bursed realized losses decreased from \$26.9 billion at the end of fiscal year 1993 to \$2.3 billion at the end of fiscal year 1996. The fiscal year 1996 appropriation completed this process by fully restoring all cumulative unreimbursed realized losses through fiscal year 1995 and a portion of fiscal year 1996 losses. In prior years, the request for appropriations to reimburse the CCC for net realized losses has been based on an estimate of losses incurred one year earlier which have not been previously reimbursed. The estimate could exceed or fall short of the actual amount of loss. Beginning in 1998, in response to OIG recommendations, the request for appropriations to reimburse CCC for net realized losses will cover the actual amount of all unreimbursed losses incurred two years earlier. The 1998 budget requests \$784 million for the balance of 1996 losses not reimbursed through appropriations in 1996 and 1997. 1996 losses totaled \$7.8 billion, of which \$5.5 billion was restored by appropriations in 1996 and \$1.5 billion was restored by appropriations in 1997, leaving a balance of \$784 million to be restored in 1998. Appropriations to reimburse CCC for net realized losses incurred in 1997, currently estimated to total \$9.002 billion, will be requested in the 1999 budget at their actual recorded level.

Question. In other words, what would the fiscal year 1998 estimate be if we continue a one-year basis for reimbursements?

Answer. The fiscal year 1998 estimate would be \$9.786 billion if we continued a one-year basis for reimbursements. This would include \$784 million for the balance of 1996 losses not reimbursed through appropriations in 1996 and 1997, and \$9.002 billion for net realized losses estimated to be incurred in fiscal year 1997. While this approximate level would keep the Corporation essentially fully reimbursed at the time of appropriation, CCC's available borrowing authority will continue to be adequate to finance expected expenditures on the two-year basis for loss reimbursement.

HIGHER COST OF FREEDOM TO FARM

Question. Have you been able to determine what your fiscal year 1997 and fiscal year 1998 outlays from CCC would have been without the changes in the 1996 Farm Bill, specifically the so-called Freedom To Farm payments?

Answer. The 1996 farm bill made profound changes in the way direct payments are made to producers. First, production flexibility contract payments under the new farm bill are no longer tied to market prices and are determined by amounts specified in law. Second, crop payments are now made in 1 fiscal year, unlike under the 1990 farm bill provisions when payments were issued over 2 or more fiscal years.

Due to the timing differences of deficiency payments under an extended 1990 farm bill versus the production flexibility contract payments, a comparison of spending by fiscal years would be misleading. Therefore, we have estimated what direct payment outlays would have been under an extension of the 1990 farm bill provisions for the 1996 and 1997 crops.

In projecting what the costs of an extension might have been, certain assumptions were made. We assumed that prices under an extension of the 1990 farm bill would not be much different than current prices except for rice, and, therefore, prices were set to equal the prices in the May 1997 "World Agriculture Supply and Demand Estimates" except that we used internal price projections for cotton because the Department is prohibited from publishing cotton price projections. Rice prices were lowered about 15 percent because additional acreage would have been planted under an extension of previous law. Acreage reduction percentages were assumed to be zero for all commodities.

Production flexibility contract payments for 1996 equaled about \$5.4 billion. If an extension of the 1990 farm bill provisions were applicable to the 1996 crop, deficiency payments would have been less than \$0.7 billion, about \$4.7 billion less than the contract payments. Deficiency payments for wheat, corn, barley and oats would have been zero because farm prices exceeded their target prices, but payments would have been made for rice, cotton and sorghum.

Production flexibility contract payments for 1997 are about \$6.4 billion. 1997 crop deficiency payments would have been about \$2.7 billion, \$3.7 billion less than the contract payments. Deficiency payments would have been issued for all crops, except oats.

FARM SAFETY NET—EXTENSION OF COMMODITY LOANS

Question. You want discretionary authority to extend commodity loans by 6 months. Historically, cotton loans have been extended for longer periods than other commodities. Do you intend to provide for this historical trend to continue?

Answer. Under current law, we have no authority to extend any crop loans. To provide a safety net for farmers under adverse price circumstances, we proposed

PART 1

512

that the Secretary be granted authority to extend loans for cotton and other commodities for 6 months. Should that proposal be enacted, we would have no authority to treat cotton any differently from other commodities.

FARM SAFETY NET—FRUIT AND VEGETABLE PLANTING FLEXIBILITY

Question. Why do you plan to change the flexibility provisions for fruit and vegetable planting on transition acres?

Answer. We believe a legislative change permitting the planting of fruits and vegetables (FAV's) following a contract commodity that is prevented from being planted or has failed due to adverse weather (ghost-crop provision) without a reduction in AMTA payment is warranted. Enactment of this change would merely allow producers to regain an option that had been available to them in 1995. We do not believe that FAV producers would be unfairly disadvantaged by the restoration of this provision.

Question. Does this reflect a change in your position during the 1996 farm bill debate?

Answer. No.

Question. What effect will this change have on traditional fruit and vegetable producers?

Answer. None. Since the proposal is an extension of law that was in place prior to 1996, there would be no impact on fruit and vegetable plantings.

SALARIES AND EXPENSES (OFFICE CLOSINGS)

Question. Since one of the goals of USDA reorganization has been to reduce more of the headquarters positions than those in the field, why is the percentage of reduction of non-Federal (county) employees so much larger than the proposed reductions for Federal employees?

Answer. The FSA has been making staffing reductions over the past several years. From fiscal year 1993 to the current fiscal year 1997, the Agency has reduced total staffing 21 percent. These reductions reflect an overall 19 percent reduction in Federal staff years, including 27 percent at Headquarters, and a 22 percent reduction in non-Federal staff years. Overall, the Headquarters staff reduction percentage exceeds the field staff reduction. As you stated, fiscal year 1998 and the years through fiscal year 2002 reflect major proposed decreases in FSA non-Federal staff years. The fiscal year 1998 Budget proposes a reduction of 2,119 staff years for fiscal year 1998, of which 269 are Federal staff years and 1,850 are non-Federal staff years. It should be noted that although non-Federal staffing is being reduced by the programmatic impacts of the 1996 Act, rather than reorganization, the projected fiscal year 1998 Federal work force of 5,877 includes approximately 2,265 employees at the county level performing Agricultural Credit program workload for direct and guaranteed loans. Furthermore, there are an additional 1,463 Federal FTE's at the State office level, including personnel that support farm credit activities as well as CCC activities, that perform program oversight, supervisory, and other support functions. In general then, Federal should be not be construed to mean Headquarters rather than field personnel.

Question. Is this a reflection of action already taken to reduce Federal positions?

Answer. No. Although I indicated earlier that relatively large reductions in Federal employment, especially at Headquarters, have taken place, the proposed reduction of non-Federal employees in 1998 is not an attempt to "catch up" on any ratio. Rather, it simply reflects that earlier years' reductions were driven by reorganization and government-wide streamlining objectives, while the more recent reductions in 1996 and 1997 (and the proposals for 1998) are driven solely by the programmatic impacts of the 1996 Farm Bill, which impacts employment more directly at the service delivery point.

Question. Since you now have buyout authority, why do you anticipate a further Reduction In Force of 1,589 employees?

Answer. The estimate of a further reduction in force of 1,589 employees reflects the assumption that reductions-in-force will make up 75 percent of the total 2,119 separations in the Budget, since the number of employees eligible for buyouts has declined due to the major use of buyouts within the Agency in 1995 and early 1997.

Question. How will that RIF be achieved?

Answer. No specific plans have been approved concerning the RIF. However, we will be formulating options and involving our employee unions soon in order to have approved procedures in place since the funding in the 1998 Budget assumes salary savings begin early in the fiscal year.

Question. How will you determine who has the benefit of the buyout and who will be subject to the RIF?

PART 1

513

Answer. The Farm Service Agency will use buyouts to reduce the number of employees who must be involuntarily separated. However, the number of those eligible has declined substantially due to two earlier buyouts. The Agency will soon be formulating its buyout plan for fiscal year 1998 in concert with RIF procedures. It is anticipated that most employees will be offered the opportunity to apply for a buyout. However, employees in certain job categories may not be selected for buyouts due to the critical nature of their position. Those critical positions will also not be targeted for RIF's.

COUNTY OFFICE WORKLOAD

Question. Will there not be regional differences in FSA county office workload, especially when comparing areas where there is substantial landlord-tenant activity and other areas where there is historically a single owner-operator where there are likely to be fewer program changes over the course of the 1996 Farm Bill?

Answer. Production flexibility contract payment shares on a leased farm may only be designated for years covered by the lease. This is true whether or not the same tenant ultimately remains on the farm. Most leases are annual leases.

Although producers with leases that do not cover the life of the contract can only designate payment shares for the years covered by the lease, they are only required to update other forms or records if there are changes in their farming operations. It is possible that regional differences in the amount of tenant turnover and other changes in farming operations from year to year may ultimately be identifiable. However, since 1996 was the first year of the program, there is insufficient information available at this time to determine regional differences regarding landlord-tenant activity.

Question. Would you please provide information to explain, on a regional basis, what the current and projected workload will be among county FSA offices?

Answer. Tobacco and peanut States would have a constant workload because the 1996 Act did not reduce the workload associated with tobacco or peanuts. In addition, States that have significant numbers of producers who plant fruits or vegetables and are participating in the AMTA Program would have greater activity concerning acre-for-acre fruit and vegetable payment reductions. Other workload, such as workload associated with conservation programs, would only vary by regions if eligibility or qualification for the program is specific to a region or otherwise pertains only to certain regions.

Question. Do your projections for staff reductions exceed the levels recommended by GAO in order to meet the mandates of the 1996 Farm Bill and if so, why?

Answer. No, our projected staff-year reductions approximated GAO's. The basis of the GAO report is that the new farm programs enacted in the 1996 Act will reduce FSA workload. We agree that, generally, this is true. For example, the pre-Farm Bill fiscal year 1997 President's Budget estimates prepared in January 1996 included county workload staffing needs of 13,224 FTE's for fiscal year 1996. Following passage of the 1996 Act in April 1996, FSA performed an internal workload analysis that showed lower staffing needs for 1996, down to an estimated 12,835 county office FTE's. The actual FTE's worked for 1996 were 12,738. FSA's analysis also showed declining workload for fiscal year 1997 and for fiscal year 1998, but stabilizing thereafter. Beyond fiscal year 1998, the Administration believes further workload reductions can be achieved, and, as mentioned, we will be initiating an independent study this year of how such efficiencies might be accomplished.

Question. You suggest the creation of an outside contract to study further streamlining of FSA and NRCS. Where will the funding come from to pay for that study?

Answer. The funding for the study is being negotiated by the Department and the agencies involved in the study.

DEFERRAL OF CRP ENROLLMENTS

Question. The administration has proposed deferring for one year the enrollment of 2 million acres of the CRP in order to achieve savings necessary to resolve an issue regarding the Crown Butte mine in Montana. What effect would this have on the CRP program?

Answer. The proposal, if approved, would defer, for 1 year, the opportunity to enroll 2 million acres in the CRP. This action only serves to postpone the sign-up of a small portion of the projected acreage, not to reduce the size of the program. The Administration's goal of enrolling 36 million acres by the year 2000 will not change.

Question. Is it likely that this action would result in the termination of any CRP acreage enrollment that would otherwise have been re-enrolled in 1997?

PART 1

514

Answer. Assuming 17 million acres are enrolled, at least 1 million acres under contract now would be impacted. The actual impact for acreage under existing contracts could be greater based on the competitive nature of the program.

Question. Because of the flooding experienced now in many parts of the country, would it be possible to defer the 2 million CRP acres and, instead, provide farmers greater participation in fiscal year 1997 through the Flood Risk Reduction Program and still achieve your budget objective?

Answer. Expansion of the Flood Risk Reduction Program (FRRP) in fiscal year 1997 is not considered a viable option because it is anticipated that the program will not be offered until October 1, 1997. The funding source is from the CCC AMTA funding, and there is not a separate appropriation for the FRRP. Participants earn 95 percent of their AMTA payments in one up-front payment. In sum, this concept would not increase producer participation and achieve the Administration's budget objective.

QUESTION SUBMITTED BY SENATOR KOHL

Question. The 1996 FAIR Act included provisions that have made it impossible for farmers to receive any new Federal farm loans, if they had ever had previous loans restructured. In many cases this seems inappropriate, especially when it was the Federal Government itself that was encouraging farmers to restructure their loans during the 1980's. I have been particularly alarmed to learn that some of my constituents in Wisconsin have even been denied disaster loans as a result of the new farm bill provisions. Given these concerns, will you be requesting any changes in these 1996 FAIR Act provisions when the Administration sends its proposed farm bill technical corrections to Congress? When can we expect to see those proposed technical corrections?

Answer. Borrowers who have had FSA loans restructured, but have had no debt forgiveness are not precluded from receiving additional loans. Provisions of the 1996 Act prohibit making direct or guaranteed loans to anyone who has previously received debt forgiveness, except for recipients of debt write down, who are only eligible for annual production loans. The Department supports changes to moderate this unreasonably harsh limitation. The Department will propose legislation to allow recipients of debt forgiveness who have reestablished an acceptable credit record over a period of time to recover eligibility for FSA loans.

FOREIGN AGRICULTURAL SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

MARKET ACCESS PROGRAM

Question. Changes have been made in the Market Access Program (MAP) to make it more targeted and to increase small business participation in the program. Secretary Glickman indicated in his testimony before this Committee that "additional program improvements have recently been made which are designed to broaden participation, clarify program participation criteria, strengthen evaluation and accountability, and simplify program requirements for participants." Can you briefly summarize the changes made and the reasons for those changes.

Answer. Consistent with the Administration's commitment to streamline government programs, new MAP regulations were published on February 1, 1995, that increased flexibility and simplified program requirements for the participants. The MAP regulations reflect public comments and changes made by the Omnibus Budget Reconciliation Act of 1993, and most recently, the Federal Agriculture Improvement and Reform Act of 1996. Specific changes in the MAP include:

- published the evaluation criteria and the corresponding percentage weight factors for allocating funds;
- eliminated the requirement for an applicant to show that the represented U.S. agricultural commodity faces an unfair trade practice in an overseas market;
- give priority assistance in the allocation of brand promotion funding to small businesses and cooperatives;
- established procedures for appealing compliance findings;
- simplified contracting standards and procedures;
- extended the time period during which expense claims may be submitted for reimbursement; and
- liberalized U.S. origin identification requirements to permit the use of generally recognized states or regions within the U.S.

PART 1

515

In addition, the Department has implemented the following improvements administratively to streamline and expedite program management:

- simplified reporting requirements for end-of-year contributions;
- delegated to FAS Commodity Division Directors the authority to approve routine administrative issues;
- eliminated the requirement for formal amendments to effect changes in approved activity plans other than those that are deemed “significant”;
- delegated authority to the State Regional Trade Groups to approve brand company plans valued at no more than \$50,000, thus expediting the approvals for primarily small companies participating in the MAP;
- eliminated the need for all brand companies, 80 percent of which are classified as “small,” to track and report expenditures by multiple cost categories for brand activities;

In response to GAO and the Government Performance and Results Act (GPRA), the MAP regulations were also tightened with regard to funding additionality and evaluation. Participants must certify and demonstrate that any MAP funds received will supplement, but not supplant, any private or third party contributions to the program. With regard to evaluation, FAS allocates funds in a manner that effectively supports the decision-making initiatives of the GPRA. In addition, each participant is required to conduct an annual program evaluation to determine the effectiveness of the participant’s strategy in meeting overall goals. Participants must identify goals to be met within a specified time, a schedule of measurable milestones for gauging success, and plans for achievement of results at regular intervals. The evaluation results are analyzed by FAS and help guide the development and scope of a participant’s program and direct changes in program strategy or design.

CCC FUNDS SHIFT/COOPERATOR PROGRAM

Question. The fiscal year 1998 budget request proposes that the Foreign Agricultural Service (FAS) directly fund two activities currently supported by the Commodity Credit Corporation. These include the Emerging Markets Program and CCC Computer Facility operating costs. To fund these activities, the budget requests an increase in FAS’ appropriation of \$14 million and a reduction of \$5.7 million in funding for the Cooperator Program.

The budget proposes to shift the cost of the Emerging Markets Program and Computer Facility operations from the CCC to FAS so that these two activities would no longer be subject to the annual limitation on CCC reimbursable agreements. How would this limitation be more restrictive than the limitation on discretionary appropriations which might force the FAS to absorb the cost of these activities within its current funding level?

Answer. The 1996 Farm Bill limits reimbursements from CCC to the fiscal 1995 level of \$45.6 million. While both the Emerging Markets Program and support for the CCC Computer Facility were funded in 1995 out of the \$45.6 million base, a number of priority activities, including the costs of technical assistance associated with new CCC-funded conservation programs, were not. As such, competition for limited CCC funds is keen. Shifting funding for Emerging Markets Program and support for the CCC computer facility to discretionary funding provides a larger base from which to fund these activities and/or to identify tradeoffs. This is evidenced by the fact that the 1998 President’s budget requests an increase in FAS discretionary funds to help offset a major portion of these costs.

Question. To partially offset \$5.7 million of the cost of shifting support for these activities from the CCC to FAS, the fiscal year 1998 request proposes increased rent collections from those using FAS Agricultural Trade Offices and an increased cost-share factor for participants in the Foreign Market Development Cooperator Program.

Please explain what rent increases will be imposed on those using FAS Agricultural Trade Offices and how the Cooperator Program cost-share factor will be changed to reduce costs by \$5.7 million.

Answer. In fiscal year 1998, FAS will modify the current policy on rents to begin charging Cooperator’s rent for the space they occupy in Agricultural Trade Offices. This change will create a uniform policy for treatment of rent expenses among all cooperators, including those which are located in commercial space, and is necessary for purposes of implementing the new competitive allocation criteria for the FMD program.

With respect to the cost-share factor, the President’s budget proposes a funding level of \$22 million for FAS’s contribution to the FMD program in 1998. In order to maintain current Cooperator overseas offices, program activities and services, it

PART 1

516

will be necessary for Cooperators to assume responsibility for those costs which will no longer be funded through FAS appropriations.

Question. Fiscal year 1997 funding of \$27.5 million was made available for the Cooperator Program. What is the proposed fiscal year 1998 requested funding level for the Cooperator Program?

Answer. The President's fiscal year 1998 budget includes \$22.0 million for FAS's contribution to the Cooperator Program.

Question. What will be the impact of the proposed fiscal year 1998 funding reduction on participants in the Cooperator Program?

Answer. The 1998 President's budget proposals reflect a policy of shifting a greater share of the costs of the FMD program on the participants who benefit, i.e., the cooperators. The budget assumes increased contributions from cooperators of \$5.5 million in order to maintain overseas FMD activities at current levels.

Question. What is the projected Foreign Market Development Cooperator Program carryover balance from fiscal year 1997 to fiscal year 1998? What is it from fiscal year 1998 to fiscal year 1999?

Answer. Currently, we are forecasting net carryover balances at the end of fiscal year 1997 to total \$10.4 million. Assuming an appropriation of \$22.0 million for fiscal year 1998 and no change in marketing plan levels, currently at \$34.0 million, the net carryover balance would decline to an estimated \$1.3 million by the end of fiscal year 1998.

Question. Please provide for the record a breakdown of how the funds for the Foreign Market Development Cooperator Program were allocated in fiscal years 1996 and 1997.

Answer. I will provide that information for the record.

PUBLIC LAW 480—FISCAL YEAR 1998 REQUEST

Question. The fiscal year 1998 request proposes to maintain funding for Titles II and III of the Public Law 480 program but to reduce funding available for Title I credit sales. Direct credit authority is reduced from the fiscal year 1997 level of \$227 million to \$113 million (reduction of \$114 million); the subsidy appropriation is reduced from \$186 million to \$88 million (reduction of \$98 million); and ocean freight differential costs are reduced from \$14 million to \$10 million (reduction of \$4 million). The budget also proposes to transfer budget and expenditures for the Title I concessional sales program from the international affairs function to the agricultural function. The rationale given for this shift is to allow the Title I program to be managed and budgeted as part of a consistent package of agricultural export programs. Why does the fiscal year 1998 request propose to reduce funding for the Public Law 480 Title I program?

Answer. The reduction in the Public Law 480 Title I program level reflects the Administration's commitment to achieving a balanced budget and the need to reduce discretionary spending.

Question. Is the proposed reduction in funding for Title I of Public Law 480 in fiscal year 1998 in any way related to the transfer of the program from the international affairs function to the agricultural function of the budget?

Answer. No. The proposed reduction in funding for Title I of Public Law 480 in fiscal year 1998 is not related to the transfer of the program to the agricultural function of the budget. In fact, the transfer should help us support funding for the program in future years.

Question. Are you requesting that this Committee take any action with respect to the function reclassification of the Public Law 480 Title I program or are you simply notifying the Committee in the budget materials of this change?

Answer. We are not requesting that the Committee take any action. The President's budget has already transferred the Title I credit account to the agriculture function.

PROPOSED FISCAL YEAR 1997 PUBLIC LAW 480 TITLE I RESCISSION

Question. The Administration proposes a \$50 million total reduction in fiscal year 1997 appropriations for Public Law 480 Title I (a \$3.5 million rescission of title I ocean freight differential funds and a rescission of \$46.5 million in subsidy budget authority in the direct credit program). The budget indicates that commodity shipments would be reduced by approximately 200,000 metric tons as a result of this proposed rescission. However, it also indicates that allocations of Title I commodity assistance that have already been announced for fiscal year 1997 would not be affected by the proposed rescission because the reduction in program funding will be taken from a reserve of unallocated funds and from unobligated funds carried over from fiscal year 1996. Isn't it common that there would be a reserve of unallocated funds at this point for fiscal year 1997, i.e., that it has been the practice not to allocate all the funds but to reserve an amount for emergencies that may arise later in the fiscal year?

Answer. Yes. Our practice in the past has been to maintain a reserve in Title I in order to meet unanticipated food aid needs. However, upon enactment of the rescission, just over \$7 million will remain in the ocean freight differential account for fiscal year 1997 and these funds are likely to be used due to increasing costs of meeting cargo preference requirements.

Question. Please indicate for the record the number, amount, and timing of Title I funding allocations which have been made in each of the last five fiscal years.

Answer. I will be glad to provide that information for the record.

Question. Why weren't Public Law 480 Title I funds carried over from fiscal year 1996 included in the initial funding allocation for fiscal year 1997?

Answer. The funds carried over from fiscal year 1996 were not included in our initial funding allocations for fiscal year 1997 because, while the funds apportioned by OMB included an estimate of carryover funds, the actual carryover balances were not known until late November or December. We did not want to announce Title I programming funded from carryover balances until we knew the actual balances carried over from fiscal year 1996.

Question. Please provide for the record the amount of Title I funds carried over in each of the past five fiscal years and indicate when those carryover balances were allocated.

Answer. Funds carried into subsequent years from fiscal years 1992 through 1994 were \$4.4 million, \$4.7 million, and \$16.9 million, respectively. In fiscal year 1995, \$28.0 million was used to reimburse CCC for wheat released from the Food Security Wheat Reserve and \$24.7 million was carried forward into fiscal year 1996. The amount of appropriation carried from fiscal year 1996 into fiscal year 1997 totaled \$32.9 million. The \$32.9 million will be used in fiscal year 1997 to fund a portion of the proposed \$50 million Public Law 480 Title I rescission.

EXPANSION OF OVERSEAS OFFICES

Question. Funding of \$1.5 million was made available for fiscal year 1997 to enable the FAS to expand overseas offices. Priority was to be given to posts serving expanding markets in Asia and Latin America. Where have offices been established with the additional funds provided?

PART 1

522

Answer. In fiscal year 1997, FAS has opened Agricultural Trade Offices in Jakarta and Miami (for the Caribbean Basin), and the opening of the Moscow ATO is scheduled for late summer 1997. In addition, an FAS office has been established in Hanoi, and FAS will open an office in Nuevo Laredo, Mexico in the summer of 1997. The agency is adding an American officer position in Geneva at the WTO and adding one officer slot at the ATO's in both Seoul and Tokyo, all of which will take place this summer.

In conjunction with this increased American officer presence, FAS will have increased foreign national contract employee staffing at the following 15 offices in the course of fiscal year 1997.

Brussels, Belgium-U.S. Mission to the E.U.	Manila, Philippines
Caribbean Basin ATO (Miami)	Nuevo Laredo, Mexico
Guangzhou, China ATO	Sao Paulo, Brazil
Hanoi, Vietnam	Seoul, Korea
Jakarta, Indonesia ATO	Shanghai, China ATO
Kuala Lumpur, Malaysia	St. Petersburg, Russia
Lagos, Nigeria	Taipei, Taiwan
	Tokyo, Japan ATO

FAS is presently conducting its annual review of overseas resources. FAS will continue to adjust staffing to take advantage of medium- and long-term opportunities for U.S. agriculture.

Question. Please provide for the record a list of FAS' counselor/attache, and trade offices overseas and the amount of funding and full-time equivalent staffing levels provided for each in each of fiscal years 1990 through 1996, and estimated for fiscal years 1997 and 1998.

Answer. I will provide a list of FAS' counselor/attache, and trade offices for the record.

PROPOSED APPROPRIATIONS BILL LANGUAGE

Question. The fiscal year 1998 budget proposes new appropriations bill language to provide up to a \$3 million advance appropriation to fund overseas wage and price increases, subject to documentation by USDA of actual overseas inflation and deflation. How has the FAS managed the impact of overseas inflation and exchange rate variations in past years?

Answer. In previous budgets, requests for adjustments for anticipated overseas wage and price increases and exchange rate fluctuations were included as part of the President's budget. However, it is virtually impossible to accurately forecast these costs given the long lead time associated with the budget process. In some years, amounts were included for increases that did not subsequently occur at the levels estimated and conversely, budgets were presented that did not include sufficient funding to maintain current services overseas.

Question. Why is the agency now seeking authority to use up to \$3 million in 1999 to compensate for any net 1998 overseas inflation?

Answer. The proposed advance appropriation will eliminate the significant budgetary uncertainties associated with attempting to accurately forecast wage and price increases as well as currency fluctuations 18 to 24 months in advance. Upon demonstration as to the extent that the U.S. exchange rate fell relative to other currencies overall in fiscal year 1998, OMB will make available some or all of the fiscal year 1999 advance appropriation. In addition, having the fiscal year 1998 appropriation available for obligation for two fiscal years will allow for the subsequent use of an unobligated balances that remain where the U.S. exchange rate rises relative to other currencies.

Question. What FAS activities would be impacted by reserving this \$3 million to possibly be spent in fiscal year 1999?

Answer. The proposed fiscal year 1999 advance appropriation would cover increases in overseas operations costs due to unavoidable wage and price increases and/or currency fluctuations in fiscal year 1998. By having these funds appropriated in advance, no FAS activities would be impacted should our overseas offices experience higher operating costs due to these macro-economic factors. In fact this proposal would eliminate the potential that FAS currently faces of having to reduce FAS export expansion efforts in the current fiscal year to offset unanticipated and unavoidable overseas cost increases.

Question. How would the agency notify this Committee that it had documented actual overseas inflation and deflation?

Answer. Using publicly available exchange rates and other factors, FAS will construct a weighted index that indicates the loss of buying power the agency faces overseas. Needed funds out of the \$3 million advance appropriation will be used to compensate for the change. The Committee would be informed ahead of time before any action is taken, as well as given an opportunity to comment on the exchange rate index.

MARKET ACCESS BARRIER IDENTIFICATION

Question. The fiscal year 1998 request includes an increase of \$500,000 for a Market Barrier Identification initiative. Under this initiative, FAS would implement a systematic process to review, identify, and catalog technical barriers to trade and other technical requirements that limit export opportunities for U.S. agricultural products in the top 30 U.S. export markets.

For fiscal year 1998, FAS is seeking \$500,000 for a Market Barrier Identification initiative. The explanatory notes indicate that this initiative will lead to recommendations for overcoming the identified barriers to expand U.S. agricultural exports. Why is the development of a catalog necessary to do this? How do you identify and overcome these barriers now?

Answer. The term catalog in this situation implies a much broader meaning—not simply short descriptions of identified trade problems in a country. The initiative's

PART 1

531

goal is to more systematically and comprehensively identify technical barriers all the way from very minor barriers up through the obvious major issues. Many barriers are minor irritants which are sporadic and in fact overcome by commerce without major fuss. Other barriers are critical blockages which effectively stop trade. The initiative envisions a broad-base engagement to better facilitate private trade's and government's ability to identify and navigate around these hurdles and eliminate the unjustified ones. The end result will provide U.S. exporters with more systematic, comprehensive, timely and definitive solutions for their export interests on the one side, and will help facilitate resolution of outstanding barriers on the other.

Question. Doesn't this annual report identify barriers to the expansion of U.S. agricultural exports? Why does the USDA need to do a separate catalog?

Answer. This initiative does not represent a duplicate listing of barriers on an annual basis. It serves both daily market servicing and outreach as well as strategic issue resolution.

Question. Who are the intended users of this proposed catalog?

Answer. U.S. agricultural product exporting firms are targeted as the primary beneficiaries of this initiative.

Question. Please provide a detailed justification of the \$500,000 requested for this initiative.

Answer. A major gain in the Uruguay Round was agreement to include disciplines on technical barriers to trade. Elaboration of the specific disciplines in both the Agreement on Technical Barriers to Trade and the Agreement on the Application of Sanitary and Phytosanitary Measures is continuing, especially with regard to harmonization, equivalency and consistency. Clearly a starting point for a meaningful discussion of all these is knowing how transparent or non-transparent a market is. This initiative takes a more comprehensive, detailed approach to transparency issues with respect to U.S. agricultural export interests in the top 30 U.S. markets. Transparency is to know in advance what will be expected if I want to export x product to y country. This information is not always readily available. This initiative is in line with the objectives of improved government services, more systematic servicing and outreach to current and potential U.S. agricultural exporters.

COCHRAN FELLOWSHIP PROGRAM

Question. Please provide a breakdown by country and funding source of the fiscal year 1996 and estimated fiscal year 1997 Cochran Fellowship participant levels.

Answer. In fiscal year 1996, a total of 676 participants from 44 countries received training under the Cochran Fellowship Program. Of the total, 287 participants (39 percent of the total) were funded by appropriations, 207 participants (31 percent of total) were funded by USDA's Emerging Markets Office (EMO), and 182 participants (27 percent of the total) were funded by the U.S. Agency for International Development (USAID) under the Freedom Support Act. Appropriations were used in 29 countries of Asia, Latin America, Africa, and Eastern Europe. EMO funds were used in Eastern Europe (excluding Turkey), South Africa and Namibia, and Russia, Ukraine and Kazakhstan. Freedom Support Act funding was used in the 12 New Independent States.

The following provides the fiscal year 1996 participant levels by region and by country:

- Asia: 102 participants from seven countries: Korea (16 participants), Malaysia (8), China (24), Thailand (17), Indonesia (10), Philippines (25), and Vietnam (2)
- Eastern Europe: 171 participants from 13 countries: Turkey (12), Poland (34), Hungary (13), Czech Republic (10), Slovakia (15), Albania (7), Bulgaria (22), Slovenia (16), Croatia (8), Latvia (10), Estonia (10), Lithuania (6), and Romania (8).
- Latin America: 85 participants from seven North, Central, and South American countries: Mexico (32), Venezuela (9), Trinidad & Tobago (8), Barbados & Other West Indies (2), Panama (9), Colombia (19), and Chile (6).
- Africa: 47 participants from five African countries: Cote d' Ivoire (2), Algeria (6), Tunisia (14), South Africa (22), and Namibia (3).
- New Independent States: 271 participants from the New Independent States of the Former Soviet Union: Russia (121), Ukraine (43), Belarus (13), Kazakhstan (23), Kyrgyzstan (7), Uzbekistan (8), Turkmenistan (6), Tajikistan (9), Armenia (18), Moldova (12), Georgia (5), and Azerbaijan (6).

In fiscal year 1997, the Cochran Fellowship Program will work in the above mentioned countries except Belarus and possibly Albania. In addition, pilot programs will be started in Brazil, Kenya, and Bosnia. The program in Vietnam will be expanded using EMO funding. We expect to provide training to more than 700 participants in fiscal year 1997.

PART 1

532

Question. Also, please provide examples of achievements, by country, the Program has documented in 1996.

Answer. The Cochran Fellowship Program provides an effective method of providing U.S.-based training for international agriculturists and business persons. The program is a tool for expanding U.S. contacts within the country, addressing important policy and trade-related issues, and in promoting contact with the U.S. agribusiness sector. The following provide examples of the success of the 1996 program.

Vietnam.—The Cochran Fellowship Program was initiated in Vietnam in 1996. The Agricultural Attache in Hanoi states: "FAS/Hanoi is extremely pleased with the development of the Cochran Fellowship Program in Vietnam. The program has served to expand our contacts and increase our knowledge and understanding of the agricultural sector. The implementation phase of the program will help develop the linkages necessary to expand the market for U.S. agricultural products here in Vietnam."

Korea.—The FAS Agricultural Office in Seoul reports that Cochran Programs in food safety have helped improve mutual understanding of food safety and technical issues: "The end result has been fewer misunderstandings, relatively fewer problems, and improved access for U.S. agricultural products. This has been especially true for high-valued U.S. agricultural products, an area that is the fastest growing and approaching \$1 billion annually."

Korea.—The Oregon Department of Agriculture reports that Korea has approved the Oregon Export Service Center as the foreign testing center for pre-clearance of U.S. products going to Korea. "We are the first organization that Korea has ever considered to certify as a foreign testing organization. This is a milestone for us and the Cochran Program helped us a great deal in achieving this goal." Twenty-two (22) Cochran-sponsored officials from the Korean Ministry of Health & Social Welfare and Food & Drug Administration have visited the Oregon Export Service Center over the past three years.

China.—The FAS Agricultural Trade Office in Guangzhou, China reports that a 1995 Seafood Team "produced excellent contacts with an enormous industry with which the U.S. had limited previous contacts. At a quantified minimum, hundreds of thousands—possibly millions—of dollars worth of trade has resulted directly from that one team."

Malaysia.—A Senior Advisor from the Prime Minister's Office in Malaysia reports that as a result of his Cochran Halal Bilateral Education Program he is forming a Halal Coordination Council for Malaysia (HCCM) in Chicago. Once established HCCM would be able to approve U.S. Halal slaughter facilities without Malaysian authorities having to physically inspect the facilities. They are working to have HCCM be recognized by other Muslim countries such as Saudi Arabia. This could greatly facilitate poultry and other livestock exports to Muslim countries.

Thailand.—The Thai Tanners Association identified their participation in Cochran Programs several years ago as the major reason Thai importers of hides and skins switched to U.S. suppliers. Exports of U.S. hides and skins to Thailand have shown tremendous gains over the past five years.

Mexico.—Over the past six months, the Cochran Program in conjunction with FAS Export Credits, CoBank in Denver, and the National Cattle Breeders Association has provided training to Mexican bankers on the GSM-103 livestock program for Mexico. Since the initial training, five sales of U.S. livestock have been registered with USDA for about \$2.2 million and at least two other sales of \$3 and \$4 million respectively are being negotiated.

Colombia.—Two Colombian alumni who trained in the U.S. in 1992 and 1993 report purchases of more than 1,500 breeding sows. Colombian food retailers reported purchases of popcorn (\$500,000), cookies (\$250,000), and dried beans after their Cochran program.

Venezuela.—FAS Caracas reports that a Venezuelan cattleman learned how to perform embryo transplants and has already purchased U.S. Brahman embryos and equipment used in embryo transplants. In another example, two Venezuelan Ministry of Agriculture officials learned how commodity boards of trade operate. This training will assist in establishing a commodity board of trade in Venezuela, which will strengthen market-oriented policies and promote trade.

Panama.—A 1995 Cochran participant developed a new store layout, better displays and advertising, and a more consumer-oriented attitude after his supermarket training. This has led to a faster turnover of products, which includes new purchases of deli meat, hams, fresh produce, and cheeses from the United States.

Poland.—Poland required imported oak logs to be debarked prior to shipping because they were concerned about pests in the bark. Debarked logs, however, often became damaged during shipment and thus became unsuitable for use in veneer. The Polish General Director for Plant Quarantine observed U.S. fumigation methods

PART 1

533

and was convinced that with-bark-on logs from the U.S. were not a threat if the logs were properly fumigated. The regulations to allow with-bark-on logs became effective in February 1996.

Regional East Europe.—The FAS Agricultural Attache in Vienna states that “the Cochran Program is one of the most beneficial tools available in promoting goodwill, building contacts, and promoting trade opportunities in the region.”

Slovenia.—The FAS Agricultural Attache in Vienna reports that a joint 1996 Cochran/American Soybean Association training activity on the use of soybean meal in livestock feed has resulted in sales of 25,000 metric tons of U.S. corn and 5,000 metric tons of U.S. soybean meal valued at about \$7 million.

Turkey.—A Turkish participant reported that his company is concluding a long-term contract with a Californian supplier of sauces, mustard, mayonnaise, and sweet corn after attending the FMI/NASDA Food Showcase. He stated: “I believe this program to be of utmost importance in promoting U.S. products for the simple reason that we had no intention of importing U.S. products until we came under the program.”

Albania.—The FAS Agricultural Office covering Albania reports that Cochran seed certification training has helped convince Albanian import authorities of the quality of U.S. certified seed: “Despite very tight Albanian import requirements, the (first shipment of U.S. certified) seeds had no problem with entry or registration.”

Uzbekistan.—A 1995 Cochran fellow from Uzbekistan started a small food store in a joint venture with a U.S. company. He imported \$130,000 worth of U.S. consumer products in 1996. The participant will pay his own way to the 1997 Food Marketing Institute (FMI) Food Expo in Chicago in order to become familiar with additional U.S. consumer ready foods.

Russia.—A businessman from the Russian Far East attended the Produce Marketing Association meeting in San Diego and purchased, on a trial basis, more than \$220,000 worth of U.S. apples, pears, and other fruits. If successful in the trial market, the participant promises to import that much per month. Another businessman from the Russian Far East is importing 1,200 metric tons per month of flour from a Seattle flour company he visited during his 1995 Cochran program.

Cote d’Ivoire.—The Agricultural Attache in Cote d’Ivoire reports that Cochran alumni have already imported or plan to import \$20 million of brown rice under Public Law 480 Title I and about \$30 million on commercial terms. A banker, who was part of a Cochran GSM-103 Agricultural Export Credit Team, reports that his bank facilitated the financing for the above purchases, and is working on financing 6,000 metric tons of U.S. soy oil.

EXPORT SUBSIDY PROGRAMS

Question. Please provide the total amount of bonus awards to U.S. exporters under the Export Enhancement Program, the Dairy Export Incentive Program, and the Sunflower and Cottonseed Oil Assistance Programs in each of fiscal years 1995 and 1996 and estimated for fiscal year 1997.

Answer. I will be glad to provide that information for the record.
[The information follows:]

EXPORT ENHANCEMENT PROGRAM—AWARDS FOR FISCAL YEARS

Commodity	Quantity (MT)	Mean bonus
Fiscal year 1995:		
Barley malt	112,700	\$3,740,640.00
Barley or malting barley	75,000	1,963,750.00
Eggs	1 63,781,720	13,178,873.47
Feed grains	396,208	11,483,323.04
Frozen pork	21,030	12,704,714.00
Frozen poultry	40,243	20,823,145.00
Rice	112,747	5,047,393.00
Wheat	13,906,704	243,133,273.97
Wheat Flour	309,799	27,409,110.48
Total		339,484,222.96
Fiscal year 1996: Frozen poultry		
	11,125	5,152,850.00
Total		5,152,850.00

Country	Quantity/awarded (MT)	Estimated ¹ bonus awarded	Actual ² bonus paid
Fiscal year 1996: There were no awards for fiscal year 1996.			
Fiscal year 1997: There are no awards for fiscal year 1997.			

¹ During fiscal years 1989–1991, the bonus was paid in physical stocks of oil. For these years, the Estimated Bonus Awarded represents the estimate of the cost of the bonus oil on the date of the Agreement. For later years, this column shows the bonus on the quantity awarded exclusive of shipment tolerances.

² The Actual Bonus Paid reflects the cost of the bonus oil purchased in fiscal years 1989–1991. In later years it reflects bonus payments on the quantity exported, inclusive of tolerances.

QUESTIONS SUBMITTED BY SENATOR BURNS

FOREIGN AGRICULTURAL SERVICE

Question. It is my understanding that your agency does not approve of the line item budget for the Foreign Market Development account. It has been stated that you are not able to place more funds into the account than what is the line item of appropriations, basically that you can not put more money in than what is legal. Yet your agency has never put any more money in the account in the past, why should this Senator and the cooperators believe you would deposit more money in the account now?

Answer. It has been FAS policy to provide the maximum level of support possible to the Foreign Market Development Cooperator Program. In six of the past ten fiscal years, FAS has provided additional funding for the program beyond the baseline level for that particular year and we have every intention of continuing this policy.

Question. FAS intends to assist American agriculture to increase the value of farm, food, fish, and forestry exports by 50 percent over 1994 levels by the year 2000. To meet this goal, FAS will conduct a “demand-driven export strategy, deploying five major policy objectives to execute the strategy while integrating commodity and country market priorities for allocating scarce export assistance resources.” How does strategic outreach and market intelligence fulfill the strategy of doing more with less? In other words, why invest in efforts to increase domestic awareness of export opportunities/global consumer quality and safety expectations, as well as educating foreign buyers about the merits of U.S. products and how they may be purchased, when the private-sector is already doing these things without additional federal expenditure?

Answer. Dunn and Bradstreet reports there are approximately 150,000 companies in the United States producing, manufacturing, packing or marketing agricultural products, yet fewer than 10,000 are actually engaged in exporting. With sales to the export market growing at three times the rate of the domestic market it is very important that U.S. companies be alerted to overseas opportunities and the potential for profit. Increased exports create jobs in both urban and rural communities, provide a safety net for farm income, and contribute positively to the balance of trade. It is clearly in the best interest of the national economy that the Government engage in increasing domestic awareness of global market opportunities, consumer quality and safety expectations, and educate foreign buyers about the merits of U.S. products. The USDA using its extensive communication network and relationships with universities, export assistance centers and, in particular, the State Departments of Agriculture is effectively conveying the message to small, medium and new-to-export companies and cooperatives alike that real export opportunities exist, and that USDA can be a full partner to the private sector in expanding sales, developing new markets and promoting new products. Frequently, companies are reluctant to attempt the export market because of the greater risks and higher demands for new market information and country specific knowledge. These barriers reduce possible exports without Federal encouragement and support. The private sector is neither organized nor equipped to conduct the type of information campaign needed to be effective in reaching such a diverse and wide-spread target audience.

Question. Consistent with the implementation of the Government Performance and Results Act (GPRA), FAS has articulated a “General Goal No. 2: Increase Foreign Demand for U.S. Agricultural, Fish, and Forest Product Exports through Market Development and Promotion Activities.” Aside from the obvious question of why this is not the agency’s number 1 goal, why does FAS propose to cut FAS foreign

PART 1

536

market development activities, particularly from Foreign Market Development Co-operator Program to fund the CCC Computer Facility?

Answer. The 1996 FAIR Act includes provisions that limit CCC funding made available each year to other agencies through reimbursable agreements. Because of this limitation and the nature of the activities involved, the budget proposes to shift the annual operating costs of the CCC Computer Facility and related IRM activities as well as the Emerging Markets Program, with a combined fiscal year 1998 budget of \$19.7 million, from mandatory funding to discretionary funding in the FAS annual appropriation. FAS, currently uses about half of the total section 11 cap, which is needed to fund other CCC activities, activities more relevant to the CCC mission in NRCS and FSA. However, the President's commitment to achieving a balanced budget by 2002 has also placed constraints on discretionary spending and, as a result, the FAS budget includes an increase of \$14.0 million for these activities, with \$5.7 million balance to be absorbed through reductions in FAS market development activities. This was not a decision that was made lightly. However, this reduction can be ameliorated by increased cost-sharing by participants in the Foreign Market Development Program.

Question. FAS proposes an increase of \$500,000 to implement a systematic process to review, identify, and catalog technical barriers to trade and other technical requirements that limit export opportunities for U.S. agricultural products in the top 30 U.S. export markets. Presumably, the private-sector representatives faced with these barriers to trade are better able to identify the problem and propose solutions to these market access problems. Why devote the time and effort at this time to the compilation of a catalog of barriers to trade?

Answer. FAS receives daily numerous questions regarding various types of market access issues. These range from persons wanting to start-up in the export market to current high-volume exporters with a newly identified (minor or major) barrier. Servicing these questions in a systematic and consistent manner will remain an ongoing challenge. Providing FAS and its key export development partners with improved tools is a key function of this initiative. It will serve both daily market servicing and outreach as well as strategic issue resolution.

A major gain in the Uruguay Round was agreement to include disciplines on technical barriers to trade. Elaboration of the specific disciplines in both the Agreement on Technical Barriers to Trade and the Agreement on the Application of Sanitary and Phytosanitary Measures is continuing, especially with regard to harmonization, equivalency and consistency. Clearly a starting point for a meaningful discussion of all these is knowing how transparent or non-transparent a market is. This initiative will take a more comprehensive, detailed approach to transparency issues with respect to U.S. agricultural export interests in the top 30 U.S. markets.

Transparency is to know in advance what will be expected if I want to export x product to y country. This information is not always readily available. This initiative is in line with the objectives of improved government services and more systematic servicing and outreach to current and potential U.S. agricultural exporters.

Question. In fiscal year 1996, FAS located staff with the California, Colorado, and Oregon State Departments of Agriculture and the Iowa State Office of USDA's Farm Service Agency. How has the expenditure for these domestically located FAS personnel resulted in increased exports? Can you quantify this?

Answer. Increased agricultural exports are generated by established exporters and new-to-export companies and cooperatives. USDA is engaged in a massive domestic awareness campaign highlighting export opportunities, and the supportive nature of USDA export assistance programs. USDA established the four domestic offices for FAS personnel to be closer to provide first hand export counseling. This counseling and use of USDA export assistance programs has gotten some companies to take the first step. The resultant sales represent tangible evidence of USDA's commitment to expanding the number of exporting companies and can be linked to the efforts of our domestic offices in partnership with State Departments of Agriculture.

Question. How does "Outreach" to small, medium and new-to-export businesses help U.S. farmers? Is this function better provided by the Commerce Department?

Answer. Targeting small, medium and new-to-export companies in addition to cooperatives has led to a higher rate of export participation among these groups. USDA continues to expand its distribution of knowledge and information on export opportunities and export markets to a wide range of target groups and trade-assistance organizations. USDA is clearly best suited to assist established exporters and new-to-export companies in gaining entry to new markets and successfully selling new products because of an extensive agricultural attache network system overseas, the largest export information network in the world, and corresponding export programs and services designed specifically for agricultural companies and cooperatives. The expertise of the Department of Commerce, and focus of their export as-

PART 1

537

sistance and information network is strictly non-agricultural. In addition, USDA's partners with the Department of Commerce to provide a seamless delivery system to companies seeking to export such non-agricultural, yet related, products as fertilizer, pesticides or agricultural equipment. The USDA has in place solid industry partnerships, and a efficient and effective delivery system to serve agricultural companies wishing to export overseas which is second to none.

Question. How much did the 48 outreach events cost per the approximately 2,100 participants?

Answer. As part of the 1996 USDA Global Attache Conference, FAS in partnership with FSA and the State Departments of Agriculture held 48 outreach events in 46 States plus Puerto Rico. Approximately 2,100 people attended, but thousands more were indirect participants contacted via extensive local television, radio and newspaper and magazine articles. The cost of the participating attaches at each of the events was minimized by arranging for many to simply stop at a selected state on the way to the conference or returning to their foreign post. The events, while organized and publicized by State Department of Agriculture officials, offered opportunities for local news coverage touting the success of a community business or highlighting the potential impact of exports on local transportation, manufacturing or financial services. The overall cost for attache participation which would include any additional air fare, per diem, and related expenses was under \$100,000, but the extent of contact, that is the inclusion of indirect participants, far exceeds the impression provided by the 2,100 estimate and must be factored in accordingly.

Question. The FAS budget request reads as follows: "With the privatization of many markets and the more disciplined use of export subsidies in the post Uruguay Round environment, the value of the more traditional marketing effort of the FMD (Foreign Market Development Cooperator Program) will take on an increasingly important role in the U.S. Long Term Agricultural Trade Strategy (LATS). While the nature of these mid-to long-term marketing programs tends to make measuring the overall success of the program difficult, it is quite clear that the FMD will play a key role in implementing the LATS and reaching the Department's Export Goal 2000. The FMD has already contributed to this effort, with the value of U.S. exports of bulk commodities (wheat, course grains, rice, soybeans, cotton, tobacco, pulses, peanuts, and others) having increased from \$18 billion to \$26 billion in the years 1991-1996." Why are you cutting the budget for this program from \$27.5 million to \$22 million?

Answer. The decision to propose reduced funding for the FMD was not easy to make but simply reflects the fiscal realities we all face as we move toward the objective of a balanced budget by the year 2002. The constraints on both the mandatory and discretionary accounts required a number of difficult choices to be made, including the proposal to reduce funding for the FMD program as well as other market development activities. The impact of the reduced level of federal contribution can be offset by higher contribution levels from program participants.

Question. Under the heading Research and Scientific Activities, FAS noted that it recruited a California confectionery company to form a joint venture with an Irish counterpart using economic growth and job creation as a "common ground upon which lasting peace can be built." Further, it noted that "discussions are still underway with a recruited Fortune 500 agricultural company to form a similar relationship in Ireland." What did this cost and how did/will U.S. farmers benefit from this activity?

Answer. FAS costs were minimal in this effort, consisting only of a small portion of one staff person's time, to help develop a list of American food companies and agricultural cooperatives that were interested in exploring investment opportunities in Ireland. This included preparations for the White House Conference on Trade and Investment with Ireland. While the joint venture of the California and Irish confectionery companies was promising, they have since terminated their partnership due to a lack of agreement on whether the U.S. company would be a partner or a customer for distribution of product. No sales of U.S. agricultural products resulted from the partnership.

With regard to the Fortune 500 agricultural companies recruitment efforts, no partnership has resulted.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

VALUE-ADDED V. BULK COMMODITY

Question. Shouldn't the higher levels for value-added products help offset the lower levels for rough grains?

PART 1

538

Answer. Yes. For fiscal year 1997, USDA is expecting overall U.S. agricultural exports will decline to \$56.5 billion, down roughly \$3.5 billion from the record level set in 1996. This overall expected decline is entirely attributable to lower bulk commodity exports, led by wheat and coarse grain exports which are forecast to fall by a combined \$5.4 billion. Partially offsetting this bulk commodity decline, U.S. exports of value-added (or high-value) agricultural exports are projected to rise \$2.5 billion to a new record high of \$33 billion.

While 1997 is expected to be a disappointing year for wheat and coarse grains, the longer term prospects for these and other bulk commodities are decidedly more bullish. By the year 2002, USDA baseline estimates project the volume of U.S. wheat exports will rise by 47 percent from 1997 levels and coarse grains will rise by 35 percent. With high-value exports expected to grow by 27 percent during the same period, this means U.S. agricultural exports will be advancing along a broad front as we enter the 21st century with total farm product exports approaching \$70 billion by 2002.

Question. What are the ratios for these categories of exports?

Answer. In fiscal 1997, U.S. exports of bulk commodities are forecast to total \$23.5 billion, representing 41.5 percent of total agricultural exports. High-value products are forecast to reach \$33 billion, accounting for the 58.5 percent of total exports.

Question. How much has each category increased or decreased from the previous year?

Answer. Bulk commodities' share of total U.S. agricultural exports has declined, from 48 percent in 1996 to 41.5 percent projected for 1997. Conversely, high value products' share of the total has increased from 52 percent in 1996 to a projected 58.5 percent in 1997. These developments are part of a longer term trend that has seen bulk commodities' share of total U.S. agricultural exports fall from 70 percent in 1980 to the current estimate of 41.5 percent, while high-value products have gone from 30 percent in 1980 to almost 58.5 percent projected for 1997. By 2002, USDA projects high-value products will account for 60 percent of total agricultural exports.

FOOD SAFETY OF IMPORTS AS A TRADE ISSUE

Question. Because we are entering a global food market, what can be done to prevent problems like we have seen last week with the case of tainted strawberries from Mexico?

Answer. FAS is very actively engaged in the international processes fostering trade in agricultural and food products. FAS focuses attention on rules, procedures and guidelines to expand U.S. agricultural exports, but we are also keenly aware these same rules must apply to U.S. imports. The experience with strawberries again reminds us that no process is perfect. Within its mission goal as a trade agency, FAS has taken on this and other similar food safety issues (such as E. coli in apple juice to Japan): within hours FAS responded definitively to foreign countries' concerns that U.S. shipped product may have included unsafe lots of specific products. FAS will continue to work with other regulatory agencies to provide foreign partners these types of timely, valuable information. FAS also continues to work within established U.S. inter-agency processes to further international standardization for food safety concern.

IMPORTANCE OF EXPORTS TO U.S. AGRICULTURE

Question. Is the fact that the agricultural sector is twice as dependent on exports (and projected to be 2.5 times as dependent by the year 2000) than other sectors of our economy a good sign or a bad sign?

Answer. We feel this is a good sign as it reflects the growing competitiveness of the U.S. agricultural sector in the global market place. Furthermore, the expansion of U.S. agricultural trade results in increased employment for U.S. citizens and increased profits for U.S. companies. It also allows U.S. companies to realize significant economies of scale, which can lower prices for U.S. consumers. Without the positive stimulus of an expanding export market, many U.S. agricultural industries would be forced to contract significantly. Exports represent the future of American agriculture. This is why USDA is so keenly interested in opening foreign markets and using its export programs to counter the efforts of competitor governments who use their own well funded programs to give their producers an advantage in the global battle for market share. In the wake of the FAIR Act, increasing export opportunities is one of USDA's highest priorities since export expansion has become a key component of the safety net for our producers.

Question. Does this mean that agriculture is more vulnerable to the often disruptive nature of foreign markets and foreign governments' trade policies?

PART 1

539

Answer. There is no denying that as our producers become more fully integrated in the global food market, the possibility of facing disruptions rises. This is an inherent risk with doing business internationally. However, USDA is doing everything in its power to ensure that disruptive actions are minimized. For example, the USDA puts a premium not only on opening foreign markets but ensuring there is no backsliding on prior commitments by our trade partners. We see the biggest threat coming from sanitary and phytosanitary (SPS) barriers where governments in the past have resorted to unsound science to justify restricting other countries' access to their markets. For that reason, we have increased the level of our resources devoted to monitoring other countries actions in this area and, if problems arise, we will do whatever is necessary to negotiate a solution that protects our industry's interests as we did when U.S. poultry exports to Russia were halted.

CLARIFICATION OF AQUACULTURE V. SEAFOOD

Question. You indicated the \$2.9 billion sales in edible fish and seafood was in addition to "agricultural" exports. Why are they not considered part of "agricultural" exports?

Answer. Traditionally, exports of products such as seafood and solid wood products were handled by the Department of Commerce and, therefore, have not been included as "agricultural" exports. In terms of FAS programs, Congress has defined fishery products as agricultural products. Now that we are actively working to open and develop markets for fishery products, we will explore incorporating fishery products trade in the agricultural statistics.

Question. Why did the edible fish and seafood exports fall from the 95 level?

Answer. The value of exports fell primarily because of lower prices for salmon and crab. Large increases in farmed salmon production in Norway and Chile have depressed world salmon prices in general and increased competition, weakening prices to our number one market, Japan.

Question. What was the balance of trade in edible fish and seafood for that year?

Answer. We imported \$6.6 billion of seafood products in 1996 resulting in a trade deficit of \$3.7 billion. Shrimp accounted for 37 percent of these imports.

Question. How is the domestic demand for these products affecting our export and import activities?

Answer. Many of our exports consist of products where our supply exceeds U.S. demand (e.g., monkfish, squid, dogfish, frozen salmon) and include products such as sockeye salmon and monkfish livers which are exported for top dollar. Primarily we import products that are not readily available in the U.S. (i.e., shrimp, year-round fresh salmon, swordfish, etc.)

DEVELOPING MARKETS FOR PORK

Question. What will be the short and long term effect of the Taiwan pork health problems for US exports and US producers of pork and other agricultural commodities?

Answer. The immediate effect of the foot-and-mouth disease (FMD) outbreak in Taiwan has been an increase in orders from Japan for U.S. fresh/chilled pork. The sharpest impact is expected to occur beginning in July, when Japan's stocks of frozen pork are drawn down, and Japan's gate price (minimum import price) for pork is reduced. Total U.S. pork exports for 1997 are now forecast to increase by 44 percent over 1996. This represent an increase of 23 percent over pre-FMD estimates.

Taiwan is expected to remain out of the pork exporting business for 3 to 5 years, and will find it difficult to reestablish its dominant position in the Japanese market. This absence will provide U.S. exporters the opportunity to improve their trade contacts within the Japanese industry and make permanent gains in market share.

U.S. pork producers are likely to see improved prices this year. Increased domestic demand for corn and soybeans will likely offset any reduction in demand from Taiwan.

The outbreak of foot-and-mouth disease among Taiwan's swine population now affects 3,255 of Taiwan's estimated 25,000 hog farms. Taiwanese government policy requires the destruction of all hogs on infected farms, a number that now totals over 2.7 million head. Estimates for the recovery of Taiwan's pork industry range from 3 to 5 years.

The ban on exports of Taiwanese pork has left a substantial gap in Japan's supply of imported pork. This gap has created an opportunity for U.S. pork exporters to increase their market share in Japan. U.S. pork exports to Japan are forecast to increase an additional 123,000 MT in 1997. This would raise U.S. pork exports from 6.5 to 8 percent of total domestic production in 1997.

PART 1

540

DEVELOPING MARKETS FOR BEEF

Question. Can U.S. beef gains in Korea offset our problems with the EU?

Answer. We do not expect sales of U.S. beef to the EU to decline dramatically. As a matter of fact, U.S. beef exports to the EU have recovered since the imposition of the beef hormone ban, increasing from \$18 million in 1989 to about \$30 million in 1996. U.S. sales of beef to Korea, our third largest beef market, are expected to grow in 1997, as Korean imports are forecast up 19 percent for the year to 234,000 metric tons. This year, we expect U.S. beef exports to increase 19 percent to \$330 million. The U.S. should maintain its majority share in 1997 as U.S. beef does well in the Hotel/Restaurant (HRI) sector. This sector accounts for over 60 percent of total beef consumed in Korea. Also, some chilled beef imports are expected to enter Korea this year, which should benefit the United States. We expect continued growth in beef exports, as market access increases under the U.S.-Korea Beef Agreement. Under this agreement, the amount of beef permitted to be imported for private sector sales will increase annually until January 1, 2001. At that time, all non-tariff barriers to beef imports, including state trading, will be removed.

Question. What is the state of beef and other commodity access to the EU?

Answer. We work to preserve or expand market access for a variety of products, both through the WTO and through bilateral contact with the Commission and EU member states. The EU remains the second largest export market for U.S. agricultural products (after Japan) and over the last five years, the value of agricultural exports to the EU has grown 17 percent to \$9 billion. Major components of our trade with the EU include soybeans (\$2.3 billion), forest products (\$1.2 billion), tree nuts (\$842 million), tobacco (\$653 million) and coarse grains (\$375 million). Consumer-oriented products show particular promise and (as a group) have grown from \$1.8 billion to \$2.5 billion over the past 5 years. In 1989, the introduction of both the EU's ban on meat from hormone-treated animals and its Third Country Meat Directive resulted in a drastic decline in U.S. beef exports to the EU. U.S. exports of beef and beef offal plummeted from over \$100 million in 1985-87 to \$18 million in 1989. Since 1989, exports of beef have actually recovered (\$40 million in 1995, compared with \$15 million in 1985-87), but offal exports have not (\$13 million in 1995, down from \$90 million in 1985-87).

Question. What steps are being taken to eliminate barriers with the EU?

Answer. Many of our trade policy efforts with the EU in the past decade have focused on the meat and livestock area. Both before and after implementation of the EU's Third Country Meat Directive, United States Government (USG) officials engaged in negotiations aimed at preserving access for our meat products. In 1992, conclusion of the U.S.-EU Red Meat Agreement succeeded in eliminating many of the barriers that had been imposed on our beef industry, and U.S. beef exports recovered somewhat.

Unfortunately, because of the hormone ban, U.S. offal trade has not recovered, and beef exports have not been able to grow as they otherwise would have. After years of fruitless attempts to resolve this issue bilaterally, and with the improved leverage of the Sanitary and Phytosanitary (SPS) Agreement and the dispute settlement procedures in the WTO, in 1996 the USG embarked upon a dispute settlement process within the WTO. The three-member panel of judges selected to review the case have concluded all their meetings, and a final report is expected in late May 1997. We are hopeful that the outcome will be in the U.S.'s favor and will result in elimination of the EU ban. In recent years, the EU has been harmonizing its directives on the whole range of animals and animal products (including fish products). We have been negotiating an equivalence agreement, in order to preserve U.S. trade in these products. We have succeeded in negotiating terms of trade for most product areas which will allow U.S. trade to continue. We are still trying to finalize details, particularly regarding poultry inspection.

Question. What effect has the BSE problems with British beef had on U.S. exports?

Answer. The only direct effect has been an increase in U.S. exports of beef to the United Kingdom, which jumped from 587 metric tons in 1995 to 1,384 metric tons in 1996. Indirectly however, fears over BSE caused considerable anxiety among consumers in important markets for U.S. beef. This is particularly true in Japan, where the combination of the BSE scare along with unexplained outbreaks of *E. coli* dampened beef consumption and led to slower than expected growth in U.S. exports. We expect to see a recovery in Japan's beef consumption over the course of 1997. Though no cases of BSE have ever been recorded in the United States, the controversy surrounding BSE has had an impact on imported beef in a number of other markets, particularly in Asia.

PART 1

541

DEVELOPING MARKETS FOR RICE

Question. Of the \$125 million in U.S. rice sales to Japan, how much is being consumed in that country rather than being used for other purposes such as meeting their own foreign food assistance needs?

Answer. Of the approximately 200,000 tons of U.S. rice purchased by Japan during their 1996/97 import campaign, 13,000 tons purchased under the semi-private Simultaneous-Buy-Sell (SBS) system is known to have entered regular marketing channels. Of the remainder, the Government of Japan (GOJ) has announced its intention to use up to 30,000 tons in food aid shipments. It is believed that all, or almost all, of the remaining amount is currently in GOJ stockpiles.

Question. What is the long-term outlook for rice exports to Japan?

Answer. The long term outlook is excellent as long as the GOJ continues to fulfill market access commitments. The GOJ has repeatedly stressed its commitment to buying the highest quality rice available for its domestic consumers. In addition, the GOJ has stated its intention to monitor SBS purchases as an indicator of consumer preference for foreign rice. In both of the first two years of Japan's minimum access rice imports the United States has dominated SBS purchases.

Question. What is the current state of the Japanese "mind set" toward consumption of U.S. rice?

Answer. Japanese consumers have had little exposure to foreign rice and U.S. rice exporters are actively engaged—under the auspices of the USA Rice Federation and with the help of USDA—in promoting U.S. rice in Japan. We have full confidence in the high-quality of U.S. rice and the eventual acceptance of U.S. rice by Japanese consumers as long as the GOJ continues to provide market access for foreign rice.

GENETICALLY ALTERED PRODUCTS

Question. You mentioned successes in Japan and the EU in introducing genetically altered products. Still, we hear reports about serious objections to those products overseas. What is the current outlook for overcoming these obstacles?

Answer. Our biggest concern now is that consumers, especially in Europe, are not receiving the best information and are voicing strong resistance to biotech products. This is a major topic in our conversations with various EU government officials and with U.S. and EU industry. We are encouraging the private sector to do more in the way of consumer education. We are also working to ensure that any labeling requirements that are adopted in foreign markets are fair and reasonable and do not amount to disguised restrictions on trade.

NEW AREAS OF FAS FOCUS

Question. What do the shifts in your focus from Europe to the Pacific Rim and Latin America mean for various U.S. commodity producers and regions?

Answer. The shift in focus from Europe to the Pacific Rim and Latin America is primarily due to changes in market demand and potential for export growth. FAS' goal is to maximize total U.S. agricultural exports with a focus on emerging markets and trade opportunities created by recent trade agreements, promotion of high value products, and export assistance for small-sized, new-to-export entities and cooperatives.

While Europe continues to be an important market for U.S. agricultural products, it can no longer be viewed as a high growth market in comparison to the potential in the Pacific Rim and Latin America. This change in focus has led to a gradual decline in USDA export promotion funding for Europe. Although changes in the European Union's agricultural policy have had notable effects on demand for U.S. agricultural exports, Europe is still our most important market for soybeans, peanuts, rice, prunes, raisins, tree nuts, walnuts and almonds.

FAS continues to take a proactive approach to position our products in growth markets to help ensure U.S. agriculture's continued export success and contribution to farm income and rural development. The growth in U.S. agricultural exports to Latin American and Pacific Rim markets is more than offsetting any declines in Europe. For example, twenty years ago the EU accounted for 31 percent of total U.S. agricultural exports while the Pacific Rim accounted for only 24 percent. Today the EU accounts for only 16 percent, while the Pacific Rim accounts for approximately 43 percent. FAS will continue to work closely with the industry to capitalize on trade opportunities and provide support for those products and activities in those markets that hold the greatest export potential for the American farmer.

Question. Does this reflect that there are going to be winners and losers among American farmers based on this change of emphasis?

PART 1

542

Answer. No. We do not believe our shift in focus will produce any losers among American farmers. In fact, that is the very thing we hope to prevent by refocusing our resources to higher return to mission markets like the Pacific Rim. However, educating an industry as broad as agriculture on the importance of these export markets and how to succeed in them is important to maximizing the numbers of winners. Therefore, one of our major initiatives over the past couple of years has been to boost our resource commitment to outreach activities. By partnering with commodity organizations, government agencies, Congress, and others, in sponsoring and participating in export seminars and trade events around the country, we can help our producers and processors stay current on the strategic shifts in agricultural markets and informed on how USDA programs, activities, and resources can help them compete in the global market as we move into the 21st century.

MARKET ACCESS PROGRAM

Question. How have the recent legislative changes to the Market Access Program (formerly the Market Promotion Program) changed the programs function in practice?

Answer. The Omnibus Budget Reconciliation Act of 1993 and the Federal Agriculture Improvement and Reform Act of 1996 have programmatically changed the MAP in the following manner:

- within the brand program, FAS gives priority assistance to small-sized entities and agricultural cooperatives;
- FAS limits assistance to promote a specific brand product in a single market to no more than 5 years;
- an eligible trade organization that receives assistance for generic promotion must provide a minimum contribution level of 10 percent. FAS has assigned the greatest weight to this factor in its allocation decisions to encourage a higher degree of cost sharing. As a result, the average level of contribution is 40 percent;
- each participant must certify that any Federal funds received supplement, but do not supplant, private or third party participant funds or other contributions to program activities;
- FAS no longer enters into direct agreements with large companies under the Export Incentive Program (a component of the MAP).

Question. What have been the results of those changes?

Answer. The most notable results stemming from the above-mentioned legislated changes are as follows: This year, FAS has targeted 84 percent of the brand promotion funds for small-sized entities and cooperatives, up from 76 percent in 1996. Funding for generic campaigns to assist small and new-to-export companies and cooperatives take advantage of real opportunities in international trade has also increased from 66 percent in 1996 to 72 percent in 1997. FAS has also responded to concerns raised by Congress and program critics by decreasing funding for large companies. Since 1996, only small entities and cooperatives have been eligible to receive promotional funds directly from FAS under the Export Incentive Program. FAS has also reduced funding available to MAP recipients to indirectly fund brand promotion by large companies by 75 percent since 1995. Beginning with the 1998 program, FAS will only provide assistance to small-sized entities and cooperatives within the brand program.

Question. Would you please provide your most recent breakdown of all MAP allocations (both your most recent actual figures and your most recent projected figures for the subsequent year) by entity for both generic and branded promotions and note which of the participants do not meet the definition of a small business?

Answer. In 1997, FAS made direct allocations to 64 nonprofit trade organizations and agricultural cooperatives. For purposes of determining size, the SBA size standards are most applicable to those U.S. commercial entities that receive indirect assistance through nonprofit trade associations and state regional trade groups. A list of the 1996 and 1997 budgets authorized for generic and brand promotions by organization follows.

[The information follows:]

¹ Applied, but not funded.

² Applied, but directed to work with the American Seafood Institute.

Question. Also would you please note the extent and the manner in which any branded promotion funds were provided to companies indirectly through trade associations or any other means?

Answer. Companies receive MAP assistance for brand promotions indirectly through trade associations. I will provide for the record a list of companies and the budgets for each that have been approved to date in 1996. The 1997 MAP allocation has just been completed. Funding available to large companies for brand promotions through trade associations was reduced by 35 percent in 1996, by 45 percent in 1997 and will be eliminated altogether in 1998.

[The information follows:]

Question. Please provide any documentation you have regarding actual market gains that are a direct result of this program.

Answer. I will provide that information for the record.

[The information follows:]

[CLERK'S NOTE.—The information referred to does not appear in the hearing record but is available for review in the subcommittee's files.]

Question. Please provide any documentation you have regarding to what extent non-coop companies which received MAP branded program dollars and are of a size which exceeds the small business definition made the decision to market products in a country only because they received the MAP assistance?

Answer. We believe a substantial number of large companies have explored opportunities in new markets as a result of receiving MAP assistance, but we do not have documentation available to this effect because program participants are not required to submit this type of information to FAS. However, program participants are required to certify that any Federal funds received will supplement, but not supplant, any private or third party funds or other contributions to program activities. Program participants must also maintain supporting documentation which demonstrates why the participant is unlikely to carry out activities without Federal financial assistance and make this information available for audit.

SECTION 11 REIMBURSEMENTS

Question. Since USDA is under the cap for section 11 transfers, why are you asking for converting the Emerging Markets Technical Assistance to discretionary sending?

Answer. The basis for proposing the change is that the nature of the activities carried out under the Emerging Markets Program do not relate directly to the primary mission of CCC, which is the stabilization of farm prices and incomes and assisting in the conservation of soil and water resources. Additionally, this proposal is consistent with past actions to discontinue the use of CCC funds for non-commodity price and income support activities, such as ASCS (now FSA) salaries and expenses and funding transferred to FAS to support the General Sales Manager's administrative expenses. Further, by making this change, funding for the Emerging

PART 1

557

Markets Program will no longer be subject to the section 11 transfer limitation and, thus, no longer have to compete for funding against other high priority activities.

Question. Would you please explain in detail the need to move FAS activities from CCC reimbursables to discretionary spending?

Answer. Provisions of the 1996 FAIR Act established a limitation on CCC funding made available each year to other agencies through reimbursable agreements. As a result, a number of priority activities are competing for limited CCC resources. Shifting the Emerging Markets Program and support of the CCC Computer Facility from mandatory to discretionary spending provides for a larger base from which to fund these activities. The 1998 budget does request an increase in funding for FAS which will help to offset a portion of the costs of the activities which will no longer be funded through CCC reimbursement.

Question. Or, do you simply intend to convert these activities to mandatory funds subject to appropriations?

Answer. No, the President's budget ultimately proposes a permanent shift of these activities from the mandatory to the discretionary account.

EXPORT EDUCATION

Question. As part of your effort to enhance export education with potential U.S. exporters on the home front, you mention activities in California, Colorado, Oregon, and Iowa. Are you also utilizing the work of the Global Marketing Support Service at the University of Arkansas?

Answer. FAS recently contacted Dr. Preston Laferney of the University of Arkansas, and we are currently exploring avenues to utilize the Global Marketing Support Service. In addition, FAS is actively working with Arkansas state agricultural officials and the Southern U.S. Trade Association to alert Arkansas companies to overseas trade opportunities and USDA export assistance programs. USDA will continue to enhance export education of potential Arkansas exporters by working with the University of Arkansas and trade related organizations to ensure small, medium and new-to-export Arkansas companies have the tools and information they need to capitalize on the growing export market.

PUBLIC LAW 480

Question. Explain why the reduction in the Public Law 480 program level will have no effect on projected tonnage exported through those programs?

Answer. The proposed \$50 million total rescission in fiscal year 1997 appropriations for Public Law 480 Title I will affect projected tonnages under that program. Commodity shipments will be reduced by approximately 200,000 metric tons as a result of the proposed rescission. However, allocations of Title I commodity assistance that have already been announced for fiscal year 1997 will not be affected by the proposed rescission because the reduction in program funding will be taken from a reserve of unallocated funds and from unobligated funds carried over from fiscal year 1996.

For 1998, while the budget includes a reduction in the Public Law 480 program level, we expect the overall tonnage level for the program to remain unchanged from our revised estimate for 1997 because of lower commodity price projections for next year.

Question. There is a pending rescission request relating to Public Law 480 Title I due to carryover funds and a further reduction in fiscal year 1998. Are the carryover funds not likely to be needed in future years?

Answer. The decision to propose the \$50.0 million Title I rescission was based on the need to identify an offset for the supplemental requests included in the budget, including one for the Special Supplemental Nutrition Program for Women, Infants, and Children. The reduction in program funding will be taken from unallocated fiscal year 1997 funds totaling \$24.6 million and unobligated funds carried over from fiscal year 1996 totaling \$32.9 million. Upon enactment of the rescission, just over \$7 million will remain in the ocean freight differential account for fiscal year 1997. We believe this remaining reserve is needed to meet current programming plans because the rate of ocean freight differential payments has been increasing recently, leading to higher program costs.

Question. Is there not a likelihood that these funds could be transferred to Title II?

Answer. By law, these funds could be transferred to Title II. However, at this time we have no reason to believe that funding will be inadequate for the Title II program this year. Nevertheless, we are monitoring the situation in North Korea and Zaire very closely. Developments in those countries could increase the need for emergency food aid.

PART 1

558

OVERSEAS OPERATIONS

Question. Would allowing for 2-year money for overseas operations provide ultimate savings?

Answer. A key advantage of this proposal is that unobligated balances remaining at the end of a given fiscal year could be applied toward offsetting the following fiscal year's operating costs. This would be particularly true in the event that favorable foreign currency fluctuations associated with overseas office operations created an operating surplus. It is expected that savings in one year would offset losses in others, as a result of currency exchange rate fluctuations.

Question. If so, how much?

Answer. Predicting any savings in advance is not possible.

Question. What other efficiencies would be realized by this move on a programmatic basis?

Answer. This proposal eliminates the uncertainties associated with forecasting overseas wage and prices increases and exchange rate movements, and coupled with the proposed advance appropriation, would ensure that only those funds necessary to offset these costs were actually made available. Currently, accurately forecasting overseas wage and prices adjustments is impossible given the long lead time involved in the budget process. In some fiscal years, more funds were appropriated for these costs than were necessary, in other fiscal years, less.

RICE/EU ISSUES

Question. What steps are USDA taking to help bring consensus within the U.S. rice industry to resolve the TRQ issue with the EU?

Answer. USDA continues to have an ongoing dialogue both with individual companies and with industry associations. At the same time, we are working with EU officials to ensure that, once we come up with a workable system, imports can commence immediately.

CUMULATIVE RECOVERY SYSTEM

Question. What is the status of negotiations with the EU on the rice Cumulative Recover System issue?

Answer. The Commission has drafted proposed regulations for both the 4CRS and the malting barley TRQ. These proposals, both of which are acceptable to U.S. industry, are scheduled to be voted on at the April 17 Grains Management Committee.

QUESTION SUBMITTED BY SENATOR KOHL

DAIRY EXPORT INCENTIVE PROGRAM

Question. Will the Dairy Export Incentive Program (DEIP) be utilized in 1997 to the maximum extent allowed under the Uruguay Round GATT Agreement? If not, why not, and how close will we come to full funding for DEIP in 1997?

Answer. We feel that our current level of activity under DEIP is moving the available dairy products to the international market without causing undue disruption to our domestic markets. We do not project reaching either the quantity or expenditure ceilings allowed under our Uruguay Round commitments for the current year. The volume of activity under the DEIP is a reflection of domestic availability and international demand. With the exception of butterfat, current allocations have been available since July 1996. However, almost 60 percent of our awards have occurred since January 1997. The tight markets in the U.S. last summer and less than aggressive international demand for the products that can be exported under the DEIP were primary reasons for this limited activity. I will provide a table showing the award totals and Uruguay Round ceilings.

[The information follows:]

PART 1

559

DAIRY EXPORT INCENTIVE PROGRAM (DEIP)

[Dollars in thousands]

Commodity	Quantity (MT)—		Bonus value—	
	Committed (from July 1)	GATT maxi- mum (from July 1)	Committed (from Oct 1)	GATT maxi- mum (from Oct 1)
Nonfat dry milk	39,024	100,222	\$30,119	\$113,388
Whole milk powder	1,540	9,971	1,510	11,503
Cheese	1,384	3,669	839	4,999
Butterfat ¹	853	38,611	803	41,934

¹ Includes butter, butteroil, anhydrous milkfat and ghee on a butter equivalent basis.

Note: Commitments are as of April 11, 1997. Quantity commitments are based on a July/June year and expenditure commitments are based on an October/September year.

RISK MANAGEMENT AGENCY

QUESTIONS SUBMITTED BY SENATOR COCHRAN

SALARIES AND EXPENSES

Question. In a climate where other agencies in USDA are decreasing administrative and operating expenses, your projected available funds and staff years for 1998 for the Risk Management Agency and the Federal Crop Insurance Corporation actually increase. Why do you estimate an increased need in funds available and staff years for 1998?

Answer. The requirements of the Federal Crop Insurance Reform Act—the Act—and the Federal Agriculture Improvement and Reform Act of 1996—the 1996 Act—drastically increased the workload required of the Risk Management Agency—RMA—to support FCIC's existing programs, crop expansion, continuing changes to overall program requirements, and the increased emphasis on new crop program development. For example, the implementation of catastrophic risk protection coverage increased the number of policies sold from 800,000 in 1994 to 1.6 million in 1996. In addition, the 1996 Act provided for the establishment of a Risk Management Education program to provide education on risk management strategies, including futures and options trading and insurance protection programs, and to educate producers of the financial risks inherent in the production and marketing of agricultural commodities. The 1996 Act also transferred to RMA responsibility for the Options Pilot Program.

Due to increasing expansion of program coverage resulting from the 1996 Act, the need for greater compliance has grown. Greater reliance on private insurance company delivery based on the Standard Reinsurance Agreement has generated increased Compliance workload in the form of additional Hotline complaints, support investigations, support of regulatory functions of the current insurance program, and upgraded program operations. In addition, the increased reliance of farmers on crop insurance as a result of the 1996 Act has led to much greater demand to expand crop insurance to new crops and new products. Our resources are stretched thin at our current rate of expansion, and we will not be able to accelerate this expansion to the rate demanded without additional resources.

Question. How has the agency conformed to the provision in the 1994 Crop Insurance Reform Act which states, "the Board shall alter program procedures and administrative requirements in order to reduce the administrative and operating costs of approved insurance providers and agents in an amount that corresponds to any reduction in the reimbursement rate required * * * during the 5-year period * * *?" Has the reimbursement rate decreased, and if so, how much?

Answer. Yes, FCIC has decreased the expense reimbursement rate as mandated in the Reform Act. For the 1997 reinsurance year, the rate was decreased from 31 percent to 29 percent. Under current law, the reimbursement rate will decrease at least to 28 percent in 1998 and decrease again in 1999 to 27.5 percent. However, we recognize that the rate may be too high and are proposing that the statutory ceiling on delivery expenses be reduced from 28 percent to 24.5 percent.

RMA also continues to seek ways to simplify the delivery of crop insurance to satisfy this mandate of the Reform Act—reducing administrative expenses. Suggestions were solicited from participating companies and all other interested parties via a

PART 1

560

Federal Register notice. Twenty-nine actions have been completed since passage of the Crop Insurance Reform Act—a few examples follow: actuarial documents have been restructured, which reduced the number of pages printed each year by one-third, or approximately two million; combined forms have been approved which allow the company to reduce the number of times that they must contact the farmer; type and practice codes have been standardized and simplified; and the basic crop insurance computer system called RAS/DAS, was analyzed to assure that it contained no unnecessary or redundant data requirements. Ten actions are still in progress and four more are currently being evaluated. Consultations with industry will continue on this important issue.

Question. The Administration has proposed legislation which will only reduce the amount needed to fund the sales commissions paid to reinsured companies from \$202 to \$150 million. How does the Administration propose to fund the remaining \$150 million?

Answer. The delivery expense of reinsured companies has been paid from the mandatory side of the budget for 1995, 1996 and 1997. For 1998, part of the delivery expenses are to be paid from the discretionary side of the budget as part of a statutory compromise reached in the Federal Crop Insurance Reform Act of 1994. We are proposing that this amount be \$150 million and that it be provided for delivery expenses in general rather than designated specifically for sales commissions. The \$150 million is included in the President's request for funding under the 1998 Appropriations Act.

Question. What will happen under current law to the crop insurance program if the Committee is unable to provide full funding requested for the sales commissions paid to reinsured companies?

Answer. As described above, RMA specifically proposed that the \$150 million be appropriated for expense reimbursement generally, so the companies could determine how to allocate the mandatory and discretionary funds they receive as they see fit. Since the Federal Crop Insurance Act of 1980, delivery of the crop insurance program has been through private companies.

RMA and the Department are committed to the private delivery of crop insurance. We believe in the private delivery system and its ability to broaden the available safety net to farmers. Insurance agents are knowledgeable about the crop insurance products and have made extra efforts to provide producers with access to other lines of insurance and non-insurance risk management tools. We strongly urge that \$150 million be appropriated.

Question. The Administration's fiscal year 1998 request proposes increases in: pay costs for the Office of the Administrator; pay costs and staff years for research and development activities; pay costs and staff years for the insurance services division; pay costs for program support; pay costs and staff years for risk compliance; and, \$202 million for sales commissions paid to reinsured companies.

How does the Administration justify these requested increases for pay costs and staff years when the program is in jeopardy if the \$202 million requested for sales commissions paid to reinsured companies is not funded?

Answer. In our proposal, RMA would be absorbing fifty percent of the combined anticipated pay raise in fiscal year 1998 and the annualization of the fiscal year 1997 pay raise as required by the Department. Therefore, the increase for pay costs for the Agency is only half of what would be needed to fund the pay costs of agency personnel currently on-board working in support of the crop insurance program. Due to the legislation of the past several years, the workload has increased to implement new programs which are of service to the producers, review existing programs and rates/coverages, assure compliance with the policies and from the private insurance companies, and provide risk management education to producers on forward contracting, futures and options trading, and other risk management tools. All of these programs need personnel to produce the desired results expected from Congress and the nation's producers.

Question. The current crop insurance regulations state, "if there are insufficient funds appropriated by the Congress to deliver the crop insurance program, the policy will automatically terminate without liability." Who makes the determination of "insufficient funds" which will trigger this provision?

Answer. Pending the degree to which funds are not fully available, several parties including companies and the Administration must make such a determination. If partial funding is available, the Administration must decide if the program can be delivered in a manner acceptable to farmers and with little confusion or program vulnerabilities. Companies must decide if they can deliver the product adequately and compliant with program standards for the funds reimbursed. Each must make their determination based on the amount of available funds and the timing of when such funds become available. If program funds are not at adequate levels, producers

PART 1

561

could find themselves without insurance after they have made many key management decisions.

Question. Has a determination been made for fiscal year 1998? What is the level of "insufficient funds" which will trigger this provision?

Answer. Such a decision has not been made for fiscal year 1998. The Administration's budget proposal is the only basis at this time upon which to make such a determination, and that proposal results in adequate funding, although some insurance providers may disagree. Until actual funding is made known, estimating levels to trigger the policy provision would only be conjecture.

Question. In your prepared statement, you state that under the Administration's proposal regarding the administrative expenses paid to the reinsured companies that an additional \$10 million in administrative reimbursements to reinsured companies would be required. Please explain why this increase is required and is it netted out of the \$53 million which the budget indicates would be saved by the Administration's legislative proposal?

Answer. Under the current Standard Reinsurance Agreement, FCIC has authorized a higher rate of compensation for expense reimbursement to private insurance companies for increased sales of CRC policies, which is estimated as a \$10 million increase in administrative expense reimbursement. Since we anticipate a 5 percent increase in sales of revenue products and a shift from current yield-based coverage products, we expect that costs to administer the programs will increase.

To offset the increase in these costs in the discretionary portion of RMA's budget, we are proposing the reduction of expense reimbursement rates paid to private insurance companies.

Question. The Administration is proposing legislative changes to reduce the reimbursement rate for delivery expenses, which I understand would lower the discretionary requirement rate from \$203 million to \$150 million. It is also proposing to make a portion of the overall reimbursement rate, not just the sales commission portion, discretionary and subject to appropriations. In your prepared statement you state that in order to be cost neutral in providing revenue insurance nationwide, the reimbursement rate used to determine administrative expenses paid to reinsured companies will be reduced. Is this reduction in the reimbursement rate the same as required by current law over a 5-year period?

Answer. No, under current law, the targeted reimbursement rate for 1998 is 28 percent and for 1999 and beyond, 27.5 percent. The Department's proposal does not specify a particular amount to be paid for sales commissions but reduces the overall reimbursement rate used to determine administrative expenses paid to the private insurance companies. This proposal would lower the reimbursement rate from 28 percent of premiums sold for multiple-peril crop insurance to 24.5 percent in 1998 and 24.25 percent in 1999 and beyond. The proposal specifies that 10.5 percentage points of the proposed rate be considered discretionary spending. This proposal achieves a reduction in discretionary spending of \$53 million from current law to \$150 million for 1998.

Question. How is this proposal to reduce the reimbursement rate connected to the Administration's proposal that will result in an estimated increase of \$10 million for administrative reimbursements to reinsured companies?

Answer. The estimated increase of \$10 million for administrative reimbursements to reinsured companies results from the expected increase in business from nationwide expansion of revenue products. The proposal to reduce the administrative expense reimbursement rate will provide an estimated savings of \$53 million in delivery expenses and is not related to the expansion of revenue products.

EXPANSION OF CROP REVENUE INSURANCE PLAN

Question. In January 1997 the Federal Crop Insurance Corporation Board of Directors approved an expansion of crop revenue coverage on corn and soybeans while adding new programs on spring wheat, grain sorghum, and cotton. (Senator Lugar has been very vocal about the anticipated high costs of expanding this program.) Does USDA have the authority under the Crop Insurance Act to expand the pilot program?

Answer. The Department does have authority to expand CRC on a nationwide basis because it was sponsored by a private insurance company under Section 508(h) of the Act. FCIC does not have authority to offer its own revenue products on a nationwide basis but is requesting an amendment to the FCIC Act which will authorize such.

Question. What is the estimated cost to extend this pilot program nationwide?

Answer. Most of the additional cost is expected due to greater participation induced by products that better meet producers' needs than does the standard yield-

PART 1

562

based coverage. To date, subsidies have been limited to the amount that would be paid if the producer had purchased the Actual Production History—APH—coverage plan. This cost generally is less than the APH plan for IP and RA. For CRC, the cost of the producer premium subsidy is the same as the APH plan, and an average of 9 percent extra is paid for administrative and operating expenses on the portion of the CRC premium that exceeds the premium that would have been paid under the APH plan. In general, the reimbursement to reinsured companies is 6–12 percent greater for CRC policies than for policies sold under the APH plan.

The cost thus depends upon several factors: the increase in total participation and the mix of products that producers purchase. Higher sales of CRC will increase costs; greater market penetration by products such as IP and RA will reduce costs.

For the purpose of the budget, FCIC assumed an increase in total participation on the order of 5 percent. It further assumed that most of the increase would be in CRC. To offset the costs associated with these assumptions, FCIC proposed that the statutory loss ratio target be reduced and made other program modifications. A part of the cost is offset by changes in other mandatory programs. The proposal is budget neutral.

Question. What portion of the \$203 million fiscal year 1998 request for administrative costs is related to this expansion of the pilot program?

Answer. None. The \$203 million estimate in the fiscal year 1998 President's Budget only reflects current law. Current law does not authorize a Federal nationwide revenue insurance program. The additional cost for CRC in 1998 under current law is estimated to be \$10 million.

Question. When does the Agency plan to expand this program and offer it to producers?

Answer. There has been great demand for increased availability of the revenue insurance concept, and the Administration is seeking legislative authority to offer revenue insurance nationwide. Presently, the Federal Crop Insurance Act authorizes only a pilot program of revenue insurance under direct Federal sponsorship. The plan or plans that may be offered are not yet known. Presumably, CRC would be one such plan. However, it probably does not meet the needs of all producers. Thus, some alternative plans may be needed such as Income Protection—IP—or Revenue Assurance—RA.

FCIC has recently received a submission from the private company that developed CRC to expand wheat to 25 additional states and to expand to all counties in states that have previously been approved for only certain counties. FCIC will continue to review and consider for approval, products or product expansions as they are received from the private industry. If approved, consideration will be given to the timing that will allow for the orderly implementation in a way that provides ample opportunity for sales to producers.

Question. What has been the participation rate in this pilot program?

Answer. The Federal Crop Insurance Corporation developed the Income Protection—IP—Plan of Insurance. For the 1996 crop year, IP was available for corn, cotton, and spring wheat in 30 counties. For 1996, about 998 IP policies were purchased, covering about 218,000 net acres with total premiums of about \$3.4 million. For the 1997 crop year the IP pilot program was expanded and is available for corn, cotton, grain sorghum, soybeans, spring wheat, and winter wheat in 159 counties. Data for the 1997 crop year will not be available until late in the calendar year.

Under the authority of the Act, FCIC approved the CRC and Revenue Assurance plans developed by the private sector. For the 1996 crop year, CRC was available for corn and soybeans for all Iowa and Nebraska counties. For 1996, about 91,000 CRC policies were purchased, covering about 11.3 million net acres, with total premiums of about \$141.0 million. For the 1997 crop year, the availability of CRC for corn and soybeans includes all counties in the States of Colorado—corn only, Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, Ohio, Oklahoma, South Dakota, and Texas. In addition, for the 1997 crop year, CRC was made available for:

Cotton

Arizona—all counties
Georgia—all counties
Oklahoma—all counties
Texas—selected counties

Grain sorghum

Colorado—all counties
Nebraska—all counties
Oklahoma—all counties

Kansas—selected counties
Missouri—selected counties
South Dakota—selected counties

Spring wheat

Minnesota—all counties
Montana—selected counties
North Dakota—selected counties

Winter wheat

Kansas—all counties

PART 1

563

Michigan—all counties
Nebraska—all counties
South Dakota—all counties

Texas—all counties
Washington—selected counties

FCIC approved the RA plan of insurance for corn and soybeans in all Iowa counties for the 1997 crop year. CRC and RA plans of insurance will only be available in counties if an existing multiple peril crop insurance program is also available for the crop.

Question. As a result of weather, adverse growing conditions, etc., what are the estimated losses as a result of farmers participating in this program?

Answer. As of April 8, 1997, reinsured companies had reported losses of \$47.3 million for Crop Revenue Coverage for corn and soybeans in Iowa and Nebraska. The overall program loss ratio was 0.34. Losses paid to producers of corn and soybeans in Iowa and Nebraska who purchased coverage other than catastrophic under the Actual Production History yield-based plan had been paid \$26.8 million, for a loss ratio of 0.26. By this time, reporting of losses normally is over 95 percent completed.

On that same date, losses of \$55 thousand and \$178 thousand had been reported for corn and wheat, respectively, under the Income Protection coverage plan. The respective loss ratios were 0.07 and 0.13. No losses had been reported for cotton under this revenue insurance plan. Since Income Protection is sold only in specific counties and not entire states, a comparable loss ratio for the APH coverage plan is not readily available.

Question. Some farmers have expressed concern that no “safety net” exists for those that can’t afford crop insurance or that no crop insurance coverage exists for a specific crop. Is there some way to address this concern?

Answer. Free catastrophic insurance coverage—50 percent yield coverage indemnified at 60 percent of the maximum price—is available wherever crop insurance is offered. Producers are responsible for a minor \$50 processing fee for each crop. The fee is waived in instances when limited resource producers cannot afford to pay it. Other alternative programs, such as the Group Risk Plan, provide low cost coverage alternatives in many areas. Where crop insurance is not available for a crop, the Noninsured Assistance Program provides coverage equivalent to catastrophic insurance coverage at no charge when an area suffers a widespread loss.

CROP INSURANCE FOR SPECIALTY CROPS

Question. In the past pilot programs have been directed and pursued for crop insurance alternatives, especially for “specialty crops” in which the standard coverage was not viable. Such policies have been suggested for peaches, pecans, citrus, nursery crops, etc. Which crops are currently participating in a pilot program and what is the status of each of them?

Answer. Specialty crops that are currently participating in a pilot program and their status is as follows:

Apple Scab Integrated Pest Management Pilot Project.—This pilot program was conducted during the 1996 crop year and is currently being evaluated to determine its success. This program provided insurance protection to apple growers participating in an apple scab Integrated Pest Management—IPM—demonstration project. The University of Vermont and the University of New Hampshire jointly conducted the project to demonstrate the effectiveness of IPM procedures for the control of apple scab.

The pilot program provided protection for quality losses due to scab on apples that, had it not been for apple scab damage, would have been marketable as fresh market U.S. Fancy or Extra Fancy apples. The protection against apple scab quality losses required an endorsement to the existing policy since that policy does not protect against quality or production losses due to disease or insects that could have been controlled. Producers desiring this optional coverage were required to carry an available level of additional coverage Actual Production History (APH) insurance coverage on their apples along with the apple scab endorsement.

Support for this IPM demonstration project is consistent with the shared goal of USDA and Congress to facilitate producers’ movement to sustainable farming practices.

Avocados.—An avocado pilot revenue program has been established for the 1998, 1999, and 2000 crop years for Ventura County, California. This program is being tested as an adaptation of the Income Protection program to a specialty crop for which revenue has not previously been insured. Plans are in place to initiate a pilot program to protect against almond revenue losses beginning the 1998 crop year. The almond insurance program has been in place more than fifteen years and provides protection only for production losses.

PART 1

564

Blueberries.—An Actual Production History (APH) based blueberry pilot program was established for the 1995 and 1996 crop years, and expanded for the 1997 and 1998 crop years. The pilot program is presently available in two counties in Maine, two counties in Michigan, eight counties in Mississippi, two counties in New Jersey, and one county in North Carolina.

Canola/Rapeseed.—An Actual Production History (APH) based canola pilot program was established for the 1995 crop year and expanded for the 1997 and 1998 crop years, and is available in sixteen counties.

The pilot program is available for spring-seeded canola in the following counties: Lewis, Idaho; Kittson, and Roseau, Minnesota; Glacier, Montana; Bottineau, Cavalier, Pierce, Ramsey, Rolette and Towner, North Dakota; Whitman, Washington.

The pilot program is available for fall-seeded canola in the following counties: Baker, Calhoun, and Early, Georgia.

The pilot program is available for spring-seeded and fall-seeded high oleic canola and fall-seeded high erucic Rapeseed in the following Pacific Northwest counties: Latah, Idaho; and Umatilla, Oregon.

Florida Fruit Trees.—A Florida fruit tree pilot program was established for the 1996, 1997, and 1998 crop years to protect grove owners for replacement or rehabilitation of trees damaged by freeze, wind, or excess moisture. The insurable tree types include all citrus and the following tropical fruit trees: avocado, carambola, and mango. The pilot program is available in the following five Florida counties: Dade, Highlands, Martin, Palm Beach, and Polk. The insured crops vary by county.

Millet.—A millet pilot program was established for the 1996, 1997, and 1998 crop years for the following five counties: Logan, Colorado; Cheyenne and Deuel Counties, Nebraska; Dickey, North Dakota; and Bennett, South Dakota. Production records, grower interest, and Risk Management Agency Regional Service Office recommendations were used to select the pilot counties. The millet pilot program is an Actual Production History plan of multiple peril crop insurance. A detailed description of these and other pilot programs is available through the Risk Management Agency's Research and Evaluation Division Internet home page at <http://www.act.fdic.usda.gov/research>. This web site also contains feasibility studies and/or executive summaries of feasibility studies conducted to determine the feasibility of developing risk management programs for specific crops, most of which are considered specialty crops.

Question. Have any of these pilot programs been successful?

Answer. The following descriptions of the outcome/status of the pilot programs.

Apple Scab IPM Pilot Program.—Although the Apple Scab IPM Pilot Program evaluation is not completed, the program appears to have served its purpose for the small number of growers who participated. The pilot program evaluation will assess the relative success of the program and its applicability to other areas and crops.

Avocado Pilot Program.—It is too early to determine the success of the avocado pilot program.

Blueberry Pilot Program.—Although the blueberry pilot program evaluation is not completed, it appears that the program has been a success, and plans are in place to convert the program to permanent status beginning the 1999 crop year. About 300 policies reported premium mostly at the CAT (50/60) level. *Canola/Rapeseed Pilot Program.*—Although the canola pilot program evaluation is not completed, it appears that the program has been a success, and plans are in place to convert the program to permanent status beginning the 1999 crop year. Over 2,000 policies reported premium, mostly at the additional coverage levels.

Florida Fruit Tree Pilot Program.—This pilot program is just into the second year of its 3-year expected duration, and the pilot program evaluation is expected to be completed in April 1998. Approximately 1,200 policies were purchased in the 1996 crop year, mostly at the CAT (50/60) level.

Millet Pilot Program.—The millet pilot program is just beginning its second year of its 3-year expected duration, and the millet pilot program evaluation is expected to be completed in July 1998. Approximately 1,700 policies were purchased in the 1996 crop year, mostly at additional coverage levels.

Question. The Federal Crop Insurance Reform Act of 1994 created the position of "Specialty Crops Coordinator." This position was created to serve as a liaison between producers and the agency. Has this position been filled? If yes, then who has been selected to fill this position?

Answer. The Specialty Crops Coordinator position was filled in March 1996 by William C. (Bill) Jones after the previous Specialty Crops Coordinator, Dr. Floyd F. Niernberger, retired in January 1996. Mr. Jones, a native from McLean County, Illinois, began his Federal civilian career with the Federal Crop Insurance Corporation in 1968, and has served in numerous positions within the agency. Although raised on a grain, livestock, and dairy farm in Central Illinois, Mr. Jones has owned and

PART 1

565

operated a small fruit and vegetable farm in the Kansas City area for 15 years, growing, wholesaling, and retailing a variety of specialty crops.

Question. What actions have the agency taken to address the insurance needs of specialty crops?

Answer. The agency has taken a number of actions to address the insurance needs of specialty crops. Major actions that have been taken in addition to developing the pilot programs for specialty crops identified above are as follows.

—The agency published “Data Collection Guidelines to Be Used in Formulating New Crop Insurance Policies” in the Federal Register on April 14, 1995, to advise interested parties of FCIC’s guidelines for data collection to assist the Corporation in researching the feasibility of formulating crop insurance policies for new crops.

—On July 12, 1995, “Notice of Specialty Crops Research Studies” was printed in the Federal Register, naming the specialty crops for which research reports were being prepared and soliciting proposals from interested parties of additional crops or comments on the crops named. Representatives of the agency had speaking engagements with grower groups and commodity associations to communicate the agency’s new and specialty crops program expansion efforts.

—The agency has developed a Summary of New Program Development Data Requirements to be provided to specialty crops growers and commodity associations to enable them to better understand the data needed to develop a new program, and to enable them to assist in the data-gathering process to facilitate expansion efforts.

—The agency contracted research with the Economic Research Service (ERS) to determine the feasibility of insuring various new and specialty crops. These feasibility studies represent one component in the process of developing risk management products for specialty crops. To date, 49 such projects have been undertaken.

—The agency has made available its New Program Development Handbook, Summary of New Program Development Data Requirements, and information regarding various feasibility studies and pilot programs through the agency’s Research and Evaluation Division Internet web site at <http://www.act.fcic.usda.gov/research>.

—In August 1996, the agency’s Research and Evaluation Division conducted an intensive New Program Development Training session for representatives from the ten Risk Management Agency Regional Service Offices and Washington, D.C. The expected outcome of this training was greater involvement in project management at the field level and maximum utilization of resources throughout the agency in the development of new programs.

—The agency is conducting a joint research project between the University of Maine, the Extension Service, and RMA’s Research and Evaluation Division to investigate the feasibility of offering a crop insurance program designed to meet the needs of specialized producers of vegetables and other perishable crops who market through direct marketing channels.

—The agency is expanding the coverage of existing specialty crops programs to new areas and new producers. As an example, the apple insurance program was expanded for the 1996 and 1997 crop years into 16 additional counties in six states. Additionally, written agreements are being accepted for producers of currently-insured crops in counties where the program is not available.

Pilot programs are in various stages of development for the following specialty crops:

Almond Revenue Pilot Program.—A pilot program offering almond revenue protection as an alternative to the current production protection program is being considered for implementation in California.

Pecan Revenue Pilot Program.—A pilot program offering pecan growers protection against unavoidable loss of revenue is being considered for implementation beginning the 1998 crop year.

Sweet Potato Pilot Program.—A pilot program offering growers protection against unavoidable loss of production is being considered for implementation beginning the 1998 crop year in a number of states and counties.

Turfgrass Sod Pilot Program.—A pilot program offering growers protection against unavoidable losses to their sod inventory is being considered for implementation beginning the 1999 crop year. The turfgrass sod industry trade group will be presenting the proposed policy to its membership at their annual meeting in June.

Wild Rice Pilot Program.—A pilot program offering growers protection against unavoidable loss of production is being considered for implementation beginning the 1999 crop year in Minnesota and California.

PART 1

566

Christmas Tree Pilot Program.—A pilot program offering growers protection against unavoidable losses is being considered for implementation beginning the 1999 crop year.

Direct Market Perishable Crops Pilot Program.—A pilot program offering growers protection against unavoidable loss of revenue is being considered for implementation beginning the 1999 crop year.

Aquaculture Pilot Program.—A pilot program offering growers protection against unavoidable losses is being considered for implementation beginning the 1999 crop year.

Peach Income Protection (IP) Pilot Program.—A pilot program offering peach growers protection against unavoidable revenue losses is being considered for implementation beginning the 1999 crop year.

Potato Income Protection (IP) Pilot Program.—A pilot program offering potato growers protection against unavoidable revenue losses is being considered for implementation beginning the 1999 crop year.

Nursery Program.—The current nursery program is being considered for redesign to provide broader protection than is currently available.

Significant pilot program development activity is taking place for the following specialty crops during 1997 and 1998: Cane Berries—Brambles; Melons; Snap Beans—Fresh Market; Squash; Artichokes; Cabbage; Chili Peppers; Citrus Fruit—Alternative to current programs; Cucumbers; and Sesame. This may result in such pilot programs being initiated in the 2000 crop year, depending upon the model used, data and resources available, and other factors.

Question. Are any special initiatives being pursued and what are they?

Answer. Without intending to single out any projects as more significant or of higher priority than the others, the direct market perishable crops program and aquaculture program would probably qualify as much as any others as “special initiatives” in that they probably have the greatest potential to be significantly different from any other programs available or being developed.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

CROP REVENUE COVERAGE

Question. How much would it cost to expand Crop Revenue Coverage (CRC) nationwide in terms of indemnities, reimbursements to private companies, and administrative costs?

Answer. Most of the additional cost expected is due to greater participation induced by products that better meet producers’ needs than does the standard yield-based coverage. To date, subsidies have been limited to the amount that would be paid if the producer had purchased the Actual Production History—APH coverage plan. This cost generally is less than the APH plan for IP and RA. For CRC, the cost of the producer premium subsidy is the same as the APH plan, and an average of 9 percent extra is paid for administrative and operating expenses on the portion of the CRC premium that exceeds the premium that would have been paid under the APH plan. In general, the reimbursement to reinsured companies is 6–12 percent greater for CRC policies than for policies sold under the APH plan.

The cost thus depends upon several factors: the increase in total participation and the mix of products that producers purchase. Higher sales of CRC will increase costs; greater market penetration by products such as IP and RA will reduce costs.

For the purpose of the budget, FCIC assumed an increase in total participation on the order of 5 percent. It further assumed that most of the increase would be in CRC. To offset the costs associated with these assumptions, FCIC proposed that the statutory loss ratio target be reduced and made other program modifications. A part of the costs is offset by changes in other mandatory programs. The proposal is budget neutral.

Question. How do those costs, in addition to the Non-insured Assistance Program (NAP) administered by FSA, compare with the average of ad hoc disaster programs provided over the past ten years?

Answer. As stated above, the cost of expanding CRC depends upon several factors including the increase in total participation and the mix of products that producers purchase. It is impossible at such an early stage of the expansion to make a meaningful comparison between the cost of CRC expansion and the cost of other ad hoc disaster programs and NAP. We can however, provide you with the average cost of disaster payments for fiscal years 1987 through 1996, as provided by the Commodity Credit Corporation, which is \$1,034,082,200. Furthermore, as of April 3, 1997, the cumulative NAP payments for 1996 were \$35,709,127 and \$26,851,144 for 1995.

PART 1

567

Question. Please explain how you plan to make full coverage for CRC revenue-neutral?

Answer. The major additional expense arises from expectations of an increase in overall program participation. The mandatory costs associated with this increase are to be offset by a reduction in the legislated target loss ratio from 1.10 to 1.085 in 1998 and 1.075 to 1.060 beginning in the year 1999. Savings from other mandatory programs also are to be credited. The discretionary costs associated with this increase are to be offset by a reduction in the rate of reimbursement for delivery expenses.

Question. Since the NAP program is designed as a risk management tool, why has it not been consolidated with the other risk management programs of your agency?

Answer. The Department of Agriculture Reorganization Act of 1994 was amended on April 4, 1996, by the Federal Agriculture Improvement and Reform Act of 1996. The 1996 Act required the Secretary to establish an independent agency to supervise the Federal Crop Insurance Corporation activities. The Farm Service Agency (FSA) administers a variety of activities and in the 1996 Act Congress retained NAP functional activities under the administration of FSA. RMA and FSA do coordinate in the collection of yield and price data on NAP crops and that information is helpful when establishing new insurance programs on those previously noninsured crops.

REIMBURSEMENTS TO PRIVATE COMPANIES

Question. On page 12 of Secretary Smith's statement, he mentions a reduction in the discretionary amount for delivery expenses from \$203 million to \$150 million. In the next sentence, he states, "Further, our proposal would make a portion of the overall reimbursement rate discretionary and subject to appropriations whereas current laws treat only the sales commissions portion of the reimbursement as discretionary." Is it not the case that the reimbursement for delivery expenses, the amount you recommend dropping to \$150 million is the only discretionary item relating to company reimbursements. Would you please clarify the statement I have quoted which sounds as though there is a further discretionary item?

Answer. In our proposal, we tried to be fair to the agents and to avoid having to tell the insurance companies how much they would be allowed to pay their agents. As you know, sales commissions have been paid out of the FCIC Fund, which is a mandatory spending account although still subject to appropriation. However, current law requires that they be treated as discretionary spending beginning in 1998.

Our proposal recognizes that the delivery expenses paid, in total not just sales commissions, may have been too high. Consequently, we are proposing that the statutory ceiling on delivery expenses be reduced from 28 percent to 24.5 percent of the premium on multi-peril coverage, which applies to production risks. For revenue insurance, which has a higher premium because it applies to price as well as production risks, the rate will be somewhat less, but the amount will be at least as much as the amount paid on multi-peril coverage. We estimate that delivery expenses under our proposal would be \$417 million, compared to \$460 million under current law, which is a savings of \$43 million, net of about \$10 million in additional cost for an increase in business.

As mentioned earlier, while we wanted to reduce delivery expenses, we did not want agents to have to bear more than a fair share of the reduction. We wanted this to be a matter of negotiation between the agents and their companies, without our getting into the matter. So our proposal provides for eliminating the distinction in current law that subjects only the sales commission portion of delivery expenses to discretionary spending ceilings.

Question. If you reduce the loss ratio used to establish the premium rates structure, what effect will that have on participation? At some point will farmers not feel the cost of the program exceeds the benefits leaving only the more "loss-prone" farmers in the programs?

Answer. RMA is not aware of any studies that reliably estimate the price elasticity of demand for crop insurance. Hence, any assessments about the effect of a change in the statutory loss ratio target can only be conjectural. The proposed reduction in the loss ratio, from 1.10 to 1.085 in 1998 and from 1.075 to 1.060 in 1999, infers a need to increase premium income by 1.4 percent in each year. This is a relatively modest amount that should not impact participation greatly. Annual changes in price elections cause a greater change in premium costs to producers.

The crop insurance program of today offers many options to producers that enable them to better target their risk management strategies with the price they are willing to pay. There are new products and new coverage levels compared to even the

PART 1

568

recent 1995 crop year. There is increasing awareness of the benefits of complementing production risk management strategies with marketing risk management strategies such as puts, calls, forward selling, and others. The environment created by the new farm programs will require producers to actively consider these strategies if they are to be successful.

QUESTION SUBMITTED BY SENATOR HUTCHISON

Question. During the month of March 1997 some areas of Texas have received in excess of 12 inches of rain and today received another 1½ inches. The heavy rains have prevented some Texas farmers from planting crops. At present only about 30 percent of the cotton has been planted and most will have to be replanted. Most of the grain has been planted, however, most will have to be replanted due to flooding and weed infestation as a result of herbicides breakdown.

Is it possible for USDA to extend the final plant date to April 15, 1997 without imposing penalties in the Texas regions where rainfall has been recently excessive? During last year's drought we used creative approaches like this to help Texas farmers and ranchers.

Answer. FCIC has received several inquiries that have recommended that insurance final planting dates be changed so that producers who plant after the final planting date will not receive reduced production guarantees. While such action may appear attractive, it can have negative effects on producers:

- Qualification for a prevented planting production guarantee would be delayed. Producers who are prevented from planting by the final planting date may qualify for a prevented planting production payment. Extension of these dates would require a producer to be prevented from planting until this extended date to qualify. Many growers have indicated that it is not practical to plant after current final planting dates.
- Producers may be compelled to plant until the extended date to qualify for insurance coverage. Planting may continue even in situations in which reduced yields and net returns would be expected. This could result in increased insurance losses and less acreage planted to short-season substitute crops.
- Insurance policy requirements regarding the replanting of a damaged crop could be impacted. Current provisions require that a crop damaged prior to the final planting date be replanted if it is practical to do so. As indicated above, many growers feel that planting past the current final planting date is not practical.
- The late planting period would be extended for most crops until 25 days after the new final planting date. The late planting period would then extend too far into the growing season for most crops.
- Premium rates may be impacted in subsequent crop years if additional losses result from the changes in the final planting date.
- This change would override current policy provisions without regulatory action in the very type of year/conditions for which they were designed.
- RMA received negative feedback after certain date changes were made for the 1995 crop year.
- Insurance providers may seek financial damages—hold harmless—from RMA to compensate for losses that would not have been incurred if planting dates were not changed.

It is for these reasons that RMA intends to maintain current final planting dates and provisions that are expressly designed to deal with situations where planting is delayed or prevented. RMA will continue to evaluate any possible steps that will increase producers' awareness and understanding of these coverages and that will enhance the service that policyholders currently receive, including any options that may expedite payment of indemnities to impacted producers.

SUBCOMMITTEE RECESS

Senator COCHRAN. Thank you all for everything you have been doing. We congratulate you for your good efforts. Thank you very much.

Our hearing is concluded. We will have another in a series of hearings next Tuesday, April 15, at 10 a.m., in this room, 124, of the Dirksen Senate Office Building. At that time, we will consider the budget request for the Department's rural economic and community development activities.

PART 1

569

Until then, the subcommittee stands in recess.
[Whereupon, at 12:05 p.m., Tuesday, April 8, the subcommittee
was recessed, to reconvene at 10:20 a.m., Tuesday, April 15.]

PART 1

PART 1

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

TUESDAY, APRIL 15, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:20 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding. Present: Senators Cochran, Burns, Bumpers, and Harkin.

DEPARTMENT OF AGRICULTURE

STATEMENT OF DAYTON J. WATKINS, ADMINISTRATOR

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION
CORPORATION

STATEMENT OF W. BRUCE CRAIN, EXECUTIVE DIRECTOR

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order. We will continue our hearings on the President's budget request for the Department of Agriculture and related agencies for the next fiscal year. We are very pleased this morning to have Under Secretary for Rural Development Jill Long Thompson to lead our panel to review this phase of the budget. With her, we understand, are Wally B. Beyer, Administrator, Rural Utilities Service; Jan E. Shadburn, Administrator, Rural Housing Service; Dayton J. Watkins, Administrator, Rural Business-Cooperative Service; Bruce Crain, Executive Director, Alternative Agricultural Research and

PART 1

572

Commercialization Corporation; and Dennis Kaplan, the Department's Office of Budget and Program Analysis representative.

Thank you all for being here. If I have omitted someone, I am going to ask Secretary Thompson to point that out and introduce others who might be accompanying her this morning.

We have your written testimony, which we appreciate very much. We will make that a part of the record in full, and ask you to make whatever summary comments or remarks you think would be appropriate. We will then have an opportunity to take questions from the subcommittee members.

Before proceeding, though, I am going to ask my colleague, Senator Burns, from Montana, if he has any opening statements or comments he would like to make at this time. Senator Burns.

Senator BURNS. Thank you very much, Mr. Chairman.

We have a very lively microphone. Does anybody ever use this thing? [Laughter.]

We are not going to dwell too much on this. Anyway, Mr. Chairman, I have a statement. We have to get this week started off with a little levity or it is going to be a long week, I fear. So, thank you very much. I will ask if my full statement can be made a part of the record.

I just want to comment this morning that times change and the way we serve our rural communities is changing, too. Mr. Beyer and RUS, we have to start thinking technology and how technologies serve our rural areas and of course the rural utilities programs, distance learning, and telemedicine. I have a great interest in them all because we are moving into a new era with the different ways that we deliver our services and how we plan for rural development, how the infrastructure should look. Broadband communications happens to be a vital part of that. With rural telephones and with the use of wireless, all of this becomes very, very important to rural Montana, just as electricity or anything else is a vital part of that infrastructure that attracts business and industry, aside from our traditional agricultural base to those communities, is vital.

And so I congratulate you for holding these hearings. I am sorry that we do not have some more money to spend in some areas on infrastructure. I think that is the role of Government—to provide that policy and seed money to build infrastructure and then the rest of us can get out of the way and let those that have great imaginations and ideas, let those ideas flow where they serve the majority of the people who are in the business of providing not only food and fiber, but the ability to provide the other services that are found in our rural communities.

And I thank you for this hearing today.

PREPARED STATEMENTS

Senator COCHRAN. Thank you, Senator. We have your written statement and it will be made part of the record along with statements from Senator Bumpers and Senator Byrd.

[The statements follow.]

PART 1

573

PREPARED STATEMENT OF SENATOR BURNS

Thank you Mr. Chairman. I thank you for calling this hearing today. The importance of what is going on in rural America is extremely real to all of us, especially since the majority of this committee comes from rural states. We are touched daily by the questions that our friends and neighbors have about the future of their way of life in rural America. Montana is no different in this respect than is Mississippi or Arkansas.

I have some concerns about what we are planning to do to assist our rural American neighbors. I would love to see the ability to spend more money to spend to assist these people in the development of industries related to their way of life. However, we must do the most with the amounts of money we have available to us.

I have a great interest in the efforts of the Rural Utilities Service to help bring our rural schools and medical facilities into the Information Age. The RUS Distance Learning and Telemedicine Grant Program provided seed money to some of our most successful telemedicine networks in Montana, networks that are still expanding. Rural America continues to face barriers to full access to telecommunications, and one of the best ways to get networks up and running is through grant programs. The grants are relatively small and usually no more than 3 years in duration, but they allow an initial capital investment so the networks can get started. Telecommunications is an important part of rural development and I believe we ought to stay focused on it as we craft this year's bill. This modest investment will bring rural areas dividends in the form of better education, better health care, and more jobs.

I will keep my statement short today to hear from the Department of Agriculture. I thank the Chairman and look forward to hearing from the Under Secretary today.

PREPARED STATEMENT OF SENATOR BUMPERS

Mr. Chairman, again, thank you for your courtesies and let me offer a welcome to today's panel. This hearing will focus on the agencies at USDA charged with the responsibilities for Rural America. My state, with the exception of a few urban areas, is a rural state. Obviously, these agencies are therefore very important to my state. I can not go into any community in any part of my state where the programs administered by the people in this room have not had some direct effect of the lives of the people in those communities.

Growing up in Charleston, Arkansas, I still recall when electricity, running water, and telephone service first came to our home. I know that these are services most Americans take for granted. In truth, there are far more Americans than many would expect that still live day in and day out without these basic services. Without the USDA rural development programs, many hundreds of thousands of Americans every year would still be surviving, somehow, without running water, electricity, or telephones. If America is going to move into the 21st Century as one nation, that means it is up to us to see that all Americans have access to, at least, the basic services of life. The United States of America is not a Third World Country and our people should not be expected to live in conditions as though it is.

Of all the requests that I receive from constituents in my state, none are more compelling, nor might I add more unrelenting, than appeals from rural communities and water districts for funding from the Rural Utilities Service's Water and Wastewater programs. I have seen first hand what a difference these programs can mean for rural communities and I have long considered myself a champion for their cause. My support for these programs is not simply because they are what my constituents want, I honestly believe these programs are among the very best provided anywhere within the federal government. Secretary Thompson, and Mr. Beyer, my congratulations to you for your continuing good work.

By underscoring my support for the Water and Wastewater programs, I don't mean to ignore the other important programs at USDA for Rural America. Adequate housing has been and continues to be a major problem for rural Americans. When one thinks of homelessness, the immediate image is usually one found in an urban setting. But homelessness is not a problem isolated to the inner city, it is found all across our countryside. Equally troubling is the large number of rural Americans who live in totally inadequate housing. USDA's housing programs are designed to make housing affordable, safe, and, in some cases, existent for many families. I continue my support for these programs, but I am a little troubled by an item in the budget request calling on this subcommittee to provide funding for certain section 8 housing assistance costs that have formerly been under the jurisdiction of the VA-HUD subcommittee. With our limited resources, I am concerned that this expansion,

PART 1

574

without a corresponding increase in our 602(b) allocation, will be problematic for existing USDA programs.

To further the need for USDA programs, I would like to focus for a moment on the tragic natural disasters that continue to ravage many parts of our country. For the past several weeks, we have all witnessed the terrible losses in the upper plains states from a combination of massive floods and freezing temperatures. The result has the appearance of convulsive ice flows that have isolated homes and communities. There is certainly a role for USDA Rural Development programs to help these communities and families cope with this disaster.

In addition, last month, deadly tornadoes touched down in several communities in Arkansas. Beyond the grievous loss of life and personal injury, many thousands of Arkansans lost their homes and places of employment. I had hoped that the emergency supplemental request pending before Congress would have included an amount necessary to remedy these programs through agencies such as the Rural Utilities Service, the Rural Housing Administration and the Rural Business and Cooperative Development Service, but I fear the amounts included, where in fact they are included, will fall far short unless there are additional amounts requested by the Administration.

The challenges facing Rural America have always been great. From the days of early settlement, giving rise to the genesis of the American spirit, through the trauma of the Great Depression, to the political disparity resulting from declining populations, Rural America has been at the heart of American perseverance and on the cutting edge of national direction. Today, rapidly changing technologies in communication and information offer Rural America a place at the table of national and global dialogue and achievement. But that place at the table will not occur if we don't ensure Rural America the tools necessary to compete and be a full player in the information age that is upon us. The agencies here today can, and must, play a vital role in making sure that Rural America not only has the basic services necessary for decent living, but also the tools appropriate for the opportunities that lie ahead.

PREPARED STATEMENT OF SENATOR BYRD

Chairman Cochran, Senator Bumpers, members of the subcommittee, and Under Secretary Long Thompson, I am pleased to be here today to review the U.S. Department of Agriculture's (USDA) Rural Development (RD) programs. These programs address one of my long-standing priorities—community infrastructure that meets the basic needs of our citizens. Particularly, the Rural Utilities Service (RUS) programs provide small rural communities with grants and loans for water and waste disposal systems—infrastructure that I deem as a fundamental element of modern civilization.

Incredibly, in these United States, nearly 8 million people do not have access to safe drinking water. Now, let me repeat that, 8 million people in the United States of America, the most prosperous and powerful nation on the face of the Earth, do not have access to a reliable source of clean drinking water. That, in my view, is a national disgrace. National safe drinking water needs are assessed at some \$10 billion. In West Virginia, in 1995, 176,000 families were without an adequate supply of safe drinking water, and the estimated cost of needed water development projects in my state alone is \$568 million.

The USDA's efforts to provide safe drinking water to American families are generally laudable, if underfunded. I have maintained for years that our budget ignores the most basic needs of the people, and that we must take action to restore common sense to our budget priorities. Last year, I offered an amendment that would close corporate loopholes and restore \$65 billion to the federal budget for domestic projects, including funds for water and waste disposal projects. Upon its defeat, I offered another amendment to add \$1.5 billion for federal water and waste water projects. Regrettably, this amendment was defeated as well. Nevertheless, last year, under the capable leadership of Bobby Lewis, the West Virginia Rural Development State Director, the USDA made available \$22.2 million to fund projects that will provide hundreds of West Virginians with access to a reliable source of clean drinking water for the first time. However, much work remains, and this hearing is a welcome opportunity to renew attention to the critical need for federal investment in basic infrastructure. I have several questions regarding the President's proposed budget in this regard.

PART 1

575

STATEMENT OF JILL LONG THOMPSON

Senator COCHRAN. Madam Secretary, you may proceed.

Mrs. THOMPSON. Thank you, Mr. Chairman and members of the committee. I am pleased to be here today to present for your consideration the 1998 budget request for the rural development mission area. And before I discuss the specifics of the budget request, I would like to thank the subcommittee and your staff for the assistance that you have provided to the mission area and to the Department over the past year.

With your assistance and leadership, we were able to enact some of the reforms needed in the multifamily housing program, and then, also, again with your assistance, we were able to conduct a very successful voluntary separation program, which mitigated the need for a large reduction in force. The voluntary separation program has assisted us in meeting other commitments, such as the implementation of the centralized servicing system, and it has permitted us to maintain a staff that is going to be with us for years to come.

This past year has been very rewarding, as the mission area has enjoyed a number of successes beyond delivering the program funds provided by this subcommittee. We began the implementation of the dedicated loan origination servicing system, which will save the taxpayers \$250 million over the first 5 years, and \$100 million annually thereafter. We have also completed the streamlining of a number of our major regulations, single-family housing, business and industry loan guarantees, and water and waste disposal loans. And we, of course, are working on others.

Mr. Chairman, since the early days of this administration, it has been evident that one of the President's highest priorities is to continue and, where possible, strengthen the investment in rural America. While we have seen some improvements in rural areas over the past few years, real household incomes have actually declined, and poverty rates are still alarmingly high.

As you know, the majority of rural poor families are working poor, and incomes are not sufficient to lift families above the poverty level in many cases. The poverty rate in rural America still stands at about 17 percent. And even more disturbing is the fact that 25 percent of rural children under the age of 18 live in families with incomes below the poverty level. And among African-American children, the level is about 54 percent.

Neither the programs of this mission area nor any other Government program can ensure the economic success of any individual, but we can help eliminate some of the obstacles. And empowering people and communities to build the capacity to control their destinies, while partnering with the private sector to build new economic opportunities is a charge that I am very committed to, and is the foundation of this budget request. This budget reflects the President's belief that jobs create opportunity and long-term community stability.

This administration stands behind the principle that if sustainable economic development is to occur, rural communities themselves must develop the structures that enable them to respond to rapidly changing economic conditions and forces in order to become

PART 1

576

competitive and to remain competitive. The communities that are successful are those that take the initiative and have the determination to succeed.

As you know, one of the requirements of the 1996 farm bill is that our State directors in rural development, working in concert with local communities and the States, prepare a plan for the expenditure of the funds appropriated through these programs. Each State office has submitted a draft of their plan, and we are now in the process of reviewing them. And based on my early review of them, I do expect that these plans will very much be like business plans that articulate where a particular State hopes to be 5 or 10 years from now, and sets forth very concrete steps, benchmarks, to get there.

In fact, the benchmarking is one of the more useful tools that comes out of the empowerment zone enterprise community experience. One of our champion communities, an applicant that did not receive designation as an empowerment zone or an enterprise community, did not wait around for the Federal Government to act, and based on the plan they developed, they have now brought in \$100 million in investments without Government assistance.

I very much appreciate the willingness of this subcommittee to appropriate funds under the Rural Housing Assistance Program, the Rural Business Assistance Program, and the Rural Utilities Assistance Program for fiscal year 1997. However, I do remain convinced that the additional flexibility that we requested—the authority to transfer up to 10 percent nationally from one funding stream to another—is a tool that we need to improve the use of the programs as development tools. For that reason, we have again submitted the budget under the terms of the Rural Community Advancement Program, as enacted in the 1996 farm bill.

The budget request for RCAP totals \$2.5 billion in program level, and that translates to a \$689 million level in budget authority. As a former Member of Congress, I fully understand and I share the committee's concerns regarding accountability for sums of money of this magnitude and the ability to track expenditures.

And today I want to assure the committee that I would not approve any transfer until a system has been developed to track the amounts of funding transferred, nor will any transfer be approved unless the administrators of the respective agencies agree to it. We have developed such a tracking system and we can implement it quickly should we be given this authority.

The budget request for the Rural Housing Service, including those programs under RCAP, totals \$921 million in budget authority, which will support a loan and grant program level of \$5.4 billion. Over 60 percent of the budget authority is for the Rental Assistance Program, which, as you know, is the rental subsidy that makes it possible for very low income families to live in the multi-family projects that the Department of Agriculture finances.

The request also includes a transfer from HUD of \$52 million, for us to assume the responsibility for administering the HUD section 8 assistance in some of our housing projects.

For the Rural Utilities Service, including what is requested under RCAP, the total is \$734 million in budget authority, which will support \$3 billion in loans and grants. And over 80 percent of

PART 1

577

the budget authority is to support the water and waste disposal loan and grant programs. The request for these two programs is essentially the same as the subcommittee provided last year. And this level will enable us to continue our commitment to the Water 2000 initiative, as well as meet some of the other increasing demands for these programs.

Probably the most significant change from last year's budget involves the Distance Learning and Telemedicine Program. We are requesting \$21 million in grant funds, compared to the \$7.5 million the subcommittee made available in 1997. And the reason for an increase of this magnitude is quite simple. As Senator Burns very eloquently stated in his remarks, I believe that, in the long term, this program will generate a greater return to the American public and the Federal Government than any other program. And the program is a prime example of why we should view these programs as investments rather than simply expenditures.

The program budget request for the Rural Business-Cooperative Service totals \$70 million in budget authority, and that would support a loan and grant program level of \$780 million. As I have stated earlier, I firmly believe that the private sector is the key to sustainable economic development in rural areas.

And while the private sector has worked very well in most areas, there are some rural communities in which the private sector does not participate as well as they or we would like them to. And as I have also said, I believe the Government's role in these areas should be to encourage the private sector in doing what it does best. Increasing the role of the private sector will enhance our ability to create and maintain jobs in rural America.

The budget request includes \$10 million for AARC. That is an increase of \$3 million over fiscal year 1997. AARC is of critical importance in enhancing private investment in rural areas. As you know, AARC's investments have led to the creation of 5,000 new jobs, all in rural areas, and each one related to value-added agricultural products.

With regard to salaries and expenses, I am very pleased with the progress that rural development has made in meeting our objectives in streamlining and reinvention. And I pledge to you that we will continue to do our share in changing how we conduct business. These changes are long overdue, and had they been made when needed, they probably would not be as costly as they are today.

The improvements we are making, such as DLIS, can only be achieved if up-front investments are made. We have implemented improvements without significant negative consequences on employees, and we thank the subcommittee for helping us to accomplish that.

For salaries and expenses, I have requested \$516 million for fiscal year 1998, which is a reduction from 1997. But I believe it is exactly what we need to continue to administer the programs and to carry out our other responsibilities without having to impose further reductions in force.

Mr. Chairman, before I close, I would like to say that, last year, you questioned our projections regarding the subsidy rate for the single-family housing loans. And at that time, I suggested, in jest, that you were being cynical. And at this point, looking back, I

PART 1

578

would like to say that I very much admire your ability to forecast economic trends; that you were more accurate than I was. And I am hopeful that, as we work toward fiscal year 1998, that what we are requesting will be a more accurate reflection of what the true interest rates are going to be and what the Treasury rates will be.

You were more accurate than I was.

Senator COCHRAN. Thank you.

Mrs. THOMPSON. And I say that as someone who has taken a number of courses in economic forecasting and have studied econometric models and feel that I have a pretty good background. And I think that you were quite accurate last year.

PREPARED STATEMENTS

Senator COCHRAN. Well, thank you, Madam Secretary. And let me say that we have statements from others on the panel which we will also incorporate in our hearing record. But if any of the others have an opening statement, we would be happy to receive their comments at this time.

Mrs. THOMPSON. We would be happy just to submit them for the record, so that we can proceed with your questions.

[The statements follow:]

PREPARED STATEMENT OF JILL LONG THOMPSON

Mr. Chairman and Members of the Committee, I am pleased to be here today and present for your consideration the 1998 Budget request for the Rural Development Mission Area. Before I discuss the specifics of the Budget request, I would like to thank the Subcommittee and your staff for the assistance provided to this mission area and to the Department during the past year. With your assistance and leadership we were able to enact some of the reforms needed in the multi-family housing program and, again with your assistance, we were able to conduct a very successful voluntary separation program which mitigated the need for a large Reduction-in-Force. The voluntary separation program has assisted us in meeting other commitments such as the implementation of the centralized servicing system, and has permitted us to maintain a staff that is going to be with us for years to come.

Mr. Chairman, this past year has been very rewarding as the mission area has enjoyed a number of successes beyond delivering the program funds provided by this Subcommittee. We began the implementation of the Dedicated Loan Origination and Servicing System (DLOS) which will save the taxpayers \$250 million over the first five years and \$100 million annually, thereafter. Implementation is still in the early stages, but we see no reason that we cannot meet our projected completion date of October 1, 1997. DLOS is one of the largest government reinvention efforts undertaken, and the monetary savings is only one part of the success. We have proven that we can successfully manage large scale change, and we have proven that change does not necessarily lead to negative consequences for our employees.

We have also completed the streamlining of a number of our major regulations: single-family housing, business and industry loan guarantees, and water and waste disposal loans, and we are working on others. Our objective has been not just to streamline, but also to produce a product that works better and costs less. These regulations are not only smaller in volume—they are much more understandable and customer friendly. Further, in order to make the business and industry loan guarantee program more attractive to lending institutions, the application forms will soon be available electronically, and they can be forwarded to our offices electronically. We are now examining other opportunities to use this application process.

FOCUS OF THE 1998 BUDGET

Mr. Chairman, since the early days of this Administration it has been evident that one of the President's highest priorities is to continue, and where possible strengthen, the investment in rural America.

While we have seen some improvement in rural areas over the past few years, real household incomes have actually declined and poverty rates are still alarmingly high. The majority of rural families are working poor. Incomes are not sufficient to

PART 1

579

lift families above the poverty level in many cases. The poverty rate in rural America still stands at about 17 percent. Even more disturbing, however, is the fact that 25 percent of rural children under the age of 18 live in families with incomes below the poverty level, and among African American children, the level is about 54 percent. As the President said in his State of the Union address, our economic future is with these children, and their Education and training will be the cornerstone of tomorrow's economy. However, many of these children may not have the opportunity to obtain the necessary education because they still lack basic amenities of life such as adequate shelter and running water in their homes. Investment in the elimination of these problems must continue, and we must view them as investments, rather than simply expenditures.

EMPOWERMENT AND PARTNERSHIPS

Neither the programs of this mission area nor any other Government program can ensure the economic success of any individual, but we can help eliminate some of the obstacles. Empowering people and communities to build the capacity to control their destinies while partnering with the private sector to build new economic opportunities is a charge that I am very committed to and is the foundation of this budget request. This budget reflects the President's belief that jobs create opportunity and long-term community stability. We recognize that it is primarily the responsibility of the private sector to create the needed jobs. However, in many rural areas, the private sector alone cannot accomplish the task. These are the areas where we need to focus our efforts and help the residents and the private sector create opportunity.

This Administration stands behind the principle that if sustainable economic development is to occur, rural communities themselves must develop the structures that enable them to respond to rapidly changing economic conditions and forces in order to become competitive and to remain competitive. The communities that are successful are those that take the initiative and have the determination to succeed.

There has been some improvement in rural areas, but examining the data closely reveals that most of the improvement occurs in those counties adjacent to metropolitan areas. According to one report, over 400 rural counties have fewer jobs today than in 1969. These counties are generally found in the northern plains, the agriculture heartland, the Mississippi Delta, the Cotton Belt, and natural resource dependent states. The growth that has occurred in rural areas tends to be concentrated in slow growth or declining industries—and in the more rural counties that have experienced growth, it tends to be in low-skill, low-wage jobs. This type of growth does not provide a base for self-sustaining economic development.

For sustainable development to occur, rural communities must either attract more of the high skill industrial employment or increase the number of higher income residents and the only means of accomplishing this is to increase investment that improves the communities' ability to compete in an increasingly global economy. Depending on their individual circumstances, this investment ranges from basic infrastructure improvements and housing to business and industrial investment. And we in the Federal government who administer programs that assist rural areas must be willing to work with the communities, and the States, to ensure that the investments are tied to long-term strategic improvements. As you know, one of the requirements of the 1996 Farm Bill is that our State Directors, working in concert with local communities and the States, prepare a plan for the expenditure of the funds appropriated through these programs. Each State Office has submitted a draft of their plan and we are now in the process of reviewing them. I expect these plans to be like business plans that articulate where a particular State hopes to be 5 or 10 years from now and sets forth very concrete steps (bench marks) to get there. Bench marking is one of the more useful tools to come out of the Empowerment Zones/Enterprise Communities (EZ/EC) experience. One of our "Champion Communities", an applicant that did not receive designation as an EZ/EC, did not wait around for the Federal government to act. Based on the plan they developed they have now brought in \$100 million in investments without government assistance. This is the ability and determination that we hope to create in all of our customers.

RURAL COMMUNITY ADVANCEMENT PROGRAM (RCAP)

I very much appreciate the willingness of this Subcommittee to appropriate funds under the Rural Housing Assistance Program, the Rural Business Assistance Program, and the Rural Utilities Assistance Program for fiscal year 1997. However, I remain convinced that the additional flexibility that we requested, the authority to transfer up to 10 percent nationally from one funding stream to another, is a tool that we need to improve the use of the programs as development tools. For that rea-

PART 1

580

son we have again submitted the budget under the terms of the Rural Community Advancement Program (RCAP) as enacted in the 1996 Farm Bill.

I strongly believe that the key to economic growth in rural areas is the private sector, particularly the investment community. In most rural areas the private sector works quite effectively and efficiently. However, in other areas it does not work as well and when investment capital flows out of rural areas the local capacity to foster economic development declines, as does the incentive to invest in these areas. Inevitably, the Congress and the Administration are faced with public policy choices regarding these problems. What we collectively have done over the past few decades is enact new programs to meet some of the needs. The programs we administer today are a result of that process and while they individually have been very successful in eliminating or mitigating specific problems, they have not been used collectively to address the economic structural problems that plague many of our rural areas. What the Administration proposed, and what the Congress enacted in the 1996 Farm Bill, was the philosophy of better using what resources we now have rather than creating new programs which stood little chance of being funded due to budget constraints. If the problem is investment capital, we should focus our efforts not on new programs, but rather on how we can encourage the private sector by expanding secondary markets, making existing programs easier to use, working with community bankers to increase their ability to package loans, sharing risk with other institutions, and creating more partnerships with the private sector. This philosophy should also apply to infrastructure investments. At every opportunity we are involving other lenders and other sources of funds in our projects to stretch our limited resources. We can and we will do more of this. But, what we need is the flexibility to bring the key players to the table and structure a financial package that is good for the community, is a sound investment for the local lender, and reduces the involvement of the Federal government. Neither the Federal government, local or state governments, nor the private sector can solve these problems alone. We have to work together. The Federal government has to be more flexible in its approach to solving these problems, and, in my opinion, the flexibility outlined in RCAP is the most important part of the legislation.

The budget request for RCAP totals \$2.5 billion in program level and \$689 million in budget authority. As a former Member of Congress, I fully understand and share the Committee's concerns regarding accountability for sums of money of this magnitude and the ability to track expenditures. I assure the Committee that I would not approve any transfer until a system has been developed to track the amounts of funding transferred, nor will any transfer be approved unless the Administrators of the respective Agencies agree to it. We have developed such a tracking system and can implement it quickly, should we be given the authority requested.

RURAL HOUSING SERVICE

The budget request for the Rural Housing Service, including those programs under RCAP, totals \$921 million in budget authority which will support a loan and grant program level of \$5.4 billion. Over 60 percent of the budget authority is for the rental assistance program which, as you know, is the rental subsidy that makes it possible for very low-income families to live in the multi-family projects that USDA finances. The request also includes a transfer from HUD of \$52 million for us to assume the responsibility for administering the HUD section 8 assistance in some of our housing projects. The Administration has adjusted USDA and HUD budget ceilings to reflect this transfer of responsibility. The request also includes \$4 billion for single-family housing loans, \$1 billion of which is for direct loans. Loans, loan guarantees and grants for community facilities total \$428 million with a subsidy cost of \$27.6 million. As you know, the funds are used to finance a wide variety of community facilities ranging from hospitals and health clinics to sidewalks and drainage improvements, with over 50 percent of the money being utilized for either health facilities or fire and rescue equipment.

Mr. Chairman, during the past few decades this country has made great strides in reducing the number of Americans living in inadequate housing and much of the credit for this success lies with this Subcommittee. Unfortunately, there is still a large number of rural Americans living in inadequate housing and, despite the desire of each one of us to balance the budget, the simple fact is that housing poor families costs money. And as we deliberate this budget request we must keep in mind that this housing is more than shelter from the elements—it is more than providing short-term jobs in the housing industry and increasing the local tax base of the community. Being a homeowner increases the dignity of these families immeasurably—it provides an environment for the children to gain more from their education. I would strongly encourage each Member of the Subcommittee to visit one

PART 1

581

of our mutual and self-help housing sites, visit with the families that have built their own homes with a little help from the Federal government, and experience what being a homeowner means to these families. Programs such as the mutual and self-help program should be among the highest priorities of this government because it gives people the opportunity to lift themselves out of their existing conditions. I think a quote from a recent article in the Los Angeles Times puts the proper perspective not only on the self-help program, but all of our programs. The statement is made by a gentleman in Mississippi, who with his family, recently moved into a new home that he and neighbors constructed through the program. He "imagines the children having a clean place to study and himself awakening after a good nights rest where you don't have to worry about catching rain in pots and pans".

RURAL UTILITIES SERVICE

The request for the Rural Utilities Service programs, including those requested under RCAP, totals \$734 million in budget authority which will support \$3.0 billion in loans and grants. Over 80 percent of the budget authority is to support the water and waste disposal loan and grant programs. The request for these two programs is essentially the same as the subcommittee provided last year and this level will enable us to continue our commitment to the Water 2000 Initiative as well as meet some of the other increasing demand for these programs. We presently have a backlog of applications for water and waste disposal loans and grants totaling over \$4 billion, and this represents but a fraction of the funding that will be required to meet water quality and drinking water standards in rural areas. We will be increasing our efforts to attract other funding for these projects in order to stretch our limited resources.

The most significant change from last year's budget involves the distance learning and telemedicine program. We are requesting \$21 million in grant funds compared to the \$7.5 million the Subcommittee made available for 1997. The reason for an increase of this magnitude is quite simple. I firmly believe this program will, in the long-term, generate a greater return to the American public and the Federal government than any other program, and the program is a prime example of why we should view these programs as investments rather than simply expenditures. This is part of the President's emphasis on education. This program will ensure that rural students have access to the same educational opportunities available in suburban and urban schools, and improves the prospect that more of the students will remain in rural areas because they will no longer have to migrate to urban areas for better jobs. This technology means that the information business is no longer dependent on being close to urban centers.

Not only does the distance learning program provide the enhanced educational opportunities to rural students that will enable them to compete in the job market and the universities with urban students, but it provides those students from poverty stricken families the educational tools that may change their lives. They no longer have to face a future of very limited opportunity or perhaps be doomed to a future of public assistance. These are the faces that light up the most when provided access to this technology. They are the ones that realize this access can help them break out of the poverty cycle that affects too many rural areas in this country. Secretary Glickman and I had the fortune to visit the schools in the Mississippi Empowerment Zone and see first hand what this technology means to these students. And I might add that this effort is supported not only by the Federal government. The private sector has been working hand-in-hand with us. In this particular school system we were able to place a number of Federal surplus personal computers, many which we and others repaired and upgraded. A private firm from Indiana donated 40,000 feet of cable initially, and has agreed subsequently to donate an additional 3.5 million feet, while Federal employees and employees of the local telephone company volunteered the labor to wire the schools so the students could have access to the information Superhighway.

Mr. Chairman, none of the success we will see from the distance learning/telemedicine program would have been possible without the rural electric and telecommunications programs. The positive economic effects these two programs have had on rural America cannot be measured. I say this to reiterate the point that rural America cannot attract the businesses or industry it needs to strengthen local economies without making investments in infrastructure. Mr. Chairman, we are requesting \$34 million in budget authority to support a total program level of \$1.5 billion for electric and telecommunication loans.

PART 1

582

RURAL BUSINESS-COOPERATIVE SERVICE

The program budget request for the Rural Business-Cooperative Service totals \$70 million in budget authority—this will support a loan and grant program level of \$780 million. As I have stated earlier, I firmly believe that the private sector is the key to sustainable economic development in rural areas, and while the private sector has worked very well in most areas, there are some rural areas in which the private sector does not participate as well as they or we would like for them to. And as I have also said, I believe the Government's role in these areas should be to encourage and assist the private sector in doing what it does best. Increasing the role of the private sector will enhance our ability to create and maintain jobs in rural America.

We have taken several steps to make the business and industry loan guarantee program easier for private lenders to use and we have also included incentives for the lenders to participate in areas in which they are now not very active, such as the Empowerment Zones/Enterprise Communities. For example, we are willing to increase the level of guarantee from 80 percent to 90 percent and decrease the guarantee fee from two to one percent on loans made in the targeted areas. The application will soon be available electronically, and the lenders will be able to submit the applications electronically. All of these changes should increase the participation and efficiency in the program.

Mr. Chairman, with the decline of the traditional farm programs which provided stability in the farm markets, I firmly believe that cooperative-owned farm businesses offer an opportunity to pool risk, increase marketing power, and provide the stability no longer available through the price support programs. We see cooperatives as part of the safety net for farmers. In addition, I think we will see more cooperative processing businesses to maximize the amount of money returning to the farmer and remaining in the rural communities. We will soon be submitting legislation to the authorizing committees to authorize the delivery of assistance to non-agricultural cooperatives. There is an increasing interest in rural areas to use the cooperative form of business to deliver other services such as health care, child care and housing. At present we are prohibited from providing such assistance unless the primary sponsor is an agricultural cooperative. This legislation, if enacted, will provide another important tool in our rural development efforts and I think we will see more use of our business programs by cooperative ventures. As I said earlier in this statement, it is important that local investment capital remain in the local community—this is the foundation that makes sustainable development possible. Once the investment capital starts to migrate to other areas a declining spiral in the economy begins and it is very difficult to reverse.

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION CORPORATION

Mr. Chairman, the budget request includes \$10 million for AARC, an increase of \$3 million. AARC is of critical importance in enhancing private investment in rural areas. AARC's investments have led to the creation of 5,000 new jobs, all in rural areas and each one related to value-added agricultural products. AARC equity investments are part of the safety net for farmers, providing that vital link between the development of new products based on agricultural commodities and successful commercialization that is now even more critical with the gradual phase out of commodity support payments.

SALARIES AND EXPENSES

Mr. Chairman, I am very pleased with the progress that Rural Development has made in meeting our objectives in streamlining and reinventions and I pledge to you that we will continue to do our share in changing how we conduct business. These changes are long overdue and had they been made when needed, they probably would not be as costly as they are today. The improvements we are making, such as DLOS, can only be achieved only if up-front investments are made. We have implemented improvements without significant negative consequences on employees, and we thank the Subcommittee for helping us accomplish that. Mr. Chairman, for Salaries and Expenses I have requested \$516 million. This is a reduction from 1997 and is exactly what we need to continue to administer the programs and carry out our other responsibilities without having to impose further Reductions-in-Force. The level appropriated for 1997 presented some management challenges, but through planning and moving some items planned for 1997 back into 1996 and delaying other plans and reducing other headquarters expenditures, we have been able to work within the level provided and maintain our commitment not to reduce administrative support of the State Offices.

PART 1

583

Seventy four percent of our request is composed of salary costs. We cannot continue to absorb costs without further reductions-in-force, and we cannot afford to reduce the staff further than we have planned without jeopardizing the delivery of programs. We will have reduced the staff by over 2,000 positions since 1993 and we have closed just under 400 offices. At the same time, our costs have increased automatically through inflation and annual cost of living adjustments and further reductions in salaries and expenses will necessitate reductions-in-force and that will negate much of the progress we have made.

Thank you very much for the opportunity to discuss the budget request for rural development. The Administrators and I will be happy to respond to any questions you may have.

PREPARED STATEMENT OF WALLY BEYER

Mr. Chairman and Members of the Subcommittee, I am pleased to accompany Under Secretary Jill Long Thompson and present the 1998 Budget and Program Proposals for the Rural Utilities Service. I want to thank the Subcommittee for the support you are providing to rural America. Investment in infrastructure continues to be an investment in our Nation's future productivity and equality of economic opportunity. Congress has always recognized that it is in our national interest for all citizens, and all regions, to have equal opportunity to build, to grow and to develop to our greatest potential. The latest example was the passage of the Telecommunications Act of 1996, when Congress and the President declared that it was in our national interest to ensure that reliable, affordable, telecommunications be available to rural citizens as well as major population centers.

The character of this Nation is rooted in rural America. We began as an agrarian society and our rural experience still affects our lives. Geographically we are rural. Rural America comprises 80 percent of the Nation's landmass. With nationhood comes responsibility, and the investment we as a people and as a government have made in the infrastructure of rural America has benefited all Americans. This investment has increased economic productivity, improved health care and education and created a modern agriculture that is a part of the global economy. Living in the Great Plains most of my life, I know firsthand the benefits of our rural electric, telecommunications and water programs. The opportunity that the government has "helped to ensure" throughout the years will be just as important tomorrow as it was 60 years ago.

The rural infrastructure programs are the foundation of rural education, health and economic development. Without a strong foundation, rural America will not be able to build on its strengths and aid the country as we move into this increasingly competitive global economy.

RUS is the Federal government's point agency for rural infrastructure assistance. RUS infrastructure programs focus on targeting scarce Federal resources into high cost areas, poverty areas, low density and out-migration areas and servicing the unserved. Priority is given to leveraging scarce Federal dollars. The 1998 budget proposes \$34 million in budget authority for the electric and telecommunications infrastructure loan programs. This \$34 million budget authority will generate \$1.5 billion in Federal loans with an additional leveraging of \$4.33 billion private capital for a total anticipated 1998 capital investment of \$5.8 billion in the rural electric and telecommunications infrastructure. This relatively small Federal dollar investment in rural infrastructure is a critical catalyst for the much needed private, state, and local capital used to maintain quality reliable infrastructure in rural America at reasonable cost. Each Federal loan dollar in the RUS telecommunications program leverages 4.5 private capital dollars. Each Federal loan dollar in the RUS electric program leverages 3.0 private capital dollars.

WATER AND WASTE DISPOSAL PROGRAMS

It is hard to imagine, but in this modern era we still have rural areas with families that are drinking unsafe water and families without plumbing and wastewater facilities. These are pressing but solvable public health concerns. Towns and communities of less than 10,000 people often lack the tax base and bonding authority to construct, update, or repair water and waste disposal infrastructure systems.

Drinking water and waste disposal infrastructure is basic and vital to both health and economic development. The Water and Waste Disposal Program administered by RUS invests loans and grants to bring safe drinking water and sanitary, environmentally sound waste disposal facilities to rural Americans in greatest need. If economic growth is going to occur in an area, adequate water and waste disposal facilities are a necessity. The challenges presented by investing in safe and clean water

PART 1

584

for rural areas and small communities are sometimes daunting, but our achievements are among our most rewarding.

The programs make sound investments in rural citizens and small communities, improving the lives and public health standards of rural Americans in all 50 states. Sanitary and environmentally sound water and waste disposal facilities are key to protecting against serious, often life threatening illnesses related to water contamination, such as crypto sporidium,¹ giardia, gastroenteritis, cholera, typhoid, and salmonella.

The RUS loan and grant programs will provide safe, affordable drinking water to an estimated 782,000 rural households and an estimated 2.2 million people in 1998. This program consistently has far more requests for funds than funds available. At the end of 1996, states had on-hand loan and grant applications totaling \$4.1 billion. State Rural Development Directors have for several years done an outstanding job of mixing grants, loans, state and non-USDA funds to leverage and finance the highest priority projects. Based on the Administration's belief and policy that low income and poverty areas represent the greatest need, water and waste disposal investments are targeted to those areas.

Water 2000 initiative

In the RUS' state-by-state assessment in 1995, we found that an estimated 2.5 million rural Americans, including some one million people who do not have water piped into their homes, have critical needs for safe, dependable drinking water. Approximately 5.6 million more were found to have additional serious needs under Safe Drinking Water Act standards. Water 2000 is an initiative to clearly assess those needs and to target the loan and grant investments to address them. State Rural Development offices have completed the Needs Assessment which shows at least \$3.5 billion in critical rural safe drinking water investment needs, and another \$6.5 billion in additional serious needs.

A good example of the value of this initiative is a project just funded to allow the City of Campton, Kentucky, to expand its current public water system to rural homes that now rely on spring, creek and well water.

Located in Wolf County in the Appalachian region of Kentucky, the local economy is limited to small farms, small timber operations, and small coal mines. The median household income in Wolfe County is approximately \$11,000, less than half the state average of \$22,232. The County has water sample records from the supplies of more than 100 people living in the proposed service area and the majority of the tested samples are highly contaminated with fecal coliform and/or confluent growth and some have detected the presence of dangerous E. Coli bacteria. By expanding the service area of the community, an additional 370 users will have a safe, dependable source of good drinking water.

Water 2000 special allocation

In 1996, Congress provided us with \$36 million (budget authority) in unspent funds from the special supplemental nutrition program for Women, Infants and Children (WIC), to be used for safe and clean water projects. In July 1996, we converted these funds into \$59 million in Water and Wastewater loans and grants, which we supplemented with \$11 million in loans and grants from regular State allocations, and used to implement a total of \$70 million 54 targeted safe drinking water projects in 35 states. These projects, once all completed, will result in improved drinking water quality, quantity and dependability for an estimated 145,122 people, including some 18,200 receiving public water in their homes for the first time.

In 1995 and 1996, RUS invested a combined total of \$547 million in loans and grants in projects that meet the guidelines of Water 2000, which place a priority on serving unserved or under served households.

Water and waste disposal budget

The budget requests a total of \$1.2 billion Water and Waste loans and grants. The program mixes loans and grants, according to the needs of the community or system, in order to provide water and waste disposal at an affordable rate. Under the RCAP program, the budget request is for a 1998 program level for Water and Waste Disposal loans of \$809 million with a budget authority of \$72 million and Water and Waste Disposal Grants and \$484 million in grants.

¹ Crypto sporidium killed more than 100 people in Milwaukee, Wisconsin, in April 1993, and seriously sickened thousands more.

PART 1

585

TELECOMMUNICATIONS

Technological advances in the telecommunications industry will mean new tools to increase opportunities for rural America. The Information Superhighway will help rural America survive, prosper, and compete. It brings the entire world to the door of our rural citizens. Whether enabling regional communication or finding new markets throughout the world, access to the Information Superhighway is vital to the future of rural America.

The RUS Telecommunications program provides a cost-effective means for assisting rural telecommunications providers in building the infrastructure for the Information Superhighway in rural America. The program provides capital, establishes telecommunications standards, and provides policy guidance for rural telecommunications in the National Information Infrastructure initiative. This service is needed more than ever with the passage of the Telecommunications Act of 1996 (Telecommunications Act). Significant investment in rural infrastructure will be required to meet the promise of the Telecommunications Act and the maintenance, expansion, and improvement of the rural infrastructure.

The RUS Telecommunications Program continues to provide leadership in this changing environment. Just as we engaged in the development of the Telecommunications Act, we have been deeply involved in working with the FCC, the Federal-State Joint Board and State Public Utilities Commissions to create an acceptable universal service structure. To share ideas about the importance of telecommunications in people's lives, RUS held six satellite accessible rural telecommunications forums around the country bringing together Federal and State policy makers with rural Americans to discuss issues and exchange ideas.

Telecommunications Program Budget

The 1998 Budget requests \$300 million for treasury rate loans, \$120 million in guarantee of direct FFB financed loans, and \$40 million for 5 percent hardship loans. These program loans are financed with a total budget authority of \$1.6 million. RUS has requested budget authority in a single amount for telecommunications programs. If the Administrator has the flexibility to move budget authority between the Telecommunications programs, it will better enable the Agency to meet the needs of borrowers and the citizens of rural America who are the end users of these vital services.

Distance Learning and Telemedicine Program

The Distance Learning and Telemedicine Loan and Grant Program has emerged as one of the most dynamic new programs in the rural development area. For the past four years grants have been made to rural organizations to buy end-user equipment to encourage, improve, and make affordable telecommunications access to educational and health care services. The demand for the distance learning and telemedicine grants has been high. For the four fiscal years from 1993 through 1996, RUS has received 896 applications seeking a total of \$277 million. Due to budget constraints, only \$35 million was available. This money funded 119 projects in 39 states and one territory, leveraged more than 66 million in non-federal dollars. In 1997, under our new authority, we will make our first loans.

Through 4 years of the grant program activity, approximately 704 rural schools in 33 states, serving nearly 600,000 rural students, will be able to utilize the Information Superhighway to share limited teaching resources and to gain access to libraries, training centers, vocational schools, and other institutions located in metropolitan areas. For telemedicine, approximately 500 rural medical facilities in 23 states and one territory, serving more than two million rural residents, will be able to provide improved health care through linkage with other rural hospitals and major urban medical centers for clinical interactive video consultation, distance training of rural health care providers, management and transport of patient information, and access to medical expertise or library resources. This amazing leveraging of resources is a testament to the creative nature of our rural citizens.

Distance Learning and Telemedicine Loan Program

The Federal Agriculture Improvement Act of 1996 (1996 Farm Bill) added a loan component to the RUS Distance Learning and Telemedicine Program. For its first year, 1997, the loan component has been funded at a program loan level of \$150 million. This loan component will help to meet the extraordinary demand from rural schools, libraries, community centers and health care providers to purchase end-user equipment. The new loan component will also allow third parties to guarantee the repayment of, or to borrow funds on behalf of, rural schools, community centers, or libraries that either cannot incur long-term debt or need a little extra help.

PART 1

586

This increase in program level for end-user equipment will fit hand-in-glove with the discount in the Telecommunications Act of 1996 for transmission costs for schools, libraries and rural health care providers. Community centers can also use the equipment for welfare to work programs.

To bring it all together, we are in the process of revising the regulations to integrate the loan component into the program.

Distance learning and telemedicine grant and loan budget

The Budget requests \$21 million for grants in 1998. This is triple the current grant program, a \$13.5 million increase over the 1997 appropriation. For the new loan program, the Budget requests a program level of \$150 million.

Rural Telephone Bank

Congress created the Rural Telephone Bank (RTB) to address the increasing need for capital to develop rural telecommunications services. Over the life of the program, the RTB has lent more than \$3.2 billion to rural telecommunications borrowers to help build, maintain, and upgrade the rural telecommunications infrastructure.

Pursuant to statute, the RTB began the process of privatization during fiscal year 1996, when the Board of Directors voted to retire \$18 million of government held stock. Also during 1996, we completed a study on how accelerated privatization of the RTB would impact the RTB's ability to obtain capital in the private markets. The study concluded that the RTB could accelerate the maximum statutory privatization period and be in good shape to borrow money in the private markets by the end of 1998.

The RTB is in a strong financial position with more than \$1 billion in net worth. By the end of fiscal year 1998, the RTB will have sufficient internally generated funds to fully retire the government's remaining \$574 million capitalization of the RTB. The Administration is working on legislation which would allow a fully private RTB to leverage its net worth in the private markets and free the RTB from the restrictive lending purposes of the RUS program—allowing more capital for investment in the new rural telecommunications market structure.

Rural Telephone Bank budget

The 1998 budget request is for \$3.7 million in budget authority, to support a program level of \$175 million in loans.

ELECTRIC PROGRAM

The Electric Program represents one of the most effective public/private partnerships in the history of our Nation. The Electric Program seeks to ensure universal electric service at affordable rates. It serves as a cost-effective means for the leveraging of capital for the maintenance of a nationwide network of infrastructure. The investment is a continuing success story.

Today, the Nation's electric industry is changing dramatically. It is moving from a monopoly-based to a competitive structure. Already, to a great extent, the wholesale power industry has been deregulated. Several states are already introducing competition at the retail level, and legislatures in another dozen states are actively considering like proposals. The 105th Congress will debate a national restructuring this year.

As the debate on electric utility restructuring and deregulation develops, the RUS believes there are two goals that should be part of the development of any restructuring of the marketplace. The first goal is to ensure the continued availability of reliable, high quality electric service at a reasonable cost to rural consumers. The second goal is to protect the integrity of the government's loan portfolio.

To accomplish these goals, the RUS believes that any restructuring of the electric utility industry should be guided by the principles of reliability, fairness and flexibility. The transition to a more competitive industry environment must maintain the reliability of the Nation's electric system. A more competitive electric sector with retail choice should be fair and equitable to all consumers—including rural citizens, to existing electric utilities, and to Federal taxpayers who support the RUS program. Finally, industry restructuring should be flexible and contain a thoughtful transition process that accommodates the diversity of the electric utility industry, state regulatory structures and policies, and a process of educating consumers about the changes.

To help address the changing nature of the industry, the RUS is reforming itself. We have made the first reform of our mortgage and loan security documents in 25 years. Working with the Office of General Counsel (OGC), we have instituted an automated loan processing system, a computerization of our loan and security docu-

PART 1

587

ment preparation that in the telecommunications program has reduced the time involved from up to 6 months to a turn around of 10 days. We have streamlined our regulations and processes to maximize borrower flexibility. The new regulations and procedures enhance a borrower's ability to attract private financing while at the same time making internal changes to compete more effectively. New merger regulations encourage borrowers to take advantage of the economies of scale. The RUS continues to review our programs and procedures to allow for a more efficient program that is customer friendly while protecting the taxpayer investment in a modern rural infrastructure.

RUS' Rural Electric Program is the primary mechanism that helps to provide universal service to those areas that are the highest cost to serve. The program helps service approximately 25 million rural Americans living on 80 percent of the land mass, areas that investor-owned and municipally-owned utilities failed to serve. Rural electric cooperatives own 2.2 million miles of line, serving an average of 5.5 customers per mile. This compares to an average of 35 customers per mile of line that other providers serve. Unlike the telecommunications industry, where over the years, many mechanisms have been created to offset the high cost to serve rural areas, in the electric industry, the RUS program is the only mechanism to address the high cost to serve. The ongoing cost to serve must be supported and aging and obsolete infrastructure must be replaced and improved.

As the electric utility industry undergoes restructuring and deregulation, RUS electric borrowers will face greater competition and uncertainty. This is particularly true of generation and transmission borrowers who, in the late 1970's and early 1980's made large investments in nuclear generation at a time of high inflation and high interest rates.

Since President Clinton appointed me as Administrator of RUS, working with the very able and competent RUS staff, I have made every effort to work through these problems. Where necessary, this has included working with the Department of Justice to resolve serious debt situations. There is no doubt that it would be easier to sit back and take no action. However, we have an obligation to manage the RUS loan portfolio, and to that end will continue to aggressively seek solutions that result in maximizing recovery of Federal loan funds.

Electric program budget

For 1998, the President's Budget requests \$400 million loans for municipal rate electric loans, a \$125 million for 5 percent hardship loans, \$300 million for guarantee of direct FFB financed loans. The 1998 budget request reflects no change from the loan level of \$825 million available in 1997. These program loans are financed with a total budget authority of \$29 million. As in the telecommunications program, RUS is requesting budget authority in a single amount for maximum flexibility in using funds for programs with the most need.

CONCLUSION

The Rural Utilities Service has had the opportunity to be at the vortex of change in two of the Nation's most important industries—electricity and telecommunications. Each of these industries generate revenue of approximately \$200 billion a year and both are evolving from a regulated monopoly to a competitive environment. Each of these industries define who we are as a nation and how we move forward into a global economy.

Rural America is challenged by distance, density and economies of scale. The facts focus the issue—rural America, 80 percent of the landmass and 20 percent of the population. Serving rural America simply costs more per person than serving urban and suburban America and therefore, the market creates an access, quality and affordability disparity between rural and urban and suburban areas. This disparity is the rationale for the concept of universal service.

A concept which holds that all Americans are part of our nation and all Americans are entitled to the opportunity to make the most of their natural abilities and the opportunity to join with each other, as a nation, in our relationship with the rest of the world.

It is this issue—universal service, coupled with universal opportunity, and ultimately what kind of country we are—which defines the issue of rural infrastructure.

The Congress debated the universal service issue last year in the Telecommunications Act of 1996. In that debate we asked how does a new competitive environment affect universal service? Will serving rural residents still cost more than serving urban and suburban residents? How do we make service affordable for rural residents? How will it affect rural America? The answer was clear—universal service must be preserved and strengthened. Rural America must not be left behind. Rural areas should be supported by the system as a whole.

PART 1

588

The question of funding rural infrastructure through the Rural Utilities Service asks the same basic question—the question of universal service. And the answer is the same as in the Telecommunications Act of 1996. Universal service support is part of who we are as a nation. The access to capital, standards, affordability equalization, and lending leadership is needed more than ever. As we move from a monopoly to a competitive market place, and as that transition takes place, the need is much greater, not less, than ever.

PREPARED STATEMENT OF JAN E. SHADBURN

Mr. Chairman and members of the Committee, thank you for this opportunity to testify today on the President's fiscal year 1998 budget proposal and the accomplishments and goals of the Rural Housing Service.

The Rural Housing Service, succeeding the Farmers Home Administration, provides opportunities to rural families which help them improve their standard of living, move out of poverty and build for the future. We enable rural communities to enhance the quality of life of their residents and to strengthen their economic competitiveness. We accomplish this mission by providing rural people and communities with: access to credit—which, as you know, is often limited in rural areas; subsidized loans and rents; and technical assistance and support to complete their community development efforts.

The Rural Housing Service operates several housing assistance programs that provide decent, safe and affordable rental and home ownership opportunities to a wide variety of Rural Americans. RHS also administers the community facilities direct and guaranteed loan and grant programs which provide funding for essential facilities such as health care centers, fire stations, municipal buildings and day care centers. These facilities allow rural communities to provide an improved quality of life for their citizens and remain competitive in attracting jobs and businesses. We deliver these programs and the necessary technical assistance through a network of state and local offices, many of which are or will be collocated with other USDA agencies in USDA Service Centers.

Too many times we talk about the number of housing units, the square footage or the payment with the associated subsidy cost. We lose touch with the final product in the blur of our daily work—that product is a chance at the American dream for thousands of poor working families. That product is the result of the efforts of this Congress and USDA, which gave an opportunity to a family or a community. The investment has paid off thousands of times, both for the individuals and communities and for the federal government. The rewards continue to grow.

While we have provided this assistance for many years, we now also focus on four goals: Reinventing government; developing a range of partnerships and leveraging opportunities; creating budget savings for the taxpayers; and expanding access to our programs across rural America.

I would like to update you on our efforts on these four goals and our modifications to the Section 515 Rural Rental Housing Program, but first I would like to share with you the impact of housing and community facilities programs on the broader range of issues which concern this Congress. These issues include moving individuals from welfare to work, containing health care costs, providing an adequate start to children to improve their opportunities in life and improving the competitiveness and stability of the rural American economy.

Although the Rural Housing Service finances the physical construction or rehabilitation of housing and community facilities, the impact on the community and the individual goes far beyond the tens of thousands of construction and related jobs, the millions of dollars generated each year in building and associated trades, the more than \$1 billion boost in state and local taxes and the actual physical shelter provided. Our assistance literally allows individuals, families and communities to turn their lives around and to start to become self sufficient. Let me just give you a few examples.

Some of the worst housing in the country is experienced by farmworkers. The horrendous housing conditions that some of these workers endure cause so many other problems, particularly for the children. I would like to share with you how one family near Madera, California credits RHS' farm labor program with providing them the opportunity to have a decent life and a future.

Three years ago, a young farmworker and his family were sharing a substandard, one-bedroom house with another family. The father worked very hard in the fields, but the high cost of child care prevented the mother from finding a job. It seemed that the children in this family had dim prospects of a better life than that of their parents—that is, until the family was able to move into the RHS-funded la Casa

PART 1

589

de la Vina farm labor housing complex, located adjacent to the grape fields which the father helps to cultivate. The eldest child attends a nearby elementary school and the middle child attends the Head Start program located in the la Vina development. These children have stability, a decent home, and good educational opportunities, all of which seemed out of reach just three years ago. And the mother now feels sufficiently secure about her children's safety and her housing that she has started to work in a local produce-packing plant. This is just one example of the thousands of hardworking, low-income American families whose housing conditions—and therefore quality of life—have dramatically improved through participation in the RHS Section 514/516 Farm Labor Loan and Grant Program.

I would also like to tell you about what a difference in people's lives our Mutual Self Help Housing Program has made. This program, in conjunction with our Section 502 Direct Loan Program, allows groups of six to ten families to build homes for themselves by contributing sweat equity. Each family works on every other family's house until every house is done. Only then may the families move into their new homes. The process lasts about a year, and it's easy to see how by the end, the families have built not only their homes but also a tight community. Billy and Debra Blackmon offer a compelling example of how these programs have brought prosperity and a sense of togetherness to the people in one rural Florida town. In 1986, Mr. Blackmon was working hard at his \$6 an hour job, but he never seemed to get ahead. Today, he is a certified electrician with his own successful business, and he credits his participation in the Self Help Program with enabling him to achieve that goal. Mr. Blackmon is giving back some of the opportunity the government gave him: today he hires young men from the local area to work in his business. He teaches them electrical skills and he mentors them, encouraging them to complete their education and to participate in society. Some of his employees who were considering dropping out of school are now on the honor roll. Mrs. Blackmon is giving back as well: she started her own day care program, thereby raising the income of her family and providing quality, affordable day care to her neighbors, who in turn are now able to return to work. As you can see, in the process of moving themselves out of poverty, the Blackmons have become community leaders and role models. Just ten years ago, they were living in a one-bedroom structure that got soaked every time it rained. Now, they and their children live in a lovely home they built with their own hands. Thanks to the Self Help Housing Program, their kids have opportunities that were unimaginable a decade ago, and their community is turning around.

As you are aware, the effort to move families off of welfare and into work requires the availability of affordable quality day care, which is often more limited in rural America. This can present a real barrier to a family who is trying to move out of poverty. RHS' community facilities programs can be used to finance both adult and child day care and RHS is working hard to ensure that communities can utilize this resource. I would like to share with you how RHS' financing of the "Time for Tots" child care facility in Harlan, Iowa, has impacted so many residents' lives and supports your efforts to move families from welfare to work.

"Time for Tots", financed by a direct community facility loan, opened in 1993 with a license to care for 113 children. According to Nancy Gessmann, general manager of Communications Data Service, Time for Tots benefits her business because "... workers are more dependable and absenteeism is reduced by as much as 50 percent." Harlan resident Mary Marco stated that "my entire life has blossomed as a result of Time for Tots." Ms. Marco, a single working mother of four, always struggled to provide her children with a safe and stable day care environment. But before Time for Tots, there was no affordable day care in Harlan, and Ms. Marco had no alternative but to move her children from sitter to sitter and relative to relative. And still she sometimes had to stay home from work to look after them. Of course, Ms. Marco's absenteeism prevented her from moving ahead in her job. She worried that she would have to go on welfare to make ends meet. But after Ms. Marco enrolled her three youngest daughters in Time for Tots, her income stabilized, and with a loan from our agency, she was able to move her family from a rented, two-bedroom apartment into her own three-bedroom home. Because of Time for Tots, Marco and her children have a better future. They and other Harlan families are able to stay off welfare, and Time for Tots' affordable, high quality child care has given many families the resources they need to move from welfare to work.

Rural America has seen tremendous progress from these investments. As a result, many of these communities are more competitive and stable, additionally many more families are contributing to the local tax base. Child care facilities and self help housing communities are pulled together by grass roots efforts of the local people. Children are healthier, doing better in school, gaining self esteem by having the pride of showing a friend where they live. This is the real story. However, we must

PART 1

590

recognize the task still to be done. Rural areas continue to have high poverty rates and over 2.3 million substandard homes. Many communities lack the essential community facilities such as child care centers, fire stations and access to health care that not only impact the quality of life but also make it more difficult to attract and retain businesses. And we cannot expect a community or a family to become self sufficient if the economy is not thriving. However, we also cannot expect a family to be able to hold down a job and stay off of welfare if they do not have a decent and stable place to live. A permanent address and a decent place to live provide the stability that a worker needs to obtain and maintain a job and that a child needs to be successful at school.

Over the last two years, we have outlined our reinvention and partnership efforts to this committee. I would like to review those efforts and lay out our plans for the future to help achieve our four goals: reinvention, partnerships and leveraging opportunities, budget savings and expanding access.

Let me first discuss reinvention. As rural America changes, so does the Rural Housing Service. Our reinvention efforts in the Single Family 502 Direct Loan Program, under the leadership of the Vice President's National Performance Review, are a great success and have set the standard for future efforts. We recognize that as we work together to balance the budget, we must use automation and modern technology to increase our efficiency, improve our customer service and cut costs.

The reinvention of the Section 502 Single Family Direct Loan Program includes three components:

- The reduction of regulations by over 90 percent from 290 pages to 30 in the Code of Federal Regulations and the production of a user friendly handbook for our field staff and partners.
- The reduction in the cost of the program by over 30 percent, reducing the subsidy rate by squeezing out excess costs. As you know, this change was accomplished in fiscal year 1996.
- The implementation of the Dedicated Loan Origination and Servicing (DLOS) System, strongly supported by this committee. The DLOS initiative includes two components—the automation of our loan origination and servicing functions, and the establishment of the Centralized Servicing Center (CSC) in St. Louis to service an \$18 billion portfolio of almost 600,000 borrowers. The DLOS Initiative will allow us to satisfy the Congressional mandate to escrow for taxes and insurance.

The Agency purchased a commercial off-the-shelf software system directly from the private sector with modifications to meet unique program requirements. Our borrowers will experience the best of both worlds by receiving the finest servicing the private industry has to offer today while still participating in Congressionally mandated "supervised credit" services delivered locally by our field staff. These services, unique to the 502 program, offer lower payments based on income (payment assistance), moratoriums and work-out agreements which allow our borrowers to preserve their homes through economic or financial difficulties. The automation and centralization efficiencies, the reduction in staff and the improved servicing of the portfolio will result in a savings to the taxpayer of \$250 million over five years (1996–2000) and \$100 million a year thereafter.

The Administration laid out a plan three years ago which stated that we would complete conversion to a centralized system by the end of fiscal year 1997. On October 25, 1996, Secretary Glickman traveled to St. Louis, Missouri, to kick off the Centralized Servicing Center, to announce that this goal has been achieved and to present Vice President Gore's Hammer Award to the staff who have worked on this initiative. We are proud of our staff and our efforts. This is truly a reinvention of our business. The conversion of the portfolio is proceeding in seven phases and will be completed on schedule by September 1997.

This year, we continue to build on our reinvention efforts by focusing on our Multifamily Housing Program. We are streamlining regulations and increasing automation. We hope to create a dramatically reduced, common-sense, non-bureaucratic set of regulations that eases the burden on our borrowers and our staff. We are confident that the result will be better administration of our programs and protection of our aging portfolio.

We are also working hard to maximize our use of technology. For example, we are now posting those community facilities direct loans that are eligible for refinancing with private sector credit on the Internet so that private financial institutions can discuss refinancing opportunities with these borrowers.

I would also like to share with you our efforts to increase and build partnerships and leveraging opportunities which expand our limited resources, ensure that as many dollars as possible are directed into rural communities, and build private,

PART 1

591

nonprofit and other public sector participation in local rural development efforts, increasing their likelihood of success.

The goal of the President's National Partnership for Home Ownership is to provide home ownership to an additional eight million Americans by the year 2000. In support of the President's Initiative, we have increased our efforts to cultivate partnerships throughout the states. Three of these new partnerships have been especially successful, and I will tell you about them now.

First, we formed the Rural Home Loan Partnership in June of 1996. RHS joined the Rural Local Initiatives Support Corporation (Rural LISC) and the Federal Home Loan Bank System to create and deliver a new single family mortgage product to enable families below 80 percent of area median income to achieve home ownership. RHS provides a fixed-rate, subsidized mortgage to cover a portion of the cost of a house, while a local bank provides financing for the remaining portion. Private nonprofit community development corporations (CDC's) identify and counsel eligible borrowers and aid in the development of affordable housing opportunities. This counseling is often critical to the long term success of the homeowner. This partnership brings a new player—The Federal Home Loan Banks—into leveraging with the 502 direct loan program. RHS' partnership with the community development corporations helps direct resources to very needy areas, leverages technical assistance and builds a long lasting partnership to accomplish other rural development initiatives. This product was demonstrated in nine states, and eight new partnerships are being formed this year. The states involved in this partnership include Alabama, California, Florida, Kentucky, Louisiana, Maine, Maryland, Michigan, Minnesota, Mississippi, Nebraska, New York, Ohio, Pennsylvania, Texas, Washington, and Wisconsin.

Second, RHS is also partnering to ensure home ownership education is available in rural America. RHS is working with Fannie Mae, Freddie Mac, the Housing Assistance Council and Rural LISC to help build a rural network and support for home ownership education which typically involves a series of classes to instruct potential homeowners on credit, budgeting, savings, home maintenance and the basic ABC's of owning a home. Numerous indicators have shown that home ownership education reduces delinquencies and increases the long term success of the borrower. However, as with so many other support services and assistance, rural residents are often at a disadvantage in accessing these resources.

In addition to these new initiatives, one of our most successful partnerships, the Mutual Self Help program, also supports the President's home ownership goals. The Self Help program provides grants to nonprofit organizations and municipalities to organize and provide technical assistance to groups of families who work cooperatively together to help build their own homes. The sweat equity built up by the borrowers means these families—and the federal government—can get more house for less debt. The families are able to achieve the American dream of home ownership and start out with significant equity and greater commitment to their neighborhoods. Activity and interest in this program has increased tremendously in the last few years. In turning around borrowers' lives, the Self Help program brings together not only the contributions of the borrowers but also those of federal, state, local, private, and nonprofit organizations, all of which are committed to the goal of making home ownership a reality for low-income Americans.

RHS' loan guarantee programs have brought increased numbers of financial institutions into partnership with the Agency. Over 1,600 partners now participate in the Section 502 guarantee loan program. This program serves low and moderate-income residents that fall under 80 percent of the median income. Additionally, in fiscal year 1996, the agency implemented a demonstration of the Section 538 multifamily guarantee program. We plan to approve approximately \$13 million in new loans for fiscal year 1997.

In the Section 502 direct program, we have encouraged leveraging, which utilizes our direct loan funds in partnership with another lender's funds. We take the second lien on the property, with the private sector lender or housing finance agency in first position. The states have been creative in establishing a wide variety of partners across the country. In fiscal year 1996 we leveraged almost 15 percent of our low-income 502 funds to increase home ownership opportunities to almost 1,600 families who would not have been served without this effort.

In the 515 multifamily housing program, we increasingly employ partnerships with state housing finance agencies, CDBG and HOME funds, the private sector and local community organizations. This has allowed RHS to reach larger numbers of low-income tenants with limited budget authority.

In the community facilities programs, RHS has leveraged over 50 percent of its funds, with state, local and private partners. RHS is developing a new partnership with HHS and Rural LISC (Local Initiatives Support Corporation) to expand the

PART 1

592

number of child care centers in rural America and demonstrate a variety of financing models.

RHS' third goal is to ensure access to our programs by all eligible residents and communities across rural America. Under Secretary Glickman's leadership, the Rural Housing Service is continuing its outreach to underserved communities and populations and its efforts to comply with both the letter and spirit of the civil rights and fair housing laws. Let me give you a few examples of our activities in this arena.

Native Americans are among the poorest housed groups in America and mortgage financing has not been widely available on Tribal lands. In 1995, USDA and HUD jointly conducted a series of home ownership conferences to enhance opportunities for lending on Native American lands. One result of these conferences is a comprehensive guide for Rural Development staff called "Lending on Native American Lands." In addition, RHS is working closely with Fannie Mae and several Tribal councils to better serve Native Americans' housing needs. Fannie Mae has agreed to a pilot program in which Fannie Mae will purchase RHS guaranteed loans made on tribal lands.

RHS has also improved the quality of life on tribal lands by expanding the use of the Community Facilities programs by Native American communities. For example, using a combination \$825,000 direct community facility loan and a \$675,000 guaranteed community facility loan, the Navajo Nation and the Foundation for Hospital Improvements were able to improve the medical compound at Ganado by building a new surgical wing, replacing the obsolete natural gas service line, making necessary repairs, and building housing for medical personnel.

RHS has worked hard to ensure that all of our borrowers and staff follow the Fair Housing Laws. We incorporated a significant Fair Housing training component at all national housing training meetings last year. We are finalizing a Memorandum of Understanding with HUD on how to manage Fair Housing complaints. We have also significantly improved our annual Congressional Report on Fair Housing and RHS Beneficiaries by using more meaningful indicators of our progress.

RHS has been promoting outreach activities to historically underserved customers. This activity includes home ownership among women by participating in the Home Ownership Opportunities for Women (HOW) partnership, one of 58 national partners in the President's Home Ownership Initiative. HOW is undertaking an initiative to bring national home ownership rates for women to the same level as those for men.

Doing more with Less: RHS has accomplished a great deal in reinventing government, in creating and expanding partnerships and in expanding access to our programs, and we have also made a significant commitment to help balance the budget. In fiscal year 1996, RHS cut the cost of the single family direct housing loan program by over 30 percent. Our Centralized Servicing and DLOS Initiative is saving the taxpayers \$250 million dollars over five years (1996-2000). RHS has proposed a legislative change to the Section 515 program. This change will reduce the subsidy rate by approximately 8 percent. Even though there is a significant demand across rural America, we have held our request for rental assistance constant, increasing it only to take on the added responsibility of converting some rural area Section 8 units to USDA rental units. Finally, RHS' Servicing Initiative has reaped tremendous savings for the government. Our single family housing delinquency has fallen by over 3 percent from fiscal year 1996 and is at the lowest rate in over twenty years.

Finally, I would like to provide an update on our Section 515 Direct Multi-family Rental Housing Program. The Section 515 rural rental housing loan program is a vital program that provides decent and affordable housing to families, disabled and elderly individuals whose annual income averages about \$7,300 dollars. No other federal program reaches into remote rural areas to provide affordable, safe and decent rental housing. We have made great strides in strengthening our management and oversight responsibilities in our Section 515 program. We have made over 100 administrative changes to improve performance and reduce fraud, waste and abuse. Changes include the establishment of a loan classification system which will enable us to improve our management and monitoring of the portfolio and reduce costs by improving the focus of our servicing. In addition, we have continued over the last four years to strengthen our debarment activities against developers and management companies which have abused the program.

These management improvements complement the reforms to the Section 515 program initiated by the Committee and passed by Congress in the 1997 Appropriations Act. The Department has worked diligently since the law was enacted to expedite the implementation of these reforms. RHS has worked extensively with stakeholders representing for-profit and non-profit developers as well as housing advocacy

PART 1

593

groups, state housing finance agencies and other interested parties to develop the regulation.

We believe we have a regulation which is workable and meets the intent of the law. The regulation is now in final clearance, and the Department is planning to publish an Interim Final Rule in the Federal Register on March 31, 1997 to implement these legislative reforms. As a result of the Congress' and the Administration's efforts to improve the 515 program, we have a healthier and safer portfolio today. The tenants' and government's interest are protected.

Before we provide the specifics of the budget request, let me reiterate the importance of RHS' housing and community facilities programs in creating strong rural economies and enabling rural families and individuals to have a decent quality of life and a fair shot at the American dream.

Now I would like to highlight the following points from the 1998 Budget proposal.

For section 502 direct single family housing loans in 1998, we are requesting a loan level of \$1 billion. This is the same level as was authorized in the 1997 Appropriation Act. However, after the Act was signed into law interest rates were higher than projected so \$83 million in budget authority only supported \$585 million in loans. The budget authority increase from \$83 million to \$128 million is necessary to maintain a \$1 billion loan level for fiscal year 1998. For the Section 502 guaranteed loans, we are requesting a loan level of \$3 billion. This level is \$300 million more the 1997 level but only costs \$690,000 more in budget authority over fiscal year 1997.

We have also proposed legislation to permit the use of Federal guarantees to help graduate current direct loan borrowers to private credit. The Rural Housing Service is aggressively encouraging our direct Section 502 borrowers to "graduate" to private sector credit, particularly in this low interest rate environment. However, many of the borrowers do not have sufficient equity to graduate and qualify for conventional credit. Further, they are statutorily prohibited from graduating to our guaranteed program. The President's 1998 Budget requests an authorization of a \$100 million for graduating direct loan borrowers into the guaranteed program, at an appropriated subsidy cost of only \$20,000. The Department will also submit a legislative proposal to remove the statutory prohibition.

In the section 515 multi-family housing loans, a loan level of \$150 million is requested for 1998. The loan level request for housing repair loans (Section 504) is \$30 million. For domestic farm labor housing loans we are requesting \$15 million. These and the two smaller loan programs for housing site development are requested at about their current 1997 levels.

The budget authority appropriation requested for the housing loan programs is \$225 million, about \$34 million higher than in the 1997 appropriation.

An increase of \$16.8 million to \$540.9 million is requested for rural rental assistance in 1998. In addition, RHS is requesting an increase of \$52 million to assume HUD's expiring Section 8 contracts in RHS financed projects. These contracts, which service Section 515 developments, can be more economically managed in the Section 521 Rental Assistance program, creating savings for the taxpayer.

The housing grant programs are being requested for 1998 under the Rural Housing Assistance Grants Program. Within this program, our requests include \$10 million for farm labor grants, \$24.9 million for housing repair grants, \$26 million for mutual and self-help housing grants, and \$10 for housing preservation grants. The supervisory and technical assistance grant program and the compensation for construction defects grant program will continue to operate in 1998 with small amounts of carry-over funds which will be available.

The community facility program request is included in the proposed Rural Community Advancement Program. Within that overall program, we project that \$209 million will be available for direct community facility loans and that another \$209 million will be available in the guaranteed loan program. About \$9 million is proposed for community facility grants. The appropriation requested within RCAP to support the community facility programs is \$28 million for 1998. This is \$9 million more than is available for 1997.

For administrative expenses, the Budget requests \$413.6 million. This is a \$13.3 million reduction from 1997 which reflects the centralization of single-family housing loan servicing.

PREPARED STATEMENT OF DAYTON J. WATKINS

Mr. Chairman and members of the Committee, I am pleased to present the Administration's fiscal year 1998 budget for the Rural Business-Cooperative Service (RBS).

PART 1

594

Rural Business-Cooperative Service is a component of the Rural Development Mission Area and has made significant contributions to enhance the lives of rural Americans. Like our counterparts, we share the belief that a strong rural America requires an investment in people, education, technology, health care, infrastructure, and social and community affairs. These investments will enable rural Americans to continue advancing in the economic mainstream of this great nation and help them build sustainable rural communities. RBS significant contribution to this effort has been in our ability to make our resources available to rural Americans. These resources build partnerships within these communities which leverage public, private, and non profit resources to stimulate economic growth. New jobs paying higher wages will be created and they will maintain the current ones. It means positioning rural residents to be able to meet the needs of their individual families for basic necessities. This can be accomplished by allowing rural residents to have income to pay for educational expenses of their children, family's housing needs, and to enhance their personal pride and self-esteem. It also means being able to meet the credit and financing needs of rural business owners who are unable to find them from other sources. It means helping the new entrepreneurs implement their dream of owning and operating their own businesses. Besides helping agricultural producers analyze alternative business forms, like cooperatives, which may offer them greater economic opportunities than currently offered by the marketplace in this highly competitive environment. Each of these efforts will touch rural America. Our responsibility is to provide efficient access to our programs so that rural Americans can maximize the benefits that will result.

At Rural Business-Cooperative Services, we strive to enhance the quality of life for all rural Americans by assisting rural business owners and new entrepreneurs to develop businesses that are sustainable and provide a product or service which consumers demand. We assist these businesses in providing employment for local residents, owners and their families. We help them identify new opportunities and markets for their goods and services. These commitments help improve the performance of rural businesses consistent with efforts to reduce the size of the Federal government and balance the Federal budget. Even in this environment we must still provide efficient services to rural residents. One of our objectives is to use this opportunity to be creative in developing new concepts and approaches to serve our customers. To ensure that rural Americans continue to have access to our programs and services, we are developing new and exciting initiatives. These initiatives will focus more resources on individuals, businesses, and communities that have not traditionally participated in our programs. By doing this, we can be instrumental in increasing the contribution made to the overall growth of rural America by putting under utilized resources to better use. This is consistent with the overall goals and objectives of the Rural Development mission area.

To meet our goals, objectives, and the growing demand for our services and resources, our strategy is to increase strategic alliances through creative partnerships with other Federal Departments, other agencies of USDA, corporate America, educational institutions, nonprofit organizations and others. Together, we can leverage resources to maximize their availability to rural America. Through strategic alliances, we can serve more people and communities because more organizations are available to serve them. Let me highlight an example of a completed strategic alliance and others currently in the developmental stages.

- Signed a Memorandum of Understanding (MOU) with the United States Army to assist with the Armament Retooling and Manufacturing Support (ARMS) Initiative. This initiative will use the ammunition manufacturing facilities on closed military bases as a catalyst for community economic development and business opportunities. Our role is to utilize our staff expertise in underwriting business loan guarantee transactions for businesses locating on these bases. We are also:
- Working with the Department of Treasury and the newly created North American Development Bank (NAD Bank) to develop an MOU to carry out the Community Adjustment and Investment (CAI) program under the North American Free Trade Agreement (NAFTA). RBS will be instrumental in simplifying some programmatic and administrative services needed to process applications for Business and Industry Guaranteed Loans, loan recovery, and provide other services to the CAI program.
- Developing expanded opportunities for women business owners to gain access to our programs so they can increase their business activities. Discussions are underway to expand opportunities for rural businesses owned by women to expand into international markets. This initiative will result in a strategic alliance with the Department of Commerce, Trade Development, International Trade Administration. This will open up opportunities for women business own-

PART 1

595

ers who will expand their business activities in rural communities and employ more rural residents.

- Developing a partnership with USDA's Cooperative State Research, Education and Extension Service and the Department of Commerce's National Institute of Standards and Technology to collaborate on developing new technology for manufacturing in rural communities. This will begin to revive the manufacturing sector which has been so valuable to rural communities in the past.
- Developing a partnership with the U.S. Small Business Administration (SBA) to include information regarding our business and economic development programs in their Business Information Centers (BIC) computer data bases. Our initial effort will focus on some 21 centers on Native American reservations.
- Increasing our assistance to small farmers to help position them to compete in the competitive global agricultural environment. Our attention must focus on resources to organize small farmers into cooperatives and enhance their economic competitiveness advantages domestically and internationally. Unless they organize them into some form which provides economic opportunities, they will continue to struggle to remain competitive. We consider this assistance to be part of the producers' safety net necessary particularly, due to the elimination of the traditional commodity programs. We are witnessing examples of how farmers are turning to cooperatives to respond more to a market oriented agriculture. For example, after the wool and mohair program was discontinued, sheep and goat producers throughout Texas and the Southwest began to organize new cooperatives to market meat and fibers.

These are a few of the strategic relationships we are encouraging throughout the rural business arena which will have a direct and positive impact on the growth of rural communities.

RBS is also very conscious of its customer service image and the types of services we provide to rural Americans. We continue to rethink and evaluate our programs and the way they are delivered to serve our customers more efficiently. Our goals are to reduce the cost to operate these programs for the taxpayers, while improving our service delivery. Through the enactment of sweeping changes in the Business and Industry (B&I) Loan Guaranteed program, we have demonstrated that this can be accomplished.

The recently published business and industry guaranteed loan regulations are shorter, clearer, and more logically organized. The material in the new regulations is about one-half that of the previous regulations. Program changes shift some responsibility for loan documentation and analysis from the Government to the lenders. This makes the program more responsive to the needs of lenders and businesses, and creates easy and fast processing of applications.

In recognition of this tremendous effort, RBS received Vice President Gore's Hammer Award for our automated application procedure for B&I lenders. Ten states participated in the user validation demonstration program for testing this new product. The new system alleviated some concerns expressed by our customers regarding requests for repetitive information, and cumbersome and complicated regulations, forms and agreements. This automated application software is schedule for release soon and nationwide implementation. In addition, we have developed a B&I video with a new program brochures and information kit to use in outreach activities within the states to make the public more aware of the program.

In expanding visibility of our programs, RBS held a series of Business Financing Forums with financial institutions around the country. Participants included members of the American Bankers Association, Independent Banker's Association, Farmer MAC, the National Association of Guaranteed Lenders, the National Association of Investment Companies, and other trade associations. This effort increased our relationship with the lending community and has substantially increased program usage throughout the financial community. Additional efforts are planned for this fiscal year because of the heightened interests in our resources and capabilities.

Now I'd like to briefly address our program funding request.

BUSINESS AND INDUSTRY LOANS

The business and industry loan program guarantees all types of businesses including those engaged in agricultural production when it is a part of the integrated operation. These companies create and save jobs, upgrade the infrastructure, and improve the lives of rural residents.

Fiscal year 1996 was a banner year for us in rural business and the best year we have had since the late 1970's. Last year, RBS provided \$638 million in guaranteed B&I loans and was able to provide financial guarantees to 560 loans to businesses which maintained their existing employees and often created many new ones.

PART 1

596

An example of the types of business and communities benefiting from the B&I program is the Southern Industrial Mechanical Maintenance Company ("SIMMCO"). This company was founded in 1977 and is in Brownsville (pop. 10,019), Tennessee. The company is a leading employer in the Brownsville community. The 1990's have caused the need for the automation of the manufacturing process and update of the physical plant site and equipment. The company performs shut down mechanical maintenance service for other companies on a contract basis and manufactures liquid propane gas tanks. These are the two core operations of SIMMCO.

In order to implement the expansion of the company, United American Bank of Memphis is providing a loan for \$3.1 million with a business & industry loan guarantee. Funds will be used for expansion of an existing business. The business will construct and equip a building on real estate the business owns in Brownsville, Tennessee. The expansion will help preserve 85 jobs and provide approximately 143 new jobs. Most of the new job opportunities are expected to come from census tracts within the Haywood/Fayette Enterprise Community. This loan will also allow the business to be more feasible in its L.P. Gas Tank Operation. The employment rate in the Enterprise Community is 8.3 percent, the wage rates run as high as \$18.00 per hour for such jobs as welding.

DIRECT BUSINESS AND INDUSTRY LOANS

Many rural areas lack a competitive capital market, which leads to inadequate sources of financial assistance, especially for new businesses. Recent statistics show extensive areas of the country where, despite outreach efforts, the need for financial assistance for business development is not being met. This is especially true in areas with long term persistent poverty, such as the Mississippi Delta; areas experiencing fundamental structural changes in their economic base, such as the Pacific Northwest; and areas of long term population decline, most notably the Central Plains States.

The President's 1998 Budget includes \$50 million for B&I direct loans and to fill gaps that cannot be met through B&I Guaranteed Loans.

INTERMEDIARY RELENDING LOANS

The intermediary relending program (IRP) invests Federal funds to leverage local funds in support of rural businesses and jobs. Loans go to nonprofit intermediaries who in turn relend them to rural businesses to improve business, industry, community facilities, jobs, and economic diversity of rural areas. The program makes investment capital available to entrepreneurs who cannot otherwise obtain financing from conventional sources.

Data shows that for every \$1.00 lent to an ultimate recipient, an additional \$3.75 of leveraged funding is provided. In fiscal year 1996, \$37.6 million funded 47 loans which resulted in more than \$141.3 million of other funds being leveraged. For every \$100,000 of program loan funds, 20-25 jobs are created or saved. It is projected that once the 47 loans made in fiscal year 1996 have been reloaned (an average of 3.4 times during the life of the loan), these funds will create or save an estimated 25,000-32,000 jobs over the life of the loan.

An example of how this program is used is as follows: After a devastating fire, the Route 1 Fashions Retail clothing store in Fort Kent, Maine contacted the Northern Maine Development Council (NMDC) for counseling and assistance. The NMDC quickly responded, collaborating with a local bank and the Town of Fort Kent. The Town packaged a loan for part of the needed funds from the State of Maine Development Fund. The NMDC packaged a restructured loan with their bank and an NMDC/IRP loan. In a short time, the store was back in business and the hole left by the fire on Fort Kent's Main Street was filled with a new building. The business could maintain full time jobs that would have otherwise been lost. The business provides an important addition to the community and the cooperation shown through this project is a true northern Maine asset.

RURAL BUSINESS ENTERPRISE GRANTS

The rural business enterprise grants (RBEG) program finances and facilitates the development of small and emerging private business enterprises. This program can be used to finance and facilitate development of small emerging businesses in the rural areas and incorporated towns and cities with a population of less than 50,000.

Last year 332 grants for \$45 million were made, approximately 3,531 businesses were assisted resulting in the potential for 10,483 jobs being created and 6,961 jobs saved.

Examples of how the program was utilized are as follows: A storm ravaged the Maine coast at the end of January 1996, and left two tugboats that service the port

PART 1

597

of Eastport inoperable. A rural business enterprise grant was given to Eastport Port Authority in the amount of \$80,000 to rehabilitate a tugboat which was acquired through the Federal surplus property program. The Eastport Port Authority and the Port of Eastport are major employers in the region. The unemployment rate in Eastport is 13.5 percent, compared to 6.5 percent for the State. Maintaining viable port operations is essential to the community. RBS funding saved 70 jobs and there is the potential of creating 62 other jobs.

In June 1996, a \$39,580 grant was made to the Emmonak Alaska Tribal Council. The grant was made to purchase and install a primary fish processing line to their processing facility. The new line will do the initial preparation process of salmon without disrupting the production process. The new line will add four new jobs to the current 20 seasonal summer jobs in this remote Alaskan Community. The RBEG was leveraged with \$120,000 in funds from state and local sources.

The Walhalla Rural Health Association received a \$50,000 rural business enterprise grant. This grant was used to purchase medical equipment such as a portable x-ray machine, ultra sound machine and a coulter counter which assists in diagnosing serious blood diseases such as leukemia and anemia. The equipment will be leased to the Walhalla Clinic's management group (the ultimate recipient) for utilization in their clinic. The Walhalla community has raised and spent approximately \$20,000 in getting the clinic approved for operation.

RURAL ECONOMIC DEVELOPMENT LOANS AND GRANTS

The rural economic development loan program promotes rural economic development and job creation projects. These zero-interest rate loans made to Rural Utilities Service electric and telephone borrowers are reloaned to provide start-up financing, project feasibility studies, and other expenses associated with creating business enterprises in rural communities. Under this program last year we provided funds to 65 electric and telephone systems, which is anticipated to provide zero-interest loans or grants totaling \$13,093,398 to more than 70 businesses, and creating approximately 2,600 jobs.

Baker Electric Cooperative, Inc. received a \$400,000 grant to establish a revolving loan fund. The initial loan covered by the grant was to the Towner County Hospital Authority in Cando, North Dakota. The purpose of the loan was to aid in constructing and equipping a new outpatient clinic and service center to update the existing hospital facility. The project beneficiaries are the residents of Towner County and the surrounding counties who will receive health care from the new hospital and clinic facility. The employees of the hospital and clinic will also benefit due to the enhanced prospects of retaining the hospital and clinic.

COOPERATIVE SERVICES

Cooperative Services (CS) devotes its efforts to promoting the understanding and use of the cooperative form of business as a viable option for rural residents. As government support programs are changed and encouragement is given to more a market driven policy, farm operators, ranchers and other rural residents are realizing that they need more effective forms of group action in the marketplace to represent their economic interests.

Cooperative Services conducts studies, alone or in conjunction, with other federal or state institutions, to provide farmers with information on economic, financial, organizational, legal, and social aspects of cooperative activity. Technical advice assists farmer cooperatives in the development and operation of viable organizations to better serve the Nation's family farmers. Educational assistance provides farmers and other rural residents with a proper understanding, use and application of the cooperative tool.

The Nation's agricultural sector is currently experiencing rapid structural changes often referred to as the "industrialization of agriculture." United States businesses involved in agriculture are finding it increasingly necessary to have a coordinated or controlled supply of a narrowly defined raw product. As previously mentioned, we intend to devote more resources to assisting small farmers in forming cooperatives. Cooperatives are adapting their structure and activities to ensure that the cooperative businesses and their independent producer members remain competitive in this new industrialized system. The Cooperative Services, through cooperative research agreements and in-house staff, has an extensive research program that is helping the agricultural cooperative sector deal with these major structural changes. This has been especially valuable in the rapid structural changes of the pork industry. Various research publications have been developed and symposiums or other types of outreach meetings have been conducted or are being planned to get the

PART 1

598

findings of these studies out to the cooperatives, agricultural producers, and other resource providers.

Meat goat producers, predominantly small farmers, from Mississippi and the southern part of the U.S. have experienced difficulties in gaining access to a profitable market for their livestock. These small producers depended on individual markets and operated in an environment with little information, as the industry is in an embryonic stage. Southern States Goat Cooperative was incorporated with our assistance in 1996 and held their first auction in June of 1996. The cooperative is now holding two auctions per month and membership has expanded to more than 300 producers. As the industry develops, the cooperative will explore the feasibility of a processing facility.

As another example of cooperative development assistance, the economy of Smith Island, MD depends on the seafood business including watermen's harvested catch of crab. Historically, crab picking has been done in "out-kitchens" in each waterman's house. Although Smith Island crabmeat has always been a high quality product, the "out-kitchens" did not meet the Maryland Health regulations for seafood processing. The crab pickers are predominately women who were told they could no longer sell to the public unless the crabmeat was processed in an approved facility.

In October 1996, the new and approved facility was dedicated. Cooperative Services helped develop a business plan and assisted the board and management of this new cooperative improve their operations, establish a bookkeeping system, review financial performance, and provided guidance for board decisions. The Smith Island Crabmeat Cooperative provides a valuable source of income for the island women and their families.

RURAL COOPERATIVE DEVELOPMENT GRANTS

The rural cooperative development grants (RCDG) program, formerly the rural technology and cooperative development grant program, has the primary purpose of improving the economic condition of rural areas through the development of new cooperatives and improvement of operations for existing cooperatives. The RCDG program provides grants to nonprofit corporations and institutions of higher education to establish and operate centers for cooperative development.

The RCDG program is used to facilitate the creation or retention of jobs in rural areas through the development of new rural cooperatives, value-added processing, and rural businesses. Grants are competitive and awarded based on specific selection criteria.

APPROPRIATE TECHNOLOGY TRANSFER FOR RURAL AREAS (ATTRA)

In fiscal year 1997 one-point-three million dollars of the RCDG funding (3 million) is being used for the Appropriate Technology Transfer for Rural Areas (ATTRA) program through a cooperative agreement. This program encourages agricultural producers to adopt sustainable agricultural practices which allow them to maintain or improve profits, produce high quality food, and reduce adverse impacts to the environment. ATTRA functions as a center for information and technical assistance, staffed with sustainable agricultural specialists and accessible nationally through a toll-free telephone number. The ATTRA program was transferred to USDA in fiscal year 1996 from the Department of Interior's National Fish and Wildlife Service. In fiscal year 1996 it responded to a record 18,246 request of which 11,810 were from farmers, and 6,436 from extension, agribusiness, university, state and federal agencies.

NATIONAL SHEEP INDUSTRY IMPROVEMENT CENTER

The National Sheep Industry Improvement Center will be used to help build the capacity of the U.S. sheep and goat industries, including infrastructure development, business development, resource development and market and environmental research.

The Board of Directors, appointed in January 1997, will operate the National Sheep Industry Improvement Center. The Center is funded through a revolving fund account which allows up to 3 percent for administrative purposes. Initially the National Sheep Industry Improvement Center's revolving fund was \$20 million. Although \$30 million is authorized during the next 10 years of the program, no additional appropriations are requested for fiscal year 1998.

1890 LAND GRANT INSTITUTIONS OUTREACH INITIATIVE

The Rural Development 1890 Land Grant Initiative involves cooperative agreements with the 1890 Land Grant Universities and Community-based Organizations

PART 1

599

to develop income-producing projects for underdeveloped rural communities. This effort supports the President's desire to reach out to low-income, rural communities to improve their economic conditions. This initiative also supports the Executive Order to work with Historically Black Colleges and Universities. It has been funded at approximately \$2 million annually for the past three years, and is included in the salaries and expense account for 1998.

The intent of this project is direct jobs' creation in communities that are traditionally agriculturally-dependent or other natural resource-dependent. The land grant universities are among the best agriculture science and business educational programs in the nation. These agreements build on the strength of these institutions to ensure quality education related to small business development and to improve the quality of life in rural communities.

A notable example involves Michael James and JWH Industries of Florence, South Carolina. In 1996, Mr. James and JWH Industries had a faltering worm business. Mr. James requested technical assistance from South Carolina State University through RBS's, Rural Development Initiative (RDI).

Prior to his request to RDI, his business consisted of one lone employee and ten worm beds on a two-acre family-worked site in Florence, SC. After receiving technical assistance he now has ten acres in Manning, SC, five acres in Summerville, SC, a five-acre breeding facility in Trio, SC and another acre in North Carolina. Mr. James now employs 15 people and tends more than 360 worm beds at his various sites.

Also, the Japanese have expressed interest in his process of treating soil with special worms called vermicomposting that he has developed. Mr. James has developed the knowledge of how the various worms can enrich the soil, resulting in organically rich compost.

BUDGET REQUEST

I would like to highlight the following points from the 1998 Budget proposal. The primary business and industry programs are requested for 1998 as part of the Rural Community Advancement Program (RCAP). Within that program, the Budget proposes \$660 million for B&I loans of which \$610 million would be for guaranteed loans and \$50 million would be for direct loans. Rural business enterprise grants are also proposed as part of the RCAP program at a program level of about \$40.375 million. The appropriation needed to support these programs in 1998 is \$46.296 million. This appropriation is needed to support the guaranteed loan and grants program, however, the direct business and industry loan program is not projected to require any subsidy cost.

Intermediary Relending under the Rural Development Loan Fund is proposed at \$35 million for 1998. This is a slight program level reduction from the 1997 level. The budget authority appropriation required to support this activity is \$17 million.

Rural Economic Development Loans are proposed at \$25 million in 1998. In addition, the request for the rural economic development grant program is \$11.3 million. The Budget proposes that these loans and grants should be funded from the cushion of credit deposits in the Electrification and Telephone Revolving Fund, therefore no appropriation of new funds is needed. The Rural Cooperative Development Grant Program is proposed at the \$3 million level for 1998, the same as the current 1997 level.

For administrative expenses, the Budget requests \$31 million. This is an increase of \$4.6 million above 1997 which is primarily requested for activities in cooperative business assistance.

Mr. Chairman the Rural Business-Cooperative Service is proud of its achievements. Through your continued support, we intend to be full partners in serving the needs and enhancing the quality of life for residents in rural America. I would be pleased to answer any questions you or the other members may have.

PREPARED STATEMENT OF W. BRUCE CRAIN

Mr. Chairman and members of the Subcommittee, I am pleased to testify today on the President's fiscal year 1998 budget proposal of the Alternative Agricultural Research and Commercialization (AARC) Corporation. It is a pleasure to provide you with an update of the Corporation's investment successes and its real and potential impact on rural communities.

With the enactment of the 1996 Farm Bill, Congress set in motion transformational changes in agricultural policy in this country. The gradual phaseout of commodity support payments means farming must become more market-driven. To

PART 1

600

compete in the global marketplace, America must produce value-added products; we cannot prosper with raw commodities alone.

In short, American agriculture must be innovative to remain strong in the 21st century. The AARC Corporation is a catalyst for innovation. It is a vital link between the development of high value-added agricultural products and their successful commercialization. It is the only agency in the Federal government making equity investments in new, rural business ventures.

Commercializing new products can be an expensive and difficult process, especially in a rural locale. It can be difficult because rural areas often lack the financial and other entrepreneurial support systems concentrated in urban areas.

The AARC Corporation makes what are known as "seed capital" and "early-stage" investments. It provides the capital resources that agricultural innovators cannot get from the private sector because of their high risk. Like private venture capital firms, the AARC Corporation conducts extensive due diligence on prospective investment opportunities. Private investors respect the AARC Corporation's expertise and track record. The 66 companies AARC has funded during its brief existence will tell you that when they obtain a "USDA stamp of approval" from AARC, it opens the doors to additional financial resources from the private sector, such as later-stage investments and debt financing, that are essential to success.

The typical cycle of venture capital investments lasts approximately 8 years. We do not expect companies we fund to generate positive cash flow until their fifth or sixth year. The AARC Corporation, currently in its fifth year of operation, has invested \$28.1 million in 66 projects in 32 states. To date, these investments have attracted \$112 million in additional private financing to projects in rural communities such as Fontana, California; Ashburn, Georgia; and Wahpeton, North Dakota—places that do not show up on the radar screens of money center banks and most venture capitalists. AARC produces a substantial multiplier effect. Every dollar invested by AARC has leveraged into \$5, money that puts people to work in permanent, manufacturing jobs in rural communities.

Despite its short history and the time needed for investments to come to fruition, seven companies have already made partial repayments to the AARC Corporation. These partial repayments are testament to the due diligence and investment decisions of the AARC Board of Directors and their wide array of private sector expertise.

Once an investment is made, the AARC Corporation assists these companies by marketing their products to the banking and venture capital communities and to potential buyers of such products, such as the Federal Government. The AARC staff and Board of Directors have worked diligently to educate members of the banking community through speeches, publications, and even satellite feeds to bank officers. In addition, AARC has visited with the venture capital communities in New York, Chicago, Los Angeles, and Houston. The responses from these potential sources of funds have been extremely positive. In fact, several of the AARC companies have already received follow-on investments from these contacts that have had a tremendous impact on the profit potential of these companies. For example, Ariboard Industries of Texas used the AARC investment to attract \$2 million in equity from Raytheon Engineering. Gridcore International of California has received follow-on investments totaling \$17 million from firms including Nihon Cement, the largest cement manufacturing company in Japan. Earthgro of Connecticut was successful in attracting \$15 million in investments from Warberg-Pincus, an investment banking firm. These and other AARC-invested companies have confirmed that AARC's initial investment was key to attracting these and other additional investors into these small, mostly rural-based companies.

AARC works closely with the Small Business Administration (SBA) to open additional doors for its value-added agriculture manufacturers to private financing. Through a new arrangement, AARC companies have access to SBA's new Angel Capital Electronic or "ACE" network, a certified investor network of individuals with net worth of at least \$1 million. This new alliance with SBA will further leverage AARC's investment funds by opening the door to an important source of potential investment dollars that previously has been difficult for AARC companies to access.

Section 729 of the 1996 Farm Bill included a provision that allows Federal agencies to establish set-asides and preferences for products commercialized with the assistance of AARC. The AARC staff is working to educate Federal procurement officials about AARC-funded products, which are all environmentally friendly, and about the authority that allows them to establish procedures for the purchase of these products. Access to this huge Federal Government market can greatly enhance the financial success of AARC-funded companies and their ability to repay their investments, and the earnings on these investments to the AARC Corporation.

PART 1

601

Based on an analysis of the AARC portfolio prepared by the Agricultural Utilization Research Institute (AURI) and the Kansas Technology Enterprise Corporation (KTEC) in 1996, AARC investments have added on the average 13 times more value to the agricultural raw products and forestry materials. In addition, AARC investments have created 5,000 new jobs, mostly in rural areas of the country. Therefore, based on AARC's current leverage ratio, one job is created for every \$5,000 invested by the AARC Corporation.

To place a more human face on these numbers, I want to briefly describe one AARC funded company and the difference we are together making in its community.

Indian Creek Mesquite of Brownwood, Texas, is manufacturing and selling a mesquite wood product that serves as an alternative to charcoal. The mesquite is paraffin-coated and packaged in a paraffin-coated bag which can be ignited without the use of lighter fluid or other added materials. Mesquite wood carries a negative value due to the cost associated with removing the trees from pasture land. This cost averages about \$150 per acre.

Because of the added value generated by Indian Creek Mesquite, the value of mesquite has gone from a negative \$150 per acre to over \$5,000 per acre. In addition, Indian Creek Mesquite has created 14 new jobs in the Brownwood area that otherwise would not exist.

With the necessary resources, the AARC Corporation can continue and even expand its role in creating value-added products and jobs that benefit rural America. With AARC serving in the capacity of facilitator, new private sector investment dollars will reach entrepreneurs that otherwise would not be available. The AARC Corporation requests \$10 million to continue its mission. The AARC Corporation pledges to work diligently to invest its funds in projects that add the most value to commodities and rural communities, and work to locate and expand markets for these new bio-based industrial products. Based on the Corporation's track record during this short time, we feel confident in assuring the Subcommittee that these resources will be used wisely and effectively.

GENERAL QUESTIONS

Senator COCHRAN. I apologize for our hearing getting underway a little late this morning. We had a series of votes over on the floor of the Senate. Those are out of the way now. I left before we had our final vote total, but I think we probably passed the Nuclear Waste Storage Act. We dealt with several amendments this morning to that bill.

I have a number of questions on a variety of subjects, but I am not going to proceed. I am going to let my colleague from Montana proceed to ask whatever questions he has. I know he has other obligations in other committees in the Senate today.

Senator BURNS, if you have questions, please proceed.

Senator BURNS. Mr. Chairman, thank you very much. I have very few questions of this panel, which I think I explained in my opening statement.

I am struck this morning that a member of the bureaucracy would walk forward and say I was wrong last year. [Laughter.]

That is highly unusual in this town. And those of you who are visiting this committee for the first time, you are seeing history made. [Laughter.]

And not even we admit that we are wrong. [Laughter.]

Mrs. THOMPSON. Well, I never admitted I was wrong when I was a Member of the House. [Laughter.]

Senator BURNS. So this week has really started off.

I, again, would just want to work with you on the budget. And I was asking the chairman, on the transfer of money—I chair Military Construction, and we do ours a little bit different over there, but I can appreciate how this transfer has kind of helped you with some versatility to do some things maybe that have to be done and

PART 1

602

where it gives you some choice to make some decisions. And I think you should have that ability to make those decisions.

We have to trust our managers and our people to make those calls, and without a lot of fuss being made up here on this Hill. But I want to congratulate you for your increases in RUS. I am very much a promoter of that. I think as we deal with distances and this type of thing, this infrastructure becomes very, very important to us. And I appreciate the approach that this budget has taken this year.

And I thank the chairman.

Senator COCHRAN. Thank you very much, Senator.

We are constrained this year in our budget process by provisions of the so-called FAIR Act, the farm bill that was passed last year. It authorizes the Rural Community Advancement Program. Funding for some of the rural development programs is to be consolidated under that program.

BUDGET REQUEST AND THE 1996 FARM BILL

My first question is whether or not the budget that is submitted for the review of the subcommittee reflects the authorities under the farm bill last year, insofar as the Rural Community Advancement Program is concerned. I know there are five different sub-accounts. There is a "Rural communities facilities" account, "Rural utilities" account, "Rural business and cooperative development" account, the "National office reserve" account, and the "Federally recognized Indian tribe" account.

You have the authority under this law, as I understand it, to transfer the money to the rural development State directors, then proceed to divide the moneys or allocate the moneys among the five accounts, within certain limitations, to meet State priorities. Does the submission that we have before us, Madam Secretary, take all of that into account? And are the specific requests for funding in accordance with the authorization of the FAIR Act?

Mrs. THOMPSON. I believe that it is. I want to confirm my response, but I believe that everything is consistent.

Senator COCHRAN. Maybe Mr. Kaplan can confirm that for us.

Mr. KAPLAN. Yes; it is consistent with FAIR Act.

Senator COCHRAN. In that connection, let me ask whether we have complicated this or whether the legislative committee in the Congress, by adopting the FAIR Act, has complicated this, so that we have a hard time understanding where the priorities are. I am interested, for example, in rural water and sewer system accounts. We have a lot of unmet needs in our rural areas in my State and, I know, generally, throughout the country. One of the main areas of emphasis has been in trying to provide the quality of life opportunities for rural communities that we have in a lot of our urban areas and areas near the larger cities.

What is the emphasis in this budget request, if you can tell us, with respect to those traditional programs of rural development?

Mrs. THOMPSON. Well, the emphasis is certainly strong with regard to those programs that serve the three areas that are covered in the three agencies. The reason that we would like the additional flexibility that RCAP would provide is that many times—well, al-

PART 1

603

ways—as you go from State to State, the needs are different. And at different points in time, those needs change.

For example, there may be a community that has a need for a water system, but funds are insufficient to finance the project from the water and waste account, but there is funding available in other accounts and there is no immediate demand. The transfer of funds and the shifting of funds to best meet not only the long-term needs, but the short-term needs for each of the States would be most helpful to our State directors.

RURAL UTILITIES SERVICE

Senator COCHRAN. One thing I noticed in reviewing the notes that I have is that the President's budget request proposes a decrease in the program level funding for direct water and waste disposal loans. I am curious as to why the administration made that decision. There are a number of increases, and you pointed them out, but this is a decrease. Are we at a point where we do not need funds in this program as we did in the past? Why would the administration submit a budget that calls for a decrease in this particular area?

Mrs. THOMPSON. Well, I am going to defer to Administrator Beyer to answer in greater detail, but the biggest challenge is that there are many needs in many areas, and we are very committed to balancing the budget. And that means that tough decisions have to be made. Additional money could be spent in virtually every area and it would enhance the quality of life in rural communities across the country. But tough budget decisions have to be made.

Senator COCHRAN. Yes.

Mrs. THOMPSON. But let me turn it over to Wally Beyer.

Senator COCHRAN. Mr. Beyer.

Mr. BEYER. Thank you, Mr. Chairman.

Senator BUMPERS. Mr. Chairman, if I may interrupt. How much is the cut?

Senator COCHRAN. It is very small, \$739 million as compared with \$734 million.

Mr. BEYER. Yes; that is exactly what I was going to point out, Mr. Chairman. It is very small.

Senator COCHRAN. I just wanted to verify that I had the right figures in front of me and that it was a decrease.

Mr. BEYER. There is a decrease in the water and waste water, but it is very small.

The other thing we are doing is a better job of leveraging the scarce Federal dollars. We are, in fact, doing that with States and with private dollars. So we are trying to do the best job we can in maximizing the budget authority that we have.

Senator COCHRAN. There is also a small decrease in the Circuit Rider Program. This is a program where technical assistance is provided to small community water associations and the like.

Mr. BEYER. Yes.

Senator COCHRAN. What is the assessment of that program? Is it not providing benefits or is this another small decrease that simply reflects budget realities?

Mr. BEYER. Mr. Chairman, the Circuit Rider Program is a very valuable program for rural America without question. It is simply

PART 1

604

a refinement. It is not an abandonment by any stretch of imagination. And here again it is a very, very small decrease.

Senator COCHRAN. I notice on page 11 of your statement, you talk about the goals—as we approach the consideration of legislation here in Congress to deregulate the electric utility industry—you point out on page 11 that you think there are two important considerations that we need to keep in mind as goals that should be part of the development of any restructuring of this industry. The first is to ensure the continued availability of reliable, high-quality electric service at a reasonable cost to rural customers. And the second is to protect the integrity of the Government's loan portfolio.

I just want to let you know that I share those goals and congratulate you on thinking about how the Rural Utilities Service that we have supported here in Congress for a long time ought to think in terms of the restructuring of the industry. Does the legislation being considered by Congress, in your view, meet or achieve those goals?

Mr. BEYER. Mr. Chairman, the Rural Utilities Service is really at the vortex of revolutionary changes in the infrastructure in this country, as you know. There is so much legislation floating around right now and given the environment, the States' rights environment that we live in, we are approaching it with a general view of encouraging and trying to ensure the best we can that quality, reliable infrastructure at reasonable cost will be maintained in rural America.

I mean if this thing is going to be open access, and cash is going to be king, then it is going to be even more difficult without some congressional help. And you couple that with the patchwork deregulation that is going on State by State, and it is a very nervous time for rural Americans in looking forward to ensure that quality infrastructure is available.

I think Congress has spoken quite loudly—they did speak loudly in the telecommunications deregulation last year—in ensuring a rural safety net network. And, second, as we move through the process of molding a new rural electric infrastructure, we would certainly encourage Congress to be very sensitive to a universal service pool concept for the electric industry as well. We certainly have concerns about loan security issues.

We have challenges all over the place in various States on our all-requirements contract, the basic documentations in loan security. We are working with that as quickly and as diligently as we can, in assisting borrowers to prepare themselves for this new, radically changed environment. So we know that your committee is very interested in this, and we would hope that you would take a very active role in watching this process unfold.

Senator COCHRAN. Well, I think we ought to be vigilant and keep in mind, as you point out in your statement, that we do not want to adopt reform legislation and then wake up and find out that those who live in the small towns and the rural communities are going to see their rates skyrocket or they are going to lose service or something like that. That would be catastrophic. We have to be very careful.

Senator Bumpers.

PART 1

605

Senator BUMPERS. Thank you, Mr. Chairman.

Mr. Beyer, just to pursue the question Senator Cochran just asked you, let me say, first of all, that the REA has never had a stronger champion in the Congress than I have been. Because you have heard me say many times what it did for the area I grew up in. In addition to that, it saved my father's business, because he was a smalltown merchant, and it gave him an opportunity to sell electrical appliances in rural areas. His business really began to boom after that. And REA operated out of the back of his hardware store for years.

So I come to this deregulation thing with considerable qualms and concerns. But I got into it, No. 1, because I became ranking member of the Energy Committee, and Senator Johnston had originally started this, and we all agreed that it was going to happen. And only if I took charge of it would it happen in a sane, methodical way. [Laughter.]

But let me just make this point and see if you agree with it. And I know that the co-ops are the biggest adversaries of this whole concept. And I understand that. They have all been in my office, and I am sure will be again and again. And they have nothing to fear insofar as my power to control this thing is determined, because I am going to make sure that the utilities are treated fairly, that they are not all sent into bankruptcy because of a crazy scheme.

The second reason I got into it, other than being the ranking member, was that this thing is going to happen whether we do it here or not. Seven States have already adopted retail competition, restructuring the electrical industry in their States—seven. Four more have it under consideration. It is a very trendy thing. And as I have said in some of my speeches, the House is probably going to pass this. You have a mix in the House of liberals who think anything that benefits consumers is good and you have conservatives who think everything is fixed by competition. So you have those two forces at work in the House, which indicate that this thing is probably going to pass the House this year.

But what I have tried to tell the co-ops and everybody else is if you allow 50 States to do this on a random, harum-scarum, ad hoc basis, you are going to wind up terribly sorry that we did not have a national guideline for this to happen. For example, Northeast Utilities is suing New Hampshire right now because New Hampshire is one of the seven States that has already gone to retail competition, and they have kind of a convoluted system of allowing people to recover their stranded cost. That is, if their generators—because of lost customers to competition—if their generators are no longer economical, they can go to the State public service commission and say, we want to recover, we want you to pay us for our own recovered cost of this generating plant.

And they say that New Hampshire law shorted them the \$434 million. Now, I do not want to go into this whole electrical deregulation thing here. All I am saying is, if you were a utility operating in three States and you had three States—two with retail competition and one with none, and you find yourself in dire straits because of competition, you are not going to get any stranded cost from the State that has not gone retail. And on the two that have

PART 1

606

gone retail, they may have entirely different formula for determining stranded cost.

Now, it is not just the co-ops, but the whole utility industry, in my opinion, that would be swamped—absolutely swamped if that happened. And it is beginning to happen, even though seven States are all we have that have gone to retail competition. So, as I say, I understand the concern. I am concerned about that person in Arkansas, who lives a mile down the lane, and REA has built a line at a considerable cost of thousands of dollars to put power down to that house. And I will not stand—at least I would not vote for it nor support or speak for any kind of a bill that did not take care of that customer.

I want to make sure, if this is not good for everybody, it is not good for anybody, in my book. Hubert Humphrey used to say that America would never be a good place for anybody to live until it is a good place for all of us to live. And I champion that same phrase in connection with electricity.

But while I know the co-ops are very much opposed to this concept, they are not likely to be exempt. And if they are not exempt, a national guideline, in my opinion, is going to be infinitely preferable to them trying to deal with—does REA operate in all 50 States?

Mr. BEYER. Not today, Senator.

Senator BUMPERS. How many States does it operate in?

Mr. BEYER. With your permission, I will have to get back to you on that. It is the bulk of them. California, for example, has four rural electrics. And some of the Northeast States. But that is about it. It is pretty broadly covered.

Senator BUMPERS. Do you quarrel with anything I just got through saying?

Mr. BEYER. Senator, I do not quarrel with it at all. We are very, very concerned about stranded investment. We are very, very concerned about reliability into the future. If this thing is wide open and it is customer choice and you have the ability to switch consumers, the industrial and commercial customers are going to be gone first. Because that is where the cash is. And there is where the power marketers are going to go. That is where the folks with low-cost generation are going to go.

And there is going to be a switch in consumers. And that is just going to be a bigger problem. We are very concerned about the national guidelines. I am speaking for myself now, but I personally think there needs to be some national guidelines for this patchwork direction that it is going in.

Senator BUMPERS. Well, you are speaking for yourself, I can tell you that.

Mr. BEYER. I am speaking for myself, Mr. Chairman. I hope you do not mind that.

And national guidelines would seem to me to be critical in the interest of reliability. We do not even understand what it is like to have systems that go on and off. Because when we turn the switch on in America, something happens. We do not even think about it. And if we start getting into this patchwork network, it threatens reliability.

PART 1

607

The other thing that we would encourage is some universal service concept in the electric system, not unlike the telecommunications. That is entirely doable. It would make a lot of sense to ensure that rural America has the ability to maintain quality, reliable, reasonable-cost electric service.

Senator BUMPERS. Mr. Beyer, how much money is in the budget this year for REA for rural electricity?

Mr. BEYER. \$29 million in budget authority. And if I may take this opportunity, Mr. Chairman, that \$29 million will generate \$825 million Federal dollars. In addition to that, it leverages 3 additional private dollars. So about \$3.3 billion will be invested in electric infrastructure in fiscal year 1998. That is a tremendous leveraging of the scarce Federal dollars.

In fact, we are going to do a piece on the evolution of leveraging. In my understanding, that is the way government is supposed to work. You are supposed to get this thing going, and then you use government to leverage private capital. And that is exactly what this program has done.

Probably the most value in the electric and telecommunications program today is the credit support leverages \$3 in investment for 1 Federal dollar.

Senator BUMPERS. How about telephone, do you have money in there for rural telephone service?

Mr. BEYER. Yes.

Senator BUMPERS. How much?

Mr. BEYER. The telecommunications is \$1.9 million, which will leverage—actually, the telecommunications program leverages about 4.3 private dollars for every Federal dollar. It is a little bit better leveraging in telecommunications.

Senator BUMPERS. Those are very small figures. And, of course, you know one of the things that we still hear around here from some sources is that REA has outlived its usefulness. They ought to be cut loose. There is nothing wrong with them being a cooperative, but they do not need Government subsidies. What is your response to that?

Mr. BEYER. My response to that is the consideration of reliability, consideration of continuing need for capital to constantly improve and replace antiquated systems, to modernize the system. That is a never-ending process in the infrastructure. So there will be a continuing need for infrastructure investments in the years.

Take, for example, the technology in telecommunications. My goodness, technology is just changing the landscape in telecommunications. And certainly you have to have a continuing availability of capital to keep that going.

Mrs. THOMPSON. If I might also add in response that virtually all electric utilities are subsidized through the tax code. The other electric utilities are subsidized through the tax code. And in fact, per consumer, rural electric users are receiving a smaller subsidy. That is per consumer.

In answer to your question about the number of States that have rural electric cooperatives, the number is 46. And let me also say that I know you would like an official administration position on some of the legislation that is being considered by the Congress, and if you would like that, we would certainly be glad to—

PART 1

608

Senator BUMPERS. I would like that.

Mrs. THOMPSON. We will provide that for you, then, on each of the pieces of legislation.

Senator BUMPERS. Yes; that would be very helpful. That is what I would like for us to have in our record, so we can consider all these options that we have before the Congress, with a view toward how they will affect those who live in rural communities and the small towns of America.

Mrs. THOMPSON. We will provide for you the official administration position.

Senator BUMPERS. Thank you very much.

[The information follows:]

Legislative policy on electric utility restructuring includes several departments of the Federal government. Administration policy is being developed at this time. USDA feels that two factors are vitally important in any legislative action that impacts the electric utility industry.

First, the taxpayers expect us to protect the integrity of the Government's loan portfolio and we take that responsibility very seriously. The second concern is that ensuring the continued availability of reliable, high quality service at a reasonable cost to consumers in all rural areas of the country is critically important.

RURAL HOUSING SERVICE

Senator BUMPERS. Mr. Chairman, just a couple of quick questions.

Mr. Shadburn, I have language I intend to offer on the supplemental that would provide some help for the storm-ravaged part of my State. We had probably the second- or third-worst tornado season we have ever had. And I will share this language with you before we offer it. But I would like for the USDA to be on board with it, because I want some housing assistance for Arkadelphia in particular, but also especially for College Station, which is a very, very poor African-American community, which is a suburb of Little Rock.

And, finally, on housing, Mr. Shadburn, your budget requests \$52 million for HUD section 8 contracts. Why are we subsidizing HUD?

Mr. SHADBURN. Well, Senator, what we are asking for is the actual transfer of the budget authority from the HUD section 8 contracts that are presently used in our section 515 projects into RHS 5-year rental assistance [RA] contracts. There are currently 46,000 HUD section 8 units in over 1,500 515 projects. In an effort to save taxpayers money over the long run, the administration is proposing this transfer.

For fiscal year 1998, the budget proposal requests \$52,497,000 of rental assistance to replace 3,665 units of expiring section 8 in 515 projects. Over the next 8 years, the administration recommended that all 46,000 section 8 units be converted to RHS RA, provided Congress accommodates the adjustments to the 602(b) allocations for both Appropriation Committees of Jurisdiction.

The budget cost for HUD to renew the 3,665 expiring section 8 units for 1 year would be approximately \$20 million for 1-year HUD contracts compared to approximately the \$52 million for RHS 5-year rental assistance contracts. The net cost in the short term would be higher, but after 3 years there would be significant sav-

PART 1

609

ing. At the conclusion of the full conversion in 2005, an estimated \$291 million would be saved.

Senator BUMPERS. I am not sure I understand that, but my time is about up. Let me just ask you this final question.

Section 515 rental assistance, that program goes from \$16.8 to \$540.9 million. Why such a staggering increase? Have we misread that?

Mr. SHADBURN. Yes, sir; I think that the \$540 million figure is consistent with what we have been requesting over the last several years.

Senator BUMPERS. And this year, 1997, you only have \$16.8 million in the program?

Mr. SHADBURN. No, sir; we have a request in the budget for—are you talking about in fiscal year 1997 or 1998, sir?

Senator BUMPERS. 1997.

Mr. SHADBURN. OK, in fiscal year 1997, it is \$518 million.

Senator BUMPERS. \$518 million this year, and you are asking for \$540 million next year. OK, then we just got a bad figure here.

Thank you very much.

Senator COCHRAN. Thank you, Senator.

Senator HARKIN. Thank you very much, Mr. Chairman.

Mrs. THOMPSON. May I answer a question of Senator Bumpers before you ask a question?

Senator COCHRAN. That is up to Senator Harkin.

Senator HARKIN. You can ask a question. I do not know if I will let him answer it, but you can ask him. [Laughter.]

Mrs. THOMPSON. Well, I am not sure I heard Jan answer your question regarding your supplemental language. And maybe he did and it just slipped. But we have reviewed your supplemental language, and it is quite acceptable to us.

Senator BUMPERS. Good. Thank you very much, Mrs. Thompson.

Senator HARKIN. I was afraid you were going to ask him a question. He has been known to give answers that can go on for quite a while. And I did not want to get bogged down here in the middle of the afternoon. [Laughter.]

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION CORPORATION

Well, guess what I want to ask about, Mrs. Thompson? I want to talk about AARC. I have been a strong supporter of that, as you know. In 1987, I introduced the legislation that we worked on for a couple or 3 years and, with some changes, it was finally adopted in the 1990 farm bill. That created AARC. It was a bipartisan effort. Then-Secretary Madigan was a strong supporter of it. He was then in the House of Representatives.

It is a Government agency that is providing very hard-to-acquire venture capital for businesses. It is making real differences in a lot of companies. But the dollars available are much too limited. I just have a series of questions on the subject of AARC.

Your statement makes reference to the fact that the key to improving economies in rural areas is the creation of business job opportunities. One of the successes you cite is how AARC is working with the private sector to create new opportunities. Can you provide a couple of examples of the products that have been commer-

PART 1

610

cialized? And, in particular, what that may mean for farmers? Can you or Mr. Crain? I do not know—whichever.

Mrs. THOMPSON. Yes; I would be delighted to answer those questions, because we have had considerable success in AARC. And one example is the use of peanut hulls to be converted into a charcoal that is used in water purification, which then changes the value of the peanut hull to the producer from a cost of \$7 per ton, I believe, to a positive \$300 per ton. That is, to me, a significant value-added matter.

We have had success, as you know, in the State of Iowa, as well as other States, with using wheat straw for wallboard. And it simply increases the demand sometimes for products that are actual waste. And so it has been a very successful program. It also means more jobs in rural communities. And so it is really a win-win program, where the farmer wins because the value of her or his commodity goes up, and the local community wins because jobs are created.

Senator HARKIN. There are a lot of other examples, I know. And if you would just provide those for the record, I would appreciate it.

[The information follows:]

Almost the entire portfolio of products could be utilized by the Federal government. For example, the U.S. Postal Service (USPS) is constructing “green” buildings around the country. One facility now being constructed near Dallas, Texas, will utilize compressed wheat straw walls produced by Agriboard Industries in nearby Electra, Texas. We believe other AARC-supported construction materials may also be used in that building.

The USPS has also contracted with Gridcore Systems International (GSI) to produce trash cans for use in post offices. The source of the raw materials used to make the strong, lightweight honeycomb panels for the trash cans is undeliverable bulk mail. We support the way the USPS has endorsed environmentally friendly building products from the AARC Corporation. We are still talking with USPS about using other products in the AARC Corporation portfolio in their course of business.

Gridcore has supplied samples and is also talking with Unicor, part of the Prison Industries Program, about making furniture.

Discussions are currently underway with the Pentagon and several of the AARC building material suppliers to provide material to renovate and “green” the Pentagon. Use of AARC materials in this multi-year project could have a major positive impact on these companies.

Phenix BioComposites produces Environ from soybean meal and waste newspaper. It is a replacement for hardwood and looks like granite. The Natural Resources Defense Council (NRDC) used Environ for the counter tops and work surfaces in its new headquarters built last year, in Washington, DC.

PrimeBoard uses 100 percent wheat straw to produce Wheat Board, a particle board replacement. This product is being widely used for manufacturing cabinets, furniture, and millwork. NRDC’s counter underlayment is from PrimeBoard and its cabinets are also made from Wheat Board.

Seed-based Lubricants.—International Lubricants Inc. (ILI) produces a line of biodegradable seed-based lubricants—everything from transmission additives, to all purpose lubricants, to two-cycle oil to industrial lubricants. Although the seed-based lubricants are environmentally preferable, these petroleum replacements face stiff competition from the existing petroleum-based products. In spite of the competition, some sales to the U.S. Air Force have taken place. Vegetable oil based lubricants could also be used with weapons and in the engines of high-performance vehicles.

The Leahy-Wolf Company uses canola oil as a lubricant for concrete forms. As the Federal government continues to build new buildings and renovate old ones, or pours cement in environmentally-sensitive areas (bridges over waterways for instance), this product may be specified.

Other Fluids.—Windshield washer fluid produced by Aquinas Technologies that is made from ethanol would seem to be a natural for all vehicles.

Absorbents.—There are several products in the AARC portfolio which will help clean up oil spills. Low value wool from Hobbs Bonded Fibers has been purchased

PART 1

611

for use at military bases in Texas to catch and hold petroleum drips from vehicles. Two other products show great promise in remediating hydrocarbons. One is Oil Gator, the Product Services Marketing Group, which is made from cotton seed lint. It has been used to remediate spilled petroleum. Kenaf core can also be used to absorb and remediate hydrocarbons. These products can be used to clean up spills from existing contaminated sites, not just new spills. As military properties are being cleaned up, these products are likely to be considered.

Filter Material.—Scientific Ag Industries makes activated carbon made from peanut hulls. These products can be used in water and air filtration systems and can also be used to remediate soils. It's also cheaper and of better quality than imported materials.

Soil Amendments.—Many military bases are located in places with poor soil conditions. Biorecycling Technologies, Inc. is currently working with the Marine Corps Ground Combat Center at Twenty Nine Palms, California, to improve soil conditions in the military housing area, the golf course, and recreation sites, using a variety of fertilizers and soil amendments derived from cow manure.

Earthgro Incorporated makes a variety of potting mixes utilizing plant and animal wastes. These can be used with interior potted plants and exterior plantings as an ideal substitute for peat, a finite and imported material, and petroleum-based fertilizers.

Cleaners.—The AARC Corporation has invested in a number of environmentally-friendly cleaning products. Interchem Environmental produces a line of solvents from soybeans including graffiti remover, paving equipment, tar remover, and cleaners for printing presses.

Shadow Lake makes Citra-Solv, a multi-purpose cleaner made from a powerful citrus extract, along with a number of other natural products—castile soap from essential oils and Air Scense, an air freshener from essential oils, which absorbs odors.

MM Manufacturing produces waterless hand cleaner from corn oil.

Tree-Free Paper.—KP Products uses kenaf, an annual fiber plant, to produce tree-free, chlorine-free paper.

Starch-based Plastics.—Several AARC-supported companies produce a variety of coatings and films from vegetable starch. For instance, StarchTech makes biodegradable packing peanuts, which replace similar petroleum-based products. The Environmental Protection Agency has been a major purchaser of these starch-based peanuts, which dissolve in water.

Forestry Materials.—Indian Creek Mesquite coats mesquite wood chunks with vegetable based paraffin in a "Light The Bag" application. No starter fluid is necessary. We can report that sales of this product are brisk in USDA's employee-owned store located in the sub-basement of the South Building.

Cat Litter.—BioPlus Incorporated products biodegradable, flushable cat litter from peanut hulls. SSM Environmental Technologies Inc. uses corn stover, a post harvest residue, as its base to also produce an environmentally friendly cat litter.

Senator HARKIN. How much money has AARC invested in companies since its inception? And what additional funding from private sources is going to these companies? I just want to know about the leveraging aspects.

Mrs. THOMPSON. Yes; I have that number here. But Bruce Crain, the Executive Director, can probably answer that off the top of his head.

Mr. CRAIN. Senator Harkin, to date, we have invested \$28.1 million and we have leveraged another \$112 million of private dollars. It is about a 4-to-1 leveraging ratio. Now, after that first leveraging takes place, we have also been successful in achieving follow-on financing into these companies. We pulled the data on five companies in which we have invested \$3.7 million. And in those five companies, we had leveraged an additional \$57 million of private equity.

That shows us that putting a USDA stamp of approval on these companies is successful in attracting that all-important private debt and equity into these companies.

PART 1

612

Senator HARKIN. Are some of them going public? What is the likelihood of some of them going public?

Mr. CRAIN. I think the likelihood is very good that most of them will go public. When they come to us, we are pushing them in that direction. Because we want to cash out and exercise our put option or they can exercise their call option in the fifth through eighth years. We are probably about 18 months away from three IPO's, we think, at this stage. But, to date, we are having a lot of success in meeting with venture capitalists and investment bankers in New York and other States in areas that are coming in behind us with these dollars. And we are finding, like I said, that USDA stamp of approval is making a difference.

Senator HARKIN. What is the average length of time for companies acquiring venture capital funds to really kind of get up and get going and get in the private sector?

Mr. CRAIN. Based on the data we have gathered from venture capital experts, it takes about 5 to 6 years for a company to experience a positive cash flow. AARC made its first investments in 1993. That means, next year, 1998, would be the first year we would really be expecting significant returns.

We structure our deals where we are going to get four to five times our money back in the form of a risk premium for our investment. So we are confident that we can meet that schedule and it will produce significant returns.

Senator HARKIN. How much funding do you believe AARC could effectively spend in fiscal year 1998? This is the Appropriations Committee; how much money do you think you could effectively spend?

Mrs. THOMPSON. Well, I actually think that it is almost unlimited. It depends on only the creativity and the initiative that is out there. And there is considerable creativity and there is considerable initiative in rural communities. So I think that it is almost open ended.

Senator HARKIN. How much did we have in the Appropriations Committee last year?

Mrs. THOMPSON. I believe it was \$7 million.

Senator BUMPERS. If anybody knows the answer to that question, it is him. [Laughter.]

Senator HARKIN. I am just making a record.

Mrs. THOMPSON. Do you think he just wants me to have this in the record? [Laughter.]

Senator HARKIN. Stick around and you will hear it more. Because I think this is where it is. This is where we are going to have the value added and we are going to create jobs and provide more industry in rural areas.

I guess what I am looking for is the budget request this year was how much?

Mrs. THOMPSON. \$10 million.

Senator HARKIN. Well, if it is doing all of these great things and we are moving ahead, why do we get a \$10 million request? That is what I am trying to figure out. Everyone I have talked to indicates that they could use more money. It is a wise investment. People are going to pay it back. It is doing good research. And we have this sort of modest, timid kind of an approach. What did you say

PART 1

613

that they were asking for, \$500 million? What was that other thing you just said, for what?

Senator BUMPERS. That has been too long ago. [Laughter.]

Senator HARKIN. Yes; about one-half hour.

Senator BUMPERS. That was the 515 Rental Assistance Program.

Senator HARKIN. Oh, the 515 Rental Assistance Program. They cannot pay the rent unless they have jobs. This provides the kind of jobs they need so they can pay your rent, Senator Bumpers.

Mrs. THOMPSON. Well, Senator, I have heard you speak on AARC a number of times, and you are very persuasive. I have been working with the White House on this issue and believe that we might be able to get support for up to \$20 million for fiscal year 1998 on the part of the administration.

Senator HARKIN. I hope so.

Mrs. THOMPSON. You are very persuasive.

Senator HARKIN. I still think that is very low. I think that we have just been muddling along here. And I have basically taken at face value some indications from this administration that they were going to boost their request for this. Then 1 year slips by, and they say, well, then we will do it next year. The next year slips by and I am through having it slip by any longer. Everything that I see indicates that there is a bright future for it.

Let me ask one last question. I know the answer to it, but I want to get it on the record. Do other countries have a program like AARC?

Mrs. THOMPSON. I am going to let Bruce Crain answer that specifically, but there are some interesting things that happen in other countries.

Mr. CRAIN. Senator, Canada, right now, is establishing a value-added program. And I think the Canadian Government has appropriated \$100 million for that program. A lot of that will be spent by individual provinces.

Australia has a similar program. And we have just recently learned that the People's Republic of China has a program which is very similar, as does Germany which has a budget of \$53 million. And in a recent meeting that I participated in with some of my counterparts in those groups, they are looking at the AARC model as to how to develop a value-added-type program in their countries. Because they like the fact that we are able to leverage private dollars so successfully. And they are attuned to the fact that for every dollar of research, it takes \$100 to commercialize that research.

Senator HARKIN. Well, I have followed it very closely and I have seen the companies that have been invested in. And everything looks like it is going to be a good program. And obviously not everyone is going to come up a winner. We know that. That is the nature of this business. But, overall, it seems to me, that you are putting the money out there, and these kind of businesses are going to add value to crops, provide jobs in rural areas, and I think that is the direction we have to go.

I just hope that we can, Mr. Chairman, find the \$20 million. We were supposed to have done that last year and we did not. So I said, OK, we will wait another year. So I was greatly disappointed when I saw the budget request come in again at last year's level

PART 1

614

for something that is actually building jobs in rural America and leveraging what, 4 to 1, private money.

Mrs. THOMPSON. Senator, I will do all I can to work with you on AARC.

Senator HARKIN. I appreciate that. Thank you very much.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

RURAL HOUSING SERVICE

Mr. Shadburn, I know you were listening when Mr. Beyer talked about leveraging the funds available for rural utilities with private sector investment dollars. And I was curious to know whether your experience in the housing programs is that we are leveraging in the same kind of way with housing dollars as we are in utility dollars. What can you tell us about the programs under your jurisdiction, as far as attracting private investment is concerned?

Mr. SHADBURN. Well, Senator, we are very proud in the Rural Housing Service of the leveraging that we are doing. Obviously, we are focusing on attracting additional private investment—in the direct program, we are requiring a goal of at least 20 percent of our direct housing money to be leveraged by each rural development State office. We also have the Real Home Loan Partnership that we initiated in fiscal year 1996 with Rural LISC, the Federal Home Loan Bank and community development corporations, where we now have 17 States that are working to leverage funding.

We also are working with the State housing finance agencies and the private lenders. So we have focused in each of our programs, the direct single-family program, our guaranteed single-family and multifamily housing program, our guaranteed and direct community facilities program, and likewise in our 515 program. So, in all of our programs, we are focusing on leveraging with partners to make our funds go further.

Senator COCHRAN. We have also heard that if you have a program that has as its goal the ownership of the housing unit by those who are being identified as beneficiaries of the program, that you are more likely to have property that is well cared for and that pride in ownership and other things flow from that experience—more responsibility for family, getting a job, for doing the things that have moved this country forward economically. My question is, Is that something that is real or imagined? Are we seeing those kinds of results flow from our rural housing programs that encourage ownership or that move someone toward owning their own home?

Mr. SHADBURN. Yes; most definitely, sir. We are focused at the Rural Housing Service on just the things that you were talking about there. But, in addition, it certainly benefits the total family, especially the children, because of their ability to live in safe, sanitary, and decent housing. It allows them to do better educationally. It has been proven. And it builds and supports the family unit. And we are finding that as we focus on our servicing and portfolio management, that we are assisting in making successful homeowners.

PART 1

615

RURAL BUSINESS-COOPERATIVE SERVICE

Senator COCHRAN. Mr. Watkins, the programs under your jurisdiction have been very helpful in many respects in my State, particularly those in enterprise zones that were identified where there is a lack of job opportunities, providing loan funds and even grants in some cases to businesses and to new initiatives to provide jobs. It has made a big difference in a lot of people's lives.

What is your assessment of those programs in the rural enterprise communities? Have they been working or not?

Mr. WATKINS. Mr. Chairman, thank you very much for the question.

Our experience to date is that as those communities develop their expertise and their capacity to understand how Federal programs can really be used to benefit their communities, as we market and promote the programs to the private sector, business-owners and entrepreneurs in those local communities, then, yes, these programs have been utilized and they make a significant difference in assisting businesses establish themselves and locate in the empowerment zones and enterprise communities.

Senator COCHRAN. When some of these programs were just starting up, I had gotten the impression that there were more meetings being held than loans being made. Are you still having more meetings than loans being made?

Mr. WATKINS. Well, Mr. Chairman, that was probably a true assessment when the program first began, because the overriding philosophy of the program was that everyone in the local community was to be involved in the empowerment zones/enterprise community program. In order to be involved, residents who had never worked together were brought together for their communities economic development. They had to develop their capacity and expertise, to understand how this initiative would benefit them.

We encouraged the continuation of meetings. Now, whether or not there are more meetings today than there are program assistance being made to those communities, from a personal perspective certainly meetings are continuing, but the resources are being made available and are being used in designated and nondesignated rural communities. We can provide you with the information to support this assessment.

Mrs. THOMPSON. I have some numbers that I think you will find of interest.

Senator COCHRAN. Yes, Madam Secretary.

Mrs. THOMPSON. Since the time of the designation of the empowerment zones and the enterprise communities, through last December, there have been \$324 million awarded from a variety of sources. And included in that is \$85 million from the private sector, where we used Federal dollars to leverage private sector dollars.

Since the inception of the program, we have had 18 new business revolving loan funds established, 3,000 residents have participated in job training. There have been six new job training centers established. And more than 7,700 residents are now being served by expanded child care or Head Start programs. So those are some of the things that we have been able to get accomplished.

PART 1

616

ADMINISTRATIVE COSTS

Senator COCHRAN. Let me ask you this one question about the budget request. I notice that in the area of administrative costs, last year's funding level was \$31 million. This year there is a \$4.6 million increase being proposed. Why is it necessary to increase the administrative costs over 10 percent in 1 year?

Mrs. THOMPSON. I believe it is technical assistance that we will be providing to the communities, but I want to ensure that that is where that money is going. It is for technical assistance. And one of the things that I think we knew before but which has been confirmed as a result of the processes that we have been going through is that some of the poorest rural communities have the greatest challenge in terms of writing grant applications and strategic plans for their communities and updating strategic plans.

And, as you know, it is very different—I know in my hometown, we do not have people working for the town of Larwell who have master's degrees in public administration, whose sole job it is to write grant applications in the private sector or the public sector. Instead, we have a lot of people who have day jobs and volunteer their time to serve the community as town board president and member of the town council.

Well, in the poorest rural communities, they have not an even greater need than in my hometown for the technical assistance information that we can provide and guidance that we can provide to link them up with Federal programs that are available. And that is the reason for the increase.

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION CORPORATION

Senator COCHRAN. With respect to the Alternative Agricultural Research and Commercialization Corporation—that is a fancy, big title—or AARC, I am impressed with the work that is being done. I appreciate very much your making this material available to the committee—or to Senator Harkin, who made us all read it. [Laughter.]

But this is strong evidence, I think, of the importance of these investments in new technologies, new ideas, and new uses of products from the farms. I am hopeful that we can support your request for the additional funding. I know that amount sounds modest to you, but it is a small request for an increase. I hope we can do it, because I think it has been a worthwhile program, and we need to provide the funds to continue it and expand it if we can.

I know, in our State, we have the facility down at the University of Southern Mississippi that this committee funded several years ago, the Polymer Science Center. It has undertaken research in many of these same areas, trying to use products in a new way—developing polymers specifically—but there are a lot of spinoff discoveries from that research, or as a result of that research.

Have you been down there recently to check out what they are doing? Is that a complementary or a duplicative investment?

Mr. CRAIN. Mr. Chairman, we work very closely with Dr. Thames at the University of Southern Mississippi. I have been down there a couple of times. And it complements what we do. We rely on re-

PART 1

617

search laboratories like that one, and the ARS laboratories and the Forest Products Laboratory to develop those technologies. Then we can assist the entrepreneurs who are attempting to commercialize these technologies. We are the next step in the process.

As you know, down there, there is the revitalization of the tung oil industry. And we are excited about the possibility of getting involved in that, and assisting those people that are trying to develop biobased products from tung oil, that, as you know, was once very prominent in that area.

Senator COCHRAN. There was once a great hope that the kenaf industry was going to be an alternative source for pulp and paper products. Are you familiar with any new developments in the kenaf area?

Mr. CRAIN. Kenaf is something that we have invested heavily in—almost 10 percent of our portfolio is invested in kenaf, directly or indirectly. We feel like it is going to be the future. We have major paper companies now stating that they want to use up to 30 percent of their alternative fiber for the production of paper in the future. We are going to have to look at alternative fibers. And kenaf is a legal one, as opposed to some that are not, that we should pursue.

I think that a few months ago there were eight paper company executives from Japan that came to Mississippi, and told the Mississippi Department of Agriculture they would take up to 1 million metric tons of kenaf pulp tomorrow if they could get it.

Senator COCHRAN. Why can't they get it?

Mr. CRAIN. Well, there is not enough in the ground. And there has not been an incentive yet for the farmer to plant it and for a paper mill to be developed or a pulping mill to be developed, say, in the empowerment zone, right near Charleston, MS.

Hopefully, though, as we have more of these products become more commercially viable and the markets become penetrated, you are going to have more farmers in that region and in Texas and Arkansas and others looking at it. And when they do, you are going to see the big paper companies, whether they be domestic or foreign, come in and make investments to produce paper and other products from kenaf.

RURAL COMMUNITY ADVANCEMENT PROGRAM

Senator COCHRAN. I noticed the overall budget request for the Rural Community Advancement Program [RCAP] is \$2.5 billion in program-level dollars. How does this compare with last year's appropriated amount for these activities?

Mrs. THOMPSON. They are very similar. It is 10 percent. So it is very similar—well, it is 10 percent of budget authority—however that translates into the programs, whether they be grant or loan programs. But they are very similar.

Senator COCHRAN. My last question involves the local administration of these programs. I know the Washington level can devise and plan, have strategies and budget numbers, but unless you have the program administered in an effective way and a sensitive way at the State level and the local community level, it may not produce the results that we all had intended. What is your assessment of the quality of administration in the offices at the local level

PART 1

618

and how they are providing the resources and assistance, technical and otherwise, to the family farms and to the people who actually are the beneficiaries of these programs and services?

Mrs. THOMPSON. I think we have a very strong field delivery system, made up of career employees in the Department of Agriculture, who know very much about the needs in their own individual communities because they live, their kids go to school there and it is their community. And we have some very talented and very committed and, quite frankly, very, very knowledgeable people, whose heart and soul is in the community that they are serving.

And I think when you look at all of the changes that we have made in the restructuring and reorganization in the Department of Agriculture and all of the changes that they have been a part of implementing in program delivery, I just think that they have performed something close to miracles over the last several years. And I, personally, as a political appointee, am very proud to be associated with the field structure and the career employees that we have across the country.

And I, frankly, do not think there is any other way that we could administer these programs as cost effectively as we are administering them. I think the field structure is working very well.

Senator COCHRAN. The reason I ask the question is we want to be sure that the dollars we appropriate go to support the workers out in the field too, and not just the people who are here in Washington managing the program. Because if we have too many managers and not enough workers, we do not get any work done. We just do not get the services provided or the technical assistance out to the local level.

Mrs. THOMPSON. I could not agree with you more.

Senator COCHRAN. I want to be sure that we have a proper balance in our budget as well. So we are going to be looking closely at that. If you have any comments that you want to submit for the record, such as comparing the cost of administration and the dollars spent on the field services delivery system now with what it was 5 years ago, before the reorganization really started, that would be interesting to look at.

Mrs. THOMPSON. We can do that. As you know, we are requesting a lower level for salaries and expenses for fiscal year 1998 than for fiscal year 1997. Even with that, we are working hard to make sure that we are making the right kinds of investment in the resources that our field employees have available to them. And so there are some up-front costs in the reorganization and the restructuring that will be pretty much one-time costs. I am thinking in particular of the centralized servicing system for the single-family housing program.

But, yes; we would be glad to provide some good statistics regarding the costs over the last several years.

Senator COCHRAN. Thank you.

[The information follows:]

PART 1

619

COMPARISON OF ADMINISTRATIVE COSTS TO PROGRAM AMOUNTS DELIVERED FISCAL YEAR 1995 THROUGH FISCAL YEAR 1998

Fiscal year	Salaries and expenses	Program amount	Administrative cost per program dollar delivered
1995	\$555,238,000	\$6,463,145,000	\$0.09
1996	533,198,000	6,933,966,000	.08
1997	519,959,000	8,205,524,000	.06
1998	514,951,000	9,126,234,000	.05

The mission area has been able to lower the cost of program delivery by using a higher level of technology and through field restructuring. However, there are some initial start-up costs associated with the initiatives. Therefore, the budget request of \$514,951,000 is required to continue the momentum on these savings.

SUBMITTED QUESTIONS

Senator COCHRAN. I may have some additional questions, and other Senators who are members of the committee may also. If we do submit additional questions, we hope you will be able to answer them in a timely fashion. We will put them in the record and carefully consider them as a part of our process.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

RURAL DEVELOPMENT

RURAL DEVELOPMENT LOAN FUND PROGRAM ACCOUNT

Question. The Administration's request proposes to change the direct loans authorized under the Rural Electrification Act. The proposal suggests using earnings generated by the interest differential on the voluntary cushion of credit payments made by Rural Utilities Service borrowers to provide loan subsidies for rural economic development direct loans. Please explain how this proposed request would work using monies from the Rural Electrification and Telecommunication Liquidating Account? How many rural economic development direct loans will be available in fiscal year 1998 if this request is approved by the Committee?

Answer. The earnings generated by the interest differential on the voluntary cushion of credit payments made by Rural Utilities Service borrowers would be used to finance the rural economic development loan and grant programs as authorized by the Rural Electrification Act. These earnings are currently being used to finance the rural economic development grant program. Some of the earnings would be transferred to the Rural Economic Development Loan Program Account from the Rural Electrification and Telecommunication Liquidating Account and used to provide the necessary loan subsidy for the loans. It is expected that the requested loan level of 25 million will provide for 79 loans.

RURAL BUSINESS-COOPERATIVE SERVICE

RURAL ECONOMIC DEVELOPMENT LOANS

Question. The fiscal year 1998 budget request proposes \$25 million, an increase of \$12.7 million, for rural economic development loans. The carryover of unfunded applications from fiscal year 1996 and fiscal year 1997 will total \$16 million by the end of fiscal year 1997. Will the proposed fiscal year 1998 budget request be sufficient to eliminate the backlog?

Answer. The carryover of unfunded loan applications for fiscal year 1996 was substantially eliminated in the first quarters of fiscal year 1997, a total of 20 loan applications for \$6.66 million had been funded under the Rural Economic Development Loan Program. As of April 1997, an additional 10 loan applications for \$3.2 million are currently being processed by Rural Development State Offices. The fiscal year

PART 1

620

1998 budget request of \$25 million is sufficient to cover any carryover of unfunded fiscal year 1997 loan applications and anticipated application activity. As you are aware, we are proposing to fund the loan program through earnings generated by the interest differential on the voluntary cushion of credit payments made by Rural Utilities Service borrowers. These earnings will be used to fund the \$5.97 million in subsidy for the proposed \$25 million supportable loan level proposed in the fiscal year 1998 budget request.

1890 LAND GRANT INITIATIVES

Question. The Rural Development 1890 Land Grant Initiative involves cooperative agreements with the 1890 Land Grant Universities and community-based organizations to develop income-producing projects for underdeveloped rural communities. What type of cooperative agreements are made with these universities and organizations?

Answer. The Rural Business-Cooperative Service agency has authority to enter into cooperative agreements with 1890 Land Grant Colleges and Universities. These cooperative agreements are for technical assistance and business development services in the local under-served communities where they are located. They assist current business owners, local business groups and budding entrepreneurs to maintain, expand and grow new businesses.

Question. Which 1890 Land Grant Universities are currently participating in this initiative?

Answer. The following is the list of all 1890 and Historically Black Colleges and Universities which are under cooperative agreements with Rural Business-Cooperative Service for fiscal year 1997 funded from fiscal year 1996 budget authority:

1890 Institutions:

1. North Carolina A&T University, North Carolina
2. South Carolina State University, South Carolina
3. Southern University, Louisiana
4. Prairie View A&M University, Texas
5. University of Maryland Eastern Shore, Maryland
6. Lincoln University, Nebraska
7. Langston University, Oklahoma
8. Kentucky State University, Kentucky
9. Fort Valley State College, Georgia
10. Florida A&M University, Florida
11. Delaware State University, Delaware
12. University of Arkansas Pine Bluff, Arkansas
13. Acorn State University, Mississippi
14. Tuskegee University, Alabama

Question. What is the history of this initiative?

Answer. The 1890 Land Grant Institution Initiative program was implemented as the result of USDA's commitment to work with these institutions as it does with the 1862 Land Grant Colleges and Universities to build capacity in the agricultural, mechanical, and technical arts areas. The Morrill Act of 1890 was enacted to provide federal assistance for Southern states for the education of African Americans. This initiative was initially implemented throughout the Department of Agriculture in fiscal year 1988. Rural Business Cooperative Service has participated in the program since fiscal year 1994 when USDA implemented its 1994 Reorganization. Prior to that, the original 1890's program was started under the old Farmer Home Administration (FmHA).

COOPERATIVES

Question. With the changing role in federal farm programs, the need for farmer cooperatives becomes increasingly important. In the fiscal year 1997 appropriations bill, the Subcommittee encouraged USDA efforts to support farmer cooperatives. Please outline the actions the agency has taken to strengthen existing cooperative development programs and what additional initiatives are planned to further encourage such cooperative self-help efforts?

Answer. The Department recognizes the important role that cooperatives continue to play for farmers, especially as they adjust to changing farm programs. We are focusing our resources in areas and activities that will support cooperative development in areas most affected by changing commodity programs and needs as expressed by producer groups. Our actions to strengthen existing cooperative programs include the following. First, we are maintaining a staff at the National Office level to conduct research, technical assistance and development of educational programs about cooperatives. The new increase for research on cooperatives proposed

PART 1

621

in our budget identifies the critical need for bolstering this work and continuing the partnership with colleges and universities in fulfilling it. Second, we are continuing to build a network of cooperative development specialists in State Offices who can work on specific projects as they are requested. These specialists coordinate with our staff at the National Office level as needed. We are also working through three additional programs to augment cooperative development assistance. The Rural Cooperative Development Grant Program is seeking to build a network of public/private development assistance. Under the Fund for Rural America, we are attempting to encourage farmers through their cooperatives to capture a greater share of the value added to their agricultural commodities. The National Sheep Industry Improvement Center Program, just underway, is attempting to address infrastructure needs to help mitigate the loss of the wool and mohair programs through industry-directed research, promotion, and technical assistance. Each of these efforts is aimed at conducting a program of research and education. This will help farmers have a clearer understanding of their options and strategies for using cooperatives as an alternative to Federal farm programs

SALARIES AND EXPENSES

Question. The President's fiscal year 1998 budget request proposes an increase of \$2 million for Rural Business-Cooperative Service salaries and expenses to fund cooperative research agreements primarily with colleges and universities on issues facing agricultural and non-agricultural cooperatives. Why are these additional funds needed and how will they be awarded?

Answer. Funds are needed to help rebuild the research base on agricultural cooperatives and to start building a research base on non-agricultural rural cooperatives. With diminishing resources for cooperative research the past few years, the base of information on which important decisions are made, by cooperatives themselves and by policy makers, has been eroded. In addition, we are seeking legislation which would expand the authority of Rural Business-Cooperative Service to provide the same type of advice and assistance to non-agricultural rural cooperatives as they are currently doing for agricultural cooperatives. Relevant research in this area is particularly lacking. If we are to provide timely and effective service to this new clientele, we need to start developing an information base through research when possible. Due to ceiling/staffing constraints, colleges and universities through cooperative research agreements will accomplish much of this research. This would be a competitive, matching program with funds allocated to those applicants with demonstrated ability to effectively carry out the needed research.

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION CORPORATION

Question. In your prepared statement, it mentions that 66 projects have been funded in 32 states with an investment from AARC of \$28 million. Seven companies have begun to partially repay AARC. In the prepared statement you say that AARC does not expect the funded companies to generate positive cash flow until their fifth or sixth year. Will any of the remaining 59 projects mature to their fifth or sixth year in fiscal year 1997 and 1998?

Answer. The AARC Corporation's Board of Directors seeks to have a portfolio with companies at various levels of maturity. Thus, there should be a continuous flow of return into the Corporation's revolving fund, as opposed to periodic waves. The investments made in the earliest days of the Corporation—when it was called the Center—were primarily made in companies that were still in the Research and Development (R&D) phase of growth; the time of repayment was at least five to six years in the future. More recent investments have focused on companies that are in the pre-commercialization phase; the repayment horizon is shorter. As the portfolio grows and the mix of companies stabilizes, with an appropriate number running the gamut from those in the R&D phase to those in full production, there should be a constant number—probably two or three—per year reaching a positive financial position.

Question. What level of payments do you expect to receive from companies in fiscal year 1997 and 1998?

Answer. The current business plan, under which the Corporation is operating, anticipates relatively constant repayments of \$100,000 in each of fiscal year 1996 and fiscal year 1997. The business plan projects an increase in repayments to \$200,000 in fiscal year 1998. Major gain in repayments is not anticipated until fiscal year 1999. The business plan also takes into account an annual growth rate of approximately 4.3 percent in unrealized gains in value of AARC's stock holdings. Major equity options are eligible to be exercised beginning in fiscal years 1999 and 2000.

PART 1

622

Question. Section 729 of the 1996 Farm Bill includes a provision that allows Federal agencies to establish set-asides and preferences for products commercialized with the assistance of AARC. What sort of products will the Federal agencies be able to use?

Answer. Almost the entire portfolio of products could be utilized by the Federal government. For example, the U.S. Postal Service (USPS) is constructing “green” buildings around the country. One facility now being constructed near Dallas, Texas, will utilize compressed wheat straw walls produced by Agriboard Industries in nearby Electra, Texas. We believe other AARC-supported construction materials may also be used in that building.

The USPS has also contracted with Gridcore Systems International (GSI) to produce trash cans for use in post offices. The source of the raw materials used to make the strong, lightweight honeycomb panels for the trash cans is undeliverable bulk mail. We support the way the USPS has endorsed environmentally-friendly building products from the AARC Corporation. We are still talking with USPS about using other products in the AARC Corporation portfolio in their course of business.

Gridcore has supplied samples and is also talking with Unicor, part of the Prison Industries Program, about making furniture.

Discussions are currently underway with the Pentagon and several of the AARC building material suppliers to provide material to renovate and “green” the Pentagon. Use of AARC materials in this multi-year project could have a major positive impact on these companies.

Phenix BioComposites produces Environ from soybean meal and waste newspaper. It is a replacement for hardwood and looks like granite. The Natural Resources Defense Council (NRDC) used Environ for the counter tops and work surfaces in its new headquarters built last year, in Washington, DC.

PrimeBoard uses 100 percent wheat straw to produce Wheat Board, a particle board replacement. This product is being widely used for manufacturing cabinets, furniture, and millwork. NRDC’s counter underlayment is from PrimeBoard and its cabinets are also made from Wheat Board.

Seed-based Lubricants.—International Lubricants Inc. (ILI) produces a line of biodegradable seed-based lubricants—everything from transmission additives, to all purpose lubricants, to two-cycle oil to industrial lubricants. Although the seed-based lubricants are environmentally preferable, these petroleum replacements face stiff competition from the existing petroleum-based products. In spite of the competition, some sales to the U.S. Air Force have taken place. Vegetable oil based lubricants could also be used with weapons and in the engines of high-performance vehicles.

The Leahy-Wolf Company uses canola oil as a lubricant for concrete forms. As the Federal government continues to build new buildings and renovate old ones, or pours cement in environmentally-sensitive areas (bridges over waterways for instance), this product may be specified.

Other Fluids.—Windshield washer fluid produced by Aquinas Technologies that is made from ethanol would seem to be a natural for all vehicles.

Absorbents.—There are several products in the AARC portfolio which will help clean up oil spills. Low value wool from Hobbs Bonded Fibers has been purchased for use at military bases in Texas to catch and hold petroleum drips from vehicles. Two other products show great promise in remediating hydrocarbons. One is Oil Gator, the Product Services Marketing Group, which is made from cotton seed lint. It has been used to remediate spilled petroleum. Kenaf core can also be used to absorb and remediate hydrocarbons. These products can be used to clean up spills from existing contaminated sites, not just new spills. As military properties are being cleaned up, these products are likely to be considered.

Filter Material.—Scientific Ag Industries makes activated carbon made from peanut hulls. These products can be used in water and air filtration systems and can also be used to remediate soils. It’s also cheaper and of better quality than imported materials.

Soil Amendments.—Many military bases are located in places with poor soil conditions. Biorecycling Technologies, Inc. is currently working with the Marine Corps Ground Combat Center at Twenty Nine Palms, California, to improve soil conditions in the military housing area, the golf course, and recreation sites, using a variety of fertilizers and soil amendments derived from cow manure.

Earthgro Incorporated makes a variety of potting mixes utilizing plant and animal wastes. These can be used with interior potted plants and exterior plantings as an ideal substitute for peat, a finite and imported material, and petroleum-based fertilizers.

Cleaners.—The AARC Corporation has invested in a number of environmentally-friendly cleaning products. Interchem Environmental produces a line of solvents

from soybeans including graffiti remover, paving equipment, tar remover, and cleaners for printing presses.

Shadow Lake makes Citra-Solv, a multi-purpose cleaner made from a powerful citrus extract, along with a number of other natural products—castile soap from essential oils and Air Scense, an air freshener from essential oils, which absorbs odors.

MM Manufacturing produces waterless hand cleaner from corn oil.

Tree-Free Paper.—KP Products uses kenaf, an annual fiber plant, to produce tree-free, chlorine-free paper.

Starch-based Plastics.—Several AARC-supported companies produce a variety of coatings and films from vegetable starch. For instance, StarchTech makes biodegradable packing peanuts, which replace similar petroleum-based products.

Forestry Materials.—Indian Creek Mesquite coats mesquite wood chunks with vegetable based paraffin in a “Light The Bag” application. No starter fluid is necessary. We can report that sales of this product are brisk in USDA’s employee-owned store located in the sub-basement of the South Building.

Cat Litter.—BioPlus Incorporated products biodegradable, flushable cat litter from peanut hulls. SSM Environmental Technologies Inc. uses corn stover, a post harvest residue, as its base to also produce an environmentally-friendly cat litter.

Question. Have any agencies established procedures for the purchase of these products?

Answer. No. USDA’s Procurement Policy Division is currently working to amend the Agricultural Acquisition Regulations (AGAR) to reflect the new procurement preference. Resource managers and contracting officers within USDA will be trained on using the AARC preference. At the same time, USDA procurement officials are working to present a case to amend the Federal Acquisition Regulations (FAR) which govern purchases by the entire Federal government. Ten years after companies are funded by the AARC Corporation, their procurement preference ends. The preference ends even for those companies that repay AARC ahead of schedule. The first group of companies was funded in 1993, therefore, only six years are left on their procurement preference.

RURAL HOUSING SERVICE

RURAL HOUSING SERVICE LOANS

Question. The fiscal year 1997 proposed subsidy rate proved to be too low for rural housing loans. Thus, the fiscal year 1997 budget authority proposal of \$1 billion for the section 502 program was inaccurate and in turn the actual program level for fiscal year 1997 was \$585 million. Interest rates have just been raised by the Federal Reserve. If these rates are in effect at the beginning of fiscal year 1998, how much lending authority will be available based on the fiscal year 1998 subsidy appropriation request of \$128 million?

Answer. If the April 14, 1997 Treasury discount rate of 7.19 percent is used to compute a new subsidy rate for the section 502 program, the result is a 16.51 percent subsidy rate. Based on the fiscal year 1998 budget authority of \$128.1 million and a new subsidy rate of 16.51 percent, the program level would be \$775.9 million. However, the forecasted rate of 6.16 percent is still the Administration’s assumption, and we anticipate a sufficient loan level in the 502 programs.

Question. Because of interest rate changes in the economy, the Secretary used monies from the Fund for Rural America to increase the fiscal year 1997 program level by \$141 million for section 502 direct single family housing loans. With the additional money allocated from the Fund for Rural America, how many loans will be made in fiscal year 1997?

Answer. With the additional money received from the Fund for Rural America, approximately 11,000 Section 502 Direct Single Family Housing loans will be made in fiscal year 1997.

Question. The budget indicates that the Administration has “increased its commitment to the mutual self help technical assistance grant program.” What does the agency mean by the statement “increased its commitment?”

Answer. In fiscal year 1996 there were 58 grants funded in a total of 26 States. The requests for technical assistance funding is ever increasing to help assist very low to low income families seeking affordable housing through the mutual self-help method. The requests for technical assistance in fiscal year 1997 far exceed our supply of funds, with 41 states requesting to fund over 113 grants. However, there were 26 other grant requests that totaled over \$4.4 million that we could not expect to fund. There is a tremendous demand for rural Americans to obtain housing through the self-help method and this demand is evident by the requests of non-profit organizations seeking technical assistance funds.

PART 1

624

Question. How much money has been earmarked for technical assistance from the appropriated fiscal year 1997 program level plus the monies from the Fund for Rural America?

Answer. There were \$26 million provided specifically for this program in fiscal year 1997. We believe this level will enable us to meet program goals and none of the Funds for Rural America are planned for this purpose.

Question. How much money is earmarked for technical assistance in the proposed fiscal year 1998 program level?

Answer. In fiscal year 1998, we planned to maintain the \$26 million program level under the rural housing assistance grant program.

Question. How many unsubsidized guaranteed single-family housing loans will be available from the fiscal year 1998 proposed program level of \$3 billion?

Answer. The fiscal year 1998 proposed program level of \$3 billion will provide approximately 42,360 guaranteed unsubsidized single-family loans.

Question. What is the status of the interim final regulations for section 515 housing loans?

Answer. The interim final rules have been submitted to the office of the Federal Register and we expect these regulations to be published on or about May 7, 1997.

Question. The fiscal year 1998 budget requests \$30 million for the program level and a subsidy level of \$10 million for housing repair direct loans. This is a decrease from the fiscal year 1997 program level of \$30.3 million and subsidy level of \$6.9 million. The Administration states that it is "essentially maintaining" the fiscal year 1997 levels and the proposed fiscal year 1998 level will enable the Rural Housing Service to provide assistance to 5,620 families. How many families will be assisted with the fiscal year 1997 appropriated levels?

Answer. Approximately 5,580 families will be assisted with fiscal year 1997 appropriated funds for Section 504 Housing Repair Loans. The subsidy level for fiscal year 1997 is \$11.081 million, not \$6.9 million, provides a loan level of \$30.251 million for fiscal year 1997. We have requested \$10.3 million in budget authority for fiscal year 1998 to have program authority of \$30 million, which is approximately the same loan level.

Question. How much of the proposed fiscal year 1998 budget request for direct farm labor housing loans and grants will be used for rehabilitation of existing USDA farm labor housing units?

Answer. The Agency has identified a need for approximately \$25 million in rehabilitation for older farm labor housing facilities. A review of the labor housing portfolio revealed that most health and safety needs have been met and the predominant need is for replacement of obsolete units and upgrading older complexes. The Agency estimates that \$5 to \$8 million will be needed from fiscal year 1998 funds for this purpose, the balance coming from loans and grants in subsequent years, internally generated reserve funds, and leveraged funds as repairs and replacement units are phased in over time to avoid tenant displacement.

RENTAL ASSISTANCE PROGRAM

Question. The Administration's request for fiscal year 1998 proposes \$593 million for the rental assistance program, an increase of \$69 million over the fiscal year 1997 level. The proposal states that during fiscal year 1998 the budget will provide \$52.5 million of rental assistance to replace 3,665 units of expiring section 8 units in section 515 projects and that this is a funding shift from HUD to USDA. The explanatory notes also state that RHS will not be able to provide any additional "servicing" rental assistance at the proposed program level. (Servicing rental assistance helps very poor communities to rent to people who receive rental assistance.) Is the proposal to use USDA rental assistance to replace expiring section 8 units "budget driven" or will it assist the Rural Housing Service to better satisfy the rental assistance renewal contracts for its customers? Does this proposal require authorizing language?

Answer. While this proposal will save the Federal government money, it was initiated to provide a more secure source of tenant subsidy for borrowers and very-low income tenants dependent on project based deep tenant subsidy, and reduce administrative burden and cost for the borrower, HUD and USDA.

USDA rental assistance (RA) is funded in five year increments, while HUD tenant subsidy is funded annually. The tenants, borrowers and RHS are all better served under a more reliable source of deep tenant subsidy. When the transition is made, borrowers will be subject to only one set of federal regulations. This will reduce operating burden and cost, and it will also allow more common sense approaches to project operations. In addition, replacing Section 8 rental assistance with RHS rental assistance will result in an overall cost savings for the government because the

PART 1

625

RHS rental assistance program uses a reimbursement structure based on project budgets to pay subsidy, which is different from the contract rent structure used by HUD, which includes automatic annual adjustments. For example, using RHS budget approval requirements will allow rents artificially inflated through automatic annual adjustments to be brought back down to reasonable levels.

Additionally, we have been advised that no change in authorizing language is needed to implement this proposal.

Question. How will the agency use the difference, \$6.8 million, after the \$52.5 million is used to replace the units of expiring section 8 in section 515 projects? Could this money be used for "servicing" rental assistance?

Answer. Once the 52.2 million is accounted for, that leave 16.8 million of the 69 million over the fiscal year 1997 level for RA. Any RA funds not needed to renew expiring USDA rental assistance or HUD Section 8 contracts could be used for servicing existing projects among other purposes such as new construction RA.

Question. Please explain in detail the Administration's proposal for the RHS to provide rental assistance to replace the expiring HUD section 8 contracts. Why did USDA, HUD, and OMB decide that USDA could best meet the needs of these projects?

Answer. After reviewing a number of options, USDA, HUD and OMB decided this approach offered the best combination of continued service to the public, reduction in subsidy cost, control of operating costs and reduction of administrative burden.

As Section 8 contracts expire, borrowers will be provided with USDA rental assistance contracts. To obtain rental assistance, borrowers will sign an RHS interest credit agreement which requires them to operate on a limited profit basis.

REDUCED GOVERNMENT COSTS/BUDGET AUTHORITY

The government will save money by eliminating Housing Assistance Program (HAP) contract requirements that create higher rents through "automatic" annual rent adjustments. RHS project rents increase only when RHS approves each project's operating costs using a zero based approach.

By 2005, all the Section 8 contracts in USDA projects would be converted to USDA RA contracts, provided that Congress accommodates the adjustments that need to be made in the 602(b) allocations for both the Agriculture, Rural Development, and Related Agencies and VA, HUD and Independent Agencies Subcommittees. For fiscal year 1998, the HUD allocation should be reduced by the amount it would cost to renew the expiring Section 8 contracts for one year, or \$20 million, while the amount allocated for USDA 5-year RA contracts should increase by \$52 million. While the net budget authority required for this conversion is greater in the near term, because 5-year RA contracts are replacing 1-year Section 8 contracts, after three years there are significant savings in the budget authority needed to maintain these units with RA. Net savings from the conversion of all 46,000 units would be an estimated \$291 million over eight years.

RHS RA is less expensive. Cost savings are due to the differing agency approaches for determining the amount of the contracts; rental subsidy upon their renewal. RA contracts are increased based on a determination of project costs. The HAP contracts are by law and regulation automatically increased through the application of HUD's Annual Adjustment Factor, which in past years led to rents in excess of the market rents for the area. As an example, the estimated cost over five years for one unit of Section 8 assistance USDA rental housing would be \$26,829. In contrast, the five-year cost of a USDA RA contract is estimated to be \$14,324. Therefore, over five years, renewing the 3,665 Section 8 units as RA would cost \$52 million versus \$98 million if renewed as Section 8 contracts, resulting in five-year savings of \$46 million.

Project operating costs will be reduced. Section 515 program borrowers with Section 8 units are currently subject to both HUD and USDA administrative requirements. Our analysis shows that management fees and expenses can be reduced by \$2 per unit per month by eliminating HUD administrative involvement in these projects. By 2005, savings to project owners/operators would be approximately \$1 million a year as a result of eliminating duplicative federal agency oversight. These cost savings would further reduce projects' rental assistance needs, because rental assistance is based on project operating costs.

Summary of cost savings:

There are two forms of savings, budget authority and outlays.

The conversion from section 8 to Rental Assistance results in a savings to HUD's fiscal year 1998 Budget and an increased cost to Agriculture's. The cost is made up of two elements, 1) Interest Credit, which is an "off-budget" cost that is paid out

PART 1

626

of the Rural Housing Insurance Fund; 2) Rental Assistance, which is an “on-budget” cost that must be appropriated currently.

Additionally, we are switching from one-year section 8 HAP contracts to five-year Rental Assistance contracts. This timing difference creates a cost up front that is recaptured over time.

The net savings to the government, including both interest credit and Rental Assistance (off and on-budget), on average, over a 10 year period amounts to \$25.4 million per year.

The net savings to the government from a budget authority standpoint total \$291 million from 1998 to 2005.

REDUCED ADMINISTRATIVE BURDEN

In addition to the significant cost savings, we see this proposal dramatically reducing the administrative burden on Section 8/515 borrowers and Agencies. Currently, borrowers must follow both RHS and HUD requirements, submit reports to both Agencies, and find ways to resolve conflicting requirements. If this proposal is implemented, borrowers will be subject to only RHS regulations.

The Federal government will also see its administrative burden reduced. HUD will no longer be required to regulate an entire category of Section 8 assistance, namely the Part 884 Section 8. RHS, HUD and borrowers will no longer be required to resolve frequent jurisdictional questions. No changes to RHS procedures should be needed to convert HUD Section 8 tenants to RHS RA. We anticipate that burden on tenants will not increase under this proposal. The only change tenants will see is that their certification will be completed on an RHS form.

Question. If this budget proposal is not included and section 8 contracts under rural rental assistance are not absorbed by RHS, will HUD then treat these contracts the same as all other section 8 contracts coming due?

Answer. We expect that HUD would treat these the same. RHS has an interest as the holder of the mortgage that these projects could fail if the contracts are not renewed or the contracts are replaced with vouchers or certificates. We would anticipate that any solution used by HUD will be more expensive in the long run than converting the subsidy to USDA rental assistance.

RHS would be concerned if tenants were required to convert to tenant based vouchers or certificates. Rural housing markets do not offer as many choices as urban and suburban markets. In many rural communities, Section 515 housing may not only be the most affordable and best maintained rental housing, but the only rental housing. In addition, many rural Public Housing Authorities (PHA's) who administer HUD vouchers and certificates do not have the delivery system to provide an appropriate level of service for rural residents to secure and administer vouchers or certificates.

If vouchers and certificates are not provided, existing tenants and projects will be forced into the non-subsidized housing market. Difficult non-subsidized market may force displaced tenants into sub-standard housing or homelessness. Borrowers will be placed in the impossible position of operating low income housing without being able to offer rents that eligible tenants can afford. Borrowers will simply not be able to operate their projects for the remaining thirty years of their fifty year loan.

We suggest that the solution must be “project based” to allow projects and tenants to at least retain their current position in the housing market. We feel that USDA rental assistance offers the best option in project based assistance.

RURAL HOUSING ASSISTANCE GRANTS (RHA GRANTS)

Question. The Administration's proposes to fund all the rural housing grant programs in one account. It also proposes that all obligated and unobligated balances available from prior years for all housing grants be rolled into this account. Please list all obligated and unobligated balances available from prior years for each housing grant program.

Answer. The requested appropriation language that would transfer both obligated and unobligated balances from prior years for all RHA grant programs from their current accounts to the RHA grant account would have no impact on grant making activity, it is only a change to simplify the accounting activities for carrying out these 6 RHS grant programs under one program account. This change would expedite the process of making funds available from recovered unobligated balances and would reduce the cost of and expedite the process of changing the computer systems. It would also reduce the administrative burden of reporting program account data to Treasury.

PART 1

627

Fiscal Year 1996 carryover for rural development programs

<i>Grant Programs</i>	<i>Budget authority carryover amount</i>
Sec. 504 very low-income housing repair grants	\$132,806
Sec. 504 very low-income housing repair grants, natural disaster	765,690
Sec. 523 mutual and self-help housing grants	9,872
Sec. 516 rural housing for domestic farm labor grants	64,125
Sec. 509 compensation for construction defects grants	1,894,376
Sec. 525/509 supervisory and technical assistance grants	1,731,394

Question. This proposal combines programs that are allocated by formula, like home repair grants, with programs that are allocated based on demand, like self-help housing and farm worker housing grants. Section 516 farm labor housing grants are not needed in all 50 states, yet the proposed Rural Housing Assistance Grant (RHAG) program would allocate the funds appropriated to this account across all 50 states. Please explain in detail how the agency will allocate these funds for each grant program included in RHAG.

Answer. RHS and the Administration anticipates providing flexibility on the state level between the 504 and Housing Preservation Grant Programs. This will allow state directors to meet the specific needs of rural communities. The Farm Labor grant activity is concentrated in certain agricultural states. This program works directly in conjunction with the Farm Labor Loan Program. The Administration anticipates that the funding will be administered from the National Office with flexibility provided to meet the need for these specific areas. Additionally, the Administration is moving forward to replace the current funding system of "first come-first serve" to a Notice of Funding Availability (NOFA) process. The Mutual Self Help Grant activity has expanded tremendously in the last few years across the rural America. The Administration anticipates to fund this program out of the National Office to ensure small communities and/or states with little or no activity have the opportunity to participate.

Question. Why don't more states, like Georgia and Alabama, that have a need for farm labor housing currently participate in this grant program?

Answer. The Agency has made specific strides through our technical assistance contractors to provide farm labor housing in underserved areas with demonstrated need. These efforts include working with local communities to develop sponsorships for farm labor housing. Additionally, the majority of Farm Labor grants are provided in conjunction with the Farm Labor loan program. The mixture of the loan and grant combination is limited to non-profits and governmental bodies. On-site farm labor projects where the farmer or owner provides farm labor housing through RHS is strictly limited to the loan program. Many states in the South have a history of on-site farm labor housing. We will continue to work with states such as Georgia and Alabama to ensure communities have the opportunity to provide needed farm labor housing.

RURAL HOUSING SERVICE

Question. What is the estimated number of Americans living in inadequate housing today?

Answer. In the December 1996 publication titled, The State of the Nation's Rural Housing in 1996, the Housing Assistance Council indicated seven percent of all rural households (2.5 million) and 8 percent of central city households (2.4 million) were in inadequate housing. This is compared to only 4 percent (1.2 million) of suburban households that were classified as inadequate.

Question. The President's 1998 budget request proposes an authorization of a \$100 million for graduating direct loan borrowers into the guaranteed program, at an appropriated subsidy cost of only \$20,000. What is the status of this legislative proposal?

Answer. The Department is in the final clearance process and we expect to transmit this legislative proposal to the appropriate Congressional Committees in the near future.

Question. How many estimated direct Section 502 borrowers would benefit from this proposal?

Answer. It is estimated that approximately 3,280 borrowers would benefit from this proposal based on refinancing an average loan balance of \$30,500. These borrowers can be generally characterized as nonsubsidized, high interest rate (10 to 13 percent) borrowers or borrowers who receive minimal subsidies but still pay above current market rates.

PART 1

628

SALARIES AND EXPENSES

Question. The prepared testimony states that the Rural Housing Service will have a savings of \$250 million because of the efficient changes brought about by automation and centralization. This savings will be a result of reduction in staff over five years. For the record, please provide the dollar and staff year savings by fiscal years (1996–2000).

Answer. I would be happy to provide that information for the record. However, I should point out that not all of the savings comes from a reduction in FTE's. The majority of the savings comes from mandatory accounts associated with reduced amounts of real estate taxes the agency has to voucher annually and reduced losses on defaults and foreclosures. I will submit a table outlining the estimated net savings for the years fiscal year 1996 through fiscal year 2000 which total \$249.2 million. This table reflects the original plan for the reduction of 220 FTE's on October 1 1996, followed by reductions of 300 on April 1, 1997 and 80 on October 1, 1997. This plan was not carried out because of the implementation of the voluntary separation authorized by the Appropriations Act for 1997, however the results are the same in terms of FTE reductions for fiscal year 1997.

[The information follows:]

PART 1

630

Question. For the record, please provide the staff years and savings associated with each of the seven phases of implementation for the conversion of the Rural Housing Service loan portfolio.

Answer. Regarding the second part of your question, I will submit for the record a table which shows the conversion to DLOS for each State in the seven conversion phases. The table reflects a planned total reduction in staffing of 888 FTE's which is a combination of the reductions attributable to DLOS and the reductions attributable to the revised streamlining targets established for Rural Development in the President's Budget. As you are aware the request for salaries and expenses reflects a reduction of \$15.5 million, in discretionary savings, associated with the implementation of DLOS.

[The information follows:]

RURAL UTILITIES SERVICE

ELECTRIC AND TELECOMMUNICATIONS LOANS

Question. The fiscal year 1998 President's budget proposes an increase in direct electric loans. It states that the need for this increase is due to over two-thirds of Rural Utilities Service borrowers' electric distribution facilities having been in service for 50 years or more. How many RUS borrowers' electric distribution facilities have been in service for 50 years or more and where are they located? How many loans can be made at the fiscal year 1998 request level?

Answer. In the aggregate, the fiscal year 1998 requested electric loan levels are roughly equal to the fiscal year 1997 supportable levels. However, the fiscal year 1998 request would increase lending authority for direct hardship loans by \$56 million from the fiscal year 1997 supportable levels. The fiscal year 1998 request offsets the increase in hardship loan levels with a commensurate decrease in "municipal" rate lending from the fiscal year 1997 supportable levels.

Current information indicates that about 90 percent of USDA RUS borrowers have some distribution plant that is in the 40 to 50+ year age range. About 65 percent (1.3 million miles) of distribution line contains components of this vintage. These facilities are spread across most of the Nation's rural areas. The attached table shows how much of this plant is located in each state. The table is ranked by the percentage of the national total of this vintage plant located in the state.

The size of individual electric loans varies considerably depending on the amount particular borrowers request. At the funding level requested, the RUS would generally make loans to between 120 and 130 rural electric distribution borrowers.

[The information follows:]

Question. The explanatory notes state that the “Fiscal year 1998 budget request would also provide the Administrator the ability to move subsidy budget authority among the electric programs * * *.” Please explain how the President’s proposed request provides the Administrator this capability, and why this flexibility is needed.

Answer. The President’s fiscal year 1998 budget request specifically proposes that the Administrator of RUS have the authority to move subsidy budget authority (BA) among the three electric loan programs and among the three telecommunications loan programs. It does not propose moving BA from the Electric Program to the Telecommunications Program or vice versa.

In the Electric Program, those programs are the direct hardship, “municipal” rate and the guaranteed loans. In the Telecommunications Loan Program, they are the direct 5 percent (hardship) loans, the Cost of Money (Treasury Rate) loans and the guaranteed loans. The subsidy rate is considerably different for each of these programs and the demand for each of these programs varies from year to year. The ability to move budget authority among the different loan programs in each of the separate programs will allow us to vary the types and overall amounts of funding available consistent with demand while keeping the program cost constant.

Question. The fiscal year 1998 budget request proposes a decrease in direct telecommunication loans of \$35 million and an increase in the subsidy budget authority of \$375,000. The budget states that the “increase in projected subsidy rate for this program leads to the decrease in program level.” This results in 5 less loans available to be made in fiscal year 1998. The Agency has a reported fiscal year 1997 backlog of \$51 million in hardship loans and expects the amount to increase to \$98 million by the first of fiscal year 1998. Why is there an increase in the subsidy rate? Why is a decrease in the loan level being proposed when the backlog for direct 5 percent loans will only continue to grow?

Answer. Direct 5 percent telecommunication loan interest rates are set by law at 5 percent. The subsidy rate increased from 1.59 percent in fiscal year 1997 to 3.92 percent in the 1998 President’s Budget because interest rates increased from 1997 to 1998. It now costs the government more to subsidize these loans. The decrease in the loan level is a direct result of the increased subsidy rate. If the 1997 loan level of \$75,000,000 was maintained, the subsidy level for direct telecommunication loans would be \$2,940,000 calculated at the 3.92 percent subsidy rate.

Question. Are the fiscal year 1998 loan assumptions reflecting the actual interest rates currently projected?

Answer. The fiscal year 1998 subsidy rate for direct 5 percent telecommunication loans was based on the fiscal year 1998 President’s Budget economic assumptions.

Question. The Commerce Department’s National Telecommunications and Information Administration announced winners of grants in its 1996 Telecommunications and Information Assistance Program (TIAP) on September 19, 1996. Sixty-seven

PART 1

635

public institutions in 42 states were selected to receive \$18.6 million in federal matching grants. These grants are used to bring together public and private sectors to improve and strengthen communities using advanced telecommunications technologies. Please distinguish this program from the RUS telecommunications programs.

Answer. The NTIA TIAP for 1997 will focus on five areas: Community-Wide Networking; Education, Culture and Lifelong Learning; Health; Public and Community Services; and Public Safety. All awards are grants, and the money can be used for a wide variety of applications in all geographic areas. The USDA Distance Learning and Telemedicine Loan and Grant Program, focuses on different applications, different kinds of financial assistance, and applies solely to benefit rural residents. The USDA Distance Learning and Telemedicine Loan and Grant Program focuses on end-user equipment for interactive distance education, telehealth and training. The focus on end-user equipment complements the discounts in the Telecommunications Act of 1996 for telecommunications services used by all schools, libraries and rural health care providers. Those discounts do not include end-user equipment. The USDA Distance Learning and Telemedicine Loan and Grant Program provides a 100 percent grant, a combination loan and grant, or a 100 percent loan to help fund a program. Loans leverage budget authority tremendously, while grants are dollar for dollar. The grants are targeted to the most needy areas and loans to those providers who need assistance, but are more able to help pay from local or enterprise resources.

The USDA Distance Learning and Telemedicine Loan and Grant Program focuses on the sustainability of projects to both prove-out and prime the pump for the use of telecommunications to address special rural education and health care needs. Finally, the USDA Distance Learning and Telemedicine Loan and Grant Program is only available to benefit rural residents who are challenged by the task of providing services to areas separated by great distances, comprised of small towns, or facing geographically difficult terrain. The TIAP and the USDA Distance Learning and Telemedicine Loan and Grant Program complement each other.

Question. The fiscal year 1998 budget request proposes \$21 million for Distance Learning and Telemedicine grants. What is the backlog in funding requests versus available funding for the fiscal year 1997 appropriation?

Answer. Since RUS has not opened the application window for applicants to request fiscal year 1997 funding, no figures are available for actual fiscal year 1997 demand. However, past experience has shown that there is an overwhelming demand for distance learning and telemedicine grant funding. In fiscal year 1996 alone, where applicants only had a 45 day window in which to submit applications, and only grants were available, RUS received 150 financing requests totaling \$38 million—only \$7.5 million was available for the fiscal year. Since the first year in which the program had been funded, 1993, grant requests totaling more than \$262 million from 858 applicants have been received; the total available funding over this period was only \$35 million.

Question. Will the fiscal year 1997 allocations for RUS hardship loans, municipal rate loans, and loan guarantees be adequate until the end of fiscal year 1997? When will the fiscal year 1997 funding run out for each of these categories?

Answer. The fiscal year 1997 allocations for guaranteed electric loans will likely be adequate for requests in fiscal year 1997. However, the allocations for hardship and municipal rate electric loans will be exhausted by the end of the third quarter. We estimate a backlog of approximately \$800 million for this type of financing going into fiscal year 1998.

In the Telecommunications Program, loan levels for RUS cost of money loans, Rural Telephone Bank Loans, and RUS loan guarantees, \$300 million, \$176 million, and \$120 million, respectively, should be sufficient based on the number and amount of loan applications currently on hand. Regarding the Telecommunications Program's hardship loan program, a total of \$58 million in hardship loans have already been approved this fiscal year out of the \$75 million available. RUS currently has an additional \$57 million in processed hardship applications on hand.

RURAL TELEPHONE BANK

Question. In the prepared testimony, you state, Madam Under Secretary, that by the end of the fiscal year 1998 the Rural Telephone Bank (RTB) will have sufficient internally generated funds to fully retire the government's remaining \$574 million capitalization of the RTB. The Administration is working on legislation which would allow a fully private RTB to leverage its net worth in the private markets. What is the status of this legislation? Is passage of this legislation necessary to achieve privatization of the bank by the end of fiscal year 1998?

PART 1

636

Answer. The Office of Management and Budget has recently completed its review of the legislation and we are in the process of assessing their comments. We anticipate being able to transmit the package to Congress in the near future.

WATER 2000 INITIATIVE

Question. In the prepared statement, Madam Under Secretary, you state that the Rural Utilities Service will continue its commitment to the Water 2000 Initiative. What are the annual goals that the agency has met since the inception of this program?

Answer. Water 2000 focuses attention on the importance of safe drinking water to the overall public, economic and environmental health of rural areas. The goal of the Water 2000 initiative is to target the largest possible portion of the Federal investment in water projects to rural communities with the most serious quality and dependability needs. The RUS has not set aside a specific amount of funds from its regular Water and Waste Disposal programs appropriation to be used for Water 2000. However, the RUS has designated additional funds, such as the \$36 million transferred from the WIC program in fiscal year 1996 and, this year, using some dollars from the Fund for Rural America and Water and Waste Disposal National Reserve, specifically for Water 2000 projects. In fiscal year 1995 and fiscal year 1996, the RUS invested over \$351 million in poverty interest rate loans and \$195 million in associated grants for 535 projects that met the goals of Water 2000.

Question. What is the agency's long-term strategy for the Water 2000 Initiative, and how will it address the backlog of applications for water and waste disposal loans and grants totaling over \$4 billion?

Answer. The Agency's long-term strategy for the Water 2000 initiative and for addressing the backlog of water and waste applications will be based on the Strategic Plans prepared by all Rural Development State Directors, which set forth their goals and objectives through fiscal year 2002. The Strategic Plans assess the current needs and resources available in each State, and develop priorities based on that assessment.

Other components include these activities:

Develop better working partnerships with commercial lenders, state revolving loan funds, Community Development Block Grant funders and other sources of credit to attract more funding for rural water projects. This is happening actively in all states.

Utilize the Rural Community Assistance Program and State Rural Water Associations to identify potential Water 2000 projects and to help community groups develop feasible, efficient, cost effective projects.

Continue actively to promote a wide range of alternatives to drinking water problems including watershed protection measures, the use of individual and cluster wells, and multi-community regional approaches.

Train Rural Development field staff to work hand-in-hand with local groups to help them find both Federal and non Federal financing solutions for their water needs.

Streamline the Agency's regulations to allow easier access and to more effectively target resources toward the most needy communities. In fact, we anticipate that the streamlined Water and Waste loan and grant regulations will be published in the Federal Register by July 4.

Question. Madam Under Secretary, you state that over 80 percent of the budget authority proposed for RCAP for fiscal year 1998 is to support the water and waste disposal loan and grant programs. How does this compare to your Water 2000 initiative goals for fiscal year 1998?

Answer. The proposed fiscal year 1998 funding for the water and waste disposal loan and grant programs will allow the Department to make measurable progress toward the central goal of Water 2000. The RUS will give priority for funding in fiscal year 1998 to water projects that meet the Water 2000 goal.

Question. The loan and grant regulations have provisions that allow a community to implement private well systems as a potable water source. In the Water 2000 action plans submitted from the regional offices to Headquarters contains very few, if any, projects that have a recommendation to implement private well systems. Are private well systems more cost effective than to build a public system in an area with scattered population? How is cost-effectiveness integrated into the decision making process to provide solutions?

Answer. Cost effectiveness is always a priority. It has been the RUS' experience that the reason communities develop or expand public water systems is in response to inadequate ground water quantity or unacceptable ground water quality. The RUS generally believes that if a private well can be constructed at a reasonable cost

PART 1

637

with a sufficient quantity and quality of water, individual private wells may be the best solution. However, if well water is contaminated or of an undependable quantity, public water systems such as those financed under the RUS program would be an option that many communities would want to explore. The RUS can and does finance public systems that use wells which serve individual residences or businesses or wells that serve small clusters of users. Water and Waste Disposal funds must be used to finance public facilities—facilities owned and maintained by a public body, non profit organization, or Indian tribe. Individual home owners, farmers and ranchers, and business owners, if eligible, could access other programs to develop or improve an individual well. We would not expect to see many public systems being developed using individual wells as source water because individual owners could likely operate and maintain individual wells more efficiently than public operators.

Question. How do the regional offices formulate their recommendations for potable water needs? Who was consulted and what is the criteria established to make the recommendation?

Answer. The Rural Development state offices administer the water and waste water programs in the field. State Offices do not formulate recommendations for potable water needs. State Offices have, on occasion, assessed the needs based on available information such as applications for RUS funding on hand and data from others that have such information. These cooperating sources have included state and local health, development and environmental agencies, and state Rural Water Association technicians.

Question. How does the agency certify that applicants for funding from the rural water financing programs are providing true information? Is this information investigated? If so, how?

Answer. The Rural Development field staffs that process water and waste water loan and grant applications review the data provided by applicants. The data provided by the applicants comes from public documents such as preliminary engineering reports, financial reports, etc. In addition, there are one or more public meetings held on each project. The RUS has staff engineers who evaluate the technical data and loan specialists who evaluate credit and other factors. Funding decisions for individual projects are based on a well-established priority scoring system that directs the funds to the most needy projects within a state. When an applicant for a rural-based project meets the statutory eligibility requirements for water and waste disposal funding and is unable to obtain commercial credit, then RUS can finance that facility (if it is modest in size and design). The more needy and less likely to qualify for other credit the communities, the more likely their project would be funded.

SALARIES AND EXPENSES

Question. The fiscal year 1998 budget request proposes an increase of \$4.5 million for salaries and expenses of the Rural Utilities Service (RUS) for the improvement of automated business services. Is the technology that the RUS is planning to use to update their services required to be compatible with the new technology that other agencies in USDA are planning to implement?

Answer. The requested \$4.5 million for improvement of the Rural Utilities Service (RUS) automated business services is part of an on-going effort to modernize the RUS loan accounting system. This effort started in fiscal year 1993 when the then Rural Electrification Agency (REA) conducted an Information Strategy Plan (ISP) to identify the business processes that required re-engineering and modernizing. The USDA reorganization necessitated a re-evaluation of the ISP which was accomplished in fiscal year 1995 by a team from the St. Louis Finance Office and Information Resources Management Division. The Study reconfirmed the need to modernize the RUS loan accounting system in providing management with the necessary data to make sound business decisions. The estimated cost of the modernization effort was approximately \$12 million dollars. The work was started in fiscal year 1996 with \$2.9 million dollars and is continuing in fiscal year 1997 with another \$1.4 million. The modernization effort for RUS is coordinated throughout the Rural Development Mission Area to ensure that what is being developed is compatible with effort within the mission area as well as the rest of USDA. The development is first re-engineering the business processes and then considering Commercial-Off-The-Shelf (COTS) software before starting to code any in-house requirements. The Chief Financial Officer of USDA is being kept abreast of the on-going modernization, as is the Chief Information Officer.

Question. Have bids been solicited for this equipment and have any contracts been signed?

PART 1

638

Answer. There is no equipment being solicited for the RUS modernization effort, at this point.

Question. When does RUS plan to have its field restructuring completed? Which areas in the field have completed restructuring and which areas have not begun?

Answer. The field office restructuring process for Rural Development Agencies should be substantially complete by the end of this fiscal year.

UNIVERSAL SERVICE

Question. The Federal Communications Commission is currently promulgating the regulations for the 1996 Telecommunications Act which proposes to shift universal service support for rural telephone systems from the basis of historic costs to some type of forward-looking costs. Will the FCC's action of using forward looking costs undermine the RUS telephone borrower's loan portfolio? Can RUS telephone borrowers repay their loans if the FCC adopts this formula change? How has the 1996 Telecommunications Act affected the Rural Electrification Act's statutory responsibilities? Did the new telecom law modify or repeal any of the mandates of the Rural Electrification Act?

Answer. The Telecommunications Act of 1996 fundamentally changed the structure of the telecommunications industry in the United States. The Act, among other things, set the framework to move the local telephone market from a regulated monopoly structure to a competitive, deregulated structure. On May 8, 1997, the Federal Communications Commission (FCC) released its Report and Order on Universal Service. The FCC stated in the Order that "consistent with the Joint Board's recommendation, we find that a cost methodology based on forward-looking economic cost should be used to calculate the cost of providing universal service for high cost areas because it best reflects the cost of providing service in a competitive market for local exchange telephone service."

After determining that it would use competitively-neutral forward looking costs, the FCC examined computer models which model sponsors postulated could accurately predict the cost of serving any high costs areas. After an extensive comment period, the FCC determined that none of the models presented could accurately predict the cost of providing rural service. Consistent with the comments of the RUS, and others, the FCC postponed the implementation of the use of the model until January 1, 1999, for "non-rural companies" that serve rural areas, and until at least 2001 for "rural companies" that serve rural areas. It is too early to tell if the FCC can find a model or models that can accurately calculate the cost to serve rural areas, or how that will effect rural companies. It is clear, in any case, that as of now the FCC has not yet found a model that can accurately predict rural costs.

Support for rural companies, of course, comes from many sources, including the Federal Universal Service Fund, state universal service funds, access charges and state public utility commission policies. The income of RUS borrowers will be affected by changing policies with regard to each of these mechanisms. For example, on average, under the old system, RUS borrowers received over 55 percent of their gross income from access charges and a little over 10 percent from universal service funds. Whether any RUS borrower can meet its RUS debt service under the changes mandated by the Act, implemented by the FCC, state legislatures and state PUC's and, of course, the newly competitive marketplace, will depend on a myriad of factors which will vary from state to state. What is clear, however, is that at this time most rural companies are in good financial shape.

Therefore, barring significant changes in the totality of Federal and State universal service support, Federal and State access charges, long distance calling patterns, local revenues, the ability to compete, and state legislative changes, RUS borrowers, on average, should continue to meet debt obligations. Nonetheless, the RUS has instituted a Task Force to review all issues relating to lending policies and loan security. The RUS is also advocating Federal and State regulatory policies to help ensure sufficient support for rural telecommunications. The RUS wants to ensure that it will bring the most benefits to rural residents into the future.

The Act, and the resulting changes in the telecommunications market and regulatory structure, has, of course, affected the RUS Telecommunications Program. The RE Act contemplates a monopoly structure and prohibits the Department of Agriculture (USDA) from lending to duplicate service. Today's telecommunications market encourages competition and the duplication of carriers and types of service, i.e., wireline, wireless and satellite. In areas served by "rural companies," state public utilities commissions will regulate the type and extent of competition, using a public interest test. Also, the Federal Universal Service support is portable to new, competitive, universal service providers. The RUS Task Force is examining this issue as well. Regarding the preemption by the Telecommunications Act of 1996, the RUS

PART 1

639

has no current belief that the Telecommunications Act modifies or repeals any section of the RE Act.

Question. RUS has proposed a rule which rations available credit in the concurrent Cost-of-Money and Rural Telephone Bank loan programs by limiting the amount of funds loaned to a single borrower. The agency has failed to meet the minimum loan levels prescribed by Congress in each of these loan programs in fiscal year 1996 and may not meet them in fiscal year 1997. What is the justification for such a proposal? Please cite the specific provision of the authorizing act which would give the agency authority to make loans for less than the full amount applied for when the application is for authorized act purposes.

Answer. From fiscal year 1991 through 1995, RUS had an average backlog of \$55 million for telecommunications loans. If the 10 percent limitation had been in place during that period, the backlog would have been negligible. In past years, several borrowers have submitted loan applications of over \$100 million each. Because the size of the construction projects for these borrowers would not have expended the funds requested over the 5-year forecast period, about one half of these funds would have been just a line-of-credit and other borrowers would have been delayed in receiving funding. At the current level of funding the 10-percent limitation would equate to a concurrent loan of \$48 million. Because the average size of an RUS loan has been about \$9 million, the 10-percent limitation will impact only a small segment of the borrowers, will make funding available to a larger number of rural areas per fiscal year, and will have no adverse impact on building rural infrastructure.

The limited requests for loans in fiscal years 1996 and 1997, can be attributed to the uncertainty in the industry on support mechanisms caused by the Telecom Act of 1996. After more information is available on the FCC universal service proceedings, we expect to see an increase in loan requests that will exceed available funds.

RURAL DEVELOPMENT

RURAL COMMUNITY ADVANCEMENT PROGRAM

Question. The President's fiscal year 1998 budget request proposes a program level of \$209 million for direct community facility loans which is an increase of \$72.5 million. The Explanatory Notes state that 300 applications totaling \$304 million are currently on hand. When were these applications received by the department? Is there any unobligated monies available from past fiscal years to fund these loans? If so, how much is on hand, by fiscal year, and how many applications will be funded?

Answer. The majority of these applications were received by the Department during the past fiscal year, although a few were received prior to that. Applications may be submitted at any time during the year, and are prioritized as they are received. Applications on hand at the end of the fiscal year are not withdrawn, but remain active for funding consideration during the next fiscal year. All funds authorized during the previous fiscal years have been obligated.

Question. Is the Department currently receiving new applications?

Answer. The Department receives new applications throughout the fiscal year.

Question. What is the backlog of applications?

Answer. There are nearly 300 applications on hand totaling \$304 million.

Question. How many loans will be funded with the fiscal year 1998 request?

Answer. We expect to fund approximately 315 loans with the fiscal year 1998 request. The average size of our loans has been decreasing in recent years as we have been emphasizing the need to leverage funds from other sources. This has allowed us to stretch our scarce resources to serve more needy rural communities.

Question. The budget requests an earmark for direct community facility loan budget authority, community facility grant budget authority, and for guaranteed business and industry loan budget authority for fiscal year 1998 totaling \$2.5 million for the Empowerment Zone and Enterprise Community Program. Will this money be distributed to the State Directors? If so, how will it be distributed since it is earmarked?

Answer. Earmarked funds are retained in a reserve account controlled by the National Office and are allocated to States on a project by project basis. State Directors are responsible for reviewing applications to determine if the project is specifically identified in the EZ/EC strategic Plan and approved benchmark documents. Requests for funds are sent to the appropriate Division in the National Office in the same manner as requesting reserve funds for regular programs. The priority/selection scoring criteria outlined in application regulations are addressed and forwarded along with funding requests. Projects are ranked based upon scores and funded accordingly.

PART 1

640

The appropriate Divisions send these requests to the Office of Community Development for review, comment, and coordination.

Question. The explanatory notes state that the USDA Rural Development State Offices completed a Needs Assessment that shows rural water needs of about \$10 billion. Would you please expound on this assessment. Did all 50 states participate in this assessment?

Answer. The Rural Utilities Service coordinated this assessment through the USDA Rural Development State offices in the second half of 1995. State office Rural Development personnel worked with representatives from county and local governments, the Rural Community Assistance Program network, the State Rural Water Association network, other Federal agencies, State public health and other State agencies, and other groups as appropriate to complete the assessment. The results indicated that just over 3 million rural households have drinking water improvement needs of approximately \$10 billion. All 50 States participated in the assessment, which used the requirements of the State Drinking Water Act as the basic standard of estimating need.

Question. The President's fiscal year 1998 budget request proposes a decrease in the program level funding for direct water and waste disposal loans. The fiscal year 1997 level was \$739 million and the fiscal year 1998 proposed level is \$734 million. The subsidy appropriation for these loans increases under the proposed request from \$66.7 million in fiscal year 1997 to \$71.6 million in fiscal year 1998. How many loans can be funded in each of fiscal years 1997 and 1998 at these proposed levels?

Answer. In fiscal year 1997, the RUS estimates that 1,068 direct loans can be made at the current estimated program level. The fiscal year 1998 estimate is 1,034 direct loans. However, as with the Rural Utilities Assistance Program of 1996 and 1997, the Rural Community Advancement Program provides funding flexibility between the Water and Waste Grant and Loan programs. Also up to 25 percent within a State's allocation can be transferred between program areas within RCAP. Further, the matching and mandatory grants to States must be used for RCAP program purposes, so the loan level will very likely be enhanced above the amount currently projected if States have a priority need for direct water and waste loans.

Question. Given the need, why does the fiscal year 1998 budget propose a decrease below the fiscal year 1997 program level?

Answer. The decrease in water and waste program levels is due primarily to designating a portion of the Water and Wastewater Program monies for matching and mandatory grants for state governments as required under the Rural Community Advancement Program. If total RCAP funding for fiscal year 1998 were compared to program funding in fiscal year 1997, there is, in fact, an increase in BA and program level. Comparable figures are:

Fiscal year 1997 RCAP funding: BA \$636 million with program level of \$2.249 billion.

Fiscal year 1998 RCAP funding: BA \$688 million with a program level of \$2.494 billion.

Question. The fiscal year 1998 budget request proposes a decrease for the circuit rider program from the fiscal year 1997 level of \$5.2 million to \$5.15 million. Why does the Administration propose a decrease in this very important technical assistance program? What other means does the agency have to provide technical assistance to small communities?

Answer. Mr. Chairman, we believe our current request will help us fulfill those program objectives, yet appropriately reflects the fiscal restraint required of all government programs today. The circuit rider program provides an invaluable service to small communities, and saves the government significant sums as well. The technical assistance rendered through the circuit rider program enhances the life of the water and waste water treatment systems and means that the Federal government will not have to finance the replacement of these systems as frequently.

Besides the circuit rider program, our staff is also able to provide some technical assistance.

Question. The Administration has proposed no increase in fiscal year 1998 for direct business and industry loans. The subsidy budget authority does not need to be appropriated since the borrower interest rate has changed to a rate equal to prime, producing a negative subsidy rate. Would you please explain why the Administration proposes no increase and the effects of a negative subsidy rate.

Answer. The Administration believes \$50 million is an appropriate loan level for the direct Business and Industry program. It is a relatively new program which will be targeted to persistent poverty program areas. Once the program is operational and customers are more aware of the program, the Administration will review the program and propose funding levels consistent with demand and other priorities.

PART 1

641

Question. For the guaranteed business and industry loans, the fiscal year 1998 budget request proposes a decrease of \$77 million. The fiscal year 1997 program level was funded at \$688 million and the fiscal year 1998 proposed program level is \$610 million. There is a proposed decrease in the subsidy appropriation also. The fiscal year 1997 subsidy level was funded at \$6.4 million and the proposed fiscal year 1998 level is \$5.9 million. How many loans will be made at the level proposed for fiscal year 1998 versus that proposed for fiscal year 1997?

Answer. The average guaranteed loan in fiscal year 1996 was \$1.14 million. If the average loan size remains constant, then 603 loans would be made in fiscal year 1997 and 535 in fiscal year 1998.

Question. With no change in the proposed fiscal year 1998 funding level for direct loans and a decrease for the guaranteed loans, should the committee be of the opinion that there will be less of a demand for guaranteed loans in the future?

Answer. The President's budget assumes a fairly consistent level of demand between 97 and 98. Assistance is available to states for business assistance through the grants to states as well as the rural business and cooperative development funding stream.

Question. Why does the Administration propose to not fund rural business opportunity grants for fiscal year 1998? How many applications for these grants does the agency have on hand? Is the available funding adequate to meet this demand?

Answer. Although specific funding is not requested for the rural business opportunity grants, it would be an eligible purpose for funding appropriated to the rural business and cooperative development funding stream, allowing State Directors to provide these grants in those cases where it is a priority. In addition, the regulations for the program will not be published until later in the fiscal year and under the terms of the Rural Business Assistance Program, we have the authority to shift funds from other business programs into this account if needed. We have no applications on hand, as of yet, because the regulations have not been published.

Question. In your prepared statement, Madam Under Secretary, you state that the agency will be able to track the expenditures for RCAP. Please describe the tracking system that the agency has developed. How will the Rural Development Agency inform the Committee of the amounts of funding transferred within RCAP?

Answer. Mr. Chairman, the system simply reflects each program under RCAP and the applicable budget authority and permits the State Director and the appropriate Administrator(s) simultaneously to see the effects of the proposed transfer on each program, both within the State and at the National cap of 10 percent. If the transfer were to be agreed upon, the State Director would still be required to submit a written transfer request to be signed by the appropriate Administrator(s). Hence, transfers could be summarized by program and by state. That information could be made available to the committee on a regular basis as frequently as desired.

QUESTIONS SUBMITTED BY SENATOR STEVENS

RURAL DEVELOPMENT

FUND FOR RURAL AMERICA

Question. The Fund for Rural America is intended to improve economic stability and quality of life in rural America, as well as improve the competitiveness of the U.S. agriculture and forestry industry sectors. I understand that of the \$100,000,000 made available under this program, some funds are intended to establish Centers to administer this new initiative. Have locations for these Centers been decided?

Answer. Senator Stevens, the part of the Fund for Rural America to which you speak is within the jurisdiction of the Under Secretary for Research, Education and Extension, but I understand the centers will not be established until the grant awards are announced.

Question. Are you considering the needs of Alaska?

Answer. The Congressional and Departmental guidelines for the fund for Rural America will insure that Alaska's needs are considered. The Fund focuses on practical problem solving by research, education, and extension teams working across institutions and disciplines in areas faced with the greatest agricultural, environmental, and rural development challenges. Alaska clearly faces serious challenges in all of these areas. Moreover, Alaskan institutions have submitted 10 applications for Planning Grants, several of which cross traditional disciplinary and institutional lines. These applications will be considered by panels of peer experts in May and June as part of the Fund decision-making process.

However, awards will ultimately be made on a merit basis that looks across all of the 425 Planning Grant proposals submitted. Hence, it would be premature to

PART 1

642

conclude that Alaskan institutions will or will not win grant support. Award decisions will be announced in late June or early July. If proposals are not selected for support, each of the principal investigators will receive an explanation of the process, copies of the materials developed during the review, and information on similar projects that were selected for funding and will share project results.

Question. The University of Alaska has applied for a grant to locate one of the program's Centers in Alaska. Would such a Center assist rural Alaskans improve their dire sanitation, water supply, energy, high unemployment and economic development circumstances?

Answer. Several Alaskan institutions have submitted proposals that address the concerns you raise. The concerns are at the core of the Fund's mandate to enhance rural economies and improve the quality of life in rural communities. Hence, if funded, an Alaskan Rural Development Center would be expected to focus on these issues. As noted in the previous question, however it would be premature to conclude that the University of Alaska proposals or any of the other Alaskan proposals will be funded until after the merit review of all the applications submitted is completed.

RURAL BUSINESS-COOPERATIVE SERVICE

RURAL BUSINESS ENTERPRISES

Question. Last year the Committee provided an appropriation of \$53,750,000 for the Rural Business-Cooperative Program for activities supporting rural business enterprises. This program is particularly important to Alaska's timber dependent communities as they struggle to adjust to the loss of timber supply from federal lands. The Committee included report language last year encouraging consideration of the needs of our Alaska Villages initiative and the community of Thorne Bay, Alaska. What is the status their grant requests?

Answer. RBEG applications were received for both of these projects and were forwarded by the State to the National Office for funding from the National Office reserve. These projects will compete with other projects on the National Office reserve list for the next funding cycle, which is scheduled to occur sometime after pooling on July 11, 1997.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

RURAL DEVELOPMENT

THE FUND FOR RURAL AMERICA

Question. The 1996 Farm Bill provided the Secretary authority to expend \$100 million on a number of programs at his discretion. Can you provide a list of actual program awards that have been made using this fund? Please explain why you think the use of this fund for rural development programs has been more innovative than how this subcommittee might have allocated the funds. How do you intend to use the \$1 million allocated in the Fund for Rural America for technical assistance for enterprise communities and empowerment zones and will they be available on a competitive basis?

Answer. Senator Bumpers, a portion of the Fund for Rural America was used to augment the 1997 program level for single family housing loans. This was necessitated by the shortfall in program level caused by higher interest rates which were higher than anticipated when the 1997 budget was being developed. In this specific instance, individual projects cannot be identified because the funds were allocated to the States and commingled with the appropriated level. Other project decisions have not yet been made even though negotiations have been completed. However, I will provide for the record specific projects in distance learning and telemedicine grants, rural business enterprise grants, and water and waste disposal loans and grants.

[The information follows:]

DISTANCE LEARNING AWARDEES

Project	Amount	City/State
Hubbard Independent School Dist	\$249,492	Hubbard, TX
Amber State University	115,000	Ogden, UT

WV: Reedsville	450,000	514,000	450,000	514,000

As you are aware the Act requires the funds to be expended through existing rural development programs which means the existing statutes and regulations apply to funding decisions. This, in addition to the decision of the Secretary to reduce the backlog of applications within these programs, limited the innovative nature of projects funded. We are, however, making \$1.7 million available from the FUND for value-added cooperative development projects for which there is no specific appropriation in fiscal year 1997. This is one area in which we hope to fund some innovative projects.

The \$1 million made available for technical assistance to empowerment zones/enterprise communities will also be innovative. In order to maximize the use of Federal dollars, we are negotiating agreements with private foundations which will inject some of their funds, along with ours, into a pool of funds which will be used for technical assistance. These funds will be available on a competitive basis.

Question. I note that some of the Fund for Rural America has been allocated to programs where there has been a decline from the expected program level (such as section 502 housing) and other programs where there is a backlog. Would you please provide this subcommittee a list of programs under the Rural Development mission area for which there is a backlog and indicate the level necessary to fund those applications?

Answer. In fiscal year 1996, RUS' Distance Learning and Telemedicine Grant Program received 150 financing requests totaling \$38 million—only \$7.5 million of funding was available for the fiscal year and that amount was provided to 29 appli-

PART 1

645

cants. This resulted in a backlog of applications totaling \$31.5 million. In January 1997, RUS received an additional \$6.5 million in funding authority from the Fund for Rural America. Utilizing those funds, RUS was able to approve an additional 23 financing requests, reducing the backlog to \$24 million for applications received in fiscal year 1996.

The RUS Telecommunications Loan Program has a backlog of \$57 million, all of which is for hardship loans.

The RUS Electric Program currently has a backlog of 98 applications totaling \$580 million.

The Water and Waste Program currently has on hand \$2.72 billion in loan applications and \$1.27 billion in grant applications. The RUS Water and Waste Disposal Program was allocated \$16,695,115 from the Fund for Rural America. Those monies have been used to help fund approximately 31 projects in 22 states.

RURAL HOUSING SERVICE

The Community Facilities Direct Loan Program has a backlog of applications on hand in the amount of \$304 million. We expect to fund approximately 290 loans in fiscal year 1997. However, new applications are received continuously throughout the fiscal year, and based on experience, we expect that the backlog will remain at its current level.

The single-family backlog is listed below as follows:

Program	Backlog of applications	Funding level
Sec. 502 direct SFH	35,000	\$1.75B
Sec. 504 housing repair grants	3,200	\$15M
Sec. 523 self-help housing	¹ 92	¹ 10.6M
Housing Credit Sales	(²)	52-70M

¹The Agency was unable to fund 23 grantees requesting \$4.5 million in fiscal year 1997. Sixty-nine grantees were funded for fiscal year 1997 at 75 percent of their request creating a balance, or backlog, of \$6.1 million. Therefore, the total backlog for funding Section 523 Self-Help Housing applications is \$10.6 million.

²There is no "backlog" of applications for credit sales; however, we average 1,500-2,000 properties in inventory.

RURAL UTILITIES SERVICE

ELECTRIC AND TELECOMMUNICATION LOANS

Question. RUS has initiated a plan to require rural electric borrowers to submit plans based on a four year period rather than the traditional two year period. What did this change do to demand for RUS financing?

Answer. In January 1995, RUS published regulations that allow distribution borrowers to submit loan applications covering a period of up to four years. The period covered by the application is determined by the borrower, up to a maximum of four years. The longer loan period was intended to reduce administrative costs to borrowers, to supplemental lenders, and to RUS of preparing and processing frequent loan applications.

The longer loan period has resulted in applications for larger loans. In fiscal year 1996, RUS used all its budget authority for municipal rate loans and hardship rate loans, approving 97 municipal rate loans (\$544,616,858) and 23 hardship rate loans (\$90,577,664).

At the end of fiscal year 1996, RUS had a backlog of 106 applications for municipal rate loans (\$709.0 million) and 28 applications for hardship rate loans (\$119.9 million). These carryover applications from fiscal year 1996 exceed the total budget authority for fiscal year 1997 (\$455,564,516 for municipal rate loans and \$68,785,578 for hardship rate loans). Additional applications have been received in fiscal year 1997.

Because of this backlog, RUS published interim final rules in February 1997 that allow the agency to process loans in two parts during a fiscal year when applications substantially exceed available funds. The first part of the loan is processed in its regular place in the queue. The second part will be automatically processed based on the same application documents as if it were received by RUS exactly two years later than the first part.

Because of the two-part loan processing, the queue for municipal rate and hardship rate loans is now about 8 months. A year ago the queues for municipal and hardship rate loans were 4 months and 9 months, respectively.

Question. What is the current status of the planning requirement?

PART 1

646

Answer. The borrower's construction planning requirement is based on the loan application periods selected by the borrower. A construction work plan in support of a loan application must cover a period at least as long as the period covered by the loan application.

The borrower's financial planning requirement is not affected by the loan application period. Borrower financial forecasts submitted in support of distribution loans cover a minimum period of ten years.

Question. Can you please respond to the continuing claims that rural electrification is a completed mission and not in need of further federal assistance?

Answer. The mission of the Electric Program is to ensure that rural customers continue to have access to reliable, reasonably priced electric service to enable a reasonable quality of life and the possibility of continued economic development. Serving rural areas costs more than serving urban or suburban areas and the RUS program provides some measure of assistance for universal electric service. Like universal service assistance in the telecommunications and transportation industries, the need to support a national basic infrastructure is still a challenge. The RUS program provides assistance, leverages both public and private funds and sets standards for this basic infrastructure in rural America.

Electric service in rural areas must be both reliable and reasonably priced. Today's technology places ever greater demands on rural electric systems. In addition to regular periodic maintenance, borrowers must continuously upgrade their systems to ensure that rural residents have access to the power needed to support their farms, industries, supermarkets, medical centers, and schools.

Electric bills reflect both the cost of generating power and the cost of lines to deliver the power. The entire industry is highly capital intensive, and economies of scale are a significant factor in the cost of serving electric consumers. Data from 1995 show that RUS borrowers serve only about 6 consumers per mile of line, compared with about 35 consumers per mile for investor owned systems.

Since virtually all RUS borrowers are cooperatives or other non-profits, their electric rates are based on the cost of service, with no profit component. Based on the cost of service, the relatively low consumer density translates directly into higher rates. Department of Energy data for 1995 show that the average residential rate for borrowers in 36 states is higher than the state average, even with RUS financing.

The high per consumer cost of electric lines in rural areas will persist even in a restructured industry. Rural economic development and the well being of rural residents depends on high quality and reasonable priced electricity. Without federal assistance and assurance, many rural areas may be left behind.

Question. Of electric power available in rural areas, what portion of the customer cost is associated with generation, transmission, distribution, and maintenance?

Answer. Customer cost depends on the costs of generating and delivering power. Both costs vary widely. Generating costs depend on the fuel source, plant characteristics such as age and size, and other factors. Transmission and distribution costs depend on consumer density and factors such as local geography and weather. An additional significant factor is state and local utility taxes associated with generation, transmission, and maintenance. These taxes vary widely across the country. Current consumer bills do not show a breakdown of these costs.

For CY 1995, the total costs reported by RUS borrowers were as follows:

<i>Distribution borrowers (\$1,000)</i>	
Cost of power	\$9,975,078
Distribution expense—operation	387,443
Distribution expense—maintenance	709,168
<i>Power supply borrowers (\$1,000)</i>	
Cost of power	\$5,758,350
Transmission	291,651
Distribution	14,673
Maintenance expense	528,840

Question. What is the current status of rural electric funds for fiscal year 1997?
Answer. For municipal rate loans, loan authority for fiscal year 1997 is \$455,564,516. As of April 24, 1997, RUS had approved 78 loans totaling \$397,559,000, with \$58,005,516 remaining. Eighty five applications are pending, totaling \$575,013,820.

For hardship rate loans, loan authority for fiscal year 1997 is \$68,785,578. As of April 24, 1997, RUS had approved 13 loans totaling \$45,435,000, with \$23,350,578 remaining. Twenty-one applications are pending, totaling \$86,697,900.

PART 1

647

For loan guarantees, loan authority for fiscal year 1997 is \$300,000,000. As of April 24, 1997, RUS had approved 6 loans totaling \$67,852,000, with \$232,148,000 remaining. Five applications are pending, totaling \$176,783,000. In addition, RUS guaranteed FFB loans totaling \$68,439,408 have been repriced or refinanced in fiscal year 1997.

RURAL HOUSING SERVICE

Question. The President's National Partnership for Home Ownership calls for a goal of 8 million homes by the year 2000. What is the projected federal cost to attain this goal?

Answer. It is not anticipated that the federal government will fund all 8 million homes for the President's National Partnership for Home Ownership. These homes will also be funded by other partnerships, such as, private lenders, state agencies, and non-profits. If Congress were to provide \$1 billion of funding in fiscal years 1998, 1999, and 2000 to the Section 502 Direct Single Family Housing loan program and \$3 billion in fiscal years 1998, 1999, and 2000 to the Section 502 Guaranteed Single Family Housing loan program, the Rural Housing Service would be able to assist 210,000 families with home ownership at a budget authority cost of \$475 million.

Question. I understand your agency has begun to use escrow accounts to help borrowers better manage their financial resources. How has the use of escrow accounts for rural housing borrowers effected the program in terms of savings, defaults, and other identified goals of this action?

Answer. The Agency is completing the conversion in seven phases. Beginning February 1, 1997, approximately 100,000 loans were converted and an equal amount is converted monthly until completion of the process in September of 1997. Therefore, it is too early to measure results as only approximately 200 borrowers are currently on escrow. This number will grow quickly as all new borrowers are required to escrow and it is estimated that 60-70 percent of the existing caseload (600,000 borrowers) will be on escrow by the end of fiscal year 1998. Savings will be substantial and will be realized from three main areas.

1. *Significant reductions in tax vouchers from program loan accounting funds.* Over the past 3 years the Agency has vouchered an average of \$50 million per year to pay overdue taxes. In many cases these vouchers were just to prevent a tax sale and not to pay all delinquent taxes owed.

2. *Uninsured losses.* This is estimated a figure that the Agency was never able to adequately capture under the old program loan accounting system. In the past these losses were buried in the foreclosure loss category. Force placed insurance should eliminate these losses.

3. *Reduced foreclosures.* Timely, consistent servicing, escrow and force placed insurance should greatly increase the Agency's ability to provide supervised credit to rural housing borrowers. With these new tools added to existing subsidy and moratorium authorities, the Agency is confident that the number of foreclosures will be reduced by at least 50 percent.

Question. The budget request includes \$52 million for HUD section 8 contracts. Why should this subcommittee be expected to help provide funding for HUD programs?

Answer. Over time, the Federal government will save money from replacing expiring Section 8 contracts in Section 515 projects with USDA rental assistance. RHS recommends this transfer if the Appropriations Committee is willing to increase the Agriculture Appropriation Sub Committee's Mark this year to allow these long term savings for the government.

Question. Can you identify any RHS programs we could reduce in order to provide the \$52 million for section 8?

Answer. If the \$52 million for the conversion of HUD section 8 HAP contracts to RHS RA contracts is not to be funded as requested in the President's Budget, the Administration would object to funding the conversion at the expense of other Rural Housing Programs. We have respectfully requested that the Congress make the necessary adjustments during its consideration of the fiscal year 1998 Budget Resolution, 602(b) allocations, and appropriations bills. The President's request will substantially reduce our future needs for total rental assistance funding and administrative costs.

SECTION 515 RENTAL ASSISTANCE

Question. I note the section 515 rental assistance increases by \$16.8 million to \$540.9 million? Does this include the assumption of HUD section 8 contracts?

PART 1

648

Answer. For the traditional Section 521 rental assistance grants, \$541 million is requested. That is \$16.8 million above the fiscal year 1997 enacted level and does not include the section 8 contracts. An additional \$52 million is requested above \$541 million for the conversion of the dual track Section 8/515 HAP contracts to Section 521 RAP contracts. The total request is \$593 million.

Question. Is this amount for both renewal of existing contracts as well as new commitments?

Answer. The funding request will address the renewal of 34,100 expiring RHS rental assistance units. In addition, the fiscal year 1998 request will fund new rental assistance units to be used in conjunction with rehabilitation new construction loans.

SECTION 502 HOUSING PROGRAM

Question. As you note, the program level for section 502 housing dropped from the projected \$1 billion to \$582 million due to increased interest rates. You imply that the increased budget authority in this account for fiscal year 1998 will still result in a \$1 billion program. However, already we have seen interest rates increase since submission of your budget request. Give current interest rates, what do you project the program level would be for section 502 housing at your requested level of budget authority?

Answer. Senator Bumpers, as I have testified, accurate estimates of long-term interest rates within this economy are very difficult to make. In mid March of 1997, I was very comfortable with the estimates because the rates at that time and those reflected in the budget were less than 50 basis points apart. As you note, we have recently seen the rates increased by the Federal Reserve Board, and now there is a difference of 100 basis points. If that difference remains in effect, the program level for 502 housing would drop to about \$750 million.

Question. Will you submit re-estimates nearer to enactment of the fiscal year 1998 appropriations bill in order to better coordinate budget authority with expected program levels?

Answer. While I do not anticipate the Administration will formally submit re-estimates of the subsidy rates, I will assure you that my staff will keep the subcommittee staff informed of the difference in rates and the resulting effects as frequently as the staff desires. However, the forecasted rates are the Administration's assumptions and we anticipate an appropriate loan level in the 502 program.

COMMUNITY FACILITIES PROGRAM

Question. You mention a number of types of projects, such as day care, fire protection, etc. that can be funded through your Communities Facilities program. What types of projects have communities identified as their highest demand in terms of program dollars and number of actual projects?

Answer. The following types of projects have been identified by communities as their highest demand in terms of program dollars and number of actual projects funded:

Purpose	Amount	Number
Health Care	\$1,956,000,000	2,282
Public service ¹	1,011,000,000	2,161
Public safety	476,000,000	2,880

¹Public service includes cultural, educational, energy, and transportation facilities, public buildings, and industrial sites.

RURAL BUSINESS AND COOPERATIVE SERVICE

BUSINESS AND INDUSTRY LOANS

Question. I have heard complaints from some states that the Business and Industry fund was pooled earlier than usual this year. When was the B&I account pooled this year? Was that the normal time for national pooling? If not, were states allowed the opportunity to obligate funds in a normal manner from obligations on hand? Was this action disruptive to states?

Answer. The pooling of the Business and Industry (B&I) Guaranteed Loan Program funds normally has been done in two stages, the first occurring in April and the second in August of each year. In an effort to give State Directors more flexibility as well as control over their allocation of guarantee authority, a decision, early in the fiscal year, was made to pool only once during fiscal year 1997. This was to

PART 1

649

occur on July 11, 1997. However, numerous States, through extensive outreach activities, depleted their B&I Guaranteed Loan Program allocation and requested funding from the National Office reserve, while several States had not obligated nor had application activity to utilize 50 percent of their allocation. National reserve funding was depleted, and a large demand from numerous States for National Office reserve funding continued, thus it was decided to conduct an early pooling of the B&I funds, which was done on March 10, 1997.

APPROPRIATE TECHNOLOGY TRANSFER FOR RURAL AREAS

Question. You mention that the ATTRA program received a record number of inquiries in fiscal year 1996. Would you please distinguish ATTRA activities from those of Extension?

Answer. The Appropriate Technology Transfer for Rural Areas (ATTRA) program serves as the central source for answering questions about and encouraging agricultural producers to adopt sustainable agricultural practices which allow them to maintain or improve profits, produce high quality food and reduce adverse impacts to the environment. ATTRA effectively combines the knowledge of the university system, the Extension Service, and other state and commercial entities into a single comprehensive center of expertise.

ATTRA offers a unique and complementary service to that provided by Extension, as illustrated by a continuing increase in the number of annual requests to ATTRA, from 4,000 annually in fiscal year 1989 to more than 18,000 in fiscal year 1996. Response by mail (more than 67 percent in less than a week) and, increasingly, by electronic means, offers farmers the convenience of receiving information on options and choices at home or on the farm. Because of its national scope, ATTRA staff more frequently access information on successful alternatives to conventional production methods for commodities, as well as a wider diversity and scale of enterprises, practices, and farmer experiences specifically related to sustainable agriculture. Through ATTRA, useful ideas and solutions can more easily cross state and agency lines, and can also include those developed and tested by innovative farmers and organizations. Through ATTRA caller surveys, farmers consider these kind of resources to be very important, and they value approaches which differ or add to the approaches taken by university-based research sources accessible to extension.

Question. What role is ATTRA playing in the overall goal of achieving a more sustainable agricultural base?

Answer. ATTRA combines the knowledge of the university system, the Extension Service, and the State and commercial entities into a single comprehensive center of expertise on sustainable agriculture practices.

Question. Is there anyway to document the role of ATTRA's role in environmental protection or assisting rural economies?

Answer. Over the last 12 months, 77 percent of the requests to ATTRA have pertained to production and management options which contribute to environmental protection. Farmer requests tallied in ATTRA's database include questions about: (a) reducing pesticide and other chemical use; (b) improving soil fertility with less environmental impact, especially on water quality; (c) diversifying crop and animal production in ways that diversify income sources; (d) meeting new markets created by greater numbers of consumers interested in food produced in more environmentally sound ways; and (e) keeping more of the income for the farm family by cutting costs and making greater use of local resources.

ATTRA maintains a database and other electronic and physical information files which track caller requests, background on their farm enterprises and staff responses, now numbering more than 100,000 as of March 1997. ATTRA is also currently analyzing hundreds of feedback surveys which describe how callers have put ATTRA's information to work.

During their calls to the national 800 line, reasons given for seeking out ATTRA include one or more of these motivating factors: Strong desire to continue making a living from agriculture, a priority on being good environmental stewards as well as good farmers, and the importance of contributing to the economic well-being and future of their local rural communities. When ATTRA staff interview callers, a majority of them (62 percent in a recent sample) say that they were not able to get their questions answered elsewhere.

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION CORPORATION

PROJECT INVESTMENT REPAYMENTS

Question. You mention that AARC has begun receiving repayments from program participants. How much has been repaid?

PART 1

650

Answer. To date, the AARC Corporation has received \$82,700 in royalties, \$50,000 from the sale of stock.

Question. What kind of equity positions does AARC have with borrowers?

Answer. AARC-funded companies are not "borrowers" in the traditional sense of the word, i.e. someone with whom a loan has been arranged. Loans usually carry a set repayment schedule and a pre-determined rate of interest that is assessed as the price of borrowing the money. Although authorized to make loans under the enabling legislation that established the AARC Center (now AARC Corporation), the Corporation's Board of Directors has decided not to use that authority. Instead, the Corporation makes investments much as any private sector venture capital fund does. The major differences between AARC's approach and the private sector are that AARC is more patient about when it expects to see some return and, overall, the rate of return is less demanding than that generally required by the private sector. This is because social externalities beyond project economics are inherent considerations in AARC investment decisions. Investment preference is given to projects that benefit rural communities, are environmentally friendly, and open non traditional markets for farm and forest products. Private venture capital firms do not make allowances for such considerations. Nevertheless, when AARC assumes an equity position within a company, it does so in the same manner as any private investor would. In some situations AARC has taken common stock, in others AARC has taken its own class of preferred stock. At times, when it has made sense to the structure of an investment, AARC has taken warrants against the future purchase of stock. In all cases, the Board of Directors negotiates an exit strategy. Ideally, AARC would cash out its equity position when a company either went public, or was acquired. If neither happens, AARC always has a negotiated put option, whereby the company agrees to repurchase the stock by a pre-determined future date. The repurchase price is typically calculated on the basis of a formula tied to a multiple of the company's net sales for a period of time prior to the repurchase.

Question. Is there a maximum length of time AARC can hold equity positions?

Answer. There is no set period of time for which AARC can remain an equity investor in a company. However, absent an Initial Public Offering (IPO) or acquisition, the repurchase strategy described above is usually set to occur within six to eight years from the date of the investment.

Question. Does AARC intend to be self-sustaining at some point?

Answer. Under the provisions of the 1996 Farm Bill, AARC has prepared a business plan that shows a self-sustaining fund by the end of 2002.

QUESTIONS SUBMITTED BY SENATOR HARKIN

RURAL BUSINESS-COOPERATIVE SERVICE

BUSINESS AND INDUSTRY PROGRAMS

Question. Clearly, one of the biggest problems facing economic development in rural areas is capital. AARCC is crucial to providing venture capital for new nonfood products. But, we also need capital for a variety of economic ventures. And, for new mid sized companies, the B&I program is the only effective substantial USDA business capital assistance program that is available. Fortunately, it has proven to be both efficient and effective. Unfortunately, it is under funded. For this year, \$1 of BA provides for about \$93 in loan guarantees. We have had a reawakening of the B&I program over the past four years. Demand has been steadily rising since fiscal year 1994 and with the new provisions now in place, demand has been further increasing. Do you believe the B&I loan guarantee program has been crucial to generating job creating businesses in Rural America?

Answer. Yes, so far this fiscal year, the loan guarantees made under the B&I program have created 4,710 jobs and saved 7,873 jobs. For the past two years, 17,787 jobs were created and 23,276 were saved. In 1995, 8,076 jobs were created and 14,300 jobs saved. In 1996, 9,711 jobs were created and 18,976 saved.

Question. What is the current level of new loan requests that have been coming in to state offices over the past several months?

Answer. At the beginning of fiscal year 1997, there were 217 B&I applications and preapplications on hand totaling \$348,200,333 with an allocation of \$680 million. Currently, there are 455 B&I applications and preapplications on hand totaling \$779,540,930 with only \$247,245,145 of the funds, allocated through the Rural Business-Cooperative Assistance Program, not obligated.

Question. If there is not a request to have processing slow down or acquisition of new funds, when will the program run out of funds?

PART 1

651

Answer. There are requests for funds from the National Office reserve currently on hand totaling \$33.23 million, which cannot be met because the reserve is out of money. Nine States have already exhausted their allocation and, out of the remaining State Offices, only 4 States have enough funds remaining in their allocation to cover the applications and preapplications that have been filed. Unobligated B&I guaranteed funds are scheduled to be pooled on July 11. If processing continues at its current pace and additional funds are not made available, we estimate that we will have exhausted funds by mid-August.

Question. What options do you now see for shifting funds into this important program?

Answer. The program is funded under the Rural Business Cooperative Assistance Program (RBCAP) along with the Business and Industry Direct Loan, Rural Business Opportunity Grant, Rural Cooperative Development Grant, and Rural Business Enterprise Grant Programs. We are currently evaluating options to administratively transfer RBCAP budget authority set-asides for these programs to the B&I Guaranteed Loan Program.

Question. If the program was allowed to continue with normal approval timing of loan guarantees with a supplemental appropriation, what would be your estimate of the size of the loan guarantee program in fiscal year 1997?

Answer. If the demand for the Business and Industry Guaranteed Loan Program continues in a linear progression from the October 1, 1996, level of \$348,200,000 through the current level of \$779,540,930 as of April 22, 1997, it is estimated that the total demand for the program for fiscal year 1997 will be nearly \$1.6 billion. This estimate is based on the average daily increase in loan activity of \$2.1 million for the remaining 161 days in fiscal year 1997 minus the appropriated funds not obligated.

Question. What do you think the likely demand for the program would be in fiscal year 1998, if it were not restricted by budget limitations?

Answer. Following the same assumptions used in the previous answer of an average daily increase in loan activity of \$2.1 million plus the existing demand of \$779,540,930, we estimate the size of the program would be \$1.5 billion in fiscal year 1998 if unrestricted by budget limitations.

Question. For maintaining the integrity of the B&I loan portfolio, what kind of exceptions to authority, waivers, are there to standard policy? What kind of assistance to state directors is being provided to maximize the quality of the portfolio?

Answer. The Administrator has been delegated the authority, on individual cases, to grant an exception to any requirement or provision of regulations, which is not inconsistent with applicable statutes, where the application of the requirement or provision of the regulation would adversely affect USDA interests. Exception have been granted on individual projects where USDA's minority business outreach initiative would have been adversely impacted if the exceptions were not granted.

Training assistance has been provided and is available to Rural Development State personnel to maximize the quality of the portfolio. In addition, training material is being developed to assist State personnel in training certified or non-bank lenders that are new to the program. A "jump team" of qualified, experienced, field personnel has been identified to provide assistance to State Directors on processing and servicing situations as needed. We perform annual business programs assessment reviews on state office activities regarding the business programs including servicing and portfolio management. Also, RBS is developing loan portfolio improvement to management procedure for implementation. This will coordinate early warning systems into the existing activity performed by our Lenders, State Offices and National Office on servicing our portfolio. Currently our management and maintenance of our portfolio by the National Office Staff have allowed us to reduce our loan delinquency to 7.5 percent of the outstanding loan portfolio of \$1.5 billion.

COOPERATIVES

Question. What do you see as the biggest obstacle facing people out in the countryside who want to develop cooperatives?

Answer. Two major barriers that people face are organizational ability and the need for start-up financing. Understanding what a cooperative business is and how to approach the organization of cooperatives are obstacles that can be addressed through various types of educational and technical assistance. Often the most valuable assistance is helping people understand their roles as members (potential members) in organizing and operating the cooperative.

The other barrier, financing, relates to the development process and business start-up. Lack of readily accessible funds to carry out phases (a business plan, make financial projections, and legal structure) of the development process are often major

PART 1

652

obstacles to start-up groups. This is particularly true of many low resource groups who are exploring cooperative business structure.

Question. What is the biggest obstacle USDA faces as it attempts to promote cooperative development in the field?

Answer. The biggest obstacle USDA face is the insufficient number of highly qualified and experienced staff with the responsibility of providing cooperative development assistance and programs at the National and State Offices. Cooperative development requires advanced skills in cooperative structure, finance, business planning, facilitation and small group process, and leadership development. There is limited availability of such expertise in USDA today. Development of a skilled staff to do cooperative development work will require training (both formal and on-the-job) and a commitment to recognize cooperative development as a primary (not secondary) job function. It must also be recognized that to develop this expertise will take time, perhaps 3-5 years.

Also, we must begin to measure the outcome of our cooperative development work in providing technical assistance. For many State staffs, performance is based upon number and amount of loans and grants processed, jobs created, delinquency rates, etc. Cooperative development (technical) assistance is measured by different criteria in meeting felt needs by farmers and other rural residents. Recognized and accepted measures are being implemented in the field to encourage staff to promote cooperative development.

Question. Given the experiences in promoting considerable economic development through the creation of cooperatives by federally-sponsored programs that fostered rural electric cooperatives, telephone cooperatives, the farm credit cooperative lending system, etc., how might we undertake a similar approach to promoting cooperatives as an economic development tool today?

Answer. The concept of using programs similar to that used in sponsoring electric and telephone cooperatives is excellent. The cooperative approach is far from exhausted as a developmental tool for strengthening rural America. The potential use of cooperatives for fulfilling a wide variety of economic and social needs in rural America is significant. To accomplish this, several coordinated steps are needed. First, the Department must be given the authority to provide technical and other assistance to all types of rural cooperatives, in addition to its present authority to work with agricultural cooperatives. Secondly, development of an extensive educational program about the cooperative method of conducting business is an essential ingredient to successful program delivery. In addition, like the electric and telephone cooperative success stories, groups forming cooperatives of all types must have adequate equity capital and access to sources of debt capital. A coordinated strategy of promotion, technical assistance, and funding can build a rural cooperative system that will make a real development impact on our most needful rural areas.

Question. Cooperatives, both existing cooperatives and new, start-up cooperatives, may cross State lines. Does this create problems in generating State matching funds?

Answer. While some cooperatives have members located in more than one State (a few even have Canadian memberships), a cooperative's headquarters address is always in a single State. Therefore, from the perspective of programs offered by Cooperative Services and our State Cooperative Development Specialists, multi-state cooperative membership does not create a State matching funds problem. We recognize that many cooperatives to be effective must be regional in nature such as efforts to organize livestock producers in the Northern Plains States. This requires more flexibility and ability to adapt and coordinate activities by State Offices.

Question. What can USDA do to take the cooperative model to other government agencies and make it part of their development outreach programs? Would it be logical to provide set-asides for certain other agencies, requiring them to commit a specific minimum of their development dollars to cooperative development?

Answer. USDA can partner with other agencies at the Federal, State, and local level to insure that information on the cooperative form of business is being fully disseminated to all those who might benefit from its use. Such partnering could be encouraged by the Congress as it authorizes funding for all development programs. We encourage a strategy which recognizes USDA's present lead agency status with respect to cooperative development activities and builds upon it through increased funding and broader authorities. Other Department's cooperative developmental programs are encouraged to work with USDA to insure the provision of strong programs.

While earmarking certain portions of funds for cooperatives will be beneficial, we also encourage an approach that focuses on reducing regulatory barriers to program

PART 1

653

access so that cooperatives can compete for program funds on an equal footing with other forms of enterprise.

Question. USDA has developed a number of public/private partnerships in rural America? What have been your most successful, creative efforts to date and to what extent can these success stories be made widely used models across the country?

Answer. We feel we have great success over the years in working with the land grant university system in carrying out programs of research, education, and technical assistance that serves the needs of local residents. Through cooperative agreements, we have been able to leverage financial resources and expertise in a manner that has been of real benefit to the rural community. We have maintained active partnerships with cooperative centers organized as non-profit private sector organizations in providing a range of cooperative education activities and programs. Through extensive joint planning, program development, and sponsorship, we have been able to make significant contribution to a greater public understanding of cooperatives through such diverse programs as the Cooperative Development Forum, the National Institute on Cooperative Education, the Graduate Institute of Cooperative Leadership, and a range of other programs.

Question. I believe that RDA should be able to provide assistance to cooperatives without regard to specific agricultural linkages in the same ways RDA can assist other forms of business enterprises. I understand USDA is considering such an expansion in authority. What is the status of those plans? If so, what plans are there to ensure that additional personnel and other resources are allocated to take on the work load?

Answer. Yes, we are seeking legislation which would expand the authority of Cooperative Services to provide the same type of advice and assistance to non-agricultural rural cooperatives as they are currently doing for agricultural cooperatives. These include applied research, technical assistance to existing cooperatives, assistance to newly developing cooperatives, education and training, and statistical services. The legislative package for this expanded approval has cleared the Department and is awaiting approval at OMB.

We are examining ways of ensuring that additional personnel and other resources are available to handle this additional work. Since so many of the missions carried out by Cooperative Services are human-intensive, we recognize that additional personnel will be needed such that current services to agricultural cooperatives do not deteriorate.

Question. A major obstacle to cooperative development is finding pre-development funds to get a project started. What suggestions do you have for how USDA can help provide pre-development funds? Have you considered generating a revolving loan fund for that purpose?

Answer. First, we want to point out that it is our belief that strong cooperatives are more likely to be developed if the potential members see the need for the cooperative rather than for a "developer" to try to "sell" the idea. Through State and National Offices, where RBS can best assist is providing technical advisory assistance at no cost to a developing group, after the economic need is determined and thereby reducing the need for pre-development funding for projects that are top-down advocacy rather than bottom-up member driven. This technical assistance is often in the form of providing a feasibility study for which groups otherwise seek outside funding. Further, strong cooperatives usually require financial commitments from their members, thus the need for pre-development funding is often at the member or producer level. With this in mind, the FAIR Act authorized the use of Business and Industry loan funds to be used for producers to purchase stock in start-up cooperatives. Additionally, the Rural Cooperative Development Grant Program, operated by RBS, helps fund Cooperative Development Centers who in turn help do some of the pre-development activities. Further, the revolving fund program operated in conjunction with Rural Utilities Service's borrowers is used as a source of funding some pre-development activities. We are receptive to consideration of a revolving loan program for cooperative development purposes, although such a program would be competing with others for scarce budget resources.

INTERMEDIARY RELENDING PROGRAM

Question. The IRP program is allocated on a project by project basis through a national pool. Has the Department considered allocating a portion of those funds to the states under an administrative formula? If not, why not?

Answer. There has been considerable internal Agency discussion about changing to a system of allocating IRP funds to the Rural Development State Offices by administrative formula, rather than through a national competition. There is a signifi-

PART 1

654

cant amount of staff support for such a change. However, there are also several reasons why such action has not yet been taken.

The current program regulations require applications to be ranked on a national basis and funded in order of priority ranking. Therefore, it would be necessary to go through the rulemaking process, with opportunity for public comment, before a change could be implemented. The issue was not considered prior to publishing a proposed rule for new IRP regulations in the Federal Register in January 1995 and was not the subject of public comment on that proposed rule. The Agency is still working on that rulemaking action and wants to publish a final rule to implement that action before developing a new proposed rule for additional program changes.

The existing requirement for a national ranking was put into the program regulations in 1990 at the insistence of the Office of Management and Budget (OMB). OMB thought a national ranking was the fairest way to distribute the small amount of funds expected to be available for IRP. How current OMB staff would react to a proposal to remove that requirement is not known.

Recent appropriation levels are still small enough that formula allocation to State Offices would cause fundamental changes in the program. For example, if the fiscal year 1997 appropriation amount of \$37,155,765 was allocated according to the formula used by the Agency for other business programs, very few State Offices would receive an allocation as large as \$1 million, which has been the approximate average amount of one IRP loan. The average size of IRP loans would be reduced dramatically. The amount available to some State Offices would not be sufficient to provide adequate funding to justify the creation and administration of a revolving fund by an intermediary.

RURAL HOUSING SERVICE

Question. The Rural Housing Service budget for personnel is being slashed with the hope that significant savings can be realized from the DLOS single family servicing. While there are many demands on the federal budget, the severe reduction in personnel in RHS could jeopardize the government's multi-billion dollar investment in multi- and single-family housing. Even if additional funding is not possible, the Agency needs to maintain its skilled and knowledgeable personnel in the complex multi-family program. To what extent is the USDA considering this important question as it develops possible further USDA Reductions-In-Force.

Answer. Senator Harkin, when we made the decision to implement the Dedicated Loan Origination and Servicing System (DLOS), one of the primary objectives was to mitigate reductions in our staffing levels. As you may be aware, had the servicing of these loans been shifted to the private sector, as was strongly suggested by some, the loss of staff would have been in the neighborhood of 2,700. Implementing the system internally enabled us to hold the staff reduction to only 600 and provided the opportunity to transfer 900 other positions, no longer needed for servicing single family housing loans to other functions that were critically understaffed, one of which was multi-family housing. The majority of the positions transferred went to this program and this was a result of decisions reached jointly with the program staffs in Washington and the State Directors.

Regarding the second part of your questions and future reductions-in-force, it is my policy that a reduction in positions involved in the delivery and servicing of our programs will be considered only after all other options are exhausted. As you know, we are in the process of a reduction-in-force presently for those positions that are to be eliminated with the implementation of DLOS. The scope of this particular reduction-in-force was held to a minimum with the help of the Appropriations Committee's enactment of voluntary separation authority beginning in fiscal year 1997. We limited participation in the voluntary separation to those states that would need to conduct a reduction-in-force associated with DLOS.

Question. The single family direct loan program must be preserved at an appropriate level without the vast difference in loan volume experienced from year-to-year due to changing subsidy rates caused by variations in interest rates. This is particularly important regarding this program where Realtors and banks need to acquire long term relationships in order for the program to smoothly function over the long term. Will the USDA provide the Committee with their best judgments of the likely program to budget authority rate for fiscal 1998 prior to the subcommittee's markup and conference this year?

Answer. We would be most happy to keep the subcommittee informed of the changes in the subsidy rate.

PART 1

QUESTIONS SUBMITTED BY SENATOR BYRD

RURAL UTILITIES SERVICE

WATER AND WASTE LOANS

Question. The proposed budget for the water and waste disposal accounts remains approximately at the fiscal year 1997 level. With the 1995 Water 2000 report identifying the need for some \$10 billion in water and waste disposal projects, why has there been no increase in funding for the water and waste disposal program?

Answer. There is great need in rural America for decent, safe drinking water, as reflected in the Water 2000 needs assessment. There continues to be a heavy demand for water and waste disposal funds. Currently the RUS has on hand \$2.72 billion in loan applications and \$1.27 billion in grant applications. The requested fiscal year 1998 water and waste disposal funding levels take into consideration all the rural development needs in rural America. The requested funding level, combined with funds from State, other Federal, and private sources will help achieve measurable progress in meeting the water and waste needs of rural people. The base amount of funding for water and waste grants and loans has remained stable. However, since these programs are included in the Rural Community Advancement Program (RCAP) there is funding flexibility between the water and waste grant and loan programs. Also up to 25 percent within a State's allocation can be transferred between program areas within RCAP (water and waste, community facilities, and business and industry). Further, the matching and mandatory grants to States must be used for RCAP program purposes, so the water and waste program level will very likely be enhanced above the amount currently projected if States have a priority need for water and waste grants and loans.

Question. Under your proposed budget, when will the goals of Water 2000—to provide reliable, clean water for rural Americans—finally be reached in the nation? And West Virginia?

Answer. The RUS has not established a specific time frame for achieving the goals of Water 2000 in the nation or West Virginia. This will be an on going initiative that targets resources from the rural water and waste disposal loan and grant program to all communities with the most serious needs, as soon as possible within overall budgetary constraints.

Question. If additional funding were provided for Rural Development programs, would you agree with me that priority should be given to the water and waste disposal accounts?

Answer. Certainly providing a water supply or waste disposal system to eliminate some acute health or environmental problems is a very important first step for many communities. However, attempting to set priorities among various services when much of the population that we serve has been without water supply or waste disposal, housing, health care, or employment for decades is very difficult. We think priorities should be set by the communities and the people they serve, and we are now attempting to work with communities and their residents in developing plans to determine their priorities rather than simply process loan and grant applications. Implementing the Rural Community Advancement Program goes to the heart of that effort. The communities with whom we have worked have found the process to be very helpful and responded very favorably to this process.

Question. In your prepared statement, you observe that this budget reflects the President's belief that jobs create opportunity and long-term community stability. How do you expect to achieve these economic goals without providing adequate funding for essential water and waste disposal systems?

Answer. Given the budget constraints that all of us are forced to work within, we think we have submitted a very responsible budget, particularly with regard to water and waste disposal grants and loans. This funding level along with the total program level for all Rural Development, will be adequate to achieve job opportunities and community stability for Rural America.

RURAL COMMUNITY ADVANCEMENT PROGRAM

Question. Your budget calls for funding for the RCAP, a new funding initiative. Given the current shortfalls in funding available to meet needs already identified within the community facilities, water and waste disposal, and business assistance accounts, why pull funds from these critical programs to establish a new funding mechanism?

Answer. Senator Byrd, the 1996 Farm Bill authorized the Rural Community Advancement program (RCAP) as a means of providing flexibility in the administration of the programs you referenced. This flexibility is badly needed by our State Direc-

PART 1

656

tors as they attempt to stretch shrinking Federal resources further to meet growing demand for these programs and to target their funds appropriately.

Question. What is the cost associated with establishing RCAP?

Answer. There is no cost associated with implementing RCAP. RCAP only changes how we administer our programs.

QUESTIONS SUBMITTED BY SENATOR LEAHY

RURAL BUSINESS-COOPERATIVE SERVICE

BUSINESS AND INDUSTRY LOANS

Question. On March 7, the Vermont Rural Development office received a letter from Rural Business Cooperative Service Administrator, Dayton Watkins announcing that 50 percent of all unobligated Business and Industry Loan Guarantee program funds should be returned immediately to the national office for re-pooling. This unwarned early re-pooling cost Vermont \$600,000 and New Hampshire \$2 million. The letter claimed this was necessary to address a backlog of projects. Early re-pooling causes significant problems for Vermont. First, the State's strategic plan targets new construction in rural areas which requires time consuming project development. Second, because of the short construction season, businesses often do not approach Rural Development for funding until close to the beginning of the building season in March or April. The Department normally "re-pools" funds in July. Why did Administrator Watkins make the decision to change the rules on the states in midstream? Can I have your assurance that states will not be subjected to this kind of unexpected and unplanned for program change in the future? What procedures does USDA currently have in place to ensure that field offices are not taken off guard by sudden changes in program funding or operation?

My concerns about moving up re-pooling dates is not limited to the B&I program. The factors which contribute in Vermont to the need for availability of program funding through the Spring are equally applicable to many other Rural Development programs. I would repeat my first question with regard to the steps that the office has in place to protect state funds from unexpected early re-pooling for all Rural Development programs.

Answer. The pooling of the Business and Industry (B&I) Guaranteed Loan Program authority has normally been executed in two stages, the first occurring in April and the second in August each year. In an effort to give State Directors more flexibility in managing their program resources, the Administrator decided to have only one pooling in fiscal year 1997, which was to occur July 11, 1997. However, because of the tremendous demand for the B&I program nationally, it became necessary to implement an early pooling to accommodate those demands. By the end of February 1997, many States had used their entire allocation and needed additional guarantee authority in order to keep their B&I program open and to enable them to maintain new relationships with business communities and lenders. Other States have not used or had application activity in amounts that would use their allocation. In addition, the National Office Reserve was completely exhausted of funds, yet, there was a backlog in demand from States for the reserve resources. Out of several options presented to the Administrator to handle this program, the Administrator chose to pool fifty (50 percent) percent of the balance resulting from subtracting the preapplications/applications on hand from the unobligated B&I allocation for each State.

At the time of pooling, Vermont and New Hampshire had a total of \$2,698,000 and \$4,074,000, respectively, in unobligated B&I authority, with only \$1.5 million of preapplications/applications on hand in Vermont. New Hampshire had no preapplications/applications. The amount pooled for Vermont and New Hampshire, respectively, was \$599,000 and \$2,037,000. This left a total of \$2,099,000 and \$2,037,000 for the two States until additional resources could be made available.

According to our latest B&I report, Vermont has obligated \$520,000 of its fiscal year 1997 allocation, and New Hampshire has not obligated any funds. While Vermont and New Hampshire have approximately \$5 million and \$4 million in preapplications, we hope to have authority to cover these demands after the July 11, 1997, pooling.

With regard to the issue of advance notification to State Directors regarding the B&I program status, in the future we will notify our State Directors through their Executive Committee of the Administrator's plans. In this instance, the Administrator did not have the time to give advance notice to States of this action.

Also, please note, that procedures for the field office funding allocations are administrative in nature, which offers the Administrator flexibility in administering

PART 1

657

programs in the Rural Business-Cooperative Service agency. The authority used is executed in a prudent, rational, and logical manner always considering the potential impact on all rural America and the States responsible for making programs available to them. It has been our experience in the past that some States do not use all of their B&I allocations, while others may use much more. If the Administrator did not have flexibility in managing the RBS programs, it's probable that we would not utilize all of our B&I authority nationwide.

RURAL DEVELOPMENT

FIELD RESTRUCTURING

Question. The Department has made significant progress in meeting staff reduction goals as required by the USDA Reorganization bill that Senator Lugar and I authored in 1994. In fact the Rural Development Office in particular has exceeded those goals—in Vermont by 20 percent—with the implementation of centralized loan servicing. I commend you for your commitment to increasing the efficiency of USDA offices—that was also the driving goal behind my Reorganization bill three years ago. However, I want to be sure that additional staff reductions do not come at the expense of customer service. The Vermont Rural Development office in particular is undergoing major changes to maximize efficiency with significantly reduced staff. Where once seven offices served Vermonsters, by the end of the year only one central office will remain. What steps is the Department taking to encourage feed-back from field offices on the restructuring? How are you monitoring any changes in office performance or program participation to make sure that the level of customer service is being maintained?

Answer. We appreciate and share your concern that the quality of service received by our customers should not be reduced as a result of reduced staffing levels. While our current staffing levels will not allow us to maintain the number of offices we have had in the past, we are providing our field staff with training to assist them in responding to the transition and to customer service changes that may be required. This training is designed to: 1) help our field employees cope with the changes brought about by the reorganization and 2) provide them with the skills required to satisfy our customers' needs from the downsized structure. This training is being provided at the local USDA Service Center level and includes employees from the Farm Service Agency (FSA) and the National Resources and Conservation Service (NRCS), as well as Rural Development employees. As part of this training session, feedback is solicited from field office employees on issues related to the downsizing and barriers to providing good customer service are identified. This information will be helpful in determining what changes are needed in processes or organization to ensure quality customer service is provided. We will also be monitoring quality of service performance by obtaining periodic feedback directly from customers through mail or telephone surveys or through focus groups.

RURAL HOUSING SERVICE

DEDICATED LOAN ORIGINATION SERVICE SYSTEM (DLOSS)

Question. The 1996 Farm bill eliminated much of the administrative work required by many Farm Service Agency programs. The changes should mean that far fewer employees will be needed at FSA to run these programs. Are you working with other Department offices like FSA to make sure that staffing needs are addressed Department-wide and not on an agency by agency basis?

Answer. Rural Development is working with both FSA and NRCS to ensure that, wherever possible, administrative activities are shared. Joint task forces are looking at short and long term procedures that can improve the support necessary to deliver our programs. We hope that in the long run this will result in economies of scale in staffing needs devoted to non-program activities in the field. We also hope that this effort will result in some standardization of these policies among the three agencies that will reduce confusion from inconsistencies for both our employees and our customers.

Question. I understand that the Department expects the centralized loan servicing system to be fully operational by the Fall of 1997. Have you experienced any problems so far in the transition to the centralized system? Has the office noticed any changes in program participation, the time required to process loans, program costs, or delinquency rates to date? What steps are you being taken to ensure that changes like this will be tracked and addressed?

Answer. The Department does expect to be fully operational by October 1, 1997. The development of the Centralized Servicing Center and conversion of the Rural Housing Service Single Family Housing portfolio from the old system to the new

PART 1

658

centralized environment continues to progress on time and on budget. Any project as large and aggressive as the reinvention of an \$18 billion, 700,000 plus loan portfolio would experience some problems. Nothing, however, has arisen to date that would throw the conversion off track or off schedule.

As of April 15, 1997, the Agency is on track for full utilization of loan funds and in fact there continues to be a shortage of funds needed to finance all pending applications.

The new UniFi loan origination system has been well received in the field. UniFi is a state-of-the-art windows-based program which automates much of what was a manual process. Therefore, the time required to process loans is reducing and will continue to improve as the field becomes more experienced on the new system.

The conversion process will continue through September of 1997. Therefore, it is too soon to make any definitive judgments as to impacts on program costs or delinquency rates.

The new commercial-off-the-shelf system that the Agency purchased from Fiserv Mortgage Systems, which has been enhanced to accommodate the unique nature of the Rural Housing Service Single Family loan program, will be able to track the status of the portfolio in a much more comprehensive manner than ever before in the history of the program. We will be able to more accurately monitor every area of the program including costs and delinquencies. The DLOS system will give us much improved checking and management information data, for example:

We will be able to monitor first-year delinquencies by county which allows the Agency to better evaluate underwriting practices, and respond to delinquencies much faster, thereby, improving the probability of the borrower to become a successful homeowner and reduce cost to the taxpayer.

RURAL DEVELOPMENT

Question. In 1995 the National Science Foundation completed a study on measuring poverty. The report concluded that the way the government measures poverty today is inaccurate and that shelter costs among other things should be factored into the measure. The findings of a recent report by the Peace & Justice Center in Vermont supports the argument that poverty in Vermont is underestimated. Other states have conducted similar surveys, with largely similar results. Many USDA programs including those run by Rural Development base state program funding on the poverty measure. The Office on Management and Budget has recently formed an inter-agency task force to decide if changes to the poverty measure are needed. Is Rural Development participating in that task force? Would you consider alternatives to the current poverty measure to determine funding needs?

Answer. We would certainly be willing to consider alternative measures of poverty. Rural Development has not been asked to participate in the inter-agency task force on poverty. The Office of Management and Budget advises that they have formed a steering committee. We will ask to be added to the committee.

Question. I was disappointed that Rural Development chose to use its portion of the fiscal year 1997 Fund for Rural America for program backlogs. While some supplemental funding was legitimately needed, in the housing program in particular, I feel that this opportunity to do something innovative was largely missed. Will the office be looking for more creative uses of the Fund for Rural America in fiscal year 1998? Will you work with Congress in determining an appropriate use for the Fund? Will Rural Development provide adequate time between the announcement of how the Fund will be used and the distribution of that funding to allow states with projects under development to submit applications for consideration?

Answer. Senator Leahy, as you are aware, the provisions of the Fund for Rural America require that the rural development portion of the Fund be used through existing programs which means that existing statutes and regulations apply. This limits our ability to use the funds for innovative purposes. However, as I am sure you will agree, the distance learning/telemedicine grant program is one of the most innovative and effective uses of funds. It combines the advancement of technology with the need to provide higher quality education in rural areas that will allow rural students the opportunity to be competitive in an economy increasingly dependent on technology.

It is difficult to weigh the need for innovation against providing basic services that residents of rural areas have been without, such as safe drinking water in their homes and adequate housing. However, we would be happy to consider any suggestions you have in using the funds in more innovative ways. As you are aware many members of Congress urged the Department to address the substantial backlogs of applications in many of our programs and we attempted to balance the two de-

PART 1

659

mands, along with addressing the funding shortfall in the single family housing program.

RURAL BUSINESS-COOPERATIVE SERVICE

INTERMEDIARY RE-LENDING PROGRAM

Question. The Department has been working on changes to the Intermediary Relending program for two years. These changes are needed to eliminate the \$2 million cap for successful lending organization, and to streamline the operation of the program. What is the status of the IRP proposed rules? What steps remain before the final rule will be ready? When does the office expect the final rule to be approved?

Answer. The Final Rule for the Intermediary Relending Program has recently cleared the USDA Office of the General Council. It is in the final steps of the process of being cleared through the Department.

The Final Rule will then be forwarded to the Office of Management and Budget (OMB) for review and clearance. OMB has up to 60 days to review and clear the regulation.

Upon OMB clearance, the Final Rule will be published and effective.

RURAL DEVELOPMENT

RURAL COMMUNITY ADVANCEMENT PROGRAM

Question. I understand that Rural Development's fiscal year 1998 budget request incorporates the RCAP authorized in the 1996 Farm Bill. Specifically how will funding be divided among the RCAP programs, and what steps has the Department taken to ensure that transfers between RCAP programs will be documented and tracked? Has the Department noticed any change in the way states operate programs in the RCAP or spend money from those programs?

Answer. The budget documents provide a table of the programs and requested funding levels for the RCAP. The Rural Development Mission Area has developed a simple software package to track transfers. This software will be made available to State Directors and Agency Administrators so they can discuss suggested transfers and both parties will be able to examine the effects of the transfers simultaneously. If a transfer is agreed to, the State Director will transmit a formal request to the appropriate Administrators for concurrence and the transfer then can be executed. The software will summarize transfers by program and by state in order to ensure the 10 percent national cap on transfers is adhered to. In fiscal year 1996, 44 transfers were made in the Rural Utilities Assistance program, 34 of the transfers involved shifting budget authority from grants to loans, thereby increasing the number of loans that were made. One state shifted all of the grant funds to loans because there was not a current demand for grant funds. The remaining transfers shifted small amounts of budget authority from the loan program to the grant program primarily to complete financing for specific projects. In every instance, the funds were used wisely and effectively and the State Directors are to be commended for their decisions.

Question. The Federal Agriculture and Improvement and Reform Act authorized a rural capital demonstration program as a way to get more private sector investment into rural business enterprises. Both the Senate report and the conference report on the fiscal year 1997 Agriculture Appropriations Act provided for funding of this demonstration out of the Business and Industrial loan program. Instead, USDA has just issued an 'Advanced Notice of Proposed Rulemaking'. This appears to me to be little more than a delaying tactic. What is the reason for the delay in going forward with this program? Is there a need for corrective legislation? How can we expedite the implementation of this important program?

Answer. Senator Leahy, the fiscal year 1997 Agriculture Appropriations Act blocked implementation of the venture capital demonstration that you have referred to. The Advance Notice of Proposed Rulemaking to which you refer is not a delaying tactic, in fact, it is quite the opposite. The staff of the Rural Business-Cooperative Service that will administer the program has no experience with venture capital funds and with the notice is soliciting ideas from interested parties about how best to administer such a program. As you are aware, venture capital is very risky and we want to be certain we take every step possible to protect the public's interest.

PART 1

660

SUBCOMMITTEE RECESS

Senator COCHRAN. Thank you all very much for your cooperation with the subcommittee and your attendance at this hearing.

Our next hearing will be on Tuesday, April 22, at 10 a.m., in room 138 of the Dirksen Senate Office Building. At that time, we will review the budget request for the Department's research, education, and economics programs. Until then, the subcommittee stands in recess.

[Whereupon, at 11:30 a.m., Tuesday, April 15, the subcommittee was recessed, to reconvene at 10:10 a.m., Tuesday, April 22.]

PART 1

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

TUESDAY, APRIL 22, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:10 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Gorton, Burns, and Bumpers.

DEPARTMENT OF AGRICULTURE

STATEMENT OF DR. CATHERINE E. WOTEKI, ACTING UNDER SECRETARY, RESEARCH, EDUCATION, AND ECONOMICS

ACCOMPANIED BY:

DR. FLOYD P. HORN, ACTING DEPUTY UNDER SECRETARY, RESEARCH, EDUCATION, AND ECONOMICS
DENNIS KAPLAN, DEPUTY DIRECTOR, OFFICE OF BUDGET AND PROGRAM ANALYSIS

AGRICULTURAL RESEARCH SERVICE

STATEMENT OF DR. EDWARD KNIPLING, ACTING ADMINISTRATOR

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

STATEMENT OF DR. B.H. ROBINSON, ADMINISTRATOR

ECONOMIC RESEARCH SERVICE

STATEMENT OF KELLEY WHITE, ASSOCIATE ADMINISTRATOR

NATIONAL AGRICULTURAL STATISTICS SERVICE

STATEMENT OF DONALD BAY, ADMINISTRATOR

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order. We welcome all of you today to our hearing reviewing the President's budget request for the Department of Agriculture, specifically in the area of agriculture research, education, and economics. This includes the Agricultural Research Service's budget; the budget of the Cooperative State Research, Education, and Extension Service; the Economic Research Service; and the National Agricultural Statistics Service.

PART 1

662

Our witnesses this morning are Dr. Catherine Woteki, who is Acting Under Secretary for Research, Education, and Economics; Dr. Floyd Horn, Acting Deputy Under Secretary for Research, Education, and Economics; Dr. Edward Knipling, Acting Administrator for the Agricultural Research Service. I am not sure about the titles of the rest of the witnesses. They probably are all Ph.D's in something, but also here with us are Dr. Bob Robinson, Administrator, Cooperative State Research, Education, and Extension Service; Kelley White, Associate Administrator for the Economic Research Service; Donald Bay, Administrator for the National Agricultural Statistics Service; and Dennis Kaplan, with the Office of Budget and Program Analysis of the Department of Agriculture.

We appreciate very much your attendance at the hearing and your cooperation with our subcommittee. We have your written testimony which we will put in the record in full, and encourage you to make any summary or additional comments you desire. Then we will have an opportunity to take questions from the subcommittee members.

Before calling on you to proceed, I am going to recognize the distinguished ranking member of the committee, Senator Bumpers from Arkansas, for any comments that he might have.

Senator BUMPERS. Mr. Chairman, I do not have an opening statement.

Senator COCHRAN. Senator Burns, do you have any comments?

Senator BURNS. Just one. Thank you, Mr. Chairman, for holding this hearing. It is ironic that just down the hall I am also involved in a hearing with the Office of Science and Technology Policy, which is Dr. Jack Gibbons and Dr. Neal Lane and the National Science Foundation. It is just down the hall.

I made the statement 3 years ago that I was concerned about the declining dollars in agricultural research, and I am still concerned about that, and said at that time when I was serving on the authorizing committee over in Commerce and Science and Technology that maybe we are going to have to use some of their resources and funds to really pick up the shortages that were lacking in agriculture, because I do not think there is any other part of science and technology that is any more important to us as a society and as a country than the work that we do in agricultural research, and also in extension and getting that information out.

But it is pretty hard to get people excited about agricultural research when their mouths are full and their stomachs are full, but we can see the day—and all you have to do is travel around the world.

Just go around the world and see a system like Russia, that has fallen apart because of the lack of interest in their agriculture. In fact, theirs is a society that cannot even feed themselves and have all kinds of prospects to do so.

So I think it is very, very important, and I am interested in hearing from our witnesses today, but I appreciate the attitude and the working relationship, especially with Dr. Horn, and what we have tried to do in agriculture research. We still have a long way to go to get it at the levels that we both would like to see it, because we both, I think, share the same feeling about the subject.

Thank you very much.

PART 1

663

Senator COCHRAN. Thank you, Senator.

Senator BUMPERS. Mr. Chairman, may I make just one statement?

Senator COCHRAN. Senator Bumpers.

Senator BUMPERS. I think I have made this before to this committee, but it is so good it is worth repeating. I have been increasingly concerned about the amount of money we put into agricultural research. It seems to me that we have got a real train wreck coming, and that we have yields that are either static or in 1995 a lower yield per acre on corn for the first time in modern history.

I think that when it comes to research in agriculture we should reflect on this. We spend \$36 billion a year on trying to make things explode down at the Defense Department in research. We spend \$13 billion at the National Institutes of Health, which incidentally should be considerably higher. We spend \$12 billion a year on space, which we have gotten very little from and in the future we will get even less, and we spend \$1.2 billion a year on agricultural research. Dr. Horn, is that about right?

Dr. HORN. That is correct.

Dr. WOTEKI. That is correct.

Senator BUMPERS. When you consider the fact that of the 438 million arable acres of land in the United States, and the fact that we are taking 3 or 4 million acres out a year for highways, suburban sprawl, shopping centers, you name it, so what you have is a static production level, yield, you have a loss of your crop base to urban sprawl, and finally, there will be about 10 million more people in the United States about 10 to 15 years from now than there are now, when you put all those together, to call it a train wreck is probably being moderate.

Now, this is not going to happen overnight, but all I am saying is that since we have the Agricultural Research Service here this morning I wanted to make that point and say again there is not anything wrong with Congress or anything wrong with this country except misspent priorities.

When I consider the fact that we are putting so much in space and so much in the military, and as I say, explosionmaking, and yet you have a really macroproblem staring us in the face, I say our priorities are wrong.

Thank you, Mr. Chairman.

PREPARED STATEMENTS

Senator COCHRAN. Thank you, Senator Bumpers. We have prepared statements from Senator Byrd and Senator Dorgan that will be made part of the record.

[The statements follow:]

PREPARED STATEMENT OF SENATOR BYRD

Chairman Cochran, Senator Bumpers, members of the subcommittee, and Under Secretary Woteki, I am pleased to be here today to review the U.S. Department of Agriculture's (USDA) research, education, and economics programs. The mission of these accounts is three fold: meeting the challenges of an increasingly competitive global market, supplying safe, wholesome food produced under environmentally friendly conditions, and responding to the industrialization of American agriculture.

Today, I would like to discuss the unique needs of West Virginia's rural farmers and citizens, and the importance that USDA programs play in their future. While West Virginia may lack a concentration of farm activities compared to other states,

PART 1

664

West Virginia farmers are hard working family operators who take pride in the quality of their production and in a self-imposed stewardship of their ancestral lands. It is my opinion that small and part-time businesses, such as West Virginia farm operations, represent the backbone of our nation's economy.

I believe that the USDA must have the foresight and the funding necessary to help rural, small family farmers, and their communities, stay in the lead of emerging opportunities, which I believe is essential to creating and retaining jobs. In this regard, I will give a quick illustration of an Agricultural Research Service (ARS) project, which I thank this subcommittee for making possible, that has already had a valuable economic impact on West Virginia, although the facility has yet to be constructed. I refer to the National Center for Cool and Cold Water Aquaculture. All leading sources of data now confirm that aquaculture production will create hundreds of jobs and generate millions of dollars in the state, and the development of this industry is a state government priority. Many reports further suggest that abandoned mine sites can be used for aquaculture with impressive economic results. Already, West Virginia boasts forty-plus active aquaculture producers, with increased activity expected this year. The new center will be an important link in maximizing this emerging field.

I have several questions regarding the Agricultural Research Service (ARS) facilities in West Virginia that support the development of research important for West Virginia farmers.

CONCLUSIONS

I hope that this subcommittee will join me in supporting ARS projects, and I look forward to working with the Chairman, ranking member, and other subcommittee members, in conjunction with the Under Secretary, in ensuring that the ARS's mission is achieved.

PREPARED STATEMENT OF SENATOR DORGAN

Mr. Chairman, thank you for the opportunity to submit this statement. Since I was accompanying President Clinton on his trip to Grand Forks, North Dakota to view the flood devastation in the Red River Valley, I was not able to attend the hearing to express my deep concern on an issue of great importance to the Northern Plains.

At a time when production agriculture is being required to become more environmentally sensitive and globally competitive, I believe it would be a giant mistake for the Agricultural Research Service (ARS) to close its Northern Great Plains Research Center at Mandan, North Dakota, as is currently proposed within the fiscal year 1998 budget for the U.S. Department of Agriculture.

The Northern Great Plains is a semi-arid region, with wide climatic extremes in temperature, wind, and moisture conditions, resulting in considerable variation in growing seasons. This region has a mixed agricultural base of grains, livestock, and other crops produced within a complex, but fragile ecosystem.

The Mandan ARS laboratory is the only ARS facility which has been conducting comprehensive agricultural production research as it specifically relates to the ecosystem of the Northern Great Plains. Since it was established by Congress in 1912, this research facility has been providing sound agricultural research for the unique needs and the environmental challenges facing farmers and ranchers in this region.

The Mandan ARS facility is centrally located in the Northern Great Plains. Its location is a critical component of the value of its research and the importance of this facility to this region.

The proposed closing of this station is not a simple matter of transferring research projects to other ARS locations. Nor is it a matter of eliminating research projects that duplicate similar research at other ARS locations. This closing would be the end of ARS research that is site specific to the Northern Great Plains ecosystem. It would leave a void for the region's agriculture that simply could not be effectively filled from other research resources.

The closing of this facility would be a serious blow to the future capability of agriculture in the Northern Great Plains to be competitive in the new global marketplace. At the same time the closure would be devastating to the continued development of environmentally sensitive and sustainable production systems for this region. I believe this ARS facility and its research programs are a vital link to the future economic and environmental health of the Northern Great Plains.

I have reviewed the project evaluation process by which ARS made its determination to close the Northern Great Plains Research Center. I believe a fundamental weakness in the subjective point system by which ARS projects were judged is that

PART 1

665

this process did not give adequate importance to research specific to the needs of a regional ecosystem.

Unfortunately, the decision data by which ARS screened its projects has not been made available to Congress or to the affected ARS facilities. However, I have been told by USDA officials that the projects proposed for termination at the Mandan ARS facility were right at the cutting line. I believe this makes it even more important not to predetermine the fate of this facility which is critically important to the future of Northern Great Plains agriculture.

If ARS is allowed to proceed with the closure of the Northern Great Plains Research Center, this facility would be precluded from undergoing the strategic planning review process established by Section 884 of the 1996 farm law.

This section requires the Secretary of Agriculture to establish a Strategic Planning Task Force to review "all currently operating agricultural research facilities constructed in whole or in part with Federal funds," as well as proposed future facilities. These facilities were to be reviewed in the context of the development of a ten-year strategic plan which reflects "both national and regional perspectives for development, modernization, construction, consolidation, and closure of Federal agricultural research facilities."

It is both presumptive and premature to make a decision on the closure of the ARS Northern Great Plains Research Center at this time. This facility should have the full opportunity to undergo the review process established by the 1996 farm law. The law's emphasis on having both national and regional perspectives considered by the Strategic Planning Task Force would give the Northern Great Plains Research Center the consideration that it deserves.

I want to underscore that the Northern Great Plains Research Center deserves the same consideration and review that will be accorded all other existing and proposed federally-funded research facilities under the provisions of the 1996 farm law.

This facility has an excellent history of providing sound conservation research which has enhanced both the productivity and the environment of the Northern Great Plains. It has been particularly responsive to the conservation needs of the region.

The fragile environment of this region with its low rainfall, shallow soils, and intense winters presents a unique challenge for effective conservation. Through its research into minimum-till, no-till, and reduced fallow cropping and conservation systems, the Mandan ARS facility has already made great contributions to reduced soil erosion and improved environmental quality.

This nation is making a considerable investment in the revised Conservation Reserve Program (CRP). This facility's research in grasses and grassland management has provided the base of information needed for land going into the CRP. Through its research into crop rotation and continuous cropping systems, it provides the needed information for land coming out of the CRP to be farmed within established conservation standards.

The nation has also embarked on the newly-established Environmental Quality Incentives Program (EQIP), which replaces and expands the Great Plains Conservation Program. The ARS facility at Mandan is central to these programs in the Northern Plains. Without the ongoing grasslands and grazing research at this location, we will not be able to achieve the full economic and environmental benefits envisioned by these programs. This is particularly true if the range management conservation component of the EQIP program is to be successful.

The Northern Great Plains Research Center has unique land and physical facilities and has developed particularly strong ties to the farmers and ranchers who are the beneficiaries of its research activities. One example of this is Area IV Soil Conservation Districts, which provide a 400-acre farm to the center for conducting field-scale research.

While its tree research project was terminated a year ago, this facility continues to provide a tremendous resource of information and tree cultivars. It should be also noted that this facility was the primary research center for reclamation of surfaced-mined land. This reclamation research has been essential to the region's lignite mining and energy production industry in establishing and meeting reclamation requirements.

This facility has a long list of accomplishments to its credit. Both the facility and its scientists are internationally recognized for their work. It is not surprising that this ARS facility has received support from a broad base of farm, environmental, and research communities. It is particularly noteworthy that organizations such as The Wildlife Society, Ducks Unlimited, and the Audubon Society have expressed opposition to the closure of this facility and instead, call for its expansion.

The long history of contributions that this facility has made to agriculture and the environment in the Northern Plains region gives credence to giving this facility

PART 1

666

a second look and allowing it to undergo the Strategic Planning Task Force review process.

Therefore I urge the Subcommittee to maintain the existing programs at the Northern Great Plains Research Center and to defer any decision on closure of this facility until that process is completed.

Mr. Chairman, I want to thank you again for the opportunity to outline the importance of this research facility to the Northern Plains.

STATEMENT OF DR. WOTEKI

Senator COCHRAN. Dr. Woteki, you may proceed.

Dr. WOTEKI. Thank you very much, Mr. Chairman, and members of the committee. We very much appreciate the opportunity to be here with you this morning and to present to you the research, education, and economic fiscal year 1998 budget request.

I might say that both Senator Burns and Senator Bumpers, your opening comments very much reflect our own concerns both about the importance of agricultural research for the future of this country and also our concerns about the level of funding for agricultural research. But before I begin what is going to be a very brief overview of our fiscal year 1998 budget request, I would like to draw your attention to a recent development that affects our fiscal year 1997 budget.

On April 16 the House Appropriations Subcommittee marked up the Department's request for supplemental funding, and in the course of the markup cut \$20 million from the Fund for Rural America as an offset for emergency funding for fiscal year 1997.

Secretary Glickman is drafting a letter to express his concerns about this reduction, but let me take this opportunity to emphasize my personal dismay and disappointment that the Fund for Rural America was identified for this reduction.

FUND FOR RURAL AMERICA

The Fund for Rural America was authorized under section 793 of the Federal Agricultural Improvement and Reform Act of 1996, and it provides \$100 million in each of three increments beginning this year, 1997, for the provision of rural development programs and also a competitive grants program for research, education, and extension activities.

In the most extreme case, if this entire offset were to come out of the competitive grants program, that \$20 million offset will reduce the \$46 million the Secretary has designated for research, education, and extension projects by about 40 percent.

At first glance, Mr. Chairman, it may seem simple to reduce the Fund for Rural America grants program. After all, the closing date for applications is next week, April 28, and as a new program it does not as yet have a very obvious constituency. However, the enthusiasm for this program has been unprecedented, and the program has been of particular interest to the schools of 1890, the tribal colleges, Hispanic-serving institutions, as well as the land-grant universities.

As of yesterday, Mr. Chairman, 425 applications have been received for center grants which will award up to \$1 million each year over 4 years, and we have made a rather conservative estimate of the number of grant applications we expect next week for

PART 1

667

the project grants, which would be up to \$600,000 for a project for up to 4 years.

We anticipate that we will get at a minimum 1,100 grant applications for those project grants, so I am not exaggerating when I say the Fund for Rural America has been a very popular program, and that I believe we will have a very diverse pool of applicants representing the private, as well as nonprofit and university, sectors.

Congress created the Fund for Rural America at the same time that it fundamentally reformed the Federal farm programs. These policy changes are likely to have a substantial and dramatic impact on production agriculture by shifting price and income risk management away from Government programs to individual farmers.

Cuts in the research, education, and extension portion of the fund are going to substantially impair the goal of this transitional program that has been designed to advance the findings of research into very practical applications to address emerging problems and to develop new opportunities for the benefit of rural America.

It is our very great hope, Mr. Chairman, that the cuts to the Fund for Rural America will be restored when your subcommittee considers the emergency supplemental appropriations legislation next week.

At this point, I would like to turn to highlight our fiscal year 1998 budget request for research, education, and economics. It totals \$1.8 billion. It is a decrease of \$49 million, or about 2.6 percent from our fiscal year 1997 appropriation.

I believe that this budget request both in the total funding as well as in the specific initiatives it contains represents a sound balance between our commitment to research, education, and extension on the one hand and the administration's commitment to a balanced budget on the other.

To get on the path to a balanced budget by fiscal year 2002, the four agencies that are represented here, along with other USDA agencies, have had to make some rather difficult decisions to reduce or to terminate some important programs in order to fund what we now consider to be higher priority programs. However, we have done a careful assessment of our priorities and we have been able to fund an increase of \$11 million, or about 1 percent, in research in this budget request.

The Agricultural Research Service budget is essentially the same as this year, \$800 million. The request reflects adjusted priorities leading to an additional \$10 million in research and a commensurate decrease in funds for buildings and facilities. The budget also provides for redirecting some funding, permitting the agency to allocate a total of approximately \$30 million in funding for high-priority research programs.

The Cooperative State Research, Education, and Extension Service budget request is \$840 million. Funding for formula programs is held constant at the fiscal year 1997 appropriated level. The National Research Initiative [NRI], as it is called, is increased by \$36 million. Decreased funding is proposed for earmarked special grants programs, buildings and facilities projects, and selected extension programs.

PART 1

668

The administration continues to believe that the NRI competitive grants program provides our most effective mechanism for eliciting and supporting the most meritorious science being conducted by university scientists.

The Economic Research Service's request is \$54 million. With an increasingly market-oriented agricultural sector, the need for economic analysis to understand the implications of new developments in technology, in policy, and in trade is critical for both public, as well as the private sector, decisionmakers. The fiscal year 1998 budget request provides funds to secure critical data to underpin these very important analyses.

The National Agricultural Statistic Service request is \$120 million, which represents an increase of \$20 million, largely for funding the peak year of the census of agriculture.

Responsibility for the census of agriculture was transferred from the Department of Commerce to NASS on October 1, 1996, and NASS is conducting the census under the Agency's broad authority to conduct agricultural surveys. We are seeking specific authorizing legislation to clarify those authorities, and I also ask your assistance and support for swift passage of this legislation.

In addition to the census, which is a very high priority for us, our budget request focuses on some high-priority administration initiatives, and these include food safety, with an increase of \$8 million, human nutrition, with an increase of \$12 million, germplasm collection and preservation, \$2 million, integrated pest management, an increase of \$15 million, emerging infectious diseases, an increase of \$5 million, and children, youth, and families at risk, an increase of \$2 million.

This last increase will restore funding for this program to its fiscal year 1995 level, and provides an additional \$1.7 million to be targeted to the 1890 institutions that are now eligible to receive Smith Lever 3(d) funding directly.

I mentioned earlier the slight decreases in the collective Research, Education, and Economics Agency budgets. This is due largely to reductions in the Agricultural Research Service and the Cooperative State Research, Education, and Extension Service budgets for buildings and for modernization of research facilities.

The funding level for buildings and facilities reflects a decrease of \$72 million this year, \$10 million from the Agricultural Research Service, and \$62 million in CSREES. Given the constraints in this budget, as well as the future costs that are associated with maintaining new facilities, we believe it is more important to put funds into research and education than into bricks and mortar, and we also believe that, since the Secretary has just recently appointed the members of a new task force to review our agricultural research facilities and to make recommendations on a strategic plan for investment in agricultural research facilities, that it is wise at this point to defer decisions about new construction.

In closing, I would like to express my interest in working closely with you and with this subcommittee as we continue to develop the strategic plans and our annual performance plans that are required under the Government Requirements and Results Act. I thank you for the opportunity to present our budget request for fiscal year

PART 1

669

1998, and my colleagues and I are going to be happy to answer any questions you might have.

PREPARED STATEMENTS

Senator COCHRAN. Thank you very much, Dr. Woteki. We have your written statement and it will be made part of the record along with statements from Dr. Knipling, Dr. Robinson, Dr. Offutt, and Mr. Bay.

[The statements follow:]

PREPARED STATEMENT OF DR. CATHERINE E. WOTEKI

Mr. Chairman, Members of the Committee, I am Dr. Catherine Woteki, Acting Under Secretary for Research, Education, and Economics (REE) at the Department of Agriculture. I am accompanied by Acting Deputy Under Secretary, Dr. Floyd Horn, and the Administrators of the four agencies in the Research, Education, and Economics mission area: Dr. Edward Knipling, Acting Administrator of the Agricultural Research Service; Dr. Bob Robinson, Administrator of the Cooperative State Research, Education, and Extension Service; Dr. Susan Offutt, Administrator of the Economic Research Service; and Mr. Donald Bay, Administrator of the National Agricultural Statistics Service. Each Administrator has submitted written testimony for the record. We have come with a few of our senior staff to discuss the fiscal year 1998 Budget proposal in detail. Before we begin, however, I would like to make a few general remarks about the REE mission area and its four agencies.

In 1994, as a part of the USDA reorganization, the REE mission area was created, bringing together the Department's primary agencies responsible for research, statistics, education, and extension. Drawing on their distinct, yet complementary capacities, the REE agencies play a critical Departmental role by supporting the work of agencies in other USDA mission areas—agencies responsible for programs that focus on the environment and natural resource conservation, human nutrition, food safety, rural development, and the production and marketing of agricultural products. REE funded physical and biological research continues to play a central role in providing the scientific foundation for a vast array of advances being made in agriculture and related industries. Our data collection and analysis provide policy makers, program managers, and producers critical information about agricultural commodities and markets. In collaboration with other USDA agencies, REE also supports research, education, and extension to better understand how good nutrition contributes to good health, to develop efficient production practices that respect the integrity of the environment, to facilitate adoption of food processing practices that promote safe food, and to assist in the development of the food and agricultural scientific and professional work force.

A compelling reason for reorganizing the four agencies into one mission area, and therefore bringing together the biological and physical sciences with the economic and statistical disciplines, was the realization that this would create synergies leading to a stronger research, education, and extension capacity in the Department; that it would facilitate greater multi-agency and interdisciplinary collaboration, resulting in more valuable and effective programs to address agricultural, food and nutrition, environmental quality, and rural development challenges facing the country.

I believe we are making the reorganization vision a reality, and our efforts are beginning to pay dividends. In a little more than two years, REE agencies have made great progress in meeting customer and Department challenges through heightened cooperation. Evidence of that collaboration is found in the fiscal year 1998 budget, as I will discuss in a moment. The budget includes several initiatives strengthened by participation of more than one REE agency.

More evidence of an increasingly effective Departmental research-education-extension capacity is found in mission area and agency activities related to implementation of the Government Performance and Results Act of 1993 (GPRA). Working together, the REE agencies are finding that GPRA affords us a valuable process for enhancing the effectiveness of our programs. It will also help us convey to our stakeholders, including Congress; the National Agricultural Research, Education, Extension, and Economics Advisory Board, which has specific GPRA-related responsibilities; and the general public, what the nation is getting for its investment in agricultural research and extension.

The mission area, collectively, and the REE agencies, individually, have developed draft strategic plans, framed by five general goals to which the mission area is com-

PART 1

670

mitted. The goals are: an agricultural system that is highly competitive in the global economy; a safe and secure food and fiber system; a healthy, well-nourished population; greater harmony between agriculture and the environment; and enhanced economic opportunity and quality of life for Americans. These goals are derived from the broad public debate that codified the purposes for agricultural research in the 1990 and 1996 Farm Bills. In addition, the REE and agency plans have been reviewed by REE stakeholders, partners, and customers. The mission area held three regional listening sessions at which stakeholders from industry, the academic community, public interest groups, farmers, ranchers, and others interested in REE programs provided useful feedback on the REE plan.

Continuing its implementation of GPRA, the mission area is nearing completion of a draft performance plan, framed by the five general goals of the strategic plans. During the spring, the REE agencies also will prepare individual performance plans using the framework of the REE performance plan.

Preparation of the strategic and performance plans, as might be expected, has been challenging. Particularly difficult is development of annual or even five-year performance goals and performance measures for fundamental research where potential payoffs are large but are realized over longer time horizons. Our general approach to GPRA performance measurement will be to use quantitative measures where appropriate, but not to lose sight of the qualitative factors that are ultimately so important in making judgments on the value of our work. Executive branch officials and appropriators have mutual interests in improving our systems for establishing goals, fixing accountability, measuring progress, and communicating success. We intend to carry out our responsibilities under GPRA with these points in mind. We look forward to consulting with this subcommittee as we move forward implementing GPRA.

REE'S FISCAL YEAR 1998 BUDGET

Now I would like to highlight the fiscal year 1998 budget for the Research, Education, and Economics mission area. The REE budget request for fiscal year 1998 is \$1.816 billion, a decrease of \$49 million or 2.6 percent from fiscal year 1997. I believe the budget, in total funding and specific initiatives, represents a sound balance among USDA's commitment to research, education, and extension investment and the Administration's commitment to a balanced budget. To get on the path to a balanced budget by fiscal year 2002, REE agencies, along with other department agencies, have had to make difficult decisions to reduce or terminate important programs in order to fund higher priority programs. However, through a careful assessment of priorities, funds for research actually increase by \$11 million or 1 percent.

Returns on investment in public agricultural research and development continue to be very strong. For example, the percentage of disposable personal income we spend on food continues to decline, reaching a low of 11 percent in 1995. This decline, sustained over many decades, has been possible in large part due to increases in agricultural productivity, which in turn is a product of research and development and a central reason for its continued support. Productivity growth has been higher in agriculture than most other sectors of the economy, with an average annual rate of 1.9 percent since the 1940's. Recently, our investments in agricultural research have resulted in new technologies that enable farmers to prevent adverse effects of production practices on the environment, to improve our capacity to prevent and detect food-borne contaminants, and to enhance the nutritional content of food. Studies, such as Huffman and Evenson's 1993 study *Science for Agriculture*, continue to find that the investment return on publicly-funded agricultural research and development is high and greater than for most other sectors. The returns for all research and development in agriculture are estimated to be 35 percent annually, while those for pre-technology or pre-development research—much of the kind of work funded through the National Research Initiative—are considerably higher.

REE AGENCY BUDGETS

The Agricultural Research Service (ARS) fiscal year 1998 budget stays essentially the same, \$800 million, as in the current fiscal year, although the fiscal year 1998 budget reflects adjustment of priorities leading to an increase of \$10 million in research and a commensurate decrease in buildings and facilities improvement funds. The budget also provides for redirected funding, making it possible for the agency to allocate a total of approximately \$30 million in increased funding for high priority research programs. As the principal intramural biological and physical science research agency in the Department, ARS continues to play a critical role for the Department and the larger agricultural community. Results from ARS's fundamental research provide the foundation of applied and development research carried out in

PART 1

671

many public and private institutions. The agency also draws on its fundamental research to conduct research directed at solving specific problems of national and regional importance and responding to the research needs of other USDA agencies.

The Cooperative State Research, Education, and Extension Service's (CSREES) budget decreases by \$69 million to \$840 million in fiscal year 1998. Funding for formula programs is held constant at fiscal year 1997 appropriated levels. The National Research Initiative (NRI) is increased by \$36 million, an increase of 38 percent. Decreased funding is proposed for earmarked special grants programs, buildings and facilities projects and selected extension programs. The Administration continues to believe that the NRI competitive grants program provides the most effective mechanism for eliciting and supporting the most meritorious science being conducted by public and private universities, Federal laboratories, and other research institutions and individuals across the country. This year's increase in the NRI will be focused on expanded research in three key areas: food safety, genetic enhancement of plants, and environmental quality. In providing critical funding to the research, education, and extension programs of the Land Grant Universities and other higher education institutions across the country, CSREES continues to play a central role in helping generate new knowledge and technology and facilitating the transfer of that knowledge and technology to those who can use it best.

The Economic Research Service's budget increases from \$53 million to \$54 million. As the Department's principal intramural economics and social science research agency, ERS conducts research and analysis on the efficiency, efficacy, and equity aspects of issues related to agriculture, food safety and nutrition, the environment, and rural development. In an era of an increasingly market-oriented agricultural sector, the need for economic analysis to understand the possible implications of any new developments in such areas as technology, policy, and trade agreements is critical for both public and private sector decision makers. The fiscal year 1998 budget provides funds to secure critical data to underpin that analysis.

Largely due to funding for the peak year of the Census of Agriculture, the National Agricultural Statistics Service (NASS) budget rises from \$100 million to \$120 million. Responsibility for the Census of Agriculture was transferred from the Department of Commerce to NASS as of October 1, 1996 and is being conducted under the agency's broad authority to conduct agricultural surveys. We are seeking specific authorizing legislation to clarify our authorities. I urge you to support swift passage of this legislation. The changes in agricultural policy in the 1996 Farm Bill make the need for NASS's statistical data program more essential than ever. Comprehensive, reliable, and timely data on U.S. agricultural commodities are critical for farmers, ranchers, and other agribusinesses to make informed production and marketing decisions in a highly competitive market. The new Census of Agriculture program at NASS complements its core program and affords the agency new program efficiencies benefiting the whole agency.

REE research activities soon will be enhanced by the Fund for Rural America mandated in the 1996 Farm Bill. In January of this year, the Department announced plans to allocate \$46.1 million of the Fund's \$100 million fiscal year 1997 funding for research, education, and extension activities. Projects that address international competitiveness, environmental stewardship, and rural community enhancement will be supported with \$33.3 million of these funds. The other \$12.8 million will be focused on Department priorities, including livestock concentration, food safety, nutrition, food recovery, and telecommunications. The grants will be awarded on a competitive basis for multi-disciplinary projects that address short-and intermediate-term issues. A request for proposals was published in January. Planning grants will be made in late spring; standard grants in early fall.

I want to stress the importance of the competitive process for making awards under this and other programs. Given the overall budget constraints, the enormous needs for science and technology to address agricultural-related issues and the general skepticism that characterizes attitudes toward so many publicly supported activities, it is important that we establish mechanisms to identify and support work on the highest priorities by the best performers.

REE FISCAL YEAR 1998 INITIATIVES

In developing the fiscal year 1998 budget request, we in REE have focused on those activities that reflect the nation's and the Administration's highest priorities. And we have targeted those activities for new or increased funding. Those fiscal year 1998 priorities include food safety, human nutrition, integrated pest management, emerging infectious diseases, the Census of Agriculture, and Children, Youth and Families At-Risk. The new initiatives or increases for on-going initiatives are closely aligned with the general goals of our strategic plans. While some involve

PART 1

672

only one REE agency, others take advantage of the complementary strengths of two or three. I would like briefly to discuss each of these initiatives and relate them to our general goals.

First, food safety. Our nation has the world's safest food supply, yet we continue to experience outbreaks of foodborne illnesses. Each year, foodborne diseases result in thousands of deaths, millions of illnesses, significant loss of productivity, and costly medical treatment nationwide and around the world. Enhancing our understanding of the basic science underlying these diseases and promoting development and adoption of food production, processing and handling practices that significantly reduce their incidence will advance the REE general goal of a safe and secure food and fiber system.

On January 25, 1997 the President unveiled a Food Safety Initiative that will move us in that direction. The President's \$43 million initiative not only focuses on inspection, surveillance, and rapid detection but also on research and education. Approximately \$8 million is included for REE agencies. Those funds will allow CSREES to launch a \$2 million food safety competitive special research grants program to expand the base of knowledge needed to address high priority food safety issues such as *Campylobacter*, *E. coli*, and salmonella. It will add \$4.1 million in ARS research into production, harvesting, and food handling practices that would reduce the incidence of exposure to microbial pathogens and improve methods to detect and survey the pathogens. Building on the CSREES competitive grants program and the ARS research component, the initiative provides CSREES \$2 million in additional funds for its Food Safety Extension Program to further enhance food safety education programs, such as compliance education, State food handler certification, and rapid exchange of food safety information. Complementing this Administration initiative, food safety will be one of three priority areas targeted for NRI increases in the CSREES budget.

A second national initiative supported with fiscal year 1998 funding addresses human nutrition. It is increasingly clear that diet and the nutritional content of food have a profound effect on human growth, development, and life-long health. Yet our knowledge in these areas is limited. We know that proper nutrition can reduce the risk of chronic diseases of aging, such as heart disease, cancer, osteoporosis, diabetes, hypertension, and obesity, but we still have a limited understanding of these relationships. Contributing to the REE general goal of a healthy and well-nourished population, this initiative includes \$12 million in the first of a new multi-year initiative to significantly increase the ARS research capacity at its six national nutrition research centers. In this first year, half the funds will support research to further understand human dietary requirements, with an emphasis on how nutrition relates to cognitive development in children. The other half will fund a survey of food consumption by infants and children to be used by the Department and the Environmental Protection Agency (EPA) to assess dietary exposures to pesticides and establish pesticide residue tolerance levels on agricultural commodities in accordance with the Food Quality Protection Act of 1996. The overall human nutrition initiative not only promises to increase our understanding of how food affects health, but has other beneficial effects as well. The knowledge gained will help set the research agenda for animal and plant breeding. And promoting a healthier population can indirectly help our economy by reducing medical costs and productivity losses due to illness.

USDA's germplasm collections, supported by ARS, underpin much of the cutting edge research currently being conducted in crop and animal breeding and other biotechnology research to develop crops and livestock that are resistant to disease, pests, and stress due to adverse growing conditions. The collections are the source of important traits that can be used in developing new crop varieties and animal breeds with desirable characteristics. The \$2 million funding increase in the germplasm initiative will allow us to fill gaps in our National Plant Germplasm System, preserving valuable plant and microbial germplasm. In so doing, we will be facilitating the science that supports several REE goals, including a secure production system and increased commodity production. Research on genetic enhancement of plants is also a priority area for the proposed NRI increase.

This fiscal year 1998 budget also includes funds to continue implementation of USDA's Integrated Pest Management Initiative (IPM), a multi-agency effort to develop environmentally-valuable IPM strategies and bring 75 percent of the nation's cropland under integrated pest management practices by the year 2000. In developing and promoting the adoption of pest management strategies that carefully balance environmental quality goals with producers' need to have economically viable enterprises, this initiative is focused squarely on achieving the REE general goal of enhanced harmony between agriculture and the environment. As part of this initiative, the ARS budget includes \$3 million for research that will focus on biological

PART 1

673

control of pests. Another \$1 million increase will permit ARS to conduct area-wide and pilot test programs on ARS-developed technology ready for large-area demonstrations. Increased IPM funding will allow CSREES to increase research and extension support of regional IPM development and implementation projects and research to develop pest management alternatives to replace pest control technologies under consideration for regulatory action by EPA. For the Economic Research Service, the initiative includes an increase to support empirical analysis of the relationships among adoption of conserving farm practices, economic incentives, and environmental protection, recognizing that ultimate adoption of IPM strategies depends heavily on their economic implications for producers. A priority research area for the requested increase in the NRI will be environmentally-oriented research.

The threat of emerging infectious diseases and exotic pests is the focus of another new initiative that will contribute to the REE general goal of a safe and secure food and fiber system. Whether a threat to livestock and the safety of our food supply, such as "Mad Cow Disease" or to plants, such as Karnal bunt, the introduction of foreign diseases and exotic pests can pose a threat to consumer confidence and raise the potential for economic disruption of production. As part of the Administration's Emerging Infectious Diseases Initiative, the budget includes an increase of \$2.5 million for research on both domestic and exotic emerging diseases of livestock, focusing on understanding how the pathogens are transmitted, what production conditions contribute to their incidence, and development of detection methods. A second \$2.5 million will be devoted to developing methods to detect and strategies to control important emerging plant diseases, such as Karnal bunt, a wheat disease found in the U.S. for the first time in March 1996.

As the agriculture sector becomes more market-oriented and more dependent on exports, the need for good information on that sector, including production and markets, is greater than ever. Reliable data is a prerequisite for the nation to have an agricultural sector that is highly competitive in the global economy, one of the REE general goals. This need exists for producers and others who want to make informed decisions as they buy and sell in commodity markets, as well as for public decision makers who need good information to make informed decisions on public policies and programs. An important source of such information is the Census of Agriculture. Every five years the Census provides comprehensive statistical information on the agricultural sector of the economy at the National, State, and county level. Because of the six-year Census funding cycle, the funding level required to support the Census program varies from year to year. We appreciate the committee's support for our request for funding last year. We are seeking an additional \$18.5 million in fiscal year 1998 for the fourth-and peak-year costs for final preparation of questionnaires, data collection, and processing of 3.5 million Census forms.

Consistent with the President's commitment to improving our children's education, the fiscal year 1998 budget includes increased funding to expand CSREES's Children, Youth and Families At Risk (CYFAR) program. Designed to ultimately empower youth, parents, and community leaders to take responsibility for their own lives and that of their community, the additional funding of \$2.1 million will be focused on enhancing statewide Extension capacity for developing and supporting community-based programs for at-risk children and families. In so doing, this initiative contributes to the REE general goal of enhancing economic opportunity and quality of life for Americans, particularly Americans who for one reason or another are not taking advantage of the economic and other opportunities found in their communities. This increase restores funding for CYFAR to its fiscal year 1995 level and provides an additional \$1.7 million to be targeted to the 1890 Institutions now eligible to receive Smith Lever 3(d) funding directly.

These are the highlights of six initiatives in the REE budget. A full discussion of them can be found in the agencies' Explanatory Notes.

BUILDING AND FACILITIES PROGRAM

I mentioned earlier the slight decrease in the collective REE agency budgets. This is due largely to reductions in the ARS and CSREES budgets for building and modernization of research facilities. The funding level for buildings and facilities decreases by \$72 million, \$10 million in ARS and \$62 million in CSREES. Given the overall constraints within which we developed the REE budget, we continue to believe that the Federal government should generally leave the investment decisions on university facilities to State and institution-level decisionmakers. In addition to the significant capital commitments, these facility decisions entail major commitments for programming, operations, and maintenance, commitments that Federal-level officials are not in a position to make.

PART 1

674

The Subcommittee should be aware that we are moving ahead on the Strategic Planning Task Force mandated in the 1996 Farm Bill. Under the Farm Bill provision, the Secretary of Agriculture is to establish a Task Force to prepare a 10-year strategic plan for guiding future Federal investment for constructing, renovating, consolidating, and, if appropriate, closing agricultural research facilities. The Secretary will be announcing the membership of the Task Force within a few weeks. The Task Force will have two years to conduct a thorough study of the building and facilities needs of the agricultural research system and the capacity of the current facilities to meet those needs and, from that assessment, develop the 10-year plan.

While we look forward to the recommendations of the Task Force, nevertheless we believe we must move forward now on several projects where needs are critical and immediate. We believe our reasoning for funding these few crucial improvements is sound and would be consistent with any future Task Force recommendations. The budget contains \$23 million in funding for the U.S. Horticultural Crop and Water Management Research Laboratory in Parlier, California. The product of careful planning over several years, the new facility will allow consolidation of several outmoded facilities and yield significant efficiencies when compared to current operating costs. The Melaleuca Research and Quarantine Facility at Ft. Lauderdale, Florida, reflects a continuing Administration commitment to restoration of the Everglades ecosystem and was designated by the Administration's South Florida Ecosystem Task Force as a top priority. Melaleuca, an exotic weed tree, is adversely affecting much of South Florida's fragile wetlands. This funding, coupled with proposed research funding, will accelerate integration of biological control technology into Melaleuca management efforts.

The budget also includes funding for a new facility in Montpellier, France to house the European Biological Control Laboratory. The new facility will replace crowded and dispersed temporary facilities that seriously impede the Laboratory's program focused on discovering and developing biological control agents for insect pests and weeds in the U. S. that immigrated from Eurasia, the Middle East, and North Africa and now seriously threaten U.S. agriculture. The new European laboratory is essential to ensure future success of many domestic laboratory programs directed toward biological control of agricultural pests, including salt cedar, knapweeds, Russian wheat aphid, and many other invasive insects and weeds. All other buildings and facilities funding in the budget is for modernization of selected ARS facilities. All the facilities designated for modernization currently have serious deficiencies that are barriers to conducting efficient and effective research.

SUMMARY

In summary, I want to emphasize that this budget, while very tight, represents a continued recognition of the value of and commensurate commitment to investment in agriculture research, statistics, education, and extension. If U.S. agriculture is to continue to be a dynamic, competitive sector in the global economy, and we as consumers are to continue to harvest the fruits of agriculture's historical success, then our national commitment to research, education, and extension must continue. I thank you for this opportunity to share with you my thoughts about the mission area and its agencies' budgets. We welcome your questions.

PREPARED STATEMENT OF DR. EDWARD B. KNIPLING

Mr. Chairman, and members of the Subcommittee. I appreciate this opportunity to present the Agricultural Research Service's budget recommendations for fiscal year 1998, and highlight some of the Agency's accomplishments of the past year.

In the past, the Congress has provided strong support for ARS and its research mission. We appreciate the fact that this Subcommittee has been instrumental in marshaling critical resources for USDA research. Attaining national goals of a healthier population, environment quality, and economic prosperity will require continuing the Nation's commitment and investment in agricultural research.

The research that ARS performs, in the areas of health, environment, and agricultural competitiveness, are more important than ever. Projected population and economic growth over the next half century will require world food production to double. Meeting this demand will require new crops and new methods to maximize crop and livestock yields consistent with recognized needs for environmental stewardship.

Research can help the nation meet the food demands of the growing population as well as address our food safety and environmental goals. Research in genetics is producing increased crop yields by developing crops that can resist disease, insects, and frost. Through genetic engineering, traits that retard spoilage are being

PART 1

675

introduced to reduce postharvest losses and costs, and increase the availability of wholesome food. Genome maps will make it possible to identify gene codes for specifically desired traits, such as lower fat content in meat animals. With genome maps, scientists will also be able to produce safer food by breeding animals resistant to foodborne pathogens, such as *E. coli 0157:H7* and *Salmonella*.

E. coli and *Salmonella* are two of the most prominent bacteria associated with serious foodborne illnesses. *Campylobacter* causes an estimated two million cases of illness each year. Another 800 Americans become seriously ill each year from *Listeria monocytogenes*. The Centers for Disease Control estimate that foodborne pathogens cause millions of illnesses and contribute to thousands of deaths annually. Medical costs and productivity losses total from \$5 to \$13 billion per year.

ARS scientists are hard at work to help ensure a safe, adequate, and sustainable food supply. To reduce pathogen contamination in the slaughter and processing of meat and poultry products, a Hazard Analysis and Critical Control Point (HACCP) system is being implemented. ARS is supporting that effort by identifying critical points of pathogen contamination, and points where they can be reduced or eliminated. The science-based HACCP system represents a significant improvement over previous organoleptic systems which used sight, sound, smell and touch to test the end-product for wholesomeness.

For example, faster, more accurate tests are being developed to combat *E. coli 0157:H7*. Traditional tests for this foodborne bacteria are time consuming and technically difficult to conduct, thus limiting their usefulness. ARS scientists at Clay Center, Nebraska devised a simple, rapid diagnostic test which will increase the testing of meat and meat products, and substantially improve food safety. Numerous other systems and technologies are being developed in both pre- and post-harvest areas to reduce foodborne pathogens.

Our food supply is also being increasingly threatened by new and emerging plant diseases and pests that affect the approximately 150 crops grown in the United States. Exotic organisms, once introduced into this country, can explode into an epidemic. Just a few examples: *Karnal bunt* disease of wheat has seriously disrupted the export market for wheat growers in the southwestern U.S. *Head scab* of wheat and barley has caused an estimated \$2 billion in losses since 1993. *Barley stripe rust*, which first appeared in Texas in 1991, has spread throughout the western U.S. *Soybean rust*, a disease recently discovered in Hawaii, is expected to cause serious losses should it migrate to the mainland. And noxious and invasive exotic weeds which already infest 17 million acres of public lands are expected to double in five years.

Strategies for controlling emerging diseases and exotic pests include the development of new and rapid tests for detection, containment, and eradication. One of the strategies ARS is employing involves Integrated Pest Management (IPM). As crop yields increase and production systems change, the importance of protection from pests increases. To maintain good stewardship over the environment, strategies for pest management must shift from primary reliance on chemicals to IPM strategies which combine multiple approaches, conserve natural controls, and utilize chemicals when other means of control have failed.

USDA has established an ambitious goal of deploying IPM on 75 percent of the Nation's crop acreage by the year 2000. Reaching this goal will result in reducing environmental damage, particularly to the water supply which can be contaminated by runoff from farms. AMS/PDP samples tend to find no, or very low, residue. These pest management strategies will be more cost-effective and sustainable over the long term. The Food Quality Protection Act of 1996 may lead to tighter controls on pesticides registered by EPA (due to tolerance reassessment?) and farmers will have even greater need for the alternative pest control technologies developed by and through USDA programs in the IPM initiative.

Human nutrition plays a critical role in growth and development, and good nutrition enhances an individual's productivity and quality of life. Poor nutrition underlies many chronic conditions, such as obesity, cardiovascular disease, cancer, osteoporosis, and diabetes. Research is only now beginning to reveal how nutrients and genes interact to cause various diseases. As the lead Federal agency in human nutrition research, ARS scientists are researching the relationships between diet and resistance to diseases, and determining the nutritional needs of specific population groups, including infants, children, and the elderly.

The agriculture-food sector is the country's largest industry, responsible for over 15 percent of the Gross Domestic Product. U.S. agricultural exports are projected to exceed agricultural imports by \$30.5 billion in 1996. Employment in the U.S. food and fiber system represented 18 percent of all civilian jobs in the U.S. in 1995.

Over the past several years, ARS requests for funding increases for genetics, food safety, human nutrition, environmental quality, and IPM research have been sup-

PART 1

676

ported by this Committee. During these same years, ARS has also redirected base funds to finance these critical initiatives.

In fiscal year 1998, ARS requests the Congress' continued support for research—research which would increase crop and livestock yields, improve food safety and nutrition, optimize the preservation of land and water resources, and promote agricultural sustainability.

The Nation faces many challenges as this century draws to a close and it moves into the 21st century—challenges to health and safety, environment, and economy arising from a growing world population, an increasing number of emerging diseases and pests, and an ever more demanding concern for the environment. The ability to meet these challenges depends upon the decisions that are made today.

ARS STRATEGIC PLAN

All of the research that ARS currently performs and the research initiatives ARS proposes to conduct in fiscal year 1998 meet one or more of the Agency's five Strategic Plan goals. They are to provide research which:

- (1) Ensures the Nation an agricultural system that is highly competitive in the global economy.
- (2) Maintains a safe and secure food and fiber system.
- (3) Maintains a healthy, well nourished population.
- (4) Promotes greater harmony between agriculture and the environment.
- (5) Enhances economic opportunities and quality of life for Americans.

Let me take a minute to identify where ARS' research programs fall within these goals. The first goal includes research on cost-effective agricultural production systems, postharvest control of pests, new uses and products, and new and alternative crops. The second goal includes ARS' pre- and postharvest food safety research. It also includes research on plant and animal production systems, product quality, reproduction and biological processes, germplasm and genetic resources, and other research designed to ensure the security of U.S. food and fiber production. All ARS' human nutrition research falls under the third goal. The fourth goal includes research on natural resources, waste management, integrated agricultural production systems, cropland and grazingland sustainability, environmentally safe pest management, and global change. And the fifth goal includes research which expands economic opportunities to rural communities by providing new crops, products and technologies; expanding markets; making small-scale processing capabilities available, and sharing new knowledge through information access and technology transfer.

These five broad goals are part of a draft Strategic Plan ARS has developed in response to the Government Performance and Results Act of 1993. ARS' Plan establishes the broad structure for setting Agency research priorities and allocating resources over the next five fiscal years. It also provides for a broad framework for systematically evaluating the impacts or outcomes of ARS' research programs.

FISCAL YEAR 1998 BUDGET

ARS proposes funding of \$726,797,000 for fiscal year 1998, an increase of \$9,971,000 over the fiscal year 1997 appropriation level. The fiscal year 1998 Budget includes increases for selected research initiatives which build upon ARS' base and contribute to the Nation's economic well-being and quality of life. To help finance these initiatives, ARS is recommending the elimination of important but lesser priority research projects. In addition, ARS is recommending modest increases for pay costs which will be partially offset by proposed reductions in staff years.

Under its Buildings and Facilities account, ARS proposes \$59,300,000 for fiscal year 1998. These funds will be used to continue the ARS facilities' replacement and modernization program.

PROPOSED RESEARCH INITIATIVES

ARS is requesting \$36,523,000 for new and expanded research initiatives, and increased pay costs. These initiatives cover an array of national research needs which directly respond to Administration and Congressional priorities. They respond to the priorities of enhancing the national economy and trade, preserving the environment, and providing for a healthy citizenry.

Food Safety (\$4,114,000).—As part of the Administration's Food Safety Initiative, ARS is proposing \$4,114,000 for pre- and post-harvest food safety research. Further research into food-production, harvesting, and handling practices that will reduce human exposure to microbial pathogens, chemicals, and biotoxins—as well as into improved methods to detect and survey these hazards—can eliminate or significantly reduce an important cause of illness in the U.S. ARS proposes \$1,614,000 for

PART 1

677

additional research in preharvest food safety. The research will develop methods and strategies for detecting and controlling pathogens in the production of live animals to prevent the contamination of meat and poultry products.

Postharvest operations, that is slaughter and processing, can be a source of contamination of meat and poultry products. These operations offer opportunities for intervention to prevent further spread of pathogens to food products. ARS is recommending an increase of \$2,500,000 in postharvest food safety, for the development of advanced systems and new technologies that prevent or reduce pathogen contamination of meat, poultry, and egg products. The research will also provide technologies to reduce pathogens in fruits and vegetables.

Emerging Diseases/Exotic Pests (\$5,000,000).—The introduction of foreign animal diseases, incidence of diseases transmitted from animals to humans, and prevalence of meatborne food pathogens have increased dramatically over the past five years. Prevention and control of emerging animal diseases can avoid economic disruptions and loss of consumer confidence like that caused by *Bovine Spongiform Encephalopathy* (“Mad Cow Disease”) in Great Britain. Measures to control organisms affecting humans, such as *E. coli* 0157:H7, *Salmonella*, *Cryptosporidium*, *Lyme disease*, and *Hantavirus disease* will prevent serious illness and disease. One-half of the proposed increase will be used to research emerging exotic diseases of livestock, and emerging domestic and zoonotic diseases of livestock.

The other half of the proposed increase will be used to fund research on emerging plant diseases, and noxious and invasive weeds. With rapidly expanding international commerce and travel, the introduction of new pests and diseases into U.S. agriculture is more ominous and threatening. For example, the silverleaf whitefly which invaded the U.S. in the 1980’s, now attacks hundreds of plant species including important agricultural species such as cotton and vegetable crops. *Karnal bunt* disease of wheat, which was first recognized in the U.S. in 1996, has seriously disrupted the wheat market for growers in the southwestern U.S.

Grazinglands (\$1,000,000).—Grazinglands which include irrigated pastures, perennial forage crops, and the prairies and arid rangelands of the West cover about half of the Nation’s land surface. They also encompass most of the country’s wildlife habitat. Most of our water for industry, domestic use, and irrigated agriculture comes from grazed watersheds. Grazinglands support about 100 million beef cattle, 10 million dairy cattle, and 11 million sheep. They also provide food and fiber for domestic consumption and export, and directly support the economies of rural communities.

Despite the importance of grazinglands, critical gaps exist in the knowledge required to develop better management technologies. More efficient and profitable forage production systems are essential for U.S. agricultural production to remain competitive. New knowledge and technology is needed for mitigating the impacts of intensive forage/livestock production systems. The proposed increase will be used to produce more profitable forage/livestock production systems while minimizing environmental impacts.

Genetic Resources (\$2,000,000).—USDA’s plant germplasm collections underpin crop breeding efforts in this country. The collections are the sources of important crop characteristics, such as host plant resistance to combat pests and stresses. The National Plant Germplasm System (NPGS) presently maintains over 450,000 different germplasm samples. Of the proposed increase, \$1,500,000 will be used to fill gaps in the NPGS collection, and to preserve rare and unique germplasm samples.

Microorganisms can play positive roles in the soil and the detoxification of the environment, nitrogen fixation in lieu of chemical fertilizers, insect control, and decomposition of organic wastes. Other pathogenic strains of microorganisms are destructive to crops and livestock. Plant breeders need to have access to the strain diversity of important diseases affecting crops in order to build broad spectrum host resistance. Veterinarians also need access to pathogenic strains to develop effective vaccines to protect live animals. Numerous valuable microorganisms will be lost soon unless a concerted effort is made to acquire, document, and preserve them. Of the proposed increase, \$500,000 is recommended for preservation of a microbial germplasm collection.

Integrated Pest Management (\$4,000,000).—USDA has established a goal of deploying IPM on 75 percent of the Nation’s croplands by the year 2000. Two kinds of research are needed to meet this goal. First, basic studies are needed that generate new fundamental knowledge, with a focus on pests and the means of controlling them. Second, a more holistic, systems-oriented approach is needed to put together the components of an IPM strategy in the best combination. The proposed increase will focus on areawide IPM and pilot test programs; augmentative and biologically-based IPM in field, horticultural and vegetable crops; and host-plant resistance and pest management strategies.

PART 1

678

South Florida Ecosystem Restoration (\$2,000,000). In 1993, a 5-year Interagency Agreement on South Florida Ecosystem Restoration was signed by the Departments of Interior, Commerce, Army, Justice, Agriculture, and EPA. As part of a task force, the Department of Agriculture has been asked to perform research to resolve the ecological, hydrological, and agricultural problems which hinder sustainable agricultural production in the Everglades Agricultural Area. The requested funds will be used to develop management strategies and biological agents for the control of *melaleuca* and other harmful nonindigenous species. Related to this initiative, ARS is also requesting \$4,000,000 for construction of a quarantine facility in Ft. Lauderdale.

Human Nutrition (\$12,000,000).—ARS is the lead Federal agency for human nutrition research. The Agency has the infrastructure and scientists required to improve the nutritional health of all Americans, a goal of this Administration.

Nutrition has a profound effect on human growth and development, yet there is only limited knowledge in this area. Additional research is needed to understand how proper nutrition can prevent the development of lifelong nutritional deficiencies that lead to chronic diseases, such as obesity, heart disease, cancer, osteoporosis, and diabetes. Similarly, research is needed to understand the nutritional requirements that promote health and enhance quality of life.

Half of the proposed increase will be used to fund research to further understand dietary requirements. The other half of the proposed increase will fund a survey of food consumption by infants and children. The survey has been requested by the EPA which is concerned that current food consumption data do not provide sufficient sample sizes to adequately estimate pesticide intakes by children.

In addition to the proposed research initiatives, ARS is also recommending \$6,409,000 to finance anticipated fiscal year 1998 Federal pay raises and associated costs.

PROJECT TERMINATIONS AND STAFF YEAR REDUCTIONS

In order to meet Administration streamlining goals, the Agency is proposing a decrease of \$3,500,000 consistent with the reduction of Agency staff years. To help finance the fiscal year 1998 proposed research initiatives, ARS is recommending the termination and reallocation of selected research projects totaling \$23,023,000. These projects represent important but lesser priority research projects. The termination of these projects, along with additional funding for the proposed increases, will enable ARS to more sharply focus its limited resources on national research priorities identified in the fiscal year 1998 Budget Estimates.

BUILDINGS AND FACILITIES

Many of ARS' facilities are inefficient and outdated. Major systems (i.e., water, heating, ventilation air-conditioning, electrical, etc.) in many of ARS' facilities have long passed their useful life expectancy and fail to meet building code requirements. The modernization or replacement of these facilities which began several years ago remains a high priority.

In fiscal year 1998, ARS recommends under its Buildings and Facilities account a total of \$59,300,000 for continuing the modernization or replacement of selected laboratories and facilities.

Beltsville Agricultural Research Center, Beltsville, Maryland (\$3,200,000).—The Center is recognized as one of the largest agricultural research centers in the world, in both program scope and concentration of scientists. Over 300 scientists and 1200 support personnel work at the Center on programs in animal and plant productivity, natural resources and environmental sciences, product quality, and human nutrition. Modernization of the Center began in fiscal year 1985. Funding will be used to continue the modernization program, including miscellaneous small projects and contingencies.

National Center for Agricultural Utilization Research, Peoria, Illinois (\$3,000,000).—The Center performs vital research on new agricultural uses and food safety. Funding will be for continuation of the facility modernization program, specifically for renovation of the North Wing.

Eastern Regional Research Center, Philadelphia, Pennsylvania (\$5,200,000).—The Center conducts critical research on new uses for farm commodities that leads to the development of new domestic and foreign markets. A facility condition study indicated that the utilities and building infrastructure have reached the end of their usefulness. A modernization program was developed and divided into 9 phases. The proposed funding will be used for construction of phase 4 of the Chemical Wing laboratory.

PART 1

679

Southern Regional Research Center, New Orleans, Louisiana (\$1,100,000).—The Center performs research on postharvest processing, product enhancement, and safety and use of agricultural commodities. The Center research includes: improving the quality of cotton products, and the safety and health of cotton workers; increasing the efficiency of food-processing systems; and enhancing the nutritional value of food products, such as rice and peanuts. The proposed funding will be used to continue with the modernization of the Center, specifically to begin the design of the Industrial Wing.

Plum Island Animal Disease Center, Greenport, New York (\$5,000,000).—The Center conducts research and diagnostic work on foreign animal diseases that are an ongoing threat to U.S. livestock. It is the only site in this country authorized by Congress to carry out such research. Funding will be for continuation of the modernization of the Center, principally replacement of the boiler plant and miscellaneous projects.

U.S. Horticultural Crops and Water Management Research Laboratory, Parlier, California (\$23,400,000).—The proposed funding will be used to finance the construction of a replacement laboratory in Parlier. The U.S. Horticultural Crops and Water Management Research Laboratory which investigates problems related to Western production and postharvest agriculture is currently in Fresno. New housing developments to be built one quarter mile from the laboratory has placed restrictions on agricultural spraying which makes the present site unsuitable for research activities.

Melaleuca Research and Quarantine Facility, Ft. Lauderdale, Florida (\$4,000,000).—*Melaleuca* is adversely affecting Lake Okeechobee, the Everglades National Park, and Big Cypress National Preserve. This weed tree reduces wildlife and native vegetation, pumps large quantities of water into the air via evapotranspiration, and is a navigational and fire hazard. The proposed funding is for construction of a facility which will serve as the quarantine facility for *melaleuca* biological control insects brought into the United States from Australia. Construction of this facility was designated by the South Florida Ecosystem Restoration Task Force as one of the highest priority initiatives to ensure restoration of the Everglades National Park.

National Agricultural Library, Beltsville, Maryland (\$6,000,000).—NAL, which is the largest agricultural library in the world, serves as a national resource for access to information on agriculture and related sciences. Built in 1968, many of the building systems are becoming unreliable and require replacement. A facility condition study identified numerous code, mechanical, electrical, and architectural deficiencies. The proposed funding will be used to begin addressing some of the major deficiencies, including installation of sprinklers, first floor renovations, replacement of boilers, and miscellaneous projects.

European Biological Control Laboratory, Montpellier, France (\$3,400,000).—Many of the insects pests and weeds in the U.S. are of European or Asian origin. The insect pests attack crops and domestic animals, ornamentals, and forests; the weeds infest millions of acres of pasture and croplands. The Laboratory researches and introduces suitable natural enemies (i.e., insects, mites, and pathogens) into the U.S. to control insect pests and weeds. Currently, the Laboratory is housed in temporary facilities which are crowded and dispersed. In addition, there is no quarantine greenhouse. Purchase of a new laboratory site, and planning and design of the new facility has been completed. The proposed funding will be used to proceed with construction.

Mr. Chairman, this concludes my statement. I will be happy to respond to any questions you may have.

PREPARED STATEMENT OF DR. B.H. ROBINSON

The mission of CSREES is to benefit people, communities, and the Nation through cooperative work with our partners and customers to advance research, extension, and higher education in the food and agricultural sciences and in related environmental and human sciences. CSREES is a Federal partner in a partnership that includes the 59 State and Territorial Agricultural Experiment Stations; the 17 1890 land-grant institutions, including Tuskegee University; the 63 Forestry Schools; the 27 Colleges of Veterinary Medicine; 42 Schools of Home Economics; and the 29 Native American Institutions which now have land-grant status.

In addition to the land-grant partners, CSREES has partners in virtually all segments of the agricultural community, including private and public colleges and universities; Federal laboratories; private industry; State, county, and local governments and entities; and individuals. The Cooperative Extension Services, our state

PART 1

680

partners for extension programs at the land-grant universities, link the education and research resources of the U.S. Department of Agriculture and the land-grant universities with 3,150 county and administrative units throughout the country.

This is certainly an indicator of the breadth of the partnership to which we belong. In fact, we look forward to further expansion of that partnership to include Hispanic-Serving Institutions with the initiation in 1997 of the our new Hispanic-Serving Institutions Grant Program. This array of CSREES partners assures that the best and most diverse talents are tapped to address current and future problems facing agriculture and rural America, particularly as we prepare for the 21st Century.

The research, extension, and education components of the partnership interact to provide coordinated approaches to problems of regional and national interest. Our land-grant universities and other partners conduct fundamental and applied research to provide the knowledge required to combat problems encountered in the development and sustainability of agriculture and forestry and in the improvement of the economic and social welfare of rural and urban citizens. Our land-grant partners, through the Cooperative Extension System, funnel this research to a network of nonformal educational, or extension, programs. This knowledge is used as a basis for practical decisionmaking to strengthen and sustain individuals, families, and rural and urban communities throughout the Nation. And, finally, recognizing that education is the catalyst for moving this nation successfully into the next century, CSREES supports several integrated higher education programs to stimulate and enable colleges and universities to provide the quality of education necessary to strengthen and replenish the nation's food and agricultural scientific and professional work force.

Changes in agriculture and the world in which we live have necessitated that the programs we administer and the client base we serve be broadened. While the scope and complexities of our programs have expanded, CSREES has continued to operate on extremely low administrative costs of about 3–4 percent. This indicates that we function effectively on a very small percentage of an annual appropriation of approximately \$900 million, making maximum program funding available to the American public through our partners.

As CSREES enters its third year after the merger of two former agencies, the Cooperative State Research Service and the Extension Service, we have been successful in meeting many of the early challenges facing us to find innovative and efficient approaches to integrating extension programs with parallel research programs. We have strived to link research and extension objectives under single programs where appropriate.

One example of our efforts to integrate research and extension objectives is the food safety area. The public is demanding, and should be assured of, a safe, high-quality food supply. Finding ways to reduce or eliminate food-borne risks spans both research and extension, from developing risk minimizing practices in growing animals and crops, attending to safety issues, including proper pre- and post-harvest practices, to introducing food processing methods at plants that incorporate pathogen reduction and Hazard Analysis and Critical Control Point (HACCP) measures, to handling the food safely during transportation and distribution and, finally, to promoting safe food handling by the consumer.

Food safety is one of three broad categories of research which is proposed for increased funding in 1998 under our National Research Initiative (NRI) Program. In addition, we are requesting funding in 1998 for a new competitive Food Safety Special Research Grant. Food safety is also one of the Cooperative Extension System's National Initiatives, and extension activities in food safety are funded under Smith-Lever 3(d) funds. Our goal is that these programs will complement each other to foster multi-disciplinary collaboration and participation from diverse sectors to solve complex food safety issues, provide the basis for new training programs and, ultimately, assure public health.

Other examples of parallel extension and research programs that we have been integrating are Water Quality, Sustainable Agriculture, Integrated Pest Management, and Pesticide Impact Assessment. Coordinating and integrating extension, research, and higher education activities effectively at the national level to solve critical issues faced by the agricultural community can only be achieved in cooperation with the university system and other partners.

The Congressionally mandated Government Performance and Results Act (GPRA) requires that Federal agencies develop strategic plans that correlate to the formulation of agency budget requests and that adhere to the "management for results" concept. The draft CSREES Strategic Plan outlines our expectations for agricultural research, education, and extension for a five-year period from 1997–2002. It also pro-

PART 1

681

vides a mechanism for assessing and redirecting agency programs to achieve strategic goals.

CSREES is one of four agencies in USDA's Research, Education, and Economics (REE) Mission Area. The draft CSREES Strategic Plan is linked to five broad goals or outcomes for the plan of the REE Mission Area and represents the work of our administrative and program staff and partners with input at the Federal, State and local levels.

The broad goals or outcomes of the REE Mission Area are the underpinnings from which CSREES has and will continue to initiate program strategies which will be explicitly stated in the annual performance plans. These strategies, in combination with program action and implementation by the university system and other partners, will lead to joint accomplishments in research, extension, and higher education in the food and agricultural sciences and related environmental and human sciences. The five broad goals or outcomes of the REE Mission Area are: An agricultural production system that is highly competitive in the global economy; a safe and secure food and fiber system; healthy, well-nourished population; greater harmony between agriculture and the environment; and enhanced economic opportunity and quality of life for Americans.

Framed by the same goals, our draft Strategic Plan focuses on planning and attaining measurable outcomes and allows for the accountability of funds in response to shared priorities for work at the national and State levels. Of course, our Strategic Plan will be an ever-changing document.

With input from the university system and other partners, the Strategic Plan will be continuously reviewed and updated to respond to new and emerging issues important to the citizens and the Nation.

FISCAL YEAR 1998 BUDGET REQUEST

The budget submitted to Congress by the President requests \$840,153,000 for the Cooperative State Research, Education, and Extension Service. This is a decrease of \$69.2 million, or approximately 8 percent, from the current appropriation. Budget highlights are provided below:

FOOD SAFETY

Reducing the incidence of food-borne illness is a top priority of the Administration. On January 25, 1997, President Clinton announced an interagency Food Safety Initiative in which USDA, including CSREES, is an important participant. As part of the Administration's Initiative, CSREES is requesting \$2 million in fiscal year 1998 to establish a new competitive Ensuring Food Safety Special Research Program. Foodborne pathogens such as *E. coli*, and water-borne pathogens such as *Cryptosporidium*, have become major threats to public health. These threats and those of other new and re-emerging infectious diseases that affect our food supply mandate that we enhance and expand our existing programs in food safety to find ways to reduce and eliminate food-borne diseases. USDA's action agencies, including the Food Safety and Inspection Service, look increasingly to research programs to provide scientific information on which to base their regulatory and policy decisions about these issues. This addition to the CSREES funding portfolio would expand the base of knowledge needed to address high priority food safety issues facing industry and consumers.

The new Ensuring Food Safety Special Research Grant program will consider pre- and post-harvest/slaughter issues related to biological aspects of food safety, reductions in microbials and pathogens, as well as the social and economic implications of ensuring a safe food supply. It will complement the longer term, more fundamental food safety research supported under our NRI Program, the more longer-term food safety research programs of ARS, and the food safety education and training programs supported under the extension portion of our budget.

We also are proposing a \$2 million increase for our parallel extension Food Safety Program funded under Smith-Lever 3(d) as part of the Food Safety Initiative. Currently, food safety extension activities address a wide variety of food safety and quality issues nationwide. The funding increase for these activities will be used to further enhance food safety education programs with outcomes focused on pre-harvest education; Hazard Analysis and Critical Control Point (HACCP) and other Quality Assurance programs; compliance education; state food handler certification programs; increased use of recommended safe food handling practices by industry and consumers; and rapid exchange of food safety information.

The funding proposed for these two programs will help provide the critical link between food safety research and education by supporting joint priority planning and programming, and increased multidisciplinary collaboration and participation

PART 1

682

among researchers and educators. These activities will directly promote two of the REE Mission Area Goals: a safe and secure food and fiber system; and a healthy, well-nourished population.

PEST CONTROL PROGRAMS

The Integrated Pest Management (IPM) program is another example of the substantial progress we have made in integrating parallel research and extension programs. The research activities supported with IPM funds will develop new pest management tools to address identified critical pest problems in crop production and will focus on implementing ecologically-based pest management tactics. The extension activities supported with IPM funds will accelerate the transfer of proven pest management technologies from the researchers to farmers, crop consultants, ranchers, and other end-users to increase profitability while protecting human health and our environment.

Increases are requested for Improved Pest Control funding to support these research programs: Pest Management Alternatives (formerly, Emerging Pest and Disease Issues), Integrated Pest Management, Expert IPM Decision Support System, Minor Crop Pest Management (formerly, Pesticide Clearance), and Pesticide Impact Assessment. Funds are included for extension activities under the IPM and Pesticide Impact Assessment programs. Activities supported under these programs directly contribute to the Department's IPM Initiative which calls for implementation of IPM practices on 75 percent of U.S. crop acreage by the year 2000. The budget includes increases totalling \$17.3 million for these research and extension pest management and pesticide related programs.

The activities supported by the CSREES Pest Control Programs will directly promote the following REE Mission Area goals: an agricultural production system that is highly competitive in the global economy; and greater harmony between agriculture and the environment.

PESTICIDE APPLICATOR TRAINING

We are proposing an increase of \$1.5 million in fiscal year 1998 to initiate a redesigned Pesticide Applicator Training (PAT) Program. This is a unique collaborative effort between USDA and the Environmental Protection Agency, which is making a parallel request for funding in its budget for the program. The purpose is to educate users of restricted-use pesticides on safe and environmentally sound methods of pesticide application. Environmental concerns over the sale, use, and disposal of pesticides are key elements in teaching plans and educational materials developed by state extension services. This collaborative effort will be especially beneficial in helping the extension specialists reach growers and producers on pesticide safety and regulatory requirements. The PAT program directly promotes the REE Mission Area goal to achieve harmony between agriculture and the environment, and contributes to the goal of a safe, secure, food and fiber system by addressing programs to meet the mandates of the 1996 Food Quality Protection Act.

NATIONAL RESEARCH INITIATIVE

An increase of \$35.8 million is requested for the National Research Initiative (NRI), USDA's major merit-reviewed competitive research grants program. "Merit review" takes into account both quality of science and relevance of the proposed research to key problems of enduring importance to agriculture, food, and the environment. The competitive mechanism of funding assures that limited financial resources are used to support only the highest quality research.

These funds provide for fundamental and mission-linked research relevant to agriculture, food, and the environment. Fundamental research tests scientific hypotheses and provides basic knowledge that supports applied research and from which major conceptual breakthroughs are expected to occur. Mission-linked research aims at solving identified high-priority problems and may be either basic or applied in nature. The research supported by the NRI Program also may involve a multidisciplinary approach, or the integration of researchers from two or more disciplines encompassing the biological, physical, chemical, or social sciences.

Research supported under the NRI program ensures our nation's farmers will retain their technological edge. Of particular concern is the need to expand the science base for the Hazard Analysis and Critical Control Point (HACCP) approach to reducing food-borne illness due to microbial pathogens. The health of the environment is also a major concern. Many production practices, such as the excessive use of pesticides, fertilizers and tillage, continue to be a major cause of environmental degradation. In addition, more research is needed on plant genetics leading to improved crops that resist pests and diseases and environmental stress and possess other de-

PART 1

683

sirable traits. Therefore, the increase we propose for the NRI program will expand research in three key areas: food safety, environmental quality, and the genetic enhancement of plants. The NRI Program directly promotes all of the five REE Mission Area goals by ensuring the highest quality of research is directed at increasing the knowledge base needed to effectively address national issues, problems, and concerns related to agriculture, food, and the environment.

RESEARCH, EDUCATION, AND ECONOMICS INFORMATION SYSTEM

We are requesting an increase of \$600,000 for the Research, Education, and Economics Information System (REEIS). The REE Mission agencies which, in addition to CSREES, include the Agricultural Research Service, Economic Research Service, and National Agricultural Statistics Service, currently lack a comprehensive, integrated, user-friendly electronic program information system. The need for complementary and integrated databases among the four agencies was significantly increased as a result of the USDA reorganization several years ago. GPRA further emphasizes the increased accountability and financial management functions which can be addressed by REEIS.

In recent years, the need for this type of system has become more urgent for several reasons. One, a rapid and comprehensive information system is needed to serve as a national reference source for development of new research and education projects on such diverse issues as increasing productivity in agriculture and processing, improving the safety and quality of food, and enhancing the sustainability of the environment and rural communities. Two, in the quest to get the maximum value from research dollars, Federal/State policy makers and administrators are requiring empirical analyses to account for historical, current, and future use of public funds and to provide a basis for redirecting funds to higher priority problems. Three, the GPRA has imposed reporting demands which current, decentralized information systems are not prepared to adequately satisfy. The REEIS will promote the five REE goals by providing current, accurate, and comprehensive information to facilitate evaluation analyses and policy decisions relating to the research, education, and economics programs within the Mission Area.

Section 804 of the 1996 Farm Bill authorized the development of this type of information system, and a modest amount of funding was made available in the fiscal year 1997 appropriation for start-up costs associated with this effort. Approximately \$400,000 is being used for planning the design and development of the REE Information System. CSREES has arranged for two leaders from academia to oversee programmatic content design and technical design of the system. A National Steering Committee has been established to provide advice and guidance throughout the development and implementation phases and a private sector firm specializing in public sector information systems will be engaged to design, develop, test, and install system software and hardware. The proposed increase of \$600,000 for the REE Information System in fiscal year 1998 will allow for the implementation, operation and maintenance of a prototype system.

CHILDREN, YOUTH, AND FAMILIES AT RISK

An increase of almost \$2.15 million is requested for the Children, Youth, and Families at Risk (CYFAR) program, which is funded under Smith-Lever 3(d) and focuses on America's children, youth and families. Of the total increase, \$446,000 will be used to bolster ongoing programs in this critical area. For example, each State has identified youth at risk as a priority, and funding from this program supports community collaborations, school-age child care programs, and strengthened science and technology programs. Of the proposed increase, \$1.7 million will be targeted to the 1890 Institutions to provide opportunities to build statewide extension capacity for supporting community-based programs for at risk youth and families consistent with the 1996 Farm Bill. Specific emphasis will be placed on electronic connectivity to provide computers, software, Internet connections, and technology training for extension staff and participants. This targeting of funds is significant because eligibility under the Smith-Lever 3(d) programs has previously been limited to the 1862 land-grant institutions. However, the Farm Bill specifies that the 1890 Institutions are eligible to apply for and receive directly new and increased funds made available after September 30, 1995, to carry out 3(d) programs or initiatives, which would include the CYFAR Program. CYFAR directly promotes the REE Mission Area goal of enhanced economic opportunity and quality of life for Americans.

SUSTAINED FUNDING SUPPORT

The State-Federal partnership in food and agricultural research, education, and extension has benefited both American consumers and the agricultural industry and

PART 1

684

merits continued strong support. The Hatch, McIntire-Stennis Cooperative Forestry, Smith-Lever, and Animal Health and Disease Research formula-based programs are proposed for funding at the 1997 appropriation levels. The formula funds have an impact far greater than the actual amount of funds provided. Each Federal dollar provided leverages 4 to 5 additional dollars from state, local, and private sources, maximizing the Federal investment in agricultural research, education, and extension. Also, these funds constitute a powerful force in bringing about inter-state cooperation and Federal-State collaboration in the planning and conduct of these activities. Sustaining formula funding strengthens the Federal investment in the research and extension infrastructure to respond to national priorities and critical needs.

The Department continues its focus on helping limited resource farmers and other disadvantaged populations. Funding is maintained at the 1997 appropriation levels for extension formula programming at the 1890 Institutions, the Evans-Allen research formula program, the 1890 Capacity Building Grants Program, and the 1890 Facilities Program.

The fiscal year 1998 Budget Request proposes continued support for most of those Special Grants that concentrate on problems of national and broad regional interest beyond the scope and resources of the formula-based programs. Funding is maintained at the 1997 appropriation level for global change, minor use animal drugs, national biological impact assessment program, rural development centers, water quality, and pesticide impact assessment. Other grant programs, such as Regional Aquaculture Centers and Sustainable Agriculture Research and Education, are also funded at the 1997 level.

Funding is also maintained at the 1997 level for several of the Smith-Lever 3(d) programs, such as Rural Development, the Expanded Food and Nutrition Education Program, Indian Reservation Agents, and Sustainable Agriculture.

HIGHER EDUCATION PROGRAMS

Fiscal year 1998 funding for most of our Higher Education Programs is proposed to be sustained at the 1997 levels. These programs include the National Needs Graduate Fellowships Program, Higher Education Multicultural Scholars Program, Tribal Colleges Education Equity Grants Program, Tribal Colleges Endowment Fund, and the Hispanic-Serving Institutions Education Grants Program. We have requested a modest increase of \$350,000 for our Institution Challenge Grants Program to return the program to its 1996 level and enable us to encourage more colleges and universities to improve the quality of their curriculum in a broader range of areas and attract a wider range of students to the food and agricultural sciences.

PROPOSED ELIMINATIONS

As part of the Administration's efforts to balance the budget, the CSREES Budget Request proposes eliminating \$42.2 million in funding for earmarked Special Research Grants which target specific, local concerns; \$500,000 for Critical Agricultural Materials; \$475,000 for Rangeland Research; \$4.5 million for Farm Safety and Water Quality under Smith-Lever 3(d); \$3.2 million under the Renewable Resources Extension Act; \$1.167 million for Agricultural Telecommunications; \$2.6 million for Rural Health and Safety Education; and \$15.4 million for earmarked special projects under the Federal Administration line items for research and extension. Generally, these programs are state specific and/or do not address current regional or national priorities. Hatch and Smith-Lever (b) and (c) formula funds are available at the discretion of the states to support activities meeting largely state or local needs. Also, in keeping with the Administration's policy of awarding research and construction grants through a competitive, merit-review process, \$61.6 million for the current Research and Education Buildings and Facilities program earmarked for specific institutions is proposed for elimination in fiscal year 1998.

PROGRAM ACCOMPLISHMENTS

Although there are numerous examples of CSREES-funded success stories, below are a few examples representative of outstanding research, education, and extension activities where our programs have made a difference:

—CSREES funding has contributed to the peach Integrated Pest Management (IPM) program at Rutgers University to enable participating peach growers in the state of New Jersey to reduce their use of pesticides by 75 percent. In addition, chemical pesticide use was totally eliminated for some pests. In its annual report on the IPM project supported by CSREES, Rutgers University projected that, if IPM practices followed by the growers participating in the Rutgers pro-

PART 1

685

- gram were adopted by all peach growers in the state, pesticide expenditures would be reduced there by nearly \$1 million annually.
- A disease affecting the catfish industry is Winter Saprolegniosis. About 10 percent of catfish die each year from this disease which results in significant economic losses annually for the catfish industry. With funding from the NRI program, scientists at the University of Mississippi, while studying disease mechanisms and immunity, discovered that Winter Saprolegniosis can be prevented by adding formalin or diquat to the water at concentrations currently approved by the Food and Drug Administration for use in catfish ponds for other purposes.
 - NRI-supported researchers at Oregon State University have invented a unique method for preventing food spoilage and food-borne illness caused by microorganisms. They were recently issued a patent and are hoping to commercialize the result of their efforts, which involve spreading food surfaces with a protein called nisin that kills any bacteria that comes in contact with the food surfaces. The nisin molecules are so firmly attached to the food surfaces that they resist removal even after washing. It is anticipated that nisin-derived solutions will work on wood, aluminum, stainless steel, acrylics and possibly other surfaces, which may increase the potential use of this microorganism “deflector” beyond reducing food-borne illnesses. For example, the use of nisin may be beneficial in the medical world to protect patients against infections during some procedures, such as organ implantation.
 - One of the most debilitating diseases of pigs in recent years has been Porcine Reproductive and Respiratory Syndrome (PRRS). At one point, it affected almost every herd in every state that raised pigs and resulted in such significant economic losses that a typical 600-sow farm could lose \$150,000–\$180,000 per outbreak of PRRS. With support from the NRI Program, researchers at South Dakota State University, in collaboration with private industry and other university researchers, used both conventional and “high tech” laboratory techniques to develop a vaccine that is successfully used to combat the PRRS virus.
 - Georgia extension specialists are helping farmers increase productivity and profitability while enhancing the environment. Farmers have spread more than 42 million gallons of effluent from lagoons that store dairy cattle wastes on crops as fertilizer without surface or ground water problems. This has contributed to a 55 percent decrease in undesirable phosphorus in nearby lakes. Land-grant universities in most states are working on similar projects with livestock wastes.
 - Best known for their learn-by-doing philosophy of youth development, state 4–H programs have successfully adapted their curricula into school enrichment programs. A Tennessee program, 4–H Building Esteem through Science and Technology, improved the science scores of participants by 29 percent on the state’s competency test.
 - In Arizona, extension specialists developed brochures for use by farmers to develop pick-your-own and on-farm produce markets. During a single season (July to October), one Arizona county reported that the brochure and other promotional efforts brought more than 80,000 out-of-county visitors to local farms where they spent \$1.1 million on fresh produce. This influx of visitors increased the income of farmers and also increased tax revenues which allowed county officials to improve public facilities for their constituents.
 - Funding provided by CSREES to the 29 1994 Land-Grant Institutions under the Tribal Colleges Education Equity Grant Program has been used to establish a Center for Integrated Rural Development studies at the Navajo Community College in Arizona, the mission of which is to design and deliver classroom, research and extension programs in fields of community development, economic development, and natural resources management. In addition, Little Hoop Community College in North Dakota is developing curricula for a program in food science to include food preparation, nutrition, and management.
 - Funding from the CSREES Capacity Building Grants Program, has enabled Alcorn State University in Mississippi to develop new four-year degree programs in international agribusiness and to develop an urban forestry program at Southern University in Louisiana. The Nation’s first bachelor’s degree program in regulatory science has been developed at the University of Arkansas at Pine Bluff.

The successes of the agriculture and forestry research, higher education, and extension systems, which were created with the initiation of the land-grant system in 1862, have enabled U.S. agriculture to maintain its world-class competitive edge. This tripartite relationship has resulted in significant improvements in agricultural productivity, created new, improved, and value-added products from agricultural

PART 1

686

and forestry materials, found ways to protect our environment, improved human nutrition and health, and increased our capacity to respond to changes. These improvements have had a profound affect on our standard of living and will impact the lives of future generations world-wide. The degree to which our standard of living has been affected by these developments is reflected in the amount we spend on food in this country compared to other countries. In the U.S., we spend only 11 percent of disposable income on food compared to 15–20 percent in other affluent countries in Europe and in Japan, 35–40 percent in developing countries such as Mexico and Thailand, and more than 50 percent in the lowest income countries such as India and other southeast Asia countries.

The fiscal year 1998 President's Budget Request for CSREES, which reflects the five goals of the REE Mission Area of USDA and issues of great importance to Agriculture, will optimize the contributions of university-based programs to sustain and enhance the agricultural systems of this Nation and worldwide.

PREPARED STATEMENT OF SUSAN E. OFFUTT

Mr. Chairman and members of the Committee, I am pleased to have the opportunity to present the proposed fiscal year 1998 budget for the Economic Research Service.

MISSION

The Economic Research Service provides economic and other social science analysis on efficiency, efficacy, and equity issues related to agriculture, food, the environment, and rural development to improve public and private decision making.

BUDGET

Fiscal year 1997. ERS's appropriation for fiscal year 1997 of \$53.1 million was the same as the fiscal year 1996 appropriation. In response to this static budget level, ERS continued implementation of its streamlining strategy and plans to maintain staff at its current level of 591 full-time equivalents. ERS will continue to make full use of early-out and buy-out authorities. Since October 1993, the ERS staff has been reduced by 204 full-time equivalents. In the future, ERS must continue to constrain staff levels to cope with cumulative budget cuts of \$5.8 million since fiscal year 1993 and to maintain its non-salary program of agricultural data purchases and cooperative university research necessary to support its analytical program.

Fiscal year 1998. The agency's request for fiscal year 1998 is \$54.3 million, an increase of \$1.2 million over fiscal year 1997. The increase consists of three parts: a \$0.8 million net increase for pay raises; \$0.3 million to increase knowledge about the costs and benefits of resource-conserving production practices, and \$0.1 million to provide statistical expertise for GPRA measurement in a governmentwide effort to develop reliable performance information.

In 1993 the Administration announced a goal of bringing 75 percent of the Nation's cropland under integrated pest management (IPM) within 7 years. In addition, the 1996 Federal Agriculture Improvement and Reform Act introduced new conservation and environmental programs aimed at encouraging the adoption of farming practices that conserve soil and reduce nutrient and pesticide run-off. To determine how best to achieve the Department's IPM goal and to implement the most cost-effective conservation programs, economic analysis is needed concerning the factors that affect the adoption of resource-saving technologies, the farm-level cost of these practices, the effect of these practices on output, prices, and the farm input market, and the environmental consequences of practice adoption.

The ERS request to increase knowledge about the costs and benefits of resource conserving production practices would be used, in part, to improve ongoing USDA data collection efforts on a wide range of farming practices, including livestock waste management, crop nutrient and pesticide management, and irrigation management. The data component of the request (\$100,000), would be directed toward: (1) expanding the number of commodities surveyed in the current program to include specialty crops and livestock; or (2) assuring that appropriate economic data are collected along with agronomic information; or (3) linking practice adoption and economic data to natural resource characteristics. The choice among these emphases will depend on an assessment of the adequacy of existing data collection as well as the requirements of the Department's initiative. Using an expanded database, the proposed analysis component of the request (\$181,000) would be used to examine the practices farmers adopt, the cost of adoption, the effect of these practices on the performance of the farm sector, and the effectiveness of practice adoption in meeting

PART 1

687

conservation and environmental goals. Related analysis would focus on variation in adoption rates and costs of adoption across farm size and type of farming operation.

A key component of the Government Performance and Results Act (GPRA) is the mandate to assess performance relative to annually established output and outcome goals. As the GPRA deadlines quickly approach, agencies across the Federal Government are working to develop performance measures and indicators. In this process, agencies are finding that developing meaningful and useful measures and indicators can be very difficult, and developing measures that can be compared across agencies is even more difficult. This initiative is designed to provide statistical support to Federal agencies across the Government to address these challenges. Under the initiative, eight Federal Statistical agencies will participate in a three-part effort to: develop or refine sampling schemes to support valid performance measurement; develop standardized questions and satisfaction scales for common element of Federal services; and add 10 Federal agencies that provide public services to the national American Customer Satisfaction Index. This initiative would provide funds totaling \$125,000 for the Economic Research Service to cooperate with other Government agencies in a \$1.6 million effort to improve statistical expertise for GPRA measurement. ERS would receive \$100,000 to share primary responsibility with the Bureau of Transportation Statistics and the Energy Information Agency in clarifying and providing guidance on performance measurement issues related to GPRA performance measurement. ERS would also use an additional \$25,000 to provide guidance on development of questions for standard survey instruments. ERS' special expertise would be applied in providing perspective and advice on bridging customer satisfaction measurement with measuring success in meeting basic goals for the program.

CUSTOMERS, PARTNERS, AND STAKEHOLDERS

The ultimate beneficiaries of ERS's program are the American people whose well-being is improved by informed public and private decisionmaking leading to more effective resource allocation. ERS shapes its program and products principally to serve key decision makers who routinely make or influence public policy and program decisions. This clientele includes White House and USDA policy officials and program administrators/managers, the U.S. Congress, other Federal agencies and State and local government officials, and domestic and international environmental, consumer, and other public groups, including farm and industry groups interested in public policy issues.

ERS carries out its economic analysis and research in five divisions and an Office of Energy and New Uses. ERS depends heavily on working relationships with other organizations and individuals to accomplish its mission. Key partners include: the National Agricultural Statistics Service (NASS) for primary data collection; universities for research collaboration; the media as disseminators of ERS analyses; and other government agencies and departments for data information and services.

ERS shares five general goals with its fellow agencies in the Research, Education, and Economics mission area: a highly competitive agricultural production system, a safe and secure food supply, a healthy and well nourished population, harmony between agriculture and the environment, and enhanced economic opportunity and quality of life for all Americans. These goals are fully consistent with the U.S. Department of Agriculture mission.

A HIGHLY COMPETITIVE AGRICULTURAL PRODUCTION SYSTEM IN THE GLOBAL ECONOMY

ERS helps the U.S. food and agriculture sector effectively adapt to changing market structure and post-GATT and post-NAFTA trade conditions by providing analyses on the linkage between domestic and global food and commodity markets and the implications of alternative domestic policies and programs on competitiveness. ERS economists analyze factors that drive change in the structure and performance of domestic and global food and agriculture markets; provide economic assessments of competitiveness and efficiency in the food industry; analyze how global environmental change, international environmental treaties and agreements, and agriculture-related trade restrictions affect U.S. agricultural production, exports and imports; and provide economic analyses that help identify competitive and environmentally sound new crops and uses. Looking ahead, ERS will consider how the potential for increased commodity price and farm income variability affects market performance and interacts with Federal policies and programs. These analyses will include short- and long-term projections of U.S. and world agricultural production, consumption, and trade. In addition, ERS will continue preparation for the 1999 World Trade Organization mini-round (expected to focus on agriculture) by analyzing the economic effects of Uruguay Round policy disciplines; assessing the economic effects of state trading and tariff-rate quota allocations; and assessing regional trade

PART 1

688

initiatives. In this latter category, ERS experts will take a more in-depth look at China's evolving role in world agricultural markets. ERS will conduct research on the changing structure (for example, vertical integration, concentration, and contracting) of the food marketing chain and will also analyze the effectiveness and use of alternative marketing strategies and risk management tools in mitigating farm income risk, including tools available from both private and public sector providers.

ERS has initiated work on case studies to support priority-setting for research on ways to use agricultural products, crop residues, and co-products from agricultural processing plants as potential feedstocks in the production of new products with enhanced value. These studies will provide estimates of market potential, job opportunities, and the income effects of new products and involve collaborative efforts between ERS economists and Agricultural Research Service scientists, as well as analysts from other Government agencies and the private sector. More generally, ERS analyses can help guide and evaluate resource allocation and management of public sector agricultural research, a key to maintaining increases in productivity that underlie a strong competitive position for U.S. farmers. ERS economists track and endeavor to understand the determinants of public and private spending on agricultural R&D; evaluate the returns from those expenditures; and consider the most effective roles for public and private sector research entities.

A SAFE AND SECURE FOOD PRODUCTION SYSTEM

ERS focuses on improving the efficiency and effectiveness of public policies and programs designed to protect consumers from unsafe food by analyzing benefits of safer food and the costs of food safety policies; efficient and cost-effective approaches to promote food safety; and how agricultural production and processing practices affect food safety, resource quality, and farm workers' safety. Plans are to focus on policy alternatives for reducing the risks of food borne illness. ERS will conduct empirical research to quantify the value placed by consumers on reduction of health risks in food and drinking water supplies. In collaboration with USDA's Food Safety and Inspection Service, the Food and Drug Administration, and the Centers for Disease Control, an interdisciplinary effort is underway to evaluate the benefits and costs of using Hazard Analysis and Critical Control Point (HACCP) approaches to improve food safety, with a special emphasis on reducing health risks from *Salmonella enteritidis* in eggs and egg products. Research continues to refine estimates of the human medical costs and farm productivity losses associated with microbial pathogens in meat and poultry.

Understanding how food prices are determined is increasingly important in responding to domestic and international market events and opportunities that promote the security of the U.S. food supply. As the farm share of the food dollar declines, accurate retail price forecasts depend more heavily on understanding the marketing system beyond the farmgate. ERS is undertaking a systematic examination of the factors that help set retail prices, including an assessment of the role of the transportation, processing, manufacturing, wholesaling and retailing sectors, the impact of imports and exports, and linkages to the total economy.

A HEALTHY AND WELL-NOURISHED POPULATION

ERS helps identify efficient and effective public policies that promote consumers' access to a wide variety of high-quality foods at affordable prices. ERS economists analyze factors affecting dietary changes; assess impacts of nutrition education and the implications for the individual, society and agriculture; and provide economic evaluations of food nutrition and assistance programs. The Agency plans to study the implications for producers and consumers of movement towards adoption of the dietary guidelines; the trends and determinants of American's eating habits; evolution of food product trade; and the determinants of food prices. Analysis of nutrition education efforts will consider what kinds of information motivate changes in consumer behavior, the food cost of healthy diets, the influence of food assistance programs on nutrition, and the implications of healthy diets for the structure of the food system. And, because trade in high valued agricultural products, including processed food, now exceeds the value of bulk commodity flows, ERS will spend more time to break down the components of these trade flows, understand relationships to international investment and strategic behavior of U.S. food firms; and investigate the implications for U.S. consumers of a globalized food marketplace.

HARMONY IN AGRICULTURE AND THE ENVIRONMENT

In this area, ERS analysis helps support development of Federal farm, natural resource, and rural policies and programs that promote long-term sustainability goals, improved agricultural competitiveness, and economic growth. This effort requires

PART 1

689

analyses on the profitability and environmental effects of alternative production management systems and on the cost effectiveness and equity, of public sector conservation policies and programs. ERS analysts focus on evaluating the benefits and costs of agricultural and environmental policies and programs in order to assess the relationship between improvements in environmental quality and increases in agricultural competitiveness. In this vein, ERS provides economic analyses on the linkages between biodiversity and sustainability issues and agricultural performance, competitiveness, and structure.

In the coming year, plans of work emphasize energy-related resource issues, sustainability, water quality and conservation programs, integrated pest management, and chemical use and risk reduction. In the energy and environment area, the ERS Office of Energy and New Uses provides departmental leadership, oversight, coordination, and evaluation for energy and energy-related policies and programs affecting agriculture and rural America. Its research program will focus on energy markets and, in particular, fuel markets that affect agriculture. ERS staff will be working jointly with analysts from the Department of Energy and the Environmental Protection Agency in developing a risk assessment and cost-benefit analysis of the use fuel oxygenates, including fuel ethanol. ERS will examine the potential use of vegetable oils, animal fats, and recycled grease as an alternative fuel (biodiesel) for diesel engines and consider the potential effects on farm prices, income, and food expenditures. This effort includes work with DOE studying the life cycle of biodiesel fuels to provide information on environmental impacts and total energy use. In an attempt to refine understanding of the components of a sustainable agricultural production system, ERS will build on the outcome of a 1996 agency-sponsored workshop on sustainable agriculture. The Agency's work seeks to identify whether and what kind of economic trade-offs might be associated with a sustainable path of development and to support decisionmaking on public sector actions that would promote sustainability and profitability of U.S. agriculture. In relation to water quality and conservation programs, the goal is to evaluate and synthesize analyses that can inform effective management of public sector environmental quality initiatives. The output will include three key reports: a synthesis assessing the successes and failures of the past 20 years of USDA conservation programs; a comprehensive economic assessment of Federal water quality programs affecting farming; and a report on the growing use of partial interests in use rights (such as easements) as an alternative public/private conservation tool.

ERS will continue to play its long-standing role in helping understand chemical use in agriculture and identifying opportunities to reduce consequent human and environmental health risks. The ERS research program on the economics of IPM will publish the proceedings of the Third National Integrated Pest Management Symposium Workshop—"Designing Integrated Pest Management Programs: Putting Customers First and Learning What Works." The proceedings of last winter's conference will synthesize current understanding of IPM adoption, the barriers to IPM adoption, and the costs and benefits of IPM. This information can be used directly by the Department in designing programs to meet the IPM 2000 goal of adopting IPM practices on 75 percent of the Nation's cropland by the year 2000. The product of the Agency's work on chemical use and risk reduction will be a comprehensive report on chemical use in agriculture. The report will document patterns of chemical use by crop and region, the economics driving changes in chemical formulation of pesticides and nutrients, the economics of pest and nutrient management strategies, and the costs and benefits of alternative policies designed to reduce the risk associated with chemical use in agriculture. ERS will also release an updated edition of "Agricultural Resources and Environmental Indicators," a comprehensive handbook containing data and analysis on the trends and issues pertinent to agricultural land and water use, the application of manufactured inputs and technology, farm productivity, and public policies affecting resource use.

ENHANCED ECONOMIC OPPORTUNITY AND QUALITY OF LIFE FOR AMERICANS

The ERS contribution to improving opportunity and quality of life in the U.S. is based on analysis that identifies how investment, employment opportunities and job training, and demographics affect rural America's capacity to prosper in the global marketplace. ERS economists analyze rural financial markets and how the availability of credit, particularly Federal credit, spending, taxes, and regulations influence rural economic development. An assessment of the availability of credit for agriculture, industry, and households in rural areas, recently completed under a 1996 Act mandate, will be extended to assess the competitiveness of rural credit markets. ERS also analyzes the changing size and characteristics of the rural and farm populations and the implications of these changes in human capital, including skill de-

PART 1

690

velopment, on the performance of rural economies. In addition, ERS studies the economic structure and performance of non-farm economic activities in rural areas. One of the areas identified for special attention this coming year concerns the fairly widespread rebound in population growth in non-metropolitan counties. The relevant analysis will involve monitoring rural earnings and labor market trends with emphasis on regional and other disaggregations in order to provide insight into the determinants of variation in trends among non-metro counties. Such work should yield a better understanding of the factors that promote rural vitality and the opportunities for effective public sector intervention.

Because the effects of changes in welfare programs may vary between rural and urban residents due to differences in labor markets and other aspects of a regional economy's structure, ERS social scientists will track implementation of recent program changes to understand any differential impacts. In particular, ERS analysis can help anticipate changes in participation across assistance programs, including those for which USDA has primary responsibility, in rural housing and in food. Another opportunity for understanding whether rural America faces unique circumstances will come with analysis of a recently-completed survey of the rural manufacturing sector.

ERS continues to monitor the financial situation of the farm sector, establishing farm business organization and performance benchmarks. This task includes study of the financial position of farmers who employ technological advances and innovative risk management strategies in their businesses, compared with the financial position of farmers who use more traditional approaches. Previous work on the use of production and marketing contracts by farmers will be extended to identify contractors by class to better define the role of non-farm businesses in the industrialization of farms. Analyses of financial performance will also measure the comparability of returns between farm and non-farm small businesses and assess the financial viability of commercial and non-commercial size farm operations. Complementary to its work on black and other minority farmers, ERS will develop a profile of female farm operators in 1997 to give support to an important but largely unreported segment of agriculture. This effort will also contribute to the Administration's initiatives supporting the goals of the U.N. Beijing Women's Conference.

CLOSING REMARKS

I appreciate the support that his Committee has given ERS in the past and look forward to continue working with you and your staff to ensure that ERS makes the most effective and appropriate use of the public resources. Thank you.

PREPARED STATEMENT OF DONALD M. BAY

Mr. Chairman and members of the Committee, I appreciate the opportunity to submit this statement for this Committee to cover the fiscal year 1998 budget request for the National Agricultural Statistics Service (NASS). This Service was created in 1862 to provide useful, timely, and unbiased statistics and other information about the Nation's food and agricultural industry.

The structure of farming and of the agricultural industry has changed dramatically since the initial crop reports were issued over 130 years ago. However, the need for accurate, timely, and impartial statistical information on the Nation's agriculture has become even more important as the Nation has moved from subsistence agriculture to a highly industrialized agricultural industry producing food and fiber for the world market. The crop, livestock, and other estimates developed and published throughout the year, in cooperation with State Departments of Agriculture, contribute significantly to the information available on American agriculture. The State-Federal cooperative relationship, which began nearly 80 years ago, eliminates duplication and provides State input, while maintaining national consistency in surveys conducted throughout the United States.

The agricultural statistics program provides information critical to the entire food and fiber system which totals over 14 percent of the gross domestic product and employs more than one out of every six employees in the United States. The basic supply information provided by NASS is of interest to producers, handlers, processors, wholesalers and retailers of agricultural commodities.

The Nation's food industry affects the U.S. balance of trade, the nutritional well-being of our citizens and people around the world, and the quality of our environment. NASS estimates play an important role in supporting this industry. Today, NASS spends about $\frac{1}{25}$ of a cent per dollar of sales of raw agricultural commodities to provide the basic impartial and unbiased statistics that underpin the United States and world commodity markets. NASS works to ensure the quality and integ-

PART 1

691

city of its surveys in order to provide timely and accurate agricultural statistics. These statistics are essential because they help provide a level playing field for all engaged in the food and fiber system and reduce market risk.

The collection of public statistics on agriculture preceded Government commodity programs and was designed to assure competitiveness in commodity markets. Therefore, a reduction in spending on Government commodity programs is not expected to reduce the need for agricultural statistics, and may actually lead to a greater demand for accurate information as producers take their production signals entirely from the market. Empirical evidence suggests that increased information improves the efficiency of competitive markets. A lack of information or inaccurate information can cause producers to underproduce or overproduce, misuse storage, or miss foreign or domestic market opportunities. As producers' abilities to process and analyze data increase, so does the demand for accurate and timely agricultural information. In addition, the increase in agricultural product differentiation and market complexity has made many commodities much more heterogeneous. This, in turn, has led to an increased need for more detailed information. For example, a vast amount of U.S. barley is sold on the basis of variety. Therefore, having data on just total barley production is no longer sufficient to support the domestic and growing international market for the sale of specific varieties of barley.

NASS statistical reports are not only used by the food and fiber industry to assess the supply and demand of agricultural commodities, but they are also used by farm organizations and government officials in analysis of agricultural policy, foreign trade, conservation programs, agricultural research programs, environmental programs, rural development, and many other activities. NASS data are examined very closely by farmers, agribusinesses, food industry analysts, economists, investors, as well as Federal policy makers and analysts, as decisions are made that affect the Nation's economy.

All reports issued by NASS's Agricultural Statistics Board are made available to the public at previously announced release times to ensure that everyone is given equal access to the information. NASS has been a leader among Federal agencies in providing electronic access to information. All of NASS's national statistical reports and data products, including graphics, are available on the Internet, as well as in the popular book, "1995-96 Agricultural Statistics."

In fiscal year 1997, NASS received funding for the first time to conduct the 1997 Census of Agriculture. By consolidating the existing NASS survey activities with the Census of Agriculture, the two agricultural statistics programs will be merged and the resources and experience pooled from the two agencies. The transfer of the responsibility for the Census of Agriculture to USDA streamlines Federal agricultural data collection activities, improving efficiency and the quality of data provided. The Census of Agriculture is conducted every 5 years and the next one will be taken in 1998 for the 1997 calendar year.

Statistical research is conducted to improve methods and techniques used in collecting and processing agricultural data. This research is directed toward providing higher quality survey data with less burden to respondents, producing more accurate and timely estimates to data users, and increasing the efficiency of the entire survey process. For example, NASS has been a leader in the research and development of satellite imagery to improve agricultural statistics. The NASS statistical research program strives to improve methods and techniques for obtaining agricultural statistics with an acceptable level of accuracy. The growing diversity and specialization of the Nation's farm operations have greatly complicated procedures for producing accurate agricultural statistics. Development of sophisticated sampling and survey methodology, along with intensive use of telephone and face-to-face contacts and computer technology enable NASS to keep pace with an increasingly complex agricultural industry.

NASS performs a number of statistical services for other Federal, State, and producer organizations on a cost-reimbursable basis. In addition, NASS has an expanding international program to provide technical assistance to a number of countries.

MAJOR ACTIVITIES OF THE NATIONAL AGRICULTURAL STATISTICS SERVICE (NASS)

The primary activity of NASS is to conduct surveys which include the collection, summarization, analysis, and publication of reliable agricultural forecasts and estimates. Farmers, ranchers, and agribusinesses voluntarily respond to a series of nationwide surveys about their crops, livestock, prices, and other agricultural activities each year. Periodic surveys are conducted during the growing season to measure the impact weather has on crop production. Frequent surveys are also needed on food products that are perishable. Many crop surveys are supplemented by actual field observations in which various plant counts and measurements are made. Adminis-

PART 1

692

trative data from other State and USDA agencies, as well as data on imports and exports, are thoroughly analyzed and utilized as appropriate. NASS prepares estimates for over 120 crops and 45 livestock items which are published annually in almost 400 separate reports.

Agricultural reports issued by NASS include: number of farms and land in farms; acreage, yield, and production of grains, hay, oilseeds, cotton, tobacco, major fruits and vegetables, floriculture, and selected specialty crops; stocks of grains; inventories and production of hogs, cattle, sheep and wool, goats, catfish, trout, poultry, eggs, and dairy products; prices received by farmers for products; prices paid by farmers for inputs and services; cold storage supplies; agricultural labor and wage rates; agricultural chemical usage; cultural farming practices; and other data related to the agricultural economy.

The Census of Agriculture provides national, State, and county data for the U.S. on the agricultural economy every five years, including: number of farms, land use, production expenses, farm product values, value of land and buildings, farm size and characteristics of farm operators, market value of agricultural production sold, acreage of major crops, inventory of livestock and poultry, and farm irrigation practices. The Census of Agriculture is the only source for this information on a local level which is extremely important to the agricultural community. Detailed information at the county level help agricultural organizations, suppliers, handlers, processors, and wholesalers and retailers better plan their operations. Important demographic information supplied by the Census of Agriculture also provides a very valuable data base for developing public policy for rural areas.

The NASS agricultural statistics program is conducted through 45 field offices servicing all 50 States. Nearly two-thirds of the Agency's staff and resources are located in the field. All State offices operate under cooperative funding and 25 are collocated with State Departments of Agriculture or land-grant universities. This joint State-Federal program helps meet State and national data needs while minimizing overall costs, eliminating duplication of effort, and reducing the reporting burden on farm and ranch operators. NASS's State Statistical Offices issue approximately 9,000 reports each year.

NASS has developed a broad environmental statistics program under the Department's water quality and food safety programs. Until 1991, there was a complete void in the availability of reliable pesticide usage data. This became evident during the Alar apple situation. In cooperation with other USDA agencies, the Environmental Protection Agency (EPA), and the Food and Drug Administration (FDA), NASS has implemented comprehensive chemical usage surveys that collect data on selected crops in selected States. Beginning in fiscal year 1997, NASS began survey programs to acquire more information on Integrated Pest Management (IPM), additional farm pesticide uses, and post-harvest application of pesticides and other chemicals applied to commodities after leaving the farm. These programs will result in significant new chemical use data, which will be important additions to the existing chemical use data base. These surveys also collect detailed economic and farming practice information for the purpose of determining the use of IPM practices as well as to analyze the profitability of different levels of chemical use.

Our farms and ranches manage half the land mass in the United States, underscoring the value of complete and accurate statistics on chemical use and farming practices to effectively address public concerns about the environmental effects of agricultural production. Annual surveys are used to assess the current level of IPM adoption by growers and in turn support research and educational efforts to assist farmers in adoption of improved pest management practices.

NASS conducts a number of surveys and provides consulting services for many USDA agencies and other Federal, State, and private agencies or organizations on a cost-reimbursable basis. Consulting services include assistance with survey methodology, questionnaire and sample design, information resource management, and statistical analysis. NASS has been very active in assisting USDA agencies in programs that monitor nutrition, food safety, environmental quality, and customer satisfaction. In cooperation with State Departments of Agriculture, land-grant universities, and industry groups, NASS conducted 152 special surveys covering a wide range of issues such as farm injury, nursery and horticulture, turfgrass, soybean cyst nematodes, farm finance, fruits and nuts, popcorn, animal predator loss, and ostriches and other exotics.

NASS provides technical assistance and training to improve agricultural survey programs in other countries in cooperation with other Government agencies on a cost-reimbursable basis. NASS's international programs focus on both developing countries, such as those in Asia, Africa, the Middle East, and Central and South America, as well as emerging democracies in Eastern Europe. Accurate information is essential in these countries for the orderly marketing of farm products. NASS

PART 1

693

works directly with countries undergoing the transition from centrally planned to market economies by assisting them in applying modern statistical methodology, including sample survey techniques. Short-term assignments supported work in Albania, Bulgaria, China, Colombia, Ethiopia, India, Kazakhstan, Morocco, Nicaragua, Poland, Romania, Russia, and the Ukraine.

NASS annually seeks input on improvements and priorities from the public through: regional data user meetings with representatives from agribusinesses and commodity groups, special briefings for agricultural leaders during the release of major reports, and through numerous individual contacts. The Agency has made many adjustments to its agricultural statistics program, published reports, and electronic access capabilities as a result of these activities to better meet the statistical needs of its customers.

FISCAL YEAR 1998 PLANS

The fiscal year 1998 budget request is for \$119,877,000. This is a net increase of \$19,656,000 over fiscal year 1997.

The budget request includes an increase of \$18,500,000 to fund the 1997 Census of Agriculture over the \$17,500,000 that was appropriated for fiscal year 1997, for a total of \$36,000,000. Fiscal year 1998 is the fourth and peak year of the six year funding cycle for the Census of Agriculture. This is the year that the questionnaires are prepared, labeled, mailed, and the data are collected, put into machine readable format, edited, tabulated, and reviewed.

The transfer of the responsibility for the Census of Agriculture to NASS consolidates the activities of the Census of Agriculture with the current agricultural survey program administered by NASS. By merging these two programs, efficiencies will be attained in building a complete list of farm and ranch operators and reducing the reporting burden on agricultural producers. The Census of Agriculture will benefit from the local knowledge base that the NASS field office infrastructure will contribute. In addition, this distributed infrastructure will make it possible to review and summarize the results of the Census of Agriculture in a more timely fashion, and will reduce the reporting burden of agricultural producers who will now be asked to report basic farm data to a single Federal agency.

NASS is realizing a decrease of \$1,000,000 and 3 staff years for list frame development and maintenance, as a result of efficiencies gained in assuming responsibility for the Census of Agriculture. NASS list frame development and maintenance costs will be reduced due to efficiencies gained from NASS conducting the Census of Agriculture. With NASS now responsible for the Census of Agriculture, list development and maintenance costs can be reduced as progress is made towards consolidating the two separate name and address lists of farmers and ranchers.

This fiscal year 1998 budget request also includes an increase of \$640,000 for increased data collection costs, which is to cover higher costs for survey interviewers who are employed under a cooperative agreement with the National Association of State Departments of Agriculture and whose salary increases are not covered by Federal pay cost increases. The data collected by these interviewers form the foundation of the NASS survey and Census of Agriculture program.

The fiscal year 1998 budget request includes an increase of \$540,000 for Government and Performance and Results Act (GPRA) measurement, which is NASS's portion of an initiative to provide statistical support by eight agencies to other Federal agencies across government in the development of meaningful performance measures and indicators.

An increase of \$976,000 is requested to cover pay costs, which consists of \$310,000 for the annualization of the fiscal year 1997 pay raise and \$666,000 for the estimated fiscal year 1998 pay raise. NASS is absorbing almost half of the combined anticipated pay raise in fiscal year 1998 and the annualization of the fiscal year 1997 pay raise.

BIOGRAPHICAL SKETCH

CATHERINE ELLEN O'CONNOR WOTEKI, PH.D. R.D.

In June, 1996, the Secretary of Agriculture appointed Dr. Catherine Woteki as the Acting Under Secretary for Research, Education, and Economics. In this capacity, Dr. Woteki is responsible for the management of four agencies: the Agricultural Research Service, the Cooperative State Research, Education, and Extension Service; the Economic Research Service; and the National Agricultural Statistics Service. She leads the Administration's implementation of the 1996 farm bill's provisions on research and education that include establishing a new 30-member Advisory Board,

PART 1

694

implementing a competitive grants program under the Fund for Rural America, and establishing a Research Facilities Strategic Planning Task Force to review agriculture research facilities and recommend a 10-year plan for modernization, construction, consolidation, and closings.

Dr. Woteki joined the U.S. Department of Agriculture in January, 1996 as the Deputy Under Secretary for Research, Education, and Economics. She led the development of a mission area strategic plan by which the four REE agencies' program and budget planning is being brought into a more disciplined, integrated program. Prior to joining USDA, she was Deputy to the Associate Director for Science in the White House Office of Science and Technology Policy (1994–95), and Director of the Food and Nutrition Board, Institute of Medicine, National Academy of Sciences (1990–94).

Dr. Woteki was born in Fort Leavenworth, Kansas, on October 7, 1947. A biology and chemistry major at Mary Washington College in Fredericksburg, Virginia, she pursued graduate studies in human nutrition at Virginia Polytechnic Institute and State University. For two years, she performed clinical research in the Department of Medicine of the University of Texas Medical School at San Antonio. She was appointed assistant professor in the Department of Nutrition and Food Science at Drexel University in Philadelphia in 1975. In July 1977, she joined the Congressional Office of Technology Assessment as Nutrition Project Director. From 1980 to 1983, she worked for the U.S. Department of Agriculture in two capacities: as leader of the Food and Diet Appraisal Research Group in the Consumer Nutrition Center, and as Acting Associate Administrator of the Human Nutrition Information Service. Dr. Woteki was Deputy Director of the Division of Health Examination Statistics, National Center for Health Statistics, U.S. Department of Health and Human Services from 1983 to 1990.

Dr. Woteki's scholarly interests include nutritional epidemiology, food and nutrition policy and nutrition monitoring. Dr. Woteki is the co-editor of "Eat for Life: The Food and Nutrition Board's Guide to Reducing Your Risk of Chronic Disease," a book selected by the Book of the Month Club. Dr. Woteki has received the Elijah White Award of the National Center for Health Statistics, the Special Recognition Award from the U.S. Public Health Service, and the Staff Achievement Award of the Institute of Medicine. She was selected as the outstanding alumna of the College of Human Resources, Virginia Polytechnic Institute and State University, in 1987. She and her husband, Tom, reside in Washington, DC.

DECREASE IN OVERALL BUDGET REQUEST

Senator COCHRAN. Dr. Woteki, I notice your comments on page 4 of your statement describe in general the decrease of \$49 million overall in the budget request for this mission area under your jurisdiction.

Are all of the cuts that the administration proposes in the CSREES portion of the budget? You mention ARS getting some cuts. There is also a comment on page 5 that says the budget reflects an adjustment of priorities leading to an increase of \$10 million in research and a commensurate decrease in buildings and facilities improvement funds, so the only area of the budget it appears to me that comes in for substantial cuts is the CSREES portion of the budget. Is that correct?

Dr. WOTEKI. The biggest cuts are in buildings and facilities grants within CSREES, which is approximately \$60 million.

We have made some adjustments within ARS of priorities that have permitted us to put some additional funding into high-priority research areas, and that also have led to decisions about closures on four facilities sites that would represent substantial savings to be put back into the research priorities, so those are the major changes that we have made.

Senator COCHRAN. With respect to the supplemental, I appreciate your comments on the House action which would reduce by \$20 million the Fund for Rural America to offset some of the additional spending in the bill.

PART 1

695

Did you notice also, and do you have a reaction to the inclusion in that bill of the Supplemental Nutrition Program for Women, Infants, and Children as eligible for funding through the Fund for Rural America?

Dr. WOTEKI. Yes.

Senator COCHRAN. What is your reaction to that?

Dr. WOTEKI. Well, it is certainly a great expansion beyond what I read as being the intent for the Fund for Rural America to allow or permit funding of the WIC program directly from that fund. I think it dilutes the original intent of it.

Senator COCHRAN. We will be taking that up very soon in our committee and having your comments about that will be helpful to us.

I am going to yield to my colleagues for any questions they might have, and I will resume my questioning of the witnesses later.

Senator Burns.

CHILDREN, YOUTH, AND FAMILIES AT RISK

Senator BURNS. I have just one question, doctor. Tell me about the children and families at risk program. Who can explain that program to me?

Dr. WOTEKI. I am going to ask that Dr. Robinson, who is Administrator of CSREES, provide you with some background about the program.

Senator BURNS. You guys have got so many letters and figures down there I do not know what they all stand for.

I had breakfast at the Pentagon this morning and got lost three times before I got out of there. I think the Agriculture Department is getting about the same.

Dr. ROBINSON. It is that time. Even with the acronym for the name of this agency one can get lost in it. I have been there for a year and still can.

Perhaps I could respond generally to your question about the purpose of the Children, Youth, and Families at Risk Program. That program has been funded for a number of years, and the increase of \$2.1 million proposed for fiscal year 1998 increases it above the 1995 level.

Senator BURNS. What is that level?

Dr. ROBINSON. The 1995 level was \$10 million. It is \$11.7 million, but of that \$1.7 million is targeted for 1890 institutions.

The reason for that is as follows. Up until the 1996 reauthorization of the research, extension, and education title, 1890's were not eligible for funds under this funding line for children, youth, and families at risk, and it was felt that a lot of these institutions deal specifically with those problems at risk in the rural communities.

Senator BURNS. Give me an example.

Dr. ROBINSON. It deals with things like making sure that there are programs through 4-H or through other youth activity programs to support youth, to educate youth, to provide alternatives to youth to the kinds of problems that they are involving themselves in.

It also involves in many cases joint work with the Department of Justice or with the Department of Health and Human Services programs in local communities to try to deal with youth crime,

PART 1

696

youth pregnancies, to try to deal with the whole array of problems that young people are facing now, and it is one of the places where actually there are partnerships that are developing between rural leadership and extension and the Children, Youth, and Families at Risk Program, and programs that are also in local communities, or State programs through Justice or Health and Human Services.

But it is addressed very much to the at-risk elements people face in growing up either in rural areas or small towns.

Senator BURNS. It just sounds like to me we have got quite a lot of redundancy here. I mean, you are trying to do the same thing as Health and Human Services are doing.

Dr. ROBINSON. Actually, we are trying very hard to make sure that we have complementary programs that are reaching beyond the programs that Health and Human Services have and reaching both groups of people and groups of problems that their programs do not reach.

That is one of the reasons to try to form partnerships with Health and Human Services, because a lot of the youth problems in many of the rural areas were not being addressed by existing programs, and that was the reason for instituting this line to begin with, and I do not recall the date that it was put into effect, but it has been in effect for several years.

Senator BURNS. I am pretty familiar with WIC and what it does because I have got county government experience, but it is little programs like this that, say, take \$8 or \$9 million here, or \$8 or \$9 million there, and pretty soon we have eaten up a budget, and basically it is make-work for the people in the Department rather than any good that they are doing for youth or families or anything else because of the redundancy involved because everybody is tripping over everybody else out there trying to show that they have compassion and we do not get anything done.

So there might be some redundancy there. That is the reason I asked you what the program does specifically. I have never run into this.

I remember when I was a county commissioner—of course, a lot of water has gone down the crick, except to Grand Forks. It is not going down the crick too quick there, but I just think there is some redundancy here of one Department with another.

Dr. ROBINSON. Perhaps I can answer a couple of the questions you posed. My colleague just told me that this program has been funded since 1991, and the figure in 1997 is \$9.5 million.

Two other programs that might be of interest to you are after school care and 4-H Club work and some summer fun experiences for children who do not understand farming activities, so it is a rather diverse program, and it is really geared to the needs of the local area where extension is located, not to a national program that says do these five things, but rather, what are the needs that are locally identified by local constituencies that are not being served, Senator, by the other programs, and once those are identified to try to address the small amount of resources nationwide specifically to those locally identified issues.

Senator BURNS. Who administers it at the local level?

Dr. ROBINSON. It is administered through the State extension services and through the local county agents.

PART 1

697

Senator BURNS. OK. That is all the questions I have.
Thank you very much, Mr. Chairman.

Senator COCHRAN. Senator Bumpers.

Senator BUMPERS. Thank you, Mr. Chairman.

Dr. Horn—maybe I should ask you, Secretary Woteki, you state in your statement that ARS is moving ahead with a strategic planning task force mandated by the 1996 farm bill to determine which, if any, ARS facilities should be closed, and yet in your budget you propose to close four facilities. Why would you propose that before your task force study is completed?

STRATEGIC PLANNING TASK FORCE

Dr. WOTEKI. Well, as I indicated in my opening statement, Senator, we have also had to make some very hard decisions based on program priorities.

We have taken as a principle that we are not proposing major new construction either within ARS or facilities to be placed on university campuses, except for those that have been very high priority within ARS, and that those three facilities that are included in our budget request represent very longstanding high-priority construction projects within the ARS.

My sense, though, is that given we are in a very tight budget climate at this point in time, given that we do have to be responsive to shifting priorities and shifting needs from the agricultural sector, and given that we do not have expectations of major new increases in funding in agriculture research, we have to make some very hard programmatic decisions based on the quality of the research that is being done as well as its relevancy to those current needs.

Based on those decisions, and a quality review and program review that was done in the Agricultural Research Service, we came to the conclusion that it was appropriate at this time to recommend closure of two work sites and two laboratories.

Now, this task force that was required in the farm bill last year, and for which the Secretary has just recently announced the membership, is tasked with making a strategic plan with a 10-year time horizon on it.

They have 2 years in which to do their work, and they will have their first meeting, in fact, next month to actually begin their work. But given, again, the very tight budget situation, our sense is that we are going to have to continue to make some decisions based on the merits of the work that is being done in ARS's facilities, and we cannot suspend all of those decisions for 2 years while we wait for the task force to complete its work.

Senator BUMPERS. Mr. Chairman, I ask unanimous consent that before I forget it I be permitted to submit a few written questions on behalf of Senator Dorgan, who is not a member of the subcommittee, but is a member of the full committee.

Senator COCHRAN. Without objection, it is so ordered.

Senator BUMPERS. Dr. Horn, you know, since the memory of man runneth not, we have been in these fights about competitive research grants as opposed to the grants that Senator Cochran and I like. I would just like to reiterate my thinking about that by reviewing some of the past history.

PART 1

698

For example, when you look at the increase in aquaculture farming in this country, double from 300-and-something million pounds a year to over 700 million pounds a year since 1980, and the rice germplasm center in Stuttgart is almost finished—and in that connection I had to fight like a saber-toothed tiger to get the rice germplasm center put in Stuttgart, AR, where about 43 percent of the rice in this country is grown, because it was going to go to Idaho, which did not have one single rice plant, simply because they had another germplasm center out there.

Now, I know that in this day of rapid communications maybe it does not make a lot of difference where it is put, but to put a rice germplasm center in a place in Idaho which does not grow any rice at all, as opposed to putting it in a perfectly legitimate place where 43 percent of the Nation's rice crop is grown made no sense.

And I think about the poultry center of excellence, which will become and is becoming one of the greatest scientific centers on increased production, safety, and everything of poultry—I will not belabor the point, but Dr. Horn was just down at Boonville, AR, at the Dale Bumpers Small Farm Research Center and saw for himself the kind of really magnificent work that research center is doing.

So let me just say, Dr. Horn, I do not know which side of this issue or whether you are on either side or not, but would you comment on that?

APPROPRIATE MECHANISM FOR FUNDING AGRICULTURAL RESEARCH

Dr. HORN. I am not sure I exactly have the issue, but I think if the issue relates to the portfolio of funding mechanisms, I am firmly on the side of a mixture. We do have some requirements for rapid responses to emergencies, and directed research, merit reviewed research programs that I think can be and have been just as good as any other kind.

On the other hand, I do think there is a need to attract the larger science community to do some cutting edge work on fundamental research programs that can feed into agriculture and help us in the long run.

I also think that we have benefited from the opportunity to specifically address questions in specific parts of the country where the work is most appropriate through the use of special grants over the years, and so I think my answer to that question would be, we need a mix of funding mechanisms, and each has proven very, very valuable to us.

Senator BUMPERS. As far as I am concerned that is a good answer. I could not agree with you more. There are perhaps some research projects that necessarily have to go on a competitive basis because there is some really giant research institution that could do it. We all admit they could probably do it better. They are equipped to do it better.

But when you think about Mississippi and Arkansas, and Mississippi is considerably bigger than we are in aquaculture, but when you look at the unbelievable increase in production which has occurred because of research—it has occurred some because of the expansion of farming itself, but a lot of it has occurred—if you look at the per acre yield, you will find it is up about fourfold in the

PART 1

699

last 20 years, all of that by research, and when you consider the fact that we are still tenth in the world in seafood production, and it is still the only thing that even holds out—we are still a net importer of fish and aquaculture products.

It contributes I do not know how many billion, a few billion dollars to the deficit every year, and here Senator Cochran and I are just busting to close that gap, and we think a lot of it can be closed by good research, so I just wanted to get that on the record and say that we will continue to fight for legitimate projects that could go to our respective States. After all, this Nation is supposed to serve everybody, not just a few prestigious institutions.

Dr. Woteki.

REAUTHORIZATION OF THE RESEARCH TITLE OF THE FARM BILL

Dr. WOTEKI. Senator, you have actually touched on some very fundamental issues with respect to the way that agricultural research is funded in this country and how we make our decisions about siting of different facilities.

As you are well aware, the research title was reauthorized last year in the farm bill for only 2 years, and that both the Senate and the House Agriculture Committees will be taking up this year reauthorizing legislation for the research programs within the Department.

Senator Lugar posed to us some very, very interesting questions about what would be the most appropriate mechanisms for funding agricultural research now and for the future. In response to those questions, the Secretary sent a letter back to the Senator which I would be happy to share with you that kind of lays out a number of principles that we believe should be the basis for the discussion on the research title reauthorization. It touches on many of these same issues, and we would be happy to share that letter with you as well.

Senator BUMPERS. I would appreciate that.
[The information follows:]

LETTER FROM DAN GLICKMAN

DEPARTMENT OF AGRICULTURE,
OFFICE OF THE SECRETARY,
Washington, DC, March 12, 1997.

Hon. RICHARD LUGAR,
U.S. Senate, Senate Committee on Agriculture, Nutrition, and Forestry, Russell Senate Office Building, Washington, DC.

DEAR MR. CHAIRMAN: I am writing in response to your letter of January 10, 1997. This letter responds to both your letter to me and Dr. Catherine E. Woteki, Acting Under Secretary, Research, Education and Economics. We appreciate your commitment to the future of the agricultural knowledge system, which is comprised of research, education, and extension programs. We welcome the opportunity to discuss the future of these programs within the Department of Agriculture (USDA) and with our partners, and we look forward to working with you and members of the Senate Agriculture, Nutrition, and Forestry Committee in preparation for reauthorization of these programs in 1997.

Federally funded agricultural research, education, and extension are conducted in pursuit of national goals, such as world food security, better health, wise use of natural resources, and greater economic security for agricultural producers. Attaining these goals is challenging given deregulated domestic and foreign markets and economic projections that world food demand will double in the next 30 years. Innovation in the agricultural sector to meet our national goals depends in part upon Federal investment in research, technology transfer, and the education of future sci-

PART 1

700

entists and producers. Although the Federal contribution is 25 percent of national agricultural research and development (R&D) expenditures, we believe that it plays a critical role.

The questions posed in your letter recognize these challenges and provide a thought-provoking starting point for our discussion about the future. This letter provides the Administration's fundamental principles guiding our thinking as we address these issues critical to success of the agricultural sector in the next century. We look forward to continued dialogue with the Committee and plan to provide a detailed legislative proposal to you later this spring.

1. USDA and the Research, Education and Economics mission area¹ within it invest in creating and strengthening the research and educational capacity essential to meeting national goals for the food and agricultural system.

Scientific knowledge is necessary for helping us achieve our broad national goals of improved health, environment, prosperity, national security, and quality of life. Equally important are educational institutions and government programs, such as Extension, that promote the dissemination of knowledge and technologies. Accelerating the development of technologies is critical to sustaining our nation's long-term economic growth and for increasing agricultural productivity while reducing its environmental impact.

Past investment in the research, education, and extension system is broadly believed to be responsible for providing substantial economic advantages to American producers and consumers and simultaneously contributing to food safety and improved health. While agricultural production employs less than 2 percent of the population, the food and agricultural sectors account for 16 percent of jobs. Agricultural exports are a significant player in decreasing the nation's trade deficit. This contribution depends on our constant attention to new challenges that emerge in the form of new pests and diseases that threaten our production capacity, of new organisms or more virulent strains of organisms that challenge our food safety system, and of new competitors around the globe who vie for the markets upon which the prosperity of farmers, ranchers, rural Americans, and all those who participate in the agricultural sector depends.

The Research, Education, and Economics (REE) mission area is focusing our research, education, and extension efforts toward attaining 5 general goals for the nation's food and agricultural system. They are:

- (1) An agricultural system that is highly competitive in the global economy,
- (2) A safe and secure food and fiber system,
- (3) A healthy, well-nourished population,
- (4) Greater harmony between agriculture and the environment, and
- (5) Enhanced economic opportunity and quality of life for Americans.

These goals were derived from purposes of agricultural research defined by Congress in the 1990 FACT Act and the 1996 Farm Bill as well as from input from numerous listening sessions and consultations with stakeholders, including our REE Advisory Committee.

2. The programs of the REE mission are dedicated to maintaining world leadership and excellence in agricultural science and education.

Scientists working at the leading edge in the food and agricultural sciences are essential to maintain and improve our competitive position for U.S. agriculture. U.S. scientists must continue to make a significant share of scientific advances and to capitalize on new discoveries that are made abroad. By maintaining a tradition of scientific excellence, the nation will be better positioned to educate the scientific and technical work force required by our economy. To sustain U.S. leadership in the world and strengthen participation in collaborative scientific and educational endeavors, we must increase our level of interaction with colleagues in other countries.

World leadership is also maintained by funding the best scientific endeavors and the best people to conduct research, education, and extension activities. As a result, the Administration supports increasing the proportion of the portfolio of Federal agricultural research that is awarded by merit review with peer evaluation. This support is evidenced in the President's budget proposal for the Department of Agriculture, which calls for significant increases in appropriations for the National Research Initiative and other competitively awarded grant programs. The Administration also supports and encourages integrated problem solving, as demonstrated by our design of the Fund for Rural America competitive grant program. The chal-

¹The Research, Education, and Economics mission area is comprised of four agencies: the Agricultural Research Service, the Cooperative State Research, Education, and Extension Service, the Economic Research Service, and the National Agricultural Statistics Service.

PART 1

701

lenges of today and the future are more complex than those we have solved in the past and require multi-functional, multi-disciplinary, multi-institutional approaches to problems. As a result, the research, education, and extension system must build on proven successes and adapt to future challenges. Well educated scientists and citizens are the well spring of new ideas and new solutions to challenging problems. America will need a scientifically literate society to face the challenges of the 21st Century. Higher education programs of diverse institutions as well as nonformal education provided by Extension are critical to achieving this literacy.

We will sustain this excellence only by engaging the talents of our diverse population. A responsive research, education, and extension system is comprised of people with a variety of experiences and perspectives, providing the necessary insight for problem solving. We must improve our educational and extension systems to give children and adults a greater understanding and appreciation of the food and agricultural sciences, thereby better informing their decisions and understanding.

3. *The Federal government has a distinct role to play in partnership with state and local governments and the private sector.*

Federal investment in research, education, and extension is necessary despite significant state and private sector investments. Economically, while state funded research benefits that state's producers and consumers, some portion "spills over" to consumers and producers in other states. If a state considers only the benefits of its research to its own producers and consumers, it would tend to invest less than would be optimal from a national perspective. This is similar to the case of a private firm under investing in research because it cannot capture all the returns, such as research on food safety, diet, health, and the environment, where private or state investments are low but social payoffs are high. In addition, states will tend to favor applied research and technology development at the expense of more basic or pre-technology research, since the former is likely to have more direct state benefit.

A second unique role for the Federal government is that of providing in-house scientific expertise, which is essential for national and international leadership and coordination in agricultural science and education. The effectiveness of the State system depends on regional and interregional coordination and linkages provided through national program leadership in USDA.

Consistent with the Administration's philosophy that state, local, and tribal governments have strong roles in governance, the Administration values an active federal-state-local partnership in setting research, education, and extension priorities, in conducting the work, and in evaluating the results. The Administration supports efforts such as:

- stronger integration with the broader science community (to the benefit of applications and advances in food and agricultural sciences);
- increasing responsiveness to the needs of today's and tomorrow's constituents;
- institutional arrangements that enhance efficiencies and reduce duplication within the national system, as well as effectively address regional and multi-state issues.

The Administration also values public sector-private sector partnerships as another means of leveraging scarce federal dollars. USDA currently focuses on two tools to bridge between public research and private economic opportunity. First, the 1986 Technology Transfer Act permits Federal laboratories to enter into Cooperative Research and Development Agreements (CRADA's) with universities, private companies, non-Federal government entities, and others. CRADA activity at USDA has increased rapidly since the program was first instituted in 1987. Between 1987 and the present, USDA has entered into over 650 CRADA's with private firms. Second, the Small Business Innovation Research Program, established in 1982, has been implemented at 11 Federal departments including USDA. In 1996, the USDA program will exceed \$10 million. Awards are made for initial exploration as well as precommercialization of research findings applicable to solving agricultural problems, including rural development.

Effectively meeting national goals requires a system of customer input, evaluation, and assessment. To ensure responsiveness to the public in meeting these goals, the Administration supports broad stakeholder access to priority setting processes and transparency in those processes. Two mechanisms currently used by the REE mission area are advisory bodies and the Government Performance and Results Act (GPRA).

Input from advisory bodies should always inform Federal government action, whether formally provided by the recently appointed National Agricultural Research, Extension, Education, and Economics Advisory Board (Advisory Board) or through informal interactions with stakeholders at the national, state and local level. Since being authorized, the Advisory Board has had one meeting and will

have its second meeting this month. The Advisory Board has provided the Secretary of Agriculture with advice on implementation of the Fund for Rural America, the composition of the Strategic Planning Task Force to review research facilities, and is considering recommendations on REE strategic plans and the reauthorization of the research title of the 1996 Farm Bill. We expect that the Advisory Board, over time, will more clearly define its role and, as Congress intended, will become an effective clearing house for numerous other advisory systems from the national, State and local levels.

Second, the Advisory Board will also be an integral part of the process of program review related to the implementation of the Government Performance and Results Act (GPRA). In response to GPRA, the REE mission area and agencies have developed a set of draft strategic plans, on which we look forward to consulting with you and the Committee, and we are in the process of developing performance plans. In the development of performance plans for research, education, and extension activities, we are considering adopting a combination of quantitative and qualitative measures. These techniques will be used to assess the quality, relevance, and timeliness of our research and education efforts. Adapted to the research, education, and extension context, we believe GPRA will serve us well, allowing us not only to conduct programs more effectively but also to be able to more accurately describe the value of those programs to society.

4. Wise strategy for public investment supports a diversified portfolio offending sources and mechanisms as well as diverse institutions performing research, education and extension.

The diverse portfolio consists of multiple funding sources and funding mechanisms as well as a diversity of institutions and performers. Our portfolio currently contains extramural funding in the form of formula funds, special grants, and competitive grants in addition to intramural funding. The Administration also recognizes that diversity among the institutions performing research, education, and extension is critical to ensuring that national goals are effectively met. A diversity of performers fosters creativity and innovation. It increases the number of perspectives on a problem, enriches competition among proposals, and induces competition to support the best work among funders, both public and private. Diverse funding alternatives give original ideas a better chance to find support than a more centralized system. As a result, a diverse system enhances quality of output and strengthens national capacity to respond to new opportunities and changing national needs.

The Administration supports USDA's mix of extramural programs in research, education, and extension, and is a proponent that formula or base program awards should allow and support maximum flexibility for states to use resources where they have the greatest ability to solve problems. The Administration also supports a strong Federal role in leveraging resources, and recent program efforts have emphasized multi-State, multi-institutional collaborations. Strengthening current mechanisms, such as the regional research program, which requires 25 percent of Hatch funds be used for multi-State efforts, and proposed mechanisms, such as set-asides for cross institutional extension, support this effort. Accountability to shared regional and national goals is also critical to this effort. As has been consistent for many years, the Administration does not support state-specific or commodity-specific special grants. The Administration does support mechanisms for multi-state research projects addressing problems of national or regional importance, such as water quality and integrated pest management. Wherever appropriate, the Administration supports nonfederal matching requirements to encourage maximum leverage of federal dollars.

The Administration also supports a balanced portfolio of intramural and extramural research. USDA relies on the REE agencies to provide the science base to fulfill its mission, and we have a historical commitment to strengthening university-based research and higher education. We look to the intramural agencies—the Agricultural Research Service (ARS), the Economic Research Service (ERS), and the National Agricultural Statistics Service (NASS)—as the primary performers of mission-oriented, problem-solving research and for the generation of statistical data important to program and policy decisions. The university-based scientists supported by CSREES produce a mixture of basic, applied, and developmental research that is key to American agriculture's future. Simultaneously, it disseminates new knowledge and new technology, and it trains the next generation of scientists and engineers.

Determining what constitutes an appropriate balance depends on the ultimate goals desired from the Federal investment. In past years, when budgets could be expected to grow every year, the question of appropriate balance between the intramural and extramural parts of the portfolio was not a major issue. With the pros-

PART 1

703

pect that the agricultural research budget will remain flat for the foreseeable future, it is of growing significance. The Administration has already expressed its preference for increases in university-based, competitive, merit-reviewed research to ensure that the Nation receives the highest quality return on its investment while maximizing the ties between research and higher education. The President's budget requests have consistently reflected this position. At present, we have little in the way of program evaluation to guide an assessment of the optimal proportions of extramural and intramural effort, but we look to GPRA as a way to introduce greater rigor into this much-needed analysis.

Intramural research conducted by the ARS addresses critical national issues requiring long-term commitments and specialized facilities, supports the research needs of action and regulatory agencies, and provides research required to support national or international policies and to meet international standards and certifications. This research is subject to an internal peer review process, which is currently under review. ARS research provides a critical resource base so USDA can rapidly respond to new problems and emergencies as they arise and supports long-term, high-risk research, in which the private sector is not likely to invest.

Federal laboratories contribute to our science and technology base in support of national goals and are an important part of our national science investment and infrastructure. It is a resource that must be continually renewed and renovated. Given the government-wide constraints on discretionary program funding and the priority this Administration places on strengthening support for research funding, careful consideration of the design of an infrastructure and its renewal is critical. We expect the Strategic Planning Task Force authorized in the 1996 Farm Bill to put forward significant recommendations regarding the best and most efficient use of future Federal investments in public agricultural research facilities.

Federal funds are currently distributed to the 1862, 1890, 1994, and Hispanic-serving institutions. In September 1996, President Clinton announced a Presidential Review Directive (PRD) to examine university-government partnerships. In cooperation with the National Association of State Universities and Land Grant Colleges (NASULGC), REE has begun to evaluate these partnerships. This will be a wide-ranging review, which we anticipate will be completed by late Fall 1997, containing recommendations that may be implemented using existing administrative authority. We will keep the Committee informed of our progress.

Mr. Chairman, Federal investment in research, education, and extension for the achievement of national goals has never been more critical to the success of the agricultural sector. While our system has served us well, clearly it is time to assess current programs, policies, and funding mechanisms to ensure those national goals are effectively met. The appendix accompanying this letter provides you with salient facts about the Nation's agriculture research and development, education and extension system. We expect to communicate to you our specific proposals for administrative and legislative change at the earliest opportunity. We look forward to the coming important debate about the future of the research, education, and extension system, and we look forward to working with you and members of the committee to strengthen the capacity of the research, education, and extension system.

Sincerely

DAN GLICKMAN,
Secretary.

March 1997

LETTER FROM SENATOR LUGAR

U.S. SENATE,
COMMITTEE ON AGRICULTURE, NUTRITION, AND FORESTRY,
Washington, DC, January 10, 1997.

Hon. DAN GLICKMAN,
Secretary, U.S. Department of Agriculture,
Washington, DC.

DEAR SECRETARY GLICKMAN: Research is vital to the future of agriculture. As you know, agricultural research, extension and education programs must be reauthorized by Congress in 1997. In preparation for review of the current programs and structure, I have prepared a list of questions for consideration. These questions will serve as the basis for a thorough and thoughtful review of the current research system structure, funding mechanisms, coordination, priority setting, and accountability. It is my hope that these questions will be given serious consideration. Your an-

PART 1

712

swers and views will be helpful as we formulate legislation to reauthorize these important programs.

I will appreciate your review of these questions and would value your answers to as many as you feel able to address. I would appreciate hearing back from you by March 14. Please feel free to share these questions with others who have an interest in agricultural research, extension and education. I look forward to hearing from you soon.

Sincerely,

RICHARD G. LUGAR,
Chairman.

AGRICULTURAL RESEARCH, EXTENSION AND EDUCATION

QUESTIONS FOR CONSIDERATION FOR 1997 REAUTHORIZATION

RESEARCH SYSTEM STRUCTURE

If the U.S. agricultural research, education, and extension system was created today, how would it be structured to maximize the social rate of return on federal funds committed to the system? How would such a system compare to the current system, which traces its roots back to the Morrill Act of 1862?

USDA's research budget for in-house research is more than twice the average for all government agencies. What type of research should be conducted in-house by ARS and what research can be done as well and more cost effectively by nonfederal institutions?

Is there a need for a college of agriculture in every state or should there be a greater effort to regionalize agricultural research (such as develop regional centers of excellence that link researchers from various states to work on research of regional importance)? What would be the impact of such a change on states with smaller colleges of agriculture that may end up closing or losing resources?

How should the more than 100 ARS laboratories be consolidated to increase efficiencies, reduce duplication with land grant research, and maintain the "critical mass" of scientists and equipment needed to ensure quality science?

Should limited federal funds be spent to construct research facilities at and for land grant and other universities?

How should our research system structure and delivery be changed to be prepared to meet the challenges of the agriculture sector in the next century?

FUNDING MECHANISMS AND ISSUES

In federal funding of agricultural research, what would be the ideal allocation of funds for basic and applied research? What has historically been the allocation and what is it today?

Federally funded agricultural research is allocated among intramural funds, formula funds, competitive grants, and special grants. Are these the most effective methods of allocating funds? If not, what is a more effective method? If they are, what is the proper balance between intramural funds, formula funds, competitive grants, and special grants?

Should receipt by land grant universities of federally-funded agricultural research and extension funds be contingent on their ability to demonstrate that a wide variety of stakeholders have dedicated to public goods in which the private sector is unlikely to invest?

What percentage of ag research funding is attributable to non-competitive funding sources, including special grants? What is the corresponding percentage for other major federal research entities including NIH, NSF, NASA, etc.? If there are significant differences, why do they exist?

The U.S. Department of Agriculture (USDA) differs from other federal agencies that support science in that the majority of agricultural research—more than 60 percent—is done in-house, by the Agriculture Research Service (ARS). (Other major federal research agencies, such as the National Institutes of Health and National Science Foundation, award more than 80 percent of their research funds competitively to scientists at a wide range of extramural laboratories.) What would be the costs and benefits of initiating a transition to a more NIH-like approach (with competitive grants as the main delivery system of federal funding) to federal agricultural research? Would this approach provide greater public return on the investment?

There is widespread support for increasing the percentage of federal agricultural research funding that is awarded competitively, as well as increasing the amount

PART 1

713

of dollars available for such grants. Assuming continued fiscal constraints, the options for meeting this demand are 1) to use savings stemming from changes in mandatory spending programs; 2) to redirect a portion of formula funds and special research grants to the current competitive grants program; or 3) to redirect a portion of ARS funding to this purpose. What would be the costs and benefits of implementing any one or a combination of these approaches?

Should the formulas by which food and agricultural research and extension funds are allocated within the land grant system be revised to better reflect changing state demographics and the increasingly diverse food and agricultural research community? Are these formulas appropriate for the research and extension needs of the 1990's and beyond? Would a regionally based (rather than state) formula approach better serve or provide a greater return to agriculture? What impact would changes in these formulas have on land grant universities?

How do smaller universities fare in the competitive grant process? Is it appropriate for the federal government to "set aside" a portion of the grant for these smaller universities?

EXTENSION SERVICE ISSUES

In the absence of federal funds for the Extension Service, would states and localities continue to provide the service? Could the federal funding role be replaced by a memorandum of agreement elicit increased state or private funding for agricultural research?

COORDINATION AND PRIORITY SETTING PROCESS

Are there overlapping missions and duplication of effort between federally conducted research and research conducted by universities and the private sector? Is there duplication with research funded through research and promotion programs (check-offs)? How can the mission and focus of USDA's and land grant universities' agricultural research program be more clearly defined to better complement one another and avoid unnecessary duplication?

Since the private sector accounts for the preponderance of total agricultural research spending, what processes exist to ensure that public research does not unnecessarily duplicate efforts already underway among private researchers? If no or few processes exist, is it desirable to develop them? If so, how could they be reconciled with the need to protect confidential business information?

What is the best process to use to set priorities for research, extension and education? Should additional guidance be given to the newly authorized National Agricultural Research, Extension, Education and Economics Board regarding how it is to function? What priority setting process should be used to ensure that recommendations reflect the needs of those who benefit from and utilize agricultural research conducted by or funded by the federal government? Is it important to evaluate whether priorities have been followed when research funds have been awarded?

ACCOUNTABILITY

What is the American public getting for its \$1.8 billion annual investment in agricultural research? (For example, how much funding goes to scientists versus administration and facilities, how many USDA and land grant universities are doing research in similar areas, and how many prestigious scientific awards for agricultural research go to USDA, university and private sector scientists respectively.) What is the best criteria to Judge whether the federal government is getting the most for its agricultural research dollars?

With growing accountability in government (for example, GPRA), how should federally-funded agricultural research results be measured and their impacts evaluated? Is there a body of science that can be used to measure research results and impacts? If so, is it currently being used?

CHILDREN'S HOSPITAL NUTRITION CENTER

Senator BUMPERS. When I first came here Bill Proxmire was the keeper of research money, and he came down 180 degrees. I voted against him every time I got a chance, because he always wanted everything to go on a competitive basis, which meant MIT and Harvard, and Stanford, and Cal Tech, and places like that, and other places who are capable of doing an awful lot of research

PART 1

714

never got considered because they did not have prestige and certainly they did not have the reputation some of these others did.

As I say, the proof is in the pudding. If you go look at some of these research centers that some of us on this committee have fought to get for our States you will find they are doing really excellent work.

Which brings me, Dr. Horn, to the nutrition center at Children's Hospital. I understand you visited that, is that correct?

Dr. HORN. I have been to that center and the other several times, including the one that I am sorry to say has got a basement full of water this week at Grand Forks, ND.

Senator BUMPERS. There are six of those in the country.

Dr. HORN. That is correct. That is a very important program for us. You will note in the President's budget request that we have a human nutrition initiative which, although it does not say it, is intended to make stronger the linkage between agriculture and human nutrition.

A good bit of the research that would be done under the auspices of that increase is to identify phytoactive compounds in foods that, in fact, can promote health and prevent disease.

USDA, of course, has the mandate to do nutrition work on behalf of healthy Americans as opposed to sick ones, and our intent is to develop a program that will prevent illness through this initiative.

The time is right. There are new technologies available to us that allow us, we think, to make some major breakthroughs in health care and prevention, and we are hopeful that this will be a real shot in the arm for those six centers.

Senator BUMPERS. Incidentally, Dr. Horn, I want to come back to nutrition in just a moment, but did you know that the rice-growing States are now producing more and more rice for Japan? It is a species developed by the Japanese, but we are growing it, and growing it very successfully, and we are exporting it to Japan. Are you familiar with that?

Dr. HORN. Yes; I am. In fact, one of the great achievements of the Department is to open up that market. And although I would say that U.S. long grain rice has always been world class standard, this rice that we are growing for Japan is a major addition for our international trade.

Senator BUMPERS. Our farmers love it because they get more for it than they do on the domestic market.

Dr. HORN. Yes, they do.

Senator BUMPERS. Back to nutrition. Mr. Chairman, I will yield. I just want to make this point. For those of us who have had chest pains in our life and still go for stress tests, the question is always first are you working out? Answer, yes. And what is your dietary habits, and so we go through that.

Now, that is an adult question, and I am talking about really the pediatric nutrition center at Children's Hospital in Little Rock, but I can tell you that so many of the health problems in this country, an unbelievable number of the amount of health costs in this country is directly related to poor nutrition.

I watched—you know, I have watched the Children's Hospital and Medical Center wrestle with these nutrition problems for a long time, and we have done quite a bit of research, but we still

PART 1

715

really—I consider that to almost be in its infancy, because we still do not really know—we know fat is bad for you, but we do not know how much of it, where the threshold changes, and when it comes to infants, you know, you saw the conference over at the White House the other day where the first 3 years of a child's life is absolutely critical to the very life of that child, and a large part of that deals with nutrition.

Now, we learned a long time ago that a good protein diet during the fetal period as well as during the neonatal period—we learned a long time ago that protein builds brain cells, and if you do not have a decent protein diet for both the fetus and the infant, that child's brain is not going to develop right. That is the reason we started the WIC Program, to make sure that poor pregnant women get a decent diet, get a good protein diet.

And I must say, we had all these people come and testify the other day for another subcommittee on appropriations. Rob Reiner, who has a program of his own—but in any event a couple of Governors and a psychiatrist from Houston, Baylor University Hospital there, and they were all honed in on this research which has determined, and as far as I know—I didn't know this was new. I thought this was old information, how critical the first 3 years of an infant's life is.

But it goes to a lot of things. It goes to how much attention they get, how tenderly they are handled, a whole host of things, their environment, but at the top of the list is nutrition, what kind of diet they get, so, I think these pediatric nutrition centers serve a great purpose, and I am convinced we are just in the infancy of deciding what we really need to be doing now.

I might say—this has nothing to do with agriculture, but I asked those people the other day, if you know that, then the next question is, what are we doing here in Congress? First of all you have to have a decent home for that child's first 3 years. Second, you have to have decent health care for that child's first 3 years, and you have to have devoted, caring parents.

I have said many times that talking about family values is a wonderful thing. I do not like for people to lecture me on family values. I have got the greatest family anybody could have. That is why I do not like for people to tell me about family values. I know that.

But I can tell you one thing, there are a lot of children in this country that would be better off anywhere than where they are, so to say that does not conflict with family values. Some people ought to be taken out of the environment they live in, and as I say, that has nothing to do with agriculture.

Coming back, it is a whole host of things that make a healthy, bright child, and to say that it all happens in the first 3 years is one thing, but the really basic question is, How do you determine how that child is going to get all that tender loving care during the first 3 years? I chose my parents well. A lot of people do not.

Do you have any comments on what I just said, or did I say it all? [Laughter.]

Dr. WOTEKI. I think definitely we would agree with you that the first 3 years of life are extremely important for children and that

PART 1

716

nutrition plays a very critical role both in a successful pregnancy, a healthy baby at birth, and in that child's development.

I mentioned in my opening statement the fact that we have been involved with some strategic planning over the last year and a half to respond to the Government Performance and Results Act, and as part of that we have identified some major goals for our research program.

One of them is a healthy, well-nourished population. That planning activity has given us a lot more insight into how we can transfer the findings of research from places like the Children's Hospital in Arkansas and our research center in Houston, which also focuses on the nutritional needs of women during pregnancy and of their children in their most formative years, very quickly to the public, and to educators who are working with the public.

We have, on a trial basis, had an extension educator located at the Human Nutrition Research Center in Houston, and that person has taken the primary responsibility for taking those research results and getting them out quickly to the extension community so that they can be helping parents such as you have just described, and also so that that information can be folded into some of our other education programs like the Expanded Food and Nutrition Education Program, which provides information on good nutrition and how to make food purchases on a limited budget to families that are of limited means.

So, this reorganization that has occurred within the Department within the last couple of years that created this organization that sits before you, research, education, and economics, gives us the opportunity to move the research results into the applications much quicker and address some of your concerns about healthy mothers, healthy babies, and maximizing their growth.

Senator BUMPERS. You are asking for a \$6 million increase in that program. I applaud that. It ought to be a lot more than that, but Senator Cochran has the responsibility of making the money fit here, and the committee has additional responsibility.

Mr. Chairman, that is the end of my story.

Senator COCHRAN. Thank you very much, Senator.

Dr. Woteki, I have a number of questions on various subjects that I am going to submit, one of which involves this integrated pest management.

I am going to ask some specific questions to Dr. Horn and his staff on that subject, but I know that one of the goals of the integrated pest management initiative is to bring much of the Nation's farmland under integrated pest management practices by the year 2000.

Can you give us a status report as to what has been accomplished in that regard to date, and what the additional funds you are requesting for 1998 for this project will achieve?

INTEGRATED PEST MANAGEMENT

Dr. WOTEKI. Yes, Senator; I can. I am fumbling here. I had put aside some special notes which I cannot seem to put my hands on immediately with respect to IPM, but we do within our budget request have an increase for IPM that involves actually three dif-

PART 1

717

ferent agencies within this area, the Agricultural Research Service, CSREES, as well as the Economic Research Service.

You are correct in identifying that the Department has a goal of bringing 75 percent of crop acreage under IPM practices by the year 2000, and the initiative that is included in our budget this year addresses not only research in support of meeting that objective, but also extension education programs, as well as monitoring programs or surveys, essentially, to monitor our progress toward meeting those goals.

I would like to start with ARS, since your question was immediately addressed toward ARS, but as far as IPM activities go there are two other agencies within the mission area that are also included within this initiative.

So, Dr. Knipling, would you like to address the ARS part?

Dr. KNIPLING. Well, Mr. Chairman, IPM is, of course, a very important part of the ARS program. It literally touches just about everything we do at most of our laboratories.

Our proposal for 1998 does call for a \$4 million increase in this area, and that is on top of about an \$18.5 million program at the present time.

Specifically for next year we want to emphasize the areawide pest management program. That is, to try to pull together many of the things we have learned in past programs and to actually apply it on an areawide basis, perhaps in almost a validation demonstration mode, working with the growers, the extension people, and many other parties, private industry as well.

Senator COCHRAN. Where will you undertake this research?

Dr. KNIPLING. Funding for this program is slated to be allocated on a competitive basis that we will manage.

Senator COCHRAN. Are you spending money in this way in this fiscal year?

Dr. KNIPLING. We have that program underway now.

Senator COCHRAN. Where is the research being undertaken now?

Dr. KNIPLING. Three programs are underway now, one in the Pacific Northwest oriented toward codling moth in apples and in pears, in the upper Midwest on the corn rootworm, and in the Midsouth on cotton insects. Those are the three main programs currently in place.

Senator COCHRAN. Where is the research being undertaken?

Dr. KNIPLING. In the Pacific Northwest it is based out of our Wapato, WA, laboratory. In the upper Midwest, there are several locations, with Brookings, SD, administering the program and then in the Midsouth, the program is based out of Stoneville, MS.

Senator COCHRAN. Can you give us for the record what the exact projects are and where they are being undertaken?

Dr. KNIPLING. Yes; we can provide that for the record.

Senator COCHRAN. And where the money, the \$4 million for IPM research will be spent next year under your program?

Dr. KNIPLING. Yes; we can provide that for the record.

[The information follows:]

AREAWIDE IPM PROGRAM

Of the \$4 million requested, \$1 million will be used for Areawide IPM and pilot test programs; \$2 million will be used for augmentation biocontrol and biologically-

PART 1

718

based IPM in field, horticultural and vegetable crops; and \$1 million will be used for host-plant resistance and related pest management strategies.

The current location of the ARS Areawide IPM test sites are as follows:

1. Southern Insect Management Research Laboratory, Stoneville, Mississippi
Cotton Bollworm/Corn Earworm/Tobacco Budworm Research Sites:
 - Washington County, Leland/Stoneville, MS
2. Fruit and Vegetable Insects Research Laboratory, Wapato, Washington
Codling Moth Research Sites:
 - Progressive Flat, Obanogan, WA
 - Brewster Flat, Brewster, WA
 - Manson, WA
 - West Wapato, WA
 - Lake Osoyoos, Oroville, WA
 - West Parker Heights, WA
 - Howard Flat, Chelan, WA
 - Ukiah, CA
 - Randall Island, CA
 - Medford, OR
3. Crop and Entomology Research Laboratory, Brookings, South Dakota
Corn Rootworm Research Sites:
 - North Central IL/IN (on the border) in Eastern Iroquois County, IL (near Sheldon); and Western Benton County, IN (near Sheldon, IL)
 - Northeastern IA, Jackson County, Preston, IA
 - North Central KS, Republic County, KS (near Scandia)
 - Southeastern SD, Brookings County, Brookings, SD

AREAWIDE PEST MANAGEMENT PROJECTS

1. *Research Project on Cotton Bollworm / Corn Earworm:*
 - Control Strategies for *Heliothis/Helicoverpa* SPP. and Other Field Crop Insects in Cotton Agroecosystem, Stoneville, MS
2. *Research Projects on Codling Moth:*
 - Areawide Pest Management of Corn Rootworm in Maize Production Systems conducted at Progressive Flat, Okanogan, WA; West Wapato, WA; Lake Osoyoos, Oroville, WA; and West Parker Heights, WA
 - Codling Moth Areawide Management Project, Brewster Flat, Brewster Heights, WA; Hanson, WA
 - Areawide Codling Moth Pilot Test Project, Howard Flat, Chelan, WA
 - Codling Moth Areawide Management Project, Mendocino County, Ukiah, CA
 - Areawide Management of Codling Moth Using Mating Disruption, The Randall Island Project, Randall Island, CA
 - Areawide Suppression Program for Codling Moth in Oregon, Medford, OR
3. *Research Projects on Corn Rootworm:*
 - Development of a Corn Rootworm Areawide Management Program, North Central IL/IN (on the border) in Eastern Iroquois County, IL (near Sheldon); and Western Benton County, IN (near Sheldon, IL)
 - Development of a Corn Rootworm Areawide Management Program in Iowa, Northeastern IA, Jackson County, Preston, IA
 - Development of a Corn Rootworm Areawide Management Program in Kansas, North Central KS, Republic County, KS (near Scandia)
 - Areawide Pest Management of Corn Rootworm in Maize Production Systems, Southeastern SD, Brookings County, Brookings, SD

INTEGRATED AND AREAWIDE PEST MANAGEMENT—\$4,000,000

Areawide IPM and Pilot Test Programs—\$1,000,000.—Headquarters.

Augmentative and Biologically-based IPM in Field, Horticultural and Vegetable Crops—\$2,000,000.—Stoneville, MS, Orlando, FL, Beltsville, MD, Gainesville, FL, and Weslaco, TX.

Host-Plant Resistance and Pest Management Strategies—\$1,000,000.—Stoneville, MS, Ames, IA, and Raleigh, NC.

PART 1

719

CHEMICAL/NONCHEMICAL RESEARCH

Senator COCHRAN. Is there any way for you to break down your chemical and nonchemical research components that fall within the general area of integrated pest management?

Dr. KNIPLING. Yes; we have that data. The vast majority is actually oriented toward nonchemical research, employing biological control and genetic mechanisms. Certainly when we get into the integrated pest management arena, that implicitly embodies all types of approaches in some combination. So, we probably could not discretely break out the pesticide part of IPM, but we can for other parts of our pest control program.

[The information follows:]

ARS CHEMICAL/NONCHEMICAL PEST CONTROL RESEARCH

Of the \$134 million ARS spends on pest control research in fiscal year 1997, \$106,799,000 is devoted to non-chemical pest control and \$27,437,000 is devoted to chemical pest control. The \$134 million total can also be subdivided into other categories: \$53,770,000 is allocated to biocontrol, \$18,544,000 to integrated pest management, and \$61,922,000 to other pest control programs.

ARS research on non-chemical means of pest management includes fundamental studies of the taxonomy, biology, ecology, physiology, pathology, metabolism, and nutrition of pests and host plants and animals; as well as development of non-chemical means through natural enemies such as predators, parasites, and pathogens of pests, pest resistance, sterile insect technology, naturally-derived attractants and repellents, and cultural and physical control practices.

ARS research on chemical means of pest management deals with technologies and systems to reduce chemical pesticides and improve upon the timing, safety, and efficiency of their use in concert with environmental and economic goals. ARS does not devote any resources to the development of new chemical pesticides, but does evaluate new ones developed by industry and other cooperators. More specifically, our efforts on chemical means is largely directed at improving pesticide use patterns, including development of safer, more effective ways to use chemical pesticides in pest management schemes by timing, formulations, and modes of application; improved detection and measurements of pesticides and metabolites; and ways to eliminate or minimize chemical residues.

NATIONAL RESEARCH INITIATIVE

Senator COCHRAN. Dr. Woteki, the National Research Initiative is another major goal for research, and it is, I understand, going to get under your budget an increase of \$36 million, a 38-percent increase from this current year level of funding if we approve the request. We understand from your statement that the research is primarily in three areas, food safety, genetic enhancement of plants, and environmental quality.

Could you tell us anything about the results that the national research initiative has produced in terms of direct, quantitative benefits or anecdotal successes to date?

Dr. WOTEKI. Well, I am going to call on Dr. Bob Robinson to give you some anecdotal evidence of success for the National Research Initiative, but before I ask him to do that I want to indicate to you that we are intending to do a review of the NRI to essentially assess its performance over the first 6 years or so of its life. It seems like it is an appropriate time to begin such a review.

The current chief scientist for the National Research Initiative, Dr. Ron Phillips, is actually the person who recommended that it is appropriate to do such a review at this point in time, and those

PART 1

720

of us in leadership within the mission area and who sit on the NRI's board very heartily endorse that idea.

He has as well collected some information about the NRI and the specific achievements of research that is funded under it, and is planning to make that more generally available so in the near future you need to be looking for some information we will be providing to you on a rather routine basis about the NRI's accomplishments.

Having said that, I would like to ask Dr. Robinson to highlight some specifics for you.

Dr. ROBINSON. Thank you, Dr. Woteki. The question that you have posed really has very many nice things to report, and I am certainly not going to be able to get them all here. What I would like to do perhaps, Senator, is to give you a few and then send you a brief which has a rather significant array.

Senator COCHRAN. That would be helpful.

[The information follows:]

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE NATIONAL RESEARCH INITIATIVE ACCOMPLISHMENTS

In the summer of 1996, about 400,000 of Bt corn was grown in the U.S. Bt corn has a bacterial gene incorporated into the corn genome that produces a toxin extremely effective against the European Corn Borer. Estimates are that 3.4 million acres will be grown in 1997. Although this product is viewed as developed by industry, public research laid the groundwork for its development. The National Research Initiative (NRI) has funded considerable work on *Bacillus thuringiensis* (1) for determining the way Bt toxin destroys its insect host so that the most effective Bt genes can be incorporated into the engineered plant, and (2) for understanding the biochemical and ecological basis of insect resistance to Bt so that resistance problems can be avoided or delayed with the engineered crop. Other NRI funding has allowed the molecular genetic mapping of corn leading to efficient means for crossing the transgene into various elite lines, documentation of the genetic behavior of tissue cultures facilitating the regeneration of corn plants with the Bt gene, etc.

The safe handling of food has been enhanced through NRI funded projects. One of the outcomes is the isolation of protein—invisible when applied to food preparation surfaces such as cutting boards—that binds firmly to the surface but does not allow harmful bacteria to bind. If they do bind, the protein kills the cells. This product is called Nisin, developed by researchers at Oregon State University. The medical field is considering Nisin's value in treating mechanical devices used in medicine.

The Spider Lamb Syndrome—SLS—is a congenital skeletal defect controlled by a single recessive gene. Lambs that carry the gene in heterozygous condition—carriers—are perfectly normal—but matings between two carriers produce defective lambs in about 25 percent of the progeny. Knowing that breeding stock carries this gene reduces their value by about 70 percent. The gene is becoming more and more prevalent in the Suffolk and Hampshire breeds. In 1994, the NRI published a "Research Highlights" publication page indicating that research had been funded to discover a marker gene that might allow farmers to know when a ewe or ram carried the gene. In the ensuing years, a marker was found that would allow the identification of such carriers with 92 percent accuracy. Using the chromosome map position of this marker gene in sheep as a guide, Utah State University researchers looked for the marker on the human molecular genetic map. At about the same distance from this marker gene as found between it and the SLS trait in sheep, the researchers noticed that a human trait had been mapped that also influenced skeletal development. Using the human gene as a probe onto the DNA from progeny segregating for the SLS, the researchers found that this gene was 100 percent associated with the trait. By this series of discoveries, we now have available not only a perfect molecular genetic tag to know when a lamb is a carrier, but the exact gene causing the biochemical defect is now known.

Several wild species of tomatoes produce seemingly worthless small—½-inch diameter—green fruit. It is not surprising to find that these wild tomato species furnish genes for cold tolerance, virus resistance, insect resistance and increased solids. What is surprising is that a Cornell University researcher, through NRI funding,

PART 1

721

found that these green tomatoes possess genes that will make our normal red tomato even redder. The researcher has found that the use of the molecular genetic map of tomato, also developed in part through NRI funding, allowed him to detect genes in the green wild tomato that have an effect directly opposite to what one would expect. The researcher also found that these tiny fruited tomatoes have genes that will increase yield in our normally cultivated types.

Researchers at Purdue University have developed a system to use corn grits—ground corn kernels—to take the water out of ethanol produced from corn, a system now used to process 750 million gallons of ethanol per year at a significant cost savings over other methods. Through NRI support, the technology is being extended to new applications. For example, modified grits are being examined as a replacement for expensive inorganic desiccants in pressure swing dryers to provide dry air or other gases for use in paint spraying, ozone generation, and pressurization of power and communication cables. In addition, corn grits are being examined as a low-cost, natural desiccant for air conditioners based evaporative cooling; in this application, the grits can help displace ozone-depleting chlorofluorocarbons and tap into a \$26 billion global market.

SOYBEAN NEMATODE RESEARCH

Dr. ROBINSON. Let me begin with one that I have used before which I find absolutely intriguing from the point of view of using fundamental science for a really basic problem, the really basic problem being nematodes with soybeans. The fundamental question is, How does it happen? How does the nematode actually destroy the soybean's productivity?

Scientists from North Carolina State University have discovered, it does it by exuding an enzyme which triggers a genetic trigger inside the soybean plant that says divert food to the nematode, and with some manipulation and fundamental biological science, scientists at North Carolina State University have been able to change that coding structure in a way that the plant now ignores the enzyme's messages to the genetic structure, and the nematode starves—very basic science applied to a very real problem.

We actually find that when we can go across the country and really look at developments all the way around, improving crop yield and disease resistance—for example, many plants have evolved very sophisticated systems to prevent inbreeding and promote outcrosses.

One mechanism is self-incompatibility, a genetic barrier to self-fertilization. For example, pollen of one genotype is not able to fertilize the ovule of the same genotype. In many plants this is controlled by a protein which rejects its own pollen.

Senator COCHRAN. A protein?

Dr. ROBINSON. A protein. Using the petunia, a very simple plant, scientists at Penn State University were able to use an approach in which they turned that protein around and actually, then, by turning the protein around they prevent the petunia from rejecting its own pollen and allow a cross, and what this is able to do in the future in terms of productive agricultural crops opens a wide array of possibilities.

NEW VACCINES

NRI funds have supported the development of new vaccines that deal with the viral diseases of pigs, for example. According to the National Pork Producers Council the porcine reproductive and respiratory syndrome is the most important animal health problem facing pigs, and researchers at South Dakota University, using

PART 1

722

funds from the NRI, have identified and characterized the agent that causes this very significant disease, and the work subsequently led to the development of the first vaccine, which is currently used by swine producers throughout the United States.

Similarly, tests have been developed to save new chicks. Researchers at Ohio State, Mississippi State, and Purdue University have developed tests that quickly and accurately detect a highly contagious viral infection of new chicks in order to prevent tremendous losses.

AQUACULTURE RESEARCH

From your State, saving catfish, one of the worst diseases affecting the catfish industry is a winter disease that I cannot even pronounce, but basically—

Senator BURNS. Give it a shot.

Dr. ROBINSON. Saprolegniosis. About 10 percent of catfish die from this disease each year, and it creates enormous economic losses, between \$20 and \$40 million in the catfish industry alone, and until recently there was no treatment for the disease, until a discovery was made as a result of research funded again under the NRI program, and scientists at the University of Mississippi, while studying the disease mechanisms and immunity, discovered that it could be prevented by adding formula or diquat to the water at concentrations presently approved already by the Food and Drug Administration in the catfish ponds.

These are just a few of the examples, and one of the reasons I picked the ones that I did is it addresses a question that Senator Bumpers asked earlier, and that is, do just the large prestigious universities, or do all universities participate, and I picked an array of them, because a number of universities participate in the NRI.

Senator COCHRAN. I did have a chance to visit Mississippi State University and see firsthand some of the research being done on catfish diseases, and was impressed with the hard work and the commitment of the scientists there and their prospects for success, and saw photographs of just what you were talking about, whole catfish ponds almost just full of dead fish, and so it is a devastating problem to the industry.

This has become one of the largest single employers in the State of Mississippi. It is a big, big industry now, and somebody told me the other day that if you buy a filet of farm-raised catfish in a supermarket, the probability is that it came from Mississippi, that it was produced, processed, and marketed from there. Eighty-five percent of the total fish being sold—this includes value-added catfish products—are coming from the State of Mississippi now, so it has had a very big economic impact in our State.

The potential for other kinds of aquaculture, too, we are seeing developed. The so-called cold water aquaculture, I am now finding out—Senator Byrd has explained that to me recently—has great prospects as well.

There is another facility I visited recently, too, I wanted to ask you about—the National Center for the Development of Natural Products which is in Oxford, MS. To support the ARS scientists at the facility, does your budget request additional funding?

PART 1

723

Funds also are still needed to complete that facility, and I was worried about the comments that were made about cutting out some of these funds in the President's budget.

I hope the committee will approve funds for completion of that facility as well as provide additional support for the research program so these scientists will be able to carry out their mission. I note that funding is included in the budget request to support the ARS natural products research program at the Center, so I hope we can work out maybe getting your support too for providing the additional resources I just indicated are needed for fiscal year 1998.

Dr. WOTEKI. Certainly, Senator, as part of the approach we are taking to facilities, given that this review is going to be ongoing for the next 2 years, projects that are in construction at this point in time will be completed.

Senator COCHRAN. The funding request which you have submitted also talks about the Government Performance and Results Act, and I remember from my service on the Governmental Affairs Committee the development of that legislation, and I know that you are conducting work to develop strategic plans. You have had regional listening sessions on the plans, and you are drafting a performance plan at the Department to implement this act.

My question is can you tell us, or maybe submit for our record, what funding has been necessary and the number of staff-years which have been utilized by the agencies under your jurisdiction for this fiscal year for activities related to the implementation of the Government Performance and Results Act? Since no funding is specifically provided for these activities, I am curious about where the money is coming from, which activities are supporting the funding and staff for this project. You may know that.

Dr. WOTEKI. Actually, Senator, I do not off the top of my head, and I doubt that any of my colleagues do, either. But we would be happy to submit for the record information on the number of staff-years that we are currently using and funding out of this year that is going in support of our strategic planning activities.

Senator COCHRAN. Thank you for that.

[The information follows:]

GPRA-RELATED COSTS

The Government Performance and Results Act (GPRA) related activities in which the REE agencies have been engaged is built on a sound foundation of previous program planning. And much of the REE mission area GPRA-related activity would have taken place, perhaps in a somewhat different form, even in the absence of GPRA, making it difficult to estimate the marginal costs resulting from the passage of GPRA. For example, ARS's current plan, "The 6 Year implementation Plan 1992 to 1998," is nearing expiration. With or without GPRA, ARS would be devoting resources to develop a new plan covering the next 5 or 6 fiscal years. The REE agencies activities focused specifically on meeting GPRA requirements include management training on GPRA and results-oriented planning and management approaches, preparation of strategic plans and performance plans, and extensive consultation with partners and stakeholders. The costs associated with these activities include staff time, travel expenses, expenses associated with training and stakeholder meetings and some training costs. In fiscal year 1997 the agencies estimate they will spend approximately \$750,000 in GPRA-related activities. Staff years devoted to GPRA activities are estimated to be approximately 7 for the four REE agencies.

Dr. WOTEKI. I might indicate to you, though sir, that my sense is that it has been a very positive experience for all of the agencies

PART 1

724

in helping to more clearly delineate what the future directions are for our research programs, how they interrelate with our commitments for extension education and higher education, and more general information provision to the public and to those who rely very much on our research programs for their livelihoods and their businesses.

It has also helped us to identify the complementarity among the programs. We touched on that issue a bit through the other questions that have been asked this morning.

So my general sense is that whatever expenditures have been put into this planning activity are going to have a long-term payoff. Senator COCHRAN. Thank you.

ARS SMALL FRUITS LABORATORY, POPLARVILLE, MS

One other parochial question I am going to ask is about a facility that ARS maintains at Poplarville, MS, another laboratory which I have visited in the past. I know it is doing research important to the blueberry industry. It is the only small fruit research station in the South, I am told, that is involved in this kind of research. Reports I get from those in the industry and from State officials who have an interest in agriculture activity in our State is that this is important to the future of many small farm industries, small landowners who raise blueberries, blackberries, strawberries, muscadine grapes, vegetables, and other horticulture crops. These producers all benefit from the research done at this facility. So I am putting in a plug for the facility. I hope it is not on anybody's list to close. I do not know that it is, but I hope it is not.

I am curious to know for the record what the funding and staffing is that is proposed for 1998, and the work that is being done there. I would like to just have a special report to bring me up to date on what is occurring there. You may know that off the top of your head.

Dr. KNIPLING. Well, I can give you a very quick overview. We consider that as one of our very important locations. It is a small activity, and different from a lot of ARS activities. We are not addressing a particular problem, but we are trying to exploit an economic opportunity. And as you pointed out, it has had, over the past 10 years, impact on creating new opportunities, new businesses, and so forth.

We have three scientists there, a total staff of about 14. There are no proposed changes for next year. We would continue that activity.

In addition to blueberries, they are also working on other small fruits, strawberries and grapes. The program is capable of doing more. That facility at one point housed a larger number of scientists. It was originally started for tung oil research, but that industry, of course, went with the hurricane back in the 1970's, I believe.

Senator COCHRAN. I am told that that is coming back.

Dr. KNIPLING. Yes; we have heard that, too. There has been some interest in our Poplarville activity to get back in that research. We still maintain some germplasm of the old tung oil plantings there.

PART 1

725

POLYMER SCIENCE CENTER

Senator COCHRAN. And I will tell you why. There is an investment that CSREES made in the Polymer Science Center at the University of Southern Mississippi a few years ago, and in the development of polymers, which you scientists know all about. Chemists know all about it anyway. They have developed a new use for this tung oil that used to be produced and virtually disappeared as a commercial crop or product in our State, but now we understand that it is being encouraged by some of the new products that have been developed as a result of research at that University of Southern Mississippi Polymer Science Center.

You may have something on that, Dr. Robinson. I do not know.

Dr. ROBINSON. I am aware of it, but I do not have anything specific on it. I will be glad to do a review and get you something.

Senator COCHRAN. That is fine. I remember that from a recent visit to that facility too.

Well, I would appreciate having that report, and if there is any additional information the committee ought to have in support of funding for the facility and the staffing of it at current levels or whatever you think appropriate levels are. It would be good for us to have that.

Dr. ROBINSON. We will provide that for the record, some of the information I gave you, plus a little bit more.

[The information follows:]

ARS SMALL FRUITS RESEARCH LABORATORY, POPLARVILLE, MS

Local and regional growers/interests groups have indicated strong support for expansion of the current ARS Poplarville research program on blueberries to include research on other small fruits, vegetables, ornamentals, and new products from tung oil. In order to fully implement new programs in these areas ARS would need to add four new research scientist positions supported by \$1.2 million annually. The current allocation to this laboratory totals \$784,700 which provide support for four research scientists.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE POLYMER SCIENCE CENTER

The University of Southern Mississippi's Department of Polymer Sciences is one of the top two polymer science programs in America and focuses research on utilizing agricultural materials as feedstocks for new and/or potentially valuable polymer industry products that replace or substitute for those traditionally derived from petroleum. The Polymer Sciences group maintains long-term, high-level interest and expertise in agriculture and, through its significant industrial ties, pursues development and commercialization of products such as foams, adhesives, coatings, elastomers, and high performance thin films.

The Polymer Sciences group is specifically developing new, advanced uses for tung oil, a drying oil used in many coatings such as enamels and varnishes. In particular, tung oil derivatives and polymers have many potential applications in the coatings industry. For example, siliconized tung oil, when used as an additive, provides property enhancements to latex or water borne coatings. Property enhancements can include: improved gloss, improved water resistance, gloss retention, corrosion resistance, better adhesion, and reduced foaming. Working with a national coatings firm, the Polymer Sciences group is confident that this product will become commercially available.

As the commercial viability of new tung oil products has become more opportune, there are also efforts in Mississippi to reestablish tung tree agroforestry. Private companies specializing in vegetable oil products and farmers are starting tung tree plantations and intend to harvest the nuts and extract the oil for use by the coatings industry.

The Polymer Sciences group also works to develop many other industrial products from plant materials. They are completing characterization of Chinese melon oil, an

PART 1

726

oil known to be similar to tung oil. They have been developing novel applications of castor and lesquerella oils for structural foams of interest to the military. In cooperation with a private company, they have explored incorporation of bioactivity from guayule resin in antifoulant paints.

SPECIAL GRANTS FOR INDEPENDENT RESEARCH

Senator COCHRAN. I know there are other facilities around the country, some of which are listed for suggested closing. Dr. Woteki mentioned that. We will review all those requests very carefully.

One thing I also hope that we will review too are special grants that we have made for independent research in a number of different areas. I know in the economic research area, Mr. White may want to comment on this, we do have some special grants that are made. I know of one particular fairly substantial grant for economic research outside the Economic Research Service. My question to you is do you review or use in any way or find helpful research that is being done by any grant recipients that you know about in developing economic analysis under your mission?

Mr. WHITE. Yes, Senator; we do collaborate with universities that get special grants—Iowa State University, University of Missouri. We find that research helpful.

We feel that it is important that we have a role in reviewing requests for grant funding of this type so that we can help to ensure that we do not get duplication of responsibilities assigned to the grant-receiving agencies and ERS. But we think it can be very productive and very complementary to have this kind of funding complement our in-house research.

Senator COCHRAN. Thank you.

AQUACULTURE RESEARCH

I have questions about aquaculture research, too. Senator Bumpers made a point that is very important, about the significance of aquaculture research, and I have a number of questions which I will submit. I know, Dr. Horn, you came to Mississippi, to the facility there, to help at the groundbreaking, to celebrate the development of the National Warmwater Aquaculture Research Center at Stoneville, MS. That was a great day, and we understand that work on that facility is proceeding on schedule. Is that your information, and do you continue to support the efforts and the research that will be undertaken there?

Dr. HORN. That is correct. In fact, I must admit that aquaculture is one of the most rapidly growing interests in our research, education, and economics mission area. The USDA is the leader in aquaculture by any account, and the big picture includes much more than warmwater or even freshwater aquaculture. We are beginning to look at the effects of agriculture on watersheds, on estuaries, and on saltwater fish, as well. We have the Oceanic Institute in Hawaii dealing with shrimp. The Stoneville facility is central to our program and extremely important to our activities, particularly, of course, to catfish disease, genetics, and production research.

Senator COCHRAN. Thank you very much.

We have systems research units in Pine Bluff, AR, and in New Orleans. I have not visited that facility. I ran into somebody from

PART 1

727

the Department of Agriculture that used to be up here in one of these jobs who is now down in the New Orleans facility. And he invited me to come down and look at that, and I think I will.

The Southern Regional Research Center, it is called, in New Orleans.

Dr. HORN. Yes; it may be of interest to you, this is a case where we have brought some of our very fundamental science to bear on a specific problem, and in this case we are using a variety of sophisticated equipment, physicists, and chemists, to look at the nature of off-flavor in catfish. And if this research can deal with both the off-flavor in fish and the algae that seemingly cause it, then the results will be applicable to the catfish industry.

ASSESSING THE CONTRIBUTION OF FUNDAMENTAL RESEARCH

Senator COCHRAN. There may be additional questions along this line dealing with this subject that we will submit for further amplification.

I am also interested in the performance goals. The ARS talks about long-term benefits to agriculture and American citizens as performance goals. I made a talk not too long ago down at Georgia Tech, or at a facility next door to the campus. It was a regional collection of industry, government, academia, talking about how we do a better job of allocating resources for research. And I think they wanted me there to persuade me to do what you all are asking us to do in your budget request, and that is to let you decide where the research dollars are spent rather than our making those decisions. But I do not think we are going to change the mix. We have an interesting mix now that I think works pretty well.

But the point is in this competition between basic research and applied research or goal-driven research, it is really impossible to quantify the practical benefits of basic research. I think Dr. Robinson did a good job of pointing out practical benefits from basic research in agriculture, nematodes and soybeans and other items of evidence, but there are no indicators as to how the agency could determine the contribution from its research. Is it realistic to even expect that?

I know I asked at the Natural Products Center. I said, can you tell me something that you have accomplished? That is a tough question to ask any scientist who is doing basic research, what have you accomplished? Well, I have come to work. I have gotten here on time every day for the whole year.

How is a question like that answered, or should we even ask that question? If we do not ask that question, what question do we ask of the basic research scientists, and why do we spend money on it?

Dr. WOTEKI.

Dr. WOTEKI. Senator, we have been asking ourselves how do we tell you the story of what the investment in the fundamental research buys for this country. And we think we have some indicators that can be used to tell that story.

If you are going to be evaluating fundamental or basic research on an annual basis, I think that the main criteria that is going to have to be used for the work that is done within a relatively short period of time, like a year, is the quality of the science. And in that, we have got mechanisms of peer review where experts come

PART 1

728

in, look at the program, and say this is a quality program or this is an area in which there are other units, other centers, other investigators that we feel are doing better work. So that kind of merit review by peers is going to be something that we are going to use not only for the selection of grant proposals under competitive grants programs for the future, but we are also going to increasingly build into our intramural research programs.

We also have got economic means for doing evaluations of a portfolio of research that look at the return on the investment that is made. But that takes a longer period of time in which to do that type of evaluation. We are planning, under GPRA, to continue to do that type of economic analysis, but it is not going to tell you every year how this program is going to do. It has to be done over a 5- or 10-year period of time.

The other way that I think that we can tell the story about what the benefit of an investment in basic research has been is by essentially tracing a story, to start with a fundamental discovery like the nematode example that Dr. Robinson cited earlier, funded out of the NRI and trace how that is incorporated into agricultural programs and practices.

As part of our annual reporting to the Congress under GPRA, we are going to choose some of those success stories that illustrate how investment in some very basic research does have a long-term payoff. They do not perhaps have a direct payoff. They may have gone down some blind alleys and some side streets; however, they tell how the investments have paid off in some practical applications.

Assessing fundamental research under GPRA is perhaps the hardest task that any Government organization has to do. It is a problem not only facing us within agriculture research, but the other science agencies are facing the same kind of problem. And we have been consulting with each other as we have gone about developing the metrics that we are going to be using, and we are all, I think, going to be putting forward some variations on these same kind of criteria that I have described that we are considering.

FUND FOR RURAL AMERICA

Senator COCHRAN. The Fund for Rural America was mentioned by you in terms of the reduction in funding in the supplemental that the House has approved. The farm bill authorized \$100 million for this fiscal year. You mentioned in your statement that you are allocating \$46 million of that for research, education, and extension activities. I am interested in the research programs that will be funded by those dollars.

You have got \$33 million earmarked for competitive research, and I assume that you are inviting or have invited requests for proposals to be submitted, or you have received proposals for funding. It would be interesting to know what research you have approved and where it is being done and what the research is that is being done under this new program. Could you submit that for the record for us? Or if you know, you can tell us.

Dr. WOTEKI. What we can provide to you at this point is the request for proposals that went out.

Senator COCHRAN. So we have not done anything with it yet.

PART 1

729

Dr. WOTEKI. We have at this point received over 400 proposals for center grants, and we are expecting proposals—the due date is the 28th, next week—for the project proposals. So those center proposals and project proposals will then be reviewed by peer panels; they will be ranked; and the decisions upon awards will be made. It is going to take several months till we get to that point. Then we would be happy to share with you the portfolio of activities.

We will also be involving our Advisory Board in reviewing the relevance of that portfolio of activities to the original intent of the fund for rural America. So we could share with you at this point the overall framework for the program, but it will be several months until we can get you the list of approved projects.

SUSTAINABLE AGRICULTURE

Senator COCHRAN. I am told that the current year's funding level for sustainable agriculture programs is \$8 million. Do you know how that money is being spent?

Dr. WOTEKI. I would like to ask Dr. Robinson to respond to that. I think he also had a comment he wanted to make on the fund for rural America question that you posed.

Senator COCHRAN. OK. Dr. Robinson.

Dr. ROBINSON. Thank you, Senator Cochran.

FUND FOR RURAL AMERICA

The Fund for Rural America RFP, which is out and the proposals are due back in the last of this month, did have three major areas in it that I thought might address to some extent your question. Proposals were solicited under three broad areas. One is international competitiveness, profitability, and efficiency. So there are a whole array of proposals that could come from an extension point of view, a research point of view, some combination of those, and problem-solving approaches were encouraged under the fund.

The second broad area is environmental stewardship, which covers the broad array of activities that interface between agricultural production and the environment in the natural resource base.

The third broad array of proposals were under the heading of rural community enhancement, which covered a number of activities dealing with rural economic development and social development that are part of the overall purpose of the fund. But they do address and repeat Dr. Woteki's point, which is something that the fund very specifically has as part of its mechanisms, a review for relevance by the National Advisory Board, and that is one of the additional elements, I think, that is involved with the proposition of trying to assess the benefits from investments in research. In addition to having peer review to ensure good science, it is a way to ensure that the scientists are considering what the industries or interest groups think are some of the most significant problems.

SUSTAINABLE AGRICULTURE

With regard to the sustainable agricultural research program, these projects or this program is actually conducted through regional sustainability consortia. These consortia of universities consider both scientists and producers when reviewed proposals that

PART 1

730

are submitted for funding under the sustainable agriculture program. Funds are competitively awarded as well as allocation to various regions for projects in sustainable agriculture research and education.

But one of the interesting and I think innovative factors in this particular program, and it is in part also harking back to the IPM question you asked earlier, and the distribution of some of the competitive funds, is that farmers or producers are participating in the early panels to look at the relevance of the proposals that are being submitted for funding for sustainable agriculture.

Just as an example of some of the output, a project in New York has helped farmers use rotations to boost corn profits by \$30 to \$115 an acre, while at the same time protecting the environment. And we have, from each of these regions, and I will be most happy to provide your office a copy of an annual report of the types of projects, the types of investments of these funds, and the results of those projects.

RANGELAND RESEARCH

Senator COCHRAN. I appreciate that very much.

There is another area, and this is going to get Senator Burns' attention, I think. But I noticed that the funding for rangeland research is proposed to be terminated or sharply reduced in this budget request. This concerns me because this is one of the biggest industries in the country. We were talking about how the aquaculture industry is growing. Well, beef cattle and related industries, dairy as well, are huge in terms of total dollar volume in our economy. I wonder why we see these proposals to cut back this area of research. Do we already know all we need to know about grasses and nutritional values and the economics of range management?

Dr. ROBINSON. No, sir; we do not know all we need to know in those areas. In keeping with the effort to increase the budget in some areas that were believed critical, and still maintain a budget that did not show so much exposure for deficit reduction purposes, the President's budget contains both some increases and some decreases. Rangeland research was one of the areas that could be part of the National Research Initiative, under the environmental component of the national research initiative, as well as under the plant component. In addition, the formula funds that are allocated to universities can also be allocated to rangeland research.

So it is certainly not a matter of suggesting that we know all that we should in those areas, but rather it is a matter of trying to set some priorities.

Senator COCHRAN. In the Economic Research Service area, I notice that there are some increases. I had that part of the original statement identified, but I do not see it now. Did I read that right, there is an increase in total number of researchers? How is the money being spent?

Mr. WHITE. There are three components, to the increase. One part would cover approximately 50 percent of the increase in salary costs to the agency for the year. The second component has to do with our participation in a joint effort involving eight of the statistical agencies of the Federal Government in coming up with better

PART 1

731

measures of contribution of our programs to the outcomes that we are seeking. And the third component has to do with improving our data and our ability to analyze that data on the practices adopted on farms. So it would help us to understand better adoption of IPM and other kinds of practices, not only the rate at which they are being adopted, but also why are farmers adopting some practices and not others. We will be looking at profitability as well as demographic and other factors that might affect the adoption of these practices.

Senator COCHRAN. I have been told that we have made some very impressive new discoveries in the use of satellite imaging or aerial photography and measuring in new and innovative ways the need for the application of pesticides or herbicides in production agriculture. You can isolate different areas in a plot of land that you may have planted to soybeans, for example, and identify that only a small portion of that may require an application of chemical sprays or whatever is being used. Is this something that is being advertised or extended to those who are in production agriculture, either through the Extension Service or the Economic Research Service, by data and reports, and how could this affect the profitability of a farmer's operation if he or she is able to utilize these new technologies? Dr. Woteki.

PRECISION AGRICULTURE

Dr. WOTEKI. Senator, I might start this off. There are many applications of remote sensing in agriculture. There is a lot of enthusiasm about what is called precision agriculture, and we have an active research program ongoing within the Agricultural Research Service that specifically focuses on remote sensing applications in production agriculture. There are some successes to talk about, and Dr. Knipling can identify those.

We also support university-based researchers, both through the formula funds and through the competitive grants programs, and Dr. Robinson can point out some of the successes in that area.

We also, within the National Agricultural Statistics Service, have been relying increasingly on satellite-generated images as the basis for the statistical sampling that NASS undertakes in its surveys. So we have a third application in that area, and among those, which one would you like to start with for more information?

Senator COCHRAN. Well, I am familiar with the work that is being done. I am just interested, from an economic standpoint, in whether the USDA agencies are involved in that too.

Mr. WHITE. Thank you.

We have done some preliminary analysis of precision agriculture. One of the difficulties that we have in analyzing precision agriculture is that it is a very microapplication of remote sensing. It really improves the ability to get correct applications of nutrients in very small geographic areas. Therefore, it is the kind of analysis that has to be done on parts of a field, and it is very difficult to generalize to the overall profitability of the program. But we are following that trend, and we will undertake research activities to look at the aggregate implications of precision agriculture when data are available.

PART 1

732

Senator COCHRAN. That is one of the reasons for my question. These things sometimes look good, sound good; they are exciting; they do great in a presentation when you put up charts to talk about everything. Then, you find out it costs five times as much to generate these charts and everything as it does the money that you save in utilizing the research or trying to put it to some practical use. That is why I asked the economics guy, because I think that is what you all are for, is it not? In part, you try to help production agriculture figure out ways to translate economic theory into practical uses. Or am I missing something?

Mr. WHITE. You are absolutely right, Senator.

CENSUS OF AGRICULTURE

Senator COCHRAN. There is another question I wanted to ask, too. You mentioned the National Agricultural Statistics Service, and I wanted Mr. Bay to know that I was not going to leave him out. I am going to ask him something.

I am curious to know about the new undertaking that has been shifted from the Department of Commerce to the Department of Agriculture to conduct the census of agriculture. There has been the suggestion that legislation may be needed to clarify the authorities of the Department of Agriculture to proceed in this area. Is that really necessary, or is that just something that the lawyers tell you you would like to have if you could? Can we get along without having legislative changes?

You have asked for some additional money to do this. If we do not get the legislative changes, can we take the money back? [Laughter.]

Mr. BAY. Mr. Chairman, thank you. I guess I would like to answer the last part of that question first. No. [Laughter.]

If we want to have the census of Agriculture conducted, we would need the resources to do that.

The first part of the question was regarding the legislation. The legislation is needed, and it is not to satisfy just what the lawyers say we have to have. We do have to have the authority in the Department of Agriculture. It is just a matter of shifting the authority that is now in the Department of Commerce Census Bureau to Agriculture, which is the same legislation that authorized it in the Department of Commerce, and that gives us the authority to collect the data.

It is on a mandatory basis, and without that legislation we do not have that authority. And if you do not have that authority, the costs for doing the census go sky high on a voluntary basis, and the coverage of the census is not as good, and therefore the quality of the data is compromised.

We had to go ahead and print the questionnaires, and we have printed them on the assumption that we would have the authority. So we really need the authority of the legislation.

Senator COCHRAN. Thank you very much.

Senator Burns, and then Senator Gorton.

Senator BURNS. I have got a couple. Refresh my memory. Why did the Commerce Department want to move the census part over to the Agriculture Department?

PART 1

733

Mr. BAY. Well, the Census Bureau went through strategic planning, like we all are, and agriculture was one of the lower priority items in their prioritizing of programs. And the Department of Agriculture was supportive of the continuation of the census of agriculture, and therefore it seemed appropriate that since we had the interest in it that it should be transferred to the Department of Agriculture.

Also, there is a savings you will notice in my budget for fiscal year 1998 of \$1 million because of the duplication that existed between what the Department of Commerce did and what the Department of Agriculture did in the way of surveying farmers, and there was a feeling that this was an opportunity to bring together two programs that overlapped.

Senator BURNS. Well, the money that the Commerce Department used to spend on agriculture, did it come with the program?

Mr. BAY. That is a committee problem. [Laughter.]

Senator BURNS. It sounds like one of yours, too, is getting the money. You know, it always just unravels my mind whenever we say the Commerce Department had such a low priority on agriculture. It is the largest contributor to the GDP in this country, and they say they represent the commerce of this country. And I just find that very, very strange, and I agree with what they did and I think you ought to be doing it.

I just have an overall—I am excited about the range management, too, and range research. I will tell you right now that I do not disagree with the science and the research that we do in agriculture, and maybe you do not get enough money. I will argue with you sometimes on priorities, but not the necessity of it. And right now I am saying that we have got some areas that we have to do a lot more work.

I have a daughter that told me the other night in a conversation, says you can talk about all this other stuff that we do on nutrition. If you want to tell your story about research, look at the American people and compare them to any other people in the world. They live longer, buy better food, more nutritional—that is the result of agriculture research. You cannot get specific about it, but just look at us. We live longer than anybody else in the world.

Now, the medical community can only claim a very small part for the increase of longevity and our lifetime in this country since World War II. Did you know that? Do you know what the rest of it is contributed to? How we handle our water. More life-threatening and life-shortening diseases are waterborne than any other way.

Dr. WOTEKI. Well, it is actually three factors, Mr. Burns. One is sanitation, as you pointed out; one is a health-promoting, easily accessible, affordable food supply; the third component is the decrease in childhood deaths through better prenatal and immediate postnatal care, and vaccination of children. That is the health component that has helped.

Senator BURNS. But that has not had any impact like it has on how we handle our water, ground water.

Now, I think Dr. Horn and some of this thing, we have got to take a look at nonpoint-source solution and agriculture's role in that. That will require research as far as irrigated farming, every-

PART 1

734

thing that we do in the handling of our water. I think that is our most important challenge that is in front of us. We can talk about all this other stuff, and I understand that when I came to town I wanted more dollars to control noxious weeds. I found out in this town that you cannot go to the gray poupon and white wine parties and talk about weeds because pretty soon you are standing there talking all by yourself, because they are not a high priority in this town, is weeds.

But to us in agriculture who understand agriculture they are damned important. So what I am saying is that you folks should be congratulated on the science that you have done, that you are doing. Maybe we are going to have to change our focus a little more, because water is pretty important, how we handle it, to Senator Cochran's State and aquaculture, because that all goes hand in hand. It is the very basic of things that we do.

And I also want to remind you that we do well in garnering Nobel Prizes for science, both in agriculture and over in other areas, too. But somebody else gets our market. So that tells me we had better be doing some research on how to sell the darn stuff. We had better get a better trader whenever we go in dickering for these international agreements on trade. We had better have a better cow trader up there than we have had in the last 10 or 15 years, because I will tell you, they have dickered away all of our market out there, and that is where we had better get sharp.

So do not be afraid to say, whenever somebody asks you on our research, do not be afraid to say let us just look at America and compare it to any other nation in the world, and I think you have got a great story to tell, and I know you can tell it.

So congratulations, and before it is all over I will have some questions I want to submit, and before it is all over I want to talk very seriously about our priorities where we should be doing most of our research.

And thank you very much for coming today. I was very much interested in your questions.

Senator COCHRAN. Thank you, Senator.

Senator Gorton.

Senator GORTON. Thank you, Mr. Chairman.

I have for you, Dr. Woteki, and perhaps for Dr. Knipling, a couple of rather parochial questions. We were startled, to say the least, to see that the President's budget was going to close down a more than 40-year history of cooperative research with Washington State University at Pullman, and I would like to hear your justification for doing so. Excuse me, not Pullman, but Prosser.

PROPOSED CLOSURE OF PROSSER

Dr. WOTEKI. Yes; you threw me for a loop there for a minute because I expected you to say Prosser.

We have had a very difficult budget year this year and had to make some very difficult decisions about priorities. Within the Agricultural Research Service, as you know, there are over 100 research laboratories, and there are multiple projects within those laboratories.

When we were planning our 1998 budget request we had a number of new initiatives. They involve either emerging problems or

PART 1

735

major new areas of research that we wanted to accommodate and be able to address within the Agricultural Research Service, things like food safety, emerging diseases that affect both crops and livestock. Within ARS we also wanted to be able to address some of the grazinglands research issues that Senator Burns has been asking about, as well as integrated pest management biocontrols and human nutrition research as major new emphases or increasing emphases within ARS.

We had a process that we used to rank all of the projects within the Agricultural Research Service that related to their relevance to the mission and the priorities of the agency, the capacity of the agency to continue that research, and the overall impact, the effect on American agriculture. The senior staff within the Agricultural Research Service reviewed all of the projects against those criteria, and then ranked them. On the basis of that ranking the lowest ranked projects were identified as being ones for either major reduction or elimination, and then based on that project ranking we looked at which facilities had most of their projects ranking in this lowest quartile.

In that ranking there were 71 projects that were found to be in that lowest tier, and on the basis, then, of that programmatic and quality, essentially, review, we made the decision to close the Prosser facility.

Senator GORTON. And the Mandan facility falls into the same category?

Dr. WOTEKI. And the Mandan facility, as well.

Senator GORTON. Are those rankings and the facts and judgments that went into them available to the committee?

Dr. WOTEKI. We can make available to you information about the process that was used, as well as the overall rankings.

Senator GORTON. I would greatly appreciate your doing so. We understand that those projects that you propose to transfer both the Washington State University and to Idaho, that the facilities to which you propose to transfer them have no room for the people or for the projects without a capital investment in new facilities. Was that considered?

Dr. WOTEKI. I am not aware of that discussion. I am going to ask Dr. Knipling to respond.

Dr. KNIPLING. The Prosser laboratory has seven research projects. Three of those are proposed for retention, while four are proposed for termination. One of the projects proposed for retention is really part of our minor uses pesticide evaluation activity, which would come back to headquarters for reallocation to other locations where we do that type of work.

The two projects that you are probably speaking of is the potato project which is proposed to go to Aberdeen, ID. This is not an issue of space. We do recognize, however, in retrospect that there was an oversight. Some of that work is dealing with potato virus-free certification. We are going to have to decide on an alternative location, probably Corvallis, OR, where we have a similar activity, or perhaps in the State of Washington at our Yakima laboratory. So it is not a matter of space at Aberdeen, but rather this virus-free certification issue.

PART 1

736

The pea and lentil project at Prosser is scheduled to be moved intact as it is now to Pullman, where we have similar work. That was one of our original objectives, to consolidate similar work so as to get more of a critical mass of scientists working on the problem. We are aware that there are some space limitations there at the university. We are exploring several options which would not involve significant capital investment, such as utilizing some temporary space or perhaps even a rental space from a private source.

We really do not consider that as an overwhelming limitation to the movement of the pea and lentil project to Pullman.

Senator GORTON. Thank you. Thank you both for your answers. I would appreciate as much background information on the way in which these priority determinations have been made as you have available so that I and we can determine whether or not we agree.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

[The information follows:]

PROJECT EVALUATION PROCESS

All research projects in the ARS portfolio were evaluated by the Agency's senior management team using the ARS Project Evaluation Guide. A copy of the Guide is available. There are three primary factors in the evaluation process. These are: I Relevance, II Capacity, III Impact. A careful analysis of the Federal role is also conducted. Relevance deals with the nature, scope, and characteristics of a project. Capacity deals with the resource capability and capacity of a project to meet the stated objectives. Impact is concerned with the changes that have or are anticipated to occur as a result of the impact of ARS research on the scientific community, the Nation's economy, society, and on policy issues of the Nation. Possible scores for each of the three factors range from a low of 2 to a high of 14 in 2-point increments, so that the maximum consensus score possible for any one project would be 14×3 or 42.

The purpose of these ratings was to develop an initial grouping of projects for further consideration. Those projects that fell into the lower quartile were the ones that were further scrutinized. These ratings represented the first step in the overall decisionmaking process to guide further discussions of the ARS senior management team, and therefore were not retained. In reconstructing the process, I recall the consensus scores for all the Agency's projects evaluated as part of the fiscal year 1998 budget process ranged from a low of 6 to a high of 38. Over 90 percent of the Agency's projects received scores in excess of 22. All of the 71 projects proposed for termination and reallocation in the fiscal year 1998 budget scored in the range of 6 to 22. In regard specifically to the Prosser location, the four projects proposed for termination scored in the range of 16 to 20. Because termination of those projects would jeopardize the capacity of the remaining three projects to support the Prosser facility, the decision was made to move the remaining projects to other locations. Specifically, the pea and lentil project will be relocated to the Pullman location and the potato project will likely be relocated to Aberdeen, Idaho or Corvallis, Oregon.

We are aware that there are no "good" ways to close ARS laboratories. However, it is important to note that earlier attempts to close facilities resulted in the identification of resources as cost savings and resulted in the loss of funds to the Agency. Under the current budget, funds are retained by the Agency and redirected to high priority research. In many instances, ARS utilizes the same scientists to carry out the newly proposed research at other nearby facilities.

SUBMITTED QUESTIONS

Senator COCHRAN. I appreciate very much the attendance and cooperation of all of our witnesses, and for your testimony. Additional questions will be submitted in writing, and we hope you will be able to respond to them in a timely fashion.

PART 1

737

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

AGRICULTURAL RESEARCH SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

LOCATION CLOSURES

Question. Please update the status of ARS laboratories closed in fiscal year 1995 and fiscal year 1996? Have these locations been turned over to GSA for disposal? Describe the disposition of these facilities.

Answer. Of the ten (10) ARS locations closed in fiscal year 1995, all disposal actions have been completed at eight (8) of these sites. These eight locations and the new owners of the land and buildings, where appropriate, are as follows: Delaware, OH, buildings transferred to USDA, Forest Service; Fairbanks, AK, (No federally owned land or buildings involved); Georgetown, DE, buildings transferred to the Department of Education for use by the University of Delaware; Lewisburg, TN, land and buildings transferred to the University of Tennessee; Lexington, KY, (No Federally-owned land or buildings involved); Oxford, NC, land and buildings transferred to USDA, Animal and Plant Health Inspection Services; Suffolk, VA, buildings transferred to the Department of Education for use by Virginia Polytechnic Institute and State University; Rotterdam the Netherlands (No federally owned land or buildings involved).

The land and facilities at Pasadena, CA, have been reported to GSA for disposal. The facilities at Savannah, GA, will be reported upon completion of environmental cleanup activities.

In fiscal year 1996, the facilities at three ARS locations were identified for transfer to non-federal entities. The land and buildings at two (2) locations have been reported to GSA for disposition. In fiscal year 1997, Houma, LA, will be transferred to the American Sugar Cane League Foundation and Brawley, CA, will be transferred to Imperial County, CA. The transfer of the facilities at Brownwood, TX, is on hold pending continuing negotiations with Texas A&M.

Question. What is the status of the closures at Bozeman, Montana and Durant, Oklahoma?

Answer. Bozeman, Montana-Research programs and personnel have been transferred to Sidney, Montana. All ARS-owned buildings, with the exception of three greenhouses, were offered to the University of Montana. The greenhouses are being used by USDA, Forest Service through September 20, 1997, then will be demolished by ARS. Durant, Oklahoma, research programs and personnel have been transferred to El Reno, Oklahoma. Completion of the real property disposal is pending resolution of environmental issues.

LOCATION CLOSURES

Question. What criteria was used to decide closure of ARS locations at Mandan, North Dakota and Prosser, Washington?

Answer. The criteria imposed included relevance, capacity, and impact. A careful analysis of the Federal role was also conducted. Relevance deals with the nature, scope, and characteristics of research projects being carried out. Capacity deals with the resource capability and capacity of the laboratory to meet the stated objective(s). Impact is concerned with the change(s) that have or are anticipated to occur as a result of the impact of ARS research on the scientific community, the Nation's economy, on society, and on policy issues of the Nation.

Question. How many people and scientists would be impacted by the closure of Prosser, Washington; Mandan, North Dakota; Orono, Maine; and Brawley, California? What are the operating costs for these laboratories?

Answer. The number of people and scientists impacted by closures and the operating costs for these laboratories are provided below.

Location/worksites*	Number of—		Fiscal year 1997 operating costs
	People	Scientists	
Prosser, Washington	137	8	¹ \$2,721,500
Mandan, North Dakota	238	9	² 2,886,300
Orono, Maine*	6	1	135,500

PART 1

738

Location/worksite*	Number of—		Fiscal year 1997 operating costs
	People	Scientists	
Brawley, California*	8	1	321,000

¹ Includes 4 scientists and \$1,284,800 proposed for redirection as follows: Pullman, WA 2 scientists/\$550,000; Headquarters \$88,600; and Aberdeen, ID 2 scientists/\$646,200.

² Includes 2 scientists and \$551,100 proposed for redirection to Miles City, MT.

REQUESTED INCREASES FOR FISCAL YEAR 1998

Question. ARS is proposing to finance most of its proposed increases through reductions of current research. Did the Agency recommend this approach or was this a department or OMB decision?

Answer. Decisions on reductions/termination of all projects are based on agency assessments and recommendations that are subsequently reviewed at the Department level and at OMB. The decisions on funding levels and targets were made at the Department and OMB levels in response to the need to balance competing agriculture priorities for limited resources and to identify savings from existing resources as a means of carrying out increased research needs to address high priority emerging research issues.

Question. Provide for the record, agency, department and OMB recommendations for the 1998 budget.

Answer. The ARS budget recommendations for the 1998 budget will be provided for the record.

FISCAL YEAR 1998 APPROPRIATION HISTORY

Item	Agency estimate	Department estimate	President's budget
Base Level ¹	\$728,853,000	\$716,826,000	\$716,797,000
PROGRAM INCREASES			
Animal Sciences	15,000,000	3,800,000
Food Safety	10,000,000	5,000,000	4,114,000
Emerging Diseases/Exotic Pests	15,000,000	9,374,000	5,000,000
Grazinglands	11,000,000	1,700,000	1,000,000
Genetic Resources	6,000,000	3,900,000	2,000,000
IPM/Biocontrol	15,000,000	5,700,000	4,000,000
NAL	4,000,000	2,000,000
Aquaculture	8,000,000
Floral/Nursery Crops	2,000,000
Lower Delta Initiative	4,000,000
Everglades Initiative	2,000,000
Human Nutrition	12,000,000
Subtotal, Program Increases	90,000,000	31,474,000	30,114,000
OTHER INCREASES			
Pay Costs (3 percent)	17,021,000	6,409,000	6,409,000
Increased Operating Costs	8,314,000
Increased CSRS Costs (1.51 percent)	2,767,000

North Central Soil Conservation Research Laboratory, Morris, MN (Construction)	3,800,000
Rearing and Genetics Laboratory, Waimanalo and Tropical Fruits and Vegetables Laboratory, Hilo, HI (Planning/Design)	1,750,000
Plant Physiology and Genetics Research Laboratory, Urbana, IL (Planning/Design/Construction)	1,800,000
Avian Disease and Oncology Laboratory, East Lansing, MI (Design)	1,900,000
Sugar Beet, Bean and Cereal Research Laboratory, East Lansing, MI (Planning/Design/Construction)	870,000
Insect Rearing Facility, Stoneville, MS (Planning/Design)	1,000,000
Energy Audits of ARS Facilities (Planning)	2,000,000
Inventory of CFC Chillers (Planning)	2,000,000
Seismic Studies of ARS Facilities (Planning)	1,000,000
Total	138,900,000	58,500,000	59,300,000

¹For the agency estimate, the base was the fiscal year 1997 President's budget. For Department Estimate, the base was the fiscal year 1997 Appropriations, and for the President's budget, the base was adjusted fiscal year 1997 appropriations.

Question. Provide for each of the requested increases, how and where the new funding will be allotted.

Answer. The new funding proposed will be allotted as follows:

EMERGING DISEASES AND EXOTIC PESTS—\$5,000,000

Emerging Plant Diseases—\$2,500,000

Frederick, \$900,000.—Develop improved techniques for karnal bunt pathogen detection, identification, and characterization; develop methods to decontaminate infested commodities, equipment, and handling facilities; and characterize factor affecting host-pathogen interactions.

Aberdeen, \$300,000.—Develop system for evaluating germplasm for resistance to karnal bunt, and establish program for systematic screening of new and existing crop varieties for resistance.

St. Paul, \$500,000.—Characterize karnal bunt disease and wheat scab epidemiology and fungal ecology, including factors affecting disease establishment and potential points of control.

PART 1

740

Manhattan, \$500,000.—Improve resistance of wheat varieties to karnal bunt by developing and utilizing genetic methods for incorporating disease resistance from related and unrelated species.

Albany, \$300,000.—Improve the genetic resistance of wheat varieties to karnal bunt by determining the number and map position of resistance genes; describing the regulation of resistance gene expression; and determining the mechanisms operating in resistant hosts.

Emerging Exotic Diseases of Livestock—\$1,100,000

Ames, \$500,000.—Develop diagnostic tests to detect Transmissible Spongiform Encephalopathies in live animals, i.e. Scrapies, Chronic Wasting Disease of Cervids, and Bovine Spongiform Encephalopathy-like Encephalopathies.

Athens, \$300,000.—Develop novel genetic vaccines and immune modulatory strategies to prevent outbreaks of exotic poultry diseases such as highly pathogenic Avian Influenza and velogenic Newcastle Disease.

Greenport, \$300,000.—Develop diagnostic tests and vaccines for emerging foreign animal diseases of livestock such as Foot and Mouth disease and African Swine Fever.

Emerging Domestic and Zoonotic Diseases of Livestock—\$1,400,000

Ames, \$400,000.—Develop methods to control porcine reproductive and respiratory syndrome (PRRS), an emerging disease problem for the swine industry.

Ames, \$300,000.—Develop a vaccine for a newly recognized variant of Bovine Viral Diarrhea.

Ames, \$400,000.—Improve diagnostic tests for the detection of Johne's disease and investigate the role of genetic resistance in this disease which has recently been suggested to be associated with Crohn's disease in human beings.

Beltsville, \$300,000.—Identify animal reservoirs, life-cycle, and intervention methods for newly recognized microsporidial protozoan parasites (*Cryptosporidium* and *Cyclospora*) both animals and people.

INTEGRATED AND AREAWIDE PEST MANAGEMENT—\$4,000,000

Area-wide IPM and Pilot-test Programs—\$1,000,000

Headquarters, \$1,000,000.—Conduct scale-up pest management pilot tests in support of the ARS Area-wide program and the USDA IPM Initiative.

Augmentative and Biologically-based IPM in Field, Horticultural and Vegetable Crops—\$2,000,000

Stoneville, \$600,000.—Develop mechanical and process engineering procedures for diet handling and mass propagation of insect and weed natural enemies, with emphasis on pests such as boll weevil, *Heliothis*, and leafy spurge.

Orlando, \$600,000.—Develop biological control and other biorational technologies for control of silverleaf whitefly, Egyptian mealybug, Thrips palmi, brown citrus aphid, and other emerging pests of horticultural and nursery crops in the Southeast U.S.

Beltsville, \$300,000.—Develop semiochemical-based IPM suppression systems for Colorado potato beetle and other insect pests of field and vegetable crops.

Gainesville, \$250,000.—Improve diets for mass rearing of parasites and predators for augmentation biological control of the diamondback moth, sweetpotato whitefly, and other vegetable pests.

Weslaco, \$250,000.—Develop IPM technologies for control of aphids, beet armyworm, and other secondary pests that limit cotton production during boll weevil suppression and eradication programs.

Host-Plant Resistance and Pest Management Strategies—\$1,000,000

Stoneville, \$400,000.—Develop and evaluate management strategies for resistance of corn earworm and tobacco budworm to *Bt* in cotton, and to new transgenic crop resistance factors that may be introduced.

Ames, \$300,000.—Develop integrated management strategies for control of corn insect pests, emphasizing management of resistance of the European corn borer to *Bt* and to new transgenic crop resistance factors that may be introduced.

Raleigh, \$300,000.—Develop host-plant resistance strategies for the management of pathogens in southeastern small grain production systems.

PART 1

741

GRAZINGLANDS THRUST, UTILIZATION AND CONSERVATION—\$1,000,000

Systems to Optimize Production & Resource Improvement—\$1,000,000

El Reno, \$400,000.—Determine impact of pasture design and grazing animals on quality of water emerging from watersheds, and develop pasture management systems that will optimize water quality and productivity in the semi-arid U.S.

Las Cruces, \$300,000.—Develop low-input technology for seeding native grasses and shrubs on rangelands and riparian areas after control of introduced weeds.

University Park, \$300,000.—Determine impact of pasture design and grazing animals and grazing animals on quality of water emerging from watersheds and develop pasture management systems that will optimize water quality and productivity in the humid U.S.

FOOD SAFETY—PREHARVEST AND POSTHARVEST—\$4,114,000

Food Safety—Preharvest—\$1,614,000

Ames, \$300,000.—Monitor *Salmonella* isolates from cattle and swine for *S. Typhimurium* DT104 and characterize the epidemiology, transmission and nature of antibiotic resistance of the organism.

Clay Center, \$500,000.—Correlate production practices for cattle and swine with post processing contamination of food products.

College Station, \$500,000.—Develop competitive colonization systems, as have been successfully accomplished for broilers, to prevent *Salmonella* and *E. Coli* 0157:H7 in swine and cattle.

Athens, \$314,000.—Delineate the dynamics of campylobacter transmission in production in order to identify control points and strategies to limit contamination in poultry.

Food Safety—Postharvest—\$2,500,000

Wyndmoor, \$400,000.—Develop quantitative data on food pathogen inactivation and survival needed to evaluate adequacy of processing and process controls in the production of meat and poultry products and validate risk assessment.

Wyndmoor, \$300,000.—Develop pasteurization requirements for the thermal destruction of *Listeria monocytogenes*, *Salmonella* spp., and other pathogens in commercially produced egg product blends containing non-egg products.

Beltsville, \$300,000.—Develop advanced inspection methods utilizing machine vision and electronic databases to increase the thoroughness and rapidity of individual carcass inspection.

Athens, \$600,000.—Develop the necessary detection and enumeration methods and delineate the dynamics of pathogen transmission in order to identify control points and strategies to prevent spread of campylobacter in poultry.

Wyndmoor, \$300,000.—Evaluate and optimize various intervention technologies for use solely, and in combination, to reduce pathogens in food products of plant origin while retaining their fresh appearance and high consumer acceptance.

Albany, \$300,000.—Evaluate and optimize various intervention technologies for use solely, and in combination, to reduce pathogens in food products of plant origin while retaining their fresh appearance and high consumer acceptance.

Pullman, \$300,000.—Prevent production of vomitoxin (DON) in wheat and barley by developing control strategies utilizing bioengineering to enhance natural resistance in crops.

GENETIC RESOURCES—\$2,000,000

Preservation of Plant and Microbial Genetic Resources—\$2,000,000

Ft. Collins, \$500,000.—Preservation and methodologies for plant germplasm.

Beltsville, \$400,000.—Research in quarantine, databases, and ecogeographic studies of plants.

Fresno/Parlier, \$400,000.—Regeneration of plant germplasm for the National Plant Germplasm System (NPGS).

Ft. Collins, \$500,000.—Preservation of base collection of microbial germplasm.

Hilo, \$50,000.—Support for Clonal Repository.

Riverside, \$50,000.—Support for Clonal Repository.

Davis, \$50,000.—Support for Clonal Repository.

Corvallis, \$50,000.—Support for Clonal Repository.

PART 1

742

HUMAN NUTRITION—\$12,000,000

Survey—\$6,000,000

Headquarters, \$6,000,000.—Survey with EPA, DHHS on food consumption patterns of infants and children.

Dietary Research—\$6,000,000

Beltsville, \$1,000,000.—Support Human Nutrition Initiative.

Boston, \$1,000,000.—Support Human Nutrition Initiative.

San Francisco, \$1,000,000.—Support Human Nutrition Initiative.

Grand Forks, \$1,000,000.—Support Human Nutrition Initiative.

Houston, \$1,000,000.—Support Human Nutrition Initiative.

Little Rock, \$1,000,000.—Support Human Nutrition Initiative.

SOUTH FLORIDA ECOSYSTEM RESTORATION—\$2,000,000

Sustainable Agricultural Production Systems of Sugarcane and Other Crops in South Florida—\$1,000,000

Canal Point, FL, \$1,000,000.—Identify sugarcane germplasm aimed at improving sugarcane tolerance to high water tables and determine agronomic practices that control soil subsidence without reducing yield; evaluate water quality and quantity effects from producing sugarcane and other crops under high water table conditions; and develop hydrologic models that evaluate the operation of agricultural water management control systems in south Florida.

Biological Control of Melaleuca and Other Exotic Plant Species of Consequences to Agriculture and the Everglades—\$1,000,000

Ft. Lauderdale, \$1,000,000.—Accelerate research to identify biological agents that control melaleuca and other exotic plant species.

HUMAN NUTRITION RESEARCH

The largest increase proposed is for Human Nutrition research. Half the money is to fund a survey of food consumption by infants and children to be used by EPA to assess dietary exposures and the other half to support research at ARS' six nutrition centers.

Question. Is the survey of food consumption mandated by law?

Answer. The Food Quality Protection Act of 1996 (FQPA) requires the Environmental Protection Agency (EPA) to set regulations on the limits of safe exposure of children to pesticide residues in food based on statistically valid estimates of dietary intakes as obtained from nutrition surveys conducted by the Department of Agriculture and the Department of Health and Human Services. The Department of Agriculture, through the Agricultural Research Service, conducts the Continuing Survey of Food Intakes by Individuals (CSFII) that collects dietary information from respondents of all ages. The current CSFII covers the period 1994 to 1996 and contains data on dietary intakes of approximately 5,700 children. The EPA estimates that data from approximately 10,000 children are needed to predict a safe exposure limit. Thus, a supplemental survey consisting only of children is required to meet the requirements of the EPA in response to the FQPA.

Question. Isn't this the same survey that the Congress eliminated funding for a few years ago because the cost per participant was excessive?

Answer. Prior to the passage of the FQPA, previous requests for a dietary survey of children by the former Human Nutrition Information Service, in response to issues raised by the National Academy of Science in a report raising concerns about pesticide residues in the food of children, were not funded by Congress. The difference between those requests and the current one is the requested survey is a supplemental survey that provides the EPA with a statistically valid number of children in each age group when the data are combined with the funded 1994–1996 Continuing Survey of Food Intakes by Individuals (CSFII) that was just completed.

Question. What is the justification for increasing support for ARS research at its six nutrition centers, particularly when it is coming at the expense of reducing existing agriculture production research?

Answer. The Human Nutrition Research Initiative is intended to enhance the capacity of the six USDA/ARS Human Nutrition Research Centers to complement ongoing research with new research approaches to: (1) define the relationship between diet and the risk of chronic disease; (2) improve resistance to acute infections and immune disorders by investigating the interaction between nutrition and immune function; (3) enhance capacity to promote changes in dietary habits by basic research; (4) improve the scientific basis for more effective Federal food assistance pro-

PART 1

743

grams; (5) extend dietary guidance to nutritionally-vulnerable groups, such as children, within the U.S.; and (6) generate a more nutritious food supply by defining the basis for modifying the health promoting properties of foods and to make beneficial changes in the consumption of foods. The knowledge to be obtained from the initiative will enable ARS to better conduct research related to production agriculture leading to the development of products that meet the demands of consumers for foods that are health promoting and nutritious. A major area of ongoing research is product quality; certainly, for foods and food products, nutritional quality is an area of increasing emphasis. Furthermore, the much needed supplemental dietary intake survey of children will provide the EPA with information upon which sound and responsible regulations concerning the levels of pesticide residues in foods can be developed. It is essential to the agricultural producers and processors that the regulations to be developed are based on accurate dietary intake data so that the regulations protect the best interests of the consuming public and at the same time maintain the competitiveness of American agriculture.

Question. The human nutrition increase is described as the first year of a multi-year initiative. What increases are contemplated in each year of this initiative? Do you expect these increases also to come at the expense of ARS' existing research programs?

Answer. The fiscal year 1998 budget includes a \$12M proposed increase. Follow-up increases of \$6M in fiscal year 1999, \$12M in fiscal year 2000, \$12M in fiscal year 2001 and \$11M in fiscal year 2002 are needed for a total of \$53M for the initiative. It is not expected that the increase will come at the expense of ARS's existing research programs but will come through increases in appropriations.

EMERGING DISEASES

Question. The requested increase for emerging diseases and exotic pests is for both plant and animal diseases and pests. You are not specific as to which disease or pest you will allot these funds. Do you plan to use these funds as flexible or contingency basis or will you allot them permanently? Please explain.

Answer. ARS plans to allot these funds permanently because developing adequate control measures for both plant and animal diseases and pests will require long-term research efforts. The plant diseases included are: Karnal bunt and head blight (scab) of wheat and the animal diseases included are: Transmissible Spongiform Encephalopathies including scrapie, chronic wasting disease and Bovine spongiform encephalopathy or BSE-type encephalopathies, Avian Influenza, and velogenic Newcastle disease, hog cholera, porcine reproduction and respiratory syndrome, Bovine Viral Diarrhea, Johne's disease, and cryptosporidium and cyclospora. Increased attention to these problems now will also serve the very important purpose to increase our scientific capacity and base of expertise to enable us to respond on an emergency basis to other crop and livestock disease problems that may arise in the future.

GERMPLASM

Question. Please identify your resources committed to maintaining plant germplasm repositories. How much is committed to the collection of plant germplasm and how much is committed to evaluation of your germplasm?

Answer. The estimated funding for maintaining the ARS plant germplasm system repositories for fiscal year 1997 is \$20,057,900. Included in this total are: \$3,951,700 for collection activities to include acquisition, quarantine, and taxonomy; and \$16,106,200 for preservation activities, to include germplasm maintenance, characterization, documentation, storage, and distribution.

Evaluation of germplasm is an activity conducted outside of the repositories by breeders and other users of germplasm. ARS commits \$19,625,100 to evaluation activities.

Question. What are the State resources committed to the repositories? Provide a listing of your germplasm repositories.

Answer. State resources committed to the repositories include both direct commitments and in-kind support to Regional Plant Introduction Stations (RPIS) and the Interregional (IR) Potato Station. The direct commitments can be identified and reported more accurately as off-the-top funding from formula funding through the Regional Directors' Associations and direct contributions from the host agricultural experiment stations. Those resources are identified:

PART 1

744

Location/repository	Formula funds	Local funds
Griffin, GA, Southern RPIS	\$234,800	\$350,000
Ames, IA, North Central RPIS	479,000	319,000
Geneva, NY, Northeastern RPIS	142,000	156,000
Pullman, WA, Western RPIS	352,000	250,000
Sturgeon Bay, WI, IR Potato Station	153,500	118,700
Total	1,371,300	1,193,700

A listing of the major ARS germplasm repositories is provided for the record: Davis, CA; Fresno, CA; Riverside, CA; Ft. Collins, CO; Washington, DC; Miami, FL; Griffin, GA; Hilo, HI; Ames, IA; Aberdeen, ID; Urbana, IL; Beltsville, MD; Stoneville, MS; Fargo, ND; Geneva, NY; Corvallis, OR; Mayaguez, PR; College Station, TX; Logan, UT; Pullman, WA; Madison, WI; and Headquarters.

BIOCONTROL

Question. How much is ARS currently allocating to the biocontrol of pests?

Answer. Currently, ARS spends \$53,769,900 on biologically-based pest control technologies which includes research on host plant resistance, classical and augmentative biological control, pheromone mating disruption, sterile insect release, and other related pest control strategies.

Question. What is the justification for the \$3 million increase proposed?

Answer. The proposed increase of \$3 million for biocontrol of pests is part of the \$4 million requested for research in support of the USDA Integrated Pest Management (IPM) initiative and will fund additional research to meet the Department's goal of having 75 percent of the crop acreage under IPM by the year 2000.

Question. The testimony indicates that of the requested increase, \$1 million is to permit ARS to conduct area-wide and pilot test programs on ARS-developed technology ready for large-area demonstrations. What area-wide and pilot test programs are planned?

Answer. Several area-wide pest management programs have already been initiated by ARS in partnership with the State Agricultural Experiment Stations. These programs currently address the corn earworm in the southeast, the codling moth in the pacific west, and corn rootworm in the Midwest United States. Because of the high success of these programs thus far, ARS plans to conduct additional programs in fiscal year 1997 and fiscal year 1998 as a part of the USDA IPM initiative. A peer review panel met on April 28-29, 1997, to evaluate and prioritize eight area-wide proposals that were submitted to the agency in March of 1997. At least one of these proposals will be funded in fiscal year 1997, with up to two additional proposals planned for implementation in fiscal year 1998, if new funding is appropriated. Targets of the eight area-wide pest management candidate programs include leafy spurge, stored grain insects, corn earworm/tobacco budworm, Russian wheat aphid, Colorado potato beetle, boll weevil, silverleaf whitefly, and fruit flies.

Question. What ARS-developed technology will be tested?

Answer. ARS has developed a number of environmentally-friendly pest control technologies that will be tested against one or more of these pests. These technologies include traditional biological control with parasites, predators, and microbial agents; host-plant resistance; behavior-modifying chemicals, such as pheromone mating disruptors and attractants; sterile insect release techniques; and cultural practices.

Question. Where will these demonstrations be carried out and what is the cost of each?

Answer. A final decision as to which program and how many of these programs ARS will be able to implement has yet to be made. Once this final decision is made, then candidate sites for demonstration and the cost of each program will be evaluated. Generally speaking, each of the 5-year area-wide pest management programs cost \$1-2 million per year.

FOOD SAFETY RESEARCH

Question. You are again requesting an increase for food safety research. How much does ARS currently commit for pre- and post-harvest food safety research? How are you assisting FSIS?

PART 1

745

Answer. ARS currently commits \$29,381,200 for pre-harvest and \$20,266,100 for post-harvest food safety research related to the microbiological contamination of meat and poultry products, for a total of \$49,647,300.

The ARS is assisting the Food Safety and Inspection Service (FSIS) by conducting research that (1) provides screening or confirmatory methods for use in FSIS laboratories, such as the development of a screening and confirmatory method for *Campylobacter jejuni*, and a rapid and sensitive PCR molecular biology method for identification of *E. coli* 0157:H7, (2) provides information for FSIS use in making regulatory decisions, such as (a) the modeling of bacterial growth or thermal death times to help set standards for processed meat products and (b) the comparison of the use of sponging vs. excision and one vs. three carcass sites for industry process control of cow/bull and hog carcasses and (3) provides and/or evaluates technology which can be approved by FSIS for use in inspected establishments to lower contamination of meat and poultry, such as steam sterilization of beef carcasses.

Question. Please identify the current and proposed funding for pathogen reduction research. Where is this research carried out? What is the nature of this research?

Answer. Current funding for pathogen reduction research is \$24,952,100. Proposed funding is \$28,737,000. This research is carried out at Albany, CA; Ames, IA; Athens, GA; Beltsville, MD; Clay Center, NE; College Station, TX; Fayetteville, AR; and Wyndmoor, PA. This research determines the presence and numbers of specific pathogens in various environments both on the farm and during slaughter and processing; develops predictive models of bacterial growth rates and survival; develops specific pre-harvest and post-harvest controls for reducing pathogens during production and processing, such as competitive exclusion, vaccines, isolation rearing and new antimicrobial agents and processes; determines the attachment characteristics of various pathogens and develops more rapid methods to identify infected animals and animal products.

Question. Where will the recommended increase be implemented? How many scientists will be recruited for this research? How will these funds be used?

Answer. The recommended increase of \$4.1 million will be implemented at Albany, CA; Ames, IA; Athens, GA; Beltsville, MD; Clay Center, NE; College Station, TX; Wyndmoor, PA; and Pullman, WA.

Fifteen scientists requiring about \$4 million will be recruited for this effort. The remainder of the funds will be used to supplement and accelerate existing programs.

These funds will be used to develop: production systems to reduce human pathogens in food producing animals and poultry, in particular, Salmonella and Campylobacter; pre-/postharvest intervention strategies for animal and plant based products; pathogen-reducing slaughter processes; food pathogen risk assessment technologies; rapid pathogen diagnostic and detection; advanced inspection methods utilizing machine vision, pasteurization requirements to destroy pathogen in egg products; and also to characterize the antibiotic resistance of specific pathogens found in food producing animals.

Question. Provide the Committee with actual obligations your Agency incurred in fiscal year 1996 for research on *E. coli*; salmonella; listeria and campylobacter. How many scientists were involved in this research?

Answer. Twenty-six scientists were involved in this research in fiscal year 1996. The actual obligations ARS incurred are as follows:

	<i>Actual obligation</i>
<i>E. coli</i>	\$1,226,606
Salmonella	5,674,131
Listeria	33,435
Campylobacter	869,069

INTEGRATED PEST MANAGEMENT (IPM)

Question. ARS is requesting an increase of \$4,000,000 for IPM research. What research is currently undertaken by ARS and by location? Provide funding and scientist effort.

Answer. In support of the Department's IPM Initiative, ARS currently conducts pest control research which includes projects to develop environmentally-friendly pest control technologies that emphasize classical and augmentation biological control, host-plant resistance, behavior modifying chemicals (e.g. pheromone mating disruptors and attracticides), sterile insect release techniques, autocidal control technologies, resistance management, cultural practices, and other related pest control tactics. ARS scientists are not only working to develop these component IPM technologies but are also involved with State, regional and local IPM teams in a variety of action-oriented implementation programs that demonstrate biologically-based pest control in on-farm situations. In addition, ARS has taken the lead in

PART 1

746

demonstrating the use of area-wide IPM tactics. The information on the location, funding and scientist effort for consolidated IPM projects currently undertaken by ARS is provided for the record.

Location	Fiscal year 1997—	
	Funds	Scientists
Fresno, CA	\$1,009,200	3.4
Salinas, CA	545,600	1.0
Shaftner, CA	230,800	0.8
Ft. Lauderdale, FL	657,500	3.0
Gainesville, FL	1,338,400	4.8
Miami, FL	460,000	1.3
Byron, GA	123,900	0.3
Tifton, GA	865,200	2.5
Ames, IA	56,200	0.3
West Lafayette, IN	86,400	0.4
Manhattan, KS	193,800	0.8
New Orleans, LA	142,500	0.8
Beltsville, MD	169,500	0.5
Morris, MN	265,200	1.0
Stoneville, MS	2,481,800	8.0
Columbia, MO	90,000	0.4
Lincoln, NE	279,900	1.3
Ithaca, NY	315,700	1.3
Raleigh, NC	48,300	0.2
Stillwater, OK	198,100	0.9
Charleston, SC	534,400	1.5
Brookings, SD	1,101,100	4.5
College Station, TX	898,500	3.7
Kerrville, TX	417,300	1.4
Weslaco, TX	691,300	1.8
Prosser, WA	144,600	0.5
Pullmann, WA	213,100	1.1
Yakima, WA	2,379,200	3.4
Headquarters	2,606,800
Total	18,544,300	50.9

Question. How will the requested funds be implemented?

Answer. Of the \$4,000,000 requested, \$1,000,000 will be used for area-wide IPM and pilot-test programs; \$2,000,000 will be used for augmentation biocontrol and biologically-based IPM in field, horticultural and vegetable crops; and \$1,000,000 will be used for host-plant resistance and related pest management strategies.

Question. Please provide a breakdown of your chemical and non-chemical research components that fall within the general area of IPM.

Answer. Of the overall figure of \$134,236,000, \$106,798,700 (80 percent) is devoted to non-chemical research while \$27,437,300 (20 percent) is associated with research on chemical pest control technology. Our research related to chemical technology focuses on reducing chemical usages and substituting currently used chemicals with ones that are safer and more environmentally friendly.

CONTINGENCY FUND

Question. You report that you spent \$51,967 in 1995 for drydock, maintenance, marine vessel upgrade. How many vessels does ARS maintain to support the Plum Island operation? What is the annual cost of operating these vessels? What has been the cost of maintenance and upgrade for those vessels since 1990?

Answer. ARS presently maintains three vessels to support the Plum Island Animal Disease Center. The annual operating costs for these vessels are \$475,000 for staff and \$220,000 for fuel.

The cost of repairs and maintenance for fiscal years 1993 to 1997 are as follows:

<i>Fiscal year</i>	<i>Funding</i>
1993	\$215,284

PART 1

747

<i>Fiscal year</i>	<i>Funding</i>
1994	329,783
1995	241,336
1996	403,334
1997	¹ 300,000

¹ Estimate.

The contingency fund expenditure in fiscal year 1995 is included in the reported total cost for the year. Agency financial records are only maintained for five years therefore data for 1990–1991 is not available. In fiscal year 1992, the operations and maintenance contract under which the boats are operated did not provide these specific costs.

Question. Contingency Fund releases were provided to Frederick, Maryland, for TCK Smut and Karnal Bunt. How were these funds used?

Answer. In fiscal year 1996, \$187,164 was released to Frederick, Maryland, and \$79,592 was released to Raleigh, North Carolina, for an ARS/Grain Inspection, Packers, and Stockyards Administration cooperative study to determine how TCK spores are distributed in wheat shipments and how that distribution affects reliability of sampling for TCK smut on wheat detection. Frederick Maryland received \$370,893 for research on karnal bunt disease and to purchase the necessary research equipment.

PERFORMANCE GOALS

Question. The most important performance goal listed by ARS is that dealing with potential long-term benefits to agriculture and American citizens. However, you provide no indicators or how the Agency could determine such contributions from its research. Is this a realistic goal? If so, how will the Agency capture this data and identify it as an outcome of its research?

Answer. ARS' mission is to conduct research to address and solve agricultural problems of high national priority. As the ARS Strategic Planning Team (SPT) worked on the task of identifying measurements for research outcomes and impacts, they decided to include a measure that addressed the Agency's central mission by identifying ways for ARS to capture and report on "... research accomplishments with significant potential long-term benefits to U.S. agricultural industry and American society." The agency believes that this is a realistic objective. The mechanism for identifying and reporting these accomplishments will be an annual review by Research Leaders, the National Program Staff, and Area Directors in an effort to identify the research products with the greatest probability of making an important contribution to American agriculture. This process will be as objective as possible, but it is not always possible to immediately determine the value, application or longer term impact of research. ARS intends to identify and report accomplishments each year in the Agency's annual performance plan.

Question. It appears that numbers of published papers and presentations are the only goals that ARS could express that lend themselves to tracking and quantifying. This is similar to tracking the number of assets and scientists the Agency employs—but not very meaningful in terms of measurable contributions. Given the effort involved in the GPRA program, have you concluded that this represents the only goals and measurements available to judge the merits of your agency's contributions?

Answer. Shortly after GPRA was enacted, ARS established an agency-wide Work Group that sought to apply these new programmatic accountability principals in a research environment. To ascertain how other research agencies were responding to GPRA, ARS helped initiate and co-chair the Research Round Table, an ad hoc committee consisting of the major Federal research agencies. This group met monthly for 18 months in an effort to define and resolve the issues posed in this question. ARS and its colleagues in REE also met with the research directors from the food and agricultural industry to learn how these issues are handled in the private sector. From these discussions, ARS developed a draft strategic plan that mixed broad qualitative goals and output measures such as the number of papers published or the number of new patent applications. Qualitative performance goals can be found under each Specific Goal and Initiative in the ARS plan. One example of a qualitative performance goal, taken from Specific Goal 1.2.2 "New Uses and Products," states that ARS will "experimentally demonstrate genetically improved crops with potential for successful introduction." While refereed papers and other outputs are important measures of productivity, quality, and substance in the scientific community, they do not, as you indicated in your question meaningfully measure the contributions of the Agency's research.

What emerged from all these activities and the comments we received on our draft plans was a clearer picture of just how difficult, if not impossible, it is to apply

PART 1

748

metrics to research, especially basic research. The key points that emerged from this entire process include: (1) the outcomes and impacts of research are difficult to identify and quantify in advance, (2) the value and potential application of knowledge gained is not always immediately recognized and understood, (3) results are not always predictable, (4) there is a high percentage of negative determinations or findings, and (5) the unknown cannot be measured. After much deliberation, we have concluded that the best approach is to abandon the numerical measures of outputs and rely instead on qualitative measures in each annual performance plan describing what the agency expects to produce in a given fiscal year. This new approach is reflected in the most recent draft of the ARS strategic plan dated April 21, 1997.

SELECTED EXAMPLES OF PROGRESS

Question. Drip irrigation in the Southeast can be profitable. How new is this technology?

Answer. With the development of plastics during and after World War II, the idea of drip irrigation became feasible. After a small irrigation manufacturing firm in New York began to supply the first drip irrigation equipment to water plants in greenhouses, researchers in Israel and the United States began to expand their efforts in the early 1960's. The first commercial-scale, demonstration study occurred on a grower's avocado orchard in San Diego, California, in 1969.

Question. Isn't this technology being utilized in other regions of the U.S.?

Answer. Yes. Drip irrigation is used in the Southeast, Southwest, and West, primarily, to irrigate vegetable, fruit, and vine crops. The largest usage of drip irrigation systems is in Florida and California, and about 4 percent of the irrigated land in the United States is currently being irrigated by this technology.

Question. Explain the potential use of this technology and the benefit to be derived.

Answer. Historically, the use of drip irrigation technology has been associated with irrigating high-value crops where soils are marginal, terrain is steep, and water costs are high. Potential benefits include reduced water use and cost, improved yields, product quality, salinity control, and nutrient management; and reduced evaporative losses and weed growth. Drip irrigation's potential use becomes an economics decision, balancing the above-noted benefits against the relatively high initial cost of the hardware, significant maintenance costs, and increased management requirements.

Question. ARS scientists at Orlando, Weslaco, and Beltsville have utilized a parasitic wasp to control the brown citrus aphid, boll weevils, and whiteflies. Is the same wasp being employed in the research studies at three ARS locations? Explain.

Answer. ARS scientists in Orlando, Weslaco, and Beltsville are each using different wasp species to respectively control the brown citrus aphid, boll weevils, and whiteflies. Biological control is the science of using natural enemies (parasites, pathogens and predators) to control insect pests using biological rather than chemical means. Beneficial parasitic wasps, are highly specialized and generally attack only a single or very few species of insects. This specialization makes them safe to use as they do not affect humans or most other nontarget species (including other insects) that are important to agriculture and the natural environment. Although this is a positive trait for environmental safety, it also means that research must be conducted on different parasitic wasps for each major insect pest. ARS scientists work closely together across geographic locations to identify, develop, implement and test new biological control technologies. Thus, the research at Orlando, Weslaco and Beltsville, although unique in some ways, employ integrated information and activities to assist one another in solving severe pest problems such as the brown citrus aphid, boll weevil and silverleaf whitefly.

Question. What is the relationship between the scientific studies on the parasitic wasp on whitefly and the irrigation work on whiteflies in cotton at Phoenix, Arizona?

Answer. ARS scientists at Phoenix, Arizona, have determined that irrigation patterns affect the attractiveness of the cotton crop to adult whiteflies. Water stressed plants are more attractive to these adults and thus receive more eggs than greener more highly irrigated plants. Although no direct effects have yet been measured on parasitic wasps, ARS scientists in Phoenix believe that the more highly irrigated cotton would have lower whitefly numbers and thus would be sprayed less with chemical insecticides. Fewer chemical insecticides mean a more positive environment for parasitic wasps allowing wasp numbers to increase more than in similar pesticide treated areas. ARS scientists studying parasitic wasps in other locations have found that increased nitrogen fertilizer which stimulates plant growth also affects the attractiveness of these plants to whitefly adults. ARS scientists are linking

PART 1

749

these findings together through an ARS led "Silverleaf Whitefly: 5-Year National Research and Action Plan".

Question. What is the coordination and relationship of these studies and the studies on cotton insects at your Gainesville laboratory investigating plant emissions to attract beneficial insects?

Answer. ARS conducts research on parasitic wasps affecting whiteflies at several different locations including, Beltsville, MD; Montpellier, France; Orlando, FL; Phoenix, AZ; and Weslaco, TX. These programs are coordinated within the Agency by the ARS National Program Staff, and with other state and federal institutions through an ARS led "Silverleaf Whitefly: 5-Year Research and Action Plan". Although the ARS scientists in Gainesville, FL are investigating parasitic wasps that attack caterpillars rather than whiteflies, they have found that plants under stress by defoliating caterpillars cause cotton to produce volatile chemicals that attract certain parasitic wasps that then search these plants for damaging caterpillar pests. Currently, this research is investigating basic aspects of plant, pest and parasite interactions. The long term goal of this work is the manipulation of these interactions to better manage parasitic wasps by controlling their behavior through plant characteristics that may be enhanced through plant breeding or genetic engineering. Through the ARS National Program on "Crop and Commodity Pest Biology, Control and Quarantine", studies of this type are integrated by the ARS National Program Staff into sets of nationally organized activities to accelerate the development and application of many different types of biologically-based pest control efforts.

Question. ARS has discovered a new class of insect repellent, Piperidine. Does ARS have a CRADA for commercial development?

Answer. ARS does not have a CRADA for the commercial development of Piperidine. Piperidine, a natural repellent of insects, is being evaluated as a component of fire ant baits. It is expected that by incorporating Piperidine into our proprietary fire ant baits, ant species we do not want attracted to the bait will be repelled. It seems that fire ants themselves use Piperidine to repel other ant species from their food and nests. ARS has a Memorandum of Understanding with the University of Brussels, Belgium, to produce Piperidine, which must be synthesized in a laboratory, for ARS' use. Additional studies are rapidly progressing and ARS hopes to identify a commercial partner before the end of the year.

Question. Irradiation of blueberries is a proposed alternative to methyl bromide. How will acceptance of this quarantine treatment enhance U.S. and foreign markets? Is this procedure acceptable to the market place? Is this an effective substitute for methyl bromide? What other commodities are subject to this treatment?

Answer. Some countries that import U.S.-produced blueberries require a methyl bromide fumigation treatment to kill quarantined insect pests that might be present in the commodity. Methyl bromide will not be available for use in the U.S. after January 1, 2001. The short shelf life and delicate nature of blueberries limits options for replacing methyl bromide. Irradiation is a promising methyl bromide alternative to disinfest blueberries with minimal phytotoxic effects. Acceptance of this treatment will allow continued shipment of blueberries to countries currently requiring methyl bromide fumigation.

Radiation is approved for food use in many countries. Recent tests of Hawaiian commodities and Florida strawberries marketed in the U.S. showed wide acceptance by consumers. Consumers are likely to become even more comfortable with this technology with the publication of new regulations allowing radiation to treat chicken and other meats and as a fruit fly quarantine treatment.

Many commodities, including spices and grains are irradiated in many countries. The U.S. is publishing regulations to allow irradiation of various animal products to ensure microbial decontamination and of fruits and vegetables to disinfest fruit flies. As methyl bromide is phased out in many countries around the world in the next several years, there will be an increased reliance on radiation as a quarantine treatment to replace methyl bromide for many commodities.

Question. Describe the utilization and cost benefits U.S. cotton farmers are realizing through the use of the GOSSYM-COMAX cotton model. How many farmers are employing this model and what are the total estimated savings from its application?

Answer. Over 500 producers have licensed GOSSYM-COMAX since 1986 and over 200 growers have recently renewed their licenses or are new buyers of licenses, while the number of producers currently using old versions of the model are unknown. In addition to individual farmers, about 50 consultants use GC. They consider the number of clients serviced to be proprietary information. According to a commissioned report by Dr. Howard Ladewig, Texas A&M University, farmers across the cotton belt who have not licensed GOSSYM-COMAX (GC) are benefiting from this technology's principles in a number of ways:

PART 1

750

- 60 percent of all cotton growers are using plant mapping, a practice that was introduced by GC.
 - 54 percent of GC users have modified their irrigation schedules.
 - 76 percent of GC users have modified their nitrogen fertilization rates.
 - 47 percent of GC users pay more attention to early-season insect damage.
 - 29 percent of GC users have reduced their production costs.
 - 57 percent of GC users have increased cotton yields.
- Net income increase was found by Dr. Ladewig to average \$45 per acre per year, as determined by the growers.
- Dr. Ladewig also estimated that about \$187 million has been the total financial benefit of GC to date.

NATIONAL AGRICULTURAL LIBRARY

Question. The National Agricultural Library supports information centers including the Rural Information Center, Water Quality Information Center, Animal Welfare Information Center, Technology Transfer Information Center, Plant Genome Information Center, Food and Nutrition Information Center, and the Biotechnology Information Center. What are the resources currently committed to these programs in each of fiscal years 1996–98?

Answer. The appropriated resources committed for the Information Centers for the three fiscal years are provided below.

Information center	Fiscal year—		
	1996 (actual)	1997 (budgeted)	1998 (estimated)
Rural	\$411,540	\$393,000	\$403,485
Water quality	233,708	232,000	237,107
Animal welfare	708,076	711,000	720,825
Technology transfer	245,096	230,000	231,636
Plant Genome	1,448,668	1,383,000	1,383,000
Food and Nutrition	705,466	688,000	680,331
Biotechnology	182,340	165,000	130,748

Question. Provide the NAL appropriations and staff year levels for fiscal years 1996, 1997, and 1998.

Answer. The NAL appropriations levels for fiscal years 1996, 1997, and 1998 are \$19,464,000, \$19,319,000, and \$19,394,000 respectively. The staff year levels for fiscal years 1996, 1997, and 1998 are 209, 201, and 196 respectively.

ORGANIZATION OF NAL

Question. Briefly describe the major organizational components of the NAL and provide respective funding and staffing levels in each of fiscal years 1996–1998.

Answer. NAL has 4 major organizational components:

The Office of the Director (OD) provides leadership, general support, and building services.

The Technical Services Division (TSD) selects and acquires information resources for the collection and provides bibliographic and subject access to that literature.

The Public Services Division (PSD) facilitates access to the information and materials needed by researchers, scientists, educators, administrators and the general public through a variety of general and specialized information services, document delivery services, and instructional programs.

The Information Systems Division (ISD) is responsible for the automation activities of NAL.

The funding and staffing levels for each component (including repair and maintenance funding) follow:

	Fiscal year 1996 (actual)		Fiscal year 1997 (budgeted)		Fiscal year 1998 (estimated)	
	Funding	Staffing	Funding	Staffing	Funding	Staffing
OD	\$4,310,701	13	\$3,074,000	15	\$3,086,000	13
TSD	6,629,073	82	6,971,000	82	6,998,000	82
PSD	6,114,802	76	6,457,000	74	6,482,000	72
ISD	3,831,919	24	2,817,000	30	2,828,000	29

PART 1

751

	Fiscal year 1996 (actual)		Fiscal year 1997 (budgeted)		Fiscal year 1998 (estimated)	
	Funding	Staffing	Funding	Staffing	Funding	Staffing
Total	20,886,495	195	19,319,000	201	19,394,000	196

NATIONAL AGRICULTURAL LIBRARY OBJECT CLASSIFICATION

Question. Provide a breakdown of NAL's 1996 obligations by object classification for fiscal years 1996–98.

Answer. The object classification table for the National Agricultural Library for fiscal years 1996–98 is provided for the record.

Object classification	Fiscal year—		
	1996 actual	1997 appropriation	1998 budget estimate
Personnel Compensation			
11.1 Permanent positions	\$7,782	\$8,162	\$8,192
11.3 Positions other than permanent	258	270	271
11.5 Other personnel compensation	88	92	92
Total, Personnel Compensation	8,128	8,524	8,555
12.0 Personnel benefits: civilian retirement	1,619	1,699	1,706
13.0 Former employees	18		
Total, Object Classes 11–13	9,765	10,223	10,261
Other Obligations			
21.0 Travel and transportation of persons	132	108	108
22.0 Transportation of things	91	75	75
23.3 Comm., util, other rents	739	605	605
24.0 Printing and reproduction	110	90	90
25.2 Other services	2,163	1,768	1,805
25.3 Purchases of goods and services	62	51	51
25.4 Operations and maintenance of facil	1,928	1,577	1,577
25.5 Research and development contracts	1,310	1,072	1,072
25.7 Operations and maintenance of equip	150	122	122
25.8 Subsistence and support of persons	6	5	5
26.0 Supplies and materials	1,259	1,030	1,030
31.0 Equipment	2,481	2,029	2,029
41.0 Grants, subsidies and contributions	690	564	564
Subtotal, All Other	11,121	9,096	9,133
Total	20,886	19,319	19,394

Question. What is the annual maintenance cost of the Beltsville NAL facility for each of fiscal years 1996–1998?

Answer. The annual maintenance costs include NAL's Repair and Maintenance budget as well as contracts for building maintenance activities such as cleaning, an elevator repair contract, and other similar activities. The total maintenance costs for fiscal years 1996–98 were: 1996—\$1,358,700 (actual); 1997—\$1,333,000 (budgeted); and 1998—\$1,346,000 (estimated).

Question. Identify funding by agency that NAL receives from Federal and non-federal sources.

Answer. The funding by agency that NAL receives from Federal and non-federal sources is provided in the table below:

NAL Federal funding:	
Office of the Secretary	\$32,114
Agricultural Marketing Service	45,195
Animal Plant Health Inspection Service	65,862
Cooperative State Research, Education, and Extension Service	270,157
Economic Research Service	76,500
Food and Consumer Service	405,950
Forest Service	40,805
Office of Operations	2,103

PART 1

752

Natural Resources Conservation Service	53,387
Foreign Agricultural Service	23,857
Grain, Inspection, Packers and Stockyards Administration	4,106
Rural Development	125,053
Office of the Inspector General	1,949
Food Safety and Inspection Service	107,647
Farm Service Agency	65,689
National Bureau of Standards	6,000
Food and Drug Administration	30,000
National Institutes of Health	692,370
National Institute of Mental Health	12,500
Department of Justice	30,000
National Finance Center	2,147
National Agricultural Statistics Services	12,500
Total, NAL Federal funding	2,105,891
NAL non-Federal funding:	
University of Mississippi	43,000
Virginia Polytechnic Institute and State University	16,000
National Rural Electric Cooperative Association	7,028
Total, NAL non-Federal funding	66,028
Total, NAL funding	2,171,919

Question. Identify the services NAL provides other agencies through reimbursable agreements.

Answer. NAL provides three types of services that other agencies fund via reimbursable agreements. (1) Through the Current Awareness Literature Services (CALIS), NAL provides USDA researchers ongoing literature searches through a centralized electronic database. (2) NAL also arranges Dunn and Bradstreet financial database services that provide USDA agencies with business and financial reports. (3) Additional reimbursable arrangements make it possible for NAL to provide specialized information services that support other agencies. The Rural Information Center, for example, provides information and referral services to local government officials, community organizations, health professionals and organizations, rural electric and telephone cooperatives, libraries, businesses, and rural citizens working to maintain the vitality of America's rural areas. Through a separate reimbursable agreement, the Alternative Farming Systems Information Center operates the Sustainable Agricultural Network which fosters the exchange of scientific and practical information on sustainable agricultural systems.

Question. Agricultural Genomes Information System. ARS also maintains the GRIN system. How do these two systems differ? Why are they managed separately?

Answer. The Agricultural Genomes Information System (AGIS) and the Germplasm Resources Information Network (GRIN) differ by being designed, at least initially, to serve somewhat different groups of users, to play different information management roles, and to address different objectives. Because of the generally substantial differences in the preceding factors, the databases were developed and are managed separately but contain appropriate links between the genomic and germplasm data.

The GRIN was developed primarily to play two central roles in managing germplasm and associated information. First, it is the means whereby germplasm managers of the National Plant Germplasm System (NPGS) manage the local inventory of information, seeds, and plants conserved at various NPGS sites. For example, it is used to record requests for germplasm accessions, to keep a running tally of the number of seeds, clones, available per accession, etc. It also serves as an archive for the results of seed quality assays, the ambient experimental conditions during germplasm production, and similar information. The preceding uses require that a variety of standard and nonstandard reports be generated periodically from the GRIN database by a variety of germplasm managers. In general, the segments of GRIN devoted to inventory management are only accessible to NPGS germplasm managers.

Second, GRIN is designed to help encourage the use of genetic diversity, in the form of germplasm, in crop improvement and in scientific research. An extremely wide variety of information is available on GRIN for germplasm accessions, because the user community is extremely broad, ranging from plant scientists and breeders, to educators and students, to crop producers. The information entered into GRIN

PART 1

753

emphasizes traits that are often immediately useful for crop production and improvement, such as yield, adaptation, and resistance to biotic or abiotic stresses. Often, the genetic basis of the preceding traits is unknown, or may be irrelevant for effectively deploying the traits for certain applications.

In contrast to GRIN, AGIS is designed primarily to make information relevant to plant genome research readily available in useful formats. The primary clientele for AGIS is the biological research community, especially plant geneticists.

There are also substantial technical differences between the systems. For example, they were constructed with somewhat different software, with the GRIN now being based on the industry-standard Oracle. AGIS is Unix-based, and constituent crop-specific genome databases in AGIS have been constructed with ACeDB or with Sybase (the maize genome database) software. The database structures of GRIN and AGIS—the electronic arrangement of the data—are different, with GRIN generally arranged around the germplasm accession as the central, unifying element, with accession attributes, such as physical location, being extremely important descriptors. In contrast, the constituent crop-specific databases of AGIS focus on specific genes and their locations on the genome as the unifying database structural elements.

Despite their differences, various elements of the two separate database systems are now linked electronically via the World-Wide-Web (WWW). In the future, it is anticipated that additional components of the two systems will be similarly linked. Nonetheless, it is likely that the two database systems will remain separate entities in the future, because of the intrinsic factors noted above.

NATIONAL PRESERVATION PROGRAM

Question. NAL established a Preservation Officer position. How many staff years are employed in this effort?

Answer. The equivalent of four staff years are employed in the NAL preservation effort.

Question. How much money does NAL spend in contracting for preservation workload?

Answer. NAL is spending \$215,000 in fiscal year 1997 on contracts and cooperative agreements to obtain a variety of preservation services and products.

Question. What does the Agency envision this effort costing on an annual basis?

Answer. NAL envisions that a fully implemented ongoing preservation effort would cost more than \$2 million per year.

Question. Please explain, in more detail, the National Preservation Program for Agricultural Sciences.

Answer. NAL has established a national preservation program for agricultural sciences in conjunction with the United States Agricultural Information Network. The National Preservation Plan for Agricultural Literature is a discipline-based approach to creating a distributed system for preserving agricultural literature. The Plan calls for each state in the U.S. to take responsibility for preservation of its own state and local agricultural literature. This will result in the systematic identification of the universe of state and local level published literature. NAL's role in the Plan is to focus on federal publications, rare books, manuscripts and other uniquely held materials.

PERFORMANCE MEASURES AND GOALS

Under the outcomes listed by ARS, NAL will receive and handle customer requests within established timeframes: deliver of documents, 95 percent; and library research (references), 95 percent.

Question. Who are the clientele of the Library?

Answer. The clientele of the Library includes members of Congress and their staff; Federal administrators and managers; state and local officials of government; agricultural program administrators, scientists, engineers, and researchers; extension personnel; educators; employees of agriculturally-related businesses and industries; students and scholars; consumers and the general public.

Question. How many types of electronic and hard copy delivery systems are in place?

Answer. NAL delivers both publications and reference services, and different delivery systems are appropriate in each case. For distributing publications, two electronic systems are used. One system is via telefacsimile, and the other utilizes the Ariel System. Ariel involves the use of a document delivery software to deliver publications over the Internet. Hardcopy documents are generally sent by U.S. mail, although rush delivery is sometimes arranged by other carriers.

For the delivery of reference services, all the common methods of communication are employed. Electronic means include electronic mail, telefacsimile and telephone.

PART 1

754

Other reference requests are answered via the U.S. mail. Reference information of general use to NAL clientele are available 24 hours a day via the World Wide Web on the Internet.

Question. How will you document efforts to achieve these goals?

Answer. NAL periodically samples workflow to ensure prompt document delivery and reference services for customers. Based on a comparison of data from before and after the designated period we will be able to document progress toward these goals.

Question. How will you distinguish performance achievement among these goals?

Answer. NAL will distinguish performance achievement among these goals by comparing data from before and after the designated period.

BUILDINGS AND FACILITIES

NAL completed a facility study in 1991 that identified numerous code, mechanical, electrical and architectural deficiencies estimated at \$18 million.

Question. Please list the deficiencies and costs identified in this study.

Answer. In general the deficiencies and costs can be categorized into three major areas of work: architectural, mechanical/plumbing, and electrical. The types of deficiencies and associated estimated costs are as follows:

Architectural deficiencies include items such as deteriorating brick; exterior glazing leaks; egress requirements; fire code deficiencies; accessibility issues; and other items of this type. The estimated cost to correct these deficiencies is \$4.7 million.

Mechanical/plumbing deficiencies include items such as lack of sprinkler system; insufficient cooling capacity; lack of temperature and humidity control; poor air circulation; lack of vacuum breakers on hose bibbs; worn out water control valves; and other miscellaneous items. The estimated cost to correct these deficiencies is \$10.2 million.

Electrical deficiencies include items such as improper lighting levels; insufficient emergency power system; branch circuit wiring devices in disrepair; insufficient lightning protection system; and other miscellaneous items. The estimated cost to correct these deficiencies is \$3.1 million.

The \$18 million estimate is based on constant 1998 dollars. The total program cost will increase depending on how much is appropriated each year and the corresponding rate of inflation.

Question. Why has NAL waited until fiscal year 1998 to request funding for these deficiencies?

Answer. When the facility study was completed in late fiscal year 1991, the NAL Director worked with USDA building engineers to analyze and prioritize the recommendations. Some existing funds were used to begin addressing the highest priority deficiencies, and the 1991 study has been used since its receipt as justification for increased building-related appropriations. In fiscal year 1992, NAL did receive a small increase in its annual Repair and Maintenance budget.

Question. How many phases will be involved in correcting facility deficiencies and adding storage space?

Answer. The number of phases to correct facility deficiencies and add storage space is dependent on both funding and impact to library services.

Question. How much will each phase cost and what work will be accomplished?

Answer. Due to uncertainty regarding future funding levels, the Agency has not developed a firm phasing plan beyond Phase 1. Phase 1 will address the replacement of boilers, renovations to the first, third, fourth, and fifth floors, and installation of sprinklers. It is estimated at \$6 million.

Question. You state that in addition to these facility deficiencies, NAL needs to acquire additional storage space. How do you plan to do this?

Answer. NAL plans to acquire additional storage space through more efficient use of its existing space. Current plans call for returning the fifth floor to a stack floor and relocating the staff currently located on the fifth floor to floors one, three, and four.

Question. What is the cost involved for added space?

Answer. It is not expected that there will be any significant cost increase for this work since most of the work required would have been needed to address the facility deficiencies.

Question. Is this cost part of the original study?

Answer. The cost for added space was not directly identified in the original study, however, addressing the architectural, mechanical/plumbing, and electrical deficiencies will require extensive tear out of existing finishes. It will be during the repair of these disturbed areas that staff consolidation can be accommodated.

In addition to the Facility Condition Study, the NAL also commissioned a space utilization study in 1990/1991 to investigate how best to meet competing space

PART 1

needs for the staff, the collection, and library users. As a result of that study, it became clear that NAL needed more space for collections.

Question. NAL has annual funding appropriated for building repairs. How will these funds be used in defraying these costs?

Answer. NAL has available \$900,000 per year in repair and maintenance funds. Much of this funding goes to immediate repair and maintenance needs not necessarily related to the major facility deficiencies being addressed in this effort. An additional problem is the repair and maintenance funds are annual appropriations, therefore, they cannot be used to supplement the Buildings and Facilities appropriations.

Question. Detail your plans and costs in conjunction with the overall \$18 million. *Answer.* Because of the uncertainty regarding what immediate repair and maintenance demands may be made on the annual repair and maintenance account from year to year, and the difference in type of funds, no plans have been developed addressing how these repair and maintenance funds could supplement the Building and Facility request. The \$18 million cost estimate is based on 1998 dollars. The total program cost will increase depending on how much is appropriated each year and the corresponding rate of inflation.

Question. The justification for \$18 million "in 1998 dollars" is tied to the comprehensive Facility Condition Study. This study refers to deficiencies. The request for 1998 includes First Floor Alterations. Were these alterations also included in this study?

Answer. These alterations were not specifically included in the Facility Condition Study.

Question. Are alterations requested outside this study, and if so, please detail for the Committee your request?

Answer. In addition to the Facility Condition Study, the NAL also commissioned a space utilization study in 1990/1991 to investigate how best to meet competing space needs for the staff, the collection, and library users. As a result of that study, it became clear that NAL needed more space for collections. It was determined that the most cost-effective approach to the storage issue was to return the fifth floor, originally designed for book storage and subsequently modified for staff use, back to book storage and relocate the personnel currently occupying the fifth floor to floors one, three, and four.

Question. How much of the \$18 million is planned for alterations? *Answer.* Correcting the numerous facility deficiencies will require demolishing existing facility components to access the underlying utilities. The additional cost of alterations required to accommodate personnel displaced from the fifth floor is not expected to significantly increase the cost of correcting facility deficiencies beyond the \$18 million estimate.

Question. Funds are requested to alter existing space. Please provide for the Committee the current utilization of NAL space and planned use for this space.

Answer. The current and planned utilization of NAL space (exclusive of mechanical areas) is as follows:

Purpose	Approximate percent of space usage	
	Current	Planned
Office space	38	33
Collections	53	59
Public areas	9	8

Question. What areas need to be modified? *Answer.* In order to increase the space available for collection growth, it is necessary to reduce slightly the office space and public areas.

OBJECT CLASS

Question. The actual full-time equivalents for 1994, 1995 and 1996 are well below the Agency's authorized ceiling for those years. What is the cause for underutilization of your work force?

Answer. The fiscal year 1995 budget proposed closure of 20 research locations. Hiring during fiscal year 1994 was curtailed and vacancies were held open to provide maximum placement opportunities for affected employees. Although final congressional action directed the closure of only 10 locations and 2 programs, the locations which did not close began the year with a significant number of vacancies. In

PART 1

756

addition, in fiscal year 1995 there was a freeze placed on all hires outside of USDA and personnel actions were frozen on grade 13–15 positions. These actions caused the agency to begin fiscal year 1995 with a large number of vacancies. Early retirement was also offered to eligible employees in fiscal years 1994 and 1995 to comply with the Administration's streamlining initiatives. This action produced additional vacancies and further reduced full-time equivalents (FTE) usage below ceiling levels. ARS is now moving toward aggressively to recruit new personnel to fill existing vacancies but is experiencing a significant lag problem and new offsets due to continuing retirement attrition.

Question. Please provide a detailed breakdown of your equipment purchases in fiscal year 1996. Please distinguish scientific or laboratory equipment purchases, computer and related costs and other major purchases for the Committee.

Answer. A detailed breakdown of ARS equipment purchases for fiscal year 1996 is provided for the record. The information follows:

	<i>Fiscal year 1996 actual</i>
<i>Object Class 31 Equipment</i>	
Research Equipment such as: Atomicabsorbtion Spectrophotometer, Bicemek 2000 Laboratory Automatic, Accelerated Solvent Extractor, Gas Chromatograph Laboratory Casework and Fumehoods, Hewlett Packard Benchton, 6 Incubators, Near Infra Red Instruments, and other scientific equipment	\$6,871,545
Furniture and Fixtures	303,735
Laboratory Equipment such as: Laboratory Casework and Fumehoods, Autoclaves, Columns, High Pressure Liquid Chromatograph Ultracentrocentrafuses, and other similar lab equipment	13,097,007
Snow Telemetry Equipment	1,376
Engineering Equipment	58,788
Radio and Communications	110,672
Agricultural Machinery and Equipment (includes heavy vehicles such as pickup trucks and tractors)	622,954
Subtotal	21,066,077
ADP Software, Personal Computers	4,451,225
Motor Vehicles, Working Capital Fund Fleet Equipment	1,264,115
All Other Equipment: Telephone, office machines, reproduction machines, etc	9,878,830
Subtotal	36,660,247
Buildings and Facilities Account	400,000
Total	37,060,247

Question. How much money was obligated for consultant services in fiscal year 1996?

Answer. There were no funds obligated for consultant services under 5 U.S.C. 3109 in fiscal year 1996.

Question. Please provide a detailed breakdown of obligations incurred in fiscal year 1996 in the area of "Other Services": contracts for research services, contracts for administrative services, etc.

Answer. Provided is a detailed breakdown of obligations incurred in fiscal year 1996 in the area of "Other Services": contracts for research services, contracts for administrative services, etc.

Other services

	<i>Fiscal year 1996</i>
Research and Development Contracts:	
Service Contracts	\$26,705,209
Research Contracts	17,577,024
Research Support Agreements	26,494,290
Interagency Agreements	7,356,339
Specific Cooperative Agreements w/State Institutions	20,246,792
Specific Cooperative Agreements w/Private Corporations and Institutions	2,391,926
General Cooperative Agreements	11,491,518
Advisory and Assistance Services from Non-Governmental Sources	1,192,000

PART 1

757

	<i>Fiscal year 1996</i>
Contractual Services for: Auditing, Stenographic Services, Training, Reimbursable Details, Fees, Health Units and Related Activities	6,523,126
Purchase of Services from USDA Account: NFC Processing/Greenbook Costs, Video and Film Services, ADP Data Processing Services and Related Services	2,916,194
Operation and Maintenance of Facilities: Contracts, Including Government-Owned Contractor-Operated Facilities, and Services Contracts and Routine Repair, Upkeep of Land, and Maintenance of Facilities, and A-76 Contractual Services	20,828,308
Operation and Maintenance of Equipment: Maintenance of Motor Vehicles, Office Equipment, Telephones, ADP Software, Other General Type Equipment	9,121,296
Subsistence and Support of Persons	923,936
Medical Care (Clinical/Services)	185,592
Subtotal, Other Services	153,953,550
Building and Facilities Contracts	20,985,000
Total, All Other Services	174,938,550

Question. Provide a breakdown of the costs associated with "Personnel Benefits" in fiscal year 1996.

Answer. A breakdown of costs associated with "Personnel Benefits" in fiscal year 1996 is provided for the record. The information follows:

<i>Personnel benefits</i>	<i>Fiscal year 1996 actual (In thousands)</i>
Contribution to CSRS	\$12,313
(Number of Employees)	(3,127)
Contribution to FERS (Includes Thrift Savings Plan)	29,498
(Number of Employees)	(4,186)
Health Insurance	17,368
Life Insurance	618
Workmen's Compensation	2,790
Quarters Allowance	1,021
Other costs, e.g. FICA, Medicare	6,780
Subtotal Benefits	70,388
Former employees	434
Total, Personnel Benefits	70,822

FUNDS AND RESEARCH MANAGEMENT

Question. Again in fiscal year 1996 as in fiscal year 1995, ARS was under its personnel ceiling by a significant 300 full-time equivalents. How much money budgeted for compensation for these positions was saved by your Agency?

Answer. A total of \$12.4 million was saved due to ARS being below ceiling.

Question. What was done with these savings?

Answer. A portion of these savings accrued to Headquarters and were reallocated as follows:

<i>Use of funds</i>	<i>Fiscal year 1996 funds (In thousands)</i>
Area-Wide Priorities(Research Equipment and Other High Cost Needs)	\$2,193.9
Location Closures, Conversions, and Transfers	2,299.5
Remedial Investigation and Feasibility Study (Beltsville, MD)	1,400.2
ADP and Other Infrastructure Upgrades	1,147.9
Removal Actions (Hazardous Waste Material)	436.9
RCRA Closure Sites (Greenport, NY)	360.0
SES Relocations	309.5
Roof Repairs (Beltsville, MD)	275.8
Oil Spill (Orient Point, NY)	164.6
Summer Intern Program	118.0
USDA Liaison Program	100.0
ESA Phase II Sampling (El Reno, OK)	70.0

PART 1

758

<i>Use of funds</i>	<i>Fiscal year 1996 funds (In thousands)</i>
Agency-Wide Hazardous Waste Cleanup	68.4
Subtotal	18,944.7

¹The balance of accrued lapsed salaries was retained at ARS field locations for locally-based spending decision. The primary uses of these funds were for research equipment, employee relations, facilities repair and maintenance, safety and health improvements, and unanticipated operating needs.

Question. To what extent were these funds obligated at the locations where they were saved?

Answer. Approximately, 40 percent of the funds saved were obligated at the locations where they were saved. The remaining 60 percent was used for Agency priorities not necessarily at the location where the funds were saved. An example of this would be the funding provided for location closures; no savings occurred at these locations, however, funds were obligated at these sites for closure costs.

Question. How many active projects does ARS currently engage?

Answer. 1200 individual research projects are in progress at this time.

Question. How many scientists are currently on-board?

Answer. There are currently 1,810 permanent scientists on-board in ARS as of April 29, 1997. Additionally, ARS employs a variable number of temporary scientists or post-docs on 2 to 4 year appointments. The current number of post-doctoral scientists is 312.

EXTRAMURAL FUNDING

Question. Please list the funding ARS commits to Land Grant Universities. Please identify these amounts by recipient.

Answer. A list of funding committed to 1890 Land Grant Universities follows:

<i>School</i>	<i>Fiscal year 1996</i>
Alabama Agri and Mech College	\$12,500
Alcorn State (MS)	488,300
Auburn University	71,000
Clemson University	41,000
Colorado State University	609,500
Cornell University	734,400
Florida Agri and Mech University	5,100
Iowa State University	143,000
Kansas State University	274,700
Louisiana State University	146,700
Michigan State University	250,700
Mississippi State University	1,080,700
Montana State University	874,500
New Mexico State University	687,400
North Carolina State University	976,300
North Dakota State University	215,600
Ohio State University	343,800
Oklahoma State University	144,500
Oregon State University	479,400
Pennsylvania State University	87,600
Purdue University	708,800
Rutgers University	98,200
Southern University	340,900
Texas A&M University	1,064,500
Univ of Alaska	6,000
Univ of Arizona	309,100
Univ of Arkansas	456,700
Univ of California	2,247,000
Univ of Connecticut	80,000
Univ of Delaware	4,500
Univ of Florida	1,603,700
Univ of Georgia	377,500
Univ of Hawaii	1,507,300
Univ of Idaho	162,400
Univ of Illinois	470,700
Univ of Maryland	784,200
Univ of Massachusetts	10,000

PART 1

759

<i>School</i>	<i>Fiscal year 1996</i>
Univ of Minnesota	435,200
Univ of Missouri	685,800
Univ of Nebraska	749,500
Univ of Tennessee	149,900
Univ of Vermont	45,000
Univ of Wisconsin	720,900
Univ of Wyoming	48,700
Utah State University	156,000
Virginia Polytechnic Institute and State Univ	100,000
Washington State University	859,300
 Totals	 21,848,500

Question. Please identify other extramural recipients of ARS research contracts.
Answer. In fiscal year 1996 ARS committed \$11.77 million to Tufts University and \$4.22 million to Westat Inc. for research contracts.
Question. In fiscal year 1997, the Committee directed that general reductions be taken across each program, project and activity. What was the magnitude of the fiscal year 1997 general reduction and explain how this was implemented?
Answer. As directed by the Congress, the agency applied general reductions totaling \$4.8 million in fiscal year 1997. This was implemented through an across-the-board reduction of all research specific projects.

OBLIGATIONS FOR NEW CROPS AND PESTS

Question. Provide for the record fiscal year 1996 obligations incurred and your current fiscal year 1997 funding estimates for the following areas of research: canola, hops, kenaf, guayale, Lesquerella, and sunflowers. Similarly, provide the Committee with information on the pests: bollworm, boll weevil, whitefly, karnal bunt, fire ant, and gypsy moth.
Answer. Obligations incurred for fiscal year 1996 and fiscal year 1997 estimated funding for crops and pest research are provided as follows:

CROPS AND PEST RESEARCH

	Fiscal year—	
	1996 obligations	1997 funding
<i>Crops:</i>		
Canola	\$188,867	\$147,400
Hops	374,114	388,200
Kenaf	1,328,338	1,391,700
Guayule	621,617	567,700
Lesquerella	589,801	584,900
Sunflower	2,788,706	2,483,600
<i>Pests:</i>		
Boll Worm/Corn Earworm	5,242,793	4,532,100
Boll Weevil	1,897,062	1,758,300
Whitefly	5,480,163	5,276,500
Karnal Bunt	348,267	218,100
Fire Ant	1,194,834	1,159,400
Gypsy Moth	2,353,078	1,620,600

CONTRACTS

Question. What are the total obligations for contractual services in fiscal years 1995 and 1996 and what is estimated in fiscal year 1997? Please specify amounts in support of research and those in support of management.
Answer. The total obligations for contractual services in fiscal year 1995 was \$60,269,044. Of this total, \$59,970,486 was obligated in support of research and \$298,558 was obligated in support of management.
The total obligations for contractual services in fiscal year 1996 was \$61,377,791. Of this total, \$61,191,791 was obligated in support of research and \$186,000 was obligated in support of management.

PART 1

760

The total estimated obligations for contractual services in fiscal year 1997 is \$53,000,000. Of this total, \$52,820,000 is estimated for support of research and \$180,000 is estimated in support of management.

Question. Please indicate A-76 contract agreements in effect, by location, the funding, and when they were implemented.

Answer. This information is detailed as follows:

Location	Fiscal year 1997 funding	When implemented
Philadelphia, PA	\$2,286,857	May 1982.
New Orleans, LA	1,557,458	July 1982.
Peoria, IL	2,400,000	September 1982.
Athens, GA	1,570,705	July 1983.
Beltsville, MD	500,000	April 1985.
Albany, CA	1,823,358	June 1988.
Orient Pt., NY	5,491,132	February 1991.

Question. How many full-time equivalents are represented through contractual services in ARS?

Answer. This information is detailed as follows:

Location	Facility support FTE	Scientist support FTE	Research support FTE
San Francisco, CA	22.0
Philadelphia, PA	38.0
Orient Point, NY (Plum Island)	87.0
Boston, MA	15.0	39	171
Athens, GA	34.0
New Orleans, LA	40.2
Albany, CA	28.0
Peoria, IL	43.6
Total	307.8	39	171

Question. Identify the research contracts and agreements entered into by ARS for fiscal year 1996 by recipient and funding.

Answer. Research contracts for fiscal year 1996 were:

Contractor	Contract amount (annual)
Tufts University, Boston, MA	\$11,771,000
Westat, Inc., Rockville, MD	4,220,000

Answer. Agreements for fiscal year 1996 were:

Cooperator	Amount
A. Duda & Sons, Inc., Salinas, CA	\$3,000
Agriculture and Agri-Food Canada Research Station, Summerland, Canada	20,000
Alabama Agri and Mech College, Normal, AL	12,500
Alcorn State University, Lorman, MS	488,262
Arkansas Children's Hosp., (Univ of AR) Little Rock, AR	1,646,400
Auburn University, Auburn, AL	71,000
Baylor University, Waco, TX	15,000
Brigham Young University, Provo, UT	25,440
Carrington Agri Expt Station, Carrington, ND	6,375
Catholic University, Washington, DC	65,000
Central Oregon Expt Station, Redmond, OR	27,425
Clemson University, Clemson, SC	41,000

CONTRACTS

Question. ARS receives significant reimbursements from APHIS, CSREES, ERS, NASS, and FSIS. Explain the use of the funds.

Answer. The reimbursements from APHIS are for the support agreement at Plum Island Animal Disease Center. Research is also conducted on silverleaf whitefly and water quality program activities. Funds received from FSIS are used to develop dosimetry standards for radiation processing of food and mathematical models to predict levels of bacterial pathogens in food. ARS reimbursable agreements with CSREES, ERS and NASS are primarily for support of the Administrative and Financial Management unit which provides personnel, contractual and financial management services to the Research, Education and Economics agencies.

Question. ARS receives significant reimbursements from other Federal agencies: HHS, EPA, DOE, and DOI. Explain the research performed for these agencies.

Answer. The research performed for HHS includes anti-microbial susceptibility testing of veterinary origin salmonella isolates; effect of nitrofurazone in dairy cattle; nutrient content of foods in the American diet; methods for food components associated with reduced cardiovascular disease risk and fumonisin exposure, serum sphingolipids and esophageal cancer relationships. The research performed for EPA includes the comparison of remediation and assessment of contaminated soils, water and air in agricultural watersheds and the development and evaluation of an aerial video imaging system for natural resource assessment. The research performed for DOE includes the metabolic regulation of plant hormones; investigation of heavy bioaccumulation in plants grown on metal-polluted soils; genetic variation among switchgrasses for agronomic traits; forage quality and biomass fuel production; and control of sucrose biosynthesis in plants by protein phosphorylation. The research performed for DOI includes the application of modeling technology in rangeland resource management and improved water quality in Mississippi Delta watersheds and lakes.

Question. ARS received funding from State and other sources: California; Cotton Incorporated; International Life Science; Florida and North Carolina. Explain the use of these funds.

Answer. ARS funding received from the State of California were used to develop a means for controlling aquatic weeds in the Sacramento Delta, and to manage aquatic weeds in California waterways. Research was also performed to develop systems and sprays for monitoring and suppressing fruit fly populations, as well as mex and medfly. The funding that ARS received from Cotton Incorporated were

PART 1

763

used in the identification and chemical characterization of insect honeydews on sticky cotton; development of an integrated resistance management program for the silver leaf whitefly in AZ and CA; and methods for improving the handling characteristics of fuzzy cottonseed. The funding that ARS received from International Life Science Institute were used in the controlled diet human studies assessing dietary fatty acid impact on blood lipids and hemostasis. The funding that ARS received from Florida were used in the study of biological control agent development for the Australian Malaleuca and the management of bio-agents for hydrilla, pista and water hyacinth. The funding that ARS received from North Carolina were used in the evaluation of alternative constructed wetland systems for swine wastewater treatment and management practices to reduce nonpoint source pollution.

ARS APPROPRIATIONS LAW

Please describe your activities and funding obligations in fiscal year 1996 under the provisions limiting construction, alteration, repair and improvements of buildings in the ARS appropriation language:

Question. The cost of constructing any one building shall not exceed \$250,000.

Answer. No obligations were made by ARS in fiscal year 1996 under this unlimited building program limitations.

Question. Head houses and greenhouses which shall be limited to \$1,000,000.

Answer. No obligations were made by ARS in fiscal year 1996 under the headhouse and greenhouse building program limitations.

Question. Ten buildings to be constructed or improved at a cost not to exceed \$500,000 each.

Answer. No obligations were made by ARS in fiscal year 1996 under the ten buildings program limitations.

Question. How were these activities funded?

Answer. No projects required funding by ARS under these provisions in fiscal year 1996.

NATIONAL ARBORETUM

Question. Please describe the projects and programs conducted at the National Arboretum.

Answer. The National Arboretum has a diversified program that includes Research, Gardens, and Education functions. The Research program develops new and improved trees, shrubs and flowers to meet the needs of a rapidly expanding market for floral and nursery products and to satisfy public demand. The Gardens program is responsible for developing and maintaining public display gardens on the 440 acre site in Washington, D.C. The Education program conducts a wide ranging program of public education in plant conservation, environmental stewardship and the application of principles of integrated pest management in public and private gardens.

Question. What is the resource distribution to these programs?

Answer. The National Arboretum budget in fiscal year 1997 is \$7.274 million. Resources are distributed as follows: Research program—\$4.616 million; Garden program—\$1.976 million; Education program—\$.682 million.

Question. In fiscal year 1997, Congress appropriated an increase of \$200,000 for floriculture/horticultural research. How are these funds being implemented?

Answer. The funds are supporting research on genetic engineering of roses for disease resistance; tissue culture of crape myrtle to develop a tissue regeneration procedure for genetic engineering; and studies on impatiens necrotic spot virus and the engineering of virus-resistant impatiens.

Question. What is the status of replacing and modernizing the water lines at the National Arboretum? When will this be completed? What is the total estimated cost for this project?

Answer. The Arboretum has received and obligated \$2.9 million through fiscal year 1997 for the replacement of the irrigation water system. These funds have been used to replace the main irrigation lines throughout the National Arboretum. As part of this replacement project, three wells were drilled and tied into the system. (This project does not address replacing and automating the lateral irrigation lines off the mains.)

Upon activating the wells, it was determined that the quality of the well water was not adequate for irrigation purposes. A study is now underway. ARS will evaluate this study carefully to determine the economic feasibility of building this treatment facility rather than staying on District of Columbia water. Preliminary estimates put the cost of installing a treatment system at approximately \$1.75 million and estimate 18 months to construct. If this course of action is chosen, the total cost for the new water system at the Arboretum will total about \$4.65 million.

PART 1

764

Question. How much money does the Arboretum commit to overall renovation and modernization annually? Describe the use of these funds in fiscal years 1995–1997.

Answer. The Arboretum commits \$739,633 annually to renovation and modernization. The major projects these funds were used for are as follows:

	<i>Amount</i>
Fiscal year 1997:	
Update Master Plan	\$300,000
Design renovation of Herb Garden Paths	60,000
Design Bonsai Complex Courtyard	60,000
Replace directional and traffic signs	30,000
Design exterior lighting	115,000
Design renovation of Lath Facility	30,000
Trim and remove trees	25,000
Design renovation of Building 015	55,000
Design renovation of Asian Valley Paths	40,000
Fiscal year 1996:	
Replace directional and traffic signs	87,008
Phase V, Water System replacement	134,292
Repairs to Bonsai Museum	53,536
Repairs to Chinese Pagoda	57,080
Replace Auditorium roof	128,980
Install irrigation system	66,467
Trim and remove trees	29,341
Install Fibre Optics cable	41,220
Renovate hallways, Administration Building	19,727
Renovate heading systems, Bldgs. 013/014	34,052
Fiscal year 1995:	
Phase IV, Water System replacement	203,488
Trim and remove trees	24,000
Replace Greenhouse cooling/ventilation	129,425
Replace drainage system, Gotelli Collection	41,820
Restoration Projects	134,144
Repairs to Bonsai Museum	43,253
Replace boiler, Bldg. 012	18,945

CENTERS OF EXCELLENCE

Question. For fiscal year 1998, identify the proposed ARS Centers of Excellence, where they are located and their funding. Describe the programs at these Centers.

Answer. The ARS Centers of Excellence, at 1890 Land Grant University locations and fiscal year 1998 funding are as follows:

ARS 1890's Centers of Excellence

<i>Location</i>	<i>Fiscal year 1998 estimate</i>
Delaware State University, Dover, Delaware	\$250,000
Langston University (proposed), Langston, Oklahoma	200,000
Alcorn State University, Lorman, Mississippi	166,000
Tennessee State University, McMinnville, Tennessee	491,000
University of Arkansas, Pine Bluff, Arkansas	373,000
University of Maryland Eastern Shore at Princess Anne, Maryland	246,000
Total	1,726,000

The research program is as follows:

Dover: Aquaculture Products.—Rapid methods are needed for monitoring the microbial profile of aquaculture processes and products to assure safety. Develop rapid detection and monitoring methods for pathogens and spoilage microorganisms in aquaculture process and products and to improve purging efficiency in order to prevent human illness.

Langston: Grazing lands.—Determine impact of pasture design and grazing animals on quality of water emerging from watersheds, and develop pasture management systems that will optimize water quality and productivity in the semi-arid U.S.

Lorman: Swine Production.— Development of an efficient system for production of meat-type pigs in the southern United States. The objectives are to: evaluate breeds of swine that have good reproductive performance and produce high quality lean carcasses in the southern U.S.; develop feeding systems to obtain efficient con-

PART 1

765

version of feeds at minimum cost; and to develop a system to transfer this new technology to local producers.

McMinnville: Horticulture.—Develop new and improved ornamental trees and shrubs for the U.S. nursery industry. Develop basic genetic and physiological information related to nursery crop species. Reduce pesticide use and fertilizer run-off during nursery crop production. Develop improved nursery crop propagation methods. Evaluate existing germplasm or ornamental trees and shrubs for pest resistance, tolerance of environmental stress, and superior ornamental value.

Pine Bluff: Aquaculture.—Evaluate alternatives and develop new components of aquaculture production systems to improve efficiency of freshwater fish farming including cultural and processing methods to enhance quality.

Princess Anne: Food Safety.—Identify and conduct research on critical control points affecting the microbiological contamination of poultry from grow-out through final consumer preparation, and to develop interventions and quantitative risk models to ensure food safety.

Question. What are the Agency's long-term plans with respect to staffing these Centers?

Answer. ARS' long-term plans with respect to staffing these Centers is as follows:

Dover, Delaware: One scientist will be hired with funds appropriated in fiscal year 1997. At the current level of funding, there are no plans to expand beyond one scientist.

Langston, Oklahoma: Proposed Center of Excellence in fiscal year 1998. Plans are to use funds, if appropriated in fiscal year 1998, for a cooperative undertaking utilizing cooperative university staff. We do not plan to add any permanent staff.

Lorman, Mississippi: At present only temporary staff have been hired to support the project. At the current level of funding, we do not plan to add any permanent staff.

McMinnville, Tennessee: Current staffing includes an ARS Research Geneticist and a Research Horticulturist is being recruited.

Pine Bluff, Arkansas: One ARS scientist is now in place. A second scientist is currently being recruited with additional funds appropriated in fiscal year 1997. At the current funding level, there are no plans to expand beyond two scientists.

Princess Anne, Maryland: ARS has no plans at present to expand beyond the one scientist and support staff currently in place.

Question. Describe the working relationship and accomplishments resulting from these collaborations.

Answer. The working relationship and accomplishments resulting from these collaborations are as follows:

Dover, Delaware: The program is just being developed. The combination of physical resources (facilities, laboratory space, and water resources of the Microbial Food Safety Unit, at ARS' Eastern Regional Research Center, and the Aquatic Ecology/Aquaculture Research Program at Delaware State University) will allow the conduct of important aquaculture food safety research that neither organization could carry out independently.

Langston, Oklahoma: The anticipated outcome of the proposed cooperative endeavor between ARS' El Reno Grazing Lands Research Laboratory will result in new research information: (1) impacting pasture design and grazing animals on quality of water emerging from watersheds, and (2) the development of pasture management systems that will optimize water quality and productivity in the semi-arid U.S.

Lorman, Mississippi: A new physical facility is being developed that will permit the housing of boars that are needed to initiate an artificial insemination program. Alcorn State University staff members have received training in ARS' laboratories on the technologies associated with the use of implementing a program on artificial insemination in swine. Selected genetic stock (females) have been purchased and are now part of the Alcorn project. ARS and the Alcorn State University have worked together in developing the plan that was used to select the genetic stock that will be used in the project. The overall plan for the implementation of the long term project on swine is now being developed by Alcorn State University and ARS scientists. The progress to date has been good. The project has led to considerable interactions between Alcorn State University and ARS scientists. More importantly, the project has outstanding potential to improve swine production systems for local producers that at a later date can be transferred to other producers in the south.

McMinnville, Tennessee: An excellent collaboration has been established between Tennessee State University, ARS and the Tennessee Nursery industry. This partnership has resulted in jointly establishing research objectives including breeding for resistance to dogwood anthracnose and the development and use of natural products for pest and disease control on nursery crops.

PART 1

766

Pine Bluff, Arkansas: The ARS program is cooperative with and complementary to the strong aquaculture research and extension program already in place at the University of Arkansas at Pine Bluff (UAPB) (five Ph.D.-level scientists and four M.S.-level staff members have research appointments in the UAPB's Aquaculture/Fisheries Program). UAPB and ARS share facilities, space and water resources and cooperate on research related to aquaculture engineering, water quality, and systems technology. The cooperation results in substantial benefits to both ARS and UAPB in terms of cooperative research, technology transfer (through UAPB's extension activities), and training and recruitment of minority scientists.

Princess Anne, Maryland: A survey of growth characteristics of various *Salmonella* isolates obtained from poultry operations in the Delmarva was completed. The results of this survey will provide the basis for developing predictive models to estimate changes in *Salmonella* numbers on poultry as it moves through the farm to fork chain. The ARS laboratory uses University of Maryland at Eastern Shore (UMES) laboratory space and UMES scientists and students provide support for the research program. Thus, working relationships for this program are close with the UMES, as well as the Eastern Regional Research Laboratory of the ARS at Wyndmoor, Pennsylvania, and the combined expertise provides for a strong research program.

TECHNOLOGY TRANSFER

Question. Please describe your activities in the area of technology transfer. How many licenses, patents and CRADA's were entered into in fiscal year 1996? How do these statistics compare to fiscal year 1994? What is your activity to date in fiscal year 1997?

Answer. There are a variety of activities associated with technology transfer in ARS. There are currently eight individuals in field locations functioning as full or part time Technology Transfer coordinators. Their duties include working closely with ARS scientists to identify developing technologies of potential commercial interest, identifying specific strategic partners, and negotiation of a variety of agreements including CRADA's, Trusts, Reimbursable Cooperative Agreements, Memorandums of Understanding, Material Transfer Agreements, and Confidentiality Agreements. Domestic and foreign patents and licenses continue to be an important part of technology transfer activities. Each year OTT staff members participate in more than 30 technology transfer meetings and targeted trade shows where they exhibit materials and/or give presentations on new technologies available for licensing, examples of past successes, and how to develop partnership with ARS. These events also provide a venue for farmers, industry representatives, consumers, and end users to inform ARS of their specific problems and needs. In addition, OTT staff members also develop and conduct workshops targeting specific industries who are potential strategic partners. Other recent efforts to enhance and speed the transfer of ARS technology have focused on electronic access via the OTT home page, and closer working relationships with the Information Staff, and the National Agricultural Library. The area or rural development has received special emphasis with efforts ranging from active participation in the USDA Rural Development Action Team, closer ties with the SBIR program, AARC, and BRDC, to the development of agreements with several state Economic Development Agencies to foster closer working relationships at the local level. In fiscal year 1996, ARS filed 76 patent application, while 53 ARS patents were issued by the Patent and Trademark Office. Also in fiscal year 1996, ARS licensed 25 inventions to the private sector, while entering into 81 Cooperative Research and Development Agreements. In fiscal year 1994, ARS filed 40 patent applications, while 36 patents were issued by the PTO. Also in fiscal year 1994, ARS licensed 9 inventions and negotiated 93 CRADA's. For fiscal year 1997, to date, ARS has filed 19 patent applications, while 20 have been issued by the PTO. ARS licensed 11 inventions and negotiated 45 CRADA's as of April 29, 1997.

Question. How does ARS interface with Federal and State Extension activities? How effective is this relationship?

Answer. The application of new technologies to complex modern farming systems is becoming extremely complicated. A key component in the successful transfer of new technologies to producers and users is to provide training and education in the diagnosis of problems, selection of solutions, and method of application. In addition, a new system of independent crop consultants is involved in the rapid dissemination of new technical developments that are effective, economically feasible, and environmentally friendly. ARS is heavily dependent on Federal and State Extension services to achieve this vital element of training and education of all interested parties. This relationship has been highly effective in the continued success of American ag-

PART 1

767

riculture. The interface between ARS and Extension occurs in many ways. Numerous ARS units are co-located at Universities where the close working relationship among ARS scientists and their University colleagues leads to a daily transfer of information. Furthermore, many new ARS technologies undergo pilot tests and demonstration phases in which extension personnel are intimately involved. Two recent examples where ARS/extension interactions have been critical for progress are release of predatory wasps for augmentive biocontrol of the cotton boll weevil in West Texas, and release of a beetle for biocontrol of the noxious weed melaleuca in Florida.

Question. Describe major accomplishments through the CRADA program?

Answer. Since passage of the Technology Transfer Act of 1986, ARS has entered into more than 670 CRADA's with companies and other entities, resulting in new products ranging from edible coatings to extend shelf life of fruits and vegetables, new plastic products from renewable resources, new diagnostic tests for toxins and food safety microorganisms, to novel and more effective pest control and crop protection. Through the CRADA program, ARS is leveraging its resources by encouraging domestic companies to partner in high-risk unproven technologies. Such partnerships permit these companies and the U.S. to remain globally competitive, while delivering improved and environmentally-friendly products to farmers and consumers in a timely manner. In some cases, the CRADA program has been instrumental in the creation of new businesses.

Some examples include:

CRADA's with EMBREX, Inc. of Research Triangle Park, North Carolina, are leading to the development of several new poultry vaccines, such as the recently registered Bursaplex vaccine to combat infectious bursal disease in poultry. EMBREX Inc., a start-up company with two employees in 1985, today employs more than 120 people, with international operations in London, where it has entered European and African markets. The company is also working on similar arrangements with the Japanese to enter the Asian market. EMBREX has seven research and development agreements on techniques ranging from poultry protection against avian coccidiosis to *Salmonella*.

A CRADA with Handley Yosemite Farms of Turlock, California is evaluating molding technologies to develop value-added restructured fruit products. A Cooperative Research and Development Agreement (CRADA) is assisting in commercial development of shelf-stable products that are convenient and nutritious to consumers, while offering growers and processors new markets for fruits, such as apricots, peaches, grapes, strawberries and oranges. Potential markets for these products include the confectionery and health food markets.

A stable, nonseparable composition made from starch and oil developed by ARS led to three CRADA's for uses in food and nonfood applications. A CRADA with the Union Camp Corporation of Wayne, New Jersey, was used to develop environmentally friendly adhesives, glues, and coatings. The technology could capture a significant share of the \$100 million per year adhesive and coating market for wood-based products. A CRADA with Opta Food Ingredients of Bedford, Massachusetts used the technology in a variety of food applications, such as fat replacements. The total market for fat replacements and food ingredients exceeds more than \$300 million per year. The starch-oil combination also attracted the attention of Seedbiotics, Inc. of Caldwell, Idaho, which in partnership with ARS developed a way to encapsulate fertilizers and biological pesticides and herbicides in compositions that can be used to coat seeds to enhance seedling development.

A CRADA with Demeter Biotechnologies Ltd. of Research Triangle Park, North Carolina is developing technologies to control bacterial diseases of channel catfish. ARS researchers are investigating the potential of synthetic lytic peptides to control specific bacterial diseases. Losses from these diseases in commercial production range from 20 percent with mild infections to 95 percent with severe infections. Enteric septicemia, caused by the bacterium *Edwardsiella ictaluri* is responsible for about 30 percent of all channel catfish disease losses in the southeastern United States. Research results will be used to develop disease-resistant stocks of channel catfish for release to commercial catfish farmers.

A CRADA with Zellweger Uster, Inc. of Knoxville, Tennessee, is incorporating a new moisture sensor into the company's system of measuring cotton fiber quality for the international cotton industry. The moisture sensor was originally developed for the cotton ginning industry, but also has applications in other industries, such as textile processing and marketing classification of cotton. For classification, some of the measured fiber qualities such as strength and micronaire are strongly influenced by the fiber moisture. The mutual interest of ARS and Zellweger Uster is to validate a moisture measurement system which can be commercialized and introduced into the cotton industry.

PART 1

768

A CRADA with the Whirlpool Corp. of Benton Harbor, Mich. is evaluating fabric damage during laundering of cotton fabric. The objectives of this project include minimizing fabric damage, lint generation and cross contamination of lint between garments during laundering of cotton fabric. ARS scientists are studying the effects of moisture, heat, duration and extent of tumble drying and laundering additives on fiber structure and morphology of fabric by light and electron microscopy and image analysis. In addition, the partnership is addressing the problem of lint production and cross contamination between garments. The results of the CRADA will assist Whirlpool, a major manufacturer of laundering machines, in improving their laundering machines, primarily tumble dryers.

ARS PERSONNEL

Question. The fiscal year 1998 budget proposes a 186 reduction in ARS full-time equivalent positions (FTE's) from 7,800 in fiscal year 1997 to 7,614, the fiscal year 1996 level. How will this reduction be realized, by location? How many scientists will ARS lose as a result of this proposed reduction? What number of staff year reductions will be taken from headquarters?

Answer. The 7,800 FTE authorized for fiscal year 1997 represents an increase over actual FTE used in fiscal year 1996. The proposed allowance for fiscal year 1998 is equal to the fiscal year 1996 level. ARS currently is working toward increasing the number of research scientists to 2000 from the current level of 1810 by changing the mix of administrative, technical, clerical and post doctoral support positions. These changes will be accomplished through normal attrition in headquarters and the field offices. ARS does not anticipate losing any scientists due to authorized ceiling allocations. Any FTE changes between fiscal year 1997 and fiscal year 1998 which occur will be managed, if necessary, through normal attrition. Until actual FTE's are reduced reductions in staffing cannot be broken out by location.

Question. Update the Committee on the average age of ARS scientists. Compare this to that of 1990 and 1985.

Answer. ARS does not have employment statistics for the years prior to fiscal year 1986. The current average age of ARS scientists on-board is 50.8. At the end of fiscal year 1990 the average age was 48.33. The average age was 47.78 at the end of fiscal year 1986.

Question. How many scientists are currently on-board?

Answer. There are currently 1,810 permanent ARS scientists on-board.

Question. How many were on-board at the beginning of fiscal years 1996 and 1995?

Answer. In the beginning of fiscal year 1996, there were 1,906 permanent ARS scientists on-board. At the start of fiscal year 1995, there were 1,969 permanent ARS scientists on-board.

Question. What is the current scientist to laboratory capacity ratio in ARS? Has this changed over the past 10 years? For each of the following locations, list the current capacity and scientists on board: Beltsville, MD; Utilization Centers at Peoria, IL; Albany, CA; Philadelphia, PA and New Orleans, LA; and NADC, Ames, IA.

Answer. The current scientist to laboratory capacity ratio in ARS is about 80 percent. This ratio has not changed significantly over the past 10 years. The current capacity and scientists on-board for specific locations requested are as follows:

Location	Capacity	Scientists	Ratio (percent)
Beltsville, MD	600	512	85
Peoria, IL	164	134	82
Albany, CA	208	166	80
Philadelphia, PA	154	121	79
New Orleans, LA	127	90	71
NADC, Ames, IA	160	106	66
Total	1,413	1,129	80

Question. ARS' actual staff years have come in well below its authorized ceilings the past two years. What do you anticipate in fiscal year 1997?

Answer. Current staffing and plans indicate that ARS' full-time equivalent (FTE) usage for fiscal year 1997 will be an estimated 300 below the ceiling of 7,800.

PART 1

769

Question. Please identify the number of personnel defined as management in ARS in Washington headquarters and in the field.

Answer. The number of personnel defined as ARS management is 11. These positions are located in Washington headquarters.

Question. How has this changed since 1990?

Answer. In fiscal year 1990, ARS had 13 management positions. The total increased to 16 in fiscal year 1991 due to the expansion of the National Program Staff from two program areas to five. Near the end of fiscal year 1996 the total decreased to 11 when activities under the Global Warming Staff were reassigned to the National Program Staff.

Question. What is the makeup and diversity of the ARS work force? How does it compare to 1990?

Answer. The chart below identifies the diversity of the ARS work force for fiscal year 1990 and the current ARS work force. The numbers are expressed as percentages of the total work force based on end-of-year employment data.

Race	Percent—	
	Fiscal year 1990	Current work force
Asian/Pacific Islanders	4	3
Black	8	9
Hispanic	3	4
Native American	1
White	85	83
Total	100	100

Question. Provide the Agency level of ARS FTE's for 1985, 1990, and 1996. Provide scientific, support, and management FTE's for these same years.

Answer. ARS FTE's for 1985, 1990, and 1996 are as follows:

Fiscal year	FTE's
1985	8,112
1990	8,207
1996	7,614

FTE information by specific employment categories is not available. However, on-board end-of-year employment by major position categories for fiscal year 1986, 1990 and 1996 is listed below. The categories are defined as follows:

Professional.—Occupations which require knowledge or learning acquired through education or training equivalent to a bachelor's degree or higher, with a major study in a specialized field. Examples include: entomologists, geneticists, soil scientists, chemists, etc.

Technical.—Occupations typically associated with and supportive of a professional position that requires extensive practical knowledge. Examples include: Biological technicians, engineering technicians, physical science technicians, and office automation clerks.

Administrative/Clerical.—Occupations which require analytical ability, judgment, discretion, and personal responsibility in applying principles, concepts or practices to fields of administration or management, as well as positions which involve structured work in support of an organization. Examples include: computer specialists, administrative officers, personnel specialists, management and program analysts.

Wage Grade/Other.—Occupations involving the trades, crafts, or skilled, unskilled or semiskilled manual labor and white collar student trainee positions. Examples include: animal caretakers, maintenance mechanics, and biological science student trainees.

Group	Fiscal year—		
	1986	1990	1996
Professional	3,420	3,565	3,063
Technical	2,593	2,791	3,030
Administrative/Clerical	1,461	1,439	1,089

PART 1

770

Group	Fiscal year—		
	1986	1990	1996
Wage Grade/Other	1,214	873	764
Total ¹	8,688	8,668	7,946

¹ Total represents on-board, end-of-year employment by major position categories as shown.

AQUACULTURE

The ARS report to the Committee on warmwater aquaculture research facilities and programs indicates that the continued growth and competitive position of the U.S. aquaculture industry in a global marketplace will be directly related to the resources invested in research and technology development.

Question. What level of resources are included in the fiscal year 1998 request to enhance the growth and competitiveness of U.S. aquaculture? How does this compare to the federal resources devoted to this purpose for fiscal year 1997?

Answer. The Department's fiscal year 1998 budget request includes \$8,572,400 in aquaculture funding for the Agricultural Research Service. Fiscal year 1997 funding for aquaculture in the Agricultural Research Service is \$10,184,800.

Question. The report indicates that the ability of ARS' research program in support of the warmwater aquaculture industry will be significantly improved with the completion of programs and facilities still under development. With respect to each of the locations where warmwater aquaculture research is conducted, which programs and facilities are still under development? What staffing and funding will be required for the programs and facilities at each of these locations once they are fully developed?

Answer. Warmwater aquaculture research locations still under development, with required staffing and funding at each location, are as follows:

National Warmwater Aquaculture Research Center, Stoneville, Mississippi.—Total program funding of \$5.1 million is projected to support a total of 17 research scientists, 11 of which would be Mississippi Agricultural and Forestry Experiment Station scientists and 6 of which would be ARS scientists. With the current funding level of \$3.2 million, an additional \$1.9 million is needed to support research programs in catfish production practices, nutrition, water quality/quantity, genetics and breeding, disease diagnosis and control, and food processing.

Fish Diseases and Parasites Research Laboratory, Auburn, Alabama.—Total program funding of \$1.74 million is projected to support a total of 6 research scientists. With the current funding of \$0.84 million, an additional \$0.9 million is needed to support research programs in disease diagnosis, and control, immunology, and vaccines development to solve fish health programs in aquaculture.

National Aquaculture Research Center, Stuttgart, Arkansas.—Total program funding of \$3.59 million is projected to support a total of 11 research scientists. With the current funding of \$1.24 million, an additional \$2.35 million is required to support research programs in therapeutics evaluations and production systems for the aquaculture industry.

Aquaculture Systems Research Unit, Pine Bluff, Arkansas.—A total of \$0.5 million is projected to support a total of 2 research scientists. With the current funding of \$0.37 million, an additional \$0.13 million is needed to support aquaculture engineering-related research programs in aquaculture pond management practices, postharvest procedures, and value-added products.

Question. The report indicates that during fiscal year 1997, a thorough review of the Stuttgart National Aquaculture Research Center will be undertaken to determine the specific directions of future research programs. When will this review be complete? Please submit the results of this review to the Committee.

Answer. We expect that the review will be completed by September 30, 1997. The results of the review will be submitted to the Committee.

PROJECT TERMINATIONS

Question. ARS is recommending a number of project terminations to fund "high priority research." Why do you consider these projects, many of which impact production research, to be low priority?

Answer. ARS considers all research within its mission to be important; however, in situations in which there are not enough assigned funds to allocate to all required research, it becomes essential to assign priority. The President's budget provides an overall net increase of \$10 million for ARS, but also identifies \$36.5 million of new

PART 1

771

high priority research to undertake. Therefore, it became necessary for ARS to identify over \$26 million invested in current research activities to terminate and redirect toward these new initiatives. In an effort to objectively identify the most appropriate research to terminate, ARS developed a "Project Evaluation Guide" that focuses on an analysis of three primary factors: relevance, capacity, and impact. A careful evaluation of the Federal role is also included in the analysis. The ARS top management team applied this guide to all research projects in the Agency and achieved consensus on overall ratings. Projects that were in the lower quartile were further scrutinized. Using this process, the ARS management team selected those projects whose terminations were judged to have the least overall negative impact on agriculture from a national perspective, in relation to all other research ongoing in the Agency. The 71 projects proposed for termination were not limited to production agriculture, but represented many other areas of concern. Within the diverse ARS research portfolio, there are no "low priority" research projects; however, in times of tight budget scenarios, and required new allocations to selected program areas, difficult judgments must be made in terms of which projects are less critical.

Question. What criteria did you impose to determine the projects proposed for termination?

Answer. The criteria imposed include relevance, capacity, and impact. A careful analysis of the Federal role was also conducted. Relevance deals with the goals and objectives of a project relative to critical national or regional problems as identified by customers and stakeholders. Capacity deals with the fiscal, human, and physical resources available to support the project and meet the stated objective(s). Impact is concerned with the beneficial change(s) that have occurred or are anticipated to occur for the agriculture and food industry, scientific community, economy, society, and/or policy issues of the Nation.

Question. By location, provide a list of the proposed project terminations. How many scientists are impacted at each location?

Answer. A list of the proposed project terminations and number of scientists impacted are as follows:

PROPOSED PROJECT TERMINATIONS IN FISCAL YEAR 1998—RESEARCH PROJECT TITLE BY LOCATION, FUNDING AND STAFF YEARS

Location	Fiscal year 1997 (base) gross	Scientists
California:		
Albany:		
Flavor Optimization of Major Food Crops through Control of Metabolic Processes	\$357,600	.9
Modification of Vegetable Oils as Raw Materials for Industrial Uses	681,900	3.0
In Vitro Creation and Commercialization of High Solids Tomatoes and High-Solids, Low Sugar Potatoes	398,900	1.6
New Bacterial Polysaccharides for Food and Industry	324,200	1.5
Novel Biopolymers Based on Agricultural Sources	282,500	1.0
Biological Control of Yellow Starthistle and Other Non-indigenous Plant Pests in the Western USA	88,200
Total	2,133,300	8.0
Fresno: Shallow Groundwater Management Systems for Arid Irrigated Areas		
(w/s Brawley): Irrigated Desert Research II	245,700	2.0
Total	321,000
Total	566,700	2.0
Colorado: Ft. Collins:		
Global Change Research, Decision Support, Modeling, and Database Management (Extramural-CIESIN) (\$789,137 Est.)	727,500

PART 1

772

PROPOSED PROJECT TERMINATIONS IN FISCAL YEAR 1998—RESEARCH PROJECT TITLE BY
LOCATION, FUNDING AND STAFF YEARS—Continued

Location	Fiscal year 1997 (base) gross	Scientists
Development of Improved Cropping System Models and Technology for Sustainable Production (Extramural-Colorado State Univ.) (\$50,000 Est) (Total Agreement \$170,000 balance of \$120,000 funded from another CRIS Project in Ft. Collins)	158,400
Development of a Decision Support System for Farmers and Ranchers in the Great Plains	80,000
Total	965,900
Florida: Gainesville: Mgt of Termites as Urban Pests in the American Pacific (Extramural-Univ of HI for Formosan Termites) (\$120,288 Est)	144,100
Total	144,100
Hawaii: Aquaculture Productivity Research Phase II (Extramural-All to Oceanic Institute) (\$1,434,195 Est)	1,612,400
Total	1,612,400
Idaho: Aberdeen: Development and Use of Molecular Techniques in Oat Enhancement	160,700	1.0
Total	160,700	1.0
Illinois:		
Peoria:		
Animal Health Consortium (shown geographically in Ames) (Extramural-BRDC) (\$834,545 Est)	919,800
Exploratory Thermal Chemical Conversion of Starch to Enhance Derivatization	161,700	1.0
Enhanced Use of Plant Proteins: Identifying, Isolating and Relating Structures to Properties	577,900	2.0
Genetic Engineering of Anaerobic Bacteria for Improved Rumen Function	490,800	2.0
Total	2,150,200	5.0
Urbana:		
Reduced Herbicide Inputs for Effective Weed Management Systems to Improve Water Quality	185,700
Sensors and Systems for Site-Specific Crop Management to Improve Environmental Quality (Extramural-III. Ag. Exp. Sta.) (\$32,000 Est)	229,200	1.0
Soybean Diseases	344,100	2.0
Total	759,000	3.0
Iowa: Ames:		
Limits to Digestibility and Interactions Among Quality, Growth, and Persistence of Forages	171,000
Genetic Characterization of Soybean Germplasm	178,900	1.0
Total	349,900	1.0

PART 1

773

PROPOSED PROJECT TERMINATIONS IN FISCAL YEAR 1998—RESEARCH PROJECT TITLE BY
LOCATION, FUNDING AND STAFF YEARS—Continued

Location	Fiscal year 1997 (base) gross	Scientists
Kansas: Manhattan: Protecting Hard Red Winter Wheat from Biotic Stress	250,000
Total	250,000
Louisiana: New Orleans:		
Improving Sugarcane Productivity by Conventional and Molecular Approaches to Genetic Development	233,300
Disease and Insect Control Mechanisms for the Enhancement of Sugarcane Germplasm Resistance	83,400
Developing Integrated Weed Management Systems for Efficient and Sustainable Sugarcane Production	83,300
Total	400,000
Maryland: Beltsville:		
Ecologically-Based Technologies for Controlling Ixodes Scapularis and Reducing Lyme Disease (Extramural-Yale) (\$157,500 Est)	175,200
Remote Sensing and Associated Technologies for Production Decisions (Extramural-Institute of Tech Develop, MS) (\$70,000 Est)	206,100
Stability/Maturity/Safety of Composts and Organic Residuals: Criteria and Tests for Agriculture (Extramural-Rodale Inst.) (\$237,223 Est.) (Total Agreement \$324,523 balance of \$77,300 funded from other CRIS Projects in Beltsville and \$10,000 from ERRC)	281,700
Automated Firmness Classification of Apples	378,600	1.0
Production and Evaluation of Tissue-Cultured Fruit Crops	237,900
National Turfgrass Evaluation Program	55,300
Genetic Modification of Soybean Inoculants to Improve Their Effectiveness	171,800	1.0
Molecular Genetics of Populations of Fungi Important in Biological Control	182,300	1.0
Reduction of Chilling Injury by Techniques Safe for Food Consumption	454,000	2.0
Total	2,142,900	6.0
Michigan: East Lansing:		
Innovation Technology to Improve the Production and Handling of Vegetables (Extramural-MI State Univ.) (\$50,000 Est)	222,200	1.0
Crop/Animal Systems to Improve Nutrient Management and Sustainability of Dairy Farms	170,800	1.0
Total	393,000	2.0
Minnesota: St. Paul: Germplasm Evaluation and Genetic Improvement of Oats and Wild Rice (Extramural-No. Central Ag Exp Sta, Grand Rapids for Wild Rice) (\$132,353 Est)		
Total	147,000
Total	147,000
Mississippi: Stoneville: Agronomic and Economic Evaluation of Kenaf as a Field Crop in Mississippi (Extramural-MS. St. Univ.) (\$418,019 Est)		
Total	491,500
Total	491,500

Grand Total	23,023,000	³ 59.0

¹ Excludes 2 SY's proposed for redirection to Miles City, MT.

² Excludes 4 SY's proposed for redirection (2 SY's to Pullman, WA and 2 SY's to Aberdeen, ID).

³ Excludes 6 SY's proposed for redirection.

Note: Fiscal year 1997 Extramural Research Estimates are based on Actual Agreements in fiscal year 1996.

Question. Again, you are justifying an increase for Integrated Pest Management; yet you are recommending the termination of many projects which deal with pest control; biocontrol; sustainability; reduced herbicides; production systems beneficial to the environment; conservation systems, etc. Please explain your rationale for the elimination of many of these projects that target IPM goals.

Answer. ARS does not propose to terminate all research in these areas, but only selected specific projects that have been judged to be relatively less critical at this point in time. Also, other locations could fill any critical gaps created by the terminations. Factors considered as a major part of the rationale in making these judgments were research relevance, impact, degree of Federal role, benefit to the public at large, adequacy of resource level to sustain a critical mass effort, and others.

ARS RESEARCH

BEE RESEARCH

Question. Please provide a map indicating the history of the Africanized bee migration from South America. Where are its current boundaries?

Answer. A map reflecting the history of the Africanized bee migration from South America and its current boundaries is provided.

PART 1

777

Migration of Africanized Honey Bees

Africanized honey bees have expanded their range northward and southward since 1957. The rate at which they spread is influenced by many factors including weather. Since 1992, their spread has slowed significantly.

Question. Where do you project the Africanized bee population will ultimately extend?

Answer. There have been several projections on how far the Africanized honey bee (AHB) migration will ultimately extend. The actual migration will depend on the impact of parasitic mites, climate, availability of food throughout the year, and competition for food from the commercial European honey bees (EHB).

We predict that along the Pacific coast, the Africanized bee will extend its range as far north as San Francisco, on a seasonal basis if not permanently. Similarly, along the East coast it may extend its range to Norfolk, Virginia, on a seasonal basis if not permanently. In the South, we believe that ultimately the Africanized bee will migrate to and establish in the southern States—Florida, Georgia, Alabama, Mississippi, Arkansas—along the Gulf Coast.

However, as the Africanized bees extend their range northward, they will, through matings with the commercial European bees over many generations, lose their distinctive genetic and behavioral characteristics. This is expected to happen because by mating with local bees in successive generations, the genetic material of AHB will be diluted out to the point that it would be difficult to distinguish the hybrid from the European bees.

PART 1

778

Question. What is the status of Varroa and Acarine mites? What research is being done on these pests? At what locations?

Answer. Varroa and Acarine mites continue to cause significant economic losses to beekeepers. However, honey bee colony losses this past winter have been light compared to those in the previous winters. This is probably due, in large part, to the relatively mild winter and increased beekeepers' attention to monitoring and treating with available acaricides. Most beekeepers lose bee colonies to mites during the winter. Consequently, beekeepers must replace these colonies in the spring. The high demand for honey bee queens drives up the cost of starting new colonies to make up for the winter loss of colonies. This, in turn, increases the cost of rental bees to the farmers and vegetable and fruit growers.

New and improved methods of mite control are being developed at four ARS locations. Scientists at the Honey Bee Research Units at Weslaco, Texas, and Tucson, Arizona, are developing new and improved methods for chemical control of mites; the Bee Research Laboratory at Beltsville, Maryland, is focused on finding natural products including such things as clove oil, eucalyptus, and thymol for mite control. Scientists are conducting research on developing a gel formulation of formic acid, which is being tested for efficacy in controlling mites under different climates in Texas, Nebraska, and Minnesota. Scientists at the Honey Bee Breeding, Genetics, and Physiology Research Unit at Baton Rouge, Louisiana, are working on selection and propagation of mite resistant stocks of honey bees.

Question. How much is the agency spending on honey bee research by location for fiscal years 1997 and 1998?

Answer. In fiscal year 1997, funding for honey bee research is \$4,720,000. This excludes funds for "other pollinating insects" in the amount of \$1,193,100. The ARS total bee research budget in fiscal year 1997 amounts to \$5,913,100. The proposed fiscal year 1998 funding remains at the same level. Honey bee research by location is provided in the following table.

Location	Fiscal year—	
	1997 funds	1998 funds
Tucson, AZ	\$1,021,900	\$1,021,900
Baton Rouge, LA	1,115,600	1,115,600
Beltsville, MD	1,772,800	1,772,800
Weslaco, TX	809,700	809,700
Total	4,720,000	4,720,000

Question. Please breakdown your spending by honey bee research; Africanized bee research, Varroa mite research, and Acarine mite research. How many scientists are involved in these areas of research?

Answer. A breakdown in spending by honey bee research, Africanized bee research, Varroa mite research, and Acarine mite research is provided in the following table.

Area of research	Fiscal year 1997—	
	Funds	Scientists
Honey bee research	\$4,720,000	¹ 19
Africanized bee research	1,860,000	8
Varroa mite research	417,700	1
Acarine mite research	941,900	4

¹ This excludes "other pollinating research" of \$1,193,100 and 4 scientists.

Question. By location, how many scientists working on bee-related research are on board and how many positions are unfilled?

Answer. The following table provides, by locations, the number of scientists on board working on bee-related research and the number of unfilled positions.

PART 1

779

Location	Number of scientists	Number of unfilled positions
Tucson, AZ	5
Baton Rouge, LA	4
Beltsville, MD	8
Weslaco, TX	3	1
Logan, UT	3	1

RANGE RESEARCH

Question. Specify the objectives of ARS range research?

Answer. The primary objective of the ARS rangeland research program is the development of better practices for the management of range vegetation and livestock practices which not only sustain profitable production of meat and fiber but also protect the soil and vegetation, maintaining the ability of rangelands to function as watersheds and provide wildlife habitat. For example, research at certain locations focuses on how to manage rangelands during periods of drought. Another objective of the rangeland research program is to develop a better understanding of the ecological processes which characterize these complex environments, such as nutrient cycling, the hydrological cycle, and the effects of grazing on the many kinds of plants which grow on rangelands. This work supports the development of computer models and decision-support tools which allow managers of both public and privately-owned rangelands to select the best options from among the alternatives available to them. The ecosystem research also provides the fundamental knowledge upon which improvements can be made in natural resource conservation and environmental protection. ARS research focuses on the development of more productive and drought-tolerant forage grasses, provides information concerning the biology and control of introduced weeds, and provides better ways to avoid livestock losses due to poisonous weeds. ARS laboratories in the eastern U.S. and in foreign countries support the research directed at range weed control and poisonous plants by evaluating potential biological control agents and characterizing the chemistry of plant toxins.

Question. Which locations carry out these objectives? What funds were obligated in fiscal year 1996? What is your funding estimate for fiscal years 1997 and 1998?

Answer. The locations and funds allocated for fiscal years 1996–1998 to carry out these objectives are as follows:

Location	Fiscal year—		
	1996 funds	1997 funds	1998 funds
Booneville, AR	\$247,090	\$253,300	\$253,300
Tucson, AZ	320,292	320,100	320,100
Albany, CA	166,980	166,900	122,800
Fresno, CA	578,386	536,100	536,100
Ft. Collins, CO	565,592	659,600	643,600
Boise, ID	498,070	495,700	495,700
Dubois, ID	319,813	309,300	309,300
Columbia, MO	30,393	30,000	30,000
Beltsville, MD	110,474	106,400	106,400
Frederick, MD	132,858	124,100	124,100
Bozeman, MT	461,737
Miles City, MT	481,910	438,700	719,800
Sidney, MT	3,170,921	1,891,300	1,891,300
Lincoln, NE	156,302	102,000	102,000
Mandan, ND	601,398	555,200
Las Cruces, NM	1,107,472	1,046,300	1,346,300
El Reno, OK	139,291
Burns, OR	381,400	350,700	350,700
Woodward, OK	1,199,756	1,066,700	1,066,700
Temple, TX	1,432,860	1,342,300	1,342,300
Weslaco, TX	332,014	318,900	318,900
Logan, UT	1,680,204	1,404,800	1,404,800

PART 1

780

Location	Fiscal year—		
	1996 funds	1997 funds	1998 funds
Cheyenne, WY	798,269	708,000	708,000
Buenos Aires, Arg	283,237	258,100	258,100
Montpellier, France	573,567	496,000	496,000
Total	15,770,286	12,980,500	12,946,300

Question. Please explain how your range research objectives relate to those of the Forest Service, BLM, and Interior.

Answer. ARS range research objectives directly support the research needs and objectives of the Forest Service, Bureau of Land Management, and Bureau of Reclamation of the Department of the Interior, in that the technology and knowledge produced by the ARS range research programs are often directly applicable to their specific problems. Much of the ARS range research is conducted in western States where most rangeland is managed by the Forest Service and Bureau of Land Management. Such research is often conducted cooperatively by ARS and other Federal agencies. Rangeland research conducted by the Forest Service is primarily directed at maintenance and restoration of native plants and animals and their habitats, biodiversity, shrub ecology, and monitoring of the ecological status of rangelands. Forest Service research does not address the agricultural use of rangelands for food and fiber production, with the exception of a program concerned with overlap of habitat requirements for livestock and wildlife. The Bureau of Land Management and the Bureau of Reclamation have little in-house research capability, and they are considered to be important customers by ARS range researchers. Similarly, the ARS range research program supports the needs of the Natural Resources Conservation Service for science and technology related to improved management and conservation of privately-owned rangelands.

AQUACULTURE RESEARCH

Question. Please list those locations involved in aquaculture research, their specific programs and current funding and staffing.

Answer. The funding and scientists for aquaculture by location are as follows:

Location	Fiscal year 1997—	
	Funds	Scientists
Auburn, AL	\$841,800	3.0
Pine Bluff, AR	373,300	2.0
Stuttgart, AR	1,235,600	4.0
Hilo, HI, Oceanic Inst	1,612,400
New Orleans, LA	759,400	2.4
Beltsville, MD	142,800
Stoneville, MS:		
Warm Water Aquaculture	2,652,000	2.5
Other—In-house	505,100	2.5
Total MS	3,157,100	5.0
Wyndmoor, PA	250,000	1.0
Kearneysville, WV	1,447,200
Headquarters, College Sta., TX	365,200
Total	10,184,800	17.4

The specific ARS aquaculture research programs are as follows:

Auburn, AL.—Diagnosis and control of diseases and parasites of cultured fish.

Beltsville, MD.—Aquaculture Information Center. Provides the public with information on aquaculture.

Albany, CA (Hilo, HI).—Tropical aquaculture, feeds and culture technology development.

New Orleans, LA.—Improve flavor quality of farm-raised catfish.

Pine Bluff, AR.—Aquaculture production and processing technology.

PART 1

781

Stoneville, MS.—Improve production efficiency, including breeding, genetics, and endocrinology of catfish.

Kearneysville, WV.—Water quality control and intensive culture of fish.

College Station, TX.—Food safety of catfish.

Stuttgart, AR.—Research on therapeutics evaluation, health management and culture systems for farm-raised fish.

Dover, DE (Wyndmoor, PA Worksite).—Food safety of farm-raised fish.

Question. What accomplishments are being generated from aquaculture research?

Answer. ARS scientists conducting disease research at Auburn, AL have demonstrated that some strains of commercial channel catfish have resistance against *columnaris disease*. *Columnaris disease*, caused by the bacterium *Cytophaga columnaris*, is responsible for widespread mortality in channel catfish farms. Through a Cooperative Research and Development Agreement with Gold Kist, Inc., Inverness, MS, ARS scientists at the Fish Diseases and Parasites Research Laboratory, Auburn, AL, demonstrated that some strains of channel catfish selectively bred by Gold Kist were more resistant than other strains to mortality from *columnaris disease*. Selective breeding of the resistant strains should result in commercial catfish less susceptible to *columnaris disease*. This could reduce losses to the disease by \$10 to \$15 million annually.

ARS scientists at Auburn, AL, have developed an experimental vaccine to control enteric septicemia of commercial catfish. *Edwardsiella ictaluri* causes the disease, enteric septicemia, in catfish. Losses from the disease reduce catfish farm revenues by \$25 million annually. Scientists at the Fish Diseases and Parasites Research Laboratory, Auburn, AL, have developed a modified live vaccine to protect commercial catfish. Protection from the vaccine lasts 6 months or more. While the vaccine is presently applied through immersion of the fish in water, the ARS scientists are working on feed-delivery of the vaccine for catfish fingerling producers.

ARS scientists at Stuttgart, AR, have shown that disease treatment with copper sulfate poses no hazard to human consumers of cultivated food fish. Copper sulfate has been effectively used for many years as a treatment for waterborne parasitic, bacterial, and fungal diseases of cultivated fish, but has never been approved by the U.S. Food and Drug Administration (FDA) for use on food fish because of questions about human food safety. Scientists at the National Aquaculture Research Center, Stuttgart, AR, demonstrated that copper concentrations in fish tissue remain unchanged when cultivated channel catfish are exposed to levels of copper sulfate far in excess of concentrations required to treat diseases. The FDA has accepted the results of the study as demonstrating that the use of copper sulfate for treatment of waterborne diseases of cultivated food fish presents no hazard to the health of human consumers.

ARS scientists in Stoneville, MS, have developed genetically improved strains of channel catfish for commercial culture. Commercial use of improved catfish germplasm, developed through an applied selective breeding program, will dramatically improve production efficiency in commercial catfish production. Scientists at the Catfish Genetics Research Unit, Stoneville, MS, have evaluated and selected strains of channel catfish for commercially important traits such as growth, reproductive performance, processing characteristics, and disease resistance. DNA markers, termed microsatellites, have been isolated and characterized; the microsatellites are useful for identifying and tracking genetically improved strains. These markers will form the basis of a catfish genetic map that will improve the efficiency of genetic selection in this species.

Canned bighead carp products developed by an ARS food technologist at Pine Bluff, AR, were evaluated by consumer taste panels and were found to have a high level of acceptance.

ARS scientists in New Orleans, LA, have developed highly sensitive methods to detect off-flavor compounds in farm-raised catfish. The high incidence of environment-derived off-flavors in farm-raised catfish has consistently been identified as the most important production-related problem in the catfish aquaculture industry. Scientists at the Southern Regional Research Center have developed extraction and gas chromatographic methods that can detect geosmin and MIB, the two most important catfish off-flavor metabolites, at concentrations near the theoretical limits of the most sensitive electronic sensors and equal to the levels of human perception.

Scientists at Shepherdstown, WV, have developed an improved ultrasonic waste feed monitor through a cooperative arrangement with the University of Mississippi's National Center for Physical Acoustics. This device efficiently detects waste feed, while ignoring fecal material, and represents an improvement over earlier technology developed by these scientists. The device is currently being commercialized through a California computer company.

PART 1

782

Funding levels provided for the cooperative research program with the Freshwater Institute are \$1,447,200 in both fiscal year 1997 and fiscal year 1998.

FRUIT FLY RESEARCH

Question. Please detail the fruit fly research program.

Answer. The ARS fruit fly research program encompasses a diversity of approaches that address the issues of detection, control and eradication of pest species. Major emphasis is placed on the following seven fruit fly species: Mediterranean, Oriental, Caribbean, Mexican, Melon, Malaysian, and Papaya. Innovative research programs include the development of new, sensitive traps for detecting fruit flies; development of an environmentally acceptable toxicant as a replacement for malathion in bait sprays, including photoactivated dyes; commodity treatments to allow movement of fruit-fly host material from areas quarantined for fruit flies; biological control with fruit fly specific parasites to reduce the level of pest populations; enhancement of natural resistance of host fruit to infestations; and improvements in competitiveness of sterile flies released as a part to the sterile insect technique. Taken together, these programs provide an integrated approach to the control of pest species of fruit flies, that emphasizes early detection with more effective traps, reduction in the pest populations through biological control with parasites and environmentally acceptable pesticides, and improvements in the sterile insect technique.

Question. Where is this research carried out?

Answer. Research on fruit flies is based at the following eight ARS locations: Albany, CA; Fresno, CA; Gainesville, FL; Miami, FL; Orlando, FL; Hilo, HI; Beltsville, MD and Weslaco, TX.

Question. How much money was obligated for each of those pests in fiscal year 1996; what is currently planned and what is your estimate in fiscal year 1998?

Answer. The amounts for each pest species are as follows:

Species	Fiscal year—		
	1996 obligations	1997 funds	1998 funds
Caribbean Fruit Fly	\$1,652,744	\$1,539,600	\$1,539,600
Malaysian Fruit Fly	766,054	745,500	745,500
Mediterranean Fruit Fly	3,242,847	3,240,400	3,240,400
Melon Fruit Fly	845,814	823,400	823,400
Mexican Fruit Fly	947,197	781,400	781,400
Oriental Fruit Fly	1,076,926	1,066,300	1,066,300
Papaya Fruit Fly	175,098	176,000	176,000
Other Fruit Flies	2,124,327	2,086,700	2,086,700
Total	10,831,007	10,459,300	10,459,300

SUGAR CROPS RESEARCH

Question. Please describe your research in sugar crops.

Answer. Research on sugar crops includes breeding for improved cultivar adaptation to stress environments and increased levels of pest and disease resistance; more efficient production systems; improved management for pest, disease and weed control; and development of value-added coproducts of sugarcane production.

Question. Where is the research performed? What is the current and projected funding for this research?

Answer. Listed below are the locations where research is performed and the fiscal year 1997 and 1998 funding for this research.

Location	Fiscal year—	
	1997 funds	1998 funds
Albany, CA	\$21,900	\$21,900
Salinas, CA	1,314,400	1,314,400
Ft. Collins, CO	620,300	620,300
Canal Point, FL	891,600	891,600
Miami, FL	108,600	108,600
Hilo, HI	1,491,700	1,491,700

PART 1

783

Location	Fiscal year—	
	1997 funds	1998 funds
Peoria, IL	94,000	94,000
Urbana, IL	217,400	217,400
New Orleans, LA	2,101,900	1,702,000
Beltsville, MD	951,800	951,800
Frederick, MD	32,000	32,000
East Lansing, MI	659,700	659,700
Sydney, MT	111,500	111,500
Fargo, ND	1,080,200	1,080,200
Wyndmoor, PA	62,600	62,600
Mayaguez, PR	95,600	95,600
College Station, TX	219,700	219,700
Weslaco, TX	319,900	319,900
Headquarters	64,000	64,000
Total	10,458,800	10,058,900

Question. Please discuss recent accomplishments in sugar crops research.

Answer. Recent accomplishments for sugarcane and sugarbeets are provided for the record.

Sugarcane—(1) The research team in Houma, Louisiana has made major advances in breeding for resistance to sugarcane rust, smut, yellow leaf syndrome and leaf scald. Four recent cultivars, were developed. These cultivars have the potential of increasing sugar yields per unit area by 10–25 percent. The team has released 6 varieties in the last 6 years and has registered 5 germplasm clones with superior resistance to the sugarcane borer. (2) Research in Florida is focusing on the development of sugarcane that can be grown under high water table conditions. Varietal selections have been made that tolerate these conditions in the changing south Florida ecosystem environment. Studies are also in progress on reducing the levels of phosphorus applied to sugarcane and preliminary results show that concentrations of phosphorus applied to the crops may be reduced without affecting plant growth.

Sugarbeets—(1) Research in Fargo, North Dakota, on development of a biopesticide for control of sugarbeet root maggot has shown that selected strains of *Bacillus thuringiensis* can be used to infect the maggot achieving high mortality. In addition, a germplasm line has been selected that has a high level of resistance to the root maggot. (2) ARS researchers have released sugarbeet lines with resistance to *Cercospora* leafspot disease, *Rhizoctonia* root disease, and *Rhizomania*, three of the most serious diseases of sugarbeet.

LOWER DELTA NUTRITION RESEARCH

Question. Please describe your progress in establishing and coordinating research and intervention activities in the Lower Delta.

Answer. The Lower Mississippi Delta Nutrition Intervention Research Initiative (Delta NIRI) involves a consortium of seven partners: Alcorn State University, Arkansas Children's Hospital Research Institute, Pennington Biomedical Research Center, Southern University and A&M College, University of Arkansas at Pine Bluff, University of Southern Mississippi, and the Agricultural Research Service (USDA/ARS). The consortium is publishing a monograph of existing data relative to the nutritional status and health of people in the Delta of Arkansas, Louisiana, and Mississippi. Thirty-six counties (10 in Arkansas, 12 in Louisiana, 14 in Mississippi) have been selected for the research based on rates of unemployment, population, and percent of population below the poverty level. A key informant survey has been piloted and the main survey will be implemented in the 36 counties in May/June, 1997. With direction from a USDA Scientific Review Board, a pilot/validation study to determine the feasibility of using telephone interview methodology to obtain food consumption and food security data will be underway during the summer of 1997. This information will be used as baseline data to evaluate the impact of welfare reform programs in the area at a later time. Other research protocols are being developed, i.e., a community assessment survey and a longitudinal study of nutritional status of select segments of the population.

Question. Please list objectives and funding by participant. Does the Agency still consider this to be a ten-year program?

PART 1

784

Answer. The overall objective of the project is “to design, implement, and to experimentally test nutrition interventions that will improve the health and well-being of people in the Lower Mississippi Delta.” This objective is consortium-wide with each partner participating in each of them. To further this objective, each partner is participating in capacity building and hiring at least one new nutrition related scientist. Each participant in the Lower Delta Nutrition Intervention Initiative is currently funded at \$448,100. ARS considers this to be a major assessment and intervention study which will require 10 years to complete.

Question. What is your overall funding?

Answer. The overall funding of the program in fiscal year 1997 is \$3,166,900. Of this, the Agricultural Research Service receives \$478,300 and each of the other partners is funded at \$448,100 each.

Question. Describe your accomplishments to date.

Answer. A functioning and fully participatory consortium of seven diverse partners was organized, and they have identified the problems to be addressed based on an understanding of the information that is available regarding the needs of the population of the Lower Mississippi Delta. A monograph describing existing data about the nutritional health and well being of the population was written and is soon to be published. An electronic communication system among the partners (including electronic mail, fax, and video conferencing) was implemented and is in regular use. A pilot study of key informants as part of a larger community assessment was implemented.

Advisory Groups were established in each State. A pilot/validation study of food consumption and food security was developed. All partners participated in three capacity building workshops focused on nutritional and dietary assessment methods, community assessment methods, and nutrition intervention methodology.

Question. To what extent do you classify your activities as intervention as opposed to research?

Answer. The proposed activities are research. Although the main objective of the project is to carry out nutrition intervention research, the interventions will be experimentally tested (with controls) to determine which interventions are effective and can be sustained in the Delta. Such information can then be used by other agencies to design and implement effective interventions based on the results of sound research.

Question. What is your funding goal for this program?

Answer. An effective nutrition intervention research program is projected to require \$10.5 million per year. This level of support will provide for complete cross-sectional and longitudinal data collection. The data collected will determine specific nutritional and food related problems that could be amenable to interventions and development and testing of the nutrition intervention methodology. The proposed funding for the Lower Delta Nutrition Intervention Initiative activities in fiscal year 1998 is \$3,166,900.

Question. What level of funding is included in the fiscal year 1998 request for the Lower Delta Nutrition Initiative?

Answer. The fiscal year 1998 budget request is \$3,166,900 which is the same level of funding as the current fiscal year.

ANIMAL SCIENCE RESEARCH

Question. Please identify priority research needs in the area of animal production efficiency research. Identify funding requirements and current resources.

Answer. Current resources for animal production efficiency research total \$43,024,000. The animal production program includes research on: dairy and beef cattle, swine, chickens, turkeys, goats, sheep, and aquaculture.

The overall goal of the ARS program of research is to improve the sustainability and competitiveness and long-term profitability of animals used to produce food and fiber, while protecting the environment. Research is conducted in the disciplines of genetics, reproduction, nutrition, pre-harvest food safety, animal waste management of integrated systems, grazingland management and product quality. ARS scientist and laboratories are using the most recent technologies to improve the efficiency of animal production, based on ARS facilities and scientific capabilities. There are five high priority areas in animal production that warrant additional research effort. The budget proposes to expand and initiate new research in Pre-harvest food safety in animal production systems—\$1.6 million.

Pre-harvest Food Safety in Animals—\$1.6 million of additional funding, current resources total \$9.5 million

Exposure, infection, and contamination of animals by certain bacteria and parasites during production is a known source of pathogens in our meat-based foods.

PART 1

785

Several components of the live animal sector offer opportunity for significant reduction of pathogens in the animals presented for slaughter. The dynamics of pathogen transmission and the host parasite relationship of microbial organisms which are important to food safety, must be elucidated in order to identify critical control points.

Effective pathogen interventions, such as competitive colonization systems, which have been successfully accomplished for broilers, need to be developed to protect swine and cattle against Salmonella and E. Coli 0157:H7. Production practices for cattle and swine must be correlated with post-processing contamination of food products. The dynamics of Campylobacter transmission during production must be delineated in order to identify control points and strategies to limit contamination in poultry. Antibiotic resistance is emerging as a food safety concern, and we need to characterize the epidemiology, transmission and biological basis of the emerging resistance of Salmonella typhimurium DT104 in order to prevent its occurrence and maintain consumer confidence in meat and poultry based foods.

Question. Please update your priority research needs in the area of animal health. Identify funding requirements.

Answer. The USDA-ARS Animal Health Program of research concentrates on three areas: (1) emerging diseases within the U.S.; (2) chronic animal diseases within the U.S. that cause production losses; and, (3) foreign animal diseases that pose a threat to the U.S. livestock industry. The 1998 budget request for ARS emerging diseases requested \$2.5 million in new funding research in these three categories as follows: (1) porcine reproductive syndrome, bovine viral diarrhea, and Cryptosporidia; (2) John's disease and transmissible spongiform encephalopathies; and, (3) foreign animal diseases including classical swine fever (hog cholera), highly pathogenic Avian Influenza, and velogenic Newcastle Disease.

Question. ARS has a number of animal science laboratories. Please explain the distinction of the research at these centers.

Answer. ARS has four major animal science laboratories. The Plum Island Animal Disease Center (PIADC), Greenport, New York, is responsible for research to protect U.S. animal industries and exports against catastrophic economic losses caused by foreign animal disease agents. The National Animal Disease Center (NADC), Ames, Iowa, conducts basic and applied research on selected diseases of economic importance to the U.S. livestock and poultry industries. The Roman L. Hruska U.S. Meat Animal Research Center (MARC), Clay Center, Nebraska, is responsible for efficiency of production that includes reproductive efficiency, nutrition, production and health systems, genetics, germplasm and gene mapping, environmental stress, manure management and product safety and quality research for the U.S. beef, sheep, and swine industries. The Livestock and Poultry Sciences Institute (LPSI), Beltsville, Maryland, conducts fundamental research to improve genetic evaluation techniques for dairy breeding, develops knowledge of the genomes/germplasm of livestock, identifies factors that affect growth and lactation, controls parasitic diseases, improves the efficient use of dietary nutrients for livestock and poultry, and develops techniques to enhance the quality and safety of meat and poultry products.

In addition, ARS has animal sciences laboratories at a number of locations that focus on regional problems such as aquaculture, forage/grazingland production systems, and other animal health related issues.

Question. How are these programs coordinated?

Answer. All ARS research programs are coordinated by the National Program Staff (NPS), which consists of approximately 30 National Program Leaders (NPL's), 3 Associate Deputy Administrators (ADA's), and the Deputy Administrator for national programs. The NPS professional staff members are distinguished scientists in their fields. The work of the ARS animal science laboratories is managed by one or more NPL's with expertise in various disciplines of animal and veterinary sciences under the leadership of the ADA for Animal Production, Product Value and Safety. In establishing national research programs relating to animals, the NPL's focus the work of the scientists on addressing specific problems of high national priority.

The recent restructuring of NPS and the aggregation of 1,100 research projects in 25 national programs, is changing the way ARS manages its research activities. The new broader-based national programs will be coordinated by multi-disciplinary teams of NPL's. This new organizational structure will improve program management, and make it easier for ARS to meaningfully involve customers and stakeholders in the process of setting research priorities and increase the rate and timeliness of knowledge, technology, and information transfer to potential users. The new approach in managing NPS and its research programs will also make ARS more responsive in meeting the priorities identified by Congress in the Farm Bills and Appropriations measures.

Question. Provide current funding and staffing levels for each.

PART 1

786

Answer. The current funding and scientific staffing levels for animal science research by location are as follows:

Location	Fiscal year 1997—	
	Funds	Scientists
Auburn, Alabama	\$841,800	3.0
Booneville, Arkansas	971,700	2.9
Fayetteville, Arkansas	917,800	4.5
Brooksville, Florida	415,700	1.5
Gainesville, Florida	4,288,500	15.0
Athens, Georgia	4,138,300	12.9
Hilo, Hawaii	1,612,400
Dubois, Idaho	1,700,600	3.6
Peoria, Illinois	919,900
West Lafayette, Indiana	985,600	3.0
Ames, Iowa	189,200	1.0
Ames, Iowa (NADC)	18,354,200	46.0
Beltsville, Maryland (LPSI)	23,725,900	55.6
East Lansing, Michigan	2,705,100	9.1
St. Paul, Minnesota	194,700	1.0
Mississippi State, Mississippi	818,400	3.6
Stoneville, Mississippi	3,157,100	2.5
Columbia, Missouri	629,000	2.0
Miles City, Montana	1,745,100	5.3
Clay Center, Nebraska (MARC)	13,566,800	37.3
Lincoln, Nebraska	874,900	1.0
Ithaca, New York	265,900	1.0
Greenport, New York (PIADC)	9,853,300	6.9
Raleigh, North Carolina	149,700	0.8
Fargo, North Dakota	931,900	3.5
El Reno, Oklahoma	346,400	.8
Wyndmoor, Pennsylvania	186,800	.6
Bushland, Texas	308,200	1.2
College Station, Texas	2,155,100	8.7
Kerrville, Texas	2,939,600	9.0
Logan, Utah	1,833,600	6.6
Pullman, Washington	2,059,700	6.0
Beckley, West Virginia	496,300	1.5
Kearneysville, West Virginia	1,447,200
Madison, Wisconsin	1,574,000	5.5
Laramie, Wyoming	2,199,300	6.0.8
Panama City, Panama	997,900	2.0
H.Q. Administered Funds	4,454,800
Total	114,952,000	273.9

FRUIT AND NUT RESEARCH

Question. Describe your current program in fruit and nut research?

Answer. The current program in fruit and nut research includes research activities on many different fruit and nut crops including apples, pears, oranges, grapefruit, lime, lemon, plum, peach, prune, strawberry, raspberry, blueberry, grape, pecan, walnut, hazelnut and many minor tropical and subtropical crops. Projects include both pre- and post-harvest investigations for improved product varieties and quality. Projects at 35 locations involve both basic and developmental research in plant breeding and genetics, physiology, entomology, pathology, and engineering technologies.

Question. Where is it conducted? By location, provide major research objectives, current funding, and staffing.

Answer. Research locations, current funding, staffing and major research objectives are:

PART 1

787

Location	1997 funding	Scientists
Booneville, AR	\$126,700	0.2
Tucson, AZ	92,700	.5

Total	35,620,800	103.1

Booneville, AR.—Develop management practices for soil and water and implement agroforestry techniques on family farms.

Tucson, AZ.—Improve bee pollination of crops and ecologically important plants.

Albany, CA.—(1) Develop improved methods for detection of compounds affecting healthfulness and quality of foods; (2) control of nutritional properties of extruded cereal based foods; (3) detection of aflatoxin contamination in human foods by imaging technologies; (4) image analysis and other physical methods for detection of unwanted matter in fresh and processed food for improved quality. Other projects include: (1) the modification of vegetable oils as raw materials for industrial uses; (2) development of edible coatings to keep lightly processed vegetables fresh; (3) devise innovative processing to develop value-added fruits and vegetables for foreign markets; (4) control aflatoxin in tree nuts using biocontrol procedures; and (5) genetically engineer resistance and reduce aflatoxin in tree nuts and figs by decreasing invasion of *Aspergillus flavus* caused by insects.

Davis, CA.—Develop control practices for bacterial and viral diseases of fruit and nut trees and grapes, resistant rootstocks or cultivars, and chemical treatments to eliminate pre-plant fumigation with methyl bromide.

Fresno, CA.—Develop quarantine/post-harvest control strategies to reduce losses by insect pests in the investigation of new fumigants and methodologies to reduce methyl bromide emissions. This includes: (1) research on reducing or eliminating chemical pesticides and developing alternative biological and physical treatments and integrated pest management control procedures. Research is also being done to

develop alternatives to methyl bromide in the management of soil pests. In addition, *Prunus* and *Vitis* germplasm is hybridized for increased pest resistance, drought and salinity tolerance with improved fruit characteristics. Control post-harvest decay utilizing microbial biocontrol and improve commodity handling with reduced injury to fruit. Determine the feasibility of cropping systems utilizing subsurface drip irrigation to apply alternative fumigants as well as irrigation.

Riverside, CA.—Determine the fate and transport of alternative fumigants to methyl bromide in field application. *Salinas, CA.*—Develop biologically-based or chemical alternatives to methyl bromide as a soil fumigant for control of soilborne pests of strawberry as a component of integrated management strategies for suppression and control of soilborne pests in strawberry and vegetable crops.

Salinas, CA.—Development of preplant soil treatments as alternatives to the use of methyl bromide in the production of strawberries.

Ft. Collins, CO.—Determine the physiological and biochemical factors responsible for loss of seed viability and deterioration in storage and develop improved storage methods.

Newark, DE.—Develop biological control of selected insect pests: Tarnished Plant Bug, Alfalfa Plant Bug, and Sweetpotato Whitefly (in greenhouses) and quarantine evaluation of predators of Russian Wheat Aphid.

Winter Haven, FL.—Develop alternative chemical and non-chemical treatments for preserving quality and improving convenience of minimally processed fresh fruits and vegetables.

Montpellier, FR.—Discover, collect, and ship to the U.S. new natural enemies to reduce populations of codling moth, gypsy moth, pear thrips, pear psylla, and apple ermine moth.

Byron, GA.—(1) Breed and develop deciduous peach fruit cultivars and rootstocks adapted to the Southeast. (2) Develop control strategies for insect problems of deciduous fruit. (3) Identify and develop improved cultivation and disease management strategies for pecan. (4) Identify factors affecting the nature and occurrence of disease and nematode problems of deciduous fruits in the southeastern U.S. (5) Develop disease and nematode management procedures based on biological control and nonchemical methods for the management of post-harvest diseases of stone fruits. (6) Develop alternative methods of biological control for insect pests of pecan.

Tifton, GA.—Determine pesticide residues in food crops in support of petitions to EPA through the IR-4 "Minor Use" project for registration or reregistration of pesticide use.

Hilo, HI.—Develop novel and more efficient semiochemical based eradication technology for fruit flies.

Peoria, IL.—Identify biologically active natural products and determine their potential for commercial exploitation as herbicides, fungicides, and plant growth regulators.

Urbana, IL.—Develop control measures for weeds in vegetables, fruits and specialty crops and determine pesticide residues in harvested products.

New Orleans, LA.—This multifaceted research program includes: (1) investigation on the conversion of commodity by-products (nut shellers, grain millers, oilseed crushers) to value-added absorbents and the optimization of absorbent properties for removal of metals and organics; (2) immunological studies on enzymes involved in aflatoxin formation to investigate processes of aflatoxin formation; (3) clone genes governing aflatoxin formation in studies designed to select plants expressing compounds inhibitory to aflatoxin formation; and (4) optimize the flavor and texture of fresh cut fruit products and develop methodologies for predicting food sensory quality to meet consumer demand.

Beltsville, MD.—(1) establish and implement area-wide pest management for high priority agricultural pests of fruit and other crops; (2) develop instrumentation to nondestructively assess apple fruit quality; (3) develop methods to utilize gypsum byproducts for use in field soil applications of fruit crops; (4) enhance the development of blueberry cultivars utilizing molecular techniques to manipulate the chilling required for flowering; (5) develop methods to genetically transform raspberry and regenerate plants in tissue culture; (6) develop and introduce new germplasm and cultivars of small fruits, such as blueberry and strawberry, that are pest and disease resistant; (7) develop molecular methods for detection and control of viruses and viroids in fruits; (8) process prohibited foreign germplasm through quarantine and deposit in U.S. repositories; (9) develop molecular methods to detect and identify phytoplasma pathogens in plants; (10) transfer genes and develop tissue culture methods to improve peach, apple and pear; (11) increase quality and shelflife of fruit by controlling ripening and softening; (12) reduce the use of fungicides in control of post-harvest decay; and (13) determine the role of membrane lipid metabolism and composition in fruit ripening, senescence and quality.

Frederick, MD.—Identify casual agents of graft and insect transmissible disorders of foreign horticultural germplasm and develop rapid methods of detection of exotic pathogens.

Poplarville, MS.—Develop new and improved muscadine grape and other small fruit cultural practices, management techniques and germplasm for the Gulf States Region to increase yield, minimize production losses and conserve natural resources.

Stoneville, MS.—Develop and integrate biological and other non-pesticidal methods for control of insect and mite pests of pecan.

East Lansing, MI.—Develop, evaluate and implement new technologies to reduce post-harvest handling damage and nondestructively measure fruit quality for fresh markets and maintain U.S. competitiveness in international markets.

Geneva, NY.—Acquire, maintain, characterize and distribute apple, grape, and sour cherry genetic resources from this national collection.

Wooster, OH.—Develop improved spray application technology for crop protection using surfactants to reduce crop damage, reduce cost and energy use as well as pollution of the environment.

Lane, OK.—Characterize the physiological changes occurring during storage and ripening of small fruits and utilize this information to develop practices leading to increased shelflife.

Corvallis, OR.—Evaluate genetic variability within raspberry, blueberry, and strawberry and identify traits, individuals and populations valuable to breeding programs.

Wyndmoor, PA.—Develop and utilize pectin by-products from fruit in the production of biodegradable polymers.

Mayaguez, PR.—Acquire, preserve, characterize and distribute valuable tropical and subtropical germplasm.

College Station, TX.—Characterize genetic diversity of existing pecan and hickory cultivars and develop improved pecan cultivars with disease and pest resistance.

Weslaco, TX.—Develop a systems approach to quarantine security for tropical and subtropical fruits with emphasis on fruit flies.

Prosser, WA.—Develop chemical control measures for weeds in fruit crops and determine herbicide residues in crops and soils.

Wenatchee, WA.—Determine the factors that influence the development of fireblight disease and develop environmentally sound management practices.

Yakima, WA.—(1) Develop new control methods for green peach aphid and Colorado Potato Beetle utilizing beneficial agents in biological control; (2) develop areawide control program for codling moth using pheromones sterile insects and other biological control agents; (3) determine the amount persistence and fate of insect control chemicals and their toxic breakdown products; and (4) provide efficacy, phytotoxicity, and yield data residue samples for analyses to support the registration of minor use pesticides.

Beckley, WV.—Develop agroforestry systems that incorporate production of high-value specialty products to fill niche markets.

Kearneysville, WV.—(1) Identify and isolate genes affecting fruit development; (2) develop enhanced pear and plum cultivars with disease and pest resistance and improved fruit yield and quality; (3) identify and characterize genes associated with cold hardiness and stress resistance; (4) develop pest management methods to reduce pesticide use in deciduous fruit tree production systems; (5) develop plant-based technologies to treat water and concurrently produce a high-value product; (6) develop principles and mechanisms for improved harvesting of fruits for fresh market; (7) develop improved orchard practices affecting fruiting, fruit development and stress tolerance; (8) develop information on interactions between soilborne pests, root development and plant growth; (9) evaluate cover crop species and organic amendments on soilborne disease organisms and weeds as alternatives to methyl bromide; (10) examine the effects of cultural management techniques on the severity of fireblight in apple; (11) develop fundamental knowledge of the microbial community on fruit surfaces and methods for control of pre- and post-harvest disease and soilborne disease; and (12) develop nondestructive sensors measuring the post-harvest quality of apples and incorporate the sensing techniques into an automatic inspection system for sorting apples based on surface and internal defects.

Headquarters.—Staffing and operation of national clonal repositories for plant germplasm including fruits.

Question. Does the fiscal year 1998 budget propose decreases in this area?

Answer. The fiscal year 1998 budget proposes decreases in small fruits research and in development of instrumentation for the nondestructive assessment of apple fruit quality in Beltsville, Maryland. A decrease has also been proposed for herbicide work on drip irrigation in grapes with the proposed closure of the ARS location in Prosser, Washington.

SMALL GRAINS RESEARCH

Question. Describe your current program for each of the small grains.

Answer. The small grains include wheat, oat, barley, and rice. We have research on wheat at 38 locations, oat at 13 locations, barley at 16 locations, and rice at 19 locations. The Agricultural Research Service's small grain research program is a nationally managed, fully coordinated, multi-disciplinary approach to solving production and postharvest issues. The thrusts of this research by location are:

Wheat

Albany, CA (PGEC)—Genetics modification and gene action
Albany, CA (WRRC)—Product quality and transformation
Riverside, CA—Salt tolerance
Ft. Collins, CO—Germplasm preservation
Newark, DE—Biocontrol
Gainesville, FL—Stored product insects
Athens, GA—Product composition and value
Aberdeen, ID—Preserve and evaluate germplasm
Peoria, IL—Toxin research
Urbana, IL—Virology
W. Lafayette, IN—Mechanisms of resistance to disease and insect
Manhattan, KS—Resistance to Hessian fly and rusts
Beltsville, MD—Stress physiology and disease resistance
Frederick, MD—Exotic diseases
Morris, MN—Production systems
St. Paul, MN—Spring wheat improvement and cereal rust research
Columbia MO—Wide crosses and cytogenetics
Stoneville, MS—Insect management
Sidney, MT—Management systems
Raleigh, NC—Disease resistance
Fargo, ND—Host-plant resistance, cytogenetics and quality evaluation
Mandan, ND—Production systems
Lincoln, NE—Genetic enhancement with emphasis on quality and virus resistance

Question. Please describe and identify recent accomplishments in this research.

Answer. More than 15,000 new accessions have been added to the National Small Grain Germplasm Collection in the past 10 years. Well over 400,000 accession samples have been distributed to scientists in the U.S. and worldwide in the past decade. Small grain germplasm has been evaluated for such traits as growth habit; agronomic spike-panicle, and seed descriptors; disease and insect reaction data and quality components. Characterization and evaluation data have been included in the GRIN database. All genetic and cytogenetic stocks, that have been analyzed or collected, have been systematically cataloged and stored for use by scientists nationally and internationally. Immunological and biochemical means have been developed to rapidly identify wheat lines carrying the 1RS rye chromosome which is related to some deleterious quality characteristics.

ARS geneticist/breeders have had lead responsibility in the development of important varieties of rice, hard red spring wheat, club wheat, malting barley and oats. ARS scientists have also coordinated regional testing nurseries of all small grain species in all parts of the country. Data from these nurseries have contributed information toward the release of nearly all public small grain varietal releases and many releases from private industry.

A novel gene was identified which controls aroma in a foreign rice introduction. This gene will be valuable in U.S. breeding program. The entire wheat and barley germplasm collection was evaluated and resistance to the Russian wheat aphid identified. Sources of resistance have been incorporated into improved germplasm lines, which are proving to be of immense value to U.S. breeders. A rapid, inexpensive screening method was developed which allows oat lines to be efficiently screened for beta-glucan (the cholesterol lowering soluble fiber component). ARS scientists identified 160 accessions with specific stem rust resistance genes. An 18 chromosome barley was developed, which may exhibit agronomic advantages over existing 14 chromosome barley. *In situ* hybridization techniques were utilized to physically map molecular markers to chromosomes. With this information, differences were established between recombinational maps and true physical locations of RFLP's (Restriction Fragment Length Polymorphisms)(of wheat and rye), which indicated the presence of "hot" and "cold" spots of recombination along chromosome arms. This information is extremely valuable for scientists working on plant transformation.

PART 1

792

Molecular biology offers powerful approaches to plant improvement and ARS cereal scientists are at the forefront. Among their accomplishments are: 1) developing DNA probes for rice cultivar and germplasm identification, 2) developing an oat tissue culture system suitable for *in vitro* gene transfer, 3) producing a seed cDNA library which can be used to detect antifungal protein genes, 4) demonstrated, through the similarity of gene arrangement among grass species, that the convergent domestication of maize, sorghum and rice appears to be due to mutations of major gene loci; thus, showing that mapping data developed in one crop is applicable to other crops, and 5) identified root specific and spike specific ethylene probes—allowing the study and improvement of root health and grain production.

Finally, one of the most exciting “targets of opportunity” for cereal researchers is to design crops for specific uses. It may be informative to present such ARS accomplishment in more detail, as follows:

Discovery and development of non-lethal maize, barley, and rice “low phytic acid” (LPA) mutants.

This pioneering research has demonstrated that the fraction of grain total phosphate that is “nutritionally available” in non-ruminant diets is greatly increased in LPA grain. Methods and technologies are under development to facilitate utilization of these mutants in crop breeding and agricultural production.

Isolation of LPA mutants confirms “Mendelian” inheritance of seed phosphorus and mineral storage processes; provides the first genetic resources for study of seed phosphorus and mineral storage processes, including phosphorus homeostasis during seed development and germination; provides the first genetic evidence that phytic acid is not an essential component of seeds and provides first genetic identification of genes important to phytic acid synthesis; and provides the first genetic resources necessary to study the role of phytic acid in human and animal nutrition and health.

This research has been conducted over the past decade and is now coming to fruition through technology transfer to private industry and facilitation of new levels of nutritional research.

Poultry, swine, and fish production using LPA grain will be less expensive, more efficient, and have a reduced impact on the environment. In addition to improvement in the efficiency of agricultural production, competitiveness of domestic producers in the international marketplace will be enhanced. This work may also lead to improved human nutrition and health in those countries or populations for whom cereal crops are staple foods.

Companies representing well in excess of 50 percent of the domestic hybrid corn seed production are obtaining licenses to use the LPA mutants and related technology to develop “low phytic acid” corn.

Question. What is your current funding and staffing by location? Does the fiscal year 1998 budget propose decreases for small grains research? Explain.

Answer. The overall fiscal year 1998 budget proposes an increase in research funding for small grains of \$685,000. The current funding and staffing by location follows:

NEW USES RESEARCH

Question. ARS carries out a major effort in research to find new uses and process for agricultural commodities. Please identify by location, the research and funding for fiscal year 1997 and 1998 in this area.

Answer. The focus of the ARS new uses research program is to enhance U.S. economies through the development of value-added food and industrial (nonfood and biofuels) products for domestic and export markets. The fiscal year 1997 and 1998

PART 1

Question. Please explain the recent accomplishments derived from this research.
Answer. Selected examples of accomplishments in developing value-added products and processes in each of the categories follow:

Valuable protein products from solid tannery waste.—The land filling of chromium-containing solid waste generated during the manufacture of chrome-tanned leather has become a world-wide problem. ARS scientists at the Eastern Regional Research Center (ERRC), Wyndmoor, Pennsylvania, have developed two processes to treat this waste as an alternative to land filling. The products isolated from these treatments are a recyclable chromium cake and protein products of varying characteristics and quality. To make these processes economically viable, end uses need be found for the protein products. At present, the ERRC researchers are examining the functional properties of the protein—adhesiveness, foamability, oil and water absorption, and emulsification capacity. Evidence of worldwide concern about the problem and the remedy includes ongoing cooperative agreements with ATO-DLO in the Netherlands for modification of the protein; with Ramon Llull University in Barcelona, Spain, for process improvements and for chrome recycling; and with University of Brno, Zlin, Czech Republic, for studying the protein properties and for development of an industrial scale treatment plant.

Animal fats, restaurant grease and vegetable-oil refining waste as biodiesel feedstocks.—ARS researchers at the Eastern Regional Research Center, Wyndmoor, Pennsylvania, are using nature's enzymes in new approaches to make biodiesel. The enzymes allow conversion of three feedstocks that are cheaper than conventional vegetable oil: animal fats, restaurant greases, and soapstocks. The high content of free fatty acids in these feedstocks obviates conventional conversion technology. The enzyme process with branched alcohols as co-feedstocks enhances the cold-temperature properties of the biodiesel. A Cooperative Research and Development Agreement among ARS, the DoE's National Renewable Energy Laboratory (NREL) and the Fats and Proteins Research Foundation promotes the development and transfer of this technology and cost engineering to optimize the economics of the new process. Since the cost of feedstock for conventional biodiesel is 75 percent of the manufacturing cost of the fuel, the importance of using cheaper feedstocks is significant.

Biodegradable polyesters produced by bacteria growing on fats and oils.—ARS researchers at the Eastern Regional Research Center (ERRC), Wyndmoor, Pennsylvania, are investigating the conversion of fats and oils into biodegradable plastics called polyhydroxyalkanoates (PHA's). Industry has produced PHA's from other agricultural feedstocks, but ERRC's use of selected bacteria on fats and oils results in polymers with unique properties—elastomers and intermediates that can be further modified chemically for even new types of plastics. The ERRC research is multidisciplinary, including molecular and microbiology, organic chemistry, and materials engineering; Collaborating with the University of Massachusetts (Lowell and Amherst).

“Amazing Gum”: A valuable food and industrial gum made from corn processing byproducts.—A novel process has been developed by ARS scientists at the Eastern Regional Research Center in Wyndmoor, Pennsylvania, to produce a valuable polysaccharide (gum) from corn fiber, an abundant but under-utilized byproduct of the corn wet-milling industry. About 1.5 pounds of Amazing Gum can be produced from the corn fiber derived from one bushel of corn, so vast quantities are potentially available. Amazing gum has properties which suggest numerous uses in foods as a soluble dietary fiber, a thickener, an emulsifier and a “home grown” replacement for imported Gum Arabic. Potential industrial uses include natural adhesives and water-based functional ingredients for coatings and paints. A U.S. patent for the corn fiber gum process has been filed and a Cooperative Research and Development Agreement with a major food and specialty chemical company is being finalized to facilitate commercialization of the new technology.

Nutritious restructured fruit snacks.—Utilization and consumption of many fruit and vegetable crops are constrained by their short harvest seasons and limited market outlets. ARS scientists at the Western Regional Research Center in Albany, California, have developed new technologies to increase utilization and consumption of fruits and vegetables. Novel extrusion and molding technologies are used to produce convenient, value-added restructured fruit and vegetable products from bulk-processed ingredients. These technologies make use of concentrated fruit and vegetable purees as starting materials. Novel, convenient and nutritious products have been developed as a means to supplement the fruit and vegetable component of a healthy diet in accordance with the USDA recommended guidelines. U.S. growers and processors would benefit from this research through increased utilization and consumption of their crops, extended processing periods for seasonal crops and improved production efficiencies.

Life-threatening allergies to latex products can be avoided using a novel latex.—The latest studies suggest that more than 20 million Americans now are affected by “latex allergy,” which is triggered by many of the proteins present in latex products, and a number of deaths from anaphylaxis have occurred. Even highly purified products, made from commercially available Hevea (natural rubber) latex, are unsafe for use by hypersensitive people. Scientists at the Western Regional Research Center in Albany, California, have found a way to produce hypoallergenic latex products from guayule, a domestic rubber-producing plant species. The new latex has successfully passed medical trials and processing scale-up, and a U.S. patent has been obtained. Prototype latex products have been manufactured and tests by FDA scientists showed that guayule latex examination gloves are impermeable to viruses. Commercialization efforts are initially aimed at the very high margin medical products market with over 300 natural rubber medical devices. A license to this technology has been granted to Yulex, Inc. of Philadelphia, Pennsylvania.

Lightweight concrete containing starch.—Lightweight, insulative concrete is used in the building industry for non-structural applications such as for roof tiles, floors and as insulation around fireplaces. Traditional methods of making lightweight concrete require either expensive air entraining equipment or a source of lightweight aggregate that may be in limited supply and obtained at a cost to the environment. Scientists at the Western Regional Research Center in Albany, California, have developed a method of making lightweight concrete using wheat starch. The wheat starch has the appearance of sand and is hydrated before being mixed into the concrete. Concrete with varying densities, strengths and insulative properties have been made using the starch method. Starch is a renewable resource that is in abundant supply and could provide a viable alternative to lightweight aggregate for making lightweight concrete. A patent has been issued for this technology and licensees are being sought.

Zero calorie substitute for fat.—It is well recognized that the average American diet is too high in fat and too low in fiber. New ARS technology should help alleviate both problems. Z-trim, invented by an ARS scientist in Peoria, Illinois, is a high-fiber, zero calorie fat and/or flour substitute.

The product is made from seed byproducts (bran, hulls, etc.) of commodity grains, such as corn or oat, and is suitable for use in many food items. For example, a lunch of Salisbury steak, mashed potatoes with gravy, broccoli with cheese sauce, Waldorf salad, and two brownies, all containing Z-trim, has a total of 600 calories removed and 3.9 grams of fiber added compared to the same lunch without Z-trim.

New starch-based biodegradable plastics.—“The costs for producing biodegradable plastics can be greatly reduced when inexpensive starch is used as an ingredient. Until now, however, the resulting starch-containing materials often had poor properties and were not useful for most commercial applications.” Scientists at the National Center for Agricultural Utilization Research (NCAUR) in Peoria, Illinois, have developed new biodegradable plastic materials based on starch and novel polyesters.

Under a CRADA with the Biotechnology Research and Development Corporation (BRDC), NCAUR and BRDC scientists have devised new materials with properties similar to commercial plastics such as polystyrene, but with starch contents much greater than previously achieved. The high starch content makes these materials more cost competitive than synthetic biodegradable materials with comparable performance characteristics. These materials offer biodegradable alternatives to synthetic plastics currently used in disposable applications such as cups, utensils, and food service trays. This technology has recently been licensed by a major U.S. company with plans to commercialize within the fiscal year.

Discovery of new enzyme for lower cost biofuels.—The research for lower cost raw materials for the production of biofuels has led to increasing interest in the enzymatic breakdown of cellulosic biomass to fermentable sugars. Scientists at the National Center for Agriculture Utilization Research, Peoria, Illinois, have discovered several unique enzymes from yeast that are free from product and substrate inhibitions and work best at high temperatures. These improved properties are the desired attributes of an enzyme suitable for commercialization and should lower the cost of producing fuel alcohol.

Seed yields in Vernonia galamensis doubled by improvement in seed retention.—Vernonia is a potential oilseed crop for the American farmer, with uses in paints and coatings industries. Seeds produced at the beginning and middle of the growing season were previously lost by harvest time. A new trait, developed by ARS scientists at Phoenix, Arizona, keeps seeds on the plant longer, resulting in more seeds at harvest. As yields are increased in this crop, it becomes a more economically-viable option for commercialization. Production of new crops results in diversification, which leads to farm stability and sustainability for agriculture.

Facile dyeing process for blends of wool and cotton.—Wool-cotton blends have been shunned by the textile industry because of difficulties in dyeing to “union” shades, where dye uptake is uniform from one fiber to the other. Agricultural Research Service researchers at the Eastern Regional Research Center, Wyndmoor, Pennsylvania, have optimized their pretreatment protocol for these blends, whereby the cotton component is made chemically similar to wool in its ability to take up dye. The protocol involves pretreatment with commercial agents called dye fixatives. The ARS process should give the public an excellent, all-natural, trans-seasonal fabric with excellent comfort and appearance qualities, and should provide a new market for domestic wool and cotton. A CRADA with the American Sheep Industry Association and Cotton, Inc. seeks to demonstrate the technology and promote its adoption by the American textile industry as a new use for both agricultural fibers.

Computerized process control for cotton gins increases monetary income to farmers and improves cotton quality.—Scientists at the Cotton Ginning Research Unit at Stoneville, Mississippi, developed and implemented a computerized and automated system to automatically measure the quality of cotton at various stages of gin processing and automatically select and route the cotton through the optimum machine sequence. One commercial gin has been fully automated and two others are partially automated. Application of the Computerized Process Control Systems (CPCS) will improve fiber quality substantially and increase farmer profits \$10 to \$20 per bale with a potential impact of \$400 million annually. The CPCS includes new automated bypass valves (patent applied for), automated calibration devices (patent applied for), automated sample collection and analyses hardware (three patents awarded), and associated software. Key components of the CPCS have been licensed to an international company for marketing in 1998.

New process for preserving fresh-cut pears shows promise.—Fresh sliced pears are subject to rapid browning, tissue breakdown, and microbial spoilage which have, heretofore, prevented the development of a fresh-cut product. By optimization of fruit ripeness for fresh-cut applications, use of novel browning inhibitor formulations, and special packaging in a modified atmosphere, scientists at the Eastern Regional Research Center, Wyndmoor, Pennsylvania, have overcome these problems with two key pear varieties, d’Anjou and Bartlett, attaining a shelf-life of 2–3 weeks at 4 °C. Work is in progress to establish the feasibility of the new process for commercial use.

Extending the shelf life of fresh and low temperature pasteurized citrus juices.—The marketing of fresh citrus juices is severely restricted due to the presence of an enzyme that clarifies the juice. Consumers perceive this as a serious quality defect. The same enzyme may also cause gelation of frozen concentrated citrus juice and flocculation in drinks containing citrus juice. Scientists at the U.S. Citrus and Subtropical Products Research Laboratory, Winter Haven, Florida, have discovered that a form of the enzyme present in citrus fruit peel causes the most rapid juice cloud destabilization. A Cooperative Research and Development Agreement has been established with a major producer of machinery used to extract juice from citrus fruit.

This collaboration between ARS scientists and private industry is designed to determine if methods of juice extraction can be developed to decrease the amount of the detrimental peel enzyme in juice, extending the shelf life, and increasing the geographic market area for fresh citrus juices.

Corn Fiber Oil as a Natural Cholesterol-Lowering Product.—ARS Scientists at the Eastern Regional Research Center, Wyndmoor, Pennsylvania, and the National Center for Agriculture Utilization Research, Peoria, Illinois, have developed a process to extract a new natural oil from corn. Unlike conventional corn oil, which is extracted from corn “germ,” corn fiber oil is extracted from corn “fiber,” which is a low-valued by-product of the industrial processes that convert corn into sweeteners, starch, and other products such as fuel-grade ethanol. Collaborative studies with scientists at the University of Massachusetts, Lowell, have confirmed that corn fiber oil significantly lowers total serum cholesterol and LDL cholesterol (“bad” cholesterol) in hamsters. The active cholesterol-lowering component may be an unusual compound called “sitostanol-ferulate” which comprises about 6 percent of the oil. The natural sitostanol-ferulate in corn fiber oil may lower serum cholesterol in the same way as a popular new synthetic Finnish Margarine-type product called “Benecol,” which sells for five to ten times the price of regular margarine. ARS has applied for a U.S. patent on this new technology and licensing negotiations with major U.S. food companies are now being conducted.

Commercialization of this new technology will result in new uses for agricultural byproducts, more revenue for processors and growers, and new healthful food products for consumers.

New Fat Replacer.—ARS scientists at the Southern Regional Research Center in New Orleans, Louisiana, have developed a process for making a new low-calorie fat replacer from rice flour. This white-colored, all natural rice-based product looks and feels like hydrogenated fat. It can be used in non-frozen, fat-free or dairy-free products like yogurt, cream cheese, sour cream, and whipped cream. A patent on this discovery is currently being sought and a Cooperative Research and Development Agreement is being negotiated with a U.S. company in order to commercialize the new technology.

Anticancer compounds derived from citrus-processing byproducts.—A collection of nearly 200 compounds derived from citrus peel and various citrus peel byproducts were submitted to the National Cancer Institute for testing for anti-HIV and anticancer characteristics. A number of these compounds have been shown in a second study to have strong anticancer characteristics against several types of cancer cell lines, especially, breast cancer cell lines. ARS scientists at the U.S. Citrus and Subtropical Products Laboratory in Winter Haven, Florida have isolated a number of additional compounds with structural similarities to these active compounds, and these additional compounds have also been submitted to a second study. Although the National Cancer Institute has completed the screening on only a small percentage of the submitted compounds, one compound, a synthetic analogue of a naturally-occurring citrus flavonoid, has been shown to have significant characteristics against a number of cancer cell lines, and has been selected for animal trials. Based on the similarities between this compound and others submitted, but not yet tested, more compounds are expected to be selected for further study by the National Cancer Institute. These findings are contributing to our knowledge of the link between improved human health and nutrition and will also lead to important new uses for citrus byproducts.

Question. How many cooperative partnerships with industry have resulted from research in this area?

Answer. Since 1995, of the 56 licenses that have been issued on ARS technologies, 21 relate directly to “value-added” products derived from agricultural commodities. This classification excludes genetic engineering technologies, pest control alternatives, diagnostic tests, etc. Of the CRADA’s issued since 1992, 37 deal specifically with non-food value-added products and another 15 deal with new food products. Another 180 CRADA partnerships deal with technologies that will enhance production, quality, and profitability of crop and animal commodities, thus increasing the quantity of economical agricultural-based raw materials for the creation of new value-added products and additional market opportunities. These partnerships have also led to the successful development of new products that have contributed to the change in U.S. exports from bulk commodities to value added products.

Question. What are the prospects for further accomplishments?

Answer. The prospects for further accomplishments are excellent. ARS has adopted a market-rational approach to the development of value-added products in which market requirements for cost, performance, and functional properties must be clearly understood and the product developed must be equal to or better than the product it is displacing. Preference is given to development of new products that displace

PART 1

800

imported rather than domestically produced ones in order to further enhance the U.S. balance of trade. ARS has developed a unique cost engineering and analysis program at the Eastern Regional Research Center, Wyndmoor, Pennsylvania, to assist ARS researchers in their product/process development goals. ARS is further committed to the concept that early involvement of industry is key to rapid development of value-added products, to successful development of new business opportunities, and to the creation of new jobs.

Question. Over the past ten years, how much money has ARS redirected into new uses research?

Answer. Since fiscal year 1988, ARS has redirected approximately \$21 million into new uses research. In addition to the redirections, ARS received an increase of \$4.3 million for new uses research in fiscal year 1994.

NURSERY CROPS RESEARCH

Question. Where does ARS conduct its nursery crops research? Please describe the program and funding for each location.

Answer. Nursery crops research is funded at 12 locations. A summary of project activities and funding for each location follows:

<i>Location</i>	<i>1997 Funding</i>
Washington, DC	\$5,273,900
Miami, FL	56,200
Montpellier, FR	89,400
Tifton, GA	76,500
Peoria, IL	92,400
Ames, IA	128,000
Beltsville, MD	462,200
Wooster, OH	402,700
Corvallis, OR	654,300
Logan, UT	20,700
Yakima, WA	14,900
Headquarters	210,100
 Total	 7,481,300

Washington, DC.—(1) Evaluate new floral crops and determine the effects of cultural practices on growth and flowering; (2) develop new methods to improve floral and nursery crops with enhanced flower color and disease resistance utilizing biotechnology; (3) select, evaluate, and develop cultivars of new trees and shrubs with improved growth habits and stress tolerance; (4) develop biologically-based alternatives to methyl bromide; (5) develop new approaches for disease control utilizing techniques of molecular biology in characterizing plant viruses; (6) identify biologically active natural products for insect control; (7) conduct efficacy and phytotoxicity tests to develop data in support of expansion of labels for minor use pesticides; (8) collect, identify and establish woody and herbaceous plants for public display; and (9) establish, develop, operate, and maintain an educational center for gardens and collections.

Miami, FL.—Introduce, preserve, distribute and evaluate tropical and subtropical fruit and ornamental plants.

Montpellier, France.—Discover, collect, and determine the potential for biocontrol agents in controlling sweetpotato whitefly and export those with promise to the quarantine facility in the U.S. for distribution to the research community.

Tifton, GA.—Evaluate the effectiveness and phytotoxicity of nematocides, fungicides, herbicides, insecticides, and acaricides for control of nematodes, diseases, weeds, insects and mites in minor use pesticide evaluation on ornamental and food crops.

Peoria, IL.—Develop low-cost culture techniques for producing fungal and bacterial biocontrol agents and enhance viability of the microorganisms in storage.

Ames, IA.—Obtain performance data and/or residue samples in support of minor-use pesticides registration for pesticide use on ornamental specialty and food crops.

Beltsville, MD.—(1) Integrate practices to improve soil/crop health by analyzing interactions of biological and physical properties of organic amendments, and combine the use of biocontrol agents and organic amendments to increase crop tolerance to water, nutrient and pathogen stress; (2) identify microorganisms with potential for control of soilborne pathogens and transfer technology to industry; (3) conduct research on biocontrol of gypsy moth and turf insects; (4) develop and evaluate new methods for detection of phytoplasmas; (5) develop and coordinate uniform evaluation trials of turfgrass varieties.

PART 1

801

Wooster, OH.—Reduce damage and crop losses caused by selected insect pests of horticultural, turf and ornamental crops by developing alternative management strategies for pest control.

Corvallis, OR.—(1) Investigate factors affecting seed quality and optimum production of forage and turf grass; (2) determine the effects of biocides on mycorrhizal fungi and produce new strains of these fungi resistant to biocides for possible use as an alternative to methyl bromide soil fumigation; (3) characterize changes in gene expression and levels of growth hormone in relation to flower induction; (4) investigate the distribution of products of photosyntheses in selected horticultural plants with and without mycorrhizal fungi associated with the roots; (5) develop technology to identify beneficial organisms to apply to roots to reduce stress and reduce disease severity; and (6) evaluate various fungicides, insecticides and herbicides for efficacy and phytotoxicity in support of floral and nursery crops label expansion through the IR-4 minor-use pesticide regional project.

Logan, UT.—Evaluate and define existing turfgrass germplasms and characterize the genetic diversity to enhance germplasms with desirable traits for use by plant breeders.

Yakima, WA.—Provide efficacy, phytotoxicity and yield data and residue samples for analyses to support registration or reregistration of minor use pesticides for control of insect pests.

Headquarters.—Support minor use pesticide registration.

Question. What major accomplishments have come from your research in this area?

Answer.

Washington, DC.—Introduced more than 100 new trees and shrubs during the past 70 years since the National Arboretum was established. The Arboretum has developed a wide range of plants with superior landscape qualities that are more disease and cold resistant and tolerant to urban stresses. For example, the Bradford pear introduced from the Arboretum is among the 10 most widely planted ornamental trees in the U.S. Other introductions include improved horticultural forms of crape myrtle, firethorn, viburnum, elm, magnolia, and holly. In addition, new flower introductions include lisianthus, kangaroo paw, ornithogalum and clematis for pot plant production. Many of these introductions are now produced and utilized nationwide and some introductions have been distributed abroad.

Miami, FL.—Collections of avocado, mango, carambola, passionfruit and other tropical and subtropical fruits are maintained for use in ARS research programs in plant improvement through breeding and improvement of post-harvest quality for domestic use as well as export.

Peoria, IL.—Molecular techniques have been applied in developing improved methods of classification of fungi and bacteria that will enhance the utilization of these organisms as biocontrol agents.

Montpellier, France.—Approximately 25 natural enemies of the sweetpotato whitefly have been brought to the U.S. and five have been released in Texas, California and Florida for control of the insect.

Tifton, GA and Ames, IA.—Support of minor-use pesticide registrations is a critical need of industry and is an integral part of pest and disease control procedures utilized by growers and processors to reduce crop loss and maintain high quality products.

POULTRY DISEASE (PEMS) RESEARCH

Question. An increase of \$100,000 above the fiscal year 1996 level was provided for fiscal year 1997 for ARS poultry enteritis and mortality syndrome research. Where is this research being carried out and what have been the results of your research on this disease to date?

Answer. The fiscal year 1997 increase was allocated to the ARS Southeast Poultry Research Laboratory at Athens, Georgia where poultry enteritis and mortality syndrome research is carried out. Collaboration with the College of Veterinary Medicine at North Carolina State University has been established. Experiments to determine what agents are present in the infected samples, but absent from controls, are in progress.

AIR QUALITY (PM-10) RESEARCH

Question. Where does ARS perform Air Quality (PM-10) research. Please describe the program, funding, and staffing by location.

Answer. At Pullman, Washington, 1.3 scientist years (SY's) and \$480,500 are allocated to PM-10 and PM-2.5 research. One component of the research is directed to understanding the physics of particulate emissions from agricultural fields during

PART 1

802

field operations and wind storms. Another component is determining where particulates caught in samplers have originated. The third component is directed to developing methods for reducing particulate emissions.

At Manhattan, Kansas, 1.0 SY and \$167,700 are allocated to research on PM-10 and PM-2.5 particulate physics and on developing a PM-10 and PM-2.5 module for inclusion in a wind erosion model (Wind Erosion Prediction System—WEPS). The latter will be used to select, from among alternative land treatments, the most appropriate treatments for controlling wind erosion and particulate emissions.

At Lubbock, TX, 1.7 SY and \$319,500 are allocated to field measurement and documentation of particulate fractions during wind erosion events.

Question. What major accomplishments have come from your research in this area?

Answer. a) Considerable progress has been made in identifying the physics of PM-10 emissions during weathering, tillage, traffic, and abrasion by wind-blown soil clods. b) Progress has also been made in establishing typical emission rates under field conditions for various tillage practices. c) The PM-10 module for inclusion in the wind erosion model has been coded, but still needs validation; and d) A scientist in Pullman, WA, has developed a biologically-based method for assaying the sources of particulates (i.e. where do particles come from—agricultural fields, roads, parking lots).

Question. Is the ARS research effort in this area connected at all to the San Joaquin Valley PM-10 study funded through the CSREES or is that separate and apart from the ARS program?

Answer. The ARS program and the CSREES-administered PM-10 program in the San Joaquin Valley of California are funded separately. However, there is informal coordination, communication, and cooperation between the programs. California personnel participate in the review and planning meetings of the Washington study (which is joint study between ARS, CSREES-administered Washington State University projects, EPA and State of Washington agencies), and ARS and other co-operators in the State of Washington participate in similar California meetings.

NEW CROPS RESEARCH

Question. Provide the Committee with a list of new crops ARS is researching.

Answer. ARS currently conducts research on guayule, vernonia, lesquerella, cuphea, meadowfoam, crambe, jojoba, kenaf, and *Hevea*.

Question. What progress has been made in your research?

Answer. Guayule—*Parthenium argentatum* is a desert shrub that has been grown in Arizona, California, and Texas. Guayule produces natural rubber that has potential markets in non-allergenic products such as latex gloves and condoms, and as a resin for paints and coatings. We anticipate commercial production of hypoallergenic medical products from guayule within the next three to five years building on an ARS patent for latex extraction based on work at Albany, CA. The patent has been licensed by Yulex, Inc. ARS has proved that guayule latex can be manufactured into high-quality latex products and that guayule latex films provide an effective barrier to virus transmission. Through work at Phoenix, AZ, ARS has released six guayule lines selected for improved rubber concentration and yield, and that regenerate following harvest.

Vernonia—*Vernonia galamensis* is native to Africa. Vernonia oil (epoxy oil) has the potential to replace solvents in paints and become part of the finished coating, which reduces air pollution from solvents. The domestication and commercialization of vernonia depends on development of high yielding cultivars and development of reliable agronomic practices. We have developed vernonia plants that grow and flower during the summer in the United States. Further, the harvestable yield of vernonia has been nearly doubled by developing lines with modified bracts in the seed head so that seeds remain on the plant longer.

Lesquerella—*Lesquerella fendleri* is a winter annual that can be grown in the southern United States for its oil, gum, and meal. There is a large potential market for these products, so we expect that several thousand acres could be supported. Barriers to commercialization are the current incomplete development of high oil content, self-pollinating seed, reliable cultural practices, and seed harvesting and cleaning equipment. Basic research is being conducted with the oil to make new molecules with potential as biodegradable detergents, lubricants, and personal care ingredients. We have released three lesquerella lines with increased oil concentration and improved oil composition and developed another line with yellow seeds instead of the normal brown seeds, which reduces oil pigmentation contamination.

Cuphea—*Cuphea viscosissima* is native to the temperate regions of the United States and contains medium chain oils. Cuphea oil has the potential to replace oils

PART 1

803

that are now imported such as coconut and palm oils from tropical regions, (about one billion pounds per year) for use in detergents and other industrial products. We are investigating oil modifications that can lead to new products for niche markets.

Meadowfoam—*Limnanthes alba* is commercially grown in Oregon with 8,100 acres planted for 1997 harvest, double that of a year ago. The economic impact is estimated to the \$5 million. Meadowfoam oil, has been chemically modified to develop potentially new products for the personal care, lubricants, and detergent industries, while the seed meal may have application as a natural preemerge herbicide and nematocide.

Crambe—*Crambe Abyssinia* is grown commercially in North Dakota, with 45,000 acres planted for 1997 harvest. The economic value is estimated to be over \$9 million. We are conducting research to find new products from the oil.

Jojoba—*Simmondsia chinensis* is a perennial shrub that is commercially grown in the desert Southwest for its unique oil. The oil has markets in lubricants and personal care items. More than 2 million pounds of seed were harvested in 1996 with an oil value of \$7.5 million. We have research underway to develop new products from jojoba.

Kenaf—*Hibiscus cannabinus* is an annual fiber crop grown in the southern United States on 3,000–4,000 acres for a number of specialty fiber applications. Fiber separation facilities are in Texas, Mississippi, and Louisiana. Kenaf may have potential as a forage crop as well as a fiber crop. We have conducted research to develop improved varieties and cultural practices and to find new products.

Hevea—*Hevea braziliensis* is the natural rubber tree, which is the source of the United State's imported natural rubber. We have conducted research to compare the biochemical pathway and enzymes responsible for production of rubber in guayule with those in *Hevea* to better understand how to further modify the rubber produced in guayule.

Question. What benefits have been derived by the marketplace from this research?

Answer. The most striking potential benefit can be shown for rubber production from guayule. The United States retail market for latex gloves was \$3.1 billion in 1993. All natural rubber currently in commercial use is obtained from the Brazilian rubber tree (*Hevea*), a species restricted to the tropics for commercial production. Consequently, the United States is wholly dependent on nondomestic sources for this vital raw material. Furthermore, the recent widespread occurrence of life-threatening "latex allergy" to *Hevea* rubber makes development of an alternative, safe source of natural rubber imperative.

Guayule commercialization has enormous potential. Allergic reactions to *Hevea* rubber have become severe. The first United States' cases appeared in 1988, growing to at least 500,000 by 1992. Estimates suggest that more than 20 million Americans were affected by 1994. This life-threatening allergy has created a major new, high-value market for hypoallergenic natural rubber products throughout the world. A hypersensitive individual must take care to avoid contact with current natural rubber products, which number 40,000, including more than 300 medical devices. Severe reactions have occasionally caused death. The occurrence of "rubber allergy" is not only widespread but may be spreading rapidly, which apparently is due to increased use of latex gloves and condoms in response to the AIDS epidemic. Proteins present in the latex cause the allergy from *Hevea* and technologies have not yet been developed to remove the harmful protein. Latex from guayule does not contain these proteins and does not produce these allergic reactions.

Our research has shown that guayule can be grown profitably for hypoallergenic latex production without a government subsidy. Thus, guayule production would enhance rural development in the southwestern United States. Rural development could be enhanced beyond the benefits to farmers through the concurrent development of local processing facilities and manufacturing plants.

Development of new uses and improved varieties from the other new crops could further diversify American agriculture and aid in rural development. A cooperating company has licensed an ARS patent to make "estolids," a new biodegradable material and is now starting to manufacture new personal care products from meadowfoam based on this technology. Finally, at Peoria, IL, ARS has analyzed 15,000 seeds of new crops for useful oil and protein concentrations and placed this information on the Internet. This information is guiding the development of new crops worldwide.

Question. Please provide the Committee with actual obligations incurred for each line of research last year. What is the current and budgeted funding level for each?

Answer. The obligations incurred and the current and budgeted funding levels for each of these new crops are as follows:

PART 1

804

Crops	Fiscal year—		
	1996	1997	1998
Guayule	\$621,617	\$567,700	\$519,600
Vernonia	160,517	154,200	154,200
Lesquerella	589,801	584,900	584,900
Cuphea	294,689	280,400	280,400
Meadowfoam	101,908	101,600	101,600
Crambe	77,922	77,800	77,800
Jojoba	152,862	152,300	152,300
Kenaf	1,328,338	1,391,700	400,500
Hevea	278,842

KENAF

Question. What is your justification for terminating the Kenaf program at Weslaco, Texas and Mississippi State?

Answer. Kenaf has long been proposed as a source of fiber for production of newsprint. Nonetheless, it has not gained a foothold in the paper making industry or newsprint market. At current low newsprint prices kenaf is unlikely to be produced at an economical cost. Major newsprint producers are committed to wood feedstock, and recycling is increasing in importance, so the future of kenaf for this market is speculative.

The project at Mississippi State, funded through an extramural agreement with ARS, focuses largely on how to produce and harvest kenaf for fiber production. With the speculative market ARS can not justify investment in production research for kenaf fiber. In Weslaco, TX, ARS fulfilled its mission by developing nematode-resistant varieties. Entrepreneurs there are satisfied with the varieties, and are now concentrating on establishing a vertically-integrated industry to reduce costs and improve efficiency.

Question. Where else does ARS perform research on Kenaf?

Answer. In addition to Weslaco and Mississippi State, kenaf research is performed at College Station, TX; Lane, OK; New Orleans, LA; and Athens, GA.

Question. Provide funding and staff years for fiscal years 1996–1998.

Answer. Funding and staff years for kenaf research are as follows: fiscal year 1996, \$1,651,400, 3.1 SY; fiscal year 1997, \$1,391,700, 3.1 SY; and, proposed for fiscal year 1998, \$400,500, 1.8 SY.

FUNDAMENTAL RESEARCH

Question. How much money does ARS commit for basic research?

Answer. ARS commits \$363,985,000 for basic research, which is approximately one half of the agency's appropriated research funds.

Question. How much of this research is classified as biotechnology research?

Answer. ARS is devoting \$77,439,200 in fiscal year 1997 on biotechnology research as a component of its basic research effort. This amounts to 10.8 percent of the total ARS appropriation.

Question. Please identify current funding for plant genome and animal genome research.

Answer. The current funding is \$3,708,700 for plant genome research and \$7,196,500 for animal genome research.

Question. What portion of ARS' major research activities of Plant Sciences, Animal Sciences, etc., is basic, applied and developmental? Has this changed over the past 10 years?

Answer. The portion of ARS' major research activities of Plant Sciences, Animal Sciences, etc., that are devoted to basic, applied or developmental research follows:

Research activity	Basic	Applied	Developmental
Soil, Water and Air Science	\$43,092,000	\$32,543,000	\$7,707,000
Plant Sciences	123,713,000	93,427,000	22,127,000
Animal Sciences	58,504,000	44,182,000	10,465,000
Commodity Conversion and Delivery	72,638,000	54,856,000	12,992,000
Human Nutrition Research	32,276,000	24,375,000	5,772,000
Integration of Ag Systems	15,343,000	11,587,000	2,745,000

PART 1

805

Research activity	Basic	Applied	Developmental
Ag Information and Library Services	18,419,000
Total	363,985,000	260,970,000	61,808,000

The research activities and the distribution by basic, applied and developmental have not varied over the past 10 years.

PLANT GENE EXPRESSION CENTER

Question. What programs are being carried out at the Plant Gene Expression Center? Reflect funding and staff years for fiscal years 1996–98.

Answer. The total funding and scientists for the PGEC in fiscal year 1996 was \$3,145,700 and 5 SY's, fiscal year 1997 \$3,091,300 and 5 SY's, with \$3,091,300 and 5 SY's proposed for fiscal year 1998.

The Plant Gene Expression Center (PGEC) conducts both long-term and short-term research. The long-term fundamental research fills gaps in our scientific knowledge of plant genetics, genetic mechanisms, and genetic modification. The short-term research is focused on solving specific problems by application of basic genetic knowledge to plants. Short descriptions of specific PGEC projects and their accomplishments are provided for the record.

Regulatory genes that alter growth patterns.—Scientists at PGEC are identifying and analyzing regulatory genes that alter the growth patterns in corn. Because the arrangement of genes on the chromosomes in various grass species is so similar, this research on corn might be applicable to other cereals. A gene has been isolated that regulates the number of tillers in a corn plant, a trait that might be useful for rice or forage grass breeding. Through a CRADA with Pioneer Hi-Bred International, a gene that controls the number of individual flowers in a corn inflorescence was characterized. Manipulation of the preceding gene in cereals has the potential to increase yield.

Mutants in pollen-specific receptor-like kinase genes from corn.—Researchers at PGEC are studying how the pollen grain interacts with female tissue during pollination and fertilization; receptor-like kinases are thought to be involved with this interaction and other interactions, such as plants with pathogens. Working with scientists at Pioneer Hi-Bred through a CRADA, PGEC scientists have isolated and characterized pollen-specific kinase genes from tomato and from corn. If these kinases play critical roles in determining pollen-female interactions, plant breeders may try to manipulate them as a new means of controlling pollination and fertilization.

The NSF-DOE-USDA Arabidopsis Genome Project.—The PGEC initiated a large-scale genome sequencing effort for the model plant *Arabidopsis* in conjunction with Stanford University and the University of Pennsylvania. The Genome Sequence Lab of the PGEC has produced 1,000 kilobases of gene sequence data since its recent inception. This project constitutes an international effort for identifying for the first time the genes that are responsible for the entirety of plant form and function.

Improving gene transfer in cereal crops.—The gene transfer process produces unpredictable DNA integration and expression patterns in plants. PGEC scientists are applying novel site-specific recombination technology to wheat transformation to allow for precise DNA integration.

Degrading the compound gossypol.—Scientists at the PGEC have isolated a bacterium that can break down gossypol, a toxic compound in cotton. Current research is underway to identify the genes(s) responsible for gossypol breakdown. Cottonseed free of gossypol could be used for food and feed.

Transgenic plants.—Scientists from the PGEC have developed transgenic plants with a suppressed shade-avoidance response that will yield more grain under crowded field conditions than will non-transgenic plants. Through research such as this on the fundamental biology of the phytochrome (light-detection) system in plants, the productivity of crop plants can be increased without increased application of fertilizers or changes in cultivation practices.

Control of plant tolerance to heavy metals.—Scientists at PGEC are characterizing several genes that affect metal toxicity in plants. Plant genes that confer tolerance to toxic metals may serve as tools for regulating and altering the rate and amount of toxic metal accumulation in plants. The goal of this research is to reduce the accumulation of toxic metals in food plants, and to enhance the rate of toxic metal accumulation in selected other plants so that they can be used for bioextraction of toxic metals from contaminated soils.

PART 1

806

Genic control of cell division in pollen.—Flower development and pollination are critically important to agriculture, because the world's major food crops are the products of seeds, which are the products of flowering. Many aspects of gene regulation during development of pollen grains are poorly understood and therefore genetic manipulation of pollen is difficult. Scientists at the PGEC have characterized genes that control development of a functional pollen grain through a tissue culture maturation system that assesses the relative importance of different types of gene regulation to pollen development. Manipulation of these genes will enable the development of novel pollen ("male-sterility") systems to improve germplasm and to facilitate hybrid seed production.

Control of plant cell growth.—As in animals, plants have hormones that regulate virtually all aspects of growth and development. Ethylene, a plant hormone, triggers ripening and decay of many fruits. Scientists at the PGEC have blocked ethylene synthesis in ripening tomatoes using a DNA-based technique termed "antisense technology." The genetically engineered tomatoes have excellent flavor compared to normal tomatoes, because they can ripen on the plant before picking without spoilage. This discovery has been licensed to the private sector and is being commercialized. Now the scientists are putting their genetic tools to work studying other important metabolic processes governed by auxin. The long-term goal of the investigation is to enhance the value of agronomic products and to enhance crop productivity.

New approaches for isolating resistance genes to potato late blight.—Most plant diseases kill some plants but leave others untouched. Naturally-occurring genes for disease resistance offer huge potential for protecting crops from pathogens to which they are susceptible. The goal of this project is to transfer highly effective disease resistance genes into crops that suffer disease problems. Scientists at the PGEC previously isolated the tobacco mosaic virus resistance gene N from tobacco. The genetic material of tobacco, tomato, and potato are highly similar in content and organization, and homologues to the N gene have been located in a region of the potato genome bearing genes that confer resistance to the fungus that causes potato late blight and to the virus that causes a potato viral disease. This program is currently trying to isolate and determine the sequence of the genetic material near the resistance gene in potato. If successful, this research will have developed an effective approach for the isolation of numerous disease resistance genes of most crops, as well as providing a genetic means of combating diseases that threaten agriculturally-important crops.

PEAS AND LENTILS RESEARCH

Question. Please describe your research effort in peas and lentils research.

Answer. ARS conducts research on genetic improvement of peas and lentils with these efforts concentrated at Pullman and Prosser, Washington. Programs at other locations focus on problems of production and post-harvest issues.

Question. By laboratory, what funds were obligated in fiscal year 1996; what is your current estimate?

Answer. The funding for peas and lentils for fiscal year 1996 and 1997 is as follows:

Location	Fiscal year—	
	1996 obligations	1997 funds
Albany, CA	\$153,046	\$143,500
Beltsville, MD		64,000
Pendleton, OR	14,874	87,600
Prosser, WA	199,224	220,000
Pullman, WA	534,512	478,200
Total	901,656	993,300

Question. How many scientists are involved in Federal/State peas and lentils research?

Answer. The ARS staff for peas and lentils research is 3.3 scientist years.

Question. Does ARS execute cooperative agreements for this research?

Answer. When appropriate, ARS executes cooperative agreements to accomplish some of the goals of this research.

Question. Explain with whom and how much.

PART 1

807

Answer. In 1995, ARS executed a specific cooperative agreement with Ireland on the *Mycosphaerella* blight fungus of peas, and funded it with \$4,500. The purpose was to evaluate resistance of U.S. Plant Introduction accessions of peas where the disease is severe. In 1995, ARS executed a specific cooperative agreement with Washington State University in Mount Vernon, Washington, and funded it with \$12,745 in fiscal year 1995 and \$3,225 in fiscal year 1996. The purpose was to evaluate resistance to the pea cyst nematode in field conditions where the nematode actually occurs.

GRAPE RESEARCH

Question. Please describe your grape research program including your efforts in disease research areas of grape phylloxera and grape virology.

Answer. The ARS grape research program involves efforts to enhance grape germplasm including development of methods to control pests and diseases. Activities include maintenance of a National Clonal Repository for grape germplasm, acquisition, evaluation and distribution of grape germplasm, development of quarantine and postharvest strategies to control arthropod pests, genetic improvement of grape scions and rootstocks, development of alternatives to soil fumigation with methyl bromide, and development of improved cultural practices to improve quality, production efficiency, and pest control.

Grape phylloxera research is conducted on the cause of the death of newly planted phylloxera-resistant rootstocks in young replanted vineyards. This work is focused on the role of grapevine viruses and water mold fungi. Grape rootstocks with resistance to phylloxera and other soilborne pests are being developed by conventional breeding and evaluated. Using biotechnology, new genes providing resistance to soilborne pests are also being introduced into grapes.

Grape virology research involves identifying the causal agents, describing disease spread, and devising control methods for viruses and graft-transmissible pathogens affecting grapevines. This research effort also includes developing specific assays for the rapid detection and identification of the pathogens. Sensitivities of various commercial grape rootstocks to viruses and graft-transmitted pathogens are being investigated.

Question. Where is this research implemented?

Answer. This research is implemented at Geneva, New York; Fresno, and Davis, California; Poplarville, Mississippi; Prosser, Washington and Kearneysville, West Virginia.

Question. Provide actual obligations and staffing for 1996 actual.

Answer. Actual obligations and staffing for fiscal year 1996 for all grape research was \$2,486,750 supporting 7.5 SY's. This included research on grape phylloxera at \$255,777 with 0.6 SY and grape virology at \$222,522 with 0.6 SY.

Question. Provide funding and staffing for 1997 current and fiscal year 1998 estimated for research on grapes.

Answer. Funding in fiscal year 1997 and projected for fiscal year 1998 is \$2,420,600 supporting 7.0 scientists.

HOPS RESEARCH

Question. Please describe your research on Hops.

Answer. Hops research in ARS includes breeding and genetics in the development of new varieties with improved flavor characteristics. In addition, breeding for pest and disease resistance is an important component in the program. ARS also maintains a collection of foreign and domestic hop varieties and breeding germplasm used in the research program.

Question. Whom does ARS cooperate with in this program?

Answer. ARS cooperates with scientists at Washington State University at Prosser and with the University of Idaho in Moscow. Oregon, Washington, and Idaho are the three hop producing states.

Question. Please provide your actual obligations and staffing for 1996.

Answer. Actual obligations in fiscal year 1996 for Hops research was \$374,114. The project was supported by 1.1 scientist years.

Question. Provide funding and staffing for 1997 current and fiscal year 1998 estimated for Hops research.

Answer. ARS Hops research is conducted in Corvallis, Oregon. Funding for fiscal year 1997 is \$388,200 with 1.1 scientist years of support. The same funding and scientist year allocation is projected for fiscal year 1998.

PART 1

808

COOPERATIVE RESEARCH

Question. Describe the programs jointly carried out between ARS and Mississippi State University and the funding involved for fiscal years 1997 and 1998.

Answer. The programs in the form of specific cooperative agreements jointly carried out between the designated ARS locations and Mississippi State University follow. Except where noted, funding for fiscal year 1997 and estimated funding for fiscal year 1998 are the same.

College Station, Texas

- Catfish food safety—\$324,700 (est)
- Classification and database development of sorghum accessions screened for acid soil tolerance—\$2,800 (est)

Mississippi State (Starkville), Mississippi

- Development of the GOSSYM-COMAX systems—\$95,000 (est)
- Insertion of competitor receptors from F strain *Mycoplasma gallisepticum* into *M. gallinarum*—\$55,800 (est)
- Economic returns on inputs for environmental control of poultry houses—\$25,500 (est)

Stoneville, Mississippi

- Research on kenaf in Mississippi—FY 1997: \$418,000 (est); fiscal year 1998: \$0.
- Interaction of herbicides with soil humic materials—\$15,000 (est)

ARS Headquarters

- Impact of Management Systems Evaluation Area on fisheries characteristics and ecology of MS Delta watersheds and oxbow lakes (2)—\$120,900 (est)
- Aflatoxin development in modules during field storage in the Midsouth—\$22,900 (est).

Question. What accomplishments have been generated from these research initiatives?

Answer. Catfish food safety: Treatment of catfish fillets with two percent malic or tartaric acids (naturally-occurring chemicals) extended microbial shelf-life by 6 days, maintained acceptable flavor, and reduced the human pathogen, *Listeria monocytogenes*. A Master-pack system was developed and proven to increase shelf-life of catfish fillets, even after placement above freezing conditions. An application to FDA for approval in catfish and other aquaculture species is pending.

Classification and database development of sorghum accessions screened for acid soil tolerance: 5400 Ethiopian sorghum lines have been screened for acid tolerance in soils in Columbia, South Carolina. Data will be entered in the GRIN database.

Development of the GOSSYM-COMAX systems: Cotton growth has been correlated with tissue potassium content and potassium deficiency in soils from areas of poor cotton productivity. The information is near the final analysis stage and will be disseminated to aid producers, consultants and state extension personnel in providing updated extension bulletins describing potassium deficiency symptoms. This information will be incorporated into the GOSSYM-COMAX decision support model for cotton production.

Insertion of competitor receptors from F strain *Mycoplasma gallisepticum* into *M. gallinarum*: DNA has been prepared from the F strain *Mycoplasma gallisepticum* for use in the construction of DNA libraries. Cytakesin mgcl has been cloned for transformation into the genome of *Mycoplasma gallinarum*.

Economic returns on inputs for environmental control of poultry houses: The effect of environmental temperature on growth and feed conversion in poultry has been determined. This information will be used to ascertain the economic return from changing environmental conditions inside poultry houses.

Research on kenaf in Mississippi: Early breeding and selection studies on kenaf indicate that yield improvements for kenaf in the Midsouth are possible.

Impact of MSEA on fisheries characteristics and ecology of MS Delta watersheds and oxbow lakes: In upland soils with erodible soils and flat slopes of two to six percent, no-till management was highly effective in controlling soil erosion. Cover crops enhanced the effectiveness of no-till production. Yields and profitability of crops with no-till management were equal to or greater than those from conventionally-tilled crops. The project has established five riparian zone sampling sites to evaluate the movement and degradation of herbicides in oxbow lake watersheds.

Aflatoxin development in modules during field storage in the Midsouth: Two modules have been constructed near Corpus Christi, Texas, and two in Yuma, Arizona, where aflatoxin contamination of cottonseed is high. Additionally, two modules have been constructed at Mississippi State, Mississippi. The modules are being used to

study aflatoxin development during field storage of cotton and wheat. The highest concentrations of aflatoxin production to date occurred in 1996 Texas modules and seem to be related to temperature within the modules.

Question. Describe the programs jointly carried out between ARS and University of Mississippi and the funding involved for fiscal years 1997 and 1998.

Answer. The programs in the form of specific cooperative agreements jointly carried out between the designated ARS locations and the University of Mississippi follow. Except as noted, funding for fiscal year 1997 and estimated funding for fiscal year 1998 are the same.

Oxford, Mississippi

- Acoustic detection of insects in field crops—\$176,500 (est)
- Acoustic principles and techniques in soil & sediment research—\$430,100 (est)
- Numerical modeling of soil erosion & transport processes to support the DEC project—\$847,000 (est)
- Transport of sediment by wave power in shallow flow—\$30,000 (est)
- Development of natural products from plants and microbes for replacement of synthetic pesticides—\$165,400 (est).

Headquarters funding

- Role of tension cracks in surface runoff—\$44,700 (est)
- Impact of agricultural MSEA on water quality and ecology of MS Delta watersheds & oxbow lakes—\$40,000 (est)

Beltsville, Maryland

- Remote sensing & associated technology transfer to production agriculture—Fiscal year 1997: \$70,000 (est); fiscal year 1998: \$0

Question. What accomplishments have been generated from these research initiatives?

Answer. Acoustic detection of insects in field crops: Acoustical instruments have been developed for the detection of insect sounds in the soil, on plants, and in the laboratory environment. The instruments are being used in experiments while they are being further developed and refined. Previously unknown sounds made by imported fire ants have been detected. This technology has great potential for sensitive detection of small numbers of insect pests.

Acoustic principles and techniques in soil and sediment research: The research has established: (1) feasibility of rapid, inexpensive, and non-invasive characterization of soil properties; (2) potential of acoustical techniques in describing the microtopography of agricultural lands; and, (3) usefulness of acoustical techniques in monitoring stream bed form.

Numerical modeling of soil erosion & transport processes to support the Demonstration Erosion Control project: Improvements have been made in the modeling of soil erosion and sediment transport for watersheds and channel systems. A one-dimensional model for routing flow and sediment through natural channels with in-stream structures was upgraded and verified. A two-dimensional model has also been developed for predicting the propagation of unsteady flows along a channel with in-stream structures.

Results demonstrated that when stream corridors needed restoration to be stabilized, degraded channels, water quality, aquatic habitat, and ecosystem health can be improved at little or no extra cost.

Impact of agricultural MSEA on water quality and ecology of MS Delta watersheds and oxbow lakes: Research on CRP lands has established the effectiveness of grass strips in trapping sediments.

Remote sensing and associated technology transfer to production agriculture: Physical and chemical properties of soils were combined with remotely sensed and global positioning system (GPS) data for two fields. Geostatistics was used to establish optimum designs for experiments.

Question. ARS maintains ARS research locations in Mississippi at Stoneville, Starkville, Oxford, and Poplarville, Mississippi. Describe the programs carried out at these locations.

Answer. The programs and their locations are described below: Stoneville, Mississippi—The research programs at Stoneville, Mississippi, are broad in scope and content. They include: the development of soybean genotypes and management systems that are specific to the early season and stress environments of the southern production area, including host resistant germplasm to manage soybean cyst nematodes; improved surveillance and pest control strategies for areawide management of cotton insect pests, and biological and genetic strategies for controlling the insect pests of soybeans, cotton, and pecans; the biochemical genetics of fiber quality, including identification of genetic-physiological parameters that enhance fiber quality,

PART 1

810

and the application of this knowledge to the improvement of cotton varieties; the development and evaluation of sustainable weed management strategies for cotton, soybeans and other crops, including assessment of the ecological and environmental benefits of reduced herbicide use, and the replacement of herbicides and methyl bromide by microbiological agents; the development and implementation of new technologies in cotton ginning that will maintain or enhance fiber quality while saving energy and other costs and improve efficiency; the breeding, genetics, and endocrinology of catfish; and the development of innovative technologies for more efficient pesticide applications in field crops.

Mississippi State (Starkville), Mississippi.—The research programs at Starkville, Mississippi include: the development of integrated pest management strategies with emphasis on boll weevil and other cotton insects, as well as augmentation biocontrol and insect mass-rearing; the development of insect, disease and nematode resistant varieties of corn for the south; the modification and management of forage legume traits that enhance beef and dairy cattle production; the etiology and control of clover diseases caused by fungi, nematodes, and viruses; germplasm conversion and evaluation, and genetic enhancement in cotton, including host plant resistance to insects, diseases, and nematodes; the development of decision support systems for cotton production and cotton pest management; and nutritional and environmental management strategies, including the diagnosis and control of mycoplasmosis, to improve the quality and production efficiency of poultry.

Oxford, Mississippi.—The program at the National Sedimentation Laboratory emphasizes interdisciplinary research on the processes, control, measures, prediction, and evaluation procedures associated with soil erosion by water; transport and deposition of sediment; and movement of agricultural chemicals in watersheds, streams, and lakes. At the National Center for the Development of Natural Products, the ARS Natural Products Research Unit research goals include: discovery of natural products that can safely be used to manage agricultural pests; cultural and genetic alteration of crops and cover crops for self-generation of natural chemicals to manage pests; and development of alternative crops producing high-value natural products such as pharmaceuticals, pesticides, and flavorings.

Poplarville, Mississippi.—Research at Poplarville includes: breeding and cultural evaluation of new and improved small fruits for the Gulf Coast region including cultivars of strawberry, blackberry, highbush blueberries and muscadine grapes; development of new and improved small fruit management practices to increase yields, minimize production losses, improve fruit quality and conserve natural resources; determination of factors that regulate flowering, fruiting, dormancy, yield, cold hardiness, and tolerance to other environmental stresses; determination of optimum planting systems, irrigation and cultural systems adapted to the Gulf States region; and determination of the chemical and physical properties, nutritive value and quality of muscadine pomace and develop methods for utilization of products of pomace by the food industry.

Question. What programs are coordinated with Mississippi State University, the University of Mississippi, and the University of Southern Mississippi?

Answer. Programs that are coordinated with Mississippi State University include GOSSYM-COMAX systems research, boll weevil research, genetic engineering of *Mycoplasma gallinarum*, research on environmental control of poultry houses, kenaf research, weed research, and the Mississippi Delta MSEA project. Programs that are coordinated with the University of Mississippi include acoustic detection of insects in field crops, the Demonstration Erosion Control (DEC) project, the Mississippi Delta MSEA project, and natural products research. Programs coordinated with the University of Southern Mississippi include the Lower Delta Human Nutrition Initiative.

COTTON RESEARCH

Question. Describe by location the pre- and post-harvest cotton research initiatives in ARS.

Answer. Cotton research initiatives (projects) in ARS, by location, are as follows:

Auburn, AL.—Managing wheeled traffic to avoid soil compaction in cotton production systems.

Phoenix, AZ.—Management of the sweetpotato whitefly, including the basic genetics and ecology of the insect; development of economic thresholds for control action; on-farm integrated pest management; reduction of lint stickiness in infested cotton; and host plant resistance to whiteflies. Also, integrated management for suppression of the pink bollworm, crop management for efficient production, and breeding and genetics of extra-long staple (American Pima) cotton.

PART 1

811

Albany, CA.—Cost-effective means of rearing biological control agents for cotton pests.

Fresno, CA.—More efficient ways to manage irrigation of cotton, especially drip irrigation systems; crop management in the irrigated desert.

Shafter, CA.—Integrated systems for managing cotton production in the San Joaquin Valley, including crop production efficiency, pests and diseases, computer modeling of the crop, and improved equipment for production and harvesting.

Fort Collins, CO.—Storage and maintenance of the nation's germplasm collection.

Gainesville, FL.—Ecology, behavior, and biological control of insect pests; modification of insect behavior through manipulation of insect semiochemicals.

Athens, GA.—New means of fiber processing for pulp.

Tifton, GA.—Production systems for the Southeast, emphasizing management of nematodes, weeds, and insect pests with reduced use of nematicides and other pesticides.

New Orleans, LA.—New instrumentation for cotton fiber quality evaluation; new processes for adding value to fiber and to textiles; molecular, biochemical, and ecological analysis of cotton fiber quality factors; and new products from cotton. Also, elimination of formation of aflatoxins in cottonseed; and development of new products and new processes to enhance utilization of cottonseed.

Beltsville, MD (Headquarters).—Area-wide integrated management of insect pests; demonstration trials of biocompetitive strains of *Aspergillus flavus* to reduce aflatoxin contamination of cottonseed.

Mississippi State, MS.—Breeding cotton for resistance to pathogens, nematodes, and insects; integrated management of insect pests; and development and transfer to users of a computer model of the cotton crop production system.

Oxford, MS.—Farming systems that decrease soil erosion and improve water quality in the Mississippi Delta region.

Stoneville, MS.—Breeding for fiber quality and resistance to insect pests; improved crop management with environmentally acceptable production practices; operation of the National Cotton Variety Testing Program; technology for mass rearing of beneficial insects; biological control and other management strategies for insect pests; technology for area-wide control of pests; development of sustainable alternatives to herbicides for weed management in cotton, emphasizing biocontrol; management of herbicide-resistant cotton crops; means to keep herbicides from contaminating waters; development and implementation of new ginning technology; and more efficient and effective technology for application of pesticides to the crop.

Columbia, MO.—More efficient and effective propagation of insects for biocontrol of cotton pests.

Las Cruces, NM.—Gin plant design and operation to retain fiber quality and spinnability of cottons from the West.

Fargo, ND.—Basic genetics, physiology and molecular biology of insect pests.

Wyndmoor, PA.—New value-added industrial products and biodiesel fuel from seed oils and tallow.

Clemson, SC.—Evaluation of cotton spinning performance and end use quality; and instrumentation systems for improved cotton grading.

Florence, SC.—Developing germplasm and soil, crop, and irrigation management practices suitable for Southeastern cotton production systems.

College Station, TX.—Maintenance of the working germplasm collection for cotton; genome mapping for improved cotton breeding; development and testing of area-wide strategies for managing important insect pests of cotton; improved aerial application technology for pesticides; and basic and applied research to control pathogens and nematodes of cotton.

Lubbock, TX.—New principles and new technology for efficient irrigation of cotton and other crops; improving plant productivity under stress conditions (unfavorable environments) in High Plains production systems; and improved harvesting and ginning technologies for stripper-harvested cottons.

Temple, TX.—Sustainable production systems to minimize soil erosion in clay soils.

Weslaco, TX.—Insect pest suppression through area-wide integrated pest management; development of biological control systems; conservation tillage practices for cotton; remote sensing capability for resource assessment; and breeding pest-resistant cottons.

Montpellier, France.—Collection and evaluation of candidate biological control organisms from Eurasia for control of insect pests, weeds, and pathogens.

Question. For your overall cotton research program, provide funding and staffing by project.

Answer. Funding and staffing for the overall cotton research program are as follows:

PART 1

812

Project title	Fiscal year 1997—	
	Funds	Scientists
COTTON		
Soil dynamics, plant growth, and organic waste for sustainable management of degraded soils	\$218,900	0.8
Biology, ecology, sampling and control of whiteflies	1,490,500	5.2
Cotton physiology, genetics, and plant insect interactions	1,277,300	5.0
Integrated pest management strategies for cotton insect control	1,202,900	3.5
Extrusion processing of insect diets for biological control programs	107,900	0.4
Irrigated desert research—II	48,100
Irrigation water and crop management to sustain productivity and protect water quality	91,800	.2
Western integrated cropping systems research	1,154,000	4.0
Preservation of base plant germplasm collection	165,300	.1
Biocontrol through artificial rearing of natural enemies and manipulation of host plant resistance	120,000	.5
Behavioral ecology and management of crop insect pests with semiochemicals	155,200	.3
Insect biological control through behavioral and genetic manipulation	300,300	.9
Chemistry and biochemistry of insect behavior, physiology, and ecology	195,700	.6
European based research on biological control of sweetpotato whitefly	89,400	.4
Microbial treatments to enhance value of agricultural crops and products	34,400	.2
Genetic approaches for managing the corn earworm, <i>helioverpa zea</i> , and the faw <i>spodoptera furgiiperda</i>	27,300	.1
Integration of tachinid parasitoids and pathogens to suppress insect pests of corn	55,900	.2
Development of innovative pest control strategies with biological and chemical control agents	116,200	.4
Biology and pathogenicity of <i>noctuidonema guyanense</i> on <i>spodoptera frugiperda</i> and <i>S exigua</i>	76,500	.2
Management of nematodes to reduce crop loss and nematicide use on irrigated crops of the Southeast	38,200	.1
Develop weed management alternatives to methyl bromide for irrigated Southeastern crops	32,500	.1
Molecular analysis of cotton fiber development to improve cotton fiber quality	285,100	1.0
Treatments for delayed cure applications for cotton fabrics	744,300	3.0
Cotton with improved wear and resiliency by facile polymerization reactions	650,200	2.0
Improved durability press cottons via a multifaceted approach	837,400	3.0
Nonwoven textiles from cotton and other natural fibers	586,400	1.1
Develop technology for producing improved and ecologically friendly cotton-rich textiles	714,900	2.7
Correlations between fiber breakage and properties, surface modifications and textile processing quality	856,200	1.9
Biochemical modification of cotton textiles for enhanced performance	735,200	5.5
Variation in structure and performance of cotton from variety, growth history, and processing	1,157,600	5.4
Nature and causes of motes and undeveloped cotton fibers, as related to dyeing imperfections	661,400	4.0
Development of improved instrumentation to measure cotton maturity and fineness	418,800	1.2
Area-wide management of agricultural pests	488,800
Biochemistry and genetics of host plant resistance to insects, diseases, and nematodes	190,000	1.0
Biological control of cotton insects	437,100	1.5
Germplasm enhancement in cotton with the primitive race stocks of <i>gossupium hirsutum</i>	244,200	1.0
Genetic enhancement for resistance to insects and nematodes in cotton	539,200	1.1
Development of model-based decision support systems for cotton production management	822,900	3.0
Integrated computer-based decision aid for cotton pest management	428,800	3.0
Development of integrated control procedures	883,500	3.0
Improved erosion control for upland areas and reduced sediment production in DEC watersheds	101,000	.3
Farming systems for improved water quality/ecology for a Mississippi Delta MSEA	49,100	.1
Development of mass propagation technology for beneficial and pest insects	764,300	1.5
Develop sustainable integrated weed management systems for cotton, soybeans, and other crops	134,100	.3
Ginning methods to enhance fiber quality and value	594,100	2.5
Development and implementation of new technologies in cotton ginning	603,600	2.6
Development of technology for efficient crop production systems	229,400	.8
Develop innovative technology for more efficient pesticide application in field crops	647,200	2.7
Replacement of herbicides and methyl bromide by microbiological control of weeds	137,400	.6
Reduce herbicide contamination of surface water by using alternative management systems cotton production 16,400
Biochemical genetic and ecological effects of natural and synthetic herbicides	137,400	.5

PART 1

813

Project title	Fiscal year 1997—	
	Funds	Scientists
Soil quality of sustainable agricultural systems and impacts on herbicide and alternative weed management systems	256,300	1.0
Genetic-physiological parameters that enhance fiber quality	495,800	1.6
Biological and genetic control of crop pests emphasizing heliothis	417,100	0.9
Areawide management of cotton insect pests in midsouth development of improved surveillance and pest management technology	678,400	3.0
Control strategies for heliothis/helicoverpa spp. and other field crop insects in cotton agroecosystem	1,025,900	3.0
Biochemical genetics of fiber quality and its application to the improvement of cotton varieties	132,400	1.0
Development of high yield, high quality, and environmentally acceptable cotton production systems	459,100	2.1
National Cotton Variety Test Program	458,900	.2
Developmental and genetic factors useful to the propagation of beneficial insects for biocontrol	242,200	.8
Development of ginning systems and knowledge to enhance value and textile utility of Western cottons	962,000	2.7
Biochemical and molecular approaches to the development of artificial rearing diets and DNA probe	494,100	1.5
Genes controlling insects development and reproduction and methods for insect genetic transformation	462,800	.7
Cotton quality identification and measurements affecting processing performance and end use quality	2,179,500	6.0
Management systems that enhance soil productivity in the Southeastern coastal plain	99,600	.4
Cotton germplasm enhancement and production systems with higher lint yield and improved fiber quality	377,300	1.5
Development of area-wide management strategies for adult corn earworm and other crop insect pests	266,300	1.1
Aerial application technology for crop protection	432,400	1.7
Acquisition, evaluation, maintenance and systemization of cotton germplasm	412,700	1.2
Cotton germplasm evaluation and genome mapping	389,900	.8
Identify and develop alternative strategies for control of nematode parasites on cotton and kenaf	339,600	1.2
Develop nonchemical strategies for control of cotton diseases	979,300	3.7
Improving plant performance in adverse environment	369,600	.8
Development of cotton germplasm with improved tolerance to abiotic stresses	150,700	.6
Characterizing plant responses to thermal stress and their metabolic and molecular basis	264,300	.9
Harvesting and ginning technologies for stripper cotton	674,300	3.5
Managing stress for improved water use efficiency and semi-arid crop production	130,300	.6
Cotton root systems: genetic diversity and response to environmental stress	190,600	1.0
Sustainable agricultural production systems for clay soils	62,800	.3
Mass propagation/augmentation of wasp parasites to manage weevils, caterpillars, and other pests	715,200	.9
Biology and ecology of crop pests emphasizing area-wide suppression of boll weevil and corn earworm	568,400	1.6
Spatial information technology and computer-aided decision support systems for field management	61,400	.1
Integrated production systems	145,400	.4
Total	36,988,900	123.1
COTTONSEED		
Development of processes to improve oilseed utilization	765,100	3.0
Development of biologically active peptides as pesticides	65,600	.2
Aflatoxin control through targeting gene cluster governing aflatoxin synthesis in corn and cottonseed	519,200	2.1
Modification of fungal community structure to improve food safety	397,900	1.6
The conversion and utilization of agricultural byproducts as adsorbent material	103,700	.3
Aflatoxin control through addition of enhancement of antifungal genes in corn and cotton	674,100	3.4
Preharvest control of aflatoxin	219,200
Development of ginning systems and knowledge to enhance value and textile utility of western cottons	106,900	0.3
Conversion of natural glycerides to higher valued products	214,100	.8

PART 1

Project title	Fiscal year 1997—	
	Funds	Scientists
Harvest and ginning technologies for stripper cotton	92,000	.5
Total	3,157,800	12.2
Total for cotton and cotton seed	40,146,700	135.3

Question. What recent accomplishments have come from the research?

Answer. A few recent accomplishments of ARS cotton research are as follows:

New cottons from India available to broaden the genetic base of cotton.—An ARS geneticist from Florence, SC, in cooperation with other scientists, analyzed the pedigrees of modern cotton varieties to prove that the genetic base of modern cotton varieties is narrowing. The “sameness” of varieties that are supposedly genetically distinct increases their vulnerability to a disastrous disease epidemic. Another ARS geneticist from College Station, TX, has recently collected more than 1100 cotton accessions from India, which will be added to the national germplasm collection and made available to breeders. These Indian cottons will help to broaden the genetic base of American cotton varieties.

Cotton seedling diseases suppressed.—ARS scientists in College Station, TX, identified a fungus that can be applied to cotton planting seed as a biological control agent for seedling diseases. In tests across the Cotton Belt, the combination of the biological control agent and a fungicide was superior to fungicides alone in controlling seedling diseases. The biological control agent is being commercialized by the private sector.

Nectariless cotton resists tarnished plant bug damage.—ARS genetics research in Stoneville, MS, produced a *nectariless* cotton variety (lacking a gland called the “nectary”). These plants sustain about 50 percent less damage from tarnished plant bugs than do normal plants. Seed companies are now breeding the nectariless trait into *Bt* cotton because of it reduces the need for insecticides to control pests unaffected by the *Bt*.

Artificial diet for rearing predatory green lacewing larvae.—These larvae are voracious predators of whiteflies, aphids, and many other crop pests, but until now they had to be reared on insect eggs that cost more than \$600 per kg. On the new artificial diet, developed by ARS in Phoenix, AZ, they can be reared for 1/100 the cost, which will open the market for their use as biological control agents in cotton crops in the field. A patent is pending for the diet.

“Moisture-seeking” cottonseed planter developed.—ARS in Shafter, CA, has developed and patented a planter that places the seed in soil with constant moisture, despite variation in soil texture or moisture distribution. The planter is expected to eliminate the need for replanting on virtually all cotton acreage in the West, for a savings of \$10 million per year.

Boll weevil management system for South Texas.—ARS in Weslaco, TX, demonstrated that *Catolaccus grandis*, a wasp parasite of the boll weevil, killed 96 to 99.6 percent of boll weevils in the field. Wasps reared on an artificial diet were effective. The total cost of using *Catolaccus grandis*, including rearing and release, is less than \$23 per acre per year. A boll weevil management system has been proposed that reduces insecticide runoff from the field by 2/3, increases profitability, and creates a new industry (propagation of natural enemies of the boll weevil).

Core-wrapped yarns.—ARS research in New Orleans, LA, has led to development of new spinning technology for producing a unique core-wrap yarn. The yarn consists of a strong synthetic core fiber with a sheath of pure cotton fibers. The core and sheath do not slip or separate during use. The synthetic core provides high strength, durable press, and other valuable properties, while the sheath provides the comfort of pure cotton. The patented spinning process has been licensed to a U.S. company for commercial use.

SCREWWORM RESEARCH

Question. What objectives are currently underway on screwworm research?

Answer. There are seven objectives underway on screwworm research. All of these objectives are aimed at supporting the APHIS screwworm eradication program in Central America and FAO screwworm efforts in the Caribbean region. The ultimate objective is to free Central America and the Caribbean from screwworm so that we can either eliminate or minimize the possibility of reintroduction of screwworm into the U.S. The seven objectives of ARS screwworm research are to develop:

—a vigorous screwworm strain for mass production of sterile flies;

PART 1

815

- new methods and validate the existing methods for surveillance, trapping, and monitoring of screwworm in Central America and the Caribbean region;
- an easy to use, color-based Elisa method to distinguish the primary from the secondary screwworm under field conditions;
- genetic fingerprints of feral screwworm populations of Central America and the Caribbean region so that we can trace the source of screwworm reinfestation in eradicated areas;
- improved methods for the study of ecology, biology and population dynamics of screwworm populations in their natural habitats. This includes study of behavior, specially the habitat preferences, and dispersal of sterile and native flies using remote sensing and Geographic Information System technologies;
- economical substitutes for the larval diet and cost effective screwworm rearing technologies. This includes development of male-only strain; and
- cryopreservation methods for long-term storage of screwworm eggs to reduce the cost of continual screwworm rearing during the period of low demand for sterile flies and to increase the production of screwworm on short notice in response to high-demand and emergency periods.

Question. At what locations is the research conducted?

Answer. ARS conducts its screwworm research at four locations. These include Beltsville, Maryland; Lincoln, Nebraska; Fargo, North Dakota; and Panama City, Panama.

Question. Provide resources associated with this research by location.

Answer. The funding associated with screwworm research in fiscal year 1997 is as follows:

<i>Location</i>	<i>Fiscal year 1997 funds</i>
Beltsville, MD	\$60,600
Lincoln, NE	612,400
Fargo, ND	78,400
Panama City, Panama	998,000
Total	1,749,400

Question. What work is carried out cooperatively with APHIS?

Answer. ARS conducts six research projects in cooperation with APHIS. These include:

- development and testing of new vigorous screwworm strains for mass production of sterile flies;
- development of economical substitutes for the larval diet and cost effective screwworm rearing technologies. This also includes development of a male-only strain;
- diagnosis and correction of problems that occur in mass production of screwworm; such as breeding of house fly populations in the mass rearing facility or decline in screwworm pupal weights;
- field testing of new screwworm trapping technologies developed by ARS. This includes the use of remote sensing methods;
- diagnosis of factors contributing to the lingering screwworm infestations in areas under eradication; and
- collection of feral screwworm samples from areas targeted for eradication for genetic fingerprinting.

FOOT-AND-MOUTH RESEARCH

Question. Describe your research on Foot-and-Mouth Disease (FMD).

Answer. All ARS research on FMD is conducted at the Plum Island Animal Disease Center (PIADC), Greenport, New York. The first goal of the FMD program is to continue development of genetically engineered or altered FMD virus that can be used to make vaccines that in the future would allow production and safe use outside of biocontainment. A second goal is development of diagnostics that can be produced and used outside of biocontainment and which can detect and differentiate vaccinated from infected animals. No such diagnostics currently exist. A third goal is to understand the basic cellular immune response of infected cattle in order to optimize vaccines, diagnostics, and alternative control measures. A fourth goal is to examine why some animals recover from infection but continue to shed virus.

Question. Provide funding and staffing for fiscal years 1997 and 1998.

Answer. In fiscal year 1997, funding of \$5,167,900 including 3.9 SY's was allocated to Plum Island Animal Disease Center. The same amount of resources is proposed in the fiscal year 1998 Budget.

Question. How do we cooperate with foreign countries in FMD research?

PART 1

Answer. The ARS FMD program continues to maintain a number of international research collaborations on a formal and informal basis throughout the world. These include cooperative agreements, training programs, and participation in international meetings and on international committees. PIADC's Foreign Animal Disease Laboratory holds the North American FMD vaccine bank for Canada, U.S., and Mexico. Scientists meet at least once a year to update emergency preparedness plans to make use of this resource in an emergency. Examples of recent new international collaborations are a proposed Brazil/U.S. project and a proposed Egypt/Israel/U.S. project. These types of programs allow international researchers to participate in the development and testing of new FMD diagnostics and vaccines. Concurrently, such cooperative programs provide PIADC scientists access to field environments to test new vaccines and diagnostics that have already been tested in the laboratory. This permits ARS to validate a new generation of genetically-engineered vaccines since USDA can not test FMD vaccines in the U.S. PIADC provides reagents and ideas and shares authorship on publications with many international groups. Participation in international workshops recently allowed PIADC to share information on their molecular expression system used to develop a new generation of vaccines, and it has resulted in several new collaborations. This technology is believed to be superior to that used by many European institutes.

Question. Describe recent outbreaks of FMD and responses to control or eradicate them.

Answer. The March 1997 outbreak of FMD in Taiwan is one of the most dramatic examples of how a livestock industry in a country can be totally destroyed in less than 1 month's time. FMD is highly contagious and spreads through herds at an alarming rate. More than 700,000 of Taiwan's 11 million pigs have died of the disease, and 3.6 million more are being slaughtered. This has resulted in environmental concerns about how to dispose of the dead swine. This outbreak closed all markets for Taiwan except those that already have FMD, and Japan has lost an important trading partner. This crisis will or is expected to increase total U.S. exports by \$.5 billion. Taiwan will have to completely restock their swine industry with new animals and they are predicted to need a vaccination program for at least 10 years. The loss of FMD-free status will completely preclude their export of fresh pork products. With the number of international travelers entering the U.S. each day and the fact that FMD virus remains viable in pork and beef products for long periods of time, the U.S. is constantly concerned about accidental or terrorist introduction of FMD into the U.S. livestock population. Environmental concerns associated with the destruction of large numbers of animals during an FMD eradication program also contribute to the vulnerability of the U.S. livestock industry.

RESEARCH ON NARCOTICS

Question. Describe ARS's Program in research on drugs and narcotics.

Answer. The Agricultural Research Service (ARS) narcotics research program supports the overall narcotic control programs of federal law enforcement, foreign affairs, and intelligence agencies.

ARS currently maintains research programs for the eradication of narcotic crops using chemical and biological means, the identification of illicit crops using remote sensing, the estimation of narcotic crop yields, narcotic plant chemistry, and environmentally sound agricultural alternatives to illicit cultivation in narcotics producing countries.

Question. Provide funding and staff years for fiscal years 1996-1998.

Answer. The funding and staffing for ARS narcotics research programs are as follows:

Location	Fiscal year 1996—		Fiscal year 1997—		Fiscal year 1998—	
	Funds	Scientists	Funds	Scientists	Funds	Scientists
Beltsville, MD	\$2,677,800	9.1	\$3,053,200	9.4	\$3,051,300	9.4
Weslaco, TX	277,800	1.0
Headquarters	1,756,400	1,658,800	1,657,700
Total	4,712,000	10.1	4,712,000	9.4	4,709,000	9.4

Question. List recent accomplishments and benefits from this research.

Answer. During the last year, ARS supported herbicidal, eradication programs in Colombia and Panama, implemented by the U.S. Department of State. ARS also supported opium crop estimation efforts in Burma, India, and Laos, an opium evaluation program in Turkey, and implemented cooperative alternative crop research

PART 1

programs with counterpart institutions in Mexico, Peru, and the United Nations Drug Control Program. In support of these overseas efforts, an additional \$250,000 was received from the intelligence community, \$50,000 from the Department of State for crop eradication, an additional \$265,000 earmarked from Department of State for the Turkish opium program, and \$100,000 from the U.S. Embassy, Lima, for alternative crop development.

ARS is currently in the process of preparing peer reviewed journal articles relevant to both bioherbicides for narcotic crop control, and integrated pest management for alternative crop initiatives in the tropics.

SOYBEAN RESEARCH

Question. What areas of soybean research are you pursuing?

Answer. ARS conducts soybean research at 28 locations in Federal research laboratories and on university campuses. The program is a nationally managed, fully coordinated, multidisciplinary approach to solving production and postharvest needs of soybeans. The locations with objectives for the research follows:

Albany, CA.—Genetic modification of soybean oil for industrial use.

Ames, IA.—Genetic research for soybean improvement.

Beltsville, MD.—Develop improved varieties with desired genetic traits such as resistance to pathogens and insects, and suppression of weeds, and develop management/crop models.

Brookings, SD.—Integrated crop management systems.

Columbus, OH.—Production optimization, water quality, and flooding tolerance.

Columbia, MO.—Cropping systems and water management strategies.

Coshocton, OH.—Management practices for erosion control and water quality.

Florence, SC.—Development of cropping systems to optimize water management.

Fort Collins, CO.—Acquisition, maintenance, and preservation of germplasm.

Frederick, MD.—Molecular characterization of soybean dwarf virus.

Gainesville, FL.—Environmental, physiological, and genetic limitations to production.

Ithaca, NY.—Genetic enhancement of root development.

Lincoln, NE.—Management practices to maximize production efficiency.

Madison, WI.—Minimize harmful effects of bacterial pathogens.

Manhattan, KS.—Grain odor assessment technology.

Mayaguez, PR.—Winter nursery facilities to accelerate improved variety development.

Morris, MN.—Environmental and crop management limitations to production.

New Orleans, LA.—Biomodification of soybean oil for value-added products.

Oxford, MS.—Develop sustainable cropping systems.

Peoria, IL.—Product development, conversion of oil and protein for food and new industrial uses.

Raleigh, NC.—Eliminate genetic and physiological limitations to production and enhance nitrogen fixation.

St. Paul, MN.—Management and cropping practices affecting water quality.

Stoneville, MS.—Develop insect resistant germplasm and improve weed control techniques, and host resistance to soybean cyst nematodes.

Tifton, GA.—Develop pesticide technology for control of nematodes, weeds, and insects.

Urbana, IL.—Develop comprehensive soybean production technologies and maintain, evaluate, and distribute germplasm.

West Lafayette, IN.—Management practices for weed and disease control, and develop improved germplasm.

Wooster, OH.—Management practices for pest control and to develop germplasm for divergent environments.

Wyndmoor, PA.—Develop oil products for industrial use.

Question. List research funding and staff years by location.

Answer. Current funding and scientific years for each location follows:

Location	1997 funding	Scientists
Albany, CA	\$559,300	2.5
Ames, IA	803,300	2.2
Beltsville, MD	4,514,600	15.3
Brookings, SD	148,600	1.0
Columbus, OH	99,200	0.4
Columbia, MO	267,700	.8

PART 1

818

Location	1997 funding	Scientists
Coshocton, OH	69,400	.3
Florence, SC	198,400	.8
Ft. Collins, CO	279,100	.5
Frederick, MD	83,900	.1
Gainesville, FL	52,900
Ithaca, NY	22,100	.6
Lincoln, NE	63,900	.2
Madison, WI	21,200	.1
Manhattan, KS	128,200	.6
Mayaguez, PR	120,200	.1
Morris, MN	249,700	1.3
New Orleans, LA	1,063,100	4.0
Oxford, MS	101,000	.3

W. Lafayette, IN	793,900	3.0
Wooster, OH	297,500	1.4
Wyndmoor, PA	741,300	2.7
Total	23,349,100	86.6

Question. List recent accomplishments obtained in your research on soybeans.

Answer. ARS focuses its soybean research on developing new uses for soybeans and on increasing soybean production efficiency so that production costs are lowered and soybeans are more competitive in the global market. Several ink formulations have been developed by scientists at Peoria, Illinois. This work resulted in a patent being issued for newspaper printing ink and a pending patent for heat-set and sheet-fed printing inks. Market potential use of soy or vegetable oil in ink formations is estimated at one billion pounds or eight percent of domestic soybean oil production and would represent a 300 percent increase in current industrial use of soybean oil. Modified soybean oil continues to be evaluated as an alternative for diesel fuel by developing cost-effective technology for conversion to fatty acid esters and commercial testing of performance enhancing additives. Work is progressing on use of soy foamed plywood glues. Soybeans could be used as a foaming agent for softwood plywood adhesives and replace blood protein at a lower cost. Work is also continuing to develop soybean-derived lubricants that are biodegradable and friendly when lost to the environment such as when used on chainsaws.

Significant advancement has been made toward broadening the genetic base of soybeans by obtaining hundreds of soybean lines from China and adding these to the soybean collection maintained at Urbana, Illinois. The soybean plant originated in China and adding new lines brings new genes for pest resistance and for developing new value-added products. The nation's commercial soybean varieties are descended from a small number of ancestral lines. Thirty-five lines account for more than 95 percent of the genes in all commercial varieties grown in the United States. Soybean lines also have been developed that are expected to have longer shelf-lives without developing rancidity, and other lines have less capability of developing off-flavors. The projected cost savings for processors is about \$200 million per year. A new variety, jointly released with the University of Illinois, lacks an enzyme inhibitor that interferes with protein digestion by people and animals, thus making the meal a higher quality and more nutritious feed. This will considerably increase the feeding efficiency of animals fed soy meal. Progress continues in identifying new lines with resistance to nematode infections and other disease organisms. Drought-resistant germplasm is nearing the stage of public release, and lines have been identified that will contribute flooding tolerance genes to soybeans. A new soyfood variety, "Pearl," has been released and provides a new high-value product for export to Japan. Another variety recently released demonstrates it is possible to achieve simultaneous increase in protein, oil, and yield. The high protein variety "Prolina" should deliver high protein meal for the poultry and swine feed industries.

PART 1

819

HUMAN NUTRITION

Question. ARS now has six human nutrition centers. Please explain the mission of each.

Answer. The mission of each of the six human nutrition centers follows:

Beltsville Human Nutrition Research Center, Beltsville, Maryland.—Defines the role of food and its components in optimizing health and reducing the risk of nutritionally related disorders in the diverse American population. To accomplish this mission, the Center develops new methods of food analysis; determines the role of nutrients and their interactions in maintaining health; monitors nutritional intakes and maintains the database of the nutrient content of foods; studies the expenditure of energy by using direct and indirect calorimetry; and investigates the consequences of altered nutrient intakes in free-living humans.

Jean Mayer USDA Human Nutrition Research Center on Aging at Tufts University, Boston, Massachusetts.—Defines safe and adequate nutrient intakes and identifies factors that may contribute to degenerative processes associated with aging. To accomplish this mission, the Center determines factors related to prevention of age-related loss of bone density leading to osteoporosis and fracture, and the preservation of muscle strength; identifies dietary factors critical in slowing or preventing cataract development; determines the relation of antioxidant food components to heart disease and immune function; and explores relationships between vitamins and brain function, stroke, and dementia.

Grand Forks Human Nutrition Research Center, Grand Forks, North Dakota.—Determines nutrient needs for humans with an emphasis on mineral element requirements that prevent disease and promote health and optimal function throughout life. To accomplish this mission, the Center determines the importance of mineral elements at the molecular level with an emphasis on chronic disease; identifies detrimental functional changes, especially in bone, brain, cardiovascular and reproductive systems, that occur in the U.S. population because of improper mineral element nutrition; identifies and validates biochemical and physiological status assessment indicators for use in the study of populations at risk from inadequate mineral element nutrition; and defines the impact of environmental, dietary, physiological and psychological stressors on specific mineral requirements.

Children's Nutrition Research Center at Baylor College of Medicine, Houston, Texas.—Defines the nutritional needs of pregnant and lactating women and of their infants and children from conception through adolescence. To accomplish this mission, the Center establishes nutrient requirements to prevent low birth weight babies, particularly in pregnant adolescents; elucidates nutrient-gene interactions that regulate metabolism and disposition of nutrients; determines nutrient requirements for growth and development of school-aged and adolescent children; and establishes nutritional relationships to acute and chronic childhood diseases.

Western Human Nutrition Research Center, San Francisco, California.—Determines the impacts of dietary, environmental, behavioral, and genetic factors on nutrient requirements and functions. To accomplish this mission, the Center establishes markers of nutritional status in relation to maintenance of healthy body weight, nutrition, infection and immune disorders; and protective factors in foods.

Arkansas Children's Nutrition Research Center, Little Rock, Arkansas.—Determines the role of nutrition in cognitive and behavioral function, and the health consequences of infant consumption of dietary factors (phytochemicals) such as phytoestrogens on endocrine and metabolic development and prevention of chronic diseases.

Question. Provide existing resources, both funding and staff years, for each center. Provide the resources planned for each.

Answer. The funding and scientific staffing for the ARS Human Nutrition Research Centers and other related programs for fiscal year 1997 and fiscal year 1998 are as follows:

Centers and other related programs	Fiscal year 1997		Fiscal year 1998 funding
	Funding	Staffing	
Beltsville Human Nutrition Research Center, Beltsville, MD	\$18,499,900	43	\$19,499,900
Grand Forks Human Nutrition Research Center, Grand Forks, ND	7,999,700	12	8,999,700
Human Nutrition Research Center on Aging at Tufts	14,747,900	42	15,747,900
University, Boston, MA (Includes Geriatric Nutrition Research, Danville, PA) ...	(188,000)	(188,000)
Children's Nutrition Research Center at Baylor College of Medicine, Houston, TX	10,756,600	26	11,756,600
Western Human Nutrition Research Center, San Francisco, CA	5,317,600	12	6,317,600
Arkansas Children' Nutrition Research Center, Little Rock, Arkansas	1,878,800	5	2,878,800

PART 1

820

Centers and other related programs	Fiscal year 1997		Fiscal year 1998 funding
	Funding	Staffing	
Lower Mississippi Delta Intervention Research Initiative (LA, AR, MS)	3,166,900	16	3,166,900
National Agricultural Library	693,400	7	693,400
Headquarters			6,000,000
Other Locations	1,075,600	5	1,089,600
Totals	64,136,400	168	76,150,400

Of the total staff of 168, 85 are Federal FTE and 83 are cooperator employees.

Question. There appears to be significant overlap in the research carried out at the nutrition centers. Can the resources of these centers be combined? Explain.

Answer. Each of the described missions of the USDA/ARS Human Nutrition Research Centers are distinct and unique. It would be difficult, if not impossible, to combine resources at these Centers because of the different populations and nutrients studied and approaches used at each that require specific types of skills, equipment, and facilities. To best use their limited resources, the six USDA/ARS Human Nutrition Research Center Directors meet regularly with the National Program Staff for Human Nutrition Research in ARS to assure that there is no overlap in research programs and that critical and high impact research is carried out at the Center with the appropriate staff, equipment and facilities. A specific research problem such as the cause of a certain nutritional disorder, or the assessment or alleviation of a nutritional problem, may require study at more than one Center because of the specific resources and expertise available in each.

Question. How do you integrate human nutrition research with the agricultural mission of your agency?

Answer. Knowledge about health-promoting foods and components of foods is used by animal, plant, soil, and post-harvest scientists for development of methods that modify food composition both during production and processing, expand food choices, and provide more options for healthful diets. Examples of nutritional input to the agriculture include:

- Production of meat with less fat.
- Development of grains with more healthful fatty acid profiles and with increased content of health promoting vitamins and minerals.
- Development of fruits and vegetables with increased content of beneficial phytochemicals such as vitamin C and carotene—a precursor of vitamin A.
- Identification of components of a healthful diet high in phytonutrients and antioxidant substances.

Nutrition research results can counteract some of the claimed negative attributes for some nutritious foods such as meat, milk, and eggs which have affected the market for these products.

REMOTE SENSING

Question. What remote sensing research are you pursuing?

Answer. ARS research on the development of remote sensing technologies that can benefit agricultural production, resource management, and the environment is conducted at the following locations: Phoenix, Arizona; Tucson, Arizona; Shafter, California; Fort Collins, Colorado; Beltsville, Maryland; El Reno, Oklahoma; University Park, Pennsylvania; and Weslaco, Texas.

Phoenix, Arizona.—Research is focused on four main areas: development of satellite-based remote sensing for assessing large-area evapotranspiration rates over croplands and rangelands to assess plant vigor, soil moisture conditions, and biomass production; development of decision support tools for farm managers using both on-site measurements of physical and biological conditions, and geospatial information provided by sensors mounted on farm equipment and aircraft; use of hand-held radiometers for non-destructive estimation of light and water use efficiencies by agricultural crops and native plant communities; and improvement of basic sensor design, use, and image quality.

Tucson, Arizona.—Research is targeted toward the scientific and inventory needs of the SALSA (Semi-Arid Land-Surface Atmosphere) project. The primary goal of this multi-year, multi-disciplinary project, involving several agencies and research institutions, is to understand, model, and predict the consequences of natural and human-induced changes on the basin-wide water balance and ecological diversity of semi-arid regions at storm event, seasonal, interannual, and decadal time-scales using the San Pedro River Basin. Remotely sensed data will be used to determine the rates of evapotranspiration from key landscape features, such as riparian cor-

ridors, and to quantify long-term changes in vegetation for both the U.S. and Mexican components of this river basin.

Shafter, California.—Remote sensing activities are directed toward the development and validation of precision farming practices which would provide economic benefits to California cotton growers and the industry, and environmental benefits to rural communities. Detailed ground-based radiometer measurements are being used to develop spectral signatures for detecting insects, mites, nematodes, and diseases with the aid of high-resolution imagery. An aircraft-based, multi-spectral remote sensing system is being developed for scouting early stages of pest infestations in cotton fields. Procedures for incorporating this remotely-sensed information into ARS cotton production models will extend their crop and farm management capabilities.

Fort Collins, Colorado.—Research is aimed at assessing the potential for using readily available soil survey information and passive microwave reflectance imagery to map the subsurface hydraulic properties of agricultural soils. The methodology will be validated using data from the intensively instrumented ARS watershed on the Little Washita River in central Oklahoma. The productivity, economic, and environmental benefits of incorporating remotely sensed data in farm-level decision support models are also being evaluated using data from two farms in eastern Colorado.

Beltsville, Maryland.—The Remote Sensing and Modeling Laboratory is evaluating the potential for using actively induced fluorescence to determine vegetation condition, retrieve important biophysical parameters, and estimate large-area crop yields. Laser induced fluorescence techniques are being used to determine changes in leaf photosynthesis, and measure water and nutrient stresses. Remotely sensed biophysical parameters, such as leaf area index, are being used with process-based crop models to assess changes in crop condition and predict crop yields at regional scales. Research on the use of spectral imagery from satellite-based sensors for improving reliability and performance in precision farming is also being pursued.

The Hydrology Laboratory at Beltsville, Maryland is conducting research on remote sensing applications to water resources management and agriculture. Techniques are being developed to use existing and future satellite-based sensors, with wavelengths in the visible to microwave bands, for mapping water, energy, and biogeochemical fluxes over large areas. These techniques will provide resource management agencies with practical and cost-effective methods for monitoring environmental conditions. Techniques for measuring the water equivalent of snow cover are being developed and tested in several western U.S. basins. ARS is collaborating with the National Aeronautics and Space Administration in the development of practical technologies for mapping surface soil moisture over large areas using microwave imagery to improve both hydrologic and climate forecasts, and agricultural management decisions. Airborne laser altimeter data is being used to measure topography, gully and stream cross-sections, vegetative cover, and other landscape features for large areas. These measurements have the potential to improve estimates of soil losses from agricultural landscapes and promote more effective management of the nation's water resources.

El Reno, Oklahoma.—Remote sensing research is directed toward using digital elevation data and imagery from satellite-and aircraft-based sensors to characterize diverse agricultural landscapes at watershed and river basin scales. Hydrologic and geomorphic analyses of vital landscape features, such as topography, channel networks, subdrainage boundaries, and flow paths are being extracted from the digital elevation data. Spatial distributions of suspended sediment and chlorophyll contaminants in surface water bodies are being estimated from low-level, hyperspectral sensor platforms. Soil moisture and biophysical properties of vegetation, such as leaf area index, are being mapped using remotely sensed data from aircraft-based sensors. Future research will include the use of aircraft-and satellite-based sensors to provide estimates of forage quantity and quality over large areas.

University Park, Pennsylvania.—Remote sensing research is directed toward using aircraft-and satellite-based sensors to evaluate spatial and temporal changes in surface soil moisture over northeastern landscapes. This information will be used to establish the reliability and performance of soil water balance, and natural resource management models that incorporate both the temporal and spatial variability of the hydraulic properties of soils in agricultural landscapes. The National Aeronautics and Space Administration and Pennsylvania State University are collaborating in the work.

Weslaco, Texas.—Remote sensing research includes: development of near real-time sensors to identify, quantify, and analyze biological and soil variables; data integration from remote sensing, geographic information systems, and global positioning systems into technologies for agricultural and resource management; methodologies for using sensor imagery in developing site-specific strategies for crop and pasture

PART 1

822

land management; and the transfer of spatial information systems and technologies to public agencies and the private sector. This work is collaborative with several academic institutions, State and Federal agencies, and private companies. For example, ARS researchers, the Animal Plant Health Inspection Service, farmers, and crop insurance representatives are cooperating in the development of spatial management systems for monitoring and responding to the impact of Mexican fruit flies on citrus production in Texas. In April 1997, the location hosted the 16th Biennial Workshop on Color Photography and Videography with participants from several companies and 16 foreign and domestic research institutions.

Question. Please list funding and staff years by location.

Answer. Funding and scientists by location for fiscal year 1997 are as follows:

Location	Funding	Scientists
Phoenix, AZ	\$327,300	1.2
Tucson, AZ	88,600	0.3
Shafter, CA	115,400	.4
Ft. Collins, CO	26,100	.1
Beltsville, MD	2,236,500	8.4
El Reno, OK	599,600	2.0
University Park, PA	38,400	.1
Weslaco, TX	1,042,700	1.8
Total	4,474,600	14.3

Question. What is your justification for proposing the elimination of the "Remote Sensing Technologies for Crop Production" project?

Answer. This Cooperative Research Project, which was established by Congressional Directive in 1989, was targeted toward stimulating private sector interest in agricultural applications of imagery from satellite-and aircraft-based sensors, and expanding the use of ARS developments of Remote Sensing Research by resource managers and food and fiber producers. In recent years, there has been substantial growth in the private sector's interest in applying remote sensing technologies to both resource management and food and fiber production therefore reducing the need for this project. Because of pressures on the ARS budget, several current activities, including this project, must be terminated to support new budget initiatives. Every effort will be made to insure that the desired inter-action between ARS remote sensing specialists, public sector resource management agencies, and industry will continue to be promoted through other remote sensing initiatives.

HAZARDOUS WASTE CLEAN-UP (HWC)

Question. Please list the funds obligated by location for hazardous wastes projects for fiscal year 1996 and planned for fiscal year 1997.

Answer. The funds obligated by location for hazardous waste projects for fiscal year 1996 and planned for fiscal year 1997 are as follows:

Fiscal year 1996 funded projects

Athens, GA	\$7,500
Savannah, GA	375,000
Ames, IA	243,863
Peoria, IL	63,100
Beltsville, MD	2,662,103
Greenport, NY	524,569
El Reno, OK	70,000
Mayaguez, PR	12,000
Weslaco, TX	35,775
St. Croix, VI	48,890
Madison, WI	37,200
Total	4,080,000

Fiscal year 1997 planned projects

Shafter, CA	\$50,000
Washington, DC	100,000
Savannah, GA	100,000
Ames, IA	20,000

PART 1

823

Peoria, IL	50,000
West Lafayette, IN	50,000
Beltsville, MD	2,658,000
East Lansing, MI	116,000
Greenport, NY	1,030,000
Coshocton, OH	150,000
Weslaco, TX	15,000
Temple, TX	36,000
Madison, WI	25,000

Total 4,400,000

Question. Provide amounts and brief description of each project funded from both Agency funds and departmental HWC funds.

Answer. The amounts and a brief description of each project funded from both Agency funds and departmental HWC funds for fiscal year 1996 and planned for fiscal year 1997 are as follows:

Fiscal year 1996 Agency Funded Projects:

Athens, GA: Underground Storage Tank Removal/Replacement	\$7,500
Beltsville, MD:	
Remedial Investigation/ Feasibility Study at National Priorities	
List Sites	1,400,191
Removal Actions at National Priorities List Sites	436,850
Greenport, NY:	
RCRA Site Closure Activities	360,017
Petroleum Contamination Cleanup	164,552
El Reno, OK: Environmental Site Assessment Phase II/Sampling	70,000
Mayaguez, PR: Underground Storage Tank Removal/Replacement	12,000
St. Croix, VI: Underground Storage Tanks Removals/Replacements ..	48,890
Subtotal	2,500,000

Fiscal year 1996 HWC Funded Projects:

Savannah, GA: RCRA Sampling and Remedial Actions	375,000
Beltsville, MD:	
Biodegradable Site Cleanup	574,606
Remedial Investigation/ Feasibility Study at National Priorities	
List Sites	14,837
Underground Storage Tanks Removals/Replacements	235,619
Ames, IA: Underground Storage Tanks Removals/Replacements	243,863
Peoria, IL: Sampling and Remedial Actions	63,100
Weslaco, TX:	
Investigate Acid Neutralization Tank	7,225
Investigate Tractor Rinse Station	16,025
Upgrade Pesticide Rinsewater Underground Storage Tank	12,525
Madison, WI: Underground Storage Tanks Removals/Replacements ..	37,200
Subtotal	1,580,000

Total 4,080,000

Fiscal year 1997 Agency Planned Projects

In fiscal year 1997, it is anticipated that all critical hazardous waste cleanup requirements will be funded via the departmental HWC central account.

Fiscal year 1997 HWC Planned Projects:

Shafter, CA: Drywell Remediation	\$50,000
Washington, DC: Legal Support, Office of General Counsel	100,000
Savannah, GA: RCRA Sampling and Remedial Actions	100,000
Ames, IA: Underground Storage Tanks/Remedial Actions	20,000
Peoria, IL: Sampling and Remedial Actions	50,000
West Lafayette, IN: Underground Storage Tanks Removals/Replacements	50,000
Beltsville, MD:	
Remedial Investigation/Feasibility Study at National Priorities	
List Sites	1,408,000
Removal Actions at National Priorities List Sites	1,000,000
Underground Storage Tanks Removals/Replacements	250,000

PART 1

824

East Lansing, MI:	
Site Investigation/Additional Sampling	50,000
Underground Storage Tank Removal/Replacement	66,000
Greenport, NY:	
RCRA Site Closure Activities	600,000
Removal Actions at Various Sites	400,000
Underground Storage Tank Removal/Replacement	30,000
Coshocton, OH: Underground Storage Tanks Removals/Replacements	150,000
Weslaco, TX: Underground Storage Tank/Remedial Actions	15,000
Temple, TX: Site Assessment and Remedial Actions	36,000
Madison, WI: Underground Storage Tanks/Remedial Actions	25,000
Total	4,400,000

Question. Please provide a listing of ARS locations where environmental clean-up activities are planned in fiscal years 1997 and 1998.

Answer. A listing of ARS locations where environmental clean-up activities are planned in fiscal years 1997 and 1998 is provided below:

Shafter, CA	Coshocton, OH
Savannah, GA	El Reno, OK
Ames, IA	Wyndmoor, PA
Peoria, IL	Brownwood, TX
West Lafayette, IN	Temple, TX
Beltsville, MD	Weslaco, TX
East Lansing, MI	Madison, WI
Greenport, NY	

Question. Describe the nature of the work and the estimated cost for each site.

Answer. A description of the nature of the work and the estimated cost for each planned site in fiscal years 1997 and 1998 is provided below. The costs have been estimated using fiscal year 1996 cost data and remediation information. The estimates are subject to increases/decreases as the project requirements become better defined through investigative and planning activities.

Shafter, CA: Drywell Remediation	\$75,000
Savannah, GA: RCRA Sampling and Remedial Actions	220,000
Ames, IA:	
Underground Storage Tanks/Remedial Actions	20,000
Site Investigation/Additional Sampling	30,000
Peoria, IL:	
Sampling and Remedial Actions	80,000
Underground Storage Tanks Removals/Replacements	225,000
West Lafayette, IN: Underground Storage Tanks Removals/Replacements	50,000
Beltsville, MD:	
Remedial Investigation/Feasibility Study at National Priorities List Sites	3,008,000
Removal Actions at National Priorities List Sites	1,750,000
Underground Storage Tanks Removals/Replacements	500,000
East Lansing, MI:	
Site Investigation/Additional Sampling	50,000
Underground Storage Tank Removal/Replacement	66,000
Greenport, NY:	
RCRA Site Closure Activities	1,100,000
Removal Actions at Various Sites	400,000
Remedial Investigation/ Feasibility Study	800,000
Underground Storage Tank Removal/Replacement	30,000
Coshocton, OH: Underground Storage Tanks Removals/Replacements	150,000
El Reno, OK: Site Assessment and Remedial Actions	50,000
Wyndmoor, PA: Underground Storage Tank Removal/Replacement	40,000
Brownwood, TX: Site Assessment and Remedial Actions	75,000
Temple, TX: Site Assessment and Remedial Actions	86,000
Weslaco, TX: Underground Storage Tank/Remedial Actions	15,000
Madison, WI: Underground Storage Tanks/Remedial Actions	25,000
Total	8,845,000

Question. What is your estimate of costs, by location, through fiscal year 2002.

Answer. The estimated cost for each location for fiscal year 1998 through fiscal year 2002 is provided below:

PART 1

825

Shafter, CA	\$25,000
Savannah, GA	250,000
Ames, IA	30,000
Peoria, IL	305,000
Beltsville, MD	15,300,000
East Lansing, MI	30,000
Clay Center, NE	300,000
Greenport, NY	7,600,000
El Reno, OK	75,000
Wyndmoor, PA	40,000
Kearneysville, WV	75,000
Temple, TX	150,000
Brownwood, TX	75,000
Total	24,255,000

TRAVEL

Question. Please provide the Committee with a breakdown of your actual travel costs in fiscal year 1996.

Answer. fiscal year 1996 travel costs are as follows:

Common Carrier	\$5,041,459
Mileage Allowance	431,794
Per Diem Allowance	3,557,071
Actual Subsistence	1,706,823
Transfer of Station	1,005,306
Vehicular Transportation	361,656
Miscellaneous Travel Expenses	499,889
Total	12,603,998

Question. Please identify foreign travel obligations for fiscal years 1994, 1995, and 1996, and estimates for fiscal year 1997.

Answer. Foreign travel obligations for fiscal years 1994, 1995, and 1996, and estimates for fiscal year 1997 are as follows:

<i>Fiscal year</i>	
1994	\$2,030,978
1995	1,654,038
1996	2,012,667
1997 est	1,516,300

Question. How many ARS personnel were engaged in foreign trips in these years and for what purposes?

Answer. The number of employees performing foreign trips for these years is as follows: 1,363 in fiscal year 1994; 1,226 in fiscal year 1995; 995 in fiscal year 1996; and 654 estimated for fiscal year 1997.

The majority of foreign travel was to present scientific findings at international conferences, collaborate and review research at international organizations, and collect germplasm and biological control organisms in foreign countries.

MANAGEMENT COSTS

Question. How much will ARS expend for Headquarters management costs in fiscal year 1997?

Answer. ARS will expend approximately \$56.1 million for Headquarters management costs in fiscal year 1997.

Question. How does this correspond to your 10 percent program assessment?

Answer. The \$56.1 million expenditure excludes field management costs for the Area Administrative Offices and Area Directors of \$15.1 million. The combination of these two costs correspond to the Agency's overhead program assessment.

Question. Please list your management and FTE's by function e.g., Personnel, Contracting, Accounting etc., and location for fiscal year 1995 and estimated fiscal year 1996.

Answer.

PART 1

826

WASHINGTON, DC, AREA

PART 1

827

According to your responses to Committee questions last year, ARS planned to spend \$69,833,000 for management costs in 1996 and 1997—about 10 per cent.

Question. ARS proposes to reduce headquarters management by \$550,000 in 1998. This amounts to 2 per cent of the ARS proposed reductions of \$23 million in 1998. It appears that research is being reduced at a much greater rate than management. What is your rationale?

Answer. The Agency had, in the past, received reductions in its administrative overhead activities. These administrative savings were, however, offset by corresponding increases for pay and inflation costs thereby eliminating the need for showing actual reductions in these activities. In the fiscal year 1998 Budget, the Agency proposed more specific reductions for administrative activities carried out at Headquarters with follow up reductions in fiscal year 1999 for both Headquarters and field administrative activities. This action is in line with the Agency's policy to reverse the continuing reduction in its scientific force by protecting research related dollars at every opportunity.

Question. According to your response last year, ARS reported as a result of REE management reorganization effective April 30, 1995, combining resources of ARS, CSREES, ERS, and NASS, of over 460 FTE's, you achieved savings of only 3.7 FTE's. This is a negligible savings. Please explain this result.

Answer. The limited savings in FTE were due to a commitment to place all administrative and financial management staff in the new organization.

Question. A major reason for reorganization was to achieve savings in costs and FTE's. By Agency and in total dollar resources, how much money was allocated for management services before the reorganization and subsequently allocated by them.

Answer. The following table reflects the resources allocated to management services before and after the reorganization by Agency:

[Dollars in thousands]

	Before	After
ARS	\$20,272.3	\$19,999.4
ERS	3,306.5	2,783.7
NASS	3,306.5	3,200.1
CSREES	2,223.1	2,972.9
Total	29,108.4	28,956.1

Question. How much money has been saved through this reorganization effort?

Answer. We achieved savings of \$152,300 through this reorganization.

Question. How will ARS implement its \$550,000 Headquarters reductions in fiscal year 1998?

Answer. The reduction of \$550,000 in management costs in fiscal year 1998 is tentatively planned to be applied proportionally to the ARS Headquarters program and administrative support staffs.

Question. How will it achieve proposed management reductions in fiscal year 1999?

Answer. Alternatives to achieve efficiencies in Headquarters and in the field management activities are currently under review and assessment by the Agency leadership.

PANAMA CITY

Question. ARS Explanatory Notes indicates \$898,300 and 4 FTE's located at Panama City, Panama. Describe the programs carried out at this location.

Answer. ARS screwworm research is carried out in Panama City. This program is focused on three principal activities in support of APHIS and FAO screwworm eradication efforts in Central America and the Caribbean region respectively. These include: characterization of screwworm habitats in Panama using remote sensing technology; improvement of screwworm surveillance, trapping and monitoring methods which includes development of an "Artificial Wound" technology for survey and trapping of feral screwworm populations; and conducting studies on ecology, biology and population dynamics of screwworm populations in the Caribbean region.

MONTPELLIER, FRANCE

Question. The ARS Montpellier, France location estimates a program level of \$1,728,700. Please describe the program carried out here.

PART 1

828

Answer. United States agriculture is subjected to a constant invasion of foreign insect and weed pests which gain entry through human immigration and accelerated agricultural trade of diverse commodities. Many of these foreign insect and weed pests enter the United States without any of the natural enemies which keep them at nondamaging levels in their native lands. To combat this threat to U.S. agriculture, forestry, and the environment, the USDA-ARS laboratory in France was established in 1919 to collect and evaluate beneficial natural enemies for eventual import to the U.S. The USDA-ARS laboratory, although located in France, serves as an extension of the ARS domestic program in biological control of invasive insects and weeds. Operationally, the laboratory staff searches for natural enemies of pests in appropriate areas of origin ranging from Europe, Central Asia, and Africa. In cooperation with scientists and quarantine officials in the United States, the ARS staff in France conducts carefully planned tests of natural enemies to ensure that they are safe to U.S. agriculture according to established quarantine procedures. The USDA-ARS laboratory in France provides about 70 percent of all biological control organisms to researchers and cooperators in the United States.

Question. What is the SY capacity of the proposed laboratory? Do you have funds to operate the proposed laboratory at capacity?

Answer. The proposed laboratory is architecturally designed to accommodate the current staff of three ARS scientists which includes one vacancy. The laboratory also will accommodate visiting U.S. scientists, cooperators from U.S. action and regulatory groups, as well as cooperators from foreign research institutions. With present funding levels of \$1,728,700, the research program is adequately funded to operate the laboratory at its full capacity and to accommodate successive TDY visitors of state-side cooperators.

Question. What is the total cost of this laboratory?

Answer. At present, the USDA-ARS laboratory in France is housed in facilities leased from French institutions. To establish the laboratory in Montpellier, two hectares of land were purchased by USDA in 1993 and an architectural design was completed in 1995. The total cost for construction of the permanent facility, at the prevailing Franc/Dollar exchange rate, is \$3.7 million, of which \$3 million of the necessary funding will come from anticipated French financial assistance toward USDA-ARS implantation in Montpellier.

Question. What kind of lease cost comparison has the Agency completed in determining the need for another U.S. laboratory in France?

Answer. The Agency is proposing that a permanent laboratory facility be constructed to relocate present research activities from temporary leased facilities at a savings to U.S. taxpayers. The current short term lease cost is \$197,000 annually including operation and maintenance costs. The facilities being leased are temporary laboratories with minimal quarantine and office space, and inadequate safety features that do not meet the Agency's minimum facility requirements. The proposed new laboratory facility after construction will cost \$130,000 annually to operate and maintain. The proposed facility is necessary to provide adequate laboratory and quarantine space which would otherwise be more costly to lease.

Question. What is the long-term plan for biocontrol research activities in France?

Answer. This USDA laboratory in France has been utilized for 78 years by ARS scientists and state-side cooperators to provide biocontrol agents for immigrant insect and weed pests and thus to protect U.S. Agriculture. As foreign pests continually enter the United States, this ARS laboratory will be a key element for the foreseeable future in the USDA biological control strategy for the long term well-being of U.S. agriculture.

FOREIGN LOCATIONS

MONTPELLIER, FRANCE

Question. Your request for construction is \$3.4 million in the 1998 budget. If the Congress provides these funds, will this be sufficient to meet your program requirements?

Answer. The total fiscal year 1998 appropriation need of \$3.4 million for the new USDA-ARS laboratory in France will be sufficient to meet program needs. It is expected that French subventions totaling \$300,000 will be made available in view of the overall project cost of \$3.7 million.

Question. Does the Agency have plans to add or expand laboratory and related facilities?

Answer. The new USDA-ARS laboratory in France will provide 850 gross square meters of office, laboratory, and headhouse/greenhouse space to operate in an efficient and effective manner. While the Agency has no plans to add to the facilities, the project, as designed has the capability of being expanded in out years if future

PART 1

829

domestic pest problems were to require an accelerated program for discovery and evaluation of beneficial biological control organisms.

BUENOS AIRES, ARGENTINA

Question. ARS is also located at Buenos Aires, Argentina. Describe the program carried out here.

Answer. The Buenos Aires location primarily serves as a support facility for insect and weed control programs significant to the United States. The primary scientific area of emphasis is the biological control of exotic insect and weed pests from South America. Several weed species common to Florida and the American Southwest have their source of origin in Patagonia, the Pampas, or the tropical regions of Brazil and the tropical Parana River Basin of Brazil, Argentina and Paraguay.

Among the primary target insect species are fire ants, corn rootworm, corn earworm and sweet potato/silverleaf whitefly. Among the economically important weeds are water hyacinth, tropical soda apple, snakeweed, itchgrass and hydrilla.

In addition to funding support from participating ARS laboratories in the U.S., particularly Gainesville, Florida, the ARS Buenos Aires Laboratory (SABCL) maintains cooperative relationships with the University of Arkansas, the Army Corps of Engineers, South Florida Water Management District, APHIS (USDA), and international research institutions.

Question. List accomplishments resulting from the work at this location.

Answer. Currently, fire ant is the primary Target insect of the ARS Buenos Aires research program (SABCL). Promising beneficial parasitic wasps and pathogens of the ant have been discovered by SABCL personnel in Central Brazil. A parasitic wasp has been identified and evaluated under quarantine conditions and is in the final stage of clearance for field release in Florida.

Increasingly, water hyacinth, an exotic weed introduced from the Parana Basin of Brazil, has created major water management problems in the Gulf States and Florida. Similar infestations in Africa have gained major international attention. In March 1997, the World Bank hosted an international Water Hyacinth Conference in Washington, D.C. As a consequence of these proceedings, SABCL, in cooperation with other Federal agencies, universities and research institutions will be involved in a coordinated effort to attack this problem. SABCL, with a permanent institutional base at the source of origin of hyacinth, is ideally situated to take the lead in exploratory activities designed for biological control. Several herbivorous beetles have been collected and are now under evaluation for use as biological control agents in the U.S.

BUILDINGS AND FACILITIES

Question. Please provide the Committee with costs and projects completed and planned for the modernization of each of ARS' Regional Research Centers.

Answer. The Department has established a Facility Task Force to investigate the utilization of Agricultural research facilities. Pending the results of this Task Force, the status of modernization efforts at the four Regional Research Centers is as follows:

Southern Regional Research Center (SRRC).—The SRRC Modernization involved a complete renovation of the surrounding site and Chemical Wing and included such items as asbestos abatement, new and upgraded drainage, landscaping, equipment pads, pavement repairs, retaining walls, and handicapped ramps. Work to the interior of the building will include replacement of HVAC systems, reconfiguring each laboratory module, new stairwell to comply with safety codes, replacement of floor finishes, new windows and complete patched, primed, and painted walls and ceilings as necessary. Total cost is estimated at \$17.8 million, phased over 9 years.

The design of the Chemical Wing project is complete. Construction for Phase I was awarded in fiscal year 1991 for \$1.4 million. Phase II was awarded in fiscal year 1992 for \$2.4 million using Agency funds. Phases III, IV, and V were awarded in fiscal year 1992 for \$5 million. (In fiscal year 1992, \$1,950,000 was specifically appropriated for Phase II. However, this budget line item amount was not sufficient to pay the cost of Phase II which totals \$2.7 million for construction, contingency, and architect-engineer inspection services. The \$1,950,000 was used to award Phase V.) In fiscal year 1994, \$2.667 million was appropriated for Phase VI of the Chemical Wing and in fiscal year 1995, \$2.934 million was appropriated for construction of Phase VII. These phases were awarded in fiscal year 1996. Design and construction of Phase I site repair work was funded using \$1,651,000 in fiscal year 1993 appropriations. The fiscal year 1996 appropriation of \$900,000 was used to award Phase 2 of the site repair work.

PART 1

830

The remaining elements of SRRC that need to be modernized are the Administration Wing, Textile Wing, and the Industrial Wing. It is estimated the completion of the SRRC modernization program will require an additional \$22.65 million.

Eastern Regional Research Center (ERRC).—In fiscal year 1993, ARS completed the facility modernization study begun in fiscal year 1992. The findings indicate that the utilities and building infrastructures have reached the end of their useful lives, and the facility itself has been overtaken by the evolution of codes, Agency criteria, and research needs over the past 50 years.

The proposed modernization program will occur in 9 phases with a total planning, design, and construction budget of \$39 million over 9 years.

In fiscal year 1994, ARS funded design of Phase I (Service Building) and Phase II (Engineering Research Laboratory in Pilot Plant) with \$595,000 in Repair and Maintenance funds. In fiscal year 1995, ARS funded construction of Phase I, and design of Phases III through VII, using \$4,175,000 in Repair and Maintenance funds. In fiscal year 1996, ARS funded construction of Phase II using \$4,100,000 in Repair and Maintenance funds. In fiscal year 1997, \$4,700,000 was needed to fund construction of Phase III, and \$4 million was appropriated.

In fiscal year 1988, \$5,200,000 is needed to complete funding of Phase III and fund construction of Phase IV leaving a balance of \$20,851,000 to complete modernization. This additional modernization need will be met with a combination of Repair and Maintenance and Building and Facility funds.

Western Regional Research Center (WRRC):

1. WRRC modernization includes the upgrade of outside utilities and complete renovation of the North Wing. The renovation includes asbestos and lead abatement, upgrade of existing HVAC system, laboratory reconfiguration to comply with safety and accessibility codes, replacement of all laboratory counters and tops, replacement of floor and windows, and completely patch, prime, and paint walls and ceilings as necessary. Total cost is \$29.6 million phased over a 7-year period.

2. The design is complete for all phases. Phases I and II were awarded in fiscal year 1990 for \$5.9 million. Phase III was awarded in fiscal year 1991 in the amount of \$3.4 million. Phase IV was awarded in fiscal year 1993 in the amount of \$3.0 million. Phases V and VI were awarded in fiscal year 1993 in the amount of \$4.4 million and \$3.2 million. Construction for Phase VI is expected to be complete by the third quarter of fiscal year 1997.

3. Total construction funds committed to date for 6 phases—\$23.5 million.

4. In fiscal year 1997, \$6.08 million is available to award Phase VII construction and A-E support services. In fiscal year 1994, fiscal year 1995, and fiscal year 1997 \$1.161 million, \$.919 million, and \$4.0 million were appropriated for construction of Phase VII. The Area funded all necessary fine tuning costs. Construction for Phase VII is expected to be complete by the fourth quarter of fiscal year 1998.

5. The Small Animal Facility (West Annex Building) planning, design, and construction is complete for Phase I. Design of Phases II and III was completed in the third quarter of fiscal year 1994. The construction of Phases II and III was awarded in the fourth quarter of fiscal year 1994. Construction was completed in the fourth quarter of fiscal year 1996. The design and construction costs for all three phases is approximately \$5.0 million.

6. A construction contract was awarded in September 1995 using Agency funds in the amount of \$800,000 to upgrade the building envelope of the Research and Development Facility (RDF) (Pilot Plant) which includes Food Processing Laboratory and Industrial Processing Laboratory. Concurrently, a program of requirements is being developed using Agency funds, \$180,000, for the modernization of RDF. This facility occupies the south wing of WRRC encompassing approximately 21,000 square feet of space. The estimated design and construction cost for this project is \$15,000,000.

National Center for Agricultural Utilization Research (NCAUR):

1. The National Center for Agricultural Utilization Research is currently proceeding with a facilities upgrade design and construction program, as follows:

Phase IA—Utility Tunnel, Steam Lines, and Boiler: Construction contract was awarded in the fourth quarter of fiscal year 1991. Construction was completed in the second quarter of fiscal year 1995. Total project cost of \$2.5 million is for construction.

Phase IB—Electrical and Drain System Upgrade: Construction contract was awarded in the third quarter of fiscal year 1992. Total cost of \$.9 million is for construction. Construction was completed in the first quarter of fiscal year 1994.

PART 1

831

Phase IID—Pilot Plant and Semi-Works Building Upgrades: Total cost for design is \$1,825,000 which was appropriated in fiscal year 1992. The design for Phase II was awarded in fiscal year 1992 and is complete.

2. Appropriations to Date: fiscal year 1992—\$1,825,000 Planning and Design for Phase II Pilot Plant; fiscal year 1993—\$1,545,000 Planning and Design for Phase III Chemical Wing.

3. In fiscal year 1996 and fiscal year 1997, \$3.9 and \$1.5 million has been appropriated instead of \$11.7 million requested to implement modernization efforts. A revised phasing plan was necessary to renovate the Pilot Plant and Semi-Works Building. A phased renovation plan was developed in fiscal year 1996 and recommended a three-phase renovation plan for the North Wing. The initial phase (Segment I of Phase IID) will renovate four modules of the Pilot Plant, add mechanical rooms and an exterior stairway. Estimated planning, design, and construction cost is \$5.4 million for this segment. Construction will be awarded in the fourth quarter of fiscal year 1997.

4. The remaining two segments are: Segment 2 of Phase IID: This segment will renovate adjoining areas in the North Wing. General laboratory, support space, and testing facilities will be provided to support the Pilot Plant modules. The Semi-Works Building will be renovated to support infrastructure of the Center. Estimated planning, design, and construction cost of \$8.0 million is needed in fiscal year 1998. Segment 3 of Phase IID: This segment will renovate additional laboratory, support space, and testing facilities will be provided to support the Pilot Plant modules. Estimated planning, design, and construction cost is \$8.4 million (escalated to 1999).

5. Additional funding needed which has been escalated to the planned year of implementation is \$70.2 million. This will complete planned modernization efforts at the Center.

Question. Please provide the Committee with an update of the costs and projects completed and planned for the modernization of the Beltsville Agricultural Research Center.

Answer. Beltsville Agricultural Research Center (BARC):

Through fiscal year 1997, a total of \$103,416,792 has been expended on the modernization of BARC. The attached is a listing of projects that have been completed, initiated, or are proposed for fiscal year 1998. The funding source for these projects is the Building and Facility Modernization funding.

Projects currently underway include the construction of a Controlled Environment Facility. This will consolidate plant growth chambers in one building which will reduce staffing needs to monitor the chambers as well as increase energy efficiency. Construction of the gut and rebuild of Building 004 (Plant Sciences) is scheduled to begin in July 1997.

In fiscal year 1998, BARC plans to utilize the limited funding to upgrade the infrastructure of the Center Road Building Complex Area. This will prepare the area for the proposed construction of the Human Nutrition Wing (70,000 square feet), as well as the gut and rebuild of the existing Human Nutrition Building—Building 308 (69,300 square feet). Future work in this area includes the gut and rebuild of the adjacent Buildings 306 and 307; these facilities are needed for modernization of the Livestock and Poultry Sciences Institute. The design of the Human Nutrition Wing is scheduled to begin in late fiscal year 1997, in anticipation of construction funds in fiscal year 1999.

The clustering of animal buildings is another priority of BARC. A site plan for all animal buildings has been completed. As funds become available, design and construction will begin. This will ensure that BARC's animal buildings satisfy all animal care guidelines. In fiscal year 1998, a new Feed Center will be built near the Dairy Complex. This will replace the existing out-dated granary facility. In future years, BARC plans on gutting and rebuilding Building 200 (52,000 square feet) which is used for research on livestock and poultry-related issues. We anticipate that the design of a new swine parasitology barn will be awarded by early fiscal year 1998 with construction scheduled immediately after the design is complete. The design of two new poultry barns is also scheduled for award during fiscal year 1998. Funds for construction of the new poultry buildings will be included in future budget requests. This will advance the clustering of animal buildings which is needed for security reasons. Additional infrastructure upgrades will be needed to support renovated buildings and additional research facilities on the east side of BARC.

Beltsville Agricultural Research Center (BARC) Modernization—Fiscal year 1988

Renovate Building 007	\$2,000,000
Design Building 003	660,859
Renovate Abattoir, Building 204	57,446
Renovate Building 303	506,877

PART 1

832

Modify HVAC, Building 306	372,270
Water Lines	1,402,195
Miscellaneous Projects, BARC (under \$100,000)	374,234
Repair Building 307	88,064
Repair Building 467	10,835
Repair Building 264	5,480
Small Animal Facility Contingency	271,740
Total	5,750,000

Fiscal year 1989

U.S. National Arboretum Roof Repairs	\$300,852
U.S. National Arboretum Greenhouse Electrical Repairs	273,200
Steam Lines, Phase IV	1,100,000
Oil to Gas Conversion	328,237
Renovate Building 203 (Boar Facility)	529,026
U.S. National Arboretum, Relocate Service Road	87,643
Hazardous Waste Marshalling Facilities	79,662
Waste Water Treatment Study	194,864
Renovate Building 204	354,335
Beltsville Area Security	91,806
Pesticide Handling Facilities	441,793
Swing Space	274,100
Miscellaneous Projects	44,482
USNA Brickyard	2,000,000
Total	6,100,000

Fiscal year 1990

Steam Lines, Building 169-179	\$568,752
Steam Lines, Buildings 001-011A	1,407,084
Range 2 Modernization	690,574
Waste Water Treatment Facility	1,100,056
Electrical Distribution System	574,157
BARC Roads	361,027
Animal Parasitology Unit Planning	30,282
HVAC System, Building 050	44,598
Repair Embankment Failure	211,135
Powder Mill Road	1,547,588
Swing Space	103,685
Brooder House	230,000
Renovate Building 043, 046, 047	148,591
Annual Painting	200,098
Annual Roofing	247,582
U.S. National Arboretum Storage Building	90,402
U.S. National Arboretum Plastic Greenhouses (3)	235,687
Demolition of Facilities	27,985
Replace Chiller, Building 006	103,965
Renovate Building 209	71,693
Renovate Headhouse 16	35,124
Repairs Building 177B	12,465
Repairs Building 211	7,965
Renovate Building 1120	18,391
Elevator, Building 449/Gas Cyl	50,954
Renovate Building 449	4,865
Key Card Security Gate	37,002
Small Miscellaneous Projects	625,031
Repairs, Building	15,000
Contingency Steam Lines	297,170
Contingency	197,604
Replace Roof, Building 012	139,000
Contingency	194,488
Total	9,860,000

Fiscal year 1991

Addition, Building 426	\$65,000
------------------------------	----------

Total	3,200,000

BUILDINGS AND FACILITIES

Question. Please provide the Committee with costs and projects completed and planned for the modernization of the Plum Island Animal Disease Center.

Answer. Plum Island Animal Disease Center (PIADC): Modernization projects at PIADC are as follows:

Fiscal year 1992

Consolidation (C)	\$18,400,000
-------------------------	--------------

Fiscal year 1993

Underground Storage Tank Removal/Replacement (C)	\$443,000
Wastewater Treatment Plant (C)	185,000
Boiler Rental (C)	304,000
Incinerator Repair (C)	74,000
Environmental Assessment (S)	33,000
Chiller Plant (C)	1,400,000
Sludge Removal (C)	500,000
Miscellaneous Projects	784,000
Total	3,723,000

Fiscal year 1994

Wastewater Treatment Plant (C)	\$1,250,000
Miscellaneous Projects	741,250
Total	1,991,250

Fiscal year 1995

Above-Ground Fuel Tanks (Phase I) (C)	\$1,168,000
Miscellaneous Projects	747,000
Total	1,915,000

Fiscal year 1996

Upgrade Fire Alarm System B-101 (D/C)	\$1,000,000
Above-Ground Fuel Tanks (Phase 2) (C)	1,000,000
Wastewater Treatment Plant Closure (C)	1,500,000
Boiler Plant Design	500,000
PCB Transformer Replacement (D/C)	51,000
Miscellaneous Projects	1,006,000
Renovate B-102 (D)	250,000
DOE-National Renewable Energy Lab Support	280,000
Plum Island Harbor Repairs (D/C)	1,514,000
Install Chiller (D/C)	900,000
Electric/Telephone Distribution System (D)	199,000
Total	8,200,000

Fiscal year 1997

Above-Ground Fuel Tanks (Phase 3) (C)	\$1,400,000
Underwater Electric Cable (C)	2,000,000
Sewage Decon Plant (D)	500,000
Miscellaneous Projects	500,000
Upgrade Pathological Incinerators (D)	400,000
Electric/Telephone Distribution System (C)	2,800,000
Energy Savings Performance Contract Windmill Proposal(s)	600,000
Total	8,200,000

Total for fiscal year 1992 through fiscal year 1997	42,429,250
------------------------------------------------------------------	-------------------

PART 1

835

Future modernization efforts at PIADC will address numerous infrastructure and physical plant repair and improvements. While the original modernization plan was estimated at \$81 million in fiscal year 1995 dollars, inconsistent funding levels have resulted in a higher cost.

Question. Please provide the Committee with costs and projects completed and planned for the modernization of the Subtropical Agricultural Research Laboratory at Weslaco, Texas.

Answer. The Modernization Plan for the Subtropical Agricultural Research Laboratory in Weslaco, Texas, established six phases for execution as listed below:

Phase 1: Planning and Design—This phase completed the Environmental Assessment for the entire modernization effort and initiated the Program of Requirements for Phases 2 and 3. Demolition of some existing dilapidated buildings was accomplished during this phase.

Construction Cost—\$93,000

Planning and Design Cost—\$322,000

Status—Design and construction was completed in the first quarter of fiscal year 1996.

Phase 2: Site Preparation and Utility System Upgrade—Projects in this phase upgrade the water, sanitary, electrical, and storm drainage systems at the main laboratory campus. Recently acquired property is cleared of existing structures in preparation for a new laboratory facility to be constructed in Phase 3. Some grading and landscaping work is accomplished as well as construction of a new entrance road serving the site.

Construction Cost—\$1,278,000

Planning and Design Cost—\$69,800

Status—Design efforts for the Phase 2 projects are completed.

Construction contract was awarded in July 1996.

Phase 3: Construct New Laboratory Facility, Building N-01—This phase constructs a new laboratory and office building of approximately 24,700 gross square feet. The new facility will house the Crop Quality and Fruit Insect Research Unit as well as the Laboratory Director and administrative support staff. Also included in this phase is renovation of two existing greenhouses and construction of four new greenhouses.

Construction Cost—\$6,773,000

Planning and Design Cost—\$570,400

Status—Design for the new laboratory is complete. Construction contract award is anticipated in July 1997. Design for the renovation of two greenhouses and construction of two greenhouses is completed. A construction contract was awarded in April 1997. Design for the remaining two greenhouses has not started. The construction of these facilities is partially funded.

Phase 4: Construct Operations Support Facilities and Renovate Research Facilities—This phase constructs a pesticide storage and handling facility, farm implement storage facility, and a shipping and receiving facility. It includes renovation of the primary existing research building as well as headhouse and greenhouse space on the main research campus, Highway 83 site.

Construction Cost—\$4,290,300

Planning and Design Cost—\$377,200

Status—Design for the operations support facilities has been completed, construction is scheduled for fiscal year 1998. The design for renovation of the research facilities began in fiscal year 1997 and award of a construction contract is scheduled in fiscal year 1998. These construction projects are not currently funded.

Phase 5: Renovation of Existing Laboratory Facilities—This phase renovates existing headhouse and laboratory space in Buildings 205, 221, 414, and 202 located at both the Highway 83 campus and the FM1015 site.

Construction Cost—\$2,890,400

Planning and Design Cost—\$218,300

Status—The design for renovation of these research facilities is scheduled to begin in fiscal year 1998 and award of a construction contract in fiscal year 1999. The design and construction of these projects is not currently funded.

Phase 6: Renovation of Existing Laboratory Facilities—This phase completes renovation of the existing laboratory facilities in Buildings 203 and 204 located at the Highway 83 campus. It also accomplishes demolition of existing facilities which have been retained as swing space during the modernization effort.

Construction Cost—\$3,218,900

Planning and Design Cost—\$328,100

Status—The design for renovation of these research facilities is scheduled to begin in fiscal year 1998 and award of a construction contract in fiscal year 1999. The design and construction of these projects is not currently funded. The total estimated

PART 1

planned, design, and construction costs for the modernization at this facility is \$20.5 million.

Question. Please provide obligations to date and projected funding requirements for major modernization projects planned by ARS.

Answer. Obligations and projected funding requirements are as follows:

Modernization location	Obligations to date	Balance of funding required
California—Albany	\$38,270,227	\$15,000,000
Illinois—Peoria	4,780,600	70,200,000
Iowa—Ames	1,620,550	139,000,000
Louisiana—New Orleans	17,836,000	22,650,000
Maryland:		
Beltsville	73,072,837	102,000,000
NAL		18,000,000
Michigan—East Lansing	462,000	18,100,000
New York—Plum Island	15,829,000	66,000,000
Pennsylvania—Wyndmoor	4,870,000	25,700,000

The “Balance” represents remaining modernization project funding requirements that were either originally identified via facility condition studies, the development of Program of Requirement documents, in-house estimates, or design drawings. Obligations to date for these projects was either congressionally funded through the Agency’s Buildings and Facilities account, or through the Agency’s Annual Repair and Maintenance budget line item appropriation.

Question. Please provide obligations and projected funding requirements for each major new construction project.

Answer. Obligations and projected funding requirements for each major new construction project are as follows:

Construction locations	Obligations to date	Balance of funding required
California—Parlier	\$1,503,716	\$23,400,000
Florida—Ft. Lauderdale	43,000	4,000,000
France—Montpellier	500,000	3,400,000
South Carolina—Charleston	1,176,570	14,030,000
Texas—Lubbock	1,367,079

The “Balance of Funding Required” represents remaining construction project funding requirements that were either originally identified via the development of Program of Requirement documents, in-house estimates, or design drawings. Funding to date for these projects was either congressionally funded through the Agency’s Buildings and Facilities account, or through the Agency’s Annual appropriation.

Question. The Committee appropriated \$18.3 million to ARS for Repairs and Maintenance of Facilities in fiscal year 1996. How were these funds used?

Answer. The fiscal year 1996 repair and maintenance budget was \$18.262 million. This amount includes \$14.246 million in Agency funds, \$900,000 for the National Agricultural Library, \$740,000 for the USNA, and \$2.376 million in BARC Renaissance 1993 funds. Some of the types of repair and maintenance projects funded in fiscal year 1996 include: bridge repairs, roof repair, HVAC repair, plumbing repairs, upgrade to sewage lines, electrical repairs, fencing replacement, painting, pavement repair, asbestos and lead abatement, accessibility projects, and replacement of fire alarm systems.

Question. What are the planned use of these funds in fiscal year 1997?

Answer. Some of the types of repair and maintenance projects scheduled in fiscal year 1997 include: upgrades to building systems such as HVAC, plumbing, sewage lines, water treatment facilities, electrical, roof repairs, accessibility requirements, CFC replacement, asbestos, and lead abatement; removal of underground storage tanks; correcting building and life safety code deficiencies; repair of pavement; energy surveys and retrofits, and harbor repairs.

Question. The Budget Appendix reflects year-end 1995 unobligated balances for \$105 million for Building and Facilities. Identify these balances by project.

PART 1

837

Answer. The Budget Appendix reflects a year-end 1996 (September 30, 1996) unobligated balance of \$79.1 million for Building and Facilities. The balance by project is as follows:

<i>Location</i>	<i>Balance</i>
Arizona, Maricopa—Water Conservation Laboratory	\$396,000
Arkansas, Stuttgart—Rice Center	1,064,604
California:	
Albany—Western Regional Research Center	3,370,443
Parlier—Horticultural Crop Research Laboratory	2,630,000
Riverside—U.S. Salinity Laboratory	881,353
Colorado, Ft. Collins—Storage Laboratory	117,648
District of Columbia, National Arboretum	(9,896)
Florida, Ft. Pierce—Horticultural Laboratory	4,524,982
France, Parlier California, Florida	470,001
Hurricane Andrew/Iniki—Florida, Hawaii, Louisiana	13,053,794
Georgia, Athens—Poultry Disease Laboratory	935,665
Illinois, Peoria—National Center for Agriculture Utilization Research	5,165,176
Indiana, Lafayette—Purdue University	9,892
Iowa, Ames—	
Swine Center	2,111,664
National Animal Disease Center	411,745
Kansas, Manhattan—Grain Marketing Research Laboratory	1,201,641
Louisiana, New Orleans—Southern Regional Research Laboratory	889,293
Maryland, Beltsville—Modernization	16,272,258
Massachusetts, Boston—Nutrition Center	33,031
Michigan, East Lansing—Regional Poultry Research Laboratory	2,327
Minnesota, Morris—Soil and Water Laboratory	43,454
Nebraska, Clay—Meat Animal Research Center	19,985
New York, Greenport—PIADC	4,693,853
North Dakota, Fargo—	
Research Laboratory, North Dakota State University (NDSU)	14,561
Greenhouse, NDSU	4,781
Oklahoma:	
Lane—Farm Experiment Station	231
Lane—Agricultural Research Facility	44,860
Woodward—Greenhouse	355
Oregon, Corvallis—Northwest Small Fruit Center	5,198
South Carolina, Charleston—	
Feasibility Study	635
Construction Vegetable Laboratory	9,460,795
Texas:	
Lubbock—Plant Stress Laboratory	5,534,207
Lubbock—Cons Moisture Laboratory	1,714
Weslaco—Plan ARS Bee Laboratory	71,287
Weslaco—Southern Agricultural Research Center Modernization	3,788,340
Washington, Yakima—Fruit/Vegetable Laboratory	321
West Virginia—National Aquaculture Center	1,821,651
Wisconsin, Madison—Greenhouse	12,176
Total	79,050,025

It is expected that the unobligated balance at the end of fiscal year 1997 will be \$53,400,000.

Question. Congress appropriated \$3.9 million in fiscal year 1994 to complete the construction of the Necropsy incinerator and at the National Animal Disease Center. In fiscal year 1996, Congress agreed to the department reprogramming request providing an additional \$700,000 to complete this project. When will this project be completed?

Answer. The contract completion date is June 30, 1997. However, due to delays in shipping, the high efficiency particulate air (HEPA) filters, which are critical to the overall biocontainment, the Necropsy/Incinerator building may not be completed until August 29, 1997.

Question. The Committee understands that once the Necropsy incinerator facility is complete, there will remain serious biocontainment problems. Is this true? Please explain? How much more money will be required to remedy this problem and how will it be financed?

PART 1

838

Answer. Currently the NADC does high-level biocontainment work in Buildings 3 and 4. Pathological waste generated in these buildings is incinerated in the Building 4 incinerator (the incinerator in Building 3 is only used on an emergency or backup basis because of its deteriorating condition). After the Necropsy Incinerator facility is completed and operating, high-level biocontainment waste will be incinerated in this facility and in Building 4.

However, there will be a need for an animal transport vehicle to transport live infectious, or potentially infectious animals from the area where the research is conducted to the Necropsy Incinerator facility. Materials from other containment buildings, including Building 3, will have to be transported to either Building 4 or the Necropsy Incinerator facility for disposal. This animal transport vehicle must be able to connect via a containment air seal to both the source containment building and the Necropsy Incinerator facility, and be able to maintain Biosafety Level 3-Ag containment security while transporting the animal from the research building to the appropriate incinerator building.

The cost of a Biosafety Level 3-Ag transport vehicle for large animals and associated work to the existing buildings has not yet been determined. It is anticipated that additional Building and Facilities funds will be required for construction of this specialized vehicle.

In the preliminary design, the Necropsy Incinerator facility was to be connected to Building 3 in order to address this transportation problem. However, due to limited funding, and other technical and logistical problems associated with relocation of existing Center utilities and the feasibility of upgrading containment of Building 3, the facility was constructed as a stand-alone building. This decision was consistent with the NADC needs identified in the Facility Condition Study being completed at that time.

The NADC has other existing biocontainment problems that have been identified in the 1992 Facility Condition Study. This fiscal year, the Agency plans to fund the development of a Master Plan that will provide the roadmap for the process by which existing facilities at NADC will be modernized to meet current requirements and standards.

Question. Your justification for BARC modernization states costs in excess of \$190 million, yet the fiscal year 1998 request is only \$3.2 million toward this effort. Which is realistic, the \$190 million requirement or the 1.5 percent increase requested to meet this need?

Answer. The \$190 million plus requirement is a realistic estimate of the cost to modernize BARC. The limited increase requested in fiscal year 1998 is due to other higher priority ARS facility project needs. Each year every project must compete with other Agency and Department projects for funding, and decisions are made accordingly.

Question. Each year modernization funds are requested for various phases of ARS utilization centers. Provide for each center, phases completed and the work and costs involved. Also, provide the remaining phase, cost and work to be done.

Answer. The Department has established the Strategic Planning Task Force as required by the 1996 Farm Bill to investigate the utilization of Agricultural research facilities. Pending the results of this Task Force, modernization plans at the four ARS utilization centers are as follows:

Southern Regional Research Center (SRRC).—The SRRC Modernization involved a complete renovation of the surrounding site and Chemical Wing and included such items as asbestos abatement, new and upgraded drainage, landscaping, equipment pads, pavement repairs, retaining walls, and handicapped ramps. Work to the interior of the building will include replacement of HVAC systems, reconfiguring each laboratory module, new stairwell to comply with safety codes, replacement of floor finishes, new windows and complete patched, primed, and painted walls and ceilings as necessary. Total cost is estimated at \$17.8 million, phased over 9 years.

The design of the Chemical Wing project is complete. Construction for Phase I was awarded in fiscal year 1991 for \$1.4 million. Phase II was awarded in fiscal year 1992 for \$2.4 million using Agency funds. Phases III, IV, and V were awarded in fiscal year 1992 for \$5 million. (In fiscal year 1992, \$1,950,000 was specifically appropriated for Phase II. However, this budget line item amount was not sufficient to pay the cost of Phase II which totals \$2.7 million for construction, contingency, and architect-engineer inspection services. The \$1,950,000 was used to award Phase V.) In fiscal year 1994, \$2.667 million was appropriated for Phase VI of the Chemical Wing and in fiscal year 1995, \$2.934 million was appropriated for construction of Phase VII. These phases were awarded in fiscal year 1996. Design and construction of Phase I site repair work was funded using \$1,651,000 in fiscal year 1993 appropriations. The fiscal year 1996 appropriation of \$900,000 was used to award Phase 2 of the site repair work.

PART 1

839

The remaining elements of SRRC that need to be modernized are the Administration Wing, Textile Wing, and the Industrial Wing. It is estimated the completion of the SRRC modernization program will require an additional \$22.65 million.

Eastern Regional Research Center (ERRC).—In fiscal year 1993, ARS completed the facility modernization study begun in fiscal year 1992. The findings indicate that the utilities and building infrastructures have reached the end of their useful lives, and the facility itself has been overtaken by the evolution of codes, Agency criteria, and research needs over the past 50 years.

The proposed modernization program will occur in 9 phases with a total planning, design, and construction budget of \$39 million over 9 years.

In fiscal year 1994, ARS funded design of Phase I (Service Building) and Phase II (Engineering Research Laboratory in Pilot Plant) with \$595,000 in Repair and Maintenance funds. In fiscal year 1995, ARS funded construction of Phase I, and design of Phases III through VII, using \$4,175,000 in Repair and Maintenance funds. In fiscal year 1996, ARS funded construction of Phase II using \$4,100,000 in Repair and Maintenance funds. In fiscal year 1997, \$4,700,000 was needed to fund construction of Phase III, but only \$4 million was appropriated. In fiscal year 1998, \$5,200,000 is needed to complete funding of Phase III and construction of Phase IV leaving a balance of \$20,851,000 to complete Phases V through IX modernization. These phases will complete work in the Chemical and Pilot Plant wings. This additional modernization need will be met with a combination of Repair and Maintenance and Building and Facility funds.

Western Regional Research Center (WRRC):

1. WRRC modernization includes the upgrade of outside utilities and complete renovation of the North Wing. The renovation includes asbestos and lead abatement, upgrade of existing HVAC system, laboratory reconfiguration to comply with safety and accessibility codes, replacement of all laboratory counters and tops, replacement of floor and windows, and completely patch, prime, and paint walls and ceilings as necessary. Total cost is \$29.6 million phased over a 7-year period.

2. The design is complete for all phases. Phases I and II were awarded in fiscal year 1990 for \$5.9 million. Phase III was awarded in fiscal year 1991 in the amount of \$3.4 million. Phase IV was awarded in fiscal year 1993 in the amount of \$3.0 million. Phases V and VI were awarded in fiscal year 1993 in the amount of \$4.4 million and \$3.2 million. Construction for Phase VI is expected to be complete by the third quarter of fiscal year 1997.

3. Total construction funds committed to date for 6 phases—\$23.5 million.

4. In fiscal year 1997 \$6.08 million is available to award Phase VII construction and A-E support services. In fiscal year 1994, fiscal year 1995, and fiscal year 1997 \$1.161 million, \$.919 million, and \$4.0 million were appropriated for construction of Phase VII. The Area funded all necessary fine tuning costs. Construction is expected to be complete by the fourth quarter of fiscal year 1998.

5. The Small Animal Facility (West Annex Building) planning, design, and construction is complete for Phase I. Design of Phases II and III was completed in the third quarter of fiscal year 1994. The construction of Phases II and III was awarded in the fourth quarter of fiscal year 1994. Construction was completed in the fourth quarter of fiscal year 1996. The design and construction costs for all three phases is approximately \$5.0 million.

6. A construction contract was awarded in September 1995 using Agency funds of \$.800 million to upgrade the building envelope of the Research and Development Facility (RDF) (Pilot Plant) which includes Food Processing Laboratory and Industrial Processing Laboratory. Concurrently, a program of requirements is being developed using Agency funds, \$.180 million, for the modernization of RDF. This facility occupies the south wing of WRRC encompassing approximately 21,000 square feet of space. The estimated design and construction for this project is \$15 million.

National Center for Agricultural Utilization Research (NCAUR):

1. The National Center for Agricultural Utilization Research is currently proceeding with a facilities upgrade design and construction program, as follows:

Phase IA—Utility Tunnel, Steam Lines, and Boiler: Construction contract was awarded in the fourth quarter of fiscal year 1991. Construction was completed in the second quarter of fiscal year 1995. Total project cost of \$2.5 million is for construction.

Phase IB—Electrical and Drain System Upgrade: Construction contract was awarded in the third quarter of fiscal year 1992. Total cost of \$.9 million is for construction. Construction was completed in the first quarter of fiscal year 1994.

PART 1

840

Phase IID—Pilot Plant and Semi-Works Building Upgrades: Total cost for design is \$1,825,000 which was appropriated in fiscal year 1992. The design for Phase II was awarded in fiscal year 1992 and is complete.

2. Appropriations to Date: fiscal year 1992—\$1,825,000 Planning and Design for Phase II Pilot Plant; fiscal year 1993—\$1,545,000 Planning and Design for Phase III Chemical Wing.

3. In fiscal year 1996 and fiscal year 1997, \$3.9 million and \$1.5 million have been appropriated instead of \$11.7 million requested to implement modernization efforts. A revised phasing plan was necessary to renovate the Pilot Plant and Semi-Works Building. A phased renovation plan was developed in fiscal year 1996 and recommended a three-phase renovation plan for the North Wing. The initial phase (Segment I of Phase IID) will renovate four modules of the Pilot Plant, add mechanical rooms, and an exterior stairway. Estimated planning, design, and construction cost is \$5.4 million for this segment. Construction will be awarded in the fourth quarter of fiscal year 1997.

4. The remaining two segments are: Segment 2 of Phase IID: This segment will renovate adjoining areas in the North Wing. General laboratory, support space, and testing facilities will be provided to support the Pilot Plant modules. The Semi-Works Building will be renovated to support infrastructure of the Center. Estimated planning, design, and construction cost of \$8.0 million is needed in fiscal year 1998. Segment 3 of Phase IID: This segment will renovate additional laboratory, support space, and testing facilities will be provided to support the Pilot Plant modules. Estimated planning, design, and construction cost is \$8.4 million (escalated to 1999).

5. Additional funding needed which has been escalated to the planned year of implementation is \$70.2 million. This will complete planned modernization efforts at the Center.

Question. Funding of \$3.4 million is requested for fiscal year 1998 to construct a new biocontrol laboratory in Montpellier, France. Funding for this facility has been proposed in the President's budget in previous years but was not approved by the Congress.

The testimony indicates that site acquisition and planning and design work has been completed. When was this funding made available and when was this work completed?

Answer. Two hectares of land for a new laboratory in Montpellier, France, were purchased on September 10, 1992 for \$331,290. Fiscal year 1992 Agency funds were used for this purchase. The architectural design was completed in the fourth quarter of fiscal year 1995. Funding for planning and design was appropriated in fiscal year 1993 in the amount of \$500,000 from miscellaneous appropriations of \$1,200,000.

Question. Why was construction funding for this laboratory not included in the President's fiscal year 1997 request?

Answer. Each year, every project must compete with other Agency and Department projects for funding, and decisions were made accordingly.

Question. What is the total construction cost of this facility?

Answer. The total construction cost for this facility is \$3.7 million of which \$300,000 is expected from French subventions. The fiscal year 1998 appropriation need is \$3.4 million.

Question. Have you determined that ownership is less costly than leasing?

Answer. The Agency has determined that the proposed permanent facility in France will, in the long term operation of the Agency's biological control program, represent a cost savings to U.S. taxpayers. The current short term lease, with inadequate space and facilities, is \$197,000 annually which includes operation and maintenance. The proposed permanent facility, with appropriate quarantine facilities and adequate laboratories, will cost \$130,000 annually to operate and maintain. This cost savings, over the long term will offset the cost of construction and provide superior facilities to conduct an exemplary biological control program.

Question. Why can't research planned for this laboratory be carried out more efficiently by contractors already located in France and Switzerland?

Answer. Montpellier is a major center for agricultural research in Europe and hosts the consortium AGROPOLIS of which ARS is a member. Benefits derived from carefully nurtured relationships with individual scientists and institutions at this location are very important to the Agency's research programs. Yet, this research can be carried out more efficiently by permanent ARS staff than by contractors because ARS Headquarters and NPS maintain direct control of the Agency's program and can respond to emerging and shifting priorities in the United States. ARS has the mandate to meet changing national needs, which contractors are not able. Research funds maintained by a permanent ARS facility contribute to developing a far sighted cost effective, institutional capability which cannot be achieved by contractors who have their own institutional goals. In particular, contractors in Switzerland are geo-

PART 1

841

graphically located far from the natural range of most ARS target pests, and cannot effectively conduct a research program to meet the needs of the Agency.

The fiscal year 1998 request includes \$4 million for a new quarantine facility at Fort Lauderdale, Florida, for research on the control of Melaleuca.

Question. The U.S. Army Corps of Engineers planned and designed this facility. Why isn't the project being completed by the Corps? Why should the USDA pick up the construction cost of this facility?

Answer. The planning and design of the facility by the U.S. Army Corps of Engineers (COE) was actually undertaken at the request of the Agricultural Research Service (ARS). The Administration determined that USDA should pay for the construction cost of this facility since ARS will operate, maintain, and provide leadership for biological control research on Melaleuca and other aquatic weeds or exotic plant species in Florida.

Question. There is an excellent, modern quarantine facility at Stoneville, MS, that is grossly underutilized at the present time. Why is another facility needed for this program?

Answer. The Stoneville quarantine facility is not adequate to conduct Melaleuca biological control studies because: 1) the facility is not, and in all likelihood never will be, quarantine certified for pests that are not in Mississippi or adjacent states; 2) the facility is not designed to hold trees like Melaleuca which is necessary for testing and cultivation; 3) since Melaleuca is not found in Mississippi, all host plants would have to be produced inside the quarantine which is not practical and may not even be possible; 4) even if it would be legal to grow Melaleuca outside of the quarantine facility, it would not be feasible as this subtropical tree would not be able to survive the cold winters; and 5) the cooperating research staffs of ARS, COE, South Florida Water Management District, and the University of Florida are not located in Mississippi.

Question. In fiscal year 1996, the Agency recommended a consolidation of research programs by transferring the Bozeman program to the Sidney, Montana, location. I understand that a new facility (to include Lab/Office, Greenhouse/Headhouses, and a Biocontainment Facility) is now needed to accommodate this consolidation of research programs and that \$600,000 in planning and design funds are needed in fiscal year 1998 for this purpose. Does the Agency agree that this additional facility is needed as a result of this?

Answer. The consolidated programs will preserve the high priority research of current programs and allow for the development of an Integrated Pest Management Center. This is enhanced by (1) the strong grass roots regional support of producers, agribusiness, and researchers organized in a rural development effort; (2) the region is destined to grow agriculturally as it is one of the remaining parts of the Western U.S. with available water resources to significantly increase irrigated acres; and (3) research is viewed by producers and agribusiness as a key to the region's rural development efforts.

TERMINATION OF KENAF RESEARCH

One of the projects proposed for termination is kenaf research which is carried out through an extramural agreement with the Mississippi Agricultural and Forestry Experiment Station (MAFES). MAFES believes that kenaf holds much potential for economic development in Mississippi and the southeastern United States. In recent months, considerable interest in kenaf has been expressed by major corporations in the United States and Japan. Continued research support is vital to stimulate private sector investment which could result in significant acreage of kenaf. With the commercial interest, it would be very poor timing to discontinue the research program.

Question. What is your justification for proposing to terminate the kenaf research program at the Mississippi Agricultural and Forestry Experiment Station?

Answer. Kenaf has long been proposed as a source of fiber for production of newsprint. Nonetheless, it has not gained a foothold in the newsprint market, and at current low newsprint prices kenaf is unlikely to be produced at a suitable cost. Major newsprint producers are committed to wood feedstock, and recycling is increasing in importance, so the future of kenaf for this market is speculative.

The project at the Mississippi Agricultural and Forestry Experiment Station (MAFES), funded through an extramural agreement with ARS, focuses largely on how to produce and harvest kenaf in Mississippi for fiber. Soft commercial interest and market demand, however, does not justify Federal investment in production research for kenaf fiber at this time. Redirection of these funds to various pest management research programs in Mississippi are expected to have a much greater beneficial impact on the agriculture industries and market economies in the mid-south.

PART 1

842

Commercialization of kenaf products has taken place as a result of the ARS funded kenaf program at the Mississippi Agricultural and Forestry Experiment Station (MAFES). Products currently manufactured at the Charleston, MS complex include:

(a) Bio-Sorb, an industrial sorbent and bioremediation agent, distributed by Delta Environmental Services, McComb, MS;

(b) Delta-Dri, a high quality bedding for the animal research industry, distributed by Shepherd Specialty Paper, Kalamazoo, MI;

(c) Lizard Litter, a high quality terrarium ground cover for the retail pet trade, distributed by Energy Savers, Frampton, CA;

(d) Kenaf bark fiber for the interior automotive panels, used by Findlay Industries, Troy, MI;

(e) Kenaf bark fiber for other nonwovens applications, used by Danforth International, Point Pleasant, NJ;

(f) Kenaf bark fiber for pulp/paper applications, used by Ecusta, Pisgah Forest, NC.

Question. Shouldn't kenaf research continue in order to improve efficiency in production, processing, and marketing to assist in further expansion of existing markets?

Answer. With the failure of kenaf to make inroads in the wood pulp market, attention has turned to other uses of the plant, especially the use of the core (not the fiber) as an absorbent. Several commercial applications exist, such as animal bedding, but these are not high-volume applications requiring large acreage of kenaf to be grown. ARS believes that uses of kenaf other than newsprint have limited commercial potential and that the research funding now available for kenaf would have much greater short and long-range impact on market economies if applied to various pest control programs. These include the development of mass propagation technologies for biological control organisms which could lead to the establishment of new, locally-based industries to serve mid-south agriculture.

Funding and support by the Southern U.S. Trade Association has found a significant demand in Japan for kenaf pulp and composite panel products. The report and trade missions suggests that major paper companies in Japan will require over 100,000 mt of kenaf pulp by the year 2000. These same companies have shown interest in investing in pulp mills and composite plants in Mississippi in order to economically transport value-added products to Japan. These include companies such as Oji Paper, Mishima Paper, Yamaha Livingtec, OG Corporation and Marubeni. Senior executives are impressed with the agricultural infrastructure available in Mississippi and the comprehensive kenaf research program at MAFES.

Question. If the kenaf research program is eliminated, don't you believe it would significantly alter the perception of these potential major investors and cripple the opportunity for major economic development in Mississippi and the Southeast?

Answer. ARS believes funding now available for kenaf would have much greater short and long-range impact on market economies in Mississippi and the Southeast if applied to various pest control programs. These include the development of mass propagation technologies for biological control organisms which could lead to the establishment of new, locally-based industries to support agriculture in Mississippi and the Southeast.

The kenaf research and development team hosted and/or provided information to numerous corporations in 1996. These companies are evaluating the technical, economic and environmental advantages of kenaf in their respective industries. Many of these companies are quite impressed with the potential advantages of kenaf and are seriously evaluating commercial use. With a research and development team of some twenty-two scientists at the MAFES, the industrial clients can find the appropriate expert to provide the information required. There is no other public institution in the United States that has this capability.

Question. Without reliable, up-to-date information provided by the public sector, do you believe further kenaf developments are likely?

Answer. Further commercial developments of kenaf using available research information and technology are very likely if a real market demand develops for kenaf products. Good communication between public and private sectors is vital for proper targeting of public research. Considerable information from ARS in-house and sponsored research on kenaf is available to the industry. ARS will work with the industry to transfer technology to industry to foster the development of commercially feasible products and markets. However, kenaf production and processing costs remain high. For a market to develop, the use of kenaf fiber must add considerable value to products, compared to other fibers.

Interest in kenaf commercialization in other states is increasing. Besides Mississippi, commercial developments are in process or planned in Arkansas, Alabama,

PART 1

843

Georgia, Florida, Texas and Delaware. Investors and university personnel utilize MAFES scientists extensively to aid commercialization in the states mentioned.

Question. Without this support from MAFES, don't you believe the momentum for commercialization in other states would be limited?

Answer. MAFES and ARS scientists always have a continuing role to transfer available information and technology arising from past research. Such activities will assist future commercial developments. In Texas, ARS fulfilled its mission by developing and transferring nematode-resistant varieties. Entrepreneurs there are satisfied with the varieties, and are now concentrating on establishing a vertically-integrated industry to reduce costs and improve efficiency. Commercialization will succeed or fail based primarily on the economics of kenaf production and use.

Question. Where else does ARS perform research on kenaf?

Answer. Kenaf research carried out in fiscal year 1997 is conducted at the following locations: College Station and Weslaco, TX; Lane, OK; New Orleans, LA; Stoneville, MS; and Athens, GA.

INSECT REARING FACILITIES

ARS recently submitted an assessment of its insect rearing facilities to the Committee. That report indicates the need for two new insect mass rearing facilities within ARS to support research and control efforts. It proposes that two old and inadequate facilities in Mississippi be combined into a single new facility at Stoneville to enable ARS to develop and support USDA and grower action program in field crop pest control (projected cost of \$10 million); and a Fruit Fly Rearing Research Laboratory in Hawaii to address research needs for fruit fly control in fruit and vegetable crops supporting implementation programs conducted by the States of California and Hawaii, and APHIS (estimated cost of \$5 million).

Question. When does the Administration intend to propose funding for the two new insect rearing facilities the report indicates are needed?

Answer. ARS will continue to consider insect rearing needs as we develop budget proposals for buildings and facilities over the next several fiscal years. ARS will also be guided by recommendations of the Strategic Planning Task Force which has been established in accordance with the 1996 FAIR Act. This Task Force will be making a national assessment of future federal investments for agricultural research facilities.

Question. Was there any planning money for either of these facilities in the Agency's original fiscal year 1998 budget submission to OMB?

Answer. No, the Agency did not request funding for either the Mississippi or the Hawaii insect rearing facilities in the fiscal year 1998 budget submission to OMB.

Question. What amount of planning funds are needed for each of these facilities?

Answer. The estimated amount required to conduct planning and design efforts for the Waimanalo, Hawaii, insect rearing facility is \$500,000, and the amount needed for the Stoneville, Mississippi, rearing facility is \$1,000,000.

With respect to the ARS insect rearing facility planned for Stoneville, MS:

Question. Can the biological control program continue to advance on a major scale without the new facility?

Answer. ARS has identified the area of augmentation biological control as a major new area of technology that needs to be developed to support the USDA Initiative on Integrated Pest Management (IPM) and agrees with the findings of the National Research Council report that research and development on mass propagation of biological control agents needs to be expanded. In anticipation of these needs, ARS has conducted substantial supporting research in this area and has developed new cost effective artificial diets capable of producing large numbers of effective biological control agents. Unfortunately, neither ARS nor any other research and development organization (public or private) has adequate facilities to conduct the necessary scale-up research to develop and demonstrate the technical and economic feasibility of mass rearing these new biologically-based pest control agents. Without new facilities to conduct research on technology scale-up and pilot scale production for field testing, augmentative biological control can not effectively advance.

Question. How many jobs will the proposed new facility bring to the Mississippi Delta?

Answer. An ARS planning document developed cooperatively by the Midsouth Area Office and the National Program Staff estimated that the proposed National Augmentative Biological Control Laboratory at the Jamie Whitten Delta States Research Center in Stoneville, Mississippi, would need to be staffed by 65 to 70 employees.

Question. Who are the expected customers of the output of this facility?

Answer. Direct customers of this facility, may include agricultural producers interested in managing insect and weed pests in a number of different crop, commodity and rangeland/pasture situations, private companies interested in the production of biological control agents, USDA, APHIS and FS who are interested in using augmentative biological control agents to control pests of agriculture and forestry, and other federal and state land managers who are interested in non-pesticidal methods to control insect and weed pests. Other possible indirect customers include research and development personnel interested in new mass production technologies, private agricultural consultants that may recommend the use of these new biologically-based pest control technologies, and the general public that are expected to benefit through the reduced use of chemical pesticides.

Question. What is industry's role now in biological control of pests and what is it expected to be in the future?

Answer. Currently, the biological control industry is in a fledgling state as it relates to the commercialization of biologically-based technology for large-scale pest control. Although some major industrial groups such as Ciba-Geigy have invested in this industry through subsidiary companies such as Ciba-Bunting, the majority of companies are small, family owned and operated businesses that exploit small niche markets rather than large-scale agricultural production markets. ARS feels that the primary bottleneck in using this technology for commercial agriculture is the development of scale-up mass rearing technology and other supporting research that can only be accomplished in a pilot production facility as is being proposed at the Stoneville location. Through research and development activities at this facility, ARS believes that large and small businesses alike can be assisted through Cooperative Research and Development Agreements and joint patents to further develop and commercialize new biologically-based pest control alternatives for major agricultural commodities and production systems.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

HUMAN NUTRITION

Question. Would you offer your views of why the Human Nutrition research initiative is important?

Answer. The human nutrition research initiative is important because it will provide information to (1) better define the relationship between diet, genetic inheritance, and lifestyle and the risk for chronic disease such as obesity, diabetes, ischemic heart disease, and cancer; (2) improve the resistance to acute infections and immune disorders by investigating the interaction between nutrition and immune function; (3) enhance the capacity to promote changes in dietary habits by basic research on neural processes, memory and learning, appetite regulation, and physiological factors influencing food habits; (4) improve the scientific basis for more effective Federal food assistance programs by better defining nutrient requirements and monitoring food and nutrient consumption and identifying socio-economic, cultural, and environmental forces that influence eating habits; (5) extend dietary guidance to nutritionally-vulnerable groups within the U.S. by determining how food consumption at critical points in the life cycle affects normal development and risk of disease; (6) generate a more nutritious food supply by defining the basis for modifying the health promoting properties of plant and animal foods, and making beneficial changes in the composition of foods.

Specific benefits of the Human Nutrition Research Initiative will include: 1) a delineation of the roles of phytonutrients, e.g., beneficial substances found in fruits, vegetables and grains—in preventing chronic diseases such as cancer, cataracts, and heart disease; in maintaining healthy body weight to avoid diabetes and other diseases; in the role of nutrition in brain function and the resistance to mental decline; 2) determination of factors assuring good bone growth and the protection from osteoporosis; and 3) identification of foods that help in the fight against infectious diseases. The Initiative also provides for a supplemental survey on the food consumption patterns of infants and children so that the Environmental Protection Agency can be provided with the statistically valid sample size for estimating the pesticide residue intakes of children as required by the Food Quality Protection Act.

Question. In what ways will this initiative be applicable to production agriculture?

Answer. Knowledge about health-promoting foods and components of foods can be used by animal, plant, soil, and post-harvest scientists to develop methods to modify food composition both during production and processing, expand food choices, and provide more options for healthful diets. Plant foods have over 600 phytochemicals that have antioxidant, immune-stimulating, sex hormone-modifying, and detoxifica-

tion properties. Human nutrition research is needed to determine which of these phytochemicals can prevent disease associated with aging such as cancer, cataracts, and heart disease, and enhance the ability to resist infectious disease.

Knowledge from human nutrition research indicates that a group of chemicals known as carotenoids, which have antioxidant and immune stimulating properties, help prevent specific diseases such as cancer. This knowledge has been a stimulus for researchers in plant genetics and breeding to significantly increase carotene availability in the food supply. Through genetic research, the total carotene content in tomatoes, sweet potatoes, corn, carrots, and cantaloupes has been increased. Genetic selection has also yielded germplasm that initiates carotene production in such typically carotene-free vegetables as cauliflower, yams, cucumbers, and potatoes. Similar research is needed to exploit the isoflavonoids and lignans, phytoestrogens found in soybeans, and fiber-rich foods such as flax, rye, and legumes, to help prevent sex hormone-related diseases such as breast and prostate cancer.

Other examples of nutritional input to modify food consumption include the production of meat with less fat and the development of grains with more healthful fatty acid profiles and with increased content of health promoting vitamins and minerals.

Nutrition research results can counteract some of the claimed negative attributes for some nutritious foods such as meat, milk, and eggs which have affected the market for these products.

AQUACULTURE

Question. Would you provide your views about the future of aquaculture generally and in terms of activities at Stuttgart and Pine Bluff, Arkansas?

Answer. Aquaculture is poised to become a major growth industry of the 21st century. With increasing seafood demand and declining capture fisheries, global aquaculture production will have to increase some 500 percent by the year 2025 to meet projected needs. Although the United States is the world's largest exporter of seafood, the annual U.S. trade deficit in fisheries products has been \$4.5 billion to \$7 billion since 1987. This trade deficit is the largest for any agricultural commodity. The expansion of domestic aquaculture could help offset this deficit and reduce pressure on threatened capture fisheries. Led by catfish farming, U.S. aquaculture has expanded steadily in the 1980's and 1990's. Production increased from 308.4 million ponds in 1980 to 665.6 million pounds in 1994, while farm-gate value increased from \$260.8 million to \$751.1 million during the same period.

Aquaculture accounts for approximately 181,000 jobs in the U.S. with a total economic impact estimated at \$5.6 billion annually.

Despite recent growth, the U.S. presently ranks only tenth in the world in the value of its aquaculture production and many sectors of the U.S. aquaculture industry are challenged to compete in the global marketplace. Other nations, including China, Japan, Thailand, the Philippines, and Norway, have made aquaculture a national priority with substantial government investments in research and development. Farm-raised seafood from foreign nations is capturing a growing share of the U.S. seafood market. The U.S. has an important opportunity to develop an aquaculture industry to serve national needs and the global marketplace with high quality, safe, and wholesome aquaculture products.

The continued growth and competitive position of the U.S. aquaculture industry in a global marketplace will be directly related to the resources invested in research and technology development. A strong ARS aquaculture research and technology development program offers significant benefits to both producers and consumers of aquatic products by enhancing the production efficiency and quality of aquatic organisms cultivated for both food and non-food purposes.

ARS aquaculture research at Stuttgart and Pine Bluff, Arkansas, contributes substantially to the Agency's national aquaculture research program. Research at Stuttgart is aimed toward improving production efficiency, health management, product quality, and value of a variety of important U.S. aquaculture species. ARS research at Pine Bluff, carried out in cooperation with the University of Arkansas at Pine Bluff, focuses on development and evaluation of new or alternative components of aquaculture systems to improve production efficiency and quality of freshwater fish.

RICE GERmplasm LAB

Question. What plans does USDA have to bring the rice germplasm lab into full operation?

Answer. The National Rice Germplasm Evaluation and Enhancement center has been designed and planned to include an expansion of existing research efforts to include new programmatic thrusts as follow:

PART 1

846

Molecular Genetics.—To apply modern techniques of molecular marking of rice genes to keep pace with technologies being developed in the Japanese Rice Genome Project.

Cereal Chemistry.—To focus upon basic factors affecting traditional long grain rice quality, especially sensory factors of taste and aroma and to help develop aromatic rice varieties for U.S. production. Ten percent of current U.S. consumption is aromatic rice from Asia. There is also a need to develop medium grain varieties suited to the Japanese market.

Molecular Plant Pathology.—To utilize modern biological tools to incorporate diverse resistance in improved varieties. Major diseases include sheath blight, blast, and a new fusarium-type disease.

Molecular Cytogenetics.—To transfer useful genetic characteristics, such as disease resistance and improved quality from 20 species of wild relatives of rice and apomixis, which allow cloning of plants through seeds for production of true breeding hybrids.

Plant Physiology.—To determine basic factors affecting yields and raise the present yield ceiling. The goal is to bring high yielding traits into new varieties, while maintaining desirable grain quality.

Question. What will the operational cost requirements be in the short term?

Answer. The operational cost for the new facility is estimated at \$8 per square foot. This translates to an annual cost for this 46,000 sq. ft. facility of \$368,000.

Question. What are the long term goals for the lab?

Answer. The long-term goal is to conduct germplasm based research directed of the needs at the U.S. rice industry; high yields, superior grain quality, and pest resistance. In order to keep the U.S. industry competitive in the world marketplace, we need to be at the forefront in the development of new technology.

ARS FACILITY CLOSURES

Background

The prepared statement of Secretary Woteki states that ARS is moving ahead with the Strategic Planning Task Force, mandated by the 1996 Farm Bill to determine which, if any, ARS facilities should be closed. Still, the fiscal year 1998 budget proposes to close four facilities next year.

Question. Why did you not wait until completion of your Task Force review to make the decisions to close facilities?

Answer. The question of which programs and locations to maintain and which ones to phase out involved many complex issues. Although the ARS budget has grown gradually over the last 20 years, in real terms there has been little if any growth. Because of inflation, the rising costs of high technology scientific equipment, unfunded increases in personnel costs, and the expense of maintaining an aging infrastructure ARS has seen its scientific work force shrink from 3,400 to 1,900 scientists. In addition, new programmatic demands are constantly being made on the agency as the high priority needs of American agriculture change. In this tight budget environment, the agency has to constantly reevaluate what it is doing and what it needs to be doing. That process makes us identify and discontinue areas of good and useful research that are deemed to be of lower priority at the present time. Where several projects at a given location are terminated, it impacts on the agencies's ability to maintain that location. In such situations the cost of keeping a location open cannot be borne by the remaining programs. Regarding Prosser and Mandan, those projects that are to be retained will be moved to other suitable locations. The facility closures contained in the President's fiscal year 1998 budget are driven by programmatic and budgetary considerations and not by issues related primarily to the facilities themselves.

Question. Did you not think that Congress should have the benefit of your Task Force recommendations before acting on your request to close facilities?

Answer. The Strategic Planning Task Force will explore a host of issues over the next several years regarding ARS and other federally funded research facilities before it submits its recommendations to Congress and the Department. We anticipate that Congress, USDA, and the Land Grant University system will all benefit from the work of this task force. But in the interim, we will have to continue working within the limits of the resources available to us as we adjust and redirect over research program to address emerging problems and initiatives established by the Administration, the Department, and by Congress.

UPDATE ON ARS ITEMS

Question. Would you provide me an update on the following ARS items: Endophyte research at the University of Arkansas and the University of Missouri.

Answer. Endophyte research at the University of Arkansas and the University of Missouri is continuing as follows:

At the University of Arkansas (Fayetteville), ARS is providing funding for cooperative research on reducing the effects of tall fescue toxicosis through development of persistent nontoxic populations of tall fescue, identifying the toxins, identifying beef cattle with genetic tolerance of the toxins, determining the effect of toxins on reproduction in cattle, and development of grazing management to minimize the effects of the toxins.

At the University of Missouri (Columbia), ARS is providing funding for cooperative research on effective management practices to enhance tall fescue field persistence and to determine methods to reduce the effects of tall fescue-fungal endophyte toxicosis. Funding will continue at the current level to the fullest extent possible for the Center of Excellence in Endophyte/Grass Research at the University of Missouri and the University of Arkansas. Endophyte Grass (Univ. of MO/AR): Fiscal year 1996 gross, \$200,000; fiscal year 1997 gross, \$198,400; and fiscal year 1998 gross, \$198,400.

Extramural Agreements with University of Missouri (\$81,456) and University of Arkansas (\$80,152) in fiscal year 1997.

Question. Would you provide me an update on the following ARS items: Lower Mississippi Delta Nutrition Intervention Project.

Answer. This nutrition project is a fully participatory consortium of seven diverse partners organized to address the problems and needs of the population of the Lower Mississippi Delta. The seven partners are: Alcorn State University, Arkansas Children's Hospital Research Institute, Pennington Biomedical Research Center, Southern University and A&M College, University of Arkansas at Pine Bluff, University of Southern Mississippi, and the Agricultural Research Service (USDA/ARS). An electronic communication system among the partners (including electronic mail, fax, and video conferencing) was implemented and is in regular use. The consortium is publishing a monograph of existing data relative to the nutritional status and health of people in the Delta of Arkansas, Louisiana, and Mississippi. Advisory Groups have been established in each State. A pilot/validation study of food consumption and food security was developed. All partners participated in three capacity building workshops focused on nutritional and dietary assessment methods, community assessment methods, and nutrition intervention methodology. Thirty-six counties (10 in Arkansas, 12 in Louisiana, 14 in Mississippi) have been selected for the research based on rates of unemployment, population, and percent of population below the poverty level. A key informant survey has been piloted and the main survey will be implemented in the 36 counties in May/June, 1997. With direction from a USDA Scientific Review Board, a pilot/validation study to determine the feasibility of using telephone interview methodology to obtain food consumption and food security data will be underway during the summer of 1997. This information will be used as baseline data to evaluate the impact of welfare reform in the area at a later time. Other research protocols are being developed including a community assessment survey and a longitudinal study of nutritional status of select segments of the population.

NATIONAL CENTER FOR AGRICULTURAL LAW RESEARCH AND INFORMATION

Question. Would you provide me an update on the following ARS items:

The National Center for Agricultural Law Research and Information.

Answer. The National Agricultural Library (NAL) administers funding for the National Center for Agricultural Law Research and Information (NCALRI) through a grant to the University of Arkansas School of Law. NAL assists NCALRI in the dissemination of information on agricultural law; operation of the Center's information programs; training of Center staff; implementation of compatible cataloging and indexing methods; and addition of the Center's records to NAL's AGRICOLA database and online catalog.

The NAL home page on the Internet provides a link to the NCALRI home page, and NCALRI links to the USDA home page. Potential users may identify NCALRI publications using INFOLINKS, the University of Arkansas online library catalog, NAL's AGRICOLA database and ISIS online catalog, and catalogs of other libraries. Users may obtain many of these publications through interlibrary loan departments at the NAL, the University of Arkansas Mullins Library, and other libraries. Order information for many NCALRI publications is provided on the NCALRI home page.

PART 1

848

QUESTION SUBMITTED BY SENATOR HARKIN

I have reviewed the draft strategic plan for the Agricultural Research Service and applaud the effort expended in developing this document. I am concerned about the measurement of performance mainly on the basis of peer-reviewed journals articles. We all want excellent science from our national labs, but we also want science that is relevant to the problems faced by farmers in the field. Producers want answers to critical problems of agricultural production.

Question. How will you incorporate the needs of producers for answers to specific problems such as wheat/barley scab, the need for new crops, insect infestations and the need for increasing yield of crops and livestock into your strategic plan? What specific measurements in addition to scientific articles, will you employ to ensure that you are meeting yield goals? pest resistance goals? environmental goals? food safety goals? development of new product goals?

Answer. Let me stress that we have a long history of working closely with our customers to determine their research needs. Our customers range from USDA action and regulatory agencies, other Federal and State agencies, commodity groups, processors, farmers, ranchers, to scientists around the world. We try to track "emerging problems" (diseases, weeds, insects, pathogens, and so forth) before they begin to affect American agriculture. In the case of Karnal bunt for example, our scientists followed its movement northward through Mexico and, before it infected American wheat fields, were searching for ways to control and eradicate the fungi. In addition, we were already searching world-wide for Karnal bunt resistant wheat that might become the bases for a long-term solution to this problem. We respond with similar speed and vigor to any threat that could jeopardize the safety and security of U.S. agricultural production systems

Before we started to draft the ARS strategic plan, we held five regional visioning conferences specifically to obtain input from our customers on what they saw as the future needs of American agriculture. When we begin or renew a research project, conduct a program review at a research location or center, or establish a new National Program we involve customers in the process to ensure that our research is relevant to their needs. In part as a result of our customer outreach efforts, all of the issues you noted in your question, yields, environmental protection, food safety, and pest resistance, are covered in the ARS strategic plan.

QUESTIONS SUBMITTED BY SENATOR KOHL

Recently I wrote you with questions regarding the ARS commitment to the new Integrated Farming Systems program initiated by the agency, and funded by Congress, in fiscal year 1997. I greatly appreciated your prompt written response to my questions, which has been very helpful in clarifying some of my concerns. However, a few of your written responses raise additional questions, which I would like to have clarified for the record. Specifically,

Question. In your letter, you state that the \$1 million provided in fiscal year 1997 for the IFS program has been "institutionalized into ARS' base research program on IFS which agency-wide is proposed to total \$7,517,800 in fiscal year 1998." Could you please provide me with an accounting of the full \$7,517,800 request. Specifically, what activities does ARS intend to conduct with this funding, and where would these activities take place?

Answer. The ARS base funding for Integrated Farming Systems (IFS) research is currently at \$7,597,800 and is proposed to become \$7,517,800 in fiscal year 1998. The focus of integrated farming systems research is two-fold: 1) Develop farming systems that are sustainable, economically viable and environmentally friendly; and 2) Provide management decision aid and information systems that enable farmers and their consultants to evaluate alternatives, both strategically and tactically, so that they may make informed decisions about farming operations in the context of a large number of variables.

The following ARS locations are conducting research relative to the development of farming systems: Athens, GA; Ames, IA; St. Paul, MN; Columbia, MO; Oxford, MS; Lincoln, NE; Columbus, OH; University Park, PA; Florence, SC; and Madison, WI.

The following ARS locations are conducting research on decision aid and information systems: Tucson, AZ; Ft. Collins, CO; Morris, MN; and Madison, WI.

Question. Last year, it had been my impression that the IFS program, as described in the fiscal year 1997 budget request, was a new program. Now, I am getting the impression that the agency is viewing the IFS program as an ongoing program that existed prior to fiscal year 1997. Could you clarify any confusion with regard to this matter?

PART 1

849

Answer. IFS is a designation for a new research emphasis rather than for a new program of research. As a result of a presidential initiative in 1990, ARS and other federal agencies embarked upon an agricultural water quality initiative, one aim of which was the same as focus number 1 above. The first seven locations conducting research on farming systems are also involved in the USDA Water Quality Program where a systems approach is being taken to create harmony between agriculture and the environment. Concurrently, other ARS units were developing models, expert systems, and other types of decision assistance tools to help farmers make complex decisions about their farm operations. Those units are included in the second part of the above list.

Several years ago, the U.S. scientific community realized the benefits of a systems approach, and scientists began characterizing some of their work as being oriented towards IFS. ARS began unofficially recognizing and tracking IFS about three years ago. In fiscal year 1997, however, a first attempt has been made at an official designation and tracking of this area of research. In common with the rest of the scientific community, ARS has not come to a final decision about establishing boundaries around what is to be called IFS research. Such boundaries are usually indistinct. The list of locations given above may change in the future.

QUESTIONS SUBMITTED BY SENATOR BYRD

NATIONAL CENTER FOR COOL AND COLD WATER AQUACULTURE

Question. Please detail the progress in developing the National Center for Cool and Cold Water Aquaculture.

Answer. A detailed progress report follows:

- Senate Report No. 101–468, 1991, directed ARS to report on the feasibility for establishing a National Fresh Water Aquaculture Research Center (subsequently named the National Center for Cool and Cold Water Aquaculture [NCCCWA]) in Appalachia. ARS submitted the report in March 1991.
- Senate Report 102–116, 1992, directed ARS to report on the program and site requirements for the NCCCWA. The report was submitted in March, 1992.
- Senate Report 103–102, 1994 directed ARS to proceed with the environmental assessment required to make final recommendations on a suitable site for the NCCCWA. A report was submitted in June 1993. Since then an additional site in Leetown, WV, was identified. An environmental assessment for that site is underway.
- ARS received \$1.9 million in fiscal year 1995 for land purchase and laboratory planning and design. ARS received \$6 million in fiscal year 1997 for construction of the NCCCWA. An additional \$6 million will be required for construction.
- ARS held a program planning workshop in March 1996 to define the research program and criteria for laboratory site and facilities needs.
- Through a September 1996 Memorandum Of Understanding, ARS will co-locate the NCCCWA with the U.S. Department of the Interior's (USDI) Leetown, WV, Science Center. This site, already federally owned, will enable ARS to develop a cooperative program with the USDI Fish Health Laboratory at Leetown, WV, and to share ARS administrative overhead with the ARS Appalachian Fruit Research Station, Kearneysville, West Virginia, within a mile of the Leetown site.
- In December 1996, ARS selected an A-E firm to carry out the design for the NCCCWA. The design is expected to be completed by September 1998.
- ARS is presently negotiating for the purchase of a 215-acre farm adjacent to the Leetown site, to provide for additional watershed protection.
- The projected research program will require a modern laboratory complex, comprising approximately 30,000 square feet, with 12 scientists, and require an annual operating budget of approximately \$4 million. No funds have yet been appropriated for the research program.
- A staffed research facility to address cool and cold water aquaculture production problems could be operational as early as the year 2000.

Question. While the center is under construction, what actions will the USDA take to expand cool and cold water aquaculture opportunities in the state? Through the land-grant university research, extension, and higher education system? Through the Freshwater Institute at Shepherdstown, West Virginia?

Answer. While the National Center for Cool and Cold Water Aquaculture (NCCCWA) is under construction, the Agricultural Research Service (ARS) will continue its ongoing cool and cold water aquaculture research programs through the ARS Appalachian Fruit Research Laboratory, Kearneysville, WV. ARS has conducted an in-house research program in cooperation to develop means to remove

PART 1

850

with the Freshwater Institute in Shepherdstown, West Virginia, wastes and dissolved nutrients from the water used for aquaculture before it is returned to streams or rivers. The water used in this research comes from the intensive culture research tanks of the Freshwater Institute.

Most of the ARS research has been focused on removing the nutrients through the technique of thin-film hydroponics, and using the nutrients to grow commercially valuable crops such as lettuce, sweet basil, strawberries, and turf grass. Research also has been done on artificial wetlands, that efficiently remove nutrients, but do not produce commercially valuable crops.

ARS has recognized the strong potential for cooperation in aquaculture with the University of West Virginia, and has had preliminary discussions with the University to identify opportunities for collaborative aquaculture research and technology transfer programs while the NCCCWA is under development and after it has been constructed.

As soon as program funding for the NCCCWA has been appropriated, ARS will initiate hiring of aquaculture scientists so that research programs can be undertaken, even before the NCCCWA is constructed. The Leetown Science Center has offered the use of research facilities and space during the interim period.

FRESHWATER INSTITUTE

Question. Please provide an update on the programs being carried out through your cooperative research arrangement with the Freshwater Institute. Detail the specific research projects and problems currently being addressed.

Answer. Through a cooperative research arrangement with the Freshwater Institute, ARS has provided funds to the Freshwater Institute to support a portion of its research program on aquaculture in Appalachia. The research problems to be studied have been developed jointly by ARS and the Freshwater Institute, and the research proposals have been developed by the Freshwater Institute.

The cooperative research arrangement between ARS and the Freshwater Institute is consolidated under a cooperative program entitled, "Development of Aquacultural Systems for Appalachia," and has resulted in two highly productive, ongoing research projects. The first project is "Water Quality Control in Intensive Recycle/Reuse Aquaculture Production Systems." This project is focusing on developing new or improved technologies for intensive recycle/reuse aquaculture systems, including modifications to and evaluations of fluidized sand-bed filter design, application of ozone with low-head oxygenator technology, new carbon dioxide control techniques, waste feed detection technology, control of bacterial and nodular gill disease, economic modeling, and quality control. The second project is "Arctic Char: Development of Production Technologies Suited to Water Resources in Appalachia." This project is identifying, studying, and addressing the constraints to Arctic char egg, fry, and fingerling production using the water resources of Appalachia. Arctic char production is new and rapidly expanding in the aquaculture industry of the northern hemisphere, but there is a very limited research base to support domestic production in the U.S. Research from this project will develop and evaluate optimal production technologies and engineered systems that will be required for producing Arctic char seedstock.

Question. What progress and/or accomplishments have been achieved through this cooperative research arrangement? What are the funding levels provided for these efforts in fiscal year 1997 and 1998?

Answer. Noteworthy recent progress and accomplishments for the programs carried out through our cooperative research arrangements with the Freshwater Institute are as follows: Scientists at the Freshwater Institute have developed an improved ultrasonic waste feed monitor through a cooperative arrangement with the University of Mississippi's National Center for Physical Acoustics. This device efficiently detects waste feed, while ignoring fecal material, and represents an improvement over earlier technology developed by these scientists. The device is currently being commercialized through a computer company. Arctic char were successfully hatched and reared to the fry/fingerling stage in recirculating systems conditions. Hatching success was from 95 to 97 percent and post-hatch survivorship was from 80 to 90 percent. This is an important accomplishment for this difficult-to-culture species.

Funding levels provided for the cooperative research program with the Freshwater Institute are estimated at \$1,447,200 in both fiscal year 1997 and fiscal year 1998.

APPALACHIAN SOIL AND WATER CONSERVATION RESEARCH LABORATORY

Question. Please describe research being conducted for agroforestry.

PART 1

851

Answer. The agroforestry research conducted by ARS is focused on increasing income to small family farms in forested Appalachia and the mid-South, where rainfall is abundant but intensive agriculture can occupy only a small proportion of the land because of steep slopes and infertile and shallow soils. Agroforestry has been highly successful in other parts of the world, but it has not been widely adapted to our economy and environment, or to the kinds of small-farm enterprises common in the eastern U.S. The basic objective is to develop diversified and value-added production systems, including crops and/or livestock, which provide income during the 25 to 30 years required for growth of merchantable trees. In part, this involves the planting of genetically improved trees which provide products other than lumber, such as nuts, but spaced so that forages, niche-market or specialty crops like herbs, or other marketable crops can be produced between and beneath the trees. This research identifies compatible tree and understory species, develops integrated pest and weed management practices, and provides efficient management of inputs such as fertilizer. In addition, the research provides basic knowledge concerning the ways desirable trees and understory plants interact, either competing with each other or synergistically promoting greater growth by sharing the sun's energy, water, and nutrients, so that more efficient systems can be designed and evaluated. The integration of livestock, such as cattle, sheep and goats, into this land-use is also studied. ARS research is focused more on management of crops and livestock components than on forestry issues. The U.S. Forest Service is also involved in agroforestry research through its Agroforestry Center in Lincoln, Nebraska. ARS scientists maintain close ties with the Agroforestry Center through communications, cooperation and collaborations. The ARS unit in Booneville, Arkansas has both a Memorandum of Understanding (MOU) and a interagency agreement (IAG) with the Forest Service unit in Pineville, Louisiana regarding tree growth research and data. The ARS unit in Beckley, West Virginia although not a formal participant in the MOU and IAG, is knowledgeable of these activities and also utilizes this information. The ARS agroforestry program also explores ways that trees, shrub, and grass plantings can be used in soil and water conservation efforts, to stabilize streambanks, stop erosion, and improve water quality by capturing runoff water and sediment.

Question. Please advise the committee of the potential of the agroforestry industry in stimulating economic development in the Appalachian region and describe research progress being made in this area.

Answer. Twenty-eight percent of Appalachia's approximately 197,000 square miles is currently in agricultural production. Of this, the dominant agricultural enterprise is livestock grazing by beef cattle and sheep, although production of poultry, swine, dairy, fruit and vegetable, and tobacco are also important. The typical Appalachian farm is less than 150 acres in size, includes one or more hilly wooded acres, and requires off-farm income for economic survival. Agroforestry systems, which allow production of two or more complementary crops on the same land base, have the potential for diversifying and increasing total income on such farms. One example of an agroforestry system is forage production within black walnut plantations. Research at the University of Missouri has demonstrated a 5-fold increase in value over a 20-year period on a black walnut/forage system versus on a similar acreage used for forage alone. In this example, the largest increase in value was from annual nut production income, although under this tree species forage production also remained high. Additional value was accrued as a future high-value veneer harvest. Research is needed to develop sacomparable agroforestry systems for Appalachia. These systems should emphasize species-diverse, sustainable production and include high-value specialty crops and products that provide raw materials for novel, value-added rural enterprises. The Appalachian Region's proximity to major eastern population centers provides access to markets for such niche products. Research to develop agroforestry systems specifically suited to Appalachia was initiated at the Appalachian Soil and Water Conservation Research Laboratory in Beckley, West Virginia. In fiscal year 1993, funds were appropriated for agroforestry research at Beckley, West Virginia. In fiscal year 1995, funds were appropriated to purchase land and initiate a program on agroforestry at Beckley, West Virginia. One area of emphasis includes adding tree components to existing grazing enterprises; a second new area examines production of high-value understory crops in managed woodlots. Anticipated benefits from this research include; 1) diversifying and improving the economic status of small, hill-land farms; 2) development of innovative production systems which are sustainable and ecologically compatible with the region; 3) increasing the provision of raw materials to supply small, locally owned, value-added enterprises; and 4) making a positive contribution to the survival of small rural communities.

PART 1

852

At Beckley, black walnut and honey locust were planted in experimental spacings with various forage species on instrumented watersheds, on a very steep hillside with varying soil depth, typical of the region, for studies of productivity, water requirements, and nutrient cycling. Improved strains of black walnut, honey locust, and other trees with potential value for multiple-use plantings were selected and planted for evaluation within forage production systems. A modeling effort has begun on partitioning of solar radiation, water, and nutrients between trees and understory for use as a tool to generalize research findings for a wide range of production conditions found in Appalachia. The objective is to find the most efficient and cost effective plant established strategies. Other work being implemented in this new program addresses the use of desirable trees in the management of new varieties of chestnut and hazelnut which produce high-carbohydrate nuts very soon after planting, as an early source of income.

Agroforestry research began at Booneville, Arkansas, in fiscal year 1992. There, ARS scientists developed the practice of harvesting the plentiful supplies of pine straw for sale to homeowners and landscapers as mulch. This provides cash flow averaging about \$440.00 per acre annually, while pine plantings mature. ARS scientists at Booneville have demonstrated that various forages can be produced profitably within timber plantations of various spacings, and are defining the optimum numbers of trees and orientation of tree rows for maximizing production of forage in the tree understory. Working with cooperators from universities and other Federal agencies, Booneville scientists are adapting the New Zealand Forest Research Initiative's Agroforestry Estate Model to U.S. conditions and requirements. This model is a decision aid which provides yields and profits for any specific situation. It is being evaluated in the field by agroforestry cooperators across the U.S. Booneville scientists and their cooperators at Langston University in Oklahoma also demonstrated that goats can be used profitably and effectively in place of herbicides to clear the vegetation from land to control weeds and shrubs that would compete with tree seedlings.

Question. Please identify additional program and resource requirements to enhance the productivity of this facility. Specifically, please provide the committee with an analysis on constructed biosystems for disturbed hill lands.

Answer. The Appalachian region is experiencing the following activities that potentially threaten its natural resources. Accelerated harvesting of forests for chips and pulp and continued extraction of minerals are creating an increasing number of disturbed sites. Because of low population density, Appalachia is being targeted by surrounding regions as a site for disposal of wastes. Industrial activities such as coal power plant production in the Appalachian region are also creating large quantities of by-products requiring disposal. A program focusing on constructed biosystems for disturbed hill lands would benefit Appalachia by developing management strategies for these activities.

The constructed biosystems program would focus on research in which best management practices are developed for the integration of animal, industrial, and municipal by-products in the development of nontraditional agricultural with the selection of new plant materials systems. The goals are to improve disturbed areas, develop new agricultural enterprise and promote rural economic development. Projected benefits include: new environmentally sound technologies for management of disturbed lands; maintained or improved environmental quality and enhanced standard of living; and opportunities for cooperation with industry and other Federal and State agencies.

Question. Please describe research being done regarding the utilization of coal combustion by-products, which are generated abundantly in West Virginia, as a means of managing acidic hill-land soils for improved growth of forage and crop plants.

Answer. Plant growth on acidic soils is limited by the deficit in both magnesium and calcium. Coal combustion by-products from the flue gas desulfurization process pose a disposal problem, but contain significant amounts of calcium. A Cooperative Research and Development Agreement (CRADA) has been developed between ARS scientists at Beckley, WV, and Dravo Lime Company of Pittsburgh, PA, to produce a magnesium enhanced local combustion and gypsum by-product. This now patented by-product improved yields of forage and row crop species in acid soils. Other research has shown that some coal combustion by-products are of concern because trace elements, such as boron, may accumulate in plants. Research has shown, however, that plants showed no excessive accumulation of heavy metals. Gypsum enhanced by-products have also been shown to raise subsoil pH and improve root growth. Another approach under investigation is combining coal combustion by-products with animal manures to create a nutrient source and acidic soil conditioner.

PART 1

Fluidized bed combustion residue along with polyacrylamide also reduced erosion on tilled hillsides. This coal combustion by-product combined at a moderate rate with phosphate rock and dolomitic lime improved phosphorus, calcium and magnesium levels in infertile acid soils while reducing levels of phytotoxic aluminum.

Question. Please identify the department's current research efforts, including funding and scientific support of each project at the Appalachian Soil and Water Conservation Laboratory.

Answer. The fiscal year 1997 funding and scientific support for each project at the Appalachian Soil and Water Conservation Laboratory are shown below:

Project title	Scientists	Funding
Potentials for Agroforestry	1.6	\$396,900
Alleviation of Acid Soil Constraints to Plant Growth	2.5	1,006,200
Selection and Improvement of Plants for Infertile Acid Soils	3.5	912,100
Livestock Grazing Systems and Water Quality in Appalachia	2.5	744,700
Management and Ecology of Pastures in the Appalachian Region	2.5	763,800
Forage Legume Breeding for the Appalachian Region	1.4	400,200
Total	14.0	4,223,900

Question. Please provide significant accomplishments attributed to each project.

Answer. Potentials for Agroforestry—The use of black locust, honey locust and black walnut within forage pastures appears to be beneficial. The trees provide shade for the livestock and their seed pods are a good source of nutrients for the livestock. The growth of shade tolerant forage species among the trees also may allow the pastures to be grazed for a longer time during the summer.

Alleviation of Acid Soil Constraints to Plant Growth—The application of a coal combustion power plant residue, a flue gas desulfurization (FGD) by-product, to an Appalachian acid soil resulted in increased crop yields. This gypsum quality by-product was effective in raising calcium levels and reducing phytotoxic soil aluminum concentrations. When this by-product was combined with phosphate rock and dolomitic lime, improved soil phosphorus and magnesium levels and higher soil pH also resulted. The development of this combined product is being pursued through a Cooperative Agreement and Development Act (CRADA) activity. The FGD by-product combined with polyacrylamide was also shown to reduce soil erosion from tilled hillsides.

Selection and Improvement of Plants for Infertile Acid Soils—Poor plant growth in acid soils is most often caused by excessive aluminum adsorption by plant roots. This toxic effect of aluminum on plants is dependent upon the form or species of aluminum in soil, which in turn is dependent upon the other minerals present in a soil. The form or species of aluminum in acid soils toxic to plants has been re-evaluated based on new information. These data were used to develop a mathematical model that describes the interaction between aluminum and other soil minerals that can relieve the aluminum toxicity. This model also describes the adsorption of aluminum and other minerals by plant root membranes. It can be used to predict the likely toxicity of various acid soils to plants. Not only do soils differ in their toxicity, but plants and varieties of plants differ in their tolerance to acid soil toxicity. The Alfagraze alfalfa variety was shown to be more tolerant and thus produce higher yields than the Vernal variety at a soil pH of 4.6.

Livestock Grazing Systems and Water Quality in Appalachia—Grazing studies in the Beckley area show that a balance of fiber, energy, and protein improves nitrogen (N) use efficiency in grazing livestock. If fiber energy and protein are in proper balance, less N will be excreted and the reduction in manure nitrogen will improve the quality of water leaving the watershed. A predictive energy model for grasses has been developed that will help managers decide how to stock or utilize a pasture to meet the energy demands of livestock. Water resource management practices, grazing techniques, and pasture management strategies were tested and shown to improve and preserve water quality in highly agriculturalized karst landscapes.

Management and Ecology of Pastures in the Appalachian Region—Different types of plants are being evaluated for use in Appalachia to lead to improved production efficiency. The composition of new and nontraditional plants is being examined as is the potential for production of bioactive compounds that may serve as herbivore deterrents. Some grasses infected with a beneficial mycorrhizal fungal symbiont were shown to have improved nutrient uptake ability and enhanced competitive ability, important features for low-input pasture systems in Appalachia.

PART 1

854

Forage Legume Breeding for the Appalachian Region—The capability of legumes, such as clover and alfalfa, to fix atmospheric nitrogen in combination with a bacterial rhizobia symbiont and; thus, help the plant meet its requirement for this major nutrient as well as their digestibility makes legumes highly desirable forage plants. Unfortunately, most legumes are sensitive to acid soils. White clover cultivars currently used in Appalachia were found to be less acid soil resistant than those available from New Zealand and elsewhere. These more resistant cultivars are now being used to develop white clover varieties more suitable to Appalachian soils and conditions.

APPALACHIAN FRUIT RESEARCH STATION

Question. Please identify the department's research projects being carried out by the Appalachian Fruit Research Station and identify the funding and scientific support for each.

Answer. There are twelve base funded research projects at the Appalachian Fruit Research Station in Kearneysville, West Virginia. The individual projects, funding and scientific support for each project are provided for the record.

Molecular Biology and Genetic Engineering of Fruit Trees—\$835,500, 2.8 scientist years.

Genetics and Cultivar Development of Pear and Peach—\$536,000, 1.5 scientist years.

Cold Hardiness and Stress Adaptation in Fruit Trees—\$271,500, 1.0 scientist years.

Related Costs for Apple Research—\$201,300. In consultation with industry these funds have been redirected to high priority research on assessment of apple quality (\$100,000 to East Lansing, Michigan) and in support of apple rootstock breeding and development (\$100,000 to Geneva, New York).

Biological Management of Deciduous Tree Fruit Insect Pests—\$371,100, 1.7 scientist years.

Utilization of Waste & Byproducts from Aquaculture to Enhance Economic . . . Sustainability—\$482,800, 1.4 scientist years.

Mechanization for Deciduous Tree Fruits and Small Fruits—\$301,200, 1.2 scientist years.

Vegetation and Soil Management in Fruit Production—\$568,200, 2.2 scientist years.

Improved Deciduous Tree Fruit Product, Efficiency and Fruit Quality Through Integrated Cultural Management—\$606,200, 1.7 scientist years.

Deciduous Fruit Crop Diseases—\$438,700, 2.0 scientist years.

Nondestructive Sensors Measuring the Postharvest Quality of Apples—\$415,000, 1.1 scientist years.

Development of Aquacultural Systems for Appalachia—\$1,302,700, extramural project.

Question. Please provide the accomplishments made by the station in developing naturally based products that can be used by the fruit industry as alternatives to pesticide control of post-harvest rotting.

Answer. A significant discovery has been made in pest and disease control with the observation that a naturally occurring hydrophobic clay material when applied to foliage will greatly reduce the severity of insect attack and severity of disease on susceptible fruit trees.

Question. Significant losses are occurring each year in the production of peaches due to plant stress. Please advise the committee of the progress being made by the Appalachian Fruit Research Station in identifying stress-resistant genes which would enhance peach quality and production.

Answer. ARS scientists at the Appalachian Fruit Research Laboratory in Kearneysville, West Virginia have identified genes that may provide resistance to plant stress in peaches, specifically freezing stress. A gene has been isolated from peach tree bark that encodes a protein known as a "dehydrin." Similar proteins have been identified from other plants, and they seem to protect plant cells against damage from freezing and drying. In peaches, either drought or fall dormancy caused the dehydrin to accumulate, and the amount in a tissue closely followed the degree of cold hardiness. This long-term research, when combined with other research underway at the laboratory, is expected to lead to more frost-tolerant peach trees.

Question. Please identify recent research accomplishments by the Appalachian Fruit Research Station of significance to the fruit industry.

Answer.

Molecular Biology and Genetic Engineering of Fruit Trees.—Transgenic plums showing immunity to plum pox virus were obtained via genetic engineering.

Genetic and Cultivar Development of Pear and Peach.—Genes for resistance to viral and bacterial diseases that have devastating economic impact on grape production each year were transferred into “Thompson Seedless” grapes by genetic engineering. The same gene transfer techniques are being used to develop pear and peach cultivars resistant to viral and bacterial diseases.

Cold Hardiness and Stress Adaptation in Fruit.—A gene encoding a “cryoprotective” protein was isolated from peach bark; manipulation of the expression of this gene could potentially decrease current tree fruit losses due to cold temperatures and expand the range of temperate tree fruits.

Related Costs for Apple Research.—Nine specific cooperative agreements were initiated with university researchers to address problems of fruit storage and pesticide reduction.

Utilization of Waste and Byproducts from Aquaculture to Enhance Economic and Environmental Sustainability.—Hydroponic plant production cleaned aquaculture wastewater to water quality standards equal to the original water in the spring source. Hydroponic plant production of lettuce, strawberry, and basil also generated a gross additional gross income of \$4/ft of greenhouse area while removing a waste product.

Mechanization for Deciduous Tree Fruits and Small Fruits.—In 1995, a mechanical harvester for fresh market blueberries was developed, tested, and licensed to a Michigan firm. This same harvesting concept was used to build a mechanical harvester for processing citrus. The citrus harvester was built, tested, and shown to be highly effective in removing various citrus fruits without damage to fruit, tree, or developing fruit. A unique trellis system for eastern thornless blackberries was developed that separates fruiting canes from vegetative canes. This trellis system together with the mechanical blackberry harvester are able to harvest fresh-market quality blackberries.

Vegetation and Soil Management in Fruit Production.—A tensiometer irrigation valve was designed, tested, and patented in 1993. In 1995, a cooperative research and development agreement was in place with a Virginia company to commercialize this invention. The tensiometer valve senses the water content of the soil and opens an irrigation valve when the soil needs water and closes the valve when wet. It operates without electricity and only one moving part. It will have application in horticulture greenhouses, landscape settings, nurseries, and home gardens. Inert and non-toxic hydrophobic particles reduced disease incidence and repelled major insect pests of apple and pear.

These reflective particles also reduced water stress. A cooperative research and development agreement is being negotiated to commercialize this broad spectrum, non-toxic pest control product.

Improved Deciduous Tree Fruit Production Efficiency and Fruit Quality Through Integrated Cultural Management.—Selected ground cover systems or a new plant growth regulator reduced vegetative growth in apple trees and the number of shoots exhibiting fire blight symptoms. These findings could lead to improved fruit productivity and reduced tree losses from fire blight, a major problem in the Appalachian Region.

Nondestructive Sensors Measuring the Postharvest Quality of Apples.—A prototype on-line system that non-destructively measures apple quality has been developed and is being evaluated in cooperation with an industry partner.

Water Quality Control In Intensive Recycle/Reuse Aquaculture Production Systems.—Results of a field trial of the ultrasonic waste feed controller (UWFC) showed that satiation feeding with the UWFC or by hand produced the same feed conversion and 30–50 percent faster growth than ration feeding produced. A tagging experiment showed that growth of rainbow trout stocked at 8–12 cm (within a mixed cohort system) and harvested at 340 g was not strongly dependent upon initial length. Adding ozone to the water within a recirculating system was found to improve microscreen filtration, water quality, and reduce bacterial gill disease problems.

Question. Please identify additional program and resource requirements to enhance the productivity of this facility.

Answer. Pest and disease control is the single greatest cost in fruit production. The impact and productivity of the Kearneysville research group would be enhanced by strengthening the following areas of research. (1) Identify, characterize and implement the development and utilization of natural compounds and microorganisms as biocontrol agents in preventing or suppressing diseases and pests in pre- and post-harvest crop production. (2) Expand activities in biotechnology and the application of genetic engineering technologies in the development of transgenic plants with improved product quality and resistance to pests and diseases. (3) Investigate

PART 1

856

pesticide degradation and movement in orchard soils under various ground cover management systems to reduce ground water contamination.

QUESTIONS SUBMITTED BY SENATOR LEAHY

FOODBORNE ILLNESSES

Question. Under the draft research agenda for the Office of Food Safety and Inspection Services, there are a number of recommendations for food borne illnesses in humans. What research is the Agriculture Department currently conducting to address this issue and what level of funding would be necessary to implement the recommendations for further research?

Answer. The Agriculture Department is not addressing those questions from the draft research agenda of the Food Safety and Inspection Service which relate to food borne illness in humans, that is, such questions relating to the epidemiology and incidence of human disease related to food borne pathogens, and the sensitivity of specific human populations to these pathogens. The minimum funding necessary to implement these recommendations for further research would be \$10 million.

ASIAN LONG-HORNED BEETLE

Question. Without immediate attention, spread of the Asian Long-Horned beetle into forested areas of New York, Vermont and Massachusetts could threaten the important maple sugar and fall foliage industries of the northeast. Has the Agriculture Department proposed a research program to investigate and develop potential control mechanisms for this pest?

Answer. Currently, the State Departments of Agriculture are attempting to eradicate this insect pest by felling, chopping up, and burning trees in which the beetle has been found. For example, contractors hired by New York State started cutting down the first of up to about 50 trees in February of 1997, from backyards and streets in infested communities. New York plans to replace the trees with varieties the beetle doesn't eat and conduct periodic surveys to see if the insect is in other locales. Other states that may become infested could use similar tactics. USDA will add \$500,000 to efforts in New York to replace trees being removed and destroyed because of the beetle. The state and city will each expend \$1 million. USDA Animal and Plant Health Inspection Service and Forest Service have requested that the public contact them if they suspect an infestation in their area. USDA Animal and Plant Health Inspection Service (APHIS) and Forest Service have also requested that ARS determine what natural enemies might exist in the pest's native habitats of Japan, Korea and Southern China through its European Biological Control Laboratory in Montpellier, France. Cornell University scientists are also studying the situation. No large scale research effort has been formulated as yet.

Question. What level of funding is necessary to undertake such a research project?

Answer. If the pest cannot be prevented from spreading and eradicated, then a research project that would include studies on the biology and ecology of the pest, as well as development of effective IPM tactics, should be initiated. Such a project should be funded at a minimum of \$600,000.

Question. Would the Department include and/or delegate the project to a university research program?

Answer. The Department would include appropriate university research scientists as partners in addressing this pest.

Question. Will some of the \$2.5 million requested increase in support of emerging disease and exotic pests be used to address the Asian Long-Horned beetle?

Answer. ARS has requested a \$5,000,000 increase to address emerging diseases and exotic pests in fiscal year 1998. Of the \$5,000,000 requested, ARS plans to allocate \$2,500,000 for studies on emerging plant diseases, \$1,100,000 for studies on emerging exotic diseases of livestock, and \$1,400,000 for studies on emerging domestic and zoonotic diseases of livestock. ARS has not planned to use these funds for research on the Asian longhorn beetle.

Question. Outside of the U.S. Forest Service, please list the research projects being conducted by the Department on forestry issues.

Answer. ARS does not conduct forestry research per se. ARS does, however, conduct some research that can be related to forestry issues as follows: Agroforestry Systems for the Family Farm—Booneville, AR; Potentials for Agroforestry—Beckley, WV; Systematics of Flies of Importance in Biocontrol, Agricultural Crops, and Forests—Beltsville, MD; Genetic Improvement of Trees for Soil and Water—Mandan, ND; Genetics and Germplasm Evaluation of Landscape Woody Plants—Washington, D.C.; The Development of Pest-Resistant Landscape Trees to Enhance Environment

PART 1

857

and Reduce Use of Pesticides—Washington, D.C.; Development of Sustainable Urban Agro-Systems and Biocontrol Strategies for Gypsy Moth and Turf Pests—Beltsville, MD. Agroforestry is a land-use system that attempts to optimize the benefits from the interactions created when trees and/or shrubs are deliberately combined with crops and/or livestock. ARS agroforestry research is focused more on the crop and livestock components than on trees and shrubs. Less directly, but still potentially related to forestry, is ARS' research on trees for windbreaks, arboretums, and horticultural applications. Some of the research findings on genetics, diseases, and biocontrol may be applicable to forestry issues. Colleges of Agriculture at many land grant and other universities include Forestry Departments and; therefore, CSREES conducts research on forestry related issues. Individual researchers in ARS cooperate with CSREES scientists on specific topics related to tree and forestry issues, but ARS is not in a position to address the CSREES forestry research program.

Question. The President's budget request includes an increase of \$1 million to support the Grazing Lands Initiative. What will this additional funding be used for? How will the funding be dispersed? Are there research projects proposed for specific regions?

Answer. The increase of \$1 million to support grazing lands research will be utilized to strengthen the ARS rangeland and pasture research program in the areas of utilization and natural resource conservation. This funding will be directed to the ARS laboratories at El Reno, Oklahoma (\$400,000) and University Park, Pennsylvania (\$300,000) for research to determine the impact of pasture design and grazing animals on the quality of water emerging from watersheds, and to develop pasture management systems that will optimize water quality and pasture productivity. In addition, \$300,000 will be directed to ARS research at Las Cruces, New Mexico, to develop low-input technology for seeding native grasses and shrubs on degraded rangelands and riparian areas. Current methods of reseeding rangeland require mechanical seedbed preparation, which is costly and encourages erosion. Methods of distribution of seed which do not disturb soils or require expensive equipment include overland water flow during rainfall events, wind dispersal, and distribution by cattle themselves after passing through the digestive tract.

Question. The President's request includes an increase of \$2.5 million for research in support of emerging exotic diseases in livestock. The focus of this increase is on limiting the introduction of exotic disease. What activities has the Department undertaken to develop a tracking system for livestock to address the spread of disease once it has been introduced?

Answer. The ARS animal health research program develops diagnostic tests and vaccines for monitoring or tracking livestock disease. ARS works closely with APHIS and producer groups to use new diagnostic tests to track spread of disease. This type of research has been particularly important recently in detecting new domestic strains of bovine viral diarrhea and porcine reproductive respiratory syndrome.

OZONE STANDARDS

Question. In response to the U.S. Environmental Protection Agency's proposed tighter ozone and fine particulate standards, agriculture groups have asserted that the new standards would have a detrimental impact on farm operations. Has the Department undertaken any research projects to assess these claims?

Answer. ARS is pursuing an aggressive research program to assist U.S. farmers in meeting air quality standards, but is not doing research on claims that new air quality standards would adversely affect farm operations.

INTEGRATED PEST MANAGEMENT

Question. How much funding is the Department directing towards Integrated Pest Management and environmentally-friendly techniques?

Answer. The information on the funding for Integrated Pest Management and related programs by USDA agencies is provided for the record.

<i>Agency</i>	<i>Fiscal year 1997</i>
AMS	\$2,556,000
APHIS	34,493,000
ARS	75,612,000
CSREES:RES	58,441,000
CSREES:EXT	13,997,000
ERS	2,500,000
FS	16,117,000
NASS	5,700,000

PART 1

858

<i>Agency</i>	<i>Fiscal year 1997</i>
NRCS	6,617,000
Total	216,033,000

Question. What is the status of the USDA goal to have 75 percent of U.S. agriculture using IPM?

Answer. Upon the commencement of USDA's Integrated Pest Management (IPM) initiative in 1994, the Department's Economic Research Service estimated that American farmers have adopted IPM methods on nearly half of all fruit and nut, vegetable, and major field crop acreage. Total land used for crops in the United States is estimated at 332 million acres. The level of use of IPM practices depends on the crop, the region and the pest problem. The National Agricultural Statistical Service is currently conducting national surveys of major field crops, and selected fruits and vegetables to ascertain levels of IPM adoption and chemical use. The results of the first of these surveys will be available in early 1998. Much more work is needed to refine and implement a sound measurement methodology. After the Economic Research Service (ERS) report was published in 1994, additional studies have been completed by Department analysts and outside experts, and most support ERS' conclusion that 50 percent or more of the nation's crop acreage is currently managed under at least a "low" level of IPM. However, several analyses, including the one published by Consumers Union in *Pest Management* at the Crossroads, have concluded that considerable more work is needed to help producers move along the IPM continuum to the "medium" and "high" levels. We believe that an accelerated effort is needed, and warranted, to help growers reduce reliance on high-risk pesticides and enhance the sustainability of farm operations.

Question. What research activities are being undertaken to help farmers reach this goal?

Answer. A variety of interagency partnership research activities are being undertaken to provide the necessary components for adoption by farmers into an integrated pest management systems approach. Practices and methods being developed vary among crops and among different regions of the country. For example, in some regions, the introduction of parasites or predators, which naturally prey on particular pests are being developed for introduction into infested areas. In other areas, crop rotation and planting date tactics, resistant crop varieties, and cultural practices are being developed for use in combination with other methods, such as microbial biocontrol, mating disruption, and sterile insect technology, to manage pests before they reach damaging levels. The pests that are targeted by these studies include insects and mites, plant pathogens and nematodes, and weeds. The control tactics may be used in greenhouse, on crop acreage, and in urban gardening settings.

Under the USDA IPM initiative all the activities of the agencies and the land-grant system State Agricultural Experiment Stations have been pulled together into a coordinated effort that is more efficient and more effective in getting new knowledge and technology resulting from the research activities into the hands of the farmers. The priority needs identified by state and regional IPM teams are being used to orient area-wide IPM programs conducted by the Agricultural Research Service, IPM research conducted at State Exp. Stations and Extension IPM programs. All of these activities are being directed to meet the educational needs of farmers and their advisors for IPM adoption.

Question. What research activities is USDA undertaking to develop alternatives to comply with the Food Quality Protection Act?

Answer. The USDA recognizes the critical need to develop alternatives as the Food Quality Protection Act is implemented and needs for pest management alternatives are identified. The USDA IPM Initiative is a critical activity for addressing pest management needs identified by farmers and others through a comprehensive needs identification and priority process involving every state. A number of major research and education programs are currently underway to develop and deliver alternative management methods to producers as increasing broad restrictions on pesticide use and continuing development of pest resistance occur. For example, the ARS area-wide IPM program, in partnership with CSREES and the land-grant university system, other state and federal agencies, and the private sector are undertaking research on sustainable systems including biological, cultural and other biorational technologies. CSREES provides funds to support mission-linked research that is focused on biological control, host resistance, cultural control and applied ecology, and management of resistance. CSREES also supports IPM education and training programs needed to transfer pest control alternatives to farmers, crop consultants, and other IPM end-users via Cooperative Extension Service programs in every state. The Food Quality Protection Act includes language requiring the Sec-

PART 1

859

retary of Agriculture to ensure support for minor-use pesticide research. ARS and CSREES in partnership with the Land Grant Universities carry out research under the IR-4 program which supports the use of registered pesticides and biological control agents for minor crops where there are no economic incentives to do so by private industry. Regulatory action prompted by the Food Quality Protection Act has increased the burden on this program in terms of alternative control materials compatible with IPM systems.

PEAR THRIPS RESEARCH

Question. The fiscal year 1997 Senate Agriculture Appropriations report provides \$78,000 for Pear Thrips research in Vermont and includes the following report language: "ARS application of project funds for overhead expenses are not to exceed 10 percent of the amount appropriated for the project." How much of the original \$78,000 award has ARS directly granted to the research institution? Please provide a breakdown of how the balance of the \$78,000 award has been used by ARS.

Answer. The fiscal year 1997 funding level for pear thrips research in the northeastern U.S. is \$80,300. Of the \$80,300 provided to ARS, \$45,000 is provided under a cooperative agreement to the University of Vermont. The emphasis of the Vermont program has been to use entomopathogenic fungi to control pear thrips in sugar maple plantations. The remaining \$35,300 is allocated to Ithaca, NY to directly support activities conducted by the pear thrips program in Vermont and has included the cryogenic storage of fungal pathogen isolates important to the program, the taxonomic identification of collected isolates, molecular systematics research on associated fungal pathogen species, assistance with fungal pathogen isolation and culturing techniques, and other similar support services.

QUESTION SUBMITTED SENATOR FAIRCLOTH

PROJECT TERMINATION

Question. The White House budget proposal eliminates 71 Agricultural Research positions. I just learned that the Agriculture Department contacted some of those researchers and, in essence, directed them to accept new posts. I understand that the Department told these researchers that a failure to accept the new posts will result in possible unemployment if Congress fails to restore their current positions in the appropriations process. I am informed, in fact, that several of these researchers were told that reluctance to accept the new posts will jeopardize their careers. I am thus concerned that some of these scientists construed these job "offers" as an effort to ensure that their current posts are vacated prior to congressional action on the budget and possible restoration of these positions (these researchers were told that these posts will not be left open through the fiscal year). However, if these people accept the new positions, they will be unavailable to return to their current posts if Congress opts to restore funds for the positions. Their decisions will appear voluntary, but, as you know, these circumstances paint a rather different situation. As you know, these decisions are the province of the Congress, and it appears that the Department is in the midst of an effort to undermine the congressional prerogative. How does the Department justify these actions?

Answer. The proposed fiscal year 1998 budget for ARS identifies 71 research projects to be terminated to help fund several new research initiatives. New positions associated with the new research initiatives will be established that will offset those positions associated with projects that will be terminating. In addition, there are a number of available unencumbered positions currently in the Agency as a normal process of attrition. Managing the transition from positions associated with project terminations to new or existing positions poses many challenges. There is no provision for an orderly transition because we will not know what the content of our fiscal year 1998 budget will be until final legislative and executive approvals occur, usually in September. We are very sensitive to the effect these actions are having on the specific projects and personnel involved. We are making every attempt to plan for the reassignment of these impacted employees to other available positions. To the greatest extent feasible, we are attempting to coincide the timing of the relocation of our researchers with the beginning of the 1998 fiscal year so that in those situations where Congress restores projects, those decisions can be reversed. No employee was told that their job would be in jeopardy. Whether an employee voluntarily elects to transfer to another position in the Agency is independent of the Agency's commitment to maintaining a given project. As long as appropriated funds are in the ARS budget for the project, however, ARS is obligated to maintain the program. If placement within the local area is not possible, we will be offering

PART 1

860

reassignments to vacant positions at other ARS locations to all permanent employees. For those who are unable to relocate, we will provide counseling and assistance in finding jobs in the local area. Unfortunately, this uncertainty and inability to develop definitive plans presents many dilemmas for our impacted employees from a personal perspective. Most of them will not know what ultimately will happen to them until final action is taken on the budget.

QUESTIONS SUBMITTED BY SENATOR GRASSLEY

BIOFUELS

Question. How has your relationship with the Department of Energy progressed during the past year with regard to biofuels? What new areas are being researched in science and economics? What are the Department's plans for this coming year to increase cooperation with DOE on biofuels? What is the status of the Memorandum of Understanding?

Answer. During the past year ARS has had 2 workshops with DOE and its laboratories. The areas covered were fuel ethanol research and biodiesel research. The participants also set up a joint steering committee to plan for future coordination at the research level, began sharing materials, and agreed to implement a scientist exchange. DOE's National Renewable Energy Laboratory (NREL) has provided their new biomass fermenting organism to 2 ARS Research Centers, both of which are concerned with applying that technology to making ethanol from corn biomass. The steering committee will also facilitate sharing plans.

ARS also has a CRADA with NREL and the Fats and Protein Research Foundation to examine the use of biodiesel feedstocks such as animal fats and restaurant grease, enzymatic hydrolysis, and using branched chain alcohols as biodiesel fuel.

Question. Has the Department designated a single person to coordinate ethanol, and separately biodiesel, research Department-wide? Who is that person? If not, why has the Department chosen that course of action?

Answer. The Associate Deputy Administrator for Crop Production, Product Value, and Safety coordinates ethanol and biodiesel research for ARS. The Director, ERS-Office of Energy and New Uses has responsibility for the Department.

BIOFUELS

Question. Will the Office of Energy receive the same amount of funding as last year, or has the Department asked for increased funding? Does the Office of Energy still have the ability to contract out for special studies? How much money has been allocated for this purpose? If not, why has the Department curtailed funding and activity in this area?

Answer. In fiscal year 1996, the Office of Energy and New Uses was funded for \$849,000. In fiscal year 1997, the estimated funding is \$499,000. The Office, as a part of ERS, does have the authority to contract out for special studies. Thirteen thousand has been allocated for nonsalary expenses. Funding has been reduced in this area for two reasons: First, ERS is moving and must pay some of the moving expenses out of its nonsalary expenses. Second, the budget allocation process was redesigned by me to establish a central, flexible pool of funds from the Agency's nonsalary expenses to be allocated by collective management decisions, rather than portioning out the entire Agency allocation to ERS divisions and office at the start of the year.

Question. Will the Department maintain, at least, level funding for ethanol research at ARS and CSREES? If not, why not?

Answer. ARS proposes level funding for ethanol research at \$5.2 million. CSREES estimates a decline from a current estimate of \$2.9 in fiscal year 1997 to \$1.8 in fiscal year 1998 due to reductions proposed for special research grants.

Question. Has the Department assisted the biodiesel industry in their efforts to achieve alternative fuel status in Department of Energy regulations? In what way? Will the Department increase these efforts? If needed, will the Department support changes in EPACT favorable to biodiesel?

Answer. ARS has and continues to foster biodiesel development from the early 1980's to its present programs in fiscal year 1997. Specific research that has been conducted includes the following: feedstocks, e.g., soy oil, tallow, recycled greases and soap stocks; fuel quality assessment to demonstrate that biodiesel and blends of biodiesel (B20) are energy equivalent to petrodiesel, substantially similar (sub sim) regulations; and engine testing as well as emission testing of neat biodiesel and B20. ARS plans to maintain its current level of effort on this issue. DOE is the lead agency determining implementation of EPACT rules and regulations. USDA is pre-

PART 1

861

pared to provide whatever information it has to DOE on the net benefits of biodiesel to facilitate its use. If the changes considered in EPACT are legislative, then an Administration position would need to be developed depending upon the nature of the change.

Question. What USDA agencies are involved in value added research? What is the proposed budget for new uses? How does this differ from the previous budget request?

Answer. The USDA agencies involved in value added research and their proposed budgets for new uses are follows:

[Dollars in thousands]

Agency	Fiscal year—	
	1997 funds	1998 funds
Agricultural Research Service	\$82,368	\$76,326
Alt. Agric. Research and Comm. Corp	7,000	10,000
Cooperative State Research, Education, and Extension Service	28,701	18,885
Economic Research Service	1,274	1,274
Forest Service	9,482	9,482
Office of Operations	49	51
Total	128,874	116,018

The fiscal year 1998 budget for USDA reflects a decrease of \$12.9M in new uses research.

OFFICE OF ENERGY AND NEW USES BIOFUELS FUNCTION

Question. Will the Office of Energy be capable of fulfilling its function of advocating for biofuels under this budget request?

Answer. The Office of Energy and New Uses is responsible for assisting the Secretary in developing departmental energy policy and coordinating departmental energy programs and strategies. Secretary Glickman has made clear that he has a policy of encouraging the development of an agriculturally-based biofuels industry. The Office will continue to support the policy position of the Secretary of Agriculture under the current budget request.

QUESTIONS SUBMITTED BY SENATOR DORGAN

PROJECT TERMINATION

In its evaluation of research projects, ARS used a subjective point system to screen which projects to consider and subsequently recommend for termination. The data collected through this subjective review has not been made available to Congress. In fact, Congress has been told that the data developed through this screening process has been destroyed because it was part of a “pre-decision” review. Congress must have such information available not only to determine the effectiveness of the screening process, but also to consider whether ARS priorities are consistent with the public policy objectives established by Congress.

Question. Since the screening process was an essential component of determining which projects would be considered for termination, what is the purpose of withholding this data from Congressional review as it considers budget and research priorities for USDA?

Answer. Our intent was not to withhold information; the initial ratings of research projects based on the ARS Project Evaluation Guide were only the first step in the process to identify projects for proposed termination. All projects that fell into the lower quartile were further scrutinized and evaluated by the ARS top management team. This collection of information which included the consensus scores plus the scientific and programmatic knowledge and experience of the ARS management team, was then used to select those projects that were judged to be less critical to agriculture from a national perspective at this point in time, in relation to all other research ongoing in the Agency. The initial data, without the benefit of the followup analysis, debate, and judgmental inputs that occurred to develop the final list of proposed project terminations could be misinterpreted and therefore be potentially detrimental to those individual employees and programs implicated.

PART 1

862

The original project scores were not conscientiously destroyed but simply were not retained in computer files after they had served their purpose in the initial part of the overall evaluation process.

The 1996 farm law established a "Strategic Planning Task Force" which was given the responsibility of reviewing "all currently operating agricultural research facilities constructed in whole or in part with Federal funds," as well as proposed future research facilities. These facilities were to be reviewed in the context of the development of a ten-year strategic plan which reflects "both national and regional perspectives for development, modernization, construction, consolidation, and closure of Federal agricultural research facilities."

The fiscal year 1998 recommendation by ARS to close four research facilities, does not in my view give equal consideration to the importance of research from both national and regional perspectives. The ARS fiscal year 1998 budget proposal precludes the "Strategic Planning Task Force" from considering these four facilities in its review, thereby prejudging the outcome of this process.

Question. Based on the 1996 farm law directive, would it not be more appropriate for ARS to postpone any facility closures until the Strategic Planning Task Force is able to consider all currently operating agricultural research facilities from both national and regional perspectives and make its recommendations to the Secretary and Congress?

Answer. The Federal Agriculture Improvement Act of 1996 established a Strategic Planning Task Force to explore a host of issues, over the next several years, regarding ARS and other Federally funded research facilities. It will be approximately two years before the task force submits its recommendations to Congress and the Department. We hope that Congress, USDA, ARS, and the Land Grant University system will all benefit from the work of this task force. But in the interim, we will have to continue working within the limits of the resources available to adjust and redirect our research program to address emerging problems and new initiatives established by the Administration, the Department, and by Congress.

The question of which programs and locations to maintain and which ones to phase out involved many complex issues. Although the ARS budget has increased gradually over the last 20 years, in real terms there has been little if any growth. In addition, new programmatic demands are constantly being made on the agency as the high priority needs of American agriculture change. In this tight budget environment, the agency has to constantly reevaluate what it is doing and what it needs to be doing. That process makes us identify and discontinue areas of research that are deemed to be less critical at the present time. One of the factors we keep in mind when making these decisions is our desire to maintain research capabilities in all regions of the country. The facility closures contained in the President's fiscal year 1998 budget are driven by programmatic and budgetary considerations and not by issues related primarily to the facilities themselves.

There appears to be a shift in emphasis within USDA away from basic production-related agricultural research. Currently, production agriculture is being called upon to be more environmentally sensitive and sustainable, while also being internationally competitive. In order to achieve these objectives, basic production research needs to pay particular attention to the specific regional ecosystems in which farmers and ranchers operate.

Question. To what extent were these objectives particularly as they relate to regional ecosystems considered in the project evaluation process by USDA in its recommendation to terminate 71 projects and four ARS facilities and specifically, the Mandan, North Dakota ARS facility?

Answer. ARS research priorities continue to reflect the sustainability, environmental harmony and international competitiveness aspects of production agriculture. The process used by ARS to evaluate research projects included a consideration of similar research being conducted elsewhere in the Agency that would have applicability to those regions or areas where research projects would be terminated. For example, the three projects proposed for termination at Mandan focus on water management systems, soil management, and forage germplasm. Similar research on water management is being conducted at ARS locations in Akron, Colorado; Sidney, Montana; and Bushland, Texas. Research related to soil management is conducted at Lubbock, Temple, and Weslaco, Texas; and Morris, Minnesota, and research to improve forage germplasm is carried out at ARS in Lincoln, Nebraska, and Logan, Utah. ARS researchers at these locations have the capacity to extend and apply their work on a broad regional basis to include the Northern Great Plains.

USDA is in the process of terminating ARS projects and facilities, as well as embarking upon a study of research capacity through the Strategic Planning Task Force. At the same time funds from prior appropriations and other sources have

PART 1

been set aside or held in reserve for the modernization, expansion, refurbishing, etc. of ARS offices and facilities.

Question. Please identify the amount of funding which is being held by USDA for such purposes, the sources of such funding, and the ARS facilities for which such funding is being held. Also, please distinguish between the funding held for administrative offices and laboratory facilities.

Answer. The agency is currently holding in reserve a total of \$25,480,000 of prior appropriations to the Buildings and Facilities account. These amounts are being held until sufficient funds are accumulated for a design or construction contract award. Full funding of a design or construction project is required before a contract can be awarded. Of the total, \$3,065,000 is being held for the modernization efforts at the National Center for Agricultural Utilization Research, Peoria, Illinois (\$1,545,000) and U.S. Grain Marketing Research Laboratory, Manhattan, Kansas (\$1,520,000). The remaining \$22,415,000 is being held for construction of the following replacement laboratories: U.S. Horticultural Crop and Water Management Laboratory, Parlier, California (\$2,630,000); U.S. Vegetable Laboratory, Charleston, South Carolina (\$12,453,000); National Center for Cool and Cold Water Aquaculture, Leetown, West Virginia (\$6,000,000); Poultry Disease Laboratory, Athens, Georgia (\$936,000); and the Water Conservation and Western Cotton Research Laboratory, Maricopa, Arizona (\$396,000). It is not possible to distinguish the agency-held funds by laboratory or office space usage.

	Replacement laboratories	Modernization projects
Parlier, CA	\$2,630,000
Athens, GA	936,000
Charleston, SC	12,453,000
Leetown, WV	6,000,000
Maricopa, AZ	396,000
Peoria, IL	\$1,545,000
Manhattan, KS	1,520,000
Total	22,415,000	3,065,000

ECONOMIC RESEARCH SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

TRAVEL

Question. Please provide the Committee with a breakdown of ERS actual travel costs in fiscal year 1996.

Answer. ERS travel costs in fiscal year 1996 were \$1,184,000. Of this amount \$621,000 or percent was paid by ERS appropriations, and \$563,000 or 48 percent was paid from reimbursements from other government agencies. The primary reimbursement source for ERS travel is the Foreign Agricultural Service for technical assistance studies in Eastern Europe.

Question. Please identify foreign travel obligations for fiscal years 1994, 1995, and estimates for fiscal years 1996 and 1997.

Answer. A table that shows travel obligations paid from ERS appropriations and reimbursement funds will be submitted for the record.

[The information follows:]

Economic Research Service Foreign Travel Obligations

<i>Fiscal year</i>	<i>Amount</i>
1994	\$383,000
1995	407,000
1996	607,000
1997 (est.)	700,000

Question. How many ERS personnel were engaged in foreign trips in these years and for what purposes?

Answer. A table that shows the number of ERS personnel engaged in foreign trips will be submitted for the record. The primary purpose of these trips was to provide technical assistance to Former Soviet Union countries and Eastern Europe countries

PART 1

864

to facilitate their transition toward market economies. Commodity outlook and policy analysis training in the form of seminars and hands on experience was provided.

ERS travel to Eastern Europe and the FSU has been part of a program to provide technical assistance to help develop and institutionalize the capacity to conduct and disseminate market reporting, analysis and forecasting for key agricultural commodities. The funding for these activities came initially from AID (SEED Act), and subsequently from USDA's Emerging Democracies Program. These trips have been very successful. Programs for agricultural market analysis and forecasting now exist as self sustaining programs in Poland, the Czech Republic, and Slovakia, where ERS programs are ending. ERS training in Russia led to the establishment of successful reporting and analysis programs in 20 oblasts, and provided the model for a larger World Bank loan (ARIES) to allow the Russians to spread the system to all oblasts. The transition from technical assistance to a Russian led program was a hallmark of the recent Gore-Chernomyrdin meeting. Programs in Bulgaria, Romania and Ukraine are still ongoing, but have already led to a series of market analysis and forecasting reports which are produced regularly and widely disseminated.

Improved transparency and availability of market information has benefited the US—both public and private sector—as well as the recipient countries. The technical assistance activities have significantly increased the quantity and quality of information available to the United States on these countries' agriculture. The Foreign Agriculture Service has included reports produced by these countries on its website for use by the private sector and other government agencies and organizations. Current market assessments and forecasting of likely future conditions has helped to improve the trade and investment climate and provides private sector with valuable information on which to base its decisions. The countries themselves also benefit. Better information on their markets reduce costly and counter-productive interventions by governments, and has been important to countries in conducting the analysis needed to meet international trade obligations. The trips have also helped develop a network of well-trained economists and market analysts who are able, in turn, to provide additional training in their own countries and in other emerging democracies not covered by the ERS program.

In fiscal year 1997, a group of ERS employees will be participating in the American Agricultural Economics Association meetings in Toronto, Canada.

[The information follows:]

Economic Research Service Personnel Engaged in Foreign Trips

<i>Fiscal year</i>	<i>Personnel</i>

1996	243
1997 (est.)	313

GPRA INITIATIVE DESCRIPTION

Question. Would you please briefly describe the Administration's initiative to develop performance measures and indicators that can be employed to carry out program assessments mandated by the Government Performance and Results Act. What is the total cost of this initiative in fiscal year 1998 and future years? How much is USDA to contribute in each of these years?

Answer. The initiative "Provide Statistical Expertise for GPRA Measurement" draws upon the expertise of eight federal agencies to develop performance measures and indicators to assist federal government agencies in meeting their GPRA requirements. The overall initiative statement explains a number of reasons for undertaking the activities. Many agencies have been struggling with measurement problems associated with outcome based performance. Consistent concepts, scales, and sampling methods are critical for reliable performance-based comparisons among Departments. Many Federal services contain common dimensions—e.g. courtesy, timeliness, knowledge—that are currently measured on different scales that undermine useful comparisons. Many agencies have asked for help in developing a catalog of tested questions and satisfaction scales. The American Consumer Satisfaction Index is the only nation-wide standardized satisfaction measure that permits consistent comparison of private sector products and services with Federal agency products and services.

The total budget request for the initiative is \$3.55 million and is composed of the following parts: a.—\$1.6 million to develop or refine comparable "turn-key" data collection and measurement resources for use by agencies throughout the Government; b.—\$0.75 million to develop standardized questions and satisfaction scales for common elements of Federal services; and c.—\$1.2 million to add 10 Federal agencies

PART 1

865

to the American Consumer Satisfaction Index. USDA, through the participation of ERS and NASS, is requesting a total of \$665,000.

GPRA INITIATIVE TIME FRAME

Question. Shouldn't government-wide performance measures and indicators be available for agencies to use in the development of their strategic plans, goals and measures? What is the proposed time frame for the development of these statistical measures and indicators?

Answer. Development of measures and indicators is inextricably tied to the goals set. The benefits from the outcome oriented GPRA management approach depends first upon setting the correct goals. Challenges agencies governmentwide face in setting goals include: a.—balancing the relative importance of cost effective outcomes versus effectiveness at any cost; b.—setting goals to obtain outcomes which the agency can definitely control versus broader policy outcomes; and c.—balancing goals relative to customer satisfaction measurement—e.g., responsiveness and courtesy shown to customers—with basic goals for the program—e.g., retiring most environmentally sensitive lands at the lowest cost to U.S. taxpayers. Setting simplistic quantity goals for people served and answers provided may undermine the quality of the service and the answers. The choice of goals must define the measures and indicators used rather than allow the ease of measurement dictate the formulation of the goals. As agencies government-wide make progress in developing their strategic plans and setting goals, the statistical agencies involved in the initiative will be charged with finding what and how common performance measures and indicators can be developed to improve comparisons between different agencies' progress towards similarly defined goals. Identifying commonality in goals across the complex and sometime apparently conflicting array of outcomes sought will not be easy. Work on development of these statistical measures and indicators will begin in fiscal year 1998. Because all agencies will have developed their strategic plans by this time, the GPRA initiative will help agencies to refine and improve their goals and measures. Furthermore, the availability of these strategic plans will greatly assist ERS in identifying common goals in the various plans and allow ERS to focus our efforts.

ERS ROLE IN GPRA INITIATIVE

Question. No staffing increases are proposed. What specifically will be funded with \$125,000 in ERS funding and the \$540,000 in NASS funding requested for fiscal year 1998?

Answer. The additional funding for ERS and NASS would allow ERS to participate regarding performance measurement issues. NASS would be involved in all three phases of the initiative including formulation of sampling plans, development of standard survey instruments and scales, and work with the American Customer Satisfaction Index on development of measures for farm/rural programs and nutrition programs.

OTHER PARTICIPANTS IN GPRA INITIATIVE

Question. Which other six federal statistical agencies will participate in this initiative, in addition to the Economic Research Service and the National Agricultural Statistics Service? Is there a lead agency?

Answer. In addition to ERS and NASS, the other federal agencies participating in this initiative include the Bureau of Labor Statistics, Bureau of Transportation Statistics, Census, Energy Information Agency, National Center for Health Statistics, and the Statistics of Income in the Internal Revenue Service. The Interagency Council on Statistical Policy, chaired by OMB's Chief Statistician, will determine the most cost-effective tasks and division of labor with inputs from the President's Management Council and OMB Resource Management Officer's staff on priority objectives.

QUESTIONS SUBMITTED BY SENATOR GRASSLEY

USDA-DOE BIOFUELS COLLABORATION

Question. How has your relationship with the Department of Energy progressed during the past year with regard to biofuels? What new areas are being researched in science and economics? What are the Department's plans for this coming year to increase cooperation with DOE on biofuels? What is the status of the Memorandum of Understanding?

PART 1

866

Answer. The Department of Agriculture—USDA—has developed a close working relationship with the Department of Energy—DOE—on biofuels activities. For example, during the past year, the Agricultural Research Service—ARS—along with the Economic Research Service's—ERS—Office of Energy and New Uses have had two workshops with DOE and its laboratories to develop collaborative scientific activities. The areas covered were ethanol research and biodiesel research. The participants also set up a joint steering committee to plan for future coordination at the research level, to began sharing materials, and agreed to implement a scientist exchange. DOE's National Renewable Energy Laboratory—NREL—has provided their new biomass fermenting organism to two ARS Research Centers, at Peoria, Illinois and Wyndmoor, Pennsylvania. These labs plan to apply that technology to experiment with making ethanol from corn biomass. The steering committee will also facilitate sharing and coordinating strategic plans. ARS also has a cooperative research and development agreement with NREL and the Fats and Protein Research Foundation to examine the use of biodiesel feedstocks such as animal fats and restaurant grease, the use of enzymatic hydrolysis technology for making biodiesel fuel, and the use of branched chain alcohols as biodiesel fuel.

The Forest Service is collaborating with the Quincy Library Group in California and DOE and its NREL lab to develop a feasibility study that includes ethanol as an option for disposal of wood waste from tree thinning. The Forest Service and DOE are also developing hybrid poplars on conservation reserve land in the north central region for use as an energy source for electric generation. One power company has already contracted with farmers to purchase their wood when it reaches maturity in 6 to 10 years. Oak Ridge and ARS have developed a new switchgrass variety, Shawnee, that combines higher forage value for livestock with high biomass yields. Finally, DOE and USDA cosponsored a request for proposal for a biomass power for rural development project to demonstrate and commercialize new biomass power technology agencies. As part of the request for proposal, the Rural Utilities Service, Farm Service Agency, and Natural Resource and Conservation Service in USDA offered to use existing programs and authorities to help facilitate this project. Three awards were made in New York, Minnesota, and Iowa in response to the request for proposals.

Ongoing economic research includes a project with DOE and the University of Tennessee to use an agricultural intercommodity model to evaluate how an expanding energy crop market would affect agricultural food and fiber markets and farm income. In addition, USDA is collaborating with DOE to update the net energy balance of corn ethanol and to look at the climate change emission benefits and is also working with DOE's NREL lab to examine the transition economics of moving from a corn-based to a biomass-based ethanol industry. USDA and DOE have nearly completed a life-cycle analysis of biodiesel's net environmental benefits. The next step will be to monetize the benefits in an economic analysis. USDA and DOE are cooperating with the Environmental Protection Agency—EPA—on an analysis of the effects of using oxygenates in gasoline on toxic emissions. USDA, DOE, and EPA are also participating in a benefit-cost analysis of the Oxygenated Fuels Program with the White House Office of Science and Technology Policy. All of these projects are ongoing into the coming year.

ERS and DOE analysts will continue to evaluate the short-run and long-run marketing opportunities for biofuels response to the changing economic and policy environment. The Department will also take a fresh look at existing programs and authorities that could complement DOE biofuels efforts.

The Memorandum of Understanding with DOE on biofuels research lapsed this past January. Nevertheless, USDA and DOE are continuing close coordination and mutual research on biofuels issues as I have discussed.

USDA BIOFUELS COORDINATION

Question. Has the Department designated a single person to coordinate ethanol, and separately biodiesel, research Department-wide? Who is that person? If not, why has the Department chosen that course of action?

Answer. Yes, Dr. Roger Conway, Director of the ERS Office of Energy and New Uses has overall responsibility for coordinating energy and biofuels research for the Department. Most agencies within the Department also have an energy contact person.

OFFICE OF ENERGY AND NEW USES FUNDING

Question. Will the Office of Energy receive the same amount of funding as last year, or has the Department asked for increased funding? Does the Office of Energy still have the ability to contract out for special studies? How much money has been

PART 1

867

allocated for this purpose? If not, why has the Department curtailed funding and activity in this area?

Answer. In fiscal year 1997, the Office of Energy and New Uses has been funded at \$544,000. Of that amount, \$58,000 has been allocated for non-salary expenses that may include contracts for special studies. It is likely that another \$45,000 for non-salary expenses will be allocated to the Office in the last quarter of the fiscal year. Assuming a total \$103,000 of non-salary funds is ultimately available to the Office, it would have a more than proportionate share of such agency resources: with about one percent of the staff, it would claim 10 percent of the agency's non-salary expenses. With the Departmental reorganization, the Office of Energy and New Uses becomes a component of the Economic Research Service, a move that facilitates the ability of the Office to draw on the agency's analytical resources and, indeed, it has. Consequently, the need for non-salary funds to contract for special studies should decrease commensurately. The allocation for fiscal year 1998 has yet to be determined.

ARS AND CSREES ETHANOL FUNDING

Question. Will the Department maintain, at least, level funding for ethanol research at ARS and CSREES? If not, why not?

Answer. ARS proposes level funding for ethanol research at \$5.2 million. CSREES estimates a decline from a current estimate of \$2.9 million in fiscal year 1997 to \$1.8 million in fiscal year 1998. The decline in the fiscal year 1998 estimate reflects the reduced level of funding for Special Research Grants in the CSREES 1998 President's Budget Request.

USDA BIODIESEL SUPPORT

Question. Has the Department assisted the biodiesel industry in their efforts to achieve alternative fuel status in Department of Energy regulations? In what way? Will the Department increase these efforts? If needed, will the Department support changes in EPACT favorable to biodiesel?

Answer. Yes, the Department has assisted the biodiesel industry in its efforts to achieve alternative fuel status in DOE regulations. One hundred percent biodiesel fuel has been accepted by DOE as an alternative fuel. USDA research and economic analysis was used in the industry petition to include biodiesel blends in DOE's EPACT program. USDA is working with DOE on a biodiesel life-cycle analysis to estimate the comparative environmental benefits of biodiesel and biodiesel blends relative to petroleum diesel. A report on using alternative fuels in urban transit buses was cofunded by the biodiesel industry and USDA and published by ERS. This study shows that B20 is cost competitive with other alternative fuels such as natural gas and methanol. An ERS study published in the Industrial Uses of Agricultural Materials, Situation and Outlook Report shows that using B20 in Federal fleets can increase soybean prices and enhance farm income. In addition, USDA has met with DOE on several occasions to discuss the appropriate role of biodiesel in EPACT's alternative-fueled vehicle program. DOE has consistently stated that a biodiesel blend could qualify as an alternative fuel, although the level must be consistent with certain criteria to qualify as an alternative fuel.

The Department also supports biodiesel through its research program to lower production costs of biodiesel fuels. ARS has and will continue to foster biodiesel development in fiscal year 1997. Specific research that has been addressed to feedstocks, e.g. soy oil, tallow, recycled greases and soap stocks; fuel quality assessments to demonstrate that biodiesel and blends of biodiesel—B20—are energy equivalent to petrodiesels, and engine and emission testing of neat biodiesel and B20.

DOE is the lead agency determining implementation of EPACT rules and regulations. USDA is prepared to provide whatever information it has to DOE on the net benefits of biodiesel to facilitate its use. If the changes considered in EPACT are legislative, then an Administration position would be developed depending upon the nature of the change.

USDA NEW USES RESEARCH

Question. What USDA agencies are involved in value added research? What is the proposed budget for new uses? How does this differ from the previous budget request?

Answer. USDA agencies involved in nonfood new uses include the Agricultural Research Service—ARS—the Alternative Agricultural Research and Commercialization Corporation—AARCC—Cooperative State Research, Education, and Extension Service—CSREES—the Economic Research Service—ERS—and the Forest Service—FS. The current total USDA budget estimate for nonfood new uses for fiscal year

PART 1

868

1997 is \$70.2 million, and the proposed fiscal year 1998 budget is \$63.6 million. The decrease is a result of declines in ARS funding from \$40.2 million in fiscal year 1997 to \$36.5 million in fiscal year 1998 and in CSREES from \$13.4 million in fiscal year 1997 to \$7.6 million in fiscal year 1998.

OFFICE OF ENERGY AND NEW USES BIOFUELS FUNCTION

Question. Will the Office of Energy be capable of fulfilling its function of advocating for biofuels under this budget request?

Answer. The Office of Energy and New Uses is responsible for assisting the Secretary in developing departmental energy policy and coordinating departmental energy programs and strategies. Secretary Glickman has made it clear that he has a policy of encouraging the development of an agriculturally-based biofuels industry. The Office will continue to support the policy position of the Secretary of Agriculture under the current budget request.

NATIONAL AGRICULTURAL STATISTICS SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

GPRA INITIATIVE DESCRIPTION

Question. The fiscal year 1998 request includes increased funding of \$125,000 for the Economic Research Service and \$540,000 for the National Agricultural Statistics Service to participate in an initiative to provide statistical support to Federal agencies in meeting the requirements of the Government Performance and Results Act. Would you please briefly describe the Administration's initiative to develop performance measures and indicators that can be employed to carry out program assessments mandated by the Government Performance and Results Act.

What is the total cost of this initiative in fiscal year 1998 and future years? How much is USDA to contribute in each of these years?

Answer. The initiative, "Provide Statistical Expertise for GPRA Measurement," draws upon the expertise of eight federal statistical agencies to develop performance measures and indicators to assist federal government agencies in meeting GPRA requirements. The overall initiative statement explains a number of reasons for undertaking the activities. Many agencies have been struggling with measurement problems associated with outcome based performance. Consistent concepts, scales, and sampling methods are critical for reliable performance-based comparisons among Departments. Many Federal services contain common dimensions such as courtesy, timeliness, and knowledge that are currently measured on different scales that undermine useful comparisons. Many agencies have asked for help to develop sampling schemes, a catalog of tested questions, and satisfaction scales to obtain reliable results which can be compared across agencies and tracked over time. The American Customer Satisfaction Index is the only nation-wide standardized satisfaction measure that permits consistent comparison of private sector products and services with Federal agency products and services.

The total budget request for the initiative is \$3.55 million and is composed of the following parts: a) \$1.6 million to develop or refine comparable "turn-key" data collection and measurement resources for use by agencies throughout the Government; b) \$0.75 million to develop standardized questions and satisfaction scales for common elements of Federal services; and c) \$1.2 million to add 10 Federal agencies to the American Customer Satisfaction Index. USDA, through the participation of both NASS and ERS, is requesting a total of \$665,000 in fiscal year 1998. Development of sampling plans, questionnaires, and satisfaction scales would require one-time development costs, followed by much lower costs to maintain and refine. Actual measurement tasks would be funded by the sponsoring agencies.

GPRA INITIATIVE TIME FRAME

Question. Shouldn't government-wide performance measures and indicators be available for agencies to use in the development of their strategic plans, goals and measures? What is the proposed time frame for the development of these statistical measures and indicators?

Answer. Development of measures and indicators is inextricably tied to the goals set. The benefits from the outcome-oriented GPRA management approach depends first upon setting the correct goals. Challenges agencies governmentwide face in setting goals include: 1) balancing the relative importance of cost effective outcomes versus effectiveness at any cost; 2) setting goals to obtain outcomes which the agency can definitely control versus broader policy outcomes; and 3) balancing goals rel-

PART 1

869

ative to customer satisfaction measurements, such as responsiveness and courtesy shown to customers with basic goals for the program. Setting simplistic quantity goals for people served and answers provided may undermine the quality of the service and the answers. The choice of goals must define the measures and indicators used rather than have the ease of measurement dictate the formulation of the goals. As agencies government-wide make progress in developing their strategic plans and setting goals, the statistical agencies involved in the initiative will be charged with finding what and how common performance measures and indicators can be developed to improve comparisons between agencies of progress made towards achievement of similar goals. Identifying commonality in goals across the complex and sometime apparently conflicting array of outcomes sought will not be easy. Work on development of these statistical measures and indicators will begin in fiscal year 1998. Because all agencies will have developed strategic plans by this time, the GPRA initiative will be available to help them refine and improve their goals and measures. Furthermore, the availability of these plans will facilitate identification of common goals and measures, allowing NASS to focus its efforts on developing standard instruments and scales that will be useful to many agencies.

NASS ROLE IN GPRA INITIATIVE

Question. No staffing increases are proposed. What specifically will be funded with the \$540,000 in NASS funding requested for fiscal year 1998?

Answer. NASS would be involved in all three phases of the project including formulation of sampling plans, development of standard survey instruments and scales, and work with the American Customer Satisfaction Index on development of measures for farm/rural programs and/or nutrition programs.

OTHER PARTICIPANTS IN GPRA INITIATIVE

Question. Which other six federal statistical agencies will participate in this initiative, in addition to the Economic Research Service and the National Agricultural Statistics Service? Is there a lead agency?

Answer. In addition to ERS and NASS, the other federal agencies participating in this initiative include the Bureau of Labor Statistics, Bureau of Transportation Statistics, Census, Energy Information Agency, National Center for Health Statistics, and the Statistics of Income in the Internal Revenue Service. The Interagency Council on Statistical Policy, chaired by OMB's Chief Statistician, will determine the most cost-effective tasks and division of labor with inputs from the President's Management Council and OMB's Resource Management Office staff on priority objectives.

NASS DATA COLLECTION COSTS

Question. The fiscal year 1998 request includes an additional \$500,000 to cover higher costs for survey interviewers employed under a cooperative agreement with the National Association of State Departments of Agriculture whose salary increases are not covered by Federal pay cost increases, and for increased costs of per diem and mileage. Are these pay cost increases mandated under the cooperative agreement with the National Association of State Departments of Agriculture?

Answer. No, the pay cost increases are not mandated by the agreement with the National Association of State Departments of Agriculture (NASDA). NASDA interviewers are intermittent, part-time employees. It has become extremely difficult in many areas of the country for NASDA to hire and retain enumerators because salaries are generally below local wages for comparable jobs. A failure to adjust salaries and mileage reimbursement of survey interviewers to keep pace with competing employers will result in higher turnover rates, lower morale, and a reduction in the overall quality of the survey work.

Question. How much of the \$500,000 increase requested is for pay cost increases and how much is for per diem and for mileage expenses?

Answer. The total request is actually \$640,000. The request is in two parts: \$500,000 is for increased costs in NASS's regular survey program and an additional \$140,000 is for increased data collection costs associated with the 1997 Census of Agriculture. The \$640,000 breaks down as follows: \$470,000 is for increased pay costs; \$30,000 is for increased per diem costs; and \$140,000 is for increased mileage costs.

TRAVEL

Question. Please provide the Committee with a breakdown of NASS's actual travel costs in fiscal year 1996.

PART 1

870

Answer. Total NASS travel costs in fiscal year 1996, including appropriated and reimbursable travel, were \$1,396,000.

Question. Please identify foreign travel obligations for fiscal years 1994, 1995, and estimates for fiscal years 1996 and 1997.

Answer. Foreign travel costs for fiscal years 1994 through 1997 are as follows:

<i>Fiscal year</i>	
1994	\$73,700
1995	223,400
1996	377,200
1997 (est.)	400,000

Question. How many NASS personnel were engaged in foreign trips in these years and for what purposes?

Answer. The following table shows the number of people and the purpose of the foreign trips for fiscal years 1994–97.

NUMBER OF PEOPLE TAKING FOREIGN TRIPS

Purpose	1994	1995	1996	1997 (est.)
Technical Training and Survey Assistance	29	42	45	40
Workshops, Meetings and Conferences	11	15	4	10

QUESTIONS SUBMITTED BY SENATOR KOHL

CHEESE PRICE SURVEY

Question. NASS recently started conducting a nationwide survey of dairy manufacturing plants to determine the prices being paid for cheese nationally. I applaud the efforts of USDA to move forward with this survey, which I believe will help provide more accurate market information about cheese prices. Accurate market information is an important prerequisite to an efficient pricing system for cheese in the private sector, as well as being important to the overall federal milk pricing reforms that are underway at USDA. However, with any new survey, it takes some time to determine if the data retrieved is reliable and accurate. This is particularly true when the survey is voluntary, as is the case with this cheese price survey. In that regard, I have the following questions. How many dairy plants receive the survey each week?

Answer. NASS contacted 112 plants for the cheddar cheese price survey. These plants accounted for over 99 percent of production. Thirty of the plants screened out of the survey because they had no bulk sales, aged all their cheese, used all production internally, etc. Seven plants refused to participate in the survey and another 12 have not made a final determination.

Question. How many plants are responding?

Answer. The 63 plants reporting price data weekly account for about 80 percent of all bulk, wholesale sales of natural cheddar cheese.

Question. In your view, does the rate of nonparticipation threaten the accuracy of the survey?

Answer. Currently the survey accounts for about 80 percent of qualifying sales, which is a high level of coverage. However, there is no guarantee NASS will be able to maintain this high level of voluntary cooperation. Declining cooperation rates could threaten the accuracy of the series in the future.

Question. Would the survey be more accurate if all the surveyed plants participated?

Answer. Yes, it would be more accurate if all plants participated. This would ensure that the survey would be representative of all sales and produce consistent, statistically valid results. By consistency, we mean it is important for a large portion of the sales to be reported by the same firms every survey period.

Question. Are there other aspects of the survey which raise concerns about the accuracy of the data? For example, are some regions more fully represented in the survey than others, and if so, does that in any way skew the data?

Answer. The plants not participating in the survey are fairly evenly distributed across the country. But NASS has no way to measure the effect the nonreporting plants would have on the cheese prices.

Question. Since industry has traditionally used the price established by the National Cheese Exchange (NCE) each week as a benchmark price for the large major-

PART 1

871

ity of off-exchange bulk cheese sales, is there any attempt being made in the survey to distinguish between forward-contract sales, which are linked to the NCE price, and spot market sales, which may be more independent of the NCE?

Answer. All sales data recorded in the survey are for sales transactions completed during the survey week. Completed transactions generally mean cheese is shipped or title transfers. The possibility of collecting contracted sales was explored when the plants were initially contacted. It did not prove to be feasible to collect contracted sales since prices for the future were not generally established.

FORAGE STATISTICS

Question. As farmers seek to take advantage of new crop insurance programs, dairy farmers in my state have had continuing difficulty with crop insurance on their forage crops, such as alfalfa. In discussing the matter with crop insurance providers in Wisconsin, one of the concerns that has been raised in this regard is related to an inadequacy of NASS data reporting. Specifically, the concern is that payments under Group Risk Plans (GRP) for forage crops are triggered by county average losses as reported by NASS. However, it is my understanding that while NASS calculates and reports figures for county average harvests, you do not report data for losses due to winterkill, which is a predominate form of forage loss for northern-tier states.

In order to make the GRP crop insurance plans work effectively for forage crops, it would seem appropriate for NASS to augment its data retrieval process to show not only forage harvested, but also forage lost to winterkill. Would you be willing to make that change?

Answer. The NASS program for forage is limited to dry hay statistics and includes acres harvested, yield, and production estimates. Since most hay crops are perennial, the acreage planted each year is not the same as the area devoted to hay.

The GRP insurance program was implemented by the Risk Management Agency (RMA) using existing county data series published by NASS. NASS is very concerned that the yield data being used to determine payments under the GRP are not adequate to measure all losses which farmers may incur. The lack of data on forage losses due to winterkill is just one of many examples of the inadequacy of the existing NASS county estimates data series to measure losses due to adverse weather such as drought, flooding, hail, or severe winter temperatures which can cause excessive winterkill.

The GRP insurance program for all crops, including forage, rely on the final average county yield per harvested acre. This means that severely damaged acres not harvested are not accounted for in the final county yield estimates. Also, severe natural disaster losses, such as those caused by hail and flooding, frequently occur in only a portion of any given county. Therefore using the county average statistics provide very limited risk protection for farmers since it requires a significant number of other farms to also incur severe losses.

Forage crops in particular present special challenges. Because of the multiple uses of forage crops, NASS seriously questions whether reliable statistical data could be collected that would accurately measure winterkill and other factors which cause forage acres not to be harvested. For example, in most areas, forage crops can be cut for dry hay, green chop, silage, pastured by livestock, or plowed under for green manure. Also, a certain percentage of forage acres require reseeding every year—would those acres be reported as abandoned acres? Therefore, NASS has never attempted to measure forage acres planted. Finally, the RMA would probably need several years of historical forage data for use in the payment calculations.

ADDITIONAL COMMITTEE QUESTIONS

QUESTIONS SUBMITTED BY SENATOR COCHRAN

Dr. Woteki, you indicate in your prepared testimony that the “returns for all research and development in agriculture are estimated to be 35 percent annually, while those for pre-technology or pre-development research—much of the kind of work funded through the National Research Initiative—are considerably higher.”

RETURNS TO PRE-TECHNOLOGY/PRE-DEVELOPMENT AGRICULTURE RESEARCH

Question. What are the returns for pre-technology or pre-development agricultural research?

Answer. Although there have been many studies that provide estimates of the rate of return to public agricultural research, few provide estimates for pre-tech-

PART 1

872

nology and applied research separately. An important exception is a landmark study by Wallace E. Huffman and Robert E. Evenson—professors of economics at Iowa State University and Yale University, respectively—entitled “Science for Agriculture,” published by Iowa State University Press, Ames, 1993. In this study, Huffman and Evenson examined the contribution of research, extension, and improvements in farmer’s schooling to productivity growth in U.S. agriculture between 1950 and 1982. They derived a separate rate of return to “pre-technology” or “pre-invention” research, which they define as “research directed specifically toward producing discoveries that enable and assist technology invention” (p. 42). A table that summarizes their findings is provided for the record.

Their estimates measure social rather than private rates of return. The social rate of return includes benefits from research that go to farmers, agricultural input suppliers, food processors, and consumers. The private rate of return, on the other hand, is the return to the individual or group that conducted it.

Their results indicate that while public agricultural research as a whole had a rate of return of 41 percent, the rate of return to pre-technology research was considerably higher, at 74 percent. Private agricultural research, which is almost entirely applied research, had a rate of return of 46 percent, comparable to public agricultural research. The private rate of return to private research is probably no more than 20 percent, indicating that a large share of the benefits from private research spills over to other firms and to consumers.

The results of pre-technology research often benefit a wide range of commodities and regions, whereas applied research tends to be more commodity- or location-specific. This may explain why pre-technology research has apparently earned a higher rate of return. Public support for pre-technology research is especially important because the private sector lacks an incentive to fund it. Pre-technology research is usually long-term and high-risk in nature, and the results are often too general to be patented.

[The information follows:]

Social Rates of Return to Agricultural Research, Extension and Education

<i>Source</i>	<i>All agriculture (percent)</i>
Public agricultural research (all)	41
Public pre-technology research	74
Public extension	20
Private research	46
Farmer’s schooling	40

Source: W.E. Huffman and R.E. Evenson, “Science for Agriculture,” Iowa State University Press, Ames, 1993. Table 9.1, p. 245.

RETURNS TO NRI-FUNDED RESEARCH

Question. What are the returns to research funded through the National Research Initiative specifically?

Answer. To our knowledge, no study has estimated the returns to research funded specifically through the National Research Initiative (NRI). However, support for fundamental, pre-technology research is a stated goal of the NRI. According to the NRI annual report prepared by the Cooperative State Research, Extension, and Education Service, 63 percent of NRI grants were awarded for fundamental research in 1994. This implies that a high proportion of NRI funds are allocated to pre-technology research. Given the findings of the Huffman and Evenson study, this would indicate that research funded through the NRI might earn a rate of return above the average for all USDA research.

DOCUMENTATION FOR RETURNS TO RESEARCH

Question. What is the documentation for these findings?

Answer. The findings about returns to research are documented in a 1996 report issued by the Economic Research Service, “Agricultural Research and Development, Public and Private Investments Under Alternative Markets and Institutions,” Agricultural Economic Report No. 735 and in a Wallace Huffman and R. E. Evenson study, “Science for Agriculture” that was published by the Iowa State University Press in 1993.

PART 1

873

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FOOD SAFETY

Question. Funding of \$4.365 million, a \$2 million increase, is proposed for the Food Safety extension program. What is the justification for this increase? How are current program funds allocated and what have been the achievements of the program to date?

Answer. Currently, food safety education programs funded under the Smith-Lever Act, Section 3d, address a wide variety of food safety and quality issues nationwide, and their intended purpose is to provide education, skills, and information needed to safeguard America's food supply, while reducing the risk of foodborne illness among consumers. Funded programs provide education and training for the development and implementation of Hazard Analysis and Critical Control Point—HACCP—programs for the meat and poultry industry, and for Federal and state inspectors of meat and poultry plants. In addition, food safety education programs focus on increasing consumer awareness and understanding of food irradiation, microbiological pathogens, pesticide residues, and safe food handling practices for both industry and consumers.

As part of the President's Food Safety Initiative, the requested budget increase of \$2 million will be used to further enhance food safety education programs and to increase the capacity of the research and extension system to address the ongoing critical issues in food safety, particularly as they relate to Hazard Analysis and Critical Control Point education and to food handler certification training.

New HACCP regulations have presented significant challenges to the Department of Agriculture to provide compliance education for food handlers. Food handler certification training is provided by Cooperative Extension System faculty in many states as described below, and there is a growing trend for partnership and collaboration with state health departments and others to provide food handler certification training for food handlers from all areas of the food industry. States providing food handler certification training to industry, school foodservice workers, and health care facilities will be required to incorporate HACCP principles into their food handler programs. Food handler training and certification for foodservice workers at congregate meal sites for older Americans, foodbanks, day care, and child care facilities, among others, will also require compliance education to meet new Federal regulations. Increasingly, community kitchens, public service and public outreach programs rely on workers with limited foodhandling skills. HACCP and quality assurance education for consumers can provide education and training to support cleaning and other food rescue programs, two priority areas for the Department.

Since 1991, 49 states and 5 territories have established food safety education programs with Smith Lever 3d funds and are addressing at least one of three major food safety educational objectives:

- To increase the adoption of recommended food handling practices
- To improve practices and processes that promote the production and protection of a safe food supply
- To improve the understanding of risks and responsible practices related to food and health

In subsequent years, food safety education programs have achieved the following impacts based on participant surveys:

- 42 percent of food safety education program participants have increased their adoption of recommended food handling practices.
- 70 percent of participants have increased their adoption of practices that protect the food supply.
- 53 percent of participants have increased their knowledge of food safety public policy issues.

Food safety education funds were used to support the development of the National Food Safety Database, which completed its second phase of development in fiscal year 1996. The database is now available on the World Wide Web for use by consumers, educators, researchers, and others seeking food safety information and resources for a wide variety of uses. Further development of the database will be completed with fiscal year 1997 competitive funds awarded to a multi-state, interdisciplinary team of database researchers coordinated at the University of Florida.

Food safety education funds were used to support the development of the Food Animal Residue Avoidance Databank, a central source of residue avoidance information for producers, veterinarians, extension specialists, and regulatory agencies. Drug and pesticide tolerances for food animal products, residue screening methods,

PART 1

874

and pharmacokinetics of chemicals in food animals have been included in the database. In fiscal year 1996, the Food Animal Residue Avoidance Databank grew to include a seafood and aquaculture component. The Databank has been jointly developed by a multi-state, interdisciplinary team of researchers at the University of California-Davis, North Carolina State University, and the University of Florida. The University of Illinois, a partner in the development of the Food Animal Residue Avoidance Databank, is no longer active in the project.

Food safety education programs funded through Smith Lever 3d have included the following:

- 24 states and territories have implemented Hazard Analysis and Critical Control Point education programs with food safety education funds.
- 20 states and territories have implemented food safety programs related to biotechnology.
- 28 states and territories have conducted educational programs focused on microbiological pathogens.
- 24 states and territories have developed educational programs on pesticide residues.
- 44 states and territories have conducted educational programs in food processing and food preservation.

Audiences targeted by food safety education programs funded through Smith Lever 3d have included the following:

- 33 states and territories have implemented food safety programs targeting youth audiences.
- 32 states and territories have targeted industry.
- 8 states and territories have focused on providing food safety education to immigrants, those with low literacy skills, or those who speak English as a second language.

Since the program's inception in 1991, approximately \$18.5 million—\$10.5 from Federal sources, and \$8 million from State matching funds—have supported the development and implementation of 283 food safety education projects. More than half of those funded projects remain active and continue to impact both national and international audiences.

INTEGRATED PEST MANAGEMENT

Question. How have extension activities supported with Integrated Pest Management (IPM) funds accelerated the transfer of proven pest management technologies from the researchers to farmers, crop consultants, ranchers, and other users?

Answer. Presently, \$10.8 million of Smith-Lever 3(d) funds are distributed to land-grant universities for extension activities to educate farmers and others about IPM methods. This investment has resulted in an increased use of IPM methods by farmers in the United States. The extension effort is focusing on the expansion of team-based, multidisciplinary programs in areas where tough pest problems continue to cause major losses to growers, threaten the competitiveness of food industries, and sometimes pose unacceptable risks to the environment and workers. USDA investments have resulted in improved management of a wide array of pests that inflict economic and quality damage on nearly every crop produced in the country.

The Department is supporting IPM education programs at every land-grant university in the country, and successful outcomes resulting from this investment can be cited for virtually every state. At Mississippi State University, Cooperative Extension estimates that its IPM education efforts have helped cotton growers increase their yields by approximately \$50 per acre and reduce control costs by approximately \$40 per acre, an economic benefit to Mississippi cotton growers of more than \$90 million. The use of IPM tactics has played a crucial role in maintaining the viability of cotton as one of Mississippi's leading agricultural commodities, despite the problems with insecticide resistance. Research and extension efforts conducted by the University of Missouri have provided Missouri farmers with resistant soybean varieties and other management techniques that have increased their profits by \$7.5 million per year. It is estimated that Iowa corn farmers save \$15 million annually as a result of improved management of black cutworms made possible by Iowa State University's early-monitoring program. Washington Cooperative Extension has worked closely with the Agricultural Research Service to implement an Area-wide IPM Program for codling moth on over 3,000 acres of apples. This program has reduced pesticide use by over 75 percent, improved quality, and increased net profits by more than \$30 per acre. The University of Wisconsin's IPM program developed decision support software that saved potato growers more than \$5.9 million per year by reducing input costs while protecting the water resources of the region through

PART 1

875

reductions in applications of pesticides, nitrogen and water. Stored grain IPM strategies developed by Kansas State University research and extension staff helped reduce pest management costs by 45 to 70 percent, leading to a net savings of more than \$1 million per year in Kansas. These technologies have been distributed nationwide to over 2,400 elevator operators. In Oklahoma alone, elevator operators and producers have saved \$20 million per year by reducing pesticide use and grain losses.

PESTICIDE APPLICATOR TRAINING

Question. Funding of \$1.5 million is being proposed for fiscal year 1998 to initiate a redesigned Pesticide Applicator Training Program. No funding was provided for the program for fiscal year 1997. Is this program currently being carried out? How will the program be redesigned?

Answer. It is anticipated that \$1.7 million will support the Pesticide Applicator Training Program in fiscal year 1997 through a reimbursable agreement with the Environmental Protection Agency. The proposed funds would provide "seed money" for states to develop partnerships with other public programs such as EFNEP, 4-H, Master Gardener and selected private organizations to educate the general public, especially homeowners and small or part-time farmers that will reduce exposure of toxic pesticides to users and the environment. Educational programs are needed in the areas of risk management that will mitigate exposure, when pesticides are used in a pest management program, and minimize risk to public health and the environment. The lack of education in use of pesticides has resulted in gross misuse in home environments, threatening personal health, as well as possibly causing the loss of the pesticide to production agriculture.

CHILDREN, YOUTH, AND FAMILIES, AT RISK

Question. An increase of almost \$2.15 million is requested for the Children, Youth, and Families at Risk [CYFAR] program. Of this increase, \$446,000 is to bolster on-going programs and \$1.7 million is to be targeted to the 1890 Institutions. What is the justification for the increase in funding for this program?

Answer. Since 1991, USDA has received an annual appropriation to expand Extension programs to reach at-risk children and families. The Children, Youth, and Families at Risk [CYFAR] National Initiative mission is to marshal resources of the land grant university Cooperative Extension System to develop and deliver educational programs that equip limited resource families and youth who are at risk for not meeting basic human needs, to lead positive, productive, contributing lives.

The CYAR funds are distributed to 1862 land-grant universities' Cooperative Extension Service through a competitive application and review process. Projects are funded for five years. Since only 1862 land-grant universities have been eligible for funds, they were urged to partner with 1890 universities on Children, Youth, and Families Networks and State Strengthening Projects. Changes in the 1996 Farm Bill allow 1890 institutions to apply for these programs—if there is new or increased funding over the fiscal year 1995 appropriated level.

Increased funding would open the CYFAR Initiative to 1890 universities and provide them the opportunity to support community-based programs for children, youth and families at risk. Educational resources of the entire university/Extension System could be made available to people and communities least likely to have access. 1890 universities would be able to support prevention education programs which meet critical needs of children and families.

Question. How are the current program funds allocated and what has been accomplished through the program?

Answer. In 1997, Children, Youth and Families at Risk funds have been allocated for community-based projects for at risk children and their families and for support systems for these community-based projects.

<i>Children, Youth and Families at Risk</i>	<i>Fiscal year 1997</i>
Youth At Risk Community Project Renewal	\$149,834
40 State Strengthening Projects—50 percent to communities	6,709,787
Five CYF Networks	900,000
CYFERNet Coordination	184,000
Technical Assistance liaisons	215,000
CYFAR Evaluation Collaboration	494,000
Annual CYFAR Conference—for community projects	40,000
Annual Report Publication, Distribution	40,059
CYFAR Video/Brochures: Product/Distribution	25,000
State Strengthening Review Team Expenses	15,000

PART 1

876

<i>Children, Youth and Families at Risk</i>	<i>Fiscal year 1997</i>
State Strengthening Project Meeting	17,000
Subtotal	8,789,680
Federal Administration	764,320
Total	9,554,000

Through this Initiative, the Cooperative State Research, Education, and Extension Service has supported 170 community-based projects with sites in over 500 communities in 49 states and 3 territories. These programs serve 99,000 youth and 17,000 parents.

CYFAR projects incorporate research-based strategies for effective programs through collaboration, citizen involvement, inclusiveness, community-base, and ecological principles. Extension staff have formed collaborations with other community agencies and with citizens to create programs that meet critical needs of children and families. Each year state and local public and private agencies and organizations contribute cash and in-kind resources that match or exceed the Federal appropriation for the Children, Youth and Families at Risk program. In addition, approximately 25,000 youth and adult volunteers contribute time to the community programs.

In the interest of sustaining and expanding these community programs, the Children, Youth and Families at Risk Initiative has also funded a broad variety of support and technical assistance including:

The 5 National Children, Youth, and Family Networks which merge resources of all the land grant universities to provide research-based program and curriculum information, technical assistance, and training to communities. National Networks focus on Child Care, Family Resiliency, Science and Technology, Collaborations, and Decisions for Health.

CYFERNet, the electronic information infrastructure which links and supports all the five networks and assists communities with computer and technology issues.

Forty (40) State Strengthening Projects which each support a minimum of three community-based programs for at risk youth and children through the universities.

The Children, Youth, and Families at Risk Evaluation Collaboration which is assessing program impact and assisting communities evaluate their prevention education programs. This evaluation is finding that many of the community-based projects funded previously for five years by CSREES are no longer receiving federal funding and are continuing to operate with a variety of community and county public and private resources. The Children, Youth, and Family Networks have stimulated collaboration across universities, more efficient use of faculty and program monies, and broad dissemination of information on the World Wide Web which meets quality standards established by consensus of multidisciplinary faculty teams from many universities.

Question. What specific activities will be carried out with the increased funding proposed?

Answer. 1890 Universities could apply for Children, Youth, and Families at Risk Projects for statewide staff development and training, technical assistance to community programs, and direct funding to community programs designed to address needs identified by youth and adult citizens. Electronic connectivity could provide computers, software, Internet connections, and technology training for staff as well as youth and adult participants in community programs—to citizens least likely to have the resources for access.

This funding available on a competitive basis could insure active involvement of the 1890 universities in collaborative sharing of research and educational resources of the Children, Youth and Family Networks.

EXTENSION ACTIVITIES PROGRAMS

Question. The budget proposes to terminate a number of extension activities which this Administration has requested funding for in past years. These include farm safety, the Renewable Resources Extension Act, agricultural telecommunications, and rural health and safety. The budget indicates that these programs are state specific and/or do not address current regional or national priorities. With respect to each program listed above, please indicate why the Administration requested funding for the program in past years and why it now believes support of the program should be left to the discretion of the states to support through Hatch and Smith-Lever (b) and (c) formula funds.

Answer. The Administration has not requested continued funding for these programs because we are committed to responding to high priority problems of broad national concern. For example, CSREES has requested an increase of \$2 million for

PART 1

877

the Food Safety programs funded under Smith-Lever 3(d) because reducing the incidence of food-borne illness is a top priority of the public and the Administration. We have also requested an increase of \$2.146 million for the Children, Youth, and Families at Risk programs funded under Smith-Lever 3(d), which is consistent with the nationwide focus on at-risk youth.

Farm Safety and Rural Health and Safety.—Both of these programs are national in scope and affect rural, suburban, and urban populations. The farm safety and rural health and safety programs focus on the rural sector and, while the importance of these programs to some rural communities cannot be understated, the Administration believes that the availability of Smith-Lever 3(b) and (c) formula funds enables States to provide continued support of the programs as they deem appropriate. The formula funds permit a consistent, stable, dependable, and reliable programming source for State and county Extension cooperators and allow maximum flexibility in addressing national, regional, and/or local problems and issues.

Agricultural Telecommunications.—Continued funding of the Agricultural Telecommunications program has not been requested because the Administration has viewed the program as an opportunity to provide an infusion of funding to move the Cooperative Extension System forward in the areas of distance learning and computer networking. However, one of the criteria for award under the program has been the sustainability of a proposed project, or the ability of a project to continue and grow after receiving funding from the program. It is anticipated that these projects will be sustained through other funding sources, such as from the sale of products and/or the use of ideas and results from the projects by others. The projects could also be sustained through the use of formula funds if deemed appropriate by the States.

Renewable Resources Extension Act.—Funds provided under the Renewable Resources Extension Act provide for expanded natural resource education programs and are distributed to all States for educational programs and projects. Continued funding under the Act has not been requested because natural resource education programs are currently supported through the States' use of Smith-Lever 3(b) and (c) formula funding for Natural Resources and Environmental Management, which is one of the Extension base programs.

FORMULA FUNDS

Question. Why is no increase in Hatch and Smith-Lever formula funds proposed if the Administration is proposing to withdraw over \$9 million in federal support for these specific activities?

Answer. As part of the Administration's efforts to balance the budget, we have not requested increases in formula funding to offset the proposed eliminations of several programs.

WATER QUALITY PROGRAM

Question. Why is a reduction of \$1.672 million being proposed for Water Quality extension activities? What activities are currently being carried out through this program?

Answer. The President's \$1.672 million reduction for Water Quality extension activities reflects a desire to place emphasis in other priority areas in addition to water quality extension programs. It is anticipated that the state partners will secure additional funding to compensate for all or part of the federal reduction in funds. The Water Quality extension program provides support to every state for educational programs concerned with improving water quality. In addition, demonstration and hydrologic unit activities are funded throughout the country through almost 100 individual projects.

EXPANDED FOOD AND NUTRITION PROGRAM

Question. Would you please provide a description of the projects being funded through the Expanded Food and Nutrition Program [EFNEP].

Answer. EFNEP funds are distributed to all 50 States and 6 territories based on a formula that takes into account the percent of the population at or below 125 percent of poverty. These funds are used to deliver intensive nutrition education to limited resource youth and families with young children. Through an experiential learning process, adult participants learn how to make good choices to improve the nutritional quality of the meals they serve their families. They increase their ability to select and buy food that meets the nutritional needs of their family. They gain new skills in food production, preparation, storage, safety and sanitation, and they learn to better manage their food budgets and related resources such as Food Stamps. EFNEP is a program that produces results; surveys show that 87 percent

of the Expanded Food and Nutrition Program adult graduates improve 1 or more food resource management practices; 92 percent improve 1 or more nutrition practices; and 69 percent improve 1 or more food safety practices; EFNEP reaches all ethnic groups, in urban and rural settings, with culturally sensitive educational programs leading to positive behavior change.

RURAL HEALTH AND SAFETY PROGRAM

Question. Would you please provide an update on achievements of the projects being carried out through the Rural Health and Safety Program?

Answer. The Rural Health and Safety program is conducted by the Cooperative Extension Service and community colleges in Mississippi to address the problems of shortages of rural health care professionals and health care services and facilities. The Mississippi program has established the Mississippi Rural Health Corps—MRHC—a program of 15 community and junior colleges. The program is designed to increase the number of nurses, licensed practical nurses, and other health care professionals with a commitment, up to three years, to work in a rural health care service, and to develop an Extension health education and community health service strategic planning program.

After four years of operation, the MRHC provided junior and community colleges with educational opportunities for 2,516 students in the health care field. Nearly 90 percent of those enrolled have either completed their courses of study or remained in training. Of the program's 962 graduates, over 90 percent are employed in rural communities. Because of additional state funds generated by the project, one community college was able to add Emergency Medical Technician—EMT—and Emergency Medical Responder—EMR—courses to its curriculum. Nearly 200 students have been able to complete this training in the first two years of the program. In fiscal year 1997, an additional distance learning downlink site will be established with the Mississippi Nurses Association in preparation for adding graduate nursing education programs to help provide continuing nursing education certification and advanced degree faculty members for the MRHC program.

Rural health educational activities of the Mississippi Cooperative Extension Service have been very effective in raising rural residents' awareness of health care needs and available services. Over 29,000 residents have received health screening and referral services, and community leaders have begun strategic planning efforts towards establishing local community health centers. Eleven county-wide health coalitions and two health councils have been established to address county needs in the areas of breast cancer, high blood pressure, and sexually transmitted diseases education. The councils are served by 154 certified MRHC volunteer lay health advisors.

A second program, conducted by Cooperative Extension and the School of Nursing at Louisiana's Southern University, provides community-based health promotion and disease prevention services to persons who otherwise would not have access to them. The Louisiana program has established a nurse-managed mobile health care clinic that is providing culturally sensitive community-based health education, assessments, screening, and referral services. The mobile clinic also provides nursing students with clinical learning experiences within the immediate environment of the medically at-risk and underprivileged populations. The Louisiana program has also made progress in developing a mobile clinic-based nurse education curriculum. This mobile clinic gives students a direct understanding of health care needs and obstacles to accessing health care services of the rural medically at-risk populations. Community residents are given the opportunity to advise in the operation of the mobile clinic. Many of the student nurses acknowledge a change in attitude and perception regarding diverse groups. This experience has enabled them to more effectively provide culturally sensitive health care services. Health education is provided to participants to enhance individual and family awareness in health promotion and disease prevention strategies, while increasing self-care capabilities in nutrition, dental health, aging, childhood immunizations, breast self-examination, hypertension, diabetes, and other illnesses.

A major focus of this Louisiana program has been serving the health care needs of the homeless. The program report states that: "This excursion into the world of the homeless has assisted all directly involved to clearly understand the problems associated with the population. The student nurses experienced a gamut of emotions from brief moments of depression over their experiences to absolute joy at being able to do something to assist the homeless to meet health care needs. Many of them express a new interest in the field of community nursing."

PART 1

879

AGRICULTURAL TELECOMMUNICATIONS

Question. Would you please tell us how the agricultural telecommunications funds have been spent in each of the last three fiscal years and who has received these funds.

Answer. The Cooperative State Research, Education, and Extension Service conducts a competitive grants program to make available to accredited institutions of higher education the funding allocated to the Agricultural Telecommunications Program.

In fiscal year 1994, 12 projects were funded in the areas of Staff and Faculty Training, Program Delivery and Program Development and Production. Grant recipients in the Staff and Faculty Training category included University of Alaska, and two projects at Iowa State University. In the Program Delivery category, grant recipients included University of Puerto Rico, University of Hawaii, California State University-Fresno, and University of Nebraska. In the Program Production and Development Category, grant recipients included New Mexico State University, University of Florida, University of Idaho, Texas A&M University, and Utah State University.

In fiscal year 1995, 12 projects were funded in the areas of Program Delivery; Innovative Program Development and Production; and Capacity Building. Grant recipients in the Program Delivery category included University of Massachusetts, University of California, University of Georgia, University of Arkansas. In the Innovative Program Development and Production category, grant recipients included Iowa State University, University of California, University of Illinois, and two projects at Cornell University. In the Capacity Building category, grant recipients included University of Florida, Pennsylvania State University, Texas A&M University.

In fiscal year 1996, 13 projects were funded in the areas of Program Delivery; Innovative Program Development and Production; and Capacity Building. In the Program Delivery category, grant recipients included Cornell University, University of Idaho, University of Arizona, Oklahoma State University, University of Vermont, Mississippi State University, University of Hawaii. In the Innovative Program Development and Production category, grant recipients included New Mexico State University, Ohio State University and Fort Valley State University. In the Capacity Building category, grant recipients included University of Arkansas-Pine Bluff, Kansas State University, and North Carolina State University.

1890 FACILITIES

Question. Please provide a summary of how the 1890 facilities funding has been allocated in each of the past three fiscal years, including how much was received by each institution and the facilities funded.

Answer. The information follows.

1890 FACILITIES (SEC. 1447)

Institutions	Fund status	Fiscal year—			Status
		1994	1995	1996	
Alabama:					
Alabama A&M University	Allocated ... Awarded	\$422,607 422,607	\$422,607 422,607	\$416,242 416,242	The construction of the joint Research/Extension Conference Center is planned.
Tuskegee University	Allocated ... Awarded	422,607 422,607	422,607 422,607	416,242 416,242	The renovation of the food processing laboratories and the construction of the Extension Activities Center in progress.
Arkansas: University of Arkansas at Pine Bluff.	Allocated ... Awarded	405,926 405,926	405,926 405,926	399,812 399,812	Construction of the small ruminant research and fish processing/marketing buildings in progress.
Delaware: Delaware State University.	Allocated ... Awarded	324,560 324,560	324,560 324,560	319,672 319,672	Construction plans underway for the Research/Extension herbarium.

PART 1

880

1890 FACILITIES (SEC. 1447)—Continued

Institutions	Fund status	Fiscal year—			Status
		1994	1995	1996	
Florida: Florida A&M University ...	Allocated ... Awarded	427,721 427,721	427,721 427,721	421,279 421,279	Construction of farm shops & equipment shed planned.
Georgia: Fort Valley State University.	Allocated ... Awarded	469,833 469,833	469,833 469,833	462,757	Plans include an education support center, a family life center, and an agricultural administrative support complex.
Kentucky: Kentucky State University.	Allocated ... Awarded	520,692 520,692	520,692 520,692	512,850 512,850	Plans include the construction of horticulture and entomology labs, renovation of the water quality lab and the purchase of land to develop a fish nutrition lab.
Louisiana: Southern University	Allocated ... Awarded	397,350	397,350	391,365	Plans include purchasing movable equipment for livestock pavilion, construction of a multi-purpose research & demonstration facility, and construction of an Extension telecommunication center.
Maryland: University of Maryland Eastern Shore.	Allocated ... Awarded	373,433 373,433	373,433 373,433	367,809 367,809	Plans include the construction of a food science & technology Research & Extension center, and a human development center.
Mississippi: Alcorn State University.	Allocated ... Awarded	410,717	410,717	404,531	Original plans included renovation of swine research & demonstration unit, construction of a poultry research feed mill and a fish hatchery.
Missouri: Lincoln University	Allocated ... Awarded	518,512 518,512	518,512 518,512	510,702 510,702	Design & construction for the beef/cattle facility and the multi-purpose building underway.
North Carolina: North Carolina A&T State University.	Allocated ... Awarded	534,886 534,886	534,886 534,886	526,830 526,830	The 5-year plan has been amended to include construction of an Extension/Research office building at the university farm complex and the renovation of the food & nutrition lab.
Oklahoma: Langston University ...	Allocated ... Awarded	418,263 418,263	418,263 418,263	411,963 411,963	Plans include construction and equipment/furnishing for a Research and Extension multi-purpose facility.
South Carolina: South Carolina State University.	Allocated ... Awarded	413,265 413,265	413,265 413,265	407,041 407,041	The renovation design for the 4-H camp has been completed. Construction is scheduled to begin in June 1997.
Tennessee: Tennessee State University.	Allocated ... Awarded	476,248	476,248	469,075	Proposed plans include the purchase of land and the construction of a Research/Extension facility.

PART 1

881

1890 FACILITIES (SEC. 1447)—Continued

Institutions	Fund status	Fiscal year—			Status
		1994	1995	1996	
Texas: Prairie View A&M University.	Allocated ...	597,336	597,336	588,339	Irrigation system, security fence, and waste disposal system installed.
	Awarded	597,336	597,336	588,339	
Virginia Virginia State University	Allocated ...	451,004	451,004	444,211	Parking lot for the Multi-purpose Pavilion has been completed. Diagnostic laboratory furnishings and satellite downlinking equipment has been installed in the Pavilion. Renovation of the meat goat handling & housing facilities underway.
	Awarded	451,004	451,004	444,211	

BUILDINGS AND FACILITIES

Question. Please provide the Committee with a summary report on each of the facilities funded through CSREES' Buildings and Facilities Program, including the federal funds provided, the total estimated cost of the project, the current status of the project, and the available non-federal project match.

Answer. This information is provided in the following table.

SUMMARY OF FUNDING AND PROJECT STATUS, CSREES BUILDINGS AND FACILITIES PROGRAM—FISCAL YEAR 1997
 (Dollars in thousands)

Name and location of facility	Total est. cost of project	Total Federal funding provided as of fiscal year 1997	Total non-Federal match available to date	Current status of facility
Poultry Science Facility, Auburn University (Auburn, AL).	\$12,000	\$6,000	Assurance of required match has come from State and poultry industry sources.	Design work is underway.
Animal Sciences Research and Teaching Facility, University of Arkansas ¹ (Fayetteville).	3,892	1,946	Matching funds of \$200,000 are now available, balance of \$720,000 is being pursued from State appropriations.	Design phase completed; preparing bids for construction phase.
Alternative Pest Control Containment/Quarantine Facility, University of California (Davis/Riverside).	38,118	10,921	Majority of matching funds are anticipated to become available in fiscal year 2000 (and in-kind value of land to be proposed as part of match).	Most of the programming & design phase is completed; develop. of construction documents to begin in fiscal year 1997.
Animal Reproduction & Biotechnology Laboratory, Colorado State University (Fort Collins).	5,302	2,651	Matching funds are available	Construction work began in fiscal year 1994. Full occupancy expected by Summer 1997.
Agricultural Biotechnology Laboratory, University of Connecticut (Storrs).	18,100	3,915	Matching funds to be made available annually by the State.	Most of the programming & design phase is completed; develop. of construction documents to begin in fiscal year 1997.
Center for Applied Aquaculture, Oceanic Institute (Waimanolo, HI) ² .	11,450	9,956	Availability of required match for the fiscal year 1995 increment of funding has not been determined.	Construction Ongoing.
Agricultural Biotechnology Facilities, University of Idaho (Moscow) ³ .	13,479	5,900	In 1991, Univer. provided \$1M to complete an aquaculture lab, but only \$250,000 came from the State. The State did not match during fiscal year 1992-1995. During fiscal years 1996-97, the university was able to obtain a total of \$4.3 million in bond commitments from the State with an additional \$1 million of State support anticipated for fiscal year 1997.	Design & construction completed on an Aquaculture Lab (1 component of the project). Preliminary stages only on the remaining components.
Biotechnology Center, Northwestern University (Evanston, IL).	24,000	8,536	Matching funds are available	All construction has been completed; the buildings are occupied.
Biological and Environmental Sciences Facility, DePaul University (Chicago, IL).	10,000	5,000	Matching funds are available	Most of the programming & design phase is completed; develop. of construction documents to begin in fiscal year 1997.
Institute for Natural Resources and Environmental Science, University of Maryland (Statewide).	20,000	10,000	\$1.1 million of matching funds have been provided by the State, with more matching funds anticipated from State appropriations next year.	Planning and design phases are underway.

PART 1

Center for Hunger, Poverty, and Nutrition Policy, Tufts University (Boston, MA).	16,340	8,170	CSREES is considering the University's proposed use of in-kind value of land as part of its matching contribution. Cash may become available for additional matching purposes in the future.	Most of the programming & design phase is completed; develop. of construction documents to begin in fiscal year 1997.
Center for Plant Biodiversity, Missouri Botanical Garden (St. Louis).	15,826	7,913	Matching funds are available	In final phase of construction work; occupancy date estimated at 12/01/97.
Center for Molecular Biology, Rutgers University (New Brunswick, NJ).	47,900	17,836	Matching funds are available	Construction Ongoing.
Center for Arid Land Studies, New Mexico State University (Las Cruces).	22,600	11,000	Matching funds are available	Most of the programming & design phase is completed; develop. of construction documents to begin in fiscal year 1997.
Ctr. for Resch. on Human Nutr. & Chronic Disease Prevention, Wake Forest University (Winston-Salem, NC).	108,607	18,108	Matching funds are available	Construction Ongoing.
Research Greenhouse, Cornell University (Ithaca, NY) ⁴	1,212	606	Matching funds are available	Construction completed; building is occupied.
Lake Erie Soil & Water Research & Education Center, The University of Toledo (Toledo, OH).	5,600	2,800	Matching funds made available through State appropriations in fiscal year 1994.	Construction Ongoing.
Forest Ecosystem Research Laboratory, Oregon State University (Covallis).	24,000	10,000	Matching funds are available	Most of the programming & design phase is completed; develop. of construction documents to begin in fiscal year 1997.
Animal Resource Wing, South Dakota State University (Brookings).	11,600	5,400	Matching funds are available	Design work to be initiated in fiscal year 1997.
Agricultural, Biological, & Environmental Research Complex, University of Tennessee (Knoxville).	38,500	10,434	Matching funds of \$5-6 million are available now, the balance to be pursued from State appropriations.	Most of the programming & design phase is completed; develop. of construction documents to begin in fiscal year 1997.
Horse Science and Teaching Center, Middle Tennessee State University (Murfreesboro).	5,170	2,585	MTSU has requested the award to be made to the MTSU Foundation since the univer. has not been able to obtain the matching funds required. CSREES is currently reviewing the proposed request to change the award recipient to the Fdn. since they can provide the match.	Design work to be initiated in fiscal year 1997.
Center for Southern Crop Improvement, Texas A&M University (College Station).	14,500	7,000	Matching funds are available	Most of the programming & design phase is completed; develop. of construction documents to begin in fiscal year 1997.
Animal Disease Biotechnology Facility, Washington State University (Pullman).	54,000	23,400	Matching funds are available	Construction Ongoing.
Totals	522,196	190,077		

¹ Includes carryover funds from fiscal year 1995 in the amount of \$946,000. ² Includes carryover funds from fiscal year 1994 and 1995 in the amount of \$3,581,000. ³ Includes carryover funds from fiscal year 1993 and 1994 in the amount of \$1,266,000. ⁴ Includes carryover funds from fiscal year 1993 in the amount of \$232,000.

884

HIGHER EDUCATION PROGRAMS

Question. Please provide the Committee with a report on each of the CSREES higher education programs, indicating the institutions receiving grants under each program and an assessment of how each program is meeting its objectives.

Answer. In most programs, fiscal year 1997 awards currently are being processed. The most recent funding information is provided for each program, as follows.

Higher Education Challenge Grants Program

Institutions funded in fiscal year 1996 are the following:

California Polytechnic State University-San Luis Obispo
California State University, Chico
Cornell University
East Carolina University
Iowa State University
Kansas State University
Louisiana State University
Michigan State University
Mississippi State University
Montana State University
Ohio State University
Oklahoma State University
Rutgers University
Salish Kootenai College
Southern Illinois University
State University of New York College of Environmental Sciences and Forestry
Tarleton State University
Texas Tech University
Texas A&M University
University of Connecticut
University of Delaware
University of Florida
University of Georgia
University of Hawaii at Manoa
University of Illinois at Urbana-Champaign
University of Kentucky
University of Maryland, College Park
University of Minnesota-Twin Cities
University of Nebraska
University of North Carolina at Chapel Hill
University of Rhode Island
University of Tennessee, Knoxville
University of Texas-Austin
University of Wisconsin-Platteville
University of Vermont
Utah State University
Virginia Polytechnic Institute and State University
Washington State University

The objective of the Challenge Grants Program is to enable colleges and universities to provide high quality education in the food and agricultural sciences required to strengthen the Nation's food and agricultural scientific and professional work force. The program is accomplishing this by funding model projects that address regional and national higher education issues, use creative approaches to teaching, and foster partnerships among universities and between universities and the private sector. The program doubles the Federal investment since it requires dollar-for-dollar matching. The program serves both land-grant and other institutions with baccalaureate and higher degree programs in food and agricultural sciences, making it the centerpiece of USDA's teaching grants programs. An exciting array of projects funded under the program are serving to revitalize agriscience and business curricula, enhance faculty teaching skills, introduce and emphasize international issues and strengthen students' problem solving skills.

Hispanic-Serving Institutions Education Grants Program

The Hispanic-Serving Institutions Education Grants Program is being initiated in fiscal year 1997. The program's objectives are to promote and strengthen the ability of Hispanic-Serving Institutions to carry out higher education teaching programs in the food and agricultural sciences. The program will accomplish these by awarding grants to Hispanic-Serving Institutions for projects that will address one or more

PART 1

885

targeted need areas: curricula design and materials development; faculty preparation and enhancement for teaching; instruction delivery systems and scientific instrumentation for teaching; student experiential learning, and student recruitment and retention. The program is competitive among Hispanic-Serving Institutions. Awards will be made later this fiscal year.

1890 Institution Capacity Building Grants Program

Institutions funded for teaching projects in fiscal year 1996 are:

Alabama A&M University
Alcorn State University
Delaware State University
Florida A&M University
Kentucky State University
Langston University
North Carolina A&T State University
South Carolina State University
Tennessee State University
Tuskegee University
University of Arkansas-Pine Bluff
University of Maryland-Eastern Shore
Virginia State University

Institutions funded for research projects in fiscal year 1996 are:

Alabama A&M University
Alcorn State University
Delaware State University
Florida A&M University
Fort Valley State University
Kentucky State University
Langston University
North Carolina A&T State University
Southern University and A&M College
Tuskegee University
University of Maryland-Eastern Shore
University of Arkansas-Pine Bluff
Virginia State University

The highly competitive 1890 Institution Capacity Building Grants Program serves as the crux of the Department's high-priority initiatives to advance the teaching and research capacity of the 1890 Land-Grant Institutions and Tuskegee University. It reflects USDA's commitment to encourage more minorities to prepare for careers as food and agricultural scientists and professionals. The program meets these objectives by providing support for teaching and research projects in high-priority areas targeted by the institutions and USDA. Matching support from non-Federal dollars is strongly encouraged. Another component of the program that assists the 1890 Institution to build teaching and research capacity is the required cooperation of the institutions with one or more USDA agencies in developing a proposal and carrying out a project.

Multicultural Scholars Program

Grants are awarded every two years. Thus, institutions funded in fiscal year 1997, with combined 1996 and 1997 funds, include:

Alabama A&M University
California State University, Fresno
California Polytechnic State University-San Luis Obispo
Cornell University
Michigan State University
New Mexico State University
North Dakota State University
Oklahoma State University
Pennsylvania State University
Purdue University
Rutgers University-Cook College
Seton Hill College
South Dakota State University
Tennessee State University
University of Arkansas
University of Florida
University of Hawaii at Manoa

PART 1

886

University of Idaho
University of Illinois at Urbana-Champaign
University of North Dakota
University of Vermont
University of Wisconsin-River Falls
University of Wisconsin-Stout
Virginia Polytechnic Institute and State University

The Multicultural Scholars Program ultimately aims to increase the participation of America's diverse talent in the food and agricultural work force and to advance the educational achievement of all Americans. The program strives to attract and educate more students from groups currently underrepresented in the food and agricultural sciences for careers in agriscience and agribusiness. The program accomplishes these goals by providing undergraduate scholarships for outstanding students from such underrepresented groups. The program is open to all colleges and universities. Since the program began in 1994, 206 scholarships have been provided. The Federal investment in the program leverages state and private support via a 25 percent matching requirement.

USDA National Needs Graduate Fellowships Grants Program

Institutions funded in fiscal year 1996 are:

Colorado State University
Cornell University
Iowa State University
Kansas State University
Michigan State University
North Carolina State University
Ohio State University
Pennsylvania State University
Purdue University
Texas A&M University
University of Missouri
University of Minnesota
University of Nebraska
University of Chicago
University of Illinois at Urbana-Champaign
University of Florida
University of California, Davis
University of Wisconsin-Madison
University of Washington
Virginia Polytechnic Institute and State University

Begun in 1984, the USDA National Needs Graduate Fellowships Grants Program seeks to stimulate the development of food and agricultural scientific expertise in targeted national need areas. This program represents a key investment strategy, as it is the only Federal program targeted specifically to the recruitment and training of pre-doctoral students for critical food and agricultural scientific positions. The program achieves its goal by providing funds competitively to universities for attracting and supporting outstanding graduate students to pursue advanced degrees in areas of the food and agricultural sciences experiencing shortages of expertise. Over the 12 years of this program, approximately 915 fellows have been trained within 6 areas, namely Plant and Animal Biotechnology; Human Nutrition and/or Food Science; Water Science; Engineering—Food, Forest Products, or Agricultural; and, Marketing or Management—Food, Forest Products, or Agribusiness. Graduates of the program are working in private industry, with such major companies as Kellogg, Nabisco, Kraft, General Foods, American Express Company, and General Mills, as well as with major universities. They hold such positions as Product Engineer, Research Scientist, Econometrician, Chemical Engineer, Extension Economist, and teaching positions from Instructor to Professor.

Tribal Colleges Endowment Fund

All 29 tribally controlled Land-Grant Institutions were funded in the Tribal Colleges Endowment Fund in fiscal year 1996. They are:

Bay Mills Community College, MI
Blackfeet Community College, MT
Cheyenne River Community College, SD
College of the Menominee Nation, WI
Crownpoint Institute of Technology, NM
D-Q University, CA

PART 1

887

Dull Knife Memorial College, MT
Fond du Lac Tribal and Community College, MN
Fort Belknap College, MT
Fort Peck Community College, MT
Fort Berthold Community College, ND
Haskell Indian Nations University, KS
Institute of American Indian Arts, NM
Lac Courte Oreilles Ojibwa Community College, WI
Leech Lake Tribal College, MN
Little Hoop Community College, ND
Little Big Horn College, MT
Navajo Community College, AZ
Nebraska Indian Community College, NE
Northwest Indian College, WA
Oglala Lakota College, SD
Salish Kootenai College, MT
Sinte Gleska University, SD
Sisseton Wahpeton Community College, SD
Sitting Bull College, ND
Southwestern Indian Polytechnic Institute, NM
Stone Child College, MT
Turtle Mountain Community College, ND
United Tribes Technical College, ND

The Tribal Colleges Endowment Fund, launched in 1996, distributes interest earned by an endowment established for the 29 tribally controlled Land-Grant Institutions, as authorized by law in 1994. The Endowment Fund seeks to enhance education in food and agricultural sciences and related areas for Native Americans by building educational capacity at these institutions in the areas of curricula design and materials development, faculty development and preparation for teaching, instruction delivery systems, experiential learning, equipment and instrumentation for teaching, and student recruitment and retention.

Tribal Colleges Education Equity Grants

All 29 tribally controlled Land-Grant Institutions were funded under the Tribal Colleges Education Equity Grants Program in fiscal year 1996. See above list of institutions.

This program, launched in fiscal year 1996, is a formula program designed to enhance educational opportunities for American Indians by strengthening instruction in the food and agricultural sciences at 1994 Land-Grant Institutions. This is accomplished by strengthening instructional programs in the food and agricultural sciences at the 29 tribally controlled colleges designated as the 1994 Land-Grant Institutions. These institutions serve approximately 14,000 American Indian students. Funded projects focus on undergraduate and graduate studies in the food and agricultural sciences and must address one or more of the following need areas: (1) Curricula Design and Materials Development; (2) Faculty Development and Preparation for Teaching; (3) Instruction Delivery Systems; (4) Student Experiential Learning; (5) Equipment and Instrumentation for Teaching; and (6) Student Recruitment and Retention. Each institution is required to develop a plan of work that addresses the institution's long-range goals and shows how these funds will be used to strengthen institutional capacities.

CHALLENGE GRANTS PROGRAM

Question. Why is increased funding being requested for the Institution Challenge Grants program for fiscal year 1998?

Answer. American higher education in the food and agricultural sciences must continually address a number of issues to maintain its quality and competitiveness. The USDA Higher Education Institution Challenge Grants Program is the Department's flagship initiative to ensure excellence in education by stimulating and providing incentives for institutional change. This program has shown its worth by moving higher education in the following directions over the last seven years. An increasing number of joint degree programs in agribusiness have emerged between colleges of business and colleges of agriculture. Faculty in colleges of agriculture are increasing their skill in working with multicultural student bodies through specially designed workshops. Significant numbers of faculty have participated in workshops that have reoriented them from use of traditional lecture methods to experiential learning and problem solving for students. Undergraduate students more often participate in research in biotechnology, environmental management, and other impor-

PART 1

888

tant emerging fields. Institutions more often partner to accomplish their educational goals. However, current funding is not adequate to meet the needs or to fully capture the potential benefits to be derived from the program. For example, there are critical needs to expand curricula to include global perspectives and to enhance graduate education, which the program does not have the capacity to accomplish. The changing nature of higher education and its students requires more emphasis on the utilization of various new delivery systems to promote outreach and flexibility and the creation of partnerships among institutions to make higher education more efficient and cost-effective. Over time, inflation has negatively impacted project scope. Over the past seven years, only about 22 percent of approximately 1,000 excellent proposals generated by this highly competitive program could be funded. In fiscal year 1997, this program experienced a cut of \$.35 million from the level of fiscal year 1996. An increase in 1998 will return the program to the 1996 funding level and will enable four to five more colleges to undertake projects, including international projects, that promote excellence in agricultural education. In order to really achieve the potential of this program to change the face of food and agricultural higher education at both the undergraduate and graduate levels, sufficient funds must be allocated. At the current and projected size, the potential benefits cannot be fully realized.

SPECIAL RESEARCH GRANTS

Question. The fiscal year 1998 budget proposes a new \$2 million food safety competitive special research grants program. Why is a special research grants program being proposed? You are also proposing to target food safety increases through the National Research Initiative (NRI) competitive grants program. Why is a special research grants program needed? Why can't this research be funded through the NRI?

Answer. The proposed special research grant will be more responsive and able to address more specific research priorities within a shorter time frame. In the past, CSREES has been asked by FSIS to assist them with research that would address their specific needs in providing a scientific basis for setting policies or providing information to food producers, processors, handlers, and consumers; to develop improved analytical techniques for detecting and measuring contaminants in foods; and to develop intervention techniques that would prevent or eliminate contaminants. The Agency funds food safety research through formula funds (including Hatch, Evans-Allen, and Animal Health and Disease Acts), competitive grants (through the NRICGP), and Congressionally directed special research grants. The research is conducted by the Agency's land-grant university partners and other co-operators. The current programs afford little flexibility for the Agency to direct its food safety research in a timely manner to address specific high priority needs identified by USDA action agencies and other federal and state food safety experts. The new special grants program will increase the Agency's ability to respond rapidly to research questions. NRI funding allows the Agency to research more fundamental, often longer-term, research problems.

BINATIONAL AGRICULTURAL RESEARCH AND DEVELOPMENT—BARD

Question. The budget proposes \$2.5 million for United-States-Israel Binational Agricultural Research and Development program (BARD), a \$500,000 increase above the 1997 level. Why is an increase in funding for this program being proposed, especially given the fact that the Administration is proposing the elimination of funding for a number of on-going CSREES activities?

Answer. The \$2.5 million requested for the BARD program would restore funding to the level provided by CSREES for BARD in each of the fiscal years 1994, 1995, and 1996. CSREES also requested \$2.5 million for BARD for fiscal year 1997, but only \$2 million was appropriated. Restoration of the \$2.5 million funding level for BARD is requested because the Administration supports increasing the proportion of agricultural research funding that is awarded by merit review with peer evaluation, as is the case with the BARD program. The Administration also believes that the dollar-for-dollar matching support provided by the Israeli government under BARD results in a high quality return on the U.S. investment in the program. Further, each project funded under the BARD program is a joint effort between U.S. and Israeli scientists, which exemplifies the integrated approach to problem solving preferred by the Administration in meeting the challenges facing U.S. and global agriculture. The challenges of today and the future are more complex than those we have solved in the past and require the multi-functional, multi-disciplinary, multi-institutional approaches found under the BARD program.

Question. Please indicate the research projects which have been carried out under this program for each of the last five fiscal years.

PART 1

889

Answer. The BARD program has been funded through CSREES in fiscal years 1994 through 1997. While none of the 1997 funds have been awarded to date, a listing of the research projects funded in fiscal years 1994, 1995, and 1996 follows:

Binational Agricultural Research and Development Program—Fiscal year 1994

<i>Organization / title</i>	<i>Amount</i>
University of California:	
Davis, CA:	
Utilization of NMR Technology for Internal Non-Destructive Quality Evaluation of Fruits and Vegetables	\$135,000
Grapes, Wines, and Byproducts as Potential Sources of Antioxidants	120,000
Riverside, CA:	
Ecology, Population Dynamics and Genetic Diversity of Epiphytic Yeast Antagonists of Postharvest Diseases of Fruit	125,000
Characterization of Field-Scale Solute Transport in Spatially Variable Unsaturated Field Soils	78,120
Colorado State University, Ft. Collins, CO: Evaluation of Naked Proviral DNA as a Vaccine for Ovine Lentivirus Infection	140,000
University of Florida, Gainesville, FL:	
Strategies to Optimize Reproduction in Heat Stressed Dairy Cattle	120,000
Citrus Tristeza Virus: Molecular Approaches to Cross Protection	144,000
Iowa State University of Science and Technology, Ames, IA: Molecular Markers for Immunocompetence and Resistance to Disease	127,000
University of Minnesota, Minneapolis, MN: Bacterial Mineralization of Atrazine as a Model for Herbicide Biodegradation	119,000
North Carolina State University, Raleigh, NC:	
Aspects of Sugar Metabolism in Fruit as Determinants of Fruit Quality	125,000
Non-Destructive Quality Sensing of High-Valued Agricultural Commodities through Response Analysis	113,000
University of Nevada, Reno, NV: Mechanisms for Control of Leaf Growth during Salinity Stress	125,000
Cornell University, Ithaca, NY:	
Improving Preferential Flow Modules by Experimentation	107,000
Consequences of Nonequilibrium Pesticide Fate Processes on Profitability of leaching	141,000
Discovery and Use of Genes and Gene Products Coding for Proteins Useful in Biocontrol	131,000
Texas A&M Research Foundation, College Station, TX: Pathogenic Streptococcus in Tilapia: Rapid Diagnosis Epidemiology and Pathophysiology	94,000

Binational Agricultural Research and Development Program—Fiscal year 1995

<i>Organization / title</i>	<i>Amount</i>
University of California:	
Berkeley, CA: Relationship of Genes Conferring Epiphytic Fitness and Internal Multiplication in Plants in <i>Erwinia Herbicola</i>	\$137,500
Davis, CA:	
Involvement of the TMV-MP in the Control of Carbon Metabolism and Partitioning in Transgenic Plants	133,000
Environmental, Developmental and Physiological Bases of Curcubit Seed Quality ¹	115,370
Isoflavonoid Regulation of Root Bacteria	125,000
Wooliness in Peaches and Nectarines	109,778
Targeting of an Expressed Insect Selective Neurotoxin by its Recombinant Baculovirus	102,000
Genetic and Biochemical Characterization of Fructose Accumulation	106,614
Riverside, CA: Structural Elements and Neuropharmacological Features Involved in the Insecticidal Properties of an Alpha Scorpion Neurotoxin	105,000
University of Florida, Gainesville, FL:	
Mapping Quantitative Trait Loci in the Woody Perennial Plant Genus Citrus	130,000
Identification of DNA	125,000

PART 1

890

<i>Organization / title</i>	<i>Amount</i>
Purdue Research Foundation, West Lafayette, IN: An Inquiry into the Phenomenon of Enhanced Pesticide Transport Caused by Effluents	109,200
Michigan State University, East Lansing, MI: Analysis of Senescence-inducible Ribonuclease in Tomato	116,700
University of Nebraska, Lincoln, Nebraska: Pathogenicity and Sclerotia Development of <i>Sclerotinia sclerotiorum</i> : Involvement of Oxalic Acid and Chitin Synthesis	50,100
Cornell University, Ithaca, NY:	
Analysis of Quantitative Traits in Pepper using Molecular Markers	124,200
Polyphenoloxidases—Expression, Assembly, and Function	122,410
Texas A&M Research Foundation, College Station, TX: Improving Productivity of Cotton in Arid-Region Agriculture: An Integrated Physiological/Genetic Approach	110,000
Virginia Polytechnic Institute and State University, Blacksburg, VA: Environmental, Developmental, and Physiological Determinants of Curcubit Seed Quality ¹	63,820
University of Wisconsin, Madison, WI: Lymphocyte Response to Genetically-engineered Bovine Leukemia Virus Proteins	125,000
<i>Binational Agricultural Research and Development Program—Fiscal year 1996</i>	
<i>Organization / title</i>	<i>Amount</i>
University of California:	
Berkeley, CA: Functional Biogenesis of V-ATPase in the Vacuolar System of Plants	\$81,000
Davis, CA:	
Enhancement of Baculovirus Potency by Expression of Synergistic Scorpion Toxin	125,000
Genetic Diversity of Resistance Gene Clusters in Wild Population of <i>Lectuca</i>	125,000
Biosensors for On-line Measurement of Reproduction Hormones and Milk Proteins to Improve Dairy Herd Management	145,870
Resistance to Tomato Yellow Curl Virus by Movement Protein in a Single Cultivar	121,250
Creating Genetic Variation in Tilapia Through the Creation of an Artificial Center of Origin ²	145,500
Mapping and Tagging by DNA Markers of Emmer Alleles that Improve Traits in Wheat	137,000
Rhizosphere Ecology of Plant-Beneficial Microorganisms	130,410
Molecular Genetic Analysis of Citrus Acid Accumulation in Citrus Fruit	125,000
Purdue Research Foundation, West Lafayette, IN:	
Osmotin and Osmotin-like Proteins as a Novel Source for Phytopathogenic Fungal Resistance in Transgenic Carnation	125,000
Regulated Expression of Yeast FLP Recombinase in Plant Cells	135,610
Elicitor-Induced Response in <i>Lycopersicon Esculentum</i>	125,000
Study of the Basis for Toxicity and Specificity of <i>Bacillus Thuringiensis</i> -Endotoxins	113,630
Cornell University, Ithaca, NY: Virus Synergy in Plants	124,480
The Pennsylvania State University, University Park, PA:	
Developing Nutritional-Management Protocols Which Prevent Tibial Dyschondroplasia	125,000
Ozone Altered Stomatal/Guard Cell Function: Whole Plant and Single Cell Analysis	135,400
Identification of <i>Staphylococcus Aureus</i> Virulence Factors Associated With Bovine Mastitis	142,000
Texas A&M Research Foundation, College Station, TX: Role of Placental Lactogen in Sheep	116,130
Virginia Polytechnic Institute and State University, Blacksburg, VA: Creating and Characterizing Variation in Tilapia by Creating and Center of Variation ²	65,700

¹ Collaborative project funded at the University of California, Davis, and Virginia Polytechnic Institute and State University.

² Collaborative project funded at the University of California, Davis, and Virginia Polytechnic Institute and State University.

PART 1

891

SPECIAL RESEARCH GRANTS

Question. For each of the special research grants listed below which the Administration proposes to continue for fiscal year 1998, please indicate how the current funding is being allocated, the research activities being carried out, the location where the research is being performed, and what has been accomplished to date under the program: Critical Issues, Expert IPM Decision Support System, Global Change, Integrated Pest Management and Biological Control, Minor Crop Pest Management—IR-4, National Biological Impact Assessment Program, Pesticide Impact Assessment, Pest Management Alternatives, Rural Development Centers, and Water Quality.

Answer. The information for the special research grants follows:

Critical Issues.—These grant funds, which are appropriated at \$200,000 in fiscal year 1997, support research on critical issues impacting agriculture that require immediate attention. These funds are intended to initiate research efforts until other resources can be secured to address the critical issues. Six research proposals have been funded to address potato late blight and two research proposals have been funded to address vesicular stomatitis. The potato late blight work is being carried out at Washington State University, Oregon State University, the University of Idaho, the University of Wisconsin, and the Pennsylvania State University. The first North American Late Blight Workshop was convened which involved potato growers and processors, national potato organizations, university scientists, and the chemical industry. The major contribution of this workshop was the resulting set of recommendations for short- and long-term efforts needed to solve this problem. The vesicular stomatitis work is being carried out at Colorado State University and the University of Arizona. Work has been initiated to focus on the transmission of this virus, which was identified by commodity groups, regulatory veterinarians, and USDA researchers as a high priority problem.

Expert IPM Decision Support System.—A prototype information and decision support system was developed in collaboration with Purdue University and the Department of Energy's Argonne National Laboratory that integrates and manages information from multiple data sources. Information on the status of EPA review of pesticides, losses caused by pests, status of alternative tactics, status of minor use registrations, current research in progress, and priorities of IPM implementation teams are integrated in the Pest Management Information Decision Support System—PMI/DSS. The appropriation for this grant in fiscal year 1997 is \$177,000. The PMI/DSS supports a USDA/EPA Memorandum of Understanding to find alternatives to pesticides under regulatory review or being lost due to genetic resistance. The data base has identified priorities for the Pest Management Alternatives request for proposals for the past two years and interacts with the project system of the IR-4 Minor Use Registration Program. It also interacts with the identification of priorities for research and extension activities in the regional IPM special grant and special projects. It provides a mechanism for growers and grower organizations to interact with the priority process, and the ultimate result is to help insure that farmers have alternatives for managing pests at the specific local level. Work is carried out by CSREES National Program Leaders in IPM, NAPIAP, and IR-4 program areas working on PMI/DSS. The Argonne National Laboratory has a Washington, D.C. office where information, decision support personnel are housed, and there are daily interactions between CSREES and other USDA staff personnel, the program addresses priority commodity pest management needs due to voluntary pesticide cancellations and regulatory cancellations responding to the MOU and supplemental MOU between USDA and EPA. In fiscal year 1996, there were 58 pesticides and 374 uses identified and prioritized. The process included information on cancellations furnished by EPA, selected uses were sent to the states NAPIAP and IPM network, and impacts of cancellations effecting individual state agriculture reported back for compilation in the decision support system.

Global Change.—The work supported by this grant has a fiscal year 1997 appropriation of \$1,657,000. CSREES is in the process of establishing a network for monitoring surface UV-B radiation which will meet the needs of the science community of the U.S. and will be compatible with similar networks being developed throughout the world. The discovery of a deterioration of the stratospheric ozone layer and the occurrence of an ozone hole over polar regions has raised concern about the real potential for increased UV-B irradiance reaching the surface of the earth and the significant negative impact this could have on all biological systems, including man plus animals and plants of agricultural importance. This research is closely coordinated with other Federal agencies involved in the U.S. Global Change Research Program UV-Monitoring Network Plan. Colorado State University is managing the operating network which, when completed, will include all regions of the country. At

PART 1

892

least 30 sites are planned for the climatological network including sites in Hawaii, Alaska, and Puerto Rico. Ten sites have been operational with broad band instruments for up to three years, and it is planned to have at least twenty sites operational with new generation instruments by the summer of 1997. The research level network will begin with the first instrument to be installed at the Department of Energy Solar Radiation site near Ponca City, Oklahoma, as part of the Atmospheric Radiation Measurements field network. The USDA UV-B Network is to provide accurate, geographically-dispersed data on UV-B radiation reaching the surface of the earth, and to detect trends over time in this type of radiation. A network of a new multi-band instrument, which will provide the spectral information needed to support both biological and atmospheric science research and to serve as ground-truth for satellite measurements, was made available in 1996. These instruments have been deployed and are currently in operation at ten monitoring sites across the U.S. To gain network experience, broadband instruments, along with ancillary instruments, had been installed at ten selected field sites and operated for the last 28–36 months. An additional ten sites have been developed during the last 12 months, including those equipped with the new multi-band UV instrument. Data from all sites is transmitted daily to Colorado State University for analysis, distribution, and archiving.

Integrated Pest Management/Biological Control.—Research supported by IPM special grants, which has a fiscal year 1997 appropriation of \$2,731,000, continues to provide a science basis for the development of alternative approaches for managing pests including insects, mites, weeds, plant pathogens, and ectoparasites. Emphasis of the program has been on enhanced natural control, which emphasizes increased use of biological control, cultural control, and host resistance practices and the management of genetic resistance of pests. Research is being carried out in nearly all of the State Agricultural Experiment Stations. The original and current goal is to bring IPM into the 21st Century with a paradigm shift from past sole dependence on pesticides to an emphasis on natural control integrated with selective pesticides and biopesticides when pest population densities warrant their use. The more recent increase in joint research/extension collaboration has assisted bringing the accomplishments of research into implementation reality. All four regions have produced 12- to 15-page brochures documenting the impacts of research and extension efforts. IPM advances on 25–30 commodities are described in these brochures.

Minor Crop Pest Management, IR-4.—The Pest Management for Minor Crops IR-4 Program, formerly the Pesticide Clearance Program, is a joint effort between the State Agricultural Experiment Stations, CSREES, and ARS with a fiscal year 1997 appropriation of \$5,711,000. IR-4 provides the national leadership, coordination, and focal point for obtaining tolerance and safety data for pesticides and biological control agents for specialty crops such as horticultural crops. With Federal registration resulting from this research, a large number of small acreage crops such as vegetables, fruits, nuts, spices, and other specialized crops have been provided with needed crop protection against pests. Field work is performed at the State and Territorial Experiment Stations. Laboratory analysis is conducted primarily at the California, New York, Florida, and Michigan Agricultural Experiment Stations. Protocol development, data assimilation, writing petitions, and registration processing are coordinated through the New Jersey Agricultural Experiment Station. ARS is conducting minor use pesticide studies at several locations also. This research effort has been responsible for data in support of 2,074 food use clearances, which include 1,127 since 1984, 3,602 ornamental registrations, and research on 26 biopesticides resulting in 18 minor use registrations.

National Biological Impact Assessment Program.—This program, with a fiscal year 1997 appropriation of \$254,000, was established to facilitate and assess the safe application of new technologies for the genetic modification of animals, plants, and micro-organisms to benefit agriculture and the environment. This program supports the agricultural and environmental biotechnology community by providing useful information resources to scientists, administrators, regulators, teachers, and the interested public. The research for this program is being conducted by the Virginia Polytechnic Institute and State University. This computer-based information system now includes texts of Federal biotechnology regulations, proposed rules, and policy statements; databases of biotech companies, research centers, institutional biosafety committees, and state regulatory contacts; resource lists of publications, directories, bibliographies, and meetings; monthly newsletters developed and distributed by this program; relevant Federal Register announcements; and links to other electronic information resources. In addition, this program provides biosafety training through workshops for academic and corporate scientists, biosafety officers, and state regulators.

PART 1

893

Pesticide Impact Assessment Program.—Research funded by the National Agricultural Pesticide Impact Assessment Program—NAPIAP—which has a fiscal year 1997 appropriation of \$1,327,000, discovers, gathers, publishes, and distributes information relating to the use and effectiveness of pest management alternatives essential to the maintenance of U.S. agricultural crops and livestock production. These data involve evaluating the biologic and economic impact and consequences of restricting the use of key pesticides either through voluntary cancellations or regulatory action. This work is being carried out at 53 state and territorial Agricultural Experiment Stations. Competitively awarded research funds are coordinated through a lead state in each of the four regions of the U.S.—California, West; Ohio, North Central; Pennsylvania, Northeast; and Florida, South. NAPIAP's goals are defined in its strategic plan as: first, in collaboration with USDA, EPA, and Land-Grant partners, to focus activities on collecting and delivering high quality, science-based pest management information for use in the regulatory process; and second, maintain and enhance a strong partnership between the USDA and the Land-Grant System in order to continue the positive interactive flow of vital pest management information between the USDA, the regulatory community, and production agriculture.

Pest Management Alternatives.—The research supported by this grant, which has a fiscal year 1997 appropriation of \$1,623,000, represents a new proactive way to address and interface with environmental regulatory issues confronting agriculture. The goal of this research is to provide farmers and other pest managers with alternative pest management approaches and technologies when pesticide tools are lost due to regulatory action, voluntary withdrawal by the registrant, or the development of resistance. This research is being carried out by State Agricultural Experiment Stations, Land-Grant Universities, and other public and private research institutions and organizations. Examples of research supported by this program are (1) provides farmers and others with replacement technologies for agricultural chemicals lost due to regulatory actions, potential regulatory actions, or due to voluntary cancellation by registrants for which producers do not have effective alternatives; (2) provides effective alternative technologies for situations where pest resistance to pesticides limit adoption of integrated pest management strategies; and (3) facilitates implementation of new technologies on farms, ranches, forests, urban landscapes, and in homes, public, and commercial buildings.

Rural Development Centers.—The function of the Rural Development Centers, which has a fiscal year 1997 appropriation of \$423,000, is to increase the productivity of regional faculty both in doing research on rural issues and in using research to do effective outreach with rural communities. The number of research faculty who are addressing broader rural issues is declining in many places. The multi-disciplinary and multi-state work, supported by the Centers, becomes even more crucial in a period of reduced research emphasis. Critical needs are being met by Center's support, including public lands policy, changing rural migration patterns, fiscal alternatives for local governments, and forest stewardship education. The regional rural development centers include the following: Northeast Regional Center for Rural Development, Pennsylvania State University; North Central Regional Center for Rural Development, Iowa State University; Southern Rural Development Center, Mississippi State University; and Western Rural Development Center, Oregon State University. There is also a rural development project at North Dakota State University. The Rural Development Centers' mission is to strengthen rural families, communities, and businesses by facilitating collaborative socio-economic research and extension. Research programs are undertaken after evaluating broader regional and national priorities.

Water Quality.—This national, competitively-awarded grants program, which has a fiscal year 1997 appropriation of \$2,757,000, supports research to investigate the impacts of non-point source pollution from agriculture on water quality and to develop improved, sustainable agricultural practices and systems that protect the environment and are economically profitable. This program also supports research on five Management Systems Evaluation Area (MSEA) projects as part of the Midwest Initiative on Water Quality to develop new farming systems that protect water quality, with research located at 10 sites throughout the Corn Belt. Funds provided under the Water Quality Program have been awarded to institutions in virtually every state, so work is being carried out in all parts of the country. The MSEA projects of the Midwest Initiative on Water Quality are headquartered in Iowa, Minnesota, Missouri, Nebraska, and Ohio, with satellite locations in North Dakota, South Dakota, and Wisconsin. During the past three years, focus and allocation of resources have increased for surface water quality. Major progress has been made on these goals. Nitrogen testing research and implementation of the Pre-sidedress Nitrogen Test in the Northeast and Midwest is helping producers match the supply

PART 1

894

and demand for nitrogen, thus reducing excess application. Also, in the Pacific Northwest, nitrate lost from the root zone of irrigated potatoes can be effectively recaptured by following with a grain or forage crop. The Management System Evaluation Area modeling group has adapted, improved, and verified the usefulness of the Root Zone Water Quality Model as a tool for extending MSEA results beyond the research sites.

RANGELAND RESEARCH

Question. The fiscal year 1998 request proposes to terminate funding for rangeland research. What is the justification for this proposal? For each of fiscal years 1993–1997, please indicate how these funds have been allocated and the specific activities have been supported through the program.

Answer. The proposed elimination of this program is consistent with the emphasis on high priority national interest programs in the 1998 CSREES budget. Although this program is proposed for elimination, alternate sources of funding, including the Hatch Act formula and related base funded programs, permit institutions to fund research in those areas identified as high priority. This flexibility could provide for maintaining some of the rangeland research programs if the State institutions wish to continue the research. These projects could also be submitted for competition and possible funding under CSREES' National Research Initiative—NRI—Program.

The following tables list funds allocated and activities for the Rangeland Research program from fiscal years 1993–1996. No awards have been made in fiscal year 1997. The solicitation for applications for the fiscal year 1997 program was published in the March 1997 Federal Register. Proposals are due to CSREES by May 17, 1997.

Rangeland research

<i>Recipient / title</i>	<i>Amount</i>
Fiscal year 1993:	
Colorado State University, Cattle Preference as a Tool to Modify Riparian Vegetation	\$77,200
University of Nebraska, Influence of Genetic Variation in North American Leafy Spurge on <i>Apthona nigriscrutis</i>	74,740
Texas A&M University, Spatial Modeling of Succession in a Subtropical Savanna: An Integrated Approach	73,982
Utah State University, The Importance of Food and Companionship in Choice of Foraging Location by Sheep	77,200
USDA-ARS, Characterization of Seedbed Microclimate for Burn-Rehabilitation Planning	72,572
USDA-FS, Regulation of Seed Germination in Facultatively Fall-Emerging Grasses	77,175
Subtotal, Grants	452,869
SBIR	6,911
Biotechnology Risk Assessment	970
Federal Administration	14,250
Total	475,000
Fiscal year 1994:	
University of Arizona, Significance of Local Adaptation in Rangeland Revegetation with Native Species	34,549
Oregon State University, Quantifying the Impact of Rangeland Management on Stream Temperatures	68,500
South Dakota University, Effects of Stocking Rate and Grazing System on Patterns of Tiller Utilization	69,500
Texas A&M University, Tree/Shrub Influence on the Nitrogen Cycle of a Subtropical Savanna Ecosystem	69,500
University of South Dakota, Intraspecific Action of Allelochemicals in Leafy Spurge— <i>Euphorbia esula</i> L.—	13,790
Utah State University, Biological Control of Dyer's Woad with a Pathogenic Rust Fungus	61,000
Washington State University, The Influence of Grazing on Long-Term Site Productivity of Transitory Range	68,500

PART 1

895

<i>Recipient/Title</i>	<i>Amount</i>
USDA-FS, Regeneration Biology of Shadscale—Atriplex confertifolia	68,500
Subtotal, Grants	453,839
SBIR	6,911
Biotechnology Risk Assessment	14,250
Federal Administration	14,250
Total	475,000
Fiscal year 1995:	
Montana State University:	
Livestock, Forage, and Grasshopper Interactions: Cumulative Effects of Grazing	79,950
Integrated Management for Spotted Knapweed Infested Range ..	57,050
Texas A&M University:	
Hydrologic Mechanisms Determining Plant Species Interactions in Grazed Savannas	79,992
R:FR Regulation of Tiller Initiation: Is It Applicable to Range Grasses?	79,354
Bush Removal and Regrowth: Implications for Water Use and Aquifer Recharge	75,835
Utah State University, Behavioral Bases for Varied Diets of Ruminants	79,354
Subtotal, Grants	451,535
SBIR	9,215
Biotechnology Risk Assessment	14,250
Federal Administration	14,250
Total	475,000
Fiscal year 1996:	
Colorado State University, Grazing Impacts on Infiltration, Runoff, and Erosion in a Montane Riparian Ecosystem	79,999
Montana State University, Do Windbreaks Minimize Stress on Cattle Grazing Winter Range?	59,941
Texas A&M University:	
Quantification of Vegetation Transitions and Thresholds on Diverse Landscapes	79,893
Does Soil Carbon and Nitrogen Accumulation Beneath Plants Regulate Bunchgrasses?	80,000
USDA-FS:	
Nitrogen and Phosphorus Mineralization in Conifer and Aspen Soils	71,717
Basin Big Sagebrush Dominated Riparian Corridors-Dry Meadows as an Alternative Stable State	79,985
Subtotal, Grants	451,535
SBIR	9,215
Biotechnology Risk Assessment	14,250
Federal Administration	14,250
Total	475,000

SUSTAINABLE AGRICULTURE PROGRAM

Question. How is the \$8 million currently available for the Sustainable Agriculture Program being spent? For each of fiscal years 1993-1997, please show how these funds have been allocated and the specific activities which have been supported through the program.

Answer. For fiscal year 1997, the \$8 million allocated for sustainable agriculture spending on research and education is being awarded primarily through a regional competitive grants program. Of the funds being awarded through the four regional programs, roughly 90 percent is spent on competitive grants of \$30,000 to \$150,000 to universities, non-profit organizations, or public agencies. The remaining funding supports grants to farmers and ranchers for research, demonstration, or education efforts on their farm; these grants are typically under \$5,000 per project. About 2

PART 1

896

percent of the total fiscal year 1997 funds are being used for general sustainable agriculture education efforts through the National Agricultural Library and the Sustainable Agriculture Network, and about 2 percent of funds are used for national communications and program coordination. Less than 1 percent of funds were awarded directly from national office for special education projects or workshop and conference support. The regional funds typically provide for about 11 to 14 institution/agency research or education projects, and 25 to 35 farmer projects per year in each region.

Detailed fiscal year allocations are as follows:

	Fiscal year—				
	1993	1994	1995	1996	1997
Regional allocations (divided among 4 regions) ...	\$4,632,785	\$6,229,900	\$7,159,520	\$7,014,000	\$7,077,700
National initiatives/projects ¹	1,760,000	804,540	551,747	685,860	487,958
National communications/coordination				(346,000)	(219,000)
National Agricultural Library				(116,200)	(122,010)
SARE Sustainable Agriculture Network				(80,000)	(82,000)
National projects (education, conferences)				(143,660)	(64,948)
Subtotal	6,392,785	7,034,440	7,711,267	7,699,860	7,565,658
Federal Administration	201,750	222,000	243,360	243,000	240,000
SBIR	130,465	143,560	157,373	157,140	194,000
Biotechnology Risk Assessment					342
Total, SARE	6,725,000	7,400,000	8,112,000	8,100,000	8,000,000

¹ In 96 and 97, national allocations were more specifically broken out into subcategories.

HEADQUARTERS MANAGEMENT

Question. How much will CSREES expend for Headquarters management costs in fiscal year 1997? How does this correspond to your percentage program assessment?

Answer. It is estimated that CSREES will spend \$39.3 million in fiscal year 1997 for Headquarters management costs. These funds will be used to cover the salaries and benefits of Federal staff, travel, printing, supplies, equipment and other miscellaneous expenses necessary for the administrative oversight and coordination of CSREES programs. Funds from federal administrative set-asides, carry over funds, and reimbursable agreements with other Federal agencies are used to cover these operating costs. Management costs account for 4.3 percent of the total fiscal year 1997 appropriation for CSREES. With the \$7.1 million available in Direct Federal Administration funds, excluding earmarked grants and projects, and the current legislative set-asides of 3 or 4 percent, CSREES has continued to operate on extremely low administrative costs.

FOOD AND AGRICULTURAL EDUCATION INFORMATION SYSTEM

Question. CSREES recently gave a presentation on the Food and Agricultural Education Information System (FAEIS). How much funding is being allocated for this system for fiscal year 1997? Is funding included in the President's fiscal year 1998 budget request for this system? If so, where is it included?

Answer. In fiscal year 1997, Congress directed \$150,000 from the funds appropriated for the USDA Higher Education Challenge Grants Program be made available to support the continued operations of the Food and Agricultural Education Information System. This provided assured funding for the information system that furnishes the Department and its university partners with necessary baseline data for planning and coordinating efforts directed towards supporting higher education in the areas of food, agriculture, natural resources, forestry, family and consumer sciences, and veterinary medicine. While the fiscal year 1998 budget request does not explicitly cite this system, it is included.

NATIONAL RESEARCH INITIATIVE

Question. Please provide a summary of the geographical distribution of the competitive research grants awarded under the National Research Initiative for the last two years showing the state, entity and funding level.

[The information follows:]

PART 1

897

State/recipient	Fiscal year—

USDA-EPSCOR PROGRAM

Question. Ten percent of the competitive research grant funds are to be used for the USDA-EPSCOR program (Experimental Program to Stimulate Competitive Research). Please provide a list of eligible States and funding levels awarded under this program for each of the past two fiscal years and a list of the States that will be eligible for the program in fiscal year 1997.

Answer. Below is a table of funding for the USDA EPSCOR program:

NRI COMPETITIVE GRANTS PROGRAM FUNDING FOR USDA EPSCOR STATES

[Total funding for fiscal years 1995, 1996]

USDA EPSCOR States	Fiscal year—	
	1995	1996
Alaska	\$147,000	
Arkansas	1,112,080	\$1,279,862

PART 1

904

NRI COMPETITIVE GRANTS PROGRAM FUNDING FOR USDA EPSCOR STATES—Continued

[Total funding for fiscal years 1995, 1996]

USDA EPSCOR States	Fiscal year—	
	1995	1996
Connecticut	816,789	516,206
Delaware	1,187,004	682,628
Hawaii	665,000	87,212
Idaho	1,057,836	1,037,530
Maine	567,194	325,932
Mississippi	811,183	746,568
Montana	1,869,826	1,355,810
Nevada	906,923	116,283
New Hampshire	281,061	515,663
New Mexico	0	106,379
North Dakota	1,350,733	970,260
Rhode Island	253,500	882,688
South Carolina	825,641	733,009
South Dakota	468,083	714,523
Vermont	219,000	175,551
West Virginia	445,000	238,540
Wyoming	154,998	585,974
Total for States	13,138,851	11,070,618
U.S. Territories & Possessions		
District of Columbia	434,978	48,691
Puerto Rico		
Grand total	13,573,829	11,119,309

1997 USDA-EPSCOR STATES

For fiscal year 1997, the following states are eligible for the EPSCOR Program. In addition, all U.S. territories and possessions and the District of Columbia are eligible.

Alaska	Mississippi	South Carolina
Arkansas	Montana	South Dakota
Connecticut	Nevada	Utah
Delaware	New Hampshire	Vermont
Hawaii	New Mexico	West Virginia
Idaho	North Dakota	Wyoming
Maine	Rhode Island	

NATIONAL RESEARCH INITIATIVE

Question. Please summarize the major accomplishments of research funded through the NRI in each of the past five fiscal years.

Answer. The goal of the NRI is to support fundamental and mission-linked research of importance to agriculture. Over the past 5 years, the NRI has supported almost \$500 million in agricultural research. This research is designed to contribute to the knowledge base from which practical solutions can be made to the most pressing agricultural problems. Because the NRI has six major divisions and 27 program areas, it is difficult to describe all of the many scientific accomplishments. However, below are some general and specific accomplishments of the program:

General advancements:

Knowledge has been gained in the area of natural resources and the environment addressing contemporary issues of importance for agriculture and forestry and society as a whole. Biological systems, including humans, influence and are influenced by the environment. Further, the impact of environmental changes on the sustainability of agriculture and forestry, and the enhanced stewardship of natural resources and the minimization of negative environmental consequences, have been

PART 1

905

the subject of many grants. A strong scientific basis also is being sought for understanding the impact of potential global change.

The maintenance of human health is significantly affected by both the quality and quantity of the foods consumed by individuals. Research is supported which contributes to our understanding of the requirements of dietary components and factors which impact optimal human nutrition. Data generated from these studies and those conducted to better understand consumer attitudes and behavior toward food will be used for updating dietary recommendations, formulating national nutrition policy, and stimulating new developments by the food industry. Safety of food products is of paramount importance to the producer, processor, distributor, and consumer. In response to this need, food safety research has been supported emphasizing the detection, prevention and control of food-borne disease-causing microorganisms, naturally occurring toxicants and drug residues. Research on food safety is a Department-wide initiative which adds scientific validity to the HACCP Model.

Research across the broad scope of animal agriculture has been funded for achieving competitive and sustainable food and fiber production from animals. The critical need for a better understanding of the biology of animal production and performance necessitates a broad scientific approach that contributes to integrated food animal management systems. To accomplish this, both fundamental and mission-linked research have been supported that have the following goals: (a) enhancing reproductive efficiency; (b) improving animal growth and development; (c) identifying animal genetic mechanisms and mapping genes; and (d) sustaining animal health and well-being. Emphasis has been given to innovative approaches to research questions related to animals primarily raised for food or fiber. This includes aquaculture species and those animals such as horses that contribute significantly to the agricultural enterprise of the country.

Pests cause major damage each year to crops, forests, rangeland, and livestock. How well pests are controlled becomes a major limiting factor in the ability of the United States to produce, store, ship and trade food and other products of agriculture. Although vital to the sustainability of agriculture, pest control also can have negative effects. Environmental damage can occur in the form of chemical contamination due to pesticide use. Conversely, lack of pest control may create other environmental and human health problems. Fundamental knowledge has been gained to form the basis of novel pest management strategies for new or emerging pests or for replacement of obsolete pest management practices. Moreover, pest management of the future has been improved while simultaneously reducing our dependency on pesticides as one of many steps toward the goal of sustaining agriculture and our natural resources. Research conducted by NRI supports the Department's initiative to implement IPM practices on 75 percent of U.S. crop acreage by 2000.

Additional knowledge has been generated across a broad range of plant sciences critical to sustainable crop and forest productivity, and for addressing the environmental impacts of farming and forestry. For example, the ability to breed crop and forest species with specific desirable traits has been enhanced by knowledge of the location, behavior, and characteristics of plant genes. Plant development affects plant productivity and the quality of plant products. Knowledge of how plants obtain, use, or store energy and nutrients has been obtained and is essential for proper management of plant populations. Innovative research on plant systems has been supported in: (a) genomes, genetics, and diversity; (b) plant growth and development; and (c) energy and metabolism.

The economy and standard of living in the United States are increasingly dependent upon export market growth and the retention of domestic markets. This is especially true for the nation's rural areas long dependent upon the production and marketing of agricultural, aquacultural, and forest products. The research supported by NRI grants has generated a continuing stream of new knowledge on how to compete in the production and marketing of raw commodities and value-added products, stimulated economic development in rural areas, and developed production and processing practices to enhance the natural environment and standard of rural living.

Research to enhance the value and use of agricultural and forest products helps to maintain and strengthen U.S. agricultural and forest based industries. Expanded uses for agricultural and forest commodities, more efficient use of resources, more environmentally sound manufacturing processes, and greater economic competitiveness of U.S. produced goods are all resulting from NRI funded research. Opportunities exist for making new and better agricultural and forest products at all stages of product development and use, starting with understanding and improving the agricultural/forest resource base, production, harvest, storage, transportation, product formulation, processing and manufacturing, and understanding and optimizing end-

PART 1

906

use characteristics. Innovative research has been supported in: (a) value-added products research encompassing food and non-food characterization/process/product research and (b) improved utilization of wood and wood fiber.

Agriculture encompasses the system that produces, processes, and distributes food, fiber, and other products and services from the producer to the consumer. Agricultural systems also include aquaculture, forestry and a diversity of supporting natural resource elements such as soils, surface water, ground water, wildlife, and the atmosphere. In addition, human resources, institutions, and financial capital are needed to support and manage agricultural systems. It is the management of all these diverse and complex resources within a systems context that is critical to how well the agricultural system fulfills societal goals. Although agricultural research has most often focused on individual components of systems, the NRI has provided opportunities for integration of these components through a systems research program. The objective has been to obtain knowledge that is essential to sustain the viability of agriculture. Such research addresses directly interactions among the components that comprise agricultural systems. The NRI supports systems research that has the potential to aid in the development and/or evaluation of national, regional, community, and/or producer level practices and policies that will sustain: a safe and adequate supply of agricultural products and services; environmental quality and the natural resource base; human health; and the economic viability and quality of life of rural communities; and address linkages between urban and rural areas.

Specific Accomplishments:

Erwinia herbicola is a bacterial plant pathogen responsible for fruit russetting of pear trees. Researchers at the University of California at Berkeley studied the expression of a gene in this pathogen that is activated in dry environments, a condition quite common for bacteria growing on plants in the field. They found that this gene is inhibited in the presence of free ammonium ions when the bacteria are grown in culture. They tested these results in the field and found that the application of nitrogenous compounds, such as ammonium sulfate, at low rates near bloom is a simple and safe alternative to the use of chemical pesticides for the control of fruit russet.

Researchers at South Dakota State University have identified extracts of the noxious weed, leafy spurge that induce a strong aversive feeding response in laboratory rats. The extracted portion of leafy spurge is being characterized for chemicals that induce this aversive feeding reaction. Once such a chemical(s) is(are) identified, researchers may be able to alter leafy spurge such that cattle will graze on this noxious weed.

Porcine Reproductive and Respiratory Syndrome—PRRS—is caused by a virus that causes a disease identified by the National Pork Producers Council as the number one disease problem of swine. Based on an understanding of the biology of the virus—research funded by the NRI and the National Pork Producers Council—a vaccine was developed that prevents the disease. Investigators at South Dakota State University and the University of Minnesota have made a major contribution to the swine industry through this research.

In the summer of 1996, about 400,000 acres of Bt corn was grown in the U.S. Bt corn has a bacterial gene incorporated into the corn genome that produces a toxin extremely effective against the European Corn Borer. Estimates are that 3.4 million acres will be grown in 1997. Although this product is viewed as developed by industry, public research laid the groundwork for its development. The NRI has funded considerable work on *Bacillus thuringiensis* (1) for determining the way Bt toxin destroys its insect host so that the most effective Bt genes can be incorporated into the engineered plant, and (2) for understanding the biochemical and ecological basis of insect resistance to Bt so that resistance problems can be avoided or delayed with the engineered crop. Other NRI funding has allowed the molecular genetic mapping of corn leading to efficient means for crossing the transgene into various elite lines, documentation of the genetic behavior of tissue cultures facilitating the regeneration of corn plants with the Bt gene, etc.

The safe handling of food has been enhanced through NRI funded projects. One of the outcomes is the isolation of a protein—invisible when applied to food preparation surfaces such as cutting boards—that binds firmly to the surface but does not allow harmful bacteria to bind. If they do bind, the protein kills the cells. This product is called Nisin, developed by researchers at Oregon State University. The medical field is considering Nisin's value in treating mechanical devices used in medicine.

The take-all disease can wipe out whole fields on wheat in the U.S. as well as abroad. A few soils, called "suppressive soils", do not allow much growth of the fun-

PART 1

907

gus. USDA Agricultural Research Service scientists at Washington State University with NRI funding have found that certain strains of *Pseudomonas* bacteria found in suppressive soils prevent the growth of the take-all fungus. These scientists found that certain soil bacteria produce antibiotics—phenazines—that stop the growth of the fungus. The antibiotic has been isolated and characterized. These bacteria can be grown in a fermentor and applied as a seed coating like any other seed treatment, except this represents a biological control agent instead of chemical control. Another difference is that only the seed to be immediately planted is treated because otherwise the bacteria will die; an advantage is that only seed to be planted is treated. Currently, seed treated with chemicals and not planted must be disposed of and that can be a problem.

The Spider Lamb Syndrome—SLS—is a congenital skeletal defect controlled by a single recessive gene. Lambs that carry the gene in heterozygous condition—carriers—are perfectly normal—but matings between two carriers produce defective lambs in about 25 percent of the progeny. Knowing that breeding stock carries this gene reduces their value by about 70 percent. The gene is becoming more and more prevalent in the Suffolk and Hampshire breeds. In 1994, the NRI published a “Research Highlights” publication page indicating that research had been funded to discover a marker gene that might allow farmers to know when a ewe or ram carried the gene. In the ensuing years, a marker was found that would allow the identification of such carriers with 92 percent accuracy. Using the chromosome map position of this marker gene in sheep as a guide, a Utah State University researchers looked for the marker on the human molecular genetic map. At about the same distance from this marker gene as found between it and the SLS trait in sheep, the researchers noticed that a human trait had been mapped that also influenced skeletal development. Using the human gene as a probe onto the DNA from progeny segregating for the SLS, the researchers found that this gene was 100 percent associated with the trait. By this series of discoveries, we now have available not only a perfect molecular genetic tag to know when a lamb is a carrier, but the exact gene causing the biochemical defect is now known.

Several wild species of tomatoes produce seemingly worthless small— $\frac{1}{2}$ -inch diameter—green fruit. It is not surprising to find that these wild tomato species furnish genes for cold tolerance, virus resistance, insect resistance, and increased solids. What is surprising is that a Cornell University researcher, through NRI funding, found that these green tomatoes possess genes that will make our normal red tomato even redder. The researcher has found that the use of the molecular genetic map of tomato, also developed in part through NRI funding, allowed him to detect genes in the green wild tomato that have an effect directly opposite to what one would expect. The researcher also has found that these tiny fruited tomatoes have genes that will increase yield in our normally cultivated types.

Researchers at Purdue University have developed a system to use corn grits—ground corn kernels—to take the water out of ethanol produced from corn, a system now used to process 750 million gallons of ethanol per year at a significant cost savings over other methods. Through NRI support, the technology is being extended to new applications. For example, modified grits are being examined as a replacement for expensive inorganic desiccants in pressure swing dryers to provide dry air or other gases for use in paint spraying, ozone generation, and pressurization of power and communication cables. In addition, corn grits are being examined as a low-cost, natural desiccant for air conditioners based evaporative cooling; in this application, the grits can help displace ozone-depleting chlorofluorocarbons and tap into a \$26 billion global market.

Technology also can result from the USDA competitive grants program that has an impact on all of biology. A system has been developed for isolating and biologically purifying fragments of DNA that led to the “shotgun cloning” of DNA, declared as a revolution in DNA sequencing technology by many writers. The contribution of this research was in using the M13 bacteriophage to amplify specific DNA segments. The genome programs of today owe part of their success to this innovative strategy funded by USDA.

SPECIAL AND ADMINISTRATIVE GRANTS

Question. For each of the special research and administrative (research and extension) grants funded for fiscal year 1997, please indicate the following: a detailed description of the project funded; who is carrying out the research; federal and non-federal funding made available for the project to date, by fiscal year; and the anticipated completion date for the original objectives of the project and whether those objectives have been met; and the anticipated completion date of additional or relat-

PART 1

908

ed objectives. For each project, please indicate when the last agency evaluation of the project was conducted. Provide a summary of the last evaluation conducted.

Answer. The information follows.

AFLATOXIN RESEARCH, ILLINOIS

Past work on this problem has involved identifying corn germplasm resistant to aflatoxin, identifying *Asperigillus flavus*-inhibiting compounds, identifying fungus-inhibiting enzymes, developing transformation methods, and developing tissue culture/plant regeneration procedures. Aflatoxin are potent carcinogens with other toxic properties, and pose potential health risks wherever toxin-contaminated corn occurs. Aflatoxin contamination occurs frequently in the southeastern United States, but outbreaks have also occurred in the upper Midwest. Because there are significant needs for research and program implementation national interest areas such as the integrated pest management initiative, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal of this research was the reduction of aflatoxin production in corn. Recent accomplishments include identification of corn germplasm producing high levels of fungus-inhibiting enzymes, production of transformed corn plants, finding new sources of resistance, and developing advanced corn lines for hybrid production.

Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$87,000; fiscal year 1991, \$131,000; and fiscal years 1992–1993, \$134,000 per year, fiscal year 1994, \$126,000; and fiscal years 1995, 1996, and 1997, \$113,000 per year. A total of \$951,000 has been appropriated.

The non-federal funds and sources provided for this grant are: \$21,251 university operating funds for project investigator salary and fringe benefits, and \$18,000 in corn seed company support.

This research is being conducted at the University of Illinois. The anticipated completion date for the original objectives was 1995. The original objectives have not been completely met. In other related work, the project leaders, working with collaborating corn breeders, anticipate providing the different sources of resistance to commercial seed companies for incorporation into high-yielding commercial hybrids within five to seven years. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The last agency evaluation was in December 1996. In summary, the evaluation stated that the research techniques are consistent with high likelihood that specific objectives will be accomplished. There is a good balance between fundamental and applied research, which should foster the development of new, highly-desirable corn germplasm.

AGRICULTURAL DIVERSIFICATION AND SPECIALTY CROPS, HAWAII

The white taro project is in its final phase. Many of the processing obstacles have been overcome, flour is being produced in pilot-scale quantities, better taro food product formulations are coming out, and the project is ready to turn over to the private sector.

Due to demand conditions, the pineapple wet-pack processing project was changed to a high pressure minimal processing of tropical fruits. High pressure processing of tropical fruits provides a ready-to-eat chilled fresh product by adding value to fruit which can not meet fresh fruit quality standards and eliminating the fruit fly quarantine problem. Once the high pressure equipment arrives in February 1997, qualitative results should be out quickly. An agricultural business development handbook called, "This Hawaii Product Went to Market" was published. It contains 43 short chapters written by 46 people representing 26 companies and institutions in Hawaii. This book was necessary to help others with business initiation and expansion. A new taro production manual is nearing completion. Agribusiness interested in taro now have what all good agribusinesses need: a cost of production study, market reconnaissance information delivered by the project's newsletter, marketing tools developed in earlier phases of this project, and a production manual. Underlying all of this information is a business guide.

Hawaii's economy needs help to recover after the decline of sugar and pineapple in the state. Taro products would be one such avenue, albeit relatively small at the outset. These gluten-free products could be a staple to many people in the U.S. who suffer from food ingredient intolerance. In general, collaboration with the private sector is needed to evaluate the commercial potential of university-based work. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this

PART 1

909

grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The principal investigator believes this research to be of regional and local need.

The goal of the original proposal was to screen potential food and non-food crops for commercial development in Hawaii. As mentioned above, white taro emerged as one of the most promising opportunities and also offered the opportunity to develop an infrastructure that will help new crop ideas come on line even faster. Overall, the researchers have identified a need, people with food sensitivities; then identified a crop; figured out a mechanism to inexpensively process the crop into flour; worked with a private sector company to set-up a pilot-scale facility; developed the operating protocol for the facility; worked with local food processors to develop prototype products and have improved on them; and found some interested parties that might be willing to invest in the commercial version of this project. Currently, the University of Hawaii is working on handing-off the project to the private sector. The high pressure project is just getting off the ground because it took a long time to acquire the equipment.

Grants have been awarded from funds appropriated as follows: fiscal years 1988 and 1989, \$156,000 per year; fiscal years 1990 through 1993, \$154,000 per year; fiscal year 1994, \$145,000; fiscal years 1995 through 1997, \$131,000 per year. A total of \$1,634,000 has been appropriated.

The University of Hawaii provides in-kind support in the form of laboratory and office facilities, equipment and equipment maintenance and administrative support services: \$68,503 in fiscal year 1992; \$75,165 in fiscal year 1993; and \$74,663 in each fiscal year 1994–1997. In addition, nearly \$35,000 of in-kind support has come from private sector partners and \$30,000 is committed from the private sector on the high pressure minimal processing project.

Research is being conducted at the University of Hawaii's College of Tropical Agriculture and Human Resources, and on the Big Island of Hawaii. All taro-related work will be done by May 31, 1997 and all objectives will be met. The high pressure processing project will have a great deal of work done by May 31, 1998 but will need to be continued on private sector funds. In keeping with the Administration's policy of awarding research grants competitively, no further federal funding for this grant is requested. Research could be continued at the state's discretion using, formula funds.

The CSREES agency representative to this project meets with the University of Hawaii investigators at least twice each year to review progress and plan subsequent activities. This close interaction has led the project through a progression of steps from research discovery to near-term commercialization, and, in the case of high pressure processing, back to testing and development of a new technology for possible commercial use.

ALLIANCE FOR FOOD PROTECTION, NE, GA

The fiscal year 1997 appropriation supports the continuation of a collaborative alliance between the University of Georgia Center for Food Safety and Quality Enhancement and the University of Nebraska Department of Food Science and Technology. Fiscal year 1996 funds supported research at the University of Nebraska on the detection, identification and characterization of food allergens, the effects of processing on peanut allergens, and investigation of the efficacy of using various types of thermal processes to reduce or destroy the toxicity and mutagenicity of certain *Fusarium* metabolites in corn and corn products. Research at the University of Georgia was directed toward determining the foodborne significance of *Helicobacter pylori*, determining the fate of *Arcobacter* in foods and the effect of environmental factors on survival and growth, determining the efficacy of nisin and environmental factors on controlling *Bacillus cereus*, and developing a device to rapidly detect foodborne pathogens using immunomagnetic separation technology. The principal researcher believes the proposed research addresses emerging issues in food safety which have national, regional and local significance. Specifically, research will address bacterial pathogens that can cause ulcers, cancer and diarrheal illness and allergens in foods that cause serious reactions, including death, in sensitive people. These emerging issues affect consumers, the food industry, and food producers at all levels, national, state, and local. In view of significant needs for research in high priority national interest topics such as improved pest management systems and food safety, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original goal of this research was to: (1) facilitate the development and modification of food processing and preservation technologies to enhance the micro-

PART 1

910

biological and chemical safety of products as they reach the consumer and (2) develop new rapid and sensitive techniques for detecting pathogens and their toxins as well as toxic chemicals and allergens in foods. The University of Nebraska developed assays for the detection of milk and egg residues in processed foods, produced high-quality antibodies for soybean proteins, partially characterized sunflower seed, and soybean allergens, and developed a simple liquid chromatographic procedure for determination of moniliformis toxin. The University of Georgia developed a method to culture *Helicobacter pylori*, identified a treatment to prevent *Bacillus cereus* from producing toxin in refrigerated foods, determined survival and growth characteristics of *Arcobacter* and *Helicobacter pylori*, and determined the appropriate homogenization conditions to prepare food samples for rapid detection of pathogens by immunoseparation.

The work supported by this grant began in fiscal year 1996, and \$300,000 was appropriated in fiscal years 1996 and 1997, for a total appropriation of \$600,000. The nonfederal funds and sources provided for this grant were \$117,000 state funds and \$250,000 industry and miscellaneous in fiscal year 1996 and are expected to be \$141,000 state funds and \$175,000 industry and miscellaneous in fiscal year 1997.

Research will be conducted at the University of Georgia Center for Food Safety and Quality Enhancement in Griffin, Georgia and at the University of Nebraska Department of Food Science and Technology in Lincoln, Nebraska. The original objectives have not yet been met. The researchers anticipate that work will be completed on the original objectives in 1999. However, in keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using Hatch or other funds.

An agency science specialist conducts a merit review of the proposals submitted in support of the appropriation on an annual basis. A review of the proposal from the University of Nebraska was conducted on December 20, 1996, and good progress was demonstrated on the objectives undertaken to date as discussed above. A progress report from the University of Georgia was evaluated by the agency on January 16, 1997, and demonstrated good progress on its 1996 objectives.

ALTERNATIVE CROPS FOR ARID LANDS, TEXAS

This grant is to develop the two most abundant plants in southwestern United States, i.e. mesquite and cactus, into commercial crops through a combination of applied research and marl, et development. In Texas, New Mexico, Arizona and California these plants occupy 72 million acres. The semi-arid regions of the United States that border with Mexico in Texas, New Mexico, Arizona, and California have some of the highest unemployment rates, lowest economic returns per acre, and lowest incomes in the United States. The two most abundant plant species in this region are prickly pear cactus and mesquite. By working with Mexican researchers, this grant will help to stabilize the economic situation of rural poor in Mexico and the United States. There are few crops capable of being grown sustainably in these regions. Due to the nitrogen fixing capability, and thus soil improving properties, of mesquite and high water use efficiency of cactus, these plants contribute to sustainable agriculture, and will diversify southwestern agriculture. This research group is the only center in the United States developing these plants as crops. The principal researcher has been active with a national New Crops initiative supported by the Center for Agricultural Science and Technology (CAST) to develop grants programs for new feed/food from new crops. In view of the significant need for research in national priority areas, such as integrated pest management, additional funding for this Special Grant is not proposed. At the discretion of the State, Hatch Act or other funding could be used to support this effort.

The goal is to improve the economic returns, and year-to-year economic stability in the southwestern United States. Accomplishments have been sale of a new cactus vegetable variety in 100 stores of the largest retail grocery chain in Texas, presentations to architects in all major cities in Texas on mesquite technical qualities and all mesquite sawmill and furniture manufacturers, publication of 4 year field trials in which cactus was found to be the most efficient converter of water to dry matter of all plant types, a major collection of 130 fruit, forage and, vegetable varieties of cactus, 10 year non-irrigated pruning and spacing trial with mesquite found diameter growth rates greater than walnut and oak in the northeastern United States, and a sustainable system for mesquite management that avoids use of bulldozers and aerial herbicides by creating markets for mesquite products and utilizing mesquite's nitrogen fixing properties.

PART 1

911

Fiscal year 1994 was the first year of funding for this grant and \$94,000 was appropriated. In fiscal years 1995 through 1997, \$85,000 was appropriated each year. A total of \$349,000 has been appropriated. In fiscal year 1994, \$43,215, was provided by the Texas legislature.

The work is being conducted by Texas A&M University, Kingsville, Texas. Significant but small Texas cactus and mesquite industries now exist. Transformation of these small industries into medium industries and transfer of the and technologies to low rainfall areas of the Midwestern and southeastern United States will carry on 10 years into the next century. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

Evaluation of this project is conducted annually based on the annual progress report and discussions with the principal investigator, as appropriate. The review is conducted by the cognizant staff scientist who has determined that this research is in accordance with the mission of the agency.

ALTERNATIVE CROPS, NORTH DAKOTA

In this investigation of alternative crops, there are two main thrusts: the development and commercialization of novel new crops, and the differentiation of traditional crops. Both avenues of research have the shared goals of increasing biodiversity at the farm and field, while producing new crops and products for current and future societal needs. Some of these include (a) the development of crambe, flax, sunflower, safflower, and various rapeseeds as a renewable supply of industrial oil, (b) the study of products from amaranth, potatoes, sugarbeets, carrots, soybeans, barley, and sunflower for novel new uses in the paints, coatings, as food ingredients, and critical human nutrition markets, and (c) the development of new bio-chemical and enzymatic processes to refine and create super critical and other high-value fluids from oilseed crops which could serve as effective renewable replacements for industrial uses.

The principal researcher believes that nationally, developing new crops and new markets for agricultural products is critical for both environmental and economic reasons. Enhanced biodiversity that comes from the successful commercialization of new crops aids farmers in dealing with pests, reducing the dependency upon pesticides. New markets are needed to provide more economic stability for agricultural products, especially as federal price supports are gradually withdrawn. The development of new crops and products, offers a unique way to satisfy national goals of enhanced environmental quality, while at the same time opening new economic opportunities to farmers and other rural entrepreneurs. Regionally, the temperate areas of the Midwest have the potential to grow a great number of different crops, but are in need of publicly sponsored research efforts to reveal the most practical, efficient, and economical crops and products to pursue. This effort has forged a strong link with the private sector, and successfully spawned several crops and products into profitable private sector businesses. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The principal researcher believes this research to be of national, regional or local need.

The original goal of this research was to introduce, evaluate and test new crops which will broaden the economic diversity of crops grown in North Dakota. Over the past eight years, this special federal appropriation has been an important part of North Dakota State University's approach to research and development on agricultural alternatives. It has helped sponsor research on crambe, lupin, canola, safflower, cool-season grain legumes, buckwheat, amaranth, field pea production and utilization, transgenic sugar beets to produce levan, utilization and processing of lupin flour, confectionery sunflower production, and growing and marketing of carrots in North Dakota. It has helped develop a crop-derived red food dye and high quality pectin as food ingredients. It has sponsored research on innovative new bio-chemical means of splitting crop oils, and other new uses of oilseed crops. It has also helped develop markets for new crops as livestock and fish feeds. This appropriation has helped create both new knowledge and new wealth.

Appropriations by fiscal year are as follows: 1990, \$494,000; 1991, \$497,000; 1992 and 1993, \$700,000 per year; 1994, \$658,000 and in fiscal year 1995, \$592,000; and in 1996 and 1997, \$550,000 per year. A total of \$4,691,000 has been appropriated.

In fiscal year 1991, \$10,170 was provided by state appropriations. In fiscal year 1992, \$29,158, was also provided by state appropriations and self-generated funds. In fiscal year 1993, \$30,084, was provided by state appropriations. In fiscal year 1994, \$161,628 was provided by state funds, \$3,189 provided by industry and \$9,020

PART 1

912

provided by other sources, totalling \$174,417. In fiscal year 1995, \$370,618 was provided by state appropriations, \$1,496 provided by self-generated funds, \$1,581 provided by industry and \$5,970 was provided in other non-federal funds, totalling \$379,665 for fiscal year 1995. In fiscal year 1996 \$285,042 was provided by state appropriation, \$4,742 provided by industry, \$14,247 provided from other non-federal funds, totaling \$304,031 for 1996.

The work is conducted on the campus of North Dakota State University and at the Carrington Research and Extension Center, Carrington, North Dakota, and the Williston Research Center, which are both in North Dakota. Work is also done in eastern Montana.

Fiscal year 1997 is the eighth year of activity under this grant. The primary emphasis has been to find new crops with non-food uses and create value added products. The original objectives have been met. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

This project has been evaluated based on the annual progress report and agency participation in evaluating proposals submitted to the Agricultural Experiment Station under this grant. The cognizant staff scientist has reviewed the project and determined that the research is conducted in accordance with the mission of this agency.

ALTERNATIVE MARINE AND FRESHWATER SPECIES, MISSISSIPPI

The research has focused on the culture of hybrid striped bass, prawns, and crawfish. Nutritional requirements and alternative management strategies for these species have been evaluated and field tested. Utilization of improved technologies will enhance production efficiency and accelerate the use of these alternative species and alternative management strategies in commercial aquaculture. The principal researcher indicates that as the aquaculture industry continues to grow, it is extremely important to consider alternative species and production strategies for culture in order to help the industry diversify. Diversification is of benefit to both the producer and consumer of aquaculture products. In view of the significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal of this research was to develop and evaluate aquaculture production technologies that would lead to the use of alternative species and management strategies in commercial aquaculture production. Research evaluating stocking rates, nutritional requirements, and methods to reduce stress in hybrid striped bass production systems has led to the development of improved production efficiency in these systems. Recent research indicates that feed formulations for hybrid striped bass should be adjusted for seasonal fluctuations in temperature. Nutritional studies also indicate that the niacin requirement for striped bass may be much lower than previously reported. Field testing of alternative management strategies for crawfish indicates that the most efficient and cost effective production strategy involves the appropriate combination of stocking, feeding, and harvesting practices. In addition, researchers evaluating product quality of cryogenically frozen whole prawns indicate that prawns can be kept in frozen storage up to 7 months with no loss of quality.

The work supported by this grant began in fiscal year 1991 and the appropriation for fiscal years 1991-1993 has been \$275,000 per year, \$258,000 in 1994, and \$308,000 in fiscal years 1995-1997 each year. A total of \$2,007,000 has been appropriated.

The university reports a total of \$332,091 of non-federal funding to support research carried out under this program for fiscal years 1991-1994, \$70,636 in fiscal year 1995 and \$79,935 in fiscal year 1996. The primary source of the non-federal funding was from state sources.

Research is being conducted at Mississippi State University. The original specific research objectives were to be completed in 1994. These specific research objectives have been met, however, the broader research objectives of the program are still being addressed. The specific research outlined in the current proposal will be completed in fiscal year 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using other funds.

The agency evaluates the progress of this project on an annual basis. The university is required to submit an accomplishment report when the new grant proposal is submitted to CSREES for funding. The 1996 review indicated that the research

PART 1

913

addresses an important opportunity in the aquaculture industry, that progress on previous research was well documented, and that the proposed research builds on the previous work funded through this program.

ANIMAL SCIENCE FOOD SAFETY CONSORTIUM

The research goal of the consortium has been to enhance the safety of red meat and poultry products for human consumption. Research has focused on accomplishing six objectives (1) develop rapid detection techniques for pathogenic bacteria and toxic chemicals for use by the red meat and poultry production-marketing system; (2) devise a statistical framework from which to develop tolerance levels for these hazardous substances; (3) identify effective interdiction points and develop methods to prevent or reduce substance presence; (4) develop monitoring techniques and methodologies to detect and estimate the human health risk of these contaminants; (5) develop technologies to reduce hazards and enhance quality of animal food products to complement the development of Hazard Analysis Critical Control Point [HACCP] programs by the Department's Food Safety and Inspection Service; and (6) estimate benefits and costs and risks associated with interdiction alternatives. The consortium's researchers have focused their efforts primarily on the first, third, fifth, and sixth objectives.

The principal researchers believe a safer national meat product food supply could reduce large economic losses, they estimate \$4 to \$7 billion a year, as a result of lost productivity and wages and medical treatment of victims of food-borne illnesses, in addition to reducing the human suffering and loss of life that occur every year as a result of these illnesses. Safer products could also find greater acceptance in global markets and, therefore, could contribute to increased meat product exports and rural economic growth. In view of significant needs for research in high priority national interest topics such as improved pest management systems and food safety, funds are not proposed to continue this Special Research Grant. However, the fiscal year 1998 President's Budget requests \$2 million for a competitively-awarded food safety program. The principal researchers could submit a proposal to this new program if it is funded. Also, at the discretion of the State, Hatch Act or other funding could be used to support this research.

The goal is to develop detection, prevention, and monitoring techniques that will reduce or eliminate the presence of food borne pathogens and toxic substances from the Nation's red meat and poultry supplies. The consortium is organized and operated along institutional lines with a coordinator and directors managing the research program. Advisory and technical committees consist of outside representation and provide advice on research planning and expertise on technical matters.

Major accomplishments this past year by the University of Arkansas include showing that young infants and children are more likely to be infected with *Salmonella* by caretakers than through food consumption, developing a technique to distinguish strains of *Salmonella* that are epidemiologically related, discovering anti-microbial bacteriocin with potentially broad application in the food system, and testing a process for mechanically stripping meat from poultry carcasses which may reduce microbiological contamination. Researchers have also developed a research oven which is leading to valuable models for cooking processes that kill pathogens while retaining quality of cooked poultry. They have also found that certain enzyme linked immunosorbent assays for *Listeria monocytogenes* may not be as useful in detecting these pathogens in cooked food products as on uncooked products. An experimental system for detection of *Salmonella typhimurium* organisms in pure culture has been developed which is based on immunomagnetic, immunofluorescent staining and image analysis which results in a significant reduction in time for analysis. Intervention techniques have been shown to aid in the reduction of bacterial populations as an integral component in successful HACCP program implementation.

Major accomplishments this past year at Iowa State University include development of rapid detection methods for foodborne pathogens in live swine and on pork products, intervention approaches at production and processing levels to enhance product safety, and assessment of health risks from pathogens which may be borne by pork or pork products. Specifics include the application of polymerase chain reaction technology to detect and differentiate *Campylobacter jejuni* and the more prevalent *Campylobacter coli* in pork, effective application of enzyme-linked immunosorbent assays to identification of antibodies against prevalent *Salmonella* species in swine sera and pork meat extracts, and development of a reliable culture test for rapid detection and differentiation of coliform and *E coli* bacteria. Effectiveness of a new vaccine for *Salmonella* developed with partial sponsorship of the Consortium has been assessed in laboratory experimentation and field experience. Research found that bacteria are readily inactivated by practical levels of irradiation

but viruses, especially the small RNA viruses were quite resistant to irradiation and were not sensitized to low heat treatment which would be sublethal to non-irradiated contaminated pork. Willingness to pay for irradiated pork or chicken was 10–30 percent above non-irradiated products in customer market tests. Risk assessment studies on food borne pathogens placed public health impact from pork at high level for no pathogens, at moderate level for *Salmonella*, *Yersinia*, *Clostridium*, and *Staphylococcus*, and at low to negligible level for all other potential pork borne pathogens.

Kansas State University has demonstrated under commercial conditions that electronic identification systems to track and determine contamination points for beef cattle are feasible from an implant retention, operational, and retrievability standpoint; developed analytical procedures to detect mycotoxin and organophosphate pesticide contaminants in animal tissue; demonstrated optimum carcass washing and trimming practices supplemental treatments of carcasses and cuts after final handling to be effective in the removal of pathogens; and demonstrated the efficacy of steam pasteurization and steam vacuuming in eliminating pathogenic bacteria from beef carcasses. University researchers have also determined that low dose irradiation is a viable intervention technology with minimal effects on beef quality; demonstrated that processing protocols for large diameter Lebanon bologna are sufficient to control *E coli* 0157:H7; determined that monitoring endpoint cooking temperature of ground beef patties or following a prescribed time/temperature interaction known to achieve a given endpoint are the safest ways to prevent consumption of undercooked ground beef, and developed technology to enhance growth of pathogenic bacteria so they can be rapidly detected at very low but potentially hazardous levels.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1,400,000; fiscal year 1990, \$1,678,000; fiscal year 1991, \$1,845,000; fiscal years 1992–1993, \$1,942,000 per year; fiscal year 1994, \$1,825,000; fiscal years 1995–1996, \$1,743,000 each year; and fiscal year 1997, \$1,690,000. A total of \$15,808,000 has been appropriated.

The non-federal funds and sources provided for this grant are as follows: \$1,313,653 State appropriations, \$2,959 product sales, \$35,600 industry, and \$259,735 miscellaneous for a total of \$1,611,947 in 1991; \$1,270,835 State appropriations, \$10,129 product sales, \$90,505 industry, and \$267,590 miscellaneous for a total of \$1,639,059 in 1992; \$1,334,680 State appropriations, \$1,365 product sales, \$33,800 industry, and \$356,308 miscellaneous for a total of \$1,726,153 in 1993; \$1,911,389 State appropriations, \$192,834 industry, and \$200,000 miscellaneous for a total of \$2,304,223 in 1994; \$1,761,290 State appropriations, \$221,970 industry, and \$91,885 miscellaneous for a total of \$2,075,145 in 1995; \$2,643,666 State appropriations and \$152,431 industry, for a total of \$2,796,097 in 1996; and \$1,508,112 State appropriations, \$638,172 industry, and \$129,753 product sales, for a total of \$2,276,037 in 1997. Thus, from 1991 through 1997 a total of \$14,428,661 in non-federal funds was provided.

Research is being conducted at the University of Arkansas at Fayetteville, the University of Arkansas for Medical Sciences at Little Rock, Arkansas Children's Hospital, Iowa State University, and Kansas State University.

The current program of research outlined under the Consortium's revised strategic research plan should be completed in 1999. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. However, the fiscal year 1998 President's Budget requests \$2 million for a competitively-awarded food safety program. The principal researchers could submit a proposal to this new program, if funded. Also, at the discretion of the State, Hatch Act or other funds could be used to support this research. An agency science specialist evaluates the progress of this project on an annual basis.

APPLE FIRE BLIGHT, MICHIGAN AND NEW YORK

This project studies fire blight in apple trees, which is a disease that can kill fruit spurs, branches, and whole trees. The research supported under this project will help develop fire blight resistant varieties, evaluate biological and chemical controls, and develop an education and extension component. Fire blight disease is caused by bacteria and affects apple trees in all apples growing areas of the nation. In the northeast, the disease is more prevalent because of humid weather conditions. The management of this disease is difficult because only one antibiotic treatment is available. Because there are significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act

PART 1

915

or other funding could be used to support this research. The principal researcher believes this research to be of national, regional, and local need.

The objectives are to develop transgenic apple trees through various molecular technologies, to develop new approaches to antibiotic treatment of the disease, to develop an early screening technique for tree sensitivity to the disease, to evaluate biological and cultural controls and to develop and improve education and extension components of disease management.

Fiscal year 1997 was the first year funds were appropriated for this grant. A total of \$325,000 was appropriated. The proposed non-federal funds for 1997 for the Michigan proposal are estimated for state appropriated matching at \$20,127 in salaries and \$20,000 miscellaneous whereas New York is estimating state appropriated funds at \$104,166 for 1997.

Research will be conducted at Michigan State University and Cornell University, New York Experiment Station. The anticipated date of completion of the projects is in fiscal year 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The projects underwent merit reviews in January 1997. The objectives outlined in the proposal appear to be satisfactory to meet the goals.

AQUACULTURE, ILLINOIS

Researchers are developing and evaluating closed system technology for application to commercial aquaculture. System design and cost of production analysis for these systems have been conducted in commercial trials and pilot studies. The principal researcher believes the development of alternative aquaculture production systems, such as closed recirculating systems, would reduce demands for water and would provide for greater control over production in aquacultural systems. Closed systems could be established independent of climatic condition in any region of the country. These systems also offer greater opportunity to manage aquacultural waste and reduce environmental impact. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The goal of this program is to develop closed recirculating aquacultural systems in order to lower production cost, improve product quality, and reduce the potential environmental impact of aquacultural production systems. An analysis of production costs and risk factors has been conducted on a new system design and on commercial systems in cooperation with the private sector. Best management practices have been developed for these systems. Solid waste management techniques are also being evaluated.

The work supported by this grant began in fiscal year 1992. The appropriation for fiscal years 1992-1993 was \$200,000 per year; fiscal year 1994, \$188,000; and fiscal years 1995-1997, \$169,000 each year. A total of \$1,095,000 has been appropriated.

The university estimates that non-federal funding for this program is as follows: in fiscal year 1992, \$370,000; in fiscal year 1993, \$126,389; in fiscal year 1994, \$191,789; in fiscal year 1995, \$152,682; and in fiscal year 1996, \$171,970. The primary source of funding is from the state with gifts and grants accounting for the remainder. This estimate does not include substantial in-kind contributions from industry as this program conducts cooperative research with commercial producers.

Research is being conducted at Illinois State University at Normal, Illinois, through a subcontract with the University of Illinois. The original objectives were to be completed in fiscal year 1995. The original specific objectives have been met. The specific research outlined in the current proposal will be completed in fiscal year 1997. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The agency evaluates the progress of this project on an annual basis. The university is required to provide an accomplishment report each year when the new grant proposal is submitted to CSREES for funding. The 1996 review of the project indicated that the project has met stated objectives.

AQUACULTURE, LOUISIANA

Research has focused on catfish, crawfish, reddish, and hybrid striped bass in commercial aquaculture. Research has included basic and applied research in the areas of production systems, genetics, aquatic animal health, nutrition, and product quality. The principal researcher indicates that there is a need to improve production efficiency for a number of important aquaculture species such as catfish, crawfish, hybrid striped bass, and reddish in order to enhance the profitability and sus-

PART 1

916

tainability of the aquaculture industry in the region. The research also addresses the issue of food safety and the quality of farm-raised products. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act, or other funding could be used to support this research.

The original goal of this research was to expand the technology base to enhance the development of aquaculture through a broad research program that addresses the needs of the industry. The university has completed studies in the area of fish nutrition, fish health, production management strategies, alternative species, seafood processing and broodstock development. Research has led to improved feed formulations, improved production strategies for crawfish, and improved processing technologies for aquaculture products.

Research to be conducted under this program will continue research initiated under the Aquaculture General program in fiscal years 1988 through 1991. The work supported by this new grant category began in fiscal year 1992 and the appropriation for fiscal years 1992–1993 was \$390,000 per year, \$367,000 in fiscal year 1994, and \$330,000 in fiscal years 1995–1997 each year, for a total of \$2,137,000.

The university estimates that non-federal funding for this program is as follows: in fiscal year 1991, \$310,051; in fiscal year 1992, \$266,857; in fiscal year 1993, \$249,320; in fiscal year 1994, \$188,816; in fiscal year 1995, \$159,810; and in fiscal year 1996, \$150,104. The primary source of this funding is from state sources with minor contributions from industry and other non-federal sources.

Research is being conducted at Louisiana State University. The original specific objectives were to be completed in 1990. These specific research objectives have been met. The specific research outlined in the current proposal will be completed in fiscal year 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The agency evaluates the progress of this project on an annual basis. The university is required to provide an accomplishment report each year when the new grant proposal is submitted to CSREES for funding. In addition, the CSREES program manager made a site visit in 1996 to meet with the scientists involved in the project and review the progress of the research. The 1996 review of the project indicated that the research is addressing important research needs of the aquaculture industry, the proposed research represented a logical progression of research previously funded through this program, and that the progress on previous research funded under this program is well documented.

AQUACULTURE RESEARCH, STONEVILLE, MISSISSIPPI

The primary objectives of this research have been to improve practical feeds and feeding strategies and improve water quality in channel catfish ponds. Additionally, scientists are evaluating the application of acoustical instrumentation in commercial aquaculture. The principal researcher indicates that the research findings from this project have a direct impact on the profitability and sustainability of a significant segment of the domestic aquaculture industry. The farm-raised catfish industry accounts for over 55 percent of the total U.S. aquaculture industry. Research funded in this program is directed towards two of the most important research needs of the industry; water quality and improved feeds and feeding strategies. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal of this research was to address the research needs of the catfish industry in the areas of water quality and nutrition. The research has led to improved water quality management practices in commercial catfish ponds. Research in the area of catfish nutrition has led to improved diet formulation and feeding strategies that have been widely adopted by the industry. Scientists are currently evaluating five protein levels under two different feeding regimes using conditions that closely reflect commercial catfish ponds. Studies evaluating acoustical instrumentation have demonstrated possible applications in commercial aquaculture. Researchers are determining the accuracy and effectiveness of upgraded and calibrated acoustical monitoring equipment.

Grants have been awarded from funds appropriated as follows: fiscal years 1980–81, \$150,000 per year; fiscal year 1982, \$240,000; fiscal year 1983–84, \$270,000 per year; fiscal year 1985, \$420,000; fiscal years 1986–87, \$400,000 per year; fiscal year 1988, \$500,000; fiscal year 1989, \$588,000; fiscal year 1990, \$581,000; fiscal year 1991, \$600,000; fiscal years 1992–1993, \$700,000 per year; fiscal year 1994,

PART 1

917

\$658,000; and fiscal years 1995–1997, \$592,000 each year. A total of \$8,403,000 has been appropriated.

The university estimates a total of \$2,101,508 in non-federal funding to support this research for fiscal years 1991–1994; \$1,128,451 in fiscal year 1995; and \$601,473 in fiscal year 1996. The primary source of non-federal funding is from the state. Additional funding is provided from product sales, industry contributions, and other miscellaneous sources.

The grants have been awarded to the Mississippi Agricultural Experiment Station. All research is conducted at the Delta Branch Experiment Station, Stoneville, Mississippi. The acoustical research in aquaculture will be conducted in cooperation with the National Center for Physical Acoustics at the University of Mississippi. The anticipated completion date for the specific original research objectives was 1984. These specific research objectives have been met, however, the broader research objectives of the program are still being addressed. The specific research outlined in the current proposal will be completed in December 1997. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

The agency evaluates the progress of this project on an annual basis. The university is required to provide an accomplishment report when the new proposal is submitted to CSREES for funding. The 1996 review indicated that the research addresses important opportunities in the farm raised catfish industry, significant progress has been reported on specific research objectives, and that the scientists involved in the project are leading authorities in this area of research.

AQUACULTURE, NORTH CAROLINA

CSREES has requested the university to submit a grant proposal that has not been received. The researchers indicate that the research will focus on reducing the environmental impact of aquaculture systems, reducing the impact of diseases in cultured finfish, and reducing the inherent risk of culturing emerging species. The principal researcher indicates that there is a need to reduce the environmental impact of aquaculture systems, to enhance fish health management strategies, and to reduce the impediments to culture selected emerging species. Improved environmental quality and improved production efficiency in aquacultural systems could have regional and national impacts. Diversification of the industry in terms of species cultured is of benefit to both the producer and consumer of aquaculture products. In view of the significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The principal researcher believes this research to be of national, regional or local needs.

The goals of the research are to reduce environmental impacts of aquaculture systems by improved system design and improved feeding strategies, to evaluate the efficacy of current vaccination methods and develop improved methods for vaccine administration, and to develop culture techniques for potentially important aquaculture species.

The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 is \$150,000. The university reports a total of \$94,000 of non-federal funding to support research carried under this program for fiscal year 1997. The primary source of the nonfederal funding was from state sources.

Research is being conducted at North Carolina State University. This is the first year of the project. The researchers anticipate that the specific research objectives will be completed in 1999. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The agency will conduct the initial review of this proposal when it is submitted to CSREES for funding. Since this is the first year of the program, the proposal will be externally peer reviewed as part of the CSREES evaluation.

BABCOCK INSTITUTE FOR INTERNATIONAL DAIRY RESEARCH AND DEVELOPMENT

The Babcock Institute for International Dairy Research and Development was established with participation of the University of Wisconsin-Madison College of Agriculture and Life Sciences, School of Veterinary Medicine and the Cooperative Extension Division. The objective of the Babcock Institute is to link the U.S. dairy industry with the rest of the world through degree training, continuing education, technology transfer, adaptive research, scientific collaboration and market analysis. The principal researcher believes the need is to strengthen dairy industries around the world, to enhance international commercial and scientific collaborative opportunities

PART 1

918

for the U.S. dairy industry, and to draw upon global perspectives to build insight into the strategic planning of the U.S. dairy industry. Because of the significant need for research in high priority national topics, such as the Department's Pest Management Initiative, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The goal of the Institute remains the linkage of the U.S. dairy industry with the rest of the world through training, continuing education and outreach, technology transfer, adaptive research, scientific collaboration and market analysis. Initial efforts were focused on planning and staffing. An initial activity was, and continues to be, the development of multi language extension materials about basic management techniques essential to optimize performance of U.S. germplasm overseas. This activity has grown to include manuals on Breeding and Genetics, Lactation and Milking, and Basic Dairy Farm Financial Management published in English, Spanish, French, Russian, and Chinese. Research on potential implications of NAFTA and GATT on the U.S. dairy industry was completed. A technical workshop on dairy grazing in New Zealand and the Midwest was organized and held in Madison during the fall of 1993. A technical workshop on Nutrient Management, Manure and the Dairy Industry: European Perspectives and Wisconsin's Challenges was held in Madison, Wisconsin during September 1994. A round table was held in January 1995 addressing "World Dairy Markets in the Post-GATT Era." Funding from this project also supported the Great Lakes Dairy Sheep Symposium in 1995 and 1996, and created a World Wide Web site in 1996 for distribution of Babcock Institute technical dairy fact sheets in four languages. The first International Dairy Short Course for a group of producers and technicians from Argentina has been organized on the University of Wisconsin Campus. Scientist's are being supported in collaborative research with New Zealand primarily to gain a better understanding of grazing systems as related to dairy management.

Grants have been awarded from funds appropriated as follows: fiscal years 1992 and 1993, \$75,000 per year; fiscal year 1994, \$250,000; and fiscal years 1995-1997, \$312,000 per year. A total of \$1,336,000 has been appropriated.

During fiscal year 1992, \$13,145 of State funds were used to support this program and \$19,745 of State funds in fiscal year 1993 for a total of \$32,890 during the first two years of this research. Information is not available for fiscal year 1994-1996.

Research is being conducted at the University of Wisconsin-Madison College of Agriculture and Life Sciences. The Babcock Institute's overarching mission has been to link the U.S. dairy industry and its trade potential with overseas dairy industries and markets. The original objectives of this project have remained consistent over the years. However, each year specific objectives were proposed to further the mission of the Institute and to build on previous accomplishments. The Institute has accomplished specific objectives each year in a timely manner. This objective remains of increasing importance with continued development of international markets for dairy products and technologies. The University researchers anticipate that work currently in progress will be completed by September 1998. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The Babcock Institute undergoes two independent review processes each year. The first is done by a committee of university and industry representatives who review the annual research proposal and amend it prior to submission to the agency. The annual proposal is reviewed by agency technical staff prior to approval for fund release. In addition, the institute was included in a comprehensive review of the programs of the Department of Dairy Science at the University of Wisconsin in May 1995. The agency project officer has conducted two on-site reviews of the institute since its formation in 1992. The most recent review has found that the approach proposed by the researchers is appropriate and that the researchers are well qualified to perform the objectives as stated.

BARLEY FEED FOR RANGELAND CATTLE, MONTANA

This project will support research on the nutritional value of barley cultivars as feed for beef cattle. This effort will assist with the breeding and selection of superior types that can be more competitive with other feed grains and improve farmer income from barley crops grown in rotational systems in the Northern Great Plains. Barley as a feed grain is grown extensively in the United States. Based on chemical analyses and the experience of some cattle feeders the principal researcher believes it should have a feed value on par with corn and wheat. However, it is listed as inferior to both in feeds hand books and is therefore discounted in the market. Comprehensive feeding studies of various barley types will be conducted to document the

PART 1

919

value as a feed grain for beef cattle. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The principal researcher believes this research to be of national, regional or local need. The original goal of this research was to determine the true feed value of barley for feeder cattle, and thereby improve the economic return to barley production.

The work supported by this grant began in fiscal year 1996 with an appropriation of \$250,000. For fiscal year 1997, the appropriation is \$500,000. The total appropriation is \$750,000. The Montana State Agricultural Experiment Station is estimated to provide \$30,000 in staff time and operational funds toward this project. The Principal investigator has generated an additional \$130,000 of grant funding to support the work.

Research will be conducted at Montana State University. The project is proposed for completion following fiscal year 2001. Progress toward the objectives have been reported by the principal researcher. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

The project was peer reviewed in 1996 and judged to be scientifically sound and appropriate for the stated objectives.

BINATIONAL AGRICULTURAL RESEARCH AND DEVELOPMENT PROGRAM

The Binational Agricultural Research and Development (BARD) Program is a competitive research grants program that supports fundamental research in areas of animal and plant sciences, economics, and engineering, that is important to both U.S. and Israel agriculture. Each application for funding must be a joint effort put forward by a team of U.S. and Israel scientists. The requests for proposals for the 1997 competition was released in the fall of 1996. The proposals received are currently under review and funding decisions are expected to be completed by May 1997. The funds available through the BARD Special Research Grants Program are used to support the U. S. portion of approximately twenty joint U. S./Israel proposals each year. All proposals awarded by the BARD program must have significance to both U.S. and Israel agriculture. Thus, applicants must justify the work in terms of its global significance in order to receive funding. Fundamental research supported by the program provides the knowledge base needed to develop solutions to pressing agricultural problems in both nations.

The goal of the BARD program is to support fundamental research in plant and animal sciences, economics, and engineering that are important to both U.S. and Israel agriculture. In that, the generation of new knowledge is an ongoing process, the original goal of the BARD program to produce new knowledge continues today. Much of the research supported concentrates on issues of animal and plant health (including studies of the pests and pathogens of both plants and animals), and responses of plants to environmental conditions (particularly crops grown in warm, dry climates). Many accomplishments in fundamental sciences have been made in these areas that will lead to the development of crop plants resistant to disease, pests, and harsh environmental conditions; reduction in livestock diseases; and increased livestock production.

An agreement between the U.S. and Israel governments to establish BARD was signed in 1977, and an initial endowment fund of \$80 million was established through equal contributions from both countries.¹ Funds for BARD were available from the interest earned from the endowment fund, but a reduction in interest rates and increased research costs over the years impeded the ability of the BARD program to adequately meet the research needs of each country's producers and consumers. In fiscal year 1994, the Department directed that \$2.5 million of funding appropriated for CSREES' National Research Initiative (NRI) program be used for the BARD program to supplement the interest earned from the endowment fund, and that amount was matched by Israel. In fiscal year 1995, Congressional language directed that CSREES again use \$2.5 million of the NRI appropriation for BARD, and in fiscal year 1996, the Department directed that a third \$2.5 million increment of NRI appropriations be used for BARD. CSREES has received a direct appropriation in the amount of \$2 million for BARD in fiscal year 1997.

Each BARD grant funded by CSREES is for the U.S. portion of a joint U.S./Israel project. The Israeli portion of the joint project is supported from either the endowment fund or from supplemental funds provided by Israel. Israel matches the sup-

¹ Subsequent increase of \$30 million to current total of \$110 million.

PART 1

920

plemental funds provided by CSREES. Therefore, a significant portion of each project is supported with non-federal funds.

BARD is an ongoing program designed to support fundamental science of importance to agriculture. Each year new projects are supported through the competitive process. Therefore, new objectives are set forth each year through the support of new and innovative proposals. Each proposal is funded for two to three years.

Each proposal submitted to the BARD program receives a peer review evaluation. Only those proposals which review favorably are funded. CSREES has not conducted an overarching evaluation of the BARD program. However, the BARD program has an administrative council that is chaired by the ARS administrator. The council is responsible for providing advice as to content and policies of the BARD program.

BIODIESEL RESEARCH, MISSOURI

Research on biodiesel involves examining the feasibility of producing biodiesel and other higher value products from oilseed crops including soybeans, canola, sunflower and industrial rapeseed. It also involves identifying and evaluating potential markets for the fuel and other products. An important thrust is to identify how biodiesel and other environmentally-friendly products can help meet state and federal environmental mandates of reduced air and water pollution. The project is also evaluating local processing plants whereby farmers could produce crops, process the crops locally and use the fuel and high protein feed coproducts on their farms or locally. The initial work is being done in Missouri. The results may provide the agricultural community with alternative crops and more diverse markets, additional marketable products and a locally grown source of fuel. This may result in increased investment in local communities, additional jobs, and increased value added in the farm and rural community sectors. The principal investigator believes this research to be of local, regional and national importance. However, in view of the significant need for research of high-priority national scope, such as integrated pest management, additional funding for this project is not proposed. At the discretion of the State, this effort could be supported with Hatch Act or other funding.

The goals were to examine the feasibility of producing biodiesel and other higher value products from oilseed crops, plus to increase the value of coproducts. Results indicate that biodiesel can be produced most economically from soybeans, primarily because of the high value of soybean meal. Research indicates that with a community based biodiesel processing plant, costs of production could be as low as \$0.59 per gallon, although farmers might increase revenues by selling the soybean oil rather than using it to produce biodiesel. Since small quantities of biodiesel regularly sell for \$4.00 to \$9.00 per gallon, the structure of the production, marketing and transportation is currently under evaluation to identify more efficient and less costly ways to produce and market biodiesel. Also, a study of which markets might provide the best opportunity to use increased levels of biodiesel is underway. Such markets might include underground mining and the marine industry in addition to urban mass transit systems and cities having problems meeting more stringent air quality mandates. Research results indicate that for each one million gallons of biodiesel used in a B20 blend (20 percent biodiesel and 80 percent petroleum-based diesel) by the Kansas City, Missouri, transit fleet would have the following estimated impacts: almost 100 additional jobs; increased investment of \$500,000; net increase in personal income of \$3.2 million; and increase in total economic activity in the region of \$9.6 million. Research has also identified that rapeseed meal compares favorably to soybean meal and blood meal as an animal feed. It has a higher escape protein value than soybean meal. This research is carried out in close cooperation and coordination with other state and federal agencies, plus trade associations such as the National Biodiesel Board, the United Soybean Board, American Soybean Association, and others.

The work began by this program began in fiscal 1993, and the appropriation for that year was \$50,000. The appropriation for 1994 was \$141,000; and for fiscal years 1995 through 1997 was \$152,000 annually. A total of \$647,000 has been appropriated.

The source of non-federal funds is state appropriated funds. The level in 1994 was \$7,310. The funding level in 1995 was \$74,854. Additionally, some work funded by this grant has been conducted in cooperation with the National Biodiesel Board, plus the Missouri Soybean Merchandising Council. The level of those matching funds for these two sources are not available.

The work is being carried out at the University of Missouri-Columbia. The principals estimate that the work with biodiesel will require an additional two years to complete. Additionally, the work on higher value products, such as solvents from

PART 1

921

biodiesel, is expected to be on-going. Successes with the higher value products will help make bio-based business more profitable, thus increasing chances for success which will result in more value added opportunities for farmers and rural communities. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The CSREES agency scientist reviews the annual proposal submissions to evaluate progress to date.

BIOTECHNOLOGY, OREGON

Research that has been funded under the Biotechnology Oregon project includes the use of nematodes for biocontrol of insect pests; development of bacterial vectors for vaccines and food additives; resistance to crown gall disease in plants; enhancement of anthocyanin pigments in plants, and enzymes for degrading lignin and wood waste. The principal researcher believes the research funding is requested to enhance the biotechnology research infrastructure in basic and applied biotechnology within the cooperating institutions, Oregon State University, the University of Oregon, and the Oregon Graduate Institute of Science and Technology. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research, including IPM competitive grant and emerging pest and disease funds.

The goal of the program is to improve the biotechnology research infrastructure, to foster research discoveries, and to develop technologies that lead to agricultural applications. Preference is given to research that has the potential for commercial development in the near future and that has the potential for additional funding from other sources. Five research projects in the areas mentioned above were funded under the grant in 1996.

The work supported by this grant began in fiscal year 1996, and the appropriation for fiscal year 1996 was \$217,000, and for fiscal year 1997 is \$250,000. A total of \$467,000 has been appropriated. In fiscal year 1995, the State of Oregon appropriated \$1,226,706 for biotechnology research at Oregon State University. For fiscal year 1996, non-federal support amounted to \$303,100, mostly from the private sector.

The research is being carried out at three cooperating institutions, Oregon State University, the University of Oregon, and the Oregon Graduate Institute of Science and Technology. Both the overall grant and the individual research projects funded under it are funded on a two-year basis. The Biotechnology Oregon grant was first awarded in 1996 and the anticipated completion date is July 31, 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

The agency has not yet received the Biotechnology Oregon proposal for fiscal year 1997. The project was last evaluated for scientific merit by a Peer Review Panel in the spring of 1996. The Panel recommended approval without change in the research approach and plans.

BROOM SNAKEWEED

Current research addresses several areas for broom snakeweed control, including efforts to understand more fully the onset of invasion and persistence of broom snakeweed, evaluate the toxicology and physiological effects of broom snakeweed on livestock, and develop an integrated weed management approach for broom snakeweed. Broom snakeweed is a serious weed in the southwestern United States and adjacent Western States. About 22 percent of rangeland in Texas, and 60 percent in New Mexico is infested to some degree by the weed. Current cost for control of broom snakeweed in the southwestern United States is estimated at over \$41 million. Dense broom snakeweed stands cause significant economic losses in the plains, prairie and desert areas of the central and southwestern United States. Snakeweed is a poisonous plant causing death and abortion in livestock and reduced productivity of associated vegetation. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

Ground surveys have been conducted statewide from 1989 to map snakeweed distribution and relative density patterns throughout every county in New Mexico. This project is in its fourth research year. A Geographic Information System [GIS] approach is used to relate snakeweed populations to plant communities and soil

PART 1

922

type in areas where snakeweed is particularly dense. Research is addressing three general areas which are, first, ecology and management; second, biological control studies; and third, toxicology and animal health research. A considerable amount of useful research and practical application has resulted from this special grant. As an example, in biological control, several plant pathogens and insects are proving to be effective in snakeweed's control. Another area of emphasis, has been grazing management techniques and feeding studies to minimize toxicological effects on livestock. Feeding trials have demonstrated that, snakeweed ingestion at 10 percent of diet did not impair fertility or semen characteristics in the test animal which was male rats.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$100,000; fiscal year 1990, \$148,000; fiscal year 1991, \$150,000; fiscal years 1992 and 1993, \$200,000 per year; fiscal year 1994, \$188,000; fiscal years 1995 and 1996, \$169,000 each year; and fiscal year 1997, \$175,000. A total of \$1,499,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$249,251 state appropriations in 1991; \$200,110 state appropriations in 1992; \$334,779 state appropriations in 1993; \$302,793 state appropriations in 1994; \$294,451 state appropriations in 1995, and an estimated \$300,000 in state appropriations in 1996.

Research is being conducted at New Mexico State University. The project was initiated in 1989. Currently additional and related objectives have evolved and anticipated completion date for these is 1999. Considerable progress has been made on many of the objectives. Anticipated completion date of the additional and related objectives that have resulted based on the current work, would indicate another five years. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

Each year the grant is peer reviewed and reviewed by CSREES's senior scientific staff. A summary of those review indicated progress in the achieving the objectives.

CANOLA RESEARCH SPECIAL GRANT, KANSAS STATE UNIVERSITY

Rapeseed lines from around the world are being evaluated for increased winter hardiness. Elite lines are being used to develop canola germplasm lines that will survive the winter in the central Great Plains. This will be accomplished using a plant breeding program. The domestic demand for canola oil has been increasing rapidly. With little domestic production, most of the demand has been met by imports. Private seed companies are not devoting time or money to develop the cultivars needed for canola production in Kansas and central Great Plains. Oil seed crushing facilities in the region are shutting down for several months each year due to a lack of sunflowers/soybeans grown in the area. A canola harvest in July would precede the sunflower or soybean harvest by three months, help crushing facilities continue crushing during this slow period, and maintain jobs. A canola industry in the area would also help spread the risk of the producers into more than just a small grain commodity base and into the oilseed market. Germplasm developed at Kansas State University is being evaluated from Virginia and Georgia to Wyoming and Texas and may help develop an industry in other areas of the country. In view of the significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The principal researcher believes this research to be of national, regional or local need.

The original goal was to collect germplasm with increased winter hardiness and use it to develop cultivars with sufficient winter survivability to be grown in the central Great Plains. At present, nearly 700 rapeseed and canola quality lines have been acquired and tested. The hardiest have been used as parents to produce lines. In the past five years, over 800 crosses have been made. Field and laboratory testing began during the fall of 1993. In 1993-94, advanced selections from these populations had a 30 percent increase in winter survival over the best released cultivars in western Kansas and in environments where winter survival was not a factor, these same lines had a 20 percent yield advantage over the best released cultivars. In 1994-95 this germplasm was tested at 12 locations in seven states throughout the Great Plains and Midwest. Over all locations, several experimental lines that have shown increased winter hardiness in past years had yields equal to the best cultivars used as checks. The winter of 1995-96 has been severe in the Great Plains as well as most of the country. Severe winter kill is expected in the breeding nurseries with only the hardiest plants surviving. Advanced lines continued to demonstrate a winter survival advantage over previously released cultivars. Over the

PART 1

923

next several years, surviving plants will be advanced and those lines possessing superior traits will become the basis of our second generation of released cultivars. In 1995, KS3579 was released to other breeders as a germplasm. This line has shown significant improvement in winter hardiness and will be beneficial in increasing winter hardiness in canola cultivars around the world. A canola quality rapeseed cultivar is planned for release in the summer of 1997. It will be used as the basis for establishing production in south central Kansas, as well as other areas of the Great Plains.

Work began on this project in 1992. Funding for fiscal year 1992 and fiscal year 1993, was \$100,000 per year; fiscal year 1994 was \$94,000; and fiscal years 1995 through 1997 were \$85,000 each. A total of \$549,000 has been appropriated.

Kansas State University has provided \$44,960 in fiscal year 1992, \$21,321 in fiscal year 1993, and \$22,336 in fiscal year 1994, \$23,399 in fiscal year 1995, \$24,513 in fiscal year 1996 and \$25,679 in fiscal year 1997. An additional \$50,000 was provided through a grant from Dane G. Hansen Foundation for fiscal years 1993–1995.

The work is being conducted at Kansas State University, Agricultural Experiment Station, Department of Agronomy. The primary research site is at Manhattan with additional field locations at Hutchinson, Hays, Colby, Belleville, Kingman, Garden City and Parsons, Kansas. Germplasm developed by Kansas State University is also being cooperatively tested by researchers in Texas, Missouri, Colorado, Nebraska, Illinois, Arkansas, Oklahoma, and Wyoming.

The original objectives were to develop the factors needed to establish canola production in Kansas and the Central Great Plains. The primary concern addressed by this project was the lack of cultivars adapted to the area. Advanced selections adapted for the growing conditions of the Great Plains and representing a significant improvement in both winter hardiness and yield potential for our unique environment, are being developed. Foundation seed of the best of these lines will be increased over the 1996–1997 growing season and released to certified seed growers in 1997. Industrial groups have been instrumental in developing a market for the area. Improved germplasm in the early generations continues to be identified so progress and cultivar improvement can continue. The average time between the initial cross and a released variety is 8 to 10 years. The first crosses made at Kansas State University were in 1993. Germplasm that is currently targeted for improvement will be released in year 2007. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

This project is reviewed annually, based upon the annual progress report and presentation at the Southern Extension and Research Activity Information Exchange Group for oilseeds [SERA-IEG-11]. The review is conducted by the cognizant staff scientist who has determined that the research is in accordance with the mission of the agency.

CENTER FOR ANIMAL HEALTH AND PRODUCTIVITY, PENNSYLVANIA

This research is designed to reduce nutrient transfer to the environment surrounding dairy farms in the Chesapeake Bay watershed. Progress to date includes the development of a individual dairy cow model which will predict absorbed amino acids and the loss of nitrogen in manure. This model has been developed into user friendly software so that trained farm advisors can evaluate herd nutrient management status while on site. A whole farm model has been developed which integrates feeding and agronomic practices to predict utilization of nitrogen and farm surpluses. Using these tools, a survey of dairy farms in the region has been done to assess nitrogen status on dairy farms and potential management practices to reduce nitrogen excesses on dairy farms. Refinement of the model tools and research to refine estimates of the environmental fate of excess nitrogen from dairy farms is in progress.

The principal researcher believes that reducing non-point pollution of ground and surface water by nitrogen from intensive livestock production units is of concern nationally, and especially in sensitive ecosystems like the Chesapeake Bay. This research is designed to find alternative feeding and cropping systems which will reduce net nutrient flux on Pennsylvania dairy farms to near zero. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research. The principal researcher believes this research to be of national, regional, and local need.

PART 1

924

The original goal of this research remains the development of whole farm management systems which will reduce nutrient losses to the external environment to near zero. To date the researchers have developed their own models to more accurately formulate rations for individual dairy cows which permit the comparison of alternative feeding programs based upon both maximal animal performance and minimal nutrient losses in animal waste. This model is being tested on select commercial dairy farms to evaluate the extent to which total nitrogen losses in manure can be reduced without impacting economic performance of the farm. At the same time, whole farm nutrient models have been developed to evaluate alternative cropping systems which will make maximum use of nutrients from animal waste and minimize nutrient flux from the total farm system. These tools are currently being used to survey the current status of nutrient balance on farms in the area and efforts to fine tune the tools are in progress.

A grant has been awarded from funds appropriated in fiscal year 1993 for \$134,000 and in fiscal year 1994 for \$126,000. In fiscal years 1995–1997, \$113,000 has been appropriated each year. A total of \$599,000 has been appropriated.

Research is being conducted at the University of Pennsylvania, College of Veterinary Medicine. The University researchers anticipate that work currently underway will be completed by September 1998. This will complete the original objectives of the research. The principal researcher indicates that consideration has been given to the broadening of objectives to include additional nutrients in the model system, but this has been dropped because technical expertise required is currently not readily available. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The Center for Animal Health and Productivity project was last reviewed in June 1996. An on site review by agency technical staff was conducted in June 1995. It was concluded that project objectives are within the goals of the program, are within the mission of both USDA and CSREES, and the institution is well equipped and qualified to carry out the research project.

CENTER FOR INNOVATIVE FOOD TECHNOLOGY, OHIO

Funds from the fiscal year 1996 grant are supporting research projects on using neural network/fuzzy logic tools to develop a model of a growing and processing cycle for processing tomatoes, developing specifications for a system and to optimize the techniques necessary to satisfactorily package products sterilized non-thermally with pulsed electric field systems, to demonstrate whether an ultrasonic washing appliance has the capacity to kill common foodborne pathogens or modify it to do so, to demonstrate the feasibility of using enzyme linked immunosorbent assays in the measurement of pesticides in Great Lakes fish, to refine and optimize the performance of a prototype turkey deboning system, to develop a vision based inspection system for baked goods, and to develop electrostatic coating processes for applying powdered materials to food products.

The principal researcher believes the value-added food processing industry is the largest industry in Midwestern states, including Ohio where the industry contributes over \$17 billion to the annual economy. From an economic development point of view, processing and adding-value to crops grown within a region is the largest possible stimulus to that region's total economic product. This program aims to partner with and encourage small and medium sized companies to undertake innovative research that might otherwise not be undertaken due to risk aversion and limited financial resources for research and development in these companies. In view of significant needs for research in high priority national interest topics such as improved pest management systems and food safety, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original goal of the research was to develop innovative processing techniques to increase food safety and quality or reduce processing costs. The neural network project has led to a model that will be used to relate growing and processing variables to product quality, resulting in higher product quality at lower cost. The pulsed electric field sterilization program has demonstrated the ability to produce high quality products with extended shelf stability. The research on immunosorbent assays has demonstrated benefits, beyond the original scope of the project, to the poultry industry by providing an inexpensive and timely method for measuring residual pesticide levels in turkeys. The coating project has generated several applications where the shelf life of products can be extended.

The work supported by this grant began in fiscal year 1995. The project received appropriations of \$181,000 in fiscal years 1995 through 1997. A total of \$543,000 has been appropriated. In fiscal year 1995, non-federal funds included \$26,000 from

PART 1

925

state funds and \$70,000 from industry memberships. In fiscal year 1996, non-federal funds included \$26,000 in state funds and \$80,000 in industry funds.

Research is being conducted in the laboratories of the Ohio State University and at various participating companies in Ohio, Illinois, and Pennsylvania. The principal investigator anticipates that some projects supported by the fiscal year 1996 grant will have been completed by February 28, 1997, while other projects will not be completed until February 28, 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. Since the agency has not yet received the proposal in support of the fiscal year 1997 proposal, the last review of the proposal was conducted on January 22, 1996. At that time, the agency science specialist believed that the projects addressed issues relevant to food manufacturing, were scientifically sound, and that satisfactory progress was being demonstrated using previously awarded grant funds.

CENTER FOR RURAL STUDIES, VERMONT

The University is developing and refining social and economic indicators used to evaluate the impact of economic development programming and activities. They are also perfecting a delivery format for technical assistance for community and small business development. A major focus of current research relates to utilizing the World Wide Web as a major delivery vehicle. The principal researcher believes that the database and analytical capability provide technical indicators and timely information to support entrepreneurial and community development activities in the State. The program is conducted in concert with other University and State agency outreach activities. In view of significant needs for research in high priority national interest topics, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original goal was to create a database and analytical capability for rural development in Vermont. Examples of past accomplishments include thematic maps presented to help target child hunger programs and target places for programmatic intervention; analytical reports provided to guide the development of retail shopping areas; a reference volume, "Economic Handbook for Vermont Counties," produced for public distribution to help Vermont citizens and leaders answer the most frequently asked questions about their State and counties; currently utilizing the World Wide Web to disseminate information and technical assistance.

The work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992-1993 was \$37,000 per year; fiscal year 1994, \$35,000; and fiscal years 1995-1997, \$32,000, for a total of \$205,000. Prior to receipt of any Federal funds in fiscal year 1991, the Center was supported by \$91,130 in State and other non-federal funds. In fiscal year 1992, these funds increased to \$101,298 and to \$143,124 in fiscal year 1993. The amount of non-federal dollars was \$3,547 for fiscal years 1995-1996 and \$2,931 in fiscal year 1997 plus researcher's salary.

Research is being conducted at the University of Vermont. The original completion date was September 30, 1993. The original objectives of the research project have been met. The completion of additional objectives is scheduled for August 31, 1998. However, in keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

The agency evaluates merit of research proposals as submitted. No formal evaluation of this project has been conducted.

CHESAPEAKE BAY AQUACULTURE, MARYLAND

The objective of this research is to improve the culture of striped bass through genetics, reproductive biology, nutrition, health management, waste management and product quality. The research provides a balance between basic and applied research. The principal researcher believes the Mid-Atlantic region of the country has significant opportunities to contribute to the overall development of the domestic aquaculture industry. Research supported through this program can have broad application and enhance production efficiency and the sustainability of aquaculture as a form of production agriculture. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

PART 1

926

The original research goal was to generate new knowledge that can be utilized by the aquaculture industry to address problems limiting the expansion of the industry in Maryland and the Mid-Atlantic region. The program focuses on closing the life cycle of the striped bass and its hybrids, enhancing production efficiency, and improving product quality under aquaculture conditions. Research is conducted in the areas of growth, reproduction and development, aquacultural systems, product quality, and aquatic animal health. Researchers are currently evaluating the performance of triploid striped bass. Progress has been made in developing controlled artificial spawning techniques and refining the nutritional requirements of striped bass. Scientists continue studies to characterize waste production as a function of feeding levels to reduce waste generation in striped bass production systems.

The work supported under this grant began in fiscal year 1990 and the appropriation for fiscal year 1990 was \$370,000. The fiscal years 1991–1993 was \$437,000 per year; fiscal year 1994, \$411,000; and fiscal years 1995–1997, \$370,000 each year. A total of \$3,202,000 has been appropriated.

The university reports the amount of non-federal funding for this program is as follows: in fiscal years 1991 and 1992, \$200,000; in fiscal years 1993 and 1994, \$175,000; in fiscal year 1995, \$400,000; and in fiscal year 1996, \$536,000. The university reports that these funds are from direct state appropriations and other non-federal funding sources.

Research is being conducted at the University of Maryland. The original specific research objectives were to be completed in 1993. These specific research objectives have been met. The specific research outlined in the current proposal will be completed in fiscal year 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The agency evaluates the progress of this project on an annual basis. The university is required to submit an accomplishment report when the new proposal is submitted to CSREES for funding. The 1996 review indicated the proposal was well written with objectives clearly stated, that adequate progress had been reported on previous work, and that the scientific expertise is appropriate for the proposed research.

COASTAL CULTIVARS

This project will be undertaken to identify new ornamental, fruit, and vegetable crops for the lower coastal plain of Georgia and develop management systems for profitable production. This effort is designed to improve the rural economy and to help supply an expanding market for the products in that region and possibly beyond. The research under this project has regional significance for coastal zone land in the South Eastern U.S. on potential new plants for the growing regional market for ornamental and speciality fruits and vegetables. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research. The original goal of this research was to identify new plant cultivars to provide alternative crops with economic potential to the coastal area.

The work supported by this grant begins in fiscal year 1997 and the appropriation for fiscal year 1997 is \$200,000.

Research will be conducted at the University of Georgia coastal garden. The project is projected for three years duration and, therefore, should be completed following fiscal year 1999. In keeping with the Administration's policy of awarding research grants competitively, no further funding for this grant is requested.

COMPETITIVENESS OF AGRICULTURE PRODUCTS, WASHINGTON

This grant improves the global competitiveness of value-added agricultural and forest products produced in the Pacific Northwest region. It identifies and conducts needed research and disseminates the results through various activities such as trade shows, international conferences, and a variety of media. Research focuses on foreign market assessments, product development, and policy and trade barriers. Particular attention has been paid to developing the technology that can add value to U.S. agricultural and forest products in order to make U.S. exports more competitive. The principal researchers believe that rural economic development and growth of the Pacific Northwest region is dependent upon the ability of the agricultural and forest product sectors to penetrate overseas markets, especially in Pacific Rim countries. Japan and China present especially attractive prospects for evolving U.S. food and forest products exports. In view of significant needs for research in high priority, national interest topics such as improved pest management systems, funds are

PART 1

927

not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act, or other funding could be used to support this research.

The original goals were to develop export markets for value-added food and forest products produced in the Pacific Northwest and to improve competitiveness of these industries. Research at Washington State University's International Marketing Program for Agricultural Commodities and Trade enables Pacific Northwest producers to grow and export Asian and other products never before produced in this country on a commercial basis. The Center identified export opportunities in East Asia and elsewhere and has developed production and marketing systems for Wagyu beef, azuki beans, edamame soybean, and wasabi radish, to name a few. Other promising products are in the pipeline leading toward commercialization. The Center is also developing economical and environmentally-friendly food processing techniques. It searches for scientific solutions to trade barriers. It monitors progress in multilateral trade agreements, leading to opportunities for trade liberalization.

Research at the University of Washington's Center for International Trade in Forest Products has helped open the Japanese housing market to U.S. exports. The Center hosted a significant housing export conference in Seattle in September 1996 at which U.S. Ambassador Walter Mondale and Japanese officials agreed to what has been a major breakthrough in U.S. export opportunities. Japanese builders have benefited from the Center's research. They have been taught how to lower their costs by using U.S. building techniques and products. Value-added exports have grown 200 percent since 1989 as Japan deregulated its housing market after recognizing the opportunities set forth by this research. Other research at the Center developed export and marketing information for prefabricated housing, red cedar, substitute products, Russia/China trade potential, impact of climate change on competitiveness, U.S./Canadian trade, and impact of Western supply constraints on Southern forest products markets.

The work supported by this grant began in fiscal year 1992. The appropriation for fiscal year 1992-1993 was \$800,000 each year; fiscal year 1994, \$752,000; and fiscal years 1995-1997, \$677,000 each year. A total of \$4,383,000 has been appropriated.

The non-federal funds and sources provided for this grant are as follows: \$716,986 State appropriations, \$209,622 product sales, \$114,000 industry, and \$661,119 miscellaneous for a total of \$1,701,727 in 1991; \$727,345 State appropriations, \$114,581 product sales, \$299,000 industry, and \$347,425 miscellaneous for a total of \$1,488,351 in 1992; \$1,259,437 State appropriations, \$55,089 product sales, \$131,000 industry, and \$3,000 miscellaneous for a total of \$1,448,526 in 1993; \$801,000 State appropriations, \$1,055,000 product sales, \$1,040,000 industry, and \$244,000 miscellaneous for a total of \$3,140,000 in 1994; \$810,000 State appropriations, \$42,970 product sales, \$785,000 industry, and a \$2,000,000 gift of a ranch due to the IMPACT Center's research on Wagyu Cattle, for a total of \$3,637,870 in 1995; and \$844,000 State appropriations, \$45,000 product sales, \$900,000 industry, and \$45,000 miscellaneous for a total of \$1,789,000 in 1996. The preliminary allocation for 1997 is \$1,305,000 state appropriations, \$92,000 product sales, \$1,000,000 industry, and \$85,000 miscellaneous for a total of \$2,542,000.

The research program is being carried out by the International Marketing Program for Agricultural Commodities and Trade at Washington State University, Pullman, and the Center for International Trade in Forest Products at the University of Washington, Seattle.

This is a continuing program of research with long-term, crop and animal improvement projects, and long-term agricultural and forest products market development projects. As projects are completed, new projects have begun. Some of the new projects can be completed by 2000, but some improvement and development projects will take much longer to reach their full potential. Objectives have been met for certain products in certain markets, but unmet opportunities abound. With the exception of the improvement projects, most of the work can be completed by 2000. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

Projects are evaluated annually through review of progress reports and periodically through more extensive review. The U.S. Department of Agriculture reviewed the Washington State University project in 1991. The University of Washington Center is just completing a formal 5-year review. The report will be available early in 1997. In addition, the Center made comprehensive use of a broadly-construed Executive Board having industry, agency, and academic representation to review quarterly accomplishment reports and suggest additional activities. The last formal on-site Departmental review was in 1991, but the Department reviews the project annually and participates in the quarterly Executive Board reviews.

PART 1

928

COOL SEASON LEGUME RESEARCH

The Cool Season Legume Research Program involves collaborative research projects to improve efficiency and sustainability of pea, lentil, chickpea and fava bean cropping systems. Scientists from seven states where these crops are grown have developed cooperative research projects directed toward crop improvement, crop protection, crop management and human nutrition/product development. The principal researcher believes the original goal of this project was to improve efficiency and sustainability of cool season food legumes through an integrated collaborative research program and genetic resistance to important virus diseases in peas and lentils. Evaluation studies of biocontrol agents for root disease organisms on peas are underway. Other studies are evaluating integration of genetic resistance and chemical control. Considerable progress has been made using biotechnology to facilitate gene identification and transfer. Management system studies have addressed tillage and weed control issues. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The work supported by this grant began in fiscal year 1991 with appropriations for fiscal year 1991 of \$375,000; fiscal year 1992 and 1993, \$387,000 per year; fiscal year 1994, \$364,000; fiscal year 1995, \$103,000; fiscal years 1996 and 1997, \$329,000. A total of \$2,274,000 has been appropriated.

The nonfederal funds provided for this grant were as follows: fiscal year 1991, \$304,761 state appropriations, \$14,000 industry, and \$18,071 other nonfederal; fiscal year 1992, \$364,851 state appropriations, \$15,000 industry, and \$14,000 other nonfederal; fiscal year 1993, \$400,191 state appropriations, \$19,725 industry, and \$10,063, other nonfederal; and fiscal year 1994, \$147,607 nonfederal support. Nonfederal support for fiscal year 1995 was \$150,607 and for fiscal year 1996 it was \$386,887.

Research has been conducted at the Agricultural Experiment Stations in Idaho, Oregon, Washington, Wisconsin, Minnesota, New York and New Hampshire. The funds have been awarded competitively among participating states and not all states receive funds each year. The projected duration of the initial project was five years. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

The steering committee made up of growers, industry representatives and scientists, review this project annually for merit and relevance. Each annual proposal is made up of sub-projects that have been peer reviewed and selected to address priority issues within each of the broad objectives. The combined project is reviewed by CSREES before funds are awarded.

CRANBERRY-BLUEBERRY DISEASE AND BREEDING, NEW JERSEY

This work has focused on identification and monitoring of insect pests on blueberries and cranberries, the identification, breeding, and incorporation of superior germplasm into horticulturally desirable genotypes, identification and determination of several fungal fruitrotting species, and identification of root-rot resistant cranberry genotypes. Overall, research has focused on the attainment of cultural management methods that are environmentally compatible, while reducing blueberry and cranberry crop losses. This project involves diseases having major impacts on New Jersey's cranberry and blueberry industries, but the findings here are being shared with experts in Wisconsin, Michigan, and New England. In view of significant needs for research in high priority national interest topics such as the Department's pest management initiative, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original goal was the development of cranberry and blueberry cultivars compatible with new disease and production management strategies. Last year, over 75 blueberry selections were moved into advanced testing, and wild blueberry accessions resistant to secondary mummy berry infections were identified. The biology and seasonal life history of spotted fireworm on cranberries was determined. A pheromone trap-based monitoring system for cranberry fruitworm was developed and further refined for commercialization in 1997. Blueberry fruit volatiles attractive to blueberry maggot were identified and tested in the field. Seven major fungal fruit-rotting species were identified, and their incidence in 10 major cultivars of blueberry and blueberry were determined, and it is likely that resistance to fruit rots is specific to fungal species. Researchers identified about 20 root rot-resistant cranberry genotypes in an artificially inoculated field trial.

PART 1

929

Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$100,000; fiscal year 1986–1987, \$95,000 per year; fiscal years 1988 and 1989, \$260,000 per year; fiscal year 1990, \$275,000; fiscal years 1991–1993, \$260,000 per year; fiscal year 1994, \$244,000; and fiscal years 1995–1997, \$220,000 each year. A total of \$2,769,000 has been appropriated. State and other non-federal sources are providing funds in the amount of \$93,970 for this grant in fiscal year 1997.

This research is being conducted at the New Jersey Agricultural Experiment Station. The anticipated completion date for the original objectives was 1995. Those objectives have not been met. To complete the breeding, disease and insect management and provision of new management guidelines for extension and crop consultants, it is estimated that an additional three to nine years will be required. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The last agency evaluation of this project occurred in December, 1996. In summary, the evaluation stated that the effort has continued to be highly productive, with various improved management strategies, plant material and environmentally-balanced pesticides being areas of major impact.

CRITICAL ISSUES

These grant funds support research on critical issues impacting agriculture that require immediate attention. These funds are intended to initiate research efforts until other resources can be secured to address the critical issues. This program started in fiscal year 1996 when one half of our Critical Issues funds were allocated to initiate research on potato late blight, which is caused by a fungus, a new strain of which has spread through the nation causing extensive crop losses. The objective is to have a better understanding of the fungus to enable scientists to predict and in manage the outbreaks using an integrated pest management program. The other half of our 1996 Critical Issues funds were allocated to initiate research on vesicular stomatitis, a disease of horses, cattle, and swine which has symptoms very similar to those of food and mouth disease. Livestock producers are concerned about the potential adverse impact of quarantine measures as a result of the spread of this disease. The objective is to develop a better understanding of the disease so more effective control measures can be used. Both potato late blight and vesicular stomatitis have national impact of a critical nature and are therefore both very high priority efforts.

Six research proposals have been funded to address potato late blight, and scientists have initiated their work on aspects of this epidemic. The first North American Late Blight Workshop was convened which involved potato growers and processors, national potato organizations, university scientists, and the chemical industry. The major contribution of this workshop was the resulting set of recommendations for short-and long-term efforts need to solve this problem, and workshop organizers set up a Internet home page which invites dialogue on research and education needs for the management of late blight.

Two research proposals have been funded to address vesicular stomatitis, which was identified as the highest priority problem in 1996 in discussions with commodity groups, regulatory veterinarians and colleagues in ARS and APHIS. Work has been initiated under the two funded projects which are now focusing on transmission of the virus.

\$200,000 was appropriated in both fiscal year 1996 and 1997 for a total appropriation of \$400,000 to date.

Potato late blight work is being carried out at Washington State University, Oregon State University, the University of Idaho, the University of Wisconsin, and Pennsylvania State University. Vesicular stomatitis work is being carried out at Colorado State University and the University of Arizona. The Critical Issues funds are intended to support the initiation of research on issues requiring immediate attention until other, longer-term, resources can be secured. The objectives of the projects supported with these funds are short-term and are therefore expected to be met within 1–2 years.

All projects were reviewed for scientific merit before funding decisions were made. Also, scientists whose work on potato late blight and vesicular stomatitis is supported with Critical Issues funding are in close contact with CSREES' National Program Leaders so that the agency is kept abreast of developments as they occur.

DAIRY AND MEAT GOAT RESEARCH, PRAIRIE VIEW A&M, TEXAS

The program has addressed a range of issues associated with goat production. Research by Scientists at the International Dairy Goat Center, Prairie View A&M University focuses on problems affecting goat production in the United States. Issues

PART 1

930

included are the study of nutritional requirements of goats, disease problems, methods to improve reproductive efficiency in the doe, the use of gene transfer to improve caprine genetics and the evaluation of breeding schemes to improve meat and milk production. Currently, research is in progress to develop an enterprise budget support program for goat production systems in the Texas Gulf Coast Region. The principal researcher believes that nationally, most of the farm enterprises that include goats are diverse and maintain a relatively small number of animals. Responding to disease, nutrition, breeding and management problems will improve efficiency of production and economic returns to the enterprise. In view of significant needs for research in high priority national interest topics, funds are not proposed to continue this Special Research Grant. At the discretion of the State, other funding could be used to support this research.

The original goal of this research was to conduct research that will lead to improvement in goat production among the many small producers in the United States. Research has been conducted to develop and improve nutritional standards, improve genetic lines for meat and milk production and to define mechanisms that impede reproductive efficiency in goats. Current efforts focus on the development of enterprise budget management tools for goat producers in the Texas gulf coast region.

Grants have been awarded through appropriated funds as follows: \$100,000 per year for fiscal years 1983–85; \$95,000 per year for fiscal years 1986–88; no funds were appropriated in fiscal year 1989; \$74,000 for fiscal year 1990; \$75,000 per year for fiscal years 1991–1993; \$70,000 for fiscal year 1994; and \$63,000 per year for fiscal years 1995–1997. A total of \$1,143,000 has been appropriated. The University reports no non-federal funds expended on this program.

Research is being conducted at Prairie View A&M University in Texas, The overall objective of this research is to support the needs of small farms engaged in the production of meat and milk from goats along the Texas Gulf Coast. The university researchers continue to address those needs on an annual basis and anticipate that work currently in progress will be completed by the end of fiscal year 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The Dairy/Meat Goat Research grant was last reviewed in June 1996. The project objectives are within the goals of the program, are within the mission of both USDA and CSREES, and the institution is well equipped and qualified to carry out the research project.

DELTA RURAL REVITALIZATION, MISSISSIPPI

The project has gone through several phases in the delineation of a strategy for a long-range development plan for the Mississippi Delta region. Phase I was completed with the delivery of a baseline assessment of the economic, social, and political factors that enhance or impede the advancement of the region. Phase II of the project evaluated the potential for entrepreneurship and small business creation as mechanisms to improve economic conditions. Phase III is now focusing on technical assistance to Delta region manufacturing firms to strengthen their ability to provide employment and incomes. Continued emphasis on technical assistance and the development of appropriate data bases to guide development opportunities. The principal researcher believes that the databases, technical assistance, and analytical capability will provide more impact in support of entrepreneurial and community development activities in the State. The program is conducted in concert with other University and State agency outreach activities. In view of significant needs for research in high priority national interest topics, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original goal was to develop an analytical baseline for the Delta region. A publication titled, "A Social and Economic Portrait of the Delta," serves as an analytical baseline for further work. A Delta Inventors Society has been created to assist creative individuals in developing ideas which can be successfully commercialized. An Entrepreneurial Forum was established to help new business ventures with start-up advice and assistance. Finally, a venture capital association has been formed to help both inventors and businessmen find capital resources to carry out their plans. The emphasis of the project has now shifted to technical assistance for industrial development.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$175,000; fiscal year 1990, \$173,000; fiscal year 1991–1993, \$175,000 per year; fiscal year 1994, \$164,000; fiscal year 1995–1997, \$148,000 per year. A total of \$1,481,000 has been appropriated. Total non-federal funds directed to this project, as reported

PART 1

931

by Mississippi State University, are: fiscal year 1991, \$117,866; fiscal year 1992, \$84,402; fiscal year 1993, \$68,961. Reports for later years are incomplete at this time.

Research is being conducted at the Mississippi State University. The original completion date was September 30, 1990. The original objectives of the research project have been met. The completion of additional objectives is scheduled for September 30, 1997. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

The agency evaluates merit of research proposals as submitted. No formal evaluation of this project has been conducted.

DROUGHT MITIGATION, NEBRASKA

This grant supports the National Drought Mitigation Center program in the Department of Agricultural Meteorology at the University of Nebraska. The Center is developing a comprehensive program aimed at lessening societal vulnerability to drought by promoting and conducting research on drought mitigation and preparedness technologies, improving coordination of drought-related activities and actions within and between levels of government, and assisting in the development, dissemination, and implementation of appropriate mitigation and preparedness technologies in the public and private sectors. Emphasis is directed toward research and outreach projects and mitigation/management strategies and programs that stress risk minimization measures rather than reactive actions.

The principal researcher believes drought is a normal part of climate for virtually all regions of the United States. The impacts of drought are diverse and affect the economic, environmental, and social sectors of society. Almost without exception, the occurrence of widespread severe drought in the past decade has illustrated the inadequacy of existing assessment, mitigation, response, and planning efforts at the federal, state, and local level. Rather than the "crisis management" approach of the past, a "risk management" approach is needed where the emphasis is on preventive measures, preparedness, education, and mitigation strategies. Until recently, little attention has been focused on drought among the long list of natural hazards that affect our nation. The Center is receiving non-federal funds in support of this research from the University of Nebraska. In view of the significant needs for research on national high priority topics, additional funding for this project is not proposed. At the discretion of the State, Hatch Act or other funding could be used to support this effort.

The original goal of this research was to create a National Drought Mitigation Center and develop a comprehensive program aimed at lessening societal vulnerability to drought. The Center has created an information clearinghouse for drought mitigation technologies and associated informational products. This has been accomplished through the development of a national drought management information system, an electronic portfolio of information available on the Internet. About 16,000 users each month connect to the National Drought Mitigation Center's home page to gather information on drought conditions and management strategies. This home page was used extensively by state and federal agencies during the 1996 drought to assist in the evaluation and response process. This home page networks potential users of drought-related information in the United States and elsewhere with information that would otherwise be unavailable or inaccessible to users.

The National Drought Mitigation Center played an important role in the response of federal and state government to the 1996 severe drought in the Southwest and southern Great Plains states. The Center participated in the Multi-state Drought Task Force workshop organized at the request of President Clinton and help formulate long-term recommendations to improve the way this nation prepares for and responds to drought. The Center was also a member of the Western Governors' Association's Drought Task Force. This task force has also developed recommendations to reduce the risks associated with the occurrence of drought in the western United States. The Center is actively involved with the Western Governors' Association in the implementation of these recommendations.

The work supported by this grant received an appropriation of \$200,000 in fiscal years 1995 through 1997, for a total appropriation of \$600,000. The University of Nebraska contributed \$75,737 of non-federal funds in support of this research in fiscal year 1995 and \$58,977 in fiscal year 1996. The University of Nebraska will contribute \$61,545 in fiscal year 1997.

The research will be conducted at the University of Nebraska-Lincoln. The research conducted under this project is being undertaken under a series of 10 tasks that have been addressed, but these activities are ongoing. The national drought

PART 1

932

management information system has been established but much of this work is continuing in order to expand the information available through the clearinghouse and to keep it current. For example, the drought watch section of the Center's home page is updated monthly to provide users with up-to-date information on water and climate conditions nationwide. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The activities of the Center are continuously evaluated by users that have access to the home page. They provide feedback and suggestions on a continuous basis. The Center also solicits input on its program and products at workshops and other meetings in which it participates. The Center has established a national advisory committee that consists of three representatives: one from state government, one from federal government, and one from a regional organization. These committee members are well known for their expertise in drought management. The purpose of this committee is to provide feedback to the Center on existing products and program direction. This national advisory committee met twice during 1996 to advise the director and staff.

ENVIRONMENTAL RESEARCH, NEW YORK

The environmental research in New York consists of two main thrusts which are aimed at understanding the nitrogen flowing from agricultural activities and their impacts on adjacent ecosystem components, and the agricultural dimensions of global climate change. Included in the program are a technology transfer aspect and an environmental assessment activity. The principal researcher believes there is a need to understand the impacts of ecosystem components upon each other. As global change occurs, impacts will become critical. In view of the significant need for research on national, high priority topic areas, such as integrated pest management, funding for this project is not proposed. At the discretion of the State, Hatch Act or other funding could be used to support this effort.

The main objectives of this program are to identify and address interactions and feedbacks between agricultural ecosystems, natural ecosystems, and natural resources which affect the long-term well being of each. Agroecosystem management strategies that maintain agricultural productivity and environmental quality will be devised. Policies will be established for addressing problems at the interface between agriculture and the environment. Ongoing program activities are intended to meet the mentioned objectives. Some examples of projects are as follows: Several aspects of nitrogen supply interactions with crops and the recovery of fertilizer nitrogen at crop harvest. Water quality research has been focused on the relation of intensive animal production areas and contamination caused by nitrates. Geographic Information System capability is being developed to evaluate various scenarios regarding the future of agriculture in broad landscape changes.

In the sixth year of the program, the principal investigators propose to substantially complete research on the two main themes of their program to date, namely nitrogen flows from agricultural ecosystems to non-agricultural ecosystems and groundwater. A new project on carbon storage in soils will be added to continuing work on climate. Continuation of their involvement with the Remington Farms Sustainable Agriculture Project on the Eastern Shore of Maryland will extend the results of their nitrogen research programs to other farms. They will also continue two projects that focus on intervention strategies to improve management of agricultural systems; one will explore the potential for reducing herbicide use by using weather forecasts to predict weed competition, and the second will explore the use of constructed wetlands to off-set barnyard run-off. The principal investigators will expand their activities in watershed management by increasing support to the program that was begun last year.

The work supported by this grant began in fiscal year 1991 with an appropriation of \$297,000. The fiscal years 1992-1993 appropriation was \$575,000 per year; \$540,000 in fiscal year 1994; and fiscal years 1995 through 1997, \$486,000 each year. A total of \$3,445,000 has been appropriated.

In fiscal year 1991, Cornell University provided \$27,893 and the State of New York provided \$118,014. In fiscal year 1992, Cornell University provided \$37,476 and the State of New York \$188,915. In fiscal year 1993, Cornell University provided \$13,650 and the State of New York \$243,251. In fiscal year 1994, the State of New York provided \$214,989. In fiscal year 1995, the State of New York provided \$233,085. In fiscal year 1996, the State of New York provided \$388,301.

This research is being conducted at Cornell University. The original estimate was for a five-year program and many of the initial objectives in the nitrogen and climate change areas have been met. New objectives evolved from the original work

PART 1

933

and the program was also oriented to consider broader dimensions of environmental management, particularly strategies for community-based watershed management, involving linkage of technical knowledge with social and local governmental perspectives and needs. Estimated completion dates for current program elements are:

1997–1998 program year:

- Impacts of Nhx deposition on forests
- Landscape evaluation of denitrification
- Nitrogen utilization in agricultural ecosystems
- Contributions of agricultural ecosystems to climate forcing

1998–1999 program year:

- Nutrient processing in wetlands
- Use of weather forecasts in weed management
- Use of constructed wetlands to remediate barnyard run-off
- Effect of climate variability on crop production
- Carbon storage in soils

Completion beyond 1999:

- Watershed science and management
- Effects of elevated CO₂ on crop yield potential
- Remington farms sustainable ag. project (a 10-year project)

Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The agency evaluates this project through the review of an annual proposal submission.

ENVIRONMENTAL RISK FACTORS/CANCER, NEW YORK

The Cooperative State Research, Education, and Extension Service has requested the university to submit a grant proposal that is currently being reviewed. The American Cancer Society has estimated that over 184,000 women in the United States will be diagnosed with breast cancer in 1996. The role of environmental risk factors, such as pesticides, is of concern to women, the agricultural community, and policymakers. While some data exist in the scientific literature, little has been done to synthesize and evaluate these studies and make this research information available to the people who need it—the general public. This project, emphasizing risk reduction prevention information, will work at filling that void. However, in view of the significant needs for research on national high priority topics, such as integrated pest management, funding for this project is not proposed. At the discretion of the State, Hatch Act or other funding could be used to support this effort.

The original goals of this research are:

1. To establish a database of critical evaluations on the current scientific evidence of breast carcinogenicity and effects on breast cancer risk for selected pesticides.

2. To effectively communicate database information to the scientific community, federal agencies, public health professionals, the agricultural community, and the general public using innovative electronic methods of communication, in-service training sessions, and printed materials.

3. To further develop the Breast Cancer Environmental Risk Factors World Wide Web to improve ease of use, add informational materials and hyperlinks, and determine the feasibility of developing an online, searchable bibliography on pesticides and breast cancer risk accessible through this Web site.

The work supported by this grant is scheduled to begin in fiscal year 1997. The appropriation requested for fiscal year 1997 is \$100,000. The non-federal funds and sources provided for this grant were as follows: \$150,000 state appropriations for fiscal year 1996; \$250,000 in state funds (New York) has been requested for fiscal year 1997.

This research will be conducted at the Cornell University, Ithaca, New York. This is a new project—not yet funded—scheduled to begin in April 1997. The anticipated completion date is March 31, 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

As a new project, an evaluation has not been conducted, although the proposal is currently under review. Periodic progress reports are made throughout the year. A final evaluation will be made after March 31, 1998.

EXPANDED WHEAT PASTURE, OKLAHOMA

This project was designed to develop improved supplementation programs and new systems for technology delivery to reduce production risk of raising cattle on wheat pasture. The work involves evaluation of grazing termination date on grain

PART 1

934

and beef production, assess the impact of wheat cultural practices and develop an economic model to evaluate alternative decisions on grain/beef production. Additional effort is directed toward development of cool season perennial forage grasses to complement wheat pasture. The proposal for fiscal year 1996 has been received and is being processed. The principal researcher believes that this work addresses the needs of wheat/cattle producers of Oklahoma as a primary focus. However, it would appear to have some application regionally in adjacent states. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research. The principal researcher suggests the research will indicate mutual benefit to wheat grower and livestock producer.

The original goal of this research was to develop economically viable management systems for use of wheat for supplemental pasture for beef cattle before the crop starts making grain. This work has already shown how the use of feed supplements can increase net profit from cattle grazing on wheat pasture. The study has identified management practices, e.g. date of planting, cultivar selection, grazing intensity and date of cattle removal that produce the optimum grain yield and cattle gain. A Wheat/Stocker Management Model has been developed as a decision aid to help producers assess income risk in the operation. Work is underway on a Wheat Grazing Systems simulation model.

The work supported by this grant began in fiscal year 1989 and appropriations were as follows: fiscal year 1989, \$400,000; fiscal year 1990, \$148,000; fiscal year 1991, \$275,000; fiscal years 1992-1993, \$337,000 per year; fiscal year 1994, \$317,000, and fiscal years 1995-1997, \$285,000 each year. A total of \$2,669,000 has been appropriated.

The nonfederal funds and sources provided for this grant were as follows: \$175,796 state appropriations in 1991; \$174,074 state appropriations in 1992; and \$236,584 state appropriations in 1993. The non-federal support for 1994 was \$238,058 for state appropriations. Funds for fiscal year 1995 were \$275,426, and for 1996 were \$120,000.

The research is being done at Oklahoma State University. This project started in 1989 with a projection of 10 years to complete the research objectives. Some objectives are nearing completion while others will probably require further study. A number of wheat cultivars have been identified which will tolerate grazing and still produce economic grain yields. The grazing cut off date for grain production has been established. However year to year variation need additional study in order to develop a reliable decision support system. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

This program has not been subjected to a comprehensive review. However, each year's funding cycle is reviewed internally and by CSREES scientist for scientific merit and relevance.

EXPERT IPM DECISION SUPPORT SYSTEM

A prototype information and decision support system was developed in collaboration with Purdue University and the Department of Energy's Argonne National Laboratory that integrates and manages information from multiple data sources. Information on the status of, EPA review of pesticides, losses caused by pests, status of alternative tactics, status of minor use registrations, current research in progress, and priorities of IPM implementation teams are integrated in the Pest Management Information Decision Support System (PMI/DSS). Information on the genetic resistance of pests has been planned with Michigan State University but the resources to implement the plan have not been available to date. With the information in the current data base, commodity/pest problems are prioritized using a science-based logic developed by Argonne National Laboratory personnel based on key policy concerns. The need for decision support and information is greater than in the past with the passage of the Food Quality Protection Act [FQPA] of 1996. The act requires the Environmental Protection Agency (EPA) to place greater reliance on science, dietary exposure to pesticides, reasonable risks, and emphasis on children's diets and exposure. The Act also recognizes IPM as helping to provide workable solutions to pest problems. The decision support system is incorporating increased information to address these needs. The data fields and sources of the data bases that will contribute to additional information are: Risk Assessments (EPA), Registered Alternatives by Commodities for Pesticides Under EPA Review (EPA Registration Tapes), Critical Pest Problems with Removal of Suspect Pesticides (State IPM

PART 1

935

Teams and NAPIAP State Liaison Coordinators; Commodity Groups), State Crop Production (U.S. Census), Pesticide Tolerances on Commodities (EPA Data Bases), Market Basket Residues on Commodities (AMS and EPA Analyses), Dietary Habits of Adults and Children (1977 data base, and data bases to be developed), Method of Use and Reduction of Risk (State IPM Teams and NAPIAP State Liaison Coordinators; Commodity Groups), IPM Dependence (State IPM Team Data Bases).

The PMI/DSS serves national, regional, and local needs for research and extension activities. At the national level, the system supports the USDA/USEPA Memorandum of Understanding (MOU) to find alternatives to pesticides under regulatory review or being lost due to genetic resistance. The data base has identified priorities for the Pest Management Alternatives request for proposals for the past two years and interacts with the project system of the IR-4 Minor Use Registration Program. It also is interacting with the identification of priorities for research and extension activities in the regional IPM Special Grant and Special Projects. It provides a mechanism for growers and grower organizations to interact with the priority process and the ultimate result is to help insure that farmers have alternatives for managing pests at the specific local level.

The goal of the PMI/DSS is to refine the process to identify IPM needs of USDA, EPA, and states by addressing critical needs, reinforce state and federal partnerships to disseminate important pest management information for improved decision making, profitability, and environmental quality, and to address future applications and needs. In 1996 and 1997, the program addressed priority commodity pest management needs due to voluntary pesticide cancellations and regulatory cancellations responding to the MOU and supplemental MOU between EPA and USDA. The supplemental MOU was signed in April, 1996, at which time there were 58 pesticides and 374 uses identified and prioritized. The process included information on cancellations furnished by EPA, selected uses were sent to the states NAPIAP and IPM network and impacts of cancellations effecting individual state agriculture reported back for compilation in the decision support system. The results were used in the 1996 and 1997 request for proposals for the Pest Management Alternatives Program. Twenty-five minor commodities on which 40 specific pest were identified in the 1997 request for proposals. This was the first time that we have identified specific commodity/pest combinations for which proposals were limited. Results were also used by the regional IPM request for proposals. As previously stated, the program is currently addressing issues associated with the FQPA which increases the information requirements significantly.

In fiscal year 1994, we expended \$40,000 of CSREES administrative funds and \$90,000 from Science and Education Evaluation Funds to initiate collaborative work with the Argonne National Laboratory. In fiscal year 1995, we expended \$172,000 as a Cooperative Agreement with Purdue University and Argonne National Laboratory from the Pest Management Alternative Special Grant Funds and \$5,000 from NAPIAP funds. In fiscal year 1996, we expended \$177,000 in a cooperative agreement with Purdue University and Argonne National Laboratory from Pest Management Alternative Special Grant Funds, \$21,000 from Research, Extension, and Education Evaluation Funds, and \$40,000 from NAPIAP funds (for development of NAPIAP data fields). In fiscal year 1997, we are expending \$165,425 to Purdue University and Argonne National Laboratory. The total resources to date are \$710,425.

It is difficult for us to estimate the amount of non-federal funds supporting the Pest Management Information, Decision Support System. Purdue University and Cornell University have contributed non federal resources to the oversight of the information, decision support system as well as a number of states that have provided information that is part of the information base. Many program areas are contributing data bases that are run on the Pest Management Information, Decision Support System.

The bulk of the work is carried out in Washington, D.C. CSREES has National Program Leaders in IPM, NAPIAP, and IR-4 program areas working on the Pest Management Information, Decision Support System. The Argonne National Laboratory has a Washington, D.C. office where information, decision support personnel are housed and there are daily interactions between CSREES and other USDA staff personnel on a daily basis. Interactions and information is provided by every state in our system. We are in the process of institutionalizing this program by hiring and assigning dedicated staff to this area.

Our original estimate was two-to-three years with adequate resources to complete the developmental work. However, the design considerations become more complex as program needs dictate expansion of the information base such as the developments under FQPA. In addition, the technology is moving so swiftly that we must continue to do updating. We feel we are reasonably meeting our objectives with re-

PART 1

936

sources that are available. As indicated, we are institutionalizing this activity and it will become an ongoing activity of the agency of increasing importance.

We have a guidance committee that gives us input on an ongoing basis. We conduct an annual evaluation of this progress in this program. A specific technical evaluation was made of the Toulmin-based logic which is policy-question driven that under lines the design and decision support process in fiscal year 1996. It was concluded that this science-based logic has significant relevance to decision making in agricultural pest management systems. We are currently developing plans for an intensive outside review of the system and proposed directions involving personnel in participating program areas, research and extension partners, and grower organizations. The review includes World Wide Web activities and evaluation input from a wide community of users and potential users.

FARM AND RURAL BUSINESS FINANCE, ILLINOIS AND ARKANSAS

The long-range plan of work for this program focuses on three principal areas. One is the financial management and performance of rural businesses which includes on-going research into financial management and decisionmaking by farm and agribusiness firms complemented by evaluation of the performance of existing firms and training programs for farm and rural business owners. The second area includes research on financial markets and credit institutions serving rural America with emphasis on pricing and credit evaluation of loans, evaluation of credit relationships, identification of key factors affecting the supply and demand for financial capital, and evaluation of financial innovations for farm and rural business finance. The third area addresses the impact of public policies and programs on the financial health of rural America, measures the effect of regulatory changes on the performance of financial institutions, evaluates organizational alternatives for rural credit markets and analyzes the effects of geographical liberalization of commercial banking on structure and performance. The principal researcher believes traditional characteristics of agriculture such as capital intensive businesses, variable prices and production and seasonality present unique risks with important implications for the cost and availability of financial capital for farm and rural businesses. In the present uncertain policy and budget environment, identification of new sources of financial capital and innovative programs are essential to enhance the financial capacity for undertaking rural development programs and responding to growth opportunities in rural businesses. In view of significant needs for research in high priority national interest topics, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The goal is to assist farmers and rural businesses with research-based information on financial management as they deal with changing and increasingly complex financial markets. The program has completed projects on the financial structure and efficiency of grain farms, risk and financial implications of vertical coordination in hog production, commercial bank access to agency market funds through government sponsored enterprises, and competitive challenges for bankers in financing agriculture. Additional projects in various stages of completion include investigate the financial implications of property tax reform at the State level and investment options for farmers and businesses during high income periods. Other projects weigh regulatory costs in rural lending, conduct statistical analysis of Chapter 12 bankruptcy filing data, and identify determinants of the type and terms of leases used in agriculture.

The work has been underway since 1992. Appropriations were \$125,000 in fiscal year 1992, \$125,000 in fiscal year 1993, \$118,000 in fiscal year 1994, and \$106,000 in fiscal year 1995 through fiscal year 1997. Appropriations through fiscal year 1997 total \$686,000.

The non-federal sources and funds provided for this program in fiscal year 1992 totaled \$259,427 with \$58,427 in State appropriations, \$189,000 from industry and \$12,000 from miscellaneous sources. In fiscal year 1993, the total was \$287,890 with \$94,588 in State appropriations, \$133,000 from industry and \$25,000 from miscellaneous sources. In fiscal year 1994, the total was \$391,000 with \$221,000 coming from State appropriations, \$45,000 from industry and \$125,000 from miscellaneous sources. In fiscal year 1995 the total was \$185,000 where \$46,000 came from State appropriations, \$62,500 from industry and \$76,500 from miscellaneous sources. In fiscal year 1996, the total was \$344,000 where \$294,000 was appropriated from State sources and \$50,000 from private sources. In fiscal year 1997, \$177,000 is being appropriated from State sources.

The work is being carried out at the University of Illinois and University of Arkansas. The original objectives of the program were amended with additional fund-

PART 1

937

ing and new termination dates which now extend to fiscal year 1998. While many of the objectives have been met, the principal researcher believes that new dimensions of the originally proposed objectives need to be addressed as a result of changing conditions and new financial environments. Anticipated completion date of these related objectives will extend into fiscal year 1998. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant. Research could be continued at the State's discretion using formula funds.

The project is evaluated with the submission of the annual proposal and as progress reports are received. The program has supported projects which cover topics involving farm and rural business finance. During this past year, the projects have been responsive to the changing policy and financial risk environment including the examination of financial impacts of vertical coordination in the livestock industry and impacts of structural change within the rural finance sector. Evaluation of the program considers methodologies used to conduct specific projects, the impact the projects have on current issues, and products resulting from the projects.

FLORICULTURE, HAWAII

The research carried out with these funds involves wholesale and retail US and Japan market research, development of new varieties for aesthetic values and pest resistance, and pest and disease management strategies to meet quarantine needs and consumer expectations. The researcher believes the tropical cut flower and foliage industry in Hawaii, which includes antilurium, orchids, flowering gingers, bird of paradise, heliconia, protea, and cut foliage—ti leaves and other greens—is worth over \$50 million primarily in out-of-state sales. Development of disease resistant cultivars and quarantine pest and disease management strategies which reduced pesticide usage are included in the national high priority improved pest management systems. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original goal of the research was to develop superior Hawaii anthuriums, orchids, protea, and exotic tropical flower varieties with disease resistance, particularly to anthurium blight which devastated the Hawaii anthurium industry through the mid-1980's and reduced Hawaii's market share. Additionally, research focused on development of post-harvest handling practices and quarantine pest control. To date, a new anthurium cultivar has been patented and released. Additional blight resistant cultivars are being propagated and tested by the anthurium industry. Disease resistant protea germplasm has been obtained from South Africa and is being used in the protea breeding program. A post-harvest hot water dip treatment has been developed and is being used commercially on tolerant cutflower species to meet quarantine requirements.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$300,000; fiscal years 1990–1993, \$296,000 per year; fiscal year 1994, \$278,000; and fiscal years 1995–1997, \$250,000 each year. A total of \$2,512,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: State appropriations of \$87,937 in 1995 and \$87,937 in 1996.

Research is being conducted by the University of Hawaii at Manoa and Hilo. The objectives in the original project were to maintain Hawaii floricultural industry competitive. This objective continues to be the principal direction for the projects. Because the industry and the markets are changing, pests are becoming either resistant or newer strains, and quarantines are changing with technology the objective remains valid. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the state's discretion using other funds.

The individual projects funded under this Special Research Grant are evaluated through merit review to ensure that good science is being used. This evaluation is the major tool used to award funds to the projects.

FOOD AND AGRICULTURE POLICY INSTITUTE, IOWA AND MISSOURI

The Food and Agriculture Policy Research Institute (FAPRI) was established by Iowa State University and the University of Missouri, Columbia, in 1984. The purpose of the institute is to conduct comprehensive analyses and disseminate results about the economic impacts of U.S. food, farm, and trade policies to agricultural producers, agribusinessmen, and public policymakers. Iowa State conducts research on the economic interrelationships within and between domestic and foreign food and agricultural markets from the farm gate to market destinations; develops and main-

PART 1

938

tains databases and analytical support systems to facilitate the analysis of agricultural and trade policy issues; and evaluates the impacts of U.S. and foreign commodity supply, demand, and public policy programs on agricultural trade. The University of Missouri maintains models of the domestic agricultural economy and directs its efforts primarily to the analysis of domestic policy issues. The two universities maintain linkages with a number of other universities who provide data and analytical support to the system. The universities maintain a comprehensive analytical modeling system of the U.S. and international food and agricultural sectors to evaluate near-and long-term economic implications of alternative farm policies for the basic commodities. The system is capable of providing economic information on potential impacts out to 10 years in the future of farm policies on farm prices, income, output, government program costs and means to enhance the management of farm programs at the national level.

The Nation's agricultural sector and its components are subject to numerous Federal policies and programs. FAPRI is the only publicly supported, non-federal organization with the analytical capability to assess and evaluate the numerous public policies and programs affecting the agricultural sector and report results to a broad constituency including farmers, agribusinessmen, and Federal and State policymakers. However, in view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other formula funding could be used to support this research.

The original goal was to develop the analytical capability to assess farm policies on the U.S. agricultural sector and disseminate this information to farmers, agribusinessmen, and public policymakers. The mission has been expanded to include assessment of trade and environmental policy impacts and their interaction with the agricultural sector at national, regional, and farm levels. The models in place are also used to assess fiscal and monetary policy implications and impacts of new technologies such as biotechnological innovations on the agricultural sector. Both institutions maintain large econometric models and data sets which are regularly updated to analyze farm and trade policy alternatives and the impacts of various programs on the several sub sectors of the agricultural economy. During the past year, the FAPRI completed over 45 studies addressing policy issues such as assessments of the 1996 Farm Bill and alternative ways of implementing its provisions. Numerous studies were completed addressing improvements made to the empirical modeling system to improve domestic and international policy capabilities. The FAPRI professionals made numerous public appearances throughout the U.S. to agricultural groups and Congressional committees and Executive branch groups addressing policy issues. New thrusts include development of two new baselines to complement the existing agricultural baseline used for agricultural policy analysis. These are the resource and environmental baseline and the food-nutrition-health baseline. Completion and incorporation of these baselines into the existing model framework will provide an integrated procedure to assess environmental and health policies on the agricultural and food sectors and implications of agricultural policies on the environment and public health.

Grants have been awarded from funds appropriated as follows: fiscal years 1984–1985, \$450,000 per year; fiscal years 1986–1987, \$357,000 per year; fiscal year 1988, \$425,000; fiscal year 1989, \$463,000; fiscal year 1990, \$714,000; fiscal years 1991–1993, \$750,000 per year; fiscal year 1994, \$705,000; fiscal years 1995–1996, \$850,000 each year, and fiscal year 1997, \$80,000. The total amount appropriated is \$8,671,000.

The non-federal funds and sources provided for this grant are as follows: \$260,355 State appropriations, \$113,565 industry, and \$37,913 miscellaneous for a total of \$411,833 in fiscal year, 1991; \$321,074 State appropriations, \$51,500 industry, and \$35,100 miscellaneous for a total of \$407,674 in fiscal year 1992; \$234,796 State appropriations and \$70,378 industry for a total of \$305,174 in fiscal year 1993; \$78,286 State appropriations, \$43,925 industry, and \$29,750 miscellaneous in fiscal year 1994 for a total of \$151,961; \$80,155 State appropriations, \$37,128 industry, and \$42,236 miscellaneous for a total of \$159,519 for fiscal year 1995; \$124,123 in State appropriations with no other funding for fiscal year 1996; and \$79,000 in State appropriations, \$50,000 industry and \$25,000 miscellaneous for a total of \$154,000 in fiscal year 1997.

The program is carried out at the Center for Agriculture and Rural Development, Iowa State University and the Center for National Food and Agricultural Policy, University of Missouri. This is a continuing program of research and analysis for the purpose of assessing farm and related policy actions and proposed actions likely to affect the agricultural sector and its components. However, in keeping with the

PART 1

939

Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant.

We have conducted no formal evaluation of this program. However, the project proposal is carefully reviewed for adherence to stated objectives and annual progress.

FOOD IRRADIATION, IOWA

Since the Linear Accelerator Facility was placed in operation in March 1993, studies on the effect of irradiation on shelf-life extension, safety and quality of ground beef, beef steaks, ham, pork chops from loins, chicken breasts, and turkey have been conducted. Studies combining irradiation with high hydrostatic pressure and cooking, using whole chicken breasts, turkey and ham, have been conducted to determine the combination of these treatments that will yield a shelf-stable product while maintaining high eating quality. Several studies were conducted to determine whether consumers can detect a difference between irradiated and nonirradiated ground beef patties. Experiments were also conducted to investigate consumer acceptance of pork products irradiated to prevent trichinosis. Test markets of irradiated chicken breasts were conducted to determine consumers' willingness to pay for irradiated products. The principal researcher believes consumers' attention and concern about the safety of fresh meat and poultry has increased with recent outbreaks of foodborne illness from *E. coli* 0157:H7. The meat industry has also expressed interest regarding the quality of irradiated products, and how this process can be used to yield high quality fresh meats that are free of pathogens. With the recent outbreak of illness of thousands of Japanese due to *E. coli* 0157:H7 and the subsequent drastic reduction of U.S. beef exports to Japan, irradiation of beef could have significant economic impact on the nation's export of this high value product. Additionally, researchers from eight other research institutes have used the irradiation facility for research projects. In view of significant needs for research in high priority national interest topics such as improved pest management systems and food safety, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch or other funding could be used to support this research.

The original goal of the research was to generate knowledge necessary to develop a research and technology transfer program leading to commercial use of irradiation of foods, whereby consumers would be provided with food products with enhanced safety. The effectiveness of irradiation, using an electron beam accelerator, in destroying known pathogenic bacteria in pork and beef has been determined. Mathematical models have been developed to predict the growth of bacteria in low-dose irradiated ground pork. Demonstration of irradiation technology has been presented to some commercial firms, and plans are being developed for some large scale test markets.

The work supported by this grant began in fiscal year 1991 when \$100,000 was appropriated for this project. The appropriations for fiscal years 1992 and 1993 were \$237,000 per year; fiscal year 1994, \$223,000; and fiscal years 1995-1997, \$201,000 each year. A total of \$1,400,000 has been appropriated.

The project received \$1,037,270 in State of Iowa funds—\$1 million of which was for capital construction—in fiscal year 1991; \$37,942 in state funds and \$67,800 in industry grants in fiscal year 1992; \$68,897 in state funds, \$78,300 in industry grants and \$9,666 in user fees in fiscal year 1993; \$70,652 in state funds, \$35,420 in industry grants and \$47,788 in user fees in fiscal year 1994; and \$72,772 in state funds, \$100,000 in industry grants and \$55,211 in user fees in fiscal year 1995; and \$81,540 in state funds, \$115,300 in industry grants.

Research is being conducted at Iowa State University. The principal investigator anticipates that the project will continue through June 1998. Since irradiation continues to be viewed skeptically by many non-scientists as a tool for improving shelf-life and preserving food, and because optimal dose and use parameters are still being defined, additional research will be needed to move this technology to broader consumer acceptance and industry use to enhance safety of food products. Until irradiation of red meat is approved by the Food and Drug Administration, research on the factors affecting the quality of irradiated red meat will be primarily conducted using the Iowa State University facility. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on December 20, 1996. Previous studies funded under this project have provided useful information toward understanding how irradiation can be useful in

PART 1

940

eliminating or reducing foodborne pathogens in meat products. It is anticipated that the proposed research will continue to further the understanding of how irradiation can be used to improve shelf-life and enhance safety of meats and meat products.

FOOD MARKETING POLICY CENTER, CONNECTICUT

The Food Marketing Policy Center was established in 1988 at the University of Connecticut at Storrs. The Center conducts interdisciplinary research on food and agricultural marketing and related public policy issues that influence economic performance of the food marketing system. The Center studies how public policies and private sector organization and strategies affect food industry competitiveness and the delivery of food and services, their costs, prices, and safety. The Center works closely with the University of Massachusetts to carry out the research program. The research proposal identifies an ongoing national need to continually improve the economic efficiency and operation of the U.S. food marketing system to benefit farmers, merchants, and consumers. In view of significant needs for research in high priority national interest topics such as improved pest management systems and food safety, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The ongoing research goal is to identify marketing problems and assess alternatives that improve economic performance of the U.S. agricultural and food marketing sector. The Center conducts research in conjunction with the Hatch regional research project NE-165, "Private Strategies, Public Policies and Food System Performance." The Center performs studies on food marketing, including a description of food quality issues and enhancement policies; private label food brands; advertising strategies of agricultural cooperatives; assessment of food retailing mergers and competition; and evaluation of state dairy regulations, branded product marketing strategies, supermarket chain entry, oligopsony in agricultural markets, and the impact of agricultural cooperatives on food processor market performance. The Center develops analytical methods to assess market performance. It has sponsored workshops on industrial organization issues. Food safety economic issues are addressed in two books and at workshops that summarize research done at the center and the regional research project.

This grant will be used to support research on 12 projects with research targeted at three problem areas. They are factors shaping decisions by food firms and the consequent effects; impact assessment of public intervention on firm food safety and quality strategies; and analysis of public policies affecting competition in food markets. Projects include analyses of the effects of trade agreements on food quality and trade in food products; an assessment of the efficiency aspects of ex ante versus ex post approaches to food safety problems; firm strategic responses to food safety and nutrition regulation and effects on competition, market structure and food price levels; demographic patterns of food borne illness for high risk populations; market structure on food advertising activity; competitive strategies of cooperatives; basic research on oligopoly theory; and publication of new data sets on the food industry.

Grants have been awarded from funds appropriated as follows: fiscal year 1988, \$150,000; fiscal year 1989, \$285,000; fiscal year 1990, \$373,000; fiscal years 1991-1993, \$393,000 per year; fiscal year 1994, \$369,000; and fiscal year 1995 through 1997, \$332,000 each year. A total of \$3,352.00 has been appropriated. The non-federal funds and sources provided for this grant are State appropriations as follows: \$234,259 in fiscal year 1991; \$231,741 in fiscal year 1992; \$201,288 in fiscal year 1993; \$234,557 in fiscal year 1994; \$219,380 in fiscal year 1995; and \$134,399 in fiscal year 1996.

The research is being carried out by the Connecticut Agricultural Experiment Station at Storrs and at the University of Massachusetts. The original proposal in 1987 was for 24 months. The objective of conducting policy-oriented research on food manufacturing and distribution industries to assist state and Federal policy decision makers in improving the performance of the food system is still an ongoing public concern, given increasing levels of concentration in food processing according to the principal researcher. The current phase, as funded in fiscal year 1997, will be completed in 2001. However, in keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant. Research could be continued at the state's discretion using formula funds.

CSREES annually reviews project reports, succeeding annual project proposals, research studies and educational programs.

PART 1

941

FOOD PROCESSING CENTER, NEBRASKA

The University of Nebraska Food Processing Center has been conducting short-term, highly applied research projects to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Projects were selected based on the estimated economic impact of the technical assistance or the criticality of the technical assistance to the future of the firm or venture. Priorities were placed on projects relating to the safety of the food product or process and to the fulfillment of regulatory mandates such as nutrition labeling, use of approved and effective ingredients, and adherence to regulations imposed by foreign governments. In addition, several research projects were conducted to improve or assess the quality, extend the shelf-life, or assess or improve the processing efficiency of specialty food products which impacted several processors or used alternative agricultural products. The principal researcher believes the primary impact of this project will be statewide. Small and mid-sized food processing companies and entrepreneurs have limited technological capabilities for addressing issues related to product development, process development, product and process evaluation, food safety, quality assurance, and regulatory mandates. The short-term research and technology transfer projects conducted as part of this overall project will aid these companies in appropriately addressing these oftentimes complicated issues. In view of significant needs for research in high priority national interest topics such as improved pest management systems and food safety, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The goal of the research, as stated previously, is to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Technological evaluations were conducted for 210 individuals or companies interested in developing new food processing businesses. These evaluations included formulations, processes, processing equipment, packaging, shelf-life, sensory, nutritional attributes, microbiological quality, regulatory considerations, and other factors. Additionally, microbiological analyses, shelf-life assessments, sanitation audits, and nutritional analyses were conducted for numerous Nebraska food companies.

The work supported by this grant began in fiscal year 1992. The appropriations were \$50,000 per year for fiscal years 1992–1993 ; \$47,000 for fiscal year 1994; and \$42,000 for fiscal years 1995–1997 each year. A total of \$273,000 has been appropriated. The Food Processing Center received \$288,421 in State funds and \$1,303,685 in food industry grants and miscellaneous sources from 1992 through 1996.

Research is being conducted at the University of Nebraska. Because this project supports ongoing technical assistance to clients, the objectives are ongoing. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on December 20, 1996. Progress under previous grants for this project appears to be satisfactory.

FOOD SYSTEMS RESEARCH GROUP, WISCONSIN

The Group conducts research on contemporary issues affecting the organization and competitiveness of the U.S. food system in domestic and international markets. The issues include new technologies, market structure, and government policies and programs. Studies have been completed on pricing of cheddar cheese, fed cattle and hogs; changes in private label product markets; causes of structural change in the flour milling, soybean oil milling, wet corn milling, cottonseed milling, beef packing, and broiler processing industries; competition in U.S. food markets; and the relationship between U.S. food market structure and the industry's performance in global markets. The principal researcher believes that the U.S. food system is changing rapidly in response to a large number of global economic-social-technical changes. Research is needed to determine the effects of these change on the system's organization and performance, and to ascertain needed adjustments in public policies based upon sound research. In view of significant needs for research in high priority national interest topics such as improved pest management systems and food safety, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

PART 1

942

The original goal was to conduct research to assess and evaluate the organization and performance of the U.S. food industry and provide recommendations for improvements. The Food Systems Research Group recently completed a study of the National Cheese Exchange which resulted in a major public report, Congressional hearings, and a Wisconsin task force. Alternative pricing mechanisms are being developed to avoid the problems of a very thin market which is used to price a large volume of off-market sales. The group is also examining the impact of "tough competition" policies on industry performance. Deregulation in the United States and privatization in the U.K., Mexico, and Eastern Europe provide empirical bases for evaluating the impact. The Group has completed numerous studies on economic structure and performance issues of the U.S. food manufacturing and distribution system. Basic research is conducted on market theories; effects of mergers, new technologies, and firm conduct on industry structure and organization; factors affecting industry prices, profits, efficiency and progressiveness; and impact of public policies and regulations on food system organization and performance.

Grants have been awarded from funds appropriated as follows: fiscal years 1976–1981, \$150,000 per year; fiscal years 1982–1985, \$156,000 per year; fiscal years 1986–1989, \$148,000 per year; fiscal year 1990, \$219,000; fiscal years 1991–1993, \$261,000 per year; fiscal year 1994, \$245,000; and fiscal years 1995–1997, \$221,000 per year. A total of \$4,026,000 has been appropriated.

The non-federal funds and sources provided for this grant are as follows: State appropriations of \$120,304 in fiscal year 1991; \$119,448 in fiscal year 1992; \$85,188 in fiscal year 1993; \$96,838 in fiscal year 1994; \$100,869 in fiscal year 1995; \$101,272 in fiscal year 1996; and \$112,842 in fiscal year 1997.

The grant supports research at the University of Wisconsin, Madison. The original proposal in 1976 was for a period of 36 months. The current phase of the program will be completed in 1999. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant.

CSREES performed a merit review of the project in January 1997 as it evaluated the project proposal for 1997 and concluded that, under this project, researchers conduct unique studies on the structure, conduct and performance of selected segments of the food industry. In spite of the growing concentration in food production-processing and increasing public policy questions concerning the performance of this industry, few organizations are providing the research needed for public and private decision-making. Research results appear in several professional journals and popular press and researchers have ongoing dialog with private and public decision-makers.

FORESTRY RESEARCH, ARKANSAS

The Arkansas Forest Resources Center has offered programs of teaching and research to the landowners of Arkansas and the surrounding region. This has been done through offering continuing education workshops for landowners. The educational thrust has combined Center and private dollars to establish computer software capability capable of use in the education of landowners and students. The Center includes one of only three Arc View learning centers for natural resources. The Center has acquired quality staff, well versed in the use of advanced technologies. Projects address issues of species diversity, richness, redundancy, and the resilience of disturbed and undisturbed hardwood stands. Furthermore, evidence exists that neotropical migratory birds are indicators of ecosystem health. Factors implicated as influencing their breeding range include habitat destruction/alteration, forest fragmentation, etc. Thus, issues of reestablishment and the structure of regenerated hardwood stands are important for timber, non-timber values, and the quality of life enjoyed regionally, nationally, and internationally. These issues will grow in importance as Southern forests assume greater proportions of the national demand for hardwood fiber and wood. The principal researcher believes that with the reduced levels of production of wood products from the Northwest, Southern forests are increasingly bearing the brunt of providing the majority of wood products for the United States. This increased production makes more imperative the appropriate and efficient balance in the use of Southern forests in producing timber and non-timber outputs. This would prevent these conflicts, or at least reduce them significantly. However, with the limited resources available and the possibility that at the discretion of the state, Hatch Act or other funding could be used to support this research, funds are not proposed to continue this Special Research Grant.

Developing alternative forest management strategies for achieving multi-resource objectives; i.e., joint production of timber, wildlife, recreation, and other outputs of the forest on private, industrial, and non-industrial forest lands and public forest

PART 1

943

lands, is the thrust of goal one of the project. In the last year, significant progress has been made in several areas. Some examples include: developing intensive fiber farming systems as alternatives to soybeans for Mississippi farmers, taking the first step toward biological control of the Southern pine beetle by discovering the nutrient needs of predators of the beetle so they can be grown and studied in artificial cultures, and conducting the first survey of nonindustrial landowners in Arkansas for 15 years. The survey shows some areas for concern, such as the fact that the average age of forest landowners is over 60. There will be a massive change in ownership in the next 10–20 years. Landowners continue to not be aware of assistance programs and a concern about government programs and intervention on private land. This is information needed to prepare our institutions for transitions and to design more effective programs. Ongoing projects include a broad array of topics, competitively awarded within the Center, concerned with best management practices, ecological characteristics, effects of different management intensities, streamside buffer zone effectiveness, as well as the efforts mentioned previously.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$470,000 and for fiscal year 1995 through 1997, \$523,000 each year. A total of \$2,039,000 has been appropriated. During fiscal year 1994, more than \$380,000 was funded by forest and related industries and private foundations. For fiscal years 1995 and 1996, these figures were \$815,000 and \$910,000, respectively.

This research is being conducted at the School of Forest Resources, the University of Arkansas at Monticello. The primary project objectives are to be completed by the end of the fifth year of funding, and the specific objectives of each project will be met. Some projects have long-term objectives, typical of forestry research. These projects and objectives will be continued using the infrastructure and capacity developed with these Special Research Grants. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

In 1991, a Cooperative State Research, Education, and Extension Service team visited Monticello and reviewed faculty qualifications, supporting sources, and the feasibility of the proposal. The team exit report indicated the faculty was highly capable, the infrastructure needed strengthening, and the proposal concepts were feasible. Since 1991, there has not been a formal program review.

FRUIT AND VEGETABLE MARKET ANALYSIS, ARIZONA AND MISSOURI

The purpose is to provide timely knowledge of the impacts of trade, environmental, monetary, and other public policies and programs upon the Nation's fruit and vegetable industry to farmers, agribusinessmen, and policymakers through a program of empirical assessment and evaluation. The U.S. fruit and vegetable sector is experiencing increased growth from greater domestic and export demand. However, the growth of this sector depends upon its ability to compete domestically and internationally and to conform with the regulatory environment in which it operates. This program of research provides information to farmers and policymakers on the implications and impacts of various policies and programs. However, in view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The goal is to develop the analytical capability to assess and evaluate public policies and programs impacting the U.S. fruit and vegetable industry and disseminate the results to users. Proposals have been submitted that outline long-range plans and specific projects for funding. Models have been developed for potatoes, fresh market tomatoes, onions, broccoli, lettuce, cauliflower, oranges and apples. This grant will be used to develop models for processing market tomatoes, strawberries, celery, cucumbers and green peppers. Trade models for those commodities with a significant import and/or export sector will also be developed. These models feed in to a larger food and agricultural sector model to support analyses of cross commodity and policy effects.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$329,000, and for fiscal years 1995–1997, \$296,000 each year. A total of \$1,217,000 has been appropriated.

The non-federal finding provided to this grant in fiscal year 1994 was \$50,073 State appropriations and \$11,000 industry for a total of \$61,073; \$21,876 State appropriations and \$36,624 industry for a total of \$58,500 for fiscal year 1995; a total

PART 1

944

of \$62,400 from State and industry sources expected for fiscal year 1996; and approximately \$50,000 from these sources in fiscal year 1997.

The work is being carried out at Arizona State University and the University of Missouri. The university researchers anticipate that work is an ongoing project to look at the impact of various public policy proposals on the U.S. fruit and vegetable industry. However, in keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

We have conducted no formal evaluation. However each annual proposal is carefully reviewed and work progress is compared with prior year's objectives.

GENERIC COMMODITY PROMOTION, NEW YORK

The grant supports, in part, the National Institute on Commodity Promotion Research and Evaluation which provides objective analyses of national and state commodity checkoff programs designed to enhance domestic and export demand. The principle researcher believes that producers are contributing about \$1 billion annually to commodity research and promotion funds designed to expand the domestic and export markets for their products. The number of commodity groups participating and the size of the funds available could continue to grow. There are national and regional needs to ascertain the effectiveness of such programs because of the large number of dollars involved and several questions about their effectiveness. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The goal is to determine the economic effectiveness of generic promotion programs designed to increase the sales of agricultural commodities in domestic and international markets. Recent accomplishments include: the impact of promotion and other factors on the sales of almonds, beef exports, pork exports, and wheat exports; development of a major database of commodity advertising expenditures for future research; new methods of measuring advertising wearout; and comparisons of research techniques to determine sensitivity of results based on various methods used.

The work supported by the grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$235,000 and for fiscal years 1995-1997, \$212,000 each year. A total of \$871,000 has been appropriated. The non-federal matching funds and sources allocated to this grant by Cornell University are as follows: \$97,333 a year in State appropriations for fiscal year, 1994-1996; \$97,333 for fiscal year 1997. Collaborating institutions performing work under subcontract agreements have not provided information.

The work is being carried out at Cornell University in collaboration with eight other land-grant universities. The original proposal in 1994 was for a period of 21 months, however, the objectives for evaluating the benefits of promotion programs is a growing regional and national concern as producers take on greater responsibility for marketing their products. The current phase of the program will be completed in 1998. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant.

CSREES performed a merit review of the project in January 1997, as it evaluated the project proposal for 1997, and determined that the project provides leadership for a unique body of research and education on the impact of commodity promotion programs. Research results appear in several professional journals and popular press and researchers have ongoing dialog with private and public decision makers.

GLOBAL CHANGE

Radiation from the sun occurs in a spectrum of wavelengths with a majority of wavelengths being beneficial to humans and other living organisms. A small portion of the short wavelength radiation, what is known as the Ultraviolet or UV-B Region of the spectrum, is harmful to many biological organisms. Fortunately, most of the UV-B radiation from the sun is absorbed by ozone located in the stratosphere and does not reach the surface of the earth. The discovery of a deterioration of the stratospheric ozone layer and the occurrence of an ozone hole over polar regions has raised concern about the real potential for increased UV-B irradiance reaching the surface of the earth and the significant negative impact this could have on all biological systems including man plus animals and plants of agricultural importance. There is an urgent need to determine the amount of UV-B radiation reaching the earth's surface and to learn more about the effect of this changing environmental force. The Cooperative State Research, Education and Extension Service, CSREES, is in the process of establishing a network for monitoring surface UV-B radiation which will meet the needs of the science community of the United States, and which

PART 1

945

will be compatible with similar networks being developed throughout the world. The fiscal year 1996 grant supports work through July 1997. This grant is part of a government-wide initiative. The research is closely coordinated with other Federal agencies involved in the U. S. Global Change Research Program UV-Monitoring Network Plan.

The principal researcher believes destruction of the stratospheric ozone layer, our shield from the full intensity of solar radiation, continues to increase. This creates a high priority need for information to document not only the levels of UV-B radiation reaching the earth's surface, but the climatology of that radiation. The United States, and the rest of the world, needs to know the strength of the UV-B radiation reaching the earth and the potential impact on all forms of life, especially animal and plant life of agriculturally important species.

The principal researcher believes this research to be of national as well as regional and local importance.

The USDA UV-B Network is to provide accurate, geographically dispersed data on UV-B radiation reaching the surface of the earth and to detect trends over time in this type of radiation. A primary problem which had to be overcome in order to reach this goal is the development of instrumentation adequate to make the measurements required for the monitoring network. A major advance occurred during 1996 with the availability to the network of a new multi-band instrument which will provide the spectral information needed to support both biological and atmospheric science research and to serve as ground-truth for satellite measurements. These instruments have been deployed and are currently in operation at ten monitoring sites across the United States. The researchers plan to have twenty sites operational by the summer of 1997. Two grants to design and build advanced spectroradiometers have been awarded under the National Research Initiative Competitive Grants Program. These instruments are to be used in a research network to make precise measurements of the total UV-B spectra at selected sites. The first of these instruments failed to meet spectral performance standards when tested and calibrated by the National Institute of Science and Technology. An alternative design which will result in a much larger and difficult instrument to deploy is currently under development. To gain network experience, broadband instruments along with ancillary instruments have been installed at ten selected field sites and operated for the last 28-36 months. An additional ten sites have been developed during the last 12 months, including those equipped with the new multi-band UV instrument. Data from all sites is transmitted daily to Colorado State University for analysis, distribution and archiving. These data are available, within 24 hours of collection, on the Internet via a World Wide Web Site located in the Natural Resources Research Laboratory at Colorado State University. The Department of Agriculture is also a participant in the development of a central calibration facility located at Department of Commerce facilities in Boulder, Colorado to ensure uniform and acceptable calibration and characterization of all instruments used in interagency UV-B monitoring programs.

The work supported by this grant began in fiscal year 1992, and the appropriation for fiscal years 1992-1993 was \$2,000,000 per year; fiscal year 1994 was \$1,175,000; fiscal year 1995 was \$1,625,000; fiscal year 1996 was \$1,615,000; and fiscal year 1997 is \$1,567,000. A total of \$10,072,000 has been appropriated. The non-federal funds and sources provided for this grant are as follows: \$162,000 state appropriations in 1993; \$183,106 state appropriations in 1994; and \$285,430 provided by Colorado State University in 1995.

Colorado State University is managing the operating network which, when completed, will include all regions of the country. At least thirty sites are planned for the climatological network including sites in Hawaii, Alaska and Puerto Rico in order to provide broad geographic coverage. Ten sites have been operational with broad band instruments for up to three years and it is planned to have at least twenty sites operational with new generation instruments by the summer of 1997. The research level network will begin with the first instrument to be installed at the Department of Energy Solar Radiation site near Ponca City, Oklahoma, as part of the Atmospheric Radiation Measurements field network. As with other weather and climate observations, this network will address an ongoing need for the predictable future. These measurements will provide information on the nature and seriousness of UV-B radiation in the United States and will provide ground truth validation to other predictions of UV-B irradiance.

The agency has assigned two technical staff to continuously monitor activities in the global change research program. A team of three experts in UV-B radiation measurement technology reviewed specifications for the development of the advanced spectroradiometers in July 1996 prior to the procurement of major components of the instrument. A panel of radiation spectra scientists was brought in to

PART 1

946

review data derived from the new multi-band instruments in December 1996 to advise on the interpretation and analysis of data derived from these instruments. Agency staff are in contact with program management on a weekly basis and have visited the program headquarters four times during the last year.

GLOBAL MARKETING SUPPORT SERVICES, ARKANSAS

This grant supports the University of Arkansas Global Marketing Support Services program to provide research and service to agribusinesses. The objective of the university research is to identify potential foreign markets for Arkansas products and to conduct and disseminate foreign market assessment and evaluation studies to agribusiness firms. The principal researcher believes the emerging importance of global trade to the nation's economy and the reduction of trade barriers world-wide presents unprecedented opportunities for cooperative public-private-university research to develop expertise in world markets. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The goal is to develop a university research and service organization to support international trade development activities by local area businesses. Research is conducted to determine the demand for specific Arkansas products in selected countries. Recent results include: twelve "Industry/Company Opportunity Reports" that provided local businesses with information about potential export markets; a report on consumer attitudes in Mexico and Columbia toward imported products; an evaluation of the food system in China, with emphasis on poultry sector; two new fact sheets; and additions to an electronic export information database that is accessed by local firms.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$47,000; and for 1995 through 1997, \$92,000 a year. A total of \$323,000 has been appropriated. The non-federal funds and sources provided for this grant are \$90,000 per year in State appropriations for fiscal years 1994-1996. Private funds also support this grant but an estimate is not available.

This research is being conducted at the University of Arkansas, Fayetteville. The original proposal in 1994 requested funding for a period of 12 months, but the objectives for expanding the export capacity of small to medium-sized agribusiness firms will not be fully met until 1999. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant.

CSREES performed a merit review of the project in January 1997 as it evaluated the project proposal for 1997. CSREES scientists are currently working with the university researchers to enhance the 1997 proposal so that it adequately reflects the kind of work being conducted and to address timelines for the initiation of new research and the distribution of results.

GRAIN SORGHUM, KANSAS

This project was designed to address the lack of yield improvement in grain sorghum cultivars, particularly when grown under dryland conditions where a considerable portion of this crop is grown. The research will focus on identification of early maturing lines which will shift more of the production to grain and less to vegetative growth and thereby making more efficient use of the limited water supply. The focus of this research is toward the non-irrigated lands of Kansas where sorghum can produce a grain crop under conditions that would not be possible with corn and is therefore very important in the rotation with wheat. While the research is directed toward Kansas conditions, it would also apply to adjoining states. However, in view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The original goal of this research is to identify/develop grain sorghum cultivars that mature earlier with more of the production in grain rather than vegetative growth. This is a new project starting in fiscal year 1997, so no significant accomplishments can be reported at this time.

The work supported by this grant begins in fiscal year 1997 and the appropriation for fiscal year 1997 is \$106,000.

Research will be conducted at Kansas State University. This is a new project starting in fiscal year 1997, so the objectives have not yet been met. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

PART 1

947

The research proposal will be peer reviewed prior to awarding of funds.

GRASS SEED CROPPING SYSTEMS FOR SUSTAINABLE AGRICULTURE

This program was developed to provide management systems for sustainable grass seed production without field burning of the straw residue following harvest which results in adverse air quality problems. Grass seed yields are often significantly reduced the following season if the residue is not burned. Fiscal year 1996 grant proposal has been received and is being processed. The principal researcher believes that according to information provided by technical committees representing researchers and the grass seed industry, the need for this research is to develop sustainable systems of seed production that do not depend on field burning of straw residue. Much of the grass seed for the United States including lawn grasses is produced in the area. Field burning of straw residue creates unacceptable levels of air pollution and yields of some cultivar decline without burning. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The original goal for this project is to develop grass seed production systems that do not depend on field burning of straw residue. To date, joint planning by state experiment station administrators and researchers from the three states with industry input for an integrated regional research effort to solve the problem.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$470,000, and for fiscal years 1995–1997, \$423,000 each year. A total of \$1,739,000 has been appropriated. The nonfederal support for this project in fiscal year 1994 was \$266,055, \$298,052 for fiscal year 1995 and \$282,053 in 1996.

The research will be conducted by the three state agricultural experiment stations in Idaho, Oregon and Washington. Completion of the initial objectives was anticipated to take 5 years and therefore should be completed in 1999. In keeping with the Administration's policy of awarding grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

The entire project is reviewed annually by a steering committee for focus and relevance. The combined proposal is reviewed by CSREES before funds are awarded.

HUMAN NUTRITION, IOWA

This research aims to develop animal and plant foods with nutritionally optimal fat content and to improve utilization of foods containing non-nutrient health protectants, components that may reduce health risks. The research includes human and animal nutrient utilization, consumer food choices, and economic impacts of nutritional optimization of food production and processing. The fiscal year 1996 grant supports research efforts of 25 investigators from six disciplines through June 1997. The research addresses food quality, nutrition and optimal health. Much of the research focuses on improving the nutritional quality of foods important to the economy of the Midwest, while making those improvements economically feasible. This work may be a model for the nation with regards to designing foods to improve human nutrition. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The goal of the Center for Designing Foods to Improve Nutrition, the administrative unit for this grant, is to improve human nutrition and health maintenance by determining how to improve animal and plant food fat content and how to increase availability of health-protectant factors in the human food supply. The research includes food production, processing, consumer choices, biological utilization, and economic impacts. This research has identified soy oils which can be naturally hardened and early results indicate potential feasibility of processing these oils into shortenings, which may provide human health benefits in comparison with chemically saturated vegetable fats containing trans fatty acids. Additional work further verifying the feasibility of production of more highly unsaturated pork fat has also been conducted, with human feeding trials underway. A novel health-protective, cholesterol-lowering component of soy, the isoflavone daidzein, has been identified in a mouse feeding study. Further evidence has been found that oxygenated carotenoids potentially found in processed fruits and vegetables have greater antioxidant ability than the parent carotenoids. This greater antioxidant ability might be expected to decrease cancer and heart disease risk.

PART 1

948

The work supported by this grant began in fiscal year 1991 with an appropriation of \$300,000. The fiscal years 1992–1993 appropriation was \$500,000 per year; \$470,000 in fiscal year 1994; \$473,000 in fiscal years 1995 through 1997. A total of \$3,189,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$293,000 university, \$312,869 industry, and \$14,000 miscellaneous in 1991; \$90,000 state appropriations, \$473,608 university, \$131,160 industry, and \$116,560 miscellaneous in 1992; \$307,500 state appropriations, \$472,081 university, and \$222,267 industry in 1993; \$486,000 university, and \$254,000 private in 1994; \$210,000 university, and \$200,000 private in 1995; and \$613,770 university and \$207,811 private in 1996.

Research is being conducted at the Center for Designing Foods to Improve Nutrition, Iowa State University. The original overall objective to design foods to improve nutrition is continuing to be addressed. A set of related objectives will be completed in 1999. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant requested.

The grant proposal for fiscal year 1996 was subjected to extensive peer review and the recommendations will be incorporated into the proposed renewal.

HUMAN NUTRITION, LOUISIANA

Obesity is a major problem in the United States. This grant, entitled Dietary Fat and Obesity, will help answer three issues about this problem. Is there a specific preference for fat in some people, and if so, how is it controlled? Why do thin people adapt differently to a high fat diet than obese people? How do specific fatty acids in the diet influence body metabolism of lean and obese people differently? Obesity is one of the most important and preventable problems in America today and its prevalence in Louisiana is among the highest in the nation. The results will expand the foundation for setting national dietary guidelines for individual fat intake. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The overall goal of this grant is to identify the basis for the susceptibility to obesity of some people who eat high fat diets and to understand how they differ from those people who are resistant to becoming obese when eating a high fat diet. The first project is aimed at identifying people who eat large amounts of fat and those who eat small amounts of fat. The researchers are taking several approaches to this problem, including specific laboratory tests and evaluations of people in free choice environments. In the second project, they have examined the effect of different levels and distributions of body fat on the way foods with different amounts of fat are used by the body. This will be followed by detailed studies on the processes by which adjustments to changes in body fat are made. The third project will evaluate the effect of different types of dietary fat on the metabolism and response to insulin. These studies have just begun.

The work supported by this grant began in fiscal year 1991 and the appropriation for fiscal years 1991–1993 was \$800,000 per year; for fiscal years 1994–1997 was \$752,000 per year. A total of \$5,408,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$523,100 state appropriations in 1991; \$515,100 state appropriations and \$2,216,606 private in 1992; \$536,100 state appropriations and \$940,000 private in 1993; \$627,000 state appropriations and \$3,775,000 private in 1994; \$546,100 state appropriations and \$3,100,000 private in 1995; and \$1,471,000 state appropriations and \$2,488,000 private in 1996.

Research will be conducted at the Pennington Biomedical Research Center, Louisiana State University. The anticipated completion date for the original objectives is fiscal year 1999. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The grant proposal for fiscal year 1996 was subjected to extensive peer review, and in December 1996 an on-site panel of researchers evaluated the proposed objectives and experimental protocols. On the basis of the written comments from the reviewers, the proposal for fiscal year 1997 was revised.

HUMAN NUTRITION, NEW YORK

The work focuses on the basic biological roles of selected nutrients and other food components which are expected to increase or fall as consumption patterns move toward dietary guidelines. The objectives are to develop strategies for improving methods to monitor plant-based food consumption; approaches to increase their consump-

PART 1

949

tion by school-aged children; and an integrated analysis of availability, accessibility, and consumption of plant-based foods at the community level. The research will contribute to the knowledge base needed by consumers to make informed decisions, businesses to plan for maintaining the world's most efficient food system, and those who make and implement policies related to agriculture, food and health outcomes as eating patterns shift to predominantly plant-food based diets. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The newly revised dietary guidelines reemphasize expected health benefits from the increased consumption of fruits, vegetables, and grain products. As pointed out in the response to the first question, investigations are carried out at the basic, clinical, and community levels. Brief synopses typifying the accomplishments are reported. Changes in the American diet are expected to alter lipid metabolism by impacting fat levels and composition. Lipoprotein lipase is a pivotal enzyme that regulates lipid metabolism. New understandings about the enzyme were reported. Researchers cloned a larger portion of the human lipoprotein lipase promoter than had been isolated previously. The activity, synthesis and secretion of lipoprotein lipase is decreased ten fold in young fat cells transfected with the hormone leptin, which suggests a new function for this hormone. In addition, investigators demonstrated that fatty acids enhance the differentiation of young fat cells and possible mechanisms are being explored. Work also has been done on strategies for improving the quality of school lunch programs. This work builds on an earlier study which showed the reluctance of children to consume unfamiliar foods to be a significant barrier. A coordinated effort by food service personnel, teachers, and cooperative extension has resulted in a successful program that introduces unfamiliar to school children by a variety of methods, such as the introduction of various ethnic foods as part of lessons on cultural diversity. Another portion of the work focuses on the interrelationships among the factors that influence food choice at the community, family and individual levels. The approach involves a unique integration of research and intervention. Results indicate that use of fruits and vegetables is positively associated with the previous consumption of fresh produce from a home garden; regional, cultural, or family traditions that emphasize these food groups, and health concerns. Limited access to low cost and preferred types of fruits and vegetables, and lack of time and skill for food preparation are significant barriers to consumption. A "Life Course Model of Fruit and Vegetable Choices" has been developed to guide further research and intervention efforts.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$450,000; fiscal years 1990-1991, \$556,000 per year; fiscal years 1992-1993, \$735,000 per year; fiscal year 1994, \$691,000; fiscal years 1995-1997, \$622,000 each year. A total of \$5,589,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$154,056 state appropriations and \$2,456 private in 1991; \$238,430 state appropriations and \$60,746 private in 1992; \$19,401 state appropriations and \$22,083 private in 1993; \$202,441 state appropriations and \$1,175 private in 1994; \$296,794 state appropriations in 1995; and \$348,127 in state appropriations and \$39,593 private in 1996.

Research is being conducted at Cornell University, New York. The original overall objective to integrate nutrition goals and food systems is continuing to be addressed. A set of retained objectives will be completed in 1997 and a set of new related objectives are planned for an additional three years. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The grant proposal for fiscal year 1995 was subjected to extensive peer review, and the recommendations were incorporated into the ensuing experimental designs.

ILLINOIS-MISSOURI ALLIANCE FOR BIOTECHNOLOGY

The Illinois-Missouri Alliance has initiated a competitive grants program in agricultural biotechnology for research in targeted priority areas of need related to corn and soybeans. The scope of interest includes production, processing, marketing, utilization, inputs and support services, along with economic, social, environmental, and natural resource concerns. The Alliance has solicited research project proposals from scientists at Illinois and Missouri and other Midwestern institutions, and have conducted peer reviews for science quality, commercial feasibility and potential economic impact to select the proposals that will be funded. In 1996 the Alliance awarded four research grants at three institutions totaling \$1,012,859. The Alliance

PART 1

950

also issued a second request for proposals and received fifteen proposals which are being reviewed by an external review panel of scientists employed by agribusinesses. The principal investigator has indicated that the goal of the Alliance is the pre-commercial development of emerging biotechnology discoveries for agriculture. The Midwestern region produces more than half of the nation's output of corn and soybean crops, and the principal investigator believes it is critical to domestic food security and United States competitiveness in global agricultural markets. The Alliance is implementing a research strategy that it hopes will generate important biotechnological developments that are rapidly adaptable to unique local soil, climatic and socioeconomic conditions of the region. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

Fiscal year 1996 was the second year of funding for the Alliance. The research program focuses on the two major commodity crops, corn and soybeans, as produced, processed and marketed in the Midwest. The goal of this biotechnology program is to fund integrated research and development projects that will lead to specifically defined practical technologies for commercialization. The projects funded in fiscal year 1996 include efforts to: (1) produce soybeans free of phytic acid to improve nutritional value and reduce phosphate pollution, (2) improve the protein quality of corn by increasing its lysine and tryptophan content, (3) increase oil content and change the fatty acid composition of soybeans to add value, and (4) commercialize a fast-acting recombinant baculovirus for control of European corn borer.

The work supported by this grant began in fiscal year 1995 and the appropriations for fiscal years 1995 and 1996 were \$1,357,000 each year, and for fiscal year 1997, \$1,316,000. Thus a total of \$4,030,000 has been appropriated.

The Alliance has not specified a required amount of matching funds, but it is expected that most projects will have commitments for significant direct and in-kind non-federal support. Since Alliance projects are only now getting underway, the exact amount of the non-federal contribution is still unknown. The non-federal contribution is expected to be substantial, and a system for accounting for future non-federal contributions is in place.

The research projects identified for funding in fiscal year 1995 is being conducted at the University of Illinois, the University of Missouri, and Iowa State University. Each project proposal for Alliance funding has a target date for completion. The four initial projects were three-year studies with anticipated completions at the end of fiscal year 1998. Most of the second round of projects are also three-year studies with anticipated completions at the end of fiscal year 1999. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

The Illinois-Missouri Biotechnology Alliance was evaluated for scientific merit by an agency peer review panel on January 7, 1997. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project.

IMPROVED DAIRY MANAGEMENT PRACTICES, PENNSYLVANIA

The research focuses on developing methods to help dairy farmers in the adoption of new technology and management practices which lead to improved dairy farm profitability. The principal researcher believes the local need is the identification and implementation of profit enhancing management strategies for Pennsylvania dairy farms in response to changing market conditions and emerging technologies. The current focus is to develop economically-viable solutions to issues confronting Pennsylvania dairy farmers such as dealing with animal waste in an environmentally-friendly manner, reducing the cost of forage production systems, including grazing systems, and to develop a better understanding of decision processes by dairy farmers. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original goal of this research remains the same, which is the development of methods to help dairy farmers in the adoption of new technology and management practices which lead to improved dairy farm profitability. A farm management survey is complete and analysis of results is in progress. Farm financial models have been developed and are undergoing field test on selected farms. Workshops to teach elements of business management to dairy farmers have been conducted, and survey

PART 1

951

instruments are in place to monitor effectiveness of workshops. Research is currently underway to develop improved models for nutrient management on north-eastern dairy farms, to evaluate the potential role of intensive grazing systems to replace harvested forage, and to better understand how decisions are made by dairy farm families. Refinements of an expert computer based system to assist dairy farmers in controlling the udder disease, mastitis, is underway. A study to evaluate the induction of lactation on dairy profitability is underway. An additional study to evaluate the impact of improved protein nutrition during late gestation on dairy cow performance has been initiated.

The work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was \$335,000 per year. The fiscal year 1994 appropriation was \$329,000 and \$296,000 each year in fiscal years 1995–1997. A total of \$1,887,000 has been appropriated. During fiscal year 1992, \$354,917 were from State funds, \$16,000 from Industry, for a total of \$370,417. During fiscal year 1993, \$360,374 were from State funds and \$16,000 from Industry for a total of \$376,374. Information is not available for fiscal years 1994–1996.

Research is being conducted at Pennsylvania State University. The principal researcher anticipated completion of the original objectives by March 1994. The original objectives were met. Availability of continued funding has permitted the institution to develop a competitively awarded grant program within the institution to address priority issues related to management of dairy farms. Proposals are reviewed and ranked by peers in other institutions prior to award. It is anticipated that awards from the fiscal year 1997 appropriation will be complete in September 1999. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The agency accepts technical review of specific proposals funded by this grant on an annual basis. The overall proposal is reviewed by the agency on an annual basis. In addition, technical staff conducted on-site reviews of the program in 1993 and in 1995. The overall objectives of the work funded by this grant has direct relationship to the development of an Integrated Management System as well as to aspects of animal production systems on animal well-being and impact on the environment. The activities of this grant lie within the mission of USDA and CSREES.

IMPROVED FRUIT PRACTICES, MICHIGAN

This research will involve a multidisciplinary approach to reduce chemical use on apple, blueberry, and sour cherry, three important Michigan fruit crops, and improve the management of dry edible beans and sugar beets. Research will be conducted on crop management techniques and reduced chemical use. The principal researcher believes Michigan's need for this research is to develop and maintain/expand their tree fruit and small fruits industry. There is a need to improve the culture and management of dry edible beans and sugar beets. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The planned objectives of the research are to reduce the chemical contamination of the environment from fruit production and improve production practices for beans and beets through multidisciplinary research, including pesticides, and the development of new nonchemical production methods.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$494,000, and for fiscal years 1995–1997, \$445,000 each year. A total of \$1,829,000 has been appropriated. The nonfederal funds and sources provided for this grant in fiscal year 1994 were \$437,338 from state appropriations and \$135,000 from industry, for fiscal year 1995 were \$574,494 from state appropriations and \$127,000 from industry and a total of \$908,969 for 1996.

Research will be conducted at Michigan State University. The anticipated completion date of this project is 1998. The PI's have reported significant progress toward improved cultural practices for these speciality crops which is expected to reduce the need for chemical pesticides. Keeping with the Administration's policy of awarding grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

This project has not been subjected to a comprehensive review. The annual proposals including all of its sub projects are subjected to CSREES review before they are approved.

INSTITUTE FOR FOOD SCIENCE AND ENGINEERING, ARKANSAS

As the flagship center for the Institute for Food Science and Engineering, the Center for Food Processing and Engineering has as its objectives to facilitate and

PART 1

952

encourage value-added research and improve the efficiency and effectiveness of processing agricultural products. Its research program includes seventeen projects which have been funded and are underway or complete. The Center requires that researchers acquire the financial support of industry to support their research. Thus, five additional research projects have been approved but are awaiting funding from industry. The next request for proposals by the Institute will be issued on April 4, 1997. The Center for Food Safety and Quality, with a mission to conduct research on the safety and quality of foods relative to microbiological and chemical hazards, will be activated during this grant period. The principal researcher believes the Institute will provide technical support and expertise to small and mid-sized food processors that usually do not possess adequate expertise in-house. The economy of the southern region will be improved through the creation of new jobs. The Institute will develop and disseminate scientific information and provide educational programs related to value-added further processing, storage and marketing of food products. In view of significant needs for research in high priority national interest topics such as improved pest management systems and food safety, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original goal of this research is to establish an Institute of Food Science and Engineering at the University of Arkansas-Fayetteville. As noted in an earlier response, the Institute for Food Science and Engineering and the flagship Center for Food Processing and Engineering were established and several research projects were funded through the Center. Research demonstrated promise for a high pressure water spray to remove phomopsis decay and brown rot tissue from peaches for processing. Considerable progress was made in modifying commercially produced rice hull silicate to create silica gel. Other research results indicated that holding green and ripe peaches in elevated carbon dioxide atmospheres could reduce acidity and decay, possibly allowing fruits to ripen prior to processing without excessive losses to decay. The Institute provided information to new food business entrepreneurs on food regulations, safety, labeling, ingredients, packaging, and financial aspects of starting a food business and on marketing products. Several products were evaluated and specific recommendations made to those entrepreneurs.

The work supported by this grant began in fiscal year 1996, and the appropriation for fiscal years 1996 and 1997 was \$750,000 each year. A total of \$1,500,000 has been appropriated. The non-federal funds and sources provided for this grant include \$184,700 in state funds and \$93,000 from industry in fiscal year 1996, and \$187,357 in state funds and \$166,752 in industry funds in fiscal year 1997. The Institute received, as a donation worth \$200,000 from industry, a trained sensory panel to qualify and quantify sensory properties of foods. Industry has pledged an additional \$109,628 which has not yet been received.

Research will be conducted at the University of Arkansas at Fayetteville. The principal researcher anticipates that work will be completed on the original goals in fiscal year 2005. The goals of this project related to establishing the centers of the Institute are sequential and have not been fully met. The Center for Human Nutrition is scheduled to be activated in 1999. It is expected that objectives related to research and service to food entrepreneurs will be ongoing and require ongoing support. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on January 13, 1997. The assessment was that satisfactory progress was demonstrated in meeting the goals of the Institute, noting that the timetable for activating the Center for Food Safety and Quality had been accelerated.

INTEGRATED PEST MANAGEMENT/BIOLOGICAL CONTROL

Research supported by Integrated Pest Management special grants continues to provide a science basis for the development of alternative approaches for managing pests including insects, mites, weeds, plant pathogens, and ectoparasites. Emphasis of the program has been on enhanced natural control. Enhanced natural control emphasizes increased use of biological control, cultural control, and host resistance practices and the management of genetic resistance of pests. Most of the research projects emphasize the development of natural control practices used in conjunction with selective pesticides and biopesticides when pest monitoring programs and pest populations warrant a pesticide application. In recent past years, a limited number of joint research/extension projects were initiated in the North Central Region, and in fiscal years 1996 and 1997, three to four joint projects were funded in each of

PART 1

953

the four regions. The extension component of the joint project, focusing on the education component for implementing new approaches, is funded by extension IPM funds for special projects. These joint projects are having an impact on the entire research community. Researchers are planning for the implementation of research from the beginning and throughout the research.

This research program addresses the national priority to implement IPM on 75 percent of the nations cropland by the year 2000. In particular, the research will provide the tools to take IPM to more bio-intensive levels which will have greater impact on environmental quality and consumer safety while maintaining the agricultural productivity, sustainability of protection practices, and competitiveness of American agriculture. This research program addresses the regional needs. The program is organized by regional competitive grant programs, and the request for proposals address both the national and regional needs and priorities. In the past year, jointly funded research and extension production region commodity teams with grower and private sector participation have identified priority protection needs. This research program addresses local needs. State IPM commodity interdisciplinary teams working with growers and private consultants have identified priority local needs which are addressed in the regional request for proposals. The fiscal year 1997 requests for proposals in all four regions have made measurable shifts in emphasis based on these priority setting activities.

The original goal and current goal is to bring IPM into the 21st Century with a paradigm shift from past sole dependence on pesticides to an emphasis on natural control integrated with selective pesticides and biopesticides when pest population densities warrant their use. The more recent increase in joint research/extension collaboration has assisted bringing the accomplishments of research into implementation reality. It has also provided for better documentation and measurement of impacts of research and extension efforts. All four regions have produced 12 to 15 page brochures documenting the impacts of research and extension efforts. The titles are indicative of the goals: Integrated Pest Management in the North Central States, a sustainable approach to managing crop pests, using a combination of biological, cultural, and chemical tactics that reduce pests to tolerable levels that minimize economic, health, and environmental risks; Integrated Pest Management in the Northeast Region, 1996 update Involving Stakeholders; Integrated Pest Management in the Southern Region, At the heart of Integrated Pest Management is its dual focus on improving profitability and protecting vital natural resources; and Integrated Pest Management in the Western Region. IPM advances on 2530 commodities are described in these brochures.

Grants have been awarded from funds appropriated as follows: fiscal year 1981, \$1,500,000; fiscal years 1982 through 1985, \$3,091,000 per year; fiscal years 1986 through 1980, \$2,940,000; fiscal year 1990, \$2,903,000; fiscal year 1991, \$4,000,000; fiscal years 1992 and 1993, \$4,457,000 per year; fiscal year 1994, \$3,034,000; and fiscal years 1995–1997, \$2,731,000 each year. A total of \$52,668,000 has been appropriated. Non-federal funds are as follows: for fiscal year 1993, state appropriations, \$841,017; product sales, \$33,987; industry grants, \$17,081; and other, \$31,737; for fiscal year 1994, state appropriations, \$2,303,458; product sales, \$77,157; industry grants, \$210,110; and other, \$216,552.

This research is being carried out in practically all of the State Agricultural Experiment Stations. There is a high priority for continuation of IPM research and for collaborative linkages with other research, extension, technology transfer, regulatory, and incentive programs to accomplish the transitions called for in the administration's policy for reducing overall risks from the use of pesticides through integrated pest management programs which lead to more sustainable agricultural production strategies and reduction in the use of pesticides. The future will bring more collaboration between program areas that address pest management building on the increased collaboration between research and extension. Integration is currently focused on the commodity production system. These are highly complex systems involving a network of organizations that impact on the system. Future levels of integration will address whole farm planning where issues of landscape ecology can be addressed and better interactions with water quality programs can take place. The rate of progress will be determined by the availability of resources.

Due to the complexity of the program, evaluations are done at a number of levels. All grants awarded are evaluated by peer scientists in the multiple disciplines comprising IPM. These peer reviews are conducted in the four regional IPM programs. Peer scientists are drawn from regions outside of the region conducting the review. State IPM commodity teams, with growers and private consultants, review plans and priorities for commodities programs. Production region commodity development programs have been reviewed by peer scientists at the national level.

PART 1

954

INTEGRATED PRODUCTION SYSTEMS, OKLAHOMA

This grant focuses on the development of efficient management systems for production of watermelons and blackberries under intensively managed conditions. The work will address biotic and abiotic production components under Southeastern Oklahoma conditions for use in production guidelines. This will include planting densities, fertilizer studies, weed management and insect and disease control. The proposal for fiscal year 1996 has been received and is being processed. The principal researcher believes the need for this research is focused on the local area of Southeastern Oklahoma, an area that is economically depressed and in need of alternative crops to diversify the dominant cow/calf livestock production. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The original goal of this research was to develop new and alternative crops to supplement and diversify the cow/calf livestock agriculture of Southeastern Oklahoma with emphasis on horticultural crops. Work to date has shown promise for strawberries, blackberries, cabbage, melons and blueberries. CD-ROM technology transfer to research results to support an expert system will be developed for grower use.

Work supported by this grant started in fiscal year 1984 and the appropriations were: fiscal, year 1984, \$200,000; fiscal year 1985, \$250,000; fiscal year 1986, \$238,000; fiscal years 1987-1989, \$188,000 per year; fiscal years 1990-1991, \$186,000 per year; fiscal year 1992, \$193,000; fiscal year 1993, \$190,000; fiscal year 1994, \$179,000; fiscal years 1995-1997, \$16 1,000 each year. A total of \$2,669,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$165,989 state appropriations in 1991; \$160,421 state appropriations in 1992; and \$164,278 state appropriations in 1993. Nonfederal support for 1994 was \$141,850 for state appropriations. Funds for fiscal year 1995 were \$129,552, and for 1996 were \$146,000.

This research is being done at the Wes Watkins Agricultural Research and Extension Center at Lane, Oklahoma, a branch of the Oklahoma State Agricultural Experiment Station. The original objectives of this project were to develop production system for alternative crops with economic potential for southeastern Oklahoma. Each year's funding cycle has address specific crop and management objectives to be completed over two years time. These short term objectives have been met for each of the completed two year projects. However the original objective of developing alternative cropping systems is very long term and has not been completed. In keeping with the Administration's policy research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

Each of the annual project proposals has been put through the institutions review and is also reviewed by a CSREES scientist before approval. In addition to the annual review of individual proposals, a comprehensive review of the Lane Agricultural Center, where this research is conducted, was conducted in 1993. This review revealed that work supported by this grant is central to the mission of that station and represents an important contribution to the agriculture of the area.

INTERNATIONAL ARID LANDS CONSORTIUM

Fiscal year 1996 was the third year that CSREES funded the International Arid Lands Consortium. The Forest Service supported the program during fiscal year 1993 to develop an ecological approach to multiple-use management and sustainable use of and semiarid lands. Projects that began in 1994-1996 will continue to be funded to address issues of land reclamation, land use, water resources development and conservation, water quality, and inventory technology, e.g. remote sensing. The principal researcher believes the Consortium is devoted to the development, management and reclamation of and semi-arid lands in the United States, Israel, and elsewhere in the world. The International Arid Lands Consortium will world to achieve research and development, educational and training initiatives, and demonstration projects. The current member institutions are the University of Arizona, The University of Illinois, Jewish National Fund, New Mexico State University, South Dakota State University, Texas A&M University, Kingsville. The United States Department of Agriculture's Forest Service works very closely with The International Arid Lands Consortium through a service-wide memorandum of understanding. The IALC's affiliate members include Egypt's Ministry of Agriculture and Land Reclamation Undersecretarial for Afforestation and Jordan's Higher Council for Science and Technology. In view of significant needs for research in high

PART 1

955

priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal of this consortium is to be acknowledged as the leading international organization supporting ecological sustainability of arid and semi-arid lands. To date, 35 projects have been funded, 25 of which are to conduct research and development, 6 for demonstration projects, and 4 for international workshops. Funds approximating \$1.91 million have been used to fund these projects.

International Arid Lands Consortium was incorporated in 1991. Funds were appropriated to the Forest Service in 1993. Additional funds were received during each of the years that followed. \$329,000 has been appropriated from CSREES for fiscal years 1994 through 1997 for total appropriations of \$1,316,000 for the 4-year period.

Members of the International Arid Lands Consortium have provided funds to support the consortium office in Tucson, Arizona, and for printed materials as needed. Each member has provided travel and operations support for semi-annual meetings, teleconferences, and other related activities. In fiscal years 1993-1996, \$60,000 in state appropriations were provided. Industry provided \$84,083 and \$100,000 and \$25,000 in fiscal years 1993, 1995 and 1996, respectively. Amounts are not yet available for fiscal year 1997.

Research is currently being conducted at the University of Arizona, South Dakota State University, Texas A&M University, Kingsville, New Mexico State University, University of Illinois, and several research/education institutions in Israel. Research projects started in 1993 have been completed. The projects started in 1994 and 1996 are expected to be completed within 6 months to 3 years depending upon the nature of the research or demonstration projects. Several demonstration projects were completed and 4 international workshops were held during 1994 through 1996. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

This project is evaluated annually based on an annual progress report and agency participation in the Consortium Board of Directors meeting. The cognizant staff scientist has reviewed the project and determined that the research is conducted in accordance with the mission of the agency.

IOWA BIOTECHNOLOGY CONSORTIUM

This consortium is the focal point for cooperative biotechnology research endeavors between Iowa State University, the University of Iowa and the City of Cedar Rapids, Iowa to develop and test methods to improve wastewater treatment processes for agricultural wastes, and when possible, to convert by-product materials in agricultural wastes into useful new products. The overall objectives of this research are to conduct fundamental and applied research aimed at enhancing the recovery and utilization of byproduct materials through studies involving fermentation, enzyme catalysis and bioprocessing. The expectation is that technologies will be developed from the research to reduce the burden of agricultural bioprocessing wastes on municipal waste management systems and to transform these wastes into commercially viable products. Developments in biotechnology have allowed for the development of improved management systems that increase the capacity and sophistication of agricultural waste processing. These researchers believe that technological breakthroughs are possible to deal effectively with the increasing burden of agricultural wastes and that useful byproduct materials can be recovered and recycled through bioprocessing of wastes, especially fermentation wastes. In view of significant needs for research in high priority national interest topics such as pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original goals of this project were aimed at enhancing the recovery and utilization of by-product materials arising from new and emerging industries using biotechnology. Recycling agricultural wastes, isolating useful byproducts and developing value added processing remain the primary thrusts of the project. The Consortium has established a network of researchers to assist them in finding uses for the by-product streams as concentrated steepwater and to find methods to concentrate by-products for industrial uses. The Consortium is also making important progress in the bioconversion, biocatalysis, membrane concentration, and bioseparation of fats and carbohydrates.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1,225,000; fiscal year 1990, \$1,593,000; fiscal year 1991, \$1,756,000; fiscal year 1992, \$1,953,000; fiscal year 1993, \$2,000,000; fiscal year 1994, \$1,880,000; fiscal

PART 1

956

years 1995–1996 \$1,792,000 each year; and in fiscal year 1997, \$1,738,000. A total of \$15,729,000 has been appropriated.

Non-federal funds and sources provided for this grant were as follows: \$623,803 from the State of Iowa, \$42,813 from the city of Cedar Rapids in 1991; \$768,287 from the State of Iowa, and \$365,813 from the city of Cedar Rapids in 1992; \$858,113 from the State of Iowa, and \$170,000 from the city of Cedar Rapids in 1993; \$841,689 from the State of Iowa, and \$36,000 from the City of Cedar Rapids in 1994; and \$1,016,505 from the State of Iowa, and \$36,000 from the city of Cedar Rapids in 1995.

Research is being conducted at Iowa State University and the University of Iowa, in collaboration with the City of Cedar Rapids. The Consortium was originally formed between the City of Cedar Rapids and the participating universities to assist the City in dealing with wastes associated with corn and oat processing and milling, biocatalysis to produce high-fructose syrups, and one of the largest fermentation facilities in the world. No firm date was established to complete this work. The researchers have worked closely with the City and the industries generating these wastes and have made significant progress in analyzing the waste streams and in devising laboratory procedures for extracting useful products. The City of Cedar Rapids is planning to invest funds from other sources in special waste treatment facilities to conduct large scale tests of new treatment methods. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The Iowa Biotechnology Consortium was evaluated for scientific merit by an agency peer review panel on January 7, 1997. The panel recommended approval of the project pending receipt of supplemental information. The Consortium was also featured in a biotechnology special grant seminar hosted by the agency on December 16, 1996 at which the principal investigator presented research progress and highlights to an audience of agency scientists, administrators, and awards management staff.

JOINTED GOATGRASS

Research is being conducted on control systems for jointed goatgrass in wheat production including integrated cultural management, seed bank studies, and modeling for management conducted as sub-projects by several states. The premier research project continues to be an "Integrated Management" study being conducted across states in the Midwest and west. In this study, jointed goatgrass management is being evaluated based on planting dates, planting density, economic thresholds, and competitive varieties. Research is also being conducted on crop rotations, biological control, seed production and spread, and the development of computer-based decision aids. All funded work has a technology transfer plan and a national coordinator for technology transfer to insure that growers are fully informed about all options for managing this devastating weed. The National Technology Transfer Coordinator has been hired, with the concurrence of a steering committee, and that person is housed at the University of Nebraska. To maximize cooperation among scientists, an annual meeting is held among all investigators and the national steering committee to strengthen collaborations and optimize the distribution of limited funds.

Jointed goatgrass infests nearly five million acres of winter wheat in the west and Midwest and is spreading unchecked. It costs U.S. wheat growers an estimated \$145 million annually. Control of jointed goatgrass in wheat is impossible with current methods because its seed survives in the soil for five or more years. Jointed goatgrass has increased rapidly in the past 20 years because of the widespread adoption of conservation tillage systems. Jointed goatgrass proliferated in such reduced tillage systems, and it seriously impedes the universal adoption of such practices. The research involves scientists from other states. In view of significant needs for research in high priority national interest topics such as pest management systems, funds are not proposed to continue the Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The principal researcher and the National Wheat Growers Association believe this research is of national and regional importance.

The goal of this project is to reduce the devastating effect of jointed goatgrass on wheat production and quality and to prevent its continued spread into new, non-infested areas. A jointed goatgrass population model has been constructed including a post-harvest (fall) seed bank, spring seed bank, and fall and spring germination, seeding mortality, mature plants and seed production. The underlying jointed goatgrass population model has been constructed with a vision that the weed management strategies are going to be long-term in nature and be focused on the impact of crop rotation, tillage and weather on jointed goatgrass population dynamics.

PART 1

957

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$329,000, and for fiscal years 1995–1997, \$296,000, each year. A total of \$1,217,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: for 1994, \$82,198 state appropriations, \$82,256 from industry, and \$14,871 miscellaneous; for fiscal year 1995, \$67,442 state appropriations, \$38,496 from industry and \$13,304 miscellaneous; and for fiscal year 1996, an estimated \$70,000 state appropriations, \$50,000 from industry, and \$14,000 miscellaneous.

The research is being conducted by University scientists in the states with serious infestations including Washington State University—the principal coordinating institution—Colorado, Kansas, Nebraska, Oklahoma, Utah, Oregon, Idaho, Montana, Wyoming, and South Dakota. The project was initiated to accomplish significant results in about five years. The original objectives are being met, and the researchers anticipate that the original work may be completed in fiscal year 1999. Keeping with the Administration's policy of awarding research grants competitively, no further funding for this grant is requested.

Each year the grant is peer reviewed and reviewed by CSREES's senior scientific staff.

LANDSCAPING FOR WATER QUALITY, GEORGIA

The project is a comprehensive multi-institution, multi-agency, private producer partnership directed by the University of Georgia. The researchers believe it will lead to development of management and siting guidelines for animal agriculture based on landscape and watershed scale environmental quality considerations. Participating institutions and agencies are the University of Georgia, the Joseph W. Jones Ecological Research Center, the Middle South Georgia Soil and Water Conservation District, the USDA Agricultural Research Service, the USDA Natural Resources Conservation Service, the USDA Cooperative State Research, Education, and Extension Service, and the Georgia Department of Natural Resources. Growers from Brooks and Thomas counties, Georgia are key partners in the project. The multidisciplinary research team believes that the efficiency of modern confinement-based livestock feeding and production facilities and prevailing economies of scale have led to concentration of these facilities in several regions of the United States, including the Southeast. This regional concentration of animal production and processing has frequently led to degradation of regional water quality resulting from the excessive discharge of nutrients, organic matter, and pathogens to receiving waters. One factor contributing to these problems in the Southeast has been the historical concentration of animal processing and confinement production facilities in regions with inadequate crop land for proper management of manure resources. This research project may provide the knowledge base for the integration of increased animal production into a regional agricultural system without sacrificing water quality. The findings will be immediately applicable to the Southeast. In view of significant needs for research in high priority national interest topics such as pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this grant.

The goal of this research project is to provide the knowledge base for the integration of increased animal production into a regional agricultural system without sacrificing water quality. The goal will be met by completing five specific objectives over a period of five years. The proposed research is on schedule. Since the project began on February 1, 1996, significant progress has been made on three of the five objectives. Work on the final two objectives will begin once fiscal year 1997 funds become available. Specific accomplishments include:

1. Completed installation and began sampling for chemical and biological water quality parameters at seven stream monitoring sites in the 390 square kilometer Piscola Creek Watershed, and continued sampling eight stream monitoring sites in the 340 square kilometer Little River Research Watershed.

2. Nearing completion of Geographical Information System databases for these two watersheds including information on soils, hydrography, topography, and landcover.

3. Began compiling a database listing all regulations, guidelines, and recommended management practices pertaining to animal agriculture and environmental quality in the southeast region.

The work supported by this grant began in fiscal year 1996 and the appropriation for fiscal years 1996 and 1997 was \$300,000. A total of \$600,000 has been appropriated. Information provided by the University indicates that \$202,000 in state funds will be provided to support this grant during fiscal years 1996 and 1997. Similar amounts of state support are anticipated for future years. In addition, funds will

PART 1

958

be expended by the other participating nonfederal institutions in support of this grant.

This research is being conducted by an interdisciplinary team of 19 scientists led by researchers at the University of Georgia's National Environmentally Sound Production Agriculture Laboratory in Tifton and Athens, Georgia. The experimental aspects of the project are being conducted in the coastal plain region of Georgia in watersheds that are representative of southern Georgia, southeast Alabama, and north central Florida. The anticipated completion date for the original objectives of the project was January 31, 1998. As discussed earlier, significant progress has been made on these objectives and they are on schedule. The anticipated completion date of additional or related objectives is January 31, 2001. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

As this project is still in its first year, a comprehensive external evaluation has not yet been conducted. However, the principal researcher is working with us to schedule an evaluation during 1997.

LIVESTOCK AND DAIRY POLICY, NEW YORK AND TEXAS

The purpose of this grant is to assess the possible economic impacts on the U.S. livestock, poultry, and dairy sectors from various macroeconomic, farm, environmental, and trade policies and new technologies. Both Cornell University and Texas A&M University conduct analyses of these policies and disseminate the information to policymakers, farmers, and agribusinessmen. Cornell focuses on dairy policies, and Texas A&M focuses on policies affecting livestock and poultry. Information on the implications of new and alternative farm, trade, and macroeconomic policies affecting the livestock and dairy sectors is of special interest to policy-making officials, farmers, and others. Such information enables farmers and agribusinessmen to make necessary adjustments to their operations to enhance profitability and for public officials to consider alternatives to sustain adequate supplies and minimize public program costs. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the States, Hatch Act or other formula funding could be used to support this research.

The original goal was to establish a specialized research program that could provide timely and comprehensive analyses of numerous policy and technological changes affecting livestock and dairy farmers and agribusinessmen and advise them and policymakers promptly of possible outcomes. This goal has been achieved. The program continues to provide assessments and evaluations of provisions and proposed changes in agricultural policies, the General Agreement on Tariffs and Trade, and the North American Free Trade Agreement; various income and excise tax measures; and alternative pricing measures for milk. The institutions are involved in several current studies relating to dairy provisions in the 1996 farm legislation. Both institutions maintain extensive outreach programs to disseminate results throughout the United States.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$450,000; fiscal year 1990, \$518,000; fiscal years 1991–1993, \$525,000 per year; fiscal year 1994, \$494,000; and fiscal years 1995–1997, \$445,000 each year. A total of \$4,372,000 has been appropriated.

The non-federal funds and sources provided for this grant are as follows: \$37,420 State appropriations in fiscal year 1991; \$162,086 State appropriations and \$133,278 product sales for a total of \$295,364 in fiscal year 1992; and \$301,817 State appropriations, \$1,412 industry, and \$7,121 miscellaneous for a total of \$310,350 in fiscal year 1993; \$24,702 State appropriations, and \$5,961 industry for a total of \$30,663 in fiscal year 1994; \$235,526 State appropriations for fiscal year 1995; \$250,000 in State appropriations for fiscal year 1996; and approximately \$245,000 in State funding for fiscal year 1997.

The research is being conducted at Cornell University and Texas A&M University. The original objectives of this project have been achieved. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

We have conducted no formal evaluations of this project. Annual proposals for funding, however, are carefully reviewed and work progress is noted. Our agency contact is also in regular contact with principal researchers at each institution to discuss progress toward project objectives.

PART 1

959

LOWBUSH BLUEBERRY RESEARCH, MAINE

Interdisciplinary research is being conducted on many aspects of lowbush blueberry culture and processing includes investigation into factors affecting processing quality, biological control of insect pests, sustainable pollination, weed, disease and fertility management, cold hardiness and ground water protection. Maine produces 99 percent of all lowbush blueberries or 33 percent of all blueberries in the United States. This work is of major local interest, and helps maintain the continued availability and high quality of this native fruit commodity. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding sources could be used to support this research. In addition, future efforts will be made to collaborate with IPM regional and state representatives in finding solutions to the specified pest concerns.

The original research goal was to provide research answers to unique lowbush blueberry production, pest and processing problems. Research to date indicates that the field sanitizer was able to use heat to control insect pests without adversely affecting plant growth, providing a nonchemical alternative to pest management. Eumenid wasps were found to control red striped fireworm, providing a potential biological control. Native leafcutter bees and alfalfa leafcutter bees were found to increase lowbush blueberry fruit set and yield, providing an alternative to imported honeybees. Clonal variation was found to affect stem and flower bud hardiness that will prove to be important in clonal selection for planting. Control of monolina disease was found in using 4 ounces of propiconazole instead of 24 ounces of triforine thereby reducing the chemical needed for control of this disease. Boron and calcium were found to have more influence on the ability of the stigma to stimulate pollen germination than the germinability of the pollen grains themselves. A mechanical harvester was found to be effective and had yields and fruit quality comparable to hand harvest, providing growers with a more efficient tool to harvest blueberries. Economic weed thresholds have been determined for weed species, thereby giving growers a method to determine when to use control measures. Mowing proved as effective as wiping to suppress two of these species, providing a non-chemical control alternative. A rope wick wiper effectively controls weeds growing higher than blueberry plants without injuring the crop. Pesticide residues in lowbush blueberries were found to be well below federal tolerances. Carboxymethyl cellulose and various gums were found to control berry leakage, thereby improving quality for use in baked products. Products for use in food industry are being extracted from cull berries, thereby improving utilization and reducing waste.

Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$170,000; fiscal year 1991, \$202,000; fiscal years 1992 and 1993, \$185,000 per year; fiscal year 1994, \$208,000; and fiscal years 1995, 1996, and 1997 at \$220,000 each year. A total of \$1,610,000 has been appropriated. Direct industry support from blueberry tax funds for 1996 is about \$65,000.

Research is being conducted at the University of Maine. The original objectives have not yet been met. The University of Maine researchers estimate that the project will be concluded at the end of fiscal year 2001. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

The agency evaluates this project on a yearly basis as funding is renewed. Project proposals are peer reviewed by the University of Maine review mechanism. Progress reports are submitted to the Cooperative State Research, Education, and Extension Service on a yearly basis as part of the review of the proposed project.

MAPLE RESEARCH, VERMONT

The research increased understanding of how water moves from the soil into and through the maple trees, affecting tree growth and sap production. It examined the relationship of maple decline to acid precipitation. It measured the effectiveness of various fertilizer combinations in improving the health of declining maple trees. It identified sources of lead contamination in maple products and began testing lead-free equipment and possible commercial methods for removing lead from maple syrup. Maple products are an important source of seasonal income in maple-growing areas of rural America. Identifying the source of contamination during processing and identifying commercial methods to remove lead from products is important to assuring consumers that these food products are not harmful. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding sources could be

PART 1

960

used to support this research. The goal of this research is to conduct research on maple tree physiology, management of sugar maple stands, and related aspects of the maple industry to benefit the maple industry in Vermont and the Northeast. The U.S. Department of Agriculture approved an amendment to these goals to permit the research to focus on lead in maple products.

Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$100,000; fiscal years 1986–1987, \$95,000 per year; fiscal years 1988–1989, \$100,000 per year; fiscal years 1990–1993, \$99,000 per year; fiscal year 1994, \$93,000; and fiscal years 1995–1997, \$84,000 each year. A total of \$1,231,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$52,220 state appropriations and \$10,345 product sales in 1991; \$49,450 state appropriations and \$18,950 product sales in 1992; \$49,575 state appropriation and \$23,860 product sales in 1993; \$44,543 state appropriation, \$29,321 product sales, and \$25,000 local support in 1994; \$60,856 state appropriation, \$12,000 product sales, and \$19,090 local support in 1995; \$83,000 state appropriation and \$15,000 product sales in 1996; and \$67,000 state appropriation, \$11,000 local support, and \$15,000 product sales in 1997.

This research is being conducted at the Vermont Agricultural Experiment Station. The work relative to maple tree physiology and management of maple stands has been completed so far as this project is concerned, but it continues under sponsorship of the U.S. Forest Service. The new objective of identifying sources of heavy metals in maple products and reducing them is underway. Anticipated completion date is 1999. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

This project is evaluated annually by the U.S. Department of Agriculture through review of the project proposal and any previous accomplishments. Although satisfactory progress was being made on the tree physiology and maple tree management aspects of the project, the project was amended to focus on lead in maple products.

MICHIGAN BIOTECHNOLOGY CONSORTIUM

The objective of the Michigan Biotechnology Consortium's research program is to develop bioprocessing technology to manufacture products from agricultural raw materials, to increase the utilization of raw materials, reduce surpluses, and to degrade agricultural and associated wastes, thereby decreasing environmental costs of agricultural products and processes. Bioprocessing may include fermentation, an enzymatic step, chemical catalysis, or physical modification of agricultural raw materials. The principal researcher believes the results from the research to develop bioprocessing technology to manufacture value-added products from agricultural raw materials, which increases their utilization and reduces agricultural commodity surpluses and environmental costs, will contribute to regional and national priorities. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original goal of this research remains to select and develop market-viable technologies that will form the basis of new companies, new jobs, and additional tax revenues produced for state, local and Federal governments. The Michigan Biotechnology Institute and Michigan State University have succeeded in developing numerous technologies that are now in the marketplace.

Examples include the following: A process was developed to produce lactic acid through fermentation using corn as the feedstock resulting in a polymer for biodegradable plastics and a disinfectant. The properties of the polymer make it useful for non-woven applications such as medical packaging, clear blister bags, diapers, etc. Corn was used as a feedstock to develop plant growth formulations to enhance plant growth and productivity and reduce nitrogen fertilizer requirements. Growth promoters for high volume or high value crops have the potential for productivity increases of 15 percent and a reduction in nitrogen fertilizer use of 25 percent. Biodegradable plastic resins developed from cornstarch were made to produce compostable films for agricultural mulch and other soluble films, and for cellulase-base engineered thermoplastic resins. Biodegradable plastic resins from cornstarch were also developed for moldable products such as disposable cutlery, plastic containers, toys and toothbrushes. The market for resins for use in formulation and extrusion of plastics for all applications is in excess of \$2 billion annually. Corn was also used for the development of all-natural flavors and derivatives including a salty flavor compound that can be produced to taste in non-sodium and non-potassium forms. Low-cost, readily-available carbohydrates were used to produce high-quality,

PART 1

961

high-value optically-pure chiral intermediates for the pharmaceutical and agrochemical industries. A sand/manure separation system for dairy farmers was developed to cost-effectively separate manure from sand and recycle both components. Many of these products are being explored for commercial development through licensing agreements with industrial partners or new company startups. In addition, there are many agri-based industrial products under development including: several succinate-based green chemicals for surfactants and detergents, new food ingredients and flavors, paint removers, adhesives, lubricants, and plastic resins; green solvents from fermentation of corn-derived materials; ethanol produced from cellulose; natural food preservatives, improved enzymes for processing starch and fructose production, food flavors and pigments, feed ingredients to improve digestibility of forage-based animal feed; biomass-based animal feeds; and agricultural waste treatment processes to improve methods to clean up herbicides and pesticides.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1; fiscal year 1990, \$2,160,000; fiscal year 1991, \$2,246,000; fiscal years 1992–1993, \$2,358,000 per year; fiscal year 1994, \$2,217,000; fiscal year 1995, \$1,995,000; and fiscal years 1996 and 1997, \$750,000 per year. A total of \$16,584,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$1,750,000 in State of Michigan appropriations, \$160,000 from industry, and \$1,000,000 from miscellaneous in 1991; \$1,750,000 in State of Michigan appropriations, \$175,000 from industry, and \$1,000,000 from miscellaneous in 1992; \$1,750,000 in State of Michigan appropriations and \$100,000 from industry in 1993; \$1,750,000 in State of Michigan appropriations, \$175,000 from industry, and \$100,000 from miscellaneous in 1994; and \$200,000 in State of Michigan appropriations and \$2,035,000 from industry in 1995; \$1,250,000 in State of Michigan appropriations and \$350,000 from industry in 1996. A total of \$13,545,000 has been provided to support this work by non-federal sources.

The research is being conducted on the campus of Michigan State University and at the Michigan Biotechnology Institute. The Institute had reported specific milestones that it intended to be accomplished within the five-year period ending in fiscal year 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

The Michigan Biotechnology Institute was evaluated for scientific merit by an agency peer review panel on January 7, 1997. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. The Institute was also featured in a biotechnology special grant seminar hosted by the agency on December 16, 1996 at which the principal investigator presented research progress and highlights to an audience of agency scientists, administrators, and awards management staff.

MIDWEST ADVANCED FOOD MANUFACTURING ALLIANCE, NEBRASKA

The stated purpose of the Midwest Advanced Food Manufacturing Alliance is to expedite the development of new manufacturing and processing technologies for food and related products derived from United States produced crops and livestock. The Alliance involves research scientists in food science and technology, food engineering, nutrition, microbiology, computer science, and other relevant areas from 12 leading Midwestern universities and private sector researchers from numerous U.S. food processing companies. Close cooperation between corporate and university researchers assure that the latest scientific advances are applied to the most relevant problems and that solutions are efficiently transferred and used by the private sector. Fiscal year 1997 funds will support research from June 1, 1997 through May 31, 1998. The principal researcher believes the food manufacturing industry is the number one manufacturing industry in the Midwestern region and that opportunities for trade in high value processed food products will grow exponentially on a worldwide basis. The researcher believes the Alliance is positioned to fill the void in longer range research and development for the food industry. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The goal, as stated previously, was to expedite the development of new manufacturing and processing technologies for food and related products derived from United States produced crops and livestock. This is accomplished by conducting research proposal competition among faculty from the 12 participating universities to find research projects where matching funds are available from industry. Fourteen (14)

PART 1

962

projects were funded from fiscal year 1994 funds with completion and final reports due by May 1, 1996. Ten (10) projects were funded from fiscal year 1995 funds with anticipated completion and final reports due by August 31, 1997. Ten (10) projects were also funded from fiscal year 1996 funds with anticipated completion and final reports due by May 31, 1998. Proposals are reviewed for scientific merit by independent scientists, and final selection of projects includes consideration of industrial interest and commitment of non-Federal matching funds.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$470,000, and for fiscal years 1995–1997, \$423,000 each year. A total of \$1,739,000 has been appropriated. Industry matching funds were \$823,148 in fiscal year 1994, \$414,164 in fiscal year 1995, and \$576,600 in fiscal year 1996.

The work is being coordinated by the Nebraska Agricultural Experiment Station at Lincoln. Specific research projects are also being conducted at seven (7) other universities that are part of the Alliance. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on December 20, 1996. The principal investigator has provided descriptions of projects funded by this grant.

MIDWEST AGRIBUSINESS PRODUCTS, IOWA

The Midwest Agribusiness Trade Research and Information Center does applied research to improve the global competitiveness and marketability of agricultural products produced in the Midwest and disseminates the results to small and medium-sized agribusinesses. Projects include analyses of potential markets for U.S. agricultural products and equipment/technology in several countries; attitudes of foreign consumers; and development of new/improved U.S. products to meet foreign needs. The principal researcher believes that agribusiness firms in the United States, especially small to medium-sized firms, have a large unrealized potential to expand export sales and foreign business ventures. These untapped opportunities exist in well-established growth markets in the Pacific Rim and in newly opening markets such as Mexico, China, and Eastern Europe. The reluctance of small to medium-sized firms to explore these market opportunities is, in part, due to the high cost of market information and analysis and the perceived high risk of doing business in new markets with unfamiliar partners. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The goal is to enhance the export of agricultural commodities, value-added products, and equipment produced by Midwestern agribusiness firms through research and education programs utilizing close-working relationships with those firms. In the past year, several studies were completed and distributed to interested firms, and new ones were initiated. Completed studies included: an analysis of conditions and prospects for agribusiness ventures in Egypt; market analyses for U.S. agricultural products in Cameroon, Senegal, and Cote d'Ivoire; an assessment of market opportunities for food processing equipment in China; Mexican consumer response to U.S. pork products; comparative advantage of U.S. pork in North American markets; impact of NAFTA on Midwest beef industry; an evaluation of the need for government regulation for maintaining or improving the quality of 12 export commodities; case studies of 16 outstanding food and agricultural exporters; evaluation of 60 varieties of corn for dry milling for the Mexican market; suitability of microsoy flakes for markets in Pacific Rim and African countries; and use of the Internet for marketing goods and services. In addition several seminars and conferences were held, "Global Connections" newsletter was published regularly, and business contacts database kept up to date. As a result of much work to establish trading relationships with China, the Des Moines sister-city of Shijiazhuang, China established a trade office in Des Moines.

The work supported by this grant began in fiscal year 1992. The appropriation for fiscal years 1992–1993 was \$700,000 per year; fiscal year 1994, \$658,000; and fiscal years 1995–1997, \$592,000 per year. A total of \$3,834,000 has been appropriated.

The non-federal funds and sources provided for this grant are as follows: \$185,495 State, appropriations and \$373,897 industry for a total of \$559,392 in fiscal year

PART 1

963

1992; \$183,192 State appropriations and \$318,966 industry for a total of \$502,158 in fiscal year 1993; \$127,948 State appropriations and \$500,394 industry for a total of \$628,342 in fiscal year 1994; \$258,053 State appropriations and \$389,834 industry for a total of \$647,887 for fiscal year 1995; \$165,425 State appropriations for fiscal year 1996; and \$162,883 State appropriations for fiscal year 1997. Industry contributions continue but were not reported for 1996 and 1997.

The program is carried out by Iowa State University. The original proposal in 1994 was for a period of 24 months, however, the objectives for expanding the export capacity of small to medium-sized agribusiness firms is an ongoing regional and national concern. The current phase of the program will be completed in 1999. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant.

CSREES performed a merit review of the project in January 1997 as it evaluated the project proposal for 1997 and concluded that the Midwest Agribusiness Trade and Research Center at Iowa State University has a record of producing research and trade information for agribusinesses in the Midwest and other states. Research results appear in several professional journals and popular press.

MILK SAFETY, PENNSYLVANIA

The overall goal of the milk safety program is to provide insight into factors that help ensure an adequate and safe milk supply. Toward that end, the research has focused on factors that affect milk production, processing, manufacturing, and consumption. Special attention has been given to ways of preventing and/or treating pathogens that enter the milk supply.

The principal researcher believes that the question of microbial safety is of paramount interest to the milk/dairy industry at all levels. Dairy products such as milk, nonfat dry milk, cheese, butter, and cream have been associated with several large outbreaks of staphylococcal food poisoning, and coagulase negative *Staphylococcus* infections are one of the most common intramammary infections of dairy cattle. *Listeria monocytogenes* is present in about 4 percent of raw milk, and it has the potential to grow to dangerous levels during refrigeration and storage, making pasteurization critical in preventing foodborne illnesses from this organism. Bovine mastitis is the most important infectious disease affecting the quality and quantity of milk produced in the nation, costing producers an average \$180 per cow per year. The researchers believe ensuring safety of dairy products impacts not only consumer health and confidence in the safety of the food supply, but economic viability as well. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The research is aimed at minimizing or eliminating future foodborne disease outbreaks from milk and dairy products. A key accomplishment includes the discovery of potential approaches of enhancing natural defense mechanisms of the bovine mammary gland through vaccination and immunoregulation. Discoveries of factors influencing growth of *Staphylococcus aureus* could be used to prevent or contain growth of this pathogen in foods. Researchers have identified and sequenced a gene from this bacterium that is essential for growth under stressful conditions. A computer model of *Listeria monocytogenes* growth in dairy foods under dynamic refrigeration conditions and during extended storage is under development to provide producers and processors with a proven technology for further enhancing the safety of fluid milk and related products. Researchers have elucidated conditions that significantly enhance the survival of *Listeria monocytogenes* during heat challenge. Research also revealed that consumers having high general concern about milk and dairy product safety and nutrition were more likely to be female, to have lower levels of education, be non-white and report more attention to scientific news, health and nutrition news and news about government food safety regulatory attention.

Grants have been awarded for milk consumption and milk safety from funds appropriated as follows: fiscal years 1986 through 1989, \$285,000 per year; fiscal year 1990, \$281,000; fiscal year 1991, \$283,000; fiscal year 1992, \$284,000; fiscal year 1993, \$184,000; fiscal years 1994–1997, \$268,000 per year. A total of \$3,244,000 has been appropriated for milk safety and milk consumption.

The University estimates that non-federal funds contributed to this project include the following costs and salaries: \$265,000 for fiscal year 1991; \$224,700 for fiscal year 1992; \$142,600 for fiscal year 1993; and \$252,168 for fiscal year 1995. No data are currently available for fiscal years 1994 and 1996.

The research is being conducted at the Pennsylvania State University. The researchers anticipate that research supported by this grant should be concluded in

PART 1

964

1999. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. Since the agency has not yet received the proposal in support of the fiscal year 1997 proposal, the last review of the proposal was conducted on March 8, 1996. At that time, the agency science specialist believed that the projects addressed issues retained to safety of milk and dairy food products, were scientifically sound, and that satisfactory progress was being demonstrated using previously awarded grant funds.

MINOR USE ANIMAL DRUGS

The National Agricultural Program to Approve Animal Drugs for Minor Species and Uses (NRSP-7) was established to obtain Food and Drug Administration clearance of animal drugs intended for use in minor species and for minor uses in major species. The funds for the special research grant are divided between the four regional animal drug coordinators and the headquarters at Michigan State University for support of the drug clearance program. The NRSP-7 funds are being utilized by the regional animal drug coordinators and by allocation to State Agricultural Experiment Stations to develop data required for meeting clearance requirements. Participants in the research program consist of the regional coordinators, State Agricultural Experiment Stations, USDA's Agricultural Research Service (ARS), the U.S. Department of Interior, schools of veterinary medicine, and the drug industry. Each year priorities are established for the various species categories including small ruminants, game birds, fur-bearing animals, and aquaculture species. The fiscal year 1996 grants terminate between April 1997 and September 1998. The 1997 grant proposals have been received and are being reviewed.

Animal agriculture throughout the U.S. has relied on chemical and pharmaceutical companies to provide their industry with safe efficacious drugs to combat diseases. The need for approval from FDA's Center for Veterinary Medicine (CVM) for drugs to control diseases in minor species and for minor uses in major species has increased with intensified production units and consumer demand for residue-free meat and animal products. The high cost incurred to obtain data required by federal, regional, and local regulations to approve these drugs, when coupled with limited economic returns, has limited the availability of approved drugs for minor uses and minor species. The program provides research needed to develop and ultimately culminate in drug approval by FDA/CVM for the above purposes. The goals are accomplished through the use of regional animal drug coordinators as well as a national coordinator to prioritize the need, secure investigators at federal, state and private institutions, and oversee the research and data compilation necessary to meet federal regulations for approval. All drug approvals are national, although industry use may be regional. For example, aquaculture is concentrated in specific geographic sections of the country. The Administration believes this research to be of national, regional and local need.

The original NRSP-7 goal to obtain FDA clearance of animal drugs intended for use in minor species and for minor uses in major species remains as the dominant goal. In recent years, the research program has expanded or given additional emphasis to aquaculture species, veal calves and sheep. In addition, several new animal drug requests from the game bird industry were received during the past year. The importance of environmental assessment, residue withdrawals and occupational safety have increasingly been given more attention during the approval process to help assure consumer protection. To date, 282 drug requests have been submitted to the Minor Use Animal Drug Program for clearance. Working in conjunction with many universities, the U.S. Department of Interior, ARS, and numerous pharmaceutical companies, 24 research projects are now active and will be continued through 1997 to establish data for clearances. Twenty four public master files have been published in the Federal Register providing clearance for drug use in minor species. Two additional public Gmaster files are currently being completed and several others are under review by FDA. The Center for Veterinary Medicine is cooperating and supporting this program to the fullest extent. The program is a prime example of Federal interagency cooperation in coordination with academic institutions, pharmaceutical industries and conunodity interests to effectively meet an urgent need.

Grants have been awarded from appropriated funds in the amount of \$240,000 per year for fiscal years 1982-85; \$229,000 per year for fiscal years 1986-1989; \$226,000 for fiscal year 1990; \$450,000 for fiscal year 1991; \$464,000 per year for

PART 1

965

fiscal years 1992 and 1993; \$611,000 for fiscal year 1994; and \$550,000 for fiscal years 1995–1997. A total of \$5,741,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$156,099 state appropriations, \$29,409 industry, and \$11,365 miscellaneous in 1991; \$265,523 state appropriations, \$1,182 product sales, \$10,805 industry, and \$59 miscellaneous in 1992; \$212,004 state appropriations, \$315 industry; and \$103 miscellaneous in 1993; \$157,690 state appropriations, and \$7,103 miscellaneous in 1994; \$84,359 state appropriations in 1995; and \$191,835 non-federal support in 1996.

The grants have been awarded to the four regional animal drug coordinators located at Cornell University, the University of Florida, Michigan State University and the University of California-Davis, and to program Headquarters at Michigan State University. Research is conducted at these universities and through allocation of these funds for specific experiments at the State Agricultural Experiment Stations, ARS, the U.S. Department of Interior, and in conjunction with several pharmaceutical companies.

Selected categories of the Special Research Grants program address important national/regional research initiatives. The overall objectives established cooperatively with *FDAL* and industry are still valid. However, specific objectives continually are met and revised to reflect the changing priorities for FDA, industry, and consumers. Research projects for this program have involved 20 different animal and aquaculture species with emphasis given in recent years to research on drugs for the expanding aquaculture industry and increasing number of requests from the sheep, veal calf, and game bird industries. The minor use animal drugs program involves research on biological systems that by their nature are ever changing and representing new challenges to agriculture. Especially with the new sensitivities about safety and the environment, there is a high priority for continuation of these ongoing projects.

The agency conducted a formal review of the Minor Use Animal Drug Program in 1991. The program was found to be very productive and it was recommended that increased financial support should be sought in order to meet the national needs identified for the program. GAO also conducted a review of the program in 1991 and recommended additional support for the program. Each year the project is peer reviewed and twice a year the agency and representatives of the program meet with FDA to evaluate progress and to prioritize research. Biannually, a workshop is held to identify priorities for the program whereby producers, pharmaceutical companies, FDA, and researchers participate.

MOLLUSCAN SHELLFISH, OREGON

The research under this program was initiated in fiscal year 1995. A repository for the conservation of genetic material of molluscan shellfish was established during the first year of the project. This repository is serving as a source of genetic material for current breeding programs aimed at commercial production of shellfish with desirable traits. The researchers indicate that there is a national need for a molluscan broodstock development program to benefit the commercial industry through conservation, genetic manipulation and wise management of the genetic resources of molluscan shellfish. In view of the significant research needs in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this research. At the discretion of the state, Hatch Act funds or other funding sources could be used to support this research. The goals of this research program are to establish a repository for genetic materials of molluscan shellfish, to establish breeding programs for commercial production of molluscan shellfish, and to establish a resource center for the industry, researchers, and other interested parties in the United States and abroad.

The work supported by this grant began in fiscal year 1995 with an appropriation of \$250,000; fiscal year 1996 was \$300,000; and fiscal year 1997 is \$400,000. A total of \$950,000 has been appropriated. The university estimates a total of \$135,454 of non-federal funding in fiscal year 1995 primarily from state sources; in fiscal year 1996 no cost sharing was provided.

Research will be conducted at Oregon State University, Rutgers University, and the University of California at Davis. Although the specific research objectives outlined in the original proposal were to be completed in 1996, researchers anticipated that the original broad objectives would be completed in 1999. Progress has been made on major components of the research program. The anticipated completion date is for the broad research objectives is still 1999.

PART 1

966

The specific research outlined in the present proposal will be completed in fiscal year 1997. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The agency evaluates the progress of this project on an annual basis. The university is required to submit an accomplishment report when the new proposal is submitted to CSREES for funding. The 1996 review indicated that the researchers were well qualified to conduct the research, the research is being conducted in close cooperation with the private sector.

MULTI-COMMODITY RESEARCH, OREGON

The purpose of this research program is to provide agricultural marketing research and analysis to support Pacific Northwest producers and agribusiness in penetrating new and expanding Pacific Rim markets for value-added products. The program examines the potential for increasing the competitiveness and economic value added of Pacific Northwest agriculture through improvements in food production, processing, and trade by assisting decision makers in developing economic and business strategies. The principal researcher believes that Oregon and the other Pacific Northwest States produce a wide variety of agricultural commodities and products with commercial potential for export to Pacific Rim countries. Research and analysis is necessary to guide agricultural producers and processors in assessing these markets and developing market strategies and value-added products, and marketing strategies tailored to specific Pacific Rim markets. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research. The principal researcher believes this research to be of national, regional and local need.

The goal of this proposed research project is to gain better scientific understanding of the Technical, economic and social relationships that define Oregon's value-added agricultural sector, and examine how these factors affect the economic performance of this sector. Project objectives were to:

1. develop a pilot agricultural economic growth assessment model for Oregon's farm and value-added agricultural products. While developed as an Oregon-specific model, it is anticipated that the resulting approach and methodologies will be applicable to other Pacific Northwest state economies.

2. conduct and coordinate applied research focused on understanding the factors affecting the global competitiveness of Oregon agriculture and the roles of public policies influencing the long-term success of the industry.

3. reassess and modify as necessary existing economic performance benchmarks designated for the Oregon agricultural industry, and create strategies and actionable targets for industry performance to be achieved within defined time periods.

4. encourage and facilitate applied, industry-level research into value-added agricultural trade, marketing and policy issues affecting Oregon and the Pacific Northwest.

5. assess, on an on-going basis, related agricultural trade and marketing research across multidisciplinary fields at Oregon State University and other universities throughout the region. This will include work with affiliated universities to establish research projects that further the development of agricultural products, processes, or international markets.

6. establish, in collaboration with the Asian wheat foods industry, criteria for development of noodle of varieties best suited to Asian markets. This will enhance the competitiveness of U.S. wheats in the Asian wheat foods markets through the accurate description of wheat quality characteristics and the exploitation of wheat blends, an inherent strength of the U.S. multi-class wheat delivery system.

The research began in fiscal year 1993 with an appropriation of \$300,000. The fiscal year 1994 appropriation was \$282,000, and fiscal years 1995 through 1997 appropriations are \$364,000 for each year. The total amount appropriated is \$1,674,000. The non-federal funding provided for this grant was \$168,824 State appropriations in fiscal year 1992; \$177,574 State appropriations in fiscal year 1993; and \$162,394 State appropriations in fiscal year 1994. Due to a change in university policy, the university has not reported the amount of non-federal funds appropriated for fiscal years 1995-1997.

The research program will be carried out at Oregon State University in Corvallis, and at the Agricultural Marketing and Trade Program in Portland, Oregon. This Special Grant is awarded on a year-by-year basis. Thus, Oregon State University has traditionally requested funds for this project on an annual basis and has budgeted the funds to individual sub-projects on that basis. Progress on original objec-

PART 1

967

tives is as follows: baseline data has been accumulated, an economic growth assessment model is being formulated and tested, global competitiveness is being assessed for value-added Pacific Northwest agricultural products, targets for performance are being worked out with agricultural industries, and many trade teams have been involved in assessing the ability of U.S. based industries to meet the demands for noodle production for Asian markets. Anticipated completion date is 1998. However, in keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant. Research could be continued at the state's discretion using formula funds.

The agency reviews progress each year when a new proposal is submitted. We believe satisfactory progress is being achieved.

MULTI-CROPPING STRATEGIES FOR AQUACULTURE, HAWAII

In fiscal year 1993, the university redirected this research program to address the opportunities of alternative aquaculture production systems, including the ancient Hawaiian fish ponds on the island of Molokai. The university has developed a community based research identification process and has developed specific research projects to be included in this program. Current research includes work in the area of edible seaweed cultivation and the culture of the Pacific threadfin, a species indigenous to Hawaii. Previous research under this program led to the development of coproduction of shrimp and oysters in aquacultural systems. The technology developed from this program has been commercialized. The principal researchers indicate that the primary need for this research is to assist the native Hawaiians in improving the profitability and sustainability of the ancient Hawaiian fish ponds and other appropriate aquaculture systems as part of a total community development program. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal of this program was to develop technology for the coproduction of shrimp and oysters in aquacultural production systems. Research led to the development of oyster production systems that have been field tested under commercial conditions. The current research effort is aimed at developing sustainable commercial aquaculture production systems on the island of Molokai. Hatchery techniques have been developed for the culture of the Pacific threadfin. Techniques for the culture of two edible aquatic plants have been refined. Multidimensional field testing and evaluation of existing and restored ancient Hawaiian fish ponds is currently underway.

This research was initiated in fiscal year 1987 and \$152,000 per year was appropriated in fiscal years 1987 through 1989. The fiscal year 1990-1993 appropriations were \$150,000 per year; \$141,000 in fiscal year 1994; and \$127,000 in fiscal years 1995-1997, each year. A total of \$1,578,000 has been appropriated. The university reports a total of \$137,286 of non-federal funding for this program in fiscal years 1991-1994, \$318,468 in fiscal year 1995. The primary source of non-federal funding was from state sources.

Research is being conducted through the University of Hawaii on the island of Molokai. The completion date for the original project was 1993. The original objectives were met. The specific research outlined in the current proposal will be completed in fiscal year 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

The agency evaluates the progress of this project on an annual basis. The university is required to provide an accomplishment report when the new grant proposal is submitted to CSREES for funding. In addition, in 1996 the CSREES program manager conducted a site visit to Molokai to meet with the principal investigator and industry cooperators. The 1996 review indicated that progress has been made in the implementation of the program despite the challenges of developing a community based program in such a unique social and cultural environment.

NATIONAL BIOLOGICAL IMPACT ASSESSMENT PROGRAM

The National Biological Impact Assessment Program was established to facilitate and assess the safe application of new technologies for the genetic modification of animals, plants and micro-organisms to benefit agriculture and the environment. This program was established in fiscal year 1989. During the last decade there has been an explosion of new information produced by rapid advances in biotechnology and its beneficial application to agriculture and the environment. The research proposed for this program fulfills an important national need to provide scientists easy

PART 1

968

access to relevant information that will facilitate the preparation of scientific proposals that comply with the oversight and regulatory requirements for testing potential biotechnology products and foster the safe application of biotechnology to benefit agriculture and the environment. This program supports the agricultural and environmental biotechnology community by providing useful information resources to scientists, administrators, regulators, teachers and the interested public.

The original goal of the National Biological Impact Assessment Program was to provide easy access to reliable information on public health and environmental safety of agricultural biotechnology research. Its objectives were to increase the availability, timeliness and utility of relevant information to the biotechnology research community; facilitate the compliance of biotechnology research with oversight and regulatory requirements for testing biotechnology products; and provide informational resources to the scientific community that would foster the safe application of biotechnology to agriculture and the environment. This same goal continues today. Each year much new information is added and integrated into the computerized database. The system has evolved to adapt new computer technologies and is now available via internet and the World Wide Web. This computer-based information system now includes texts of Federal biotechnology regulations, proposed rules and policy statements; databases of biotech companies, and research centers, institutional biosafety committees and state regulatory contacts; resource lists of publications, directories, bibliographies and meetings; monthly newsletters developed and distributed by this program; relevant Federal Register announcements; and links to other electronic information resources. In addition, this program provides biosafety training through workshops for academic and corporate scientists, biosafety officers and state regulators. A Field Test Notebook has been developed as a reference text for these workshops.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$125,000; fiscal year 1990, \$123,000; fiscal years 1991–1993, \$300,000 per year; fiscal year 1994, \$282,000; and fiscal years 1995–1997, \$254,000 per year. A total of \$2,192,000 has been appropriated.

The co-principal investigator of this grant is Head of the Department of Biochemistry and Anaerobic Microbiology at Virginia Polytechnic Institute and State University. The university contributes its time to administer this grant which amounts to approximately \$5,000 each year.

This grant award is with Virginia Polytechnic Institute and State University. Former and current partners in the program include The Pennsylvania State University, Louisiana State University, North Carolina Biotechnology Center, University of Arizona, University of Missouri, Michigan State University, Purdue University, and the National Agricultural Library. There remains a continuing need to address the safety of field testing of genetically modified organisms to benefit agriculture and the environment. This continues to be a rapidly expanding field. Increasing amounts of new information needs to be properly integrated into the computerized information system each year. This program has been very successful in providing essential, updated information on the conduct of safe field experiments. Thus, the program remains a high priority and needs to be continued.

The National Biological Impact Assessment Program was extensively reviewed by an external panel of scientists in October 1994. The review report was highly complimentary regarding the Information Systems for Biotechnology funded by this special grant and recommended continuation of this program. The fiscal year 1997 proposal was peer reviewed and highly recommended for funding. Peer reviewers consistently conclude that the Information Systems for Biotechnology supported by this grant contains current, highly relevant, and useful information for the biotechnology research community. Scientists rely on this database as a source of current and accurate information in a rapidly changing field of science.

NEMATODE RESISTANCE GENETIC ENGINEERING NEW MEXICO

This research is designed to investigate naturally occurring compounds from diverse sources that may confer pesticidal resistance if introduced into agronomic plants. The main target pests are plant parasitic nematodes. The work is using molecular biological techniques to incorporate genes into agronomic plant which will shorten the time frame to produce transgenic plants. Progress includes the a Diphtheria A toxin has been engineered behind a root-knot promoter. The promoter triggers the toxin to kill the nurse cell, which is necessary for nematode development. Two proteinase inhibitor genes have been constructed and have been inserted into crop plants. The expression rate however is low at this time. Other genes that promote toxins have been constructed and inserted into experimental and crops plants. The bioassay with targeted pest appear very promising. The principal researcher be-

PART 1

969

lieves that the successful development of these techniques and subsequent transfer of nematode resistant genes into agronomic plants will provide an environmentally-sound system for all plants susceptible to plant parasitic nematodes. Because there are significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The original goal of this research was to provide an alternative approach for the control of plant parasitic nematodes through the use of molecular biological technologies to transfer pesticide resistant to plants. A nematode-stimulated promoter element was engineered for insertion in front of a bacteria toxin. A unique technique utilizing insect intestinal membrane vesicles were used as tools for detection of specific protein binding domains. The synthetic gene, CRY3A Bt has been successful in field trials on potato and eggplants.

The work supported by this grant began in fiscal year 1991 and the appropriations for fiscal years 1991–1993 was \$150,000 per year; \$141,000 was appropriated in 1994; \$127,000 in fiscal years 1995–1997, each year. A total of \$972,000 has been appropriated thus far.

The non-federal funds and sources provided for this grant were as follows: \$65,000 state appropriations in 1991; \$62,000 in state appropriations in 1992; \$75,000 in state appropriations in 1994; and \$75,000 in 1995. For 1996, the University and the Plant Genetic Engineering Laboratory are providing matching contributions in faculty and staff salaries, facilities, equipment maintenance and replacement, and administrative support. In 1997, there are no matching non-federal funds.

Research is being conducted at the New Mexico State University, and at collaborating universities in the region. The estimated completion date for this project is estimated to be in 2001. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The last evaluation of this project was a merit review conducted December 19, 1996. In summary, the overall goal of this project is to use molecular biological techniques to develop pesticide capability in plants of agronomic importance. The research accomplishments demonstrated the feasibility of insertion of toxin genes into plants for expression against nematodes. The use of the synthetic CRY3A Bt gene has been successful in potato and eggplant in field trails.

NONFOOD AGRICULTURAL PRODUCTS PROGRAM, NEBRASKA

This work focuses on the identification of specific market niches that can be filled by products produced from agricultural materials, developing the needed technology to produce the product, and working with the private sector to transfer the technology into commercial practice. Major areas of application include starch-based polymers, use of tallow as diesel fuel, improvements in ethanol production, use of vegetable oil as drip oil for irrigation wells, production of levulinic acid, the extraction of wax from grain sorghum and production of microcrystalline cellulose from crop biomass. The principal researcher believes our ability to produce agricultural commodities exceeds our needs for food and feed. These commodities are environmentally-friendly feedstocks which can be used in the production of many biochemicals and biomaterials that have traditionally been produced from petroleum. The production of the commodities and the value-added processing of these commodities is regional in scope. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The objectives of the Center are to identify niche markets for industrial utilization of agricultural products, improve and develop conversion processes as needed for specific product isolation and utilization, provide technical, marketing and business assistance to industries, and coordinate agricultural industrial materials research at the University of Nebraska, Lincoln. Accomplishments include developing a formula that combines starch from corn and wheat, plastic resin from polystyrene and polymethylmethacrylate and compatibilizing agents to make loose fill packaging materials. Collaborations with the private sector to optimize the technology and to initiate a startup company are ongoing. Crude degummed and dried soybean oil has been proven to be an effective drip oil for irrigation wells. Archer Petroleum in Omaha is developing a marketing plan for regional distribution through 2500 distributors. Crude beef tallow has been converted to methyl esters and studied as diesel fuel. Fuel tests and extensive engine studies have shown it to be compatible with petroleum diesel and diesel engines. Starch has been converted to levulinic acid using acid hydrolysis and an extruder. As an antifreeze, levulinic acid has a freezing point of -18°C , which is not as low as conventional antifreeze but is environ-

PART 1

970

mentally friendly. Other industrial uses of levulinic acid need to be explored. Protein films have been made and evaluated for potential use as coatings and in laminated packaging materials. These films may have a unique application for use as sprayed-in-place agricultural mulches. Seeds or plants could be easily planted by puncturing the film on the soil surface. Preliminary studies show significant potential for such film applications in controlling soil erosion.

The funding levels for this project are \$109,000 in 1990; \$110,000 per year in fiscal years 1991–1993; \$103,000 in fiscal year 1994; \$93,000 in fiscal year 1995; and \$64,000 in fiscal years 1996 and 1997. A total of \$763,000 has been appropriated.

The non-Federal funding for this project is: in fiscal year 1992, \$315,000, fiscal year 1993, \$330,000, fiscal year 1994, \$330,000, fiscal year 1995, \$309,000, and fiscal year 1996, \$251,000 and fiscal year 1997 \$250,000. These funds were from Nebraska Corn, Soybean, Wheat, Sorghum and Beef Boards, World Wildlife Fund, Nebraska Bankers Association, United Soybean Board and National Corn Growers Association.

This work is being conducted at the Industrial Agricultural Products Center, University of Nebraska, East Campus, Lincoln, Nebraska. The objectives of the original projects have been completed. Specific objectives have been identified in each renewal request. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

This project is evaluated annually based on an annual progress report. The lead staff scientist has reviewed the project and determined that the research is conducted in accord with the mission of this agency.

NORTH CENTRAL BIOTECHNICAL INITIATIVE

The North Central Biotechnical Initiative administered by Purdue University conducts a regional competitive research grants program for biotechnology research to enhance the economic value and commercial use of plant-based agricultural products of the North Central Region. The Initiative has funded biomolecular studies with commercial potential in corn, soybean, rice, barley, and alfalfa, as well as studies on significant plant pests such as corn borer, corn rootworm, and fungal pathogens. The principal researcher believes that the proposal links public and private research in plant biotechnology for enhanced commercialization of agricultural research that will contribute to regional and national priorities. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research. The principal researcher believes this research to be of national, regional or local need. The original goal of this project is to enhance the economic value and commercial use of plant-based agricultural products of the North Central Region. In 1996, the project awarded 13 grants for biomolecular studies with commercial potential in corn, soybean, rice, barley, alfalfa, and plant pests.

The work supported by this grant began in fiscal year 1995 and the appropriation for fiscal years 1995–1996 was \$2,000,000 per year and for fiscal year 1997, \$1,940,000, for a cumulative appropriation of \$5,940,000. At this time Purdue University has not allocated any direct non-federal funds for grants management. Purdue University staff are providing management and oversight support for the program. Non-federal support may accrue to individual research projects funded under the grant.

The funds are administered at Purdue University and the research is currently carried out at Purdue University, Iowa State University, Michigan State University, North Dakota State University, Ohio State University, University of Minnesota, University of Missouri, and University of Wisconsin. The researchers anticipate that work may be completed in fiscal year 1999. Completion of initially awarded grants will be in the summer of 1998 for two-year awards and later for programs extending beyond two years. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

The North Central Biotechnical Initiative was evaluated by an agency peer review panel on January 7, 1997. The panel expressed concerns about the project, primarily because of the brevity of the proposal and the absence of a proposal from the grant application. The agency requested additional information from the principal researcher, and the grant has been forwarded for final processing. The North Central Biotechnical Initiative was also featured in a biotechnology special grant seminar hosted by the agency on December 16, 1996, at which the principal investigator pre-

PART 1

971

mented progress and highlights to an audience of agency scientists, administrators, and awards management staff.

OIL RESOURCES FROM DESERT PLANTS, NEW MEXICO

The Plant Genetic Engineering Laboratory has been exploring the potential for the production of high value industrial oils from agricultural products. The effort has been focused on transferring the unique oil producing capability of jojoba into oilseed rape and soybean. With the development of technology to both isolate the enzyme components of oil biosynthesis and successfully transform the target plants, significant advances have been made with jojoba. In addition, oil enzymes have been studied in soybean, castor, oilseed rape, and meadowfoam. The principal researcher believes desert plant sources of valuable oils for industrial applications are typically low yielding and limited in climatic areas for farm production. Genetic engineering offers an opportunity to move genetic capability to high yielding major crops. Many of the oils and their derivative acids, waxes, and others can directly substitute for imports of similar polymer materials, especially petroleum. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research. The goal of the research is to transfer the unique oil producing capability of jojoba and other native shrubs into higher yielding crops such as oilseed rape and soybean. This is a form of metabolic engineering and it requires the transfer of coordinated groups of genes and enzymes into the host plant to catalyze the necessary biochemical reactions. Progress has included characterization and isolation of several lipid biosynthetic enzymes along with associated genes, binding proteins, and molecular enhancers.

This research began in fiscal year 1989 with a \$100,000 grant under the Supplemental and Alternative Crops program. Grants have been awarded under the Special Research Grants program as follows: fiscal year 1990, \$148,000; fiscal years 1991-1993, \$200,000 per year; fiscal year 1994, \$188,000; fiscal years 1995-1996, \$169,000 each year; and fiscal year 1997, \$175,000. A total of \$1,549,000 has been appropriated.

Non-federal funds are not provided for operational portions of this research. However, New Mexico State University and the Plant Genetic Engineering Laboratory provide \$90,000 for in-kind support per year including faculty salaries, graduate student stipends, facilities, equipment maintenance, and administrative support services.

The research is being conducted by the Plant Genetics Engineering Laboratory at New Mexico State University, Las Cruces, New Mexico. An estimate of the total time in Federal funds required to complete all phases of the project is 3-4 years. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

The Oil Resources from Desert Plants, New Mexico project was evaluated for scientific merit by an agency peer review panel on January 7, 1997. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project.

ORGANIC WASTE UTILIZATION, NEW MEXICO

Composted dairy waste is utilized as a pretreatment to land application. Composting dairy waste before land application may alleviate many of the potential problems associated with dairy waste use in agronomic production systems. Composting may also add value to the dairy waste as a potential landscape or potting media substrate. High temperatures maintained in the composting process may be sufficient for killing enteric pathogens and weed seeds in dairy waste. Noxious odors and water content may be reduced via composting. Composted dairy waste may be easier to apply, produce better seed beds, and not increase soil salinity as much as uncomposted dairy waste. The principal researcher believes the research will address the utilization of dairy waste combined with other high-carbon waste from agriculture and industry, including potash and paper waste, for composting. This approach to waste management will have high impact for states where dairy and agriculture are important industry sectors. This is especially true for New Mexico and the southwest United States, where the dairy business is growing rapidly. This research will also provide an additional pollution prevention tool for the industrial sectors dealing with potash and paper waste. In view of significant needs for research in high priority national interests such as pest management systems, funds

PART 1

972

are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal of the research is to determine the feasibility of simultaneously composting of dairy waste from agriculture and industry. The research will determine effects of utilizing composted waste, as opposed to raw waste, as a soil amendment on plant growth, irrigation requirements, and nutrient and heavy metal uptake. Phase 1, to determine the feasibility of simultaneous composting dairy waste with available high carbon wastes from agriculture and industry, has been completed. Phase 11, to determine the appropriate ratios of waste to carbon substrate for successful composting, is 50 percent completed.

The work supported by this grant begins in fiscal year 1996 and the appropriation for fiscal year 1996 was \$150,000, and for fiscal year 1997 is \$100,000. A total of \$350,000 has been appropriated. The non-federal funds for the duration of this grant from the state appropriation is \$50,000. There is another \$30,000 in-kind support from the industrial partners. Additionally, a sum of \$15,000 from the New Mexico State Highway Department is also being leveraged by this project.

This work will be carried out in New Mexico under direction of the Waste-Management Education & Research Consortium in collaboration with The Composting Council and industrial partners, such as Envio (Ohio), Plains Electric and McKinley Paper (New Mexico). Completion date will be January 1999. Objectives are being met as the project continues. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

This project has been evaluated based on the annual progress report and research findings presented at the annual Composting Council Conference. The lead staff scientist has reviewed the project and determined that this research is conducted in accordance with the mission of this agency.

PASTURE AND FORAGE RESEARCH, UTAH

CSREES has requested the university to submit a grant proposal in accordance with the Senate directive that has been received, and is being reviewed by the agency. The proposed research under this Special Research Grant will address issues related to forage production and utilization in Utah. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The original goal of this project is to develop a comprehensive guide for the management of irrigated pastures to assist livestock producers, reduce cost, and increase net returns.

The work supported by this grant begins in fiscal year 1997 and the appropriation for fiscal year 1997 is \$200,000.

Research will be conducted at the Utah Agricultural Experiment Station. The principal investigators anticipate the completion date for these objectives to be in 2002. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The proposal for the initial year's funding is currently under agency review.

PEACH TREE SHORT LIFE IN SOUTH CAROLINA

Progress continued in 1996 with focus on the continued evaluation of longevity and productivity of Guardian rootstocks on peach tree short life sites in the southeast and replant sites throughout North American. More fundamental work has involved the biochemical characterization of the egg-kill factor produced by a bacteria on nematode eggs. Other basic studies involved the cloning of genes associated with production and expression of toxins from the bacteria. The problem of the disease on peach, nectarine, and plum trees in the southeastern United States effects is very great. More than 70 percent of peach acreage in the southeast is effected. Due to the loss of chemical nematicides, this disease has increased to nearly three times the levels experienced when nematicides were in use. In South Carolina, an average of 100,000 trees died in the years between 1980 and 1986. Continued studies on improvement of rootstock and the use the cultivar Guardian BY520-9 has potential to benefit the entire peach industry including California, New Jersey and Michigan where bacterial canker is a problem. Because there are significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

PART 1

973

The goal of this research was the continued evaluation of productivity of peach Guardian BY520-9 rootstocks on peach short life and investigations into novel management for ring nematodes by bacteria. Recent accomplishments include increased Guardian seed production that reached 600,000 commercial seeds. The rootstock is being tested in a 22 states and provinces and continues to perform well. Bulk seed lots of Guardian was shown to be resistant to root-knot nematodes. Fingerprinting using RAPD successfully separated root-knot nematode resistant rootstocks from susceptible ones. The unique insertion site in four Tn5 egg-kill factor minus mutants were identified. The bacteria, *Pseudomonas aureofaciens* BG33R was shown not to produce chitinase but other enzymes.

Grants have been awarded from funds appropriated as follows: fiscal year 1981, \$100,000; fiscal years 1982-1985, \$192,000 per year; fiscal years 1986-1988, \$183,000 per year; fiscal year 1989, \$192,000; fiscal year 1990, \$190,000; fiscal years 1991-1993, \$192,000 per year; fiscal year 1994, \$180,000, and fiscal years 1995-1997, \$162,000 each year. A total of \$3,041,000 has been appropriated.

The non-federal funds and sources for this grant were as follows: \$149,281 state appropriations in 1991; \$153,276 state appropriations in 1992; \$149,918 state appropriations in 1993; \$211,090 state appropriation in 1994; \$193,976 in state appropriation in 1995, \$169,806 in state appropriation in 1996.

This research is being conducted at South Carolina Agricultural Experiment Station. The researchers anticipated that the work may be completed in fiscal year 1998. Adequate progress has been made to assure that the objectives will be met before the completion date. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The last agency evaluation was a merit review completed January 5, 1997. In summary, the evaluation of peach rootstocks with resistance to peach tree short life is of continued importance in managing this disease. The use of biological control strategies in suppression of plant parasitic nematodes are a complementary areas of research in that it can enhance disease management by protecting the peach rootstocks. Progress was made in all the objectives in 1996. Some accomplishments were the increased production and release of commercial Guardian seed and continued evaluation of the seed in 22 states and provinces. A molecular technique that separates resistant from susceptible peach rootstocks appeared successful in preliminary studies. Other accomplishments were on the identification of the Tn5 egg kill factor.

PEST CONTROL ALTERNATIVES, SOUTH CAROLINA

This grant supports research and technology transfer to provide growers with alternatives for managing pests and to implement the use of new alternatives reducing the sole reliance on chemical pesticides. The investigators contributing to the research and technology transfer at South Carolina believe that need for the development of alternatives for managing pests on vegetables is a regional and national problem. Research contributions are projected by South Carolina to impact vegetable production in the Southern region and consumers of vegetable production from the Southern region. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other formula funding could be used to support this research. In addition, future efforts will be made to collaborate with Integrated Pest Management (IPM) regional and state team representatives in finding solutions to the specified problem area.

The goal of this program is to investigate alternative methods of managing insects, plant diseases, and nematodes in vegetable crops as complements to or as substitutes for conventional chemical sprays. Principal accomplishments appear to rest in a four-year comparison of study plots of organically grown and conventionally grown vegetables. Residual nutrient levels in subplots treated with organic sources of fertilizer were greater than in subplots which received inorganic source of fertilizer. After four years of summer cropping followed by winter cover crop treatments, no herbicides nor pesticides have been applied to the study area. Weekly scouting has determined that harmful insect thresholds have not been reached. Naturally occurring beneficial insects were sufficient for pest control. The role of indigenous predators, parasites, and pathogens in controlling insect pests are being evaluated. Technology transfer to conventional and IPM systems has resulted in modified thresholds for caterpillar pests in collards and tomatoes which incorporate the impact of beneficials in the system and a sampling plan for tomato fruitworm which considers numbers of parasitized eggs used to schedule insecticide sprays. Numbers

of insecticide sprays were reduced by 75–100 percent and the weight of marketable fruits was the same in plots receiving weekly sprays.

This work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was \$125,000 per year. In fiscal year 1994 the appropriation was \$118,000 and in fiscal years 1995 through 1997, \$106,000 per year. A total of \$686,000 has been appropriated. South Carolina has provided \$124,860 per year from State appropriations.

This research and technology transfer program is being conducted at the South Carolina Agricultural Experiment Station, Clemson University at Clemson, Florence, and Charleston, South Carolina. The original objectives of the project were for five years. Funding last year completed the five-year duration, and researchers indicated that the work would be completed by the end of the last fiscal year. Research on objective A, develop and evaluate microbial pest control agents for control of plant pathogens and insect pests of vegetables, is defuse and non-conclusive. Work in this area could be submitted to competitive peer review programs where the investigators would need to clearly focus specific activities and receive the benefit of the comments of peer scientists. Research on objective B, determine the efficacy of innovative cultural practices for vegetable production systems in South Carolina, and objective C, assess the role of indigenous predators, parasites, and pathogens in controlling insect pests, determine environmental and biological factors that influence the abundance and distribution of these indigenous beneficials, and consider the presence of natural enemies, as well as pests, in management decisions, is the area where the most progress appears evident. The base of information and orientation of the research in this area is adequate and of quality that the investigators could compete well in competitive grant programs such as sustainable agriculture or regional IPM grant programs, and would benefit from the peer review process. Progress in this area is an ongoing process as explanations are sought for the results being obtained. Research on objective D, evaluate and develop germplasm, breeding lines and cultivars for resistance to major pathogens of commercially important vegetables, and objective E, transfer new technology to user groups, has not demonstrated any progress that would not be anticipated from ongoing conventional sources of funds. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

We evaluate this project annually when we process the grant. Last year we wrote to the South Carolina station indicating that they should consider initiating a comprehensive review with CSREES participation. CSREES plans to initiate this review before we process the 1997 grant.

PESTICIDE CLEARANCE

Pest Management for Minor Crops

The Pest Management for Minor Crops (IR-4) Program, formerly the Pesticide Clearance Program, is a joint effort between the State Agricultural Experiment Stations, CSREES, and the Agricultural Research Service. IR-4 provides the national leadership, coordination and focal point for obtaining tolerance and safety data for pesticides and biological control agents for specialty crops such as horticultural crops. The agricultural chemical industries have not economically-justified the time and expense to conduct the necessary research for pesticides with small market potential. With the Federal registration resulting from this research, a large number of small acreage crops such as vegetables, fruits, nuts, spices and other specialized crops have been provided with needed crop protection against pests. Protocols are written after careful review and inputs from representatives of grower groups, industry and researchers. The researchers then carry out field trials on priority needs to determine their effectiveness, safety and usefulness and then analyze the field grown commodities, where appropriate, to identify and quantify any residues that may persist. All of this is done according to the Environmental Protection Agency's (EPA) Good Laboratory Practices guidelines which calls for rigorous field testing and chemistry analysis. The research program then assimilates the data from all the grower groups and chemical industry, and petitions are written for tolerances and Federal registration or reregistration. The 1996 grants terminate between March 1996 and March 1998. The basic mission of IR-4 is to aid producers of minor food crops and ornamentals in obtaining needed crop protection products. IR-4 is the principal public effort supporting the registration of pesticides and biological pest control agents for the \$31 billion minor crop industry. This is a national research effort which identifies needs by a network of users and state university and Federal researchers. This research is highly significant to national, regional or local needs.

PART 1

975

The goal is to obtain minor use and specialty use pesticide registrations and assist in the maintenance of current registrations, and to assist with the development and registration of biopesticides and safer pesticide products useful in IPM systems for minor crops. This research effort has been responsible for data in support of 2,074 food use clearances, which include 1,127 since 1984, 3,602 ornamental registrations, and research on 26 biopesticides resulting in 18 minor use registrations. The Pesticide Clearance program continues to have a high productivity which, according to EPA, results in 40 percent of all EPA pesticide registrations.

Grants have been awarded from appropriated funds as follows: Program redirection in fiscal year 1975, \$250,000; fiscal year 1979, \$500,000; fiscal years 1977–1980, \$1,000,000 per year; fiscal year 1981, \$1,250,000; fiscal years 1982–1985, \$1,400,000 per year; fiscal year; 1986–1989, \$1,369,000 per year; fiscal year 1990, \$1,975,000; fiscal year 1991, \$3,000,000; fiscal years 1992–1993, \$3,500,000 per year; fiscal year 1994, \$6,345,000; and fiscal year 1995 through 1997, \$5,711,000. A total of \$52,529,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$891,856 state appropriations and \$65,402 industry in 1991; \$1,002,834 state appropriations and \$104,292 industry in 1992; \$1,086,876 state appropriations and \$310,133 industry in 1993; \$550,160 state appropriations, \$408,600 industry, and \$924,169 miscellaneous in 1994; \$775,432 state appropriations, \$266,714 industry, and \$751,375 miscellaneous in 1995; and an estimated \$800,000 state appropriations, \$250,000 industry, and \$800,000 miscellaneous in 1996.

Field work is performed at the State and Territorial Experiment Stations. Laboratory analysis is conducted primarily at the California, New York, Florida and Michigan Agricultural Experiment Stations with assistance by the Oregon, Hawaii, North Dakota, Arkansas, North Carolina, Washington, Virginia, Mississippi, Idaho, Pennsylvania and New Jersey Agricultural Experiment Stations. Protocol development, data assimilation, writing petitions, and registration processing are coordinated through the New Jersey Agricultural Experiment Station. ARS is conducting minor use pesticide studies at locations in California, Georgia, Illinois, Maryland, Ohio, Oregon, South Carolina, Texas, and Washington. ARS laboratories in Georgia, Maryland and Washington are cooperating with analyses.

Selected categories of the Special Research Grants program address important national and regional research initiatives. The pesticide clearance program, also referred to as pest management for minor crops, involves research on biological systems that by their nature are ever changing and presenting new challenges to agriculture. The IR-4 workload is anticipated to be long term because of the sensitivities about food safety and the environment, plus the reregistration of older pesticides mandated by the 1988 amendments to the Federal Insecticide, Fungicide, and Rodenticide Act—FIFRA. IR-4 developed a strategy in 1989 to defend needed minor use pesticides that were subject to reregistration but would not be supported by industry for economic reasons. In addition, the Food Quality Protection Act calls for more extensive residue data requirements which would take into account an additional safety factor for assessing pesticides on foods consumed by infants and children. IR-4 will fulfill these commitments by December 1997, the conclusion of reregistration process mandated by the FIFRA amendments. IR-4's updated strategic plan focuses on the registration of biopesticides and safer pest control technology for minor crops. This program thrust will be carried out along with the traditional minor crop pesticide clearance programs

Each year the program is peer reviewed and reviewed by CSREES' senior scientific staff. A summary of those reviews indicate excellent progress in achieving the objectives. In addition to the yearly evaluations, the program received an on-site external review sponsored by CSREES in December 1990, and a GAO review, the results of which were published in June 1992. The GAO report notes that IR-4 has an effective research agenda to include pesticides that are most likely to be approved by EPA, using the existing land-grant university infrastructure. The mentioned legislative requirements and regulatory standards add to IR-4's already significant workload.

PESTICIDE IMPACT ASSESSMENT PROGRAM

Research funded by the National Agricultural Pesticide Impact Assessment Program NAPIAP—discovers, gathers, publishes, and distributes information relating to the use and effectiveness of pest management alternatives essential to the maintenance of U.S. agricultural crops and livestock production. These data involve evaluating the biologic and economic impact and consequences of restricting the use of key pesticides either through voluntary cancellations or regulatory action. NAPIAP data augments National Agricultural Statistic Service—NASS—data by conducting

PART 1

976

commodity based assessments on minor-use or small acreage crops. To insure that there is no duplication of effort, NAPIAP coordinates information collection with NASS and concentrates its pest management inquiries on commodities not surveyed by NASS. This program provides the Environmental Protection Agency (EPA) and the USDA with information on the use and effectiveness of pest management alternatives essential to the maintenance of U.S. agricultural crops and livestock production. EPA uses this information in making environmentally sound regulatory decisions which have minimal risk to human health and the economic balance of U.S. agriculture. USDA uses these data to identify commodity sites where there are critical pest threats to production because no or few pest management alternatives exist. This national research and information delivery effort involves USDA coordinated cooperative interactions with scientists in all State Agricultural Experiment Stations and Cooperative Extension Services. The USDA and EPA receive state generated agricultural information needed for sound regulatory decision-making and the state partner receives federal funds, participatory input into the regulatory process, and direct access to timely regulatory information.

The National Agricultural Pesticide Impact Assessment Program—NAPIAP—has been an on-going research effort whose original goal in 1977 was to gather data to provide comprehensive assessments documenting what would be the impact on agriculture if certain pesticides would no longer be available. A federally coordinated network of state scientist contacts was developed in the intervening years as broader and more environmentally enlightened goals evolved within this program. Today the NAPIAP's goals are defined in its strategic plan as: first, in collaboration with USDA, EPA, and Land-Grant partners, to focus activities on collecting and delivering high quality, science based pest management information for use in the regulatory process; and second, maintain and enhance a strong partnership between the USDA and the Land Grant System in order to continue the positive interactive flow of vital pest management information between the USDA, the regulatory community, and production agriculture.

Grants have been awarded from funds appropriated as follows: Fiscal years 1977–1981, \$1,810,000 per year; fiscal years 1982–1985, \$2,069,000 per year; fiscal years 1986–1988, \$1,968,000 per year; fiscal year 1989, \$2,218,000; fiscal year 1990, \$2,437,000; fiscal years 1991–1993, \$2,968,000 per year; fiscal year 1994, \$1,474,000; and fiscal years 1995–1997, \$1,327,000 per year. A total of \$42,244,000 has been appropriated.

The majority of the cost of the state scientist and the NAPIAP program is born by the state partner. The exact contribution of each state is not known, nor has this information been requested to be reported to the federal partner during the duration of this program. The federal program funds provided to the states by the Cooperative State Research, Education, and Extension Service have been used by state partners to partially defray their costs of staffing a Pesticide Impact Assessment Program State Liaison Representative on their Land Grant campus. The remainder of the salary costs, facility costs, clerical support expenditures, supplies and program costs of the program's State Liaison Representative have been born by each state and these costs are considered the state funding provided to support this program. State estimates of their contributions to this program have ranged from 3 to 6 times the federal dollars that have been provided to support their cooperative efforts.

This work is underway at State Agricultural Experiment Stations in 53 states and Territories. Competitively awarded research funds which fill both national and regional informational needs are coordinated through a lead state in each of the four regions of the United States: California—West; Ohio—North Central; Northeast—Pennsylvania; and Florida—South. The National Agricultural Pesticide Impact Assessment Program—NAPIAP—has been an ongoing research effort whose original goal in 1977 was to gather data to provide comprehensive assessments documenting what would be the impact on agriculture if certain pesticides would no longer be available. A federally coordinated network of state scientist contacts was developed in the intervening years as the information needs of the regulatory agency increased. This is a multi-agency on-going program strongly supported by dollars and personnel within CSREES, ARS, ERS, and the Forest Service which is attempting to address the ever increasing data needs for information by EPA in recent years. As the impacts of the Food Quality Protection Act become more widely realized and IPM implementation requires measurements to comply with the Government Performance and Results Act, there will be an even greater need for pest management information traditionally gathered, developed, and processed by the NAPIAP.

A comprehensive evaluation and review of the national component of the National Agricultural Pesticide Impact Assessment Program—NAPIAP—was conducted in February 1995. The review panel's report was published in June 1995. The review team was composed of 10 scientists from EPA, Industry, and the Land Grant Sys-

tem. The recurring theme that emerged from the 1995 review was a directive to focus the NAPIAP program on data collection on the benefits of pest management alternatives. To address this directive, CSREES brought together the programmatic and budgetary components of CSRS and CES into a single coordinated NAPIAP effort. This reorganized program is now supported by parallel funding of Public Law 89-106 and Smith-Lever 3(d) dollars. In addition to NAPIAP program allocation funds, there is a regionally-based competitive grants program designed to: first, quantify the usage of different pest management alternatives; second, quantify yield and quality data related to pest management alternatives; and third, measure other benefit parameters related to agricultural pest management. The data gathered by NAPIAP will also be used to aid the Pest Management Alternative program efforts. There is strong potential for further collaboration between these two programs.

PHYTOPHTHORA ROOT ROT, NEW MEXICO

Work has continued to focus in general on development of strategies for sustainable vegetable production in irrigated lands. Work has continued on the search for Phytophthora root rot resistance in chilies, identification of molecular markers for rot tolerance genes, investigation on irrigation modification as a means to manage root rot, and soil bed temperature control as a means to control disease. Because the Phytophthora disease threatens chili production in west Texas, New Mexico, and Eastern Arizona, this problem is of state-and regional-scale significance. In view of significant needs for research in high priority national interest topics such as the integrated pest management systems initiative, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The original goal was to improve chili production through genetically superior cultivars, combined with new improved cultural practices. Researchers have developed a highly effective disease screen that selects resistant seedlings, found that genes for resistance to root rot do not provide protection against Phytophthora foliar blight, that a wild species of Capsicum is immune to the fungus, and that molecular markers are useful to introgress genes for tolerance. They also found that alternate row irrigation and drip irrigation significantly reduce Phytophthora root rot. Control of soil temperature with soil mulches can greatly impede the progression of root rot in the irrigated fields.

The work supported by this grant began in fiscal year 1991 with an appropriation of \$125,000 for fiscal year 1991. The fiscal years 1992-1993 appropriation was \$150,000 per year; \$141,000 in fiscal year 1994; and \$127,000 in fiscal years 1995-1997, each year. A total of \$947,000 has been appropriated. The non-federal funds supporting this project amount to \$255,319, from state appropriations and the California Pepper Commission.

Research is being conducted at New Mexico State University. The anticipated completion date for the original objectives was 1995. Those objectives have not been met. Related programs deal with research and development efforts designed to prevent or manage diseases impacting vegetable production in irrigated areas, and co-operators estimate that the objective of these programs should be met by 2002. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The last agency evaluation was made in December, 1996. In summary, the evaluation stated that the overall goal of this project is control of various soil-borne diseases of irrigated vegetable crops in New Mexico, with applicability to other southwest U.S. production areas. Specifically, the current effort focuses on Phytophthora root rot of chilies.

POSTHARVEST RICE STRAW, CALIFORNIA

The postharvest rice straw special grant is new in 1997 and has two main objectives: (1) characterize current capabilities, costs and constraints in harvesting and handling rice straw as a renewable material for commercial products and (2) investigate alternative harvest and handling systems and evaluate their specialized equipment and system designs. California legislation mandates reduction in the amount of open rice straw burning, the principal method of rice straw disposal. Efficient harvest and handling may make rice straw a suitable raw material for user businesses while meeting straw burning regulations and improving air quality. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The principal researcher believes this research to be of regional and local need. This research was initiated in 1997. The goal is to

PART 1

978

demonstrate efficient and economic rice straw harvest and handling, thereby establishing rice straw as a feedstock for value-added manufacturing and other uses.

The work supported by this grant begins in fiscal year 1997 and the appropriation for fiscal year 1997 is \$100,000. The University of California-Davis cites cooperation by the California Rice Industry Association and the California Rice Research Board. Cost-sharing support from non-federal funds is not included. Cost-sharing may become available from industry later in the project as prototype harvest and handling equipment and systems for rice straw are developed and tested.

Research will be conducted at the Department of Biological and Agricultural Engineering, University of California-Davis, California. It is anticipated by the University of California-Davis that the postharvest rice straw project will be completed in 2002, after a five year-period to meet objectives. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

Since 1997 is the first year for the postharvest rice straw project, no evaluation has been conducted.

POTATO CULTIVARS, ALASKA

This research will focus on the development of potato cultivars that might be useful as disease resistant seed stock for the contiguous U.S. This research will focus on the development of potato cultivars that might be useful as disease resistant seed stock for the contiguous U.S. However, in view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. This research will focus on the development of potato cultivars that might be useful as disease resistant seed stock for the contiguous U.S. Funding for this project was initiated in fiscal year 1997, so no accomplishments have been made under the grant to date.

The work supported by this grant begins in fiscal year 1997. Funding is appropriated in fiscal year 1997 for \$120,000. No information on non-federal funds have been reported to CSREES yet.

The research will be conducted in the state of Alaska. It is anticipated that the completion date for the original objectives will be within a 5-year period. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

Because this is a new project in fiscal year 1997, the agency has not had an opportunity to evaluate the project, but will follow its procedures of reviewing the University's proposal and the resulting progress reports.

POTATO RESEARCH

Scientists at several of the State Agricultural Experiment Stations in the Northeast, Northwest, and North Central States, are breeding new potato varieties, high yielding, disease and insect resistant potato cultivars, adapted to the growing conditions in their particular areas, both for the fresh market and processing. Research is being conducted in such areas as protoplast regeneration, somoclonal variation, storage, propagation, germplasm preservation, and cultural practices. The principal researcher believes this research effort addresses needs of the potato producers and processor. Research areas being studied include storage and postharvest handling of potatoes and their effect on potato quality. Potato producer and processor needs are breeding and genetics, culture factors and pest control on potato production. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. Efforts will be made to collaborate with IPM regional and state team representatives in finding solutions to specific pest concerns. The original goal was to improve potato production through genetics and cultural practices as well as improve storage for quality potatoes for processing and fresh market. This research has resulted in a number of new high yielding, good quality, disease and insect resistant, russet type cultivars, which are now being used in the processing industry and in the fresh market. Research by the Pacific Northwest States of Washington, Oregon and Idaho has resulted in the release of a number of cultivars, including Gemchip, Calwhite, Century Russet, Ranger Russet, Frontier Russet and Chipeta. In addition, North Dakota developed Norkatah as a result of this program.

Grants have been awarded from funds appropriated as follows: fiscal year 1983, \$200,000; fiscal year 1984, \$400,000; fiscal year 1985, \$600,000; fiscal years 1986-

PART 1

979

1987, \$761,000 per year; fiscal year 1988, \$997,000; fiscal year 1989, \$1,177,000; fiscal year 1990, \$1,310,000; fiscal year 1991, \$1,371,000; fiscal years 1992 and 1993, \$1,435,000 per year; fiscal year 1994, \$1,349,000; and fiscal years 1995 through 1997, \$1,214,000. A total of \$15,438,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$401,424 state appropriations, \$4,897 product sales, \$249,830 industry, and \$30,092 miscellaneous in 1991; \$567,626 state appropriations, \$6,182 product sales, \$334,478 industry, and \$44,323 miscellaneous in 1992; \$556,291 state appropriations, \$9,341 product sales, \$409,541 industry and \$44,859 miscellaneous in 1993; \$696,079 state appropriations, \$21,467 product sales, \$321,214 industry, and \$226,363 miscellaneous in 1994; \$935,702 state appropriations, \$35,376 product sales, \$494,891 industry, and \$230,080 miscellaneous in 1995; and an estimated \$900,000 state appropriations, \$10,000 product sales, \$400,000 industry, and \$200,000 miscellaneous in 1996.

The research work is being carried out at the Cornell, Idaho, Maine, Maryland, Michigan, North Dakota, Oregon, Pennsylvania, and Washington State Agricultural Experiment Stations. The project was initiated to accomplish significant results in about five years. Because the research is based on genetic varietal development, progress in developing new potato varieties takes from 5 to 10 years. Keeping with Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

Each year the grant is peer reviewed and reviewed by CSREES's senior scientific staff. A summary of that review indicated progress in achieving the objectives. In addition, the agency has at least one formal meeting with representatives from the potato industry to review research needs.

PREHARVEST FOOD SAFETY, KANSAS

The project is to examine the incidence of shedding of *E. coli* 0157:H7 in feces of beef cattle and the impact of various management procedures such as calving, weaning, routine cattle handling for vaccination, etc. on the frequency and amount of shedding of these bacteria. The study will focus on the differences between small and large cow-calf operations in Kansas. The presence of *E. coli* in cattle destined for slaughter and entry of meat products into the human food chain has given impetus to the need for understanding the ecology of the organism and the impact of management strategies, including herd size, on the prevalence of the organism and likelihood of contamination of meat supplies. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal of this research was to determine the relative incidence of shedding of *E. coli* 0157:H7 from beef cattle in small and large cow-calf operations and the impact of various management events in the production cycle on this bacterial shedding. The principal researcher expects this information will assist in reducing the prevalence of this organism in beef cattle and, thus, reduce the incidence of food-borne illness in humans due to this bacterium. To date, the research team has established new highly effective and rapid detection systems for identifying the *E. coli* organism in feces of cattle. The cooperating herds have been identified and initial collections have been made. Collaborative arrangements have also been established with scientists at the University of Nebraska-Lincoln for doing more intensive work with animals that are identified as "shedders". At this time they have met all of their goals on time and expect to continue to do so.

The work supported by this grant began in fiscal year 1996. The appropriation for fiscal years 1996 and 1997 was \$212,000. A total of \$424,000 has been appropriated. During fiscal year 1996 non-federal funds provided to this project were \$150,000 in state appropriations and \$91,450 in contributed indirect costs. It is anticipated that a similar contribution will be made by Kansas State University in fiscal year 1997.

This research is being conducted at Kansas State University, University of Nebraska-Lincoln and at ranches in Kansas, Nebraska and Colorado. The anticipated completion date was October 1, 1998, for the original objectives. At this time, the research team has completed all objectives that were planned for Year 1 of the grant and are working on the objectives for Year 2. It is anticipated that the other original objectives will be completed on schedule and the project should terminate in late 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

PART 1

980

The agency evaluates the progress of this project on an annual basis. The principal researcher has provided regular progress reports which have confirmed that the objectives are being accomplished in a timely manner.

PRESERVATION AND PROCESSING RESEARCH, OKLAHOMA

Research has focused on the effects of preharvest and postharvest factors on the market quality of fresh and minimally processed horticultural products, including factors affecting marigold petal pigment content, minimal processing procedures for extending the shelf life and reducing the oil content of pecans, and harvest quality evaluations for watermelons, pecans and peaches. Researchers are developing harvester prototypes for multiple harvest of marigold flowers and drying and threshing systems for marigold petal drying and separation. Work is ongoing to develop a fruit orienting mechanism to be incorporated into an on-line grading system and to develop integrated harvesting/postharvest handling systems for fresh market and processing market horticultural products. Research is also ongoing to develop methods to determine textural properties of pecans, determine optimum operating parameters for supercritical carbon dioxide and other alternative partial oil extraction, and develop and optimize modified atmosphere packaging techniques for pecan shelf life extension. Fiscal year 1997 funds will support research from July 1, 1997 through June 30, 1999. The principal researcher believes that technological improvements in fruit, nut and vegetable handling systems are critically needed to supply domestic markets and to support continued participation in international commerce and thus serves the national need. Regionally, processing systems under development for commercial adaptation provide crucial solutions required for market expansion of pecans, affecting product market potential and value throughout the southern U.S. Locally, improvements in postharvest handling and processing are necessary to support growth of the industry and ensure competitive involvement in national and international commerce of horticultural commodities uniquely suited for production in Oklahoma. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other formula funding could be used to support this research.

The goal of the research has been to define the major limitations for maintaining quality of harvested fruits, vegetables and tree nuts and prescribe appropriate harvesting, handling and processing protocols to extend shelf life and marketability of harvested horticultural commodities, thus maintaining profitability of production systems and assuring an economic market niche for Oklahoma producers and food processors. A systems approach to develop complementary cropping, harvesting, handling and processing operations has resulted in development of improved handling systems for cucurbit and tree fruit crops. Matching funding has supported development of nondestructive processing systems for partial oil reduction of tree nuts, to extend shelf life and lower the calorie content for the raw or processed product, resulting in development of a business plan for a commercial facility. Technologies and procedures previously developed for cucurbit and tree fruit systems are now being applied to support development of profitable okra, pepper, sage, basil, tree nut, sweetcorn, and marigold cropping, handling and light processing systems, with a targeted completion date of 1999. Research from this project provided the basis for commercial high relative humidity storage of peaches. Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$100,000; fiscal year 1986, \$142,000; fiscal year 1987, \$242,000; fiscal years 1988 and 1989, \$267,000 per year; fiscal year 1990, \$264,000; fiscal year 1991, \$265,000; fiscal year 1992, \$282,000; fiscal year 1993, \$267,000; fiscal year 1994, \$251,000; and fiscal years 1995-1997, \$226,000 each year. A total of \$3,025,000 has been appropriated.

Support from the State of Oklahoma, through the Oklahoma Agricultural Experiment Station and through the Oklahoma Centers for Advancement of Science and Technology, have been provided as follows: fiscal year 1991, \$126,900; fiscal year 1992, \$209,783; fiscal year 1993, \$219,243; fiscal year 1994, \$308,421; fiscal year 1995, \$229,489; and fiscal year 1996, \$366,570, for a total of \$1,460,405 in state funds. An additional \$16,100,000 has been committed by the State of Oklahoma for development of an Agricultural Products and Food Processing Center to support, among other programs, the horticulture processing initiatives, and to begin operation in the spring of 1997. The Oklahoma State University Division of Agriculture Sciences and Natural Resources has appropriated approximately \$2 million dollars to staff the facility.

This work is being conducted at the Oklahoma State Agricultural Experiment Station, in conjunction with ongoing production research at the Wes Watkins Agricultural Research and Extension Center and the South Central Agricultural Research

PART 1

981

Laboratories. The principal investigator anticipated that the fiscal year 1996 grant would support work through June 1998. It is expected that ongoing research will be completed in 2001. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on December 20, 1996. Though research progress was satisfactory, development and commercial adoption of new practices and equipment has been less certain. The project was evaluated as part of a comprehensive CSREES program site review in the fall of 1995, with a recommendation by the review team to continue the value-added product development.

RED RIVER CORRIDOR, MINNESOTA AND NORTH DAKOTA

The purpose is to conduct a program of research to assess emerging international trade opportunities for the Red River trade region and develop the means to be able to compete for such opportunities in order to stimulate economic development. Projects were initiated to assess the Corridor's transportation infrastructure, research and development capability, competitive position, export opportunities in Europe and Latin America, and trade strategies. Emphasis is placed on technology and information transfer to inform users and potential users. The University of Minnesota has submitted a grant proposal for fiscal year 1997 to CSREES, and the grant has been awarded. The researchers believe there is a regional need to find new and alternative markets to replace traditional markets that have little or no growth potential and to develop the capabilities to compete successfully for these markets. International trade is expected to support continued economic growth in this primarily rural, agriculturally dependent region. In view of significant needs for research in high priority national interest topics, such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The goal is to identify and assess export market opportunities and develop strategies and programs to improve the region's competitiveness in international trade. The program has completed studies on transportation services and costs, the region's trade position on specialty crops and metal fabrication, agro-industrial research and development capabilities, and export opportunities through collaboration with Canada. Studies in progress include trade strategies of selected European regions and their implications for regional trade strategies, trade opportunities with Mexico, bilateral technology transfer among businesses in the region, assessment and implications of Latin American transportation systems on trade, opportunities and linkages between rural Mexico and the Red River region, and relationships between social structure and rural development. This grant will be used to fund projects to expand the use by rural businesses of state-of-the-art telecommunications technologies to expand markets and up-grade worker skills.

The work supported by this grant began in fiscal year 1992. The appropriation for fiscal years 1992-1993 was \$200,000 per year, \$188,000 in fiscal year 1994, and \$169,000 in fiscal years 1995-1997. A total of \$1,095,000 has been appropriated.

The non-federal funds and sources provided for this grant are as follows: \$4,300 State appropriations and \$2,269 miscellaneous for a total of \$6,569 in fiscal year 1992; \$16,000 State appropriations, \$4,138 industry, and \$16,688 miscellaneous for a total of \$36,826 in fiscal year 1993; and \$1,600 State appropriations, \$1,637 industry, and \$29,501 miscellaneous for a total \$32,738 in fiscal year 1994. The preliminary allocation of non-federal matching funding for fiscal year 1995 is \$2,000 State appropriations, \$7,500 industry, and \$6,500 miscellaneous for a total of \$16,000. Therefore, a total of \$91,133 non-federal funds has been provided through fiscal year 1995. Data for fiscal year 1996 are not available at this time.

The research program is carried out by the University of Minnesota, Crookston, in collaboration with North Dakota State University. The researchers indicate that this phase of the program may be completed in fiscal year 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant.

A merit review was conducted of this project in 1996 which indicated that it has contributed to the strengthening of communications to rural America regarding international trade opportunities. A site visit is scheduled for 1997 to assess the project.

PART 1

982

REGIONAL BARLEY GENE MAPPING PROJECT

The objectives of this project are to: construct a publicly available medium resolution barley genome map; use the map to identify and locate loci, especially quantitative trait loci controlling economically important traits such as yield, maturity, adaptation, resistance to biotic and abiotic stresses, malting quality, and feed value; provide the framework for efficient molecular marker-assisted selection strategies in barley varietal development; identify chromosome regions for further, higher resolution mapping with the objective of characterizing and utilizing genes of interest; and establish a cooperative mapping project ranging from molecular genetics to breeding that will be an organizational model for cereals and other crop plants. The fiscal year 1995 grant proposal has been received and is being processed. The principal researcher believes barley breeders nationwide need information about the location of agriculturally important genes controlling resistance to biotic and abiotic stresses, yield, and quality factors in order to rapidly develop new, improved cultivars and respond to disease and pest threats. This project provides that information along with appropriate molecular markers to track these traits through the breeding and selection process. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal of this project has been to develop a restriction fragment length polymorphism map for barley and associated important genetic traits as a map to provide closely linked molecular markers for barley breeders. The project successfully mapped 300 molecular markers. Portions of the map are described as very dense and contain key location points for enhanced utility. The project is now using the map to locate quantitative traits loci of economic importance. These include genetic determinations for yield, maturity, rust resistance, plant height, seed dormancy, and components of malting quality. Technical papers have been published to report research results to the scientific community.

Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$153,000; fiscal year 1991, \$262,000; fiscal years 1992–1993, \$412,000 per year; fiscal year 1994, \$387,000; and fiscal years 1995–1997, \$348,000 each year. A total of \$2,670,000 has been appropriated. The nonfederal funds and sources provided for this grant were as follows: \$203,760 from industry in 1991; \$212,750 from industry in 1992; \$115,000 from industry in 1993; and \$89,000 from industry in 1994; and \$35,000 from the State of Washington and \$108,000 in other nonfederal funding, for a total of \$143,000 in 1995. An estimated total of \$163,000 of non-federal funds supported this project.

Research is being conducted in the following state agricultural experiment stations; Oregon, Colorado, Washington, Montana, Idaho, North Dakota, Minnesota, New York Virginia and California. The original objective of the “Regional Barley Gene Mapping Project” was to produce a genetic map of agronomically important traits of the barley genome. The anticipated time to complete this task was estimated at 10 years with completion in 1999. Many important genes have been mapped, some of which are being used to improve barley cultivars. Keeping with the Administration’s policy of awarding research grants competitively, no further Federal funding for this grant is requested.

This project is made up of many competitively awarded subprojects that are reviewed annually by a peer panel and selected for relevance to the original objective and scientific merit of the proposed research. This project has been judged as an exceptionally productive project which serves as a model for multiinstitutional, multidisciplinary competitively awarded research projects.

REGIONALIZED IMPLICATIONS OF FARM PROGRAMS

The purpose of this research is to estimate the impacts of farm, trade, and fiscal policies and programs and assess their alternatives on the economic viability of typical crop and livestock production operations located in different regions of the United States. The principal researcher believes there is a need for research that provides an assessment and evaluation of the potential impacts of Federal farm, trade, and fiscal policies on the economic viability and competitiveness of farmers located in different regions of the United States. Policy impacts vary regionally because of differences in farm productivity, input costs, climate, farm enterprises and size. The research results are widely used by farmers and public policymakers concerned about minimizing policy and program inequities between regions and farm sizes. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Spe-

PART 1

983

cial Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original, as well as current, goal was and continues to be to provide the farm community, extension, and public officials information about farm, trade, and fiscal policy implications by developing regionalized models that reflect farming characteristics for major production regions of the United States. The researchers have developed a farm level policy analysis system encompassing major U.S. farm production regions. This system interfaces with existing agricultural sector models used for farm, macroeconomic, and trade policy analysis. The universities have expanded the number and types of representative farms to 80. Typical farm models also are being developed for Mexico and Canada under a collaborative agreement for use in analyzing impacts of the North American Free Trade Agreement. Some 25 policy studies were completed this past year at the request of policymakers and farm groups including analyses of the impacts of various farm policy proposals on representative crop farms in the U.S., elimination of the rice program, conservation reserve program impacts on farms in the Great Plains, and revised baseline projections for representative farms. The representative farms were used extensively for analysis of farm level impacts of the alternative farm program proposals considered for the 1996 Farm Bill as well as implementation alternatives after passage of the Bill.

The work supported by this grant began in fiscal year 1990 and the appropriation for fiscal year 1990 was \$346,000. The fiscal years 1991–1993 appropriations were \$348,000 per year; \$327,000 in fiscal year 1994; and \$294,000 in each of the fiscal years 1995 through 1997. A total of \$2,599,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$288,843 State appropriations and \$46,773 industry for a total of \$335,616 in fiscal year 1991; \$45,661 State appropriations in fiscal year 1992; \$33,979 State appropriations in fiscal year 1993; \$40,967 State appropriations in fiscal year 1994; \$161,876 State appropriations in fiscal year 1995; \$187,717 State appropriations for fiscal year 1996; and \$137,100 for fiscal year 1997.

Research is being conducted by the Texas A&M University and University of Missouri at Columbia. The researchers believe this program is of a continuing nature for the purpose of assessing the impacts of existing policies and issues and proposed policy and program changes at the individual firm level for feed grain, wheat, cotton, rice, oilseed and livestock producers. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant. No formal evaluation of this project has been carried out.

RICE MODELING

The purpose of this research project is to develop a rice industry model with domestic and international components to aid U.S. farmers, millers, and policymakers in making production, investment, marketing and public policy decisions. Research is needed to assist both the U.S. rice industry and national policymakers in assessing the impact of existing and proposed changes in public policies for rice. This research enables improved analysis of both international and domestic policy changes on rice production, stocks, prices of substitute crops and consumption. However, in view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research. The original goal of this research was to develop international, national and regional models to analyze the impact of foreign and domestic policy changes, and forecast changes in production, stocks, prices of substitute crops and consumption.

The work supported by this grant began in fiscal year 1996. The appropriation for fiscal years 1996 and 1997 was \$395,000 for a total of \$790,000. For the 1996 fiscal year, state appropriations are estimated to be \$178,000; and for 1997, approximately \$150,000.

The research is being carried out at the University of Arkansas-Fayetteville and the University of Missouri-Columbia. The researchers anticipate that the domestic portion of the rice model will be complete by September 30, 1997. The international modeling research is a little over half completed and the researchers estimate another 5 years is required. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant.

We have conducted no formal evaluation of this project. However, each annual proposal is carefully reviewed for adherence to stated objectives and annual progress is discussed with the principal investigators.

PART 1

984

RURAL DEVELOPMENT CENTERS

The overall objectives of the research agenda of the five rural development centers are to: Improve economic competitiveness and diversification in rural areas; support management and strategic planning for economic development; create community capacity through leadership; assist in family and community adjustments to stress and change; and promote constructive use of the environment. The function of the Centers is to increase the productivity of regional faculty both in doing research on rural issues and in using that research to do effective outreach with rural communities. The number of research faculty who are addressing broader rural issues is declining in many places. The multi-disciplinary, multistate, work supported by the Centers becomes even more crucial in a period of reduced research emphasis. Critical needs are being met by Center support including public lands policy, changing rural migration patterns, fiscal alternatives for local governments, and forest stewardship education. Specific needs for regional research are reviewed annually by the Centers. The focus of proposals varies from year-to-year depending on the shifting priorities.

The Rural Development Center mission is to strengthen rural families, communities, and businesses by facilitating collaborative socio-economic research and extension through higher education institutions in the various regions. These program objectives are also consistent with one of the 5 major goals discussed in the fiscal year 1999 Performance Plan for the REE Mission Area. Research programs are undertaken after evaluating broader regional and national priorities. Following are some accomplishments of selected research activities conducted under the auspices of various centers. A group of economists from Oregon, Washington, and Nevada used recent developments in regional economic modeling to look at the effects on rural and urban economies of reduced timber harvests in Oregon and of limited grazing on public lands in northern Nevada. Rural-Urban Interdependence and Natural Resource Policy, a publication recently released by the Western Rural Development Center, reports these studies in detail. This report reflects core-periphery input-output modeling that has grown out of an earlier research project supported by the Center. Northeast Center staff have been working with faculty of the University of Minnesota Extension Service and West Virginia University Extension Service to alter and condense a business retention and expansion notebook. Retaining and expanding existing businesses in communities is an effective alternative approach to industrial recruitment. The resulting publication will appeal to and be appropriate for use by community leaders/volunteers interested in helping businesses maintain or expand their services in their community. The community development approach to solving business problems is what makes these materials so appealing. The authors are in their final stages of editing, and the materials should be available for purchase by the spring of 1997.

Grants have been awarded from funds appropriated as follows: fiscal year 1971, \$75,000; fiscal year 1972, \$225,000; fiscal year 1973, \$317,000; fiscal years 1974–1981, \$300,000 per year; fiscal years 1982–1985, \$311,000 per year; fiscal years 1986–1987, \$363,000 per year; fiscal year 1988, \$475,000; fiscal year 1989, \$500,000; fiscal year 1990, \$494,000; fiscal years 1991–1993, \$500,000 per year; fiscal year 1994, \$470,000; and fiscal years 1995–1997, \$423,000 per year. A total of \$9,695,000 has been appropriated.

Non-federal funds available to the four Regional Centers for Rural Development were: fiscal year 1991, \$1,117,000; fiscal year 1992, \$790,000; fiscal year 1993, \$900,000; fiscal year 1994, \$776,591; and fiscal year 1995, \$710,050; for a total of \$4,293,641 across the five years for which there are complete data.

The regional rural development centers include the following: Northeast Regional Center for Rural Development, Pennsylvania State University; North Central Regional Center for Rural Development at Iowa State University; Southern Rural Development Center at Mississippi State University; and Western Rural Development Center at Oregon State University. There is also a rural development project at North Dakota State University which receives funding from the annual Rural Development Centers appropriation. Most of the research sponsored by the four regional centers is actually performed by resident faculty at landgrant universities in the respective region through subcontracts from that center's grant. The regional rural development centers were established to provide an on-going "value added" component to link research and extension and by doing so to increase rural development under the special conditions in each region. The work of the Centers is being carried out in all 50 states and in some territories. The Centers compile a report of annual accomplishments and share those with the states in the region. The list of needs is constantly evolving and is being addressed through projects that are matched to the

PART 1

985

constantly shifting local agenda. The current phase of the program will be completed in 1997.

The Centers enlist the help of advisory committees that help establish operating rules and provide professional, technical counsel and peer evaluation of Center projects. Advisory committee members are qualified to fulfill these roles because they are directly involved in the scholarship of rural development and are knowledgeable on changing issues in rural areas. Specific site evaluations have been undertaken as follows:

Western Rural Development Center—November 1994
North Central Center—July 1992
Northeast Center—May 1993
Southern Center—August 1995

RURAL POLICIES INSTITUTE

The Rural Policy Research Institute (RUPRI) is a consortium of three universities designed to create a comprehensive approach to rural policy analysis. The Institute conducts research and facilitates public dialogue to increase public understanding of the rural impacts of national, regional, state, and local policies on rural areas of the United States. There is a need to be able to estimate the impacts of changing programs and policies on rural people and places. Objective public policy analysis can provide timely and accurate estimates of the impacts of proposed policy changes to allow more reasoned policy discussions and decisions. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding sources could be used to support this research. The original goal of the Rural Policy Research Institute was to create a new model to provide timely, accurate, and unbiased estimates of the impacts of policies and new policy initiatives on rural people and places. The Institute has completed a number of successful policy research projects and developed three analytic models central to its mission. These Projects focus on the rural implications of health care, education, housing, rural development, tax and telecommunications policy proposals. In addition, the Institute uses expert panels to provide policy decision support to a number of policy making groups at national and State levels.

The work supported by these grants began in fiscal year 1991 and the appropriation for fiscal year 1991 was \$375,000. The fiscal year 1992 appropriation was \$525,000; for fiscal year 1993, \$692,000; for fiscal year 1994, \$494,000; and fiscal years 1995 to 1997, \$644,000 each year. A total of \$4,018,000 has been appropriated.

Aggregated non-federal funds to support the Rural Policy Research Institute across the three universities involved include unrecovered indirect costs, salary support from university and other non-federal sources, and various other grants, contracts, and reimbursable agreements. They amounted to \$316,458 for fiscal year 1991; \$417,456 in fiscal year 1992; \$605,302 in fiscal year 1993; \$537,834 in fiscal year 1994; \$584,516 in fiscal year 1995; \$576,782 in fiscal year 1996; and \$186,859 in 1997. Total non-federal funding to date is \$3,225,207.

The Institute's member universities are: the University of Missouri-Columbia; the University of Nebraska-Lincoln; and Iowa State University, Ames. Current funding will sustain activity through January 1998. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant.

We have conducted no formal evaluation, however, annual project proposals are carefully reviewed, as are policy analyses produced by RUPRI.

SEAFOOD HARVESTING, PROCESSING, AND MARKETING, MISSISSIPPI

Research related to seafood safety, quality and by-product utilization has been supported by this grant. Compounds that are generally recognized as safe and naturally occurring viruses have been tested for their potential to control pathogenic *Vibrio vulnificus* that is associated with gastroenteritis and fatal septicemia following consumption of raw oysters. The researchers have also evaluated a new impedance technology to objectively and rapidly determine the freshness of seafoods. Researchers are also testing steam pasteurization to reduce catfish microflora and extend shelf life. The principal researcher believes that needs reflected in the project include providing consumers with affordable alternative seafood products. Alternative sources of seafood protein are needed because of a drastic decline in natural harvests due to overexploitation. Other needs addressed in this project include reducing pollution during seafood and aquaculture food processing by converting by-products into value-added food ingredients or materials. A regional interest for the

PART 1

986

Gulf coast is the potential devastation of the oyster industry if harvests are severely restricted during warm months. The present project seeks to provide alternative processing strategies to control foodborne disease agents in oysters. Locally, catfish processors are a major employer of the severely economically depressed Delta region of Mississippi. By further enhancing the value of catfish products, this project seeks to improve the livelihood of individuals both on the Gulf coast and in the aquaculture region of the state. In view of significant needs for research in high priority national interest topics such as improved pest management systems and food safety, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research.

The original goals of the research were to improve the quality and safety of catfish and improve the utilization of catfish byproducts and underutilized marine species. Due to successes of the original project, subsequent efforts are focusing on additional uses of seafood and aquaculture foods by improving processing strategies and providing alternative products from waste materials. The project has thus expanded to include crab, shrimp, oysters, freshwater prawns, hybrid striped bass, and crawfish.

The work supported by this grant began in fiscal year 1990 when \$368,000 was appropriated for this project. The appropriations for fiscal years 1991-1993 were \$361,000 per year; fiscal year 1994, \$339,000; and fiscal years 1995-1997, \$305,000 each year. A total of \$2,705,000 has been appropriated.

The State of Mississippi contributed \$1,949 to this project in fiscal year 1991; \$41,286 in fiscal year 1992; \$67,072 in fiscal year 1993; \$91,215 in fiscal year 1994; \$147,911 in fiscal year 1995; and \$61,848 in fiscal year 1996. Product sales contributed \$7,044 in 1991, \$13,481 in 1992, \$13,704 in 1993, and \$5,901 in 1994. Industry grants contributed \$14 in 1992 and \$31,796 in 1993. Other non-federal funds contributed \$80 in fiscal year 1991, \$838 in 1992, and \$17,823 in 1993. The total non-federal funds contributed to this project from 1991 through 1996 was \$501,962.

Research is being conducted by scientists in the Departments of Food Science and Technology and Agricultural Economics of the Mississippi Agricultural and Forestry Experiment Station at Mississippi State University and at the Coastal Research and Extension Center, Seafood Processing Laboratory, in Pascagoula, Mississippi. The principal investigators anticipate that research on the original objectives will be completed in 1999. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula or other funds.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. Since the agency has not yet received the proposal in support of the fiscal year 1997 proposal, the last review of the proposal was conducted on March 18, 1996. At that time, the agency science specialist believed that the projects addressed needs and interests of the regional seafood and aquaculture industries.

SMALL FRUIT RESEARCH

Research carried out using funding for this Special Research Grant has been to enhance the production and quality of small fruits in the Pacific Northwest which includes Idaho, Oregon, and Washington. Research has been focused on cold hardiness, breeding and genetics, and pest management. The principal researchers believe Washington, Oregon, and Idaho are important states for growing, processing, and marketing small fruits such as strawberries, blackberries, raspberries, grapes and cranberries. Research is needed to help solve the myriad of problems in order to remain competitive and expand markets. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding sources could be used to support this research.

The original goal of this project was to improve the production and quality of small fruits in the Pacific Northwest through research on cold hardiness, breeding and genetics, and pest control. Research progress to date for Oregon is the evaluation of new strawberry germplasm from Chile and North America for resistance to fruit rot, aphids, spider mites, and weevils; virus indexing of small fruit germplasm; better color stability of processed strawberries; increasing cranberry production through better weed control; and improving wine quality. Work is continuing in Washington on fruit physiology; cold hardiness of strawberries, grapes, and red raspberries; pest management of cranberries; and breeding of pest resistant strawberries. Idaho work continues on postharvest research for better marketability and adapting small fruit crops to high elevation growing conditions. Oregon and Wash-

PART 1

987

ington are jointly carrying out marketing studies to identify new market niches for berry crops and wines.

The work supported by this grant began in fiscal year 1991 and the appropriation for year 1991 was \$125,000, The fiscal years 1992 and 1993 appropriation was \$187,000 per year, fiscal year 1994 was \$235,000, and fiscal years 1995–1997 are \$212,000 each year. A total of \$1,370,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: 1991, \$1,562,078 state appropriations, \$40,933 product sales, \$62,993 industry, \$357,266 other nonfederal; 1992, \$1,465,969 state appropriations, \$90,453 product sales, \$119,164 industry, \$287,976 other nonfederal; 1993, \$1,539,255 state appropriations, \$91,954 product sales, \$161,141 industry, \$416,712 other nonfederal; 1994, \$368,375 state appropriations, \$45,430 industry and \$90,822 other nonfederal; and \$1,185,249 for fiscal year 1995.

The research is being conducted at Oregon State University, Washington State University and the University of Idaho. Oregon State University is the lead university. The original objectives of the project are still valid today. The main goal was to have a competitive industry to satisfy the needs of those using blueberries. However, the researchers anticipate that most of the objectives will be met within five or six years. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

These projects are evaluated on a yearly basis through a peer review mechanism set up by the University of Maine and by staff from the Cooperative State Research, Education, and Extension Service. Peer review ensures that good scientific practices and rationales are used while university and national staff reviews ensures that objectives are addressed and budgets are within the policies and regulations.

SOUTHWEST CONSORTIUM FOR PLANT GENETICS AND WATER RESOURCES

New Mexico State University, Los Alamos National Laboratory, Texas Tech University, the University of Arizona and the University of California at Riverside entered into a cooperative interdisciplinary research agreement constituted as the Southwest Consortium on Plant Genetics and Water Resources to facilitate research relevant to arid and semi-arid land adaptation. The overall goal of the Consortium is to bring together multidisciplinary scientific teams to develop innovative advances in plant biotechnology and related areas to bear on agriculture and water use in arid and semi-arid regions. The Southwest Consortium for Plant Genetics and Water Resources is addressing the need for an integrated program that identifies specific problems of southwest agriculture, coordinates water and biotechnology research aimed at solving these problems, and facilitates the transfer of this information for commercialization. The specific research objectives of the Consortium include the development of crops with resistance to: drought and temperature extremes, adverse soil conditions, and pests and parasites. The Consortium is also identifying technologies for improved water and nutrient delivery. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funding is not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding sources could be used to support this research. This research has national, regional and local applications.

The original goals of this Consortium remain to facilitate research to provide solutions for arid and semi-arid crop adaptation. Five participating institutions have developed research plans consistent with the Consortium's goals. Subgrants are awarded competitively following peer review to support research that would solve problems unique to southwest agriculture. Specific attention is given to interdisciplinary agricultural research. The Consortium has discovered a gene that makes plants more resistant to water stress. They have identified a genetic marker for salt tolerance and have compared a genetic system of wild plant species to domestic crops for differences in drought response. One research team has cloned a gene from alfalfa that controls an important biosynthetic pathway, another is working out the complex metabolism of salt tolerance in resistant plant types, and other teams have identified genes involved in pest resistance, herbicide tolerance and nutritional enhancement of arid-land forage.

Grants have been awarded from funds appropriated as follows: fiscal year 1986, \$285,000; fiscal years 1987–1989, \$385,000 per year; fiscal year 1990, \$380,000; fiscal years 1991–1993, \$400,000 per year; fiscal year 1994, \$376,000; and fiscal years 1995–1997, \$338,000 each year. A total of \$4,410,000 has been appropriated.

The Consortium's host institution, New Mexico State University, reports matching nonfederal funds of \$80,000 in state appropriations in 1992; \$100,000 in 1993;

PART 1

988

\$100,000 in 1994; \$100,000 in 1995; and \$100,000 estimated in state appropriations for 1996. These funds exist in the form of researchers' salaries, facilities, equipment maintenance and administrative support.

Research is being conducted by a consortium of institutions comprised of New Mexico State University, Los Alamos National Laboratory, Texas Tech University, University of Arizona, and University of California at Riverside. New Mexico State University is the lead institution. The project was initiated in 1986 and accomplished significant results in the first five years. Currently additional and related objectives have evolved and anticipated completion date for these is 2001. Many of the objectives of this research have been met. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested. Research could be continued at the State's discretion using formula funds.

Each year the grant is peer reviewed and reviewed by CSREES's senior scientific staff. A summary of that review indicated excellent progress in achieving the objectives.

SOYBEAN CYST NEMATODE, MISSOURI

The research being funded by this grant is crucial to the development of effective management strategies to understanding host-parasite relations of the pathosystem and each of its components. Two new nematode resistant soybean lines have been or will be released in 1996. The need for breeding soybean lines to develop resistant varieties with a broad spectrum of resistance continues. More fundamental research involves the utilization of new molecular technologies to identify genes responsible for resistance. Other aspects of the works relate to field management strategies for these nematodes including cultural and biological applications. The soybean cyst nematode, *Heterodera glycines* is the most serious pest of soybean in the United States. The problems continue to increase in the Midwest where 12 states have yield reductions in soybean because of this nematode. Due to the nematodes' ability to adapt to resistant varieties over time, new varieties are continually needed. Because there are significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal of this research was managing the soybean cyst nematode, *Heterodera glycines* through the development of new resistant soybean varieties and the use of biological and cultural management strategies. To date, a new soybean variety that has resistance to *Heterodera glycines* race 3 and moderator resistance to race 14 has been developed and will be released shortly. This variety also has resistance to *Phytophthora sojae*. Further, approximately 1,000 lines resulting from resistant soybean lines were selected for progeny row planting and 150 lines advanced to 1996 yield tests. Delsoy 5500, a soybean variety in maturity group V, was released in 1996 to five state experiment stations. A single dominant gene was determined to be a condition of resistance by two PI lines of soybean for *Heterodera glycines*, race 3 while there was a two gene difference between two PI line for race 5. The cultural studies involving no-till and disk-till varied in different locations while the effects of six cropping sequences indicated that *Heterodera glycines* can develop in the winter on certain host crops.

This is a renewal of grant that started in 1991. Grants have been awarded from funds as follows: fiscal year 1980-1981, \$250,000 per year; fiscal year 1982, \$240,000; fiscal years 1983-1985, \$300,000 per year; fiscal years 1986-1989, \$285,000 per year; fiscal year 1990, \$281,000; fiscal year 1991, \$333,000; fiscal years 1992-1993, \$359,000 per year; fiscal year 1994, \$337,000; and fiscal years 1995-1997, \$303,000 per year. A total of 5,358,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$105,012 state appropriations in 1991; \$84,368 state appropriations in 1992; \$168,017 state appropriations in 1993; \$118,725 state appropriations in 1994; \$33,498 state appropriations in 1995; and \$33,723 state appropriation in 1997.

This research is being conducted at the Missouri Agriculture Experiment Station and the University of Missouri. The anticipated completion date for the major objectives was 1996. Many of the objectives are being met but genetic interaction of the soybean cyst nematode/soybean is extremely complex. The anticipated completion date of the continuing research is 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The last evaluation of this project was a merit review in December, 1996. In summary, continued development of new management strategies for the soybean cyst nematode is extremely important.

PART 1

989

SPATIAL TECHNOLOGIES FOR AGRICULTURE, MISSISSIPPI

CSREES has requested the university to submit a grant proposal that has been received, and is being reviewed. This project will evaluate the Components of Advance Spatial Technology for Agriculture (ASTA), also known as precision farming, to improve the level of Crop Management and thereby improve farm income while avoiding adverse environmental impacts. Integration of ASTA Components included computers, Global Positioning, Geographic Information System and Yield Monitor will permit combining yield maps with agronomic data and variable rate technology for application of seed fertilizer and pesticides, as well as other management practices to specific sites as precisely the right amounts for optimum production with minimum inputs. The proposed research under this Special Research Grant will focus on evaluation of site-specific technology evaluation and utilization for the major agronomic crops in Mississippi. In addition, the technology evaluation information would apply to many other crops where precision farming systems are used. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The original goal of this project is to develop production management strategies utilizing site-specific technologies to enhance crop production efficiencies and environmental quality.

The work supported by this grant begins in fiscal year 1997, and the appropriation for fiscal year 1997 is \$350,000.

Research will be conducted at the Mississippi Agricultural Experiment Station. The principal investigators anticipate the completion date for these objectives to be in 2002. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. The proposal for the initial year's funding is currently under agency review.

STEEP III—WATER QUALITY IN PACIFIC NORTHWEST

The STEEP III study was established in 1996 as the third phase of the tri-state STEEP Program entitled "Solutions to Environmental and Economic Problems," to meet the needs of farmers and ranchers in the Pacific Northwest in solving severe problems with soil erosion and water quality, while maintaining economically and environmentally sustainable agricultural production. The principal researcher believes the Pacific Northwest wheat region is subject to severe wind and water erosion, which has taken a heavy toll of the topsoil in a little more than 100 years of farming. Due to the hilly terrain, water erosion has reduced potential soil productivity in the high rainfall areas of the region by about 50 percent. Wind erosion has reduced productivity on the sandy soils in the lower rainfall areas. Also, off-site environmental costs of water erosion are large. Although many of these are difficult to measure, they include damage from sediment to recreational areas, roadways, and other areas which costs taxpayers millions of dollars annually. Wind erosion, which occurs mostly in the spring and fall, also can be costly and environmentally damaging, and causes increasing concerns for human health and safety from blowing dusts. Water quality degradation is of increasing concern in the agricultural areas of this region, since sediment is a major pollutant of surface water runoff which may contain varying amounts of chemicals. The complex hydrology of the region's landscape has made it difficult to identify the sources of these chemicals in surface and ground waters. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The primary goals are: to obtain and integrate new technical/scientific information on soils, crop plants, pests, energy, and farm profitability into sustainable management systems; to develop tools for assessing the impacts of farming practices on soil erosion and water quality; and to disseminate conservation technology to the farm. The original STEEP and STEEP II projects for erosion control, and the successor STEEP III program for erosion and water quality control, have provided growers a steady flow of information and technologies that have helped them meet economic, environmental, and resource conservation goals. Through the adoption of these technologies, the researchers believe wheat growers have been able to reduce soil erosion, improve water quality, and maintain or increase farm profitability. This has been accomplished through a tri-state, multi-disciplinary approach of basic and applied research and through technology transfer and on-farm testing to assist growers with applying these research findings on their farms. The on-farm testing program has been especially successful because growers are involved directly in the research and education effort. For example, the on-farm testing program has evalu-

PART 1

990

ated conservation options that growers can use to meet Farm Bill conservation compliance requirements. STEEP programs have helped position farmers with new conservation technologies well in advance of deadlines to meet current and anticipated policy requirements. This preparation protects farmers against potential penalties and loss of government program benefits.

The work supported by this grant began in fiscal year 1991, and the appropriations for fiscal years 1991–1993 were \$980,000 per year; in fiscal year 1994, \$921,000; in fiscal year 1995, \$829,000; and in fiscal years 1996 and 1997, \$500,000 per year. A total of \$5,690,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$938,812 state appropriations, \$63,954 product sales, \$156,656 industry, and \$16,994 miscellaneous in 1991; \$1,025,534 state appropriations, \$75,795 product sales, \$124,919 industry, and \$88,696 miscellaneous in 1992; \$962,921 state appropriations, \$62,776 product sales, \$177,109 industry and \$11,028 miscellaneous in 1993; \$1,069,396 state appropriations, \$46,582 product sales, \$161,628 industry, and \$22,697 miscellaneous in 1994; and \$1,013,562 state appropriations, \$31,314 industry, and \$107,151 miscellaneous in 1995. In 1996, Washington received \$231,724 in state appropriations; Oregon passed Measure 5 which reduced revenues and imposed funding restrictions so they were unable to provide any non-Federal cost-sharing or matching funds; and Idaho contributed \$81,525 state support, and \$86,242 in estimated non-Federal grant support, for a total non-Federal contribution of \$167,767.

The work under STEEP III will be done at laboratories and field research sites at the University of Idaho, Oregon State University, and Washington State University. Cooperative on-farm testing will be conducted in cooperation with growers on their fields in Idaho, Oregon and Washington. The STEEP II project was completed in 1995. The results are compiled and are available as of January 1997 in a final, 5-year report. The STEEP III project started in 1996 and will continue through the year 2000 as a 5-year project. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Research could be continued at the State's discretion using formula funds.

The Cooperative State Research, Education, and Extension Service program manager annually reviews progress reports and proposes new research on the STEEP Program, and attends the annual meetings to assess progress. However, the program is evaluated each year by three committees: grower, technical, and administrative. Annual progress is reported at an annual meeting and compiled into written reports. These reports and the meeting are reviewed annually. Grower and industry input is solicited at the annual meeting on research objectives and accomplishments.

SUSTAINABLE AGRICULTURE, MICHIGAN

This project is intended to develop agricultural production systems that are highly productive and profitable as well as being environmentally sustainable. More specifically, this project will examine how to achieve a high nutrient flow from soil to crops and animals, and back to soil, with low loss to ground and surface waters. The principal researcher believes there is a need to better understand the biological processes occurring in Michigan's high-nutrient-flow crop and animal systems. With high water tables, networks of lakes and slow-moving streams, and concern about environmental standards, field contamination by agricultural production materials is a high priority. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. In addition, funding for these projects could potentially be available through a competitive grant under the Sustainable Agriculture Research and Education program. The specific goals of this research are to develop an agroecological framework for decision-making, develop crop and cover crop rotations, develop water table management strategies, and develop rotational grazing systems. Accomplishments to date include an extension publication on agroecology, development of on-farm compost demonstration sites, collection of research data and computer software models on water table management, and completion of initial research trials on rotational grazing at three sites in Michigan.

The work supported by this grant began in fiscal year 1994 with an appropriation of \$494,000; \$445,000 were appropriated in fiscal years 1995 through 1997, bringing total appropriations to \$1,829,000. Matching funds were provided at the state level for \$511,900 in fiscal year 1994, \$372,319 in fiscal year 1995, and \$359,679 in fiscal year 1996.

This work is being carried out in Michigan at several locations by Michigan State University. Locations include the Kellogg Biological Station and the Upper Peninsula Experiment Station. This project is currently scheduled to go through March

PART 1

991

31, 2000. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

Findings from this project have demonstrated that rotational grazing reduces production costs, and increases net profits, compared to traditional cow management. This project has also shown that composting is an effective way of stabilizing livestock waste, controlling odor, and improving nutrient composition for later land application. The computer modeling done with this project has shown reduced contamination of ground water through alternative management practices employed in the project.

SUSTAINABLE AGRICULTURE AND NATURAL RESOURCES, PENNSYLVANIA

This project studies the cycling of nutrients from animal agricultural production systems through soil and water into crops and back to food for animals or directly to humans in the case of vegetable production. Environmental degradation is a major concern of agricultural production near urban areas, especially with regard to pest management and pesticide use, nutrient loading of soils and water associated with chemical fertilizers and animal and poultry manures. However, in view of significant needs for research in high priority national interest topics such as improved pest management, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funds could be used to support this research. In addition, funding from the Sustainable Agriculture Research and Education (SARE) competitive grants program could be available for this type of research. The original goal of this research was to understand the cycling of nutrients from animal agricultural production systems through soil and water into crops and back to food for animals or directly to humans in the case of vegetable production. Conventional science in the late 1980's and early 1990's held that if only all animal wastes were composted, the nutrient management problems would disappear. However, the results of this research to date show that this is a more complex problem. If farmers are to manage their farm lands properly, indicators of soil quality and health must be developed that can be used by agricultural producers and consultants. Efforts under this project have been devoted to this goal.

The work supported under this grant began in fiscal year 1993. The appropriation for fiscal year 1993 was \$100,000, and \$94,000 was appropriated in each of the fiscal years 1994 through 1997 for a total of \$476,000. A total of \$195,901 in matching support from university, state and private industry sources was provided in fiscal year 1996.

Research is being conducted by the Pennsylvania State University with cooperators throughout the state. The anticipated completion date for the overall original project objectives in 1998. It is anticipated that the original objectives will be met at the end of 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

There has not been a formal evaluation of this project, but progress reports have been submitted to the agency and reviewed by our scientific staff.

SUSTAINABLE AGRICULTURE SYSTEMS, NEBRASKA

This project is aimed at integration of field crops, animal production, agroforestry, livestock waste management, and diversified enterprises to meet production, economic, and environmental quality goals. Farmers and ranchers in Nebraska and throughout the Midwest face increasing difficulties in maintaining profitable operations that are sustainable under increased production costs and more stringent environmental regulations. They continue to seek alternative production systems, integration of crop and animal enterprises, value-added products, including those from woody perennials, and new marketing approaches to secure more of the food dollar. Work on crop residue utilization is highly important to assess the loss of erosion mitigation when grazing occurs as well as the benefits of winter forage to production of lean beef. Erosion is still a major problem with monoculture cropping, and work with contour strips, residue management, and animal grazing is essential to provide good recommendations to farmers for how to manage fragile lands. However, in keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this Special Research grant is requested. At the discretion of the State, Hatch Act or other funding could be used to support this research. In addition, funding for these projects could potentially be available through a competitive grant under the Sustainable Agriculture Research and Education program. This project has involved several components, with a number of results to date. In improving erosion control through grazing, calves were fed cornstalks from October through March, and fed some supplements. The calves had lower costs of production, and reduced need for grain feed. The researcher's work on integrative

PART 1

992

cropping and agroforestry has shown that diversifying rotations centered around soybeans has provided increased economic returns. In the objective dealing with compost utilization, compost has provided increased sources of nitrogen and improved soil quality. Reports from this project have been disseminated through extension and through a sustainable agriculture newsletter.

This project began in fiscal year 1992, with an appropriation of \$70,000; subsequent appropriations are as follows: \$70,000 in fiscal year 1993; \$66,000 in fiscal year 1994; and \$59,000 in fiscal years 1995 through 1997. Total appropriations to date are \$383,000. Matching funds provided for this research include state funds in the amount of \$25,313 for fiscal year 1992, \$26,384 for fiscal year 1993, \$27,306 for fiscal year 1994, and \$36,091 in fiscal year 1995.

Research is being conducted by the University of Nebraska at several locations in Nebraska, with the major part of the project at the Agricultural Research and Development Center near Mead, Nebraska. The current project proposes work through March 31, 1998. It is expected that current objectives of the project will be met by this time period. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested. Findings from this project have shown that young cattle can be fed with lower costs if cornstalks are used as part of their ration. This system also allowed for a cropping pattern that reduced erosion. The corn, soybean, and agroforestry system showed the highest net income of the systems tested.

SUSTAINABLE PEST MANAGEMENT FOR DRYLAND WHEAT, MONTANA

This research will address pest issues of the dryland wheat areas of eastern Montana. The proposed research is specifically designed to address pest issues of the dryland wheat area of eastern Montana. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The original goal of this research was to provide pest management information to dryland wheat producers of eastern Montana where crop loss can approach \$100 million per year.

The work supported by this grant begins in fiscal year 1997 and the appropriation for fiscal year 1997 was \$200,000.

Research will be conducted at Montana State University Experiment Station. The project is proposed for a duration of 3 years and therefore should be completed after fiscal year 1999. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The expected completion date of the project is fiscal year 1999. Assessment of the precision of biological control organisms and estimates of profitability, marketability, and risk will be used to assess progress.

SWINE WASTE MANAGEMENT, NORTH CAROLINA

CSREES has received the grant proposal from North Carolina State University and is being processed at this time. The objectives of this project are: (1) to develop a prototype system for treatment of animal waste which will be used to study and optimize a new and innovative swine waste management treatment process; (2) to provide funds for additional technical staff to perform the work under this project; (3) to purchase additional analytical equipment; and (4) to provide funding for operation of the prototype facility. The prototype facility will consist of a set of eight tanks which will be connected by piping or hoses to enable researchers to test a variety of different strategies for treatment of animal waste, including anaerobic or aerobic digestion, removal of nutrients such as nitrogen and phosphorus, and alterations in the sequence of these various operations. The principal researcher has stated that North Carolina now ranks second in the United States in both pork and poultry production. The problem of waste management has become critical because adequate land for application of waste is not available in some areas, water quality problems have been noted in both surface and ground waters, nutrients from several lagoon failures have created serious pollution problems in rivers and coastal areas, and communities have become less tolerant of odor problems. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The original goal of this research was to enhance the design, development, and implementation of alternative swine waste management strategies and treatment systems. The project is awaiting the initial award of funds so no progress can be reported at this time.

PART 1

993

The work supported by this grant begins in fiscal year 1997 and the appropriation for fiscal year 1997 is \$215,000. The exact amount of non-federal funds to be contributed to this project in fiscal year 1997 is not known. However, faculty time from three individuals will be contributed to this project so it is anticipated that the non-federal contribution will be substantial.

This research will be conducted at North Carolina State University in Raleigh, North Carolina. The anticipated completion date is October 1, 1997. The project is just getting started so there is no interim progress to report at this time. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

An evaluation of this project has not undertaken since fiscal year 1997 was the first year funds were appropriated for this grant.

TILLAGE, SILVICULTURE AND WASTE MANAGEMENT, LOUISIANA

This research has five components: Rice and Cotton Tillage, Dairy and Poultry Waste Management, and Bald Cypress Silviculture. More specifically, the Rice scientists are looking for ways to improve stand establishment; the Cotton scientists are focusing on the use of tillage system to combat harmful insect populations; the Waste Management Scientists are quantifying the environmental and economic effectiveness of approved dairy and poultry waste disposal systems; and the Silviculturists are conducting a problem analysis of Louisiana's Bald Cypress forest. Since the crops, forest, and waste issues extend beyond the borders of Louisiana, this research may have application outside the state. However, in view of the significant research needs on national high priority issues, funding for this project is not proposed. At the State's discretion, Hatch Act or other funding could be used to support this effort.

The original goals were to: improve conservation tillage in rice and cotton production, to determine the effectiveness of no-discharge dairy waste treatment facilities, to determine permissible poultry litter land-treatment rates, and to evaluate wetland forest regeneration problems. All components of the project have established research studies and are monitoring progress. Each year the principal investigator initiates a review of the sub-projects and, in this fashion, is encouraging good dialogue and cooperation among the sub-project investigators and their respective departments. For instance, Louisiana State University's Poultry and Forestry Scientists are working closely to establish application rates and procedures for applying poultry waste to forest plantations.

The work began in fiscal year 1994. The appropriation for fiscal year 1994 was \$235,000, fiscal year 1995 to 1996, \$212,000 each year. This totals \$659,000. State funding in support of these areas of research exceeds \$750,000 annually.

Investigations are being conducted on the main campus at Louisiana State University as well as the Experiment Stations at Calhoun and Washington Parish. The original work was scheduled for completion in 1999. Early term objectives have been met even though they suffered the loss of a promising graduate student. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The last field evaluation was completed on December 12, 1995. The evaluation summary complimented the scientist on the interdisciplinary components associated with this project, along with their investigative procedures, report writing, and external networking.

TROPICAL AND SUBTROPICAL RESEARCH

The Tropical and Subtropical Research (T-STAR) Program is operating in coordination with the Caribbean Basin Administrative Group and the Pacific Basin Administrative Group. State Agricultural Experiment Stations that are members of the Caribbean group are Florida, Puerto Rico, and the Virgin Islands; members of the Pacific group are Hawaii and Guam. Nonmember institutional interests are represented by the Executive Director of the Southern Region Agricultural Experiment Station Directors, who is a member of the Caribbean group, and the Executive Director of the Western Region Agricultural Experiment Station Directors, who is a member of the Pacific group. The Agricultural Research Service also has representation on the two groups, as does the CSREES scientist who manages the T-STAR grant program. Funds for the program are divided equally between the two Basin Administrative Groups. The research objective of the program developed by the principal researchers is to improve the agricultural productivity of many of the subtropical and tropical parts of the United States. Special research grants have been awarded for research on controlling insect, disease and weed pests of crops; increasing the production and quality of tropical fruits, vegetables and agronomic crops;

PART 1

994

promoting increased beef production through development of superior pastures; detection of heartwater disease of cattle and the influence of heat stress on dairy cattle reproduction; better use of land and water resources; developing computer models for efficient crop production systems and animal feeding systems; developing computer models for land-use decisions; using biotechnology methodologies for improving plant resistance to viral and bacterial diseases; using biotechnology to develop non-chemical, or biological, strategies for controlling insect pests; and potential for growing new speciality crops. Fiscal year 1997 proposals have been requested.

The principal researchers believe there is a need for the T-STAR program to provide research-generated knowledge that enables informed choices in the responsible use of natural resources, facilitates the health and well being of American citizens through improved food safety and nutrition, provides frontline protection for the rest of the nation's farms and ranches from serious plant and animal diseases and pests, and enhances the ability of U.S. farmers to produce crops efficiently and economically and/or to introduce new crops and agricultural products with export potential to gain market share abroad. On a regional basis, the T-STAR program addresses the unique challenges of practicing tropical agriculture, that is presence of pests year-round, heat stress, post-harvest processing to meet regulatory requirements for export, etc. The local need of Americans living in tropical regions of the nation for T-STAR knowledge-based products to design and implement sustainable agricultural development within fragile tropical agroecosystems—particularly on tropical islands—and to develop new crops and niche markets. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant program. At the discretion of the States, Hatch Act or other funding could be used to support this research.

The original goal of this research was to increase the production and quality of tropical crops; control pests and diseases of plants and animals; promote increased beef production and conserve land and water resources. In fiscal year 1996, grants were supported for research on control strategies for Melon thrips; the biochemical nature of resistance to rust in nutsedge; development of bioherbicides for nutsedges; development of tomato cultivars with resistance to the spotted wilt virus; development of pheromones for monitoring and controlling the citrus root weevil; reducing the effects of heat stress in dairy cattle; development of a decision support system for vegetable production; finding cucurbits with resistance to silverleaf, developing a computer program for optimal supplementation strategies for beef and dairy cattle on tropical pastures; characterizing new strains of citrus tristeza virus in the Caribbean basin; determining the economic threshold for the citrus leaf miner on limes; using viral replicase genes to engineer rapid detection methods for geminiviruses; developing makers of bacterial spot resistance genes in tomato; breeding snap and kidney beans for resistance to golden mosaic virus and for heat tolerance; searching for resistance to papaya bunchy top disease; developing weed controls for yam production; and bioengineering ringspot virus resistance in papaya.

The operation of the tropical and subtropical research program was transferred from ARS to CSREES, with CSREES funding being first provided in fiscal year 1983. Funds in the amount of \$2,980,000 per year were appropriated in fiscal year 1983 and 1984. In fiscal year 1985, \$3,250,000 was appropriated. In fiscal years 1986, 1987, and 1988, \$3,091,000 was appropriated each year. \$3,341,000 was appropriated in fiscal year 1989. The fiscal year 1990 appropriation was \$3,299,000. The fiscal years 1991–1993 appropriations are \$3,320,000 per year; \$3,121,000 in fiscal year 1994; \$2,809,000 in fiscal years 1995–1996; and \$2,724,000 in fiscal year 1997. A total of \$46,546,000 has been appropriated.

For fiscal year 1996, more than \$1 million of nonfederal funds were provided to the T-STAR program from state appropriations. These state funds were in the form of faculty salary time commitments and indirect costs covered by the institutions.

This research is being conducted in Florida, Puerto Rico, Virgin Islands, Hawaii, and Guam. Work is also being done in other Pacific and Caribbean countries through agreements between institutions but not using federal funds. Research on tropical crop and animal agriculture to increase productivity, net profits, decrease harmful environmental impacts, conserve water, and natural resources. The need to continue with this project has been expressed by producers in the area, importers in the U.S. mainland and the institutions involved. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The projects that are funded by the T-STAR Special Research Grant have been peer reviewed by panels of scientists in the U.S. to assure that good science is undertaken. Also as part of the grant renewal process, progress reports are reviewed

PART 1

995

by the two Administrative Groups and by the grant manager at the national level. Workshops in which research results and their application for agricultural production are developed every two years. Research papers are published in the appropriate regional, national, and international forums available. The development in 1995 of the Strategic Plan for T-STAR provided a mechanism to define priorities, examine program direction, and recommend operational changes. One of the principal points considered was to bring the Caribbean and Pacific Basin components closer and better coordinated. T-STAR and the coordination which it implies was an outcome that will make this program better.

URBAN PESTS, GEORGIA

This research is focused on urban pests with specific emphasis on termites and ants. The principal researcher believes subterranean termites and ants are significant economic pests in the southeastern United States. Damage and control costs for termites in Georgia were estimated at \$44.5 million in 1993. It is estimated that Professional Pest Control Operators apply over 23 million pounds of active ingredient in and around homes each year. Chemicals currently registered for controlling these pests are less efficacious than desired and applied at an intensity that exceeds most agricultural settings. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other formula funding could be used to support this research.

The goal of the termite research is to better understand the foraging activities of subterranean termites and their responses to selected environmental cues in order to tailor monitoring and predictive strategies with efficacious conventional and alternative methods of control. Specific accomplishments in the subterranean termites research in 1996 are as follows:

A third year of data on termite foraging behavior was collected and completed in 1996. Three years of data indicates Subterranean termite colonies in Georgia are 500,000 termites per colony and are characteristically smaller than those in Florida and Canada, but are within the same size range of those in Mississippi. It is believed that colonies of subterranean termites are nonindigenous to Florida and Canada and are not subject to the same competitive interactions as those colonies that are native to Georgia and Mississippi. However, structures attacked by subterranean termites in Georgia are often attacked by more than one distinct colony. Three manuscripts have been published and one is in press in this area of research. Studies with termite baits in 1995 have demonstrated the seasonality of termite feeding activity and behavior impacts the timing of application and the timeframe for expected results from termite baiting. Research in 1996 demonstrate that the active ingredient used in termite baits must display a lack of dose-mortality effects for at least two weeks to insure consistent, significant, and long-term suppression of termite activity. Three manuscripts have been published. Mitochondrial DNA preliminary work indicates that human transport of termite-infested materials is the primary mode of termite dispersion and could result in a higher frequency of hybrid formation within the *genus Reticulitermes*. One manuscript has been accepted for publication.

The research supported by this grant began in fiscal year 1991, and the appropriation for fiscal years 1991-1993 was \$76,000 per year. In fiscal year 1994 the appropriation was \$71,000 and in fiscal years 1995-1997 the appropriation was \$64,000 each year. A total of \$491,000 has been appropriated. The non-federal funds and sources provided for this grant by fiscal year were as follows: 1991—none, 1992—\$26,000, 1993—\$18,000, 1994—\$59,530 and 1995—\$59,539.

This research and technology transfer is being conducted at the Georgia Agricultural Experiment Station in Griffin, Georgia. The grants have been processed on a year to year basis pending the availability of funds, however, the original objectives were essentially a five- to eight-year plan of work. CSREES entomologists judge that excellent progress has been made on foraging behavior and the identification and development of termite baits. The publication of the research results has also been excellent. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

This project has been evaluated on an annual basis by CSREES, and the progress has been excellent. Last year we documented the progress on foraging behavior, genetic isolation of termite colonies, new chemistry soil termiticides, the killing potential and repellency of several strains of the fungus *Metarhizium anisopliae*, termite baits and feeding activity and behavior that impacts the time frame for expected results from termite baiting. A peripheral objective on Argentine ants was completed last year with the development of commercial baiting stations used on the outside

PART 1

996

periphery of buildings. This method was proven effective in preventing infestations in apartment complexes and reducing ant complaints by residents.

VITICULTURE CONSORTIUM, NY & CA

The University of California and Cornell University in New York received funding in the spring of 1996 for research on varietal responses of grapes, modeling of water requirements, management of diseases including phyloxera and other cultural aspects of grape production. The fiscal year 1996 funds will be used by the lead institutions to fund projects in the various grape producing states within their region. The research being carried out is designed to help the viticulture and wine industries remain competitive in the United States and in the global market. Both these industries have a positive effect on the United States balance of payments. In view of the fact that there are significant needs for research in other high priority national interest topics, such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be used to support this research. The original goal of this research is to maintain or enhance the competitiveness of the U.S. viticulture industry in the global market.

Grants have been awarded from funds appropriated as follows: fiscal year 1996, \$500,000; fiscal year 1997, \$500,000. The non-federal funds used in conjunction with this grant have not been accounted for because these projects are in their first year and have not yet been evaluated. However, monitoring of non-federal funds used to further the projects will be carried out.

Research is being conducted in various states which include California, Washington, New York, and Pennsylvania. A recent review of the project revealed the research priorities set by the guidance group were not all addressed nor will they be in the near future. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

WATER CONSERVATION, KANSAS

This research program is designed to develop and disseminate technical and economic information on the efficient use of water for irrigated crop production in western Kansas. The following objectives comprise this program for the fifth year of the project:

1. develop regression models to estimate the longevity of subsurface drip irrigation systems using calculations of annual system performance deterioration based on 11 years of operating pressures and flow rates;
2. develop efficient advanced irrigation management procedures for subsurface drip irrigation systems for corn;
3. identify and evaluate the technically and economically feasible modifications to irrigation systems for irrigation of corn, wheat and grain sorghum as affected by well capacity, institutional water restrictions, and the new federal farm program and;
4. increase the availability of irrigation research information and best management practice recommendations to Kansas irrigators through a series of extension bulletins and updates based on research-based information.

An advanced study was conducted to evaluate the water use efficiency of high frequency deficit subsurface drip irrigation for corn production. The 1994-1996 results indicate that corn yields can be maintained at a level nearly equal to fully irrigated crop production at significantly lower water inputs when daily deficit irrigation is used. An advanced substudy was initiated in 1996 to develop water/land allocation strategies for corn using subsurface drip irrigation. This substudy was initiated as a result of the changes in the federal farm program which allow greater planning flexibility. These changes removed the need of irrigators to protect base acreages, so economic efficiency will be a strong determinant in water/land allocation strategies. This substudy along with economic and system longevity analyses will be continued in 1997.

Water is a precious resource to farmers in the Great Plains. Corn is a principle crop for feeding livestock. To produce corn in the Great Plains, additional water applied as furrow irrigation enhances production. The most common irrigation methods are furrow irrigation or center pivot irrigation. The need to conserve water has turned attention to drip irrigation as an efficient alternative. In view of significant needs for research in other high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

PART 1

997

The research goal is to determine the feasibility of subsurface drip irrigation and other alternative irrigation systems in western Kansas to sustain irrigated corn production to support the beef feedlot industry. The project also supports an educational effort through collection and dissemination of information on efficient irrigation methods. The project has a significant and active technology transfer and extension program. In 1996 alone, one paper was given at an international conference, three refereed journal articles were submitted, two extension publications were published, and ten other miscellaneous presentations and publications were made. The computer program Irrigation Economics Evaluation System is complete and will be distributed by the Kansas State University Cooperative Extension Service in 1997.

The work supported by this grant began in fiscal year 1993 with an appropriation of \$94,000; \$88,000 in fiscal year 1994; and \$79,000 in fiscal years 1995–1997 each year. The total funds appropriated are \$419,000.

The non-federal funds and sources provided for this grant were as follows: \$781,232 state appropriations, \$55,205 product sales, \$60,907 industry and miscellaneous in 1991; \$863,408 state appropriations, \$37,543 product sales, \$35,484 industry and miscellaneous in 1992; \$833,324 state appropriations, \$54,964 product sales, \$144,225 industry and miscellaneous in 1993. Amounts for other fiscal years are not available.

The research is being conducted at Kansas State University. The field portion of the research is being conducted on Research Centers at Colby and Garden City, Kansas. Additional work is being carried out on campus at the Departments of Agronomy and Agricultural Economics in Manhattan, Kansas. The original anticipated completion date for the project was May 31, 1998, following the funding in fiscal year 1997. The original objectives of the project appear to be on track for completion by that date. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The project has been peer reviewed. The reviewers felt the project concept to be valid and the timetable for accomplishments to be on target. The research as outlined in the proposal is within the mission of the Agricultural Experiment Station and is a high priority to Kansas agriculture.

WATER MANAGEMENT, ALABAMA

The program components of the Water Management, Alabama project include: renovation as a water quality enhancement practice for pastures fertilized with poultry waste, the efficacy of a new biocidal polymer water filter against *Cryptosporidium* oocysts and *Giardia* cysts, improving effluent quality of the in-pond raceway fish culture system through removal and infiltration of fish wastes, relationships between landscape characteristics and nonpoint pollution inputs to coastal estuaries, and resource management for enhancement of environmental quality as conservation reserve program contracts expire in the Alabama Black Belt.

The principal researchers believe that perennial pastureland is the most common disposal area for waste collected from confined animal operations in the humid Southeast. This is especially true in broiler chicken production areas such as Alabama, where litter is generated, since this material can be used as both fertilizer and feed in associated cattle operations. Most broiler production in this region is highly concentrated where topography and soil fertility limit row crop production. Although application of high rates of poultry wastes to perennial pastures in these areas has the potential to cause environmental pollution, operators have few alternatives to land application. This research provides solutions and/or potential recommendations for utilization of broiler litter in the best manner to protect water from both nitrogen and phosphorous application. With the considerable acreage that is coming off the Conservation Reserve Program, this research will give guidance to landowners and government agencies in the best use for the land. Published guideline handbooks have been distributed and the researchers believe they are providing much assistance to landowners, county agents, Natural Resources Conservation Service personnel, and others in applying best management practices.

The potential for Geographic Information Systems to be major tools for determining the best use for land so as to protect the environment will be enhanced because of this study. Entire watersheds can be protected as landowners, land use planners and government entities make decisions for the future. The data provided by this study are particularly important in light of proposed revisions to the Coastal Zone Management Act. Given concerns regarding land use activity in the coastal zones, these data may provide indications of which combinations of land use and land forms may be problematic in terms of water quality. In view of significant needs for research in high priority national interest topics, such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At

PART 1

998

the discretion of the state, Hatch Act or other funding could be used to support this research.

This is a new grant, however, water quality work has been ongoing in Alabama in recent years. This previous research will be used to strengthen and backdrop work for this grant. Previous research has shown the relationships between cattle foot traffic, forage canopy, ground cover, root biomass, and nutrient uptake for grazed versus hayed tall fescue following two renovation tillage treatments. As a followup to this research, 25 Conservation Reserve Programs were surveyed. This included 300 sampling points, each covering 300 acres. Instrumentation was installed on several of the properties for measurement of soil erodability. Non-point source pollution in streams is being examined using the Geographic Information System and Remote Sensing analysis tools to assess the relationships between land use complex and water quality. Lands within each sub-watershed were classified according to their use, and the location of forested land use relative to the stream channel was noted. A linkage model was developed which relates land use/land cover with non-point source pollution.

The work supported by this grant begins in fiscal year 1997 and the appropriation for fiscal year 1997 is \$170,000. The non-federal funds and sources provided for this grant for fiscal year 1996 are as follows: \$894,344 state appropriations; and \$572,342 miscellaneous. It is anticipated that the University will more than match federal funds for this grant with state appropriations and miscellaneous non-federal funds in fiscal year 1997.

This work is being conducted at the Auburn University Main Campus, and at the Upper Coastal Plain Substation at Winfield, Alabama, the Tennessee Valley Substation at Belle Mina, Alabama, the Black Belt Substation at Marion Junction, Alabama, the Sand Mountain Substation at Crossville, Alabama, and on private forest land near Greenville, Alabama. It is anticipated that the completion date of the project will be August 31, 1998, even though selected objectives will be met sooner. Work is proceeding on all objectives and some of them have already been met. Some objectives will be completed at the end of summer 1997 and others will continue through August 31, 1998. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

The Program Manager from the Cooperative State Research, Education, and Extension Service reviewed and evaluated the proposed research prior to the award of the grant, and reviewed and evaluated the annual progress reports from the Principal Investigator, following internal review by the University. Annual progress reports are due to be submitted by the individual research investigators to the University on March 1, 1997, after which a University evaluation will be made on each segment with the project leaders and department heads during March and April 1997, prior to submission to the Cooperative State Research, Education and Extension Service for review and approval.

WATER QUALITY

The Cooperative State Research, Education, and Extension Service (CSREES) continues support of this national, competitively-awarded grants program as part of USDA's Water Quality Initiative. The program supports research to investigate the impacts of non-point source pollution from agriculture on water quality and to develop improved, sustainable agricultural practices and systems that protect the environment and are economically profitable. Also, this program supports research on five Management Systems Evaluation Area (MSEA) projects as part of the Midwest Initiative on Water Quality to develop new farming systems that protect water quality, with research located at 10 sites throughout the Corn Belt. This program is conducted jointly with the State Agricultural Experiment Stations, USDA's Agricultural Research Service and Natural Resources Conservation Service, the U.S. Environmental Protection Agency, the U.S. Geological Survey, extension specialists, and other Federal, State, and local agencies. The water quality grants have supported more than 300 research projects across the country. In fiscal years 1996 and 1997, funds were awarded to the five MSEA projects in the Midwest to continue the water quality systems research started in 1990. In 1996, new projects were initiated as Agricultural Systems for Environmental Quality. The new projects focus on watershed-scale agriculture production systems that reduce pollution of soil and water while maintaining productivity and profitability. Concerns have been raised by the public about the possible risks to the environment and soil and water quality resulting from the use of agricultural chemicals. Better methods detection of minor amounts of chemicals in water have made the public, farmers, and policy-makers more concerned about the use and management of these agricultural chemicals and wastes, while meeting the challenge of maintaining the efficiency and productivity

PART 1

999

of agricultural production systems. Water quality continues to be of high priority at local, regional, and national levels. Results from the research are providing technologies to reduce pollutants, guidelines for site-specific farming, and improved farming systems.

The original goals of the program were to determine the extent to which agriculture has impacted ground water quality, and to develop new, improved, cost effective agricultural systems that enhance ground water quality. During the past three years, focus and allocation on resources have increased for surface water quality. Major progress has already been made on these goals. Examples of some of the results of recently completed research include the following:

1. Nitrogen continues to be of concern as a pollutant in our Nation's waters. The rapid expansion of the Hypoxic zone in the Gulf of Mexico in 1993 has focused additional attention on nitrates coming from several sources, including agriculture. Nitrogen testing research and implementation of the Pre-sidedress Nitrogen Test in the Northeast and Midwest is helping producers match the supply and demand for nitrogen, thus reducing excess application.

2. Crop rotations can significantly reduce nitrate pollution. In the Pacific Northwest, nitrate lost from the root zone of irrigated potatoes can be effectively recaptured by following with a grain or forage crop.

3. The Management System Evaluation Area modeling group has adapted, improved, and verified the usefulness of the Root Zone Water Quality Model as a tool for extending MSEA results beyond the research sites. The model predicts the movement of water and agricultural chemicals.

The work under the Water Quality Program began in fiscal year 1990 with an appropriation of \$6,615,000. The subsequent appropriations were as follows: \$8,000,000 in fiscal year 1991; \$9,000,000 in fiscal year 1992; \$8,950,000 in fiscal year 1993; \$4,230,000 in fiscal year 1994; and \$2,757,000 in fiscal years 1995 through 1997. A total of \$45,066,000 has been appropriated for the Special Research Grants Water Quality Program. The non-federal funds in support of the Water Quality Program, provided by state appropriations, industry, product sales, and other local sources, have averaged approximately \$1,000,000 annually since the program began in 1990.

Funds provided under the Water Quality Program have been awarded to institutions in virtually every state, so work is being carried out in all parts of the country. The MSEA projects of the Midwest Initiative on Water Quality are headquartered in Iowa, Minnesota, Missouri, Nebraska, and Ohio, with satellite locations in North Dakota, South Dakota, and Wisconsin. Three new projects located in Indiana, North Carolina, and Ohio were initiated in fiscal year 1995. The original goals of the USDA Water Quality Research Plan were to: (1) assess the seriousness and extent of agriculture's impact on ground water quality, and (2) develop new and improved agricultural systems that are cost effective and enhance ground water quality. The original project was developed for five years with the expectation that it would be reviewed and possibly extended beyond the five year period if warranted. The 1995 review of the program identified a need for increased attention to surface water quality problems. The research funded under the Special Research Grants Program has produced significant progress in understanding the impacts of agricultural practices on surface and ground water pollution, and in developing improved agricultural systems that are economically and environmentally sustainable. Implementation of some of these improved agricultural systems is already underway in a number of states. The focus over the next five years will be on developing and implementing agricultural systems that utilize the results of research funded under this program. The March 1995 Water Quality Users Conference brought together research findings and new technologies that have been developed.

An external review team evaluated the Management System Evaluation Areas and associated component projects. All MSEA projects have an impressive record of successfully implemented interdisciplinary teams to study water quality problems. Credibility and confidence in experimental data has been assured by implementation of quality assessment/quality control procedures, and a diversified delivery system/educational outreach effort will be a necessary key component of MSEA success.

WEED CONTROL, NORTH DAKOTA

The project is designed to reduce the environmental pollution caused by the extensive usage of herbicides for weed control and provide growers with environmentally safe weed control systems. The present project addresses three areas; one being crop production practices, second, weed biology and herbicide resistance, and third, efficient herbicide usage. In crop production practices, systems experiments have been established at three locations that include crop rotation, tillage, seeding method and

PART 1

1000

timing; these variables are incorporated into sustainable, reduced tillage and conventional systems. Results being monitored include the effect of weed control intensity on long-term weed infestations and economic returns. The emphasis in weed biology research is with kochia, wild oat, and green foxtail that are herbicide resistant. In efficient herbicide usage, several factors are being studied such as application methods to improve weed retention of herbicides and weed-detecting sprayers to treat only areas where weeds are present. The research addresses new methods to control weeds using systems control with multi-year, multi-crop rotations, reduced pesticide applications, that better simulate a typical on-farm sequence than short-term grants. Some variables included in the research are reduced pesticide applications and techniques to enhance herbicide efficacy. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The original goal was to develop new, efficient weed control methods. To accomplish this, long-term field experiments have been initiated to obtain basic crop-weed biology and production system information. The first three years of the rotation experiments have been completed in 1993 through 1995. Changes in weed populations were beginning to occur in 1995 and the environmental conditions were atypically wet during these three years; these observations support the need to complete at least two cycles of the rotation for a total of at least eight years to obtain reliable scientific information. The improved efficiency of weed control method has developed adjuvants to overcome the antagonism of salts, which naturally occur in water and reduce the efficacy of some herbicides. Another approach is adjuvants to reduce the herbicide rate required and/or to improve their performance consistency. Kochia genetic lines have been developed that are homozygous for resistance to various studies to determine inheritance and possible spread of herbicide resistance. Fields are being monitored for the development of kochia resistance to dicamba. A better understanding of how herbicide-resistant weeds occur in a population should be useful to developing methods to prevent herbicide resistance from becoming an unmanageable problem.

The work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was \$500,000 per year; \$470,000 in fiscal year 1994; and \$423,000 in fiscal years 1995 through 1997. A total of \$2,739,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: no matching in 1991; \$27,030 state appropriations in 1992, \$48,472 state appropriations in 1993, \$41,969 state appropriations in 1994, \$71,847 state appropriations in 1995, and an estimated \$70,000 state appropriation in 1996.

Research is being conducted at North Dakota State University. The original anticipated completion date was a minimum of 5 years, with an additional 5 years currently being projected. The original objectives have been satisfactorily met, but the research with biological traits of herbicide-resistant weeds require more time, depending upon whether the traits prove to be simply inherited or involve multiple genes with a complex inheritance. The anticipated completion date of the additional and related objectives is 2001. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

Each year the grant is peer reviewed and reviewed by CSREES's senior scientific staff. A summary of that review indicated excellent progress in the achieving the objectives.

WHEAT GENETICS, KANSAS

This project provides partial support for the Wheat Genetics Resource Center at the University of Kansas, which focuses on collection, evaluation, maintenance and distribution of exotic wheat related germplasm needed to develop new wheat cultivar resistant to disease, insects, and environmental stress. The principal researcher believes most cultivated varieties of wheat are derived from common sources. They lack the rich genetic diversity needed to develop resistance to diseases, insects and environmental stress. The replacement of genetically rich primitive cultivar and land races by modern, more uniform cultivars all over the world is causing erosion of wheat germplasm resources. New pests or those that have overcome varietal resistance pose a constant threat to the nations wheat production. Genetic resistance often resides in wild relatives of wheat. The researchers believe this program, which was established in Kansas, is providing service to wheat breeders nationwide. In view of significant needs for research in high priority national

PART 1

1001

interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the state, Hatch Act or other funding could be used to support this research. The original goal of this research was to enhance the genetic diversity available to wheat breeders nationally and internationally by collecting, evaluating, maintaining and distributing germplasm derived from wild relatives of wheat. To date 25 germplasm releases have been made containing new genes for resistance to such pests as Hessian fly, greenbug, leaf rust, soilborne mosaic virus and Russian wheat aphid. Germplasm stocks with resistance to leaf rust and powdery mildew are under development. Evaluation of germplasm for important resistance genes was carried out by Center scientists and cooperating institutions. The Center filled 30 requests from U.S. wheat breeders for seed from the germplasm collection and 57 requests for seed of germplasm releases, as well as large numbers from international breeders.

Work supported by this grant began in fiscal year 1989. Appropriations were for fiscal year 1989, \$100,000; fiscal year 1990, \$99,000; fiscal year 1991, \$149,000; fiscal years 1992–1993, \$159,000 per year; fiscal year 1994, \$196,000; and fiscal years 1995–1997, \$176,000 each year. A total of \$1,390,000 has been appropriated.

The nonfederal funds provided for this grant were as follows: \$493,285 state appropriations, \$31,414 product sales, and \$84,610, other non-federal in 1991; \$414,822 state appropriations, \$14,259 product sales, and \$102,086 other non-federal in 1992; and \$533,848 state appropriations, \$32,297 product sales, and \$163,937 non-federal in 1993, \$468,960 in 1994; \$563,671, non-federal funding for 1995 and \$457,840 of non-federal support for 1996.

This research is being conducted at Kansas State University by the Wheat Genetics Resource Center. The collection, evaluation and enhancement of Wheat germplasm is continual process. Therefore this project does not have a defined completion date. The principal researcher anticipates continuing the work for an indefinite period of time. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

This Special Grant has not been subjected to a comprehensive review. However each annual proposal is peer reviewed at the institution and reviewed by CSREES scientists.

WOOD UTILIZATION RESEARCH

The new wood utilization knowledge and technologies discovered help maintain a vigorous, competitive, domestic forest industry. This, in turn, helps achieve sustainable forests since improved utilization extends timber supplies. The research includes: meeting environmental objectives in timber harvesting and forest products manufacture; extending the timber resource through research, including management; exploiting pesticides developed from forest trees; wood machining; introducing small forest products industries to wood technology; and developing new products from wood and recycled materials. Research at four of the centers improves the utilization of those forest species that grow in these regions, i.e. western conifers, southern pines, Lake States hardwoods, and northeastern forests. The other two centers conduct research in specific subdisciplines, i.e. machining of wood and incubator technology transfer. The wood machining work at North Carolina State University improves wood machining. Wood industry incubator work in Duluth, Minnesota, contributes to rural development of local economies. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this Special Research Grant. At the discretion of the State, Hatch Act or other formula funding could be used to support this research.

The original goal was to generate new knowledge that would benefit the forest industry. This goal has been fine-tuned to place additional emphasis on environmental stewardship, resource extension, technology transfer, and scientist education. Research that extends the resource benefits forest ecosystems and increases the competitiveness of the forest products industry. In addition, the principal researchers believe consumers benefit from the more efficient production. For example, quality control procedures have saved \$200,000 per year in one mill and \$300,000 per year in a second through reduced waste. The researchers estimate that handheld calculator programs developed by this research have resulted in savings of nearly \$1,000,000 to woodworkers. Research has reduced the cost of cleanup of superfund sites by tenfold due to the use of biodeterioration technology. Water quality is believed to have been improved due to the introduction of bacteria that consume polychlorinated phenols in contaminated water sources. Laser cutting of wood holds potential for high savings in raw materials. Systems analysis of sawmill operations has allowed managers to improve the efficiencies of operation. Improve-

PART 1

1002

ments in membrane pressing of cabinet doors has improved production and product quality. The research developed an electric wood defect deterioration system to improve automated production systems. These are a few examples of the benefits from continuing research in wood utilization. Each of these centers has an advisory committee that establishes priorities and peer reviews research proposals.

Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$3,000,000; fiscal years 1986 through 1989, \$2,852,000 per year; fiscal year 1990, \$2,816,000; fiscal years 1991 and 1992, \$2,852,000 per year; fiscal year 1993, \$4,153,000; fiscal year 1994, \$4,176,000; fiscal year 1995–1996, \$3,758,000 per year; and \$3,536,000 in fiscal year 1997. A total of \$42,309,000 has been appropriated.

Mississippi State University non-federal funds were: State appropriations \$2,498,800, \$2,178,725, \$2,353,225, and \$2,331,691, \$2,650,230, and \$2,778,535 for 1991, 1992, 1993, 1994, 1995, and 1996, respectively. In addition, industrial funds averaged \$553,700 for those 4 years in support of the Mississippi Forest Products Laboratory. Oregon State University state appropriations were: \$1,337,962, \$1,394,304, \$1,256,750, \$1,252,750, 1,417,755, and \$1,117,000 for 1991, 1992, 1993, 1994, 1995, and 1996, respectively. Estimated non-public support averages \$500,000 per year. Michigan State University non-federal contributions for 1994 totaled \$910,481. Three new locations were added in 1994: University of Minnesota-Duluth non-federal match was \$590,000, \$550,000, and \$560,000 for 1994, 1995, and 1996. North Carolina State University was \$126,000, \$165,000, and \$135,000 for 1994, 1995, and 1996. University of Maine was \$600,000, \$445,723, and \$459,100 for 1994, 1995, and 1996.

There are six locations. The initial three—Oregon State University, Mississippi State University, and Michigan State University—were joined by the University of Minnesota-Duluth, North Carolina State University, and the University of Maine in fiscal year 1994. The original objective was to build and maintain strong regional centers of wood utilization research to address the Nation's needs for wood products through strengthening university wood products research and graduate education. These centers have been established, and wood utilization improves each year as a result. Projects begun in 1997 will be completed by 2001. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

Progress reports from the six centers are reviewed yearly or more frequently. Center directors last met together in June 1996. Centers all have advisory committees which meet periodically. The U.S. Department of Agriculture conducts informal on-site reviews periodically. The Duluth and Oregon sites were visited in 1996. A Departmental panel reviewed the original three centers in 1992 and 1993. At that time, the original objectives were broadened. The centers have responded to the review recommendations by increasing their focus on meeting environmental objectives by conducting research leading to sustained timber production; extending the timber supply through improved processing; developing new structural applications for wood; and developing wood extractives to substitute for pesticides, preservatives, and adhesives.

WOOL RESEARCH

The overall goals for this research are the development of objective measures of wool, mohair, cashmere and other animal fibers to increase profitability of the sheep and Angora goat industries. Specific objectives include: develop and evaluate measurement techniques for rapid objective evaluation of wool, mohair, cashmere and other animal fibers; increase the use of objective measurements to increase fiber production, quality and income to producers, and increase consumer acceptance of wool fabrics. The fiscal year 1996 grants terminate between January 1997 and April 1998. The 1997 grant proposals have been received and are being reviewed. Collaboration exists among researchers in Texas, Wyoming, and Montana associated with this grant and other Federal, university, and industry scientists on a wide basis to assure responsiveness to the needs of those involved in wool and mohair production, marketing, and processing. In view of significant needs for research in areas that are high priority nationally, no further funding is proposed for this project. At the discretion of the State, Hatch Act or other funding could be used to support this effort.

The overall goal for this research to develop objective measures of wool, mohair, cashmere and other animal fibers to increase profitability of the sheep and Angora goat industries remains the primary emphasis of the research. Computer software programs for the automatic image analysis system are being evaluated and improved for the purpose of measuring the average diameter and distribution of animal fibers. Software is also being modified to permit rapid, accurate measurement

PART 1

1003

of other fiber properties such as fiber style crimp and character. Near infrared reflectance analysis was compared to standard practices for yield measurement of mohair. Progress was again made to improve the quantity and quality of fibers produced from sheep and goats. Selection and crossbreeding experiments, part of a national study, were conducted to evaluate wool characteristics, reproduction, and lamb quantity and quality of crosses between Merino and Rambouillet breeds. Correlation studies were completed to compare the measurements made by the laser scan image analyzer with those made by microprojection. Numerous scientific and technical papers were published during the past year.

Grants have been awarded from appropriated funds in the amount of \$150,000 for fiscal years 1984–1985; \$142,000 per year for fiscal years 1986–1989; \$144,000 for fiscal year 1990; \$198,000 for fiscal year 1991; and \$250,000 per year for fiscal year 1992–1993; fiscal year 1994, \$235,000; and fiscal years 1995–1997, \$212,000 each year. A total of \$2,581,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$150,913 state appropriations, \$11,800 product sales, \$5,817 industry, and \$3,556 miscellaneous in 1991; \$111,394 state appropriations, \$25,451 product sales, \$41,442 industry, \$3,068 miscellaneous in 1992; and \$152,699 state appropriations, \$39,443 product sales, \$40,804 industry and \$3,556 miscellaneous in 1993; \$150,094 state appropriations, \$35,284 product sale, \$36,484 industry and \$3,556 miscellaneous in 1994; and \$67,345 state appropriations, \$10,000 product sales; \$34,325 industry contributions in 1995; and \$39,033 non-federal support in 1996.

The research is in progress at the Texas A&M University, Texas Agricultural Experiment Station, the University of Wyoming and Montana State University. The original objectives to improve the efficiency and profitability of wool, mohair and cashmere production and marketing are still valid. Specific objectives for individual laboratories and experiments are continually revised to reflect the changing priorities for the wool and mohair industries and consumers. It is anticipated that five years will be required to complete the current research. Keeping with the Administration's policy of awarding research grants competitively, no further federal funding for this grant is requested.

The principal investigators from the three institutions meet annually to evaluate progress and prioritize research according to industry needs. The research for this Special Grant is a component of a regional research project which entails coordination by the agency, reporting of accomplishments annually, and overall project peer review every three years. Last year the regional research project was reviewed and approved for renewal. Annually, Special Grant proposals are submitted to the agency for review and approval. The design and procedures in the most recent proposal were deemed to be adequate to supply the data necessary to fulfill the objectives. Excellent facilities and equipment are available to provide scientists with complete fleece analyses for objective measurements of wool and mohair. The investigators are able to conduct unique experiments as a result of the very specialized instrumentation available for the project. The agency representative periodically visits the research facilities and reviews progress, the most recent in May of 1994. It was concluded that the research was addressing the priorities of the U.S. wool and mohair industry, contributing to the introduction of value-based marketing systems, assisting in the establishment of a nucleus for U.S. cashmere production, and being effectively coordinated with other research laboratories. Research results are annually reported to the industry and the agency providing the means for adoption of new practices to improve the marketing of wool and mohair.

AGRICULTURAL DEVELOPMENT IN THE AMERICAN PACIFIC

The Agricultural Development in the American Pacific (ADAP) project allows the Land Grant research, extension, and instruction programs of the five participating institutions—American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam and University of Hawaii—to collaborate and cooperate to enhance their impact on agriculture and communities. ADAP is a mechanism to address common regional client-based issues while maintaining cultural, rural, economic and environmental integrity. When American Samoa assumes the Chair of ADAP in 1997, it will be the first time in the program's ten-year history that ADAP will be lead by an institution other than Hawaii. Detailed preparations are underway for a formal review by CSREES in July 1997. The five institutions have nearly completed the required review document and have formed three categories for future priorities: sustainable systems, collaboration/partnerships, and communication systems. ADAP Deans/Directors will use this review as input to formulating a new strategic plan articulated by and for the American Pacific. The principal researcher believes the five participating institutions are geographically dis-

PART 1

1004

persed yet facing many similar issues which can best be served through extensive networking and communication. ADAP facilitates communications and seeks to raise levels of academic achievement and improve the quality of education. In addition to a capacity building degree studies program for bachelors, masters and doctoral students, ADAP in 1996 opened a new area in faculty/staff development to improve institutional capability and credibility. For 1997, each ADAP institution will self-determine their best means for electronic communications and an independent assessment of overall electronic communication needs will be conducted. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this grant. At the discretion of the state, Hatch Act or other funds could be used to support this research.

ADAP's original goals are embodied in the 1992 strategic plan, namely to develop human resources within the institutions, to more effectively manage agricultural programs within and among the institutions, and to focus resources available on ADAP mission needs. Priority projects for 1997 include: animal health survey, livestock waste management, dietary guidelines for Pacific foods, artificial insemination demonstration/education, youth-at-risk assessment, and market information collaboration with "state" Departments of Agriculture.

This work has been underway for seven years with an annual appropriation of \$650,000 to the former Extension Service. In fiscal year 1994, an appropriation of \$608,000 was made to CSREES to continue the ADAP program. The fiscal year 1995 appropriation was \$544,000, and fiscal year 1996 and 1997 were \$564,000 each year. The appropriation total to CSREES is \$2,210,000. Non-federal funds are not provided. Unspecified in-kind support, such as facilities, equipment and administrative support, are provided by each institution and, in some specific projects, by non-ADAP collaborating institutions.

This work is being carried out by American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam, and the University of Hawaii. The ADAP program has been gradually achieving original program objectives, particularly in the areas of improvement in institutional capacity and communications. The 1997 formal review by CSREES will evaluate achievement of the objectives of the 1992 strategic plan. It is anticipated that an additional 5 to 10 years will be needed to fully achieve collaborative integration of the American Pacific land grant programs. In keeping with the Administration's policy to award grants competitively, no further federal funding for this grant is requested. Research could be continued at the state's or territory's discretion using formula or other funds.

The ADAP program was last evaluated by a review team in 1992 which prepared a 5 year strategic plan. That strategic plan has guided the ADAP mission and activities, including the call for the forthcoming formal program review.

ALTERNATIVE FUELS CHARACTERIZATION LABORATORY

The principal researchers believe these research and information dissemination activities have advanced the utilization of ethanol-based and other alternative fuels. They believe they have resolved issues affecting the use of ethanol in conventional and reformulated gasolines. The research addressed evaporative emissions from fuels, performance of vapor control sorbents, the environmental effects of ethanol fuels, and developing an ethanol-based fuel for piston engine aircraft. Dissemination involved promoting ethanol fuels in the Red River Valley. The researchers believe the need is to ensure the availability of unbiased scientific data to ensure that renewable fuels are represented accurately in the marketplace. The project is developing partnerships with public and private sectors in advancing cleaner burning fuels technology. Fuels from renewable resources will reduce U.S. dependence on overseas petroleum, while providing cash crops for farmers. Renewable fuels are essential to energy and economic sustainability, benefiting people, communities, and the Nation. In view of significant needs for research in high priority, national interest topics such as improved pest management systems, funds are not proposed to continue this grant. At the discretion of the State, other funding could be used to support this research. One goal is to compare alternative fuels to conventional fuels, and promote alternative fuels through the international Red River Valley Clean Cities Coalition. Another goal is to provide consumers with information regarding the efficiencies of the broad range of fuels, and provide information on conversion of agricultural materials and other biomass materials to alternative fuels. The program was instrumental in building North Dakota's first public ethanol fueling site and in solving cold-start problems.

The work supported in part by this grant began in fiscal year 1991. The appropriations for fiscal years 1991 through 1993 were \$250,000 per year, \$235,000 in

PART 1

1005

fiscal year 1994, \$204,000 in fiscal year 1995, and \$218,000 in fiscal year 1996 and 1997. A total of \$1,625,000 has been appropriated.

Over the duration of the grant, about \$845,000 in non-federal funding has been allocated toward performance of grant objectives. For fiscal year 1996, non-federal funding was \$105,000. In fiscal year 1995, it was \$50,000. In fiscal year 1994, it was \$60,000. In fiscal years 1991 to 1993, non-federal funding was \$630,000, which included \$600,000 from the Illinois State Geological Survey to evaluate an ethanol-based process for coal desulfurization.

The University of North Dakota, Grand Forks, is the site of the Energy and Environmental Research Center, a major research laboratory employing over 250 scientists and technicians. The anticipated completion date for the original objectives of the project was April 30, 1992. This research has been completed, and its results have been published. In 1995, the scope and collaborative abilities of this program were expanded to include the Red River Valley Clean Cities program and collaborative efforts with industry and economic development partners. Most of the research and dissemination activities now underway could be completed by 2001. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this project.

The last agency on-site evaluation was conducted in July 1996 by the U.S. Department of Agriculture. The program was given a very favorable review based on its ability to forge partnerships with both regional and national public and private organizations committed to commercial development of alternative fuels, its ability to disseminate research results to an international technical audience, and its ability to provide up-to-date research and unbiased information in response to scientific needs, regulatory demands, and public requests.

CENTER FOR AGRICULTURE AND RURAL DEVELOPMENT

The research provides current economic information on international trade in agriculture and analyses of the implications of trade policy alternatives on the agricultural sector of the United States and other countries. According to the proposal, trade negotiations and agreements are of national concern to policymakers, farmers, and agribusiness industries because of the implications for maintaining or opening markets and establishing terms of trade and prices. Typical agreements are extremely complex, requiring analysis by specialists to determine outcomes and to provide objective and accurate information to those impacted by such agreements. However, in view of significant needs for research in other high priority national interest topics such as improved pest management systems, funds are not proposed to continue this grant. At the discretion of the State, Hatch Act or other formula funding could be used to support this research.

The original goal was to assess and evaluate various proposals affecting agricultural trade to provide analytical support to the Office of the U.S. Trade Representative, and to provide information to farmers and agribusiness firms on the competitive implications of such agreements. An extensive number of theoretical studies and empirical and descriptive analyses of policy issues and technical problems pertaining to the Uruguay Round of negotiations were used by negotiators and the agribusiness community. Studies included the development of international trade models and assessments of trade options for meat, dairy, feed and cereal grains, oilseeds, and other commodities; impacts of the agreement upon selected countries; and reforms needed for compliance. Analyses included determination of the value and implications of export subsidies, import protection, and internal support mechanism and levels. Knowledge developed in this phase is now being used to monitor the effects of Uruguay Round implementation and the differential impacts for developed, developing and transitional economies. This grant supports six projects focusing on General Agreement on Tariffs and Trade for Eastern Europe, Baltic and the Newly Independent States; development of a model to assess the North American Free Trade Agreement and its linkages with the General Agreement on Tariffs and Trade; trade implications of U.S. food and development aid in developing countries; integration of China into world agricultural markets; and special projects as requested for the U.S. Trade Representative's office.

This research program was initiated in fiscal year 1989. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$750,000; fiscal years 1990 and 1991, \$741,000 per year; fiscal years 1992-1993, \$750,000 per year; fiscal year 1994, \$705,000; fiscal year 1995, \$612,000; fiscal year 1996, \$655,000 and fiscal year 1997, \$355,000. A total of \$6,059,000 has been appropriated.

The non-federal funds and sources provided for this grant are as follows: \$111,210 State appropriations and \$175,616 miscellaneous for a total of \$286,826 in fiscal year 1991; \$113,779 State appropriations and \$173,117 miscellaneous for a total of

PART 1

1006

\$286,896 in fiscal year 1992; \$120,138 State appropriations and \$164,707 miscellaneous for a total of \$284,845 in fiscal year 1993; \$161,673 State appropriations and \$32,000 miscellaneous for a total of \$193,673 in fiscal year 1994; \$161,000 State and \$30,000 miscellaneous for a total of \$191,000 in fiscal year 1995; \$70,000 State appropriations and \$44,000 miscellaneous for a total of \$114,000 in fiscal year 1996. Fiscal year 1997 preliminary information indicates \$60,325 in State appropriations and information is not yet available on miscellaneous funds.

The research program is carried out by the Center for Agriculture and Rural Development at Iowa State University. The university researchers anticipate that the work should be completed in 1998 with analyses of the final agreement of the Uruguay Round and related trade agreements and dissemination of these results. Work covered by the most recent agreement would be completed by the end of 1998. However, in keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant.

Evaluation of this project occurred as a part of the 1997 project review and approval process. We found that this project was useful in estimating impacts of the Uruguay Round provisions on world trade in important U.S. agricultural commodities.

CENTER FOR NORTH AMERICAN STUDIES, TEXAS

The purpose of this grant is to develop linkages with educational and other institutions in Mexico and Canada to share data and faculty, conduct research identifying trade opportunities and marketing problems, conduct policy analysis, and develop a broad range of training programs preparing agricultural/agribusiness firms for international marketing opportunities. The program director believes that citizens of the United States, Mexico and Canada have some similar concerns about the impact of the North American Free Trade Agreement (NAFTA), and that new, innovative approaches involving international cooperation are needed to assess and evaluate these issues. Research and training are needed to provide information to evaluate alternatives for expanding U.S. exports and resolving potential social, economic, and environmental conflicts. In view of significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed to continue this grant. At the discretion of the state, Hatch Act or other funding could be used to support this research.

The goal is to promote strong agricultural ties among the three North American countries, ensure the continued competitiveness of U.S. agriculture, and foster greater cooperation among the three countries in resolving critical agricultural issues of common interest. As a result of this project, cooperative study, research, policy analysis, and training programs have been developed and presented to U.S. producers and agribusiness managers, reaching over 2,600 people regarding trade opportunities in Mexico, impacts of expanded trade on selected agricultural sectors, and the procedures of international marketing. The Center recently co-sponsored the Tri-National Research Symposium, "NAFTA and Agriculture: Is the Experiment Working?" in San Antonio with 215 participants, of which 100 were from Mexico. The proceedings are available electronically through the Symposium Web page on the Internet. Research comparing the competitiveness of major agricultural production sectors is focused on Mexico's dairy, livestock, meat, feed grain, and fresh vegetable industries. Information databases on North American agriculture are being built to support the Center programs and are accessible on the Web. The electronic database on NAFTA and agriculture currently contains over 2,400 articles from major U.S., Canadian, and Mexican publications. A study of trans-boundary trade and environmental linkages found that existing institutions in both countries do not adequately address environmental losses or gains.

Work supported by this grant began in fiscal year 1994 with an appropriation of \$94,000; \$81,000 in fiscal year 1995; and \$87,000 in fiscal years 1996 and 1997. A total of \$349,000 has been appropriated. The non-federal funds and sources provided for this grant are as follows: \$39,000 State appropriations in fiscal year 1994 and \$54,000 in fiscal years 1995. The annual State contributions for fiscal years 1996 and 1997 exceed \$60,000.

The program is being carried out at Texas A&M University through the Texas Agricultural Experiment Station in collaboration with the Louisiana State University Agricultural Center, and other universities and agencies of the Texas A&M University System. The original proposal in 1994 was for a period of 12 months. The current phase of the program will be completed in the year 2000. In keeping with the Administration's policy of awarding research grants competitively, no further Federal funding is requested for this grant.

PART 1

1007

CSREES performed a merit review of the project in August 1996 as it evaluated the project proposal for 1996 and concluded that progress on the four objectives was made and that a satisfactory plan of work had been planned for the next funding period. Linkages were made with counterparts at Mexican institutions and cooperative research projects are being planned. Similar linkages will be made with counterparts in Canada.

DATA INFORMATION SYSTEM QUESTIONS

Cooperative State Research, Education, and Extension Service (CSREES) is in the process of funding a cooperative agreement with the University of Arkansas to provide national leadership in coordinating the efforts of our university partners in helping us determine appropriate content for a Research, Education, and Economics Information System (REEIS)-wide information system. In addition, the University of Arkansas will provide essential services in managing and coordinating a national Steering Committee responsible for overseeing the overall design, development, testing, and implementation of REEIS. Similarly, funds have been allocated to employ a technical services manager and a program analyst to oversee contracting with outside sources to design and launch REEIS and to comply with the necessary clearances and regulations applicable to information technology systems. In addition, funds have been allocated to secure a temporary director through the Intergovernmental Personnel Act (IPA) to coordinate and guide the overall aspects of development, testing, and implementing REEIS. Remaining funds are being allocated for contracting with a private sector firm to conduct a strategic audit of available data and a national needs assessment.

USDA's Research, Education, and Economics (REE) mission agencies and their university partners lack a central, integrated, user-friendly electronic information system capable of providing a knowledge base of the thousands of programs and projects for which they are responsible that focus on food, agriculture, natural resources, and rural development. Such an information system is increasingly needed to enable the Department and its partners to readily conduct both comprehensive baseline and ongoing assessments as well as evaluations of research, education, extension, and economics programs and projects. In recent years, this need has become more urgent for several reasons. First, the United States needs a visionary public funded research and development program to produce essential knowledge and innovations for meeting growing competition in a global market—which is largely attributable to the expanding research and development efforts of foreign nations. Second, a comprehensive information system is needed to serve as a primary reference source for development of new research and education projects on such diverse issues as increasing productivity in agriculture and processing, improving the safety and quality of food, and enhancing the sustainability of the environment and rural communities. Third, Federal/State policy makers and administrators are requiring empirical analyses to account for historical, current, and future use of public funds and to provide a basis for redirecting funds to higher priority problems. Fourth, the Government Performance and Results Act (GPRA) has imposed reporting demands on program outcomes which current, decentralized information systems are not prepared to adequately satisfy.

The original goal of this initiative was to develop an information system that can provide real-time tracking of research, extension and education projects and programs; has the capability to communicate vertically between field, state and Federal locations; will enable the REE agencies and their partners to conduct rapid and comprehensive policy assessments and program evaluation analyses; facilitates assessment of technologies and practices employed in extension, education, economics and research activities at the field and/or regional levels; provides clear and transparent public access to relevant parts of the information; and provides information management tools to enhance the timeliness and accuracy of REE-wide responses to inquiries about program objectives and expenditures.

Congress first appropriated \$.4 million for REEIS in fiscal year 1997 to begin planning its design and development. We are in the process of establishing a National Steering Committee to provide advice and guidance throughout the development and implementation process. The Steering Committee will be chaired by a notable administrator of extension and research at a key land-grant university. It will be comprised of both users and producers of Research, Education, Economics agencies' data, including program officials and program leaders, information system managers from other Federal agencies, representatives from Federal oversight agencies, program/project leaders representing partner institutions, and private sector users of REE data. Ultimately, this body will be responsible for recommending work

1008

specifications and for assessing the quality of work performed by an experienced and successful private contractor specializing in public-sector information systems.

Leadership responsibility for REEIS resides within the Cooperative State Research, Education, and Extension Service's Science and Education Resources Development division. This provides for effective integration of the Current Research Information System, the Food and Agricultural Education Information System, and appropriate extension data bases. CSREES is working closely with all REE agencies and with the university system via a cooperative agreement with the University of Arkansas. We hope also to use the Intergovernmental Personnel Act to secure an IPA from another university to carry out REEIS essential management responsibilities. In addition, a process is underway to engage a private sector firm specializing in public-sector information systems to design, develop, test, and implement REEIS.

It is anticipated that REEIS can be operational by the year 2000. The current appropriation of \$400,000 will cover start-up costs such as establishment of a National Steering Committee, preparation and specifications for contracting with an outside firm, selection of a contractor, a needs assessment, identification of functional requirements, a draft plan for designing and developing the system including recommendations for in-house hardware, operating system, and software programs. The \$600,000 increase request for fiscal year 1998 will allow for implementing, testing, and refining a prototype, including preparation of an operations manual and a full-scale implementation and maintenance plan. The Research, Education, and Economics Information System meets a high priority national need for a continuing national information system. REEIS is being designed to meet the data information needs of all REE agencies and their university and private sector cooperators. It will link data systems on research, education, extension, and economics. Therefore, annual maintenance costs will be ongoing.

An evaluation of Research, Education, and Economics Information System is not appropriate at this early stage of development.

GEOGRAPHIC INFORMATION SYSTEM

The program is designed to transfer evolving geographic information systems technologies to state and local governments. This technology—and in particular—the related technologies including Internet access for information, data bases, and telecommunication for cooperative system development are sufficiently complicated that most of the people familiar enough with them to serve as effective transfer agents are researchers. The current program is being carried out by a non-profit corporation, The National Center for Resource Innovations whose directors and participants are the sub-contractors who are carrying out the program. These sub-contractors range over a wide spectrum of sizes and special areas of site based expertise involving different Departments in four academic institutions, one regional development authority and one non-profit corporation working on agro-environmental problems in the Chesapeake Bay. A new site at the University of New Mexico has been added by the Board this year. This unique institutional arrangement has helped fill a unique role in linking some of the otherwise balkanized efforts of agencies and academic institutions and now seven regions of the country.
