possible. We expect that at least 20 of the additional devices will be eligible for third-party review by the end of fiscal year 1997, bringing the total number of eligible Class II devices at that time to approximately 50. The remaining 40 additional Class II devices will be phased-in as soon thereafter as possible.

Question. What are your success measures for this pilot, and when were they established?

Answer. FDA's April 3, 1996 Federal Register notice stated that the purpose of the pilot is to test the feasibility of using third-party reviews to improve the efficiency of the agency's review of 510(k)'s for low and moderate risk devices. The notice further specified that this includes determining a number of factors which I will provide for the record.

[The information follows:]

- the willingness of qualified third parties to participate;
- the willingness of device manufacturers to participate;
- the quality of third-party reviews, including the extent to which third parties are free of conflicts of interest;
- the impact upon FDA workload, decisions, and 510(k) processing times; and
- the impact on the total time necessary for manufacturers to obtain marketing clearance decisions.

The notice elaborated that if the piloted approach is successful, it will provide manufacturers with an alternate, potentially more rapid means of obtaining pre-market reviews and enable FDA to target its scientific review resources at higher risk devices while maintaining confidence in the review by third parties of low and moderate risk devices.

Question. How many applications have been reviewed under this program so far?

Answer. As of May 1, 1997, FDA has received eight 510(k)'s under the pilot program, although additional 510(k)'s may currently be under review by the recognized third parties. FDA has issued substantial equivalence decisions for five of the eight submissions, and has requested additional information from the third parties for the remaining three submissions.

Question. Is this sufficient to gauge the success of the program?

Answer. No. The number of submissions indicates that most manufacturers of the eligible devices have elected not to participate in the pilot. Therefore, the pilot has not provided a sufficient basis to assess the quality or timeliness of third-party reviews.

Question. Why do you think more manufacturers are not taking advantage of this program? Is it because you are doing a better job of reviewing 510(k) applications and there is no incentive for manufacturers to try this path to market?

Answer. FDA's success in eliminating the backlog of overdue 510(k) reviews certainly limits manufacturers' incentive to try a different approach. Based on industry comments, this is most true for Class I devices, which generally have lower FDA review times than other device types. Industry comments have suggested adding more Class II devices to the pilot to encourage increased participation, and FDA is currently working to do so. Other factors which may contribute to manufacturers' lack of participation include: manufacturers are accustomed to interacting with FDA; manufacturers are uncertain about the costs and benefits of the third party approach; third parties assess manufacturers a fee-for-service whereas FDA does not charge for 510(k) reviews; and manufacturers do not know whether FDA will accept the results of a third party's review, given that by law FDA must issue substantial equivalence orders.

Question. What have you done to encourage participation from device manufacturers?

Answer. Before initiating the pilot program, FDA solicited public comments on the proposed approach for the pilot through a June 1995 Federal Register notice and a public workshop. FDA attempted to address the resulting comments in its final plans for the pilot. For example, FDA significantly expanded the number of eligible

PART 1

1117

devices beyond what was originally proposed, and established a 30-day performance goal for its issuance of final decisions based on third-party reviews. After announcing the pilot in the Federal Register, FDA promoted the pilot through a July 1996 mass-mailing to approximately 13,000 registered device firms. FDA also assisted the recognized third parties in promoting the pilot by providing them with non-proprietary mailing list information for device firms that have registered and listed with FDA for the device types that are included in the pilot. FDA has also provided frequent information about the pilot to the trade press and at numerous professional and trade association meetings.

Question. Does this program offer a cost benefit to the Agency?

Answer. At the current level of participation, any efficiencies which may be provided by third-party review are outweighed by the start-up and operating costs of the program. Given that the start-up costs of a pilot program such as this are relatively high, however, FDA had anticipated that third-party reviews may not yield a cost benefit to the agency during the pilot phase. We believe it is premature to draw any final conclusions about the pilot given that participation may increase as additional devices become eligible for third-party review and as manufacturers obtain more information about the outcomes of third-party reviews. FDA intends to complete an evaluation of the pilot before the end of its planned 2-year duration.

Question. The "Report on Medical Device Review Performance 2nd and 3rd quarters fiscal year 1996" submitted to the Appropriations Committee indicates that some of the offices within the Office of Device Evaluation are piloting the use of electronic transmission of applications to help ease the burden of the current paper-intensive submission process. The document states that electronic access will also provide significant savings on the storage and retrieval of applications for both industry and the agency. How many sponsors of applications have taken advantage of this system?

Answer. Through the first half of fiscal year 1997, there were 34 applications submitted electronically, by seven different sponsors. These applications included 510(k)'s, PMA's, PMA Supplements, IDE's, and IDE supplements.

Question. Could you give me some idea of what you mean by "significant savings"? Do you have any information on full-time equivalent's (FTE's) or FTE staff hours that are saved by the utilization of electronic submissions?

Answer. Significant savings will be realized when the majority of medical device applications arrive in electronic form. We will then be able to eliminate our costly process of scanning paper to make document images available to reviewers. That contract effort costs FDA about \$1,000,000 per year of which 75 percent goes toward the scanning of pre-market applications. In addition, savings are foreseen in the preparation of the reviewers notes, the resolution of questions asked of the sponsor and the final review document. We do not yet have sufficient statistics to project actual savings. However, based on our limited sample, an overall savings of one week in total elapsed time of the application review process for each pre-market application is a reasonable projection. The quality of the review will also be improved by having access to more information in a shorter time period.

Question. How do review times for "paper less" applications compare to the current method?

Answer. Reduced review times are difficult to estimate based on our small sample of experience with electronic submissions. Anecdotal experiences have shown a reduction of reviewer time of several hours for a single electronic search which otherwise would have to have been accomplished manually. One company has estimated that they experienced a savings of 20 percent in the time required to prepare a submission to the Agency. It is anticipated that additional savings in review time will be gained from the use of electronic conferencing between reviewer and sponsor.

Question. What is your projection on when FDA will have moved into a "thoroughly paper less program"?

Answer. FDA's Center for Devices and Radiological Health could be prepared for all applications to be submitted electronically within the next twelve months. It will then be up to the medical device industry to take advantage of the technologies available. This could happen to a significant extent in the next two to three years.

Question. What is the estimated cost of moving to a "paper less" system?

Answer. Beyond what has already been invested in our moving towards a "paper less" system, another \$1,000,000 will be used to complete the upgrades of desktop equipment, storage devices, and software, and to provide training, and personal video conferencing and group video conferencing capabilities for all reviewers. Another \$500,000 per year will be utilized to maintain pace with the technology.

Question. Can all FDA's systems "talk" or link up with one another—for example, those systems that you use to track reports? For example, is the MAUDE system

PART 1

1118

designed to process the MEDWATCH forms compatible with all FDA's other reporting systems? Is there any duplication in FDA's reporting systems?

Answer. The Agency is now implementing a common Information Systems Architecture, or ISA, which will provide a consistent technology infrastructure across the FDA to ensure that systems developed throughout the Agency will be compatible with each other. Legacy systems are being evaluated to determine if they should be modified to conform to the new ISA standards. Initiatives are underway to guide the submittal and dissemination of information to and from the Agency via Internet and other communication mechanisms to assure compatibility across the FDA. One such example is the development of an Agency "Gateway" designed to provide a single receipt point for the electronic submission of adverse event reports from industry.

Recently developed FDA reporting systems were designed for compatibility where appropriate and are not duplicative. These systems were designed to support specific legislative mandates and regulatory processes which differ from one FDA Center to another and even from program to program within a Center. For example, MAUDE was designed to fully integrate with other medical device databases and was designed for data element compatibility with other Agency systems collecting MedWatch data. However, the design of MAUDE also had to support unique requirements for reporting medical device adverse events, from the Safe Medical Devices Act of 1990, including specific data elements, reporting time frames, and report flows which differ significantly from other Centers' MedWatch reporting requirements.

Question. What does the FDA fiscal year 1998 salaries and expenses appropriations request mean in real terms for the device industry? What can be expected in terms of review times for 510(k)'s and PMA's?

Answer. FDA is requesting a total program level of \$166,072,000 which includes a \$5.2 million proposed increase for user fees for medical device review of PMA applications and PMA supplements and 1,623 FTE for the Medical Device program. Without this increase, the total base level for the program would be \$160,872,000. Medical device review is the Center for Devices and Radiological Health's, or CDRH's, highest resource priority and the number of FTE spent on device review has been steadily increasing between fiscal year 1993 and fiscal year 1996. FDA has undertaken several management initiatives to reinvent its medical device program in an effort to minimize industry workload and better use its own resources. I would be happy to provide a list for the record.

[The information follows:]

Exempting nearly three-fourths of all Class I device categories from the 510(k) pre-market clearance requirement;

Undertaking a pilot program to test third-party review of low and moderate risk-medical devices by outside organizations;

Conducting a project management initiative for PMA's in two device review divisions;

Developing a "real time" review pilot for some types of PMA supplements where the supplement will be reviewed by FDA during a meeting or tele-conference with the industry;

Initiating a one-year pilot project to test a new way to handle PMA supplements pertaining to changes in product manufacturing and/or sterilization sites; and

Implementing new strategies to aid in IDE development and review.

FDA will also continue its efforts to streamline and support a more stable and predictable review process. FDA expects a 15 percent increase in PMA workload from fiscal year 1997 to fiscal year 1998 due to requests for reclassifications and submissions or required preamendments PMA's. In addition, efforts will be made to limit the increase in the number of pending PMA's in fiscal years 1997 and 1998.

The following chart shows projected fiscal year 1998 product performance at Base Resource levels:

Fiscal year 1998 performance	510(k)	PMA
Pending from fiscal year 1997	1,929	86
Received in fiscal year 1998 (est.)	4,800	70
Completed in fiscal year 1998 (est.)	5,000	55
Pending from fiscal year 1998 (est.)	1,729	101
Reduction in percent pending fiscal years 1997-98	- 10	+ 17

Question. Will FDA be able to keep up with its current performance goals for 510(k)'s and PMA's with the resources requested for fiscal year 1998?

PART 1

1119

Answer. FDA will not be able to maintain current performance goals for 510(k)'s and PMA's with base level resources requested for fiscal year 1998. FDA is requesting the addition of \$5,207,000 to the Medical Devices budget to improve the quality and timeliness of its review process for Class III pre-market approval applications, or PMA's, and PMA supplements. Since PMA devices by definition are essentially "new" and medically important products, they represent the highest potential risk to patients. Given this, our goal is to focus our resources on high-risk, high-impact products, or work areas to maximize public health impact. In addition, FDA expects a 15 percent increase in PMA workload from fiscal year 1997 to fiscal year 1998 due to requests for reclassifications and submissions of required preamendment PMA's.

While FDA has made great strides in reducing its review times and backlogs for medical device applications, continued improvement is needed to meet mandated goals. Additional resources will allow FDA to allocate more resources toward the PMA process and to limit the increase in pending PMA's without jeopardizing the recent performance gains made in the 510(k) program.

FDA knows that resources will continue to be scarce, and is beginning to re-engineer the medical device program to obtain maximum public health impact from the resources that will be available. The goal behind this effort will be to focus resources on high-risk, high-impact products while at the same time de-emphasizing areas that pose lower risk to the public, or where FDA involvement is not essential. The improvements and changes that arise from the re-engineering process will ensure that the medical device program is as effective and efficient as possible, and may increase productivity in the future.

We are providing a table that shows FDA's fiscal year 1998 performance goals for PMA workload at base resource levels and with additional resources.

[The information follows:]

ESTIMATED FISCAL YEAR 1998 PERFORMANCE GOALS FOR FDA

	Performance goals—	
	Base level resources (percent)	\$5.2 million additional resources (percent)
PMA originals:		
Complete first actions on Standard PMA's originals within 180 days	35	50
Complete expedited first actions within 180 days	85	90
PMA supplements:		
Complete first actions on standard PMA supplements within 180 days	35	80
Complete expedited first actions within 180 days	85	90

FDA is committed to achieving the following review times at base level resources:

FISCAL YEAR 1998 PERFORMANCE GOALS WITH BASE RESOURCES—INCREASED PMA WORKLOAD

510(k)'s	PMA's
Complete 80 percent first actions within 90 FDA days, compared to 94 percent in fiscal year 1996.	Complete 35 percent of first actions on standard PMA originals within 180 days, compared with 53 percent in fiscal year 1996.
Complete 40 percent final actions within 90 FDA days. FDA completed 59 percent for the first nine months of fiscal year 1996.	Complete 55 percent of first actions on standard PMA supplements within 180 days, compared with 77 percent in fiscal year 1996.
	Complete 85 percent of expedited first actions within 180 days. (FDA completed three out of four expedited applications filed in fiscal year 1996 that have been under review at least 180 days).

Question. In the 2nd and 3rd Quarter Fiscal year 1996 Performance Reports submitted to this Committee, FDA reported that CDRH utilized approximately 565 FTE in premarket review activities. The fiscal year 1998 budget justification indicates

PART 1

1120

that out of more than 1,600 FTE designated for the medical and radiological devices program, approximately 643 FTE will be utilized on premarket review activities. What is meant by "premarket review activities"? Does this include more than simply reviewing applications?

Answer. Yes, premarket review activities include more than simply reviewing applications. Premarket review activities are conducted by CDRH and the Office of Regulatory Affairs, or ORA. For the record, I would be happy to provide a list of activities included under pre-market review activities.

[The information follows:]

- 510(k)'s (including Supplements)
- IDE's (including Amendments)
- IDE Supplements
- PMA's (includes Amendments)
- PMA Supplements
- Petitions
- Bioresearch Monitoring
- Regulation/Policy Development
- Pre-market Manufacturers' Assistance
- Pre-market Liaison/Support Activities

Pre-market Activities for ORA include:

- Preapproval Inspections
- Data Integrity Audits
- "For Cause" Investigations

For fiscal year 1996, time reporting data shows FDA's CDRH used 565 FTE's in pre-market activities out of a program total of 643 FTE's. FDA employs time reporting surveys to estimate actual resource use during the year and to guide future formulation of resource requirements.

Question. Are all of the 643 FTE's devoted solely to premarket review functions?

Answer. Yes, the 643 FTE represent total estimated FDA pre-market resources for the Medical Device program for fiscal year 1998. The fiscal year 1998 FDA distribution of resources for CDRH is 577 FTE and for ORA is 66 FTE.

Question. Provide a breakdown of how these 643 FTE's are assigned, i.e., how many work on: 510(k)'s, PMA's, PMA supplements, IDE's, and IDE supplements.

Answer. The 643 FDA FTE's are assigned to CDRH and ORA. I would be happy to provide the breakdown of how the 577 CDRH FTE are projected to be used for pre-market evaluation activities in fiscal year 1998.

[The information follows:]

<i>Pre-market Evaluation Activity</i>	<i>FTE</i>
510(k)'s (including Supplements)	196
IDE's (including Amendments)	52
IDE Supplements	35
PMA's (includes Amendments)	150
PMA Supplements	52
Petitions	7
Bioresearch Monitoring	23
Regulation/Policy Development	17
Pre-market Manufacturers' Assistance	22
Pre-market Liaison/Support Activities	23
Total, CDRH FTE	577

The breakdown of pre-market activities for the Office of Regulatory Affairs include:

<i>Pre-market Evaluation Activity</i>	<i>FTE</i>
Preapproval Inspections	63
Followup to Preapproval Inspections	3
Total, ORA FTE	66

Question. In the quarterly reports to this Committee, the FDA stated that in order to help PMA review, it has shifted FTE's to PMA review during the year. Where did these FTE's come from?

Answer. The FTE that were shifted to PMA review during fiscal year 1996 came from the science base area. For fiscal year 1997 to 1998, we plan to significantly increase the effort devoted to PMA reviews. This will be done by transferring people from other work areas, primarily the review of lower-risk devices under 510(k)'s. The additional staff assigned to work on PMA's will be used to bolster the present work on reviewing new and medically important PMA's as well as reviewing

PART 1

1121

preamendment PMA's and/or preparing reclassification actions. The result should be timelier reviews while maintaining appropriate scientific rigor.

Question. In the first quarterly report, FDA stated specifically: "In addition, exempting more of the easiest-to-review Tier One 510(k)'s and shifting resources from 510(k)'s to PMA reviews may increase 510(k) review times for the remaining 510(k) applications. However, the 2nd and 3rd Quarterly reports indicate that FDA has "been able to continue improving 510(k) performance." How have you done this?

Answer. We were able to continue improving 510(k) performance in fiscal year 1996 because we increased the FTE in the 510(k) area and the PMA area while reducing resources from the science base area.

Question. How many resources have you shifted from 510(k)'s to PMA's?

Answer. We are projecting a shift of up to 15 FTE from the 510(k) area to the PMA area in fiscal year 1997 and possibly an additional 15 FTE will be shifted in fiscal year 1998. Sufficient FTE, however, will be retained for adequate review of complex 510(k)'s. We want to continue to improve the timely review of higher impact and medically important devices. To accomplish this, FDA's CDRH is in the process of re-engineering the pre-market work processes to make them as efficient and effective as possible. The re-engineering effort involves a risk-based approach to increase the direct attention paid to reviewing those medical devices that present an important clinical benefit or significant risk to patients. FDA will also identify simplified, alternative methods for reviewing routine, lower risk products in ways that continue to provide adequate consumer protection, and also continue reviewing devices that can be exempted from the 510(k) process.

Question. Did FDA ever shift PMA resources to 510(k)'s in order to reduce the backlog and review times? If so, what impact did this have on the PMA review process?

Answer. FDA did not shift PMA resources to reduce the 510(k) backlog. We temporarily shifted some FTE from outside the program area to assist in decreasing the backlog. Approximately 18 FTE from the Office of Science and Technology, or OST, within FDA's, CDRH, were used to conduct direct review of pre-market submissions. In fiscal years 1994 and 1995, CDRH also received a substantial amount of new resources for medical device review and most of the new staff were assigned to work on 510(k)'s. The additional review staff, coupled with several management initiatives for the 510(k) process, enabled FDA to substantially reduce the backlog of overdue and pending applications.

Question. The reports, along with the fiscal year 1998 budget justification, indicate that a 33 percent increase in PMA workload is expected from fiscal year 1996 to 1997, and another 15 percent increase is projected in fiscal year 1998. Do you plan to continue to shift resources from 510(k) reviews and, if so, how do you plan to continue to maintain or improve 510(k) review times?

Answer. In fiscal year 1997, we project shifting up to 15 FTE from review of lower-risk devices under 510(k)'s to the PMA area. In fiscal year 1998, an additional 15 FTE possibly will be shifted to the PMA area.

The 510(k) devices encompass a broad variety of devices whose risk potential varies widely. We plan to focus our resources on the 510(k)'s with the greatest technological complexity and uncertainty as to safety and effectiveness. Because of the potential public health impact for these types of devices, we plan to increase the personnel assigned to reviewing them. Again, these people will be reassigned from the review of lower risk 510(k)'s. We will identify alternative mechanisms for providing adequate public health protection for the lower risk 510(k)'s by redirecting or reducing FDA's direct involvement. In fact, by fiscal year 1999, we anticipate developing alternative regulatory mechanisms for 33 percent more lower risk devices. Further, improving upon the current high level of 510(k) review time would be difficult because the remaining 510(k)'s will be the more complex applications involving more scientific issues and data.

OFFICE OF REGULATORY AFFAIRS

Question. Dr. Friedman, you indicate in your testimony that the Office of Regulatory Affairs began implementing a new automated system—called Operational and Administrative System for Import Support (OASIS)—that greatly speeds up FDA's handling and clearance of imported products. How is this new paperless processing system helping the agency to maintain its surveillance of the rapidly mounting number of imports of FDA-regulated products?

Answer. The OASIS computerized electronic entry review system is the cornerstone of FDA's strategy which aims to be responsive to the need of the importer/broker for speedy access to domestic commerce while maintaining adequate watch on imported goods.

PART 1

1122

OASIS greatly speeds up FDA's handling and clearance of imported products, and operates in a largely paperless environment. Data FDA needs to make its admissibility determinations are transmitted electronically, and FDA's decisions are communicated electronically back to the brokers.

With OASIS, the initial FDA admissibility determination on every shipment is provided to the broker within eight minutes after the broker submits the entry data. Eighty percent of all shipments get their final FDA clearance within those eight minutes, and over 85 percent are given clearance within three hours, all completely without paper.

The nationwide roll out of OASIS, FDA's new automated system for processing shipments of foreign-origin products seeking to enter the U.S., is underway. On December 2, 1996, OASIS was implemented at FDA's Seattle, Philadelphia, Baltimore, and New Orleans districts. On January 23, 1997, OASIS was implemented at FDA's Atlanta and San Juan districts, and at San Francisco and Kansas City districts on February 19. The rest of the OASIS roll out will be to Detroit and Minneapolis districts in March; Florida and Nashville in April; Dallas and Denver in May; Cincinnati and Chicago in June; New York in July; and Los Angeles, Buffalo and New England districts in September. By the end of September, 1997, OASIS will be operational at every FDA district, covering every U.S. port of entry where FDA-regulated products come in by sea, land, and air.

OASIS will enhance FDA's ability to identify problem shipments by improving our capability to target products with a history of non-compliance and those products which constitute a high risk for a potential public health hazard. Further, it will help assure that problem products and manufacturers are recognized as such in whatever port they are entered, thereby limiting the problem of "port shopping."

OASIS operates in conjunction with the U.S. Customs Service's Automated Commercial System, or ACS. A line is a unique item on an import entry differentiated by country of origin, manufacturer, container size, or product. For lines regulated by FDA, the filers send information required by both Customs and FDA when offering the shipment for entry. For electronically filed entries, ACS assembles a set of data for FDA by combining Customs and FDA data. The lines are then electronically screened against a set of criteria developed and maintained by FDA using OASIS.

The screening determines if the lines match any of the established criteria based on product, manufacturer, shipper, country of origin, or any combinations of these four screening elements. The results of the screening are summarized at the entry level and passed as an electronic message back to the filer.

The purpose of this initial electronic screening is to forward to FDA for further review those products with which, based on the product itself, the country of origin, manufacturer or shipper, FDA may have further regulatory interest and to do this on a uniform nationwide basis. The screening criteria take into account such factors as FDA's previous experience with the product, for example a high compliance rate or low compliance rate, planned surveillance work in various program areas, emerging problems or trends, and the capacity of FDA field staff to collect and examine imported product. FDA is capable of changing the electronic screening criteria in OASIS within minutes as the need arises to respond to emerging problems.

For those products that are flagged as "FDA Review" during the initial electronic screening, the entry data is loaded into a different database and screened again using more sophisticated criteria. It is then made available for review by the initial OASIS user, the FDA entry reviewer. At this time, OASIS enables the entry reviewer to request possible actions and OASIS presents all applicable guidance, such as Import Alerts, Surveillance Programs, and Assignments, which may apply to the line to assure that all available information is evaluated when an entry decision is made. Based on this additional review, the FDA entry reviewer will make a decision to detain, sample, or release the entry. Once all lines of an entry have been processed, a decision message for each line is electronically sent to the filer. Further, for the first time, OASIS enables FDA to maintain a readily accessible database of FDA regulated products that have entered the U.S. This capability of accessing information on previous shipments of products, who shipped them and who received them, has proven to be a very valuable tool in responding to possible health hazards associated with imported products. We are now able, in a very short time, to identify who may have received products of concern and plan appropriate follow-up.

Question. What level of funding is being provided for fiscal year 1997 for the implementation of OASIS? What level of funding is included in the fiscal year 1998 appropriations request for this system?

Answer. Development and maintenance of OASIS will require approximately \$1,500,000 in fiscal year 1997. The estimate for fiscal year 1998 is \$1,650,000.

Question. Will additional investments in OASIS be required in future fiscal years? If yes, please identify the level of funding required by fiscal year.

PART 1

1123

Answer. It will cost approximately \$500,000 per year to maintain the OASIS system in the outyears.

BLOOD SUPPLY AND BLOOD PRODUCT SAFETY

Question. What are FDA's current procedures in dealing with adverse incidents in blood products when they occur?

Answer. Under 21 CFR 600.80, licensed manufacturers of biological products, including blood derivatives, are required to report adverse experience information to FDA. Manufacturers are required to report serious and unexpected adverse experiences within 15 working days of initial receipt of the information. They are required to report other adverse experiences at periodic intervals. FDA has required that plasma derivative manufacturers file monthly reports on adverse reactions, including reports of potential transmission of infectious diseases, associated with their products to assure that incidents involving potential transmission of infectious agents are investigated expeditiously. In addition, manufacturers are required to investigate reports of adverse experiences. Whole blood and blood component manufacturers are not subject to the adverse experience reporting requirements in 21 CFR 600.80, but they are required to investigate such reports under 21 CFR 606.170(a). Blood and blood component manufacturers are required to report deaths under 21 CFR 606.170(b).

The FDA may receive reports of incidents of Adverse Experience Reports, or AER's, from a number of different sources. The Centers for Disease Control and Prevention, or CDC, reports directly to FDA any adverse events associated with blood products that it receives. These reports generally come from the FDA's MedWatch system, manufacturers, or consumers. The Agency has evaluated its procedures for processing these AER's and implemented additional steps to have AER's relating to biological products provided directly to FDA's Center for Biologics Evaluation and Research, or CBER, in an expedited manner. FDA is currently developing a proposed rule to require unlicensed establishments to report errors and accidents to the Agency. This rule will provide FDA with a more accurate surveillance of the nation's blood supply and facilitate a rapid response where public health may be at risk. This is under review in the Agency and will be forwarded to OMB in the next few months.

CBER also has a Standard Operating Procedure, or SOP, for emergency operations. This document provides guidance to CBER staff on the procedures to be used in situations that might constitute a threat to the public health. The SOP designates contacts in CBER's review offices, Office of Blood Research and Review, Office of Vaccine Research and Review, and Office of Therapeutics Research and Review, and compliance components. These individuals are the focal points for evaluating and ensuring rapid responses to significant and serious reports of AER's that present public health concerns and may represent emergency situations. These officers, in consultation with other appropriate experts, such as the Office of Regulatory Affairs, evaluate the information provided in the AER, determine if more information is needed to fully assess the impact of the incident, and initiate a response to the incident based on the threat or potential threat to the public health.

AER's from plasma derivative manufacturers which are determined to be a public health threat, result in expedited actions which include, but are not limited to, initiating establishment inspections to conduct a complete assessment of manufacturing practices, determine the manner in which a manufacturer responds to AER's pursuant to Good Manufacturing Practices, or GMP's, and reporting requirements, and evaluating proposed corrective actions and planned responses and public notifications by the manufacturer.

Question. How does the FDA coordinate with and respond to CDC when CDC reports a transmission of infectious disease related to the blood supply or blood products?

Answer. The FDA has extensive interactions at all levels with its sister Public Health Service agencies, CDC and NIH, on blood safety issues.

In October 1995, Secretary Shalala accepted the recommendations of a Department task force reviewing the July 1995 Institute of Medicine, or IOM, report on HIV and the blood supply. In response to these recommendations, the Secretary raised blood safety to the highest levels of Department concern. The Assistant Secretary for Health was designated to be the Blood Safety Director, with overall responsibility for coordination and oversight of the Public Health Service's blood safety programs.

Working with the Blood Safety Director is the Blood Safety Committee which includes the Director, NIH; the Director, CDC; the Administrator, Health Care Financing Administration; and the Commissioner of Food and Drugs. The Blood Safe-

PART 1

1124

ty Committee has been meeting periodically since January 1996. The PHS Advisory Committee on Blood Safety and Availability further supports this effort. This Advisory Committee includes representatives of industry, consumers, scientific experts and ethicists. Its purpose is to provide a forum to examine broad public health and societal implications of blood safety issues.

Since its inception in 1996, the Blood Safety Committee has been informed of adverse events or emergency situations whenever they are likely to have broad public health impact or require increased coordination between the public health agencies.

The CDC has created a position of Assistant Director for Blood Safety in the Division of Viral and Rickettsial Diseases, to facilitate interactions with FDA on blood issues. FDA also receives input from CDC and NIH on issues of blood safety through other mechanisms. CDC and NIH representatives serve as members of the Blood Products Advisory Committee which provides scientific advice to FDA on a variety of issues including product approvals. NIH and CDC representatives also serve on the Transmissible Spongiform Encephalopathies, or TSE, Advisory Committee which advises FDA on TSE issues including their possible impact on blood and blood products. NIH and CDC participate in the interagency Advisory Committee on Blood Safety and Availability which holds monthly teleconferences to discuss issues affecting blood safety. Together, these efforts ensure that CDC and NIH have input at the highest levels of FDA and the Department concerning blood safety.

The CDC has a number of different systems for surveillance of current or potential threats related to the transfusion of blood/blood products. These include disease-specific surveillance systems, donor-based systems for HIV, and recipient-based systems. Identification of previously unknown agents may occur through epidemiological investigations or emerging infection projects. CDC reports directly to FDA any adverse events associated with receipt of blood and blood products that are identified through its surveillance systems or epidemiologic investigations. The CDC routinely provides input to the FDA's Blood Products Advisory Committee, affording the Committee the benefit of this surveillance expertise.

As described previously, the Agency procedures for evaluation and response to AER's includes consultation as necessary with appropriate experts. The expertise needed may require contact with the CDC. The purpose of the contact is to gather additional surveillance data that may be available and to coordinate investigational efforts at user sites where significant adverse events have occurred.

The CDC also participates in product investigations by conducting epidemiological studies or assisting with scientific analysis. Recent examples include Centeon Albuminar in which CDC provided epidemiological assistance in investigating cases of individuals affected by bacterially contaminated product and Alpha Factor VIII and Factor IX in which the CDC provided epidemiological and laboratory assistance in investigating the transmission of Hepatitis A virus from clotting factors. NIH and CDC also share information from large scale surveillance studies on blood safety issues such as the retrovirus epidemiology in donors study, the transfusion transmitted virus study, and the transfusion safety study.

FDA recognizes the sentinel role that CDC plays in safeguarding our nation's blood supply. CDC, in cooperation with FDA, has been conducting surveillance in this country for a rare strain of HIV-1, group O, through the CDC surveillance program. In 1996, the first two cases of HIV group O were reported because of these efforts. FDA has advised manufacturers to improve their test kits to detect these novel strains of HIV and is currently reviewing applications for HIV test kits to detect HIV group O. These issues were discussed at public sessions of FDA's Blood Products Advisory Committee held in September 1996. In cooperation with CDC and NIH, FDA has established a working group to identify and obtain samples from individuals infected with novel HIV strains worldwide. These samples will be used to ensure that HIV tests used in this country can detect novel HIV strains before they reach our country. As a precautionary measure, FDA issued recommendations in December 1996 to defer from donating blood individuals who were in countries identified as endemic for HIV-1 Group.

In 1996, FDA approved tests to detect HIV antigen in blood donors. FDA issued recommendations to blood banks to implement HIV antigen tests when they were licensed. These HIV antigen tests are used in addition to tests to detect antibodies to HIV and serve to further close "the window period" for HIV by providing another level of assurance to prevent HIV transmission through blood and blood products. FDA worked with CDC in developing recommendations for the use of tests such as the HIV p24 antigen test in non-blood bank clinical care settings and these were published in the CDC's "Morbidity and Mortality Weekly Report."

One example of FDA interactions with CDC and NIH involves the potential transmission of Creutzfeldt-Jakob Disease—CJD—through blood products. CJD is a transmissible spongiform encephalopathy possibly caused by a protein called a

PART 1

1125

prion. FDA has been involved in national and international efforts focused on better understanding Transmissible Spongiform Encephalopathies, or TSE, including CJD. In this area, FDA has collaborated extensively with NIH and CDC, as well as the United States Department of Agriculture, and affected industries and consumer groups.

FDA has formed an intra-agency working group composed of the FDA Deputy Commissioner for Operations and experts from each FDA Center to consider transmissible spongiform encephalopathies and their impact on FDA regulated products. A special CJD advisory committee was formed in 1995, and was rechartered in June 1996 for two additional years as the TSE Advisory Committee. The TSE Advisory Committee has met periodically to provide advice to FDA, most recently, in April of this year. Issues related to blood safety and CJD have been discussed periodically with these committees.

FDA has also taken other precautionary measures to safeguard the blood supply. In August 1995, FDA issued recommendations for the deferral of blood donors at risk for CJD. FDA issued revised recommendations in December 1996 to clarify familial risk following a discussion of this issue by the TSE Advisory Committee. CDC is conducting surveillance studies to look for CJD in this country in patients who have diseases associated with increased exposure to blood and blood products, such as persons with hemophilia. No association between hemophilia and CJD has been found to date. In addition, FDA, CDC, NIH and industry have been cooperating in scientific studies to assess the risk of transmission of CJD by blood and blood products. These studies are ongoing. The issue of CJD transmission by blood and blood products was discussed at the Advisory Committee on Blood Safety and Availability in April of this year.

Question. What efforts have been taken to move forward in improving rapid patient and physician notification when an adverse incident occurs?

Answer. The FDA is working with industry and consumer groups to identify more efficient and effective consumer notification methods. These notifications range from product alerts and quarantine notices to product recalls. The Agency has detailed guidelines at 21 CFR, Part 7 which outline the responsibilities and expectations of manufacturers in conducting field corrections of marketed products that represent a potential threat to the health of consumers. In addition, FDA can order the recall of biological products that present an imminent or substantial hazard to the public health. Plasma derivative manufacturers are required to file monthly reports on adverse reactions associated with their products to assure that potential transmissions of infectious agents are investigated expeditiously. The FDA has also taken further steps to address the issue, which I would be happy to provide for the record.

[The information follows:]

- The Agency utilizes electronic communications including the CBER World Wide Web Home Page, fax-on-demand, press releases and talk papers, and a Blood and Plasma Products hotline to disseminate information concerning product recalls and market withdrawals.
- FDA has instituted communication of withdrawals and/or recalls of plasma derivatives to consumer groups such as the National Hemophilia Foundation and the Committee of Ten Thousand, as appropriate.
- A PHS meeting, including FDA, CDC, and the National Heart, Lung, and Blood Institute, or NHLBI, was convened in November 1996 to discuss and obtain public input on notification of the public on recalls and ongoing investigations. An interagency working group discussed proposals to track products by lot number to recipient at a March 1997 Blood Products Advisory Committee meeting. The industry representatives were encouraged to develop plans to more effectively notify blood product end-users of recalls and market withdrawals.
- On September 9, 1996, FDA in cooperation with HCFA issued a final rule on, “Current Good Manufacturing Practices for Blood and Blood Components: Notification of Consignees Receiving Blood and Blood Components at Increased Risk for Transmitting HIV Infection.” This rule requires blood establishments to notify consignees of HIV lookback cases so that physicians or other health care workers can be notified and, where appropriate, recipient notification can occur.
- In December 1996, FDA advised plasma derivative manufacturers to modify their labeling of plasma derivatives to include warnings about the potential of these products to transmit infectious diseases.
- The Agency has continued efforts to make the public aware of FDA’s decision-making process on evaluating AER’s, initiating recalls, clarifying present operating procedures and encouraging the use of new technologies for notifying consumers.

PART 1

1126

The FDA holds periodic meetings with consumer organizations such as the National Hemophilia Foundation and the Committee of Ten Thousand to discuss these issues.

FISCAL YEAR 1997 REPROGRAMMING NOTIFICATION

Question. On April 10, 1997, I received a letter from Secretary Shalala notifying me of the agency's plan to reallocate funds identified in the fiscal year 1997 Committee Report and adopted by the Conference committee. While the letter identifies four specific changes in accordance with the established reprogramming thresholds, it does not adequately identify where these funds are being shifted to or taken from and for what reasons. Included is a copy of the April 10, 1997, letter and the backup summary table the agency provided to the Committee.

[The information follows:]

LETTER FROM DONNA E. SHALALA

SECRETARY OF HEALTH AND HUMAN SERVICES,
Washington, DC., April 10, 1997.

Hon. THAD COCHRAN,
Chairman, Subcommittee on Agriculture, Rural Development, and Related Agencies,
Committee on Appropriations, U.S. Senate, Washington, DC.

DEAR MR. CHAIRMAN: I am writing to inform you of our plan to reallocate funds which were identified in the fiscal year 1997 Senate Appropriations Committee Report, and adopted in the Conference Report, to more accurately reflect fiscal year 1997 costs of the National Center for Toxicological Research (NCTR). As described in the enclosed information, the estimate the Food and Drug Administration (FDA) provided to the Committee for inclusion in the fiscal year 1997 report, was substantially higher than the base funding level for NCTR. The resources resulting from this action have been reallocated to other program activities. These reallocations have been reflected in the fiscal year 1998 Congressional Justification. We regret any confusion that this has created.

Also enclosed is information informing the Committee of FDA's plans to implement the regulations on nicotine-containing tobacco products, and to more appropriately allocate the funds remaining under "Program Management," thus eliminating that as a separate budget activity. In addition, FDA plans to reduce the amount of funding for the Orphan Product Grants program to help defray the costs of pay increases and inflation absorbed by the agency. This reduction in funds may result in a decrease in the number of new grants awarded in fiscal year 1997.

The specific impact of each funding reallocation on program activities is detailed in the enclosure to this letter. The enclosure summarizes these changes by program activity.

I appreciate the Committee's continued interest in and support of the activities of the Food and Drug Administration.

Sincerely,

DONNA E. SHALALA.

Enclosure.

THE FOOD AND DRUG ADMINISTRATION

PROPOSED REALLOCATIONS—FISCAL YEAR 1997

National Center for Toxicological Research (NCTR)

Senate Committee Report Funding Table: \$37.0 million

Fiscal Year 1997 Current Estimate: \$31.3 million

NCTR relies on a high level of contract support for managing its facilities, maintaining its animal colonies, and for many other research support services. In past years, FDA has redirected funds toward the end of the year from other programs to NCTR for its contract support. NCTR's operating budget is then reduced by the same amount at the beginning of the next year so that the base level of funding remains relatively constant. The agency is not able to provide these additional funds to the NCTR at a consistent level every year, but endeavors to keep the NCTR funded at a "base" level of funding necessary to sustain its current level of operations, including mandated contract labor increases. The amount FDA provided to the Committee for inclusion in the fiscal year 1997 Committee report was based on fiscal year 1995 actual obligations (when a substantial amount of funds were redirected to NCTR) and a fiscal year 1996 estimated obligation level that proved to be too

PART 1

1127

high. The fiscal year 1997 estimate in the fiscal year 1998 Congressional Justification reflects, the current planned level of funding for NCTR and for all other Centers.

ADDITIONAL INFORMATION

Regulation of Nicotine-Containing Tobacco Products

Senate Committee Report Funding Table: Not separately identified

Fiscal Year 1997 Current Estimate: \$4.9 million

The fiscal year 1998 Congressional Justification establishes Tobacco as a separate program activity to adequately reflect the resources planned for FDA activities related to the regulation of nicotine-containing tobacco products. FDA plans to devote approximately \$4.9 million during fiscal year 1997 to implement the regulation of nicotine-containing tobacco products. In previous years, funding for the tobacco initiative came from funds allocated to the Office of the Commissioner. Funding for this effort in fiscal year 1997 will come from general reductions in funding for "Other Activities." Although we intend to report our costs for this initiative separately, this effort will be housed, for administrative purposes, within the Office of Policy, at least through the initial implementation stage.

As you know, on August 23, 1996, President Clinton approved FDA's final rule for the regulation of nicotine-containing tobacco products. The final rule limits the availability and appeal of tobacco products to young people. Our goal is to promote and protect the health of our nation's youth by reducing the easy access and strong appeal of these products to children, before they become addicted.

Our efforts during fiscal year 1997 will focus on outreach and preliminary enforcement activities. The new rule requires certain actions to be implemented during fiscal year 1997. The requirement for vendors to check age/photo ID's before selling these products to young people by February 28, 1997, has been implemented. All other provisions of the regulation, except those related to sponsorship, are to be implemented by August 28, 1997. Approximately \$2 million of the total fiscal year 1997 budget will be allocated to States to provide training for State and local officials who will help enforce FDA's rule. The remainder of the budget will be used for outreach activities to educate and mobilize state and local public health, law enforcement, and other officials and to raise awareness about the new rule with community organizations, parent groups, voluntary health groups and others.

Program Management

Senate Committee Report Funding Table: \$6.1 million

Fiscal Year 1997 Current Estimate: Not separately identified

In its fiscal year 1997 report, the Committee requested a new presentation of Other Activities. A significant portion of what had been Program Management was moved to Other Activities. The only portion of Program Management remaining after this change, was related to Direct Field Management. Since funding for all other field activities are reflected in the appropriate program lines, we are doing the same for Direct Field Management, thus eliminating Program Management as a separate program activity.

Orphan Products Grants

Senate Committee Report Funding Table: \$12.2 million (excludes extramural services)

Fiscal Year 1997 Current Estimate: \$11.3 million

During fiscal year 1997, FDA plans to reduce the funding for Orphan Product (OP) grants. FDA's budget has been at a constant level for the past three years. In real terms, however, the agency's resources have been declining due to pay cost increases and inflation absorbed by the agency. Because of this, we have had to reduce many operating costs. During this same time, the OP grant program has not been reduced. In fiscal year 1997, however, we plan to reduce the funding for OP grants to \$11.3 million. Please also note that, in the fiscal year 1998 Congressional Justification, the cost of the OP grants program has been moved from "Other Activities" and included in the program activities directly related to these grants (Human Drugs and Medical Devices and Radiological Products). This is consistent with all other grant programs.

FOOD AND DRUG ADMINISTRATION FISCAL YEAR 1997 APPROPRIATION ESTIMATES

[Dollars in thousands]

Program	Fiscal year 1997 Senate Committee recommendations—			Changes—			Fiscal year 1998 congressional budget request—Fiscal year 1997 appropriations—			
	Program totals	PDUFA/MQSA	S&E	Tobacco	SBIR and OPD grants	Program management	Other changes	Program totals	PDUFA/MQSA	S&E

PART 1

1129

Question. Why is the agency proposing to eliminate the program management line-item after the Committee sought to separately identify those costs in cooperation with the agency last year?

Answer. The fiscal year 1997 Senate Committee report language directed FDA to make a number of changes to its budget structure, primarily to more clearly delineate funding among the various components of the Agency. In working on the requested changes, we recognized this as an opportunity to make other changes that would result in a more understandable and consistent budget presentation. One of the Committee's directions was to split the line for "Program Management", and to spread back funding directly attributable to each program and to 'other activities' as appropriate. This would help provide the true costs of funding each program. Redirecting these costs left only \$6,094,000 in the old program management line for funding of Direct Field Management. Since all other field costs had been appropriately spread to the programs, we believed that it was consistent to spread the field management costs to the programs as well in order to achieve an understanding of the full cost for each program. The roughly \$6.1 million was spread back to each program to which funding was directly attributable. For Foods, the amount is \$2,377,000, for Human Drugs, \$1,463,000, for Biologics, \$244,000, for Animal Drugs and Feeds, \$366,000, and finally for Medical Devices, \$1,645,000.

Question. Please explain which line-items are being increased as a result of the \$5.670 million reduction for National Center for Toxicological Research (NCTR) and the specific programs and activities receiving enhanced funding as a result and the reasons for each increase.

Answer. The adjustment of \$5.7 million in the amount planned for NCTR in fiscal year 1997 is not really a reallocation to other programs, but an adjustment to reflect the true continuing costs of FDA's major programs. The estimate for NCTR furnished to the Committee in mid-1996 was too high because it was based on an unusually-high level of funding for NCTR in fiscal year 1995.

The reason that the obligations for NCTR were unusually high in fiscal year 1995 relates to the nature of NCTR's operating budget, which includes a number of support service contracts. NCTR relies on a high level of contract support for managing its facilities, maintaining its animal colonies, and for many other research support services. In past years, FDA has redirected funds toward the end of the year from other programs to NCTR for its contract support. NCTR's operating budget is then reduced by the same amount at the beginning of the next year so that the overall level of funding remains relatively constant. The Agency is not able to provide these additional funds to the NCTR at a consistent level every year, but endeavors to keep NCTR funding at a "base" level necessary to maintain its current level of operations. The Agency's current estimate for NCTR for fiscal year 1997 of \$31.3 million is very similar to NCTR's actual expenditures for fiscal year 1996 of just under \$31 million. The current fiscal year 1997 estimate reflects the current planned level of funding for NCTR and for all other programs.

Again, all of these adjustments are not truly program increases or decreases, but adjustments to more accurately reflect the continuing cost in fiscal year 1997 of the level of program activities conducted in fiscal year 1996. However, since the fiscal year 1997 appropriation did not include inflationary allowances, all programs have had to absorb a reduction in their operating funds, and NCTR has had to absorb its proportionate share of this reduction. To partially compensate for this, the Agency did allocate an increase of \$533,000 to NCTR early in fiscal year 1997 to absorb some of the inflation in NCTR's contract costs.

Question. The agency indicates that the new line-item of \$4.9 million for the regulation of tobacco was created through a reduction in "Other activities". Please explain which line-items under "Other activities" were reduced, the impact of each reduction on the specific office or activity from which these funds were taken. Is the funding being moved from each of these "Other activities" that previously dedicated to tobacco? If not, what is the impact of the reduction being taken to provide increased funding for tobacco?

Answer. Yes, the funding for fiscal year 1997 is indeed coming from the budgets of these same offices, and represents funding previously dedicated to tobacco activities. I would be happy to provide, for the record, a table showing the offices from where tobacco funding was taken in fiscal year 1997.

[The information follows:]

Fiscal year 1997 current estimate

Tobacco	+ \$4,914,000
Other activities:	
Office of the Commissioner	(1,422,000)
Office of Policy	(1,164,000)

PART 1

1130

Office of External Affairs	(518,000)
Office of Operations	(905,000)
Office of Management and Systems	(905,000)
Total, tobacco funding	(4,914,000)

Question. What is the reason for the increase in non-GSA rent and rent-related activities?

Answer. The increase in the S&E Rent and Related as shown in the explanatory notes was based on the current estimated costs projected at the time the President's Budget was presented. FDA has since further refined its estimates, and to show the various elements of these costs we are providing a chart which shows actual obligations since fiscal year 1992 and a revised fiscal year 1997 estimate.
[The information follows:]

FIVE-YEAR HISTORY OF S&E RENT AND RELATED ACTIVITIES

[Dollars in thousands]

	Fiscal year—					
	1992	1993	1994	1995	1996	1997 est.
Commercial rent and related services	\$5,917	\$5,865	\$6,544	\$6,510	\$6,558	\$6,558
Costs for FDA owned facilities	3,254	3,997	4,332	4,711	5,205	5,205
GSA rent-related services	3,599	3,857	4,925	6,866	6,719	7,019
GSA building delegation services ¹	5,341	5,306	3,630	3,580	3,976	5,418
Total, S&E rent and related	18,111	19,025	19,431	21,667	22,458	24,200

¹The fiscal year 1997 estimate of \$5.4 million for costs related to building delegated to FDA includes \$1.4 million for MODULE II, FDA's new Lab facility in Beltsville, MD.

The new fiscal year 1997 estimate is based primarily on the costs associated with MOD II. MOD II is a state-of-the-art laboratory, built and owned by GSA on FDA land. FDA took occupancy of MOD II on October 21, 1996. MOD II has recently been added by GSA to FDA's inventory of delegated buildings for operation and maintenance. Additional S&E appropriated funds are required to supplement the funds provided by GSA for the MOD II delegation. These funds will be used for the operation and maintenance of the facility above GSA's standard level 8 hour day. The estimated total costs associated with MOD II did not become apparent until after the first estimates, those used for the President's Budget Appendix and the explanatory notes, had been printed. The new estimate of \$24.2 million includes \$1.4 million to cover the costs of MOD II coming on line.

Question. The reprogramming letter indicates that a reduction in the amount provided by the Committee for Orphan Product Grants, from \$12.2 million to \$11.3 million is being taken to accommodate pay cost increases and inflation absorbed by the agency. Why is this grant program being reduced to cover these costs? What other program reductions have been made from the fiscal year 1996 levels to cover pay, inflation and other mandatory cost increases in fiscal year 1997?

Answer. FDA's budget has been at a constant level for the past three years. In real terms, however, the Agency's resources have declined as inflationary increases for pay and other operating costs have been absorbed by the Agency. Because of this, FDA has had to reduce many operating costs across most program areas. During this same time, the Orphan Product grant program has not been reduced. In fiscal year 1997, however, we have had to make the very difficult decision of reducing the funding for Orphan Product grants to \$11.3 million, as we continue to absorb inflationary increases.

Question. The agency indicated that the \$12,868,000 provided by the Committee for Orphan Product Grants and extramurals is being reduced by \$905,000 for tobacco, \$12.010 million for SBIR and Orphan Product Grants, and that "other changes" are resulting in an increase of \$2.131 million, for a net total of \$2.084 million. Why is the Orphan Product Grants Program being shifted to Human Drugs?

Answer. Grant programs that are specifically tied to certain program areas are generally reflected in that program area. Thus, for the fiscal year 1998 budget request we moved the Orphan Grants program, which is clearly a Human Drugs program, into that activity line. Thus, the total cost of the Human Drugs program is reflected under Human Drugs. This is consistent with the budget presentation of the President's budget that includes the Orphan Products program under Human Drugs. FDA would be happy to footnote separately in all future budget presentations the amount included for the Orphan Products program.

PART 1

1131

Question. What specific “other changes” are being made resulting in an increase of \$2.131 million for this line-item?

Answer. Funding for the Office of Operations and administrative support for the Orphan Products program was moved from the Office of the Commissioner.

Question. What remaining programs/activities are being funded by the new proposed level of \$2.084 million for this line-item?

Answer. The net \$2.084 million will fund the staffs that support the Deputy Commissioner for Operations and administration of the Orphan Grants Program. This is slightly less than the \$2.286 million provided for these activities in fiscal year 1996.

Question. The agency has provided a table (inserted above) to the Committee showing the changes associated with the reprogramming letter. Please explain the specific changes being made to each of the line-items contained in the Committee report, the dollar amount of each increase or decrease resulting in this net change, and the reason for each.

If not provided in answering the above question, please provide the specific reductions and/or increases producing the net change reflected in the “other changes” column for each line-item, the dollar amount, and the impact of each change.

Answer. The numbers provided the Committee in the budget request when compared to the fiscal year 1997 Senate Report have changed due to a variety of factors—elimination of program management as a separate activity line, an unusually high fiscal year 1995 actual at the NCTR, the addition of tobacco as a separate program, changes in field workloads which caused the shifting of funds between activity areas, a new display for grants under the Orphan Products and Small Business Innovative Research programs, and a new line item under Other Activities for the costs of the Office of Operations and the administrative support for the Orphan Products program.

The information initially provided, when the Committee recommendations directed the changes in mid-1996, was based on fiscal year 1995 actuals and any mid-year fiscal year 1996 estimates available at the time. We now realize that these were not good estimates of 1996 breakouts. The differences between 1996 estimates and actuals are a significant part of the difference between the Committee’s recommendation for fiscal year 1997 and our current resource estimates.

Generally, at the start of each fiscal year, we look at how to manage our resources within the environment of having to absorb all inflationary costs associated with pay raises and other operational increases beyond our control, plus having to plan for unknown contingencies or events that may develop during the course of the year. We have not received funding to cover current services for the past three years. Because FDA is a very payroll intensive agency, we must first assure that our payroll costs will be met. As a result of inflation absorption and the need to plan for unknown circumstances, we reduce operating budgets through prorata agency-wide decreases—across the centers and the offices—at the start of the year. For fiscal year 1997, we held back about \$5 million, or one-half of one percent, for these potential exigencies. Throughout the course of the year, as events unfold, we allocate previously unallocated funds to FDA organizations based on priorities established by top management. This is the reason that we cannot provide a track of each and every dollar from one activity to another. The money is held back in a reserve at the start of the year, and is subsequently re-allocated, in many cases, back to the same activities.

The resulting changes in the current fiscal year 1997 Appropriation column of the fiscal year 1998 Congressional Justification reflect the estimates at that time of the allocation of FDA resources.

In addition, the Committee’s direction for a new display of our resources provided us an opportunity to further streamline our budget presentation. We have traditionally combined funding by program which covered costs for the center itself, its field components, plus some portion of overhead. The Committee’s direction required the overhead to be shown separately under the new Other Activities line. This greatly cleaned up the structure of our request, which was an advantage to us as well as the Committee.

FDA seeks to provide the Committee with the best information on how the agency resources are and will be managed, consistent with congressional direction, and we will continue working with Committee staff to assure that our budget is understandable and consistent.

It has been difficult to adjust to the Committee’s program structure modifications, as directed in the Committee’s Report on FDA’s fiscal year 1997 Appropriations. The Agency regrets any confusion that may have been created by some of its preliminary estimates, and by the presentation changes made in the fiscal year 1998 President’s budget and the subsequent reprogramming letter. The Agency has made several

PART 1

1132

changes in its planning and budgeting systems to better manage according to the Committee's program structure, and we believe that improvement is reflected in the fact that the Agency's current estimates are not very different from the estimates included in the explanatory notes.

Further, the Agency is planning the purchase and implementation during fiscal year 1997 of new software that will greatly enhance our ability to manage costs according to the Committee program structure, and the ability to plan and project future estimates. This software will be utilized by all components of the agency, and during the application design phase of the project, emphasis will be given to assuring that all agency costs will be reported and managed according to the Committee program structure.

I would be happy to provide some additional detail for your information, including a detailed crosswalk table that attempts to bridge the gap from the fiscal year 1997 Senate Report language to the fiscal year 1997 column of the fiscal year 1998 President's budget, then to our current estimate, plus some descriptions of the reasons for the changes, wherever possible.

1/ Through column 5, includes funding for Office of Operations, with the administrative support for the Orphan grants program.

PART 1

1134

Crosswalk Table Explanatory Notes:

1. *Fiscal year 1997 Committee Report.*—Reflects the activity lines and dollars amounts found in the fiscal year 1997 Senate Subcommittee Report language, based on numbers from fiscal year 1995 actuals and mid-year fiscal year 1996 estimates.

2. *Fiscal year 1996 Actual Obligations.*—Reflects actual obligations for fiscal year 1996 for comparison purposes. Note that costs for tobacco are included under Other Activities for this column, and that funding for the Office of Operations (and the administrative support for the Orphan Products Grants program) are included under the Office of the Commissioner. In several cases, these fiscal year 1996 actuals were significantly different from the fiscal year 1996 projections used by the Committee.

Columns 3 and 4 represent corrections for changes between fiscal year 1996 mid-year estimates and fiscal year 1996 actuals, which includes field workload adjustments, as well as some forecasting and calculation errors we have uncovered.

3. *Restore NCTR Funding to Programs.*—The reduction of \$5,670,000 in the amount planned for NCTR in fiscal year 1997 is an adjustment to reflect the true continuing costs of FDA's major programs. The estimate for NCTR furnished to the Committee in mid-1996 for inclusion in the report was too high because it was based on funding in fiscal year 1995 that included significant one-time money.

The reason for this relates to the nature of NCTR's operating budget, which includes a number of support service contracts. NCTR relies on a high level of contract support for managing its facilities, maintaining its animal colonies, and for many other research support services. In past years, toward the end of the year, FDA has redirected remaining funds from other programs to NCTR for its contract support. The Agency endeavors to keep NCTR funding at a "base" level necessary to maintain its current level of operations. The Agency's current estimate for NCTR for fiscal year 1997 of \$31,307,000 is in line with NCTR's actual expenditures for fiscal year 1996 of just under \$30,774,000, and incorporates a \$533,000 increase over the fiscal year 1996 funding level to cover increased contract costs.

4. *Changes for fiscal year 1996 Actuals with Field Adjustments.*—This column reflects the differences between fiscal year 1996 actuals, including changes in field workloads, and some calculation/forecasting errors made in developing the budget display numbers used in the report language. Each year, unanticipated events and changes in workload affect estimates made for field activities as they relate to each program area. We have attempted to reflect these shifts among programs.

The numbers developed for the Senate contained an inadvertent errors regarding field costs for MQSA. Funds for field activities for MQSA were reflected under S&E, not under user fees. For the purposes of this table and for consistency with previous displays, we have included the user fees with S&E, and plan to accurately reflect the split in future tables. For PDUFA under Other Activities, the \$3,500,000 reduction reflects a management decision to shift investment fund control for information resources back to the Centers for Drugs and Biologics.

5. *Fiscal year 1997 Estimated Adjustments.*—Provides an adjusted fiscal year 1997 estimate to reflect the changes shown in columns 3 and 4. This column is calculated by adding columns (1), (3), and (4). Column (5) serves as a more comparable starting point for cross-walking to the fiscal year 1997 column of the fiscal year 1998 Congressional justification.

6. *Separate funding for Office of Operations (and administrative support for the Orphan Product Grants program).*—Reflects support costs for these offices, in conjunction with individual representation of each major office within FDA's structure.

7. *Delete Program Management.*—The \$6,094,000 is the remaining portion of field activity of what the agency formerly referred to as "program management". Since funding for all other field activities are reflected in the appropriate program lines, we are doing the same for Direct Field Management, thus eliminating Program Management as an activity. Costs included under direct field management consist of a portion of headquarters costs of the Office of Regulatory Affairs which manages FDA Field activities. In order to depict the total program costs (including all field costs), the \$6,094,000 balance was distributed to all of the programs proportionately except NCTR and Other Activities, as these areas are not supported by the field.

8. *Add Tobacco Line.*—The new display line for Tobacco shows a planned level of funding of \$4,614,000 to be included in the fiscal year 1997 column of the fiscal year 1998 President's budget. This funding is derived from reductions for the various offices under "Other Activities".

9. *Move Grants to Programs (Orphan Product Grants and Extramural Funding).*—The display in the Committee report included funding for the Orphan Product Grants and Small Business Innovative Research (SBIR) programs under Other Activities. Both of these programs are directly related to specific program areas, not the indirect nature of the funding included under Other Activities, which provides

PART 1

1135

support across-the-board to each of the program areas. Thus, these grants are shifted back to the programs to which they relate: the drug-related activities undertaken by the Orphan Products Grants program is now under Human Drugs, and the device-related SBIR grants funding is now reflected in the Medical Devices program.

10. *Original fiscal year 1997 Column of fiscal year 1998 CJ.*—This column represents the fiscal year 1997 column of the fiscal year 1998 congressional justification.

11. *Adjustments from fiscal year 1997 CJ to fiscal year 1997 Current Estimate.*—Reflects adjustments made from the congressional justification through our current estimates for fiscal year 1997. The primary adjustments in this column are for increased funding for Food Safety in support of the President's Food Safety Initiative, and for Animal Drugs to implement the Animal Drug Availability Act. Also, increased funds are needed for Rent and Related Services for the costs of operating FDA's new Beltsville, MD, facility known as MODULE II. Funding for these initiatives was provided through pro-rated, across-the-board, operating reductions done at the beginning of the year.

The adjustments reflected under Other Activities would constitute a reprogramming from the fiscal year 1997 Congressional Justification's explanatory notes. We plan to submit a reprogramming letter to the Committee very soon. In general, increases under Other Activities for the Office of the Commissioner and the Office of Policy will be offset by reductions in the Office of Management and Systems and Central Services, accommodated through continued streamlining of contract and other support costs, and by cost reductions paid to the DHHS Program Support Center and other central costs. Overall, the Other Activities line in our fiscal year 1997 current estimate column is slightly less than the amount included in the fiscal year 1998 Congressional Justification.

12. *Fiscal year 1997 Current Estimate.*—Reflects FDA's current estimate for costs, by each activity line, for fiscal year 1997.

Question. For each program area, please break down the fiscal year 1997 and 1998 proposed levels reflected in the budget request by Center and related field activity.

Answer. I would be happy to provide a table showing the splits between the centers and field. These dollars reflect fiscal years 1997 and 1998 program areas as they appear in the Congressional Justification.

¹ Amount included for orphan product grants (CDER): Current fiscal year 1997 estimate, \$11,345,000; fiscal year 1998 freeze, \$11,345,000.

Question. What has FDA done to manage its budget within the amounts for each activity reflected in the Senate Committee report accompanying the fiscal year 1997 appropriations bill, and approved by the conference committee?

Answer. Except for the items noted in the reprogramming letter dated April 10, 1997, we have attempted to manage within the amounts for each activity reflected in the fiscal year 1997 Senate Committee report. Generally, at the start of each fiscal year, we look at how to manage our resources within the environment of having to absorb all inflationary costs associated with pay raises and other operational increases beyond our control, plus having to plan for unknown contingencies or events that may develop during the course of the year. We have not received funding to cover current services for the past three years. Because FDA is a very payroll intensive agency, we must first assure that our payroll costs will be met. As a result of inflation absorption and the need to plan for unknown circumstances, we reduce operating budgets through prorata agency-wide decreases—across the centers and the offices—at the start of the year. For fiscal year 1997, we held back about \$5 million, or one-half of one percent, for these potential exigencies. Throughout the course of the year, as events unfold, we allocate previously unallocated funds to FDA organizations based on priorities established by top management. This is the reason that we cannot provide a track of each and every dollar from one activity to another. The money is held back in a reserve at the start of the year, and is subsequently re-allocated, in many cases, back to the same activities.

The Committee's direction for a new display of our resources provided us an opportunity to further streamline our budget presentation. We have traditionally combined funding by program which covered costs for the center itself, its field components, plus some portion of overhead. The Committee's direction required the overhead to be shown separately under the new Other Activities line. This greatly clarified the structure of our request, which was an advantage to us as well as the Committee.

It has been difficult to adjust to the Committee's program structure modifications, as directed in the Committee's Report on FDA's fiscal year 1997 Appropriations. The Agency regrets any confusion that may have been created by some of its preliminary estimates, and by the presentation changes made in the fiscal year 1998 President's budget and the subsequent reprogramming letter. The Agency has made several changes in its planning and budgeting systems to better manage according to the Committee's program structure, and we believe that improvement is reflected in the fact that the Agency's current estimates are not very different from the estimates included in the explanatory notes.

Further, the Agency is planning the purchase and implementation during fiscal year 1997 of new software that will greatly enhance our ability to manage costs according to the Committee program structure, and the ability to plan and project future estimates. This software will be utilized by all components of the agency, and during the application design phase of the project, emphasis will be given to assur-

PART 1

1137

ing that all agency costs will be reported and managed according to the Committee program structure.

FDA seeks to provide the Committee with the best information on how the agency resources are and will be managed, consistent with congressional direction, and we will continue working with Committee staff to assure that our budget is understandable and consistent.

GENERIC DRUG APPROVALS

Question. In the Conference Report that accompanied H.R. 3603 (Report 104-726), the Appropriations Committees directed FDA to "use available funds to ensure compliance with its 180 day statutory review period for generic drug applications." What steps has FDA taken to respond to this request? Please list the dates on which any remedial action was taken.

Answer. FDA has taken a number of actions to enhance compliance with its 180 day statutory review period for generic drug applications. These actions have been taken to improve efficiencies in the application review process. At the end of fiscal year 1996, there was a backlog of 46 overdue applications, meaning abbreviated new drug applications, or ANDA's, pending greater than 180 days. In addition, 71 chemistry supplements were overdue. As a reference, at the end of fiscal year 1995, there were 58 ANDA's and 104 supplemental applications overdue. Thus, FDA has substantially reduced the backlog of overdue applications and supplements.

FDA has implemented new faxing and teleconference procedures, and has begun faxing the review/comments/deficiencies to applicants during this fiscal year. Additionally, for most "minor" issues, applicants will be able to submit responses via facsimile. If the fax response is received from an applicant within 30 days, the reviewer will then complete review of the application. If it is not received within 30 days, then this would be classified as a minor amendment. Currently, responses to minor amendments are placed in a queue and reviewed within 60 days.

In fiscal year 1996, FDA also implemented a procedure for public release of bioequivalence protocols and protocol reviews. It is anticipated that by providing public access to this information, there will be fewer protocols submitted for review, thus decreasing the Division's protocol workload and allowing more time to be spent on application reviews. By releasing the first protocol for a drug, FDA no longer has to review duplicative protocols thereby freeing up more resources to conduct timely reviews.

Also, FDA initiated a procedure to contact applicants that undergo two or more major deficiency cycles during the review process. Applicants are requested to contact FDA for discussion or clarification regarding the deficiencies. If FDA is not contacted, the Office will call the applicant within 30 days to see if any further discussion, or perhaps a meeting, is necessary. It is hoped that this interaction will prevent additional major deficiency cycles and shorten total time to approval.

In 1996, FDA's Office of Generic Drugs, or OGD, hired a medical officer to improve timeliness of reviews of ANDA's with bioequivalence studies with clinical endpoints. In the past, these complicated studies were referred to the Office of Review Management for review, and then returned to the OGD for final processing after completion of the scientific review.

The Office of Generic Drugs has implemented its program for electronic submission of bioequivalence data. The program was developed under contract with the University of Maryland. Under the program, applicants that choose to may prepare electronic submissions on diskette with the aid of a user-friendly program call Entry and Validation Program. The program is expected to have a very positive impact on the efficiency of reviews, ultimately reducing review times.

Question. In your opinion, why is FDA exceeding the statutory requirement that Abbreviated New Drug Application (ANDA) be reviewed in 180 days?

Answer. Staffing reductions coupled with an increased number of submissions of original applications have had a significant detrimental impact on review times.

Question. Since 1990, what have been the mean and median review times for New Drug Applications, ANDA's and ANDA supplements?

Answer. I will be happy to provide this information for the record.
[The information follows:]

Fiscal year	NDA's		ANDA's		ANDA supplements	
	Mean	Median	Mean	Median	Mean	Median
1990	31.7	23.8	25.0	23.0	N/A	N/A
1991	29.2	24.2	36.3	32.7	N/A	N/A

PART 1

1138

Fiscal year	NDA's		ANDA's		ANDA supplements	
	Mean	Median	Mean	Median	Mean	Median
1992	30.0	24.2	35.4	34.5	N/A	N/A
1993	34.3	26.8	40.4	39.7	N/A	N/A
1994	27.3	20.8	29.4	24.4	N/A	N/A
1995	25.7	18.7	35.3	28.2	N/A	N/A
1996	19.6	15.0	33.2	24.7	N/A	N/A

Question. List the ANDA's that are currently being delayed because of an outstanding scientific or regulatory bioequivalence issue, and provide the mean time the application has been pending before FDA.

Answer. FDA is not permitted to specifically discuss pending applications. However, the types of drug products that may take longer to approve are nonsystemically absorbed drug products that require more extensive bioequivalence testing and others that raise especially complex scientific issues.

Question. Since 1990, what has been the mean and median review cycle in months for ANDA's and ANDA supplements?

Answer. I will be happy to provide this information for the record.
[The information follows:]

REVIEW CYCLE TIMES (MONTHS) FOR ANDA'S AND AADA'S ^{1 2 3}

Year	Originals		Supplement median ^{4 5}

PART 1

1140

REVIEW CYCLE TIMES (MONTHS) FOR ANDA'S AND AADA'S^{1 2 3}—Continued

Year	Originals		Supplement median ^{4 5}	
	Mean	Median	Major	Minor
JAN 97	5.9	5.7	5.1	1.8
FEB 97	5.6	5.1	4.8	1.2

¹ Amendments for both originals and supplements are counted under the review cycle times.

² Times correspond to actual applications received. The new ANDA/AADA submission policy that went into effect 1/1/91 allows certain variations in a drug product to be included in a single application.

³ In September 1991, the OGD started implementation of the Application Integrity Policy by suspending review of applications suspected of being tainted by fraud. AIP time has been subtracted from review time above for the period after 9/91. However, before the AIP went into effect, the review of many applications suspected of containing fraudulent data were suspended. These suspensions were not recorded in the MIS and are not reflected in the above chart.

⁴ Mean supplement review cycle times are not captured by the Office of Generic Drugs.

⁵ Median supplement review times are broken out by major and minor reviews (starting in July 1992). An amendment to a supplement may be classified as minor when an experienced review chemist can reasonably be expected to take less than one hour to complete the review. Major amendments are all other reviews of amendments to supplements.

Question. Since 1990, what have been the mean and median review times for consults sent from the Office of Generic Drugs (OGD) to the New Drug Division?

Answer. The Office of Generic Drugs—OGD—does not calculate the mean and median review times for consults sent to the Office of Review Management—ORM. However, it can be safely stated that many consults take months to well over a year to be returned to OGD. Upon return of the consults, OGD must still review ORM's comments and prepare a deficiency letter, if applicable, for the applicant. In the fall of 1996, OGD hired a medical officer to improve the timeliness of reviews of abbreviated new drug applications that include bioequivalence studies with clinical endpoints.

Question. How many ANDA's and ANDA supplements has FDA received each year since 1990?

Answer. I will be happy to provide this information for the record.
[The information follows:]

Fiscal year	ANDA/AADA received	ANDA supplements received
1990	352	3,946
1991	300	2,632
1992	339	3,117
1993	308	3,506
1994	332	2,528
1995	404	2,694
1996	378	2,521

Question. How many ANDA's and ANDA supplements has FDA approved each year since 1990?

Answer. I will be happy to provide this information for the record.
[The information follows:]

Fiscal year	ANDA/AADA approved	ANDA supplements approved
1990	73	2,489
1991	¹ 141	3,413
1992	239	3,470
1993	215	2,635
1994	255	2,486
1995	288	2,466
1996	340	2,730

¹ In 1991, there were 141 approvals and 4 tentative approvals. The tentative approvals were counted previously and should not have been included in the count.

PART 1

1141

Question. Since 1990, what have been the annual FTE ceilings at OGD and the number of personnel on board? Please break out these figures by category, e.g., chemistry reviewers, bioequivalence reviewers, etc.

Answer. I will be happy to provide this information for the record.
[The information follows:]

OFFICE OF GENERIC DRUGS

Fiscal year	Program FTE ¹	Chemistry reviewers	Bioequivalence reviewers	Labeling reviewers	On board	FTE ceiling
1990	41	33	28	7	109	121
1991	56	42	28	8	134	132
1992	57	53	30	10	150	150
1993	62	51	28	8	149	155
1994	60	50	26	9	145	155
1995	59	50	26	8	143	144
1996	35	48	25	10	118	² 125

¹ Program FTE include laboratory and management staff, part-time employees, summer students and non-reviewing supervisors and scientists.

² The reduction in OGD's FTE ceiling from 155 to 125 includes two components. Approximately 16 FTE do not represent true reductions in the core review functions of the office, as these positions were transferred to the Office of Testing and Research (OTR) and the immediate staff of the Office of Pharmaceutical Science. These transfers were part of an overall reorganization of the Center, intended to make the best possible use of limited resources. The FTE transferred to OTR are still devoted to product quality research and performing the same product quality testing function as when they were part of OGD. The additional cut of 14 FTE that existed in the OGD in 1994 represent one of many examples of the agency's efforts to comply with directives to reduce the number of federal employees.

Question. Since 1990, what have been the annual salary outlays for program FTE's, primary reviewers, and total program outlays for OGD?

Answer. I will be happy to provide the average salaries for program FTE and primary reviewers for OGD.
[The information follows:]

OFFICE OF GENERIC DRUGS

Fiscal year	Program FTE	Primary reviewers	Total est. costs ¹ (salary/outlays)
1990	\$2,006,879	\$3,286,598	\$5,293,477
1991	3,394,704	4,595,226	7,989,930
1992	3,638,505	5,908,980	9,547,485
1993	4,090,543	5,688,643	9,779,186
1994	4,151,055	5,867,594	10,018,649
1995	4,187,318	5,953,800	10,141,118
1996	2,609,843	6,195,479	8,805,322

¹ Based on average salary data.

Question. FDA has a number of responsibilities that the Food, Drug, and Cosmetic Act requires be completed within a specific time frame, including the obligation to review ANDA's within 180 days. Other FDA duties may be important; however, they are not mandated by a statutory schedule.

Administrative support office activities are less likely to be subject to a statutory schedule. There are a number of administrative offices at FDA including the Office of the Commissioner, the Office of Policy, the Office of External Affairs, and the Office of Management and Systems. The fiscal year 1997 Program Level Appropriation for these offices was \$85.41 million and 954 FTE.

FDA has estimated that an additional \$13 million in annual funding above the fiscal year 1997 funding level would enable OGD to approve 90 percent of ANDA's within 180 days. These funds would permit the addition of 92 FTE in OGD and related offices.

Why couldn't FDA fully fund an effective ANDA review program by retaining the present level of funding in OGD and transferring approximately 15 percent of the resources from the above listed administrative offices, or \$13 million, to OGD?

PART 1

1142

Answer. The \$18 million in user fees requested for generic drugs in FDA's fiscal year 1998 budget request is necessary to maintain the current resource level in the generic drug program. This \$18 million in user fees does not reflect an increase in funding in this area, and should not be construed to be program enhancement funds. If the user fees requested in this and other critical program areas are not approved, and the existing base resources are not restored, the cuts will be felt across each program area of FDA. At this point in time, I cannot say with any degree of certainty where specific cuts would be taken, but given the magnitude of the potential reduction, I can safely say that review times and backlogs for all FDA-related products would increase substantially. FDA's ability to fulfill its mission of protecting and promoting the health of the American public would be seriously undermined. Decreasing the funding available for administrative functions would be expected to reduce the agency's operating efficiency, which would adversely affect a variety of programs, including ANDA review.

Question. Describe in detail any additional funds you believe would be necessary to review 90 percent of ANDA's in 180 days. Please list the additional FTE's that you would add, break out these FTE's by category, and list where they would be assigned in the agency.

Answer. The budget provides a reasonable level of resources for FDA. As we continue to make productivity enhancements, we can review a greater percentage within 180 days. In an attempt to identify an answer to your specific question, in a preliminary survey, FDA estimates that approximately \$12.8 million and 85 FTE per year could be used to further enhance the current drug evaluation activities such as the review of original ANDA's/AADA's and chemistry supplements within 180 days, the reduction of overall approval times through a reduction in review cycles.

This \$12.8 million can be further broken down: Initial, one-time start-up costs of furniture, computer and other equipment, and recruitment would be about \$2.1 million, or \$530,300 per year spread over four years. The annual increase in the operating costs of the generic drugs program, including research, operations, and infrastructure, would be about \$4.1 million. Thus, the total annual costs to be covered by generic user fees, including the start-up costs for the first four years of \$530,300, the annual increase in operating costs of \$4.1 million, and increased salaries of \$8.2 million would be approximately \$12.8 million.

The increase of 85 FTE would be distributed as follows: OGD (70), other CDER offices (7), and the Agency (8).

Question. The International Committee on Harmonization (ICH), which includes the U.S., European Union countries, and Japan, has been meeting to seek agreement on standards for clinical trials and other related issues. Please provide the employee title and days on travel for FDA employees who have attended ICH conferences since 1990. In addition, provide a dollar figure for out-of-pocket expenses and salary costs attributable to ICH since 1990.

Answer. The International Conference on Harmonization of Technical Requirements for the Registration of Pharmaceuticals for Human Use, ICH, is a unique project that brings together the regulatory authorities of the European Union, Japan and the United States and experts from the pharmaceutical industry in the three regions to discuss scientific and technical aspects of new product registration.

Since commencing work in 1990, ICH has made recommendations and developed guidelines with the purpose of achieving greater harmonization in the requirements for registration of new medicines, in order to reduce or obviate the need to duplicate the testing carried out during the research and development and ensure a more economical use of material, animal and human resources. An overall objective is the elimination of unnecessary delay in the global development and availability of new medicines while maintaining safeguards on quality, safety and efficacy, and regulatory obligations to protect public health.

Harmonization under ICH involves the European Union, Japan and the United States, with the assistance of observers from WHO, EFTA and Canada. The six cosponsors of ICH are: the European Union, the U.S. Food and Drug Administration, the Japanese Ministry of Health and Welfare, together with the pharmaceutical industry, represented by the European Federation of Pharmaceutical Industries' Associations, the Japan Pharmaceutical Manufacturers Association, and the Pharmaceutical Research and Manufacturers of America. In addition, the International Federation of Pharmaceutical Manufacturers Associations participates as an 'umbrella' organization for the pharmaceutical industry, and provides the ICH Secretariat.

The Steering Committee appoints joint industry/regulatory Expert Working Groups to deliberate on technical aspects of harmonization. Topics were originally selected under three main subject areas, "Quality", "Safety", and "Efficacy", but in 1994, the scope was extended into multi-disciplinary topics concerned with "Regulatory Communications." ICH has developed more than 40 technical guidelines, and

PART 1

1143

virtually all of these will be finalized by July 1997. These guidelines on technical requirements for drug submissions are intended to form the basis for allowing a single application to be submitted in each of the three regions. ICH is studying a topic proposed for the future intended to harmonize the content and format of drug submissions in the three regions. This would allow the goal of a single "global dossier" or "common technical document" to be realized. The work of ICH is coordinated and reviewed at large conferences held in two year intervals. The first large conference, ICH 1, was held in 1991 in Brussels, Belgium. The second conference, ICH 2, was held in 1993 in Orlando, Florida, and the third conference, ICH 3, was held in 1995 in Yokohama, Japan. The next large conference is scheduled for July 1997 in Brussels.

There are many ICH activities which support the development of the ICH guidelines, including meetings of the technical expert working groups and the ICH Steering Committee. I would be happy to provide a list of the attendees and the dates of the ICH conferences, along with the data related to the travel and salary and benefits costs directly related to these conferences, for the record.

[The information follows:]

ICH 1—Brussels, Belgium—November 5—7, 1991

Travel Costs: \$17,340

Salary and Benefits Costs: \$10,883

FDA Attendee Titles:

PART 1

1145

Question. The Transatlantic Business Dialogue (TABD) is a group of U.S. companies that advocate a wide variety of positions on international trade issues. The generic pharmaceutical industry is not represented in the TABD.

The TABD recommends overturning the Bolar provisions of the 1984 Drug Price Competition and Patent Term Restoration Act (popularly known as the Hatch Waxman Act), which are critical to the availability of generic pharmaceutical products in the United States.

How many FDA dollars and days in travel have been spent by FDA employees to attend TABD conferences since 1990?

Answer. TABD is composed of both U.S. and European industry representatives. The issues, agendas, participation, and pronouncements of the TABD are all controlled by and represented to be the products of the industry participants in the TABD. FDA has had no interaction with the Transatlantic Business Dialogue, TABD, regarding their position on the Bolar Amendment. FDA representatives have attended TABD meetings to explain the Agency's position regarding the U.S.-EU negotiations toward Mutual Recognition Agreements in the pharmaceutical and medical device sectors.

In 1995 FDA expended 12 staff days, including the Veterans Day weekend, to send three people to Seville, Spain, at a cost of \$7,400. In 1996, the expenditure was 16 staff days, with one person attending a mid-year meeting in Brussels, Belgium, at a cost of \$2,100, and three people representing FDA at the TABD conference in Chicago, at a cost of \$1,400. So far in 1997, four staff days and \$2,100 have been expended for an FDA representative to attend a TABD Biotechnology Working Group in Brussels.

EXIMER LASERS

Question. On October 10, 1996, the FDA announced an amnesty policy that allows users of illegal excimer lasers (used in eye surgery), which are classified as Class III significant risk devices, to come into compliance with FDA regulations governing the use of those medical devices. Users or manufacturers of these lasers were given until January 15, 1997, to submit an Investigational Device Exemption (IDE) application to the FDA, or to submit a certification (for reimported lasers) that the laser is identical in all relevant aspects to approved lasers. To date, how many IDE applications has the Agency received?

Answer. The Agency has received 15 IDE applications from owners of unapproved excimer lasers for refractive surgery.

Question. How many IDE applications have been approved?

Answer. The agency has conditionally approved eight IDE applications for refractive surgery. The conditions for approval include limiting the number of patients as well as the refractive indications. Six of the IDE applications were disapproved and one is currently under review.

Question. What options are available to physicians or manufacturers who submit an IDE that is not adequate according to FDA regulations?

Answer. The physician or manufacturer cannot use their laser until they have received approval for their IDE. Submitters of an IDE that is disapproved have several options. The applicant can respond to the deficiencies cited in the disapproval letter and resubmit their application. In the applicant's deficiency letter a contact person is named for any questions the applicant may have in responding to the deficiencies. The Office of Device Evaluation also has an interactive review process in place for IDE submitters and urges frequent communication with the regulated industry during the review process in order to clarify ambiguities or remedy deficient information prior to completing the review.

In addition, it is our understanding from the industry that an applicant can trade-in their unapproved device for a legally marketed VISX, Inc. or SUMMIT Technology, Inc. device.

Question. How many certifications has the Agency received? How many of these certifications has the Agency accepted?

Answer. The Agency has received 13 certifications for reimported lasers. Of these, two certifications for reimported lasers manufactured by Summit Technology Inc. were accepted as complete. A small number of certifications are under consideration.

Question. For certifications not accepted, what course of action must the applicant take?

Answer. Certifications were deemed to be inadequate if the certification did not demonstrate that the laser was an approved laser. Thus, the owner of such an unapproved laser may only use the laser if the device has in effect an approved IDE or an approved PMA. Applicants whose certification was not accepted have the option of submitting IDE applications for clinical trials for their devices to obtain clinical

PART 1

1146

data on the safety and effectiveness of the devices. In addition, the applicant may seek approval of the PMA, if the applicant has all of the necessary data and information.

Question. Has a limit been placed on the number of eyes that can be treated under each IDE application?

Answer. Yes, there is a limit on the number of eyes that can be treated under an IDE application. All IDE studies, including any IDE studies approved for excimer lasers, have a limited number of subjects and sites based on the scientific hypotheses being studied by the applicant and on statistical considerations. The typical study design for this device has between 300–400 subjects per type of visual correction or indication being studied.

The October 10, 1996, letter announcing the FDA's amnesty and IDE policy, indicates that: "The grace period does not apply to individuals who have received Warning Letters or other regulatory communications from the FDA or who are importers of lasers currently under detention."

Question. How many warning letters or other regulatory communications were sent to manufacturers or physicians who are using unapproved (black box) lasers? How many were sent to importers of lasers currently under detention?

Answer. FDA has issued four Warning Letters, or WL's, and four untitled letters, or UTL's, to black box users; and two WL's to manufacturers of black box lasers. Additionally, the Agency has issued 5 WL's as well as 1 UTL to users of gray market lasers.

Question. It has been over five months since the Agency sent the October letter. What action has the Agency taken against those who have received Warning Letters or other regulatory communications? What action will be taken against these individuals?

Answer. FDA is conducting numerous investigations in the field involving manufacturers and owners of unapproved excimer lasers. The Agency anticipates that at least some of these investigations will lead to enforcement actions, including seizure, injunction and or civil penalty.

Question. Has anyone been injured with an unapproved, illegal laser?

Answer. The Agency has received allegations of injuries, and is currently looking into these allegations.

Question. How much longer will the Agency allow the users of these illegal lasers to remain in non-compliance with FDA regulations?

Answer. The Agency has been working with the physician community to bring these users into compliance. Initially, the physicians did not have an understanding of their responsibilities under the device law, and we waited to give them time to understand and to avail themselves of the IDE or Certification process. Additionally, we were exploring and evaluating our legal authority to regulate physicians and sort out complex issues such as regulation of custom devices. At this point, the Agency believes that unapproved lasers that are not under IDE should be subject to regulatory action, and we are vigorously pursuing that end.

Question. The Food, Drug, and Cosmetic Act places a strict ban against advertising or otherwise promoting the off-label use of drugs and medical devices. I have been told that numerous physicians around the country are actively promoting unapproved laser vision correction procedures, that the Agency is aware of these advertising abuses, and in fact has in its possession copies of many of these advertisements and infomercials. Is this true, and, if so, why has the FDA not taken enforcement action against the clear violation of the prohibition on advertising or promoting unapproved procedures?

Answer. FDA has long maintained that off-label use of an approved device without advertising is within the realm of the practice of medicine and the Agency has not exercised its enforcement discretion in this area. However, the Food, Drug, and Cosmetic Act prohibits the advertising and promotion of off-label use of devices. FDA is aware that some physicians are advertising unapproved refractive procedures using excimer lasers. The Agency believes that the overriding concern from a public health perspective is the use of an unapproved laser. Thus, FDA is vigorously following up on the use of unapproved lasers.

Question. Does the Agency plan to take action, and if so, when?

Answer. We are vigorously following up on the use of unapproved lasers. When we become aware that they are in fact advertising and using an unapproved laser, the overriding issue is the use, not the advertisement, of an unapproved laser. FDA intends to take enforcement action in this area in the near future.

Question. What resources has the Agency put in place to assure that these physician IDE sites are in compliance with FDA regulations and that they receive adequate oversight to protect the public?

PART 1

1147

Answer. Staff from FDA's Office of Compliance, Office of Device Evaluation, and Office of Regulatory Affairs are working together to assure that physician IDE sites are in compliance with FDA regulations and that they receive adequate oversight to protect the public. Actions that are being taken include inspections of sights to determine compliance. Further action will be taken against sights that are found to be out of compliance, including withdrawal of IDE's and possible seizure of the unapproved devices.

RADIOPHARMACEUTICALS

Question. Why does the FDA on average take 29.8 months to review a radiopharmaceutical NDA submission given their high level of safety as measured by the incidence rate for adverse reactions?

Answer. In the past, we had a backlog of applications for radiopharmaceutical drugs. For example, two applications in the fiscal year 1994 submission cohort were overdue when acted upon, because we were working to reduce an existing backlog including those for radiopharmaceuticals. The backlog has now been eliminated and we are now reviewing applications according to the PDUFA time frames. Regarding the effect of the safety record of radiopharmaceuticals, a historically good safety record of a broad class of drugs does not eliminate the need to thoroughly review each member of the class and ensure it is safe and effective. As our current results demonstrate, we are able to provide a thorough and careful review and still meet our PDUFA goals.

Question. Is there a reason why the review times for radiopharmaceuticals have not improved under PDUFA, even while FDA has shown improvement in the time it takes to review drugs in general?

Answer. Review times under PDUFA have improved quite dramatically for drugs in general and for radiopharmaceutical in particular. Because the FDA's focus was to eliminate the pre-PDUFA backlog before concentrating on applications filed more recently, the overdue rate for that division's 1994 submission cohort under PDUFA was 100 percent. For the 1995 submission cohort, the overdue rate for NDA's was zero—a substantial improvement which has continued in the 1996 submission cohort. The improvement is even more striking when looking at the raw numbers underlying the percentages. The 1994 cohort of new product applications consisted of two original submissions that were filed, each of which was reviewed in more time than allotted by the PDUFA goals, and one resubmission that was reviewed on time. The very next year, the 1995 cohort of applications filed included three original submissions and three resubmissions, all of which were reviewed on time or faster than the PDUFA goals. The 1996 cohort of applications that were filed is larger still. The reasons for this improvement are similar to the reasons for improvement for drugs in general: accountability, clear objectives, and concomitantly enhanced resources that were devoted to meeting those objectives. There is an additional factor contributing to improvement in approval times—the elimination of the pre-PDUFA backlog of NDA's. After completing that particular body of work, the FDA was able to turn its full attention to PDUFA applications and to meeting PDUFA goals, with the gratifying results I have just described.

Question. Is there a reason why the Division of Medical Imaging and Radiopharmaceutical Drug Products has one of the highest mean drug review times? Is the PDUFA process only working well for certain drugs?

Answer. Again, the Division of Medical Imaging and Radiopharmaceutical Drug Products had a backlog in the past, but this is no longer the case and the division is now meeting its PDUFA goals.

FOOD ADDITIVE APPROVALS

Question. To what extent has FDA looked at feasible plans for improving the food additive approval process? Have you looked at a way to provide a proprietary benefit in exchange for some type of fee?

Answer. FDA has instituted, and is continuing to implement, a variety of reforms designed to improve and streamline the food and color additive approval process. The goal of these initiatives is to set in place a strong and credible food and color additive review process that results in timely decision-making with predictable outcomes.

FDA has initiated several new approaches to the review of food ingredients that allow us to better prioritize our allocation of resources. FDA has recently proposed to adopt a streamlined notification process for substances whose use is generally recognized as safe—GRAS—to replace the current petition process by which FDA has affirmed, by rule, that the use of a food ingredient is GRAS. Substances whose use is GRAS do not require FDA approval and we expect that eliminating the peti-

PART 1

1148

tion and rulemaking on such substances will free up critical resources for work on food additive petitions. Similarly, FDA has also proposed to exclude certain food and color additive petitions from a requirement to include an environmental assessment, saving both reviewer and petitioner effort.

In the area of approval of "indirect" additives, such as food contact substances, FDA has implemented a Threshold of Regulation Policy whereby exemptions from the need to submit a food additive petition may be granted for certain low-risk food contact substances. More than 40 exemptions have been granted by letter under this policy during the last two years for materials that would otherwise have been the subject of food additive petitions. A Special Project Team has also been established to expedite the review of other low-risk food contact materials that are not eligible for the Threshold of Regulation Policy. As a result, fewer resources have been expended.

FDA is undertaking many other management and process initiatives to improve our guidance to prospective petitioners, establish and articulate performance goals for timeliness of decision-making, ensure that our communication to petitioners is timely and unambiguous, and strengthen and better articulate filing criteria to increase the likelihood that filed petitions will be complete and adequate for timely review and regulation.

Under current statute, regulations permitting the use of new food and color additives are generic—that is, any person may manufacture or use an approved food or color additive in conformance with the conditions of use permitted by the regulation. This construct has been cited by industry groups as a disincentive to establishing a fee system for the support of approval of food additives. Several possible mechanisms to provide a proprietary benefit to petitioners have been discussed. For example, the food and color additive approval system could be constructed so that only the petitioner would have the right to market the additive for a certain period of time. Alternatively, a system incorporating "data exclusivity" could be established—that is, for a period of time, the data a petitioner uses to support a food or color additive petition could not be used by another applicant to support approval of the same additive. Any system to provide a proprietary benefit to petitioners would require amendment of the statute.

Question. Exclusive of indirect additives and Generally Recognized As Safe (GRAS) affirmation petitions, how many direct food additive petitions were approved last year? How many had been pending more than five years, and what was the average time they had been pending?

Answer. In fiscal year 1996, FDA completed action on a total of 22 direct food and color additive petitions. Of these, 13 were approvals. FDA established or amended regulations for the use of 11 direct food additives—substances intentionally added to food—as well as two color additives for food use. In the other nine cases, the petitions were either withdrawn by the petitioner or were dropped because they were inadequate for filing.

FDA has 13 petitions which have been pending for five or more years. I will provide, for the record, a table that displays the average pending time for these petitions.

[The information follows:]

Approval times: Decision cohort fiscal year 1996—Direct food additive petitions and color additive petitions pending 5 or more years

<i>Action</i>	<i>Months</i>
Initial receipt of petition to approval (average)	29
Initial receipt of petition to approval (median)	19
Range	6–99
<hr/>	
Last file ¹ to approval (average)	11
Last file ¹ to approval (median)	9
Range	6–20

¹Last file refers to the date of receipt to a petition, in reject status, of information necessary to complete the review.

Approvals for food additives and color additives are effective when an order prescribing the conditions of safe use of a food additive is published, or when an order listing a color additive is published with a specified effective date. Thus, the intervals presented in the top half of the table represent the total time from the date of receipt of a fileable petition to the date of publication of a regulation. In many cases, during the review of a petition, deficiencies in the data supporting the safe use of the additive are identified; in such case, the petitioner is notified and given the opportunity to amend the petition to provide the necessary information. FDA

PART 1

1149

does not have data on how much of the total time from receipt to approval is "FDA time" and how much is "petitioner time." However, we do have information pertaining to the interval between the date of "last filing" (i.e., the date of receipt, to a petition in "reject status" of the information necessary to complete review of the petition) and the date of publication of a regulation.

Question. How many direct food additive petitions were submitted last year?

Answer. In fiscal year 1996, FDA received six petitions to establish or amend regulations for the use of direct food additives.

Question. How did you arrive at the figures \$12 million for food additives approvals, and \$19 million for post-market surveillance?

Answer. FDA's budget must also be looked at in the context of the overall plan the President has proposed for a balanced budget by fiscal year 2002. New and expanded user fees have been proposed across the Federal Government. The President's budget identifies by program area and dollar amount where fees could be derived. This provides a more substantial basis from which to develop reasonable and achievable user fees for fiscal year 1998, with input from both Congress and the affected regulated industries. We looked across the board at FDA activities to determine which would be most appropriate for user fees. Any specifics by activity area to be covered by user fees serves as a useful starting point for any upcoming negotiations on the proposed user fees among FDA, Congress, and the affected industries.

Proposals under the Foods program include: premarket approval activities for food and color additive petitions submitted pursuant to certain sections of the Food, Drug and Cosmetic Act—FD&C Act—of \$12,543, and partial funding of postmarket regulatory activities of \$19,024, as covered by section 704 of the FD&C Act. User fees are proposed to cover essentially all of the costs of the premarket review of petitions.

In general, postmarketing regulatory activities include not only traditional domestic postmarketing activities but also emerging strategies. These include partnering with state, local, professional and industry groups and individuals, to enhance the quality and safety of products. In addition, by increasing information sharing and technical assistance so that establishments are operating with strong quality assurance systems, the Agency anticipates that less formal regulatory intervention may be required. Traditional domestic postmarketing activities such as inspections, investigations, sample collections and analyses, regulatory analytical methods development, field exams, recall effectiveness checks, and injunctions and seizures will continue to play a role in postmarketing regulation.

Postmarketing fees are based on the Agency's Official Establishment Inventory, or OEI, and would be used to offset a portion of FDA's postmarket activity expenses. For postmarket regulatory activity fees we have determined a fee of about \$550 per establishment, which would be applied to the 35,369 Food and Cosmetics Establishments listed in the OEI. Any establishment fees would be collected at the beginning of the fiscal year.

Question. Last year, to address the severe backlog of additives, money and personnel were temporarily transferred to the Center for Food Safety and Applied Nutrition (CFSAN). What is the status of these additional resources? When is this commitment scheduled to end? What will this mean for CFSAN when future additional resources are no longer available?

Answer. Review of food additive petitions is a high priority for the Agency. FDA is committed to reforms that will permit the Agency to achieve its goals of health protection, timeliness, and accountability in the long-term.

In fiscal year 1996, CFSAN temporarily reassigned 23 FTE to petition review activities in an effort to reduce the current inventory of pending food additive petitions. Final decisions were made on approximately 30 more petitions than were received during the year and the cohort of 295 petitions reported to Congress in June of 1995 was reduced by more than 100 petitions by the end of fiscal year 1996. Great progress was made; however, much work still remains. In response, CFSAN permanently reassigned eight of those individuals to petition review activities and has continued to utilize temporary reassignments as a means of providing additional resources to food additive petition review activities. The remainder of the original individuals temporarily reassigned returned to their permanent job assignments; seven of these are committed to work on food additive petitions part-time or on special petition-related projects. Temporary reassignments of 14 other individuals from other programs in the Center have been made in fiscal year 1997. It is expected that such temporary reassignments will continue in order to accomplish the goals of reducing the inventory of pending petitions and eliminating overdue petitions.

FDA provided funds for two major contracts to assist in petition review. One is for the review of toxicology studies contained in petitions and the other is to review

PART 1

1150

study packages from indirect additive petitions. These contracts extend for three years and are intended to reduce the inventory of data awaiting scientific review. This will allow FDA scientists to focus on new petitions as they come in rather than setting them aside to await completion of work on earlier petitions. Contracts were also awarded to document petition review resource needs, to assist in developing a higher threshold of filing, to advise FDA on alternative safety decision models, and to conduct petitioner workshops annually. These contracts will result in a more efficient process—one where less time is spent in reviewing and correcting inadequate petitions and where new decision strategies will be available after a petition is received.

Funds were also provided to upgrade the information management capabilities available to the food additive program. When fully implemented, the new resources will aid in the searching, retrieval, and review of data in food additive petitions, and will markedly enhance document management. The work required to install, test, and implement these resources is ongoing and is on schedule. FDA is committed to reforms that will permit the Agency to achieve its goals of timeliness, accountability and predictability in the review of petitions over the long-term.

QUESTIONS SUBMITTED BY SENATOR SPECTER

METHADONE REGULATIONS

Question. Methadone has been used for over 30 years as a treatment for heroin addiction. Is methadone safe to use?

Answer. FDA has approved methadone as a narcotic analgesic and for the detoxification and maintenance treatment of narcotic dependence. Methadone is safe under the conditions set forth in the product labeling, and for the treatment of narcotic dependence, in the regulations set forth under 21 CFR § 291.505.

Question. Is methadone effective in treatment of heroin addiction?

Answer. FDA has determined that methadone is effective for the detoxification and maintenance treatment of opioid addiction.

Question. What is the justification of the FDA for regulating methadone differently than all other drugs?

Answer. As a narcotic intended for the treatment of narcotic dependence, methadone falls under the Comprehensive Drug Abuse Prevention and Control Act of 1970, CDAPCA, Public Law 91-513, and the Narcotic Addict Treatment Act of 1974, NATA, 21 U.S.C. § 823(g). These statutes require the Secretary to consult with organizations and the Attorney General to determine the appropriate methods for medically treating narcotic addiction and to develop standards to determine whether practitioners are qualified to provide narcotic treatment. In addition, the NATA requires the Secretary to determine that narcotic treatment providers will comply with standards that address the medical use of narcotic drugs, including standards for providing narcotic drugs for unsupervised use by individuals enrolled in a treatment program. FDA, in conjunction with the National Institute on Drug Abuse, has carried out the Department's responsibilities by enforcing process oriented regulations. FDA is proposing to switch to an oversight system that relies on accreditation to fulfill the Department's obligations in this area.

Question. What is your view in regard to the conclusions of the Institute of Medicine Report from 1995 on the Federal Regulation of methadone treatment that concludes "the risks to the public safety and the public health of diverted methadone do not outweigh the benefits of making methadone treatment more readily available."?

Answer. FDA is aware of the risks to the public health associated with the diversion of methadone. The current regulations include extensive requirements, limitations, and conditions on providing methadone to patients for unsupervised use. What is not obvious, however, is the extent to which the risks associated with diversion affect the availability of methadone treatment. Indeed, the Institute of Medicine, or IOM report noted that there are many factors affecting the availability of treatment, including financial factors, community resistance to new or expanded programs, and others. In addition, in several instances, the report stressed the need for quality treatment, noting that no treatment is preferable to poor treatment.

The IOM report included many recommendations for changes to the existing regulations. Included were recommendations directed at the relaxation, or elimination, of most of the regulatory requirements governing the provision of methadone for unsupervised use. The IOM was careful to caution that a contingency should be available in case a public health crisis resulted from recommended changes.

PART 1

1151

FDA is actively considering the IOM Report recommendations, including diversion control recommendations, as it continues to evaluate changes to the regulatory oversight system for methadone treatment.

DRUG APPROVALS

Question. As you know, the President's budget proposal would redirect a portion of the prescription drug user fees to general revenue. To what extent would this proposal, if enacted, negatively impact the ability of the FDA to complete drug approvals on a timely basis?

Answer. We are not aware of any proposal to redirect prescription drug user fees to general revenue. Under the current legislation, FDA deposits PDUFA collections into an FDA account at the Department of the Treasury, and these resources are available to the Agency when apportioned by the Office of Management and Budget. We do not anticipate any change in this current practice and therefore do not foresee any effect on our ability to complete drug approvals on a timely basis.

Question. How is the FDA streamlining the process for obtaining emergency Investigational New Drug approvals so terminal patients may receive immediate treatment in dire situations?

Answer. FDA currently has a regulation specifically intended to expedite obtaining an investigational drug for emergency use where the situation does not allow time for submission of an IND. Generally, the process works well. In most cases, FDA's review of a practitioner's request for 21 C.F.R. § 312.36 use of an investigational drug in an emergency situation and FDA's authorization to the manufacturer to ship the drug for that use can be accomplished over the telephone or by FAX within a matter of hours. It should be noted that an emergency IND can only be granted to a licensed physician and not to an individual patient or manufacturer.

Notwithstanding the success of this program, FDA is looking at ways to provide more consistent application of evaluation criteria and procedures across reviewing divisions and is considering whether to propose regulations to clarify the types of treatment uses that can be authorized under emergency IND's and the criteria for their authorization. However, there are certain circumstances that can affect whether a drug may be made available under an IND for emergency use. If a manufacturer of a drug does not want to ship the drug for such use, FDA does not have the authority to require such shipment. If supplies of the drug are low, such as in the situation where clinical trials are being done with a lottery, the sponsor must decide whether making the drug available under an emergency IND could jeopardize the conduct of the ongoing trial. In all cases, even for emergency IND's, local Internal Review Board oversight is required.

INSPECTION OF IMPORTED MUSHROOMS

Question. I have been informed that the FDA and the State Administration of Import and Export Commodity Inspection of China (SAC) held a meeting in January of this year regarding the current automatic detention order in effect for imports of canned mushrooms from China. During that meeting, I understand that FDA discussed sending an observation team to China. Has a trip to China been scheduled? Does FDA have any plans to lift the automatic detention or change the lot by lot release program?

Answer. A meeting was held on January 14, 1997, between representatives of FDA and the State Administration of Import and Export Commodity Inspection—SACI—of the Peoples' Republic of China, or PRC. FDA's imposition of countrywide detention without physical examination of canned mushrooms from PRC, due to the presence of Staphylococcal enterotoxin—SET—was one of several items discussed. PRC representatives indicated their concern with the FDA program, since there had been a very low incidence of SET contamination of Chinese mushrooms in the eight-year history of the program. The PRC representatives also provided a summary of the improvements made by the Chinese mushroom industry since 1989 and their government's oversight of production and export.

FDA representatives informed SACI that the Agency still awaits the information from PRC which was requested during a July 1996 meeting in order to perform a thorough review of processing, shipment, and Chinese government's oversight. FDA indicated that once this information is received and reviewed, the Agency will determine whether a technical, policy team should be sent to PRC to observe and evaluate the current situation. To date, FDA has received some of the requested information, which is now under review. FDA has also indicated that it is amenable to scheduling a visit to PRC in the fall of 1997 and requested a letter of invitation from SACI. However, pending the receipt of the remainder of the requested information,

PART 1

1152

results of the information review, and an assessment of available agency resources, no FDA trip to PRC has been scheduled to date.

Pending FDA's evaluation of the technical and regulatory information provided by PRC, and verification that there has been satisfactory resolution of the problems that resulted in the country-wide detention without physical examination of canned mushrooms from PRC, FDA would consider appropriate modifications to the current lot-by-lot release program, and the necessity for country-wide detention without physical examination of canned mushrooms from PRC. Currently, FDA has no immediate plans to lift or change the lot-by-lot release program.

Question. During 1996, were there any detentions or seizures of imported canned mushrooms? If so, please provide the Subcommittee with the details of each.

Answer. In fiscal year 1996 there were no seizures of imported canned mushrooms from PRC for violations involving the presence of SET. In addition, no shipments of product offered for entry under the lot-by-lot program were refused entry.

QUESTIONS SUBMITTED BY SENATOR MCCONNELL

RECENT COURT RULING AND FDA RESOURCES

Question. Last week, a United States District Court Judge ruled that FDA lacks the statutory authority to regulate tobacco advertising and promotion. The judge also stayed—or put a hold on—all of the FDA's rules except for the minimum age rule and the rule requiring retailers to card anyone who is younger than 27 years old.

Dr. Friedman, under the Synar Amendment, every state in the union already is taking steps to increase its enforcement of its own minimum age laws. Given these factors, does it make sense for FDA to continue to expend resources on its tobacco rules, especially when the only rules in effect duplicate ongoing state efforts?

Answer. There is a substantial difference between the provisions of the Synar Amendment and the FDA tobacco regulations. The Synar Amendment requires that, in order for State Substance Abuse Agencies to receive federal block grants, States must enact and enforce legislation prohibiting the sale of tobacco products to minors. Although all States currently have such laws, their enforcement varies dramatically, because block grant dollars cannot be used for such enforcement efforts. In contrast, the FDA regulation establishes mandatory conditions on the sale and distribution of tobacco products that apply to manufacturers, distributors, and retailers of tobacco products. FDA's regulation is enforceable through fines and other means for non-compliance. The funds FDA has requested are for enforcement activities to achieve compliance with the requirements of its regulation. Thus, the funds requested by FDA are to be used for a different purpose than those for the SAPT Block Grant related to Synar.

FDA believes that enforcement of its regulations is essential if there is to be a reduction in the premature death and disease that result from the use of cigarettes and smokeless tobacco. The problems associated with nicotine addiction are so substantial, in fact, that it will take the concerted efforts of everyone interested in improving and protecting the health of children and adolescents to achieve the Administration's goal of reducing the number of young people who use cigarettes and smokeless tobacco by 50 percent over the next seven years.

Question. For the record, please provide a revised estimate of the resources (in dollars and FTE's) the FDA believes would be necessary to implement the tobacco rules that have not been stayed by the United States District Court.

Answer. The Administration is still requesting the full \$34 million for the tobacco initiative. The bulk of the money requested for fiscal year 1998 is for state contracts to enforce the February 28 provisions upheld by the court. Only a small portion—between \$1 to \$2 million—of the planned outreach activities would have been devoted to the advertising provisions overturned by the court. Those dollars will be re-allocated to outreach for the access provisions already in effect.

FDA'S PLAN IS REDUNDANT WITH STATE EFFORTS TO ENFORCE TOBACCO MINIMUM AGE LAWS

Question. Under the Synar Amendment, a state risks losing federal funding if it is not adequately enforcing its own tobacco minimum-age laws. Please explain how the FDA's rules that took effect on February 28, 1997 are not duplicative of state minimum age laws already being enforced by state officials?

Answer. The FDA rule complements all ongoing activities at the state and local level aimed at reducing young people's use of tobacco. Despite that fact that all states have minimum age laws for the sale of tobacco, the incidence of young peo-

PART 1

1153

ple's use of tobacco is rising dramatically. Among 8th graders, the rate has climbed 50 percent in the last six years. A coordinated effort between federal, state, and local governments is essential to reduce the number of young people that use tobacco products.

Question. Dr. Friedman, in FDA's April 23rd letter to me, FDA indicated that the Substance Abuse and Mental Health Services Administration has informed the FDA that "all 50 States currently have laws prohibiting tobacco sales to minors and that all States have submitted their inspection methodologies and sampling designs" to HHS. Does FDA have any indication that the states are not adequately enforcing their minimum age laws under the Synar Amendment?

Answer. According to SAMSHA, although all states have submitted their block grant applications to SAMHSA describing their enforcement efforts, not all applications have been reviewed by SAMHSA. Preliminary results show that although states have begun enforcing their laws, the level of enforcement varies from state to state.

Question. In the final rule implementing the Synar Amendment, HHS indicated that states could use certain federal block grant funds toward their retail inspection costs. Why is FDA requesting additional expenditures to do a job that the states are already performing with the aid of existing federal block grants?

Answer. There is a substantial difference between the provisions of the Synar Amendment and the FDA tobacco regulations. The Synar Amendment requires that, in order for State Substance Abuse Agencies to receive federal block grants, States must enact and enforce legislation prohibiting the sale of tobacco products to minors. Although all States currently have such laws, their enforcement varies dramatically, because block grant dollars cannot be used for such enforcement efforts. In contrast, the FDA regulation establishes mandatory conditions on the sale and distribution of tobacco products that apply to manufacturers, distributors, and retailers of tobacco products. FDA's regulation is enforceable through fines and other means for non-compliance. The funds FDA has requested are for enforcement activities to achieve compliance with the requirements of its regulation. Thus, the funds requested by FDA are to be used for a different purpose than those for the SAPT Block Grant related to Synar.

Question. FDA indicates its plan to "commission" state and local officials to help enforce its tobacco rules. FDA also indicated in its April 23rd letter to me that it does not "necessarily" plan to commission only those state and local officials already responsible for enforcing the state's own minimum age laws. Please explain why it would be necessary for FDA to enforce its federal minimum age rules by funding state officials other than those state officials currently responsible for enforcing the State's own minimum age laws.

Answer. FDA is relying on the states to identify the appropriate state agencies who will be contacted for contracting with the federal government. It is possible that a state may identify an agency other than the one currently responsible for enforcing the state's own minimum age law.

FDA'S TOBACCO PLAN DUPLICATES EFFORTS

Question. FDA indicates that it wants to work with CDC to develop a national survey of young people to determine, among other things, the prevalence of tobacco usage and illegal purchase rates by minors. Aren't such efforts duplicative in that state reports required under the Synar Amendment are required to indicate illegal purchase rates?

Answer. No, these are not duplicative efforts. We are meeting and working with both SAMHSA and CDC on this issue. SAMHSA, for purposes of administering the Synar rule, is monitoring State inspection activities and results. SAMHSA is not monitoring teen tobacco use rates.

Meanwhile, FDA is working with CDC to refine their existing national survey of young people, to determine, among other things, the prevalence of tobacco usage and illegal purchase rates by minors.

Question. FDA says that it wants to work with states to develop comprehensive-tobacco-control demonstration projects. Don't the Centers for Disease Control and Prevention and the National Cancer Institute already provide millions of dollars to the states through the IMPACT and ASSIST programs to help states develop comprehensive tobacco control programs?

Answer. Enforcement of the FDA rule at the state and local level is intended to complement all ongoing tobacco control activities including those efforts underway under the auspices of IMPACT and ASSIST. FDA is working and meeting with CDC and NIH to coordinate efforts.

PART 1

1154

FDA SHOULD ALLOCATE ITS AVAILABLE RESOURCES TO PRODUCT REVIEW FUNCTIONS

Question. In the last Congress, this Committee repeatedly encouraged FDA to reallocate its resources in order to meet its statutory deadlines for the review of various product applications. If FDA was able to find \$34 million in its fiscal year 1998 request for its tobacco rules, why hasn't FDA been able to find additional resources for product review functions?

Answer. Improving the safety of the food supply and keeping tobacco out of the hands of children are both initiatives of the utmost importance and are very high priorities for FDA and this Administration. While FDA's traditional activities in promoting and protecting the public health through product review functions are of vital importance, the Administration's budget for FDA should be viewed in total, keeping in mind that it fits in with the President's plan for an overall balanced budget by fiscal year 2002.

Question. From what functions did FDA take the \$34 million?

Answer. The Administration's fiscal year 1998 budget for FDA includes adequate funding to maintain our current level of activities in our traditional areas of concern, as well as provides additional funding for two important and high priority initiatives that correspond with FDA's mission of protecting and promoting the public health—reducing the incidence of death and illness associated with foodborne pathogens through the Food Safety Initiative, and reducing the availability and appeal of nicotine-containing tobacco products to children.

PRESCRIPTION DRUG USER FEE ACT (PDUFA)

Question. Dr. Friedman, during the House Commerce Committee hearing you stated that FDA's base budget is not stable and this factor could put PDUFA at risk of failure. If I recall correctly, user fees under PDUFA can only be collected if appropriations for human drug application review reach the level provided in fiscal year 1992 for such costs multiplied by an adjustment factor. In your statement before Commerce Committee, were you referring to the PDUFA I definition of a base budget? If not, please define what a stable base fund for FDA is measured by, and what level of funding is required?

Answer. Yes, Senator you are correct. PDUFA I was intended to finance increases in the costs of the process to review new human drug applications. Performance goals were established contingent to the resources provided by user fees in addition to base appropriations calculated by the level of FDA funding in fiscal year 1992 multiplied by an adjustment factor.

Question. Did you make the President aware of the potential consequences that an eight percent reduction in FDA budget authority could have on the agency in light of the fact that no additional user fees are authorized?

Answer. During the President's Budget development many proposals were discussed fully. These fees are a part of a government-wide policy to establish user fees. These user fees—tied to performance measures in maintaining important government functions—are a key component to achieving a balanced budget by the year 2002.

Question. Do you recommend authorization of the President's proposed user fees as part of the PDUFA II reauthorization or in separate legislation?

Answer. PDUFA has been a very successful program, facilitating the availability of important new therapies to the public sooner than they otherwise would have been available, and without sacrificing the assurance of safety and effectiveness of these products. Obviously the reauthorization of this program is a priority for the Agency and its primary beneficiary, the public. Discussions with industry representatives on PDUFA II have been productive in identifying several areas where the overall process can be improved, including development time. We would recommend reauthorization of this program either as separate legislation or as part of the larger bill as proposed by the Administration.

Question. FDA's fiscal year 1998 budget proposal states that the agency intended to implement the new user fees, which supplant appropriated resources, with performance measures and goals. In addition, FDA stated it "will work with its many constituencies, including the regulated industry, to develop appropriate performance goals." If FDA finds merit in setting performance measures and goals for its obligations in food, devices, generics, animal drugs, and over-the-counter drugs, why hasn't FDA pursued these to date?

Answer. FDA has always measured its performance. The fiscal year 1998 President's budget, with its inclusion of new user fees, provided an excellent opportunity to tie our request with performance measures and goals, as we prepare for a performance-based budget for fiscal year 1999, as required by the Government Performance Results Act.

PART 1

1155

Question. Why has future progress on these accountability initiatives been staked to the implementation of substitution user fees?

Answer. The performance measures described relate to the availability of resources at the total levels indicated for each program, whether those resources are from a combination of budget authority and user fees or all budget authority. However, the proposal for new user fees provided FDA with an opportunity to tie our budget request to performance measures, as required by the Government Performance Results Act, or GPRA. The fiscal year 1999 budget will be the first under full coverage of GPRA, and will reflect progress on performance goals and measures.

Question. I have noted with interest the FDA's response to my questions from the FDA hearing before the Senate Labor and Human Resources states that "it is appropriate that the regulated industries contribute a share of FDA's cost of ensuring the safety and effectiveness of their products." Second, the FDA's budget states that the FDA supports the development of "appropriate performance goals to ensure" that user fees "will be used to finance and enhance program activities." Appropriate is a vague, relative term, Dr. Friedman. Are members of this subcommittee to conclude that FDA means that it is "appropriate" for PDUFA to provide additive funds while any new user fees substitute appropriated funds?

Answer. The President's fiscal year 1998 request includes a variety of different user fees as part of FDA's budget, and in the overall context of a balanced budget by the year 2002. User fees in need of reauthorization—the Prescription Drug User Fee Act and the Mammography Quality Standards Act—are additive. To meet the requirements of a balanced budget by fiscal year 2002, the President's budget also includes proposals for a number of new user fees which are not additive to existing resources, but substitute for appropriated funds, as a way to reduce the deficit. In either case, FDA remains committed to developing performance goals that reflect the level of resources anticipated.

Question. Relative to performance goals, how do "appropriate" performance goals differ from what FDA does now?

Answer. FDA has been working to develop additional performance measures as well as working to fine tune its current performance measures that will accurately reflect the important work done by the Agency in our core activities of premarket review and postmarket assurance. This work has been driven by the statutory requirement for a performance-based budget for fiscal year 1999, stipulated by the Government Performance Results Act.

FDA is making progress in defining results-oriented performance measures through a vehicle which we are defining as "process improvement" goals. These are goals that position the Agency to be better able to strive toward outcome goals such as reduction in product hazards. Process improvement goals can be one of two types, as illustrated in connection with our request for additional funding for the Food Safety Initiative.

First are those that reinvent programs to be better able to produce outcomes. An example of this type of goal might be to establish a collaborative arrangement with states, and the regulated industry, so the appropriate persons are working together to produce results that these institutions working alone are not able to accomplish. An example of this would be the Agency's seafood initiative in which FDA, the States, and the regulated industry work together to establish an industry managed quality control system which will position the industry to produce consistently high quality and safe seafood products. The HACCP system—Hazard Analysis Critical Control Points—is an illustration of a reinvention performance goal that will make major differences in the safety of seafood to the U.S. consumer.

Second are those that establish a capability to measure and track outcomes. Examples of such process improvement goals include the establishment of a seafood data base which will collect information on product hazard information. Another example would be the Agency's work with other Federal regulators to establish a Sentinel System which collects microbiological data on foods, and which will enhance the government's capability of tracking food safety outcomes that will be of interest to Congress and the public.

The challenges to such endeavors include the expense associated with establishing such systems and institutional arrangements, the continuing uncertainty that causal links can ever be established between Agency efforts and desirable end outcomes, and the usual cultural resistance of moving from traditional organizational arrangements and measures that require reliance on influence rather than control to produce desired effects.

Question. Dr. Friedman, you've expressed repeated concerns that without at least level funding with fiscal year 1997, the FDA will not be able to perform its statutory duties to protect the public's health and safety. Third party review has generated much attention in recent years as a means to reduce the time necessary for evaluat-

PART 1

1156

ing safety and efficacy and to reduce resource demands on the FDA. How could third party review entities alleviate FDA's budget constraints?

Answer. FDA is exploring this mechanism, but the concept of third party reviews is problematic for several reasons. First, FDA's scientific and clinical experts are charged with exercising independent and unbiased judgment. They comply with stringent financial disclosure and conflict-of-interest requirements designed to protect the decision-making process against bias. It is not clear how or whether this independence can be maintained with the private sector, particularly since the sponsor gets to choose the private party and repeat business may depend on the sponsor's satisfaction with the private party's decision.

Second, FDA's reviewers have extensive knowledge about all of the similar products that are made by different companies around the country. When a reviewer looks at all of the drugs for arthritis and other inflammatory diseases, or all of the heart valves, what that reviewer learns from each review increases his/her understanding of that group of drugs or devices and their effect on the body. As a result, FDA reviewers see problems that reviewers with less information may not see.

The third problem with privatization is the lack of continuity. Third party reviewers may have little knowledge of the specific development process for the product and/or of the development agreements made during the process.

FDA believes that contracting out product review to third parties should be done only if there is evidence that it can be done without jeopardizing the public health. FDA has been working on a pilot program to determine whether third parties can accomplish the goal of getting safe and effective products to the American public.

Question. Dr. Friedman, FDA provided an incomplete answer to my question regarding FDA's plan to respond to industry members who request proof that a dollar in new user fees pays for a dollar in review work within their specified account. FDA's letter notes that PDUFA is independently audited and these funds are meticulously accounted for. I commend the agency on its careful attention to the concerns of drug companies. However, does the FDA believe that PDUFA accounting methods should be used for future user fee proposals?

Answer. FDA believes that funds received for specific activities should be used only for those activities. FDA has experience under the Prescription Drug User Fee Act, or PDUFA, and the Mammography Quality Standards Act, or MQSA, of assuring the use of any fees collected to fund specific activities. FDA is committed to continuing this practice. Let me assure you that any fees collected under legislative authority that requires such fees to be used for specific programs or activities will be used for the program areas so designated. Further, as we continue discussions with Congress and industry on the proposed user fees, we would be amenable to including this particular point as part of those discussions.

Question. Would the FDA object to the consistent use of PDUFA accounting methods throughout the agency? If so, what problems does FDA foresee in such a system?

Answer. Providing for appropriate financial management procedures and controls for the review process of Human Drug Applications, as required by PDUFA, presented a number of challenges to FDA financial and program managers. This is primarily because the Act created a definition for the process which included a unique subset of activities to be included, and specifically excluded other functions of the offices involved in the process for which user fees could not be allocated. To begin with, FDA first had to examine and amplify the definition of what is included in the process and what is excluded from it. In doing this, we found that none of FDA's accounting cost centers, in their entirety, could be included in this definition. This required an extra level of time reporting, in order to meet the unique requirements. Pieces of each had to be excluded, because of specific exclusions in the new statutory definition, and in the legislative history.

Since these inclusions and exclusions defined a totally new subset of FDA activities, it was necessary to develop and implement a methodology that would allow the agency retrospectively to capture the fiscal year 1992 costs from the "base year" for the newly defined "Process for the Review of Human Drug Applications" and allow that same methodology design to be used for future year cost management and calculations.

Costs are accumulated using a variety of methods including time reporting, management surveys, and detailed interviews which are specifically tailored to meet the requirements of PDUFA. In essence, the procedural methods FDA utilizes for PDUFA are an overlay and in addition to FDA's core accounting system to meet a unique set of needs. While these techniques are very reasonable to apply for PDUFA, they do add to our financial management costs and may be unnecessarily burdensome to be implemented throughout FDA for existing needs. However, if FDA were to implement new user fee programs, such as those proposed in the fiscal year

PART 1

1157

1998 budget, with a defined subset of activities, it is likely that many of the same methodologies for the allocation and control of costs would be employed by the Agency.

FDA—FTE

Question. Dr. Friedman, can you provide information on the number of full-time equivalent positions that have been supported exclusively by user fees to date and the projected number of FTE's that would be funded by user fees under the fiscal year 1998 budget?

Answer. During fiscal year 1996 the Agency financed 600 FTE with collections authorized by PDUFA. The Agency expects to continue at least this level of FTE in 1997 and 1998, and possibly more if application workload and accompanying fees continue to increase. For MQSA, FDA financed 43 FTE's, and estimates 35 for both fiscal years 1997 and 1998. For the new user fees proposed in the Administration's budget, 1,120 FTE's would be financed.

Question. Dr. Friedman, during the House Agriculture Appropriations Subcommittee hearing, you stated that each year FDA experiences a 2.5 percent reduction in FTE's, and that the FDA is prepared to absorb the cost of inflation through efficiencies. Can you describe those efficiencies for this subcommittee?

Answer. Our budget has been roughly flat in recent years. As a result, FDA's budget has actually declined in real terms due to increased inflationary costs for pay and benefits, and other operating expenses. Even with this absorption, FDA is committed to making the government work better and continues to be active in response to the efforts of the National Performance Review, NPR, and the HHS streamlining initiatives, and its own reviews to support its own streamlining and reinvention efforts. To meet these inflationary costs, we have initiated specific streamlining and reinvention initiatives.

Building on our central mission to promote and protect the public health, we have embarked in the past year on five far-reaching reinvention initiatives: reforming drug and medical device regulation; overhauling regulation of drugs made from biotechnology; streamlining food safety regulations; reinventing animal drugs; and increasing the availability of new cancer therapies. When fully implemented it is expected that these reinvention initiatives could save industry millions of dollars, and help FDA attain its streamlining goals, while investing agency resources in its core mission to promote and protect the health of the American people.

The Agency is continuing with the Reinventing Administrative Management Program, or RAMP, designed to gain further efficiencies in administrative and management systems. Several RAMP initiatives have helped by reducing the number of reviews and redundant steps in administrative processes and more will follow.

The Streamlining Administrative Management project encourages senior management officials to redelegate administrative authorities to as low a level within their organizations as they consider appropriate.

In other streamlining efforts, FDA analyzed supervisory ratios and spans of control agency-wide and initiated programs focusing on eliminating redundant and unnecessary steps and on reducing internal management controls. One such initiative is that over 100 policies addressing principles and procedures to enhance committee integrity and accountability were streamlined which eliminated bottlenecks in the process and greatly reduced the amount of time and paperwork. We reengineered the process for obtaining and reviewing financial disclosure forms, thus reducing the time required to complete the forms from 3 hours to 15 minutes. We reduced, from three levels to one, the number of approvals required to clear conflict of interest waivers for government employees serving on advisory committees. We implemented an Administrative Quality Assurance Program in compliance with the Federal Managers Financial Integrity Act. This program, a combined effort of headquarters and field offices, is designed to assess the management controls and programmatic requirements within selected administrative field components and make improvements. Thus far, the program has replaced three existing review programs, improved the follow-up on findings, and reduced travel time and checklists.

GPRA has also played a large role in the reinvention process. FDA implemented a broad-based training initiative to enhance manager preparation for incorporation of performance measures as an integral part of planning and managing their programs. To date, over 400 agency managers have received hands-on training in performance measurement techniques through the GPRA pilot and training efforts. The combination of FDA's reinvention and streamlining initiatives will enable the Agency to position itself for the 21st century and manage more efficiently while carrying out its mission of protecting the public health.

PART 1

1158

Question. Do I understand correctly that such efficiencies will save 3 percent of the FDA's annual budget?

Answer. No, but these actions should help us absorb the roughly three percent in anticipated inflationary costs for fiscal year 1998 for which we did not receive additional appropriations.

Question. Are these accounted for in the fiscal year 1998 budget?

Answer. Yes. The President's fiscal year 1998 budget request, taken in total, would provide FDA the resources necessary to undertake our core activities of pre-market approval and postmarket assurance as we fulfill our mission of promoting and protecting the public health.

Question. If so, do the savings apply to the total budget, Salaries & Expenses, certain activities such as generics review?

Answer. Our ability to absorb inflation costs through increased efficiencies would apply across all FDA programs.

Question. If not, why are they absent?

Answer. The President's fiscal year 1998 budget request, would provide FDA the resources necessary to undertake our core activities of premarket approval and postmarket assurance.

Question. I note with interest that the FDA budget justification lists 329 FTE's as dedicated to Generic Drug Evaluation. Am I wrong in my understanding that the Office of Generic Drugs has a 126 FTE ceiling?

Answer. The Office of Generic Drugs has a 125 FTE ceiling.

Question. Can you explain the 200 FTE discrepancy?

Answer. The total number of FTE in the Agency allocated to the generic drug review process is 329. Of these, 125 represent the ceiling for the Office of Generic Drugs, Center for Drug Evaluation and Research, or CDER. Their primary mission is to review and evaluate Abbreviated New Drug Applications and Abbreviated Antibiotic Drug Applications, establish bioequivalence specifications for drug products, and develop guidelines for bioequivalence reviews. An additional 90 FTE located in other CDER organizations also contribute to the generic drug review process. These individuals include additional reviewers, regulatory staff, information technology support staff and other support staff. The remaining 114 FTE provide inspectional support in the Office of Regulatory Affairs.

SHIFTING OF RESOURCES TO USER FEES SUPPORTED ACTIVITIES

Question. When questioned about deficiencies in performance, the FDA points to a lack of adequate resources. Dr. Friedman, it appears to me that FDA's management of resources is also a critical component in the performance equation.

I note with interest that the FDA budget justification lists 329 FTE's as dedicated to Generic Drug Evaluation. Am I wrong in my understanding that the Office of Generic Drugs has a 126 FTE ceiling? Can you explain the 200 FTE discrepancy?

Dr. Friedman, several questions recently raised in the media focused on FDA's practice of shifting assigned resources to other activities. For example, the FDA has consistently told the generic drug industry that the reason why generic drug reviews take so long is because the agency lacks the resources needed to hire more reviewers. Yet press reports indicate that the fundamental reason generic drug reviews take so long is because FDA is shifting resources out of the Office of Generic Drugs in order to meet the PDUFA goals for new drug approvals. In addition, an FDA official testified that the reason food additive petition reviews were so long was due in FDA's focus on meeting PDUFA goals at a recent hearing before the House Subcommittee on Government Reform and Oversight.

In contrast, I understand House Commerce Oversight and Investigations Subcommittee Chairman Joe Barton expressed grave concerns regarding the possible use of PDUFA funds for other FDA activities.

Dr. Friedman, I know you share my concern that this subcommittee faces difficult decisions regarding funding allocations. Reliable data and budgeting are paramount in assuring member confidence that every dollar of approved funding goes to the function that this subcommittee assigns. Please clarify to this subcommittee FDA's response to these reports of resource "borrowing." What resource reporting methods would provide this subcommittee with the necessary information to evaluate the accuracy and legitimacy of questions regarding resource "borrowing."

Answer. The issue involves protection of certain activities from reductions to which other activities are subject. Under PDUFA, fees can only be collected and made available to cover increases in the costs for the process to review human drug applications over and above a base level of appropriated resources, as provided in the Federal Food, Drug and Cosmetic Act, in section 736 (g)(2)(B). This provision of the PDUFA legislation along with the requirement to apply an adjustment factor

PART 1

1159

calculation, defined in section 735 (8) of the FD&C Act, to the fiscal year 1992 base level of appropriated funding for the process, was enacted to ensure that user fees collected under PDUFA are indeed additive resources for the review of human drug applications. In the straight-lined budget environment to which FDA has been subject for the past several years, when a significant portion of base appropriated resources must remain stable or increase, other activities must take a higher proportion reduction to absorb increased inflation costs.

FDA PRIORITIES

Question. FDA's fiscal year 1998 budget request proposes about \$244 million in regulatory fees to be paid by the industries it regulates. The request also included \$58 million for new agency initiatives. Specifically, FDA requests \$24 million to implement the President's "Food Safety Initiative" and \$34 million to implement the FDA regulation prohibiting advertising of tobacco products to children. FDA consistently fails to meet its statutory deadlines for review of food, drug, and medical device applications and petitions and claims that the agency is unable to meet these deadlines because it lacks the necessary resources. Dr. Friedman, on average, your agency fails to meet its statutory deadlines to review petitions and applications for foods, drugs, and medical devices. You claim that FDA lacks the resources necessary to meet these statutory duties. Yet, FDA proposes two new spending initiatives totaling \$58 million. All of this comes in a year when discretionary monies are tighter than ever. Let me ask you about the priority setting issue this Committee will probably face. Should existing FDA activities be cut to fund new spending initiatives or is maintenance of existing agency activities a priority over new spending initiatives?

Answer. The Administration's budget for FDA should be viewed in total, keeping in mind that it fits in with the President's overall balanced budget plan by fiscal year 2002. I am unable, at this time, to prioritize among the new funding included in the budget versus our traditional areas of concern. Improving the safety of the food supply and keeping tobacco out of the hands of children are both initiatives of the utmost importance and are very high priorities for FDA and this Administration. However, FDA's traditional activities in promoting and protecting the public health through premarket review and postmarket assurance are also of vital importance.

FDA has made strides in improving performance its many programs. For human drugs and biologics, we have consistently succeeded in meeting and even exceeding all performance measures established in the Prescription Drug User Fee Act, or PDUFA.

But even in areas where we did not receive additional resources, we continue to make progress. In medical devices we have improved premarket approval reviews, or PMA's, while maintaining review times for abbreviated applications—the 510(k)'s. This latter category of applications—which accounts for the vast majority of all device submissions—covers devices that are substantially equivalent to those already on the market. In fiscal year 1996, we approved 43 PMA's, a 6-year high, and 24 major new products, an all-time high. Further, eight of the 15 PMA's submitted to FDA in the first half of fiscal year 1996 received a first action within the 180-day deadline—significantly better than in either 1994 or 1995.

Even though we are approving more PMA's for increasingly complex devices, and we have improved the time to first action, the PMA approval time is coming down only slowly. It takes too long—more than two years—to get a device through the process. We continue to focus on bringing down PMA review times, just as we have done in the human drug area.

FDA has also successfully managed the review times for 510(k) applications. In fiscal year 1996, the median review time for these devices that received a finding of substantial equivalence was 85 days. The reviews were almost 70 percent longer—144 days—at their peak in 1993. Even accounting for applications that had to be returned to the manufacturer for more information, the average 510(k) review time in fiscal year 1996 was 110 days, down from the peak of 184 days in fiscal year 1994.

Even with our best efforts, there is still room for improvement, particularly in the area of food additive petitions. In the past, we have fallen short on average of meeting statutory deadlines. However, in the past few years, we have made a concerted effort to improve in this area by speeding up the review process and reducing the inventory of pending petitions. Scientists from other program areas were shifted to petition review, the existing electronic information processing infrastructure was modernized, technical services were contracted out to third parties, and we provided guidance to petitioners on how to improve the quality of their submissions to the Agency. These efforts have paid off. In June 1995, there were 295 petitions in the

PART 1

1160

inventory. By the end of fiscal year 1996, we had received an additional 82 petitions, yet the inventory was 60 below the total in June 1995. We approved the highest number of petitions in a decade—54—during calendar year 1996. Further, the median time from receipt to approval of food and color additive petitions decreased from 37 months in fiscal year 1993 to 27 months in fiscal year 1996. While we are still not where we want to be, we clearly are continuing to make progress.

The new user fees proposed in the budget would allow us to continue our current level of activity in each of these areas.

QUESTIONS SUBMITTED BY SENATOR BURNS

USER FEES

Question. The fiscal year 1998 budget request has a nearly \$68 million decrease for non-user fee budget authority, but a nearly \$69 million increase in total funding. The increase is accounted for by new user fees. What is the rationale for the decrease in budget authority, and how will the decrease affect the FDA's ability to review new and supplemental applications if new user fees are not authorized?

Answer. The Administration's budget for FDA should be viewed in total, keeping in mind that it fits in with the President's plan for an overall balanced budget by fiscal year 2002. The President's Budget proposes new user fees for many FDA activities in the context of constructing a balanced budget by 2002. The Administration believes these new user fees are appropriate funding mechanisms in that the industries regulated by FDA benefit from increased consumer confidence in their products.

If the proposed user fees are not authorized and the base resources replaced by these user fees are not restored, the impact across all FDA programs would be tremendously detrimental. The Administration is proposing new user fees of \$131,643,000, of which \$122,436,000 would replace existing base appropriation resources, and 1,120 FTE. Without new user fees or the restored base resources, the necessary reductions would be felt across each program area of FDA.

Further, the President's budget included new funding for food safety and tobacco regulation. At this point in time, I cannot say with any degree of certainty where specific cuts would be taken, but given the magnitude of the potential reduction, I can safely say that review times and backlogs for all FDA-regulated products would increase substantially. FDA's ability to fulfill its mission of protecting and promoting the health of the American public would be seriously undermined.

Question. Do you believe that new user fees, beyond those authorized under the Prescription Drug User Fee Act (PDUFA), are justified to offset decreased budget authority, and is this good policy in light of the success of PDUFA?

Answer. We believe that PDUFA, with its reliance on performance measures, goals, and program improvements can be a successful model for user fees in other FDA programs to enhance performance and efficiency. The industries regulated by FDA derive valuable benefits from some FDA activities, including increased customer confidence in their products and significant protection from liability. FDA's reputation also improves the competitive position of American firms in overseas markets. The President's budget proposes that the regulated industries contribute a share of FDA's cost of ensuring the safety and effectiveness of their products. The following are the types of user fees, by program area, being proposed by the Administration. We intend to work with Congress, industry and other affected parties to develop these or other proposals to achieve informed consideration of proposed user fees, and to ensure necessary funding for important FDA public health activities in fiscal year 1998. The new user fees proposed in the President's Budget and before the Committee are based on the PDUFA model but proposed in the context of balancing the budget by 2002.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

FISCAL YEAR 1998 PROGRAM LEVELS (USER FEES)

Question. The fiscal year 1998 budget shows an increased program level, but assumes new user fees. What reception are you getting from the authorization committee and the regulated community from the user fee proposals?

Answer. New and expanded user fees were proposed across the Federal Government as part of the overall plan the President proposed earlier this year for a balanced budget by fiscal year 2002. FDA's authorizing committees in the House and Senate have not yet held hearings or invited testimony from FDA specifically on the

PART 1

1161

user fee proposals, with the exception of a House Commerce Committee hearing on the Prescription Drug User Fee Act, or PDUFA. The House and Senate authorizing committees have expressed interest in timely reauthorization of PDUFA, which also has the highest support from industry. Although no extensive discussions have been held on the other user fee proposals, the regulated industry has not expressed support of these fees.

FDA FIELD OPERATIONS

Question. Over the course of the past several years, FDA has received overall increases in budget authority from this subcommittee. In fiscal year 1994, the total made available (including user fees) was \$869.6 million. For fiscal year 1997, the amount is \$995.9 million and you propose an increase to \$1.064 billion for fiscal year 1998. At the same time, I hear of reductions in operational activities at the field level. For example, I understand NCTR has lost 20 or more positions over the same period due to budget shortfalls. Would you respond to this issue.

Answer. In fiscal year 1994, NCTR utilized 249 budget authority FTE. The estimate of budget authority FTE utilization for NCTR in fiscal year 1997 and fiscal year 1998 is 223. This is a net loss of 26 FTE by the NCTR between fiscal year 1994 and fiscal year 1998. The bulk of this reduction, 20 FTE, is the NCTR program share of the President's initiative to reduce the deficit by streamlining Federal employment. The remaining decrease of 6 FTE is the result of the NCTR absorbing a share of agency-wide reductions.

NCTR base resources have been fairly consistent for the past several years, both in dollar terms and as a percentage of the Agency's total Salaries and Expenses appropriation. Fluctuations are attributable to the amount of one-time contract support made available to the NCTR. Reductions in funding for the NCTR and other programs have resulted from the Agency absorbing contract and salary inflation increases and a general decline in available operating costs to all FDA programs.

Question. What amounts of the budget that would have otherwise gone to NCTR have been used for other operational activities. What might those activities be? Which of these activities might be referred to as "initiatives"?

Answer. The adjustment of \$5.7 million in the amount planned for NCTR in fiscal year 1997 is not really a reallocation to other programs, but an adjustment to reflect the true continuing costs of FDA's major programs. The estimate for NCTR furnished to the Committee in mid-1996 was too high because it was based on an unusually high level of funding for NCTR in fiscal year 1995.

The reason that the obligations for NCTR were unusually high in fiscal year 1995 relates to the nature of NCTR's operating budget, which includes a number of support service contracts. NCTR relies on a high level of contract support for managing its facilities, maintaining its animal colonies, and for many other research support services. In past years, FDA has redirected funds toward the end of the year from other programs to NCTR for its contract support. NCTR's operating budget is then reduced by the same amount at the beginning of the next year so that the overall level of funding remains relatively constant. The Agency is not able to provide these additional funds to the NCTR at a consistent level every year, but endeavors to keep NCTR funding at a "base" level necessary to maintain its current level of operations. The Agency's current estimate for NCTR for fiscal year 1997 of \$31.3 million is very similar to NCTR's actual expenditures for fiscal year 1996 of just under \$31 million. The current fiscal year 1997 estimate reflects the current planned level of funding for NCTR and for all other programs.

The reallocations from the NCTR to the other program areas are not truly program increases or decreases, but adjustments to more accurately reflect the continuing cost in fiscal year 1997 of the level of program activities conducted in fiscal year 1996. However, since the fiscal year 1997 appropriation did not include inflationary allowances, all programs have had to absorb a reduction in their operating funds, and NCTR has had to absorb its proportionate share of this reduction. In partial compensation for this, the Agency did allocate an increase of \$533,000 to NCTR early in fiscal year 1997 to absorb some of the inflation in NCTR's contract costs.

NCTR LAB CONSTRUCTION

Question. I understand construction of the Arkansas Regional Lab (NCTR) is underway. Will the amount requested for fiscal year 1998 complete construction of Phase II at NCTR?

Answer. The fiscal year 1997 appropriation of \$13,000,000 for Phase I of the Arkansas Regional Laboratory, ARL, will support construction of the building, foundation, substructure, superstructure, exterior enclosure and roofing as well as major building systems such as fire protection, HVAC, electrical and some site work. The

PART 1

1162

fiscal year 1998 request for \$14,550,000 will complete Phase II, the laboratory portion of the project, of the construction of the ARL, by completing building systems and providing laboratory fit-out. This amount is based on the Architecture and Engineering estimate. The construction bid process for Phase I is underway and will determine the exact amount needed to complete the ARL. Some portion of the ARL fit-out planned in Phase II is likely to be deferred to Phase III.

Question. What will be the total remaining cost to complete Phase III?

Answer. Phase III is estimated to be \$9,800,000 and provides the renovation of the existing NCTR Building 50 in its entirety to accommodate the common ORA/NCTR administrative and support area. This projection is based on the Architect/Engineer estimate. The construction bid process for Phase I is underway and will determine the exact amount to complete Phase III. Construction and construction management costs are estimated at \$37,400,000.

Question. Does FDA intend to seek a full request for Phase III in the fiscal year 1999 budget?

Answer. FDA and the ORA Laboratory Consolidation Plan require the completion of all Phases for the ARL project to be successful in providing the state-of-the-art facility and quality of work life environments which ORA and NCTR staff need. Hence, FDA will address the ARL project and Phase III in subsequent years.

LAB CONSOLIDATION

Question. Your plan for lab consolidation includes the Arkansas Regional Lab as a facility which will host operations current conducted at several other facilities. What is the status of FDA field lab consolidation?

Answer. In 1994, ORA received approval from the Secretary of Health and Human Services to proceed with streamlining laboratory operations. The plan calls for the creation of 5 large multipurpose laboratories in Seattle, Washington; Los Angeles, California; Jefferson, Arkansas; New York, New York; and Atlanta, Georgia; and 4 specialty laboratories in San Juan, Puerto Rico; Winchester, Massachusetts; Philadelphia, Pennsylvania; and Cincinnati, Ohio; for a total of nine field labs, replacing the current network of eighteen laboratories, over a 20-year period, from 1994 to 2014. FDA projects costs savings of \$112.7 million, based on the fiscal year 1997 annual review and updated cost estimates, namely rents and budget outlays toward lab consolidation. FDA will maintain inspection, public affairs and enforcement operations at the current District offices and resident posts. In fiscal year 1995, 1996 and 1997 appropriations, FDA received appropriations for the design and land acquisition for the Los Angeles and Arkansas new facilities; the construction of ARL Phase I core and shell.

Currently FDA has formulated Building and Facility plans including new construction, expansion, restructuring, and decommissioning, as well as personnel transfer plans which carry out the ORA 21 Laboratory Consolidation goals and coincide with current facility lease expiration dates.

In fiscal year 1997, three FDA laboratories, Buffalo, Chicago and Cincinnati are scheduled to be closed and two laboratories, Philadelphia and Winchester, MA, restructured. The fiscal year 1997 work plan comprehensively transferred the corresponding analytical programs and resources to the respective multipurpose or specialty laboratories. I would be happy to provide for the record a list of dates for either closing or restructuring for each of these labs as well as provide more detail on our planned laboratory consolidation.

[The information follows:]

Lab closure dates: Buffalo, October 1, 1996; Chicago, July 1, 1997; and Cincinnati, June 30, 1997.

Lab restructure dates: Philadelphia, October 1, 1996; Winchester Engineering and Analytical Center, July 1, 1997.

ORA 21 Multipurpose labs

1. *New York-Northeast Regional Laboratory, Northeast Regional Office and New York District Office-Jamaica, Queens.*—An authorization for prospectus was approved in 1994 with delineated area in the Borough of Queens. An Architect and Engineering or A&E Program of Requirements was prepared for 75,000 net sq. ft. laboratory and 100,000 net sq. ft. regional and district office facility. In fiscal year 1996, GSA/FDA finalized negotiations for the 4.5 acre site at York College, Jamaica Queens. GSA had intended to award the lease by April 1997. We have now been advised by GSA that the lead offeror has rescinded his proposal. GSA will now go to other offerors to continue the project. FDA occupancy has been scheduled for March-May 1999.

2. *Arkansas Regional Laboratory.*—In fiscal year 1995, Congress authorized \$2,500,000 for A&E design for the ARL. The ARL A&E design was completed in

PART 1

1163

March 1996. In fiscal year 1996, \$3,800,000 was appropriated for the joint ARL/NCTR facility. fiscal year 1996 funds were used for A&E design items including construction of an animal quarantine facility and preparation of space for an ORA Dioxin lab facility. ARL facility construction is estimated at \$37,400,000. Phase I construction funds were approved in fiscal year 1997. In fiscal year 1998, \$14,550,000 is requested to complete Phase II, the fit out of Arkansas Regional laboratory. Construction bid process is underway and award is anticipated summer of 1997. Phase III, the NCTR building 50 renovation and the new common ORA/NCTR administrative and support area was initially estimated at \$9,800,000.

3. *Los Angeles-University of California at Irvine.*—In fiscal year 1995, \$9,800,000 was appropriated for A&E design and land acquisition. FDA, through the Corps of Engineers, has awarded an A&E design contract to Zimmer, Gunsul, Frasca/HDR, and acquired 10 acres of land, at University of California at Irvine. FDA and the A&E firm have developed a design concept for the replacement laboratory, which is planned to house 75 laboratory staff and support personnel, estimated at \$26,500,000. No construction funds have been approved.

4. *Southeast Regional Laboratory.*—In fiscal year 1996, GSA issued a sole source Solicitation for Offer to construct 42,000 net square feet of lab and lab support space adjoining the current FDA complex at 8th and Peachtree Streets. The ground breaking ceremony occurred in January 1997. Construction completion and FDA occupancy is expected by December 1997.

5. *Seattle Laboratory.*—In fiscal year 1996, a 5,000 square feet expansion project of the lab was completed.

ORA 21 Specialty Labs

6. *Cincinnati.*—National Forensics Chemistry Center and Cincinnati District Office—The decommissioning of the current facility began in 1996. A prospectus was approved for 31,170 net square feet laboratory space and 13,930 net square feet of office space. Ground breaking occurred in October 1996. Construction completion and FDA occupancy is scheduled for late 1997 or early 1998.

7. *Philadelphia.*—GSA is proceeding to expand the U.S. Customhouse facility in Philadelphia by 8,378 square feet and accommodate 16–20 additional laboratory staff. FDA occupancy of new space on floors 10 and 12 is expected by summer 1997.

8. *San Juan.*—FDA will renovate and expand the facility to house 20–25 total laboratory employees by the year 2000.

9. *Winchester.*—FDA building and facility funds were used to establish an American Association for Accreditation of Laboratory Animal Care, or AAALAC, facility. Design of additional AAALAC facilities is under development and awaiting cost estimates.

Other Facility Activities

Decommissioning: Decommissioning schedules have been established for each closing laboratory upon lease expiration. In fiscal year 1996, FDA B&F funds totaling \$2,600,000 were ear-marked for facilities decommissioning activities at Buffalo, Cincinnati, Chicago, and New Orleans. In fiscal year 1997, decommissioning activities are scheduled for Baltimore, the Brooklyn complex in New York, and the Pico Blvd. facility in Los Angeles. In fiscal year 1998, decommissioning activities will commence for Dallas, Minneapolis and Detroit.

Personnel Activities: Voluntary transfers to other ORA labs:

In fiscal year 1995, 19 transfers at a cost of \$910,000.

In fiscal year 1996, 9 transfers at a cost of \$284,900.

In fiscal year 1997, the lateral transfer period has been extended throughout the fiscal year; to date 16 have been approved at an estimated cost of \$525,000.

Total cost to date is \$1,719,900.

Total transfers to date is 44.

Question. When will other field labs begin transferring operations to the Arkansas Regional Lab?

Answer. Once the Chicago laboratory closes on July 1, 1997, Chicago's dioxin program, 5 FTE, the high resolution mass spectrometer, valued at \$450,000, and, associated glassware and supplies will be moved into an interim laboratory facility. The interim laboratory facility is renovated space located in NCTR's Building 14. ORA plans to start operations at the dioxin laboratory by late summer 1997. ARL is anticipated to have 10–12 staff in Jefferson, Arkansas during 1997–1999.

Other ORA personnel, programs and equipment are scheduled for transfer upon their lease expiration dates. Laboratories in Detroit, Minneapolis and Dallas will be transferred to ARL during 1999 and 2000, and Denver and Kansas City during 2010–2014.

PART 1

1164

Question. When will transfer of all operations to the Arkansas Regional Lab be complete?

Answer. The ORA Lab Consolidation Plan has scheduled full occupancy and completion of all transfers to ARL by 2014.

The ARL facility has a capacity of approximately 140 operational and support staff. Upon laboratory closures scheduled to take place by 2000, at Minneapolis, Detroit, Chicago and Dallas, approximately 55 operational FTE will be transferred to ARL. Additionally in between 2010 and 2014, upon lab closures in Denver and Kansas City, approximately 85 additional operational FTE will be transferred to ARL.

Question. What are the projected savings of this consolidation effort and what efficiencies will result?

Answer. FDA projects a costs savings of \$112.7 million, through 2014, based on the fiscal year 1997 annual review and updated cost estimates, namely rents and budget outlays toward laboratory consolidation. FDA will maintain inspection, public affairs and enforcement operations at the current District offices and resident posts.

ARL is an integral part of the Laboratory Consolidation plan not only from a programmatic efficiency standpoint but also because the completion of ARL and closure of the six existing labs contributes approximately 50 percent of the Lab Plan cost savings.

Let me provide for the record a statement made by the GAO about FDA lab consolidation efforts to date:

[The information follows:]

“ORA has used the Southeast Regional Lab, SRL, located in Atlanta, Georgia as the model of the future for the multipurpose/mega labs. SRL services the southeastern United States from Louisiana to North Carolina. This laboratory consistently meets time frames and has an excellent rapport with its customers. More importantly, SRL has a large enough cadre of scientists to conduct uninterrupted operations on a day-to-day basis and meet emergency and other non-routine requests that arise. It's this critical mass of experienced, equipped scientific staff, housed in a state-of-the-art lab, which provides the wherewithal to meet efficiency and effectiveness goals. Hence, the Lab Consolidation Plan incorporates these essential elements to efficiency at each of its planned mega-lab facilities.”

Similar efficiencies are expected from consolidation at ARL.

FISCAL YEAR 1998 INITIATIVES

Question. The fiscal year 1998 budget contains a number of new initiatives. One concerns tobacco. Another related to food safety. What amount of the tobacco “initiative” will be used for normal enforcement activities and please explain the items within this request that are actually new activities for the agency.

Answer. The tobacco initiative is a new agency effort. Implementation of the first provisions of the rule that went into effect in February 1997 has been underway for some time. It is normal for the Agency to train, commission, and contract with state and local officials for the enforcement of FDA regulations. That is how the tobacco rule will be enforced and, in that sense, the Agency considers these to be “normal enforcement activities.”

Question. What effect will the recent court decision regarding FDA regulation of tobacco have on this initiative or similar activities at FDA?

Answer. The February 28 access provisions have gone into effect and the Agency will continue to implement and enforce those provisions. The access and labeling provisions scheduled to go into effect this August were upheld but stayed by the district court. The advertising and promotion provisions scheduled to go into effect in August were overturned by the district court. The parties have appealed.

Question. If full funding is not included for your Food Safety initiative, will you be able to work with USDA, EPA, and CDC in a way to blend all resources, government-wide, into this effort or do you feel that FDA will not be a player to the extent of the other agencies?

Answer. FDA's fiscal year 1998 request provides adequate resources to maintain our current level of activities that were funded in fiscal year 1997. However, to go a step beyond our “every day efforts” to reduce the risk to health that foodborne microorganisms pose to consumers, we have requested additional funding for the Food Safety Initiative, or FSI, which is an important extension of all ongoing food safety efforts. Without this additional funding, we will not be able to work toward the goal of reducing the incidence of foodborne illnesses. Further, Seafood HACCP will be implemented at a much slower pace.

The federal food safety agencies will continue to respond to problems once they are identified, until the goals of the Food Safety Initiative are realized. The Food

PART 1

1165

Safety Initiative will enable the Agencies to develop systems with strategies and mechanisms to anticipate and prevent most of the significant food safety problems. It is clear that outbreaks such as hepatitis in frozen strawberries, *E. Coli* in unpasteurized apple juice, and *Cyclospora* in raspberries, will only increase in terms of frequency. The ability of the Federal government, and in particular FDA's ability to prevent and respond to these situations, will be greatly enhanced by this new funding. The goal of the initiative is to reduce the incidence of deaths and illnesses associated with foodborne pathogens.

QUESTIONS SUBMITTED BY SENATOR HARKIN

SAFETY OF THE BLOOD SUPPLY

Question. I'm informed that prior to 1990 when blood was first screened for Hepatitis C, an estimated 300,000 people annually were infected with Hepatitis C from blood and blood products. While this has now been reduced to about 180,000 a year, the continued prevalence and increasing death rate from this disease merits attention. How has the FDA followed up on the recommendation last year by the House Committee on Government Reform and Oversight that the estimated 300,000 living recipients of blood and blood products who were infected with Hepatitis C prior to 1990 be notified of their potential infection so that they might seek diagnosis and treatment?

Answer. An estimated 3.9 million Americans are infected with Hepatitis C virus, or HCV. Seven percent, or about 300,000 people, acquired their infection from blood transfusions received prior to 1990. The number of transfusion-associated Hepatitis C cases each year has declined dramatically since the introduction of screening tests, and CDC currently estimates the risk from blood to be between 0.01 percent and 0.001 percent, per unit transfused, or no more than 1,000 HCV infections from blood transfusions each year.

Transfusion-associated risk is only a small proportion of the overall HCV infection burden in the United States. Most HCV infections in the United States are acquired from other sources and 8,000 to 10,000 people die each year from HCV-associated chronic liver disease.

The issue of notification of recipients of blood products from donors subsequently found to be infected with HCV, or look back notification, has been publicly discussed at the Blood Products Advisory Committee on several occasions.

In April 1997, the Department of Health and Human Services brought this problem to the attention of the first meeting of the PHS Advisory Committee on Blood Safety and Availability. This Committee includes representatives of industry, consumers, scientific experts and ethicists. Its purpose is to provide a forum to examine the broad public health and societal implications of blood safety issues. The PHS Advisory Committee provides advice to the Secretary of HHS. This issue also has been considered by HHS's Blood Safety Committee which includes the DHHS Blood Safety Director, the Director of NIH, the Director of CDC, the Administrator of HCFA, and the Commissioner of Food and Drugs. The Blood Safety Committee is involved in identifying issues for discussion by the PHS Advisory Committee.

At its April 1997 meeting, the PHS Advisory Committee considered the issue of HCV look back notification of recipients but did not issue recommendations. Among the issues discussed at the Advisory Committee meeting were the overall problem of HCV in our country; the patient's right to know about possible infection; the difficulty of tracing blood recipients; the utility of a targeted look back to certain populations such as the hemophilia community; and other issues. The PHS Advisory Committee indicated it would attempt to provide DHHS with recommendations in a timely fashion. The FDA is awaiting the recommendations from the PHS Advisory Committee on Blood Safety and Availability.

Question. Has FDA developed guidelines or standards that blood banks should use in notifying individuals of their exposure to Hepatitis C through contaminated blood or blood products?

Answer. Most plasma derivatives undergo manufacturing or viral inactivation procedures that will eliminate any HCV which may have come from donors whose positive status was not detected by the current screening tests. However, in some immune globulin products without viral inactivation, there have been transmissions of Hepatitis C virus in recent years. The FDA has acted in close concert with the CDC to identify such events and manufacturers have initiated notifications to alert individuals who received these blood products of their possible exposure. These products are now either virally inactivated or else tested for HCV by gene amplification and released for commercial distribution only if found to be negative for HCV.

PART 1

1166

Transmission of HCV by blood component transfusion is more complicated. At this time, the FDA has not developed guidelines or standards to be used in notifying individuals of their exposure to Hepatitis C through contaminated blood components. Although effective donor screening has substantially reduced this risk since 1990, the best approach to identifying persons who become infected by transfusion both prior to and since 1990 remains undefined. This question has been brought before the PHS Advisory Committee on Blood Safety and Availability.

Options under consideration for recommendation by the Committee include recipient tracing based on knowledge of a positive donor, public health service announcements focusing on prior receipt of transfusion, and physician education regarding disease prevention, management and therapy. It is likely that some combination of these approaches will be recommended.

The CDC already has begun implementing a broad nationwide prevention and control plan for Hepatitis C. This program is aimed at early identification of persons with chronic HCV infection, including transfusion recipients, and reducing transmission in groups at high risk of infection. Three approaches are being used to identify and educate persons at risk of HCV infection: verbal, written, and visual material directed to the public; educational efforts directed to health care and public health professionals; and, development of community-based prevention programs.

CONCLUSION OF HEARINGS

Senator COCHRAN. Today's hearing concludes our review of the budget request for the President's fiscal year 1998 budget.

The subcommittee will recess and reconvene at the call of the Chair.

[Whereupon, at 11:50 a.m., Thursday, May 1, the hearings were concluded and the subcommittee was recessed, to reconvene subject to the call of the Chair.]

PART 1

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

MATERIAL SUBMITTED BY AGENCIES NOT APPEARING FOR FORMAL HEARINGS

[CLERK'S NOTE.—The following agencies of the Department of Agriculture and one related agency did not appear before the subcommittee this year. Chairman Cochran requested these agencies to submit testimony in support of their fiscal year 1998 budget request. Those statements follow:]

DEPARTMENT OF AGRICULTURE

NATIONAL APPEALS DIVISION

PREPARED STATEMENT OF NORMAN G. COOPER, DIRECTOR

Mr. Chairman and members of the Subcommittee, I am pleased to appear before you to discuss the fiscal year 1998 budget request for the National Appeals Division—NAD.

MISSION

NAD was established by the Department of Agriculture Reorganization Act of 1994, Public Law No. 103-354. The mission of NAD is to carry out the provisions of that law in establishing an independent administrative appeals process. NAD conducts evidentiary hearings and reviews respecting adverse program decisions made by agencies of Rural Development, the Natural Resources Conservation Service, the Risk Management Agency, and the Farm Service Agency.

Program participants—appellants—have the right to appeal adverse decisions and to have a hearing before an NAD hearing officer in their State of residence. Once a hearing officer makes a determination, the appellant or the affected agency head may request a review of the hearing officer's determination by the NAD Director. NAD's final determinations are reviewable by United States District Courts.

NAD is headquartered in Alexandria, Virginia, with a small review and support staff, with three regional offices responsible for the activities of more than 70 hearing officers in three geographic areas: Eastern—Indianapolis, Indiana; Southern—Memphis, Tennessee; and Western—Lakewood, Colorado.

CURRENT ACTIVITIES

Recent accomplishments include:

—NAD conducted a national training conference in fiscal year 1996, and in fiscal year 1997 is conducting training conferences at three regional sites and at headquarters. These conferences provide development opportunities to ensure that NAD personnel are kept current of Administrative proceedings, current laws and regulations in the program areas that are subject to NAD jurisdiction. In addition, training is provided in standards of review, evidentiary considerations and judicial issues, ethics, and EEO.

PART 1

1168

- In accordance with the Government Performance and Results Act, NAD has drafted its 5-year Strategic Plan and 1997 Annual Performance Plan.
- NAD interim final rules imposed a reconsideration requirement for Director Review Determinations, and NAD has developed a procedure for such reconsideration. Reconsideration of a determination of the Director may be requested by the appellant or the Agency within 10 days of receipt of the determination. The Director has 5 days to issue a decision on the request for reconsideration.
- An NAD directives system and a Hearing Officer Manual have been developed to provide a systematic method of communicating information and policy to the headquarters and field office personnel.
- A Civil Rights and Equal Employment Opportunity Advisory Committee consisting of representative employees from headquarters and the field offices was established to advise and help the Director.
- NAD has initiated a quality assurance program designed to enhance quality of decisions, advance the rights of program participants, and promote the lawful operation of agency programs.
- During fiscal year 1996, there were 6,137 appeals requested and 1,263 Director Reviews. Of the 1,263 Director Reviews, 1,006 were requested by appellants and 257 were requested by heads of agencies. Additionally, 54 requests for reconsideration were received.

FISCAL YEAR 1998 BUDGET REQUEST

For fiscal year 1998, NAD is requesting \$13,359,000 in direct appropriations. This request represents an increase of \$1,641,000 over the fiscal year 1997 appropriation. The increase consists of \$143,000 for pay costs, and the remaining \$1,498,000 will fund four initiatives.

The first initiative will enable NAD to replace the tracking system that now track appeals only for former Farmers Home Administration's cases. The current system cannot accommodate cases from other agencies that are now appealed to NAD. For example, if information on an appeal pertaining to a disaster program is requested, it must be obtained by a manual search, which is costly and time consuming. This limits our ability to provide Congress, USDA, and other interested parties, accurate and timely information regarding appeals handled by NAD, as well as to make informed management decisions. NAD needs to develop and procure a new tracking system to meet these requirements.

The second initiative provides necessary training to NAD hearing officers and review staff, as well as other employees. They must keep abreast of current laws and regulations, administrative procedures, and automation. To ensure fair and impartial determinations based upon correct application of laws and regulations, and guarantee the rights of program participants and the efficient operation of agency programs, hearing officers, in particular, must be trained in the proper methods of fact finding, hearing procedures, and application and analysis of regulatory authority. The NAD staff is dispersed across the country, and the development of a standard curriculum to include a minimum number of quasi-judicial courses to be completed within specific time frames would ensure a standard level of competency is reached and maintained.

With proper training, hearing and review officers will be able to render competent determinations based upon a required level of knowledge. In addition, they will be supported in rendering timely, complete, and correct determinations with assistance from NAD personnel with extensive knowledge of computer systems that support the hearing and review officers in affecting NAD's goal of timely, complete, and correct determinations.

The third initiative will fund the development of an automated system to provide hearing officers and the review staff electronic access to previous NAD decisions. This system will establish a mechanism that will be used by all NAD hearing and review officers to ensure consistency in NAD determinations, and it will supplement an NAD directive system that provides guidance on policy and law.

The fourth initiative provides for the enhancement of new computer equipment to ensure NAD employees are able to provide quality internal and external customer service in an efficient manner. Because of the geographically dispersed nature of NAD operations and its customer base, efficient and reliable data communications capabilities are critical to achieve quality, timeliness, and completeness goals.

We urge the Committee to approve these initiatives in the interest of improving the services that we provide to our stakeholders. NAD's primary stakeholders include: four statutorily-defined client agencies—Farm Service Agency, Rural Development, Natural Resources Conservation Service, Risk Management Agency; potential appellants—including all participants in programs administered by NAD's four cli-

PART 1

1169

ent agencies and applicants for such programs, and advocacy groups that represent appellants.

NAD has streamlined its organizational structure effectively and efficiently to carry out its statutory mandate. To sustain its mission in delivery of high quality adjudication administrative appeals and reviews, NAD requires the appropriation requested.

This concludes my statement Mr. Chairman. I will be happy to answer any questions that the Subcommittee might have.

OFFICE OF THE CHIEF ECONOMIST

PREPARED STATEMENT OF KEITH COLLINS, CHIEF ECONOMIST

This statement discusses the functions and fiscal year 1998 budget request of the Office of the Chief Economist.

OCE is a small staff of economists, scientists, meteorologists and support personnel all located in Washington, D.C. The Office reports directly to the Secretary of Agriculture. OCE has three primary missions: 1) provide economic analysis to executive branch and Congressional policy officials on alternative policies, programs and regulations; 2) serve as a focal point for the collection and reporting of economic and weather data, forecasts and projections related to agricultural commodities and the performance of the agricultural economy; and 3) conduct statutory review and oversight responsibilities related to risk assessment and cost-benefit analysis of major USDA regulations. OCE consists of three functional units: the Immediate Office, the World Agricultural Outlook Board—WAOB, and the Office of Risk Assessment and Cost-Benefit Analysis—ORACBA. Recent activities and accomplishments in each of these three areas are briefly discussed.

IMMEDIATE OFFICE OF THE CHIEF ECONOMIST

The immediate office, with a staff of nine, directs a wide range of analysis related to policy, program and legislative proposals, and regulations. The focus is on only the most substantial, complex and controversial issues, usually at the request of the Secretary, other Administration officials, or members of Congress. The most important products are briefings, and briefing and analysis papers prepared on tight deadlines. These analyses generally focus on short-to medium-term effects, involve staff from other agencies, and apply the results of existing, basic economic research to specific policy issues. The immediate office staff is also responsible for regulatory review. A key role of the staff is to coordinate analyses among USDA agencies. OCE staff include the directors responsible for coordinating agricultural labor issues and sustainable development issues within USDA. Examples of key activities are:

Farm Bill Implementation.—Since passage of the 1996 Farm Bill, the staff of the Immediate Office has had a series of key implementation responsibilities. OCE coordinated analysis of, and the decision process for, the Secretary's decision to implement the Northeast Interstate Dairy Compact. OCE briefed the President's Chief of Staff twice on this issue and several members of Congress as well. OCE coordinated, with the Assistant Secretary for Marketing and Regulation, a review of the performance of the National Cheese Exchange—NCE—and analysis of options to replace the use of the NCE price in Federal Milk Marketing Orders. OCE also chaired USDA's Interagency Dairy Analysis Team which served as the reviewer for the concept proposals prepared by the Agricultural Marketing Service for Federal Milk Marketing Order consolidation and reform. OCE reviews resulted in material changes to the options released to the public for comment. OCE is also participating in the preparation of the economic analysis for the planned proposed rule on order consolidation and reform. OCE also served on numerous decision teams for the Secretary to resolve issues related to farm and conservation program implementation.

Commodity Market Analyses.—During the 1996/97 crop years, prices of wheat, corn and milk reached record highs. In the spring of 1996, cattle prices reached a 10-year low. OCE provided the Secretary regular briefings on the developments in commodity markets during this period. OCE coordinated development of the President's initiative to support beef prices, announced in April 1996, and participated in the briefing of the President. OCE coordinated the Secretary's initiative to stabilize milk prices, announced in December 1996, after the unprecedented decline in the Basic Formula Price.

Concentration.—OCE played a major role in the Department's efforts to understand and address issues of concentration in agriculture. OCE provided staff support to the Secretary's Advisory Committee on Concentration in Agriculture and co-chaired the Department's Response Team which reviewed the report and developed

PART 1

1170

responses to its recommendations. The Team's efforts resulted in a number of programmatic changes in the collection and dissemination of market information.

Karnal Bunt Compensation.—OCE assisted Animal and Plant Health Inspection Service—APHIS—in establishing a compensation scheme for producers, handlers and others adversely affected by the Federal quarantine established for the eradication of Karnal Bunt. Activities included directing analyses of the effects of the quarantine on the wheat industry and developing compensation plans for producers, handlers, and flour millers.

Crop and Revenue Insurance Evaluation.—OCE assisted the Risk Management Agency—RMA—in evaluating the rating structure and reinsurance implications of revenue insurance. In cooperation with researchers at The Ohio State University and the Economic Research Service, a model was developed to evaluate the performance of the 1996 reinsurance agreement and to assist RMA in negotiating the 1998 Standard Reinsurance Agreement with crop insurance companies.

Testimony and Congressional Analyses.—During the past year, the staff responded to many Congressional requests for information or analysis. During fiscal year 1996 and early fiscal year 1997, OCE testified before Congress as the principal USDA hearing witness five times. Testimony was provided on the following issues: the effects of immigration reform on farm employers; risk assessment at USDA; allegations of price manipulation on the National Cheese; renewable fuels and energy security; estate and capital gains taxes. In addition, the Chief Economist frequently appeared before Congress with the Secretary, Deputy Secretary or others on issues ranging from the USDA budget, the Conservation Reserve Program—CRP, concentration, international trade to dairy policy.

Special Studies.—OCE has coordinated a number of special studies bringing together analysts from various USDA agencies to ensure the best expertise addresses the issue. For example, OCE coordinated the Department's response to the Environmental Protection Agency's—EPA's—proposed rule on particulate matter and ozone, and OCE has participated in executive branch analysis of the effects of global climate change. OCE chairs the Capper-Volstead Committee which responded to requests related to permissible activities of cooperatives. OCE responded to many requests for rapid analysis of issues such as the effects of the Florida freeze; the relationship between price volatility and commodity stocks policy; using cost of production to establish the Basic Formula Price for milk; economic effects of U.S. grain imports from Canada; effects of proposed changes in the Commodity Exchange Act; implications of foot and mouth disease in Taiwan for U.S. pork exports to Japan and for U.S. producers; U.S.-EU grain and oilseed Uruguay Round concerns; North American Free Trade Agreement; and regionalization of plant and animal health regulations. OCE participates in the USDA working group on the 1999 World Trade Organization agricultural negotiations including preparation of analysis of U.S. objectives and approaches. OCE also provides staff support to the Secretary's Special Assistant for Trade.

Regulatory Review and Clearance.—A major responsibility of the immediate office staff is to review and clear regulatory impact analyses of USDA regulations. During fiscal year 1996, OCE reviewed and cleared approximately 70 significant or economically significant regulations. This process often involves assisting the regulating agency with identification of feasible alternatives and planning the economic analysis. Examples of special rulemaking efforts this past year included the Conservation Reserve Program, the Environmental Quality Incentives Program, the Wildlife Habitat Incentives Program, avocado imports, and organic certification.

Agricultural Labor.—OCE fulfills the statutory mandate to consult with the Department of Labor—DOL—on regulations related to the H-2A Temporary Agricultural Worker Program. A major effort this past year involved working with DOL on a final rule issued in 1997 establishing the conditions under which a farm employer would be jointly responsible for actions of a farm labor contractor. Other key activities included rulemaking support to EPA through analysis of pesticide protections for farm workers, such as warning sign posting, decontamination sites, and analysis of immigration reform on USDA programs and on farm employment.

Sustainable Development.—OCE advises the State Department, Foreign Agricultural Service—FAS, and others of sustainable development issues for negotiations, treaty formulation and implementation, and trade discussions. For example, OCE led the USDA delegation to the meetings of the United Nations' Commission on Sustainable Development, which focused on issues of sustainable agriculture and forestry, and participated with FAS in representing USDA with the Asian Pacific Economic Cooperation—APEC—group. OCE serves as liaison to the President's Council on Sustainable Development and organized the USDA response to the Council's report, "Sustainable America—A New Consensus for Prosperity, Opportunity, and a Healthy Environment for the Future." A USDA Council on Sustainable Develop-

PART 1

1171

ment, chaired by OCE, was established to develop, coordinate, and integrate the principles of sustainable development into policies and programs across all mission areas of the Department. OCE serves as liaison to the Council on Environmental Quality in its effort to develop a framework for measuring progress toward sustainable development and manages USDA efforts to coordinate work on performance measures and criteria and indicators for sustainable development.

WORLD AGRICULTURAL OUTLOOK BOARD—WAOB

The WAOB prepares world agricultural and weather assessments and coordinates USDA's work related to agricultural outlook, projections, weather, and remote sensing. The Board, with a staff of twenty-five, issues a monthly publication known as the *World Agricultural Supply and Demand Estimates* report and oversees long-term USDA forecasts required for preparation of the Federal budget. The Board also operates and manages the Joint Agricultural Weather Facility—JAWF—in cooperation with the National Oceanic and Atmospheric Administration—NOAA, and is home to the Department's Chief Meteorologist. In addition, it provides technical assistance and coordination for USDA's remote sensing activities.

Coordinating USDA Economic Forecasts.—The WAOB plays a critical role in assuring that the Department's commodity information system responds to today's rapidly changing world. The Board's mission is to ensure that USDA's intelligence on domestic and foreign agricultural developments is timely, accurate, and objective, and to speed the flow of that information to producers, consumers, and policy makers.

One of WAOB's primary functions is to coordinate and review all USDA forecasts and analyses of foreign and domestic commodity supply and demand conditions. The Interagency Commodity Estimates Committees are chaired by staff of the WAOB. The purpose of these committees is to assure that sound information from domestic and international sources is fully integrated into the analytical process and that USDA economic forecasts are objective, thorough, and consistent. The committees, with representatives from the Economic Research Service, Farm Service Agency, Foreign Agricultural Service, Agricultural Marketing Service, and WAOB, are responsible for developing official estimates of supply, utilization, and prices and reviewing economic reports issued by USDA agencies. In fiscal year 1996, the Board reviewed and approved for release more than 250 such reports.

Each month, the WAOB publishes *World Agricultural Supply and Demand Estimates*—*WASDE*—report forecasts production, trade, utilization, prices and stocks. Coverage includes U.S. and world grains, oilseeds, and cotton and U.S. livestock and poultry products and sugar. Release is simultaneous with the *U.S. Crop Production* report. *WASDE* is internationally viewed as a benchmark for agriculture and provides timely knowledge of world food markets that is increasingly critical to our export-led farm economy. Equally important, the *WASDE* report gives early warning of changing crop production and supply prospects in the United States and in other countries.

Monitoring Weather Impacts on Agriculture.—USDA places a high priority on incorporating weather-based assessments into all analyses. The focal point for this activity is the JAWF, operated jointly by the WAOB and NOAA of the Department of Commerce. The JAWF staff continually monitors and assesses global weather and its probable impact on agricultural output. JAWF briefings, reports, and special alerts are key inputs to the development of USDA crop yield estimates for both competitors and customers in world markets. JAWF weather assessments are widely available to the agricultural community and are made available to the public through the *Weekly Weather and Crop Bulletin*, USDA's electronic dissemination network, and the news media. In addition, WAOB now provides access to the *Weekly Weather and Crop Bulletin* through its home page. In 1996 the National Weather Service—NWS—proposed eliminating the *Weekly Weather and Crop Bulletin* as part of a plan to privatize weather services. WAOB, however, persuaded the NWS not to terminate this vital report.

During fiscal year 1996, through *WASDE* reports and the *Bulletin*, WAOB provided timely assessments of dramatic crop developments unfolding globally. Stocks of grains and oilseeds were depleted following reduced 1995 harvests in the United States and several other countries. In combination with continuing strong world demand, this created a very tight supply situation for 1996. Prices for some commodities reached record highs, triggering apprehension for consumers and a cost-price squeeze for livestock and milk producers. As growing conditions for winter wheat in the U.S. Southern Plains deteriorated from the fall of 1995 through the spring of 1996, the JAWF issued early warning alerts and provided timely assessments to USDA crop analysts. During the spring, the JAWF kept USDA on top of adverse

PART 1

1172

weather that seriously delayed planting of crops in the Midwest. Meanwhile, early warnings and assessments were provided on foreign crop weather developments such as drought in the former Soviet Union, flooding in China, and late planting in the Canadian Prairies, as well as favorable weather in North Africa and many of the Southern Hemisphere's grain exporting nations.

Despite planting delays, prospects for U.S. crops improved during the summer, leading to increased U.S. production of grains, oilseeds, and cotton. Production increases were mirrored by larger grain harvests abroad, rebuilding depleted grain stocks and easing price pressures in early 1997. However, U.S. and world oilseed supplies are currently very tight in the face of continuing strong global use.

Disseminating USDA Numbers to the Public.—As commodity prices are affected less by Government programs and more by market forces, the need for objective and current market information is becoming especially critical. The WAOB recognizes the need for rapid information dissemination and strives to place the *WASDE* report *Weekly Weather and Crop Bulletin* in the hands of farmers and other users as quickly as possible. The goal is to provide simultaneous access at a minimum cost to all market participants.

Given the market conditions of the past year, there was great demand for rapid access to WAOB's supply/demand forecasts and weather analysis. The *WASDE* report was revamped to provide quicker access to key numbers. A new summary table on world oilseeds, meals, and oils provides a better perspective of competitive market developments for U.S. soybeans. The *WASDE* publication schedule was streamlined in May 1996 to enable release of cotton estimates at 8:30 a.m., rather than issuing them separately at 3:00 p.m. the previous day. The change, made possible by Section 870 of the 1996 Farm Bill, has reduced industry confusion.

Electronic release of the *WASDE* report was greatly improved to give much faster public access. Guaranteed time for posting of the report on the "USDA Economics and Statistics System" on the Internet, which has become extremely popular with data users, was cut from three to one hour after release, and actual release time is usually much faster.

A review of forecast reliability for estimates in the *World Agricultural Supply and Demand Estimates* report covering 1981/82 through 1994/95 showed the estimates to be statistically sound. The review found that *WASDE* forecasts improve as the season progresses, and that there are no systematic overestimation or underestimation tendencies. Export forecasts show greater variation, as exports reflect variability in both domestic and foreign production and markets. As expected, ending stocks reflect the largest deviations because, as a residual, all errors accrue to this term.

Information Exchange with China.—Obtaining good data from other countries is essential to USDA's international commodity forecasts. WAOB has actively participated in a series of information exchanges between USDA and China's State Statistical Bureau—SSB—to enhance USDA's international forecasts through a keener understanding of China's agricultural statistics, and to help China better understand the sources and uses of U.S. agricultural data. During a U.S. visit by the SSB in September to study data collection methods, WAOB explained its supply and demand forecasting procedures, and the use of weather and remote sensing in the process of outlook reporting. A USDA team then visited China to obtain similar information about SSB procedures in China. In subsequent exchanges, WAOB staff reviewed China's procedures for collecting statistics on grain and oilseed production and presented seminars on USDA's long-term agricultural projections.

Oversight of Long-Term USDA Commodity Projections.—WAOB chairs the Department's Interagency Agricultural Projections Committee that oversees preparation of long-term projections for farm commodities, the U.S. agricultural economy and world agricultural trade. The Economic Research Service has the lead role in preparation of the projections. WAOB's role is to ensure a strong multi-agency effort and sound analytical procedures for the projections. In the past year, procedures for projections of the U.S. farm economy and world farm trade were significantly improved.

The projections are used for a variety of analytic and mandated functions of the Department, such as preparing the USDA portion of the President's budget. They are also published in long-term baseline projections that provide an objective, rigorous, and thorough view of the likely path of the sector over the long term. The most recent set of projections, *Long-term Agricultural Projections to 2005 Reflecting the 1996 Farm Act*, was issued in February 1997 at the Department's annual Agricultural Outlook Forum.

The Forum, conducted under WAOB's leadership, is a public meeting on farm, food, and trade prospects. The 73rd annual Agricultural Outlook Forum, held in February 1997, explored the long-term impacts of the 1996 Farm Act, new trade agreements, and changes in the agricultural sector. More than 800 people attended

PART 1

1173

the meetings to hear public and private analysts, farmers, and leaders from Government, agriculture, and international organizations discuss future prospects and issues. New USDA projections released at the Forum foresee strong growth in world food consumption and agricultural trade over the years covered by new farm legislation, and favorable trends for farm prices and returns.

Coordinating USDA Weather and Climate Activities.—During fiscal year 1996, WAOB recruited a new Chief USDA Meteorologist. A major focus of activity for the Chief Meteorologist has been the impact of privatization of specialized weather services by the NWS. NWS invited USDA to help draft a background report to Congress articulating the impact of cutbacks on agriculture.

WAOB is leading USDA efforts to revitalize plans for a National Agricultural Weather Information System—NAWIS, which was initially authorized in the 1990 Farm Bill. Alternatives are being developed to achieve cooperation with NWS and the private sector and linkages with existing local agricultural data collection networks to fill the void in agricultural weather information for all users.

With NWS's planned elimination of its Regional Climate Centers, the Cooperative Observer Program, a volunteer weather observing network known as the COOP network, is in jeopardy. The COOP network is a prime source of agricultural data throughout the Nation. The Chief Meteorologist is actively working with NWS to develop a plan to assure continuation of this vital program.

WAOB's JAWF represents USDA interests in a number of climatic activities, including liaison to the Office of the Federal Coordinator for Meteorology. The JAWF was appointed to chair a World Meteorological Organization—WMO—Working Group on Agrometeorological Data Management that includes members from Europe, Russia, Africa, Asia, and South America. Recently, the National Weather Service terminated all representation on WMO agricultural committees, and USDA assumed responsibility for representing all U.S. agricultural weather and climate interests.

The Chief Meteorologist has accepted a leadership role in the Western Drought Coordination Council. The Council was created by a memorandum of understanding between several Federal agencies and the Western Governors Association. USDA is the lead Federal agency.

WAOB's Joint Agricultural Weather Facility was involved in several interagency activities in fiscal year 1996. For example, JAWF staff continued to work closely with the Water and Climate Center of USDA's Natural Resources Conservation Service to formulate the second phase of implementation of a Unified Climate Access Network, which provides on-line access to weather and climate data from a variety of sources. Similarly, JAWF staff continued to provide meteorological expertise for a USDA team assembled to determine the incidence and extent of *Tilletia Controversa* Kuhn smut in the 1996 winter wheat crop.

As part of a broad cooperation agreement between the United States and South Africa, JAWF has begun an exchange of technical expertise and will help South Africa develop an improved weather data monitoring and information delivery system. The Oklahoma State University "Mesonet" system is being examined as an adaptable model.

Supporting USDA Remote Sensing Activities.—In its role as the Department's coordinator of remote sensing work, WAOB works to enhance the abilities of the six USDA agencies that make use of remote sensing for operational and research programs. The WAOB chairs quarterly interagency meetings to review current projects and facilitate data sharing. Through guest speakers, WAOB alerted agencies to technical advances and new sources of imagery data, including radar and planned visible band imager. On behalf of several USDA agencies, WAOB initiated discussions with the National Imagery and Mapping Agency to acquire radar imagery of flooded areas in the Midwest. Similarly, WAOB requested radar data from the National Environmental Satellite, Data, and Information Service of NOAA.

OFFICE OF RISK ASSESSMENT AND COST-BENEFIT ANALYSES—ORACBA

The principal task of ORACBA, with a staff of five, is to promote effective and efficient USDA regulation of hazards to human health, human safety and the environment. This is accomplished by bringing science and management together in policy and regulatory development. By statute, ORACBA is required to ensure that the analysis supporting a major rule proposed by USDA includes a risk assessment and a cost-benefit analysis for mitigation measures that are performed consistently, and use reasonably obtainable and sound scientific, technical, economic, and other data. ORACBA serves as a reservoir of expertise for analyses and information resources for conducting risk assessments and cost-benefit analyses and works with USDA agencies in coordinating analyses supporting major regulations. ORACBA is seeking

PART 1

1174

closer ties with land-grant universities to promote multidisciplinary research in food safety, resource conservation, and other areas where USDA has regulatory responsibilities.

ORACBA also develops training programs and information resources which support the use of risk assessments and cost-benefit analyses for regulatory development. ORACBA has also taken steps to ensure that these analyses are held to high standards through peer review. These and other activities are undertaken to assure USDA leadership and the public that regulatory analyses rely on sound scientific and economic information and the most appropriate methods, and that the regulation provides protection against the identified risks in a cost-effective manner.

Current Progress in Expanding USDA Risk Assessment Capabilities.—ORACBA programs for training, information resources, analytical support, and peer review are the primary means for integrating risk assessment and USDA regulatory impact analysis. For example, in February 1997, ORACBA worked with the Food Safety and Inspection Service—FSIS—to conduct a 2-day risk assessment workshop specifically tailored to the agency's needs. In March 1997, ORACBA and the Food and Drug Administration jointly launched a 4-day course, "Introduction to Risk Assessment." Enrollment in this course, also to be offered for June and August 1997, will be available to other Federal agencies as well. ORACBA will continue to rely on training programs such as these to develop a trained cadre of USDA risk assessment professionals.

ORACBA's Risk Forum, a monthly seminar series on risk assessment issues, has begun its second year of providing top quality speakers to address major issues in food safety, resource conservation, and environmental risk assessment. The *ORACBA News*, also entering its second year, has become an important communication vehicle for the growing USDA risk assessment community. Over 650 copies of the most recent issue were distributed and is also available through the USDA website.

ORACBA is expanding ties to the research community to stimulate research in critical areas where USDA programs affect human health, safety, or the environment, and provide much needed depth to ORACBA programs. Beginning this fall, an American Association for the Advancement of Science—AAAS—fellow will conduct critical developmental research on agro-ecosystem risk assessment methods. In partnership with FSIS, a second AAAS fellow will be working to develop methods for food safety risk assessment. Through a Memorandum of Understanding, two scientists from the Agricultural Research Service will work this year directly with ORACBA on food safety risk assessment and risk assessment management for USDA's conservation programs. Through the Cooperative State Research, Education, and Extension Service, a scientist from an 1890 institution will lead a team devoted to the examination of a major hazard addressed by USDA programs and develop literature resources to support further risk assessment. ORACBA is also meeting with university groups to discuss issues and opportunities for multi-disciplinary risk assessment research.

Conducting Risk Assessments and Reviews.—ORACBA assisted the Natural Resources Conservation Service in the preparation of the risk assessment for the Environmental Quality Incentives Program—EQIP. Risk assessment experts were identified by ORACBA to provide technical assistance and guidance at critical steps in the process. Program agency and ORACBA personnel worked in a highly collaborative manner to conduct an ecological risk assessment that may be unique in its scope and complexity. ORACBA also coordinated interagency peer review of the EQIP risk assessment. The end result was a sound assessment of the risks addressed by EQIP and a sound basis to address future resource concerns under the program. ORACBA also helped the Farm Service Agency conduct the risk assessment for the Conservation Reserve Program. A process similar to the one for EQIP was used.

FISCAL YEAR 1998 BUDGET REQUEST

For fiscal year 1998, OCE is requesting \$6,408,000 in direct appropriations. This request represents a net increase of \$2,002,000 over the fiscal year 1997 adjusted base. The proposed budget includes an increase of \$56,000 for the annualization of the fiscal year 1997 pay raise and the anticipated fiscal year 1998 pay raise, and \$1,946,000 are for the following:

An increase of \$525,000 for Modernization of Weather and Climate Data Acquisition. The Department of Commerce, National Weather Service—NWS has redefined its mission and reduced its role in the weather and climate community. NWS has limited its role to data collection, archival, and distribution, the issuance of weather warnings, and general forecasting. Services tailored to specific communities such as

PART 1

1175

agriculture have been terminated by NWS. Concurrent with a renewed emphasis on data dissemination, NWS is adopting state-of-the-art communications technologies known as the Advanced Weather Information Processing System—AWIPS.

USDA is a principal user of meteorological data as weather and climate affects all aspects of crop and animal life. In a modernized NWS, the collection, dissemination, and quality control of weather and climatic data will be accomplished on AWIPS equipment. AWIPS will be USDA's only means of access to the full suite of meteorological information from NWS and other sources. Requested funding will be used to purchase hardware and software necessary to fully implement the compatible AWIPS operational sites, install telecommunication hardware, and pay line maintenance and transmission charges.

To access the daily operational data available from the NWS, USDA proposes to acquire and install two AWIPS compatible hardware and software units at selected sites. These modern computer workstations include telecommunication links and adequate computer power to analyze and display the full complement of NWS data products. Installation of AWIPS compatible units will be accomplished in phases. The first will be located at the Joint Agricultural Weather Facility, USDA, Washington, D.C., and the second at a selected USDA site.

Without AWIPS compatibility, USDA will lose direct and real time access to all the weather and climate data made available by NWS. Dependence on secondary sources will result in data costs for which funding does not exist. Further, time delays associated with intermediate processing by secondary vendors will slow USDA's recognition and response to unfolding weather events.

To make economically sound management decisions, preserve and protect natural resources, and mitigate the impact of extreme and/or rapidly changing weather conditions, farmers and ranchers must have access to timely and accurate meteorological information. The new AWIPS technology at USDA will expedite the flow of basic information to agricultural users via publication in the *Weekly Weather and Crop Bulletin*, and for delivery of data from agricultural areas to the NWS for weather forecasts and warnings and to the private sector for specialized agricultural services.

USDA's initiatives will not replicate or substitute for private sector weather forecasting services. Requested funding will restore agricultural data lost to NWS budget cuts and will assure the continued availability of quality-controlled meteorological data to the private sector in a timely manner. Private sector meteorologists will, in turn, use these data to provide value-added weather products and services to the agricultural community on a contractual basis.

An increase of \$350,000 and 6 staff years for the National Agricultural Weather Observing Network—NAWON. With the redefining of the NWS mission and closure of agricultural weather offices, USDA has lost access to meteorological data critical to its mission. This funding will enable a partial restoration. The first priority of NAWON will be selectively to restore data sources lost to NWS cutbacks. Second, NAWON will expand the availability of agricultural weather and climate data by establishing linkages with existing weather and climate networks operated by Federal, State, and local agencies previously beyond the scope of NWS. Linking fragmented, agriculturally-oriented networks and developing an integrated data base will facilitate quality assurance, provide data needed by USDA, and improve the ability of NWS to forecast weather events in agricultural areas. All data collected will be made available to the private sector which, in turn, will generate "value added" products for the agricultural community.

These increases are partially offset by a decrease of \$29,000 and one staff year to support the President's Executive Order to reduce Federal employment.

An increase of \$1,100,000 and 4 staff years for the Commission on 21st Century Production Agriculture. The Commission on 21st Century Production Agriculture was created by the Federal Agricultural Improvement and Reform Act of 1996—FAIR—in order to make farm program policy recommendations to Congress regarding future farm legislation beyond the year 2001. The Commission will be comprised of three members appointed by the President and eight members appointed by the Chairmen of the Senate and House Agricultural Committees.

The Commission will conduct a comprehensive review and assessment of the success of production flexibility contracts in supporting the viability of U.S. farming; assess the economic risks to farms delineated by size; assess the changes in farmland values as a result of the FAIR; assess the extent to which regulatory relief and tax relief for agricultural producers is implemented; and assess the effects of trade embargoes, international trade agreements and export programs on U.S. agriculture; assess the likely effect of transferring peanut quotas across state lines; assess the personnel and infrastructure requirements of the Department of Agriculture necessary to support the future relationship of the Federal Government with

PART 1

1176

production agriculture and make specific legislative recommendations to the Congress in this regard.

In order to fulfill its mandate, it is expected that the 11 member Commission will meet on a regular basis over a period of 39 months from October 1, 1997 to January 1, 2001; conduct hearings in various agricultural producing areas and trade centers; maintain a small office and a staff; commission studies and engage consultants with expertise in the various subject areas to be reviewed; and arrange for the production and printing of an interim report by June 1, 1998, and a final report of the findings and recommendations of the Commission by January 1, 2001. The total cost of the Commission for the 39-month period is estimated to be \$3.4 million.

That concludes my statement Mr. Chairman. I would be pleased to respond to questions.

OFFICE OF THE CHIEF FINANCIAL OFFICER

PREPARED STATEMENT OF IRWIN T. DAVID, ACTING CHIEF FINANCIAL OFFICER

Mr. Chairman and members of the Subcommittee, I appreciate the opportunity to appear before you today to discuss USDA's progress in improving financial management and to present the President's budget proposal for USDA's Office of the Chief Financial Officer—OCFO—and the Department's Working Capital Fund. With me today are Pearlie Reed, Acting Assistant Secretary for Administration, Allan Johnson, the Department's Associate Chief Financial Officer, Steve Dewhurst, the Department's Budget Officer, and Constance Gillam, my budget officer.

Mr. Chairman, most decisions by USDA's policy, program and management personnel have financial implications. When we in the Office of the Chief Financial Officer improve the quality of the information on which such decisions are based, we promote better, more effective Government. OCFO administers a variety of programs and activities, required by the Chief Financial Officer's Act of 1990 and delegated by the Secretary of Agriculture, to support decision making by our policy, program and management personnel. As examples, OCFO develops and maintains financial information systems and services; ensures that adequate controls exist to safeguard USDA assets and manage liabilities; fosters accountability for management performance Departmentwide; coordinates strategic planning and performance measurement; oversees implementation of the Government Performance and Results Act—GPR—in USDA; oversees the operation of the Departmental Working Capital Fund; manages the National Finance Center; and, provides budget, accounting, and fiscal services to the Office of the Secretary, Secretarial Level Offices, and Departmental Administration.

THE CHALLENGE TO FINANCIAL MANAGEMENT IN USDA

USDA is a large, decentralized agency with offices spread throughout the Nation and the world. The programs and activities which USDA administers are complex and diverse. As a result, requirements for financial information are complex and diverse. Currently USDA operates approximately 67 financial management systems with 133 different applications to meet these program requirements. The data in several of these systems are neither timely nor readily accessible. Several systems were developed to address specific agency needs, and issues of standardization and data interchange were frequently not addressed. Serious weaknesses in USDA's financial management systems and practices have been identified by the General Accounting Office, the Office of the Inspector General, the Office of Management and Budget, and others.

The challenge facing my office and the entire USDA financial management community is to revolutionize the financial management systems and programs of the Department, so that they produce quality information for users—both inside and outside USDA—whose needs may differ significantly. Accurate, timely, reliable, consistent and useful financial information are the key management requirements for effective program delivery decisions and assessments of the financial health, efficiency, and effectiveness of USDA and its programs.

This is not an easy task, nor one that can be achieved quickly. It requires establishing and maintaining consistent accounting standards and practices throughout USDA; measuring and evaluating performance of USDA programs; developing and maintaining financial information systems that are not just timely, accurate, reasonable in cost, and reliable, but responsive to the needs of end users. In addition, we must educate policy, program and management personnel to the importance and use of financial, strategic and performance information in planning for and managing their programs; and improving the competence of financial managers at all lev-

PART 1

1177

els. Further, once we succeed in improving financial management within USDA, we must sustain or exceed the baseline levels set in order to inspire confidence in our ability to manage our programs effectively.

We are asking for a modest increase to meet this challenge. We know this is a time when most budgets are declining, but we believe that the investment we are asking you to make will more than pay for itself in terms of management improvements, increased program effectiveness, and increased efficiency. Before discussing the details of our fiscal year 1998 request, I would like to tell you what we are already doing to address USDA's financial management challenge.

FINANCIAL SYSTEMS

OCFO is leading a major effort to transform USDA's outdated, cumbersome, inefficient financial systems into a single, integrated financial information system responsive to the needs of USDA policy, program and management personnel. We have assembled a highly-trained, interdisciplinary team to begin the phased implementation of the Financial Information Systems Vision and Strategy—FISVIS, a system which will eliminate current system weaknesses. Such weaknesses have not only hampered effective decision making, but resulted in less than unqualified audit opinions on USDA's consolidated financial statement and some agency financial statements for the past five years.

USDA has made major strides in developing and implementing FISVIS. We have instituted financial standards—the language of finance—for all USDA entities, and are well on our way to implementing a single integrated financial information system, consistent with OMB directives. We expect that, when fully implemented, FISVIS will make it possible for USDA to integrate financial data with other information to promote better management decisions and program delivery. The estimated completion date for FISVIS is fiscal year 1999.

Implementing FISVIS, however, is just the beginning. The standards and the system must be maintained. OCFO must constantly update and monitor standards and ensure that all Departmental financial and mixed information systems—both current and planned—are consistent with the foundation financial system. We must ensure that agencies coordinate their system development activities to reduce the number of “stand-alone” systems, and provide faster and more accurate response to internal and external inquiries, improve interchange of data among USDA agencies and provide a standardized methodology for collecting and reporting financial information. We also will ensure that all financial systems are in compliance with the Department's Information Technology Architecture.

Implementation of FISVIS is crucial to achieving our financial management improvement goals because timely, accurate, reliable, and useful information is critical to improved financial management. Until FISVIS implementation is complete, however, we are systematically addressing the financial management weaknesses that have been identified by the General Accounting Office, the Office of the Inspector General—OIG, and others.

AUDITED FINANCIAL STATEMENTS

The members of Congress, public, and the Administration, as well as USDA policy, program, management and operating personnel are entitled to comprehensive, comprehensible, and consistent statements of USDA's overall financial position and results of operations. With poorly functioning financial systems, we are unable to attain an unqualified audit opinion for some of our agencies' financial statements. The less than unqualified audit opinions we have received over the years are largely due to problems in various stand-alone financial systems and supporting processes and procedures. The systems changes underway in FISVIS will resolve many of the problems. OCFO staff are working directly with USDA agencies, including the Forest Service, Rural Development, Farm Service Agency, Food and Consumer Service, and the National Finance Center to put in place systems, processes and management disciplines to eliminate system and management weaknesses. In fact, we have formed a unique partnership between the OCFO, the OIG and the agencies to resolve many of the identified problems. Our target is to achieve an unqualified audit opinion on the fiscal year 1998 consolidated financial statement.

ACCOUNTABILITY/MANAGEMENT CONTROLS

For the sixth consecutive year, USDA has not fully complied with the accountability, management controls and financial system provisions of the Federal Managers' Fiscal Integrity Act—FMFIA—of 1982. Thus, we have not been able to provide assurance that our management controls and financial systems provide adequate control over the assets entrusted to our care by the U.S. taxpayers. Many of the open

PART 1

1178

FMFIA issues will be addressed by our new Department and agency financial systems. However, we are not relying solely on systems modifications to ensure accountability. The Secretary is requiring that each member of the Sub-Cabinet ensure that the accountability issues for which he or she is responsible are fully and satisfactorily addressed. In addition, we have simplified procedures so that agencies can devote more time to resolving problems and less to processing forms.

We are working closely with individual agencies, and these efforts are showing results. Our goal is to be able to report conformance with all aspects of FMFIA for fiscal year 1998.

COST ACCOUNTING

In this time of constrained budgets and increased needs, USDA policy and program personnel must know the full costs of providing services and to use such cost information for decision making and performance management. Cost information is also one of the crucial factors for judging performance under the Government Performance and Results Act—GPR. Such cost information must be available not only at the appropriation level—it must be available for programs, activities, functions, organizations and services. In addition, uniform full-cost information is fundamental to our ability to monitor the fees charged by USDA entities under various fee based programs, as required by the CFO Act. Implementing cost accounting systems in an agency as diversified and complex as USDA requires system modifications and new procedures. More important, effective use of cost information requires education and training of program managers to enable them to effectively use such information.

USDA is now in the initial stage of implementation of improved cost management principles. We are beginning to see results. For example, one USDA agency that provides services to other agencies, internal and external to USDA, has revamped its pricing structure based on an analysis of its costs. The agency is now more fully recovering its costs. In another instance, a program is being redesigned to reduce the cost and improve the quality of its services. In other examples, use of cost management principles are aiding in the modernization of administrative systems. These are examples of the effectiveness of cost management as a management tool. We are striving to institutionalize those techniques throughout USDA.

USDA is committed to complying with the Governmentwide standard of fully costing our functions, activities, outcomes, outputs, and programs. The financial systems we are implementing will accumulate cost information for sound decision-making, for cost/benefit analyses, for budgetary analysis, for performance measurement, to comply with OMB requirements and to provide better information to Congress and the public. In addition, the OCFO has undertaken a variety of activities, ranging from cost management training to policy and/or procedures development to technical oversight, advice, and assistance, to prepare policy and program personnel for the better use of such information. We are also planning to undertake our first reviews of charges, fees and royalties, as required by the CFO Act.

Better financial information is the key to sound financial management; cost information on programs, activities, functions, organizations and services is the key to sound decision making and performance evaluation.

GOVERNMENT PERFORMANCE AND RESULTS ACT

The Government Performance and Results Act—GPR—seeks to improve the efficiency and effectiveness of Federal programs by establishing strategic plans and performance goals, and measuring and evaluating performance against those goals. GPR also requires the participation of Congress and customers, partners, and employees in establishing the strategies and the goals. In USDA, OCFO is responsible for coordinating Departmentwide implementation of GPR.

GPR requires that the USDA Strategic Plan be submitted to OMB and Congress by September 30, 1997 and that the budget for fiscal year 1999 include its first Annual Performance Plan. Because of the diversity of USDA programs and missions, the USDA Strategic Plan will include an overall statement of the Department's mission and major themes summarized in an Executive Summary and the Strategic Plans of each Mission Area and Agency. In that way, interested readers can view USDA in totality as well as view the specific programs and functions in which they are interested.

USDA is well on its way to completing the Plan on time. Each USDA Mission Area/Agency has prepared a draft Strategic Plan. We plan to provide draft plans for Congressional consultation this Spring and to continue to seek input from customers, employees and stakeholders. The USDA Strategic Plan will be provided to Congress and OMB as required by the Act. In addition, we are preparing the Annual Performance Plans for submission with the fiscal year 1999 budget requests.

PART 1

1179

The submission of the first strategic and performance plans is only the beginning of the process enabling USDA, and the Federal Government to manage by outcomes and results. The true value of strategic and performance planning and measurement will come over the years as we get feedback and gain more experience with these new disciplines. OCFO personnel will continue to work closely with agency personnel to refine both the planning, measurement and interpretation techniques so that they become the new management disciplines of the Federal Government. At the same time, use of such techniques will enable us to better communicate to the public the value of the services received for the resources entrusted to our care.

COST REDUCTION AND COST RECOVERY PROGRAMS

OCFO is undertaking a number of other initiatives aimed at reducing the cost of Government. I would like to briefly describe three such efforts:

Debt Collection.—Swift and effective collection of delinquent debt reduces the Federal Government's interest payments for financing that debt and prevents write-offs of uncollected debts. We are moving aggressively to reduce the amount of delinquent debt owed USDA, which approached \$8.7 billion in fiscal year 1996. The Debt Collection Improvement Act of 1996 has provided additional tools to aid us in this effort. For example, we are working with the Department of the Treasury to implement the Administrative Offset Program, designed to offset payments from any Government agency to any entity delinquent on a debt owed to any other Government agency. USDA has very successfully used the Internal Revenue Service offset program for a number of years. Further, barring delinquent debtors from obtaining Federal credit in the future will significantly improve our ability to reduce the amount of overdue debt owed USDA.

Electronic Funds Transfer.—The Debt Collection Improvement Act also mandates that all payments by USDA, as of January 1, 1999, must be made by electronic means—no more paper checks. Electronic Funds Transfers reduce the cost of making payments to recipients by using state-of-the-art electronic mechanisms. USDA has been at the leading edge of using electronic means for payments with over 90 percent of the salary payments from the National Finance Center made by direct deposit. We are now converting as many payments to electronic means as possible. Moreover, USDA is at the forefront of Federal Government efforts to receive and process vendor or invoice electronically.

Reengineering Travel.—Travel regulations and related processes and systems are incredibly complicated. We spend too many resources on the administrative aspects of managing travel. In accord with the Joint Financial Management Improvement Policy Task Force Report on Improving Travel Management Governmentwide, USDA has set a goal to simplify travel policies by using new electronic tools for reimbursing travelers. Thus, we have implemented several policy changes recently allowed by Congressional action and GSA policy, and we are revising our travel processes and systems to make them more useful to the traveler. Further, we plan within the next several months to initiate a complete analysis of USDA travel policies and systems so that we can modernize those systems and reduce the administrative costs of traveling.

CUSTOMER SERVICE

Because quality program and service delivery is essential to good Government, OCFO has made providing high quality customer service an integral component of all of our activities. During fiscal years 1997 and 1998, we are developing baseline levels of customer expectations and customer satisfaction throughout the organization. These baselines, in turn, will aid us in setting customer service standards, measuring and assessing our performance, determining needed program changes or remedial actions, and increasing our efficiency. We are working toward developing performance metrics that are meaningful and future-oriented, so that we can ensure successful organizational performance into the next century and beyond. This is crucial if we are to provide program managers and policy officials the tools they need to manage Federal resources effectively.

FISCAL YEAR 1998 BUDGET REQUEST

To continue our efforts to address the financial management needs of USDA, and to complete implementation of the CFO Act, we are requesting a budget of \$4,718,000. This is an increase of \$435,000 over our fiscal year 1997 current estimate and consists of an increase of \$60,000 for pay costs and an increase of \$375,000 to build upon the financial management efforts currently underway. We plan to focus the additional resources on activities relating to reviewing, approving and managing the Department's financial management systems design and en-

PART 1

1180

hancement projects, overseeing the development and maintenance of the integrated central accounting system, developing an integrated accounting and budget reporting system, establishing a biennial review of all fees, royalties, rents, and other charges by USDA, reviewing the financial execution of the USDA agencies' budget, developing a simplified financial management budget for USDA, and implementing a Departmentwide financial management training program.

WORKING CAPITAL FUND

Mr. Chairman, I would like to provide an overview of our activities and plans for our Departmental Working Capital Fund for fiscal year 1998.

One of the important ways we reduce administrative and financial costs in the Department is by pooling resources to develop and operate central services. We do this through our Working Capital Fund, or WCF. The WCF provides 22 centralized services, ranging from the National Finance Center to central copying services. The OCFO manages the largest of the central services, the National Finance Center and provides financial oversight of the entire fund. I share with other managers of WCF activities the responsibility for ensuring that all WCF activities are managed in the most cost-effective manner possible.

The activities of our WCF provide services that your constituents, as users of our agricultural programs, never see. But without those services, the program agencies could not be as effective as they are. Since WCF services are not provided to the public directly, we have to be especially careful about our costs so that the programs that your constituents use can devote more resources to providing service and less to overhead. We have done an excellent job of keeping those costs down over the years through our WCF. For example, the National Information Technology Center, which provides computer services, will see prices for its service cut by a third from 1996 to 1998, from 51 cents per minute of use to 34 cents. We will see the costs to store standard forms in our warehousing facility cut by almost a fourth over the same period. Procurement actions processed on our automated contract system will be cut by almost 10 percent. When we cut costs for administrative services, program agencies have more resources available to assist your constituents.

Another important way we reduce administrative costs to our agricultural program agencies is by making our administrative services available to other Federal agencies, or cross-servicing. In so doing we can reduce unit costs by spreading our fixed costs of operations over a larger group of users. For over 10 years, we have enjoyed success in bringing other agencies into our systems and reaping the benefits in terms of lower unit costs to all of our users. For example, in 1989, when we began tracking unit costs by individual service, the average cost of payrolling an employee through the payroll/personnel system at our National Finance Center was about \$102 per employee. If you just added inflation to that cost from year-to-year, the cost to payroll an employee would be about \$134 per employee by 1998. In our 1998 budget, we expect to be able to do this for about \$104. This is more than 20 percent less than what we would expect to pay, given inflation.

The Congress has asked us to do more to make our services at the National Finance Center available to other Federal departments. I would like to bring you up to date on what we have been doing. In 1996, we began servicing the Federal Mediation and Conciliation Service and the Office of Congressional Compliance. We are scheduled to bring another four agencies into the National Finance Center over the next two years: the U.S. Capitol Police, the U.S. Architectural and Transportation Barriers Compliance Board, the Federal Housing Finance Board, and the Federal Elections Commission. We are pursuing several other potential clients for our payroll systems as well as other administrative payment systems.

We are also pursuing a number of marketing strategies to make our services more visible and appealing to potential users. For example, we held an "NFC Payroll/Personnel EXPO" here in Washington last October and participated in an information processing interagency conference in Austin, Texas, in December. We are scheduled to participate in at least four more conferences this fiscal year, allowing us to market the full range of NFC services to a wide audience. We are initiating use of the Internet for marketing of services and will be taking advantage of these and other opportunities to give our systems and services greater visibility over the next several months.

Other WCF activities are making use of "cross-servicing" agreements with other Federal agencies to reduce costs as well. As examples, the National Information Technology Center will be expanding its services to the General Services Administration over the next two years and the Consolidated Forms and Publications Distribution Center will expand its cross-servicing activity. The increased income will go a long way toward enabling these centers to reduce unit costs.

PART 1

1181

Making our services attractive to customers requires continuous attention to and improvement of our systems. We are proceeding with several important initiatives to achieve these improvements. For example, we are in the process of modernizing our payroll/personnel system at the National Finance Center to take advantage of relational data base management systems. This will make new tools available for reporting and decision-support processing, and it will enable us to use client/server technologies that will combine the power and flexibility of work stations with centralized storage, backup, and recovery capabilities of our mainframe computers. Making the best use of existing technologies in the context of emerging processes and software applications is one way we can do more with less and make the services we offer more cost-efficient.

This year, our National Finance Center also will improve the system of paying the more than 26,000 telephone bills we receive each month through the use of electronic data interchange—EDI—technology. EDI technology will enable us to streamline processes, eliminating mail time and manual processing of documents. Over the next several years, we will be employing an Electronic Output Strategy to align changing business demands with emerging output technologies to reduce operating media costs, minimize duplication, and strengthen controls.

Another important ingredient in keeping our services state-of-the-art is keeping abreast of changes in technology and business processes. All of our activities are exploring investments in technologies and processes that will make the services we provide more efficient. To cite just one example, the Modernization of Administrative Processes—MAP—program completed work on making effective use of purchase cards for small purchases. We expect that customer agencies will be able to save up to \$15 per transaction and up to \$45 million in cost avoidances.

Given our reliance on technology to provide a variety of administrative and financial services, we must take special care to ensure a seamless transition to the year 2000. The National Finance Center is pursuing a “Year 2000 Ready” strategy to prevent any disruption caused by 2-digit-year dates. “Year 2000 Ready” means that date fields in all NFC products, programs, files, databases, and processes are systematically changed to accommodate the year 2000. This involves approximately 26,000 programs totaling over 22 million lines of code. NFC has had a plan in place for over a year to deal with this transition and is now on target for completing the plan.

What is particularly important to note here is that I do not come here asking for more money from the Congress for our WCF. The dollar figures provide our best estimate of what it is going to cost to provide the services that our customers demand, both USDA agencies and our non-USDA customers. We are entirely reimbursable; we recover all WCF operating costs through the rates charged for goods and services. We do not use appropriations to subsidize any of our activities. In that respect, the WCF and the services it supports operate very much as business enterprises.

We do, however, have a special obligation to USDA agencies as customers of our services. It is important that they participate in the oversight of our activities and financial management of the WCF. That is why last year we restructured the way we oversee the WCF and its activities. We created a WCF Executive Committee, made up of senior financial and administrative managers from our agencies to provide advice and counsel on financial management of the WCF. We also created a “working group” to provide detailed analysis of finances and operations from an agency perspective. Working with the WCF Controller and Departmental offices, we have a unique oversight process that ensures the effectiveness of the WCF. The cost estimates provided to you in our budget submission are the result of this cooperative oversight process—customers, service providers, and financial managers working together. The WCF is, in my opinion, one of the real success stories in financial management in USDA.

I have tried to give you a general idea of the reason we have a working capital fund and the benefits it can and does provide to the customers of the services it finances. The performance of our WCF and the plans for its activities in 1998 clearly show that customers, working together cooperatively with service providers, can save money and do things more efficiently, thereby freeing up resources to deliver services to your constituents.

I would be happy to answer any questions you might have.

PART 1

1182

OFFICE OF THE CHIEF INFORMATION OFFICER

PREPARED STATEMENT OF ANNE F. THOMSON REED, ACTING CHIEF INFORMATION OFFICER

Mr. Chairman and members of the Subcommittee, good afternoon. I am pleased to present the fiscal year 1998 budget request for the Office of the Chief Information Officer—OCIO, U.S. Department of Agriculture—USDA.

THE OCIO ORGANIZATION

USDA established the OCIO in August 1996 to meet the requirements of the Information Technology Management Reform Act of 1996, and its successor, the Clinger-Cohen Act of 1996. All functions and personnel from Departmental Administration, Policy Analysis, and Coordination Center-Information Resources Management—PACC-IRM—were reassigned to OCIO. Subsequently, the Deputy Secretary has approved the consolidation of all Department-level information resources management functions under the Chief Information Officer—CIO.

OCIO provides Departmentwide policy guidance, leadership, coordination, and oversight of USDA information management and information technology investment activities to support USDA program delivery. My office provides long-range planning guidance, implements measures to ensure that technology investments are economical and effective, coordinates interagency Information Resources Management—IRM—projects, and implements standards to promote information exchange and technical interoperability.

I am honored to serve as the Acting Chief Information Officer for USDA, and during the past six months, I have set in motion a decisive course of action to address the issues, challenges, and new requirements that USDA faces in the information technology—IT—arena. Many of these issues and requirements are not unique to USDA but affect the Federal IT community as a whole. USDA senior officials recognize that some of our information technology activities in the past have raised concerns in the Congress, the General Accounting Office—GAO, the Office of Management and Budget—OMB, our own Inspector General, and the General Services Administration. I am here to assure you that OCIO has taken constructive steps to address these concerns. My mission is to provide effective leadership in the field of information technology and information management throughout the Department. OCIO has moved forward aggressively to further our goals and to accelerate the progress of activities currently underway. While much remains to be done, I would like to share some of our activities and accomplishments with you.

STRATEGIC PLAN

In accordance with Government Performance and Results Act guidelines, the OCIO initiated the development of a strategic IRM plan for the Department during the fall of 1996. Through this process, we identify a vision and set a course for the future. The identification of core business processes arising from strategic planning establishes a framework for modernization of operations. Survival of every organization depends upon its ability to modernize and continuously improve operations, deliver programs, and meet customer requirements. As USDA embarks upon the modernization of its program delivery structures, the efficient collection, management and dissemination of information is increasingly important. To meet information management demands, the approach of the USDA draft IRM Strategic Plan is threefold: first, invest in the planning process and ensure that technology selection and deployment are based on business needs; next, invest in the infrastructure to improve service delivery through more effective information systems and data management; and, finally, invest in human resources by implementing a professional development strategy to ensure that skills necessary to meet the challenges of delivering programs through information technology are available.

IMPROVED ACCOUNTABILITY OVER INFORMATION TECHNOLOGY

In the summer of 1995, the Secretary launched a major initiative to look at how we could improve and modernize our approach to information resources management in support of program delivery. The result was the USDA IRM Modernization Plan. The two highest priorities of the IRM Modernization Plan are to ensure senior policy-level accountability for IT investments and priorities and to establish an information technology architecture. To improve our decision-making process, we established two boards, one, the Executive Information Technology Investment Review Board—EITIRB, consisting of Subcabinet officials from each mission area and the other comprised of senior IRM officials from each mission area. The passage of the

PART 1

1183

Clinger-Cohen Act of 1996 only served to intensify efforts we already had underway. The EITIRB is chaired by Deputy Secretary Rominger; I serve as the vice-chair. Membership includes mission-area Under and Assistant Secretaries and other senior management officials. The primary purpose of this Board is to make strategic investment decisions that will leverage our limited budgetary and personnel resources to meet our program objectives. The EITIRB will not only select the new investments but will also monitor and evaluate all technology investments to ensure that they deliver as promised. A number of factors, including greater recognition of the need to align business needs with information technology capabilities, OMB requirements, and Congressional interest, have contributed to a need for monthly meetings of the Board since the first of the year. Originally scheduled to meet quarterly, the Deputy Secretary has pledged to meet as often as necessary to address IT priorities and ensure that the right decisions are made to provide cost effective IT support for program delivery throughout the Department.

The second board, the IRM Council Board, composed of senior IRM managers from each mission area, provides guidance to me on technical issues. In addition, this Board provides assistance in the areas of technical analysis and the planning, implementation, and monitoring of projects affecting multiple USDA agencies.

Operating from different perspectives for meeting program delivery goals, these boards bring a much needed balance to decision-making that was absent previously. As a result, both have provided valuable input and recommendations on key Departmental decisions that have been made during the past six months, particularly those relating to development of the information architecture and instituting of the moratorium on IT acquisitions.

We plan to use this new decision-making process to ensure compliance with the IT architecture and the best value for USDA as we implement the decisions for 1998, and as we make decisions for fiscal year 1999. Our USDA fiscal year 1998 budget request for information technology is about \$1.2 billion, which includes the Department and all the agencies. Included in the \$1.2 billion are approximately \$234 million for acquisitions including equipment and software, \$253 million for commercial support services including operations and maintenance, \$474 million for intra-governmental payments including grants to the States and FTS 2000 services, \$326 million in personnel costs, and \$60 million in other services including non-FTS 2000 voice and data communications. Offsetting these costs are collections from non-USDA agencies of approximately \$179 million. Included in the acquisitions and commercial support services requests are several notable ongoing investments which agencies are planning for fiscal year 1998. The Food Safety Inspection Service is asking for \$8.5 million in fiscal year 1998 for Field Automation and Information Management to continue to modernize the way it inspects meat, poultry, and egg products using technology. The Animal and Plant Health Inspection Service—APHIS—is asking for \$4 million in fiscal year 1998 for the Integrated Systems Acquisition Project to continue to upgrade its existing technology infrastructure. This expenditure will support the APHIS mission of ensuring the health and care of animals and plants and improving agricultural productivity and competitiveness. Included in the intra-governmental payments are \$241 million in grants to the States that the Food and Consumer Service plans to spend for information technology in support of the Food Stamp Program and Special Supplemental Nutrition Program for Women, Infants, and Children, as well as \$54 million to implement Electronic Benefit Transfer in the States. These are selected examples of how USDA is improving its program delivery capabilities with technology.

INFORMATION TECHNOLOGY ARCHITECTURE

The second priority identified by the IRM Modernization Plan and one of the key responsibilities of the CIO defined in the Clinger-Cohen Act is the development and maintenance of an integrated information technology architecture for USDA. An architecture seeks to provide a blueprint or a common framework for Information Technology investments, including standards and operating policies that will assure that information can be shared more effectively among our agencies and customers. At this point, the USDA architecture is a high level document which establishes an umbrella beneath which we now need to fill in the pieces. It has three parts—the business/data architecture, the technical standards, and the telecommunications architecture. It is important to realize that because of changing business and legislative requirements, an IT architecture can never be considered complete—it is an evolving effort. The architecture reflects the Department's ongoing effort to develop a more effective process for making technology investment decisions that support USDA business needs. While we recognize that much work remains and plans are

PART 1

1184

underway to implement the architecture and to continue the work necessary to refine it, I take great pride in what has been accomplished to date.

INFORMATION TECHNOLOGY MORATORIUM

In November 1996, Deputy Secretary Rominger instituted a moratorium on significant information technology acquisitions and certain telecommunications equipment acquisitions until the architecture is developed. Without a common architecture, our information technology activities in USDA would remain fragmented, and the risk of implementing additional stovepipe systems in our key business areas would be great. A temporary pause to step back, develop and apply consistent standards which enhance program delivery to every information technology investment is a good use of time, and ensures better use of scarce dollars. This action has constrained spending while we bring the architecture development together and has brought a higher level of focus on technology issues at the Subcabinet and Agency Head levels. A waiver process was instituted to avoid unacceptable disruption to the delivery of mission-critical programs. As of March 7, 1997, 18 waivers have been granted. Many were for required telecommunications lines, but others supported program missions such as laptop computers for Food Safety and Inspection Service inspectors. Overall, USDA agencies have supported the intent of the moratorium by limiting requests for acquisitions of new information technology and focusing resources on completing the architecture. Recently, the Deputy Secretary, at the recommendation of the EITIRB, decided to extend the moratorium to allow senior management to review and understand the new architecture. OCIO is using this time to meet with each mission area to facilitate the architecture education process and validate core business processes. During this time, OCIO is continuing efforts to refine a process for managing IT activities differently in the post-moratorium environment based on capital planning principles defined by the Clinger-Cohen Act and further defined by OMB in what has come to be known as the "Raines' Rules." These rules refer to OMB Director Franklin Raines' focus on ensuring that Federal agencies are doing the right things.

YEAR 2000

Another challenge facing all of us in the IT community is the Year 2000 date change to ensure that hardware, software, and IT applications systems are certified Year 2000 compliant prior to the turn of the century. There is potential for tremendous impact to the delivery of USDA programs. USDA has been working to prepare for this possible disruption through an integrated, coordinated strategy based on the Year 2000 Interagency Committee's 5-phased approach: awareness, assessment, renovation, validation, and implementation. Most agencies within USDA are in the assessment phase, with a few agencies in varying stages of renovation, validation, and implementation. The National Finance Center, the National Information Technology Center, and the Food and Consumer Service are examples of USDA organizations that have moved into the advanced phases. A Year 2000 Working Group has been established to exchange information across the Department, with particular focus on the sharing of lessons learned, the development of an applications systems inventory, and the establishment of contract services within USDA. In partnership with the Department of Energy, USDA sponsored a Year 2000 Exposition to increase awareness of Year 2000 issues and requirements across the Department. Because of the high visibility of the Year 2000 Project, USDA has responded to a series of requests from the Congress, OMB, and GAO, which have required agencies to develop inventories and cost projections and to stay focused on planning functions for this complex undertaking. These cost projections have been included in the fiscal year 1998 President's Budget. Approximately \$35 million will be spent in fiscal year 1998. At the current time, the total investment planned for Year 2000 related projects is approximately \$100 million.

TELECOMMUNICATIONS

USDA is also working to establish a telecommunications environment that is optimized for maximum benefit and cost to the Department as a whole. With the telecommunications architecture as a guide, the existing Departmental and agency networks will evolve to become the USDA Enterprise Network, a completely integrated and efficient telecommunications utility. The Enterprise Network is the set of modern telecommunications resources needed to meet, in the most cost-effective manner possible, the current and future needs of USDA customers, personnel, and business processes.

The Telecommunications Services Redesign Project was initiated as a result of recognition of problems in USDA telecommunications processes. This project was

PART 1

1185

chartered to conduct business process reengineering—BPR—of the administrative processes USDA uses to plan, procure, manage, and pay for telecommunications services and equipment. The BPR aims to achieve dramatic mission performance gains from customer and stakeholder perspectives. An interim report which defined the “As-Is” model, or current processes, was issued on November 15, 1996. The “To-Be” definition phase is underway and should be completed shortly. Rapid implementation of the “To-Be” model offers USDA significant savings opportunities in telecommunications administrative management activities.

We have worked closely with other Federal agencies on Governmentwide telecommunications initiatives. A recent example is a cooperative effort with the Department of Interior on its Alaska Regional Telecommunications Network—ARTNet. ARTNet is the first collaborative project in Alaska to address Federal agency requirements for developing a high speed network infrastructure that connects the Federal business centers of Anchorage, Juneau, and Fairbanks with the lower 48 States. I am pleased to announce that two USDA employees were members of the interagency team that received the National Performance Review Golden Hammer Award as a result of this effort.

Additional work must be done, but the telecommunications arena is one that will provide significant savings and efficiencies in the future. We are currently working to implement management controls, particularly in the areas of telecommunications planning and ordering, to derive immediate cost savings.

Over the coming months, new challenges await as we move forward to reassemble Departmentwide IT functions under the OCIO and continue to address the requirements of the Clinger-Cohen Act.

OFFICE OF THE CHIEF INFORMATION OFFICER BUDGET REQUEST

The fiscal year 1998 Office of the Chief Information Officer budget request totals \$4,828,000, an increase of \$330,000 over the adjusted fiscal year 1997 level of \$4,498,000. Of the increase, \$55,000 is to partially fund pay cost increases to maintain current services. The additional \$275,000 is required to fund my immediate office. This request will allow me to have a small immediate staff to enhance our leadership and coordination capabilities.

This concludes my statement, Mr. Chairman. I am happy to answer any of your or the Committee members' questions.

QUESTIONS SUBMITTED BY SENATOR COCHRAN

USDA'S IRM BUDGET

Question. For the last couple of years USDA's IRM budget exceeded \$1 billion. What does USDA plan to spend in fiscal years 1997 and 1998 for IRM activities, and how much will come from appropriated funds and how much will come from CCC funds?

Answer. In fiscal year 1997 the Department expects to spend just under \$1.2 billion for IRM activities. Of this total, about \$110 million is from CCC. In fiscal year 1998 we plan to spend just over \$1.2 billion for IRM activities, of which \$106 million is from CCC funding.

Question. What did USDA spend in fiscal year 1996 on IRM activities, and how much came from appropriated funds and how much came from CCC funds?

Answer. In fiscal year 1996, \$1.08 billion was spent for IRM activities, of which \$930 million was appropriated funding and \$150 million was CCC funding.

MORATORIUM

Question. We understand that USDA placed a Moratorium on significant information technology investments in November 1996 and continues to have a moratorium in place. How long does USDA expect to have the moratorium in place and what specifically must occur for the Department to lift the moratorium?

Answer. The moratorium on Information Technology—IT—acquisitions will remain in place until the USDA's information architecture elements are in place and USDA has established a solution to rectify IT management problems. Secretary Glickman has recently extended the moratorium and has requested a plan for achieving reform of IT management at USDA.

Question. With only six months remaining in fiscal year 1997, what impact will the moratorium have on USDA's IRM expenditure plan for fiscal years 1997 and 1998?

Answer. USDA's IRM expenditure plans for fiscal years 1997 and 1998 will be delayed due to the continuance of the moratorium.

PART 1

1186

Question. What waivers were requested under the moratorium, which waivers were approved and why, and which waivers were denied and why?

Answer. The attached table identifies the waivers requested, approved and denied during the moratorium. The waivers which were approved were determined to meet a mission-critical program need, represented a more cost effective solution by sharing services and were compliant with the direction that USDA's information architecture elements were developing. Several waivers were denied because resources could be shared and/or optimized providing a more cost effective solution.

[The information follows:]

U.S. DEPARTMENT OF AGRICULTURE IT ACQUISITION MORATORIUM WAIVER REQUESTS

[As of June 2, 1997]

Agency	System name	Requested cost	Date received	Date out	Action
MASS	Dedicated T1 telephone line to California state office for farm labor statistics	\$200 per month	12/04/96	12/10/96	Approved.
GIPSA	Atlanta Regional office move—frame relay service request	\$1,000	12/13/96	12/26/96	Disapproved—existing services available.
NRCS	Field Office Computing System (FOCS) servers for field offices	\$5,000,000	12/16/96	12/30/96	Returned—incomplete information.
MASS	T1 telephone line from Census to Washington, DC, headquarters LAN	\$613 per month	12/23/96	1/8/97	Approved.
FSA	T1 line and cable for Dedicated Loan Origination and Servicing System in St. Louis	\$1,275 plus \$2,190 per month	12/26/96	12/31/96	Approved.
00	USDA Network Analysis	\$344,639	12/27/96	1/14/97	Approved.
FSIS	Field Automation and Information Management (FAIM)—inspector PC's and laptops	\$1,300,000	1/07/97	1/24/97	Approved.
FS	Telecommunications services and equipment for Custer National Forest, Billings, Montana.	\$68,337	1/9/97	1/24/97	4 of 6 parts approved; FS must justify not sharing with other agencies for the other two parts.
FS	Various telecommunications services for FS office moves in fiscal years 1997 and 1998 and temporary Emergency Situations (fire, earthquake, etc.).	\$74,300	1/9/97	1/17/97	5 approved; 5 denied for lack of information on sharing; 46 returned for additional justification and technical information.
AMS	AMS/Washington Service Center LAN Systems Segmentation—19 Ethernet switches	\$132,503	1/13/97	1/27/97	Approved.
APHIS	Automated Cargo System—PC's, servers, laptops, software, and telecom services for Miami, Los Angeles, and Houston to interface with U.S. Customs automated systems.	\$2,350,000	1/13/97	1/29/97	Approved with mandate for sharing telecom in certain locations.
APHIS	Integrated Systems Acquisition Project (ISAP)—PC's, servers, laptops, software, and telecom services for Ames, IA and Ft. Collins, CO.	\$2,092,399	1/13/97	1/29/97	Approved with mandate for sharing telecom in certain locations.
NRCS	Hardware and Software for Administrative Management Reengineering Test Lab	\$860,000	1/23/97	1/29/97	Returned for resubmission thru RD and FFAS Under Secretaries.
00	Resubmitted 2/12/97		2/12/97	3/7/97	Limited approval.
RD	Computer Associates Software Maintenance for NITC, Kansas City, WA.	\$19,675,000 over 5 yrs.	1/27/97	2/10/97	Returned—exempt from moratorium.
RD	Move current T1 telecommunications circuit from current state office to Olympia, WA.	\$2,000 installation	1/30/97	2/20/97	Disapproved—telecom services available at site.
RD	Telecommunications circuit between NITC-KC and Tax Service Data Center in Dallas, TX for DLDS.	\$599/month and \$1,600 installation.	2/5/97	2/25/97	Approved.
FCS	Frame Relay telecommunications services connecting headquarters, Regional Offices, and some field offices.	\$145,000 per year	2/7/97	3/4/97	Approved with mandate for sharing telecommunications.
OCFO	Direct Access Storage Devices for NFC, New Orleans, LA	\$1,200,000	2/13/97	3/3/97	Approved.
FCS	Dedicated Transmission Service—Atlanta Regional Office move processing fee.	\$341/month and \$825	2/13/97	2/25/97	Approved.
OCFO	Computer Associates Software Maintenance Contract for NFC, New Orleans, LA	\$24,000,000 for 10 yrs	2/13/97	2/25/97	Returned—exempt from moratorium.

U.S. DEPARTMENT OF AGRICULTURE IT ACQUISITION MORATORIUM WAIVER REQUESTS—Continued
[As of June 2, 1997]

Agency	System name	Requested cost	Date received	Date out	Action
FSA	Local T1 primary rate interface telecommunications line between CCC computing center and local Bell Atlantic for dial-in access to FSA's Novell network.	\$450/month and \$1,400 in-stallation.	2/18/97	3/11/97	Denied—implements an agency-specific, non-shared telecom solution.
00	NITC to purchase hardware, software and support services for potential contract with FAA's ICE-MAN workload.	\$19,920,000 only if win FAA bid.	2/18/97	3/21/97	Approved.
00	Redundant Arrays of Independent Disks (RAID) for NITC, Kansas City	\$1,500,000	2/18/97	3/3/97	Approved.
RMA	Modification of Revenue Assurance System for the Risk Management Agency	\$900,000	2/18/97	2/27/97	Approved.
NRCS	National Resources Inventory—550 personal digital assistants for collecting NRI data.	\$550,000	2/19/97	3/6/97	Approved.
NRCS	Local T1 telecommunications circuit from Natural Resources Council of America in Rosslyn, VA, to Washington, DC LAN.	\$375/month and \$1,500 in-stallation.	2/26/97	3/11/97	Approved.
FS	Telecommunications services at eight FS sites that are moving in next couple of months.	\$1,400/month and \$45,716 one-time cost.	2/25/97	3/13/97	6 Approved and 2 denied until share services with other agencies.
FSA	T1 telecommunications circuit to upgrade existing 56kb line at Kansas City	\$236/month and \$534 in-stallation.	3/4/97	3/11/97	Approved.
OCFO	Five T1 primary rate interface telecommunications circuits for Thrift Savings Plan access.	\$1,675/month and \$11,080 in-stallation.	3/5/97	3/17/97	Approved.
RD	Two large-scale routers for DLDS in NITC-KC	\$350,000	3/10/97	3/26/97	Approved.
FS	Reduce packet switched band width at Union, SC	Save \$79/month	3/13/97	3/24/97	Approved.
SCIT	Equipment to set up one phone number for SCIT service centers	\$917,500	3/5/97	3/21/97	Approved.
RD	Router networking boards for DLDS in St Louis	\$21,000	3/17/97	3/26/97	Approved.
NAD	National Appeals Division in Memphis, Indianapolis, and Denver—routers, ISDN lines, and 56KB circuit to GIPSA offices for sharing.	\$22,785 plus \$314/month	3/18/97	4/3/97	Approved conditional upon sharing with other USDA agencies at site and OCIO approving functional diagrams for need of routers for NAD.
FS	Telecomm equipment and circuits for relocation of four offices	\$600/month and \$14,175 one-time cost.	3/31/97	4/7/97 & 4/11/97	Approved.
FS	Voice grade circuit for radio comm. for Francis Marion and Sumter National Forests in South Carolina.	\$451/month and \$850 in-stallation.	3/31/97	4/14/97	Approved.
DA	Two hubs for Civil Rights Implementation Team's new location	\$2,752	4/3/97	4/3/97	Approved.
FS	PBX Switch replacement for one destroyed by lightning in Mark Twain NF, Rolla, MO.	\$1,000	4/4/97	4/4/97	Emergency approval with paperwork to follow.
OCIO	T1 circuit to upgrade existing frame relay between Kansas City and Washington, DC	\$3,245/month and \$1,781 in-stallation.	4/4/97	4/16/97	Approved.
FS	Project 615	\$81,000,000	4/3/97	5/1/97	Approved.

PART 1

1189

Agency	Description	Amount	Start Date	End Date	Status	Notes
SCIT	Replace X.25 service with frame relay in five Kentucky counties	Savings of \$3,500 per month.	4/3/97		Returned for more info and Under&Asst. Sec. approval.	
FCS	Resubmitted 5/12/97		5/12/97			
FS	SIARS software development	\$350,000	4/11/97	4/29/97	Approved.	
RD	Emergency PBX replacement for Teton Basin Ranger District, Driggs, ID	\$10,000	4/14/97	4/14/97	Approved—paperwork to be submitted.	
FSA	Wetumpka, AL, Service Center move of 56KB circuit	\$2,000 installation	4/22/97	4/29/97	Approved.	
	Document Management Imaging System and temporary T1 to contractor's site	\$260,000 for support svcs. and \$6,000 for T1 install and usage.	4/15/97		Returned for more information and proper signatures.	
DA	Hub and T1 line for CRT in L'Enfant, Washington, DC	\$5,904 one-time cost and \$458/month.	4/22/97	4/22/97	Approved.	
ARS	Emergency telecommunications equipment replacement in Grand Forks, SD due to flooding.		4/22/97	4/22/97	Approved w/paperwork to follow.	
ARS	Replace old PBX in Ft. Lauderdale, FL	\$21,000	4/23/97	5/2/97	Approved.	
RMA	Support of reengineered systems development	\$2.5 million	4/28/97		In process.	
FCS	Special Nutrition Pgms. and Food Stamp Pgm. Integrated Information Systems software development and enhancement.	\$375,000	4/28/97	5/15/97	Approved.	
OCFO	Upgrade of mainframe computing capacity	\$4 million	4/28/97	5/19/97	Approved.	
FS	New phone system for Tofte Ranger District, Superior National Forest	\$14,400 one-time cost	5/8/97	5/16/97	Approved.	
FS	New PBX and circuits for relocation of Shawnee National Forest office	\$30,125 one time; \$1,800 per month.	5/8/97	5/27/97	Approved if consolidated.	
FS	Telecom equipment, circuits and services for Willamette National Forest	\$7,627 one-time cost and \$743/month.	5/8/97	5/16/97	Approved.	
FS	Telecom services for Great Lakes Assessment NPR Project at 3 FS offices	\$1,600 one time; \$1,100 per month saving.	5/8/97	5/16/97	Approved.	
APHIS	Telecom equipment and services to connect international offices to the State Dept. WAN.	\$10,000 one time; \$2,400 per month.	5/8/97	5/28/97	Approved.	
OCFO	Support services-programming for Thrift Savings Plan	\$350,000	5/8/97		In process.	
NRCS	Relocate telecom services for Auburn, AL, state office relocation	\$2,000	5/12/97	5/15/97	Approved.	
CSREES	Router—WSC	\$3,800	5/15/97	5/30/97	Approved.	
FS	Switched Video Transmission at SW Regional Office, Albuquerque	\$22,000	5/15/97	5/30/97	Approved.	
FS	Replace PBX—Willamette NF	\$22,000	5/15/97	5/28/97	Approved.	
FS	New Data Line—Tahoe NF	\$1,192 one-time cost and \$118/month.	5/15/97	5/28/97	Approved.	
FS	Move data line—Toccoa RD	\$7,000	5/15/97	5/30/97	Approved.	
NRCS	7 Soils Digitizing Offices	\$1.2 million	5/15/97		Returned for proper approvals and more information.	
GIFSA	Router and Ethernet Switch	\$9,300 one-time cost	5/19/97	5/27/97	Approved.	
NRCS	Servers, PC's, laptops, printers and X-terminals for meeting 1996 Farm Bill, Emergency Watershed Pgm., and maintenance (\$7.7 million).	\$7.7 million	5/19/97		Being returned for proper approvals and more information.

INFOSHARE

Question. We appropriated \$7.5 million to the Secretary in fiscal year 1996 specifically for the InfoShare program. Provide a breakout of how much of the \$7.5 million has been spent to date, and what specifically was accomplished with these expenditures.

Answer. I will provide the information for the record.
[The information follows:]

InfoShare / service center implementation obligations to date

[Dollars in thousands]

<i>Project</i>	<i>Obligations</i>
InfoShare Transition	\$495
Kentucky Pilot	438
Telecommunications	500
BPR/BPI	1,300
Change Management/Customer Service	2,850
Service Center Implementation Project Management	330
Departmental Administration/Chief Information Officer Oversight	150
Total Obligations	6,063

The \$6.063 million obligated to date were designated by the National FAC to undertake change management, business process reengineering/improvement and shared data management activities. These activities define both how we will work in the future and the technology which will enable effective implementation of re-engineered/improved processes in support of quality customer service.

Business Process Reengineering/Improvement.—A BPR Management Review Board (MRB) has been established consisting of the NFAC Executive Officer, partner agency Deputy Administrators for Programs and Management, and Project Executive Sponsors. The Chief Information Officer, Chief Financial Officer and Director of the MAP Program Office serve as advisors to provide Departmental coordination and oversight. The MRB serves an advisory and assistance role, to assist in dispute resolution and to ensure that adequate resources are available to complete the projects. Each BPR Project is headed by an Executive Sponsor, responsible for assisting teams in project development and oversight, and a Team Leader responsible for ensuring that the team follows the applicable problem solving techniques. BPR Teams are facilitated by a contractor with proven expertise in BPR methodology. The teams consist of headquarters and field personnel representing the partner agencies.

The BPR process is overseen on a broader policy level by the Deputy Secretary and the Under Secretaries.

Thirteen areas have been identified as targets for BPR because of the potential for significant savings. Four of the BPRs—Customer Interface, Customer Service—Program Delivery, Geospatial Information Services, and Administrative Management—will be completed by September 1, 1997. A BPR framework has been established that will allow the Service Center Implementation Team—SCIT—to build on the successes of the first four projects. Recommendations from the first four BPR projects will be tested and deployed to the field in 1998. Follow-on BPR's will begin in the September, 1997 timeframe. The second phase of BPR's will build on the first phase and build on integrated customer interface and program delivery.

Shared Data Management Initiatives.—Shared data management provides the foundation layer for reengineered/improved processes which can be utilized across agency/mission lines. The Service Center Data Sharing Team is building on earlier work to develop departmental data element standards and is piloting a shared data repository. Full implementation of this project depends on future funding levels.

Change Management.—The training approved by the National FAC "USDA Service Center Skills: Working Together for Customers" provides Service Center employees the skills to deal with organizational changes as well as the skills to deal with such issues as downsizing, relocation, and reassignment of duties. It also brings employees together to address how they will work together as a team to better serve rural America and gives practical steps to providing extraordinary customer service. Employees in all 50 states, Puerto Rico and the Pacific Basin have been trained to facilitate this program. Approximately 2000 service center employees have already received this training. All service center employees will be trained by December 1998.

Additional Customer Service Listening.—To ensure that USDA Service Centers serve customers, USDA has asked customers about their experiences, opinions and

PART 1

1192

needs. In order to reengineer business processes we needed to know what customers value in service delivery. Two systematic methods were implemented to obtain this information—focus groups and surveys. A prototype customer complaint and feedback process has been developed based on customer opinions and recommendations acquired in focus group interviews and surveys. The prototype is consistent with the guidelines of the National Performance Review team as presented in their March 1996 report “Serving the American Public: Best Practices in Resolving Customer Complaints”.

In addition, a service center implementation plan has been developed. The four goals: One Stop Service, Quality Customer Service, Cost Reduction, and Partnership are driven by a desire to satisfy customer needs and Department fiscal necessities. Customers have been surveyed to determine their needs and the extent to which they are satisfied. These needs have been translated into business drivers which are the catalyst of the BPR recommendations. The primary measures being tracked in the “AS IS” and “TO BE” business processes are quality, cost and service. The strategic plan is being updated to reflect changes made in the Departmental and Agency strategic plans. The revised strategic plan will link service centers goals, objective, and performance measures to those of the farm service agencies and the Department. The BPR objectives and resulting recommendations are being driven by the current organizational goals and objectives. It is the intent of management to measure the results of the BPR recommendations in testing and post deployment against the service center, agency, and departmental goals. This performance driven approach is being refined as we get better at quantifying success.

The current plan includes additional focus groups to pilot and evaluate the customer complaint and resolution process but it does not include any follow-on actions. Our progress depends on future funding levels.

Union and Partner Relationships.—An integral part of any change management program and foundation for ultimate success of implementing reengineered processes is having an open and trusting relationship with the unions and employee associations. Without their understanding and support, implementing change is almost impossible and the dramatic results planned often fall short of expectations. Without additional funding, this critical relationship and the ultimate success of our change effort may be negatively affected.

Kentucky Project.—This program provides a test bed of uniformly equipped computer integrated USDA County offices using client/server technology to enable offices representing multiple agencies to share data and information, and communicate with each other. SCIT funding started this pilot project by covering the initial equipment acquisition and installation, and telecommunications costs. Although the pilot program was turned over to the Kentucky State Food and Agriculture Council in fiscal year 1997, this program will continue operations under a coordinated plan developed by the partner agencies to utilize it as a test bed for new applications resulting from BPR/BPI projects. The pilot program will be continued until replaced by the common computing platform which will be deployed in fiscal year 1998. BPR outcomes will define the ultimate platform which will be deployed for the use in USDA Service Centers. Until that time, this test bed will be used as a learning and testing laboratory.

Telecommunications.—Our geographically diverse field service structure requires a robust and cost effective telecommunications system to deliver service to our program recipients. As this is a need common to other USDA agencies, we invested \$500,000 for a proportional share of the Department’s contract effort to develop and deploy a USDA Enterprise Network. This contract vehicle provides specialized expertise and services for development of deliverables in support of USDA’s Enterprise Network architecture. The final report will be completed by the beginning of fiscal year 1998.

Question. How much of these funds have not been spent as of this date hearing?

Answer. To date, about \$1.4 million of these funds remain unobligated.

Question. Provide a breakout of how the Department plans to spend any funds that still remain unobligated and what will be accomplished with these expenditures?

Answer. I will provide a table describing our plans for the remaining balance.

[The information follows:]

Service center implementation projected obligations

[Dollars in Thousands]

<i>Project</i>	<i>Obligations</i>
BPR/BPI	\$168
Change Management/Customer Service	567

PART 1

1193

<i>Project</i>	<i>Obligations</i>
Service Center Implementation Project Management	51
Future Oversight Needs	651
Total Projected Obligations	1,437

REENGINEERING BUSINESS PROCESSES

Question. This Committee two years ago provided several expectations relating to reengineering business practices, addressing other oversight concerns, and implementing a Departmentwide information systems technology architecture. Each of these were to be completed prior to USDA acquiring new technology. Some of these expectations are now requirements under the Clinger-Cohen Act. What progress has USDA made to reengineer business processes, which is now required under Clinger-Cohen, and what specific timeframes and milestones exist for completing this very important effort?

Answer. We have been successful in revising work processes in several areas prior to investing in technology. Examples include:

- Our credit card purchase systems have reduced costs associated with small purchases;
- Business process reengineering is a major part of our Service Center Implementation strategy, as we follow the requirements of recent legislation and the guidance from oversight bodies that we review and revise work processes before applying technology;
- Meat inspection processes have been altered and will improve food safety. Computerized reporting is an important aspect of the new processes;
- The Modernization of Administrative Processes—MAP—program has been in the forefront of departmentwide process analysis and redesign for some time.

Four business process reengineering projects are underway as part of our Service Center Implementation—SCI—effort. These projects focus on community outreach, customer service, providing geospatial—map-based—information, and administrative management. The SCI team plans to construct a mock-up service center site on or about September 1, 1997, where the four BPR projects would be integrated with one another, and the appropriate technologies identified. Pilot testing will be done at operational sites during fiscal year 1998.

The Department, in conjunction with the interagency CIO Council, has already begun developing a Capital Planning and Investment Control process which addresses sections 5122 and 5123 of the Clinger-Cohen Act. Business process analysis and reengineering will continue to be important factors in our decisions to acquire and deploy information technologies. In concert with the requirements of the Clinger-Cohen Act, the Office of the Chief Financial Officer has drafted the departmental guidance for meeting the GPRA requirements. This guidance directs our planning efforts, and will help us as we develop performance indicators, measures and benchmarks.

Question. What progress has USDA made to address other oversight concerns, such as establishing a usable project management system to track project activities and a comprehensive budget tracking and accounting system to identify and report agency expenditures?

Answer. While USDA does not have a central project management system to track project activities, individual agencies have long used project management for their projects. Most USDA project managers currently use off-the-shelf software to track and report on their projects. While individual project tracking software is largely not integrated with agency budget and accounting systems, there is growing recognition that using recognized project management practices such as reporting on variances for cost, schedule and performance is vital to meeting the new planning and reporting requirements for information technology systems development.

With the advent of the Clinger-Cohen Act, more emphasis is being placed on the management of projects on a portfolio basis. The Capital Planning and Investment Control Process, which is under development in OCIO, places greater emphasis on developing standardized project reporting systems right from the onset of the initial planning stage of a project. As standardized and modernized accounting systems are being introduced within agencies, the ability to track project tasks and identify expenditures will become commonplace, subject to budgetary constraints.

Question. To what extent has USDA examined and implemented a Departmentwide information systems technology architecture, which also is now required under Clinger-Cohen, and if is not yet implemented, when does USDA expect to accomplish this?

Answer. USDA has historically operated as a conglomerate of separate agencies pursuing their legislated mandates. In more recent times, however, as the Depart-

PART 1

1194

ment continues to provide leadership for the world's agricultural resources and manages with diminishing human and financial resources, USDA recognizes that effectiveness can be achieved and economies gained through coalescence of business activities and information and information technology resources. Under the leadership of the Chief Information Officer, USDA has developed the USDA Information Systems Technology Architecture—ISTA—to meet these immediate and future needs.

The successful implementation of this architecture is critical to USDA's ability to meet today's mission requirements and to position itself for agricultural leadership in the 21st century. As USDA continues to advance its information technology investment strategy, USDA will employ the ISTA to guide its decisions. The ISTA is a living document and will be continually refreshed to ensure that USDA employs established and emerging technology to meet its strategic business needs.

As the IT architecture and associated IT procurement and deployment issues have become more defined during the moratorium period, it has become extremely important that USDA efforts focus on the actions required to effectively implement the broader strategies set forth in the high level architectures. To support agency decision makers, OCIO has developed a set of criteria to guide Agency IT investment decisions. This criteria describes architecture issues which must be addressed by USDA agencies before investing in IT. Architecture issues specifically focus on:

- IT investments which are consistent with Federal, agency, and bureau information architectures which integrate agency work processes and information flows with technology to achieve the agency's strategic goals;
- reflecting the agency's technology vision and year 2000 compliance plan; and
- specifying standards which enable information exchange and resource sharing, while retaining flexibility in the choice of suppliers and in the design of local work processes.

USDA is moving forward to institutionalize the mechanisms required to ensure implementation and further integration and management of the ISTA. Through a number of processes and procedures, USDA is addressing the required management mechanisms and tools to ensure successful implementation, assessment, and monitoring of the USDA architecture.

Implementation of the ISTA has already begun and will continue as a dynamic process as USDA continually addresses its business delivery needs for an information intense society. For example:

- a project plan is in place and addresses each of the three areas of the architecture;
- technical standards working group has been formed and is actively engaged in defining standards in the areas of computer hardware and software;
- an independent verification and validation program is underway and provides critical reviews of management approaches and technical solutions;
- the OCIO is engaged in an inter-agency effort focused on interoperability issues.

Question. How is USDA ensuring that the information architecture is driven by business needs and as well as strategies required under GPRA, and will support re-engineered business processes?

Answer. USDA employs the strategic planning principles for information technology resources as required by OMB Circular A-130, coupled with those of GPRA. The importance of strategic planning has been emphasized to all USDA mission areas and agencies. The Office of the Chief Information Officer and the Office of the Chief Financial Officer—OCFO—recognize the critical link between an agency's strategic plan and its IT plan. As part of the Department's strategic planning process, OCFO asked the agencies to include one or more goals relative to information technology and program administration.

Agencies were asked to coordinate their plans with those of other mission areas and agencies to ensure that all cross-cutting issues, including IT, have been identified. Agencies were asked to meet among themselves to assure consistency of the plans and that each plan uses consistent language to describe the identical activities.

During the moratorium on IT acquisitions, waivers have been granted with mandates for resource sharing among agencies, and have been disapproved when it has been shown that shareable resources already exist.

OCIO is currently working to further develop the process to ensure critical linkage of the strategic business goals to IT investments. OCFO and OCIO have held several meetings to discuss approaches for accomplishing this, including linkage to the Capital Planning and Investment Control—CPIC—process. Reengineered business processes will be addressed in the CPIC process as well as in the Business Architecture. The Business Architecture is a dynamic document which identifies core

PART 1

1195

business processes. The core business processes are adjusted and targeted based on the strategic goals and objectives of the business.

Question. What specific circumstances existed that required the Department to overlook this committee's concerns about making significant IRM acquisitions prior to completing reengineering, addressing oversight concerns, and developing a department-wide architecture?

Answer. I believe that we have taken positive steps to address the Committee's concerns, and those of our oversight agencies, prior to new IRM acquisitions. The November 1996 moratorium on IT acquisitions is an example. This time-out has been effective in stopping "business as usual" while we devote our energies to completing the required information architecture.

The Secretary has commissioned a high-level USDA team which is now working to create a report to the Secretary, which will be delivered on or about July 9, outlining our plans for effectively completing work on USDA IT management reform, addressing issues of budgeting and legislation, service center implementation, Year 2000, telecommunications and implementation of the Clinger-Cohen Act.

We must continue to provide services to our customers, and be able to accommodate new reporting and processing requirements which are the results of legislation, such as the most recent Farm Bill. While meeting these responsibilities, we continue to look for opportunities for improvements and cost savings through business process analysis and subsequent reengineering.

SERVICE CENTER IMPLEMENTATION

Question. USDA reported in its fiscal year 1998 budget summary that it continues to implement service centers. However, the summary also notes that the number of field office "service centers" is now expected to be less than 2,000 by 1999, as opposed to 2,500 originally planned. How much did USDA spend in fiscal year 1996 to implement new Field Service Centers, what was acquired with these investments, and how many Service Centers were established?

Answer. I will provide the information for the record.

[The information follows:]

Service center implementation fiscal year 1996 obligations

[Dollars in millions]

	<i>Obligations</i>
I. Voice/LAN/WAN:	
A. Voice Equipment	\$13.2
B. Data Equipment	26.2
C. Installation and Training	33.3
Total	<u>72.7</u>
II. IRM support for BPR/I:	
A. Customer Information Profile	0.1
B. Data Management	0.7
Total	<u>0.8</u>
III. Common computing environment (CCE):	
A. Develop/Implement Technical Architecture	0.2
B. Studies/Documentation Needed for 1999 Investment Package	4.0
Total	<u>4.2</u>
Total, above shared items	<u>77.7</u>
IV. Base data acquisition:	
A. Digital Orthophotography	27.5
B. Digitizing Soils Data	2.5
Total	<u>30.0</u>
V. County office consolidations	<u>22.1</u>
VI. SCIT/InfoShare support:	
A. Change Management/Customer Service6

PART 1

1196

B. Other	<i>Obligations</i> 2.5
Total	3.1
<hr/>	
Total	132.9

As of December 1996, 2,400 Service Centers had been established.

Question. How much does USDA plan to spend in Fiscal year 1997 and 1998 under each of the agencies' budgets, including CCC funds, to implement new Service Centers?

Answer. I will provide the information.
[The information follows:]

SERVICE CENTER IMPLEMENTATION FUNDING BY SOURCE

[Dollars in thousands]

Agency	1997	1998
Commodity Credit Corporation	\$20,500	\$35,800
Farm Service Agency	9,233	8,120
Natural Resource Conservation Service	33,433	45,170
Rural Development	14,693	5,520
OSEC/InfoShare	3,700	700
Total	81,559	95,310

Question. Provide a detailed breakout of what these funds will be used for in fiscal years 1997 and 1998 for Service Center implementation and what specific technology acquisitions will this include.

Answer. I will provide a table for the record.
[The information follows:]

SERVICE CENTER IMPLEMENTATION INFORMATION TECHNOLOGY ACQUISITIONS

[Dollars in millions]

	1997	1998
I. LAN/WAN/Voice:		
A. Voice Equipment	\$1.0	
B. Data Equipment	2.0

CONSOLIDATION OF FUNCTIONS

Question. The President's fiscal year 1998 budget request for USDA notes that the budget assumes a consolidation of certain functions of the Farm Service Agency—FSA—and the Natural Resources Conservation Service—NRCS—at the national headquarters level in 1998, including personnel, IRM, property and public affairs. The summary also notes that a study will be conducted in 1997 by an independent entity to examine the FSA and NRCS for opportunities for further coordinating and reducing costs in these agencies, including alternative means of program delivery, such as centralized servicing for AMTA payments and CCC non-recourse loans, and consolidation of the two agencies' operations. What overall savings does the budget assume from implementing the consolidation of certain FSA and NRCS functions?

Answer. During fiscal year 1998 Budget deliberations, the Department agreed to an independent study to explore opportunities for greater efficiencies in program delivery, including a possible merger of certain functions of FSA and NRCS. However, the fiscal year 1998 Budget does not assume a specific level of savings from any potential consolidation or other changes. The independent study will soon be contracted for by the Department.

Question. How many IRM personnel does FSA and NRCS each have, including a breakout by the headquarters level and field level and what are the associated fiscal year 1998 budget for these?

Answer. For fiscal year 1998, FSA projects that it will have 690 IRM personnel, measured in terms of full-time equivalents, and NRCS projects that it will have 405. The associated costs are \$41,765,000 and \$31,853,000 respectively, broken out as follows:

Agency/location	Staff-years	Cost
NRCS:		
Headquarters	85	\$7,631,000
Field	320	24,222,000
Total	405	31,853,000
FSA:		
Headquarters	87	5,883,000
Field	603	35,882,000
Total	690	41,765,000

PART 1

1198

Question. What specific personnel, IRM, property, and public affairs functions will be consolidated, what are the expected timeframes for completing this, and what impact will this have on the level of staff and overall costs on each of these functions for the two agencies?

Answer. The Service Center partner agencies—FSA, NRCS and Rural Development—are conducting business process reengineering for customer interface, customer service, geospatial information services and administrative management. The interagency teams will deliver recommendations on new ways to do business in these areas which provide common streamlines processes and meet all partner agency requirements in a common computing environment. The business case for IT investments based on business requirements is being developed to support an investment proposal in the fiscal year 1999 budget cycle. Actual implementation and full deployment of consolidated functions will stretch into the year 2001 and beyond.

In parallel with the BPR activity, the Deputy Secretary, in a February 10, 1997 memorandum, charged the Service Center agencies with developing and implementing common administrative policies and procedures with a goal of October 1, 1997 to implement significant changes in functional areas “as a first step toward full integration and consolidation of administrative services.” He also noted that the next steps for further consolidation should be based on outcomes of the BPR projects and the recommendations of the independent study.

Question. What is the status of the independent study, including its estimated total cost, when the study was initiated, what is the scope of the study, who is doing the study and when will it be completed?

Answer. The attached Memorandum from the Secretary outlines the status of this study.

[The information follows:]

MEMORANDUM FROM THE SECRETARY

May 21, 1997.

To: The Subcabinet

Subject: Study of County-Based Agencies Proposed in the Fiscal Year 1998 Budget

The fiscal year 1998 President’s Budget requires the Department to conduct a study of its county-based agencies to examine options for streamlining program delivery, administrative support at all levels of the agencies, and identifying the optimum number of service centers.

I have deferred the start of the study expecting that a forum with key members of Congress would produce guidance for designing the study. Unfortunately, we have been unable to find a suitable date to accommodate the invitees and I have decided that the Department cannot wait any longer and that we need to move ahead with the study.

PROJECT MANAGER

Dr. Susan Offutt, Administrator of the Economic Research Service, will be project manager for the study.

MANAGEMENT STRUCTURE

To assist Dr. Offutt with policy advice, I am establishing a Policy Oversight Board which will be chaired by the Deputy Secretary. Members will include Dallas Smith, Acting Under Secretary for Farm and Foreign Agricultural Services; Tom Hebert, Deputy Under Secretary for Natural Resources and Environment; and Inga Smulkstys, Deputy Under Secretary for Rural Development.

I am directing this group to develop an outline and project statement as soon as possible. Departmental staff organizations will provide support to the policy oversight board and Dr. Offutt as needed. Dr. Offutt and the board will brief the Office of Management and Budget and staff of the House and Senate Agriculture and Appropriations Committees on the status of the study periodically.

SCOPE OF STUDY

The study will be performed by an independent private sector contractor with appropriate expertise in analyzing public sector organizational structure and service delivery. The study will examine alternatives for coordination or consolidation of Farm Service Agency, Natural Resources Conservation Service, Rural Development, and Risk Management Agency activities and the design of a delivery system for the services and products of these agencies that strikes an appropriate balance between the cost to taxpayers of its operation and the effectiveness of the provision of assist-

PART 1

1199

ance to targeted individuals and communities. The study of the convergence of administrative systems, the Farm Service Agency State Directors' review, the Service Center Implementation Team activities, and the Civil Rights Action Team review, will be coordinated with this larger, more comprehensive effort. Our contractor will be required to seek input from the county-based agencies' customers, conservation districts, farm organizations, rural development organizations, insurance groups, and others.

POLICY ASSUMPTIONS

The President's fiscal year 1998 Budget provides the funding baseline for these organizations during the life of the budget agreement between the Administration and the Congress. A review of expected workload and anticipated dollars and staffing resources will be conducted to determine if the anticipated workload can be accomplished within available resources.

The study will examine a scenario assuming continuation of the farm programs under the 1996 Farm Bill after 2002 and one scenario with farm payments ending in 2002. It should address the implications of the uncertainty over continuation of payments for any recommendations for field office change.

The study will assume no change from the existing legislative authorization for conservation, farm credit, risk management, rural development and other major programs within the scope of the study.

The study will include a comprehensive review of the involved agencies at all levels.

The study will catalogue and evaluate the range of services provided and functions performed at field offices and analyze such questions as the extent to which there is duplication or complementarity and whether there are opportunities for consolidation or streamlining. At the same time, the analysis must consider and identify the effect of any change to field office operations on the timeliness and quality of service to clients.

TIMING

If the study is to influence the final decisionmaking for the fiscal year 1999 budget, it should be structured, if feasible, to provide some preliminary observations in late fall 1997. A final product will be produced as soon as possible thereafter, recognizing that a contract is not likely to be in place before mid-summer 1997.

FUNDING

No funding has been specifically provided for the study in fiscal year 1997, nor is any funding proposed in the fiscal year 1998 budget. Therefore, we will use available funds. Since the study involves multiple agencies funding will be drawn from all of the key agencies affected. Since many, but not all of the programs delivered by the Farm Service Agency and the Natural Resources Conservation Service are funded by the Commodity Credit Corporation, it may be possible to consider use of Commodity Credit Corporation funds for a portion of the study.

I have asked Dr. Offutt and the Policy Oversight Board to provide a progress briefing to the Subcabinet once a month between now and the completion of the study. If you have any suggestions concerning the conduct of the study, please advise Dr. Offutt as soon as possible.

Question. What does USDA currently spend annually for servicing AMTA payments and CCC non-recourse loans on a decentralized basis? What does USDA estimate it would cost to perform these servicing functions centrally?

Answer. The existing administrative workload reporting system captures workdays and related costs on a broad functional basis for the currently decentralized structure and does not, for example, identify AMTA payments individually and all related servicing. To derive such an estimate would require many programmatic assumptions and would be a major endeavor. FSA is currently working with a contractor to compare and contrast FSA/CCC's decentralized payment process and related servicing to other various alternative processes, including a centralized methodology. This study was requested by OMB and is expected to be completed by mid-September. The servicing related costs for these processes are being projected as part of the study. Also, the study is considering other related legislative requirements such as Electronic Funds Transfers and offset requirements created by the Debt Collection Improvement Act of 1996.

We have only the check processing and related costs readily available. Based on the most recent 5-year average, the Farm Service Agency currently issues about 8.36 million CCC checks annually for all FSA program payments on a decentralized basis. These checks cost 62.89 cents per check to process. This processing cost in-

PART 1

1200

cludes all overhead costs including equipment service costs, systems analysis/development, blank check printing, annual photocopying, blank stock mailing costs, paper, and personnel costs associated with printing, signing, and verifying checks. Therefore, it costs about \$5.26 million annually to issue the 8.36 million checks on a decentralized basis. We do not have a check volume figure which covers only the portion of checks issued for AMTA payments and commodity loans, but it would be the same per check average cost.

With regard to the estimated cost of processing payments in a centralized manner, we have hired a private contractor to conduct a study of the existing check writing processes and to make recommendations for how checks can best be processed in the future. Since centralized processing is one of the viable alternatives for the future environment, a cost estimate will be a part of that study. We expect the study to be completed in mid-summer, at which time we can provide you with those estimates.

FIELD LOCATIONS

Question. In September 1995, GAO found that USDA paid thousands of dollars for telecommunications services for a USDA field office that closed over a year earlier. USDA reported on its Fiscal year 1998 Budget Summary that the Department has moved or closed about 1,300 field locations since December 1994 for the farm service agencies and has closed additional field offices for several other USDA agencies with field structures. What specific actions has USDA taken to ensure that telecommunications services for the 1,300 field locations the Department reported it closed since December 1994 have terminated telecommunications and other services at these locations?

Answer. As the result of concerns in this area, the Department amended its Departmental Regulation "Telecommunications Policy" (DR 3300-1) on March 20, 1996 and distributed it to all USDA agencies and staff offices. This policy strengthens the requirement for the agencies to: "Eliminate redundant or uneconomical services, especially in office closures, relocations, or consolidations to ensure: (a) All unneeded telecommunications services are terminated and accounts are closed. (b) Telecommunications equipment is properly accounted for and used where it is practical and cost beneficial." (Reference: DR 3300-1, Appendix G, Section 4 Responsibilities, Paragraph C (3)).

This policy establishes specific procedures to ensure that USDA agencies manage telecommunications services more efficiently.

In October 1995 the CFO issued a bulletin and special report of Active Telephone System Accounts to all agencies. The bulletin highlighted the GAO's finding that, in several cases, USDA was paying for outdated equipment and for services no longer being provided.

Agencies were instructed to thoroughly review all accounts for which they are responsible and to: (1) notify the National Finance Center if an account was no longer active and/or if a bill for collection should be issued; and (2) notify local telephone companies to stop billing for these active accounts.

In addition to the CFO memorandum, the Secretary and Assistant Secretary for Administration have issued letters to the Under Secretaries and the Assistant Secretaries with specific instructions to work with OCIO to improve telecommunications management activities. Each agency has been directed to work OCIO and OCFO to review all current telephone service accounts. Copies of telephone account invoices were sent to each agency. Through May 22, 1997, the audit of the invoices has been completed for 84.6 percent of the 25,021 accounts with an estimated savings of \$258,000. The review is scheduled for completion by October 1, 1997.

Question. How is the Department verifying that it is not paying for services to locations it has closed?

Answer. Departmental Telecommunications Policy specialists have established procedures for the department as a whole to verify that services are terminated whenever offices are closed or consolidated. The USDA Service Center Implementation Team—SCIT—has developed and implemented specific procedures, in the form of a checklist, for use in closing of field offices to establish USDA Service Centers. SCIT telecommunications specialists conduct follow up inquiries to make sure that USDA is not paying for unneeded services.

STAFF REDUCTIONS

Question. USDA reported in its Fiscal year 1998 Budget Summary that the Department's Federal employment will be reduced by over 16,400. In light of this reduction of staff, we assume that most of these employees used telecommunications equipment and other information technology, such as computers. What analysis has

PART 1

1201

the Department done to identify the surplus of equipment that should exist with the reduction in staff and what does this analysis show?

Answer. As an agency reduces its staff, excess personal property will be redistributed within the agency to replace outdated or obsolete equipment on a continual basis. Once an agency has accomplished this, any excess equipment is reported through USDA's Departmental system for redistribution throughout USDA. Until this is completed, no in-depth analysis can be made of what to do with excess property. However, within USDA our normal procedure would be to transfer excess property to other federal or state agencies using existing legislation.

Question. What is the Department doing to cost-effectively use such equipment and relocate it, where feasible, to other field offices or locations anywhere across the Department where there is a need for such equipment rather than purchasing new equipment?

Answer. USDA has extensive programs at the headquarters and national level for the reutilization of excess personal property. All excess personal property in the Washington, D.C. metropolitan area is reported and transferred to our Centralized Excess Property Operation located in Landover, Maryland for redistribution within USDA. Property located in field locations is reported through the departmental Property Management Information System—PMIS—to the Departmental Excess Personal Property Coordinator for redistribution. The property is then available for redistribution by using either the on line PMIS or the Internet. For agencies in remote locations which may not have systems available for on-line screening a catalog is published and distributed.

OFFICE OF COMMUNICATIONS

PREPARED STATEMENT OF TOM AMONTREE, DIRECTOR OF COMMUNICATIONS

Mr. Chairman and members of the Subcommittee, I am pleased to discuss the fiscal year 1998 request for the Department of Agriculture's Office of Communications.

The Office of Communications leads and coordinates the carrying out of the mission described in the organic act establishing the Department of Agriculture in 1862: "To acquire and to diffuse among people of the United States useful information on subjects connected with agriculture in the most general and comprehensive sense of that word . . ."

The Office of Communications informs the general American public about the programs, functions, and initiatives of the Department of Agriculture: Disseminates both general and technical information to the customers and constituency groups of the Department who depend on the Department's services for their well-being, coordinates the communications activities of USDA component agencies and provides leadership for internal and external communications. The Office of Communications has been streamlined through restructuring and reduction in staff years. To coordinate the communications of the Department's 7 program mission areas, 19 program agencies and various staff offices, the Office of Communications has 122 staff years in fiscal year 1998—that's 28 staff years less than fiscal year 1993.

To carry out its goal of informing the public about USDA policies, programs, and initiatives with a reduced communications staff, the Office of Communications is increasing its use of the latest and most efficient communications technology, methods and standards. From use of the world wide web on the Internet to radio, television and teleconference facilities, thousands of people who depend on USDA's services for their livelihood and/or their personal well-being are informed daily.

Scope and dimensions of communications activities are integrated into USDA's mission of enhancing the quality of life for American people by promoting a healthy, accessible and affordable food supply; caring for agricultural, forest and range lands; supporting sound development of rural communities; providing economic opportunities; expanding global markets for agricultural and forest products and services; and providing efficient and effective government service in a fair and equitable manner.

To support the Department's strategic plan, the Office of Communications will emphasize these general goals in its 5-year strategic plan: Increase knowledge of the general public about USDA policies, programs and initiatives through integration of communications management with USDA policy and program management; improve access to and dissemination of USDA information to news media, constituent groups and individual customers using latest and most efficient communications technology, methods and standards; improve communications with USDA employees by leading and coordinating internal USDA communications; develop an efficient and effective, results-oriented, public affairs community within USDA that provides

PART 1

1202

high-quality customer service; and foster civil rights and diversity throughout USDA's public affairs community and its communications products and services.

In the first goal, the Office of Communications will continue to take an active part in policy and program management discussions at the highest levels to integrate communications components into decisions for action. After defining the audience for each major USDA policy and program initiative, the Office of Communications will coordinate the public communications component of the initiatives. We will continue to provide centralized operations for production, review and distribution of USDA messages to its customers and the general public. We will monitor and evaluate the results of communications to the public about USDA programs.

In carrying out the second goal, the Office of Communications will continue to acquire and instruct staff to use the most effective and efficient communications technology, methods and standards in carrying out communications plans. We will use among USDA mission areas the most effective and efficient communications services and methods in getting USDA information to the public. We will evaluate results of using this technology and of using these services and methods.

The Department values its employees as good Government "ambassadors" who need to be kept informed. The Office of Communications intends to improve communications with USDA employees, especially those away from headquarters. We will help employees understand USDA's general goals and policy priorities, and to be more familiar with USDA programs and services. We will help employees understand new initiatives, especially cross-cutting ones, and how they relate to each USDA employee's specific job duties. We will provide means to inform and train USDA employees both at headquarters and in the field.

In relation to the Government Performance and Results Act, the Office of Communications will update USDA regulations and guidelines for communications; plan and conduct regular information exchange and training sessions for USDA communications managers, specialists, and support staffs in use of communications technologies and processes to enhance service to the public; foster accountability for communications management performance throughout USDA; and reassess its own organization and if deemed necessary, restructure into a more efficient, effective, centralized communications work force.

The Office of Communications will provide equal opportunity for employment and promote an atmosphere that fosters valuing individual differences. We will continue to provide equal opportunity for contracting goods and services. We will increase availability of USDA information to under-served communities and geographic areas to ensure equal opportunity in USDA's outreach efforts. We will continue to develop information products that are universally accessible.

The Office of Communications' accomplishments the past year included communications coordination and support for: the implementation of the historic 1996 Farm Bill; the modernization of the 90-year-old meat and poultry inspection system; the release of updated dietary guidelines for Americans; and the expansion of the Water 2000 and other rural development programs.

The Office of Communications' staff also provided information support for the agricultural concentration study and follow-up actions, the agricultural export trade expansion, the launch of new risk management tools for farmers, the inauguration of a comprehensive school nutrition education program, the creation of new consumer interest in farmers' markets, and the public benefits of USDA-sponsored research.

FISCAL YEAR 1998 BUDGET REQUEST

The Office of Communications is requesting a budget of \$8,279,000. This is an increase of \$141,000 over our fiscal year 1997 current estimate. This modest increase covers \$106,000 for pay costs, and includes \$35,000 for an initiative to provide Outreach to Underserved Groups. The additional resources will help OC fulfill the information distribution mission of USDA by communicating to the public through media and constituent organizations and by providing a coordinated program for such under-served client populations as Native Americans, Hispanics and Asian Americans. The increase would be used to conduct an initial survey to identify the level of knowledge of USDA services and the best information channels to reach underserved groups. This initiative will allow USDA to fulfill its goal of communicating to all stakeholders by reaching particular segments of the public who have been underserved.

This concludes my statement, Mr. Chairman. I will be pleased to respond to any questions.

PART 1

1203

OFFICE OF THE GENERAL COUNSEL

PREPARED STATEMENT OF JAMES S. GILLILAND, GENERAL COUNSEL

INTRODUCTION

Mr. Chairman and members of the Subcommittee, I am pleased to have this opportunity to provide you with an overview of the Office of the General Counsel, to include some of the current activities and issues facing the Department. I would also like to present our appropriation request for fiscal year 1998.

MISSION

The Office of the General Counsel (OGC) is the national law office serving the Department of Agriculture. As a free standing USDA agency, OGC provides legal advice and services to the Secretary of Agriculture and other officials of the Department of Agriculture with respect to all USDA programs and activities.

The mission of OGC is to determine legal policy, provide legal services, and direct the performance of all legal work for the Department throughout its Washington and field locations.

ORGANIZATION

The headquarters for OGC is located in Washington, D.C. The Office is directed by a General Counsel, a Deputy General Counsel, five Associate General Counsel, 11 Assistant General Counsel, and a Director for Administration and Resource Management. Our field structure consists of five regional offices, each headed by a Regional Attorney, and 13 branch offices.

Our full staffing levels are approximately 247 attorneys and 118 support staff in the Washington, D.C. headquarters and the 18 field locations. Approximately half of our personnel are located in the field.

CURRENT ACTIVITIES AND ISSUES

There are several areas of our current work that I would like to highlight to demonstrate how OGC serves the Department.

During the past year, OGC has been engaged in supporting the Foreign Agricultural Service (FAS) in a number of diverse areas. Foremost on the international agenda since the Uruguay Round Agreement came into force has been implementation of commitments in the area of sanitary and phytosanitary ("SPS") measures. The first formal challenges to unfair practices under the World Trade Organization (WTO) SPS Agreement were brought by the United States this year against the European Union's (EU) continued import ban on meat produced with the use of growth-promotant hormones. Consultations were held early in the year and formal dispute resolution was instituted requiring full briefing of the issues and several formal panel meetings this past summer and fall.

The United States has also initiated WTO consultations during the past year with Korea in two disputes involving Korea's system of shelf-life rules and its new inspection regulations. As a result of substantial interagency work on the shelf-life issues, the United States has been able to convince Korea to institute changes in that system which will liberalize market conditions in Korea and, if fully implemented, should permit the United States and Korea to avoid formal dispute resolution. Similarly in the case of Korea's inspection system, we have done substantial technical and legal groundwork to support continued negotiations with Korea on these issues.

During the past year, we have seen progress towards an equivalency agreement with the EU on veterinary inspection matters. This negotiation has been long and difficult and represents a first attempt by WTO parties to address the novel question of how to recognize the equivalency of differing technical systems. OGC has been instrumental in preparing the text of this agreement as well as providing legal advice with respect to the form and meaning of numerous and complex annexes.

OGC has provided a significant amount of advice to Departmental officials concerning the implementation of the commodity and conservation program provisions of the Federal Agriculture Improvement and Reform Act of 1996. In this regard, OGC has provided a significant amount of advice concerning the promulgation of the proposed and final rules for the Conservation Reserve Program (CRP), including the provision of advice with respect to the review of the thousands of comments received in response to the proposed rule. In addition to the review of these rules, this effort involved the review of numerous decision memoranda, the CRP contract, and related documents.

PART 1

1204

OGC attorneys are substantially involved in providing legal services related to the continuing changes in the Department's crop insurance program, especially the review of private insurance company initiatives including crop revenue coverage; non-procurement suspension and debarment issues; and the protection of the public interest in regards to food stamp fraud and the development of the Department's plans for the extension of Food Stamp Program electronic benefit transfer systems.

The enactment of welfare reform legislation in 1996 has raised many legal issues. Already, the implementation of the alien provisions is generating substantial controversy and threatened litigation. OGC attorneys are also working closely with the Food and Consumer Service in connection with state efforts to privatize welfare programs and to enhance food stamp program efficiency and integrity through implementation of electronic benefit transfer systems. Debarment and suspension activities continue with OGC attorneys assisting FCS in taking actions to protect the federal government and the public with respect to over 150 dairy companies and individuals convicted of bid rigging on school milk contracts.

In the marketing and regulatory area, we filed a trade practices enforcement case last year against the country's largest meat packer alleging that the packer has given an undue or unreasonable preference to certain feedlots resulting in disadvantages for others. The trial began on January 29, 1997. We have also provided assistance and counsel to the Secretary regarding the establishment and implementation of the Advisory Committee on Concentration in Agriculture and the Department's responses to the Committee's recommendations.

In the food safety area, we worked very closely with the Food Safety and Inspection Service (FSIS) on the development of the Pathogen Reduction/Hazard Analysis and Critical Control Points (HACCP) final rule, which was published on July 25, 1996. We have also provided legal assistance to FSIS in connection with the implementation of the final rule, particularly with regard to the Sanitation Standard Operating Procedures and *E. coli* testing requirements. We are currently working with FSIS on technical amendments to the HACCP rule. We continue to provide legal support to FSIS as the agency develops initiatives designed to make the meat and poultry regulations more compatible with HACCP, eliminate redundant and obsolete regulations, allow more productive use of scarce agency resources, and make regulations less burdensome and easier to understand and meet.

OGC worked closely with the Animal and Plant Health Inspection Service (APHIS) on the preparation of the final rule that established a systems approach permitting the importation of fresh Haas avocados from Mexico into 19 northeastern states. We have also worked with APHIS on sanitary and phytosanitary issues that have risen under GATT and NAFTA.

We provided extensive legal support to APHIS in connection with its program to control Karnal bunt, a fungal disease of wheat. We are also defending a lawsuit brought by producers and handlers of wheat in Arizona challenging the Department's Karnal bunt regulations.

There continue to be very significant developments in connection with litigation challenging generic advertising programs under both marketing orders and free-standing research and promotion programs. Most significantly, in *Wileman Bros. et al. v. Glickman*, the Ninth Circuit's decision holding the advertising program under the California peach and nectarine marketing orders unconstitutional on First Amendment grounds has been argued and submitted to the Supreme Court for decision. In another important case, *Goetz v. Glickman*, the plaintiff appellants are appealing an adverse decision which rejected a First Amendment challenge to the beef advertising program. In addition, cases challenging the mushroom, milk and fresh cut flower advertising programs were filed against the Department. Dairy issues, including consolidation of milk marketing orders and the Northeast Interstate Dairy Compact, also required extensive legal assistance.

In the area of animal welfare, we coordinated the seizure and movement of certain dolphins to ensure their safety and well-being, provided legal services in a dispute between a university and a former employee regarding animal research activities, and took separate actions against a university and a well known research facility to require that they provide humane living conditions for primates used in research.

We provide legal services to agencies which manage some of America's largest lending portfolios. Overall, USDA extends credit of nearly \$24 billion through its various lending programs. We oversee such legal work with a far smaller staff than a comparable private organization would use. The ongoing implementation of centralized processing (DLOS) for Rural Housing loans uses substantial legal resources. OGC continues to be heavily involved in debt collection and foreclosure work with many cases going back to the emergency loan programs of the 1970's and 1980's.

PART 1

1205

The Secretary is committed to regulatory reform. We continue to work with Department officials to implement the President's regulatory reform package. This is a significant undertaking as we work with agencies throughout USDA to reduce regulatory burden, eliminate obsolete or unnecessary regulatory requirements, and streamline regulation, particularly in the areas of rural, farm and utility lending.

We have been required to devote considerable resources to the Rural Utilities Service (RUS) and its electric borrowers as they experience the effects of and respond to the rapid deregulatory changes in the electric industry. We are working closely with RUS and DOJ on the involved and time-consuming problems of several borrowers, including several bankruptcies and financial workouts that have raised complex new issues of law and policy.

A number of issues and concerns have arisen in the RUS program with the passage of the Telecommunications Act of 1996. The Act is revolutionizing the transmission of information in the United States as it eliminates barriers to market entry and expands competition in the telephone and cable TV industries. The Act encourages universal service but RUS, charged with financing telecommunications services throughout rural America, faces new questions of loan purposes and assuring loan repayment.

In the natural resources area, we have been involved in a number of extremely significant undertakings concerning national forest management and soil conservation programs. We have provided assistance nationally to the Natural Resources Conservation Service under the Wetlands Reserve Program through the acquisition of voluntary wetland easements.

Management of our National Forests is a subject of intense debate and litigation, with a great deal of legal work generated by the impact of new scientific information on ongoing Forest Service projects and commitments. Such legal challenges involve the President's Northwest Forest Plan, Forest Plan amendments to protect the Mexican Spotted Owl in the Southwest as well as numerous other species, fisheries protection in the intermountain West and the Migratory Bird Treaty Act in various places.

Further, we are defending against numerous timber sale claims arising from legally created delays and contract modifications to protect the habitat of endangered species. We also are defending challenges in several places in the West by local governments and individuals under the so called "County Supremacy" movement disputing federal ownership or jurisdiction over public lands.

We have also devoted substantial resources to other legislative and regulatory initiatives, such as land exchanges, grazing reform, Forest Planning reform, reauthorization of the Endangered Species Act, the Safe Drinking Water Act and the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). OGC also provided the Forest Service with support in the administration of the National Forest lands as they are affected by the complex statutes related to mineral exploration.

In addition, we regularly provide advice on compliance and litigation arising under the pollution control laws. Most frequently, these issues involve abandoned and inactive mines and landfills on federal lands, the use and storage of agricultural chemicals, and management of hazardous waste at agricultural research facilities. We have worked with other federal resource management agencies on implementation of new executive authority under CERCLA to order cleanup of hazardous substances affecting federal resources.

In the general law area, OGC has assisted the Civil Rights Office (CR) in its effort to promulgate comprehensive civil rights procedures and regulations, and the Office of Operations (OO) in processing compensatory damage decisions in civil rights complaints brought by USDA employees. We anticipate an increase in OGC involvement in assisting CR in future endeavors, as well as assisting OO in processing and adjudicating civil rights complaints already brought by both employees and applicants for employment in the Department, as well as private individuals who allege violation of their civil rights in programs administered by the Department. Based on recommendations by the Civil Rights Action Team, OGC is in the process of establishing a civil rights division, dedicated to providing legal counsel to the Department and agency officials on civil rights issues. This endeavor has the full support of the Secretary.

OGC anticipates an increased demand for legal services to client agencies to advise them as to the legality of their downsizing efforts; to provide representation of USDA agencies, upon request, in actions brought before the Equal Employment Opportunity Commission and the Merit Systems Protection Board; and to provide legal support in the defense of any action brought in Federal court as the result of any downsizing.

PART 1

1206

We continue to provide considerable assistance to the National Appeals Division (NAD) with ongoing questions and litigation arising regarding its authority under the Federal Crop Insurance Reform and Department of Agriculture Reorganization Act of 1994. Additionally, numerous changes in the farm credit area made by the Federal Agriculture Improvement and Reform Act of 1996 have generated questions regarding the effect of such changes on pending NAD appeals and the appealability of agency decisions mandated by the provisions of that Act. We have worked a great deal on a case now on appeal in the Eighth Circuit which should resolve issues concerning the applicability of the Administrative Procedure Act to NAD proceedings and the allowance of legal fees under the Equal Access to Justice Act for such proceedings.

With regard to the procurement of property and services, the Clinger-Cohen Act of 1996 mandated many changes that address source selection procedures in negotiated procurements; the acquisition of commercial items; and the acquisition, use, and disposal of information technology by the Federal Government. Substantial resources in the general law area will be devoted to assist Department implementation of the changes mandated by this Act.

We also expect to see an increase in procurement protest-related work in the general law area as a result of the recent expansion of the jurisdiction of the Court of Federal Claims that allows it to hear post-award procurement protests. An initial decision of the court indicates that such protests will require complex record compilation for review. Enhanced legal representation of USDA agencies in protests before the General Accounting Office (GAO) also may be necessary to ensure that the position of the agency is set forth fully in the record in preparation for a potential secondary protest to the Court of Federal Claims if the GAO protest is denied.

We continue to provide legislative drafting and related assistance to the Department and the Congress on major legislative activities that involve the Department. Recently, we have provided assistance in the development of legislation to reauthorize the Department's research activities.

All these comments hardly touch upon the dozens of daily issues that come before the legal office of a Department of over 100,000 employees administering programs in an extremely wide range of areas.

FISCAL YEAR 1998 BUDGET REQUEST

For fiscal year 1998, OGC is requesting \$29,449,000 in direct appropriations. This request represents an increase of \$1,700,000 over the fiscal year 1997 appropriation. Of this amount, \$351,000 is for the anticipated pay raise, which is needed to maintain staff so that existing levels of mission efforts may continue. OGC is requesting \$1,149,000 to maintain staff and provide pre-decisional legal work. This critically important increase is needed to fully fund current staffing needs and to keep pace with the continued high volume of legal work. This requested increase must be viewed against the background of staff reductions which occurred during fiscal years 1994, 1995 and 1996, which have left OGC with a number of areas where staff was insufficient to adequately meet the demands for legal services generated by the Department. OGC has been able to recruit replacement attorneys for several of these key positions, although even with the requested increase, OGC will be able to support a projected staffing level of only 367, which is significantly below the fiscal year 1994 level of 398.

In order to ensure that agencies of the Department receive adequate legal advice, it is important that OGC attorneys be involved in decision making before decisions have been reached. By doing so, legal issues can be identified and addressed at an early stage. OGC can participate in Department decision making to an adequate degree only if there are adequate OGC resources available to address the press of daily business and litigation already filed, as well as ongoing decision making within the Department. Placing OGC attorneys in the decision making process helps ensure that Departmental decisions comply with applicable legal requirements, litigation is avoided whenever possible, and the government's chance of successfully defending litigation filed against the Department is substantially improved. Ensuring that adequate OGC staff are available to provide that pre-decisional legal advice garners significant savings in the avoidance of costly litigation expenses.

For example, it is absolutely necessary that we maintain current staffing levels in order to provide legal advice to the Food and Consumer Service, which administers the Food Stamp, School Lunch and Child Nutrition Programs. The food assistance programs are undergoing major changes as a result of welfare reform. Legal assistance must also be maintained for the Grain Inspection, Packers and Stockyards Administration, which is currently considering implementation of actions to address the issue of concentration in the meat packing industry.

PART 1

1207

OGC must likewise maintain legal support to the Food Safety and Inspection Service during implementation of the Hazard Analysis and Critical Control Point (HACCP) regulations. Staff must be maintained in the General Law area, which continues to receive a steadily increasing number of requests for assistance in legal matters related to contracts and cooperative agreements, torts, FOIA and appropriation issues.

In addition to these ongoing activities, we anticipate a number of developments that will generate additional demands for legal services related to trade issues, agency downsizing efforts, efforts to amend the National Forest Management Act and legal work associated with amendment of Forest Plans.

OGC has made substantial improvements in the ADP computing environment, upgrading both its hardware and software as well as making substantial improvements to the OGC communication network. In order to continue improvements and train staff to make full utilization of available computer resources, additional resources are necessary.

Also included in this request, is a shift of \$200,000 from Departmental Administration (DA) to OGC to aid the Office of Operations (OO) in processing and adjudicating civil rights complaints brought by both employees and applicants for employment in the Department, as well as private individuals who allege violation of their civil rights in programs administered by the Department. In fiscal year 1997, the Congress appropriated an additional \$1.5 million to DA to facilitate the processing and adjudication of civil rights complaints. However, as the work has developed, the Secretary has determined that more legal resources should be employed to address the pending cases and assist in those now in development.

CLOSING

That concludes my statement, Mr. Chairman. We appreciate the support this Subcommittee has given us in the past. Thank you.

OFFICE OF INSPECTOR GENERAL

PREPARED STATEMENT OF ROGER C. VIADERO, INSPECTOR GENERAL

Good afternoon, Mr. Chairman and members of the Committee. I am pleased to have this opportunity to visit with you today to discuss the activities of the Office of Inspector General (OIG) and to provide you with information on our audits and investigations of some of the major programs and operations of the U.S. Department of Agriculture (USDA).

Before I begin, I would like to introduce the members of my staff who are here with me today. James Ebbitt, Assistant Inspector General for Audit; Craig Beauchamp, Assistant Inspector General for Investigations; and Del Thornsby, Director of our Resources Management Division.

I want to thank the Committee for the support it has shown me and the agency during the nearly 2½ years since my appointment as Inspector General. We have tried to work closely with you, and I hope that we have been able to address some of your concerns.

OIG's mission is to perform audits and investigations of the Department's more than 300 programs and operations, recommend policies and actions to promote economy and efficiency, and prevent and detect fraud, waste, and mismanagement in these programs and operations. We keep you and the Secretary informed about problems and deficiencies relating to the administration of the Department's programs and operations and report criminal violations to the U.S. Department of Justice (DOJ). We have a diverse staff of auditors, criminal investigators, and other personnel in offices throughout the country to carry out these activities.

I am proud to say that in fiscal year 1996, we continued to more than pay our own way. In the audit arena, we issued 282 audit reports and obtained management's agreement on 1,627 recommendations. Our audits resulted in questioned costs of \$1.5 billion. Management also agreed, as a result of our audit work, to recover \$11.4 million and put \$264.7 million to better use. Additionally, our investigative staff completed 956 investigations and obtained 738 convictions. Investigations also resulted in \$71.5 million in fines, restitutions, and other recoveries and penalties during the year.

Still, our auditors and investigators can continue to recover and save money for the taxpayers only if they have the tools needed to perform their duties. For several years, we have been required to absorb increases in personnel costs, which has forced us to limit our replacement hiring and has extensively limited the funding we have available for other necessary items such as travel and specialized law en-

PART 1

1208

forcement equipment. For example, in January 1993, we had 875 employees on board. Now we have only 745—130 less than 4 years ago. At this level, we are simply able to deal with crisis issues needing immediate audit and investigative attention. Many critical issues, including agency concerns, must be put on hold until staff can be made available from current assignments which are already backlogged. This is especially disconcerting in the investigative arena where it is critical to address issues as quickly as they are brought to our attention. For instance, we currently have a backlog of about 1,400 cases which we have had to decline during the past year, mostly because we do not have the staff to do the work.

Adequate funding and staffing for our office makes good sense because we help create a Government that works better and produces positive results. While I recognize that these are difficult budget times and every agency must do more with less, I believe OIG cannot continue to provide sufficient service and assistance to you, the Congress, and to USDA agencies without being provided adequate resources, and I request that our proposed funding level be approved. I believe that resources allocated to OIG are very cost-effective in view of the money we save for the taxpayers.

Before I move to specific audit and investigative activities, I would like to update the Committee on our progress in implementing the requirements of the Government Performance and Results Act (GPRA) and our new forfeiture authority.

We have made significant progress in implementing GPRA in OIG. We have prepared a 5-Year Strategic Plan that describes our mission and sets forth our general goals and objectives through fiscal year 2002. This year, we are preparing our first Annual Performance Plan under GPRA which will contain specific performance goals and objectives for a fiscal year.

In order to prepare the 5-Year Strategic Plan and the Annual Performance Plan, we consulted with management officials from USDA agencies, held focus group meetings, and used several survey instruments. We have also gotten input from your committee, Mr. Chairman, as well as from the other agricultural oversight committees. These initiatives helped us gain a more thorough knowledge of issues critical to the Department and a better understanding of the specific needs of our customers and shareholders. We are also developing performance measures to assess our progress in achieving our goals and objectives under these plans so that we might make adjustments as appropriate to maximize our effectiveness.

We also use a strategic planning process to determine where to specifically focus our resources. This process dovetails with the strategic plans required by GPRA and begins with the construction of profiles of all USDA agencies and major functional areas. We use these profiles to help us review the Department's programs to determine where large dollar losses could occur or where public health and safety could be affected. We also consider such issues as new or changed legislation or regulatory requirements, prior audit and investigative findings, suggestions provided by departmental officials, and fraud in departmental programs. With this approach in mind, we hold planning meetings to determine how best to allocate our resources so that we may perform work in areas that impact the most critical issues and priorities affecting the Department.

During the year, we continued to work closely with agency officials to address key issues and to expand our cooperation with other Federal, State, and local law enforcement and audit agencies to broaden the impact of our work. Our achievements would not be possible without the actions of the Department's program managers who have worked closely with us in carrying out our mission. Working together, our staffs identified program weaknesses and program violators. Capitalizing on the staffs' respective expertise, we created solutions for positive action.

In fiscal year 1997, we are focusing our audit efforts on the Department's financial accounting systems, farm credit programs and civil rights, implementation and compliance with the Farm Bill, and the Food Stamp Program including its Electronic Benefits Transfer project. Our investigative priorities include the timely and thorough investigation of threats to the health and safety of the public, employee integrity issues, and fraud in the Department's loan, regulatory, and benefit programs.

With the Committee's support, we are now authorized to receive proceeds from forfeiture actions arising from our investigations. During this past year, all of our special agents received specialized training on this new law enforcement tool and how it could be used. Extensive administrative control systems were established to monitor and track forfeiture actions and any proceeds identified to be provided to the Government. These are now all in place and operational. While over \$10 million has been identified for possible forfeiture to the Government as a result of our investigative actions since OIG was provided the authority in November 1995, to date, OIG has not received any funds from these proposed forfeitures. We are continuing

PART 1

1209

to work with the Department, the Office of Management and Budget, and the Departments of Treasury and Justice to ensure OIG receives its appropriate share of proceeds from these proposed forfeited assets as approved by you.

I would also like to mention that in recognition of USDA OIG'S standing as a Federal law enforcement agency, we were the only OIG requested to provide special agents to assist in providing security at the summer Olympics this past year in Atlanta. Sixty OIG agents worked on this special security assignment in Atlanta for approximately 1 month under the auspices of DOJ at a cost to OIG of nearly \$700,000 of which DOJ reimbursed us \$256,000—a \$444,000 shortfall we have had to absorb from other budget areas.

Mr. Chairman, at this time, I would like to highlight some of our audit and investigation activities.

AUDIT AND INVESTIGATION ACTIVITIES—ENTITLEMENT PROGRAMS

FOOD AND CONSUMER SERVICE (FCS)

Food Stamp Program (FSP)

The Food Stamp Program represents almost 45 percent of the Department's budget for fiscal year 1997. Approximately \$26.4 billion will be available for issuance in food stamps. This is the largest program activity in the Department and, due to the ease with which food stamps may be illegally exchanged or used as a secondary currency, it is the program most vulnerable to fraud, waste, and abuse. With about 1 in 10 Americans and over 190,000 retail stores participating in the Program, OIG must continue to channel substantial resources to FSP fraud prevention and detection efforts.

During fiscal year 1996, we devoted approximately 46 percent of our investigative resources and almost 11 percent of our audit resources to FSP. We completed and issued 691 reports of investigation and 13 audit reports. The results of our work included 766 indictments, 593 convictions, and over \$21 million in fines, restitution, recoveries, and other monetary penalties. Following are some examples of our food stamp audits and investigations.

Issues Affecting Nationwide Implementation of Electronic Benefits Transfer (EBT)

The EBT system is designed to replace food coupons and other Federal benefits with electronic delivery of those benefits. The national strategy includes expanding EBT services to all States by fiscal year 1999. Under agreement with the President's Council on Integrity and Efficiency (PCIE), we were assigned the lead to review EBT systems that deliver State-administered programs. State-administered programs include USDA's FSP and the Special Supplemental Food Program for Women, Infants and Children (WIC), the U.S. Department of Health and Human Service's Aid to Families with Dependent Children (now Temporary Assistance to Needy Families (TANF) under welfare reform), and States' general assistance programs.

Currently, 15 States have operational EBT systems which, in fiscal year 1996, issued about \$1.4 billion in food stamp benefits. Five of the systems operate statewide. An additional 30 States have selected an EBT processor and are currently negotiating contracts. FCS anticipates these systems coming on-line in fiscal years 1997 and 1998. Program spending levels for fiscal year 1996 were about \$22.8 billion for food stamps, \$4 billion for WIC, and \$16.9 billion for TANF.

We are very supportive of EBT and believe it will reduce trafficking by recipients as well as make trafficking by retailers easier to detect and investigate. EBT takes food stamps off the street.

During this past fiscal year, we completed audits of on-line EBT systems delivering food stamp benefits in four States: Maryland, New Jersey, South Carolina, and Texas. We also performed reviews at FCS' headquarters. Security policies and control processes in the four States were adequate to ensure timely and accurate availability of food stamp benefits to recipients and payments to authorized stores. However, we did identify some areas needing improvement, as well as issues that could impact nationwide implementation of EBT. For example:

- Some States proposed expanding their EBT systems into non-EBT States so that recipients visiting or shopping in the non-EBT States would be able to use their EBT cards. Non-EBT retailers could transact sales to out-of-State EBT cardholders independently of FCS' authorization and without an FCS site visit to the store. If implemented, this proposal could diminish FCS' control over a store's eligibility to transact EBT benefits.
- The Security features of EBT cards for operational systems, as well as future EBT systems, may not be adequate. Inexpensive security features, such as fine-line printing and holograms, are not required to be included on the cards al-

PART 1

1210

though they would enhance security of the cards and systems greatly. FCS is proposing regulations which include the EBT card security specifications previously mentioned.

- Some inconsistencies in procedures may affect interstate operability of EBT systems. Some States reimburse stores daily for their sales while at least one State waits until the stores request payment. This procedure would potentially allow the processor operating the State's EBT system to hold Government funds indefinitely and would also impact future interstate transactions.
- FCS' regional offices did not fully reconcile EBT processor drawdowns of Federal funds to store transaction data. We found \$37 million in discrepancies, but we did find that the processors requested the proper amount of Federal funds from the U.S. Department of the Treasury.
- Operating controls established by EBT processors identified some concerns: security requirements for processor personnel were not clearly defined, certification standards for third-party processors had not been established, and additional audit requirements for the systems themselves needed to be included in the contracts so that audit opinions rendered on financial statements of agencies being serviced by the EBT processor are not qualified.

We recommended that FCS modify its data base to identify stores eligible to process EBT transactions and that it continue to develop procedures to ensure that out-of-project stores it authorizes to accept EBT transactions are eligible to do so. We also recommended that FCS expedite the issuance of proposed regulations concerning EBT card security specifications and ensure that EBT settlement procedures with stores are consistent.

To strengthen processors' controls, we recommended that FCS direct the States to develop minimum personnel security requirements, develop certification guidelines for third-party processors, and include additional requirements for audits of EBT systems in all contracts. Concerning FCS oversight, we recommended that the national office ensure that complete reconciliations between processor drawdowns and store transactions are performed and that processors maintain accurate EBT retailer data bases. FCS was in general agreement with our findings and recommendations and has initiated corrective actions to address many of these issues.

EBT data has also increased our ability to identify food stamp trafficking. For example:

- Following separate OIG investigations, the owners of two small Baltimore, Maryland, grocery stores pled guilty to trafficking in nearly \$1.5 million worth of food stamps through the EBT system. The owner of one of the stores was sentenced to 1 year in prison while the second owner was sentenced to 2 years in prison and ordered to pay restitution of \$250,000 to USDA. In addition, over \$92,000 from the proceeds of these illegal actions has been seized or forfeited to the Government.

During our investigation, we found that one of the owners thought he had developed a tactic which would allow his illegal trafficking to go unnoticed. Since most trafficking transactions are conducted in even dollar amounts, he had instructed his employees to add \$3 and some change to all trafficking transactions at the store. We found that a total of \$745,623, or 92 percent of all food stamp transactions exceeding \$20 at the store, included this "three dollar and change" multiple during the 18 months the store was open.

These cases are perfect examples of how EBT allows us to use computerized data to conduct sophisticated analyses of store redemptions in order to identify schemes and to prove the amount of fraud against FSP. Prior to EBT, this store owner's scheme may have gone unnoticed since this type of incriminating information was rarely maintained in the store's records.

Other Food Stamp Trafficking

Some other examples of food stamp trafficking we have investigated are:

- The owner of two stores in Columbus, Georgia, pled guilty and was sentenced to 4¼ years in Federal prison and fined \$240,000 for participating in a scheme to illegally traffic and redeem over \$2.1 million in food stamps through the two store accounts. Two accomplices in the scheme cooperated with the Government, entered guilty pleas, were each sentenced to 3 years' probation, and fined a total of \$35,000. The store owner, who was on probation from a populous trafficking conviction and was barred from the program, devised a scheme to continue participating in the program by placing the ownership of the two stores in the names of his accomplices. On numerous occasions during the investigation, the accomplices bought food stamps for cash from undercover agents and operatives.

PART 1

1211

- Two separate investigations in Alexandria, Louisiana, resulted in the conviction of eight persons for conspiracy to traffic in approximately \$5.9 million worth of food stamps. All eight were sentenced to 1 to 4 years in prison, fined nearly \$200,000, and ordered to pay restitution of \$6.2 million. To date, assets worth \$383,000 have been seized.
- In Riverside, California, 16 business owners/managers and their associates were arrested and charged with trafficking in food stamps and receiving stolen property. As an example of how food stamps are used as a second currency, food stamps were exchanged for cash, guns, and three vehicles at eight different businesses, only four of which were authorized to accept food stamps. One of the food stamp transactions involved the purchase of a Mercedes Benz automobile from a car dealership. OIG agents worked jointly with California's Office of Alcohol Beverage Control and the Riverside Police Department.

Food Stamp Errors Amount to Over \$2.4 Billion Annually

With escalating caseloads over the past several years, the amount of erroneously issued benefits increased. The combined value of FSP overpayments and underpayments jumped from \$1.1 billion in fiscal year 1989 to about \$2.4 billion in fiscal year 1993. Error rates fell in fiscal year 1994, but the dollar value of combined errors still totaled \$2.3 billion. In fiscal year 1995, FCS developed an error rate reduction plan which called for FCS to help States implement error rate reduction strategies. FCS concluded that some States had not committed enough resources to reduce the error rates. Our review corroborates that more FCS involvement with States is needed since past actions had not led to sustained reduced error rates.

While the error rates fell in fiscal year 1994, we identified several areas that FCS should address. For example:

- Over the last 14 years, States were liable for \$939 million in sanctions but paid only \$6 million because legislation and settlement actions allowed States to eliminate or substantially reduce their liabilities. Therefore, there was little incentive for States to take corrective action.
- States' corrective action plans to reduce errors did not adequately address deficiencies and were not always implemented. Corrective actions did not address deficient staffing levels or backlogs in processing claims.
- Caseworker staffing levels had not kept pace with caseload growth. Workers' caseloads had increased 36 percent over the last 5 years and substantial disparities in workers' caseloads existed between States. Excessive certification periods also had a negative impact on error rates. For example, in West Virginia, about 82 percent of the caseload of 124,050 households had certification periods of 12 or more months. These cases accounted for 85 percent of the State's error rate.
- Caseworkers did not always use the Income Eligibility Verification System (IEVS), and States did not effectively monitor its use. IEVS helps caseworkers to verify the accuracy of reported income and also to identify unreported income. State automated systems did not automatically add Government benefit payment increases, such as Social Security, to households' incomes. Income errors are one of the primary reasons for error rates.

We recommended that FCS pursue penalties against States with histories of high error rates and perform onsite reviews of States' corrective actions. We also recommended FCS evaluate States' caseworkers' staffing levels, review States' use of IEVS, and evaluate the feasibility of automatically recognizing Government program benefit increases in the food stamp case files. FCS agreed with our recommendations or proposed alternative solutions to the deficiencies.

Bank Encoding Procedures Need Monitoring

Approximately \$21 billion annually in food stamps is deposited by 10,000 financial institutions into 37 Federal Reserve Banks. Food stamps must be accompanied by a redemption certificate when deposited into a financial institution. Under agreement with the Federal Reserve Banks, the financial institutions are responsible for verifying that stores have deposited food stamps equal to the amount recorded on the redemption certificate. We evaluated FCS' controls to ensure that store redemption certificates processed by financial institutions were accurately recorded in the agencies tracking system.

Our analysis of data on high-redeemer stores and reviews of food stamp redemption certificates identified five financial institutions with questionable redemptions totaling over \$8.5 million. Redemption certificates had been altered to show that food stamp redemptions were for amounts greater than stores' original deposits. Although we did not find evidence of fraud, we did find that food stamp deposits were not always processed in a manner that provided FCS with accurate redemption in-

PART 1

1212

formation which, in turn, severely hindered FCS' ability to properly monitor the food stamp redemption process.

We found that, over a 2-year period, one financial institution had altered at least 625 redemption certificates by changing totals and encoding redemption certificates for more than authorized stores had deposited in food stamps. Because the financial institution lacked internal controls to assure that employees correctly processed food stamps, bank officials revised their operating procedures to include review of food stamp transactions in their internal audits. We also found that the FCS officer-in-charge who had oversight over this bank recognized possible alterations of redemption certificates but did not follow up to determine the underlying problems. DOJ is pursuing civil penalties against this financial institution.

We recommended that FCS (1) issue guidance to all authorized stores on the proper redemption and processing of food stamps and obtain the assistance of all Federal Reserve Banks to do the same for financial institutions, (2) advocate that financial institutions incorporate reviews of food stamp transactions into their internal auditing procedures, and (3) instruct field office personnel on how to properly follow up on indications of irregular activities found during their reviews. FCS officials agreed with our findings and recommendations and are taking corrective actions.

CONSUMER PROTECTION

FOOD SAFETY AND INSPECTION SERVICE (FSIS)

Historically, OIG's highest investigative priority has involved health and safety issues affecting USDA programs. We continue to believe that this should receive our immediate attention whenever serious violations are suspected which may endanger the wholesomeness of America's food chain.

In one such case, the owner of a California poultry ranch, along with his wife and brother, were indicted for violations of the Federal Poultry Products Inspection Act for slaughtering chickens in adulterated conditions without the benefit of inspection and then transporting the adulterated poultry in commerce for human consumption.

During the joint investigation with the State of California's Department of Food and Agriculture, we found that chickens were slaughtered in a filthy facility using equipment that was contaminated by rats, fecal material, decomposing chickens, and the presence of cats and dogs in the immediate slaughter area. The equipment used for slaughter consisted of a plywood table with deep score marks, barrels, and a knife with a rusted blade. The table was adjacent to a row of wire cages which were covered with an accumulation of matted feathers and also contained decomposed chickens which had been present for an extended length of time. The plastic barrels contained feathers and what appeared to be chicken fat or feather oil. No hot water supply was available to allow for cleaning. During the course of the investigation, OIG special agents observed uninspected, adulterated poultry products being entered into commerce in order to be sold to the public for human consumption. This case is currently awaiting trial.

In another case, the owner, the owner's son-in-law who was also the plant manager, and the Federal food inspector assigned to a North Carolina pork processing plant were convicted of offering rotten pork products for sale in commerce. The owner and the plant manager were sentenced to 2½ years and 6 months' imprisonment, respectively, and fined nearly \$10,000. The Federal inspector was sentenced to 2 years in prison and fined \$3,500.

Our investigation disclosed that hogs, which were already dead when they arrived at the plant, were processed and represented as having been inspected and passed under the Federal Meat Inspection Act. Spoiled and rotten meat was either washed in water and bleach or mixed with good product in order to hide its true condition. Our investigation also found that the FSIS meat inspector failed to perform his inspection duties, was involved in disguising the actual condition of the rotten meat, and was involved with other inappropriate activities at the plant.

In an investigation in Pennsylvania, a meat market in Folcroft pled guilty to selling adulterated meat and was sentenced to 1 year of probation and fined \$10,000. Also, the presiding judge prepared a "public notice" stating how the market violated the Federal Meat Inspection Act and sold adulterated meat products, which he ordered to be published three times over a 3-week period in a local newspaper.

During the investigation, which was conducted jointly with FSIS compliance officers, the driver of a rendering truck delivered spoiled meat, bones, grease, and floor sweepings from his truck into the meat market. The spoiled meat was washed, trimmed, ground, mixed with the other waste products, made into ground beef or ground beef patties, and sold to the public. The market purchased the waste products from the truck driver approximately eight times over 7 months.

PART 1

1213

During the course of the investigation, the driver encouraged a witness to lie to OIG special agents in order to thwart the investigation.

Eventually, the driver pled guilty to the sale of adulterated meat and conspiracy and following a trial, was convicted of witness tampering. He was sentenced to 1 year and 1 day in prison followed by 2 years' probation and fined \$3,130.

FARM PROGRAMS

FARM SERVICE AGENCY (FSA)

Farm Credit Programs—State Mediation Program Mismanaged

At last year's hearing, I advised the Committee of a concern regarding our authority. I want to update you on this issue at this time. The Texas attorney general instructed Texas Tech University (TTU) officials to deny OIG access to mediation program records, asserting that such records were confidential under Texas law. We have issued Inspector General subpoenas to obtain the records, and litigation in this matter is pending.

We identified a potential conflict of interest for three of the four full-time mediation program employees. A Texas Agricultural Mediation (TAM) official, who in a licensed attorney, had a private law practice specializing in farm matters such as delinquent loans, appeals, bankruptcy, and reorganization. This official confirmed that he sometimes represented USDA borrowers in his law practice. Another employee of TAM was also an attorney with a private law practice. In addition, an employee on the Texas Tech Agricultural Financial Analysis Project had outstanding USDA farmer program loans totaling approximately \$475,000 and had not taken any action in over 10 years to repay or otherwise resolve the delinquency.

To meet the 50-percent matching fund requirement during fiscal year's 1989 through 1993, TTU claimed a portion (usually 25 percent) of the salaries paid to nine university professors and a department chairperson as part of the cost to operate the mediation program. Since these individuals did not work with the mediation program, TTU received excessive grant reimbursements totaling over \$485,000 during this period. TTU also claimed a TAM official as a full-time employee of the mediation program. However, this official routinely taught courses at the university, was allowed 10 to 12 hours per week by TTU for personal business purposes, and routinely served during normal work hours as an active member of various professional organizations. His salary, benefits, and related indirect costs charged to the Federal Government totaled over \$479,000 during fiscal years 1989 through 1995.

TTU mediation program accounting records showed \$347,500 charged to the "Mediation Training" account during fiscal year 1993 through the third quarter of fiscal year 1995; however, we could not identify any formal training provided to TTU or other mediators.

We recommended that the FSA Administrator cancel the certification of the agricultural mediation program administered by TTU and instruct the FSA Texas State Executive Director to implement an alternative mediation program (regulations already provide for such a program) for Texas borrowers. We also recommended that FSA recover the excessive grant funds, clarify the extent and type of mediation training required to meet the mediation program certification requirement, and evaluate the effectiveness of the agricultural loan mediation program by determining whether grant funds are being used effectively. FSA has decided to recertify the TTU mediation program for fiscal year 1997; however, FSA officials stated that the program would not be funded until all issues identified in the audit report are resolved. During our continuing review of the State certified mediation programs, we were denied access to mediation program records for the Michigan, North Dakota, and Minnesota mediation programs. We continue to meet with the FSA Administrator and other Department officials to discuss resolution of these issues.

FSA State Office Officials Improperly Handled Loans and Loan Servicing

We received complaints that high-level Texas FSA officials disregarded regulations and procedures and approved improper loans and loan servicing actions for borrowers who did not meet program requirements. We investigated 2 cases, the FSA National Office reviewed 25 cases, and the Rural Development National Office reviewed 2 cases. We then examined the adequacy of the agency national office reviews.

Our work and the agency reviews confirmed that State office officials violated agency procedures and regulations and approved improper loans and loan servicing actions. Despite the objections of operating personnel, State office management officials approved eight borrower groups for \$2.6 million in unauthorized assistance. Four other cases of State office officials not following regulations were also identified by the national office reviews. However, no action was taken by national office

PART 1

1214

officials to follow up or fix responsibility for the improper loans and servicing actions. We were told that the FSA review did not support the allegations.

We disagreed and recommended that the FSA Administrator (1) establish and hold the applicable State officials accountable for not following regulations and procedures in approving loans and providing servicing to individuals who did not meet program requirements, (2) determine whether the responsible national office official properly fixed responsibility and reported State office management's actions that led to the improper loans and servicing, and (3) ensure that future national office reviews address causes and establish responsibility for errors or mismanagement. The FSA Administrator agreed with the recommendations. The primary State officials involved have separated from the agency, and the responsible national office official has been reassigned.

Other Farm Credit Program Activity

A Mississippi cotton farmer was sentenced to 34 months in prison in connection with a fraudulent scheme that relieved him from FSA indebtedness of nearly \$1 million. He was also fined \$10,000 and ordered to pay restitution of \$965,600 to FSA and \$148,000 to a federally insured bank. The farmer filed false petitions in his Chapter 7 bankruptcy, concealing his assets and transfers of real estate and income. The farmer transferred two dwellings to a third person just before filing his bankruptcy petition, with an agreement to regain title to the properties after the bankruptcy discharge, and concealed farm-related income of \$116,000 from the court. The farmer also purchased real estate and automobiles in the name of his wife while under the protection of the bankruptcy court and concealed these purchases from the court.

Farm Program Payments—90-Day Rule

The Food, Agriculture, Conservation, and Trade Act of 1990 provides that, in the absence of misrepresentation on the part of a producer, any determination FSA makes regarding the producer's participation in farm programs shall be final after 90 days, and no action shall be taken to recover overpayments. This 90-day rule applies to erroneous decisions, calculation errors, or overpayments discovered on or after November 28, 1990. The Federal Agriculture Improvement and Reform Act of 1996 continues the 90-day rule, known alternatively as the finality rule.

In an earlier OIG audit, we questioned the need for this rule which allows producers to receive unearned benefits. These kinds of unearned benefits are expected to continue. We determined those cases that are valid under the 90-day rule generally involve only small amounts, where repayment would not place an unreasonable burden on producers. Furthermore, FSA has authority to grant relief to producers if conditions warrant. We recommended that FSA officials seek legislative change to rescind the 90-day rule. Although FSA officials drafted a legislative change, the Department has not formally submitted the change to Congress. The General Accounting Office is currently reviewing this area, and a report is expected soon.

Producers Continue to Circumvent Payment Limitations

The Food, Agriculture, Conservation, and Trade Act of 1990 also continued the \$50,000 limit on 1991 through 1995 deficiency payments and the \$100,000 limit on disaster payments. Our reviews continue to find that producers are using schemes or devices to abuse or circumvent the payment limitation requirements by misrepresenting their farming operations. Some of these situations also impact upon the Federal Crop Insurance Corporation (FCIC) programs which are now administered by the Risk Management Agency (RMA). Following is an example of our reviews.

Large Landlords Used Combination Leases to Circumvent Payment Limits

If large landowners lease their land for a share of the crop, Government payments and benefits up to the limitation are attributed to them for their share of the crop. If they lease their cropland to others for cash, all Government payments and benefits are attributed to the tenants or lessees. However, FSA also authorizes combination cash-share leases where the landlord receives a specified cash minimum together with a share of the crop. FSA determines whether individual combination leases are to be considered a cash or share lease for program payment purposes. Combination leases are considered cash leases, with all program payments going to the tenants if the minimum payment or guaranteed production amount specified in the leases is the normal rental rate for the area. If not, the combination leases are considered share leases.

We reviewed the operations of large landowners in two States to determine whether combination leases were being used to circumvent payment limitation provisions. We found that the combination lease arrangements approved for use by one FSA State office contained provisions establishing lease payments at the greater of

PART 1

1215

a cash minimum or a specified share of the total crop revenues or proceeds. The total crop revenues or proceeds included FSA deficiency payments and price support benefits. In effect, some tenants in this State were required by an FSA-approved lease arrangement to pay landlords a share of Government payments and benefits that the tenants received from FSA.

Using these combination leases, two large landlords received over \$1 million in Government benefits indirectly from tenants which they would not otherwise have been eligible to receive because of payment limitation provisions. These arrangements also violated FSA regulations which state that no program payment shall be approved if any lease required by the landlord causes tenants to pay the landlord any Government payment. In contrast, FSA officials in other States under review would not approve combination leases that required tenants to pay any portion of their Government payments to landlords.

We recommended that FSA determine whether the FSA-approved combination leases permitted two landlords in one State to circumvent payment limitation provisions and, if so, to either recover or waive recovery of over \$1 million in payments and benefits provided to tenants which were then given to landlords. We also recommended that FSA officials clarify and consistently apply regulations prohibiting landlords from using combination leases or other agreements requiring tenants to pay them any Government payments or price support benefits earned by the tenants under FSA programs. FSA replied that it will not take action to recover the \$1 million in questioned payments because the producers provided sufficient information for the county committees to make determinations but the county committees read and misinterpreted the leases. However, FSA staff agreed to clarify lease provisions.

Implementation of the Federal Agriculture Improvement and Reform Act of 1996

We evaluated the implementation of the Federal Agriculture Improvement and Reform Act of 1996 (the Act) in order to provide an early warning system of potential control weaknesses as a means to reduce future fraud and waste in the new programs legislated by the Act. We considered the phaseout of acreage reduction programs and the payment of deficiency payments based upon target prices and the establishment of "production flexibility contracts" as the major portion of the Act. Therefore, a mayor focus of our evaluation was on the Agricultural Market Transition Act (AMTA) portion of the Act.

We initiated a three-phase review to assess the implementation of AMTA. This review is a cooperative effort between OIG and FSA and is being conducted concurrently with program implementation. FSA has been receptive to our early involvement and is taking immediate action on review findings when needed.

In the first phase, we focused on producer enrollment and visited 52 county offices in 13 States. Some other examples of concerns we brought to FSA's attention were:

- States were inconsistent in identifying the regions that could be approved to double-crop faults and vegetables. FSA subsequently removed some questionable regions from the list before it was printed in the Federal Register.
- Designated payment shares for landlords and tenant farmers were approved beyond 1996 even though there were no lease agreements between the two parties.
- Farms were approved for payment even though contracts did not show all the necessary signatures.
- Proper powers of attorney were not on file to support signatures on contracts and crop insurance waivers.

We recommended that FSA staff (1) obtain the landlord's concurrence in cases of share leases, (2) obtain proper documentation for contracts, and (3) reconsider the criteria for double-cropping history.

We have since begun the second and third phases of our assessment of AMTA implementation. Phase two will review FSA's controls over the computer software that calculates producer payments. It will verify that payments are properly computed and reconciled to each producer's supporting contract data and that required administrative offsets are made. We will also verify that program benefits are paid to only authorized individuals.

Phase three will assess FSA's controls over AMTA compliance activities. This review will examine internal controls over conversion of contract acreage to non-agricultural use, planting flexibility, protection of contract acreage from weeds and erosion, and producers' reporting of fruit and vegetable acreage.

Further Problems Noted with the Ad Hoc Disaster Assistance Program

In the past, we reported problems with the 1993 Ad Hoc Disaster Assistance Program (DAP). As a result, legislative changes were made and implemented by FSA to improve the program for 1994. These changes included authority to reduce the

PART 1

1216

payment rate for crops not planted or harvested. Regulations were also changed to require that producers provide evidence that nonprogram crops, such as fruits and vegetables, were produced on the farm for an identified market. FSA has also implemented better controls over compliance with the \$2 million gross income limitation provisions.

However, we found problems in the 1994 DAP similar to those we reported for the 1993 DAP, although at a lower rate. Ad hoc disaster programs have now been replaced by the noninsured crop assistance program (NAP) with passage of the Crop Insurance Reform Act of 1994, which is effective for 1995 and subsequent years. Since similar procedures exist for the management of NAT as used for DAP, we expect to continue expending substantial resources to evaluate disaster assistance activities.

For the 1994 ad hoc program, we continued to find problems with the reporting of production and farming practices and the establishment of yields and rates. However, the number and monetary value of claims in 1994 have been substantially reduced. FSA paid approximately \$1 billion for crop disaster losses claimed under the 1994 disaster assistance program. We performed 26 audits in 17 States. These 26 audits covered a total of \$13 million in loss claims, and we identified overpayments of \$5.3 million. Approximately \$3 million of the overpayments were caused by administrative error and were forgiven under the 90-day rule. The agency is taking action to collect the other \$2.3 million in overpayments caused by improper reporting by the producers. In these reports, we also questioned about \$2.8 million in 1993, and prior years, disaster assistance payments.

In our investigative activity, two former FSA county officials and 10 other individuals in Kentucky pled guilty to participating in illegal schemes relating to the Feed Grain Program, the Burley Tobacco Program, and the Disaster Program. The parties involved in the fraud formed fictitious program participants, allowed producers to exceed established tobacco quotas, filed false disaster claims, and paid/received kickbacks from other members of the fraud scheme. The fraud in this case caused a loss to the Government of approximately \$850,000.

Six of the 12 defendants received prison sentences ranging from 4 to 57 months, while the others received varying periods of probation and home detention. Additionally, all 12 were ordered to pay a total of more than \$600,000 in restitution and fines. The former FSA County Executive Director, who directed the schemes and received kickbacks, was given the longest sentence, 57 months, and, jointly with another defendant, was ordered to forfeit \$246,000 in assets.

NATURAL RESOURCES AND ENVIRONMENT

FOREST SERVICE (FS)

Preseason Inspections of Airtankers Were Poorly Managed

Airtankers are large multi-engined aircraft that drop fire retardant chemicals to suppress or extinguish wildfires. These aircraft operate through areas of reduced visibility, in close proximity to rugged terrain, and frequently in turbulent air. They are required to meet standards above and beyond those established by the Federal Aviation Administration for basic air worthiness. Preseason inspection by FS inspectors is designed to certify compliance with these additional, more stringent, requirements. Our review showed that the agency was not effectively managing this important program.

Airtankers with Uncorrected Deficiencies Flew Firefighting Missions

FS procedures allowed approval cards to be issued to airtankers even though inspectors had identified serious deficiencies. Airtankers sometimes flew hazardous firefighting missions with broken or malfunctioning equipment. For example, FS inspectors determined that the temperature data amplifier on a C-130A airtanker was inoperative. The temperature data amplifier reports engine temperature to fuel control. Fuel control uses this data to decide to increase or decrease fuel to the engine to keep the temperature constant. The airtanker began flying missions for FS and continued to do so for almost 2 months before replacing the defective equipment.

Investigations of Fatal Aircrashes Were Conducted by the Same Inspector Who Approved the Airtankers and Pilots for Duty

We found that the same inspector who had initially signed the preseason inspection report was assigned as part of the team to investigate the causes and circumstances surrounding two different fatal airtanker crashes. In one instance, the FS employee signed the preseason inspection report showing approval contingent on the correction of several deficiencies. There was no documentation that the defi-

PART 1

1217

ciencies were corrected before the aircraft began fighting fires. The airtanker crashed into the Lolo National Forest, killing both the captain and the copilot.

In the subsequent FS investigation, the employee who initially approved both pilot and aircraft was assigned responsibility for “aircraft and pilot approval records.” The report concluded that “Both piloted were qualified and approved” and “The aircraft was airworthy at time of takeoff on mishap flight.”

Officials Did Not Properly Assess Risks

We also found that FS officials did not comply with risk management guidance set forth in the agency’s Aviation Safety Plan. We observed that important decisions were made without all the facts or the concurrence of management. As a result, FS has not ensured appropriate maintenance for ex-military airtankers previously transferred to contractors. In addition, FS did not follow up or perform risk analysis to determine the impact of information reported by the National Transportation Safety Board (NTSB) concerning the cause of a fatal FS airtanker accident. According to the NTSB Brief of Accident, the most probable cause of the accident was deemed to be fuel leakage due to O-ring failure. Upon receiving the NTSB conclusions, the Aviation Safety Manager determined that no action was needed and simply filed the report away. When we became aware of this potentially dangerous situation, we recommended that FS inspectors immediately check O-rings on similar airtankers to ensure that the same problems would not cause another fatality.

We recommended that FS officials immediately implement the necessary measures to obtain compliance with the management controls already contained in their own policies and procedures.

We also recommended that FS officials exert some type of meaningful supervision to ensure appropriate assessment of risk prior to any future transfer of ex-military aircraft to airtanker contractors. Prudent risk management dictates that FS safety officials consider all information available to include obtaining and reviewing all NTSB reports of aviation incidents involving FS-owned or contract aircraft to identify potential safety concerns.

FS management concluded that our recommendations would help strengthen the preseason airtanker inspections and more effectively link management’s involvement with aviation and safety specialists in identifying and assessing risks. In December 1996, FS submitted a plan to address our recommendations. Once the specific actions outlined in this plan are in place and operating, we believe that the preseason inspection program and overall air safety program will be more effective.

Cooperative Forestry—Grant Funds Advanced in Lump Sum Cost the Government \$11 Million

The America the Beautiful Act of 1990 authorized FS to give the National Tree Trust Foundation (NTTF) a \$19.8 million grant to promote the planting and care of trees. FS advanced the entire amount to the foundation in one lump sum even though Federal regulations required that the funds be advanced only as needed. This decision to advance all funds at once cost the Government over \$7.8 million in interest on funds the Treasury borrowed through the end of October 1995. In addition, the Treasury paid \$3.2 million in interest to NTTF because the foundation had invested a major portion of the grant funds it received (i.e., \$19.8 million) in U.S. Government securities. Ironically, a provision in the laws that created the grant allows the foundation to keep the interest it received from Government investments and another \$1 million in interest the foundation earned from other investments.

The purpose of the grant was to enable the foundation to make further grants to local organizations to plant and care for trees. However, during the 5 years the foundation has been operating, it has made only \$792,000 in grants. Not only did the foundation not grant the \$19.8 million, but the small grants it did make were less than one-fifth of the \$4.2 million interest it acquired as a result of its investments of Government funds. The grant required the foundation to match Federal funds with donations from the private sector. We found that only two corporations have contributed to the foundation in the amount of approximately \$400,000.

Since the original grant period was due to expire in September 1996, we recommended that FS request NTTF return unspent grant funds to the Treasury. We based this recommendation on the fact that FS would no longer have oversight over the grant funds and would have no assurance that the funds would be spent as intended by Congress. FS responded that it would request that, instead of the funds being returned, an agreement extending FS’ oversight of the grant be negotiated with NTTF. This agreement was signed by NTTF and FS in October 1996 and continues FS oversight over the grant for an additional 5 years.

PART 1

1218

NATURAL RESOURCES CONSERVATION SERVICE (NRCS)

Inappropriate Cooperative Agreement

Based on a Congressional request, we evaluated the legality and propriety of a cooperative agreement between NRCS and the Minority Enterprise Financial Acquisition Corporation (MEFAC). The stated purpose of the cooperative agreement was the establishment of economic development to assist rural communities on business and economic issues. We found that NRCS officials used Rural Development funding provided by the Rural Business Service (RBS) to enter into an inappropriate cooperative agreement with MEFAC. The RBS agency official took direct personal action to facilitate the award of the \$250,000 agreement and subsequent payments totaling \$150,000. The funds were channeled through the NRCS Alabama State office and ultimately used, in part, to benefit pastors and active lay persons of specific religious denominations.

As one example of the type of control procedures that were bypassed, the RBS agency official personally signed forms SF 270, Request for Reimbursement, in lieu of requiring signatures from MEFAC officials. This practice was unusual, as the certification was designed to be signed by an official of the entity receiving the payments.

MEFAC drew down and spent \$150,000 of the \$250,000 cooperative agreement and did not conduct any of the regional workshops required by the statement of work or maintain accounting records showing the disposition of the funds expended. The scattered records, which were provided in response to our request, confirmed material noncompliance with regulations for the use of cooperative agreement funds, to include excessive spending and unallowable costs. As a result, neither the Government nor the rural communities received value for the \$150,000 in Federal funds expended.

We recommended terminating the cooperative agreement and recovering the funds expended. NRCS and RBS agreed with our findings and recommendations and planned corrective action to include cancellation of the cooperative agreement and efforts to collect the expended funds.

INSURANCE

RISK MANAGEMENT AGENCY (RMA)

Audit Verifies Allegations of Crop Insurance Abuse

During the spring of 1996, the Coastal Bend area in south Texas experienced a severe drought that impacted the three primary crops in the area: corn, cotton, and grain sorghum. FCIC had established the same final planting date (April 195) and late planting period (April 16 to May 10) for these three crops. We received complaints that insurance agents were using a loophole in the standard crop insurance policy to give insureds in this area an unfair advantage. According to the allegations, double and even triple indemnities were paid to producers who planted two or three different crops sequentially on the same acreage before the May 10 deadline. The normal practice was to replant the original crop if it did not make an adequate stand.

We determined that producers were able to increase their indemnity payments by (1) not replanting the original crop, (2) planting grain sorghum or corn after cotton failed to mature in soil treated with a yellow herbicide (e.g., Treflan), and (3) lose adjusters making questionable assessments of seed viability. Rather than producers replanting the original crop when it failed, reinsurance companies had the acreage appraised and released for further use. Therefore, depending on the dates the acreage was released, it was possible to have as many as three different crops fail on the same acreage during the same crop year.

We questioned whether it was the intent of the crop insurance laws to allow multiple indemnity payments in this situation. Also, some insureds were planting grain sorghum or corn in fields where they had applied Treflan within 12 to 18 months, contrary to the manufacturer's recommendation. Some of these insureds were attempting to plant a second crop on acreage applied with Treflan by planting deep enough to avoid the chemical's effects. In addition, some loss adjusters were determining potential crop productions of zero, based on seed appearance and condition. This appraisal method has not been approved by RMA and, according to Extension Service representatives, may not accurately determine viability.

Based on the initial results of the joint review, RMA issued guidance to reinsurance companies. FCIC plans to review all the insurance claims filed in the area for evidence of abuse, and OIG will monitor this review.

PART 1

1219

CONSUMER PROTECTION

ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

USDA-Licensed Individuals Keep Exotic Pets That Could Endanger the Public

Under the Animal Welfare Act of 1966, APHIS is responsible for regulating the use of warm-blooded animals in research, exhibition, and commerce in order to ensure their humane treatment. APHIS issues class "C" licenses to individuals, carnivals, zoos, circuses, and education exhibitors who wish to display animals to the public. We reviewed APHIS' policies and procedures related to the licensing of animal exhibitors, particularly those applying to exhibit dangerous or exotic animals such as lions or tigers. Our review focused on licensees with 10 or fewer animals because of the greater likelihood they may not be true exhibitors and may not be properly qualified to safely handle dangerous animals.

Although APHIS' exhibitor licensees were intended solely for those wishing to exhibit animals to the public, we found that the broad wording of APHIS' regulations has allowed a wide variety of individuals to obtain licenses. Sixty-four percent of the licensees we visited did not exhibit their animals but instead maintained them as personal pets. These individuals had obtained exhibitor licenses to circumvent State and local laws intended to protect the public by restricting ownership of such animals.

Many of the animals, such as lions, bears, and wolves, kept by these individuals are considered dangerous and were often kept in urban or other populated areas. However, APHIS issued licenses without requiring the owners to provide any evidence that the owners had the knowledge, experience, or qualifications to safely handle such animals. APHIS' preclicensing inspections are geared solely to determining if the owners' facilities are sufficient to house the animals present at the time of inspection; however, once licensed, an individual may acquire any additional number or type of animals without APHIS' approval. In some instances, we found large and dangerous animals that were housed in enclosures inadequate to contain them. In one such case, a licensee's pet tiger had to be shot to prevent it from escaping into the surrounding neighborhood.

We recommended that APHIS amend its regulations to (1) restrict the definition of an "exhibitor" to exclude pet owners, (2) require that applicants meet standards of knowledge and experience before being licensed to exhibit, and (3) limit the ability of licensees to obtain additional large or dangerous animals without APHIS approval. We also recommended that APHIS deny licenses for possession of exotic animals which would violate State or local laws and explore the possibility of entering into cooperative agreements with selected States to more efficiently carry out its inspection and enforcement activities. APHIS officials agreed with our findings and recommendations.

RURAL DEVELOPMENT

RURAL HOUSING SERVICE (RHS)

Rural Housing Program

In an investigative case in Tennessee, a woman was convicted of making false statements and false claims to RHS concerning her income, assets, and permanent place of residence in order to receive rental assistance in Florida while she was actually a resident of Tennessee. The defendant certified in RHS documents that she had no assets and income apart from Social Security when, in fact, she lived with her spouse on a Tennessee cattle farm they owned. The couple's house was valued at \$225,000, and they had income which at times exceeded \$100,000 annually. Government witnesses testified that the defendant referred to her Florida rural rental apartments as her "Florida Condos." The defendant sometimes stopped by the apartments in her \$47,000 34-foot motor home en route to Disney World. She was sentenced to 1 year in prison and ordered to pay restitution of \$22,674.

Rural Rental Housing (RRH) Program

Many of our audits of the RRH Program are performed in response to agency requests. Others are self-initiated and address problems not previously identified. Federal regulations allow borrowers to use independent management companies to manage their properties or to form management companies (identity-of-interest companies) to manage their own and/or other RRH projects. These types of relationships must be disclosed to RHS.

A joint audit-investigation of a management agent disclosed he removed \$700,000 from the accounts of eight RRH projects and used the funds for his personal benefit. The management agent (1) falsified confirmations of balances in the projects' bank

PART 1

1220

accounts to cover up a diversion of \$514,000; (2) deposited U.S. Government rental assistance checks payable to RRH projects into bank accounts controlled by him to divert \$45,000 from the projects; (3) transferred \$98,000 from RRH accounts to a bank account controlled by him and designated for payment of project expenses but used the funds for nonproject purposes; (4) deposited checks payable to RRH bank accounts totaling \$13,000 into bank accounts controlled by him; and (5) withdrew \$98,000 from RRH project reserve accounts without RHS authorization. The management agent pled guilty to diverting funds of over \$700,000 to his own use or benefit.

We reviewed another RRH borrower, also acting as management agent of four projects, who had diverted over \$2.4 million for his own use or benefit. The audit disclosed that (1) \$938,000 was spent for nonproject purposes; (2) \$536,000 in excess reserve funds was withdrawn without RHS authorization; (3) \$488,000 in management fees was expended in excess of amounts authorized by RHS; (4) \$248,000 for returns on investments was withdrawn in excess of amounts authorized by RHS; (5) \$147,000 in accrued interest owed by the borrower to the projects was removed from project books; and (6) improper withdrawals from tenant security deposit accounts totaling \$19,200 were made.

RURAL UTILITIES SERVICE (RUS)

Water and Waste Loans

Private lenders were not being given the opportunity to review applications to determine their interest in financing the projects. Applicants must be unable to obtain commercial credit in order to be eligible for assistance, but RUS does not require borrowers to contact investment lenders as a potential source of financing and document such contacts in writing. Our review of the approval process for water and waste disposal loans disclosed that RUS was competing with private credit sources. Based on our review, we statistically projected that RUS funded 813 water and waste loans, totaling approximately \$832.7 million, which commercial lenders may have financed if given the opportunity.

RUS does not require former borrowers to pursue additional financing from the lenders who had purchased their prior loans under the Discount Purchase Program (DPP). We also statistically projected that 132 loans, totaling over \$184.7 million, may have been financed by the lenders who purchased previous loans under DPP. We are working with the agency to establish a policy to require future applicants to submit a proposal from at least one investment lender capable of financing water and waste loans and to require that State office and/or district office staff discuss investment lenders nationwide with future applicants.

MARKET DEVELOPMENT

FOREIGN AGRICULTURAL SERVICE (FAS)

During the past year, an OIG investigation resulted in the largest monetary settlement for a fraud in the history of USDA, when a prominent international grain company and one of its foreign affiliates reached a global settlement with DOJ and USDA. The grain company paid \$25 million to the U.S. Government in settlement of all civil claims, and its affiliate paid a \$10 million fine after pleading guilty to a criminal charge of conspiracy. In addition, three associated entities agreed to permanent debarment from participation in all Federal programs.

These actions culminated a series of high profile investigations conducted by OIG since 1989 into fraudulent activities related to the export of agricultural commodities to Iraq under USDA's Export Credit Guarantee Programs, beginning with our involvement in the investigation of the Government-owned Italian Banca Nazionale del Lavoro.

After 6 years of intense investigation, our efforts have lead to monetary results relating to USDA programs totaling some \$50 million in fines and restitution, hundreds of millions of dollars in cost savings, and the debarment of seven parties from participation in USDA and other governmentwide programs.

As a result of another OIG investigation, a North Carolina vegetable oil supply company's vice president, plant manager, and a former USDA grain inspector were convicted of conspiring to defraud the Commodity Credit Corporation (CCC) of \$2 million by underfilling contracts to deliver vegetable oil to CCC. CCC purchased the packaged oil from the supplier for export and free distribution to developing countries under Public Law 480, Title II, Food for Peace Program.

Some of the illegal proceeds were used by the vice president to pay kickbacks to the plant manager and the USDA inspector, as well as to fund the construction of a baseball field, which bears his name, at a local college. Sentencing and forfeiture

PART 1

1221

action are pending. Assets worth an estimated \$6 million were seized from the vice president including two homes, an ocean-front condominium, manufacturing equipment, and over \$400,000 in cash. The case was worked jointly with the U.S. Agency for International Development's OIG, the Federal Bureau of Investigation (FBI), and the Internal Revenue Service (IRS).

Another OIG investigation led to a guilty plea by a Florida dairy exporter for making false statements to FAS after he received over \$1 million in subsidies under the Dairy Export Incentive Program (DEIP). The payments were made in 1994 to subsidize shipments of dry milk to the United Arab Emirates (UAE). However, the shipments were diverted in Singapore and shipped to the Philippines instead. Shipments of milk to the Philippines were not eligible for subsidy payments under DEIP. To conceal the fact the milk was shipped to an ineligible country, the exporter formed a fictitious company with an UAE address and created false bills of lading and arrival notices which were then submitted to FAS in order to receive his subsidy payments.

Following his guilty plea, the exporter was sentenced to serve 6 months in prison, with another 6 months of home detention, and was ordered to pay more than \$1 million in restitution.

Food Aid Assistance to the Russian Federation

The Freedom Support Act of 1992 allowed the United States to contribute food and technical assistance to the former States of the Soviet Union. We audited one nonprofit organization which received \$19.6 million of commodities donated by CCC to carry out humanitarian and development programs in Russia.

We found the organization could not account for \$600,000 of the commodities and misappropriated commodities valued at \$1.5 million. Also, FAS needed to determine the proper disposition of \$3.6 million of funds generated by the sale of the donated commodities.

FAS has agreed to recover the value of the misappropriated and unaccounted for commodities and to determine the disposition of the \$3.6 million of sale proceeds.

MANAGEMENT AND CONTROL OF ENVIRONMENTAL HAZARDS

USDA Facilities Are Not in Compliance with Environmental Laws and Safety Standards

Executive Order 12088 requires Federal agencies to ensure that facilities under their stewardship comply with Federal, State, and local guidelines for the control and abatement of environmental pollution. Executive Order 12196 directs the heads of agencies to establish and implement standards and program elements for the protection of employee safety and health. The agencies of USDA are responsible for the environmental and safety compliance of owned and leased facilities that include over 191 million acres of land and more than 21,000 buildings that house its operations. From its inception in fiscal year 1988 through fiscal year 1996, the Hazardous Waste Program has obligated more than \$130 million to bring USDA facilities into compliance with State, local, and Federal environmental standards.

This past year we reported on FS' efforts to identify, assess, and clean up environmental hazards from active and abandoned mines. Our work found that an extensive remedial effort had barely started. We estimated that site cleanups and the correction of environmental hazards and mining deficiencies would require the input of high-cost technology for many years to come. Our audit disclosed that, as of August 1995, there were 2,500 mining sites producing pollution that would need \$2.1 billion for cleanup while still another \$2.3 billion might be needed to keep other sites from becoming future pollution problems. FS now recognizes this long-term liability and has begun to develop a cleanup plan. It has also undertaken measures to reduce further pollution and to recover from commercial users the costs of both monitoring and cleaning up their mining sites.

We have recently reported our review of the Department's management of hazardous biological materials—the pathological, biomedical, biohazardous, toxic, infectious, or medically hazardous agents that pose harm to humans if improperly handled or stored. We found that risks to employee and public health were increased because agencies did not have adequate control over biological agents and waste at USDA facilities and that some facilities were susceptible to illicit access that could threaten national security. As a result of our disclosure, the Department is now in the process of developing an interagency coordinated biohazards policy and standards committee, individual agency biosafety programs, and improved inspection procedures.

PART 1

1222

ACCOUNTING, FINANCIAL, AND INFORMATION RESOURCES MANAGEMENT

Financial Statement Audits

In accordance with the Chief Financial Officers Act of 1990 and the Government Management Reform Act, we completed seven fiscal year 1995 financial statement audits. We issued unqualified (clean) opinions on the financial statements of FCS, CCC, the Federal Crop Insurance Corporation, and the Rural Telephone Bank. Audits of Rural Development and FS received a qualified opinion and adverse opinion, respectively. And, we issued a disclaimer on the USDA consolidated statement. Rural Development received a qualified opinion because sufficient documentation was not available to assess the reasonableness of credit program receivables and the estimated losses on loan guarantees. FS received an adverse opinion due to pervasive errors, material misstatements, and departures from applicable accounting principles which affected various financial statement accounts such as property, plant, and equipment. Material weaknesses existed in FS controls over compilation of its financial statements, integration of accounting system data into the general ledger accounts, and data entry at the field level.

We made a substantial commitment in fiscal year 1995 to help FCS overcome its systemic weaknesses by providing management advisory services to the agency. We assigned a senior auditor to work closely with FCS to rectify longstanding encumbrances to accurate reporting.

This joint OIG/FCS effort played a major role in the improvement in the agency's financial statements, as evidenced by an unqualified opinion in fiscal year 1995 from a disclaimer in fiscal year 1994. In fiscal year 1997, we are focusing on assisting FS in its efforts to improve its financial condition. OIG is working in tandem with the Office of the Chief Financial Officer and FS to identify and isolate the most significant financial and accounting weaknesses and to develop an action-oriented plan to yield prompt resolution. Many of the problems confronting the task force are systemic in nature and/or exacerbated by a lack of documentation and, thus, will not be rectified overnight. However, our commitment to this project reflects our determination that this is the best and fastest way for FS, and ultimately the Department, to generate usable financial statements.

NFC Needs to Continue Improvement of Management Controls

Our audit of management controls at the National Finance Center (NFC) disclosed that improvements are needed to provide additional assurance that the integrity of the accounting data was adequate. We found that reconciliations were not performed or resultant variances were not fully resolved to ensure that, for example, feeder systems were properly summarized to major application systems. In addition, the process governing accounting adjustments was not sufficiently controlled to preclude unsupported entries. In response to our recommendations, NFC has developed a corrective action plan to rectify the conditions reported.

NFC and Working Capital Fund Need to Improve Their Accounting and Rate-Setting Practices

Our audit of the working capital fund at NFC disclosed that improvements were needed to ensure that profits were accurately accounted for and users were equitably billed. We recommended that NFC strengthen the coordination between its rate-setting, budgeting, and accounting processes; improve its billing; and document its rate-setting and allocation decisions.

EMPLOYEE INTEGRITY

Investigation of serious misconduct by USDA employees remains a high priority for OIG. During fiscal year 1996, OIG issued 59 reports of investigation concerning serious breaches of employee integrity by USDA employees. Our investigations resulted in 17 convictions of current and former USDA employees, and 61 personnel actions, including reprimands, suspensions, removals, resignations, and alternative discipline. For example:

—A soil conservation technician in Nevada is awaiting sentencing after he was convicted of making false statements to conceal the theft of over \$500,000 worth of excess property from several U.S. Army depots. All of the equipment, which he claimed to be for the use of NRCS, was diverted to the South Fork Indian Reservation, where the employee was a tribal member. Although the employee maintained that the equipment, including a bulldozer, road grader, and boat, was to be used for firefighting purposes, we found it in private use, scattered across the reservation. While the employee traveled throughout the Western United States acquiring the property, he falsified his travel and attendance records to make it appear that he was on official business. This investigation

PART 1

1223

was conducted jointly with the General Services Administration's OIG, the FBI, the Defense Criminal Investigative Service, and the Defense Logistics Agency.

CONCLUSION

This concludes my statement, Mr. Chairman. As you can see, the work of OIG is far-reaching and expansive. I appreciate the opportunity to appear today and present this information, and I hope that my comments have been helpful to you and the Committee. I will be pleased to respond to any questions you may have at this time.

OFFICE OF THE SECRETARY AND DEPARTMENTAL ADMINISTRATION

PREPARED STATEMENT OF PEARLIE S. REED, ACTING ASSISTANT SECRETARY FOR ADMINISTRATION

Mr. Chairman and Members of the Subcommittee my presentation will discuss the 1998 budget requests for Departmental Administration; Agriculture Buildings and Facilities and Rental Payments, including the Department's Strategic Space Plan; Hazardous Waste Management and the Office of the Secretary.

Testifying with me today to ensure thorough and complete answers to your inquiries are key members of the Department's financial management leadership: Ted David, Acting Chief Financial Officer, and Anne T. Reed, Acting Chief Information Officer. Also with us are Steve Dewhurst, the Department's Budget Officer, and Connie Gillam, the Budget Officer for Departmental Administration.

USDA STREAMLINING

Over the last few years we have achieved significant reductions in our staff years and costs. By the end of 1996, our streamlining effort was ahead of schedule and USDA had eliminated 13,500 staff years with only minimal use of Reductions-In-Force, RIF's. These reductions have been accomplished largely by offering buy-outs and early-outs to employees, and through prudent management of vacancies. Also, the Department requested and received from Congress additional buy-out authority running from fiscal year 1997 through 1999. Most employees who accepted the fiscal year 1997 buy-outs were required to be off their agencies' rolls by October 31, 1996.

CAREER MANAGEMENT RESOURCE CENTERS

Our collocated Career Management Resource Centers in Washington, D.C. and Kansas City provide a wide variety of career transition services to assist the USDA work force in making informed decisions about career transitions, such as exploring job opportunities within and outside of Government, retirement, self-employment, and other options. This activity is fully supported by the Department and mission areas to ensure that the work force has the necessary tools to manage their careers in this time of downsizing, streamlining, reorganization, and budget constraints. In addition, these Centers support the September 12, 1995, Presidential Memorandum on Career Transition Assistance for Federal Employees.

CIVIL RIGHTS

Departmental Administration—DA—fully supports Secretary Glickman's civil rights initiative of creating an environment in which every customer who comes to a USDA office is treated fairly, effectively, and efficiently, and a workplace in which all of our employees are treated with dignity and respect. As you may know, I headed the Civil Rights Action Team, created by the Secretary, to do a thorough audit of USDA civil rights issues and provide him with recommendations for improvement. The Team issued its report of recommendations on February 28, 1997.

In order to assist us in our investigation, 12 civil rights listening sessions were held in various sites around the country to hear from our customers and employees on civil rights issues in both program delivery and employment. These listening sessions provided an opportunity for minority and socially disadvantaged farmers to discuss their concerns about USDA program delivery, assisted USDA in identifying new ways to build partnerships and improve the Department's outreach and service, and provided an opportunity for USDA employees to discuss their work environment concerns. With one exception, each listening session included a panel consisting of either Secretary Glickman or Deputy Secretary Rominger and other Team members. The Team discussed and evaluated the sessions, and presented recommendations to Secretary Glickman.

PART 1

1224

As an extension of the listening sessions, USDA established a toll-free telephone number to facilitate responsiveness. This toll-free number is staffed to provide information on the status of current allegations of discrimination, both in the area of employment and program delivery, as well as to take comments and respond to questions from the public. USDA employees and other interested persons are able to access the newly created Internet Web site on the USDA Home page for information, or contact the Team by facsimile, written correspondence or electronically.

EQUAL EMPLOYMENT OPPORTUNITY/PROGRAM DELIVERY COMPLAINTS

One of the major civil rights problems identified within USDA was that complaints were not processed in a timely manner. As a result, there was a backlog of complaints that increased each year. To begin addressing this problem, some funds were redirected to the civil rights area during fiscal year 1996. With these funds we have increased our civil rights staff by 20; increased contracts with private firms to investigate complaints, provide additional counseling services, and draft final agency decisions; assigned 28 temporary detailees from the various mission areas to clear up the complaints backlog; established internships for Howard University law students to adjudicate cases; and installed new EEO case-tracking software.

These efforts achieved dramatic results. USDA closed 604 formal employee complaints in fiscal year 1996, an increase from 285 in fiscal year 1995. Also, we reduced the time to close an employee complaint case from 1,003 days in fiscal year 1995 to 491 days in fiscal year 1996. Last year we received 212 program complaints of which 118 cases were resolved. The average processing time for program discrimination complaints in fiscal year 1996 was 415 days. Despite this significant reduction in case processing time, the complaint backlog remained at an unacceptable level.

To overcome the complaint backlog problem, the Congress appropriated an additional \$1.5 million in fiscal year 1997. This funding level is maintained in the 1998 budget request to continue these activities and ensure that the past backlog will not occur in the future. As more staff are hired and trained, we expect further reductions in the case backlog and in case processing time. We are making substantial progress and will continue to work to improve program delivery. In order to improve program delivery we are working on ways to prevent and resolve complaints and ensure in discrimination cases that responsible person is held accountable.

COMPLAINT PREVENTION AND RESOLUTION

Complaint prevention and resolution are goals we are accomplishing by educating and training our managers and supervisors. Each senior executive is required now to develop individual benchmarks for performance on civil rights and equal employment opportunity. These benchmarks are intended to establish expectations for performance and provide objective bases for measuring performance in these very important areas. We are also providing a diversity training course for the entire Sub-Cabinet, agency heads, and senior staff. Also, we developed a Conflict Resolution Program designed to help resolve conflicts in a non-adversarial way between managers and employees. So far, we have tested the process on four cases and all were successfully resolved.

MANAGEMENT ACCOUNTABILITY FOR EMPLOYMENT PRACTICES

Management accountability is the very cornerstone of the equal employment opportunity agenda. This issue has been attacked on three fronts. First, we recently established a special compliance unit to follow-up and determine that settlement agreements, or proposed disciplinary actions against discriminating officials, are being carried out by the agency. Second, we ensured that supervisors found guilty of discrimination are accountable for their actions by holding their Sub-Cabinet official responsible for corrective action. Third, we established an ambitious schedule of EEO compliance reviews to look at systemic problems and make recommendations to improve our performance in following Equal Employment Opportunity and Civil Rights laws, Executive Orders, and regulations.

As Secretary Glickman stated, "We have a real opportunity to make positive change in the area of civil rights enforcement—to ensure that USDA is a diverse, civil Department to both its employees and its customers." Departmental Administration fully supports the Secretary to bring about this change.

REENGINEERING PROCESSES

We are continuing our effort to reengineer USDA's administrative processes through the Modernization of Administrative Processes—MAP—program in USDA.

PART 1

1225

This program develops administrative processes and systems which lead to better customer service and more efficient business practices in the functional areas of Procurement, Property Management, Human Resources Management, Information Resources Management, and Civil Rights. Great attention has been focused by the Congress and this Administration on streamlined administrative management within the Federal government, especially on ways to decrease administrative costs. Prime examples of MAP's reengineering efforts include the Purchase Card and the Third-Party Draft Processes. In February 1997, USDA began implementing a Departmentwide purchase card program. These are generally purchases by non-procurement personnel of less than \$2,500, or purchases by USDA procurement officials of less than \$100,000. The purchase card program is eliminating the need for paperwork, signed authorizations and delays for office-oriented acquisition. An authorized employee with a purchase card can purchase a wide range of business-related goods and services other than travel. By the end of fiscal year 1997, about 9,000 employees will be issued the USDA purchase cards. We expect that our reengineered purchase card program, once fully implemented, will result in reducing the current \$32 administrative cost for processing a transaction to \$17 per transaction.

The USDA purchase card program also is designed to shorten the time needed to make purchases and improve the quality of management information needed to monitor those purchases. Because of automation, the account reconciliation process will be less time-consuming and will contain fewer errors.

MAP team participants worked with the National Finance Center to develop new computer software that allows purchasers to eliminate several steps in the current purchase process, as well as a number of forms. In fact, this is an automated process where billing, account reconciliation, and subsequent payments are all done electronically. This system will eliminate redundant levels of review which will result in cost avoidances.

Besides the advantages of the purchase card program, the new software includes the use of "convenience checks" issued to authorized employees with individual names printed on each check. Employees can write checks drawing against their purchase card accounts. This new system will also benefit small and minority owned businesses because payments for goods and services received will be accelerated.

These are just a few areas—we are aggressively looking at more. In conjunction with the USDA agencies, MAP has initiated business modernization initiatives in Procurement, Property Management, Information Resources Management, and Civil Rights. When MAP's work is done, its legacy will be a more efficient and cost-effective USDA. The MAP Office will sunset in 1999, and I can assure you that once its mission is completed, MAP will leave behind a better USDA. Other modernization efforts are taking place in USDA within the functional offices themselves. For instance, within Human Resources Management there is a modernization effort to develop a customer-oriented and streamlined human resource management system for the Department.

USDA HUMAN RESOURCES MODERNIZATION

Departmental Administration, with assistance from the Office of the Chief Financial Officer, is leading USDA Human Resources Offices and cross-serviced agency stakeholders in an extensive Human Resources Modernization effort to develop a customer-oriented and streamlined human resource management system. The paper copy USDA recruitment bulletins have been replaced by electronic media formats. USDA vacancy announcements are now available to customers on the Internet and the Office of Personnel Management touch-tone telephone hotline. Through our efforts with the National Finance Center and the Forest Service to streamline and automate cumbersome personnel processes, we are able to avoid printing and mailing costs.

Another example of our ongoing efforts is the Employee Express pilot project which now allows 10,000 USDA employees to use a touch-tone telephone or touch-screen computer to make changes to their personnel records such as address changes, federal and state tax withholding, financial allotments, and health benefits. Approximately 30 percent of all changes to personnel actions are employee-generated. In November 1996, Employee Express allowed employees to make changes on-line to their Thrift Savings Plan and Health Benefits during Open Season. Additionally, DA streamlined the Departmental Personnel Manual, reducing two bookshelves of issuances to one three-inch binder and placing it on the DA Home Page on the Internet. Annual printing and mailing costs will be avoided by this change.

PART 1

1226

USDA SMOKING POLICY

USDA's new smoking policy, which became effective on January 16, 1997, prohibits smoking inside all USDA facilities and motor vehicles. The Department is focusing on providing a healthy, comfortable work environment for all employees, contractors, and visitors, and requires that everyone share in the responsibility to achieve this effort. This policy applies to all buildings and facilities—both at headquarters and USDA field locations, as well as USDA offices overseas—that are owned, leased or otherwise occupied by USDA. It covers all interior parts of the building, including corridors, restrooms, cafeterias, stairways, and enclosed offices occupied by only one employee.

However, the Department remains sensitive to its employees who choose to use tobacco products and has designated “outside smoking area” sites. These sites are at least 15 feet away from common entrance and exit points to a facility and offer a measure of protection from the weather elements. For instance, in the Washington, D.C. Headquarters Complex, outside locations have been identified at entrances with canopies to provide employees protection from the weather. In USDA field office locations, Agency Heads have been delegated the responsibility for establishing outside smoking areas.

USDA agencies are also responsive to their employees and can authorize the use of available funds for training, education, and counseling for smoking cessation programs for its employees—but not for items considered personal medical expenses for treatment and rehabilitation, such as nicotine gum or patches. We are hopeful that both smokers and non-smokers in USDA facilities and motor vehicles will be thoughtful, considerate, and cooperative to ensure the success of this policy.

DEPARTMENTAL ADMINISTRATION BUDGET REQUEST

This budget was developed under some very tight funding constraints—we are absorbing half of the pay cost increases and all of the inflation costs in our fiscal year 1998 Budget Request. The Budget Request total is \$25,258,000, a net increase of \$110,000 over the adjusted fiscal year 1997 level of \$25,148,000. Of this net increase, \$310,000 is for pay cost increases. A decrease of \$200,000 is offset by an equivalent increase in the request for the Office of the General Counsel to provide legal services required to adjudicate civil rights complaints within the Department.

OFFICE OF THE SECRETARY

I now turn to the individual budget requests for the other appropriations, starting with the Office of the Secretary—OSEC. The OSEC provides policy oversight and guidance for the Department and maintains relationships with agricultural organizations and others in the development of USDA programs. OSEC also oversees special projects that are conducted at the behest of the Congress. These projects include short-term studies, investigations, and research on matters affecting the Department or its constituents.

The 1998 Budget Request for the Office of the Secretary is \$11,400,000, an increase of \$372,000 over the 1997 level. This increase consists of \$142,000 for pay cost increases, and \$230,000 to provide additional funding for the Office of the Under Secretary for Food Safety and the Office of the Under Secretary for Food, Nutrition and Consumer Services.

AGRICULTURE BUILDINGS AND FACILITIES AND RENTAL PAYMENTS

The 1998 budget request of \$131,085,000 is a net decrease of \$12,913,000 below the adjusted 1997 level. This decrease consists of an \$18,505,000 reduction in the Strategic Space Plan, a reduction of \$1,599,000 for the rental payments to the General Service Administration, an increase of \$4,491,000 to secure and maintain the Headquarters Complex and the Beltsville Office Facilities, and an increase of \$2,700,000 to cover a necessary one-time relocation expense due to expiring leases of USDA agencies in the Washington, D.C. area.

STRATEGIC SPACE PLAN

In our efforts to help reduce costs associated with housing our employees, USDA is underway in implementing the long term plan to consolidate USDA Headquarters into two Government-owned locations which will provide modern and safe facilities and enhance USDA operations. This plan consists of two major projects—the Beltsville Office Facility and the modernization of the South Building. It is based on projected reductions in staff at the Washington Headquarters. In fiscal year 1997, the funding level for this plan is \$23,505,000; of which, \$5,000,000 is allocated to complete the Beltsville Facility and \$18,505,000 is allocated for the first phase of the

PART 1

1227

South Building modernization. In fiscal year 1998 we are requesting \$5,000,000 which will be used to continue the South Building modernization. The fiscal year 1998 level is a one year reduction proposed in order to better coordinate funding with the anticipated project implementation schedule. Outyear projections assume funding at the fiscal year 1997 enacted level of \$23.5 million.

The Beltsville Office Facility, now under construction, is located on Government-owned land at the Beltsville Agricultural Research Center. This facility has been designed as a low-rise campus of four buildings with 350,000 gross square feet to house approximately 1,500 employees. Construction of the Beltsville Office Facility began in June 1996 by Tompkins Construction. The buildings are progressing on schedule and will be ready for occupancy starting in January 1998. Currently, we are in the process of determining which agencies will occupy the Beltsville Complex.

We are also developing a Transportation Management Plan which will provide for our employees detailed information on how to get to work. This plan will help employees make the necessary changes in their transportation, such as available bus, metro, parking, and carpool/vanpool locator assistance. As part of the construction, there will be about 900 parking spaces available for carpools and vanpools and a shuttle bus from the Greenbelt Metro station to the office facility. USDA is providing improvements to State and County roads in partnership with the State of Maryland and Prince George's County. We are making every effort to achieve a smooth transition for all USDA employees.

The second part of the Strategic Space Plan is the modernization of the South Building. The sixty-one-year-old Agriculture South building, eligible for listing on the National Register of Historic Places, is in dire need of repair and renovation to make it safe, efficient and functional. The required renovation work includes fire protection systems, abatement of hazardous materials such as asbestos, PCB light fixtures, lead paint, replacement of old, inefficient heating ventilation and air-conditioning systems, improved accommodations for disabled persons and accommodation of modern office telecommunications systems. The current plan is to modernize the building in eight primary phases and to consolidate USDA agencies into the modernized areas as each construction phase is completed. The first phase will include Wing 3. Funding for this phase was provided in fiscal year 1997. The architect-engineer contract to develop the concept design for the entire building and the contract documents for the modernization of Wings 3 and 4 was awarded in January, 1997. By the end of the South Building modernization project, USDA Headquarters offices will be consolidated into two locations, the Beltsville facility and the downtown Headquarters Complex, eliminating our reliance on leased space, which will result in considerable savings.

BUILDINGS OPERATIONS AND MAINTENANCE

An increase of \$4,491,000 in fiscal year 1998, over the 1997 level of \$20,294,000, is requested for Building Operations and Maintenance. Of these funds, \$2 million is for maintaining a healthy, safe working environment for USDA employees and customers at the new Beltsville Facility. Specifically, the increase will provide funds for onsite maintenance of mechanical and electrical equipment, elevators, landscaping, and security services as well as office cleaning, recycling, and other services considered routine to maintain a commercial facility. We anticipate that the facility will be occupied starting in January 1998.

The day after the bombing of the Alfred P. Murrah Building in Oklahoma City, the President directed the Department of Justice (DOJ) to assess the vulnerability of all U.S. Federal office buildings. The DOJ assessment and a subsequent risk assessment by USDA identified additional security measures, such as, surveillance and structural changes, needed to enhance the security of the four Headquarters buildings. Of the \$4,491,000 increase, \$1,000,000 will be used to provide for security upgrades to the Headquarters buildings to meet minimum security standards identified in the DOJ and USDA assessment and survey. Some of the upgrades include a security intercom system, an intrusion detection system, access control verification station, activation control gates, parking lot controls and installation of full height turnstiles at entrances. Additional funds are also included for increased operating costs and pay costs for maintenance of the Headquarters Complex.

RELOCATION EXPENSES

An increase of \$2,700,000 will cover the necessary one-time relocation expense due to expiring leases in the Washington, D.C. area. A GSA lease recompetition conducted in accordance with the Competition in Contracting Act resulted in six USDA agencies having to vacate two existing leased buildings. GSA is prohibited by law from incurring expense to replicate agencies' telephone, LAN, systems furniture, se-

PART 1

1228

curity, compressed filing, and other miscellaneous equipment systems in the new locations.

HAZARDOUS WASTE MANAGEMENT

The safe disposal of hazardous waste is a challenge we must meet. We are now paying the cost of cleanups associated with environmental problems caused by the past disposal practices on our facilities but also primarily the activities of others on lands under the jurisdiction, custody or control of USDA. Of some 38,000 abandoned and inactive mines, we currently estimate 1,700 could require a Superfund cleanup. Up to 120 inactive or abandoned landfills are undergoing evaluation for Superfund cleanup. In addition, the USDA Commodity Credit Corporation leased grain storage bins throughout the mid-west that need to be evaluated, and cleaned up where drinking water and ground water supplies have been contaminated by our actions. The Department requests \$25,000,000 for the central Hazardous Waste Management program, an increase of \$9,300,000 over the 1997 level under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) and the Resource Conservation and Recovery Act (RCRA) statutes.

Funding from this appropriation is allocated to agencies based on priority needs and made available until expended. The increase will facilitate the cleanup of abandoned mines and landfills, identify and clean up grain storage bins, and support other agency cleanup efforts throughout the Department. The additional funds will allow the agencies to complete more of the backlog of projects and provide funding for crucial work.

CONCLUSION

This concludes my statement, Mr. Chairman. I appreciate the opportunity to appear today and present this information, and I hope my comments have been helpful to you and the Committee. I will now be happy to answer any questions you or your subcommittee members may have at this time.

OFFICE OF SMALL AND DISADVANTAGED BUSINESS UTILIZATION

PREPARED STATEMENT OF SHARRON HARRIS, DIRECTOR

Mr. Chairman and members of the Subcommittee, I am pleased to discuss the fiscal year 1998 budget request for the Office of Small and Disadvantaged Business Utilization—OSDBU.

Our mission is very simple. OSDBU has the responsibility to increase the number of business opportunities available to small, small disadvantaged, and women-owned businesses; identify and eliminate barriers that prevent or severely restrict small business participation in providing goods and services to the agency; establish partnerships to promote the growth and competitiveness of the small business community; and provide Departmentwide leadership in the implementation and execution of programs under Sections 8 and 15 of the Small Business Act, as amended, as well as Executive Order 12432.

Established on June 26, 1979, OSDBU is statutorily tasked to foster and serve as advocate for the use of small, disadvantaged, minority, and women-owned businesses as Federal contractors. OSDBU is the Department's central point of contact for general inquiries from industry and the small business community, the Small Business Administration, and from Congress on issues relating to the small business preference program. OSDBU is also the Department's central repository for advocacy and information for all programs affecting USDA's procurement activities impacting the small business community.

To accomplish its mission, OSDBU conducts reviews of major USDA procurement programs, conducts outreach to the small business community, sponsors procurement conferences, evaluates subcontracting plans of major prime contractors, and provides counseling to small businesses.

Most small businesses that contact our office are usually seeking contracting opportunities. They expect this type of contact because of the nature of our mission. We serve as a liaison between the small business community and the appropriate USDA agency that would most likely use their products. Our intervention saves marketing time for the small business and gives contracting officials many qualified small businesses from which to select.

A constant challenge to any small business office is its ability to quickly and efficiently provide the small business community with timely contract and program information. To address this concern, we put into place the "OSDBU Online" World

PART 1

1229

Wide Web Internet page in September 1996. OSDBU Online provides the small business community with a vehicle through which to access information concerning potential USDA contracting opportunities as well as USDA programs that support agricultural related businesses. Online hot links allows a small business to quickly navigate through a diverse assortment of USDA programs that support agribusiness, agricultural scientific research, product research and development, food processing, and exporting. USDA programs of interest to small and medium sized agribusinesses include the:

1. *Alternative Agricultural Research and Commercialization Centers—AARC.*—AARC is a joint venture between USDA and industry and assists small and medium size businesses in the commercialization of research results on non-food, non-feed products from farm and forestry materials. Assistance is usually in the form of investments in the small business project by USDA and industry. Since 1993, AARC-sponsored projects have resulted in the commercialization of products such as materials for building walls made from a mix of wheat straw and recycled plastic and insulation produced from milkweed.

2. *Trade Assistance and Promotion Office—TAPO.*—This office serves as the initial point of contact in USDA for all questions on agricultural trade.

3. *AgExport Connections Program.*—This program offers several low cost services which can help U.S. exporters contact foreign buyers. Among the services offered are: Trade Leads, Buyer Alert, Foreign Buyers Lists, and U.S. Suppliers List. For a small business seeking to enter the export market this service is invaluable.

4. *Market Assistance Program—MAP.*—This program assists U.S. Agriculture producers, exporters, and other trade organizations to finance promotional activities for U.S. agricultural products. MAP encourages the development, maintenance, and expansion of commercial export markets for agricultural commodities. Activities financed include consumer promotions, market research, technical assistance, and trade servicing.

5. *Export Enhancement Program—EEP.*—This program helps specified products produced by U.S. farmers better compete with agricultural products from subsidizing countries. Under the program USDA pays cash to exporters as bonuses, allowing them to sell specified U.S. products in targeted countries at prices below the exporter's costs.

6. *Small Business Innovative Research—SBIR Program.*—The SBIR program awards competitive grants to qualified small businesses for innovative, applied research and development on important agricultural problems. They aim these grants at the development of commercial products or services to provide significant public benefits. Research is supported in the areas of: 1) Forest and Related Resources, 2) Plant Production and Protection, 3) Animal Production and Protection, 4) Air, Water, and Soil, 5) Food Science and Nutrition, 6) Rural and Community Development, 7) Aquaculture, 8) Industrial Applications, and 9) Marketing and Trade.

OSDBU is proud of its venture into the arena of the World Wide Web and will continue to seek innovative ways to assist the small community to participate in all of USDA's programs. Incidentally, our address is <http://www.usda.gov/da/smallbus.html>. Our current, as well as, future efforts should increase small business participation and give USDA management officials an additional vehicle to promote USDA programs. We hope that our collaborative efforts to improve the comprehensiveness of our outreach will increase the small business community's interest in agribusiness.

FISCAL YEAR 1998 BUDGET REQUEST

For fiscal year 1998, OSDBU is requesting \$795,000 in direct appropriations. This request represents an increase of \$12,000 over the fiscal year 1997 appropriation. The increase consists of \$12,000 for pay costs.

As in the past, the Administration's request for OSDBU has been included within the bureau Executive Operations, whose activities, which include the Office of the Chief Economist, the National Appeals Division, and the Office of Budget and Program Analysis, have multi-agency or Department-wide impact—and which therefore reports directly to the Secretary and Deputy Secretary—rather than to a specific Under or Assistant Secretary.

Public Law 95-507 Section 15, of the Small Business Act (15 U.S.C. 644(k)) establishes in each Federal department and agency an OSDBU and requires that the Director of OSDBU "be responsible only to, and report directly to, the head of such agency or the deputy of such head." Further, on September 16, 1994, the President issued Executive Order 12928, "Promoting Procurement with Small Business Owned and Controlled by Socially and Economically Disadvantaged Individuals, Historically Black Colleges and Universities, and Minority Institutions," which directs each

PART 1

1230

agency to comply with the Office of Federal Procurement Policy (OFPP) Letter No. 79-1 of March 7, 1979. The OFPP Letter provides implementation guidance for section 15k and the organizational placement and functions of OSDBU.

Due to the importance of OSDBU's Department-wide crosscutting and oversight function, we urge that the Committee provide funding under the bureau and account "Executive Operations."

Mr. Chairman, once again, I would like to thank you and members of the Subcommittee for this opportunity to discuss the fiscal year 1998 request for the Office of Small and Disadvantaged Business Utilization.

RELATED AGENCY

FARM CREDIT ADMINISTRATION

PREPARED STATEMENT OF MARSHA PYLE MARTIN, CHAIRMAN AND CHIEF EXECUTIVE OFFICER

Mr. Chairman and Members of the Subcommittee, I am Marsha Martin, Chairman and Chief Executive Officer of the Farm Credit Administration (FCA).

I will highlight the Agency's accomplishments during the past year and present FCA's budget request for fiscal year 1998. The FCA fiscal year 1998 Budget Justification and Supplement were previously submitted to the Committee. Before I present the budget request, I respectfully call to the Committee's attention the fact that FCA's administrative expenses are paid by the institutions it regulates or examines. The Agency does not receive a Federal appropriation. It is funded with assessments of Farm Credit System institutions.

Mr. Chairman, I am pleased to present you a fiscal year 1998 budget request that is more than \$3 million below the budget for fiscal year 1997. This 8.2 percent budget reduction demonstrates the Agency's commitment to its goal of enhancing effectiveness and cost efficiency. I emphasize, however, this in no way indicates any sacrifice of program effectiveness.

MISSION OF THE FARM CREDIT ADMINISTRATION

Our mission is to promote a safe and sound, competitive Farm Credit System (System or FCS) so that agriculture, rural America, farmers, ranchers and their cooperatives will continue to have a permanent source of farm credit in good times and bad. While we are not involved in the daily management of System institutions, FCA does ensure that the System complies with the law and regulations, and exercises safe and sound banking practices. In turn, the System's role is to improve the income and well-being of America's farmers and ranchers through the extension of sound, adequate, and constructive credit. We continue to be proud of our performance in carrying out our mission, and we are also pleased with the continuing progress the System is making in strengthening its financial condition.

CURRENT ACTIVITIES AND ISSUES

This past year, the Agency continued to reduce costs, streamline operations, and reduce regulatory burden. I am especially proud of the fact that FCA was able to accomplish these improvements without compromising its ability to oversee the safety and soundness of System institutions. We also continued to place a high priority on creating increasingly efficient and innovative examination and supervisory programs that met our needs, as well as those of our customers. For example, examination resources are deployed on the basis of the level of risk in each institution. Off-site examinations are conducted on low-risk institutions. In 1993, when this program began, we completed six off-site examinations. This grew to 96 off-site examinations in 1996.

We also have established a quality assurance program to ensure that quality control in the examination process is maintained as we close regional offices and streamline operations. Our Office of Examination has instituted several internal projects to improve operating efficiency and to enhance risk evaluation. One of these projects currently is evaluating ways to directly access loan account information systems at FCS institutions. A related project establishes a uniform system to identify and respond to deteriorating trends in highly-rated institutions. These projects could improve significantly the Agency's ability to foresee and counteract risks to the System.

I would like to briefly highlight some of the Agency's additional major accomplishments during the past year.

PART 1

1231

- The Board adopted a policy statement on association structure that provided greater flexibility for associations seeking to merge and to those associations affected by the mergers.
- The Board adopted a policy statement on disaster relief efforts, encouraging System institutions operating in disaster-affected areas to work to alleviate pressures on borrowers under stress.
- Regulatory burden was reduced by eliminating several policy statements, developing new guidelines for issuing bookletters, and identifying regulations that can be revised by incorporating them into new or existing regulation projects. Also, to promote more participation in the rulemaking process, the Agency published an Advance Notice of Proposed Rulemaking on two occasions, seeking comments on prospective regulations.
- This past January, the Board adopted final regulations concerning customer eligibility and stricter capital standards for FCS institutions.

The previous customer rule had not been updated in 25 years, and it imposed many restrictions not required by law. Coupled together, the new customer and capital regulation strengthens financial standards and helps ensure a continuing, competitive source of credit for agriculture and rural America in good times and bad. I personally believe that the mission of the Farm Credit System to finance the needs of American agriculture is as vital and important today as it was when the System was first established. It is critical to this great nation that agricultural producers continue to have a choice as to where they obtain their credit to buy their farms and plant their crops.

Primary regulatory projects currently under review by the Agency will further reduce the burden of FCA's regulations while continuing to ensure safety and soundness of System institutions. For example, the FCA Board:

- Proposed regulations that would clarify loan underwriting guidance and provide flexibility where appropriate.
- Proposed regulations addressing policies and procedures for establishing a funding relationship between the Farm Credit Banks and their affiliated direct lending institutions. The proposed regulations would eliminate existing FCA prior approvals and provide uniform guidelines on which the general financing agreements will be developed and executed.
- Plans to clarify existing policies and procedures for establishing and maintaining the funding relationship between Farm Credit System banks and other financing institutions.

Staff is conducting an ongoing review to identify and provide recommendations to dispose of unnecessary policies, regulations, bookletters, and other forms of guidance. In addition, the FCA Board has requested an ongoing evaluation of existing statutes, as appropriate.

A major development in 1996 was the implementation of a Five-Year Staffing and Structure Plan (Staffing Plan). This effort was completed in response to my request for a comprehensive study of FCA's organizational, functional and staffing requirements. It has positioned the Agency to move smartly into the next century with the right mix of positions and talent to accomplish the Agency's mission and strategic plan. The elements of the plan include restructuring several offices, creating a new Office of Policy Development and Risk Control, reducing Agency staffing levels by 10.5 percent, eliminating the regional offices in the Office of Examination, and the closing of two field offices in fiscal year 1997. Since the Staffing Plan was implemented, total FCA staff has declined by 48 full-time equivalents (FTE's). The Agency's staffing level today is 328, and it will be down to 314 by July 1, 1997.

During fiscal year 1996, we continued to develop performance measures for Agency operations as part of our emphasis on operating FCA as a well run business. We are committed to strategic planning and performance measures as good business practices. As part of this project, the Agency researched performance measures concepts; benchmarked other Government agencies, as well as a private company; and devised a strategy to develop and implement performance measures at FCA. These measures closely track the goals included in the Agency's strategic plan.

In the area of operational efficiencies, this year the Agency essentially completed its migration to a client/server architecture with the installation of services to every office and employee; configuration of internet service; and installation of more than 10 major applications such as Lotus Notes databases for regulations, Agency correspondence, and workgroup information sharing.

CONDITION OF THE FARM CREDIT SYSTEM

Mr. Chairman, I am pleased to report that the Farm Credit System has continued to make progress in regaining its financial strength. During 1996, its earnings

PART 1

1232

reached \$1.2 billion. Total System capital increased to \$10.6 billion at the end of 1996, which represented 14.1 percent of total assets. Total capital was 13.6 percent of total assets at yearend 1995. The quality of System assets also continues to improve. Nonperforming assets comprised only 1.6 percent of total loans and other property owned at the end of 1996, down from 2 percent a year earlier. Overall loan volume climbed by \$2.6 billion during the year.

The strengthened financial condition of the System is reflected by improved CAMEL ratings—the Agency’s evaluation of an institution’s capital, asset quality, management, earnings, and liquidity. With a 1 being the best rating, the percentage of System institutions rated 3, 4, or 5 dropped from 36 percent at the end of 1992 to only 5 percent on December 31, 1996. The number of System institutions under enforcement action also declined substantially, from 65 at December 31, 1992, to 6 at December 31, 1996. These 6 institutions accounted for only 1 percent of the System’s total assets, as compared with 55 percent of the System’s total assets represented by the 65 institutions under enforcement action at the end of 1992.

Mr. Chairman, we congratulate the Congress on the enactment last year of the Farm Credit System Reform Act of 1996 (Reform Act) which provided some statutory relief to System institutions. Among other measures, it extended the mandatory examination cycle from 12 to 18 months for most System institutions and repealed a provision requiring a separate Board of Directors for the Farm Credit System Insurance Corporation. Both of these measures translates directly into cost savings for the System.

FEDERAL AGRICULTURAL MORTGAGE CORPORATION

FCA has oversight responsibility for the Federal Agricultural Mortgage Corporation (Farmer Mac). The provisions of last year’s Reform Act removed some hindrances to Farmer Mac’s operational flexibility and competitiveness and have improved its business prospects. Specifically, the Reform Act gave Farmer Mac the authority to purchase loans directly from lenders and assemble its own loan pools; eliminated the required 10 percent subordinated interest; and established new capital standards and granted limited forbearance from these standards. For 1996, Farmer Mac showed a net profit of \$775,000, its first profitable year. Farmer Mac also had a successful stock subscription of nearly \$32 million, allowing it to exceed the \$25 million capital level required by law by February 1998. In conjunction with the Treasury Department, FCA is monitoring the operations and the financial condition of Farmer Mac. Periodic and timely reports are provided to Congress. FCA also has approved proposed regulations that would govern a Farmer Mac conservatorship or receivership, as required by the Reform Act, should one become necessary. In addition, we have begun work on the risk-based capital standards required by the Reform Act.

FISCAL YEAR 1998 BUDGET REQUEST

Mr. Chairman, after reporting on recent events and accomplishments of the Agency, I now propose a budget of \$34.4 million for fiscal year 1998. As I pointed out earlier, this amount is \$3.1 million, or 8.2 percent, less than the \$37.5 million presented to the Committee for fiscal year 1997.

We continue our commitment to FCA’s effectiveness and cost-efficiency. We regularly review how further progress can be made in meeting this objective. For example, on October 11, 1996, the FCA Board approved budget revisions that are projected to bring Agency fiscal year 1997 spending to \$35.9 million, \$1.6 million less than the amount proposed to this Committee a year ago.

Our fiscal year 1998 budget request reflects a reduction of FTE’s from the 357 in the fiscal year 1997 budget to 309. This is substantially below the Office of Management and Budget’s established target of 408 FTE’s for the Agency by fiscal year 1999. It also represents a reduction in Agency staff by nearly one third from the 450 FTE’s in fiscal year 1993.

We continue to be proud of our accomplishments as the safety and soundness regulator of the Farm Credit System. And in keeping with our discussion of the budget, we are also proud that we continue to hold the line on costs while achieving our mission.

Mr. Chairman, we welcome any questions you might have.

PART 1

1233

QUESTIONS SUBMITTED BY SENATOR COCHRAN

BUDGET REQUEST

Question. The fiscal year 1998 budget proposes an increase of \$289,000 for equipment upgrades and information technology. Does FCA have a long term plan to upgrade hardware and software?

Answer. The FCA has a five-year Strategic Plan for Information Resources Management (IRM). One of the goals within the IRM plan is to provide for the continued delivery of an appropriate technology infrastructure for the FCA. One of the Agency's strategies to meet this goal is to continuously define and implement standards and systematically replace obsolescent technology. Generally, we are replacing hardware investments in a three to five-year life-cycle. The proposed budget provides the funds to meet FCA's systematic replacement needs.

STAFFING PLAN

Question. The fiscal year 1998 budget notes state that a 11.1 percent decrease in staff will occur for fiscal year 1998. How many full-time equivalents does this percentage represent? Please provide the number of full-time equivalents in each year of the five year staffing plan.

Answer. The 11.1 percent decrease represents a reduction in personnel compensation dollars. The fiscal year 1997 original budget included \$31,552,000 for personnel compensation, compared to \$28,624,000 in the fiscal year 1998 proposed budget. The difference of \$2,928,000 included -\$4,165,926 (11.1 percent) due to a reduction in full-time equivalents (FTE's), as well as an increase of \$1,237,926 for pay-for-performance increases and increased benefits for a veteran work force. The FTE's are estimated to decrease by 47.1, or 13.5 percent, from 356.5 in the fiscal year 1997 original budget to 309.4 in the fiscal year 1998 proposed budget. The number of FTE's in the five-year Staffing and Structure Plan is as follows:

<i>Fiscal year</i>	
1996 actual	361.4
1997 original	356.5
1997 revised	329.6
1998 proposed	309.4
1999 estimate	301
2000 estimate	293

It should be noted that the FTE's in the out-years are estimates and may change as strategic and operating plans are approved in the future or as conditions change.

CAPITAL STANDARDS

Question. When does the Agency predict that the risk-based capital standards will be implemented?

Answer. The new regulations on capital adequacy for Farm Credit System (FCS or System) institutions became effective on March 11, 1997. Separate capital regulations will be developed for the Federal Agricultural Mortgage Corporation (Farmer Mac) as required by the Farm Credit System Reform Act of 1996 (Reform Act). However, the Reform Act does not permit the FCA to publish proposed risk-based capital regulations for Farmer Mac prior to February 1999. Because this will be a complicated rule, we have already begun research toward its development. We anticipate publication of the regulation as soon as the statute permits, and the regulation should become effective in late 1999.

FARM-RELATED SERVICE BUSINESS LOANS

Question. Has the Agency implemented the new provision that would allow any company unlimited access to Farm Credit loans if more than 50 percent of its services are "agriculture-related?" How many companies have applied for loans and how many have been rewarded?

Answer. The amendments that revised FCA's rule on financing farm-related service businesses became effective on March 11, 1997. Both before and after these amendments, eligibility for financing under titles I and II of the Farm Credit Act of 1971, as amended, is limited to those businesses providing services to farmers and ranchers that are directly related to their agricultural production. Under the new provision, a firm that derives more than 50 percent of its annual income from furnishing such farm-related services may receive financing for all of its "farm-related business activities." This authority is restricted. At no time can services or goods

PART 1

1234

that are not related to the agricultural production of farmers or ranchers be financed under the farm-related business authority.

The FCA does not have data on the number of companies that have applied for farm-related service business loans. While the Agency does collect loan data from each FCS institution on a quarterly basis, the data on loan purpose does not provide sufficient detail to determine whether a loan would have been authorized under the new provision but not the old. These data could only be obtained through an inspection of the individual loan files, which are located throughout the United States in the over 220 privately-owned lending institutions comprising the FCS. However, loans for farm-related service businesses historically have been a very small part of Farm Credit lending and comprised less than 1 percent of the FCS portfolio as of yearend 1996.

STATUS OF LAWSUIT

Question. What is the status of the suit filed against FCA by two banking organizations asking for a permanent injunction against the rules which expand the FCA's customer base?

Answer. On April 9, 1997, the Independent Bankers Association of America and the American Bankers Association filed suit in the United States District Court for the District of Columbia seeking to overturn several provisions of FCA's new customer eligibility regulations. Pursuant to an agreement of the parties, FCA's response to the Complaint is due to be filed by July 3, 1997. The FCA Board continues to believe that the Court will confirm that the FCA was well within its statutory authority in promulgating the new regulations.

PART 1

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

NONDEPARTMENTAL WITNESSES

[The following testimonies were received by the Subcommittee on Agriculture, Rural Development, and Related Agencies for inclusion in the record. The submitted materials relate to the fiscal year 1998 budget request for programs within the subcommittee's jurisdiction.]

PREPARED STATEMENT OF JOHN A. WAITS

Mr. Chairman, Members of the Subcommittee, my name is John A. Waits. I am submitting this statement for consideration on behalf of the ad hoc coalition,¹ supporting increased funding levels above those proposed in the President's fiscal year 1998 budget request for Food for Peace title I concessional credit sales and the Food for Progress Program. We would appreciate the inclusion of this statement in the hearing record.

The administration proposes a rescission of \$50 million from the amounts appropriated for title I credit sales and the Food for Progress Program. The effect of this proposed rescission would be to reduce commodity shipments by some 200,000 metric tons. Moreover, the administration's proposed budget for fiscal year 1998 would further reduce next year's title I sales to \$123 million and provide for shipment of only 600,000 metric tons of grain equivalent. This is sharply down from \$290 million in title I credit sales funded in fiscal year 1996.

These severe program reductions are proposed because times are good, unmarketable commodity surpluses are gone, and U.S. agricultural export markets are strong. This approach, however, is very shortsighted. The good times may not last forever, the need for new export markets remains undiminished, and Food for Peace title I stands unchallenged as a highly successful export market development and food assistance program.

As we will demonstrate below, the United States now has an almost unparalleled opportunity to employ title I concessional sales not only to alleviate hardship and overcome temporary food shortages in developing countries, but also to develop and expand export markets for U.S. agricultural commodities. The United States, without question, should seize that opportunity. Those new markets, particularly in Eastern Europe and the former Soviet republics, will be urgently needed in future years.

THE HISTORICAL SIGNIFICANCE OF TITLE I

American agriculture, in 1996, had a great year. Gross farm income exceeded \$230 billion, an all-time record, and net farm income for the first time exceeded \$50

¹The ad hoc coalition is composed of the USA Rice Federation, the National Association of Wheat Growers, the National Cotton Council of America, the National Council of Farmer Cooperatives, the American Soybean Association, the American Maritime Congress, the Maritime Institute for Research and Industrial Development, the Transportation Institute, Gulfcoast Transit Company, and Liberty Maritime Corporation.

PART 1

1236

billion. Our exports were valued at approximately \$60 billion—another record—and those sales represented 28 per cent of total farm cash receipts for crops and livestock. As world agricultural trade approaches \$250 billion, the U.S. share of this global market is about 23 per cent—up by more than one-third since 1986.

There is no doubt that the current prosperity of American agriculture is directly dependent upon continued access to foreign markets. Our success in promoting agricultural exports permitted Congress to enact the 1996 Farm Bill, a landmark measure that affords farmers freedoms unprecedented in modern times. Our prospects appear good now, but they could change. Prudence dictates that we evaluate how we came to this good fortune, then build upon our past achievements to ensure continued success.

The U.S. agricultural export markets of the 1990's could not have been captured without the dedicated efforts and outstanding productivity of America's farmers. Our producers met every challenge before them, but they still needed export assistance. One highly successful initiative has been the Food for Peace program, especially the title I credit sales program. It is difficult to overstate the historical significance of Public Law 480, the Agricultural Trade Development and Assistance Act of 1954. Title I of Public Law 480—the focus of this statement—provides for U.S. government financing of sales of U.S. agricultural commodities to developing countries on concessional credit terms. Under current law, the concessional terms include a maximum 30-year period for repayment, with a grace period of up to five years and below-market interest rates.

The title I program has been an essential element in the overall development of strong export markets for American agriculture. When Public Law 480 was enacted in 1954, the total value of all U.S. agricultural exports was extremely low—about \$3 billion per year. The title I program, of course, had an immediate impact: until the mid-1960's, title I shipments accounted for about 20 percent of the annual value of all U.S. agricultural exports. Until overall exports quickly doubled in the mid-1970's, title I shipments continued to represent more than five per cent of all agricultural exports. As recently as fiscal year 1990, moreover, title I export values regularly exceeded \$700 million.

Title I's enduring legacy is underscored by the fact that of the top 50 countries which are significant markets for U.S. agricultural exports, 41 of them were once recipients of title I program assistance. Of course, not every title I country has graduated to become a major commercial market for U.S. agricultural products. India, for example, received considerable food assistance under title I, but remains an insignificant commercial market today. Other countries, however, have become good trading partners: South Korea, for example, purchased \$3.7 billion worth of U.S. agricultural products last year, an amount that exceeds the total value of U.S. sales worldwide in 1956. The Philippines and Indonesia are now each importing more than \$900 million worth of U.S. agricultural products annually, and exports to Egypt exceed \$1.5 billion in value. The title I program in Latin America has proven fruitful: Brazil and Colombia have each become \$600 million markets for American agriculture, while Peru has increased annual purchases from U.S. farmers to nearly \$400 million.

Thanks to title I and other factors, U.S. farmers have made major gains in scores of countries around the world. But not only have our farmers benefited. Over four decades, Food for Peace program shipments have provided a consistent market for U.S. commodity suppliers, promoted the development of the inland waterway system, provided substantial traffic for barge operators and railroads, encouraged port development and modernization, and provided employment opportunities and cargoes for the U.S. merchant marine. In short, title I has been very good for America—and its best days may be yet to come.

RECENT TITLE I GRADUATES

Unfortunately, the Food for Peace Program, in title I, has suffered greatly in recent years. From nearly \$750 million in 1990, title I allocations have declined in fiscal year 1997 to \$205 million for 21 countries. We would encourage this committee to reject the rescission proposal, and direct the Department of Agriculture to allocate the remaining \$50 million available from prior year appropriations.

Despite severe budgetary limitations, title I has remained vital in the 1990's. Since 1989, at least eight countries have graduated out of title I concessional credit sales into the GSM program. These are Costa Rica, Croatia, Egypt, Estonia, Latvia, Morocco, Poland and Tunisia. In addition, Armenia and Georgia have graduated from Food for Progress to title I participation, and Bolivia and Guyana reportedly will rely in the future on title I, rather than on title III grant assistance, as in the past.

PART 1

1237

In 1996 one-half of the title I program was allocated to 10 countries of the former Soviet Union and the Eastern Bloc. The remaining one-half was allocated around the world to countries with real humanitarian needs, where prospects for future commercial sales are bright. The 1997 allocations follow this same pattern: from the former Soviet Union and the Eastern Bloc, seven countries will receive allocations, while 14 other countries around the world will also share in the program.

THE FUTURE ROLE OF TITLE I

In its Budget Summary for fiscal year 1998, the Department of Agriculture reports that "the importance and role of the title I program in the Department's overall long-term market development strategy has increased." The Department complains that title I's former placement in the international affairs function "has contributed to reduced funding" for the program. We are pleased the Department is committed to title I's "continued viability," for the greatest challenges and opportunities under title I may lie just ahead.

The Food for Peace Program had an important role in the Cold War era. The United States, for humanitarian and geopolitical reasons, became the world's leading food aid supplier. We remain so today: through the 1990's, the United States has supplied more than one-half of all food assistance provided by all the world's donor countries. This is a proud record of achievement, one that we must maintain through continued commitment and no cutbacks in funding for titles I, II, and III of Food for Peace, and other food aid programs.

In the post-Cold War era, title I and Food for Progress have significance far beyond any dollar-levels associated with the programs. These concessional programs, quite simply, will be America's ticket of admission into new markets for U.S. agricultural exports that could approach or exceed the present market in Western Europe. The new markets lie in Central and Eastern Europe and the former Soviet Union. Today Western Europe accounts for more than \$9.5 billion in U.S. agricultural exports. Eastern Europe and the former Soviets account for about \$2 billion, including title I and Food for Progress shipments.

The population of this region is comparable to Western Europe's, their prospects for recovery are improving, and their natural resources are abundant. Only the farmland throughout much of the region is poor. In 20 years or less, the Eastern Europeans and former Soviets will represent a major market for agricultural products. The United States should do everything possible to position itself competitively as a major supplier in that market. One important step is to enhance commitments to title I, and to promote the program aggressively throughout this emerging market region.

THE COMPETITIVE CHALLENGES AHEAD

USDA's Economic Research Service reported in December 1996 that "U.S. corn exports are projected to drop 12 percent in 1996/1997," and that increased shipments from Argentina and Canada will reduce U.S. coarse grain exports to the "lowest level since 1993/94." The ERS also stated that "U.S. wheat exports are projected to decline 23 per cent from 1995/96, despite greater U.S. production." One reason cited: "Global wheat production for 1996/97 is currently projected to be the second highest on record." On a brighter note, increased Chinese demand will boost U.S. exports of soybeans, despite increased global shipments from Argentina and Brazil.

Neither Congress nor farmers can rest on their laurels. The challenges of the global marketplace are increasing, and no market is completely secure. According to Dennis Avery of the Hudson Institute, "Brazil could open up more than 100 million acres of unplanted arable land in its southwestern Cerrado Plateau. * * * Brazil has pioneered new acid-tolerant varieties of soybeans, corn, and wheat, which now make the region a prime prospect * * *." Mr. Avery reports "Argentina could at least double its crop production * * * It is pasturing cattle on some 75 million acres of the finest cropland in the world * * *. Bolivia's eastern lowlands have long been known to have 60-75 million acres of unplanted arable land * * *."

The agricultural potential of Latin American countries is simply staggering: they lack only infrastructure, primarily port and rail facilities, to become competitive with U.S. farmers in every global market. That infrastructure could be built in less than a decade.

CONCLUSION

Title I remains a key instrument of trade development policy, even as it also serves as an important food assistance program. Together with title I's vital role in Central and Eastern Europe and the former Soviet Union, this Food for Peace Pro-

PART 1

1238

gram continues to have relevance and significance in developing countries around the world.

Mr. Chairman and other Members of the Subcommittee, the ad hoc coalition respectfully asks that appropriations for title I of Food for Peace be maintained in fiscal 1998 at funding levels not less than those provided in fiscal 1997. Furthermore, we urge that any rescissions be disapproved, with instructions to the Department to allocate fully all appropriated monies for the program.

Thank you very much for your consideration of our views. We look forward to working with the Subcommittee on this important issue.

PREPARED STATEMENT OF THE AMERICAN ASSOCIATION OF NURSERYMEN

Mr. Chairman, the American Association of Nurserymen (AAN) welcomes this opportunity to present the nursery industry's views regarding the fiscal year 1998 (fiscal year 1998) Budget for the U.S. Department of Agriculture (USDA).

AAN is the national trade association for the nursery and landscape industry. AAN represents 2,000 production nurseries, landscape firms, retail garden centers and horticultural distribution centers, and the 16,000 additional family farm and small business members of the state and regional nursery and landscape associations.

ECONOMIC SIGNIFICANCE OF THE NURSERY INDUSTRY

According to USDA's Economic Research Service (ERS), the nursery and greenhouse industry remains the fastest growing agricultural sector in cash receipts. In 1969, an estimated 18,000 farms (or 1 percent of all farms) were engaged in producing at least some nursery and greenhouse crops. By 1992, an estimated 47,425 farms were included in this sector. In 1994, nursery and greenhouse crops totaled an estimated \$10.04 billion in farm-gate value, representing 11 percent of the total cash receipts for all U.S. farm crops.

Nursery and greenhouse crops in 1994 ranked 6th in total grower cash receipts among all agricultural commodities. It is the third largest plant crop—behind corn and soybeans, but ahead of wheat, cotton, and tobacco. Nursery and greenhouse crop production now ranks among the top 5 agricultural commodities in 27 states, and among the top 10 in 43 states. USDA data from 1990 also found that nursery and greenhouse farms had the highest average net farm income of all agricultural commodity groups at \$53,589. This was four times higher than the average American net farm income in 1990 of \$13,458. Although nursery farms can be profitable, they are often more capital intensive than other agricultural operations, and are very labor intensive given the thousands of different plant species and the wide-ranging sizes in which they are grown.

AGRICULTURAL RESEARCH SERVICE (ARS)

Noting the increasing economic significance of the nursery and greenhouse industry, AAN is very grateful and pleased that Congress provided \$200,000 to ARS in fiscal year 1997 specifically to address the important research needs of the nursery and greenhouse industry. It is AAN's full intention to build upon that foundation of Congressional support. AAN and the Society of American Florists (SAF) are jointly developing a detailed proposal establishing a coordinated research initiative for the nursery and floral industry. To underscore this cooperative spirit, AAN fully supports and endorses the testimony which SAF presented to this Committee last week.

While AAN was very pleased that Congress provided \$200,000 in fiscal year 1997 for nursery and greenhouse industry research needs, we are deeply disturbed that the Administration has failed to provide for a continuation of these research dollars in fiscal year 1998. Apparently, the Administration is proposing to redirect a total of \$23 million from research projects funded by this Committee in fiscal year 1997. AAN respectfully urges Congress to restore in fiscal year 1998 the 5200,000 funding which serves as an encouraging foundation for the joint research initiative that the nursery and floral industry is currently developing.

Although recognition of the economic significance of the nursery industry is indeed increasing, very few federal dollars are dedicated directly to the nursery and greenhouse industry. In fact, only about 0.02 percent of all federal agricultural research dollars are currently so dedicated. This underscores why last year's provision of \$200,000 is so important. Current competitive grant programs and other public funding mechanisms are unable to meet the industry's research needs. The nursery

PART 1

1239

and greenhouse industry has an exemplary record of supporting its own research needs as industry-funded research grants annually total several million dollars.

The industry will continue to support research efforts through its own privately funded research foundations, including AAN's very own research division (the Horticultural Research Institute) which is providing \$280,000 in research grants this year alone. The federal government must play a research role more appropriate to its scope. It must retain the lead in developing basic building blocks of plant science, in contrast to the industry's applications of those blocks to build solutions to its particular challenges. It is important to note that both the Northwest Nursery Crops Research Center in Oregon, and the Nursery Crops Research Station in Tennessee, play such integral regional roles for our industry's research needs. The federal role in research is longer term, cuts across multiple disciplines, calls for extensive coordination among scientists and institutions, and involves higher risk than can be undertaken by any one industry.

As noted above, and in cooperation with ARS, the nursery and floriculture industry are jointly developing a detailed proposal establishing a coordinated research initiative. The goals of this initiative are to:

- Protect the environment, including human health and safety through research leading to reduced use of chemicals and to reduce runoff and other wastes.
- Maintain biodiversity through germplasm preservation, so that useful botanic traits may be transmitted to future generations.
- Enhance environmental remediation and cleanup efforts on wetlands, post-industrial sites, air quality, and other environmental areas through research on the ability of plants to reverse and mitigate environmental pollution.
- Improve rural and suburban economies across the U.S. by providing improved crop production systems and technologies to nursery and greenhouse crop growers and by helping them to increase production efficiency.
- Contribute to the U.S. agricultural economy and to increase international competitiveness by conducting research leading to improved nursery and greenhouse products and production strategies, and by improving technology transfer of research results to benefit other U.S. agricultural sectors.
- Improve Americans' quality of life through increased availability and diversity of plants and flowers for the consumer.

The joint industry research initiative will accomplish these goals by focusing research on three essential areas: (1) improved environmental and resource management; (2) improved pest management; and, (3) improved production system practices and strategies. AAN will endeavor to keep this Committee informed of the progress of this emerging joint research initiative.

Methyl Bromide

As a widely used fumigant, methyl bromide is a critical input to many nursery crop management and quarantine systems. However, the U.S. Environmental Protection Agency has listed methyl bromide as a Class I ozone-depleting substance under the Clean Air Act and will ban its use by January 1, 2001. Research and development of effective methyl bromide alternatives for soil fumigation and quarantine treatments are absolutely critical to the nursery industry. Effective alternatives to methyl bromide must be identified. Therefore, AAN urges Congress to direct additional, specifically targeted funding for USDA research into methyl bromide alternatives. AAN also urges Congress to direct USDA to continue to work with the Crop Protection Coalition (of which AAN is a member) in determining how these critical research dollars are employed.

U.S. National Arboretum

When it was founded in 1927, Congress had the foresight to designate research and education as the mission of the U.S. National Arboretum. Since its founding, the National Arboretum has introduced over 200 important new cultivars, including azaleas, New Guinea impatiens, crepe myrtles, hollies, magnolias, and disease resistant elms. The nursery industry has immense respect for this highly successful federal institution and for the Friends of the National Arboretum (FONA), which is the non-profit, private sector organization whose mission is to garner additional resources to advance the quality and scope of the National Arboretum's activities. AAN fully supports and endorses the testimony which FONA presents before this Committee.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

International and interstate trade in nursery crops is governed by inspection and quarantine regulations designed to prevent or slow the artificial spread of hazardous agricultural pests. APHIS works in cooperation with state departments of agri-

PART 1

1240

culture to promulgate and enforce such regulations. AAN strongly supports APHIS' request for adequate program funds for safeguarding plant resources from exotic pests and diseases. The continued growth and success of the nursery industry, and all of American agriculture, depend on these vital APHIS programs.

Agricultural quarantine inspection (AQI)

Port-of-arrival inspections and first-class mail inspection under the AQI program are the first line of defense against damaging pest introductions. About 80 percent of the funding for this important program comes from user fees levied broadly across international travel and commerce.

APHIS does not currently collect user fees associated with commerce and travel from Canada to the U.S. Given the risks demonstrated in recent years of movement of such pests as exotic fruit flies into the U.S. from Canada, APHIS might consider whether collection of user fees on goods moving from Canada would allow for enhanced pest exclusion efforts along the U.S./Canada border.

Pest and disease management

The Administration's budget seeks about \$80 million for pest and disease management programs in fiscal year 1998. These programs provide funding for critically important survey and management for a wide range of pests, including imported fire ant and gypsy moth. However, AAN notes that APHIS plans to discontinue funding for the imported fire ant quarantine. The fiscal year 1997 funding level of \$1 million represented only 27 percent of the funding level three years ago, yet the workload associated with the quarantine has increased as the pest has continued to spread. AAN respectfully urges Congress to direct APHIS to maintain imported fire ant funding at the fiscal year 1997 funding level of \$1 million. The small federal funding share is used to carry out cooperative efforts with infested states in the South and Southeast. Continued federal involvement strengthens the level of protection of uninfested states, and ensures a fair, consistent framework for domestic commerce for nurseries located in the 11 affected states from North Carolina through Florida and west to Texas.

Chrysanthemum white rust

Chrysanthemums are an important nursery and greenhouse crop. Annual farm-gate value of the U.S. chrysanthemum crop is about \$160 million. Chrysanthemum white rust (CWR), a serious disease of chrysanthemums not known to be established in the U.S., was discovered in 1995 in California, Oregon and Washington. During fiscal year 1995 and fiscal year 1996, APHIS and state cooperators engaged in CWR detection survey, control and regulatory activities with these states. Yet, this level of funding has been inadequate to yield a comprehensive understanding as to whether eradication efforts have succeeded. Future regulatory decisions must be based on sound, comprehensive information. AAN respectfully urges Congress to direct that APHIS: (1) cooperatively fund completion of thorough detection surveys in fiscal year 1997/98; and, (2) evaluate eradication program success based on survey results.

Plant pest emergency fund

In recent years, emergencies have been declared as a result of discovery of such devastating pests as Karnal bunt of wheat, Asian gypsy moth, and Mediterranean fruit fly. The long-term benefits of successful eradication efforts far outweigh the short-term costs of emergency programs to eradicate such pests. However, such efforts require rapid response and adequate resources. AAN supports the establishment of a "no-year" emergency agricultural pest fund that could be accessed at the sole discretion of the Secretary of Agriculture in the event of pest emergencies. Such a fund should be adequate to deal with multiple emergencies, and should be replenished as needed.

COOPERATIVE STATE RESEARCH, EDUCATION AND EXTENSION SERVICE

Pesticide clearance

AAN strongly supports the Administration's fiscal year 1998 budget proposal of \$10.7 million for the IR-4 program under the USDA-CSREES Special Research Grants Program. This represents a \$5 million increase over fiscal year 1997, which is needed and justified in view of the new requirements of the Food Quality Protection Act (FQPA) passed by Congress in 1996. FQPA requires the reassessment of virtually all pesticide dietary tolerances over the next 10 years—an enormous task that will require comprehensive IR-4 support. Together with USDA-ARS funding, this would increase IR-4 funding to \$12.8 million for 1998.

PART 1

1241

The IR-4 program has achieved unparalleled success in facilitating the registration of minor-use crop protection tools, including biopesticides and other reduced-risk pesticides. While most IR-4 projects focus on minor-use food crops, to date, the program has generated crucial data supporting uses of most products registered for nursery and greenhouse use. The program's successes are being leveraged by private industry resources as well. In 1996, AAN led a successful effort to raise \$20,000 to fund a workshop where key nursery and floral researchers prioritized production problems and critical pesticide registration needs. This effort was also supported by AAN's research division, the Horticultural Research Institute, as well as by the American Floral Endowment and the Society of American Florists.

Higher education

The nursery industry is concerned about the apparent loss of teaching instruction in basic horticulture at some land grant schools. AAN supports the \$10 million allotted for higher education and urges Congress to encourage CSREES to utilize a portion of such funds so that horticulture teaching capability is maintained at land grant schools.

OFFICE OF THE DEPUTY SECRETARY

FQPA implementation

As noted above, the passage of the Food Quality Protection Act of 1996 (FQPA) has substantial impacts on the agricultural community, particularly so-called minor use specialty crops such as those produced by the nursery and greenhouse industry. AAN believes it is imperative that USDA engage with the Environmental Protection Agency (EPA) in the implementation of FQPA. USDA should serve as a spokesperson to EPA regarding the potential impacts of different policy choices considered by EPA otherwise agriculture, and the nursery industry, will suffer.

There are other provisions of FQPA which require USDA action. For example, the law requires USDA to coordinate all its various internal agency actions involving pesticides. Currently, there is no structure in place to achieve this. AAN urges Congress to establish a structure in the Secretary's office, preferably under the auspices of the Deputy Secretary, to address these issues. This is a necessary first step to USDA carrying out its full and proper role in the implementation of FQPA.

NATIONAL AGRICULTURAL STATISTICS SERVICE (NASS)

AAN strongly supports the Administration's proposed budget for the 1997 Census of Agriculture. Furthermore, AAN urges Congress to specifically direct NASS to assure funding of the decennial 1998 Horticultural Specialties survey which follows the 1997 Census of Agriculture. The nursery industry statistics provided by these projects are not available from any other source, nor could they be objectively and successfully generated by anyone other than the federal government. In addition, AAN strongly supports expansion of the labor statistics gathering of NASS as part of the Horticultural Specialties survey. As the industry's single greatest production expense, labor is key to our ability to move into the future, while attracting, training and retaining employees.

ECONOMIC RESEARCH SERVICE (ERS)

The nursery industry relies heavily upon the agricultural economic analyses produced by the Economic Research Service (ERS). In fact, ERS is this nation's sole source of such comprehensive nursery industry analyses. The availability of these economic analyses of statistical data generated by the Census of Agriculture, Horticultural Specialties Survey, and other sources, continues to be strikingly deficient for the nation's sixth largest agricultural commodity group.

AAN deeply appreciates the past support provided by Congress for the continued support of economic analyses of the nursery and greenhouse industry. Despite this Congressional support, AAN remains concerned that ERS may choose to ignore both the Congressional support and the nursery industry's demonstrated need for a continuation of these economic analyses. Therefore, AAN urges Congress to earmark \$240,000 in USDA's fiscal year 1998 funds and direct ERS to continue conducting its on-going economic analyses of the size and scope of the nursery and greenhouse industry. AAN respectfully requests Congress to ask ERS for a study of both national and international trade flows of the nursery industry.

CONCLUSION

In closing, Mr. Chairman, AAN is mindful of the budget constraints faced by this Committee. Yet, we believe that federal funding of the kinds of activities supported

PART 1

1242

in our testimony is not only justified, but necessary, if the nursery industry is to continue to prosper and to play its increasingly significant part of our nation's economic strength. As in past years, AAN genuinely appreciates this opportunity to present the nursery industry's views regarding USDA's agricultural research programs and the Department's annual proposed budget. Thank you for your consideration, and we look forward to continuing to work with you, Committee members and your staff.

PREPARED STATEMENT OF THE AMERICAN ASSOCIATION OF RETIRED PERSONS

The American Association of Retired Persons appreciates this opportunity to comment on appropriations next year for various programs which benefit the low income elderly in rural America. Initiatives such as Section 515 Rural Housing Loans and Section 504 Very Low Income Home Repair Grants and Loans make a real difference in the quality of life for many elderly Americans.

AARP's recommendations may be summarized as follows:

- Include the Administration's recommended increase for Section 504 Very Low Income Home Repair Grants and Loans;
- Provide at least the current appropriation for Section 515 Rural Housing Loans—or supplement funding, if possible—with special emphasis on congregate facilities for the frail elderly; and
- Provide sufficient resources for Food Stamp outreach activities.

POVERTY AMONG RURAL OLDER PEOPLE

Some of the nation's most persistent economic, housing, and health problems are concentrated in rural areas among older people. In 1993, older people living in non-metropolitan areas had a poverty rate of 16.1 percent, compared with 8.7 percent for those living in the suburbs and 15.5 percent for those living in central cities. Poverty increases with age, reaching rates of 19 percent for rural elderly ages 75 to 79, 24 percent for those ages 80 to 84, and over 27 percent for rural older persons 85 and above, according to the 1990 Census.

Economic problems are particularly severe among older minorities and among rural women living alone. When these factors are combined, poverty is nearly universal. According to the 1993 American Housing Survey, 36 percent of all nonmetropolitan households consisted of older women living alone. Especially hard hit are older minorities living in areas where poverty is highly concentrated. Among rural African Americans age 65 and older, the poverty rate in 1993 was approximately 40 percent. In the southern U.S., where the nine states with the highest rates of poverty are located, the 1990 Census reports that poverty rates for the elderly ranged from 23 to 34 percent.

Poor older persons are also more likely than higher income elderly to have difficulty caring for themselves because of physical disabilities. According to the 1990 Census, 31 percent of rural elderly with incomes below the poverty level had mobility or self-care limitations. Such restrictions in activity have a direct impact on the ability to maintain and repair a home.

In addition to problems associated with low incomes, older persons in rural areas have much less access to needed services. The lack of support has driven many older people to give up their homes and relocate to areas and facilities where services are available or to be placed in nursing homes as a last resort.

The Association urges special attention to the plight of older migrant and seasonal farmworkers. Working and living conditions, which are generally bad for farmworkers of all ages, are abysmal for older farmworkers. Earnings for farmworkers over age 65 who are engaged only in farmwork continue to be far below the poverty threshold, and many receive no Social Security or other benefits. Not surprisingly, farmworkers often experience problems characteristic of the elderly before reaching their fiftieth birthday. Disability levels are high—44.5 percent of farmworker families include a disabled member according to one federal study. Unfortunately, access to needed services has often been blocked by prejudice, language barriers, and a lack of outreach activities.

RURAL HOUSING

One result of high rates of rural impoverishment is a striking concentration of housing problems among rural older people. Data from the 1993 American Housing Survey indicate that 34 percent of older people living in moderately or severely inadequate housing reside in rural areas, though only 28 percent of all older households live in rural areas. To address the needs of these older households and other

PART 1

1243

vulnerable populations, it is critical that federal housing programs targeted to rural America be continued and strengthened.

For Section 515 Rural Housing Loans, AARP recommends that no less than the current \$153 million be made available next year. To the extent additional resources become available, we strongly urge an appropriation of \$220 million. This level of funding will help restore some of the cutbacks made in the program—down from \$512 million in fiscal year 1994 to the existing \$153 million. Legislative reforms in Section 515 have been enacted to address congressional concerns. Loan demand for both new construction and rehabilitation far exceeds existing resources. Section 515 is the only federal program to target funds directly to rural areas for rental housing production. We recommend that greater priority be given to serving previously underserved areas and populations such as older farmworkers. Elderly rural renters are cost-burdened to a greater extent than their younger counterparts. The 1990 Census indicates that more than half of elderly rural renters spent more than 30 percent of their income on housing compared to a third of younger rural renters. Section 515 Rural Housing Loans are critical to providing affordable rental housing opportunities in rural areas to very low-income households. Half of these loans have historically gone to provide housing for the elderly poor and disabled tenants of all ages. Given the extreme poverty which exists in many rural areas, the availability of such housing is vital for many families.

The Association further recommends that the Rural Housing Service place more emphasis on the development of congregate facilities and on the retrofitting of existing projects. Because of the scarcity of social services in many rural communities, congregate housing programs that provide nonmedical assistance such as meals, housekeeping, and transportation can be especially crucial to the independence of frail older residents. Unfortunately, a study conducted in 1991 by the Farmers Home Administration identified the lack of services and management personnel as obstacles to expanding the congregate housing program. We urge that the Secretary be encouraged to utilize existing programs within the Department to provide non-medical support services in congregate projects both for residents and older persons in the surrounding community.

AARP further urges greater attention to programs providing affordable housing to remote rural areas and areas with large concentrations of underserved populations such as older and disabled farmworkers. We support the set-aside of funds for underserved rural areas as included in the National Affordable Housing Act. In addition, the Association supports funding for the program for migrant workers and rural homeless people. Migrant workers tend to be older than other farmworkers and are more likely to be minorities with extremely low incomes. Farmworker housing very often has no heat or running water, creating barely tolerable living conditions for most families and a health-threatening situation for older persons.

The Association would like to take this opportunity to express its appreciation for the Subcommittee's continued support of the Section 504 Very Low Income Home Repair Program. Funds are used to remove safety and health hazards for the elderly poor or to install basic necessities such as indoor plumbing. We strongly urge the Subcommittee to provide the \$25 million proposed next year for Section 504 grants and the \$30 million recommended for the loan component. Funds provided in this program can really make a difference for the poorest of elderly Americans.

FOOD STAMP OUTREACH ACTIVITIES

Many older people in rural areas also suffer from nutrition-related health problems because they are economically unable to maintain a good diet. All too often, these individuals are forced to limit food purchases in order to manage the increasing costs of other necessities such as medical care, housing, and energy.

Food Stamp benefits can be a lifeline for such families but participation rates remain low due to a lack of information about the program or distance from Food Stamp offices. The social and physical isolation of rural older people makes outreach activities difficult but all the more critical. We urge the Subcommittee to provide sufficient resources for outreach activities next year.

Thank you again for the opportunity to present our views on rural housing and food stamps. We look forward to working with the Subcommittee to improve the lives of rural Americans of all ages.

PREPARED STATEMENT OF THE AMERICAN FARM BUREAU FEDERATION

Passage of the 1996 farm bill marked a new era for U.S. agriculture. Farmers and ranchers have received benefits from the new program, but many challenges remain and must be dealt with in order for agriculture to be profitable in the coming years.

PART 1

1244

If agriculture is to fully utilize the new policy environment to increase farm income, we must continue to develop new markets for agricultural products at home and abroad, expand research efforts to improve our competitive advantage in food and fiber production, improve methods to ensure food safety and develop new efforts to protect the environment. The programs funded by this subcommittee are vitally important to achieving these objectives.

We are aware of the need for the subcommittee to make difficult funding choices consistent with efforts to balance the budget. We offer these suggestions to help the subcommittee make those difficult choices.

FARM BILL IMPLEMENTATION

Full implementation of the FAIR Act should not be compromised. As you know, the FAIR Act set agriculture on a seven-year course that eliminates price supports by establishing a hard cap on total spending regardless of prices or the volume of production. Agriculture's support for the FAIR Act was based upon the promise and assurance given that it was a seven-year contract between the federal government and agricultural producers. Accordingly, any change in current policies and programs would represent a violation of that agreement.

RISK MANAGEMENT

Farm Bureau places a high priority on the development of risk management tools to supplement or provide an alternative to traditional crop insurance

The expansion of risk management programs is of importance to farmers and ranchers. Farm and ranch income is increasingly at risk due to the phase-out of traditional price and income support programs. New and innovative tools to manage risk are needed by farmers everywhere.

We support the continued expansion of new risk management tools that may be offered by private companies and reinsured by the federal government. To the extent that the pilot Crop Revenue Coverage (CRC) program is actuarially sound, it should be expanded to cover as many parts of the country and as many crops as is feasible.

Farm Bureau is concerned about the budget shortfall which could leave thousands of producers without crop insurance. There are currently more than 1.6 million crop insurance policies which provide more than \$26.5 billion in liability protection to rural America. If Congress does not provide funding for delivery expenses for fiscal year 1998, the 1.6 million policies will be canceled.

CONSERVATION PROGRAMS

Farm Bureau places a high priority on funding for voluntary incentive-based conservation programs

Conservation funding is an integral component of the nation's overriding food and natural resource policy. Farmers and ranchers respond to positive incentives that enable them to: improve soil, water and air quality; reduce erosion; provide additional wildlife habitat; and increase green space. Because conservation projects can be very costly to implement, priority should be given to initiatives that provide education, technical assistance, training and financial assistance to accomplish the nation's farm and resource policy objectives.

Conservation incentives like Environmental Quality Incentive Program (EQIP), enable farmers and ranchers to incorporate conservation practices on their farms and increase efficiency, in addition to conserving and improving natural resources. EQIP provides the incentives necessary to achieve a broad range of conservation policy objectives. We support funding for EQIP at \$200 million.

In addition to EQIP, programs like the Grazing Lands Conservation Initiative and the Forestry Incentive Program (FIP) allow farmers and ranchers to accomplish further conservation and environmental gains without compromising net farm income. FIP does so by encouraging the planting and management of trees on nonindustrial private forest lands. We support the continued funding for FIP at \$6 million. The Grazing Lands Conservation Initiative does so through technical assistance and should be fully funded at the authorized level of \$60 million.

The small watershed and flood prevention program should continue to be funded at last year's level of \$90 million. This program is currently funding more than 500 small watershed programs, successfully addressing local water quality issues. The goals of this highly popular program are consistent with the new emphasis Congress placed on addressing agricultural water quality at the local level during the farm bill debate and reauthorization of the Safe Drinking Water Act. We oppose the redi-

PART 1

1245

rection of National Resource Conservation Service (NRCS) small watershed program funds to other NRCS program areas.

We oppose funding for the Conservation Foundation. According to the 1997 report of this subcommittee, there are already 560 conservation foundations, including the federal government's Fish and Wildlife Foundation. This new foundation would be a private entity with no public or federal accountability even though it would receive federal funds.

We oppose the Administration's efforts to shift \$65 million of funding from the Conservation Reserve Program (CRP) to fund the Crown Butte Mines agreement. Money allocated for CRP should remain in that program to meet the objectives as outlined by Congress.

FOOD SAFETY AND INSPECTION

Farm Bureau supports the modernization of food safety and inspection programs

No group is more concerned about food safety than farmers and ranchers. USDA programs that keep food safe as it moves from farm to market and those that monitor the safety of consumer ready products are very important.

Farm Bureau supports adequate funding to implement Hazard Analysis Critical Control Point (HACCP) meat and poultry inspection reforms. Funding should be provided to train inspectors, pilot-test HACCP based inspection systems and to provide small plant HACCP demonstration projects. We are concerned about the impact on smaller processors and ask that an unreasonable burden not be placed on these plants.

Meat and poultry inspection is a public health function mandated by public law which should be paid from the general fund. We oppose user fees to finance federally mandated meat and poultry inspection. Agency reports on the impact of user fees fail to consider that, in general, user fees are not passed on to the consumer but rather are passed downward to producers in the form of lower prices paid for livestock.

Farm Bureau supports USDA funding for the Pesticide Data Program (PDP). PDP provides valuable pesticide residue information to the Environmental Protection Agency so that chemical registration decisions can be made on actual pesticide residues rather than on presumed maximum possible residue levels. This program should remain within USDA because it has the scientific expertise and working agreements with state agencies to effectively administer this program.

Also important is funding for USDA to update its database on human food consumption patterns. The Food Quality Protection Act requires EPA to evaluate the total risk associated with pesticide use. To do this, accurate information on human diets is needed but USDA's last human consumption survey was conducted 20 years ago. Updating this information should be a priority.

AGRICULTURAL RESEARCH

Farm Bureau places a high priority on funding for research which is focused on food and production agriculture

Agricultural research, education and extension activities should be focused on improving the performance of the food and agriculture sector. The benefits of this research will accrue not just to agricultural producers, but also to the general public. The food and fiber needs of a growing world population can be met only if there is a sharp focus on securing answers to questions challenging production agriculture.

Research funding should contain an appropriate mix of formula, competitive and special grants to assure an adequate, long-term commitment to top quality investigators. Each funding source plays a special role in our research system. We urge that growth in federal agricultural research funding be directed toward competitive grants to foster excellence and innovation.

Support for the National Research Initiative (NRI) needs to be provided at the original commitment of \$500 million needs to be considered. The NRI provides funding for basic research and long-term efforts that are primarily high-risk but which have high potential payoffs. These are usually the types of effort that private funding is reluctant to undertake due to the uncertainty of the return on investment, but which are vital to future discoveries.

It is appropriate, and in fact important, to review how federal dollars are being spent at the regional and state levels. We believe federal money spent on research or extension should be utilized to address priority national topics which have multi-state or national relevance, or will not be readily pursued by other entities. Institutional programs that are more locally focused should be covered by state funds.

PART 1

1246

Special grants for national centers of excellence within the land grant university system should be awarded competitively and recognize unique abilities, institutional strengths and specialized regional needs. These grants should encourage alliances among land grant universities, state governments, USDA and private industry. Consideration should be given to incentives for proposals from national centers of excellence rather than proposals from individual institutions.

Farm Bureau strongly supports full funding of the Global Food Security and U.S. Agricultural Competitiveness Agri-Genome Project being developed to systematically map the genes of the most important U.S. crop and livestock's species. We believe this is an example of a project which would be well served by a special grant for a national center of excellence.

Farm Bureau supports the national effort of IR-4 to clear the registration of safe chemicals and biological pest control agents for use on minor crops. Tolerance reassessment, new deadlines and other provisions of the 1996 Food Quality Protection Act create a need for IR-4 to focus on developing additional tolerance information to support existing minor use registrations and new registrations where new products are needed.

We believe adequate research should be completed to determine air quality and odor parameters that provide scientifically proven levels which promote livestock health and worker safety. Research on manure management is a high priority, including such topics as odor reduction, waste and nutrient management and artificial wetland remediation of nutrients.

The Fund for Rural America should have a greater focus on research to assist farmers and ranchers. An example is research activities to develop marketing methods which allow producers to counter increasing concentration within the livestock and poultry industries.

We support continued research to verify the means of transmission of bovine spongiform encephalopathy (BSE) and methods to inactivate the causative agent. We support funding for research to reduce the risk to livestock and crop production from infection from exotic, foreign and new domestic diseases such as Karnal bunt.

We support funding for research to find an effective control of fire ants.

INTERNATIONAL MARKET DEVELOPMENT

Farm Bureau supports programs to maintain and expand foreign markets for agricultural products

Farm Bureau places a high priority on export promotion programs. Foreign sales continue to provide a market for 30 percent of U.S. agricultural production. Passage of the 1996 farm bill has increased the significance of overseas markets to farm and ranch profitability as farmers and ranchers become more dependent on exports to expand their incomes.

Maximum funding for the Market Access Program (MAP), the Foreign Market Development Program, the Export Enhancement Program (EEP) and Dairy Export Incentive Program (DEIP) are critical to maintaining and expanding foreign export markets. Funding provided for EEP and DEIP should be \$500 million and \$89 million, the maximum allowed. Stable funding for MAP, at \$90 million, will allow that program to continue to expand markets.

The Overseas Private Investment Corporation (OPIC) should be funded at no less than 1997 levels to guarantee access and investment in developing counties and territories. Because OPIC targets emerging markets for American products, the program provides access to markets with the greatest potential for growth.

We support the flexibility to maximize the use of available resources by allowing funds not utilized for direct export subsidies to be made available for other GATT-allowed or "Green Box" programs (including market development, research and promotion). Funding should be maintained for Commodity Credit Corporation (CCC) export credits and Public Law 480.

ANIMAL AND PLANT HEALTH

Farm Bureau places a priority on programs that protect plant and animal health

The Animal and Plant Health Inspection Service (APHIS) must be adequately funded to meet the high demands of protecting the nation's agriculture industry and its role in maintaining consumer confidence in the safety of the U.S. food supply. APHIS must have state-of-the-art diagnostic and processing procedures to ensure plant and animal health and to guarantee the safety of agricultural imports and exports.

Farm Bureau supports APHIS' request for \$7 million to provide leadership, management and coordination of international activities relating to sanitary and phytosanitary measures. This is important to the long-term leadership of American

PART 1

1247

agriculture in international trade. The dispute with the European Union over beef hormone use, the poultry dispute with China, and the controversy surrounding the export of genetically-modified organisms provide examples where sound science is critical to lowering barriers for expanded trade.

APHIS is developing "regionalization" rules to govern the importation of animals and animal products. Regionalization will change the current system which prevents imports of any animal or animal products from a country with even a small incidence of diseases to a system that relies on risk-based assessments. Regionalization rules will need to be developed in the near future for all commodities in order for the United States to comply with international trading agreements. While cost effective in the long term, sufficient funds must be provided to adequately evaluate the monitoring, surveillance and control programs of our trading partners.

In conjunction with the development of the "Regionalization," APHIS is working with industry to establish an emergency preparedness plan to deal with new and emerging diseases. This is a critical complement of regionalization because it provides the internal infrastructure to allow the United States to deal rapidly with situations that may endanger domestic plants or animals or which may threaten our ability to export agricultural products. Funding for this project should not be short-changed.

Farm Bureau supports funding to complete brucellosis, tuberculosis, and pseudorabies disease eradication efforts. After decades of work, the program is on schedule to complete eradication of brucellosis from cattle herds by 1998. Any reduction in funding will negatively impact eradication efforts and could waste millions of dollars that already have been spent in this effort. As we move toward eradication of these diseases, core funding for animal disease control and eradication programs should be maintained to prevent new outbreaks and to respond swiftly to any that occur.

We support the allocation of additional funds for increased Bovine Spongiform Encephalopathy (BSE) surveillance of domestic cattle and for compensation to livestock owners whose animals must be destroyed. We support the implementation and funding of the Sheep and Goat Scrapie Voluntary Flock Certification Program and efforts to develop a swift and accurate live animal diagnostic test for scrapie. We support full funding of the National Sheep Industry Improvement Center.

We urge that funding for grasshopper control programs be made available when the need arises and support funding for the grasshopper integrated pest management program. Regulatory and pest control programs should be organized in each of the infested states, including all land in the affected area. We oppose reduction of funding for boll weevil eradication from the current level of \$16 million to \$6 million. With the great strides made to date, this is not the time to reduce the effort.

Farm Bureau opposes reductions in the Animal Damage Control and supports continued funding at \$26.6 million. We also oppose USDA's proposal that "APHIS should fund no more than 50 percent of total program operations in any state." Additional funding is needed to deal with damage caused by wolves due to the growth in the present population and reintroduction programs. Additional research is needed to develop effective biological alternatives for animal damage control.

USDA ADMINISTRATION

Farm Bureau urges Congress to act cautiously in considering another round of massive Farm Service Agency (FSA) service center closures. These offices are the conduits between farmers and ranchers and the programs created to help them. While acknowledging that additional efficiencies are possible, we believe any decision to close FSA offices should be based on several factors including workloads and geography and with local input. The implementation of the FAIR Act, EQIP, the Conservation Reserve Program (CRP) and other conservation programs and loan programs will ensure a significant work load for FSA in future years.

Farm Bureau is very concerned about proposals that would levy a one cent-per-pound tax on Florida sugar production to fund Everglades protection. It is very troubling that this idea has resurfaced after being soundly rejected by Florida voters in a 1996 ballot referendum. We believe that Florida voters are in the best position to judge the merits of this proposal and they recognized that Florida farmers are already aggressively addressing environmental concerns in the Everglades.

We support funding for Packers and Stockyards Administration programs. Expenditures to enable electronic submission of industry data, increase poultry compliance activities, to monitor and analyzing packer market competition and implications of structural change and behavioral practices in the meat packing industry are important.

PART 1

1248

The Census of Agriculture has been an effective policy tool for monitoring the current status and documenting changes in the agricultural industry and for allocating federal funds. We support the funding the Census of Agriculture at \$36 million so that it can be completed in a timely manner.

We support the Commission on 21st Century Production Agriculture and urge sufficient funding to ensure that the commission will be able to conduct a thorough evaluation of the effectiveness of the FAIR Act and potential agricultural policy alternatives.

We support accurate, timely reporting of weather information and the maintenance and adequate funding of current weather analysis and information dissemination systems. We encourage federal, state and private agencies to work to improve these systems and the coordination of user support and federal funds to ensure continuity and improvement.

We oppose the diversion of any commodity program payment funds or conservation appropriations for the administration of USDA programs or to fund USDA employee buy-outs or restructuring.

PREPARED STATEMENT OF RALPH GROSSI, PRESIDENT, AMERICAN FARMLAND TRUST

American Farmland Trust appreciates this opportunity to provide you with our views on fiscal year 1998 appropriations for agriculture. The American Farmland Trust is a 30,000 member, private, non-profit organization founded in 1980 to protect our nation's farmland. AFT works to stop the loss of productive farmland and to promote farming practices that lead to a healthy environment. We respectfully request that these comments be entered into the record.

The complement of natural resource and research programs funded by your Subcommittee represents the most significant national investment towards natural resource conservation on private lands. Made up of research, cost-share, incentive, technical and financial assistance, annual rental payment, and longer term easement programs, these programs under USDA have the potential to work together to address the long term sustainability of our natural resource base and the availability of this base for agricultural production.

Protecting our nation's farmland through the Farmland Protection Program; ensuring a vital natural resource base through the voluntary conservation programs such as WRP, CRP, WHIP and EQIP; and identifying ways to produce safer, healthier food through the Integrated Pest Management and Sustainable Agriculture Research and Education programs must go hand in hand. Only by providing landowners with the tools to protect productive, private agricultural land can USDA ensure that this land will also be available to provide the multiple benefits of safer food production, rural character, wildlife habitat, and wetlands preservation to society as a whole.

I. NATURAL RESOURCES CONSERVATION SERVICE

Farmland Protection Program: American Farmland Trust strongly supports the Farmland Protection Program in the 1996 FAIR Act and urges Congress to make the remaining \$18 million available for fiscal year 1998.

Every year, hundreds of thousands of acres of our nation's most productive farmland are lost due to urbanization. When urban pressure pushes the value of agricultural land up, the next generation simply cannot afford to farm land valued at development prices.

The Farmland Protection Program encourages states and local communities to expand their own farmland protection efforts by providing federal matching funds. In addition to preserving the food production capability and the character of rural areas, funds from the FPP help communities retain the important natural resource conservation benefits provided by farmland. Well managed, farmland can provide open space, forest lands and wetlands for wildlife; protect the local tax base; and provide a sustainable and safe food source.

This program was authorized to draw \$35 million in CCC funds. When funded in fiscal year 1996 at \$15 million, this program protected 77,000 acres on more than 200 farms. It created no new bureaucracy, required no additional FTE's, yet leveraged funds available through 37 state and local farmland protection programs in 17 states.¹ Unfortunately, in fiscal year 1997 this program was capped at \$2 million, which is not enough for a functioning program. We strongly urge that you not cap

¹ California, Connecticut, Colorado, Delaware, Maine, Maryland, Massachusetts, Michigan, New Hampshire, New Jersey, New York, North Carolina, Pennsylvania, Rhode Island, Vermont, Washington, and Virginia.

PART 1

1249

this program. Let it continue to work, encouraging action at the state and local level to protect farmland across the country.

Conservation Technical Assistance (CTA): Conservation Technical Assistance is provided by NRCS to conservation district cooperators and other land users in the planning and application of conservation treatments to control erosion; improve water quality; enhance fish and wildlife habitat; improve pasture and range conditions; and protect and enhance wetlands. The 1996 FAIR Act provided funding for CRP, WRP, EQIP, WHIP and CFO through the Commodity Credit Corporation. However, the 1996 FAIR Act also amended the CCC charter by limiting the reimbursement for salaries to the 1995 spending level. In addition, technical assistance funding for EQIP is limited to 10 percent of the total instead of the approximately 19 percent or more needed by NRCS to effectively carry out the program. While this would leave 90 percent of the EQIP funds for implementing on-the-ground management practices, NRCS will have to supplement funding for EQIP technical assistance from the Conservation Operations account.

The shortfall in technical assistance resulting from the CCC cap and the OMB restriction will have a devastating impact on NRCS's ability to carry out these functions. To remedy this problem, AFT recommends that Congress increase funding by \$18 million for technical assistance at the field level through NRCS's Conservation Operations account to meet the needs of both the new and ongoing USDA conservation programs.

Wildlife Habitat Incentives Program: American Farmland Trust is pleased to see the renewed commitment by Congress and the Administration to encourage natural resource conservation on private lands. The new WHIP program is a positive step towards helping landowners continue to sustain healthy wildlife populations on private agricultural land. We support the Administration's request for \$30 million (\$22.5 million in financial and \$7.5 million in technical assistance) for the second year of the WHIP program.

Conservation Farm Option: The Conservation Farm Option provides a voluntary approach to implementing full-farm conservation plans to include the use of multiple conservation practices. Six regional pilot programs, authorized by section 335 of the 1996 FAIR Act, will be conducted for the purpose of soil and water conservation; water quality protection or improvement; wetland restoration, protection and creation; wildlife habitat development or protection, or other similar conservation purposes. CFO provides an opportunity to achieve multiple, targeted conservation benefits on farmland. This type of integrated approach is crucial to protect the integrity of the natural resource base upon which farming depends, and to protect farmland for the multiple environmental benefits it provides: scenic views, open space, food production, wildlife habitat. Thus we support the Administration's fiscal year 1998 request for \$11.250 million for financial assistance and \$3.75 million in technical assistance for the Conservation Farm Option and urge Congress not to cap these funds as was done in fiscal year 1997.

Wetlands Reserve Program: The Wetlands Reserve Program, authorized by the 1990 FACT Act, is an example of the kind of incentive driven approach to wetlands protection and restoration that should be a centerpiece of national agricultural policy. Thus we support the Administration's \$163.597 million dollar request, including \$18.200 million for technical assistance.

II. FARM SERVICE AGENCY

Conservation Reserve Program: American Farmland Trust has been a long-standing supporter of the Conservation Reserve Program. In its 1984 report, "Soil Conservation in America: What Do We Have to Lose?" AFT documented soil erosion as one of the country's most serious environmental problems, and recommended that a conservation reserve program be created to convert highly erodible lands to conserving uses such as pasture, hay, range, forest, or wildlife habitat. Today, the 36.4 million acre program which is projected to spend \$20 billion dollars over the next decade, is the most important conservation initiative in the country.

As the only national land conservation organization dedicated to protecting farmland and promoting farming practices that lead to a healthy environment, American Farmland Trust recognizes the Conservation Reserve Program is an effective, voluntary approach to improving the nation's natural resource base. American Farmland Trust urges the Congress to make funds available to achieve the full 36.4 million acre CRP. This will allow USDA to use the Conservation Reserve Program creatively, along with local, state and federal farmland protection efforts, to protect the resources and the land for this and future generations.

PART 1

1250

III. COOPERATIVE STATE RESEARCH, EDUCATION AND EXTENSION SERVICE

Fund for Rural America: The Fund for Rural America was established by the 1996 FAIR Act to provide funds for rural development programs and a competitive grant program to support research, education and extension activities. We support the Administration's request for \$100 million, including, specifically: the Administration's request for \$33.3 million for Research, Education and Extension which will go, in part, to improve the stewardship of natural resources in agriculture and forestry; and the \$12.8 million of the Secretary's discretionary fund which will go, in part, to counter livestock waste problems.

Sustainable Agriculture, Research and Education: Sustainable Agriculture, Research and Education (SARE) is a grants program that funds high-quality, farmer involved research and education on economic, agronomic, and environmental aspects of sustainable agriculture farming systems. Authorized at \$40 million, it has been underfunded with a high of \$8.1 million. We request an increase in SARE funding of \$10.5 million to research and \$4.5 to extension for a total of \$15 million.

Bio-intensive Integrated Pest Management: Our ability to produce food and fiber in the United States in step with domestic and global demands depends upon access to safe, profitable and reliable pest management systems. New tools and better information are essential for farmers to (1) protect their crops; (2) lower production costs; and (3) reduce reliance on high risk pesticides. Confidence is growing in the profitability and effectiveness of biologically based integrated pest management (IPM) systems—or bio-intensive IPM for short. Such systems combine the pest control options available with an understanding of what is needed to address pest problems on each farm. We support the Administration's request for an increase in IPM funding in fiscal year 1998.

Thank you for this opportunity to comment. I look forward to working with this Committee to ensure the vitality and sustainability of our nation's farmland and natural resources.

PREPARED STATEMENT OF JERRY STROOPE, AMERICAN HONEY PRODUCERS ASSOCIATION

My name is Jerry Stroope. I am a third generation commercial beekeeper. I have come here to testify in behalf of the American Honey Producers Association, a national organization of beekeepers. I have brought with me today: Mr. Mark Brady, President of the Texas Beekeepers Associations Mr. James Ross, Past President of the Oklahoma Beekeepers Associations and Mr. Glenn Gibson, President of the Oklahoma Beekeepers Association. I have brought these industry representatives along today to answer any questions that this committee may wish to ask.

Honey bees pollinate over 90 cultivated crops whose estimated value exceeds \$9.3 billion and produce an average of 227 million pounds of honey annually. These figures represent one third of food supply which is dependent on honey bee pollination. Since 1984, the survival of the honey bee has been threatened principally by a number of problems for which beekeepers are depending upon research for the answers.

In 1984, a parasitic mite, the tracheal mite, was first found in honeybees in this country. In 1987, a second parasitic mite, the varroa mite, also found its way into our bee population. These two parasitic mites have spread throughout the country and have had a devastating effect on beekeeping in the United States. Colonies that have been able to survive, have been weakened to the point that they become poor honey producers and pollinators. Anytime the beekeeping industry experiences these type of losses those food crops that are dependent upon honey bee pollination experience decreased yields and poorer quality thus increasing the cost of our nations food supply.

Since our last testimony, our mite infestation has increased from 30 percent to nearly 100 percent. Untreated colonies have very little chance of survival and recorded losses of treated colonies continues to rise. The feral (wild) bee supply has been virtually wiped out. Home gardeners and wildlife are very dependent on feral colonies for their pollination services.

Parasitic mites continue to develop resistance to our treatments. The long range solution to our mite problem is the development of resistant bee stocks. This research is ongoing and will take years to complete.

The Africanized honey bee (AHB) continues to warrant strong attention and research. It appears that the AHB was strongly hit by the mites, just as our feral and domestic bee stock. However, the AHB appears to have rebounded much better than its cousins and is now on the rebound.

With beekeepers experiencing heavy losses of bees, many have given up. Those choosing to hang in there, continue to be hurt in other areas that need serious at-

PART 1

1251

tention by researchers. The greater wax moth continues to destroy millions of dollars of bee equipment. Hives weakened by the mites are taken over by the wax moth and destroyed. There is no generally acceptable chemical available that the average commercial beekeeper can use to control the wax moth.

Beekeepers continue to experience heavy losses from pesticides that are used on crops. Expanded research is needed in this area to develop methods to control crop pests without killing the badly needed honey bees.

One of the most important methods of dealing with many of our bee problems involves requeening our colonies. Locating queens is very labor intensive and time consuming. Research is needed to develop practical methods for requeening. Success in this area could virtually change beekeeping as we know it. The entire beekeeping industry could in a short period of time improve its stock by requeening, thus allowing the beekeeper to deliver healthy strong hives to the crops dependent upon the services of the honey bee.

It is our understanding that the Department of Agriculture is seeking an appropriation for the fiscal year 1998 of \$4.7 million for honey bee research. We earnestly request that your committee support this level and an additional \$995,000 for funding that would support four new scientists to be stationed at the Weslaco Bee Lab. This would bring the total to seven scientists at Weslaco which is the number that the Weslaco unit was designed to accommodate. If the Weslaco unit is not adequately filled with bee research scientists, the lab may be lost. This loss would definitely hurt the beekeeping industry. Remember, that an investment in honey bee research is an investment in at least one third of our food supply.

We appreciate the past and present support of the Department of Agriculture. We hope this committee will feel free to call upon us with any questions that will help clarify our industry needs. I would like to thank this committee for this opportunity to testify and I or my associates here today would be happy to answer any questions.

PREPARED STATEMENT OF THE AMERICAN INDIAN HIGHER EDUCATION CONSORTIUM

I. INTRODUCTION

Mr. Chairman and Members of the Subcommittee, the American Indian Higher Education Consortium (AIHEC) and the 29 Tribal Colleges that comprise the AIHEC land-grant institutions, are honored to have this opportunity to share our funding requests for fiscal year 1998. We respectfully request full funding of our four land-grant programs. These include: \$4.6 million for the Tribal College endowment; \$1.45 million for the equity grant program; \$5 million for the joint 1862–1994 institution extension program; and \$1.7 million for institution capacity building grants.

This statement will cover four key points: first, we will provide a brief background on the Tribal Colleges and our long-awaited inclusion in this nation's land-grant system; second, we will discuss the agricultural potential of American Indian communities and the need to ensure that American Indians have the skills needed to maximize the economic development potential of our resources; third, we will discuss ways in which the Tribal Colleges are working with the U.S. Department of Agriculture and state land-grant institutions toward the goal of full integration into the land-grant system; and fourth, we will describe our program requests for fiscal year 1998.

II. BACKGROUND ON TRIBAL COLLEGES

Since American Indian reservations became the final lands under the American flag to receive land-grant status in 1994, we have heard very quiet, but persistent, rumblings that Tribal Colleges should not be part of the land-grant system because we are not "true" land-grant institutions. Mr. Chairman, nothing could be further from the truth. Today, 130 years after enactment of the first land-grant legislation, Tribal Colleges, more so than any other institutions, truly exemplify the original intent of the land-grant legislation. The first Morrill Act was enacted in 1862 specifically to bring education to the people and to serve their fundamental needs.

C. Peter Magrath, president of the National Association of State Universities and Land-grant Colleges, writing in the foreword to John Campbell's "Reclaiming a Lost Heritage," said the authors of the 1862 legislation realized that "education would be extraordinarily valuable to all of America if there were universities open to all—to the daughters and sons of farmers, mechanics, and other workers, not only to the rich, the well-born, the privileged." The universities were to "promote education that would be practically applied to meet the economic development needs of that area

PART 1

1252

* * *. In effect, the universities were to be chartered by the people * * * to serve the people.”

Mr. Chairman, this is the definition and mission of the Tribal Colleges. We truly are institutions by, of, and for our people.

In the early 1970's, American Indians faced dismal statistics: out of one hundred students, 56 percent would become high school drop-outs; 44 percent would graduate high school; of those graduates, only 15 percent would go on to college; of those, 70 percent would drop out; of those remaining who would go on to graduate school, 90 percent would drop out.

If you do the math, you will realize that of those 100 students, only two were likely to graduate from college, and the two who graduated had less than a 10 percent chance of getting an advanced degree. The impact statistics like these have on the economies of Indian Country is well-documented: unemployment on the reservations hovers around 48 percent and soars to 80 percent or higher in the Northern Plains.

These astounding statistics brought tribal leaders to the realization that only through local culturally-based education could many American Indians succeed in higher education and help bring desperately needed economic development to the reservations.

In the late 1960's and early 1970's, the first Tribal Colleges were chartered on remote reservations by their respective tribal governments, to be governed by boards of local tribal people. In 1972, the first six tribally-controlled institutions came together to form the American Indian Higher Education Consortium. Today, AIHEC is a cooperatively sponsored effort on the part of 31 member institutions in the United States and Canada, 29 of which are the 1994 land-grant institutions.

Tribal Colleges now serve 25,000 students each year, offering primarily two-year degrees, with a few colleges offering four-year and graduate degrees. In addition, Tribal Colleges offer a wide range of community services. Since their inception, the Tribal Colleges have helped address the problems and challenges of our welfare system. Tribal Colleges provide GED and other college preparatory courses, probably more than any other community colleges in this country. We have done this because our mission requires us to help move American Indian people toward self-sufficiency and help make American Indians productive, tax-paying members of American society. Fulfilling this obligation will become increasingly more difficult over the next several years for two reasons: (1) federal funding resources are becoming smaller; and (2) as a result of welfare reform legislation, more and more welfare recipients are turning to the Tribal Colleges for training and employment opportunities. Already, the Tribal Colleges serve as community centers, providing libraries, tribal archives, career centers, economic development centers, public meeting places, and child care centers.

Despite our many obligations, functions, and notable achievements, Tribal Colleges are the most poorly funded institutions of higher education in this country. Historically, states do not have an obligation to American Indian lands because our reservations are trust lands under federal jurisdiction. Unlike mainstream land-grant institutions that can depend on state and local governments to match or surpass their federal investment, we cannot. Our core funding under the Tribally-Controlled Community Colleges Assistance Act of 1978 remains grossly inadequate; and total funding for the agriculture programs authorized for all 29 of the 1994 institutions combined equals approximately the amount the Department of Agriculture gives to just one state land-grant institution each year.

III. UNTAPPED ECONOMIC DEVELOPMENT POTENTIAL

Although current land-grant programs at the Tribal Colleges are modest, our 1994 authorizing legislation is vitally important to us because of the nature of our land base. Of the 54.5 million of acres that comprise American Indian reservations, 75 percent are agricultural lands and 15 percent are forestry holdings. In fact, Indian agricultural production has been valued at nine times the production potential of oil and gas resources.

Tragically, due to lack of expertise, equipment, and training, millions of acres are under-used or are developed through methods that render the resources non-renewal. The Department of Agriculture's National Indian Working Group (NIWG) reported nearly ten years ago that, "Indian use of Indian lands has dropped off significantly in recent years, and idle Indian lands have increased at a rate as high as 40 percent in one year." (1987 Final Findings and Recommendations of NIWG)

The Educational Equity in Land-grant Status Act of 1994 is our hope for turning these statistics around. It is absolutely critical that American Indians learn more about new and evoking technologies for managing our lands. We are committed to

PART 1

1253

becoming, as we were when your forefathers came to this land centuries ago, productive contributors to this nation's—and the world's—agricultural base.

IV. PARTNERSHIPS WITH DEPARTMENT OF AGRICULTURE AND OTHER LAND-GRANT INSTITUTIONS

The 1994 institutions are ready to address the challenges of Indian Country, but we need this Subcommittee's support. Already, a firm and growing commitment exists on the part of the U.S. Department of Agriculture and the mainstream land-grant community to work cooperatively with the 1994 institutions to address the challenges of American Indian agricultural and higher education systems.

As you know, this has not always been the case. In fact, the Department of Agriculture admits that over the past several decades, its programs did not address the special status of Indian tribes as sovereign nations and did not accommodate the special needs of tribal ownership of land in trust. However, as a result of the 1994 legislation, a firm commitment to the Tribal Colleges from the administration, as exemplified in the Executive Order on Tribal Colleges signed last fall and a series of "listening sessions" held recently by a USDA's Civil Rights Action Team, we believe the Department has evolved into a much stronger supporter of the Tribal Colleges.

Over the past three years, departmental officials have made a sincere effort to include the Tribal Colleges in long-established programs. To build on this relationship, the February 1997 report on "Civil Rights at the Department of Agriculture" recommends that the USDA "thoroughly examine funding for the 1994 institutions and adjust its budget recommendations and consider other statutory or regulatory changes required to eliminate any disparate funding of land-grant institutions." We win be working closely with the Department to see that this critically-important recommendation and other tribal-specific suggestions are carried out.

Last December, AIHEC was pleased to co-host with USDA a joint conference and working session on departmental programs. This two-day meeting in Albuquerque, New Mexico, gave Tribal College presidents and USDA officials and staff a chance to become better acquainted. Tribal College Presidents and faculty were able to learn details about USDA's higher education programs and resources, and the USDA personnel who administer our programs were able to learn more about the unique character and needs of the Tribal Colleges. We believe ad who attended would agree that the meeting was a resounding success.

In addition to the Albuquerque meeting, we have met on several occasions with Deputy Secretary Rominger, most recently at AIHEC's annual Winter Conference in Washington D.C. last month. At the conference, the Deputy Secretary, along with Dr. K. Jane Coulter, Deputy Administrator for Science and Education Resource Development, discussed programs being implemented by the Department for the benefit of the Tribal Colleges. In particular, the Deputy Secretary provided us with an update on the status of the Memorandum of Agreement between the Department and the Tribal Colleges, which we hope to sign shortly. The MOA, which was mandated in the 1996 Farm Bill, will cover four key points: (1) student programs; (2) employment and program opportunities; (3) capacity building; and (4) full access to grant and excess property programs. We are heartened by the Department's apparent commitment to the Tribal Colleges, and we look forward to joining with the Department and other land-grant institutions, as Dr. Coulter urged, to "make a better world."

Prior to enactment of the 1994 legislation, the National Association of State Universities and Land-Grant Colleges (NASULGC) endorsed the concept of the Tribal Colleges receiving land-grant status. Today, we are members of the Association. We are pleased that earlier this year, NASULGC's Board of Agriculture's Academic Programs Section voted to include a Tribal College representative on the Academic Programs Committee on Policy. Partnerships like this will strengthen both American Indian higher education and the U.S. higher education system.

I would like to note that Tribal Colleges adhere to the same strict accreditation standards and accrediting boards as do mainstream institutions; and for a number of years, most 1994 institutions have had articulation agreements in place with 1862 institutions. The history of successful student transfers from Tribal College to mainstream four-year institutions is well documented.

Over the past few years, Tribal Colleges and 1862 institutions have successfully collaborated on several competitive grants through the Department of Agriculture, and as the new extension grant program begins later this Summer, partnerships will increase significantly. These collaborations form a comprehensive and well-planned system in which both the Tribal Colleges and the state institutions win.

PART 1

1254

For example, Lac Courte Oreilles Ojibwa Community College in Wisconsin submitted a successful USDA Multi-cultural Scholars proposal with the University of Wisconsin-River Falls. This program allows American Indians in agriculture and natural resources fields to study for two academic years at the 1994 institution and then transfer to the state institution. This successful program is complimented by the Tribal College's collaboration on a distance-learning project which received funding under USDA's competitive Higher Education Challenge Grant program. American Indian students who will transfer from Hayward can take academic courses from the River Falls campus, acclimating them to River Falls' instructors and course work and ensuring a smooth transition later. These types of programs are enabling the land-grant community to dramatically improve their retention and completion rates with American Indian students.

V. FUNDING EQUITY FOR TRIBAL COLLEGE PROGRAMS

The twenty-nine 1994 Institutions' appropriations request for fiscal year 1998 are extremely modest when compared with the annual appropriations to each existing land-grant institution. The 1994 legislation authorized four vital programs: \$4.6 million for the Tribal College endowment; \$1.45 million for the equity grant program; \$5 million for the joint 1862-1994 institution extension program; and \$1.7 million for institution capacity building grants. It is important to remember, as we stated earlier, total funding for the programs authorized for all 29 of the 1994 institutions combined equals approximately the amount the Department of Agriculture gives to just one state land-grant institution each year.

The Tribal Colleges are grateful for the Subcommittee's support in the past for funding of three of our programs. These small programs catalyzed the 1994 institutions' crucial first steps in initiating and strengthening agriculture and natural resource programs in our communities. During this third year of our authorization, it is critical that we build on the momentum we have gained. AIHEC respectfully requests full funding for our four programs in fiscal year 1998:

1. *\$4.6 million Endowment Fund for 1994 Land-Grant Institutions.*—This endowment installment remains with the U.S. Treasury. Only interest is distributed to the 1994 institutions. Just as other land-grant institutions historically received large grants of land or endowments in lieu of land, this sum assists the 1994 institutions in establishing and strengthening our academic programs in the areas of curricula development, faculty preparation, instruction delivery systems, equipment and instrumentation for teaching, experiential learning, and student recruitment and retention in the food and agricultural sciences. As the endowment increases over time, it will provide each 1994 institution with significant income. The first year interest payment totaled nearly \$116,000, which was distributed to the 29 land-grant institutions on a formula basis.

2. *\$1.45 million Tribal College Educational Equity Grant Program.*—Closely linked with the endowment fund, this program provides \$50,000 per 1994 institution to assist in academic programs. The 1994 institutions are in their second year of funding under this program. Through the funding made available in fiscal year 1996, the Tribal Colleges were able to support vital courses and planning activities specifically targeted to meet the unique needs of our respective reservations. Examples of programs include:

- Navajo Community College, which has established an interdisciplinary "Center for Integrated Rural Development Studies." The new center will design and deliver classroom, research, and extension programs in three interrelated fields: community development, economic development, and natural resources management. These three fields are critical to the Navajo well-being.
- Fort Peck Community College in Montana, which is building a distance learning program, supplemented by on-site instruction, to provide agricultural and agribusiness courses through its interactive telecommunications system. Through the enhancement of its electronic technology capabilities and through articulation agreements with four year institutions, the college will provide the training needed to promote agriculture as a meaningful and productive way of using the reservation land base.
- Southwestern Indian Polytechnic Institute in Albuquerque, New Mexico, which is establishing a comprehensive Agricultural Science, Engineering, and Technology training infrastructure. This program builds on current resources, prepares students for immediate entry into the labor force, provides fundamental course work needed at four-year institutions, and opens the door for eventual success in a wide variety of professions.
- Other Tribal Colleges have started natural resource management courses; nutrition and dietetic programs; environmental sciences curricula; comprehensive

PART 1

1255

horticulture programs; and courses on sustainable development, forestry, and buffalo production and management.

3. *\$5 million Extension Programs.*—Currently, extension services provided by the states on our reservations are woefully inadequate. We are anxious to begin our first year of funding under a new extension program specifically for the remote reservation communities served by Tribal Colleges. For fiscal year 1997, the Congress appropriated \$2 million to begin this competitive grant program, which will be administered and coordinated through the 1862 institutions. In fiscal year 1998, we are requesting a modest funding increase of \$3 million, to \$5 million, the fully authorized level for this program.

During the development of regulations for this new program, we are pleased to report that the Department of Agriculture actively sought guidance and recommendations from both Tribal Colleges and the 1862 institutions. Like so many others within the Department of Agriculture, the Deputy Administrator for Partnerships, Dr. George Cooper, and Joan Gill, program manager, have made the Tribal Colleges feel like true partners in the Department's efforts. We are grateful for their interest and support, and we are optimistic that the new partnerships we will forge with the Department and the 1862 institutions will be highly beneficial to our tribal communities.

As you know, Mr. Chairman, this is an extension program, and some questions have been raised that this program is duplicative of ongoing extension activities. This is not the case; rather, we believe this new program will complement current programs. The existing Reservation Extension Agent program is underfunded and needs other programs to build upon its modest efforts. Currently, the program provides personnel for some reservations, but it is not commensurate with the need. In 1996, only 32 Indian Reservation Extension Agents existed nationwide to meet the agricultural needs of 314 reservations and trust lands of 54.5 million acres.

Just as federal, state, and local resources combine to form an effective and non-duplicative extension program for mainstream America, the new Tribal College program and the Reservation Extension Agent program can comprise key parts of a comprehensive strategy for Native America. In addition, this extension program will give the 1862 institutions and extension agents access to the Tribal College infrastructure, which has had unmatched success in implementing programs in Indian Country.

These resources will be used for programs such as rural agriculture economic development, 4-H programs, entrepreneurial encouragement, small farm sustainability, agricultural business development, nutrition and food services for the elderly, and numerous other programs which have already served mainstream America so well through state extension services. This program represents an ideal combination of federal resources and Tribal College-state institution expertise, with the overall impact being far greater than the sum of the parts.

4. *\$1.7 million Institutional Capacity Building Grant Program.*—This competitive grant program, which requires non-federal match, would provide the 1994 institutions with the investment necessary to allow us to strengthen and more fully develop our educational infrastructure. Unlike state institutions that have existed for nearly a century and a half, the 1994 institutions have basic infrastructure needs. The Tribal Colleges must develop our classroom capacity, upgrade and purchase computers and equipment, and garner the resources necessary to provide American Indian students with the education necessary to fully compete in the modern agricultural world.

5. *NASULGC Requests.*—The 1994 Institutions support NASULGC's funding requests, particularly the requests for a modest increase in funding for the Higher Education Challenge Grants (to \$5.35 million); the Multi-cultural Scholars program (to \$2 million); and the Graduate Training Fellowships (to \$4 million). These competitive programs allow the Tribal Colleges to participate jointly with four-year agricultural colleges and help develop effective collaboration and innovation within the land-grant community.

VI. CONCLUSION

The 1994 institutions are efficient and effective tools for bringing education to American Indians. The modest federal investment in the Tribal Colleges has paid great dividends in terms of employment, education, and economic development, and continuation of this investment makes sound moral and fiscal sense. No communities are in greater need of land-grant programs than American Indian reservations, and no institutions better exemplify the original intent of land-grant institutions than the Tribal Colleges.

PART 1

1256

Mr. Chairman, we appreciate the Subcommittee's long-standing support of the Tribal Colleges, and we are grateful for your commitment to our efforts to bring self-sufficiency to our communities. We look forward to continuing a partnership with you, the Members of your Subcommittee, the Department of Agriculture, and the mainstream land-grant system—a partnership that will bring equal educational agricultural, and economic opportunities to Native America. Thank you.

PREPARED STATEMENT OF THE AMERICAN PHYSIOLOGICAL SOCIETY

The American Physiological Society is pleased to provide its views concerning funding for enforcement of the Animal Welfare Act, which is a subject of profound concern to the biomedical research community.

The American Physiological Society (APS) is the nation's oldest learned society dedicated to medical research. Founded in 1887, the Society now has more than 8,000 members who teach medical students about the workings of the body's organs and systems and also conduct research at colleges, universities, medical schools, and pharmaceutical and biotechnology companies throughout the U.S.

The APS supports Animal Welfare Act enforcement within USDA's Animal and Plant Health Inspection Service (APHIS). Proper treatment of animals is important both for its own sake and to ensure that research results genuinely represent what is being studied. This can only be achieved with a healthy, unstressed animal.

The Animal Welfare Act governs the humane care and treatment of many of the species of animals used in biomedical research. APHIS enforces the law by licensing facilities that do animal research, carriers who transport animals, and dealers who buy and sell certain species of animals. It also conducts inspections to ensure compliance and collects annual statistics on how many animals of the regulated species are used in research each year.

The research community supports Animal Welfare Act enforcement. Given the current budget environment, we also believe that APHIS should have clear priorities to make the most of its funding. Enforcing regulations concerning USDA-licensed Class B dealers should be one of those priorities. Members of this Subcommittee are no doubt aware of allegations that large-scale pet theft is taking place in this country. There have been well-publicized claims that as many as one to two million stolen dogs and cats are sold each year to research laboratories. This has led to calls for eliminating Class B dealers (who sell non-purpose-bred dogs and cats for research) as a way to end pet theft. Last year a House Agriculture Subcommittee held hearings on pet theft allegations and USDA enforcement efforts.

Access to non-purpose-bred dogs and cats is important for medical research. Eliminating Class B dealers is an unnecessary step that would hamper medical progress. It is unnecessary because adequate enforcement of existing laws will provide people with assurance that their pets are safe. Eliminating Class B dealers would hamper medical progress because some research relies upon the kinds of animals Class B dealers supply. Relatively little research in this country involves dogs and cats. However, advanced investigations of certain aspects of heart disease, neurological disorders, bone and joint deterioration, or shock-trauma may require animals that are larger, older, or free from shared genetic defects, which can confound the results of the research. It is much easier to find animals with these traits among non-purpose-bred animals rather than purpose-bred ones. Not surprisingly, breeders tend to sell animals that are small, young, and genetically homogenous. Class B dealers currently supply about a third of all dogs and cats used in medical research, and in some places where animal activists have succeeded in closing pounds and shelters to research, there is no other source of non-purpose-bred animals.

The research community finds itself in an impossible position of proving a negative—that animals are not stolen pets. We don't want to use stolen pets in research. We want legally-acquired, non-purpose-bred animals that no one wants so we can study important health problems that affect humans and animals alike. These accusations of massive pet theft frighten the public, and while there is good reason to doubt those claims, there is also evidence that some aspects of APHIS enforcement have been inadequate. Therefore, we believe that the solution is good enforcement of the existing Animal Welfare Act regulations on Class B dealers.

The Animal Welfare Act has provisions to ensure that Class B dealers do not receive stolen pets. By law Class B dealers may only obtain dogs and cats from defined, legal sources, and they must keep identifying information on each animal and the person who supplied it. They must adhere to USDA standards for providing food, shelter, sanitation, and veterinary care. USDA makes unannounced inspections of dealers' facilities and has the authority to search for missing animals and to confiscate an animal whose life is in danger.

PART 1

1257

The research community supports enforcement of these laws, including revoking the license of any dealer who acquires stolen animals or repeatedly refuses to comply with the other provisions of the law. APHIS clearly recognizes the importance of its enforcement role and has taken steps to ensure compliance by investigating complaints against B dealers. APHIS must continue to give these inspection efforts the high priority they deserve.

The Federation of American Societies for Experimental Biology (FASEB), of which APS is a member, also supports Animal Welfare Act Enforcement. FASEB, which is comprised of 12 Societies representing 43,000 research scientists, recently released its fiscal year 1998 funding and policy recommendations concerning federally funded biomedical research. In its report FASEB urged USDA "to enforce the AWA provisions with respect to random-source animal dealers in order to fulfill the intent of Congress and uphold the public's confidence about their pets' safety." A copy of this report language is attached.

Some aspects of the administration's budget proposal do raise concerns. The administration has requested \$9.175 million for Animal Welfare Act Enforcement. The program's funding has been hovering around \$9.2 million for 5 years, after declining from a high of \$9.7 million in the early 1990's. This has required APHIS to take difficult steps such as closing regional offices and not filling vacant animal welfare inspector positions. Even if the current budget squeeze precludes an increase, APHIS definitely needs the full \$9.175 in fiscal year 1998 to carry out its responsibilities.

While unclear, the administration's budget request seems to rely upon new user fees to supply \$3 million of the requested funds. These user fees, apparently to be levied against research facilities, dealers, and carriers, have not been formally proposed by the administration, much less approved by Congress. Nevertheless, the request seems to rely upon these fees to replace \$3 million in appropriated funds. The APS urges this committee to take a very close look at this matter. APHIS needs to be given both the necessary funding and a clear sense of priorities to continue its important work of enforcing the Animal Welfare Act.

Thank you for this opportunity to express the views of the American Physiological Society.

ANIMAL WELFARE ACT ENFORCEMENT

USDA is also charged by Congress to enforce the Animal Welfare Act (AWA), which is vitally important to the conduct of biomedical research across the nation. Congress passed the AWA and its subsequent amendments to protect family pets without imposing unjustified restrictions on the use of dogs and cats for medical research. Under the AWA, USDA licenses dealers to buy and sell nonpurpose-bred or random-source animals to research facilities that are unable to obtain them from municipal pounds and shelters. Scientists need random-source dogs and cats, which are older, larger, and more diverse in genetic background than those available from animal breeders, for research on health problems, including cardiovascular disease and aging-related disorders such as bone and joint deterioration.

FASEB urges USDA to enforce the AWA provisions with respect to random-source animal dealers in order to fulfill the intent of Congress and uphold the public's confidence about their pets' safety.

PREPARED STATEMENT OF THE AMERICAN SEED TRADE ASSOCIATION (ASTA) CORN AND SORGHUM BASIC RESEARCH COMMITTEE

SUMMARY

We are requesting \$500,000 be added to the \$500,000 appropriated in 1996, for a total of \$1,000,000 to be appropriated annually for enhancing corn germplasm.

1. Corn is a key resource providing food, industrial uses, livestock feed, and export.

2. Corn production in the U.S. is based on less than 5 percent of corn germplasm available in the world. Broadening the germplasm base would provide genes to im-

PART 1

1258

prove yields and protect against new disease, insect and environmental stresses. Exotic germplasm would also be a source for changes in grain quality being demanded by export markets, industrial processors, and other end users.

3. Most exotic germplasm is unadapted to growing conditions in the U.S. This proposal is a joint USDA/ARS, university, and industry effort to adapt this material, so that it can be used by commercial breeders in the development of new hybrids to meet the demands of the American consumer and our foreign markets.

4. We greatly appreciate the \$500,000 previously appropriated for this research, beginning in the 1995 federal budget. This funding is supporting the two main USDA/ARS locations involved in this research (Iowa and North Carolina), as well as USDA/ARS and university locations in Delaware, Georgia, Illinois, Iowa, Louisiana, Mississippi, Missouri, New York, Ohio, Pennsylvania, Tennessee, and Wisconsin. Industry is providing \$450,000 in-kind support annually for this effort.

5. The additional appropriation of \$500,000 annually would enable the Iowa and North Carolina locations to purchase equipment and add staff necessary for carrying out this research. It would also provide funding for the increased germplasm evaluation and breeding necessary to test and enhance the exotic materials available.

BACKGROUND

Corn is the major crop on the cultivated land of the USA where approximately 75 million acres are planted each year. U.S. corn production, accounting for about half of the world's annual production, adds over \$16 billion of value to the American economy as a raw material. About 20 percent (\$3.2 billion) of this production is exported each year, thereby providing a positive contribution to the nation's trade balance. Approximately 17 percent of the yearly corn crop is industrially refined. A portion of refined products is exported resulting in an additional \$1.4 billion in export. Through feeding livestock, the rest of the crop is processed into meat and dairy products that affect everyone in our society. Corn is a key resource within our country.

CONCERNS

All of this production is based on using less than 5 percent of the corn germplasm available in the world. Less than 1 percent of our commercial corn is of exotic (foreign) origin, and tropical exotic germplasm is only a fraction of that. This situation exists because private sector corn breeders have generally concentrated on genetically narrow based, or elite by elite, sources for their breeding efforts, since their use results in getting hybrids to the marketplace faster.

Traditionally, corn has been treated as a commodity. In recent years corn grain users and processors have become more interested in the quality characteristics of the grain itself and how this affects their business. Since much of the exotic germplasm has undergone selection for many indigenous uses (foods, beverages, etc.) by various cultures, it seems likely that new grain quality characteristics will be found in exotic rather than the narrow-based germplasm now used. A small increase in value to the grain, such as 10 cents per bushel, would increase its annual value by \$800 million for an eight billion bushel harvest.¹

Breeders must still be concerned with breeding for higher yields so that U.S. corn farmers can remain competitive. Tapping into the broader germplasm pool could provide new sources of genes for higher yield and other performance traits, such as disease and insect tolerance or improved stalk and root strength.

A further concern with a narrow genetic base is the potential for widespread disease or insect damage due to new diseases or insect species spreading into U.S. corn growing areas. It is more likely that resistance to these dangers would be found in genetically diverse exotic germplasm sources than in our breeding material. One major benefit would be reduced pesticide use. In addition to protection against diseases and insects, these exotic materials provide insurance for unforeseen climatic or environmental problems.

A great deal of excitement has been generated over the new techniques of biotechnology, especially over the potential value to the corn industry of gene transformation using genetic engineering. Research conducted on exotic germplasm could yield many beneficial genes that genetic engineers could quickly transfer to commercial hybrids.

¹Salhuana, Pollak, Tiffany 1994. Public/Private Collaboration Proposed to Strengthen Quality and Production of U.S. Corn through Maize Germplasm Enhancement, Diversity Vol. 9, no. 4, 1993/Vol. 10, no. 1, 1994.

PART 1

1259

LAMP PROJECT

What would be the source of this exotic germplasm? Over the years, collections of corn have been made from farmers' fields and other sources all over the world, and are stored in various germplasm banks. In 1987, the Latin American Maize Project (LAMP) was initiated to evaluate these corn collections (accessions). It was a cooperative effort among 12 countries to identify accessions that might provide valuable source material for further improvement in hybrid and open-pollinated cultivars in the U.S.A. and other areas. Pioneer Hi-Bred International gave USDA/ARS \$1.5 million to fund the LAMP research.

Nearly 12,000 maize (corn) germplasm accessions were evaluated. In successive stages, the project identified the top 268 accessions. The environmental areas of adaptation for these 268 "elite" populations range from temperate to tropical, and are prime candidates for enhancing the U.S.A. corn germplasm base.

GERMPLASM ENHANCEMENT

Most of this germplasm is unadapted to growing conditions in the U.S. and requires genetic enhancement to make it adapted, or able to grow and mature in our environmental conditions. Enhancement basically means that these exotic materials will be bred with U.S. adapted materials and breeders will select progeny that carry the desired exotic traits and are also adapted to U.S. growing conditions. This will require a concerted long-term breeding approach by corn breeders at numerous locations (environments) throughout the U.S. Only after this process of enhancement will these exotic materials be ready to enter commercial corn breeding channels and be effectively utilized by a broad cross-section of the industry in the development of new hybrids for farmers and corn users.

The total process of enhancement is too large and long-term for public institutions and/or seed companies to accomplish individually. An ambitious task of this nature can only be completed through a coordinated and cooperative effort between the USDA/ARS, land-grant universities, and industry.

The Corn and Sorghum Basic Research Committee of the American Seed Trade Association has been concerned that enhancement of this exotic germplasm would proceed. The Committee consists of representatives from about 30 companies actively involved in the corn and sorghum seed industry, and at the committee's request, Dr. Linda Pollak, Research Geneticist, USDA-ARS, et al, developed a proposal for enhancing exotic germplasm starting with materials which will include the elite LAMP accessions as noted above. This proposal has developed into the U.S. GEM (Germplasm Enhancement of Maize) Project.

U.S. GEM PROJECT OUTLINE

Since this project serves a national need, the primary effort and direction has come from the USDA/ARS. Two permanent USDA/ARS locations are being used as primary sites for enhancement breeding and coordination. One is at Ames, Iowa, where the USDA/ARS currently conducts corn evaluation and enhancement efforts. Dr. Linda Pollak, Research Geneticist, is located there. Dr. Pollak was the Principal Investigator of the U.S.A. for LAMP, and is the lead scientist for this project.

The other permanent site is the USDA/ARS location in North Carolina. This site has responsibility for initial evaluation and conversion of the tropical materials. Tropical corn populations normally will not reach maturity in the Corn Belt, but will produce seed in North Carolina. After initial enhancement of the tropical materials in the South, they will be sent to Ames for further enhancement and testing in Corn Belt conditions. Dr. Marty Carson is in charge of this program.

A number of corn researchers at various land-grant universities and other ARS locations are also taking part in the enhancement and evaluation of this exotic germplasm. This cooperative effort is very important and serves not only as a source of improved germplasm but also provides excellent training for future plant scientists.

Industry is also involved. A total of 21 companies have pledged research nursery and yield trial plots to be used in this breeding effort. This in-kind support is valued at \$450,00 per year.

An important component of the project is an annual meeting of all cooperators to evaluate progress and plan strategies. An information network has been established to keep everyone up-to-date. A U.S. GEM Technical Steering Group consisting of members from USDA/ARS, University, and Industry has been formed for guidance and administration of this cooperative effort.

PART 1

1260

This germplasm enhancement project is public and is open to all public sector institutions as well as private seed companies. Information will be freely available and publicly developed materials will remain in the public domain, accessible to all.

ACCOMPLISHMENTS IN 1996

Following is a description of accomplishments and research conducted at various locations using 1996 funding.

Ames, Iowa.—Priorities for the corn enhancement work at this location are overall project coordination, data analysis and management, management and release of enhanced germplasm, analysis of materials for value-added traits, and as one of the many breeding sites. In cooperation with Iowa State University, a postdoctoral food technologist is working on the utility of unique oils obtained from GEM accessions and a graduate student is studying environmental effects on starch quality measurements.

The laboratory is continuing to evaluate oil, starch, and protein in the exotic accessions and in the breeding populations made up of exotic materials crossed to proprietary corn belt inbreds. In results from this past year, a line from one breeding cross measured total protein of 16 percent (corn belt germplasm has 10 percent) and total oil level of 6 percent (corn belt is 4 percent). It is extremely unique to find increased levels for both of these traits in the same line, and it is potentially very useful for food and feed applications. High yielding lines are being developed from two breeding crosses with protein levels above 16 percent.

GEM's World Wide Web site opened on July 15, 1996. From this site cooperators can obtain the latest data from yield tests, disease and insect screening, and value-added trait research, as well as news and upcoming events.

Raleigh, North Carolina.—The focus of this location is twofold. One priority is to develop enhanced material adapted to the Southern U.S. corn growing conditions. The second is to be a stepping stone for adapting tropical material to Midwest conditions.

Breeding populations were tested for resistance to various leaf diseases and stalk rots. Selections were made for improved material with resistance to these diseases as well as for improved yield, standability, and adaptation to North Carolina conditions. For example, eight of the tropical x elite breeding crosses were more resistant to Gray leaf spot and eight were more resistant to Southern leaf blight than the most resistant commercial check hybrids. Twenty-three of these breeding crosses had average yields over twelve locations that were not significantly different from the commercial checks and two outyielded the commercial check hybrids.

Other public cooperators conducted evaluations as follows: Yield and Stewart's bacterial wilt data accumulation in Delaware. Resistance to fall armyworm and corn earworm at two locations in Georgia. Quantitative genetic study in Illinois. Corn rootworm and Fusarium ear rot resistance in Iowa. Grain physical properties, wet milling properties, starch functionality, and other value added grain traits in Iowa. Resistance to Aspergillus and maize weevil in Louisiana. Resistance to aflatoxin and southwestern corn borer in Mississippi. Resistance to corn rootworm in Missouri. Resistance to anthracnose stalk rot in New York. Physical and compositional grain quality in Ohio. Gray leaf spot resistance in Pennsylvania. Grain yield tests in Tennessee. Evaluation of silage quality in Wisconsin.

Demonstration nurseries were planted at Iowa, North Carolina and Kentucky for viewing by cooperators. Fall field days were held at Iowa and Ohio.

Yield trials were conducted on over 200 GEM breeding populations crossed to private elite inbreds. The top 15 breeding populations were sent to winter nurseries to self about 1000 plants each. The private cooperators will continue the breeding and adaption of these accessions following the protocol developed by the GEM Technical Steering Group. Companies increased their nursery and yield trial in-kind support by approximately 25 percent.

RESEARCH IN 1997

Research will continue at the various USDA/ARS, university, and company locations similar to 1996.

EFFECTS OF INCREASED FUNDING BEGINNING IN 1998

Appropriation of the additional \$500,000 annually would provide funds to increase research in the following ways:

Ames, Iowa.—Additional funding would provide laboratory equipment (NIR and HPLC) to conduct analyses of feed quality (approximately 60 percent of corn is fed to animals). An increase would provide money for purchasing a research plot combine for conducting yield trials. The increase in winter nursery funding would allow

PART 1

1261

the Ames location to support the public breeding activities and allow public materials to reach commercial breeding programs in half the time. A small amount of money would be available to help public cooperators to attend the annual meeting and field day.

Raleigh, North Carolina.—This location has a number of equipment needs, such as seed counters, that have to be fulfilled in order to be fully equipped. Current resources restrict testing and development work to only two tropical x elite breeding crosses per year. With the increased funding, the number of breeding crosses could be tripled to 6 or more, greatly speeding up the introduction of adapted GEM material into private and public breeding programs. Additional funding would provide for yield trial testing at more locations and more extensive disease and insect resistance screening, greatly increasing the precision in selecting materials that are high yielding and have high levels of pest resistance.

Other Public Cooperators.—The increase in funding for public cooperators (to \$281,000 per year in the third fiscal year) would allow for full evaluation and development of new breeding materials improved for productivity as well as disease and insect resistance and value-added traits. It would also provide for the use of biotechnology tools in this development work. Most public cooperators are willing to participate, but cannot unless they have at least partial funding. There are approximately 30 public cooperators now, and as the project develops we are likely to have more. The full amount of funding for \$281,000 would allow 30 cooperators to each receive approximately \$9,700 per year to help fund their participation.

CONCLUSION

Corn hybrids in the U.S. have a very narrow genetic base, utilizing only a small percentage of all available corn germplasm. This greatly increases vulnerability to unforeseen pest problems, and may lead to an eventual yield cap. Exotic corn germplasm could provide genes for resistance to pest problems and for increased yields. These exotic materials may also contain quality traits to meet new market demands. This will help ensure the U.S. maintains its world leadership in providing the best raw materials to meet the demand for the production of meat, eggs, milk, and many other food and industrial uses.

The LAMP project identified the top 268 corn accessions from among 12,000 populations evaluated. The present proposal represents a joint USDA/ARS, land-grant university, and industry effort to enhance these and other exotic accessions so that they can enter commercial corn breeding programs. The result of this cooperation will be an increase in the productivity, quality, and marketability of hybrid corn in the U.S. and for export, benefiting the farmer, the feed and processing industries, and the consumer.

Therefore, the ASTA Corn and Sorghum Basic Research Committee hereby requests the 105th Congress of the United States to include funding of \$500,000 (in addition to the \$500,000 appropriated initially in 1996, for a total of \$1,000,000) annually for this corn germplasm enhancement project beginning with the 1998 federal budget.

BUDGET SUMMARY

This is a summary of the operational and capital budgets for 1997, 1998, and 1999; 1999 will only be operational. The budget is divided into the Corn Belt Location and corresponds to Ames, Iowa (USDA-ARS) and the cooperators in the Corn Belt area. The Southern Location corresponds with Raleigh, North Carolina (USDA-ARS) and the cooperators in states in the South. For a complete copy of the budget, please contact Dr. David Harper, Holden's Foundation Seeds, Inc., Box 839, Williamsburg, IA 52361 or call 319-668-1100.

Items	1997	1998	1999
Corn belt location:			
Taxes & Reductions	\$17,000	\$3,900	\$3,900
Personnel	146,840	178,700	197,600
Office/field	42,160	71,900	88,500
Capital equipment	34,000	249,000	60,000
Specific agreements for public cooperators ¹	60,000	96,500	250,000
Total for corn belt location	300,000	600,000	600,000

PART 1

1262

Items	1997	1998	1999
Southern location:			
Personnel	78,000	125,000	128,000
Office/field	23,000	57,000	54,000
Capital equipment	19,000	68,000	68,000
Specific agreements for public cooperators ¹	30,000	50,000	50,000
Total for southern location	150,000	300,000	300,000
USDA/ARS: Total USDA/ARS overhead	50,000	100,000	100,000
Summary:			
Corn belt location	300,000	600,000	600,000
Southern location	150,000	300,000	300,000
USDA/ARS overhead	50,000	100,000	100,000
Grand total	500,000	1,000,000	1,000,000

¹ Specific Agreements for Public Cooperators: Agreements for public cooperation can be made with universities and ARS scientists in many locations which could include the following states: Delaware, Georgia, Illinois, Indiana, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Nebraska, New York, North Dakota, North Carolina, Ohio, Pennsylvania, South Dakota, Tennessee, Texas, and Wisconsin. Research at these locations would include selection for disease and insect resistance, evaluation for value added traits, and yield trials.

PREPARED STATEMENT OF STEVE RAFTOPOULOS, PRESIDENT, AMERICAN SHEEP INDUSTRY ASSOCIATION

The American Sheep Industry Association (ASI) is a federation of state member associations representing the nearly 80,000 sheep producers in the United States. The sheep industry views numerous agencies and programs of the U.S. Department of Agriculture as important to lamb and wool production. Sheep industry priorities include rebuilding and strengthening our infrastructure, critical predator control activities, maintaining and expanding research capabilities and animal health efforts.

The rapid changes that have occurred in the domestic sheep industry and continue to take place put further emphasis on the importance of adequately funding the U.S. Department of Agriculture programs important to lamb and wool producers.

We appreciate this opportunity to comment on those portions of the USDA fiscal year 1998 budget.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

The mission of APHIS, "to protect U.S. animal and plant resources from diseases and pests," is very important to the sheep industry of the nation.

Animal Damage Control

The Animal Damage Control (ADC) program of USDA-APHIS is vital to the economic survival of the sheep industry. The value of sheep and lambs lost to predators and predator control expenses are second only to feed in sheep production costs. Costs associated with predation now exceed our industry's veterinary costs, labor, and transportation costs.

The sheep industry adamantly disagrees with the Administration's budget proposal to reduce operation funding for ADC.

A reduction cannot be justified, neither can a 50/50 ratio of cooperator funding for all states. The ratio is strictly an arbitrary number with no justification in statute or regulation or policy. Furthermore such a ratio ignores a great variety of factors upon which the need for ADC operations is based. These factors include types of livestock and populations, geographical differences, public lands, endangered species present or being reintroduced, presence of major airports, aquaculture, and high risk crops as well as the presence of wildlife borne diseases such as rabies, plague, and Lyme disease in each respective state. These elements form the basis for the complex Finding efforts in the states.

The Administration proposal would jeopardize cooperative programs nationwide in wildlife damage management—human health and safety, transportation safety, disease control and protection of this great nation's agricultural resources. The Administration has once again announced another wolf reintroduction program, this one

PART 1

1263

to put the Mexican wolf in the Southwest. And yet the Administration has chosen to ignore what has been proven in several states around Yellowstone National Park where federal introduction of wolves has placed tremendous burdens on the ADC resources.

The sheep industry strongly supports the funding for operations of ADC for fiscal year 1998 at \$30,281,600, an increase of \$3,314,600 over the fiscal year 1997 level.

In 1994, the National Agricultural Statistics Service reported that the sheep industry lost 520,600 sheep and lambs to predators! Since 1990, predator losses have increased from nearly 5 percent of the total U.S. sheep inventory to 7 percent of the inventory. In states such as Idaho, Montana, and Wyoming, sheep and lamb losses to predators increased 33.5 percent between 1990 and 1994. The value of these state's sheep losses increased 53.2 percent to over \$7.2 million. It should be noted that these states have a large amount of public lands on which the industry depends.

Not only are sheep industry losses to predators significantly increasing, but also total agriculture and non-agricultural requests for ADC are increasing. Agricultural requests for ADC assistance increased from 52,000 in 1988 to 99,000 in the latest report. During this time period, urban requests for ADC assistance increased from 3,635 to 84,199 which shows the need for increased funding, not less.

The point cannot be over stressed. The ADC program is an important and necessary government service. The purposes of the program are to control wildlife and pest damage to agriculture, other wildlife, aquaculture, forest, range and other natural resources; to protect public health and safety through control of wildlife-borne disease; and to control wildlife hazards at airports. Many sectors of agriculture, wildlife management and public health and safety rely heavily on the ADC program whose services are provided through a partnership between federal, state, and private interests. If the Administration's goal is to forge stronger partnerships, then reducing Finding will only diminish long standing and newly formed cooperative relationships.

ASI has worked with and relied upon the USDA APHIS/ADC program to assist in reducing predator losses on sheep. The ADC program is charged to provide federal leadership in managing problems caused by wildlife. Our industry recognizes that ADC is in dire need of additional resources to meet existing and new demands.

Rather than reducing the funding for this program, we need to modernize it by providing resources to allow use of trap monitors and tranquilizer devices on traps. While not feasible to have every trap equipped in this manner given the cost, work load, and state mandates, these devices would address concerns where threatened or endangered species or sensitive species are present, and allow the ADC program to safely and humanely remove these animals from traps. Monitors and devices to assist with safe removal of these animals at \$457,600 are a necessary funding increase to ADC.

A main strength of the ADC program is the professional leadership provided in the complex field of wildlife damage management. This opinion is not only held by the sheep industry, but by the rest of the wildlife management community. The demands for professional leadership in wildlife damage management are increasing and to meet the need, an additional \$1 million is strongly supported.

The Omnibus Budget Reconciliation Act of 1993 mandates that federal agencies convert radio systems to narrow band radios before the year 2005. After that date, ADC will no longer be allowed to use existing wide-band radios and due to the nature of ADC's work in rural areas, a funding increase of \$1,857,000 is needed to purchase new repeaters, base stations, portable and mobile radios.

Research in animal damage control is also important to the sheep industry. The long-term ability to protect livestock depends on the development of effective control methods through adequately funded research programs. We supported the increased funding of \$926,000 in fiscal year 1997 to relocate the Denver Wildlife Research Center employees to the National Wildlife Research Center facilities at Ft. Collins, Colorado. This funding should be maintained and dedicated to the development of new and effective control methods to address predator problems facing livestock producers. The sheep industry supports the fiscal year 1998 funding level for the Methods Development at \$10,951,000 to adequately address research in depredation on livestock.

Scrapie

Adequate Finding of the Voluntary Scrapie Flock Certification Program through USDA-APHIS is of critical importance to the sheep industry, as well as all segments of the livestock industries. ASI appreciates this Subcommittee's efforts in recognizing the seriousness of this devastating disease and the real need for control and eradication. Sheep producers are now paying over 50 percent of the total cost. We

PART 1

1264

request that this program be funded adequately in fiscal year 1998 under the "Animal Health Monitoring and Surveillance" line item at least at the fiscal year 1997 level.

No country has, to date, conducted an active surveillance study of scrapie. ASI has requested that APHIS conduct a national surveillance study of scrapie since our industry's ability to compete in the market place is encumbered by both existence of scrapie in our flock and the lack of quantitative data about the disease. Additional appropriations up to \$200,000 are supported by the industry to enhance completion of this critical surveillance effort.

AGRICULTURAL MARKETING SERVICE

Lamb market information and price discovery systems

The sheep industry strongly supports continued appropriations at the fiscal year 1997 levels for USDA-Agricultural Marketing Service and the National Agricultural Statistics Service to proceed with market information and price discovery systems for lamb. In addition to current market information and reports, retail price reporting for lamb and lamb import prices and data collection are key initiatives which need to be implemented to keep pace with the meat industry on a domestic and international basis.

FOREIGN AGRICULTURAL SERVICE (FAS)

The sheep industry participates in FAS programs such as the Market Access Program (MAP) and the Foreign Market Development Program. ASI strongly supports continued appropriations at the fiscal year 1997 level for these critical Foreign Agricultural Service programs. ASI is the cooperator for American wool and sheep genetics and has achieved remarkable success in increasing exports of domestic wool, breeding sheep and semen. Wool exports have increased 170 percent over the last five years with the aid of this funding. American lamb sales also benefit from the Foreign Market Development Program through increased international efforts.

NATURAL RESOURCES CONSERVATION SERVICE (NRCS)

ASI urges increased appropriations for the range programs of the Soil Conservation Service to benefit the private range and pasture lands of the United States with conservation assistance. We support the budget item and recommend an increased level for the Grazing Lands Conservation Initiative which ASI has worked with, along with other livestock and range management organizations, to address this important effort for rangelands in the U.S.

RESEARCH, EDUCATION AND ECONOMICS

The sheep industry recognizes that it must be globally competitive, profitable and sustainable as a user of and contributor to our natural resource base; that production and processing practices must be environmentally sound, socially acceptable and must contribute to the goals and overall well-being of families and communities. It is therefore essential that an integrated systems approach be used, focusing on problem-oriented programs utilizing interdisciplinary team efforts. These efforts should be applied both to plan and to conduct research on complex problems as well as to apply problem-solving technologies on farms and ranches through quality educational programs.

Linking science and technology to societal benefits was the theme of the "Food Animal Integrated Research for 1995" (FAIR 1995) symposium. Research and education priorities were agreed upon by a cross-section of society from farmers to consumers. The FAIR 1995 report combined with the sheep industry Research, Development, and Education Priorities paper list the priority funding needs of the industry in these areas.

Agricultural Research Service

ASI recommends the continued support and expansion of the scrapie/BSE and other TSE research initiatives at Pullman, Washington and Ames, Iowa. The collaborative research that is ongoing at these locations is recognized world wide and will be key in finding solutions to these disease problems. We believe regulatory initiatives to prevent, control and eradicate TSE's in our livestock populations will work when based on sound research information.

COOPERATIVE STATE RESEARCH EDUCATION AND EXTENSION SERVICE (CSREES)

We strongly support the National Research Initiative (NRI) and we appreciate the Administration's request of \$130 million. The competitive grants awarded under its

PART 1

1265

program are for the highest quality research addressing the goals and objectives of FAIR 1995.

The ongoing research in wool is critically important to the sheep industry. ASI supports continued funding of \$212,000 for fiscal year 1998 through the special grants program of the CSREES.

We urge the subcommittee to appropriate both intramural and extramural funding for research to measure the well being of livestock. Animal well being is an emotional issue; in order to consider new management strategies for the enhancement of animals, we need improved methods of measurement.

The industry greatly appreciates this opportunity to discuss these programs and appropriations important to the sheep industry.

PREPARED STATEMENT OF DIANE VANDE HEI, EXECUTIVE DIRECTOR, ASSOCIATION OF METROPOLITAN WATER AGENCIES

Thank you for the opportunity to provide the subcommittee with this testimony on fiscal year 1998 appropriations for the Department of Agriculture's conservation programs.

The Association of Metropolitan Water Agencies (AMWA) is composed of the nation's largest publicly owned metropolitan drinking water suppliers, serving over 100 million Americans with clean, safe drinking water.

AMWA places a strong emphasis on source water protection and control of nonpoint sources of pollution and looks to the agriculture community for stewardship of our natural waterways. Through various management practices like waste containment, buffer zones, filter strips and targeted fertilizer and pesticide applications, our nation's rivers and streams and the people who use the water as a source of drinking water stand to benefit.

CRP AND EQIP

AMWA was proud to support the conservation programs in the Federal Agricultural Improvement and Reform Act of 1996 (the FAIR Act), especially the redirection of the Conservation Reserve Program (CRP) to focus on more environmentally sensitive land and the new Environmental Quality Incentives Program (EQIP). If the Department administers CRP in such a way that is consistent with the intent of the Fair Act, thousands of miles of waterways nationwide should see noticeable water quality improvements. EQIP holds great promise to reduce pollution loading from land erosion, pest control and animal waste. These and other important programs are funded through the Commodity Credit Corporation as mandated by the FAIR Act. AMWA appreciates Congress' support for these two programs.

CONSERVATION OPERATIONS

Some of the most valuable programs of the Department are those offering technical assistance through the Natural Resources Conservation Service (NRCS). These extremely important efforts help farmers through NRCS field offices and staff to plan and implement conservation systems to reduce erosion, improve soil and water quality, reduce flooding and improve woodlands. Combined, these practices are key contributors to the improved quality of sources of drinking water. AMWA fully supports the Secretary of Agriculture's budget request for Conservation Operations.

WATER RESEARCH

An integral component of source water protection is research into how agriculture affects water quality. Understanding how best to manage and conserve soil, water and air resources, control animal waste, conserve water and assess the impact of pesticides minimizes the negative effects of agriculture on the environment. AMWA encourages the subcommittee to adequately fund the research conducted through the Agricultural Research Service and the Cooperative State Research, Education and Extension Service.

There are many conservation programs at the Department of Agriculture not mentioned here. Nevertheless, AMWA would like to express its support to the subcommittee for adequate funding of all the conservation efforts affecting water quality.

Since the Clean Water Act was enacted 25 years ago, our nation's waterways have improved dramatically mainly through point source controls. Given that nonpoint source pollution from agriculture is still the major remaining problem, the drinking water community looks to Congress and the USDA's conservation programs to assist

PART 1

1266

farmers, who are stewards of our land and water, to protect the nation's sources of drinking water.

Thank you, again, for allowing AMWA the opportunity to submit this testimony. If my staff or I can be of any assistance, please call.

PREPARED STATEMENT OF BERNARD H. BERNE, M.D., PH.D.

I am a resident of Arlington, Virginia. I serve the Food and Drug Administration (FDA) as a Medical Officer and as a reviewer medical device approval applications. I am testifying as a private individual. I ask your Subcommittee to appropriate \$4,000,000 for FDA to study the feasibility of consolidating its facilities at the Southeast Federal Center or at another site in the District of Columbia.

The FDA Revitalization Act (Public Law 101-635, Nov. 28, 1990) (104 Stat. 4583 et seq.) authorizes the Secretary of Health and Human Services (the Secretary), in consultation with the Administrator of the General Services Administration (GSA), to "enter into contracts for the design, construction, and operation of a consolidated Food and Drug Administration administrative and laboratory facility." It is therefore the responsibility of your Subcommittee to initiate the appropriations of funds to permit the Secretary to develop this single facility.

In the past, Treasury, Postal Services, and General Government Appropriations Acts have appropriated funds to GSA to construct separate consolidated FDA facilities in Montgomery and Prince George's Counties, Maryland. Public Law 101-635 did not authorize these appropriations, since this law only authorized a single facility and only authorized the GSA Administrator to consult with the Secretary regarding this project.

Further, because of a 1995 rescission (Public Law 104-19, July 17, 1995) and the lack of proper authorization for later appropriations, there are presently no funds available to GSA or to FDA to design, construct, or operate the consolidated facilities.

GSA is presently making plans to develop the two new separate consolidated facilities for FDA. These facilities would be located far from each other in College Park in Prince George's County and in White Oak in Montgomery County. If supported by appropriations, GSA's plans would negate the goal of Public Law 101-635, which authorizes only a single consolidated facility.

There does not appear be any benefit to the government for FDA to consolidate in two locations, rather than in one. This is a wasteful type of consolidation that is not cost-effective to the government or to the public.

In 1991, a Conference Committee of the Treasury, Postal Services, and General Government Subcommittees (Treasury-Subcommittees) of the House and Senate Committees on Appropriations created this double "consolidation" so that the two facilities would serve the political jurisdictions represented by certain members of the Treasury Subcommittees (House Report 102-234 (Oct. 3, 1991)). This so-called "consolidation" would benefit neither FDA, the federal government, the general public, the federal taxpayer, nor the Washington Metropolitan Area.

The Congressional division of the single consolidated facility and the forced suburban locations of the resultant FDA buildings contradicted both Public Law 101-635 and an existing Executive Order that is designed to strengthen the Nation's central cities. The location of the facilities also contravened a long-standing National Capital Region Planning Commission goal of retaining and increasing federal employment in the District of Columbia. It is difficult to find a worse example of "pork-barrel" legislation.

It is therefore necessary for your Subcommittee to review this situation and to appropriate funds to the Secretary of Health and Human Services (not to the GSA Administrator) to design and construct a single consolidated FDA headquarters facility. Your Subcommittee also needs to encourage the Secretary to locate the facility at a site that conforms with existing Executive Orders and Presidential policies that direct the placement of federal facilities in urban areas and in the National Capital Region. Previous appropriations acts relating to the FDA consolidation have disregarded these Orders and policies.

Former President Jimmy Carter's Executive Order 12072 (August 19, 1978, 43 F.R. 36869 (Federal Space Management)) states in Section 1-1 (Space Acquisition), Subsection 101: "Federal facilities and Federal use of space in urban areas shall serve to strengthen the nation's cities and to make them attractive places to live and work. Such Federal space shall conserve existing urban resources and encourage the development and redevelopment of cities."

Section 1-1, Subsection 1-103 of the Executive Order states: "Except where such selection is otherwise prohibited, the process for meeting Federal space needs in

PART 1

1267

urban areas shall give first consideration to a centralized community business area and adjacent areas of similar character, including other specific areas which may be recommended by local officials." Section 1-3, Subsection 1-301 of the Executive Order states: "The heads of Executive agencies shall * * * economize on their use of space."

President William J. Clinton has reaffirmed the Administration's commitment to Executive Order 12072 in his Executive Order 13006, May 21, 1996 (61 F.R. 26071). Section 1 (Statement of Policy) states: "Through the Administration's community empowerment initiatives, the Federal Government has undertaken various efforts to revitalize our central cities, which have historically served as the centers for growth and commerce in our metropolitan areas. Accordingly, the Administration hereby reaffirms the commitment set forth in Executive Order No. 12072 to strengthen our nation's cities by encouraging the location of Federal facilities in our central cities."

In March, 1997, President Clinton ordered his Cabinet Secretaries to assure that federal agencies do not leave the District of Columbia. The President considers this action to be an important element in his plan to revitalize the District.

Despite all of the above Executive policies and orders, GSA and FDA are presently planning to locate the major consolidated facility on a sprawling 130-acre site at White Oak, Maryland. According to GSA's 1956 Draft Environmental Impact Statement for the project, no building on this campus-like site would exceed six stories in height. The campus' site plan is clearly not intended to economize on the use of space.

White Oak is located about a mile outside of the Capital Beltway in a suburban area of Montgomery County that is far from any centralized business area, is not in any city, and is three miles from the nearest Metrorail station. The highways and roads near White Oak are among the most congested and dangerous of all traffic arteries in the Washington Metropolitan Area.

If implemented as GSA intends, the Prince George's and Montgomery Counties consolidations would relocate about 1,000 FDA employees out of D.C. and would encourage associated development to occur in the District's suburbs, rather than in the District itself. The White Oak facility's decentralized location would discourage FDA's visitors and employees from using Metrorail and would force nearly all employees to drive to work. FDA's consolidations would therefore serve to weaken a central city, rather than to strengthen it.

Your Subcommittee needs to take control of the FDA consolidation process and to stop this wasteful type of planning. Appropriations legislation should encourage the Secretary to consolidate FDA in a compact facility that can fit into the District of Columbia's central business area and is convenient to Metrorail.

It is not difficult to achieve such an economy of space. FDA's major headquarters presently occupy an 18-story building (the Parklawn Building in Rockville, MD). Further, the National Institutes of Health constructed in 1980 a 13-story building at its Clinical Center in Bethesda, MD, to house many of its clinical research laboratories. The FDA consolidated facility can thus be entirely accommodated in several high-rise buildings located close to each other in Washington, D.C.

GSA controls a large amount of underutilized federal space at the Southeast Federal Center. This space is located next to the Navy Yard Metrorail station in downtown Washington, D.C.

The Southeast Federal Center is only a mile from Capitol Building and from the headquarters of the Department of Health and Human Services in the Hubert H. Humphrey Building. It is thus an ideal site for the FDA consolidation.

The Southeast Federal Center can easily accommodate the FDA consolidation. No appropriated funds are presently available to construct any federal facilities at this location, which is largely vacant or occupied by obsolescent facilities.

In the National Capital Planning Commission's March, 1996, Plan for Washington's Monumental Core, a proposal in the category of "Economic Development" states: "Assist the transformation of the Southeast Federal Center and adjacent Navy Yard into a lively urban waterfront of offices, restaurants, shops and marinas."

An FDA office and laboratory facility at the Southeast Federal Center would be fully consistent with this goal. The facility would further help to compensate for the relocations of thousands of federal employees from the District of Columbia to suburban sites in Maryland and Virginia that have taken place in recent years. During the last two decades, these relocations have contradicted Executive Order 12072 and have greatly contributed to the decline of the District's economy.

Because of budgetary constraints and of FDA's uncertain future, your Subcommittee should not appropriate a large amount of funding to the Secretary for the FDA consolidation at this time. However, a small appropriation is needed to encourage

PART 1

1268

FDA and GSA to begin to plan for a consolidation at the Southeast Federal Center or at another location in the District of Columbia.

I therefore request that your Subcommittee initiate a 1998 appropriation of \$4,000,000 to FDA for the specific purpose of studying the feasibility of constructing a single consolidated FDA administrative and laboratory headquarters facility in Washington, D.C. Legislative or Committee Report language can direct or request the Secretary to give first consideration to the Southeast Federal Center as the site for the consolidation.

Thank you.

PREPARED STATEMENT OF MICHAEL P. KENNY, EXECUTIVE OFFICER, CALIFORNIA AIR RESOURCES BOARD; ROBERT J. CABRAL, SUPERVISOR, SAN JOAQUIN COUNTY, CHAIRMAN OF THE BOARD, SAN JOAQUIN VALLEY UNIFIED AIR POLLUTION CONTROL DISTRICT; MANUEL CUNHA, JR., PRESIDENT, NISEI FARMERS LEAGUE; LES CLARK, VICE PRESIDENT, INDEPENDENT OIL PRODUCERS' ASSOCIATION; AND CATHERINE H. REHEIS, MANAGING COORDINATOR, WESTERN STATES PETROLEUM ASSOCIATION, ON BEHALF OF THE CALIFORNIA INDUSTRY AND GOVERNMENT COALITION ON PM-10/PM-2.5

Mr. Chairman and Members of the Subcommittee: On behalf of the California Industry Government Coalition on PM-10/PM-2.5, we are pleased to submit this statement for the record in support of our fiscal year 1998 funding request of \$2,125,000 for the California Regional PM-10/PM-2.5 Air Quality Study. Our request includes \$436,500 (one-half of the historical baseline split between California and Washington) from CSREES, an additional allotment of \$1,563,500 from CSREES for critical in-field studies, and \$125,000 from the ARS-requested \$968,000 appropriation to be targeted to California.

The San Joaquin Valley of California and surrounding regions exceed both state and federal clean air standards for small particulate matter, designated PM-10/PM-2.5. The 1990 federal Clean Air Act Amendments require these areas to attain federal PM-10/PM-2.5 standards by December 31, 2001. Attainment of these standards requires effective and equitable distribution of pollution controls that cannot be determined without a major study of this issue.

According to EPA and the California Air Resources Board, existing research data show that air quality caused by the PM-10/PM-2.5 problem has the potential to threaten the health of more than 3 million people living in the region, reduce visibility, and impact negatively on the quality of life. Unless the causes, effects and problems associated with PM-10/PM-2.5 are better addressed and understood, many industries will suffer due to production and transportation problems, diminishing natural resources, and increasing costs of fighting a problem that begs for a soundly researched solution.

PM-10/PM-2.5 problems stem from a variety of industry and other sources, and they are a significant problem in the areas that are characteristic of much of California. Typical PM-10/PM-2.5 sources are dust stirred up by vehicles on unpaved roads, and dirt loosened and carried by wind during cultivation of agricultural land. Soil erosion through wind and other agents also leads to aggravation of PM-10/PM-2.5 air pollution problems.

The agriculture portion of this study will be developing specific types of information, tools and techniques needed to develop an inventory and the management practices that will most likely be part of the control strategies. They are: (1) validate method or methods for accurately measuring fugitive PM-10/PM-2.5 emission rates from an individual site or operation; (2) a method to easily and quickly estimate PM-10/PM-2.5 emissions; (3) an accurate inventory of fugitive PM-10/PM-2.5 dust sources by individual farming operations; (4) validated (field tested) best management practices; (5) a clear understanding of significant factors that effect PM-10/PM-2.5 emissions; and (6) a workable, validated model or models for predicting PM-10/PM-2.5 emission, based on operational parameters.

The primary focus of the short term objectives is on those soils, practices, and conditions presumed to have the highest PM-10/PM-2.5 emissions. Priority for this work will be focused on the following situations, practices, and crops within the study area.

Almond, Walnut, and Fig Harvest: Preparation for harvest; Shaking trees; Windrowing; Picking up nuts; and Ambient conditions before and after.

Dairy Industry: Dairy Lagoons and Livestock Corrals.

Cotton Harvest: Harvesting—1st and 2nd picking; Shredding of stalks; Stalk incorporation; and Ambient conditions before and after.

Feedlots: Feedlot activities.

PART 1

1269

Fall/Spring Land Preparation: Deep tillage; Discing; Land planning; Bed formation; and Ambient conditions before and after.

Grain Harvesting: Harvesting; Stubble incorporation; Discing; and Burning.

Land Leveling: Appropriate practices.

The importance of this study on PM-10/PM-2.5 is underscored by the need for more information on how the federal Clean Air Act Amendments standards can be met effectively by the business community, as well as by agencies of federal, state and local government whose activities contribute to the problem, and who are subject to the requirements of Title V of the Clean Air Act. There is a void in our current understanding of the amount and impact each source of PM-10/PM-2.5 actually contributes to the overall problem. Without a better understanding and more information—which this study would provide—industry and government will be unable to develop an effective attainment plan and control measures.

Agriculture wants to be a part of the effort to solve this major problem, but to do so, we need federal assistance to support research and efforts to deal effectively with what is essentially an unfunded federal mandate.

Agriculture and industry, in concert with the State of California and local government entities, are attempting to do our part, and we come to the appropriations process to request assistance in obtaining a fair federal share of financial support for this important research effort. In 1990, our Coalition joined forces to undertake a study essential to the development of an effective attainment plan and effective control measures for the San Joaquin Valley of California. This unique cooperative partnership involving federal, state and local government, as well as private industry, has raised more than \$15 million to date to fund research and planning for a comprehensive PM-10/PM-2.5 air quality study. Our cooperative effort on this issue continues, and our hope is that private industry and federal, state and local governments will be able to raise an additional \$12 million over the next three years to fund this important study.

The following is a list of PM-10/PM-2.5 research projects which are in progress:

- Planning*.—Development of products for emissions, field monitoring, data analysis and modeling.
- Technical support studies*.—Suitability of data base; Winter/Autumn intensive study; micrometeorological parameters; fog formation/dissipation; and ammonia from soils.
- Modeling*.—Demonstration of modeling system for application in SIP's.
- Data analysis*.—Analysis of existing data to aid project planning.
- Demonstration studies*.—Almond, fig, walnut, cotton, harvesting; unpaved agricultural roads; unpaved public roads; unpaved shoulders of paved roads; dairies, feedlots, poultry, dry cereal grain.

For fiscal year 1998, our Coalition is seeking \$2,125,000 in federal funding through the U.S. Department of Agriculture to support continuation of this vital study in California. In the budget for the Cooperative State Research, Education, and Extension Service (CSREES), we request \$436,500, representing one-half of the \$873,000 historical baseline split between California and Washington in the past two budget cycles. Additionally, we request \$1,563,500 from CSREES specifically targeted to California to support and accelerate critical research activities underway at the University of California at Davis, and especially to provide support and funding for the development of control measures that have emerged from the project's research efforts to date.

This additional funding request will support timely and critical in-field testing that must be done in fiscal year 1998. The efforts of the UCD program to date have been focused on measuring the amount of PM-10 and PM-2.5 generated by agricultural practices. The initial proposal submitted in 1994 included a budget of approximately \$900,000/year. Although the program was approved in concept the funds were split between California and Washington. We have made tremendous progress in measuring fluxes from the harvesting of almonds, walnuts, figs, cotton, and wheat and, at the same time, have made preliminary measurements on the pollutants emitted from dairies and feedlots. While the Coalition appreciates the funding from USDA to date, our research has actually been slowed because of the reduced funding level. The additional amount being requested from CSREES will allow us to "catch up" to the funding levels initially proposed, so that critical base measurements can be researched in a timely manner.

In addition, the research to date has expanded the scope of the original proposal. Inhalable particulate matter in the San Joaquin Valley is composed primarily of PM-2.5 particles during the winter months when exceedances of the air quality standards occur most frequently. The dominant form of these particles is secondary ammonium sulfate. Although it is thought that most of the ammonia emitted in the San Joaquin Valley derives from livestock operations (dairies, feedlots, poultry oper-

PART 1

1270

ations), few quantitative measurements have been made to fully quantify these sources, and evaluation of NO and NH₃ emissions from soils requires further detailed work. The new technology we wish to employ in this project will allow us to measure the complete ammonia flux from the livestock facilities, without the need to completely envelop the facility with fixed samplers. Further, the ammonia and nitrogen oxide emissions for fertilized fields vary considerably over time, so they are difficult or impossible to measure using our current technology. We have developed a new method that uses a sensitive, fast-response laser to measure the concentrations. The new project will apply this instrument in a variety of locations to measure the time-variable emissions of ammonia and nitrogen oxides for the soil, especially following fertilization. We will also measure the emissions from non-fertilized grassland, a large land use category that surrounds the San Joaquin Valley. The cost associated with this work is approximately \$350,000 a year.

The University of California at Davis (UCD) continues to improve the instrumentation to measure the wide range of atmospheric pollutants required in the San Joaquin Valley. We wish to continually improve the methodologies for measuring emission rates and to improve the spatial resolution of our measurements. Furthermore, to understand the new project, UCD will be proposing a second device that will enable us more accurately to measure the dust emissions for a dispersed source (e.g. a field). The cost of such a device and operating costs amortized over a 4-year period are \$450,000 a year.

Finally, initial discussions have begun with equipment manufacturers to explore the possibilities of cost-effectively reducing emissions from nut harvesters and devices used in land preparation. This effort will explore ways to reduce dust emission without serious adverse effects on the agricultural community. These discussions are preliminary, but it is estimated that support in the range of \$300,000 a year would be needed to advance this research.

In the budget for the Agricultural Research Service (ARS), we request that \$125,000 of the PM₁₀/PM_{2.5} funding requested by ARS be directed to the ARS facility in Fresno, California, to assist the PM₁₀/PM_{2.5} study in coordination with UC/Davis.

The California Regional PM₁₀/PM_{2.5} study will not only provide vital information for a region identified as having particularly acute PM₁₀/PM_{2.5} problems, it will also serve as a model for other regions of the country that are experiencing similar problems. The results of this study will provide improved methods and tools for air quality monitoring, emission estimations, and effective control strategies nationwide. Consequently, the beneficial results of this research will contribute to national policy as well.

The Coalition appreciates the Subcommittee's consideration of this request for a fiscal year 1998 appropriation of \$2,125,000 for U.S.D.A. to support the California Regional Region PM₁₀/PM_{2.5} Air Quality Study.

PREPARED STATEMENT OF DR. MELVIN C. RAY, ACTING VICE PRESIDENT FOR RESEARCH, MISSISSIPPI STATE UNIVERSITY; CHAIR, MISSISSIPPI EPSCoR COMMITTEE

Mr. Chairman and Members of the Subcommittee, I would like to thank you for the opportunity to submit this testimony regarding the U.S. Department of Agriculture Experimental Program to Stimulate Competitive Research (USDA EPSCoR). USDA EPSCoR is extremely important to the state of Mississippi and to our nation, and I appreciate the opportunity to testify.

I would also like to thank you, Mr. Chairman, for your support of this program. USDA EPSCoR would not be possible without your efforts and your strong support. You know, Mr. Chairman, that USDA EPSCoR is having a significant impact in Mississippi. I deeply appreciate your support of this program, and I thank you for all of your fine work representing Mississippi in the United States Senate.

I would like to begin with a brief summary of the importance of USDA EPSCoR to Mississippi. USDA-funded research is making a significant impact on efforts to improve Mississippi's science and technology (S&T) capability. In 1990 Mississippi had one award, a \$120,000 grant to a single investigator, from USDA's National Research Initiative Competitive Grants Program (NRICGP). In 1996, awards to Mississippi researchers from the NRICGP totaled \$746,568—an increase of more than 500 percent. Even more significant than the increase in dollar amount is the fact that eleven researchers at two institutions were the recipients. The previous year, nine investigators at three institutions, including the medical center, received \$811,183.

PART 1

1271

This increase is a clear indication of EPSCoR's success. EPSCoR is helping researchers in Mississippi and the other EPSCoR states¹ improve the quality of their research and improve our nation's R&D capability. We attribute Mississippi's success to USDA EPSCoR, which was implemented in 1992. The bulk of Mississippi's funding increase since 1990 has been in the non-EPSCoR Standard Research Grants program. fiscal year 1992 funding was double our fiscal year 1991 amount, and researchers at several institutions in the state continue to become more competitive.

Important examples of Mississippi's research include such varied studies as kenaf processing, which is a potential economic opportunity for rural states; rapid detection of E coli, an important safety issue that has been in the news recently; and disease mechanisms in channel catfish, impacting a significant cash crop across the southern part of the country. These projects and those they represent address important issues not only to rural states, but to the rest of the nation. Because of this important program, fine researchers are able to contribute to our economy and our knowledge base.

EPSCoR is needed because our nation's R&D funds have historically been concentrated in just a few states. That means our country has undoubtedly missed many important research opportunities. Congress created the first EPSCoR program in the National Science Foundation in 1979 as a means to ensure that all regions of the country, not just a small number of states, have a science and technology capability sufficient to help meet our nation's R&D needs. Students across the country deserve access to the high-quality education and research that go along with a high-quality R&D base.

Allow me to give the Subcommittee just a brief overview of the USDA EPSCoR program. All academic institutions within USDA EPSCoR states are eligible to apply to the Strengthening Awards Program. USDA defines EPSCoR states as those that have had a funding level from the USDA National Research Initiative Competitive Grants Program (NRICGP) no higher than the 38th percentile of all states, based on a 3-year rolling average. All U.S. territories and possessions and the District of Columbia are also eligible.

USDA EPSCoR funds projects that improve the research capacity of researchers and institutions in USDA EPSCoR states. EPSCoR funds only high quality, peer-reviewed research. Let me stress that all proposals must relate to the program areas of the NRICGP—areas that address critical agricultural issues of importance to USDA. USDA EPSCoR provides four kinds of awards: Research Career Enhancement Awards, Equipment Grants, Seed Grants, and the Strengthening Standard Research Project Award.

- Research Career Enhancement Awards help faculty enhance their research capabilities by funding sabbatical leaves. Applicants may not have received a NRICGP competitive research grant within the past five years.
- Equipment Grants strengthen the research capacity of institutions in USDA EPSCoR states. The organization submitting the grant must commit to providing 50 percent of the total cost from non-federal sources.
- Seed Grants enable researchers to collect preliminary data in preparation for applying for a standard research grant. Seed Grant awards are limited to a total cost of \$50,000 and are non-renewable. Applicants must indicate how the research will enhance future competitiveness in applying for standard research grants.
- Strengthening Standard Research Project Awards fund standard research projects of investigators who have not received a NRICGP grant within the past five years.

USDA EPSCoR provides our country with needed, high-quality, peer-reviewed research. It allows all regions of the country to contribute to our nation's science and technology capability while allowing flexibility to meet regional research needs. Because EPSCoR awards are matched with state funds, it is a sound investment of taxpayer dollars.

Mr. Chairman, this Subcommittee has for the past several years directed USDA to set-aside 10 percent of USDA NRICGP funds for USDA EPSCoR. Those funds have provided significant success in Mississippi and in the other EPSCoR states. I request that, as it has done in previous years, the Appropriations Committee direct USDA to set aside 10 percent of its NRI competitive grant funds in fiscal year 1998 for an EPSCoR program. These funds will allow the EPSCoR states to continue providing for the agricultural research needs of rural America and of our nation.

¹For fiscal year 1997, USDA-EPSCoR states include: Alaska, Arkansas, Connecticut, Delaware, Hawaii, Idaho, Maine, Mississippi, Montana, Nevada, New Hampshire, New Mexico, North Dakota, Rhode Island, South Carolina, South Dakota, Utah, Vermont, West Virginia, and Wyoming. All U.S. territories and possessions and the District of Columbia are also eligible.

PART 1

1272

I thank the subcommittee for the opportunity to submit this testimony.

PREPARED STATEMENT OF THE COALITION TO PROMOTE U.S. AGRICULTURAL EXPORTS

As members of the Coalition to Promote U.S. Agricultural Exports, we commend the Chairman and members of the Subcommittee for their interest and support of U.S. agriculture and express our appreciation for this opportunity to share our views.

The Coalition to Promote U.S. Agricultural Exports is an ad hoc coalition of over 80 organizations, representing farmers and ranchers, cooperatives, small businesses, regional trade organizations and the State Departments of Agriculture. We believe the U.S. must continue to have in place policies and programs which help maintain the ability of American agriculture to compete effectively in a global marketplace still characterized by subsidized foreign competition.

This is especially true under the new Federal Agriculture Improvement and Reform Act of 1996 (FAIR Act), which resulted in the most sweeping reforms in farm policy in over 60 years. While achieving significant budget savings, it reduces income support to producers over 7 years; eliminates acreage reduction programs; and provides increased planting flexibility. More than ever, farm income and the economic well-being of American agriculture are now dependent on continued access to foreign markets and maintaining and strengthening U.S. agricultural exports.

Accordingly, we strongly urge that USDA's export programs be fully funded and aggressively implemented. This includes maintaining funding for USDA's Market Access Program (MAP) at \$90 million as recommended in the President's fiscal year 1998 budget; providing \$30 million for the Foreign Market Development (FMD) Co-operator Program (with additional funds necessary to meet forward funding requirements for six months); and ensuring adequate funding for USDA's Foreign Agricultural Service (FAS) to help meet critical export goals and objectives. Such action is essential to America's overall trade strategy and economic interest.

It also has strong public support. A 1996 national election day poll by Penn + Schoen Associates, Inc., showed 75 percent of all Americans surveyed support such policies and programs, including USDA's Market Access Program, to promote U.S. agricultural exports, meet subsidized foreign competition and protect American jobs.

Agriculture is our nation's most export-dependent industry with exports accounting for one-third of U.S. production. In 1996, U.S. agricultural exports reached a record high of nearly \$60 billion, strengthening farm income, generating billions more in related economic activity, broadening the tax base and providing jobs for over one million Americans.

U.S. agricultural exports this past year also led to a record agricultural trade surplus of approximately \$30 billion. Without such exports, our nation's trade deficit would have been even worse.

American agriculture and American workers, however, continue to be threatened by subsidized foreign competition. Recent trade agreements, including NAFTA and the Uruguay Round Agreement on GATT, did not eliminate the use of export subsidies or other forms of export assistance. The European Union (EU), which maintains a huge advantage over the U.S. in terms of export subsidies, has recently announced a major new initiative to promote EU exports of meat, dairy, fruit, vegetables and wine into Japan—a significant U.S. market.

U.S. agricultural exports to Japan last year amounted to nearly \$12 billion, accounting for 20 percent of total U.S. agricultural exports. As many as 200,000 American jobs depend on continued exports to Japan. Clearly, any loss with regard to the Japanese market would have an adverse impact on American agriculture and American workers.

This is but one example of the competition facing American agriculture. Other countries are pursuing similar strategies. Again, this underscores the importance of USDA's export programs, including the Market Access Program (MAP) and FMD Co-operator Program. American agriculture is the most competitive industry in the world, but it can not and should not be expected to compete alone against the treasuries of foreign governments.

Funding for USDA's Market Access Program (MAP) has already been reduced by two-thirds from its original authorized level. It now represents only a fraction of what our competitors are spending. To further reduce or eliminate funding for MAP in the face of increasing subsidized foreign competition would put U.S. agriculture at a substantial competitive disadvantage.

Further, it is important to note, USDA's Market Access Program has been substantially reformed. The FAIR Act, for example, made permanent the reforms con-

PART 1

1273

tained in previous appropriations bills. In addition to requiring that the program continues to be administered on a cost-share basis, the Act specifically targets direct assistance to small businesses, farmer cooperatives and trade associations; requires that funds be used only to promote American grown and produced agricultural commodities and related products; prohibits assistance to foreign firms relating to foreign products; maintains ongoing review and certification of use of funds; and provides for program graduation.

By any measure, USDA's Market Access Program has been a tremendous success and extremely cost-effective. It demonstrates what can be accomplished as a result of a true public-private partnership. Since the program began, U.S. agricultural exports have more than doubled and value-added exports have tripled. The number of jobs which depend on U.S. agricultural exports has also more than doubled—making it one of the most successful job-creating programs ever established.

For all these reasons, we again urge that USDA's export programs be fully funded and aggressively implemented. As a nation, we can work to export our products. Or, we can export our jobs. USDA's export programs are a key part of an overall trade strategy that is pro-growth, pro-trade and pro-job.

PREPARED STATEMENT OF ELDON HOUT, CHAIRMAN, COASTAL STATES ORGANIZATION

On behalf of the Coastal States Organization (CSO), I thank you for the opportunity to provide you with our views on fiscal year 1998 appropriations for agricultural programs. We are specifically referring to several conservation provisions enacted through the 1996 Farm Bill. We submit this letter on behalf of the Coastal States Organization, and respectfully request that it be entered into the record.

Since 1970, the Coastal States Organization has served as the coastal Governors' official representative for ocean, coastal and Great Lakes affairs of the United States. Delegates to CSO are appointed by the Governors from each of the thirty-five States, Commonwealths and Territories bordering the Atlantic and Pacific Oceans, the Gulf of Mexico, and the Great Lakes.

The coastal zone is perhaps the most intensively utilized area of our country. In addition to traditional uses such as recreation, fisheries, and shipping, the coastal zone is home to more than half the nation's population, as well as substantial agricultural interests. The coastal zone is also a fragile ecosystem that must be managed carefully in order to ensure its viability for future generations. The intertwining of agriculture and conservation programs is one step forward in that process.

Productive and sustainable agriculture is an integral component of the coastal zone. State coastal management programs have been familiar with the costs and benefits of coastal agriculture for many years. Although the States have traditionally taken the lead in agricultural conservation measures, the Federal government's role in providing monetary support and technical assistance is invaluable. To this end, the Coastal States Organization respectfully requests funding for the following programs:

Farmland protection program.—The Coastal States Organization supports the Administration's request, and urges Congress to fully fund the Farmland Protection Program at \$18 million for fiscal year 1998. This program seeks to conserve prime farmland by limiting non-agricultural uses of the land. These funds will specifically be used to leverage State and local government funds to purchase conservation easements. By limiting coastal farmland to agricultural use, development and increasing population pressures on particularly fragile coastal areas can be relieved. Coastal agriculture provides visitors to the coast with uncluttered landscapes and scenic views, and rural communities with an economic base necessary for their survival. Many of the crops grown along the coast are produced in few, if any, other areas. In all cases, these protection programs are voluntary.

Wildlife habitat incentives program.—The Coastal States Organization supports the Administration's request of \$30 million, of which \$22.5 million is directed to financial assistance, and \$7.5 million in technical assistance. This program, also of great benefit to the coastal states, seeks to encourage resource conservation on private agricultural lands. WHIP provides funds to the States, which can in turn encourage farmers to enhance wildlife habitat using monetary incentives.

Wetlands reserve program.—This program, designed to restore and protect wetlands, is integral to protecting water quality. CSO therefore supports the Administration's request of \$163.597 million.

Conservation reserve program.—CSO supports the Administration's request of \$1.926 billion for fiscal year 1998. This program conserves and improves soil and water resources of eligible farmland primarily by reducing erosion from highly erodible and marginal croplands. Special priority is given to watersheds adversely af-

PART 1

1274

ected by agricultural activities, in addition to certain targeted coastal watersheds (Chesapeake Bay Region, Great Lakes Region, and the Long Island Sound Region).

Environmental quality incentives program.—CSO supports the Administration's request of level funding, \$200 million, for EQIP. This program provides financial, technical and education assistance to farmers and ranchers who face serious threats to soil and water. EQIP offers five to ten-year contracts that provide incentive payments and cost-sharing for conservation practices, such as nutrient management, manure management, and wildlife management.

CSO greatly appreciates this opportunity to submit our recommendations to the Subcommittee, and stands ready to assist you in any way we can. Thank you for your consideration.

PREPARED STATEMENT OF JACK A. BARNETT, EXECUTIVE DIRECTOR, COLORADO RIVER BASIN SALINITY CONTROL FORUM

With the enactment of legislation that placed, Colorado River Basin Salinity Control Forum With the enactment of legislation that placed the Colorado River salinity control program's funding in the new Environmental Quality Incentives Program (EQIP), the funds are obtained through the Commodities Credit Corporation. We realize that this no longer places the funding of the program in the discretionary category that is the focus of your subcommittee's deliberations. However, we would appreciate your considering this letter as a part of the formal record of testimony as allowed by the Agriculture, Rural Development, and Related Agencies Subcommittee. You have been a much appreciated supporter of the Colorado River salinity control program and we take this opportunity as your subcommittee is receiving testimony to advise you of the funding status and the funding needs of this program.

The Colorado River Basin Salinity Control Forum has met and concluded that approximately \$10 million is needed to improve on-farm practices in the Upper Basin states each year if the water quality standards on the Colorado River are to be met. The Basin states are in a position to take from Basin funds a 30 percent up-front cost sharing to match EQIP dollars. It is anticipated that farmers will also contribute 30 percent. This would bring the total non-Federal contribution to the program to over 50 percent. We are currently attempting to convince decision makers within the Department of Agriculture that this very large cost sharing should result in needed Federal EQIP dollars being designated for Colorado River salinity control.

To date, we have not been as successful with respect to the arguments concerning the merits of the program as we would desire. The issues focus around the fact that this is a regional program that appears to be a prime candidate to be designated as a national priority area as provided for by the Congress. The Department has not yet determined how to react to the Congressional directive of establishing national priorities.

We would very much appreciate your vigilance as Chairman of the Subcommittee in assuring that adequate funds are made available to the salinity control program so that water quality standards on the river system can be met. We would also appreciate your alerting us to issues that develop. We plan to monitor the implementation of the EQIP program and try to influence administration decisions yet to be made. We will keep you apprised of our progress.

PREPARED STATEMENT OF SUSAN G. SCHRAM, PH.D., FOOD AND AGRICULTURE PROGRAM COORDINATOR, DEPUTY DIRECTOR, WASHINGTON OPERATIONS, CONSORTIUM FOR INTERNATIONAL EARTH SCIENCE INFORMATION NETWORK [CIESIN]

Mr. Chairman, thank you for the opportunity to submit testimony to the committee. I would like to thank you and the Subcommittee for your support for The USDA/CIESIN Global Change Data Assessment and Integration Project, funded through the Agricultural Research Service (ARS). I am pleased to be able to report what we have accomplished this year, and to highlight the importance of the continuation of this project.

Mr. Chairman, this has been an exciting year for the USDA/CIESIN project! As you know, our efforts are devoted to the challenge of harnessing cutting-edge information technologies to bring long-term scientific research data to bear on agriculture and natural resource decision making. To date, our program has helped address agricultural and natural resource issues in New Mexico, Michigan, Arizona, Colorado, Texas, Oregon, Alaska, Hawaii, Oklahoma, and Idaho. This year we are particularly pleased to report that our research has led to new and innovative collaboration with USDA—in the Agricultural Research Service, the Forest Service and the Natural Resource Conservation Service.

PART 1

1275

Our project makes a unique contribution in that it provides USDA agencies with the capacity to: (1) rescue and put to use valuable long-term scientific data that taxpayers have paid millions of dollars to collect and that have been at risk of being lost; (2) provide state-of-the-art technical tools so that concerned farmers, ranchers, and citizens can visualize alternatives and participate in decision-making about the uses of our natural resources; (3) access documentation on USDA's data resources related to agriculture and the environment, and, (4) assure that USDA benefits from new developments in electronic information technology.

Mr. Chairman, the first logical step in harnessing our scientific data resources for improved use by the research community and the public is to determine the location and condition of our precious long-term scientific agricultural and natural resource data assets. We must assure that previous public investments in scientific data collection are not sacrificed due to retirement of data custodians, inadequate documentation, or existence in single, hard copy format.

To address agricultural data rescue needs, CIESIN has continued its collaboration with the Physical Sciences Lab (PSL) at New Mexico State University (NMSU). Due to continuous funding, since the inception of our project, we have been able to complete data rescue projects at the Jornada Experimental Range and the Cibola National Forest in New Mexico and at the Santa Rita Experimental Range in Arizona. This year our efforts are devoted to data rescue work at the Southern Plains Experimental Range in Woodward, Oklahoma and at the Northwest Watershed Research Center in Boise, Idaho. Following is a capsule summary of each of these projects:

- In the course of a two-year data rescue project on the Jornada Experimental Range near Las Cruces New Mexico, we digitized and visualized over 7,000 images of basal vegetation growth dated from 1915. This project preserved over 80 years of previous government investment in scientists' efforts at tedious data documentation on graph paper and converted them to computer accessible visualization now available for land management decision making;
- The Bluewater Creek Watershed Data Rescue Project in Northwestern New Mexico involved digitizing hard copy range condition survey and aerial photography data, integrating these data with existing digital data and developing tools to make it easier for scientists and researchers at both the Cibola National Forest and the Mount Taylor Ranger District to use the data;
- A project on The Santa Rita Experimental Range near Tucson Arizona was completed through a partnership with PSL, the Agricultural Research Service, the Forest Service, the academic community, Agricultural Experiment Stations, and the Extension Service. CIESIN digitized range photographs dating back to 1903 for integration with weather data, plant species composition change data, and land treatment information to gain a comprehensive picture of changes in the landscape;
- Working with ARS personnel at the Southern Plains Experimental Range in Woodward Oklahoma, this year's data rescue efforts are devoted to rescuing hard copy forage density and animal weight data associated with a twenty year grazing intensity study that took place on the Southern Plains Experimental Range from 1941–1961. This period covered the dramatic swing in climate from wet to drought and back to wet in the southwest. CIESIN transcribed detailed hand written data records from yellowed journals to data entry sheets, in preparation for keying into a digital database at New Mexico State University. Ultimately these data will be formatted for inclusion in statistical software or other visualization tools; and,
- In consultation with ARS, work on an additional data rescue project at the Northwest Watershed Research Center at Boise Idaho will begin in March of this year.

Some of our most exciting project developments this year have been related to creative research employing the Active Response Geographic Information System (AR/GIS). As you know, geographic information systems incorporate complex databases and models with computer maps to enable policy makers and citizens to visualize the impact of alternative uses of natural resources and to reach consensus. We have won national recognition for our technology, due especially to the fact that it makes it possible to incorporate public input into controversial decisions about our precious land and forest resources. This year, USDA agencies which have taken advantage of the decision support capabilities of AR/GIS include:

- The Forest Service.*—The Arapaho and Roosevelt National Forests in Colorado have used AR/GIS to incorporate public input into their Five Year Plan. This year CIESIN facilitated district workshops to support final review of public comment and final update of the 1997 Management Revision Plan. Efforts focused around use of a spatial decision support system for interactive update and annotation of Forest Plan maps;

PART 1

1276

—*The Natural Resource Conservation Service.*—Many federal agencies have generated eco-region maps for the United States, based on their own mission (soils types, vegetation cover, etc.). To support eco-system management strategy development across agencies and geographic regions, national integration is needed to define eco-region types. USDA's Natural Resources Conservation Service (NRCS) is leading a government task force to integrate critical parameters into a common framework. CIESIN is working with NRCS regional offices on software that will enable them to update their own regional eco-region definitions, in an effort that will lead to national integration;

—*The Agricultural Research Service.*—This year, CIESIN has begun to work with the ARS Great Plains System Research Unit (GPSR) in Ft. Collins, Colorado to develop a means of organizing, visualizing and presenting data generated by the Great Plains Framework for Agricultural Resource Management (GPFARM) model. CIESIN work provides GPFARM with geographic capabilities. We have provided a mechanism for farmers to keep records in a geographic format for input to GPFARM and a mechanism to visualize GPFARM output for decision making. We are excited to note that, in a recent GPFARM planning committee meeting, farm consultants advising the project emphasized that the continuing CIESIN contribution is imperative to the ultimate application of this overall ARS research project by farmers.

Also in the decision support area, through small public/private partnerships made possible by the existence of the core project, the City of Denver and the City of Scottsdale Arizona are interested in AR/GIS to facilitate decision making. We are exploring a partnership with Scottsdale that would help make data and information collected by NASA more available to the public. This project would be managed through the Stennis Space Center in Mississippi.

This year, in the area of data documentation CIESIN continued its work to expand public awareness of the rich data resources of USDA in the area of agriculture and the environment. CIESIN has developed and updated metadata about global environmental change-related data sets across the major USDA research agencies and made this information accessible to USDA and other researchers through the World Wide Web. The USDA/CIESIN World Wide Web "home page" (<http://www.ciesin.colostate.edu/USDA>), provides an integrated view of over 600 USDA global change data sets, 160 models, and 173 GIS applications with electronic connections to a full spectrum of information related to environmental change research topics. The home page now connects USDA researchers with over 450 additional sources of agriculture and natural resource data worldwide. CIESIN also serves as the official provider of agricultural data entries, formatted appropriately, for inclusion in the electronically-accessible NASA Global Change Master Directory.

Mr. Chairman, this project is an important part of the work of USDA in preserving previous public investment in scientific data collection, providing state of the art tools for sound agriculture and natural resource decision making, and making scientific data and information more readily available and more useful for the research community, for federal, state and local policy makers and taxpayers. We are grateful for the opportunity to provide Subcommittee members with an update on our activities.

PREPARED STATEMENT OF SAMUEL F. MINOR, VICE CHAIRMAN, COUNCIL FOR AGRICULTURAL RESEARCH, EXTENSION, AND TEACHING

Mr. Chairman, I am Sam Minor, a dairy farmer and retail market and restaurant operator with my wife and family just south of Pittsburgh, Pennsylvania. On this farm we milk 100+ cows, grow forage for the dairy herd and in addition grow several acres of sweet corn, pumpkins and other fresh vegetables. These products are primarily marketed through our dairy store, farm market, and on the farm restaurant which is operated by five family members and approximately 55 additional full-time and part-time employees. The customer count would indicate that in excess of 200,000 people visited our farm this past year.

In addition to working with our farm business, I have, for a number of years, had the opportunity to serve on the Boards of Directors of two farm cooperatives—PennWest Farm Credit that provides credit and financial services to 4,600 farmers in western Pennsylvania, and Agway Inc. the primary farm supply cooperative for 85,000 farmers in the 13 northeastern states.

I am here today to testify on behalf of the Council for Agricultural Research, Extension, and Teaching [CARET]. CARET is a national organization of grassroots or lay people, such as myself, that was created in 1982 by the National Association of State Universities and Land-Grant Colleges commonly referred to as NASULGC.

PART 1

1277

Our mission as CARET is to enhance national support for and understanding of the land-grant university food and agricultural research, extension, and teaching mission and programs.

I have taken the time to talk about my personal background because of the importance of the subject that we are here to discuss—agricultural research and education. This agricultural research and education has been very important to our family, to our farm business, to the farmer members of these two cooperatives, and to the agricultural industry.

For example, prior to starting our farming operation in 1975 I had the opportunity to work for several years in the artificial breeding industry where we saw first hand the result of basic and applied research and extension work in dairy cattle genetics and semen physiology, which allows U.S. dairymen to have the highest producing most efficient dairy herds in the world today.

Then it really hit home when we started our own farming business. Although growing up on a general farm in the hills of southwestern Pennsylvania, I was not fully appreciative of the full impact of our land-grant research and extension programs until we started our own farm and retail farm business. We soon learned that research and extension was the basis of nearly every program we carried out in this business—literally everything from testing the soil and planting to selecting varieties, and harvesting all the way through to producing, processing, and selling the milk. I know that these comments are very basic. But this availability of science and technology is the very reason that, today, American agriculture is the envy of the world.

It has been the federally supported programs of research, extension, and teaching that have provided the scientific basis to allow 1.8 million U.S. farms, such as ours in southwestern Pennsylvania, to produce a record in excess of \$200 billion of food and fiber. A record \$60 billion of this went to the export market, allowing for a nearly \$30 billion positive contribution to the balance of trade. While these are numbers that are familiar to all of us they are very significant and, I believe, only touch on the opportunity for agriculture in the future.

This is an important time to talk about agricultural research and education. We are aware of the fiscal restraints and the changing role of the federal government in the conduct of our agricultural businesses. Agriculture will rely less upon the commodity support programs but will compete effectively in the worldwide marketplace. Agriculture research and the implementation of the research findings has been a major factor in preparing for this transition. As a result of these past efforts we will have an agricultural system that is even more competitive in the global economy.

These combined sectors of food and agriculture and their related industries provide almost 20 percent of the jobs in this country and account for 16 percent of our gross national product. Yet the consuming public spends just over 10 percent of their disposable income to meet their food needs. Every year we see new science and technologies such as global positioning precision farming that allows for site-specific decisions, or the new “super seed” varieties that have bred in resistance to pests and herbicides or new value added technologies that will allow us to more effectively market this great production capability in the expanding worldwide marketplace.

The federally-supported programs in cooperation with our state land-grant colleges and universities are crucial for us to retain and expand this competitive edge in this worldwide marketplace. Public agricultural research, education, and extension enables us to produce better and safer foods, find new uses for agriculture products, while minimizing the use of potentially harmful chemicals and curbing deterioration of our environment and natural resources.

Specifically we are here to request support for the fiscal year 1998 budget recommendation of the NASULGC Board on Agriculture of \$891.2 million, an increase of 6.6 percent over the current year appropriations. This request is for the federal portion of the funding for research extension, and higher education and federal administration that is in turn leveraged up to five times at the individual state and local level. While this is a large amount of money it is quite moderate when one considers this in relation to the total federal appropriation to research or even in relation to the agriculture appropriations. This is especially moderate when we consider this is just \$1 of federal monies for agricultural research, extension, and teaching per \$800 of consumers' food and fiber expenditures.

Mr. Chairman, I especially want to emphasize the importance of the request for the small increase in the amount appropriated for the base programs for research and extension. These base funds provide the infrastructure for the long term research and extension programs. These base funds represent the on-going state/federal partnership that represents a long-term commitment to U.S. agricultural re-

PART 1

1278

search and the transfer of this research to implementation. The importance of these base fiends can not be over-emphasized.

The Council for Agricultural Research, Extension, and Teaching strongly supports the education programs at all of our schools including the 1862, 1890, and 1994 institutions which are enriched and improved through the higher education and challenge capacity building grants programs of the Cooperative State Research, Education, and Extension Service (CSREES).

Also, I would like to take just a moment to say a few words about the land-grant system as the Congress is about to begin consideration of the reauthorization of the Title VIII portion of the Farm Bill. This land-grant system is recognized internationally as a unique partnership working for people, food, agriculture, and the environment. This system has, however, recognized that as agriculture has changed so must the land-grant university system consider change. This recognition of the need for change has resulted in a very thorough reassessment or futuring process that has brought about "A Plan for Action on Agriculture and Natural Resources for The Land-Grant Universities."

This Plan for Action has six specific goals that are very closely coordinated with the similar objectives of the USDA REE Section. The achievement of these goals shall provide for:

1. An Agriculture System that Is Highly Competitive in the Global Economy.
2. A Safe and Secure Food and Fiber System.
3. Healthy Well-Nourished Populations.
4. Establish Greater Harmony Between Agriculture and the Environment
5. Economic Development and Quality of Life for Citizens and Communities.
6. Society Ready Graduates.

The land-grant university system, one of the greatest inventions ever in higher education, is today, in cooperation with its federal partner CSREES, positioned with a renewed commitment to help the U.S. food and fiber sector prepare to take advantage of the great opportunities that are ahead.

As an individual farmer and a member of the agriculture community, I am very proud of what this partnership has provided to us. At the same time, I believe that agricultural research and education must be an important part of our long-term agricultural policy. We must strengthen our financial commitment to assure that these basic programs of the land-grant system will be prepared to address the emerging needs of this food and fiber sector. We want to be prepared as the opening of global markets, the deregulation of commodity programs, the promise of scientific breakthroughs, and the complexity of environmental and food safety issues provide an unprecedented opportunity to put science and education to work in support of mankind. Thank you for this opportunity.

PREPARED STATEMENT OF THE CROP INSURANCE RESEARCH BUREAU, INC.

The Crop Insurance Research Bureau (CIRB) appreciates the opportunity to provide its comments to the Senate Committee on Agriculture, Nutrition, and Forestry on the future of the federal crop insurance program. CIRB is a national trade organization of crop insurers, whose members insure crops in nearly every state in the union and provide billions of dollars in crop hail and multiple peril crop insurance protection to American agricultural producers. CIRB membership is diverse and includes some of the smallest crop insurance providers to organizations delivering crop insurance nationwide.

CIRB's mission is to continuously improve crop insurance and supports efforts to strengthen and increase the efficiency of the crop insurance program. CIRB's member companies promote research and educational programs to increase the accuracy of crop insurance procedures. Its members work cooperatively with organizations and governmental institutions for the advancement of crop insurance as an integral part of the agricultural risk management environment. CIRB members are committed to delivering to the American farmer an efficient and effective crop insurance product and provide a valuable risk management tool to agricultural producers.

AGRICULTURE'S PRIMARY RISK MANAGEMENT TOOL

Through the Crop Insurance Reform Act of 1994 and the Federal Agricultural Improvement Act (FAIR) Act of 1996, Congress designed crop insurance to be one of the few remaining risk management tools. As farm subsidies and disaster payments are eliminated, it is critical that the federal crop insurance program be administered and funded in a way to adequately supports the American agricultural producer. Ken Ackerman, Acting Administrator of the Risk Management Agency has noted that recent public policy changes have redefined the Government's role in providing

PART 1

1279

assistance to farmers, and “the key result has been to elevate Federal crop insurance into the principal pillar of the remaining ‘safety net’ for the American farmer.”

THE CROP INSURANCE PROGRAM HAS BEEN SHOWN TO WORK AND PROVIDES MORE PROTECTION TO FARMERS THAN EVER BEFORE

In the last two years, crop insurance policies have doubled, and over 75 percent of all insurable acreage is in the program. If delivery expenses for the program are not adequately funded, rural communities could lose \$26 billion in protection nationwide.

CIRB supports review of crop insurance program to ensure the delivery of quality crop insurance protection to America’s farmers in the most efficient and effective method possible. Member companies have proposed streamlining and simplification of insurance procedures, and have taken efforts to increase the accuracy of insurance procedures.

Congress, recognizing the “important role that private industry plays in delivering crop insurance,” directed the General Accounting Office (GAO) and the Federal Crop Insurance Corporation (FCIC) in the Federal Crop Insurance Reform Act of 1994, to jointly evaluate the financial agreements between FCIC and insurance providers for delivering crop insurance to producers. The law also ordered review of the FCIC directive toward simplification of delivery procedures. While CIRB commends GAO’s efforts toward this end, we conclude that the recommendations and policy announcements made in the report do not adequately reflect the crop insurance reimbursement process, and do not serve to strengthen this most crucial risk management tool. (CIRB members’ views are expressed and incorporated in the Joint Crop Industry Comments on Draft GAO Report submitted on behalf of the collective crop insurance industry.)

There are several issues which CIRB member companies believe were not appropriately addressed in the GAO study and therefore do not form the necessary basis for which GAO bases its conclusions and recommendation. These issues include:

—*The Report is inherently flawed and fails to comply with congressional mandate*—GAO presented insufficient and unrepresentational evidence to support the policy recommendations made in the study. The report did not consider the overall program performance and the larger picture of highly successful program delivery. GAO failed to comply with the congressional mandate of Section 118 of the Federal Crop Insurance Reform Act of 1994. (Public Law 103–354) to:

“determine the quality, cost, and efficiencies of providing the benefits of multiple peril crop insurance to producers of agricultural commodities”.

—*Value to producer and taxpayer*.—The GAO study fails to recognize the value to the agricultural producer in the current partnership between government and private companies in the delivery of crop insurance. The current multiple peril crop insurance (MPCI) program is highly effective and cost efficient method of risk management placing farmers in a position to share in the costs and risks of production. Public agricultural disaster assistance programs of the past strained the federal budget far beyond the cost of the current private-public crop insurance partnership. Prior to the crop insurance program, the federal government spent more than twice as much, or \$4 billion annually on farm disaster payments. The average cost of the crop insurance program is less than half of this amount. We can not afford to loose this highly efficient program both to taxpayers and the agricultural community.

—*Time period of study unrepresentative*.—The years of 1994–1995, upon which GAO bases its conclusions is not an adequate or representational time period. In those two years companies had significantly lower adjustment expenses due to low claims because of extraordinarily good weather. Nor does this narrow time period adequately reflect the significant fluctuation in operating expenses that may occur from year to year due to natural weather forces and other variables.

These significant fluctuations have direct impact on operating expenses, and companies may pay out significantly higher indemnities in a poor crop year. In fact, over the eight year period from 1988 to 1995, companies operated at a cumulative expense deficit. This is the very nature of crop insurance.

—*Failure to comply with simplification mandated by law*.—FCIC fails to implement its congressional mandate in the 1994 Federal Crop Insurance Reform Act to simplify the administrative burden placed on companies to a level “commensurate with scheduled reductions in reimbursement rates”. Under the law, FCIC was directed to “reduce paperwork to private insurers, and adopt new pro-

PART 1

1280

cedures to reduce the cost of each crop insurance policy to companies to targeted percentage point". The GAO report does not meet its statutory mandate to include in the report a quantification of simplification measures to meet the level designated by law. Furthermore, even GAO's and RMA's estimates, stated below, indicate that RMA fell short of meeting its Congressional mandate of regulatory reduction.

The Risk Management Agency's April 17 Report to Congress "Simplification Process" states:

"The Reduction in the Administrative cost reimbursement rates mandated under section 508 (k)(4) is 3.5 percent; from 31 percent in 1994 to 27.5 percent in 1999. Neither RMA nor the General Accounting Office (GAO) has been able to quantify the savings generated by the suggestions implemented and those in progress. However, within RMA and GAO, the informal consensus of opinion is that savings generated by those suggestions is from 1.5 to 2.5 percent."

This level falls below that dictated by law.

Furthermore, according to the language of the 1994 Act authorizing an evaluation of the crop insurance program, (Public Law 103-354 Sec. 118, Crop Insurance Provider Evaluation), GAO was charged with including an evaluation of "the cost per policy of complying with the requirements, regulations, procedures and processes of the Federal Crop Insurance Act". (7 U.S.C. 101 et seq.) GAO does not include such evaluation of regulatory costs as mandated by law. Congress's intent was made explicit on the matter of regulatory simplification, in the Statement of Rep. Barrett, Cong. Record. 149, August 5, 1994, p. H6999:

"My amendment, which is incorporated in the bill before us, directs the Federal Crop Insurance Corporation to reduce the amount of paperwork burden to private insurance companies, and lower the cost of each policy held by farmers. Further, the corporation after reporting to Congress, must adopt new procedures to reduce the cost of each crop insurance policy by a targeted percentage. Not only will these provisions allow the private sector to more efficiently deliver crop insurance, but the excess administrative costs of the Federal Crop Insurance Corporation will be reduced."

Most importantly, FCIC has not taken measures as mandated by Congress to reduce the regulatory burden placed on private companies in complying with the law. Simplification measures asserted by FCIC do reduce expenses to companies, and in many instances, serve to increase companies cost by shifting the administrative burden from FCIC to the private sector. For example FCIC has shifted the burden of acreage determination to insurance companies while at the same time reducing administrative reimbursements.

FCIC proposals as listed in the GAO report do not substantially streamline the administrative process, nor do they contribute to additional cost savings toward the companies, as specified by law.

—*GAO called for a reimbursement rate similar to the already scheduled 1998 rate. Then cuts an additional 3 percent based on crop price speculation.*—According to the report, "GAO's review shows the appropriate reimbursement rate to be at about 27 percent of premium" (GAO: Report to Congress, GAO/RCED-97-70, p.10). Under current law, the reimbursement rate is scheduled to drop to a rate of 28 percent in 1998, rate very similar to GAO's recommended rate. GAO then recommends cutting an additional 3 percentage points, to a level of 24.5 percent, based on speculation that crop prices will remain at the high levels experienced in 1996.

Speculation on crop prices is not an appropriate justification for such a dramatic decrease in administrative reimbursements and not a suitable basis for determining crop insurance funding levels. Crop prices continue to be volatile, and prices have already dropped dramatically in the last year. According to RMA testimony, no similar mechanism has been proposed to compensate companies should crop prices drop.

Furthermore, compensation paid to agents represents about 45-55 percent of premium, or about 16 percent of the 28 percent reimbursement rate. So GAO's modifications based on crop fluctuations should only be made of the remaining 11 percent of the reimbursement rate, and not on the entire 28 percent reimbursement rate level.

—*GAO's recommended funding rate jeopardizes service to farmers.*—The reduced reimbursement rate called for by GAO does not provide a realistic means of funding and places the future of the Federal Crop Insurance Program in peril. Farmers could lose this most critical risk management tool. Current regulations

PART 1

1281

state that if Congress does not appropriate funds to delivery the program, an existing policies terminate automatically without obligation.

(Sec. 457.9 Appropriations Contingency. Notwithstanding the cancellation date stated in the policy, if there are insufficient funds appropriated by the Congress to deliver the crop insurance program, the policy will automatically terminate without liability. (7 CFR Sec. 457.9)

One must remember that crop insurance stands as the only remaining safety net against crop losses as all previous crop disaster programs have been repealed. It is clear, if crop insurance funding is not sufficient, there will be no program, and no safety net for farmers.

—*Congressionally scheduled funding reductions have already taken place.*—Scheduled Reductions in delivery funds for this program have taken place, and continue to do so. In 1991, the reimbursement to companies was dropped to 34 percent of premium; 33 percent in 1992; 32.5 in 1993; 31 percent in 1994–6. Under the Crop Insurance Reform Act of 1994, Congress scheduled rates to drop to 29 percent in 1997 and to decrease to 28 percent in 1998 and 27.5 percent in 1999. The industry has made their crop insurance delivery plans based on Congress's word in the statute.

The GAO study would go beyond these Congressional scheduled reductions in law to a rate of 24.5 percent. A reduction that deep would threaten the viability of the entire program's delivery system and significantly weaken the safety net. In 1994, the Secretary of Agriculture opposed must less drastic cuts in reimbursement rates:

“To mandate that the reimbursement rate on renewals be limited to 28 percent of premium or a lower level, could impose serious burdens, particularly on smaller companies.” Letter for the Secretary of Agriculture, 1994 U.S. Code of Congressional and Administrative News, Vol. 5, p.2544.

—*Quality and efficient service.*—Congress directed GAO in the first line of the Authoring Act to study to evaluate the “quality and efficiencies” of providing multiple peril crop insurance. The GAO report is absent of any such analysis. The report fails to recognize the nature of the crop insurance product that the private sector has been asked to deliver in partnership with the federal government. The sales and marketing of this type insurance requires substantial knowledge of the product and considerable time and effort in providing and servicing the product to the insured. Significant time and costs are involved in tailoring the product to meet the specific needs of the agricultural producers. Service provided to agricultural producers by private sector delivery is much higher and more responsive to the needs of farmers. Private companies average only 30 days to get refund checks to producers, while it takes USDA an average of 160 days, or six months to satisfy farm claims.

—*Success of private sector in crop insurance delivery.*—The industry has had tremendous success in recent years in developing products providing a wide range of coverage, beyond a one option/low coverage catastrophic policy that the federal government offer. Crop insurance coverage has doubled in the past two years, and over 75 percent of all insurable acreage is currently insured. Attaining this goal of providing a superior and critical risk management tool to farmers came only after considerable commitment by the industry.

To assure farmers a quality program, companies must attract agents to participate in the federal program, which requires continuous training, familiarity and compliance with an increasingly complex program. Companies invest substantial time and resources in the education and motivation of agents in order to provide a quality product that works.

The report fails to acknowledge the service commitment required following policy sales through the acreage reporting and loss adjustment process. This post sales process in crop insurance is a critical and resource consuming activity including, field inspection, compliance reviews, acreage reporting, and maintenance of yield histories. This investment of the industries' time and resources was not taken into account in arriving at an appropriate reimbursement expenses level.

An analysis of sales and service process indicates that the work required to sell or renew crop policies is considerably more intense than that of the typical property/casualty sales process.¹ The process chart attached shows significant paper flow between farmer, agent and insurer, and these processes occur several times a season

¹Price Waterhouse, “Federal Crop Insurance Profitability and Effectiveness Analysis,” April 1997, p. 27.

PART 1

1282

before the policy is delivered. In addition, considerable time is spent in the field adjusting policies, requiring extensive training.

Despite the higher level of work effort that is involved in delivering crop insurance, comparative statistics show that the average commission for this line is lower than most of the property/casualty lines.

—*Expense costs comparison.*—Even GAO's analysis indicates that Multiple peril companies consistently showed lower total expense ratios than the Property/Casualty industry for the 1995 to 1995 period.² Where comparisons can be drawn with other delivery systems, private sector crop insurance is less costly. In addition, expenses have been reduced over the eight year period.

—*Companies have sustained considerable losses.*—Over the eight year period from 1988–1995, participating companies operated at a cumulative deficit with respect to expenses reimbursement (total reimbursement less than total expenses).³ In years such as 1988 and 1993, due to natural disasters, the industry sustained considerable losses and paid out far greater amounts than it received. Gains must be built up in favorable years to compensate for large loss years.

—*GAO excluded expenses are reasonable related to crop insurance delivery.*—GAO identified the following specific expenses to as disallowed for reimbursement purposes: acquisition costs of other companies (28 percent); payment of bonuses to employees (26 percent), reinsurance costs (25 percent); management fees paid to parent companies (11 percent); state income taxes (4 percent); write-off of bad debt expenses (6 percent). We believe that a strong case can be made for including all of the identified expenses categories, as they arise in the normal course of doing business with the exception of lobbying expenses (1 percent).

Many of these expenses pertain to the acquisition of assets (tangible, intangible, and human resource) that are necessary to the operation of the company's insurance business or that will produce future efficiencies in operation. The payment of bonuses to employees is part of the normal compensation package for many companies. The bonuses excluded by GAO amount to less than 3 percent of the total expenses incurred by the three out of the nine total companies reporting.

In respect to Reinsurance, many smaller companies require commercial reinsurance to maintain underwriting capacity. It is therefore appropriate to include the net cost of commercial reinsurance premiums, minus claims recovered from the insurer, as a program cost. Management fees paid to parent companies include payments for services such as computer facilities, human resource management, etc. for MPCIC subsidiaries because it is more cost effective to provide centralized processing of these services than to reallocate their costs to the operating units.

The bad debt expense is a necessary cost for MPCIC business. The instructions to the FCIC expenses exhibit specifically include fees and expenses for collecting balances as an appropriate expense item. Therefore, related bad debt associated with the collection efforts, would appear to be a appropriate expense of the program. The GAO report excludes state income taxes. Income tax, whether federal, state, or local are expenses of operating in the crop insurance business. Included within the FCIC guidelines is a line item for taxes, licenses and fees (p.18).

—*RMA lacked guidelines on administrative expenses.*—FCIC did not respond to industry's continued requests for official guidelines on FCIC approved reimbursement expenses.

—*Company's gains kept in taxable, non-interest bearing government reserve.*—While GAO asserts that crop insurance companies experienced significant gain in recent years, (based only on the two very favorable crop years of 1994 and 1995), all gains over 15 percent are inaccessible to companies and placed in a government "reserve account". Companies while not privy to the gains held in reserve for a three year period, are liable for taxes and are not accorded interest on the funds.

—*Lack of opportunity for industry participation.*—Congress envisioned Private sector crop insurance companies and the federal government to works as partners in crop insurance delivery. However, companies participation in crop insurance decisions has been very limited by federal regulators.

The GAO study took place over a two year time period, at which time industry had little opportunity to participate, and was given an extremely limited time frame in which to respond to this report. In addition, on major decisions regarding the Standard Reinsurance Agreement (SRA), and other issues such as regulatory simplification, industry's comments have not be seriously considered. We encourage open communication and participation by all parties.

² Ibid, p. 16.

³ Ibid, p. 32.

PART 1

1283

In conclusion, CIRB appreciates the opportunity to review and provide our comments to the Committee as they review the future of the federal crop insurance program. In keeping with our organization's mission to continuously improve crop insurance we respectively make the fundamental recommendation that GAO reconsider the narrow nature of its analysis in its study and further review the fundamentals of insurance and reevaluate its analysis and recommendations based on that review.

We request the report to consider the quality, efficiencies, and timing of the service of the private sector in providing benefits to agricultural producers. We further recommend that analysis be expanded to include a more normal loss year, and conduct a much more thorough study on the volatility of crop prices before recommending such a significant reduction in the premium subsidy for operating and administrative expenses.

Most importantly, we ask that analysis be guided by the over reaching goal of the crop insurance program—to provide risk management protection, via crop insurance, to the American farmer. Agricultural producers and taxpayers have reaped great benefits from private industry involvement in the crop insurance program. We believe that the performance record over the last years speaks for itself, as crop insurance coverage in our nation has doubled. We believe that the best, most cost effective, and most efficient means for delivering federally subsidized crop insurance is through private insurance. Therefore the performance of this program should be closely examined, and highly regarded as the best way to provide an effective means of risk management to the American farmer.

PREPARED STATEMENT OF JOHN W. SUTTIE, PH.D., PRESIDENT, FEDERATION OF AMERICAN SOCIETIES FOR EXPERIMENTAL BIOLOGY [FASEB]

Mr. Chairman, Mr. Bumpers, Members of the Subcommittee: I am John Suttie, the current President of the Federation of American Societies for Experimental Biology (FASEB). I am also a Professor of Biochemistry at the University of Wisconsin, Madison, as well as a Professor and Chair of the Department of Nutrition Sciences at that institution. It is as President of the Federation that I submit this statement in support of the life sciences research budget of the Department of Agriculture. FASEB considers, as we believe this committee does, USDA-supported research conducted at universities throughout the United States to be essential for ensuring an affordable, abundant, and wholesome supply of food and fiber for our citizens. It also promotes the competitive position of U.S. agriculture in the global marketplace.

For those of the committee not familiar with it, FASEB is a coalition of 14 societies with a combined membership of more than 45,000 individual scientists who work in life sciences research at all the major universities and in corporate research laboratories. The Federation was created in 1913 to provide an organization which could represent the views of the basic research scientist in the science policy debates of its day. More than 80 years later, this still remains the fundamental purpose for the existence of our Federation. FASEB, through its consensus-based policy development process provides a vehicle for the basic scientist to be heard in public policy deliberations which affect biomedical and life science research in this country. We believe we bring a unique perspective to the difficult policy questions which this Subcommittee must face in allocating scarce federal resources.

In that context, we come to you not only as advocates for life sciences research, but also as experts on the approaches which we, as bench scientists, believe will lead to the most productive science in the public interest. These approaches are grounded foremost in the principle that a competitive system for allocating government research funds is the most effective and efficient mechanism for getting the results we all seek to better the health of the American people.

It is for this reason that FASEB recommends to the Committee an increase in funding for the National Research Initiative Competitive Grants Program at the Department of Agriculture from \$94 million to \$138 million. This amount, similar to that which the President presented to Congress in February, reflects our view that the competitive grants program will lead to a more balanced and productive system of research. The National Research Initiative is an area that Science magazine recently characterized as "chronically underfunded".

NRI COMPETITIVE GRANTS PROGRAM [NRICGP]

Let me describe for the Committee briefly the Department's current competitive grants program and give some examples of the quality of research which is already being carried out. Officially referred to as the National Research Initiative Competitive Grants Program (NRICGP), this program funds extramural research projects at

PART 1

1284

public and private universities and colleges. Research proposals are merit reviewed and those attaining the best scores on a rigorous system of peer review are funded. Projects have a schedule for completion, and both yearly progress reports and final reports are required. At its inception in 1989, the NRICGP was authorized to reach a total budget of \$500 million. However, only \$94.2 million was appropriated in fiscal year 1997 for the program, which amounts to only about 5 percent of the Department's total budget for Research, Education, and Extension. We believe that this action was short-sighted.

Recent accomplishments of NRICGP-funded research are relevant to broad areas of agricultural and social concerns and provide rich evidence in support of our request that this program be expanded. Let me present just three examples out of many:

Plant pathology and healthier corn.—Disease resistance in plants is often controlled by genes that recognize the presence of a pathogen and then trigger a defense response. Unfortunately, over time the pathogen can change until it is unrecognized, at which time it is no longer attacked by the plant's defense gene. Recognizing the importance of this finding, researchers have identified a cluster of genes in corn that control resistance to the fungus causing common rust disease; they have found that the defense genes can be reordered so as to maintain at least a partial defense against changing fungus populations. This research is now being applied to create corn varieties with resistance to the common rust fungus.

Animal health.—Porcine reproductive and respiratory syndrome is a viral disease of pigs cited by the National Pork Producers Council as its most important animal health problem, and a cause of substantial economic loss. NRICGP-supported research has identified and characterized the causative agent of this disease and, subsequently, contributed to the development of the first vaccine to protect against it. The vaccine is now being used by swine producers throughout the United States.

Improving human nutrition.—Human nutrition, traditionally a key program in USDA, has become more complex as we have established connections among nutrient intake, nutritional status, and human health. For example, we know from investigations of their interactions that inadequate nutritional status of folate, vitamin B12, and/or vitamin B6 is a major factor associated with mild elevation of plasma homocysteine concentration, which in turn is associated with increased risk for several kinds of vascular disease. This is but one example of the need to improve our understanding of the metabolic functions and the interactions of essential nutrients.

Mr. Chairman, we believe these examples are typical of the quality of the science you can expect from an expanded competitive research program at the Department of Agriculture. It is for this reason that the Federation urges this Subcommittee to increase the funding for the National Research Initiative to \$138 million for fiscal year 1998.

FASEB has previously distributed to the Subcommittee other recommendations of the Federation in several areas under your jurisdiction. They are included in the report of our fiscal year 1998 Federal Funding Consensus Conference, which has been circulated to Committee members. In the interest of space, I will not cover all of these in my statement. However, I would like to touch briefly on two other issues.

ANIMAL WELFARE ACT ENFORCEMENT

The first issue I wish to bring to the Subcommittee's attention is our concern regarding the enforcement of the Animal Welfare Act (AWA), which is vitally important to the conduct of biomedical research across the nation. Congress passed the AWA, and its subsequent amendments, to protect family pets without imposing unjustified restrictions on medical research. FASEB urges USDA to enforce the AWA provisions with respect to random-source animal dealers in order to fulfill the intent of Congress and uphold the public's continued confidence about their pets' safety.

TRAINING OF AGRICULTURAL RESEARCHERS AND SCIENTISTS

The second issue has to do with support for the training of agricultural scientists. USDA supports critically needed stipends for graduate students through its National Needs Initiatives (NNI). The NNI is the only national research training program in agriculture, and its investment in human capital is essential for recruiting, preparing, and training the next generation of scientists. FASEB recommends that the decrease in NNI funding be reversed, and that this initiative be increased from \$4 million to \$5 million in fiscal year 1998.

Mr. Chairman, that concludes my statement. Thank you for this opportunity to bring FASEB's recommendations to your attention.

PART 1

1285

PREPARED STATEMENT OF THE CITY OF GAINESVILLE, FL

Mr. Chairman: On behalf of the City of Gainesville, Florida I appreciate the opportunity to present this written testimony to you today. The City of Gainesville is seeking federal funds in the fiscal year 1998 Agriculture Appropriations bill, in order to assist our efforts to protect the Floridian aquifer from stormwater runoff. In particular, we are hopeful that the Subcommittee will provide the City with \$2 million through the Fund for Rural America.

In Gainesville, the Sweetwater Branch basin contains approximately 1,710 acres and is located in the southeast central portion of the City. The outfall from this basin discharges into Paynes Prairie, a state owned preserve and park system, which eventually flows into the Alachua Sink, a natural sink hole that drains directly into the Floridian Aquifer. This Aquifer provides the majority of drinking water to Florida's residents and has a direct impact on Florida Everglades.

The Sweetwater Branch drainage basin contains urban, commercial, industrial, and residential area stormwater runoff. Because the branch runs through some of the oldest portions of Gainesville, most stormwater runoff is directly discharged into the Branch with very little flooding attenuation or pollution loading reduction. The runoff has the potential to affect threatened and endangered wildlife such as the Bald Eagle, the Woodstork, the Florida Sandhill Crane, and the Southeastern American Kestrel. In addition, many domestic water wells are used to obtain water from surficial and intermediate aquifers in the area. In summary, the situation has created a concern amongst environmentalists, business leaders, and concerned citizens throughout the region that Paynes Prairie and the Floridian aquifer are being compromised.

With this in mind, the City of Gainesville, Alachua County, St. Johns River Water Management District, Florida Department of Environmental Protection and local citizens are all seeking a comprehensive ecosystem management solution to the problem of stormwater runoff from downtown entering Sweetwater Branch, Paynes Prairie, and the Alachua Sink. The project devised by these groups would reduce or eliminate the sediment, debris, nutrients and general pollutants currently being discharged. Current projections are that the project would consist of the following three components:

- the purchase of undeveloped property in the vicinity of State Road 331 and Sweetwater Branch;
- the construction of maintainable sediment and debris removal systems; and
- the construction of maintainable nutrient removal systems.

An in-depth engineering analysis of the creek system, property topography, associated wetlands, and other pertinent factors is needed to determine the optimum and appropriate scope of property purchase and facilities construction. The City is prepared to pay some of the cost for this analysis, but we are simply unable to bear the entire burden. As a result, we request that the Subcommittee appropriate \$2 million to assist our efforts. Once the project construction is complete, Gainesville Stormwater Management Utility, a public utility, would provide the required annual maintenance for the facility and no federal maintenance funds would be needed.

This is a critical and much needed project for the City of Gainesville, as well as the entire State of Florida, and we respectfully ask the Subcommittee for its consideration of the Sweetwater Branch/Paynes Prairie Stormwater Project.

PREPARED STATEMENT OF DR. RAYMOND E. BYE, JR., ASSOCIATE VICE PRESIDENT FOR RESEARCH, FLORIDA STATE UNIVERSITY

Mr. Chairman, thank you and the Members of the Subcommittee for this opportunity to present testimony before your Subcommittee. I would like to take a moment to acquaint you with Florida State University. Located in the state capitol of Tallahassee, we have been a university since 1950, prior to that, we had a long and proud history as a seminary, a college, and a women's college. While widely-known for our athletics teams, we have a rapidly-emerging reputation as one of the Nation's top public universities. Having been designated as a Carnegie Research I University several years ago, Florida State University currently exceeds \$100 million per year in research expenditures. With no medical school, few public institutions can boast of that kind of success. We are strong in both the sciences and the arts. We have high quality students; we rank in the top 25 among U.S. colleges and universities in attracting National Merit Scholars. Our scientist and engineers do excellent research, and they work closely with industry to commercialize those results. Florida State ranks seventh this year among all U.S. universities in royalties collected from its patents and licenses. In short, Florida State University is an exciting and rapidly-changing institution.

PART 1

1286

Mr. Chairman, let me briefly describe two projects that we are pursuing through the Fund for Rural America Research, Education and Extension grants program. Both projects are consistent with this Subcommittee's report language in fiscal year 1997 which noted support for a Florida State University project working with public libraries. Our first project has the practical goal of utilizing communications technologies that are interactive, multimedia, and have touch screen programs to provide user-friendly health information to the citizens of the 17 rural counties in north Florida. The information would be targeted at common medical conditions or explanations of laboratory tests or health promotion facts. The dissemination of this information would be through both public libraries and public health facilities in these 17 counties. Our partner in this project will be the Panhandle Library Access Network, Inc. (PLAN), an organization of 41 libraries located throughout the 17-county area of north Florida. Substantial on-line capabilities and trained resource personnel are available through this Network. Working with FSU's staff in social work, nursing, and child and elderly health programs, the information will be developed for wide distribution and utilization, allowing consultation for these rural populations without necessitating their travel to urban areas. Substantial in-kind matching will be provided as part of the local and state commitment.

Our second project is a collaborative effort between Florida State University's Center for Ocean-Atmospheric Prediction Studies, the University of Florida's Institute for Food, Agriculture, and Science (IFAS), and the Panhandle Library Access Network (PLAN). FSU has developed analyses that can determine and interpret for farmers the effects of seasonal climate shifts on the production of grain and fruit crops across the United States.

This new analytical approach is based upon the recently-acquired ability to forecast the warm and cold swings of El Nino in the equatorial Pacific Ocean and to ascertain the weather impact of regions and smaller areas. These climate impacts are understood, and this project will apply that understanding to localized information for farmers about wet or dry conditions. The information will be developed and interpreted by FSU, with the assistance of the University of Florida, and disseminated by IFAS's extensive network of communications to farms and cooperatives. In addition, an educational and dissemination component will be provided through the public library network of 41 libraries in seventeen north Florida counties.

An assessment of the utility of this effort will also be done to determine the value of this information on climate shifts from summer to summer or spring to spring. Published research shows an estimated \$300 million per year in mitigable savings on grain crops across the U.S.; when applied to vegetable and fruit production, the estimated savings is \$500 million annually. We feel this project can make a substantial contribution to the profitability and efficiency of the American farmer.

Mr. Chairman, these activities discussed will make important contributions to solving some key problems and concerns we face today. Your support would be appreciated, and, again, thank you for an opportunity to present these views for your consideration.

PREPARED STATEMENT OF THE FLORIDA SUGAR CANE LEAGUE

The USDA-Agricultural Research Service (ARS) operates the Sugarcane Field Station, a key agronomic research facility for the mainland U.S. cane sugar industry, at Canal Point, Florida. The Sugarcane Field Station, in cooperation with industry and the University System, is responsible for Sugarcane germplasm improvement and variety development in Florida, Louisiana and Texas through genetic research, and a well-established plant hybridization and selection program. The station has been in operation since 1928 and is widely recognized and respected throughout the world for its contributions to Sugarcane agriculture.

There is currently a strong need for additional funding at the Sugarcane Field Station to carry out new research toward the development of a higher level of agricultural sustainability for the Everglades Agricultural Area (EAA). As recommended by the President's proposed budget, an annual increase of \$1 million for ARS in Florida would enable the agency to begin much needed new research to improve sugarcane's water tolerance, reduce nutrient requirements and develop Sugarcane varieties and management practices that would allow for substantial restoration of the pre-drainage hydrological relationships of the EAA with Lake Okeechobee and other natural areas of the south Florida landscape.

The proposed research by ARS would be long term with gradual improvements expected throughout. Within ten years, the program should produce sugarcane varieties and management practices which could significantly improve the relationship of EAA agriculture to ecosystem restoration objectives. This is why research of this

PART 1

1287

type was identified by the Federal Task Force on South Florida Ecosystem Restoration and Governor Chile's Commission for a Sustainable South Florida as an essential element of ecosystem restoration and sustainable development in south Florida.¹ This proposed research is now the central principle for incorporating the EAA into the restoration plans of the now expanded Federal, State and Tribal Task Force.

Many view efforts in the Everglades as an international model for ecosystem restoration, and far too often, modern agriculture has been depicted as conflicting with ecological restoration. In reality, agricultural and natural systems are interdependent and supportive of each other. This is clearly the case in south Florida where conceptually a sustainable EAA agriculture and a sustainable Everglades are inextricably linked. Contrary to many negative perceptions, sugarcane production in the EAA is a good example of the kind of relationship that agriculture should have within the natural system.

The growers of the EAA agree with the administration that the science proposed here will benefit all legitimate interests of Everglades restoration by working towards a more sustainable agriculture in south Florida. The resulting model would serve us well because it would concurrently sustain agriculture, the regional economy and the natural ecosystem of the area. We respectfully request your support of this important research initiative.

PREPARED STATEMENT OF R. LAWRENCE COUGHLIN, PRESIDENT, FRIENDS OF THE NATIONAL ARBORETUM

Mr. Chairman and Members of the Subcommittee, I appreciate the opportunity to submit testimony as President of Friends of the U.S. National Arboretum (FONA) in support of three specific programs at the U.S. National Arboretum.

FONA is a private, non-profit corporation dedicated to providing support for the U.S. National Arboretum. Since 1927, the U.S. National Arboretum has engaged in horticultural research and education in nursery and floral crops, the fastest growing segment of the U.S. agricultural business.

Thanks to your foresight and generosity, as well as the generosity of the private sector, the U.S. National Arboretum has introduced over 150 important new cultivars of disease resistant and ornamental plants. This year, with the support of generous contributors to FONA, the U.S. National Arboretum went on-line on the Internet in a further effort to enhance dissemination of research and horticultural information. Today, nursery and floral crops represent 11 percent of the total cash value of all U.S. agricultural products and gardening is the number one hobby and leisure activity in the U.S.

We at FONA are well aware of the fiscal constraints on the Federal government. At the same time, the U.S. National Arboretum is a tiny piece of the budget of the Agricultural Research Service (ARS). In fact the Arboretum represents less than one percent (1 percent) of the President's fiscal year 1998 budget of \$726.8 million for the ARS. In addition, the allocations of funds that FONA is seeking for the Arboretum are a small part of specific increases proposed in the President's budget.

The President's budget requests a \$4 million increase for Integrated Pest Management (IPM) research and biological control. Of this amount, we request the Committee to direct that a modest increase of \$150,000 be allocated to the Arboretum's very successful landscape IPM program—only \$150,000 of a \$4 million increase! This would match and supplement current private grant funds and allow the Arboretum to develop a landscape IPM program with significant national implications.

Second, we request the Committee to direct that \$250,000 of the \$4 million IPM/Biocontrol increase be allocated to the Arboretum's ongoing program to develop environmentally safe pesticides. Products like Rose Guard, containing neem oil, are paving the way for a new generation of "people safe" products to control harmful pests and diseases. Again, this is a small part of the specific increase requested by the President and is for the purpose of the President's requested increase.

Third, the President's budget for fiscal year 1998 requests an increase of \$2 million to expand ART germplasm collection. We request the Committee to direct that \$250,000 of this increase be allocated to expand the Arboretum's modest program of germplasm collection of trees and shrubs. This would provide potentially useful

¹The Federal Task Force identified this effort as one of three unfunded science priorities (Report of the Science sub Group, June 23, 1995 Science Priorities and Gaps: Considerations for Budget Planning) and it was a preferred alternative of the Governor's Commission (Report of the Governor's Commission for a Sustainable South Florida—A Conceptual Plan for the S&SF Project Restudy, 1996 pp. 52–53).

PART 1

1288

genetic materials for the development of new and improved ornamental trees and floral plants.

It is of course important that these increased allocations not be done in such a way that funds are shifted from other U.S. National Arboretum priorities. Modernizing and adapting the Arboretum to the information age as well as providing new horticultural research is ongoing with both public and private funds. It is important that Federal support for U.S. agricultural research not be regarded as waning.

We would emphasize again that our request is not for unbudgeted funds or new programs. It is for a portion of budgeted funding increases for ongoing priority programs. The U.S. National Arboretum performs outstanding research as well as providing the outlet, the outreach and the showcase for U.S. agriculture.

Thank you for your stewardship of the jewel that is our National Arboretum and for your consideration of FONAs request.

PREPARED STATEMENT OF THE HEALTH INDUSTRY MANUFACTURERS ASSOCIATION

INTRODUCTION AND SUMMARY

The Health Industry Manufacturers Association (HIMA) appreciates the opportunity to present this statement on FDA's fiscal year 1998 budget. HIMA is the largest medical technology trade association in the world, representing more than 700 manufacturers of medical devices, diagnostics, and health information systems. HIMA members are intimately familiar with FDA regulation, so we welcome the opportunity to comment on the issues surrounding FDA's funding for the next fiscal year.

In our testimony, we wish to share several points with you:

- We urge this Subcommittee to continue its pressure on the FDA to modernize and improve management—particularly with respect to the agency's performance in reviewing life-saving and life-enhancing medical technologies through the PMA review process.
- We believe that FDA's medical device program can be improved without increases in appropriations, but it must be able to count on stable funding.
- We believe that, if cuts are made in FDA's budget, they must be carefully targeted. They should be focused on stopping low-priority work, and they should not threaten activities central to FDA's core mission—for example, activities dealing with product review and product safety. More broadly, what reductions need to be made should be fair and proportionate across the various program areas of the agency.
- Finally, we believe the Administration's user fee proposal for the medical device program masks dangerous cuts in FDA's budget authority that undermine the efforts of agency personnel to protect and promote public health. This point deserves special attention this year. As our testimony will outline, the Administration's medical device user fee proposal threatens innovation and endangers patient access to needed medical technologies.

In summary, we ask this Subcommittee to make sure that the "jump start" it has provided on FDA reform continues until Congress is able to give FDA the lasting legislative "tune-up" the agency needs.

FDA PERFORMANCE

At the outset, we want to point out that FDA's performance in regulating medical devices has improved over the past two years. Product review times, especially for products that come to market through the 510(k) review process, have come down, though much work remains—especially for breakthrough products reviewed through the PMA process, as we will detail in a few moments.

In addition, the agency has undertaken a number of administrative reforms in the product approval, postmarket, and enforcement areas that—even a year ago—seemed unlikely. We draw a number of lessons from these improvements.

The first lesson is that the impact of the appropriations committees of Congress is significant when it comes to reforming FDA. When we testified on the agency's fiscal year 1996 budget two years ago, we urged the appropriations committees of Congress to "jump start" FDA reform. You have done just that. We thank you. And we urge you to keep up the good work. Much of the progress we have seen during the last two years reflects administrative reforms this Subcommittee encouraged. These include: better management; better targeting of resources; better accounting practices; and better use of appropriated funds overall.

Your efforts have complemented the work of the Labor and Human Resources Committee by pushing for a clearer picture of how resources are being used at the

PART 1

1289

agency and by pressing the agency to make budgeting and management improvements to meet statutory goals. Indeed, we believe the appropriations committees and the authorizing committees have become a unified team that is forcing the agency to modernize step-by-step—much to the betterment of patient care.

The second lesson that we draw from FDA's progress over the past two years is that the agency can clearly improve its performance without increases in appropriations. As you know, this Subcommittee has held the line on FDA's budget. For the past two years, FDA's medical device program has operated with, in effect, a flat level of funding. As a result, FDA has been forced to use the management tools at its disposal to do the job before it—not by relying on vast new funding. We believe the record shows that entrepreneurial thinking and innovative management are the commodities the agency needs and that improvements in performance are more a question of intent than of increased appropriations.

The third lesson that we draw from these initiatives and FDA's performance in the past couple of years is that the agency does not need user fees for medical devices. Indeed, this is one of the most resounding and important lessons. In virtually every year in recent memory, FDA has requested medical device user fees, claiming that they were absolutely vital to performing its duties. In 1994, FDA went so far as to predict that 510(k) review times and backlogs would steadily rise if Congress did not authorize such fees.¹ But, instead, Congress instructed the agency to use its existing resources more wisely.

The result? While review times still need improvement, the agency has cut down on 510(k) review times. We have included charts which show that average 510(k) review times have declined from a high of 216 days total time in 1994 to 145 days in 1996. Further, the backlogs of 510(k)'s in most reviewing divisions have been eliminated.

ADMINISTRATION DEVICE USER FEE PROPOSAL

But this year's user fee proposal for medical devices deserves special attention, and—in many ways—cannot be fully understood in the context of past proposals of this kind. The reason is that the Administration request is far worse than any made in the past—and could reverberate for generations to come.

The proposed device user fee program differs from previous Clinton Administration proposals in two respects: (1) It is much larger—\$45 million, in place of the approximately \$24 million program requested in fiscal years 1996 and 1997; (2) Secondly, it would not be used to enhance the agency's ability to improve device reviews—which is how user fees were presented during the past two years. Instead, it would take the place of federal appropriations—creating a kind of backdoor tax on the device industry to help reduce the federal deficit.

But perhaps most troubling is this: The Administration has structured its user fee proposal in such a way that—if Congress does not accept the “savings” it offers and chooses, instead, to reject user fees—the budget authority for FDA's medical device program would be slashed by approximately \$40 million. If that happens, the FDA's device center could lose as many as 388 full-time-equivalent employees.

The impact on public health would be devastating. By FDA's own estimates, the agency's ability to comply with the statutory limits for device review would drop in comparison to fiscal year 1996—both in PMA's and 510(k)'s. This drop in performance would occur despite the fact that FDA already falls far short of complying with the time deadlines set by Congress in both the 510(k) and PMA review tracks. What this means in real-world terms is that many patients are going to be waiting a lot longer for the treatments they need.

ADMINISTRATION'S PROPOSED BUDGET FOR FDA

In light of the potential impact of this medical device user fee proposal—and in light of the agency's performance during the past two years without user fees—we arrive at a couple of unmistakable conclusions about the Administration's fiscal year 1998 budget proposal for FDA.

First, the kind of deep cuts in FDA's budget authority contemplated by the Administration's medical device user fee proposal must not be allowed. Cutting 388 medical device staffers and allowing device review times to fall even further short of legislative mandates may help promote deficit reduction, but it certainly carries a high price tag in terms of public health. Our feeling is that FDA medical device personnel must be able to count on a reasonable and predictable budget to carry

¹U.S. House of Representatives, Committee on Energy and Commerce, Subcommittee on Health and the Environment, Hearing on H.R. 4728—The Medical Device User Fee Act of 1994, Report No. 103-139 (July 14, 1994), p. 61 and p. 142.

PART 1

1290

out their duties. In our view, that means stable and level funding for FDA's medical device review effort during fiscal year 1998.

The second conclusion we reach in reviewing FDA's performance during the past couple of years—without medical device user fees—is that before the Subcommittee seriously considers enough user fees of any kind, we must be absolutely certain the agency is doing all it can to use its existing funds wisely and to perform fully its core duties of protecting and promoting public health. Unfortunately, FDA is not doing enough—despite the progress we noted earlier.

PROTECTING PUBLIC HEALTH

As we have said before, we believe that FDA's responsibility in protecting and promoting the public health has two parts: (1) Keeping unsafe and ineffective products off the market, and (2) ensuring that new and improved technologies reach patients in a timely manner.

While FDA is attempting to meet the first charge, many policies continue to fall far short of the second. This can be seen most clearly in FDA's performance in reviewing and approving PMA's. The charts we have enclosed show that while PMA submissions have dropped by roughly half since 1989, total average review time has skyrocketed from 348 days to 786 days in 1996. Keep in mind that the Congress has said that such products must be reviewed within 180 days—making FDA's average performance on PMA's some 400 percent more than what Congress allowed. The net effect of such delays is to deny patients access to life-saving and life-supporting technologies—clear harm to the public health.

According to one recent study, such policies are already forcing companies to introduce products overseas and are driving R&D out of the U.S. Technologies now available in this country are frequently many generations behind Europe. The primary reasons for these kinds of delays are excessive FDA policies that hinder innovation and slow product approvals. For example, FDA continues to impose clinical standards on device reviews that are clearly inappropriate for devices. FDA has substantially revised its effectiveness criteria by venturing into such fields as clinical outcomes, relative effectiveness, and cost-effectiveness. FDA seems wedded to certain postmarket and enforcement programs that are in dire need of streamlining and improvement. Although some progress has been made, more is needed.

These policies harm patients because they delay access to new products. Though FDA touts its product review performance improvement on 510(k)'s, it overlooks the fact that the length of time it takes for PMA products to move from the idea stage to final marketing and, ultimately, to the bedsides of patients is actually increasing. From an appropriations perspective, these policies also have a devastating impact because they consume FDA's scarce resources. Until such activities are substantially curtailed or reformed, we believe FDA cannot claim it has done all it can to find management efficiencies and use appropriated dollars as wisely as possible.

REFORMS NEEDED

Ultimately, we believe that lasting correction of FDA's tendency to veer away from its primary duties—such as clearing new PMA's—can be achieved only through legislative reform of the agency. Administrative reform is not enough. It is only a start. The administrative improvements we've seen can be undone as quickly as they have been put in place. To ensure they are locked-in and are not changed by a new Administration, new Commissioner, or new regulations, Congress must pass legislation to modernize the FDA and outfit the agency for the next century.

Legislative reform will ensure that FDA finally and permanently focuses on achieving all—not just some, but all—aspects of its public health mission, including seeing to it that patients receive timely access to new and improved technologies.

Legislative reform will ensure that FDA finally imposes clinical standards that are appropriate and fitting for medical devices and geared toward what is best for public health. Legislative reform will ensure that duplicative regulatory requirements worldwide are finally eliminated. Legislative reform will ensure, finally, that FDA uses appropriated dollars wisely and in a manner that truly protects and promotes public health.

FUNDING RECOMMENDATIONS

Nevertheless—while Congress continues to grapple with the elements of this modernization effort—we urge this Subcommittee to continue the excellent work it has done in past years to buttress and reinforce FDA reform. Toward that end, we offer you these specific suggestions for funding levels and report language as you consider the details of the Administration's fiscal year 1998 budget:

PART 1

1291

Soundly reject the Administration's medical device user fee proposal and send a strong signal that deep cuts in the agency's budget authority are unacceptable

As noted above, the medical device user fee proposal should be flatly rejected because of the devastating impact on FDA's ability to meet its product review responsibilities. In addition, we urge the Subcommittee to include language in its report that expresses its concern about the impact of such a proposal on the ability of the medical device industry to innovate. User fees are nothing more than a tax on the ability of our industry to develop new products, refine existing products, and push the frontiers of medicine for patients.

Ensure level funding for the medical device program in fiscal year 1998 so that it has adequate resources to do the important job before it

Providing level funding is especially important with regard to FDA regulation of devices. According to the Administration proposal, the device program would shoulder about two-thirds of the \$67.5 million net drop in FDA budget authority from fiscal year 1997 to fiscal year 1998. This is a disproportionate cut, given the improvements that are needed in the medical device program. This is an irresponsible cut when you consider its impact on patients who will be denied timely access to life-saving and life-supporting medical products.

Ensure that any reductions in FDA funding are not made in activities central to the agency's primary mission—such as device reviews and activities to protect patient safety

In a time of austerity, FDA must do first things first—that is, those activities central to its primary mission. In the device program that means product reviews and activities to protect patient safety. In particular, FDA should be directed to improve its performance in reviewing PMA's without undercutting the progress it has made in the 510(k) area. Any reductions in funding that Congress deems necessary must be targeted on programs that veer away from the agency's core mission, or that—while perfectly appropriate—cannot be justified during periods of budget constraint. Many of FDA's educational and scientific endeavors fall into this latter category.

Press the agency to use its management tools to continue efforts to modernize

As FDA itself has shown, it has plenty of opportunity to improve product review performance. In many cases, these are simple things—communicating more clearly, acting more uniformly, not changing directions in midstream, and so on. In other cases, it involves trying a new approach or rethinking old practices. Sometimes, it means simply discontinuing lower priority work or stopping projects that do not achieve its core mission. As far back as 1993, Congress stressed that such techniques could improve FDA performance.² Since then, this Subcommittee and the authorizing Committee have sent a consistent message to the agency, Aging management reforms. We urge you to continue to do so.

Tighten the agency's performance goals to ensure that it achieves its central mission of promoting and protecting public health

We believe that the performance goals FDA has set for itself under a fully funded budget are not ambitious enough, while its goals under a partially funded budget are downright devastating. We urge the Subcommittee to make clear to the agency that such targets are unacceptable. Regardless of the level at which the Subcommittee chooses to fund the agency, we believe it can demand much better performance.

CONCLUSION

In conclusion, we think FDA can point to reasonable efforts to improve its work during the past years. We applaud them. And we applaud you. But we believe that this progress will continue only if you, once again, force the agency to work harder and smarter and if you tell the Administration clearly that proposals to impose medical device user fees—while slashing FDA's base funding—are unacceptable. By taking this approach, you will—as we said earlier—ensure that the “jump start” you provided several years ago continues until Congress is able to give FDA the lasting legislative “tune-up” it needs.

PREPARED STATEMENT OF WAYNE PACHELLE, VICE PRESIDENT, GOVERNMENT AFFAIRS AND MEDIA, HUMANE SOCIETY OF THE UNITED STATES [HSUS]

SUSTAINABLE AGRICULTURE PROGRAMS

Public interest in sustainable agriculture farming systems continues to grow. The HSUS supports these cost-effective yet environment-friendly systems which also improve the welfare of animals. We join the Campaign for Sustainable Agriculture in requesting funding of the following sustainable agriculture programs.

The Sustainable Agriculture Research and Education (SARE) program is a competitive grants program that funds high-quality, farmer-involved research and education on economic, agronomic, and environmental aspects of sustainable agriculture farming systems.

SARE's professional development program (formerly known as SATDTP) funds projects to train extension, NRCS and FSA staff, and other agricultural professionals in sustainable ag concepts, research and practices.

We join the Campaign in requesting \$10.5 million for the SARE program and \$4.5 million for the Professional Development Program for fiscal year 1998.

PART 1

1293

AGRICULTURAL TECHNOLOGY AND TRANSFER FOR RURAL AREAS (ATTRA)

The HSUS strongly supports funding for ATTRA at the level of \$1.3 million for fiscal year 1998. ATTRA handled over 22,000 cases in 1996. Since 1989, the case-load has quadrupled but has received the same level funding for years. It serves the entire nation with specialists who provide farmers and others with sustainable agriculture information, research results, and information based on practical experience. There is no other source of readily available information covering such a wide scope of sustainable agriculture topics. The funding level requested for fiscal year 1998, \$1.3 million, will allow ATTRA to continue to perform this important function.

ORGANIC FOOD PRODUCTION ACT

For the sixth year in a row, the organic industry has grown more than 20 percent in sales, with reasons for purchase ranging from environmental and health concerns to that of enhanced animal health and well-being. Adopting consistent national standards for organic products is very important, and now is a crucial time for the national organic program to begin full implementation. This program is on the verge of becoming extremely beneficial to consumers and producers alike. More staff hours are needed to manage comments on the proposed rule, to get the final rule out, enable implementation of the program and facilitate dissemination of program information. The HSUS joins the President and the organic community in urging that the program receive funding of \$1 million.

INTEGRATED FARMING SYSTEMS

This new ARS program was initiated last year, receiving strong support from the Campaign for Sustainable Agriculture and the IFS network. The program funds long-term research on farming systems that integrate livestock and resource-enhancing crop rotations. We support the funding level of \$1 million for this program.

ANIMAL WELFARE INFORMATION CENTER

The Animal Welfare Information Center (AWIC) of the National Agricultural Library (NAL) was started as a Congressional mandate in the 1985 Farm Bill. By law, AWIC's main missions are to provide information that can be used for: (1) training researchers about more humane animal care and use and (2) improving methods of animal experimentation that can reduce or replace animal use or minimize pain or distress to animals.

As part of the NAL, AWIC also provides information to the public. There are several thousand users of its services, including researchers, technicians, veterinarians, IACUC members, exhibitors, dealers, Federal agencies, educators, students, and others. Due to the great success of the AWIC program in the U.S., it is being duplicated in other countries, with farm animal welfare information included in those services.

AWIC is currently operating on a staff of only 3 full-time and 3 part-time individuals. We request that increased funding be provided to AWIC making it possible to hire more staff which would increase the productivity of the center and enable the center to add the farm animal welfare component (recommended from the 1993 Purdue University and USDA conference on food animal well-being) to their services.

PACKERS AND STOCKYARDS ADMINISTRATION

We support the USDA's fiscal year 1998 request for an increase of \$1,595,000 and twenty staff years to focus on packer competition and industry structure. This funding will support the Secretary's Advisory Committee on Agricultural Concentration recommendations that include appropriating sufficient resources to aggressively enforce the Packers and Stockyards Act.

The HSUS also supports an increase of \$750,000 and ten staff years for poultry compliance requested by the Secretary's Advisory Committee on Agricultural Concentration. We share their expressed concern that contract poultry growers have the ability to bargain with integrators and be protected from unfair and discriminatory practices and that the Secretary be provided the same administrative enforcement authority over poultry that currently exists for red meat.

ANIMAL WELL-BEING RESEARCH

Living conditions for farm animals which provide for their health and well-being are increasingly recognized as an important component of food quality, and are also of increasing concern to the public. Research into understanding what is required to provide for the well-being of these animals is needed to help address these con-

PART 1

1294

cerns. However, funding of such research is virtually nonexistent in the U.S. We support the Presidents request that \$29.5 million be appropriated to the Animals division of NRI with at least 50 percent of the funding allocated specifically for well-being research, thereby achieving a greatly needed balance between animal health and animal well-being research.

ANIMAL DAMAGE CONTROL PROGRAM

Mr. Chairman, the Animal Damage Control (ADC) Program is one of the most controversial programs in the Department of Agriculture because it continues to focus on killing wildlife rather than solving the damage wildlife sometimes causes. The ADC Program is the subject of intense public scrutiny; demands for its abolishment are increasing with each passing year.

The majority of federal funding for ADC operational activities is directed toward coyote control in Western states. Although the results of scientific research have shown that control of coyote populations, as opposed to individual offending animals, is futile and even counterproductive in stopping damage, this is the approach that ADC employees continue to use. As a result, far more coyote killing is undertaken than is necessary to effectively handle livestock losses.

The HSUS believes that the solution to the problems posed by the ADC Program lies not in its abolishment, but in changing its focus to one of education and self help. By teaching livestock producers and property managers how to prevent or reduce wildlife-caused problems themselves, the cost of this Program would be substantially reduced, while its effectiveness would markedly increase. Only when initial efforts to prevent or reduce the problem fail to do so would lethal control, under this approach, be conducted by the government with federal funding.

A similar program of shared responsibility has very effectively reduced wildlife-caused damage in Kansas, Missouri and other states for a fraction of the federal share of the ADC Program in most Western states. The HSUS recommends, therefore, that the Subcommittee direct APHIS/ADC to undertake a shift in focus from direct control services to education/self-help. Lethal control would be provided by the government only as a last resort. With such a change, operational funding as proposed by the Administration for the 17 Western states could be reduced by approximately 70 percent immediately, with further reductions possible as the changed focus becomes established. We strongly urge the Subcommittee to reduce the fiscal year 1998 budget of the ADC Program in this manner.

In addition, we urge that the Program be directed to spend 85 percent of fiscal year 1998 funds allocated to ADC research on the identification and development of non-lethal, non-injurious control methods.

ANIMAL WELFARE ACT

The HSUS requests \$12 million for enforcement of the Animal Welfare Act (AWA). A lack of sufficient funding in this area has exacerbated the gross inadequacies that exist in the level of AWA enforcement. These inadequacies result in direct animal suffering in USDA licensed facilities.

Facilities that house animals covered under the Animal Welfare Act are not being inspected with enough regularity to ensure adequate enforcement of the Act: currently, there are 73 inspectors covering 13,000 licensed facilities, including 2992 registered research facilities that house laboratory animals. The HSUS supports funding for an immediate increase in the number of field inspectors, as well as for a mandatory training requirement for all inspectors and investigators.

As was demonstrated in hearings held last year in the Agriculture Subcommittee on Livestock, Dairy and Poultry, the USDA is incapable of enforcing the current laws with its present levels of staffing and appropriations. As Assistant Secretary Michael Dunn stated in that hearing, every time the USDA develops a new way to look at things, class B dealers develop a new way to hide them. The time and resources expended by the USDA to attempt to regulate one class of licensee—class B dealers who sell to laboratories, of which there are less than 40—is disproportionate to the effort that the Department should be expending on all other licensees. Class B dealers who sell random source animals for research should be prohibited and those freed resources should be allocated for the oversight of other licensees.

The HSUS also suggests modifications to the operation of Animal Care that could increase government revenues. These suggestions include: an increase in the fees for dealers and exhibitors, the prohibition of random source class B dealers, reclassification efforts to streamline operations, and the imposition and collection of strict penalties and fines not only for violations of the Act, but also for failure to be present for an inspection. Current estimates indicate that APHIS collects only 25–50 percent of the fines that have been imposed for violations.

PART 1

1295

Our organization supports current efforts to strengthen USDA regulations covering large scale commercial breeding facilities. There are a number of serious problems existing in the commercial breeding trade, and USDA licensed facilities need to be brought into compliance immediately or shut down completely if compliance cannot be met.

MARKET ACCESS PROGRAM

The HSUS request that no monies under this program be allotted to the Mink Export Development Council or any other mink industry cooperative. From 1989 to 1995, more than \$13 million in federal funds were handed over to the Mink Export Development Council. Despite this large commitment of funds, which were used primarily for fashion shows overseas, the value of mink exports declined by 33 percent and U.S. production dropped by more than half (Source: Fur Age Weekly). In addition, mink fur is purely a luxury item for which animals are subjected to extreme cruelty. In the last Congress, an overwhelming majority of the Congress agreed that the mink industry should not receive a government subsidy under this program. In light of these facts, we urge that the Congress continue to bar funding to the Mink Export Development Council.

THE HORSE PROTECTION ACT

The HSUS supports the full appropriation of funds as authorized by law under the Horse Protection Act. The authorization limit for the enforcement of the Act has been frozen at \$500,000 since the enactment of the law in 1970. In addition to the devaluing effects of inflation, the actual appropriation has been drastically cut in recent years. USDA received less than \$350,000 for the Horse Protection Act program in fiscal year 1996, and only about \$260,000 of that money was available for enforcement purposes.

The HSUS requests that \$500,000 be appropriated for the next budget year. This amount represents the absolute minimum expenditure necessary to carry out the provisions of the Act. It is essential to insure the proper training of USDA enforcement personnel in the use of thermovision and other diagnostic techniques employed to detect the illegal soring of gaited horses. It will also support some needed research. The full appropriation will enable USDA staff to attend a representative number of target horse shows (approximately 10 percent) and it will help to improve the training and oversight of non-governmental enforcement personnel (known as Designated Qualified Persons or DQP's.)

The HSUS also wishes to go on record as stating that the Tennessee Walking Horse industry has demonstrated that they are clearly incapable of effective self-regulation as envisioned by the 1976 amendments to the Act. Industry inspectors consistently report fewer than half the number of violations cited when USDA personnel are in attendance. Also, an increasing number of walking horse shows have no inspection programs whatsoever.

COMMERCIAL TRANSPORTATION OF EQUINES FOR SLAUGHTER

The promulgation of regulations concerning the humane and safe transport and treatment of horses shipped to slaughter within the U.S. are provided for under a provision of the farm bill passed in 1996. We support full development and implementation of thorough regulations to remedy the mistreatment and inhumane conditions to which horses transported to slaughter are currently subjected.

Our two year investigation and subsequent research confirmed that there are several areas of serious concern regarding how these horses are treated and transported on these long distance trips to one of the eight slaughter plants. These areas include but are not limited the shipment of seriously injured, late-term pregnant mares, foals, and ill or incapacitated horses. In addition there are serious deficiencies regarding the duration of deprivation of water, food and rest during transport, the inappropriate interior height of the transport vehicle, design and use of many livestock vehicles, the lack of segregation of horses by size, the lack of segregation of fractious horses and stallions from others, and the lack of protection from the elements. We are also concerned about the lack of any record keeping by which to establish ownership or track these animals. We urge full funding be appropriated for implementation of these regulations and specifically request \$425,000, the approximate amount requested by the USDA. We urge that the money allocated include adequate funding for USDA FSIS inspectors to enforce these regulations.

PART 1

1296

PREPARED STATEMENT OF NAOMI B. LYNN, CHANCELLOR, THE UNIVERSITY OF ILLINOIS AT SPRINGFIELD AND NORM STEPHENS, PRESIDENT, LINCOLN LAND COMMUNITY COLLEGE, UNIVERSITY OF ILLINOIS

Mr. Chairman and distinguished members of the Agriculture, Rural Development, and Related Agencies Subcommittee: Lincoln Land Community College (LLCC) and the University of Illinois at Springfield (UIS) have been engaged in a joint project, the Rural Education and Technology Center, in recognition of the educational and medical needs of rural Central Illinois and in making a commitment to meeting those needs through the application of distance learning and other advanced technologies.

The project includes the construction, equipping and operation of a new state-of-the-art learning and information center for colleges, schools, businesses and homes in rural Central Illinois. The project will deliver education and training programs to hard-to-reach and historically underserved rural residents and communities. The project will provide high quality services that will result in positive economic, educational, health-related and social development for this region.

The project will provide education and information through a computer-based interactive network for farm owners, rural businesses and homes. It will assist the small rural high schools to deliver comprehensive programs for their students. It will consolidate telecommunications systems among LLCC, UIS and other systems in order to deliver secondary and post-secondary distance learning programs cost-effectively throughout the immediate districts and throughout the state. It will provide expanded facilities for originating distance learning programs, for teleconferencing and other education services. It will also provide rural Illinois citizens with greater access to academic and training programs and necessary support services.

The Center will be located on the campus of LLCC, but in close proximity to UIS, whose campus is contiguous to LLCC. The facility will house programs and services from both institutions that relate to health education, continuing education, computer-based learning laboratories, interactive distance learning classrooms, agricultural programs and business development programs.

This is a unique joint community college-university project, cooperative in nature, technological in focus, and it addresses a need in America's heartland-rural economic development.

USDA'S Rural Business Enterprise Grant (RBEG) program has just awarded a \$1.5 million grant to begin the work on the state-of-the-art high tech learning and information center to serve rural residents of Central Illinois. In October of 1996, the USDA, through its Medical Link grant program, awarded a \$336,124 grant to LLCC in partnership with UIS for a new joint telecommunications system for the center to link LLCC and UIS to several rural facilities and networks.

LLCC and UIS are seeking matching funds for the RBEG grant from the state of Illinois. In partnership, LLCC and UIS are submitting an application for funding to USDA for fiscal year 1998 funding to complete the project. We urge your continued support for the RBEG program and our Center.

PREPARED STATEMENT OF R. MAX PETERSON, EXECUTIVE VICE PRESIDENT,
INTERNATIONAL ASSOCIATION OF FISH AND WILDLIFE AGENCIES

The International Association of Fish and Wildlife Agencies was founded in 1902 as a quasi-governmental organization of public agencies charged with the protection and management of North America's fish and wildlife resources. The Association's governmental members include the fish and wildlife agencies of the states, provinces, and federal governments of the U.S., Canada, and Mexico. All 50 states are members. The Association has been a key organization in promoting sound resource management and strengthening federal, state, and private cooperation in protecting and managing fish and wildlife and their habitats in the public interest.

NATURAL RESOURCE CONSERVATION SERVICE (NRCS)

The Natural Resource Conservation Service has immense responsibilities for implementing the conservation provisions of the 1985 Food Security Act (FSA), the 1990 Food, Agriculture, Conservation and Trade (FACT) Act, and the Federal Agricultural Improvement and Reform (FAIR) Act of 1996.

Technical assistance.—In addition to the existing technical assistance workload, increased technical assistance funds are needed to implement additional provisions of the 1996 FAIR Act. For example, the Environmental Quality Incentive Program (EQIP), Wetland Conservation Mitigation, Mitigation Banking, the Conservation Farm Option, the Grazing Lands Conservation Incentive, Wildlife Habitat Incentive

PART 1

1297

Program, and the Farm Land Protection Program are all provisions requiring additional technical assistance from the Service for which there are insufficient funds in present budget recommendations. The Association strongly urges that adequate technical assistance funding be provided for these additional responsibilities in order to ensure that maximum agricultural and natural resource benefits accrue from these programs. We note and applaud the 346 FTE increase in staffing levels for technical assistance under Conservation Operations. There remains, however, an OMB constraint on the customary 19 percent allocation from EQIP which could result in as much as a \$38 million shortfall for technical assistance in designing complicated engineering proposals for livestock projects. That constraint needs to be removed. The Association endorses the NRCS request for a \$15 million increase in technical assistance and soil survey to update older soil surveys, prepare soil surveys for digitization and train field staff to improve technical assistance to users of soil survey data.

State technical committees (STC).—The 1990 FACT Act required that State Technical Committees (STC) be established to facilitate interagency cooperation and coordination of technical guidelines for the conservation programs. Further, the USDA 1995 Reorganization Act specifically exempted the STC from the Federal Advisory Committee Act (FACA). The 1996 FAIR Act further added additional members to the STC. Federal-State coordination is an ongoing normal function which is required with or without a formal State Technical Committee. We commend the strong efforts of the Chief of NRCS that has ensured the establishment of the State Technical Committees in each State with representation from the respective State fish and wildlife agency.

Wetland determination.—We believe the need for wetland determination, certification, and mapping is great and urge NRCS to proceed as soon as possible, under the guidance of FAIR Act of 1996. The Association urges expeditious completion of the wetland determinations required to implement the Swampbuster provisions of the 1985 FSA, 1990 FACT Act, and the 1996 FAIR Act as well as the FAIR Act directed interagency cooperation, whereby NRCS assumed responsibility for wetland designation for Section 404 (Clean Water Act) purposes on farmland, including tree farms, rangelands, native pasture, and other private lands used to produce or support the production of livestock. The Association and individual states wish to continue to work with NRCS to help achieve these goals.

Public Law 566.—The Association generally supports the \$40 million request for small watershed (Public Law 566) projects. That support is based upon continued emphasis on undated watershed planning and management. Such efforts could utilize and expand upon existing Public Law 566 plans examined in light of present day issues of wetland protection, water quality enhancement and fish and wildlife habitat. The greatest potential for these programs is for land treatment measures that retain the water on the land, improve infiltration, improve water quantity and quality, and provide fish and wildlife habitat. Structural and non-structural land treatment activities require state and local matching funds and are therefore leveraged to provide greater conservation benefits for each federal dollar spent while promoting valuable partnerships among states, local agencies, and other organizations.

Waterbank.—The Association has been concerned that the very valuable Waterbank Program that protects 75 million acres of wetlands and associated uplands habitat would be lost under the 1996 FAIR Act. The present 75 million acres protected under Waterbank may now qualify for the Conservation Reserve Program (CRP). The Association applauds the efforts of USDA to apply this appropriate opportunity to protect these valuable wetlands and associated uplands.

Wildlife Habitat Incentive Program (WHIP).—The Association supports the Administration's request for \$30 million for the second year of the WHIP and a concerted effort to involve the state fish and wildlife agencies.

Wetland Reserve Program (WRP).—The primary objectives of the Wetlands Reserve Program are to protect, enhance and restore valued wetlands and improve wildlife, including migratory bird, habitat, by providing payments for easements. The Association supports the Administration's proposal to increase the authorized level to \$164 million for fiscal year 1998, an increase of \$45 million over the fiscal year 1997 funding level and applauds the goal of a 212,000 acre WRP sign-up. The Association continues to be concerned about the cumbersome, complicated procedures that have resulted in the very slow progress and high dropout rate for this program. NRCS should make no regulatory decision which would unduly restrict possible enrollment and should carefully examine regulations to see if they are hindering present program success. Factors motivating enrollees to drop out must be identified and remedied.

National buffer strip initiative.—The National Academy of Sciences has found that buffer strips can reduce off-field pollution by 70 percent, thus also contributing to

PART 1

1298

meeting non-point service remediation goals under the CWA. NRCS has committed special emphasis and a major effort to use the strip practices covered by the continuous CRP sign-up in a more targeted fashion. Unlike the large or whole field CRP retirements, buffer strips will require extensive outreach plus a much more attractive rental rate above that presently allowed. The Association supports the allocation of funds specifically for outreach to increase participation in the various buffer strip practices.

Forest Incentive Program (FIP).—The Forest Incentive Programs (PIP) has multiple resource values for fish, forests, wildlife, clean water and erosion control. The Association Supports the NRCS request to continue funding at the fiscal year 1997 level of \$6.325 million.

National Natural Resources Conservation Foundation.—The Association applauds the authorization of the Foundation and recommends initial funding of \$1 million. This Foundation can play an important role in facilitating conservation landowner recognition and fundraising for highlighting conservation achievements on private land, promote innovative solutions to conservation problems associated with private lands, and funding education and research related to conservation of natural resources on private land.

Conservation farm options (CFO).—The CFO provides a voluntary approach to implementing a full farm conservation plan for total resource management on a farm. The Association supports the concert and the \$15 million request for the pilot effort.

Farmland Program (FPP).—The FPP provides federal matching funds to the state and local sources to cost share in the acquisition of easements. The Association supports the concept and the \$18 million request for fiscal year 1998.

FARM SERVICE AGENCY (FSA)

An adequately funded budget for the FSA is essential to implement those conservation related programs and provisions under FSA administration as a result of passage of the Federal Agricultural Improvement and Reform (FAIR) Act of 1996. The Association strongly advocates that the budget include sufficient personnel funding to service a very active CRP sign-up.

FSA programs have tremendous quantifiable impacts on natural resources, and yield substantial public as well as private benefits. Building on the provisions of the 1985 FSA, the 1990 FACT Act, and the 1996 FAIR Act, the Association wants to ensure that each program accomplishes the broadest possible range of natural resource objectives, and encourages close cooperation between FSA, NRCS and the State Technical Committees in implementing the 1996 FAIR Act.

We urge FSA to prepare regulation and budget to implement the Flood Risk Reduction Program and make every effort to ensure that language used in its easements and agreements provide a streamlined basis for appropriate administration and are user-friendly.

The continued administration of CRP under the guidelines of the 1996 FAIR Act is a very significant and valuable commitment of USDA and the FSA. The Association applauds FSA efforts to fund and extend CRP contracts for the multiple benefits that accrue to the public as well as the landowner. The Association is especially pleased to note the commitment to reach as soon as practical and maintain the authorized 36 million acres in CRP. The Association provides special thanks to FSA for the continuous CRP sign-up of high value environmental practices and urges a special effort to advertise and increase landowner participation.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

Animal Damage Control, a unit of APHIS, is the Federal agency responsible for controlling wildlife damage to agriculture, aquaculture, forest, range and other natural resources; for protecting public health and safety through control of wildlife-borne diseases; and wildlife control at airports. Its control activities are based on the principles of wildlife management and integrated damage management and are carried out cooperatively with State fish and wildlife agencies. Most APHIS operational work is cost shared between the Federal Animal Damage Control program, State and county governments, agricultural producers, and other cooperators.

The cooperation and support of the agricultural community are essential to maintaining wildlife populations because much of the Nation's wildlife exists on private agricultural lands. A progressive animal damage control program which reduces the adverse impact of wildlife populations is necessary to maintain the support of the agrarian community and to counter increasing pressures for indemnity due to wildlife damage.

Since Congress transferred ADC to USDA, the Association has worked closely with this program on numerous issues critical to the State fish and wildlife agencies

PART 1

1299

such as the proposed fur ban by the European Union. In the realm of making the trap a more humane device, ADC has developed a trap monitoring device that would emit a signal when an animal is caught and a tranquilizer tab that would keep an animal calm. This would allow the ADC biologist to check traps more frequently and remove the captured animal without inflicting undue pain and suffering. The cost of implementing this new technology would be \$500,000, which the Association supports.

The Fort Collins National Wildlife Research Center has established a trap testing program and is the appropriate place to conduct newly required information necessary for the development more humane traps and trapping systems. While some question the use of certain traps, no widely applicable alternative trapping devices are available. IAFWA requests that 350,000 be added to the Methods Development Program at the Center to work with the states cooperatively to support this trap research effort.

One of the strengths the ADC program brings to the wildlife community is their professional leadership in wildlife damage management. The Association has become aware that over the past several years budget shortfalls have caused the program to cut back on the number of key professional positions; therefore, the danger of losing this edge is being threatened unless Congress provides the needed \$1 million to maintain the high level of professional leadership.

The Association has become aware of serious workload burdens and the continued requests from citizens and local governments who are willing to pay 100 percent of the cost of the control operations. We are also aware of the reduction in staff years, irrespective of the funding source. Therefore, because of the entrepreneurial nature of this small program, the Association encourages the Congress to consider directing the Administration not to count the personnel who are fully funded by non-federal money toward the staff year reductions.

There is a growing need for new alternative control methods to come with the increasing number and diversity of wildlife damage problems. The Association recommends that Congress make \$926,000, used for moving personnel to Ft. Collins in fiscal year 1997, now be available for development of methods because many of the current tools are becoming less acceptable to the public. The only source of new methods is through research.

We commend Congress for recognizing the need to move research scientists to Ft. Collins to begin using the new wildlife damage research facilities. The Association urges Congress to finish what it has begun and provide the \$14 million to complete this \$37.7 million state-of-the-art facility.

The Association is pleased with the accomplishments of the Berryman Institute for Wildlife Damage Management at the Utah State University in Logan, Utah. However, the activities have seemed to reach a plateau, and we would like to see the Institute enhance its capabilities to conduct social science research, expand continuing education programs, and start a new high quality scientific journal for wildlife damage management that would be patterned after other established journals. To reach these new goals, the Association supports an increase of the funding to the Berryman Institute by an additional \$236,000.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE (CSREES)—U.S.
DEPARTMENT OF AGRICULTURE

We note that the President's fiscal year 1998 budget requests continued level funding for Smith-Lever 3(b&c) funds at \$268,493,000 and provided for a total of \$417,811,000, including 3(d) items, which is an \$8.462 million decrease from the fiscal year 1997 appropriation. IAFWA appreciates the Administration's continued support for Smith-Lever 3(b&c) base programs that provide "Block Grant" type funds for Land Grant Universities to permit educational outreach based on local needs assessment. However, we recommend a 5 percent increase for these programs: i.e., that Smith-Lever 3(b&c) funds be increased to \$281,917,650, provided that not less than 35 percent of this increase be applied to Environmental Stewardship Education programs as part of Extension's Natural Resource and Environmental Management (NREM) education programs which are so relevant to the Nation's needs.

We support expanding Extension programs in natural resource public issues education on such critical issues as wetlands, endangered species, and human/wildlife interactions, as well as to strengthen its programs in urban and community forestry and environmental education as called for in the 1990 FACT Act. We are concerned that the Administration is requesting a decrease for Water Quality education in 1998. This is an area of significant concern for the Nation, and it must receive increased attention.

PART 1

1300

IAFWA supports the CSREES and State programs in Environmental Stewardship Education and NREM programs, and encourages continuation of close cooperation between State CES's and their State fish and wildlife agencies, as well as other appropriate State and Federal agencies and conservation groups. Extension 4-H Youth natural resource programs and projects continue to increase with over 1,350,000 youngsters presently enrolled from both urban and rural communities across the Nation.

The Association is disappointed that the Administration has zeroed out funding for the Renewable Resources Extension Act (RREA) for 1998. The fiscal year 1997 funding was not adequate for the task at hand, and this program, which is leveraging about \$4 in cooperative funding for each \$1 of federal funds, desperately needs continuing support. The \$500,000 increase for RREA in fiscal year 1994 and fiscal year 1995 to \$3,341,000 has been judiciously targeted to ecosystem management as mandated. These funds have leveraged significant state and local level investment and currently enable 22 states to implement professional continuing education programs for natural resource professionals, to increase private landowners' understanding, and to implement new technologies for addressing landscape environmental problems.

IAFWA recommends that the Renewable Resources Extension Act be funded at a minimum level of \$9.5 million in fiscal year 1998. RREA has been reauthorized to the year 2000. IAFWA supported and appreciated the \$1 million increase proposed by the Administration for RREA in the investment proposals Section in fiscal year 1994, later reduced to \$500,000 and sustained for fiscal year 1995. Even this small increase enabled 13 multi-state, regional or national forest ecosystem management projects to be implemented. When apportioned to State Extension Services, these funds have been effectively leveraged with cooperating partnerships at an average of about four to one, with a focus on dissemination of educational programs to private landowners (rural and urban) and continuing education of professionals.

The Association is disappointed that the practical and applied problems addressed by the Rangeland Research Grants (RRG) program are zeroed out in the President's 1998 budget. Over one-half of the land area of the United States is rangeland, and elimination of the only Federal competitive grants program for rangelands has serious implications for wildlife, watersheds and other natural resources. A recent study shows that modest appropriations for RRG have supported some of the most important rangeland research conducted over the past decade, and wildlife issues on rangelands will present some of the more important rangeland research problems over the next decade. The IAFWA supports restoration of the Rangeland Research Grants \$500,000 budget for fiscal year 1998.

IAFWA notes that \$15 million has been recommended in the President's budget for pest management, a \$5 million increase from 1997. IAFWA recommends that not less than 25 percent of the total appropriation for pest management should be dedicated to educational programs for control of vertebrate pests (wildlife damage management), and to address noxious weed problems on rangeland for restoring, managing and sustaining the biological integrity of the Nation's natural resource base upon which the agricultural economy depends.

LETTER FROM JEAN HOCKER, PRESIDENT, LAND TRUST ALLIANCE

Washington, DC, April 11, 1997.

Hon. THAD COCHRAN,
*Chairman, Subcommittee on Agriculture, Committee on Appropriations, U.S. Senate,
Washington, DC.*

DEAR MR. CHAIRMAN: On behalf of the Board of Directors and members of the Land Trust Alliance (LTA), I am sending this letter to be included in the record of testimony on the fiscal year 1998 appropriation for the conservation programs of the Department of Agriculture.

The Land Trust Alliance serves more than 1,200 land trusts across the country. These are independent grassroots organizations dedicated to protecting land and the quality of life in their communities through private, voluntary action. Working with a cooperative, incentive-based strategy, these groups have helped save more than 4 million acres of wetlands and wildlife habitat, productive farm and forest lands, and other significant resources.

Land trusts across the country are working in partnership with the conservation programs of the Department of Agriculture. The farmland protection program is an excellent example of such a partnership opportunity. It is an especially worthwhile and cost effective program that leverages state funding to keep threatened agricultural land in production. It accomplishes conservation goals through private, vol-

PART 1

1301

untary, incentive-based action. LTA supports the President's request of \$18 million, which will allow this program to protect valuable farmland across the country. Ideally, this program would not be subject to limits on its access to the \$35 million in funds from the Commodity Credit Corporation authorized by the farm bill.

The Conservation Reserve Program and the Wetlands Reserve Program have both made a real difference in the protection of sensitive lands. LTA supports the Administration's request of \$1.926 billion and \$164 million, respectively, for these programs. We also support the Administration's request for funding of the Environmental Quality Incentives Program at \$200 million, the Conservation Farm Option program at \$15 million, and the Wildlife Habitat Incentives Program at \$30 million.

The 1996 farm bill created the National Natural Resources Conservation Foundation. Congress envisioned that this foundation would serve a role for the USDA's Natural Resources Conservation Service similar to that served by the National Fish and Wildlife Foundation for the U.S. Fish and Wildlife Service. This nongovernmental, charitable non-profit organization would raise private funds and accept gifts of real property to promote public-private partnerships, conduct educational and demonstration projects, and encourage innovative solutions to the conservation of natural resources on private agricultural lands. Unfortunately, to date no start-up funds have been appropriated to the Foundation. LTA strongly supports including \$1 million in this appropriations bill for the Foundation start-up funds authorized under the farm bill.

We greatly appreciate your past and future support of USDA's conservation programs. Thank you for considering the views of LTA and the 1,200 volunteer citizen conservation organizations that make up the nation's private land trust movement as you make your funding decisions for the coming fiscal year.

Sincerely,

JEAN HOCKER,
President.

PREPARED STATEMENT OF MERLE JEFFERSON, DIRECTOR, DEPARTMENT OF NATURAL RESOURCES, LUMMI INDIAN NATION, LUMMI INDIAN BUSINESS COUNCIL

Request.—An appropriations increase to the Department of Agriculture's Fund for Rural America Rural Business Enterprise Grants. This request is for \$385,000 for each of three years 1998–2000 to complete the second phase of the Northwest Tribal Clam and Oyster Project. The project is supported by the Tribes in the Pacific Northwest, Washington State Departments of Health and Fisheries, and the private commercial shellfish industry.

NORTHWEST TRIBAL CLAM AND OYSTER PROJECT

Background.—Indian Tribes in Western Washington gathered shellfish on the Pacific ocean for thousands of generations. Treaties between the United States and these Tribes, signed in the mid-1800's, provided protection for the continued rights of the Tribes to these shellfish. In the following century urban, forest and agricultural developments have seriously reduced shellfish resources impinging on the treaty-guaranteed rights. In late 1994, a U.S. District Court decision upheld the Tribal rights to the shellfish resource and recognized that enhancement of the resource would be essential to the establishment of a meaningful right to help Tribes enhance their lands and assist in conflicts with private land owners. In fiscal year 1994, this Subcommittee directed the Department of Agriculture to renovate and begin to operate a shellfish hatchery on the Lummi Indian Reservation at a level of production adequate to supply seed for enhancement of the resource by Tribal businesses on a regional basis. Congress further instructed the Department of Agriculture to assist in funding the hatchery operations in fiscal year 1995 in order to move the Tribal shellfish enterprise towards self-sustainability.

The Department of Agriculture has provided the grants as directed, and the hatchery has successfully distributed nearly 4 billion shellfish larvae to Northwest Tribes which has produced 50,000 bags of oyster seed with a value of over \$2,000,000 at harvest in 2000–2002. Additional jobs and value are generated by processing, marketing and utilization of the product. These efforts have brought the Tribes closer to self-sustaining projects that will help meet increasing world seafood demands. In fifteen years fish farming could provide 40 percent of all fish for the human diet and more than half the value of the global fish catch.

Fiscal year 1998 USDA appropriations request.—The second phase of the Northwest Clam and Oyster Project has two primary components: (1) The expansion and development of remote setting of seed capability in rural areas of the Pacific North-

PART 1

1302

west; and, (2) The addition of hatchery capability for additional species for seed production:

(1) Remote setting of seed

Oyster larvae raised at the Lummi Hatchery is the first step of production. The Oyster Larvae produced is then put into large tanks where they are combined with large volumes of cultch, in the case of oysters—shell. Manila clams, after setting, need room to grow to a large enough size to gain the survivability necessary for commercial viability. This is best accomplished at juvenile rearing sites near the growout area.

Both of these activities are limited to the Central Hatchery and would be much more efficient at on-site facilities for this phase of seed production. Far more efficiency is gained through shipping larvae and small clam seed early in their development. In the case of oysters the difference would be a small jar or zip-lock bag of larvae compared with a semi-load of set seed.

We have identified potential regional sites which can be used by Tribes in those areas for the setting and grow-out of seed. The proposed sites are: (1) Squaxin Island in South Sound; (2) Port Gamble Bay in Hood Canal; (3) Sequim Bay in the Strait of Juan de Fuca; and, (4) Tulalip Bay in the Admiralty Inlet. The funds would build setting tanks for oysters, and upwell systems for manila clams.

In 1998, we request \$385,000 which would include the construction of the facilities, operations costs for the Lummi Seed Production at \$100,000 for direct costs and \$30,000 for indirect expenses, and \$80,000 for additional species capability. We further request \$385,000 for 1999 and 2000 with costs to include the operations of the facilities at \$175,000; operating costs for the Lummi Seed Production would be \$100,000 for direct costs; \$30,000 for indirect expenses; and, \$80,000 for additional species capability.

(2) Additional species capability

In Phase I the hatchery focused on manila clam and pacific oyster production. In Phase II the capability to produce additional oyster species, mussels¹ and geoduck clams² would be added to the hatchery's capability. This additional level of services would require some additional capital expenses for the existing facility and training and labor costs during the development phase. (The cost for this portion of the plan would be \$80,000 for each of the years 1998–2000 as identified above.)

The total project cost for 1998–2000 is \$1.13 million.

In addition to the funds requested to meet the specific line items shown on the following budget page, the Lummi Nation will re-invest shellfish revenues in the Project. These revenues have been re-invested in each year of Phase I of the Project; the amount re-invested has increased each year. In fiscal year 1998, we anticipate sales of adult oysters from the grounds at approximately \$45,000 and hatchery product sales to be approximately \$165,000, for a total of \$210,000 in matching funds for the first year of Phase II. We expect continued growth in these sales in subsequent years of the project.

CONCLUSION

Mr. Chairman the first phase of this project has been very successful with tribes rapidly increasing their capacity for growout of oysters and clams using seed from the Lummi Shellfish Hatchery. More than 50 jobs were initially created by this project which will expand to nearly 200 when harvest of the created crops occurs. There is a great opportunity to increase existing production with new low cost regional facilities and additional species. These sites are in rural areas of Washington that fit the federal mandates for rural development and tribal capacity building.

We appreciate the support this Subcommittee has demonstrated during Phase I of this Project, and request that you appropriate the necessary funds to the USDA, which will along with Tribal matching funds, will allow for the continuation of this valuable project.

¹ Mussel production in the State of Washington will exceed 1,000,000 pounds in 1997 and is expected to double in 1998. Hatchery seed is need for this expansion.

² Geoduck clam is an emerging industry that needs seed for development. This animal presently brings \$7.50 per pound live weight. A market size clam of 1.5–3 pounds is produced in 3–5 years. Sub-tidal populations are inadequate to meet market demands.

PART 1

Total project costs	385,000	385,000	385,000

PREPARED STATEMENT OF GARY A. GLENN, PRESIDENT, MASSACHUSETTS FOUNDATION FOR EXCELLENCE IN MARINE AND POLYMER SCIENCES

This testimony outlines urgently needed activities in the area of research on biodiversity. The outcomes of this research will contribute to knowledge of U.S. and global food chains, agricultural practices and food security. This knowledge will be essential to long-term United States participation in global food markets, including sale of U.S. commodities internationally. The present testimony also describes an in-

PART 1

1304

novative method for involving U.S. multinational corporations as players in the effort to identify and preserve global diversity, including at the microbial level.

INTERNATIONAL BUSINESS AND BIODIVERSITY

Most prominent scientists acknowledge the vast importance of biodiversity protection and enhancement to the future well-being of mankind. Some have argued that biodiversity is the single most urgent issue facing mankind in the 21st century, since world food production will increasingly rely on biological diversity. Yet most real world decisions that effect biodiversity are made not by scientists or governments but by major multinational corporations and other private sector entities. The connection between biodiversity needs and corporate awareness of these needs is at present very weak. Regrettably, most scientific and governmental proposals effecting biodiversity involve increased regulation and other actions unpopular with companies.

CHANGING THE FOCUS TOWARD CORPORATE INVOLVEMENT

The success of the environmental movement in the U.S. was greatly advanced when major sectors of the U.S. corporate community perceived that environmental protection was in their interest and that significant business opportunities existed in the design, manufacture and sale of environmental products and services. The same future is available in the area of biodiversity, and business awareness will enable a rapid acceptance of biodiversity principles.

DEFINITION OF BIODIVERSITY

What exactly is "biodiversity" and why is it so essential to our future well-being and prosperity? Simply stated, biodiversity is a term that describes the basic natural biological systems on which we rely for survival. These systems include the processes that underlie agricultural production, control of pests, forestry, aquaculture, the existence of drinkable water and breathable air, and the production and manufacture of most items on which we depend for good health, including medicines and drugs. In all of these cases, mankind relies on the diversity of plant and animal species which comprise ecological systems. We now live in a global economy, which offers us great opportunities, but which also means that dysfunction in any part of the global system can directly impact the lives of Americans. In past decades Americans could be relatively self-reliant, but today, what happens in Europe, Asia or Latin America can immediately and dramatically affect our lives. Thus, it is in our immediate and direct self interest to encourage and promote biodiversity in those parts of the world on which we rely and with which we trade and invest.

GLOBAL NATURE OF BIODIVERSITY

We know that species diversity tends to become richer and more complex in warmer regions. Many of the fruits, vegetables, grains, and forest products on which we rely have their origins in warm weather regions, and we continue to depend on infusions of natural species from these areas. Similarly, many of our medicines and drugs have tropical origins. It is also in tropical areas that many current biodiversity crises are being played out. Many countries with the most crucial stores of plants and animal species are also ones that lack the resources for serious and widespread biodiversity protection programs. These countries are also targets for U.S. trade and investment; for instance, several of the countries in the U.S. National Export Strategy that have been identified as "Big Emerging Markets" (BEM's) are locations of major biodiversity confrontations (i.e., Brazil, Argentina, China, India). In this century 75 percent of the worlds variety of crops have become extinct: most of these have been in warm weather regions.

MICROBIAL BIODIVERSITY

Scientists are only now beginning to understand the nature and function of microbial life, especially as it relates to ecological processes that effect human foods and other mechanisms. Only in the past few years have we realized that biodiversity extends deeply into the three domains of life on earth, and that fundamental interactions underlie the ability of many life forms to survive. Certainly in the area of agriculture, as natural environments are challenged by human activity, it is essential that we learn to understand these interactions. Our ability to obtain useful resources from microbial biodiversity is directly related to knowledge of microbial life, and the maintenance of these life forms on earth.

PART 1

1305

CURRENT INTERNATIONAL BIODIVERSITY EFFORTS

Serious action on biodiversity issues in countries like Brazil, Indonesia, India and China will require massive efforts on the parts of domestic and foreign companies, governments, citizen groups, and other institutions. How can these actions be encouraged by the United States? U.S. foreign policy can and has been supportive of biodiversity issues; the U.S. was a major player in the most significant meeting ever to be convened on biodiversity and environmental issues, the Rio de Janeiro conference of 1992. However, it is acknowledged that many—perhaps most—of the guidelines and goals enunciated at the Rio conference are not being complied with or honored. A key problem is that responsibility for implementation has been placed on the shoulders of governments faced with development imperatives that create jobs and alleviate poverty. In most tropical countries, expanding populations and continued poverty create conditions that favor development over environmental needs. What is missing is a realization that development and biodiversity/environmental protection are not mutually exclusive. The recent history of the United States, where continued economic growth has occurred in harmony with improved environmental protection, has shown that wise and carefully planned development can actually promote environmental quality. This has been accomplished because of the willingness of the private sector to take environmental issues seriously and to incorporate environmental factors into manufacturing methods, product design, space planning, building, and waste management. The same kind of thinking can reap tremendous benefits in countries such as Brazil and India. But the effort needs to be led and promoted by those who are doing the developing—namely by the private sector. That community often includes as major players U.S. companies and investors.

NEED FOR U.S. PRIVATE SECTOR LEADERSHIP

It should be recognized that virtually all United States trade and investment practices have some impact on biodiversity issues. Some activities have immediate and dramatic effects—for instance, investments in natural resource exploitation or urbanization/construction/coastal development. Virtually all other economic activities require the use of some natural resources, land, water, energy, etc. All of these activities impact biodiversity in some way, since biodiversity involves the natural balance of organisms from the microbial level up to large-scale plant and animal populations. Similarly, certain industries depend very heavily on continued availability of natural products—pharmaceuticals, medical materials, foods, materials—but most others also rely on continuation of diversified biological systems. This has been recognized in the writing of the new ISO 14,000 international environmental standards, which bring a global focus to the management of environmental policies. Biodiversity, as the foundation for all healthy ecological systems, is a centerpiece in these new standards.

BIODIVERSITY RESEARCH AND TRAINING ACTIVITIES

In order to involve the U.S. private sector in the effort to identify, protect and preserve the biodiversity upon which U.S. and global agriculture depends, it is proposed to carry out biodiversity training programs for senior officers of United States corporations that are investing in or otherwise involved in regions of particular biodiversity vulnerability. It is intended to carry out the training activities in Hawaii for the Asian Pacific region and in Massachusetts for Latin America. The training programs will use existing intellectual and academic resources in the two states, and will also utilize existing physical facilities. Hawaii and Massachusetts are ideal locations for this kind of training, since they are two of the world's leading centers of research on biodiversity issues and problems. In order to organize and administer this pioneering effort, we request that the Committee recommend funding for \$740,000 in fiscal year 1998, with instructions that the project be carried out by a partnership between the Massachusetts Foundation for Excellence in Marine and Polymer Sciences and the Partners in Development corporation of Hawaii.

PREPARED STATEMENT OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

Chairman Cochran and members of the subcommittee: The Metropolitan Water District of Southern California (MOOD) appreciates the opportunity to submit testimony regarding the U.S. Department of Agriculture's (USDA) fiscal year 1998 budget, for the Hearing on Agriculture, Rural Development and Related Agencies Appropriations. MWD is a public agency created in 1928 to meet supplemental water de-

PART 1

1306

mands of those people living in what is now portions of a six-county region of southern California. Today, the region served by MWD includes nearly 16 million people living on the coastal plain between Ventura and the Mexican border. It is an area larger than the State of Connecticut and, if it were a separate nation, would rank in the top ten economies of the world.

Included in our region are more than 225 cities and unincorporated areas in the counties of Los Angeles, Orange, San Diego, Riverside, San Bernardino, and Ventura. We provide more than half the water consumed in our 5,200-square-mile service area. MOOD's water supplies come from the Colorado River via the district's Colorado River Aqueduct and from northern California via the State Water Project's California Aqueduct.

INTRODUCTION

MWD is encouraged by USDA's commitment to implementation of conservation programs and is especially encouraged by the opportunities afforded by the reauthorized and newly established agricultural conservation programs that are part of the Federal Agricultural Improvement and Reform Act of 1996 (Public Law 104-127). MWD firmly believes that cooperative, locally-led conservation programs, that are incentive-based and facilitate the development of partnerships, such as the conservation programs in Public Law 104-127, are critical to addressing natural resources concerns, such as water quality degradation, wetlands loss and wildlife habitat destruction. It is vital that Congress provide USDA with the funding necessary to successfully carry out its commitment to natural resources conservation.

Our testimony focuses on USDA's conservation programs that are of major importance to MOOD. In particular, MWD urges your full support for USDA's Environmental Quality Incentives Program (EQIP). Full funding for this program is essential for achieving Colorado River Basin salinity control objectives through the implementation of salinity control measures as part of EQIP. In addition, MWD requests your full support for the Wildlife Habitat Incentives Program, Conservation Reserve Program, Wetlands Reserve Program, Integrated Pest Management and related programs, and the Water and Waste Disposal Loans and Grants program. Sufficient federal funding for these USDA programs is necessary to achieve wildlife habitat restoration and source water quality protection objectives in the Colorado River Basin and in California's Sacramento/San Joaquin Bay-Delta (Bay-Delta) estuary.

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

The Environmental Quality Incentives Program provides cost-sharing and incentive payments, technical assistance and educational assistance to farmers and ranchers for the implementation of structural practices (e.g., animal waste management facilities, filterstrips) and land management practices (e.g., nutrient management, grazing management) that address the most serious threats to soil, water and related natural resources. EQIP is to be carried out in a manner that maximizes environmental benefits per dollar expended. This assistance is focused in conservation priority areas identified by the Natural Resources Conservation Service's State Conservationists, in conjunction with State Technical Committees and Farm Service Agency personnel. Sufficient federal funding for implementation of EQIP is critical in order to achieve Colorado River Basin salinity control objectives and source water quality protection and ecosystem restoration objectives in the Bay-Delta estuary and watersheds tributary to the Bay-Delta.

In 1984, Congress amended the Colorado River Basin Salinity Control Act (Act) to authorize the Secretary of Agriculture to establish a voluntary cooperative salinity control program with landowners to improve on-farm water management and reduce watershed erosion on non-federal lands and on lands under the USDA's control. In Public Law 104-127, Congress amended the Act to direct the Secretary of Agriculture to carry out salinity control measures in the Colorado River Basin (Basin) as part of EQIP. Such salinity control measures are to include watershed enhancement and cost-share measures with livestock and crop producers.

The Colorado River Basin Salinity Control Forum (Forum), the interstate organization responsible for coordinating the Basin states' salinity control efforts, issued its 1996 Review, "Water Quality Standards for Salinity, Colorado River System (1996 Review)" last June. The 1996 Review found that additional salinity control was necessary with normal water supply conditions two years ago to meet the numeric criteria in the water quality standards adopted by the seven Colorado River Basin states and approved by the U.S. Environmental Protection Agency. For the last three years (1994-96), funding for USDA's salinity control program has not equaled the Forum-identified funding need for the portion of the program the Federal Government has the responsibility to implement. It is essential that implemen-

PART 1

1307

tation of Colorado River Basin salinity control efforts through EQIP be accelerated to permit the numeric criteria to be met again under average annual long-term water supply conditions, making up the shortfall. The Basin states and farmers stand ready to pay their share of the implementation costs of EQIP.

The President's proposed fiscal year 1998 budget contains funding of \$200 million for implementation of EQIP. MWD supports this level of EQIP funding. The Forum has determined that allocation of \$11 million in EQIP funds in fiscal year 1998 is needed for on-farm measures to control Colorado River salinity. This level of funding is necessary to meet the salinity control activities schedule in order to maintain the state adopted and federally approved water quality standards. MWD urges you and your Subcommittee to support full funding for EQIP as requested in the President's fiscal year 1998 budget for USDA.

WILDLIFE HABITAT INCENTIVES PROGRAM

Public Law 104-127 directed the Secretary of Agriculture, in consultation with State Technical Committees, to establish the Wildlife Habitat Incentives Program (WHIP). WHIP is a voluntary program, providing technical assistance and cost-sharing, to help landowners develop habitat on their properties that will support wetland wildlife, upland wildlife, threatened and endangered species, fisheries, and other types of wildlife. WHIP offers an opportunity to encourage development of improved wildlife habitat on eligible lands by providing assistance to landowners who wish to integrate wildlife considerations into the overall management of their operations.

WHIP cost-sharing assistance could be utilized to support ongoing interim conservation efforts both in the Bay-Delta estuary and for the Lower Colorado River Multi-Species Conservation Program. The CALFED Bay-Delta Program is a cooperative effort among state and federal agencies and the public to develop a long-term, comprehensive solution to ecosystem and water supply problems in the Bay-Delta. One of the main objectives of the CALFED Bay-Delta Program is to improve and increase aquatic, wetland and riparian habitats so that they can support sustainable populations of wildlife species, by implementing a system-wide ecosystem restoration approach. WHIP could benefit this program by providing cost-share assistance for the development of wildlife habitat on private lands in the Bay-Delta watershed.

The Lower Colorado River Multi-Species Conservation Program (LCR MSCP) is a broad-based partnership of state, federal and private entities in Arizona, California, and Nevada. Participants include water, hydroelectric power and wildlife resource management agencies, Tribal governments, and environmental organizations with interests in the Lower Colorado River. The LCR MSCP is focusing on the conservation of over 100 threatened, endangered and sensitive species and their habitats. WHIP would allow the combination of federal cost-sharing dollars and voluntary agricultural land-use practices to enhance habitat for listed and sensitive species of interest in the Lower Colorado River. This could be a valuable vehicle for gaining further agricultural support for conservation efforts and the goals of the LCR MSCP.

The President's budget requests \$30 million for WHIP for fiscal year 1998. MWD recommends that you and your Subcommittee support WHIP at the level requested in the President's fiscal year 1998 budget for USDA.

CONSERVATION RESERVE PROGRAM

Continued support for the Conservation Reserve Program (CRP) is necessary in order to build on the past successes of this USDA conservation program. Under the CRP, incentive payments are provided to producers to remove highly erodible and other environmentally sensitive land from production. This program helps protect the quality of drinking water supplies and facilitates ecosystem restoration efforts by reducing soil erosion, improving water quality, protecting wildlife habitats, and achieving other natural resource conservation measures. Enrollment of eligible agricultural lands that are located in the Bay-Delta estuary and tributary watersheds in the CRP, could provide water quality improvement benefits for this important source of drinking water. MWD urges you and your Subcommittee to support the President's budget request for the CRP of \$1.926 billion for fiscal year 1998.

WETLANDS RESERVE PROGRAM

The Wetlands Reserve Program (WRP), first authorized in 1990, is a voluntary program providing incentives to landowners for the restoration and protection of wetlands with long-term or permanent easements. Wetlands restoration provides important water quality improvement and wildlife habitat restoration benefits that are important to the Bay-Delta estuary. MWD urges you and your Subcommittee

PART 1

1308

to support appropriation of \$164 million for the WRP in fiscal year 1998, as requested in the President's budget. Full support for the WRP is necessary to achieve the Administration's goal of enrolling an additional 212,000 acres into the program, for a cumulative enrollment of approximately 655,000 acres by the end of 1998.

INTEGRATED PEST MANAGEMENT AND RELATED PROGRAMS

The USDA's Integrated Pest Management (IPM) Initiative provides for the research and development of IPM practices and the coordinated implementation of IPM programs at the local level. The development and application of proven IPM practices offers the potential to reduce reliance on chemical pest controls and minimize the adverse water quality effects of pesticide use. Implementation of IPM programs could provide source water quality protection benefits in both the Bay-Delta estuary and the Colorado River Basin. The President's fiscal year 1998 budget includes funding for a variety of research and assistance programs contributing to the overall objectives of the IPM Initiative. MWD urges your full support for the \$249 million included in the President's fiscal year 1998 budget for IPM and related programs.

WATER AND WASTE DISPOSAL LOANS AND GRANTS

The President's fiscal year 1998 budget includes funding for a number of USDA programs that provide loan, grant and technical assistance to rural communities. Of particular interest to MWD is the Water and Waste Disposal Program. This program provides loans and grants to small rural communities for water infrastructure projects, in order to assist those communities with drinking water quality and supply problems and help them achieve compliance with federal drinking water standards. MWD requests you and your Subcommittee to support the President's request of \$1.293 billion for fiscal year 1998 for water and waste disposal loans and grants.

CONCLUSION

Thank you for your consideration of our testimony. We believe our comments emphasize the importance of continued funding for USDA's agricultural conservation programs. The USDA's conservation programs are critical for achieving Colorado River Basin salinity control objectives, as well as broader wildlife habitat restoration and source water quality protection objectives in the Colorado River Basin and the Bay-Delta estuary.

PREPARED STATEMENT OF MICHIGAN STATE UNIVERSITY

We write as citizens concerned about our country and as scientists and engineers who hope to better the lives of future generations. As our national leaders attempt to make the difficult choices necessary to bring the Federal Government back to fiscal health, we respectfully request that they not lose sight of the crucial importance of investing in our nation's future.

We call upon our Federal leaders to support legislation such as the National Research Investment Act of 1997 (S. 124—by Senators Gramm, Mack and Hutchison), which proposes to double funding for most non-defense federal R&D over the next ten years. We further request that Federal leaders begin working to accomplish this goal by increasing Federal research spending by 7 percent this year.

We and our colleagues are contributing to a time of unparalleled opportunity and scientific achievement. There are many benefits spawned by the research underway at Michigan State, much of it federally funded. A few examples:

- Basic research in chemistry led to the discovery of cisplatin, one of the most widely prescribed cancer drugs in the U.S.;
- Superconducting cyclotron technology was used in the construction of the Harper Hospital cyclotron for the treatment of cancer patients;
- Contaminant eating bacteria are being used to clean the ground water at Schoolcraft, Michigan; they have the potential of great savings in the cleanup costs for contaminated hazardous waste sites; and
- The development of faster and less costly methods of making composite materials has led to several MSU patents. These strong, light, corrosion resistant materials will greatly improve automobiles, trains, and bridges.

Our national leaders recognize the necessity of this investment. "This country must sustain world leadership in science, mathematics, and engineering if we are to meet the challenges of today * * * and of tomorrow." (President Clinton, November, 1993). Yet, despite the efforts of the Congress and the Administration to increase Federal investment in the NIH and the National Science Foundation, overall

PART 1

1309

Federal research expenditures have fallen. "From 1992 through 1995, for the first time in 25 years, real federal spending on research declined for four straight years. If we don't restore the high priority once afforded science and technology in the federal budget and increase federal investment in research, it will be impossible to maintain the United States' position as the technological leader of the world" (Senator Phil Gramm).

We strongly believe in the need to set priorities for all national expenditures—particularly in science and engineering. We, and our national colleagues, are working hard—on campus, in our scientific societies, and as advisors to Federal agencies—to establish priorities for today's constrained funding.

But we are alarmed by the prognosis for the U.S. scientific and engineering enterprise. Even as U.S. corporations reduce their own long-term research, increasingly relying on university laboratories, we are losing many of our most promising science and engineering students. They see troubling trends in the funding of science. For example, an analysis of the President's budget by the AMS, projects further 14 percent reductions in support for R&D by fiscal year 2002. They rightly question whether they can expect a satisfactory career in science.

We recognize that the commitment to doubling Federal investment in research (and the accompanying graduate education) will not come easy and there are many competing national priorities. However, many economic studies have found substantial returns on these investments—in fact there would be few other federal investments that would return such critical dividends to the country. We shall continue contributing our expertise to discovery and education, and to assist our national leaders, in any way we can.

PREPARED STATEMENT OF THE MINOR CROP FARMER ALLIANCE

I. INTRODUCTION

The Minor Crop Farmer Alliance (Alliance) was formed in November 1991 to address legislative and administrative policies to ensure the continued availability of safe crop protection tools for minor uses.

Congress, in passing the Food Quality Protection Act (FQPA), provided for the establishment of a minor use program within the U.S. Department of Agriculture (USDA). The primary purpose of this office includes the coordination and policy oversight for specific program areas within USDA that impact minor use pest management practices (including: availability of needed tools either chemical or non-chemical alternatives, extension and outreach for educational efforts and direct coordination with other federal agencies). It was envisioned that responsibility for this program would be placed in an office having the support and authority of the highest levels of USDA.

With passage of FQPA and its major new areas of responsibility identified for USDA, the need for coordination at the Secretary's level has increased in importance. Minor crops have been identified as the "sentinel" species for implementation aspects of the new law. This has resulted in elevating anxiety to a very high level in the user community.

It is critical that the USDA step up to a more direct leadership role during implementation of FQPA to be a source of information and review on issues being discussed by the EPA. For minor use crops, including food and non-food uses such as nursery, Christmas trees, and ornamentals, this will require a shift in focus and priority within some branches of USDA.

II. ROLE OF USDA

Implementation of FIFRA

USDA has been identified in the new law as a full cooperator with EPA in the development and review of impacts in certain provisions of the new law, i.e., use information, IPM education and qualification of uses under the minor use provisions. A major leadership presence that cuts across line agencies within USDA will be required to focus the resources necessary to meet the expedited schedules for data generation and review during implementation of the law.

It is critical that USDA be at the table, providing the EPA and the FDA guidance during the implementation process on agricultural impact and possible mitigation measures. There are several activities dictated by the law requiring direct input on policy implications for potential impacts from a crop production, economic impact, and overall food production standpoint. USDA is the appropriate focal point for the collection and coordination of information review to assure accurate timely assessments.

PART 1

1310

Implementation of Federal Food, Drug and Cosmetic Act (FFDCA) provisions

USDA's direct participation in implementation of the FFDCA amendments involve residue data collection and dietary exposure surveys in cooperation with the Food and Drug Administration (FDA) and EPA. There are also very clear indirect roles that are critically important as well. The methods and analysis of the data to support tolerances in light of the new safety requirements pose the most significant threat to the continued economical production of high dietary exposure crops. USDA must serve a pivotal role in the credible establishment of risk mitigation criteria to minimize impacts on the limited spectrum of crop production tools available to control pests and pest complexes on these crops.

With the magnitude of effort and time sensitive nature of the tolerance reevaluation process, the multiple line agencies that will need to be involved in development of data and policy direction will require Department oversight at the highest levels to assure timely intervention in the regulatory process.

Specific minor use provisions

In order to facilitate the coordination and oversight responsibilities required under FQPA related to minor uses, all efforts should be made to expedite the creation, organization and staffing of the "Minor Use Program" authorized in the FQPA. This Office or Program should reside at the Secretary level to ensure the needed coordination among agencies of the Department. In addition to the specific responsibilities spelled out in the Act (coordination of IPM research, IR-4 coordination, data development to support minor uses, and regulatory assistance for registration, tolerance establishment and reregistration activities), it is anticipated that USDA will become the focal point for many other efforts relative to pesticide use in American agriculture. It must also be a critical component in the development of policy positions relating to pesticide use practices and production technology.

The second major provision contained in Section 32 of FIFRA is the authorization of the "Most Use Pesticide Data Revolving Fund". USDA and the user community are working to better define the mechanism needed for such a fund so that appropriations can eventually be requested to establish this revolving program.

CODEX and harmonization

Many of the tolerance requirements under the FFDCA provisions of the FQPA have tremendous potential to impact both international and interstate commerce as a result of changing pest management practices dictated by shifts in availability of certain pesticides or changes in the tolerances allowed on specific crops. This area of impacts is not clearly defined at this time and will require continued monitoring by both the Agency and the impacted user community. The USDA should serve as a leader in assuring the maintenance of CODEX standards needed by minor crops involved in international trade.

III. RESOURCES

Resources will be critical to fulfill the direct and indirect responsibilities contained in the legislation. The user community is committed to work cooperatively with the Department and this Committee to assure that funds appropriated for these efforts are effectively and efficiently utilized to ensure the performance of USDA's responsibilities under this Act. Priority efforts should be directed toward creating a coordinated effort at the Secretary's level, appropriation or use of existing funds for the Minor Use Pesticide Data Revolving Fund once an adequate mechanism is established, adequate appropriations to allow the data collection of residue and dietary exposure information required under the Act, and other appropriations as necessary to fulfill the indirect responsibilities required under the Act.

IV. CONCLUSION

Therefore, the MCFA urges the Committee to: (1) direct the USDA to coordinate activities relating to the implementation of the FQPA out of the Office of the Secretary; (2) appropriate at least the \$6 million in the Department's budget request for a food consumption survey of infants and children. The MCFA also urges that the Committee support a possible reprogramming request from USDA to do some survey work in fiscal year 1997 to provide some more immediately needed data to the EPA to assist in their FQPA decisions; (3) appropriate \$10.4 million as requested in the USDA budget to continue the Pesticide Data Program (PDP); and (4) appropriate funds as requested in the USDA budget for Integrated Pest Management and Biological Control, Minor Crop Pest Management (IR-4), Pest Management Alternatives and Pesticide Impact Assessment. However, MCFA also recommends that the utilization of any such funds appropriated be coordinated by the

PART 1

1311

Office of the Secretary to ensure that these program activities accurately reflect EPA regulatory decisions.

PREPARED STATEMENT OF THAD SHOWS, MISSISSIPPI RURAL WATER ASSOCIATION

Mr. Chairman, thank you for allowing me, as Board Member for the Mississippi Rural Water Association and representative for the over 1000 small communities with water systems in Mississippi to appear before this Committee today. In addition, I am here on behalf of the all the other State Rural Water Associations and rural water folks all over this country to thank you for the rural water and sewer grant funding program last year. These funds are being used and will be used to great advantage by many small water systems to improve the public health and strengthen local economic opportunity in rural America. Finally we want also to express our deepest appreciation for the help of the Committee in providing funding for our rural water Circuit Rider program. We are here today to request the continued support of you and the Committee for both the grant and loan funds and the Circuit Rider program funding.

Specifically, we are requesting for fiscal year 1998:

- Funding for the Rural Utility Service's Rural Community Assistance Partnership Rural Water and Waste Disposal grant program at \$800 million. The USDA's fiscal year 1998 budget request includes \$668,570,000 for the program.
- Funding for the Circuit Rider technical assistance program at \$5.5 million to fund our existing contract with RUS. The USDA's fiscal year 1998 budget request includes \$5,150,000 for the program.
- Requiring that the Fund for Rural America provide sufficient funding to Mississippi and the other state rural water associations to allow for a full-time person in each state to implement the county-by-county Water 2000 effort initiated by the state rural water associations.

Our primary reason for supporting additional funding in the water and sewer grant and loan program is that water and sewer are basic to rural public health. As environmental and health expectations rise, the need for safe drinking water and sanitary sewers has become a necessity for rural residents. Community water systems provide this service. USDA grants and loans allow rural residents to build systems and to repay the loans over an extended period. Without the current assistance from USDA, most rural residents could not initiate the construction of new systems and the expansion of existing ones. This funding allows more rural Americans to have safe water.

Mississippi would be a far different state without the water and sewer small communities grants and loans made through the program over the past 40 years. In our county alone I have witnessed the impact of new water systems on the health of our rural families. Mississippi has over 1000 small community water systems, before these systems were built many of us used marginal water supplies including partially polluted wells.

The need for grant and loan funds grows each year as the Federal government presses for higher and higher environmental standards on small water and sewer systems. The goal of USDA has always been to bring safer drinking water to rural residents. However, now EPA has strengthened its role through both the Safe Drinking Water Act (SDWA) regulations and through the deadlines for compliance with the Clean Water Act. To put it simply Mr. Chairman, federal requirements are increasing the cost of drinking water in rural America to the point that drinking water is becoming unaffordable in many rural towns.

The Congress has recognized this burden and is moving this year to remedy some of the problems caused by unfunded mandates and excessive federal regulations. This new emphasis on more responsibility and control at the local government level needs to replace the often suffocating constraints caused by the growing number of new federal requirements.

One alternative to increased federal regulations is on-site technical assistance. We believe that technical assistance operated by local governments provides more environmental benefits than increasing the size of the regulatory bureaucracy. As federal responsibilities are reordered, the rural water and sewer grant and loan program and the circuit rider water program in each state are an essential element to a return to greater local and state responsibility.

For example, in Mississippi, the Circuit Rider program assisted rural water systems with over 800 technical assistance contacts an average of 35 technical assistance contacts per month. Approximately one half of the contacts were made in response to direct calls for help from water system personnel. Circuit Riders have saved significant amounts of money for towns by preventing water loss, reducing the

PART 1

1312

need for replacement of pipes, pumps and equipment, educating the towns on their most cost effective option to maintain compliance, and in working with systems to set adequate water rates in order to provide funds for continuous preventive maintenance. Often these savings are used to reach new customers or make improvements required by the SDWA.

During the past year, the Circuit Riders have made over 25,000 on-site types of technical assistance to rural water systems throughout America to provide hands-on help. We now know that having a national border-to-border program is having a dramatic impact on the upgrading of small water systems in those areas with the most serious water problems. It has proven to be the most important alternative to increased federal regulatory intervention in rural areas.

One issue that is of particular importance to rural water systems is the proposed reorganization of the USDA. The President's budget includes a request for funding the Circuit Rider program because we are in the middle of a five year contract for the program. As Congress moves to support more local control over governmental matters, the Circuit Rider is the first line for local self-help technical assistance. I have provided a list of all small communities assisted by Circuit Riders in Mississippi last year. We strongly urge you to make the funding for the Circuit Rider program a top priority for the USDA budget.

RURAL UTILITY SERVICE—RURAL WATER GRANTS AND LOANS

The grant and loan program is the backbone for rural public health. It is the program that small communities start with and count on in assembling financing for rural water and sewer systems. To best utilize USDA funds, small communities have gone to their state governments for help and in some cases have received new resources. However, in these and other cases it would be impossible to gain new financial support without the critical "seed money" that the USDA grant funds provide for projects in low income areas of each state. These grant funds are highly leveraged and the increase in the grant program is having a multiple impact on the improvement of small water and sewer systems throughout the nation.

This funding is vital to most small water systems because rural water districts do not have the legal standing to float bonds, levy taxes or seek other types of public financing. Private financing as a sole source has seldom been an alternative because of its high cost and consistent unavailability. With a repayment rate on USDA water and sewer loans of over 99 percent, this is the most sound government loan assistance program in the nation.

The Environmental Protection Agency (EPA) continuously cites the USDA rural water and grant loan program as the major source of funding assistance to help small rural systems meet SDWA requirements. The EPA has met with the USDA in an effort to ensure that adequate financial support is and will continue to be available to small water systems to meet additional requirements imposed by the Safe Drinking Water Act. This is of particular importance in that the cost to small water systems for SDWA compliance is estimated at \$8 billion over the next twelve years. While much of this cost will be borne by the small water system customers themselves, the USDA program is the catalyst to generate the necessary funding. In effect, we have one federal agency imposing regulatory requirements and relying on another agency (USDA) to provide funds to support compliance. It is in rural areas which the USDA grant and loan program is critical to SDWA compliance.

RURAL COMMUNITIES CAN'T ACCESS COMMERCIAL LENDING PROGRAMS

The existing rural water and sewer program is unique in its ability to reach the smallest communities who have no other source of assistance. In addition, the independent circuit rider gives these systems their own technical assistance program that is accountable only to them. RUS Water and Sewer funding is only available to communities who can't find "credit elsewhere", it is the funding of last resort only available to communities that can document hardship conditions.

This is the most important aspect of the program and it also reflects the very purpose of the federal government involvement. Most large communities can get loan funds from other sources such as bonds, commercial loans, and SRF's. The funding of last resort requirement is the fairness test at the very grassroots level. These requirements should be applicable to all funds set aside for rural water and sewer projects. This greatly reduces any "slush fund" possibility for the program.

Cities larger than 10,000 persons generally have access to the tax-exempt bond market and have a population density that makes water and sewer construction and operation economically feasible. The real problems are systems below 3,000.

For example in the CWA-SRF, small communities receive only a small portion of the funding because: (1) larger communities can more easily access loans, (2) large

PART 1

1313

communities have engineers and resources to complete applications and administrative requirements, (3) larger communities mean fewer loans for state agencies to manage, and (4) and small communities don't have bond ratings which allow lower interest rates on bonds and other types of loans.

MAKING THE FUND FOR RURAL AMERICA WORK

The 1996 Farm Bill created a new program called the Fund for Rural America. Correspondingly the Department of Agriculture established the ambitious goal of providing community water to those rural residents not yet served by existing water systems. The core element of this strategy is to go county-by-county to work with existing water systems (which are state rural water association members) to plan for system expansion in underserved areas, and obtain funding assistance in order to implement the plans. This is important not only for public health, but to prevent EPA sanctions on these rural communities and to assure a base for future community economic stability.

With this in mind, rural water supported the "Fund for Rural America" provisions because this would include funding for a major effort to carry out the county-by-county strategy proposed by the state rural water associations. This effort would in turn result in an increase in the amount of funding from SDWA and HUD for these "unserved" areas.

We were stunned when only \$9.1 million out of the \$100 million for the Fund for Rural America was allocated to rural water and sewer; the program that has been the core for rural public health and economic stability. This year's limited funding will allow for money for a county-by-county program in only eleven states, which means there will not be a concerted national effort to move EPA funding away from big systems refinancing into solving the smallest water system public health priorities.

Our request is that the Congress consider designating \$4.5 million from the Fund for Rural America in fiscal year 1998 to carry out the county-by-county program in all states for next year. This will provide a full time person with each state rural water association who will be responsible for:

- assembling the information and support in priority areas to assure that RUS, EPA, and HUD monies better target those rural areas with the greatest need.
- reporting to RUS and Congress on the progress being made in reaching unserved areas in every rural county.
- assisting directly those communities that are most in need to secure funds, develop system plans, and start construction.

The RUS rural water and sewer grant and loan program has been the beacon that has led the way to a 90 percent reduction in the number of rural households without safe drinking water. It has been the wisdom, the common sense, and the support of Congress that has made this possible. As we close in on bringing rural water to those left behind, our state rural water associations need to be able to use their grassroots networks to direct newly available state level funding to supplement the long-term strategy and objectives of the RUS programs. There is an immediate need to go county-by-county and capture the available monies in SRF funds and HUD grant monies in order to intertwine them with the core RUS programs. We need the help of Congress to fund this program nationwide from the Fund for Rural America.

In next year's \$100 million allocation, Rural Water will urge both the USDA and Congress to use the Fund for the goal of providing community water to those rural residents not yet served by existing water systems. We feel that providing the maximum percentage of Funds for Rural America into the Rural Water programs will be the one action that moves the Agency's goal from initial effort to national impact.

PREPARED STATEMENT OF NORMA J. CURBY, VICE PRESIDENT, GENERAL MANAGER,
PHOSPHORUS AND DERIVATIVES, MONSANTO

We are writing to urge you and your colleagues on the subcommittee to support funding the Public Law 480 program in your upcoming deliberations at a level which will allow this valuable humanitarian assistance program to maintain its effectiveness.

Monsanto is a multi-faceted general chemical company whose products include a wide array of mineral-based food additives. We have production facilities or of rices in over 17 states. Monsanto has a long history of supplying mineral supplements for inclusion in many of the blended and processed foods utilized in the Public Law 480 program. In fact, Monsanto worked cooperatively with program officials in the development and testing of many of the Public Law 480 foods. Over the years, we

PART 1

1314

have also made substantial donations of nutrients to private voluntary organizations for inclusion in foodstuffs to complement the Public Law 480 program.

Because of our long-term involvement in the Public Law 480 program, we are very concerned that recent substantial cuts in the program, if continued, will seriously undermine the ability of it to provide effective humanitarian assistance to the needy overseas. For example, the President's proposed budget, which you will be considering, projects providing a little more than 3 million metric tons of food aid in fiscal year 1998. That volume must be compared with nearly 8 million metric tons of food aid which was provided as recently as 1993. Although we recognize that the 1993 level included large donations of surplus governmental stocks which are no longer available, it is an obvious concern that such a reduction in donations will have a substantial negative impact on the future viability of the program. We believe this concern has already manifested itself since private voluntary organizations are reducing, or eliminating, programs in many areas of the world due to the cutbacks.

What is most troublesome in the President's budget is that it proposes an overall foreign aid increase of \$1.2 billion, while at the same time cutting the Public Law 480 budget by more than \$120 million. The President's proposed Public Law 480 budget of \$990 million represents a cut of more than one-third from the program's fiscal year 1994 level of \$1.55 billion. It is difficult for us to believe that world-wide humanitarian food needs have diminished to the extent suggested in the President's budget. In fact, if the United States is to maintain its longstanding role as the world's leader in providing humanitarian food aid, our recent decrease in support of assistance must be halted.

Title II of Public Law 480 is indeed the lifeblood of our humanitarian assistance program. We take some comfort in the fact that the President's budget proposes maintaining Title II funding in fiscal year 1998 at current levels. Even maintaining the status quo in Title II places this vital component of Public Law 480 at risk, especially in light of proposed cuts in the other titles which will continue to have a negative impact on programs under Title II. In light of these factors, we believe that an increase in Title II funding is justified and should be seriously considered by the Subcommittee.

It seems inherently unfair to increase the foreign aid budget while cutting humanitarian food assistance as the President's budget proposes. We would hope that during your deliberations these priorities can be rearranged so that the food aid budget, especially Title II, is adequately maintained, and hopefully increased, in order that this crucial assistance program can remain viable.

Thank you for your attention to this matter.

PREPARED STATEMENT OF GERALD L. VAP, PRESIDENT, NATIONAL ASSOCIATION OF
CONSERVATION DISTRICTS

The National Association of Conservation Districts is a nonprofit, nongovernment organization that represents the nation's 2,950 conservation districts and more than 16,000 men and women who serve on their governing boards. Established under state law, conservation districts are local units of state government charged with carrying out programs for the protection and management of natural resources at the local level. Conservation districts work with nearly two-and-half million cooperating land owners and operators each year and provide assistance in managing and protecting nearly 70 percent of the private land in the contiguous United States.

For nearly sixty years, conservation districts and state conservation agencies have worked in close partnership with U.S. Department of Agriculture agencies to provide technical and financial assistance to help farmers, ranchers and other land managers preserve and protect our land and water resources. This partnership has been carried out primarily with the Natural Resources Conservation Service (NRCS), but also involves other agencies such as the Farm Services Agency and the Extension Service. The partnership bonds NRCS with local conservation districts, state conservation agencies, private land managers and others, and has evolved over the last half century to become an efficient and effective system to deliver conservation assistance to the nation's private land owners and operators.

The "Federal Agriculture Improvement and Reform Act of 1996," better known as the Farm Bill, strengthened USDA's conservation mission by expanding existing conservation programs and creating several new initiatives that significantly broaden the scope of the department's natural resource management responsibilities. Congress intended these programs to be carried out as voluntary, locally driven partnerships between land managers and the local, state and federal agencies that serve them. They represent opportunities to make tremendous progress in addressing the nation's most serious resource problems by helping land owners and operators make

PART 1

1315

sound land management decisions. As in the past, however, adequate funding will be the key to the success of USDA's voluntary, incentive-based conservation and natural resource programs.

Conservation districts and state conservation agencies devote enormous human and financial resources to help meet the nation's conservation needs. State and local contributions to partnership conservation efforts now exceed \$700 million and 7,000 employees each year. In developing funding recommendations for specific agencies and programs, we recognize our own responsibilities to contribute a fair share of resources. Our recommendations on federal funding are based on information from our members, discussions with program managers and estimates based on workloads mandated by federal, state and local program authorities. We believe they represent the minimum levels necessary to address the most basic resource problems under the purview of USDA and its state and local partners.

NATURAL RESOURCES CONSERVATION SERVICE CONSERVATION OPERATIONS

Conservation technical assistance is the cornerstone of most NRCS activities, supporting activities such as the Farm Bill and programs to address state and local program priorities. The highest priority of the conservation partnership remains that of meeting the planning and technical assistance needs of farmers, ranchers and other land managers.

In addition, specific programs, such as the Farm Bill's conservation compliance provision, require that NRCS devote a significant amount of technical assistance to helping farmers and ranchers meet erosion control and other conservation requirements. Other Farm Bill programs such as the new Environmental Quality Incentives Program (EQIP) and the expanded Wetlands Reserve and Conservation Reserve Programs (WRP and CRP) also require considerable technical assistance resources from NRCS.

A number of other federal programs, as well as state and local programs, also utilize NRCS planning and technical assistance to address resource issues such as range and pasture management, mined-land reclamation, and urban and community conservation needs. As a result, the NRCS-state conservation agency-conservation district partnership has been stretched beyond capacity during the past several years. Surveys conducted by NACD to assess staff resources and needs at the local level show that approximately 9,000 additional field staff would be needed to implement local, state and federal conservation initiatives in which conservation districts and their partners are involved.

In fiscal 1997, we have faced a particularly serious shortfall in technical assistance as a result of actions by the Office of Management and Budget (OMB) and the restructured Farm Bill conservation programs. In crafting the fiscal 1997 appropriations bill, Congress reduced the mark for NRCS conservation technical assistance by approximately \$38 million. This action, we believe, was based on the assumption that roughly 19 percent of the \$200 million in Commodity Credit Corporation (CCC) funds for EQIP would be used for NRCS technical assistance. OMB, however, has directed that only 10 percent of EQIP funds can be used for technical assistance. The resulting \$28 million decrease in fiscal 1997 funding for technical assistance equates to 500-600 staff years that are no longer available to assist farmers, ranchers and other land users in carrying out EQIP and addressing other federal, state and local natural resource management priorities.

The 1996 Farm Bill also provided funding for CRP and WRP through the CCC—an action America's conservation districts applaud. However, it placed a cap on the amount of CCC funds that can be used for personnel and other program support activities at the fiscal year 1995 level. Since CRP and WRP were not funded through the CCC at that time, this action effectively precludes NRCS from using any CCC funds for technical assistance to implement the programs.

The combination of the OMB limitation and the CCC cap means that NRCS must shift technical assistance away from almost all other priorities to service these programs. If the situation is not corrected, in order to service these federal priorities, NRCS will have to virtually abandon its commitment to work with its state and local partners. That outcome would be particularly ironic, since the 1996 Farm Bill established in law the concept of local leadership, in concert with state and federal assistance, as the model for the delivery of conservation programs.

To correct these problems, we recommend that the committee provide additional funding to address this shortfall, or adopt language in the appropriations bill to exempt technical assistance for CCC-funded conservation programs from the CCC cap. We also recommend that the committee make clear to the administration its intent to allow adequate use of CCC funds for technical assistance for the Farm Bill programs.

PART 1

1316

The conservation district role in delivering local, state and federal conservation programs has changed considerably in the past two decades. Today, more than 7,000 employees work for the nation's conservation districts. Still, the public's demands grow as expectations for a healthy and sustainable resource base increase. Conservation districts remain the critical link in meeting these expectations.

Under the 1996 Farm Bill's new model for local leadership in the delivery of conservation programs, conservation district responsibilities were greatly expanded. Districts are to provide the lead in setting priorities and bringing communities together in decisions concerning local needs and issues. While districts welcome this new opportunity, we also recognize that it creates new demands and challenges.

To help meet these ever-increasing demands being placed on the conservation partnership, NACD recommends that \$100 million be budgeted through the NRCS Conservation Operations account for direct grants to conservation districts. This action would help NRCS offset some of the costs of carrying out federal conservation programs and enhance conservation districts' ability to address national conservation concerns and priorities at the community level. We fully expect that state and local governments will step in and provide matching funds under grants program.

The capacity of the nation's rangeland to satisfy values and produce commodities is threatened or, in some cases, may have been lost on 233 million acres (60 percent) of U.S. rangeland because of one or more resource problems such as brush, weeds and water or wind erosion. The amount of rangeland in a deteriorating trend increased from 15 to 22 percent in 1992. About 46 percent (58 million acres) of permanent pasture needs treatment to sustain or enhance resource values and production. Noxious weeds, which often are able to rapidly invade and completely dominate even well-managed grazing lands, currently occur on more than 200 million acres of grazing land.

In many cases, technical assistance to help landowners and land managers develop and implement improved grazing management is all that is needed to solve resource problems and improve or maintain grazing land health. Preventing degradation before it occurs is extremely important on grazing lands, because once been damaged, the cost of restoring these lands can exceed its economic value.

Section 386 of the 1996 Farm Bill authorized the Secretary of Agriculture to establish a voluntary program to provide technical, educational, and related assistance to owners and managers of private grazing land. The program, to be carried out through local conservation districts, will help land owners address resource problems that cannot be solved easily by individual efforts without technical and financial assistance. To help meet this need, NACD recommends that the Conservation of Private Grazing Lands Program be funded at \$60 million as a new line-item in the NRCS budget.

In order to meet the expanded technical assistance needs of the Farm Bill programs and to maintain its commitment to the local-state-federal conservation partnership, America's conservation districts recommend a total appropriation of \$900.892 million for NRCS Conservation Operations. Of this amount, \$628.892 million should be approved directly for the conservation technical assistance.

CCC-FUNDED PROGRAMS

The 1996 Farm Bill combined the functions of the four principal USDA conservation cost-share programs: the Agriculture Conservation Program; the Great Plains Conservation Program; the Water Quality Incentives Program; and the Colorado River Basin Salinity Control Program. The new program, the Environmental Quality Incentives Program (EQIP), now constitutes a broad, multi-purpose national conservation cost-share program. NACD believes that the EQIP paradigm of locally led conservation, with leadership by conservation districts, should be adopted as the model for all USDA natural resource conservation programs. We also strongly support fully funding EQIP at \$200 million per year.

The Wetlands Reserve Program (WRP) has been extremely popular and successful in recapturing important wetland acreage previously converted to agricultural use. Conservation districts strongly support WRP as a model "landowner friendly" wetlands conservation program and recommend that it be funded at \$100 million for fiscal year 1998 to enroll 100,000 additional acres in the program. This funding level would allow for a significant expansion of the WRP and move toward meeting Congress's goal of 975,000 acres in the program by 2002.

The Conservation Reserve Program (CRP), originally enacted in the 1985 Farm Bill, has been one of the most successful natural resource conservation programs in the nation's history. The 1996 Farm Bill expanded the program's eligibility criteria to include enrollment of additional environmentally sensitive lands for water quality, wetlands conservation and wildlife habitat benefits. Existing contracts will ex-

PART 1

1317

pire on roughly 24 million CRP acres by the end of fiscal 1997. In order to build upon the environmental investment and benefits from the CRP, NACD strongly recommends that CRP be funded at \$1.926 billion in fiscal 1998 to support full enrollment in the program. We emphatically oppose efforts to re-direct any CRP funds to address nonagricultural resource problems.

OTHER NRCS PROGRAMS

NRCS provides assistance for implementing more than 500 watershed projects that were established under Public Law 566 and other federal programs. Many of the projects, which have created an \$8.5 billion infrastructure, are nearing the end of their evaluated lives. Approximately 5,000 of the floodwater retarding structures are 30 years old and many are in need of repair, rehabilitation, replacement or decommissioning.

Over time, the areas surrounding many structures have changed, populations have grown and flood plains have been developed. In some cases, structural components and vegetated measures have deteriorated, creating potential hazards to communities and affecting quality of life and community economic stability. By the turn of the century, 2,000 existing structures will require significant work at a cost of up to \$750 million. The magnitude of the problems will increase as the infrastructure ages.

In order to meet the federal government's commitments, project sponsors in the 500 active watersheds need design and construction assistance to implement project plans. Watershed sponsors also need technical assistance for rehabilitation, upgrading to current standards or decommissioning of aging structures. In order to address these needs, NACD recommends funding for NRCS Watershed & Flood Prevention Operations be increased to \$350 million in fiscal 1998.

NACD also supports proposals for fiscal year 1997 supplemental appropriations for an additional \$161 million for NRCS's Emergency Watershed Program and \$77 million for FSA's Emergency Conservation Program address recent flooding and storm damage.

Through the Resource Conservation and Development Program (RC&D), NRCS provides needed assistance to rural communities. Resource management and rural development initiatives undertaken by local RC&D's help revitalize economically disadvantaged rural areas. For fiscal year 1998, NACD recommends an appropriation of \$48 million to fund outstanding applications for new RC&D areas. Further, America's conservation districts believe that any new funding should be directed toward expansion of the current RC&D program to meet locally identified needs. We do not, however, support the administration's proposal to use this funding to hire watershed and rangeland coordinators through RC&D's. Although funds to support watershed initiatives are critically needed, they should be provided through NRCS's existing watershed program, not the RC&D program.

Additional line-item recommendations for NRCS program funding are contained in the attached chart.

EXTENSION PROGRAMS

Several Extension Programs represent critical components are significant in USDA's natural resource management delivery system. For example, activities under the Renewable Resources Extension Act provide educational assistance to help private landowners manage their lands to meet commodity demands and needs while, at the same time, providing for the many public values associated with the forests and rangelands of our nation. Although the actual funding need for this program is roughly \$15 million, NACD recommends that at least \$4.0 million be appropriated in fiscal 1998.

OTHER

Research remains one of the key to the continued vitality of agriculture and effective management of the nation's resource base. U.S. competitiveness in world markets is contingent an aggressive research and development program for agricultural conservation and production techniques. We also recognize that conservation, environmental quality and production research needs vary across the United States. America's conservation districts support maintaining strong research programs in NRCS, the Agricultural Research Service, the Cooperative State Research, Education and Extension Service and other agencies as needed.

In addition to those outlined above, recommendations for other USDA natural resource and conservation-related programs can be found in the attached chart. Footnotes are provided to explain the need for many of these recommendations.

PART 1

1318

We appreciate the opportunity to share our recommendations with the subcommittee.

FISCAL YEAR 1998 FEDERAL FUNDING RECOMMENDATIONS FOR CONSERVATION PROGRAMS ADMINISTERED BY USDA'S NATURAL RESOURCES CONSERVATION SERVICE

[In millions of dollars]

	Fiscal years—				
	1996 final	1997 NACD	1997 estimated	1998 admin.	1998 NACD

1319

FISCAL YEAR 1998 FEDERAL FUNDING RECOMMENDATIONS FOR CONSERVATION PROGRAMS
ADMINISTERED BY USDA'S NATURAL RESOURCES CONSERVATION SERVICE—Continued

[In millions of dollars]

	Fiscal years—				
	1996 final	1997 NACD	1997 estimated	1998 admin.	1998 NACD
Renewable Resources Extension Act	3.00	6.00	3.192	4.000

¹ *Conservation Technical Assistance.*—Adequate funding for NRCS Conservation Technical Assistance is NACD's highest priority. NACD is requesting \$280 million in new money for fiscal year 1998, to be allocated as follows: \$100 million for basic technical assistance (detailed justification included on p. 3); \$100 million for grants to conservation districts (detailed justification included on p. 4); \$60 million for grazing lands conservation (detailed justification included on p. 6); and \$20 million for NRCS urban and community assistance activities

Note.—The funding resolution as adopted by the Council did not provide separate line-items for "Grants to Conservation Districts," "Grazing Lands Conservation" and "Urban & Community Assistance." These have been added to the "Conservation Operations" account based on other Council action. Although the "Conservation Technical Assistance" line-item has been reduced by \$180 million to account for these additional line-items, the "Conservation Operations Total" remains the same.

² *Watershed Surveys and Planning.*—Line item includes both Watershed Planning and River Basin Surveys and Investigations.

³ *Watershed and Flood Prevention Operations.*—Detailed justification for NACD's recommended increase of \$250 million is included on p. 5.

⁴ *Resource Conservation and Development.*—The NACD proposal for increased funding is premised on fulfilling the outstanding applications for new RC&D areas. NACD believes that the new funding should be directed towards expansion of the current RC&D program to meet locally identified needs.

⁵ *CSREES Special Research Grants.*—As authorized under Public Law 89-106, grant funding is earmarked for approximately 140 priority research and education programs in various states and regions. Of the total appropriation, NACD recommends that \$1.5 million be earmarked for the STEEP program for developing and testing practices to stem erosion in critical areas of the Palouse Region and the Pacific Northwest.

All USDA programs should utilize the existing delivery mechanisms, and our partnership, to implement conservation-related policies and/or programs. In particular, conservation districts should always be recommended for use as they were designed to be.

PREPARED STATEMENT OF KENNETH HOOD, PRESIDENT, NATIONAL ASSOCIATION OF
FARMER ELECTED COMMITTEEMEN

As the Appropriations Subcommittee considers funding for the United States Department of Agriculture, and specifically for fiscal year 1998 appropriations for the Farm Service Agency in the coming weeks, I respectfully submit this statement of concerns on behalf of our members.

In order to carry out programs mandated in the 1996 Farm Bill, additional downsizing in the Farm Service Agency delivery system will result in delays and reduced services to producers.

Therefore, the National Association of Farmer Elected Committeemen (NAFEC) urges Congress to provide adequate funding for fiscal year 1998 Salaries and Expenses for the County Office Committee (COC) system in the Farm Service Agency (FSA). Congress must provide the necessary funding to prevent FSA county office closings and county employee cut-backs and instead take the USDA program delivery system into the 21st century.

In addition, the Farm Service Agency already provides services to other organizations for which the agency bears the financial burden. Any funding decisions should look to the future of USDA and recognize the possibility of providing new services in USDA service centers.

We urge Congress to preserve current Farm Service Agency operations and prevent disruption in agency systems and operations.

Changes in farm programs will require the continued servicing of production contracts and a substantial workload for local FSA offices well beyond fiscal year 1998. For example, each time a new lease is entered into on land subject to the contract, FSA county offices must update the production contract.

Congress should provide the necessary funding for continued servicing of farm programs.

Congress should provide sufficient funding to retain the current FSA credit program. This is especially important because FSA delivers disaster loans through its credit function to help producers when natural disasters occur.

PART 1

1320

In fiscal year 1996, loan processing activity was up substantially from fiscal year 1995 levels. Direct operating loan obligations increased 29 percent over fiscal year 1995 levels. Direct farm ownership loan obligations increased by 57 percent. Emergency loan obligations increased by 156 percent. The total number of loans processed by FSA offices increased between fiscal year 1995 and fiscal year 1996.

At the same time delinquencies in the loan portfolio have been reduced from 26 percent two years ago to 20.65 percent today and the numbers are improving. Less money is delinquent from a year ago. And more borrowers are ahead on repayment schedules. The current process has been successful.

USDA has the opportunity make use of some of the advantages of local servicing for its loan portfolio. Centralization limits customer service that is the hallmark of the field-based office structure and has costs.

Adequate funding is required to ensure the success of the Conservation Reserve Program. FSA is currently taking applications for the new CRP program contained in the 1996 Farm Bill. ASCS, and now FSA, has successfully delivered CRP for the past 11 years. It is one of the most successful conservation programs ever enacted by Congress.

FSA will also be a partner with the Natural Resource Conservation Service (NRCS) in the delivery of the Environmental Quality Incentives Program (EQIP). FSA's delivery system and administrative expertise will make EQIP successful as well.

Appropriations decisions should reflect that county FSA offices provide related services in the delivery of private crop insurance. FSA already has a proven record to deliver federal crop insurance for less cost than the Risk Management Agency. In order to provide one-stop service FSA should provide catastrophic policies to all producers. In addition, FSA can provide to all producers certain services—proving yields, lost adjustment—to assist the Risk Management Agency.

County offices have the ability and expertise to administer emergency livestock assistance and related disaster programs. Maintaining the delivery system will keep in place the ability to respond to natural disasters.

County Office Committees should retain their authority to hire County Executive Directors to provide direct accountability to taxpayers.

There currently is a direct line of authority from the Secretary to the State Executive Director, District Director, County Office Committees and County Executive Directors that assures direct accountability of activities and actions within county offices.

NAFEC believes the farmer-elected County Office Committee system can be improved and expanded to increase voting participation by under-represented farmers.

Additional funding should be made available for direct loans targeted to socially disadvantaged farmers.

There is an important role that farmer-elected County Office Committees play in the delivery of programs, providing grassroots control over program delivery at the local level and is consistent with the Vice President's National Performance Review.

Even with increased responsibilities for county office employees in farm, credit, insurance and conservation programs, the job is getting done. Shifting programs because of budget pressures to agencies and mission areas that lack experience with constituencies and delivery mechanisms may not be the answer.

Moves in program delivery responsibilities to agencies and organizations that are not accountable to the customer could be costly. The present county office system efficiently serves constituencies that have objectives and missions that are close to production agriculture.

FSA is the only USDA agency with a production agriculture focus, a historic expertise in working with a production agriculture constituency, and the only agency whose primary mission includes advocacy for farmers and ranchers.

The County Office Committee system is the only grassroots system of review and appeal. County office employees, utilizing local resources, provide real world solutions to constituent problems that often can be solved at the local level.

This foundation of experience, practicality and wisdom can be used to expand services offered by county offices.

County offices currently administer USDA functions related to production, conservation, risk management, credit and other activities. This flexible concept of multi-service delivery by local FSA county offices was the hallmark of the bipartisan Reorganization Act of 1994. We urge Congress to improve upon the service center delivery system it envisioned in 1994.

We should look at the potential for adding new services in delivery centers—servicing smart cards in federal nutrition programs, providing the leg and paper work for the agricultural census, assisting with federal emergency management applications, conducting collateral checks in credit, record-monitoring and loss adjustment

PART 1

1321

assessments in risk management—to move the system closer to one-stop shopping that customers prefer.

FSA can be the hub of the wheel to truly have a USDA service center structure to serve all of rural America. For these reasons, we urge Congress to provide the appropriate funding for fiscal year 1998 Salaries and Expenses for the County Office Committee (COC) system in the Farm Service Agency (FSA) to get the job done.

On behalf of the dedicated people who serve on elected county and area committees, I respectfully request that this letter be included in the official record of hearings on this subject.

PREPARED STATEMENT OF ROBERT D. BROWN, PRESIDENT, WILDLIFE AND FISHERIES SCIENCES DEPARTMENT, TEXAS A&M UNIVERSITY

The National Association of University Fisheries and Wildlife Programs (NAUFWP) submits this statement on the proposed fiscal year 1998 budget for the Cooperative State Research, Education and Extension Service (CSREES), U.S. Department of Agriculture.

Members of NAUFWP include 55 Universities. We seek to enhance public understanding of the needs for improving natural resource management and to advance the science and practice of sustainable uses and management of the resource base. Our efforts focus on cooperative work with partners and customers to advance research, education and extension to benefit people and communities throughout the country.

Results from the Roper Starch fifth annual survey of adult Americans, prepared for the National Environmental Education and Training Foundation and released in December 1996, illustrate pressing needs for CSREES's research, education and extension programs. Key findings of adult views on natural resources provide an overall context in which to consider the specific figures in the President's proposed fiscal year 1998 budget. Adult Americans believe:

- Environmental resources should be conserved in ways that balance economic growth while protecting the environment and human health;
- Natural resources can be managed in ways that protect wildlife and ecosystems while humans benefit from their planned use;
- Federal government spending should be shifted to environmental programs from other areas; and
- Concerns for the environment and management of natural resources can be responded to by expanding education programs designed to raise current low levels of knowledge about the environment, such as to maintain and improve water quality.

Within this context of public views and needs for research, education and extension, the NAUFWP supports continuing and strengthening CSREES programs. The NAUFWP requests and urges that some adjustments be incorporated in the proposed fiscal year 1998 budget to be more responsive to needs of the public and resource managers. Specifically, it recommends that funds for four items in the proposed budget be increased.

- \$9.5 million be provided for the Renewable Resources Extension Act (RREA).

This important program should be strengthened, not eliminated as proposed in the President's draft budget. It should be continued to improve the management and production of natural resources, to enhance the economic viability of natural resource enterprises, and to maintain and restore natural resources on a sustainable basis. The fact that cooperators provide about \$4 for each \$1 of federal funds demonstrates the broad acceptance of this essential program in meeting pressing public and management needs. By providing information and motivating individuals, extension personnel can assist those whose actions affect the resource base. Advances can be registered in improving management of natural resources, as the poll findings cited above clearly show citizens want. Continuing the RREA on a reasonable level will help ensure the flow of essential information to private landowners for building more effective programs.

- \$10,773,000 be provided for water quality extension activities, not a decrease, as carried in the President's proposed fiscal year 1998 budget. Broad public concern over water quality issues and the need to improve management to restore and maintain water quality justify increased funding for this extension activity.
- \$500,000 be provided for Rangeland Research Grants, not zero as proposed in the President's fiscal year 1998 budget. The practical and applied problems addressed through this grant program need attention and definitely should be continued. More than half of the U.S. land area is rangeland. Elimination of the only national competitive grant program for rangelands has very serious impli-

PART 1

1322

cations for watersheds, wildlife, fish and other natural resources, as well as the agricultural interests and economy. A recent study shows that modest funds for rangeland research supported some of the most important studies on rangelands conducted in the past decade. Wildlife issues on rangelands will involve some of the more important problems in the next decade and require prompt study to provide practical solutions.

—\$283,260,000 be provided for the Smith-Lever Formula extension program. These block-grant type funds for land grant universities permit educational outreach to help meet local and state needs. Not less than 35 percent of this increase over fiscal year 1997 should be applied to Extension's Environmental Stewardship Education Programs, which are very relevant to the Nation's natural resource management challenges and needs. These funds will enable the programs to develop the critical mass of expertise at state and local levels to address important existing and emerging natural resource and environmental issues directly affecting rural and urban communities nationwide.

With the above four adjustments to provide more reasonable levels of funds to help meet pressing needs of citizens and resource managers, the NAUFWP is pleased to see increases carried in the proposed budget for:

—The national research initiative competitive grants program; and
—Pest management. Assuming the \$4,217,000 increase carried in the President's fiscal year 1998 budget is approved, the NAUFWP recommends that not less than 25 percent of the total appropriation for pest management be dedicated to educational programs to address wildlife damage management and noxious weed problems on rangelands. Needs are increasing for managing certain plants and animals that become pests in given situations.

The NAUFWP recognizes that programs of the CSREES and its Land Grant partners stimulate relevant, positive changes in acceptance and implementations of new technologies and management approaches by private landowners, resource managers, community decision makers and others in the public sector. Significant benefits accrue to individuals, communities, states and the nation through building and sustaining a more viable and productive natural resource base, and competitive and profitable agriculture and other activities. Demands for CSREES are heavy and expected to increase as citizens seek information to help resolve their environmental concerns and improve management of the resource base. For example, enrollment in extension 4-H youth natural resource programs and projects continue strong, with more than 1,350,000 young people now enrolled from both urban and rural communities across the country.

With deep concerns of adults over resource management and pressing needs to strengthen research, education and extension programs, the NAUFWP recommends the adjustments described above for the proposed fiscal year 1998 budget. Incorporating those adjustments yields the following figures.

—\$402,342,000 for research activities, including: \$221,741,000 for base programs (Hatch Act, McIntire-Stennis, Evans-Allen and Animal Health and Disease (Section 1433)); \$34,789,000 for special research grants; \$130,000,000 for National Research Initiative competitive grants; and \$15,812,000 for additional important research, including rangeland research and sustainable agriculture.

—\$20,500,000 for higher education, including fellowships, and challenge and partnership grants.

—\$443,750,000 for extension activities, including \$283,260,000 for Smith-Lever formula funds.

These funding levels would help respond to current public needs and legal responsibilities, and assist in carrying out programs more effectively. The NAUFWP requests that the Appropriations Committee approve these adjusted figures.

PREPARED STATEMENT OF JOHN M. WHITE, CHAIRMAN, 1998 ACADEMIC PROGRAMS SECTION, BUDGET COMMITTEE, BOARD ON AGRICULTURE, NATIONAL ASSOCIATION OF STATE UNIVERSITIES AND LAND-GRANT COLLEGES

Mr. Chairman, members and staff of the Subcommittee, I appreciate the opportunity to address the important issue of science education in the United States and the 1998 budget for the USDA. Few issues are of more importance to the well being of our country and the future of our food and agriculture system.

Over the last five years, three White House reports and three presidential administrations have called for more emphasis by federal agencies on undergraduate education and K through twelve science education. The most recent call was made by President Clinton in his State of the Union message February 4, 1997.

PART 1

1323

Federal agency involvement with higher education is especially critical to American agriculture. The great size of the American food and agricultural system and its very favorable competitive position in the world economy is due in large measure to our ability to substitute scientific knowledge for natural resources and labor. Theodore Schultz, using agriculture as his model, won the Nobel Prize in economics for demonstrating that the return on human capital was much higher than the return on physical capital.

This year the Board on Agriculture Budget Committee of the National Association of State Universities and Land-Grant Colleges carefully constructed a list of priorities for funding of USDA programs in research, education, and extension. Pre-eminent in this list was the Higher Education Challenge Grants Program administered by the Science and Education Resources Development unit of the Cooperative State Research, Education, and Extension Service.

- This program is a matching program, generating dollar-for-dollar non-federal funds, thereby doubling the federal investment.
- It is a highly competitive program, assuring only the most appropriate, highest quality projects will receive funding.
- It supports innovative and model projects that can and are transferred to other campuses throughout the system.
- It promotes partnerships among universities and colleges as well as with private industry.
- It promotes faculty development in order to be better able to serve student educational needs in the biological and social science area.
- The program allows us to enrich curricula to meet needs of potential scientists, technicians, and the future informed non-science citizens.

A multitude of outstanding examples of successful Challenge Grants can be cited, however noting but two illustrates the innovative nature and important role these grants play in our agriculture and natural resource system.

- New Mexico State University.—Enhancing Faculty Capacity to Internationalize Professional Agriculture Curricula
- Mississippi State University.—A World Wide Web Hypermedia Textbook for Improving Instruction in Agriculture

Present funding for this Higher Education Challenge Grants Program is \$4.35 million. The Academic Programs Section and the Board on Agriculture Budget Committee of NASULGC recommend funding for 1997 of \$5.350 million. This modest increase will allow the agency to award larger grants, which will encourage cooperative grant proposals from participating schools. Presently the percentage of submitted proposals funded is only 19 percent.

The Challenge Grants Program is the cornerstone of the higher education effort of the USDA. This program complements and enhances the successful efforts of the 1890 Capacity Building Program and the new programs for the 1994 land-grant institutions.

The very successful Institution Capacity Building Grants Program for 1890 Institutions strengthens the linkages among historically minority institutions and other colleges and universities, the U.S. Department of Agriculture, and private industry. This program is presently funded at \$9.2 million. The Academic Programs Section and the Board on Agriculture Budget Committee recommended 1997 funding at \$10 million. Building and enhancing the capacity of the 1890 institutions to educate undergraduates in agriculture and natural resources provides a sound base from which these institutions can enrich their programs through the Higher Education Challenge Grants Program.

Similarly, the 1994 land-grant institutions are building and enlarging their capacity to educate Native American students in agriculture and natural resources, primarily through the 1994 Education Equity Grants Program and the interest from the Native American endowment fund. In addition, the 1994 land-grant institutions have authorization for a \$1.7 million Capacity Building Grants Program to further develop their educational capacity and encourage cooperation with 1862 and 1890 institutions. These programs, aimed at substantially improving educational efforts of the 1994 institutions many, of which are only 20 years old and all with a scarce resource base, complement perfectly the Higher Education Challenge Grants Program. The Higher Education Challenge Grants build upon the educational foundation provided by the 1994 Education Equity Program, endowment, and Capacity Building Programs. The Academic Programs Section and the Board on Agriculture 1997 Budget Committee recommend full funding for all of these necessary programs.

Another cornerstone of this educational effort is the Multicultural Scholars Program. This program allows institutions to encourage a variety of educationally outstanding minority students to enter the field of agriculture and natural resources. Again, it further extends the cooperation between 1862, 1890, and 1994 land-grant

PART 1

1324

institutions. Presently the program is funded at \$1 million with funds carried over to allow for a \$2 million program every other year. We recommend funding for this important program at \$2 million for 1997.

The Graduate Training Fellowships is the only federal program targeted specifically to the recruitment and education of pre-doctoral students for critical food and agricultural science positions in areas identified as having a shortage of expertise. The Academic Programs Section and the Board on Agriculture Budget Committee recommend funding at \$4 million.

The above-mentioned programs have been extensively reviewed by the USDA-land-grant partnership members and have received a high priority ranking by both the Academic Programs Section and the Board on Agriculture of the National Association of State Universities and Land-Grant Colleges.

We appreciate the opportunity to submit this testimony and encourage your positive response to these prioritized requests.

PREPARED STATEMENT OF DR. DARYL B. LUND, CHAIR, FISCAL YEAR 1998 COMMITTEE, BOARD ON AGRICULTURE, NATIONAL ASSOCIATION OF STATE UNIVERSITIES AND LAND-GRANT COLLEGES, AND DEAN, COLLEGE OF AGRICULTURE AND LIFE SCIENCES AT CORNELL UNIVERSITY

INTRODUCTION

Mr. Chairman and members of the Subcommittee. I am Daryl Lund, Dean of the College of Agriculture and Life Sciences at Cornell University. I also serve as chair of the fiscal year 1998 Budget Committee of the NASULGC Board on Agriculture. My colleagues and I are grateful for the support the land-grant university system has received from this Subcommittee in the past. I appreciate the opportunity to come before you to speak on behalf of the land-grant system for continued federal investment in the teaching, research, and extension programs at our institutions. Before I present our priorities and budget recommendations for fiscal year 1998, I would like to comment briefly on the unique land-grant partnership that works with and for people, families and communities, for production agriculture and food systems, for the food and fiber precious to our health and our economy and for the environment and natural resources for which we are stewards.

FROM VISION TO REALITY—THE LAND-GRANT SYSTEM: DURABLE, RESPONSIVE AND ACCOUNTABLE

A bold new federal and state partnership was begun on July 2, 1862, when President Abraham Lincoln signed visionary legislation to provide grants of land to states for the endowment, support and maintenance of colleges of agriculture and mechanical arts

This far-reaching step was followed in 1887 by the Hatch Act which created the State Agricultural Experiment Station system and in 1914 by the Smith-Lever Act which set up the State Cooperative Extension Service. Thus, the federal/state/local industry partnership that we now know as the land-grant system was established to provide all Americans access to teaching, research and extension. The system depends, for its effectiveness, on the unique partnership of the federal government with state and local governments and the private sector. The system was enhanced in 1890 when Congress passed legislation to endow seventeen predominately black colleges and, more recently, in 1994 when Congress added twenty-nine Native American colleges to the land-grant family.

That unique partnership created by those nineteenth-century visionaries has demonstrated its lasting value and promises continued effectiveness far into the next century. A key benefit of this democratic participatory concept has to do with accountability. A variety of concerned participants ensures that projects meet clientele needs in accordance with mutually formulated work plans and projected outcomes. The land-grant systems superb accountability has earned it the public's trust.

THE ULTIMATE BENEFICIARY OF OUR SUCCESS IS EVERY AMERICAN CITIZEN

Thanks in part to America's public investment in the federal/state partnership programs of education, research and extension, agriculture is one of this nation's greatest success stories; the return on that public investment and the resulting benefits to the American consumer have been remarkable.

Every year, U.S. consumers save approximately \$200 billion because they pay 2.3 times less for food and fiber than they would have if technology had halted at 1950 levels. The U.S. food supply is the safest and most affordable on the planet. There is a measured rate of return in the overall investment in research, education and

PART 1

1325

extension of between 30 and 50 percent, depending on location and commodity. The social changes accrued by the American public are no less important. The Cooperative Extension nutrition education program has assisted thousands of low income families improve their diet and health, thereby saving millions of dollars in health care.

4-H is the largest youth-serving, non-formal educational program in the nation, reaching 5.5 million young people across the nation—rural, small town, suburban and urban settings—and across all racial ethnic and economic groups.

Technology, along with improved farming practices, has also reduced soil erosion by a factor of six over erosion rates of the 1930's. And, a too-often forgotten fact is the extent to which the American food and agriculture sector contributes to the nations wealth. Agricultural technology has reduced by 393 million acres the prime farmland required to meet the nations needs for food production. Output has doubled since 1950 to over one trillion dollars, which represent 16 percent of the national economy and the industry accounts for 11 percent of the total value added segment of the U.S. economy. The industry accounts for over 23 million jobs or almost 20 percent of the total work force.

Agriculture and society always have been inseparable. In fact, agriculture is a key foundation for society. And the centrality of agriculture is no different today—but it includes food, fiber, natural resources, and environmental stewardship.

All Americans have a strong expectation to eat every day, three times a day. Fortunately, American agriculture provides the safest, most abundant, most affordable food and fiber supply the world has ever known. In addition to providing our critical food supply every day for everybody, American agriculture acts as environmental steward to 400 million acres of farmland, 500 million acres of forest land and 390 million acres of rangeland. American agriculture is literally us, our land, our food and fiber, our environment, our people. Eleven percent of our wages, salaries, proprietor income, rents and profit is contributed by food and agricultural enterprises. Almost 20 percent of American workers earn a paycheck in agricultural and food enterprises. Meanwhile, as Americans we spend 11 percent of our disposable income on food, far less than Canadian, French, Australian and Japanese consumers. Improved international trade conditions in the 1990's have resulted in increased exports, resulting in a \$60 billion positive balance of trade in agriculture. Agricultural exports in 1994 were responsible for about 790,000 jobs in the United States, including 260,000 in rural areas.

Better nutrition is the result of better nutrition education. Because of our efforts in agricultural research and education, Americans understand more about nutrition and are healthier for it. Increasingly sophisticated computers coupled with highly trained agriculturalists will provide American agriculture with access to information on global weather, marketing and changes in consumer tastes and dietary habits, resulting in increasing efficiency, high-quality products and lower consumer costs. Precision farming will become routine. Sophisticated machinery for variable rate application of nutrients, yield monitors to track crop yields and sophisticated field mapping using satellite technology will further enhance our environmental stewardship.

Just around the corner are more biopesticides, industrial-use crops, a multitude of new and improved food products—and as you have heard recently, genetic cloning of animals, all of which will address the tripartite necessity for convenience, cost and healthfulness. Increasingly, the future of America's agriculture will depend on a high-quality research and education system.

THE PARTNERSHIP AND U.S. AGRICULTURE IN THE GLOBAL MARKETPLACE

Through its positive trade balance, the U.S. agricultural sector significantly helps to offset the large U.S. non-agricultural trade deficit. In addition, agricultural exports stimulate further income and growth in the domestic economy outside the agricultural sector.

However, the competitive position that the U.S. now holds in international markets is a concern. Growth of the U.S. agricultural sector has fallen behind that of other nations. The dominance the U.S. once enjoyed as an abundant supplier of low-cost commodities may no longer hold true. Other countries have begun to catch up and in some cases surpass U.S. agricultural productivity growth in certain areas and the result is a weaker competitive position. In fact, the global share of U.S. agricultural exports has slipped in the past ten years.

As we approach full implementation of international free trade agreements such as GATT and NAFTA, continued growth in the U.S. agricultural sector is vital to maintaining a strong competitive position in the global marketplace. Without expanded research and development efforts, the U.S. may continue to sacrifice its posi-

PART 1

1326

tion in global markets and profitability in the total agriculture sector. The U.S. should not allow this to happen.

If the agricultural sector of the economy is not competitive in the global market, we will lose our ability to provide the most inexpensive and safe food supply the world has ever known. We will be subject to food and fiber from countries with their standards, not ours. We will lose diversity, food safety will always be at risk and costs will rapidly escalate. We will be vulnerable to shortages, and our lifestyle will change as a proportionately larger amount of our disposable income would be directed to food, clothing and other consumables attributable to agriculture.

The responsive, adaptable and efficient integrated partnerships which have served domestic agriculture so well for decades must now be expanded and enhanced in order to assist U.S. agriculture in sustaining its international competitiveness and to ensure significant future gains.

FISCAL YEAR 1998 BUDGET PRIORITIES

Funding for research extension and education programs

The fiscal year 1998 budget priorities were identified through a process of nationwide consultation with the land-grant community, farmers and agribusiness persons, consumers, industry, individuals and families, as well as local community leaders.

There are two crosscutting priorities that define the NASULGC fiscal year 1998 budget recommendations:

- Strengthen base funds in agricultural research, extension and higher education programs
- Targeted funds which advance special initiatives in support of the food, agriculture and environmental system

BASE FUNDS: THE HEART OF THE SYSTEM

Base funds for research are appropriated under Hatch McIntire-Stennis, Evans-Allen, and Animal Health legislation; Extension base funds are appropriated under Smith-Lever 3b and 3c, D.C., and 1890 Colleges and Tuskegee Extension Acts.

Base funds create a unique partnership between the United States Department of Agriculture (USDA), the state land-grant universities and county governments, which has ensured a profitable and successful food and agriculture industry.

BASE FUNDS

Provide the infrastructure for long-term research and extension programs.

Rapidly and effectively address problems that arise for producers and customers.

Facilitate the network or national system of different institutions working together on broader needs, challenges and concerns of all citizens.

Leverage greater outside support for programs (approximately \$4 for every base \$1).

Base funds represent the federal portion of the ongoing state/federal partnership that helps provide stable and ongoing mission-oriented research and education programs to support the agricultural sector of each state. These resources represent a long-term commitment to U.S. agricultural research and technology transfer and are absolutely essential for leveraging external resources for enhanced agricultural systems. Base funds provide a balanced portfolio to assure that long-term research and extension programs remain viable. Base funds make it possible to develop and support working teams over time while competitive grants typically last only for two or three years. It is not efficient nor is it reasonable to mount long-term projects solely on the basis of short-term competitive grant funding mechanisms.

Base funds assure that resources are available to address specific and unpredicted problems, many of which are applied science issues that need to be addressed but would not likely be funded through a competitive grant process. While competitive grant programs tend to focus on new discoveries, base funding transfers these discoveries to agricultural products and applications. Erosion of base funds over the past two decades has impaired the ability of the system to meet critical state and national research and extension needs. Major redirection of these funds to focus on contemporary issues already has occurred at most land-grant universities. Many universities have been forced to reduce their faculty and Extension staff at a time when the needs for science-based research and Extension programs have escalated dramatically. Reversal of this erosion in base funding is essential to maintain the basic infrastructure for research and extension.

PART 1

1327

An increase of 5.5 percent in base funds for research extension, and education is needed to rebuild capacity after nearly a 20 percent decline in real funding levels since 1980.

TARGETED FUNDS

Targeted funds address specific issue areas such as food safety, water quality, youth and families at risk or other specific problems like the outbreak of new wheat diseases which could significantly affect food production and farm gate as well as consumer prices. Even during times of fiscal restraint, public investments are needed to assure the continuation of a dynamic food, agriculture and environmental system of research, extension and instruction which anticipates information needs on a global scale while maintaining a sound base from which to respond.

Assessing need and changing focus require special research and extension initiatives such as the National Research Initiative and programs on water quality, youth-at-risk, food safety and sustainable agriculture. Base funding sustains the infrastructure of information, expertise and facilities from which new initiatives emanate, but each requires funding to advance a competitive U.S. agriculture, food and environmental system.

We recognize the serious budget restrictions faced by the Congress this year and we have tried to be reasonable in our request. We do feel, however, that several high-priority areas deserve special attention because of their impact on contemporary societal concerns and U.S. competitiveness in global agriculture. The high-priority areas include:

- Integrated Pest Management
- Institution Challenge Grants
- 1890 Capacity Building
- Children, Youth and Families at Risk
- Sustainable Agriculture
- Water Quality
- Food Safety and Health
- Managing Change
- Native American Education in Agriculture and Natural Resources

The NASULGC Board on Agriculture strongly supports the education programs at all of our schools including the 1862, 1890, and 1994 institutions which are enriched and improved through the higher education and challenge capacity building grants programs of the Cooperative State Research, Education, and Extension Service (CSREES).

The land-grant community urges full funding for the authorized amount of \$100 million for the Fund for Rural America and retain the original intent of the legislation for the use of these funds. We are encouraging this because of the transition occurring in agriculture due to the changes in the national farm policy enacted by Congress.

CONCLUSION

Mr. Chairman, distinguished citizens representing all phases of the land-grant system have worked diligently to prepare what we feel are reasonable yet effective budget recommendations for fiscal year 1998. These recommendations address critical national priorities and they provide solutions to important problems in agricultural production, environmental and natural resource stewardship, rural social and economic welfare, and the global competitiveness of U.S. agriculture.

Mr. Chairman, I appreciate the opportunity to present this budget and its rationale on behalf of the Board on Agriculture of NASULGC. On behalf of all the land-grant universities in the United States, I respectfully request that you accept for the record our Science and Education budget recommendations for fiscal year 1998, which are attached to my statement. Thank you.

PREPARED STATEMENT OF DR. THOMAS L. PAYNE, DIRECTOR, AGRICULTURAL
RESEARCH AND DEVELOPMENT CENTER, OHIO STATE UNIVERSITY

The State Agricultural Experiment Station System, representing fifty-nine State and Territorial Experiment Stations, sixty-three Schools and Colleges of Forestry, seventeen 1890 Land-Grant Institutions and Tuskegee University, twenty-seven Colleges of Veterinary Medicine and forty-two Schools and Colleges of Home Economics, is appreciative of the opportunity to present this testimony for the fiscal year 1998 Budget Committee of the Board on Agriculture of the National Association of State Universities and Land-Grant Colleges.

The fiscal year 1998 budget request for research was developed with great sensitivity to the fiscal constraints being felt at the national level while, at the same time, focusing on the responsibilities of the state partners to assist and support the food and fiber systems of the nation. These systems face challenges unparalleled in our nation's history. The realities of NAFTA and GATT coupled with proposed changes in farm programs are creating an environment of revolutionary, not evolutionary, change in American agriculture. The products of research, including new and innovative technologies, are needed more than ever before. These research products must reduce economic and environmental risks, improve competitiveness in the international marketplace, develop ways to add value to raw agricultural products, maintain and enhance a safe and nutritious food supply, and increase that food supply to meet the demands of our ever-increasing human population around the world.

PART 1

1332

We have limited our request for increases in funding to a few critical areas, held many program requests at the fiscal year 1997 funding levels and reduced or even eliminated some programs which, while important, may be addressed in other ways.

The fiscal year 1998 request for research represents an overall increase of 6.1 percent above fiscal year 1997 funding levels with the following critical areas targeted for increases:

- Base Programs
- The National Research Initiative
- Managing Change
- Food Safety
- Pest Management Control Strategies (IPM) with a focus on:
 - Pest Management Alternatives and Critical Issues
 - IPM/Biocontrol
 - Pesticide Clearance
- Soil Quality Initiative
- Water Quality Initiative

Our budget request includes a 5.5 percent increase in base programs. Base programs form the foundation on which all of our research efforts are built. This priority has broad-based support from the customers of the system and the research conducted under these programs undergoes review by scientists and administrators. And very importantly, the research priorities are determined based on input from customers at the local, state and national level.

The National Research Initiative continues to be a high priority as we ask for your support in reaching the authorization level of funding. In recognition of fiscal restraints, our request this year is the same as requested in fiscal year 1997. This is in order to reinforce the critical nature of this research.

We request increases in the Pest Management Control Strategies categories to support the USDA IPM initiative that has as its goal farmer implemented IPM methods on 75 percent of total crop acreage by the year 2000. These programs identify the Land Grant university system, both research and extension, as major entities in the development and implementation of this program. IPM places emphasis at the regional and local levels with major involvement of producers and private industry to set the priorities for research and technology transfer.

We request support for a new research initiative on soil Quality at a level of \$3.0 million. This initiative is proposed in support of efforts toward whole farm and ecosystem level planning. Understanding of the role of soil in forest, range, and pasture, crop and wetland ecosystems is critical in the development of management plans on these lands. Currently, resources are not available to conduct the needed research.

This budget was developed with our USDA partners and reflects recommendations of a system-wide joint planning effort. The research planning process, leading to the development of the research budget, involved more than 200 "Customer Input Groups" including commodity and farm organizations, professional and scientific societies, institutes, foundations and councils (both public and private), and policy makers. Research partners included USDA/Cooperative State Research, Extension, and Education Service, USDA/Agricultural Research Service, and Schools and Colleges of Veterinary Medicine, Forestry, and Home Economics.

The Federal/State partnership through the combination of research programs in this budget proposal, when coupled with state and non-federal support, continues to provide the flexibility to address a wide array of issues and has resulted in the high rate of return on public investment in agricultural research ranging from 30 to 65 percent. These data are based on independent studies of return on investment in agricultural research and development. Research programs of the Agricultural Experiment Station System perform approximately 68 percent of all public funded agricultural research in support of the \$600 billion agricultural industry. The federal investment represented in this budget is leveraged by approximately \$1.5 billion in state and non-federal funds.

Thank you for the opportunity to provide this testimony on behalf of the Board on Agriculture of the National Association of State Universities and Land-Grant Colleges. The 108-year partnership of state and federal research, along with the support of Congress, will continue to meet the challenges of the future and create opportunities for agriculture. I strongly encourage you to consider and adopt this budget recommendation. Your continued support is appreciated and we are committed to continue playing a major role in sustaining a strong agriculture for the benefit of all citizens of this country and people of the world.

PART 1

1333

PREPARED STATEMENT OF WILLIAM B. LACY, DIRECTOR, COOPERATIVE EXTENSION SYSTEM AT CORNELL UNIVERSITY

Mr. Chairman, I am William B. Lacy, director of the Cooperative Extension System at Cornell University. My testimony as the chair of the fiscal year 1998 Budget Committee represents all state directors and 1890 administrators of Cooperative Extension in the United States.

The Cooperative Extension System has a rather extensive and intensive process for program priority setting. The budget I present today has been through this same scrutiny. Our budget development committee is comprised of representatives from all regions of the country, as well as representations from our citizen advisory committee, CARET. Each line item in this budget was carefully examined.

Understanding the fiscal climate in which we make this budget presentation, we have limited our requests for significant increases to a few key critical areas. However, based on the fiscal problems in many states, reductions in the Extension budget at the federal level are not apt to be offset by state, county or private funding partners. These partners now provide over seventy percent of the Extension System's annual budget across the nation. Thus, each federal dollar is very important because it leverages several more dollars from state, local and private sources and serves as the "heart" of this unique partnership.

Congress has been supportive as the Extension System has focused on seven base programs and six targeted national initiatives within these base programs. We have emphasized issues which require a solid research base and applied education. We have strengthened our resolve and commitment not only to agriculture, but to the entire food and fiber system while maintaining strong programs in family, youth and community issues.

The highest priority for the Cooperative Extension System is a 5.5 percent increase in the funding for base programs. In addition, this budget request includes added support in several of the targeted programs, and two new initiatives: "Managing Change in Agriculture" and "Pesticide Applicator Training."

BASE PROGRAMS

Smith-Lever 3 (b)(c).—Base funds, along with matching state and local funds, provide the nucleus for maintaining the scientific and community-based network which is critical to the implementation of the base programs and the national initiatives. This network of faculty and staff of 74 land-grant universities represents an intellectual resource unmatched by any other country of the world. In addition, nearly three million trained volunteers work with the Cooperative Extension System in areas such as health, nutrition, gardening, financial planning and youth development. Access to research-based education and information enables agricultural producers, agribusiness leaders, community leaders and citizens at-large to make better decisions, in order to compete in an increasingly global market place. No other informal education system has the capabilities of reaching citizens in some 3,150 counties in the United States.

This increase will help to maintain a strong base for Extension programming across the country and provide the important foundation for the national initiatives, such as "Integrated Pest Management" and "Children, Youth and Families at Risk."

1890 Colleges and Tuskegee University.—These institutions maintain base programs geared to the needs of culturally diverse audiences, especially those limited in selected economic as well as social resources. Funds provided these institutions have helped them prioritize highly essential educational initiatives focused on families, community leadership, small scale farms and youth programs. These programs are designed to address new directions for what has become a large audience of people at risk and generally out of the mainstream of society. This 5.5 percent increase for the 1890's would enhance programming capabilities in key areas.

NATIONAL PRIORITY INITIATIVES

The national increases are requested for three national priority initiative programs: "Food Safety and Quality," "Sustainable Agriculture" and "Children, Youth and Families at Risk."

Food Safety and Quality.—A safe food supply is of utmost importance to consumers as well as food producers, processors and distributors. Public concern about food contamination has escalated during the last decade. Even so, information about the causes and prevention of food-borne illnesses is still very limited. Furthermore, much of the current knowledge is inadequately applied and practiced. This program is to ensure a safe and nutritious food supply through linked research and education.

PART 1

1334

Extension education programs focus on protecting the safety of food from production to consumption. These programs assist food producers and processors, food service establishments and consumers in understanding safe production, handling and preparation practices. The Hazard Analysis and Critical Control Points (HACCP) model is used as the primary basis for these educational programs. We are proposing \$4.365 million for fiscal year 1998; the fiscal year 1997 appropriation was \$2.365 million.

Sustainable Agriculture.—Sustainable agriculture is a systems framework of technologies and procedures that provides for continuing productivity. The challenge for sustainable agriculture is to develop systems that are economically sound, socially acceptable and environmentally benign. Sustainable agriculture systems are site-specific and require skillful management. Effective sustainable practices are based on all factors that affect a specific site, such as soil type and fertility, cropping history, microclimate conditions, surrounding vegetation and pest pressures. This program relates to and complements food safety, integrated pest management, water quality, agroforestry, other environmentally-related activities and rural development. We request \$4.0 million to continue this program. The fiscal year 1997 appropriation was \$3.309 million.

Children, Youth, and Families at Risk.—Land-grant universities have developed the finest system of non-formal education for young people. The system uses preventive educational programs to help youth and families become healthy, productive, financially secure and responsible members of their community. Extension has built linkages and networks with many agencies that provide services to children and family. Currently, 49 states and six territories conduct “Children, Youth and Families at Risk” programs. The current federal appropriation of \$9.554 million leverages an additional \$40 million and involves the support of nearly 37,000 volunteers for its programs. We request that the \$9.554 million appropriation be increased to \$11.7 million, so this important work of salvaging and rebuilding human capital may reach more youth and families.

SPECIFIED PROGRAMS

Mr. Chairman, specified programs we recommend for level funding are:

Farm Safety/Agribility	\$2,855,000
Agricultural Telecommunications	1,167,000
Rural Health and Safety Education	2,628,000
1890 Extension and Research Facilities	7,549,000
Extension Services at the 1994 Institution	2,000,000

Three specified programs are recommended for modest increases:

Expanded Food and Nutrition Education Program (EFNEP).—We request that EFNEP funding be increased from the current level of \$58.695 to \$60.0 million. The EFNEP program is functioning in 725 sites and in all 50 states. Within these sites last year, the program provided intensive nutrition education for nearly 200,000 family household heads. These adults represented about 739,000 family members. In addition, the EFNEP program involved over 400,000 youth in special nutrition education programs, primarily during the months when the school systems were in summer recess. These various educational experiences for youth and adults are provided primarily by persons indigenous to the program sites, well trained in basic nutrition education and teaching skills and kept current by university nutrition professionals. It is also important to note that all of the 725 sites function in cooperation with the various nutrition and feeding programs of the U.S. Department of Agriculture and the state and local youth and adult public assistance programs.

Integrated Pest Management.—We request that funding be increased for Integrated Pest Management (IPM) from \$10.783 million to \$15.0 million. Pesticide use in agriculture, as well as in urban America, continues to be a major public issue. IPM programs set the stage for innovative crop protection programs that meet economic and environmental needs. Additional resources are needed if the goal of establishing effective IPM practices on 75 percent of the crop land is to be achieved by the year 2000. The increase will address this concern and supports the Department of Agriculture’s initiative.

Renewable Resources.—We requests that the Renewable Resources Extension Act funding be increased from the current level of \$3.192 million to \$3.368. Public forests and rangelands now emphasize production of non-commodity values and commodity production has decreased. Concurrently, federal requirements for environmental protection on private lands have increased (Endangered Species Act, Wetlands Protection). Private landowners are, therefore, challenged to provide both increased commodity output to meet the nation’s needs and increased environmental

PART 1

1335

protection. Intensive management of non-industrial private forests for greater profitability, commodity resource output and environmental protection will be enhanced by this expanded educational effort. The impact on currently declining rural communities will be positive.

Three additional programs are recommended for slight increases: Rural Development Centers (fiscal year 1997 \$.908 million; fiscal year 1998 recommendation is \$1.0 million); Pesticide Impact Assessment (fiscal year 1997 \$3.214 million; fiscal year 1998 recommendation is \$3.3 million); and Reservation Extension Agents (fiscal year 1997 \$1.672; fiscal year 1998 recommendation is \$1.724).

NEW PROGRAM INITIATIVES

Funding is requested for two new program initiatives: "Managing Change in Agriculture" and "Pesticide Applicator Training."

Managing Change in Agriculture addresses how the Cooperative Extension System can assist the U.S. agricultural sector in managing the changes that are impacting the sector in the 1990's. These changes include: globalization of markets; declining governmental "safety nets;" public concerns and expectations for production and processing of safe food at reasonable prices, while protecting the environment; rapid technological advances; and accelerated industrialization of agriculture.

Within the agricultural sector, the forces of change are causing significant shifts in how business is done. These include: structural integration of input suppliers, producers and processors through increased use of contracts, alliances and other linkages; more product specificity driven by consumer tastes and preferences, and technological advances in the distribution and retailing of food and fiber products; industrialization of additional commodity areas including vegetables and pork, with the expectation that this trend will spread; and the rise of a new class of entrepreneurs who focus on the assembly and distribution of inputs and products without being centrally involved in the production processes.

The Cooperative Extension System, in concert with the agricultural private sector, will provide the leadership for the initiative. Funding will be sought from three sources: \$4.0 million for extension through your committee, Mr. Chairman, with matching funds from the state government and private sector. This will leverage the initiative into a \$12.0 million plus program.

Pesticide Applicator Training funding is a collaborative effort between the Department of Agriculture and the Environmental Protection Agency. Each is requesting \$1.5 million to support, in part, the training of users of restricted use pesticides so they can be certified users. This is a very demanding program because of the number of people that require training each year to become certified or recertified. The participants needing this training are growers, commercial applicators and home owners. The total cost of operating this program exceeds \$9.0 million a year. Thus, other state and local public funds and private funds are heavily committed.

SUMMARY

Mr. Chairman and Members of the Subcommittee, the Cooperative Extension System is mindful of the significant economic, technological and societal changes occurring in our nation. Thus we have redirected programs to better serve the needs of agriculture, the food system and rural America, to address directly the growing needs of children and families facing difficult situations and to help communities work for a better future. We have focused on issues of national importance, identified at the grass roots level. We very much appreciate your continued support to invest in initiatives of national importance and serve the needs of the citizens of this country.

We thank you for this opportunity to present our budget proposal for fiscal year 1998.

PREPARED STATEMENT OF DR. JAMES P. LASOIE, RESEARCH CHAIR, NATIONAL ASSOCIATION OF PROFESSIONAL FORESTRY SCHOOLS AND COLLEGES, AND CHAIR, DEPARTMENT OF NATURAL RESOURCES AT CORNELL UNIVERSITY

The National Association of Professional Forestry Schools and Colleges (NAPFSC) represents the 67 universities that conduct the Nation's research, teaching, and extension programs in forestry and related areas of environmental and natural resource management. We appreciate this opportunity to comment on the three programs administered by the U.S. Department of Agriculture (USDA) which greatly enhance the abilities of our member institutions to effectively meet the needs of the American People: the McIntire-Stennis Cooperative Forestry Research Program

PART 1

1336

(McIntire-Stennis), the Renewable Resources Extension Act (RREA), and the National Research Initiative (NRI).

Funding appropriated by Congress for McIntire-Stennis, in particular, has been a key part of university-based research support offering the flexibility to pursue high priority research needs in forestry while proving vital to the training of future scientists, educators, and managers. For more than 25 years, these funds have been judiciously allocated and have brought much in return. Each dollar in federal appropriations has been leveraged by a factor of five in nonfederal dollars in support of research programs having state, regional, and national significance. This is a very cost-effective and far-reaching program. RREA has been the principle vehicle for timely dissemination of new knowledge and it has leveraged more than three dollars for every dollar appropriated. Finally, NRI has been crucial to fundamental and interdisciplinary research. All three programs have stimulated the development of unique partnerships involving universities, various federal agencies, nongovernmental organizations, and industry.

Throughout the country these three programs have been unqualified successes. They have improved the understanding of (1) the biology of forest organisms; (2) the structure and function of forest ecosystems; (3) human-forest interactions; (4) wood as a renewable raw material; (5) economics, environmental policy, and business management related to the forest industry; and (6) international trade, competition, and cooperation. These programs have advanced our knowledge of the forest ecosystem including the basic chemical, physical, and biological forces that influence forest health and productivity. At the same time, they have expanded the marketing horizons for environmentally friendly and renewable wood and fiber-based products. Furthermore, they have significantly aided the development of new forest management systems for multiple-uses including timber, water, wildlife, grazing, recreation, and aesthetic purposes. Very recent work has examined the economic and ecological benefits of combining agricultural and forestry practices into integrated land-use systems termed "agroforestry."

Why fund forestry research now? Unlike many sectors of the Nation's economy, justifying private investment in forestry research is problematic. The payoffs can be large, but individuals or industries are often deterred by the size of the investment required and the fact that benefits are diverse, accrue widely to society, and are not readily quantifiable. Consequently, most industry support is focused on product development where benefits are readily captured. Forestry research is especially difficult for individual landowners to perform because research problems are often very large and commonly extend beyond any single ownership. Also, forestry research investments are usually long-term with benefits accruing well into the future.

Federal funding is urgently needed because forestry in the United States is undergoing a major transition. Until recently, wood and wood fiber demands have mainly been met in significant part from federal lands. However, recent controversies over endangered species and alternative land-use practices have led to challenges to USDA Forest Service's management plans which have greatly reduced the level of harvesting on federal lands. This means the bulk of the supply requirements has shifted to privately owned forest lands. To meet this major change, research priorities must be adjusted to better address the needs of private land owners, and to specifically enhance the productivity of such lands through economically efficient and environmentally sound means. Imports are not a viable option as the Nation cannot afford the trade imbalance, loss of jobs, or the importing of potentially serious plant, animal, and human diseases and pests. These challenges, however, can be met by the university community through the building of integrated research and extension programs assisted by McIntire-Stennis, RREA, and NRI.

Who benefits? Forestry research provides many direct and indirect benefits to society by increasing forest productivity, improving forest health, and providing diverse employment opportunities—all while enhancing environmental quality and improving environmental protection. Forests contribute substantially to the economic well-being of the United States. Forestry related employment constitutes a large sector of our work force, including manufacturing, research, and recreation. Forest product companies alone employed 1,580,000 people in 1988, representing 8.5 percent of the Nation's manufacturing work force. Many of these benefits accrue in rural areas of the United States where economic and social viability remain a wide spread concern. In addition, approximately seven million nonindustrial private forest land owners manage almost 60 percent of the Nation's timberland. These private citizens depend on the generation of critical forestry research information and its accessibility through extension to support and improve the wide range of public and private benefits arising from their investments. Society as a whole benefits from the improved recreational opportunities and amenity values provided by healthy forests. By increasing our understanding of forest ecosystems, the forestry research-exten-

PART 1

1337

sion partnership also improves our ability to protect the environmental amenities associated with forest lands, including the protection of biodiversity and the improvement of water and air quality.

The sum of these arguments is that the past, present, and future success of forestry research and extension activities arising from the NAPFSC member institutions results from a unique partnership involving federal, state, and private co-operators. Much of the funding of forestry and forest products research comes from the private industrial sector. However, such funding is commonly committed within the companies themselves and is typically focused on near-product development where the benefits of investments are readily captured. Federal agencies have concentrated on large-scale national issues while state funding has emphasized applied problems and state-specific opportunities. University research in contrast, with the assistance of federal, state, private, and other support, has been able to address a broad array of applied problems related to technology development and fundamental biophysical and socioeconomic issues and problems that cross ownership, state, region, and national boundaries. This testimony encourages continued federal participation in this partnership with NAPFSC institutions by providing specific funding recommendations for McIntire-Stennis, RREA, and NRI. In particular, the federal share has been an important incentive and mechanism for focusing on the most meaningful mix of state, region, national, and international issues and problems and for leveraging funds from other sources.

Where are we? The partnership between the federal government and the NAPFSC has been long-standing and has proven very successful. Over the years, Congress, through its continued support of McIntire-Stennis, RREA, and NRI, has provided the funding avenues to address the above noted applied research needs in timely fashion. However, despite the gains made in developing research information needed to maintain the health, productivity, and environmental quality of our forest resources, much remains to be done.

We know only too well the public's concerns, both pros and cons, over such issues as ancient forests, threatened and endangered species, global warming, wetlands and wilderness preservation, and tropical deforestation. Furthermore, it is now paramount that these issues be addressed within the broader context of the need to enhance and sustain the economic, ethical, and social systems which are important to all Americans. Despite past progress, this testimony is driven by the fact that the scientific base to which resource management and national, state, and local policy measures can be anchored is simply inadequate. The urgent need for research on environmental issues related to forest lands is most apparent at the state and local levels. Management of land for timber, water, wildlife, and recreation is becoming increasingly more difficult and expensive because we lack reliable information on the best management and harvesting practices on a site specific, landscape, and regional basis. Finally, the emerging area of agroforestry lacks the biophysical and socioeconomic data bases critical for its implementation.

What are the important implications? The funding by Congress of McIntire-Stennis, RREA, and NRI has permitted NAPFSC institutions to quickly respond to changing research priorities in forestry. This year's request is for your continued support of university-based forest research and extension. This request reflects the increasing importance of forest resources to the economic, environmental, and social well-being of our citizens. The growing and processing of timber provide the economic superstructure for literally thousands of communities in all regions of the country. Some examples are:

- In Texas timber is the second largest crop and it accounts for the largest value-added sector associated with agricultural production.
- In New York forests cover almost 62 percent of the state, forest-related businesses employ about 122,400 people, and annual sales and payrolls from forest based industries total \$13.3 billion.
- In Wisconsin the primary wood using industry employs over 94,000 people representing one in every six manufacturing jobs.
- In Mississippi 38 percent of all manufacturing firms are in the forestry sector.
- In Illinois forest related industries employ 55,000 people and contribute \$2 billion in valued added manufacturing.
- In Arkansas the forest products industry accounts for one of every six basic jobs. Over half of the state is forested and timber was the state's leading cash crop.
- In Oregon the forest products industry represents 31 percent of the manufacturing jobs and represents \$.35 of every \$1 generated by the state's economy.

Whether by weight or volume, wood is our most widely used raw material. There is also convincing evidence that forest products will become even more important in the future. Global demand is increasing and coincides with diminished supplies

in many established wood-producing countries of the world. The United States is well positioned in terms of timber supply and the manufacturing and transportation infrastructures needed to satisfy a major share of this increase in demand. However, continued economic competitiveness of forest-based industries in today's society requires that we develop more efficient and environmentally benign production and processing systems. These systems will be essential to success in increasingly competitive international markets.

The above economic characterization is not complete. We must add the very significant degree to which our forests provide the setting for outdoor recreation and the considerable economic impacts associated with such uses. In many areas, tourism and the forest products industry coexist very effectively and together make for very viable rural communities. There is also convincing evidence that forests, by virtue of their structure, will become even more important in maintaining biodiversity and the gene pool for a wide range of plants and animals. Especially important will be the role of forest communities within complex landscapes and the biophysical, social, and economic interrelationships between different land uses, including urban/suburban development.

Overall, we are facing problems that are more pervasive and complex than any previously addressed by humankind. We must question our collective ability to provide the diversity of goods, services, and values currently demanded by a pluralistic society while sustaining the natural resource and environmental quality bases equally critical to future generations. The structures and partnerships are in place to address these tough issues, but we must recognize that these relationships are fragile ones. Continued Congressional support of the McIntire-Stennis, RREA, and NRI will insure that we will continue to improve our understanding of how forest ecosystems function under a continually changing set of socioeconomic conditions.

A framework for action has been established.—Three years ago the National Research Council published a study of forestry research needs which had been commissioned by the National Academy of Sciences. This report, entitled *Forestry Research A Mandate for Change*, supported and recommended a significant strengthening of forestry research in the United States. Following the report, an implementation committee began working closely with partners including the USDA Forest Service, state foresters, forest industry, professional societies, and various interest groups to develop a cooperative effort known as the Forestry Research Initiative. The NAPFSC institutions and many of our cooperators see the expansion of this effort as an imperative for the environment and the economy and consider the Forestry Research Initiative to be a road map for this expansion. One example of this commitment is the recent report of the Forestry Research Advisory Committee (FRAC) of the USDA. This report highlighted questions relevant to forest policy needs and recommended additional investments in the following areas beginning in fiscal year 1996. These priorities continue to be relevant and to serve as a guide for forestry research and extension programs across the Nation. They include a need to:

- improve existing inventories and assessments of forest resources and their many functions;
- conduct research to improve the understanding of ecosystem dynamics and alternative forest management systems on the most productive lands to meet increasing demands;
- develop adaptive management strategies and prototypes for multiple-use management of forest lands to provide both commodities (wood and fiber) and other resource values (water quality, wildlife habitat, livestock grazing, recreation and aesthetics); and
- build a forestry research and education infrastructure to foster interdisciplinary studies on long-term sustainable forest management, promote timely scientific synthesis and communication, and provide anticipatory leadership.

Role of university leadership.—Given these recommendations, it is important to recognize that forestry and natural resources research and extension programs arising from NAPFSC institutions are ideally positioned to make key contributions to these efforts and to society. We have a history of solid achievement in terms of (1) basic long-term inquiry; (2) issue-focused, problem-solving interdisciplinary research and development; (3) scientific support to the ongoing management of rural lands; (4) innovation in new product development, utilization, and recycling; (5) integrating science and the human dimensions of resource use into the policy-making process; and (6) close working relationships with the users of research information being facilitated through extension.

University-based forest research is also a key part of the collaborative research effort involving federal, state, and industry scientists and resources. Schools and colleges with programs in forestry, forest products, and natural resources have the expertise in-house to address a broad range of problems and opportunities related to

PART 1

1339

the forest resource and its utilization. Because of their university affiliation, the faculty can conduct research on problems that require scientists from many disciplines.

The FRAC report also highlighted the need for a systematic extension process to:

- provide continuing education for natural resource professionals;
- enable landowners/managers/industry to access, adapt, and utilize research results;
- assure basic understanding by public decision-makers; and
- reach the general public with education to guide their individual and collective efforts.

Here NAPFSC institutions—with their well-established education, extension, and communication capabilities—can play a lead and very cost-effective roles.

We see the federal funding programs described herein as especially important to state and regional concerns as pressures on federal lands are shifted to private ownerships. In articulating the initiative described above, funding to universities would be largely directed to the problems of state, local, and private ownerships. In particular, the large, nonindustrial private forest landownership nationally is one that will have to carry a larger share of the burden for timber production and multiple use. These lands are also where considerable improvement in management is both desirable and possible for a wide range of forest values.

Our fiscal year 1998 request.—Those of us at NAPFSC institutions know that our request for continued funding for forestry research and extension comes at a time when Congress must deal with severe budget constraints. We know you are looking for cost-effectiveness, accountability, and leverage—all within an important backdrop of reducing the National Debt. We commend you for this effort. We also know that you value the concept of investing in programs that will shape the future of the United States. Given this situation, we call your attention to the major transition that has occurred in forestry and the associated land uses in America's rural areas. The number and complexity of the economic, social, and environmental problems associated with the forest resources of the United States and the world will likely grow unless we continue to invest strongly now.

It is this concern for the future that leads us to request your support in securing an appropriation of at least \$21.625 million for the McIntire-Stennis Cooperative Forestry Research Program. This is the key federal program in support of forestry and natural resources research through our Nation's Land Grant Universities.

We also ask your continued support of an important component to our applied research program—the Renewable Resources Extension Act at a modest funding level of at least \$3.368 million. Extension activities made possible through the RREA have become integral parts of the outstanding programs conducted by the Cooperative Extension Service in each state. Funding for this Act have made possible the timely dissemination of research results derived from the McIntire-Stennis and NRI.

Lastly we urge your support of the Competitive Grants Program administered under the National Research Initiative of the USDA. Peer competition for grants is at the heart of the university system and this program has become very important to natural resource scientists working within NAPFSC institutions. Research funds from NRI enable NAPFSC institutions to build upon the base provided by McIntire-Stennis. We urge funding of NRI at a level of at least \$113.5 million, and specifically endorse a funding level of at least \$22.0 million for its Natural Resources and Environment Program.

Final comment.—We respectfully ask that you consider the continued funding of the McIntire-Stennis Cooperative Forestry Research Program, the Renewable Resources Extension Act, and the National Research Initiative. This is not simply a request for NAPFSC institutions, forest industries, or environmental organizations. Nor is it a request to only aid the forest landowners nationally. Rather, it is a request to address crucial needs and issues and invest in work that can have a significant positive effects on the environmental and economic health of our society for decades to come. Thank you.

PREPARED STATEMENT OF DR. DONALD K. LAYMAN, ASSOCIATE DEAN, COLLEGE OF AGRICULTURAL, CONSUMER AND ENVIRONMENTAL SCIENCES, UNIVERSITY OF ILLINOIS

The Board on Human Sciences of NASULGC represents the colleges and programs of human, family and consumer sciences. These colleges have grown out of the heritage of home economics and provide national leadership in programs of foods, nutrition, health, human development, social and economic well-being of individuals and families, and environmental design. The testimony today is in support

PART 1

1340

of the funding recommendations of the NASULGC Board on Agriculture fiscal year 1998 budget.

TOP PRIORITIES FOR FISCAL YEAR 1998

Strengthen Base Programs for Research, Extension and Higher Education.—The Hatch and Smith-Lever base programs of the national land grant system provide a critical foundation for programs in human sciences and provide the infrastructure to support and enhance the essential federal, state and local partnerships. This partnership is critical to maintain global competitiveness, to support the well-being of youth, families and rural communities, and to achieve Welfare Reform. We recommend a 5.5 percent increase in funding for base programs for research and extension over fiscal year 1997.

Advance Special Initiatives.—Special initiatives address five critical priority areas as defined by the National Agricultural Research, Extension, Education and Economics Advisory Board (NAREELAB). These “targeted funds” address specific issues and provide short-term response to critical problems. Programs in the human sciences contribute extensively to three of the special priority areas:

- A safe and secure food and fiber system
- Healthy, well-nourished children, youth and families
- Enhanced economic opportunity and quality of life for Americans

Issues of Welfare Reform, food safety, nutrition and health, youth-at-risk, and rural economic and social development are critical national issues where Human Sciences programs at the land grant universities provide unique expertise and the Base programs provide the critical infrastructure of research and extension.

Special Initiatives in research and extension are outlined below.

Research

The National Research Initiative (NRI) has served to revitalize and strengthen basic research in areas of agriculture, food, nutrition, rural development, and the environment. Under Research Grants Public Law 89–106, Sec. 2b of the fiscal year 1998 budget, we recommend an increase in the total NRI program to \$113.5M with specific interest in competitive grants in Nutrition, Food Quality and Health (\$10M) and Markets, Trade and Policy (\$8M). Programs in Human Sciences make major contributions to each of these areas. For Nutrition, Food Quality and Health, we contribute extensive expertise in food safety, human health through proper nutrition, molecular and cellular basis of human nutrition, and dietary patterns and behavior of the consumer. For Markets, Trade and Policy, we provide leadership in rural development, economic performance, stability and well-being of families, youth and the elderly, and education policy.

Under Special Research Grants (Sec. 2c) Food Safety (\$3M) is a new initiative designed to be a collaborative research and extension program. A safe food supply is of utmost importance to consumers as well as food producers. Public concern about food contamination continues to grow, but information about the causes and prevention of food-borne illnesses is still very limited. This program is to ensure a safe and nutritious food supply through linked research and education.

Rural Economic and Social Development is recommended at (\$2M). There are over 34 million poor people in the United States with approximately 9 million living in rural areas. New information and strategies are needed to overcome rural poverty through training individuals and empowering communities to work toward positive economic development. These funds would be used to develop models of family, community and agency activities to enhance the quality of life, to identify barriers to family and community development, and to identify means to provide increased job opportunities in rural areas.

Extension

Extension is a network of professionals and paraprofessionals connected to land grant universities who serve the needs of local people and communities. It is a life-long learning system that links the education and research resources and activities of 74 land-grant universities, 3,150 counties, and the U.S. Department of Agriculture (USDA). Extension’s network includes 32,000 employees and 2.8 million trained volunteers.

National Extension Priorities include several of particular concern to the well-being of individuals, families and communities. Critical funding needs exist for Water Quality (\$10.7M), Food Safety and Quality (\$4.3M) and Youth and Families at Risk (\$11.7M).

Extension and the land grant university have a long-standing commitment to Youth and Families at Risk. Extension currently serves over 5.6 million youth through 4–H and other educational programs for youth and families. Rural and

PART 1

1341

urban communities share increasing problems with social factors that put youth at risk. In collaborations with federal, state and local partners, Extension has implemented effective community-based educational programs for youth, parents and local leaders. Prevention and intervention are very cost effective compared to remedial costs to society.

Expanded Food and Nutrition Education Program (EFNEP) (\$60M).—EFNEP is a voluntary, nutrition education program for low-income families. It is currently present in 725 cities across all 50 states. Programs of EFNEP provide intensive nutrition education for nearly 200,000 families plus involve over 400,000 youth in special nutrition education programs during the summer. EFNEP programs work in cooperation federal, state, and local nutrition and feeding programs to enhance understanding of nutrition and food safety for health.

A major change for low income families and rural poor is Welfare Reform. The primary concept of welfare reform is personal responsibility. Personal responsibility for welfare recipients will mean starting at many different skill levels from the very basic to skilled to be ready to go to work and maintain employment. It will mean training and education to understand the expectations of a work environment, as well as the skills to perform successfully within that environment. Extension Service has a long record of successful education programming.

Jobs and the creation of new jobs are necessary for work to occur. Extension has the expertise to help communities with small business development. This creates economic opportunities and helps make possible creative local solutions for Welfare Reform. Extension has partnerships for training already in place, these partnerships should be encouraged and strengthened across all programs and agencies to create long term solutions.

Child care has come to the forefront in Welfare Reform. Extension is actively addressing this issue with training and certification programs, with consulting for local and state agencies and with the education of future child care providers. The issue of who will care for America's children while parents are at work challenges the premise that families are our primary concern. The reasonable way to achieve adequate, secure child care is to work together in communities to devise solutions that work locally.

PREPARED STATEMENT OF DR. P.S. BENEPAL, ASSOCIATE DIRECTOR OF RESEARCH,
VIRGINIA STATE UNIVERSITY

Senator Thad Cochran, Chairman, and distinguished members of the Committee, the Association of Research Directors (ARD) strongly supports the budget recommendations for fiscal year 1998 submitted by the Budget Committee, Board on Agriculture, NASULGC. The two top priorities recommended by the NASULGC for fiscal year 1998 are to strengthen the base programs for research, extension and higher education, and to sustain current high priority initiatives and to mount a few new programs in much needed critical priority research areas. A modest increase of 5.5 percent in base funds for research is being requested. These programs represent the long-term commitment of Land-Grant Universities to maintain a stable research base including personnel and facilities in the food and fiber and agricultural and environmental sciences, and natural resources.

1890 EVANS-ALLEN RESEARCH PROGRAM (\$29,261,000)

We strongly support the recommendation for an increase of 5.5 percent in base funds for the Evans-Allen Program for the 1890 institutions in fiscal year 1998. These funds provide the primary and principal support to conduct basic and applied research to ensure a safe, economical and adequate food supply, promote a sustainable environment, conserve the natural resource base, and contribute to the improvement of the socio-economic well being and overall quality of life of diverse rural and urban populations. These funds also contribute to the development of professional expertise (especially, minority persons) in the food and agricultural sciences through focused programs.

1890 CAPACITY BUILDING GRANTS PROGRAM (\$10,000,000)

We strongly support the recommendations for funding the 1890 Capacity Building Grants Program at \$10,000,000 in fiscal year 1998. This program is critical in enhancing teaching and research programs at the 1890 Land-Grant Colleges and Universities and in advancing partnerships with industry, USDA agencies and other institutions of higher education. This is a highly competitive program which helps to

PART 1

1342

build greater capacity in research and teaching in food and agricultural sciences at these Institutions.

1890 RESEARCH AND EXTENSION FACILITIES GRANTS PROGRAM (\$7,549,000)

We strongly support the 1890 Extension & Research Facilities Grants program at a funding level of \$7,549,000. This program was authorized in the Food, Agriculture, Conservation and Trade Act of 1990. The facilities program enables the 1890 Institutions to develop state-of-the-art facilities and acquire needed equipment for scientific research and outreach for training of students.

RURAL ECONOMIC AND SOCIAL DEVELOPMENT (\$2,000,000)

We also strongly support the initiative for 1890 Institutions on Rural Economic and Social Development at \$2,000,000 in fiscal year 1998. Over 55 percent of the rural poor and 97 percent of the rural black poor live in the South. Targeted research is needed that will specifically address the disadvantaged and under served communities and families in the following areas: barriers to family and community development; incentives for new linkages and partnerships; infrastructure needs; business and job opportunities; enhanced development of human capital and leadership; use of natural resources for community development; and new markets for agricultural products.

Mr. Chairman, on behalf of the ARD, I wish to express our thanks to you and the distinguished members of the committee for this opportunity to submit this testimony.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF WIC DIRECTORS [NAWD]

WIC is a program of which you should be very proud. WIC is a short-term intervention program designed to influence lifetime nutrition and health behaviors in a targeted, high-risk population. WIC provides services in 9,000 clinics administered by 1,800 Local Agencies in 86 State WIC Programs.

Of the federal appropriation, only 9 percent of the WIC grant is allocated for program administration; 16 percent is allocated for direct client services needed to assess individuals nutrition, health and income eligibility, provide nutrition education, breast-feeding support and promotion, prenatal, pediatric and immunization screening and referral to provide drug, alcohol and tobacco abuse information, to prescribe and issue food benefits, register voters and provide other mandated or necessary client services. The remaining 75 percent of the WIC grant is allocated for food benefits.

WIC's monthly food prescription (package), tailored to meet the specific nutritional needs of each client, is serving 7.4 million participants including 1.8 million infants, and 3.89 million children. WIC requires that clients have one or more documented nutrition risks and incomes less than or equal to 185 percent of the poverty level. In fact, 94.5 percent of all WIC participants have incomes below 150 percent of the poverty level.

Numerous studies show that pregnant women who participate in WIC seek earlier prenatal care and consume more healthy diet. They have longer pregnancies leading to fewer premature births; have less low and very low birth-weight babies; and have fewer fetal and infant deaths;

It costs \$544 a year for a pregnant woman to participate in WIC. By contrast, it costs \$22,000 per pound to give a low and very low birth-weight baby to normal weight of 7 pounds in a neonatal intensive care unit. WIC prenatal care benefits reduce the rate of very low birth-weight babies by 44 percent.

WIC promotes breast-feeding as the preferred method of infant feeding. Breast milk contains all the nutrients infants need to grow and develop. Breast-fed infants tend to be healthier since they receive antibodies from the breast milk, which protects them against infection. In 1994, WIC mothers increased their breast-feeding initiation rates to 44 percent.

WIC helps to assure children's normal growth, reducing levels of anemia, improving access to regular health care, increasing immunization rates, and improving diets. Forty-seven percent of all infants born in the United States are on WIC. Eighteen percent of all children in the United States are on WIC.

Four and Five-year-olds whose mothers participated in WIC during pregnancy had better vocabulary test scores than children whose mothers had not received WIC benefits. Children who participated in WIC after their first had better digit memory test scores than children who did not participate in WIC.

PART 1

1343

States stretch available WIC funds through rebates on foods and other cost saving initiatives. State WIC agencies use their infant formula buying power to achieve bulk purchase savings, in the form of monthly rebates paid by infant formula manufacturers. Rebates save over \$1.1 billion for federal tax payers and fund services for 1.5 million women and children.

NAWD supports both the Administration's \$100 million supplemental appropriation request for WIC in fiscal year 1997 and its increase of just over \$378 million (including \$100 million for an emergency contingency reserve) in WIC funding for fiscal year 1998.

NAWD is aware that a major concern of the Committee has continued to be the amount of carryover funds projected into the next fiscal year. Why is a supplemental needed given that carryover funds are available to the Program?

WIC Directors cannot overspend their WIC grants. It is not possible, nor is it prudent management, for WIC to expend all of its appropriated resources in a given fiscal year. WIC managers have typically experienced carryover margins of between 3 percent and 4 percent or about three cents on the dollar of the total WIC grant. This is well within the operating margins of the nation's fortune 500 companies.

What happens at the local level, makes it difficult to give precise estimates of expenditures. The Public Health Foundation WIC Program of Los Angeles, for example, schedules about 240,000 families to receive WIC services within a 2 month period. Each month about 110,000 families will come in to receive WIC services. Each family member will receive about 10 checks for specific foods. Some of these checks are for this month and some are for next month. Each family spends the WIC checks at authorized grocery stores. The price of the foods on each check varies from store to store and day to day. The food instruments are for specific choices of food—for example 2 dozen eggs. They have dollar limits, but the food instruments are not for specific dollar figures. In other words, the cost of the 2 dozen eggs may be \$1.79 today at one store and \$1.75 at another store. The market deposits the food checks to the bank which in turn submits the checks to the state for reimbursement. The WIC client has 30 days to purchase the WIC foods. If she receives WIC food checks on 25 September, she will purchase the food perhaps in 3 or 4 trips to the market during the 30 day period. The market also has a legal time frame in which to deposit the checks to the bank. Time lags occur in the process. The point of all this is that USDA, the state and local agencies do a remarkable job of bringing the participation and expenses of this wonderfully complex program to within 97 cents of each dollar appropriated.

Voucher redemptions which occur late in the fiscal year are redeemed through a state's financial system after the close of the fiscal year. This makes it difficult for managers to predict exactly what their voucher redemption rates will be.

As with vouchers, rebate transactions late in the fiscal year do not accrue to a state until early in the next fiscal year. This results in carryover monies from the previous fiscal year when rebate checks received from formula vendors are not fully utilized to cover expenses incurred in the previous fiscal year.

On average, states will expend roughly 97 percent of their federal grant to ensure a sufficient of safety to prudently manage the program and prevent caseload disruptions.

States have made every effort to prudently reduce the level of carryover funds available in the program, voluntarily advising USDA of available recoveries, and rendering resources available for frequent reallocation to those states most in need of resources.

Without the supplemental, caseload levels of 7.4 million reached in November, seasonally adjusted downward in December, and somewhat recovered in January, to perhaps the September 1996 level, will soon begin to experience reductions as States seek to manage resources within anticipated levels for the remainder of the fiscal year.

The Administration's fiscal year 1998 Budget request of nearly \$378 million includes a \$100 million contingency fund to cover unexpected WIC food cost increases. As this fund is only meant to cover emergency situations, the actual request is approximately \$278 million. This amount is necessary for the following reasons. The amount of carryover funds anticipated for fiscal year 1998 are expected to be less than for the current fiscal year. To maintain current participation levels and prevent caseload reductions, the reduction in carryover funds available in fiscal year 1998 must be adequately offset by fiscal year 1998 appropriations. WIC food costs rose dramatically in fiscal year 1997 and may do so in fiscal year 1998 as a result of continuing dairy pressures, and anticipated fruit juice and cereal price increases. And finally, if the WIC Program is to reach the Administration's full funding goal, additional resources will be needed. The Committee should note, that even if the

PART 1

1344

Administration's goal is met, there will still be over 1.5 million potentially eligible WIC participants who will go unserved.

Finally, a few thoughts with you as regards the State Spending Plans provided by USDA to the Committee. NAWD has learned from its members that there appear to have been several disparities in the directions given by the various USDA Regional Offices to the States as they prepared their individual Spending Plans. The Plans were requested in such short order that States did not have adequate time to appropriately reflect on the substance of the requests. Political pressures in some States seem to have forced Directors to provide data reflective of 100 percent grant expenditures which may not necessarily be reflective of historical experience.

In addition to funding limitations, other challenges affect the WIC Program's ability to make the best use of existing funding.

The President's Budget Proposal provides for \$12 million to fund the Farmers' Market Nutrition Program, FMNP. NAWD recognizes the importance of FMNP, which support WIC's health and nutrition objectives. NAWD recommends that alternative methods for funding the FMNP be explored. Currently, funding for FMNP is subtracted or set-aside from the WIC appropriation. If funding FMNP is to be at the expense of cutting WIC caseload, then maintaining WIC caseload must be the priority of policy makers. If FMNP is to remain a part of the WIC appropriation, we urge the Committee to empower WIC Directors with the ability to make management decisions to protect WIC caseload and prevent the diversion of WIC resources to FMNP or other programs.

Spending constraints and operational limitations in WIC policies and regulations limit States' ability to maximize the use of Program resources. These constraints govern the management of the WIC federal grant and policies governing the use of funds obtained through rebate or other sources.

The WIC Program has a long history of reducing or maintaining food costs through the competitive procurement of foods; competitive selection of retail vendors; food brand and container size limitations that do not affect the nutritional value of the food benefits; aggressive fraud and abuse control. The savings from these proactive efforts accrue to the food portion of the WIC grant. Funds available for direct services to the additional caseload made possible by these efforts, lag or do not exist. The bottom line—states contain or reduce costs only to be forced to return the savings to USDA because there are inadequate resources to assess and certify participants, provide nutrition education, assess and refer for a host of Congressionally mandated health and social needs, and issue food benefits.

States need to be allowed to use cost-savings revenues in the same way as grant funds or other program income. Identifiable and predictable food cost savings could be considered as funds returned to the entire WIC grant and not just the food grant; each state would then be able to direct a portion of these funds to NSA services, capping at a preset rate such as the current NSA grant ratio. In addition, cost savings could be used to bring states up to "parity" or "potential" NSA formula grant levels. The NSA to food ratio for conversion could be adjusted when appropriations cannot fund full NSA grants, such as has happened in preliminary fiscal year 1997 funding.

Only in this way will states have a real opportunity to develop the infrastructure, staffing and outreach capacities needed to bring WIC services to the eligible women and children who could be served through the states' creative food cost savings initiatives.

The National Association of WIC Directors, NAWD, remains available to answer any questions you may have. Please feel free to contact the Association's Executive Director, Douglas Greenaway should you require further information or assistance.

PREPARED STATEMENT OF TERESA MAURER, PROJECT MANAGER, APPROPRIATE TECHNOLOGY TRANSFER FOR RURAL AREAS (ATTRA) PROGRAM, NATIONAL CENTER FOR APPROPRIATE TECHNOLOGY (NCAT)

Mr. Chairman, and members of the Subcommittee on Agriculture, Rural Development, Food and Related Agencies, I appreciate the opportunity to offer written testimony. I am Teresa Maurer, Project Manager for the Appropriate Technology Transfer for Rural Areas (ATTRA) program, a national information service based in Fayetteville, Arkansas.

ATTRA is funded through Rural Business-Cooperative Service (RBS) of the U.S. Department of Agriculture. ATTRA is operated by the National Center for Appropriate Technology (NCAT). NCAT is a private, nonprofit organization which provides information and technical assistance in the areas of sustainable agriculture, energy efficiency and resource-efficient housing. The USDA budget requests \$1.3

PART 1

1345

million for the ATTRA program for fiscal year 1998. Today I am presenting supportive information for that figure, but wish to recommend that the program be funded at the level of \$1.5 million to provide additional capacity for meeting the demand for information on successful marketing approaches for sustainably produced agricultural products.

ATTRA is nationally accessible through a toll free 800 telephone number. We respond to requests from farmers, information providers and other agricultural professionals seeking information and technical assistance on a wide range of sustainable agriculture practices. ATTRA was initially authorized in the 1985 Farm Bill and was first funded in 1987. Since that time, ATTRA has responded more than 100,000 requests for information, reaching that milestone in late March, 1997. In fiscal year 1996 alone, ATTRA received 18,246 requests. This figure primarily includes many new callers, as well as many who have used the service in the past, and underscores the continuing and growing interest and need for ATTRA's services.

The program offers callers from across the US a unique, cost-free one-stop access point to research-based and practical-experience-based information about ways to farm with innovative techniques and technologies that combine environmental and economic benefits. With changes in recent agricultural legislation, farmers want information on a variety of creative options that may be available to them to carry out on their farm. They are exploring what they can produce, how they might produce it, and how they can add value and market their products—through ATTRA they learn about approaches they may not even be aware of. Farmers also continue to look for practices that help them keep more of their farming income by reducing production costs. The written materials provided by ATTRA's 25 staff members meet those informational needs and bring choices right to the caller's mailbox, helping them make their own important farming and economic decisions.

Caller requests cover a wide range of sustainable topics, including crop, livestock and horticultural practices and include questions on production approaches, soil fertility, pest management, adding new enterprises, etc. Much of the research results and farmer-to-farmer information that is relevant to these questions on improving sustainability is not readily available from a single source. ATTRA meets this need by providing vital and timely information.

In addition to accessing information from hundreds of periodicals, research reports and electronic databases, we have developed a unique national network of sustainable agriculture practitioners, researchers and extension specialists with whom we have ongoing contact. This network allows ATTRA to get information on innovative or changing practices and technologies out quickly and directly to farmers.

ATTRA also enhances the "reach" of traditional sources of agricultural information. In fiscal year 1996, about 35 percent of ATTRA's requests for information for sustainable approaches to agricultural production came from Extension, various government agencies, agribusinesses and universities. For example, an extension agent in Maryland reported that he uses ATTRA information to assist new and diversifying farmers in identifying various opportunities for horticultural and agronomic enterprises in their communities.

By working as educators and information providers, farmers share and spread information obtained from ATTRA to other farmers. A farmer from Pennsylvania reported "Researchers at two universities referred me to ATTRA. The research I received from ATTRA on sustainable poultry production, helped me to identify a prospective new market. I shared the information with other farmers." A farmer from Texas said "I was looking for personal testimony from an experienced farmer who had similar interests. The materials I received from ATTRA helped me to formulate a personal plan that I believe will be efficient, have a beneficial impact on the environment, and help improve the lives of my family and myself."

Returning to my earlier figures on interest and demand for ATTRA's services, I would like to offer a comparison between fiscal year 1989 and fiscal year 1996. In eight years, demand for information quadrupled from 4114 requests annually to 18,246 annually. In the same time period, our annual appropriation moved from \$500,000 to \$1,300,000 and has not been significantly increased in the past five fiscal years. In fact, the fiscal year 1996 funding rate was cut by almost 10 percent but requests increased 12 percent during that year. In the past two years, we have seen a doubling in the growth rate of requests from farmers desiring marketing information to be included as part of ATTRA's production information.

As a result of our program's gains in popularity, staff are now having difficulty meeting demands for information from producers—increases in real costs have actually decreased the resources we have available to meet farmers' diverse information needs. The 15 percent increase requested, from \$1.3 million to \$1.5 million would help staff meet demand and increase service in important new ways. That percentage is small compared with the 425 percent increase in demand we have experi-

PART 1

1346

enced during the past 5 years of level or reduced funding. However, that funding level would indeed offer the program limited but significant capabilities to meet farmers' increasingly complex needs for information as they face the millennium. For example, many farmers (or their children) have increased electronic access, either in their own homes or at a local public facility. More callers now are asking for immediate electronic access to some of our materials. Additional funding would allow us to expand and maintain a Website which is being tested now and is planned to be available to the public later this summer.

We are convinced that ATTRA provides a national service that is very valuable to broadening the acceptance of more sustainable and profitable approaches to agriculture. We appreciate the past support that Congress has provided, which enables this unique service to provide information that helps farmers make wise decisions among choices they face. We urge you to continue to support this work, and we pledge to continue to improve the efficiency of the program and the quality of information we offer to farmers.

I have appreciated the opportunity to provide testimony and will welcome any questions you may have about this program.

PREPARED STATEMENT OF THE NATIONAL CENTER FOR RESOURCE INNOVATIONS

As ever, we appreciate this opportunity to provide, testimony to the Senate Appropriations Subcommittee on Agriculture, Rural Development and Related Agencies.

The National Center for Resource Innovations (NCRI) was established in 1990 through a joint private/federal initiative in an appropriation to USDA/Cooperative State Research Service. The consortium now includes six sites, one designated fixture site, and an Administrative Office in Rosslyn, VA. Each site in the consortium provides a unique expertise to this national program. NCRI capabilities include integration of large data sets in a GIS framework from the national level down to the farm field, weather analysis, land use planning, resource management at the state and local levels, and support for public and private policy development. The seven sites are:

- NCRI-Chesapeake: NCRI Chesapeake, Inc., Rosslyn, VA
- NCRI-South West: The University of Arkansas—Fayetteville, AR
- NCRI-South East: The South Georgia Regional Development Center, Valdosta, GA
- NCRI-North Central: The University of North Dakota—Grand Forks, ND
- NCRI-North West: Central Washington University, Ellensburg, WA
- NCRI-Great Lakes: The University of Wisconsin—Madison, WI
- Future Site: The University of New Mexico—Albuquerque, NM and the Southwestern Indian Polytechnic Institute (SIPI).

MISSION OF MCRI

To provide collaborative and innovative transfer of geographic information systems technologies to support local government and other public policy development and decision making.

NCRI FUNDING HISTORY AND MATCHING FUNDS

In the past, NCRI has consistently requested \$1 million annually for minimum program operations. Federal funding for NCRI increased from \$500,000 in 1990 to \$1.075 million in 1994. Rescissions and other adjustments reduced actual funding from \$1.075 to \$939,000 for fiscal year 1996 and again reduced the appropriations for fiscal year 1997 to \$844,000

COST/BENEFIT ANALYSIS

At the request of Congressman Joe Skeen, the six NCRI sites independently generated site specific cost/benefit analyses. The average benefit/cost ratio for NCRI's program is \$7.40 for every federal dollar received from USDA/CSREES funds. A copy of an updated cost/benefit analysis will be made available to the Subcommittee in the coming weeks.

CURRENT FUNDING LEVEL AND FISCAL 1998 FUNDING

The current level of funding (fiscal year 1997) for NCRI is \$844,000. NCRI requests that funding through the USDA/CSREES be restored to the 1992 of \$1,200 million for fiscal year 1998 to include \$100,000 to bring the University of New Mexico-Southwestern Indian Polytechnic Institute consortium formally into the NCRI program.

PART 1

1347

BACKGROUND

NCRI is a cooperative, coordinated network with its agenda implemented through its corporate offices in Rosslyn, VA. NCRI operates primarily at the nexus of government where filed level information systems have been built and academic centers where GIS technology and educational techniques are often developed. NCRI's program bridges the widening gap under a mandated reorganization of government. The advantage of a consortium of regional centers is that each site has unique expertise and shares specialized technical support with other sites, thereby strengthening the project as a whole through shared resources and experience needed to build complex and comprehensive information systems. Site-to-site technology transfer and networking builds NCRI's overall capabilities, aids in problem solving and facilitates consistency and avoids duplication.

NCRI SITE EXPERTISE AND ACCOMPLISHMENTS

NCRI-Chesapeake, Inc. (NCRI-CB).—NCRI-CB builds cooperative integrated information systems “from the nation to the neighborhood” with federal and state agencies, universities and others to provide new information for better decision making. These systems focus first, on the farm, productivity and the farmer in their own very specific neighborhoods as related to natural systems and their socio-economic position on the landscape.

In addition to extensive Public Education and Outreach in the past, NCRI-CB has the following accomplishments to report:

- Applied private sector, commercial target marketing techniques to build sub-county clusters from integrated farm, socio-economic and environmental characteristics and prototype public sector target marketing of USDA's conservation and technology programs.
- Developed informational materials to promote understanding about Precision Farming and related technologies as an important new way to optimize farm productivity, efficiency and environmental protection.
- Cooperated with the Washington Post to present new images and data describing loss of farmland to suburban expansion in an 18 county region surrounding Washington DC to the year 2020. Images are installed on the Post homepage (www.washingtonpost.com) for downloading, analysis and educational use by readers.
- Provided images and data describing two hundred years of historical population and farmland expansion/decline from 1790–1990 to the National Biological Survey's Land Use History of North America Homepage (www.nbs.gov/luhna). Researchers, educators and individuals can download text, information about data sources, and images for their own use.
- Expanded regional-scale analyses of agro-eco indices from the Chesapeake watershed to the northeast and mid-atlantic regions to describe farm production systems with higher spatial precision for targeting public and private conservation/technology programs.

University of Arkansas-Fayetteville (NCRI-SW).—NCRI-SW has been based at the University of Arkansas at Fayetteville since its inception in May of 1990. Through university support and hardware and software grants, the program has a fully-equipped research, training, and outreach facility capable of demonstrating a wide range of software for geographic information systems, remote sensing, spatial statistics, and database management. In the fall of 1994, expansion of the Center's facilities was completed to include five state-of-the-art teaching and research laboratories, ten offices, and a library/reading room. A variety of advanced computer equipment now facilitates the center's teaching, outreach, and cooperative project capabilities. NCRI-SW continues to focus on technology transfer through training, the development of statewide GIS databases, and representative projects demonstrating the cost benefits and efficiency of GIS technology.

The NCRI-SW program has provided opportunities for cooperation and support to a wide range of communities:

- Arkansas Tornado of March 1997. With data provided by the National Weather Service, NCRI-SW provided maps correlating the storm route with community infrastructure and housing to the Arkansas' Governors office. In cooperation with the Arkansas Forestry Commission, staff used airborne videography and GPS to do near-real-time detailed mapping of the tornado damage;
- Arkansas Hazard Mapping. A joint project between the Arkansas Forestry Commission and the Center will provide a statewide hazard map based on vegetation fuel types, rural volunteer fire departments, transportation networks, and locations of known hazardous sites;

PART 1

1348

- Vision 2010 Program. In cooperation with the Cooperative Extension Service, many of the state's utilities, the State Chamber of Commerce and others, the Center has developed the Vision 2010 Program. This program brings together leaders of seven rural counties in the state and, over a two year program, provides them with information and access to a variety of technologies that can improve their communities;
- High Accuracy Reference Network (HARN). Along with the Arkansas Highway and Transportation Department and the National Geodetic Survey, the Center is coordinating statewide HARN implementation which will greatly improve accessibility to National Geodetic Reference System monuments and improve local surveying;
- Arkansas Delta Agricultural Landuse Mapping. With funding provided by the Arkansas Legislature, NCRI-SW staff are preparing a detailed agricultural land use/land cover map for the 27 counties of the Arkansas Mississippi River Deltas.

South Georgia Regional Development Center (NCRI-SE).—NCRI-SE's program is an integral component of the South Georgia Regional Development Center—a regional agency that supports local governments across ten counties. NCRI-SE's primary objective is to encourage the use of geographic information for ecologically responsible decision making in this primarily rural region. "Real world" presentations by NCRI-SE using actual local geographic data has proven to be an effective method of demonstrating the value of GIS. This, coupled with the experience gained by NCRI-SE personnel from implementing GIS for local governments, has proven invaluable to government managers in the south east region. NCRI-SE also provides direct technical and "hands on" advice and training for any regional entities working in the GIS realm.

NCRI-SE in the past year has added these to its accomplishments:

- Completing Ben Hill County parcels and roads for local tax office;
- Completion of City of Fitzgerald, GA GIS including roads, parcels city limits and zoning;
- Added utility meter locations to current GIS for Adel, GA;
- Delivery of Parcel GIS to Cook County tax office;
- Added soils and trees coverage to current Cook County GIS.

University of North Dakota-Grand Forks (NCRI-NC).—NCRI-NC's interdisciplinary research and technology transfer programs are located and supported at the University of North Dakota Regional Weather Information Center. From this facility, NCRI-NC is linked to the UND Aerospace Scientific Computing Center which houses a CRAY J90. The resource issues in the region are related to the enhancement and protection of farming and ranching which are principal contributors to the region's economy. The work performed by NCRI-NC and the Regional Weather Information Center has resulted in their being recognized by the Ford Foundation as a semifinalist in the 1995 Innovations in American Government Awards Program.

NCRI-NC has the following accomplishments to present:

- Developed GIS designed and implemented strategy for Grand Forks Air Force base low level flight hazards GIS system;
- Provided proof of concept for insurance industry on damage assessment from Doppler radar and GIS data integration;
- Provided technical knowledge and assistance for Grand Forks City and County emergency management personnel on the acquisition and implementation of a GIS system;
- Provided weather related information to North Dakota congressional delegates for legislative decision making;
- In the process of providing Red River basin wide flood information via the Internet. This will include detailed maps and hot links to real time data;
- Participated in "The State of Education in Grand Forks, Kindergarten through Ph.D.", community based, interactive session, on what NCRI is all about;
- Participated in the University of North Dakota's "Creativity and Leadership Institute" with a short course entitled "Applications of Remote Sensing and GIS";
- Education and outreach was augmented this year with technology transfer to a local High School through their science club. This initial pilot group has an interest in Geographical Information Systems (GIS) for use with chemistry and biological studies. Through training with GIS software, chemical and biological measurements within a local ecosystem can now be brought together and spatially referenced. This transfer of technology will be continued so that the technology is used across the entire curriculum. This technology validates the entire process of science, from collection of georeferenced data through to the analysis of the information.

PART 1

1349

Central Washington University (NCRI-NW).—NCRI-NW continues to concentrate on the local and regional resource issues of the Yakima valley and eastern Washington. These issues include irrigation of agricultural lands' county planning needs, Native American interests, and the management of inter-mixed public and private lands. NCRI-NW works in close cooperation with the faculty and staff of Central Washington University as well as the GIS Lab.

The items listed below are noteworthy accomplishments of NCRI-NW:

- Completed digital soil surveys for Yakima, Asotin, Kitsap, and Okanogan Counties and the Snoqualmie Pass Area. These digital soil surveys are available to public agencies for use in land use and Growth Management Act planning, and will be a critical component for precision farming in the region;
- Completed several mapping projects for bird populations on the Hanford Nuclear Reservation. Studies will play a role in the future management of the Hanford Reservation and the Hanford Reach of the Columbia River;
- Provided mapping and analysis to assist with Bureau of Reclamation Teanaway River Project. This project is identifying water rights that can be leased or purchased to return water to the river to enhance salmonid habitat;
- Completed mapping and project for the Chelan County Conservation District. Results will be used in the Districts future planning.

University of Wisconsin-Madison (NCRI-GL).—The NCRI-Great Lakes project site is located at the Land Information and Computer Graphics Facility (LICGF) at the University of Wisconsin-Madison in the College of Agricultural and Life Sciences. The Facility was instituted in 1983 to function as a research, teaching, and outreach resource in land and geographic information systems (LIS/GIS). Researchers at LICGF explore uses of LIS/GIS for local and regional land and resource planning to support social, economic, and environmental decision-making processes.

NCRI-GI has added the following accomplishments to its roster of achievement:

- A four-hour satellite LIS/GIS distance education program for local governments was conducted on April 11, 1996. About 75 sites across the U.S. joined the program;
- LIS/GIS training for a variety of local governmental entities was expanded in our LICGF training facility;
- Continued determination of factors that encourage the implementation of automated LIS/GIS at the local level. A longitudinal survey is conducted annually to monitor adoption and diffusion of LIS/GIS at the county level;
- Results of innovations and benefits resulting from the Wisconsin Land Information Program (WLIP) were published nationally in *GeoInfo Systems* (October 1996);
- Work continues on the transfer of use of parcel scale tax assessment data as a tool for local land use and resource planning and management;
- This fall (1996), LICGF affiliates began a year long seminar entitled "Planning Wisconsin: Exploring the Role of LIS/GIS Technology." The focus of the seminar is to share with the university community, state, and federal agencies and other interested parties our experiences in the use of LIS/GIS through our website.

University of New Mexico.—The University of New Mexico (UNM) has been a future site of NCRI and has received small amounts of income from NCRI during that time. The personnel have been active in the development of New Mexico's state Geographic Information Systems (GIS) standards and the founding of the state's GIS Data Clearinghouse. NMERI has participated in various related committees, task forces, and programs aimed at bringing GIS and related technologies into wider use to solve real world problems.

Currently UNM has the following items as goals for the coming year:

- Cooperating with the Southwestern Indian Polytechnic Institute (SIPI) in a grant-funded UPWARD BOUND program for first generation college bound students;
- Producing a demonstration project which would disseminate precision farming techniques to Indian Reservations in Northern New Mexico;
- Cooperating with SIPI to produce and disseminate curriculum and Internet based teaching tools in Agricultural Science;
- A joint venture with SIPI to design, develop, and implement a comprehensive training and certification program in GIS, GPS, and Remote Sensing technologies for high-potential Native American students.

COOPERATIVE INITIATIVES

NCRI is immensely proud of its unique and effective national program that is producing better resource information systems in collaborative and cooperative efforts. We have accomplished much in our short lifetime and look forward to continuing

PART 1

1350

work for increasingly better public policy and decision making leading to sustainable communities and resources.

Senator Cochran, we appreciate this opportunity to provide testimony to the Senate Appropriations Subcommittee on Agriculture, Rural Development, and Related Agencies. The current level of funding (fiscal year 1997) for NCRI is \$844,000. NCRI requests that the current level of funding through the USDA/CSREES be restored to \$1.2 million for fiscal year 1998 to bring on board the University of New Mexico.

PREPARED STATEMENT OF W. RON ALLEN, PRESIDENT, NATIONAL CONGRESS OF
AMERICAN INDIANS

INTRODUCTION

Greetings Chairman Cochran, Senator Bumpers and distinguished members of the Agriculture Appropriations Subcommittee. Thank you for the opportunity to submit a statement for the record regarding the fiscal year 1998 agriculture program needs in Indian Country. My name is W. Ron Allen. I am the Chairman of the Jamestown S'Klallam Tribe of Washington State and President of the National Congress of American Indians (NCAI), the oldest, largest and most representative Indian organization in the nation. The NCAI was organized in 1944 in response to termination and assimilation policies promulgated by the federal government which proved to be devastating to Indian Nations and Indian people throughout the country. NCAI remains dedicated to advocating aggressively on behalf of the interests of our member tribes on a myriad of issues including the critical issue of adequate funding for Indian programs.

BACKGROUND INFORMATION

It is a rare occasion indeed, if ever, when Indian programs receive the federal funding required to fulfill the needs of Tribal members. Historically, Indian funding has lagged far behind that of non-Indian funding. This gap continues to grow, creating heavier burdens upon Tribal governments to deliver basic services to their members. Compared to all other sectors of the American populace, American Indians and Alaska Natives rank at or near the bottom of most social and economic indicators. Of the 557 federally-recognized Indian Tribes, a great majority of their populations are characterized by severe unemployment, high poverty rates, ill-health, poor nutrition and sub-standards housing. In 1989, the average unemployment rate in Indian Country was 52 percent, and by 1990 the rate had jumped to 56 percent.¹ The 1990 Census shows the percentage of Indian people living below the poverty line is 31.6 percent, or three times the national average. As one of its first priorities, the 105th Congress must critically review the budget reductions for Indian programs and reverse the downward direction the appropriations process has taken towards those programs.

The inadequacy of federal funding is especially true in the current budgetary era when the Congress and the nation have resolved to reduce and eliminate federal deficit spending. Local empowerment, the theme of the 104th Congress' federal downsizing and budget balancing initiative, was initially met with optimism by Tribes who considered this an opportunity for Congress to help nurture economic opportunities throughout Indian Country—that increased Tribal infrastructure development and other economic development opportunities would be harmonious with federal government's streamlining efforts. However, what Tribes were offered was the complete opposite. Budget cuts and welfare reform legislation have created a critical need for infrastructure and economic development opportunities on Indian lands, opportunities that the Senate Subcommittee on Agriculture Appropriations is in a unique position to provide. With current federal spending on Indian programs representing less than one percent (1 percent) of the total federal budget, Congress should look elsewhere for savings to reduce the federal deficit and hold harmless the rights and opportunities of the independent sovereign Tribal nations for which Congress has a solemn duty to protect and provide for under the Constitution of the United States.

THE FISCAL YEAR 1998 INDIAN AGRICULTURE BUDGET REQUEST

In 1996, Congress passed and the President signed into law the Federal Agriculture Improvement and Reform Act of 1996 ("FAIR", Public Law 104-127). This

¹See generally "1990 Census of Population—Characteristics of American Indians by Tribe and Language", U.S. Department of Commerce, Economic and Statistics Administration, Bureau of the Census.

PART 1

1351

law provides new mandates for the Department of Agriculture's Rural Development mission on infrastructure, housing, and business needs in remote areas. FAIR also recognizes the needs of Tribal governments for capital and infrastructure and authorizes a 3 percent set-aside for tribal infrastructure, housing, and related rural development projects. FAIR requires state-tribal "strategic plans" as well as separate Tribal "strategic plans" to include a detailed needs assessment as well as other factors involved with rural development.

Securing adequate appropriations for these programs is the key to their success in Indian Country. NCAI, along with Tribal governments and other Tribal organizations have been urging the Department of Agriculture and the Clinton Administration to request appropriations sufficient fund the 3 percent set-aside, as well as critical technical assistance, in the department's fiscal year 1998 budget request. The Agriculture Department has asked for Tribes to submit their needs assessments for economic and infrastructure development planning by March 1, 1997. Secretary Glickman addressed the NCAI Executive Council in Washington, D.C. about FAIR and the need for infrastructure initiatives in Indian Country. The Secretary indicated the department would look into providing technical assistance to Tribes to comply with FAIR, and would consider extending the March 1, 1997 deadline to allow tribes the time to participate in the 5-year period beginning in fiscal year 1998, which begins on October 1, 1997. However, we understand that the deadline was not extended and we do not know how many Tribes were able to meet this deadline.

Additionally, on March 12, 1997, the NCAI submitted to your office questions to be asked to under-Secretary Jill Long Thompson who was scheduled to testify before the Subcommittee the following day. These questions surrounded the 3 percent set-aside funding mandate, as well as the Department's position on extending the March 1, 1997 deadline for the submission of Tribal "strategic plans." In order to further ensure full tribal participation in FAIR, I urge Congress to support an appropriated 3 percent set aside, earmarked for tribal strategic plans development, technical assistance, and other Tribal needs associated with full Tribal participation in FAIR.

Along with Rural Development, other areas such as Natural Resource Conservation and Environment programs; Cooperative State Research, Education and Extension Services programs; and Food, Nutrition, and Consumer Services programs must all be funded at the maximum levels to ensure that the greatest tribal participation rates are achieved. The NCAI asks that the Subcommittee support the funding levels outlined in the President's request for the following programs that impact tribes.

Natural resources conservation services

- Zuni River Watershed Project—\$300,000;
- Outreach to Socially Disadvantaged Farmers Program—\$10 million (full funding level, CRAT Recommendation);
- Environmental Quality Incentive Program—\$300 million (with \$100 million targeted for assistance to minority and limited resources farmers, ranchers, and Indian nations, CRAT Recommendation).

Cooperative state and research, education and extension

- 1994 Institution Endowment Fund—\$4.6 million;
- 1994 Institution Strengthening Payments—\$1.45 million;
- 1994 Institution Extension Competitive Grants—\$5 million;
- 1994 Institution Institutional Capacity-Building Grants—\$1.7 million;
- Indian Reservation Extension Agent Positions—\$8 million;
- Adjust budget recommendations, develop statutory and regulatory changes, to eliminate disparate funding of the 1890 and 1994 land-grant institutions (CRAT Recommendation);
- Require land-grant institutions and major USDA programs to give priority to the research and educational needs of the socially disadvantaged, (CRAT Recommendation).

Rural development

- Rural Community Advancement Program—\$689 million;
- Rural Utilities Assistance Program—\$100 million (targeted annually from the Rural Utilities Service Water and Waste Disposal grant program to Indian Tribes, CRAT Recommendation);
- Distance Learning and Medical Link—(Target funds to Indian nations);
- Dedicate one-third of the Fund for Rural America to servicing the needs of socially disadvantaged customers (CRAT Recommendations).

The Food Distribution Program on Indian Reservations (FDPIR) is another very important program in Indian Country which requires the attention of the Sub-

PART 1

1352

committee in developing adequate funding levels. The impacts of welfare reform on tribal communities will surely create additional increases in the needs for commodities distribution, and therefore, the President's request of \$75 million should be considered the minimum level of funding for fiscal year 1998.

Tribes are not seeking handouts, they are seeking opportunities. The FAIR Act's tribal set-aside along with other USDA funding authority for tribal programs and services will provide those opportunities. Housing, infrastructure, and other community development provisions currently authorized by law must be followed through with adequate funding authorization by this Subcommittee.

CONCLUSION

Mr. Chairman, we urge the Senate to fulfill its fiduciary duty to American Indians and Alaska Natives and to uphold the trust responsibility, which includes the fulfillment of health, education and welfare needs of all Indian Tribes in the United States. This responsibility should never be compromised or diminished because of any Congressional agenda or party platform. Tribes throughout the nation relinquished their lands as well as their rights to liberty and property in exchange for this trust responsibility. The President's fiscal year 1998 budget acknowledges the fiduciary duty owed to tribes. We ask that the Senate consider the funding levels in the President's Budget as the minimum funding levels required by Congress to maintain the federal trust responsibility and by Indian Country to continue on our journey toward self-sufficiency. This concludes my statement. Thank you for allowing me to present for the record, the position of the National Congress of American Indians in regards to the President's fiscal year 1998 Budget. I will be happy to answer any additional questions for the record that you may have.

PREPARED STATEMENT OF RUSSELL C. NOTAR, PRESIDENT AND CEO, NATIONAL COOPERATIVE BUSINESS ASSOCIATION

Mr. Chairman, members of the committee, we appreciate the opportunity to present testimony as you prepare to consider appropriations for the Department of Agriculture for fiscal year 1998. I would like to discuss today our active support for rural economic development through a network of cooperative development centers, to recommend that Cooperative Services at USDA might play a more vital role in all such economic development if its authority were expanded to include service to all rural cooperatives rather than just farm cooperatives, and to suggest that an expanded role for Cooperative Services will require additional resources.

The National Cooperative Business Association (NCBA) is proud of its role in assisting the creation of a network of rural cooperative development centers across the country. We know that you are equally as proud of that achievement within the federal government, in that the USDA's Rural Cooperative Development Grants program has also supported this network in its efforts to revitalize rural America through the development of cooperatives.

The program I am referring to was originally authorized by section 2347 of the 1990 farm bill as a program of Grants for Technology Transfer and Cooperative Development. In fiscal year 1993, this committee began to provide funding for the program, and report language over the years has indicated your strong support for the concept of using this funding for the purpose of creating a network of centers for rural cooperative development.

NCBA and its members, along with other supporters of cooperatives around the nation, joined together as the National Rural Cooperative Development Task Force to advocate for support for a national network of centers and to develop the linkages among the centers and between the centers and local partners to sustain the network's development. NCBA also launched the CLUSA (our former name) Institute for Cooperative Development to coordinate our development efforts and focus resources on cooperative economic development. The CLUSA Institute is now working with ten regional centers providing vital technical assistance and support for the development of cooperative enterprises in rural America.

Last year, Congress demonstrated its strong commitment to the centers approach when it passed the FAIR Act, also known as the 1996 farm bill. The program is now called Grants for Rural Cooperative Development in section 747(c)(4) of Public Law 104-127. The program focuses on supporting "nonprofit institutions for the purpose of enabling the institutions to establish and operate centers for rural cooperative development." It is authorized to provide funding at \$50 million per year. The new statutory language defines the goals of these centers as "facilitat[ing] the creation of jobs in rural areas through the development of new rural cooperatives, value added processing, and rural businesses."

PART 1

1353

With the support of funding received from the program over the past few years, the rural cooperative development centers we work with have demonstrated quantifiable results. Centers in different regions of the country have given crucial help to the formation of farmer cooperatives building value added processing facilities, community development credit unions, partnerships among cooperative financial institutions, flexible manufacturing networks, and cooperatives providing housing and child care for impoverished farmworkers. I am including a copy of a document entitled "Best Practices for Cooperative Development: Defining, Communicating and Replicating Success" with this testimony. This narrative describes some of these projects the centers have undertaken and the concrete results they are achieving.

This coming year, centers will be involved in replicating successes they have achieved and breaking new ground in areas where cooperative development is needed. The electricity industry is rapidly being deregulated in every part of the country. Consumer-owned rural electric cooperatives have provided reliable and affordable electricity to rural Americans since the rural electrification program began directing federal resources for them in the 1930's. Once again, a small federal investment can provide essential assistance to develop consumer-owned energy purchasing cooperatives so that Americans are able to provide themselves with access to electricity. Centers are providing the opportunity for people to own and control these cooperative businesses.

The President has proposed allocating \$1.7 million in his budget for this program. Though these funds would indeed provide important support for the centers' endeavors, additional funding would have a far greater impact. In fiscal year 1996, 87 proposals submitted for program funding qualified for approval under USDA's selection criteria. The total amount of funding requested for these meritorious applications was \$13 million. The Administration recognized the importance of this program when it requested that \$5 million be allocated to it for fiscal year 1995.

We believe that \$5 million in funding for the program would be a wise and cost-effective use of the limited funds available for rural development in the federal budget. Each dollar invested in cooperative development has a multiplier effect which results in increased benefits for the U.S. economy.

Let me turn now to Cooperative Services. For decades, this office, formerly known as Agricultural Cooperative Services, has provided invaluable technical assistance and basic information that has furthered the creation of new cooperatives. As the federal government diminishes its role in supporting rural economies through commodity price support programs, it is critical that some of that funding be reallocated to promoting alternative forms of economic development in rural America.

Legislation has been circulating within USDA, and will be coming to the Hill soon, that would pave the way for an expanded role for Cooperative Services by allowing it to assist in the creation of all types of new cooperatives in rural areas. We support that as being a vital contribution to the work being undertaken by the network of centers. We hope that along with the new authority, Cooperative Services will be given the resources it needs to maintain its ongoing work while accepting these new responsibilities.

NCBA is a national cross-industry membership and trade association representing cooperatives—over 100 million Americans and 47,000 businesses ranging in size from small buying clubs to businesses included in the Fortune 500. Founded in 1916 and known for many years as the Cooperative League of the USA (CLUSA), NCBA's membership includes cooperatives in the fields of housing, health care, finance, insurance, child care, agricultural marketing and supply, rural utilities and consumer goods and services, as well as associations of cooperatives. NCBA's mission is to develop, advance, and protect cooperative enterprise.

PREPARED STATEMENT OF THE NATIONAL COUNCIL OF FARMER COOPERATIVES

The National Council of Farmer Cooperatives (NCFC) appreciates very much this opportunity to share its views regarding the fiscal year 1998 agriculture appropriations bill, and respectfully request that this statement be made a part of the official hearing record.

OVERVIEW OF NCFC

The National Council of Farmer Cooperatives (NCFC) is a national trade association representing nearly 100 regional marketing, supply and credit cooperatives, along with 31 state councils. Included among these regional cooperatives are over 4,000 local cooperatives with a combined membership of nearly 2 million individual farmers.

PART 1

1354

These farmer-owned cooperative businesses are engaged in virtually every facet of agriculture. This includes handling, processing, marketing and exporting of U.S. produced agricultural commodities and related products; the manufacture, distribution and sale of farm supplies; and the providing of credit and related financial services, including export financing for, and on behalf of, their farmer owners.

SUPPORT FOR FARMER COOPERATIVES

For farmers, such cooperative self-help efforts provide the opportunity to reduce risks, capitalize on market opportunities and earn a greater return on their productivity and investment. Earnings derived from such business are returned to the cooperative's farmer owners on a patronage basis, which also helps contribute to local and regional economic activity as well as the national economy. Another important contribution is reflected in the fact that these cooperatives businesses also employ nearly 200,000 people with a combined payroll of approximately \$5 billion. Many of these jobs are in rural areas where employment opportunities are sometimes limited.

Looking to the future, we believe the ability of farmers to join together in such cooperative self-help efforts will become even more important. This is especially true as a result of several ongoing trends, including changes in farm policy under the new Federal Agriculture Improvement and Reform (FAIR) Act of 1996. There is now an even greater need to help ensure that farmers and their cooperatives are able to: (1) better manage the risks and uncertainty inherent in production agriculture; (2) capitalize on new market opportunities, including moving more into value-added production and processing; (3) compete more successfully in a global marketplace still characterized by subsidized foreign competition, and (4) help maintain and create needed jobs in communities throughout rural America.

RURAL BUSINESS-COOPERATIVE SERVICE

For these reasons, we strongly recommend that funding and staffing be strengthened for USDA's Rural Business-Cooperative Service (RBS) and its related programs aimed at achieving these important objectives. Such action would help ensure that USDA is fully able to carry-out its historical mission as mandated by Congress in support of farmer cooperatives.

EXPORT PROGRAMS

We also believe it important to maintain and strengthen funding for USDA's export programs, including the Market Access Program (MAP) and Foreign Market Development (FMD) Cooperator Program. We strongly urge that MAP be funded at no less than \$90 million for fiscal year 1998 as recommended by the Administration and that FMD be funded at a level of \$30 million (with additional funds as necessary to meet forward funding requirements); and we endorse the recommendations of the Coalition to Promote U.S. Agricultural Exports of which NCFC is a member.

Such programs have been tremendously successful and extremely cost-effective in expanding U.S. agricultural exports, countering subsidized foreign competition and protecting American jobs. They have also helped encourage and strengthen the ability of farmers to join together in cooperative efforts to promote their products in overseas markets and improve their income. Administered on a cost-share basis, they remain one of the few tools available to help American agriculture and American workers remain competitive in a global marketplace still characterized by subsidized foreign competition.

AGRICULTURAL RESEARCH

Another important area of emphasis when it comes to enhancing the global competitiveness of farmer cooperatives and American agriculture is research. It is equally important to help ensure that farmer cooperatives and American agriculture can continue to help provide consumers at home and abroad with a dependable supply of safe, high quality food and fiber at reasonable prices, while meeting important environmental and food safety objectives. This includes recognition of the need to help farmers, their cooperatives, and others engaged in agriculture meet the goals and requirements of such statutes as the Food Quality Protection Act (FQPA), the Clean Water Act (CWA), the Safe Drinking Water Act (SDWA) and the Clean Air Act (CAA), among others.

To help meet these challenges, we believe every effort should be made to help maintain and strengthen the highly successful public-private partnership involving USDA, the land grant universities and colleges, and the private sector. This in-

PART 1

1355

cludes providing needed funding at the federal level through USDA and ensuring that such funding helps achieve the important objectives outlined above.

CONSERVATION/EQIP

We strongly support continued funding for the Conservation Reserve Program (CRP), as well as Environmental Quality Incentives Program (EQIP), as recommended in the Administration's budget. Such programs are necessary to help achieve and maximize water quality and other environmental benefits. The CRP and EQIP programs in particular are critical to empowering farmers to continue voluntary efforts to sustain the natural resource base and to respond to societal expectations and demands with regard to water quality and protecting our natural resource base.

CROP PROTECTION/PESTICIDE PROGRAMS

The Administration's budget request includes funds for Integrated Pest Management (IPM) programs and IR-4 program to collect and analyze data on pesticide residues through the Pesticide Data Program (PDP); as well as funds for a consumption survey intended to improve information about children's food consumption patterns to be used by EPA.

With regard to this request, we endorse the comments being submitted by the Minor Crop Farmer Alliance (MCFA) of which NCFC is a member of its executive committee. USDA's role in this process is critical if the Food Quality Protection Act (FQPA) is to be implemented as intended by Congress.

In brief: (1) USDA is uniquely qualified to (a) gather and provide data to the EPA regarding pesticide use and dietary consumption patterns, and (b) to provide information about crop protection needs and efficacious and affordable alternatives; and (2) USDA has statutory obligations to carry-out regarding minor use pesticides pursuant to FQPA, including establishment of a minor use office and revolving fund to facilitate grower efforts to provide information needed to maintain or develop label uses. However, the Department must have the necessary resources to carry out such responsibilities.

MEAT INSPECTION/USER FEES

We are also concerned over the Administration's user fee proposal relating to Food Safety and Inspection Service (FSIS) meat inspection. Such meat inspection programs provide important public benefits relating to food safety and quality and should continue to be publicly funded. Farmers through their farmer-owned cooperatives are already contributing to meeting important food safety and quality requirements through investment in new Pathogen Reduction Hazard Analysis and Critical Control Point (HACCP) Systems for meat and poultry. The imposition of new user fees, to the extent that such fees could not be passed on to consumers, would impose an additional cost burden on farmer cooperatives and their farmer members, and reduce farm income. Again, in recognition of the public benefits of such programs and the need to maintain confidence in the safety and quality of such products, the federal government should maintain its historic role.

CONCLUSION

Mr. Chairman, on behalf of NCFC and its members, we want to again thank you for the opportunity to share our views with regard to the fiscal year 1998 agriculture appropriations bill. We recognize the difficult challenges facing you and your Subcommittee in the current budget environment. At the same time, it is important to recognize the contribution to deficit reduction that agriculture has made in recent years.

In concluding, we also wish to take this opportunity to express our appreciation to you and the members of the Subcommittee for your interest and support of farmer cooperatives and American agriculture.

PREPARED STATEMENT OF THE NATIONAL DRY BEAN COUNCIL

STRATEGIC PLAN FOR U.S. BEAN RESEARCH

Dry & Snap bean (*Phaseolus vulvaris* L.) are versatile short season, high value food crops that niche well into shorter production seasons of the northern and intermountain states, providing vital alternatives to growers where crop options are limited. Beans offer the consumer a healthy, tasty and inexpensive food choice as either low fat, low calories vitamin/mineral rich green bean pods or as a protein rich

PART 1

1356

source of complex carbohydrates and fiber in a variety of canned and dry bean products differing in color, size, shape, and flavor. Clinical studies have documented that the soluble fiber or pectin content of dry bean seed has potent effects in the prevention and treatment of chronic medical conditions such as cardiovascular disease, diabetes mellitus, and obesity, hypertension, cancer and diseases of the digestive tract. Beans are currently endorsed by the American Heart Association, the American Cancer Society, and the American Diabetes Association. The beans are touted by these Agencies as the fiber food of the 1990's. The canning and freezing industry for both seed and pod types is diverse and located across the country offering employment outside the 20 major production states. The same processing industry which cans over half the dry bean crop as beans in either clear brine, sauce with pork, or chili has seen an increase in production in the last 10 years of 10 million cases. This volume represents an increase of \$160 million to a current value in excess of \$900 million.

Production

Phaseolus dry edible beans are planted on approximately 1.5 million acres (1.1–2.6) in the U.S. Production fluctuates around 26.7 million hundred weight (cwt) annually, ranging from 19 million cwt in 1988 to over 32 million cwt in 1990, 1991, and 1995. On-farm value of this crop ranges from \$350 to \$700 million, depending on the season and price. The major production states ranked in order of acreage are: ND, MI, CO, NE, CA, ID, MN, WY, WA, NY, and KS. Ten dry bean commercial classes are produced in the U.S. and these are differentiated by color, size and shape of the bean.

In addition to production of Phaseolus dry beans, green bean, or snap bean production occurs in several regions of the U.S. (approximately 220,000 acres), with an estimated value of \$110M annually. States leading in snap bean production for processing are WI, OR, IL, MI, NY and ID. Snap beans for fresh market are grown primarily in FL, with smaller acreage in NJ, AR, and TN. Snap beans for fresh market are grown on approximately 80,000 acres nationwide with an additional value of \$80 million annually.

Utilization and exportation

Approximately 60 percent of the total U.S. dry bean production is consumed nationally. Over 90 percent of the navy bean crop is processed as canned baked beans, while only 20 percent of the pinto bean market class is processed as a canned food. Dry bean consumption has increased from 5.7 to 7.2 lbs. since 1984. This represents a 26 percent increase which is largely due to the recognition of the food and health value of beans.

A large share of the U.S. dry bean production is now targeted at export markets. Exports peaked in the early 1980's at over 12 million cwt. Currently, 40 percent of the U.S. production is exported with certain commercial classes grown exclusively for export. Cultural preferences in certain export markets for specific commercial classes of dry bean allows for diversification of U.S. dry bean agricultural production. Bean exports have played an important role in reducing the balance of payment deficit the U.S. suffers in world trade. Bean exports are becoming increasingly important because they are an indispensable protein source in Latin America and many developing countries particularly those in East Africa. Their value in famine relief in these countries is vital. The array of seed types currently grown in the U.S. makes beans an important choice to meet the energy and protein needs of estimated 21 million people at risk of death from starvation and disease in Central Africa.

CURRENT SCOPE OF U.S. BEAN RESEARCH

A major strength of the U.S. economy is its agricultural production. Stable U.S. agriculture production helps maintain a vibrant economy because food costs to consumers can be kept low yet still profitable to the producer. In addition, agricultural exports contribute substantially to reduce trade deficits. Continued U.S. dominance in agriculture will require major efforts to improve both crop productivity and quality while stabilizing or improving the physical environment. This process will allow U.S. agriculture to supply both domestic and world markets with affordable, high quality products and preserve precious natural resources for future generations. These efforts can only be accomplished by investing in strong agricultural research technologies. Beans can only continue to be a vital part of the U.S. agricultural economy if research to keep them competitive with other commodities continues.

The number of state and federal scientist years (SY's) devoted to bean research in the U.S. in all disciplines is approximately 27 (20 SY's—dry beans, 7 SY's—snap beans). The specific locations of the larger programs are shown on the attached table, along with the agencies involved, SY's, and primary research emphasis at

PART 1

1357

each location. A network of federally-supported USDA positions were established through the Agricultural Research Service (ARS) in the 1920's to support both public and private programs dedicated to dry bean and snap bean research. The ARS research mission for beans is to solve specific high priority problems of a national scope. A national research mission cannot be addressed by any single Agricultural Experiment Station. Moreover, since the bean industry is regionalized, ARS is in a better position to develop the necessary research teams to address problems that extend far and beyond state and regional boundaries. The national leadership extended by ARS scientists in areas of pathology, germplasm maintenance and enhancement and food quality genetics has strengthened the entire bean industry nationally. The present national bean research effort is operating at a minimal level but is effective because of the unique collaboration among state, federal and industry partners, fostered in part by the Western Regional W-150 project and nurseries and the Phaseolus Crop Advisory Committee.

A National Bean Research Task Force (NBRTF) has been formed to identify needs and concerns within the research community and to make recommendations to correct the deficiencies. The task force recognizes and appreciates the continued federal support for the ARS bean research positions at Prosser, WA; Beltsville, MD; and Mayaguez, PR, and for the increase in funding for the ARS food quality genetics position at E. Lansing, MI, but NBRTF is concerned by the lack of critical research areas of bean pathology. New and more virulent strains of bean pathogens have made a major onslaught in several bean production areas. There is critical need for research to characterize the new pathogens and develop strategies for resistance in the plant.

The NBRTF requests that the National Dry Bean Council (NDBC) lobby for support for federally supported research programs which are currently under funded and for the creation of a new position to solve critical problems caused by foliar, bacterial and fungal pathogens.

USDA—AGRICULTURAL RESEARCH SERVICE BEAN RESEARCH WORKERS AND FACILITIES

Goals and recommendations for fiscal year 1998

The National Dry Bean Council (NDBC) is urging Congress to approve funding in fiscal year 1998 for the USDA Agricultural Research Service (ARS) Plant Science Program that increases funding from fiscal year 1997 levels to the \$300,000 required by ARS to fund a CRIS project. This will enable the ARS to provide adequate support for these bean scientists.

Specifically, the NDBC is recommending Congress address the following priority needs in bean research.

Operations budget

1. Maintain the current ARS bean viral pathology position at Prosser, WA with the \$300,000 level of funding required by ARS to maintain a viable CRIS project. This position will enable ARS to effectively conduct research on common bean virus problems and resistance breeding and expand activities on bean root rots and allow ARS to address critical needs pertaining to disease resistance in the major bean seed production area in the U.S.

2. Appropriate an additional \$80,000 in fiscal year 1998 for the under funded ARS bean fungal pathology position at Beltsville, MD. The appropriation will bring the funding of this position up to the \$300,000 level required by ARS to maintain a viable CRIS project and enable the scientist to effectively conduct his research on bean rust pathology and genetics and expand activities on bean golden mosaic virus recently introduced into the U.S. and allow the ARS to successfully refill the position upon the retirement of the scientist.

3. Appropriate an additional \$300,000 in fiscal year 1998 for the ARS Sugar Beet and Bean Research Unit, Michigan State University, East Lansing, MI to correct a critical federal need in bean pathology, particularly in the area of foliar bacterial and fungal pathogens namely common blight, halo blight, bacterial brown spot, anthracnose, and white mold disease pathogens. The appropriation will enable the hiring of a bean bacteriologist/microbiologist to conduct the needed work pursued formerly by the late Dr. Saettler in the area of bean pathology. This critical position has been vacant for several years.

Background

A well-balanced approach to the nations's bean research needs requires the maintenance of a team of ARS bean research workers in diverse disciplines including genetics, germplasm enhancement, germplasm evaluation, pathology, quality, and molecular biology. In order to maintain an adequate team of ARS bean research workers, it is important that ARS research workers presently engaged in bean research

PART 1

1358

not be redirected to other crops and that vacancies created by retirements and deaths be filled and these programs maintained for bean research.

During the period from 1970 to 1990, the number of USDA-ARS bean research workers declined substantially, from 13.0 to 5.0 positions, a decrease of 56 percent. This decline severely hampered the ability of ARS to meet national bean research needs, and the SAKS to meet state bean research needs.

The total ARS budget increased by 67 percent from fiscal year 1980 to fiscal year 1990 while the bean appropriation remained constant at just under \$1.6 M. Total bean appropriations as a percent of total ARS budget in fiscal year 1980 was 0.43 percent which dropped to 0.25 percent by fiscal year 1990.

Unfortunately, the number of ARS bean researchers is again on the decline, due to the untimely death of Dr. Saettler in East Lansing, MI and the impending retirements of incumbents at the USDA, Prosser, WA and Beltsville, MD facilities. Action by Congress is needed to restore the national ARS bean research team to a level that can meet the nation's bean research needs.

In a real sense, the bean industry (dry and snap beans), although vitally important in specific other geographic regions, does not have the resources of the major crops to establish pathological or basic mission oriented expertise in every region where beans are grown. The USDA can mend this void by maintaining the vital network of scientists currently working and dealing with important regional pathogens, problems and opportunities which are of a national importance.

USDA/ARS BEAN PATHOLOGY RESEARCH POSITION PROSSER, WASHINGTON

The ARS BEAN Project at Prosser, Washington has been long standing with a presence under the legacies of D.W. Burke and M.J. Silbernagel. Under the leadership of these scientists, programs were developed to study the pathogenic variability of common bean mosaic virus (BCMV) and the introgression of diverse resistance genes into snap and dry bean germplasm, and the development of screening techniques for germplasm enhancement of root rot complex pathogens. The ARS Prosser, WA bean project has released over 10 snap bean lines and 18 dry bean lines in six distinct market classes. A number of the dry bean lines have become successful dry bean varieties in the West and Intermountain states (CO, ID, and WA) and the upper-Midwest (ND). The dry bean varieties developed by ARS, Prosser, WA have generated about \$1 billion in income to farmers in the Pacific NW over the past 20 years. Othello pinto bean is grown on about 50 percent of the pinto acreage in the west and intermountain region and has generate \$68 million revenue in the state of Idaho in the last 5 years. The ARS Prosser, WA bean project is currently under the leadership of Dr. Phillip Miklas who in addition to screening for root rot and introgressing genes form diverse germplasm, is conduction basic genetic studies on the resistance to different strains of BCMV, bacterial blight, rust and white mold. Mr. Miklas has developed effective cooperative research efforts with ARS and SAKS scientists at several locations in the US and Puerto Rico, and commercial plant breeders in CA and ID. Over 90 percent of the foundation and certified bean seed (dry and garden) is produced in California, Washington and Idaho. The ARS bean project at Prosser, WA has saved the Western bean seed industry considerable sums of money that could have been lost to disease epidemics. Over the years the facilities at Prosser, Washington have evolved to a point where there is an excellent infrastructure in which dry bean disease and germplasm enhancement research is conducted productively, efficiently, and has garnered a wide customer base. A rapport has been established with this customer base that is extremely supportive of ARS research efforts. In addition, nurseries have been established that facilitate long term research on the complex of bean root rot organisms and curly top virus.

Recommendation

In order to meet the President's budget requirements for ARS in fiscal year 1998, the Vegetable & Forage Crops production Research unit has been slated for closure. Under this plan, there is talk of moving bean research to Pullman, WA. The NDBC calls on ARS to maintain bean research at Prosser, WA and fund this project at \$300,000, the ARS guideline for programs. Prosser is near the bean production area and several long term nurseries have been established at or near Prosser to conduct bean pathology research. Many of the facilities at the Prosser Station have been developed to conduct bean research and are highly suitable to conduct the "cutting-edge" research that is fundamental to Dr. Miklas' CRIS. There are sufficient greenhouses to conduct the genetic introgression work and disease screening efforts.

The NDBC thinks its at a "water shed" in regards to federal support for bean research. Over the years ARS bean research positions have eroded to the point the NDBC wonders whether a critical mass of federal scientific expertise exists in the USA to conduct the type of research vitally needed to keep our industry healthy.

PART 1

1359

The NDBC urges Congress to maintain this vital ARS position and insure funding at \$300,000 in fiscal year 1998 for this position.

USDA/ARS BEAN FUNGAL PATHOLOGY RESEARCH POSITION BELTSVILLE, MARYLAND

Dr. J.R. Stavely, full-time ARS Research Plant Pathologist at Beltsville, devotes 100 percent of his research effort to the study of fungal pathogens attacking beans. Historically, Dr. Stavely has studied the foliar fungal pathogen causing rust disease in dry and snap beans. Dr. Stavely has developed important technologies for introgressing rust resistant genes into adapted and useful germplasm. He is also studying the new viral disease, Bean Golden Mosaic Virus, introduced in 1993 in South Florida. This disease has the potential to "wipe-out" the snap bean industry in Florida.

This highly productive ARS project has released 43 processing and 15 fresh market snap beans and 24 dry bean germplasm lines in three market classes. Research has focused on the introgression and pyramiding of resistance genes into both snap and dry beans as the most effective control of the variable rust pathogen. This long-term germplasm enhancement project involves identification of novel sources of resistance present in the USDA Plant Introduction collection, incorporation of these resistance genes, both individually and as groups, into snap bean and several dry bean market classes, and field evaluation of elite material in major production areas. In addition, basic plant pathological studies on the epidemiology and genetics of the rust fungus are conducted. The current project leader cooperates effectively with other USDA scientists, SAKS researchers in at least nine states, and commercial plant breeders. This position serves the national needs for bean research in the area of fungal pathogens attacking beans and provides leadership to SAKS and industry and snap bean breeding efforts.

Dr. Stavely's position is currently under funded, with a major portion of the funding utilized for salaries and greenhouse rental, leaving very little for research operating costs. An increase appropriation of \$80,000 is needed to enable Dr. Stavely to effectively conduct his research, by bringing his CRIS into line with the \$300,000 level of funding required by USDA.

Recommendation

The NDBC calls on ARS to maintain the program in bean rust pathology germplasm enhancement research at Beltsville, MD and expand the program into anthracnose disease pathology and study the bean golden mosaic virus disease. Increased funding to current ARS level of \$300,000 per year would allow this project to perform at optimum efficiency to develop improved rust, anthracnose, and bean golden mosaic resistant germplasm lines. An increased emphasis on the genetics of pathogen virulence will offer insights on the development of strategies needed to obtain stable rust and broad based genetic resistance to variable fungal and viral pathogens.

The NDBC urges Congress to appropriate an additional \$80,000 in fiscal year 1998 for this position to bring the funding level to the \$300,000 required by ARS to maintain a CRIS.

USDA/ARS BEAN PATHOLOGY RESEARCH POSITION EAST LANSING, MICHIGAN

There is a urgent need to create a new position in bean pathology at E. Lansing, MI recognizing that an increase in bacterial diseases is negatively affecting bean production in the Midwest and intermountain areas. An ARS Plant Pathology position addressing national problems caused by foliar bacterial pathogens was closed-out in 1992 due to the untimely death of then incumbent (Dr. A.W. Saettler). There are no funds to "backfill" this position. Dr. Saettler worked to determine the molecular and genetic basis of host and non-host resistance to the bean common bacterial blight pathogen, *Xanthomonas campestris* pv. *phaseoli*, develop molecular and immunological diagnostics to determine the epidemiology and population biology of common and halo bacterial blights, and design alternative control strategies, including biological, chemical, and cultural practices that will complement the move toward sustainable agricultural practices.

Dr. Saettler was an international expert on foliar bacterial pathogens of beans. he was the only bean pathologist in the USA (either SAES or Federal) that had an active and comprehensive research program on foliar bacterial pathogens of beans. Dr. Saettler's research contributed positively and significantly to several of today's highest national priorities as established by the National Research Council. In that position at E. Lansing, Dr. Saettler contributed to the development of 17 dry bean cultivars in five major market classes and he actively cooperated with other state and private bean research programs. The bean research community needs a patholo-

PART 1

1360

gist working full time on foliar bacterial pathogens. The work could best be done by ARS because of the national scope of the problem. This position must be funded at the \$300,000 level to meet ARS guidelines for CRIS positions.

Recommendation

The NDBC calls on ARS to create a new position in bean pathology at East Lansing, MI, at the level of funding commensurate with ARS guidelines. A qualified scientist should be recruited to fill the bean bacteriology position as soon as possible.

The NDBC urges Congress to appropriate an additional \$300,00 in fiscal year 1998 for the creation of the new position.

PREPARED STATEMENT OF THE NATIONAL EASTER SEAL SOCIETY

The National Easter Seal Society appreciates the opportunity to report on the substantial accomplishments of the USDA AgrAbility Program, and comment on the challenges and choices confronting over a half million people with disabilities who work in agricultural production. AgrAbility offers farmers, ranchers, and farmworkers with disabilities and their families the critical assistance that they need to stay productive in agriculture and active in rural economic and community life.

Easter Seals strongly recommends that the USDA AgrAbility Program be reauthorized. Continuation and expansion of AgrAbility is in the best interests of America's agricultural and rural communities. Notably, the 1990 Farm Bill statutory provision that established AgrAbility remains relevant and requires only minor updating.

The AgrAbility Program is an essential, unduplicated, hands-on resource for farmers, ranchers, and farmworkers with disabilities. It is the only USDA program dedi-

PART 1

1361

cated exclusively to helping disabled agricultural producers. It demonstrates the value of public-private partnership by securing donations of funds, talent, and materials to magnify the impact of a modest federal investment.

Small, but damaging, reductions in funding over the last two years resulted in a fiscal year 1997 appropriation of \$1.91 million, down from \$2.0 million in 1995. Regrettably, this decline may trigger a net loss of one or more existing state-level projects, and shuts out the dozen states seeking AgrAbility funds to initiate needed services. For this reason, Easter Seals encourages subcommittee members to advocate for increased funding for AgrAbility in fiscal year 1998 and beyond to assure the viability and capacity of existing AgrAbility projects, and address significant unmet need in currently unserved states.

The need for the AgrAbility Program has never been greater, and its accomplishments to date are remarkable by any standard. Please accept Easter Seals' recommendation that AgrAbility be continued through the 1997 reauthorization of federal agricultural education and research programs, and expanded through an increased allocation of \$4.0 million in fiscal year 1998. The justification for this action and related information follows.

DISABILITY & AGRICULTURE

Agricultural production is one of the nation's most hazardous occupations. Each year, approximately 200,000 people working in agriculture experience injuries that limit their ability to perform essential farm tasks. In Mississippi, for example, this means that 12,400 Mississippians working in agriculture are injured annually, with a significant percentage incurring permanent disabilities. Tens of thousands more across the country become disabled as a result of non-farm injuries, illnesses, other health conditions, and the aging process. Nationwide, approximately 500,000 agricultural workers have physical disabilities that prevent them from performing one or more essential farm tasks. Estimates of disability among farmers are often as high as 15 percent of all agricultural producers, as in Kentucky, where 13,350 or 15 percent of farm operators have physical or cognitive disabilities, and another 8,200 have disabling conditions that make farming difficult.

For many of these individuals, the presence of a disability jeopardizes their rural and agricultural futures. Rural isolation, a tradition of self-reliance, and gaps in rural service delivery systems frequently prevent agricultural workers with disabilities from taking advantage of growing expertise in modifying farm operations, adapting equipment, promoting farmstead accessibility, and using assistive technologies to safely accommodate disability in agricultural and rural settings. Yet, with some assistance, the majority of disabled agricultural workers can continue to earn their livelihoods in agriculture and participate fully in rural community life.

AGRABILITY'S ROLE & RECORD OF SUCCESS

The AgrAbility Program was established under the 1990 Farm Bill. The Farm Bill authorizes the Secretary of Agriculture to make grants to state extension services for conducting collaborative education and assistance programs for farmers with disabilities through state demonstration projects and related national training, technical assistance, and information dissemination. The program combines agricultural know-how with disability expertise to provide people with disabilities working in agriculture with the specialized services that they need to safely accommodate their disabilities in everyday farm operations. AgrAbility received strong bipartisan support during the 1996 Farm Bill reauthorization, and was extended through fiscal year 1997.

Under the statute, state and multi-state AgrAbility projects engage Extension Service agents, disability experts, rural professionals, and volunteers in offering an array of services, including: identifying and referring farmers with disabilities; providing on-the-farm technical assistance for agricultural workers on adapting and using farm equipment, buildings, and tools; restructuring farm operations; linking disabled farmers for peer support; providing agriculture-based education to prevent further injury and disability; and, upgrading the skills of Extension Service agents and other rural professionals to better promote success in agricultural production for people disabilities.

The USDA administers AgrAbility on a fair and competitive basis. Applications for state-level project funding are submitted annually to USDA for peer review and, if successful, qualify applicants for up to four years of support. At the end of a funding cycle, previously-funded projects compete on a level playing field with new applicants. Applications must demonstrate collaboration between a state extension service and one or more nonprofit disability organizations, and must propose a workplan

PART 1

1362

that reflects priorities established by the Farm Bill. Every year, a dozen or more unserved states seek AgrAbility funding from USDA to initiate project services.

AgrAbility provides customized assistance to farmers, ranchers, and farmworkers with disabilities and their families. The nature and degree of assistance depends on the individual's disability needs and agricultural operation. For example:

—Charlie Gogel and his family raise corn, hogs, and turkeys on a 200 acre farm near Dale, Indiana. In 1994, Charlie experienced a stroke that caused him to lose the use of his right arm, limited his overall strength, and reduced his ability to do calculations in his head. The Indiana AgrAbility Project, carried out by Purdue University's Breaking New Ground Resource Center (BNG), assessed Charlie's situation and helped him make the modifications needed to keep him fully productive on his farm. BNG staff recommended fixing the cam grinder so that Charlie could operate it from his tractor, modified a loading chute for the corn planter, so that Charlie no longer has to lift heavy bags; and, facilitated installation of a hydraulic lift on his combine to help him get on and off safely. Extra steps were attached to his tractors to help get him into his seat.

—Kentucky farmer, Raymond Read, lost his left arm in a silage chopper accident three years ago. After several months of not being able to farm, Raymond was contacted by AgrAbility staff to explore his desire and ability to get back to work. AgrAbility staff helped provide Raymond with power steering for his large cattle truck, an all-terrain vehicle for use on the farm, and a special welding hood designed for one-armed individuals. With AgrAbility's help, Raymond is now able to top tobacco, weld, repair equipment, check his herd of beef cattle, and haul them to market. Mr. Read is just one of the 186 farmers with disabilities that received direct assistance from the Kentucky AgrAbility Project since its inception in 1993.

—LeRoy Haberl of Carroll, Iowa grows cam, soybeans, and alfalfa and has a 400-head cow/calf operation. A genetic disorder that began in childhood has left LeRoy legally blind, with 20/400 vision that allows him to see only peripherally. LeRoy was referred to the Iowa AgrAbility Project by the Iowa Commission for the Blind. AgrAbility staff have helped LeRoy modify tools and equipment and are currently working to secure a scanner to read documents and a voice-activated computer to help him manage the farm. Since 1992, LeRoy has volunteered his time and expertise to help other disabled farmers as an AgrAbility peer counselor. He is currently mentoring two men with 20/300 vision set up a calf-raising operation in southwest Iowa. For his accomplishments and volunteerism, LeRoy was named the 1996 Farmer of the Year by the Easter Seal Society of Iowa, which, together with the Iowa State University Extension Service runs the Iowa AgrAbility Project.

—Dave Kemper is a 41-year old dairy farmer in Huntington County, Pennsylvania. He comes from a family of dairy farmers. Nearly two years ago, Dave was involved in a car accident that damaged his spine and left him with severe back pain and a degenerative bone condition. After Dave's injury, his twelve-year old son Daniel tended the 30 head of dairy cattle, shouldering predawn and evening milking duties, while Dave himself could do little more than sweep-up and give the cows shots. Dave reamed of AgrAbility of Pennsylvania, a joint effort of Penn State University and the Central Pennsylvania Easter Seal Society, at an extension service workshop and, within three months, he was receiving equipment and making modifications that would make him a full-time farmer. Specifically, AgrAbility staff helped Dave secure a new shock-absorbing tractor seat that swallowed the jolts that would otherwise have forced Dave off his tractor within minutes. They identified a milking pipeline to carry fresh milk, a chore that Dave can no longer do. They also identified a skid loader for Dave to use to do anything from shovel feed to scoop manure to drive in fence posts. According to Dave, AgrAbility's help means that he can do 90 percent of everything that needs to be done. In its first two years, the Pennsylvania AgrAbility Project has assisted 60 to 70 farmers like Dave, who, with some guidance and support, can continue in production agriculture.

Since 1991, twenty-one states have been served by AgrAbility projects. In the aggregate, AgrAbility is estimated to have:

—Provided direct on-farm assistance to 5,000 farmers, ranchers, and farmworkers with disabilities and their families.

—Provided information and advice to 10,000 persons with disabilities employed in agriculture and related occupations.

—Educated over 100,000 agricultural, rehabilitation, and rural health professionals on safely accommodating disability in agriculture.

—Recruited and trained more than 1,000 volunteers to assist agricultural producers with disabilities and their families.

PART 1

1363

—Reached approximately 6.1 million people through 3,200 exhibits, displays, and demonstrations to increase awareness of the challenges affecting and resources available to people with disabilities who work in agriculture.

CURRENT STATUS

In 1996, USDA received an allocation of \$1.97 million to support eighteen projects in nineteen states: Colorado, Idaho, Illinois, Indiana, Iowa, Kentucky, Minnesota, Missouri, Montana, Nebraska, New Jersey, New York, North Carolina, North Dakota, Ohio, Pennsylvania, South Dakota, Tennessee, and Wisconsin. The average grant award per state was \$85,000, which generally supported one-to-two persons (often part-time), at each partnering agency.

More than a dozen states have sought AgrAbility funding without success, including Arkansas, California, Georgia, and Washington. Other states, including Louisiana, Michigan, New Hampshire, South Carolina, and Vermont, had USDA-funded AgrAbility projects in the past and seek to re-establish their programs. Each of these states can demonstrate significant unmet needs among farm and ranch families affected by disability that AgrAbility could potentially address.

In 1997, USDA received \$1.91 million for AgrAbility. Easter Seals understands that the USDA received sixteen applications for AgrAbility project funding for fiscal year 1997. Only four awards are expected, so that, as noted earlier, the total number of AgrAbility projects in 1997 may drop to seventeen. It appears that fiscal year 1997 awards will be made to three established projects in Kentucky, Missouri, and Tennessee; and a new project will be launched in Mississippi. It does not appear that the dozen or so applications for current year funds to continue or initiate AgrAbility services in Arkansas, Vermont, Louisiana and other states were successful.

Easter Seals firmly believes that AgrAbility's lack of growth, even down-sizing, represents a tragic step backward in Congress' efforts to address staggering levels of unmet need among farm families affected by disability. Instead of limiting funding for AgrAbility, Easter Seals is encouraging House and Senate appropriations committees to double the federal investment. For too long, AgrAbility projects have been underfunded relative to need and objective. At \$85,000 per state, only a few staff can be hired to provide state-wide education and assistance to disabled farmers, educate rural professionals, recruit volunteers, and work with rural businesses on disability-related issues. Rising demand for services and the great distances that must be traveled to reach farmers and ranchers, severely strains even the most dedicated of AgrAbility's outstanding staff. Ultimately, failure to invest wisely and adequately in this worthwhile program will ultimately cause it to falter.

JUSTIFICATION OF REAUTHORIZATION AND FUNDING RECOMMENDATIONS

The National Easter Seal Society strongly believes that the USDA AgrAbility Program should be continued and expanded. Substantial unmet need among farmers with disabilities and the program's impressive track record to date warrant this action. The following points capture Easter Seal's Justification for reauthorization:

Cost-benefit.—AgrAbility generates practical solutions that enable people with disabilities to perform agricultural tasks safely and efficiently. Many solutions are low to moderate cost and can be fabricated on-site or locally, or obtained through networking available public and private resources. AgrAbility provides the strategic insights that promote self-help, peer support, and community responses to disability-related challenges. AgrAbility assistance helps prevent farmers from being forced out of farming and, in so doing, prevents the disruption to families and economic damage to rural communities that results. It is estimated that one rural business closes when ten farmers leave farming.

Rising demand.—Demand for AgrAbility assistance has skyrocketed since 1991. AgrAbility projects report waiting lists of farm families seeking assistance, and ever-greater numbers of requests for first-time and ongoing help from farmers, farm family members, agribusinesses, rural professionals, and the media. Many projects have cut back on educational outreach due to lack of resources. In states not served by AgrAbility, people with disabilities who work in agriculture receive information and advice via the mail and telephone. Because AgrAbility is a one-of-a-kind program, individuals interested in farming and disability have no alternative but to wait for assistance from AgrAbility staff. Lacking assistance, many disabled farmers employ unsafe or inefficient methods of accommodating their impairments, often leading to new or more serious disability. Mounting demand for assistance puts undue pressure on AgrAbility staff, who are already struggling to carry-out statewide program activities and attract new sources of funding to the program.

PART 1

1364

Core project support.—The 1990 and 1996 Farm Bills recognize that a minimum of \$150,000 per state is required to support basic AgrAbility project activities. Unfortunately, no project has received this amount to date. Easter Seals is seeking an appropriation of \$4.0 million in fiscal year 1998, which would fund 21 state projects at \$150,000 per project, enabling each state to hire at least one full-time professional to provide on-the-farm assistance. On average, one staff person can conduct assessments and serve 30–40 farm families affected by disability annually, which represents the current number of farm families on waiting lists for services in most states.

Non-Federal support.—AgrAbility project staff regularly pursue private sector resources to augment Federal funds and thereby enhance the impact of the program. John Deere, Land 'O Lakes, Country Companies, Kraft Foods, Farmer's Union, Farm Bureau, Kellogg Foundation, and the American Corn Grower's Association are among the groups that have recently contributed to the program. Locally, individuals and businesses regularly donate money, materials, equipment, and expertise to help disabled farmers.

The National Easter Seal Society is proud to contribute to the ongoing success of the USDA AgrAbility Program. Easter Seals believes that the original 1990 Farm Bill provision establishing the program in 1990 and restated in 1996, still accurately defines its purpose, scope of activity, and funding authority. Easter Seals proposes very minor modification of this original statutory language and report language, as follows:

—Simplify funding authority for state-level projects and the national training, technical assistance, and information dissemination project by eliminating the distinction between state and national level activities. Nationally-coordinated activities should be authorized to receive approximately 15 percent of overall program support. Total funding authority for the program would be unchanged at \$6.0 million. This change reflects current funding levels and practices. Since 1991, Congress has appropriated a single amount for the program and USDA has apportioned that amount between the AgrAbility Program's two components: state-level projects and the national project providing training, technical assistance, and information dissemination.

—Easter Seals recommends report language be included that provides USDA AgrAbility Program administrators with discretion to contract directly with a national nonprofit disability service organization that solely, or in collaboration with a land grant university-based extension service agency, is charged with carrying out national-level AgrAbility activities. Currently, USDA awards a single contract for nationally-coordinated training, technical assistance, and information dissemination activities to an extension service agency, with the nonprofit disability organization as subcontractor. This arrangement is unduly cumbersome for the extension service agency and potentially limiting for USDA.

The AgrAbility Program is an excellent example of how a relatively modest investment of public resources can boost rural productivity and substantially improve the quality of life for thousands of rural Americans with disabilities. It strengthens rural America by investing in people who, despite having disabilities, are highly motivated to stay in food and fiber production. With project support, these individuals overcome disability-related barriers, work hard, and contribute much to the rural economy. Without support, such individuals might be forced out of farming into non-rural employment, underemployment, or joblessness.

Please ensure that the USDA AgrAbility Program is continued and expanded through the current reauthorization of agricultural research and education programs and the fiscal year 1998 appropriations process. AgrAbility is a valuable, one-of-a-kind public-private partnership that has the potential to serve agricultural producers with disabilities and their families across America. Thank you for considering Easter Seals' views and recommendations.

For information contact Randall Rutta, National Easter Seal Society 202/347-3066.

PREPARED STATEMENT OF THE NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION

The Diagnostic Imaging and Therapy Systems Division of the National Electrical Manufacturers Association is pleased to provide testimony on fiscal year 1998 funding levels for the Food and Drug Administration. NEMA, headquartered in Rosslyn, Virginia, is the nation's largest trade association representing the electroindustry. NEMA's Diagnostic Imaging and Therapy Systems Division represents more than ninety-five percent of U.S. manufacturers of X-ray imaging, computed tomography, magnetic resonance imaging, diagnostic ultrasound, and nuclear imaging equip-

PART 1

1365

ment. In addition, the division represents manufacturers of picture archiving and communications systems, as well as manufacturers of extracorporeal lithotripters and radiation therapy equipment.

NEMA appears before the subcommittee today to express its strong opposition to the \$44.7 million in medical device user fees set forth in the administration's fiscal year 1998 budget submission. NEMA believes that these user fees are being used to camouflage severe reductions in FDA funding, and urges the members of the subcommittee to reject this hidden tax upon industry.

Under the administration's proposal, only \$107 million of the FDA's medical device program's overall budget of \$166 million would be funded by appropriated dollars. The remainder would be funded by user fees, including \$44.7 in medical device user fees. Absent the user fee revenue, and the agency's device program would be slashed by over \$40 million, resulting in severe reductions in the number of full time equivalent employees (FTE's). Clearly this a situation which holds the potential to severely undermine the agency's ability to protect the public health and safety.

FDA's rationale for requesting the additional user fee revenue rests upon the assertion user fee dollars would be used to enhance the agency's performance in a number of key areas, including product review times. Yet, by the agency's own estimate, product review times for 510(k) submittals are expected to increase by nearly 20 percent over fiscal year 1996 levels.¹ As this is the most common route to market for most innovations in medical technology, one is left to question the extent to which the increase in user fee revenue would lead to increased efficiency in agency operations.

Similarly, the agency's own stated performance goals call for the completion of first action on 80 percent of all 510(k) submittals within the first ninety days of the review cycle, as compared to actual fiscal year 1996 performance levels which indicate that the agency completed first action on 94 percent of all 510(k) submittals within ninety days. Furthermore, the agency's performance goals call for the completion of final action on 40 percent of all 510(k) submittals within ninety FDA days, as compared to an actual agency performance rate of 59 percent during the first nine months of fiscal year 1996.² Once again, it appears as if user fee revenue will be used to support diminished, rather than enhanced levels of product review performance for the agency.

Similar trends persist in the PMA and IDE areas. In the PMA area, for example, the agency's performance goals call for the completion of 35 percent of first actions on PMA submittals within 180 days, as compared to actual agency performance levels of 53 percent in fiscal year 1996. And with respect to PMA supplements, the agency calls for the completion of 55 percent of first actions on PMA supplements within 180 days, as compared to a performance level of 77 percent in fiscal year 1996. Finally, in the IDE area, FDA performance goals call for the completion of 90 percent of all IDE actions within thirty days, and the approval of 50 percent of all IDE submittals within the first review cycle. Compare this with actual fiscal year 1996 performance levels of initial action on 99 percent of all IDE's within thirty days, and final action on 73 percent of IDE submittals within the first review cycle.³ If diminished performance is to be the net result of user fee gains, one is left to ponder the agency's efficiency in its management of taxpayer dollars.

In past years, the subcommittee has had the wisdom to reject user fee proposals, correctly recognizing the proposal as a hidden tax upon industry. NEMA urges the members of the subcommittee to follow the same expeditious course of action this year.

Rather than impose a tax upon industry to fund FDA activities, NEMA believes that the true solution to the agency's funding dilemma lies in an increased reliance on independent scientific review organizations to perform many of the regulatory functions currently delegated to FDA. Specifically, NEMA envisions a public-private partnership for the regulation of medical devices. Under this scenario, enforcement responsibilities would continue to rest with FDA's Center for Devices and Radiological Health, along with the public health responsibilities of post-market surveillance, standards development (including global harmonization efforts), and education. Product review activities, as well as GMP inspections, would be assigned to independent scientific review organizations, which would function in a fashion similar to the notified bodies established under the recently adopted European frame work

¹ U.S. Department of Health and Human Services, "Justifications of Estimates for Appropriations Committees, Food and Drug Administration, Fiscal Year 1998" (Washington D.C.: U.S. Department of Health and Human Services, 1997), p. 87

² Ibid, p. 83.

³ Ibid, p. 84.

PART 1

1366

for the regulation of medical devices. In the U.S., a variety of independent testing laboratories are equipped to perform this function, most notably Underwriters Laboratories.

NEMA takes this position for several reasons. First and foremost, experience has shown that the current framework for the regulation of medical devices lacks the flexibility and responsiveness necessary to adapt to the changing technological requirements of the twenty-first century. Recent backlogs in agency review of new product submittals provide compelling evidence of FDA's inability to keep pace with device innovation. The cumbersome nature of FDA's product review process is further exacerbated by the agency's inability to attract and retain qualified personnel. Charging independent scientific review organizations with the review of new product submittals and the task of conducting GMP inspections will create a competitive labor market for both product reviewers and field inspectors.

Similarly, delegating product review and quality assurance responsibilities to independent scientific review organizations will result in a competitive framework for the review of new product submittals, thus leading to greater efficiency in the product review process. As mentioned previously, enforcement responsibilities would remain vested with FDA, including the authority to ensure that independent reviewers maintain credible and ethical relationships with regulated industry. Not only would the implementation of independent scientific review expedite product review times, it would also better position FDA to enter into mutual recognition agreements with European nations, thus enhancing the global competitiveness of U.S. manufacturers. Finally, to the extent that independent scientific review organizations would be funded directly by U.S. industry, delegating product review and inspection responsibilities to independent organizations would result in considerable savings to the taxpayer, as public resources would no longer be expended on product review activities. If this system for product review were in place today, nearly \$64 million in product review costs could have been trimmed from the fiscal year 1996 FDA budget.⁴

Finally, delegating FDA's product review and enforcement functions to independent scientific review organizations will enhance the scientific and technical expertise available to the agency, enabling the agency to make use of the best and the brightest of today's scientific researchers. This, in turn, holds the potential to re-focus the product review process on product performance.

NEMA believes that the agency has an important role to play as protector of the public health and safety, and does not advocate the wholesale privatization of the agency; nor does NEMA advocate delegating specific aspects of the agency's regulatory authority to other agencies. Rather, NEMA envisions the agency working with the private sector in a collaborative fashion to ensure the safety of health care technologies. In short, NEMA envisions a public-private partnership which builds upon the strengths of the current system for the regulation of medical devices while at the same time providing the flexibility to adopt to the constant pace of medical innovation.

It is this public-private partnership which NEMA envisions as the mechanism for carrying the important work of the Food and Drug Administration forward into the twenty-first century. In such a fashion, the FDA can continue to fulfill its important mission of ensuring public access to safe medical technologies while at the same time fostering the competitiveness of the U.S. medical device industry, a world leader in product innovation.

PREPARED STATEMENT OF THE NATIONAL PHARMACEUTICAL ALLIANCE

Mr. Chairman and Members of the Subcommittee, the National Pharmaceutical Alliance is pleased to have the opportunity to present these comments on the fiscal year 1998 budget requests for the Food and Drug Administration. NPA is a national trade association consisting of more than 170 companies dedicated to manufacturing and distributing safe, effective and affordable pharmaceutical products.

PRESENTATION OVERVIEW

Generic drugs represent one of the most cost-effective means of controlling U.S. healthcare costs. For example, consumers, insurance carriers, and the U.S. government spent an estimated \$85.35 billion on approximately 2.41 billion drug prescrip-

⁴U.S. Department of Health and Human Services, "Justifications of Estimates for Appropriations Committees, Food and Drug Administration, fiscal year 1996" (Washington D.C.: U.S. Department of Health and Human Services, 1995), p. 33.

PART 1

1367

tions in 1996 alone.¹ About half of those prescriptions were filled with generic versions of the prescribed drug.² Using conservative estimates, if generics were available for only one-third³ of the remaining 1.2 billion prescriptions, at 40 percent less than the price of the brand drug,⁴ the net savings would be \$5.6 billion annually.

While cost-effective generics have assisted in controlling health care costs in this country, additional savings could be realized if FDA reviewed generics within the statutorily required 180 days.⁵ With this potential for an estimated savings in health care costs of over \$5 billion annually, especially for lower income families, it is difficult to understand why generic approvals are not more of a government priority. Rather, in recent years, FDA has slowly and silently shifted its resources away from its generic approval program to other public health initiatives. This shift in agency priorities has created a governmental barrier that impedes approval and access to affordable generics.

NPA RECOMMENDATIONS TO EXPEDITE GENERIC DRUG APPROVALS

NPA commends this Subcommittee for including language in the Conference Report to its fiscal year 1997 Agriculture Appropriations bill that directed FDA to "use available funds to ensure compliance with its 180 day statutory review period for generic drug applications."⁶ NPA requests that the Subcommittee implement this report language in fiscal year 1998 by taking the following actions:

1. Appropriate \$13 million directly for the Office of Generic Drugs, in addition to its fiscal year 1997 funding level;

2. In the alternative, re-allocate \$13 million to OGD from FDA administrative of fees that oversee few, if any, programs with statutorily required deadlines;

3. As a further alternative, re-allocate sufficient funds to restore OGD FTE's to at least the fiscal year 1993 level of 155 FTE's;

4. As a final alternative, ensure that OGD and its programs maintain fiscal year 1997 funding levels in fiscal year 1998, despite the Administration's fiscal year 1998 budget request; and

5. Separately, require that FDA submit, as a line item, agency expenditures for, and by OGD.

TIMELY GENERIC APPROVALS WOULD SAVE CONSUMERS AND GOVERNMENT BILLIONS OF DOLLARS

NPA makes these recommendations because OGD often fails to meet its statutory obligation as to generic reviews, even though OGD has made valiant attempts to constructively utilize its resources and to streamline its generic approval process. Significant improvement in generic approval times will not occur through simple efficiency measures. Thus, a national commitment to substantially improve OGD's system is imperative.

Given the therapeutic and economic benefits of generic drugs, this nation's healthcare system, including its government entities, should further encourage the utilization and approval of cost-effective generics. It is estimated, for instance, that generic drugs typically enter the market at a price that is 25 percent less than that of the brand drug.⁷ Furthermore, within one year, the price of competing generics is estimated to be 45 percent below the brand; and at two to three years, the price will be 60 percent to 75 percent less than the brand drug.⁸ In 1996, the top 500 brand drug prices increased 4.1 percent, while the Producer Price Index and

¹ See IMS America, Inc. Sales and Prescription Data, cited in F-D-C Reports, Inc. ("The Pink Sheet"), Feb. 17, 1997, at T&G-16-17.

² See IMS International, Inc. Data, "Distribution of Prescriptions By Product Types" and "1995 New Prescriptions."

³ In support of our view that these estimates are conservative, the PRIME Institute estimates that a newly marketed generic drug captures 45 percent of the market within one year. See "Economic Impact of GATT Patent Extension on Currently Marketed Drugs," PRIME Institute, College of Pharmacy, University of Minnesota, March 1995, at Executive Summary.

⁴ From the time generic drugs are marketed, and for 3 years thereafter, generic prices are estimated at 25-75 percent below brand prices. See "Economic Impact," supra at footnote 4.

⁵ Under the law, FDA, through the Office of Generic Drugs, must review generic applications within 180 days. 21 U.S.C. §355(j)(4). Currently, OGD reviews only 55 percent of the ANDA's within that time (a 45 percent failure rate). See Generic Line, November 29, 1996, at 2-3 (Interview with OGD Director Douglas Sporn).

⁶ H.R. Rep. No. 104-726, 104th Cong., 2nd Sess., at 32 (1996) (accompanying H.R. 3603).

⁷ See "Economic Impact," Dora at footnote 3.

⁸ See id. A comparison of actual drug prices further illustrates these savings. For example, the 1996 wholesale brand price for Xanax 2 mg was \$140.32 per 100 tablets, while a generic wholesale price for the same product was \$12.24. See Red Book Update, Top Volume Rx Products, April 1996; McKesson's Multi-Source Complete Generics Catalog, Nov-Dec-Jan 1996.

PART 1

1368

Consumer Price Index for that period increased only 2.5 percent and 3.0 percent, respectively.⁹ Remarkably, generic drug prices decreased by 12.6 percent in 1996.¹⁰

Lower-priced generics provide economic advantages to individual Americans, especially to senior citizens, the 40 million Americans without health insurance, and the underinsured who need access to affordable pharmaceutical products.¹¹ Without access to generics, economically disadvantaged patients may postpone treatment until their medical conditions are advanced or may fail to seek treatment altogether. Generics also benefit private insurance carriers, as well as the U.S. government, which purchases prescription drugs through the Veterans Administration, the Department of Defense, and Medicaid.¹² Thus, the government itself has a vested interest in ensuring proper funding for an effective generic review process. More efficient approval times would offset an increase in appropriations by providing the government with additional savings in prescription costs each year.

Yet, the enormous public benefits of safe, effective and affordable generics cannot be realized, unless and until, OGD's funding is increased and its primary reviewing staff is expanded. Given that under fiscal year 1997 funding levels, OGD is straining to maintain its insufficient approval rates, it would be counter-productive if OGD's funds were further reduced. Unfortunately, the Administration's proposed budget could have that result. Although the Administration's fiscal year 1998 budget request includes \$13 million in generic user fees,¹³ it appears that those user fees are intended to replace current program expenditures, with a net loss to OGD. NPA is vehemently opposed to such action.

OGD LACKS THE NECESSARY RESOURCES TO MEET ITS STATUTORY REQUIREMENTS

Despite the obvious economic savings of generic drugs, their approval is often delayed due to OGD's insufficient staffing, inadequate resources, and increased workload. OGD has experienced a steady increase in ANDA filings over the last few years, causing a substantial application backlog. In 1995 alone, approximately 411 ANDA's were submitted to FDA, an increase of almost 100 from 1994.¹⁴ An estimated 453 ANDA's were submitted in 1996.¹⁵ Yet, of these 1995 and 1996 filings, OGD annually reviewed only 302 and 351 filings, respectively.¹⁶ A significant reduction in this application backlog is unlikely, given OGD's limited resources.

While ANDA filings have increased, OGD staffing and resources have been slowly and silently shifted to other agency initiatives. For example, between 1994 and 1996, 14 staff members were transferred out of OGD; 8 of whom were directly responsible for reviewing applications.¹⁷ An additional 17 staff members were reassigned to other administrative duties outside OGD, depleting OGD's staff to 125 FTE's for fiscal year 1996.¹⁸ Moreover, this depleted staff has been working beyond expected capacity—giving 110 percent—often without overtime compensation.¹⁹ If OGD remains understaffed, low morale, “burn-out,” and workload limitations will continue to delay the marketing of cost-effective generics.

This trend must be reversed at once. Instead of funding discretionary health initiatives, agency resources should be infused into the generic review program to ensure timely approvals. For instance, FDA could fund a fully functional OGD pro-

⁹ See 1996 National Association of Chain Drug Stores PRIME Index and February 13, 1997, press release (tracking prescription drug prices charged to retail pharmacies by manufacturers); Bureau of Labor Statistics' 1996 Producer Price Index (tracking finished goods) and 1996 Consumer Price Index.

¹¹ See Employee Benefit Research Institute's Appendix to Issue Brief No. 179, “Sources of Health Insurance and Characteristics of the Uninsured” (Nov. 1996).

¹² The VA purchased \$1.1 billion in prescription drugs in 1996. DOD purchased \$834 million in prescription drugs that same year. The Medicaid program purchased approximately \$900 million in prescription drugs in 1994 for a vast number of the estimated 33.4 million people over 65 and 3.7 million over 85 years of age. See Testimony before the House Committee on Appropriations, Subcommittee on Labor, Health and Human Services and Related Agencies, by June Gibbs Brown, Inspector General, HHS, Feb. 12, 1997; “Current Population Reports, Population Estimates and Projections,” Series P-25, No. 1018, U.S. Dep't of Commerce, Bureau of Consensus, 1989 (June 23, 1992 Supplement) at 21.

PART 1

1369

gram for about 1.5 percent of its annual budgeted.²⁰ Alternatively, FDA could re-allocate 15 percent of the appropriated funds from four of its administrative support offices, having an fiscal year 1997 budget of \$85.41 million and 954 FTE's.²¹ Restoring OGD's FTE's to at least the fiscal year 1993 level would be even less costly. Without an economic infusion, generic approvals will continue to slowly trickle out of FDA.

INCREASED EFFICIENCIES IN THE APPROVAL PROCESS WILL NOT ACCELERATE APPROVAL TIMES

OGD has accomplished a lot with its existing resources over the last few years. Specifically, generic drug median approval times have improved from 34 months in 1992 to 23 months in 1996.²² These improvements occurred, despite a reduced budget and staff, by streamlining OGD's approval process. Program improvements, some of which were industry recommendations, have included electronic data filing, public bioequivalence protocol reviews, and efficient labeling procedures. Yet, OGD continues to fall short of its statutory responsibility to review generics within 180 days.

The latest OGD statistics reveal that only 12 percent of the applications submitted are approved within 1 year.²³ Almost half of the applications approved in 1996 languished at the agency for 2-3 years.²⁴ Given OGD's six-month statutory mandate, this approval delay is unacceptable. While NPA intends to continue its dialogue with OGD on other program improvements, further efficiency measures will not significantly impact approval times. Rather, OGD requires adequate funding and staffing to function effectively.

RATIONALE FOR APPROPRIATING ADDITIONAL FUNDS FOR OGD

NPA maintains that Congress must re-establish FDA's priorities by appropriating and allocating resources directly to OGD. Only Congressional mandates can ensure that FDA will reverse its past trend and invest the necessary resources to ensure timely generic approvals. The agency has admitted as much by initiating an agency-industry discussion on the possibility of utilizing user fees to supplement OGD funding. While NPA's membership remains divided on the user fee issue, it has authorized its Board of Directors to begin discussions with FDA on user fees.

One important aspect of the recent agency-industry meetings concerns the agency's estimate for additional OGD funding. Specifically, the agency has asserted that an additional \$13 million per year will enable OGD to review 90 percent of the generic applications within the 180 day statutory time frame.²⁵ Based on this figure, NPA requests that the Subcommittee appropriate \$13 million to OGD within the fiscal year 1998 budget, in addition to its fiscal year 1997 funding level. An increase in appropriations earmarked for OGD is essential to dismantle the existing governmental barriers impeding access to affordable generics. The effectiveness of generics in reducing healthcare costs while providing safe and effective products to this nation cannot be fully realized without direct OGD appropriations.

In closing, the NPA would like to thank the Subcommittee for its time and attention concerning this critical aspect of FDA's fiscal year 1998 budget requests.

PREPARED STATEMENT CHUCK GUNNERSON, VICE PRESIDENT, LEGISLATIVE/ GOVERNMENT AFFAIRS, NATIONAL POTATO COUNCIL

My name is Chuck Gunnerson. I am a potato farmer from Minnesota and current Vice President Legislative/Government Affairs for the National Potato Council (the Council). On behalf of the Council, we thank you for your attention to the needs of our potato growers.

²⁰ "Full" funding is based on FDA's preliminary request for \$13 million in user fees. See FDA's "Preliminary Concepts Under Consideration For a Generic Drug User Fee Program" (Nov. 1996). FDA's fiscal year 1997 budget was \$996 million. See FDA Talk Paper, "1998 Budget Proposal for FDA," February 6, 1997.

²¹ The four offices are the Office of the Commissioner, the Office of Policy, the Office of External Affairs, and the Office of Management and Systems, which have important functions but administer few, if any, statutorily required programs. See FDA fiscal year 1998 Justification at 97-99, *supra* at footnote 13.

²² See "OGD Overview," *supra* at footnote 14; "Practical Solutions," *supra* at footnote 15.

²³ This figure considers the time from submission of the application to the time of final agency disposition. See "Practical Solutions," *supra* at footnote 15.

²⁴ See *id.*

²⁵ See *id.* The proposed \$13 million budget for user fees would cover 92 FTE's for review and support personnel and other program operating costs. *Id.*

PART 1

1370

The Council is the only trade association representing 10,500 commercial growers in 50 states. Our growers produce both seed potatoes and potatoes for consumption in a variety of forms. Annual production in 1995 was 442,531,000 cwt with a farm value of \$2.8 billion. Total value is substantially increased through processing. The potato crop clearly has a positive impact on the U.S. economy.

The potato is the most popular of all vegetables grown and consumed in the United States and in the world. Annual per capita consumption was 143 pounds in 1996 up from 107 pounds in 1962 and is increasing due to the advent of new products and heightened public awareness of the potato's excellent nutritional value. Potatoes are considered a stable consumer commodity and an integral, delicious component of the American diet.

THE COUNCIL PRIORITIES FOR FISCAL 1997 APPROPRIATIONS

The National Potato Council strongly urges that the Congress: (1) support Agricultural Research Service (ARS) funding for potatoes at fiscal year 1997 levels and continue to include report language urging that the ARS work with the National Potato Council in determining priorities, earmark an additional \$300,000 for the replacement of Dr. Joe Pavek, retiring plant breeder, at Aberdeen, Idaho, and oppose the USDA budget proposal to close ARS facilities at Prosser, Washington, and Orono, Maine. Much of the USDA research at Prosser has focused on reducing pesticide use through the development of pest resistant plants with genetic engineering. Eliminating USDA research at Prosser would appear to conflict with President Clinton's goal of helping minor crop producers find new ways to control pests while reducing pesticide use. The ARS lab in Orono is the only one in the northeast that approximates Maine's unique soil types and climatic conditions which are different from most other potato-producing areas. Maine is a humid area rather than arid with less than 10 percent of its production under irrigation. Closure of this facility would be disruptive to current research and marketing activities of the northeast. Considering current budget constraints, it is critical that the ARS, working with potato growers, is able to adjust current research to meet agreed upon priorities. This would allow for better program streamlining and effectiveness; (2) appropriate additional funds for a special grant under the Cooperative State Research Education and Extension Service (CSREES) to accelerate national efforts in breeding and varietal development to among other things eradicate or manage late blight disease. We urge that the CSREES Special Grant Program be increased from \$1.2 to \$2 million. We also support the Administration's budget request for the continuation of the USDA-IPM initiative and funds to meet the data requirements of the new Food Quality Protection Act; (3) appropriate adequate funds to the Animal and Plant Health Inspection Service (APHIS) to continue the Golden Nematode quarantine program, without which the industry would be subjected to probable export trade restrictions by importing nations; and (4) not restrict funding for the Market Access Program.

AGRICULTURAL RESEARCH SERVICE (ARS) FUNDING

For fiscal year 1998, in order to maintain the current level of research, the National Potato Council seeks at least the 1997 level of funding for all programs along with flexibility by ARS for potato research priority projects which would include more research on late blight. The Council specifically urges that the Appropriations Committee report also include language directing ARS to continue to work with the National Potato Council in determining priorities. We also hope that you will encourage the ARS, as potato base research funds come up for review, to direct more of such base funds into agreed upon higher priority research projects.

As you recall, the National Potato Research Proposal was the result of an intensive effort begun in 1984 between the Council and the ARS to identify national priority research issues of concern to the potato industry. Based on these identifiable research needs, the National Potato Research Proposal received initial funding from the Congress for ring rot diseases; early dying disease; marketing; aphids; potato beetle and varietal development.

The monies provided to the ARS have been greatly appreciated and the potato growers definitely see results from this research program. As a result of ARS research, potato varieties have been developed that are resistant to aphids which carry the potato leafroll virus. This virus limits potato yields and marketability by causing spotting and discoloration inside potatoes. The development of these resistant varieties should translate into reduced use of crop protection chemicals to control aphids on potatoes. We are getting feedback on research results back to the producer by having researchers speak at seminars and by making available to the potato industry a written summary of all research underway.

PART 1

1371

Potato growers recognize that, in order to remain a viable and competitive industry, we must constantly strive to improve production efficiency and market quality while reducing the use of pesticides. Through carefully planned and coordinated research, we believe we can continue to offer an excellent high-value product and maintain a viable and competitive industry in the United States.

The National Potato Council has agreed to work with USDA, EPA and FDA in what we call a National Stewardship Program. Our growers will work toward pest management practices that further reduce risk to humans and the environment. Flexibility in ARS potato research funds will greatly facilitate this effort.

It is important to note that representatives of the Council have held annual meetings with ARS officials, the most recent in December of 1996, to discuss the distribution and use of research funds. In response to this Committee's direction, the Council has worked closely with the ARS to ensure that the research conducted is meaningful and addresses industry problems in the most thorough, expeditious, and cost effective manner. The Council looks forward to continuing its close partnership with ARS to maximize the use of these important funds as this subcommittee has directed.

CSREES SPECIAL GRANT REQUEST

The Council has also been working with CSREES on priorities for potato research and extension.

We request \$2 million (an increase of \$800,000 over last year) for a special grant under the CSREES and urge that the Committee report repeat language included last year; "Potato research—The conferees expect the Department to ensure that funds provided to CSREES for potato research are utilized for varietal development/testing. Further, these funds are to be awarded competitively after review by the Potato Industry Working Group."

CSREES received 28 excellent proposals for variety development and testing in 1997, but due to funding limitations only 8 were funded. For example, two projects were submitted by New York, but only one was partially funded. Other states, including Wisconsin, Maryland, North Carolina and Colorado submitted proposals with only one, Colorado, receiving partial funding.

The Council will continue to work closely with USDA and will report annually to the Congress on the progress of current research and, once USDA's reviews are completed, the need for new research efforts.

GOLDEN NEMATODE QUARANTINE AND SURVEY

The Animal and Plant Health Inspection Service assures that potatoes are protected from the importation of harmful pests and diseases and works with potato growers in assuring that potatoes meet phytosanitary export requirements.

The Golden Nematode is a significant pest which has been quarantined by USDA-APHIS for over 50 years, and this pest has been confined to a few locations in New York state. Its commercial hosts are potatoes, tomatoes, and eggplants. It is important to our domestic industry and to our export market that this quarantine be continued and be effective. We are informed that federal budget reductions over the past several years have raised concerns over the future of this program. Funding for this program has dropped from almost \$900,000 in fiscal 1992 to \$444,000 in fiscal year 1997. We strongly urge that the 1997 level of \$444,000 be provided and used for regulation enforcement and survey work so that this program can continue in order to avoid jeopardizing domestic production and eliminating export markets.

MARKET ACCESS PROGRAM

The Foreign Agricultural Service (FAS) assists U.S. potato growers in the export market and administers funds provided to the National Potato Promotion Board under the Market Access Program (MAP). MAP and its predecessor program have been particularly successful since 1986 in helping potatoes gain greater access and product recognition in foreign markets and is legal under the new GATT agreement.

Industry research shows that there is a direct correlation between receiving MAP funds and the ability to effectively market overseas. With MAP assistance, the U.S. Potato Board has developed long-term markets for U.S. potato exports and created an outlet for surplus potatoes grown domestically, helping stabilize farm gate prices throughout the U.S. industry. As a direct result of promotional campaigns made possible by the pooling of industry monies and government MAP funds, U.S. potato exports have reached record volumes and values. Since 1986, total U.S. potato exports have increased three-fold in volume terms and almost six-fold in value, reaching an export value of over \$583 million in 1996. In fiscal year 1996, U.S. frozen potato exports alone were valued at over \$285 million, a 14 percent increase over

PART 1

1372

1995. Exports for 1986 were valued at \$64 million. Exports account for 8 percent of U.S. production. With MAP, U.S. potato exports have expanded to new markets in Asia and South America and the industry has diversified its marketing activities to include trade advertising, trade seminars, restaurant and food service promotions, industry orientation tours, merchandising, and research and evaluation.

During the recent Farm Bill debate, the U.S. potato industry in cooperation with a coalition of agricultural commodity groups fought to preserve the current MAP program. It was our industry's position then and remains our position today that substantive changes made to the MAP program by the 1993 Omnibus Budget Reconciliation Act and the 1996 Agricultural Appropriations Bill, which our industry supported, fully addressed the concerns raised by some in the Congress and others about program efficiencies and management. Those changes imposed minimum contribution amounts for nonprofit participants, required that all participants certify that funds supplement but do not supplant industry funds, imposed a five-year limit on the use of brand MAP funds in a given country, and gave priority funding to small U.S. entities and cooperatives under the branded program. Additional changes to the program made by the 1996 Farm Bill, which preclude direct MAP funding to large corporations and to foreign entities for foreign-produced products, ensure that the real beneficiaries of the MAP program will be U.S. farmers, cooperatives, and U.S. agricultural products.

One remaining concern about the MAP program relates to annual funding levels, which have been reduced by Congress over the last several years and again last year by the 1996 Farm Bill. U.S. potato growers were discouraged that the 1996 Farm Bill reduced program funding from its previous authorized level of \$110 million to \$90 million annually, and strongly believe that funding should eventually be restored to its previously high level of \$200 million to take full advantage of the WTO-legal program.

Despite funding cuts, we nevertheless are encouraged that Congress recognized the importance of continuing this fully accountable and result-oriented program for U.S. farmers. At a time when U.S. agriculture is struggling to compete with subsidized foreign competition and foreign governments are increasing GATT/WTO-legal promotional assistance to their agricultural sectors, we encourage Congress to keep in tact and extend greater funding to the one USDA program that has truly helped U.S. agricultural products compete in the global marketplace.

This concludes our statement and we would be pleased to respond to questions or provide further information for the record.

PREPARED STATEMENT OF JOHN F. O'NEAL, GENERAL COUNSEL, NATIONAL RURAL TELECOM ASSOCIATION

SUMMARY OF TESTIMONY REQUESTS

Project involved: Telecommunications lending programs administered by the Rural Utilities Service of the U.S. Department of Agriculture.

Actions proposed: Supporting loan levels for fiscal year 1998 in the same amounts as those contained in the Fiscal Year 1997 Agriculture Appropriations Act (Public Law 104-180) for hardship, cost-of-money, Rural Telephone Bank and guaranteed loan programs and the associated subsidy to support hardship and Rural Telephone Bank loans at existing levels. Also supporting funding for \$150 million in loan and \$21 million grant authority designated for distance learning and telemedicine purposes as requested in the President's budget. Supporting an extension of the language removing the 7 percent interest rate ceiling on cost-of-money loans for fiscal year 1998. Supporting continuation of the restriction on retirement of Rural Telephone Bank class A stock in fiscal year 1998 at the level contained in Public Law 104-180 and an extension of the prohibition against the transfer of Rural Telephone Bank funds to the general fund.

Mr. Chairman, Members of the Committee: My name is John F. O'Neal. I am General Counsel of the National Rural Telecom Association. NRTA is comprised primarily of commercial telephone companies which borrow their capital needs from the Rural Utilities Service of the U.S. Department of Agriculture (RUS) to furnish and improve telephone service in rural areas. Approximately 1,000, or 71 percent of the nation's local telephone systems borrow from RUS. About three-fourths of these are commercial telephone companies. RUS borrowers serve almost 6 million subscribers in 46 states and employ over 30,000 people. In accepting loan funds, borrowers assume an obligation under the act to serve the widest practical number of rural users within their service area.

PART 1

1373

PROGRAM BACKGROUND

Rural telephone systems have an ongoing need for long-term, fixed rate capital at affordable interest rates. Since 1949, that capital has been provided through telecommunications lending programs administered by the Rural Utilities Service and its predecessor, the Rural Electrification Agency (REA). Telephone loans are made for telephone facilities related to the furnishing, improvement or extension of rural telecommunications at the local exchange level.

RUS loans are made exclusively for capital improvements and loan funds are segregated from borrower operating revenues. Loans are not made to fund operating revenues or profits of the borrower system. There is a proscription in the Act against loans which would duplicate facilities and state authority to regulate telephone service is expressly preserved under the Rural Electrification Act.

Rural telephone systems operate at a severe geographical handicap when compared with other telephone companies. While almost 6 million rural telephone subscribers receive telephone service from RUS borrower systems, they account for only four percent of total U.S. subscribers. Clothe other hand, borrower service territories total 37 percent of the land area—nearly 1½ million square miles. RUS borrowers average about six subscribers per mile of telephone line and have an average of more than 1,000 route miles of lines in their systems.

Because of low-density and the inherent high cost of serving these areas, Congress made long-term, fixed rate loans available at reasonable rates of interest to assure that rural telephone subscribers, the ultimate beneficiaries of these programs, have comparable telephone service with their urban counterparts at affordable subscriber rates. This principle is especially valid today as the United States endeavors to deploy telecommunications “information superhighway” technology and as customers and regulators constantly demand improved and enhanced services.

At the same time, the underlying statutory authority which governs the current program has undergone significant change. In 1993, telecommunications lending was refocused toward facilities modernization. Most of the subsidy cost has been eliminated from the program. The subsidy that remains has been targeted to the highest cost, lowest density systems. Other loans are made at Treasury’s cost-of-money or greater. We are proud to support this committees’ and the Congress’ deficit reduction efforts without jeopardizing the important mission of modernizing rural telecommunications.

We are proud to state once again for the record that there has never been a default in the RUS/REA telephone program! All loans have been repaid in accordance with their terms with interest. As of December 31, 1996, over \$4 billion of principal and \$5 billion in interest had been paid by borrowers.

NEED FOR RUS TELECOMMUNICATIONS LENDING CONTINUES

The need for rural telecommunications lending is great today, possibly even greater than in the past. Technological advances make it imperative that rural telephone companies upgrade their systems to keep pace with improvements and provide the latest available technology to their subscribers.

As the rural telecommunications infrastructure continues to evolve, the benefits for rural life and the rural economy will be impressive. As existing distance learning programs prove, interactive optical fiber can provide education opportunities in even the smallest towns comparable to hiring many extra teachers. Using communications for medical diagnosis, monitoring and even treatment can help combat the shortage of doctors and the rash of rural hospital closings. Improved emergency services can save lives. For example, telephone systems are working to improve the ability of the 911 emergency system to recognize the location from which emergency calls originate to allow faster response.

Businesses like telemarketing and insurance can thrive in rural areas, and telecommuting can become a realistic employment option. RUS is already providing financing for digital switches, more optical fiber between central offices and for school and medical communications facilities, helping rural communities to reap the benefits of technology.

In addition, rural Americans continue the struggle to revitalize their rural economies. In light of the fact that both Congress and the President have recognized that telecommunications enhancement is a significant part of such development, the need for affordable capital to finance technological upgrading is greater than ever.

These rapid technological changes and federal policies of competition and deregulation in the telephone industry, as evidenced by last year’s passage of the “Telecommunications Act of 1996”, underscore the continuing need for targeted assistance to rural areas. The inherently higher costs to serve these areas have not abated. Regulatory trends towards encouraging competition among telephone sys-

PART 1

1374

tems increase pressures to shift more costs onto rural ratepayers. Interstate subscriber line charges of \$3.50 have already shifted costs to customers. Pressures to recover more and more of the higher costs of rural service from rural customers to foster urban competitive responses will further burden rural consumers. And, as rural rates rise, small telephone systems will tend to lose confidence that they can recover the investments for costly network upgrades.

1996 TELECOMMUNICATIONS ACT EFFECT ON RURAL AMERICA

Congress passed the Telecommunications Act of 1996 as the culmination of more than a decade of debating national telecommunications policy and balancing many diverse needs and interests. The 1996 Act responded to a number of rural needs and differences with a series of safeguards to ensure that rates, services and network development in rural America will be reasonably comparable to urban telecommunications opportunities.

The process of implementing the new law raises troubling uncertainties and concerns about whether the FCC and the states will honor the balance Congress achieved in its policy, as regulators (a) radically revise the mechanisms for preserving and advancing "universal service," (b) adjust the cost recovery responsibilities and allocations of authority between federal and state regulation, (c) effectuate the Act's somewhat different urban and rural ground rules for how new companies and incumbent universal service providers connect their networks and compensate each other and (d) peel back layers of regulation developed over a century. So far, the FCC has been overzealous in expanding the Act's market-opening provisions to give new entrants a regulatory head start and advantage at the expense of the Act's rural development and universal service provisions. The FCC is trying to usurp the role of competition by dictating a whole new—and wholly inadequate—way to measure the costs of modern, nationwide telecommunications access to information. Measuring rural telephone companies' costs for the networks they are already providing by theorizing about an imaginary, idealized new network, as the FCC proposes, threatens to undermine the Act's commitment to rural progress. The FCC is also neglecting the Act's requirement for "sufficient" high cost support for nationwide evolving universal service and network progress.

Both strong RUS and RTB programs to finance up-to-date rural facilities and closer FCC adherence to the Act's rural development objectives are crucial to rural America. Congress and the courts must carefully supervise the FCC's implementation to achieve the rural access to information and an evolving modern public network intended by Congress, as well as the benefits of deregulation and genuine competition.

EXPANDED CONGRESSIONAL MANDATES FOR RURAL TELECOMMUNICATIONS

Considerable loan demand also will be generated in the future because of two additional mandates for enhanced rural telecommunications standards contained in the authorizing legislation enacted in 1993 by Congress in Public Law 103-129.

First, Congress expanded the definition of a "rural area" to include towns up to 5,000 population from the previous standard of 1,500 which had the effect of qualifying substantial additional geographic areas of the country for loans. Second, as a prerequisite to eligibility for insured and Rural Telephone Bank loans, RUS, is in the process of approving a telecommunications modernization plan for each state which meet certain minimum statutory objectives for the deployment of modern telecommunications technology. Implementation of these plans will generate additional loan demand as rural telephone systems strive to meet these increased service objectives in the rural areas they serve.

These two Congressional mandates coupled with the need for stable financing sources to meet the infrastructure demands envisioned for rural areas by the new telecommunications act amply demonstrate the continuing need for this important program at the levels established in last year's appropriations act. They are:

5 percent hardship loans	\$75,000,000
Cost-of-money loans	300,000,000
Guaranteed loans	120,000,000
Rural telephone bank loans	175,000,000
Total	670,000,000

The President's budget request for this program closely parallels last year's approved loan levels with one important exception: Despite substantial ongoing demand, the President proposes to reduce hardship loans \$35 million next year. The savings are only about \$1.5 million dollars. Based on figures supplied by RUS, early

PART 1

1375

in this fiscal year there was a backlog of \$65 million in this program. At the end of the first quarter, the agency had already approved \$51 million hardship loans or almost 75 percent of the authorization for this entire fiscal year and had an additional \$84 million in applications on hand. We believe that the needs of this program balanced with the minimal cost to the taxpayer argue for its continuation at current levels given the fact that it provides funding for the neediest borrower systems serving the highest cost areas.

SPECIFIC ADDITIONAL REQUESTS

Removal of the 7 percent cap on cost-of-money loans

Again this year we are supporting removal of the 7 percent ceiling on cost-of-money loans. This Committee included language in the fiscal year 1996 act to permit cost-of-money loans approved to exceed the 7 percent per year interest rate ceiling contained in the authorizing act. The language was continued in the fiscal year 1997 act. We support an extension of this provision in the fiscal year 1998 bill. Long-term Treasury interest rates currently exceed 7 percent and may exceed 7 percent in fiscal year 1998. In that event, the cost-of-money loan program could be disrupted and loan levels not achieved since adequate subsidy would not be available to support the program at the authorized levels. For this reason, we believe it is important to incorporate this language in the bill again this year.

Restriction on retirement of class A government stock in the Rural Telephone Bank (RTB) and continuation of the prohibition against transfer of RTB funds to the general fund

The Committee should continue the restriction on retirement of the amount of class A stock by the Rural Telephone Bank in fiscal year 1998. The Bank is currently retiring the government's stock as required under current law. We believe that this process which began last year should continue to be an orderly one as contemplated by the retirement schedule enacted two years ago and continued in last year's bill to retire no more than 5 percent of the total class A stock in one year. The Committee should also continue the prohibition against the transfer of bank funds to the general fund of the Treasury along with the requirement that the bank receive interest on those funds. The private Class B and C stockholders of the Rural Telephone Bank have a vested ownership interest in the assets of the bank including its funds and their rights should not be abrogated.

Loans and grants for telemedicine and distance learning

Last year's Farm Bill (Public Law 104-127) authorized a new loan and grant program administered by RUS specifically devoted to telemedicine and distance learning. The purpose is to accelerate development of telemedicine and distance learning services in rural areas through the use of telecommunications, computer networks, and related advanced technologies by students, teachers, medical professionals, and rural residents. The President's budget requests \$150 million in loan authority for fiscal year 1998 and \$21 million in grants for these purposes. Loans are made at the government's cost-of-money.

We believe this program specifically designated for distance learning and telemedicine purposes is particularly important. Targeting funds in this manner should spur deployment of this new technology which is vital for the survival of rural schools, hospitals and the rural communities they serve. At the same time, we believe the level proposed strikes a cost effective balance for the taxpayer.

CONCLUSION

Thank you for the opportunity to present the association's views concerning this vital program. The telecommunications lending programs of RUS continue to work effectively and accomplish the objectives established by Congress at a minimal cost to the taxpayer.

PREPARED STATEMENT OF THE NATIONAL TELEPHONE COOPERATIVE ASSOCIATION

SUMMARY

Considering the current telecommunications demands being made by the Administration, Congress, and rural Americans, it is clear that the need for the Rural Utilities Service (RUS) telecommunications lending has never been greater. In this context, the National Telephone Cooperative Association (NTCA) strongly supports the continuation of the RUS telecommunications loan program. For nearly 48 years, the RUS and its predecessor, the REA, has carried out its mission, of both providing

PART 1

1376

and improving rural telephone service, with distinction. Appropriately funded, it will continue to do so well into the future. In short, RUS financing is critical to ensuring that rural Americans enjoy the benefits of the information revolution currently sweeping the nation.

INTRODUCTION

It is a pleasure to have the opportunity to discuss the current financing needs of the rural local exchange carrier (LEC) industry. In light of all that is occurring the telecommunications front, this discussion is urgently needed. NTCA, who represents our concerns here in Washington, is a national trade association representing nearly 500 small, rural cooperative and commercial telephone systems. These locally owned and operated LEC's are situated throughout our nation. More than 80 percent of NTCA's member systems and their subscribers have benefited by the RUS/REA telecommunications loan program.

NTCA's members, like most of the country's independent LEC's, evolved to serve the high cost rural areas of the nation. There can be no doubt regarding the high cost of providing telecommunications services to rural America. Just considering that these telcos provide service to approximately 40 percent of the nation's geographic area is convincing enough. In addition, when we consider that rural subscribers account for only 4.3 percent of the nation's total population, it quickly becomes clear why rural America is so costly to serve.

Congress recognized this unique financing dilemma confronting America's rural telecommunications providers as early as 1949. It was in that year that it amended the Rural Electrification Act (RE Act) was amended to create the REA telephone loan program. Congress planned for the future and fully understood that rural America's telecommunications financing needs would be ongoing. It charged the REA with the responsibility for making low interest loans to both a " * * * furnish and improve * * *" rural telephone service.

In keeping with its mission, Congress has periodically amended the RE Act to ensure that the original mission of the program is met. In 1971, the Rural Telephone Bank (RTB) was created as a supplemental source of direct loan financing. In 1973, the REA was provided with the ability to guarantee Federal Financing Bank (FFB) and private lender notes. In 1993, the Congress established a fourth program lending facet, the REA treasury-cost fund. Most recently, the reorganization of the U.S. Department of Agriculture facilitated consolidation of the Department's utility development programs through transferring the telecommunications loan and technical assistance programs of the REA to the Rural Utilities Service (RUS).

The infrastructure being deployed by a majority of rural LEC's today is capable of providing state-of-the-art services such as two-way interactive video links. These services are changing the destiny of rural America. Through this technology, rural Americans are assured of improved education, health care access, and business and government services. The RUS's telecommunications loan program is financing a significant portion of such infrastructure enhancement.

RESPONSIBILITIES CONFRONTING INDUSTRY ARE SUBSTANTIAL

The success of private/public partnership represented by NTCA's members' use of the RUS telecommunications loan program is substantial. This partnership boasts infrastructure of a highly sophisticated quality. With the assistance of RUS capital and technical standards, NTCA's members are leaders in modernizing their telecommunications systems. This financing partnership fosters a true commitment to rural residents. Compared to their urban counterparts, rural communities are faced with higher poverty rates, lower income levels, and higher costs of delivering modern infrastructure.

These rapid changes are underscored by recent actions taken with passage of the "Telecommunications Act of 1996." As we enact federal policies of competition and deregulation, the high costs associated with providing modern telecommunications services in rural areas will not diminish. Moreover, the mandated provisions for an evolving definition of universal service serves to emphasize the need for targeted assistance to rural areas. One year into implementation of the act, the FCC's interpretation of the law has held little regard for congressional intent particularly with respect to rural provisions that are vital to rural incumbent LEC's. These important provisions include universal service language mandating a national commitment to geographic toll rate averaging and consumer access to quality services at reasonable and affordable rates; interconnection exemption, suspension and modification language to spare rural LEC's from excessive new regulatory burdens; infrastructure sharing language requiring large carriers to engage in such sharing upon request

PART 1

1377

of a facilities based universal service designee that lacks resources; as well as other provisions important to the rural industry.

It is clear that without appropriate strong national safeguards the transition to a competitive and deregulatory telecommunications environment would damage the ability of rural Americans to fully participate in the information age. Today, RUS borrowers average only 6 miles per subscriber compared to 37 per mile for the larger, urban-oriented, non-RUS financed systems. This results in an average plant investment per subscriber that is 38 percent higher for RUS borrowers. Without the availability of affordable capital financing to compete and provide adequate, up-to-date services in an unfavorable environment, building adequate telecommunications infrastructure in rural communities will be untenable.

RUS: CONNECTING RURAL AMERICA TO THE FUTURE

Clearly, the RUS telecommunications loan program is helping extend benefits of the information superhighway to rural America. RUS telephone lending creates public-private partnerships that work to create telecommunications infrastructure. These federal resources have stimulated billions of dollars of private capital.

For example, in fiscal year 1996, a subsidy of just \$3.9 million generated \$670 million in federal loans and loan guarantees. For every dollar in government money invested, 4.5 private dollars were invested. RUS borrowers will use these funds to provide modem services to 74,811 rural families, install more than 8,000 miles of fiber optic facilities, and purchase 187 new digital switches.

The RUS is also making a difference in our rural schools, libraries, and hospitals. Since 1993, the RUS Distance Learning and Telemedicine (DLT) Grant and Loan program has provided 142 grants totaling over \$41.5 million for funding for interactive technology in rural schools, hospitals, and health clinics. This program has provided unprecedented educational opportunities for rural students and enhanced health care for rural residents.

As a result of this program, thousands of rural students will gain access to additional classes and advanced curriculum. The RUS reports that previously unavailable courses such as calculus, physics, chemistry, and accounting will be made available to 550 rural schools in 33 states. In addition, telemedicine facilities which provide cost-effective services such as 24 hour access to trauma specialists, continuing medical education, and distance consultations for pediatrics, obstetrics, cardiology, and oncology will be made available to 438 hospitals and clinics in 23 states. Simply stated, this critical program is allowing our rural citizens to overcome the isolated nature of their rural areas through the power of modern telecommunications.

To date, the RUS has made nearly \$11.4 billion in loans for the improvement and expansion of telecommunications development in our rural areas. At the end of 1996, about \$6.2 billion in principal and interest had been paid by borrowers. We are proud to claim that there has never been a loss for U.S. taxpayers through borrower default or abuse in 47 years of RUS telecommunications lending!

RECOMMENDATIONS FOR THE SUBCOMMITTEE'S CONSIDERATION

RUS telecommunications loan program

Increasing demand for expanded telecommunications services and infrastructure upgrades indicates the level of need. The amount of loan applications pending before RUS stands at more than \$300 million as of January 31, 1997. To allow for this demand to be met, NTCA recommends that the Committee consider the following RUS Telecommunications loan levels for fiscal year 1998:

5 percent hardship loans	\$75,000,000
Treasury-cost loans	300,000,000
F.B. Loan guarantees	120,000,000
Rural telephone bank loans	175,000,000
<hr/>	
Total	670,000,000

These loan levels are the same as the current fiscal year's funding provided by this committee and represent genuine commitment to rural telecommunications needs.

Removal of interest rate cap on Treasury-cost loans

We are also requesting that the Committee include language removing the 7 percent interest rate cap on Treasury-cost loans. This provision was included in this year's Fiscal Year 1997 Agriculture Appropriations Act, and it prevents the potential disruption of the program in the case where interest rates exceed 7 percent and

PART 1

1378

insufficient subsidy cannot support authorized lending levels. It is a continuation of current policy and supports the viability of this critical loan program.

Rural Telephone Bank (RTB) privatization issues

As the RTB continues the process of statutorily privatizing during the course of the current fiscal year, the committee should be reminded of the importance of the language included in last year's legislation ensuring that the cash assets of the RTB are not "swept" by Treasury.

In this Subcommittee's 1995 report, the Administration was directed to conduct a study on privatization and to report these findings to both authorizing and appropriating committees. Last June, the Administration released its findings from the study which concluded that privatization of the bank is viable as early as the end of 1998 so long as the interest formula is changed to reflect the actual cost of lending for the bank. Congress, RTB Stockholders, and the rural telecommunications industry deserve the benefit of having RTB privatization reviewed thoroughly.

RUS Distance learning and telemedicine (DLT) program

The RUS Distance Learning and Telemedicine Grant program has proven to be an indispensable tool for rural development. In this regard, NTCA urges the Committee to provide adequate funding for this critical program. NTCA supports the exciting initiative included with the recent enactment of the Farm Bill (Public Law 104-127). This legislation authorizes a \$150 million Distance Learning and Telemedicine cost-of-money loan and grant program that began in fiscal year 1996. As of January 1997, there is a \$30 million backlog in requests for funding from the program. In looking at fiscal year 1998, NTCA would encourage the Committee to consider funding this critical program for the purpose of extending benefits of modern telecommunications to rural America. However, to ensure that these networks are built, the RUS telecommunication loan programs must be fully funded to provide the necessary backbone for the DLT infrastructure.

CONCLUSION

The RUS telephone loan program bears a proud record and should remain in place to continue assisting the rural LEC industry to meet its service commitment to rural Americans. As changes to the nation's telecommunications policy are on the horizon, the continuation of the RUS telephone loan program is a critical necessity to ensure the highest standard of modern service in rural America. The rural segment of the nation's telecommunications infrastructure is critical to the national objective of universal telecommunications service. The RUS and the rural LEC industry are natural partners in linking all Americans to the "information super-highway."

As the nation faces substantial economic and technological challenges in the near future, rural areas must be equipped with the appropriate tools need to manage those challenges. The RUS telecommunications loan program has carried out its mission for more than 48 years with distinction and unrivaled financial reliability. Congress willing, the RUS can do the job necessary to connect rural America to the future!

Thank you for your time and consideration!

PREPARED STATEMENT OF WALTER GAINER, PRESIDENT, NATIONAL UTILITY CONTRACTORS ASSOCIATION

Mr. Chairman and members of the subcommittee, my name is Walter Gainer. I am president of W.F. Wilson & Sons, Inc., in Ellicott City, Maryland. I am pleased to appear before you today on behalf of the National Utility Contractors Association (NUCA). NUCA is comprised of about 2,000 companies that build and supply the materials for vital water, sewer, gas, and communications systems.

I have been in the business of building and repairing water and sewer systems for the past 28 years. My personal and professional experience has shown me that there is a critical need for federal water and sewer construction funding in rural America. Strong federal leadership and continued federal investment in the Rural Utilities Service Water and Waste Disposal Program is critical due to the institutional weaknesses of rural water and sewer entities. Among other disadvantages, these communities may have a limited tax base, a limited knowledge of financial markets and tools, or simply no authority to issue public debt to pay for improvements.

I grew up in a small town in Nicholas County, West Virginia. It was so far back in the mountains that they had to pipe sunshine into the area. Fortunately, the

PART 1

1379

local mill had a water system that was made available to the town. In the 1960's the mill changed hands, and the city built a new system with the help of federal rural water funds. Since then, many miles of water lines have been installed in Nicholas County. Like the benefits bestowed by the Rural Electric Administration back in the 1940's, these water lines have quite literally brought parts of the county into the modern world. I cannot tell you how important these lines have been in helping the growth of Nicholas County and other rural economies.

There is still a lot of work to be done. In Nicholas County, there is an area called Hinkle Mountain near Richwood that has been hoping to get a water system for the past 15 years. The people on Hinkle Mountain have been hauling water with tanks for years just like people in Third World countries. The residents have been told that they are not high on the project priority list. There are scores of other areas in worse shape. It's hard to believe that some in Congress fail to recognize the importance of construction assistance for basic services in rural areas.

At a time when everyone's talking about the Internet and other technological advances throughout industry, including utility construction, the concept of basic plumbing isn't very exciting. But if we don't address this issue, a lot of people are going to be left behind—way behind. I know they don't put brass plaques underground, but the Rural Utilities Service programs work for rural residents and should be funded until everyone in America has access to good drinking water and waste disposal facilities.

FISCAL 1998 RECOMMENDATION

We support the Administration's \$1.2 billion request for RUS Water and Waste Disposal Grants and Loans. This represents a much-needed increase in funds that will benefit hundreds of thousands of rural households and millions of people. Projects are ready to go. A backlog of pending loan and grant applications totaled more than \$4 billion at the end of 1996.

RURAL INFRASTRUCTURE NEEDS

The documented need for capital investment continues to climb as the federal government, in partnership with state and local governments, wrestles with budgetary constraints. Rural communities are hardest hit because they often lack any type of water or waste disposal system and have few technical or financial resources. The documented needs are irrefutable.

Wastewater

The U.S. EPA's 1992 needs assessment of publicly owned treatment facilities showed more than \$137 billion in wastewater collection and treatment needs over the next 20 years, including \$13.4 billion for communities with fewer than 10,000 residents. New collector sewers (\$5.2 billion), interceptor sewers (\$2.5 billion), and secondary treatment facilities (\$3.9 billion) account for most of rural America's documented wastewater infrastructure needs. EPA officials are currently working on a revised needs assessment that is expected to show even higher numbers. The new report is expected this September.

Drinking water

Drinking water needs assessments have been conducted by the U.S. EPA and the USDA. Safe Drinking Water Act treatment requirements are a significant factor driving infrastructure costs and needs, but the largest share of capital needs is for the repair and replacement of existing water supply and distribution infrastructure.

In January, the U.S. EPA released its first drinking water infrastructure survey, which found that more than \$138 billion is needed over the next 20 years for water infrastructure—transmission and distribution lines, water treatment plants, and water storage and supply facilities. The survey looked only at community water systems that have at least 15 service connections or regularly serve at least 25 residents. Small systems serving 3,300 or fewer people reported more than \$37 billion in construction needs, including \$23.8 billion to fix or build transmission and distribution pipes. Of particular concern for rural households is the fact that they represent the largest per-household need and are burdened with the highest per-household cost. The EPA believes that as many as 16 million households are not served by community water systems, and an unknown number of these homes lack a safe drinking water supply.

Last year the USDA presented the Water 2000 study, which found that as many as 8 million people have drinking water quality problems and approximately 1.1 million people lack indoor plumbing. The study concluded that at least \$10 billion is needed to address these problems.

PART 1

1380

BENEFITS OF CAPITAL INVESTMENT

Investment in rural water and sewer facilities generates important benefits in terms of public health and safety, economic growth, and environmental protection. For many rural communities, contaminated water, the inability to attract new businesses, and the lack of adequate fire protection are daily problems.

Public health and safety

Safe drinking water cannot be taken for granted. The dangers posed by microbiological organisms and chemical contaminants in water are certainly well-known to this committee. The Water 2000 assessment cited earlier demonstrated that water supplies in rural areas are susceptible to contamination from farm runoff, including animal waste, herbicides, and pesticides. Regulations alone don't solve the problem. Capital infrastructure, including new and upgraded treatment plants and good distribution systems, go hand in glove with public health.

Public safety is an issue in old, dilapidated pipelines. For example, severely clogged or tuberculated water mains make fire protection difficult. This tends to be a problem in older, urban areas but can occur in rural areas with old systems. Similarly, aged sewer mains can collapse and create dangerous sinkholes if they are not rehabilitated or replaced.

Economic development

Water delivery and treatment systems must be in place before homes, schools, hospitals, and businesses can be established. No systems, no jobs. Conversely, investment in rural water and sewer systems stimulates the demand for goods and services. The investment enhances private-sector profitability, increases labor productivity, and stimulates private investment in plant and equipment.

A 1990 study published by NUCA showed that under a relatively conservative set of assumptions, a one-time investment in water and waste facilities of \$2.5 billion is self-financing in less than a decade as a result of the expanded tax base. Copies of the study are available upon request.

A 1992 study released by NUCA concluded that a many as 57,000 jobs are created for every \$1 billion invested in clean water projects. More than one-half of these jobs are permanent jobs that pay good wages.

Environmental protection

Untreated sewage and stormwater runoff can devastate water bodies. This occurs when collection and treatment systems are nonexistent and when pipes leak. For example, a leaking water main will often seep into sewer lines located below, with two results: (1) additional water flows to the treatment plant, which is unnecessary and costly, and (2) the treated water mixes with sewage and filtrates into the water table. The tuberculated pipes previously mentioned also require substantial additional power (electricity) to stay pressurized.

CONCLUSION

The overwhelming need for water and waste disposal investment in rural communities outweighs current funding resources at all levels of government. For this reason, NUCA has proposed the creation of a revenue-generating mechanism tied directly to water and sewer infrastructure. For example, broad-based user fees based on gallons of water consumed and/or wastewater discharged (e.g., a nickel per 1,000 gallons) could be funneled into federal or state trust funds.

In the meantime, we urge the subcommittee to strongly consider the administration's \$1.2 billion request for RUS Water and Waste Disposal programs in fiscal 1998. An appropriation of this magnitude will help address the enormous backlog of qualified applicants.

Mr. Chairman, we recognize that our country's future is at stake if we don't do something about runaway and wasteful spending. But we urge you to remember that clean water is one of the most important and most basic public needs out there.

Thanks once again for the opportunity to provide recommendations.

PREPARED STATEMENT OF RICHARD G. JONES, CHAIRMAN, NATIONAL WATERSHED
COALITION

Mr. Chairman and members of the subcommittee: The National Watershed Coalition (NWC) is pleased to present this testimony in support of some of the most beneficial water resource conservation programs ever developed in the United States. The Coalition recognizes full well the very difficult financial situation our nation faces. That makes the work of this Subcommittee very important. It also makes it

PART 1

1381

imperative that the federal programs that are continued are those that provide real benefit to society, and are not programs that would be nice to have if funds were unlimited. We believe that the Small Watershed Program (Public Law 83-566) and the Flood Prevention Operations Program (Public Law 78-534) are examples of those rare programs that address our nation's vital natural resources which are critical to our very survival, do so in a way that provide benefits in excess of costs, and are programs that serve as models for the way all federal programs should work.

The National Watershed Coalition is an alliance of national, regional, state and local organizations that have a common interest in advocating the use of the watershed when dealing with natural resource issues. We also support the use of total resource management principles in planning. We are advocates of both the Small Watershed Program and the Flood Prevention Operations Program administered by USDA's Natural Resources Conservation Service (NRCS), formerly the Soil Conservation Service (SCS). These resource protection programs deserve much higher priority than they have had in the past. Even in difficult financial times, their revitalization would pay dividends in monetary and other benefits, and jobs! The disastrous 1993 Midwest floods should have taught us something. If one examines the Report of the Interagency Floodplain Management Review Committee that studied that event, we see that flood damages were significantly reduced in areas where Public Law 566 projects were installed. The requests for disaster assistance were also less.

The watershed as the logical unit for dealing with natural resource problems has long been recognized. Public Law 566 offers a complete watershed management approach, and should have a prominent place in our current federal policy emphasizing watersheds and total resource management based planning. Why should the federal government be involved with these watershed programs?

- They are programs whose objectives are the sustaining of our nation's precious natural resources for generations to come.
- They are not federal, but federally assisted. They do not represent the continued growth of the federal government.
- They are locally initiated and driven. Decisions are made by people affected, and respect private property rights.
- They share costs between the federal government and local people. Local sponsors pay between 30-40 percent of the total cost of Public Law 566 projects.
- They produce net benefits to society. The most recent program evaluation (1987) demonstrated the actual ratio of benefits to costs was approximately 2.2:1. The actual adjusted economic benefits exceeded the planned benefits by 34 percent. How many other federal programs do so well?
- They consider and enhance environmental values. Projects are subject to the discipline of being planned following the National Environmental Policy Act (NEPA), and the federal "Principles and Guidelines" for land and water projects. That is public scrutiny.
- They are flexible programs that can adapt to changing needs and priorities. Objectives that can be addressed are flood damage reduction, watershed protection (erosion and sediment control), water quality improvement, rural water supply, water conservation, fish and wildlife habitat improvement, recreation, irrigation and water management, etc. That is flexibility.
- They are programs that encourage all citizens to participate.
- They can address the needs of low income and minority communities.
- And best of all—they are programs the people like!

The National Watershed Coalition commends the Congress for the support given these programs over the years, and hopes that the outcome of the fiscal year 1998 appropriations process will enable this vital work to continue and expand as we seek to preserve, protect and better manage our nation's water and land resources. Every State in the United States has benefited from the Small Watershed Program.

In order to continue this high priority work in partnership with states and local governments, the Coalition recommends a fiscal year 1998 funding level of \$350 million for Watersheds and Flood Prevention Operations, Public Laws 566 and 534. The allocation between these two programs is best left to the NRCS. Of this amount, we would suggest that \$10 million be used for structural rehabilitation and replacement, and \$10 million be used for wetland acquisition as authorized by the 1990 Farm Bill. We recognize that in these difficult financial times, the Congress may not find it possible to provide that amount, but we also believe that we are not doing our job of helping you recognize the true need if we continually recommend the federal share of these needed funds be less. We would hope that everyone understand that these funds are only a part of the total that are committed to this vital purpose. The local project sponsors in these "federally assisted" endeavors, have a tremendous investment also. Additionally, the Coalition supports \$10.5 million for

PART 1

1382

watershed planning, \$13.0 million for River Basin Surveys and Investigations, and \$38.0 million for the Resource Conservation and Development Program (RC&D). The Coalition also supports \$6.6 million for the Forestry Incentives Program. We also suggest that the Emergency Watershed Program (EWP) be provided with \$20 million to allow the NRCS to provide rapid response in time of natural disaster.

In addition to offering our thoughts on needed conservation program budget levels, we would like to express our great concern with the way in which the Administration's budget proposes to change the watershed program funding in fiscal year 1998. The Administration proposes taking \$60 million from the Public Law 83-566 Small Watershed Program, and putting it in the NRCS Conservation Operations account. While the Administration's budget suggests this approach simply combines some of the NRCS's technical assistance expenses into one account, and the funds will be used for "water resource assistance," we believe this is a means to put these funds in an account where they will not be used for Public Law 83-566 Small Watershed Projects, but instead will be spread around with virtually no program accountability. In our view this represents the long time desire of some in the Administration to circumvent the will of the Congress and eliminate Small Watershed Projects. The Administration's budget also eliminates any funding for the eleven watersheds authorized by the Flood Control Act of 1944 (Public Law 78-534), which was about \$18 million in 1997, but suggests that "worthwhile Public Law 534 projects" can be continued under the Small Watershed Program, Public Law 83-566 (with no funding?). We see this as a way to again administratively eliminate a Congressionally mandated program which some in the Administration don't care for, but one which has provided millions of dollars of benefits to society. Watershed project sponsors, who were encouraged to assume such responsibility by the federal government, now feel abandoned by that same federal "partner." The Administration's budget also provides an additional \$18 million in the RC&D program account (was this the Public Law 534 funding?), for funding local, non-federal, watershed and rangeland "coordinators." We believe it's time for less "coordinating", and more actual work on the ground. It seems to us that the money taken from the Small Watershed Program (\$60 million put in the Conservation Operations account and \$18 million in the RC&D account) would be far better used, and provide many more real benefits, if left in the Small Watershed Program where Congress intended it.

A number of proposed amendments to this legislation were considered during the discussions of the 1996 Farm Bill. For whatever reason, those proposed amendments did not survive. The NWC would urge you, whenever the time is appropriate, to take another look at those proposals, particularly the idea of expanding the objectives that the legislation can serve to include more non-structural practices, allow the law to provide assistance in developing rural water supplies (without water there is no rural development), eliminate the current requirement that mandates twenty percent (20 percent) of the total project benefits be "directly related to agriculture" which has the unintended effect of penalizing projects in poor, small, rural communities, and continue to explore the idea of allowing the USDA Secretary to accept transfers from other Federal departments and agencies to carry out projects under Public Law 83-566, when it is to the advantage of all. We would also urge that as the issue of cost sharing rates is examined in the future, cost sharing rates be set for the natural resource purpose to be achieved, rather on the practices used to achieve those purposes.

The Coalition appreciates the opportunity to offer these comments regarding fiscal year 1998 funding for the water resource programs administered by the Natural Resources Conservation Service. With the "downsizing" the NRCS has experienced, we would be remiss if we did not again express some concern as to their ability to provide adequate technical support in these watershed program areas. ARCS technical staff has been significantly reduced and budget constraints have not allowed that expertise to be replaced. Traditional fields of engineering and economics are but two examples. We see many states where the capability to support their responsibilities in these program areas is seriously diminished. This is a disturbing trend that needs to be halted. This downsizing has a very serious effect on state and local conservation programs. Local Watershed and Conservation Districts and the NRCS combine to make a very effective delivery system for providing the technical assistance to local people—farmers, ranchers and rural communities—in applying needed conservation practices. Many states and local units of government also have programs that provide financial assistance to land owners and operators for installing measures that reduce erosion, improve water quality, and maintain environmental quality. The NRCS provides, through agreement with the USDA Secretary of Agriculture, "on the land" technical assistance for applying these measures. The delivery system currently is in place, and by downsizing NRCS we are eroding the most effective and efficient coordinated means of working with local people to solve environ-

PART 1

1383

mental problems ever developed. Our system and its ability to produce food and fiber is the envy of the entire world. In our view, these programs are the most important in terms of national priorities.

The Coalition pledges its full support to you as you continue your most important work. Our Executive Director/Watershed Programs Specialist Mr. John W. Peterson, who has over forty years experience in this business, is located in the Washington, DC area, and would be pleased to serve as a resource as needed.

Thank you for allowing the National Watershed Coalition (NWC) this opportunity.

PREPARED STATEMENT OF THE NONPRESCRIPTION DRUG MANUFACTURERS ASSOCIATION

The Nonprescription Drug Manufacturers Association (NDMA) is a 116-year old national trade association representing manufacturers and distributors of nonprescription or over-the-counter (OTC) medicines. Members of the Association account for over 90 percent of the retail sales of OTC medicines in the United States.

We appreciate the opportunity to comment on legislation that would fund the Food and Drug Administration (FDA), and on user fees that would be levied across-the-board on companies subject to FDA regulation. NDMA is opposed to such sweeping user fees.

NDMA supports full funding of the FDA by Congress to enable the agency to fulfill its important mission to assure protection of the public health and safety. We commend the job FDA has done, and are heartened by the dedication of the many FDA employees devoted to OTC drug regulatory activities.

NDMA supports reasonable user fees that are additive to adequate baseline OTC drug appropriations, if they are dedicated solely to the purpose of supporting and expediting approvals of new drug applications (NDA's) for original OTC's or for the switch of prescription drugs to nonprescription status, and if the user fees are subject to mandatory performance standards. NDMA categorically opposes the imposition of user fees as a substitute for full funding of FDA through the normal appropriations process to enable FDA to carry out its public health mission to regulate the general safety and effectiveness of OTC drugs, including fees levied to conduct inspections or other compliance activities that are part of FDA's core mission. NDMA also opposes as improper the levying of unrestricted user fees aimed at reducing or retiring the federal deficit.

With NDMA's support, the 1992 Prescription Drug User Fee Act (PDUFA) imposed user fees on NDA's and supplemental NDA's for the approval of OTC drugs, including OTC drugs switched from prescription to nonprescription status. FDA performance goals included in the legislative package under PDUFA 1992 apply to these applications. NDMA believes that PDUFA has worked to help accelerate the review and approval process, so that new OTC products can be made available to consumers. We therefore support the reauthorization of PDUFA for an additional five-year period, beginning with the 1998 fiscal year, and the continued coverage of original OTC and switch applications and supplements under the application fee provisions and under the FDA performance goals and procedures.

NDMA is opposed, however, to user fees that would go beyond these purposes as contrary to sound public policy. Congress' intent was clear in PDUFA 1992 that FDA user fees must not be a substitute for baseline appropriations adequate for FDA to carry out its general responsibilities, but could only be levied to supplement existing appropriations in order to expedite the drug approval process. Thus, general purpose user fees on FDA-regulated OTC companies must not be a substitute for full funding of the agency's core activities involving enforcement and compliance, or used to reduce the federal deficit.

PREPARED STATEMENT OF ROGER JOHNSON, COMMISSIONER OF AGRICULTURE, NORTH DAKOTA DEPARTMENT OF AGRICULTURE

Chairman Cochran and members of the Senate Appropriations Subcommittee on Agriculture, Rural Development, and Related Agencies. My name is Roger Johnson, and I serve as the North Dakota Commissioner of Agriculture. I request that the budget for the Northern Great Plains Research Laboratory (NGPRL) located in Mandan, North Dakota, be reinstated for the following reasons: 1. NGPRL research has substantial financial impact in North Dakota and surrounding states; and 2. NGPRL research helps provide a safe food supply.

PART 1

1384

NGPRL RESEARCH HAS A SUBSTANTIAL FINANCIAL IMPACT IN NORTH DAKOTA AND SURROUNDING STATES

NGPRL has an overwhelming impact on agriculture in North Dakota and surrounding states. Estimations made by NGPRL staff show that the economic benefit to renewable natural resource conservation relating to research conducted at NGPRL is estimated between \$50 and \$210 million annually; implementation of NGPRL research has the potential to increase farm income by \$200 to \$360 million annually. Examples of NGPRL research programs that have great potential economic applications to North Dakota and surrounding states include: (1) conservation and tillage programs, (2) grass research and the Conservation Reserve Program, and (3) tree improvement research.

Potential economic application—conservation tillage and cropping systems

Research conducted at NGPRL has played a major role in producers changing from crop-fallow to a continuous cropping system of farming, reducing soil loss through erosion. In central and western North Dakota, summerfallow acres decreased 1,540,000 acres from 1991 to 1995, thus increasing the acreage of continuous cropping. Studies by NGPRL staff indicate about a \$10.70 per acre advantage with conventional-tillage to an \$18.80 per acre advantage with minimum tillage for continuous cropping over that of a spring wheat-fallow system. The direct economic benefit is approximately \$16.5 to \$29 million per year increase in North Dakota farm income alone.

Also, as a result of research conducted by NGPRL, 67 percent of the winter wheat produced in 1995 was in a continuous cropping production system using reduced tillage systems. The 12-year advantage of minimum-till and no-till winter wheat over conventional-till winter wheat has been 2.5 and 3.3 bushels per acre. At \$3.50 per bushel, the gross economic advantage using reduced tillage systems would be \$8 to \$11 per acre or on 26,900 acres a gross advantage of \$215,000 to \$296,000 per year in North Dakota.

Potential economic implication—conservation reserve program

Recently, Congress reauthorized the Conservation Reserve Program (CRP). Research at NGPRL has developed techniques that reduce grass stand failures. Just a 5 percent reduction in stand failures for cool-season grasses can yield savings of \$3.9 million for North Dakota and \$38.9 million nationally when considering just the acres seeded in CRP. A 9 percent reduction in reseeding for native grasses in CRP can yield a savings of \$82.6 million.

Potential economic application—tree improvement research

For the first time in North Dakota history, the entire state has been declared a disaster area due to the severe winter storms suffered in 1997. Currently, the Fifty-fifth Legislative Assembly of North Dakota is considering a bill that would provide \$5.1 million in relief to counties for snow-removal. Until being cut from the budget last year, NGPRL was involved in important research studying the use of trees as windbreaks. Tree improvement research at NGPRL was evaluating over 200 seed sources of junipers and cedars that could be utilized as living snow fences, which are 62 times cheaper than slat fences.

NGPRL played a leading role in evaluating and developing tree varieties and windbreak designs that currently protect 2.5 million acres of North Dakota cropland that NGPRL staff estimate result in yield increases totaling \$8.75 million annually.

Genetic tree improvement research at NGPRL, which is duplicated nowhere else in the country, has resulted in tree variety releases that grow faster, live longer, and are more resistant to diseases, all which improve the negative effects of ozone depletion and formation of greenhouse gases.

Windbreaks serve as an excellent measure to protect homes, livestock, roadways, and wildlife habitat. As North Dakota digs out important roadways blocked from continual blizzard snow, the importance of windbreaks and continued development of research in this area is necessary and will be needed in the future.

Potential economic applications—other research projects

Other research conducted at NGPRL includes studies into water management and irrigation, protecting the environment from contamination and reducing the amount of water used for irrigation; forage breeding and genetics, improving the quality of feed for cattle operations; and many other research projects that are necessary for protecting the environment and for providing a safe food supply in the future.

All of these research projects are part of promoting a system that looks into the emerging needs of agriculture, provides information transfer to the producers that

PART 1

1385

utilize the research in everyday practices, and provides a more economical approach to producing the safe food supply that is important to everyone.

NGPRL PROVIDES A SAFE FOOD SUPPLY

Providing a safe food supply and studies in nutrition have become high priorities in the Agriculture Research Service. The first step in providing a safe food supply begins with research in farm production. We must continue to provide agricultural producers with a method of technology transfer so improvements can be made in the way the food supply is being raised. Efficiencies in production systems provide more resources for agricultural producers to expand operations to meet increased demands for food as the population grows. Research efforts not only help expand the food supply being raised, but also provide a safer food supply by developing systems that require less use of farm chemicals, lessening the risk to the producer, consumer, and environment.

It is my belief that the continued research at NGPRL will encourage the increased production of a safe food supply that the Midwest has always provided for this country. NGPRL serves as a clearinghouse of information for producers throughout the Midwest that are dedicated to keeping this growing nation supplied with a continued and safe food supply.

REINSTATEMENT OF THE BUDGET

Finally, I request that the budget be reinstated for NGPRL in Mandan, North Dakota.

I am aware that the United State Department of Agriculture administration will establish a commission to evaluate all the USDA ARS sites across the country to determine need in the future. I believe NGPRL should be reinstated at a minimum to continue operation at least until the appointed commission has a chance to evaluate the facility and the research programs conducted there. I am confident that the commission will find that NGPRL is an important part of the Agriculture Research Service that should be continued in the future.

Chairman Cochran and members of the subcommittee, as I have outlined in this testimony, NGPRL has a great economic impact based on the technology transfer from research to field implementation of farming practices developed to provide an increase in agricultural production that is safe for the consumer. As the public demand for clean air, pesticide free crops and water resources, roads without snow, and better conditions for wildlife increases, so to do the need for crop, forage, and tree research to meet these needs. NGPRL is the facility that is positioned well to continue to develop research and programs that will fill those needs not only in North Dakota but throughout the Midwest and across the entire nation.

PREPARED STATEMENT OF BILLY FRANK, CHAIRMAN, NORTHWEST INDIAN FISHERIES COMMISSION

INTRODUCTION

The Northwest Indian Fisheries Commission is the intertribal fisheries management organization of the tribes party to the *United States v. Washington* litigation, more commonly known as the *Boldt* decision. Our member tribes are very active in a number of fisheries arenas, including habitat protection and shellfish management.

In this testimony, we are seeking assistance from the Subcommittee in the form of additional funding to the member tribes of the Commission so as to enable them to fulfill important management objectives consistent with federal judicial opinions and treaty rights.

REQUEST

The Northwest Indian Fisheries Commission support two primary request for our member tribes:

(1) Earmark special funding of \$1 million to the member tribes of the Northwest Indian Fisheries Commission from the Department of Agriculture, Natural Resources Conservation Service (NRCS). This will be used by the tribes to perform watershed analysis and monitoring services in their Usual and Accustomed Areas in support of conservation district watershed and resource planning efforts. I his partnership of tribes and conservation districts and local landowners will prove essential to fulfilling the mandate of the NRCS, bring stability to the agricultural community and protect the salmon of the region.

PART 1

1386

(2) An appropriations increase and directing language to the Department of Agriculture's Rural Development Administration, Industrial Development Grant Program. This request is for \$385,000 to complete the second phase of the Northwest Tribal Clam and Oyster Project: This project is supported by the Tribes in the Pacific Northwest, Washington State Departments of Health and Fisheries, and the private commercial shellfish industry.

BACKGROUND ON WATERSHED ANALYSIS AND MONITORING

Our member tribes are deeply concerned about the plight of Pacific Salmon, and are taking serious steps to address this issue consistent with their treaty protected fishing rights. Such efforts involve tribal, state, federal and private entities, and are juxtaposed onto a variety laws, including the Clean Water Act and the Endangered Species Act. To this end, the tribes are active participants in a wide array of planning and management forums, providing legal, policy and technical expertise into the coast wide salmon recovery efforts. Tribes participate in the Timber-Fish-Wildlife (TFW) process, playing the lead role in the effectiveness and ambient monitoring program that is a major part of the state of Washington salmon recovery process. Likewise, tribes actively work on the Interagency Advisory Committee (IAC) of the Northwest Forest Plan, where these efforts are integrate private, state and federal lands for effective ecosystem management.

Tribes have also played a major role in watershed analysis, bringing the cumulative effects issue forward in the TFW process and seeing to it that this tool was included in the Northwest Forest Plan. As a result, watershed analysis is now seen as the very best scientific approach to establish necessary prescriptions to protect the Pacific Salmon.

Funding from the ARCS will create additional tribal capability to serve the needs of the agricultural community as they begin to develop their responses to salmon recovery. We anticipate that the tribes will allocate these monies regionally, and integrate this effort with current state of the art efforts underway as part of the larger coast wide salmon recovery efforts. This convergence will yield synergy and be a value to the federal government as it must implement its Endangered Species Act obligations.

RESOURCE CONSERVATION AND DEVELOPMENT (RC&D) PROGRAM

We also support the Administration's proposed fiscal year 1998 appropriation for an additional \$18 million for funding of non-Federal watershed and rangeland coordinators to assist in watershed planning and rangeland conservation. Some of these monies are designed to pass through the NRCS to support and/or establish watershed councils that will work towards salmon recovery efforts in California, Oregon, Washington and Idaho. Such efforts are very consistent with tribal interests, as they will lead to the greater protection and recovery of the Pacific Salmon which the Northwest tribes depend upon for their subsistence, cultural and economic livelihood.

BACKGROUND FOR NORTHWEST CLAM AND OYSTER PROJECT PHASE II

This is the second phase of the Northwest Clam and Oyster Project. Phase one was completed this past year. Phase two has two primary components: (1) The expansion and development of remote setting of seed capability in rural areas of the Pacific Northwest; and (2) the addition of hatchery capability for additional species for seed production.

(1) *Remote Setting of Seed.*—Oyster Larvae raised at the Lummi Hatchery is the first step of production. The Oyster Larvae produced is then put into large tanks where they are combined with large volumes of cultch, in the case of oysters—shell. Manilla clams; after setting, need room to grow to a large enough size to gain the survivability necessary for commercial viability, this is best accomplished at juvenile rearing sites near the growout area.

Both these activities are limited to the Central Hatchery and would be much more efficient at on-site facilities for this phase of seed production. Far more efficiency is gained through shipping larvae and small clam seed early in their development. In the case of oysters the difference would be a small jar or ziplock bag of larvae compared with a semi-load of set seed.

When looking at a map of Washington State we are proposing that regional sites be developed for the setting and grow-out of seed at the following sites that can be used by Tribes in those areas: (1) Squaxin Island in South Sound, (2) Port Gamble in Hood Canal, (3) Sequim Bay in the Strait of Juan de Fuca and (4) Tulalip Bay in the Admiralty Inlet. The funds would build setting tanks for oysters, and up well systems for manilla clams. The estimated costs for this is a one-time capital expense

PART 1

1387

of \$175,000 in 1998 to construct the facilities and operations cost of \$175,000 to operate the facilities for 1999–2000. Operating costs for the Lummi Seed Production would be \$100,000 for direct costs and \$30,000 for indirect expenses for each of the years 1998–2000.

(2) *Additional Species Capability.*—In Phase I the hatchery focused on manilla clam and pacific oyster production. In Phase II, the capability to produce additional oyster species, mussels,¹ and geoduck clams² would be added to the hatchery's capability. This additional level of services would require some additional capital expenses for the existing facility and training and labor costs during the development phase. The costs for this portion of the plan would be \$80,000 for each of the years 1998–2000.

CONCLUSION

We strongly request your support for these projects. I believe that our two requests are not only of great benefit to the tribes of Washington State but to Washington State as a whole.

Thank you for your consideration of our requests.

NORTHWEST SHELLFISH PROJECT

	1998	1999	2000
Construction (remote setting/juvenile rearing at four sites):			
Insulated fiberglass tanks 4 @ \$12,000	\$48,000		
Tank heaters and controls 4 @ \$4,500	18,000		
Seawater pumps and controls 4 @ \$4,000	16,000		
Concrete slab and drains 4 @ \$1,500	6,000		
Aerators and piping 4 @ \$1,500	6,000		
Upwellers 4 @ \$13,000	52,000		
Set-up and construction	29,000		
Total construction	175,000		
Juvenile rearing at four remote setting sites:			
Salaries 4 @ \$28,000		\$112,000	\$112,000
Operations including utilities 4 @ \$12,000		48,000	48,000
Miscellaneous 4 @ \$3,750		15,000	15,000
Total juvenile rearing operations at four remote setting sites ..		175,000	175,000
Hatchery operations salaries:			
Hatchery manager (.75 FTE)	27,000	27,000	28,000
Shellfish manager (.75 FTE)	20,000	20,000	21,000
Technicians (4 FTE)	69,000	71,000	74,000
Subtotal hatchery operations salaries	116,000	118,000	123,000
Fringes @ 22 percent	25,520	25,960	27,060
Total hatchery operation salaries	141,520	143,960	150,060
Operations costs:			
Utilities	25,000	25,000	27,000
Repair and maintenance	7,000	7,000	9,000
Supplies	18,000	17,560	20,000
Telephone	2,000	2,000	2,500

¹ Mussel Production in the State of Washington will exceed 1,000,000 pounds in 1997 and is expected to double in 1998. Hatchery seed is need for this expansion.

² Geoduck clam is an emerging industry that needs seed for development. This animal presently brings \$7.50 per pound live weight. A market size clam of 1.5–3 pounds is produced in 3–5 years. Sub-tidal populations are inadequate to meet market demands.

PART 1

1388

NORTHWEST SHELLFISH PROJECT—Continued

Oxygen generator			1,440
Total capital for hatchery	16,480	74,480	1,440
Total project costs	385,000	385,000	385,000

PREPARED STATEMENT OF THE ORGANIZATION FOR THE PROMOTION AND ADVANCEMENT OF SMALL TELECOMMUNICATIONS COMPANIES

SUMMARY OF REQUEST

The Organization for the Promotion and Advancement of Small Telecommunications Companies (OPASTCO) seeks the Subcommittee's support for fiscal year 1998 loan levels for the telecommunications program administered by the Rural Utilities Service (RUS) in the same amounts as those contained in the Fiscal Year 1997 Agriculture Appropriations Act. The requested program levels are:

Telecommunications loans program

[In millions of dollars]

5 percent hardship loans	75
Treasury rate loans	300
Guaranteed loans	120
Rural Telephone Bank (RTB) loans	175

In addition, OPASTCO requests the Subcommittee's support for the following: (1) removal of the statutory 7 percent cap on Treasury rate loans for fiscal year 1998; (2) a prohibition against the transfer of unobligated RTB funds to the general fund of the Treasury or Federal Financing Bank; and, (3) funding of the distance learning and medical link grant and loan program at sufficient levels.

OPASTCO is a national trade association of more than 475 independently owned and operated telephone companies serving rural areas of the United States. Its members, which include both commercial companies and cooperatives, together serve over 2 million customers in 40 states. Well over half of OPASTCO's members are RUS or RTB borrowers.

Perhaps at no time since the inception of the RUS (formerly the REA) has the telecommunications program been so vital to the future of rural America. The telecommunications industry is at a crossroads, both in terms of technology and public policy. Great leaps in telecommunications technology in recent years will deliver on the promise of a new "information age." The Federal Communication Commission's (FCC) implementation of the landmark Telecommunications Act of 1996, as well as fundamental statutory changes to RUS's lending program, will expedite this transformation. However, without continued RUS support, rural telephone companies will be hard pressed to build the infrastructure necessary to bring their communities into this new age, creating a bifurcated society of information "haves" and "have-nots."

Contrary to the belief of some critics, RUS's job is not finished. In fact, in a sense, it has just begun. We have entered a time when advanced services and technology—such as fiber optics, digital switching equipment, custom calling features, and the Internet—are an expected and needed part of a customer's telecommunications service. Unfortunately, the inherently higher costs of offering such services in rural areas has not abated. Rural telecommunications continues to be more capital intensive and involves fewer paying customers than its urban counterpart. In order for

PART 1

1389

rural telephone companies to modernize their networks and provide their customers with advanced services at reasonable rates, they must have access to reliable low-cost financing.

Furthermore, telecommunications enables applications such as distance learning and telemedicine that can alleviate or eliminate some rural disadvantages. Telecommunications can also make rural areas attractive for some businesses and result in revitalization of the rural economy. For example, businesses such as telemarketing and tourism can thrive in rural areas, and telecommuting can become a realistic employment option.

While it has been said many times before, it bears repeating that RUS's telecommunications loans program is not a grant program. The funds loaned by RUS are used to leverage substantial private capital, creating public/private partnerships. For a very small cost, the government is encouraging tremendous amounts of private investment in rural telecommunications infrastructure. Moreover, there has never been a default in the history of the lending program.

The FCC's implementation of the Telecommunications Act of 1996 will only increase rural telephone companies' need for RUS assistance in the future. The 1996 Act requires the FCC, by May 8, 1997, to release rules on universal service. The forward-looking Act defines universal service as an evolving level of telecommunications services that the FCC must establish periodically, taking into account advances in telecommunications and information technologies and services. One of the principles for universal service established in the 1996 Act is that consumers in rural areas have access to advanced telecommunications and information services that are reasonably comparable to those services provided in urban areas at reasonably comparable rates. At present, it is uncertain whether the FCC will provide a "sufficient" mechanism, as required by the Act, to achieve this urban/rural comparability goal. Long before the enactment of the 1996 Act, RUS has been the great facilitator of a dynamic universal service concept in rural areas, providing rural telephone companies with the financing to fund technological improvements. RUS now has an essential role to play in the implementation of the new law, as it will complement new funding mechanisms established by the FCC and bring rural America closer to the federally mandated goals.

Working in tandem with the 1996 Act, the Rural Electrification Loan Restructuring Act of 1993 (RELRA) will further help to ensure the comparability of telecommunications service between urban and rural America. As a prerequisite to eligibility for insured and RIB loans, RELRA requires that every state have an RUS approved modernization plan which provides a timeline for the improvement of the state's telecommunications network and that the purpose of every loan is consistent with achieving the requirements of the borrower's state plan. Implementation of these plans will generate additional loan demand as rural telephone systems strive to meet these increased service objectives in the rural areas they serve.

One of the most vital components of RUS's telecommunications loans program is the 5 percent hardship loans. These loans provide below-treasury rate financing to telephone companies serving some of the most sparsely populated, highest cost areas in the country. The commitment these companies have to providing modern telecommunications service to everyone in their communities has made our nation's policy of universal service a reality and, in many cases, would not have been possible without RUS's hardship loan program. The RUS reports that through the second quarter of fiscal year 1997, they had already approved \$52 million in hardship loans—or almost 70 percent of their authorization—and had an additional \$84 million in applications on hand. For fiscal year 1997, the government subsidy to support a \$75 million loan level was a mere \$1.2 million. Given the need and demand for this essential program, it is critical that the loan level be maintained at \$75 million for fiscal year 1998.

With regard to RUS's Treasury rate loan program, OPASTCO supports the removal of the 7 percent ceiling on these loans for fiscal year 1998. This Subcommittee appropriately supported language in the Fiscal Year 1996 Agriculture Appropriations Act to permit Treasury rate loans to exceed the 7 percent per year ceiling contained in the authorizing act. This language was continued in the fiscal year 1997 Act. Long-term Treasury interest rates have already edged up past the 7 percent mark and were they to remain there, adequate subsidy would not be available to support the Treasury rate loan program at the authorized levels. Therefore, it is important that the Subcommittee ensure that this language is included in the appropriations bill again this year.

OPASTCO also urges the Subcommittee to reinstate the language introduced in the Fiscal Year 1997 Agriculture Appropriations Act prohibiting the transfer of any unobligated balance of the RTB liquidating account to the Treasury or the Federal Financing Bank which is in excess of current requirements and requiring the pay-

PART 1

1390

ment of interest on these funds. As a condition of borrowing, the statutory language establishing the RTB requires telephone companies to purchase Class B stock in the bank. Once all loans are completely repaid, a borrower may then convert its Class B stock into Class C stock. Thus, all current and former borrowers maintain an ownership interest in the RTB. As with stockholders of any concern, these owners have rights which may not be abrogated. The Subcommittee's inclusion of the aforementioned language into the fiscal year 1998 appropriations bill will ensure that RTB borrowers are not stripped of the value of this required investment.

In addition to RUS's telecommunications loans program, OPASTCO supports adequate funding of the distance learning and medical link grant and loan program authorized in the Federal Agriculture Improvement and Reform Act of 1996. Through this worthy program, rural students will gain access to advanced classes which will help them prepare for college and jobs of the future. Also, rural residents will gain access to quality health care services without traveling great distances to urban hospitals. The Agriculture Act authorizes \$100 million for each of the fiscal years 1996 through 2002. Loans are made at the government's cost-of-money, which should help to meet demand for the program in the most cost effective way. In light of the Telecommunications Act's requirement that schools, health care providers, and libraries have access to advanced telecommunications services, sufficient targeted funding for this purpose is essential.

CONCLUSION

The development of the nationwide telecommunications network into an information superhighway, as envisioned by policymakers, will help rural America survive and prosper in any market—whether local, regional, national, or global. However, without the availability of low-cost RUS funds, building the information superhighway in communities that are isolated and thinly populated will be untenable. By supporting the RUS telecommunications programs at the requested levels, the Subcommittee will be making a significant contribution to the future of rural America at a negligible cost to the taxpayer.

LETTER IN SUPPORT OF THE PESTICIDE DATA PROGRAM

MARCH 20, 1997.

Hon. THAD COCHRAN,
*Chairman, Subcommittee on Agriculture, Rural Development, and Related Agencies,
Committee on Appropriations, U.S. Senate, Washington, DC.*

DEAR CHAIRMAN COCHRAN: We the undersigned organizations strongly recommend that \$10.24 million in funding be approved for fiscal year 1998 for the Pesticide Data Program (PDP) within USDA's Agricultural Marketing Service (AMS) as requested in the President's budget. AMS and its partnering state agencies have the systems, equipment, and experience to collect, test, and report the vast quantities of residue data generated by the PDP. This effective and efficient program is needed to carry out residue testing to ensure the continued safety of our food supply.

In fiscal year 1997, the PDP was funded at \$11.581 million. The President's request for \$10.24 million for fiscal year 1998 already represents an 11.6 percent savings to the American taxpayer.

Since 1991, the USDA has utilized PDP to collect reliable, scientifically-based pesticide residue data that benefit consumers, food processors, crop protection pesticide producers, and farmers. By using good accurate residue data, U.S. Environmental Protection Agency (EPA) regulatory decisions can be based on a more accurate assessment of risk. Without the actual residue data, overly conservative theoretical assumptions of risk could lead to withdrawal of pesticide uses that pose no actual human health risk. The collection of scientifically-based pesticide residue data also allows for a more accurate assessment of the risk to infants and children.

In fact, Section 301(c) of the Food Quality Protection Act (FQPA) requires the Secretary of Agriculture to ensure that the residue data collection activities conducted by the Department of Agriculture in cooperation with EPA and the Department of Health and Human Services, provide for the improved collection of pesticide residues and the increased sampling of foods most likely consumed by children.

The USDA is the federal entity best equipped to collect the data and administer PDP since it already has working agreements with ten states that process data representing approximately 75 percent of the nation's fruits and vegetables, as well as large portions of the wheat and milk program. In 1997, the program added orange juice, pears, and winter squash. In 1998, other crops will be added.

PART 1

1391

Under the guidance of AMS, PDP has provided considerable assistance in confronting barriers to the international trade of American agricultural commodities and in the establishment of international standards. By developing a statistically reliable testing system, AMS has used the PDP residue testing results to convince foreign governments that our food is safe, thus enhancing our ability to increase U.S. agricultural exports.

We believe that full funding of USDA's PDP will ensure the program continues to play an important role in collecting pesticide residue data consistent with the Congressional intent of the recently passed FQPA. We strongly believe that the responsibility for the collection of pesticide residue data and supporting appropriations rightfully belongs within the jurisdiction of AMS.

We look forward to working with you to secure full funding for the USDA Pesticide Data Program within AMS in the fiscal year 1998 budget. Thank you for your efforts on this important matter.

Sincerely,

PREPARED STATEMENT ALAN F. HOLMER, PRESIDENT, PHARMACEUTICAL RESEARCH AND MANUFACTURERS OF AMERICA

Mr. Chairman and Members of the Subcommittee, I am Alan F. Holmer, President of the Pharmaceutical Research and Manufacturers of America. PhRMA represents the country's major research-based pharmaceutical and biotechnology companies, which are leading the way in the search for new cures and treatments that will enable patients to lead longer, healthier, happier, and more productive lives. I appreciate this opportunity to submit a statement for the record on our recommendations on the fiscal year 1998 budget for the Food and Drug Administration.

PhRMA urges funding FDA at the level of appropriations enacted for the current fiscal year, adjusted for inflation, and designating similar level funding for the human drug-approval process. In particular, we strongly support keeping budget authority for FDA salaries and expenses at \$820 million, adjusted for increases in the cost of living. Of this amount, we also urge that the Committee designate at least \$263 million for the human drug-approval process, which would include \$110 million that our industry is willing to pay in user fees under a reauthorized Prescription Drug User Fee Act (PDUFA) of 1992.

We are deeply concerned that the Administration's budget proposal for FDA in fiscal year 1998 would reduce budget authority by over \$68 million—which would represent an 8 percent cutback in federal appropriations, including a 13 percent cut

PART 1

1392

in the FDA's budget for human-drug approvals. These reductions would occur entirely in the salaries and expenses account of FDA, which would translate directly into reduced professional staff resources.

Funding for FDA professional staff resources constitutes the major portion of the agency's budget. The work of qualified and dedicated staff is critical to the FDA's efforts to streamline regulatory activities that promote and protect the health and safety of the American people.

The Administration's budget proposal appears to provide a 7 percent increase in FDA resources, but this is misleading because it includes \$131 million in user fees for other industries that have been previously proposed but consistently rejected by Congress. It is irresponsible to suggest that FDA's budget for the next fiscal year will be increased when that increase is based on user fees that have never been authorized by Congress.

LEVEL FUNDING OF FDA REQUIRED TO CONTINUE PDUFA

We are especially concerned that FDA's baseline appropriations for salaries and expenses be maintained at least at the current level because such funding is required to continue PDUFA, which is scheduled to expire on September 30, 1997.

PDUFA represented an historic agreement between Congress, the FDA, and the research-based pharmaceutical and biotechnology industries to improve FDA's drug-approval process so that new medicines could be made available sooner to patients. The law is based on four bedrock principles: It (1) represents a long-term commitment by Congress, (2) requires that the fees be additive to the FDA's baseline appropriations, not a substitute for such appropriations, (3) dedicates the fees to the drug-approval process, and (4) provides quantifiable performance standards. Under the 1992 law, industry agreed to pay \$327 million in user fees during 1993–1997, which enabled FDA to hire 600 additional reviewers.

To continue PDUFA, funding for FDA for fiscal year 1998 must be at least at the current level of \$820 million, adjusted for inflation, including at least \$263 million designated for the human drug-approval process, as described above. This level of funding is essential under the bedrock principle that user fees must be additive to baseline appropriations, not a substitute for such appropriations. Otherwise, the fees would represent an additional tax on the industry and would simply be a means to achieve general deficit reduction.

The Administration's budget proposal also would undermine the PDUFA program in another way. The Administration's proposal would reclassify user fees from "off-setting collections" to "governmental receipts." Such a reclassification would, in effect, be a new tax and would allow industry user fees to be expended for any Government purpose. That would contravene the user-fee principles that the fees be additive and dedicated to the drug-approval process. For this reason, PhRMA strongly opposes the reclassification of user fees as proposed by the Administration.

Without level funding for FDA, the 600 additional reviewers hired under the user-fee program would have to be dismissed. This would cause a substantial increase in drug review times to the detriment of patients, reversing the progress made under the 1992 law in cutting review times nearly in half. With industry spending \$19 billion on R&D this year to develop new cures and treatments and U.S. taxpayers providing \$13 billion to NIH for biomedical research, it would make no sense to cut FDA's budget by \$68 million and delay approval of these new medicines.

PDUFA SHOULD BE RENEWED FOR FIVE MORE YEARS

Just as the 1992 user-fee law represented a long-term commitment by Congress for five years, a reauthorized PDUFA should be for five more years. A five-year extension will demonstrate Congress' continuing long-term commitment to ensuring that new life-saving, cost-effective medicines are made available to patients as quickly as possible. It will allow FDA to continue operations without interruption and provide the job security necessary to retain and hire the best reviewers. And it will enable FDA to plan ahead, allocate resources, and implement agreed-upon timelines, performance goals, and other program objectives in an incremental way, just as it has under the 1992 law.

On the other hand, a one-year extension would raise doubt about Congress' long-term commitment to the user-fee program and slow the momentum that FDA has generated under the program. A one-year extension would make it difficult for FDA to retain and hire the best reviewers, undermine the careful, incremental way in which FDA has planned to implement changes, and require the agency to waste valuable staff time again next year in addressing reauthorization of the user-fee law.

The results of the 1992 user-fee law strongly support a five-year reauthorization. In 1992, the mean approval time for a New Drug Application (NDA) was 29.2

PART 1

1393

months. In 1996, for drugs for which user fees were paid, the mean approval time for an NDA was nearly cut in half to 15.5 months. In 1992, the FDA approved 26 New Molecular Entities (NME's). In 1996, the agency approved more than twice that figure—53 NME's—and nine new biologics compared to six in 1992.

Few Government initiatives have been so successful for so many people in such a short period of time. PDUFA has been a winner for Congress, the FDA, industry, and—most of all—millions of American patients.

Among the new medicines approved in 1996 were two new protease inhibitors and a non-nucleotide transcriptase inhibitor to fight HIV and AIDS, as well as a drug to combat a leading cause of blindness in AIDS patients; four new drugs for orphan diseases; five new anti-cancer drugs; the second new drug for Alzheimer's Disease; two new mental-health medicines—an anti-depressant and an anti-psychotic; an important new cholesterol-lowering drug; two new medicines in a new class of asthma drugs; two new treatments for multiple sclerosis; two new drugs for glaucoma, and the first new insulin product in 14 years.

Pharmaceutical companies are investing almost \$19 billion this year, 21 percent of sales, to discover and develop many more new drugs that will save lives—and money. Hundreds of medicines and vaccines already are in the pipeline, including 107 in development for heart disease and stroke, 132 for older Americans, 215 for cancer, 122 for AIDS, 125 for infectious diseases, 64 for mental illness, and 284 biotechnology products.

Renewal of PDUFA would ensure that these and other pipeline drugs are developed and approved more quickly; failure to renew the law would delay their development and approval. The law must be renewed for five more years so that the agency can continue to move forward in a steady, carefully planned, step-by-step way without interruption.

PDUFA-II WOULD SAVE 10–16 MONTHS

As effective as PDUFA-I has been, there is room for improvement. PDUFA-I focused on the drug-approval process. It did not affect the clinical-development phase of the regulatory process.

The drug discovery and development process—which now typically takes a total of 15 years at an average cost of about \$500 million a drug—is divided into three distinct phases. The first phase, following discovery of a new compound, is devoted to early research and preclinical testing. Thereafter, during the clinical-development phase, the new compound is tested in humans for safety and efficacy in large, complex trials. Finally, in the drug-approval phase, FDA reviews a drug sponsor's NDA.

During the past several months, industry and FDA have developed a legislative framework for Congress to consider that would build on the substantial progress made under the 1992 law.

For the first time, the clinical-development phase would be addressed, as well as the drug-approval phase. Under the framework, FDA would undertake more comprehensive improvements and establish quantifiable, measurable timelines and performance goals, in exchange for which industry would increase its user-fee payments by more than 21 percent over those set forth in the 1992 law.

Industry regulatory experts estimate that PDUFA-II would save 10 to 16 months in drug development and review time.

To complement reauthorization of the user-fee law, the pharmaceutical and biotechnology industries have developed other FDA-improvement proposals that reflect consensus views that emerged in Congress during the past year and that would structurally change critical agency practices and procedures. The aim of the provisions in the PDUFA framework and the FDA-improvement proposals is the same: to make new medicines available sooner to patients.

CONCLUSION

PhRMA strongly supports level funding for FDA in fiscal year 1998 compared to fiscal year 1997, adjusted for inflation. The agency needs these appropriations to fulfill its many and vital public health responsibilities, including implementation of an improved and renewed user-fee law. A five-year, reauthorized user-fee program, combined with consensus FDA-improvement provisions, would enable the agency to continue the progress it has achieved during the past five years in making new life-saving, cost-effective medicines available more quickly to waiting patients.

PART 1

1394

PREPARED STATEMENT OF DR. TED R. BATTERSON, DIRECTOR, NORTH CENTRAL
REGIONAL AQUACULTURE CENTER

Thank you Mr. Chairman and Members of the Subcommittee for allowing me this opportunity to submit testimony on behalf of the Regional Aquaculture Center Program. We are truly appreciative of the Subcommittee's support for this program over the last decade. Funding appropriated for the Regional Aquaculture Centers in fiscal year 1997 was \$4 million. I am submitting this testimony to urge you to increase the support for the Centers to the fully authorized level of \$7.5 million for fiscal year 1998.

The mission of the Regional Aquaculture Centers is to support aquaculture research, development, demonstration, and extension education to enhance viable and profitable U.S. aquaculture production which will benefit consumers, producers, service industries, and the American economy.

The U.S. aquaculture industry continues to be one of the fastest growing sectors within U.S. agriculture. Production has increased 77 percent in the 10-year period from 1985 to 1994. Production in 1994 reached 665 million pounds and generated approximately \$751 million for producers. Final sales value in 1993 were estimated to be \$5 billion; direct and indirect economic impact was estimated at \$8 billion. Yet, anticipated growth in the industry, both in magnitude and in species diversity, continues to fall short of expectations.

Five Regional Aquaculture Centers have been established in response to Congressional legislation. The North Central Regional Aquaculture Center (NCRAC) came into existence in February 1988. It serves as a focal point to assess needs, establish priorities, and implement research and extension educational programs in the twelve state agricultural heartland of the United States which includes Illinois, Indiana, Iowa, Kansas, Michigan, Missouri, Minnesota, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin. NCRAC also provides coordination of inter-regional and national programs through the National Coordinating Council for Aquaculture. The council is composed of directors of Regional Aquaculture Centers and is chaired by a representative of the U.S. Department of Agriculture.

The fertile North Central section of the country produces abundant grains and soybeans that can be processed for fish feeds. We also have spectacular water resources for aquaculture within our boundaries. These include U.S. portions of four of the five Great Lakes, and rivers and streams that make up the Missouri, Ohio, and Upper Mississippi River drainages. The majority of the 62 million people residing in this region are concentrated on these water bodies. They have a long tradition of using fish as a source of protein in their diets.

In 1995, an estimated 926 million pounds of fish and shellfish were consumed by residents of the North Central Region. On the supply side, probably less than 5 percent of regional consumption can be accounted for by commercial capture fisheries and aquaculture ventures from our lakes and rivers. Consequently, fish consumption in the North Central Region was a major factor in the \$3.5 billion U.S. trade deficit in edible fishery products reported by the U.S. Department of Commerce for 1995.

I would like to suggest that the time is clearly at hand to move aggressively to increase regional aquaculture production. We also need processing technology and market development programs to make use of new and nontraditional aquaculture species and products.

The aquaculture community of the North Central Region is very appreciative of the steps Congress has taken to improve our fish supplies and reduce the trade deficit in fish products. USDA's Regional Aquaculture Center Program is one such initiative. NCRAC works with the other four centers on an integrated approach to a well developed and sustainable aquaculture industry in the U.S.A. and its territories. Programs of the centers are driven by needs of regional industries, articulated through strong Industry Advisory Councils. Top-notch teams of research and extension specialists from universities and public agencies in the North Central states began executing plans of work to solve problems of the industry in May 1989. Work is accomplished using in-place people and facilities. No expenditures are made on brick-and-mortar or institutional overhead. NCRAC has funded a number of projects involving numerous researchers, extension specialists, and collaborators from universities, public agencies, and the private sector. Projects on the culture of trout, hybrid striped bass, walleye, yellow perch, and sunfish have been the thrust of the program, including the economic viability of such aquacultural species. Work on crayfish, baitfish, and aquaculture waste management have also been undertaken. Aquaculture specialists within USDA's Extension Service are making information from these projects available in the region and across the country through a variety of delivery systems, including an aquaculture network information center

PART 1

1395

on the World Wide Web (AquaNIC; <http://www.ansc.purdue.edu/aquanic/>) and satellite teleconferencing.

While a good start has been made to serve needs of the industry and consumers, additional regional problems of high concern are left unattended. Environmentally sound cultural practices, least-cost nutrition for newly emerging species, fish health, and food safety are among them. On hold, is a large pool of expertise in our publicly funded universities and agencies that can deal with these and other concerns facing the aquaculture community.

Mr. Chairman, and Members of the Subcommittee, thank you for your support of the Regional Aquaculture Center Program. Funding over the past years has been put to good use in this program. We respectfully request that funding at the authorized level of \$7.5 million be provided so that this important program can conduct the full range of activities necessary for development of the industry and continued reduction of our large trade deficit.

PREPARED STATEMENT OF STEVE CHAIKIN, OWNER, MOLOKAI SEA FARMS,
KAUNAKAKAI, HI

Mr. Chairman and Members of the Subcommittee: Thank you for the opportunity to submit testimony on behalf of the Regional Aquaculture Centers. I am a member of the Industry Advisory Council of the Center for Tropical and Subtropical Aquaculture and the owner of Molokai Sea Farms in Hawaii.

In these times of fiscal restraint, it is important to support those areas of business—including the business of agriculture—that have proven track records of industry growth. Aquaculture is the fastest growing segment within agriculture, and I believe that the Regional Aquaculture Centers have played a vital role in making that growth possible.

A major impetus in the growth of aquaculture has been diminishing quantities of wild stocks of many seafood species. Depletion of wild seafood stocks is expected to continue to be a major factor in the growth of aquaculture. Although this is encouraging news for aquaculture farmers, the reality is that the industry can only grow as fast as the available technology. Much remains to be learned about culture technology of many high value stocks and about disease management for those species for which culture technology has been developed.

As a direct result of one of the Center for Tropical and Subtropical Aquaculture's projects, the Food and Drug Administration approved the use of formalin in shrimp hatcheries. I derived immediate financial benefit from this approval, which allowed me to use formalin to protect my shrimp crops from certain disease problems that could have otherwise devastated my farm and, quite possibly, my ability to stay in business.

In addition, work done under the project titled "National Coordinator for Aquaculture New Animal Drug Applications," which is partially funded by the Center for Tropical and Subtropical Aquaculture and three other Regional Aquaculture Centers, has expedited Food and Drug Administration approval for the use of Human Chorionic Gonadotrophin as a fish spawning aid and for the use of formalin to control protozoa and fungi on fish and fish eggs.

My commercial aquaculture farm expanded its product line to include two additional species. The first is Pacific threadfin, a high value species, and the second is milkfish, which is a prized food-fish in local ethnic markets and may have potential as bait for tuna fishing vessels. This expansion was made possible only because of advances in larval rearing and growout technology resulting from projects funded by the Center for Tropical and Subtropical Aquaculture.

These are but a few examples of the fine work being done by the Regional Aquaculture Centers. It is my hope that this subcommittee will allow the success of the Centers to continue and grow by funding the Centers at the authorized funding level of \$7.5 million.

As we say in Hawaii, mahalo nui loa—thank you very much—for the opportunity to submit this testimony.

PREPARED STATEMENT OF WILLIAM K. HERSHBERGER, DIRECTOR, WESTERN
REGIONAL AQUACULTURE CENTER, UNIVERSITY OF WASHINGTON

Mr. Chairman and Members of the Subcommittee: I wish to speak on behalf of the Western Regional Aquaculture Center (WRAC), one of the five Regional Aquaculture Centers established through the U.S. Department of Agriculture to support and encourage aquaculture research, development and extension programs. The concept of cooperative and collaborative regional programs has special importance in

PART 1

1396

enhancing the viability and sustainability of an industry such as aquaculture with increasing national and international economic importance. From my perspective as a newly appointed Director of the WRAC Administrative Office and an active participant in aquaculture via research and development, it is apparent that the growth in aquatic animal and plant production and the increased interest in these commodities by other sectors of the food production will continue with a cooperative approach to solving constraints as they arise.

The twelve states in the western region encompass a very large geographic area (about 1.8 million sq. mi.) and a diverse array of terrestrial and aquatic environments that stretch from the Arctic circle to the desert southwest. This diversity is reflected somewhat in the number of aquatic species produced by the aquaculture industry in the western region (15 species) and the variety of products marketed. With such variety a major challenge to advancing the industry is in defining and placing the appropriate research emphasis on the most important problems. The regional approach fostered by this USDA program has facilitated the identification of the common needs of major segments of the aquaculture production industry and the development of research and extension programs to address these.

An approach to WRAC project development has been devised whereby input from the aquaculture industry is the paramount factor. Impediments or constraints to the production of aquatic species are identified by a balanced group of industry representatives from the region. Through interaction with a technical committee comprised of aquaculture researchers from a variety of disciplines and extension experts, the industry-defined areas are developed into projects that will address the problem(s) identified. This process, plus the mandate for participation of researchers from two or more states has led to an effective and innovative program that addresses constraints to aquaculture production across the western region.

A side benefit from this regional approach to aquaculture research and development has been the regular communication among various segments of the aquaculture community. As a researcher, I was able to participate in annual meetings among the investigators in our project group (a function strongly encouraged by WRAC). This resulted in many new approaches that were used in our project and maintained a vitality in the group that assisted the realization of the project goals.

Maintaining vitality and realizing progress in the production of aquatic plants and animals will continue to be important in the future. It is well established that the global harvest of edible seafood from the natural environment via the traditional capture fishery has leveled out at about 60 million metric tons. Projections for worldwide consumption of fish and shellfish point toward a steady increase; annual per capita consumption in the United States between 1980 and 1995 increased by 20 percent (12.5 lbs./person in 1980 to 15.0 lbs./person in 1995). In order to meet these demands the United States has increased imports from outside our country, which further raises an already substantial trade deficit (for non-manufactured goods, it is second in magnitude only to petroleum products). A lot of developing countries with cheap labor and fewer environmental constraints than the United States have encouraged the development of aquaculture to take advantage of increasing global demands for fish and shellfish; in many cases this is accomplished with governmental incentives and financial support. Establishment of the five Regional Aquaculture Centers by Congress provided greatly needed support for aquaculture research and extension activities, which had previously been largely overlooked. This has been a significant step to make U.S. aquaculture production more competitive in the international marketplace.

Initiating such increased competitiveness is, perhaps adequate reason for continuing support of the existing five Regional Aquaculture Centers. However, much also needs to be done with regard to enhancing research support, technology development, and communication infrastructure on national, regional and local levels. Although the demand for seafood is likely to grow in the United States, economic viability and stability will be certain only with the coordinated and cooperative efforts of the entire aquaculture community. The Regional Aquaculture Centers have the appropriate structure and are poised in a very enviable position to take on and accomplish this task.

Mr. Chairman and Members of the Subcommittee, I thank you for your continuing support. However, we have a big job ahead of us if aquaculture production in the United States is to achieve its potential in a sustainable and viable manner. I urge you to support efforts to increase funding for the five existing Regional Aquaculture Centers to the full authorized level of \$7.5 million. Thank you for giving me the opportunity to provide this testimony.

PART 1

1397

PREPARED STATEMENT OF DAVID MOREHOUSE, PRESIDENT, MOREHOUSE BAIT FARMS

Mr. Chairman and members of the Subcommittee, the following is an appeal to increase the amount of support to the five Regional Aquaculture Centers (RAC) to the original authorized amount of \$7.5 million.

I am sure you are aware of the declining fisheries in the worlds oceans, the increased demand for seafood and the devastating effect on our nations balance of trade. The deficit, caused by seafood imports, are second only to oil imports when speaking of natural products that are imported. This amount, in some years, has approached \$9 billion.

To meet the demands for seafood, aquaculture has become the fastest growing segment of America's agriculture industry. Aquaculture's future, as well as it's past, needs support from universities, regulators, marketing, production and extension resources that only research and development can give. This support has as one of the cornerstones the need for funding, which has been met through the regional aquaculture centers.

Here in the northeast, where we are limited in production by climatic conditions, enclosed systems are being developed which increase production and quality while lowering the risks from disease, predation and climate. Research and development is continuing to fuel the technology breakthroughs needed by the aquaculture industry.

I have not stated statistics, of the situation, to support this request only because others have. However, as a 35 year veteran of private aquaculture, I know the importance of these centers. As past chairman of the Northeastern Center and past president of the New York State Aquaculture Association, I have first hand knowledge of the national importance of these centers as well as their international impact on aquaculture.

Mr. Chairman, members of the Subcommittee, I urge you to not only support Regional Aquaculture Centers at their present level but to increase the level to the authorized level of \$7.5 million.

PREPARED STATEMENT OF LESTER W. MYERS, PRESIDENT AND GENERAL MANAGER,
DELTA WESTERN, INC.

Mr. Chairman and Members of the Subcommittee, we thank you for the opportunity to submit testimony in support of the Regional Aquaculture Centers. My name is Lester Myers. I own and operate a catfish farm near Inverness, Mississippi, and am President and General Manager of Delta Western, Inc., Indianola, Mississippi, the largest catfish feed mill in the United States.

The aquaculture industry in the United States has an urgent need for new technology to reduce production costs and make it more competitive in the global market. For the past several years, I have been actively involved with the Southern Regional Aquaculture Center as Chairman of the Industry Advisory Council, and I feel that the Regional Aquaculture Center program is well suited to help meet that need. Already, results from the Regional Center projects are having a significant impact on domestic aquaculture. I believe this success is attributable to three characteristics that set the Regional Aquaculture Centers apart from other publicly funded programs.

First, the activities of the Regional Centers are industry-driven. The Center's activities are initiated by the Industry Advisory Council, which consists of producers, marketing personnel, bankers, and other individuals with fiscal interests in aquaculture. The Industry Advisory Council provides an open forum for input from private and public sectors which is then incorporated into annual and ongoing plans for the Center. As such, the genuine needs of the industry are addressed rather than the needs as perceived by scientists or government officials.

Second, allocation of funds through the Center is a very deliberate process. Industry problems that are identified by the Industry Advisory Council are discussed within the Center's Technical Committee, which consists of aquaculture research and extension personnel from across the region. Priority issues are then refined by committees of scientific and industry experts and further focused during open deliberations with prospective project participants. Project proposals that result from this process are then thoroughly reviewed for relevance and scientific rigor by experts from within and outside the region. This methodical process assures that only priority issues are addressed and that the approach used to solve the problem is thorough and carefully developed.

Third, the Center's programs are regional in nature, rather than of local interest only. It is the policy of the Center that the issues addressed must be of regional significance and that the resulting project involves participation from institutions

PART 1

1398

from at least two states within the region. In reality, most Center projects involve institutions from at least seven states within the region. This approach makes it possible for Centers to address problems that require more personnel, equipment, and facilities than are generally available at one location. It also makes better use of limited resources and a saving of funds relative to funding of independent, uncoordinated projects at many different locations. Accordingly, it is possible to bring the best scientific talent in the region to bear on priority problems in an extremely cost-effective manner.

In summary, representatives of the U.S. aquaculture industry are convinced that the Regional Center programs are highly valuable and productive. Additional new research findings will help insure future success for aquaculture production in the United States. The authorized level of funding for the five Regional Aquaculture Centers is \$7.5 million annually. The total annual appropriation for the Centers for fiscal year 1997 was \$4.0 million, or \$800,000 for each of the five Regions. We strongly request your consideration in the fiscal year 1998 budget to provide the full authorized level of \$7.5 million for the existing five Centers to support these extremely important and effective programs.

On behalf of the U.S. aquaculture industry, we thank you for the opportunity to present testimony in support of the Regional Aquaculture Centers, and express our sincere appreciation for the support you have provided in previous years. Again, we would like to emphasize that significant benefits have already been provided from work conducted by these Centers and additional funding is urgently needed by our industry.

PREPARED STATEMENT OF CRAIG S. TUCKER, DIRECTOR, SOUTHERN REGIONAL
AQUACULTURE CENTER

Thank you Mr. Chairman and other Members of the Subcommittee for the opportunity to provide testimony in support of the Regional Aquaculture Centers. A strong domestic aquaculture industry offers significant economic and social benefits to the citizens of the United States. Domestic aquaculture can meet the ever-increasing demand for fishery products and help conserve ocean resources while reducing our dependency upon foreign suppliers of fish and shellfish. Enhanced aquaculture development in the United States can be achieved through a partnership among elements of the private sector, state and local public institutions, and the federal government. Such a partnership is the distinguishing characteristic of the Regional Aquaculture Center program.

The Regional Aquaculture Center program provides a unique and extraordinarily effective mechanism for assessing industry needs, establishing priorities, and implementing regional research and extension programs. Beyond that simple operational description, the characteristics that distinguish the activities of the Regional Aquaculture Center from that of other organizations are:

- Priority issues are identified by industry representatives familiar with aquaculture in the region;
- The issues that are addressed require more scientific expertise and facilities than are generally available at one location; that is, a team effort using the scientific resources of two or more institutions is required to solve the problem;
- Projects are planned and conducted as concerted efforts in which the participating research and extension scientists are mutually responsible for accomplishing the objectives; and
- Projects make use of personnel, facilities, and equipment already existing within the region, thereby reducing the administrative and overhead costs of conducting the work.

These characteristics make it possible to address important practical problems in a cost-effective manner. This is exemplified by the following three examples of recent work sponsored by the Southern Regional Aquaculture Center.

Food safety.—This multidisciplinary study involved scientists from institutions in eight states in the Southern Region. The goal of this proactive project was to identify real and potential food safety issues and to ensure and promote high quality aquaculture food products through educational activities. This was a highly successful project that provided a strong endorsement for the safety of farm-raised aquaculture products.

Aquaculture effluents.—This was another multidisciplinary, proactive study to examine potential environmental problems with water discharged from aquaculture facilities. The project involved scientists from institutions in nine states. The results of the project showed that aquaculture can be conducted with a minimal impact on

PART 1

1399

the environment and provided management techniques that can be used to minimize waste discharge from farms.

Improving nutrition.—Researchers in nine states are collaborating on a project to identify means of reducing feed costs, improving farm profitability, and increasing efficiency of feed utilization. Results have been impressive and indicate that simple changes in diet formulation can significantly reduce costs of feeding catfish, striped bass, and baitfish. Several of these improvements have already been implemented in commercial production.

Although producers from across the Region appreciate the practical results obtained from projects sponsored by the Center, benefits of the program extend far beyond immediate problem-solving. Through the cooperative approach to work fostered by the Center, existing research and extension linkages within the region are strengthened, which enhances interregional cooperation in other areas of endeavor. Also, support provided by Regional Aquaculture Center programs has been effective at leveraging other funding opportunities at participating institutions, which has enhanced overall research productivity beyond the immediate area of work supported by the Centers.

In summary, I believe that the Regional Center programs are highly productive and provide a cost-effective means of addressing important regional constraints to industry growth. Aquaculture industry representatives and research and extension personnel from throughout the Southern Region have embraced the Center's program as an effective and efficient means of ensuring future success for the industry. The authorized level of funding for the five Regional Aquaculture Centers is \$7.5 million annually. Over the last six fiscal years, the total annual appropriation for the Centers has been level at \$4.0 million, or \$800,000 for each of the five Regions. Each year that level of funding falls increasingly short of meeting the Centers' needs because the cost of conducting research and educational programs has risen sharply over that period. Accordingly, I respectfully request that you consider providing the full authorized level of \$7.5 million in fiscal year 1998 for the existing five Centers to support these extremely important and effective programs.

On behalf of the aquaculture industry in the Southern Region, I thank you for the opportunity to present testimony in support of the Regional Aquaculture Centers, and express our sincere appreciation for the support you have provided in previous years.

PREPARED STATEMENT OF JAMES T. ELFSTRUM, MANAGER, REGULATORY AFFAIRS,
RHÔNE-POULENC, INC.

We are writing to urge you and your colleagues on the subcommittee to support funding the Public Law 480 program in your upcoming deliberations at a level which will allow this valuable humanitarian assistance program to maintain its effectiveness.

Rhône-Poulenc is a multi-faceted general chemical company whose products include a wide array of primarily mineral-based food additives. We have production facilities or offices in 21 states, employing about 6,800 individuals. Both Rhône-Poulenc and its predecessor company, Stauffer Chemical, have a long history of supplying mineral supplements for inclusion in many of the blended and processed foods utilized in the Public Law 480 program. In fact, Stauffer Chemical worked cooperatively with program officials in the development and testing of many of the Public Law 480 foods. Over the years, we have also made substantial donations of nutrients to private voluntary organizations for inclusion in foodstuffs to complement the Public Law 480 program.

Because of our long term involvement in the Public Law 480 program, we are concerned that recent substantial cuts in the program, if continued, will seriously undermine the ability of it to provide effective humanitarian assistance to the needy overseas. For example, the President's proposed budget, which you will be considering, proposes only 3 million metric tons of food aid in fiscal year 1998 compared with nearly 8 million metric tons of food aid as recently as 1993. Although we recognize that the 1993 level included large donations of surplus governmental stocks which are no longer available, these further proposed reductions in donations will have a substantial negative impact on the future viability of the program. We believe this concern has already manifested itself since private voluntary organizations are reducing or eliminating programs in many areas of the world due to these cutbacks.

We note the President's budget proposes an overall foreign aid increase of \$1.2 billion while cutting the Public Law 480 budget by more than \$120 million. The President's proposed Public Law 480 budget of \$990 million represents a cut of more

PART 1

1400

than one-third from the program's fiscal year 1994 level of \$1.55 billion. Worldwide humanitarian food needs have not diminished to the extent suggested in the President's budget, and if the United States is to maintain its long-standing role as the world's leader in providing humanitarian food aid, our recent fall-off in support of assistance must be halted.

Title II of Public Law 480 is indeed the lifeblood of our humanitarian assistance program. We are pleased that the President's budget proposes maintaining Title II funding in fiscal year 1998 at current levels. However, even maintaining the status quo in Title II places this vital component of Public Law 480 at risk, especially in light of proposed cuts in the other titles which will continue to have a negative impact on programs under Title II. In light of these factors, we believe that an increase in Title II funding is justified and should be seriously considered by the Subcommittee.

Lastly, we do not agree to increasing the foreign aid budget while cutting humanitarian food assistance. We would hope that during your deliberations, the food aid budget, especially Title II, is adequately maintained, and hopefully increased, in order that this crucial assistance program can remain viable.

Thank you for your attention to this matter.

PREPARED STATEMENT OF MICHAEL CONNEALY, PRESIDENT AND CHIEF OPERATING OFFICER, RURAL COMMUNITY INSURANCE SERVICES

This statement is submitted on behalf of Rural Community Insurance Services ("RCIS") to provide the Senate Committee on Appropriations with RCIS' views on appropriations for the Federal crop insurance program for fiscal year 1998.

RCIS is a managing general insurance agency that, in 1996, sold and serviced approximately \$250 million of multiple peril crop insurance, approximately \$5 million of catastrophic coverage and approximately \$13 million of crop revenue coverage, pursuant to a Standard Reinsurance Agreement ("SRA") with the Risk Management Agency ("RMA"). RCIS is a wholly-owned subsidiary of Norwest Corporation, the bank holding company.

Norwest is one of the largest agriculture lenders in the United States with an agricultural loan portfolio of approximately \$1.28 billion. Whether Norwest lends money to a family farmer or to a business such as a seed, fertilizer or equipment dealer that, in turn, sells its products on credit to that family farmer, crop insurance is an essential link in the chain of credit on which our rural communities depend.

Because those communities and towns, their houses of worship, schools, hospitals, and businesses are heavily dependent on farm income, they are as much affected by uninsured natural disasters as are the farmers whose crops have been destroyed. Thus, to the extent that crop insurance increases the ability of our farm families to manage risk, crop insurance also strengthens the financial underpinnings of all rural communities which look to those farm families for their own livelihoods and future. Indeed, in the words of the Federal Crop Insurance Act, the very purpose of the "sound system of crop insurance" that Congress mandated is "to promote the national welfare by improving the economic stability of agriculture." 7 U.S.C. § 1502.

The schematic devised by Congress to foster "a sound system of crop insurance" and thereby "the economic stability of agriculture" is one of privatization and partnership. For example, in amending the Federal Crop Insurance Act in 1980, the Committee on Agriculture, House of Representatives, stated:

"In implementing the new crop insurance program. H.R. 4119 provides that reinsurance of private insurance companies willing to offer the all risk program shall be used to the "maximum extent practicable." This language reflects the Committee's desire to see maximum cooperation between the public and private sectors and ensure that the FCIC [Federal Crop Insurance Corporation] understands that it is to make a good faith effort to negotiate reinsurance arrangements. The Corporation should seek out private companies in all areas of the country which have the capability and desire to enter into a successful reinsurance arrangement.

* * * * *

"A serious effort must be made by FCIC to involve private industry in the Federal crop insurance program. The burden of negotiating an arrangement using reinsurance of private companies, to the maximum extent practicable, rests with FCIC, especially in view of the hiring limitation of 200 new personnel contained in H.R. 4119."

House Rept. No. 96-430, 96th Cong., 1st Sess., pp. 14-15.

PART 1

1401

Subsequent amendments to the Act did not dilute or divert Congress' direction. Indeed, the 1994 Amendments extended the role of the private sector beyond reinsurance. For example, the 1994 Amendments directed the FCIC "to the maximum extent possible" to:

"Contract with private insurance companies, private rating bureaus, and other organizations as appropriate for actuarial, loss adjustment, and other services to avoid duplication by the Federal Government of services that are or may readily be available in the private sector and reimburse such companies for the administrative and program expenses as determined by the Board, incurred by them, under terms and provisions and rates of compensation consistent with those generally prevailing in the insurance industry * * * ."

7 U.S.C. § 1507(c)(2).

On January 15, 1997, Secretary Glickman pledged his support for the public-private partnership that Congress envisaged. In a speech before the National Press Club, Mr. Glickman said, in pertinent part:

"Our greatest challenge coming out of the new farm bill is to find new ways to help farmers thrive in an increasingly risky environment, and yet not be involved in the micromanagement of agricultural decisions. That is why risk management has become a top priority.

"Better risk management means many things: more and better market information; better access to information; producer education, and development and use of mechanisms to share or transfer risk. There is a role for a government-private sector partnership in helping producers use market information and in developing insurance products and other risk management products to deal with variabilities in agriculture."

Release No. 0008.97, p.4.

RCIS is aware of criticism that is currently being leveled at the multiple peril crop insurance industry. While some criticism may be warranted, much is not.

First, for example, in 1988, the FCIC contracted with Arthur Anderson & Co. to gather and analyze the costs incurred by private contractors in 1987 in the sale and service of multiple peril crop insurance and to compare those costs to the level of FCIC reimbursement, which was then 34 percent, plus additional reimbursements for excess loss adjustment costs. Specifically, Arthur Anderson was asked to determine:

"if the reimbursement rates are on the basis of costs to the same extent that such costs are covered by the FCIC and are consistent with terms and conditions and rates of compensation prevailing in the insurance industry * * * ."

Arthur Anderson & Co. "Review of Reimbursement Rates and Costs Incurred by the FCIC for the Federal Multiple-Peril Crop Insurance Program", September, 1989, p. 10.

Arthur Anderson found as here pertinent:

"The FCIC should make a determination regarding which of the contractors' costs are allowable for reimbursement and communicate the information to the contractors, preferably within the contractor agreements. We [Arthur Anderson] did not disallow any costs in our analysis as inconsistent with terms and conditions and rates of compensation prevailing in the insurance industry."

Id.

The FCIC took no action on Arthur Anderson's recommendations.

More recently, on May 11, 1993, RCIS urged the FCIC to identify and define the costs that were reasonable, allowable and allocable to expense reimbursement. In particular, RCIS suggested that the cost principles, Part 31, of the Federal Acquisition Regulation provided a ready made template for such an undertaking. Again the FCIC took no action.

In the absence of regulation prohibiting it from using its expense reimbursements to pay for expenses it lawfully incurred in the business of selling and servicing multiple peril crop insurance, RCIS incurred lawful expenses consistent with those prevailing in the insurance industry. And now RCIS is subject to criticism for doing those things that insurers and general agents do when no one, even after the Arthur

PART 1

1402

Anderson report and RCIS' own proposal, told it not to do the things that insurers and general agents do.

Second, at a time when bad news is more fashionable than good, it is too easy to overlook the simple fact that the federal crop insurance program is a success. For example, in 1986, \$378 million of federally insured and reinsured crop insurance was in force; in 1996, that amount had grown to \$1.8 billion. In 1986, 60.8 million acres were insured; in 1996, 203.7 million acres were insured. And, while the program has expanded, the rate of expense reimbursement has contracted and an acre of coverage costs the Government less to deliver today than in 1986.

This success, in turn, has induced reinsured companies to invest in the future of the federal crop insurance program. RCIS, for example, has invested over \$8 million since 1995 in a business re-engineering project, Impact 1995, to develop a new personal computer and software system for its agents and loss adjusters and in new loss adjustment procedures that will permit RCIS to allocate its loss adjustment budget according to the indemnity dollars it disburses and not the number of claims forms it processes, as the FCIC procedures now require. RCIS is looking forward to the FCIC's prompt approval of this new claims process.

To maintain the momentum that Congress initiated with the Crop Insurance Reform Act of 1994, RCIS believes the following, minimal measures are needed.

First, the expense reimbursement for the sale and service of multiple peril crop insurance should be 28 percent with a reduction of no more than two percent on CRC and group risk plan insurance. A reduction below 28 percent will throw the multiple peril crop insurance program into uncharted waters. There is simply no way to predict the effect of a greater decrease on service to policyholders or future investment in the program. In this regard, in 1986, there were 39 reinsured companies selling, servicing and underwriting multiple peril crop insurance. Today, there are 16 companies. A reduction in expense reimbursement from 28 percent, the amount of reimbursement currently authorized by law, may reduce further the number of participants in the federal crop insurance program and have a particularly adverse effect on smaller companies. RCIS questions whether it is in the public interest to force smaller companies from this program and discourage new companies from entering.

A reduction in expense reimbursement below 28 percent will also limit, if not end, research and development of new risk management products as well as other long term investments. As expense reimbursements become more dear, the greater will be the need to retain all underwriting gain for reserves. Conversely, if the Committee were to appropriate 28 percent for expense reimbursement, the Committee may choose to earmark some amounts for long term investments such as computers, software and product development and require the refund of any earmarked funds that were not spent for their appropriated purpose.

Second, RCIS urges the Committee to restore appropriations to reimburse companies if they incur excess loss adjustment costs as defined by and provided for in the current Standard Reinsurance Agreement which states in Section IV. B.:

"In addition to the expense reimbursement in subsection IV.A., if the loss ratio on the Company's total book of business in any individual Fund in a state for the reinsurance year is in excess of one-hundred twenty-five percent (125 percent), FCIC will pay to the Company two hundredths of one percent (.02 percent) of the net book premium on all eligible multiple peril crop insurance contracts reinsured under this Agreement for that individual Fund in a state, for each full point in excess of the one-hundred twenty-five percent (125 percent) loss ratio. The excess loss adjustment expense reimbursement under this section will not exceed four percent (4 percent) of the net book premium in any individual Fund in a state for all eligible multiple peril crop insurance contracts reinsured under this Agreement. Group risk plan crop insurance contracts are specifically excluded from this computation."

The Committee had provided appropriations for such reimbursements in past years but apparently the language necessary to permit the FCIC to pay excess loss adjustment costs in the 1998 reinsurance year, which begins in the 1997 fiscal year, was unintentionally omitted from the 1997 fiscal year appropriations act. It is important that this language be restored. If loss ratios do exceed the above perimeters, the FCIC will not be required to disburse additional funds; however, if loss ratios are excessive, reinsured companies will not be able to adjust those excess losses without the compensation that the FCIC historically has paid and Congress has approved for such excess costs.

Finally, we question whether the Committee should provide appropriations for RMA's headquarters offices, its regional service offices, and its field compliance of-

PART 1

1403

fices. Instead, RMA should comply with section 507(c)(2) of the Federal Crop Insurance Act which Congress enacted in 1009 but which RMA still has not employed. That section requires RMA “to the maximum extent possible” to:

“contract with private insurance companies, private rating bureaus, and other organizations as appropriate for actuarial, loss adjustment, and other services to avoid duplication by the Federal Government of services that are or may readily be available in the private sector, and reimburse such companies for the administrative and program expenses, as determined by the Board, incurred by them, under terms and provisions and rates of compensation consistent with those generally prevailing in the insurance industry * * * .”

RCIS does support an increase in RMA personnel at its Kansas City operations office to augment its actuarial capabilities.

RCIS and Norwest appreciate the opportunity to submit this statement for the Committee’s consideration.

PREPARED STATEMENT OF BRUCE C. CARLTON, EXECUTIVE DEAN OF AGRICULTURE AND NATURAL RESOURCES, ON BEHALF OF THE BLUEBERRY AND CRANBERRY RESEARCH AND EXTENSION STATION, RUTGERS UNIVERSITY

SUMMARY

The Rutgers Blueberry/Cranberry Research and Extension Center at Chatsworth, New Jersey is recognized as one of the finest research centers serving the national blueberry and cranberry industries. The research and outreach activities ongoing at Chatsworth have had, and continue to have, a profound impact on the blueberry and cranberry industries and the mostly small farmers who grow these crops. The station’s focus is on environmental and agricultural sustainability and on the “nutraceutical” (medicinal) properties of cranberries and blueberries, thus serving the broader public interest. The very modest federal investment in this research and outreach effectively leverages continuing state support, as well as significant industry support.

We seek your support for appropriating \$220,000 from the fiscal year 1998 USDA budget for the Rutgers Blueberry and Cranberry Research and Extension Station at Chatsworth to match the \$250,000 annual appropriation from the New Jersey legislature and the annual budgetary support from the New Jersey Agricultural Experiment Station.

This state and federal partnership we call the land-grant system is one of America’s proudest and most fruitful achievements. Through the dedicated, even inspired, use of federal base funds, this country’s land-grant institutions have established a base of knowledge and expertise that serves the immediate and long-term needs of our clientele in every state. We at Rutgers University have no higher priority than to support base funds distributed through the United States Department of Agriculture for agricultural research and cooperative extension services.

Mr. Chairman: The Rutgers Blueberry/Cranberry Research and Extension Center at Chatsworth, New Jersey was created in 1984 as a state initiative. Blueberries and cranberries are important crops for New Jersey (we rank first in the nation in fresh market blueberry production and third in cranberries), and the value of the Chatsworth Center to the state blueberry and cranberry industries has been and remains very high. As of about 1990, however, the scope and benefits of the station’s work began to extend beyond New Jersey.

The Rutgers Blueberry/Cranberry Research Station now ranks among the finest national research centers serving the national blueberry and cranberry industries. Indeed, growers from Washington, Wisconsin, Oregon, Michigan, and Massachusetts—and cooperative associations representing growers and distributors throughout the US and Canada—rely on this research and extension station to carry out research essential to the continued viability of their industry. Today the national blueberry crop is worth more than \$135 million each year, and it injects more than \$300 million into the national economy. The annual cranberry crop is worth some \$250–300 million and is estimated to contribute about \$1.8 billion to the U.S. economy.

We seek support for inclusion of \$220,000 in the fiscal year 1998 USDA budget for the Rutgers Blueberry and Cranberry Research and Extension Station at Chatsworth to match the \$250,000 annual appropriation from the New Jersey legislature and annual budgetary support from the New Jersey Agricultural Experiment Station.

PART 1

1404

Federal support of blueberry and cranberry research apparently has been put on a "hit list" of so-called "corporate welfare" programs. In fact, it is nothing of the sort. Rather, this very modest appropriation serves as a model for federal research investments: it is essential to continued state support and helps leverage private research dollars far in excess of the federal appropriation. Moreover, the advances in breeding disease resistance and drought resistance have application far beyond these berry crops, as does groundbreaking work in identifying and understanding the specific medical and health benefits of certain compounds in these fruits.

If federal funding for the station is removed, research on development of berry varieties resistant to diseases and pests that account for the vast majority of fungicide and insecticides use would be terminated. Development of integrated pest management techniques for these crops also would end, as would research and development of biocontrol measures that would enhance the nationwide Integrated Pest Management effort.

Throughout its lifetime, the Rutgers Blueberry/Cranberry Research Station has been very productive. Besides developing many new varieties of blueberries and cranberries for the industry, this national research and extension center both generates and disseminates the results growers need to produce consistently reliable yields of high-quality berries. The project objectives are twofold: first, to develop pest management methods and disease-resistant varieties that will reduce losses to cranberry and blueberry crops from disease, insects, and climatic factors while minimizing the use of pesticides. This is particularly important in accommodating continued agricultural production near environmentally sensitive areas such as wetlands and the Pinelands where these crops must be grown. The second objective is to improve fruit quality and productivity through genetic enhancement of these crop species. Another important and extremely promising area of research is in the medicinal properties of cranberries and blueberries.

Among the Center's specific achievements:

- Researchers have succeeded in isolating the specific compound in cranberries that can prevent and cure urinary tract infections. Intellectual property issues are being resolved before a formal announcement of this achievement is made.
- In cooperation with USDA/Agricultural Research Service (ARS), the Center has released eight blueberry varieties since 1988, all of which are adapted for growing in New Jersey, Massachusetts, New York, Michigan, Arkansas, North Carolina, Oregon, and Washington.
- Work at the Center has resulted in increased genetic diversity in the blueberry and cranberry gene pool for both breeding and inbreeding lines; it houses the largest collection of blueberry and cranberry plants; and identification and evaluation of elite breeding lines for future release.
- Center scientists have successfully identified and characterized the causal agent and insect vector for a very destructive blueberry disease, Blueberry Scorch Virus; have identified major causal agents inciting cranberry fruit rot in New Jersey; and have identified potentially useful biological control organisms against cranberry fruit rot.
- Research has led to identification of a new destructive pest—mealybug—in blueberry and identification of potentially useful biological control organisms against cranberry and blueberry insect pests.

The Blueberry/Cranberry Research and Extension Center has an excellent record of productivity and achievement. Still, much remains to be done, particularly in the area of improving cranberry varieties. Successful cultivation of both these wetland crops depends upon pesticides to control a variety of major pests and diseases. IPM research is needed to reduce our reliance on these chemicals, as is the breeding of resistant varieties.

Let me emphasize that the small family farms/businesses that grow and manage both of these crops are doing what they can to support themselves. Modest federal funding for blueberry and cranberry research in no way qualifies as an undue federal subsidy for farmers or agribusiness.

Thank you for the opportunity to offer testimony on behalf of federal funding for the Rutgers Blueberry and Cranberry Research and Extension Center in Chatsworth. Please do not hesitate to contact me if I can provide further information or address any concerns you may have.

PREPARED STATEMENT OF RICHARD T. GUEST, PH.D., OFFICE OF IR-4, COOK COLLEGE/NEW JERSEY AGRICULTURAL EXPERIMENT STATION, RUTGERS UNIVERSITY

Mr. Chairman: Thank you for the opportunity to submit comments concerning the USDA's IR-4 Minor Crop Pest Management program.

PART 1

1405

BACKGROUND

The IR-4 Project was organized in 1963 with the singular purpose of helping producers of minor crops obtain needed pesticide registrations in the absence of private sector support. The program has expanded over the years to address the needs of nurserymen in the \$10 billion "green" industry and to assist both public and private organizations obtain registrations for biologically based pest control products. IR-4 has developed a highly efficient research operation involving a network of field research centers and analytical laboratories which are managed by regional offices at four principal state land grant institutions and by the USDA-ARS minor use office at Beltsville, MD. Coordination of the overall IR-4 minor use program with EPA, USDA, user groups and private sector registrants is carried out by a headquarters operation located at the New Jersey Agricultural Experiment Station.

Although the importance of minor crops to the United States economy and to the diet of citizens of this nation is not new, the 1996 Food Quality Protection Act has again focused attention on the minor use issue. It is well recognized that "minor crop" is a serious misnomer in that the combined acreage of these crops in the U.S. exceeds 11 million acres with an annual value of more than \$32 billion. Indeed, the value of minor crops in 27 states exceeds 50 percent of the value of all crops grown in those states. For many states, such as California, Florida, Georgia, Hawaii, New Jersey, New York, North Carolina, Pennsylvania and Washington, minor crops make up a very significant portion of all crop sales.

Although the traditional mission of IR-4 has been to assist with the registration of renew pesticide products, the 1988 amendments to FIFRA resulted in the need for IR-4 to support minor use reregistrations that would not be supported by commercial registrants. Utilizing additional funds appropriated by Congress, IR-4 fulfilled its 1990 Strategic Plan commitment by supporting the reregistration of more than 600 existing minor crop registrations while continuing its ongoing pest management programs on food and ornamental crops and expanding its biopesticide registration program.

IMPACT OF FQPA

While FQPA amendments to FFDCA have eliminated the conflict caused by the Delaney clause, amendments to FIFRA will have a major affect on minor uses. On one hand, the Act contains provisions that will encourage private sector registrations for minor crops. On the other hand, there will be an increased need for residue data brought on by tolerance reassessment, the impact of aggregate exposure and increased costs to registrants for data required to maintain existing registrations. Because of the economics inherent to minor uses and with more than 500 minor crops currently grown in the U.S., it is clear that IR-4 will once again serve a critical role in developing data to support minor crop reregistrations and the registration of alternative pest management tactics.

IR-4 RESPONSE PLAN

The FQPA requires that all tolerances be reassessed over the next ten years (by 2006) according to current standards. The U.S. EPA has proposed a three year timetable to complete tolerance reassessment of the first group of pesticides which represent more than 3100 crop tolerances. With assistance from the USDA-CSREES Expert IPM Decision Support System database, IR-4 estimates that about 1700 pesticide registrations on minor crops are at risk as a result of this initial tolerance reassessment. Working with crop producers, registrants and EPA, IR-4 has initiated a program to estimate the effect of tolerance reassessment on minor crops by:

- identifying affected minor crop registrations
- surveying producers and state and federal agricultural scientists to determine needs
- contacting registrants to determine support/non-support decisions
- working with other USDA programs to identify alternatives
- identifying pest control gaps
- using workshop committees to establish priorities

Grower surveys have been initiated and industry support decisions will be evaluated as FQPA regulatory requirements are finalized. The evaluation of "at risk" minor crop registrations will culminate with an October IR-4 prioritization workshop at which producers, scientists and registrants will provide guidance to IR-4 on short and long term research and registration objectives.

Although research on reduced risk alternatives has already begun, this effort will be accelerated in 1998 based on workshop recommendations. The ongoing IR-4 re-

PART 1

1406

search program will assure the continued availability of pest control products for minor crops through:

- cooperation with USDA, EPA, land grant scientists, producers and registrants to identify effective reduced risk alternatives for minor crops and assist in their registration
- coordination with EPA and registrants to develop GLP-compliant data to support tolerance reassessment on minor crops. This may require risk reduction tactics such as:
- consumer-based vs. farm gate-based residue information
- lowering existing tolerances by reducing rates and extending PHI's

Research on alternative pest control products and risk mitigation tactics will continue to be carried out mainly at IR-4's 19 field research centers and 16 analytical laboratories under Good Laboratory Practice Standards. The long term goal of this research is to develop data to support registrations for reduced risk alternatives for all minor crops.

MINOR USE DATA REVOLVING FUND

To ensure the adequacy of effective pest management on minor crops, the FQPA authorized the establishment of a Minor Use Pesticide Revolving Fund within USDA. Since the present mission of IR-4 is to provide product performance and residue chemistry data, funds available from the USDA grant program should be utilized to develop additional data required to support registrations and reregistrations. Such information may include one or more of the basic or core studies required by EPA for product registration as well as studies and surveys relating to pesticide usage, food consumption and dietary exposure which may be important to the evaluation of pesticides subject to tolerance reassessment and reregistration.

The IR-4 Project is a proven national agricultural research program and a significant data contributor to EPA. With additional resources, IR-4 can utilize its expertise and capabilities to assist with the evaluation and management of projects eligible for grants under the Minor Use Pesticide Data Revolving Fund by:

- interacting with EPA and registrants on data requirements
- preparing and reviewing research protocols
- providing or locating appropriate testing/analytical facilities
- preparing data packages for approval by registrants and EPA
- providing quality assurance inspections and audits

Further, IR-4 can provide assistance in coordinating with its existing minor use residue program to assure concurrent data development. And the IR-4 Quality Assurance program can provide guidance to insure that research data are in compliance with EPA Good Laboratory Practice Standards.

BIOPESTICIDE RESEARCH PROGRAM

IR-4's commitment to "safer" pest control began in 1982 with the adoption of its biopesticide initiative. Although relatively small in terms of dollars spent on research, there is growing interest in the IR-4 Biopesticides program on the part of state and federal researchers and venture-capital firms. As a result, the program has successfully attracted extramural funding to the point where research is supported nearly dollar for dollar with outside monies. This has permitted the Biopesticide program to make a number of significant contributions to minor crop pest management over the past several years, including the following registrations:

- methyl anthranilate, a natural ingredient, for bird repellency on blueberries, cherries and grapes
- codling moth granulosis virus for insect control on apples, pears, walnuts and plums
- Pseudomonas fluorescens* for bacterial disease control on mushrooms
- formic acid for control of tracheal mites on honey bees

As stated in the IR-4 Minor Crop Pest Control Strategy, it is the goal of IR-4 to increase intramural funding to about 50 percent of the total IR-4 budget to support research on biologically based and reduced risk pest control products on minor crops.

PROGRAM FUNDING

Many sources of funding contribute to the support of the IR-4 Project. These include direct funding from USDA, commodity producers and commercial registrants and non-monetary support from state and federal research institutions. In fiscal year 1997, \$8.3M in federal funds supported the operation of IR-4 including \$5.7M from CSREES Special Research Grants, \$2.1M from ARS and \$0.5M in Hatch Funds. Direct support from the private sector typically totals \$0.5M annually. Fund-

PART 1

1407

ing to IR-4 is highly leveraged by host institutions from a variety of sources including technical and administrative assistance, laboratories and other research facilities, equipment and land. It is estimated that for each federal dollar directed in support of IR-4, three dollars are contributed by host research institutions.

Although no overhead is charged against IR-4 grant funds, real dollars available for research have been reduced by several factors. A recent survey among IR-4 co-operators showed that compliance with Good Laboratory Practice Standards consumes 36 percent of IR-4 research dollars. Moreover, EPA mandated geographic data requirements have increased the cost of field trials by 60 percent and inflation has further eroded research monies. Although IR-4 program accounting show an increase in analytical productivity along with a decrease in analytical costs, there is evidence of a decline in overall program productivity as a result of level funding since 1994.

USDA-CSREES has requested an increase of \$5M in funding in the Special Research Grant line entitled Minor Crop Pest Management, IR-4 for fiscal year 1998. This will increase the overall federal support for the minor use program to \$13.3M. The additional funding will be used to support registrations for reduced risk pest management alternatives for minor crops and to support risk reduction tactics for current registrations where effective alternatives are presently unavailable.

Thank you for this opportunity to testify on behalf of the IR-4 minor use program. We are grateful to the Committee for its past support of the IR-4 Project and look forward to a favorable response to the current USDA-CSREES funding request.

PREPARED STATEMENT OF BRUCE C. CARLTON, EXECUTIVE DEAN OF AGRICULTURE
AND NATURAL RESOURCES, RUTGERS UNIVERSITY

SUMMARY

With a combination of federal and state funds, Rutgers University has completed Phase 1 construction of Walter E. Foran Hall, a remarkable facility which has had a dramatic impact on the quality of teaching, research, and outreach in the plant sciences, agricultural biotechnology, and natural products chemistry programs at Rutgers. The university needs to complete Phase 2 construction of Foran Hall, and so currently seeks \$3.5 million from the USDA fiscal year 1998 budget as the final federal match needed for the Foran Hall project. We ask your support for this appropriation.

Mr. Chairman: Thank you for this opportunity to submit comments.

This state and federal partnership we call the land-grant system is one of America's proudest and most fruitful achievements. Through the dedicated, even inspired, use of federal base funds, this country's land-grant institutions have established a base of knowledge and expertise that serves the immediate and long-term needs of our clientele in every state. We at Rutgers University have no higher priority than to support base funds distributed through the United States Department of Agriculture for agricultural research and Cooperative Extension services.

While adequate base funding is critical, targeted funding also can yield important benefits. With a combination of federal and state funds, Rutgers University has completed Phase 1 construction of Walter E. Foran Hall, a remarkable facility which has had a dramatic impact on the quality of teaching, research, and outreach in the plant sciences, agricultural biotechnology, and natural products chemistry programs at Rutgers. The university needs to complete Phase 2 construction of Foran Hall, and so currently seeks \$3.5 million from the USDA fiscal year 1998 budget as the final federal match needed for the Foran Hall project. We ask your support for this appropriation.

As is documented briefly in this testimony, the Plant Science and Biotechnology Complex already has resulted in significant discoveries and public benefits related to plant sciences, agricultural biotechnology, and natural products chemistry. Research to be pursued in the Phase 2 wing will serve key state and regional priorities, as well as these USDA-identified national goals:

- increase partnering among scientists and policy centers
- introduce new and value-added products
- leverage public resources to attract private investment and support economic development
- recruit and educate more women and underrepresented minorities in the sciences
- optimize health by improving the nutritional quality of foods
- achieve sustainable agriculture production systems
- protect, conserve, and improve water, soil, and air resources

PART 1

1408

—expand and apply new technologies to distance education

The purpose of Walter E. Foran Hall is to support agriculture. The building is used for teaching, research, and Extension that benefit agriculture in New Jersey and in the United States. During the last 10 years, the Committee on Appropriations has appropriated \$10 million for Phase 1 construction, and approximately \$7.47 million toward Phase 2 construction. Mr. Chairman, we are extremely grateful for this committee's strong vote of confidence in supporting the complex thus far.

Phase 1 of the project was completed at an overall cost of \$37.2 million. Of that total, Congress appropriated \$10 million, and \$27.2 million came from the State of New Jersey and Rutgers University. In addition, Rutgers has invested another \$10 million in such ancillary, but necessary, facilities as greenhouses and containment facilities for transgenic plants.

Phase 2 of the project consists of building a wing to the existing structure, which originally called for a \$10 million federal investment, of which approximately \$7.47 million has been appropriated by Congress since fiscal year 1994. The amount actually received by Rutgers University for Phase 2 is about \$7.24 million, as USDA retains a 3 percent administrative allowance. Since 1993, when the project was originally budgeted, construction costs have risen, and the Phase 2 budget now stands at \$10.64 million, or \$3.4 million more than Rutgers has received.

For fiscal year 1998, therefore, we request that Congress authorize and appropriate \$3.5 million, which, minus the 3 percent USDA allowance, will provide the \$3.4 million required by Rutgers to complete the Plant Science and Biotechnology Complex. To repeat, this is the final federal match required to complete construction of the Phase 2 wing of the complex, thus completing the federal share of the entire project.

Through an unfortunate error last year, the Appropriations Conference Committee received incorrect information that resulted in a substantial reduction in the fiscal year 1997 appropriation for Phase 2, which was to have been the final appropriation for this project. We are aware that the fiscal year 1997 Appropriations Act Conference Report contained language suggesting that no additional federal funds would be available for facilities. It is our fervent hope, however, that additional funds will be made available that would otherwise in all likelihood have been made available last year, had the confusion not occurred.

Completing the Phase 2 wing will allow for total consolidation of the Plant Science and Plant Pathology departments and will provide additional, much-needed instruction facilities, including a computer laboratory that will double as a distance-learning facility, thus serving an important regional and national need. Primary areas of focus in the Phase 2 wing include new-use agriculture and natural products chemistry, two areas of increasing strength at Rutgers. We are focusing on these areas because of their importance to New Jersey agriculture and other key industries, and because they require the kind of team-based, interdisciplinary approach that is becoming a hallmark of New Jersey's State University. The Phase 2 wing also will enable the University to expand on its technology development and transfer to commercial partners, and cultivate the development of new global markets.

The finished portion of Foran Hall contains state-of-the art research laboratories, conference and classroom facilities, an outstanding science library, and attached greenhouses. The facility is home to our departments of Plant Science and Plant Pathology, our Center for Agricultural Molecular Biology (the AgBiotech Center), and our Center for Turfgrass Science.

Foran Hall has already influenced the status and quality of plant science, agricultural biotechnology, and student life on the Cook College and Douglass College campuses of Rutgers University. Because the facility stands adjacent to a residential building for Douglass College women who are part of the intensive math and science program there, it inspires and serves those students, simultaneously advancing Rutgers' overall effort to increase the representation of women in the natural sciences.

In addition:

—The AgBiotech Center has quickened its pace of research disclosure and patent applications. In the past two years alone, fourteen disclosures and eight patent applications have been filed on discoveries ranging from disease resistance in plants and antiviral plant proteins to phytoremediation technologies, that is, using plants to clean up radioactive materials and heavy metals from soils and water. For New Jersey agriculture, phytoremediation holds promise for new, high-demand, high-value crops and offers potential for converting or returning cleaned soils to production agriculture and other uses that support economic development.

—The AgBiotech Center recently made international news, when research on methyl salicylate and airborne signaling in plants was the cover story in the

PART 1

1409

prestigious British science journal *Nature*. This is only one of several research projects having similar impact.

- Turfgrass research was strong before moving into Foran Hall, but the move afforded new opportunities for closer interaction with colleagues from other disciplines. Those interactions are leading to new advances in improving disease resistance and drought resistance in plant varieties, which in turn reduces use of pesticides and water by agriculturists and homeowners alike.
- Last summer, plant scientists in Foran Hall announced that the saponin found naturally in asparagus can inhibit the growth of human leukemia cells. Other research is identifying which natural component of cranberries can prevent or cure infections of the urinary tract. Discoveries like these add to the momentum of our initiatives in natural-products chemistry, nutraceuticals, and new-use agriculture.

These are manifestations of the phenomenon documented in a recent national report, and reported on in a recent *New York Times* article (attached) titled "Study Finds Public Science is Pillar of Industry."

Work ongoing in Foran Hall has leveraged significant external, competitive funding. In AgBiotech alone, external funding generated by only seven research teams increased in fiscal year 1997 to more than \$2.8 million from federal, industry, and foundation sources.

Students, too, make good use of the facility: undergraduates flock to take advantage of the biotechnology curriculum and research opportunities in faculty laboratories. The computer terminals in Foran Hall's Chang Science Library are in use late into the night.

Perhaps the most profound impact the facility has had is its affect on the way that academic departments interact, leading to more and better collaboration, and better preparation for students. Foran Hall combines conventional agricultural research with biotechnology at a high level, and both kinds of researchers profit from the interaction. Foran Hall is proof that problems formerly believed to be virtually insurmountable can be solved more readily when addressed by an interdisciplinary team of scientists. Consequently, the results of scientific breakthroughs can be delivered to the public more quickly than in the past.

Although population pressure and high costs challenge many in production agriculture around the nation, New Jersey, as the most densely populated and the most urban state, has experienced these challenges sooner and more intensely. In many ways, New Jersey is a microcosm of contemporary global issues, and our ability to address them effectively as they relate to agriculture is extraordinarily important within and beyond the Garden State. Completing Foran Hall will substantially improve our capacity to do just that.

Thank you for your consideration. We are most grateful to this committee for its pivotal support in bringing our Plant Science and Biotechnology Complex to fruition. The complex underpins our philosophy that we must integrate developing technologies with traditional approaches to ensure that modern American agriculture is as productive and competitive as it needs to be in the global economy.

Please do not hesitate to contact me if you require additional information.

PREPARED STATEMENT OF THE SOCIETY OF AMERICAN FLORISTS

The Society of American Florists (SAF) appreciates the opportunity to submit testimony on the important topic of federal spending for American agriculture. Our testimony will address four specific areas within the USDA budget: research funding, pesticide clearance and research, international trade and quarantine protection, and collection of statistical information.

The Society of American Florists (SAF) is the national trade association representing the entire floriculture industry. We are a vertically integrated organization, representing all segments of the industry: growers, wholesalers, retailers, importers, suppliers, educators, and related organizations. Our membership includes about 20,000 small businesses, located in every state and Congressional district nationwide.

Even in this era of reduced federal spending, it is a great time to be testifying on behalf of our industry. Floriculture and nursery crops are becoming an increasingly important part of agriculture, and their economic role in rural communities across America is increasing every year. Congress noted that increased importance last year by including in the fiscal year 1997 budget research money specifically targeted to our industry. We were very pleased with that first-ever recognition of our industry.

PART 1

1410

We hope to build on that foundation. The Society of American Florists and the American Association of Nurserymen have begun an exciting and important new initiative. We have joined together to develop a proposal for the establishment of a coordinated research initiative for our industry.

Unfortunately, in its 1998 budget proposal, the Clinton Administration has failed to include a continuation of the research dollars targeted to our industry by Congress last year. In our testimony today, we request the Committee restore that funding, which serves as a foundation for the research initiative for our industry that we are now preparing and which we will also describe to you.

INTRODUCTION: THE FLORICULTURE AND NURSERY INDUSTRY

The combined products of the floriculture and nursery industry include cut flowers and foliage, potted flowering and foliage plants, bedding plants, perennials, annuals and bulbs, shrubs, trees, cut Christmas trees, and seeds and other propagative material. Together, our industry is also known as "environmental horticulture."

In 1994, according to USDA statistics, environmental horticulture crops were estimated to be \$10.04 billion in farm-gate cash receipts and to represent more than 10 percent of all U.S. crop cash receipts. Yet less than one percent of federal research dollars is devoted directly to this industry's research. Floriculture and nursery crops are the third largest farm crop, ranking ahead of all others except corn and soybeans. Combined environmental horticulture production now ranks in the top five agricultural commodities in 26 states, in the top ten commodities in 43 states, and in the top 20 in all states. The environmental horticulture segment continues to be one of the fastest growing areas of agriculture, growing between 5 and 8 percent annually.

Among the various agriculture sectors, environmental horticulture is a major employer, and very labor intensive, given the diversity of crops produced. For example, nursery growers are conservatively estimated to employ at least 43,000 persons on a full-time basis year-round, and 102,000 during seasonal peak periods. At the retail and landscape level, there are estimated to be more than 600,000 full-time, part-time and seasonal workers employed in the nursery industry, and another 350,000 in floriculture.

Yet, although recognition of the importance of the industry is increasing, few federal research dollars are dedicated to the floriculture and nursery industry. Current competitive grant programs and other public funding mechanisms are unable to meet the industry's research needs. The industry supports, and will continue to support, research efforts through its own privately funded research foundations. However, the Federal government needs to play an appropriate role in research which cannot be undertaken by the private sector.

I. RESEARCH FUNDING

For fiscal year 1997, Congress directed \$200,000 to the Agricultural Research Service to address the research needs of the floriculture and nursery industry. We are extremely to note that in its 1998 budget, the Clinton Administration has failed to include a continuation of even that amount of direct research money. The 1998 budget request includes a \$10 million net increase for ARS research programs. We are supportive of that increased funding for agriculture research. However, the Administration has redirected a total of \$23 million from ongoing research projects, apparently including that targeted last year to our industry. We thus request that Congress continue to direct specific funding to the USDA to undertake new research initiatives in support of the research needs of the floriculture and nursery industry.

We also draw the Committee's attention to our current effort of preparing a detailed research initiative for the floriculture and nursery industry. That research initiative can only be built by continuing into fiscal year 1998 the foundation so wisely authored by this Committee, and enacted by Congress, last year.

The following is a preview of the floriculture and nursery initiative which we are currently developing. The initiative's goals clearly show the importance to society at large of directing research funding to our industry. The goals of the floriculture and nursery initiative are to:

- Protect the environment, including human health and safety, through research leading to reduced use of chemicals and to reduced runoff and other wastes.
- Maintain biodiversity through germplasm preservation, so that useful botanic traits may be transmitted to future generations.
- Enhance environmental remediation and clean-up efforts on wetlands, post-industrial sites, air quality, and other environmental areas through research on the ability of plants to reverse and mitigate environmental pollution.

PART 1

1411

- Improve rural and suburban economies across the United States by providing improved crop production systems and technologies to greenhouse and nursery growers and by helping them to increase production efficiency.
- Contribute to the U.S. agricultural economy and to increased international competitiveness by conducting research leading to improved greenhouse and nursery products and production strategies, and by improving technology transfer of research results to benefit other sectors of U.S. agriculture.
- Improve Americans' quality of life through increased availability and diversity of plants and flowers for the consumer.

The joint research initiative will accomplish these goals by focusing research on three essential areas: (1) Improved environmental and resource management; (2) Improved pest management; and (3) Improved production system practices and strategies.

We specifically note here, as well, that our proposed initiative also includes funding for the establishment of a germplasm center at the Ohio State University, in conjunction with the USDA National Plant Germplasm System. We have reviewed, and specifically endorse, that request to you by Ohio State University and incorporate it as a part of our initiative.

The floriculture and nursery industry has an exemplary record of supporting its own research needs. Industry-funded grants for research to benefit the industry total several million dollars each year. The industry has a long record of commitment to supporting its own research needs, and is prepared to continue to do so. However, Federal support is also necessary. Federal support can provide greater depth, increased duration, and better long-term coordination of research efforts.

Accountability is an important consideration in all research efforts, and nowhere more so than when Federal tax dollars are involved. The floriculture and nursery research initiative will be formulated with the joint input of industry, academic and government researchers. The proposed research program will rely upon that continued, joint input to ensure that research projects remain relevant to the needs of the industry.

Currently, the ability of the US industry to compete effectively in the world marketplace is hampered. The opportunity for research piloted by our industry, which could be of inestimable benefit to U.S. agriculture, is in danger of being lost. Local communities and businesses are missing economic opportunities. Environmental improvements which will benefit all Americans are needed. Increased federal research funding for the environmental horticulture industry will return benefits not only to the industry itself, but also to the nation's environment, to other segments of agriculture, to rural and suburban economies across the country, to our international competitiveness, and to our quality of life. We urge you to continue your support of research funding for our industry.

II. PESTICIDE CLEARANCE AND RESEARCH

SAF very strongly supports the Administration's budget request of \$10.7 million for the Interregional Research Project No. 4 (IR-4), as well as monies for related pesticide registration, clearance, and training activities. The IR-4 program is extremely important to our industry, and we are most pleased that the Administration has requested additional funding for this program for the coming year. The loss of crop protection chemicals for the "minor crops" is one of the most serious problems facing agriculture today. The IR-4 program, which helps in obtaining registration data required by EPA for minor use chemicals and biological pest control agents, is of critical importance. In 1996, IR-4 helped to support some 891 registrations for ornamentals. Since 1977, the program has assisted with over 3,600 plant ornamental label expansions.

SAF also urges Congress to direct additional, specifically targeted funding into USDA research into methyl bromide alternatives. We further urge Congress to direct USDA to continue to work with the Crop Protection Coalition, of which SAF is a member, in determining how these critical research funds are used. Methyl bromide is a widely used fumigant and a necessary component of many crop management and crop quarantine systems. Its use will be banned in this country by January 1, 2001. It is imperative that effective alternatives to methyl bromide be identified.

III. INTERNATIONAL TRADE AND QUARANTINE PROTECTION

Animal and Plant Health Inspection Service (APHIS)

SAF strongly supports adequate funding to ensure that APHIS performs its vital mission of safeguarding domestic plant resources from exotic pests and diseases. Our entire industry—and indeed, all of American agriculture—depends upon

PART 1

1412

APHIS' continued ability to perform and improve its mission. We would oppose any diminution in APHIS' resources that might impair its ability to protect U.S. agriculture against the introduction of foreign pests and diseases.

Trade is becoming increasingly international, and a strong effort is underway to encourage freer trade across borders. In light of this trend, it is imperative that APHIS increase and strengthen its role in ensuring the protection of U.S. agriculture from foreign pests and diseases. Our industry, like other segments of U.S. agriculture, simply cannot otherwise survive. If biological risk cannot be protected against and controlled, then limits must be placed on the importation of plants and floral products into this country.

APHIS plant pest emergency fund

SAF supports an appropriation designated for APHIS to establish, a "no-year" emergency agricultural fund that could be accessed at the sole discretion of the Secretary of Agriculture in the event of pest or disease emergencies. Such a fund must be adequate to deal with multiple emergencies and must be replenished regularly.

When a potentially devastating pest is discovered in the U.S., it is very clear that the Department of Agriculture must be able to act swiftly and decisively. Emergencies, like the Karnal bunt, in wheat, or the Mediterranean fruit fly, require very rapid response and adequate resources. The costs of eradication are far outweighed by the benefits of success—yet success depends upon ability to respond quickly.

Chrysanthemum white rust

SAF urges that Congress direct APHIS to continue to fund and to conduct cooperatively, with any affected state, thorough survey and eradication programs for chrysanthemum white rust in fiscal year 1998.

Chrysanthemums are the top-selling potted flowering plant sold year-round in the U.S., and chrysanthemums—as cut flowers, potted plants and garden plants—are an important economic contributor to both the nursery and greenhouse industries. Chrysanthemum white rust, a serious disease of chrysanthemums, is not indigenous to the United States, and can only occur here when brought in from foreign sources. Until now, USDA and the states, in cooperation with our industry, have kept the disease eradicated in this country.

However, there is great concern throughout our industry that given continued budgetary pressures, APHIS might not be able to continue this fight. Without a strong commitment from APHIS, the disease might become established—resulting in loss of export markets and severe economic losses for U.S. growers.

IV. COLLECTION OF STATISTICAL INFORMATION

National Agricultural Statistics Service (NASS)

We strongly support the Administration's proposed budget for the Census of Agriculture, to be conducted in 1998, and further urge that Congress specifically direct NASS to assure funding of the Horticulture Census as a part of the Census of Agriculture. The Census of Agriculture, and the related Horticulture Census, are extremely important to our industry. The statistics provided by these efforts are not available from any other source, nor could any entity other than the federal government successfully produce such statistics.

CONCLUSION

In closing, we are mindful of the budget constraints faced by this Committee. Yet we believe that federal funding of the kinds of activities supported in our testimony is not only justified, but necessary, if U.S. agriculture is to continue to survive in the world marketplace. We look forward to continuing to work with the Committee, and with the Department of Agriculture, on behalf of our industry as an important part of American agriculture.

PREPARED STATEMENT OF THE SOCIETY FOR ANIMAL PROTECTIVE LEGISLATION

\$12 MILLION IS DESPERATELY NEEDED BY APHIS' ANIMAL CARE PROGRAM FOR ENFORCEMENT OF THE ANIMAL WELFARE ACT

The Animal Welfare Act, passed in 1966 and amended in 1970, 1976, 1985 and 1990, is intended to ensure the protection of animals used in exhibition, the commercial pet trade, experimentation and during transportation. The responsibilities of USDA-APHIS' Animal Care Program for enforcing the Act have increased greatly over time and the number of facilities which must be inspected by Animal Care field

PART 1

1413

staff have increased too. Meantime, the budget provided for the program has fallen below the fiscal year 1993 level.

Nationwide, more than a million animals are covered by the law's standards for basic care and treatment. USDA inspectors visit the following sites to ensure compliance with the Act, including provision of food, water, housing and veterinary attention:

<i>Type of facility</i>	<i>Number of sites</i>
Dealers (breeders, random source suppliers, brokers, and operators of auctions)	4,265
Exhibitors (zoos, circuses and carnivals)	2,453
Research facilities (hospitals, universities, pharmaceutical companies and private firms)	2,506
Intermediate Carriers (airlines and railroads)	725
Intermediate handlers (service between consignor and carrier)	417
 Total sites inspected by USDA inspectors	 10,366

A sufficient field force is essential to widespread compliance with the Animal Welfare Act. At least 100 field inspectors are needed to do the job given to USDA by Congress. Sadly, the number of inspectors has been decreasing over time from a peak of 86 inspectors in fiscal year 1993.

Now, there are only 72 field inspectors responsible for making compliance inspections at the more than 10,000 separate sites across the country. Severe budgetary constraints preclude an adequate number of inspectors to make the necessary inspections. The Animal Care Program is falling further and further behind in meeting its responsibilities as expenses increase, but the budget doesn't.

Following are the monies provided by Congress over the past five years:

[In millions of dollars]

<i>Fiscal year</i>	<i>Amount</i>
1993	9.188
1994	9.262
1995	9.262
1996	9.185
1997	9.185

Each year of level funding results in a loss of approximately 4 members of the Animal Care staff. The program cannot sustain such continued losses.

There are two money saving changes which should be made in the existing Animal Care Program. The first is to eliminate the Preceptor Program. The Preceptor Program costs \$10,000 per year and provides training to only 2 or 3 inspectors. The Veterinary Medical Officers spend up to 6 weeks, away from their jobs, visiting a number of different research facilities. There are a number of less costly means to educate the veterinary inspectors including the use of videotapes, and it would be far more beneficial to provide training, with USDA oversight, to all. With the serious shortage of field inspectors, the loss of 2 or 3 inspectors for 6 weeks is an additional problem.

The other cost saving change which could be made in the Animal Care Program would be the elimination of Random Source (USDA Licensed Class B) dealers who supply dogs and cats to research. Report language could offer support to H.R. 594, The Pet Safety and Protection Act, sponsored by Agriculture Committee Members Congressman Charles Canady and Congressman George Brown. As you can see from the attached report on hearings held this past summer, the legislation would greatly reduce USDA's regulatory burden, while still allowing research to continue unhindered.

Because of their failure to obey the law, Class B dealers require an inordinate amount of time and resources to regulate, needing four times as many inspections under the Act as other licensees and registrants. USDA has cited countless record violations by these dealers making it virtually impossible to determine which animals may be stolen or fraudulently acquired pets.

AN APPROPRIATION OF AT LEAST \$900 THOUSAND IS NEEDED FOR THE ANIMAL WELFARE INFORMATION CENTER

The Animal Welfare Information Center operates out of the National Agricultural Library in Beltsville, Maryland. It has received level funding of \$750 thousand since its creation over ten years ago. In addition, approximately half of the funds that are intended for the Center have been used for other purposes by the National Agricultural Library. Therefore, the Center requires appropriations of at least \$900 thou-

PART 1

1414

sand or a line item appropriation of at least \$750 thousand and report language preventing the use of these funds for other purposes.

The Animal Welfare Information Center is an extremely valuable and essential resource for scientists, veterinarians, caretakers and administrators involved in the care and use of animals for research purposes. The Center provides information on methods which could (1) minimize the pain and distress caused animals including the use of anesthetics and analgesics and (2) reduce or replace the use of animals in experiments. The Center helps to prevent unintended duplication of experiments on animals and assists with employee training.

The Animal Welfare Act requires principal investigators to consider “* * * alternatives to any procedure likely to produce pain to or distress in an experimental animal.” A January 1995 audit by the Office of the Inspector General identified a failure of principal investigators to meet this requirement. Of 36 research protocols reviewed by OIG at 9 research facilities, 12 “did not contain a written narrative description of the methods and sources used to determine that alternatives to the procedures were not available.” This is the type of data that AWIC is suited to assist the investigator in compiling. The staff at the Center is able to conduct the necessary literature searches and instruct the investigators how to do database searches on their own.

Over the past 8 years the Animal Welfare Information Center’s small, but efficient, devoted staff have answered more than 12,000 requests (principally questions about research protocols), responded to 20,000 requests for publications, distributed over one-quarter of a million AWIC publications (these are not copyrighted, so have likely been photocopied and disseminated further), conducted thousands of workshops and educated tens of thousands of people through exhibitions at conferences and presentations.

Lack of sufficient funds has prevented the Center from continuing its program of printing many publications (such as information on providing enrichment to animals and on research refinements), often done as collaborative projects. Additional funds would permit creation of an educational electronic interactive module and permit development of a training class for all members of Institutional Animal Care and Use Committees to ensure compliance with their responsibilities under the Animal Welfare Act.

THE HORSE PROTECTION ACT IS IN NEED OF \$500 THOUSAND FOR ENFORCEMENT PURPOSES

The Horse Protection Act (HPA), enacted in 1970, prohibits the cruel practice known as “soring”. Soring is act of causing pain to the limbs of horses, usually by application of chemical or mechanical agents, to produce an exaggerated gait. Tennessee Walking Horses are the common victims. Managers of horse shows are required to disqualify any horse that has been sored.

A 1976 amendment to the HPA established a program of inspection utilizing Designated Qualified Persons (DQP’s) to assist APHIS’s veterinary inspectors, who were not able to attend the vast majority of horse shows to check for compliance with the HPA. DQP’s are trained and licensed by APHIS-certified Horse Industry Organizations to detect sored horses.

Unfortunately, the turndown rate is significantly lower when DQP’s are checking horses without the presence of APHIS veterinary inspectors. In fiscal year 1995, DQP’s turned down .95 percent of the horses they inspected, but with the presence of APHIS inspectors, 2.48 percent were turned down, a dramatic difference.

There are more than 500 horse shows per year which must be monitored and nearly 100,000 horses which need to be examined. APHIS was only present for 50 shows. Additional resources are needed to permit APHIS inspectors to attend more shows, ensuring significantly stronger compliance with the HPA.

In fiscal year 1995 money was appropriated for thermography equipment to assist in detecting sore horses. Using these devices, USDA inspectors look for abnormal heat indications to detect apparent soreness. Additional monies are needed to permit training of personnel in the use of thermography as a key enforcement tool. This equipment should be used widely since it appears to assist with compliance efforts—both through accurate, scientific determination of sore horses as well as by serving as a powerful deterrent against would-be violators of the HPA.

THE ANIMAL DAMAGE CONTROL PROGRAM SHOULD BE FOCUSING ON EFFECTIVE, PUBLICLY ACCEPTABLE, NON-LETHAL METHODS

The Animal Damage Control Program (ADC) should be making a transition to publicly acceptable non-lethal methods and away from reliance on publicly unacceptable methods such as steel jaw traps, necksnare and other painful, indiscriminate

PART 1

1415

lethal devices. ADC's research program should be increasing its attention towards alternative methods, too, to insure an adequate supply of wildlife control tools that will be accepted and permitted by the general public.

This Fall, ballot initiatives were adopted in Colorado and Massachusetts which prohibit use of leghold traps, necksnares and other devices. A public opinion poll conducted by Caravan Research in November of 1996 reveals that 74 percent of Americans want the leghold trap to be banned.

Meantime, ADC possesses 30,000 leghold traps for use in its control operations. These relics of the past should be melted down. The program should switch to any of an array of alternative traps which greatly reduce the suffering of the animals. Herewith the testimony is *Alternative Traps: The Role of Spring Powered Killing Traps in Modern Trapping, The Role of Cage and Box Traps in Modern Trapping, and The Role of Legsnare in Modern Trapping*, which describes the various devices which are available.

This past year ADC set enormous leghold traps with teeth for use in capturing wolves outside of Yellowstone National Park. While attempting to catch a mother wolf, her pup was caught by mistake. The following is a report on his condition after the incident:

July 11—" * * * foot severely swollen from corpus down, puncture wound with pus flowing out at distal carpus, severe bruising and soft tissue trauma."

July 14—" * * * still not eating."

July 15—" * * * swelling still pronounced * * * more necrotic tissue present."

July 16—"Still not eating."

July 17—"Much tissue loss and self mutilation of toes (gone). Foot dead. Foot should be removed or wolf put down."

July 18—" * * * food not eaten."

July 19—"Removed left front leg."

As noted, his leg had to be amputated to save his life. He will spend the rest of his life at a wildlife center in Minnesota. Use of extremely painful steel jaw traps is unnecessary; legsnare can be used to catch wolves with much less suffering. In addition, ADC has developed sensors which emit a signal when a trap is sprung to allow the trapped animal to be removed from the device far more rapidly. Traps sensors and tranquilizer tabs, already developed by ADC, need to be utilized in the field as much as possible.

LETTER FROM DR. SHELBY F. THAMES, DISTINGUISHED UNIVERSITY RESEARCH PROFESSOR, PROFESSOR OF POLYMER SCIENCE, UNIVERSITY OF SOUTHERN MISSISSIPPI

UNIVERSITY OF SOUTHERN MISSISSIPPI,
Hattiesburg, MS, May 13, 1997.

Hon. THAD COCHRAN,
Committee on Appropriations, Subcommittee on Agriculture, Rural Development, and Related Agencies, Washington, DC.

DEAR SENATOR COCHRAN: I am writing once again to seek your continued support for the Mississippi Polymer Institute funding in the fiscal year 1998 Agriculture Appropriations legislation. I have also taken the liberty of enclosing a copy of the testimony I submitted to your Subcommittee for inclusion into the written hearing record.

Senator, as you know, the Mississippi Legislature in 1983 authorized the Polymer Institute at The University of Southern Mississippi to work closely with emerging industries and other existing polymer-related industries to assist with research, problem solving, and commercializing efforts. From this modest beginning, the mission of the Polymer Institute also included in its mission the commercialization and expanded use of alternative agriculture crops. As you know, we have approached the commercialization mission via developing new polymeric products from agricultural derived crops.

The support, leadership, and guidance you have given to these efforts has allowed the University to turn the dream of a multi-dimensional center for polymer related research into a reality. Today, the Mississippi Polymer Institute is staffed to capacity and it continues to address national as well as state and regional needs. I have included a number of our new commercialization research efforts in my testimony which confirm and validate our original concept for the Center. These efforts also point to the very real need for continued support for the Center and its people. We have developed a number of products that are currently being reviewed by industrial firms for potential commercialization. In fact, one firm has provided patent attorneys and the funds for preparing and submitting five patent applications. These

PART 1

1416

applications are now pending in the patent office and they all focus on a novel use of agricultural based crops.

Our efforts are certainly maturing and the support you have made possible is responsible for whatever success we might enjoy. We have accumulated a very fine staff of mature scientists who appreciate our commercialization objectives and, thus, are able to be very productive. I am confident that the investment you have made on our behalf is paying dividends and I want to accelerate this productivity if at all possible. For instance, one of the developments under patent application includes a concept whereby latex coatings can be prepared without the use of organic solvents! This is made possible via a novel agricultural product. Its potential for generating funds for the University is significant, however, it needs additional research before proceeding to commercialization. The concept by which it functions is novel and will require that we educate the potential user to its full benefits. This will mean that we must have a "technical service" arm of our team to provide necessary information and assistance to potential users of the technology. Clearly there is no better group to service this technology than its founders, i.e., our group. A similar issue exists with another of our patent application discoveries dealing with multi-functional coating additives. Indeed, this technology must mature and we should be the ones seeing to its maturity.

For this reason, I have requested \$1.2 million for fiscal year 1998 to support the Institute. These funds will support the ongoing commercialization efforts and the "technical servicer type efforts needed to commercialize our recent technology developments. These are really exciting times for our group and I look forward to your next visit so that I can share these developments with you first hand.

While I know you face many difficult budget decisions this year, I do believe we are producing high quality commercialization efforts, and the enthusiastic involvement of industry confirms our potential for a significant return on investment. I truly hope that you can continue to support our efforts as you have in the past. I hope you realize that we will work tirelessly to insure that your faith in our abilities has not been misplaced.

Again, thank you for your support and for your leadership in the Senate. The good people in Mississippi have indeed been fortunate to have you representing us.

With warm personal regards,

Very truly yours,

SHELBY F. THAMES.

Enclosure.

PREPARED STATEMENT OF DR. SHELBY F. THAMES

Mr. Chairman, distinguished members of the Subcommittee, I would like to thank you for this opportunity to provide testimony to you concerning the ongoing efforts of the University of Southern Mississippi (USM) and the Mississippi Polymer Institute. I would also like to repeat my expression of gratitude to the Subcommittee for its many years of leadership and support of the Institute and its work. This testimony will include an update on the progress of the Institute since my testimony of approximately one year ago. During the past year, I have focused on the development of products that have potential of near term commercialization, and I am pleased to tell you that I believe 1997 will see the commercialization of at least one of our technologies.

In 1983, the Mississippi Legislature authorized the Polymer Institute at USM to work closely with emerging industries and other existing polymer-related industries to assist with research, problem-solving, and commercializing efforts. The Institute provides industry and government with applied or focused research, development support, and other commercializing assistance. This effort complements existing strong ties with industry and government involving exchange of information and improved employment opportunities for USM graduates. Most importantly, through basic and applied research coupled with developmental and commercializing efforts of the Institute, the Department of Polymer Science continues to address national needs of high priority.

A major goal of my work is in pursuit of commercializing the use of alternative agricultural crops. This approach offers an array of opportunities for agriculture as the polymer industry is the largest chemical products industry in the world, and heretofore has been highly dependent upon petroleum utilization. However, my efforts are directed to the development of agricultural derived materials that can improve our nation's environment, and reduce our dependence on imported petroleum. As farm products meet the industrial needs of American society, rural America is the benefactor. Heretofore this movement to utilize alternative agricultural products

PART 1

1417

as industrial raw materials has received some attention but much less than the opportunities warrant. Your decisions are crucial to the accomplishment of these goals as funding from this Subcommittee has enabled us to implement and maintain an active group of university-based polymer scientists whose energies are devoted to commercializing alternative crops. We are most grateful to you for this support and ask for your continued commitment.

The faculty, the University, and the State of Mississippi are strongly supportive of the Mississippi Polymer Institute and its close ties with industry. Most faculty maintain at least one industrial contract as an important part of extramural research efforts.

Polymers, which include fibers, plastics, composites, coatings, adhesives, inks, and elastomers, play a key role in the materials industry. They are used in a wide range of industries including textiles, aerospace, automotive, packaging, construction, medical prosthesis, and health care. In the aerospace and automotive applications, reduced weight and high strength make them increasingly important as fuel savers. Their non-metallic character and design potentials support their use for many national defense purposes. Moreover, select polymers are possible substitutes for so-called strategic materials, some of which come from potentially unreliable sources.

As a polymer scientist, I am intrigued by the vast opportunities offered by American agriculture. As a professor, however, I am disappointed that few of our science and business students receive training in the polymer-agricultural discipline as it offers enormous potential.

I became involved in the polymer field 33 years ago, and since that time have watched its evolution where almost each new product utilization offered the opportunity for many more. Although polymer science as a discipline has experienced expansion and a degree of public acceptance, alternative agricultural materials are an under-utilized national treasure for the polymer industry. Moreover, there is less acceptance of petroleum derived materials today than ever before and consequently the timing is ideal for agricultural materials to make significant inroads as environmentally friendly, biodegradable, and renewable raw materials. These agricultural materials have always been available for our use, yet society, for many reasons, has not recognized their potential. I would like to share with you several examples to support this tenet:

- A natural product has been identified, and transformed into a polymerizable monomer to be included in emulsion polymers. The utility of this natural product allows the synthesis of emulsion polymers that perform their intended uses at room temperature and without the use of organic solvents. Thus, we have developed a truly no volatile organic content (VOC) coating. Most coatings of this type contain between 375 to 500 grams of VOC/gallon. It is expected that this monomer will be offered for sale in the last quarter of 1997 or the first quarter of 1998.
- A waterborne, water proofer has been designed and formulated with the help of several natural products. The material functions as a water proofer yet is carried in water. However, after application to the intended substrate, typically wood or cementous products, the material becomes hydrophobic and highly water resistant. We have collected one and one-half years of exposure data on this product with excellent success. It will be available on the retail market in 1997 via Southern Chemical Formulators of Mobile, AL.
- We have designed, synthesized, and formulated a SOLVENTLESS emulsion coating. The novel technology used in this synthesis has been expanded to a wide variety of polymeric types and thus this technology should have wide application in the emulsion or latex coatings market. The significant advantage of this technology is the ability to produce a high performance, waterborne coating using only water as the carrier medium. Thus, essentially a solventless coating has been discovered and synthesized that performs as well or better than traditional latex products. This finding represents a significant discovery in polymer design and is successful only because a significant portion of this technology involves the use of an agricultural crop. Negotiations are currently underway with a raw material manufacturer who will synthesize and market the novel polymer forming raw material. Four patent applications have been prepared and filed on this and allied technology.
- A new, multifunctional polymer additive has been designed, synthesized, and tested. It is a highly efficient, multifaceted additive that functions as a dispersant, a defoamer, an adhesion promoter, a gloss enhancer, and corrosion inhibiting species. It is derived from an agricultural raw material and is very novel in its performance and applications. A patent has been prepared and submitted to the patent office.

PART 1

1418

- We are exploiting the potential of lesquerella, a crop that produces a triglyceride similar to castor oil. Several products have been prepared and include: polyesters, stains, foams, pressure sensitive adhesives, and 100 percent solid ultraviolet (UV) coatings. In fact, the latter technology, UV cured coatings, was highlighted at the most recent AARC/NASDA meeting in Washington, DC.
- Novel open cell foams have been designed and prepared from lesquerella and/or castor oil. They are of high quality and can substitute for foams used extensively in industrial settings. In fact, scientists from the Department of the Army (Natick, MA) are performing biodegradability on castor and lesquerella based foams prepared and submitted by the Thames' Research Group.
- During the most recent six months, novel closed cell lesquerella foams have been prepared from lesquerella derivatives and will be submitted for testing. This commercialization focus is attractive as castor foams are prepared from imported oil, i.e., at an annual \$50–75 million import cost. Thus, emergence of a lesquerella oil industry has the potential to reduce U.S. imports.

It is clear that commercial utilization of agricultural products is needed. However, we simply must devote more support and effort to this rewarding undertaking.

U.S. agriculture has made the transition from the farm fields to the kitchen tables, but America's industrial community has been frightfully slow in adopting ag based industrial materials. Let us aggressively pursue this opportunity and in doing so:

- Intensify U.S. efforts to commercialize alternative crops.
- Reduce U.S. reliance on imported petroleum.
- Maintain a healthy and prosperous farm economy.
- Foster new cooperative opportunities between American farmers and American industry.

Mr. Chairman, your leadership and support are deeply appreciated by the entire University of Southern Mississippi community. While I can greatly appreciate the difficult financial restraints facing your Subcommittee this fiscal year, I feel confident that further support of the Mississippi Polymer Institute will continue dividends of increasing commercialization opportunities of agricultural materials in American industry. Advances in polymer research are crucial to food, transportation, housing, and defense industries. We have sampled and established the value of ag products as industrial raw materials, and I believe it is time to move to another level of investigation with these efforts. Therefore, we respectfully request \$1.2 million in federal funding to exploit the potentials of commercializing alternative agricultural materials and to continue our initiatives. Thank you Mr. Chairman and Members of the Subcommittee for your support and consideration.

PREPARED STATEMENT OF DR. ROBERT C. ALBIN, INTERIM DEAN, COLLEGE OF AGRICULTURAL SCIENCES AND NATURAL RESOURCES, TEXAS TECH UNIVERSITY

SUMMARY

Specific action requested of the committee.—It is requested that Congress appropriate \$1.2M for a collaborative research initiative with Texas Tech University through the Institute for Research in Plant Stress. The overall Plant Stress and Water Conservation research program has received level funding for the past seven years at \$1.675 million annually. It is critical that the research programs of the collaborating University and USDA-ARS scientists, which will continue to focus on understanding the genetic control of plant mechanisms that facilitate drought and heat tolerance in crop plants, move forward to coincide with the expected construction completion date of January, 1999, for the new laboratory.

Justification.—The formal plant stress and water conservation research program was initiated in 1979 after 20 years of feasibility studies and planning by agencies of the federal government. Of major significance is the Congressional action for fiscal year 1997 that awarded fob funding of \$8.1M to complete construction of the \$13.6M research laboratory. Groundbreaking for the laboratory is expected to be late July, 1997. The federal government through USDA/ARS, and the State of Texas through Texas Tech University and the Texas Agricultural Experiment Station, have put in place over the last 17 years a comprehensive-integrated program in which 18 senior scientists are today working to develop improved crop plants and planting systems that will provide for economically optimal crop production under variable, extreme environmental conditions. Scientists with expertise in the broad areas of genetics, breeding and molecular biology; biochemistry and physiology; and climatology, soil science and systems research have research programs poised for the challenges of the predicted climatic changes forecast within the next several dec-

PART 1

1419

ades. This research program will be greatly enhanced with the completion of construction of the laboratory on the Texas Tech campus and through funding for a collaborative research initiative with faculty scientists in the Institute for Research in Plant Stress at Texas Tech University and USDA-ARS scientists. This research initiative will provide the impetus for the continuing, collaborative discovery and transfer of technology from laboratory molecular technologies to field applications of genetically modified plants exhibiting improved stress tolerance.

INTRODUCTION

The background setting for the problem which the research program addresses is found in Senate Document 59, the feasibility study conducted by the Science and Education Administration of USDA in 1977, and the statement of Texas Tech University submitted for the record before this committee on March 26, 1979. We will not repeat this information, as the record is replete with scientific and economic documentation prepared by a select committee which describes the conditions of the region and the research required to seek viable solutions to a complex set of critical problems confronting the areas of agriculture, natural resource conservation and environmental protection. The need for a comprehensive, multidisciplinary, long-term basic science research program is obvious. Texas Tech University has taken the lead in the development of a cooperative research program with the USDA/ARS and the Texas Agricultural Experiment Station. As Congressional funding increases for the requested collaborative research initiative, colleges, universities, and federal laboratories throughout the Great Plains, agricultural producers, the agribusiness industry, and private research organizations will become participants in this critical, far-reaching research program.

This collaborative research initiative will provide the impetus to allow the University and USDA-ARS cooperating scientists to move their research programs forward to coincide with completion of construction of the new laboratory. The collaborative research effort will continue to focus on understanding the genetic control of plant mechanisms which facilitate drought and heat tolerance in crop plants. This vital research is encompassed in the comprehensive nationwide research mission of the U.S. Department of Agriculture/ARS, and the research program implements the recommendations of the original Plant Stress and Soil Water Conservation feasibility study prepared by the USDA/ARS.

BACKGROUND

Key planning events involving Texas Tech University have taken place in conjunction with the development of the research program and laboratory. Preliminary discussions with officials of the U.S. Department of Agriculture and members of Congress were held in 1975. Initial funds for construction of the research laboratory were appropriated in 1978 in the amount of \$0.8M. Varying amounts of funds for construction were appropriated over the years with \$8.1M appropriated for fiscal year 1997 to complete the required funding of \$13.6M to initiate construction of the laboratory; groundbreaking is expected to begin in late July, 1997; and construction completion is expected to be January, 1999. The 18 senior scientists working in the research program and all participants in the valiant effort are elated with this Congressional action.

Funding for the research program was initiated in 1980 at \$0.2M. Congressional funding for the research program reached \$1.675M in fiscal year 1991 and has remained constant at this level to date.

RESEARCH MISSION AND ACTIVITY TO DATE

The mission of the Plant Stress and Water Conservation Research Program is to develop a detailed understanding of how plants survive and grow when exposed to extreme temperatures and limited moisture. This knowledge is used to develop improved varieties and crop production systems for cotton, wheat, sorghum and forage crops that insure greater water use efficiency, improved drought tolerance and increased winter hardiness. This research is critical to the future success of the agricultural industry of the Great Plains region of the central U.S. where environmental extremes cause millions of dollars of losses in crop production each year. Reduction of these annual losses would stabilize the economy of this region while improving the ability of the American farmer to compete in domestic and export markets for agricultural commodities. The Plant Stress and Water Conservation Research Program has concentrated in three specific areas: Stress Physiology; Genetic Enhancement; and Advanced Production Systems.

Stress physiology.—The specific objective of research in stress physiology is to identify and understand the structural and biochemical mechanisms in higher

PART 1

1420

plants that could mediate the impact of environmental extremes. These studies have concentrated on the evaluation of those weed and crop species which grow in the driest deserts and coldest regions of our planet. Scientists have isolated specific morphological modifications, enzymes and proteins that drastically reduce the damage caused to plants exposed to environmental stress. Only recently have the first of the hundreds of genes available from these exotic species been fully characterized.

Genetic enhancement.—Plant physiologists work cooperatively with molecular biologists to isolate the specific DNA sequences needed to synthesize the unique proteins and enzymes that reduce environmental stress. The plant stress DNA sequences are combined with other regions of DNA that regulate gene expression to insure that the selected stress genes are “turned on only when the crop plants are exposed to specific environmental conditions. These carefully designed plant stress genes are then introduced into bacterial cells to generate the millions of additional copies needed for incorporation into a crop plant.

Cell biologists have developed several innovative techniques to introduce these genes into individual cells or intact plants of cotton and alfalfa. Only in a small proportion of the cells exposed to the plant stress genes will the introduced DNA be incorporated into the original DNA of the crop species resulting in a transformed plant. Scientists worldwide are still working on similar techniques to allow transformation in wheat and sorghum.

Plant breeders and molecular biologists have only recently begun to select among thousands of transgenic plants for appropriate expression of the introduced genes. Only after extensive and carefully controlled evaluation under laboratory conditions are transformed plants evaluated under field conditions.

Agronomists are evaluating the impact of row orientation, row spacing/plant populations, nitrogen fertilization and water management to optimize economic yields under both dryland and irrigated conditions. These cultural practices have a drastic impact on the efficiency of critical physiological processes such as photosynthesis, nitrogen metabolism and carbon metabolism as well as soil water and crop canopy temperature relationships. Optimization of the soils and crop production environment is essential to ensuring economic crop production.

POTENTIAL ECONOMIC IMPACT

Insuring that the U.S. farmer is economically competitive in both domestic and export markets is essential to the future of American agriculture. Use of genetically enhanced varieties and advanced production systems to improve the efficiency of producing major crop commodities has the potential to revolutionize American agriculture. These technologies are beginning to be applied in specific production regions worldwide to improve the efficiency and stability of crop production. Any country or geographic region not participating fully in this revolution will become increasingly less efficient and less competitive in both domestic and international agricultural markets. If the agricultural industry of the Great Plains is to survive in this highly competitive global environment, it is essential that the U.S. move ahead in the application of leading edge science to this industry. The success of the Plant Stress and Water Conservation Research Program will allow future generations of American farmers to efficiently produce crops for food during extremely cold winters or hot, dry summers and in direct competition for international crop commodity markets.

PREPARED STATEMENT OF DOUGLAS H. FENDER, EXECUTIVE DIRECTOR, TURFGRASS PRODUCERS INTERNATIONAL

Mr. Chairman and Members of the Subcommittee: On behalf of Turfgrass Producers International (TPI), I appreciate this opportunity to provide the Subcommittee with the turfgrass industry's perspective in support of restoration of the \$55,000 appropriation for the National Turfgrass Evaluation Program (NTEP) deleted in the President's fiscal year 1998 budget request for the Agricultural Research Service (ARS). TPI also requests that the Subcommittee appropriate an adequate amount to fund a full-time ARS turfgrass scientist position.

Turfgrass Producers International (TPI) is a 30-year-old, not-for-profit association of turfgrass sod producers with members in all 50 states, Canada and 34 additional countries. TPI represents over 650 turfgrass sod farm operations that produce approximately 80 percent of the acreage sold each year in the U.S. The 1992 U.S. Census of Agriculture reported sod sales to be in excess of \$471,640,000. TPI represents its members on federal issues of importance, and adequate funding of the National Turfgrass Evaluation Program is an issue of significant concern to this organization's members.

PART 1

1421

The National Turfgrass Evaluation Program (NTEP) has been unique in that it provides a working partnership that links the federal government, turfgrass industry and land grant universities together in their common interest of turfgrass cultivar development, improvement, and evaluation. The National Turfgrass Evaluation Program is the primary means by which cultivated varieties of turfgrass are evaluated in this country. It provides unbiased information on turfgrass cultivar adaptations, disease and insect resistance, and environmental stress tolerance. The public and private sectors of the turfgrass industry use this information to develop cultivar recommendations for home owners, sod producers, sports turf managers and golf course superintendents.

At a time when this nation's awareness of environmental considerations is increasing, and because of the multiple benefits provided by turfgrass, as well as the advancements that are being made to further improve them through integrated pest management programs, recycling, and other means, the USDA has before it a unique opportunity to take positive action in support of the turfgrass industry, and similarly enjoy a tremendous return for what must be considered, in relative terms within USDA's budget, a minuscule investment of Department funds.

While the vast majority of the Department's funds have been and will continue to be directed toward traditional "food and fiber" segments of U.S. agriculture, it is important to note that turfgrass sod production is clearly defined as agriculture in the recently-passed Farm Bill and by many other Departments and Agencies. Further, it is estimated by the ERS that the turfgrass industry, in all its forms, is a \$30-35 billion industry and that, despite recessions of the early 1980's and 1990's, grower cash receipts for floriculture and environmental horticulture crops continued to increase. According to the ERS, cash receipts reached \$8.7 billion in 1991. It should also be noted that the turfgrass industry is the fastest growing segment of U.S. agriculture, while it receives essentially no federal support. There are no subsidy programs for turfgrass nor are any desired.

For the past 70 years, the USDA's support for the turfgrass industry has been modest at best. The turfgrass industry's rapid growth, importance to our urban environments, and impact on our daily lives warrant more commitment and support from the USDA. A full-time turfgrass scientist position, funded at a minimum of \$350,000 per year, is needed to address critical research needs and to provide liaison with the turfgrass industry. A scientist in this position will be able to address USDA programmatic needs relating to priorities in genetic resources and biodiversity, as well as address important aspects relating to integrated pest management. This USDA scientist would also provide scientific oversight to the NTEP program.

Failing to support the National Turfgrass Evaluation Program would be considered by TPI to be a tremendous oversight of a major opportunity. USDA's support of the NTEP at the \$55,000 level does not cover all costs. The NTEP will continue to rely most heavily on industry support. However, it is essential that the USDA maintain its financial support and that a commitment be made to support a turfgrass scientist position to work closely with NTEP. The turfgrass industry relies heavily on NTEP for unbiased findings. Discontinuing this support would eliminate a highly reliable and credible level of objectivity that is associated with the NTEP program.

The members of Turfgrass Producers International respectfully request that the Subcommittee restore this vital \$55,000 appropriation for the National Turfgrass Evaluation Program (NTEP), and that an ARS turfgrass scientist position be funded to work with the NTEP.

Thank you very much.

PREPARED STATEMENT OF THE U.S. AGRICULTURAL EXPORT DEVELOPMENT COUNCIL

U.S. agricultural exporters want to compete on a level playing field. However, the large amount of foreign government manipulation of markets and production means U.S. agricultural exporters need Washington's support to make this happen. The record shows that U.S. agriculture is serious enough about this public-private partnership to contribute significant amounts of its own resources to the effort.

Further, U.S. agriculture and the U.S. Department of Agriculture (USDA) are using strategic planning, program evaluation, quantifiable goals, and a competitive award process to ensure that taxpayer's money is being used in a way which generates the biggest returns for the U.S. economy and its 1.2 million citizens who depend on a healthy agricultural export sector for their livelihood.

The U.S. Agricultural Export Development Council (USAEDC) respectfully urges this subcommittee to fully support all USDA export promotion efforts in the fiscal year 1998 budget, especially the FMD program at a level of \$30 million, and an

PART 1

1422

MAP program at \$90 million. We also urge the subcommittee to support a strong USDA Foreign Agricultural Service (FAS), our partner in promoting increased U.S. agricultural exports.

First and foremost, it is important to revisit the role agricultural exports play in the health of our national economy and the well being of our citizenry. Every \$1 billion in agricultural exports supports approximately 20,000 U.S. direct and indirect jobs. With our \$60 billion in agricultural exports in 1996, this means a successful U.S. agriculture export effort was responsible for 1.2 million jobs. According to the U.S. Department of Agriculture Foreign Agricultural Service (FAS), Iowa has the second largest number of agricultural export related jobs at 96,000. Agricultural exports play an important role in every region of the country, including the South (189,000 jobs), the Pacific Northwest (67,000 jobs), and the Northeast (24,300 jobs). These jobs not only ensure family incomes, but help grow the national tax base and thus increase revenue to the Treasury, contributing to the reduction of our national debt. It is clear that without a healthy agricultural export sector, we all lose.

Ensuring the long-term vitality of U.S. agricultural exports is the reason the U.S. Agricultural Export Development Council (USAEDC) exists. We are a national, non-profit, private sector trade association funded solely by our members. Our nearly 80 members are U.S. farmer cooperatives and agricultural trade associations who in turn represent the interests of farmers and agribusinesses in every state of the Union. Our members represent producers of both bulk and high-value processed products, including grains, fruits and vegetables, cotton, livestock, dairy products, seeds, fish, wood products, wine, poultry, nuts, and rendered products among others.

Our members continually strive to ensure the United States remains one of the most active agricultural exporting countries in the world. We proudly produce among the world's highest quality products as evidenced by our ability to be one of the few sectors of the U.S. economy to consistently run a positive balance of trade. In 1996, U.S. agriculture racked up a record year in exports: \$60 billion in sales to more than 40 countries.

THE WORLD AGRICULTURAL PLAYING FIELD IS TILTED AGAINST U.S. EXPORTERS

Unfortunately, record exports do not tell the whole story. U.S. agriculture has done well, but international conditions are increasingly competitive. Foreign governments are bolstering agricultural production, putting the United States at a competitive disadvantage in foreign markets. With the demise of the Cold War, more and more countries have turned their attention to increasing support for agricultural production for both their domestic and export markets. Through their spending and production decisions, foreign governments have strengthened traditional, and created new, competitors for U.S. exports. For example, the European Union (EU)—our biggest competitor in world markets—in 1995 allocated over \$9 billion to expand their agricultural exports, far outstripping U.S. efforts. Over \$300,000 of this total was used for programs very similar to the FMD program and the MAP—triple the U.S. budget outlay for these programs.¹ U.S. exporters have lost export sales to unfairly under-priced EU agricultural products.

U.S. exporters are also encountering a rapid increase in the proliferation of new non-tariff barriers to agricultural products. With the Uruguay Round's move to reduce tariffs, many countries have turned to sanitary and phytosanitary requirements as barriers to market entry of U.S. agricultural products. Although said by their proponents to be objective, many of these sanitary and phytosanitary barriers are in actuality an attempt to use scientific data (or lack thereof) to establish import regimes which effectively halt or severely restrict U.S. imports. The recent EU uproar concerning U.S. genetically modified corn and soybeans is a perfect example.

A myriad of other types of non-tariff barriers exist. FAS and its overseas offices have gathered plentiful information on the numerous cases of foreign assistance for agricultural production as well as barriers to trade which prevent U.S. agriculture from reaching the exports levels of which it is capable. The National Trade Estimate of the Office of the U.S. Trade Representative catalogues this loss to U.S. agricultural exports from unfair foreign competition. Despite a significant commitment of their own resources, the U.S. private sector cannot overcome such an extensive amount of barriers alone.

A U.S. PUBLIC-PRIVATE PARTNERSHIP IS NECESSARY AND APPROPRIATE

Given the magnitude of the task, it would be impossible to expect either the U.S. private sector or the U.S. public sector to be able to remedy the unfair competition

¹ See attachment 1, taken from "The Competition in 1996," USDA Foreign Agricultural Service, November 18, 1996, p.5.

PART 1

1423

which U.S. agriculture faces overseas on their own. In the past, U.S. agriculture has worked successfully with the U.S. Government to remedy foreign unfair competition and market access barriers which have prevented U.S. exports from fulfilling their potential. To those who say there is no appropriate role for Washington in this fight, former U.S. Under Secretary of Commerce Jeffrey Garten, now dean of the Yale School of Management, sums up the situation quite well: "In the best of worlds, governments ought to get out of this business [of export promotion] altogether. But the marketplace is corrupted by the presence of government. So do you sit on the side and pontificate about Adam Smith, or do you enter the fray?"² Mr. Garten argues that Washington must enter into the battle or risk losing U.S. jobs.

In the fiscal year 1998 Federal Budget, USDA proposes funding a number of programs for U.S. agriculture which help the sector overcome these foreign trade barriers and market distortions. USAEDC commends the actions of this subcommittee in the past to fund these programs. We strongly support efforts by this Congress and the Administration, as provided for in the fiscal year 1998 Federal Budget, to again provide a dynamic arsenal of programs to boost the efforts of U.S. agricultural producers to maintain current, and establish new, markets around the world.

The Federal Agricultural Improvement and Reform Act of 1996 (the 1996 Farm Bill) re-authorized and refocused a number of important export-related programs to help achieve the specific U.S. agricultural export goals contained in the Act itself. It is essential that the full range of USDA's export programs be fully funded and aggressively implemented this coming year, including the Foreign Market Development (FMD) program and the Market Access Program (MAP).

Nowhere is the record of success of the public-private partnership move evident than in the FMD and MAP programs. USAEDC members consider these programs the "heavy artillery" in the USDA arsenal. These complementary programs have been instrumental in our record export performance. The Foreign Market Development Program is aimed at long-term marketing efforts, i.e., making infrastructural changes to foreign markets through training and educational efforts among members of the foreign trade. Successful efforts result in a modification of the foreign market structure so that U.S. products become an available, attractive, well understood alternative to other sources of competing products. FMD activities help the foreign importer, processor, and retailer to understand not only how to properly store, handle, process, and market the U.S. product, but also to appreciate its unique characteristics, high quality, and reliability of supply.

The FMD program helps create new markets for U.S. agricultural exports. For example, as a result of FMD-funded market development efforts by the U.S. Beef Breeds Council and the American Shorthorn Association—one of their seventeen U.S. partner associations contributing their own resources to this program—150 head of U.S. breeding beef cattle departed last December for China. This was the first-ever shipment of U.S. purebred cattle breeders to China. Now that an agreement has been reached between Washington and Beijing on a health regulation protocol, further purchases are expected. A Chinese buying team has already made inspections and selections for a second shipment to be completed within the first half of 1997. Without the FMD program, the Council does not believe they would have had the opportunity or resources to establish this new market for U.S. cattle. With the sustained effort of the U.S. cattle industry and the FMD program, China could become a multi-million dollar market for U.S. cattle exporters in the near future.

The FMD program helps expand existing markets. In January of this year, the American Forest & Paper Association (AF&PA) succeeded in having the Government of Japan accept U.S. grade stamps for softwood lumber, a major non-tariff barrier to U.S. value-added wood products exports to Japan. AF&PA and the Western Wood Products Association—one of AF&PA's four U.S. partner associations contributing their own resources to this program—have been able to work with the Japanese for almost ten years on this issue. As the number one export market for U.S. wood products, Japan is currently a billion dollar market for the U.S. wood products industry and is expected to expand further with this major development. Without it, U.S. exports would have been lost to the Canadian wood industry which has already had its grade marks accepted by Japan. FMD resources, combined with those of the U.S. wood products industry, made this U.S. export expansion possible.

The Market Access Program (MAP) is the complement to the FMD program. Where the FMD program is aimed at long-term market infrastructural change, MAP targets more immediate, shorter-term market opportunities. MAP funds are often used for consumer promotion efforts to create or capitalize on new trends in foreign consumption. Activities tend to be targeted at the foreign consumer, increasing their awareness and level of comfort with the imported U.S. product. Consumer pro-

²"Don't Be Salesmen", *The Economist*, Jan. 2, 1997.

PART 1

1424

motions have taken the form of in-store promotions, contests, advertising, and cooking demonstrations to name but a few. Numerous examples of both successful FMD and MAP programs are contained in the attached pamphlet, "A Working Partnership Builds Markets Abroad, Creates U.S. Jobs." which catalogues USAEDC member successes with both programs.

Therefore, USAEDC strongly supports an fiscal year 1998 FMD funding level of \$30 million. This amount does not grow the program, but keeps it at a level U.S. agriculture feels is necessary to support meaningful export promotion. It is consistent with recent funding levels of the program following years of program budget reductions. In addition, USAEDC strongly supports an fiscal year 1998 MAP funding level of \$90 million.

It is important to realize that the program participants put up their own money to participate in these programs. As such contributions are part of the rules of both the FMD and MAP programs, no one is getting a "free ride." Program participants are required to contribute their own cash and manpower to run these programs. Thus, the program participants have just as much, if not more, impetus to conduct responsible and effective FMD and MAP marketing programs. For example, in fiscal year 1995 (the most recent date available), USDA reports that U.S. program participants contributed over \$60 million of their own funds to match the \$92 million in MAP funds expended. Thus, U.S. agriculture contributed 65 cents for every MAP program dollar used. The FMD ratio is even higher, with U.S. agriculture contributing \$1.12 for every FMD program dollar used in fiscal year 1996. These numbers clearly illustrate the private sector's strong belief that the FMD and MAP programs are essential, and that the public-private partnership approach is effective.

U.S. agriculture is also active on other fronts to maximize opportunities for export increases, e.g., our public-private partnership with Washington extends into the trade policy arena. U.S. trade policy efforts have met with success in opening new markets to U.S. agricultural products. We are encouraged that the Administration appears set to continue this effort, as evidenced by U.S. Trade Representative Charlene Barshefsky's comments to the House Appropriations Commerce, Justice, State Subcommittee March 14, 1997, indicating that increasing U.S. agricultural exports will be one of her top priorities.³ However, trade policy alone is not enough. Bringing down barriers to trade is only truly effective at increasing U.S. agricultural exports when followed by intensive marketing efforts. The FMD and MAP programs help U.S. agriculture do just that.

FINE TUNING OF THE FMD AND MAP PROGRAMS HAS ENHANCED EFFECTIVENESS

USAEDC members are as concerned as anyone else in America about the federal budget deficit and the long-term fiscal health of this country. The public-private partnership in the FMD and MAP programs allows us to do something about it, namely increase U.S. agricultural exports beyond that which U.S. agricultural interests would be able to do on their own. USDA's own evaluation efforts indicate that for every federal dollar spent on agricultural export promotion, \$16 worth of exports are generated. In addition, USDA program rules require all program participants to conduct independent annual evaluations to determine the past impact and future direction of their marketing programs. This evaluation is in addition to that conducted independently by many of the associations themselves as part of their own strategic planning. Program evaluations are reviewed jointly by USDA and program participants to determine the appropriate promotional programs for particular markets in the future. These evaluations are evidence that USDA and program participants are serious about getting the best possible return on FMD and MAP funds.

Both generic and branded promotion have a place in marketing U.S. agricultural products abroad. Depending on the type of product and foreign market involved, branded promotion can be more effective than generic promotion as a way to increase U.S. farmers' exports. In fiscal year 1997, 100 percent of FMD funds and more than 70 percent of MAP funds were awarded for generic marketing efforts overseas. More than 80 percent of MAP branded marketing funds went to U.S. farmer cooperatives and small agribusinesses which met the Small Business Administration's definition of a "small business." In accordance with recent program reforms, in fiscal year 1998 only farmer cooperatives and small businesses will be eligible to receive MAP branded promotion funds. Additionally, all applicants—whether large or small, non-profit or corporate, for FMD or MAP programs—must go through a rigorous competitive award process for program funds. Recent program

³"China Dominates Barshefsky Hearing," Annie Tin, Congressional Quarterly Daily Monitor, March 17, 1997, on-line service.

PART 1

1425

reforms have resulted in application and allocation criteria being much more widely known and transparent for all potential applicants.

USDA has also made other changes to the FMD and MAP programs over the past several years in response to General Accounting Office and Office of Management and Budget recommendations to ensure the best possible return to the U.S. taxpayer and the U.S. Treasury. Changes also reflect public comment on various proposed changes published in the Federal Register. These changes include: per the Government Performance and Results Act, changes to evaluation procedures and demonstrations of additional sales as a result of the programs; a reduction in paperwork requirements; the addition of an appeal procedure for compliance findings; and the expediting of routine administrative issues by delegating approval authority to lower levels within FAS. FAS is to be commended for its work in implementing these changes as well as its continuing efforts to support efforts by U.S. agriculture to expand our exports. A continued strong and well-funded FAS is an important part of our successful public-private partnership.

The U.S. Agricultural Export Development Council (USAEDC) appreciates this opportunity to submit written testimony in support of an aggressive U.S. effort in fiscal year 1998 to increase U.S. agricultural exports, specifically with an FMD program funded at \$30 million, and an MAP program funded at \$90 million.

TABLE 1.—COMPETITORS' 1996 EXPENDITURES ON AGRICULTURAL EXPORT MARKET PROMOTION¹
AND EXPORT SUBSIDIES²—Continued

[In millions of U.S. dollars]

	Government appropriation	Producer/ industry levies	Total expenditures
23-country total	9,391.7	488.7	9,880.4

¹Market promotion expenditures are for the most recent full year available and are drawn from 1996 FAS Posts' Special Request cables, additional communications with the Posts and other information. In most cases, the numbers are 1995 or 1996 budgets for national promotion agencies and producer boards. Posts do not have access to regional and local government promotion expenditures. The methodology for determining the breakdown of export market development funding is outlined in the "end notes" at the end of this report.

²Direct export subsidies included in this table are an estimated: \$9 billion budgeted by the EU for export subsidies in 1996; \$1.1 million for 1994/95 Indian fruit export transportation subsidies; \$83 million for 1995 Norwegian export subsidies for meat and dairy products; \$15 million for 1995 South African agricultural product export subsidies; \$6 million for Thailand's 1995 rice export subsidies; and \$30 million for Turkey's 1996 agricultural export subsidies. Estimated export subsidies totaled \$9.135 billion as compared with \$745.3 million in export market promotion expenditures.

PREPARED STATEMENT OF THE U.S. APPLE ASSOCIATION

On behalf of the U.S. apple industry, the U.S. Apple Association appreciates the opportunity to provide comments on the appropriations for the U.S. Department of Agriculture (USDA) for fiscal year 1998.

Our focus is on three agencies of the Department: the Agricultural Research Service (ARS), the Foreign Agricultural Service (FAS) and the Agricultural Marketing Service (AMS).

The U.S. Apple Association is a non-profit national trade association representing all segments of the U.S. apple industry. Our membership includes 30 state organizations representing approximately 9,000 producers and over 450 individual firms which handle and market the bulk of the nation's apples. Apples are grown commercially in 35 states, with gross returns to growers last year totalling \$1.8 billion. Top producing states include Washington, New York, Michigan, California, Pennsylvania, Virginia, North Carolina, Oregon, Idaho and West Virginia.

FOREIGN AGRICULTURAL SERVICE—MARKET ACCESS PROGRAM (MAP)

All segments of the U.S. apple industry benefit directly from the use of the export promotion funds, which build markets and demand for our domestically produced product, and indirectly strengthen our markets in this country as well. While many FAS activities are important to the apple industry, the U.S. Apple Association believes the Market Access Program (MAP) in particular should be fully funded at its current authorized level of \$90 million. This program is consistent with new international trade rules, helps small businesses, and is effective in promoting U.S. exports.

After nearly a decade of multinational trade negotiations in the Uruguay Round, the global agricultural community is facing substantial trade liberalizing policies. One of the few areas in which government policies can still effect agriculture is export promotion. We support a strong MAP, which is permissible under the Uruguay Round international trade rules.

The U.S. apple industry faces severe competition from around the globe. Most competitors receive significant government funds for generic promotions. Both production and exports from European Union (EU) countries receive government subsidies. Foreign governments spend approximately \$500 million on export promotion and market development. With apple production increases occurring around the world, already severe competition is expected to intensify further.

Apple industry members believe in agricultural export programs and back their support of these programs with cost-sharing contributions of 30 to 75 percent of the total. According to USDA estimates, every \$1 in export promotion funds translates into \$16 in additional agricultural exports. MAP is an investment by the federal government that generates substantial returns to the Treasury and helps American business. MAP has been a sound investment in this nation's agricultural economy.

California, Colorado, Connecticut, Idaho, Maine, Massachusetts, Michigan, New Hampshire, New York, Pennsylvania, Utah, Vermont and Virginia are members of the U.S. Apple Export Council (USAEC). USAEC manages the export promotion activities of these states. One success story of MAP is the experience of Pennsylvania, New York, Michigan and Virginia in exporting to Brazil. In 1994, USAEC identified

PART 1

1427

Brazil as an emerging market for U.S. apples exported by its members. Brazil's strengthening economy and its population of more than 160 million people, make it the tenth-largest market in the world. Problems for apples entering the Brazilian market included a lack of trade and consumer awareness, a lack of supplier awareness and competition from other suppliers. The goal in 1995 was to increase exports from the apple industry in four participating states to 130,000 cartons, or to increase market share 4.8 percent.

In the fall of 1995, a tasting demonstration for "USA Apples" was held in hypermarkets in the Sao Paulo area, trade services were provided and attractive consumer materials were developed. The results from the MAP activities in Brazil that year were excellent. Through retail promotions, point-of-sale promotions and consumer advertising, the apple industry exceeded its goal. Exports from the four participating states—Pennsylvania, New York, Virginia, and Michigan—reached 269,479 cartons, accounting for a market share of 9.6 percent. The quantity exported was 2.3 times the level sent the prior year, and exceeded the goal by more than two-fold. The price per carton shipped to Brazil in 1995 averaged \$13.50 per carton for a total value from the four states of \$3.6 million. With the use of only \$80,300 in MAP funds to promote the 1995 crop, the apple industry saw an increase in exports to Brazil of 230 percent.

Each year export markets become increasingly important to apple businesses and related industries. U.S. apple production has steadily grown over the past decade, and these new markets provide outlets for this increased production. It is vital not only to the apple industry but agriculture as a whole to continue trade promotion efforts to help U.S. producers and exporters take full advantage of emerging and existing export markets. It is critical that assistance to small businesses is continued. The program makes export markets more accessible to smaller businesses which would otherwise be unable to individually effectively promote and market their apples around the world.

AGRICULTURAL MARKETING SERVICE—PESTICIDE DATA PROGRAM (PDP)

As requested in the President's budget, we recommend appropriation of \$10.2 million for the Pesticide Data Program (PDP), managed by the Agricultural Marketing Service (AMS) of USDA.

Since 1991, USDA has utilized PDP to collect reliable, scientifically-based pesticide residue data that benefit consumers, food processors, crop protection pesticide producers, and farmers. These data accurately reflect the consumer's actual exposure to pesticides from certain dietary sources. This real-world information allows the U.S. Environmental Protection Agency (EPA) to make more accurate assessments of risk. Without the actual residue data, overly conservative theoretical assumptions of risk are used. These assumptions could lead to withdrawal of pesticide uses that pose no actual human health risk.

On August 3, 1996 the President signed into law the Food Quality Protection Act (FQPA). This landmark legislation requires extensive reevaluation of the safety of agricultural pesticides and requires extensive data to evaluate the risk associated with the exposure to pesticides. Over the next three years, EPA will reevaluate the pesticide tolerances of many of the most important pesticides used on apples. Lacking sufficient data, EPA will make conservative assumptions about the use of pesticides and the resulting exposure. The conservative assumptions could lead to unnecessary cancellations or restrictions of critically important pesticides used on apples. EPA will be able to make a more accurate assessment of the actual risk associated with pesticides using data from PDP. As a result, apple growers will benefit from the continued availability of safe and effective pesticides. It is imperative that the subcommittee support PDP.

In fiscal year 1997, the subcommittee defunded PDP from the USDA budget, but arranged to fund the program through EPA's budget. The U.S. apple industry believes that PDP is better suited to management through USDA and requests reinstatement of this program in the USDA budget.

USDA is the federal entity best equipped to collect the data and administer PDP since it already has working agreements with ten states that participate in PDP. These states represent approximately 75 percent of the nation's fruit and vegetable production, as well as large segments of wheat and milk production in the United States. Management by EPA adds additional expense and bureaucracy to a well managed USDA program.

Also, PDP has provided considerable assistance in confronting barriers to the international trade of American agricultural commodities and in the establishment of international standards. By developing a statistically reliable testing system,

PART 1

1428

AMS has used the PDP residue testing results to convince foreign governments that our food is safe, thus enhancing our ability to increase U.S. agricultural exports.

AGRICULTURAL RESEARCH SERVICE—CHILDREN'S FOOD CONSUMPTION SURVEY

The U.S. Apple Association supports the \$6 million funding of the children's food consumption survey as proposed in the USDA fiscal 1998 budget. The data from this survey is expected to lessen the potential that critical pesticides used on apples will be unnecessarily canceled or restricted as a result of implementation of the Food Quality Protection Act.

EPA uses food consumption data from the USDA food consumption survey to evaluate dietary pesticide exposures resulting from different food consumption patterns. EPA currently uses data which was produced from the latest survey conducted in 1978. The data from this survey are inadequate for certain demographic categories such as infants and children.

As previously noted, PQPA implementation will require accurate data to avoid the unnecessary cancellation of critical pesticides used on apples. Under FQPA, EPA must issue a finding that tolerances are safe for infants and children. Lacking sufficient data on infants and children, EPA is required by the new law to use additional margins of safety that could threaten the availability of pesticides used on apples. Data from a new consumption survey would refine EPA's risk assessments and possibly prevent unnecessary cancellations or restrictions on pesticides used on apples. It is also important that the survey is completed as quickly as possible since EPA will make many of its most critical decisions on apple pesticides within the next three years and will proceed on that schedule regardless of the availability of the data. The U.S. apple industry believes that the critical nature of the survey timing justifies a reprogramming request from USDA to do some of the survey work in fiscal year 1997 to provide data to EPA as early in the decision making process as possible.

AGRICULTURAL RESEARCH SERVICE, EASTERN REGIONAL RESEARCH CENTER, WYNDMOOR, PENNSYLVANIA—THE PRESIDENT'S FOOD SAFETY INITIATIVE AND APPLE-SPECIFIC E. COLI RESEARCH

The U.S. Apple Association supports the fiscal 1998 USDA request for additional research funds to address food safety issues and requests that an additional \$300,000 be appropriated to support apple-specific research on E. coli 0157:H7 at the Eastern Regional Research Center in Wyndmoor, Pennsylvania.

The request for additional apple-specific research reflects both the scope and the urgency of the food safety problems faced by 1,500 apple cider producers across the country. There is a critical need to understand how apple cider becomes contaminated and to identify alternative methods of effectively killing pathogens. Little if any research has been conducted in this area.

FDA is also currently considering the need to change federal regulations governing fresh unpasteurized juice production, following several outbreaks of foodborne illness linked to fresh apple cider and orange juice. Due to recent outbreaks from contaminated apple cider, and in particular a well-publicized E. coli outbreak last fall that led to one death, apple producers are already at the forefront of the issue of juice safety, along with other commodities including berries, melons and lettuce. The apple industry is anxious to institute specific changes to enhance the safety of unpasteurized apple juice products, but the industry must first understand the nature of the organism, how juice becomes contaminated and which sanitizers will eliminate harmful bacteria. The Eastern Regional Research Center in Wyndmoor, Pennsylvania is poised to undertake the research that will answer these questions, but current research funds are insufficient to address all aspects of the problem. An increase of \$300,000 allocated specifically to this problem will answer many of the basic questions about the safety of unpasteurized apple juice and allow the apple industry to take decisive action to eliminate any food safety concerns.

While some research has been undertaken by industry, state and other public institutions, there is a critical need for more research and information if these businesses are to continue and the public's health to be ensured.

AGRICULTURAL RESEARCH SERVICE—APPLE-SPECIFIC LEAFROLLER RESEARCH

The U.S. Apple Association requests support for ongoing apple-specific research of \$575,000 and requests an additional \$300,000 to address critical research needs on the leafroller complex. The Research Subcommittee of the U.S. Apple Association has identified leafroller research to be an important national research priority.

Apple growers in all regions of the United States are taking steps to avoid pesticide applications whenever possible. In the Western region of the country, many

PART 1

1429

apple growers are engaged in advanced pest management strategies that eliminate the use of broad spectrum pesticide applications. Previously, the broad spectrum pesticides controlled leafrollers, but without those pesticide applications, leafrollers have become increasingly difficult to control. In other apple growing regions, leafrollers have become resistant to commonly used pesticides or they are difficult to control using Integrated Pest Management (IPM). In New York, some orchards are presently sustaining leafroller damage amounting to \$500 per acre.

The apple industry has made tremendous progress in reducing pesticide applications and reducing the risks associated with the use of pesticides. Unless the industry is able to overcome the leafroller complex, IPM efforts will stall at their present level. IPM programs which were developed to control mites using biological control have become practically unworkable due to complications surrounding the leafroller problem. New information about this pest will be a critical factor in determining the apple industry's ability to advance to even more environmentally-friendly production practices.

FOOD QUALITY PROTECTION ACT IMPLEMENTATION

In passing the Food Quality Protection Act (FQPA), Congress provided for the establishment of a minor-use program within USDA. The primary purpose of this office is to provide coordination and policy oversight for specific program areas within USDA that impact minor-use pest management practices including pest management practices within the U.S. apple industry.

Some of these areas would include the issue of meeting grower needs for chemical or nonchemical pest management tools, providing extension and educational services, and direct coordination with other federal agencies, primarily with the U.S. Environmental Protection Agency.

The minor-crop community and the U.S. Apple Association believe that responsibility for this program must be placed at the highest levels of USDA. The U.S. Apple Association believes that the office should take an aggressive leadership role in providing for the needs of minor-use growers including apple growers in the implementation of FQPA.

The U.S. Apple Association believes that implementation of FQPA will require significant amounts of information and data. USDA should assume a role in providing the data and assist the apple industry with risk mitigation measures if necessary.

Implementation of the Food Quality Protection Act could have a significant impact on apple growers and the apple industry. The U.S. Apple Association requests that the subcommittee provide the necessary funds for USDA to respond to this new regulatory challenge.

PREPARED STATEMENT OF DR. WILLIAM W. WALKER, ASSOCIATE DIRECTOR FOR RESEARCH, UNIVERSITY OF SOUTHERN MISSISSIPPI, INSTITUTE OF MARINE SCIENCES, GULF COAST RESEARCH LABORATORY

Mr. Chairman, I greatly appreciate the opportunity to appear before you and the Subcommittee, to thank you for your past support and to discuss the achievements and opportunities relating to the Gulf Coast Research Laboratory Consortium's U.S. Marine Shrimp Farming Program.

My testimony is presented on behalf of the members of the Consortium: The University of Southern Mississippi-Gulf Coast Research Laboratory, Mississippi; the Oceanic Institute, Hawaii; Texas A&M University, Texas; the Waddell Mariculture Research and Development Center, South Carolina; the University of Arizona, Arizona; and Tufts University, Massachusetts.

Today, the United States is not competitive in the farming of marine shrimp. Some 80 percent of all shrimp consumed in the United States today is imported, and virtually all farmed shrimp consumed is produced in foreign countries. Meeting the demands of U.S. consumers presently results in an annual trade deficit of about \$2.5 billion, precluding U.S. jobs and economic benefit.

The U.S. Marine Shrimp Farming Program was initiated in 1984 through congressional initiative resulting in grants to the Gulf Coast Research Laboratory and the Oceanic Institute administered by the Cooperative State Research, Education, and Extension Service (CSREES) of the U.S. Department of Agriculture (USDA). The objectives of the program were then and continue today to be to develop the advanced, second-generation technology processes, products, and services necessary to enable the U.S. shrimp farming industry to become economically viable and to be competitive with its foreign counterparts.

PART 1

1430

To date over 35 million dollars have been invested in the U.S. Marine Shrimp Farming Program. According to the USDA, the technologies, products, and services developed have catapulted the U.S. into a world leadership role in second generation shrimp farming. It is widely recognized that this effort has been funded by congressional initiative spearheaded by yourself, this subcommittee, and your colleagues in the Senate and in the House.

Whereas the Consortium has accomplished much, its work is not finished. The shrimp farming program in the U.S. has successfully cleared only its initial hurdles. The U.S. shrimp farming industry today remains totally dependent on the Consortium for its continued survival and development. In 1995, 1996, and again in 1997, exotic viruses found their way to isolated shrimp farms in this country with devastating impacts. These occurrences demand that the Consortium complete the development of biosecure and environmentally friendly shrimp growout systems, better understand the diseases which continue to plague our industry, and develop advanced disease control measures, including disease resistant shrimp.

Let me take a few minutes to highlight the accomplishments of the U.S. Marine Shrimp Farming Program to date, and then address the vulnerability and eventual independence of the industry.

ACCOMPLISHMENTS

The economic impact of shrimp farming in the United States increased from about \$22 million in 1991 to over \$65 million in 1994. The number of jobs associated with shrimp farming in this country tripled during that period. While viral diseases caused significant setbacks in 1995 and 1996, there is every reason to believe that the industry will enjoy successes similar to and greater than those in 1994 once the Consortium has come to terms with these disease agents. In fact, 1996 production of farmed shrimp in Texas, which produced nearly 75 percent of all farmed shrimp in the U.S. in 1994, more than doubled the state's 1995 output, due to the research and development by the U.S. Marine Shrimp Farming Program and to the funding for these efforts by the Federal government.

Even in the face of the aforementioned disease problems, the U.S. marine shrimp farming industry is expanding, indicating industry confidence in the U.S. Marine Shrimp Farming Consortium.

The U.S. is presently the only producer and exporter of high health and genetically improved shrimp broodstock and seed. The U.S. is the world supplier of high health and genetically improved shrimp stocks.

Expansion continues with respect to private U.S. seed hatcheries and broodstock multiplication centers. Several new U.S. companies have been formed.

The U.S. is also the world leader in shrimp disease diagnosis, prevention, and treatment technologies. New U.S. companies have been established which produce and export diagnostic products.

Private industries are partnering with the U.S. Marine Shrimp Farming Consortium in their quest to develop and transfer needed second-generation technologies, products, and services. It is our expectation that two additional major partnerships will come to fruition in calendar year 1997.

INDUSTRY VULNERABILITY

Private industries spawned as the result of the U.S. Marine Shrimp Farming Program remain dependent on that program. It is imperative that the efforts of the Shrimp Farming Program continue and expand to foster the viability of activities within the private sector until they become self-sufficient. Product and technology development and transfer continues today, but they are presently incomplete. Presently, all captive stocks of high health and genetically improved shrimp are produced, maintained, and controlled by the Shrimp Farming Program and provided to private sector industries at or near cost.

The industry is today more than ever before dependent on the Shrimp Farming Program for disease diagnosis, prevention and treatment methods, and technologies. The appearance of exotic viruses in U.S. shrimp farms, while temporarily devastating, underscored the need for continued research to develop the advanced biosecurity and disease control technologies necessary to assure industry independence. The U.S. Marine Shrimp Farming Program is the only group in the world capable of developing these technologies and procedures. Simply put, failure of the Shrimp Farming Program to be able to continue its research and development activities will clearly result in the death of the U.S. marine shrimp farming industry.

PART 1

1431

INDUSTRY INDEPENDENCE

We anticipate that in a few years, probably not more than five, the U.S. shrimp farming industry will become essentially self sufficient by following commercialization plans developed by the Shrimp Farming Program. At that time, the mission of the U.S. Marine Shrimp Farming Program will be accomplished and the U.S. will be a major player in the \$4+ billion world shrimp farming industry. We expect that the trade deficit will be decreased by at least one billion dollars. The economic impact of this reduction will exceed \$1.5 billion per year and contribute about 50,000 additional U.S. jobs.

The Consortium continues to receive substantial support and encouragement from CSREES in their administration of grant funds. CSREES has indicated that this represents a model program for resolving important problems and capturing opportunities in both agriculture and aquaculture. These sentiments have been underscored by independent review of Consortium operations.

To begin completion of our remaining tasks, the Consortium requests operational support in the amount of \$5.0 million and a one-time capital grant in the amount of \$5.0 million for fiscal year 1998.

Mr. Chairman, the U.S. shrimp farming industry and our Consortium deeply appreciate your support, and we respectfully seek your favorable consideration of our request.

PREPARED STATEMENT OF THE UNITED STATES TELEPHONE ASSOCIATION

SUMMARY OF REQUEST

Project involved.—Telephone Loan Programs Administered by the Rural Utilities Service.

Actions proposed.—Supporting RUS loan levels for the hardship, cost of money, Rural Telephone Bank and loan guarantee programs in fiscal year 1998 in the same amount as loan levels specified in the Fiscal Year 1997 Agriculture Appropriations Act (Public Law 104–180). Also supporting an extension of the language removing the 7 percent interest rate cap on cost of money loans for fiscal year 1998. Also supporting continuation of the restriction on the retirement of class A Rural Telephone Bank stock in fiscal year 1998 at the level contained in Public Law 104–180 and an extension of the prohibition against the transfer of Rural Telephone Bank funds to the general fund. Supporting funding for \$150 million in loan authority and \$21 million in grants designated for distance learning and telemedicine purposes.

The United States Telephone Association (USTA) represents over 1,000 local telephone companies that provide over 95 percent of the access lines in the United States. USTA members range from large publicly-held corporations to small family-owned companies and cooperatives owned by their customers. We submit this testimony in the interests of the members of USTA and the customers they serve.

Local telephone companies are dedicated to fulfilling two goals: serving the nation's telecommunications needs and maintaining universal service at reasonable rates. USTA members, both large and small, firmly believe that the targeted assistance offered by a strong and viable telephone loan program remains essential in order to maintain a healthy and growing rural telephone industry that contributes to the provision of universal telephone service. We appreciate the strong support this committee has provided for the telephone program since its inception in 1949 and look forward to a vigorous program for the future.

A CHANGING INDUSTRY

As this Congress recognized through passage of the Telecommunications Act of 1996, the telephone industry is in the midst of one of the most significant changes any industry has ever undergone. Both the technological underpinnings and the regulatory atmosphere are dramatically different. Without system upgrades, rural areas will be left out of the emerging information revolution. This will impact not only rural Americans, but people in urban areas that need to communicate with those in rural areas.

As the need for new services evolves, rural telephone systems must have access to low cost RUS financing to fund technological improvements such as digital switching equipment, access to services such as the Internet, updated switch software to provide advanced services and communicate with discrete signalling networks and associated data bases, and broadband fiber optic lines.

Regulatory uncertainty, caused by recent actions of the Federal Communications Commission and the Federal State Joint Board with regard to interconnection and

PART 1

1432

universal service, have caused many rural telephone to examine the feasibility of continuing to invest in the communications infrastructure of rural America. Needed upgrades to bring modern services, including Internet access, to rural areas, may be stalled. Previously underserved areas newly acquired by RUS borrower companies may not get the reliable one-party service that they have expected and deserved for many years.

As Senator Conrad Burns put it at USTA's 1996 Convention: "People say to me 'My gosh, how do you make a living in Montana? We go through here and we don't see anything for miles!' And I say—You know what? There's people in houses in Montana, and they've got faces, and they've got dreams too, and their needs are the same as anybody in any other part of this country. I represent a big state. From one end to the other is further than from Washington, D.C. to Chicago. So I've got to deal with distances. But you know what? Our kids are just as important, their eyes are just as bright, and their dreams are just as valid as any other kid's. They just want an opportunity, and local telephone companies are a vital part of the infrastructure that will allow them that."

Of course, Mississippi and the rest of rural America are no different. RUS borrowers have built the infrastructure to serve those kids and their parents. But our members have a responsibility to their stockholders and their ratepayers to not make investments they can't pay for by charging reasonable rates. Many local telephone companies are concerned about making the long term commitments needed to build the rural telecommunications infrastructure. They are worried about fair treatment from regulators. RUS has always been an important element in convincing local telephone companies to make needed investment.

After all, RUS is a voluntary program designed to provide incentives to local telephone companies to build the plant essential to economic growth. RUS endures because it is a brilliantly conceived public private partnership in which the borrower telephone systems are the conduits for benefits from the federal government to rural telephone customers, the true beneficiaries of the RUS program. The government's contribution is leveraged by the equity, technical expertise and dedication of local telephone companies.

The Telecommunications Act of 1996 recognized the key role telecommunications plays in education and health care, particularly in rural areas. Business, large and small, and parents and children, are making increased use of the limitless resource of the Internet. Local telephone companies are providing customers connections to the Net. RUS financed modern, reliable facilities are necessary to access these advanced telecommunications services at reasonable cost.

Particularly in rural areas, telecommunications is a substitute for transportation and an especially important element in economic growth. Not only do RUS telephone companies directly employ 30,000 Americans, RUS loans have a multiplier effect. RUS seed dollars stimulate business activity and create jobs, generating Federal, state and local tax revenues.

RECOMMENDATIONS

Continuation of the loan levels and associated subsidy amounts for the RUS telephone loan programs that were recommended by this committee and signed into law for fiscal year 1997 would maintain our ability to adequately serve the nation's telecommunications needs and to maintain universal service. Through a dramatic restructuring, carefully and thoughtfully accomplished by Congress, the RUS telephone loan programs have more than met their responsibility to contribute to fiscal restraint and should be continued at their present levels of investment in the infrastructure of rural America.

Request support for streamlining and deregulation

In our testimony before this subcommittee last year, we requested support for efforts by RUS to administratively streamline RUS procedures, reduce paperwork burdens on RUS borrowers, automate antiquated systems, and deregulate to the extent consistent with preservation of the government's loan security. We have been disappointed that no initiatives have yet been made by the RUS telephone program to fulfill these worthy goals. Meanwhile, both the government and the borrowers have been burdened with another year of excessively regulatory and cumbersome procedures. We heartily support efforts to reduce red tape and reduce costs for all parties and recommend that Congress support them as well by encouraging RUS to accomplish them expeditiously.

Request support for elimination of the 7 percent cap on cost of money loans

Last year, Congress also eliminated the seven percent "cap" placed on the insured cost-of-money loan program. If long term Treasury interest rates exceeded the 7 per-

PART 1

1433

cent ceiling contained in the authorizing act, adequate subsidy would not be available to support the program at the authorized level. This would be extremely disruptive and hinder the program from accomplishing its statutory goals. Accordingly USTA supports continuation of the elimination of the seven percent cap on cost-of-money insured loans in fiscal year 1998.

Request support for continued restriction on retirement of government stock in the Rural Telephone Bank

The restriction on the retirement of the amount of class A stock by the Rural Telephone Bank, adopted last year, should be continued. The Bank is currently retiring Class A stock in an orderly, measured manner as current law requires. This should continue. The Committee should also continue to protect the legitimate ownership interests of the Class B and C stockholders in the Bank's assets by continuing to prohibit a "sweep" of those funds into the general fund.

Recommended loan levels

USTA recommends telephone loan program loan levels for fiscal year 1998 as follows:

[In millions of dollars]	
RUS insured hardship loans (5 percent)	75
RUS insured cost-of-money loans	300
Rural Telephone Bank (RTB) loans	175
Loan guarantees	120
Total	670

The President's budget proposes a reduction of \$35 million in the hardship program designed for the neediest borrowers. If loans approved already this year are added to applications already in hand, all fiscal year 1997 hardship funds will be used up and another \$60 million will have to be carried over into fiscal year 1998. Under the President's proposal, one-third of those loans won't be able to be made until fiscal year 1999. And applications are still coming in. Rural Americans cannot wait any longer to be full participants in the Information Age. One and a half million dollars in subsidy authority would restore this proposed \$35 million cut in the hardship loan level. We cannot imagine a more deserving use of scarce government resources for the benefit of rural Americans.

Distance learning and telemedicine

USTA strongly supports the loan and grant proposal and recommends its funding for fiscal year 1998 at the levels proposed in the Administration's budget submission, that is, \$21 million for the grant program and \$150 million for the loan program. This program is a perfect complement to the traditional RUS telephone loan programs. For distance learning and telemedicine to become a reality, schools and hospitals need training and equipment. Similarly, local telephone companies need modern infrastructure to connect these facilities to the telecommunications network.

CONCLUSION

Our members take pleasure and pride in reminding the Subcommittee that the RUS telephone program continues its perfect record of no defaults in almost a half century of existence. RUS telephone borrowers take deadly seriously their obligations to their government, their nation and their subscribers. They will continue to invest in our rural communities, use government loan funds carefully and judiciously and do our best to assure the continued affordability of telecommunications services in rural America. Our members have confidence that the Subcommittee will continue to recognize the importance of assuring a strong and effective RUS Telephone Program through authorization of adequate loan levels.

PREPARED STATEMENT OF SAM J. MASELLI, EXECUTIVE VICE PRESIDENT, WESTERN RURAL TELEPHONE ASSOCIATION

SUMMARY OF REQUESTS

Program of interest.—Telecommunications lending programs administered by the Rural Utilities Service (RUS) of the U.S. Department of Agriculture.

Recommendation.—WRTA supports loan levels for fiscal year 1998 at such amounts as they have been designated in the Agriculture Appropriations Act for Fiscal Year 1997 (Public Law 104-180) for hardship, treasury-cost, Rural Telephone

PART 1

1434

Bank (RTB), and guaranteed loan programs and the associated subsidy to support hardship and RTB loans at existing levels. WRTA also supports the President's budget request for funding of the RUS's Distance Learning and Telemedicine (DLT) programs at \$21 million in grants and \$150 million in loan authority. WRTA supports a continuation of the current fiscal year's policy of language removing the 7 percent interest rate ceiling on Treasury-cost loans for fiscal year 1998. Finally, WRTA supports the continued provisions contained in Public Law 104-180 restricting retirement of RTB class A stock in fiscal year 1998 and prohibiting the transfer of RTB funds to the general fund.

Mr. Chairman and Members of the Subcommittee: It is an honor and privilege to have the opportunity to discuss the unique infrastructure financing needs of the rural local exchange carrier (LEC) industry. My name is Sam J. Maselli, and I am the Executive Vice President of the Western Rural Telephone Association (WRTA). WRTA is a regional trade association representing nearly 150 small rural commercial and cooperative telephone systems throughout the western United States and the Pacific Rim territories.

BACKGROUND

WRTA's member systems, like most of this nation's independent LEC's, evolved to serve the high cost, low density areas in the rural western United States. Congress recognized this unique dilemma confronting America's rural LEC's as early as 1949 when it amended the Rural Electrification Act (RE Act) to create the REA telephone loan program. With the future of rural America in mind, Congress charged the REA with the responsibility for making low interest rate loans to both " * * * furnish and improve * * * " rural telephone service at the local exchange level.

In subsequent years, Congress has periodically acted to amend the RE Act to insure that the original mission of the program is fully met. In 1971, the Rural Telephone Bank (RTB) was created as a supplemental source of direct loan financing. In 1973, the REA was provided with the ability to guarantee Federal Financing Bank (FFB) and private lender notes. And in 1993, the Congress established a fourth lending component, the Treasury-cost program, and Congress eliminated most of the subsidy costs associated with the administration of the program. The formal consolidation of the Department's utility programs through transferring the telecommunications loan and technical assistance programs of the REA to the Rural Utilities Service (RUS) in 1994 further served to enhance and update the effectiveness of the agency in promoting rural infrastructure development.

Due to the difficulty of providing service in high cost, low density areas, Congress provided for long-term, fixed rate loans available at reasonable rates to borrowers to assure that rural citizens benefited from the highest quality of telephone service and affordable subscriber rates. Through this ongoing commitment to capital financing, Congress affirmed the goal of comparable and affordable telephone service for rural Americans as their urban counterparts.

As a result of this commitment to rural telecommunications, rural America has greatly benefited from the highest quality of information technology. Through its effort, Congress has played a critical role in developing a rural telecommunications infrastructure financing program which best responds to the needs of rural America.

THE OBLIGATIONS OF THE INDUSTRY CONTINUE

The RUS telecommunications loan program represents a remarkable public/private partnership success story which continues to produce tangible results in the lives of rural citizens. With the assistance of RUS capital and technical standards, rural telephone systems are providing modern telecommunications services of a highly sophisticated quality. However, with the rapid pace of change in the development of information technology, the need for RUS telecommunications lending is greater than ever.

Due to the nature of rural areas, particularly in the rural West, the challenge of providing modern telecommunications services is formidable. Compared to their urban counterparts, rural communities are faced with higher poverty rates, lower income levels, physical isolation and higher costs associated with deploying modern infrastructure. Economic development is often frustrated by these unique rural conditions. With the United States in the midst of the "information revolution," rural areas are confronted with the dilemma of being left behind.

The implementation of the Telecommunications Reform Act of 1996 has also added to the uncertainty and collective uneasiness of the rural telecommunications industry. Despite the Act's solid rural safeguard provisions, the Federal Communications Commission (FCC) has embarked in a regulatory direction which explicitly threatens rural ratepayers, services, and infrastructure investment.

PART 1

1435

Through attempting to “jump-start” competition, the FCC has threatened to reduce the effectiveness of the Act’s specific rural protections and universal service provisions. Inadequate regulatory proposals to revamp our nation’s universal service and other cost-recovery mechanisms through idealized modeling arrangements threatens the embedded investment of rural telephone systems who rely on these critical policies developed over the decades for their continued financial viability. Moreover, the FCC Order dictating how new entrants interconnect with incumbent LEC’s networks and provide compensation for unbundled network elements has already resulted in a stay issued by the 8th Circuit Court of Appeals in St. Louis, MO.

Congress must keep a vigilant watch over the FCC to ensure that implementation of the Act is consistent with congressional intent. This is particularly true of RUS program borrowers where the federal government has a significant loan security interest at stake. Whatever the outcome of the regulatory process, the RUS telecommunications loan program will be as important as ever to rural systems attempting to modernize their networks and improve service to rural residents.

THE PROMISE OF THE RUS PROGRAM

Despite the obstacles to rural economic revitalization, information technology holds significant promise for our rural areas. As we have seen in recent years, information services can directly benefit our schools, libraries, hospitals and clinics. In addition, telecommunications services facilitate commercial opportunities such as telemarketing, insurance, and manufacturing not possible in previous years.

While the explosive nature of technological change offers our rural communities genuine opportunities for economic and social progress, special attention must be placed on providing rural areas with the appropriate tools to address their unique set of needs. In this context, the RUS telecommunications loan program is playing a critical front-line role in ensuring that rural America is linked to the Information Superhighway.

Today, RUS borrowers average only 6 subscribers per mile compared to 37 per mile for the larger, urban-oriented telephone systems. This results in an average plant investment per subscriber that is 38 percent higher for RUS borrower systems. Without the availability of affordable capital financing, enhancing telecommunications networks for rural communities would be untenable.

The RUS is providing affordable capital financing to allow its borrowers to upgrade their plant and facilities for digital switching, fiber optic cabling, emergency 911, and other enhanced features such as ISDN, SS7, and CLASS. Due to the dependability of the RUS program, borrowers provide their rural subscribers with cutting edge services.

RUS telecommunications lending also performs a pivotal function of stimulating substantial private investment. In fiscal year 1995, a subsidy of \$4.8 million generated \$584 million in federal loans and loan guarantees which leveraged an additional \$2.63 billion of private investment, resulting in a total investment of \$3.22 billion in rural telecommunications infrastructure.

In addition, the RUS telecommunications program boasts a proud financial record probably unprecedented for federal loan programs. To date, the program has never experienced a borrower-related default in its history. At the end of 1996, over \$9 billion in principal and interest had been paid by RUS borrowers. For nearly 48 years, this successful public/private partnership has worked.

In 1993, this partnership agreed to a \$31 million cut in the name of debt reduction, and it agreed to a twelve year freeze in program loan levels while other programs grew by at least the rate of inflation. This partnership is committed to providing service to areas long neglected by others. Ultimately, this partnership will foster the rural information network of the 21st century.

SPECIFIC RECOMMENDATIONS FOR THE SUBCOMMITTEE’S CONSIDERATION

RUS Telecommunications loan program

Increasing demands for expanded telecommunications services and infrastructure upgrades suggests that the level of need continues. Congressional mandates as a result of the Rural Electrification Restructuring Act (RELRA) of 1993 (Public Law 103-129) have placed additional obligations on RUS borrowers to upgrade their technology in order to maintain their loan eligibility.

To address the persisting need, WRTA recommends that the Committee consider the following RUS Telecommunications Program loan levels for fiscal year 1998:

5 percent hardship loans	\$75,000,000
Treasury-cost loans	300,000,000

PART 1

1436

FFB loan guarantees	120,000,000
Rural Telephone Bank loans	175,000,000
Total	670,000,000

These loan levels are the same as the current fiscal year's funding provided by Congress and represent a genuine commitment to rural telecommunications.

Removal of interest rate ceiling on treasury-cost loans

WRTA supports language removing the 7 percent interest rate cap on the program's Treasury-cost loans. This provision was originally included in the Agriculture Appropriations Act for Fiscal Year 1996 and continued for the current fiscal year. The inclusion of this provision for fiscal year 1998 will prevent a potential disruption of the program in the case where interest rates exceed 7 percent and insufficient subsidy cannot support authorized loan levels. Stated simply, it is a continuation of current policy, and it promotes the viability of the program at zero cost.

Rural Telephone Bank (RTB) issues

During the course of fiscal year 1996, the Rural Telephone Bank began the statutory retirement of class A, government-owned stock. WRTA supports the restriction on accelerating the privatization process as conceived beginning in fiscal year 1996 of no more than 5 percent of total class A stock retired in one year. We believe that a continuation of this policy best addresses the orderly and systematic privatization of the RTB.

WRTA also urges the Committee to continue the prohibition against the transfer of bank funds to the general fund of the Treasury along with the requirement that the bank receive interest on those funds. The private B and C stockholders of the RTB have an interest in the assets of the bank and the protection of all funds.

Distance learning and telemedicine (DLT) loans and grants

The RUS Distance Learning and Telemedicine (DLT) program has proven to be a remarkable tool for promoting rural development. The authorization of a new DLT loan and grant program administered by the RUS in last year's Farm Bill (Public Law 104-127) holds significant promise for the deployment of modern technology for scores of our rural communities.

WRTA supports the President's request for \$150 million in loans delivered at the government's cost-of-money and \$21 million in grants for DLT purposes. We believe that the proposed level adequately responds to the overwhelming demand for DLT resources since the implementation of the program by the RUS in 1993.

CONCLUSION

Rural economic and social development and access to advanced information services are an inseparable combination for the future. The RUS telecommunications program has proven to be an indispensable tool for rural America. Its existence continues to improve the nature of rural life in our nation, particularly in our isolated Western communities.

We appreciate the opportunity to comment on this critical program. Thank you for your time and consideration of this issue.

PREPARED STATEMENT OF HON. JIM GERINGER, GOVERNOR, STATE OF WYOMING

This testimony supports fiscal year 1998 funding for the Department of Agriculture in the amount of \$200,000,000 for the Environmental Quality Incentives Program (EQIP) in order that a portion of that funding may be used for the Colorado River Salinity Control Program, one of the programs made a part of the EQIP by Public Law 104-127.

This testimony supports fiscal year 1998 appropriations for the Department of Agriculture's Environmental Quality Incentives Program to carry out Colorado River Basin Salinity control activities. You recently received testimony from the Colorado River Basin Salinity Control Forum (Forum) on behalf of the seven Colorado River Basin states that was submitted by the Forum's Executive Director, Jack Barnett. The State of Wyoming, a member state of the Forum, concurs in that testimony. EQIP funding is critically important to maintaining the basin-wide Water Quality Standards for Salinity.

The Forum's testimony is in accordance with the Advisory Council's written recommendations. Wyoming is represented on both the Colorado River Basin Salinity Control Forum and the Colorado River Basin Salinity Control Advisory Council. The 1974 Colorado River Basin Salinity Control Act (Public Law 93-320) created the Ad-

PART 1

1437

visory Council. Like the Forum, the Advisory Council is composed of gubernatorial representatives of the seven Colorado River Basin states, and serves as a liaison between the seven States and the Secretaries of the Interior and Agriculture and the Administrator of the Environmental Protection Agency (EPA). It advises these Federal officials and the involved agencies on the progress of efforts to control the salinity of the Colorado River and annually makes funding recommendations, including the amount believed necessary to be expended by the USDA for its onfarm Colorado River Salinity Control (CRSC) Program. Although the CRSC Program has now been made a part of the EQIP, it is anticipated that the Advisory Council will continue to make recommendations to the USDA relative to the amount of EQIP funding which should be devoted to accomplishing salinity control.

The Plan of Implementation and the numeric water quality criteria set for three Lower Colorado River stations constitute the State-adopted, EPA-approved, water quality standards for salinity the Colorado River. Jointly developed by the States and involved Federal agencies, the Plan of Implementation has been prepared and is being carried out to ensure continuing compliance with the numeric water quality criteria for salinity. Falling behind the schedule set forth in the Plan raises vitally important questions about whether the Basin States can be assured that the water quality numeric criteria, a component of the Water Quality Standards for the Colorado River, will continue to be complied with in the future.

During its October, 1996 meeting, the Advisory Council recommended that at least \$9,800,000 be expended by the Department of Agriculture for cost-sharing to implement salinity reduction practices (funds that are matched with individual contractor's cost-share funds) in fiscal years 1998 and 1999, plus sufficient funds for administration, technical information and education, in order to assure that the progress of removing salt and preventing additional salt loading into the Colorado River system stays on schedule with the Plan of Implementation. Should a lesser funding level be provided for on this important basin-wide water quality program, the progress (as measured in tons of salt prevented from entering the Colorado River system) achieved by the USDA component of the multi-agency, state and federal Colorado River Basin Salinity Control Program will fall far short of meeting the rate of salinity control determined to be necessary in the Plan of Implementation.

Accordingly, if less salt is removed from the Colorado River than called for in the Plan of Implementation, it is apparent that the salinity levels of Colorado River water at the three downstream stations will in the future likely exceed the numeric criteria values established for those stations. Further, it is unmistakable that funding shortfalls will result in significantly higher costs to implement the same level of salinity control in future years. Farmers and agricultural producers in the areas of Colorado, Utah and Wyoming where the Program's salinity control efforts are underway are patiently waiting for the appropriation of funds to the Department of Agriculture so that they can match their 30 percent local-cost sharing against those federal funds and proceed with the installation of measures to reduce salt loading into the Colorado River system. Literally hundreds of producers have indicated their desire and intent to participate in this Program—but are unable to do so on account of the lack of Federal cost-sharing funds.

The Federal Agriculture Improvement and Reform Act of 1996 (Public Law 104-127) provided for the CRSC Program to continue in the future—as a part of the Environmental Quality Incentives Program (EQIP). We view the inclusion of the Salinity Control Program in EQIP as a direct recognition on the part of Congress of the Federal commitment to maintenance of the water quality standards for salinity in the Colorado River—and that the Secretary of Agriculture has a vital role in meeting that commitment. We urge the Subcommittee to remind the Secretary of Agriculture of his obligations under that Federal commitment as he makes decisions about national conservation priority areas and priority resource concerns. While the intention of the Public Law 104-127 is that the nation's agricultural programs are “locally led and driven” and we agree with that approach, it is also necessary to recognize the Federal role and obligation relative to this basin-wide water quality maintenance program. The USDA portion of the overall salinity reduction effort is critical to the overall effort.

I wish to thank you for the opportunity to submit this testimony and would request, in addition to your consideration of its contents, that you make it a part of the formal hearing record concerning fiscal year 1998 appropriations for the Department of Agriculture. In accordance with the Subcommittee's direction, I have submitted three copies of this statement.
