DEPARTMENT OF TRANSPORTATION AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

THURSDAY, MARCH 6, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:02 a.m., in room SD–192, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senators Shelby, Domenici, Specter, Bond, Bennett, Faircloth, Stevens, Lautenberg, Byrd, Mikulski, and Murray.

DEPARTMENT OF TRANSPORTATION

STATEMENT OF HON. RODNEY SLATER, SECRETARY

ACCOMPANIED BY LOUISE FRANKEL STOLL, ASSISTANT SECRETARY FOR BUDGET AND PROGRAMS/CHIEF FINANCIAL OFFICER

OPENING REMARKS

Senator SHELBY. The subcommittee will come to order.

Mr. Secretary, we appreciate your joining us today.

Secretary SLATER. Thank you, sir.

Senator SHELBY. We will get into some of the specifics of the President's budget request in a few minutes, Mr. Secretary, but I am going to be looking to you to help me better understand the criteria by which the administration evaluates the cost effectiveness of some of your programs.

In the current budget environment, it is critical that we do all we can to make sure that we focus our limited Federal resources on projects that create jobs, create opportunities, create economic activity, and improve mobility in this country. As we put this year's bill together, I have asked the staff to focus on some of the large-dollar highway, transit, and aviation projects to make sure that we are being wise stewards of our limited transportation dollars.

In turn, I am committed to doing what I can to bring more private money to building transportation infrastructure by utilizing innovative financing and establishing a business-friendly environment. I will also try to identify any money we are currently spending on potentially unnecessary transportation studies into spending on real projects that bring value to real people.

Increasingly, this subcommittee performs a balancing act, juggling resources among a host of worthwhile priorities competing for the same Federal dollar. There are no easy choices. Pressure to

fund new initiatives and to maintain and expand current discretionary programs continues, while there are fewer options and less consensus on where offsetting cuts should be taken.

In turn, I am dedicated to continuing the search for more efficient, less costly ways to deliver essential transportation services, to consolidate and to reform programs to increase flexibility over the use of limited Federal dollars, to question the merit of Federal expenditures, and to shift funds from lower to higher priority activities. However, I believe, Mr. Secretary, we must recognize that if the total amount available for transportation appropriations is frozen, we must weigh the future consequences of continuing to defer needed capital investments.

I probably bring a little different perspective to this subcommittee than some of the past two chairmen, who are friends of mine. Like every State in the Union, my home State of Alabama has substantial transportation needs, but our needs are primarily to improve and expand our highway system. I am very sensitive to the varied transportation needs of the States represented by other members of the subcommittee, the Appropriations Committee, and the Senate, and I commit to them and to you, Mr. Secretary, that I will do everything possible to help them find the tools and the flexibility to address their individual State's transportation needs. I strongly believe that all solutions involve a reexamination of the Federal commitment to investing in transportation infrastructure and a renewed commitment to ensuring that all States and regions receive adequate consideration of their transportation needs.

Finally, Mr. Secretary, I want to reiterate my commitment to preserving and promoting transportation safety. I want to work with you to create a better understanding of how safety cuts across modal lines. While we need to strive for continued improvements in transportation safety, we must be mindful that the cost of safety improvements in one mode of transportation may influence transportation choices by the traveling public.

I look forward to our discussion today and to working with you on the many challenges facing our transportation system.

Senator Lautenberg.

STATEMENT OF SENATOR LAUTENBERG

Senator LAUTENBERG. Thanks very much, Mr. Chairman. Let me first congratulate you on being named chairman of the Transportation Subcommittee. I can speak with authority it is a very good job. You will find it fulfilling. You can make a difference, and I am glad that we both have significant transportation interests and hopefully we will be able to satisfy our mutual interests with the appropriate amounts of funding and interest on our part.

Never in the 14 years that I have been in the Senate—and I have served on this subcommittee for a long time. I am thankful to Senator Byrd, our distinguished ranking member and past chairman, for encouraging my appointment to the Subcommittee on Transportation.

Never, though, have we had so many historic decisions related to transportation in the same year that we were charting the course and will continue to chart the course of our national transportation policy.

In the coming year, we are going to be debating proposals to convert the entire Federal aviation system to a user-based fee. It will, however, not be enough to simply enact financial reform for the FAA. We will need to monitor its progress to ensure that taxpayers and the flying public actually enjoy the benefits of true reform.

While we have already granted the FAA far-reaching personnel reform, we continue to see unacceptable delays in getting an adequate number of fully trained staff into some of the busiest air traffic control facilities in the country.

While we have granted the FAA far-reaching procurement reforms, we still see difficulties and delays in getting state-of-the-art traffic control equipment deployed to the field. Just 1 week ago this day, we saw an equipment failure at Newark Airport, one of the busiest airports in the world, which caused the radar screens in the air traffic control tower to go blank. Thankfully, all systems were fully operational within 9 minutes and no passengers were put at risk and there were hardly any departure or landing delays.

But I, like all Senators, find such incidents to be intolerable. We cannot and should not wait 1 day more than is necessary to replace aging equipment with modern and fully reliable systems. We have added hundreds of millions of dollars to the FAA's budget to address critical deficiencies in the areas of safety and security. Yet, we continue to see holes in the safety net that require immediate attention.

This subcommittee can easily spend all of its energies this year on ensuring that our aviation system remains the safest in the world, but we are simultaneously charged with focusing on the reauthorization of the Intermodal Surface Transportation Efficiency Act—ISTEA as it used to be called in the old days—and I understand we might even have a new name.

As we approach reauthorization of ISTEA, we will continue to advance the balance of the agenda, balance of flexibility that was the centerpiece of that landmark legislation. Or will we retrench to our previous one-dimensional policy that would exacerbate rather than mitigate congestion?

Will we face the fact that Amtrak is a critical part of our national transportation network, or will we deprive the railroad of the kind of capital that is necessary to improve its performance to the level of a high-speed railroad that this country so rightly deserves?

And what about the safety agenda? After years of steady improvement, we are now seeing a tragic increase in fatalities that are associated with drunk driving. As a result of Congress' ill-advised repeal of the national maximum speed limit, we are now seeing increased carnage on our highways, especially increasing fatalities resulting from high-speed crashes. Will we use ISTEA II to insist on improvements in the safety of our highways and railroads, or will we continue to simply deregulate, abdicating our Federal leadership on safety?

If these challenges were not enough, the President's budget asks us to address still other challenges: improving the ability to move welfare recipients to work and increasing the Coast Guard efforts to keep drugs off our shores. And the President's budget asks us to address all these challenges within a very tight funding enve-

lope, a budget that is consistent with the goal of balancing the budget but leaves no room for redundancy or waste.

While we may wish that we had the opportunity to address each of these challenges 1 year at a time, we are required to address them all and address them now. There will be no hiatus for the new chairman of the subcommittee, just as there will be no hiatus for our new Secretary of Transportation.

Now, fortunately, we have in Secretary Slater a proven executive with years of experience at DOT. This, Mr. Secretary, is your first appearance before the subcommittee in your capacity as Secretary, but hardly your first appearance before those of us at the table.

The ease with which Mr. Slater was confirmed by the Senate serves as testimony to his performance as our Federal Highway Administrator, as well as the confidence that we place in him in his new role. And I want to welcome you this morning, Mr. Secretary. I look forward to your presentation of the administration's budget.

And I thank you, Mr. Chairman.

Senator SHELBY. Senator Bennett.

STATEMENT OF SENATOR BENNETT

Senator BENNETT. Thank you, Mr. Chairman.

Mr. Secretary, first let me apologize to you for having been out of town during the final vote on your confirmation and make the record clear that had I been able to be there, I would have cast a very enthusiastic aye in favor of your confirmation. I am delighted with the President's decision that you are the man for this position.

If I may be allowed a personal reaction to your testimony, which I have glanced through, I am delighted that you are quoting my old boss, John Volpe. I entered the Nixon administration in 1969 as the chief lobbyist for the Department of Transportation. We do not call them that. We call them congressional relations and congressional affairs and that kind of thing, but I have always liked to call a spade a spade. I was in charge of the lobbying effort of a very new, fragmented cabinet level department that was less than 2 years old.

If I may say so, I have my fingerprints very, very lightly, to be sure, but I was involved in convincing the Congress to pass the Airport Airways Act creating the airport airways trust fund, the Urban Mass Transit Act laying down the legislative structure for that administration and, Senator Lautenberg, Amtrak.

One of the last things I did before I left the administration to go to private practice was convince Mike Mansfield that if we did indeed run a train to Yellowstone Park through Montana, he would allow that bill to pass out of the Senate and become law. Some of the folks at Amtrak were not understanding how important it was that we got Mike Mansfield's support. They said, he is just another Senator. I was able to add my expertise, which was not very expert, to say that if you do not have Mike Mansfield with you, you are probably not going to get this piece of legislation.

They showed the same obtuseness toward Harley Staggers in West Virginia. They did not understand why the chairman of the House committee had to have a train running to the universities

in West Virginia in order to make sure that the whole system would pass congressional muster.

But I have a great affection for your Department, having served there and learned many things there, and welcome you to this position. If there is any position that I would personally lust after in an administration, it might be yours. I make it very clear I am not available, however, because I like the one I have a lot better. [Laughter.]

References have been made by the other Senators to their own States, and that is appropriate and fairly standard in these circumstances. I will not go on at length but simply point out that, which I am sure you already know and I know the people in the Department already know, in addition to all of the standard kinds of transportation challenges faced by the State of Utah, we are acting as host for the Olympic games in the year 2002. That puts an absolute deadline that cannot be stretched on our finishing some of our projects and it will not look good—which is a very mild understatement—to have the television cameras of the world focus on Utah in the winter of 2002 and have us say, well, the highway that would connect you to the venues where all of these events are going to take place was to be finished 6 months ago, but we have had a few delays and you will be able to get there by summer. Do not worry about it. The Olympic games do not give us the luxury of waiting on that, and I know you understand that and your people in your Department understand that.

I look forward to working with you in ways to see that Utah meets its deadlines. I am not asking for anything that is untoward. I am not saying that Utah should get any favoritism above and beyond other States just because of the Olympics, but I think all of us as a nation recognize that we have an obligation, having made a commitment that something will be done by *x* date, in this case to make sure that date is met. Or, to take out of context another phrase, the whole world will be watching, and I am sure none of us want that to happen.

So, I welcome you to the committee and to your assignment. My congratulations to you in your assignment. I look forward to the balance of your testimony.

Senator SHELBY. Senator Byrd.

STATEMENT OF SENATOR BYRD

Senator BYRD. Thank you, Mr. Chairman. First I congratulate you on the occasion of your first hearing as chairman of the Transportation Subcommittee. I am pleased to have a chairman of the subcommittee who is sympathetic for the need for highways in this country and who in this particular instance has some unfinished Appalachian corridors in his State.

I also look forward to continuing to work with our very capable former chairman, now the ranking member of the subcommittee, Mr. Lautenberg, on the many responsibilities that we face in this extremely important, in some ways, most important subcommittee. I say this because this subcommittee provides funding for the Nation's transportation infrastructure, its 953,000 miles of Federal-aid highways and its 296,000 bridges, together with the Nation's mass transit systems, Amtrak, and all the Nation's airports.

In addition, the subcommittee must address critical safety issues in all of these transportation modes, whether the issue is airbags, air traffic control, rail highway crossings, oilspills, or curtailing drunk driving.

I join the subcommittee in welcoming Secretary Slater. I congratulate you, Mr. Slater, on having been promoted to the position of Secretary of Transportation after serving the Nation very ably as the Federal Highway Administrator. I have had several occasions over the past 4 years to work closely with our new Secretary. He was a very forthcoming and capable Administrator, and I look forward to continuing my close cooperative relationship with him in this new capacity.

Mr. Chairman, never are we reminded more quickly of the importance of our highways than at times of disaster. Secretary Slater has just returned from Arkansas where he witnessed firsthand the devastation from the tornadoes that cut a deadly path across his home State.

My State is also suffering at the present time, for the umpteenth time, suffering from the effects of yet another spate of floods that have taken the property and not the spirit of so many families. I know that the members of this subcommittee join me in saying to the Secretary that we intend to move as rapidly as possible on any funding requests that the President puts forward to address the needs arising from this recent rash of disasters, the floods and heavy snows in the West and Midwest, the tornadoes and floods in the South, as well as the floods affecting the States of Ohio, West Virginia, Kentucky, and other States.

As Secretary Slater knows, I have grave concerns regarding our decades-long disinvestment in our Nation's infrastructure. Our national investment in our infrastructure as a percentage of our gross domestic product has been cut almost in half since 1980, from roughly 1.2 percent to 0.6 percent. This trend has taken a severe toll on the viability and the safety of our National Highway System.

In his last full year as highway Administrator, Mr. Slater published a comprehensive report on the conditions of our National Highway System, showing that we are developing a larger and larger backlog in the funding necessary to maintain even an adequate system of highways and bridges.

Unfortunately, we are faced with a budget request from the administration that calls on this subcommittee to effectively freeze the annual obligation limitation on the Federal Highway Program at its current level for each of the next 6 years. Secretary Slater's statement makes some mention of a few encouraging signs that indicate that we may be witnessing a turning point in the continuing deterioration of our National Highway System, but there is no question that if we freeze highway spending at the current level, this perceived stabilization in our highway system's performance will be short-lived indeed.

The current level of spending certainly will not allow us to address the millions of hours and billions of dollars that our economy loses every year due to constrained capacity and traffic congestion not only in the Nation's major metropolitan areas, but also in many rural and suburban areas as well.

Plus we must simultaneously remember that highway use is on the rise. The vehicle miles traveled by our citizens have grown more than 40 percent in just the last decade and this trend is expected to continue.

According to the Secretary's formal statement—and I quote him—"The Department is committed to a long-term infrastructure investment program and seeks the highest levels of investment within the balanced budget context."

Well, the Secretary knows that it is with great respect and fondness that I'm required to disagree with the notion that a freeze on highway funding is the best that we can do. We must do better, and I am hopeful that we in Congress can find a way to increase substantially the levels of funding for the programs covered in ISTEA over the next 6 years, while simultaneously finding a way to balance the budget over that same period.

While I cannot agree with the overall funding levels assumed for our highway programs in the administration's budget, I can and do agree with many of the priorities that the administration has highlighted in its ISTEA reauthorization proposal.

For this Senator, the brightest spot in the President's proposal is his $2.19 billion authorization of direct contract authority toward the completion of the Appalachian Development Highway System. A total of $200 million is requested in contract and obligational authority for this initiative in fiscal year 1998. That is only a portion of what is needed.

I have introduced a bill, S. 182, the Appalachian Development Highway System Completion Act. Senator Sessions has joined me in sponsoring this legislation. I know that the chairman of this subcommittee is very sympathetic with this legislation.

My bill will provide sufficient funding over the next 6 years to complete the 725 unfinished miles in the 13 Appalachian States, the people of which have been promised now for more than 30 years this highway system.

I discussed my proposal with a number of my colleagues who have direct responsibility over the ISTEA legislation, and I received favorable reactions from the Senators with whom I have spoken.

While the Interstate Highway System is now almost 100 percent complete, the Appalachian Highway System remains only 76 percent complete throughout the region and only 74 percent complete in the State of West Virginia, even though its completion was promised in law, as I say, some 32 years ago. And I was here at the time that we made that promise, as I was here at the time we made the promise concerning the Interstate Highway System during the administration of President Eisenhower.

Mr. Chairman, our region has waited long enough for the Federal Government to meet its responsibility to complete this essential part of our National Highway System. So, I again want to compliment Secretary Slater and the President for proposing an excellent first step toward that end.

In conclusion, let me again congratulate you, Mr. Slater, and assure you that this subcommittee stands ready to do its part in achieving what you described as your goal, namely, the highest lev-

els of investment to a long-term infrastructure investment program within the balanced budget context.

And as the last word of the New Testament of the Bible is amen, let me say that also in closing my statement. Amen.

Senator SHELBY. Senator Murray.

STATEMENT OF SENATOR MURRAY

Senator MURRAY. Well, thank you, Mr. Chairman. It is a delight to be on this committee, working with you as one of the newer members. Congratulations on your assignment and I look forward to working with you.

Secretary Slater, it is good to see you again on your side of the world. The Secretary and I have met several times now in the past several months, both of them in my home State, the first time when our State had severe flooding and disaster about 1½ months ago, and the Secretary came out and met with some of the people who were firsthand experiencing some of the dramatic impacts of what weather can do to them and their roads. I appreciated your being out there.

The second time was in a very tragic circumstance when we lost three young Coast Guardsmen who were trying to save a sailboat off the northernmost corner of my State and the Secretary was most kind in coming out with Commandant Kramek, traveling all the way across the country to be at that funeral service in a very remote community of La Push in the State of Washington. I want you to know that your words and your being there really meant a lot to those young Coast Guardsmen and the community and the Quillayute Indian Tribe who is such a tremendously important part of that community. We very much appreciated your being there.

That community is continuing to try and deal with that tragedy, the first Coast Guardsmen that we have lost in this country in a number of years, and I just wanted to tell you how much we appreciate your personal interest in them and in that community.

I am looking forward to your remarks in just a few minutes, but I just wanted to touch on a few issues that I am going to be following on this committee.

As you traveled to La Push, you had the opportunity to fly over the Olympic Peninsula in my State and saw what a beautiful natural area that is, tremendously large. It is a regional interest for cyclists who come there from all over the country now. They do not mix well with logging trucks, and we have had a number of accidents. So, we have been working with seven different communities out there on a voluntary basis to put together a bike trail, a 360-mile bike trail, around the Olympic Peninsula and hope we can work with you further to be flexible with some of our funds so that we can meet some of these safety issues on those logging roads.

Second, I just wanted to quickly mention the regional transit plan that was just passed by Puget Sound with a 50–50 match. They are very excited about this opportunity, particularly in Bellevue. We have a crowded I–405 that is becoming a real congestion problem. My constituents are concerned that as the Federal budget declines, that they will not be able to see this get off the drawing board, and they want some information back on whether these new

projects will be able to have Federal matching dollars as they push forward.

Finally, just let me mention the Airport Improvement Program. I noticed that it is being targeted a cut of nearly one-half of a billion dollars. Many of our airports are suffering. Infrastructure is old, needs replacing. Our traffic is greatly increasing. Particularly in rural areas, people depend on the AIP funds for survival and safety, and we want to hear from you how we are going to be able to absorb some of these cuts.

So, with that, Mr. Secretary, I welcome you and thank you for all your great work and I look forward to working with this committee.

Senator SHELBY. Senator Bond. I understand it's your birthday. Is this the day?

STATEMENT OF SENATOR BOND

Senator BOND. Yes, sir; thank you. I appreciate that. I am at that stage where one is delighted to be here to celebrate one. [Laughter.]

We do not worry about the number of years that have gathered.

Mr. Secretary, I welcome you.

And I also congratulate our new chairman and I certainly look forward to working with you, Mr. Chairman, and with our good friend, Rodney Slater, with whom we've worked on many, many important issues.

I can certainly sympathize with Senator Byrd and others who are having the problems of flooding. You well know how serious an impact the floods of this magnitude can have on the entire transportation system, and it is absolutely essential to have someone as responsive as you have been, Mr. Slater, in these efforts.

I also want to join with the Senator from Washington, expressing our thanks for the concern you showed for the Coast Guardsmen. One of those brave, young men who was lost was from southeast Missouri, and I know that the family and all of the friends in that area appreciated your concern.

But speaking of safety, I have to tell you, again to go along with what Senator Byrd said, that the lack of adequate funding for transportation, for highways in particular, was really brought home to me this past weekend. We had the funeral for one of my very good friends from Chillicothe, MO, who was killed in a head-on collision on a narrow, two-lane highway which is in the process but is not yet upgraded because it carries traffic for a four-lane.

The evening after his funeral, I attended an event in Festus, MO, where the mayor had just buried his wife, who also was killed in a head-on collision on a two-lane road that now has been upgraded to a priority for improvement.

The funds that we need for highways, roads, and bridges, all transportation needs, are overwhelming. Yesterday, with Senator Chafee, I introduced a measure to change the budget scoring so that the highway trust fund moneys, collected one year would be paid out the next year—the Highway Trust Fund Integrity Act. I think that the people of America who pay into that fund, when they gas up their cars, want to know that these funds are going

for transportation purposes, and I hope we can obtain support both from your side and from my fellow Members of the Senate for that.

I am not going to be able to stay for the full hearing. I have some other obligations, but there is one issue that I did want to call to your attention.

You have been most generous and helpful in dealing with our bridge problems. We have stood side by side in Hannibal, MO, at the Chouteau Bridge and at Cape Girardeau where there's a bridge named for my dear friend, the late Congressman Bill Emerson.

It was initially rumored that the administration's ISTEA bill would not include a bridge discretionary program. However, my good friend and Missouri colleague, the widow of Bill Emerson, JoAnn Emerson, brought this up in a House hearing last week. You mentioned that the Department was in the process of reconsidering that position but was unable to make any specific recommendations. I applaud your reconsideration and ask for your careful attention as you give thought to this vitally important program.

Something has to be done. I think the statistics showed that in 1995, the Department reported that 25 percent of the Nation's interstate bridges were classified as deficient or in poor condition, and 28 percent of 130,000 bridges on all other arterial systems were deficient. According to your Department, my State of Missouri has the dubious distinction of being sixth from the bottom in condition of bridges. We are sixth highest in total number of bridges, something to do with the Missouri and the Mississippi Rivers, I believe. Over 10,000 bridges in my State are in need of some kind of repair and replacement.

We certainly do not want to be talking about attending any more funerals if a bridge collapses. So, I would hope that you would be able to inform this committee and our House counterparts and also the authorizing committees what your position will be on the bridge discretionary program.

Thank you very much, Mr. Chairman.

Senator SHELBY. Senator Domenici. Oh, excuse me. I did not see. Senator Faircloth.

Senator FAIRCLOTH. Go ahead, Pete.

Senator DOMENICI. Oh, no.

Senator SHELBY. You were sitting back Senator Faircloth.

STATEMENT OF SENATOR FAIRCLOTH

Senator FAIRCLOTH. Thank you, Mr. Chairman.

Mr. Slater, delighted to see you here this morning.

I am new to the subcommittee but spent about 8 years as chairman of the North Carolina Highway Department. Just as an aside, Mr. Chairman, it is the largest in the Nation. We have close to 78,000 miles of highway. North Carolina has very few city streets and no county roads. They are all under one unified system, and it works extremely well.

I recently had some conversation with Secretary Slater, and he was most helpful in saving air service to two communities and I want to thank you.

Secretary SLATER. Thank you, sir.

Senator FAIRCLOTH. Mr. Chairman, one of the most contentious transportation issues in this Congress will be surface transpor-

tation and the reauthorization of the bill. I am glad that we have scheduled a hearing to do it.

This subcommittee is also going to have to address some very important issues this year. We face critical issues in subcommittee with aviation safety as well as highways. So, I am eager to start working on the program.

North Carolina has been rapidly growing, particularly in the Raleigh-Durham and Charlotte areas. Our State in the late 1940's built the most complex farm-to-market road system of any State in the Nation, literally tens of thousands of miles of it. Now, along those same roads, instead of farms, are microelectronics plants and high-technology industry. We simply are going to need much upgrading to maintain and to look after the traffic that is created.

But one thing that was unheard of, or would have been unheard of, even 10, 15 years ago in North Carolina—we are going to have to go in many of our highly congested areas to some sort of light rail transportation, and I look forward to working with you on that and look forward to the rest of the hearing.

Thank you, Mr. Chairman.

Senator SHELBY. Senator Domenici, now.

STATEMENT OF SENATOR DOMENICI

Senator DOMENICI. Well, Mr. Chairman, thank you.

I would ask your permission, before you close this record, to put in the record the 5-year budget requests of the President on transportation.

Senator SHELBY. Without objection, it is so ordered.

Senator DOMENICI. Frankly, it is nice to be here, all talking like things are rosy because we have this wonderful Secretary before us, but the truth of the matter is, the President's budget cuts transportation over the next 5 years. Actually I think it is pretty obvious that the administration does not believe that is what is going to happen.

But just so people know, it is kind of difficult to put budgets together when everybody wants to cut more and more out of the appropriated accounts and the President sends us a budget in an area that is least probable to get cut. When everybody is asking for more, the President asked for less. In the fifth year, there is less transportation funding than there is in the first year, according to what my staff tells me.

So, I just think we ought to make the point that it is not going to be easy. The chairman does not know what amount he is going to get to spend yet from the distinguished chairman and ranking member of the full committee when funding is allocated.

But I want you to know, members of the committee—and I have already said it publicly—while we do not direct the spending in the budget, I clearly am not going to produce a budget that has less transportation money over the next 5 years, but rather more. I am just struggling with how much more. My ranking member, Senator Lautenberg, while we do not see eye to eye on some budget issues—I am hopeful on this one we will see eye to eye and put more money in transportation rather than less.

I am absolutely convinced that people are talking about alternate modes of transportation and that is a great idea, but for many,

many, many parts of America, there is no alternative. It is a road or no transportation, a safe road or a dangerous road, and there is nothing in between. That need is growing, not diminishing.

Thank you very much.

Senator SHELBY. Senator Stevens.

STATEMENT OF SENATOR STEVENS

Senator STEVENS. Thank you, Mr. Chairman. I am delighted to have a chance to stop by. I see my colleague from West Virginia is here. Mr. Slater, I think we are both here to welcome you to one of the most difficult portions of the budgets that we oversee. I do not want to prolong this because I know my colleagues want to hear from you.

But I join with the chairman of the Budget Committee in indicating I think there is no alternative but to fund the moneys that are needed for highways and for the modernization and replacement of our bridges.

We do have a study, Mr. Slater, going on to determine the number of bridges that are really critical. I know your Department has already addressed that, but clearly we are going to have to have some reconsideration on how this money is allocated because of the safety considerations of many of these bridges. And one is right here in the District of Columbia.

Now, I do have some questions, Mr. Chairman, I would like to submit.

Mr. Slater, the question about the commuter rule is very critical to my State, and I do request that once you have addressed that, that we see if we cannot get together with you and with the head of the FAA because the application of this rule has already reduced the fleet of commuter airlines in my State, which I might say, Senator Faircloth, does not have 10,000 miles of roads despite the fact we are one-fifth the size of the United States. It has reduced the commuter fleet by one-half. We have one-half the transportation now for rural areas of Alaska that we had 2 years ago because of the application of this rule to a State for which it was not intended.

So, once you have read that question, I urge that you give us a chance to come visit with you and see if we cannot restore really the basic backbone of transportation in my State and that is the commuter airlines.

Mr. Chairman, I thank you very much. I look forward to working with you, and I am sure my colleague does, as we get the bill to the full committee.

Senator SHELBY. Secretary Slater.

Senator DOMENICI. Mr. Chairman.

Senator SHELBY. Senator Domenici.

Senator DOMENICI. Could I just give you three outlay numbers so I will not burden the record?

Senator SHELBY. Go ahead.

Senator DOMENICI. Highways from 1998 to 2002 are down $3.9 billion, a 3.8-percent reduction. FAA is down 3 percent, a $1.4 billion reduction, and transit is down 7 percent, a $1.5 billion reduction. So, I will not put anything in the record. Those are the summary numbers.

Senator SHELBY. Senator Domenici, we thank you for those numbers, though.

Secretary Slater, your entire written statement will be made part of the record, and if you will just briefly sum up the highlights of it, and this will give us some opportunities to question you. Thank you.

STATEMENT OF SECRETARY SLATER

Secretary SLATER. Thank you, Mr. Chairman and members of the committee. At the outset, I would like to thank you for the opportunity to testify in support of the fiscal year 1998 budget of the Department of Transportation as submitted by the administration.

DEPARTMENTAL PRIORITIES

Let me say at the outset, just in summary, in response to all of the concerns raised, with priorities, three in particular, during my tenure as Secretary—with safety as the No. 1 priority, dealing with transportation and its relationship to the economy, and also bringing a commonsense approach to our operations as servants of the American people—with you in partnership and in partnership with the private sector, I think we can address effectively many, many of the issues that you have raised.

It is noted that I have a longer statement that I would like to submit for the record, Mr. Chairman, outlining some of the specific particulars of the administration's commitment to invest $38.4 billion next year in our transportation infrastructure.

The President, in his State of the Union Address, noted that, "Over the last 4 years we have brought new economic growth by investing in our people, expanding our exports, cutting the deficit, and creating over 11 million jobs, a 4-year record. Now we must keep our economy the strongest in the world." And clearly, transportation is central to all of that.

Under President Clinton, we have tried to make good—and I believe we have made good—on the promise of ISTEA, landmark legislation that the Congress will be reauthorizing this year. With the Congress, we have increased transportation infrastructure investment to record levels. These investments have paid off in substantial improvements in the condition and the performance of our highways and mass transit systems.

The President's budget includes $38.4 billion for our Nation's transportation system and key national transportation priorities which invest in both our people and our economy. Foremost among these priorities is to make the Nation's transportation system even safer for the American people.

When George Washington saw the mountain terrain, separating the seaboard cities of the United States from the settlements along the Ohio River, he noted that we have to open a wide door to connect those markets.

Well, over the last few years, we have worked to continue to open that wide door with an effective intermodal transportation system, allowing new businesses, express packages, to move in just-in-time delivery practices and procedures where items move almost seamlessly through the system, whether on land, water, or air.

Thirty years ago, we started the Department of Transportation, committed to a vision. Today we work continuously to make that vision a reality, investing in people and investing in safety.

As you know, I believe transportation is about more than concrete, asphalt, and steel. This budget proposes many critical investments in the quality of life concerns of the American people.

SAFETY

First, as relates to safety, we propose in 1998 raising the direct safety spending for highways, aviation, rail, and maritime by $200 million to a total of $2.9 billion, a record 7.5 percent of our total budget. And all of you have mentioned safety as a top priority, whether on a two-lane highway or as it relates to aviation.

Also I would like to note that this administration has tried to work with the National Transportation Safety Board to respond speedily to all of its recommendations. One of the first meetings I held, even before being confirmed, was with Jim Hall, the Chair of the National Transportation Safety Board [NTSB]. Approximately 88 percent of the recommendations offered by the NTSB have been closed, and of the 758 open recommendations, over 86 percent have been classified by the NTSB as open with acceptable action underway. So, clearly safety is a priority.

STRATEGIC INVESTMENT

As relates to jobs, one of the key provisions that we will have in our proposal is to improve our transportation system for people whether they live in rural, urban, or suburban areas, and a critical part of that will be a new $100 million program to deal with questions concerning welfare-to-work initiatives.

Strategic transportation investment in infrastructure aids the economy. Beyond improving the quality of life, the transportation system of the 21st century must provide Americans with the ability to compete and win in a truly global marketplace. Working with the Congress over the past 4 years, we have increased Federal investment in highways, transit systems, and other infrastructure to an average $25.5 billion, more than 20 percent higher than the 4 preceding years.

These investments are producing results. The conditions of bridges—and that has been noted time and time again—as well as the pavements of our system, have improved significantly. We have financed nearly 26,000 buses and almost 600 railcars for State and local transit systems as well, and we are doing a lot along the Northeast corridor.

I believe, like you, that our transportation must be a part of our overall economic system but that it must be consistent with our commitment to balance the budget by the year 2002. So, as Senator Byrd has noted, our proposal is to get the highest level of funding possible within that context.

Let me close by making a couple of commitments and also comments regarding aviation operations. Just as the interstate system expanded our national economy in this century, I believe that aviation will expand our global economy in the 21st century. I assure you that I will use the leverage provided by all of the innovative decisions made over the last year or so to give the FAA improved

legislation as it relates to procurement reform and personnel reform. We will work hard to deal with the question of long-term economic investment.

COMMONSENSE GOVERNMENT

On the issue of commonsense Government, let me note that we, too, Mr. Chairman, will make an effort to work with you to bring private sector dollars to the financing of transportation infrastructure investment. We hope to do that through our State infrastructure bank initiative, as well as through the establishment of a $100 million new Federal credit program designed to deal with big-ticket items.

In closing, I would like to say that as we work to create the transportation system for the 21st century, we must also work to build a critical mass of professional wherewithal and skill to man and to provide the human resources to make that system work.

And I would like to ask the Congress to work with me in establishing a Garrett A. Morgan technology and transportation futures program designed to bring 1 million young people across our country into the transportation industry. Giving them access to the technological advancements of our transportation system of tomorrow will be just the kind of inspiration they need, I believe, to find this profession rewarding.

In closing, let me just say that I look forward to working with all of you to ensure that our best days as a Nation are yet ahead of us, and in doing so, we have to make sure that we have a quality transportation system to sustain and to buttress the economic activity that we know will come from our efforts to improve and stimulate our economy.

Thank you, Mr. Chairman.

PREPARED STATEMENT

Senator SHELBY. Thank you, Mr. Secretary. We have your complete statement and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF RODNEY E. SLATER

Mr. Chairman, Members of the Subcommittee. Thank you for the opportunity to testify in support of the fiscal year 1998 budget proposals for the Department of Transportation.

OVERVIEW

President Clinton said in his State of the Union address: "Over the last four years we have brought new economic growth by investing in our people, expanding our exports, cutting our deficits, creating over 11 million jobs, a four-year record. Now we must keep our economy the strongest in the world." Under President Clinton, we have made good on the promise of the Intermodal Surface Transportation Efficiency Act of 1991—ISTEA, the landmark legislation that Congress will be reauthorizing this year. Working with Congress, we have increased transportation infrastructure investment to record levels. These investments have paid off in substantial improvements to the condition and performance of our highways and mass transit systems.

Four weeks ago, President Clinton presented the details of the Administration's fiscal year 1998 budget. Included in that budget is proposed funding of $38.4 billion for our Nation's transportation system and key national transportation priorities, which both invest in our people and in our economy. First and foremost among these priorities is to maintain the safety of the nation's transportation system and

to make that system even safer for the American public, whether they travel by land, water or air.

Transportation is critical to economic growth and for providing our citizens with the mobility on which they have come to rely to sustain their quality of life.

This is as true today as it was at the beginning of our nation, when George Washington saw that the mountain barrier separating the seaboard cities of the new United States from the settlements along the Ohio River must be overcome or the settlements would be pulled into economic alliances with the British in Canada and the Spanish along the Mississippi River. The solution that was in the young nation's clearest interests was to: "open a wide door, and make a smooth way for the produce of that Country to pass to our Markets before the trade may get into another channel."

Today, just think of the wide doors that have been opened, the new businesses and innovations in the last twenty years that have arisen because of our effective intermodal transportation systems—express packages, just-in-time delivery—where items move almost seamlessly from land, whether by highway or rail, to water or air and then back to land. These innovations are not just transportation change—they support whole new ways of doing business.

Former Transportation Secretary John Volpe discussed the objectives of the Department almost thirty years ago and his remarks are quite remarkably pertinent today, as we near celebration of the 30th anniversary of the Department. "Our objectives range over improvements in the overall efficiency of transportation, ensuring that the unemployed have access to employment * * * that there be joint planning of transport corridors in the hearts of our cities, that we upgrade the safety of all modes, and most important for those who will come after us—that we safeguard our priceless heritage of natural wonders, historic sites and places of recreation."

Even though transportation improvements over the last 30 years have been astounding—for example, the ability of businesses to minimize inventories because of the reliability and efficiency of the nation's transportation system—the challenge that we face today sounds remarkably similar to John Volpe's assessment. Today we must improve our transportation system to meet the needs of the 21st century. We must continue to invest in improving the safety of our people. We must maintain critical infrastructure investment to meet the needs of our economy. And we must do that in a way that protects our environment, our neighborhoods and our national heritage.

INVESTING IN OUR PEOPLE

The Department's budget proposes many critical investments in the quality of life of the American people. I would like to highlight three of these.

(1) Improving the safety of the transportation system, to save even more lives so that the heartbreak that we see everyday due to transportation is reduced. As you may know, in the past few weeks the Department of Transportation experienced this heartbreak directly within its family—two Maritime Administration employees were killed when coming back to the office from lunch and three Coast Guardsmen's lives were lost as they were trying to save others in rough seas.

(2) Ensuring that those going from welfare to work are not stymied by lack of transportation. Transportation is one of the three major challenges faced by welfare recipients, along with day care and skills training.

(3) Interdicting illegal drugs, which continue to threaten the well-being, safety and security of all American citizens, including the children in our schools.

Safety

Our most important investment in the quality of life of the American people and our highest priority—as always—is improving our transportation system's safety and security.

Although it's already the safest in the world, much of what we do is aimed at making it safer, as travel continues to grow. That's why the President's fiscal year 1998 budget proposes to raise Department of Transportation direct safety spending by $200 million—to $2.9 billion, a record 7½ percent of our total budget.

A major focus in our safety effort will be highway crashes, which account for more than nine out of every ten transportation fatalities. About 41,500 travelers died in highway crashes last year, a slight reduction from 1995. That's notable because it turned around a three-year trend of increasing highway deaths. But, unless we also begin again to lower the fatality rate, the growth in travel created by our expanding economy will begin increasing the number of deaths once again.

To cut the fatality rate, we have to focus not only on safer cars and safer roads, but also on affecting the human factor. To do that, we need measures such as in-

creased education and law enforcement, and so we propose raising NHTSA's safety spending by 11 percent—to $333 million. That includes:

—$9 million for a new occupant protection grant program to promote safety belt use, the best way to protect travelers;

—a $9 million increase to support states in passing tough drunk driving laws;

—$8 million for a new research and education program to reduce air bag risks for children and small adults, while still preserving the benefits of air bags for all motorists; and,

—$2 million for a pre-license drug-testing pilot program, the first step in launching the President's new initiative to combat drug-impaired driving.

We're also increasing funding for important safety programs in aviation, rail and maritime safety.

—Aviation safety spending would increase 12 percent to $839 million, enabling the FAA to hire 273 safety inspectors and certification staffers. It also funds the work of the new National Certification Team, which inspects start-up airlines.

—Railroad safety spending would increase by 12 percent, to $57 million, with funds going to speed up new safety rules and to buy an automated track inspection vehicle.

—Finally, we're proposing to increase maritime safety funding to $797 million—including Coast Guard programs to improve vessel and recreational boating safety.

Access to Jobs

Transportation empowers our neighborhoods by providing access to jobs, to markets, to education and to health care for all Americans, whether they live in rural, urban or suburban areas. But this budget, in addition to working for all Americans, is directing resources to one group that needs special assistance: we are proposing the creation of a new $100 million program to provide access to jobs and training, administered by the Federal Transit Administration and cooperatively supported by the Federal Highway Administration. This new initiative will elevate the transportation contribution to welfare reform. We hope this program will act as a catalyst, uniting local governments, mass transportation providers, and social service providers in working toward a common goal of helping people who do not own cars improve their lives not only by finding a job, but by being able to get regularly to that job.

As President Clinton said in his State of the Union address: "Over the last four years we moved a record 2¼ million people off the welfare rolls. Then last year Congress enacted landmark legislation demanding that all able-bodied recipients assume the responsibilities of moving from welfare to work. Now each and every one of us has to fulfill our responsibility, indeed our moral obligation, to make sure that people who now must work can work." One part of the President's three-part plan to accomplish this goal is to provide training, transportation and child care to help people go to work.

Our proposed new $100 million program would offer welfare recipients the access to jobs, training, and support services that they need to make the transition to the working world. This program would promote flexible, innovative transportation alternatives—such as vanpools—that get people to where the jobs are. It also would promote family-friendly transportation, such as day care centers at bus and rail stations.

In addition, DOT's ISTEA reauthorization proposal contains several provisions designed to strengthen existing programs allowing states to utilize Federal-aid funds for training.

Drug Interdiction

And third, the work of the Coast Guard not only directly supports the safety and security of our people, but also is a direct investment in the future of our country through its role in interdicting illegal drugs before they get to America's streets and young people. We're proposing to increase the Coast Guard's drug law enforcement budget—by 15 percent—to $389 million. That includes $53 million in additional funding for surveillance technology, improved intelligence capabilities and increased operations as part of the President's effort to stop illegal drugs from entering our country.

INVESTING IN OUR ECONOMY

In the 21st century Americans will compete in a truly global marketplace. This marketplace will be fiercely competitive and our success as a nation will be determined on how safely, reliably and cost-effectively we can move people, goods and information. Transportation expenses now account for eleven percent of the United

States gross domestic product—a greater share of the economy than health care or defense—and will affect our country's global competitiveness in the future.

As he again made clear when he met with the nation's governors last month, President Clinton recognizes the contribution of sound infrastructure to increasing America's prosperity and its international competitiveness. That's why he's worked on increasing infrastructure spending even as he's reduced the budget deficit.

Infrastructure Investment

Working with this Subcommittee and the entire Congress, over the past four years (fiscal years 1994–97) we've increased Federal investment in highways, transit systems, and other infrastructure to an average of $25.5 billion, more than 20 percent higher than the previous four years. The Department is committed to a long-term infrastructure investment program and seeks the highest levels of investment within the balanced budget context.

Our investment is producing results, even with many of these projects still under construction. For example, the latest data on the National Highway System shows us that the condition of bridges and pavement has improved significantly. System performance—as measured by peak hour congestion, which had been deteriorating—has now stabilized.

This success extends to transit. In the last four years we've financed nearly 26,000 buses and almost 600 rail cars for state and local transit agencies. With 19 new full-funding grant agreements, we've also financed more than 100 miles of new transit lines, serving more than 100 stations. Meanwhile since 1993, Amtrak has either taken delivery of or placed orders for 236 new rail passenger cars, 191 new locomotives and 18 high speed train sets, making dramatic improvements in the age and condition of its fleet and enabling 150 mph service in the Northeast Corridor by the turn of the century.

The fiscal year 1998 proposal of $25.6 billion for infrastructure—actually above the average of the past four years—would sustain the investment that's produced these results. And I want to emphasize that—by proposing even higher ISTEA reauthorization levels—we're leaving room for additional investment in the future as economic conditions and our deficit reduction efforts warrant.

For next year's federal-aid highway program, we're proposing an $18.17 billion obligation limit, just a shade below this year's $18.19 billion.

We also propose a supplemental request for 1997 to increase the obligation limit by $318 million. This would be distributed to states that received lower-than-expected obligation authority this year because of the Treasury Department's correction of an accounting problem in crediting prior-year tax receipts to the Highway Trust Fund.

We're proposing $4.2 billion for transit capital this year, a $390 million increase. Transit operating assistance for communities with more than 200,000 people would no longer be available. But increased capital funding would be made available to them, and, as an added measure of support for them and for communities of all sizes, we're proposing to broaden the definition of "capital" to include preventive maintenance of capital investment. Smaller communities—which are the ones most dependent on federal aid—could use transit formula grants for either capital or operating expenses.

Our efforts in the coming months will be largely devoted to ensuring that an ISTEA reauthorization bill gets passed in a manner that does not result in increases in the budget deficit, but also provides states and localities with much needed flexibility and funding in a timely manner. I know that you share that same goal. For the past year, Congress and the Department have been engaged in reaching out to groups and individuals across the country to gather ideas for reauthorization of ISTEA. What has emerged is a consensus that ISTEA works. The goal upon which our ISTEA reauthorization proposal is based is to build on ISTEA, not abandon it.

Maritime

While not under this Committee's jurisdiction, I would also like to mention that the Department's maritime programs have at their center the strengthening of our national and economic security. They accomplish this through genuine partnership with other government agencies and absolute reliance on the private sector to accomplish two goals: making our maritime transportation system the most modern, competitive and efficient in the world and providing strategically critical sea-lift capacity to support our national security needs.

Aviation Operations

Just as the Interstate highway system expanded the potential of our national economy in this century, so aviation is tying us to an expanded global economy as we enter the 21st century. Aviation has not only brought Americans closer to each

other, it has brought us closer to the rest of the world. Our aviation system is vital to our domestic economy and to our nation's global economic competitiveness. I can assure you that I will use the leverage provided by access to the vast United States market to urge our aviation partners to adopt more open markets—and to ensure expanded access to their markets for United States carriers.

The FAA's air traffic control system enables the safe travel of 1½ million passengers every day, and its inspections ensure that aircraft, pilots, and aircraft operations meet the highest safety standards. We're requesting an 8.7 percent increase, a notable amount in an era of budget freezes, to the FAA's operating budget, up to a record $5.4 billion. In addition to more safety inspectors, that will let the FAA add 500 air traffic controllers and 173 security personnel to carry out the Gore Commission's recommendations. The personnel and procurement reform authority provided in our fiscal year 1996 Appropriations Act will enable FAA to hire the best people possible in the most effective way, as well as to accelerate modernization of critical equipment.

One area in which tough budget choices resulted in our proposing lower investment is airport grants, for which we're proposing $1 billion. We've chosen this course because large airports can obtain funding more easily than can other types of infrastructure; in fact, most already use other sources—such as aircraft landing fees, concession revenue, and passenger facility charges—for most of their capital financing. We plan to mitigate the impact on small airports—which are especially dependent on federal aid—by proposing that their formula grants continue at current levels.

Financing all of our aviation system's needs—airports, airway facilities, security, and FAA operations—is a critical priority for us. I want to commend the Congress for its prompt action in renewing expired aviation taxes and crediting receipts to the Trust Fund. We are grateful for this quick action, which will avoid a serious, short-term financing crisis.

We also want to work with Congress to establish a reliable, long-term funding base so that the FAA can provide the services our aviation system needs. As an interim measure until comprehensive financial reform is achieved, we're proposing $300 million in new user fees. We're looking forward to appointing the new National Civil Aviation Review Commission—which will analyze aviation budget requirements and ways to fund them—and help us to reach a consensus on what course to take.

PROACTIVE LEADERSHIP

As I said in my confirmation hearing, I will continue to bring common sense government to the Department of Transportation in order to provide the people we serve with a Department that works better and costs less. I will encourage more flexible, innovative funding to leverage federal dollars for infrastructure investment, technology use to improve the performance of our transportation system, and transportation policies that are sensitive to environmental concerns.

Innovative Financing

The fiscal year 1998 budget expands the efforts the Department has made in innovative financing by providing another $150 million in seed money for State Infrastructure Banks (SIB's) and $100 million for a new Federal Credit Program, both to be included in our proposal for ISTEA's reauthorization.

The Federal Credit Program will be similar to the SIB's in its support of innovative financing, but it will fill a different need—the support of projects which, by virtue of their size or their multistate benefits, are nationally significant but which might not fit into the programs of individual states. That will enable us to make loans and apply other financing arrangements for these vital investments, much as we did with California's Alameda Corridor project.

Technology

Technology is particularly essential to the health of our transportation system. Innovations in transportation technology contribute to America's global competitiveness and national security, enhance the capacity of our infrastructure, our environment and local communities, and perhaps most importantly, save lives and reduce the risk of accidents and injuries. That's why we propose to increase investment in technology research and development by nine percent, to $1 billion.

This total includes $250 million for Intelligent Transportation Systems, which apply advanced computer and communications technologies to travel. This will help improve information to drivers in order to increase transportation efficiency. About $150 million will fund ITS research and technology development, and $100 million is to encourage state and local governments to invest in electronic infrastructure

such as travel information programs and automated traffic signals to enhance infrastructure performance.

The budget also requests funding to complete all six prototypes and conduct testing of the Advanced Technology Transit Bus. This bus was developed using proven, advanced technologies from the aerospace industry and is a lightweight, low-floor, low-emission alternative to current buses.

Other efforts in the technology area are geared at helping the Department target its resources to address critical problems. For example, the FAA's technology budget includes funding for an aviation safety risk analysis program. This program is designed to improve FAA and industry measurement of and accountability for safety performance. The analytical techniques to be developed will focus on more effectively and efficiently using information contained in FAA and industry databases.

Protecting the Environment

Transportation, like all human activity, affects the environment, and we have an obligation to mitigate its impacts. That's why we're proposing a five percent increase in environmental funding—to $1.53 billion.

Much of this would be for the successful Congestion Mitigation and Air Quality Improvement Program, which state and local governments use to cut pollution through transit projects, traffic flow improvements and alternatives such as ridesharing. CMAQ funds would be authorized at $1.3 billion a year, up 30 percent from their level under ISTEA.

The Coast Guard's marine environmental protection program, which promotes and enforces an aggressive approach to pollution prevention, preparedness, and response, along with oil spill cleanup programs, would increase seven percent, to $326 million.

CONCLUSION

As the President has said, when times change, so government must change. And so, as I look to the next four years, I believe we in the Department of Transportation must set high goals and must be architects of change, but also build a new balance in our relations with state and local governments. We must ensure our success in the 21st century by recognizing the crossroads we are at today—recognizing the need not only to invest in our current infrastructure, but to take full advantage of technology and leave a more efficient, safer transportation system and environment than we have today. I hope that I can help us reach not just for the easy and the quick, but for the solutions that will make a difference in the long run, for the solutions that appear, but are not really, just beyond our reach.

As President Clinton said in Putting People First, "Just as interstate highway construction in the 1950's ushered in two decades of unparalleled growth, investing in the pathways of the future will put Americans back to work and spur economic growth." The Department's fiscal year 1998 budget proposes strategic investments in two important pathways: people and infrastructure. It also does its part to balance the federal budget by 2002. I stand ready to be your partner as you develop a DOT appropriations bill that is consistent with our national commitment to reach a balanced budget by 2002 and with our commitment to ensure that critical national transportation needs are met so that Americans can maintain their mobility and our economy can continue to prosper. I also stand ready to work with the Congress as it develops a long-term ISTEA reauthorization bill that address the issues of this fiscal year and the 21st century.

PROPOSED HIGHWAY OBLIGATION LEVELS

Senator SHELBY. Mr. Secretary, the administration's ISTEA proposal in the President's fiscal year 1998 budget, as Senator Domenici referred to, appeared to set a highway obligation limitation significantly below the contract authority level. Effectively, the obligation limitation envisioned in the 1998 budget request in the administration's ISTEA proposal has been frozen below the 1997 appropriated level. The administration proposes, as I understand, a higher contract authority level but without—but without—the accompanying obligation limitation.

That simply raises false expectations among my colleagues, the States, the transportation constituency, and the American public.

Why, Mr. Secretary, are you proposing higher contract authority numbers in the budget than your proposed obligation limitation?

Secretary SLATER. Mr. Chairman, what we are trying to do is to exercise a policy that really is evident in ISTEA where you have higher contract authority than obligation authority, but with the robust economy, we have actually been able to fund approximately 96 percent of the authorized levels in ISTEA. Under our current scenario, it provides for a contract authority that is at the highest level possible and an obligation authority at the highest level possible within the context of our overall budget goal of balancing the budget by the year 2002.

But with a multiyear program, it is our hope that as much as we have been able to do in ISTEA in its full-funding effort, we will be able to do the same as we look at the outyears of our proposal.

Currently the obligation limitation would limit us to about, I guess, 86 percent on the dollar of the moneys coming into the trust fund. But again, we had a similar situation with ISTEA. Over time, because we were able to provide record-level investment over the last 4 years, we were able to provide 96 percent of the funds coming into the trust fund during this period. We believe that the same will hold true as we look forward to a robust economy in the coming years.

TRANSIT NEW STARTS

Senator SHELBY. Mr. Secretary, the President's proposed 1998 budget would cut transit new starts by $126 million from the current enacted level of $760 million.

There are now 13 new starts with full funding grant agreements in the funding pipeline, and two more are awaiting FFGA's. These 15 projects will cost $3.7 billion to complete. There are about 100 other projects already in various preliminary stages, totaling about $10 to $20 billion to complete. The San Francisco BART subway extension to the San Francisco airport is awaiting approval of a new $750 million Federal full funding grant agreement, and Sacramento is awaiting one for about $100 million.

Some new start projects have encountered serious construction problems, notably in Los Angeles, where concerns have been raised about whether improved bus service is a cheaper and a better option.

Should, Mr. Secretary, the administration be entering into new funding grant agreements when the new starts program is already at least oversubscribed?

Secretary SLATER. Well, Senator, your point is well taken in that we have recently moved rather aggressively as it relates to new starts, really, 13 major new starts, but on average I think we had about 20 or so over the last 4 years, a considerable investment.

I think it responds to the challenges of the moment. I found it quite interesting that Senator Faircloth from North Carolina would make mention of the importance of light rail, a southern State, a State clearly dependent on highways, as he noted, with the largest system in the country, but because of the capacity needs of this age and the future, States are beginning to diversify their system much more, even in the South, a region that we both hail from.

It is the opinion of the administration that through the planning process, working with local and State officials, we will be able to bring about better transportation decisions so as to bring more transit projects on line, but to do so in a way that recognizes our limited dollars, our limited ability to play at the Federal level, but to also encourage and stimulate activity at both the local and State levels and even from the private sector. We are finding that these arrangements can be put together as we work as a team and bring commonsense approaches to these kinds of decisions.

Senator SHELBY. Mr. Secretary, is the administration interested in working with new starts project sponsors to help reduce the size of the Federal commitment to these expensive projects?

Secretary SLATER. I think we have to continue to work with our partners to do that.

Clearly, State and local governments are strong and actually majority participants in all transportation infrastructure investments. I think we have moved past the day when the Federal Government is the total pocketbook when it comes to these kinds of major investments. We also have to test the private markets, and many of you have spoken to that.

But that is not to say that we can shirk our responsibility as a Federal Government in providing much needed resources and in carrying our part of the load, and I do believe we are going to work through this process as we go forward as a nation into a new era.

Senator SHELBY. Thank you.

Senator Lautenberg.

SAFETY REGULATIONS

Senator LAUTENBERG. Thanks very much, Mr. Chairman.

Thank you, Mr. Slater, for an excellent presentation.

Mr. Slater, I was opposed to the passage of the National Highway System bill, and I asked the President to veto the bill. The bill, in my opinion, went just too far in undermining our Federal role in ensuring safety on our highways. The law repealed Federal mandates regarding speed limits, as well as use of seatbelts and motorcycle helmets.

Now, I hear that some interests want to use the reauthorization of ISTEA to force more rollbacks and deregulation in the safety area, including allowing longer and heavier trucks on our highways and eliminating mandates on the minimum drinking age.

Can you tell me what the administration's position is going to be regarding the effort to roll back the existing safety mandates in current law?

Secretary SLATER. Senator, I do not think that those kinds of rollbacks can be tolerated, frankly. As you know, the administration fought vigorously to make the case for a national speed limit law, for the helmet law, and the like. It was a battle that we lost.

We also made a strong case for the importance of the National Highway System. This is a system that is but 4 percent of all the roadways in the country, but it carries 45 percent of all the highway traffic, 75 percent of the truck traffic, 80 percent of the tourist traffic. It is on this system that we hope to make the kinds of improvements that will make less likely the kinds of accidents that we have heard about even this morning.

Because of that, because of the focus on intermodal connectors that will hopefully take us closer to the establishment of a national intermodal system where all of the modes of transportation play the roles that they play best, it was my suggestion, along with Secretary Peña, to the President that he sign the bill, knowing that many of our key supporters were on a different side.

We also then made a commitment to establish a strong and aggressive safety action plan that we are yet in the process of moving forward on implementing, and I assure you, Mr. Chairman, that as Secretary I will make safety not only my No. 1 priority in rhetoric, but it will be the North Star by which we will be guided and also a commitment by which we will be judged. I am committed to following through on this commitment.

DRIVING WHILE INTOXICATED

Senator LAUTENBERG. I am pleased to hear that, Mr. Secretary. We cannot expose our passengers on the highways to ever more danger and ignore what is taking place.

I was the author of the provision that sanctioned State highway funds for failing to adopt the 21-year-old drinking age bill.

Secretary SLATER. Yes.

Senator LAUTENBERG. I am pleased to say that as I look back on my work here, one of the things that pleased me most was the fact that it is estimated somewhere around 14,000 young people did not die on the highways because of our legislation. I think it is also assumed that if the law was enforced more rigorously, that we would have a substantially higher number that would have escaped death and injury on the highway.

The NHS bill included an initiative that Senator Byrd had to sanction State highway funds if they did not prosecute drivers under the age of 21 with any amount of alcohol in their system.

Have these sanction programs served their purpose?

Secretary SLATER. They have, Senator. Actually we have a commitment to the Congress to respond with a report dealing with what have been the effects of some of the other safety provisions, and at that time, we will have better data as relates to the success of this particular program.

But, again, I do think that it underscores the fact that there were safety components of the NHS bill that really made it worthy of the President's signature, and you have just noted the commendable effort on the part of Senator Byrd in that regard. And I might add that that was a provision that passed overwhelmingly in the Congress and also by numbers comparable to the numbers by which some of the other provisions were actually removed from our national policy.

So, I do believe that the Congress is ready and willing to ensure that we have laws on the books that make safety our No. 1 priority in transportation.

Senator LAUTENBERG. We are happy to hear your commitment and to test whether or not the Congress is determined to do what it can to prevent this carnage when it comes to determining blood alcohol levels for prosecuting drunk drivers. NHTSA has determined that drivers become significantly impaired at .08 BAC. They also found that the risk of being in a crash rises gradually as the

BAC level increases, but then rises very rapidly after a driver reaches or exceeds .08 blood alcohol content.

Do you think we ought to take a more aggressive stance to get the States to adopt .08 for prosecuting drunk drivers?

Secretary SLATER. Let me just say that that is clearly an issue to be considered.

What I would really like to note, though, is I do believe NHTSA is doing quality work. One area where we are focusing a great majority of our attention is in the seatbelt area. So, this, as well as other initiatives, can be considered as a part of an overall toolbox from which States, locales can select those programs, policies, and procedures that best relate to the transportation and safety challenges that they face at the State and local level.

AMTRAK FUNDING

Senator LAUTENBERG. Mr. Secretary, under your view of things, your ISTEA proposal assumes that Amtrak will be funded from the highway trust fund, but it is not at all clear that Amtrak will see any sizable increase in capital funding under your request. Will your ISTEA proposal provide Amtrak with sufficient capital dollars to eliminate the need for operating subsidies and be able to provide first-class service? Because that is what is going to determine the success of the railroad.

Secretary SLATER. I understand. Senator, I know that the issue of Amtrak is one that is very important to you and many Senators clearly in the Northeast corridor, but I have heard from a number of Members really across the country, Senator Lott in particular from Mississippi and others, who are in some of the more rural areas of the country, who also value the importance of Amtrak.

I can tell you that it is my personal desire that Amtrak has to be a part of the 21st-century transportation system. The challenge before us is to determine how to best fund it, how to best make it self-sustaining. The people within Amtrak, the leadership, Tom Downs and others, I think have made a very strong case in that regard, but we do have a long ways to go.

I would hope that when we unveil our proposal in the first instance, that Amtrak could be a part of it. I have to tell you that because we are trying to come to grips with how to best fund it, that may or may not be the case, but it would again then be my hope that before we move through the entire reauthorization process, that we would be able to come to some consensus, find some common ground as to how to make Amtrak more viable and self-sustaining.

Senator LAUTENBERG. It needs leadership, Mr. Secretary, and Amtrak, when presented as an asset in a State or a community, is very much sought after by people here, the Members. I am sure the distinguished Senator from Utah would like to see that Amtrak is there in 2002 carrying all those people, bringing all that money, getting——

Senator BENNETT. I think it has a better role to play in the Northeast corridor than it does in Utah, and I support it in the Northeast corridor.

Senator LAUTENBERG. Well, I am willing to share the admiration for Amtrak. [Laughter.]

Well, can you guarantee now in front of this subcommittee, Mr. Secretary, that Amtrak will not have to terminate more routes under the funding levels that are being proposed?

Secretary SLATER. What I would like to do, Senator, is to just make a firm, unequivocal commitment that the Department will work with the Congress, with the Amtrak team, both management and labor and its leadership, and State and local governments, to find common ground and to ensure that we do not lose any more service and actually that we build on the service that we currently have. My objective would be to see Amtrak as a viable part of a transportation system for the 21st century.

Senator LAUTENBERG. You will convey that to Majority Leader Lott, please?

Secretary SLATER. I will.

FAA FACILITY IN ATLANTIC CITY

Senator LAUTENBERG. Mr. Secretary, the Coopers & Lybrand accounting firm evaluation of the FAA's financial needs was released just this Friday, and as you know, this report included a recommendation that the FAA look into consolidating the Hughes Technical Center, which is in Atlantic City, NJ, into a facility in Oklahoma City, OK. They justify this recommendation largely based on the value of the land they say could be sold if FAA moved from its present location.

Well, it is mysterious to those of us who know the area, because it is an established fact that there is a reversionary clause that says this property that FAA is on must be sold to the Southern New Jersey Transportation Authority for only $55,000. The estimate on it is, I think, a couple of hundred million dollars. And there is no way that that is going to redound as a bonus to the Federal Government.

The Hughes Technical Center is also, unfortunately, a Super Fund site, and it is going to require some very expensive environmental remediation.

It functions, however, in its present form to continue the pursuit of explosive detection equipment, of ways to thwart terrorists, of ways to reduce the damage that comes from bomb explosions, hardened containers. They do some wonderful, wonderful work down there.

To uproot this infrastructure of intellectually trained people, I think, would be a travesty, and I hope that, based on the facts, that you will be able to assure us that the Atlantic City technical center will continue to operate to provide safety to the traveling public and to deal with our expanding need.

As we all know, aviation is scheduled for growth. Mr. Chairman, I think it could almost double in the next 20 years.

So, I would like to have your word, Mr. Secretary, that you will look very closely at that and make sure that we do not lose this asset.

Secretary SLATER. Yes; Mr. Chairman, what we are doing now is analyzing the study of which you speak. Our objective will be to pass it on to the National Civil Aviation Review Commission that will be established soon for full consideration and for the imple-

mentation of those parts of the study that we would find worthy of implementation.

I can tell you, speaking specifically about your concern, that the cost of land should be a factor, but not the sole determining factor, when it comes to this issue. Clearly the issues that you have raised here and that we will likely discuss as we go forward will be taken into account.

Senator LAUTENBERG. Thank you very much. Thank you, Mr. Chairman.

Senator SHELBY. We have been joined by Senator Mikulski. Do you have any opening statement?

Senator MIKULSKI. I will be happy to wait for my turn for questions, and I am very happy to welcome Secretary Slater to this committee.

Secretary SLATER. Thank you.

Senator SHELBY. Senator Bennett.

TRANSIT NEW STARTS FUNDING

Senator BENNETT. Thank you, Mr. Chairman. I realize I did not do my manners properly by congratulating you in my opening statement for your assumption of this chairmanship.

Senator SHELBY. Thank you.

Senator BENNETT. I am delighted to have you there and to join you as a new member of the committee.

I want to follow up on the chairman's comment about full funding grant agreements. I am not sure I heard quite what I wanted to hear in the answer, and it may be my faulty hearing.

But once you get a full-funding grant agreement in place and a new start underway, filling up the pipeline with other full funding grant agreements behind it that end up diluting what you are doing on existing projects can have the effect of slowing down what is there on the projects in progress, which ultimately drives up the costs.

I think the issue that the chairman raised about the BART extension in San Francisco and the extra hundred million in Sacramento is one that has to be looked at in terms of its impact on the FFGA's that are already in place.

Would you address that again for me? As I say, I may not have got it properly from your comment. How do you react to that?

Secretary SLATER. Sure. Senator, clearly as we deal with those two proposals, we will take into account those projects that are currently in the pipeline. Your point is well taken there. When we talk about our priority of bringing a commonsense approach to Government, I think that that would mandate that kind of analysis and review.

I can tell you that the way we have been able to handle these projects thus far is to continue to monitor the progress of the projects in the pipeline and, where in an instance a project is not moving as effectively, efficiently, as we would like, we make decisions about the resources. I can tell you that the Los Angeles Red Line is a project in point dealing with that particular issue.

So, I think that your point is well taken, and I assure you that that is the kind of thoughtful consideration that will go into the

way we address these new proposals that are yet before us and how they relate to the projects that are currently in the pipeline.

SPENDING OF TRUST FUNDS

Senator BENNETT. Thank you. I appreciate that clarification.

Reference was made earlier to spending the money that is in the trust fund. If I may again go back to my history, we naively thought in the Department of Transportation in the late 1960's when we created the airport airways trust fund, we were guaranteeing that FAA would have sufficient funds, independent of the ups and downs of budget cycles, to see to it that the airport airways system would be properly funded.

We did not recognize that Presidents, regardless of party—the Presidents of my party have been just as guilty of this as the Presidents of yours have been—could find ways to thwart the effect of creating a trust fund for both airport airways and highways. The money that is put in both those trust funds piles up on paper so that the funds have huge, wonderful surpluses, but in effect in the unified budget, the impact is to say we have lowered the deficit elsewhere because we are not appropriating those funds.

Talking about safety, I heard a report of someone who looked into the issues of hackers breaking into the computer systems of the Federal Government and whether or not they would be able to render serious mischief in the Federal Government and was told the one place where a hacker cannot create damage in the Federal Government system is in the FAA airport airways computer system because it is so obsolete, there is not a hacker anywhere in the world that is capable of penetrating it. That is not a really reassuring kind of safety circumstance.

I support the notion that the money that is in the highway trust fund should be spent on highways and not sequestered for a budget effect later on, and I support the notion that the money that is in the airport airways trust fund should be spent on bringing the airport airways computer system up to the point where hackers can at least understand it.

I would like your reaction to that. I know I am putting you and the chairman of the Budget Committee in something of a box with this, but I do go back to the days when the trust funds were created as trust funds and I have seen the budgeters of both parties get around that congressional intent and would like just a comment.

AVIATION TRUST FUND

Secretary SLATER. Well, first of all, let me commend you for raising really an important question, even though it is difficult to grapple with.

But let me also commend the Senate and the Congress as a whole for the prompt action taken on the reinstatement of the aviation excise tax, because our trust fund was almost in bankruptcy status, and I very much appreciate, and I know that the entire administration appreciates, the prompt action taken there.

Also let me say, as relates to the issue of equipment and the other needs of the aviation industry, because that is what is really underlying the question and the strength and power and force of

it—Senator Lautenberg mentioned earlier the fact that there was the equipment failure at an airport in his State, and that has happened probably all too often in districts and States around the country.

I think that the Congress, working with the administration, has acted to give us the most powerful tools we have ever had to deal effectively and forthrightly with these issues. I speak of it from the vantage point of my work as Federal Highway Administrator. I think coming into the office and having the ability to make ISTEA real, with all of the planning and flexibility and innovative potential there, was a treat for someone who really wanted to make a difference, as was noted earlier by Senator Lautenberg in reference to Chairman Shelby and the opportunity he has now serving as chairman.

I think today the aviation industry, FAA, has the same opportunity we had in highways with the enactment of ISTEA to really make a difference, to turn the curve, to deal with these issues of personnel reform, procurement reform, and then with the advent of the National Civil Aviation Review Commission and the work that it will do in dealing with the long-term funding needs to put aviation on a path, a flight path if you will, that will ensure that it will give us what we need in the first half of the 21st century when it must play the role that the Interstate System played in the last half of the 20th century, helping us to develop a national economy, the Interstate System, but the aviation industry helping us to compete effectively and forcefully and win on the international stage.

And all of these funding questions underlie that, and so I would like to, in offering my response, make the point that I do understand the issue. I think that you raise it—even though uncomfortable—you raise it as it should be raised, and we just have to work over the coming year to answer this very difficult question and to find common ground in doing so.

Senator, as one who would not see any Senator as just another Senator, I very much appreciate you for having raised this very, very important issue.

Senator BENNETT. Thank you. Thank you, Mr. Chairman.

Senator SHELBY. We have been joined by Senator Specter. Do you have any opening statement, Senator Specter?

STATEMENT OF SENATOR SPECTER

Senator SPECTER. Well, thank you very much, Mr. Chairman. I am delighted to join others in welcoming the new Secretary of Transportation. It is a job of enormous importance.

I am very much concerned about the funding for mass transit, for operating expenses. The impact of cuts is very, very hard on not only the big cities but in the rural areas. People do not understand that mass transit affects small counties in my State like Monroe County and Schuylkill County, and in the big cities it is indispensable in order to take people from the inner city to jobs in the suburbs. I think we have to do better on that subject.

On the ISTEA issue, I am hopeful that we will be able to find the money to take care of America's infrastructure. I know that in the House of Representatives, Chairman Shuster is taking the position that the highway trust fund ought to spend all the money on

highways. It has some very substantial opponents, as I understand it, Senator Domenici, among others.

But I think we need to get to the day where we will have the trust funds carry out the purpose for which they were intended. They really are trust funds.

When I was district attorney in Philadelphia, I indicted people who invaded trust funds because that is a fraudulent conversion, and the Federal Government, regrettably, can get away with it.

One other point that I would like to comment on, as we move forward to ISTEA, I think it was very important that we maintain adequate funding for mass transit. We have a very delicate situation with the supply of oil from the Mideast. This is something I saw in some detail working on the problems of terrorism in Saudi Arabia, the difficulties we have seen with Iran, and while we do not like to think about it or talk about it, we have to face up to the fact that the government in Saudi Arabia is on a thin thread and that if we had a problem with Saudi oil, we would be in very, very deep trouble, the entire Western World and Japan. So, we ought to be moving toward independence from Mideast oil.

I know Senator Byrd and I and others have worked years on the subject of clean coal. We have hydrocarbons in our country which would go a long way for independence from Mideast oil. That is a very bitter pill we might have to face, but we can do a little something about it on ISTEA if we look more to mass transit.

Thank you very much, Mr. Chairman.

Senator SHELBY. Senator Byrd.

Senator DOMENICI. Senator Byrd, would you yield one moment to me?

Senator BYRD. Certainly. I would be glad to.

Senator DOMENICI. Thank you. I cannot stay because of another engagement.

I have several questions, which I am going to submit for the record, Mr. Chairman.

Senator SHELBY. Submit them for the record.

Senator DOMENICI. I very much would appreciate as early an answer as you can give us.

Secretary SLATER. Yes, sir.

SPENDING OF TRUST FUNDS

Senator DOMENICI. Let me just make one quick observation about trust funds. What we are trying to do is make sure the Appropriations Committee maintains some power over how the trust fund moneys are spent, just to be honest with you. Frankly, just because you have an airport trust fund did not mean that the expenditure from that trust fund to build a new computer system was right. Had somebody been looking at it, they might have said we do not want to spend the money. It turned out to be a botched project.

So, I am trying to find a balance between a trust fund and making sure somebody has some real oversight and some ability to say that this year we are not going to spend all the money in the trust fund because the program is not right.

Now, I am sure, even in your capacity as district attorney, that the judge would understand that I am acting in good faith. So, I

would urge that you not seriously consider taking any action against the chairman of the Budget Committee. [Laughter.]

Senator SPECTER. Mr. Chairman, just one comment. I would confess error if there was any error to confess about implicating the distinguished chairman of the Budget Committee. I am not saying that you have to spend all the money in the trust fund. What I am saying is that the money in the trust fund ought to be spent for the purpose for which it is intended.

Thank you.

Senator SHELBY. Senator Byrd.

Senator DOMENICI. Thank you, Senator Byrd.

STATUS OF APPALACHIAN HIGHWAY SYSTEM

Senator BYRD. The Senator is welcome.

Mr. Secretary, as I indicated in my opening statement, I am very encouraged by the President's request for $2.19 billion in contract authority and obligational authority for the Appalachian Highway System. I think it is an excellent first step toward ensuring the system's completion.

Question.

Secretary SLATER. Yes, sir.

Senator BYRD. Even though you are not able to request the adequate funding in the next 6 years to complete the system, is the administration committed to its eventual completion as soon as possible?

Secretary SLATER. Senator, we are committed to that end.

Senator BYRD. Based on the funding stream that you have recommended for the next 6 years, when do you estimate that construction of the system will be completed?

Secretary SLATER. We anticipate that—well, first of all, we are doing an update of the estimate. I believe the last was done in 1992. At that time we anticipated that the cost to complete was probably in the neighborhood of about $7 billion or so. We were asked by the Appalachian Regional Commission to do an update. We hope to have that update completed by the middle of the year. I would say summer. I think we are looking at May. At that time we will have a better handle on what the challenge is. We anticipate that it will again be in the neighborhood of about $7 billion or so.

When you consider what we were able to offer as a result of this reauthorization proposal—that will become public fairly soon—of around $2.19 billion, it is anticipated that it will probably require that we go beyond the 6-year period of reauthorization. So, I would assume and hope that over the next decade or so, maybe a little longer, we can complete the funding of this very important program.

I do understand that many are a bit frustrated. This was an effort that started more than 30 years ago, and you do have the commitment of this administration to work with you in partnership to see that the work is done and is done as timely as possible.

Senator BYRD. I appreciate your answer, Mr. Secretary. I was a little bit concerned by the words that you used. Perhaps you did not choose them with design.

Secretary SLATER. Yes, sir.

Senator BYRD. But you said, within the next decade or so, possibly a little longer.

Secretary SLATER. Yes, sir.

Senator BYRD. I would hope that we would complete this system in 12 years, which would give ISTEA—two highway bills—certainly no longer than 3, which would be 18 years.

Secretary SLATER. I understand. I can tell you that as I was thinking about the next decade or so, I was thinking basically two evolutions of reauthorization.

Senator BYRD. Yes.

Secretary SLATER. But since those bills can sometimes be 6 years, 5 years, I just did not want to be too specific there, but we are going to do the best we can this time around.

Senator BYRD. Well, you cannot be too specific. I think we are on the same wavelength and I appreciate your understanding of our needs, those of us who represent the Appalachian States.

Secretary SLATER. Yes, sir.

Senator BYRD. Will the Appalachian highway funding that you are proposing in your ISTEA proposal also grant the necessary obligational authority so that the States do not have to choose between funding the Appalachian highways and addressing their other highway needs?

Secretary SLATER. That is correct, sir. There will be no impact on the obligation authority that is normally given to the States through the formula program.

ALCOHOL-IMPAIRED DRIVING

Senator BYRD. Mr. Secretary, I have been concerned for many years about the dangers of alcohol-impaired driving.

Let me say, incidentally, we have witnessed a great crusade in this country against smoking and it is being fairly successful, I think. I am not critical of that crusade, but what I cannot understand is why this Government of ours is not equally concerned about alcohol. Why do we not have a crusade against drinking, not just drinking while driving but against drinking, period?

Now, it may not be very politically correct—God help us if we ever succumb to that term—to mention drinking.

I see the smoker as maybe killing himself, but I see the driver who is drinking as killing other persons, innocent people, my wife, your wife, our children, our grandchildren, and so on, and likely not killing himself.

As I have noticed most of these collisions that involve drunken drivers, it seems to me that they get off with a few bruises in most instances, but it is the person who was not drinking who is killed.

I just hope that this administration will take up the crusade against this evil. Smoking does not break up homes. Smoking does not cause divorces. Smoking does not cause absenteeism from the job, from the work place, but it is Old John Barleycorn, that evil we call booze. We need to effectuate a crusade in that regard.

Now, that is neither here nor there as far as your questions and answers are concerned, but it leads me at least to this question.

Are the fiscal year 1998 requested amounts for these types of programs sufficient to deal effectively with the problems associated with drunk driving, particularly given the fact that in 1995 alcohol-

related fatalities rose for the first time in a decade to 17,274 deaths?

I am alluding to the request for the alcohol-impaired driving incentive grants for which NHTSA has requested $34 million, an increase of $8.5 million from fiscal year 1997.

I am also referring to the impaired driving research or section 403. NHTSA is asking for $1.6 million, the same amount as fiscal year 1997.

For the State and community formula grant program, NHTSA has requested $140.2 million, $34.1 million of which is approximately spent on alcohol safety programs. The fiscal year 1998 funding is at the same level as fiscal year 1997.

So, again, are these requested amounts for these types of programs sufficient, in your judgment, to deal effectively with the growing problems associated with drunk driving?

Secretary SLATER. Senator, first of all, let me say that the increase in the number of accidents involving alcohol-impaired drivers was not a figure that went unnoticed by those of us within the Department. We are committed to safety as the No. 1 priority, more than just through rhetoric. That kind of reality is what has caused us to make a significant increase in our request for funding to really provide more incentive to States to respond to these kinds of issues.

As relates to the alcohol-impaired driving program, we do request an additional $9 million. That is a significant increase, but I would like to note that overall, as it relates to all of the NHTSA programs, we are requesting an 11-percent increase in those programs.

So, again, to give States a toolbox from which to select those initiatives that best meet their particular challenges, we are asking for total funding in the amount of $333 million for NHTSA for these types of programs.

We are also beginning to focus more and more on driver behavior as an area on which to provide additional resources and focus to deal with this particular issue. We have made significant contributions on the infrastructure side, dealing with pavements and the like, also as it relates to vehicle safety, but we do believe we can do more in the area of human factors and that is where we are going to focus a lot of attention and effort in the coming years.

Senator BYRD. Mr. Secretary, I compliment you on your response.

I hope that you will be more aggressive, very aggressive in pushing the States in this direction.

Secretary SLATER. Yes, sir.

SAFETY OF WASHINGTON, DC, AREA PARKWAYS

Senator BYRD. The life you save may be mine, and I am thinking of the George Washington Parkway.

Secretary SLATER. Oh, yes.

Senator BYRD. Recently we have seen some terrible, most tragic accidents occur on that road, and it was my understanding in watching the TV that $16 million would be needed to install structural divides between the road going east and the highway going west.

Secretary SLATER. Yes, sir; your divides.

Senator BYRD. Those median strips are so very narrow in so many places.

Do you have any comment?

Secretary SLATER. Yes; I do, sir. This is something that we have followed very closely. I might also add that the Baltimore-Washington Parkway, about which I know Senator Mikulski is very interested—we have looked at these and we have really tried to work with the Park Service to make the necessary improvements. I might add, though, that our figure is more in the area of about $10 million for the improvement, but I am willing to be mistaken on that point.

The only point I want to make is we will work with the Park Service in partnership to make sure that the necessary improvements are made. We are expediting the process to provide for some temporary structural improvement over the next few months, and then we will move forward with the kind of resources and initiative necessary to provide for the permanent barriers.

But if I may, Senator, let me just say that I saw a very interesting editorial in the Washington Post dealing with this issue, which noted that these parkways were not built to interstate standards, nor were they built with their use to be in the same way as the interstates are used.

In the final analysis, I think we have to seek the assistance and the support of the driving public that will use this facility and know that it is constructed in the way that it is constructed so as to accentuate the pristine beauty of the roadway and the landscape, as well as to provide a transportation service. We just all have to be considerate of the individuals with whom we share the road. So, I think enforcement is also a part of the answer, and that is really what I am getting to.

Senator BYRD. Mr. Chairman, I know my time is up. May I ask one question of the Secretary with regard to the funding that is needed in regard to the problem that we just indicated?

Would this be funding that would come through this subcommittee or would it come through the Interior Appropriations Subcommittee which has jurisdiction over the parks?

Secretary SLATER. It is going to come from our Federal Lands Program, which is a part of our overall DOT program. So, this committee would have a lot to say about those resources and how they are expended.

Senator BYRD. Mr. Chairman, I hope we will do something about this.

I thank the chairman and thank the Secretary.

Senator SHELBY. Senator Faircloth.

MILEAGE OF APPALACHIAN HIGHWAY SYSTEM

Senator FAIRCLOTH. Thank you, Mr. Chairman.

I also share an interest with Senator Byrd on the Appalachian Highway System. I was 8 years working with it.

Have we added additional miles to it? Have there been miles added since the inception—what? Thirty years ago?

Senator BYRD. Over 30; 32 years.

Senator FAIRCLOTH. Have there been additional miles added to that system or is it a locked-in mileage? If we have continued to

add mileage to the system, then there is some reason for not having completed it in 30 years, so are we still adding? That is my question.

Secretary SLATER. Yes; I understand the nature of the question.

Let me just say that I do not know personally whether miles have been added. I would say this, that most of the costs and the increase that we have determined are really based on other factors, the need to ensure that the roadways are compatible with the environment and a lot of our clean air responsibilities that have come into existence in the ensuing years. But that represents the increase in the costs more so than the addition of miles.

I have just gotten a note that no new miles have been added.

Senator FAIRCLOTH. No new miles.

Senator BYRD. It seems to me, if the Senator would yield, that there have been some new miles added from what they were in the very beginning.

Secretary SLATER. OK. Let me just say that what I would like to do is to look into it. I know that the system is pretty much consistent with the way we have looked at the Interstate System where originally it was about 42,000 miles, if I understand correctly. Then over time, because of changes in demographics, there were some roadways that were added, and we have got a system now that is about 45,000 miles. I would not be surprised if a few miles have been added to the system.

But the point that I want to underscore is that the increase in the cost is primarily based on inflation and based on other responsibilities that we have to meet that go beyond just the laying of the concrete, the asphalt, and the steel, many of them environmental considerations. We are taking those into account appropriately so, and our objective is to complete the system as soon as possible at a cost as low as possible.

Senator BYRD. Mr. Chairman, would the Senator yield again?

Senator FAIRCLOTH. Sure.

Senator BYRD. I wonder if the Secretary—and perhaps I am the one who is confused—is talking about the interstate mileage system when I believe the Senator is talking about the Appalachian corridor.

Secretary SLATER. Yes; I was talking about Appalachian. But my point is I would not be surprised that some miles were added. We are going to confirm that.

But then I went on to use the interstate as an analogy. Originally it was laid out actually during the Roosevelt administration, and then during the Eisenhower administration, we were able to put together—Senator, you noted your presence at the time—not only the concept but also the funding mechanism. Then over time, because of some demographic changes, we did add miles here, miles there. We are talking about I–73/74 right now. So, those kinds of additions have been made over time, but it has not resulted in a large addition. We started at about 42,000 miles. We are now at roughly 45,000. That is not a significant addition with a system of that size, and I would think that the same would hold true with the Appalachian development highway program.

[The information follows:]

No corridors have been added to the system since 1978. However, Congress amended the 1965 Appalachian Development Act to increase the original 2,350-mile Appalachian system in 1967 to 2,700 miles, in 1975 to 2,900 miles, and finally in 1978 to its present size of 3,025 miles.

VARIED USES OF HIGHWAY TRUST FUND

Senator FAIRCLOTH. Thank you.

Secretary Slater, the administration has expanded the use of highway trust funds in many, many areas. When we added a 4.3 cents per gallon tax increase on gasoline, it simply went to the general revenues. And now the President has proposed that funding for Amtrak come from the trust fund, which it did not in the past. Additional funds for the National Highway Traffic Safety Administration come out of the trust fund.

If we keep bleeding the highway trust fund—and that is what we are doing with every program that comes up—do not we at least need to give the States additional flexibility in the use of their transportation funds?

And if we need to fund Amtrak, do you favor an additional one-half cent per gallon as they have wanted, and is that the direction we are headed in?

Secretary SLATER. First of all, let me just deal with the issue involving Amtrak. We are engaged in ongoing discussions internally about how to best fund Amtrak. Once we are clear as to our thinking, we will then, as we always have to do, come to the Congress for your consideration of that proposal, and hopefully in the process, we can find some common ground there.

What I have said is that, as Secretary of Transportation, I do view Amtrak as being central to our transportation system for the 21st century. Now, the issue of how we fund it is a matter that is open to discussion and to debate.

On the question of the use of the trust fund for purposes that go beyond, say, the hard side of transportation, meaning the investment in the concrete, asphalt, and steel, with the highway trust fund, let me just say that with our reauthorization proposal that will become clearer as we unveil it and roll it out. The focus will be on the preservation primarily of the system as it exists, with over 80 percent of the resources going toward the NHS system, interstate maintenance——

Senator FAIRCLOTH. Excuse me.

Secretary SLATER. Yes, sir.

Senator FAIRCLOTH. Maintenance of the Interstate System?

Secretary SLATER. The NHS which includes the interstate; yes, sir.

Senator FAIRCLOTH. Just the maintenance, not expansion.

Secretary SLATER. Well, also expansion.

Senator FAIRCLOTH. But primarily maintenance.

Secretary SLATER. Primarily maintenance because most of the system is in place.

And I want to get to that question of flexibility because that is exactly what we are doing. We are giving the States the option. They are not being forced to do anything. They are going to have the flexibility to use the resources to make the decisions that they think best, clearly after having gone through the planning process.

But the point I want to make is that, with the reauthorization proposal, we are going to focus primarily on preserving the system that we have, and that could include expansion. But the NHS, which includes the Interstate System, the interstate maintenance portion of the NHS, the bridge program—many have mentioned bridges here today—and then the Surface Transportation Program [STP], which is almost like a grant program that provides maximum flexibility to States and local governments to deal with their transportation needs. Eighty percent of all the funds will go toward that kind of an investment.

When you compare apples to apples, meaning ISTEA and our program, the total amount for ISTEA is about $157 billion. For our program, again apples to apples, those things in our program that are in ISTEA, our total is about $169 billion, which is still a considerable increase, I think about 8 percent.

Then you get to the additions that take our total program to roughly $175 billion. But again, most of the program goes exactly as you have expressed in your comment, toward the core system, the core programs.

But we do offer a proposal to include other things, for instance, the welfare-to-work portion of our effort, at $100 million. That is a part of our initiative to ensure that all Americans, wherever they find themselves, whether in urban, suburban, or rural America, have the benefits of our transportation system and also have really the skills that make them viable players in our society, individuals able to make a difference. But it is only a small portion of the bigger pie.

Then we also hope to make that pie even bigger through our innovative financing initiatives, again the State infrastructure banks and also the Federal credit program that we hope to finance at about $100 million per year. That is the way we hope to deal with the important issues that you have raised, Senator.

Senator FAIRCLOTH. Are we going to see this flexibility in the administration's ISTEA proposal that is coming up?

Secretary SLATER. Yes, sir; we hope to provide even greater flexibility.

An example, the ITS technologies, intelligent transportation technologies. We want to make those kinds of expenditures eligible for all of the major programs, but we want to give that flexibility again to the States and to locales.

Senator, I too have had the honor of serving as a commissioner in my State, you serving as the head of your program in North Carolina. I know that from that vantage point, you want as much flexibility as possible when it comes to dealing with too many projects with too little money, and with that flexibility, you can be strategic and you can put the moneys to the greatest use. We hope to make that the norm rather than the exception.

AVIATION COMPUTER SYSTEMS PROCUREMENT

Senator FAIRCLOTH. Secretary Slater, my time is running out but I have one question that bothers me, and we talked on it briefly in my office the other day.

Secretary SLATER. Yes, sir.

Senator FAIRCLOTH. I understand it was not of your doing and you were not even there. But the $1 billion that was put into an utterly failed computer system is a great source of bother to me and a lot of other Senators that I have heard mention it. I understand that some of the overall project might be salvageable for something.

But has any investigation internally been pursued about how they could spend $1 billion—and I think that was the figure—on a total failure? And not only did it waste the $1 billion plus, we went 12 years with a deteriorating system for the FAA. We are operating with an absolutely antiquated system. Has there been any investigation as to who created this fiasco?

Secretary SLATER. Well, let me just say that I do believe that there have been some investigations. What I would like to do is to follow up with more detailed information on that.

[The information follows:]

There were several investigations in the form of studies on the AAS program and the problems that surrounded it. Studies were conducted by the National Volpe Transportation Systems Center, Center for Naval Analysis, Lincoln Labs, the Software Engineering Institute, and a team of independent FAA experts. Those investigations concluded that there were multiple reasons that resulted from the actions of numerous organizations for the failure of AAS. Subsequent to these studies, the program was rescoped, top-level management of the program was changed, major improvements were made in the way major acquisitions are managed, and the resulting programs are fully on track.

Secretary SLATER. What I would like to do, if I may, is to say that this sort of thing cannot be tolerated, that we have limited resources, and as good stewards, we have to ensure that those resources are expended in such a way as to bring about the best and the greatest good for the American people.

It is true that we had a very detailed conversation about this long before I was confirmed, and I made a commitment to you then that we would move forth aggressively and with dispatch to fully implement all of the laws that the Congress has given us to deal with acquisition reform, to deal with personnel reform, and hopefully in the next few months to a year, to get the tools that we need to deal with the long-term funding needs of aviation. But your point is well taken.

I would also like to note that Secretary Peña and Administrator Hinson and also Deputy Administrator Daschle, upon getting into office and getting a sense of this issue, did revive the approach to dealing with this concern, and I think we have had a pretty good record since that time. But it is a record that we want to make better. In partnership with you, Senator, and others who I know are concerned about this issue, I know we can.

Senator FAIRCLOTH. Could you have someone in your office send me the background on this?

Secretary SLATER. We will do that.

Senator FAIRCLOTH. And somewhat of a litany of how the fiasco developed.

Secretary SLATER. Yes, sir; we will do that.

Senator FAIRCLOTH. I understand we are going to have another hearing later on with the FAA people. I would like to have that report as soon as possible and before the hearing.

Secretary SLATER. Yes, sir; we will get that for you.

Senator SHELBY. Senator Mikulski.

TRANSPORTATION ISSUES FOR MARYLAND

Senator MIKULSKI. Mr. Chairman, thank you very much. I too would like to congratulate you on assuming the chairmanship and stewardship of this subcommittee. We have worked together in the House on Energy and Commerce where we did a lot of the railroad legislation in those days and also worked with the chairman on Treasury/Post Office where you showed us so many courtesies, for which we were appreciative. I look forward to working with you on this committee.

Mr. Slater, let me just talk about a few things. First, my opening statement is in the record, but transportation is vital to Maryland. We are in both the interstate and rail corridor from Massachusetts down all the way through the South into the Carolinas, and of course are part of the hub.

We are also in many ways part of the regional hub for the capital of the United States of America. So, it tends to be that our subway system, our highway system are very important to that.

Of course, we are on the Chesapeake Bay and the Coast Guard is so crucial to us.

So, we could go through all of those, but I would like to get to a few top priorities.

Your agency is truly where the rubber meets the road, and the American people really count on you for safety. I am not going to reiterate what my colleagues have said, but I really want to offer the strongest and amplified voice that our safety, particularly in rail and aviation and highway, really be affirmed, whether it is the behavior of drivers, the fitness for duty of FAA, and also of our rail.

Senator Byrd has left, but this time last year we were just about attending the funeral for some wonderful Job Corps kids who were killed in a most ghoulish accident in the MARC train in Silver Spring.

So, we are really safety obsessed and count on you to really be able to move on that. Often air safety captures the imagination of people, but everything from driver's education to switches now are yours.

WOODROW WILSON BRIDGE

Let me, though, go on to what I think is another safety issue and it does affect the capital area, and that is the Woodrow Wilson Bridge. I know this might be seen as a Maryland or Virginia project, but it is a national project because it is a bridge over the Potomac that is one of the key links in the I–95 Interstate.

As you know, the Woodrow Wilson Bridge is, No. 1, 30 years old. No. 2, it was designed to serve 70,000 people. It now currently serves one-quarter of a million people a day and projections increase.

The bridge is outmoded. It is of questionable safety as it goes on.

I wonder what the administration's timetable is and plans are for the Woodrow Wilson Bridge. I note a $40 million item in the budget. That is about 4 percent of what is estimated. So, I would like to hear from you your plans for the Woodrow Wilson.

Secretary SLATER. First of all, we recognize the importance of this structure to the overall transportation system of the country, especially the interstate. This is the only bridge on the interstate that is owned by the Federal Government, and because of that fact, we also understand the important role that we must shoulder and must carry in dealing with this very important transportation safety challenge.

Let me just say that the $40 million that is in the budget, the 1998 budget, is for continued design purposes, as well as I think about $10 million for rehabilitation purposes, to just extend the life of the structure.

But we do know that we are working on a short fuse here and we have got to deal with this issue as quickly and as expeditiously as possible. In that spirit, we are working with the Woodrow Wilson Bridge Commission that has worked tirelessly to come up with a design that I think has received at least positive response. It is a design that has a price tag in excess of $1 billion.

We have made the comment in the President's budget that we see ourselves as clearly having a $400 million or so obligation as relates to the structure, because that is the amount that it would take to rebuild the structure to current standards, if we were merely replacing it as is.

But we understand the concerns of both the State of Maryland and the State of Virginia, as well as the District, when it comes to dealing with this issue and want to come to some closure on it and look forward to working with you in that regard.

Senator MIKULSKI. So, you anticipate, from what you see, that the Federal Government's obligation would be one-half of what is estimated that the project would cost to rehabilitate the current bridge.

Secretary SLATER. That is correct.

Senator MIKULSKI. Therefore, your current thinking is that the other one-half would come from Maryland and Virginia.

Secretary SLATER. Well, clearly that is our current thinking, but I can tell you that we have gotten strong vibes from both Maryland and Virginia that it is their belief that since it is a bridge that is owned by the Federal Government, that our responsibility is much greater. We are taking those comments into account.

Senator MIKULSKI. This requires further conversation.

Secretary SLATER. Sure.

Senator MIKULSKI. I have gotten more than vibes from Governor Glendening. I have gotten vibrations from Governor Glendening [Laughter.]

Secretary SLATER. I understand.

Senator MIKULSKI. And the Maryland General Assembly, concern about exactly how we would do this.

What do you think would be a process by which we should go in order to be able to resolve what we are going to do and how we are going to pay for it so we really do move expeditiously on this project? Do you have suggestions on that?

Secretary SLATER. I do.

First of all, let me say that I have gotten more than vibes as well from Governor Glendening. We have talked directly about the matter and I do understand his position on it.

I think that there are a number of ways to approach it.

First of all, there has been significant coordination among the States and the District, the State leadership, the congressional leadership, and our Department on this matter. Also, I do think that there is a recognition clearly that we have a responsibility to play a substantial role when it comes to financing this project. One of our employees was actually the Chair of the Woodrow Wilson Bridge Replacement Committee.

Senator MIKULSKI. My time is going to run out. So, what do you think we should do?

Secretary SLATER. Yes; this is what I think we should do: Not lose the opportunity to take full advantage of reauthorization. It is a 6-year bill. It gives us an opportunity to deal with the money responsibilities over a period of time. Look at all innovative financing opportunities available to us, whether it is the State infrastructure bank [SIB] initiative or the credit program that we are going to bring on line to deal with large multistate projects, and to just stay engaged. I think we can come to some common ground on the matter.

There are many funding strategies to be taken into account, and we should explore them all. But I want to assure you that we understand our obligation to play a substantial role in dealing with this matter.

Senator MIKULSKI. Is it your intent within the next few months to meet with the Governors of the two States, their secretaries of transportation?

Secretary SLATER. Yes; that is my goal.

Senator MIKULSKI. I can say this on behalf of Senators Warner and Robb, Senator Sarbanes and myself, we are very eager to resolve this and I think we would look forward to any type of collegial consultation process in which we then would bring our Governor or our secretaries of transportation in for a meeting and almost like a little workshop on this to resolve this.

Secretary SLATER. Yes.

TRANSPORTATION-RELATED EMPLOYMENT

Senator MIKULSKI. I know my time is moving along. Let me just ask two things about jobs because you help people get to work. I have two questions on that.

No. 1, my concern is that I would like the United States to be a leader in manufacturing of transportation. Right now we are the world's leader in the manufacture of airplanes, but we are not the leader in manufacturing of buses and railcars. What is happening is we buy all of this stuff and it is not from America.

Now, this is not jingoism. I agree we believe in a global economy, but we spend all this money, Federal level, State level, on buses and railroad cars, freight as well as passenger. I wonder if you have thoughts on—not a Government program; we are not looking for a comrade five-point program here—but what we could do to strengthen the Buy American provision, not shackle the Government or private sector. But, boy, I wish when we were spending this money, we were back in the transportation business.

This is no fault of our cousins from Canada, who are wonderful neighbors, but we have got a little $20 million subway system run-

ning around this capitol, and we bought it from Canada. Well, I did not know if we had to spend $20 million and I did not know if we had to spend it in Canada. Maybe we did, and it is no fault of Canada. But, my gosh, every time I see a bus and a railroad car, I wish it was made by UAW workers or their equivalent somewhere.

Do you have thoughts on that?

Secretary SLATER. I do. Senator, first of all, I believe as well in the made-in-America spirit. I think that has been manifested in the Department of late with the significant rebound that has occurred on the aviation front, but I would also mention the shipbuilding industry as well. We, through the support of the Congress, have a Maritime Administration that is moving, moving forth aggressively, confidently, and I am sure will be a major player in the years to come.

There is a lot of talk about how we are moving from an industrial society to an information-based, technology-based society. We still need to build things and our people are capable of building things to be used in the 21st century. I think transportation provides an ideal arena in which to explore this kind of initiative.

One thing that I mentioned in my opening statement was a desire to have the support of the Congress, this committee in particular, as I move toward the implementation of what I am calling the Garrett A. Morgan Technology and Transportation Futures Program to focus on those transportation needs of the coming century and to work now to build a work force of visionary and vigilant individuals who can make real that dream.

I would like to bring in 1 million young people in that kind of effort, working with management and labor, and I have spoken to President Sweeney about this. I have spoken to CEO's, CAO's of some of the major companies, and I have also had conversations with many of you. I look forward to making this a reality.

Senator MIKULSKI. Well, I think that is a good step.

Would you also support strengthening Buy American provisions in both the authorization and appropriations?

Secretary SLATER. Oh, yes; yes, I would.

TRANSPORTATION AND WELFARE REFORM

Senator MIKULSKI. Thank you.

Mr. Chairman, my time is up. I just want to wrap up by saying I really support your initiative of welfare to work. I think transportation is one of the biggest deterrents, particularly in rural parts of my State, of people being able to move back into the market force. I think by that initiative, we will truly get welfare reform moving literally and figuratively, and I look forward to working with you.

Secretary SLATER. Thank you. Thank you, Senator.

STATUS OF ADMINISTRATION'S SURFACE TRANSPORTATION REAUTHORIZATION

Senator SHELBY. Mr. Secretary, when is ISTEA coming up?

Secretary SLATER. Well, we hope to have our bill soon, Mr. Chairman. You know I had two committee hearings last week. One of them went a little better than the other, and I think it is because I was more specific. I made a commitment then that we would have

our proposal ready within 7 to 10 days. We are nearing that 10-day period, and I am committed to fulfilling that commitment.

AIRPORT IMPROVEMENT FUNDING

Senator SHELBY. AIP funding is at an alltime low in recent history, and in the 1998 budget request you have requested an obligation ceiling of only $1 billion. In the past 4 years, Mr. Secretary, annual airline passenger enplanements have increased 16 percent and investment in airport development has decreased 23 percent. That is before the $460 million decrease in airport investment envisioned in the President's budget.

I have been informed that the FAA has pending applications for over 3 billion dollars' worth of airport improvement projects ready to go. The FAA cites 22 airports that are seriously congested and estimates, Mr. Secretary, that number growing up to 32—in other words, another 10—in the next several years.

Delays, as you well know, associated with congestion cost the airlines over $500 million a year directly, and the total cost to the national economy is many times greater, if you consider the time lost to passengers and businesses in doing it.

Yet, your budget request here requests the historically low airport improvement funding level that I mentioned earlier of $1 billion, lower than the AIP ceiling has been in 10 years.

Mr. Secretary, have we been spending too much on airports or is the President's budget underfunding our airport needs? And has the Department done any research on the economic impact of funds spent on new airports and airport improvements?

Secretary SLATER. On the latter question about the research, let me just say that we have ongoing research dealing with the overall impact of transportation on the economy and we are studying it from all vantage points. So, clearly, we are looking at it from the vantage point of investments in airports.

Let me also say that I do not think that we in the past have been spending too much on airport infrastructure improvements, but I also say that as we offer a budget in this environment, that I do not think, as we have reasoned, that we will be spending too little in this instance, because it is our belief that the larger airports have many, many opportunities to access resources for improvements on and improvements to the system.

It is your smaller airports that really, really rely on the Airport Improvement Program, and if we can continue to address their concerns and in innovative ways encourage the larger airports to try to leverage private sector dollars or to utilize public sector dollars in more innovative ways, then I think we can bridge the gap, if you will. But it is going to be difficult.

In a nutshell, this proposal is merely reflective of our desire to have as much investment as possible but within the context of a balanced budget goal, shared by both the administration and the Congress.

REGULATION OF GOLF CARS

Senator SHELBY. I want to get into the regulation of golf cars, whatever that is. I was intrigued, Mr. Secretary, to learn that the National Highway Traffic Safety Administration is proposing to

regulate the safety of golf carts. Evidently golf carts whose speeds do not exceed 15 miles per hour would be excluded. However, faster golf carts whose speeds are over 15 miles per hour but under 25 miles per hour would be regulated as golf cars.

Golf cars, I understand, would be required to have headlights, turn signals, taillights, reflectors, mirrors, parking brakes, windshields—windshields—and seatbelts. They would also have to post warning stickers that state, "This vehicle must not be operated on the public roads at a speed more than 25 miles per hour."

I know that the NHTSA has important responsibilities to deal with to reduce the number of deaths and injuries resulting from highway traffic accidents. However, I am not aware myself of any deaths or accidents dealing with these.

I would like for you to explain.

Secretary SLATER. Well, if I may, Mr. Chairman, I have been on the job now for a couple of weeks.

Senator SHELBY. Is this a surprise for you as well?

Secretary SLATER. And during my confirmation preparation and hearings, this is an issue that never came up.

Senator SHELBY. Would you look into it?

Secretary SLATER. I will definitely look into this.

I will say this. We are serious when we say we are going to take a commonsense approach to Government.

Senator SHELBY. Just common sense.

Secretary SLATER. Common sense. We will review this particular action.

Senator SHELBY. I hope you will. I do not have a golf cart. I do not ride in one, but I do not know how you make a car out of it.

Secretary SLATER. I understand.

[The information follows:]

There appears to be a growing demand, especially around retirement communities, for small, light-weight, low-speed vehicles as alternatives to the traditional passenger car for short, in-town trips. Part of this demand will be met by "Neighborhood Electric Vehicles" (NEV's), which are small, electric passenger cars manufactured for on-road use, but capable of being used on golf courses. Part of this demand will be met by golf carts, because States have begun to amend their laws to allow golf carts to use the public roads with other heavier forms of traffic at speeds up to 25 miles per hour.

The National Highway Traffic Safety Administration (NHTSA) has jurisdiction over vehicles used on the public roads. At the present time, any on-road vehicle capable of a speed of 25 miles per hour is subject to the full range of Federal motor vehicle safety standards. It does not appear practicable or necessary for NEV's, on-road golf carts, or other small, low-speed vehicles to meet current Federal motor vehicle safety standards, which, in the absence of further NHTSA action, they would be required to do. After studying the regulations of the City of Palm Desert, California, which has a golf cart safety program in force for golf carts registered for use on the city roads, NHTSA decided to propose creation of a new class of vehicle, called "Low-Speed Vehicles" (LSV's). All LSV's, whether fast golf carts or NEV's, would be required to have the safety equipment that Palm Desert has found to meet the needs for safety of that community. In addition, a warning label would be required advising that the LSV is not to be operated at speeds in excess of 25 miles per hour.

NHTSA is currently evaluating comments on the proposed regulation. The Senator is correct that there are no reported deaths and injuries concerning on-road golf carts. That is attributable in part to their scarcity. The possibility of accident involvement is bound to increase with their numbers. In addition, there is no assurance that Palm Desert's system of road zoning and restriction of LSV use to daylight hours—factors contributing to golf cart safety—will be adopted by other municipalities permitting the use of golf carts and NEV's on their streets.

TRAFFIC SAFETY TERMINOLOGY

Senator SHELBY. One other thing. The NHTSA has been in the news also for pushing a new policy that its employees are not to use the word "accident" in any official communication from the agency. Instead, the word "crash" is to be used. Do you believe that the NHTSA should be spending valuable resources—you know, we are having money problems—and time on initiatives such as changing the vocabulary of its employees? Is it reasonable to think that the Federal Government has a role in removing the word "accident" from our common language, common parlance? Would you look into that?

Secretary SLATER. I will look into it, but let me offer this.

Senator SHELBY. Everything is not a crash.

Secretary SLATER. I understand.

Senator SHELBY. I would think a crash would entail something really big.

Secretary SLATER. I understand. I will look into it.

Let me just say that for the second time in the history of NHTSA we have a physician at the helm, and there are within the medical profession terms of art. This effort is only to bring greater clarity to actions that can be prevented. Thus, they are actions that are not perceived as accidents.

But, now, I do not want to get into a long discussion of it. What I would like to do is just follow up with a detailed explanation and then look forward to discussing with the chairman and other interested parties why this is the approach that is being discussed internally. But no final action has been taken on this particular initiative.

[The information follows:]

NHTSA is promoting use of the word "crash" in lieu of "accident" because motor vehicle crashes and injuries are predictable, preventable events. Continued use of the word accident promotes the concept that these events are outside human influence or control. In fact, they are predictable results of specific actions. NHTSA can identify their causes and take action to avoid them.

SUBMITTED QUESTIONS

Senator SHELBY. Thank you. We do have a number of questions for the record that we will be submitting to you. I will have some. Senator Domenici had a number and other members, Mr. Secretary.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR SHELBY

ESSENTIAL AIR SERVICE (EAS)

Question. The FAA Reauthorization Act of 1996 provides a $50 million annual set-aside for EAS, funded by FAA "overflight" user fees. Will FAA realize $50 million in overflight fees in fiscal year 1997? Can this level be anticipated in 1998?

Answer. The FAA issued its rulemaking establishing the specifics of the overflight fee schedule on March 20, 1997. The charges will take effect 60 days after issuance of the rule, on May 19, 1997. As a result, fees will be collected for only about four and one-half months of fiscal year 1997, and are expected to be well under $50 million. EAS does not have access to these funds during fiscal year 1997 until collected revenues exceed $75 million; thus, no funds from the overflight fees will go to the

EAS program in fiscal year 1997. The Department expects that the overflight fees will generate about $90 million per year in fiscal year 1998 and beyond.

Question. In fiscal year 1997, EAS is funded at $25.9 million. Is a $50 million annual program level necessary? Currently, are eligible communities not receiving EAS service because of funding constraints?

Answer. The $50 million funding level for EAS and rural airport safety was established by Congress last year. In our fiscal year 1995 appropriations act, the EAS program was reduced by one-third and the Department was directed to implement service and subsidy reductions across-the-board (except in Alaska), but to keep at least some air service at all communities. In order to do so and stay within the budget, the Department had to reduce subsidy levels below even the statutory minimum service guarantees. The Department would now propose to restore service levels at all of the subsidized communities to at least the minimum statutory guarantees.

There are now nine EAS communities that have no air service as a result of the budget cuts: Kearney and Hastings, NE; Fergus Falls, Mankato, and Fairmont, MN; Brookings and Mitchell, SD; Goodland, KS; and Lamar, CO. As a result of the one-third, across-the-board budget cut, one of the major EAS airlines serving about 20 communities, Mesa Air, announced that it would suspend service at six communities. The Department issued an order prohibiting that suspension, as required by statute. Mesa took the issue to court claiming that the Federal Government had breached its contract by unilaterally reducing EAS subsidies. Mesa prevailed in a unanimous decision in which the Court ruled that Mesa, and by extension all EAS carriers, could suspend service where their subsidies had been cut, leaving affected communities with a hiatus in service.

FISCAL YEAR 1997 SUPPLEMENTAL REQUEST

Question. Currently, there are only two components to DOT's fiscal year 1997 supplemental request: $318 million to correct a Treasury Department error that affected States' highway allocations, and $4 million to cover a military cost of living adjustment for Coast Guard retired pay. Will you request a supplemental for highway funds to repair damage from the January floods in the Northwest, and, even more recently, from the damage stemming from tornadoes in your home State of Arkansas and flooding throughout the Ohio Valley? How much will you request? Will these be classified as "emergency relief" funds?

Answer. Yes, on March 19th the administration requested a supplemental appropriation in the amount of $291 million for emergency needs due to flooding. Of this amount, $276 million is needed for additional emergency relief funding due to floods in the Winter of 1996 affecting the States of California, Idaho, Nevada, Oregon, Washington and Montana. Many of these States required emergency relief funding under both their Federal-aid and the Federal roads programs. The remaining $15 million is requested as contingency funding, for the emergency requirements in the Midwestern and Mid-Atlantic States.

Question. Are there any other pending or possible DOT supplemental requests for fiscal year 1997?

Answer. No, there are none anticipated at this time.

OFFICE OF AVIATION AND INTERNATIONAL AFFAIRS

Question. OST's office of aviation and international affairs utilizes airline traffic and financial data to support its statutory responsibilities in aviation programs. Some of these responsibilities include: developing the U.S. position in aviation bilateral negotiations with foreign countries; deciding carrier selection cases and making international route awards; resolving international route transfer issues; reviewing the antitrust implications of carrier acquisition and merger proposals; setting international and intra-Alaska mail rates; and determining the essential air service needs of small communities and establishing appropriate subsidy rates for such services. The data and statistics that OST utilizes in all these areas is provided by the Bureau of Transportation Statistics office of airline information (OAI). In return for this data, does OST support OAI through annual reimbursable agreements? If so, at what level? If not, why not?

Answer. At times in the past, OST has supported the Office of Aviation Information (OAI) through annual reimbursable agreements when it was a part of the Research and Special Programs Administration. More recently, it was decided that all funds for OAI would be provided more effectively through the modal administration's authorizations. In the current fiscal year, OST does not have any reimbursable agreements with OAI.

TIMELY AVAILABILITY OF AVIATION DATA

Question. Please discuss any problems OST has encountered in the last two years with timely availability of airline data from OAI. Have these problems been resolved? If not, please outline some possible solutions.

Answer. Aviation data frequently are not available on a timely basis, particularly, the Passenger Origin and Destination Survey data and the monthly segment and market data that the airlines file on Form 41, Schedule T–100.

It is clear that timeliness, accuracy, availability and accessibility of aviation data are important for proper analysis. One possible example of a solution is our ongoing effort to replace the Passenger Origin and Destination Survey with a database built on data from computer reservations systems. If this effort proves feasible, we should have an excellent database for the future that could serve many purposes and would not be a major burden for the airlines or OAI staff to administer.

TRANSPORTATION SAFETY PRIORITIES

Question. Given the relative differences in fatality and accident rates on our nation's highways, in the air, on rail lines, and on waterways, are the Department's efforts adequately balanced to address the relative incidence in each mode of transportation? Does the Department conduct any cross-modal safety analyses?

Answer. Ensuring the overall safety of our transportation system requires us to focus our efforts on a diverse array of transportation activities involving the movement of both passengers and freight, some of it commercial, but most by private citizens. The magnitude of the Department's programs in each mode is also determined by the role that Congress has given to the various operating administrations. The FAA budget reflects the fact that it directly operates a massive and complex safety system, which requires the public's full confidence that it is extremely safe. NHTSA, in contrast, can use its regulatory power to set motor vehicle safety standards, but these automobiles are then operated independently by individuals. Other programs in NHTSA, as well as those of FHWA, must use their funding to form partnerships with the States and local governments that have the police and safety enforcement authorities.

All the modal administrations within the Department utilize a cooperative and leveraged approach to achieve continuous improvements in the safety of each mode of transportation. The Department's recently announced NEXTEA proposal reflects an increased emphasis on programs that address the single largest source of transportation-related fatalities (94 percent) and injuries (99 percent), the operation of motor vehicles, particularly passenger cars and light trucks and vans.

Cross modal safety analyses are conducted in the Office of the Secretary, primarily in the comparison of relative statistics and development of common measures, and to assure that safety approaches that prove successful in one mode are applied, where feasible, in others.

SURFACE TRANSPORTATION INFRASTRUCTURE

Question. Congress will take up the reauthorization of ISTEA this year. With continuing budget deficit reduction goals, increasing spending for transportation programs is difficult. Our infrastructure is deteriorating, and congestion clogs our cities. Total public spending on the capital needs for highways and bridges was about $40 billion in 1993, the most recent year for which data are available. However, DOT estimates that as a nation, we are about $16 billion short on an annual basis, just to maintain our existing highway and bridge infrastructure at the 1993 level. Issues at the forefront of the reauthorization debate are how Federal funds will be distributed, and what the Federal role will be. Are we currently getting the most bang for the Federal dollars we invest in our surface transportation infrastructure? Are we directing Federal funds to those programs that can produce results?

Answer. One of the key factors in the success of the ISTEA legislation over the past six years has been the flexibility it allowed for States and local governments to distribute funding to their top-priority transportation needs. The National Economic Crossroads Transportation Efficiency Act of 1997 (NEXTEA) continues this approach and responds to our core program infrastructure needs while helping us move toward a balanced budget. It would authorize about $175 billion for surface transportation programs from fiscal year 1998 through fiscal year 2003, and increases funding for core highway programs such as the National Highway System, maintenance of the interstate system, and the Surface Transportation Program by 30 percent. It continues the commitment to cities in terms of mass transit, helping them get more capacity from existing systems, and allows rural areas to play a greater role in protecting planning and in determining which projects get done first.

NEXTEA would give State and local officials greater flexibility to target funds toward projects that best meet community needs. It also increases the tools available to State and local officials by making intelligent transportation systems eligible under all major program categories and by expanding innovative finance strategies to cut red tape and leverage private and non-Federal public resources.

INTERMODALISM

Question. What actions will you take to further encourage the integration of surface modes of transportation to enhance the mobility of people and transport of goods? How will you address the conflict between continuing to fund modally-based programs while attempting to foster an intermodal approach to transportation decision making?

Answer. Although DOT's funding programs continue to be modally-based, they are significantly adaptable to local needs. To a much greater extent than previous surface transportation legislation, ISTEA allows State and metropolitan areas to spend their apportioned Federal funds based on thorough and inclusive planning rather than restrictive program categories. Specifically, almost 60 percent of the funds authorized by ISTEA have been available, at the initiative of State and local officials, for almost any type of surface transportation projects.

The administration's proposal for reauthorization—the National Economic Crossroads Transportation Efficiency Act, or NEXTEA—continues these ISTEA programs that have given State and local officials the freedom to spend Federal dollars on an expanded set of transportation solutions.

NEXTEA would retain the enhanced flexibility and eligibility provisions of three programs introduced by ISTEA: the National Highway System (NHS), the Surface Transportation Program (STP) and the Congestion Mitigation and Air Quality (CMAQ) program. Through these programs, $3 billion in five years has been transferred at local request from the FHWA to the FTA for delivery to its grantees. Without any administrative transfers, however, the STP and CMAQ programs support many projects that directly benefit multiple transportation modes. In addition to preserving this flexibility, NEXTEA would extend eligibility within certain programs to intercity bus and rail service and publicly owned freight rail service.

COLLOCATION OF DOT FIELD OFFICES

Question. Please provide a detailed plan of how DOT will collocate and/or consolidate the Department's surface transportation field offices (that now number more than 150) to best serve transportation needs in a cost-effective manner.

Answer. In June 1996, the Department chartered a co-location task force to review the field office structure and prepare a report.

To date, the restructuring effort has focused on six major areas: planning, safety, co-location, administrative resource sharing, program management and the establishment of metropolitan offices.

The task force identified approximately 160 offices (including CG, RSPA and FAA) that appeared to offer co-location opportunities. It is the goal of the Department to co-locate offices and consolidate services wherever reasonable in order to provide enhanced customer service, reduce costs and operate more efficiently. Currently, additional analysis is underway to determine the feasibility and costs associated with such a consolidation.

Because of the major costs associated with such a major co-location, the task force has recommended that the initiatives be undertaken as leases are due to expire or other restructures are about to be undertaken which would advance the consolidation. Presently, there are field work groups developing localized plans for their respective areas. Last November the first of many anticipated co-locations occurred when NHTSA moved into space occupied by FHWA in Region III. In this one case, we were able to reduce 2,096 square feet, which will result in overall rent savings of $37,854.

DOT SICK BUILDING

Question. What have been the total costs through fiscal year 1997 associated with cleanup of the "sick" Nassif Building? (Please display each year's associated costs, and a total to date.) Are any fiscal year 1998 costs anticipated?

Answer. As of February 28, 1997, the total costs associated with the cleanup and repair of the Nassif Building that have been incurred by the Government is approximately $6,389,000. The General Services Administration has picked up these costs for DOT. At this point in time, costs in fiscal year 1998 are not anticipated.

	Fiscal year—		Total
	1996	1997	
Environmental testing/health assessments	$941,875	$565,125	$1,507,000
Project management	591,000	1,104,000	1,695,000
Swing space rent	276,000	1,568,000	1,844,000
Moving expenses	97,000	116,000	213,000
Swing space set-up	1,130,000	.....	1,130,000
Total	3,035,875	3,353,125	6,389,000

FRA VACATING THE DOT BUILDING

Question. It is our understanding that some FRA offices have declined to move back to the Nassif Building, though the affected floors have undergone cleanup. Why? What additional costs will be incurred by this decision?

Answer. The Federal Railroad Administration (FRA) began relocating some employees shortly after air quality problems began to affect their work space in October 1995. As time passed, more and more employees were relocated to space outside the Nassif Building due to symptoms that employees believed were caused by the building's indoor environment. The sheer number of FRA employees working in different locations caused disruption to the organization. As a result, in August 1996, the entire FRA headquarters organization was relocated to a single location, with plans to remain there until the cleaning and repair program of the Nassif building is completed.

The FRA organization is now operating without disruption and would like to avoid the disruption of a major move back to the Nassif Building until the Department consolidates its headquarter operations following expiration of the lease on the Nassif building. The Department supports this request, since we are able to consolidate other elements of the Department from higher-cost space in downtown Washington into the vacated area of the Nassif Building.

NEW PROGRAMS

Question. If Congress authorizes and appropriates funds for the Transportation Infrastructure credit program ($100 million requested); the Intelligent Transportation System infrastructure integration program ($100 million requested); and the "access to jobs and training" transit grant program ($100 million requested), how quickly do you envision these programs spending out in fiscal year 1998 (and the outyears)?

Answer. For each of these three new programs, the administration is proposing $100 million for each of the 6 years of NEXTEA.

The Transportation Infrastructure Credit Program is expected to outlay 50 percent in the first year, 25 percent in the second year, and 25 percent in the third year.

The ITS deployment incentives program is expected to be fully obligated each year. It will be within the category of the Federal-aid program. Overall spend-out rates for the Federal-aid program are estimated at 15 percent in the first year, 53 percent in the second year, 16 percent in the third year, 5 percent in the fourth year, 3 percent in the fifth year, 3 percent in the sixth year, 2 percent in the seventh year, 2 percent in the eighth year, and 1 percent in the ninth year.

The Access to Jobs and Training grant program is projected to have an outlay rate similar to that of the existing Urban Capital formula program: 5 percent in the first year, 20 percent in the second year, 30 percent in the third year, 20 percent in the fourth year, 20 percent in the fifth year, and 5 percent in the sixth year.

CREDIT PROGRAM VERSUS SIBS

Question. Please describe the differences between the Transportation Infrastructure credit program and the current State Infrastructure Banks program.

Answer. The National Highway System Designation Act of 1995 authorized DOT to establish the State Infrastructure Bank (SIB) Pilot Program. SIBs are State-level investment funds capitalized in part with Federal grants. They are intended to complement traditional transportation programs and provide States with increased flexibility to offer many types of assistance, including low-interest loans, loan guarantees, and standby lines of credit. However, Federal capitalization grants for SIBs currently are limited to 10 percent of most categories of a State's annual apportion-

ments for fiscal years 1996 and 1997 and $150 million of "new money" to be shared among the participating States. Moreover, Federal legislation limits the annual disbursement of these funds, thus reducing the capacity of the SIBs to provide large amounts of credit assistance directly in the near term. SIBs will require a number of years to build up sufficient financial resources to gain access to external funding beyond their own contributed capital. Consequently, SIBs, like other startup credit intermediaries, are best suited to assist portfolios of smaller, relatively homogenous, shorter-term projects that are regional or local in scope.

A Federal credit enhancement program would complement existing financing techniques, including SIBs, by directing resources to areas of critical national importance—such as intermodal facilities, expansion of existing highways, border infrastructure, trade corridors, and other investments with national benefits—that otherwise might be delayed or not constructed at all because of risk or scope. Federal credit assistance would encourage more private-sector and non-Federal participation, address important public needs in a more budget-effective way, and take advantage of the public's willingness to pay user fees to receive the benefits and services of transportation infrastructure sooner than would be possible under traditional, grant-based financing. Essentially, providing direct credit assistance would be a more efficient and effective way for the Federal Government to help advance a limited number of nationally significant projects than increasing outlays for regular grant reimbursement programs or even SIBs.

ITS INFRASTRUCTURE INTEGRATION PROGRAM

Question. Please provide a detailed description of the proposed ITS infrastructure integration program.

Answer. The ITS infrastructure integration program is an initiative to foster the uniform national deployment of a computer and communications infrastructure in our surface transportation system, both inside and outside metropolitan areas.

In 1991, the Department initiated the Intelligent Transportation Systems program, through the Intermodal Surface Transportation Efficiency Act, to research, operationally test and promote the application of computer and communications technology to our surface transportation system, in part to address the growing gridlock in our nation. Over the past five years, we have learned through our research efforts that an intelligent transportation infrastructure applied to our surface transportation can improve efficiency, productivity, and safety. Such an infrastructure consists of a series of "elements," such as smart traffic signals, advanced traffic management systems, and more, that allow the public to travel more efficiently and safely. This system works best when the components are interoperable, or can "talk to one another." ITS is an important option in an era when we can no longer depend on building our way out of congestion.

We are proposing a one-time incentive to last through the next five years. Its purpose is to jump start State and local government involvement in deploying ITS in a coordinated manner, consistent with standards and within the bounds of the national ITS architecture. This deployment incentive focuses on:

—Integrating existing intelligent transportation infrastructure elements in metropolitan areas, including those elements installed with other Federal-aid funds.

—Installing, as well as integrating, the various elements of an intelligent transportation infrastructure for commercial vehicle projects and projects outside metropolitan areas, such as rural areas.

The priorities are as follows:

—At least 25 percent of the funds made available would allow eligible State or local entities to implement commercial vehicle information systems and networks, and international border crossing improvements.

—At least 10 percent of the funding would be made available for the intelligent transportation infrastructure deployment outside metropolitan areas (in rural areas).

—The Federal share payable to the project cost is 50 percent. The matching funds can include funds from other Federal sources.

The projects are to accelerate the deployment and commercialization of ITS; realize the benefits of regionally integrated, intermodal applications, including commercial vehicle operations and electronic border crossing applications; and demonstrate innovative approaches to overcoming nontechnical constraints.

Projects chosen for funding within the intelligent transportation infrastructure deployment incentives program would, in general terms, have to meet the following criteria:

—Help meet the national goals of the ITS program;

—Demonstrate public-private partnerships;

—Aim to achieve integration with the architecture and standards;
—Be a part of State and metropolitan plans for transportation and air quality implementation;
—Catalyze private sector investment and minimize Federal contributions;
—Include a sound financial plan for long-term operations and maintenance; and
—Demonstrate the ability to operate and maintain the systems.

This program will build upon prior efforts. We have already identified a core intelligent transportation infrastructure and set a national goal for deployment of this infrastructure across the United States over the next decade. We are facilitating model deployments that will serve as showcases for operators and users of the system. They also will show both State and local transportation officials and citizens how to envision ITS deployment in their communities. In 1996, four metropolitan areas were chosen: Seattle, Phoenix, San Antonio, and New York. We have also established eight model deployments of the Commercial Vehicle Information Systems and Networks (CVISN) to be operational by the end of 1997, in Connecticut, Kentucky, Michigan, Minnesota, Colorado, Washington, Oregon, and California. These model deployments will perform the same function for other State officials in helping them to envision the fully integrated system and to understand the benefits.

A deployment incentives program is needed to alleviate a hardening or "stove-piping" of the existing fragmented infrastructure. Timing of deployment is critical. At the moment, elements of the intelligent transportation infrastructure are being deployed piece by piece with no guarantee of interoperability. State and local governments will then have to live with a "stove-piped infrastructure," one in which components do not form a system and are not necessarily efficient.

This program gives State and local governments an incentive to cooperate with agencies, jurisdictions, and the private sector, to achieve fully integrated ITS deployment in accordance with the national ITS architecture and established ITS standards and protocols. This commitment will be shown through the signing of Memorandums of Understanding that clearly define the responsibilities and the relationship of all parties to a partnership agreement which outlines the institutional relationships and the financial agreements to ensure continued, long-term operations and maintenance for the project.

We're providing the incentive, but are also limiting the Federal share payable to 50 percent of the project cost and requiring a financial plan for long-term operation and maintenance. We're asking State and local governments to be creative, to use their own funding, other Federal-aid monies, and to leverage the private sector's involvement. This is a minimal Federal role. In short, after this five-year period, the incentive program will not be up for additional Federal funding in the future; it's a one-shot deal.

ACCESS TO JOBS AND TRAINING

Question. Why is the FTA a more appropriate provider agency for the proposed "access to jobs and training" program than Health and Human Services?

Answer. Transportation is one of the three major challenges faced by welfare recipients, along with day care and skills training.

Welfare recipients rarely own cars. Furthermore, studies show that existing public transit frequently does not provide realistic connections to the locations where entry-level jobs are concentrated. The need for off-peak time service and multiple stops for activities such as day care complicate further the problem of access to jobs.

DOT's Access to Jobs Initiative will enable State and local governments to provide the transportation services that welfare recipients need within the framework of the existing transportation planning process—an important factor in sustaining their delivery. But collaboration with the human service agencies is a key element of the proposed program. The criteria in the proposed program call for a coordinated planning process, a financial partnership and a 50/50 (FTA/non-FTA) match to ensure that transportation providers and human services providers are working closely to ensure that those Americans who have to go to work can get there.

HIGHWAY TRUST FUNDS

Question. I note that the President's Budget request would have Amtrak and FTA funded from the Highway Trust Fund, rather than general funds. Under your budget, the total percentage of highway trust funds in the transportation appropriations bill increases from 78 to 85 percent. What is the rationale for shifting the number of DOT programs from being funded by general funds to highway funds?

Answer. The administration proposes to use the Highway Trust Fund for all highway safety research and agency operations (parts of NHTSA are currently funded from the general fund), as well as the transit program and Amtrak.

The rationale for these shifts is that the programs to be funded from the trust fund are directly associated with highway construction or preservation, or are associated with providing alternative transportation services that contribute to reducing the demands placed on our highways, thereby improving service to the users of highways.

Question. What will the Highway Trust Fund balance be at the end of the current ISTEA authorization period, as envisioned by the administration's pending reauthorization proposal?

Answer. We project cash balances of $14.8 billion in the Highway Trust Fund and $9.6 billion in the Mass Transit Account at the end of fiscal year 1997.

FLEXIBILITY IN STATE USE OF FEDERAL FUNDS

Question. This approach of having different modes drawing on the Highway Trust Fund would seem to me to argue for increasing the States' flexibility in the use of their transportation funds. Do you share that view?

Answer. Yes. Under NEXTEA, State and local officials would have greater flexibility to target funds toward projects that best meet community needs, including Amtrak and intermodal terminals. It also increases the tools available to State and local officials by making Intelligent Transportation Systems eligible under all major program categories.

HIGHWAY TRUST FUND OFF-BUDGET

Question. What is the administration's official position on the proposal to move transportation trust funds off-budget?

Answer. The administration opposes taking the transportation trust funds off-budget. We should not redefine the deficit calculation to exclude certain programs or to exempt programs from appropriate budget controls. That would mean either a larger real deficit or a larger burden for deficit reduction on other critical programs in DOT or elsewhere in the Federal Government. Either outcome would be inconsistent with the joint commitment by the President and Congress to balance the Federal budget.

WOODROW WILSON BRIDGE

Question. I understand that the administration was prepared to transfer the Woodrow Wilson Bridge to the States of Maryland and Virginia and the District of Columbia back in 1990 and 1991. Why didn't this transfer take place? Why is this the only non-defense interstate bridge still under Federal jurisdiction?

Answer. The bridge has been the subject of three agreements. The December 18, 1961, agreement was simply a detailed contractual arrangement between the three jurisdictions (FHWA was not a party) as to the rights and responsibilities of each jurisdiction in the operation and maintenance of the bridge. It was the result of Federal legislation (Public Law 87–358, October 4, 1961).

A June 28, 1982, agreement was signed by the three jurisdictions and the FHWA. Again, this agreement was the result of Federal legislation (Public Law 97–134, December 28, 1981) that provided $60 million for 4R work on the bridge, and spelled out more details as to each jurisdiction's operation and maintenance duties, and provided that the "* * * three jurisdictions shall submit to FHWA within 6 months of the date of the agreement proposed reasonable terms and conditions upon which they would be willing to accept title to the Woodrow Wilson Memorial Bridge." This agreement was never fully implemented.

The last signed agreement between the two States, the District of Columbia, and FHWA was on April 19, 1985. The 1985 agreement required the jurisdictions to accept the bridge once rehabilitation of the bridge was complete, e.g. upon "completion and final acceptance of the construction work * * * which will include rehabilitation for the bridge bascule span and minor substructure rehabilitation." Although the $60 million provided under the 1981 legislation was used for the bridge—most of it for 4R work and some for a study on long-term needs—the District and the States declined to take over responsibility for the bridge because of the cost of continued maintenance.

Question. What is the traffic mix on the bridge between local commuters and through traffic?

Answer. Local commuters comprise between 85 to 90 percent, and through traffic 10 to 15 percent, depending on the time of year.

Question. What is the justification for the President's Budget request of $400 million?

Answer. The fiscal year 1998 budget includes $40 million for the Wilson Bridge project: $30 million is needed for the continued design (and construction) of a new

bridge, and $10 million is needed for necessary interim repairs and rehabilitation work on the existing bridge.

The Department has been working closely with the Woodrow Wilson Bridge Coordination Committee on options for replacing the existing bridge. The Committee has selected the current alignment, with side-by-side drawbridges having a 70-foot navigational clearance, as the preferred alternative for replacing the bridge. There would be a total of 12 lanes: 8 general purpose lanes, 2 merge/auxiliary lanes, and 2 HOV/express bus/transit lanes. The current estimated cost for this alternative is $1.56 billion.

$400 million is the cost to replace the existing structure. The NHS Designation Act of 1995 provides a framework for determining the Federal contribution of the cost to replace the existing 6-lane bridge with a replacement structure. The Woodrow Wilson Bridge Coordination Committee estimated that this would cost approximately $400 million.

Question. Since initial construction, how much has the Federal Government spent on the Woodrow Wilson Bridge?

Answer. A total of $168.9 million in Federal funds has been allocated since 1954; $163.9 million was at a 100-percent Federal share, and $5.0 million was at an 80-percent Federal share.

Question. Given that the Woodrow Wilson bridge alternatives being considered are all significantly in excess of the President's Budget request, is this bridge a reasonable candidate for the proposed new credit program in ISTEA reauthorization or another innovative financing approach?

Answer. The bridge likely would be eligible for a credit program or other innovative financing approaches; the project would also be eligible for regular Federal-aid apportionments. The bridge could be funded through a combination of a direct Federal contribution ($400 million) and some form of credit.

ALAMEDA CORRIDOR

Question. FHWA officials have cited the Alameda Corridor's Federal loan as a precedent for future finance efforts. Officials noted that FHWA used the project as a model in the agency's effort this year to create a new $100 million Transportation Infrastructure Credit Program. The program is intended to leverage Federal funds and provide credit to assist nationally significant projects, particularly large, multimodal, and revenue generating projects. However, since the Alameda Corridor project is in its early stages, there are a number of unanswered questions concerning the risk to the Federal Government if other funding sources are not realized and the success of this type of Federal loan at leveraging other funding. How important was the Federal loan to the project?

Answer. The Federal loan, which was signed January 17, 1997, is a vital part of the project's financial package. The $2 billion project is a public-private venture involving the ports and cities of Los Angeles and Long Beach, the regional transportation authority, the railroads using the corridor, and the Federal Government. The Alameda Corridor Transportation Authority (ACTA) is a joint-powers public agency established by Los Angeles and Long Beach to develop, finance, build, and operate the project. The two ports have already contributed $400 million for rights-of-way along the corridor, and the Metropolitan Transportation Authority (Los Angeles County's metropolitan planning organization) will provide nearly $350 million of its Federal, State, and local grant funds. Project revenues—user charges paid by the railroads and other income of the ports—will be used to repay approximately $735 million in revenue bonds and the $400 million Federal loan.

The Federal loan offers permanent financing with flexible payment features that should alleviate market concerns and promote efficient use of private capital by positioning the government as a patient investor in the project with a long-term horizon and no liquidity requirements. Those features include: (1) structuring flexible repayment schedules with deferrable interest and principal to match realized project revenues; (2) facilitating the project's access to private capital by enhancing the capital markets debt coverage, lowering interest rates, and reducing reserve requirements; and (3) leveraging substantial private financing by limiting Federal participation to 20 percent of total project costs. At a budgetary cost of only $59 million (to cover the subsidy or risk of non-repayment), the Federal Government is providing a $400 million loan that will help advance a $2 billion project with significant local, regional, and national benefits.

Question. How will the loan be used? Could you expand on how the Federal loan will be spent?

Answer. Under the terms of the January 17 loan agreement signed by DOT and the Alameda Corridor Transportation Authority, the Federal loan can be used for

any costs related to: (1) acquisition, design and construction of the project, including legal, administrative, engineering, planning, design, insurance and financing costs; (2) debt service, capitalized interest, contingency, or capital reserve funds, (3) debt service payments; and (4) costs of equipment and supplies and initial working capital.

Question. In the loan agreement, why was the Federal loan repayment made subordinate to the repayment of revenue bonds?

Answer. Given the uncertainty of the projected revenue stream and operating costs associated with large startup transportation facilities, investors and rating agencies typically require that the project revenue bonds have a relatively high coverage margin. Coverage is the annual surplus of net revenues after payment of operating expenses and debt service. A high coverage factor (such as 1.75 times) constrains the permitted level of annual debt service, reducing the amount of debt that can be supported and leaving a funding gap.

While project sponsors could seek to raise additional debt proceeds with a thinner coverage margin (such as 1.10 times), such debt likely would be rated sub-investment grade. The major capital market funding source for debt financing of infrastructure—the municipal bond market—is generally risk averse, and there is only a limited market for non-investment grade obligations. The situation defines the need for a flexible debt instrument that can be payable out of the coverage factor after the senior bonds' debt service. The Federal loan addresses this market gap and promotes the efficient use of capital by positioning the Government as a patient investor with a longer-term time horizon and no liquidity requirements.

Question. How much would the Federal Government lose if the project goes into default? How much would the Federal Government gain if the loan is paid back?

Answer. The Fiscal Year 1997 Omnibus Consolidated Appropriations Act (Public Law 104–208) provides $59 million for the Department of Transportation to pay the subsidy costs associated with making a direct loan not to exceed $400 million to ACTA for the Alameda Corridor project. If the loan is repaid in full, the subsidy budget authority of $59 million will be returned to the General Fund. In a worst-case scenario, none of the $400 million loan would be repaid, and the Federal Government would lose $400 million. However, such a scenario is unlikely. If project bonds are not issued to construct the project or an alternative source for funding the remainder of the project's costs is not put into place by December 31, 2005, the loan will still be repaid by ACTA from rental income from the partially built project and other port revenues. And if the project is fully constructed as planned, the flexible terms and rate covenants included in the loan agreement offer the Federal Government additional security.

Question. How much of the corridor's financing is based on Federal funding, including both direct and indirect Federal funds, both with and without the Federal loan?

Answer. The $2 billion project is a public-private venture among the ports and cities of Los Angeles and Long Beach, the regional transportation authority, the railroads using the corridor, and the Federal Government. Direct Federal contributions to the project include $45 million in ISTEA demonstration funds (USDOT), $2 million in Economic Development Administration funds (Commerce), and the $400 million direct Federal loan. Thus, the project will receive $447 million ($47 million without the Federal loan) in direct Federal funding.

In addition, the Metropolitan Transportation Authority (MTA) will provide another $329 million of apportioned Federal-aid highway funds. Total Federal funding for the project (including indirect Federal-aid highway funds passed through the Los Angeles County MTA) equals $776 million ($376 without the Federal loan).

Question. Will the revenue bonds be fully or partially tax-exempt? How could that affect the Federal loan?

Answer. Under current law, without special legislative authority, ACTA believes that a portion of its revenue bonds could be issued as tax-exempt debt (relating to public use/public purpose). The amount of the tax-exempt debt ultimately issued for the project should not affect the security of the Federal Government's investment, as the budgetary cost of the Federal loan was "scored" based on the assumption of all revenue bonds being taxable.

Question. Is the Alameda Corridor Federal loan being seen as a promising way to finance other projects? If so, why?

Answer. The Alameda Corridor Federal loan was a unique, ad hoc response to a specific project. The administration is seeking in NEXTEA a somewhat different approach. The Transportation Infrastructure Credit Enhancement Program would provide grants (up to 20 percent of total cost) to assist in the funding of nationally significant transportation projects that otherwise might be delayed or not constructed at all because of their size and uncertainty over timing of revenues. After projects

are selected by the Secretary, grants are made to capitalize revenue stabilization funds. A revenue stabilization fund could be drawn upon if needed to pay debt service on the project's debt obligations in the event of revenue shortfalls. The stabilization fund may also be used to secure junior lien debt or other obligations requiring credit enhancement. Limiting the use of the revenue stabilization fund to these types of obligations is designed to maximize the project's ability to leverage private capital, and assist it in obtaining investment grade ratings on senior debt. The program's goal is to encourage the development of large, capital-intensive facilities through public-private partnerships consisting of State or local governments with private business.

TRANSPORTATION INFRASTRUCTURE CREDIT PROGRAM

Question. How will the Transportation Infrastructure Credit Program affect the trust fund balance, since the program calls for more money up front and for payment out of the highway trust fund?

Answer. The new transportation infrastructure credit enhancement program is funded at $100 million. This level of funding would have a minimal impact on the highway account balance, which is projected to be about $15 billion at the end of fiscal year 1997.

Question. How will DOT assess the economic benefits of a project? Will it just consider future revenue streams or will it consider pollution reduction, congestion relief and other indirect benefits?

Answer. Projects selected for this program will have to demonstrate the ability to generate broad economic benefits, support international commerce, or otherwise enhance the Nation's transportation system and economy. Specific factors would include the extent to which the project: (1) advances high-priority corridors (NAFTA, trade corridors), intermodal connectors and border facilities, or otherwise promotes regional, interstate or international commerce; (2) enables U.S. manufacturers to deliver their goods to domestic and foreign markets in a more timely, cost-effective manner; (3) stimulates new economic activity and job creation; (4) reduces traffic congestion, thereby reducing shipping delays and increasing workforce productivity; and (5) protects the environment by enhancing air quality through the reduction of congestion and decreased fuel and oil consumption.

Question. Who will be able to apply for funding—private organizations, cities, States, metropolitan planning organizations, etc.?

Answer. The sponsor of a project eligible for assistance under the credit enhancement program must be a State, local government, or other public agency, or the project must be publicly owned and publicly sponsored, meaning it satisfies the Statewide and metropolitan planning requirements of Title 23, U.S.C., and the application is submitted by a State, local government, or other public agency. Therefore, the applicant could be a corporation, partnership, joint venture, trust, or governmental entity.

Question. Since the Department will not directly oversee the project, how will it assure that the Federal money will be used efficiently and effectively?

Answer. As with other projects funded in part through Federal transportation programs, the Department will work with its State and local partners to ensure that Federal funds are used effectively and efficiently in accordance with relevant laws and regulations. Recipient projects will be treated like "regular Title 23" projects in that they must be advanced by a State or local government (or agency thereof), satisfy the usual planning requirements, and be eligible for Federal assistance under Title 23 or chapter 53 of Title 49, U.S.C. In addition, the usual Federal requirements that apply to funds and projects under titles 23 and 49 shall also apply to revenue stabilization funds and projects receiving them under the new credit enhancement program. The Secretary of Transportation will consult with the Secretary of the Treasury to ensure that any grants made to capitalize revenue stabilization funds under the new program shall contain appropriate terms and limitations to ensure that Federal funds are used prudently in leveraging private capital to advance important national transportation investments.

Question. Given that the Department has had limited experience with loan guarantee projects such as the Alameda Corridor, should more experience be gained before establishing a nationwide program?

Answer. The need for and efficacy of Federal assistance (whether direct loans, loan guarantees, or credit enhancement) for large revenue-generating projects of national significance is already being demonstrated by the TCA toll roads (through Federal lines of credit) and Alameda Corridor (a Federal direct loan). Establishing a Federal credit enhancement program provides the benefits of being able to clearly set forth prudent and consistent policy guidelines and fiscal parameters that will

advance vital national transportation goals while maximizing efficiency and minimizing risk. Without a programmatic structure, such Federal credit assistance provided on an ad-hoc basis may not have the desired level of efficiency, equity, and effectiveness.

Also, we believe any Federal credit enhancement program should be limited in scope, targeted to a relatively small number of projects of national significance. Each project will be one-of-a-kind, evaluated according to a unique set of benefit and cost factors. It is not expected that the Federal Government will or should generate a large portfolio of such project financings. The program should rely on the discipline and credit evaluation expertise of the private capital markets. One measure of the program's success might be the extent to which it demonstrates the feasibility of long-term infrastructure investments to the private capital markets and can eventually be phased out.

Question. If this program is established, will the Boston Central Artery/Tunnel Project qualify for funds under this program? Does it meet the criteria for a project with a revenue stream? Has there been any discussion about using this program to help fund the suggested freight tunnel beneath New York Harbor?

Answer. The new Transportation Infrastructure Credit Enhancement Program is intended to help advance projects of national significance that require Federal assistance to secure financing and begin construction. Based on the proposed eligibility criteria (national significance, planning requirements, need for financial assistance, State/local support, size, and existence of revenue sources), the Central Artery project could be eligible for assistance. However, the project's current finance plan does not contemplate additional Federal assistance outside the State's regularly apportioned Federal-aid funding. Also, any project determined to be eligible for assistance would have to be assessed against various selection criteria.

To our knowledge, no proponents of the suggested freight tunnel beneath New York Harbor have approached the Department about seeking assistance under the Transportation Infrastructure Credit Enhancement Program. If the project satisfied the eligibility criteria set forth in NEXTEA, it could seek funding under this program. Its application would be evaluated along with those of other applicants.

STATE INFRASTRUCTURE BANKS

Question. To what extent are SIBs expected to leverage new, non-Federal money? Do any of the ten pilot States plan to try and attract private financing? If yes, how?

Answer. The extent to which SIBs will leverage non-Federal money will depend on a number of factors, such as the amount of non-Federal matching funds (State and private) contributed to the SIB; the type of assistance offered by the SIB, including the extent to which any assistance is subsidized; and whether the SIB is able to leverage itself, i.e., issue debt or provide credit enhancement in excess of its own contributed capital.

The Environmental Protection Agency's State Revolving Funds (SRFs) for wastewater treatment facilities have, on average, a leveraging ratio of about 1:2 (Federal grant contributions to total credit assistance provided). We believe SIBs are likely to have a higher leveraging ratio because they will be able to leverage funds through projects—by contributing only a portion of required assistance in conjunction with significant private and other non-Federal capital—as well as by issuing debt against their contributed capital. For example, a SIB loan of $10 million might be part of a total financing package for a project costing $100 million. Also, SIBs have a much larger and more diverse pool of potential recipient projects.

Three loans have been made by the initial ten States participating in the SIB pilot, and all three loans will support bond issuances by localities. In these cases, the loans will help the localities access the capital markets by raising their ratings and thus lowering the interest that the bonds will require when repaid.

Question. How does DOT plan to choose and allocate the $150 million in new SIB money for fiscal year 1997 and, if passed, DOT's request for $150 million in fiscal year 1998?

Answer. We are currently reviewing the new SIB applications, and approvals should be made soon. After this is completed, decisions will be made on allocation of the $150 million.

Question. Will the selection criteria DOT chooses affect the type of projects States submit in their applications? For example, will DOT likely target States with several projects as a State, or will DOT consider States submitting only one project for SIB funding?

Answer. The number of projects a State submitted in its application will probably not be a factor for selection. We hope the SIBs will be able to assist many projects, but we believe that more projects will be identified as a State implements its SIB.

Question. Why have SIBs been slow in getting projects underway?

Answer. A number of actions are required before a project can be funded from a SIB. After DOT approved the first 10 States in 1996, cooperative agreements had to be executed. Most of the agreements were signed at the end of fiscal year 1996. States had to establish a SIB structure and develop procedures. Once a SIB is in place, projects must be selected and financial assistance negotiated. A number of other project actions may be needed before a project is ready to receive funds from a SIB.

Another factor involves the Federal capitalization of SIBs. The legislation requires that SIBs be funded at the traditional highway and transit outlay rates, which means that Federal deposits into SIBs are made over several years. Therefore, the amount of Federal funds currently available to a State is considerably less than 10 percent of its apportionments—the limit a State may transfer to the SIB.

CENTRAL ARTERY/TUNNEL PROJECT

Question. In FHWA's opinion, are the State of Massachusetts projections of savings on the insurance program realistic?

Answer. We understand that the GAO is concerned about the degree of certainty that can be assumed for the large savings that have been reported for the Owner Controlled Insurance Program (OCIP or Wrap-Up Insurance). Given the fact that the project is entering the heaviest phase of construction over the next several years, GAO is concerned that the level of savings trended for the OCIP may not occur. While we understand the cautionary tone reflected in GAO's comments, the FHWA continues to believe that, as in a number of other areas on the CA/T project, an appropriate management and oversight strategy for the OCIP is to set clear and measurable objectives or milestones regarding project costs and schedules. Then FHWA's and the Project's performance can be clearly measured against meeting these objectives or milestones. Given this recommended oversight strategy, the OCIP is an excellent example of one of the more readily trackable programs. The Project Management Monthly Report tracks the Insurance Program's measures on a monthly basis, giving early indications of any positive or adverse trends. The structure of the insurance program now reflects and benefits from that trackability in its use of a retrospective approach that allows for adjustments in the cost of the program based on how claims have occurred during a preceding year. The extraordinary success of the Insurance Program can be reported as very real, given the established track record of safety programs and insurance claims on the project during the last four years, a period that certainly contained its share of heavy construction in sensitive areas. Each year that successes occur in very measurable and actuarial aspects of the insurance program, the Project is more and more able to report a firming up of the expected performance of the program in the future. Likewise, given the retrospective adjustments based on year-by-year performance, the Project will have early indicators of any trends that may be developing. Finally, the Project continues to proactively explore ways to further improve the excellent safety record. Therefore, in summary, FHWA has accepted and believes that the State's projected savings on the insurance program are realistic.

Question. Does FHWA believe the project's cost can be kept to $10.4 billion?

Answer. The Central Artery/Tunnel (CA/T) Project (the Massachusetts Highway Department—MHD—& FHWA) is aggressively managing to the $10.4 billion total cost through the implementation of strategies to meet cost containment goals for design and construction. The CA/T Project recognizes this estimate as achievable, and FHWA supports this management strategy that involves setting measurable milestones regarding cost and schedule and measuring the CA/T Project performance against these milestones. The CA/T Project uses trend analyses and early indicators that allow the management process to be dynamic and adjust to deviations in schedule and cost. As long as this aggressive management is maintained, the current budget is viewed by FHWA as achievable.

Question. What is FHWA doing to review and scrutinize project costs? What does FHWA think the cost of the project is?

Answer. The FHWA is actively involved with the MHD CA/T staff in scrutinizing and controlling total project costs, and in developing a variety of cost saving strategies. The unprecedented allocation of resources to staffing in the Massachusetts Division Office, with assistance from both Region and Headquarters Offices, has enabled the FHWA to provide a program of both comprehensive and tailored oversight regarding cost, schedule and quality. The FHWA engineering and technical staff provide a range of project- or contract-specific design and construction monitoring based upon a geographic assignment of responsibility. Each area engineer is specifically responsible for monitoring all Federal-aid work within this assigned area, re-

viewing designs to ensure that components are both economical and cost-effective. This design review also ensures compliance with necessary standards. Area engineers are also responsible for monitoring costs and quality for their area during construction, monitoring construction procedures and the administration of change orders as necessary. A variety of technical experts are available from the division, the regional and headquarters levels of FHWA to provide special expertise to the area engineers as needed during both design and construction. This expertise is especially valuable in bench marking design or construction procedures and cost-effectiveness in areas such as specialty tunnel areas or environmental mitigation.

Besides contract-specific monitoring, the Division Office, supplemented with assistance from the Region and Headquarters, also provides programmatic oversight through a variety of task team, peer review, and/or process review activities. These activities insure that design and construction processes are designed or re-engineered to provide streamlined and cost-effective outcomes. To give two examples from 1996, task team/process reviews were conducted on the wrap-up insurance program and the geotechnical instrumentation. Cost saving strategies were identified in each review. The Division Office also participates in a number of MHD CA/T committees that have been charged with managing costs on the project. Examples of these activities include the Cost Containment Committee (generating innovative approaches such as the Design-to-Cost program, an approach that controls growth of design estimates) and the Project Contingency Allowance Committee (controlling costs associated with such issues in construction as changed site conditions). Through further participation on value engineering teams and through construction partnering, Division Office representatives ensure that cost-effective functional designs are provided and moved to construction in a fashion where costly litigation or dispute resolution is avoided through collaboration with the contracting industry. Total costs and cost trends are closely monitored by the FHWA upper management at all levels by proactive involvement in Project Management Monthly reporting and through quarterly briefing of FHWA's highest management. These review activities include monitoring and periodic validation of macro-level Finance Plan assumptions or trends in areas such as inflation and bidding results.

In regard to the second question, as reported in an earlier question and as has been reported in the September 30, 1996 Financial Plan, FHWA has accepted the State's total cost as $10.4 billion.

Question. Does FHWA believe it is time for Massachusetts to revise its cost estimate to be more realistic? Why or why not?

Answer. The cost estimate for the Central Artery/Tunnel is validated monthly. This has been done for approximately a year now as part of the Project Monthly Management report that tracks the actual project cost and schedule, gives early indication of potential cost increases or decreases, compares it to the Cost/Schedule Update 6 (Rev 6) and previous forecast, and develops a new forecast for the remaining cost and schedule. The report also shows the changes from the previous month for actual versus planned costs and schedule time. The result is a current cost-to-go and total cost, and a current schedule on a monthly basis. Assumptions used for Rev 6 are also being tracked. While some of the assumptions are tracking better than others, the overall project cost is staying within budget. As part of the next Finance Plan Update, currently planned for October 1, 1997, we will assess the need to revise these assumptions.

Question. Does FHWA believe that the financing strategies outlined in the consultant's study are viable? Has FHWA conveyed these views to the State?

Answer. Massachusetts' Metropolitan Highway System (MHS) Financial Feasibility Study, while legislated by Massachusetts itself, is a key part of the State's plan to finance the Central Artery/Tunnel. FHWA's acceptance of the State's CA/T Finance Plan was conditioned upon the State's completion of the MHS Study and implementing legislation. The MHS Study was completed in December 1996 and contained numerous scenarios, the majority related to increasing existing tolls, to identify State funding for the CA/T, and MHS operation, and still allow a $400 Million (Federal and State) Statewide Program exclusive of the CA/T.

The Executive Office of Transportation and Construction's December 5, 1996, submittal to the Legislature and Governor contained specific recommendations primarily related to raising existing tolls for the tunnels and bridge in downtown Boston. Implementing MHS (State) legislation was introduced on January 6, 1997; two public hearings were held, at the first of which FHWA's Massachusetts Division Administrator answered questions as requested. The legislation has moved through the Legislature and was signed by the Governor on March 20, 1997. The existing legislation does not set toll levels, but does enable the Massachusetts Turnpike Authority to adjust tolls to meet the needs to complete the CA/T and operate the MHS and maintain a $400 million Statewide program.

While FHWA believes that the assessment of the options in the MHS Study is a State and local responsibility, we believe the study did a good job of identifying options that would meet both the State's needs and conditions as relate to the completion of the CA/T, maintaining a $400 million Statewide Program, and operating the MHS. FHWA also believes the existing legislation is feasible and will meet both the State's and our needs. FHWA has conveyed these views to the State both informally and in answering questions in a State legislative hearing.

Question. Is the use of grant anticipation notes to leverage future Federal funds a feasible strategy for financing $1 billion or more of a project's costs? What experience has FHWA had with these kinds of instruments?

Answer. In general, we believe that the use of grant anticipation notes (GANs) is a prudent and effective way to cover the timing gap between a project's up-front cash flow requirements for construction and the receipt of future anticipated Federal aid. The amount that can be financed through GANs depends on the size of the cash flow shortfall, the term of the notes, and the predictability of the future Federal grants to be used to repay the GANs.

GANs have been used extensively in connection with other Federal aid programs (notably FTA and EPA) but only occasionally with FHWA receivables. We believe the reason for this is that most States historically have had sufficient cash balances in their highway programs to internally finance the timing gap, thus avoiding the need to borrow externally through GANs. However, for large projects (such as the Central Artery) it may be necessary to consider using GANs to meet cash flow needs.

Question. What actions does FHWA plan to take if legislation is not enacted by the State to implement the study's recommendations?

Answer. On March 20, 1997, Governor Weld signed the Metropolitan Highway System (MHS) legislation into law, thus implementing the recommendations of the Executive Office of Transportation and Construction from the MHS Financial Feasibility Study. Given the enactment of the required legislation, FHWA will not have to withhold authority or take other actions in regard to this issue.

Question. Does FHWA believe that the shortfall estimates are accurate? How much will these estimates go up if costs increase?

Answer. Yes, the annual shortfall estimates (cash flow needs) are believed to be accurate for the scenario(s) used in the CA/T Finance Plan, and recognizing that the actual Federal funding levels for post-ISTEA are still unknown. The effect of cost changes, even assuming the same scenario(s) for unknown post-ISTEA Federal funding levels, would depend on what year the associated changes were built and needed to be paid. That is, a design change or construction change could be known today, but its effect would depend on whether the actual billing for the resultant work occurred in a peak cash flow year or afterward when cash flow needs are not as great.

Question. What fallback position is available to the State if the strategies outlined in the consultant's report are not sufficient to meet the funding gaps?

Answer. The Metropolitan Highway System (MHS) Financial Feasibility Study contained several options for the State share of costs associated with the CA/T interim cash flow needs, total CA/T project cost needs, and also operating expenses for the MHS. The options included revenue bonds backed by toll increases, interim borrowing backed by anticipated Federal funds, increased gas tax, toll increases, and/or other State sources. The Executive Office of Transportation and Construction requested legislation, which passed both houses of the State legislature and which has been recently signed by the Governor, turning the construction of the CA/T, and operation of the MHS (including the CA/T) over to the Massachusetts Turnpike Authority (MTA). The legislation also indicates the amount of State share to be paid by the Massachusetts Port Authority (MassPort or MPA), MTA, and the Massachusetts Highway Department. It also enables them to adjust tolls as needed to cover such costs. The State would have the option of covering funding needs by such tolls or short-term borrowing, or if necessary could consider a gas tax. The latter is not considered necessary by the State at this time.

TRANSIT NEW STARTS

Question. The President's proposed fiscal year 1998 budget would cut transit new starts by $126 million from the current enacted level of $760 million. There are now 13 new starts with full funding grant agreements in the funding "pipeline" and two more awaiting FFGAs. These 15 projects will cost $3.7 billion to complete. There are about 100 other projects already in various preliminary stages, totaling about $10 billion to $20 billion to complete. Should the administration be entering into new

full funding grant agreements when the new starts program is already oversubscribed?

Answer. The fiscal year 1998 budget proposes funding for 15 projects for which FFGAs are in place or pending. Our 1998 funding request reflects budgetary pressure, and while it is not the annual amount for fiscal year 1998 in the FFGAs, our proposed outyear funding is sufficient to cover funding requirements for these 15 projects. Furthermore, our reauthorization proposal includes an even higher level of contract authority that could become available dependent upon future Federal budget decisions. Therefore, our current plans to sign two new FFGAs are within our long-term budget plan.

Question. Why is the administration asking for a cut in transit new starts at the same time that it is poised to approve $850 million in new commitments?

Answer. The request for Major Capital Investments (new starts) funding in fiscal year 1998 represents the funding necessary to enable those projects recommended for funding to proceed at a reasonable pace.

The "$850 million in new commitments" (actually $853 million) represents the administration's planned Federal commitment through multi-year Full Funding Grant Agreements for two projects: the BART Extension to San Francisco Airport ($750 million) and the Sacramento light rail extension ($103 million). Through fiscal year 1997, $84 million has already been appropriated toward the total $853 million planned Federal commitment to these projects. Our request for fiscal year 1998 includes another $75 million for the two projects, leaving outyear requirements of $694 million in Federal funding. Our proposed outyear funding levels are sufficient to cover these funding requirements.

Question. Is the administration interested in working with new starts project sponsors to help reduce the size of the Federal commitment to these expensive projects?

Answer. There are already provisions in law that encourage project sponsors to do this, and FTA actively encourages their use.

Title 49, U.S.C., Section 5309(h) establishes the level of Federal participation in new starts projects at 80 percent of the net project cost, unless the grant recipient requests a lower percentage. There are at least two reasons why a project sponsor may want to reduce the percentage of Federal participation. First, project sponsors seeking discretionary funds for less than one third of the total cost of the project, or less than a total of $25 million in discretionary new starts funds, are exempt by statute from evaluation under the project justification criteria established in 49 U.S.C. Section 5309(e).

Second, the statutory project justification criteria themselves require an evaluation of local financial commitment. One indicator of this commitment would be a higher share of project costs from State and/or local sources. Therefore, a project with a proposed Federal share of 50 percent, for example, might be rated higher than a similar project proposed for 80 percent Federal funding (provided, of course, that FTA's analysis of the financing plan confirms its viability). This may speed the project with the smaller Federal share through the new starts funding process.

A number of project sponsors have taken advantage of these provisions in recent years. In Los Angeles, the Metro Red Line is being constructed with 50 percent of the project costs from Federal new starts funding. The Federal proportion of funding for the Houston Regional Bus plan, which evolved as a cost-effective alternative to a proposed monorail system, is slightly less than 60 percent. Light rail extensions in Baltimore and an extension of the BART system to San Francisco International Airport are being constructed as part of regional transit improvement programs, of which the Federal share will be less than one-third overall.

AVIATION EXCISE TAXES

Question. The aviation excise taxes were recently reinstated by the Congress, and went back into effect March 7th. Are there any critical FAA capital needs that will go unfunded because of the lapse in the aviation excise taxes?

Answer. No, the recent reinstatement of the excise taxes will fund the FAA's capital requirements for the balance of fiscal year 1997. However, according to the current legislation, the excise taxes will lapse again on September 30, 1997. Unless there are alternative financing plans in place, the FAA would not be able to proceed with the capital programs in fiscal year 1998.

Question. If so, are you planning to submit a supplemental request to fill urgent safety needs?

Answer. Since the excise taxes were reinstated, the FAA is proceeding with the capital programs and does not foresee a need for a supplemental in fiscal year 1997.

FAA ADMINISTRATOR

Question. How is the administration progressing on the appointment of a new FAA administrator?

Answer. Candidates have been identified and we are in the final stages of preparing a nomination. We expect to finish our internal processes shortly.

FAA FINANCIAL AND PERSONNEL MANAGEMENT

Question. The recent Coopers & Lybrand study is critical of the FAA's financial management of large procurement projects, and the agency's personnel management. There seems to be a continuing drumbeat of experts who have studied the FAA and all come to the conclusion that the agency must fundamentally change the way it makes decisions, approaches personnel costs, and transitions from older technology to new technology. These are not new challenges, but they are challenges that continue to frustrate the FAA and the Congress. It is especially frustrating in light of the fact that this Committee has been responsive to the department's requests for flexibility in the personnel and procurement areas. In the fiscal year 1996 bill, FAA was given unprecedented personnel and procurement reform tools, which the Coopers & Lybrand study points out that they have yet to effectively use. Why does the FAA fail to include any estimated savings from personnel and procurement reform in its five-year business plan?

Answer. Cost containment and potential cost savings for the agency in the longer term are basic tenets of personnel and acquisition reform.

Since the advent of personnel reform in April 1996, FAA has made significant accomplishments in implementing an initial phase of new personnel policies and processes. However, development of new personnel programs to replace the existing systems that have been in place for decades must be done in a thorough, systematic manner to ensure that the new programs support the underlying objectives, properly address problems with the existing systems, and ensure fiscal responsibility. Until we have made specific decisions on what the major components of our new human resource systems will look like, we cannot identify specific cost savings that might result from the new programs.

Under acquisition reform, our goal is to reduce costs of new acquisitions by 20 percent and reduce the time it takes to make an award by 50 percent by April 1999. At this time, it is too early to estimate specific future cost savings resulting from the new system. Only five or six new programs have been awarded since April 1996 when procurement reform went into effect. However, we do know that procurements have been awarded faster, and time is money.

FAA is developing metrics and will conduct annual internal evaluations that will build the infrastructure to calibrate and project savings that we can expect in the future. In addition, FAA will provide for independent evaluations of the acquisition management system later this year and in April 1999 as directed by the Appropriations and Authorization Committees.

Question. What savings have been realized from the procurement and personnel reforms? What savings are projected for fiscal years 1997, 1998, and the outyears?

Answer. While it is too early to assess the full benefits of the new acquisition management system (AMS), we know there have been successes and we must continue to work to ensure complete success. However, there have been numerous lessons learned under the AMS that indicate time savings for both the FAA and industry.

As an example, the STARS procurement was awarded in 6 months (with no protest) under reform; award under the previous system could have been up to 18 months. The time and resource savings experienced under this procurement is 12 months, not including any time and resources which would have been expended in the event of a challenge to the award. Another example is the procurement handled by the newly formed Security Integrated Product Team (IPT). This team used the reform flexibility and authority to make an award within a six-week period and saved valuable time and resources.

While many procurements have been handled in less time and with less resources, another factor that cannot be overlooked under reform is the culture change. An example of this culture change is the Computer Based Instruction procurement. Historically this action would have been handled as a single-source procurement. However, the IPT made the decision to compete the requirement. The IPT was able to award to a new contractor and save $3 million over the incumbent's prices, as well as obtain state-of-the-art equipment.

There have been many procurements of lesser dollar value that have been awarded in shorter time frames than would have been under the previous system. The reason for these shorter time frames is that the response times are tailored to the

requirement, there is more discussion with industry to obtain a better understanding of the requirement (therefore less time and resources spent on numerous proposal submissions), and the decision-making process is within the IPT.

We anticipate that there will be similar savings in the future. Our goal is to reduce costs by 20 percent and reduce the time it takes to make an award by 50 percent by April 1999.

Question. Why should Congress be expected to take seriously FAA's estimates of offsetting collections from user fees, if the agency can't accurately lay out the FAA's costs that are associated with the services for which they plan to charge the fees?

Answer. The FAA is implementing a cost accounting system that will permit the allocation of costs to users of FAA services. This system is to be fully operational by October 1, 1998. Until information from this system is available, an independent financial assessment conducted by Coopers & Lybrand, Inc., determined that a cost allocation study conducted by GRA Inc., which was recently finalized, provided an acceptable interim basis for attributing FAA costs to broad categories of users and could be used for fee setting.

FAA'S ACQUISITION SYSTEM

Question. In 1995, Congress gave FAA unique authority among Federal agencies to establish its own procurement system. In response, FAA replaced the extensive set of procurement rules with a 100-page document, entitled Acquisition Management System. GAO has reported that elements of the new system are a promising first step in improving acquisitions, but has expressed caution. How complex and difficult to address do you consider FAA's acquisition problems to be? What are the major issues that need to be addressed to solve the problems?

Answer. The problems are complex and difficult, especially considering the rapidly growing demand for air traffic management and infrastructure. Prior to the Acquisition Management System (AMS), a rigid set of acquisition laws, regulations, internal rules, and overlapping approvals contributed to costs and delays in fielding and maintaining systems. Excessive time to field systems often led to those systems containing obsolete technology. Also, there was no coordinated, corporate-level view of acquisition programs. Rigorous mission needs determinations, analyses of alternatives, and affordability decisions were not always focused at a corporate level.

The new AMS addresses the problems of excessive time and cost, unnecessary oversight, and burdensome processes. The AMS promotes time and cost savings by allowing streamlined processes, decision-making at a level appropriate for the circumstances, integration of all disciplines responsible for an acquisition into product teams, and innovation. All elements of acquisition are integrated by the AMS, from determining mission need to disposal. The AMS also requires the FAA to prioritize mission needs and make investment decisions based on those needs. In summary, the AMS will allow the FAA to buy what it needs, when it needs it, at the best deal, and will allow for changes.

AIRPORT FUNDING

Question. AIP funding is at an all-time low in recent history. And in the fiscal year 1998 budget request, you have requested an obligation ceiling of only $1 billion. In the past four years, annual airline passenger enplanements have increased 16 percent and investment in airport development has decreased 23 percent—and that is before the $460 million decrease in airport investment envisioned in the President's Budget. I'm informed that the FAA has pending applications for over $3 billion worth of airport improvement projects ready to go.

The FAA cites 22 airports that are seriously congested, and estimates that number growing to 32 in the next several years. Delays associated with congestion cost the airlines over $500 million a year directly, and the total cost to the national economy is many times greater, if you consider the lost time to passengers and businesses. Yet your budget requests the historically low airport improvement funding level of $1 billion—lower than the AIP ceiling has been in 10 years.

Have we been spending too much on airports, or is the President's Budget underfunding our airport needs?

Answer. Like many other Federal programs, the requested AIP level has been reviewed carefully to help the administration and Congress balance the Federal budget. Airports, particularly large ones, are able to raise capital for airport development in the private market. Also, the ability to collect and use Passenger Facility Charge funds will continue to provide an important supplement to Federal grant funds. We hope the newly authorized demonstration program for innovative financing will help airports do more with the Federal funds that are made available to them.

We are optimistic that the work of the National Civil Aviation Review Commission will produce recommendations for long-term funding of airport infrastructure, as well as other aviation programs.

Question. Has the Department done any research on the economic impact of funds spent on new airports and airport improvements? If so, please provide an executive summary of the results of this research for the record.

Answer. FAA has not conducted research into the broad impact of airport improvements on the economy of the surrounding area. FAA has conducted benefit/cost analyses of specific proposals for large airport capacity improvements to be funded in part through the Airport Improvement Program. These analyses were conducted within FAA and did not result in formal reports. We have included economic impact analysis as an element of the master planning process, and have developed a suggested methodology for use by airports.

WHITE HOUSE COMMISSION REPORT

Question. On page 11 of the Gore Commission report, the Commission concludes that "Cost alone should not become dispositive in deciding aviation safety and security rulemaking issues" and that "non-quantifiable safety and security benefits should be included in the analysis of proposals." What are some of the factors in this "non-quantifiable" category? Are these just factors that we'll know when we see them?

Answer. The White House Commission recommendation that cost alone not become dispositive in regulatory cost/benefit analysis is consistent with current FAA practice and with Executive Order 12866 (Regulatory Planning and Review), which recognizes that some significant costs and benefits are difficult to quantify. With respect to U.S. aviation safety and security, examples of difficult to quantify benefits include estimates of the value of public confidence in the safety of air travel, the value of trying to achieve 100 percent risk reduction with the use of redundant systems or procedures, and safety measures instituted as a result of risk analysis rather than a record of actual accidents. In regulatory actions where these difficult to quantify benefits or costs are included, the specific issues are identified and discussed so the reader is aware that they have been included in the analysis.

WEATHER-RELATED AVIATION RESEARCH

Question. Weather is a contributing factor in over one-third of aircraft accidents. In the report, the Commission sets the goal of reducing "the fatal accident rate by a factor of five within ten years and conduct safety research to support that goal." I note that the President's Budget request for aviation weather research has been reduced by over 60 percent below current levels (from $13 million to $6 million). Is enough money committed to weather research, or is this an area that deserves greater attention by the FAA?

Answer. Research and development project funding varies considerably from year to year, depending on the phase of research. The FAA's Aviation Weather Research program is in a phase where several components have completed the capital intensive portions and are now in a less costly period of analysis. We are studying how to implement the recommendations of the White House Commission Report, and can shift resources, as necessary, to fund any additional weather research.

NASA SAFETY PROGRAM

Question. I've heard that in response to the Gore Commission report, NASA has started planning a $300 million a year safety program. Is NASA the appropriate agency to lead on aviation safety, and what type of safety initiatives would you anticipate that NASA is best suited to contribute?

Answer. The FAA is working in partnership with NASA in an endeavor to reduce the aviation fatal accident rate by a factor of five within ten years. NASA has pledged to contribute one-half billion dollars over the next five years to support the safety research. The initiative, now named the Aeronautical Safety Investment Strategy Team (ASIST), was kicked off by an FAA and NASA workshop February 18–21, 1997. Subsequent ASIST workshops were held March 6–7 and March 25–28, 1997. The groups used facilities provided by Boeing and worked on a process for prioritizing safety research. Subgroups are preparing a comprehensive list of research projects being done by FAA and NASA to identify those projects with the most immediate impact. Long range research is also being examined in those areas expected to have a major impact on accident rates. The next workshop will be held April 17–19.

While aviation safety is the responsibility of the FAA, the agencies have worked in partnership for over ten years on several safety research initiatives that contrib-

ute to the overall goal of reducing accident rates. Current FAA/NASA cooperative research programs include aging aircraft studies, Advanced General Aviation Transport Experiments (AGATE) to include the General Aviation Propulsion Program (GAP), and new situation awareness methods such as the Aviation Performance Measuring System (APMS) program.

The research roles of the two agencies are complimentary in that the FAA's research program is focused on applied research with results expected within two to five years, while the NASA research programs tend to be longer term. Working in partnership will ensure that the research performed by NASA can be applied by the FAA in its advisory material and rules.

Question. I note that the Gore Commission Report mentions the need for a "new long-term financing mechanism to ensure that modernization occurs on an acceptable schedule, and that the resulting safety and efficiency benefits are realized faster." and that "Replacing the traditional system to excise taxes with user fees offers the potential to correlate revenues and spending more closely." What is the Department's view of what a user-financed regime might look like? I know that this is the task for the National Civil Aviation Review Commission, but can you give the subcommittee a sneak preview of what you expect the administration to favor for user fees, fuel taxes, ticket taxes, or other financing mechanisms?

Answer. User fees should cover the full costs of operating FAA. Ideally, the fees would be derived by determining the full costs of providing specific services such as air traffic control services to aviation users and relating the fees to those costs. Recommendations for specific types of changes and types of services subject to charge will be heavily influenced by the findings of the National Civil Aviation Review Commission.

PASSENGER FACILITY CHARGES

Question. To augment funding from the AIP grants, in 1990 the Congress established the Passenger Facility Charge (PFC) program. Under the program, commercial service airports can charge each airline passenger $1, $2, or $3 per trip segment up to a maximum of four segments per round trip. After determining which projects to fund with PFCs, an airport must apply to FAA for approval of the PFC. In 1996, PFC collections totaled over $1 billion. Generally, PFCs can only be spent on the same types of airport development projects that can be funded with AIP grants. However, in 1996, the Congress extended the use of PFCs to include relocating air traffic control towers and navigational aids as part of an approved project, and meeting Federal mandates. Have any airports as yet requested to use PFC's to relocate a tower or navigation aid? If so, what was the PFC contribution to the total project cost?

Answer. Yes, the Albany County Airport Authority in Albany, New York, has an approved project to relocate the air traffic control at the airport. The Albany County Airport was approved to impose and use $8,521,093 in PFCs toward the total project cost of $15,496,956. Also, numerous public agencies have been approved for the imposition and use of PFCs for runway projects of various types at airports they control. However, it is not known which, or if any, of these projects contained navigational aids as a construction element.

Question. Have any airports as yet requested to use PFCs to meet Federal mandates? If so, could you provide an example of the type of mandate and the PFC contribution to the total project cost?

Answer. Yes, many public agencies have had projects approved that were federally mandated or had projects that contained construction elements that were federally mandated. Examples of these mandates are: airfield signage; terminal security; projects to comply with the Americans With Disabilities Act (ADA) requirements; and clean air and water projects. Many of these mandates are carried out as elements of other major construction projects. For example, many ADA projects are contained within terminal rehabilitation projects. The FAA has approved over $15.2 million in terminal ADA projects and $16.4 million in airfield signage projects.

Also, Dayton, Ohio; Indianapolis, Indiana; Syracuse, New York; and Tulsa and Oklahoma City, Oklahoma, have environmental clean water projects totaling over $41.8 million approved or pending approval.

FAA'S FUNDING SHORTFALL

Question. In its fiscal year 1998 budget, FAA projects a $6 billion shortfall between its existing requirements and projected funding levels through 2002. In addition, the cost of the Gore Commission's proposal to accelerate improvements in aviation safety and security will increase this shortfall by over $2 billion, placing an ad-

ditional burden on FAA's resources. What cost containment efforts have you implemented to address these escalating costs?

Answer. The FAA has taken numerous steps in the last three years to reduce personnel costs and reduce FTE levels, as called for by the National Performance Review. Through the end of fiscal year 1996, the agency has been able to reduce overall FTE usage by 11.7 percent or 6,324 FTE. Cumulative savings as a result of FAA's downsizing exceed $1 billion through fiscal year 1996, with fiscal year 1996 savings estimated at over $400 million.

Since over 62 percent of the agency's work force is part of what is referred to as the "safety work force," the downsizing has been concentrated in the non-safety areas. The non-safety work force has been reduced by 18 percent through fiscal year 1996.

Some examples of efforts by the agency to streamline and achieve cost savings are as follows:

—Contracting Out of Level 1 Towers
  —85 Towers contracted out
  —Additional savings anticipated in fiscal year 1998
  —Supported by the NPR
—Airway Facilities (AF) Realignment
  —Reduced levels of AF organization in regions and field from 5 to 3
  —Nearly 900 supervisory positions eliminated
—Human Resource Management (HRM) Streamlining
  —HRM staffing reduced by over 400 positions since fiscal year 1993
  —Supervisory ratio increased from 1:5 to 1:15

The FAA is currently in the process of an integrated review of the agency's structure, processes, and restructuring plans. Contrary to previous studies that have concentrated on specific areas (e.g. regional structure, administrative services, etc.), the integrated review now in process will incorporate plans already in place in the lines of business as well as a corporate review of the FAA mission, processes, and structure.

Question. How has the FAA's investment in ATC modernization increased controller and workforce productivity? Could you discuss how this investment has reduced or contained personnel staffing levels?

Answer. The ATC modernization has not specifically reduced or contained air traffic staffing. An increase in controller productivity may be a by-product of our efforts to adopt new technologies. We hold technologies we pursue up to the standard of the agency mission: Safe, Orderly and Expeditious flow of Air Traffic. In the Standard Terminal Automation Replacement System (STARS) program, for instance, we have required only the capability to replicate our current functionality. In the preplanned product improvement area of STARS, we require the contractor to give us a platform within which additional functionality can be readily accommodated.

The Display System Replacement (DSR), like the STARS program, has kept the system as functionally close to today's system as possible. This was done intentionally to reduce schedule risk and transition and training impact to the facilities. The system will provide a platform that has open system architecture and will allow us to integrate new ATC technologies when they are available.

Among the expected additional functions are data link communications, surveillance enhancements, surface separation, improved weather display, Terminal Air Traffic Control Automation (TATCA), Enhanced Traffic Management System (ETMS), medium-range conflict probe and others. The benefits will accrue to FAA customers as a function of increased performance of the system, a large part of which is enhanced by controller productivity improvements resulting from better tools.

Question. How will FAA fund Gore Commission recommendations relating to the acceleration of ATC modernization and improvements to airport security?

Answer. The White House Commission recommendations are interrelated. The FFA's ability to accelerate ATC modernization and improve security will depend upon congressional action on the recommendation to implement user fees. These fees will provide the resources needed to address these two areas.

We are currently identifying those specific programs that need to be accelerated to meet full modernization by 2005. We are considering not only existing programs, but also identifying possible changes in how the FAA provides necessary services.

Some modernization efforts are already underway and budgeted, including development of data link, DSR, STARS, and some of the traffic management decision support tools. By late April 1997, the FAA expects to have schedules identified for each program element and refined cost data to share with the National Civil Aviation Review Commission. The White House Commission deferred to this body to help define the alternative financing mechanisms necessary to reach the 2005 goal.

The planning to support full ATC modernization is heavily dependent on the users equipped with avionics that produce both user and FAA benefits. Their input to this planning is critical for success and will occur prior to the July 15, 1997, deadline recommended in the White House Commission report.

DOMESTIC AIRLINE COMPETITION

Question. Nearly 20 years ago, Congress phased out control of domestic airline service and relied on market forces to decide fares and levels of service. Last year the GAO reported that, overall, air fares have decreased and service has improved since airline deregulation. However, GAO emphasized that several "pockets of pain" exist—that is, a number of smaller communities, particularly in the Southeast and upper Midwest, have higher fares and worse service today than under Federal regulation. What steps, if any, can the Department of Transportation take to ensure that the benefits of deregulation reach these areas of the country?

Answer. The GAO report identified some small-and medium-sized communities that had not benefited from deregulation, and they did find a few that they clearly identified as worse off today. They stated, "these pockets of higher fares and worse service stem largely from both a lack of competition and comparatively slow growth over the past two decades".

Geography and the size of the local economy are major factors that determine whether a community can support competitive service. If a city is relatively small and is located within a reasonable driving distance from one or more major cities, some of the population that would normally use the local airport will drive to the larger airports. This is particularly true if low-fare service is available at the larger nearby airports. To date, none of the low-fare carriers has entered a non-hub airport (defined by the FAA as enplaning fewer than 0.05 percent of domestic passengers or 263,028 per year) and only a handful have entered small FAA hubs.

Under deregulation, the Department does not regulate prices or service. These decisions are made by the airlines in the marketplace. However, a DOT study last year showed that the low-cost carriers were beginning to move into ever smaller markets, and if the growth of low-cost service resumes its pattern of a year ago, there might be some low-fare service to smaller cities over time. Another new development that could change the fortunes of the cities noted in the GAO study is the spread of the new 50-seat jets that are just beginning to come into the market. With these new aircraft, it will be feasible to offer jet service to smaller cities.

Question. What steps can local communities take to improve the quality of their air service?

Answer. At a round-table discussion about market-based solutions to local air service problems held in Chattanooga, TN, on February 7, 1997, two important local self-help measures were developed. First, was consumer education. Because of the importance of affordable air service to local economic development, local leaders should become more aggressive in educating consumers about competitive issues facing the local aviation marketplace. Second, local financial incentives were discussed. Such incentives can encourage market entry by guaranteeing a particular level of revenue or providing direct promotional support. In partnership with local airport authorities, corporations can make contractual or preferential agreements with interested new entrants or the most responsive incumbent carriers, steering business toward these airlines.

Question. GAO also reported last year that barriers to entry continue to limit competition at several key airports, such as Chicago O'Hare and New York LaGuardia, to an extent not anticipated by Congress when it deregulated the industry. The result, according to the GAO, has been significantly higher air fares at these airports. Do you agree with GAO's finding and conclusions? If so, what specific actions do you think are necessary to address these barriers to market entry?

Answer. We do not agree completely with GAO's conclusions. While fares may be higher in some markets out of these specific slot-controlled airports, our analysis of fares in Chicago and New York suggests that average fares for local passengers are not significantly higher because both cities have alternative airports that are not slot-controlled: Midway in Chicago and Newark in the New York area. We know, for example, that fares in the Baltimore-O'Hare market are disciplined by Southwest's service in the Baltimore-Midway market.

Nevertheless, in response to GAO's report, the Department announced that it would consider the impact on competition in responding to requests for exemptions from the slot rule by new entrants. This represents a new policy that should enable the Department to encourage new competitive service.

Question. A key barrier to entry that GAO identified was the artificial limits set by DOT on the number of takeoffs and landings that can occur at Chicago O'Hare,

New York LaGuardia and Kennedy, and Washington National. Many in the airline industry believe that these slot controls, established in 1969, are no longer necessary. Do you plan on re-examining the need for slot controls at these airports during your tenure?

Answer. Less than two years ago, the Department completed an exhaustive study of whether slot controls should be eliminated. We sent that study to Congress for its review. Based on that study, no changes were made to the slot rule. Because this was studied so recently, we have no active plan to revisit this issue.

Question. GAO has also identified the perimeter rule at Washington's National Airport as a barrier to entry. GAO suggested that Congress consider giving DOT the authority to grant waivers from the perimeter rule where it could promote competition. What are the Department's views on this issue?

Answer. The perimeter rule at Washington National was created by Congress in its oversight capacity over Washington's two local airports. The Department appreciates arguments for and against modification of the perimeter rule, and takes no position on whether it should be modified.

Question. Given that capacity in the air traffic control system and in the national airport system is available in some sectors and at some airports, while the system operates at or above capacity (at significant expense) in others, is there merit in considering a structure of user fees tied to peak-time pricing concepts on capacity-constrained airports or sectors on non-origin/destination travelers, to encourage greater utilization of system capacity by airlines?

Answer. The development of a user fee system will have to take into account many complicated factors, including peaking issues. DOT at this point is looking to the recently named National Civil Aviation Review Commission to sift through the data and arguments in developing a sound recommendation on user fees.

INTERNATIONAL AVIATION

Question. Over the past several years, DOT has been successful in reaching liberal agreements with other countries that dramatically increase U.S. airlines' access to those countries' markets. Unfortunately, DOT has made little progress with our two largest aviation trading partners overseas—the United Kingdom and Japan. Will DOT take a different approach toward the British and the Japanese under Secretary Slater than was taken by his predecessor? If so, how would the approach differ?

Answer. The goals for our aviation relationships with the British and the Japanese have not changed. In both cases, the Department is committed to eliminating the restrictions that limit the ability of U.S. carriers to structure their services in response to market demands. With respect to the United Kingdom, the proposed alliance between American Airlines and British Airways, for which the airlines are seeking antitrust immunity, has given the British an incentive to liberalize the air services relationship, and talks to establish an open-skies aviation regime have begun. Although the pace of negotiations to establish the new regime has been slow, progress is being made—most significantly, the British have accepted that the restrictions on entry to London's Heathrow Airport must be eliminated. However, further action is unlikely until after the British general election, which is scheduled for May 1.

With regard to Japan, we have been holding high-level exploratory discussions aimed at reaching a framework for resuming formal negotiations. Since the Japanese indicated they were not prepared to accept implementation of a fully liberal regime at this time, we have proposed that such a regime be phased in over a reasonable period. We are continuing to discuss this concept with Japanese officials.

Question. DOT policy has been that the grant of antitrust immunity to international airline alliances is contingent upon an "open skies" agreement removing all restrictions on air travel between the United States and the other country. During negotiations with other countries, DOT has used antitrust immunity as a carrot to obtain open skies accords. Does the current administration agree with this approach?

Answer. The possibility of securing antitrust immunity for an alliance in which their national carrier participated has provided an incentive for some U.S. bilateral partners to agree to "open-skies" aviation regimes. However, U.S. negotiators have made clear to foreign partners that an open-skies agreement is a necessary, but not sufficient, condition for the grant of antitrust immunity. Each of the immunized alliances was also subjected to in-depth competitive reviews by both DOT and the Department of Justice. These reviews were conducted separately from the open-skies negotiations, and as appropriate, conditions were imposed on the alliance to address

competitive concerns. This approach has yielded valuable new opportunities for U.S. aviation interests and will be continued.

Question. Two of the world's largest airlines—American Airlines and British Airways—propose forming a strategic alliance and have applied to DOT for immunity from U.S. antitrust laws. If the United States and the United Kingdom are eventually able to reach an agreement that opens up aviation trade between the two countries and antitrust immunity is granted to the American/British Airways alliance, do you believe that other actions will be necessary to ensure adequate competition? If so, what would those actions be?

Answer. It is the Department's position that an "open-skies" agreement with the British is a prerequisite for any decision to grant antitrust immunity to the proposed American Airlines/British Airways alliance. Moreover, the agreement must be accompanied by a competitively effective presence of U.S. carriers at London's Heathrow Airport. Since the application for immunity is pending before the Department, it would not be appropriate to comment on how any competitive concerns might be handled. However, an in-depth review of the competitive implications of the request for antitrust immunity will be undertaken by both the Transportation and Justice Departments. That review will be conducted separately from U.S. and British Government discussions on open skies.

COAST GUARD MISSION

Question. The Coast Guard makes a great deal of the multi-mission environment in which they operate. In light of budgeting constraints and the increasing mission demands placed on the Coast Guard in drug interdiction, search and rescue and maritime safety, is a reassessment of the Coast Guard's workload necessary?

Answer. No, a reassessment of mission workload is not necessary. The Coast Guard uses the same people and platforms to efficiently and effectively perform a broad spectrum of missions. The Coast Guard's authority to move assets between and among missions to meet emerging and differing national priorities while retaining a core maritime competence in marine safety, environmental protection, law enforcement and national defense, makes the Coast Guard a model for efficient government operations.

Question. Is the Coast Guard overextended? Should consideration be given to transferring some missions to the private sector?

Answer. No, the Coast Guard is not overextended. The fiscal year 1998 budget request marks the effective completion of the Coast Guard's Streamlining Plan, which is on track and has reduced the size of the Coast Guard without reducing services to the public. Over the past four years, the Coast Guard has saved the American taxpayer nearly $400 million and has reduced approximately 3,500 personnel to the smallest work force size since 1967. These savings have been achieved by restructuring, divesting inefficient assets, eliminating expensive infrastructure, and leveraging technology to reduce administrative overhead.

There are currently no plans to change or transfer any of the Coast Guard's primary mission areas of maritime safety, maritime law enforcement, marine environmental protection, and national defense.

Over the years, Coast Guard missions have evolved and grown through the addition of new missions that leverage the Coast Guard's core attributes and multi-mission capabilities against new national challenges. The Coast Guard is uniquely positioned as a military service with law enforcement authority as the lead agency for maritime drug and migrant interdiction and as the lead agency for environmental protection to advance the President's priorities in the marine environment, in national security, and environmental protection. The Coast Guard is constantly reviewing its goals, soliciting feedback from customers, and evaluating the cost of services as part of a quality approach to government services.

STREAMLINING THE COAST GUARD

Question. For the past several years, the Coast Guard has engaged in a streamlining effort—how is the plan proceeding?

Answer. The Coast Guard's National Streamlining Plan is proceeding on schedule and accomplishing projected savings. Coast Guard Headquarters was reorganized and downsized by 600 people. Coast Guard District staffs have dropped from 12 to nine, with field command and control staffing reduced by 374 personnel. Twelve Integrated Support Commands have been established, allowing operational commanders to focus on external customer delivery and facilitating field Command and Control reductions. Four activities prototypes have been established to test various concepts for greater integration of operations management. Most Coast Guard functions have moved off Governors Island, New York. Remaining work is on schedule to

place Governors Island's 170 acres and 225 structures in caretaker status by September 30, 1997. Training is being enhanced by the newly established Performance Technology Center in Yorktown, VA, and work continues for co-locating and integrating a Coast Guard-wide Leadership Development Center at the Coast Guard Academy by the summer of 1998. The Coast Guard has established a number of Centers of Excellence, including restructuring the Coast Guard's R&D Program and merging the Civilian Personnel servicing "hub" with the Coast Guard Personnel Command. Finally, work is progressing with the realignment of specialized command, control and communication (C3); IRM; and electronics engineering support functions, which are being relocated from the Electronics Engineering Center, Wildwood, NJ, by the summer of 1997.

STREAMLINING SAVINGS UPDATE

Question. In anticipation of possible budget cuts beginning in fiscal year 1997, the Coast Guard developed a national streamlining plan. The plan focused on reducing headquarters organizational units and personnel, consolidating field command and control and support, enhancing training, closing Governors Island, and creating centers of excellence. When the plan is fully implemented in fiscal year 2000, the Coast Guard expects to save between $63 million and $80 million a year and reduce its staffing by 1,300 positions. Conversely, the Coast Guard anticipates spending approximately $97 million in one-time relocation and construction costs to implement the streamlining plan's specific actions. For fiscal year 1997, the Coast Guard estimated eliminating 838 positions (555 military and 283 civilians) and saving $36.5 million in personnel and operations and maintenance costs as a result of streamlining. Is the estimate of $36.5 million savings in fiscal year 1997, due to actions taken as a result of the national streamlining plan, still accurate?

Answer. The Coast Guard's fiscal year 1997 budget request identified the elimination of 838 positions (555 military and 283 civilians) and $30.7 million in savings associated with the National Plan for Streamlining the Coast Guard (reference pages 2, 5 and 86 of the Coast Guard's fiscal year 1997 budget request). There was also $701,000 in annualized savings in the fiscal year 1997 budget request from the consolidation of civilian personnel offices portion of the national streamlining plan (reference page 92 of the Coast Guard's fiscal year 1997 budget request).

In addition, to reduce the negative impact on direct operational services of the $7 million congressional "general reduction" to the Operating Expenses account in fiscal year 1997, the Coast Guard accelerated portions of the national streamlining plan, resulting in the elimination of an additional 93 military positions, which provided an additional savings of $3.8 million that was originally planned to be taken in fiscal year 1998. Therefore, total on-budget national streamlining plan actions in fiscal year 1997 will result in the elimination of 931 positions (648 military and 283 civilian), saving $35.1 million.

An additional $7.9 million in national streamlining plan savings was reinvested to fund civilian pay raises, thereby bringing the gross savings to $43.0 million in fiscal year 1997 (reference page 29 of the Coast Guard's fiscal year 1997 budget request).

The following table summarizes the fiscal year 1997 streamlining savings:

Initiative	FTP	Savings
Annualized fiscal year 1996 actions	.....	$700,000
Initial fiscal year 1997 actions	838	30,700,000
Accelerated fiscal year 1998 actions	93	3,800,000
Total net savings	[1] 931	35,100,000

[1] The Coast Guard expects to achieve a gross reduction of 931 positions in the Operating Expenses (OE) account as a result of its national streamlining plan and an additional 218 positions from other actions in fiscal year 1997. At the same time, the Coast Guard was required to add some positions in order to staff new and ongoing projects (e.g., new buoy tenders, Aids to Navigation Team Red River, Differential Global Positioning System Maintenance Engineering Facility, Afloat Tactical System project, and Communications Station Honolulu Transmitter project (reference pages 88–89 and 128–133 of the Coast Guard's fiscal year 1997 budget request).

Overall, for fiscal year 1997 (in all accounts), the Coast Guard expects to achieve a net reduction of 910 positions.

COAST GUARD STREAMLINING REDUCTIONS

Question. Does the Coast Guard expect to achieve a reduction of 838 positions by the end of fiscal year 1997.

Answer. The Coast Guard expects to achieve a reduction of 931 positions (FTP) in the Operating Expenses (OE) account by the end of fiscal year 1997 as a result of the National Plan for Streamlining the United States Coast Guard. The Coast Guard expects to achieve total net reductions of 910 positions (FTP) for all accounts by the end of fiscal year 1997, indicated as follows:

Fiscal year	Total work force	Cumulative work force
1994	−886	−886
1995	−953	−1,839
1996	−818	−2,657
1997	−910	−3,567
1998	+90	−3,477

Notes:
I. 1993 fiscal year baseline: 45,836 FTP
II. The fiscal year 1998 budget request eliminates 508 FTP from streamlining and other actions, and adds back 598 FTP (net increase of 90 FTP) for drug/LE initiatives, quality of life initiatives, crews for the new buoy tenders scheduled to be commissioned in fiscal year 1998, and pre-commissioning personnel for the polar icebreaker HEALY.

COAST GUARD STREAMLINING—FISCAL YEAR 1998 COSTS

Question. Of the $97 million in one-time relocation and construction costs, how much has already been expended and how much is expected to be expended in fiscal year 1998?

Answer. When the Coast Guard published its National Plan for Streamlining the United States Coast Guard in 1995, it estimated these costs at $107 million for fiscal years 1995 through 1999. On page 947 of last year's hearing record, the Coast Guard updated its estimate of fiscal year 1995 through 1997 streamlining exit costs at $103–$110 million. (Actual costs of $108 million for these fiscal years are in line with this updated estimate.) Over the next two years, the remaining streamlining costs are forecasted at $24-$26 million in fiscal year 1998 and $1.0–$1.5 million for fiscal year 1999. This would place the total cost of streamlining at $133 million to $136 million. Significant fiscal year 1998 and 1999 streamlining estimates include caretaker costs for Governors Island; pier improvements required due to unavailability of leased piers in Bayonne, NJ; remaining environmental remediation; and berthing improvements required at the Leadership Development Center.

STREAMLINING SAVINGS ESTIMATES

Question. Given the savings estimates of $63 to $80 million were made in 1996, can you provide a more precise savings estimate now?

Answer. The current estimate for net savings associated with the National Plan for Streamlining the Coast Guard is approximately $76.8 million, as follows:

Fiscal year	Net savings	Reinvestments	Gross savings
1996	$2,100,000	.....	$2,100,000
1997	35,100,000	[1] $7,900,000	43,000,000
1998	30,200,000	[2] 2,100,000	32,300,000
1999	9,400,000	([3])	9,400,000
Total	76,800,000	10,000,000	86,800,000

[1] In fiscal year 1997, $7.9 million in national streamlining plan savings was reinvested to fund civilian pay raises, bringing the fiscal year 1997 savings total to $43.0 million.
[2] In fiscal year 1998, $2.1 million in national streamlining plan savings was reinvested to provide funding for the Leadership Development Center (LDC) in New London, CT, bringing the gross fiscal year 1998 savings total to $32.3 million.
[3] Fiscal year 1999 reflects annualized savings from closing Governors Island.

COAST GUARD STREAMLINING SAVINGS

Question. What have been the total savings to date? (Please display by fiscal year, with a total). Are there savings anticipated because of the effort in fiscal year 1998? What are the next steps in this effort?

Answer. From fiscal year 1994 up to and including the fiscal year 1998 budget request, the Coast Guard will have saved $378.1 million (current year dollars) in gross Operating Expenses (OE) reductions. This includes approximately $67 million

in savings to date from the National Plan for Streamlining the Coast Guard, and all other Coast Guard-wide streamlining initiatives and programmatic reductions. The total savings are not adjusted for inflation. Assuming a 2.5-percent yearly inflation rate, the Coast Guard will have saved $397.5 million in constant fiscal year 1998 dollars.

In fiscal year 1998, the Coast Guard estimates that it will save approximately $55 million in OE reductions (including approximately $30 million from the national streamlining plan). The fiscal year 1998 budget request marks the effective completion of the Coast Guard's streamlining plan, which is on track and has reduced the size of the Coast Guard by approximately 3,477 people without reducing services to the American public.

[Dollars in millions]

Fiscal year	Coast Guard operating expenses reductions	Additional operating expenses enacted reductions	Total gross annual operating expenses savings	Operating expenses savings adjusted for inflation [1]	Cumulative operating expenses savings [2]
1994	($42.4)	($18.0)	($60.4)	($66.7)	($66.7)
1995	(42.6)	(23.0)	(65.6)	(70.6)	(137.3)
1996	(81.6)	(41.2)	(122.8)	(129.0)	(266.3)
1997	(54.3)	(20.2)	(74.5)	(76.4)	(342.7)
1998 Request	(54.8)		(54.8)	(54.8)	(397.5)
Total	(275.7)	(102.4)	(378.1)	(397.5)	(1,210.5)

[1] Inflation-Adjusted Savings = Constant fiscal year 1998 dollars at 2.5-percent inflation rate.
[2] Savings reflects gross Operating Expenses (OE) only.

COAST GUARD REAL ASSETS

Question. Please provide a comprehensive listing of all Coast Guard real assets in the Federal inventory.

Answer. The following table identifies the Coast Guard's assets by Civil Engineering Unit (CEU) and Headquarters (HQ) Unit. Information provided for the CEUs includes all buildings and structures within their area of responsibility.

Unit	Number of buildings and structures	Building square feet (thousands)	Value of buildings and structures ($000)
CEU Cleveland	9,547	4,133	1,302,452
CEU Miami	3,001	4,289	1,275,857
CEU Providence	7,952	7,757	1,308,048
CEU Oakland	4,911	5,301	1,047,677
CEU Honolulu	763	989	271,619
CEU Juneau	2,146	3,087	1,683,615
HQ Units:			
Academy	117	1,315	208,643
TISCOM	62	128	18,998
Petaluma	235	767	169,271
Yorktown	285	717	109,306
Mobile	104	367	75,658
Cape May	227	1,009	166,637
Yard	287	985	173,278
Totals	29,637	30,844	7,811,059

In the above table, "value" means "plant replacement value" and is derived by a formula. A listing of Coast Guard-owned properties to show acreage will be compiled; several months will be required to complete the task.

SALE OF COAST GUARD REAL ASSETS

Question. The Coast Guard fiscal year 1998 request for its Acquisition, Construction, and Improvements (AC&I) account is $379 million. Of this amount, $9 million

is expected to result from the sale of selected surplus Coast Guard properties. In developing its budget, the Coast Guard presented the Office of Management and Budget (OMB) with a list of 29 properties that the Coast Guard expected to be surplus in fiscal years 1997, 1998, and 1999. The Coast Guard estimated the fair market value of these properties to be $19.9 million. Which specific properties were selected by OMB to be sold to obtain the $9 million to supplement the AC&I account and how were these properties selected?

Answer. No specific properties were selected. The $9 million level was established based on forecasts of potential total proceeds, and in recognition that some properties on the list would eventually be unavailable for sale. No-cost transfers (from the federally-mandated screening process) could reduce the proceeds or delay disposal.

COAST GUARD REAL ASSETS IMPACT OF NOT SELLING $9 MILLION OF REAL PROPERTY

Question. If the Coast Guard falls short of selling the properties for $9 million, will the Coast Guard reduce its AC&I spending accordingly or does the Coast Guard expect to spend $379 million for AC&I whether or not any of the properties are sold?

Answer. The Coast Guard plans on new Budget Authority in fiscal year 1998 of $379,000,000 for Acquisition, Construction, and Improvements (AC&I) whether or not any of the properties are sold.

ENVIRONMENTAL CLEANUP OF EXCESS PROPERTIES

Question. What environmental cleanup issues has the Coast Guard identified with the $9 million of properties, selected by OMB, and what are the expected costs of cleaning up those properties?

Answer. The Coast Guard has evaluated the condition of the properties forecasted for sale in 1997. Two of these sites have been identified as having environmental cleanup issues. Both are included in the Coast Guard's fiscal year 1998 Environmental Compliance and Restoration (EC&R) budget under "Various Projects under $500,000 each" (page 338). Cleanup has been essentially completed at LORAN Station Dana, Indiana. Closure of the site has been requested from the State of Indiana. Because some additional sampling may be required for this site, $50,000 has been requested in fiscal year 1998.

At Electronics Shop Major Telephones (ESMT) Portsmouth, NH, $65,000 has been requested to initiate site investigation. Any follow-on environmental cleanups at this facility depend upon the results of the site investigation and will likely be budgeted in a future fiscal year.

As of the date of this response, the Coast Guard has not identified any environmental cleanup issues for the remaining 1997 properties, and is evaluating potential environmental issues in the properties proposed for sale in 1998 and 1999.

COAST GUARD REAL ASSETS—GSA REPORTING

Question. When does the Coast Guard intend to report the $9 million in properties to be sold to the General Services Administration to begin the Federal screening process? What is the process for disposing of selected surplus property from current status?

Answer. The following table provides the dates when the Coast Guard expects to report the 1997 properties to GSA. Report dates for properties to be sold in 1998 and 1999 are being determined.

1997 property	*Est. date to GSA*
Eatons Neck—GRP Long Isl Sound, NY	Jan 98
Sta Rockaway, NY	Oct 97
Housing—Loran Sta Dana, IN	Feb 97
ESMT Manasquan, NJ	Sept 97
Marblehead Lt—Ant Huron, OH	July 96
Comsta Boston—Marshfield, MA	Aug 97
ESMT Portsmouth, NH	Sept 97
Housing—Ft Crockett, TX	Sept 96
Highland Light, MA	Dec 96
Nahant Rec Facility, MA	Aug 97
Housing—Hyde Park, MA	Dec 97
Moorings/Land/Bldg—Petersburg, AK	June 97
Radar Site—Port Orford, OR	Nov 96

Once the Coast Guard declares the property excess to its needs, a formal Report of Excess is provided to the GSA, which acts as the Coast Guard's disposal agent. GSA completes the federally mandated screening of potential government and homeless reuse. If not reused for these purposes, GSA markets and sells the property for the Coast Guard. The sale proceeds, less GSA costs, are returned to the Coast Guard.

COAST GUARD REAL ASSET REPORTING

Question. Why is the Coast Guard not reporting all 29 properties to the General Services Administration as surplus?

Answer. It is anticipated 25 of the 29 properties will be reported to the General Services Administration as excess. The remaining four properties are:

—Housing—Wakefield, MA
—Housing—Randolph, MA
—Housing—Nahant, MA
—Air Station—Brooklyn, NY

After further study, the Coast Guard will retain the three family housing areas to ensure adequate housing for Coast Guard personnel in the Boston area.

Air Station Brooklyn will be transferred to the Federal Aviation Administration.

COAST GUARD REAL ASSETS—OPERATING COSTS

Question. What is the estimated operations and maintenance costs for fiscal years 1998 and 1999 for all 29 of the identified surplus properties?

Answer. The fiscal year 1998 operations and maintenance cost for the 29 properties is approximately $2,675,000. It is highly probable that 13 of the 29 properties will be disposed of prior to fiscal year 1999. Of the remaining 16 properties, 3 family housing areas will be removed from the surplus list and retained by the Coast Guard. The fiscal year 1999 operations and maintenance cost for the remaining 13 properties is approximately $1,414,000.

COAST GUARD REAL ASSETS—GOVERNORS ISLAND

Question. What is the current status of removing Governors Island from the Coast Guard's real property inventory?

Answer. The Coast Guard is required to maintain Governors Island on its real property inventory until the property is transferred or sold. Title 41 CFR 101–47.402–1 states that the holding agency (Department of Transportation) shall retain custody and accountability for excess and surplus real property pending its transfer to another Federal agency or its disposal.

The Coast Guard and the General Services Administration (GSA) have held quarterly partnership meetings to identify the various tasks that need to be accomplished in an effort to dispose of the island. This is not a typical disposal, due to the size, historicity, and value of the facility. The Coast Guard plans to submit the Report of Excess to GSA in July 1997.

STREAMLINING—MAINTENANCE AND LOGISTICS COMMANDS (MLCS)

Question. To develop its national streamlining plan the Coast Guard established two teams to assess potential organizational consolidations and training infrastructure modifications. The teams' objectives were to identify recurring budget savings of $100 million without reducing services to the public. They identified a variety of options to streamline the agency. The Coast Guard selected several of the options which made up the Coast Guard's national streamlining plan. Some of the options not included in the national streamlining plan were to replace the Coast Guard's current field structure with a regional structure, eliminate the two Maintenance and Logistics Commands (centralized support commands), eliminate one of the two Maintenance and Logistics Commands by merging them together, and close one of the three training centers (Training Center, Petaluma, CA) to consolidate training. Why did the Coast Guard decide not to eliminate the two Maintenance and Logistics Commands or merge them together?

Answer. Currently, two Maintenance and Logistics Commands (MLCs) directly support the two Area commands. The following factors contributed to maintaining the status quo as the most desired organization:

(1) The Coast Guard relies heavily on its MLCs for technical and administrative support of operational assets and crews. The disruption or inefficiencies of consolidation could affect front-line readiness and degrade vital services the Coast Guard provides the public. Consolidating both MLCs into one would have created a situation

where the single MLC would have an over-extended span of control and reduced customer focus, thereby adversely impacting operational capabilities.

(2) Maintaining two MLCs retains the existing strengths of the current organization. Each has adapted to the unique operational and support needs of differing geographic regions, and each MLC has a strong customer focus and familiarity.

(3) The Area/MLC combination links the delivery of support with operations in each Area. The current alignment maintains unity of command within each Area.

(4) Maintaining the two-MLC concept provides needed stability in order to establish the new Integrated Support Commands (ISCs) for decentralized support delivery. These new ISCs were designed to more efficiently and effectively provide front-line customer support while relying on their respective MLCs for resource, technical, and administrative support. In this sense, the MLCs and their ISCs are an integrated support system. Eliminating one MLC would necessitate additional staff for the new ISCs and pose a digression away from one major Streamlining objective—refining operations and support activities as core expertise.

STREAMLINING SAVINGS—MLCS

Question. What was the estimated savings of (a) eliminating the two Maintenance and Logistics Commands and (b) merging them together?

Answer. The savings that would have resulted from consolidating the two Maintenance and Logistics Commands (MLCs) was estimated at 83 full-time equivalents (FTE). Eliminating both MLCs and distributing their functions to other organizations was less efficient and had savings estimated at 64 FTE. In neither case was the level of estimated savings sufficient to offset the anticipated negative impacts discussed in the response to the previous question.

STREAMLINING—TRAINING CENTERS

Question. Why did the Coast Guard decide not to close one of the training centers?

Answer. There were three main reasons why the Coast Guard decided not to close one of its training centers. First, the up-front costs to close a training center and consolidate functions at other training centers were substantial. The least-cost option would have required an additional $20 million to $26 million in Acquisition, Construction, and Improvements (AC&I) funding to accommodate construction requirements. Second, the significant changes caused by streamlining initiatives required additional training, not less. Stability in the training system was imperative to successful streamlining. Finally, the Coast Guard had concern for the economic impact of closure on the local community in Petaluma, CA, particularly in view of other significant downsizing actions.

EXCESS CAPACITY AT USCG TRAINING CENTERS

Question. How much excess capacity (classrooms, sleeping areas) currently exists at each of the three training centers?

Answer. The following table shows utilization rates of the three major training centers in fiscal year 1996 as measured by berthing. In general, student capacity and classroom utilization are driven by total beds available for use. It is generally recognized with the training community that 80-percent loading is an achievable target capacity for training centers. This achievable level is based on the need for maintenance, male/female berthing limitations, and berthing constraints based on rank and/or seniority.

Training Center	*Average Percentage Utilization Rate fiscal year 1996*
Yorktown	88
Petaluma	58
Cape May [1]	64

[1] Recruit Training Center Cape May training load is seasonal. Cape May reaches a utilization rate in excess of 80 percent during the summer, with substantially lower loading during the winter when recruiting is more difficult. Total student load at Cape May ranged from a low of 2,355 in fiscal year 1994 to an estimated 4,395 in fiscal year 1997. Cape May is the Coast Guard's only recruit training center, and as such, the Coast Guard needs the capacity to handle fluctuating recruiting demands from year to year.

COAST GUARD CAPITAL NEEDS—FUNDING STRATEGIES

Question. Over the next ten years, the Coast Guard faces the prospect of having to replace billions of dollars of assets, particularly vessels. What are some potential strategies for the agency and the Department to obtain the necessary funds?

Answer. The Coast Guard has faced similar recapitalization challenges in previous years. In each case, the Coast Guard provided sufficient justification to the administration and Congress to support replacing assets that were essential to maintaining the Coast Guard's national security capabilities. For example, in fiscal year 1990, when the Coast Guard needed to replace its polar icebreaking capability and its aging patrol boats, Congress provided $847 million in Acquisition, Construction, and Improvements (AC&I) funding. Likewise, in fiscal years 1986 and 1987, when the Coast Guard needed to replace the HH–3F helicopter with the HH–60, and renovate the 210-foot Medium Endurance Cutters, Congress provided AC&I funding at a level of about $550 million each year.

In the next few years, the Coast Guard will face similar recapitalization needs as its long-range cutters and aircraft approach the end of their service lives. The Coast Guard expects to be able to provide sufficient justification to support funding an appropriate level of assets that serve such vital national interests as stopping the flow of illegal drugs (FRONTIER SHIELD); interdicting alien migrants (Haiti/Cuba); responding to national security crises (Cuban shootdown of U. S. civilian aircraft, TWA 800 disaster) and natural disasters (west coast flood relief); and responding to oil spills (Rhode Island).

The Coast Guard intends to work with the administration and Congress to support funding for outyear investment in Coast Guard assets that serve the national interest.

COAST GUARD CAPITAL NEEDS—SAVINGS FROM AC&I PROJECTS

Question. The Coast Guard's current fiscal situation may be worsened by its need to replace an aging fleet of ships, planes and other assets. The Coast Guard estimates that the total capital requirements for current and new acquisition projects will increase to as much as $1.2 billion in fiscal year 2002. This is more than three times the $370 million the Coast Guard received for capital projects in fiscal year 1997 and greatly exceeds OMB targets for the agency's capital needs through 2002. According to Coast Guard managers, their cost estimates represent the upper limit of future capital needs because they assume a one-for-one replacement ratio for ships and planes. Recent acquisitions of such equipment as buoy tenders have shown that the replacement ratio could be substantially less than this, however, due to improvements in technological capability. In addition, alternatives to replacement, such as renovating old assets, using DOD resources, or leasing rather than buying may also be considered.

Can you give any estimates of the yearly savings through 2002 which should be achieved because of your AC&I projects? If additional AC&I funding were identified, are savings possible by virtue of increasing the size of the buy quantity?

Answer. One of the cornerstones of the Coast Guard's streamlining philosophy has been to "invest in Acquisition, Construction, and Improvements (AC&I) to achieve outyear Operating Expenses (OE) savings." That investment strategy is paying more than $5 million in dividends in the fiscal year 1998 budget. The following recapitalization projects will save recurring dollars in the OE base through fiscal year 2002 and beyond. All projects with the exception of the Seagoing Buoy Tender will be completed and fully operational by 2002.

A. The combined Seagoing/Coastal Buoy Tender projects will reduce fleet size from 37 to 30 ships and save 500 billets, which will be part of a total anticipated recurring savings of approximately $12 million when all of the old ships are replaced with new ones. Project completion was scheduled for approximately 2002, but has been extended to 2004–2006 due to funding constraints.

B. The HC–130 Engine Conversion, which replaces old, fuel inefficient engines that are prone to explosion with safer, more efficient ones, will save $1.3 million per year when all engines are converted.

C. The Aviation Logistics Management Information System, which integrates two separate aviation inventory management systems, is projected to save 20 billets and yield additional yet-to-be determined OE savings.

D. The Fleet Logistics System, which will provide an information system for managing vessel logistics, is projected to save more than $9 million per year in efficiencies and reduced inventory costs when the system is fully operational.

E. The Finance Center computer consolidation, which replaced outdated information systems with one fully integrated system, is projected to save 10 billets and approximately $150 thousand per year when it becomes operational.

F. Communications System 2000, which converts 8 fully-staffed communications stations to 2 master stations, 5 remote sites, and 1 stand-alone station, will save approximately $2 million per year when completed.

G. The Personnel Management Information System/Joint Military Pay System will save approximately 190 billets and yield yet-to-be determined OE savings associated with integrating and centralizing the previously separate pay and personnel systems.

H. Local Notice to Mariners automation, which will integrate 4 non-compatible aids to navigation information systems into a single integrated system, is projected to save approximately 12 billets and yield yet-to-be determined OE savings due to efficiencies gained by the elimination of redundant processes and reduction of printing and mailing costs.

If additional AC&I funding was identified, the Coast Guard could accelerate some of these projects, such as the Seagoing Buoy Tender and HC–130 Engine Conversion, to achieve savings sooner. For example, the Coast Guard intends to award a full production contract for 11 Seagoing Buoy Tenders in fiscal year 1998. The initial strategy was to buy four ships the first year, four ships the second year, and three ships the third year. Due to funding constraints, funds were appropriated for just one ship in fiscal year 1997, and the fiscal year 1998 budget also includes funds for just one ship. If the Coast Guard had funds to buy these ships faster, OE savings could be achieved sooner by completing the project earlier. Cost avoidance would chiefly result from minimizing inflation costs and reducing the time project management staff and project resident office personnel remain on the AC&I payroll.

Accelerating other capital investments not mentioned above could also achieve acquisition savings by increasing the size of the option awards. For instance, both the Coastal Patrol Boat and Motor Lifeboat acquisitions have minimum and maximum option quantities offered under the contract. Were the Coast Guard to purchase the maximum versus the minimum quantities, these acquisitions could both have been completed one to two years earlier, saving costs associated with inflation and personnel required to manage the acquisitions.

COAST GUARD CAPITAL NEEDS—ACTUAL AC&I NEEDS IN 2002

Question. Since your current AC&I estimated needs assume a one-for-one replacement and, therefore, are probably significantly inflated, can you estimate what your actual needs might be in 2002?

Answer. The Coast Guard's Capital Investment Plan currently presumes one-for-one replacement of existing assets for which mission analysis has not yet been completed. Without a completed mission analysis, this is the most logical data upon which to base projected replacement requirements. However, the Coast Guard makes every effort to reduce acquisition costs through use of mission analysis and by leveraging technology. The combined Seagoing/Coastal Buoy Tender acquisitions are good examples where the use of mission analysis/technology resulted in less than one-for-one replacement. In these projects, 37 old ships will be replaced with just 30 new ones—a reduction in combined fleet size of almost 20 percent. However, each acquisition has independent characteristics, so the 20-percent reduction cannot be unilaterally applied to every ship construction project. For example, the Motor Lifeboat project will probably result in close to one-for-one replacement of the 100 old boats.

The Coast Guard's greatest capital investment need in fiscal year 2002 will be the replacement of its long-range cutters and aircraft. Mission analysis for this project is complete, and fiscal year 1998 funds are being requested for the concept exploration phase of the major systems acquisition to replace these vital national assets. Using fiscal year 1998 funds, the Coast Guard intends to award contracts to industry and government entities to propose integrated systems to replace its long-range assets. These integrated systems are intended to minimize quantity and maximize effectiveness and efficiency of the Coast Guard's long-range assets. Once the Coast Guard has a better idea of what and how many assets will be required, acquisition strategies can be developed to minimize budgetary impact.

Until concept exploration for the long-range cutters and aircraft replacement is completed, scheduled for the end of fiscal year 1999, the Coast Guard is unable to give a more accurate estimate of actual AC&I needs in fiscal year 2002.

COAST GUARD CAPITAL NEEDS—IMPACT OF FLATLINED AC&I APPROPRIATION

Question. What would the impact be both on costs and on program performance if AC&I appropriations were flatlined at $370 million through 2002?

Answer. Capital investments would be deferred, as would resultant Operating Expenses (OE) savings. For example, the Seagoing Buoy Tender project would have to be extended, which would further delay the projected recurring savings of approximately $14 million. This would also require the extended operation of buoy tenders already 50 years old. Likewise, the Coast Guard expects to replace its long-range

cutters and aircraft with fewer units, which should result in lower operating costs. Potential operating savings from this project would also have to be deferred. Concurrently, as Coast Guard assets age, particularly the long-range cutters and aircraft, they cost more to maintain. For example, the cost of each subsequent overhaul of one of the Coast Guard's oldest HC–130 aircraft increases by $500 thousand. As new acquisitions are pushed further into the future, their cost will be higher as a result of inflation.

The Coast Guard is an operating agency that relies upon capable, dependable assets to carry out its services to the Nation and the public. As these assets age, their availability becomes less certain as the ratio of maintenance to operations increases. For example, the seagoing buoy tenders are already over 50 years old and the 82-foot patrol boats are over 30 years old.

The most significant adverse impact would be on the future mission performance of our long-range cutters and aircraft. Some of the HC–130 aircraft are 20 years old, and the 378-foot high-endurance cutters are approaching 30 years of age and have already been overhauled once.

COAST GUARD CAPITAL NEEDS—AC&I

Question. What actions would you have to take to continue operations if the AC&I appropriation was not increased through 2002?

Answer. The impact of a flatlined AC&I appropriation would fall heaviest on the largest recapitalization projects—the Seagoing Buoy Tender replacement, the Coastal Patrol Boat, the National Distress System (short-range distress communications network), and the Deepwater Capability replacement (long-range cutters and aircraft). If these projects were stopped or slowed down through fiscal year 2002, the Coast Guard would have to perform its missions for 5 or more years using aging assets at or near the end of their service lives.

COAST GUARD CAPITAL NEEDS—ACQUISITION/RESEARCH & DEVELOPMENT PROGRAM LINK

Question. How is your AC&I technology improvement project linked to your research, development, testing, and evaluation projects?

Answer. The Coast Guard's Research, Development, Test, and Evaluation (RDT&E) program addresses potential for AC&I technology improvements in two ways.

The first involves project work that is specifically directed at acquisition-related technology improvement issues. In fiscal year 1998, RDT&E's Future Technology Assessment efforts include support for the Coastal Zone Mission Analysis now being conducted to examine all missions performed by the Coast Guard in the coastal zone (shoreline to 50 miles offshore). Once current needs in the coastal zone are assessed and future requirements projected, gaps in capability will be identified. RDT&E can then provide the technical expertise to conduct an emerging technology assessment to determine ways to close the gaps through leveraging technology, uncovering information, techniques, and alternatives to support appropriate AC&I technology improvement efforts. If the AC&I technology improvement is a major systems acquisition, the RDT&E program may also be called upon to assist with the concept exploration phase.

The second leverages the core expertise and technical knowledge of the RDT&E personnel to develop new or alternative methodologies for performing mission analysis using state-of-the-art operations research, modeling, statistical analysis, and other related techniques. This was used in the pre-acquisition phase of the Coast Guard's new project to replace its long-range cutters and aircraft. In fiscal year 1998, RDT&E personnel will participate as members of acquisition matrix teams engaged in the concept exploration phase of the long-range cutters and aircraft replacement project. The RDT&E program will also review requirements provided by acquisition matrix teams and perform focused technology assessments.

COAST GUARD VTS TECHNICAL SOLUTIONS STUDY

Question. Last year, Congress cut the funding for the Vessel Traffic Service (VTS) program and provided $1 million for a study of available technical solutions which minimize complexity and cost in any follow-on VTS programs. The President's Budget requests $5.5 million for PAWSS (Ports and Waterways Safety System), a follow-on to VTS 2000, to transition from "requirements development to acquiring an initial off-the-shelf system component." How is the VTS technical solutions study proceeding, and when might we expect the delivery of a report?

Answer. In response to last year's direction from Congress, the Coast Guard has held national and local-level public forums to gather user input on VTS require-

ments, and hosted technical symposiums to gather information on off-the-shelf technical solutions. Through this deliberate process, the Coast Guard and the users are partnering to define the problem, develop requirements to address the problem, and devise a mutually-agreed-upon solution. This evaluation process is the core of the Ports and Waterways Safety System project.

In March 1997, members of the national maritime community provided input on defining the elements that should constitute a basic VTS. A users forum in New Orleans is expected to deliver their local requirements by May 1, 1997.

The Coast Guard held a Technical Symposium in February 1997, where vendors presented information on commercially available equipment for use in VTS. The Coast Guard, with the assistance of the Radio Technical Commission for the Maritime Services, will hold a second symposium April 28–29, 1997, to allow vendors to demonstrate their equipment.

Using input from these various sources, the Coast Guard will be able to propose a viable new production program to Congress by October 1, 1997. The input gathered will also be used to define user requirements and develop a technical specification for acquiring an initial system in fiscal year 1998.

FUNDING NEEDED FOR VTS PROGRAM

Question. The Department does not envision the need for the $5.5 million requested in the President's Budget until the study of available technical solutions is completed, does it?

Answer. The development of VTS requirements is being accomplished in consultation with the maritime community. The $5.5 million to initiate installation of VTSs based on the new requirements will be required once consensus is reached on a VTS solution that realistically addresses the users' needs and meets the Coast Guard's duty to ensure waterway safety. Based on the positive progress of consultations at national and local levels, the Coast Guard fully expects consensus will be reached in the near future, and that funds will be required in fiscal year 1998.

DOMESTIC ICEBREAKING FEES

Question. The Coast Guard provides domestic icebreaking services in the Great Lakes region and on the East Coast, primarily to assist commercial shippers and fisherman. These services (particularly in the Great Lakes) are considered by the shipping community to be essential services that the Coast Guard provides as part of its mandate to facilitate commerce. A recent study by the Volpe National Transportation System Center calculated a cost-benefit analysis for icebreaking in the Great Lakes region. In this analysis, the cost of providing icebreaking services in the Great Lakes region was estimated at $8.8 million per year while the benefit to shippers was estimated at $78.1 million per year. In light of this significant benefit received by shippers, and the budgetary constraints facing the Coast Guard, some investigation of alternative icebreaking options may be warranted. The Coast Guard is currently studying alternatives to providing icebreaking services in the Great Lakes region. What conclusions have been reached in the Coast Guard's analysis?

Answer. While the Volpe study did not provide any formal recommendations, the economic data presented indicated Coast Guard services were a vital part of the shipping infrastructure in the Great Lakes. Consequently, the Coast Guard is currently preparing the Mission Analysis Report (MAR) and Mission Needs Statements (MNS) for Great Lakes Icebreaking Capability. This is the process that formally defines the performance goals, standards, and requirements for the Great Lakes icebreaking mission. It is being prepared with stakeholder involvement and is expected to be completed in early summer 1997. This document does not address "solutions," but does serve as the critical precursor to the formal, multi-year acquisition process that would then explore solutions and costs for Great Lakes Icebreaking Capability in accordance with the formal A–109 Acquisition Process. In the interim, the Coast Guard has committed to the continued operation of the CGC *MACKINAW*.

DOMESTIC ICEBREAKING FEES CRITERIA

Question. The President's fiscal year 1998 budget indicates that legislation will be proposed to assess and collect fees from commercial maritime carriers to recover the Coast Guard's cost of providing domestic icebreaking services beginning in fiscal year 1999. What would be the most reasonable and equitable means of charging user fees? What are the difficulties associated with identifying users and collecting fees?

Answer. The administration is preparing proposed legislation to allow the assessment of user fees beginning in fiscal year 1999 for icebreaking services provided by the Coast Guard. The proposed fee would be assessed to commercial activities con-

sistent with other applications of user fees, including those for highway, air, and rail. The fee would not apply to recreational vessels, fishing vessels, fish processing vessels, fish tender vessels, passenger vessels, ferries, public vessels, or vessels not traveling to or from a U.S. port.

The proposed user fee legislation establishes a fee level based on tonnage of cargo that is transported during the ice season through areas requiring Coast Guard icebreaking services. Since the proposed legislation specifies those vessels subject to the user fee, as well as the collection mechanism, no significant difficulties are expected in identifying commercial users or collecting the user fees.

DOMESTIC ICEBREAKING FEE ALTERNATIVES

Question. What alternatives exist to the Coast Guard providing icebreaking services in the Great Lakes?

Answer. One of the important highlights of the Volpe study was the clarification that the commercial shipping infrastructure is geared to a 42-week shipping season. Of those 42 weeks, at least 8 weeks require icebreaking services provided by the Coast Guard.

For industry and commercial shipping, the least-cost alternative to icebreaking services is increased stockpiling, at a cost of $78.1 million. The second-least-cost alternative was shipment by rail, with a projected industry cost of $192.02 million. The Volpe study states that the cost of shipping by rail would be $22.26 per ton, as compared with current shipping at $6.00 per ton. The third alternative evaluated in the study was pre-positioning inventory at a Great Lakes location below the Soo Locks (i.e. Escanaba, MI). The Volpe study states that the pre-positioning alternative is only feasible when the locks are closed and the pre-positioning location is still accessible. However, absent the availability of local icebreaking capability, pre-positioning is not feasible. Therefore, this is not a viable alternative to icebreaking.

Until such time as industry and commercial shipping can modify their infrastructure to operate in a shortened season, approximately 34 weeks each year, Coast Guard icebreaking services will be required. Industry and commercial shipping do not have the icebreaking resources to facilitate the movement of ships during the ice season.

AUTHORIZATION FOR INSPECTIONS OF FOREIGN-FLAGGED CRUISE SHIPS

Question. The multi-billion-dollar passenger cruise market in the United States is almost exclusively served by foreign-flagged vessels. There are only two oceangoing U.S.-flagged cruise vessels of any substantial size. Access to the U.S. market is therefore a very lucrative privilege, which is made even more so because the vessels and their crews pay virtually no corporate or personal U.S. income tax. To ensure adequate shoreside facilities, the safety of U.S. passengers and property, and enforcement of immigration laws, the Federal Government has enacted laws and dispersed responsibility for their administration and enforcement throughout several departments and agencies of the Federal Government. This raises the question of whether the foreign-flagged cruise vessels, which are enjoying substantial profits as a result of their monopoly, are paying their fair share of the cost to the Federal Government of ensuring that this extremely valuable U.S. market operates safely and in accordance with our laws and regulations. In 1996, the Congress authorized the Coast Guard to begin collecting fees for its inspection services. What is the status of the rulemaking to implement the authorization to charge user fees for the Coast Guard's inspection of foreign-flagged cruise ships?

Answer. The rule to set fees for foreign-flagged cruise ships is still in the conceptual stage. The Coast Guard is currently developing a work plan that establishes the critical activities and milestones necessary for this regulatory initiative. The Coast Guard currently expects to publish a rule by the end of 1998.

FEES FROM FOREIGN-FLAGGED CRUISE SHIPS

Question. How much does the Coast Guard estimate it will collect annually for its inspections? How will the collections be made?

Answer. The Coast Guard expects to collect approximately $616,000 per year from the inspection of foreign-flagged cruise ships. This figure is based on an annual charge per vessel of $4,896 and a foreign-flag passenger vessel fleet of 126 ships. Fees would be collected in the same manner as foreign tank vessel examination fees, with fees due prior to performance of the initial or annual examination. These fees would cover initial and annual examinations, and subsequent reexaminations. An average of four examinations/reexaminations are conducted per year for most vessels.

OTHER POTENTIAL FEES FROM FOREIGN-FLAGGED CRUISE SHIPS

Question. Are there any other services provided by the Coast Guard to foreign-flagged cruise ships for which fees could also be charged?

Answer. There are no other services provided by the Coast Guard to foreign-flagged cruise ships for which user fees could reasonably be charged. The Coast Guard was tasked with establishing user fees for services provided under Subtitle II—Vessels and Seamen—of Title 46 U.S.C. by the Omnibus Budget Reconciliation Act of 1990. The Coast Guard Authorization Act of 1996 amended Title 46 U.S.C. and removed prohibitions to the collection of user fees for foreign-flagged passenger vessel inspections.

DRUG TONNAGE REDUCTION UNDER FISCAL YEAR 1998 BUDGET REQUEST

Question. According to statistics from the Office of National Drug Control Policy, over 400 metric tons of cocaine enter the U.S. every year—which far exceeds the estimated annual consumption of cocaine in the country. The Coast Guard is requesting an additional $34.3 million to support its anti-drug activities in fiscal year 1998. The Coast Guard's fiscal year Budget in Brief states that the additional funds will be used to increase coastal border protection by increasing the number of hours that cutters patrol maritime areas, increase aviation capability by reactivating two HU–25Cs, improve training, increase intelligence, and international treaty support. How large a reduction in the entry of illegal drugs into the U.S. do you anticipate will result from the additional money requested by the Coast Guard? What is the basis for your response?

Answer. The Coast Guard estimates that once all additional assets requested in the fiscal year 1998 budget are on line, approximately 52 fewer tons of cocaine—an estimated 472 million "hits" of cocaine—will be prevented from entering the U.S. each year. (See pages 454 and 455 of the Coast Guard's fiscal year 1998 budget request.) The 1998 budget request, however, is the first step in a multi-year strategy to increase maritime interdiction effectiveness in support of the National Drug Control Strategy. The basis for the Coast Guard's analysis is a 1989 Rockwell International Study, "Measuring Deterrence." Deterrence is a major component of the Coast Guard's counterdrug effectiveness.

The Rockwell study indicated that when potential smugglers perceive a 40-percent probability of interdiction, 80 percent will be deterred from smuggling. The Coast Guard has used this study as a starting point for its law enforcement program standards. A deterrence model, based on these standards, has been used to project effectiveness and formulate optimal resource requirements included in the 1998 budget request.

Based on a recommendation from The Interdiction Committee, the Office of National Drug Control Policy is forming a working group to further investigate the effects of deterrence, and how it can be used in planning.

RESULTS OF COAST GUARD ANTI-DRUG EFFORTS

Question. What have been the results of the Coast Guard's anti-drug efforts? How much has been deterred? How much has been interdicted?

Answer. The Coast Guard's transit zone drug interdiction program is the first and, in many cases, only line of defense against drug traffic that threatens to enter the United States through maritime routes. The security of our maritime borders is dependent on the depth and effectiveness of interdiction resources operating in the transit and arrival zones.

Based on the analysis cited in the preceding question, the Coast Guard estimates law enforcement resources deterred an estimated 24 percent of drug traffickers from using maritime routes in the transit zone last year. This deterrence rate translates to an average of more than 100 tons of cocaine deterred from maritime routes each year. Deterrence rates are higher in areas where law enforcement activity is concentrated, such as the Eastern Caribbean.

In addition, over the past 3 years, Coast Guard law enforcement resources have seized an annual average of nearly 36 tons of cocaine and marijuana. Moreover, interdiction forces have disrupted, through jettisons and aborts, a substantial number of smuggling operations that further reduce success rates for drug traffickers attempting to export their illicit cargo to American shores.

In fiscal year 1997, the Coast Guard initiated Operation FRONTIER SHIELD in the Eastern Caribbean to demonstrate that smuggling routes could effectively be denied to traffickers by increasing resources committed to drug law enforcement. In the first quarter alone, nearly 14,000 pounds of cocaine were seized and an estimated 17,000 pounds of cocaine were lost at sea or thrown overboard by traffickers

to avoid arrest. The resources included in the fiscal year 1998 request will allow the Coast Guard to institutionalize capabilities and strategies that have proven effective in FRONTIER SHIELD. As a result, the Coast Guard expects increased seizure totals, disruptions, and deterrence if funded at the fiscal year 1998 budget request level.

ADDITIONAL PERSONNEL AND HOURS WITH FISCAL YEAR 1998 FUNDS

Question. Where will the additional personnel and assets be deployed? How many additional staff will the additional funds pay for? How many additional hours will assets be deployed with the additional funds?

Answer. Coast Guard's fiscal year 1998 budget request contains an additional 251 full-time positions (FTP) for increased drug law enforcement. Of these, 30 FTP are required to operate two additional HU–25 Falcon aircraft that will deploy to sites throughout the transit zone. One HU–25C will be based out of Air Station Miami, and the home base for the second will be determined by the Atlantic Area Commander.

An additional 105 FTP are necessary to increase C–130 Hercules aircraft flight hours by 1,600, increase H–65 Dolphin aircraft flight hours by 1,240, and improve H–60J helicopter deployment capability. These personnel will be assigned to Coast Guard air stations that support drug law enforcement.

For cutter initiatives, 24 FTP are intended to establish Maintenance Augmentation Teams (MATs) in Miami and Puerto Rico to support 110-foot patrol boats operating in these areas.

Of the 43 FTP intended for increased intelligence collection, analysis and dissemination, 20 of the intelligence related positions will be Coast Guard Investigative Service special agents assigned to existing Organized Crime Drug Enforcement Task Forces (OCDETFs), High Intensity Drug Trafficking Areas (HIDTAs), and regional Coast Guard Investigative Service offices. Two positions would support Defense human source intelligence programs in locations outside the United States. The remaining 21 FTP would augment intelligence collection analysis and dissemination at existing intelligence facilities, such as the Intelligence Coordination Center (ICC), El Paso Intelligence Center (EPIC), and Coast Guard area intelligence staffs.

International Training will be increased by 28 FTP to provide expanded deployable training teams. Coast Guard training teams provide experience and expertise to developing nations' maritime forces to make them better partners in counter-drug efforts. Three more FTP will be added to the Coast Guard Reserve Training Center to train additional boarding officers. The Reserve Training Center and International Training Detachment are located in Yorktown, VA.

Finally, 18 FTP are requested for law enforcement command and control positions. They will be assigned to Coast Guard units involved in drug law enforcement to permit more focused strategic and tactical planning, inter-agency coordination, and execution of the law enforcement mission. (Please see pages 200–215 of the Coast Guard's fiscal year 1998 budget request for a detailed description of the drug/law enforcement initiatives.)

COAST GUARD PERSONNEL POSITIONS

Question. To what extent could Coast Guard personnel working in off-line positions be reassigned to on-line positions so that cutters and aircraft could be deployed a greater number of hours?

Answer. Every position in the Coast Guard contributes to the overall mission effectiveness of the organization. As such, the Coast Guard makes no distinction between "on-line" and "off-line" personnel. The ability of Coast Guard cutters to deploy for the period of time they do, and for aircraft to fly their program hours, is contingent on the maintenance, logistics, and administrative support provided by other entities within the organization.

Coast Guard streamlining, which began in fiscal year 1994, has eliminated nearly 3,500 positions, and in the process has made the Coast Guard a much leaner and efficient organization. The Coast Guard has a diminished ability to surge in support of one mission without soon affecting the performance of another mission.

Increasing the deployment of existing resources is not simply a matter of buying more fuel and spare parts for cutters and aircraft. Resources are acquired, staffed, and funded to provide a specific level of service over a finite projected service life. Operating assets above their programmed standard will require more personnel and increased operations and maintenance funding.

OIL SPILL PREVENTION AND RESPONSE—POST-OPA 90

Question. The *Exxon Valdez* oil spill in 1989 highlighted many of this Nation's weaknesses in the areas of preventing and cleaning up oil spills. Over the recent years, the Coast Guard, along with several other agencies, has been implementing the Oil Pollution Act of 1990 (OPA 90), which the Congress passed to improve oil spill prevention and clean-up. The recent oil spill in Japan, however, demonstrates once again the risk associated with the maritime transportation of oil. It underscores the continuing need to be vigilant to prevent such occurrences and the difficulty in cleaning up an oil spill. How confident are you that measures developed as a result of OPA 90 will avoid another large oil spill, like the *Exxon Valdez* spill, or mitigate the environmental loss if one does occur?

Answer. The Coast Guard is confident that a significant discharge of oil is less likely to occur now that the spill prevention mandates of the Oil Pollution Act of 1990 (OPA 90) have been implemented. This is based on a marked drop in the number of medium (less than 10,000 gallons) and major (greater than 100,000 gallons) oil spills per billion tons of oil shipped since the passage of OPA 90.

The Coast Guard's two-pronged approach to pollution mitigation is prevention and, if an incident does occur, a successful response. The multi-disciplined approach to prevention includes double hulls for tank vessels, operational measures to reduce spills, more vessel traffic systems, improvements for vessel navigation, and international and domestic efforts to improve crew competency and qualifications. These measures, coupled with the Coast Guard's partnerships with industry organizations such as the American Waterways Operators, the U.S. Chamber of Shipping, and the American Petroleum Institute, have increased industry awareness and greatly reduced the chances of a significant discharge into the marine environment.

If a significant discharge were to occur, the Coast Guard is highly confident that the OPA 90-driven response and preparedness initiatives would ensure a rapid response and a successful mitigation of the spill's environment impacts. Successful responses in Rhode Island, Texas, and Maine are recent examples of more effective, post-OPA 90 mitigations and cleanups.

The Coast Guard's and the industry's preparedness levels were greatly increased with the development of vessel and facility response plans in conjunction with Area Contingency Plans (ACPs). Vessel and facility operators are required to "think through" their response activities in advance and contract with response resources. The ACPs, created by local Area Committees, form the shoreside complement to the vessel plans and provide the mechanism for the necessary advance coordination and cooperation among the response community, governments, agencies, industry, and environmental groups.

In addition to increased preparedness, OPA 90 had a positive effect on Coast Guard and industry response capabilities and resources. An additional Coast Guard Strike Team, pre-positioned oil spill equipment, Vessel of Opportunity Skimming Systems (VOSS), and an OPA 90-fostered growth in the commercial response industry have increased the overall effectiveness of the public and private sectors to bring appropriate resources to the scene.

Additionally, the Coast Guard has attained a more robust response posture with the adoption of the Incident Command System (ICS) as its response management structure. ICS has been embraced by other Federal agencies, State agencies and the industry. The Incident Command System fosters cooperation, communication, and concurrence on important issues. ICS has proven to be the most flexible and responsive way to incorporate the multiple governments, agencies, and private entities, to mobilize and respond effectively to an incident.

ADDITIONAL ACTIONS TO PREVENT OR MITIGATE LARGE OIL SPILLS

Question. What other actions, beyond the safeguards imposed by OPA 90, would significantly reduce the risk of a large oil spill occurring or mitigate its effects if one does occur?

Answer. Beyond OPA 90, the Coast Guard is pursuing the application of advanced technology, increased cooperation with international maritime interests, and drawing focus on the elimination of human error to improve mission performance and increase the overall effectiveness of the prevention and oil spill response programs.

The Coast Guard is actively researching and testing digital-based charting and computer-assisted waterways management systems. The Coast Guard has implemented a computer-based decision-support tool, complete with oil weathering models, dispersant application planners, and a geographic information system. The Coast Guard has acquired hand-held infrared cameras to complement its aircraft-deployed Side-Looking Airborne Radar and Forward-Looking Infrared systems. A command and control information management system is under development that

will greatly increase the ability to receive, display, analyze, and manage the large amount of information and data that accompanies a major oil spill response. Oil spill trajectory models and real-time imagery of oil spills are part of this system that will begin to be tested in 1998.

The Coast Guard is also working at the international level to improve the preparedness of the world's tanker fleet to respond to oil spills. The Coast Guard has been administering and enforcing the various conventions of the International Convention for the Prevention of Pollution from Ships (MARPOL) and participating in the International Maritime Organization-sponsored convention on Oil Pollution Preparedness, Response, and Cooperation (OPRC).

The Coast Guard's Prevention Through People (PTP) program recognizes that the majority of casualties are attributed to human factors, and focuses on improvements based on the human element, the vessel, and the operating environment viewed together as a system. PTP is fundamentally a voluntary program and relies heavily on the idea that increased safety leads to greater competitiveness through fewer accidents.

AVERAGE COST TO ROTATE COAST GUARD MILITARY PERSONNEL

Question. The Coast Guard's current policy is to periodically rotate all but a few of its military personnel, both officer and enlisted. Officer rotations vary from 18 months to 5 years, enlisted rotations vary from 2 to 4 years. Costs to rotate staff in fiscal year 1996 were about $73 million; other costs are also incurred for moving time and preparing over 19,000 orders annually. Some studies have questioned whether the Coast Guard should revise rotation practices by increasing the length of time between rotations and/or eliminating rotations for certain types of activities. Besides saving money, such a change could counter a problem pointed out in several studies—the undesirable effects of frequent rotation on the continuity of operations and ability to build expertise and knowledge in certain areas.

Coast Guard officials believe that current rotation policies are adequate and that they have developed optimum tour lengths that should not be revised. They said changing current practices would have several undesirable effects, including adverse effects on multi-mission capabilities, a smaller and less qualified leadership pool, and less qualified people because potential recruits may be concerned about being in undesirable locations for extended periods. The Coast Guard currently plans no formal study of this issue. What is the total average annual cost to rotate Coast Guard military personnel, including moving expenses, idle time, paperwork, and training?

Answer. From fiscal year 1992 to fiscal year 1996, the Coast Guard transferred on average 17,400 Coast Guard personnel each year at an average cost of approximately $63 million. The nature of the volunteer military workforce means that enlisted personnel contract for periods of four years. Currently, only 40 percent of the personnel completing their first 4-year enlistment re-enlist for another term. Officers enter the Service with either a three-year initial contract or a five-year commitment, depending on their accession source. Likewise, even those officers and enlisted who remain beyond their initial career decision point reach their elected or mandatory retirement date. These factors alone create a need to recruit, train, and transfer new members on a continuous basis. Thus, over 50 percent of all transfers were not discretionary, since they were required by new accessions, retirements, separations, or training. An additional 25 percent of the transfers were required due to the arduous nature/remote location of the assignment, or due to special needs of individuals.

There is no idle time in moving. Members are authorized four days to physically pack out and unpack their household goods incident to a change of station. Members are also allowed one day travel time per 350 miles of transfer distance, which averages 2 days per transfer. Members may also take accrued annual leave in conjunction with their transfers.

Paperwork associated with a relocation involves the member, his or her command, the servicing Personnel Reporting Unit, and the Coast Guard Personnel Command. Each of these commands has multiple functions and responsibilities beyond processing transfers. The time required to process transfer paperwork varies based on the type of assignment, location (in or out of the United States), and number of dependents being moved. Considering the non-discretionary nature of most moves and the complexities of establishing a standard "paperwork" cost of a transfer, no specific cost study has been conducted to determine the "paperwork cost per move." Similarly, training costs vary widely depending on the type of assignment, specialties involved, and previous experience of the individual. No specific study has been conducted to determine the "training cost per move."

IN-DEPTH STUDY OF LENGTHENING ROTATIONS

Question. Why does the Coast Guard believe that an in-depth study of the merits of lengthening rotations is not needed, given their high costs?

Answer. In July 1995, the Coast Guard dedicated 10 months to studying this issue. The end result was the change of two rotation policies: tour lengths for members assigned in Puerto Rico, Alaska, and Hawaii were adjusted; and alternate, shorter unaccompanied tour lengths were eliminated in these same locations. These changes established closer parity with tour lengths within the continental United States.

Additionally, in August 1993, the Coast Guard developed a geographic stability policy for enlisted personnel and began emphasizing voluntary extension of tour lengths and no-cost and low-cost transfers for both officers and enlisted members. In March 1995, the Coast Guard increased E–4 and E–5 tour lengths to 4 years for ashore billets. Finally, during the Coast Guard's streamlining initiatives, site location that would facilitate geographic stability to reduce transfer cost was a prominent factor in unit consolidations and relocations.

The Coast Guard believes these proactive changes, employed since 1993, have responded to the high cost of rotations.

ADVERSE EFFECTS OF LENGTHENING ROTATION PERIODS

Question. Would lengthening rotation periods adversely affect the Coast Guard's performance of its missions? Please explain.

Answer. Yes, lengthening rotation periods would adversely affect the Coast Guard's performance of its missions. Fifty percent of all rotations are non-discretionary due to accessions, separations, retirements, and training. An additional 25 percent are required due to the remote location of assignment, arduous nature of the assignment, or by special needs of the member or family. Remote location tours are those where the military member is unaccompanied by his or her family, such as assignment to one of three isolated Loran stations in Alaska. Arduous tours of duty are those tours in which a member is subject to frequent immediate recall or subjected to harsh physical demands, such as assignment to one of the Coast Guard's 86 patrol boats. Lastly, special needs are created when a military member or immediate family member experiences a change in physical or emotional status, requiring a move. For example, a special need arises when a spouse dies, creating a need to relocate a family closer to child care providers. Beyond these extraordinary assignments, more than 4,800 members are assigned to major cutters that deploy away from home port more than 185 days per year. Rotational assignments provide these and other members an opportunity for greater family stability.

The Coast Guard prides itself in the Service's ability to quickly and efficiently shift from one mission to the next without a degradation in mission effectiveness. This multi-mission capability is gained through the wide experience base of Coast Guard personnel, and is only achieved through the regular rotation of personnel to different assignments.

The Coast Guard needs a pool of highly qualified operational leaders. These leaders—men and women, officers and enlisted—acquire the requisite experience for command through exposure to different and increasing operational challenges, achieved by rotational assignments. An increase in tour lengths will cause a commensurate reduction in breadth of experience represented in senior leadership positions. Similarly, lengthening tours will lead to a decreased number of training opportunities for junior members in afloat, aviation, and marine science careers.

Finally, from a Service retention perspective, longer tour lengths decrease the attractiveness of the Service to new accessions. Most of the Coast Guard's new recruits are attracted by the opportunity to serve their country, while still gaining life experiences through operational assignments in different geographic areas, which will make them valuable contributors to the Coast Guard and the Nation. By lengthening tours, training and experience opportunities will decrease, and over-exposure to demanding assignments may further reduce their propensity to remain in the Coast Guard.

In summation, significant changes to the Coast Guard's rotation policies would significantly alter multi-mission effectiveness, leadership development, and retention in the Service.

COAST GUARD ROTATION POLICIES COMPARED TO OTHER MILITARY SERVICES

Question. How do the Coast Guard's rotation polices compare to the policies of the other military services?

Answer. The Coast Guard's rotation policy is similar to the policies of the Department of Defense (DOD). In general, the Coast Guard's rotation policy for assignments within the U.S. is four years in shore billets and three years in sea billets, except patrol boats, which are two-year assignments. In assignments outside of the continental U.S., tours range from 12 months to 36 months, based on the arduous nature of the assignment and remoteness of the location.

DOD's rotation policy within the continental U.S. is three years in both shore and sea billets; however, certain enlisted ratings extend sea billets to five years. Naval commands, such as combatants based in foreign countries and fleet marine forces deployed overseas, limit their tours of duty to two years. DOD shore duty outside of the continental U.S. ranges from 12 months to 36 months, based on the arduous nature of specific locations and whether the assignment is accompanied or unaccompanied.

All of the services make allowances from the general rotation policy to meet their service needs. For example, command cadre positions among all of the services tend to be shorter for assignments ashore and afloat. Additionally, first tour assignments afloat and some assignments ashore are 18 months to two years. Specific extensions and reductions are made to member tours based on special needs of the member or the service.

FREQUENCY OF ROTATION

Question. If the Coast Guard were to revise rotation policies, what programs or missions would lend themselves to less frequent rotations? For which programs or missions is it critical to maintain the current rotation policies and why?

Answer. As outlined in the previous questions, the Coast Guard has recently reviewed and changed tour lengths where appropriate. Also, for the reasons cited, there will be adverse consequences for making further changes.

AMTRAK REGIONAL SUPPORT

Question. Amtrak's financial health is precarious, despite the fact that its current appropriation level is $843 million (including $175 million just for the Northeast Corridor Improvement Program). Amtrak is the Nation's only intercity passenger rail system. It is burdened with many expenses over which it has little control, such as railroad retirement payments for employees of freight railroads as well as its own employees, six-year labor payments for workers who are laid off, limited opportunities for contracting out, heavy debt service payments, and limited opportunities to generate new revenues. Reform legislation that might have helped to reduce overhead and increase revenues failed to pass during the last Congress. Amtrak's future is troubled unless legislation is passed to either reduce its need for Federal subsidy, or to provide it with a dedicated revenue source, or to privatize it.

The annual appropriations process has been keeping Amtrak on "life support" while Congress and the administration have failed to agree on long-term solutions to make Amtrak viable, or to privatize it. "Life support" has not helped Amtrak to get stronger, but it has reduced the funds available for other programs.

What are your views on tapping into regional support for Amtrak service, whereby States and/or private investors could pay for Amtrak service?

Answer. The administration believes it is important that States, localities and the private sector provide support for those Amtrak services that are important to them. This is already happening. Since fiscal year 1995, the amount of State operating assistance supporting Amtrak operations has almost doubled. In addition, several States are purchasing equipment for enhanced Amtrak service. The Department's National Economic Crossroads Transportation Efficiency Act (NEXTEA) proposal includes increased flexibility in many programs to permit States to use Federal funds to provide capital support to Amtrak.

INNOVATIVE FINANCING FOR AMTRAK

Question. Could innovative financing be available to help Amtrak, such as State Infrastructure Banks or other Federal credit programs contained in your ISTEA legislation?

Answer. Amtrak capital support would be eligible for State Infrastructure Banks and the Infrastructure Credit Enhancement program in the Department's NEXTEA proposal. Amtrak has many capital needs that do not generate a positive return. It would be counterproductive to finance these investments. However, last year Amtrak ordered over $1 billion in equipment with the bulk of the financing provided through vendors and other non-Federal sources.

LONG-TERM PLAN FOR AMTRAK

Question. How do you plan to work with congressional authorizing and appropriations committees this year on resolving Amtrak's long-term problems? If no legislative changes are made, how long do you think Amtrak can continue "business as usual?"

Answer. The Department is committed to working with Congress, Amtrak management and labor, State governments, and other interested parties in the coming year to develop an affordable long-range plan that eliminates Amtrak's dependence on Federal operating subsidies. Amtrak is an important component of the Nation's intermodal passenger transportation system. We believe that Amtrak must have a reliable source of capital investment in the form of contract authority as requested in NEXTEA to address the previous lack of investment if we are to preserve the national system and permit Amtrak to achieve its potential.

REGIONAL SUPPORT FOR AMTRAK

Question. Is it more appropriate that States who directly benefit from regional Amtrak programs—such as the Northeast Corridor Improvement Program—share this burden with the Federal Government?

Answer. As stated earlier, the administration believes it is important that States, localities and the private sector support those Amtrak services that are important to them. New Jersey Transit and Amtrak recently signed an agreement to jointly fund infrastructure improvements to the Northeast Corridor over the next five years that benefit both commuter and intercity service. Washington State is funding track improvements in the Pacific Northwest Corridor. California, North Carolina, Pennsylvania, and Washington have all acquired equipment for Amtrak's use on intrastate service. The administration's NEXTEA proposal would offer States greater opportunities to support Amtrak service important to them.

HIGHWAY SAFETY ISSUES

Question. Currently, more than 40,000 people die every year on our Nation's streets and highways, and nearly 3.5 million people are injured in police-reported accidents. NHTSA Administrator Martinez has testified that all the "easy gains" in reducing fatalities and accidents and in making vehicles and highways safer have already been made. Incremental improvements will be much more difficult. What further gains do you believe that the Department can make, and what specific plans does the Department have to make these gains? Does DOT need new legislative authority or changes to existing legislative authority?

Answer. The Department's overriding goal in NEXTEA is safety, to reduce deaths and injuries from transportation-related crashes. We have fashioned a reauthorization proposal that cuts across intermodal lines to help achieve a safe and secure U.S. transportation system.

The NEXTEA proposals must contend with the fact that motor vehicle deaths and injuries have increased in recent years, and the traffic fatality rate has ceased its decline and instead stagnated. A number of risk factors associated with crashes are evident: the number of older and younger drivers is increasing; use of alcohol and other drugs is rising, and the results are showing up in our crash statistics; safety belt and child seat use is still low; and speeding and other forms of aggressive driving have increased. We also face higher speed limits and attempts to weaken or repeal motorcycle helmet laws.

NEXTEA needs to provide a balanced program for NHTSA that addresses both vehicle and behavioral safety problems, while providing a foundation for research, crash data and injury prevention activities. An active technical assistance program is required to support NHTSA's safety partners in the States and communities, health and business arenas, educators, and safety advocates.

A critical need in NEXTEA is to make an adequate Federal investment in highway safety, consistent with the top priority assigned to safety by the administration. Coupled with this is the Department's proposal to fund all of NHTSA's program from the Highway Trust Fund. NHTSA and FHWA incorporated flexibility for States to be able to shift their infrastructure safety funds to address other critical highway safety issues.

The goal includes continuing a performance-based Section 402 grant program that supports basic highway safety programs in States and communities. The Department's proposal also recommends continuing the use of incentive grant programs, because incentive grants have proven effective in motivating States to enact stronger laws and begin better programs. The proposal recommends incentives for new laws, programs and safety results in the areas of impaired driving deterrence and

increased restraint usage, plus new initiatives to strengthen State data systems, and programmatic and legal actions to deter drugged driving.

Since behavioral programs alone cannot prevent vehicle crashes and crash injury, the reauthorization needs to provide an adequate resource base for NHTSA's initiatives in both vehicle safety and consumer safety information.

A final goal for NEXTEA is to create a foundation of critical research for pursuing future safety initiatives in vehicle crash worthiness and crash avoidance, as well as behavioral areas. Priorities include linking vehicle safety engineering and medical research to learn more about preventing crash injury. High among the Department's priorities are promoting improved air bag systems, collision avoidance under the Intelligent Transportation System program, and intermodal human factors work using research tools such as advanced motion-based simulation. Continuation of national crash and injury data systems is also crucial.

FOREIGN EXPERIENCE

Question. What are we learning from other countries in reducing accidents and keeping unsafe drivers off the road? What fundamental societal differences, if any, exist between these other countries and the United States that would make it difficult to adopt their successful countermeasures?

Answer. Through bilateral contacts with researchers in most of the developed world, as well as active participation in international organizations such as the International Council on Alcohol, Drugs and Traffic Safety (ICADATS), the Department can stay abreast of advances in other countries. We have international cooperative agreements in place between NHTSA and Germany and the Netherlands to conduct research of common interest. In Germany, a series of studies was completed on the effects of various drugs on driving performance, and in Holland, a study of the effects of marijuana smoking on driving is underway.

Individual liberties differ greatly between the U.S. and other countries. For example, some members of the European Union, Australia and New Zealand more freely allow the use of automated enforcement devices, and view civil liberties in a different light. In much of Europe, automated speed enforcement is widespread. In Australia, besides the use of photo radar, no probable cause is required to compel a motorist to take a roadside breath test. Many Australian states use random breath testing, red light cameras, photo radar for speeders, and strict enforcement of belt use and helmet use laws to reduce crashes and injuries. These measures have worked and are acceptable to Australians, but it is doubtful that many of them would pass legal, constitutional, or political muster in the U.S.

In most countries other than the U.S., national laws, rather than a myriad of differing State and local laws, prevail. Most European countries have national police forces or, as in Canada and Australia, few state or provincial police agencies, instead of over 13,000 agencies as in the U.S. Their systems can often provide greater national uniformity in legislation, enforcement and adjudication.

The fundamental societal difference in occupant protection is reflected in the difficulty the United States has experienced in increasing its national seat belt use rate. Other industrial countries have not been hampered by the passage of secondary enforcement laws and the need to pass belt law legislation in a large number of States. An additional consequence of that process is that each one of these laws differs in some way from the other State laws. All this tends to erode the importance of compliance among the general public. Other countries have been able to raise use rates into the 80-percent range over a much shorter duration, which has then enabled them to implement stronger countermeasures involving the assessment of driver points for violators, and to implement enforcement programs that increase the risk of apprehension for belt law violations than is able to be accomplished in this country. The result is that these countries have use rates in the high 80 to low 90 percentages, while the U.S. has been stagnant at national use rates of 66 to 68 percent for the past 4 years.

SAFETY BELT GOAL

Question. The Nation has not reached DOT's goal that 75 percent of all vehicle occupants will use safety belts by 1997. Was this goal too optimistic? How do other countries achieve 90–95 percent usage rates? What do you propose to do to increase safety belt usage?

Answer. The usage rate goal of 75 percent by 1997 was not too optimistic; however, the level set was intentionally challenging because of the importance of increasing usage as quickly as possible in order to prevent unnecessary losses.

There are a number of differences between the United States and other countries that have achieved seat belt usage rates of up to 90–95 percent. These countries

have primary enforcement laws and have had these laws in effect for longer periods of time. Many of the countries with the highest use rates assess driver's license demerit points, in addition to fines, for seat belt law infractions. Some countries have nationwide traffic laws and police agencies. Others (such as Canada or Australia) have different laws in different states or provinces but have many fewer such jurisdictions than the U.S., with our 50 States and over 13,000 law enforcement agencies. This uniformity eliminates confusion about seat belt use laws, penalties, and enforcement.

The Department proposes a number of actions to increase safety belt use in the United States. As directed by President Clinton, NHTSA, in cooperation with the Congress, the States, automobile manufacturers, the insurance industry and other concerned Americans, has developed a plan to increase the use of safety belts and child safety seats nationwide. NHTSA also provided the leadership to establish the Air Bag Safety Campaign (ABSC, created May 1996). The ABSC is a public-private partnership including car and safety seat manufacturers, insurance companies, government agencies and health and safety advocates. The ABSC is building on three proven NHTSA program initiatives: intensive public education, occupant protection use law improvements, and high-visibility safety belt and child safety seat law enforcement programs. The ABSC is coordinating activities with NHTSA to maximize national impact.

NHTSA has made extensive efforts to provide States technical support to upgrade their safety belt and CSS laws. NHTSA has worked closely with many partners (such as the National Automobile Dealers Association, National Safe Kids Coalition, Juvenile Products Manufacturers Association, National Sheriffs' Association, International Association of Chiefs of Police, AAA, IIHS, and National Safety Council) and has distributed educational materials (such as video news releases, satellite media tours, consumer advisories, press releases, fact sheets and basic tips sheets, articles for magazines, press interviews, news articles, print ads, educational videos, and posters) to educate the public. NHTSA is assisting about 18 States to conduct Special Traffic Enforcement Programs (STEPS) thru June 1998 to increase belt use. In addition, the Department's NEXTEA reauthorization proposal includes an occupant protection incentive grant program to encourage States to increase their belt use and improve their occupant protection laws.

AIR BAG RISKS

Question. There has been a lot of publicity recently about the risks of air bags, particularly for young children and small women. What concrete steps is the Department taking to reduce these risks, while providing protection for front seat occupants of a car?

Answer. The Department has amended the occupant crash protection standard to ensure that vehicle manufacturers can quickly depower all air bags so that they inflate less aggressively. This action is temporary, and will provide manufacturers with the option of producing air bags that are less aggressive to small children and small-stature adults, such as small female drivers who are at risk with current air bag designs. These amendments became effective March 19, 1997 (62 FR 12960), and manufacturers are expected to take immediate advantage of the new provisions by planning to install depowered air bags in the very near future. These provisions apply to any new vehicle manufactured between March 19, 1997, and September 1, 2001.

CONSENSUS ON "SMART" AIR BAGS

Question. NHTSA has said there is a consensus that the "smart" air bag is the best means for preventing air bag deaths. How was this consensus determined?

Answer. Automobile manufacturers submitted comments in response to a "Request for Comments" on aggressive air bag deployments in November 1995 and a Notice of Proposed Rulemaking (NPRM) on options to reduce adverse effects of air bags in August 1996. Comments to both these actions indicated that manufacturers are actively developing improved air bag systems. The essence of an improved air bag is that the system will provide air bag deployment, when needed, and possibly at different inflation levels, and will not deploy when sensing a situation where the occupant will be at risk from the air bag deployment. The goal is to provide the optimum means for preventing air bag deaths while providing protection to a wide range of occupants in a variety of crash circumstances and severity.

TECHNOLOGIES FOR AIR BAGS

Question. What efforts has the Department made to encourage the development of different technologies to solve air bag risks to vehicle occupants?

Answer. The Department has encouraged advanced occupant crash protection through direct advisory briefings with the original equipment manufacturers (OEMs) and suppliers (e.g. the inflatable knee bolster, in production by Morton International; and the acoustic/infrared occupant position sensor produced by Aerojet General [now owned by Bosch]).

The Department has sponsored, through cooperative agreements, the following contracts: the assessment of pre-crash sensing technologies (Romeo Engineering International, Inc.); development and demonstration of occupant position discrimination through use of ultrasonic compartment mounted sensors and signal processor (Automotive Technologies International); and an economical radar system to detect and identify impending crash and closing speed immediately prior to impact, thereby providing information to allow earlier air bag deployment avoiding late deployments where the occupants are too close to the air bag prior to deployment (Hittite Microwave Corporation). In addition, a cooperative agreement with Automotive Safety Laboratory is producing major reductions in the aggressivity of deploying driver air bags through development of improved air bag inflators and redesigned air bags, thereby reducing the hazards to out-of-position small-stature drivers.

The Department also supports an ongoing test program at its Vehicle Research and Test Center to test and evaluate any new and innovative air bag systems that reduce the potential for injury and fatalities to occupants. To date, depowered and alternative inflator systems, along with a few improved systems using seat sensors, have been tested and evaluated.

"SMART" AIR BAG AVAILABILITY

Question. When will so-called "smart" air bags likely be available in cars?

Answer. Mercedes Benz has provided improved air bag inflation in their production cars sold in the U.S. for approximately seven years. Its air bag deploys at a lower crash severity if the occupant is unbelted (about 9 m.p.h. crash-induced velocity change) and only at high crash severity if the occupant is belted (about 16 to 18 m.p.h.).

According to U.S. car producers, improved air bags in their most simplistic and least sophisticated forms will be introduced in 1999, and improvements will be produced through the next 5 to 10 years, with each improvement reducing the air bag threat and increasing occupant crash protection. Initial systems will include such devices as dual level inflators, and then evolve eventually into more comprehensive systems that can discriminate by occupant size, weight and position, and by crash severity, deploying at differing levels, or not at all, accordingly.

SHORT-TERM SOLUTIONS FOR AIR BAGS

Question. Have other short-term available solutions been explored that do not require new technology (for example, variable sizes of air bags, variable deployment speeds, and variable reaction times that correlate to vehicle speed)? Is the technology for these three examples currently available? What is NHTSA's position on each of these options?

Answer. Variable sizes of air bags have not been developed outside Europe, where there is the "Euro-bag" or "face-bag" for belted drivers. This is a smaller bag that provides protection to the face and head in frontal crashes if the occupant is belted. If the occupant is unbelted, the Euro-bag may provide less chest or lower torso protection than that afforded by air bags sold in the U.S. NHTSA has found that nearly three-fourths of the lives already saved by air bags have been in crashes where the occupant has been unbelted. The Department, therefore, does not advocate only small air bags.

Variable deployment speeds are the subject of current efforts by the Inflatabelt Co. and dual-stage air bag inflators are available from several air bag suppliers (TRW, Morton International and Bendix/Allied Signal are three of the major suppliers in the industry). Dual-stage inflators allow a delay between activation of the first and second stages. The first stage permits an initial, slower emergence of the air bag, and based on the crash severity or occupant proximity, activation of the second inflator stage can provide rapid inflation and maximize gas into the air bag for best crash energy management for the occupant. Alternatively, the intentional nonactivation of the second stage can provide a compromised, less aggressive deployment that is less likely to cause serious injury to an occupant who is too close to the air bag.

Implementation of dual-stage inflators and other sophisticated approaches to achieve variable deployment speeds requires reliable crash severity sensors and/or occupant position sensors. Such sensors are currently in various stages of produc-

tion, prototyping, or fleet evaluation testing. The Department looks forward to and encourages manufacturer implementation of such advancements.

QUESTIONS SUBMITTED BY SENATOR DOMENICI

ROSWELL RADAR STATUS

Question. Secretary Slater, over the past six years we have been working with the FAA to establish a stand-alone Terminal Radar Approach Control Facility (TRACON) at the Roswell Industrial Air Center Airport in Roswell, New Mexico.

I appreciate the FAA's monthly updates to the Congressional Delegation. However, I am very disturbed to learn that completion of the radar may once again be delayed by the FAA. This is just one more delay in the long line of similar setbacks in completing this important project and frankly my concern stems from the FAA's inability to stay on schedule.

I am continually being forced to readdress this issue during each appropriation cycle and would very much like to pin down a timetable and have the FAA's commitment that the project will be completed on time.

What is the current status of the Roswell Radar project and why are we once again facing a delay?

Answer. The building construction phase of the project is approximately 86 percent complete. Duct work and fire alarm systems are currently being installed in the TRACON building. With the improvement in the weather, the remote transmitter/receiver (RTR) construction has resumed and is projected to be completed by September 1997. The ASR–9 radar system was commissioned on March 24, 1997, one month ahead of the projected schedule. The delay we are experiencing in commissioning the facility is due to software development and testing difficulties Lockheed Martin has encountered with the ARTS2E automation system. The ARTS2E Program Office met with Lockheed Martin on March 20, 1997, and determined the system can be delivered no later than February 1998.

Question. Would you provide a current schedule for completion of this project and include any further anticipated FAA delays?

Answer. We do not anticipate any further delays to the following current timetable:

Function	Projected	Revised	Actual
Roswell ASR–9 Commissioned	11/96	4/97	3/97
RTR Construction Completed	9/97	9/97	.....
ARTS IIE Delivery	11/97	2/98	.....
Roswell Controller Training	12/97	4/98	.....
Roswell Ready for Commissioning	1/98	5/98	.....

Question. Will you give me your commitment that completion of the Roswell Radar Project will be a top priority within the FAA and will be completed according to the schedule you produce?

Answer. The Roswell Radar Project is a top priority in the FAA. We regret these unavoidable delays and remain committed to completing the project as soon as possible.

AGING AIRCRAFT CENTER IN ALBUQUERQUE

Question. Secretary Slater, you are aware of my ongoing interest in work to ensure the safety of our commercial air fleets. Exciting new technology is being developed to improve the safety of our aging air fleet at the Aging Aircraft Non-destructive Evaluation Center (AANC) in Albuquerque, New Mexico. This center has been supported by the FAA for the past six years and we are seeing substantial progress in developing new techniques to assess the structural integrity of our commercial fleets.

In fact, in your budget request, the administration highlights this new technology by stating it will save over 700 man-hours per aircraft inspection over current methods. You also acknowledge this new technology will require less disassembly of the aircraft to conduct the inspection which reduces the chance for ancillary damage during the disassembly and reassembly process should no corrosion be detected. Recently, I requested the Department of Transportation to designate this center as one of excellence so new technology may be utilized more extensively.

What is the process followed for a center to be designated a Center of Excellence by the Department of Transportation?

Answer. Public Laws 101–604 and 101–508 authorize the FAA Administrator to select and establish Air Transportation Centers of Excellence (COE) at universities and mandate the following evaluation criteria:

—Needs of the region for improved air transportation.
—Demonstrated research and extended resources.
—Established air transportation programs.
—National or regional leadership capability in air transportation solutions and advancements.
—Ability to disseminate results through State or regional technology transfer and continuing education.
—Proposed projects.

The FAA received approval from the White House Reinvention Laboratory to award sole source contracts without further competition, in addition to matching grants—a first in government. This enables aviation research centers to engage in engineering development and rapid prototyping, and to provide deliverables as appropriate.

The COE selection process developed by the FAA follows:

Step 1.

Needs Assessment. On an annual basis, the FAA conducts a survey of organizations to determine interest, need, and anticipated available funding to support a COE for a period up to ten years.

Following organizational responses, one technology area is specified and approved as the focus of the new COE, and base funding levels are solidified.

Draft solicitation is prepared.

Information Meeting. A public meeting is announced in the Federal Register, and an open session for potential offerors is hosted with the sponsoring organization(s). A draft solicitation is provided to attendees for discussion and external input.

Step 2.

Final solicitation is prepared, published and distributed.

Lead universities submit proposals.

Step 3.

Government subject matter technical experts evaluate proposals.

Government management/fiscal team reviews proposals.

Site visits are conducted to inspect facilities as appropriate.

Evaluation package is prepared by the COE program manager for final review by the FAA Associate Administrator for Research & Acquisition.

FAA Administrator announces selection.

Step 4.

COE program manager prepares cooperative agreement. New COE prepares for dedication.

FAA/COE define technical projects, and funding levels are established for matching grants. FAA awards grant at the time of dedication.

Step 5.

Technical monitor(s) and COE program manager administer grant awards.

Technical monitor determines need to award contracts and serves as contracting officer's technical representative.

Reporting requirements: Year 1, Quarterly Reviews; Year 2, Semi-Annual Reviews; Annual Meeting and Report; and Year 3, Symposium hosted by each COE, close out initial award, call for audit of matching funds.

Prepare Phase II documents.

Question. Where in the process is the Aging Aircraft Non-destructive Evaluation Center?

Answer. The Air Transportation Center of Excellence (COE) in Airworthiness Assurance (AWA) was approved in 1996 for establishment during fiscal year 1997. It is currently in the final stage of the selection process. The solicitation closed on February 15, 1997, and an initial technical evaluation followed. On March 20–21, 1997, the FAA's COE program manager and the airport and aircraft safety R&D division mangers hosted a joint meeting at the FAA William J. Hughes Technical Center. In attendance were representatives from the two proposing institutions found to be within the competitive range. Technical debriefings were conducted and an opportunity was provided for questions and answers.

Question. What would be the next step and a timetable for its evaluation?

Answer. The proposing universities will be given two weeks to provide additional questions for clarification and will submit a best and final proposal to the FAA within the next eight weeks. We anticipate an announcement in June, and establishment of the new Center by October. The Aging Aircraft Non-destructive Evaluation Center will be an integral part of any COE that is established in Airworthiness Assurance.

AGING AIRCRAFT RESEARCH FUNDING

Question. Speaking again of the Aging Aircraft Center, the administration's budget proposes to reduce the level of funding for aging aircraft research from $13.9 million in fiscal year 1997 to $13 million in fiscal year 1998. I am puzzled by this administration's policies regarding aviation safety. On one hand the President identifies commercial air safety as one of his top priorities, but on the other hand he produces a budget proposal that once again decreases funding for one of our most important aviation safety issues. Knowing that by the year 2000 more than 2,500 commercial aircraft in the United States may be flying beyond their original design lives, I believe this is dangerous policy.

Do you believe the administration's current budget proposal is sufficient to continue our efforts in ensuring aircraft safety?

Answer. The fiscal year 1998 budget request does not represent a decrease in the aging aircraft program. Rather, it reflects an increase of $2.4 million in contract funds. The total dollar amount appropriated in fiscal year 1997 was $13.9 million, which included in-house costs. The fiscal year 1998 budget request of $13 million reflects contract funds only, as in-house costs are now part of a separate budget line item. The budget proposal is sufficient to continue our highest-priority work in ensuring the safety of aging aircraft.

Question. What current activities will be sustained with these resources?

Answer. Our highest-priority aging aircraft activities in structural integrity, and maintenance and inspection in testing, evaluation, demonstration, and validation will be conducted.

Question. What activities will be reduced or eliminated due to budget reductions?

Answer. No major activities will be reduced or eliminated at the proposed $200 million budget level.

Question. What is the administration's proposed budget for the Aging Aircraft Non-destructive Evaluation Center in Albuquerque?

Answer. The 1998 budget requests approximately $3 million for inspection technology development and validation.

RECOMMENDATIONS OF WHITE HOUSE COMMISSION ON AVIATION SAFETY

Question. Secretary Slater, Vice President Gore's final report from the Commission on Aviation and Security made several recommendations to the President on increasing aviation safety and security. I believe this report has raised several important safety and security concerns which merit our attention, however, I would like to have your insight on one recommendation today. The Gore Commission also identifies aging aircraft as a major concern for aviation safety. In fact, the Commission recommends expanding the current Aging Aircraft program to include the effects of age on non-structural components of commercial aircraft.

Is the administration supportive of expanding the current aging aircraft safety testing to include non-structural components?

Answer. The FAA, working with the aviation industry, will develop a coordinated plan to implement the White House Commission recommendations regarding the effects of age on non-structural components of commercial aircraft. This partnership approach was used very successfully in the current aging aircraft program.

Question. Which technologies are the most promising/cost efficient in accomplishing this recommended goal?

Answer. At this time, the FAA has not identified which technologies are the most promising/cost efficient in accomplishing the White House Commission recommendations.

RURAL ROADS PROTECTION ACT OF 1997

Question. Secretary Slater, one transportation challenge rural States like New Mexico must face is maintaining and improving our vast rural road systems. Rural States like New Mexico, with a large land mass and smaller population, face an uphill battle in meeting the demands of supporting our transportation infrastructure. For example, I am sad to say that New Mexico is reported to contain five of the 20 most dangerous roads in the nation. While I understand that every State is in

need of additional highway funding, I believe we need to pay more attention to the special needs of rural States like New Mexico when reauthorizing ISTEA. For this reason, I have co-sponsored a bill which mandates a one-percent set-aside within Federal-aid Highway funding for rural States. I believe this set-aside is essential to leveling the playing field for rural States and will be helpful in providing the necessary funds to ensure safer roads.

Does the administration's NEXTEA proposal contain any provisions which would assist rural States such as New Mexico to receive additional highway funding?

Answer. The administration's NEXTEA proposal would authorize $175 billion over 6 years, which represents an 11-percent increase in funding over ISTEA. In addition, the highway apportionment formulas included in the proposal to distribute funds among the States attempt to strike a fair balance between the many diverse States of this nation. Beyond just the overall funding increase, NEXTEA would provide States and local governments with greater flexibility through expanded eligibilities in the core programs, better enabling them to target NEXTEA funds to the types of infrastructure investments that will work best for them.

Although we were cautious about proposing new programs in NEXTEA, the administration's proposal does include a new Border Crossing and Trade Corridors Program. This program would provide $270 million in funding over six years to assist States, such as New Mexico, in meeting needs at border crossings and along trade corridors.

NEXTEA also significantly increases the emphasis on safety with greater funding levels, better targeted safety programs, greater emphasis on safety results, and greater flexibility for States to tailor safety programs to their needs. It eliminates the current STP ten-percent safety set-aside and replaces it with two new programs: (1) a new Highway Infrastructure Safety Program ($3.25 billion over 6 years), and (2) an Integrated Safety Fund ($300 million over 6 years).

NEW MEXICO SPACEPORT

Question. Secretary Slater, as you are probably aware, New Mexico has the potential to be one of the leaders in commercial space launches. The State of New Mexico, through its Office of Space Commercialization has worked tirelessly to promote this effort statewide and I am excited about the prospect of bringing commercial space launches to Southern New Mexico. I believe New Mexico, with its excellent climate, high altitude, and low population density is well suited to take advantage of the new opportunities available in commercial space efforts being put forth by the State of New Mexico. Currently, the New Mexico Office of Space Commercialization has submitted an application for a site license to the Licensing and Safety Division of the FAA, and they are anticipating approval no later than April 16, 1997.

Would you work to ensure this license is issued to the New Mexico Spaceport on schedule?

Answer. The New Mexico Office of Space Commercialization (NMOSC) is utilizing a phased approach to development of a commercial launch site in New Mexico for the staging of activities involving reusable launch vehicle technology currently under development. NMOSC is employing a phased approach as a result of, among other things, the lack of detailed information on reusable launch vehicles. The FAA is cooperating with NMOSC's request and has been working closely with the State of New Mexico to complete a site feasibility review. The licensing process cannot be completed until the NEPA process is concluded and the site is finally selected and is under NMOSC's operational control. We will continue our close cooperative efforts with the State of New Mexico.

As part of its phased approach, NMOSC has requested a determination of feasibility of a proposed site in south-central New Mexico from the FAA, with the understanding that any findings by the FAA are preliminary, or conditional, in that they are subject to completion of all environmental reviews required under NEPA as well as acquisition of the land under consideration. A finding of site feasibility signifies that, based on NMOSC's planned uses for the site, it is situated in a manner that can support safe launch activities at the site.

Question. Secretary Slater, the New Mexico Office of Space Commercialization is currently working with the Department of Transportation to obtain the notice of availability on the Environmental Impact Statement it submitted for legal review. This approval is necessary for the State of New Mexico to begin conducting public hearings and proceed with future construction plans. Unfortunately, the DOT has been delayed in performing this important review for various reasons and currently no date has been set for initiating the review.

When can the State of New Mexico expect the Department of Transportation to conduct the legal review and issue a notice of availability?

Answer. The legal sufficiency review of the Draft Environmental Impact Statement for the Southwest Regional Spaceport has been completed and review comments have been provided to representatives of NMOSC for inclusion in the document. Department of Transportation cognizant personnel received the revised document from NMOSC and it is now under review. The Bureau of Land Management (BLM) and Fish and Wildlife Service (FWS) have voiced objections regarding the Southwest Regional Spaceport (SRS) EIS effort undertaken by the FAA. Once the final review is completed and the issues with BLM and FWS are resolved, the Notice of Availability will be published shortly thereafter. The notice should be published within the next two months.

INNOVATIVE FINANCING AND CAMINO REAL INTERMODAL CENTER

Question. Secretary Slater, the Department of Transportation recently began utilizing innovative financing initiatives to launch critical transportation projects nationwide. I have followed this new program closely and am impressed with its preliminary results. I believe it is essential for Congress to provide greater flexibility to States engaging in advanced construction using anticipated apportionments and private funding alternatives. One pilot project selected for this new program was the Camino Real Intermodal Center in Saint Teresa, New Mexico. The New Mexico Department of Transportation has partnered with a private entity to expedite a needed intermodal facility to make border crossing more efficient. I must commend the New Mexico Department of Transportation for being innovative and resourceful in meeting the increased demands for border crossings due to the NAFTA free trade agreement.

What effects has this new program had on transportation infrastructure construction, and do you see innovative financing provisions to be utilized more rather than less in the future?

Answer. The innovative finance program has created new ways of thinking about funding transportation projects. Innovative finance provides the States more incentive to obtain other sources of revenue, issue bonds, or seek donations. The program also provides more flexible Federal procedures, allowing States to better tailor finance plans to meet individual project needs. The result has been an increase in the non-Federal investment in projects and, for many projects, the ability to advance the construction schedule by several years. We believe these provisions will be used more in the future as States become more familiar their benefits.

Question. Has the DOT discovered any complications or inadequacies within this new program?

Answer. Certainly, some of the innovative finance provisions are more complicated to administer than traditional grant provisions; however, as we become more familiar with the new techniques, the complexities will diminish.

Question. I understand that within the administration's NEXTEA proposal, a new Border Crossing and Trade Corridors program is established to supplement existing funds available for border infrastructure. Are there provisions within this program which provide relief funds to States like New Mexico which have already invested significant highway funds to improve their border crossing stations such as Santa Teresa?

Answer. The Trade Corridor and Border Gateway Pilot Program contains three elements: (1) supplementary surface transportation planning funds for multistate efforts to coordinate trade corridor development; (2) supplementary surface transportation planning funds to support binational planning efforts; and (3) a discretionary capital program directed toward major international gateways with Mexico and Canada to improve gateway transport efficiency and safety. The capital improvement program would be restricted to the major gateways identified in the Department's ISTEA Section 6015 study report, "Assessment of Border Crossings and Transportation Corridors for North American Trade." The West Texas/New Mexico gateway is identified in the Pilot Program as being eligible.

The Pilot Program does not identify prior State and local efforts to improve gateways as a discretionary grant condition. It establishes criteria for grants as follows: (1) reduction in travel time through the gateway; (2) leveraging of Federal funds; (3) improvements in vehicle and cargo safety; (4) degree of binational involvement and cooperation, including cooperation with the Federal Inspection Services (Customs, INS, USDA, etc.); (5) innovation and transferability to other gateways; (6) local commitment to sustain the effort; and (7) full use of existing facilities prior to any new construction.

THE ROLE OF NEW MEXICO'S NATIONAL LABS IN TRANSPORTATION RESEARCH

Question. Secretary Slater, as you are aware, the State of New Mexico has two of our national labs. I believe these labs provide this nation with not only a strong national defense but a valuable resource for developing new technologies. Both Sandia and Los Alamos National Labs have permanent departments which research and develop Intelligent Transportation Systems (ITS) and alternative fuels. As we begin to debate the reauthorization of ISTEA, I have a strong interest in re-evaluating the current role our national labs play in transportation research and development. I believe our nation's transportation infrastructure is of the utmost importance, and as our transportation needs continue to grow, I believe our labs can play a significant role in researching and developing new transportation technologies.

Do you support our national labs playing a significant role in transportation research and development?

Answer. DOT considers the national labs to be a major technical resource, for both the public and private sectors of this country. DOT is an active member, along with many of the Department of Energy (DOE) labs, in the Federal Laboratory Consortium (FLC). The FLC is a legislatively mandated body that exists to make the technical expertise of the labs available to solve national problems and support industry in the development of commercializable products. The FLC has also proven to be a very effective forum for sharing technical insights across Federal agency and program lines.

DOT also uses national labs to perform research for it on a reimbursable basis, with great success. In addition to the work highlighted in the question, we are particularly proud of the work the Los Alamos National Laboratory performed to advance the state-of-the-art with transportation planning tools. An interagency Travel Model Improvement Program (TMIP) is addressing the linkage of transportation to air quality, energy, economic growth, land use, and the overall quality of life. One of the most advanced components of TMIP is the TRansportation ANalysis and SIMulation System (TRANSIMS). TRANSIMS is a series of advanced computer models specifically designed to help State and metropolitan planners meet the analytical requirements of the planning processes created in the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA). TRANSIMS was originally proposed by Los Alamos, and its development and testing is proceeding there.

We have had excellent results with our use of the labs for transportation R&D, and strongly support their continued use in this manner.

Question. Do you foresee our labs being utilized more rather than less in developing new Intelligent Transportation Systems and alternative fuels?

Answer. On August 6, 1993, the U.S. Departments of Transportation and Energy signed a Memorandum of Understanding (MOU) defining the working relationship between them for conduct of research on Intelligent Vehicle-Highway Systems, or IVHS (a more narrowly defined concept that has evolved into ITS). The MOU specifically permits DOT to "use the DOE and its laboratories on a reimbursable basis to conduct IVHS R&D and operational testing activities, and to transfer the technologies developed to the commercial sector." It highlights sensors, navigation systems, data fusion, communications, safety assessments, system concepts, and systems integration as areas for collaboration.

The Department of Transportation considers the DOE labs a major resource supporting its ITS program, and will continue to do so in the future. Moreover, our surface transportation reauthorization proposal provides opportunities for the Department of Transportation to enhance its relationship with the national laboratories, and we plan to take advantage of this opportunity. Their world-class and interdisciplinary scientific and technical capability in areas such as advanced materials, manufacturing, energy and environmental technologies (e.g., fuel cells and alternative fuels), simulation and modeling, testing, and electronics, coupled with their ability to prototype and demonstrate new and innovative concepts to address national problems, can be a real boon to the civil and commercial transportation sectors.

Question. Does the Department of Transportation recommend any changes to the current role our labs play in transportation research and development?

Answer. As mentioned previously, the Department of Transportation has been very pleased with the performance of the national labs, both as sources of technical expertise on advanced technologies, and on actual conduct of R&D. Much of the department's research and development, historically, has focused on applied research that can be implemented in the near term. The Intermodal Transportation R&D Program in our surface transportation reauthorization proposal, with its emphasis on basic research and longer time horizons, will be an area where the labs can make

significant contributions, and we hope to be able to draw on their skills more in the future.

PROCESS TO DISCONNECT AIR BAGS

Question. Secretary Slater, recently, both the United States House and Senate Transportation Committees held hearings on the unintended consequences surrounding air bag safety devices. Clearly, we have found that air bags save lives; however, we are now aware these devices actually pose a life-threatening situation for certain people and their families. I understand that the National Highway Traffic Safety Administration (NHTSA) and the automobile manufacturers are working to educate car owners and produce safer air bags. I would like to know what steps are currently being taken to modify the standard for air bag deployment and what stage we are currently at regarding new rules for legal air bag disconnection.

What is the current process a vehicle owner must pursue to obtain the necessary permit from NHTSA to have their air bag disconnected by an authorized automobile dealership?

Answer. The vehicle owner should contact NHTSA in writing, asking for permission to have the air bag(s) disconnected. The letter should state why the owner wants the air bag(s) disconnected and should provide any additional information, such as a physician's statement of medical reason why the air bag(s) could do more harm than good in this specific case. The letter should be addressed to: Office of the Chief Counsel, National Highway Traffic Safety Administration, 400 Seventh Street, Southwest, Washington, D.C. 20590.

TIMING OF NEW RULE ON DISCONNECTING AIR BAGS

Question. What is the current time line for implementing new regulations which allow vehicle owners to work directly with the dealership for air bag disconnection?

Answer. This proposed rulemaking is part of NHTSA's highest-priority rulemaking actions regarding air bags. The proposals for deactivation were published in the Federal Register (62 FR 831) on January 6, 1997. To date, over 500 respondents have replied to this proposal, with additional comments coming in almost daily. There are many complex legal issues surrounding this proposal. A final resolution of these issues is expected shortly.

UNBELTED TESTING STANDARD

Question. Are steps currently being taken to modify the testing standard for air bag deployment to no longer use the unbelted standard for certification?

Answer. NHTSA is currently responding to a petition from Senator Dirk Kempthorne to amend the provisions in its automatic occupant protection standard to place a moratorium on testing with unbelted test dummies. NHTSA has concluded that Section 2508 of the Intermodal Surface Transportation Efficiency Act of 1991 precludes it from eliminating the unbelted test requirement. Since NHTSA can recommend legislative changes to Congress, it is currently seeking public comments on the benefits and disbenefits of eliminating the unbelted test. The Request for Comments was published in the Federal Register (62 FR 8917) on February 27, 1997, with comments due by March 31, 1997.

NAFTA BORDER CROSSING AND TRUCKING

Question. Secretary Slater, the North American Free Trade Agreement (NAFTA) has opened our nation's borders to its neighbors to promote trade and strengthen our global economy. In 1993, the Senate passed a resolution which instructed the Department of Transportation to "uphold all United States truck safety standards, including truck sizes and weights" during the negotiations with Canada and Mexico. Unfortunately, with over a year behind us, this issue of commercial trucks crossing the Mexican border is still lingering and remains unresolved.

What is the current status of negotiations regarding the harmonization of truck safety standards with the Mexican government?

Answer. Since NAFTA was implemented on January 1, 1994, the Department of Transportation has worked with its counterparts in Mexico and Canada through the Land Transport Standards Subcommittee (LTSS) to develop compatible safety and operating standards for motor carriers. For example:

—Truck Requirements. The three NAFTA countries have adopted a basic commercial vehicle safety standard as the minimum level of mechanical fitness to be sustained by all commercial motor vehicles operating in international commerce. This standard is based on regulations currently in effect in the United States and Canada.

—Driver Age and Language Requirements. The three NAFTA countries have agreed to require that drivers operating in international commerce be at least 21 years old and be able to communicate in the language of the country in which they are operating. Thus, even though Mexico permits drivers to obtain a commercial license at age 18, only drivers who are at least 21 years old will be permitted to operate across the border into the United States. Moreover, those drivers will have to have at least a basic understanding of English.

—Hazardous Materials Requirements. Mexico requires drivers of trucks carrying hazardous materials to obtain an endorsement to their drivers licenses indicating that they have received specialized training for handling shipments of hazardous cargo, for driving tank trucks containing bulk shipments of hazardous materials, and for emergency response. Moreover, Mexico has promulgated regulations applicable to hazardous materials transportation that are based on the UN recommendations on the Transport of Dangerous Goods, which is the international consensus standard. In addition, the three NAFTA countries have published a North American Emergency Response Guidebook in English, Spanish, and French.

—Hours-of-Service and Driver Logs. The United States, Canada, and Mexico have agreed to assure that the duty time of drivers engaged in cross-border transportation will be recorded and accounted for. Mexico has already begun to take the steps necessary to implement a logbook requirement for hazardous materials and bus drivers. The three countries are developing a North American logbook that will be modeled on logbooks currently used in the United States and Canada. In addition, Mexico has asked that the United States and Canada assist in completing regulations on hours-of-service for commercial drivers that Mexico would implement for domestic and cross-border motor carrier operations.

If the Department were to consider amending existing truck size and weight regulations, it would follow the normal regulatory procedures for the issuance of Federal regulations, including ample provision for public comment on any proposals. Any proposals to change current vehicle weights and dimensions standards as set forth by statute would be decided by the Congress. No such recommendations are currently being considered by the LTSS.

Question. What are the areas of major contention involved in the negotiations regarding cross-border trucking?

Answer. In negotiations over the past year, the United States, Mexico, and Canada have discussed developing a strategy to assure that motor carriers are in compliance with their safety obligations prior to beginning cross-border operations. These discussions are taking place in the Land Transport Standards Subcommittee, which was established by NAFTA to address development of compatible safety and operating standards for truck, bus, and rail transportation and for the transportation of hazardous materials.

The three countries have agreed on critical safety areas that will be reviewed and approved by each country's authorities before a carrier can begin cross-border operations, including: (1) safety management systems, (2) driver qualifications, (3) hours of service compliance, (4) drug and alcohol testing, (5) condition of vehicles, (6) accident monitoring programs, and (7) compliance with regulations governing the transportation of hazardous materials. In addition, we have agreed on several elements that are essential to implementation of a successful cooperative and coordinated compliance and enforcement program, such as clear communications between governments and with motor carriers; development of electronic data bases and exchange of safety information for companies, drivers, and vehicles; and involvement of State and local officials.

Discussions with Mexico currently involve implementation of specific elements of a compliance and enforcement program in Mexico that will be directed at motor carriers who will be operating across the border into the United States. This program includes a roadside inspection program focussed on the northern border, a process for providing the United States with detailed information on motor carrier applicants for authority, and a safety management oversight program.

Taken as a whole, this strategy will enable the Department to evaluate a carrier's safety performance based on verified information provided by the Mexican government and the carrier itself. Only carriers with positive evaluations will be approved to operate beyond the commercial zones. In addition, this strategy will assure that carriers that receive such approval will be monitored for compliance with safety and operating regulations by inspectors based both in Mexico and the United States.

Question. When do you expect to have this issue resolved?

Answer. The Department hopes to have a package that resolves all outstanding transportation issues between Mexico and the United States in the near future. Senior officials from the Department and Mexico's Secretariat of Communications and

Transportation have met on many occasions over the past months to discuss safety issues that led to the delay of implementation of NAFTA's truck and bus access and investment provisions.

DOT's major concern is that there be a system in place in Mexico to independently verify the safety compliance of the carriers that will be operating across the border into the United States. Thus, officials are discussing with Mexico implementation of basic compliance/enforcement program elements for motor carriers granted authority to operate in the United States. DOT is working with its Mexican counterparts on how best to implement these measures and to determine a time frame within which implementation will be possible.

Question. Do you anticipate any further delay in finalizing this agreement in a timely fashion?

Answer. The United States remains committed to NAFTA and its promise of economic prosperity for North America. The United States fully intends to honor its NAFTA commitment to permit Mexican motor carriers to operate in this country. However, there are a number of steps that the United States, Mexico, and Canada can take together that will benefit motor carriers and their customers while enhancing public safety and security in all three countries. Once the safety concerns that led to the delay in implementing NAFTA's truck and bus access and investment provisions have been resolved, the Department of Transportation will begin processing applications from Mexican motor carriers to operate in the U.S. border States. The Department hopes to have a package that resolves all outstanding transportation issues between Mexico and the United States in the near future.

NONDESTRUCTIVE EVALUATION AND TESTING

Question. Secretary Slater, the administration puts an increasing emphasis on the use of technology in transportation in its fiscal year 1998 budget request. You know of my interest in the work that is being done by the Aging Aircraft Nondestructive Evaluation Center (AANC), which is supported by the Federal Aviation Administration. This collaboration has been very successful. Several years ago, the Department helped fund the use of such techniques on two bridges in New Mexico that were scheduled to be demolished. This project provided valuable information on the utility of these techniques to transportation.

The Department's budget request now includes $10 million for advanced research through the Federal Highway Administration to investigate new, emerging or advance technologies which have the potential for long-range application in highway engineering, safety, and traffic research and development. Throughout this initiative, nondestructive testing and evaluation is a component.

Mr. Secretary, can you please characterize the Department's current initiatives that focus on nondestructive evaluation and testing techniques or technologies and their contribution to the mission of the Department?

Answer. The contribution of FHWA's current initiatives in nondestructive evaluation to the Department's mission can be summarized in two words: safety and efficiency. The FHWA's current safety-related initiatives include projects to develop new and better technologies to detect and evaluate fatigue cracks in steel bridges; projects to evaluate bridges where the depth and condition of the foundations below ground are unknown; projects to ensure that the cables supporting large bridges are intact; projects to ensure that the highly stressed, yet hidden, tendons supporting prestressed concrete bridges are intact; and projects to facilitate the quantitative load testing of bridges. The FHWA is also developing nondestructive evaluation technologies which support rapid, efficient, and quantitative condition assessment in support of modern bridge management systems. The FHWA is developing new technology to rapidly and quantitatively evaluate the condition of bridge decks without the need to stop traffic. This particular project is highly significant because half of the bridge deck area in the United States is covered by asphalt and cannot be adequately evaluated using visual inspection. The FHWA is developing other devices to quantitatively measure overloading, fatigue loading, and corrosion rates in passive non-invasive ways. The FHWA is developing new tools, technologies, and methods to manage the Nation's bridges with factual objective data, in addition to subjective visual inspection.

Question. What is currently underway at the Department to assess, for example, the structural integrity of bridges? What are the components of this program?

Answer. A large component of FHWA's NDE research and development program specifically addresses structural integrity of bridges. In addition to the specific projects mentioned above, FHWA has developed a laser-based bridge deflection measurement system that quantitatively measures the three-dimensional deflection response of highway bridges to load. The system provides the ability to accurately

and precisely measure deflections at hundreds of points on a bridge. This global assessment technology can rapidly detect pathologic conditions such as corrosion or fatigue weakened girders that could compromise structural integrity.

The FHWA has also developed wireless telemetry systems that greatly facilitate the ability to assess bridge structural integrity through diagnostic and proof load testing of highway bridges. FHWA is also closely coordinating, cooperating, and cosponsoring bridge health monitoring technologies with its State partners. Several large-scale bridge instrumentation projects are underway in Ohio, New Mexico, Connecticut, California, and New York—all intended to develop systems to ensure structural integrity by measuring the dynamic and static response of highway bridges using sophisticated computer-based sensor and telemetry systems.

Question. What are the research goals of the proposed new program?

Answer. The goals of the Advanced Research Program are to improve the long-term safety, durability, mobility, efficiency, environmental impact, and productivity of highway and intermodal transportation systems. Certainly, Advanced Research has long been one of the cornerstones of the R&T programs in FHWA. During FHWA's outreach meetings in preparation for development of NEXTEA, we consistently heard from States that Advanced Research needed to be done by the FHWA. One top official, reflecting on the need for a national focus on Advanced Research said, "If not by FHWA, then who?"

There are elements of the more basic scientific research in all of our research categories (i.e., Pavements, Safety, ITS, Structures, etc.). However, the proposed initiatives are directed to five areas that have crosscutting applications. These five areas are:

—Diagnostic Methods: advanced sensors to nondestructively measure the "health" of the physical infrastructure (roads and bridges). Diagnostics lies at the intersection of three fields: nondestructive testing, material science, and computational structural mechanics.

—Materials Characterization: better understanding of the chemistry and microstructure of major highway materials (cement, asphalt, steel, etc.) will permit the engineering of materials to produce the macroscopic properties (strength, stiffness, toughness) that yield better performance. Many scientists believe this is the field with the greatest potential for dramatic improvements.

—Modeling and Simulation Methodologies: through the use of advanced computer assisted modeling, we can better understand multi-faceted relationships and can better predict the consequences of changing variables. This technology supports ITS, Safety, Materials, and Traffic Assignment. Effective modeling focuses the research and is perhaps one of the best investments we can make in terms of conducting research.

—Artificial Intelligence and Mathematics: developing, testing, and evaluating the reliability and robustness of software for many traffic, safety, structural conditions and other technologies requires advanced mathematical concepts such as expert systems, neural networks, voice recognition/synthesis, pattern recognition, advanced visualization, and related statistical and computational methods.

—Advanced Sensor and Commutations Technology: traffic control and vehicle surveillance systems are keys to the safe and efficient operation of most major urban highways in the next century. Development of "smart" detectors for highways, building on aerospace and military technologies, will leverage this investment.

Question. Is this a multi-year effort, and what are the outyear projected budgets for this advanced research program?

Answer. This program is proposed at a budget level of $10 million for fiscal years 1998–2000, and then at a level of $20 million for fiscal years 2001–2003. There is a need to "grow" staff and research management in several of these sophisticated areas, and prudent judgment suggests starting with a good foundation. As basic research flows through the R&D pipeline, experience has taught us that the heaviest demand is several years after the initial investment if we are to capitalize on our investment.

Question. How does the Department propose to implement this new initiative?

Answer. No increase in staff is proposed. We intend to lead this advanced research program using the much more effective Broad Agency Announcement device for acquisition of research. This approach permits FHWA to select several contractors with several different concepts from the same advertisement. Also, we would continue to utilize Cooperative Agreements and, when appropriate, grants to public agencies to leverage research providers such as the national laboratories. Internally we will continue to utilize NSF post-doctorate individuals, graduate research fellows, and loaned staff from States, other countries, and universities. As existing

staff retire or resign, we will investigate filling of each vacancy so as to maximize the effectiveness of the total R&D program.

HIGHWAY FUNDING REQUEST

Question. Secretary Slater, the President's Budget proposes that total highway spending for programs authorized under the Intermodal Surface Transportation Efficiency Act (ISTEA) will be reduced from their 1997 level of $20.5 billion to $19.9 billion in 2002.

The aggregate reduction, when compared to a current law spending path, is $3.9 billion over this five-year period.

Do you personally think such a reduction is possible, especially in 2001 and 2002, given the level of support here in the Senate for highway spending?

Answer. The administration is committed to the overall effort to balance the Federal budget, and all spending decisions should be made in that context. As we all know, hard choices are necessary to achieve a balanced budget. If we are to achieve a balanced budget, increased highway spending translates into decreases elsewhere. If both Congress and the administration are willing to make hard choices, then this spending level is realistic. But you may, of course, decide to pursue a different approach. We submitted a proposal that makes a serious effort to address the concerns of the Senate and others about achieving a balanced budget. It should also be noted that the $600 million reduction in obligations cited in the question is less than the $745 million reduction in highway demonstration obligations from fiscal year 1997 to fiscal year 2002.

HIGHWAY FUNDING NEEDS

Question. Do you also believe such a reduction can be achieved given the latest USDOT Conditions and Performance Report, showing a shortfall of $11 billion in local, State, and Federal highway funding just to maintain current highway conditions across the Nation?

Answer. The administration's reauthorization proposal seeks to maximize the overall level of funding for the transportation program within the framework of a balanced budget. We must work within the same financial constraints facing every other Department in trying to meet growing needs with limited Federal resources. To that end, we have initiatives designed to leverage the Federal dollar and increase private sector participation in transportation investment.

Specifically, our budget proposal will provide sufficient revenue, when combined with State and local match and expected State-only programs, to allow us to (1) continue improving the pavement conditions on our Nation's arterial system, including the National Highway System; (2) continue the reduction in the number of structurally deficient and some functionally obsolete bridges; (3) improve roadway surfaces, alignments, shoulders, sight distance, and other road related factors that contribute to continued reduction in highway fatality rates, including efforts to effect driver behavior that influences safety; and (4) continue making capacity and operational improvements to address the congestion problems associated with increasing highway travel demand.

ADMINISTRATION'S REDUCTIONS TO THE FAA

Question. Secretary Slater, the President's Budget proposes that total FAA spending will be increased from its 1997 level of $8.5 billion to $9.3 billion in 2002. This increase represents a 1-percent reduction when compared to a current law spending path over this five-year period.

Do you personally think such a reduction is possible, given the increased demands put on FAA, especially in light of the recently released report from the White House Commission on Aviation Safety and Security?

Answer. The Operations, Facilities and Equipment, and Research, Engineering, and Development accounts will grow at a current services spending path over the five-year period ending in 2002. Only the Airport Improvement Program (AIP) will be held constant at its fiscal year 1998 level. It is due to the lack of growth in the AIP account that the overall FAA budget appears to grow at a rate lower than current services

The five-year budget assumes a transition to full user-fee funding, which was endorsed by the White House Commission. The overall spending in the outyears will depend on FAA needs and users' willingness to finance those needs.

NEED FOR FURTHER AVIATION USER FEES

Questions. Will additional user fees, above those recommended from 1999 through 2002 in the President's Budget, be needed to meet the funding needs of the FAA?

Answer. Generally no; however, user fees are proposed to recover 100 percent of the FAA's budget, so any change in cost from current forecasts will result in adjustments to the user fee proposal.

FAA COST-BASED USER FEES

Question. Secretary Slater, the President's Budget proposes that beginning in 1999, the aviation excise tax will be replaced with a cost-based user fee system, raising $36 billion between 1999 and 2002.

How would these user fees be collected and how would they be assessed on the traveling public and the aviation industry?

Answer. The procedures for billing and collecting user fees in fiscal year 1999 to 2002 will depend on the specific fees that will be charged. The specific fees to be charged have not been determined and will be influenced by the recommendations of the National Civil Aviation Review Commission. How the user fees are assessed and collected will be based on several considerations, including whether the fees are paid before, after, or concurrent with the provision of services; the volume of payments to be made; and the size of individual payments.

Question. If these decisions have not been made, how did USDOT and OMB arrive at these revenue figures?

Answer. Projected revenues were based on the recovery of FAA's costs to provide service to users and are independent of how the fees would be assessed and collected.

Question. Would it have been more advantageous for the administration to wait for the final report of the National Civil Aviation Review Commission before making FAA user fee proposals in its budget submissions to Congress?

Answer. The administration is assuming that the work of the Commission will be completed by the end of this year and recommendations provided to Congress and DOT. This will allow time to make any necessary changes in the proposal to establish and implement user fees.

OUTYEAR FAA FUNDING

Question. Secretary Slater, the President's Budget proposes that beginning in 1999, the aviation excise tax will be replaced with a cost-based user fee system. However, the President's Budget is silent on where increases and reductions should be made in the FAA beyond 1998. Each account is zeroed out and total FAA spending is replaced by user fee revenues. There are no specific assumptions how these revenues should be spent.

In what accounts of the FAA budget between 1999 and 2002 will these user fee revenues be spent? How much will be spent for FAA operations, research, facilities and equipment, and the Airport Improvement Program (AIP)?

Answer. User fees will provide funding for all FAA programs. Estimates for the specific accounts in future years reflect 3-percent annual growth except for the Airport Improvement Program, which remains constant at $1 billion.

Question. If these decisions have not been made, how did USDOT and OMB arrive at the total funding level for the FAA between 1999 and 2002 shown in the President's Budget?

Answer. Using 1998 as a baseline, a 3-percent inflation factor per year was applied to operations, facilities and equipment, and research. AIP was straight-lined at $1 billion. As the President formulates his budget each year, decisions will be made on a year-to-year basis to update these assumptions.

QUESTIONS SUBMITTED BY SENATOR SPECTER

FOREIGN OIL DEPENDENCY AND TRANSIT

Question. As co-chair of an informal Senate Transit Coalition, I am very concerned that the administration's fiscal year 1998 budget request proposes only $4.3 billion for Federal transit programs, essentially a freeze from fiscal year 1997. You have proposed to eliminate Federal operating assistance for public transportation and the capital budget would not grow under your proposal despite available surpluses in the Mass Transit Account of the Highway Trust Fund and a widely recognized need to invest more in our transit systems. Coupled with Federal mandates and funding pressures at State and local levels, Federal cutbacks have already resulted in some

combination of fare increases and transit service cuts in many Pennsylvania communities.

At a time of instability in the Middle East (particularly Saudi Arabia) and a growing U.S. dependence on foreign supplies of oil, isn't it essential that we focus our resources on public transportation, which saves million of gallons of gasoline annually and has corresponding environmental benefits as well?

Answer. Yes. Transit reduces auto fuel consumption by nearly two billion gallons annually, lowering the Nation's trade deficit and reducing dependence on foreign oil. The energy and environmental benefits of transit are another example of what occurs when people are given transportation choices. Today's transit investments will reduce our dependence on foreign oil in the future and deliver other important benefits.

PENNSYLVANIA TRANSIT FUNDING

Question. A survey by my staff of nearly 20 small and mid-sized transit systems across Pennsylvania shows that 27 percent of their annual budgets comes from Federal sources. In Pittsburgh, the figure is even higher, at 22 percent of their $376 million annual budget. How do you envision these systems responding to the growing needs from their communities when we are curtailing the Federal Government's support?

Answer. We support continued stable funding levels for transit as reflected in the fiscal year 1998 budget and the NEXTEA reauthorization plan. In addition to stable funding, our proposals would increase transit agency flexibility in spending Federal transit dollars, allowing them to target resources to pressing needs. For example, the fiscal year 1998 budget merges Bus Discretionary funding and the Fixed Guideway Modernization grant program into Formula Programs. This increases the Formula Programs funding level from $2.1 billion in fiscal year 1997 to $3.3 billion in fiscal year 1998. This improvement gives transit agencies the ability to continue using former Bus Discretionary funds for bus purchases and Fixed Guideway Modernization funds for rail improvements and rolling stock, but the funds can also be used for any other eligible Formula purpose selected by the transit agency.

Another measure in the fiscal year 1998 budget and the NEXTEA proposal delivers relief to transit agencies through a redefinition of operating and capital expenses. Our proposal would eliminate operating assistance in urbanized areas over 200,000 population while providing relief by redefining capital to include maintenance expenses. This will match the transit definition of capital to the definition in the Highway program.

In areas under 200,000, all Urbanized Area Formula funding would be eligible for operating or capital expenses at the operator's discretion.

The proposed redefinition of preventive maintenance as a capital expense builds upon the measure endorsed in last year's Appropriations Conference Committee Report whereby a portion of transit vehicle overhauls can be reclassified from an operating to a capital expense.

FTA analysis indicates that the proposed capital redefinition will effectively offset the elimination of operating assistance. For instance, PAT, the Pittsburgh-Port Authority of Allegheny County, will be able to reclassify from operating to capital expenses over 8 times more in expenditures than its Federal operating assistance cap.

FTA will take all necessary measures to inform grantees of the change and will assist agencies in fully using the new provisions.

The combination of funding stability and increased flexibility will continue to provide transit agencies in communities of all sizes with important Federal support for transit. Federal transit funding leverages State and local support, and our proposal will continue this important Federal role.

ADEQUACY OF PROPOSED HIGHWAY SPENDING

Question. Highway spending authorized in the 1991 ISTEA law is limited by the annual obligation ceiling set in the appropriations bill, which is in turn a function of the 602(b) allocation received by your Subcommittee. In practical terms, this means that Pennsylvania is entitled to $750 million for fiscal year 1997 through formulas but can only spend $670 million, which is its share under the national obligation ceiling. Do you think that the $18.2 billion obligation limit on Federal-aid highway spending is sufficient, given the significant surpluses in the Highway Trust Fund? In Pennsylvania, for example, last year the State had to announce delays in construction of nearly 80 highway projects due to a projected lack of funds. As a result of the current obligation ceiling, Pennsylvania lost an estimated $80 million in fiscal year 1997 that it was entitled to spend through the apportionment formulas.

Answer. We realize that the Highway Trust Fund can support a higher level of funding. However, the administration's reauthorization proposal must be looked at within the framework of the entire Federal budget. The administration is committed to balancing the budget, and all spending and taxing decisions must be considered in that context. The reauthorization proposal seeks to maximize the overall level of transportation funding while still remaining within an overall balanced budget.

AMTRAK SERVICE CUTS AND PROGNOSIS

Question. The Amtrak Board has taken a number of steps to improve the financial situation of our national railroad, including a number of cuts in routes and service in Pennsylvania and other States. For example, the Board proposed eliminating the local Philadelphia-Harrisburg "Keystone Service," which was saved in part by a commitment by the Pennsylvania Department of Transportation to assume more of the costs. What is the status of the cuts in routes and service proposed by the Amtrak Board? What steps has the administration taken to work with the States to preserve routes and segments wherever possible? What is your prognosis for Amtrak?

Answer. Amtrak's Board proposed the termination of service on four routes effective November 10, 1996, which was postponed for a period of six months. These routes were the Boston to Albany segment of the "Lake Shore Limited," the St. Louis to Dallas "Texas Eagle," the Salt Lake City to Portland "Pioneer," and the Salt Lake City to Los Angeles "Desert Wind."

The Massachusetts and Texas State Departments of Transportation have developed a proposal that would, if approved by the State legislatures, continue service on the "Lake Shore Limited" and the "Texas Eagle" through October 1, 1997, during which time Amtrak and the States would work together to develop other concepts to make these trains commercially viable. It presently appears that the other trains will terminate service on May 10, 1997. The Department strongly supported the efforts of Amtrak and the States to identify means to provide the financial assistance necessary to preserve these trains.

With regard to Amtrak's future, the Department is committed to working with Congress, Amtrak management and labor, State governments, and other interested parties in the coming year to develop an affordable long-range plan that eliminates Amtrak's dependence on Federal operating subsidies. Amtrak is an important component of this Nation's intermodal passenger transportation system. We believe that Amtrak must have a reliable source of capital investment through contract authority proposed in the administration's NEXTEA bill over the next several years to address the previous lack of investment if we are to preserve the national system and permit Amtrak to achieve its potential.

AMTRAK BUDGET NEEDS

Question. As someone who rides Amtrak at least two times a week, I know that a safe, convenient and effective national passenger rail system is not a luxury, but a basic component of our modern economy and society. Amtrak also offers a viable alternative to congested highway and air travel.

What impact will the administration's budget request have on Amtrak's ability to provide intercity rail service in the future? How has the administration responded to the cost of replacing and modernizing Amtrak's physical assets (maintenance facilities, train equipment, and support assets), which represent a key challenge to the viability of the railroad?

Answer. The administration is committed to a long-term vision of Amtrak as an important component of this Nation's intermodal, intercity passenger transportation system. Amtrak must have the tools to develop into a self-sustaining competitive player. One tool that Amtrak must have is a reliable source of capital investment to address the previous lack of investment. The administration's NEXTEA proposal includes authorization of over $3.4 billion over the next 6 years to further progress the recapitalization of Amtrak.

The Department is committed to working with Congress, Amtrak management and labor, State governments, and other interested parties in the coming year to develop an affordable long-range plan that eliminates Amtrak's dependence on Federal operating subsidies.

QUESTIONS SUBMITTED BY SENATOR GORTON

AIRPORT IMPROVEMENT PROGRAM REDUCTIONS

Question. During your nomination hearing before the Senate Commerce Committee last month, as well as your written responses to submitted questions, you continually emphasized this administration's commitment to record amounts of dollars for infrastructure investment in the United States over the past four years. At the same time, however, the President's fiscal year 1998 budget submission lowers funding for the Airport Improvement Program (AIP) by over 30 percent—from an fiscal year 1997 enacted level of $1.46 billion to a proposed $1.0 billion in fiscal year 1998. This is not a new trend. When President Clinton took office, AIP was a $1.9 billion program. Every year since then, the administration has asked for less airport construction money than did the previous administration.

Regarding the Airport Improvement Program—not infrastructure as a whole—but the Airport Improvement Program specifically, can you tell me how the President continues to justify spending fewer dollars on aviation infrastructure when just yesterday, you released a statement from the Annual Commercial Aviation Forecast Conference that "an unprecedented 605 million people flew on the nation's air carriers in 1996 with enplanements expected to grow to nearly one billion by 2008?" Does the President believe that aviation infrastructure will magically regenerate itself without capital investment?

Answer. It is important to remember that the AIP is not the only source of funding for airport improvements, nor the only FAA program involved with aviation infrastructure. In fact, the majority of airport development dollars (75 to 80 percent) come from sources other than the AIP. Likewise, the FAA also administers funds for significant infrastructure programs such as the Facilities and Equipment (F&E) program. Although the ultimate "owner" of the F&E improvements, such as airport control towers and navigation aids, is the FAA, nonetheless nearly $1.9 billion is recommended for this aviation infrastructure program for fiscal year 1998.

Although certain programs are recommended to be reduced as part of the effort to balance the Federal budget, we believe that other funding sources, such as bond sales by airport sponsors and Passenger Facility Charges (PFCs), will be available to continue needed airport development. The FAA will, of course, continue to provide aviation design and operational standards to foster systemwide safety.

FUNDING PUGET SOUND REGIONAL TRANSIT

Question. As you are aware, the voters of a three-county region approved a $3.5 billion bond measure last November to construct a regional transit system in the Puget Sound area. The plan, called Sound Move, envisions a mix of light rail, commuter rail, High Occupancy Vehicle expressways and regional bus routes. Commuters would some day be able to travel through all portions of the system with a single ticket. Specifically, it calls for: a 25-mile light rail line with 26 stations between Seattle's University District and the City of SeaTac via downtown Seattle and the Seattle-Tacoma International Airport; a 1.6-mile light rail line between downtown Tacoma and the Tacoma Dome train station; and an 81-mile commuter line using existing freight track between Everett and Lakewood, via Seattle and Tacoma, with at least 14 stations. Of the total cost, the planners of this system will be asking for $737 million from your Department of Transportation to cover the Federal share of the project.

In the President's fiscal year 1998 Federal Transit Administration budget, however, not only has the President shifted all of Section 3 discretionary money back into formula grants, but more importantly for this project specifically, the President has eliminated funding for all future "new start" projects. The proposed budget, as you know, only provides money to continue funding existing full-funding agreements. How do you suggest that I explain to my constituents the President's desire, through his fiscal year 1998 budget submission, to look past the specific needs of the Puget Sound region as it relates to this specific project?

Answer. The Federal Transit Administration's policy, as found in its annual Report on Funding Levels and Allocations of Funds (the "3(j) Report"), is that transit major capital investments (or new starts) funding shall only be proposed for projects that will be construction-ready in the budget year. A project such as Puget Sound's should be funded with planning or formula funds until it is construction-ready.

Regarding the possibility of receiving funding in the next several years, NEXTEA provides $5.7 billion in budget authority for major capital investments over 6 years. Of this, $3.7 billion will be required for projects under existing or pending Full Funding Grant Agreements, using virtually all the funding under obligation limitations proposed by the administration. Those obligation limitations reflect our com-

mitment to help balance the Federal budget. If the economic and budget environment improves during the NEXTEA years, the obligation limitations may be increased, and as much as $2 billion may become available for additional projects like Puget Sound's.

Funding for additional new starts is also available through FTA's innovative finance initiatives, as well as the flexible funding provisions contained in ISTEA and broadened in NEXTEA.

CLINTON FERRY TERMINAL IN WASHINGTON

Question. Three weeks ago, I sent you a letter regarding the utilization of fiscal year 1997 funds for a ferry terminal project in Washington State, and to date, I have not received a response from your office. Accordingly, because you are here today, I would like your thoughts on this situation. Let me explain the details of this matter. On Wednesday, November 13, 1996, representatives from the Washington State Department of Transportation (WSDOT) received the first faxed notice of the fiscal year 1997 allocations of discretionary funds from the Federal Highway Administration's (FHWA) Olympia, Washington, Division Office. WSDOT officials were very pleased that two of the smaller local ferry systems in Washington State are scheduled to receive funding from the ISTEA Section 1064—Construction of Ferry Boats and Ferry Terminal Facilities—discretionary account. They were dismayed, however, to find that the Clinton Ferry Terminal was not included on the list.

A detailed analysis of the entire national listing of all discretionary funding categories for fiscal year 1997 also failed to show any funding for the Clinton Ferry Terminal. Upon further review, it appears that Washington State was overlooked, in spite of language in the Senate's fiscal year 1997 Department of Transportation Appropriations Report 104–325. Could you please explain how the FHWA has overlooked the Senate report language and neglected to provide funding for this project?

Answer. The FHWA was aware of the Senate report, but also aware of the language in the Conference report (House Report 104–785) stating that the conference agreement deleted the Senate references of priority designations and set-asides within the FHWA's discretionary grant programs. As a result, all candidates for discretionary ferry boat funding were equal from a legislative standpoint. In choosing among the many worthwhile candidates submitted nationwide, funds were not available to finance many excellent candidates, including the Clinton ferry terminal project. However, as you have noted, two other projects in the State were selected for ferry boat discretionary funding in fiscal year 1997.

HIGHWAY/RAIL GRADE CROSSINGS SEPARATION

Question. The following is an issue that you and I discussed during your nomination hearing, and I appreciate your willingness to help on this matter. As you know, with automobile and railroad traffic increasing in the Puget Sound region, the Port of Seattle, the Port of Tacoma, the Puget Sound Regional Council, and the Washington State Department of Transportation are currently working on a project to construct grade separations at existing street-level railroad crossings for both safety and traffic efficiency reasons. To date, this group has identified approximately 70 street-level crossings along the north-south corridor between Everett and Tacoma that should be grade separated. Unfortunately, this would have to be done at a cost exceeding $1.5 billion.

While grade separation and freight mobility are extremely important issues for the ports, they are also important in light of Burlington Northern-Santa Fe's decision to reopen Stampede Pass, a major east-west corridor in Washington State. Initially, BNSF projects that it will operate 10 to 12 trains per day during 1997, but will increase that number to 18 to 20 operations by 1998. With this new traffic moving through the Central Puget Sound region, cities from Auburn, Kent, and Maple Valley to Ellensburg and Yakima will be affected.

In your previous response to this question, you expressed your openness to "help develop consensus regarding the scope, cost and financial support needed to implement the rail improvements" in the region. Do you have any specific ideas on how funding for this project may be addressed within the context of ISTEA? Clearly, innovative financing is one possibility, but are there either existing alternative sources of funding or new programs that could be utilized to find funding for such a major project?

Answer. To implement the improvements envisioned along the Puget Sound rail corridor will require a public-private partnership among regional, State and Federal interests. The current ISTEA framework provides several flexible programs through which grade crossing eliminations can be funded. These programs include the National Highway System (NHS), the Surface Transportation Program (STP), and Con-

gestion Mitigation and Air Quality (CMAQ), as well as Railway-Highway Crossing and Hazard Elimination funds. The administration's NEXTEA proposal would continue these programs, and in some instances specifically extend eligibility to publicly-owned rail infrastructure.

These programs are funded, of course, from State allocations and spent according to local priorities. NEXTEA would establish two additional programs that might provide alternative sources of funding.

First is the Transportation Infrastructure Credit Enhancement Program, which would provide grants (up to 20 percent of total cost) to assist in the funding of nationally significant transportation projects that otherwise might be delayed or not constructed at all because of their size and uncertainty over timing of revenues. The program's goal is to encourage the development of large, capital-intensive facilities through public-private partnerships consisting of State or local governments with private business. The program would require a public agency to acquire and operate the rail facility, as is being done in California's Alameda Corridor.

Second is the permanent establishment of the State Infrastructure Bank (SIB) program. SIBs offer a menu of loan and credit enhancement assistance, such as direct loans, interest rate subsidies, lines of credit and loan guarantees. States can capitalize their SIBs using funds from regularly apportioned ISTEA categories and from a discretionary $150 million annual DOT fund for seed money. The program was originally limited to ten pilot States, but NEXTEA offers all States the opportunity to establish a SIB.

AVIATION USER FEES

Question. As the new Chairman of the Senate Aviation Subcommittee of the Commerce Committee, I have heard from many people who are very concerned with the $300 million in new user fees to be assessed as proposed in the President's Budget. Could you please specifically identify what types of activities these user fees will be assessed for?

Answer. The following fees are assumed in the budget request for fiscal year 1998:

—Security User Fee

—International AirCargo User Fee

—General Aviation (GA) Turbine Engine Airplane User Fee

The expected revenue in fiscal year 1998 from the three user fees is approximately $300 million. The charge rates and annual revenue from each fee have not yet been determined. The cost of service for each fee will be determined from the fiscal year 1995 Cost Allocation Study and supplementary analyses.

A more detailed list of services for which fees would be assessed follows:

Security: Services include the security inspection of domestic/foreign air carriers, inspections of hazardous materials, processing of application amendments for airport and air carrier security programs, testing and approval of advanced technology security equipment, and provision of aviation security technical assistance, education and training.

International Air Cargo: International air cargo is transported by domestic and foreign all-cargo carriers and in the belly of domestic and foreign passenger airplanes. The U.S. currently imposes no tax or fee on cargo transported by air into or out of the U.S. Airplanes carrying cargo to/from foreign countries receive terminal and enroute air traffic services from FAA. Services include domestic departures and domestic and oceanic fly-overs provided by enroute centers, and terminal radar approach control facility services. Service recipients are foreign and U.S. cargo carriers (direct service recipients) and cargo shippers (indirect recipients).

General Aviation Turbine Engine Airplane: Services include the provision of enroute and terminal air traffic services to turboprop and turbojet airplanes operated in non-commercial service which fly under instrument flight rules. Service recipients are GA turboprop and turbojet airplane operators.

QUESTIONS SUBMITTED BY SENATOR FAIRCLOTH

PRESERVATION OF RAIL RIGHTS-OF-WAY FOR TRANSIT

Question. The 1997 transportation appropriations bill included a "New Start" appropriation ($2 million) for the Triangle Transit Authority's plans to build a light rail system in Raleigh-Durham, North Carolina.

This system will use existing tracks and possibly build a limited number of additional tracks. The plan thus avoids much of the expensive right-of-way acquisition that drives up project costs. Their foresight will save the taxpayers tens of millions of dollars.

Is the policy of the DOT to encourage planning and construction of fixed-guideway transit systems before these rights-of-way are developed, sold, or otherwise lost for this use?

Answer. The Federal Transit Administration (FTA) encourages the consideration of fixed-guideway transit systems only when the local planning process identifies the need for a significant transportation investment, a wide range of multimodal alternatives to meet this need are systematically evaluated, and the ongoing financial support of such a system is adequately demonstrated. Such evaluation may in fact show that a fixed-guideway transit project on an existing rail right-of-way would be lower in cost than alternative rail alignments, and would have a greatly reduced environmental impact on the community in terms of noise, displacement, neighborhood traffic, safety problems, and destruction of parks and natural areas. However, the costs, benefits, and impacts of other mode and alignment alternatives must also be evaluated as part of this local process before a decision is made on the selection of a locally preferred alternative.

Question. What does the Department plan to do to encourage this advance planning?

Answer. FTA supports the preservation of transportation corridors through the local planning process. FTA will participate in the advance acquisition of railroad rights-of-way for future transit projects when: (1) the long-range metropolitan transportation plan for the area identifies a future need for fixed guideway transit in the corridor; (2) funding for the acquisition has been programmed in the metropolitan and statewide transportation improvement programs; and (3) the requirements of the National Environmental Policy Act (NEPA) regarding the consideration of alternatives prior to commitment to a particular project can be satisfied. In many cases, a NEPA categorical exclusion can be granted when a railroad right-of-way is merely changing ownership without any near-term change in its use.

AIRPORT CONSTRUCTION

Question. The administration budget cuts the funds for the Airport Improvement Program (AIP), which funds airport construction and improvements, from its current $1.45 billion to $1 billion. (Asheville Airport and Sanford-Lee County Airport submitted applications to the FAA for funds through this program).

AIP funding is at the lowest level in years. The administration requests $1 billion for 1998. In the past four years, annual airline passenger traffic is up 16 percent while investment in airport development has already decreased 23 percent. I know that State and local governments can now collect passenger fees, but I wonder about the lack of Federal participation. In fact, in my State, we have a number of airport expansion programs that the State is undertaking without substantial Federal aid, and I wonder if this is the future trend. Have we been spending too much on airports, or is the President's Budget underfunding our airport needs?

Answer. Like many other Federal programs, the requested AIP level has been reviewed carefully to help the administration and Congress balance the Federal budget. The ability to collect and use Passenger Facility Charge funds will continue to provide an important supplement to Federal grant funds, and we hope the newly authorized demonstration program for innovative financing will help airports do more with the Federal funds that are made available to them.

We are optimistic that the work of the National Civil Aviation Review Commission will produce recommendations for long-term funding of airport infrastructure, as well as other aviation programs. The Federal Aviation Administration will continue to place the highest priority on attaining adequate funding for the most critical system needs nationwide.

FAA MISMANAGEMENT

Question. Coopers & Lybrand just released its financial assessment of the FAA. The report concluded that "the FAA's core program managers have not demonstrated an understanding of financial management."

Last year, the FAA told this subcommittee that the congressional budget resolution for 1996 to 2002 left the FAA some $12 billion short over that time period, and this figure became known as "the gap."

I believe that the national air traffic control system is clearly a Federal responsibility. I believe that the FAA needs a stable and reliable source of funds. I look forward to that debate later this year.

However, I am concerned when the FAA points to a projected multi-billion funding dollar "gap," while I see no real movement towards internal reforms to promote efficient operation of the FAA.

Clearly, we will debate FAA reorganization at some point this year, and this will be a major issue for some Senators. However, meanwhile, what tangible steps have you taken to ensure that the taxpayers see an improved level of financial management at the FAA?

Answer. The FAA has taken numerous steps in the last three years to reduce personnel costs and reduce FTE levels as called for by the National Performance Review (NPR). Through the end of fiscal year 1996, the agency has been able to reduce overall FTE usage by 11.7 percent or 6,324 FTE. Cumulative savings as a result of FAA's downsizing exceed $1 billion through fiscal year 1996, with fiscal year 1996 savings estimated at over $400 million.

Since over 62 percent of the agency's work force is part of what is referred to as the "safety work force," the downsizing has been concentrated in the non-safety areas. The non-safety work force has been reduced by 18 percent through fiscal year 1996. Prior to the downsizing, administrative personnel accounted for only four percent of the total work force, which was already the lowest percentage among the departments of the Federal Government.

Some examples of efforts by the agency to streamline and achieve cost savings are as follows:

—Contracting Out of Level 1 Towers
  —85 Towers contracted out
  —Additional savings anticipated in fiscal year 1998
  —Supported by the NPR
—Airway Facilities (AF) Realignment
  —Reduced levels of AF organization in regions and field from 5 to 3
  —Nearly 900 supervisory positions eliminated
—Human Resource Management (HRM) Streamlining
  —HRM staffing reduced by over 400 positions since fiscal year 1993
  —Supervisory ratio increased from 1:5 to 1:15

FAA is continuing efforts to implement a cost accounting system by the end of this fiscal year. Work on this new cost accounting system began before the results of the Coopers & Lybrand assessment were available. The basic system will be in place by September 30, and continuous improvements will be made to the system to strengthen financial management in FAA.

Question. As you know, FAA procurement and personnel practices were relaxed last year, and this was intended to let the FAA modernization program move ahead. Was this a mistake in light of these studies and their conclusions about mismanagement?

Answer. The new personnel and procurement flexibilities provided to FAA have been beneficial. FAA has implemented the initial phase of new personnel policies and processes. Development of completely new personnel programs to replace the existing systems must be done in a thorough, systematic manner to ensure that new programs support the underlying objectives of reform, properly address problems with the existing system, and ensure fiscal responsibility. Procurement flexibility has allowed new contracts to be awarded in less time than under the previous system. This will result in avoiding cost growth due to longer program schedules.

HIGHWAY ALLOCATION ERROR AT DEPARTMENT OF TREASURY

Question. The DOT 1997 supplemental budget request includes $318 million to correct a Treasury Department accounting error that affected States' highway allocations. North Carolina lost $15 million in obligation authority due to this error. How hard will the administration push for this additional money from the Congress?

Answer. The administration believes this error should be rectified and is asking Congress to fund the correction.

MANAGEMENT OF HIGH-COST HIGHWAY PROJECTS

Question. As you know, the costs of large-scale highway projects continue to grow. The Boston Central Artery/Tunnel project is expected to top $10.4 billion.

The General Accounting Office (GAO) just released a report that encouraged the Federal Highway Administration (FHWA) to spread cost-containment strategies to State departments of transportation. The report concluded that FHWA was in a good position to spread the successful strategies to the States that lag behind in this area.

Do you agree with this conclusion?

Answer. The Department's surface transportation reauthorization proposal requires States to prepare financial plans as part of cost-containment for all projects estimated to cost $1 billion or more. Administratively, the FHWA has required fi-

nancial plans on the Central Artery project and the I–15 projects in Utah, and will continue to monitor costs on these projects.

Question. What steps will you take to implement these recommendations?

Answer. The FHWA will work with the States to implement these provisions and will share best practices of cost-containment as they are identified.

INACCURATE DOT STATISTICS

Question. When the so-called Baucus amendment was on the Senate floor last summer, many of us relied on charts prepared by the DOT. As it turned out, Department of Transportation charts and Federal Highway Administration charts conflicted in their data, and the final chart was admittedly wrong. As we move forward on the surface transportation reauthorization bill, we will again rely on DOT and FHWA charts.

What tangible steps have been taken to assure the accuracy of the DOT and FHWA charts that many of us will rely on?

Answer. The Department recognizes the importance of timely and accurate assistance to the Congress as it considers the complex issues associated with the distribution of funds among the States under reauthorized surface transportation assistance programs. In order to ensure that our technical assistance meets the standards we have set for ourselves and that you expect from us, FHWA has reorganized its technical assistance support staff to handle requests in a more timely and professional manner. An Apportionment Analysis Group has been established in the Office of Budget and Finance, with direct reporting links to the Acting Federal Highway Administrator.

FHWA also recently hired an outside contractor with expertise in this area to develop and operate a new model to analyze the distribution of highway funds among the States based on various proposals. We are now using that model, and believe it enhances our ability to serve the technical assistance needs of our many customers.

FHWA receives numerous requests for technical assistance on legislative proposals that often differ greatly in their basic program structure and design. This requires that FHWA utilize models that provide maximum flexibility to respond to many different highway program specifications. Given the importance to members of Congress of the computations of State-by-State shares under alternative program proposals, authorizing committee leadership (Chairman Chafee and Ranking Member Baucus of the Senate Environment and Public Works Committee, and Chairman Shuster and Ranking Member Oberstar of the House Transportation and Infrastructure Committee) asked the Comptroller General in a February 6, 1997, letter to validate the computer model being used by FHWA to provide technical assistance to the Congress. We welcome this review, which is currently underway, as we believe it will verify that the new model we are using contains all the attributes necessary to carry out this vital function.

SECTION 402 HIGHWAY SAFETY GRANTS

Question. I understand that the Section 402 Formula Grants for highway safety are among the most successful such programs. I note that the proposed budget freezes this appropriation at $140.2 million. The budget proposal increases other safety programs, such as anti-drunk driving initiatives and the National Motor Carrier Safety Program, so I wonder if this is a judgment on the Section 402 grant program.

What is your assessment of the Section 402 program?

Answer. The Section 402 program has been extremely successful in enabling all States to implement critical highway safety programs. Grants have leveraging effects and benefits far beyond their original amount. A recent assessment indicated that Federal funds have been vital for starting new programs aimed at improving traffic safety: 90 percent of the projects in 4 States were started entirely or partly with Federal grants as seed money. Every occupant protection project, every Community Traffic Safety Program, and each project to modernize traffic records began with Section 402 funds. Then, States and communities elect to take over the responsibility for projects begun with Federal funding. The assessment showed that 75 percent of the safety projects eventually obtained partial or complete funding from non-Federal sources and that 78 percent were eventually expanded to other areas of the State.

In addition, the Section 402 program is a major tool in the effort to reduce economic costs and reduce the Federal deficit. The benefits of traffic safety programs exceed their costs by very large ratios, up to 31-to-1. Even without factoring in pain

and suffering or loss of life, the economic benefits of traffic safety programs exceed their costs by a 9-to-1 ratio.

In NHTSA's fiscal year 1998 budget request, the consolidated Section 402 highway safety grant program, including formula and incentive grants, increases to $183.2 million from $165.2 in fiscal year 1997 ($140.2 million for formula grants and $25.0 million for Section 410 incentive grants).

QUESTIONS SUBMITTED BY SENATOR STEVENS

INTERNATIONAL OVERFLIGHT FEES

Question. Last year, the Congress gave DOT the authority to assess a user fee for international overflights, with the proceeds to help fund the EAS program. The legislation anticipated that these fees would not be levied on any flight with an origination or destination in the United States. It is my understanding that the administration is considering levying these fees on domestic Canadian flights and domestic Mexican flights that transit United States airspace. Is this accurate? When is the rule expected out?

Answer. The interim final rule was published in the Federal Register on March 20, 1997. Aircraft operations that transit U. S.-controlled airspace and do not land in, nor take-off from the United States, will be charged fees to recover the costs of providing air traffic control (ATC) and related services. Currently, overflights contribute nothing to the provision of FAA ATC and related services. The overflight fee for Canada-to-Canada operations is deferred until October 1, 1997. The deferral was given to allow time for U.S.-Canada consultations and NAV CANADA (the air traffic control agency of Canada) to implement its planned en route charge system, minimizing temporary disruption of air traffic due to the introduction of charges. No deferral was given to Mexican overflights. Given the pattern of Mexican aircraft operations, air traffic disruptions are not expected.

Question. Has the administration considered that the Canadian and Mexican governments might levy similar overflight fees on domestic U.S. flights that transit their airspace if we go down that path? Do you anticipate exempting domestic Canadian flights and domestic Mexican flights from this fee?

Answer. The administration does anticipate that Canada will levy overflight fees on U.S. domestic flights. Within the next two years, NAV CANADA will be required to become a fully user-fee-funded entity. Consequently, NAV CANADA will be required to recover all of its costs, including the cost of providing air traffic control services to U.S. domestic flights. The Canadian Government has presented a Note to the Department of State proposing consultations in early May to discuss overflight fees. We are in the process of setting a mutually satisfactory date for those discussions.

WIND PROFILING RESEARCH

Question. I've recently been briefed by representatives of the FAA and other organizations about some anemometer and wind profiling efforts that are ongoing in Juneau, Alaska. The effort that is underway will allow carriers to use the Gastineau Channel routes in a way previously not possible in ground-induced turbulence conditions, improving safety, and addressing the wind speed concerns that have led to a number of flight delays and cancellations. What the FAA is pursuing with Alaska Airlines and the National Center for Atmospheric Research (NCAR) is similar to what NCAR and the FAA did for the new airport in Hong Kong. This project should fit nicely with the HALASKA initiative, and I commend the effort to your attention and look forward to working with the Department to develop this new capability.

Does this particular initiative fit into the HALASKA effort, or more broadly, the Free Flight 2000 initiative?

Answer. While this capability is not specifically one of the free flight capabilities planned for Flight 2000, we are currently developing a program plan that will include weather initiatives, and this capability will be considered. The program plan is scheduled to be completed by the end of June.

FREE FLIGHT

Question. The term "Free Flight" has been discussed in many aviation publications in the past several months. In your view, how will this initiative provide the architecture and the tools to meet the projected 40-percent increase in flight operations by the end of the decade—and what shifts of resources will it require within the FAA?

Answer. The free flight initiative consists of an operational concept and a joint government/industry consensus list of 46 recommended actions necessary to evolve toward a mature free flight environment. These recommendations provided focus to the development of a complete architecture and a set of technologies and procedures necessary to meet the increased demand for services. This is outlined in the proposed FAA Architecture Version 2.0. The current FAA/industry review of Version 2.0 will help identify the appropriate shifts in resources necessary to gain free flight efficiencies in the earliest possible time frame. The architecture will implement the free flight enhancements recommended through the government/industry consensus process necessary to meet the projected traffic growth through the end of the decade and the 40-percent increase in passenger enplanements and the resulting 15-percent increase in air traffic operations forecast by the year 2006.

COMMUTER RULE

Question. Mr. Secretary, I want to draw an FAA rule to your attention that has a dramatic effect on Alaska. The rule is known as the "Commuter Rule," and requires that all airlines with scheduled service using planes with 10 or more seats conform to Part 121 requirements—the same rules that apply to jetliners. For almost all Alaska's air transportation markets, the increased economic burden represented by this rule renders 10- to 19-seat aircraft non-economic.

At present, most carriers with scheduled service in Alaska operate under Part 135—which is a much lower level of regulatory burden. The preamble to the "Commuter Rule" stated that "there are scheduled operations using airplanes of less-than-10 passenger seats conducted under Part 135, but they typically occur in geographic areas such as Alaska and Hawaii where air transportation is virtually the only feasible mode of transportation and where the operational environment is unlike other air transportation environments." Alaskan air operations with 10- to 19-seat aircraft are typically short-haul operations often carrying only 4 to 6 passengers—the additional aircraft capacity is utilized for cargo movement, mail movement, medivac evacuations, and other special needs that are unique to Alaska. They resemble air taxi operations more than commuter operations even though the flights are scheduled.

By comparison, the FAA's "Commuter Rule" was designed to cover operations for lower-48 carriers that either already operated under Part 121, or whose operations certainly resemble the operations of the large national carriers more than they do the typical Alaskan operation with 10- to 19-seat aircraft.

Last year, Senator Murkowski, Congressman Young, and I had a series of meetings with then-FAA Administrator Hinson about this matter. We informed him that over half the fleet of 10- to 19-seat aircraft had already been removed from service in Alaska—even though the rule was not in full effect—and that the other half of the fleet was anticipated to leave scheduled service by March of this year. We provided discretionary authority that would allow the FAA to view Alaska differently as they considered rulemakings. Unfortunately, the FAA has failed to use that authority.

While the FAA contends that the Commuter Rule will lead to greater safety nationwide in the 10- to 19-seat aircraft category, for every one of the 10- to 19-seat aircraft that leaves the fleet mix in Alaska, twice the number of flight operations must be made with less-than-10-seat aircraft (which still operate under Part 135) to move the same amount of people and cargo as would otherwise be moved in 10- to 19-seat aircraft. The net effect of this rule has been to reverse a 20-year trend toward the use of turboprop aircraft in Alaska—turboprop aircraft are more technologically advanced, better suited for the terrain, and the shifting weather conditions that characterize many areas of my home State.

Further, the safety record of 10- to 19-seat aircraft is the best for any category of aircraft operating within the State. The new commuter rule will require the increased burden of new dispatch rules, new communication protocols, new maintenance manuals, new operational manuals. In Alaska, many of the communications requirements are not possible—a fact that FAA has conceded as well as some other maintenance items. However, they refuse to modify the rule to save this class of aircraft operations in Alaska.

Given the safety record of these aircraft, I would really like to know how many of the accidents over the last several years in Alaska would have been prevented by the application of the Commuter Rule.

Mr. Secretary, rural Alaskan consumers are beginning to lose service with these larger turboprop aircraft, because the FAA regulations are forcing aircraft choice on carriers. This is really the wrong way for equipment decisions to be made, and may have significant safety consequences for Alaska.

My question is, have you had an opportunity to look into this situation? Do you have any thoughts for me as to how the FAA may proceed in this arena?

Answer. First, the Commuter Rule was designed to cover ALL commuter operations, including those in the State of Alaska. This rulemaking was based, in part, on safety recommendations from the National Transportation Safety Board (NTSB). These recommendations included Alaska commuter operations, although specific site visits were not conducted in Alaska as part of the NTSB's study. Many exceptions were provided for the 10- to 19-seat fleet based on specific comments from Alaska carriers and the Alaska public. These comments were provided to the regulatory docket.

During the implementation period, specific issues were raised by Alaska carriers that were resolved through exemption relief, operation specifications, or regulatory amendments. Examples of these include relief to use the Part 135 weather reporting and visibility minimums in remote areas, relief from some of the dispatch enroute communications requirements due to lack of infrastructure in parts of Alaska, and relief to carry personal medical oxygen by passengers in Alaska.

The statement that over half the fleet of 10- to 19-seat aircraft had already been removed from service in Alaska is not supported. A review and survey of all carriers shows that some carriers did go out of business in Alaska, but these actions were due to bankruptcy or lost leases or other financial reasons independent of and before the commuter rulemaking. Five carriers were in business and impacted by this rule in Alaska. The following represents the status of those carriers:

1. Pen Air. This carrier was the first in the country to transition to Part 121. Since their transition, they have added one, and are in the process of adding a second, 30-seat Saab aircraft, resulting in increased passenger seat availability. Exemption relief was provided for the carriage of medical oxygen. Actions are currently being taken to accelerate the installation of Automated Weather Observing Station weather reporting in Atka to meet the weather reporting requirements for this carrier.

2. Seaborne. This is a seasonal carrier that operates in Alaska during the summer months. Seaborne completed the recertification and did not require/request any exemption relief. They will conduct additional validation flights upon their return to Alaska in the May time frame.

3. ERA. This carrier completed the recertification. They did request, and were given, specific dispatch and some weather relief for their Bethel remote area operations. There was no loss of passenger seat availability or service in remote areas.

4. Frontier. This carrier did not meet the recertification deadline but is continuing the recertification efforts. The FAA has dedicated a team of inspectors to assist in these efforts. Exemption relief for remote area operations will be provided.

5. Cape Symthe. This carrier withdrew its transition plan. They operate a fleet of 9- or fewer-seat airplanes in addition to 3 turbine-powered Beech 99 airplanes. They are continuing to operate these three turbine-powered airplanes, but have removed seats to operate them in the nine- or fewer-seat configuration. The carrier states that operations with more than nine seats represents less than two percent of their operation. The FAA will continue to work with this carrier if it elects to transition and similar exemption relief will be provided.

The net effect of this rule is provision for the highest level of safety of operations in the United States, including Alaska. The agency has used the legislation provided for regulatory amendments, exemptions, or operations specifications relief for Alaska commuter operations. This legislation has also been used to address the needs of other Alaska carriers. It formed the basis for the Single Engine Instrument Flight Rule Notice of Proposed Rulemaking that addresses the needs of on-demand operations in single-engine airplanes. This rulemaking directly responds to requests from the Alaska Air Carrier Association and to the NTSB safety study in Alaska.

The FAA is also working with the above groups to study safety policies and regulations dealing with in-flight icing. The FAA has already issued several airworthiness directives that address in-flight icing for turbo-propeller aircraft and has also issued operational bulletins to this part of the industry. Also, as part of the FAA's in-flight icing efforts, the FAA has developed an in-flight icing plan that outlines several recommendations to improve safety for inadvertent flight into icing conditions. The FAA plans to implement as many of these recommendations as possible prior to the 1997–98 winter season.

DOT RESOURCES DEVOTED TO COMMUTER RULE RULEMAKING

Question. Please provide a breakdown of the OST/FAA FTEs and budget authority that can be attributed to the "commuter rule" rulemaking.

Answer. The FAA and the Office of the Secretary of Transportation accumulated costs of approximately $3.5 million in developing the commuter rule, beginning with the initial drafting of the rule in December 1994. Costs include dedicated rulemaking teams in the FAA headquarters, the regional offices, and field personnel involved in the data gathering; drafting of the rule; legal and economic support; public meetings; developing guidance for the FAA inspector workforce and industry; and working on implementation issues. The Department estimates that in the period between December 1994 and final implementation of the rule in March 1997, a total of 30 full-time equivalent staff were devoted to the commuter rule.

QUESTIONS SUBMITTED BY SENATOR LAUTENBERG

DOT STANCE ON 0.08 BLOOD ALCOHOL CONTENT LAWS

Question. When it comes to determining the appropriate Blood Alcohol Content (BAC) level for prosecuting drunk drivers, NHTSA has determined that drivers become significantly impaired at 0.08 BAC. NHTSA also found that the risk of being in a crash rises gradually as the BAC level increases, but then rises very rapidly after a driver reaches or exceeds 0.08 BAC.

Don't you think we need to take a more aggressive stance to get the States to adopt 0.08 for prosecuting drunk drivers?

Answer. Yes. NHTSA has been actively working to get States to adopt 0.08 BAC laws to reduce drunk driving. NHTSA has employed convincing research and timely technical assistance combined with public education and public support. Efforts such as these have resulted, for example, in Idaho becoming the 14th State to adopt a 0.08 BAC law. NHTSA will continue to provide useful support like the new publication "Setting Limits, Saving Lives—The Case for .08 BAC Laws" to its public partners to inform, educate and encourage the adoption of lower BACs in the States. In addition, the Department's reauthorization proposal in NEXTEA includes an alcohol incentive grant proposal that rewards States for enacting a 0.08 BAC law.

INCENTIVE GRANTS FOR 0.08 BAC

Question. Current law provides incentive grants to States that adopt 0.08 BAC. Even so, only 13 States have adopted this standard since it is fiercely opposed by the restaurant and tavern lobby. Now, your ISTEA proposal expands the existing incentives for going to 0.08 BAC.

Are you confident that expanded incentives will do the job in getting more States to adopt 0.08 BAC?

Answer. The Department has learned that incentive grants are effective in encouraging States to pass critical laws to reduce drunk driving. Since the passage of the amended Section 410 program in ISTEA in December 1991,

—Nine States have enacted 0.08 BAC laws. (A total of 14 States have 0.08 BAC laws.)

—34 States plus the District of Columbia have enacted 0.02 BAC laws for drivers under age 21. (A total of 37 States and DC have .02 BAC laws for drivers under 21.)

—Ten States have enacted administrative license revocation (ALR) laws. (A total of 39 States and DC have adopted some form of ALR.)

The Department believes that the new alcohol incentive grant proposal contained in NEXTEA places more emphasis than the current Section 410 program on adoption of 0.08 BAC laws as a means to receive funds. Under the current program, States can qualify for grant funds by implementing five out of seven laws or programs designed to reduce drunk driving. One of the seven requirements calls for a 0.10 per se law, and only after three years of grants is a 0.08 per se law required; therefore, States had many other options and several years of funding before considering passage of 0.08 laws as a route to receive incentive funds. Under the new proposal, there are three options for a State to qualify for funding—one option is by implementing four out of five specified laws and programs, the second is demonstrating specific performance, and the third is by enacting only two key laws: administrative license revocation and 0.08 BAC. States can qualify for funding under one, two, or all three options. However, this third option will more clearly focus State attention on 0.08 BAC laws as a means to qualify than the Section 410 approach.

HIGHWAY FUNDING SANCTIONS TO ACHIEVE 0.08 BAC STANDARD

Question. We have seen that highway sanctions HAVE done the job when it comes to getting States to do the right thing regarding drunk driving. And while I do not

usually propose legislation that could possibly sanction my own State's highway funds, I am prepared to do so to push New Jersey to do the right thing.

What would be your view of a bill that sanctioned highway funds from States that do not adopt 0.08 BAC after a reasonable period of time?

Answer. The Department supports 0.08 BAC. While the Department has witnessed success through the use of incentive grant programs to encourage passage of such legislation, the Department is open to considering a full range of options.

SANCTIONS VERSUS INCENTIVES

Question. In your formal opening statement, you correctly point out that we face a daunting challenge in reducing the fatality rate on our Nation's highways. A prestigious researcher at Boston University recently compared the number of alcohol-related deaths in the first five States that lowered their BAC limit to 0.08 to five nearby States. He found clear evidence that lowering BAC levels to 0.08 reduced the number of alcohol-related fatalities. Indeed, he estimated if all States lowered their BAC limits to 0.08, alcohol-related highway deaths would decrease in the United States between 500 and 600 per year.

Wouldn't you conclude that a sanction that pushed the States to adopt 0.08 would have a more immediate effect in saving lives than continuing or expanding incentive grants?

Answer. The Department has observed that incentive grant programs have been successful in pushing States to pass life-saving highway safety laws.

FAA PERSONNEL REFORM AND NEW YORK-NEW JERSEY CONTROLLER STAFFING SHORTAGES

Question. Mr. Secretary, in your formal opening statement, you call attention to the fact that the FAA personnel reform authority, which we included in the 1996 appropriations bill, has enabled you to hire the best people possible in the most effective way.

However, when we agreed to grant the FAA these personnel reform measures, it was in part with the intent of giving the agency the tools to get the right people in the right place at the right time. For years now, I have been frustrated with the FAA's inability to get the authorized numbers of air traffic controllers in place at the several air traffic facilities in my region.

Notwithstanding promises to the contrary, the number of controllers at the air traffic control tower and Newark Airport are almost ten percent below the authorized level. The same is true for the New York area TRACON, and staffing at the New York Air Traffic Control Center. It is 12 percent below the authorized level.

Given the far-reaching personnel reforms that we granted to the FAA in 1996, what explains these continued delays in getting the right number of controllers in the right place as soon as possible?

Answer. There are delays, unrelated to the personnel rules, associated with the recruitment, testing and selection of controller candidates. Overall controller hiring will be at an even rate of about 85 per month starting in April 1997. Newark Tower is scheduled to receive seven controllers in fiscal year 1997, four of whom are already onboard. Similarly, New York Air Traffic Control Center is scheduled to receive 42, of whom at least 12 are onboard. New York TRACON will receive a total of 22 in fiscal year 1997, of whom at least 4 are on board. All current and future hiring will be accomplished in a manner that allows sufficient time for required facility training.

Question. We continue to hear reports that trainees at these facilities cannot get fully qualified in the jobs that they are there to study because all available controllers are handling aircraft, and do not have the time to perform their training functions.

What is being done to address this problem?

Answer. We are implementing plans to increase staffing at New York area facilities. In addition, we have recently increased overtime funding for New York Center by $735,000 to optimize the on-the-job training of new hires.

In addition, we have developed some management controls at New York Center, such as: (1) the establishment of a stand-alone training department; (2) a staff manager for training; (3) assignment of two training specialists and two data analysts to the training department; and (4) six operations supervisors (one from each area to assume collateral training duties).

Question. What is your target date to get all of the facilities in my region staffed to the area called for by the FAA's own staffing plan?

Answer. The projected date to reach targets for full-proficiency-level controllers is September 30, 1998.

DIRECT AIR LINKS BETWEEN NEW JERSEY AND JAPAN

Question. Mr. Secretary, in March of 1996 United Airlines canceled the only non-stop service from Newark International Airport to Tokyo. Last year, over 85,000 passengers flew between New Jersey and Japan. New Jersey exported over $1.5 billion worth of goods to Japan's markets. Newark should have non-stop service to Japan.

What can you do to replace this critical air service with a carrier like Continental that has a vested interest in serving the Newark-Tokyo market?

Answer. Under existing aviation agreements with Japan, the United States does not currently have the right to designate a new carrier like Continental to serve the Newark-Tokyo market. However, we are now engaged in exploratory talks with Japan that we hope will lead to formal negotiations and an agreement that will open up additional opportunities for U.S.-Japan air services, including the opportunity for carriers like Continental to enter the Newark-Tokyo market.

Question. As an interim step would you consider allowing a carrier to take over the service as a replacement carrier?

Answer. Until the U.S. succeeds in negotiating additional rights, the only U.S. carriers authorized under the U.S.-Japan aviation bilateral agreements to operate nonstop Newark-Tokyo services are United Airlines, Northwest Airlines and Federal Express. Although these three airlines are authorized to serve the New York (Newark)-Tokyo market, we cannot require that any of these airlines serve a particular market. It is up to airline management to decide what markets it will serve.

QUESTIONS SUBMITTED BY SENATOR BYRD

HIGHWAY TRUST FUND BALANCES

Question. The Budget Reconciliation Act of 1991 saw to it that an additional two-and-a-half cents of the Federal gas tax began being deposited in the Highway Trust Fund at the beginning of fiscal year 1996. These new deposits, in combination with the increased amount of gas consumption, have substantially increased the balances of available resources in the Highway Trust Fund.

Under your budget proposal, how much will those balances grow over the six years of the next highway bill?

Answer. Under our NEXTEA and budget proposals and planning numbers for FYs 1998 through 2003, at the end of fiscal year 2003, the termination date for the reauthorized program, the cash balance in the Highway Trust Fund will be $48 billion, an increase of $24 billion from the $24 billion balance projected for the end of fiscal year 1997. We are proposing authorization levels in NEXTEA that are higher than outyear planning numbers in the budget. If the economic and deficit pictures improve beyond current projections, actual obligation levels might be higher than current planning levels and, as a result, Trust Fund balances could be lower than these projections.

USE OF TWO-AND-A-HALF CENTS

Question. Is it correct to say that the two-and-a-half cents that began being deposited in the Highway Trust Fund at the beginning of last year will not even be used under the highway spending figures assumed in your budget request?

Answer. Yes.

APPALACHIAN HIGHWAY SYSTEM

Question. Several weeks ago, the Chairman of the House Budget Committee held a press conference with other Members where they identified several Federal programs as "corporate welfare." I was astounded to learn that this group identified the Appalachian Development Highway System as an example of corporate welfare. The Appalachian Highway System was conceived to bring economic development to some of the most isolated and impoverished communities in the United States.

Mr. Secretary, can you imagine any definition of the phrase "corporate welfare" that can be made to include the Appalachian Highway System?

Answer. The Appalachian Highway System is a strong supporter of industry and tourism and enables the region's residents to move freely between their homes and jobs, schools and other public facilities. It is quite opposite of welfare in that it has enabled the creation of many new jobs and increased the ability of the Appalachian people to compete for jobs wherever they choose to work and live.

Question. I am grateful that you accepted my invitations to tour segments of the Appalachian Highway System in West Virginia. What were your personal observa-

tions during your tour of the Appalachian Highway System in West Virginia regarding the economic benefits that the Appalachian Highway System has brought to the region?

Answer. I was impressed by the beauty of the region, but also by the difficulty of construction. Significant economic benefits were evident both in the Corridor D area adjacent to Parkersburg and along Corridor G from Charleston to Williamson, including a new development near Charleston called Southridge, construction of another large development in the Logan area, and, in general along both corridors, considerable traffic volumes and residential and business development.

EMERGENCY RELIEF PROGRAM FUNDING

Question. Mr. Secretary, the recent tornados in Arkansas, as well as the severe flooding in my region of the country, come on the heels of earlier floods that impacted California, the Pacific Northwest, as well as the Midwest. Absent any supplemental funding, your Department will be limited to $100 million in emergency relief funding for this fiscal year.

Can you give us a preliminary assessment of the needs for emergency highway relief funding at the current time? What's the available balance in the Highway Emergency Relief sub-account?

Answer. The administration has submitted a fiscal year 1997 supplemental emergency funding request of $291 million for the emergency relief program. All available emergency relief funds have been allocated to the States.

Question. At present, do you expect to have sufficient funds to cover all of the highway restoration projects eligible for emergency relief for this fiscal year?

Answer. No. A supplemental appropriation will be needed.

Question. Do you have a sense of what amount of emergency supplemental funds will be needed?

Answer. The administration has submitted a fiscal year 1997 supplemental emergency funding request of $291 million.

Question. Do you know if and/or when the administration plans to seek an emergency supplemental for highway restoration funds?

Answer. The supplemental was submitted March 19, 1997.

PERFORMANCE OF AUTOMATED SURFACE OBSERVING SYSTEM AT AIRPORTS

Question. Mr. Secretary, on February 19, I sent a letter asking you to suspend the removal of contract weather observers from airports in West Virginia until you can certify that safety would not be compromised once they are removed. As I said in that letter, I have heard a number of complaints from airports in my State regarding the poor performance of the Automated Surface Observing System (ASOS). These automated weather observation systems are intended to replace these contract weather observers. However, they have been consistently reporting inaccurate weather conditions, especially during inclement weather.

What can you tell me regarding how the ASOS systems are performing across the country?

Answer. There are 389 commissioned ASOSs, sponsored by FAA or the National Weather Service (NWS), operating at airports throughout the Nation. Fifty-six additional systems are in the evaluation phase that precedes commissioning. ASOS observations comply with Federal aviation requirements.

A 6-month demonstration conducted at 22 operational ASOS locations in 1995 showed ASOS performance to be comparable with that of human observers in all critical aviation weather elements. This demonstration was sponsored by the FAA and NWS with participation by controllers, observers, and pilots.

The FAA is actively pursuing improvements and advances in ASOS sensor technology. Testing of an independent thunderstorm and lightning detection/reporting capability that will interface with ASOS is expected to be complete in late summer 1997, with national implementation planned by December 1997. Sensors that detect freezing precipitation have been purchased and are being installed. Additional enhancements are being included through a product improvement program.

In August 1996, the FAA began implementation of new Aviation Service Standards at airports with a commissioned ASOS. Developed in conjunction with industry and the NWS, the standards define four categories of aviation weather service. The standard level of service to be provided at an airport will be based on the occurrence of significant weather, aviation activity, distance to the nearest suitable alternate airport, and critical airport characteristics. Service provided under the new standards will range from ASOS operating in a "stand-alone" mode at low-activity airports, to ASOS operating with full-time augmentation and back-up at the high-activity major airports.

Question. Have you heard similar complaints regarding the ASOS systems from airports in other regions of the country?

Answer. The National Weather Service is responsible for the performance, maintenance, and logistical support of ASOS. The FAA's primary focus has been on operational issues that address user perceptions of ASOS and the acknowledged and truly distinct differences between human observations and those provided by automated systems.

The FAA has received a number of complaints from individuals employed as contract weather observers. A significant number of these complaints focus on the differences between reports generated by ASOS and those prepared by human observers or weather parameters that are not reported by ASOS. Complaints of this nature will be a major focus in the upcoming 120-day evaluation of ASOS at selected locations.

Question. What is your schedule for evaluating the capability of the ASOS systems in West Virginia?

Answer. The FAA will conduct a 120-day assessment of the ASOS system at selected locations, including all of the sites in West Virginia. The assessment will focus on sites with contract weather observers and the comments generated by those individuals over the past year. The assessment performed will include some combination of the following:

—field comparison of ASOS observations and manual observations for a length of time at each test site and analysis of discrepancies between the two observation types;

—pilot and airport operator feedback from user meetings at each test site; and

—evaluation of pre-commissioning certification data performed by the NWS for each test site.

ASOS commissionings in West Virginia have been placed on hold and the contract weather observers will be retained at all locations within the State, at least until the assessment is completed.

The selected test sites will include all sites at which contract weather observation was scheduled to be terminated within the next 120 days. We intend to address the perception of ASOS inadequacy, identify corrective measures where necessary (possible relocation of sensors, changes to software, etc.), and education of users on ASOS reporting capabilities.

Concurrent with this performance evaluation, the FAA will conduct an overall availability assessment by remotely gathering information from a representative sample of commissioned ASOS sites. This assessment will address site technical data such as system and sensor availability, frequency of augmentation by weather parameter, and frequency of backup by sites and by weather parameter.

The information gathered from these two assessment activities will be utilized in the overall annual Aviation Service Standards review to determine needed changes in weather elements reported at each service level, any change in ranking criteria, airport operations data or airport characteristics, and to identify, prioritize, and develop action plans to resolve personnel or equipment performance or procedural problems. The annual review will cover all ASOS sites, commissioned or not commissioned, whether they belong to the FAA or the NWS. An industry/government workshop will be conducted in April to present the plans for assessment and to obtain feedback from industry representatives on the implementation of the Aviation Service Standards over the past year.

Question. At this point, are you confident that the contract weather observers can eventually be removed from West Virginia airports and the ASOS systems will serve as adequate replacements for the contract weather observers without safety being compromised?

Answer. Yes. The ASOS provides observations in full compliance with documented Federal aviation requirements. The four parameters required for an instrument landing are wind, visibility, altimeter, and time of observation. The ASOS goes well beyond these requirements by also providing precipitation type and accumulation, cloud height, temperature, dew point, and selected significant remarks such as variable cloud height. Freezing rain sensors are being deployed at qualified sites, and FAA will begin to implement a thunderstorm reporting capability later this year.

The FAA is confident that the combination of service standards, product improvement plans, and an effective quality control program will address the concerns that have been raised regarding the performance and reliability of ASOS. Safety is and will remain the FAA's number-one priority.

QUESTIONS SUBMITTED BY SENATOR KOHL

REDUCTIONS IN AIRPORT IMPROVEMENT PROGRAM

Question. The President has proposed a funding level of $1 billion for the Airport Improvement Program (AIP) in fiscal year 1998, $460 million or 31 percent below the fiscal year 1997 level. The proposal includes increases for FAA safety personnel—air traffic controllers, safety and certification inspectors—yet decreases AIP, the core program of Federal investment in our aviation system and our primary mode of assisting those at the front line, the men and women responsible for day-to-day operations, safety and security at airports across the country.

My State of Wisconsin received approximately $20 million under the AIP formula and discretionary accounts in fiscal year 1996. Fiscal year 1997 figures are not yet available; however, the Wisconsin Department of Transportation predicts that Wisconsin airports could face precipitous and unforeseen reductions of $7 to $10 million under the President's proposal for fiscal year 1998.

Mr. Secretary, would you please take a moment to discuss the AIP reduction in the context of the U.S. Department of Transportation's (DOT) vision for the whole aviation system? In particular, how does DOT expect airports to cope with such significant reductions in core funding at a time of increased security requirements and record levels of passengers?

Answer. I agree that AIP is an important program, but the reduction of AIP does not mean that safety and security needs will go unmet, or even that all construction on airports will stop. The airport industry generally has the ability through its own revenue production activities, the collection of Passenger Facility Charges (PFCs), and other financing options, to continue needed airport development in the face of a smaller AIP. In making the hard budget choices, one consideration was these other sources of funding for airport development.

In contrast, we believed it necessary to maintain levels of funding for programs that do not have as well-developed alternative methods of funding, such as FAA's Facilities and Equipment program, personnel and operations funding, and our Research, Engineering and Development program.

The majority of airport development dollars (75 to 80 percent) traditionally come from sources other than the AIP. We believe that other fund sources, such as issuance of bonds by airport sponsors and PFCs, in addition to the AIP level we have proposed, will be available to undertake needed airport development.

COAST GUARD ICEBREAKING USER FEES

Question. The President's Budget instructs the Coast Guard to formulate a user-fee system for domestic icebreaking by fiscal year 1999. As you know, annual domestic icebreaking occurs almost exclusively on the Great Lakes and is crucial to both the regional and national economies. The Great Lakes region comprises nearly half of our national industrial and agricultural output and approximately one-third of our population. Without seasonal icebreaking, the economic impact would be felt across the country—in steel mills lacking iron ore, public utilities waiting for coal shipments, and all the world markets that rely upon the export of Midwestern grain. Icebreaking is also necessary in other areas of the country such as on the Hudson River or the Boston Harbor, and is only one of many services provided by the Coast Guard. Other Coast Guard services include such services as buoy tending and other navigational aid maintenance, vessel traffic control services, and many others.

I have strong concerns about the President's icebreaking proposal. As I've mentioned, the Coast Guard provides a whole host of services across all port ranges, and very few of these services are funded by user fees. It seems highly inappropriate for one narrow service to be singled out in this manner, especially when it would have such a grave impact on the economic viability of one specific port range.

Can you explain the administration's rationale for singling out Coast Guard icebreaking services to be funded through a user fee, when most other Coast Guard services are funded through regular appropriations? For the record, could you provide the Subcommittee with a list of all services provided by the Coast Guard, and itemize which of these services are funded through user fees? Have you consulted with the Saint Lawrence Seaway Development Corporation, another agency under the jurisdiction of the U.S. Department of Transportation, to better understand how this proposal would affect their efforts to attract vessels to the Great Lakes?

Answer. The administration intends to propose legislation to allow the assessment of user fees beginning in fiscal year 1999 for domestic icebreaking services provided by the Coast Guard. The administration's proposal is consistent with other applications of user fees where discrete services are provided to an identifiable commercial

activity user group that benefits from the service. In this case, the user group is commercial vessels operating during the ice season in the Great Lakes and northeastern U.S., and the commercial activity is the transport of cargo. The following vessels are excluded from the proposed fee: recreational vessels, fishing vessels, fish processing vessels, fish tender vessels, passenger vessels, ferries, public vessels, and vessels not traveling to or from a U.S. port.

Services provided to the public by the Coast Guard are categorized within seven major program areas: Search and Rescue; Enforcement of Laws and Treaties; Marine Environmental Protection; Marine Safety; Aids to Navigation; Ice Operations; and Defense Readiness. Services funded through user fees are listed in the Coast Guard User Fee Report, which is submitted to Congress annually. Of these existing user fees, nearly all fall within the marine safety mission area.

As the legislative proposal is developed, consultations are in progress with the Saint Lawrence Seaway Development Corporation concerning the user fee legislation and the impact of the legislation on the Corporation's efforts to attract vessels to the Great Lakes.

TRANSIT FORMULA FACTORS

Question. The President's Budget contains a number of significant changes to the Mass Transit Account. Most notably, transit discretionary grants have been folded into the formula program, and transit operating assistance has been eliminated for all but the smallest systems. It is my understanding that formula grants are currently distributed according to several factors, including population density, population and vehicle miles traveled (for the larger systems).

In addition, under the Federal Transit Administration, the President has requested $100 million for transportation assistance to welfare recipients. This effort to address one of the most crucial elements of successful welfare reform—transportation—is to be commended. Finding a job is only meaningful and sustainable progress if a person can get to work on time and secure a ride home once that work is done. For example, according to the Wisconsin Department of Transportation, in Milwaukee's central city, 64 percent of the residents do not have access to an automobile, and 17 percent of residents do not even have a valid driver's license. These figures demonstrate the vital importance of mass transit options in securing mobility for all. I look forward to working with you and the administration on implementing this new program.

On the other hand, I am concerned about the proposed compilation of transit distributions under the formula program. My State of Wisconsin has 1.6 percent of the urbanized-area population nationally, yet under the transit formula program, in fiscal year 1997 Wisconsin received only 1.2 percent of the formula distribution. That difference, 0.5 percent, may seem small, but in dollars it translates to $7.7 million, a very significant amount of money for Wisconsin's transit systems.

Mr. Secretary, would you please explain what factors are used to determine transit formula distributions and the respective weight of each individual factor? Also, would you please explain the role of population density as a criteria for transit formula distributions? Specifically, why does population density play a role for areas with populations over 200,000, even though it is not considered when determining distributions for areas with populations below 50,000, or transit assistance for the elderly and disabled?

Thank you again for your consideration. Again, I look forward to working with you on these and other issues.

Answer. The Urbanized Area Formula Program is distributed by a statutory formula based on urbanized area and transit service characteristics. It is designed to provide assistance based on relative needs for transit.

Of the funds provided, 9.32 percent is allocated to areas of under 200,000 population. Of this amount, 50 percent is apportioned based on urbanized area population, and 50 percent based on urbanized area population weighted by population density (population per square mile).

The remaining 90.68 percent is allocated to areas over 200,000 population. Of this amount, 33.29 percent is allocated by a formula reflecting fixed guideway needs. The fixed guideway tier has two parts. The first 95.61 percent of the fixed guideway tier is allocated 60 percent based on fixed guideway revenue vehicle miles, and 40 percent based on fixed guideway route miles. The remaining 4.39 percent is allocated by an incentive formula designed to reward service efficiency and effectiveness. This allocation is based on fixed guideway passenger miles weighted by fixed guideway passenger miles divided by fixed guideway operating costs.

The remaining 66.71 percent of the funds for areas over 200,000 is allocated by a formula reflecting bus needs. The bus tier also has two parts. The first part is

the basic formula, which comprises 90.8 percent of the bus tier funds. Of the basic bus tier amount, 73.39 percent is allocated among areas over 1,000,000 population, of which 50 percent is based on bus revenue miles, 25 percent is based on population, and 25 percent is based on population weighted by population density. The remaining 26.61 percent of the basic bus tier is allocated to areas under 1,000,000 population, of which 50 percent is based on bus revenue miles, 25 percent is based on population, and 25 percent is based on population weighted by population density. The second part of the bus tier is the incentive tier, and is allocated based on bus passenger miles weighted by bus passenger miles divided by bus operating costs.

In summary, population density is used to weight population in allocating 50 percent of the funds for urbanized areas under 200,000 (which account for 9.32 percent of the total), and 25 percent of the basic bus tier funds for areas over 200,000, (which account for 54.93 percent of the total). Thus, population density-weighted population is a factor in 18.39 percent of the allocation.

Population density is used as a factor to account for the greater transit needs in dense urban areas. Fixed-route transit works best when population densities are high, since traffic congestion is generally higher in such areas and additional population density results in a higher number of potential transit riders. Population density is not used in the non-urbanized and specialized program formulas, since their services are generally provided on a demand-responsive basis where population density is substantially less important. Instead, these programs are allocated based only on non-urbanized area population, and numbers of elderly and disabled persons, respectively.

QUESTIONS SUBMITTED BY SENATOR MURRAY

FLEX FUNDING POSSIBILITIES

Question. I wanted to first thank Secretary Slater and tell this committee how I met our new Secretary. He had been in office less than a week when he traveled unexpectedly, over 3,000 miles to the most remote corner of our mainland, to join myself, Commandant Kramek and the community of La Push, Washington. In an emotional farewell, the Secretary honored three Coast Guardsmen who lost their lives rescuing a distressed sailboat off the Washington Coast. I can tell you, Mr. Secretary, that your remarks and presence there that day are immeasurable. It meant so much to the families of these heros, the entire Coast Guard community and the Quillayute Indian Tribe who shares this community.

Mr. Secretary, I also wanted to commend the work of your deputy assistant secretary John Horsley. John was a long-time County Commissioner from the State of Washington and has been a tremendous asset to your Department.

Mr. Secretary, as you flew over the Olympic Peninsula in my State, you had the opportunity to view its natural beauty. This area surrounding the Olympic National Park is an unspoiled treasure and has become a destination for cyclists from around the State and Nation. However, logging trucks and cyclists do not mix well and we have witnessed unfortunate tragedies over the last few years. I have been working with 7 different communities around this Peninsula who are voluntarily constructing a 360-mile bike trail. We have used Scenic Byway funds and hope to expand these dangerously narrow road shoulders. I wanted to get your sense of Enhancement and CMAQ funds, along with future possibilities for safety improvements that can be used by our communities in a flexible manner.

Answer. Washington State has received $404,539 in Scenic Byways discretionary funds for the construction of pedestrian and bicycle facilities along Highway 101. The administration's surface transportation reauthorization proposal continues the National Scenic Byways program. There would be $15 million available each fiscal year to fund eligible scenic byways.

Several categories of Federal-aid funds are available for development of bicycle facilities and improving their safety. These facilities are one of the eligible activities under the transportation enhancement provisions of ISTEA. ISTEA provided that ten percent of the Surface Transportation Program (STP) funding was to be used for ten specific activities identified in the legislation; bike and pedestrian facilities are part of that list.

Under the administration's proposal for NEXTEA, we continue to fund project activities for transportation enhancements to the same or greater extent as we have done under ISTEA. We have found the program to be a major contributor to our efforts to participate in the President's initiative to sustain our communities

through a variety of measures that will spur economic development while maintaining the true sense of community connectivity.

The Congestion Mitigation and Air Quality (CMAQ) program is another source of funds that could be used for bicycle and pedestrian trails, provided the project is located in a nonattainment area and the project results in an improvement in air quality. However, the Olympic Peninsula is not a nonattainment area, so these funds would not be available for this bike trail project.

FUNDING PUGET SOUND REGIONAL TRANSIT

Question. Mr. Secretary, you are probably aware that the voters of the Puget Sound Region recently approved a Regional Transit Plan that has a 50/50 match. It's a mix of commuter rail, HOV lanes, express bus service and highway improvements to relieve congestion in such sites as Bellevue's crowded I–405. My constituents are excited about this proposal, but very skeptical that our shrinking budget and backlog of projects will prevent us from ever getting off the drawing board. Can you comment on the future of rail new starts in relation to projects currently underway and suggestions for my State as we begin this process?

Answer. The Federal Transit Administration's policy, as found in its annual Report on Funding Levels and Allocations of Funds (the "3(j) Report"), is that transit major capital investments (or new starts) funding shall only be proposed for projects that will be construction-ready in the budget year. A project such as Puget Sound's should be funded with planning or formula funds until it is construction-ready.

Regarding the possibility of receiving funding in the next several years, NEXTEA provides $5.7 billion in budget authority for major capital investments over 6 years. Of this, $3.7 billion will be required for projects under existing or pending Full Funding Grant Agreements, using virtually all the funding under obligation limitations proposed by the administration. Those obligation limitations reflect our commitment to help balance the Federal budget. If the economic and budget environment improves during the NEXTEA years, the obligation limitations may be increased, and as much as $2 billion may become available for additional projects like Puget Sound's.

Funding for additional major capital investments is also available through FTA's innovative finance initiatives, as well as the flexible funding provisions contained in ISTEA and expanded in NEXTEA.

AIRPORT IMPROVEMENT PROGRAM

Question. Mr. Secretary, you have stated that your foremost concern is safety. I remain concerned that we may compromise that safety by targeting the Airport Improvement Program for nearly half a billion dollars in cuts. Many of our airports are suffering, particularly rural areas who depend upon AIP funds for their survival and safety. How can our airports absorb these cuts?

Answer. A reduction in funding for AIP does not mean that safety and security needs will go unmet or that new construction at smaller airports will stop. The larger airports generally have the ability through other financing options, such as Passenger Facility Charges, to continue needed airport development if lower funding levels are provided for the AIP. The proposed budget will allow safety, security and high-priority capacity development to continue at the smaller airports.

HIGHWAY/RAIL GRADE CROSSINGS SEPARATION

Question. As you know, the West has experienced tremendous growth, particularly in regards to freight rail as we move goods to the West Coast for shipment abroad. A new rail corridor has just reopened through the middle of Washington State. Unfortunately, many communities are now watching freight trains daily cross their front yards. I am hopeful that we can work together and with these communities in helping to fund grade separations that mitigate some of the impacts this new rail corridor brings.

Answer. ISTEA provides a flexible framework of programs through which grade crossing eliminations can be funded, such as the National Highway System (NHS), Surface Transportation Program (STP), Congestion Mitigation and Air Quality (CMAQ), and Railway-Highway Crossing and Hazard Elimination funds.

The administration's NEXTEA proposal would continue these programs and, in some instances, specifically extend eligibility to publicly-owned rail infrastructure. These programs, of course, are funded from State allocations and spent according to local priorities.

NEXTEA also establishes two additional programs that might provide alternative sources of funding:

—The Transportation Infrastructure Credit Enhancement Program would provide grants (up to 20 percent of total cost) and encourages public-private partnerships consisting of State or local governments with private business. (Note: the program would require a public agency to acquire and operate the rail facility, as is being done in California's Alameda Corridor.)

—A permanently established State Infrastructure Bank (SIB) program makes possible an array of loan and credit enhancement assistance, such as direct loans, interest rate subsidies, lines of credit and loan guarantees. States can capitalize their SIBs using funds from regularly apportioned ISTEA categories and from a discretionary $150 million annual DOT fund for seed money.

SUBCOMMITTEE RECESS

Senator SHELBY. This will conclude the hearing. The hearing of the Subcommittee on Transportation is now recessed.

The next subcommittee hearing is scheduled to be held on Thursday, March 20 at 10 a.m. in Dirksen 192. The topic then of the hearing is transportation infrastructure financing. Thank you.

[Whereupon, at 12:13 p.m., Thursday, March 6, the subcommittee was recessed, to reconvene at 10:05 a.m., Thursday, March 20.]

DEPARTMENT OF TRANSPORTATION AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

THURSDAY, APRIL 10, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:01 a.m., in room SD–192, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senators Shelby, Bennett, Faircloth, Stevens, Lautenberg, Byrd, Kohl, and Murray.

DEPARTMENT OF TRANSPORTATION

FEDERAL HIGHWAY ADMINISTRATION

STATEMENT OF JANE F. GARVEY, ACTING ADMINISTRATOR

ACCOMPANIED BY:
GEORGE REAGLE, OFFICE OF MOTOR CARRIERS
PETER J. BASSO, DEPUTY ASSISTANT SECRETARY, BUDGET AND PROGRAMS

OPENING REMARKS

Senator SHELBY. The subcommittee will come to order.

Thank you for coming today, Ms. Garvey, Mr. Linton, and Dr. Martinez. We will get into some of the funding implications of the administration's NEXTEA proposal in a few minutes, but I want to discuss briefly with you some of the administration's priorities in light of the funding constraints we are likely to face for fiscal year 1998.

In addition, I want you to have the benefit of hearing from the subcommittee membership about their particular priorities in this funding cycle and for them to have the benefit of your expertise on the administration's reauthorization proposal which will ultimately influence our appropriations bill.

I think that the most important goal of the reauthorization legislation is to help States find the tools and the flexibility to address their specific transportation needs. Clearly the types of transportation infrastructure investment needed in the Nation's urban centers differs significantly from the needs of rural communities or areas of the country that are experiencing high growth rates.

My State transportation officials tell me that ISTEA has complicated their lives and made it more difficult to meet Alabama's

transportation needs. In short, they want more money and fewer categories.

Many States would like to see a more equitable return of what they pay into the highway trust fund. I agree with them and have supported proposals that would ensure that States receive at least a 95-percent return on the payments they make to the highway trust fund. I believe we must help them to make the Federal investment in this program more effective.

Today, I am interested in exploring with you and with the users group panel that follows you as many of the following issues as time permits, such as, how is NEXTEA more flexible and simpler to utilize than ISTEA?

How has the intelligent transportation systems program's evolution affected the administration's funding priorities?

How can we better focus our infrastructure investments on national priorities and on projects with significant economic returns?

What is the administration proposing in terms of financing programs and toll programs?

And in light of the severe constraints facing the transit new starts program under the 1998 budget, what does the administration's reauthorization proposal anticipate for the program over the life of NEXTEA?

And how has the administration restructured the safety set-aside program for rail-highway crossings and hazard elimination?

Over the next several months, the authorizing committees will struggle with allocation formulas, policy and equity issues, and reviewing whether the current funding categories have fulfilled the promise of ISTEA. The Transportation Appropriations Subcommittee will struggle to stretch its limited Federal resources among the competing priorities articulated in current law and in forthcoming authorization legislation.

The current budget environment further complicates our task, but it is critical that we focus our limited Federal resources on projects that create jobs, create opportunities, create economic activity, and improve mobility. As we complete the rest of our hearings and as a budget resolution takes shape, we will have a better idea of the funds available for transportation.

I can assure you that we all want more money for specific programs, projects, or initiatives. There are no easy choices. I remain dedicated to continuing in the search for more efficient, less costly ways to deliver transportation services, to work with the authorization committees to improve programs by enhancing their flexibility, and reallocating funds from lower to higher priority activities.

I hope the discussion we have today will be candid and productive and that we can start to focus on our highest priorities and needs as we move to appropriate Federal resources for the surface transportation program.

PREPARED STATEMENT

Before I ask you to summarize your opening statement for us, I want to first recognize the ranking member of the subcommittee, Senator Lautenberg.

[The statement follows:]

PREPARED STATEMENT OF SENATOR SHELBY

Thank you for coming today, Ms. Garvey, Mr. Linton, and Dr. Martinez. We'll get into some of the funding implications of the Administration's NEXTEA proposal in a few minutes, but I want to discuss with you some of the Administration's priorities in light of the funding constraints we are likely to face for fiscal year 1998. In addition, I want you to have the benefit of hearing from the Subcommittee membership about their particular priorities in this funding cycle and for them to have the benefit of your expertise on the Administration's reauthorization proposal which will ultimately influence our appropriations bill.

I think that the most important goal of the reauthorization legislation is to help states find the tools and the flexibility to address their specific transportation needs. Clearly, the types of transportation infrastructure investment needed in the nation's urban centers differs significantly from the needs of rural communities or areas of the country that are experiencing high growth rates. My state transportation officials tell me that ISTEA has complicated their lives and made it more difficult to meet Alabama's transportation needs—in short, they want more money and fewer categories. Many states, like Alabama, would like to see a more equitable return on what they pay into the Highway Trust Fund. I agree with them and have supported proposals that would ensure that states receive at least a 95-percent return on the payments they make to the Highway Trust Fund. We must help them to make the federal investment in this program more effective.

Today, I'm interested in exploring with you, and with the user group panel that follows you, as many of the following issues as time permits:

—How is NEXTEA more flexible and simpler to utilize than ISTEA?
—How has the Intelligent Transportation Systems program's evolution affected the administration's funding priorities?
—How can we better focus our infrastructure investments on national priorities and on projects with significant economic returns?
—What is the administration proposing in terms of financing programs and toll programs?
—In light of the severe constraints facing the transit new starts program under the fiscal year 1998 budget, what does the administration's reauthorization proposal anticipate for the program over the life of NEXTEA?
—How has the administration restructured the safety set-aside program for rail/highway crossings and hazard elimination?

Over the next several months, the authorizing committees will struggle with allocation formulas, policy and equity issues, and reviewing whether the current funding categories have fulfilled the promise of ISTEA. The transportation appropriations subcommittee will struggle to stretch its limited federal resources among the competing priorities articulated in current law and forthcoming authorization legislation. The current budget environment further complicates our task, but it is critical that we focus our limited federal resources on projects that create jobs, create opportunities, create economic activity, and improve mobility. As we complete the rest of our hearings and as a budget resolution takes shape, we will have a better idea of the funds available for transportation. I can assure you that we will all want more money for specific programs, projects, or initiatives. There are no easy choices. I remain dedicated to continuing the search for more efficient, less costly ways to deliver transportation services; to work with the authorization committees to improve programs by enhancing their flexibility, and reallocating funds from lower to higher priority activities.

I hope the discussion we have today will be candid and productive—and that we can start to focus on our highest priorities and needs as we move to appropriate Federal resources for the surface transportation program. Before I ask you to summarize your opening statement for us, I would ask the ranking member of the subcommittee, Senator Lautenberg, if he has an opening statement that he wishes to make?

STATEMENT OF SENATOR LAUTENBERG

Senator LAUTENBERG. Thanks very much, Mr. Chairman. I also want to welcome our witnesses from the administration. They are three very capable administrators, and I am pleased again to be able to have you in front of this subcommittee.

We are examining, as everyone is aware, the details of the administration's NEXTEA proposal, the proposal for the reauthorization of the Intermodal Surface Transportation Efficiency Act.

Let me also commend you, Mr. Chairman, for structuring this hearing the way that will allow us to discuss NEXTEA simultaneously with our Highway Administrator, Transit Administrator, our Highway Safety Administrator because it is in keeping with the spirit of ISTEA which is to structure generally an intermodal system and this, thusly, I think we can call it an intermodal hearing because we have all the parts as we would like to review them.

I recall vividly—I didn't say fondly, Mr. Chairman—my experience 6 years ago when I served as chairman of this subcommittee while working on the authorization of ISTEA as a member of the Environment and Public Works Committee. Mr. Chairman, it will be a real challenge to accommodate, as you said in your remarks, three Senate authorizing committees, while producing an appropriations bill that stays within our ceiling and maintains our role in overseeing and directing transportation expenditures. But it is a critical task for our country's future and I pledge my best efforts to work with you.

ISTEA was a bold and innovative step toward launching America's transportation system into the next century. The last 6 years demonstrated that it works. It increased planning and flexibility, put power in the hands of local planners, encouraged new technology, and prioritized the mitigation of transportation-related pollution in congested areas.

While the Nation's existing infrastructure continues to decay and we face reduced budgets, economic competition demands ever greater efficiency. We need to build upon ISTEA's successes to prepare for more intense global competition. We should retain ISTEA's intermodal system and its flexibility to let State and local officials use Federal assistance in the manner that is most appropriate for their needs.

In many ways my State, New Jersey, is a national microcosm. We have densely populated areas, sprawling suburbs, rich farmlands, and vast protected, open spaces. New Jersey is a corridor State linking commerce and travel between the Northeast and the rest of the country. No State is more intermodal than New Jersey. From the moment goods arrive in the ports of Elizabeth and Newark, they are loaded onto rail cars or trucks and they are distributed to the rest of the country. Goods traveling just 24 hours on a truck from New Jersey will reach a market of 40 percent of the total population of the United States and Canada, over 100 million people.

New Jersey is also a very heavily commuting State. There are more cars per mile on New Jersey roads than any other State in the country, but in many areas there is no place else to put down more concrete, to open new roads. We cannot build ourselves out of congestion and we are heavily reliant on new technology, mass transit, and Amtrak to reduce congestion.

ISTEA's focus on moving goods and people efficiently has given States and localities greater latitude in deciding which transportation system works best for them. The flexibility provisions contained in ISTEA undeniably improve the efficiency of our Federal transportation spending.

My State has enthusiastically opted to use over $163 million of ISTEA highway funds for mass transit. That is the choice that we

made. That is where it serves us best. Other States have used transit formula funds to build highways, and we should continue to advance the agenda of balance and flexibility.

We must also acknowledge that Amtrak is a critical part of our national transportation network. It needs the kind of capital investment that is necessary to improve its bottom line, its operating efficiency.

Mr. Chairman, I recognize that Amtrak will be called to testify before us at a later subcommittee hearing, but I want to note today that one of my greatest disappointments during the ISTEA conference 6 years ago was that my provision to allow States the flexibility of using their Federal ISTEA funds for Amtrak's expense was dropped.

Finally, I want to underscore the need to promote safety on our highways. After several years of steady improvement, we are now seeing a tragic increase in deaths associated with drunk driving. These are preventable deaths and we should insist on making our highways safer.

I look forward to discussing with our witnesses this morning how we can enhance the efficiency and safety of our Nation's transportation system. ISTEA has worked for our cities, our country, our environment, and our economy. The subcommittee's responsibility must be to build on the success of the past and not turn the clock back on transportation progress.

I thank you very much, Mr. Chairman, for the opportunity.

Senator SHELBY. Senator Byrd.

Senator BYRD. Mr. Chairman, I would like to yield to Senator Stevens first.

Senator SHELBY. Senator Stevens.

Senator STEVENS. You were here first, Senator. I will be glad to wait. Thank you very much.

Senator BYRD. Well, I thank you.

Mr. Chairman——

Senator SHELBY. The former chairman yielding to the current chairman of the Appropriations Committee. That is good. Then yielding back. That is good. [Laughter.]

Senator Byrd.

STATEMENT OF SENATOR BYRD

Senator BYRD. Mr. Chairman, the soon-to-be chairman again. [Laughter.]

Senator STEVENS. I knew a revolution was coming. [Laughter.]

Senator BYRD. Thank you very much, and let me commend you, Senator Shelby, for proceeding with these important hearings on the reauthorization of the Intermodal Surface Transportation Efficiency Act.

The crafting of a new surface transportation bill may well be the most important legislative challenge that we will face in this congressional session. While the surface transportation bill is an authorizing measure in the jurisdiction of three different Senate authorizing committees, I think it is wholly appropriate and indeed necessary for this subcommittee to review the administration's reauthorization proposal which has come to be known as the National Economic Crossroads Transportation Efficiency Act

[NEXTEA], for it will be the actions of this subcommittee that will determine whether the Federal Government will continue its ill-advised trend of disinvestment in our surface transportation infrastructure or whether we will make positive strides to replace our aging and inadequate highways and transit systems.

It will be this subcommittee that will determine whether the dozens of authorizations included in the surface transportation bill will be funded. What will really matter to the health of our national transportation enterprise is whether this appropriations subcommittee can increase substantially the annual obligation limitations that pertain to our surface transportation program.

Budget realities over the last 6 years have meant that all of the promises contained in ISTEA—at least some of the promises—were not met, and without adequate resources over the next 6 years, the promises of NEXTEA will not be met either.

One does not have to look past the administration's NEXTEA proposal to observe this disconnect between legislative authorizations and actual resources. Our very able Transportation Secretary, Rodney Slater, testified to this subcommittee that the administration's NEXTEA bill would authorize a total of $174 billion, or an 11-percent increase over ISTEA funding levels, but a review of the actual budget submitted by the administration clearly asks the Appropriations Committee to impose a freeze on the annual obligation limitation for the core Federal-aid highway programs for each of the next 6 years. There will be no increase in highway funding under the administration's budget, and the budget request calls for similar freezes for the next 6 years when it comes to transit and highway safety funding as well.

This would fly in the face of the most recently published Federal Highway Administration study which indicates that it would require an additional $15 billion each year just to maintain the current inadequate condition of our Nation's roads and bridges.

So, I hope, Mr. Chairman, that we will all work hard to ensure that transportation infrastructure is granted the highest priority in our annual budget deliberations, and toward that end, I was pleased to join with 55 of my Senate colleagues on both sides of the aisle in writing to the distinguished chairman of the Budget Committee, Mr. Domenici, to request that sufficient resources be allocated to the Environment and Public Works Committee to authorize the $26 billion annual highway program.

But we will be doing a great disservice to our States, our communities, and the driving public if we go forward and authorize a substantial increase in Federal highway spending but constrain the Appropriations Committee so tightly as to eliminate any hope of an actual increased obligation over the next 6 years.

So, I urge my 55 colleagues who wrote and those who did not write in support of a $26 billion highway program to join in seeking to secure sufficient domestic discretionary outlays in the upcoming budget resolution to support such an increased level of highway spending.

And I join with my colleagues in welcoming our witnesses here this morning, Acting Federal Highway Administrator Jane Garvey, Federal Transit Administrator Gordon Linton, and National Highway Traffic Safety Administrator Dr. Ricardo Martinez.

I am especially glad to welcome Dr. Martinez because I think it is critical that the issue of safety be prominent in each and every decision that we make in the development of a new highway bill. And as we discuss highway safety this morning, I remind my colleagues, if I needed to, that our highway construction agenda and our highway safety agenda must not be viewed as mutually exclusive. Indeed, one of the most important ways we can improve safety on our highways is to modernize them.

For this Senator, the most important safety provision in the administration's NEXTEA legislation is the proposal to grant a predictable source—a predictable source—of funding from the highway trust fund for completion of the Appalachian Development Highway System. The unfinished segments of the Appalachian Highway System are among the most dangerous roads in my State. And the same is true across the entire 13-State Appalachian region. The unfinished segments of the Appalachian Highway Corridor System often consist of undivided, two-lane roads that twist and turn around dangerous mountain curves with little or no shoulder room and very little or very poor visibility. This makes for a very dangerous situation in light of the fact that these inadequate highways must be shared simultaneously by family vehicles, school buses, and heavy commercial vehicles loaded with coal, timber, and other products.

In conclusion, Mr. Chairman, I commend the administration and the witnesses for their efforts in presenting to Congress, which they will do, the administration's proposed ISTEA reauthorization measure. I look forward to working closely with them and with the President in achieving much needed improvements in the areas that I have set forth in my remarks. Thank you, Mr. Chairman.

Senator SHELBY. Senator Stevens.

STATEMENT OF SENATOR STEVENS

Senator STEVENS. Well, thank you very much, Mr. Chairman.

I will always defer to my good friend, Senator Byrd. I think he is the person who has the institutional knowledge for our guidance, and I am pleased to hear what he said.

Ms. Garvey, Mr. Linton, and Dr. Martinez, I have some questions I would like to submit, Mr. Chairman, so I will not go into those.

But I come from a State that will be just 40 years old next year, and it is sad for me to have to try to explain to my people why there are more Federal highways in Puerto Rico than there are in Alaska. Alaska is one-fifth the size of the Union. It stretches from Maryland to California and from Duluth to New Orleans in distance, and we have the same amount of roads by mile in Alaska today that we had when we were admitted to the Union.

I have decided to commit myself to change that now, and that is why I did not sign the Senator's letter because it is not enough. I do not know why rural America has been neglected so much. It is not your errors. It is the past errors of our society.

But, for instance, we have 80 percent of the national park acreage in our State and we have fewer access roads to those parks than exist in the Nation's Capital for the National Capital parks.

Now, we have very few transportation links between our cities and now the Congress is telling us that there will no longer be any

subsidy for air mail which in Alaska is our lifeline, and we can get subsidies on the roads. But that is the catch-22. There are no roads.

So, what I would like to urge for you to do is to keep in mind that we are going to have to find some way to work together. I know that there are many people here who talk about the donor theory to the trust fund. I wonder what their predecessors would have thought in the days when General Eisenhower, then Colonel Eisenhower, devised the Interstate Transportation System, he had decided that only those States that paid taxes into the fund would receive highways. We are still part of the growth of America in Alaska and several other States I can think of that are rural States. And I do believe we have to find some way to bring a balance back to this system.

I have asked you for some specific answers to specific questions, so I might address some amendments.

As Senator Byrd says, it is our joint intention that we will monitor the expenditures of moneys under these authorization bills to assure the balance that the Senate is capable of bringing about. We are the focus of that balance in the historic compromise that formed this country. One of the Senate's most important functions is to bring about the balance in terms of States versus the population centers of the country.

So often I have witnessed the changes in the road systems of our neighboring State of the State of Washington. Again, there are twice as many roads in King County, WA, as there are in its northern neighbor, Alaska, which is 40 times the size of that State.

I want to emphasize to you that I intend to work with my friend from West Virginia. We share common thoughts, I think, with regard to the application of these funds, and I see no reason to put more and more money into these circular roads that go around population centers and not have the access for the rural people to get to those centers. It is a time for us to rethink this highway situation and NEXTEA is going to be the time we get to do that.

So, I look forward to working with you. I look forward to the answers to my questions so I might properly frame the amendments I intend to offer. Thank you very much.

Thank you, Mr. Chairman.

Senator SHELBY. Senator Faircloth.

STATEMENT OF SENATOR FAIRCLOTH

Senator FAIRCLOTH. Thank you, Mr. Chairman.

I am very much aware that this subcommittee is not going to be involved in the efforts to rewrite the new surface transportation bill, but I am pleased and I think it is proper that we examine the issues here.

North Carolina is one of the largest donor States, and we have traditionally been receiving 87 cents on the dollar return of our money. We have lived with that for a number of years, but under NEXTEA, that would go down.

Now, I am not the only North Carolinian committed to the fact that there should be a more equitable distribution. I am a strong supporter of Step 21 which returns 95 percent to each State. I know that, Mr. Chairman, you are a sponsor of the same bill. For

too long money has been pulled out of the Southeast and fed into the Northeast.

But now the Interstate System is complete, virtually, and there is no reason for the big discrepancy between donor and recipient States because the maintenance of the Interstate System is going to be the major expense on the highway system of all States.

Early parts of the Interstate System were very inadequately built. There was no way to convince in the 1960's the Federal Bureau of Public Roads that you had to drain a roadbed before you built the road, and they were built without proper drainage, subsoil, and they are giving away in many, many places. In fact, some of them have long since given away. So, there is going to be additional drainage and a lot is going to have to be done.

Senator BYRD. Mr. Chairman, would the Senator yield?

Senator FAIRCLOTH. Yes.

Senator BYRD. This again points out the fact that we do not pay enough attention to history. The Romans knew better than to do that. They knew that it was important to drain the roads.

Senator FAIRCLOTH. Well, you are absolutely right, Senator. What happened was nobody ever got reelected because he built a superior road, but he got reelected because he built a lot of roads, so he built more mileage out there.

The German Autobahn was well drained and it has held up much, much better with the proper drainage. But you have no strength. The surface of a road is merely to keep it dry whether it is asphalt or concrete. There is really no basic strength. The strength is in the sub-base and we simply did not drain it. It popped and it is falling apart.

But I believe that the role of the Federal Government in transportation must be an equitable one and the States need some ability to respond to local needs. And this is one of the important things so that we can either go to new roads or to repair of existing ones.

Mr. Chairman, I thank you for holding the hearing and look forward to participating.

Senator SHELBY. Senator Kohl.

PREPARED STATEMENT

Senator KOHL. I thank you very much, Mr. Chairman. I have a statement which I will include in the record.

Senator SHELBY. Without objection, it will be so ordered.

[The statement follows:]

PREPARED STATEMENT OF SENATOR KOHL

Good morning, Mr. Chairman and members of the subcommittee. Welcome Administrators Garvey, Linton and Martinez, and all those who will be joining us on the second panel. We appreciate your continued help and input with our work on transportation appropriations for this year and a transportation policy framework for the next six years.

It is my hope, which you no doubt share, that together we can do more in the next six years than we did under ISTEA. The number one message we hear about transportation and ISTEA reauthorization is that we are not doing enough—that our current investment in transportation infrastructure is not sufficient.

Fortunately, we all agree that investing more and investing it more wisely is imperative to ensuring economic growth, and improving transportation safety and the livability of our towns and cities.

Thank you all for coming, and I look forward to hearing your thoughts on how we might best achieve those goals. Thank you, Mr. Chairman.

INTRODUCTION OF WITNESS

Senator SHELBY. Do you have anything else?

Senator KOHL. No.

Senator SHELBY. Again, I want to join and welcome Jane Garvey, the Acting Administrator, Federal Highway Administration; Mr. Gordon Linton, Administrator, Federal Transit Administration; Dr. Ricardo Martinez, Administrator, National Highway Traffic Safety Administration. Your written statement will be made part of the record.

Ms. Garvey, if you will proceed as you wish.

STATEMENT OF JANE F. GARVEY

Ms. GARVEY. Thank you very much, Mr. Chairman. I have a very brief opening statement, if I could.

Members of the subcommittee, thank you for the opportunity to testify here this morning on the administration's proposal for reauthorization.

A few weeks ago, Secretary Slater appeared before this subcommittee and provided an overview of the Department of Transportation's fiscal year 1998 budget request. He described our transportation network as the envy of the world and, simply stated, he said that transportation is critical to the economic growth of this country. It is critical to sustaining our quality of life.

We are now, as so many of you have suggested, at an important juncture as Congress considers reauthorization of the Nation's surface transportation program. In a sense ISTEA transformed transportation decisionmaking. It was a sea change. It was a revolution.

The administration's reauthorization proposal reflects the message that we have heard from our stakeholders, the message that we have heard from our customers. Stay the course of ISTEA. Tune it. Do not toss it.

When the administration's NEXTEA proposal was submitted to Congress last month, it defined several of the Secretary's key national transportation priorities. These priorities include strategic investment in infrastructure to support economic growth, safety programs that will help reduce highway crashes, and a commitment to commonsense government and innovation.

I would like to very briefly describe the key themes from the Federal Highway perspective.

First of all, the administration's reauthorization proposal includes program increases for the core programs, the core programs that are clear national priorities. That means interstate maintenance, the National Highway System, and the surface transportation program. And when combined with the other provisions, it will allow States and MPO's to use their Federal transportation funds strategically and more flexibly. Our proposal builds on the record level of Federal investment over the past 4 years. Indeed, NEXTEA increases transportation authorizations by 11 percent over the $157 billion authorized by ISTEA.

In the highway formula area, we have sought to strike a fair balance among the many diverse transportation needs in the Nation.

Included in the Department's proposal is $20 billion in obligations for the Nation's highways and bridges.

We realize that we need to say right up front that these proposed funding levels do not fully meet the needs of the Nation's highway systems, but the levels do reflect the continuing commitment of both the President and the Congress to balance the budget and to reduce the Federal deficit. Our spending decisions have been made within the context of a balanced budget.

We are, however, proposing contract authority levels in our NEXTEA proposal that are higher than the proposed obligation level for 1998. We are doing this because if we have an improved economic condition, then we have room in our program to grow.

Secretary Slater has said that transportation safety is his highest priority. Our proposal in the 1998 budget provides the resources to fight and improve the highway safety and improve the fatality trends that we are seeing in our country. Our proposal builds on the strong components of the existing law. It streamlines programs, for example, by combining the NHSTA and the FHWA section 402 safety programs and consolidating the safety construction category.

We are also proposing incentives to encourage agencies to work closer together in dealing with their safety problems.

A cornerstone for the future is a strong shift of resources and energies to innovation, innovation that would provide for a greater return on our investment. For Federal Highway, this moves us from a traditional oversight role to one of proactive leadership and it makes technology and innovation in the broadest sense a leading element in the transportation system for the 21st century.

NEXTEA proposes a $100 million a year transportation credit enhancement program, a program that really has three goals: to leverage Federal dollars, to encourage private sector investment in projects of national significance, and to move projects into construction sooner.

Our reauthorization proposal also would continue the funding for State infrastructure banks with a level of $150 million a year.

Finally, Mr. Chairman, as we examine the Federal role in transportation and as we continue to work to increase the efficiency and effectiveness of our Government, Federal Highway has undertaken a comprehensive set of streamlining actions to support Department initiatives.

We look forward to working with Congress and we look forward to working with this subcommittee in particular to further the advances launched in ISTEA. Thank you very much, Mr. Chairman.

PREPARED STATEMENT

Senator SHELBY. Thank you, Ms. Garvey. We have the combined statement of Ms. Garvey, Mr. Linton, and Dr. Martinez, and it will be made part of the Record.

[The statement follows:]

PREPARED STATEMENT OF JANE F. GARVEY, GORDON J. LINTON, AND RICARDO MARTINEZ

ISTEA REAUTHORIZATION

Mr. Chairman, Members of the Subcommittee. Thank you for the opportunity to testify in support of the Administration's proposal for reauthorization of the Inter-

modal Surface Transportation Efficiency Act of 1991 (ISTEA) and for our respective agencies' budget requests.

OVERVIEW

A few weeks ago, Secretary Slater appeared before this subcommittee and provided an overview of the Department of Transportation's fiscal year 1998 budget request. He told how our transportation network is the envy of the world, and how it has made us the most mobile society on earth. His message is that safety is our number one priority and that transportation is critical to economic growth and to providing our citizens with the mobility on which they have come to rely to sustain their quality of life. And it is about showing that safe and efficient transportation and a clean environment can go hand in hand. We Administrators of the DOT agencies most concerned with ISTEA are here to reinforce that message and to provide details about our reauthorization proposal.

We are now at a critical juncture as we examine ways to reauthorize the surface transportation program this year and to continue to improve our transportation systems. The Administration seeks to build upon the ISTEA foundation in the six-year, $175 billion authorization proposal announced by the President, Vice President, and Secretary Slater last month—the National Economic Crossroads Transportation Efficiency Act of 1997 (NEXTEA). In the President's words, "we're taking the next big step to maintain and modernize our transportation system, and to make sure it is the best in the world." He also emphasized that NEXTEA is "one of the most important pieces of environmental legislation that will be considered by the Congress in the next two years."

When the Administration's NEXTEA proposal was submitted to Congress last month, it demonstrated several of the Secretary's key national transportation priorities. These priorities include strategic investment in infrastructure to support economic growth and enhance U.S. global competitiveness; safety programs that will improve the public health and safety of the Nation by reducing highway crashes and resulting injuries and deaths; an Access to Jobs and Training program to help ensure that welfare reform works; help to communities to balance mobility needs with environmental protection and enhancement, and a commitment to common sense government and innovation. Included among the innovations in NEXTEA are proposals for (1) innovative financing to ensure that Federal resources stretch as far as possible, (2) innovation in technology to accelerate advances that close the gap between state-of-the-art and state-of-the-practice, and (3) innovation to implement common sense government in order to provide the people we serve with programs and organizations that work better and cost less.

STRATEGIC INVESTMENT IN INFRASTRUCTURE AND SAFETY

The Nation's surface transportation system, particularly the National Highway System and its intermodal connectors, is essential to economic development, to providing Americans with greater mobility, and to national defense. Clearly, sustained Federal support for infrastructure is critical to the health of the economy. The challenge we face today is to improve our existing transportation network and to provide for continuing economic growth within constrained resources and environmental priorities.

National and regional economic growth relies heavily upon a well-functioning surface transportation system. For example, the payoff relating to highway transportation spending levels goes well beyond the actual infrastructure itself and is reflected in the contribution of the public infrastructure to private sector employment and private sector productivity. At stake are jobs and the economic productivity of the Nation. Our highways and their interconnectors to other systems are the lifeline of the Nation.

The Administration's reauthorization proposal and fiscal year 1998 budget strategically allocate our limited resources, with major increases for the National Highway System, Interstate Maintenance, Surface Transportation Program (STP), Congestion Mitigation and Air Quality Improvement, and safety programs—clear national priorities. When combined with other provisions in our reauthorization proposal that improve States' ability to use their Federal transportation funds more flexibly, NEXTEA will enable States to better target their funds to the types of infrastructure investments that will work best for them—whether traditional highway investments, transit or rail projects, safety improvements, ITS technologies, environmental needs, or new intermodal facilities to handle growing intermodal demands.

One example of the improvements our proposal would make is amendment of the definition of transit capital to include maintenance as an eligible expense. Such an approach would parallel the eligibility for Federal-aid highway projects. This would

allow local transit operators to make better decisions on whether to invest Federal funds to prolong the life of existing assets, or to invest in new vehicles, facilities and equipment. In addition, transit providers in urbanized areas under 200,000 in population would also be given the flexibility to use all their transit funds for any eligible transit purpose—including operating expenses.

The Administration's reauthorization proposal and fiscal year 1998 budget for the Department aim to build on the record level of Federal investment over the past four years. Indeed, NEXTEA increases surface transportation funding by $17 billion, or 11 percent, over the $157 billion authorized by ISTEA.

We propose authorization levels higher than the proposed obligation levels so there will be flexibility to increase transportation funding within a balance budget if economic conditions improve in future years. With multi-year authorizing legislation, such as our ISTEA reauthorization, we believe it is important that the contract authority levels are set at appropriately high levels. This allows for growth in the program in the outyears, if the budget picture permits such growth. And in the apportionment formulas that we have proposed to distribute Federal highway funds among the States, we have sought to strike a fair balance among the many diverse transportation needs of this Nation. However, we understand that there will be considerable debate over this matter and we offer our proposal as a starting point.

HIGHWAY INVESTMENT

Included in the Department's overall fiscal year 1998 program levels is $20.2 billion in obligations for the Nation's highways and bridges. This includes a Federal-aid highway obligation ceiling of $18.17 billion, which is approximately the same level as enacted in fiscal year 1997. The total contract authority proposed for fiscal year 1998 is $22.8 billion, up from $22.5 billion in fiscal year 1997.

All States have benefited from ISTEA infrastructure programs such as Interstate Maintenance, the National Highway System, the Surface Transportation Program, the Congestion Mitigation and Air Quality Improvement Program (CMAQ) and the Bridge Program. These core Federal Highway Administration (FHWA) programs are not only retained in NEXTEA, but, in the aggregate, authorizations would increase by 33 percent over ISTEA levels. The proposed funding levels for the highway program are sufficient to fund system maintenance and preservation costs and some capacity improvements. Yet these levels also reflect the continuing commitment of both the President and the Congress to balance the budget and reduce the Federal deficit.

Our NEXTEA legislation also includes more than $2 billion from the Highway Trust Fund for the continued construction of the Appalachian Development Highway System (ADHS) in the 13 States that comprise the Appalachian region. The ADHS is now 76 percent complete. In the past, this system of highways has been funded from the General Fund through various appropriations and authorization acts. Our NEXTEA funding proposal would promote much-needed economic development in the Appalachian region and throughout the entire eastern United States, because more than 92 percent of the Appalachian Development Highway System is located on our Nation's most critical and well-traveled highways—the National Highway System.

TRANSIT INVESTMENT

We propose budget authority in fiscal year 1998 of $5.1 billion, and a $4.4 billion obligation level. Within the fiscal year 1998 obligation level, our budget makes available $4.2 billion for capital investment in mass transportation. Beginning in fiscal year 1998, we are proposing to fund the entire $31 billion, six-year transit program from the Mass Transit Account of the Highway Trust Fund. Additionally, in fiscal year 1998, we are proposing that discretionary bus and bus-related funding and fixed guideway modernization funding, be rolled into Formula Programs.

NEXTEA proposes to combine some transit program categories to make the program simpler to understand and manage, at the Federal level as well as at the State and local levels. Our proposal would provide simpler, and more flexible program-wide definitions of eligible capital costs, matching ratios, and grant requirements. We would also expand the transferability of funds among the Urbanized, Non-Urbanized and Specialized formula programs.

NEXTEA proposes having a much larger proportion of the transit program go out by formula, rather than on a discretionary basis. This will help local agencies plan by reducing uncertainty over funding sources and earmarking, and will improve the equity by which the funds are distributed. It will also enhance the possibility of using innovative financing techniques to leverage the use of Federal funds.

New transit lines or significant upgrades to existing service can be more effective in some cases in addressing congestion than new or expanded highway capacity. Recent research by the firm Hickling-Lewis-Brod examined major transportation corridors and determined that high-quality transit significantly improves the overall door-to-door travel time for both transit riders and highway users. As motorists switch from automobile commuting to mass transit, congestion on highways lessens and highway travel time improves. Increased transit investment in these corridors is an effective use of transportation revenues that clearly benefits motorists.

Since January 1993, the Federal Transit Administration (FTA) has signed Full Funding Grant Agreements for 19 new or expanded fixed guideway projects totaling $7 billion. When State and local funds are also considered, these projects will result in the investment of over $12 billion in new mass transit infrastructure in metropolitan areas from coast to coast. These actions continue FTA's successful strategy of employing the mechanisms provided in ISTEA to execute long-term contracts and maintain the Administration's strong support for mass transit.

In addition, NEXTEA builds on the efforts in ISTEA to strike a balance between existing infrastructure and the need to build new systems. We recognize the need to balance new system construction with support to "older rail cities." Such support funds the replacement and rehabilitation of the existing rail fleet and the restoration of rail facilities such as stations, track, and yards and shops, as was guaranteed in ISTEA.

Our proposal provides an equal amount, $634 million, for major capital investments and fixed guideway modernization. That level for major capital investments over six years is sufficient to sustain the Federal commitment to all existing and expected FFGA's. The amount for Fixed Guideway Modernization will be funded under the Formula Programs and distributed by the current statutory formula for fixed guideway modernization.

SAFETY INVESTMENT

Secretary Slater has set transportation safety as his highest priority. Federal safety programs have contributed to real progress in highway safety. Safety belt use has grown from 11 percent in 1982 to 68 percent in 1996. Alcohol involvement in fatal crashes has dropped from 57 percent to 41 percent over this same 15-year period. The highway fatality rate has declined steadily since 1966, now at the all-time low of 1.7 per hundred million miles traveled.

Despite this significant progress, a look at recent statistics reveals that there is no room for complacency. After years of steady decline, the total number of highway deaths increased from 1992 to 1995. Motor vehicle crashes are still the leading cause of premature death of our Nation's youth. Safety belt use has grown by only two percentage points since 1993. In 1995, the number of alcohol-related fatalities increased for the first time in 9 years. In 1996, 41,500 people died and over 3 million more were injured in police-reported crashes. Although our fatality rate remains at an all-time low, highway crashes still cost the Nation $150 billion per year. Taxpayers share in these costs through Medicare, Medicaid, and income support programs. Twenty-four percent of all medical care costs associated with motor vehicle crashes are covered by public revenues (14 percent from federal revenues and 10 percent from State resources). In 1994, highway crashes cost taxpayers $13.8 billion, the equivalent of $144 in added taxes for each household in the U.S.

Improving air bag safety is a top priority. The National Highway Traffic Safety Administration (NHTSA) has initiated a comprehensive effort to realize more fully the life-saving attributes of current driver and passenger air bag systems, and to pave the way for the introduction of improved air bags in the near future. Our budget request contains an increase of about $8 million for air bag initiatives, a top-priority increase for fiscal year 1998.

Another major priority is to work with Governors and State legislatures to encourage the enactment of stronger safety belt and child safety seat laws. We will be implementing a Presidential safety belt plan to increase the use of these vital life-saving devices. We have a number of efforts underway to improve passenger safety of our children.

Speeding—exceeding the posted speed limits, or driving too fast for conditions—is a problem on all roads. The human and economic costs of speeding are staggering. In 1995, speeding was a factor in 31 percent of all fatal highway crashes, at a cost to society and the economy of more than $29 billion. Currently, 34 States have increased their speed limits beyond what would have been allowed under the former national maximum speed limit law, and 23 of these 34 States have increased their speed limits to 70 miles per hour or greater. NHTSA and FHWA have jointly devel-

oped and continue to implement a Speed Management Plan combining research, enforcement, roadway engineering and public education.

Recent surveys indicate that aggressive driving, a behavior often marked by excessive speed, has become the driver behavior that most concerns the motoring public. NHTSA's activities to combat aggressive driving include public information and education, demonstration programs in major urban areas to identify effective enforcement techniques, and research to determine the relationship between specific unsafe driving acts and crash involvement.

NHTSA programs have been highly cost effective. The number and costs of fatalities and injuries would be significantly higher if not for the effectiveness of these programs. Since 1992, safety belts, child safety seats, motorcycle helmets, and the age–21 minimum drinking age laws under have saved over 40,000 lives. Air bags have saved more than 1,850 lives.

ISTEA recognized the importance of the Federal-State partnership in highway safety. We believe that the status quo is not sufficient to accomplish what must be done. The successor to ISTEA must continue to look at new ways to advance this essential partnership and secure the safety of those traveling on our Nation's roads. Our reauthorization proposal builds on the strong components of the existing law, but streamlines programs, creates new flexibilities, and provides linkages among other highway safety programs to move our safety programs forward in a coordinated manner to address national priorities.

Our NEXTEA proposal is designed to help the States deter drunk and drugged driving and to encourage increased use of safety belts and child safety seats. It includes authorizations for significantly increased safety funding with greater emphasis on incentive programs. The flexibility inherent in these incentive programs, which give States the ability to chose whether to implement suggested legal and program criteria, has proved very successful in motivating States to make greater efforts in highway safety.

New incentives within the framework of our Section 402 State and community highway safety program will give added momentum to the program, at the same time that State and local attention is focused on high priority safety needs. Thus, in addition to the Section 402 performance-based grant program, NEXTEA provides authorizations for four carefully crafted and targeted incentive grant programs:

—an enhanced drunk driving prevention program to help States enact and enforce tough drunk driving laws;

—a new occupant protection program to encourage States to increase safety belt use—the single best way to protect the occupants of a vehicle;

—a new drugged driving program, a Presidential initiative to help States enact and enforce tough laws to prevent drug-impaired driving; and

—a new State highway safety data improvement program to encourage States to improve the data they use to identify the priorities for their highway safety programs.

NEXTEA increases authorized funding for NHTSA by about 25 percent, to $392 million in fiscal year 1998. Within the Department's overall fiscal year 1998 program levels is $333 million in obligations for NHTSA, about 11 percent more than the amount provided in fiscal year 1997. This greater amount reflects the high priority both this Administration and the American public give to highway safety. This funding level will provide a balanced program in fiscal year 1998—to address both vehicle and behavioral safety areas and to carry out essential safety research, including how to reduce crash injuries. We have a strong behavioral program that balances our regulatory mission in motor vehicle safety.

Under our reauthorization proposal, highway safety programs would become more flexible and streamlined in a number of areas. We have retained the railroad/highway grade crossing program, but would make funds under this program available to address noncompliance of grade crossing devices. We have combined the FHWA and NHTSA portions of Section 402 program so there is one allocation to the States; and we have proposed a reduction in the number of separate motor carrier program elements. We believe that our jointly administered safety delivery program is working well.

We have also created incentives for State safety agencies to work closer together in dealing with their safety problems. For example, if a State has an integrated safety planning process in place that deals with three major safety areas: roadways, drivers, and commercial vehicles, then they will have the ability to spend funds from both the STP and hazard elimination program for any of those three safety areas, as well as be eligible to tap into a new Integrated Safety Fund; again for use within any of the three safety areas.

We believe that with the increased funding and flexibilities which are being proposed, the States will be in a much better position to identify and resolve their safe-

ty problems. Our reauthorized program also includes a major safety research focus within the Intelligent Transportation Systems program for the development and testing of intelligent vehicle systems, which will include collision avoidance and in-vehicle information systems, and which promise dramatic safety improvements.

Our motor carrier safety program also retains its important role in our NEXTEA bill and our fiscal year 1998 budget request. For the last three years, the number of fatal crashes involving trucks has been higher than the number of such crashes in 1992. This follows the three-year decline in fatal involvements prior to 1992. The FHWA's budget request and NEXTEA proposal include $100 million annually for motor carrier safety, a 27 percent increase over the fiscal year 1997 level. The increased funding will be used to make improvements to driver safety programs, information systems and data analysis, and evaluation of all aspects of driver performance and safety.

These funds will support a results-oriented commercial motor vehicle safety program. Over 80 percent of the funds will be used as grants to States for the implementation of comprehensive, nationwide performance based safety programs. States will be given the opportunity to strengthen enforcement activities by investing in areas with the potential for crash reduction based on their own circumstances. The funds will also support national information systems, and analysis and development of new systems to support critical safety initiatives such as the Commercial Vehicle Information System. Within NHTSA, research will be continued to improve heavy truck safety, primarily in the areas of braking, rollover stability, tires and cab integrity.

INNOVATION IN FINANCING

As we administer transportation programs that will carry the nation into the 21st century within tight budgetary constraints, we must continue to ask ourselves how we can do it better. That is, how can we be more efficient, more innovative in the delivery of transportation services?

Government cannot meet all of the Nation's infrastructure investment needs alone. This Administration has strongly supported and encouraged creative financing solutions and more private sector involvement in infrastructure improvement and management of America's transportation system.

Our reauthorization proposal and our fiscal year 1998 budget would continue funding for State Infrastructure Banks (SIB's) at the fiscal year 1997 level of $150 million but funding would come from the Highway Trust Fund. This program had previously been funded from the General Fund.

In addition, we would continue to focus on new methods of improving the way available resources are used and maximizing their benefits. We are promoting new financing techniques that have the added benefit of leveraging still further resources, including those of the private sector, and bringing them on line for much-needed infrastructure investment. Our reauthorization proposal proposes a new $100 million a year Transportation Infrastructure Credit Enhancement Program to leverage Federal dollars and encourage private sector investment in transportation projects of national significance that may otherwise be delayed or not constructed at all because of their size and uncertainty over timing of revenues. With this new program, the Department will be able to make grants that, along with supplemental contributions by States and other entities, will comprise a Revenue Stabilization Fund for projects to secure external debt financing, or to be drawn upon if needed to pay debt service costs in the event project revenues are insufficient.

To maximize the impact of every dollar spent on transit, the FTA is working to introduce various innovative financing methods to the transit community. Since 1994, FTA has reviewed and approved 22 innovative financing transactions involving over $2.2 billion in Federally-supported assets. These included cross-border leases, sale/leasebacks, bond issues for construction, and leveraging of soft match. Altogether, these transactions netted over $143 million in additional private investment for the transit systems.

Innovative financing is but one of many efforts to expand funding availability for transit. Other initiatives include facilitating joint developments to attract private partners for transit infrastructure projects, and developing ways to better coordinate funding between Federal programs. For example, some Community Development Block Grant funds may be expended in support of transit projects in redevelopment communities. Also, FTA is Co-Chair of the DOT/DHHS Coordinating Council on Human Services Transportation, which seeks to link transportation delivery through multiple programs (Medicaid, elderly transportation, public transit) at the local level. Our Access to Jobs and Training initiative will also be an important tool in this regard.

FOCUSING ON PEOPLE AND COMMUNITIES

ISTEA focused on transportation's bottom line: making America a better place to live. It emphasized consideration of how transportation investment and policy choices affect safety, community quality of life, and the environment.

One of the most pressing problems today in light of the new welfare legislation is making the reforms work. Nationally, only six percent of those on welfare own an automobile. A person can't get a job if a person can't get to a job. In response to this problem, FTA has proposed a new initiative called "Access to Jobs and Training." Transit is the "to" in "Welfare to Work." The President alluded to this initiative in his State of the Union Address. Under this new program, governors, units of local government and nonprofit agencies will be able to compete for resources. The funds will be used to plan and implement the best methods of solving local transportation problems related to getting people off the welfare rolls and into jobs or training needed to enter the work force. Although it is our intent that funding will primarily support operating and capital costs for service start-up, other eligible costs include collaborative planning to assess employment transportation needs and develop service strategies, integrating transportation and welfare planning, the coordination of existing service providers, the development of long-term financing strategies, promotion of employer-provided financing, administrative costs associated with the program, and evaluation activities.

In addition, the proposed programmatic changes and expanding the definition of capital projects for mass transportation will give operators added flexibility within the transit programs to provide needed support for transit service to meet the requirements of the Americans with Disabilities Act.

ENVIRONMENT

Under NEXTEA, the basic program structure of our environmental programs remains unchanged from ISTEA. Our proposal also continues ISTEA's commitment to inclusive transportation planning which will enhance State and local decisionmakers' ability to consider the environmental impacts of their transportation investment decisions. Although our communities have made significant progress in improving air quality in recent years, we still face environmental challenges, not just to improve our air but to enhance our communities.

The CMAQ program has proven to be ISTEA's most flexible program, representing more than half of all flexible funds used for transit purposes ($1.7 billion of $3.0 billion). Other non-highway projects that assist areas in improving air quality are receiving an increasing share of CMAQ funds as well. Through 1996, over $500 million in CMAQ funds were used to establish or expand rideshare services, promote demand management, and support bicycle and pedestrian travel. CMAQ flexibility has allowed States to fund new innovative efforts such as vehicle emission inspection and maintenance programs, alternative fuel conversions and refueling facilities and the purchase of clean fueled buses and electric vehicles.

The congestion relief benefits of the CMAQ program have also been substantial. Houston's TransStar traffic management and control system uses cutting edge technology to manage over 300 miles of freeway and over 100 miles of high occupancy vehicle lanes. CMAQ has also funded many other congestion mitigation projects, including HOV lanes in Los Angeles, shared-ride services in Virginia and New Hampshire, and bicycle and pedestrian facilities in Montana. The benefits of promoting alternative travel options as envisioned by the Congress in ISTEA have clearly been realized through the CMAQ program.

Under NEXTEA, we will build on this success. The Department proposes an increase in the average CMAQ program funding authorization under ISTEA from $1.0 billion annually to $1.3 billion under NEXTEA, an increase of 30 percent. Funding eligibility would be expanded in several ways. These include providing funds on the basis of a State's maintenance, as well as nonattainment area, populations; clarifying that nonattainment areas for particulate matter (PM) are explicitly eligible and adjusting the funding formula accordingly; and including programs to reduce extreme cold starts (where the majority of vehicle emissions are generated) and to "buy back" or scrap higher-polluting pre-1980 vehicles. Also, with EPA's proposal to revise the national ambient air quality standards, the Department recognizes the need to extend funding to any areas newly designated under the new standards. We therefore propose that CMAQ funds be available to these areas after a State has submitted its implementation plan addressing the new standards to EPA.

NEXTEA also continues investment in bicycle paths, scenic byways, and recreational trails that cost relatively little but which greatly improve the quality of our lives. While bicycle and pedestrian projects can be funded under all of the major

ISTEA funding programs, transportation enhancement (TE) funds have accounted for 75 percent of funding for these projects.

Transportation enhancements are transportation-related activities that are designed to strengthen the cultural, aesthetic, and environmental aspects of our transportation system. Such projects have become an important part of our commitment to the redevelopment and sustainment of communities through a variety of transportation related activities, from the renovation of historic rail depots, such as the Lafayette Depot in Lafayette, Indiana to the rehabilitation of the historic Stone Arch Bridge in Minneapolis and funding for the Schuylkill River Park and Trail in Philadelphia. Because of the success of this program, in NEXTEA, we propose to retain the current TE provisions of ISTEA with continued funding from a 10 percent set-aside from STP funds, resulting in a funding increase of over 30 percent. We also included a provision that codifies the requirement that TE activities have a direct link to transportation.

INNOVATION IN TECHNOLOGY

As we began strategically planning for a post-ISTEA era, one of our goals was to create a fundamental cultural change both within the Department and the transportation community as a whole that would provide a foundation for the next century. One of the cornerstones for the future is a strong shift of resources and energy to technological innovation—innovation that would provide for a greater return on our investment. This change would also move us from a traditional oversight role to one of proactive leadership, and make technology, in the broadest sense, a leading element in the transportation system for the 21st century.

To make this happen, we are proposing significant increases in programs which support the advancement of technological innovation. Our reauthorization proposal and fiscal year 1998 budget request recognize that a strong Federal transportation research and technology program is not a trade-off with infrastructure funding, but is instead a powerful tool to ensure that innovation is incorporated into the multi-billion dollar infrastructure program.

Within the FHWA fiscal year 1998 budget request, our proposed research and technology programs would be funded through a combination of direct contract authority and the administrative takedown from the Federal-aid highway program. Technology deployment and technology transfer programs—those elements of the research and technology program most closely aligned with program delivery and professional capacity building—would be supported through their own contract authority and not be a part of the administrative takedown. This would include activities such as ITS deployment, a proposed National Technology Deployment Initiatives program, the Local Technical Assistance Program, the National Highway Institute, and University Transportation Centers.

Funds to support pure applied research including basic ITS research and technology, and highway research and development, would be funded from General Operating Expenses as part of an administrative takedown as has been the case in the past.

INFRASTRUCTURE AND TRAFFIC SAFETY

FHWA is answering our Nation's challenge to make roads better. One of our active research and development programs is defining "better" to mean highways that are safer and operate more efficiently. The annual cost of traffic crashes is $150 billion and growing, and congestion costs U.S. businesses up to $40 billion per year. The need to explore innovative solutions to our highway safety problems has led to productive partnerships with NHTSA and the private sector.

New approaches to modeling and computer simulation of vehicle and roadside hardware are being funded jointly with NHTSA and have participation from the automotive industry. The use of these powerful simulation tools will enable us to design future roadside hardware that will perform at higher levels and reduce the severity of crashes. Helping drivers to see pavement markings at night and in times of bad weather is another promising area of technology.

Research in the Automated Highway System (AHS) will reach a significant milestone this August when its technical feasibility will be demonstrated in San Diego. The Department is also planning to link more closely the near term benefits of NHTSA's work in Crash Avoidance Systems with the research that has been carried out for the AHS. A major program review of the AHS will help us focus our resources so that we will be able to deliver sooner the benefits of integrating several collision avoidance systems into smart vehicles so we can reduce crashes while improving the efficiency of our existing highway system. The resulting Intelligent Vehicle program will capitalize on the synergisms that have been created through the

public-private partnerships of the National Automated Highway System Consortium and the more than 100 public and private organizations who are participating as associate members. NHTSA's continuing basic development and integration work will help ensure that intelligent systems are fully integrated within the vehicle, are useful to the driver, and work in concert with the highway system to produce significant safety improvements.

INFRASTRUCTURE MATERIALS AND TECHNOLOGIES

Building and upgrading the physical transportation infrastructure, principally the pavements and bridges across America, requires a major use of federal-aid transportation program dollars. The challenge we face is to make these roads better. This challenge is being addressed by applying technologies developed by the FHWA which can now make better pavements, such as ones called Superpave that will last longer; better bridge decks that last two to three times longer using epoxy coated reinforcement bars and fly ash concrete; and better bridge coatings that will last three to five times longer than previous systems. For example, FHWA-led research in High Performance Concrete (HPC) is helping to construct bridge structures that will accommodate loads twice as large as before. In 1996, this was demonstrated on a bridge in Houston, Texas. In 1997 we are working with more than 12 states to build more HPC bridges. Longer spans, fewer girders or beams, and longer life cycles, will result in substantial first cost savings at well over 1 million dollars for every 10–15 bridges built.

The FHWA will use requested resources to continue to develop, transfer, and implement technology through alliances with our partners and the international community. We will use research and technology dollars to improve the quality of infrastructure projects and reduce life-cycle costs in these times of limited funds.

MASS TRANSPORTATION RESEARCH

In the area of mass transportation research, a major accomplishment was the rollout, in October 1996, of the first prototype of the Advanced Technology Transit Bus (ATTB). The ATTB incorporates aerospace construction, accessible design and hybrid-electric propulsion into a single vehicle design.

FTA has been increasingly entering into joint sponsorships with other government agencies at the Federal, State and local levels, and partnerships with consortia formed by transit industry suppliers, transit agencies, national laboratories and universities. These partnerships can increase competition and leverage funding. Examples of programs involving such partnerships include the Advanced Public Transportation Systems program (APTS) and the Fuel Cell Transit Bus.

Federal transit research has played a key role in maintaining the Nation's global competitiveness in developments such as electronic farecards and transit vehicles powered by low-polluting fuels, hybrid electric buses, fuels cells and battery powered propulsion systems. The United States must continue devoting resources to this area to ensure that emerging technologies are developed for markets both domestic and international.

INNOVATION FOR TODAY AND TOMORROW—ITS

In 1991, under ISTEA, the Department initiated the Intelligent Transportation Systems program to research, operationally test and promote the application of computer and communications technology to our surface transportation system, in part, to address the growing gridlock in our Nation. Over the past five years, we have learned through our research efforts, that an intelligent transportation infrastructure applied to our surface transportation can improve efficiency, productivity, and safety. We are now ready to support deployment of integrated, interoperable ITS infrastructure, while continuing to conduct research in critical program areas. Consistent with the conclusions of a recent GAO review of the ITS program, we will also continue to provide deployment assistance directly to State and local agencies through technical assistance, guidance, training, and development of standards.

ITS research is already providing benefits related to improved efficiency of the surface transportation system by helping system operators monitor system performance, quickly identify and effectively respond to problems that develop, and provide timely, accurate information to travelers. Freeway management systems have increased throughput by up to 22 percent, while also increasing travel speeds and reducing accidents. Several locations utilizing ITS infrastructure freeway management systems in such states as Washington, Illinois, New York, Virginia, Minnesota, and California show reductions in total crashes from 15 percent to 50 percent. In San Antonio, Texas, reports show a 30 percent reduction in secondary crashes and a 35 percent reduction in total crashes. Based on DOT research, electronic toll collection

systems can move 200–300 percent more vehicles per lane than conventional systems.

Our fiscal year 1998 budget requests a funding level of $150 million for ITS research. This research will focus on a number of areas with high potential benefits such as advanced traffic control strategies, effective transit management techniques, and collision avoidance technologies.

It is estimated that widespread deployment of three basic crash avoidance technologies—rear-end crash warning systems, roadway departure warning systems, and lane change/merge crash avoidance systems—beginning in the next five years, could ultimately reduce crashes by 17 percent and save $26 billion per year. The results of ITS research can also be applied to allow more efficient and accurate automated safety inspections of commercial vehicles, further enhancing safety.

States are beginning to experience reductions in the cost of regulating motor carrier safety through the use of automated registration, fuel tax reporting, and weight screening processes. Such deployments can also significantly improve productivity for commercial carriers by reducing time and effort needed to prepare necessary paperwork, and can reduce the time now wasted while manual weight screening is done and manual safety inspections are performed.

ITS infrastructure consists of a series of elements, such as smart traffic signals, advanced traffic management systems, and more. This infrastructure allows the public to travel more efficiently and safely. Over the last five years we have learned that this system works best when the components are interoperable, or "can talk to one another."

In order to jump start State and local government involvement in deploying ITS in an integrated manner, consistent with standards and within the bounds of the national ITS architecture, we are proposing an incentive program. Our reauthorization proposal would authorize this ITS Deployment Incentives Initiative and provide $100 million per year to fund this effort over the life of NEXTEA. This deployment incentive program will focus on integrating existing intelligent transportation infrastructure elements in metropolitan areas, including those elements installed with other Federal-aid funds. It will also focus on installing, as well as integrating, the various elements of an intelligent transportation infrastructure for commercial vehicle projects, and projects outside metropolitan areas.

We believe that the timing of deployment is critical. At the moment, elements of the intelligent transportation infrastructure are being deployed piece by piece, with no guarantee of interoperability. State and local governments will then have to live with a stove-piped infrastructure, one in which components do not form a system and are not necessarily efficient. We believe this program gives state and local governments an incentive to cooperate with agencies, jurisdictions, and the private sector, to achieve fully integrated ITS deployment in accordance with the national ITS architecture and established ITS standards and protocols.

INNOVATION—IMPLEMENTING COMMON SENSE GOVERNMENT

Secretary Slater has emphasized common sense government and innovation as being among his top three priorities and it is reflected in our reauthorization proposal. Let me provide some specific examples:

—In our planning provisions in NEXTEA, we propose to simplify the planning factors, in order to focus States and MPO's on 7 broad goals rather than the 16 to 23 that are included in the statewide and metropolitan planning provisions of ISTEA.

—In the STP, we propose eliminating the quarterly, project-by-project certification of each state's STP projects and instead establishing an annual, program-wide approval for each state's STP program.

—Also for all projects off the NHS, we would reduce DOT oversight, replacing it with State oversight (except for environmental, labor standards, and similar laws which must remain a Federal responsibility).

—For transportation enhancements, we retain the simplification provisions in the National Highway System Designation Act of 1995—and we commit emphatically to doing everything we can administratively to carry out the letter and spirit of these provisions. In response to the NHS Act, we have already put in place provisions to allow for the use of donated funds, materials, and services as a State's match; allowed for advance payment options for cash-pressed localities; streamlined environmental documentation through the use of categorical exclusions; made changes in response to Uniform Relocation Act concerns; and are completing procedures to trim review time where historic preservation issues are involved.

—Across our entire program, we propose removing a variety of restrictions on reimbursement of State and local government costs, and eliminating requirements that State and local governments "turn in" to the Federal government revenues that they gain from Federal-aid highway projects, permitting States and localities to retain those revenues as long as they use them for title 23 purposes.
—For the Section 402 highway safety grant program, we will be expanding to all states the performance based management process begun as a pilot in fiscal years 1996 and 1997. Grant management will be simplified and states will have increased flexibility.

We are also working diligently with our partner agencies to ensure that we efficiently deliver "seamless" transportation service to our customers. In February 1996, the FHWA, FTA, NHTSA and Federal Railroad Administrators submitted a joint field restructuring proposal to former Secretary Peña. While each agency retained its existing identity and reporting relationships, renewed emphasis was placed on the spirit of intermodalism embodied in ISTEA. Headquarters and field officials of the four surface transportation modes and the Research and Special Programs Administration have been actively engaged in creating a new model—one which focuses on the complementary relationships of the surface transportation modes, as opposed to viewing them as separate and unrelated entities. The new model seeks to ensure seamless, intermodal, customer-friendly delivery processes through shared technical and administrative resources, while realizing reduced operating costs.

For example, in the planning area, one of the Department's more significant accomplishments includes the establishment of Intermodal Planning/Transportation Groups in each region which include representation from each of the surface transportation modes, RSPA, and other DOT modal administrations. Many of the regional groups also include representation from outside the Department, including the Army Corps of Engineers and the Environmental Protection Agency. These planning groups serve as vehicles for developing and overseeing agendas and carrying out specific initiatives related to transportation planning activities.

CONCLUSION

In implementing ISTEA, our efforts have focused on redefining and strengthening old partnerships and building relationships with new partners. From a program standpoint, we have emphasized the sustained economic growth that results from sound and substantial investment in transportation infrastructure, particularly the National Highway System, from programs that reduce costs to business and average citizens by enhancing highway safety, and from investment in research and technology innovation that will make our investments more efficient and effective. We look forward to working with the Congress to further the advances launched in ISTEA as our surface transportation programs are reauthorized to move us into the next century.

Thank you for the opportunity to testify today. We would be pleased to answer any questions you may have.

STATEMENT OF RICARDO MARTINEZ, M.D., ADMINISTRATOR

Senator SHELBY. Mr. Linton, do you or Dr. Martinez have any statement?

Dr. MARTINEZ. Yes, sir; I have a short statement.

Senator SHELBY. Go ahead.

Dr. MARTINEZ. Thank you, Mr. Chairman and members of the subcommittee. I appreciate the opportunity to testify today, and I appreciate your opening comments.

NHTSA is essentially a public health agency. Our goal is to prevent or lessen the consequences of motor vehicle crash injury. Our mission is to provide people with the tools they need to take responsibility for addressing injury prevention and improving safety.

We have made fairly good progress in this over the years. In the last 10 years, we have seen seatbelt use grow dramatically. We have seen drunk driving deaths drop dramatically and since 1992 have saved over 42,000 lives.

But despite this progress, things are slowing down. Our recent statistics show no room for complacency. The total number of deaths has been going down. Now it is beginning to go back up as the economy expands. Our fatality rate has been going down but has flattened in recent years. Seatbelt use has gone up and now that has flattened somewhat. Drunk driving has gone down and actually, as pointed out by Senator Lautenberg, went up last year for the first time in 10 years.

We have a lot of challenges. The second baby boom is coming. We have aging of the population. We have speeds going up on the highways. So, we have a lot of things to do to make sure that we can continue to protect people.

In 1996, over 41,500 people died on the highways and 3 million more were injured. This is a huge burden to our health care system. The economic costs to the Nation exceed $150 billion a year.

But we are poised to meet these challenges. We continue to have strong support for our activities and have built new partnerships in the States. And I want to point out that with each one of the States represented here today on the subcommittee, we have strong partnerships. We have also expanded partnerships with health care, education, and business sectors. We see a growing demand for our role and the ability to work with more partners. Our programs have been very cost effective.

We are requesting additional funding this year, 11 percent more than we received in 1997. Our top priorities are airbag safety and our budget contains an increase of $8 million for airbag work. My top priority is to get this increase and use it to improve airbag safety.

We have redone the section 402 formula based grant program to provide authorization for four new programs. No. 1 is to enhance

the alcohol-impaired driving program, and we have increased funding for that program by 60 percent. That has been a very effective incentive program. We have a new occupant protection incentive program to encourage States to increase seatbelt use, which we think is one of the most important things we can do. We have a new drug-impaired driving program as a Presidential initiative to help States enact and enforce tough laws to prevent drug-impaired driving.

We are also proposing a new State highway safety data improvement incentive grant program to become effective in 1999. One of the things we want to do is have the States and the communities take ownership of the problem by collecting data and identifying problems. We have to get States and communities able to find their problem, so we can come in and partnership as a resource to help them attack the problem. I want to point out that each one of the States represented here today have safe community programs that we started and are using this sort of approach.

We appreciate the opportunity to work with the subcommittee to improve highway safety and to answer questions in the time ahead. Thank you.

STATEMENT OF GORDON J. LINTON, ADMINISTRATOR

Senator SHELBY. Mr. Linton.

Mr. LINTON. Thank you very much, Mr. Chairman. I am very pleased to be here today to join with my colleagues, Dr. Martinez and Jane Garvey, in testifying on behalf of the administration's reauthorization proposal.

We at FTA believe that ISTEA works and that the proposal we are putting forward builds on the success that we have had over the last several years. We recognize that transit is a critical element in our overall transportation system and that the goal of every Federal transit program is to optimize the benefits of transit using commonsense Government and Government that costs less and does more.

These benefits that we plan to optimize include: basic mobility for millions of Americans; congestion relief that eases gridlock and makes the country more productive; and increased access to transit and other services which improve the quality of life in making our neighborhoods more livable.

We have developed our NEXTEA proposal around four key themes: flexibility, streamlining, predictability, and innovation.

FLEXIBILITY

First, flexibility. Flexibility in local decisionmaking has been one of the hallmarks of ISTEA. NEXTEA includes provisions to make the transit program even more flexible, thus further enhancing local decisionmaking.

One, we are proposing to allow urbanized areas under 200,000 in population to use all their transit funds for any eligible purpose. That is including operating assistance without limit.

More importantly, we are proposing to make preventive maintenance eligible as a capital expense, as it is now in the highway program. This change would give local transit operators the option to invest Federal funds to prolong the life of existing assets or to invest in new vehicles, facilities, and equipment. This change would also help to replace operating assistance for those systems in areas over 200,000 in population.

STREAMLINING

Second, streamlining. NEXTEA would combine some transit program categories, thus making the program simpler to understand and manage at the Federal level as well as the State and local level. Specifically, NEXTEA would combine the fixed guideway modernization and bus discretionary program into the urbanized area formula program. NEXTEA would also provide simpler and more flexible programwide definitions of eligible capital costs,

matching ratios, and grant requirements. And NEXTEA would also expand the flexibility between the urbanized, nonurbanized, and specialized formula programs.

PREDICTABILITY

Third, predictability. Under NEXTEA, a larger proportion of the transit program would go out by formula rather than on a discretionary basis. This would not only reduce uncertainty, it would also enhance the possibility of using innovative financing techniques to leverage the Federal funds. We propose to continue to fund new starts using the full funding grant agreements approach, as we have over the last several years.

In addition, NEXTEA would fund the entire transit program from the mass transit account of the highway trust fund at an authorized level of $5.1 billion per year.

INNOVATION AND WELFARE REFORM

Four, innovation. We are proposing a series of initiatives which will enhance the ability of State and local governments to provide safe and efficient transit service by focusing on new methods designed to meet new as well as old problems.

We are particularly proud of our effort in the area of welfare reform. We in the Department of Transportation, as well as across the Nation, have recognized that transit is, in fact, the to in welfare-to-work. If we are going to make a successful transition of those now on welfare into the work force, we must make sure that transportation services they need are in place, and that the local transit agencies are involved. We have included in our NEXTEA proposal a new access to jobs and training program of discretionary grants to expand opportunities to help meet that new market.

NEXTEA also proposes to continue and strengthen our research efforts. We are very proud of these programs which recently saw the rollout of the advanced technology transit bus [ATTB]. This bus would incorporate aerospace construction, accessible design, and hybrid electric propulsion in a single vehicle. The ATTB is a solid example of our defense-related technologies converted to transit use.

In closing, NEXTEA seeks to build on the success of ISTEA in meeting the President's goal of balancing the budget by 2002. NEXTEA provides substantial funding for transit, plus gives State and local decisionmakers better tools to meet the transportation challenges ahead.

I stand, Mr. Chairman and members of the committee, to answer the questions that you may propose.

Senator SHELBY. Thank you.

GAS TAX REVENUES

Ms. Garvey, Mr. Linton, Dr. Martinez, I am going to ask this question to all of you. Are you supportive of moving the 4.3 cents of gas tax revenues currently dedicated to general revenues to the highway trust fund? Ms. Garvey.

Ms. GARVEY. I hope we all give the same answer. [Laughter.]

Let me say that the administration has not been supportive in the past of moving the 4.3 cents back into the highway trust fund. The spending decisions that we make are all within the context of trying to balance the budget and reduce the deficit. I know this is an issue that Congress is going to look at and it is going to be, I know, hotly discussed through the next few months.

Senator SHELBY. Mr. Linton, is your answer the same?

Mr. LINTON. Absolutely. [Laughter.]

Senator SHELBY. Dr. Martinez.

Dr. MARTINEZ. Yes, sir. [Laughter.]

Senator SHELBY. I believe you all had a breakfast meeting. [Laughter.]

Do you oppose moving the transportation funds off budget? Ms. Garvey.

Ms. GARVEY. The answer is essentially the same, that the administration has not in the past supported that because of again the implications for the budget and for reducing the deficit and balancing the budget.

Senator SHELBY. The same for you, Mr. Linton?

Mr. LINTON. Ditto, Mr. Chairman.

Dr. MARTINEZ. Yes, sir.

Senator SHELBY. You all had two breakfast meetings. [Laughter.]

Ms. GARVEY. Mr. Chairman, thank you very much for leading with me. [Laughter.]

Senator SHELBY. Thank you. You are doing well on behalf of the administration thus far.

Senator BYRD. They had chicken for breakfast. [Laughter.]

Senator SHELBY. Chicken for breakfast, Senator Byrd says. Probably had a lot of it.

TRANSIT FUNDING UNDER NEXTEA

Mr. Linton, the transit program is the only major component of the administration's NEXTEA bill whose overall funding authorization was cut as compared to ISTEA. Specifically transit was cut $1 billion, from $31.5 billion to $30.5 billion, over the 6 years. Is the administration sending Congress a signal that transit is less of a priority than it was under ISTEA?

Mr. LINTON. Mr. Chairman, let me just say that, considering this issue of fairness, I think transit will, in fact, get its fair share under the NEXTEA proposal. Although it may appear that transit is getting a reduction, actually under NEXTEA transit will get a 4 percent higher amount than it received under ISTEA. After you adjust for the—there is a bubble that was placed in the authorization ceiling in the last year that makes it appear as if transit gets less funding.

Senator SHELBY. How large a bubble? Do you know or do you want to furnish that for the record?

Mr. LINTON. I can submit that to you for the record, but it is clear that the bubble in the authorization ceiling makes it appear as if there is less money for transit. But it is clear I believe that the NEXTEA will provide a 4 percent higher allocation for transit than was the case under ISTEA.

[The information follows:]

ISTEA authorized $5.1 billion each year for fiscal year 1993 through fiscal year 1996, and then jumps to $7.2 billion in fiscal year 1997. This is a "bubble" of $2.1 billion in fiscal year 1997. Without this "bubble", the total ISTEA authorization would have been $29.4 billion. This when compared to the $30.5 billion proposed in NEXTEA would mean a 4 percent increase.

NEW STARTS

Senator SHELBY. Mr. Linton, currently there are 13 transit new starts with full funding grant agreements and 2 more, Sacramento and San Francisco BART, awaiting FFGA's. If the two additional projects receive their FFGA's, for a total of 15 projects, please describe for the committee how much new start funding would be available for other projects under the $634 million level proposed in the President's budget. How much would be available if new starts were to be funded at the high authorization levels proposed in NEXTEA?

Mr. LINTON. Our authorization level for the NEXTEA proposal is $5.8 billion in budget authority. If we look at our commitments to the existing full funding grant agreements, we would have assumed $3.7 billion of that. That will provide about $2 billion additional available under the authorization of NEXTEA for additional projects.

Senator SHELBY. But that would really cripple new starts in that area, would it not, if all these were fully funded that you have on the board.

Mr. LINTON. Well, it will mean that it will be difficult to meet all the demands in the country for new start projects, but clearly we have followed the path that was established in ISTEA in terms of authorizing the projects that we worked on, as well as the earmarks by the Congress. That has led us to the $3.7 billion figure that we will be working with into NEXTEA.

Senator SHELBY. Mr. Linton, I understand that yesterday, April 9, you wrote to the chairman of the Los Angeles County Metropolitan Transit Authority and essentially informed him that you plan to rewrite the full funding grant agreement regarding the troubled Los Angeles rail system. Evidently you found serious deficiencies and questionable assumptions in the recovery plan proposed by Los Angeles. Your letter states—and I quote:

We're incredulous that despite the engineering and financial difficulties on the construction already underway, the board is contemplating even more requests to the Congress about various costly extensions to your rail system.

If you rewrite the FFGA, the grant, for Los Angeles, will you free up more contingent commitment authority to be used for other FFGA's, other projects?

Mr. LINTON. I am amazed how quickly my letters get around.

Senator SHELBY. They came over the transom. [Laughter.]

Mr. LINTON. Let me just say, Mr. Chairman, that quite frankly we have had some concerns over the years with the project in Los Angeles. We did send a letter, as you indicated, to the chairman of the board, and we did call for rewriting the full funding grant agreement.

However, in our rewrite of the full funding grant agreement, what we are attempting to do is segment MOS–3 into three separate legs, primarily for administrative funding/programmatic reasons so that we can better monitor how much the Federal share is

committed to each one of the legs and to also make sure that we can monitor how the local share is being provided by Los Angeles.

However, in that rewrite of the FFGA, we do not see where there will be any additional contract authority available because the three segments of the project will still be called for in MOS–3.

Senator SHELBY. Senator Lautenberg.

HIGHWAY APPORTIONMENT FORMULAS

Senator LAUTENBERG. Thank you, Mr. Chairman.

As we all are aware, the challenge to existing formulas is developing, and one of the things that I want to point out is that though we talk about a return of dollars to particular States based on their contribution, I think if we extend that proposition, we have got to look at what return we get overall from the Federal Government based on contributions that we make. I would quickly point out that unfortunately New Jersey gets 68 cents on the dollar for all Federal programs, 68 cents on the dollar that we send down to Washington. So, we will have to look very carefully at this change in formula that is contemplated.

Now, I would ask you, given our need to conserve fossil fuels and the direct link between gas consumption and pollution, why do you choose to continue the practice of distribution of large sums of highway money to States based on their consumption of gasoline?

Ms. GARVEY. I think the formula is the most difficult issue that we face. It is certainly among the most difficult issues.

In the area of the STP program, we have included population as one of the factors. VMT is still a factor. You are right, Senator. And that seemed to be from our perspective one of the best ways to at least gain some equity.

Senator LAUTENBERG. Because I think realistically what it does is it penalizes those who choose to invest in energy efficient systems and trains, buses, et cetera, at their peril.

Ms. Garvey, in examination of the 25 busiest airports in the United States, 4 of them are used regularly by my constituents. That includes Newark, La Guardia, Kennedy, and Philadelphia. These four airports contribute a very high percentage of the ticket tax revenues that go to the airport grants program.

Well, do you think we should guarantee each airport a grant equal to 90 percent of the revenues that they contribute toward grant programs no matter what their needs are? You are just getting ready for a whole series of questions I know. [Laughter.]

I want to give you some practice.

Ms. GARVEY. I was not prepared for an airport question, Senator. [Laughter.]

If you give me overnight, Could I get back to you tomorrow on that one?

Senator LAUTENBERG. I am willing to do that because it is a little bit out of left field.

Senator SHELBY. Senator Lautenberg, if you would yield. I assure you we will get together, the two of us, and put together a hearing if you would like that, on this subject.

Senator LAUTENBERG. Excellent. Thank you very much, Mr. Chairman. You see the South and North come together here very quickly. [Laughter.]

And I like that. I have found that to be with Chairman Shelby. We work together on other committees too.

Well, if we distribute Federal airports—funds, rather—airports. Boy, that would be a good subject—based on needs rather than contribution, again why recommend that we do the reverse when it comes to distributing Federal highway funds? It is fairly simple, is it not? We will talk about that at a later date too I assume.

ITS TECHNOLOGY

Up through fiscal year 1997, we have provided almost $1.3 billion in funding to explore and apply new intelligent transportation systems [ITS]. These technologies are expected to improve the performance of roads and transit systems and increase capacity while protecting or improving safety.

Based on your most recent evaluation of this program, can you point to any concrete benefits that the Nation's taxpayers have received from this investment?

Ms. GARVEY. I think there are several areas. Starting with safety—and Dr. Martinez may want to talk about this more specifically, but in the area of safety, I think ITS has been enormously successful. One of the lessons that we are hearing and one of the observations that we have made in looking at the operational tests and also looking at the GAO report is that integration is key. When you look at ITS, it is most successful when it is integrated. That is really the emphasis that we are focusing on as we look at NEXTEA. Where can we deploy ITS in an integrated fashion to improve safety, to improve capacity. I think managing the systems we have built, ITS is key for that.

There are some applications even in the rural areas. We have a mayday system that works very well by identifying where there are accidents using ITS. Tourist information is another area that both rural and metropolitan areas find ITS very successful.

So, integration is important, training of State DOT's——

Senator LAUTENBERG. By integration, you are saying safety, efficiency bring forward the elements, or are you talking about a system that has an automobile link to a central data system that includes not only perhaps mapping, emergency calling? What is the——

Ms. GARVEY. The second part of your response, Senator, is the emphasis that we see or the area that has the most potential.

Dr. Martinez.

Dr. MARTINEZ. We look at three phases of a crash: avoiding the crash to begin with, what happens during the crash, which is our vehicle standards, and after the crash which is why we actually have such a strong role in EMS. But interestingly enough, after the crash also has a role with ITS.

The biggest bang for the buck from our perspective with ITS is the crash avoidance itself. Ninety percent of these crashes are human factors related, not vehicle related. So, therefore, we are seeing programs come on board the car to help with hazard warning, control of the vehicle, fatigue issues, et cetera. Some of them actually are already coming into the marketplace. We see that as the fastest way to get ITS into the marketplace as the infrastruc-

ture is being built. We see a huge payoff with ITS in terms of benefits for the dollars spent.

ITS ROLE IN TRANSIT

Mr. LINTON. If I may add, I think that ITS probably has the most applications in the transit industry, particularly in the areas of fleet management. We see a number of opportunities there to reap savings to our systems as we look at issues such as welfare to work and trying to create opportunities to move people from job sites to training sites as well as to their homes.

We see opportunities for things such as route deviation where you can use the ITS technology to take buses off route, to pick individuals up when they are not on a fixed-route system.

We see its uses in paratransit where you need to have an individual response to individuals.

We also see it in customer service. It enables customers to know what time vehicles are arriving so that they can better plan their time and their day.

ITS technology is valuable in emergency response by identifying where vehicles are located in case of accidents. It also provides information when there are security incidents on buses and rail vehicles; the ITS control center is used to get that information to police and other emergency personnel. So, it is very effective in transit.

Senator LAUTENBERG. Thank you very much, Mr. Chairman.

Senator SHELBY. Senator Byrd.

ZERO TOLERANCE LAW

Senator BYRD. Dr. Martinez, the zero tolerance provision, which I included in the National Highway System Act, will implement sanctions on States' Federal highway funds beginning in October 1999 if they do not pass a law requiring that youths under the age of 21 be prosecuted for drunk driving if they have an amount of alcohol above .02 in their system. At the time we passed that law, about 24 States had this policy in place.

What can you report to this subcommittee regarding the other 26 States and how many of them have implemented a zero tolerance law since passage of the National Highway System Act?

Dr. MARTINEZ. Well, that is a success, I think, of zero tolerance. It was accompanied with a Presidential radio address that talked about how simple it was, the concept that if you cannot drink under 21, you should not be able to have any alcohol in your system under age 21. I can tell you that as of June 10, 1995, 13 States have enacted zero tolerance laws, 13 additional States added to the 24 that already had that law.

Senator BYRD. What do you see for those that have not implemented this?

Dr. MARTINEZ. Well, we have a very large coalition that is working with the States to have them move forward. There are other States who have discussions under way I believe right now. I believe at least three States are looking to change their law in order to come into compliance with that zero tolerance provision. Our hope is that all States have zero tolerance in the next few years and that it becomes the law of the land.

Senator BYRD. Are you pushing hard for that?

Dr. MARTINEZ. Yes, sir.

Senator BYRD. Or are you just hoping?

Dr. MARTINEZ. We are pushing hard. We think that seatbelt use and drunk driving are two very important issues. We have a big focus not on just drunk driving but drunk driving and youth, and it is not just a matter of talking about zero tolerance, but the ability to enforce those laws. We are working also with the judicial system and with law enforcement because one of the problems we find, for example, in the younger groups under 21 that cannot get their alcohol as readily in bars and restaurants, what they do is purchase it at convenience stores or have someone else purchase it. They consume it in other places such as parks or river fronts, et cetera. So, you have to have special patrols for that.

I think that we are seeing, not only the continuation of efforts from us with our coalitions built throughout the States to pass the laws, but also to make sure those laws are seen by the youth as being effective, and they will be complied with.

Senator BYRD. Do you anticipate that any of the States will not be in compliance beginning in October 1999?

Dr. MARTINEZ. I think that is a distinct possibility, but it is something that we do not hope will happen. What we have done is create a program called Partners in Progress to not only expand the partnership but also to find ways to move this into the States. Our hope is that most all the States—or all the States would address this issue and respond to this issue within the next 2 years.

Senator BYRD. What are your impressions as to how the law has aided our efforts to minimize drunk driving by our Nation's youth?

Dr. MARTINEZ. We have found that zero tolerance laws are effective in decreasing fatalities and decreasing crashes in youth. It sends a very strong message. Youth are the highest risk drivers. They also have crashes at lower BAC. So, it is a triple win in our opinion. We find variation in the amount that it decreases. It has decreased fatalities as much as 16 percent in some places. We are excited about that.

We also know that just raising the age to 21 has dropped deaths by 50 percent over the last 10 years in that age group. We think this adds a significant margin of safety to that young, inexperienced driver.

AGGRESSIVE DRIVING

Senator BYRD. Does your administration have any ideas or proposals that would promote zero tolerance of aggressive reckless driving?

Dr. MARTINEZ. Yes, sir, we do. That is an area of tremendous concern for us. Just in local surveys in this area, we found that people are more concerned about aggressive driving than they are about drunk driving, because they see it so much more often. They can see that on the highway every day going back and forth to work, and it is certainly an area of anxiety.

What we are doing is working with 21 States right now in order to increase awareness, and at the same time increase the enforcement. One of the areas we find of greatest benefit is to increase or have highly visible law enforcement for aggressive driving.

One of the concerns we have is that over the last 10 years we have seen an increase in traffic on the highways by 35 percent. Yet, we have seen no commensurate increases in law enforcement.

We have programs ongoing in four or five States to look at how they are going after aggressive driving and evaluating those and then bringing those to other States in our role of trying to find best practices. But it is an area of extreme importance for us.

Senator BYRD. An aggressive driver may be drinking.

Dr. MARTINEZ. Absolutely and not wearing their seatbelt and following too closely and many other things. High risk behaviors link.

The other thing I will point out is that we found that by going after aggressive drivers, you also pick up a lot of other criminal behavior. I think North Carolina with their Click It or Ticket campaign has shown a tremendous correlation between people with outstanding arrest warrants, lack of seatbelt use, and other behavior just from going after those without seatbelts.

Senator BYRD. Should we consider legislation to encourage States to toughen their laws and their enforcement of those laws to vigorously prosecute these reckless, aggressive drivers?

Dr. MARTINEZ. We certainly think that is an option. What we have done right now is to begin the research aspect on it, on what we need to do to attack the problem.

One of the other areas I am concerned about is whether or not the sanctions are strong enough. Are we giving the tools to the law enforcement and to the judicial system to be able to prosecute and send the right message to people? So, I would expect in the next year or so, as we finish up our studies and our evaluations, we will be able to come forward with some very solid recommendations.

Senator BYRD. Mr. Chairman, I see my time is up. Thank you.

Senator SHELBY. Senator Faircloth.

USE OF ITS TECHNOLOGY IN THE TRUCKING INDUSTRY

Senator FAIRCLOTH. Thank you, Mr. Chairman.

Ms. Garvey, I noticed that the NEXTEA, the administration's reauthorization proposal, is committed to the promotion of intelligent transportation systems. Amongst other tools, this is the transponders on trucks to identify where they are, which can let them move nationwide and bypass weigh stations. If they have been weighed in Virginia, for example, they do not have to be weighed in North Carolina.

You are encouraging the use of these systems. Is that right?

Ms. GARVEY. For safety reasons, yes. Yes.

Senator FAIRCLOTH. All right. The companies put in this expensive system, the transportation, the trucking companies, and now you are attempting to use them as an enforcement tool. Is that not in a direct opposition to encouraging them for safety, encouraging them to put them in? And then you turn around and use it as an enforcement tool, and the trucking company that does not have it simply does not come under the enforcement rule. The one that does have does. If I ever saw a reason not to put one in, you are giving it to them. Besides that, you say you are encouraging them to do it.

Ms. GARVEY. We are encouraging them through some incentive programs for safety reasons, and Senator, I think the point you

raise in terms of enforcement, could it be abused, for example—we are working very closely with the trucking industry to establish some guidelines that works for them and works for us as well. A number of the trucking companies that we have worked with, obviously, are also very, very concerned with the safety benefits of some of the technology that we are suggesting.

Senator FAIRCLOTH. You are missing the point. You say that you are encouraging the use of ITS for safety, but when you subpoena records, it is a strong disincentive to all companies. We can't lose focus of the need for safety and these subpoenas don't help.

Ms. GARVEY. Yes, sir.

Senator FAIRCLOTH. And then you turn right around and subpoena the records. So, the trucking companies are abandoning the whole system. Now, which way are you headed?

Ms. GARVEY. We are heading toward using it for safety and working with the trucking companies to establish the appropriate guidelines for enforcement.

Senator FAIRCLOTH. What are trucking companies telling you?

Ms. GARVEY. Mr. George Regal, from our motor carriers office is here, who has worked very closely with ATA and with a number of the trucking companies, I would like for him to respond more directly.

Mr. REAGLE. Senator, I think in the past our enforcement people have in some cases been overzealous.

I think you have two things happening. You have technology emerging which we see can really help us with safety and the companies do as well.

Senator FAIRCLOTH. Who are you with?

Mr. REAGLE. I am with the Office of Motor Carriers under Ms. Garvey.

Senator FAIRCLOTH. OK, you are with the——

Ms. GARVEY. Federal Highway.

Mr. REAGLE. And so I think you have two things emerging. You have companies using technology for safety which is a plus. You have our enforcement people who in some cases—and I know the particular case you are talking about—where they in fact may have been overzealous.

What we have tried to do—we have a draft proposal now that I would like to outline for you. One, it would create incentives for companies to use this technology by reducing the paperwork burden. Now, that was not the case with the specific case you are talking about.

Senator FAIRCLOTH. Well, which one am I talking about?

Mr. REAGLE. Well, I think there was a case in North Carolina where we subpoenaed records.

Senator FAIRCLOTH. How about the Ohio one?

Mr. REAGLE. In the past, because we have not had a policy, I believe in some cases we may have been overzealous.

Senator FAIRCLOTH. What does overzealous mean?

Mr. REAGLE. Well, where we have gone in and instead of working with the company to improve their safety management oversight, we have just subpoenaed records and done those kinds of things.

Senator FAIRCLOTH. Throwing your weight around.

Mr. REAGLE. Well, that may be the right term. Yes, sir.

Senator FAIRCLOTH. All right, go ahead.

Mr. REAGLE. So, what we are trying to do is, one, create incentives for companies to use technology by in turn reducing their paperwork burden.

Two—and I think this will alleviate the problem—the methodology we use to go audit a company in the first place has been changed, and now almost exclusively, we would go into companies whose accident rates were above the average. So, we would be visiting companies who in our view would be bad carriers.

And two things could occur. If one of those bad carriers, in fact, did not have technology and our safety investigator went in, one of the suggestions he would make would be you might want to acquire technology to help you have a better safety management oversight system. Where the rubber sort of hits the road is that if we go into a company that has poor results, but it also has technology, we would want to look at that kind of technology and see how it is being used for safety purposes.

I think this policy will really go a long way in alleviating the problem you have talked about, sir.

Senator FAIRCLOTH. All right. My time is about out. I will pass it on.

Senator SHELBY. Thank you.

Senator Kohl.

NEXTEA FORMULAS

Senator KOHL. Thank you very much, Mr. Chairman.

Ms. Garvey, as you may know, my State of Wisconsin contributes more to the highway trust fund than we receive. Under ISTEA, Wisconsin and other donor States, as you know, have relied upon equity adjustments to address this problem. For example, in January of this year, Wisconsin received a one-time adjustment to compensate for its poor return in previous years. While we certainly appreciate the help, 1 good year out of 6 is still not acceptable. In reauthorization, we need to put more fairness in ISTEA's core program formulas.

NEXTEA does not provide the kind of comprehensive formula reform that I am advocating. So, how do your proposals ensure that States like my own can count on equity promises being kept every year throughout the life of the bill?

Ms. GARVEY. As I mentioned earlier, Senator, I do believe that the formula issue, as you have suggested, is among the most difficult.

What we have done or tried to do certainly with our formulas is to strike a balance among the many competing needs. We have updated the formulas and the factors that are used. For example, population factors are the most current and will be updated annually as will the contributions to the highway trust fund.

In a couple of categories, we left the formulas as is. The bridge category and interstate maintenance are left as is. The NHS we have changed somewhat and also STP.

But I think you are absolutely right. Trying to find the right balance and strike the right balance is very challenging.

We are certainly willing. We have put our formulas forward, tried to address all the needs across the Nation, but we are cer-

tainly willing to work with Congress and individual Members to try to formulate an even better formula if there is one.

Senator KOHL. OK.

CHANGES IN DEFINITION OF CAPITAL

Administrator Linton, NEXTEA proposes changes to the primary transit programs including rolling discretionary accounts into formula, phasing out operating assistance, and expanding use of capital assistance, all at a time when welfare reform will only increase demands for alternative modes of transportation. Although you proposed a separate welfare-to-work program, the transit changes appear to be a repackaging of same much needed funds.

Do you feel that the current transit formulas reflect the emerging needs of urbanized areas of all sizes throughout the country, and how do your proposed structural changes help transit systems cope with declining resources?

Mr. LINTON. Thank you very much. Actually we think the proposed changes that we are making in our formula funds and our structuring of our program will enhance transportation services available throughout the Nation, as well as urban centers. We are going to provide more flexibility, specifically by changing the definition of capital to include preventive maintenance. As I indicated earlier in my remarks, that definition will make our program similar to Federal Highway's.

I will give you an example. If you paint a bus today, that is considered operating cost. If you paint a bridge, that is considered capital. And there are a number of examples of that. If you operate a traffic control center, that is considered capital. If you operate a similar center on the transit side, it is considered operating.

So, what we are trying to do is change the definition of capital so that it is consistent with the highway programs, so we will have similar definition across our surface transportation programs.

We also think that by changing the definition and moving our bus discretionary program into a formula fund, you allow systems to have a steady stream of revenues on a consistent basis. We would be able to formulize those funds and, therefore, transit operators would have those funds readily available for innovative financing and be able to leverage funds from other financial sources.

We think this proposal provides more flexibility, more predictability, and, therefore, will aid those local transit systems in better meeting local needs.

WELFARE REFORM AND COORDINATION BETWEEN AGENCIES

Senator KOHL. Thank you.

The administration has proposed an initiative to help States and localities move people off welfare into jobs. We are pleased that you have given special attention to transportation as an integral aspect of welfare reform.

My State of Wisconsin has been a leader in welfare reform initiatives, as you know, and next month the State department of transportation and local transit authorities are scheduled to conclude a comprehensive study on transportation components of welfare reform. When released, I would like to share the results with you.

For today I am encouraging you to make access to jobs responsive to States and localities that have already begun tackling this issue.

My question is, To what extent do you perceive performance under other welfare reform initiatives playing a role in this program?

Mr. LINTON. Well, we are very excited about the Access to Jobs and Training Program that you mentioned, but what we are also doing is working with programs such as Bridges to Work which is a program that is funded under HUD and which we were involved in at the very beginning. Over the last several years, we have been doing new initiatives which we call livable communities in which we have been doing things like incorporating training facilities, day care centers, et cetera, within the same locations of transit stations.

What we are trying to do across the Government is, working with our other partners, like the Department of Labor and the Department of Health and Human Services, to make sure that we have coordinated services to meet these emerging needs that will develop as a result of people moving from welfare to work.

So, we are trying to work across Departments and also to take that across-Department approach to State governments. We are working with the National Governors Association through a grant to allow them to begin to work with their State departments of labor, transportation, and welfare so that they can also move the resources that we provide on the Federal level to more effectively target them on the State level as well.

Senator KOHL. Thank you.

My time is up, Mr. Chairman.

Senator SHELBY. Senator Bennett.

UTAH I–15 PROJECT

Senator BENNETT. Thank you, Mr. Chairman. I want to take the opportunity to thank Ms. Garvey and Mr. Linton for the personal interest that they have taken in Utah. They have been to the State of Utah. They have taken a look at some of our problems there. Like everyone, we think our problems are unique. So, we are grateful that they are willing to take a look at it.

I want to touch on two Utah issues and get some comments and reactions from them as a result of their visit there.

The first one is the Olympics. I think we have finally recognized in this Nation that with the Olympics having achieved the level of international interest and complexity that they have, that a city can no longer host the Olympics. A State can no longer host the Olympics. A nation must be involved in hosting the Olympics, and as we learned in Atlanta, many of our problems relating to hosting the Olympics are transportation problems.

So, these Administrators, Mr. Chairman, have been to Utah to deal with preliminary planning on the Olympics and we are very grateful for their willingness to do that.

And we would appreciate any comment they might have about the activity going forward in the House that would indicate that any American city—this is not Utah-specific—that ends up as a host city for the Olympics would have flexibility under ISTEA legis-

lation to have transportation support coming from the Federal Government.

And then to get the second question down so that you can be thinking about it while answering the first, I understand that the rebuilding of Interstate 15 along the western front of the Wasatch Mountains, Salt Lake County in Utah, Salt Lake County, Utah County, Davis County, and so on, is the largest design-build project ever undertaken and that DOT is watching this very closely to see how it works out on the assumption that if we get what we think we are going to get, you will learn things that will allow you to save substantial sums when faced with similar design-build opportunities in other places.

Could you comment on both of those rather parochial interests of mine?

UTAH DESIGN-BUILD

Mr. LINTON. Sure, Senator. Let me start and I will leave the design-build on I–15 to Jane Garvey, but I can talk a little bit about design-build in transit.

Let me just say, Senator, I will be leaving here about 6 o'clock to once again go to Utah. I will be traveling there this evening. We will have a ground breaking tomorrow for your light rail system, as well as announcement of additional resources for bus fleet expansion from the current 1997 grant.

Senator BENNETT. If I could just interrupt you, you do remind me I have the same interest the chairman has with respect to full funding grant agreements and what would happen to diluting existing ones. So, when you are out there looking at our program and cutting the ribbon for it, keep that in mind.

OLYMPICS

Mr. LINTON. We have no desire or plan to dilute your full funding grant agreements. Let me be clear about that right now.

But let me just say that I will also be meeting with members of the Olympic committee as well as Mayor Cordini tomorrow and looking at continued efforts on our part to work with them as they pursue the implementation of the 2002 Olympic games.

We have learned a lot from Atlanta. We have learned that Olympics is a major national event. It requires additional resources, but it also provides opportunities for the Nation in terms of putting our Nation and our Nation's cities on front stage, allowing us to benefit from that event by increasing business opportunities and increasing tourism. So, as a result of that, we think it is more than just a local event. It is a national event.

However, that means there has to be a partnership, a partnership between private providers who the Olympic committees generally are, and State and local government, as well as Federal Government. We think the reauthorization proposal does give some attention to the significance and the uniqueness of the Olympics. And many of our cities around the country are looking forward to competitively competing for Olympic games in the years to come and they are looking for some flexibility within the reauthorization that will allow us to work with them as better partners.

Senator BENNETT. Thank you.

Ms. GARVEY. Very quickly. I–15 is the largest design-build, and we are watching it very closely. We are greatly encouraged by the creativity that I think Utah's DOT has brought to this issue, and we will learn a lot both in terms of new ways of contracting, innovative contracting, financing—we are working very closely with Utah's DOT to think of new ways to finance this project—and also streamlining some of the Federal processes. And I was reminded of this when the chairman raised some of the comments earlier, that we really need to look at ways to streamline and to be more efficient.

In a project that is very large and complex, we were able to get the environmental work done, very quickly and it is because people came around the table, all the Federal agencies, the State agencies, and really hammered out some agreements and some understandings very early on in the process. So, I think those are the lessons that we can apply to other projects as well.

While design-build may not be the answer for every project, it certainly is useful for large and interesting complex projects like this one.

Thank you.

Senator BENNETT. Thank you.

Senator SHELBY. Senator Murray.

FERRYBOAT FUNDING

Senator MURRAY. Well, thank you, Mr. Chairman, and let me thank you too, Ms. Garvey, for the work you have done within my home State of Washington. You have really been a leader in innovative financing and helping us finding some solutions to our infrastructure problems, and we appreciate it.

One concern that has been voiced by many of my constituents is the loss of the ferry fund. This is a very small source of funding but it is invaluable to my State and to many of the coastal States as well. We kind of see the water in my home State as an extension of the highway system, and, in fact, there are 24 million passengers who travel by ferry every year in my home State, many of them from their home to their job.

Can you share with us what the administration's reason is for eliminating this fund and possible alternatives for these commuters?

Ms. GARVEY. That was a difficult decision and discussion within the administration, and it was really an effort to scale back on some of the number of discretionary programs. But I know you are absolutely right. Your State has done a wonderful job in addressing water transportation as a key component.

The eligibility of STP has been expanded and a number of those projects can be funded through the STP program which will be significantly larger under NEXTEA. And again, that increased flexibility will give the State an option to choose water transportation just as they might choose highway or other modes of transportation as well under the STP program.

PUGET SOUND REGIONAL TRANSIT PLAN

Senator MURRAY. OK, I appreciate that. I would like to continue to work with you.

I believe you are aware of the Puget Sound regional transit plan that was passed by voters in my State overwhelmingly provides a 50–50 funding match and it mixes commuter rail, HOV lanes, and express bus service. I know you are working through a backlog of transit projects. Can you give me an idea of what kind of chance this stands under the NEXTEA plan?

Mr. LINTON. Well, as we stated earlier, we do have an authorization level under NEXTEA of about $5.8 billion and about $3.7 billion of that will be absorbed by existing programs. I have had a chance to meet with many of the supporters from your area. My regional office and I are going to be working very closely with them in looking at the major opportunities that will come about as a result of the passing of your local tax initiative.

I have been impressed with the corporate and business involvement in the projects, and we are looking to work with them to see how we can move this through as we go through each stage of the project. But I am very impressed with the broad based support, including support from the corporate sector, and with the local initiative itself. I think it is a marvelous model for how we can develop projects in the country.

Senator MURRAY. And very supported. So, I look forward to working with you on that.

Secretary Slater is going to be in Seattle this Monday. He is looking at the fast rail corridor that is going to go through the heart of Washington State. This is an exciting project, much needed for our economy, but it also brings some problems with it. I wanted to ask you for your thoughts on some innovative financing that will help us supplement grade separation projects and other challenges we face as this goes into place.

Ms. GARVEY. We certainly would be very happy to work with you. We have a great innovative financing team at Federal Highway. It may be possible to use some of the CMAQ funds to seed or to act as a loan. We can certainly look at a number of proposals with you. State infrastructure banks is another possibility. Washington has some good and interesting ideas in that area as well.

Senator MURRAY. OK, great. I look forward to working with you.

CMAQ FLEXIBILITY

One final question. I think we all recognize that safety is a priority for any piece of legislation, and I have been working with seven different communities around the Olympic Peninsula in my home State. We are trying to expand recreational opportunities in an area that is also very reliant on our roads for commerce.

Essentially what is happening is our logging trucks and our cyclists have been debating who is going to get the roads in that region, and we have had a number of tragedies that have resulted because of that.

We have previously used scenic byway funding to expand some of our road shoulders, but that funding is very limited and we have 360 miles of very dangerous highway around the Olympic Peninsula right now.

Can you comment on the flexibility of CMAQ funding, enhancements, or other resources that we might look to in the future for this project?

Ms. GARVEY. Both the CMAQ and the transportation enhancement are increased under the President's proposal. That may be good news for projects like that.

Senator MURRAY. And there will be flexibility within that too?

Ms. GARVEY. Yes, absolutely.

Senator MURRAY. OK. I appreciate it.

Ms. GARVEY. Thank you, Senator.

Senator SHELBY. Senator Byrd, do you have any second round questions?

APPALACHIAN CORRIDORS

Senator BYRD. I have proposed that States with Appalachian corridors that remain to be completed be allowed to draw from the highway trust fund on the basis of contract authority so that those States are not dependent upon appropriations from the general fund which appear as demonstration projects.

It seems to me that if we are going to emphasize safety, we should keep in mind that in these 13 States of Appalachia, 24 percent of the corridors remain to be completed. In West Virginia, 26 percent has not yet been constructed. So, West Virginia is behind the region.

I have noted that some of these roads in my State are among the most dangerous and produce more accidents and fatalities than any other highways. It seems to me that if we really want to improve the overall safety of drivers, we ought to work with a will in completing the construction of these corridors.

Do you have any comment?

Ms. GARVEY. Senator, I think your point about the need to address safety through the infrastructure investments along the corridor that you are speaking about is absolutely right on target. I think it is also true for a number of other rural roads as well and it is why the administration has really felt a commitment to the Appalachian corridor and obviously previous administrations as well. I agree wholeheartedly.

APPALACHIAN DEVELOPMENT HIGHWAY SYSTEM

Senator BYRD. Some weeks ago the chairman of a committee—we have rules which preclude our naming names, although some Members disregard the rules, but the chairman of a certain committee held a press conference where he identified dozens of Federal programs as corporate welfare, and one of those programs was the Appalachian Development Highway System.

How can the Appalachian Development Highway System be regarded as corporate welfare in your estimation?

Ms. GARVEY. I would not describe it that way.

Senator BYRD. Pardon me?

Ms. GARVEY. I would not describe it that way, Senator. I think the points that you made earlier about the need to improve the highway both for safety reasons as well as even economic development reasons are positions that the administration would share.

Senator BYRD. You see, in West Virginia we cannot resort—I wish we could—to mass transit. We cannot have these high-speed rail systems, and we cannot depend upon aviation and airport grants. We have to depend upon highways. That is all we have. So,

I think it is very important from the standpoint of safety if for no other reason that we finish construction of the Appalachian Highway.

Corridor L, for example, runs from Beckley in Raleigh County, southern West Virginia, and joins up with I–79 around Sutton. Tourists and travelers from Canada and from the Northern States and from the Southern States use this corridor, and it has been two-lane, beautifully scenic. Two lanes. Very dangerous. Very dangerous. There have been a lot of fatalities on it.

First of all, I have assisted in completion of the construction of that highway, at least in appropriating all of the Federal funds under a matching system that would be required to finish it. Now, that would improve the safety of driving on the highways for out-of-State drivers, as well as for in-State drivers.

It seems to me if we would press harder to complete these systems—it is not easy to appropriate moneys for construction of highway corridors. It has been becoming more difficult all the time. So, that is why I suggested to the President that we initiate a program whereby these corridor States can, through contract authority, get money from the trust fund which would not compete with their other moneys that they ordinarily get through other formulas and so on so that those highways can be completed.

The people in Appalachia were promised these corridors over 30 years ago. I was around as I was around when we initiated the Interstate System.

The Senator from Alaska was here a little earlier talking about the needs in Alaska. I am the only remaining U.S. Senator who voted to admit Alaska into the Union. So, I have seen the need for this improvement of our way of funding the construction of corridors, leaving aside the economic impact that such completion would have, just talking about safety only.

I hope that we will redouble our efforts to help to see the completion of these corridors in these 13 States.

Now, if we want to really mean what we say, we ought to forget all this business about a tax cut. Forget it. It is no time to cut taxes. Of course, it is something I like to vote for. I have been voting for over 50 years, and that is about the easiest vote I have ever cast is a vote to cut taxes. But it is folly for the administration or for the other party to advocate a cut in taxes. I know it has a great political appeal out there, but we cannot talk out of both sides of our mouth and be believed and be seen as having any integrity. This is no time to cut taxes.

That money ought to be put on infrastructure, building up our country's infrastructure, so that we can compete in world markets, so that our children, our future citizens, will have an infrastructure that will enable them to improve their way of living and to increase the opportunities for jobs.

So, I know this is not in your grade level, but I hope the President and others will hear what at least one Senator thinks. It is absolutely folly to talk about cutting taxes at this period. Our unemployment is the lowest it has been in a long time. If we are not going to use the money that would otherwise go to pay for a tax cut, if we are not going to use that to lower our deficits, at least put it into infrastructure. I can think of no better way to spend it.

So, I am glad to hear you say that you think that completing the construction of these highways, making them four lanes and divided would be one of the foremost ways that we could advocate when it comes to improving safety.

My time is up.

Senator SHELBY. Senator Faircloth.

Senator FAIRCLOTH. Thank you, Mr. Chairman.

Senator Byrd, I was just wondering, did Strom vote not to let Alaska in?

Senator BYRD. Well, you know, I do not like to talk about somebody else's voting record. [Laughter.]

I can only tell you that this Senator is the only Senator who is still around who voted to admit Alaska and Hawaii into the Union. So, you will have to figure for yourself the answer to your question. [Laughter.]

Senator SHELBY. I think the Senator from North Carolina figured it out the first time. [Laughter.]

INTERSTATE REIMBURSEMENT COSTS

Senator FAIRCLOTH. Ms. Garvey, ISTEA sent $3.6 billion to New York, New Jersey, Pennsylvania and certain other States. It was supposedly to pay them for having built the New Jersey Turnpike, the New York Thruway, the Pennsylvania Turnpike, and some other preinterstate roads. I thought it was the most ridiculous and ludicrous thing I had ever heard of in my life.

Now I see you are sending them $6 billion more in NEXTEA. Will you tell me why?

Ms. GARVEY. I am going to turn to Jack Basso who is here with us who has developed some of the formulas and worked with Bud Wright.

Senator FAIRCLOTH. I am sure he is looking forward to it.

Ms. GARVEY. I bet he is. Do you think so? [Laughter.]

Sometimes it helps to be in charge and you can ask those guys to help you out a little bit.

Senator SHELBY. If the Senator from North Carolina would yield. When you are answering that, could you tell us what years this was done too?

Mr. BASSO. Yes, sir.

Senator FAIRCLOTH. What years what was done?

Mr. BASSO. I think the chairman is asking what year this money was incorporated and maybe I can tell a little bit about the system.

Senator Faircloth, I am the Deputy Assistant Secretary for Budget and Programs for the Department. Let me just make a couple of observations on that.

There has been obviously some significant debate about reimbursing for components of the system that really were built pre-1955. The administration's rationale has been that those were parts of the system that are the oldest parts of the system, are parts that did not have to be built and paid for at that time, and therefore——

Senator FAIRCLOTH. Let me ask you this.

Mr. BASSO. Yes, sir.

Senator FAIRCLOTH. Was the administration's rationale that they are going to turn all the tolls collected since 1940 over to the Federal Government?

Mr. BASSO. No, sir.

Senator FAIRCLOTH. Well, if they are going to keep the money—the Pennsylvania Turnpike was with bonds, was it not?

Mr. BASSO. Yes, sir, it was.

Senator FAIRCLOTH. Those bonds have long since been paid off, have they not?

Mr. BASSO. I really do not know, but I assume that is correct.

Senator FAIRCLOTH. When was it built?

Mr. BASSO. It was built in the late 1940's and early 1950's.

Senator FAIRCLOTH. All right. So, you are talking about 50-plus years.

Mr. BASSO. Yes, sir.

Senator FAIRCLOTH. So, the bonds were not issued in excess of 50 years.

Mr. BASSO. I understand.

Senator FAIRCLOTH. So, they have been paid off or are in default.

Mr. BASSO. Sure.

So, again——

Senator FAIRCLOTH. So, here is a highway that the traveling public has paid for totally, completely with a return to the investors on the bonds, and we are going to send them billions of dollars.

Mr. BASSO. Yes, Senator; and let me just again comment that our view was that those particular funds represented a decision the Congress made in 1991 to address an older segment of the system to provide basically costs, as they existed from a 1980 study, if I remember correctly. And the administration has decided, in submitting its bill, to propose to the Congress to continue that reimbursement.

Senator FAIRCLOTH. How long do you think we might continue that reimbursement? How long do you think we ought to continue to pay for a highway that has been built and paid for by the traveling public for 20 years and we are going to continue to pay them for it?

Mr. BASSO. I think beyond the life of NEXTEA, you know, it is very hard for us to anticipate what that might be. But clearly in this case, we have come forward with a proposal that will be debated in the Congress and decided. Senator, your position is respectfully understood by all of us who have dealt with this for a long period of time, sir.

Senator FAIRCLOTH. What do they do? Plan to cancel the tolls as soon as they get this money?

Mr. BASSO. Well, sir, I do not know about that. I could not answer that.

Senator FAIRCLOTH. What do you think?

Mr. BASSO. My opinion would be, based on——

Senator FAIRCLOTH. Do you think they are going to take down the toll booths on the New Jersey Turnpike?

Mr. BASSO. No, sir; I would be disingenuous to you if I told you I thought they were, and I do not think they would.

Senator FAIRCLOTH. Well, you could dance this around most any way you want to, but what it amounts to is $6 billion to these States, just extra money, totally pork barrel money.

How much did it cost to build the Pennsylvania Turnpike?

Mr. BASSO. I could get that figure for you for the record, Senator. I do not know right off of the top of my head what the cost was.

Senator FAIRCLOTH. Well, assuming that the split here would be about $2 billion, you are paying them about seven times what it cost to build it originally in reimbursement.

Mr. BASSO. As I said, the numbers that have been put forth for the reimbursement are based, as I recall, on a study that was done and completed in 1980 and it looked back at the original cost of the system. But I would be happy to get any of that information for you.

Senator FAIRCLOTH. You mean the $6 billion that we are giving them now was based on a study done in 1980?

Mr. BASSO. Yes, sir; it was. In fact, the 1991 legislation, the factors that were derived for each of the States was based on that same legislation except that one-half of 1 percent was guaranteed to each of the States without regard to whether they participated in this program or not.

INTERSTATE TOLLS

Senator FAIRCLOTH. Well, let me ask you one more thing. The proposal to put tolls on the Interstate System—tell me about that.

Ms. GARVEY. Thank you, Senator.

The proposal that the administration has put forward is an option for States. It is not something that is required. It is something that States can choose to use or not to use, whatever the case would be. It would involve public participation obviously, and it is just one more option for States to have, not a requirement at all.

Senator FAIRCLOTH. It is a tax increase.

Ms. GARVEY. It is an option, Senator, that would be a tax increase.

Senator FAIRCLOTH. Who would set the rate or the amount of the toll?

Ms. GARVEY. That would be decided at the State level through the planning process that is in place.

Senator FAIRCLOTH. Well, what if we put a $100 per car toll on I–95 through North Carolina? What would be the response to the Federal Highway Administration?

Ms. GARVEY. Well, to be honest, I cannot imagine the State DOT, with public participation, would be involved in something like that.

Senator FAIRCLOTH. We might just put it on interstate cars going from Virginia to South Carolina.

Ms. GARVEY. Again, it is an option for States to use.

Senator FAIRCLOTH. So, what you are saying is the States could put any sort of exorbitant toll on a highway they might see fit. Of course, I was making a ludicrous example, but for the Federal Highway Administration to say that States can put a toll on a highway that has been paid for by Federal money and the—this is a form of raising revenue.

Ms. GARVEY. Senator, the way the language is worded, it would have to be tied to the rehabilitation of that facility. So, in other

words, if you wanted to rehabilitate a section between point A and point B, a State could elect to do that. My experience in the last few years with States is that they approach those things very cautiously. It is an option that they have. ISTEA gave the option for bridges and tunnels, and States have, for the most part, chosen not to use that.

Senator FAIRCLOTH. Well, we have never had a toll road in North Carolina.

Senator SHELBY. If the Senator from North Carolina would yield for an observation. If we could follow some of the suggestions of the Senator from West Virginia and properly fund the Appalachian corridor the way the East got funded, there would probably be more equity there. The sum of $6 billion would do a lot I think for the Appalachian area, including most of the Southeast.

I would hope that we would have the administration's support in that regard. I know that Senator Byrd has toiled for years and years as he has pointed out, and this would affect not only West Virginia but North Carolina, Alabama, you name it. And $6 billion would do a lot for our area too, and I am sure that with the wisdom of Senator Byrd, we are going to pursue that till we get it.

Senator FAIRCLOTH. Thank you, Mr. Chairman. I intend to pursue opposing $6 billion to subsidize 50-year-old highways that have been paid for many times.

Senator SHELBY. Senator Bennett.

Senator BENNETT. Thank you, Mr. Chairman. I am cognizant of the fact that we have a vote coming, so I will not pursue all my time. But I would like to make a couple of philosophical statements.

I have not been around as long as Senator Byrd has, but I do go back a little ways. I served in the Nixon administration in the Department of Transportation, so I have some institutional knowledge of the Interstate Highway System and the philosophy behind it.

As we get into this debate about formulas, I would just share with you this concept that came from another official in the Nixon administration when I was there, a young adviser to the President by the name of Daniel Patrick Moynihan, who said that nothing that had been done in this country had had the impact on the way we live approaching the impact of the Interstate Highway System.

I remember the speech which he gave to us where he said Eisenhower has been categorized as a passive President, whereas Kennedy and Johnson were active Presidents. But historically nothing down in the Kennedy and Johnson administrations approached the impact of the Eisenhower decision to proceed with the Interstate Highway System, that this passive President had had more effect on Americans and the way they lived.

And the philosophy behind the Interstate Highway System was that it was national. It was truly an interstate system, and just because, to pick a State out of the air, Utah happens to have more miles than people in it and, therefore, more highway building than, say, a small State like, to pick another one out of the air, New Jersey, the impact on the Nation as a whole for the system to be able to provide free transportation of goods throughout the country affects everybody. It transformed the railroads, not necessarily for

the good from the standpoint of railroad investors, but the creation of an interstate network transformed everything for everybody, including fruit shipped from California to New Jersey, and in order to get there, they have to go through Utah.

If we start carving up the money on the basis of artificial boundaries that says, OK, this State is going to get so much money and if their highways break down and their infrastructure does not work, the folks on the east coast are going to feel that even though they say it is unfair for us to have paid for it.

So, I would hope you would keep that view in mind as you go through this.

The only other comment—and I probably should not say it, but I will—I am reading NEXTEA, and I will just highlight a few comments and then make an editorial comment.

It starts out, "President Clinton will announce." Then on page 4, "When President Clinton promised to rebuild America 5 years ago," and then it goes on. Page 7, "President Clinton recognized this in his January." Then page 8, "Under President Clinton, America is once again." Under Page 9, "President Clinton proposes to build, to support his comprehensive welfare program." Under page 10, "President Clinton has taken advantage of ISTEA's landmark to reduce," so on and so forth.

My only comment is, the election is over. This is an official document. Let us not use it for political campaigning purposes.

With that, I will go save the Republic, along with my chairman.

Senator SHELBY. I thank the Senator from Utah.

SUBMITTED QUESTIONS

I have a number of written questions for the record and the record will also stay open for other members of the committee that might have questions of the first panel.

All of you, I appreciate you coming. I wish you had not eaten breakfast together twice earlier. [Laughter.]

But you did and I understand that. I am sure that all of you will abide by the decision of the Congress in its wisdom, whatever we do up here, regarding legislation that would affect you and the American people.

I am going to go vote and we are going to have to recess, and then we will come back to the second panel. I thank all of you on the first panel.

Ms. GARVEY. Thank you, Mr. Chairman.

Senator SHELBY. We will stand in recess for about 10 minutes.

[A brief recess was taken.]

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR SHELBY

ENHANCING SAFETY WITH ROADWAY IMPROVEMENTS

Question. Under ISTEA, rail-highway crossings and other roadway hazard elimination projects were funded from a 10 percent safety apportionment from the Surface Transportation Program (STP) account. Because of the set-aside nature of the program, as the highway obligation ceiling went up, the State apportionments increased from $353 million in fiscal year 1992 to $600 million in fiscal year 1997.

The comparable NEXTEA "flexible highway infrastructure safety" program is a fixed-rate program, totaling $3.25 billion over the six-year authorization.

Does structuring rail-highway crossing and hazard elimination funding in a fixed-rate program preclude growth in this area if more highway funds are made available?

Answer. The Infrastructure Highway Safety Program (IHSP) provides funds to: 1) eliminate hazards on public roadways other than the Interstate, and 2) improve the safety of rail/highway grade crossings. The Rail/Highway Grade Crossing program receives a straight-line $165 million per year while the Hazard Elimination program receives the balance of IHSP funding, increasing from $335 million in fiscal year 1998 to $410 million in fiscal year 2003. These two programs no longer receive their funding through a percentage takedown from the STP. Under ISTEA, if increased funding were made available to STP, both Rail/Highway Grade Crossing and Hazard Elimination funding would increase. Under NEXTEA, unless more highway funds are made available specifically to the IHSP, funding for Rail/Highway Grade Crossing and Hazard Elimination programs would remain at NEXTEA authorized levels. The NEXTEA proposal allows states to shift hazard elimination funds to non-infrastructure safety programs, such as NHTSA's section 402 public education program or FHWA's motor carrier safety program.

Question. Do you believe that highway safety education and enforcement programs are more effective at preventing accidents and saving lives than correcting road hazards, separating grade crossings, and installing warning devices?

Answer. We believe both are necessary and effective. Under NEXTEA, States would be granted greater flexibility to use funding where they believe they can leverage the greatest results in grade crossing safety. Certainly, the safest crossing is one that does not exist. However, crossing safety is in most cases a local safety challenge that warrants diverse local solutions. That is why the Department initiated the multi-faceted Rail-Highway Crossing Safety Action Plan in 1994, and unveiled with Operation Lifesaver, Inc., the Always Expect a Train public awareness campaign in 1995. Since the Department instituted nationwide and multi-faceted safety initiatives, there has been a four-year downward trend in fatalities.

Question. I have heard that the administration is considering a new bill to amend or "fine tune" the safety section of NEXTEA. Can you confirm this? What programs are being reworked?

Answer. On April 17, Secretary Slater transmitted to Congress the "Surface Transportation Safety Act of 1997." This constitutes Part II of NEXTEA. Title IX—Traffic Safety, which contains certain amendments designed to enhance the safety provisions of NEXTEA. This title further encourages States to increase safety belt use by adopting primary enforcement of safety belt use laws; increases the number of new motor vehicles that may be exempted from compliance with Federal motor vehicle safety standards on the basis that they possess innovative safety features; closes a loophole in the vehicle safety statute by prohibiting retailers of motor vehicle equipment from selling defective items of equipment; clarifies the Secretary's authority to engage in harmonization activities that promote the worldwide improvement of motor vehicles; encourage new efforts to achieve uniformity in State laws regulating the titling and control of severely damaged passenger motor vehicles; and includes several regulatory reform proposals. The key provisions are:

Primary Safety Belt Use Laws: The Administration's NEXTEA proposal includes incentive funds to help States increase belt use. Primary enforcement is the most important life-saving aspect of belt use laws, adding significantly to the rate of belt use. This bill would establish a date certain by which all States would be required to have enacted primary safety belt use laws. Beginning in fiscal year 2003, a State that has failed to enact such a law would have a percentage of its highway construction funds transferred to its section 402 highway safety program. However, the transfer of funds would not apply to a State in a fiscal year beginning after fiscal year 2003 if the State has a statewide belt use rate of 85 percent or higher in both front outboard seating positions in all passenger motor vehicles.

Motor Vehicle Equipment Safety Defects: Closes a loophole by prohibiting all retailers, not just auto dealers, from selling defective items of motor vehicle equipment, such as child safety seats, that have been recalled.

Safety Compliance Exemptions: Increases the number of new motor vehicles that may be exempted from compliance with Federal standards on the basis that they possess innovative safety features.

International Harmonization: Clarifies the Secretary's authority to engage in harmonization activities that promote the worldwide improvement of motor vehicle safety without any diminution of U.S. safety performance standards.

Titling: Encourage new efforts to achieve uniformity in State laws regulating the titling and control of severely damaged passenger motor vehicles. The new program

would ensure that these vehicles are inspected for applicable safety and anti-theft standards.

Question. The NEXTEA proposal allows states to shift hazard elimination funds to non-infrastructure safety programs, such as NHTSA's section 402 public education program or FHWA's motor carrier safety program. Do you believe that highway safety education and enforcement programs are more effective at preventing accidents and saving lives than correcting road hazards, separating grade crossings and installing warning devices?

Answer. Both infrastructure and non-infrastructure safety programs are important. Our proposal gives states the flexibility to use their hazard elimination funds for non-infrastructure if the state has an integrated highway safety planning process and established goals and benchmarks for safety improvements.

Between 1992 and 1995, since ISTEA was enacted, the use of safety belts and child restraints has saved 35,000 lives, the use of motorcycle helmets has saved 2,155 lives, and age 21 drinking laws have saved 3,300 lives. Costs of highway crashes would have been $30 billion higher in 1994 (versus 1990) had it not been for injury rate reductions due to these and other safety countermeasures. Clearly behavior change can make a significant difference. Safety belt use has grown from 11 percent in 1982 to 68 percent in 1996. Alcohol involvement in fatal crashes has dropped from 57 percent to 41 percent over this same 15-year period. The President has set a national goal of 85 percent safety belt use by 2000, and 90 percent by 2005. NHTSA estimates that increasing belt use from the present 68 percent to 90 percent would save 5,500 lives per year. FHWA and FRA have estimated that during the period 1992 through 1995, hazard elimination saved 6,200 lives and highway-rail grade crossing safety programs saved 1,700 lives.

Risk factors are increasing that require renewed efforts in education and enforcement. The number of youngest and oldest drivers will significantly increase between now and 2005. The use of alcohol and drugs is on the rise and has begun to show in highway fatality statistics. Combined risk factors pose threats and challenges: aggressive driving, drivers who speed, run red lights, disregard traffic signs, drink, and don't wear their safety belt. Due to the aging infrastructure, safety features need to be added and upgraded, e.g., guardrails replaced, signs upgraded, new pavement markings, and hazards eliminated. Clearly highway safety must be attacked on all fronts.

FINANCING AND TOLL PROGRAMS

Question. What is the difference between State Infrastructure Banks and the Transportation Infrastructure Credit Program?

Answer. State Infrastructure Banks (SIB's) are State-level investment funds which are capitalized, in part, with Federal funds and offer loans and other types of financial assistance to transportation projects. Loan repayments and credit fees from the SIB's customers are used to replenish the funds and permit them to become self-sustaining financial institutions devoted to transportation investment. The Transportation Infrastructure Credit Enhancement Program, on the other hand, represents direct Federal assistance to specific projects. Rather than simply allowing States to use a portion of their Federal highway and transit grant funding to capitalize SIB's, this initiative would provide Federal assistance directly to projects of national significance—those projects with national economic benefits and financing requirements that exceed the capacity of SIB's and States' regular transportation programs. Under the credit enhancement program, the Administration's reauthorization proposal, $100 million per year would be used to capitalize revenue stabilization funds for one or more such projects of national significance to enable them to access the capital markets for most of their financing. These revenue stabilization funds would be used to secure external debt financing and if needed, to pay debt service costs in the event project revenues are insufficient.

Question. Since the SIB's program was authorized in the 1995 National Highway System Designation Act, what has the track record been for the program? How many of the 10 pilot states have secured federal loans?

Answer. The results to date for the SIB pilot suggest that the program will complement the regular Federal-aid program by serving certain local and state-wide projects that have access to dedicated revenue streams, but need flexible financial assistance to get underway.

With just four months having passed since most States signed cooperative agreements with FHWA and FTA to create their SIB's, financial activity has gotten underway with two loans from the Ohio SIB, each for $10 million, to support a $100 million bond issuance by Butler County for a toll road. A $1.18 million loan has also been made by the Missouri SIB for a debt service reserve fund to support a $17 mil-

lion bond issue by the Springfield Transportation Commission. Ultimately the bond issue will support a variety of street and intersection improvements including some overpass work.

Florida, Missouri, Ohio, Oklahoma, and Oregon intend to make additional project loans by October 1997. To date, $80 million in Federal funds have been transferred to States to capitalize their pilot SIB's. By October 1998, the initial 10 SIB's are expected to have provided various types of loans totaling $324 million supporting 1.6 billion in total project construction.

Question. The SIB's pilot projects financial condition report was due to Congress March 1st. When will this report be submitted?

Answer. The draft report is in the final review stage and should be issued soon.

Question. The primary barrier to implementing SIB's has been the low number of revenue-generating projects that will then be able to repay loans made by SIB's. In the Department's experience, what are possible ways for states to generate revenue in order to repay their SIB loans?

Answer. There are a variety of ways SIB loans can be repaid. Currently, the primary repayments being considered by the pilot states include user fees such as developer impact fees, tax increment financing, and dedicated local sales taxes. Repayments can include traditional tolls (potentially made more acceptable to the public through the use of automatic toll collection technology). In addition, SIB loans can be repaid with a dedicated portion of a State or locality's gas tax or future federal apportionments.

Question. If the Transportation Infrastructure Credit Program is established, what projects now underway would be eligible for funding? Would San Francisco's BART extension qualify? Boston's Central Artery project? Or the Woodrow Wilson Bridge?

Answer. Any type of surface transportation project that is proposed to be eligible for Federal assistance under title 23 or chapter 53 of title 49 in the Administration's reauthorization proposal would be permitted to receive a Revenue Stabilization Fund grant, as long as it satisfied the program's eligibility criteria. To meet those criteria, the project must: 1) be of "national significance" in terms of moving people or goods more cost-effectively (the Secretary will establish specific guidelines concerning improved productivity, cost-benefit analysis, job creation, and other factors); 2) be unable to obtain adequate financing on reasonable terms elsewhere; 3) be included on the State's transportation plan, and, if in a metropolitan area, be approved by the metropolitan planning organization; 4) have its application for assistance be submitted by a State or local government; 5) cost at least $100 million or an amount equal to 50 percent of the State's annual Federal-aid apportionments, whichever is less; and 6) be supported at least in part by user charges or other dedicated revenue streams.

Projects meeting these threshold criteria then would be evaluated by the Secretary based on a qualitative analysis of their credit-worthiness, degree of leveraging private capital, use of innovative technologies, and other factors. This program is intended to help large revenue-generating projects obtain private financing by enhancing their external debt. Projects already underway, such as the BART extension and the Central Artery, presumably have already secured the necessary financing or identified future funding sources and should not need such revenue stabilization funding. (The Central Artery project's current finance plan does not contemplate additional Federal assistance outside the State's regularly apportioned Federal-aid funding.) Based on the eligibility criteria, the Woodrow Wilson Bridge would be a candidate for direct Federal assistance under this program.

AIRBAG SAFETY

Question. NHTSA recently announced initiatives to improve air bag safety especially with respect to children and smaller-sized adults. For example, air bag deployment speeds are proposed to be lowered by up to 35 percent. Please describe NHTSA's efforts to make air bags safer for drivers and passengers.

Answer. On November 27, 1997, NHTSA published a final rule requiring vehicles equipped with air bags to be equipped with very obvious warning labels for parents and care-givers.

On January 6, 1997, NHTSA published a Federal Register notice proposing procedures to allow auto dealers or repair shops to disconnect air bags, at the request of vehicle owners, without requesting special permission from the Federal government. The public comment period closed on this proposal on February 5, 1997. Final decisions will be made soon.

On March 19, 1997, NHTSA published a final rule amending the occupant protection standard to allow vehicle manufacturers to quickly depower all air bags. For

the unbelted occupants, the regulation now allows a vehicle sled test to measure the performance, rather than the full-frontal barrier test. The agency and the vehicle manufacturers estimate this will allow air bags to be depowered by 20 to 35 percent. This interim solution will significantly reduce the risk to children and small statured adults.

In addition, NHTSA plans to propose mandating improved, advanced air bag technology. NHTSA believes that advanced air bags will provide greater safety in frontal crash protection for all size occupants. Advanced air bags will preclude air bags from deploying under unsafe conditions or effectively tailor the speed of the deployment to match the size of the occupant and the crash circumstances.

The agency has formed an Advanced Air Bag Technology Working Group under the Crashworthiness Subcommittee of the Motor Vehicle Safety Research Advisory Committee (MVSRAC) with participants from NHTSA, automobile manufacturers, automobile air bag suppliers, public health care professionals, and academia. The agency will use this working group's expertise to provide input to the agency on advanced air bag issues through MVSRAC. In addition, the agency is forming a team to work on the development of test procedures and performance requirements of advanced air bags. The agency also has a contract with the Jet Propulsion Laboratory (JPL) to assess the state-of-the-art in advanced air bag technology and the timeframe that will be necessary to bring these technologies to the market. A Final Report of the JPL work is due in October 1997.

Concurrent with all of these vehicle changes, the agency continues to work to increase safety belt use and to educate the public that children need to be placed in the back seat. President Clinton and Secretary Slater announced an initiative to increase the safety belt use to 85 percent by the year 2000. This is in addition to the ongoing nation-wide public initiative of the Air Bag Safety Coalition being conducted by the National Safety Council, in cooperation with NHTSA and other partners.

Question. NHTSA has a process to permit air bags to be deactivated upon application to the agency. What criteria does NHTSA use in deciding whether to approve an application? How many applications have been approved?

Answer. Although there is a statutory prohibition (49 U.S.C. 30122) against commercial entities knowingly making inoperative any device or element of design installed on or in a motor vehicle in compliance with Federal Motor Vehicle Safety Standards (FMVSS), NHTSA is not enforcing this prohibition with respect to air bag deactivation in the following cases:

a. The vehicle's owner or lessee submits a doctor's statement that the owner, lessee, or any other person 13 years or older who is a driver or passenger of the vehicle has a medical condition that justifies deactivation of the driver or passenger air bag or both;

b. With respect to a child age one to 12 years old who must sit in the vehicle's front passenger seat because of a medical condition, if the vehicle's owner or lessee submits a doctor's statement that the child has a medical condition that justifies deactivation of the passenger air bag;

c. The vehicle owner must transport an infant in the front seat of a vehicle with a passenger-side air bag, either because the infant has a medical condition necessitating that the infant be frequently monitored or because the vehicle lacks a rear seat that can accommodate a rear-facing child restraint; or

d. The vehicle owner has a frequent need to transport children under 12 in the vehicle and does not have enough seating positions in the rear to accommodate all children who must be transported.

From October 1, 1996, through April 29, 1997, NHTSA has received 6,039 deactivation requests, of which 1,897 have been granted. Approximately 80 percent of the grants were for adult medical conditions, while approximately 20 percent involved children, including both children with medical conditions and children riding in vehicles lacking a rear seat capable of accommodating a rear-facing infant seat. The ten most often cited medical conditions for which requests have been granted are, in approximate order of frequency: Osteoporosis/osteogenesis imperfecta/brittle or thin bone disease; Pacemakers; Heart/thoracic surgery; Breast cancer surgery/breast reconstruction, Tinnitus/hyperacusis; Emphysema/asthma/pulmonary conditions; Fractures (neck, back, ribs, etc.); Arthritic conditions; Dwarfism; and Previous air bag-related crash injuries.

In addition, a small number of requests have been granted for persons 4′6″ or shorter with no medical conditions, who would be unable to maintain a safe distance from the air bag.

SAFETY CHALLENGES

Question. A number of trends, demographics, and other issues comprise safety challenges facing NHTSA. Please give us your view on where highway safety is heading.

Answer. Despite significant progress, a look at recent statistics shows no room for complacency. After years of steady decline, the total number of highway deaths increased from 1992 to 1995. Motor vehicle crashes are still the leading cause of premature death of America's youth. Based on preliminary estimates the number of fatalities and the number of alcohol-related fatalities decreased slightly in 1996, but the number of crashes and non-fatal injuries increased yet again.

Key risk factors between now and the early 21st century are:

The number of youngest and oldest drivers is increasing. Between 1996 and 2005 the 15 to 24 year old age group will increase 14 percent, compared to an overall population increase of 7.8 percent, and the population over age 75 will increase 17 percent.

The use of alcohol and other drugs is rising. In 1995, the number of alcohol-related fatalities increased for the first time in 9 years. These fatalities still number over 17,000, even with the one percent estimated decrease in 1996.

Safety belt and child seat use is still low. Safety belt use has grown by only two percentage points since 1993; it stands at 68 percent. Agency checkpoints show that up to 80 percent of child safety seats are misused, and statistics show that every day an unrestrained child under the age of 5 is killed in a traffic crash.

Speeding and other forms of aggressive driving are increasing. Exceeding the posted speed limits, or driving too fast for conditions, is a growing problem on all roads. In 1995, speeding was a factor in 31 percent of all fatal highway crashes, at a cost to society and the economy of more than $29 billion. Currently, 34 States have increased their speed limits beyond what would have been allowed under the former national maximum speed limit law, and 23 of these 34 States have increased their speed limits to 70 miles per hour or greater. Recent surveys indicate that aggressive driving, a behavior often marked by excessive speed, has become the driver behavior that most concerns the motoring public.

The repeal of motorcycle helmet laws is becoming a reality. The motorcycle helmet law in Texas was recently repealed and there are moves in several other states to repeal.

A robust economy has been historically correlated with short-term increases in highway fatalities. While continuation of an expanding economy is a good thing overall for society, we must address the resulting increases in highway safety risk, e.g., higher number of miles driven for recreation at night, which is associated with higher risks; increased commercial traffic, which affects the vehicle mix on the road.

The vehicle mix on the road has been changing and will continue to change.

Sales of light trucks and vans have been increasing significantly, compared to sales of passenger cars. Since 1992 there have been more fatalities in car/light truck collisions than in car/car collision. Eighty percent of the fatalities are occupants of the passenger car.

Question. Safety belt and child seat use are low and drunk driving remains a major problem. How do you address these issues in the reauthorization and do you expect to be successful?

Answer. Included in the Department's NEXTEA legislation is a proposed incentive grant program designed to stimulate increased safety belt and child safety seat use. In addition, the Department's NEXTEA legislation includes a proposed incentive grant program designed to encourage states to implement laws and programs to combat alcohol-impaired driving. The program is intended to build on the successes of the Section 410 alcohol incentive grant program.

The Department expects these new programs to be successful. Just as in the Section 410 incentive grant program, where the number of qualifying states, including the District of Columbia, rose from 19 in fiscal year 1992 to 32 in fiscal year 1996, NHTSA expects the incentives offered will spur states to implement the laws and programs needed to meet grant criteria. In addition, participation in the occupant protection program will be accelerated as a result of the Presidential initiative to increase safety belt use rates nationwide.

Question. What are NHTSA's top priorities?

Answer. NEXTEA needs to provide a balanced program for NHTSA that addresses both vehicle and behavioral safety problems, while providing a foundation for research, crash data and injury prevention activities. An active technical assistance program is required to support our safety partners in the states and communities, health and business arenas, educators, and safety advocates. This is consistent with NHTSA's role as a public health agency.

Top priorities include:

Air bag safety:

In November 1996, we issued a rule requiring clearer and more precise air bag warning labels in both the passenger vehicle and on child safety seats.

In January 1997, we issued a rule extending the period for permitting air bag cut-off switches for passenger side air bags in vehicles without rear seats or with rear seats that are too small to accommodate a rear-facing child safety seat.

We issued two other proposals in January 1997: 1) to ensure that vehicle manufacturers can depower all air bags so that they inflate less aggressively; 2) to make it possible for vehicle owners to have their air bags deactivated by vehicle dealers and repair shops.

In February 1997, we issued a proposal to require that motor vehicles and add-on child restraints be equipped with uniform anchorages to secure the child restraints to vehicle seats.

In March 1997, we issued a final rule on air bag depowering, effective immediately, which allows the manufacturers to proceed with their depowering plans.

A comprehensive research effort to realize more fully the life-saving attributes of current driver and passenger air bag systems, and to pave the way for the introduction of improved air bags in the near future.

Occupant protection—Use of safety belts

Safety belts are the most effective means of reducing fatalities and serious injuries in traffic crashes, saving an estimated 9,500 lives in America each year. Our research has found that lap/shoulder belts, when used, reduce the risk of fatal injuries to front seat passenger car occupants by 45 percent, and the risk of moderate-to-critical injury by 50 percent. Child safety seats are the most effective occupant protection devices used in motor vehicles today. If used correctly, they are 71 percent effective in reducing fatalities to children under the age of five and 69 percent effective in reducing the need for hospitalization.

—President Clinton feels strongly that more needs to be done to encourage the use of these life-saving devices. On April 16, Secretary Slater responded to the President's call and released a national strategy to raise U.S. safety belt use to 85 percent by the year 2000. By 2005, our goal is to get 90 percent of the nation's vehicle occupants to use safety belts.

—Currently, with an estimated 68 percent of America's vehicle occupants buckling up, seat belts are saving about 9,500 lives a year. Going to 85 percent seat belt use would boost the annual number of lives saved in U.S. highway crashes by 4,194, and reduce crash-related medical costs by $6.7 billion a year. If 90 percent of vehicle occupants used their belts, 5,536 more lives would be saved annually and medical-related costs would be cut by $8.8 billion.

—Actions include: Building partnerships between government and the private sector to help America reach its potential of saving lives and preventing injuries through the use of seat belts and child safety seats; enacting State laws for primary (standard) seat belt enforcement and comprehensive child passenger safety; conducting active, high visibility law enforcement of State seat belt and child safety seat laws; and expanding well-coordinated, effective public education programs.

—Under NEXTEA, a new occupant protection incentive grant program, to encourage States to increase safety belt use, and a proposed transfer of highway construction funds to occupant protection programs to encourage enactment of primary safety belt laws.

Occupant protection—Child safety:

In February 1997 we issued a proposed rule for a universal child safety seat attachment system. The agency also has intensified its efforts to educate the public about air bag performance and to properly restrain children. We also have set a goal of reducing child occupant fatalities (0–4 years) 15 percent by 2000, and 25 percent by 2005.

Reduce alcohol-impaired driving among the population at large and especially for young drivers. Alcohol is the drug abused most frequently by our children, and is responsible for 35 percent of the highway deaths among our youth, ages 15–20. Forty-one percent of all fatal motor vehicle crashes continue to be alcohol-related, and 32 percent of these fatal crashes involve a drunk driver or pedestrian with a high blood alcohol concentration (BAC greater than 0.10 percent).

NHTSA's ISTEA Section 410 Impaired Driving Incentive Grant Program provides financial incentives to States to encourage improvements in laws and programs dealing with impaired driving. Since the passage of ISTEA, 37 States plus the District of Columbia have qualified for one or more years of incentive grants.

"Zero tolerance" laws make it illegal for a person under 21 to drive a motor vehicle with any measurable blood-alcohol content. In June 1995, President Clinton called on Congress to make zero tolerance the law of the land. Congress responded by including the provision in the NHS Act. These laws are very effective, reducing alcohol-related crashes involving teenage drivers by as much as 10–20 percent.

NEXTEA proposes an enhanced drunk driving prevention incentive grant program, to help States enact and enforce tough drunk driving laws and a new drugged driving incentive grant program, a Presidential initiative to help States enact and enforce tough laws to prevent drug-impaired driving

Crash avoidance research, conducted under DOT's Intelligent Transportation Systems (ITS) program

The goal of this research is to demonstrate that improved crash avoidance performance of vehicles can be achieved through the application of advanced sensing and communication technologies to motor vehicles. Achievements in this area require that these sensing and communication technologies are matched to the limitations and capabilities of all drivers without any diminution to safety.

Our near-term goal is to equip vehicles with several collision avoidance systems, in partnership with industry, to demonstrate their feasibility and safety potential. We estimate that if all vehicles were equipped with just three of the primary ITS crash avoidance systems (rear-end, roadway departure, and lane change/merge) 1.2 million crashes (one out of ever six) could be prevented annually, saving thousands of lives and $26 billion a year.

Giving states the flexibility to address their most critical highway safety problems

Under NEXTEA a new State highway safety data improvement incentive grant program, to encourage States to take effective actions to improve the data they need to identify the priorities for State and local highway safety programs

Full implementation of the new performance-based Section 402 state grant program.

Under NEXTEA, a program to encourage integrated safety planning and increased flexibility in the use of FHWA safety infrastructure funds for states to address their critical safety problems.

NHTSA'S ROLE IN REDUCING HEAD INJURIES AND ASSISTING EMS PERSONNEL

Question. Please describe NHTSA's role in working with EMS programs. Are EMS personnel the most likely health professionals to aid victims of motor vehicle accidents? How can NHTSA help improve the services provided by EMS personnel, especially with regard to head injuries?

Answer. NHTSA serves as a national leader, coordinator, facilitator and technical resource for EMS programs. The agency develops products and services and facilitates national consensus on issues which are more efficiently or effectively addressed at the national level than by individual states. Examples of agency programs include development of a national Standard Curricula for emergency medical providers and delivery of technical workshops on issues such as trauma system development, data management and quality improvement.

EMS personnel are typically the first health professionals to care for motor vehicle crash victims. NHTSA's central effort to improve the effectiveness of these professionals is the EMS Agenda for the Future, a vision and plan for EMS that provides guiding principles for the continued growth and evolution of EMS in a rapidly changing health care environment. The EMS Agenda addresses each of the critical aspects of emergency medical systems, assessing the current national status, projecting a vision of future performance, and recommending specific actions for realizing the vision. An implementation plan for the EMS Agenda for the Future is now being developed and will be published later this year.

Question. People injured in car crashes in rural areas may have to be transported long distances to reach trauma centers that can provide appropriate care. I understand that victims of head injuries, in particular, might be spared life-long disabilities if EMS providers could improve their emergency response protocols for brain trauma. Is NHTSA working with EMS programs to improve the treatment of head injuries?

Answer. NHTSA is currently updating the National Standard Curriculum for the Emergency Medical Technician—Paramedic. This curriculum includes both classroom and clinical instruction concerning patient assessment, injury mechanisms and head injury. The complete curriculum involves about 1,000 hours of instruction. In addition to the education of EMS providers, the agency also provides technical assistance for the development of regional trauma systems. These trauma systems utilize triage protocols that are designed to accurately assess the condition of trauma

patients and efficiently direct their transport to facilities with appropriate resources. An effective trauma system greatly improves the outcome of patients with severe trauma, such as head injury, by providing the best care in the least time.

Question. Each year we spend billions of dollars for long term medical and assisted living care of head-injured patients. Do you think that significant savings would be achieved by better EMS response to head injuries?

Answer. We believe that significant savings can be realized by better EMS response to all types of severe injuries, including head injuries. The outcome of severely injured patients is largely dependent on the amount of time between injury onset and appropriate stabilization and treatment. As the first link in the continuum of trauma care, the EMS system can influence patient outcome with a quick response, appropriate stabilization and rapid delivery to an appropriately equipped hospital emergency department.

INTELLIGENT TRANSPORTATION SYSTEMS (ITS)

Question. Ms. Garvey, the ITS program appears to be starting an evolution into a different program. To this point, IVHS, now ITS, has been a program focused on research and demonstration projects. The Administration's budget and NEXTEA reauthorization proposals anticipate beginning a shift in focus to include a $100 million annual deployment program and a 6 year total contract authority funding level increase from $659 million in the last authorization bill to almost $1.3 billion in the NEXTEA proposal.

Despite this new push to deployment, a number of obstacles must be overcome before ITS technology is widely deployed and integrated. These obstacles include the lack of a working knowledge of the systems architecture, technical standards to integrate individual ITS technologies, technical knowledge at the state and local level, and cost-benefit data on ITS.

What are the reasons for doubling the contract authority for the ITS program?

Answer. Contract authority is being requested for those portions of the ITS program which would most benefit from a long-term, predictable source of funds. These program areas include the ITS Deployment Incentives Program, crash avoidance research, the Advanced Vehicle Control and Information Systems program area, the operational test program, the architecture and standards program, and major portions of the mainstreaming program area (technical assistance, planning/policy issues, and training). These represent program areas which we know will be viable and in need of substantial funding support throughout the period covered by the reauthorization of ISTEA. Program areas with resource needs which may vary widely in amount and technical content from year to year, such as most of the research program areas, will continue to be justified and requested on an annual basis through the appropriations process.

It should also be noted that the proposed ITS Deployment Incentives program, which is designed to help spur integrated, intermodal deployment of ITS technologies and strategies, accounts for a total of $600 million of the contract authority being requested. The remainder of the contract authority being requested for research and technology transfer activities totals $678 million, an amount comparable to the amount received for similar activities under ISTEA.

Question. Are ITS technologies ready for widespread deployment in light of the numerous obstacles?

Answer. First, ITS technologies are not only ready for widespread deployment, but are being deployed. As of 1995, we have counted ITS deployments nationwide as follows: 41 freeway management centers, 39 advanced public transportation management systems, 57 centralized traffic signal control systems, 39 ITS incident management systems, and 28 electronic toll systems. In fact, about $1 billion a year of regular Federal aid funds is being spent on three of the nine ITS components that we track on our financial system. In the nation's 75 largest metropolitan areas, deployment of eight of the nine items is underway in most of them.

However, this deployment is taking place with little regard to intra-regional compatibility let alone the interoperability called for in the national architecture—thereby losing the potential of the ITS infrastructure to bridge the modal and institutional fragmentation and enable seamless system management. Thus, in NEXTEA, we propose a deployment incentives program to ensure progress to integration. We have proposed a very small incentive program, the majority of which would be used for integration of ITS infrastructure in metropolitan areas where ITS infrastructure deployment is already underway. It would also provide incentives for deployment of the commercial vehicle ITS infrastructure and rural ITS applications. Several legislative changes are also proposed to clarify the eligibility of all ITS applications for regular Federal-aid funding.

Second, we view the primary obstacles to broader ITS deployment as the lack of the following: adopted standards, expertise among state and local officials, cost/benefit data, and available funds. In our NEXTEA proposal, we address many of these "barriers" to deployment.

A significant portion of our proposed research funding would be devoted to facilitating development of industry consensus on well over 100 standards. While the process will take some five years, we expect that draft standards critical to integration will be available in the next two years. None have been completed, and four more draft standards will be done by the end of the year. And we believe that we, will have agreement on one of the most critical standards that underlie the tag and reader technology in automatic toll collection before the end of the summer.

We also have proposed training for state and local officials. Deployment of ITS is not unlike the transition FAA went through when it went from a civil engineering organization that oversaw the building of airports to one that dealt with management of assets and airspace. For that purpose we have developed a five-year strategic plan, that is now being translated into a business plan and we have asked for significant funds—some $10 million in fiscal year 1998. Recently, we launched the program with the first of 70 overview seminars that will be given to our staff and partners across the United States in the coming few months.

In these courses, we will cover in considerable detail the costs and benefits that have been documented for this program. An impressive quantity of cost-benefit data has been presented to Congress and the nation at large. For example: Buying smarter by deploying intelligent transportation systems infrastructure reduces the need for new roads while saving taxpayers 35 percent. A comprehensive study by NHTSA has estimated crash avoidance countermeasures can yield a 17 percent reduction in all accidents, resulting in a net savings of up to $26 billion per year. A study by the FTA suggests that ITS can save transit authorities between $4 billion and $7 billion over the next decade. What is not available to local officials are the analytic tools necessary to demonstrate those benefits, because to date all of our analytic tools have focused on capital decisions with long range horizons. We are in the process of developing those tools now for use by states and metropolitan areas across the country.

APPALACHIAN DEVELOPMENT HIGHWAY SYSTEM

Much is made of the need to upgrade Appalachian Development Highway System roads because of the economic development benefits for the parts of the country that these roads serve, but I do not want you to lose sight of the safety implications of failing to bring these corridors up to divided four lane standards. So I commend you for the commitment that the Administration's NEXTEA proposal makes to Appalachian Development Highways—more needs to be done—but it is a step in the right direction.

Question. In your review of the ITS program and as you consider the future of that program, have you identified rural safety applications from the research that has already been done? Please elaborate on these rural safety applications. What projects are currently funded and underway? What potential projects are being considered?

Answer. The Department has recently completed strategic and program plans for the Rural ITS Program which detail how we will allocate the increased resources of the rural program. Our needs analysis identified safety as the primary goal of the rural program. We have grouped the applications into seven critical program areas:

(1) Traveler Safety and Security Services such as wide area dissemination of safety information (weather and road conditions), site-specific safety advisories to alert travelers of near-term problems, safety surveillance and monitoring of rural transit vehicles, and vehicle or infrastructure based systems that prevent roadway departure crashes, animal-vehicle collisions, and high speed collisions between vehicles and farm equipment.

(2) Emergency Services such as May Day systems, and advanced dispatching and emergency vehicle based response systems which will reduce response times.

(3) Infrastructure and Fleet Operations and Maintenance Services which will reduce weather-related accidents and warn motorists of road work or other road hazards.

There are 11 active ITS program funded projects. But, there have been over 50 rural ITS projects funded from various private, state and Federal sources. A list of these projects can be provided upon request. The Federal ITS projects can be grouped into three areas: Research of safety information collection technologies (e.g., weather and road hazards), operational testing of May Day systems, and operational testing of safety information dissemination systems (e.g., in-vehicle displays or AM and FM subcarrier systems). In fiscal year 1997 we will initiate research and operational testing on Traveler Safety and Security Systems to investigate the most promising technologies that will reduce the most prevalent accident types. The focus will be on infrastructure based systems that do not duplicate the efforts of the collision avoidance program. Technologies may address the following issues: animal/vehicle collisions; low cost run-off road collision avoidance system; low cost vision enhancement system; and high speed farm equipment/vehicle collisions. We will also initiate research and operational testing of Emergency Response Systems. This effort will: 1) resolve the interface issues between the Public Service Answering Point and the Independent Service Providers; 2) investigate advanced applications beyond automatic collision notification which provide detailed information to emergency care givers in order to improve accident site care; and 3) investigate systems for achieving blanket communications for May Day services. It should be noted that a minimum of 10 percent of the proposed ITS Deployment Incentives program is set aside for the deployment and integration of rural ITS technologies.

Question. Most of the fatalities on rural roads are from single vehicle accidents. This would seem to me to be an area that Advanced Highway System research may have a significant life-saving application. I welcome your thoughts and comments.

Answer. The majority of rural single vehicle accidents are roadway departure collisions. The ITS program is working with industry on systems that will greatly reduce this accident type and that will be available in five to 10 years. Under the Intelligent Vehicle Program, we are developing a roadway departure collision avoidance system which automatically detects if a vehicle is leaving the lane, as well as a driver inattention detection systems and human factors guidelines to reduce driver workload. These applications will produce commercial products within five to 10 years. Deployment of these products will enable this accident type to be reduced much sooner than the AHS products will be available.

CONTRACT AUTHORITY AND OBLIGATION LIMITATION DISCONNECT

Question. In looking at the Administration's Budget submission and the NEXTEA reauthorization proposal, there appears to be a disconnect between the Contract Authority that the Administration is requesting for fiscal year 1998 and the Obligation Limitation level requested in the Administration's budget. Please explain the relationship between contract authority, obligation limitation, and liquidating cash.

Answer. Contract authority refers to the type of funding provided for the highway program. The authorizations contained in highway acts, such as ISTEA, set the amounts of funds that are available for use for the entire highway program. These authorizations, which are contract authority, represent the upper limits on the obligations that can be made by the Federal government. Sums authorized in Federal-aid highway acts, because they are contract authority, are made available for obligation without appropriations action.

An obligation is a commitment of the Federal government to pay, through reimbursement to the States, the Federal share of a project's eligible cost. Obligation is a key step in financing. Obligated funds are considered to be "spent" even though no cash is transferred, since an obligation is a legally binding commitment on the part of the Federal government to reimburse the State. As a result, obligations are usually the step in the financial process that are controlled in the Federal budgeting process. A limitation on obligations acts as a ceiling on the sum of all obligations that can be made within a specific time period, usually a fiscal year, and thereby controls spending. The limit is placed on obligations that take place within the specified time period, regardless of the year in which the contract authority was made available. Since the appropriations process has been the traditional way to control Federal expenditures, obligation ceilings are usually established in the annual appropriations act and are set at a level consistent with annual spending limits that are driven by the effort to reduce the Federal deficit.

By definition, contract authority is unfunded and a subsequent appropriations act is necessary to liquidate (pay) the obligations made under contract authority. This authority to pay obligations is referred to as liquidating cash.

Question. Why is the contract authority request for fiscal year 1998 $2.45 billion more than the total of the requested mandatories plus the requested obligation limitation?

Contract Authority	$22,480,000,000
Highway obligation ceiling	18,170,000,000
Mandatory highway programs	1,510,000,000
Total highway budgetary resources	20,030,000,000

Answer. The contract authority and obligation limitation amounts for our reauthorization proposal have been set at the maximum levels allowable within the overall budget targets. These levels reflect our continuing commitment to both balance the budget and invest in transportation. While the obligation level is lower than the contract authority for fiscal year 1998, we are hopeful that budgets in future years will permit the use of the funds that cannot be used this year. With multi-year authorizing legislation, such as our ISTEA reauthorization, we think it is important that the contract authority levels are set at the highest levels possible. Since unused contract authority can be carried over to future years, this allows for growth in the program in the outyears, if the budget picture improves. We think that our proposal is the best way to adhere to the financial concerns of today while still looking forward to the program needs of the future.

NEXTEA FLEXIBILITY

Question. As I mentioned in my opening statement, the State of Alabama views ISTEA as constraining them more than empowering them to meet their highway needs. I understand that there is a significant amount of flexibility in the current program, but that in many ways ISTEA is an overly complicated structure for administering funds to your State partners. What additional program flexibility has the Administration proposed in the NEXTEA submission, and what program delivery streamlining is envisioned?

Answer. NEXTEA proposes to build on the flexible programs and provisions of ISTEA to allow the States to put their funds into the surface transportation modes and project types that meet their own and the Nation's needs.

NEXTEA expands and clarifies eligible activities for all core Federal-aid programs, including the National Highway System (NHS), Interstate Maintenance, the Surface Transportation Program (STP), and the Highway Bridge Replacement and Rehabilitation Program. Added or clarified eligibilities include preventive maintenance; Interstate reconstruction; intercity passenger rail capital investment; bridge scour countermeasures; intelligent transportation system capital, operations, and maintenance; and intermodal activities.

Transferability provisions among the various programs and surface transportation modes allow States to put their money where their surface transportation needs are. Alabama took advantage of this feature and transferred ISTEA Surface Transportation Program funds to support transit in Montgomery and Birmingham.

NEXTEA also proposes several streamlining measures. Changes are proposed to make STP operate more like a block grant program while retaining accountability. NEXTEA establishes annual program-wide approval for non-NHS STP projects, rather than the current quarterly project-by-project certification and notification.

NEXTEA permits merger of plans, specifications and estimates approval and project agreement execution and provides for obligation of the Federal share on a project when the project agreement is executed.

NEXTEA expands flexibility to States and FHWA to determine mutually the appropriate level and extent of State and FHWA oversight on NHS projects. NEXTEA provides that FHWA's oversight responsibilities shall not be greater than they are under Certification Acceptance and ISTEA, unless the State and FHWA mutually decide otherwise. NEXTEA also provides that State must assume Title 23 oversight responsibilities on non-NHS projects.

VALUE PRICING PILOT PROGRAM

Question. What projects were implemented/completed under ISTEA's congestion pricing pilot program? What have been the results of these programs in terms of improved traffic volume and air quality and the availability of new funds for transportation programs?

Answer. Projects included under the Pilot Program, as well as congestion pricing projects in other parts of the world, are beginning to provide new, and sometimes surprising, evidence about the potential benefits of congestion pricing. Our projects are just in the beginning stages, and the evidence is necessarily preliminary, but we can provide some indication of how these programs can be expected to affect traffic, air quality, and revenue availability. We might also note that for all the implementation projects, local interest and support for congestion pricing has been quite strong.

For instance, in San Diego, where excess capacity on the I–15 HOV lanes is being sold to HOV's, the initial sale of 500 express lane passes at $50 each sold out in the first 6 hours of availability. In February of 1997, 200 subscribers were added to the original 500, for a total of 700 ExpressPass holders. In March, 1997 the monthly fee was increased to $70, and in April, an additional 200 customers may be added for a total of 900 ExpressPass holders allowed on the HOV facility. Despite a price increase from $50 to $70, 80 percent of the original customers opted to remain with the pilot program. Data is being collected to gauge price elasticity and the effects of raising the tolls on traveler behavior. One of the surprising findings from the early evidence on this project is that in the initial months of the pilot's operation, carpools on the HOV lanes have increased by 5 percent from 86 to 91 percent, while the rate of unauthorized users of the HOV facility has decreased from 14 percent to 4 percent due to increased enforcement. This important finding suggests the HOV Buy-In concept can be a "win-win" for mobility and the environment.

All reports have been strongly positive for the innovative pricing project on State Route 91 in Orange County, California. This project, a privately-designed, constructed, financed and operated project, opened in December of 1995. The State Route 91 "Express Lanes" constitute the country's first variable priced and fully-automated facility. This $126 million project has added four new lanes of capacity termed "Express Lanes" along 16 kilometers (10 miles) in the median of the highway. While this project is not a Federal-aid project, and is therefore not one of FHWA's pilot projects, Pilot Program funds are being used to support the California Department of Transportation's monitoring and evaluation study of this pathbreaking project.

In the first year of operation, public response to the Express Lanes has been excellent, with a steady increase of patronage to 25,000 daily customers. A recent opinion poll conducted by the California Polytechnic Institute at San Luis Obispo indicates that the project is viewed favorably by 65 percent of the Express Lanes customers, 62 percent of the free, HOV Express Lanes users, and 53 percent of the drivers in the adjacent freeway lanes. Express Lanes users reportedly can save up to 20 minutes in commute time, and the diversion of single-occupant vehicles to the priced lanes has made a noticeable improvement in traffic flow in the general purpose lanes. According to local transportation officials, the State Route 91 highway is running more smoothly today than at any time since 1980. Carl Williams, Deputy Secretary for Transportation for the State of California, reports that at the end of the first three months of operation, the roadway was covering the facility's operating costs. By December, 1998, the company expects to cover operating costs as well as meet their debt service. Williams also reports that HOV–3 vehicles account for 44,000 out of the 166,000 weekly trips on the express lanes. As an incentive to encourage ridesharing, vehicles with three or more passengers are exempt from the Express Lanes tolls, while all others are charged for Express Lanes usage. The costs vary with time, ranging from $.50 to $2.75 per trip. Frequent users can opt to pay a $15.00 monthly fee and receive a $.50 discount per trip, independent of time of day. All fares are automatically deducted from each customer's pre-paid account using electronic "read-write" transponders mounted on the car windshield. Currently, over 50,000 motorists have established an Express Lanes account and are equipped with transponders.

According to Gerald Pfeffer, Senior Vice President of United Infrastructure, an official of the State Route 91 Express Lanes owner/operator consortium, preliminary reports indicate that the majority of Express Lanes customers use the facility on a discretionary basis, rather than on a daily basis. Express Lanes customers represent all income levels, thereby dispelling the notion that only higher income motorists benefit from congestion pricing. Apparently, the facility is attracting a broad array of commuters including: contractors; plumbers; office workers; and parents. This finding is not surprising given the demographics of the population in that area. Affordable housing in the suburbs surrounding the State Route 91 facility attracts large numbers of lower to middle income residents who commute to employment centers in adjacent counties.

By all accounts, this project has been considered an initial success. While long-term success is yet to be determined, preliminary reports indicate that the capacity increase gained by the addition of two new toll lanes in each direction has substantially reduced peak-period congestion. Waiting times at entry points to the State Route 91 facility have been significantly reduced.

Other projects nearing implementation after initial pre-project studies under the Pilot Program are in Lee County, Florida, where off-peak toll discounts following an across-the-board toll increase in late 1995, will be used to try to divert traffic away from the most congested time periods. This project will be implemented within the next several months. In Houston, Texas, a pricing project about to get underway

will sell excess capacity on an existing HOV–3 lane on Interstate 10 to HOV–2 vehicles. Both of these projects are expected to provide new evidence on the response of travelers to the pricing of highway facilities. In Los Angeles, a just completed report on the first phase of the Southern California Association of Government's congestion pricing pilot study includes recommendations by a local task force of business, environmental and transportation interests for implementation of a HOT (High Occupancy Toll)-lane project in the Los Angeles area. Further study of specific routes will be pursued prior to implementation.

Question. What level of funding did the projects under the congestion pricing pilot program receive and spend?

Answer. A total of $30,613,479 of program funds were obligated prior to the rescission of unobligated balances and transfer of authorizations for fiscal year 1996 and fiscal year 1997 to other programs. Of this amount, $24,108,000 went to implementation projects in San Diego ($7,960,000), Lee County, Florida ($16,000,000), and to support the California Department of Transportation's monitoring study of the private sector project on State Route 91 in Orange County, California. Another $5,414,386 went to support pre-project efforts in San Francisco, Minneapolis, Houston, Boulder, Portland, and Westchester County, New York. An additional $1,091,093 was used by FHWA to conduct research and public outreach in support of local project efforts.

Question. To what extent has FHWA been able to overcome the reluctance of elected officials and policy makers to establish these programs?

Answer. We believe that significant progress has been made in bringing pricing to the forefront for consideration as a demand management tool in metropolitan areas across the U.S. Transportation officials, business interests, environmental groups, and others have begun to discuss the possibilities for road pricing solutions to congestion and air pollution problems. The progress that has been made flows out of the pre-project efforts that FHWA has supported, as well as FHWA's public education efforts, but is largely due to the efforts of FHWA's project partners at the State and local level. They have been on the front lines of introducing pricing concepts into the local context, and their efforts, following guidelines established by FHWA, have brought the participation of a wide variety of local interest groups into the development of local project proposals. Recent interest in road pricing has been spurred by the initial success of the privately-sponsored road pricing project on State Route 91 in Orange County, California, and by the early stages of our pilot project in San Diego. Our pre-project efforts in Florida, Texas, New York, Minnesota, Colorado, and Oregon have also generated considerable interest.

We recognize that much remains to be learned about the role that pricing can play in improving the efficiency of urban transportation systems but believe that carefully designed pilot projects, conceived and developed with full public participation, can play a positive role in improving urban transportation service. We recognize that the path to implementation will not be a smooth one, and any new projects will need to be developed slowly, with due regard to potential equity and other state and local concerns. Still the Department needs to be ready and able to provide support to state and local efforts when it is needed. The Value Pricing Pilot Program will provide a way for State and local governments and toll authorities to continue to experiment with congestion pricing solutions, using the Pilot Program both for financial and technical support. It will also provide a way of demonstrating Federal backing of these efforts.

Question. Why does the administration believe there is sufficient interest in congestion pricing to support the value pricing pilot program? How many projects are currently ready to take advantage of these funds?

Answer. We expect there to be considerable interest in this program in major metropolitan areas where concern with environmental problems and growing traffic congestion have led many to look for new and innovative solutions. As indicated by the activity on current pilot projects, and by the overwhelmingly positive response to FHWA's regional workshops on congestion pricing, very active interest in congestion pricing has been stimulated in several cities, including some of those facing the nation's worst air quality and congestion problems. The first workshop, held in Claremont, California in September, 1995, had 60 participants. In October, 1995, the second workshop, held in Philadelphia, had 80 participants. The Chicago workshop, held in May, 1996, had 104 participants, and 130 people participated in the Houston workshop in November, 1996. At our latest workshop, held in Tampa, Florida, in April 1997, approximately 80 attendees discussed recent and potential future applications of pricing in the U.S. Very active discussions by a wide variety of agencies represented at these workshops showed a very high level of interest in the potential of pricing solutions to congestion and air quality problems. A spur to the interest in pricing as an air quality tool will be the Environmental Protection Agency's soon

to be issued guidance document on "Use of Market Mechanisms to Reduce Transportation Emissions," which will describe how cities and states can gain SIP credits for the adoption of market-based transportation demand management measures.

Several of our current project partners, including Caltrans and the Southern California Association of Governments, the State of Minnesota, and Boulder, Colorado, should be ready to move forward with specific implementation proposals in fiscal year 1998. Portland, Oregon, and perhaps another project in Texas may be ready for implementation by fiscal year 1999. New York may be further from actual implementation, but this could change quickly depending on local conditions. The same can be said for possible pricing projects in the San Francisco area.

Even though we believe there is sufficient interest to justify our proposal, we also recognize that interest in the value pricing program and concept does not necessarily translate into a State and local commitment to implement value pricing projects. For this reason, FHWA has proposed to limit the risk of program funds not being used by incorporating into the Reauthorization proposal a "rolling lapse" provision, under which unused program funds would become available for redistribution to the States if they remain unused for congestion pricing purposes after four years of availability.

Question. What criteria will FHWA use to select the pilot projects?

Answer. As we did for the Congestion Pricing Pilot Program, FHWA will listen carefully to current and potential project partners in developing guidelines for program participation. We intend to be flexible and responsive to local needs, while maintaining sufficient oversight to ensure that projects will provide new and useful information about the potential of congestion pricing as a tool of transportation demand management. One of our goals will be to encourage broader applications of pricing, including new and innovative types of parking pricing, as we move forward under the Value Pricing program. We will continue to try to support pricing innovations by existing toll authorities, and we will continue to look for new and innovative applications of pricing that meet local needs and conditions.

INFRASTRUCTURE CREDIT ENHANCEMENT PROGRAM

Question. The grant amount is limited to $100 million per year, far less than many large projects. The Alameda Corridor project, for example, which meets DOT's criteria under the legislation and received a $400 million federal loan this year, could have absorbed the Program's resources for 4 of the program's 6 fiscal years. How does the Secretary intend to maximize the value of the program to a large project or projects?

Answer. The Alameda Corridor project will receive direct Federal assistance in the form of a loan, not a grant as contemplated under the proposed credit enhancement program. Unlike other forms of Federal spending, the Federal budgetary cost of such a loan is based on the estimated net present value of the cash inflows and outflows associated with the loan. Alameda Corridor will receive a $400 million Federal loan this year; however, that loan requires only $59 million of budget authority (appropriated in the fiscal year 1997 Omnibus Consolidated Appropriations Act, Public Law 104–208) to fund the estimated subsidy costs.

The Secretary intends to maximize the value of the Transportation Infrastructure Credit Enhancement Program by using grants (limited to 20 percent of project costs), together with any supplemental contributions by States and other entities, to establish a Revenue Stabilization Fund for each project which will be used to secure external debt financing or drawn upon, if needed, to pay debt service costs in the event project revenues are insufficient to meet annual debt service requirements. These grants could be most effective if they secured smaller, junior lien bond issues which in turn helped facilitate the issuance of larger, senior lien bond issues not directly assisted by the program.

Question. How and why did the program evolve from a loan program (outlined in the fiscal year 1998 budget request) to a grant program (NEXTEA legislation)? Has the intent of the program changed from the initial version of the proposed program, which was modeled in part on a $400 million direct federal loan to the $2 billion Alameda Corridor project? Would the program likely be used to assist projects as large as the Alameda Corridor project, or would it be limited to somewhat smaller projects?

Answer. The program evolved from a loan program to a grant program in order to address concerns raised by the Department of the Treasury. Although the Treasury Department shares DOT's view that large projects of national significance require additional forms of assistance, on fiscal policy grounds it favors grants over direct lending techniques to enhance a project's financing. The Administration's NEXTEA proposal synthesizes DOT's programmatic objectives of encouraging inno-

vative finance and private sector participation with Treasury's preference for using grant mechanisms.

Question. In addition to using grants for credit enhancement purposes, does the Department also intend to pursue credit enhancement in the form of direct loans similar to the Alameda Corridor project loan in the future outside the Credit Enhancement Program? If so, will the Department have the discretion to do so based on its authority under NEXTEA?

Answer. The Administration's reauthorization proposal (NEXTEA)—including the Transportation Infrastructure Credit Enhancement Program—does not contain the legislative authority to make direct loans (such as that received by the Alameda Corridor) or provide other forms of credit assistance. The Department cannot provide such assistance without legislative authority to do so.

Question. The Secretary is given the authority to select projects for Credit Enhancement Program grants. DOT has had inquiries from states, including small or rural states, and has noted that 18 states have projects costing less than $100 million that would qualify for Credit Enhancement Program grants. What projects in which states would qualify? What projects in which states would qualify for the program with projects at or over $100 million?

Answer. DOT has not made any determinations about the eligibility of specific projects for assistance under the proposed credit enhancement program. Of several threshold criteria relating to national significance, one addresses project scale. It would require a project to cost at least $100 million or 50 percent of the State's most recent annual apportionment of Federal-aid highway funds, whichever is less. The Department has noted that, based on fiscal year 1997 apportionments, there are 18 States that could potentially qualify projects costing less than $100 million for credit enhancement grants under this criterion.

Question. If this program is established, would projects now underway be eligible for funding? Would projects qualify such as the Boston Central Artery? San Francisco's BART extension? Has the suggested freight tunnel beneath New York Harbor been suggested as a potential grant recipient?

Answer. Any type of surface transportation project that is proposed to be eligible for Federal assistance under title 23 or chapter 53 of title 49 in the Administration's reauthorization proposal would be permitted to receive a Revenue Stabilization Fund grant, as long as it satisfied the program's eligibility criteria. To meet those criteria, the project must:

a. be of "national significance" in terms of moving people or goods more cost-effectively (the Secretary will establish specific guidelines concerning improved productivity, cost-benefit analysis, job creation, and other factors);

b. be unable to obtain adequate financing on reasonable terms elsewhere;

c. be included on the State's transportation plan, and, if in a metropolitan area, be approved by the metropolitan planning organization;

d. have its application for assistance be submitted by a State or local government;

e. cost at least $100 million or an amount equal to 50 percent of the State's annual Federal-aid apportionments, whichever is less; and

f. be supported at least in part by user charges or other dedicated revenue streams.

Projects meeting these threshold criteria then would be evaluated by the Secretary based on a qualitative analysis of their credit-worthiness, degree of leveraging private capital, use of innovative technologies, and other factors. This program is intended to help large revenue-generating projects obtain private financing by enhancing their external debt. Projects already underway, such as the BART extension and the Central Artery, presumably have already secured the necessary financing or identified future funding sources and should not need such revenue stabilization funding. (The Central Artery project's current finance plan does not contemplate additional Federal assistance outside the State's regularly apportioned Federal-aid funding.)

To our knowledge, no proponents of the New York Harbor freight tunnel project have approached the Department about seeking assistance under the Transportation Infrastructure Credit Enhancement Program. If the project satisfied the proposed eligibility criteria, it could seek funding under this program. Its application would be evaluated along with those of other applicants.

Question. Beyond the basic eligibility criteria, what expectations does the Administration have about the type of public-private partnerships that the Secretary would select for the Program to assist? Has DOT made any estimates on the amount of private capital that the Program might attract?

Answer. The goal of the program is to encourage the development of large, capital-intensive infrastructure facilities through public-private partnerships consisting of a State or local government and one or more private sector firms involved in the

design, construction or operation of the facility. It will encourage more private sector and non-Federal participation, and build on the public's willingness to pay user fees to receive the benefits and services of transportation infrastructure sooner than would be possible under traditional funding techniques. DOT has no preconceived notion of how these arrangements should be made. The program should be flexible enough to allow the public and private entities to structure their partnerships as effectively as possible according to their needs.

The credit enhancement program could effectively help these large projects access the capital markets if the Revenue Stabilization Funds were used to enhance junior-lien debt, which is difficult to sell. If a Revenue Stabilization Fund secured junior-lien bonds financing 33 percent of project costs, and if the reserve equaled 20 percent to 25 percent of the issue size, you might achieve a 12:1 to 15:1 leveraging ratio. Thus, annual budget authority of $100 million used in connection with junior lien bonds in this manner could support private financing of $1.2 to $1.5 billion a year. That would be only one project of a scale equal to the Alameda Corridor, but could represent a few projects of smaller scale.

Question. What entities will be able to apply for funding of these publicly owned facilities—private organizations, cities, states, metropolitan planning organizations?

Answer. A project sponsor may be a corporation, partnership, joint venture, trust, or governmental entity or instrumentality. If the entity is not a State or local government or any agency thereof, the project it is undertaking must be publicly owned and sponsored—meaning that it satisfies applicable Statewide and metropolitan planning requirements and that a State or local government or agency thereof submits its application to the Secretary.

CONGESTION MITIGATION AND AIR QUALITY (CMAQ)

Question. What type of projects were predominately funded out of the ISTEA CMAQ funds, e.g. HOV lanes, transit stops, etc.?

Answer. Since its introduction in 1991 as a major transportation program under ISTEA, the CMAQ program has steadily evolved to become an important component in the funding of State and local transportation projects and programs. Projects which are eligible for funding under the CMAQ program include: transit improvements, traffic flow improvements, shared ride/demand management programs, bicycle/pedestrian projects, alternative fuels, inspection and maintenance programs and others with air quality benefits.

The overall obligation rates for CMAQ projects for fiscal years 1992-1995 are as follows:

—$1,267,000,000 (46.8 percent) for transit including bus and vehicle purchases, new bus and rail services;

—$835,000,000 (30.9 percent) for traffic flow improvements including HOV lanes, traffic signal synchronization and turning lanes;

—$206,000,000 (7.6 percent) for rideshare/demand management programs including carpool and vanpool programs, guaranteed ride home programs, etc.;

—$74,000,000 (2.7 percent) for bicycle/pedestrian projects including new pedestrian and bike paths, pedestrian bridges and walkways, bike lockers and storage, etc.;

—$130,000,000 (5.0 percent) for other transportation control measures (TCM's) including inspection and maintenance (I/M) programs and other projects not classified by the above; and

—$193,000,000 (7.0 percent) for STP/CMAQ obligations in States with no non-attainment areas which may use CMAQ funds for STP-eligible purposes.

Question. Were the projects funded under the CMAQ program part of the States' transportation plans prior to passage of ISTEA or were they new projects? What are some examples of innovative projects built to help improve air quality? What air quality gains have been realized from the past six years of CMAQ projects?

Answer. The ISTEA charted a new course in flexible funding transportation programs with the creating and funding of the CMAQ program. The focus of CMAQ as an air quality improvement program is unique as a transportation funding program. In the early years of the program, it is likely that the projects funded under CMAQ had been developed prior to ISTEA and already were "in the pipeline," as it is sometimes referred. As the program evolved, other innovative alternative fuel projects, inspection and maintenance programs and freight improvements have been developed to meet the goals the CMAQ program, and funded under the broad eligibility allowed only under the CMAQ program. Transportation and environmental organizations contacted during a 1994 program review reported that many of the projects now funded under the CMAQ program would not have been funded under other programs.

The CMAQ program has funded some exemplary projects such as:

—The Intermodal Transportation Center in Worcester, Massachusetts. The intermodal transportation center will assist Worcester in encouraging the use of mass transit by providing easy access to rail, bus and shuttle services, enhancing bicycle and pedestrian access and improving traffic flow in the downtown area.

—The Transtar facility in Houston, Texas, is an advanced intelligent transportation management system which monitors traffic conditions and notifies authorities of freeway accidents and congestion problems. The center improves accident response time and reduces the blockage time on area freeways.

—A transit operating assistance project in Ventura County, California, represents an outstanding example of a cooperative, grassroots effort to implement a transportation/air quality strategy that benefits the local entities as well as the larger region. The county instituted new intracounty bus routes and linked the new routes to existing city-run services, allowing improved access to major activity centers throughout the county, and connections to existing dial-a-ride services in rural parts of the county.

In 1995 alone, CMAQ funded projects accounted for reductions in carbon monoxide of 431 tons per day, in volatile organic compounds of 170 tons per day, and in oxides of nitrogen of 113 tons per day. These benefits will continue for the life of the project.

While most CMAQ-funded projects are small relative to the size of the transportation infrastructure and yield benefits commensurate with that size, some projects yield considerably greater benefits. Inspection and maintenance programs have been funded under CMAQ programs in at least 5 States yielding between 2 tons per day to more than 20 tons per day.

CMAQ-funded projects are critical for some nonattainment areas to demonstrate conformity of their transportation plans and programs, thus allowing States and local areas to continue their federally funded programs. In these and other areas, CMAQ funding also has been necessary to ensure funding for transportation control measures contained in the State air quality implementation plan, or SIP.

Finally, the benefits of CMAQ funded projects should not be restricted only to air quality benefits when evaluating this program. Transportation projects usually meet multiple objectives, and this is true of CMAQ projects as well. In addition to air quality benefits, these projects have served to help provide congestion relief, environmental mitigation, economic development, and have assisted in meeting other environmental goals and objectives.

INTERMODAL ISSUES

Question. Has DOT conducted a comprehensive assessment of intermodal needs, with specific attention on freight infrastructure requirements? If so, what are the conclusions of this assessment?

Answer. In creating the National Highway System (NHS), the States and MPO's identified the critical highway connections to major intermodal terminals, including freight facilities, based on criteria established by the Secretary. This effort documented the major public and public/private intermodal connections affecting the efficient movement of people and goods throughout the nation. This information was sent to Congress on May 24, 1996, for approval as part of the NHS and will be used in the future to identify the condition and infrastructure needs of these connections.

Very large container ships are about to be placed in service on major shipping routes connecting U.S. ports to the global marketplace. To assess their impact on waterside and port infrastructure as well as landside transportation facilities, the Department of Transportation is conducting four outreach meetings during the spring and summer of this year that will involve representatives of shippers, transportation providers and pubic transportation agencies responsible for freight movement. This activity is jointly sponsored by the Office of the Secretary and the modal administrations within the Department involved in goods transportation. Its goal is to bring consensus within the Department and the freight community on the potential impacts on transportation infrastructure occasioned by these "big ships" as well as to provide sufficient time prior to these vessels common use to permit a coordinated response by those responsible for making transportation investments.

FHWA has undertaken a multi-year research project to study and document impediments to intermodal freight efficiency. Phase I of this research has concluded, and a two-volume report was produced in 1996. The report is titled "Intermodal Freight Transportation." Volume I, discusses impediments, data sources, and provides a detailed bibliography.

Volume II presents an intermodal impediments fact sheet and an in-depth discussion of the federal-aid eligibility of intermodal freight projects. The impediments identified include physical, regulatory, technical, facility, financial, labor, institutional, and operational barriers and impediments for port, rail/truck, and airport facilities. The one major conclusion of this research is that impediments to intermodal freight transport are widespread and diverse.

Phase II of the intermodal impediments project, currently underway, looks at strategies for overcoming the impediments identified in Phase I. The project will produce a primer for transportation planners on how to overcome impediments, along with detailed case studies of intermodal projects and processes in the U.S.

Question. Since DOT does not propose to fully fund NEXTEA and relies on the States and the private sector to provide funding through other financing methods and State Infrastructure Banks, does DOT have evidence that this approach will be adequate to meet intermodal needs?

Answer. NEXTEA's innovative finance programs expand the financing capabilities of States in order to complement DOT's traditional grant programs. State Infrastructure Banks (SIB's), for instance, offer a menu of loan and credit enhancement assistance that can tailor public funds for specific project needs, thereby increasing the effectiveness of an overall transportation program.

Our evidence indicates that most states intend to incorporate innovative finance techniques. DOT's solicitations for State Infrastructure Banks have received strong response. A pilot round in 1996 selected ten states for SIB designation. Our second round has attracted 26 new proposals from 29 states. From this experience alone, we can conclude that at least three-fourths of the states believe that SIB's offer the potential to improve their transportation programs.

Intermodal projects may indeed be well-suited for innovative finance and private sector participation. Most freight-related projects are linked to privately-owned or privately-operated facilities and thus offer the potential for significant private financial participation. On the other hand, a strictly passenger-oriented intermodal project frequently lends itself to private investment. Many passenger terminals, for example, provide retail and commercial opportunities that can attract private funds as part of an overall financial package.

Question. What steps is DOT taking to ensure that intermodal issues—particularly freight concerns—receive attention and action in the Department?

Answer. The Department has taken several steps to raise the profile of intermodal freight within the Department. It has sponsored several Freight Planning Seminars across the nation for Metropolitan Planning Organization, State, and federal transportation planners which highlight the many issues related to intermodal freight and adequately planning for freight.

In addition, the modal administrations have participated in two National Freight Planning Conferences (Albuquerque, NM, in September 1995 and San Antonio, TX, in October 1996) which provided forums for the discussion of the many facets of freight planning. Two additional National Conferences are being planned. These conferences draw attendees from various levels of government throughout the country, including the various modes at the U.S. DOT, as well as representatives from the private sector freight community.

The FHWA also sponsors, the Freight Stakeholders National Network, a consortium of the nation's eight major freight-related trade associations, which promotes more effective interaction between the public and private sectors on infrastructure planning and investment throughout the U.S. As part of this effort the modal administrations contribute articles to a bi-monthly newsletter called Intermodal Connections. This newsletter presents information on intermodal issues, including freight-related issues, to a wide range of transportation professionals.

The Department also has developed a course on "Landside Access for Intermodal Terminals" to address surface transportation infrastructure issues created by increasing volumes of maritime and air traffic. This three-day course focuses on the methodologies and design elements for improving landside access to seaports and airports and presents tools and techniques necessary to define challenges and make improvements. There have been 10 presentations of this course at major port cities around the country.

Question. How does DOT's current and proposed research support intermodal policy and infrastructure needs? Which modal administrations are conducting intermodal research and/or demonstration projects? What results are expected from this research and demonstration? What percentage of DOT's total research budget does this represent?

Answer. In addition to the specific courses, conferences, and publications referenced in the responses to questions 1 and 3 above, the following "general" re-

search activities within DOT have resulted in applications that support intermodal policy and infrastructure needs.

—Applications of Intelligent Transportation System (ITS) program technologies.
—Compendium of Intermodal Freight Projects, examples from throughout the U.S. of innovative projects and funding mechanisms.
—Freight Forecasting, development of a quick-response freight forecasting system, manual, and course.
—Public-Private Freight Planning Partnerships, research and documentation of the state-of-the-art in bringing the public and private sectors together to properly plan for freight.
—Tools for transportation planners, including the Characteristics of Urban Freight Systems (CUFS) manual, documentation of The Use of Intermodal Performance Measures by State Departments of Transportation, guidelines for public-private freight planning, and freight data handbook.

Many of the US DOT efforts to support intermodal transport through research, education, information services, and technology applications have been cooperative efforts involving multiple modal administrations and the Secretary's Office of Intermodalism. Examples of these cooperative endeavors are:

—Landside Access to U.S. Ports, 1992, study by Transportation Research Board (TRB): MARAD, FHWA, FRA co-sponsorship
—Report on Intermodal Activities in the Department of Transportation, 1993: Office of Intermodalism, FHWA, FRA, MARAD, FTA, FAA co-sponsorship
—Intermodal Technical Assistance for Transportation Planners and Policymakers, 1994: Office of Intermodalism, FHWA, FRA, MARAD, FTA, FAA co-sponsorship
—Intermodalism—Making The Case/Making It Happen, national conference and proceedings convened and compiled by TRB, 1995: Office of Intermodalism, FHWA, FRA, MARAD, FTA, co-sponsorship
—Setting An Intermodal Research Agenda, national conference and proceedings convened and compiled by TRB, 1996: Office of Intermodalism, DOD co-sponsorship.

The results of this research are outlined in responses to this question and to questions 1 and 3.

Although actual figures are not available, it is estimated that less than one percent of DOT's total research budget is specifically directed to supporting intermodal policy and infrastructure needs. Since intermodal transport makes use of individual modes' infrastructure, research directed to making the respective modal policies and infrastructure more user-friendly generates considerable benefits for intermodal transport.

FHWA RESEARCH AND TECHNOLOGY PROGRAMS

According to DOT, ISTEA provided $87 million for FHWA research and technology programs. The Administration's NEXTEA proposal authorizes $1.6 billion for the highway research program and includes $420 million for a new program entitled the "National Technology Deployment Initiatives" whose goal is to significantly expand the adoption of innovative technologies by the surface transportation community.

Question. What are the major elements of the substantially increased research program? What are the highest priorities of the expanded research program? Which ISTEA research programs is DOT proposing to keep and which is it eliminating? How will research programs be evaluated?

Answer. The major elements of the research and technology program included in NEXTEA are the 1) Intelligent Transportation Systems (ITS), 2) National Technology Deployment Initiative, 3) Professional Capacity Building and Technology Implementation Partnerships, 4) Long-Term Pavement Performance (LTPP) and Advanced Research, and 5) State Planning and Research Program.

The highest priorities of the research and technology program are to continue exploration, evaluation, and deployment of ITS technologies; deliver significant, tangible benefits to transportation users through acceleration of the deployment of all technologies; provide comprehensive technology training and education initiatives that yield the required competency to apply the technologies; initiate exploratory long-term research which involves more uncertainty and risk, but holds the potential for great payoffs; continue the LTPP program which was initiated by Congress; and provide funds to the States so that they may address research and technology transfer activities that are relevant to their needs.

The FHWA's Research and Technology Program consists of complementary elements of research, technology transfer, and deployment activities, reaching a range of partners and audiences—such as State and local governments, academia, Native

American tribal governments, private industry, and others—with different services—research, development, technology implementation, technical assistance, training, test and evaluation, incentive funding, technology exchange, etc. Solutions to national issues of infrastructure quality and mobility lie in innovations and new technologies. Discovering and refining technologies and then transferring, promoting, and integrating them into the national transportation systems requires a multifaceted program such as is proposed for the FHWA's Research and Technology Program under NEXTEA.

NEXTEA includes a number of programs that are included under ISTEA. Intelligent Transportation Systems, National Highway Institute, Local Technical Assistance Program, Eisenhower Fellowship Program, University Transportation Centers, University Research Institutes, Long-Term Pavement Performance Program and the State Planning and Research Program were included in ISTEA and are also proposed in NEXTEA. The National Technology Deployment Initiative is modeled closely after the Applied Research and Technology Program which was included in ISTEA. Also, the Technology Implementation Partnerships is modeled after the SHRP Implementation subsection which was included in ISTEA. The Advanced Research Program, a new element, focuses on exploratory, long-term research, which involves more uncertainly and risk than traditional applied research, but holds the potential for great payoffs.

The ISTEA research and technology programs which are not included in NEXTEA include the Highway Timber Bridge Research and Demonstration Program, Applied Research and Technology Program, Seismic Research Program, and Fundamental Properties of Asphalts and Modified Asphalts.

The FHWA Research and Technology Program is developed through an internal and external review process, including technical, program, and executive levels, considering needs within the highway system, "customer needs," highway community priorities, funding availability, and other issues. Projects are aligned with identified high priority areas to ensure that the program focuses where the needs are greatest. This review process continues through the technology transfer, deployment, and training stages to similarly ensure that the programs focus where the needs are greatest. Research is evaluated through a variety of means, selecting the most appropriate methodology to meet the circumstances. For example in ITS, we have used extensive field measurement techniques, robust integrated methodological processes, and peer review by practitioners and scientists, for field operational tests, model deployment, and the entire advanced transportation management research program, respectively.

It appears that in the opening paragraph to this question, the $87 million under ISTEA and the $1.6 billion under NEXTEA, including the reference to the $420 million for the National Technology Deployment Initiative, is a comparison of 1 year under ISTEA to 6 years under NEXTEA; neither of these figures includes ITS. In addition, some of the proposed funding under the Research and Technology Program under NEXTEA previously was General Operating Expenses (GOE) funds received by the Federal Highway Administration under the annual appropriations process.

Question. What has the ISTEA highway research program taught DOT about deploying new technologies in the field? How have these lessons learned been incorporated into the NEXTEA proposal? How will innovative technology information be disseminated and what tools will be used to significantly expand the use of innovative technologies?

Answer. During the years of ISTEA, closer ties and partnerships have been established throughout the transportation community. One very good example of this tighter association is the Priority Technology Program under the Applied Research and Technology program (ISTEA Section 6005); this program includes projects identified in the field and uses Federal/State/industry/academic partnerships to fund and conduct the projects as a means of increasing "ownership" among the partners and facilitating the movement of the technology into use.

Superpave technology is being implemented through a Federal/State/industry partnership that has provided significant acceleration of the technology. More than two-thirds of the States are already using the Superpave binder specification, and most of the remaining States will make the switch this year. The Superpave second goal, implementation of the volumetric mix design procedures by 2000, is also well on its way; two-thirds of the States were already using, during the 1996 construction season, equipment and techniques associated with this stage. The Superpave regional centers, formed through similar partnerships, will continue to help State, county, and local governments and others with their implementation of this technology.

The National Technology Deployment Initiatives (NTDI) under NEXTEA will focus resources on a distinct set of priority goal areas which directly address the

concerns of the traveling public. The NTDI was developed as a result of extensive outreach and discussion among major stakeholders within the surface transportation community. For delivery of NTDI resources, special emphasis will be placed on getting projects using innovative technologies "on the ground" through direct support to States and other implementors with funding and deployment support for individual projects. These projects will provide valuable insight to advance the state-of-the art, and with more widespread confirmation of the benefits of use of innovative technologies through the NTDI program, there will be significantly greater use of regular Federal-aid and other funds for technical innovation by the States and others.

Similarly, the Technology Implementation Partnerships program will facilitate the formation of partnerships and advanced implementation for products from the Strategic Highway Research Program as well as other high profile technologies that will benefit from a focused implementation effort. Individual organizations do not usually possess a "critical mass" of skills and financial resources to independently implement most advanced technologies; this program will facilitate bringing key partners together in a cooperative effort to plan and execute actions needed to expand adoption of innovation.

The Long-Term Pavement Performance (LTPP) Program, a 20-year effort under the Strategic Highway Research Program created in 1987, will be continued through partnerships with users such as State highway and transportation agencies, contractors designing and building roads, and international transportation interests. This long-term program has the unique challenge of testing, in actual service, performance of various pavement designs and materials in different conditions, resulting in a comprehensive national data set for analysis and ultimate improvement in pavement performance. The reauthorized LTPP will emphasize the creation of products to continue to fulfill the original LTPP program objectives and to meet future pavement technology needs.

Other Research and Technology elements similarly are designed to integrate a connection with the user community early in the process to facilitate adoption of innovative technologies. Means for dissemination include training, test and evaluation, deployment projects, technology exchange, hands-on demonstrations, or other means. A variety of traditional and advanced media are used to disseminate technologies and information about technologies, including classroom instruction, satellite broadcasts, mobile laboratories, computer disks, CD-ROM packages, and Internet-based instruction, to provide the highway community with the knowledge, skills and abilities needed to effectively implement and adopt the innovative technology.

Question. What are the indications that the surface transportation community will benefit from the $420 million National Technology Deployment Initiatives program? What methods will the new initiative use to increase the use of innovative technologies at the state and local levels? How do these differ from the training and technical assistance provided through the Local Technical Assistance Program—whose NEXTEA funding is $72 million? How is the National Technology Deployment Initiatives program linked to the ITS deployment activities?

Answer. Along with the other research and technology elements of NEXTEA, the National Technology Deployment Initiatives (NTDI) has been developed as a result of extensive outreach and discussion among major stakeholders within the surface transportation community. For delivery of NTDI resources, special emphasis will be placed on getting projects using innovative technologies "on the ground" through direct support to States and other implementors with funding and deployment support for individual projects. These projects will provide valuable insight to advance the state-of-the art, and with more widespread confirmation of the benefits of use of innovative technologies through the NTDI program, there is expected to be significantly greater use of regular Federal-aid and other funds for technical innovation by the States and others.

The NTDI will focus resources on a distinct set of priority goal areas which directly address the concerns of the traveling public; including improved safety, reduced delay, extended infrastructure life through use of high-performance materials and innovative preservation techniques, enhancement of the environment, and reliable system operation. Coupled with uses of advanced materials and construction/maintenance processes, we hope to foster increased use of innovative contracting procedures where valuable to the overall goals and will look to maximize flexibility in project administration to meet the need of implementing agencies. In addition, training will be combined with other methods, such as demonstration projects, to create a synergistic approach to each technology deployment area.

This focus on achieving actual deployment of innovative technologies in selected goal areas through funding and other direct support, predominately to State depart-

ments of transportation and highway agencies, is the key unique feature of the NTDI program. This contrasts with the Local Technical Assistance Program, for example, which provides technical training and assistance on a wide spectrum of transportation issues to city and county staff. In addition, the NTDI is not linked to the ITS deployment funding proposal, which will focus on integrating existing ITS components (such as traffic management systems, transit information systems, and traveler information systems) in metropolitan areas, and deployment and integration activities in rural areas and for commercial vehicle operations projects. We believe that the various elements of our proposal are very complementary, and each addresses an important Federal role in support of innovation.

INTELLIGENT TRANSPORTATION SYSTEMS (ITS) AUTHORIZED FUNDING

ISTEA established the Intelligent Transportation System (ITS) Program, and authorized funding of $659 million from 1992 to 1997. The administration's reauthorization proposal would provide $1.278 billion over six years—a 94 percent increase in contract authority. From 1992 to 1997, the ISTEA authorized funds were supplemented with $602 million through the annual appropriations process.

Question. What are the reasons for the doubling of contract authority for the ITS program?

Answer. Contract authority is being requested for those portions of the ITS program which would most benefit from a long term, predictable source of funds. These program areas include the ITS Deployment Incentives Program, crash avoidance research, the advanced vehicle control and information systems program area, the operational test program, the architecture and standards program, and major portions of the mainstreaming program area (technical assistance, planning/policy issues, and training). These represent program areas which we know will be viable and in need of substantial funding support throughout the period covered by the reauthorization of ISTEA. Program areas with resource needs which may vary widely in amount and technical content from year to year, such as most of the research program areas, will continue to be justified and requested on an annual basis through the appropriations process.

It should also be noted that the proposed ITS Deployment Incentives program, which is designed to help spur integrated, intermodal deployment of ITS technologies and strategies, accounts for a total of $600 million of the contract authority being requested. The remainder of the contract authority being requested for research and technology transfer activities totals $678 million, an amount comparable to the amount received for similar activities under ISTEA.

Question. Does DOT expect that the ITS program will continue to be significantly supplemented with additional funds through the annual appropriations process?

Answer. As noted above, we expect to continue to request funding through the annual appropriations process for activities such as research, program assessment, and program support. Our fiscal year 1998 budget request for these activities totals $54 million, which is less than half the amount received through the appropriations process in fiscal year 1997 ($122 million). If the contract authority available to the ITS program is increased as requested, and is not earmarked for specific projects, we expect annual appropriations requests for the program to remain relatively modest.

ITS DEPLOYMENT INCENTIVES PROGRAM

During fiscal years 1991 through 1997, the Congress has provided the ITS program with about $1.3 billion for research and development, operational testing of ITS technologies, and various activities to support deployment. In its NEXTEA proposal, DOT is refocusing the program to place a greater emphasis on deployment. DOT proposes a $100 million annual deployment incentives program, that would be used to integrate individual components of metropolitan areas' ITS systems. Despite this new push to deployment, DOT must overcome a number of obstacles before ITS technologies are widely deployed and integrated. These obstacles include: the lack of a working knowledge of the systems architecture, technical standards to integrate individual ITS technologies, technical knowledge at the state and local level, cost-benefit data on ITS, and funding in light of other priorities.

Question. The results of the model deployment programs will not be known before DOT begins distributing up to $65 million in deployment incentive funds for metropolitan areas. To what extent should DOT first complete and assess the model deployment program before it distributes deployment incentive funds?

Answer. Although we expect to learn a great deal from the implementation and evaluation of the four metropolitan area model deployment projects, the primary purpose of these projects is to serve as showcases of the integrated, intermodal de-

ployment of technologies and strategies which we already know to be very effective. The model deployments will help convince transportation decision-makers that integrated, intermodal ITS deployment is viable, practical, and cost effective. There is no need to wait for the completion and evaluation of the model deployment projects to help metropolitan areas which have already made a decision to deploy integrated, intermodal ITS infrastructure get started with seed funding through the proposed ITS deployment incentives program.

Question. According to the Administration's proposal, recipient's of the ITS deployment incentive funds will be required to conform to national ITS standards, yet many of the ITS standards will not be completed until 2001. How will recipient's conform to non-existent standards?

Answer. As noted in the section by section analysis accompanying the Administration's NEXTEA proposal, it is expected that the Secretary would determine on an annual basis which ITS standards would be used to fulfill the requirements of this provision. Only standards which were sufficiently mature in the development and adoption process would be included in this determination. It should be noted that, although some lower priority standards development and adoption activities may extend until 2001, we expect to have nearly all of the high priority standards in place well before then. Substantial progress is already being made. There are currently nine applicable standards which have been formally approved:

—SAE J1708, Truck & Bus Practice Serial Data Communications Between Microcomputer and Heavy Duty Vehicle Applications
—SAE J1663, Truth-In-Labeling Standard for Navigation Map Databases
—SAE J1761, Information Report on ITS Terms and Definitions
—SAE J1763, A Conceptual ITS Architecture: An ATIS Perspective
—NEMA TS–3.1 NTCIP Overview
—NEMA TS–3.2 Simple Transportation Management Protocol
—NEMA TS–3.3 Class B Profile
—NEMA TS–3.4 Global Object Definitions
—NEMA TS–3.5 Actuated Controller Unit Object Definitions

Four standards are currently in the review and approval processes within the standards development organizations:

—Message Set for Commercial Vehicle (CV) Safety & Credentials Information (TS 285)
—IEEE P1404, Guide for Microwave Communications System Development: Design, Procurement, Construction, Maintenance and Operations
—IEEE P1454, Recommended Practice for the Selection and Installation of Fiber Optic Cable in Intelligent Transportation Systems' (ITS) Urban, Suburban, and Rural Environments as well as Transportation Operating Centers and Associated Campuses
—Surface Vehicle Information Report: SAE J2355, ITS Data Bus Reference Architecture Model

Sixteen additional standards are under development, 13 of which should have usable products by the end of the 1997:

—NEMA TS–3.6 Variable Message Sign Object Definitions
—NEMA TS–3.x Ramp Meters Object Definitions
—Message Set for CV Credentials (TS 286)
—Dedicated Short Range Communication (DSRC) Protocol—Physical Layer
—DSRC—Data Link Layer
—DSRC Message Sets for CV Operations and Electronic Toll Collection
—Advanced Traveler Information Systems (ATIS) Core Message List and Data Dictionary
—In-Vehicle Navigation and Related ATIS Communications Device Message Set Standard
—Message Set for May Day Alert
—Location Referencing
—In-Vehicle Databus Interface
—Standard for Data Dictionaries for ITS
—Standard Message Set Template for ITS
—Message Set for External TMC Communication
—Navigation & Route Guidance (N&RG) Function Accessibility
—N&RG Transactions

Question. To what extent do you believe that transportation agencies at state and local levels have sufficient technical expertise to effectively use the Deployment Incentive Program funds for ITS system integration? Is there a risk that these funds will either go unused for some years as state transportation engineers begin to develop sufficient technical expertise, or that officials unfamiliar with ITS and systems integration will not make the best use of deployment funds?

Answer. Certainly, we do not contend that all States and metropolitan areas will be able to effectively use ITS deployment incentive funding during the first year or two of the program. However, we do believe that sufficient expertise does exist in many progressive States and metropolitan areas to make full and prudent use of the available funds at the beginning of the program. And as States and metropolitan areas increase their level of expertise, partially through the training and technical assistance activities sponsored through the ITS program, the pool of qualified applicants for ITS deployment incentive funds will grow. It should also be noted that we have specified very precise eligibility criteria for the ITS deployment incentives program, which would need to be satisfied before an application for funds would be favorably considered. Detailed knowledge of ITS and systems integration principles will be required to successfully satisfy these criteria.

ITS RESEARCH AND PROGRAM SUPPORT ACTIVITIES

In addition to providing funds for the deployment incentive program, the NEXTEA proposal includes $678 million over six years for carrying out multi-year research and operational tests of promising ITS technologies. These funds will be used to explore developing technologies, including the automated highway system (AHS) under which a computer and telecommunication network assumes the normal tasks of driving.

Question. What information does the Department have regarding the willingness of the public to accept the AHS concept, including their willingness to surrender control of their vehicles to a central computer system?

Answer. It is too early to tell how widely acceptable automated control will be. However, driving simulator experiments in the U.S. and Europe indicate that driver comfort with automated systems increases as the accuracy and reliability of the control system increases and as the drivers gain experience. Additionally, the 1997 Demonstration will provide a rich opportunity for passenger feedback on automated operations.

Question. What portion of these funds does DOT expect will go to further development of the AHS and related technologies?

Answer. As explained in the proposed NEXTEA legislation, the Department has integrated the AHS, collision avoidance and driver-vehicle interaction programs into the Intelligent Vehicle program. This program will shift resources to working with industry to develop integrated driver warning and assistance systems that will improve safety and mobility. Part of the Intelligent Vehicle program will investigate extending the capabilities of vehicle-based collision avoidance and driver information systems through interaction with the infrastructure. This is expected to yield improved safety and mobility. The only specific AHS work that remains is about $2 million per year to develop an AHS concept which evolves from the vehicle-and infrastructure-based systems resulting from the Intelligent Vehicle program.

Question. At the end of the six year authorization period, where does DOT expect the AHS concept to be and how much more money will be needed to advance full deployment?

Answer. At the end of the authorization period, US DOT will demonstrate an "intelligent vehicle" which will use on-board and limited infrastructure cooperative systems that will increase the driver's safety and efficiency but leave control of the vehicle in the driver's hands. We will also evaluate specific applications of trucks and buses where infrastructure cooperative automation yields substantial safety and mobility benefits. Potential applications include longitudinal and lateral control of transit buses in narrow tunnels and lateral control of snow plows to assist in finding the road edge. The AHS concept will be defined by the end of the authorization. But because full deployment is at least 50 years away, U.S. DOT has not estimated the cost nor do we plan to request additional funding in the near future.

NATIONAL TECHNOLOGY DEPLOYMENT INITIATIVES

Question. Section 6004 of the administration's proposal would establish the National Technology Deployment Initiatives program, with funding for $420 million over the 6 year period. According to the proposal, the program is intended to significantly expand the adoption of innovative surface transportation technologies. Goals include improving safety, environmental protection, and reduced delay in construction zones. As written, the proposal could extend to ITS applications. Will ITS projects be eligible for funding under this program? If so, doesn't this appear to conflict with the ITS Deployment Incentives Program restriction on deployment funding only for integration of existing or planned systems, and not new ITS systems in metropolitan areas?

Answer. In general, ITS projects envisioned by the Intelligent Transportation Infrastructure Deployment Incentives Program (NEXTEA Sec. 6057) will not be eligible for National Technology Deployment Initiative (NTDI) program funds. However, certain projects sometimes identified as ITS-related or non-ITS based traffic management concepts within the scope of the NTDI goals may indeed be supported with NTDI funds. An example would be Road-Weather Information Systems (RWIS), which have great value as a potential information source to both metropolitan and rural traveler information systems. RWIS's primary objective is to provide for more effective winter maintenance operations by guiding the timing, location, and extent of anti-icing and snow plowing forces, which can significantly aid safety and mobility. Innovations in RWIS and other winter maintenance techniques are expected to be advanced and deployed with NTDI funds, and this will enhance the value of traveler information in these areas.

WOODROW WILSON MEMORIAL BRIDGE

Reconstruction of the federally-owned Woodrow Wilson Memorial Bridge is estimated to cost nearly $1.5 billion—about $400 million for the bridge and $1.1 billion for the adjacent roadways and interchanges in Maryland and Virginia. As specified in the Woodrow Wilson Memorial Bridge Authority Act of 1995, the federal government will fund the reconstruction of the bridge, while the non-federal Authority (established by Virginia, Maryland, and the District of Columbia) will assume ownership of the bridge and undertake the reconstruction project. Accordingly, the NEXTEA proposal includes $400 million for bridge reconstruction.

Question. When will the Authority be ready to start design and construction?

Answer. Maryland and Virginia have passed enabling legislation to enter into an interstate agreement or compact to legally establish the Authority, but the District of Columbia has not. There also is no agreement among all involved parties on the project implementation schedule. The Woodrow Wilson Coordinating Committee plans to proceed with development of the project by the issuance of a design request for proposals upon the selection of a management consultant for the project and the issuance of the Final Environmental Impact Statement and the Record of Decision. This is with the anticipation of the having all outstanding issues resolved so that design can start in 1997 with construction being completed in 2004.

Question. Has a finance plan been developed, including specific sources of funding for roadways and interchanges? If the federal government is paying for the bridge, how will the roadways and interchanges be funded?

Answer. To date basic financial analyses have been performed for the total project to evaluate the various alternatives on an equal basis using different funding sources including tolls. If the federal government funds the bridge portion of the project, then the roadways and interchanges could be funded from a variety of sources including tolls, regular federal-aid apportionments, dedicated state highway revenue, and bonding which could be financed over a long term period.

Question. Should the project be allowed to progress without a finance plan?

Answer. Once the outstanding issues are resolved the project should proceed to construction with any necessary additional financial analyses being performed as appropriate. Due to the condition of the structure it is imperative that the project moves forward and final financing be completed as soon as possible.

Question. Will tolls be established for the bridge? If so, what amount of toll is being considered? Will travelers divert to the western half of the beltway to avoid paying tolls, thus worsening congestion in that area? Was the western half of the beltway constructed to accommodate the truck traffic that may use that section of the beltway to avoid tolls?

Answer. All of the replacement alternatives considered assumed tolls on the bridge. Only a reconstruction of the existing six lane facility would be toll free. The replacement alternatives considered tolls in the range of $1.00 to $2.00. Most of the truck traffic is local, so it is unlikely many of these trucks would divert to the western half of the beltway simply to avoid toll on the Woodrow Wilson Bridge; the distance is too long to offset the cost of the toll. Most of the western half of the beltway, including the American Legion Bridge crossing the Potomac River, has eight lanes.

Question. Is the $400 million federal contribution fixed? Has the federal government pledged to pay any cost increases that might occur on the bridge reconstruction?

Answer. The Administration has recommended that the federal contribution to the cost of the total project be the "minimum federal share" as defined in the NHS Designation Act of 1995 ($400,000,000). This recommendation coincides with the amount specified in the Administration's fiscal year 1998 budget as well as the Ad-

ministration's reauthorization proposal, introduced as S. 468. There has been no federal pledge to pay any cost increases beyond $400,000,000. The FHWA expects that the difference between the $400,000,000 Federal share and the total estimated reconstruction costs of $1,500,000,000 would be made up through a mix of sources—a portion financed with long-term, tax-exempt debt backed by user or other special fees, and a portion from the States which could include allocations of some part of their annual apportionments of Federal-aid highway funds available through reauthorization.

ENGINEERING COST ESTIMATES

Question. Will States continue to use 15 percent of construction costs as a basis for estimating the construction engineering component of an individual project's total costs? If not, how will States estimate the construction engineering cost component of total costs for any individual project?

Answer. Construction engineering costs can vary considerably from project to project, for example, engineering costs as a percentage of construction may be greater on a bridge construction project than on a highway rehabilitation project. FHWA has encouraged States to estimate engineering costs based on the type of project. The States have considerable information on actual engineering costs which can be used to develop more accurate project cost estimates.

Question. Will FHWA develop guidance on how to estimate costs, or will it be up to individual States to develop their procedure?

Answer. The States are in a much better position to estimate costs than FHWA. Since costs vary from State to State, estimates would be more accurate if developed by individual States. The States are responsible for estimating the total costs of the project, including design, right-of-way purchases, and construction so it is logical that they also be responsible for estimating engineering costs.

Question. What effect will removing this requirement have on construction engineering estimates and estimates for the total costs of individual projects?

Answer. Removing this requirement should have no effect on estimates. The 15 percent requirement does not apply to individual projects, but to the total program, therefore, any State currently using 15 percent as a standard estimate of a project's engineering cost is doing so on its own accord.

RAIL-HIGHWAY CROSSING PROGRAM

Question. According to FHWA, in 1994 the states used Section 130 funds to improve about 800 railroad crossings. Given the limited number of railroad crossings that can be improved with section 130 funds, to what extent does FHWA believe that states will use NEXTEA railroad safety funds to support education and enforcement initiatives?

Answer. Under the NEXTEA grade crossing allocation formula, 23 States will gain funds and 27 States and the District of Columbia and Puerto Rico will lose funds in fiscal year 1998 compared to their ISTEA allocation formula. (This analysis does not include hazard elimination funds which also can be used for grade crossing. If this is factored into the equation, 32 States and Puerto Rico gain and 18 States plus D.C. lose.)

States with increased funding are: Alabama, Arkansas, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Louisiana, Minnesota, Mississippi, Missouri, Nebraska, North Carolina, North Dakota, Ohio, Oklahoma, South Carolina, South Dakota, Tennessee, Texas, Utah, Wisconsin.

States with decreased funding are: Alaska, Arizona, California, Colorado, Connecticut, Delaware, District Columbia, Florida, Hawaii, Kentucky, Maine, Maryland, Massachusetts, Michigan, Montana, Nevada, New Hampshire, New Jersey, New Mexico, New York, Oregon, Pennsylvania, Rhode Island, Vermont, Virginia, Washington, West Virginia, Wyoming, Puerto Rico.

Question. What are the reasons for expanding the section 130 program to allow the states to improve crossings on private property? How will the public benefit from federally-funded infrastructure improvements at these crossings?

Answer. Safety improvements at private grade crossings have the potential to decrease crashes and fatalities at these crossings. The safety problem at private highway-rail crossings has been a small but constant source of collisions and casualties over the years. In the last two years (1995 and 1996), there were 942 collisions resulting in 94 deaths and 261 injuries. This problem surfaced and was emphasized during public hearings which the Department held early in 1996. Crossings where the public would benefit would include those open to public travel and where the public is often not even aware they are on private property; for example, residential, recreational and industrial crossings. These categories comprise about 40 percent of

all private crossings. (The remaining 60 percent are farm crossings.) However, about two-thirds of the collisions, occur at these non-farm crossings. On a collisions per crossing basis, the most hazardous appear to be recreational crossings with residential and industrial crossings following a close second and third. Another major concern are the nation's passenger and potential high-speed rail corridors, where the public benefit accrues more to the rail passengers and crews. The intent of expanding this program to private crossings is to provide the State program manager the option of addressing these problems where and when there will be a public benefit. The State program manager will weigh these benefits against benefits which would be realized by other options and will select accordingly.

Question. To what extent, will NEXTEA require states to update rail and motor vehicle traffic information in the inventory when they improve the physical characteristics of a crossing? Will states be allowed to use rail-highway crossing funds to update the national inventory? With only 800 crossings improved annually, how will DOT ensure that the entire national inventory is updated?

Answer. Currently, and since 1975, updating the National Inventory has been a volunteer effort. Most states and railroads do update the file, some more regularly than others. In an average year, the Federal Railroad Administration processes between 80 and 100 thousand changes into the data base. We have proposed that the allocation of funds for crossing safety improvements be predicated (partially) on the number of public crossings and the type of warning devices installed at those crossings. The provision requiring states to post information on safety improvements made with Federal funds is intended to provide accountability and to insure that annual allocations are able to take into account improvements already paid for. We would expect that when a state posts changes or improvements to warning device information they will also update traffic counts. Highway planning and Section 402 funds are already available, and have been available, which may be used for updating the National Inventory, and Rail-Highway Crossing Funds could be used under this Administration's proposal.

Question. Will states that currently do not have many railroad crossing accidents and thereby cannot demonstrate a reduction in accidents be allowed to transfer all their railroad crossing funds to the hazard elimination program?

Answer. States will be able to transfer grade crossing funds to hazard elimination after they reduce public grade crossing accidents compared to the average experienced in calendar years 1994, 1995, and 1996. This does not preclude a State with a very small number of grade crossing accidents from transferring funds. For example, if over calendar years 1994–96, a State has an average of 4 crashes at public grade crossings per year, and then has only 2 such crashes in calendar year 1998, it can transfer 50 percent of its grade crossing funds into hazard elimination.

Question. NEXTEA also allows states to transfer up to 100 percent of hazard elimination funds to NHTSA's State and Community Highway Safety grant Program (also known as the section 402 program) or its motor carrier safety allocation. What is the potential impact of this transfer on the railroad crossing program?

Answer. The safety impact on the grade crossing program itself should be minor. Flex into the 402 program does not preclude expenditures on grade crossings. Grade crossing safety information campaigns are eligible for Section 402 funding. States would not have been permitted to flex their funds into hazard elimination unless they had already demonstrated a measurable decline in number of crashes, and then transfer is permitted only in proportion to the decline in crashes. NEXTEA proposes allowing transfer of funds out of the program only to the extent that the number of crossing collisions has been reduced. This, and the needs-based formula distribution of funds, will reduce both the number of states and the amount of funds likely to be transferred out of the program. The formula uses as a baseline the average number of collisions between 1994 and 1996. A rolling three year count is used in order to dampen any potentially erratic shift that an anomalous good or bad year could have on the distribution of funds. If a state has an average of one accident or less, they will be allowed to transfer the funds.

However, under NEXTEA, States would be provided more flexibility to address a wider variety of crossing safety improvement options as it broadens program eligibility to include education and enforcement programs, trespass prevention programs and improvements at private crossings when there will be a public benefit. Private crossing eligibility could be significant for those states developing high-speed rail corridors. Therefore, even a limited amount of funding could be used to leverage significant results in areas such as public awareness campaigns or enforcement programs, previously not eligible for the program's funding.

NEXTEA also retains 100 percent funding eligibility for projects which close or eliminate one or more crossings, and retain the $7,500 per crossing bonus program

eligibility for communities that close crossings (when bonus is matched by the railroad).

Question. How will state's apportionments for the Rail-Highway Crossing Program under NEXTEA compare to their apportionment under ISTEA? Which states will gain funds and which states will lose funds?

Answer. Under the NEXTEA grade crossing allocation formula, 23 States will gain funds and 27 States and the District of Columbia and Puerto Rico will lose funds in fiscal year 1998 compared to their ISTEA allocation formula. (This analysis does not include hazard elimination funds which also can be used for grade crossing. If this is factored into the equation, 32 States and Puerto Rico gain and 18 States plus D.C. lose.)

States with increased funding are: Alabama, Arkansas, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Louisiana, Minnesota, Mississippi, Missouri, Nebraska, North Carolina, North Dakota, Ohio, Oklahoma, South Carolina, South Dakota, Tennessee, Texas, Utah, Wisconsin.

States with decreased funding are: Alaska, Arizona, California, Colorado, Connecticut, Delaware, District Columbia, Florida, Hawaii, Kentucky, Maine, Maryland, Massachusetts, Michigan, Montana, Nevada, New Hampshire, New Jersey, New Mexico, New York, Oregon, Pennsylvania, Rhode Island, Vermont, Virginia, Washington, West Virginia, Wyoming, Puerto Rico.

FINANCIAL PLANNING

Question. DOT's NEXTEA proposal will require a financial plan for any project with an estimated total cost of $1 billion or more. Does DOT have any specific requirements for the form content and scope of such financial plans? If so, when will they be published? If not, does DOT plan to implement this requirement on a case-by-case basis?

Answer. The FHWA does not currently have any specific requirements for form, content or scope of a financial plan. If the provision for a financial plan becomes law, FHWA will develop guidelines or regulations for this requirement.

Question. Currently there are no federal requirements for preparing a cost estimate. On what cost estimate will this requirement be based—an estimate prepared during an environmental impact statement process or some other specific estimate?

Answer. With the aging of Interstate highways, States are initiating some large scale reconstruction projects in urban areas costing billions of dollars, such as I–15 in Salt Lake, UT and Central Artery in Boston, MA. The FHWA required the States to develop plans for these two projects to outline the financial resources that would be available for the projects. These financial plans contain cost containment provisions and are updated at specified intervals as appropriate. As with the provision in the NEXTEA proposal requiring a financial plan for all projects estimated to cost $1 billion or more, FHWA would expect the State to use the most reliable estimate at the time it develops a plan. The FHWA also may require periodic updates of the plan.

Question. If a project is initially estimated to cost less than $1 billion, but then costs increase, will this requirement then apply?

Answer. The primary purpose of a financial plan is to serve as a cost containment strategy, therefore FHWA would expect the states to develop a financial plan for any mega-project that has the potential for reaching the $1,000,000,000 threshold.

ITS MAINSTREAMING

Question. Provide examples of some of the tangible results that can be expected from the ITS mainstreaming program. What measures of success does DOT use to estimate the benefits from the mainstreaming projects?

Answer. The purpose of the mainstreaming program is to make integrated, interoperable, compatible ITS infrastructure deployment as "normal" a part of the federal-aid highway and transit planning, development and funding processes, as construction of highway and mass transit facilities is today. That will require 1) technical assistance from headquarters until it can be delivered as a part of regular services provided through field offices. 2) guidance development on architecture, best practices, and the over 100 standards expected to support ITS deployment; 3) extensive training of FHWA and FTA staff as well as state and local staff working in this area. That will begin with an awareness of benefits and move to building key skills. In the short term our measures will be of "activities"—number of guidance documents, extent of distribution, number of courses, number of attendees etc. A more meaningful measure is the desired outcome of a surface transportation industry that routinely deploys ITS infrastructure as appropriate in a particular locality, existence of regional frameworks that are consistent with the national architecture,

use of standards, and routine inclusion of ITS in the planning process (which now includes operations planning.)

The tangible results that can be expected from the ITS/CVO mainstreaming program are institutional processes that lead to deployment of CVISN throughout the country by 2005. These processes consist of state ITS/CVO business plans which document the goals and components of a state's program, and regional business plans that integrate the business plans of the states to promote overall interoperability. Additional tangible results are expected through regional champions to help lead the deployment agenda and the mainstreaming forums which will focus on lessons learned and reduce the trial and error time that it takes to implement CVISN. The measures of success that DOT is using are the cooperative linkages that result between state agencies to allow CVISN to operate in an integrated fashion, and the level of technical readiness of the states to implement CVISN.

Question. The fiscal year 1998 request for the mainstreaming category is twice the size of the fiscal year 1997 funding. Why the substantial increase? What activities will this funding be spent on?

Answer. The total fiscal year 1997 investment in the Mainstreaming program area is approximately $13.5 million, including $2 million in training activities being funded under the Operational Tests program area. The request in fiscal year 1997, however, was for $21.7 million, because of the urgency of carrying out technology transfer and training. The GAO reflected the same urgency in it recent findings. This year, our Mainstreaming funding request mirrors our previous request. Our top priority is training, which will now be expanded to included state and local staff and more specialized skill building. Another activity being substantially increased is the Planning/Policy area, which is proposed to grow from $1 million in fiscal year 1997 to $4 million in fiscal year 1998. The increased funding for this program area will be used to continue and expand efforts to coordinate regional planning functions with State and local traffic operations and maintenance functions to foster an integrated approach to operations planning and deployment of ITS infrastructure to achieve transportation system operations and management objectives.

Question. How will this program make use of the results from projects such as the Model Deployment Initiative and Commercial Vehicle Information System Networks (CVISN)?

Answer. We have recently received an extensive case study of the Atlanta Showcase effort which has provided us and those developing the training curricula with an excellent set of detailed lessons learned. Likewise we expect that both the quantitative information emerging from both the CVISN and metropolitan area model deployments as well as the institutional lessons learned will become case studies used in numerous seminars, college curricula and our own training courses.

NATIONAL SCENIC BYWAYS PROGRAM

Question. How has DOT used the funding provided under ISTEA, and how successful has DOT been in meeting the program's goals and objectives?

Answer. The Scenic Byways Program Grant activities show that the States and local communities have achieved significant accomplishments, both in initiating new programs as well as strengthening existing programs through a variety of scenic byways projects. The Scenic Byways discretionary grant funds are serving as seed money for the States and local communities to conserve the unique qualities while developing economic resources along their byways. These funds have also provided an opportunity for the States and communities to work as partners in reaching common goals.

Consistent with ISTEA, scenic byways funds have been used to provide technical assistance to the States for the development and enhancement of scenic byways programs. Technical assistance activities have included workshops, conferences, and technical research to provide educational awareness to related scenic byways concerns. Additionally, a National Scenic Byways Clearinghouse as well as a World Wide Web site (Internet) have been established to allow the States and the public to have national/international access to current scenic byways information.

Question. What types of projects have been funded in this program during ISTEA? Has this led to a significant increase in the number of States implementing a scenic byways program?

Answer. Overall, $74,300,000 in Scenic Byways Program discretionary grant funds were awarded to 37 States, including Puerto Rico and the District of Columbia, for 552 projects. There were six categories of eligible project types outlined in ISTEA. The following identifies each project category, the funds awarded, and the total number of projects in each category.

Project category	Awards	Projects
Planning, design, and development of State scenic byway programs	$22,600,000	186
Making safety improvements to byways	782,000	2
Construction along the scenic byway (ranked in order of greatest number of projects to least: Interpretive Facilities, Pedestrian & Bike facilities, Turn-outs & Overlooks, Rest Areas, and Shoulder Improvements	38,900,000	202
Improvements to enhance recreation area access from byways	1,500,000	26
Protecting historical, archaeological, and cultural resources adjacent to byways	665,000	6
Developing and providing tourist information to the public about byways	8,900,000	130
Total	74,347,000	552

Eighteen (18) States previously had no State scenic byways and program took advantage of Scenic Byways funding to establish one. Eleven (11) additional States used Scenic Byways grant funds to improve and upgrade their existing programs.

Question. What evidence does DOT have that projects funded with scenic byway program funds would not have otherwise been funded by States and localities using other Federal-aid funds?

Answer. Demand for projects funded with Scenic Byways Program funds exceeded the total available by 145 percent. While the States had the opportunity to use Transportation Enhancement funds (TE) to undertake these byway projects that were unable to be funded under the National Scenic Byway Program, generally they did not. This limited use of TE funds is due in large part to the significant demands placed upon TE funds for other purposes, such as bicycle and pedestrian facilities.

MOTOR CARRIER REGULATORY RELIEF AND SAFETY DEMONSTRATION PROJECT

Question. When does the FHWA plan to make available application forms for the operators of light trucks that are eligible to enroll in the FHWA's Motor Carrier Regulatory Relief and Safety Demonstration Project?

Answer. On August 28, 1996, the FHWA published a Notice of Intent which outlined our proposed project plan. After the comment period, modifications were made and a draft Notice of Final Determination was prepared. This Notice of Final Determination, to be published soon, will contain the application requirements.

Question. NHTSA has made wearing safety belts the centerpiece of its strategy to save lives on our Nation's roads and highways. For a number of years safety belt usage was on the increase on a nationwide basis. NHTSA has reported nationwide rates of safety belt use of 62 percent in 1992 and 67 percent in 1994. During hearings last year the Department once again reported that the rate was 67 percent. DOT"s stated goal for some time has been to achieve 75 percent usage rate by 1997. In your current budget submission you indicate that your new goal is 80 percent by 1999. The 1999 goal appears very ambitious based on past accomplishments. Why does the Department keep raising the goal when it has yet to achieve past goals?

Answer. Safety belt usage rate goals established by the Department are ambitious, but achievable, when compared to historical data and our experience of what is necessary to meet these goals. Looking historically at safety belt usage rates, between 1982 and 1992 usage rates increased from 11 percent to 59 percent. This increase of almost 50 percentage points was due primarily to the passage of state seat belt laws. From 1991 through 1996, overall usage increased an additional nine percentage points as a result of increased enforcement and public education.

In response to the President's new initiative to increase belt use, on April 16, 1997 the Department submitted a plan to the President entitled The National Strategy to Increase Seat Belt Use in the United States. In addition to outlining a new four point strategy to increase safety belt usage, the plan calls for even more ambitious goals of 85 percent usage by the year 2000 and 90 percent by 2005. As compared to previous goals, the Department believes these new goals are achievable based on the Administration's support of the issue, our knowledge of what works in the states to significantly increase safety belt usage, and growing public and private sector support, such as the Air Bag Safety Campaign. Specifically, we now know that the combination of primary seat belt legislation, increased enforcement of existing laws, ongoing public education, and the establishment of public and private sector partnerships will dramatically increase usage in the U.S.

Question. What are the chances of achieving the nationwide rate of 75 percent during 1997?

Answer. In 1996, seven states reported a usage rate at 75 percent or above. California reported the highest rate at 87 percent. Overall, the national average for 1996 is 68 percent. NHTSA expects several additional states to raise their safety belt usage rates above the 75 percent goal during 1997; however, it is unlikely that the national average will increase seven percent points within one year.

NHTSA believes that it is realistic to expect that the United States will achieve President Clinton's new goals of 85 percent safety belt usage by the year 2000 and 90 percent by 2005. NHTSA believes these new goals are achievable based on the Administration's support of the issue and our knowledge of what works in the states to significantly increase safety belt usage. Specifically, we now know that the combination of primary safety belt legislation, increased enforcement of existing laws, on-going public education, and the establishment of public and private sector partnerships will dramatically increase usage in the U.S.

Question. How many states currently have a safety belt usage rate of 75 percent?

Answer. As of 1996, seven states reported safety belt usage rates at 75 percent or higher. These states are: California (89 percent), Hawaii (80 percent), Iowa (75 percent), New Mexico (85 percent), North Carolina (82 percent), Oregon (82 percent), and Washington (84 percent).

Question. How many states have achieved an 80 percent rate and which states are they?

Answer. As of 1996, six states reported safety belt usage rates at 80 percent or higher. These states are: California (87 percent); New Mexico (85 percent); Washington (84 percent); North Carolina (82 percent); Oregon (82 percent); and Hawaii (80 percent).

Question. What is the current range for the lowest usage rate and the highest?

Answer. Based upon 1996 data reported by the States, safety belt use rates range from 43 percent in North Dakota to 87 percent in California.

Question. What safety initiatives is the department planning between now and 1999 that will help it achieve a nationwide average of 80 percent when only a few states now enjoy that level of accomplishment?

Answer. On April 16, 1997, Secretary Slater submitted a plan to President Clinton, entitled The National Strategy to Increase Seat Belt Use Nationwide, which outlines a new strategy to achieve the Department's goals for safety belt use. This plan combines many of the highly effective current activities and initiatives with a new four point strategy for fiscal year 1998 and beyond. The plan is based on building public-private partnerships, enacting strong legislation, embracing high visibility law enforcement, and conducting coordinated public education. The plan builds upon existing programs and activities such as the Special Traffic Enforcement Programs and the Air Bag Safety Campaign partnership that have been so successful.

The plan also includes two new initiatives to help increase seat belt use. The first, included in the Department's reauthorization proposal, provides incentive grants to encourage states to improve their occupant protection laws and enforcement (sample criteria include enacting primary belt laws, requiring a fine of at least $25 for each safety belt or child seat violation, and conducting special enforcement programs). Alternatively, states can qualify if they meet belt use rate goals. The reauthorization proposal also includes a provision which would transfer funds from highway construction to occupant protection programs if a state does not meet belt use goals by 2002. The second initiative is a new Executive Order, signed by President Clinton on April 16, 1997, that requires all Federal employees to wear seat belts while on duty, requires belt and child seat use in National Parks and on Department of Defense installations, and encourages Tribal Governments and Federal contractors and grantees to adopt seat belt policies and programs

NATIONAL ADVANCED DRIVING SIMULATOR (NADS)

Question. NADS will be located at the University of Iowa in Iowa City, IA. As envisioned, NADS will represent the state-of-the-art in driving simulation, exceeding the capabilities for realism of the Daimler-Benz Driving Simulator (DBDS)—the most advanced driving simulator in the world—and the Iowa Driving Simulator (IDS)—the most advanced driving simulator in the United States. NADS is currently scheduled to be completed and operational in May 1999. TRW, the contractor building NADS, plans to begin fabricating the various simulator components (vision system, motion system, etc.) after the critical design review is completed in March 1997, the University of Iowa will award the contract to build the facility in June 1997. All components are scheduled to be completed before the end of 1998. The total estimated cost to build NADS now stands at $49.3 million—an increase of $17.3 million from NHTSA's original 1989 estimate. The Department of Transpor-

tation (DOT) approved NADS contingent upon NHTSA obtaining a one-third cost-sharing commitment from non-DOT sources. As a result, DOT will be responsible for paying $32.9 million toward the project, with the remaining $16.4 to be paid by non-DOT sources. To date, the University of Iowa and the State of Iowa have contributed $11.6 million, and TRW has contributed $3.6 million, for a total of $15.2 million, leaving NHTSA in search of an additional $1.2 million in cost sharing. Once operational, NADS will become the second driving simulator owned by DOT. FHWA currently has a driving simulator, called HYSIM, at the Turner-Fairbank Highway Research Center in McLean, VA. HYSIM was built in 1983 to study human factors issues relating to highway signs and markings, roadway geometry and in-vehicle displays. What research does DOT plan to perform on NADS that cannot now be performed on IDS or HYSIM, and how will this research benefit the Department?

Answer. Due the extremely limited motion cuing available from either the HYSIM or the IDS, neither of these devices is capable of realistically simulating hazardous driving situations that precede or precipitate vehicle crashes. Only the NADS, with its large excursion X-Y motion base (62 feet by 62 feet) and large yaw rotation capability (plus or minus 330 degrees) can provide the necessary motion cues that are generated by vehicles in pre-crash maneuvers. Without this level of motion cuing fidelity, the results of simulations in this regime of vehicle operation would be highly questionable. The extreme high fidelity of the NADS cuing systems will allow NHTSA to analyze with confidence the complex driver-vehicle interactions that occur during crashes. This will lead to the development of advanced driver aids and information systems to assist drivers in avoiding crashes.

Question. What would be the effect of DOT moving the FHWA research now being conducted at HYSIM so that it would be performed using NADS?

Answer. The FHWA research being conducted at HYSIM serves several critical functions to the overall research program in highway safety. The importance of maintaining the HYSIM at TFHRC is highlighted by the fact that the HYSIM:

—is closely integrated with in-house research conducted in other TFHRC laboratories;
—provides a flexible test bed in which research questions generated by contract research can be refined or extended;
—includes the Dynasign, which is a unique system of presenting highway signs and provides the means to evaluate signage in a dynamic driving environment quickly and flexibly;
—is in close proximity to FHWA highway engineers, who comprise the primary customer base for human factors research;
—is used as a demonstration and training tool for junior highway engineers and other FHWA customers.

Moving the research program to NADS would be deleterious to the FHWA research in highway safety and would destroy the critical daily interaction with FHWA engineers and human factors professionals required for conceptualizing, developing, and conducting highway safety research efforts.

Further, a move would:

—deprive FHWA engineers of human factors insights into every day safety issues, and result in the fractionation of highway safety concerns;
—decrease the efficiency of industry professionals who must work closely with both engineers and human factors researchers on the same project;
—disrupt in-house FHWA human factors research at a critical point in ITS and safety research restart-up time;
—postpone for several years the deployment and operational testing of ITS and safety systems;
—result in the loss of a critical number of experienced human factors FHWA professionals.

Question. DOT currently estimates a total project cost for NADS of $49.3 million. Through fiscal year 1997, NADS has received $27.8 million from DOT, $11.6 million from Iowa and $3.6 million from TRW—for a total of $43 million. However, NHTSA officials stated that NADS will need about $16.5 million in additional funding for it to be completed. If so, it appears NADS' total cost will be about $59.5 million. Please explain why it appears NADS needs about $10.2 million more than the $49.3 million estimate?

Answer. The estimate for the NADS Facility Development Cost of $49.3 million was provided to Congress in briefings to the House and Senate staff in January 1996 and has always been distinguished from the NADS Total Project Cost. The NADS Facility Development Cost ($49.262 million) is the cost of the Phase II construction contract ($34.105 million) plus the total of all cost sharing contributions ($15.157 million). The NADS Total Project Cost is the NADS Facility Development Cost plus costs associated with the Phase I design competition, Phase III transition

of the NADS operation to Iowa, program planning and management support including cost accounting, Iowa management support, Iowa technical support, and Congressionally mandated studies including the TRB utilization study and the contractor evaluation of Iowa contributed software. The following table provides consolidated costs for the total project:

NADS Total Project Cost Estimates

Project phase	*Project cost*
Phase I Design Competition	$7,827,000
Phase II—NADS Facility Acquisition:	
TRW Contract	(34,105,000)
University of Iowa Cost Share	(11,530,000)
TRW Cost Share	(3,627,000)
Subtotal Phase II	49,262,000
Phase III—Transition	1,800,000
Office Support	950,000
Total Project Cost	59,839,000

Question. DOT approved NADS contingent upon NHTSA obtaining a one-third cost-sharing commitment from non-DOT sources. If FHWA received the $12 million requested for fiscal year 1998, DOT's actual contribution would be $39.8 million, or about 67 percent of NADS' total project cost, which appears to be about $59.8 million. The Iowa and TRW contributions total $15.2 million, or about 26 percent of the total cost. What is NHTSA doing to obtain the additional non-DOT cost sharing (about $4.5 million) it needs for NADS construction?

Answer. The Department approved the NADS project with the condition that one-third of the acquisition cost of the NADS would have to be cost shared by non-DOT sources, not one-third of the total project cost. Thus, the one-third non-DOT cost sharing requirement is based on the $49.3 million or $16.4 million. The total cost sharing that is in place to date is $15.2 million, leaving a balance of $1.2 million yet to be secured. To date NHTSA has received no firm commitments for additional non-DOT cost sharing. However, NHTSA is currently exploring cost sharing with a major truck manufacturer. Preliminary discussion indicate that the manufacturer may be interested in providing the required truck cab and vehicle engineering and dynamics data.

Question. Other than NHTSA, has anyone made actual dollar commitments to pay for operating time on NADS?

Answer. At this time, NHTSA does not have any firm dollar commitments to pay for operating time on the NADS. This is not surprising, since users are unlikely to make such firm commitments 2 years before the simulator is built. However, NHTSA continues to believe in the overall finding of the TRB evaluation of the potential utilization of the NADS; i.e., the NADS will have an 80 percent utilization rate within 2 years of becoming operational.

TRANSIT NEW STARTS PROGRAM

Question. The transit program is the only major component of the Administration's NEXTEA bill whose overall funding authorization was cut as compared to ISTEA. Specifically, transit was cut by $1 billion—from $31.5 billion to $30.5 billion—over 6 years. Is the Administration sending Congress a signal that transit is less of a priority than it was under ISTEA?

Answer. The NEXTEA funding level reflects a more realistic level of increase for the program. ISTEA authorized $5.1 billion each year for fiscal year 1993 through fiscal year 1996 with a large increase in fiscal year 1997. It is proper only to compare ISTEA to NEXTEA without the $2.1 billion "bubble" provided in fiscal year 1997 Budget Authority. Therefore, NEXTEA represents an increase of $1.2 billion or 4 percent over six years. Transit remains the same high priority under NEXTEA as it did under ISTEA.

Question. Currently, there are 13 transit new starts with full funding grant agreements and two more, Sacramento and San Francisco BART, awaiting Full Funding Grant Agreements. If the two additional projects receive their FFGA's for a total of 15 FFGA's, please describe how much new start funding would be available for other projects under the $634 million level proposed in the President's budget? How much would be available if new starts were to be funded at the high authorization levels proposed in NEXTEA?

Answer. The outyear funding schedules for the BART and Sacramento projects have been accommodated in the President's budget at the $634 million level. The President's budget for fiscal year 1998 proposes to fund the existing 13 existing

FFGA's plus the BART and Sacramento projects. No funding is proposed for other projects in fiscal year 1998. It is anticipated that there will be no projects ready to receive an FFGA until next fiscal year.

To complete current and proposed FFGA's will require about $3.7 billion. NEXTEA would authorize $5.8 billion thereby leaving about $2 billion for additional projects.

Question. Will FTA be able to provide full funding grant agreements for the projects that will be requesting them in the next few years?

Answer. Assuming the authorization levels proposed in NEXTEA, FTA would be able to provide full funding grant agreements for additional projects.

Question. What impact will there be on the cost and schedule of these projects should federal funding not be available for 6 or more years?

Answer. Should federal funding be limited to the extent that no new FFGA's could be issued during NEXTEA, projects seeking new starts funding would likely face the following options: 1) cancellation; 2) delay until the next authorization period [with attendant cost increases and unknown scheduling adjustments]; 3) secure a combination of local and/or State, and non-new start Federal funding [Urban Formula, STP, CMAQ] to finance the project; 4) employ innovative financing techniques to leverage stable Federal revenue streams; or 5) use existing funds to raise bonds to finance construction.

To the extent that project sponsors delayed the initiation of the projects until Federal funding became available, the project costs would most likely escalate due to inflation, although the rate of increase might be mitigated by a more favorable bidding climate in the future.

Question. The President's budget generally freezes transit funding, except for the new starts program which was cut by about 17 percent. Thus, the budget proposes only $634 million per year in actual spending for new starts. The six-year NEXTEA bill proposes new starts funding that begins at $800 million in fiscal year 1998 and grows to $1.03 billion by fiscal year 2003. Since these additional new starts funds are not in the budget, where are they to come from?

Answer. The fiscal year 1998 President's budget proposes funding for 15 projects for which Full Funding Grant Agreements (FFGA's) are in place or pending. Our proposed outyear funding is sufficient to cover funding requirements for these 15 projects. Our reauthorization proposal includes a higher level of contract authority which could become available dependent upon future Federal budget decisions.

Question. Mr. Linton, I understand that on April 9th, you wrote to the Chairman of the Los Angeles County Metropolitan Transportation Authority and essentially informed him that you plan to re-write the full funding grant agreement regarding the troubled Los Angeles rail system. Evidently, you found "serious deficiencies and questionable assumptions" in the recovery plan proposed by Los Angeles. Your letter states that: "We are incredulous that, despite the engineering and financial difficulties on the construction already underway, the Board is contemplating even more requests to the Congress for various costly extensions to your rail system." If you re-write the FFGA for Los Angeles, will you free-up more "contingent commitment authority" to be used for FFGA's for other projects?

Answer. As part of my intensive effort to assist the LACMTA to manage this vital project, I intend to treat the three components of MOS–3, North Hollywood, East Side and Mid-City, as three separate legs. I will issue revised FFGA's for each of these legs with the overall Federal commitment for MOS–3 remaining unchanged. However, the MOS–3 outyear funding schedule will be revised to reflect cash flow requirements for each leg or segment. This will involve some reordering of the funding schedule. To the extent that outyear requests will be adjusted, some additional short term funding may become available. I do not anticipate that this will be a substantial amount and the final amounts will, of course, be contingent on the cash flow requirements analysis conducted by my staff for each segment.

We believe LACMTA's revised recovery plan, currently under preparation, will furnish a blueprint for ensuring that MOS–3 is completed in a timely and effective manner and for fully accomplishing LACMTA's other substantial responsibilities.

TRANSIT FORMULA PROGRAM FUNDING

Question. The FTA is proposing that, beginning in fiscal year 1998, the discretionary bus and bus-related funding and fixed guideway modernization funding be rolled into the Formula Program. FTA Officials state that funds from these categories will be available to be spent for any eligible purpose, as opposed to being limited to specific categories. FTA's most recent needs report painted a bleak picture as to the state of the nation's transit inventory. The report noted that over 13,000 buses were in excess of the useful life guidelines established by FTA and that over

3,800 rail transit vehicles were in excess of the minimum useful life guidelines. The cost to replace these vehicles could be in the billions of dollars. What is FTA hoping to achieve by moving funding for these categories into the Formula Program?

Answer. The significant transit needs are the primary reason for consolidating two categorical programs into a more flexible Formula program. Merging the Fixed Guideway Modernization and Bus grant programs into the Urbanized Area Formula program will provide transit operators with greater flexibility in targeting Federal funding to locally determined needs. Under this proposal, the formula funding level would increase from $2.1 billion in fiscal year 1997 to $3.4 billion in fiscal year 1998. Fixed Guideway Modernization resources will still be apportioned using the ISTEA formula, but once made available, these funds, as well as all other formula funds, may be used for any eligible purpose. This will help local agencies plan by reducing uncertainty, and will improve equity by distributing more funds by formula. It will also enhance the possibility of using innovative financing techniques to leverage the Federal funds.

Question. Under FTA's new funding proposal, what assurance is there that available funding will not be mostly directed to one category at the expense of the other?

Answer. This proposal places the responsibility for local decisionmaking where it belongs—in local hands. Local officials will be free to determine where their greatest needs lie, and direct Federal funding to eligible purposes as appropriate.

Question. What are FTA's long-range plans for replacing buses and rail cars that have exceeded their useful lives? Should we focus Federal funding more on the replacement and maintenance of the existing transit inventory and less on new starts systems?

Answer. We believe that State and local officials will act in the most cost-effective manner if given the authority. The flexibility inherent in the proposed merging of programs will enable local decisionmakers to tailor a larger pool of Federal funds to their specific needs. If the greatest need is bus replacement, funds can be targeted for bus replacement. If the greatest need is for rail vehicles or facilities, funds can be targeted for those purposes.

This flexibility is especially important given the differing life cycles between buses and railcars. Under the current division of programs, a transit operator that receives fixed guideway modernization funds cannot use those funds for new buses, even though the bus fleet may exhibit the greater need. By combining these programs, funds can be used for bus replacement/rehabilitation when needed, and railcar replacement/rehabilitation when needed.

We recognize the need to balance new system construction with support to "older rail cities" for the replacement and rehabilitation of the existing rail fleet and restoration of rail facilities. Our budget provides $634 million, the same amount as for major capital investments, to be distributed by the current statutory formula for fixed guideway modernization.

ACCESS TO JOBS AND TRAINING

Question. How long will it take for these projects to be implemented and begin assisting welfare or previous welfare recipients?

Answer. We anticipate funding the programs that are ready to be implemented to meet the needs of those transitioning from welfare to work. Although the funds are flexible and can be used to plan welfare to work activities, we are urging states and localities to plan and develop their strategies now, so that when funding becomes available, they may move to implement services quickly. The time constraints associated with welfare reform requires speedy action.

Question. Provide an example of the type of project this program will support.

Answer. Localities are free to develop the services and service strategies which the participating stakeholders agree are needed. Strategies may range from conventional bus services to flexible paratransit, including ridesharing strategies. We believe intelligent transportation technologies will allow for more effective coordination of service provided by transit agencies and other providers. The program criteria require that a mechanism be established to coordinate transportation and human service planning and to coordinate existing service providers in developing new service strategies. Therefore, participating transportation agencies, existing transportation operators, welfare agencies, employment training and other human service entities working with employers and community stakeholders are in the best position to develop appropriate service strategies. A funded program can incorporate several different services and types of providers working together to meet unmet needs. The program that is developed is meant to be derived from a comprehensive assessment of needs and must be programmed within the existing MPO and state transportation programming process. We would expect to receive a single applica-

tion to support a comprehensive program, not fragmented pieces from different local applicants.

Question. How many projects will $100 million support?

Answer. The number of projects would depend on whether projects receive a single grant for the entire period or phased funding over several years. This issue has not yet been resolved. We expect projects to occur in each state where welfare-to-work problems exist. In general we would not expect grants to exceed $3–4 million for individual areas.

WASHINGTON METRO

Question. Administrator Linton's testimony before the House Appropriation, Subcommittee on Transportation noted that the Washington Metrorail system continues on its fast track program for completion of the 103-mile system. His testimony also noted that the accelerated construction schedule, which continues to receive an annual appropriation of $200 million, is expected to save as much as $600 million. What does FTA base this savings on and is it true costs savings or expected savings from avoiding out-year inflation increases?

Answer. The fast track accelerates the construction schedule and completes the system five years earlier than originally planned. The estimated savings were based on the avoidance of out-year inflation increases.

Question. Washington Metro recently decided to extend the 103 mile system in Largo, Maryland. Have federal funds been provided to this project? If so, were they provided under a separate appropriation or as part of the $200 million annual appropriation?

Answer. No federal funds have been provided to extend the Metro rail system beyond 103 miles.

BUREAU OF TRANSPORTATION STATISTICS

Question. Since NEXTEA proposed a doubling of the BTS budget, please describe BTS' success stories that would warrant such a large increase in its budget.

Answer. The six-year total for NEXTEA is double the six-year total for ISTEA, but is a 24 percent increase in annual spending over the final year of growth in the ISTEA authorization. BTS started in the first year of ISTEA with a budget of $5.0 million, and grew incrementally pursuant to ISTEA to $25.0 million in fiscal year 1997. The proposed budget in fiscal year 1998 and each subsequent year is $31.0 million, which covers in addition to the Bureau's original responsibilities the airline and motor carrier programs not anticipated by ISTEA. Since its inception, BTS has been able to:

—Conduct the Commodity Flow Survey in 1993 and get the 1997 edition into the field, providing the first benchmarks in nearly two decades of what is shipped, its origin and destination, and how it moved. This was the first successful effort to measure shipments from non-manufacturing establishments and to estimate "bridge traffic" through each state.

—Conduct the American Travel Survey in 1995, providing the first detailed benchmarks of who travels, by which means, for what purposes, and between what locations.

—Complete three Transportation Statistics Annual Reports, including special analyses of transportation and economic performance and of transportation and the environment. The fourth edition, featuring transportation and mobility, is in the final stages of completion.

—Make foreign trade statistics more useful to the transportation community by splitting commodity flows across the US-Canadian and US-Mexican borders by mode and publishing the results on a monthly basis.

—Assemble and publish the National Transportation Atlas Database, a compilation of data on the location, connectivity, and other attributes of the highway, rail, waterway, fixed guideway transit, and airway networks.

—Initiate an interagency agreement with the Bureau of Economic Analysis to more precisely identify the resources consumed by the transportation sector, the quantity of transportation consumed by other sectors of the economy, and the contribution of transportation to the costs of products.

—Conduct a major study through four universities to ascertain the impacts of the Northridge Earthquake on the transportation system of Los Angeles, and the economic consequences of those impacts.

—Establish award winning programs to make DOT's data accessible. BTS has published 18 major CD-ROM titles, and has created an Internet site that serves over 9,000 customers per week with documents and data from BTS, the rest of

the Department, state and local transportation agencies, universities, and international organizations.
—Initiate cooperative programs with transportation and statistical agencies in Canada and Mexico to establish a continental perspective on transportation.
—Absorb the Office of Airline Information and improve the time between data collection and release.
—Absorb the Motor Carrier Financial and Operating Statistics program from the Interstate Commerce Commission and initiate a process to streamline and modernize the program.
—Launch the coordination and standards setting activities listed under a subsequent BTS question.

The proposed NEXTEA funding will meet growing demand for these services, both those initiated under ISTEA and those subsequently added to the Bureau's portfolio. The funding request will also allow pilot and proof-of-concept studies for the new initiatives indicated under the last BTS question as submitted by the Senator.

Question. What progress has BTS made in coordinating Departmental data collection efforts?

Answer. BTS is mandated by ISTEA to encourage coordinated data collection, but is precluded by ISTEA from requiring cooperation from other parts of the Department and other federal agencies unless authorized by the Secretary. BTS has been given responsibility within the Department to review all Office of Management and Budget clearance requests involving surveys to assure they maintain good statistical practice. BTS has also coordinated its own intermodal data collection programs with the other modal administrations and other federal agencies to maximize data collection effectiveness and minimize respondent burden and unwarranted program duplication. In compiling the National Transportation Atlas Database (NTAD), BTS assembled disparate spatial databases from other DOT agencies, established standard formats and metadata documentation that complies with the recommendations of the Federal Geographic Data Committee, and implemented procedures for ongoing maintenance and dissemination. The NTAD represents the first integrated set of spatial transportation networks useful for both national policy studies and intermodal analyses.

Question. What progress has BTS made in setting data collection guidelines and standards for the Department?

Answer. In spite of the limitations cited under the preceding question, BTS has successfully completed several standards-setting activities. BTS represented the transportation community in developing of the North American Industrial Classification System (which is replacing the Standard Industrial Classification system); updating the Standard Occupational Classification System; and the establishing the Standard Classification of Transportable Goods. The last item had been identified as a major need by the Department in 1969, and was accomplished when BTS took the initiative and won the cooperation of the Bureau of the Census, Statistics Canada, and Transport Canada. BTS is also the lead agency in ongoing work to establish standards for geographic data related to ground transportation as part of the National Spatial Data Infrastructure under the Federal Geographic Data Committee, as well as an effort to modernize the Standard Land Use Coding Manual. Most recently, BTS has been asked by the Department to review the feasibility and reliability of proposed output and outcome measures by each modal administration for compliance with the Government Performance and Results Act.

Question. What activities are planned for BTS over the 6 years of the NEXTEA proposal?

Answer. Most of the NEXTEA budget will be consumed by continuing those services required by ISTEA and those later transferred to the Bureau without funding (i.e., the Office of Airline Information and the Motor Carrier Financial and Operating Statistics program of the Interstate Commerce Commission). In response to customer demands, BTS also proposes building upon its initial products and services with three major initiatives. These initiatives include expanded programs of data collection and integration involving international transportation; expanded services to state, local, and private sector decisionmakers, including a grant program to enhance data collection and sharing throughout the transportation community; and a program to develop performance measures in DOT and support performance measurement by state and local agencies. Pilot and proof-of-concept activities would be initiated in each of the following areas under the proposed NEXTEA funding levels.

Transportation in a Global Economy

The initial BTS focus on domestic transportation must be expanded to reflect the increasing importance international trade has on the economic health of the Nation and its individual communities. This expansion includes:

—The domestic transportation of international trade and travel. BTS proposes to work with the Customs Service and the Bureau of the Census to determine where and how international trade and travel passes through the domestic transportation system. Such data are key to understanding the impact of NAFTA and other trade policies on the demand for domestic transportation facilities and services, and to identifying regional and local opportunities to compete in world markets. BTS has assessed major shortcomings in existing data as part of the Bureau's Transportation Statistics Annual Reports.

—The condition, performance, and use of transportation links to other nations. BTS proposes to assemble information on transportation facilities and services that link us to other nations, paralleling the Department's ongoing efforts to measure the condition, performance, and use of transportation within the U.S. The requisite work involves acquiring commercial data sources, maintaining data programs of agencies (such as those of the Maritime Administration) that may be lost with institutional change, and data integration.

—The International Transportation Database. BTS proposes to build a database that supports understanding of international issues, such as the role of transportation in global warming; provides comparative data to inform domestic policy with the experience of other countries with transportation; and contains basic information on international markets for U.S. economic interests.

Enhancing Relevance of National Transportation Statistics for State, Local, and Private Sector Decisions

The DOT budget is less than a fourth of all government spending in transportation, and only 5 percent of spending by the public and private sectors combined. For BTS to enhance the effectiveness of transportation decisions, the Bureau's national programs must be made relevant to the state, local, and private sectors that are the dominant stakeholders. The Bureau must improve the timeliness and geographic specificity of its data programs through increased sample sizes of data collections, the development of monthly transportation indicators, and the development of innovative analytical programs. To minimize cost and burden of these initiatives, BTS must also develop more efficient and less obtrusive methods for data collection, such as through capture of information from Intelligent Transportation Systems and administrative records. To maximize the effectiveness of these initiatives, BTS must also provide technical and financial assistance to organizations that integrate local data collections and analyses with national counterparts. Such activities are already taking place with respect to spatial data. BTS is actively participating in the development of the transportation framework layer of the National Spatial Data Infrastructure (NSDI), which relies on the integration of databases developed at the state and local levels to provide the most accurate and up-to-date spatial data which can be used nationwide. The demand for these activities is underscored by the Bureau's successful participation in the White House Economic Briefing Room, and by a policy statement passed unanimously by the Board of Directors of the American Association of State Highway and Transportation Officials that states "the U.S. Department of Transportation should encourage and support the further development of the Bureau of Transportation Statistics, a continuation of the dialogue between the Bureau and the states, and an exploration of the Bureau's services to the states, including the potential for increased technical assistance."

The Bureau's proposal recognizes that America is being wired for better communication and offers several programs to begin effectively using the new telecommunications technologies. Inherent in the BTS proposal is a plan for managing an integrated information infrastructure for the transportation community. The plan consists of expanding the National Transportation Library and establishing a series of partnerships with state and local agencies, universities, and trade associations. These partnerships will focus on improving the efficiency of data collection and increasing the exchange of information throughout the community. The Bureau is proposing a grant program to work with non-federal professionals as they begin to collect data through Intelligent Transportation Systems technologies, to work with universities and others as they begin to build repositories of transportation data and information on the Internet, and to work with the private sector to ensure that the Department provides American businesses with the right information at the right time in the right format so they can successfully compete in the global economy.

Performance Indicators

BTS plans to work with other DOT modal administrations to develop effective performance measures for transportation to support the Government Performance and Results Act. In response to requests from state and local agencies, BTS also

proposes to help state departments of transportation and metropolitan planning organizations to develop performance measures for their own purposes.

SAFETY ISSUES RELATED TO ANTIHISTAMINES

Question. The Committee is aware that NHTSA is currently developing a national public education program to combat the effects of fatigue, sleep disorders, and inattention on motor-vehicle crashes to be implemented and evaluated in 1998. This is a critical undertaking since in recent years, fatigue and drowsiness have been identified by experts as major causes of lost worker productivity, workplace injuries, and transportation-related accidents. This problem has been further compounded by the fact that many persons suffering from seasonal allergies self-medicate with over-the-counter (OTC) sedating antihistamines. Such reaction-impairing medications were reported to be factors in a recent Connecticut truck accident involving the death of an 11-year-old girl as well as a metro train accident in San Francisco that injured five people. With the 1998 public campaign, which was funded by this committee in fiscal year 1996 and 1997, will there be a specific focus on the dangers of driving while using sedating antihistamines, or will the campaign just have a general warning about driving while using impairing substances?

Answer. The development of the campaign is still in its early stages, so it is too soon to know exactly how it will address medications in general, and sedating antihistamines in particular. Both the target audiences and specific content of this public education program are established by a panel of nationally recognized experts in the areas of sleep and sleep disorders, education, and traffic safety. This panel is convened by the National Center on Sleep Disorders Research. At this time, the panel has recommended a focus on young male drivers and shift workers, two groups that appear to be over-represented in fatigue-related incidents. While the panel's recommendations are not yet final, they do not currently include recommendations to create a specific focus on sedating antihistamines. Rather, medication is one of several issues of which the panel believes that the motoring public should be aware.

Question. You have indicated that you have yet to find evidence that sedating antihistamines, or, for that matter, any OTC drugs, contribute to a substantial number of crashes and that it would, therefore, be inappropriate to issue warnings to the public about the use of sedating antihistamines. This is troubling because, as you know, such "evidence" is nearly impossible to collect since the information about falling asleep at the wheel, or information about any specific causes for such drowsiness, cannot be collected at the scene of an accident unless it is volunteered by the driver. And as you also know, independent research projects have concluded that the slowed reaction time experienced by a person using a sedating antihistamine is comparable to the delayed reaction of a person with a blood alcohol content (BAC) of .05. So, if it is inappropriate to issue warnings about sedating antihistamines based on a dearth of "evidence," wouldn't it be appropriate then to take the more positive tack of actively encouraging the nation's allergy sufferers to use non-sedating medications while driving, particularly given that such antihistamines are available?

Answer. This question implies that there is no evidence on the involvement of antihistamines in crashes. This is not the case. In a 1990 study of the incidence and role of drugs in fatal crashes, the Agency found that only 0.6 percent of drivers had any amount of antihistamine in their blood, compared with 51.5 percent showing measurable amounts of alcohol. This evidence suggests that antihistamines are not involved in a significant number of fatal crashes. While this does not mean that this issue is not important to recognize and address, it is important to concentrate resources on those issues that most demonstrably affect safety. NHTSA includes messages warning against impairment due to over-the-counter medications in its materials on drugged driving and driver education.

Question. For example, in 1993, the FAA approved the use of loratadine, a non-sedating antihistamine, by most pilots and air traffic controllers with allergies. Given that the FAA has recognized and addressed this safety issue, does any other agency in the DOT offer similar guidance in this area, such as the Coast Guard to its pilots and cutter commanders?

Answer. In general, the U.S. Coast Guard does not provide instruction as to the clinical treatment or therapy for specific health problems, including those requiring use of antihistamines. The over-arching policy is that all Coast Guard members must be "fit for full duty". This means that any health problem and its respective treatment must keep the "fit for full duty" concept in the forefront. Competent medical authorities (i.e., medical officers) make decisions as to the fitness for duty, using their clinical judgment, operational experience, input from supervisors/command,

and guidance set forth in various Coast Guard instructions. Advisory information on the use of specific medication in aviation is made available to medical officers through several publications including the Coast Guard "Flight Surgeon's Guide".

The Federal Railroad Administration also does not offer specific guidance on sedating antihistamines. It publishes medical regulations and conducts training for railroad company medical officers. FRA reviews the periodic training and testing of operating personnel conducted by the railroads.

The Federal Highway Administration issued a report in 1991 that states that "for treatment [of allergic rhinitis], only non-sedating antihistamines or intranasal steroid sprays should be used to prevent sedation that occurs with conventional therapy." A condensed version of the report states that commercial motor-vehicle drivers "should avoid potentially sedating antihistamines." This condensed report is included in FHWA's standard medical information package, which is sent to medical practitioners who request information regarding medical fitness qualifications for commercial drivers.

The Secretary of Transportation has reinforced modal efforts to urge caution regarding the use of medications by promulgating a policy strongly urging "all transportation industry employers to include in their employee training materials appropriate information to address" both over-the-counter and prescription medications for persons performing safety-sensitive duties. In addition, the policy encourages "employers to reiterate with their employees the need to report use of such medications when required by applicable DOT rules or by company policies."

Question. How does the FAA disseminate to medical directors at the air carriers information about the directive concerning the use of non-sedating antihistamines? Is this an adequate public information mechanism, and if so, could it be a model for NHTSA or other modes in the DOT which might consider adopting a similar advisory?

Answer. FAA provides medical advisory information including information on non-sedating antihistamines to aviation medical examiners (AME's), libraries, medical professional groups, aviation user groups, and others. This information is disseminated by the Office of Aviation Medicine (AAM) through the Federal Air Surgeon's Medical Bulletin, which is published quarterly and distributed to approximately 6,000 physicians. In addition, AAM has widely distributed information on the use of over the counter medications to both physicians and airmen.

The bulletin and other pamphlets such as Medical Facts for Pilots are prepared by the FAA's Civil Aeromedical Institute with policy guidance and support from AAM. AME's and other authors submit articles and photos for publication in the bulletin.

We believe that this is an adequate public information mechanism since all airmen are required to undergo periodic physical examinations by AME's. AME's are required to be knowledgeable of FAA policies and practices regarding the acceptability of medications in the performance of airman duties. Publication of pamphlets and distribution of informational material to libraries, medical professional groups, user groups, and others could, however, be effectively used by other modes of DOT.

Because the National Highway Traffic Safety Administration does not have regulatory control over motor-vehicle operators, it does not have a network of medical examiners through which to disseminate such information. Other modal administrations that have regulatory authority appear to use methods similar to the FAA.

Question. What plans does NHTSA have for the development of a safety standard in this area which could or should be applied to the surface transportation modes as well, particularly rail, transit and motor carriers?

Answer. NHTSA does not have statutory authority to promulgate a standard that would have any binding effect on motorists or on State and local governments. In the past, the agency has issued guidance about the negative effects that over-the-counter drugs and other drugs can have on driving behavior. As more information is developed in this area, the agency will issue additional guidance to the States and the public as the need arises.

QUESTIONS SUBMITTED BY SENATOR DOMENICI

AIR BAGS

Question. Administrator Martinez, I understand that last month, NHTSA (National Highway Traffic Safety Administration) published a new rule allowing vehicle manufacturer's to depower air bags so that they inflate less aggressively. NHTSA believes "this is a short-term solution to the problem of fatalities and injuries that current air bags cause to children and the elderly in low speed crashes." What

trade-offs result from this depowering decision? That is, if the depowering decision makes air bag deployments safer in low speed crashes, are vehicle occupants less safe in high speed crashes?

Answer. Based on the "Final Regulatory Evaluation, Actions to Reduce the Adverse Effects of Air Bags, FMVSS No. 208, Depowering," NHTSA, February 1997, the agency has estimated the benefits and tradeoffs of depowering air bags.

Assuming no changes are made in where children sit in vehicles, restraint usage rates, and no changes are made to the current air bags, an estimated 140 children, 25 drivers and 7 adult passengers would be killed in low speed accidents by air bags over the lifetime of one model year's fleet if all vehicles in that model year had driver and passenger side air bags. Of these, an estimated 47 children's lives, and a large portion of the 32 adults could be saved by depowering. For higher speed accidents, analyses based on test results and modeling indicate that depowering could save 4 to 22 belted passengers.

Analyses based on test results and modeling indicate that in higher speed accidents 16 to 151 drivers (comprised of 13 to 110 belted drivers and 3 to 41 unbelted drivers) would not be saved and 34 to 280 unbelted adult passengers lives would not be saved as a result of depowering every vehicle in the fleet.

Based on limited crash data on one less aggressive depowered air bag, an air bag on a General Motors designed Holden vehicle in Australia, an estimated 643 lives of belted occupants could be saved by having depowered air bags like the Holden bag in every vehicle.

Question. I understand that a new air bag technology, based upon compressed-gas inflation mechanism, has recently been developed and is much safer than currently installed air bags. I further understand that, last December, the federal government's Transportation Research Center in East Liberty, Ohio conducted a series of tests with this new technology. How many and what type of tests were conducted? How do the test results compare to test results for currently-installed air bags?

Answer. Air Belt Systems Inc. has made claims that their air bags are safer than conventional systems. The agency conducted over 175 tests on various production and depowered air bag systems. These tests included static (stationary vehicle) simulations of out-of position children, and 30 mph crash simulations of adult occupants. Eleven of these tests were conducted with air bags provided by Air Belt. The tests revealed that Air Belt's air bags are very similar to more conventional depowered air bags. With current technology, including Air Belt, a trade-off must be made between adult protection at higher speeds and minimizing injury to small children who are unrestrained. This trade-off can only be overcome with advanced occupant sensing, used in concert with computational algorithms and advanced multi-stage or variable inflators such as the Air Belt inflator.

Question. How does this alternative technology compare with depowered air bags? Would vehicle occupants be more safe with this new technology than with a depowered air bag?

Answer. Systems from several vehicle and component manufacturers were tested to assess aggressiveness of production systems and the potential benefit of air bags with less energy. Included in these tests were air bag systems supplied by Air Belt Systems, Inc. These systems were different from production air bags because they utilize un-heated gas and fast acting valves rather than chemical reactions and heated gas to deploy the air bag. The Air Belt air bag inflator has an output similar to depowered air bags with an additional low onset pressure rise-rate. The agency's test results showed the Air Belt design of air bags to be similar in performance to depowered air bags from other sources. Consequently, the agency does not believe that the present Air Belt air bag system is a total solution to the child and small adult injury problem, just as the agency does not believe depowering is the total solution.

Question. Are there other tests that NHTSA needs to perform with this new air bag before it can be safely installed in vehicles? Which tests and when, if appropriate, can NHTSA arrange to test fully this system?

Answer. The agency believes that the Air Belt system, together with other air bag systems, has the potential for future development toward advanced air bag systems. This development will require sensors and algorithms to tailor the air bag deployment in each particular crash based on occupant, crash and vehicle characteristics. The agency estimates three to five years before sensors and algorithms are sufficiently developed and tested to be ready for production vehicles. The agency believes that Air Belt Systems Inc. needs to conduct the necessary research for development and integration of such advanced air bags into production vehicles. The agency does not know if the design of the Air Belt system inflator will be superior to other inflators in developing smart air bag systems. Consequently, any developmental testing should be conducted in collaboration with auto manufacturers and air bag compo-

nent suppliers to ensure a competitive market that brings forth the optimum solutions for "smart" air bags.

QUESTIONS SUBMITTED BY SENATOR SLADE GORTON

INTERMODAL SAFETY

During both Secretary Slater's confirmation hearing in the Commerce Committee, as well as the first hearing of this subcommittee, I asked Secretary Slater about his thoughts/comments/suggestions on possible programs to help alleviate the freight mobility and passenger traffic congestion in the Puget Sound.

With automobile and railroad traffic increase in the Puget Sound region, the Port of Seattle, the Port of Tacoma, the Puget Sound Regional Council, and the Washington State Department of Transportation are currently working on a project to construct grade separations at existing street level railroad crossings for both safety and traffic efficiency reasons. To date, this group has identified approximately 70 street level crossings along the north-south corridor between Everett and Tacoma that should be grade separated. Unfortunately, this would have to be done at a tremendous cost.

While grade separation and freight mobility are extremely important issues for the ports, they are also important in light of Burlington Northern-Santa Fe's decision to reopen Stampede Pass, a major east-west rail corridor in Washington state. Initially, BNSF projects that will operate 10–12 trains per day during 1997, but will increase that number to 18–20 operations by 1998. With this new traffic moving through the Central Puget Sound region, cities from Auburn, Kent, Maple Valley, to Ellensburg and Yakima will be affected.

As I see it, I believe this matter of freight and passenger mobility raises two important issues. First is safety. While we have been fortunate thus far, with over 70 grade crossings between Everett and Tacoma, something has got to be done to ensure that the Puget Sound does not witness a train-car type of accident at one of these at-grade crossings in the future. From my perspective, with more trains and more passenger vehicles operating in the same limited amount of space, an accident is almost destined to occur if nothing happens to rectify this problem. Secondly, freight mobility in the Puget Sound area, unlike other regions in the country, relies on an equal balance of rail, truck and passenger traffic. Accordingly, it would seem that something has to be done to ensure that all three operations—rail, commercial vehicle, and passenger traffic—can all coexist in an efficient and safe manner to ensure that the Puget Sound can maintain its standing as the second largest import/export port on the West Coast.

Question. How would the President's NEXTEA proposal be able to address this issue of Safety? What other types of funding mechanisms would you recommend to fund a project that could potentially cost nearly $2.0 million?

Answer. The Department's NEXTEA proposal contains an Infrastructure Safety Program, funded at $500 million in 1998 growing to $575 million by 2003, which provides funds to eliminate hazards on public roadways other than the Interstate, and to improve the safety of rail/highway grade crossings. It replaces the STP safety set-aside program. The rail/highway grade crossing portion of the program is funded at $165 million per year, but additional infrastructure safety funds can be used for grade crossing improvements if the State decides it has the need. This program continues to be a 90 percent Federal share matching program.

In addition, NEXTEA would authorize an additional $50 million per year for an Integrated Safety Fund. This is a new incentive grant program designed to foster integrated, results-oriented safety planning. Where states implement an integrated safety planning process, additional funds will be provided that can be used for any purpose permissible under the various DOT auto, traffic safety or motor carrier programs.

Other sources of funding are: Surface Transportation Program (STP) funds and National Highway System (NHS) funds if the crossing is on the NHS. The State Infrastructure Bank (SIB) Program may also be an option if the projects are eligible under Title 23. The SIB program would require matching funds from the State and private sectors. In addition, the Transportation Infrastructure Credit Enhancement Program may be an option. If the project satisfies the proposed eligibility criteria, which include national significance, it could seek funding under this program. Its application would be evaluated along with those of other applicants.

Together, we believe these programs provide states, like Washington, the tools they need and the funding sources to enable them to address the grade crossing safety problems they face.

ELIMINATION OF 1064 PROGRAM

Question. The President's NEXTEA proposal eliminates funding for the 1064 program—the "construction of ferry boats and ferry terminal facilities" account. While I recognize there are several states that do not utilize this funding source because they do not operate a ferry system, that is true for many transportation programs. Respectfully using my friend and colleague from West Virginia as an example, few Washingtonians utilize the Appalachian Highway System, yet, I recognize the needs of that region and the importance in maintaining that program. How did the Administration justify eliminating the 1064 program when there are the Coastal and Great Lake state, each with unique marine transportation needs, that have used this program quite successfully to meet the transportation needs created by each state's marine environment?

Answer. During the outreach for the development of the ISTEA reauthorization proposal, there were two resounding points FHWA heard. One, ISTEA is working, it needs some minor adjustments, but it does not need to be restructured. Two, there are too many funding categories, and programs should be streamlined and consolidated. The FHWA had to strike a balance in responding to these points when formulating the program structure in the NEXTEA proposal. As a result, the NEXTEA proposal would eliminate selected relatively small discretionary programs, including the 1064 program. Ferry boats and ferry terminals are activities that a State can fund using Surface Transportation Program funds, National Highway System funds, or Congestion Mitigation and Air Quality Improvement Program funds, as appropriate. Accordingly, even if the ferry discretionary program is no longer funded, Washington and other Coastal and Great Lake states, can use their regular Federal-aid highway funds for improvements to their ferry system.

BORDER GATEWAY CROSSING PILOT PROGRAM

Question. The President's NEXTEA proposal provides $270 million for a Border Gateway Crossing Pilot Program. As you know, Washington State has been a national leader in working with its Canadian counterparts to develop an efficient flow of goods and people across the Northern border of Washington State, both through intelligent transportation systems, as well as the PACE program. Two questions—how do you envision this NEXTEA program being operated, and what type of State or local projects do you foresee as being worthy of funding from the Administration under this program?

Answer. The Trade Corridor and Border Gateway Pilot Program provides planning funds for multi-State corridor and binational transportation and program funds for improvements to border crossings and approaches. This program facilitates corridor development and border planning, and addresses the transportation impacts of NAFTA and international trade growth. It provides supplementary planning and program support to coalitions of States and transportation and economic development partners to encourage innovation and cooperation in dealing with these issues. The program provides specific sums for planning and coordination purposes with all remaining funds used for project implementation.

Corridor and border planning.—The program provides $3 million/year supplemental planning funds to States engaged in multi-State transportation corridor planning. Grantees must submit plans and implementation schedules for corridor improvements. It provides $1.4 million/year for border planning grants to States and MPO's. Under this program grants may not exceed $100,000 for any State/MPO in any one year, but grants can be made annually through the reauthorization period. Grantees must commit to joint planning with counterparts in Mexico or Canada.

Border Gateway Pilot Program.—This program provides discretionary funding to States or other implementing authorities to improve the safety and efficiency of international border gateways, through a combination of infrastructure, operational, institutional, and/or regulatory improvements. Selection Criteria for grants include: (1) reduction in travel time through the gateway; (2) leveraging of Federal funds; (3) improvements in vehicle and cargo safety; (4) degree of binational involvement and cooperation, including cooperation with the Federal Inspection Services (Customs, INS, USDA, etc); (5) innovation and transferability to other gateways; (6) local commitment to sustain the effort; and (7) full use of existing facilities prior to any new construction.

The program authorizes eight projects, including at least two each on the Canadian and Mexican borders, with no project receiving more than $40 million from this program through the reauthorization period.

The proposal intentionally does not specifically identify types of activities for which funds would be eligible to allow for a broader consideration of types of activities to address improved thruput. Generally speaking, the following would be eligi-

ble for the infrastructure elements of a border gateway pilot program, although the list is not definitive:

—Construction, reconstruction, safety improvements, or capacity additions to roads, bridges, and ramps connecting directly to a border crossing, either for the purpose of improving overall thruput or to separate commercial and non-commercial vehicles to expedite border clearance.

—Commercial vehicle inspection/enforcement facilities, used directly to process commercial vehicles within or approaching a major gateway.

—Grade separations for major border approaches.

—Telecommunications infrastructure dedicated to improvements in ITS/CVO and related EDI measures to expedite commercial thruput and/or coordinate binational border clearance procedures.

—Intermodal facilities that improve commercial and non-commercial thruput. Major rail freight relocations would be eligible only to the extent that they are also made eligible under other provisions of NEXTEA.

FERRY DISCRETIONARY PROGRAM

Question. In February, I sent a letter to Secretary Slater requesting assistance in resolving a funding dispute between the FHWA and the Washington State Department of Transportation (WSDOT). In the fiscal year 1997 Senate Transportation Appropriations Committee report, I specifically included language directing the FHWA to provide $2.5 million in fiscal year 1997 funds for a ferry terminal in Clinton, Washington. On November 13, 1996, however, representatives from the WSDOT received a faxed notice that the allocation of FHWA's fiscal year 1997 discretionary money did not include the Clinton Ferry Terminal. I would like your clarification on two matters regarding this issue. First, can you tell me why the FHWA chose to disregard the Senate report language that I included on the Clinton Ferry Terminal, which specifically designated $2.5 million for the project. Second, can you tell me why, after two months, I have not received either a telephone call or a letter from the Department of Transportation on this matter?

Answer. The FHWA was aware of the Senate report, as well as language in the Conference report stating that "[t]he conference agreement deletes the Senate references of priority designations and set-asides within the Federal Highway Administration's discretionary grant programs;" see p.45, Report 104–785, to accompany H.R. 3675. Based on the later direction from the Conference report, all candidates for discretionary ferry funding were treated equally. In choosing among the many worthwhile candidates submitted, there was insufficient funding to allocate discretionary funds to many excellent candidates, including the Clinton ferry terminal project. The formal response to your letter is under review and should be sent soon.

QUESTIONS SUBMITTED BY SENATOR STEVENS

FEDERAL LANDS HIGHWAYS

Question. Alaska, as you may know, has significant lands held by Native Corporations, some of the largest and most visited national parks in the county, has more public lands than any other state, and the largest forests in the United States. However, I'm told by my staff that last year Alaska received next to nothing under these programs. Can you explain this to me?

Answer. In fiscal year 1996, several items impacted the amount of funds which were provided for transportation projects under the Federal Lands Highway Program. These included a $32.1 million reduction required by Section 1003(c) of the Intermodal Surface Transportation Efficiency Act of 1991 and a $0.32 million reduction required by Section 31002 of the Omnibus Consolidated Recision and Appropriations Act of 1996. Also, the State of Alaska decided not to request any Public Lands Highway Discretionary funds in fiscal year 1996. The following amounts of Federal Lands Highway Program funding by category was provided for transportation projects in Alaska. A total of $28.5 million was allocated for projects in State of Alaska. This amounted to 7.5 percent of the program and is one of the largest percentage of Federal Lands Highway Program funds allocated for projects in any one State:

Federal Lands Highway Program Funding Category	*Fiscal year 1996 Allocation*
Indian Reservation Roads	$16,500,000
Forest Highways	12,200,000
Park Roads & Parkways	200,000

Federal Lands Highway Program Funding Category	*Fiscal year 1996 Allocation*
Public Lands Highway Discretionary	.....
Total	28,500,000

FERRIES

Question. In NEXTEA, the Administration has deleted the ferry discretionary program, know as Section 1064 of ISTEA. This program provided tremendous benefit to Alaska and other States, whose communities rely on ferries as their only form of transportation between communities. In Alaska alone, the public ferry system provides services to twenty percent of Alaska's population, with its eight ships stopping at 35 ports. There are 3,700 route miles, including 1,911 that are designated National Highway System miles. The ferry system also provides jobs for marine and shore-side labor, marine engineers and employees in shipbuilding industry. These jobs are in and outside of Alaska. What was the rationale behind deleting this critical program?

Answer. Under NEXTEA, no new authorizations would be provided for several discretionary programs, including the ferry discretionary program. This reflects input received during the outreach and focus group meetings held by the FHWA during the development of the NEXTEA proposal, where it was recommended that discretionary programs be eliminated or significantly reduced in number. One major concern is that funding of discretionary programs reduces funding available for core programs shared in by all States. In the case of ferry boats and ferry terminals, these are activities that a State can fund using Surface Transportation Program funds, National Highway System funds, or Congestion Mitigation and Air Quality Improvement Program funds, as appropriate. Accordingly, even if the ferry discretionary program is no longer funded, the State of Alaska can use its regular Federal-aid highway funds for improvements to its ferry system.

HIGHWAY FORMULA

Question. In the Administration's NEXTEA proposal, the highway funding formula is structured so that States without a large population, high traffic count, or high road mileage are put in a hold harmless situation. It appears that the highway funding formula seems to favor States with developed highway infrastructure because much of the apportionment is based on the amount each State pays into the Highway Trust Fund. Have you considered including in the funding formula base factors such as: 1) predominance of Federal lands; or 2) underdeveloped highway infrastructure as compared to other States?

Answer. In arriving at our formula proposal, we considered a large number of factors in the context of the program elements contained in our NEXTEA proposal, and the criticisms of the ISTEA formula factors identified in the General Accounting Office (GAO) 1995 report, "Highway Funding: Alternatives to Distributing Federal Funds." This report criticized many aspects of the ISTEA formulas as being archaic, obscure and irrelevant.

For land area, in particular, the GAO report pointed out that this factor, while once felt to be an adequate proxy for potential highway development, no longer bears a close relationship to future highway needs, namely the need for new construction, since the highway system is no longer growing rapidly throughout the country. Consideration of development needs is another possible factor, and, while this might be done by developing some measure of "highway underdevelopment," we felt that targeting funds to meeting defined national highway program goals would best serve for the economic development needs of the Nation.

In recognizing the need to replace outdated and outmoded apportionment factors, we have proposed Highway Trust Fund apportionment formulas that we believe are fair to all States, yet relate well to the objectives of the basic program elements and satisfy the overall goal of the Federal-aid program to meet the Nation's need for the safe, efficient, and environmentally sound movement of people and goods. While we believe we have a strong formula proposal, one that takes into consideration the needs of both donor and donee States, while providing protection from rapid disruptions in program apportionments, we fully understand that there is no one "right answer" to the question of apportionment formulas, and we will be working with the Congress to develop apportionment formulas that will best meet all competing demands.

QUESTIONS SUBMITTED BY SENATOR LAUTENBERG

NEXTEA FORMULA CHANGES

Question. The Administration created a great deal of nervousness when it was revealed that you would be proposing formula changes in your NEXTEA proposal. New Jersey will receive the same percentage of the total program under your proposal but this is certainly not the case for every State. Given the controversy surrounding the ISTEA formulas, what criteria did you bring to bear in developing your new formula proposal?

Answer. While recognizing the need to replace outdated and outmoded apportionment factors, we have proposed apportionment formulas which we believe are fair to all States, yet relate well to the objectives of the basic program elements and satisfy the overall goal of the Federal-aid program to meet the Nation's need for the safe, efficient, and environmentally sound movement of people and goods.

In developing the proposed apportionment factors, we attempted to choose factors that would satisfy individual program goals, such as maintaining and improving the NHS, as well as overall Federal-aid program goals such as maintaining and improving human and natural environments and conserving energy. Additionally, we considered such questions as, "Is the data for these factors current, readily updated, dependable, and easily understood by those affected?" As such, many factors were considered, both system-related such as lane miles and VMT, as well as broader economic and demographic factors such as population, in attempting to satisfy these many, competing goals. We believe that the factors contained in the our formula proposal, while individually not meeting all the varied goals and criteria set forth in our effort, do collectively, as part of the overall program structure, effectively address the multiple goals of the Federal-aid highway program.

Also, we recognize that a sudden change to new formula factors could be disruptive to State programs, and therefore, have proposed certain equity adjustments to ease the transition to a more sound, logical basis for the apportionment of Federal highway dollars. Specifically, three different equity adjustments have been included in our proposal. The first adjustment, similar to the current Minimum Allocation program, is based on 90 percent of a State's percent contributions to the Highway Account of the Highway Trust Fund. The second adjustment is based on 90 percent of a State's prior year apportionments. The third is a final adjustment designed to protect State's from too rapid a disruption in apportionment dollars by ensuring that each State's share of NEXTEA annual apportionment dollars must equal at least 95 percent of its average ISTEA (fiscal year 1992–97) percent apportionments throughout all NEXTEA years. Since the equity calculations are done sequentially, each equity adjustment is affected by subsequent equity adjustments.

In presenting these factors for consideration, we understand that there is no one "right answer" to the question of apportionment formulas, and we look forward to working with the Congress to develop apportionment formulas that will best meet all competing demands.

Question. Given our need to conserve fossil fuels and the direct link between gas consumption and pollution, why did you choose to continue the practice of distribution of large sums of highway money to states based on their consumption of gasoline?

Answer. While we recognize that using factors such as VMT and Highway Account Contributions to the HTF may reward fuel consumption and thereby raise concerns about air quality and energy conservation, we believe there are several sound reasons for incorporating these factors into our proposed apportionment formulas. First, while these factors may appear inconsistent with national air quality and energy conservation goals, they do help to achieve other important Federal-aid program goals such as mobility enhancement and economic productivity. Additionally, these factors are effective in helping to achieve program-specific goals, such as maintaining and improving the Interstate and the NHS, by accounting for the use and extent of each respective system.

It should also be noted that these factors, while important, are only part of our complete formula proposal and the Administration's overall NEXTEA package. In addition to these factors, we are proposing the use of population as a factor in apportioning 30 percent of STP funds, because we believe this factor effectively represents the multi-modal goals of the STP program. Additionally, our Congestion Mitigation and Air Quality Improvement (CMAQ) program incorporates factors for newly-designated attainment areas, so that those jurisdictions recently achieving the national ambient air quality standards can continue receiving CMAQ funds and remain in attainment. Lastly, we have proposed increasing CMAQ funding by over 25 percent, increasing transportation enhancements spending by more than 25 per-

cent, and continuing funding for National Scenic Byways, recreational trails, bicycle transportation, and pedestrian walkways as part of our NEXTEA proposal.

In developing the proposed apportionment factors, we attempted to select factors that would satisfy as many of the competing goals as possible. While we believe that we have selected factors which effectively meet many of these goals, we also fully understand that there is no one "right answer" to the question of apportionment formulas, and we look forward to working with the Congress to develop apportionment formulas that will most effectively meet all competing demands.

Question. Doesn't this factor reward States that have high gasoline consumption and penalize those who choose to invest in energy efficient modes of travel, such as buses, commuter rail and carpooling?

Answer. While we recognize that using Highway Account Contributions to the HTF as a factor may reward fuel consumption, which is inconsistent with national air quality and energy conservation goals, we selected this factor because it helps to achieve other important Federal-aid program goals such as mobility enhancement and economic productivity. Additionally, this factor is effective in helping to achieve program-specific goals, such as maintaining and improving the Interstate and NHS, by accounting for the use and extent of each respective system. Also, the data for this factor is considered highly reliable, readily updated, and easily understood by those affected.

It should also be noted that this factor, while an important element of our formula package, is only part of the complete formula proposal and the Administration's overall NEXTEA package. In addition, we are proposing the use of population as a factor in apportioning 30 percent of STP funds, because we believe this factor effectively represents the multi-modal goals of the STP program. Additionally, our Congestion Mitigation and Air Quality Improvement (CMAQ) program incorporates factors for newly-designated attainment areas, so that those jurisdictions recently achieving the national ambient air quality standards can continue receiving CMAQ funds and remain in attainment. Lastly, we have proposed increasing CMAQ funding by over 25 percent, increasing transportation enhancements spending by more than 25 percent, and continuing funding for National Scenic Byways, recreational trails, bicycle transportation, and pedestrian walkways as part of our NEXTEA proposal.

We believe the formula factors we have proposed need to be reviewed within the context of our complete NEXTEA proposal, including the various environmental provisions contained in the package, as well as the increases in funding for environmental programs we propose. We believe our NEXTEA proposal does satisfy the national goals of mobility enhancement and environmental quality maintenance.

CHAFEE-BOND PROPOSAL

Question. My colleagues, Senators Chafee and Bond, have introduced legislation that would develop a new budgetary category for the Highway Trust Fund. Under their proposal, overall highway funding would automatically be set at the level equal to the receipts of the Highway Trust Fund for the prior year. Their proposal, however, does nothing to guarantee either mass transit or Amtrak the privileged status that would be granted to highways. Mr. Linton, if we follow the Administration's recommendation to fund mass transit entirely from the mass transit account of the trust fund, what would be the impact if we gave transit the identical treatment that is granted highways under the Chafee-Bond proposal?

Answer. If the Chafee-Bond proposal was applicable to Federal Transit funding there would be significant short-falls in comparison to the proposed NEXTEA budget authority. Beginning in fiscal year 1998 FTA proposes to fund all of the transit programs from the Mass Transit Account at the proposed appropriation and obligation limitation level of $4.4 billion. The fiscal year 1997 estimated revenue into the Mass Transit Account is $3.2 billion. Therefore, in fiscal year 1998 alone there would be a shortfall of over $1 billion under the Chafee-Bond proposal.

Our authorizing legislation, NEXTEA, proposes a total of $30.8 billion for transit, while estimated revenues from Treasury are about $3.0 billion a year straight-lined into the future. Therefore, over six years only about $18.6 billion can be supported by yearly revenues into the Mass Transit Account. This would create a shortfall of over $12 billion that would not be available for transit programs.

Question. Wouldn't highway funding see a substantial increase while transit funding endured a significant cut?

Answer. Yes, this is true. The Federal transit funding would be cut by over $1.2 billion a year compared to the current fiscal year 1997 funding level of $4.4 billion. As for highways, revenue estimates are over $22 billion a year. This amount is over $4 billion higher than the fiscal year 1997 obligation limitation placed on the Fed-

eral highway programs. In addition, the Chafee-Bond bill does not address funding for Amtrak for which our authorization proposes to fund at approximately $800 million a year from the highway account of the Highway Trust Fund.

CMAQ

Ms. Garvey, we have both heard assertions that the congestion mitigation air quality program has not really served its purpose of minimizing congestion and bringing about a decrease in the pollutants put into our environment.

Question. What hard evidence do you have that the CMAQ program has succeeded in minimizing congestion and pollution?

Answer. The CMAQ program has two requirements that other ISTEA programs do not have—air quality analysis of projects funded under the program and annual reports which document the emission benefits of funded projects. The most recently available annual report prepared jointly by FHWA and FTA indicates that about 75 percent of the reported CMAQ funded projects included quantitative data on air quality benefits; 1995 CMAQ Annual Summary of Activities. Generally, reported data on the air quality benefits of projects funded under the CMAQ program show that the benefits are commensurate with the size of the projects funded. Some projects, such as educational and outreach programs, marketing and advertising programs, do not lend themselves to quantitative analysis, and there are no hard data available for these projects.

It is important to recognize that transportation and air quality improvement projects are continuing and long-term efforts, and resulting emissions reductions may take years to materialize. CMAQ funded projects are important components in the challenge to improve the nations' air quality. While projects and programs funded under CMAQ will not solve the nation air quality or congestion problems, FHWA believes that many of these projects will make long-term contributions to cleaning up the nations' air through innovative programs; for example, inspection and maintenance programs which can yield more that 20 tons per day in emission reductions.

Question. Do you have hard data as to the amount of pollutants that have not been released into our atmosphere as a result of the transportation projects funded through the CMAQ program.

Answer. The CMAQ program has a requirement that projects which receive funding under the program provide an air quality analysis and supporting data which document its emission benefits. The air quality analysis allows FHWA and FTA to track and compile data on the emission reduction benefits of the CMAQ program. The information contained in these reports include: the distribution of funding among project types, an assessment of emissions reductions analyses as required under the program guidance including estimated emission reduction benefits data in kilograms/per day for volatile organic compounds (VOC), nitrogen oxides (NO_X), carbon monoxide (CO) and particulate matter PM–10) for each project, and comments on the reported data trends.

In 1995 alone, CMAQ funded projects accounted for reductions in carbon monoxide of 431 tons per day, in volatile organic compounds of 170 tons per day, and in oxides of nitrogen of 113 tons per day. These benefits will continue for the life of the project.

While most CMAQ-funded projects are small relative to the size of the transportation infrastructure and yield benefits commensurate with that size, some projects yield considerably greater benefits. Inspection and maintenance programs have been funded under CMAQ programs in at least 5 States yielding between 2 tons per day to more than 20 tons per day.

CMAQ-funded projects are also critical for some nonattainment areas to demonstrate conformity of their transportation plans and programs, thus allowing States and local areas to continue their federally funded programs. In these and other areas, CMAQ funding also has been necessary to ensure funding for transportation control measures contained in the State air quality implementation plan, or SIP.

Finally, the benefits of CMAQ funded projects should not be restricted only to air quality benefits when evaluating this program. Transportation projects usually meet multiple objectives, and this is true of CMAQ projects as well. In addition to air quality benefits, these projects have served to help provide congestion relief, environmental mitigation, economic development, and have assisted in meeting other environmental goals and objectives.

Some project-level information is available on the congestion relief benefits of CMAQ funded projects, for example:

—Region wide signal-timing in Denver, CO reduced 34,000 hours of delay and 13,500 gallons of fuel;

—Vanpooling in San Diego eliminated 1,000 vehicles per day from the road network;
—Parking management in Glendale, CA eliminated 140,000 car trips annually;
—Freeway Service Patrol in San Francisco, CA reduced delays by 90,000 hours Region wide; and
—NYC/NJ Barge removed 54,000 truck trips annually.

INTELLIGENT TRANSPORTATION SYSTEMS

Up through fiscal year 1997, we have provided almost $1.3 billion in funding to explore and apply new Intelligent Transportation System (ITS) technologies. These technologies are expected to improve the performance of roads and transit systems and increase capacity and safety.

Question. Based on your recent evaluations of this program, what concrete benefits has the nation and the taxpayers received from this investment?

Answer. Several DOT reports have shown how ITS technologies can favorably impact transportation efficiency, productivity, safety, user satisfaction, and the environment. The following tables document the findings of eleven of the most recent major studies sponsored or performed by DOT. Research on the public benefits of ITS establish compelling national interest in deploying ITS technologies and infrastructure. Below are highlights of ITS benefits documented by DOT:

ITS Provides Better Traffic Management

Abilene, Texas replaced outdated signals with a computer-based traffic signal system and realized $8–11 in benefits from travel time savings, delay reduction and increases travel speed for each dollar invested.

The Automated Traffic Surveillance and Control (ATSAC) program controls traffic flow between freeway and parallel arterial streets in Los Angeles, California and surrounding areas. The program has reduced fuel usage by 12.5 percent, hydrocarbon emissions by 10 percent, and carbon monoxide emissions by 10 percent.

ITS Benefits Transit Agencies

Four hundred New Jersey Transit buses are able to alter their routes and stay on schedule using real-time information they receive about traffic conditions.

Baltimore, Maryland and Portland, Oregon cut travel time by 10–18 percent, using vehicle locating technology to re-route buses and dispatch additional vehicle buses to keep their services on schedule.

Kansas City, Missouri was able to eliminate 7 buses from its fleet of 280 by implementing advanced transit fleet management systems.

ITS Reduces the Costs of Toll Collecting

The Oklahoma Turnpike Authority saves about $160,000 annually by switching from a manual to electronic toll lane. The Authority incurred an annual cost of $176,000 to operate an attended toll lane vs. $15,800 to operate an automated electronic toll lane.

ITS Can Improve Safety

Just three crash avoidance systems alone could eliminate more than 17,500 fatalities, prevent 1.2 million accidents, and save $26 billion each year. (By comparison, seatbelts and airbags save 10,500 lives per year.)

Incident management programs could prevent 50 to 60 percent of the accidents precipitated by traffic delays and congestion.

ITS Increases Traveler Convenience

As part of the Los Angeles Smart Traveler project, information kiosks were located in office lobbies and shopping plazas. Between 20 and 100 users accessed these kiosks daily, with more than half requesting freeway maps and bus and train information.

Given traveler information, almost 50 percent of those surveyed in Seattle and Boston indicated that they changed their travel route and time of travel. Five to 10 percent indicated that they changed travel mode. Even if only 30 percent of travelers change travel plans daily, harmful emissions of carbon monoxide, volatile organic compounds, and nitrogen oxides would be reduced by 33, 25, and 1.5 percent, respectively.

Question. What is the ratio of cost per benefit from these systems?

Answer. While our level of knowledge is growing rapidly as more and more projects are implemented, ITS has already received more cost-benefit and cost-effectiveness analysis than almost any other public program. This effort is important both to provide guidance for state and local agencies as they implement ITS and for national policy regarding investment decisions. A recent comprehensive study by

ITS America and U. S. DOT of the potential benefit cost of deploying ITS infrastructure in the nearly 300 metropolitan areas in the U. S. found an overall benefit cost ratio of 5.7:1. In the 75 largest metropolitan areas, the ratio was 8.8:1.

It is particularly interesting to note the composition of the benefits in this study. Conventional transportation capacity investments, such as lane widening, result in benefits dominated by congestion reduction—an average of 90 percent of all investment benefits. ITS investments, on the other hand, yield a more balanced outcome by both reducing congestion and increasing safety. These systems do so by reducing accidents, smoothing traffic flow, and reducing emergency response time. Thus, beyond being more cost-effective than traditional capital-only solutions, ITS projects increase safety. Some examples of benefit-cost ratios for individual ITS deployments which reflect the variation of local costs and local benefits are presented below.

Synopsis of Selected Benefit-Cost Ratios for ITS Deployments:

The Maryland CHART program is in the process of expanding to more automated surveillance with lane sensors and video cameras. The evaluation of the initial operation of the program shows a benefit/cost ratio of 5.6:1, with most of the benefits resulting from a 5 percent (2 million vehicle-hours per year) decrease in delay associated with non-recurrent congestion.[1]

The City of Abilene, Texas, installed a closed-loop computerized signal system. Their report[2] indicates an overall decrease in travel time of 14 percent, a decrease in delay of 37 percent, and an increase in travel speed of 22 percent. Phase I of a Texas state program called Traffic Light Synchronization (TLS) involving 44 cities, has installed arterial and network signal system projects affecting 2,243 of the approximately 13,000 traffic signals in the state. An additional 73 systems were installed in phase II. TLS analysis shows a benefit/cost ratio of 62:1,[3] with a majority of the benefits being travel time reduction. ITE estimates of reduction in travel time from traffic signal improvements range from 8 percent to 25 percent.[4]

The HELP/Crescent Project on the West Coast and Southern border states represented the final stage of the HELP program that evaluated the applicability of four technologies to services including roadside dimension and weight compliance screening, pre-screening of vehicles with proper documents, government audit of carrier records, government processing of commercial vehicle operator documents, government planning, and industry administration of vehicles and drivers. The technologies included automatic vehicle identification, weigh-in-motion, automatic vehicle classification, and integrated communications systems and database. The benefits data are developed as a projection of experience from the project and from other databases rather than direct measurement by the project.[5] Impact of hazardous material incidents could be reduced $1.7 million annually per state. Estimates of reductions in tax evasion range from $0.5 to $1.8 million annually per state. Overweight loads could be reduced by 5 percent leading to a savings of $5.6 million annually. Operating costs of a weigh station could be reduced up to $160,000, with credentials checking adding $4.3 to $8.6 million and automated safety inspection adding $156,000 to $781,000 in savings due to avoided accidents annually per state. A full implementation of services examined in the Crescent project would yield a benefit/cost ratio of 4.8 for state government over a 20-year period. Less complete implementations range in benefit/cost ratio from 0 up to 12:1 for the government. The COVE Study[6] estimates a benefit/cost ratio to the government of 7.2 for electronic clearance, 7.9 for one-stop/no-stop shopping, and 5.4 for automated roadside inspections. Another study finds that administrative compliance costs for Massachusetts carriers could be reduced by $2.4 million annually using ITS techniques.[7]

An extensive benefit/cost analysis of CVO user services effects on regulatory compliance cost of motor carriers predicted a range of benefits. The study segmented the motor carrier industry into small firms (1–10 power units), medium-sized firms

(11–99 power units), and large firms (100 or more power units) and analyzed each user service from the perspective of each market segment. The predicted benefit cost ratios are generally larger for larger firms. The benefit/cost ratio for commercial vehicle administrative processes range from 19.8:1 to 1.0:1. For electronic screening the benefit/cost ratio ranges from 6.5:1 to 1.9:1. The benefit/cost ratio for automated roadside safety inspection ranged from 1.3:1 to 1.4:1. The benefit/cost ratio for onboard safety monitoring ranged from 0.49:1 to 0.02:1. For hazardous materials incident response, the benefit/cost ratio ranged from 2.5:1 to 0.3:1.[8] The narrow definition of benefits examined in this study indicate that these benefit estimates are conservative.

Electronic Information Exchange for fare payment and screening of commercial vehicles represent areas of high benefit potential. The Detroit, Michigan, to Windsor, Ontario, Canada, area experiences about 22 million border crossings annually, with roughly 75 percent of the crossings being made by daily crossers.[9] The NAFTA and development of local attractions such as the Windsor Casino are likely to cause significant increases in demand. Implementation of Automated Vehicle Identification (AVI) for use with Electronic Toll Collection and Customs and Immigration automation has the potential to benefit both the toll authorities and the Customs offices with payback on electronic equipment investment in less than five years for toll authorities and less than ten years for customs. If potential economic development is included, government payback is in one year. For auto users, delay costs would repay investment in about 2 years. Commercial vehicles would get a benefit/cost ratio of over 4:1 in a single year, again primarily due to delay reductions. Additional benefits would accrue in ability to defer infrastructure investment, with benefit/cost ratio estimated at between 25:1 and 34:1 depending on estimate of traffic growth.[10] The Minnesota Highway Helper Program [11] reduces the duration of a stall (the most frequent type of incident representing 84 percent of service calls) by 8 minutes. Based upon representative numbers, annual benefits through reduced delay total $1.4 million for a program that costs $600,000 to operate. This represents a benefit/cost ratio of 2.3:1.

ITS implementation is expected to improve the safety record of motor carriers. Electronic screening and improved inspection procedures will help to eliminate major causes of accidents through better use of communications and information technology. Evidence of future success is indicated by ongoing motor carrier safety programs including the Motor Carrier Safety Assistance Program (MCSAP) and federal safety audits. The benefit/cost ratio of these programs has been estimated as 2.5 while yielding a reduction of 2,500 3,500 accidents annually.[12]

Question. What obstacles lie ahead before these ITS improvements can be more widely implemented? How does DOT plan to overcome these obstacles?

Answer. The primary obstacles to broader ITS deployment are the lack of expertise among State and local officials, cost/benefit data, available funds, and standards. Overall, the ITS section of NEXTEA addresses these obstacles. In addition, we have gathered an impressive array of cost-benefit data, described below. Specifically:

—Training. We have requested annual authorization of $96 million in ITS Research, Training, and Technology Transfer funding. A significant portion of that will go to a five year professional capacity building effort aimed at our own staff, as well as our state and local partners. Deployment of ITS is not unlike the transition FAA went through when it went from a civil engineering organization that oversaw the building of airports to one that dealt with management of assets and airspace. We have developed a five-year strategic plan that is now being translated into a business plan and have asked for significant funds—some $10 million in fiscal year 1998. Recently, we launched the first of 70 overview seminars that will be given to our staff and partners across the United States in the coming months.

[12] Moses, L. and Savage, I., "A Cost-Benefit Analysis of the Federal Motor Carrier Safety Programs, 3rd Version," Department of Economics and the Transportation Center, Northwestern University, Evanston, IL, 1993.

—Standards. A significant portion of this authorization would be devoted to facilitating development of industry consensus on well over 100 standards. While the process will take some five years, we expect draft standards critical to integration to be available within the next two years. None have been completed, four more draft standards will be done by the end of the year. In addition, we will probably have agreement on one of the most critical standards that underlies the tag and reader technology in automatic toll collection before the end of the summer.

Cost-Benefit Data. In addition, we have provided to Congress and the nation at large an impressive quantity of cost benefit data:

—Savings of 35 percent nationally in the cost of providing future capacity to our nation's surface system.

—Potential savings of 17 percent in accidents from intelligent vehicles.

—A study by the FTA suggests that ITS can save transit authorities between $4 billion and $7 billion over the next decade.

—Savings in government costs related to toll collection, truck regulation, and transit operations.

The benefits are there. What is not available to local officials are the analytic tools necessary to demonstrate those benefits, because to date all of our analytic tools have focused on capital decisions with long range horizons. We are in the process of developing those tools now for use by States and metropolitan areas across the country.

Finally, our proposal to provide an incentive to those metropolitan areas and states willing to deploy integrated ITS infrastructure, takes a scalpel approach to the funding issues, in this era of constrained resources. For this six year period of time only, we would offer a small incentive to states and metropolitan areas to go the extra mile to integrate ITS components, consistent with the National Architecture and national standards. By the end of that period we will have the standards program complete and will mainstream the ITS infrastructure program into existing funding categories, linking the use of federal funds to adopted standards. We have also made ITS infrastructure an eligible element in virtually every category of Federal-aid funding.

ELIMINATION OF TRANSIT OPERATING ASSISTANCE

Question. New Jersey relies heavily on mass transit to provide essential transportation service to a great number of our citizens. Under transit formula grants, your NEXTEA proposal calls for Transit Operating Assistance to be virtually eliminated while funding for capital assistance would increase. Your proposal also calls for the permissible uses of transit capital assistance to be expanded to include regular maintenance activities.

Since your budget calls for transit formula assistance to be essentially frozen, what is the rationale for eliminating operating assistance and expanding the purposes of capital assistance?

Answer. We seek to replace the concept of operating assistance with a redefinition of capital which would include preventive maintenance as an eligible expense. Operating expenses would no longer be eligible for Federal reimbursement for areas over 200,000 in population.

The changes in the reauthorization proposal provide flexibility and consistency that will benefit the transit industry. This change would bring consistency between the Federal highways and transit definitions of capital. That is, both capital definitions would now include preventive maintenance. At present, painting a bus is considered operating assistance under the transit program, but painting a bridge is considered capital under the highway program.

The NEXTEA approach increases flexibility of grantees and simplifies the management of their programs. Operating assistance will no longer have to be tracked separately on grant applications and reports and more expenses can be considered within the one category of capital.

Further, much debate takes place each appropriations and authorization cycle on the Federal role in funding operating assistance. The NEXTEA proposal will help us focus on capital needs and the funds necessary to protect those assets.

Question. Two years ago, you requested a sizable cut in transit operating assistance and you asked us to expand the uses of capital assistance to include certain bus maintenance activities. At the time, you testified that the change in uses of capital assistance would eliminate the impacts of your proposed cut in operating assistance. Almost no one in the transit industry agreed with you, however. Can you assure me that this new proposed change in the use of transit capital assistance will completely mitigate the elimination of operating assistance?

Answer. FTA analysis indicates that virtually all areas over 200,000 in population will benefit from the proposed changes. These areas are currently reporting a level of maintenance expenses that, when reimbursed at the 80 percent capital rate, will exceed their current operating assistance caps. Likewise, areas under 200,000 in population will also benefit. These smaller operators will have total discretion in using their Federal assistance for capital, planning, and operating assistance, without having to manage within a specific cap on operating expenses.

HIGHWAY SAFETY AND DRUNK DRIVING MEASURES

Question. In 1984, President Reagan signed into law my bill establishing a national 21 minimum drinking age, which imposed sanctions on states that did not adopt the law. In 1995, President Clinton signed into law the NHS bill which contained Senator Byrd's provision imposing sanctions on states that did not adopt "zero-tolerance" legislation for underage drinking and driving. Do you believe that these sanctions have been effective in changing state policies for the better?

Answer. State laws setting age 21 as the minimum drinking age and establishing "zero tolerance" for underage drinking and driving clearly are effective, life-saving policies. Minimum drinking age laws have reduced alcohol-related traffic fatalities among teenagers by 13 percent. NHTSA estimates that minimum drinking age laws saved 15,667 from 1975–1995. A NHTSA evaluation of Maryland's "zero tolerance" (.02) law showed an 11 percent decrease in the number of drivers under age 21 involved in crashes who police reported as "had been drinking." A recent study of 12 states that enacted "zero tolerance" laws found a 16 percent reduction in single vehicle nighttime fatal crashes that involved young drivers, compared to a 1 percent increase in 12 comparison states.

As a result of the National Minimum Drinking Age Law enacted in 1984, all states and the District of Columbia now have laws establishing 21 years old as the minimum drinking age. When the NHS bill was enacted in November 1995, imposing sanctions on states that did not adopt "zero-tolerance" legislation for underage drinking and driving, 27 states and the District of Columbia had "zero tolerance" laws; since then, 12 states have enacted such laws. The remaining states are working to have .02 laws before the sanction provisions take effect at the beginning of fiscal year 1999 (October 1, 1998).

Question. The NHS bill repealed the federal sanctions requiring states to adopt laws requiring motorcycle helmets. Since that time, several states have moved to repeal existing helmet laws because the sanction has been lifted. Dr. Martinez, why does your NEXTEA proposal only use financial incentives to strengthen state drunk driving laws rather than the imposition of sanctions?

Answer. NHTSA's alcohol incentive grant program builds upon the successes gained from the Section 410 program. In addition, the States and safety interest groups support incentive grant programs as evidenced at the Department of Transportation reauthorization hearings. Given the present rate of progress of states enacting .08 BAC laws, the Department did not see it necessary at this time to adopt measures other the incentive program that we have proposed Incentive programs provide States with the utmost flexibility. States have the option to apply for these grants or not. If a State chooses to pursue a grant, the State may choose which legal and program criteria to implement. The alcohol incentive grant program proposed in NEXTEA is modeled on current and past successful incentive grant programs—most notably the Section 410 alcohol incentive grant program. The Department has learned that incentive grants are effective in encouraging states to pass critical laws to reduce drunk driving. Administrative license revocation (ALR), .08 BAC, and .02 BAC laws are criteria for Section 410 basic grants. Since the passage of the amended Section 410 program in ISTEA in December 1991:

—9 states have enacted .08 BAC laws. [A total of 14 states have .08 laws.]

—36 states plus DC have enacted .02 BAC laws for drivers under age 21. [A total of 39 states and DC have .02 laws for drivers under 21.]

—10 states have enacted ALR laws. [A total of 39 states and DC have adopted some form of ALR.]

Question. As you know, I have introduced legislation that would establish a national drunk driving limit of .08 Blood Alcohol Concentration—BAC. Both laboratory

and real world testing have proven that the vast majority of drivers, even experienced drivers, are significantly impaired at .08 with regard to the critical factors in vehicle control-braking, steering, turning and overall judgment. Thus far, only thirteen states have adopted the .08 BAC as law. But these states have experienced a significant reduction in alcohol related fatalities. Given that NHTSA, the insurance industry, highway safety advocates and highway safety users support lowering the limit to 0.08, why are so many states dragging their feet in enacting 0.08 BAC as law?

Answer. There have been active efforts to pass 0.08 laws in several states this year, and Idaho has already enacted its 0.08 law. Opponents of 0.08 laws say that these new laws divert attention from the "real" drunk drivers at 0.15 and above, while attempting to penalize social drinkers who are not impaired. However, states that have passed 0.08 laws have seen reductions in alcohol-related fatalities at all BAC levels. In addition, performance on driving-related tasks decreases substantially at 0.08, and crash-risk increases substantially at 0.08. Also, there is organized opposition to passage of these laws from some members of the alcohol and hospitality industries.

Question. Given the states' slow pace in adopting .08, why do you think that financial incentives will be more effective than sanctions in getting the states to move?

Answer. Given the present rate of progress of states enacting .08 BAC laws, the Department did not see it necessary at this time to adopt measures other the incentive program that we have proposed. Through the Section 410 alcohol incentive grant program, the Department has learned that incentive grants are effective in encouraging states to pass critical laws to reduce drunk driving. Since the passage of the amended Section 410 program in ISTEA in December 1991:

—9 states have enacted .08 BAC laws. [A total of 14 states have .08 laws.]

—36 states plus DC have enacted .02 BAC laws for drivers under age 21. [A total of 39 states and DC have .02 laws for drivers under 21.]

—10 states have enacted administrative license revocation (ALR) laws. [A total of 39 states and DC have adopted some form of ALR.]

The new alcohol incentive grant proposal contained in NEXTEA places more emphasis than the current Section 410 program on adoption of 0.08 BAC laws as a means to receive funds. Under the current program, States can qualify for grant funds by implementing 5 out of 7 laws or programs designed to reduce drunk driving. One of the 7 requirements calls for a 0.10 per se law, and only after 3 years of grants, is a 0.08 per se law required; therefore, states had many other options and several years of funding before considering passage of 0.08 laws as a route to receive incentive funds. Under the new proposal, there are three options for a state to qualify for funding—one option is by implementing 4 out of 5 specified laws and programs, the second is demonstrating specific performance, and the third is by enacting only two key laws (1) administrative license revocation and (2) 0.08 BAC. States can qualify for funding under one, two, or all three options. However, this third option more clearly focuses state attention on 0.08 BAC laws as a means to qualify than the old Section 410 approach.

Question. I understand the Administration will soon send up a separate safety title as part of your NEXTEA proposal. When will that come up?

Answer. The Secretary submitted the Administration's "Surface Transportation Safety Act of 1997" on April 17, 1997.

Question. I understand the Administration will soon send up a separate safety title as part of your NEXTEA proposal. Will it include any sanction programs, perhaps for seatbelts, or will it only provide more incentive programs?

Answer. The Administration's "Surface Transportation Safety Act of 1997" would establish a date certain by which all States would be required either to have enacted a primary safety belt use law or to have achieved a statewide seat belt use rate of 85 percent or higher. In fiscal year 2003, a State that had failed to enact such a law or to achieve such a seat belt use rate would have 1.5 percent of its highway construction funds transferred to its section 402 occupant protection program. The amount transferred would increase to 3 percent for later years.

NEW WELFARE TO WORK INCENTIVE

Question. Given the millions of welfare recipients across our nation that we are trying to move into paying jobs, how will this $100 million initiative be targeted to assist those individuals that are most in need?

Answer. We recognize that this $600 million initiative, which makes available to states and localities $100 million annually, cannot fill all the transportation gaps that exist in meeting the transportation needs of those who will be transitioning

from welfare to work. This number is estimated at 2 million persons over the next five years. However, the criteria for selection spell out several indicators that will help us address the most severe transportation needs. The project selection criteria include: (1) the severity of the welfare transportation problem, (2) the need for additional services to transport economically disadvantaged persons to specified jobs, training and other support services, and the extent to which proposed services will address these needs, and (3) the extent to which the applicant's program addresses a comprehensive assessment of access to work transportation needs.

Question. What will be the requirements for the states to participate in this initiative? Will they have to match any of the federal funds?

Answer. We anticipate that states will act as applicants for areas with populations of 200,000 or below. This is consistent with current procedures for other Federal transit programs. In areas above 200,000, the lead agency will be chosen through the metropolitan planning process by the stakeholders involved. Applications submitted by states will be subject to the same selection criteria as other applicants. States and other applicants must match Federal funds made available by the Access to Jobs program. However, Federal funds flowing to state and local agencies from Federal programs funded by DHHS, DOL, HUD and other agencies can be used as part of the local match. In fact, one criterion for award is the extent to which the local share demonstrates a financial partnership with human resource agencies. These partnerships are an essential element of the Access to Jobs program.

Question. Do you expect this to be a one-time initiative, or a continuing part of the DOT budget for the next several years?

Answer. The Access for Jobs & Training is proposed to be available at $100 million annually over the life of the reauthorization, anticipated to be six years.

Question. Is this initiative going to be limited to mass transit, or will there be steps taken to recognize that many welfare recipients do not have access to adequate transit opportunities?

Answer. The intent of this legislative proposal is to develop additional public transportation services to meet gaps where there is not adequate transit service available. Service strategies may be broad based, including ridesharing program, employer-provided services, human service transportation, private paratransit service, and community-based transportation arrangements as well as services directly provided by the transit agency. Since transit agencies have the infrastructure and experience with the Federal Transit Administration grant programs, it is likely that they may serve as the lead local agencies in are as above 200,000.

INSUFFICIENT FUNDING FOR NEW STARTS

Question. What should each of these transit systems conclude about the Federal Government's commitment to completing these major transit projects?

Answer. The Federal government is committed to fully funding the new fixed guideway systems that are currently under, or proposed for, Full Funding Grant Agreements (FFGA's). FTA's budget provides $634 million for Major Capital Investments. This amount reflects budgetary pressures, and while this is not the annual amount for fiscal year 1998 in the current FFGA's signed by FTA, our proposed outyear funding is sufficient to cover funding requirements for these 15 projects, and our reauthorization proposal includes a higher level of contract authority that could become available dependent upon future Federal budget decisions.

Question. If you could do it over again, would you have signed fewer full funding grant agreements?

Answer. Given the large number of worthy projects which were seeking federal funds, I would, without hesitation, proceed on the same path that I chose over the last four years. These meritorious projects will result in a wide spectrum of benefits to users and non-users alike.

Question. Are you sure that your cuts in this area will not result in construction delays, making the total cost of the project more expensive than it would otherwise be?

Answer. The budget request reflects current budget pressures. Nevertheless, it will allow these projects to initiate and continue scheduled start-up and/or construction activities without incurring any consequential delays. Localities have a variety of mechanisms which can successfully address any short term funding shortfall which might occur. These reductions, when viewed on a project-by-project amount, on average, to only 1.7 percent of the total project cost.

QUESTIONS SUBMITTED BY SENATOR KOHL

STREAMLINED AND STRENGTHENED PLANNING PROCESS

Question. In what ways does NEXTEA streamline and strengthen the planning process?

Answer. ISTEA continued the basic State and local decisionmaking framework for transportation planning adopted in the early 1970's. ISTEA strengthened the transportation planning process by putting increased emphasis on public involvement and fiscal constraint which have made the decision process more open and inclusive and financially realistic. ISTEA also strengthened the role of State and local officials in the decisionmaking process. NEXTEA would continue this same basic framework and supports the decision making efforts of State and local officials in the accomplishment of challenging investment trade-offs.

ISTEA called for greater involvement by more interested stakeholders earlier in the transportation investment decision making process. This earlier and more meaningful involvement in both the statewide and metropolitan transportation planning processes should ultimately pay-off in reduced time for project level implementation efforts where delays have often occurred. NEXTEA would continue the philosophy that involving folks early in a meaningful way results in resolving troublesome issues early thereby accelerating the overall time frame for successfully implementing a transportation project.

Simplification of the planning process was behind the effort in NEXTEA to replace the transportation planning factors (16 metropolitan and 23 Statewide) in ISTEA with seven goals which states and metropolitan areas should consider as they develop their own goals and objectives around which their own transportation planning process will be structured. The FHWA and FTA remain committed to the continued identification and implementation of streamlining opportunities.

BRIDGE REPLACEMENT PROGRAM

NEXTEA generally maintains the Bridge Replacement Program in the current form. Naturally, we all agree with the wisdom and necessity of replacing unsafe and unstable bridges across the country. On the other hand, transportation officials in my State have raised concerns that the ISTEA bridge formula actually provided a disincentive for States to invest in bridge repair. They argue that we worked at cross purposes by distributing bridge replacement program funding based on need, but then allowing States to transfer those needs-based funds to other non-bridge uses.

Question. Does the NEXTEA modify the Bridge program in any way to ensure that Bridge replacement funds are used to meet the needs for which they have been distributed, rather than transferred to other accounts?

Answer. Yes. While the NEXTEA proposal continues the flexibility for the States to transfer 50 percent of the Highway Bridge Replacement and Rehabilitation Program funds to the NHS or STP, it would required that funds transferred out of the bridge program in fiscal year 1998 through fiscal year 2002 must be restored by the State to their bridge apportionment by the end of fiscal year 2002. Any amounts not restored would be deducted from the total cost of deficient bridges for that State in fiscal year 2003, thus reducing that State's fiscal year 2003 bridge apportionment.

NONDEPARTMENTAL WITNESSES

STATEMENT OF DARREL RENSINK, DIRECTOR, IOWA DEPARTMENT OF TRANSPORTATION, PRESIDENT, AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS

INTRODUCTION OF WITNESSES

Senator SHELBY. The subcommittee will come back to order.

The second panel. We have with us the surface transportation user groups. Darrel Rensink. Is that correct?

Mr. RENSINK. That is correct.

Senator SHELBY. Iowa Department of Transportation, president, also of the American Association State Highway Transportation Officials; Mr. William D. Fay, president and CEO, American Highway Users Alliance; Mr. John Collins, senior vice president, government affairs, American Trucking Association; Mr. Frederick Gruel, president and CEO, AAA New Jersey Automobile Club, American Automobile Association; Mr. William W. Millar, president, American Public Transit Association; and Harry Blunt, Jr., president, Concord Trailways New Hampshire, vice chairman of the American Bus Association.

Welcome, gentlemen. I know you waited a while. It was a longer panel than usual, a lot of interest in the first one.

All of your written statements will be made part of the record in their entirety, and if you will just take a few minutes, because there are other meetings going on, and sum up what you are going to tell us for the record. Then I will keep the record open for a lot of questions for the record that the staff and other members, including the chairman, will be wanting to ask you. We will try to expedite this as much as possible.

Mr. Rensink.

STATEMENT OF DARREL RENSINK

Mr. RENSINK. Mr. Chairman, thank you very much.

I am Darrel Rensink, president of the American Association of State Highway and Transportation Officials and also director of the Iowa Department of Transportation.

On behalf of AASHTO, I am pleased to accept your invitation to testify on issues regarding reauthorization of the Federal surface transportation programs.

Mr. Chairman, the fact that you are conducting this hearing demonstrates that you and others on the committee are well aware of both the benefits from and the need for transportation as we head into the 21st century. The appropriations bill you will be considering is vitally important to the people of America. As members of the Appropriations Committee, you are faced with a difficult task of directing Federal resources among programs which directly

affect all Americans, decisions which will please some and upset others.

No other Federal investment has such far-reaching implications. The influence on the quality of our lives by our transportation systems is significant. The intermodal network serves all our citizens daily as they travel to their jobs, day care, and the market. It provides a way to move goods to wholesale and retail outlets. We are able to pursue recreation, education, and community activities.

America's transportation network has played a major role in our Nation's economic success. Just as in our Nation's past, the future is greatly dependent on how well we support our transportation system. Most importantly, transportation is the backbone of our State, national, and international trade economies. Transportation is our Nation's economic engine and a key component to our global competitiveness. Industry, relying heavily nowadays on just-in-time delivery of raw materials, must have an effective and efficient transportation system.

Central to the debate on reauthorization will be the level of funding and the funding formulas which distribute funds among the States. As the debate begins, we must remember that without modern transportation, our quality of life would suffer, economic development would slow, and our future would look rather bleak.

I often hear that to compete in the global economy, we need a good transportation system, and I included that concept in my formal testimony submitted to your committee. However, merely competing in the world economy is not good enough. As in sports, we can compete and still lose. We cannot afford to lose when it comes to our transportation systems. This Nation must be the leader and to lead we must have a transportation system that is the very best. To be in the forefront, we must invest in our transportation systems.

Mr. Chairman, the need for investments to adequately support the Nation's surface transportation system is well documented and far exceeds the current investment level. AASHTO analyzed the investment requirements of our transportation systems based on the information received from the U.S. DOT. This analysis is detailed in our report, "The Bottom Line: Transportation Investment Needs 1998–2002." Copies have been provided to the committee.

To briefly summarize the report, total highway investment over the next 5 years to maintain current conditions and performance capabilities is $264 billion. An additional investment of $94 billion is needed to improve the condition and performance of this essential system, for a total investment of $358 billion; transit needs identified as $39 billion to maintain and $33 billion to improve service, for a total of $72 billion over 5 years.

While the estimated amounts to improve and maintain our highway and transit system are daunting, significantly more funding is being collected from highway users that is not available for transportation. If we could use all the funds flowing into the highway trust fund and the 4.3 cents per gallon now supporting general fund programs, we could at least maintain the current conditions of our surface transportation system. AASHTO and the National Governors Association share this recommendation to fully place highway user fees on transportation purposes.

Mr. Chairman, we know the budget resolution will impact the amount of transportation appropriations you can approve. We hope the budget level will reach levels I have discussed. Beyond that, we encourage this subcommittee to recommend that all funding is released without obligation ceilings to help meet our transportation needs.

With regards to the administration's transportation reauthorization proposal, an AASHTO task force is currently analyzing the bill and comparing it to AASHTO's adopted policies.

Our major issue of concern to AASHTO is the inadequate level of funding. The proposal has been described as providing $175 billion for surface transportation, an increase over ISTEA, but when the differences between the proposed authorization and proposed spending levels are analyzed, actual investment would be substantially less than the $175 billion. On the positive side, many ISTEA provisions which improved our ability to provide better transportation are continued in the administration's transportation reauthorization proposal.

Mr. Chairman, I see my time is about up, so in conclusion as president of AASHTO, I am eager for Americans to see transportation's potential to make a positive impact over the next 5 years. I have initiated discussions between AASHTO and the National Governors Association to convene a national transportation summit this spring or summer. Our goal is clear: to bring together State, Federal, and local officials, along with the users of transportation to highlight transportation in the future and the future of this Nation.

PREPARED STATEMENT

Mr. Chairman, that concludes my remarks, and we thank you very much for the invitation to present our views. I would be pleased to answer any questions or respond in writing. Thank you.

Senator SHELBY. Thank you.

[The statement follows:]

PREPARED STATEMENT OF DARREL RENSINK

Mr. Chairman, my name is Darrel Rensink. I am President of the American Association of State Highway and Transportation Officials, and Director of the Iowa Department of Transportation. On behalf of AASHTO, I am pleased to accept your invitation to testify concerning reauthorization of the Intermodal Surface Transportation Efficiency Act (ISTEA), and the Administration's proposal, which is titled the National Economic Crossroads Transportation Efficiency Act of 1997 (NEXTEA).

Mr. Chairman, we commend you and the Subcommittee for looking at the appropriations needed for our surface transportation program. We have provided to the Subcommittee copies of the documents that AASHTO has prepared outlining our policy on many of the issues that we will be addressing. In my comments today I will summarize the Association's views and respond to any questions that you may have.

AASHTO'S REAUTHORIZATION RECOMMENDATIONS

AASHTO has been working on ISTEA reauthorization issues since 1994 through its Reauthorization Steering Committee, on which all states as well as the District of Columbia and Puerto Rico are represented. With respect to our recommendations for reauthorization, I want to refer you to our Transportation for a Competitive America report, copies of which have been provided to the Subcommittee. This report details our recommendations, which are summarized in four key recommendations:

—The maintenance needs of the nations's highways and transit systems outstrip the funds currently available. The 4.3 cents per gallon in user taxes collected from motorists should be deposited in the Highway Trust Fund and be spent on system maintenance, rather than diverted to the General Fund.
—State and local governments should be given more flexibility in determining how, when, and where transportation resources are spent, to maximize the benefit to mobility, safety, and the environment.
—Many of the key concepts of ISTEA, such as State and local cooperation, intermodal planning, and public participation, should be retained.
—Burdensome and unnecessary provisions imposed by ISTEA and earlier laws should be eliminated or reduced. The National Highway System Designation Act was a first, and major, step in this direction.

To further explain AASHTO's position on issues in reauthorization of the Federal highway and transit programs, we refer you to the attached one-page document "Summary of AASHTO Recommendations on the Reauthorization of the Federal-aid Highway and Transit Programs," which was included in a brochure we recently sent to all members of the Congress.

Mr. Chairman, for the record I want to state that AASHTO is making no recommendations as to funding formulas, leaving this to the Congress.

Turning to our recommendations, the first of the four overall recommendations just cited is perhaps the most important, since it addresses the funding levels needed to adequately support our nations's surface transportation program.

HIGHWAY AND TRANSIT FUNDING

AASHTO has comprehensively analyzed the investment requirements of our transportation systems, based on information received from the U.S. Department of Transportation, including its 1995 report titled "The Status of the Nation's Surface Transportation System: Condition and Performance". This analysis is detailed in the AASHTO report titled The Bottom Line: Transportation Investment Needs 1998–2002, copies of which have also been provided to the Subcommittee.

To summarize the AASHTO report, over the next five years, total highway investment requirements just to maintain the current condition and performance of the system are $264 billion. An additional investment of $94 billion is required to improve the condition and performance of this essential system, for a total investment requirement of $358 billion over five years. Transit investment requirements to maintain and improve are identified as $39 billion and $33 billion, respectively, for a total of $72 billion over five years.

Simply stated, our need for investments to adequately support the nation's surface transportation system far exceeds current investment levels.

Attached are three pages from the folder AASHTO recently sent to members of Congress, titled "Our Transportation Needs." They provide more details on our findings, with the third page displaying the summary information in graphic form.

While the estimated amounts to maintain and improve our highway and transit systems are daunting, the situation is made troublesome because significantly more funding is being collected by the Federal government from highway users than is being made available for transportation. If we could fully utilize the funds already going to the Highway Trust Fund, it would improve the situation. If we could also add to this the 4.3 cents per gallon now used to support general fund programs, as shown on the attached bar graph we would then just have enough funding to maintain current highway and transit conditions.

Highway users who are paying fuel and other taxes into the Highway Trust Fund ask, why we do not have access to all the funding that is being collected, when our transportation investment needs far exceed current funding levels? If we could simply have access to all the funding flowing into the Highway Trust Fund and the revenue from the 4.3 cent tax, we could at least maintain current conditions.

AASHTO commends Senators John Warner and Max Baucus and the many Senators, some of whom are on this Subcommittee, who joined them in writing to Senator Pete Domenici, Chairman of the Senate Budget Committee, seeking a highway program level of $26 billion, which has been demonstrated to be sustainable by the Highway Trust Fund. We also commend Senators Alfonse D'Amato and Daniel Patrick Moynihan for their similar letter, which also urges a transit program of $5 billion.

AASHTO hopes that these funding levels will be approved, and that the revenue from the 4.3 cent fuel tax will be placed in the Highway Trust Fund and utilized to meet our highway and transit investment requirements.

Mr. Chairman, we know that the budget resolution will impact on the amount of transportation appropriations you can approve, and we hope that the budget level

will reach or at least approach the levels I have discussed. Beyond that, we hope that this Subcommittee will recommend that all of that funding, whatever the amount, is released without obligation ceilings, to help meet our transportation needs.

AASHTO AND THE GOVERNORS AGREE

AASHTO's member departments are not alone in making this plea from the States. The nation's Governors have also spoken out about the need to increase funding for surface transportation, and to fully utilize all available funding.

When the nation's Governor's met in Washington in February, they addressed the transportation funding situation and adopted resolution EDC–21, "Surface Transportation Financing." It included the following paragraphs, and a full copy of EDC–21 is attached:

> "Growing Highway Trust Fund revenues will permit significantly higher federal spending for transportation programs over the next five years. A much greater share of Highway Trust Fund revenues can and should be spent for transportation investments than is implied in recent Congressional and Administration budget proposals. Governors are aware of and support the movement in Congress for increased transportation spending."
>
> "Governors are aware that Federal fiscal circumstances require prudence in setting spending priorities and continue to support efforts to balance the budget. However, reducing federal transportation investment and allowing our nation's transportation infrastructure to fall further into disrepair will result in lost profits, jobs, and productivity, and ultimately lower tax revenues to the federal government."

The NGA resolution then goes on to urge that the Federal government:

> "Reinstate the nation's long-standing policy of dedicating federal transportation-related motor fuel taxes and excise taxes exclusively for transportation purposes. If the 4.3 cents per gallon of fuel tax that is currently being used for General Fund purposes continues to be assessed, it should be deposited in the Highway Trust Fund and used for transportation purposes.
>
> "Restore the integrity of the dedicated trust fund. All dedicated user fees and the interest accrued on trust fund balances should be promptly distributed for their intended purposes."

Testimony by representatives of the National Governors' Association (NGA) to a joint House and Senate Budget Hearing on March 12, 1997 indicates that "steadily growing user-tax revenues can support significant and much-needed increases in federal transportation investment. In highways alone, the annual dedicated revenues could support a funding level of $26 billion per year through the year 2002; and an additional $5 billion for mass transit programs could be supported by these growing revenues." AASHTO joins the nation's governors in their call for setting annual highway and transit funding and spending levels as high as possible.

THE BENEFITS OF TRANSPORTATION INVESTMENTS

As members of the Transportation Appropriation Subcommittee, you are well aware of both the benefits and needs of transportation funding into the 21st century, so what I am about to say will come as no surprise. However, the importance of transportation for a competitive America and for the nation's future requires that we continue to focus our attention on transportation funding.

America's transportation network has played a major role in our nation's economic success. Just as in the past, the future of America will depend to a great extent on how we support our transportation system. The appropriations bill you will be considering is therefore of great importance to the people of America as we approach the 21st century.

Perhaps no other federal investment has such far-reaching implications on every aspect of our quality of life. Transportation serves all of our citizens daily in traveling to their jobs, day care centers and markets; in providing goods to wholesale and retail outlets; in traveling to recreational activities; and in a variety of other activities in which we all participate. Welfare reform will only succeed when wage-earners have access to places of employment. Quality health care depends upon the ability of the patient and the care-giver to come together.

Most important, transportation is the backbone for our State, national and international economies. Transportation is our nation's economic engine which is built on an efficient transportation system, a key component to our global competitiveness. Industry, much of which now relies on "just in time" delivery of raw materials,

must have an effective and efficient transportation system. Such a system requires funding to the levels I have discussed.

THE ADMINISTRATION'S TRANSPORTATION REAUTHORIZATION PROPOSAL

With regard to the Administration's transportation reauthorization proposal, Mr. Chairman, one major issue that concerns AASHTO is its inadequate level of funding. The proposal has been described as providing $175 billion for surface transportation. But if the differences between proposed authorization and their proposed spending levels is analyzed, actual funding under would be substantially less than $175 billion. In addition, some of the $175 billion would be spent on programs that are not now funded out of the Highway Trust Fund, such as the Appalachian Highway Program and Amtrak, and for programs not directly related to meeting our transportation needs.

Even if a full $175 billion were to be provided in the legislation and expended on our identified highway and transit requirements, it would fall far short of the funding levels recommended in U.S. DOT's own investment requirement findings, its 1995 report titled "The Status of the Nation's Surface Transportation System: Condition and Performance".

Again, Mr. Chairman, AASHTO supports efforts to get annual transportation funding as high as possible. The Administration's transportation reauthorization proposal does not do this.

Spending down the balances in the Highway Trust Fund would permit an additional $4 billion annually in highway funding levels. Including the 4.3 cent per gallon tax in the Highway Trust Fund rather than using it for general fund purposes would add another $7 billion. AASHTO supports spending the Highway Trust Fund balances and efforts to deposit the 4.3 cent per gallon to Highway Trust Fund purposes.

With regard to other components of the Administration's transportation reauthorization proposal, a task force of the AASHTO Reauthorization Steering Committee is currently analyzing the Administration's bill and comparing it to AASHTO's adopted policies. This analysis will be provided to the Subcommittee in the near future. For now, let me address a few program areas of concern to AASHTO.

—AASHTO supports continued funding in the ISTEA reauthorization for safety, Intelligent Transportation Systems (ITS) and research, and we are pleased to see these programs contained in the Administration's proposal. Safety issues are of paramount importance to state transportation departments and should continue to be funded. Regarding ITS, AASHTO has joined with ITS America and the U.S. Department of Transportation and other public and private organizations in endorsing the "National Goal for Intelligent Transportation Systems," to complete deployment of basic ITS service for passenger and freight transportation across the nation by 2001 (PR–1–96).

—With regard to research, AASHTO continues to support the highway and transit research programs that are funded in ISTEA. Also, AASHTO supports federal funding for transportation data services, and therefore supports continued funding for the Bureau of Transportation Statistics in the ISTEA reauthorization (PR–12–96). These are also included in the Administration's transportation reauthorization proposal.

—With regard to the revenue side of transportation funding, AASHTO recognizes the success of the federal countermeasures to the theft of motor fuel excise taxes, and urges that FHWA's Joint Federal/State Motor Fuel Tax Compliance Project be reauthorized at least at its current funding level. Further, AASHTO urges that legislation be enacted that would allow a state transportation agency, at its option, to expend up to one-fourth of one percent of its federal-aid highway apportionments on motor fuel tax theft countermeasures.

—In addition, AASHTO supports legislation directing the Federal Highway Administration to expend no more that $15 million for the development of a computerized system to account for the import and refinery production of motor fuels to their deliveries in accordance with the needs of the Internal Revenue Service (PR–19–95).

The Administration's transportation reauthorization proposal recognizes the need for these programs.

Where I have referred to AASHTO resolutions, they are identified in parentheses, and copies of them are attached.

The enacted Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) was important legislation, and it improved our ability to provide better transportation in many ways. The planning and decision-making processes for surface transportation were changed by the ISTEA, to move more decision making to States and

localities and to encourage looking intermodally at the whole system. Greater flexibility in utilizing Federal funding was provided under the ISTEA, allowing States and localities to better target transportation facilities they and their citizens determine are priorities. And very importantly, the National Highway System sought by AASHTO's member departments was authorized in the ISTEA, and has been established by Congress with the enactment of the National Highway System Designation Act of 1995.

These concepts and features have increased our ability to address the nation's transportation needs, and AASHTO believes that the reauthorization legislation should continue to support them. At the same time, AASHTO believes there are a number of areas that can be improved as the Congress considers the reauthorization of ISTEA. These areas are described in the policy documents we have provided to the Subcommittee.

TRANSPORTATION TRENDS FOR AMERICA

Mr. Chairman, we believe strongly that the next reauthorization bill and the funding it provides must recognize and help meet the transportation trends we see, looking ahead into the start of the next century.

The most important of those transportation trends is that transportation will continue to play a major role in the well-being of this nation. This role is demonstrated by the growth we have seen in the number of drivers, vehicles and passengers on our highway and transit systems and the reliance of industry and economic development on the availability of efficient transportation.

Vehicle miles of travel on our highways increased 40 percent in the 1980's. If the 1990 to 1994 trend continues, total miles traveled may increase by more than 20 percent in the 1990's. At the present time over 6 billion miles of vehicle travel are logged on the nation's highways every day. The number of passengers utilizing transit services has also increased with over 6.8 million Americans using mass transit each day, with over 30 million people depending on it.

Just-in-time production is one of the most significant trends in U.S. manufacturing in recent years. This trend has allowed many businesses to sharply reduce or eliminate inventories. In 1990 just-in-time manufacturing accounted for 18 percent of U.S. production; by 1995 this percentage had increased to 28 percent. Just-in-time production and reduced inventories require dependable and efficient transportation facilities, and are major sources of increased productivity in our economy.

These trends are expected to continue, placing an ever increasing demand on our transportation systems.

Our highway system is suffering from increased congestion in many areas of the nation. The urbanization of America is creating new challenges for urban areas while at the same time rural transportation needs are continuing to increase. New demands are being placed upon the highway system by shifts in both the volume and direction of world trade. For example, the focus of our major highways are essentially east-west, in keeping with the movement of goods between the east and west coasts. However, the North American Free Trade Agreement (NAFTA) has required us to evaluate and improve our systems to accommodate an increasing number of north-south transportation patterns.

Our nation's transit systems remain vital in most areas of the nation. Today, a variety of passenger mobility needs, and efforts to solve our air quality problems across America, require transit to do even more.

In short, Mr. Chairman, while our nation still has the best transportation system in the world, current trends demonstrate that it is aging and is not keeping up with the mobility needs of our citizens, our commerce, our industries and our economy.

Throughout the history of our nation, transportation has been a key driving force in building and maintaining our economy. In recent years some have requested documentation of this statement, and in particular have asked whether or not our nation is receiving a fair return on its investment in our highway system. In response, AASHTO, through our National Cooperative Highway Research Program (NCHRP), the Federal Highway Administration, and other transportation agencies have sponsored many efforts to determine the economic value of transportation, and investments in our highway system.

A copy of Chapters I and II of a report prepared under AASHTO's sponsorship by the NCHRP entitled The Economic Importance of Transportation: Talking Points and References is attached, without the voluminous materials of Chapters III and IV. The following are a few of the significant findings in this report, all of which demonstrate the benefits of transportation to our economy:

—Reliable transportation is essential for America's businesses to achieve their objectives of reduced inventories and improved distribution systems. It is esti-

mated that logistics and transportation account for 20 to 25 percent of the value of a product on the shelf.

—Wal-Mart has become the largest retailer in the U.S. by demanding that manufactures deliver products reliably and ready for the selling floor. Wal-Mart has only about 10 percent of their square footage devoted to inventory compared to 25 percent for the average retailer.

—To remain competitive, American companies and businesses demand quick turnaround and are reducing the time it takes for products to reach their markets.

The NCHRP report refers to recent studies of the economic effects of highway investment conducted by Professor Ishaq Nadiri of New York University. Professor Nadiri's work indicates that investments in highways have a strong effect on productivity. He found that transportation improvements lower distribution costs, allow the shrinking of inventory that saves money, improves firms' access to labor, and lowers production costs. Overall, Professor Nadiri's studies show a 28 percent return per year between 1950–1989 for total highway capital.

In addition to the efficiency and production benefits for the manufacturing sector, investments in transportation are important for job creation. The Federal Highway Administration's most recent report on job generation for highway investment finds that every $1 billion of investment in the Federal highway program supports more than 42,000 full-time jobs.

Also, according to the U.S. Department of Transportation, every dollar invested in the highway system will return more than $2.60 in benefits to the economy.

As indicated in the few examples shown above, investing in the nation's transportation facilities is important to ensuring long-term economic growth. Americans have long believed this, and we are now finding through research work by several economists and other experts that what we intuitively believe is in fact true.

OTHER TRANSPORTATION ISSUES

Mr. Chairman, I would like to identify a few additional transportation funding issues of concern to AASHTO. These are beyond the ISTEA reauthorization legislation, but are important to our members and fall within the responsibilities of your Subcommittee.

AASHTO supports a multi-year reauthorization of the Airport Improvement Program (AIP) at a minimum of $2 billion (PR–2–96). However, AASHTO opposes the use of AIP funds to pay for airport security measures identified by the Gore Commission on Airport Security (PR–13–96).

AASHTO also supports continuation of the Essential Air Service Program (A–7), with reasonable subsidy limits and other appropriate criteria geared toward a more efficient and productive expenditure of federal funds.

AASHTO urges the Congress to permanently reauthorize and provide for an annual appropriation of funds to the Local Rail Freight Assistance program (PR–14–95).

The respective AASHTO resolutions are again shown in parentheses above, and copies of these resolutions are attached.

SUMMARY

In summary, AASHTO believes that there will be no more important legislation before this Congress for the future of America than the reauthorization and adequate funding of our surface transportation program.

We must either meet our investment needs, or face a decline in American mobility as we enter the 21st century.

We have provided you with AASHTO's recommendations for reauthorization and stand ready to provide any further information which would be of assistance as you move forward in the legislative process.

Mr. Chairman, this concludes my remarks. Again, thank you for the invitation to present our views and we will be pleased to respond to questions now or in writing.

[CLERK'S NOTE.—Due their length, the attachments referred to in Mr. Rensink's statement do not appear in the hearing record but are available for review in the subcommittee's files.]

STATEMENT OF WILLIAM D. FAY, PRESIDENT AND CEO, AMERICAN HIGHWAY USERS ALLIANCE

Senator SHELBY. Mr. Fay.

Mr. FAY. Mr. Chairman, thank you for inviting me to testify here today. My remarks will focus first on key issues and then on the administration's NEXTEA proposal.

The Highway Users is like a consumers group. Our members are motorists and truckers who, as you know, are driving now more than ever. Our members willingly pay taxes in proportion to their driving, but they expect that those taxes will be reinvested in safe and efficient roads and bridges.

If FHWA's needs report is correct—and that report found that 28 percent of our Nation's roads are in poor to mediocre condition, and 32 percent of our bridges are deficient—then these highway consumers are being ripped off.

You know, Senator Faircloth mentioned that the Interstate Highway System is complete. That may be so but let us not forget that the Interstate System was designed in the 1950's to meet the needs of a 1950's economy. Nonetheless, that Federal creation constitutes our Nation's safest and best roads.

The NHS, which was overwhelmingly enacted in 1995, is the Interstate Highway System of the 21st century. It bespeaks nationalism. Four percent of all roads bearing 40 percent of all traffic, 75 percent of commercial truck traffic, and 80 percent of tourist traffic. These are our most vital roads and they draw our Nation together, boost economic productivity and competitiveness, create jobs, and enhance our quality of life. Through the NHS, the Nation can meet the exploding economic and interstate commerce needs of the 21st century.

We strongly disagree with those who say that the Federal role should be ended and that we should go back to before 1956 when vision did not extend beyond a State's boundaries. But that said, we also believe that the Federal program must readdress itself to defining and then adequately funding national priorities.

America's highways are in the midst of a funding and safety crisis. The needs report that Mr. Rensink referred to documented roads and bridges crumbling from underinvestment. Forty percent of the NHS roads are still two lanes. They are bearing interstate traffic loads without the benefit of interstate safety design.

And our highway death toll has been on the rise since ISTEA took effect in 1992. Last year nearly 42,000 Americans lost their lives on our roads. The FHWA also reported that road design and conditions contributed to 30 percent of these fatal crashes.

So, our Government is saying, No. 1, our roads are bad, and No. 2, bad roads kill. Now, you would think that with those two studies alone, we would embark on an urgent improvements program, one that at least maintains the current conditions, but in spite of those very powerful reports, the administration's budget actually cuts highway investments.

These funding and safety problems are not the result of insufficient revenues. Only 58 cents of every dollar of highway taxes is actually returned to the States for roads and bridges. Our problems are the result of insufficient dedication and conviction.

Increased funding then has to be our top priority. Referring to the President's inadequate highway funding level, Senator Bob Graham of Florida recently said that "starvation brings out the worst in all of us." The formula debate will only be salved if we

first return a larger share of the money that each State's motorists pay in highway taxes.

Without additional funding, our Nation simply cannot meet our road and bridge needs. The needs report says that we have to invest $20 billion more each year just to maintain the current conditions of our roads and $40 billion more to improve them. If you bridge that gap in this committee by making the needed capital investments for our roads and bridges, the dividends will be evident from a stronger economy, more jobs, productivity gains, fewer fatalities, and a greater overall quality of life.

That is why we applaud the 59 Senators, including 8 members of this subcommittee, who asked the Budget Committee for a $6 billion increase in highway funding, bringing it to $26 billion which is the level the CBO says we can sustain with no additional tax revenues.

Next Monday Governors, labor, and industry will convene on Capitol Hill to hold a press conference urging you to maximize transportation funding.

In a nutshell, the Highway Users proposal will do basically four things.

The first is to deposit the 4.3 cents into the highway trust fund.

Second, we would fund the highway program at the maximum level the trust fund can support. Including the 4.3 cents, that could be as high as $34 billion a year.

Third, we would target 85 percent of the highway funds toward the NHS, bridges, safety, research and development, and roads on Federal lands, five programs that we think are truly national in scope.

And last, we would give State officials maximum flexibility by eliminating most Federal mandates and set-asides and distributing the remaining 15 percent of highway funds to the States under a streamlined STP account.

If you are looking for a plan that is the opposite of the proposal you just heard, you have NEXTEA. NEXTEA provides too little funding for too many Federal programs with too many strings attached. It is the opposite of a program that is focused on a few clear national priorities and on a commitment to invest in them. NEXTEA offers something for everyone with too little for anyone.

For example, the President authorizes only $22 billion a year, but he makes several new programs eligible for this money. But as you know, authorizations are like monopoly money. The President's budget actually cuts highway funding by one-half of a billion dollars, and under his plan the surplus in the trust fund will grow to a $48 billion level by 2002. In other words, motorists will continue to be taxed to support road and bridge repairs, but a substantial portion of their taxes will either sit in the trust fund or be diverted to pay for other Federal programs.

And the President would finance Amtrak out of the highway account. He would expand the list of eligible projects that highway funds could be used for. He would continue the Federal funding set-asides that limit flexibility. He would allow tolls on the interstates and he would make truckers and bus operators subsidize their competitors: freight, rail, and Amtrak.

PREPARED STATEMENT

Again, Mr. Chairman, I appreciate the opportunity to present the Highway Users views on NEXTEA and the reauthorization of the Federal program. We do need more money. As Mr. Rensink, we stand ready to assist you in any way that we can over the next little while.

Senator SHELBY. I agree with you we need more money and we are going to try to get it.

[The statement follows:]

PREPARED STATEMENT OF WILLIAM D. FAY

Mr. Chairman and members of the subcommittee, thank you for the invitation to appear before you today and the opportunity to present our views on S. 468, the Administration's proposed "National Economic Crossroads Transportation Efficiency Act" (NEXTEA), recently introduced by Senators Chafee and Moynihan.

I am Bill Fay, President and CEO of the American Highway Users Alliance. The Highway Users represents a broad cross-section of businesses and individuals who depend on safe and efficient highways to transport their families, customers, employees, and products. We support a strong federal role in transportation policy and the prudent investment of scarce highway use taxes in those programs that enhance our economic productivity, improve roadway safety, and contribute to the enviable quality of life Americans enjoy.

Our view of NEXTEA and the other major reauthorization proposals is based on an understanding of the appropriate federal role in transportation and what that role means with respect to highway funding and eligible uses of Highway Trust Fund dollars. I will begin today by outlining The Highway Users' perspective on these "big picture" issues and finish with our specific comments on NEXTEA.

FEDERAL TRANSPORTATION POLICY AT THE CROSSROADS

FEDERAL ROLE

Since 1956, the federal highway program has been largely focused on constructing the Dwight D. Eisenhower National System of Interstate and Defense Highways. Now that the Interstate System is virtually completed, some have questioned whether the federal government should continue to play a significant role in highway transportation policy. These same objections were raised two years ago by opponents of the National Highway System (NHS) legislation, and Congress answered them decisively with its overwhelming vote for final passage of the National Highway System Designation Act. With NHS designation, Congress recognized the federal government's continuing responsibility to foster interstate commerce and economic growth by ensuring that our most basic transportation infrastructure is maintained and improved.

Without the NHS, many U.S. businesses could not compete in national and international marketplaces, military readiness would be put at grave risk because of the inability to mobilize quickly, and the ability of individual Americans to travel where they want, when they want would be severely hampered. To put it another way, a strong federal role in the development and maintenance of highways and bridges is essential to support economic growth, to enhance individual freedom, and to sustain our quality of life. Few other federal programs can claim such a sweeping national impact.

But there is a lot of work ahead to make the promise of the NHS a reality. The nation will not only have to invest substantial financial resources, but invest them wisely, in order to ensure that this small but important network of highways becomes the engine for economic growth, greater personal freedom, and safer travel that we all hope it will be.

FUNDING

Funding, then, has to be the top priority issue. Members of this subcommittee understand the critical importance of increasing our nationwide investment in highways. As Congress works to reauthorize the federal highway program this year, the issue takes on even greater significance. First, returning to the states more of the money motorists pay in highway taxes will certainly help resolve many of the difficult issues involved in the formula debate. Second, and of equal importance, with-

out additional funding our nation cannot meet its documented need for increased road and bridge investments.

According to the U.S. Department of Transportation, 253,629 miles of Interstate and non-Interstate roads (29 percent of total pavement miles eligible for federal funds) are in poor to mediocre condition, and 186,559 bridges (32 percent of bridges over 20 feet) are deficient and in need of repair or replacement. We are presently investing $20 billion per year less than is needed just to maintain current conditions, and a staggering $40 billion per year less than is needed to leave a better network of highways for the next generation.

This startling gap between actual highway investments and the amount we should be spending has enormous implications for our economy, our travel safety, and our overall quality of life:

—*Economy*—A recent study commissioned by the Federal Highway Administration (FHWA) indicates that between 1950 and 1989, investments in non-local roads yielded production cost savings of 24 cents for each dollar spent. Amazingly, those road investments paid for themselves in just over four years because of the economic gains they made possible. If we fail to maintain those roads, however, the gains realized could soon disappear.

—*Safety*—Highway fatalities have been on the rise over the past four years, reversing the steady improvements of the prior four years. When ISTEA took effect in 1992, 39,250 Americans died on our highways. Since then, fatalities have climbed to 40,150 in 1993, 40,676 in 1994, and 41,798 in 1995. 1996 fatalities are projected to be about the same as 1995. Substandard road designs and poor road conditions are a factor in nearly 30 percent of fatal crashes, according to FHWA. Our failure to invest in better highways will only make travel more dangerous in coming years.

—*Quality of Life*—Underinvesting in highways will make it more difficult for working parents to get from the job site, to the day care, to the grocery store, to home; will make vacations more time consuming and expensive; and will make medical care less accessible for many rural Americans.

For the sake of our continued economic growth, the driving public's safety, and maintaining our standard of living, Congress must increase overall highway funding this year. That's why we applaud the 59 senators, including eight members of this subcommittee, who signed a letter to the Budget Committee requesting that the highway program be funded at $26 billion in fiscal year 1998, a $6 billion increase over this year's spending level. As the letter indicates, the highway account of the Highway Trust Fund could sustain a program funded at $26 billion through at least fiscal year 2002 with no additional taxes.

The nation's governors have amplified the call for increased federal investment in transportation. Testifying on behalf of the entire National Governors' Association at a recent joint meeting of the House and Senate Budget Committees, Governors Paul Patton of Kentucky and Ed Schafer of North Dakota expressed their strong support for the highway funding increase requested by a clear majority of the U.S. Senate. Next Monday, those two governors will be back on Capitol Hill, joined at a press conference by industry and labor representatives, to reiterate the consensus among state and local governments and the private sector that transportation funding must be a top priority in the federal budget.

America's motorists should be able to count on their highway taxes being used for road improvements. Highway users today are paying substantially more in taxes than the federal government is spending on highway and bridge investments. In 1996, motorists paid $31.5 billion in federal highway use excise taxes. Yet, highway funding for this year is set at just over $20 billion.

Of course, the major reason for this disparity between what highway users pay and what they receive from the federal government is that not all of the taxes collected from highway users are deposited in the Highway Trust Fund, much less in the highway account of the trust fund. Taking the 4.3 cents per gallon tax that currently goes to "deficit reduction"—which simply means the use of a regressive excise tax to fund general government programs—and depositing it in the Highway Trust Fund would go a long way towards keeping faith with the American driving public.

FOCUS THE FEDERAL PROGRAM

Just as we should increase overall highway funding this year, we must ensure that those limited resources are wisely invested in programs of vital national interest. Guided by two overriding national goals—improved interstate mobility and safer travel—The Highway Users recommends a simplified highway program that targets federal funds towards five program accounts. They are:

—*The National Highway System*—While the NHS constitutes only 4 percent of the nation's road mileage, it carries over 40 percent of all highway travel, 75 percent of commercial truck travel, and 80 percent of tourist travel. The NHS is the 215' Century successor to the Interstate System and has the potential to build dramatically on the national contributions made by the Interstates over the past 40 years. To maintain these vital interstate connectors, the FHWA estimates we should be investing $18 billion annually and $24 billion annually if we want to improve their condition. Yet the current federal highway program provides only $6.5 billion per year for NHS improvements.

—*Bridges*—Both on and off the NHS, bridges are high-cost, crucial links in our nationwide highway network. The FHWA reports the country would need to spend $5.1 billion annually to maintain current bridge conditions and $8.9 billion to improve them. The current federal highway program budgets only $2.8 billion per year for bridge work. If the Administration and Congress seriously wish to build a bridge to the 21st Century, they will have to provide more adequate funding.

—*Safety*—For reasons I have already discussed, we must make a renewed commitment to safety if we hope to curb the tide of rising highway deaths. The federal government currently invests $700 million annually in highway safety programs. As Americans continue to travel more miles than ever by highway, we must focus more attention and resources on safety improvements. It's a nationwide challenge requiring a greater financial commitment from the federal government.

—*Research and Development (R&D)*—The federal government currently invests approximately $400 million annually in R&D activities to develop new technologies, construction materials, and construction techniques that will ease congestion, make travel safer, and prolong the usable life of roads and bridges. By providing up-front financing, coordinating research activities at sites around the country, and transferring information and technologies among interested parties in the public and private sectors, FHWA programs reduce the cost and enhance the benefits of the nation's highway-related R&D activities.

—*Roads on Federal Lands*—The federal highway program provides approximately $500 million per year to improve roads on federal lands, such as national parks. This program is essential to provide public access to these areas and should be retained.

By targeting at least 85 percent of federal highway funds to the above five program accounts, The Highway Users believes the federal government would significantly improve both safety and interstate mobility. Such a federal highway program would ensure we make investments in projects of truly national significance.

STREAMLINED STP

While The Highway Users seeks to target federal highway funds on programs of national interest, we also advocate giving state and local officials the latitude to plan for their regional transportation needs and the flexibility to direct federal highway dollars towards the programs they identify as priorities. The Surface Transportation Program (STP) was established in ISTEA to provide state and local governments that flexibility. While ISTEA is more flexible in terms of expanding the opportunities to use federal highway funds on non-highway projects, two of the new funding accounts established in ISTEA—transportation enhancements and the Congestion Mitigation & Air Quality improvement program (CMAQ)—are quite inflexible in terms of the discretion granted to state and local officials to set their own transportation priorities.

Specifically, 10 percent of STP funds must be set-aside and used only for transportation enhancement activities, such as pedestrian or bicycle facilities, landscaping and beautification, rehabilitation and operation of historic buildings, or other non-highway projects. The CMAQ program directs highway money, $6 billion over six years, towards urban areas that do not meet Clean Air Act requirements. These funds generally cannot be used for highway construction and maintenance, except High-Occupancy Vehicle (HOV) lanes.

The Highway Users recommends that Congress continue the eligibility of CMAQ and transportation enhancement projects under a streamlined Surface Transportation Program account. The streamlined STP would allow state and local officials to weigh all transportation needs—air quality, highway capacity, historic preservation, mass transit capital, safety, etc.—and establish priorities without the current funding constraints of ISTEA. By continuing the eligibility of CMAQ and transportation enhancement projects but eliminating the specific funding categories, Con-

gress would allow those local projects to be funded in areas where they are truly a priority.

HIGHWAY USERS PROGRAM SUMMARY

Our proposal for the reauthorized federal highway program can be summarized as follows:

—Fund the highway program at the maximum level the Highway Trust Fund will support.
—Deposit the 4.3 cents per gallon federal fuel tax in the Highway Trust Fund.
—Target the bulk of federal highway funds toward the NHS, bridges, safety, R&D, and roads on federal lands.
—Distribute the remaining federal highway funds to the states under a streamlined STP account in which state and local officials would be allowed to establish their own local transportation priorities without the constraints of ISTEA's multiple funding categories.

NEXTEA

How does the Administration's proposal rate when measured against our reauthorization priorities? In a word: poorly. NEXTEA provides too little funding for too many federal programs with too many strings attached. Where we were hoping for a program focused on a few, clear national priorities and a commitment to invest in them, NEXTEA offers something for everyone with money enough for no one.

NEXTEA: FUNDING

"Show me the money." That line from a popular movie might also be the headline for a review of NEXTEA. Despite the fact that many in Congress and all of the nation's governors are calling for a $26 billion per year highway program, NEXTEA authorizes only $22.7 billion, on average, including funding for several new programs not previously financed out of the Highway Trust Fund.

And as members of this subcommittee certainly know, authorizations are akin to "Monopoly" money. You can't spend an authorization. The real money for NEXTEA is in the President's budget, which was transmitted to Congress in February.

The President's budget actually cuts highway spending (i.e., obligation authority) by $500 million from this year's $20.3 billion level. While annual tax deposits (not including interest) to the highway account are roughly $22 billion and growing, the Administration proposes to hold highway funding well below that level. And of course, Administration officials have publicly stated the President's opposition to depositing revenues from the 4.3 cents per gallon motor fuel tax into the Highway Trust Fund.

If highway funding is limited to the level recommended in the President's budget, the cash balance in the highway account of the Highway Trust Fund would rise from the current $13 billion to more than $35 billion in five years. Motorists would continue to be taxed to support road and bridge repairs, but a substantial portion of their taxes would actually be diverted to pay for other federal programs.

As outrageous an abuse of the taxpayers' trust as that is, the cash balance sitting in the highway account five years from now would be even larger if the President were not also proposing to finance Amtrak entirely out of the highway account. The unprecedented proposal to pay the full $4.8 billion, six-year subsidy to Amtrak out of the Highway Trust Fund helps the Administration keep the trust fund's total projected cash balance below the $50 billion mark at the end of 2002. The Highway Users strongly opposes subsidizing Amtrak with highway taxes that are desperately needed to improve roads and bridges.

NEXTEA: FOCUS THE FEDERAL PROGRAM

What does NEXTEA do to focus the federal highway program on clear national priorities? The legislation would continue funding for the NHS, bridges, safety, research and development, and roads on federal lands. Less than 60 percent of the highway funds authorized in NEXTEA, however, are dedicated to these top priority programs.

In addition to targeting too small a portion of highway funds toward these five important program areas, the Administration also proposes to greatly expand the list of eligible projects for which these limited highway funds can be used. Both Amtrak and certain freight rail facilities would become eligible for funds that should be reserved for badly needed road safety, maintenance, and capacity projects, particularly on NHS routes.

NEXTEA: STREAMLINED STP

With respect to our third priority—a streamlined Surface Transportation Program—the Administration simply does not propose to give state and local officials greater authority to establish their own transportation priorities. Instead, NEXTEA would continue the funding set-asides for CMAQ and transportation enhancement activities which, in both cases, limit the potential use of these funds primarily to non-highway projects. Again, we recommend instead that Congress continue the eligibility of CMAQ and transportation enhancement projects under a streamlined STP account, thus allowing state and local officials to weigh all their transportation needs when making funding decisions.

In addition, we have two specific recommendations about CMAQ and transportation enhancement eligibility requirements. First, the CMAQ program to date is focused almost exclusively on air quality projects with very little emphasis laid on congestion mitigation. Federal highway funds certainly ought to be available to improve freeway interchanges and other traffic bottlenecks and for simple projects such as lane widening or shoulder improvements that can substantially improve traffic flow and reduce congestion. We urge Congress to allow the states to more fully utilize their federal highway funds for congestion mitigation projects.

Second, the transportation enhancement eligibility requirements have been written and interpreted so broadly that many projects funded to date have no transportation elements or connection. We think these eligibility standards should be tightened considerably. We hope to have completed a report in April that will highlight the extent to which transportation enhancement funds have been spent on non-transportation projects. We will deliver the report to members of this subcommittee as soon as it is available.

NEXTEA: OTHER SPECIFIC ISSUES

I can summarize our comments and concerns with other specific elements of NEXTEA, as follows:

—*Safety*—As I indicated previously, highway fatalities have increased in recent years, and highway accidents result in millions of injuries annually. Those traffic crashes also drain over $150 billion per year from our economy, primarily by increasing medical costs and lowering productivity.

The Roadway Safety Foundation (RSF), chartered by the American Highway Users Alliance to reduce the frequency and severity of crashes by improving the safety of roadways, recently released a report on roadway safety problems and potential solutions. The report cites four major roadway safety problems, including run-off-the-road crashes made more severe by roadside hazards, poor quality pavements, narrow lanes and shoulders, and narrow bridges.

Those problems can be mitigated in a variety of ways—widening lanes and adding or widening shoulders; ensuring that bridge widths are commensurate with the width of approach lanes; better pavement marking, traffic signs, and reflective devices; creating open space adjacent to the roadway (clear zones) that will allow motorists to regain control of their vehicles. Some of these safety improvements are relatively simple; others are more complex. All of them require a commitment of financial and human resources.

Unfortunately, the Administration's proposal would allow states to shift up to 100 percent of their Hazard Elimination funds away from these life-saving roadway improvements into Section 402 public education and information safety programs instead. (The Administration does not propose allowing states to shift funds for the "soft safety" education programs into the "hard safety" hazard elimination projects.)

All safety programs are important, and The Highway Users supports a substantial increase in overall funding for highway safety. The Administration's proposal, however, would take money away from projects for correcting road hazards that today contribute to more than 12,000 highway fatalities per year. We believe that is bad public policy, and we urge Congress to retain existing programs to fund both rail/highway grade crossing improvements and hazard elimination projects.

We are pleased that the Administration proposes funding for data collection in Section 402(n), State Highway Safety Data Improvements. Currently, law enforcement officers at the scene of a crash are sometimes unable to identify the precise location or the presence of roadside obstacles or other roadway dangers such as sharp curves. This makes it difficult for states and localities to identify roadway dangers and eliminate them.

The $12 million authorized for data collection in NEXTEA, however, is simply not enough to do the job. In addition to higher funding, this section should in-

clude language specifically identifying roadway-related data as a priority for collection. The data should include a precise description of the crash location, the type of crash—rollover or collision with roadside obstacles—and the presence of other roadway hazards such as sharp curves.

—*Tolls*—NEXTEA would eliminate the long-standing prohibition against tolls on existing toll-free Interstate highways. We strongly oppose this provision of NEXTEA. Taxes paid by motorists built the Interstates and continue to fund improvements to Interstate routes. The Administration's proposal is akin to asking a person to pay rent on a home she already owns. Administration officials say this is just one more tool to help states raise funds for road improvements. We think the federal government should fully utilize the taxes already being collected from motorists before anyone starts talking seriously about additional tax raising schemes.

—*Amtrak and Freight Rail Subsidies*—I've already indicated our opposition to the Administration's proposed direct subsidies to Amtrak out of the Highway Trust Fund. We also strongly oppose making Amtrak and freight rail facilities eligible for NHS or other highway funds. Bus operators and truckers should not be required to subsidize their competitors.

CONCLUSION

Again Mr. Chairman, I appreciate this opportunity to present The Highway Users' views on NEXTEA and reauthorization of the federal highway program. Obviously, we think the Administration's proposal falls short of the mark in several key areas. Whatever one's point of view may be with respect to the policy issues I have addressed, it is clear that this subcommittee can do a lot to help smooth the reauthorization process by providing an adequate amount of funding for the highway program. We look forward to working with you and members of the full committee toward that important end.

[CLERK'S NOTE.—The Final Report—Improving Roadway Safety: Current Issues will not appear in the hearing record, but is available for review in the subcommittee's files.]

STATEMENT OF JOHN J. COLLINS, SENIOR VICE PRESIDENT, GOVERNMENT AFFAIRS, AMERICAN TRUCKING ASSOCIATIONS, INC.

Senator SHELBY. Mr. Collins.

Mr. COLLINS. Mr. Chairman, thanks very much for the opportunity to be here. My name is John Collins. I am senior vice president for government affairs of the American Trucking Associations.

ATA represents the Nation's trucking industries. We employ about 9 million people. We pay about 43 percent of the total amount of money that goes into the Federal highway trust fund. We have only about 10 percent of the vehicles. So, we are big payers in. We are not the largest users of the system out there. Those are really the auto users.

Mr. Chairman, the American Trucking Associations and our industry believe that the current level of funding for roads, bridges, and highways is inadequate and that the administration's NEXTEA proposal is really a next toll proposal. It asks for more money in the way of tolls, while not really spending the amount of money we are already putting into the system.

I would like to thank the members of the subcommittee who have joined in calling for a $26 billion per year program. Senator Bond is leading a separate effort to increase available funds for highways, and Senator Byrd is leading an effort to bring 4.3 cents back into the highway trust fund. I think those represent a growing consensus that there is a need for more money, as you just said, Mr. Chairman, to go into the highway program and there is also a will to get it done.

The ATA proposal is very similar to the Highway Users proposal. We would go straight out for a $34 billion annual program which could be supported with the existing tax structure without any tax increases. With that program, we would see basically a two-part program. There would be a core program that would target money at those interstate facilities that are most important for moving people and moving freight, and then there would be a block grant proposal that would be turned back to States dollar for dollar for their other transportation needs. The vast majority of the funds would be dedicated to the core highway program.

The trucking industry is very skeptical of the administration's reauthorization proposal. Their proposal and their fiscal year 1998 spending level would propose $11 billion less than the level that could be supported out of a fully funded highway trust fund program.

Basically the highway program has been moving along at $20 billion per year. They, in 1998, would propose to cut that $500 million to $19.8 billion, but in fact the overall highway program that could be maintained would be about a $34 billion level.

We strongly oppose—and Senator Faircloth I think said this very eloquently about the problems of putting tolls on the Interstate Highway System. To charge a toll for something we have already paid for is absolutely a travesty.

I would like to talk to you about three things that concern us, and that is safety, jobs, and international competitiveness.

Safety. Nearly 42,000 people die on the Nation's highways each year, and the trucking industry takes little comfort in the fact that in 88 percent of those, there is not a truck anywhere nearby. So, this is not a problem caused by the trucking industry, but we are concerned obviously with safety on the Nation's highway.

We are spending billions of dollars to make our trucks safer, to make our drivers safer, and we need Congress' help to make the roads safer. We have all been on the highway where we have been driving down the road and suddenly the person in front of us swerves irrationally and it turns out they swerved to avoid a pothole. That is the kind of thing that creates havoc with the truck-driver who is trying to drive straight down the road and safely. We have got to put the money back into the infrastructure to take those kinds of problems away from us.

We think about this is as a shopping list. For each $1 billion that Congress can put into the highway system, that could upgrade 1,300 miles of rural roads into interstate quality roads, roads in Alabama where you could cut the fatality rate in half by making that kind of improvement.

You could resurface interstate highways and rural roads, and by resurfacing them and getting rid of the potholes, you could reduce accidents by 20 or 25 percent.

An important issue—and you certainly see it in Alabama—is the relationship of highways to jobs. You need good highways to get good jobs. Seventy-seven percent of the communities across America have their freight moved only over highways. The airplane does not land at the plant. The rail is an important asset but it does not bring the cargo directly to the person who needs it.

And it is fashionable in some quarters to say that the Interstate System is built, we can pull back the Federal commitment to highways. But that is like saying our schools have been built and the textbooks have been bought and we do not need anything new.

Every year in this country we add about 2.3 million people to our population, and by the year 2004, we will add 8 million more cars to our highways and rack up 30 percent more miles in demand for services from trucks. So, our surface transportation system needs every bit of money we can put into it for modernization.

In international competitiveness, the FHWA has said that every $1 billion invested in the NHS, the National Highway System, creates a $240 million reduction in manufacturing production costs per year. So, there is a real payoff between the investment and the payoff back.

PREPARED STATEMENT

It involves safety, jobs, and competitiveness, and really the challenge is to this Congress and to this committee through its appropriations efforts to make that money available. This Congress has a wonderful opportunity to earn a legacy as builders, builders of a better, safer, and more prosperous America, and I urge you to provide the funding to make that a reality.

Thank you.

[The statement follows:]

PREPARED STATEMENT OF JOHN J. COLLINS

I. INTRODUCTION

ATA Represents the Trucking Industry

The American Trucking Associations, Inc. (ATA) is the national trade association of the trucking industry. ATA's membership includes affiliated associations in every state, and 13 specialized national associations. ATA represents every type and class of motor carrier in the country. We are a federation of over 36,000 member companies and represent an industry that employs over nine million people, providing one out of every fourteen civilian jobs. We are a highly diverse industry, but we can all agree that a good system of roads is crucial both to our bottom line and to the safety of all drivers, including millions of truck drivers who deliver to all Americans their food, clothing, finished products, raw materials, and every other item imaginable. Actions that affect the trucking industry's ability to perform these services have significant consequences for Americans to do their job well and to enjoy a high quality of life.

Current Spending Levels Cannot Support a Safe and Efficient Highway System

The trucking industry contributes over $11 billion each year to the Federal Highway Trust Fund, about 43 percent of total receipts. As such, we expect a return on our investment. The user fees that we contribute to the trust fund should be invested in a manner that makes our highways both safer and more efficient.

Investing all revenues collected is especially important given the tremendous pressures our highways and bridges will face in the future, when population and economic growth will spur tremendous increases in the demand for freight transportation. In 1994 the revenue generated by the trucking industry was $362 billion and is projected to reach $437 billion in 2004. By this same date, the total volume of freight carried by trucks will reach 6.5 billion tons, 19 percent more than in 1994. Both the total number of miles driven and the total volume of ton-miles will grow 29 percent. Over the same period, more than half a million more trucks will be needed to meet these increased demands. This assumes that we will be successful in increasing intermodal business substantially to $12.9 billion-a 150 percent increase over today's levels. The safety and efficiency of the freight industry will depend in no small measure on the actions of this committee and the 105th Congress.

II. CURRENT FUNDING LEVELS ARE INSUFFICIENT

There are numerous Congressional initiatives underway to significantly increase investment in our nation's transportation systems. These efforts indicate both a recognition of the severe investment shortfall facing our transportation infrastructure and the emergence of broad consensus that something can and should be done to correct this situation. According to the Congressional Budget Office, spending all highway user fee revenues and drawing down the balance in the Highway Trust Fund, could support an annual program of $34 billion, without increasing taxes.

Current Spending will not Sustain Highway Infrastructure

The trucking industry is prepared for the tremendous challenges posed by ever increasing demands for more efficient freight service to facilitate our nation's growing population and economy. However, if under-investment in our highways continues, it may be impossible for the industry to meet these challenges. The resulting productivity losses will take a severe human toll as stiff competition from abroad wipes out existing jobs and reduces the ability of our economy to create new jobs for an expanding population. To simply maintain conditions and performance on the 162,000-mile National Highway System (NHS), an annual Federal investment of $15.6 billion is needed. The NHS carries 40 percent of all traffic and 75 percent of truck traffic. Yet the Federal government makes just $9 billion available annually for funding of these most important highways. This is only 58 percent of the Federal investment necessary just to maintain the status quo.

This dismal level of spending has contributed to the situation now faced by users of the system. The NHS has been allowed to deteriorate to the point where nearly half of urban Interstate miles are congested during peak periods. Forty percent of travel on urban NHS routes takes place under such congested conditions that even a minor incident can cause severe traffic flow disruptions and extensive queuing.[1] Congestion on urban Interstates increased from about 55 percent of peak hour travel in 1983 to approximately 70 percent in 1989, remaining relatively constant since then.[2] Travel delays in the nation's fifty largest urban areas as a result of increased congestion costs society an estimated $50 billion every year.[3] Congestion increases the risk of accidents and interferes with our ability to serve our customers' "just-in-time" delivery needs.

Highway Investment Saves Lives

Adequate highway funding allows states to make roadway improvements that increase safety. Improved roadway characteristics such as 12-foot lanes and ample shoulders, gentler curves, and improved median and median barriers, can significantly reduce the number and severity of accidents.[4] One 1995 study estimated that full funding for the NHS over a 10-year period would prevent 720 fatal crashes, 55,000 personal injury crashes, and 120,000 property damage crashes on the NHS alone.[5] The report estimated average annual societal savings of $800 million as a result of the accident prevention. Additional funding for other roads would increase these savings even more.

It is important to keep in mind that 43 percent of the NHS includes two-lane roads. These roads often have no median separation to prevent head-on collisions. Although lanes, shoulders and clear zones can provide motorists with the critical space to recover if they lose control of their vehicles, these features are inadequate or nonexistent on many NHS routes. These two-lane roads may have very tight curves with few warning signs and poor visibility to alert motorists before it is too late to adjust. FHWA crash statistics confirm the danger posed by the hazardous conditions on these narrow roads. While the Interstate System has the lowest fatality rate per 100 million vehicle miles traveled, NHS routes not on the Interstate have a death rate twice that of Interstates.[6] Other Federal aid highways not on the NHS take an even higher toll.

Additional funding will allow us to make needed highway safety improvements. Illustratively, consider what just $1 billion dollars in additional highway construction investment could achieve:

[6] FHWA, *Highway Statistics,* 1994.

—upgrade 1,300 lane-miles of off-interstate rural principle arterials to interstate standard,[7] potentially cutting the fatal accident rate on these roads in half; or
—add 500 new lane-miles to existing urban freeways, or 3,300 new lane-miles to existing rural interstates,[8] relieving congestion and reducing accidents; or
—resurface 9,800 lane-miles of rural interstate or 5,900 lane-miles of urban freeway,[9] reducing accidents on these roads by 20 to 25 percent; or
—build 170 new truck safety inspection stations, helping to get unsafe vehicles off the highway; or
—add 50,000 truck parking spaces at highway rest areas, allowing truck drivers to pull over to a safe place when they get tired.[10]

We cannot afford to become complacent. In 1995, 41,798 people died on our nation's highways. The vast majority of these fatal crashes involved cars, motorcycles, and pickup trucks. This is equivalent to a Valuejet crash every single day! Safety must be given the highest priority, and the Federal commitment must be demonstrated through adequate funding and strong leadership.

Highway Investments are the Key to Economic Development and Employment Growth

According to a Federal Highway Administration (FHWA) report, investment in the nation's highways stimulates job growth.[11] The report states that for each $1 billion in highway investment, 42,100 full-time jobs are created and supported.

United States productivity improvements are the key to global competitiveness, rising standards of living, and economic growth. Investing in the NHS results in significant, nationwide improvements in productivity.[12] In fact, every billion dollars invested in the NHS results in a $240 million reduction in overall production costs for U.S. manufacturing. These productivity improvements allow U.S. industry to sell more goods and services at lower prices both at home and abroad. More people can be employed at higher wages. Since salary increases are firmly tied to the increase in the amount of goods and services each worker produces, living standards are improved. In addition, these real wage increases result in elevated tax revenues.

Through new innovations such as just-in-time delivery, the trucking industry has played a vital role in improving U.S. productivity. This would have been difficult, if not impossible, to achieve without an efficient network of good roads that connects markets, centers of industry, and multi-modal transportation facilities. A 1994 study of five diverse U.S. companies demonstrates the importance of transportation to American businesses' daily operations.[13] For instance, a reliable system of roads allows Saturn Corporation, which has its manufacturing and assembly plant in Spring Hill, TN, to utilize a just-in-time strategy. Saturn's just-in-time approach to its inventory control system, combined with the company's advanced communications system and a safe, well-functioning highway network, has allowed the company to reduce order cycle times and inventory costs by holding down in-plant inventory to an average of two days' stock.

A Minimum of $34 Billion Annually Can and Should be Available for Investment

Although the fees paid into the Highway Trust Fund are sufficient to improve conditions and performance on the National Highway System and related roads, not enough of the funds are being spent to even maintain the status quo, the status quo itself is unacceptable. If all funds coming into the Highway Trust Fund are spent in a timely manner, a $26 billion program could be sustained. A slow drawdown of the existing balances in the trust fund would increase revenues by approximately $2 billion annually, allowing a $28 billion program. Ensuring that all highway user fees are dedicated to transportation improvements, including the 4.3 cents now deposited in the General Fund, would make a $34 billion annual program possible. This level of investment would stop the deterioration of our highways and bridges, allowing our nation's economy to move forward, renewing our commitment to safer, more efficient, and less congested highways, and improving our quality of life. Another important benefit of a higher funding level is that it would diminish the con-

tentious and divisive debate over funding formulas. We all support a better surface transportation system, and this issue is a barrier to achieving our common goals.

Given the tremendous economic and social benefits of highway investment, it is illogical to fail to spend the highway user fees collected to correct the many deficiencies of our highways and bridges. By the end of the 1997 fiscal year, the unspent balances in the Highway Trust Fund may exceed $22 billion. Extending the Administration's budget proposal for fiscal year 1998, that figure could reach nearly $50 billion in just five more years. For many years the trucking industry has been a steadfast supporter of the user fee system. However, support for that system and the Federal program will erode if the balances in the Trust Fund continue to rise or if user fees are not invested in highways in a timely manner. We urge the committee to restore trust in the Highway Trust Fund by investing the maximum amount available with a minimum of diversions.

III. THE ADMINISTRATION'S PROPOSAL IS INADEQUATE AND UNACCEPTABLE

During recent testimony, Secretary Slater declared that ISTEA's successor must be judged by how it affects "the lives of our people, the health of our economy, and the welfare of our Nation . . ." I am sorry to say that the Administration's proposal for reauthorization, which is called NEXTEA, will fall far short of meeting these laudatory criteria.

The Administration's fiscal year 1998 $22.8 billion budget authority for the Highway Account falls over $3 billion short of where it could be under current revenue circumstances and is $1 1 billion short of where it would be if the Administration made changes that restored the honesty and integrity of the user fee system. In addition, any potential for reducing highway infrastructure deterioration is obliterated by programmatic changes that further dilute highway investment. Instead of targeting limited funds where they can most effectively address national highway needs, NEXTEA diverts an additional 25 percent of user fees to programs, such as the Congestion Mitigation and Air Quality Program (CMAQ) and Transportation Enhancements Program (TEP), that will not reduce highway fatalities.

NEXTEA also includes funding for passenger and freight rail facilities and operations. ATA opposes funding Amtrak operations out of the Highway Account because Amtrak expenditures do not measurably help reduce highway fatalities or reduce congestion. Moreover, Federal decisions to allocate funds to Amtrak create a new class of donors and donees—with most of the states being losers.

Some short line railroads are proposing to fund private rail freight projects out of the highway account. The trucking industry has to pay for our vehicles, terminals and operating costs out of our pockets. Our competitors should not have their private costs paid out of the highway account. This is especially true since truckers typically earn two cents on the revenue dollar while some railroads often earn 15 cents or more. If the railroads want public funding, they also should pay a reasonable fuels tax and create a railroad trust fund account. Each one cent would raise around $30 million dollars.

Finally, the administration has proposed turning its back on 40 years of history by allowing tolls on the Interstate Highway System. Charging highway users to rent what we have already bought is a travesty. We are already paying more in highway taxes than we get back. Moreover, putting tolls on free Interstate Highways will force cars to slow from freeway speed, adding to safety, congestion, air pollution, and noise problems.

IV. ATA'S PROPOSAL FOR HIGHWAY REAUTHORIZATION

ATA's proposal is a comprehensive plan which ensures that the national interest in a safe and efficient system of highways is preserved. We propose an annual $34 billion total funding level, which includes $25 billion for a Core Highway Program and $9 billion for a highly flexible State Block Grant Program (See appendix). We propose to invest highway user fees in a targeted set of programs which serve important national needs. Our proposal creates a flexible state Block Grant Program and ensures that the Trust Fund balances are spent down.

The Core Highway Program would include the NHS, a Bridge Program, a Federal Lands Program, a national highway safety program, and a Research & Technology Activity program. Investment in these areas ensures the preservation and improvement of a seamless national highway network that benefits all Americans. Funding distribution, therefore, would be based on national need, rather than on contributions to the Trust Fund.

Concentrating funds on a Core Highway Program ensures that projects with national significance are given priority. The current program's structure fails to meet this test. For instance, the state of Alabama received an estimated apportionment

of $270 million in fiscal year 1996. Eighty-eight million dollars, a third of Alabama's total apportionment, was subject to suballocation under the Surface Transportation Program (STP). Of that, $11 million was suballocated to large urban areas. At the end of fiscal year 1996, however, $13 million in this category remained unobligated, a full 121. percent of the fiscal year 1996 funding to that category (some carries over from previous years). Prohibitions against apportionment transfers within the STP program mean that Alabama may not be able to use $13 million of its Federal-aid highway dollars.

ATA's proposed Block Grant Program gives states and localities the flexibility to select and fund highway and transit capital projects, as well as congestion mitigation and air quality projects. This flexibility allows them to address their unique needs in a manner best suited to their circumstances. Funds now available for suballocation would continue in the same proportion. Funds in the block grant would be distributed to states in exactly the same proportion as the dollars are collected from the states, so that there would not be any donors or donees.

V. OTHER REFORMS WILL INCREASE SAFETY AND PRODUCTIVITY

Several other important issues are likely to be subjects for discussion during reauthorization, and I will touch on them briefly.

—The freight planning process which ISTEA set in motion needs to be improved.

—Many Metropolitan Planning Organizations have not fully addressed the essential freight planning needs that are important to freight mobility both in their own communities and as a link in the national supply chain.

—Current hours of service regulations, many of which have been on the books since the 1930's, are too are flexible and outdated. While we are not sure at this point whether a legislative or regulatory approach is preferable, a new option should be developed that improves highway safety, as well as industry productivity and efficiency.

—Truck drivers suffered inequitably from the cutback in the meal deduction, and this should be corrected.

—States should be given more flexibility to determine the most appropriate regulations governing the size and weight of trucks on highways within their jurisdiction.

Recent research revealed a nationwide shortfall of 28,500 truck parking spaces in public rest areas.[14] When truck stops are full, truck drivers have little choice but to either park illegally—which can create a severely hazardous situation—or to continue driving, possibly breaking hours-of-service laws or becoming so fatigued that they put themselves and other motorists at risk of an accident. Neither choice is acceptable. The total nationwide cost to develop the necessary parking spaces is estimated to be $489 million to $629 million. We will request funding eligibility for rest area construction, expansion, improvement, and access under all major categories of the Federal-aid highway program.

ATA will also request funding eligibility under all major categories for state enforcement of Federal truck size and weight regulations at weigh stations, including construction of safety inspection and weight enforcement facilities. In addition, we will request the same eligibility for states' procurement and operation of portable weigh scales. These investments are essential to states' ability to ensure that unsafe and illegal trucks are taken off the.

Finally, ATA plans to work with the U.S. Department of Transportation to develop a multi-year highway safety program designed to further promote the safe operation of commercial motor carriers and maintenance of equipment through education, research & development, and technology transfer activities. This program also will require Federal funding.

VI. CONCLUSION

A few weeks ago, Deputy Transportation Secretary Mort Downey testified that, given current investment levels and travel growth projections, 9,500 more people will die on our nation's highways in 2005 than in 1996. In the face of such a grim statistic, the Administration offers a proposal that would decrease funding for investment in highways and increase diversion of highway user fee revenues to nonhighway purposes, further straining the highway system's ability to safely transport people and goods. This, despite the fact that sufficient revenue is readily available. ATA's proposal makes targeted, nationally significant investments which would both improve highway safety and spur economic growth It also gives states and localities

[14] The ATA Foundation.Inc. *No Room at the Inn,* May 1996.

unprecedented resources and flexibility to address their unique surface transportation needs in the most creative and effective manner possible.

I look forward to working with the members of this committee as you strive to meet the many challenges ahead. I hope ATA's proposal can serve as a basis for discussion during reauthorization of the highway program. Thank you.

APPENDIX

April 7, 1997

Funding Comparison
ISTEA vs ATA PROPOSAL

	ISTEA (billions)		NEXTEA (billions)		ATA PROPOSAL (billions)	
CORE Program:						
NHS and Interstate Maintenance	6.5		8.8		19	
Bridge	2.8	**10.9**	2.7	**13.4**	4	**25**
Federal Lands	.5		.5		.5	
Safety	.7		1.1		1	
R&D	.4		.28		.5	
State Block Grant Elements:						
STP (non-NHS)	2.5[15]		5.8[16]			
Transit Section 3 and 9 Capital	3.56[17]	**6.06**	4.6	**10.4**		**9**
Other Programs:						
CMAQ	1.029		1.3		Folded into the State Block Grant	
STP (NHS), State-built Interstates, Demonstration Projects, Funding Equity, miscellaneous small accounts.	5.959	**6.988**	2.6	**4.7**		
Total	FY 1997 Program Level	**23.948**	Annual Program Level	**27.3**	Annual Program Level	**34**

[15] $1.69 billion in STP funding was obligated to be spent on the NHS in FY 1995 and $4.09 billion was authorized. In FY 1997, it is assumed the same proportion of the FY 95 authorization will be obligated to the NHS.

[16] Total STP.

[17] FY 1997 Appropriations Act, liquidation of Highway Trust Fund contract authority only.

STATEMENT OF FREDERICK L. GRUEL, PRESIDENT AND CEO, AAA NEW JERSEY AUTOMOBILE CLUB

Senator SHELBY. Mr. Gruel.

Mr. GRUEL. Thank you, Mr. Chairman. I appreciate the opportunity to testify today. I am Fred Gruel, president and chief execu-

tive officer of the AAA New Jersey Automobile Club and vice chair of AAA's Public and Government Relations Committee. Today I bring you the views of the entire American Automobile Association, a federation of 99 independent clubs across North America with nearly 40 million members.

I want to briefly review AAA's position on the reauthorization of ISTEA with a focus on the tolling provisions in the administration's NEXTEA proposal.

First, AAA strongly believes funding levels for highways and bridges should be significantly increased.

AAA also believes that a strong but responsible Federal role in transportation policy and financing should be maintained. The preservation of a national transportation system is in everyone's interest. That is why we have serious concerns about proposals to turn back or devolve Federal taxing authority to the States.

Safety is another key component that should be improved in the next ISTEA. We urge you to consider an increase in overall safety investments.

In addition, the majority of AAA members oppose any congressional change in the size and weight of trucks and support the continued freeze on longer combination vehicles.

This leads me to a final issue that is of concern to AAA during ISTEA reauthorization and that is tolls.

One of the most controversial provisions of NEXTEA would allow a State to finance the reconstruction of a previously free interstate highway with tolls. The interstates were built with highway user gas taxes. Now the administration is asking these users to pay again with a toll even though there is $20 billion sitting unused in the highway trust fund.

AAA opposes toll roads as a general principle, believing that to the maximum extent possible, all highway facilities should be toll free. This position is not a new one. In 1936, AAA's bill of rights for motorists referenced tolls. It said we must have roads suitable and adequate for the movement of modern motor traffic with safety. They must be free and not toll roads. As early as 1940, AAA policy vigorously opposed the levying of tolls on existing free highways.

AAA policy remains the same today: The use of tolls results in the double taxation of motorists, once in the form of gasoline taxes and again when motorists drive on a toll road.

For over 80 years, the underlying principle of the Federal-State highway program has been developing and preserving this Nation's vast network of quality, toll-free highways. Proposals to toll existing Federal-aid highways, including the Interstate System, represent a major change in course. Instead of a pay-as-you-go highway network based on fuel taxes already collected from motorists, responsibility for funding highway maintenance and construction would be loaded onto future trips of highway users—build now, pay now, and pay later.

AAA has some specific concerns about the use of tolls and toll roads. I will outline them for you briefly.

They are expensive.

They represent a breach of trust.

They are inefficient.

They are inconvenient.

They delay the movement of people and goods.

And they offer little choice to the consumer as to available services.

AAA believes that if Congress adopts the administration's toll proposal for interstates, it could destroy the user fee structure that has brought our Nation the best and safest highway system in the world.

AAA believes most Americans consider their freedom of mobility as a constitutional right. Telling Americans that they have to pay tolls on interstates they have already paid for does not meet their idea of freedom of mobility. In fact, AAA surveys consistently find more than 70 percent of drivers oppose tolling.

AAA would like to propose an alternative to tolls. Take the highway trust fund off budget and transfer the 4.3 cents per gallon to the highway trust fund. If these two steps were taken, we would not need to toll our interstates.

A total of 59 Senators, 8 from this subcommittee, have signed the Warner-Baucus letter to the Budget Committee Chairman Domenici requesting an annual investment of $26 billion in highways. That is the minimum required to fix our Nation's highways and bridges to make them safer. Taking the highway trust fund off budget and transferring the 4.3 cents per gallon gas tax to the trust fund could provide more than $30 billion annually.

PREPARED STATEMENT

Rather than asking AAA members and all motorists for more money in tolls, AAA asks you to invest the money we have already paid on what you told it would be used for. Fix our highways and bridges and invest our gas taxes in safety.

Thank you, Mr. Chairman.

[The statement follows:]

PREPARED STATEMENT OF FREDERICK L. GRUEL

Mr. Chairman and members of the Committee, I am Fred Gruel, president and chief executive of ricer of the AAA New Jersey Automobile Club and Vice Chair of AAA's Public & Government Relations Committee. Today I bring you the views of the entire American Automobile Association. AAA is a federation of 99 independent clubs across North America with nearly 40 million members.

I want to briefly review AAA's positions on the reauthorization of the Intermodal Surface Transportation Efficiency Act (ISTEA) with a focus on the tolling provisions in the Administration's NEXTEA proposal.

First, AAA strongly believes funding levels for highways and bridges should be significantly increased. An increase in funding could be facilitated by taking the Highway Trust Fund "off-budget," as Congressman Shuster's bill H.R. 4 would do; by investing the unspent balance in the Fund on transportation; and by redirecting to the Highway Trust Fund the 4.3 cents per gallon motor fuels tax now going to deficit reduction.

AAA also believes that a strong but responsible federal role in transportation policy and financing should be maintained. The preservation of a national transportation system is in everyone's interest. That's why we have serious concerns about proposals to "turn back" or "devolve" federal taxing authority to the states.

Safety is another key component that should be improved in the next ISTEA. We urge you to consider an increase in overall safety investments.

In addition, the majority of AAA members oppose any Congressional change in the size and weight of trucks and support the continued freeze on longer combination vehicles (LCV's).

This leads me to a final issue that is of concern to AAA during ISTEA reauthorization—and that is tolls.

One of the most controversial provisions of NEXTEA would allow a state to finance the reconstruction of a previously free Interstate highway with tolls. The Interstates were built with highway user gas taxes. Now, the Administration is asking these users to pay again with a toll. Even though there is $20 billion sitting unused in the Highway Trust Fund.

AAA opposes toll roads as a general principle, believing that to the maximum extent possible, all highway facilities should be toll-free. This position is not a new one. In 1936 AAA developed a "Bill of Rights" for motorists that included a reference to tolls. It said, "We must have roads suitable and adequate for the movement of modern motor traffic with safety. There must be multiple-lane highways with opposing traffic streams divided. They must be free and not toll roads. . . ." As early as 1940, AAA policy . . . "vigorously oppose(d) the levying of tolls on existing free highways . . . privately-owned toll roads, and transcontinental toll superhighways. . . ." AAA policy remains the same today: The use of tolls results in the double taxation of motorists, once in the form of gasoline taxes, and again when motorists drive on a toll road.

For over 80 years, the underlying principle of the federal-state highway program has been developing and preserving this nation's vast network of quality, toll-free highways. Proposals to toll existing federal-aid highways—including the Interstate System—represent a major change in course. Instead of a pay-as-you-go highway network based on fuel taxes already collected from motorists, responsibility for funding highway maintenance and construction would be loaded onto future trips of highway users—"build now, pay now, and pay later!"

AAA has some specific concerns about the use of tolls and toll roads. I will outline them for you briefly:

—They are expensive: Toll road construction will probably cost as much as three to four times as much as free roads because of bond interest charges and toll collection costs.

—They represent a breach of trust: Highway users have already paid hundreds of billions of dollars to construct one of the world's finest highway networks. Why should they, and their children, now be charged to use it?

—They are inefficient: About fifteen percent of toll revenues are needed for the collection process while only about one percent of motor fuel taxes are devoted to that purpose.

—They are inconvenient: Toll roads often provide few entrances and exits in order to minimize the number and thereby the costs of toll personnel. Users are limited to those on or off ramps which may not be near where they want to go.

—They delay the movement of people and goods in two ways: First, by slowing the flow of traffic, leading to aggravation and possible safety hazards, and second, by causing congestion at toll plazas.

—They offer little choice to the consumer: Toll roads are often locked into higher-priced service stations, food establishments and other services. The highway user has little choice among concessionaires and prices.

—They can be self-perpetuating: It's rare that tolls are ended after the debt service is retired.

AAA believes that if Congress adopts the Administration's toll proposal for Interstates, it could destroy the user fee structure that has brought our nation the best and safest highway system in the world.

AAA believes most Americans consider their freedom of mobility as a "constitutional right." Telling Americans that they have to pay tolls on Interstates they have already paid for doesn't meet their idea of freedom of mobility. You may be interested to know that AAA surveys consistently find more than 70 percent of drivers oppose tolling.

AAA would like to propose an alternative to tolls: Take the Highway Trust Fund off-budget and transfer the 4.3 cents per gallon to the Highway Trust Fund. If these two steps were taken, we wouldn't need to toll our Interstates.

Fifty-seven Senators—eight from this subcommittee—have signed the Warner/Baucus letter to Budget Committee Chairman Domenici requesting an annual investment of $26 billion in highways. That is the minimum required to fix our nation's highways and bridges to make them safer. Taking the Highway Trust Fund off-budget, and transferring the 4.3 cent per gallon gas tax to the trust fund, could provide more than $30 billion annually.

Rather than asking AAA members and all motorists for more money—in tolls—AAA asks you to invest the money we have already paid what you told us it would be used for. Fix our highways and bridges and invest our gas taxes in safety.

Thank you Mr. Chairman.

STATEMENT OF WILLIAM W. MILLAR, PRESIDENT, AMERICAN PUBLIC TRANSIT ASSOCIATION

Senator SHELBY. Mr. Millar.

Mr. MILLAR. Thank you, Mr. Chairman and I am very pleased to be with you today. I am William Millar. I am the president of the American Public Transit Association, and I appear here today on behalf of our 1,100 member organizations from throughout the United States and Canada.

We believe very strongly that there needs to be a continued strong Federal role in a balanced transportation system for all Americans.

We believe, as my colleagues have spoken here today, that we simply have to have an increased investment in our surface transportation system, that the money we are spending now is simply not enough for our Nation.

And finally, we believe that proper investment in the infrastructure will allow for a growing economy and to meet the variety of Federal objectives that the Congress has set out for us over the years.

You invited us here today to comment on the administration's NEXTEA proposal, and I want to describe to you the criterion we have used in evaluating their proposal and that we would use in evaluating any other proposals.

First, we believe that ISTEA has worked well and, therefore, we consider the preservation of the general program structure, including giving States and localities flexibility in how they spend their funding, to be an essential part of any new legislation.

Second, we believe that any new legislation, as you said, Mr. Chairman, has to include adequate funding levels for both transit formula, transit discretionary programs, and flexible funds.

Third, we believe there has to be fair and equitable treatment for transit agencies and communities of all sizes as we look at the distribution of funds.

Let us take these principles, apply them to the administration's NEXTEA proposal, and see how we measure up.

On the first principle with regard to program structure and flexibility, we believe generally their proposal does a good job in adhering to this principle. We think it recognizes that there are strong Federal reasons through strong national objectives to keeping Federal involvement in surface transportation, and we believe that their proposal retains some of the planning requirements and some of the decisionmaking processes and State allocations that have been useful and have been used in innovative ways. So, in general, on the first set of criterion, we believe that the administration's proposal does pretty well.

However, the second set of principles that relate to the need for additional investment in surface transportation we believe the NEXTEA proposal falls far short of this. It simply does not provide for even the minimum levels of funding the administration's own studies show. I would agree with Mr. Rensink's determination and the information he put in the record about the need for additional investment. The administration proposal does not even measure up to that, and their measurements are very, very conservative indeed.

While the administration proposal could conceivably make at least a little bit of money more available for highways, it in fact, as one of the earlier comments from one of the earlier Senators had said, would decrease the funding for public transit if you look at the authorized levels. We think that is not fair. We think that is not appropriate.

Finally, although the administration claims that NEXTEA would increase formula capital funds, for example, once you take certain proposals of theirs off the top, for example, the access to jobs, which we generally support, and the fixed guideway modernization programs that are moved over into a new category—once you—you may take apples and oranges and now make them apples and apples. There really is not any increase of any significance in funding for public transit. So, we think that on this second basis, the administration's proposal fails rather miserably, to be honest about it.

We do strongly support the administration's proposal to switch from a Rostenkowski test to a Byrd solvency test as far as public transit money goes. We think that is important in the mass transit account and speaks to equity between highways and transit. We would like to see that the revenues that are collected, as my colleagues have said, from the American people for surface transportation be spent on surface transportation.

We would strongly support the effort to bring the 4.3 cents over from deficit reduction and put it in the highway trust fund and allocate it to the various accounts as would be appropriate under the traditional relationships.

And we support efforts to move the trust fund off budget so that we can get on with the business of measuring infrastructure in multiyear segments as the capital improvements that they really represent. So, we think that that is pretty important to do.

With regard to our third principle of fair and equitable treatment of transit agencies, large and small, we think the NEXTEA proposal has a mixed record in that regard. We oppose the elimination of the bus discretionary program. It is particularly important to smaller communities that they have the opportunity to, let us say, have a sufficient amount of money for a major bus purchase or a major facility improvement that they would not get through a formula.

We oppose the folding of the fixed guideway formula into the traditional urban formula. We think that makes an unwarranted shift from bus to rail investment and throws a number of the relationships in the bill out of kilter, so to speak, on that.

And we are particularly concerned about rural transit providers. We think the NEXTEA proposal may put their customers at risk simply by reduced authorizing levels, as well as a lower percentage of the formulas that are going to be there, and then finally, it would take away certain guarantees that rural communities now have. So, we are very concerned about that.

As I conclude, I must say on the positive side, we agree strongly with the administration's proposal on expanding the definition of capital when dealing with the operating assistance issues. We agree strongly with the research proposal that is there. We agree strongly with further investment in an intelligent transportation system and the State infrastructure bank program.

PREPARED STATEMENT

We believe that it is the basis for a good discussion, but it is a bill that should not be passed in its entirety at the moment. We look forward to working with you and the committee and everyone in Congress in making improvements to that proposal so we can get a good reauthorization of the ISTEA legislation.

Thank you, Mr. Chairman.

Senator SHELBY. Thank you.

[The statement follows:]

PREPARED STATEMENT OF WILLIAM W. MILLAR

The American Public Transit Association (APTA) appreciates the opportunity to testify on the Administration's ISTEA reauthorization proposal, the National Economic Crossroads Transportation Efficiency Act (NEXTEA). But first, Mr. Chairman, we want to commend you for your leadership in holding this hearing. Because the Congress is likely to pass the fiscal year 1998 Transportation Appropriations Act before it finishes action on legislation to reauthorize ISTEA, it is particularly important that you now gather views on that important legislation.

OVERVIEW

APTA supports ISTEA. We supported its enactment in 1991 and over the last six years our experience has demonstrated that it provides the benefits we had hoped for. Toward this end, APTA has adopted a comprehensive ISTEA reauthorization working proposal that would preserve and build on the ISTEA and transit program structures, expand opportunities for flexible funding—both highway to transit and transit to highway—and support ISTEA's planning provisions and transit research and development.

At the same time, we oppose efforts to repeal federal gas taxes that support investment in the nation's transportation infrastructure, or to eliminate the existing federal partnership with state and local governments. We are not opposed to efforts to modify the highway funding formula, but we believe that a fair distribution of highway funds can be accomplished within the current ISTEA program structure. We also strongly support the "level playing field" provisions between highway and transit investments established under ISTEA, including the roughly four to one funding ratio. Without these provisions, modal balance—an important ISTEA hallmark—will be jeopardized.

NEXTEA: AN ASSESSMENT

There are three primary principles that APTA uses to evaluate the merits of NEXTEA and other reauthorization proposals. They are: 1) preservation of ISTEA's program structure and flexible funding provisions, 2) provision of adequate funding levels for transit formula and discretionary programs, and 3) provision of fair and equitable treatment for transit agencies of all sizes.

NEXTEA Preserves the ISTEA Structure and Flexible Funding Program

The first principle is important because ISTEA's program structure and flexible funding provisions promote balanced investment among modes and require a coordinated approach to major transportation investments. APTA firmly believes that federal interests are best served by a balanced transportation system. ISTEA's program structure and flexible funding provisions allow federal, state, and local resources to be used on a range of transportation alternatives, which permits state and local authorities to choose alternatives that best meet their particular objectives. This structure also allows transportation policy to address national and local needs while recognizing that transportation is linked to other factors that affect each community's economy and quality of life.

NEXTEA generally does a good job adhering to the first principle. It retains a strong federal role in surface transportation and in assuring minimum investment levels for all transportation modes by maintaining most of the current ISTEA program structure and requirements. It retains current flexible funding programs, the existing planning and decision-making process, and current metropolitan suballocations. Furthermore, NEXTEA would expand the size of the flexible Surface Transportation Program (STP) and Congestion Mitigation and Air Quality (CMAQ) programs, and make intercity passenger rail service an eligible expense under surface transportation programs. In addition, the federal share of most transit capital ex-

penditures would remain at 80 percent and at 90 percent for Clean Air Act and Americans with Disabilities Act (ADA) compliance efforts.

NEXTEA's Transit Funding Levels Fall Short of ISTEA Levels

The second principle is critical because additional investment in the nation's surface transportation network is necessary to provide a solid foundation for economic growth. For instance, in Paul Weyrich's recent analysis of mass transit, he notes that transit investment has generated substantial economic benefits, including increased tax revenues, jobs, and related development. An adequate federal commitment, along with efficient management and state and local participation is the key to these results.

NEXTEA falls short in addressing this second principle. The problem is underinvestment in our nation's transportation infrastructure. The U.S. Department of Transportation (DOT) estimates that more than $400 billion in capital funding is needed over six years just to maintain the current systems. The Administration's response is to provide flat funding. The NEXTEA proposal would authorize $166 billion to meet highway and transit needs over six years.

Additionally, NEXTEA authorizes $30.5 billion for transit, a three percent drop from ISTEA's six-year total of $31.5 billion. In contrast, the highway program would receive $135.8 billion over six years, up 10 percent from ISTEA's $123.3 billion.

APTA's reauthorization proposal would respond to these needs by providing increased resources. Our proposal deposits revenues from the "deficit reduction" 4.3 cents gas tax into the Highway Trust Fund and calls for the use of existing balances in the MTA to meet these needs. It also maintains some general fund support for transit activities.

Formula funding under NEXTEA would appear to increase as a share of total transit program funding, but several caveats are in order. First, each year, $100 million would be taken off the top for a new Access to Jobs and Training Program. Second, the Fixed Guideway Modernization (FGM) Program would be funded at the same level as the New Start program, but would be shifted to the formula program. Formula funding would be distributed under the current formula. It should also be noted that the current discretionary bus/bus facilities grant program (funded at $360 million in fiscal year 1997) is eliminated and funding that previously went to that program is apportioned under the urban formula program. In short, funding for the current urban formula program would barely change. ISTEA authorized $17.46 billion in formula funds over six years; NEXTEA would authorize $17.55 billion in formula funds over six years once the Access to Jobs and FGM funds are taken off the top. If the discretionary bus program were not incorporated into the formula program, formula funding would actually decline.

We strongly support the Administration's proposal to switch from the Rostenkowski Highway Trust Fund solvency test to the Byrd solvency test for gauging the commitments from the Mass Transit Account (MTA) of the Highway Trust Fund. This change would apply the same spending test to the Mass Transit and Highway Accounts and permit additional spending from the MTA. We have some concerns about the proposal to fund the entire transit program from the Mass Transit Account, because the revenues now deposited in the MTA would not sustain current program levels—let alone increases—for the transit program. While APTA also supports the use of existing balances in the MTA, these balances could be spent down quickly and current revenues dedicated to the MTA cannot meet the long-term funding needs of the federal transit program. More funding must be placed in the MTA.

NEXTEA Would Modify the Transit Program Structure

NEXTEA does a mixed job of meeting the third principle, provision of fair and equitable treatment for transit agencies in large, medium-sized, and small urbanized and in rural areas. APTA fully supports the existing funding ratios within the ISTEA transit program. First, we support the current ratio of $1.36 in formula funding for every $1 in discretionary funding. This provides an equitable distribution among all transit needs. In addition, APTA urges Congress to retain the existing distribution of funds within the discretionary capital program. Current law dictates that 40 percent of this program goes to new rail starts, 40 percent goes to rail modernization, and 20 percent goes to the bus/bus facilities.

We oppose the proposal to eliminate the Bus Discretionary program and to fold the Fixed Guideway Modernization program into the formula program. Moving the Bus and Fixed Guideway Modernization programs into the formula program would upset the current relationship among new starts, rail modernization, and bus under the current discretionary capital program. These programs address special needs, have worked extremely well in their current form, and do not need to be changed. Also shifting the rail modernization program to the formula program would change

the allocation of funds between bus and rail, increasing the latter at the expense of the former.

On the positive side for urbanized areas of all sizes, NEXTEA would expand the definition of eligible capital expenditures to be more consistent with permissible expenditures in the highway program, including preventive maintenance. These changes, along with certain changes that would permit the use of capital funds to meet ADA costs, would allow elimination of operating assistance for areas of 200,000 or more in population.

APTA also strongly supports the provision to permit urbanized areas (UZA's) with less than 200,000 in population to have the flexibility to use formula funds for capital or operating purposes at their discretion.

For rural transit providers the NEXTEA proposal reduces authorized funding and places service to customers at risk. The Non-urban program (formerly section 18) would receive 3.75 percent of an expanded formula program—a lower percentage than the current 5.5 percent of the combined total for urban and rural formula funds. Of the total, 4 percent would go to the Rural Transportation Assistance Program, which is now funded through the Research program. The elimination of the Bus Discretionary Program would take away a guaranteed 5.5 percent share of that program for rural communities.

Other NEXTEA Provisions

The NEXTEA proposal includes a $100 million per year Access to Jobs and Training Initiative. In general we support this program, but oppose taking the funding as a takedown from the existing formula program. Such an important national priority deserves new resources. We also support NEXTEA's Intelligent Transportation System provisions and proposed expansion of the State Infrastructure Bank (SIB) program that would allow all states to participate, although we do note that flexible highway funds placed in the SIB can only be used initially for highway projects, which is inconsistent with the "level playing field" principles of ISTEA. In addition, we support the creation of a new Infrastructure Credit Enhancement Program to encourage public-private partnerships to speed the completion of major highway, bridge, transit, and rail projects.

THE APTA PROPOSAL

We have previously submitted to you APTA's reauthorization proposal and we are pleased to note that many of APTA's recommendations, including elimination of the operating cap for small urbanized areas and inclusion of an expanded definition of what constitutes a capital expenditure, are included in the NEXTEA proposal. We would be pleased to provide you with additional copies of our detailed proposal.

Expand Opportunities for Flexible Funding

The APTA proposal also calls for an increase in the authorized funding level for the Surface Transportation Program using resources from the Highway Trust Funds's Highway Account (HA) and Mass Transit Account (MTA). After the transit core program has been funded at our recommended level of $6.25 billion in fiscal year 1998, additional MTA funds would go to a new STP-transit program. For each $1.00 of MTA funds that go to the STP-transit program, an additional $2.00 in Highway Account funds would go to the STP-highway program. Funding for each program would be apportioned in the same manner as the existing STP program, would include metropolitan area suballocations, and would be subject to the same planning standards.

4.3 Cents/Gallon Revenue

Additional resources for the expanded STP program would be provided by depositing revenue from the 4.3 cents per gallon "deficit reduction" motor fuels tax into the Highway Trust Fund and by applying the Byrd rule solvency test to the Mass Transit Account of the Highway Trust Fund. APTA's proposal would allocate one-half-cent of the 4.3 cents per gallon gas tax revenue for a new intercity passenger rail account and the revenue from 20 percent of the remaining 3.8 cents to the Mass Transit Account.

Fixed Guideway Modernization Program Recommendations

APTA's proposal calls for a modification of the existing Fixed Guideway Modernization formula. The Fixed Guideway Modernization program should be retained as a distinct program within the Major Capital Grant program (formerly Section 3). This program addresses a specific need to modernize aging fixed guideway systems. Funding levels for the New Starts, Fixed Guideway Modernization, and Bus/Bus Fa-

cilities programs should be funded on the current 40/40/20 basis, with funding for the Fixed Guideway Modernization program set at $1 billion in fiscal year 1998.

With regard to the distribution of Fixed Guideway Modernization funds we have a detailed proposal that would largely retain the current formula distribution, with some modifications, up to the current funding level of $760 million, but would increase the share of modernization funds that goes to areas with newer fixed guideway systems as funding rises above the current level. We will submit to the Committee under separate cover copies of our Fixed Guideway Modernization proposal.

CONCLUSION

Mr. Chairman, APTA strongly supports a continued federal role in funding surface transportation. ISTEA has worked well and must be continued. While we recognize the need to control spending and reduce the deficit, increased investment in the transportation infrastructure is needed to facilitate economic growth, international competitiveness, successful welfare reform, and other national goals. Putting off necessary investment will only increase federal costs in the long run. We urge this Committee to support authorization levels that reflect these important policy goals by appropriating federal user taxes the American people are already paying. The Administration's NEXTEA proposal is a good start, but does not include adequate funding levels for surface transportation in general and public transportation in particular.

STATEMENT OF HARRY W. BLUNT, JR., PRESIDENT, CONCORD COACH LINES, INC., VICE CHAIRMAN, AMERICAN BUS ASSOCIATION

Senator SHELBY. Mr. Blunt.

Mr. BLUNT. Thank you, Senator. On behalf of the American Bus Association, I think we can address the core issues of ISTEA reauthorization quite quickly.

We support the administration's proposal on the National Highway System Program. Two years ago we were active in the passage of the NHS legislation. For the first time the focus was on connectability in our transportation system. The bus industry fought to get our terminals onto the NHS system map. The administration proposal under NEXTEA will now make funding available for intermodal terminal facilities. We think that is very important.

Second, we support the administration's proposal in the surface transportation program to make capital funds available to bus companies to acquire vehicles and to enhance public transportation over the highway network.

Third, ABA opposes the administration plan to eliminate the rural intercity bus program contained in section 18(i) of the Federal Transit Act. Our industry is beginning to work with many States to help provide essential ground transportation to small rural communities through 18(i) funding. This is a very small piece of the overall funding. Yet, the administration has chosen to take it out. We think this is wrong. If this funding is lost, communities in small rural America will lose all connection to any public transportation.

Fourth, ABA supports removing the highway trust fund from the unified budget and believes that all funds that are collected should be used as promised to the American taxpayer for highway transportation systems. We oppose the diversion of highway trust fund revenues to nonhighway users.

ABA supports the repeal of 4.3 cents per gallon Federal fuel tax that presently goes to the general fund for deficit reduction. However, if these funds were placed in the highway trust fund, we would support that. We just do not believe that the highway trust fund should be used for budget balancing.

We support a continued role in highway planning and funding on behalf of the Federal Government. Our highway system is a national system with regional and national interests that must play a role in its operation.

ABA takes no position on the various proposals to amend the current formula funding for distribution of Federal highway funds to the States. Our concern is to increase the overall level of funding in the program and to address the deteriorating infrastructure of our National Highway System.

In closing, let me speak for a minute about a positive. I arose this morning at 4:20 a.m. in New London, NH, a city that is over 500 miles from here. I took a quick shower, grabbed a cup of coffee, and jumped in my car. In 5 minutes I was in a park-and-ride lot where I got on a bus that took me directly to Manchester Airport. I was in Washington at quarter of 8 and in center city Washington by 10 after 8. In just under 4 hours, I was from the shower to the Senate, an amazing feat in this Nation.

PREPARED STATEMENT

We are the envy of the world in our transportation system, and I strongly urge you to continue to support that and fully fund it.

Thank you, Senator.

[The statement follows:]

PREPARED STATEMENT OF HARRY W. BLUNT, JR.

Mr. Chairman and Members of the Subcommittee: My name is Harry Blunt. I am the President of Concord Coach Lines, Inc., of Concord, New Hampshire. I also serve as the Vice Chairman of the Board of Directors for the American Bus Association (ABA), and I am here today to present ABA's views on reauthorization of the federal aid highway and highway safety programs as proposed in the Administration's National Economic Crossroads Transportation Efficiency Act of 1997 (NEXTEA).

ABA is the national trade association of the intercity bus industry. We have about 3,000 members, some 700 of whom are bus operators. They offer a variety of bus services:

—regular route intercity service between fixed points on set schedules;
—charter service, where a group of passengers (such as a church or organization) purchases all of the seats on a bus for exclusive use on a particular trip;
—tour service, which usually includes stops for sightseeing and recreational purposes;
—commuter bus services, generally from the suburbs into urban areas; and
—special operations, which is scheduled service to enhance public transportation systems (such as bus service from a city to an airport), or may be connected with a special event or attraction at the destination.

The rest of ABA's members include representatives of the travel and tourism industry, and the manufacturers and suppliers of products and services used by the bus industry.

Intercity bus service is the primary system of low cost intercity passenger transportation in this country. In rural areas, bus service is virtually the only transportation network available to the public. Yet public policy as set out in the federal-aid highway and mass transit programs over the years has not reflected the overriding importance of the bus industry in passenger transportation, and in fact, has discouraged low cost bus transportation in favor of higher cost alternatives. This must change; Congress must give the intercity bus industry a more central role in providing essential intercity public transportation.

ABA's positions on the core funding issues in the reauthorizing debate can be summarized as follows:

1. ABA supports removing the Highway Trust Fund from the unified budget as a mechanism to ensure that monies collected for highway construction, maintenance and repair, and highway safety programs are spent as promised.

2. ABA supports increased funding for highway programs to address the deteriorating infrastructure of our national highway system.

3. ABA supports the Administration's proposal in the National Highway System Program to make funds available for capital investments in publicly-owned intercity bus or intermodal terminals.

4. ABA also supports the Administration's proposal in the Surface Transportation Program to make capital funds available for privately-owned intercity bus companies to acquire vehicles and facilities.

5. ABA opposes the Administration's proposal to eliminate the rural intercity bus program contained in section 18(i) of the Federal Transit Act as amended by the 1991 Intermodal surface Transportation Efficiency Act (ISTEA) (49 U.S.C. 5311(f)).

6. ABA supports repeal of the 4.3 cents per gallon diesel fuel tax that presently goes into the general fund. Alternatively, ABA would support placing these revenues in the Highway Trust Fund to be spent on highway programs.

7. ABA opposes the diversion of any Highway Trust Fund revenues for non-highway purposes.

8. ABA supports continued federal role in highway planning and funding, and opposes efforts to return the federal-aid highway system to the states.

9. ABA takes no position on the various proposals to amend the current funding formulas for distribution of federal highway funds to the states—our concern is to increase the overall level of funding in the program.

Several salient statistics underscore the obvious importance of bus travel in the national transportation network when compared to transportation by Amtrak or commercial airlines, its two modal competitors for intercity public transportation of passengers.

Intercity buses serve many more points than either Amtrak or airlines.—Table 1 shows, on a state by state basis, the number of communities served by the intercity bus industry as compared with Amtrak and commercial airlines. In every state, the bus industry serves many more cities and towns than the competing modes. In my home state of New Hampshire, for instance, Amtrak serves one point and the airlines serve three points, while the bus industry serves 33 communities with scheduled service. In your home state of Alabama, Mr. Chairman, Amtrak serves ten points, the airlines serve nine points, and the bus industry serves 110 communities with daily service.

Figure 1 is a bar graph showing the number of communities served nationwide by Amtrak, the airlines, and the bus industry. Cumulatively, Amtrak serves 511 communities, the airlines serve 758 communities, and the intercity bus industry serves 4,274 communities on a daily basis with scheduled regular route service.[1] (This bus figure does not include "flag stops," at which a passenger may flag down a bus to stop for embarking passengers even though no stop is scheduled at that point.)

Intercity bus service is much more frequent than Amtrak or airline service.—Generally, buses not only serve more points than their competitors, but where the modes do compete the bus service is much more frequent than either Amtrak or airline service.

Intercity bus service is the most affordable transportation.—Bus service is also generally less expensive than Amtrak or the airlines. Even with discount fares, Amtrak and the airlines cannot compete on price with intercity bus service, which remains the most economical method of transportation. For example, on the Birmingham-Atlanta route, Delta Airlines quotes an unrestricted round trip fare of $550.00, and Amtrak's regular round trip fare is $78.00, while Greyhound's regular round trip fare is $47.00.

Low cost service is why buses are the mode of choice for the elderly, students, members of the military, and those at the lower end of the income spectrum. Greyhound Lines, Inc. has discovered through surveys that some 44 percent of its passengers have annual incomes of less than $15,000.

In other words, buses are the only mode that take you where you want to go, when you want to go, and at a price you can afford.

Notwithstanding the essential nature of the bus industry compared to other modes, and the fact that buses carry the old, the young, the poor, and those in rural America, federal transportation programs have ignored the bus industry while heavily subsidizing our competitors. The bus industry receives no direct operating subsidies, and very little federal support of any kind.

Robert R. Nathan Associates Inc. has conducted an exhaustive study of the total federal subsidies, net of user fees, received by each passenger transportation mode from 1960 through 1993.[2] This study aggregated outlays from federal funds and

[2] *The Impact of Higher Motor Fuel Taxes on the Intercity Bus Industry,* Robert R. Nathan Associates, Arlington, Va. (July 1995). This was an update of an earlier work, *Federal Subsidies*

trust funds for each major passenger transportation system—air, highway, intercity rail, and mass transit, according to the cost responsibility of each mode. In addition, the study attributed receipts into the Airport and Airways Trust Fund and the Highway Trust Fund paid by airlines and the bus industry, respectively, and into the general fund by all modes. Subsidies were then measured by subtracting the allocated receipts from the allocated federal outlays for each mode.

The results are striking. As shown in Figure 1, from 1960 to 1993, measured in constant 1993 dollars, mass transit has received a net subsidy of $91.2 billion, aviation has received a net subsidy of $104.5 billion,[3] and Amtrak has received a net subsidy of $24.6 billion. The intercity bus industry, in marked contrast, from 1960 through 1993 received a net subsidy of only $600 million. While Amtrak and the commercial airlines combined received more than $79 billion in net subsidies from the federal government, the bus industry received less than one percent of that amount. Yet the bus industry is expected to compete on an equal footing with air and rail transportation.

The disparity in federal subsidies by mode is even more outrageous when viewed per passenger trip. Figure 2 shows that commercial airline passengers have received a net subsidy of $6.38 per trip, mass transit passengers have received a net subsidy of $0.33 per trip, Amtrak passengers received a net subsidy of $54.88 per trip, and intercity bus passengers received a net subsidy of five cents per trip. Bus passengers get a nickel from the federal government while Amtrak passengers get $54.88 from the federal government for every trip they take.[4]

This is public policy at its worst. The federal government should not pick and choose winners in the passenger transportation industry any more than it should determine winners and losers in any other markets. Yet by heavily subsidizing Amtrak and commercial airline passengers, but not bus passengers, federal policy has created an atmosphere so financially skewed that bus operators find it extremely difficult to compete effectively with other modes.

Reauthorization of ISTEA presents an opportunity to level the playing field for passenger transportation. ISTEA as enacted in 1991 began this process. The intercity bus industry made considerable gains as a result of that legislation, but they represent only a start. The Administration's NEXTEA proposal builds on this beginning by expanding the scope of intercity bus projects eligible for federal funding.

INTERMODAL TRANSPORTATION CENTERS AND ROLLING STOCK ACQUISITION

The intercity bus industry's greatest need, and the most promising area for public policy successes, is the continued development and funding of intermodal transportation centers. ISTEA contained several provisions that allow states to fund intermodal transportation centers. Section 133 of title 23, United States Code currently permits states to obligate funds apportioned under the Surface Transportation Program for capital costs for "publicly owned intracity or intercity bus terminals or facilities." Additionally, section 134 of title 23 directs metropolitan planning organizations to develop plans and programs to provide for facilities that will function as an "intermodal transportation system" for the state.

There have been some success stories as a result of these provisions. South Station in Boston shows the promise of becoming a highly efficient intermodal transportation facility. The station serves Amtrak as well as my bus company, Concord Trailways, along with Greyhound Lines, Peter Pan Trailways, Bonanza Bus Lines, and Plymouth & Brockton Street Railway Company (another bus carrier). The bus portion of the terminal opened on November 1, 1995, and the bus carriers now provide connecting service to the Amtrak schedules, and vice versa. In addition, there is a subway stop on the MBTA line at the station, and the station is also a terminal for intracity transit buses.

When the Central Artery project in Boston is completed, there will also be a direct shuttle bus service from South Station to Logan Airport, using a new tunnel under Boston Harbor.

---

for Passenger Transportation. 1960–1988: Winners, Losers, and Implications for the Future, Robert R. Nathan Associates, Inc., Arlington, Va. (1989).

[3] Of this total, $52.3 billion of the net subsidy went to commercial air carriers and $52.2 billion of the subsidy went to general aviation.

[4] A recent study by the Cato Institute estimates an even higher per passenger subsidy for Amtrak riders. According to Jean Love, Wendell Cox, and Stephen Moore, "Amtrak at Twenty-Five, End of the Line for Taxpayer Subsidies," Cato Institute, Policy Analysis No. 266, Washington, D.C. (December 19, 1996), the average taxpayer subsidy per Amtrak rider is $100, or 40 percent of the total per passenger cost. On some of the long-distance routes, such as Los Angeles to New York, the study found that the per passenger subsidy exceeds $1,000.

At present, the South Station is a tremendous improvement over the prior connections. Previously, bus carriers had to park vehicles and discharge passengers across the street from the train station. When the South Station is completed, bus passengers will be carried on a people mover to the train portion of the station, for easier connections without going out into the elements.

South Station is also a success because of the federal-state partnership that funded and developed the project. In addition, the fact that the station is operated by the Massachusetts Bay Transportation Authority eliminates the competitive concerns about terminal access and rent that plague carrier-owned and operated stations where competitors rent space and services from other carriers. Multi-purpose stations, run by state or local government entities, with access for all modes, in a favorable location close to highway, rail and air connections, are the best possible method of achieving the goal to facilitate intermodal passenger transportation as set out in ISTEA. The reauthorizing bill should continue this approach.

These facilities are win-win-win scenarios. The public sector wins, because the carriers pay rent to fund the capital investment necessary to build the structures. The private sector wins, because the carriers do not need to generate the substantial amounts of construction capital. And the passengers win, because they benefit from improved service and streamlined connections.

The only problem with South Station is that there are not more examples of this facility built as a result of ISTEA funding and directives. Under § 1003(a)(4) of the Administration's NEXTEA proposal, "publicly owned . . . intercity passenger rail or bus terminals" would be eligible for capital funding in the National Highway System program. ABA supports this proposal, but encourages Congress to do more to ensure that a portion of state funds allocated under this program be used to construct, maintain and operate intermodal passenger facilities. The metropolitan planning organizations need some incentives or directives to include intermodal facilities in their plans, and Congress should plainly provide that federal funds are to be used for such projects.

Moreover, the National Highway System funds should be available for privately owned and operated terminals as long as the operator grants access to all carriers, whether or not competitors, without discrimination, as allowed by space constraints. The private sector can effectively leverage federal funds to construct, maintain and operate intercity passenger terminals for bus and rail transportation. With adequate federal supervision, there is no compelling policy reason to exclude privately-owned facilities from receiving funds under this program as well.

ABA further supports the Administration's proposal in § 1014(a) of NEXTEA to expand the funding eligibility in the Surface Transportation Program to include privately-owned intercity bus companies to acquire vehicles and facilities on the same basis as capital projects under the current 49 U.S.C. § 5302(a)(1). This will encourage private sector intercity bus companies to develop additional service in conjunction with rail and intracity passenger transportation providers.

SECTION 18(I) INTERCITY BUS TRANSPORTATION FUNDING

Section 18(i) of the Federal Transit Act, as amended in ISTEA, directs states to spend 15 percent of their rural transit funds each year to "develop and support intercity bus transportation." *See* 49 U.S.C. § 5311(f). This was the first time that states were actually directed by Congress to expend highway funds to promote intercity bus service. Under that provision, however, a state need not spend these funds on bus transportation, if the Governor of the state certifies to the Secretary of Transportation that "the intercity bus service needs of the State are being adequately met" in that particular fiscal year.

ABA does not believe that there are any states in which there are no unmet intercity bus service needs. Nevertheless, in the first few years under ISTEA many states routinely certified that there were no unmet intercity bus service needs, and therefore avoided using the section 18(i) funds for intercity bus purposes. ABA member companies have begun an educational process in many states to discuss their rural transportation needs, and the results are encouraging.

In Texas, for example, the Governor certified for several years that there were no unmet intercity bus service needs, even though Texas has one of the largest populations of rural, poor bus passengers in the country. A couple of years ago, Kerrville Bus Company in Kerrville, Texas began meeting with the Texas Department of Transportation to explore ways to use the section 18(i) funds as Congress intended. As a result of those meetings, three new bus terminals are either operating or under construction in rural areas.

The Brazos Valley Transit Authority used a section 18(i) grant to purchase a property and building in Lufkin, Texas and converted it into a combination transit

and intercity bus terminal. Similarly, the City of Del Rio, Texas used state funds under section 18(i) to construct a combination bus terminal. The City of Fredricksburg, Texas is also using section 18(i) funds to build a combination terminal, and Kerrville Bus Company is contributing $20,000 of its own capital towards the construction costs. Of course, Kerrville will also pay rent to use these facilities, and the bus passengers in rural Texas have three new terminals for intercity service.

ABA strongly supports continuation of the section 18(i) set aside program in the reauthorization legislation. Some $17 million was appropriated by Congress for fiscal year 1997, which is *de minimis* in the context of the entire transit appropriation, but tremendously important to those passengers who depend on intercity bus transportation.

The Administration has proposed to eliminate the section 18(i) set aside program, citing the expanded eligibility for facility and vehicle funding under the National Highway System and Surface Transportation Programs as an adequate replacement.

Without a specific set aside, intercity bus carriers in many states will not be able to beat competing interests for these funds, and the needs of rural passenger transportation will not be met. Although the Administration's bill does expand the types of projects eligible for federal funds, there is no assurance that these projects will actually be funded. The section 18(i) set aside was the only program that directed states to spend money on rural intercity bus transportation, and, as outlined above, many states have avoided funding intercity bus projects even under that program. ABA urges Congress to retain the section 18(i) program.

HIGHWAY TRUST FUND ISSUES

ABA supports congressional efforts to take the Highway Trust Fund off the unified budget so that the annual trust fund surplus is not used to mask the size of the federal budget deficit. The Highway Trust Fund taxes were not intended to serve as general fund taxes that might be raised or lowered according to overall spending needs. Rather, the Highway Trust Fund taxes were intended to support a federal-aid highway and bridge program that benefits all highway users and serves as a catalyst for national economic growth.

Since the inception of the Interstate Highway System in 1956, all federal fuel taxes were paid into the Highway Trust Fund and then disbursed to the states for highways and bridges. Highway users, including the intercity bus industry, were willing to pay their federal fuel taxes as an investment in the nation's infrastructure. This trust fund system has provided a nationwide highway system that has played a critical role in the economic development of this country and contributed dramatically to the mobility of Americans.

By refusing to spend some of the trust fund revenues, Congress and the Administration have transformed the Trust Fund into a general fund, to be spent or not spent as other federal budget priorities dictate. This breaks the faith with all highway users who pay into the Trust Fund, only to see their tax dollars spent on projects other than the highway program. ABA urges Congress to restore the Trust Fund concept by removing the Fund from the unified federal budget, and allowing all highway tax revenues to be spent for highway purposes.

ABA also strongly opposes continuing the 4.3 cents per gallon tax on diesel fuel if the revenue flows into the general fund for deficit reduction purposes. The intercity bus industry pays approximately $7.4 million per year in additional taxes because of the 4.3 cents per gallon surtax.[5] This money is not being used for highway purposes.

The trust fund concept was again breached in 1993 by the Omnibus Budget Reconciliation Act (OBRA), which imposed the 4.3 cents per gallon federal fuel tax but diverted the revenue to the general fund to reduce the size of the federal budget deficit.

If the highway system were in adequate repair, this diversion might not present such a critical issue to the intercity bus industry and other highway users. But by any measure, the infrastructure of highways and bridges in this country are deteriorating, and the trust fund spending is falling farther behind investment needs each year.

ABA believes that all revenues from federal fuel taxes on highway vehicles should go into the Highway Trust Fund to ensure that the investment in the nation's highway system does not fall prey to short term attempts to reduce the federal deficit.

[5] The intercity bus industry operates approximately 945 million bus miles and consumes about 172 million gallons of diesel fuel per year. The number of gallons multiplied by 4.3 cents per gallon yields an annual tax revenue of $7.4 million.

Moreover, Congress and the Administration have failed to spend the full amount of highway tax revenues collected in the Highway Trust Fund, thereby generating a substantial surplus in the Trust Fund. It makes no sense to impose a 4.3 cents per gallon surtax on highway users when the other highway tax revenues are not fully allocated for their intended purpose each year. For these reasons, ABA supports repealing the 4.3 cents per gallon fuel tax for deficit reduction. As an alternative, ABA would support placing the revenues from this 4.3 cents surtax into the Highway Trust Fund.

Finally, ABA strongly opposes the Administration's proposal for operating grants to Amtrak out of the Highway Trust Fund. The Administration proposes a grant of $344 million in fiscal year 1998 alone, and total grants of $1.354 billion in operating subsidies over the six-year life of the program. In addition, the Administration proposes capital investment grants for Amtrak out of the Highway Trust Fund in the amount of $423,450,000 per year for six years, and supplemental capital investment grants totalling $874 million over the life of the program.

As discussed in detail above, the intercity bus industry competes directly with Amtrak for passengers on all routes and in all corridors. Over its 25-year history, Amtrak has received an extraordinary federal subsidy for both capital and operating costs. Now the Administration is proposing a further capital and operating subsidy for Amtrak out of Highway Trust Fund revenues. If this provision were enacted, a portion of the intercity bus industry's federal highway use taxes would be used to subsidize a competitor instead of being spent, as intended initially, on highway construction, repair and maintenance.

ABA opposes funding Amtrak out of Highway Trust Fund revenues, and at the very least recommends that the intercity bus industry be exempted from paying taxes that would be used to support competition from Amtrak. Alternatively, ABA supports a dedicated source of funding for Amtrak only through a Surface Transportation Trust Fund in which the intercity bus industry is eligible for similar types of capital and operating grants. Further, any monies expended for Amtrak should be subject to annual appropriations, and not the contract authority envisioned in the Administration's bill.

In addition to Amtrak, the intercity bus industry must also compete with commercial airline service that has been subsidized under the Essential Air Service program for almost 20 years. In the Federal Aviation Authorization Act of 1996, Congress directed that $50 million be set aside and made available to carry out the EAS program for fiscal year 1997.

FUNDING FORMULA ISSUES

ABA takes no position on the various proposals for changing the allocation formulas under which states receive federal-aid highway money. As stated above, ABA's primary concern is that the amount of money expended on highways increases to keep pace with infrastructure needs.

ABA does, however, believe that there is a need for a fundamental federal role in the highway program, and that the entire authorization and taxation program should not be merely turned back to the states as a means of avoiding the allocation debate.

The federal government has played a guiding role in establishing a national infrastructure of highways and bridges. There is no guarantee that states would cooperate sufficiently to maintain such a system. Nor is there any assurance that if the federal highway taxes were repealed or reduced that the states would be able to raise their state taxes correspondingly to account for the revenue shortfall. The federal-aid highway program has a long history of success that should not be ignored merely because of issues regarding the proper allocation formulas.

I appreciate the opportunity to testify on this legislation, and I will attempt to answer any questions you might have or supply you with any additional information you might need.

NATIONAL CENTER FOR MISSING AND EXPLOITED CHILDREN

Senator SHELBY. That is an amazing morning. [Laughter.]

Mr. Gruel, Senator Lautenberg wanted me to tell you that he very much—he was here earlier, as you will recall—wanted to be here for your testimony, but he is required to be—he is a senior member of the Budget Committee—in some meetings with the White House. He wanted to say this to you.

Mr. GRUEL. Thank you, Mr. Chairman.

Senator SHELBY. I have got a statement.

And I am going to keep the record open because I have a number of questions to all of you for the record and I know Senator Byrd, Senator Lautenberg, and others would too. And we will move on with the panel from there.

The six of you here represent a significant portion of the surface transportation industry in America, and I want to take this opportunity to draw to your attention an effort that I would encourage all of you to explore and see if there is a way that your groups might get involved. A lot of you are probably already involved.

And the effort is the National Center for Missing and Exploited Children, and they are people who place the pictures of missing children on milk cartons, on the flyers you receive in the mail—we are all aware of this—on the kiosks, and some of our transportation hubs. And it is working. It is working for parents. It is working for children. It is working for all America.

Transportation, as you know from being here today, can play a significant role in identifying and recovering missing children. Transportation touches virtually every American's life on an almost daily basis, and if we, through the transportation system that you represent, can encourage people not to forget these missing and exploited children, we might be able to find more of those lost children.

I know you would join me in this effort because you together can make a difference and are probably already making a difference collectively. I know a number of your organizations and member companies are already participating in this effort, and I want to commend you for it, congratulate you for it. But if there are ways to take advantage of the communication channels that you already utilize to your membership, to your passengers, to your customers, it is really worth looking into because all Americans will benefit from this. I think it is a very worthy project, and you have seen the results from it.

If you have, I commend you. If you will consider it, I congratulate you because it will make a difference in families' lives and children's lives if we can do it.

I appreciate all of you coming here. I am sorry that this went on so long this morning.

SUBCOMMITTEE RECESS

This hearing of the Subcommittee on Transportation is now recessed. The next subcommittee hearing will be held on Wednesday, April 16, at 10 o'clock in Dirksen 124. The topic of the hearing will be aviation safety and security.

Thank you, gentlemen.

[Whereupon, at 12:48 p.m., Thursday, April 10, the subcommittee was recessed, to reconvene at 10:01 a.m., Wednesday, April 16.]

MATERIAL SUBMITTED SUBSEQUENT TO CONCLUSION OF HEARING

[CLERK'S NOTE.—The following material was not presented at the hearing, but was submitted to the subcommittee for inclusion in the record subsequent to the hearing:]

ASSOCIATION OF AMERICAN RAILROADS

PREPARED STATEMENT OF KAREN BORLAUG PHILLIPS, SENIOR VICE PRESIDENT

INTRODUCTION

Mr. Chairman and members of the Subcommittee, my name is Karen Phillips. I am Senior Vice President of the Association of American Railroads (AAR).[1] I appreciate the opportunity to present this statement to the Subcommittee concerning AAR's views on the reauthorization of the Intermodal Surface Transportation Assistance Act (ISTEA).

I would like to discuss four particular issues of significant concern to the railroad industry. The first of these issues is one of overriding interest to all of us—transportation safety, and in this instance safety at highway-rail grade crossings. The second issue involves an essential element in any serious effort to continue to improve the movement of freight in this country and in the global marketplace—intermodalism, and specifically the important connections between different transportation modes. Third, I would like to address the roles of States and MPO's in effective transportation planning, and, finally, I will briefly discuss the important issue of federal truck size and weight standards.

HIGHWAY-RAIL GRADE CROSSINGS

There has been an extremely successful partnership among federal and state governments, the railroad industry, and other transportation safety interests for many years. This partnership has resulted in a reduction in annual public grade crossing accidents of over 65 percent since the early 1970's. This success has been accomplished primarily as a result of engineering improvements carried out under the federal Section 130 Program, and the driver education/public information and traffic law enforcement efforts of the Operation Lifesaver Program. In fact, the Federal Highway Administration estimates that the Section 130 Program and Operation Lifesaver efforts have prevented over 8,500 fatalities and 38,900 serious injuries since 1974.

Despite the impressive safety improvement, the record of 3,697 accidents and 432 fatalities at public grade crossings in 1996 is unacceptable. More must be done to eliminate these tragic accidents, and the partnership among the involved interests must be strengthened. AAR is proposing four initiatives which it believes will result in a significant improvement in highway-rail grade crossing safety:

1. *The federal government should continue and increase funding for the Section 130 Grade Crossing Improvement Program.*—The historic Highway Safety Act of 1973 created and funded a national highway safety program specifically dedicated to enhanced safety at highway-rail crossings by providing for needed engineering and warning device improvements (Section 130 Program). In fiscal year 1997, approximately $150 million in highway user revenues was apportioned to the states to carry out this important program. As mentioned earlier, as a direct result of the earmarked federal funding for highway-rail crossing improvements, the annual crossing accident rate has been reduced by over 65 percent. This substantial reduc-

[1] AAR is a trade association whose members account for 75 percent of total rail line-haul mileage, produce 93 percent of total rail freight revenues, and employ 91 percent of the freight railway work force.

tion in accidents has occurred despite significant increases in both highway and rail traffic.

Without funding dedicated or earmarked for the Section 130 Program, crossing projects rarely compete successfully with more traditional highway needs, such as highway capacity improvements and highway maintenance. In fact, this problem was the primary reason a separate crossing improvement program was established in 1973. Despite the proven success of the Section 130 Program, however, many states continue to assign an extremely low priority to crossing improvement projects. Through the end of 1996, over $227 million of Section 130 Program funds remained unspent by the states, and approximately $230 million had been transferred to other federal-aid highway program categories.

Earmarked funding for the Section 130 Program should be continued, and the annual funding level should be increased to at least $185 million. The "Rail-Highway Crossing Study" completed by the U.S. Department of Transportation in 1989 found that:

> "For warning systems, an estimated annual investment of $185 million in improvements is necessary to maintain current overall safety performance. . . . An initiative to cost effectively reduce current accident levels would require another $30 million annually."

Additionally, in order to increase state priority for Section 130 Program projects and assure crossing improvement spending, the authority to transfer Section 130 Program funds to other federal-aid highway program categories should be restricted and obligation authority should be specifically reserved for the Section 130 Program.

2. *The federal government should establish a national mandate and a uniform process for closing unnecessary public grade crossings.*—Highway and rail safety officials have long advocated the closure of a large proportion of the public highway-rail grade crossings in the United States. Many grade crossings are redundant, serve no significant transportation mobility or access purpose, and continue to constitute a rail and highway safety hazard.

However, closing grade crossings is often not an objective transportation safety decision because the issue causes local emotional/political confrontations. The railroads support the establishment by Congress of a federal crossing closing program implemented through a uniform nationwide process. Such a process should require state transportation agencies to identify and evaluate candidate crossings for closure, utilizing uniform criteria established by the U.S. Secretary of Transportation, and to develop and implement a statewide crossing closing plan. Active participation in this National Grade Crossing Closure Program should be required of all states. DOT should also develop guidelines which states would be required to follow in deciding whether to permit the opening or creation of any new grade crossings.

3. *The federal government should finance a multi-year national grade crossing safety education and public awareness campaign to be conducted by Operation Lifesaver. Inc.*—Since motorists frequently are unaware of the grave dangers of their behavior, government should take responsibility for a major, multi-year public awareness campaign designed to illustrate the life-or-death consequences of motorists' behavior at grade crossings. ISTEA authorized $300,000 annually for the National Operation Lifesaver Program to increase public awareness of the grade crossing safety problem. Additional funds to support Operation Lifesaver are generally included in annual Federal Railroad Administration appropriations. However, a substantially increased commitment of resources is required to ensure the broadest understanding of the inherent danger of highway-rail grade crossings and the critical responsibility of motorists and the public to exercise appropriate care.

This expanded national Operation Lifesaver campaign must garner the same universal recognition and acceptance that Mothers Against Drunk Driving (MADD), for example, enjoys for its attack on drunk driving. The need to "Look, Listen . . . and Live" at grade crossings must be as familiar to the general public as "Friends Don't Let Friends Drive Drunk".

As an example of a possible component of such a national campaign, Operation Lifesaver—joined by FRA and various state agencies—is sponsoring a national campaign called "Highway or Dieways." AAR is giving significant support to this campaign. This is a very graphic and hard-hitting public service advertising campaign promoting highway-rail grade crossing safety. The campaign consists of television and radio spots, print advertising, and billboards. The strategy is to introduce the campaign in every state through Operation Lifesaver state coordinators. Begun in 1996, it has been introduced in five states, Texas, Georgia, South Carolina, Alabama, and Missouri, and has received significant media interest. The campaign will also will begin this month in Ohio and California.

4. *The federal government should create a national grade crossing warning device problem alert system.*—Despite regular and thorough grade crossing warning device testing, inspection, and maintenance conducted by railroad personnel, the industry has occasionally experienced problems in receiving timely and accurate notification when warning device problems occur. To address this problem, in 1982, the Texas legislature created the Texas 1–800 Number Rail-Highway Crossing Notification Program. Texas has installed signs at public crossings encouraging the public to call the 1–800 telephone number in the event of a crossing warning device problem. The calls are received by the Texas State Police, which in turn alert the appropriate railroad personnel.

The railroad experience with the Texas 1–800 System has been generally positive. Although occasional "crank" calls are received and the public's perception of a warning device problem may be inaccurate, the system continues to provide valuable and timely information concerning warning device problems to appropriate railroad maintenance personnel.

The railroad industry supports the creation of a publicly funded, nationwide grade crossing warning device problem alert system operated by appropriate state agencies. The federal government should evaluate the feasibility of a variety of possible nationwide alert systems, and adopt and implement an effective system.

These four grade crossing safety initiatives will significantly enhance safety at highway-rail grade crossings and strengthen the essential partnership between the railroad industry and government. I urge the Congress to include these recommendations in ISTEA reauthorization legislation.

INTERMODAL CONNECTORS

I would now like to discuss briefly the second issue of concern to the railroad industry—intermodalism and intermodal connector highways.

In ISTEA, Congress declared that:

It is the policy of the United States to develop a National Intermodal Transportation System . . . The National Intermodal Transportation System shall consist of all forms of transportation in a unified, interconnected manner . . .

In an effort to achieve that important objective, the Congress established the National Highway System, and determined that:

> The purpose of the National Highway System is to provide an interconnected system of principal arterial routes which will serve major population centers, international border crossings, ports, airports, public transportation facilities, and other intermodal transportation facilities . . .

The importance of the interconnectivity of our transportation modes and systems was subsequently underscored by the National Commission on Intermodal Transportation when it found that:

> Barriers to safe and efficient movement of freight occur at connections between modes . . . For example, inadequate roadway access to freight terminals is a barrier to the intermodal freight system and a major contributor to urban congestion. The lack of adequate connectors between the interstate highway system and the Nation's port, rail, airport, and truck terminals results in urban congestion, air pollution, negative impacts on adjacent neighborhoods, and delivery delays for shippers.

On May 24, 1996, then-Transportation Secretary Peña sent to the Congress a recommended list of highway connectors to major intermodal freight and passenger terminals. In his letter of transmittal, Secretary Peña observed:

> The Congress, in creating the NHS, recognized that the Nation's transportation infrastructure must be viewed as a single system with each mode complementing the others. With the NHS and its connections to major intermodal terminals as the united force, our national transportation network will sustain economic growth, increase our competitiveness in the international marketplace of the 21st century, and enhance the personal mobility of every American.

Representing our major freight railroads, I can assure you that these observations and findings concerning intermodal highway connectors are absolutely correct. These essential highways are the glue that holds much of this country's intermodal transportation system together. Without first rate connections, trains, trucks, barges, and planes are condemned to operate separately and inefficiently. Government and America's private transportation companies can provide the finest transportation systems and services in the world—and that is occurring—but a completely efficient intermodal transportation system can never be realized without quality connections.

During ISTEA reauthorization these important intermodal connectors are to be considered for inclusion on the National Highway System (NHS). AAR enthusiastically supports improvement of intermodal connectors and urges their addition to the NHS.

TRANSPORTATION PLANNING

ISTEA attempted to establish a new approach to transportation throughout the country, by striving to break out of traditional, but limiting, perspectives. Transportation after ISTEA would no longer suffer from historic compartmentalization. The interests and concerns of both public and private providers of transportation facilities and services would be considered jointly and cooperatively. Passenger and freight transportation needs would both receive adequate attention and an appropriate allocation of resources. State, local, and metropolitan transportation interests would each have an appropriate and important role in planning and resource allocation. These goals of ISTEA have not yet been achieved, but that should in no way tarnish the vision or diminish our efforts.

Private railroads are working closer than ever, and more successfully, with states and MPO's to develop effective transportation plans and programs. It has been an evolutionary process, primarily because all participants have had a great deal to learn about each other and about just how to integrate our respective interests and needs into a truly comprehensive transportation planning process. But the learning and improving is happening, and transportation in this country is winning as a result.

TRUCK SIZE AND WEIGHT

AAR supports the status quo on truck size and weight limits. Of particular concern are any efforts which may be made to thaw or otherwise modify the freeze on the expanded use of longer combination vehicles (LCV's)[2] that was included in ISTEA.

The railroad industry has, of course, a vital stake in truck size and weight policy. Larger, heavier trucks—especially LCV's—would cause serious traffic and revenue losses to the U.S. railroad industry. This is obviously a grave concern for the railroad industry. This vital interest extends not just to the rail companies themselves, but also to the 213,000 rail employees, rail shippers, and the railroad supply industry. Additionally, there is strong evidence that heavy trucks pay user charges far less than the costs they impose on our highways and our society. This underpayment enables them to reduce rates and divert traffic from railroads. In the absence of full cost recovery, the further diversion from rail that will result from expanded use of LCV's is likely to mean a significant net economic loss not only to railroads, but also to society.

The public strongly supports federal truck weight standards. Sixty-eight percent of Americans endorse a federal weight freeze on trucks, according to a April, 1995, nationwide poll conducted by The Tarrance Group. Further, by exercising control over the nation's infrastructure through continuation of current truck size and weight standards and the LCV freeze, Congress can prevent highway infrastructure damage and congestion, increased highway safety problems, and exacerbated harm to the environment.

Advocates of increased LCV use are now proposing a "State Option" regime in place of the current federal LCV freeze. Under "State Option", States without LCV's would come under intense pressure to allow bigger trucks as they spread to neighboring jurisdictions. Stopping this "upward ratchetting" of truck size and weight limits was the reason for the 1991 LCV freeze. Ending the current freeze through such a "State Option" approach would mean a rapid spread of LCV's throughout the United States.

The truck size and weight status quo—including the LCV freeze—is also threatened by the negotiations on standardizing truck size and weight limits which are being held with our NAFTA partners, Canada and Mexico. Last summer, 57 members of the Senate and 232 House members signed a letter to then-DOT Secretary Peña, urging him not to allow the NAFTA negotiations to be a vehicle for truck size and weight increases in the United States. AAR commends those members who signed the letter to the Secretary and the railroad industry hopes that Congress will

[2] Longer combination vehicles, or LCV's, include three main truck types: triple 28 foot trailer combinations or triples; twin 48′ or 53′ tractor trailer combinations, also knows as long or turnpike doubles; and Rocky Mountain Doubles, combinations with one long and one short trailer. The 1991 ISTEA defines LCV's as combinations with two or more trailers operating at weights above 80,000 pounds.

continue to oppose larger and heavier trucks not just in NAFTA negotiations, but also in the ISTEA reauthorization.

In conclusion, ISTEA is working, because all parties are truly working together. AAR is convinced that America must continue the progressive agenda established by the Intermodal Surface Transportation Efficiency Act into the 21st Century.

Thank you for allowing me to present the AAR's views on ISTEA reauthorization.

National Association of Independent Insurers

Prepared Statement of Gerald W. Bell, Director, Commercial and Property Lines

The National Association of Independent Insurers is the nation's leading property casualty insurance company trade association with more than 560 member companies which write about one-third of the private passenger and commercial automobile insurance in the country. NAII is an active member of the American Highway Users Alliance and Roadway Safety Foundation, and we endorse the AHUA testimony supporting reauthorization of the federal highway program with increased funding for highway building, roadway maintenance, and safety programs. NAII is submitting this additional written statement to highlight the need for adequate funding to assist border states for infrastructure and inspection systems to assure highway safety once Mexican and Canadian trucks are permitted to operate fully in this country as a result of NAFTA.

The NAII is greatly concerned that unless the Congress approves, at a bare minimum, 100 percent of the appropriation proposed by NEXTEA under Title IV—Motor Carrier Safety, the economic downside to the nation will be even more costly for Americans.

Increased Motor Carrier Safety Assistance Program (MCSAP) funding must be provided so that officials can recruit, train, and deploy greatly increased numbers of motor carrier safety enforcement personnel to the United States-Mexican border states of California, Arizona, New Mexico, and Texas. The number of vehicle inspections possible with current physical and manpower resources is insufficient to act as a deterrent to those who would scoff at current statutes and regulations. It is essential that vehicles entering the United States commercial zone are in full compliance with all applicable vehicle and driver safety requirements before any serious thought can be given to lifting the moratorium and allowing non-complying vehicles ever farther into the U.S. interior.

NAII supports the Preamble and Objectives (Part One, Chapter One, Article 102) of the NAFTA. Nonetheless, our Association is greatly concerned that the current reality falls alarmingly short of these stated ideals . . . short enough, in fact, to conclude that it would be irresponsible to lift the moratorium at this time. The threats to life safety, the environment, and the infrastructure are simply too great.

The NAFTA requires the parties to work together to enhance the level of safety and of protection of human, animal and plant life and health, the environment and consumers (Article 906.1). Compatibility of standards is to be achieved to the greatest extent possible, without reducing the level of safety (Article 906.2.). In other words, as The Honorable Ileana Ros-Lehtinen, Chair, House Subcommittee on International Economic Policy and Trade said in her March 5th statement before her Subcommittee, "[T]he minimum requirement of NAFTA, and of any other trade agreement that the U.S. enters into, is that it 'do no harm'—that is, even if the U.S. does not benefit from it, at least it should not suffer for it." Unfortunately, without greatly augmented U.S. border resources Americans will be harmed.

Parties to the Land Transportation Standards Subcommittee and to its Technical Advisory Groups have worked diligently to negotiate agreements and to achieve compatibility on many issues. That is laudable. However, the reality is that the level of safety has not been significantly enhanced since the NAFTA went into effect three years ago.

The United States General Accounting Office testified on March 6th before the House Subcommittee on Transportation, Committee on Appropriations that, "[F]rom January through November 1996, federal and state officials carried out more than 20,000 inspections of trucks entering from Mexico resulting in about 45 percent of the vehicles being placed out of service for serious safety violations. Our ongoing work shows that, while the number of truck inspectors at major southern border crossings has increased and two large permanent inspection facilities have been opened, the results of increased inspections do not show a clear trend that Mexican trucks are becoming safer."

Let's look at some facts:

Over 11,000 trucks enter the United States border zone each day. They cross at any of 28 highway points of entry. More than 4,000 of those trucks enter at Laredo, Texas, the busiest point. Concern about the potential environmental impact of a hazardous material spill from incoming Mexican trucks is so great in Laredo, Texas, that the local television stations run frequent public service videos warning residents about the threat.

The United States Department of Transportation has once again entered into agreement with Mexican officials to provide training for Mexican enforcement personnel regarding U.S. motor carrier standards for vehicles and operators. A February 1996 General Accounting Office report advises that since 1993 U.S. officials trained 285 Mexican personnel to inspect trucks. Those personnel were to have become the trainers in Mexico, but most have left the program according to Mexican officials. Why should we believe that this new effort will bear a different result?

The Governors of the four U.S. border states have widely proclaimed that their states are ready for the moratorium to be lifted and that unsafe Mexican trucks will be weeded out, but we are not convinced that effective systems are in place yet to assure safety. None of the border states appear to have the requisite number of enforcement personnel to assure that even the majority of unsafe Mexican trucks will be weeded out.

—If the four border state governors are correct about their collective resources to assure motor carrier safety then why did 201 bipartisan House lawmakers (34 Republicans, 167 Democrats) send a letter to President Clinton on March 21st warning him not to open the U.S. border until a stronger safety regime is in place?

—More than 20,000 inspections of trucks entering from Mexico resulted in about 45 percent of the vehicles being placed out of service for serious safety violations. This compares unfavorably to the 28 percent out-of-service rate for U.S. trucks inspected in the United States. This begs the question: if the December 18, 1996 joint letter from Governors Bush (TX), Johnson (NM), Wilson (CA), and Symington (AZ) is correct in claiming "that there is no reason for further delay in lifting the moratorium," why doesn't the data show that incoming trucks are becoming safer?

—Texas Attorney General Dan Morales reported in early 1996 that of the 5,000 commercial vehicles entering Texas each day that only about 150 are stopped and inspected by Texas Department of Public Safety troopers.

—Karen Hughes, a spokesperson for the Governor, is quoted in the November 30, 1996, Fort Worth Star Telegram as saying, "The Texas Department of Public Safety is fully prepared to make sure that all the trucks meet safety standards." Ms. Hughes remark seems inconsistent with a comment by the Governor on January 28th that 109 additional troopers will be added to the Public Safety Department in order to enforce safety and weight laws.

Even Mexican business community spokespersons are having second thoughts about the NAFTA.

—On February 3rd, Alfredo Cardenas, Vice President of Mexico's National Chamber of Cargo Transport was quoted by Reuters News Service as saying, "I believe it will be negative to open the border because the economic conditions between the countries are very different."

—The news service also quoted Cardenas, speaking in his capacity as director of Mexico's fourth-largest trucking company, as saying, "It will damage Mexicans because no Mexican can compete with the Americans. It should wait until our economy recovers in three to five years more."

—Bernardo Lijtzain Bimstein, President of the Mexican national trucking association known as CANACAR, was quoted by the Journal of Commerce as saying, "We are not in a position to compete with the Americans. The longer the opening is put off, the more time we have to prepare."

The true economic impact of the NAFTA must take into consideration the costs expended by the federal and state governments to enforce vehicle and driver safety standards.

—The state of California constructed new Highway Patrol Inspection facilities at Otay Mesa and at Calexico at a cost of $30 million.

—Texas is adding 109 State Troopers at a cost estimated to exceed $4 million.

—The United States Customs Service has installed the world's largest (and presumably among the most expensive) X-ray machines at its Otay Mesa facility, capable of X-raying an entire 53 foot semi-trailer at one time.

—Texas has constructed a new roadside enforcement facility at El Paso at an estimated cost of $700 thousand.

—New Mexico has constructed a new inspection facility at Anthony at an approximate cost of $9 million.

The NAFTA provides that each party will comply with the laws of its tri-lateral trading partners. These include laws relating to commercial motor vehicle, drivers, and the environment. The reality however is that Mexican trucks and their operators enter the U.S. out of compliance with applicable statutes and regulations with relative impunity. While the training and proficiency of U.S. and state enforcement personnel is high they are dangerously understaffed. Only a minuscule number of Mexican trucks can be inspected each day—too small a percentage to serve as a deterrent to those who see the chance of their getting caught to be minimal.

—The maximum legal weight limit for a truck engaged in interstate commerce is 80,000 pounds. Rob Harrison, associate director of the transport research center at the University of Texas is quoted in the January 17, 1997, Journal of Commerce as saying, "Some loads entering the border zone approach 150,000 pounds." It has long been reported that Mexican officials have not aggressively enforced weight limits. Roadside scales are virtually nonexistent.

—Mexican environmental law provides for a maximum sulfur content in diesel fuel. The national oil company, Pemex, produces diesel containing 50 percent more sulfur content than permitted by Mexican law (300 percent more than permitted by U.S. standards). Pemex is the sole source of diesel fuel in Mexico. Trucks incoming from Mexico will be belching their hazardous fumes into the U.S. environment, thus exacerbating existing acid rain, respiratory, and other health concerns.

—The Otay Mesa port of entry is the busiest in California. From the seven month period December 1, 1995, through June 30, 1996, 250,613 Mexican trucks passed through the California Highway Patrol Inspection Facility. All vehicles passed over the scales. However, only 5,744 trucks (2.3 percent) were physically inspected. Of these 5,744 inspections, 3,567 (62 percent) resulted in citations for one or more violations. 1,412 (25 percent) of the inspected vehicles were placed out-of-service on the spot.

—At the Calexico, California, port of entry the percentage of inspected commercial vehicles placed out-of-service is 30 percent according to Vince Calderon, a California Highway Patrol inspection officer.

Were the NAII to issue a NAFTA report card, these would be the grades: 'A' for good intentions, desires, determinations, resolutions, agreements, alliances, accords, assurances, and promises. 'F' for significant results that currently reduce the quadruple threats . . . life safety, environment, infrastructure, insurance cost escalation.

In conclusion, NAII urges Congress to closely monitor the implementation of NAFTA to assure safety is not compromised. We also urge Congress to assist the states financially as they seek to build the necessary infrastructure and safety inspection teams for border crossings so we can be certain that Mexican trucks coming into the U.S. will pose no greater threat to safety than U.S. trucks.

American Association of Port Authorities

Prepared Statement Kurt J. Nagle, President

Please accept this statement for the record for the Subcommittee's April 10 hearing on fiscal year 1998 Transportation Appropriations. The American Association of Port Authorities was founded in 1912 and today represents more than 140 public port authorities in the United States, Canada, the Caribbean and Latin America. The following represents the views of our U.S. members.

U.S. public port authorities have for years expressed concerns that critical transportation infrastructure needs have not been adequately recognized through federal transportation funding. Although the authorization of Intermodal Surface Transportation Efficiency Act of 1991 initiated for the first time transportation planning that includes planning for goods movement in addition to people movement, in reality, ISTEA had many shortcomings in meeting the needs of the freight community. A copy of AAPA's Platform on ISTEA is enclosed.

The reauthorization legislation for ISTEA should improve upon the positive policy changes made in the first ISTEA, but should also seek to address ISTEA's shortcomings in meeting the needs of America's freight community, which provides great economic benefit to the country and its consumers. Following the unveiling of the Administration's proposal to reauthorize ISTEA (NEXTEA), U.S. members of the American Association of Port Authorities (AAPA) indicated strong support for provisions designed to maintain the intermodal focus of the bill and expand eligibility and funding opportunities for port access and freight mobility projects. AAPA is encouraged that the Department of Transportation has cited specific ideas to improve the transportation planning process.

U.S. ports are particularly pleased with several features in NEXTEA,including (1) designation of intermodal connectors as part of the National Highway System (NHS), (2) NHS eligibility for publicly-owned intermodal surface freight transfer facilities, including publicly-owned rail access lines or roads to a seaport, (3) Surface Transportation Program Fund eligibility for publicly-owned rail freight facilities, (4) expansion of the State Infrastructure flank program, and (5) creation of a Transportation Infrastructure Credit Enhancement Program to benefit large, capital-intensive projects.

Under the proposal, state and metropolitan transportation planning would consider the economic viability of the state or metropolitan area, especially global competitiveness, productivity and efficiency, as well as how to enhance the integration and connectivity of transportation across and between modes for people and freight. It specifically provides that state transportation plans be developed in consultation with freight shippers as well as other interested parties.

Although AAPA agrees with these policy changes, public ports do not feel that the Administration's proposal for the reauthorization of ISTEA is sufficiently funded. AAPA supports legislation to take the four transportation trust funds off budget, providing much needed funding for harbor maintenance as well as surface transportation for port access. The U.S. lags far behind its trading partners in infrastructure investment, and as such, AAPA supports legislation to provide for full funding of transportation programs.

Thank you for your consideration of the views of the public port industry regarding this important issue. We look forward to working with you toward the development of a national transportation bill that effectively addresses the nation's needs.

AAPA Platform on ISTEA

U.S. public ports strongly supported the provisions of ISTEA that recognize the need to expand the scope of U.S. transportation planning and funding to include the needs of intermodal freight transportation as incorporated in the goals and provisions of ISTEA. Economic growth and quality of life are dependent upon a transportation system that moves people and goods efficiently. Public ports provide the nation with its highways to the world, linking every community in the U.S. to the world market. In 1994, ports and port users generated 15.9 million jobs, contributed $783 billion to the Gross Domestic Product, and provided $210 billion in taxes at all levels of government. Ports provided these benefits in 1994 while themselves investing over $929.6 million in new and modernized terminal facilities to better serve businesses and consumers in the global marketplace. Planning for landside access to U.S. ports is a key component of the nation's ability to compete globally and ultimately provides for maximum trade and economic growth.

Yet with ISTEA up for reauthorization in 1997, ports are finding that freight projects, particularly those meeting regional or national transportation needs, still are not competing well for a fair allocation of ISTEA funding. A recent General Accounting Office report identified that freight projects received less than 1 percent of the total highway and nontransit infrastructure money apportioned to states during the first 4 years of ISTEA. (Intermodal Freight Transportation; Projects and Planning Issues, GAO/NSIAD–96–159.)

The need to increase the focus on freight and afford it the priority it deserves was clearly voiced in Department of Transportation outreach meetings on ISTEA held last year as well as in 1993. A March 1994 report issued by DOT summarizing the first round of ISTEA outreach meetings states that "[t]hroughout the country, the message was clear: freight movement must be given a higher priority in the planning and funding allocation process under ISTEA."

AAPA will support continuation of the structure envisioned by ISTEA, with decisionmaking authority primarily at the local level, if changes are made to permit freight projects to fairly compete for funding. It must be recognized that local decisionmaking favors passenger needs, and that freight projects, particularly those meeting regional or national needs, have difficulty obtaining finding. The National Commission on Intermodal Transportation's 1994 report found that "ISTEA's emphasis on local and State decisionmaking means that projects of national significance, which sometimes largely provide benefits beyond local or State jurisdictions, may not receive appropriate funding priority."

AAPA strongly supports full funding of ISTEA and investigating new funding sources to increase available resources, as well as taking trust funds off budget in order to ensure that transportation user fees are used for infrastructure, not deficit reduction. Providing funding for adequate transportation infrastructure investment protects the nation's competitive position in the global marketplace and provides a

local economic return on investment. To maintain a modern and competitive transportation system, Congress should:

—Provide full funding to transportation legislation, including ISTEA's successor.

—Take Transportation Trust Funds off-budget so that funding may be allocated in a way which provides the greatest economic benefit for the investment.

There is clearly a vital role for USDOT in freight projects that cross multiple jurisdictions and that meet regional and national needs. To reinforce the national interest in such projects, the next generation of ISTEA should accomplish the following:

—Enhance the ability of the Federal government to provide innovative financing for projects of regional and national significance, including highway corridors of national significance under section 1105 or other major freight projects.

—Break down the Administration's modal walls and create an Intermodal Transportation Administration with a specific goods movement of rice. At a minimum, the role of the Office of Intermodalism should be enhanced to include advocacy for freight needs.

ISTEA should provide for goods movement to be an integrated component of transportation system planning. Despite public participation provisions, freight interests are not at the table and project selection criteria often do not take freight mobility into account. In order to ensure that effective transportation planning be conducted, ISTEA's successor should:

—Specify that project selection criteria to be used by States and MPO's must fairly consider freight projects and must include direct and indirect economic benefits, job creation, congestion reduction, and enhancement of freight mobility.

—Require MPO's to develop a 5-year capital improvement plan to identify high priority freight mobility projects, including an implementation schedule, within two years after ISTEA is reauthorized. Plans would have to be approved by the USDOT, and USDOT would have to report back to Congress on the progress in this area. Plans must be developed in conjunction with local freight interests and must include a market analysis as the basis for determining the need for improvements. Corridors of national significance should be included. If a plan is not submitted as of the statutory deadline, states should lose a portion of their funding. The capital improvement plan must be updated every year.

—Stress that transportation planning at the state and local level should consider waterside access as an integral portion of the system to be connected.

—Require metropolitan planning organizations (MPO), or appropriate transportation funding agencies, if not the NIPO, with a public port authority within their boundaries to include the port agency as a voting member of the MPO, as are numerous other state and local public agencies.

—Require MPO's to have freight interests of all modes represented on their policy and technical committees, and encourage the creation of goods movement task forces. Stress the need for MPO's to actively seek public participation by freight interests and to educate themselves about goods movement.

AAPA supports policy changes in ISTEA reauthorization that provide for the selection of the best mode of transportation for the most efficient movement of goods. AAPA also supports the objectives of environmental and sound economic development. In line with increased flexibility of funding, ISTEA's successor should accomplish the following:

—Expand the eligibility and flexibility of ISTEA funding to include rail freight and other intermodal projects which reduce congestion and create economic benefits.

—Enhance flexible funding for port infrastructure projects by expanding the use by public agencies of tax exempt bond authority for cargo transportation purposes. Proposals in 1996 included H.R. 1790 (Hoary, R-CA) and S. 1199 (Boxer, D-CA), legislation to amend the Internal Revenue Code to permit the use of private activity bonds to finance trackage and rail facilities, in addition to docks and wharves, in [united circumstances.

Founded in 1912, the American Association of Port Authorities (AAPA) represents virtually every U.S. public port agency as well as the major port agencies in Canada, Latin America and the Caribbean. This policy paper reflects the views of the AAPA's United States delegation.

NATIONAL ASSOCIATION OF RAILROAD PASSENGERS

PREPARED STATEMENT OF ROSS B. CAPON, EXECUTIVE DIRECTOR

Our non-partisan association—whose members are individuals—has worked since 1967 towards development of a modern rail passenger network in the U.S. We appreciate this opportunity to provide our views for the record. The subcommittee has heard oral testimony from some organizations strongly opposed to federal funding for Amtrak. We request a similar opportunity to testify at the earliest possible opportunity.

We support NEXTEA's overall general approach to transportation. We applaud giving states the right to use flexible gasoline-tax funds for intercity passenger rail. We support creation of a dedicated funding source for Amtrak, such as through S. 436 (including the earmarking of 1 percent of the funds for states with no Amtrak service). We think the public wants the enhanced travel choices and balanced transportation system such legislation would promote. Section IV (pages 4–6) lists benefits of intercity passenger rail. Finally, we endorse Amtrak's appropriations request.

I. POLL BY BRUSKIN GOLDRING RESEARCH

On May 19–21, 1995, in a national probability sample of 1,006 adults (524 women, 482 men), age 18 and over—by telephone—Bruskin Goldring Research, Inc., of Edison, New Jersey, found:

—63 percent support for earmarking a full penny of existing federal gasoline tax "to create a trust fund to pay for long-term Amtrak improvements"; and

—63 percent support for letting states "use, for intercity rail passenger service, a portion of their federal transportation funds now restricted to highways, mass transit and recreational trails."

(See Appendix I for the full text of the poll questions.)

It is noteworthy that:

—"Yes" responses were the majority in all geographical sections of the nation, even where Amtrak service is sparse. The "yes" showing ranged from 58–59 percent (penny/flexibility) in the South to 70–67 percent in the Northeast.

—For both questions, only 10 percent of women and 16 percent of men were "strongly" opposed.

The poll suggests to us that the public does not view gasoline purchases strictly as votes for more roads. America is in love with travel, not with the automobile. In spite of a woefully inadequate advertising budget, and competition from airlines whose huge ad budgets are mutually reinforcing, modern passenger trains of all types are well used in most places where they exist.

Americans often ask why "we can't have a train network as good as they have in Europe." One answer: you get what your leaders buy. The U.S. spends far more of its gas taxes on roads than do many other countries. Netherlands and Great Britain spend about 25 percent—most other European countries about 33 percent—of road taxes on roads (National Transportation Strategic Planning Study, U.S. Department of Transportation, March 1990). At the same time, intercity passenger rail investment is tiny and has been declining, both in absolute terms and as a share of federal transportation spending (see appendices).

II. THE PUBLIC VOTES WITH ITS FEET

The traveling public generally responds positively whenever modern intercity passenger rail is provided (see table on next page). The most up-to-date statistics also are encouraging. Compared with the year-earlier months, during the first six months of Fiscal 1997 (October-March), travel is up 3 percent systemwide and 5 percent at the Intercity unit (which operates most long-distance trains and all Chicago-based corridors). [The percentage changes are of passenger-miles. A passenger-mile is one passenger traveling one mile.]

Much has been made of Amtrak's small share of total intercity travel. However, this should not obscure the critical role that Amtrak plays where it operates and the fact that this role will become even more critical in the future (see #1, section IV). Amtrak handles about 44 percent of air-plus-rail traffic in the New York-Washington city-pair market; this figure rises to about 70 percent if we include intermediate points—such as Philadelphia, Baltimore and Wilmington. However, Amtrak's share is impressive even as a per cent of total travel: Amtrak has 23 percent of all Philadelphia-Washington travel, 16 percent of New York-Washington and 13 percent of New York-Albany, the latter despite an average speed of just 58 mph (vs. 76 and 66 mph, respectively, on most New York-Washington Metroliners and conventional trains). The auto market share is 70 percent in the two shorter markets, 50 percent

New York-Washington. Investments under way will bring similar benefits to the Boston-New York corridor. Currently, Amtrak has only 7 percent of all travel in the New York-Boston city-pair market; today's average speeds range from 45 to 54 mph.

AMTRAK USAGE—RIDERSHIP ON SELECTED CORRIDOR SERVICES

Route	1982	1996	Change (percent)
Pacific Northwest	73,670	303,700	+312.2
San Joaquin Valley	181,074	567,400	+213.4
Chicago-Milwaukee	142,350	320,200	+124.9
Metroliners (New York-Washington)	1,060,098	2,011,200	+89.7
San Diego-Los Angeles (-Santa Barbara)	1,190,287	1,565,700	+31.5
New York-Albany-Buffalo	768,071	978,900	+27.4

PASSENGER-MILES

[Billions]

Segment	1982	1996	Change (percent)
Nationwide	4.2	5.1	+21
Long-Distance Trains Only	2.5	2.8	+13

Prepared by National Association of Railroad Passengers, 2/97.

III. THE HALF CENT: HIGHER RIDERSHIP, LOWER FEDERAL OPERATING GRANT

The half cent and the ability to spend it would enable Amtrak to improve service quality and to provide more service. New rolling stock, improved maintenance facilities and stations, more track capacity (a new siding on the single-track Los Angeles-San Diego line, for example) and completion of the Boston-Washington high speed project would directly benefit passengers and increase ridership. Rehabilitation of the New York-Washington electrification is necessary to retain existing ridership. New mail-and-express facilities also would enhance Amtrak's efforts to meet its zero-operating-grant-by-2002 goal.

IV. BENEFITS OF AMTRAK

1. In crowded corridors, passenger trains represent vital people-moving capacity and help relieve air and road congestion. This benefit will grow over time as travel demand continues to grow while airport and highway construction face more intense local opposition and ever-tighter limits on funding and sheer availability of land.

2. Amtrak is far safer than auto travel.

3. During inclement weather, Amtrak is safer and usually more reliable than airplanes and buses.

4. Amtrak is 45 percent more energy-efficient than domestic commercial airline service (2,351 BTU's per passenger-mile v. 4,304.2) and 76 percent more energy-efficient than general aviation (9,825 BTU's per passenger-mile). Source: Oak Ridge National Laboratory's *Transportation Energy Data Book Edition 16,* July 1996. This 1994 data understates Amtrak's efficiency because it:

—reflect operation of a large fleet of old, relatively energy-intensive cars, almost all of which Amtrak has since retired.

—do not reflect Amtrak's positive impact on energy-efficient downtown development and mass transit (see #6, below).

[Note: Earlier Oak Ridge reports included Northeast Corridor electricity consumed by Maryland, SEPTA and New Jersey Transit commuter trains using Amtrak-owned tracks but excluded the passenger-miles those trains generated. This partly explains Amtrak's relative improvement from, say, 1992, when Amtrak was "only" 42 percent and 70 percent more energy-efficient than commercial and general aviation, respectively.]

5. Amtrak is much less polluting than airplanes. (Energy efficiency is a good proxy for air pollution—see #4, above.)

6. In most cities, Amtrak helps mass transit, downtown areas and transit-dependent people by serving—and increasing the visibility and economic viability of—transit-accessible downtown locations. Amtrak feeds connecting passengers to transit.

Amtrak shares costs with transit at joint-use terminals and on joint-use tracks. Positive impacts have been observed even in small cities with minimal Amtrak service. Mayor John Robert Smith of Meridian, Mississippi—on Amtrak's New York-Atlanta-New Orleans run, with but one train per day in each direction—says property values have tripled in recent years around the railroad station, where a new intermodal terminal is under construction.

By contrast, new airports intensify energy-inefficient suburban sprawl and stimulate auto-dependent development. This leads to the social costs of getting transit-dependent people to work, or the need to address the consequences of their not working.

7. Amtrak serves many communities where alternative transportation either does not exist, is not affordable or only serves different destinations. Trains can make intermediate stops at smaller cities at minimum cost in energy and time. This is apparent in corridors—where benefits go to such cities as Jefferson City, Lancaster, Trenton, Kalamazoo, Wilmington, Bloomington/Normal and Tacoma. It also means, for example, that the *Empire Builder* can stop at eight small cities in Washington (plus Seattle and Spokane), 12 in Montana and seven in North Dakota without compromising the train's appeal to those riding between Chicago or Minneapolis and Seattle or Portland. Similarly, the *California Zephyr* serves five Colorado points (plus Denver) and five points each in Iowa and Nebraska. Also, Amtrak serves 14 North Carolina points.

Here is one example of long-distance travel that I encountered on the *Southwest Chief* in March, 1995: a mother and her 14-month-old child rode from Garden City, Kansas, to Barstow, California. The family was moving to California; the husband was driving the U-Haul; the wife and child were on the train "so the move would not be so traumatic" for the child. They did not consider the plane because they felt it would be too cramped for the child. Also, the Garden City-Ontario, California air fare was $450 round-trip with a change of planes in Denver; the train was $188 round-trip (in coach) and went direct.

8. Amtrak is important to those who cannot fly due to temporary or permanent medical problems, and to those for whom physical and financial considerations rule out driving long distances, for example, seniors and students. (The editor of *Frequent Flier,* forced by doctor's orders to take the train to Florida, wrote a favorable column about the trip.) Nonetheless, a large proportion of Amtrak riders do own cars or could fly but instead chose the train.

9. Thanks to a growing array of connecting buses available with train travel in a single ticket transaction, *Amtrak puts people on intercity buses who would not otherwise have considered using them.* This trend first developed in a big way in California, where the state underwrites an impressive network of dedicated, feeder buses. (The Winter 1996–97 *Bus World* cover article, "Amtrak California's Buses," reports: "Currently, there are contracts with six independent bus operators operating 16 routes. . . . About half of the San Joaquin train riders use a bus for part of their journey.")

However, for a growing number of bus connections across the nation, the private bus companies bear any financial risks themselves. These companies highly value their Amtrak-related revenues. Another article in the same *Bus World,* "Training Greyhound," states: "Former antagonists—Greyhound and Amtrak—are cooperating to combat the real competitor, the private automobile." The article says "six significant bus enhancements to the Amtrak timetable" took effect November 10, linking Amtrak to such places as Cocoa and Melbourne, Florida; Macon, Georgia; Louisville, Kentucky; Columbus, Ohio; and Laredo, Texas. A link to Key West was added earlier last year.

10. Amtrak is part carrier (like United and Greyhound) and part infrastructure. Thus Amtrak provides important passenger-moving capacity, unlike airlines and bus companies. In much of the Northeast Corridor and a few other places, Amtrak is the rail equivalent of the air traffic control system, airport authorities and airlines. (Among the "other places": the Chicago terminal, part of the Chicago-Detroit line and the track between Albany, New York, and the Massachusetts state line.) Elsewhere, Amtrak is the only carrier with legal access to freight railroads' tracks—a quid pro quo for relieving the railroads of their passenger-train obligations in 1971.

11. Amtrak over much of its network enables one to enjoy gorgeous scenery in total comfort. Some examples: the Connecticut and California coastlines, the Hudson River in New York, the Colorado Rockies, the mountains of Vermont and northern New Mexico, Glacier Park in Montana and West Virginia's New River Gorge.

12. Amtrak's long-distance trains are transportation "melting pots." The majority of passengers on these trains ride coach. Surveys have indicated that, for 30 percent of coach passengers traveling over 12 hours, average income is less than $20,000

(for 11 percent, it is less than $10,000). Obviously, most standard- and deluxe-room sleeping car passengers have considerably higher incomes and pay much higher fares. Nonetheless, anyone who characterizes these trains as land versions of cruise ships should try walking the coaches, especially at night.

13. Trains, especially on longer trips, offer a form of social contact almost lost in this country today—the opportunity to meet and relax with total strangers that one may or may not ever see again.

V. OF TRUST FUNDS AND SUBSIDIES

Today's transportation system is largely a function of the policies of years past. Some salient parts of that history follow:

1. Railroad passengers paid $2.0 billion (not inflation-adjusted) in federal ticket taxes from 1942 to 1962, money that simply went to the U. S. Treasury (general revenues). The Doyle Report to the Senate Commerce Committee (National Transportation Policy, June 26, 1961) cited this tax as "one of the factors under Federal control which favors the growth of private transportation and makes the preservation of public service more difficult." Had this rail passenger tax been earmarked for rail passenger improvements, it is unlikely that the business would have fallen to the depths it reached by the time Amtrak began operating in 1971.

2. Federal aviation subsidies through mid-1988 totaled $32.8 billion, as follows:

—"Airport and airway development costs incurred prior to the assessment of user charges in 1971 have been treated as sunk costs, none of which have been or will be paid for by air carriers and other system users . . . these sunk costs total $15.8 billion." Source: *Study of Federal Aid to Rail Transportation,* U.S. Department of Transportation, under President Ford's Secretary Coleman, January 1977.

—From the time aviation user charges were imposed (1971) through mid-1988, private-sector air system users "received a general fund subsidy of $17 billion, which is equal to the difference between the private-sector share of FAA spending and aviation-related excise taxes since the start of the trust fund." Source: *The Status of the Airport and Airway Trust Fund,* Congressional Budget Office special study, December 1988.

3. Federal transportation taxes are mode-specific, except that—in recent years—certain highway taxes have gone to mass transit and, since 1991, to recreational trails. Intercity passenger rail has been completed excluded, although the original, Senate-passed ISTEA in 1991 would have corrected this. The selective imposition of mode-specific taxes biases policy makers *at all levels of government* in favor of more roads and airports. Road and aviation investment goes forward absent analysis of the merits of intercity passenger rail improvements and the impact they might have on road and air needs.

4. Federal matches are at 80 percent plus for most highway and aviation projects. State and local officials are eager to maximize federal aid. There is no serious accounting of the huge external costs of air and especially highway transportation. The result is an overwhelming incentive for states and cities to invest in aviation and highways, *regardless of the merits of intercity passenger rail.* That so many states nevertheless make some rail investments is encouraging, but such investments generally will be aimed only at projects or routes where the benefits are largely or exclusively within one state.

In short, today's transportation system reflects the manipulation of free market forces almost to the point of strangling the passenger train. The half cent and full funding of Amtrak's appropriations request would help offset this manipulation.

Thank you for considering this statement. I would be pleased to provide any further information the committee might request.

APPENDIX I

POLL BY BRUSKIN GOLDRING RESEARCH

Question one: Amtrak was created by Congress to provide intercity rail passenger service. Amtrak currently receives passenger fares and federal grants. You currently pay a federal fuel tax, most of which goes to the Highway Trust Fund to be spent on roads and mass transit. The need for a more stable funding source for Amtrak—comparable to the highway and aviation trust funds—has prompted a proposal that one penny of the fuel tax be used to create a trust fund to pay for long-term Amtrak improvements. This would not result in your paying any additional taxes, but would reallocate a small percentage of the total funds to Amtrak. Please tell me which of the following best describes your feelings about this proposal.

	Percent
Support	63
Oppose	26
No opinion	11

Question two: It also has been suggested that states be allowed to use, for intercity rail passenger service, a portion of their federal transportation funds now restricted to highways, mass transit and recreational trails.

	Percent
Support	63
Oppose	27
No opinion	10

APPENDIX II

APPROPRIATIONS AND OBLIGATION LIMITATIONS IN FEDERAL APPROPRIATIONS ACTS

[Dollars in billions]

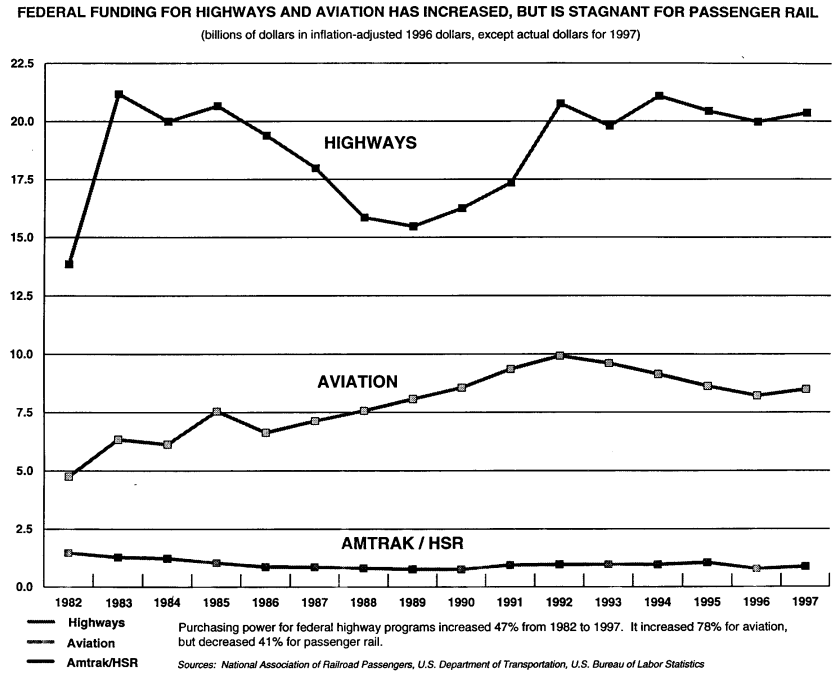
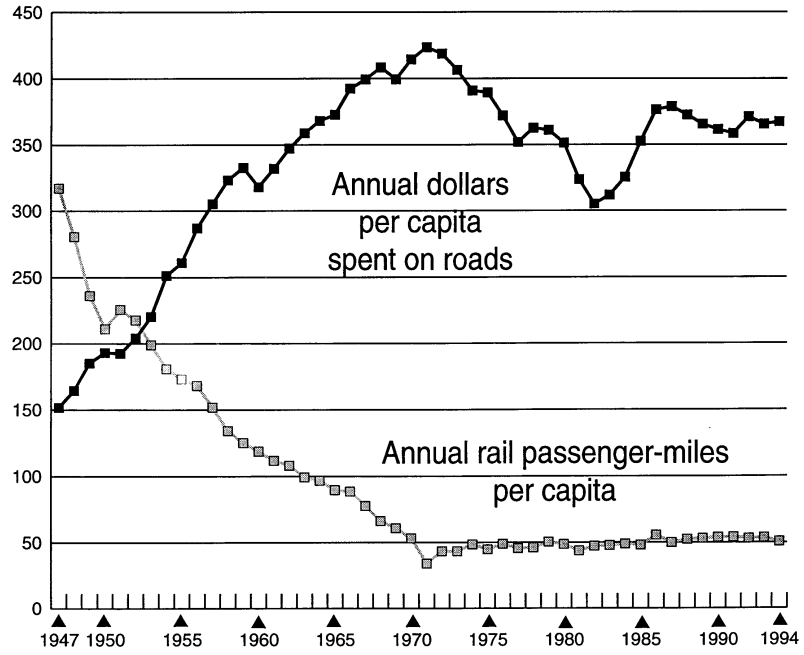
APPENDIX III



APPENDIX IV

Passenger rail usage did not decline mid-century just because people suddenly "decided" trains were passé, and other modes were better. Government policy played a tremendous role in travelers' decisions. This chart shows that as road spending (annual dollars per capita, all levels of government, adjusted for inflation) grew, so did—not coincidentally—passenger rail (intercity and commuter) passenger-miles per capital decline.



Sources—Federal Highway Administration annual statistics, Bureau of Labor Statistics, Information Please Almanac. Prepared by National Association of Railroad Passengers, April 1997.

APPENDIX V

World Mainline Rail Capital Spending Per Capita

[Selected Countries, U.S. Dollars, 1994 Spending by Central Governments and/or Public Sector Railways] [1]

Switzerland	$228.29
Sweden	146.55
Austria	132.03
Germany	110.84
Netherlands	84.97
Denmark	79.97
Norway	58.27
Finland	51.85
France	51.48
Portugal	40.34
South Korea	31.36
Belarus	25.96
Greece	24.23
Hungary	24.19
Botswana	22.65
Ireland	18.38
Britain	13.74
Slovakia	13.61
New Zealand	6.23
Latvia	5.93
Belgium	4.89
Bulgaria	4.62
Venezuela	4.20
Indonesia	4.00
Iran	4.00
Namibia	3.71

South Africa	3.58
Colombia	3.38

PREPARED STATEMENT OF THE INSTITUTE OF TRANSPORTATION ENGINEERS

The Institute of Transportation Engineers (ITE) is an organization of over 15,000 transportation professionals in some 80 countries. On a day-to-day basis ITE's 11,500 U.S. members are responsible for keeping the nation's surface transportation systems operating in the safe, efficient, and reliable fashion which our mobile society demands.

ITE members plan, design, operate, maintain, and build the infrastructure that supports 17 percent of America's gross national product. The Institute has members working for virtually every state Department of Transportation, almost 600 municipalities, over 175 counties, and some 100 metropolitan planning organizations. In addition, ITE members are employed by hundreds of consulting firms, universities, and equipment manufacturers and suppliers throughout the United States.

The Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991 has been a success, and it should be reauthorized without radical changes to its existing programs. Enhancement of ISTEA programs can be achieved by moving away from a system that is driven by process to one that is driven by results. Transportation programs should not be judged on how they are carried out, but rather on what they accomplish and contribute toward a national intermodal transportation system that is safe, economically efficient, and environmentally sound.

ITE believes that the Administration's National Economic Crossroads Transportation Efficiency Act (NEXTEA) is a solid step towards a reauthorization bill that will effectively carry the nation's transportation system into the 21st Century. However, while the Institute was generally pleased with the overall structure of the Administration's reauthorization proposal, it was disappointed with the overall funding level included in the proposal.

The Institute believes that NEXTEA should set a highway trust fund spending level of at least $26 billion. ITE believes that this funding level will help provide transportation professionals with resources necessary to meet the nation's future transportation needs.

The critical importance of transportation should not be lost as Congress and the Administration struggle to balance the federal budget. With NAFTA passed and a western hemisphere free trade agreement in the works, the U.S. transportation system will be even more vital to the delivery of goods and services. The European Commission is taking an increasingly stronger role in ensuring a seamless and more efficient transportation system throughout Europe. The U.S. can do no less.

ITE encourages Congress and the Administration to recognize that money spent on our nation's transportation systems is in fact an investment in the American economy. This investment not only directly puts people to work, but through improving the efficiency and safety of moving our workers and our products, it enhances the productivity and competitiveness of America's businesses. The resulting economic vitality creates a positive return on investment to the federal government and its citizenry.

About $57 billion should be invested annually in roads, bridges, and transit capital just to keep the systems performing at their current level of service. Unfortu-

nately, the United States is actually investing less than $41 billion each year, only two-thirds of the nation's needs. As a result, the transportation infrastructure is not able to keep up with demand. Cutting transportation funding will not cut transportation needs. Providing funding levels to maintain current conditions should be the minimum goal for lawmakers.

To ensure an adequate and predictable revenue stream for transportation investment, Congress should consider:

—Funding ISTEA 2 programs entirely from transportation user fees.
—Shifting the 4.3 cents per gallon motor fuel tax currently going to deficit reduction to the highway trust fund.
—Removing the highway Oust fund from the unified federal budget.
—Adopting a federal capital budget and/or other measures to achieve this objective.
—Expanding efforts to combat motor fuel tax evasion.
—Giving state and local agencies increased flexibility to implement innovative financing mechanisms.
—Requiring that any revenue from tolls on any highway facility be used solely for surface transportation purposes.
—Eliminating the practice of specifying funding for specific projects in federal transportation legislation.

In addition to increasing the overall funding level available for transportation investment, lawmakers must find ways to make those investment more productive.

The Administration's NEXTEA expands the eligible uses of transportation funding to include operations and maintenance costs that were not included under ISTEA. ITE supports these efforts. Transportation efficiencies cannot be realized if transportation facilities and equipment are not properly operated and maintained.

The Administration's proposal to reauthorize the Intelligent Transportation System (ITS) program is a good next step in a program that holds significant benefits for the nation's transportation system. With some changes, ITE recommends that the Administration's ITS proposal contained in NEXTEA be accepted by Congress. However, while ITE generally supports the structure of the ITS program as developed by the Administration, the Institute believes that annual funding of the program at $250 million is not sufficient considering the benefits the program has to offer. Therefore, ITE recommends that the committee increase funding for the Administration's ITS proposal to $400 million per year.

In addition, ITE recommends that Congress not accept limitations on the federal match for ITS projects that the Administration would set at no greater than 80 percent. The U.S. DOT estimates that, over the next 20 years, ITS will be able to meet two-thirds of the nation's highway capacity needs at one-fifth the cost of building additional capacity. One way that the federal government can encourage swift implementation of ITS is by allowing ITS projects to be eligible for 100 percent federal funding. This incentive is needed in order to help level the playing field for ITS projects as they compete for funds with more visible construction projects.

Transportation efficiencies are also impacted by safety. The Institute supports reauthorization of the current 10 percent set-aside of the Surface Transportation Program (STP); however, the Administration has chosen to replace this program with a set $3.2 billion Infrastructure Safety Program.

During fiscal year 1997, states will receive a total of some $601 million in safety set-aside apportionments. NEXTEA is a retreat on current funding levels under this program. In addition, removal of safety funding as a percentage of the STP program eliminates the possibility of future funding growth for safety in the event of increased out-year transportation investments. For instance, over the last five years, annual safety set-aside apportionments have increased $180 million.

This funding reduction could be exacerbated if states are allowed to shift funding out of the new highway infrastructure safety program to the extent that the number of rail crossing collisions are reduced. The shifting of safety funds away from safety initiatives should not be allowed. While safety improvements are somewhat invisible compared to most capital projects, their impacts are significant and extremely cost effective.

Finally, ITE opposes NEXTEA provisions that would allow the use of safety funds for uses beyond those allowed under the existing STP safety set-aside program. Every transportation project has an element of safety involved. Current guidelines discourage the use of safety funding for these normal activities and encourage safety enhancement activities that might not have been undertaken without the STP safety set-aside incentive. Using highway safety funds for non-traditional purposes, such as structural repairs to bridges, may improve the structural safety of these facilities, but it does not have a direct bearing on highway safety.

The Institute supports the creative financing provisions in NEXTEA and notes the efforts that this committee has taken in the past to promote creative financing proposals. ITE hopes that support will continue.

The Institute of Transportation Engineers appreciates the opportunity to submit these comments to the committee as it examines the funding requirements for reauthorization of the nation's surface transportation system. While Americans do want streamlined and better government, they do not want crumbling highways and bridges, broken down buses, or more accidents. Americans expect that their government will provide proper levels of investment in capital, operations, and maintenance programs, as well as encourage and promote ways to expand existing resources and protect the driving public.

Along with this testimony, the Institute has provided the committee with copies of "Recommendations for ISTEA 2." This document outlines in detail all the Institute of Transportation Engineers' recommendations for reauthorization of the nation's surface transportation programs. It is provided for the committee's information, and it is not necessary to be published in the record.

The Institute appreciates the opportunity to provide this testimony to the committee. Questions relating to this testimony should be directed to Mr. Thomas W. Brahms, Executive Director of the Institute of Transportation Engineers at 202–554–8050 ext. 111 or to Russell Houston, ITE's Government Relations Associate at ext. 144.

NATSO, INC.

PREPARED STATEMENT OF W. DEWEY CLOWER, PRESIDENT AND CEO

On behalf of the 1,100 NATSO member travel plazas and truckstops nationwide, I respectfully request this correspondence be submitted for the April 10, 1997, hearing record on fiscal year 1998 transportation appropriations.

During the hearing before your subcommittee, John Collins, Senior Vice President, Government Affairs, American Trucking Associations, testified that there is a nationwide truck parking space shortage. As the largest provider of truck parking in the country, NATSO believes our industry's perspective is valuable to any discussion of this issue.

First, there is no nationwide parking shortage. Mr. Collins testified there is a 28,500-space shortfall, as estimated by a 1996 federally-funded report entitled "Commercial Driver Rest & Parking Requirements: Making Space for Safety," prepared by the American Trucking Association's Trucking Research Institute. The report counted the number of rest area parking spaces available for trucks, but did not consider even one of the private sector spaces when formulating the rest area parking demand model.

Using the "American Trucker's Guide to Truckstops," published by Interstate America, NATSO estimates that truckstops provide nearly 220,000 truck parking spaces nationwide. ATA acknowledges private truckstops plan to increase their parking by 28,000 spaces over the next three years. Why should the federal government pay to build these spaces when the private sector, according to the ATA's own research, plans to increase parking by that same amount?

There may be parking problems in certain areas of the country, especially near metropolitan areas, where drivers of all types of vehicles experience difficulty finding a place to park. Contributing to this problem is the trucking industry's need for a place to "stage" trucks, since many companies require truck drivers to make their deliveries within a narrow time frame. This practice requires a truck driver who arrives near his destination (often an urban area) to wait hours or days before making his delivery. While this may be a dilemma for the trucking industry, we do not feel it justifies federally funded parking lots.

Second, no link has been established between truck parking and fatigue-related accidents. The Trucking Research Institute's study identified the number of parking spaces available at public rest areas; it did not study the causes of fatigue-related truck accidents. There is absolutely no evidence to suggest that parking has any effect whatsoever on these accidents. In fact, a National Transportation Safety Board (NTSB) report (NTSB/SS–95/01) on 113 heavy truck accidents never once cited a lack of parking as a contributing factor in fatigue-related accidents. The NTSB's comprehensive list of suggested solutions does not include increasing truck parking. The NTSB stated that while they commend efforts such as this truck parking study, "the Safety Board believes that the results of this study [the NTSB study] of actual accidents provides concrete evidence of the measures that affect fatigue in the accident environment."

ATA further maintains that public safety is compromised when truck drivers seek parking along highway shoulders and exit ramps. However, the report's direct observation of a 200-mile segment of I–81 contradicts this conclusion. The parking study found that Large numbers of trucks parked illegally on shoulders and ramps of rest areas. This often occurred before the corridor [I–81] reached capacity and even when legal parking spaces were available at a rest areas This suggests there could be convenience-based reasons for a driver choosing to park on a shoulder at an exit ramp.

Third, the overwhelming majority of truck drivers have no interest in using public rest areas for anything but a quick nap, so more money for rest area parking will be a waste of valuable transportation dollars. Perhaps the most sensible reason for not building more truck parking is that drivers simply won't use them. The Trucking Research Institute's rest area study found that 85 percent of drivers prefer truckstops to meet their long-term rest needs over public rest areas. Only 15 percent of these drivers expressed a preference to rest or sleep long-term at public rest areas.

NATSO believes that investing in more truck parking at rest areas is a colossal waste of money that will do nothing to increase public safety. In this era of fewer dollars, there are many other projects that are more deserving of federal funding.

DEPARTMENT OF TRANSPORTATION AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

WEDNESDAY, APRIL 16, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:01 a.m., in room SD–124, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senators Shelby, Gorton, Bennett, Lautenberg, and Byrd.

NATIONAL TRANSPORTATION SAFETY BOARD

STATEMENT OF JAMES EVAN HALL, CHAIRMAN

ACCOMPANIED BY:

VERNON ELLINGSTADT, OFFICE OF RESEARCH AND ENGINEERING
TOM HAUETER, OFFICE OF AVIATION SAFETY

OPENING REMARKS

Senator SHELBY. The subcommittee will come to order.

In 1996 we saw the highest fatality rate for commercial air passengers in the last 15 years. Two of the worst air crashes in aviation history occurred. First the ValuJet crash into the Florida Everglades on May 11 where 110 people were killed, and then the TWA Flight 800 explosion on July 17, which left 230 dead in the Atlantic Ocean off Long Island.

In response to these tragedies the White House Commission on Aviation Safety and Security, chaired by Vice President Gore, was chartered in August 1996 to conduct an extensive inquiry into civil aviation safety, security, and air traffic control modernization. Twenty commissioners and staff from a broad range of aviation specialties, Federal agencies, consumer groups, and the industry, worked to form a set of recommendations to improve the safety and the security of the Nation's air transportation system.

The Gore Commission agreed on 53 recommendations in four areas: One, improving aviation safety; two, making air traffic control safer and more efficient; three, improving security for travelers; and four, responding to aviation disasters. About one-half of the recommendations are solely within the FAA's area of responsibility. The rest of the Gore Commission's recommendations are either jointly shared with other departments which include Defense, Justice, Energy, NASA, Treasury, or industry. Or these rec-

ommendations are tasked to non-DOT agencies such as the FBI, Postal Service, Customs Service, or NTSB. Very few of the recommendations require new legislation.

We are pleased to welcome Mr. Carl Vogt, who with short notice, has made time in his busy schedule to join us here today. Mr. Vogt served as Commissioner on the White House Commission on Aviation Safety and Security. From 1992–94 Mr. Vogt was Chairman of the National Transportation Safety Board. Filling out our first panel we are joined by the current NTSB Chairman, Mr. Jim Hall. I want to thank you both for being here today.

Between the two aviation safety experts, I expect that the first part of today's hearing will provide a clear picture of the status of safety and security on America's air transportation system. I hope that both Mr. Vogt and Mr. Hall will tell the subcommittee what they view as the most pressing improvements that need to be made.

The second panel is made of Federal Aviation Administration officials, all of whose jobs relate in some way to ensuring safety. We will discuss with the six FAA witnesses the contributions toward improved safety and security that are made by each of the offices represented. Specifically, we will talk about how the recommendations of the Gore Commission and the NTSB's most wanted safety recommendations are being implemented in each of these offices, how these initiatives affect the way FAA does its job, and how much it will cost to do that job.

The agency is undergoing many changes, both in its organization and personnel. Most dramatically, FAA has been without an Administrator since November 8, 1996. This committee's job is to make sure that FAA is given the funding it needs in order to run a sound and effective aviation management system.

But money alone does not buy good management, nor does money necessarily buy safety. That takes an organized systemic approach, with clear goals and benchmarks along the way. It is the agency's job to show Congress that the funds requested by the administration will go forward toward this kind of successful organization.

Safety is an integral part of the jobs of all the panelists we will hear from today. Mr. Hall is tasked with investigating the failures of our transportation system and suggesting measures to improve it. Mr. Vogt most recently served on the Gore Commission, which was tasked with looking at changing security threats to air passenger safety, examining changes in the aviation industry, and looking at the technological changes coming to air traffic control, with an eye to improving aviation safety and security.

The FAA offices represented by the panel we will hear from today deal with safety in complementary and interdependent ways. If we lack sufficient resource commitment for any of these offices, airport security, research and acquisition, or regulation and certification, the entire system is compromised. All these areas are vital to ensuring the long-term safety of the system.

This now brings me to user fees. The subcommittee will be holding a separate hearing on May 7 regarding transportation infrastructure financing, including the many user fee proposals contained in the President's fiscal year 1998 DOT budget request. New

FAA user fees are projected to offset $300 million of the agency's cost of operations. Now, this subcommittee has had a little experience with FAA user fees, since we included the $75 million FAA operations user fees in the 1997 transportation appropriations bill for foreign carrier overflights of U.S. traffic control space. This user fee requested by the FAA was signed into law September 30, 1996.

According to FAA, the overflight fee will be instituted on May 19. FAA will not be able to collect anywhere near $75 million in the reigning 4.5 months of fiscal 1996. Now FAA is asking for the authority to collect $300 million in new user fees. What are these fees? We do not know. We will not know until later this summer at the earliest, if the National Civil Aviation Review Commission completes a draft proposal for long-term financing of FAA operations and modernization by that time.

These new fees would then be subject to authorization. At what point during fiscal year 1998 will these fees be authorized and instituted by the FAA? How much of the $300 million projected will the agency actually be able to collect? And I will not even mention that the administration's 5-year budget plan suggests by the year 2002 FAA will completely fund its entire $8 billion-plus budget from user fees. As chairman of this subcommittee I will be taking a long, hard look at the FAA's budget request to ensure that important safety initiatives and the funds to implement these initiatives are included in that budget in a systematic and logical way.

PREPARED STATEMENT

I look forward to hearing your testimony, and having a frank and candid exchange of views here. We must always keep in mind, I believe, that the aim of every witness and member present today is ensuring the very highest level of safety and security for the American citizen traveling by air.

[The statement follows:]

PREPARED STATEMENT OF SENATOR SHELBY

Good morning. This hearing will now come to order.

In 1996, we saw the highest fatality rate for commercial air passengers in the last fifteen years. Two of the worst air crashes in aviation history occurred—first, the ValuJet crash into the Florida Everglades on May 11, where 110 people were killed, and then the TWA flight 800 explosion on July 17, which left 230 dead in the Atlantic Ocean off Long Island. In response to these tragedies, the White House Commission on Aviation Safety and Security, chaired by Vice President Gore, was chartered in August 1996 to conduct an extensive inquiry into civil aviation safety, security, and air traffic control modernization. Twenty commissioners and staff from a broad range of aviation specialties, federal agencies, consumer groups, and industry worked to form a set of recommendations to improve the safety and security of the nation's air transportation system. The Gore Commission agreed on 53 recommendations, in four areas: (1) improving aviation safety; (2) making air traffic control safer and more efficient; (3) improving security for travelers; and (4) responding to aviation disasters.

About half the recommendations are solely within the FAA's area of responsibility. The rest of the Gore Commission's recommendations are either jointly shared with other departments (Defense, Justice, Energy, NASA, and Treasury) or industry; or are tasked to non-DOT agencies, such as the FBI, Postal Service, Customs Service, or NTSB. Very few of the recommendations require new legislation.

We are pleased to welcome Mr. Carl Vogt, who has made time in a busy schedule on short notice to join us here today. Mr. Vogt served as a Commissioner on the White House Commission on Aviation Safety and Security. From 1992 to 1994, Mr. Vogt was Chairman of the National Transportation Safety Board. Filling out our first panel, we are joined by the *current* NTSB Chairman, Mr. Jim Hall. Thank you

both for being here today. Between these two aviation safety experts, I expect that the first part of today's hearing will provide a clear picture of the status of safety and security on America's air transportation system; and that both Mr. Vogt and Mr. Hall will tell the subcommittee what they view as the most pressing improvements that need to be made.

The second panel is made up of Federal Aviation Administration officials, all of whose jobs relate in some way to ensuring safety. We will discuss with the six FAA witnesses the contributions toward improved safety and security that are made by each of the offices represented. Specifically, we will talk about how the recommendations of the Gore Commission and the NTSB's "Most Wanted" safety recommendations are being implemented in each of these offices; how these initiatives affect the way FAA does its job; and, how much it will cost to do that job.

The agency is undergoing many changes, both in its organization and personnel. Most dramatically, FAA has been without an administrator since November 8, 1996.

This Committee's job is to make sure that FAA is given the funding it needs to run a sound and effective aviation management system. But money alone doesn't buy good management, nor does money necessarily buy safety. That takes an organized, systemic approach, with clear goals and benchmarks along the way. It is the agency's job to show Congress that the funds requested by the administration will go toward this kind of successful organization.

Safety is an integral part of the jobs of all the panelists we will hear from today. Mr. Hall is tasked with investigating the failures of our transportation system and suggesting measures to improve it. Mr. Vogt most recently served on the Gore Commission, which was tasked with looking at changing security threats to air passenger safety, examining changes in the aviation industry, and looking at the technological changes coming to air traffic control, with an eye to improving aviation safety and security.

The FAA offices represented by the panel we will hear from today deal with safety in complementary and interdependent ways. If we lack sufficient resource commitment for any one of these offices—airports, security, research and acquisition, or regulation and certification—the entire system is compromised. All these areas are vital to ensuring the long-term safety of the system.

Which brings me to user fees. The subcommittee will be holding a separate hearing on May 7th regarding transportation infrastructure financing, including the many user fee proposals contained in the President's fiscal year 1998 DOT budget request. New FAA user fees are projected to offset $300 million of the agency's cost of operations. Now, this subcommittee has had a little experience with FAA user fees, since we included a $75 million FAA operations user fee in the fiscal year 1997 transportation appropriations bill for foreign carrier overflights of U.S. air traffic controlled space. This one user fee, requested by the FAA, was signed into law September 30, 1996. According to the FAA, the overflights fee will be instituted on May 19, 1997. FAA won't be able to collect anywhere near $75 million in the remaining four and a half months of fiscal 1997.

Now, FAA is asking for the authority to collect $300 million in new user fees. What are these fees? We won't know until later this summer at the earliest, if the National Civil Aviation Review Commission completes a draft proposal for long-term financing of FAA operations and modernization by that time. These new fees would then be subject to authorization. At what point during fiscal year 1998 will these fees be authorized and instituted by the FAA? How much of the $300 million projected will the agency actually be able to collect? And I won't even mention that the administration's 5-year budget plan suggests that by the year 2002, FAA will completely fund its entire $8 billion plus budget from user fees.

As chairman of this subcommittee, I will be taking a long, hard look at FAA's budget request, to ensure that important safety initiatives—and the funds to implement these initiatives—are included in that budget in a systematic and logical way. I look forward to hearing your testimony, and having a frank and candid exchange of ideas. We must always keep in mind the aim of every witness and member present here today—ensuring the very highest level of safety and security for the American citizens traveling by air.

Senator Lautenberg, do you have an opening statement you'd like to make?

STATEMENT OF SENATOR LAUTENBERG

Senator SHELBY. Senator Lautenberg.

Senator LAUTENBERG. Thank you very much, Mr. Chairman, and I commend you for getting this subcommittee hearing going, because a primary subject for us and the entire country has to be our

progress in aviation safety. And this is an oversight responsibility that is important and worth the subcommittee's time and effort.

The Federal Aviation Administration has provided us with the safest air transport system in the world. But there are still, as we say, holes in the safety net. The tragic, highly publicized aviation accidents of the last year sparked considered scrutiny by the administration, Congress, industry, and academia on how FAA does business and the steps necessary to strengthen the safety net.

The FAA concluded a 90-day safety review following the ValuJet crash, which was supplemented by reports from the GAO, the inspector general, Coopers & Lybrand, and the National Transportation Safety Board, among others. In wake of the TWA 800 tragedy, Vice President Gore's Aviation Safety and Security Commission provided further momentum for aviation safety enhancements. And I was very supportive of the Commission's mandate, and pleased that the President accepted every one of the recommendations of the Gore Commission.

Since serving on the Aviation Security Commission after Pan Am 103, I have sought to ensure that adequate attention and funding were focused on aviation security. Unfortunately, it took the tragedy of TWA 800 to once again bring these concerns to the forefront. Between the recommendations of the NTSB, the Gore Commission, the Administrator's 90-day safety review panel, and other studies, we are knee-deep in suggestions on how to improve our aviation system. And this subcommittee, Mr. Chairman, has been aggressive in following up.

Even after we completed action on the fiscal year 1997 transportation appropriations bill last year, this subcommittee added more than $225 million to the CR, to the continuing resolution, to fund recommended enhancements for aviation safety and security. This funding provided for additional inspectors, explosives detection equipment, aviation security specialists, and individual airport threat assessment. It was added on top of increased funding in the regular appropriations bill for additional air traffic controllers.

Mr. Chairman, the FAA has been given significant resources to enhance safety, and it is now up to the FAA and the industry to implement improvements in the shortest possible time. In this regard, I am disappointed that FAA is still without permanent leadership, either at the Administrator or Deputy Administrator level. And I want to add that those folks, Mr. Valentine and others, who are filling in at these posts are doing an excellent job. The question is what do we do in terms of fulfilling our long-term policy commitment to aviation safety and development of this very important department? I hope that the President will act expeditiously to select nominees, get them to the Hill as soon as possible.

And, Mr. Chairman, I want to commend you also for having Mr. Hall and Mr. Vogt here. These are two very experienced people, and we are pleased to see them as witnesses.

Thank you.

Senator SHELBY. Senator Bennett.

Senator BENNETT. Thank you, Mr. Chairman. I have no opening statement.

Senator SHELBY. Senator Byrd.

STATEMENT OF SENATOR BYRD

Senator BYRD. Thank you, Mr. Chairman, Senator Lautenberg.

Thank you for convening this very important hearing on the safety of our aviation system. In West Virginia we have always faced natural challenges in maintaining the highest levels of safety, challenges such as unpredictable weather, where fog and freezing rain can roll in taking a pilot's visibility down to zero with little or no warning. We face the natural challenges posed by our mountainous terrain. In order to build one of the principal airports in our State we were required to level off several mountains and dump the earth into the adjacent valleys, simply to create a sufficient stretch of land for the runway.

But these natural challenges to safety may have been exacerbated over the last decade or so by the changes in the quality and the mix of aviation services in my State. Over the last 10 years the Nation has seen air passenger traffic increase almost 50 percent. When one looks at the components of this increase, one will see that emplanements on major airliners have gone up roughly 39 percent, while emplanements on commuter aircraft has grown by over 150 percent.

Over the last 10 years, total emplanements in West Virginia have actually declined over 6 percent, and this decrease is comprised of an almost 50 percent cut in the number of passengers traveling on larger airplanes, while the number of passengers required to fly on smaller commuter aircraft has grown by over 100 percent.

Looked at in another way, the forces of the market in an unregulated aviation industry have resulted in my constituents being increasingly relegated to smaller commuter aircraft. And it is for that reason that I was pleased with the initiative of the Clinton administration to finally require one level of safety on the part of all passenger aircraft. I doubt that the average passenger on a 20-seat commuter aircraft appreciated the fact that that aircraft was being held to a lesser standard of safety by the FAA than the standard applying to a larger aircraft, perhaps 37-seat aircraft.

The FAA's requirement for a single level of safety was implemented in the wake of some notable commuter aircraft accidents. When the initiative was announced at the end of 1995, the commuter aircraft industry was given a period of time to come into full compliance with the more stringent safety standard. The deadline for full compliance by the commuter airline came less than a month ago. So now is the time to ask our Federal officials whether we have seen the full benefits of one level of safety, whether we have seen a lesser number of incidents and accidents involving commuter aircraft. Perhaps we have not had enough time pass.

Based on the FAA's own assessment of its deficiencies issued in the wake of the ValuJet tragedy, I think it is appropriate to ask whether our inspection system is adequate to determine whether all commuter operators are indeed in full compliance. Are the FAA's inspections of these aircraft diligent and thorough, or do they take the form of just another paperwork exercise that masks the true problem? Is the safety oversight of the commuter industry within the FAA adequately financed?

When we speak of the importance that critical spending by the FAA is within our budget, many individuals talk of the investments of hundreds of millions of dollars in new high technology air traffic control equipment or the construction or expansion of airports like Denver International and Dallas-Fort Worth. When I talk of critical aviation spending, I am talking about inspectors, weather forecasting capabilities, and small capital improvements at airports with names like Greenbriar Valley, Wood County, Beckley, Bluefield-Princeton, Elkins, Clarksburg, Huntington, and Morgantown, and so I am especially glad that we will hear testimony this morning from the chairman of the National Transportation Safety Board, Mr. Jim Hall.

The Safety Board is charged with evaluating the FAA's performance and regulations with single criterion in mind—safety. So I look forward to hearing his views on the safety of the commuter aviation industry, as well as the views of our representatives from the Federal Aviation Administration this morning.

Thank you, Mr. Chairman.

Senator SHELBY. Mr. Hall.

STATEMENT OF JAMES EVAN HALL

Mr. HALL. Good morning, Mr. Chairman, Senator Lautenberg, Senator Bennett, Senator Byrd. It is a pleasure to have the opportunity to appear before you today. Joining me in the audience are two individuals from the Safety Board, Dr. Vernon Ellingstadt, who is the head of our Office of Research and Engineering, and Mr. Tom Haueter, who is Deputy of our Office of Aviation Safety. I may ask them to join me at the table if I find that they can provide a more complete answer than I can to any of the questions that the committee may present.

Senator, let me say how much I have appreciated working with the staff of this committee, particularly since TWA 800, on the very difficult situation regarding extraordinary costs associated with that accident. Your staff has been most cooperative, and most interested in this investigation, and I would like to extend to the members of this committee an invitation for any of you that would choose to do so to please come to Calverton and visit the reconstruction that is presently underway. We would be glad to make that arrangement at any time.

It goes without saying, Mr. Chairman, that last year, as you referred, was dominated by catastrophic transportation accidents that have required extraordinary efforts by the Safety Board and have strained the agency's resources more than any time in history. I just might add that in addition to the high-profile aviation accidents that the committee is probably well familiar with, we had a number of major transportation accidents in rail, marine, and pipeline last year, as well.

The TWA Flight 800 investigation has been the Safety Board's most costly and complex in terms of dollars spent for wreckage search and recovery and the level of investigative staff work. Mr. Chairman, the TWA investigation, I believe, provides dramatic testimony to the wisdom of Congress 30 years ago when it established a multidisciplined, independent accident investigation agency which was initially affiliated with the Department of Transpor-

tation with the mission to promote transportation safety by conducting independent accident investigations and by formulating safety improvement recommendations. And of course, as you are aware, Mr. Chairman, we were made totally independent from the Department of Transportation under the Independent Safety Board Act of 1974.

The independence of the Safety Board and its clear mandate to conduct indepth objective investigations, draw conclusions from its findings, and make recommendations to improve safety without bias or undue influence from industry or other Government agencies is essential to maintaining the safety of the American traveling public. It is not unusual for the Safety Board to address safety issues that are controversial or that may be critical of Government or industry standards or operations. Since the Safety Board started investigating accidents it has made more than 10,000 safety recommendations to prevent accidents, save lives, and reduce injuries. While every recommendation from the Board is developed to help improve safety and prevent accidents, some have a greater potential to save lives than others.

As you know, Mr. Chairman, it is the responsibility of the NTSB to formulate recommendations to those parties that can effect improvements in transportation safety. But it is a responsibility of the FAA and other agencies to determine how best to implement those changes. In the last 5 years the FAA has adopted 84 percent of our recommendations. We harbor no illusions that the FAA should adopt all of our recommendations, nor do we seek to have our recommendations mandatory. Frankly, Mr. Chairman, if the FAA adopted all of our recommendations, then we would not be asking for enough.

There are bound to be some areas where the regulatory agency honestly believes that a recommended change is not cost effective. Remember, the FAA must conduct cost-benefit analysis of any proposed changes, or that a better alternative can be found. That is not to say that we do not strongly disagree with some of their actions or inaction, and that, of course, is what the most wanted list is designed to at least partially address. I would like to point out, by the way, that the Gore Commission on which I was proud to serve recommended that cost benefit analysis, while useful, should not be the driving force in determining the value of proposed safety improvements.

MOST WANTED

In order to identify those recommendations with the greatest potential to improve transportation safety that have not yet been acted on, the Board adopted its most wanted program. Recommendations added to that list will receive more intensive follow-up activity in order to encourage Government agencies and industry to act on the recommendations as quickly as possible.

Currently on the Safety Board's most wanted list are five aviation-related issues that include: First, requiring the installation of expanded flight data recorders with an increased number of parameters; second, installing airport runway incursion avoidance systems; third, reviewing safe separation distances between larger and smaller following aircraft; fourth, installing Mode C instrument

alert systems for airport terminals; and fifth, sharing pilot background information between airlines. All of these recommendations are the fruits of years of research by investigators of the NTSB, an Agency that makes its mark felt to a far greater degree than its size. I never hesitate to point out that we are just 360 employees. At a cost of just 15 cents a citizen I think the Safety Board is one of the best buys in Government.

TWA FLIGHT 800

As I mentioned to you, the investigation of TWA Flight 800 is the most extensive and costly in the Safety Board's history, and I might ask if Paul could show a couple of charts for the committee while I continue my testimony.

On July 17, 1996, TWA Flight 800 tragically crashed into the Atlantic off the coast of Long Island. Wreckage was located at a depth of over 120 feet, and the thousands of pieces were spread over 5 square miles. Based on the condition of the wreckage from the center forward section of the plane, including the center wing tank, our investigators have determined that a fuel air explosion took place. The origin of that explosion is not known. However, with over 90 percent of the plane recovered, there is no physical evidence of a bomb or a missile.

Based on the examination of the wreckage and other evidence, on December 13, 1996, the Safety Board issued four safety recommendations to the FAA aimed at reducing the flammability of the ullage in the airliner's center wing tanks, with specific emphasis on the Boeing 747 center wing tank.

SUPPLEMENTAL REQUEST

Mr. Chairman, let me briefly address some financial issues that are important to the Safety Board. As you know, the 1997 enacted appropriation level for the Safety Board is $42.4 million and 370 FTE's. Not included in this amount is the $6 million supplemental earmarked primarily for reimbursement to the U.S. Navy for TWA Flight 800 recovery costs. In the spring of 1997, we requested an additional TWA 800-related supplemental of $23.2 million. This would have covered investigative expenditures through the end of the fiscal year, as well as allowing us to start our family assistance efforts. OMB approved $20.2 million.

I realize, Mr. Chairman, this is not a budget hearing, but I do want a chance to make our case. Our $1 million emergency fund is used to pay for extraordinary recovery and investigative tasks. OMB has approved expanding the fund next year to $2 million. The simple truth is this fund does not begin to cover the extraordinary costs of our investigations.

Aircraft tragedy investigative costs are usually borne by both the Federal Government and the carrier through its insurance underwriters. If the aircraft crashes on the land, the carrier is generally responsible for wreckage recovery and removal. If we deem that the wreckage is vital to our investigation we see that the critical parts or all of the wreckage are removed to a secure sight for examination. In general, payment for this is made by the insurance underwriters.

In accidents occurring over water or where the probable cause may be criminal in nature, the responsibilities are not so clear. For example, in the TWA Flight 800 investigation I asked for the early financial participation of the carrier, manufacturers, and engine suppliers. All of them declined. The Federal Government has, in fact, borne all of the extraordinary costs in this investigation outside of the party's participation.

I would also be remiss if I did not finally mention the outstanding work of the State and of local authorities and agencies at the accident scenes. In New York, Florida, and in Michigan, costs have been incurred because of the accidents that are currently being borne by the States and localities. They are not insignificant, and I believe that a system or process needs to be put in place to address the legitimate local costs associated with aircraft disasters.

Mr. Chairman, that concludes my testimony, and I will be glad to answer any questions at the appropriate time.

PREPARED STATEMENT

Senator SHELBY. Thank you, Mr. Hall. We have your complete statement, and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF JAMES EVAN HALL

Good morning, Mr. Chairman and Members of the Committee. It is a pleasure to be here today to represent the National Transportation Safety Board.

It goes without saying that the past year was dominated by catastrophic transportation accidents that have required extraordinary efforts by the Safety Board and have strained the agency's resources more than any time in its history. It is well established that the TWA flight 800 Boeing 747 investigation has been the most costly and complex in the Safety Board's history, in terms of dollars spent for wreckage search and recovery, and the level of investigative staff work.

Moreover, as a multi-modal agency, the Safety Board has an important responsibility for the investigation of surface transportation accidents. Our workload in that area has also been unprecedented in the past year. Many of our laboratory specialists support our multi-modal mission. For example, the metallurgists working on TWA flight 800 are also working on surface accidents. Also, one of our key engineers responsible for surface transportation vehicle performance has been assigned full time for several weeks to supervise the 3-dimensional mockup of the TWA flight 800 wreckage.

Mr. Chairman, the TWA investigation provides dramatic testimony to the wisdom of Congress 30 years ago when it established a multi-discipline, independent accident investigation agency, initially affiliated with the Department of Transportation, "to promote transportation safety by conducting independent accident investigations and by formulating safety improvement recommendations." However, because the Congress recognized the need to make it totally independent from the Department of Transportation, the "Independent Safety Board Act of 1974" was passed.

The independence of the Safety Board and its clear mandate to conduct in depth objective investigation, draw conclusions from its findings, and to make recommendations to improve safety, without bias or undue influence from industry or other government agencies is essential to maintaining the safety of the American traveling public. It is not unusual for the Safety Board to address safety issues that are controversial or that may be critical of government or industry standards or operations.

The Safety Board is charged by Congress with investigating or causing to be investigated all civil aviation accidents in the U.S. In 1994, the Safety Board's authority was expanded to investigate government-operated aircraft as well, except those operating in military or intelligence missions. In addition, the Safety Board provides the U.S. Accredited Representatives to overseas investigations involving U.S.-registered, -certified, or -operated aircraft, and aircraft whose airframes, engines, and major components were manufactured in the U.S.

Since the Safety Board began investigating accidents, it has made more than 10,000 safety recommendations to prevent accidents, save lives, and reduce injuries.

While every recommendation from the Board is developed to help improve safety and prevent accidents, some have a greater potential to save lives than others.

As you know, Mr. Chairman, it is the responsibility of the NTSB to formulate recommendations to those parties that can effect improvements in transportation safety, but it is the responsibility of agencies like the FAA to determine how best to implement those changes. In the last 5 years, the FAA has adopted 84 percent of our recommendations.

We harbor no illusions that the FAA should adopt ALL of our recommendations, nor do we seek to have our recommendations mandatory. Frankly, Mr. Chairman, if the FAA adopted all of our recommendations, then we would not be asking for enough. There are bound to be some areas where the regulatory agency honestly believes that a recommended change is not cost-effective—remember, the FAA must conduct cost-benefit analyses of any proposed changes—or that a better alternative can be found. This is not to say that we don't strongly disagree with some of their actions, or inaction, and that is what the "Most Wanted" list is designed to at least partially address.

In order to identify those recommendations with the greatest potential to improve transportation safety that have not yet been acted on, the Safety Board in 1990 adopted a "Most Wanted" program. Recommendations placed on the program list will receive more intensive follow-up activity in order to encourage government agencies and industry to act on the recommendations as quickly as possible.

To be considered for the "Most Wanted" list, a recommendation must affect transportation safety on a national level, concern a safety issue of high visibility, or be of great interest to the public. Also considered is the previous loss of life or property as well as the potential for future losses, and the extent of the exposure of the public to risk by the safety problem. Previous action taken by the recipient is also taken into consideration.

Currently on the Safety Board's "Most Wanted" list are five aviation-related issues that include:

1. The requiring of the installation of expanded flight data recorders with an increased number of parameters.
2. The installation of airport runway incursion avoidance systems.
3. The review of safe separation distances between larger and smaller following aircraft.
4. The installation of mode C instrument alert systems for airport terminal areas.
5. The sharing of pilot background information between airlines.

Last year the Congress acted on the issue of pilot record sharing and the Safety Board will consider removing this issue from the "Most Wanted" list. Unfortunately the remaining four issues will remain. I would like to address two of these issues in more detail.

Flight Data Recorders.—Although not a new issue on the "Most Wanted" list, I would like to discuss the importance of enhanced flight data recorders (FDR). Almost two years have passed since the Safety Board issued its recommendations for enhanced FDR's, and the FAA has failed to enact any rulemaking on this important safety issue.

On July 16, 1996, the FAA issued the NPRM on enhanced FDR's, with a 30-day comment period. NTSB comments on the rule were generally favorable. However, the NPRM would not require FDR retrofits to begin for at least another two years. Further, no action was taken on the Board's urgent recommendation to expedite the retrofit of Boeing 737 airplanes.

We are aware that a rulemaking package was forwarded to the Office of the Secretary of Transportation on February 7, 1997. However, the DOT and Office of Management and Budget review process has been lengthy. How much longer must we wait before action is taken?

We believe that expanded flight data recorders are critical to accident and incident investigations. United Flight 585, which crashed in 1991 in Colorado Springs, Colorado, had a 5-parameter recorder and USAir 427, which crashed in 1994, had only 11 parameters. Vital information for investigators was simply unavailable and that is unacceptable.

Runway Incursions.—On March 25, 1997, a Gulfstream G–2 corporate airplane was cleared to land on runway 31 at LaGuardia Airport. About the time the G–2 was touching down on the runway, the tower controller advised its pilot to go-around. The G–2 was unable to execute a missed approach and it collided with an airport maintenance truck. The same tower controller had cleared the vehicle operator onto runway 31 about 40 minutes before the G–2 was cleared to land. The truck driver, his assistant, and the two G–2 pilots were not injured although the airplane and vehicle were substantially damaged.

Mr. Chairman, the circumstances of this accident could very easily have involved a commercial air carrier resulting in multiple fatalities. Although our investigation continues, we have learned that the controller, who cleared the maintenance truck and the incoming airplane, simply "forgot" about the truck he had approved out onto the runway.

Forgetting is a human factor routinely found in operational errors by air traffic controllers that cause incidents virtually every day in our nation's air traffic system. This type of human error has also been identified in past accidents. For example, on February 1, 1991, a USAir Boeing 737 collided with a Skywest Metroliner at the Los Angeles International Airport, killing 34 passengers and crew. This accident occurred, in part, because the air traffic controller cleared the USAir airplane to land about 3 minutes after she had cleared the Skywest airplane onto the same runway to hold for departure. She "forgot" the Skywest flight.

And I regret to say that operational errors and runway incursions have been increasing. Operational errors in the terminal environment have increased 14 percent from 1995 to 1996. Similarly, runway incursions have increased 19 percent from 1995 to 1996. These trends raise concerns about the progress being made by the FAA in addressing the risks associated with the potential for ground collisions.

Following several accidents and Safety Board recommendations, in 1991, the Federal Aviation Administration (FAA) established a Runway Incursion Action Plan to reduce surface errors at the nation's more than 570 airports. This plan was revised in 1995. The action plan focuses on reducing human error, improving ground communications, and developing and implementing technologies to increase airport surface guidance and surveillance, as well as improved ground traffic management procedures and equipment. One of the more important components of the FAA's efforts is the Airport Movement Area Safety System (AMASS).

AMASS, which is a system integrated into the new ASDE–3 ground radar system, automatically tracks all operations, compares each vehicle and aircraft movement, and provides visual and audio alerts of potential conflicts. This is a "real time" system for preventing runway accidents in a dynamic airport environment. AMASS would have provided the means to prevent accidents similar to the ground collisions that occurred February 1, 1991, at Los Angeles, November 22, 1994, at Bridgeton, Missouri, and March 25, 1997, at LaGuardia. Unfortunately, except for a prototype at San Francisco International Airport that is operating with a limited capability, AMASS installations are not yet in place.

In a February 28, 1995, safety recommendation letter to the FAA, the Safety Board expressed its concerns about delays in AMASS installations. In that letter we cited FAA testimony before Congress on March 6, 1990, in which the FAA stated that it had entered a contract for design and manufacture of AMASS that would be "fast tracked" with the project operational in 1992. In the February 28, 1995, letter, the Safety Board expressed its concerns that ". . . this important project [AMASS] has been effectively paralyzed as a result of a succession of changes. . . ."

The latest information published by the FAA on the status of AMASS is not encouraging. The prototype testing in San Francisco has been ongoing since May 1996. Under a contract awarded in June 1996, three full-scale AMASS systems are due to be installed in Detroit (September 1997), St. Louis (November 1997), and Atlanta (February 1998). Another 20 systems that are currently in initial production are scheduled to be delivered for installation between July 1998 and July 1999. There are options for 16 more AMASS systems; however, the funding is not available at present. We believe these are two important safety issues that must be addressed by the FAA.

TWA FLIGHT 800 INVESTIGATION

On July 17, 1996, TWA flight 800 tragically crashed into the Atlantic Ocean near East Moriches, New York, killing all 230 people on board. The aircraft wreckage in this accident was ten miles off the coast at a depth of 120 feet, making this investigation anything but typical.

To ensure the safety of the divers and to identify the location of the wreckage, the area had to be thoroughly mapped before the full-scale underwater recovery effort could begin. Heavy wreckage was not lifted from the ocean floor until early August. By the end of October, the divers had cleared the debris fields of all large pieces of wreckage. On November 3, scallop trawlers were brought in to drag the ocean floor. To date, an area of over 28 square miles has been trawled, with some areas having been gone over in excess of 20 times. A second pass is being made over the entire area: trawling will continue until substantial amounts of wreckage are no longer being recovered.

Based on the condition of the wreckage from the center forward section of the airplane and that surrounding the center wing tank, the investigators were particularly interested in this area and have created 3-dimensional mockups of this section. Three sets of scaffolding were erected on which this section of airplane was reassembled in order to give the investigators a better picture of what occurred. The fuselage surrounding the center wing tank was on one, the top and sides of the center wing tank on another, and the floor center wing tank was on the third. Following these initial efforts, it was decided to construct a full scale 3-dimensional mockup of a major portion of the airplane, including the fuselage skin. The mockup being constructed with the assistance of contractors to the Safety Board will be about 92 feet long, the largest in the world ever constructed. That work has been essentially completed.

It is apparent that an explosion occurred in the center wing tank, but the origin of the explosion is not yet known. To date, with over 90 percent of the airplane recovered, there is no physical evidence of a bomb or missile strike.

Based on the examination of the wreckage and other evidence, on December 13, 1996, the Safety Board issued four safety recommendations to the FAA aimed at reducing the flammability of the ullage in airliner center wing tanks, with specific emphasis on the Boeing 747 center wing tank. The recommendations urged the FAA to:

Require the development of and implementation of design or operational changes that will preclude the operation of transport-category airplanes with explosive fuel-air mixtures in the fuel tanks:

(a) Significant consideration should be given to the development of airplane design modifications, such as nitrogen-inerting systems and the addition of insulation between heat-generating equipment and fuel tanks. Appropriate modifications should apply to newly certificated airplanes and, where feasible, to existing airplanes. (A–96–174)

(b) Pending implementation of design modifications, require modifications in operational procedures to reduce the potential for explosive fuel-air moisture in the fuel tanks of transport-category aircraft. In the B–747, consideration should be given to refueling the center wing fuel tank (COOT) before flight whenever possible from cooler ground fuel tanks, proper monitoring and management of the CWT fuel temperature, and maintaining an appropriate minimum fuel quantity in the CWT. (A–96–175)

Require that the B–747 Flight Handbooks of TWA and other operators of B–747's and other aircraft in which fuel tank temperature cannot be determined by flightcrews be immediately revised to reflect the increases in CWT fuel temperatures found by flight tests, including operational procedures to reduce the potential for exceeding CWT temperature limitations. (A–96–176)

Require modification of the CWT of B–747 airplanes and the fuel tanks of other airplanes that are located near heat sources to incorporate temperature probes and cockpit fuel tank temperature displays to permit determination of fuel tank temperatures. (A–96–177)

The FAA responded to these recommendations on February 18, 1997. In general, the FAA's response stated that the recommendations propose major changes in the requirements for fuel tank design and fuel management of transport-category airplanes. The FAA stated, "the airworthiness standards of 14 CFR Part 25 assume that fuel vapor is flammable, and the design requirements dictate the elimination of ignition sources within the fuel tanks."

Because the FAA considered the control of flammability characteristics of fuel vapor in airplane fuel tanks as a "major change in design concept", it elected to evaluate the safety recommendations by means of soliciting information about the effectiveness and practicality of implementing the recommendations. The FAA stated that it would publish a public notice in the Federal Register within 30 days.

The September 8, 1994 accident involving USAir flight 427 near Pittsburgh, Pennsylvania, which killed all 132 people on board, continues to be one of our most complex investigations. It has been one of the most far-reaching investigations in the history of the Safety Board, with NTSB investigators and party participants working continually over 2½ years to try to understand the very complex circumstances of this tragic event. The investigation has involved tens of thousands of staff hours and numerous flight tests, resulting in 20 safety recommendations.

The Safety Board is aware that Boeing is actively engaged in a redesign of the main rudder power control unit for the existing Boeing 737 series at an estimated cost to Boeing of $120 million to $140 million. In January 1997, Boeing and the FAA announced that the primary and secondary slides of the PCU servo control valve would be redesigned to preclude the potential for reverse rudder operation. The FAA

plans to issue an airworthiness directive (AD) that would require the Boeing 737 fleet to be retrofitted with the new valve within two years.

We are encouraged by Boeing's commitment to move forward. We are concerned, however, that there may be a delay by the Federal Aviation Administration in issuing a final rule, or that the final rule might allow more than 2 years for operators to complete the installation of the new servo control valve. On February 20, 1997, the Safety Board issued three additional safety recommendations to the Federal Aviation Administration regarding the Boeing 737 aircraft. Those recommendations state:

Require the expeditions installation of a redesigned main rudder power control unit on Boeing 737 airplanes to preclude reverse operation of the rudder and to ensure that the airplanes comply with the intent of the certification requirements. (A–97–16)

Advise Boeing 737 pilots of the potential hazard for a jammed secondary servo control valve slide in the main rudder power control unit to cause a reverse rudder response when a full or high-rate input is applied to the rudder pedals. (A–97–17)

Require the Boeing Commercial Airplane Group to develop operational procedures for Boeing 737 flightcrews that effectively deal with a sudden uncommanded movement of the rudder to the limit of its travel for any given flight condition in the airplane's operational envelope, including specific initial and periodic training in the recognition of and recovery from unusual attitudes and upsets caused by reverse rudder response. Once the procedures are developed, require Boeing 737 operators to provide this training to their pilots. (A–97–18)

This investigation continues, and I am proud of the dedication of the investigative team. I believe these recommendations reflect, in part, the progress we are making. Safety Board staff hopes to have a final report regarding this accident before the Board for consideration this year. We will, of course, keep the Committee advised of developments.

I want to turn now to what has become a new responsibility for the Safety Board, assistance to family members of victims of air disasters.

Since the dawn of commercial aviation, the unpleasant duty of notifying next of kin after airline accidents has fallen upon the airline involved in the accident and that carrier often made arrangements for the transportation of family members to a location near the accident site and for the return of victims remains.

Whether or not this *modus operandi* was ever adequate to address the needs of victims' family members, it is clear that the way things used to be done is not adequate today. The world has changed and all of us involved in the events following major airline accidents have to change with it. The combination of a litigious society, expanded and aggressive 24-hour news coverage, and perhaps a mistrust of authority all have contributed to this new environment.

In September 1996, President Clinton issued a directive naming the Safety Board as the coordinator of federal services to families of victims of transportation accidents, and in October he signed legislation that gives us that responsibility for aviation disasters. The Safety Board did not seek this responsibility; in fact, I had hoped that it could be handled without federal intervention. But the families, the President and the Congress have entrusted us with these responsibilities and we will do the job.

Under this new authority:

—The Safety Board will coordinate the provisions of federal services to the families of victims

—These could include, but are not limited to, providing speedy and accurate information about the accident and recovery efforts, ensuring the families who wish to travel to the accident site receive all necessary assistance, and arranging opportunities for counseling and other support.

—The Safety Board will work with State and local authorities and with private relief organizations to ensure appropriate coordination of the services they provide with those of the Federal Government.

—The following federal agencies will cooperate fully with the Safety Board in these efforts; the Department of State, Defense, Justice, Health and Human Services, Transportation and FEMA.

Another provision of the Act calls on the Secretary of Transportation to appoint a task force composed of family members and representatives of government and private relief agencies. This task force will have quite a full plate before it. It is charged with developing a model plan to assist airlines in responding to aircraft accidents. The first meeting of the task force is scheduled for the end of this month.

Let me describe two recent experiences since passage of the Family Assistance Act. On November 19, 1996, a United Express Beech 1900C collided with a King

Air at intersecting runways in Quincy, Illinois. All 14 persons on both aircraft died in the accident.

Although this was a relatively low-fatality accident as major airline disasters go, it still had a significant impact on local resources and facilities. The coroner had no medical expertise, and no facilities or staff at his disposal. Under an agreement with the Department of Health and Human Services, we arranged for a mobile morgue that was fully equipped, supplied, and staffed. This service was set up inside the airport's vacant firehouse, and served as the mortuary.

Despite the fact that all 14 victims were badly burned, they all were identified and returned to their families within four days. This would not have been possible had local resources not been augmented.

Although most families did not come to the scene, those who did were taken to the accident site on the second full day. The city provided us with police escorted transportation for the family members. The families who were on scene were briefed by Safety Board and our Investigator In-Charge. Those family members who did not travel to Quincy were briefed by staff members by phone.

On January 9, 1997, a Comair EMB–120, a Brasilia, crashed on approach to Detroit, killing all 29 persons aboard. In this instance, nearly all families came to the scene. The Michigan State Police took care of security at the accident site, at the morgue, and at the hotel where the family members were staying.

The identification of victims began on the second full day following the accident—Saturday—and continued through Wednesday. All 29 victims were identified. This was an extremely difficult task because of the severe fragmentation of the remains and the extreme cold temperatures in the days following the accident (wind chills for many days after the accident were well below zero). A team of 125 people worked in the ad hoc morgue set up in a hangar for 20 hours a day. The mobile morgue was flown in the morning after the accident. Personal effects were recovered by teams of volunteers. The local Mental Health office provided counseling for family members and for rescue personnel.

What we have seen in these two accidents has been evident in many accidents in the past. Local jurisdictions are not prepared for the consequences of a once-in-a-lifetime event like a major airliner crash. This is no criticism of them. You cannot build an infrastructure to be prepared for such a rare event; it would deprive communities of resources needed elsewhere for more pressing community needs.

The Monroe County crash of the Comair commuter in January brought that county its highest death toll in a single event in more than 150 years. Any individual airline might go decades between fatal accidents; it is difficult for them, too, to be completely prepared for such an event.

The Safety Board deals with many major accidents every year. And we've been doing this for 30 years. That is why we were placed in charge of coordinating government services to the families, and that is why we are optimistic that once we have agreements in place with the many government and private agencies that can provide needed services, and once we have this program funded, we can fulfill the obligations given us by the American people though legislative directive.

I can say that both of the recent accidents taught us lessons, but they also demonstrated the benefits of our involvement; many who have participated in previous incidents commented on how far things had come and how much better off families were under this more-organized on-scene effort.

I would like to point out that we have structured our family assistance program to ensure that our new responsibilities and authorities do not interfere with or adversely affect the well-established process of managing major investigations.

Mr. Chairman, let me now address some financial issues that are important to the Safety Board. As you know, the 1997 enacted appropriation level for the Safety Board is $42.4 million and 370 FTE's. Not included in this amount is the $6 million 1996 supplemental earmarked primarily for reimbursement to the U.S. Navy for TWA Flight 800 recovery costs. In 1997 we requested approval for an additional TWA 800 related supplemental of $23.2 million. This would have covered investigative expenditures through the end of the fiscal year, as well as allowing us to start our family assistance efforts. OMB approved $20.2 million for inclusion in the President's Budget. I realize, Mr. Chairman, this is not a budget hearing but I did not want to miss a chance to make our case.

Our emergency fund, which has been funded at a $1 million level, is used to pay for extraordinary recovery and investigative tasks. OMB has approved expanding the fund next year to $2 million. The simple truth is that this fund does not begin to cover the extraordinary costs of our investigations. Aircraft tragedy investigative costs are usually born by both the Federal Government and by the carrier through its insurance underwriters. If the aircraft crashes on land, the carrier is generally responsible for wreckage recovery and removal. If we deem that the wreckage is

vital to our investigation, we see that the critical parts, or all of the wreckage, are removed to a secure location for examination. In general, payments for this is made by the insurance underwriters.

In accidents occurring over water, or where the probable cause may be criminal in nature, the responsibilities are not so clear. For example, in the TWA Flight 800 investigation, I asked for the early financial participation of the carrier, manufacturers, and engine supplier and all declined. The Federal Government has in fact borne all of the extraordinary costs in this investigation outside of the party's participation.

I would also be remiss if I did not mention the outstanding support of the state, and local authorities and agencies at the accident scenes. In New York, Florida, and in Michigan, costs have been incurred on behalf of the accident that are currently being borne by the states and localities. They are not insignificant and I believe that a system or process needs to be in place to address the legitimate local costs associated with aircraft disasters.

Mr. Chairman, this concludes my testimony and I will be happy to answer any questions.

INVESTIGATION FINANCING

Senator SHELBY. Mr. Hall, the National Transportation Safety Board is responsible for investigating significant transportation accidents of all kinds. NTSB immediately dispatches what they call a go team to an accident site, analyzes the evidence, and tries to determine the probable cause of the accident. NTSB often issues safety recommendations to help avoid future accidents.

Some investigations are very lengthy, such as the 1991 Colorado Springs crash of a United Airlines 737, cause undetermined; the 1994 Pittsburgh crash of a USAir 737, and the ongoing probe regarding TWA Flight 800, that you just mentioned. How, Mr. Hall, does NTSB finance safety investigations? Does your budget require enough flexibility?

Mr. HALL. Through appropriated funds. Mr. Chairman, obviously funding our agency is sometimes like funding the fire department—you are not exactly sure how many emergencies you are going to face in a particular year.

Senator SHELBY. Well, just like the TWA investigation has taken a long time, it has had to be very expensive.

Mr. HALL. Yes; but it is all appropriated dollars.

Senator SHELBY. It has taken a toll on your budget as well, has it not?

Mr. HALL. Yes, sir; definitely. And not just the budget, Mr. Chairman, but obviously I would be remiss if I did not say the toll it has taken on all the individual investigators.

INSURANCE COMPANY RESPONSIBILITIES

Senator SHELBY. Do insurance companies have a significant role in determining the course of an investigation, and if so, what role do they play?

Mr. HALL. The only role they have played traditionally in the past is the assistance in the wreckage and recovery costs. They do not really have any party status or other role in the investigation.

Senator SHELBY. Should DOT review the level of insurance coverage it requires of transportation providers, especially common carriers of passengers?

Mr. HALL. Yes, Mr. Chairman, I believe they should. And we have actively recommended to both OMB and to the Secretary that we ought to look at some type of emergency funding that would be

available to cover situations similar to TWA 800, and also the responsibility that a carrier may carry to some of the victims. At the present time my understanding is that most of the policies do not provide any funds for victim recovery.

Senator SHELBY. Mr. Vogt, did you have any opening statement? I was told you did not, but I wanted to clarify that.

Mr. VOGT. Mr. Chairman, I do not have a written opening statement.

Senator SHELBY. OK. Do you have any comments?

Mr. VOGT. I will share some comments with you.

Senator SHELBY. Please go ahead.

STATEMENT OF CARL VOGT, FULBRIGHT & JAWORSKI, AND MEMBER, WHITE HOUSE COMMISSION ON AVIATION SAFETY AND SECURITY

Mr. VOGT. Thank you for inviting me. I am pleased to be here. I am the only witness, I think, today who is not anticipating an appropriation from you, unless there is a rule I have missed.

Senator SHELBY. You have not missed it.

Mr. VOGT. Thank you, Senator Lautenberg also, Senator Byrd, Senator Bennett.

Just a few brief remarks.

I think it is very important to keep the perspective of historical context on where we are today in aviation safety. We recently, last week, celebrated the 50th anniversary of the Flight Safety Foundation, of which I am privileged to be a governor, and we honored the founder of the Flight Safety Foundation, a man named Jerry Lederer. Jerry was 6 months old when Orville Wright made his first flight. So all that we are talking about today and all that involves commercial aviation today has happened in the long lifetime of one individual.

We sometimes think that change which is occurring at any given time is unique, and this industry, in fact, has been characterized by change from the very beginning. Most often that change has been brought about by technological advances. Modern aviation, for example, in my judgment began with the introduction of turbine power in the late fifties and early sixties to commercial aviation. The microprocessor has had enormous impact, and today we are right on the threshold of a whole new era which is brought about by digital communications, global position satellite navigation, and so technologically today we find ourselves at the beginning of a very, very important era in aviation.

At the same time we are seeing an enormous expansion of the market for aviation services, an expansion of capacity, growth throughout the world in commercial flights. The Boeing Co. has predicted from a safety perspective that if we do not improve the accident rate we are going to have an accident a week worldwide within the next 20 years.

We also are at a point in time where I do not need to tell you that we are faced with reductions in government spending across the board. This is not only true in the United States, it is happening in Europe, as well. And so faced with an expansion of capacity in demand for aviation transportation services, on the threshold of a major technological innovation in change, we are in a position where we do not have the Federal resources available that we have

had historically to deal with the change that is coming about. And it is the juxtaposition of these things that creates some unique challenges at this point in time.

And to state the obvious, one of the challenges is that the Federal agencies involved are going to have to do more with less, and they are in the process of addressing that. The Challenge 2000 report that the FAA prepared is an innovative and thoughtful approach to this. There is a lot more to be done.

But as you review the recommendations of the Gore Commission you will see that some of the most important ones open the issue of increased funding. There is more money needed to comply with or accede to the recommendation, for example, that the modernization of our air traffic control system be expedited and be in place by the year 2000 rather than the year 2012—I am sorry, by 2005 rather than 2012.

We call for increased security measures to be funded with Federal funds. We toss the ball to the Civil Aviation Review Commission, which the Congress has established in most of these cases to find new ways to come up with money for these programs and others. But I believe that new efficiencies within the administration and new sources of money are the real challenges that are facing us today.

I would be happy to answer any of your questions.

Senator SHELBY. Senator Lautenberg.

Senator LAUTENBERG. Thank you, Mr. Chairman.

Mr. Vogt, you could not be more right in terms of the funding requirements. I am a senior on the Budget Committee and we spend every day talking about the problems that we have to solve that do require money in addition to attention. And this is one of them, and I think that we saw in TWA 800 what it is that people want to know, what we want to know about what took place.

And, Mr. Chairman, the suggestion that Mr. Hall made about visiting that site, the reconstruction of TWA 800, is something if you do have a chance you ought to see. I was there and I also saw Pan Am 103 when it was reconstructed, and it is just amazing what can be done, what science is now available to us, and we ought to pursue it as diligently as we can.

GORE COMMISSION RECOMMENDATIONS

Mr. Hall, the Gore Commission made several recommendations on how to improve aviation safety and security. In some quarters, however, it is being criticized as being long on advice and fairly short on how to accomplish some of these objectives. Both of you having been involved with it, are we seeing a situation where some of the harder to solve safety problems are deferred because we cannot get industry agreement or because they have made a hard, cold calculation about how much they can do, how much they ought to do with the funds that they have available?

Mr. HALL. Let me just briefly comment. Looking back, Senator Lautenberg, I want to commend former Administrator Hinson and Deputy Administrator Daschle. One of the things that Senator Byrd mentioned was a recommendation of the Board, one level of safety for regional aircraft is now a reality in this country. The pre-

vious administrator addressed the problem of the failed modernization of the air traffic control system and put that on track.

I think, referring to your earlier remarks, what we now need is leadership and direction. We have the Challenge 2000 program, we have the 90-day safety review, we have the Gore Commission recommendations which provide an overall direction. What we now have to talk about is the implementation of these recommendations. There are two things in that, having the direction and support of both the industry and the Government to make these things happen, and the second thing is who is going to pay.

NTSB SUPPLEMENTAL REQUEST

Senator LAUTENBERG. Well, that brings me to the next question, and that is the difference between that amount requested during the 1997 emergency supplemental, as well as the extraordinary costs associated with TWA 800, as well as the implementation of some of the Gore Commission recommendations. That is quite a package.

Now, the amount of funding, therefore, that you request of us does differ from the level formally requested by OMB. Where do you see the difference coming? Are they just saying to you we cannot handle it, or are they saying that you do not need it?

Mr. HALL. OMB did not provide us funds for the victims' assistance program that was directed by both the President and Congress for the NTSB to accomplish, and some additional positions that we felt were necessary.

I have had, Mr. Chairman, a number of my investigators that have been living for 9 months up at Calverton. If we had another aviation disaster that occurred in the near future, we would be in a very difficult situation to be able to provide the type of investigation that our agency wants to provide to the American people.

NAVY COSTS

Senator LAUTENBERG. Just questioning, the other costs that have been associated with this investigation are really significant. And I was out at Calverton twice, once a couple of days just after the airplane went down, and later on to see what the progress was, and it was an amazing task. I must tell you, your people and the FBI and the Navy and the divers and everybody that was involved gave it as good an effort as I think one could possibly see. But are you required to reimburse the Navy for any of the costs that they have incurred?

Mr. HALL. Yes, sir; we have a memorandum of understanding with the Supervisor of Salvage of the U.S. Navy to assist us in the recovery on a reimbursable basis. They work under contract to us, and are up there under our direction. It is our responsibility to fund the recovery.

Immediately after this event happened, I sent, as we have routinely done, and Peter, you might throw that other chart up, last year we had three——

Senator BYRD. Those charts are not of much assistance.

Senator LAUTENBERG. I would say.

Mr. HALL. They are hard to see, I am sorry.

Senator BYRD. I can see the chart, but I cannot read it. [Laughter.]

Senator SHELBY. That helps.

Senator LAUTENBERG. That helps. It blots out the whole audience.

Senator SHELBY. Just the press.

TWA 800 COSTS

Mr. HALL. If you would like, we could basically review for you the costs on Flight 800 to date.

VOICE. Mr. Chairman, this chart intends to show a number of things, primarily the extraordinary investigative costs relative to TWA 800. As you will notice in the center column here, $26.8 million is the total cost we now see as required to complete the investigation.

Senator LAUTENBERG. That is your share only?

VOICE. These are the total costs the NTSB expects to obtain through reimbursement of others.

Senator SHELBY. The whole thing.

VOICE. Out of 1996 we spent $766,000 out of our emergency fund. Congress provided $6 million at the beginning of fiscal 1997 in a supplemental appropriation, and we have requested a total of $23 million additional this fiscal year, $20.1 million for TWA 800, the bulk of that going for reimbursement to the Navy of victim wreckage recovery, also for the wreckage storage, the facility at Calverton. The Navy has asked for $5.6 million. And as you can see, there are other associated costs with the investigation. But the Navy portion is primarily victim wreckage search and recovery and wreckage storage. In addition, the trawling, which is ongoing, is $5.5 million all by itself.

Senator LAUTENBERG. Mr. Chairman, my time is up, but I just want to say that I have seen the NTSB in many situations, rail accidents, aviation review. Mr. Hall has been to my office several times and we have discussed things. I have got to say this is a department under Mr. Hall's leadership that has done very, very well. They work hard, they are conscientious, they are professional in every sense of the word, and I think that we run a risk if we shortchange some of these reviews because of the longer term implications, obviously, what it is you learn in one of these investigations.

Thanks very much.

Senator SHELBY. Senator Bennett.

Senator BENNETT. Thank you, Mr. Chairman.

If I may impose a little personal history, my service in the executive branch was at the Department of Transportation. And it was my responsibility and ultimately my pleasure to shepherd through the Congress the Airport Airways Act of 1969, that created the airport airways trust fund, and we assumed as a result of that action that we had secured funding for the FAA and its safety responsibility for all time. We were not aware of the fact that subsequent administrations, both Republican and Democrat, would treat trust funds, whether it is the highway trust fund or the airport airways trust fund, as simple accounting devices that had little or nothing to do with the amount of money that would actually be spent. And

as a consequence, fake balances were allowed to accumulate in the trust funds while serious needs were not met. And so I come to this committee with a little bit of that history behind me, and am concerned to hear you talk about the need for resources in this area relating to the safety of the FAA when I thought I had made a small contribution to making sure that those resources would always be there.

There is a story going around which I would like you to comment on, either confirm or deny, lay down. It makes great conversation. Someone said, and if I knew who the someone was I would tell you, I am not trying to be coy here, I am trying to get some information, that a study was made of the Federal Government's computer technology and capability, primarily from the point of view of trying to find out whether or not a hacker could get into the Government's computers and compromise them. The result was, according to the version I have heard of the study that every portion of the Government's computer system is indeed vulnerable to a hacker getting in and one way or the other compromising or taking information out of the system, with the exception of the FAA. The reason we need not worry about a hacker getting into the FAA is that the software and the hardware are so obsolete that no hacker currently existing has any technical capability to deal with it. Now, is that a true statement or an old wives' tale?

Mr. HALL. Senator, I do not know. Last year, because of concerns that came out of our Chicago regional office, we looked at the problems of the breakdowns of the air traffic control system at some of our major airports. Some of the equipment is so dated that there is a real concern about maintaining individuals on the FAA payroll to maintain that equipment till it can be replaced.

However, I think that there has been progress made in the modernization of the system. But I do not have the background and expertise to answer that question, but it is an old system.

Senator BENNETT. I trust the Acting Administrator might have an answer for that. I apologize that I am going to have to leave, and many of these questions are perhaps more appropriately addressed to the FAA Administrator.

The one other concern that I do have as we talk about resources and your obvious need for resources, is, of course, the controversy of Bay Area Rapid Transit System where BART wants to use money that might otherwise be available to the FAA or the NTSB to help defray the cost of their subway system. Senator McCain has been particularly outspoken on that, and I did not want to let the hearing pass without the opportunity of expressing myself in that regard.

Now, Mr. Chairman, I apologize, and apologize to the witnesses. My beeper is very insistent.

Senator SHELBY. We will leave the record open for any further questions you might have.

Senator BENNETT. I would appreciate that opportunity. Thank you, Mr. Chairman.

Senator SHELBY. Senator Byrd.

Senator BYRD. Mr. Hall, are you currently satisfied that the FAA's procedures for regulating and inspecting commuter aircraft are sufficient to detect the problems that may pose a safety risk?

Mr. HALL. As you pointed out, we now have one level of safety for both commuter airlines along with the major service. And last year was a good year in the commuter industry. However, 1 year is obviously not enough to see whether an effective job of oversight is being done.

Through ongoing accident investigations, we will look very closely at what the FAA is doing, as we do in all of our investigations, and how they are doing their job of safety oversight. Clearly the addition last year of a number of new safety investigators for the FAA should have a positive impact on their work in this area. Mr. Valentine would have to address how many of those individuals are now in place with the additional FTE's that have been allocated for those positions.

But this is an area of obvious ongoing concern, and is part of two investigations that we have presently underway.

Senator BYRD. What concerns do you have specifically regarding the commuter aviation industry?

Mr. HALL. Chairman Vogt was correct. We are seeing a great explosion in aviation and projected growth throughout the world. A lot of middle-sized and small communities in our country that are being left by the wayside, such as the interstate systems did years ago. In an era of deregulation, I think Congress is going to have to look at ways to ensure some service.

I know the essential air service program is there, but there are a number of communities now that are suffering. With transportation being 12 percent of our gross national product, we will be basically out of the equation for growth in the future unless that problem is addressed.

Senator BYRD. Do you have concerns with respect to the maintenance of commuter aircraft and with the experience of pilots who make these commuter runs? Do you along those lines?

Mr. HALL. Yes, sir; and I would like to ask Mr. Haueter, if he would, to come up here, because we have an investigation specifically in regard to pilot record-sharing that I would like him to briefly touch on, and what is being done in that area.

Senator BYRD. What is this gentleman's name?

Mr. HALL. This is Tom Haueter, and he is the head of our chief investigation unit for the NTSB.

Mr. HAUETER. Following the investigation of the Raleigh-Durham commuter accident the Safety Board issued a recommendation regarding pilot background checks. We found that the pilot had come from one airline to the accident airline. The previous airline had some negative findings, and those were not passed on to his new employer. We issued a recommendation to the FAA to require background checks that could be passed on from one employer to another. The FAA has been acting on that slower than we would like, but we will continue working in that area.

Senator BYRD. What are you doing to get the FAA to work faster?

Mr. HAUETER. Through our recommendation process we have a dialog back and forth, trying to help them push the system.

Senator BYRD. That sounds like in itself it is a pretty slow process.

Mr. HALL. I have, in addition, Senator, discussed this personally with Secretary Slater, our most wanted list. He is aware of those concerns and has met with Mr. Valentine and with other appropriate officials of the FAA to let them know of our interest in this area. And again, they are moving in this area. I think it is merely the speed at which they are moving that is of concern to us.

Senator BYRD. Mr. Chairman, is there anything the subcommittee can do to help to encourage an acceleration of the speed?

Senator SHELBY. I believe we could work together to get something done.

Senator BYRD. I hope we can.

Senator SHELBY. And your suggestions and your overall leadership and experience would certainly help the subcommittee. I will be willing to work with you, and I think the other members would. This is vitally important.

COMMUTER AIRLINE SAFETY

Senator BYRD. Do you have any suggestions as to how we might help? Could we request a monthly report on the progress?

Mr. HALL. Well, that would certainly be helpful, Senator.

Senator BYRD. Well, let us take that under advisement, Mr. Chairman.

Now, do you have concerns with reference to the maintenance of the commuter aircraft?

Mr. HAUETER. We saw a commuter accident in Eagle Lake, TX, where the mechanics had forgotten to put some screws back into the tail of the airplane. Subsequently, the tail came off or a portion of the leading edge came off on approach. We have looked into that. Obviously, commuters are quickly growing. Also, we are seeing the major airlines starting to need more pilots and more mechanics, and they are drawing these people out of the commuters. So in some cases the commuters are losing some of their better people to the major airlines.

I think that the FAA is going to be pressed with getting as many inspectors as they can to ensure that the training and standards are kept up. The one level of safety will definitely help in this area.

Senator BYRD. Do you have any indications of problems with drugs or alcohol on the part of any of these people who do the maintenance of the aircraft, or any of those who do the piloting?

Mr. HAUETER. Not that I have seen. We did have one case about 8 years ago or so, but I have not seen anything recently that would lead me to such a conclusion.

Senator BYRD. What have been your observations, Mr. Hall, regarding the FAA's efforts to apply the same standards of safety to the small commuter aircraft?

Mr. HALL. I think, Senator, that once the debate ended and the decision was made to move ahead with one level of safety, the Regional Airline Association and the people at the FAA have moved forward in a positive way to meet that mandate. So at this point in time I would give everybody good marks on that.

Like everything else in the safety area, you have to stay after it.

Senator BYRD. What other safety initiatives, if any, do you think would be appropriate for this segment of the aviation industry? My time is up.

Senator SHELBY. Go ahead and respond.

Senator BYRD. Perhaps you could respond briefly.

Mr. HALL. Obviously, that segment of the industry is impacted as well by the issues on our most wanted list; flight data recorders, ground separation, all the things that impact 121 also impact commuter aviation.

Senator BYRD. Thank you, Mr. Chairman.

Senator SHELBY. Senator Gorton.

Senator GORTON. I would like to paraphrase a couple of the points, at least, that I made in that opening statement. This is a vitally important subject, and it is a subject both for this subcommittee and for the Commerce Subcommittee on Aviation that I chair. We had many of these same people, all of these same institutions, in front of us to discuss the Gore Commission report some time ago, and the chairman of the full committee, John McCain, held a hearing last week on airplane accidents, the investigations, and the way in which the results of those investigations had come out. Each of these was a learning process, just as it is here today. Obviously we have got to encourage the greatest move toward safety that we possibly can. We are probably going to do that better cooperatively, in many cases at least, than with a lot of mandates.

One of the subjects I delved into during the Commerce Committee hearings was the sometimes rivalry between the FAA and the NTSB. Now, while there was a lot of criticism of that there, my own view was that there is some wisdom and some real value in having two organizations with a bit of overlapping jurisdiction. Certainly, what they talk about gets more publicity that way, and to have one checking on what the other does is probably pretty valuable. So these are really important issues because you control the money that we are dealing with, and the way in which we guide the deliberations and the actions of the Safety Board and of the Federal Aviation Administration are going to be very, very important for the future.

GORE COMMISSION RECOMMENDATIONS

With that, couple of questions. I guess, Mr. Vogt, I have really got two for you, and let me tell you an impression that I had in my own hearing on the Gore Commission report, not so much on the subjects that have been discussed, at least since I came to this hearing, on safety, but on the subject of security. Tell me whether this impression was wrong.

I got the impression that many of those recommendations, without an awful lot of examination of the cost, stemmed from the belief during the course of the summer and the fall that TWA Flight 800 was done in either by an outside attack or more likely by a bomb on board the aircraft. Now it seems much more likely than not that neither of those were the causes of that crash. But I and a number of other members of the committee just got the view that many of those recommendations were almost academic or outmoded by reason of that initial apprehension. Were we wrong?

Mr. VOGT. I am not sure whether you were totally wrong, but if you will recall, the initial mandate to the Commission was to investigate security matters, and a report was delivered within 45 days, I believe, and the members of the Commission at that point were predominantly public members, Mr. Peña, Mr. Deutsch, Mr. Freeh, and others. And it was only later that the rest of the commissioners were appointed, and that the mandate for the Commission was expanded to include air traffic control and safety.

So a number of recommendations, if you look at a copy of the report, were submitted before the full Commission actually convened, and then we reviewed those and they were included in our final report with, I think, four or five additional security recommendations. And there is a status report as of the time of our last meeting on each of the prior recommendations that was made.

I think that the issue of security is much broader, though, than the expectation initially that TWA 800 was a terrorist act, and I believe I speak for the Commission, the consensus of the commissioners is that this is a much broader issue. We were aware at that time that the focus was being directed elsewhere, so that it did not seem to be an accident-specific issue that was before us.

So these recommendations, while we have a vulnerability to terrorism in the United States, we have not as yet had a recognized threat except for one terrorist plan to blow up 12 U.S. airplanes over the Pacific Ocean. And we had not really anticipated a threat to Federal courthouses in the sense that we saw in Oklahoma City. So I think that there is much to be done here. We recognize the vulnerabilities. I think we have made some recommendations that address those vulnerabilities, and hopefully there will be implementation of many of these. Already, $160 million was appropriate, new equipment is being purchased, there is cooperation between the Customs and the FAA now—Customs Service.

There are a number of things that are ongoing. I think all of these are very positive, and most of them are not costly in a relative sense.

Senator GORTON. Thank you for that.

Another question for you but on a different subject: You have had a lot of wonderful experience with the Safety Board, as an attorney who has specialized in civil litigation, so you have had a lot of time to investigate and observe the investigation of aircraft accidents. Do you believe that the huge financial stakes involved in determining liability for accidents has hampered in any way the ability of investigators to gather and assess the information necessary to find cause and to reach objective conclusions?

Mr. VOGT. Well, I do not think the stakes are so much the issue as it bears on investigations. There are really two sets of investigations that go on. One is what the NTSB does, and I think the integrity of that process has proven itself over time, and it is very good and very impressive. And for the most part all of the parties to these investigations, in my judgment, offer good faith cooperation. Everyone wants to find the cause of the accident.

Then you get my brethren at the bar who are seeking to recover damages for families or manufacturers or all of the interests involved. And as you know, the probable cause determinations of the NTSB are not admissible in evidence, although the factual record

is available, and is used as a factual basis by attorneys in these liability cases. So I think the integrity of the governmental process is very sound.

I think the stakes are so high that the entities involved, whether they are airlines manufacturers, unions, any of the interested parties, the stakes are so high that it is my opinion that no one is deterred from finding the cause by the potential liability cost of a single accident, because most of the time what we are really concerned about is the generic application of what we find and safety precautions that come out of a given accident which would prevent future accidents.

Senator GORTON. In your view, should the NTSB conclusions be admissible?

Mr. VOGT. No, sir; they should not.

Senator GORTON. Why?

Mr. VOGT. Well, I believe that that would impact the integrity of that process. It puts it into the area of money and liability, and the NTSB—part of the reason for its effectiveness is that it has a very clear cut mission, which is safety, and that should not in any way be combined with money issues or liability issues. I think the system works well.

FLIGHT DATA RECORDERS

Senator GORTON. Mr. Hall, one for you, and, Mr. Chairman, if somebody has already asked this I apologize and you can correct me. When we were before the Commerce Committee you addressed the issue of expanded parameters for flight data recorders, and you really caused our ears to perk up when you said that a number of foreign flag airlines order far more significant data recorders than are often ordered in new aircraft manufactured by Boeing for domestic flag carriers. And there have been some real repercussions to that statement.

Some since then have told me that one of the reasons for that was that domestic carriers preferred uniformity, for example, that all of their aircraft have the same kind of flight data recorders for their purposes. I guess I need to emphasize your own point that this was not something that the manufacturers decided on, it is something the purchaser, the airline purchaser, decides on.

My basic question to you, is that an excuse? Is that a good reason for every new aircraft not being equipped by the purchaser with the most sophisticated flight data recorders?

Mr. HALL. No, Senator; that is kind of a creative excuse.

Senator GORTON. Thank you.

Thank you, Mr. Chairman.

Senator SHELBY. Good phrase—creative excuse.

Mr. Vogt, there seems to be a consensus among aviation experts that the FAA must fundamentally change the way it makes decisions, approaches personnel costs, and transitions from older technology to new technology. This subcommittee has tried to be responsive to the Department's request for increased flexibility in the personnel and procurement areas.

For example, in the fiscal 1996 transportation appropriations bill, FAA was given unprecedented personnel and procurement reform tools. But the Coopers & Lybrand independent study of FAA's

management practice points out that they have yet to effectively use these new tools. If we are to believe the Coopers & Lybrand study, there is every indication that FAA is having some difficulty managing itself. What kind of changes, from your perspective, do you think need to be made in the organization, and perhaps in the culture at FAA, to effectively keep safety as the agency's focus?

Mr. VOGT. Well, first of all, Senator, I think that the two innovations that you mentioned, procurement and personnel, are extremely important. I think it is still a little early for Coopers to reach a decision that they have not been effective. I know that some of the purchasing has been most effective, and the personnel regulations, my impression is that they are in the process of being implemented.

My concern is, as I stated initially, that we are at a crucial juxtaposition here of many changes, and it is obvious that the agency is going to have to be more efficient and effective in the way it does business, as are most Federal agencies.

Senator SHELBY. But in this particular agency, safety has got to be the real focus.

Mr. VOGT. Yes; that is correct. And if you look at the Challenge 2000, which was developed by the FAA, it is filled with terms like reinvention and cultural change. So I think there is an awareness there. What has been missing for the past few months is obviously new leadership in the agency, and I think that the changing of the way in which the agency makes decisions, and I believe there is within that agency an inbred reluctance to make decisions for some reasons which once you are there and see it are quite understandable within the culture, some of the most talented people in this Government are in that agency, and I think that if the talent is unleashed to find solutions to develop new and more effective ways to make decisions, that it will get done. And to incentivize through these new personnel regulations, reward people who do things in creative ways, there is tremendous potential there to effect these changes.

Senator SHELBY. You played a leading role in developing the safety recommendations contained in the Gore Commission report. Aviation safety has been a touchstone throughout your career, and I believe it should be. You are one of the experts on the subject. In your opinion, which of the 53 recommendations contained in the Gore Commission report are most important and need to be implemented in the shortest timeframe possible, and which of the most pressing, immediate needs currently in force are being implemented?

I know it is hard to just pinpoint which is the most important, but you have to go by priorities.

Mr. VOGT. Let me creatively try to duck your question a little bit.

Senator SHELBY. You do not want to duck the focus, though. The focus is safety.

Mr. VOGT. I am not going to duck the focus, but I do not want to make a statement that would detract from some of the issues there. But I think clearly the most weighty decisions there, first of all, is 1.1, which is to cut the accident rate fivefold within 10 years. And I think that is very doable if you take into account the fact that most accidents are caused by controlled flight in terrain today

worldwide and loss of control in flight. If we can see the implementation of advanced ground proximity warning systems, I think there is tremendous potential through new technology to reduce that accident rate.

Second, I think one of the most weighty recommendations was to implement our air traffic control system national airspace modernization by the year 2005 instead of 2012. That is a major, major task, and relevant to this committee's understanding, the $60 million need—or $60 billion need that the agency projected was verified, to a certain extent, by the Coopers report. And if OMB is going to cap those moneys at $47 million, you have got the gap that has been widely talked about. And yet, our recommendation is to do something that is extremely expensive from an infrastructure cost in far less time than the agency has projected. That is a very, very major undertaking, and I think a major recommendation.

Senator SHELBY. Would you save some money by implementing it sooner?

Mr. VOGT. Well, I do not know the figures on that. I think you probably can come to that conclusion. Some money would be saved, but you have got enormous capital costs that are going to have to be funded up front.

Senator SHELBY. Either way, have you not?

Mr. VOGT. Absolutely, and that is one of the reasons that we recommended that there be some new approaches to financing explored, and to try and leverage some of the money that flows into the FAA in the capital markets.

Senator SHELBY. What about spending some of the money that is already there and is currently used for other purposes?

Mr. VOGT. Well, you know the trust fund used to have a surplus. Right now it is pretty empty. I think it is very frustrating to everyone, as Senator Bennett said earlier, that when that trust fund does have a surplus that money is not used for its intended purpose. And there have been points in time where the use of that money could have made tremendous strides for this capital infrastructure I am talking about.

And finally, I would say that of our recommendations, the security recommendations, particularly on the recognition of security as a national problem, a terrorist problem, terrorist attacks are directed against the United States, not against an air carrier as such, just to give an example, and that new ways to fund increased expenditures for security should be explored, but that the responsibility is basically a Federal responsibility.

Those would be the recommendations I would say are the most weighty of our report.

Senator SHELBY. I think they are very important, and I concur.

Senator Lautenberg.

Senator LAUTENBERG. I have nothing more, Mr. Chairman.

Senator SHELBY. Senator Byrd.

Senator BYRD. No; nothing more, Mr. Chairman.

SUBMITTED QUESTIONS

Senator SHELBY. Gentlemen, I thank both of you for your appearance here today and for your candid testimony. We will submit additional questions to be answered for the record. Thank you.

[The following questions were not asked at the hearing, but were submitted to the agency for response subsequent to the hearing:]

QUESTION SUBMITTED BY SENATOR GORTON

Question. In testimony before the Commerce Committee, and in response to questions raised by Committee members, NTSB Chairman Hall addressed the issue of expanded parameters for flight data recorders. Chairman Hall mentioned that foreign carriers have ordered, and U.S. manufacturers have supplied, aircraft with more sophisticated flight data recorders than U.S. carriers are demanding. Chairman Hall intimated that cost was the only reason that domestic air carriers would continue to order aircraft with flight data recorders that meet only the minimum FAA standards. I understand, however, that carriers also have concerns about integrating aircraft with new systems into their fleets. For maintenance purposes, they want to maintain standardization within their fleets. Is this a valid concern on the part of U.S. carriers? Does the FAA believe that its proposal for the industry transition to flight data recorders with expanded parameters takes this concern into account?

Answer. It is a concern; however, there already is a great amount of diversity in FDR systems, more as a result of the unavoidable evolution in aircraft technology than as a result of government regulation. The age of U.S. air carrier aircraft varies greatly. It has been our experience that the older the aircraft, the more limited the number of FDR parameters available. As airplane systems have gotten more complex, airplane manufacturers (and government and airlines, too) want and need more information to determine how various aircraft systems performed after an accident or incident. The FDR itself is a very standardized unit that can operate on almost any aircraft type. Further, the Aviation Rulemaking Advisory Committee (ARAC) that helped develop the FAA's Notice of Proposed Rulemaking (NPRM) made every attempt to standardize across different airplane types and the different aircraft operating rules (i.e. Part 121, 135, 129). The airlines were well represented on the ARAC committee.

We would like to note that Southwest Airlines is retrofitting its fleet with state-of-the art flight data recorders. The carrier has not found it financially prohibitive to do so.

With regard to the FAA proposal for the industry's transition, based on our knowledge of the NPRM and how it was developed, we believe that FAA did take the industry's concerns about FDR system standardization into account.

QUESTIONS SUBMITTED BY SENATOR LAUTENBERG

NTSB'S VIEWS OF GORE COMMISSION RECOMMENDATIONS

Question. Mr. Hall, the Gore Commission report made numerous recommendations on how to improve aviation safety and security. It is criticized in some quarters as being long on advice and short on how to accomplish the objectives.

Do you believe that the Gore Commission report avoids some of the harder-to-solve safety issues in favor of accommodation with the aviation industry?

Answer. I believe that the Gore Commission report addressed all of the important aviation safety and security issues and it contained important recommendations for actions to improve the safety of our air transportation system. Some of the actions are well underway. For example, BNASA has organized a significant government/industry group (Aviation Safety Investment Strategy Team [ASIST]) to address the future research and development technological needs to reduce the accident rate five-fold over the next 10 years and ten-fold over the next 20 years. The Safety Board participated in much of the work of the ASIST project, which included a series of workshops to define an aviation safety investment strategy and delineate NASA programmatic investment options to improve aviation safety. Moreover, many initiatives in the aviation security area have already begun in response to the interim recommendations issued by the Gore Commission on September 9, 1996.

I do not believe that the Gore Commission report avoided the "hard-to-solve safety issues" to accommodate the aviation industry. However, I should point out that the industry did make certain announcements to voluntarily take certain actions within a specified time frame as a result of the issues debated during the Gore Commission meetings. For example, in December 1996, the Air Transport Association (ATA) announced that its member airlines would voluntarily install smoke detectors in Class D cargo compartments without FAA regulation.

The findings of the May 17, 1996, ValuJet accident in the Everglades highlighted the need for fire/smoke detection and suppression systems in passenger-carrying aircraft cargo compartments. The Gore Commission report did contain recommendations to the FAA for action on such systems. Last week, the FAA and ATA's member carriers announced their intention to move forward on this issue. We expect to see FAA rulemaking this summer, and Secretary Slater has committed to a final rule by the end of this year.

Question. Are there some recommendations with which the NTSB disagrees in whole or part? Are there additional recommendations that NTSB would like to see added?

Answer. As a member of the Gore Commission, I supported the Commission's final report. The Board has not formally reviewed the Gore Commission report or its recommendations.

Question. Mr. Hall, one of the Gore Commission recommendations was for the NTSB to develop a coordinated federal response plan to aviation disasters by April 1997.

What is the status of this recommendation? Have you had the full cooperation of the other agencies that would be involved in responding to a disaster?

Answer. The Safety Board has complied with the Gore Commission recommendation, and a Family Assistance Plan for Aviation Disasters is completed. Copies of the plan were forwarded to the Subcommittee on May 13, 1997. The Safety Board's plan was prepared in close cooperation with representatives from individual family members and the aviation industry, as well as legal, medical and emergency response experts. We have received excellent cooperation from other government agencies, and our plan also reflects memoranda of understanding, either in final or draft form, with six Federal agencies, including the Departments of Justice, Defense, State, Transportation, Health and Human Services, and the Federal Emergency Management Agency. These agencies, as well as the American Red Cross, are prepared to respond to an aviation disaster if needed.

NTSB'S EMERGENCY FUND REQUEST

Question. Mr. Hall, the NTSB has submitted an fiscal year 1997 Emergency Supplemental funding request to the Committee to cover the extraordinary costs associated with the TWA 800 costs as well as the implementation of some of the Gore Commission recommendations.

Why does the amount of funding you are requesting of us differ from the level formally requested by OMB?

Answer. The amount requested by the Safety Board for the supplemental appropriation reflects the amount required to accomplish the TWA flight 800 investigation, the new mandate to provide assistance to the families of the victims of transportation accidents, and other accident investigation activities.

Question. How much of the costs of the TWA 800 investigation have been borne by the Navy. Did you ask the Navy to absorb their costs out of their huge annual operating budget?

Answer. The U.S. Navy has not been reimbursed for $5.3 million for victim and wreckage recovery costs they have incurred, and they have not been reimbursed for any costs of the Calverton facility where the wreckage is stored and much of the investigation was conducted. For fiscal year 1997, the amount owed will be $5 million, for a total of $10.3 million. Since we have a reimbursable memorandum of understanding, we have not asked the Navy to absorb these costs. Also, it is our understanding that they cannot legally do so. We did ask the FBI to share in the costs of the investigation, but the Department of Justice declined.

Question. What specific activities will not get done if we approve the OMB request rather than your higher request?

Answer. If the full supplemental is not approved, we will be unable to fulfill our Congressional mandate to assist the families of the victims of recent transportation accident tragedies—including TWA flight 800—nor will we be able to avoid forcing our investigative staff to continue to take on inordinate workloads where we have only a few specialists in a given field. The real impact may take the form of diminished public confidence in the Board's work.

DEPARTMENT OF TRANSPORTATION

FEDERAL AVIATION ADMINISTRATION

STATEMENT OF BARRY VALENTINE, ACTING ADMINISTRATOR

ACCOMPANIED BY:

SUSAN KURLAND, ASSOCIATE ADMINISTRATOR, AIRPORTS
CATHAL L. FLYNN, ASSOCIATE ADMINISTRATOR, CIVIL AVIATION SECURITY
MONTE BELGER, ACTING DEPUTY ADMINISTRATOR
GEORGE DONOHUE, ASSOCIATE ADMINISTRATOR, RESEARCH AND ACQUISITIONS
GUY S. GARDNER, ASSOCIATE ADMINISTRATOR, REGULATION AND CERTIFICATION

INTRODUCTION OF WITNESSES

Senator SHELBY. In the second panel we will explore how the Federal Aviation Administration is addressing safety and security concerns. We will have Mr. Barry Valentine, Acting Administrator; Ms. Susan Kurland, Associate Administrator, Airports; Adm. Cathal Flynn, Associate Administrator, Civil Aviation Security; Mr. Monty Belger, Acting Deputy Administrator; Dr. George Donohue, Associate Administrator, Research and Acquisitions; and Mr. Guy Gardner, Associate Administrator, Regulation and Certification. Gentlemen, your written statements will be made part of the record in their entirety, without objection.

Well, that is good news. Senator Lautenberg and Wally were just telling me that we are only going to have Mr. Valentine to give testimony. Is that correct?

Mr. VALENTINE. That is correct.

Senator SHELBY. Mr. Valentine, you may proceed.

OPENING REMARKS

Mr. VALENTINE. Thank you, Mr. Chairman.

Mr. Chairman and members of the subcommittee, I welcome the opportunity to appear before you today on the Federal Aviation Administration's activities relating to aviation safety and security. I want to thank you and the other members of the subcommittee for your continued interest in and support of the FAA's activities and programs. With me today are the individuals that you just named, so I will not repeat the names and the positions. I would like to take this opportunity to mention some of the FAA's recent achievements and ongoing activities that enhance aviation safety and further ensure the security of the flying public.

WHITE HOUSE COMMISSION ON AVIATION SAFETY AND SECURITY

In February, the White House Commission on Aviation Safety and Security, led by Vice President Gore, issued its final report,

updating its initial report issued in September of last year. A key recommendation was to reduce the aviation fatal accident rate by a factor of five within 10 years. Another was to accelerate the modernization of the air traffic control system. We are ready to work with the White House, the Congress, and the aviation community to see that these recommendations are implemented as quickly as possible.

SECURITY EQUIPMENT INTEGRATED PRODUCT TEAM

The FAA formed an integrated product team of acquisition and security experts last October, to plan, purchase, and install explosive detection devices and other advanced security equipment at many of the busiest U.S. airports. As a result, we are purchasing and deploying additional FAA certified explosives detection systems, trace detection devices, and automated x-ray machines with installations already underway.

CANINE TEAMS

Also, with the help of the airport industry, we are increasing the number of canine teams at the Nation's busiest airports. In what I believe to be a model example of partnership, the FAA is entering into cooperative agreements with these airports to place more teams on the tarmac to perform highly qualified screening of suspect cargo and bags, and to clear airliners and terminals after bomb threats.

PASSENGER PROFILING

FAA has been using profiling of passengers for nearly 25 years, and views it as a significant element in the aviation security regime. Given the huge number of passengers and their bags moving through the U.S. air transportation system, profiling enables us to better focus application of the more rigorous measures. Since the airlines are responsible for the application of the profile and its results, I want to reassure the members of the subcommittee that there is no FAA data base or Federal system of records that will be generated in the process. The data that will be analyzed by the profiling program consists of information voluntarily provided by passengers to airlines in the course of commercial transactions, and the result will be automatically deleted shortly after the completion of the flight.

90-DAY SAFETY REVIEW

In June 1996, the then Deputy Administrator, Linda Daschle, led a task force to conduct a 90-day safety review examining immediate areas of concern to the agency, especially with respect to safety inspections. The centerpiece of the 90-day safety review was the formation of a team to assist local flight standards district offices in processing new air carrier certification. The new entrant airlines will now have a heightened level of inspection for at least the first 5 years of operation.

The 90-day safety review recommended the increase of funding to upgrade and accelerate the deployment of online aviation safety inspection systems to the aviation safety inspector work force by

fiscal year 1999. We wholeheartedly agree with and are moving toward implementing these recommendations.

AIRPORT IMPROVEMENT PROGRAM

As you know, the Office of Airports administers the airport improvement program [AIP]. The highest priority of the AIP is safety and security projects at airports. Typical projects for safety and security include the acquisition of aircraft rescue and firefighting equipment, runway and taxiway signs, runway incursion caution bars, runway and taxiway lighting, access control systems, and perimeter fencing, as well as lighting, marking, and removal of airport hazards. Much of the AIP is used each year to rehabilitate airport infrastructure.

Some current FAA airport standard projects that directly relate to safe aircraft operations involve improved airfield lighting to support low visibility operations and reduce runway incursions and runway pavement traction. For instance, we are working with the Port Authority of New York and New Jersey on a prototype aircraft arrestment system that can be placed in the safety areas at runway ends to bring aircraft that have overrun the pavement to a controlled stop.

MODERNIZING THE NATIONAL AIRSPACE SYSTEM

Today the United States has the safest and most efficient air traffic system in the world. However, as former FAA Administrator David Hinson warned, with projected increases in traffic, if today's accident rate remains constant, we can expect the equivalent of one major accident every 8 to 10 days worldwide by the year 2015. Therefore, the core issue is whether the FAA can continue to provide a high level of safety and service in light of the aviation industry's expected growth without modernizing the national airspace system. It is obvious that we cannot.

Without such features as digital radio communications and the decision support tools needed to increase controller productivity, the capability and capacity of the system will reach saturation by the years 2001 to 2002. If this occurs, we will have no alternative but to artificially constrain air traffic at major airports, which the FAA did after the 1981 controller strike. The consequences of such an action are obvious and severe.

One barrier to modernization is a human factors issue, a lack of experience with computer and human integration. We have conducted simulation tests and laboratory demonstrations of systems containing today's advances in technologies separately, but are designing a project to operate these systems together under real operating conditions. We currently intend to make a complete operational and systematic evaluation under real operational conditions prior to any commitment to systemwide acquisitions, training, and deployment.

In closing, Mr. Chairman, I would like to thank you and the members of this committee for the support you have provided to and for the FAA. I want to assure you of our willingness to work closely with you.

This completes my opening statement, and we would be pleased to answer any questions you have.

PREPARED STATEMENT

Senator SHELBY. Thank you, Mr. Valentine. We have your complete statement, and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF BARRY L. VALENTINE

Mr. Chairman and Members of the Subcommittee: I welcome the opportunity to appear before you today on the Federal Aviation Administration's budget request of $8.46 billion for fiscal year 1998. I want to thank you and the other members of the Subcommittee for your continued interest in and support for the FAA's activities and programs. With me today are Monte Belger, Acting Deputy Administrator; George Donohue, Associate Administrator for Research & Acquisitions; Irish Flynn, Associate Administrator for Civil Aviation Security; Susan Kurland, Associate Administrator for Airports; and Guy Gardner, Associate Administrator for Regulation & Certification. They are available to answer any questions you may have.

I would like to take this opportunity to highlight some of the FAA's recent achievements and on-going activities which enhance aviation safety and further ensure the security of the flying public. In February, the White House Commission on Aviation Safety and Security, led by Vice-President Gore, issued its final report, updating its initial report issued in September of last year. As you know, the Federal Aviation Reauthorization Act incorporated many of the White House Commission's initial recommendations dealing with aviation security and safety. Understandably then, we are focusing on implementing the provisions of the Reauthorization Act as well as those of the Omnibus Consolidated Appropriations Act of 1997, which funds the initial recommendations. As examples, we have published notices of proposed rulemaking on certification of screening companies and on extending background check regulations to include screeners. We are expanding our contract with the National Academy of Sciences to broaden our work on advanced security technologies, and have intensified our close working relationship with the FBI to refine airport risk assessment, and to conduct threat and vulnerability analyses. We have also instituted a bag match pilot program.

The FAA formed an Integrated Product Team of acquisition and security experts last October to plan, purchase and install explosives detection devices, and other advanced security equipment, at many of the busiest U.S. airports. In the spirit of partnership fostered by the Commission, representatives of airport and air carrier representatives are members of the team. As a result, we are purchasing and deploying additional FAA certified explosives detection systems, trace detection devices and automated X-ray machines with installations already underway.

Also, with the help of the airport industry, we are increasing the number of canine teams at the nation's busiest airports. In what I believe to be a model example of partnership, the FAA is entering into cooperative agreements with these airports to place more teams on the tarmac to perform high quality screening of suspect cargo and bags, and to clear airliners and terminals after bomb threats. Our classes for training the dogs and their handlers are well underway.

FAA has been using passenger profiling for nearly 25 years and views it as a significant element in the aviation security regime. Profiling permits leveraging of limited security resources. Some of the more time-consuming security measures cannot be applied universally with existing technology and space constraints while keeping the aviation system functioning near its current capacity. Profiling enables us to better focus application of the more rigorous measures, given the huge number of passengers and their bags moving through the U.S. air transportation system. Automation will make it possible to refine the process and make it less time-consuming for both passengers and airline agents.

The airlines will apply the profile and any additional screening that may occur as a result, which may delay some passengers in some cases. Since the airlines are responsible for the application of the profile and its results, there is no FAA "database" or federal system of records that will be generated in the process. The data that will be analyzed by the profiling program consists of information voluntarily provided by passengers to airlines in the course of commercial transactions. The analyzed result will be automatically deleted shortly after the completion of the flight. In addition, the Department of Transportation is proceeding with a White House Commission recommendation to have the Department of Transportation and the Department of Justice review the design and implementation of the prototype automated profiling system.

In June 1996, the then-Deputy Administrator, Linda Daschle, led a task force to conduct a 90-Day Safety Review examining immediate areas of concern to the agency, especially with respect to safety inspections. The centerpiece of the 90-Day Safety Review was the formation of a Certification, Standardization, and Evaluation Team (CSET). CSET is designed to assist local Flight Standards District Offices in processing new air carrier certification. Developing, testing, and prototyping of improved certification and surveillance procedures for new entrant carriers is scheduled to begin in the third quarter of fiscal year 1997, and will become fully functional by the end of the fiscal year. New entrant airlines will now have a heightened level of inspection for at least the first 5 years of operation.

Performance Enhancement System (PENS), also known as the On-line Aviation Safety Inspection System (OASIS), is an electronic performance system for Aviation Safety Inspectors which facilitates field data collection, information management, and on-line references. The 90-Day Safety Review recommended the increase of funding to upgrade and accelerate the deployment of OASIS to the aviation safety inspector work force by fiscal year 1999.

The 90-Day Safety Review identified a need for an increase in Flight Standards Aviation Safety Inspectors (ASI) and field support. The fiscal year 1998 budget requests an additional 326 positions including 288 Flight Safety field office personnel, 6 Aviation Safety Inspectors, 17 Aviation Safety Engineers, and 15 Technical Safety Positions, to carry out these duties.

The aviation safety record that the United States enjoys results in large part from the FAA's preventive efforts and ability to identify and solve potential safety problems before accidents happen. Despite the FAA's best efforts, accidents do occur. When they do, the FAA and the National Transportation Safety Board (NTSB) work closely together during an accident investigation to identify where and how the system failed. The FAA's Civil Aeromedical Institute in Oklahoma City is available to provide the NTSB with medical services such as pathological and toxicological testing, and funding for autopsies and other post mortem examinations. The FAA Technical Center in Atlantic City also provides investigation support through component testing and research. Of 3,123 NTSB recommendations that have been closed, 84 percent of the FAA's responses have been closed "acceptable" by the NTSB. The FAA's closed "acceptable" rate for the NTSB's urgent recommendations is 90 percent.

In response to the Gore Commission recommendation, the FAA is working in partnership with NASA in an endeavor to reduce the aviation fatal accident rate by a factor of 5 within 10 years. Current FAA/NASA cooperative research initiatives include aging aircraft studies and Advanced General Aviation Transport Experiments (AGATE).

As you know, the Office of Airports administers the Airport Improvement Program (AIP). The highest priority of the AIP is reserved for safety and security projects at airports. Airport sponsors are strongly encouraged to use their formula funds for projects to meet these requirements. Typical projects for safety include the acquisition of aircraft rescue and firefighting equipment, runway and taxiway signs and runway incursion caution bars, and runway and taxiway lighting, as well as lighting, marking or removal of airport hazards. Typical security projects include access control systems to prevent unauthorized entry onto the airport operations areas and perimeter fencing. Safety related work of equal priority, such as runway grooving, distance-to-go signs, and runway end identifier lights are generally incorporated as standard elements of many AIP funded airport development projects. Much of the AIP is used each year to rehabilitate airport infrastructure. In addition to keeping airports in serviceable condition, these projects foster safety by ensuring that deteriorated pavement or lighting, for example, not contribute to airfield accidents or incidents.

The Office of Airports also manages several key technical programs that promote airport safety and act to reduce the number of aircraft accidents on and near airports. In addition to regulatory certification, the Office of Airports establishes minimum standards and recommended practices for all aspects of the design, construction, and operation of airports. These standards must continually be reviewed and updated to reflect new technology.

Some current FAA airport standards projects that directly relate to safe aircraft operation involve improved airfield lighting to support low visibility operations and reduce runway incursions, runway pavement traction, and the minimum distance between a runway and bird attractants such as landfills. For instance, we are working with the Port Authority of New York and New Jersey on a prototype aircraft arrestment system that can be placed in the safety areas at runway ends to bring aircraft which have overrun the pavement to a controlled stop.

A modernized communications, navigation, surveillance and air traffic management system is one of the best long-term means of maximizing public safety benefits. Let me give you examples of what I mean by a public safety benefit. When we talk about modernizing the system, this means, among other things, putting state-of-the-art equipment in the cockpit to give pilots a much better picture of traffic and weather outside their cockpit window, and giving them the data needed to make real-time, informed decisions. This means giving air traffic controllers faster and more accurate decision support tools to separate aircraft. Some of this equipment uses satellite signals and digital data link capability to provide pilots with the equivalent of radar coverage no matter where they are flying in the system, worldwide, without the need for additional and costly ground-based radar.

Today, the U.S. has the safest and most efficient air traffic system in the world. However, as former FAA Administrator David Hinson has warned, if today's accident rate remains constant, statistics show that, with projected increases in traffic, we can expect the equivalent of one major accident every 8–10 days worldwide by the year 2015. Therefore, the core issue is whether the FAA can continue to provide a high level of safety and service in light of the aviation industry's expected growth without modernizing the National Airspace System. It is obvious we cannot.

Without such features as digital radio communications and the decision support tools needed to increase controller productivity, the capacity of the system will reach saturation by the years 2001–2002. If this occurs, we will have no alternative but to artificially constrain air traffic at major airport hubs, which the FAA did after the 1981 controller strike. The consequences of such an action are obvious and severe.

One barrier to modernization is a human factors issue—the lack of experience with computer and human integration. We have conducted simulation tests and laboratory demonstrations of systems containing today's advances in technologies separately, but have not operated these systems together, under real operating conditions. We must make such a complete operational and systemic evaluation under real operational conditions prior to any commitment to system-wide acquisitions, training, and deployment. We are attempting to develop such a plan that will help us accomplish such a large-scale evaluation. Our Flight 2000 project envisions such a set of conditions for a real-time demonstration and evaluation of new technologies, and their adaptability to system-wide adoption.

In closing, Mr. Chairman, we would like to thank you and the Members of this Committee for the support you have provided to, and for, the FAA, and to assure you of our willingness to work closely with you. This completes my prepared opening statement. We will be pleased to answer any questions you may have.

IMPLEMENTING SAFETY AND SECURITY RECOMMENDATIONS

Senator SHELBY. Senator Lautenberg.

Senator LAUTENBERG. Thank you, Mr. Chairman, for indulging my request to be able to ask my questions first.

Mr. Valentine, good to see you, and as I said, Mr. Chairman, in the capacity as Acting Administrator I think it is fair to say that the leadership has been diligent and good, and when we ask for a permanent resolution to that it is not intended to criticize but rather to have someone in place who is going to be there to see the long-term plans put into place and make the decisions that are long and complicated. So, Mr. Valentine, to you and your people my commendations for the hard work that does go into it.

Mr. VALENTINE. Thank you, Senator.

Senator LAUTENBERG. President Clinton, perhaps you know, before accepted virtually all of the safety and security recommendations of the Gore Commission. However, I am concerned that there is not an established timetable for the implementation of each of these recommendations. Can you give us a date by which time you expect all of the recommendations to be fully implemented?

Mr. VALENTINE. Senator, it would be difficult to give a date when all of them will be 100 percent implemented. We are still reviewing the cost implications of some of the recommendations, particularly in the security area, and because those recommendations may, in

fact, require additional appropriations funding from Congress. But of the 50-plus recommendations, a little over 30 of them were related to security, and most of the balance were related to safety. Some also relate to efficiency and response to disasters.

I would note that a number of the recommendations were gleaned from the Challenge 2000 report and from the 90-day safety review, and those recommendations represent activities that we already have underway. Some of them have been completed. We have assigned the rest of the tasks to all of the lines of business. As I mentioned in my opening remarks, we have a team established to provide agencywide oversight of all of the recommendations that we are undertaking.

We have a tracking system in place. I get briefings every couple of weeks from our staff letting me know and letting our senior managers know exactly where we are on each of those recommendations. My answer is that we will be pursuing them as expeditiously as we possibly can.

COST FACTORS—IMPLEMENTING SAFETY AND SECURITY RECOMMENDATIONS

Senator LAUTENBERG. You mentioned the appropriation and some of the cost factors that might be associated, and I quote here from the Gore Commission final recommendations: Cost alone should not become dispositive in deciding aviation safety and security rulemaking issues, and I would ask that if there are programs that have yet to be implemented that you kind of highlight those for us and let us know which of those require additional funding or what else we can do to move them along. And I would like to ask you also to look at which of the recommendations may take the longest time to implement. I will not ask you for an answer now, but I would ask that your staff supply that to the committee.

[The information follows:]

It is FAA's intent, working with agencies throughout the Federal Government, to implement all the recommendations of the White House Commission. A number of the recommendations, including some of the initial recommendations made by the Commission last September, have already been implemented. Among the recommendations we currently expect to implement this year are:

—Strengthen the emphasis that government and aviation safety research places on human factors and training,
—Require installation of enhanced ground proximity warning systems in all commercial and military aircraft,
—Strengthen the protections that airline crew members receive from passenger misconduct,
—Develop a revised NAS modernization plan that achieves modernization by 2005,
—Research innovative means to accelerate the installation of advanced avionics in general aviation aircraft,
—Identify FAA's frequency spectrum needs for the future,
—Implement a comprehensive plan to address security threats to cargo,
—Submit a resolution to ICAO to begin a program to verify and improve compliance with international security standards,
—Establish consortia at all commercial airports to implement enhancements to safety and security,
—Deploy existing checked and carry-on bag screening technology,
—Significantly expand the use of bomb-sniffing dogs, and
—Improve passenger screening, including improved passenger manifests, automated passenger profiling, and positive bag-passenger match.

Many recommendations, of course, are costly, and many will take time. Although funding for the initial White House Commission recommendations was provided in

Public Law 104–208, the Omnibus Consolidated Appropriations Act, 1997, the additional recommendations included in the final findings issued in February 1997 are not funded in fiscal year 1997. Except for an advance appropriation of $100 million requested for fiscal year 1999, funding is not included in the fiscal year 1998 budget submission since the budget was completed prior to the final recommendations being issued. Funding requirements for fiscal year 1999 and thereafter will be requested through the normal budget process. The final findings of the White House Commission are being reviewed to determine the details of implementation as well as the additional costs.

By far the most costly unfunded item is modernizing the National Airspace System (NAS) by 2005 instead of 2015, as the current architecture envisions. This will clearly add several billion dollars to FAA budget needs over the next several years. Other costly items include strengthening aviation human factors research, and accelerating GPS use in NAS modernization. The White House Commission expects the National Civil Aviation Review Commission to explore innovative federal financing approaches, such as user fees, to finance an accelerated modernization of the NAS and design a new financing system for the FAA that would ensure adequate availability of funding.

Many recommendations will also take time to complete. Modernizing the NAS by 2005 is an acceleration from FAA's existing schedule. Fully using GPS as a part of that modernization is also a long-term project. Many recommendations, such as targeting regulatory resources for the most impact, simplifying regulations, and keeping cost alone from being dispositive, are ongoing and continuous. Some additional recommendations that we see as taking over two years to implement include developing and applying higher standards for certification of aviation businesses; establishing a high level of protection for all aviation information systems; and requiring criminal background checks and FBI fingerprint checks for all screeners and all airport and airline employees with access to secure areas. In each case implementing the recommendation will require a long regulatory process, possibly preceded by the need to enact legislation and/or conduct research.

ACCESS TO SECURED AREAS

Senator LAUTENBERG. Admiral Flynn, they should not put that nameplate up there. Irish is Irish. Why would you call it anything else?

Anyway, it is good to see all of you, and you, Admiral Flynn, I know how hard you have worked on the security issue. There have been a number of well-publicized incidents, including one at Newark, where the media have with ease broken through airport security measures and gained access to vulnerable areas such as the tarmac and the ramps. The FAA Authorization Act included a provision that I authorized directing it to conduct unannounced aggressive testing of airport and airline security programs. What has changed over the last 6 months to tighten security for airport personnel to seal these vulnerable areas? Have we done enough? Are we at a point where you are satisfied?

Admiral FLYNN. I am satisfied that we are moving in the right direction. The additional resources, the additional inspectors that we are hiring, will help us carry out a comprehensive and aggressive program of testing the security measures at all of our airports.

We have made considerable progress in that area. We have changed our method of inspecting from formal announced inspections, that people know ahead of time will be occurring, to aggressive testing that is not announced, where the inspectors are seen to be members of the public or take on the role of people who are attempting to do aircraft damage. By doing that, we have discovered vulnerabilities and are in the process of repairing them.

I would say with the case with Newark in particular that that airport has taken considerable efforts to remedy the problems that they had. They are ahead of the rest of the Nation, for example,

in requiring an employment history check and criminal history check for their screeners. They are also ahead of the rule that the FAA will introduce.

I think we are on the right track to get truly secure airports.

Senator LAUTENBERG. How long do you think it might take to get it to the point where you are satisfied?

Admiral FLYNN. I think that it is a matter of months rather than years.

CERTIFICATION OF NEW ENTRANT AIRLINES

Senator LAUTENBERG. I hope so. We will watch with interest.

Mr. Gardner, good to see you. The Gore Commission recognized that FAA is sometimes too lenient when it comes to certifying airlines and contractors, especially when safety and inspection records have not been what they ought to be. The commission recommended that the FAA be more stringent in the certification of these airlines. Do you agree with this recommendation?

Mr. GARDNER. Yes, sir. Actually, the 90-day safety review which, as Mr. Valentine mentioned, a lot of recommendations are incorporated in the White House Commission report. These recommendations concern the way we do oversight and certification of new entrant airlines. We have tightened up the way we do our certification processes of the new airlines, and hold them to tougher standards than we have before, as well as increased the oversight of new entrant carriers. We define a new entrant as someone who has been in continuous business for less than 5 years.

Senator LAUTENBERG. So they are subject to more scrutiny than the existing long-time operators?

Mr. GARDNER. Yes, sir; they are not only subject to more scrutiny, but we are also refocusing the talent in our inspector corps. We have formed a new certification team to consist of our very best inspectors so that they can focus on the new entrant carriers.

VULNERABILITY OF OUT OF DATE EQUIPMENT

Senator LAUTENBERG. Mr. Chairman, I thank you. I just want to respond to something.

Senator SHELBY. You can go right ahead.

Senator LAUTENBERG. Senator Bennett asked before about the simplicity of the equipment making it less vulnerable. I come out of the computer business, and I think you have all heard the story about when my company wanted to give away equipment that FAA was not using, we wanted to give it to charity, to institutions that could use them to teach students. They would not take it because of the high maintenance costs. They could not get value of it. Simple equipment is simple to intrude on. The more complicated often is the more difficult. So just to register my 2 cents.

Thank you very much.

Senator SHELBY. Thank you.

Senator Byrd.

AUTOMATED SURFACE OBSERVATION SYSTEMS

Senator BYRD. Mr. Valentine, I spoke earlier concerning the difficult weather conditions that pilots often face in my State. Two

months ago I sent a letter to Secretary Slater passing along numerous complaints I had received from airports in my State regarding the poor performance of the automated surface observing systems [ASOS]. These automated weather observation systems which are being installed in nine West Virginia airports have been consistently reporting inaccurate weather conditions, especially during inclement weather. Have you specifically investigated the performance of these systems at the West Virginia airports?

Mr. VALENTINE. Senator Byrd, let me ask Mr. Belger if he would address that subject. He is quite familiar with that.

Mr. BELGER. Yes, sir; first, I have seen your letter and I can tell you that the final response back to you is in final coordination. The reason it was delayed will be I think somewhat clear in my answer.

We have had problems with ASOS at airports like those in West Virginia which you described. About a year ago we established some performance standards for the use of ASOS in a stand-alone mode, and when we did that we agreed that after a year we would go back and reassess how that was working. We are in the process of doing that now. I can tell you now that over the next month or 6 weeks or so we will be specifically addressing those issues at the four airports in West Virginia that you have referred to.

I decided several weeks ago that in the interim, while we are going through this period of reassessment, we will not alter the current weather collection or augmentation systems at any of the airports. In other words, we will not eliminate any of the contract weather observers while we are going through this review.

WEST VIRGINIA CONTRACT WEATHER OBSERVERS

Senator BYRD. Well, very well. You cut right through to my next question, and it was, and I will state it for the record even though you have already responded, can you assure me that you will not be removing any of the contract weather observers from these four West Virginia airports until you can certify that the ASOS systems are working at an optimum level without compromising safety.

Mr. BELGER. Yes, sir.

Senator BYRD. So the answer is yes.

Mr. Chairman, I ask unanimous consent that my letter of February 19, 1997, to Secretary Rodney Slater be included in the record.

Senator SHELBY. Without objection, it is so ordered.

[The information follows:]

LETTER FROM SENATOR BYRD

February 19, 1997.

Hon. RODNEY SLATER,
Secretary, U.S. Department of Transportation,
Washington, DC.

DEAR SECRETARY SLATER: Congratulations on your recent confirmation as Secretary of Transportation. I enjoyed very much our meeting on January 30, and I appreciate your taking the time to stop by and discuss issues of concern to me and my constituents.

I want to bring to your attention a matter of immediate concern regarding aviation safety in my State. Recently, I have been informed by several constituents that the Automated Surface Observing System (ASOS) installed at airports in West Virginia is not accurately performing its intended functions of weather reporting and forecasting. During inclement weather, the ASOS is consistently reporting inac-

curate measurements, requiring constant backup by human observers. Moreover, readings on wind conditions and visibility are commonly inaccurate, and sky sensors often report erroneous values during inclement weather. Indeed, there have been several instances in which snowfall has been indicated by the system when no such condition existed.

Of even greater concern is the fact that four of the airports in West Virginia (Bluefield, Elkins, Martinsburg, and Beckley) have been classified as "Level D" and are targeted to lose the contract weather observers that currently compensate for the inaccurate ASOS information. The Mercer County Airport in Bluefield, West Virginia, is of utmost concern, since the contract weather observers are scheduled for removal within the next few days. Therefore, I am writing to request that the transfer of human observers from these four "Level D" airports be suspended until the accuracy and reliability of the ASOS devices at *each* West Virginia airport can be certified. I would further appreciate your assurance that safety will not be compromised at these "Level D" airports once the human observers are removed.

Thank you in advance for your immediate attention to this matter.

With kind regards, I am

Sincerely yours,

ROBERT C. BYRD.

PAYING FOR CONTRACT WEATHER OBSERVERS

Senator BYRD. Now, with reference to the paying for weather observers, the FAA this past June published this policy for contract weather observers in the Federal Register, and in that policy statement you made reference to the opportunity for local airport operators to back up the ASOS systems with their own contract weather observers. However, the cost of these weather observers would have to be borne by the airport and not by the FAA. Do you think it is consistent with your initiative to provide a single level of safety for all passenger aviation operations to implement a policy where smaller airports are required to pay for the weather observers themselves while the FAA continues to compensate weather observers at other larger airports around the country?

Mr. BELGER. That is one of the things we are looking at in this annual review that I referred to. The standards that we established a year ago are broken out into four levels, and they were developed, quite frankly, with the industry, and the airports had representation in the development of those standards. At the large airports, we are going to continue to provide the human observer. The issues, as you described, are at the smaller airports, and the question becomes whether or not removing the human observer has an impact on safety and efficiency. That is what we are doing this review for right now.

There are a lot of innovative ways we are looking at in which the weather observations can be made without having to go through the FAA contracting activities, perhaps doing it on a local level. It could be that we will turn out in the end to reimburse for those costs, much like we do with the contract tower program.

CONTRACT WEATHER OBSERVERS AT SMALLER AIRPORTS

Senator BYRD. Well, I am glad to hear you say that in the end there may be some reimbursement.

Why will only the smaller airports be required to pay for contract weather observers? Why isn't that burden being passed on equally to all airports across the country?

Mr. BELGER. First of all, we have not made that decision. As I said, we are going through that review process. But the logic be-

hind that thought is that at the larger airports the human observer is absolutely required to meet the safety and the efficiency and the performance of the larger aircraft. In other words, they have to have that 24-hour capability and they have to have, quite frankly, some of the augmentation observations that ASOS does not provide.

At many of the smaller airports it might not be necessary to have that augmentation. And again, I want to reemphasize that is what we are reassessing in this review.

Senator BYRD. I hope that due regard will be given to the question in the review and the kind of terrain where I live. We have many problems with weather. I have flown in and out of West Virginia for a long time, and some of the roughest flights I have had, and I have been all over the world, Afghanistan, flown up the Kyber Pass, and these places, I think the roughest flights I have had have been over West Virginia. They do not seem to be as rough as they used to be, but this is mountainous terrain, the weather changes fast.

Mr. BELGER. Right. I can assure you that we are looking at that.

DEREGULATION

Senator BYRD. And in addition to that, the small airports, these rural airports, are socked with the increased costs of flying, far more-so than the big ones. We pay for these long trips at low prices. We in West Virginia pay for those long trips. It costs $664 for me to make a round trip to Charleston, WV. Now, I think I can also recall when that round trip probably cost $70, maybe even less. And so with deregulation the small airports in the rural counties and the rural States of this country started paying, and paying big-time.

The air carriers started pulling out almost as soon as deregulation went into effect. Big carriers moved out of West Virginia, and the prices went up. The airfares went up. And I voted for deregulation, and I have been kicking myself ever since. My former colleague, Senator Randolph voted against it, and he voted right. I voted wrong.

But that is just an aside from what we are talking about here. That is just one of the problems that we have in a State that has only small airports and very inconvenient service, and extremely costly service. So when we add to that this next specter that stands at the table, smaller airports being required to pay for contract weather observers, I hope that we will be mindful of the problems that these small airports have and that the traveling public have in flying out of those airports and into them.

I see that my red light is on, Mr. Chairman. I thank you.

CATEGORY X AIRPORTS

Senator SHELBY. Thank you.

Admiral Flynn, the administration's budget asks for $746 million for safety—I believe that is a 12-percent increase above current levels—and $97 million for security in 1998. The FAA categorizes airports by risk level. Category X airports, such as New York's Kennedy Airport, Chicago's O'Hare, San Francisco International Airport, I understand are at the greatest risk for safety and security

matters. Do you believe, Admiral, more money needs to be spent at category X airports to improve safety and security?

Admiral FLYNN. Mr. Chairman, with regard to risk, what makes the category X of greater concern is the complexity of the operations and the number of passenger embarkations. I want to hasten to say that they are not inherently more threatened by terrorists than other airports.

Senator SHELBY. But the traffic makes it so, is that correct?

Admiral FLYNN. Indeed, that is right. It is the complexity.

Senator SHELBY. But that is due to the traffic.

Admiral FLYNN. That is right, Senator. Yes, Senator. And we have sufficient operations resources to be able to perform all the FAA functions at all of the airports that we regulate. Those that are in the budget request are sufficient to give us the resources to perform all of our regulatory functions.

Then with regard to the security at those airports, the principal vulnerability is in the area of checked baggage. We are aware of that. We had recommended changes to that and had instituted changes to it prior to the White House Commission being formed. There is the funding above that $97 million that you have mentioned, that is the $100 million per year, being recommended to acquire screening equipment for check baggage and other security improvements.

COSTS FOR BETTER SAFETY AND SECURITY

Senator SHELBY. How much more money, if you would make a judgment, needs to be spent for better safety and security at a large category X airport to improve training for airport security employees who monitor explosive detection equipment, train canines, and so forth?

Admiral FLYNN. The costs over 10 years at any one of those big airports of the additional people, the upgrading of their training, paying people, good people, in order to retain them, the 10-year cost exceeds $100 million for one of those airports.

Senator SHELBY. About $10 million a year, more or less?

Admiral FLYNN. I can provide for the record more precise costs.

Senator SHELBY. Could you do that?

[The information follows:]

Based on the recommendations in the White House Commission's Report, the total ten-year cost to the Government, airport authorities, and airlines for security programs at the Category X airports will be close to $3 billion. The total includes capital costs for new equipment as well as added personnel and their training. This averages out to $154 million per Category X airport, or slightly over $15 million annually for the next ten years.

BAY AREA RAPID TRANSIT [BART]

Senator SHELBY. Mr. Valentine, Admiral Flynn has just informed us that San Francisco International Airport, or other category X airports, needs approximately $100 million over a 10-year period to meet its basic safety and security needs. The BART financing agreement, which FAA must approve, requires the airlines to pay, I understand, about $7.5 million per year to help build the transit project. Is this the best use of those airport revenues?

Mr. VALENTINE. I think the first part of the answer is that I do not know that it requires them to spend it. That was an agreement that was struck by the parties among themselves.

Senator SHELBY. Well, if they have an agreement that is going to be obligatory, is it not?

Mr. VALENTINE. What I am saying is they have an agreement. There are no AIP moneys or PFC moneys involved in this process. It is just moneys that the airport has earned, and our role in that has been principally to determine whether or not that is an appropriate use of airport revenues.

Senator SHELBY. Is this an unusual precedent?

Mr. VALENTINE. I think it is one of the first of this type, but it fits within the parameters that we use to identify whether or not money is being appropriately used. I do have Ms. Kurland here with me who is much more familiar with the details on this.

AIRPORT FUNDS FOR TRANSIT PROJECTS

Senator SHELBY. Ms. Kurland on that?

Ms. KURLAND. Yes, Mr. Chairman; I agree with what Barry Valentine has just said. I would also point out that in the AIP handbook, which has been published for quite some time, there is a recognition that transit facilities at airports can in fact be eligible, if they are on the airport and connecting to a rapid transit system and for the benefit and purpose of the airport. And as you know, the committee in the conference report directed the FAA to look at the proposal that up to $200 million of airport funds could be used for this project. What we did was look at the proposal that was provided to us, determine what parts of the proposal met the statutory criteria, set out the eligibility principles, and make it very clear that only actual costs could, in fact, be eligible.

Senator SHELBY. Is this the best and highest priority for airport revenues, in view of safety and other concerns?

Ms. KURLAND. Mr. Chairman, let me try and answer your question this way: The proposal which has been provided to us does not propose the use of either AIP or PFC funds. This is for revenues generated on the airport. The airports do have control, in conjunction with airlines, depending on what type of agreements they have with their airlines on how revenues at the airport will be used. Once it meets the eligibility criteria, this is a determination for the local airport.

Senator SHELBY. Does FAA policy require airports to prioritize their needs, and is this the best and most efficient use of the money in view of the safety concerns that we are all concerned about?

Ms. KURLAND. Let me just amplify on your statement a little. For airport revenue to be used, it has to be for an airport purpose. And when we at the FAA spend discretionary funds from the AIP fund, we in fact do have a priority system in terms of how we rank projects. Safety and security are always at the top of the list in terms of how we spend discretionary AIP funds.

BEST USE OF AIRPORT FUNDS

Senator SHELBY. Earlier, Senator Byrd was bringing up safety concerns in his own State, the same concerns we have all over

America. Would not the airport money be better spent for airport safety, and would not people feel better about it in America? Airport safety is very important.

Ms. KURLAND. Airport safety is our key mission at the FAA. And as I just stated, when we do have the flexibility to spend the discretionary funds, that is our top priority. The statutory criteria do allow airports, as long as it meets eligibility criteria, to determine, in conjunction with their airlines or based on whatever their way of governing their airports and their funds are, to make those local determinations.

Senator SHELBY. I know that several members of this subcommittee and other members of the Appropriation Committee have contacted me as the subcommittee chairman regarding the BART money, that this is a diversion of moneys that should be spent for airport safety and everything else, and I thought this issue should be raised here today.

Ms. KURLAND. Thank you, and we would be happy to provide you with whatever additional information you would like, or additional briefings.

Admiral FLYNN. Mr. Chairman?

AIRLINES COST FOR SECURITY

Senator SHELBY. Yes; go ahead, Admiral.

Admiral FLYNN. The cost that I gave for security at a major airport includes the cost that the airlines would bear.

Senator SHELBY. We understand that. But still, that is the overall cost. That was your judgment, was it not?

Admiral FLYNN. That was my judgment, but I would need to refine it for the record.

Senator SHELBY. Of course.

Senator Byrd.

SAFETY PERFORMANCE OF COMMUTER AIR CARRIERS

Senator BYRD. Thank you, Mr. Chairman.

Mr. Valentine, the implementation period for all commuter air carriers to come into compliance with your initiative to ensure one level of safety for larger and smaller aircraft ended roughly 3 weeks ago, on March 20. At this point, do we have any hard evidence that the safety performance by the commuter industry has improved as a result of this initiative?

Mr. VALENTINE. When we looked at that initiative originally, Senator, the premise on which we undertook that effort was that if the commuter industry followed the same rules and procedures as the large carriers, that they would ultimately enjoy the same safety record as the large carriers. That was based on the fact that historically the fatal accident rate among commuters was higher than that of the large carriers. So in pursuing that course of action we used that assumption. We did not say that this particular piece of what was really a 100 and some-odd part improvement would necessarily result in a specific measurable increase in safety but, in the aggregate, doing all of these things would elevate those operators to the same level as the large carriers.

I am pleased to report that 1996 was the safest year in the last 15 years in terms of operations of commuter airlines. And in fact,

candidly, 1996 was better than the large operators. I hope that we will see that trend continue and I think we can expect to.

Senator BYRD. Well, I feel a little better about flying to West Virginia and back.

Mr. VALENTINE. I understand. I am originally from a State not unlike West Virginia. I am from northern New England, and the terrain and the weather and access by only commuters is a feature of that area, as well. So I appreciate what you are saying.

INSPECTION AND OVERSIGHT METHODS

Senator BYRD. Thank you, Mr. Valentine.

Now, following the ValuJet crash, your agency conducted a 90-day safety review that revealed deficiencies in the way that your agency inspected and conducted oversight over new entrants into the aviation business. Given these findings, are you convinced that your current inspection and oversight methods are ideally structured to detect any deficiencies in the commuter airline industry?

Mr. VALENTINE. Mr. Gardner, a little earlier, addressed that subject to some extent, and I would just reiterate what he said. I think that we are on the right course of action to making sure that we have the right people in the right place to provide the right oversight for new entrant airlines.

Senator BYRD. So you are satisfied that you are detecting any and all safety lapses in this part of the industry?

Mr. VALENTINE. We are satisfied that, given our resources and our opportunities, we are doing the best we can in that area.

Senator BYRD. Mr. Chairman, I thank you. I thank Mr. Valentine and all those who have appeared as witnesses. I especially thank you for your indulgence of questions from other members of the committee.

COST OF ACCELERATED MODERNIZATION

Senator SHELBY. Thank you.

Dr. Donohue, I have another question here. How much would the accelerated modernization program outlined in the Gore Commission recommendations increase the funding levels needed in the facilities and equipment account in the years 1999 to the year 2000? Do you want to furnish that for the record, or do you have it now?

Dr. DONOHUE. Yes, sir; I think that is an excellent question. We are currently staffing that, and we are trying to make sure that we have at least the beginning of that represented in the 1999 budget. But that is actually a very difficult question to answer accurately, even probably in our timeframe for putting together the 1999 budget. But we will continue to supply you with all the information we get as we get it.

It really is, I think, a cashflow issue because up-front capital investment will decrease operations costs—a question that was asked earlier—but we have to find the availability within our cashflow constraints, through some innovative means, to do the capital investments to decrease out-year operations costs and increase safety.

SECURITY MEASURES FOR DOMESTIC AND FOREIGN CARRIERS

Senator SHELBY. Mr. Valentine, or perhaps Admiral Flynn too, in view of the clear instructions in the Terrorism Prevention Act of 1996 that the FAA require foreign airlines serving the United States to have the, quote, "identical security measures that United States airlines are required to have." Do you know why the FAA has been unwilling to implement this law?

Mr. VALENTINE. I would ask Admiral Flynn if he would address that.

Senator SHELBY. Admiral?

Admiral FLYNN. Mr. Chairman, we have not been unwilling.

Senator SHELBY. Have you been unable?

Admiral FLYNN. No; it requires a regulation to do that.

Senator SHELBY. All right.

Admiral FLYNN. And we are introducing a regulation.

Senator SHELBY. You are going to pursue it, then?

Admiral FLYNN. Oh, indeed. Indeed, yes, sir.

Senator SHELBY. Good. It is my understanding, Mr. Valentine, that about one-half of the U.S. citizens traveling internationally do so on foreign airlines. Should not our citizens receive the same level of security as a passenger of any nationality who travels on a U.S. airline? In other words, they travel on our airlines, we have high security; should we not insist on security for our own people traveling abroad?

Mr. VALENTINE. We do insist, and I will let Admiral Flynn address some of this, if he wishes. We do insist on certain levels of security regarding, for example, foreign carriers who travel to the United States and airlines operating out of airports that are the last point of departure for the United States. They have to undergo security procedures virtually identical to the ones that we have here in the United States.

BUDGET REQUEST FOR MODERNIZATION

Senator SHELBY. Mr. Valentine, I have read warnings from many experts on the aviation system that we cannot get much more capacity out of the current system without major modernization. This means we will require increased capacity, both in air traffic control systems and our ground capacity. If these modernizations and enhancements are not made, many believe that there will have to be a cap imposed on the system capacity. That would not be a popular alternative for American travelers and businesses.

However, the FAA budget for 1998 system modernization under facilities and equipment decreases by $58 million, and the fiscal 1998 request for airport improvement program plummets $460 million below the enacted level, from $1.46 billion to $1 billion. Could you explain, for the record, the apparent decrease in this administration's commitment to system modernization and capacity enhancement? I think it is very important to a growing economy, among other things.

Mr. VALENTINE. We recognize, and I think recently you have heard Secretary Slater say, that air transportation is absolutely integral to the soundness of the economic system of any country today throughout the world. And for us to experience economic

growth, we are going to have to have comparable capacity growth in our air transportation system. And we think that the budget we propose reflects a recognition of that. In putting the budget together we had to make some very tough decisions about where best to allocate those resources.

I think one of the most obvious areas that you notice when you look at the budget is the change in the AIP funding, because the emphasis was placed on the operational end. Particularly focusing on airspace capacity, we recognize that, with regard to airport capacity and particularly those capacity-constrained airports—which are our larger airports—they have the ability to secure resources from other means and, in fact, historically have secured most of their resources from means other than AIP funding.

So in making our decisions and setting our priorities, we placed our emphasis on airspace capacity issues, recognizing that there are alternatives for the land side of the capacity problem.

CTX–5000

Senator SHELBY. I suppose this next question would be directed to you, Admiral Flynn, or Dr. Donohue. The CTX–5000 is the only FAA-certified airport baggage screening system, and the agency is currently procuring 54 systems for U.S. airports. In the fiscal 1998 budget request there is no funding requested for the CTX–5000 procurement. Is 54 systems the right number of CTX–5000's for the United States? Are there other technologies that will be certified within the next fiscal year that may provide the FAA with an alternative to CTX–5000?

Admiral FLYNN. It is possible that some other machine will be certified within the timeframe you mentioned, but the 54 CTX–5000's represent a small fraction of the total that will be required.

Senator SHELBY. For everything else?

Admiral FLYNN. No; of all the certified machines, be they CTX or some other certified systems, that will be required for screening checked baggage at the 76 biggest airports in the United States, where the use of such machines is clearly practical.

So additional money was requested, and that money becomes available on October 1, 1998, if it is appropriated as requested, to continue the acquisition of CTX–5000 or some other certified equipment, if that should happen in time to use that money.

Senator SHELBY. Dr. Donohue, do you concur with that?

Dr. DONOHUE. Yes, I do. I think there are some issues of production rates and how fast we can reasonably expect these new equipments to be produced. So I think we are doing it in the most prudent way.

WIDE AREA AUGMENTATION SYSTEM

Senator SHELBY. Dr. Donohue, last year the Appropriations Committee expressed increasing concern about schedule and cost risk in the wide area augmentation system program. The General Accounting Office says that recent events have confirmed that the FAA schedule for augmenting global positioning system is at risk, and that the internal FAA documents point to the potential of substantial cost increases.

Industry and even former FAA officials are saying that eventual costs for the program, even with scaled back requirements, will vastly exceed the $475 million original contract cost. Do you know what is the current cost baseline for the WAAS program?

Dr. DONOHUE. Yes, Senator.

Senator SHELBY. And do you disagree with the General Accounting Office.

Dr. DONOHUE. To some extent yes, I disagree with the General Accounting Office. This is a very complex program, and you have to look very carefully into what part of the program one is talking about. Our program does not only develop the software and the hardware and does the deployment of the system, it also buys communication services from satellites, INMARSAT, and it is looking at total life cycle costs including out-year maintenance.

There are a number of different ways to provide the out-year maintenance costs. They cost different amounts, depending upon what we ultimately execute. Our communications satellite costs, over a 10- or 15-year period, can vary in out-years based upon ways in which we are looking to decrease those costs.

The current Hughes contract is on schedule. It is, in fact, in some places ahead of schedule. We feel very confident that the primary contract is, in fact, proceeding as we have said before. There are some technical issues that we are looking at as we collect data from our national satellite test bed. We are evaluating that data to try to see whether or not we need to modify our requirement. We have not decided that yet. We are holding to the original requirements. But they are under review right now. I am doing a full review to try to understand exactly what those costs might be and that we are doing everything we can to hold the line.

Senator SHELBY. Will you let us on the committee and the staff know the outcome of that review?

Dr. DONOHUE. Yes, Senator; as soon as I complete the review, and I hope to do that over the next month or 6 weeks. We will provide you with all the information that we get.

SUBMITTED QUESTIONS

Senator SHELBY. I appreciate all of you, Mr. Valentine and all of you, appearing here before us and having a good and frank exchange of views. We will submit additional questions to be answered for the record.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR DOMENICI

AIRLINE SAFETY IMPROVEMENT MEASURES

Question. Acting Administrator Valentine, the Gore Commission recommends that the FAA should actively include the aviation industry in improving safety by forming partnerships to work together in such areas as self-monitoring and certification. In fact, recent testimony by the General Accounting Office (GAO) highlighted several safety concerns which were identified by non-FAA sources which would not have been detected by relying solely on FAA surveillance. I believe an inclusive safety program involving various parties could present significant positive benefits in improving our nation's fleets. However, I believe such partnerships should be formed very carefully and only after the FAA has insured such as partnership would

not compromise the agencies principle role as the industries' regulator. Has the FAA begun to consider any safety program(s) which would form partnerships with various aviation industries? And if so, would you provide me with examples?

Answer. In recent years, the Federal Aviation Administration (FAA) and the air transportation industry have identified safety areas that were in need of improvement. In response to these safety needs, the FAA, in cooperation with industry, established several demonstration Partnership for Safety Programs in an effort to increase the flow of safety information to both the air carrier and FAA. Among these programs were the US Airways Altitude Awareness Program, the American Airlines Safety Action Program, and the Alaska Airlines Altitude Awareness Program.

At the Safety Conference held on January 9–10, 1995, the Secretary of Transportation and the FAA Administrator announced the standardized policy and procedures that would be provided for the use of these programs along with the expansion of these programs to include participation from aviation industry employee groups, such as flight attendants, dispatchers, and mechanics.

On January 8, 1997, the FAA published Advisory Circular (AC) 120–66, which provides guidance for establishing air transportation Aviation Safety Action Programs (ASAP), formerly known as Partnership Programs. These programs, which are entered into by the FAA and entities of the air transportation industry, are intended to generate safety information that may not otherwise be obtainable.

Under certain circumstances, ASAP provides a vehicle whereby employees of part 121 air carriers and major domestic repair station certificate holders (part 145) can identify and report safety issues to management and the FAA for resolution without fear of punitive legal enforcement action being taken against them. The elements of ASAP are set forth in a memorandum of understanding between the FAA, certificate holders, management, and employee groups or their representatives.

Apparent violations of the regulations by employees of a certificate holder disclosed through safety-related reports will ordinarily be addressed with administrative action, provided that the apparent violations do not involve deliberate misconduct, a substantial disregard for safety or security, criminal conduct, or conduct that demonstrates or raises a question of a lack of qualification. Such violations are specifically excluded from the program. With the issuance and completion of the ASAP AC, inspector bulletin, and the informational seminar, airlines are now eligible to apply for program approval.

Another area of significance within our agency is the Global Analysis and Information Network (GAIN), a proposed analysis and information sharing framework that is intended to identify emerging safety concerns and disseminate significant safety information to the aviation community world-wide. The GAIN concept would link various data sources, such as voluntary disclosure reporting, incident reporting, digital flight data, and air traffic control (ATC) radar data with analytical methods such as qualitative risk assessment, data mining, data visualization, and statistical methods. Further discussions on potential features of the proposed GAIN system can be found in the GAIN concept document that was issued by the FAA's Office of System Safety on May 9, 1996 (a copy of which may be found on the System Safety website at http://nasdac.faa.gov).

The GAIN concept is not intended to replace the aviation safety programs currently active in segments of the global aviation community but will complement and build upon those activities, perhaps using information from some of these programs as inputs while helping to bring a wider, "global" participation to many of the programs. In addition, while many existing safety data systems rely on the more serious events that must be reported by regulation, GAIN will emphasize proactive identification of safety concerns through collection of data about the less serious but more numerous occurrences that are currently under-reported in the aviation system.

GAIN would also go beyond many of the current safety data programs by incorporating analysis of empirical data, such as digital flight data and ACT system data. The two potential uses of this empirical are to validate the concerns raised in voluntary reports and to create measures that describe system operations. Monitoring National Airspace System day-to-day operations for deviations from these statistical norms should quickly heighten aviation operators' awareness of conditions or circumstances that may signal the onset of increasing safety risk.

Other distinguishing features of GAIN include its scope, data management, and ownership. The scope of GAIN is envisioned as incorporating all aviation systems—flight operations, surface operations, and air traffic control—and all of the worldwide aviation community. By accessing the experience of the entire aviation community, GAIN will vastly increase the capability for all to benefit.

The data management concept for GAIN is very flexible. For a number of reasons, including the large quantity of raw data available, little or no sharing of raw data

is expected. Instead, the information resulting from analysis of raw data will be shared. In addition, it is unlikely that data or resulting information would be stored in a centralized location. Raw data could reside with its owners while the information byproducts could be made available to users through networking, a dissemination concept commonly known as a "virtual database."

While the FAA is helping facilitate the creation of GAIN by informing potential participants about the concept and bringing potential participants together, FAA will not own or operate GAIN. It is hoped that the potential safety and economic benefits to be derived from GAIN would motivate the aviation community to step forward and fund its development and then to own and operate GAIN for the mutual benefit of many users. FAA would be one of those users, providing some of GAIN's data/information inputs and then using GAIN's analytical results and supporting data.

Question. Do you as Acting Administrator, believe the FAA could effectively increase the safety of our nation's air fleet through a self-monitoring and self-certification process?

Answer. The Federal Aviation Administration (FAA) has developed and implemented a voluntary disclosure policy for specific types of airlines and repair stations. This is a policy under which 14 Code of Federal Regulations Parts 121, 135, and 145 certificate and production approval holders may voluntarily report apparent violations of the regulations and develop corrective action satisfactory to the FAA to preclude their recurrence. Certificate holders who satisfy the elements of the voluntary disclosure policy, receive a letter of correction in lieu of civil penalty action. Voluntary disclosure reporting procedures are outlined in Advisory Circular (AC) 120–56, Air Carrier Voluntary Disclosure Report Procedures. *Although not presently required by the regulations, manufacturers have been encouraged to perform self-audits as a basis for future changes since the new Federal Aviation Regulations (FAR) Part 21 will require self-audits by manufacturers.*

Voluntary disclosures for air carriers, which result in administrative actions, account for an increasing percentage of total air carrier enforcement investigative reports, growing from 7 percent in calendar year 1990 (the first year of the program) to 25 percent in calendar year 1996. This program is only one of several tools that the FAA has to seek compliance with the safety regulations. When appropriate the FAA will continue to use suspension or revocation and civil penalty actions for more serious cases.

The FAA also believes that the certificate holder is in the best position to identify deficiencies and promptly correct them, and it should have in place a procedure whereby internal compliance audits are performed and top management is informed of its company's operations, compliance, and safety record. Such internal audits will improve the certificate holder's ability to identify and correct any safety problems before, rather than after, FAA inspections. Public safety is enhanced significantly if deficiencies are identified and corrected when they are discovered by the certificate holder, instead of when the FAA discovers the deficiencies, sometimes much later, in the course of an inspection or in the wake of an accident or incident.

In 1990, the FAA announced a policy (Compliance & Enforcement Bulletin No. 90–6) that was intended to serve as an incentive to institute and maintain a system of internal evaluation. The FAA believes that aviation safety is best served by incentives to certificate holders to identify and correct their own instances of noncompliance and invest more resources in efforts to preclude their recurrence, rather than paying penalties. Prompt and meaningful remedial action to prevent the same or similar sort of violation from happening again, more directly and substantially improves the safety of our national transportation system than the recovery of thousands of dollars in civil penalties.

In 1992, the FAA published AC 120–59, Air Carrier Internal Evaluation Programs. This AC provides information and guidance material that may be used by air carrier certificate holders, operating under FAR Parts 121 and 135, to design or develop an Internal Evaluation Program. The procedures and practices outlined in this document can be applied to maintenance, flight operations, and security aspects of an air carrier's organization.

The Internal Evaluation Program is a voluntary program. Participation is left solely to the discretion of each certificate holder. As a matter of policy, the FAA encourages certificate holders to identify, correct, and disclose instances of noncompliance. Therefore, the development and implementation of an Internal Evaluation Program will benefit both the certificate holder and the flying public.

In a joint venture between the FAA and industry, self-certification has been used to some extent for a number of years. These initiatives are Designated Alteration Stations (DAS) and Delegation Option Authorizations (DOA). In both of these initiatives, the function of self-certification is performed with limited oversight being per-

formed by the FAA. However, in both the DOA and DAS, the company must have exhibited extraordinary abilities to perform these functions.

Our experience to date with the various programs have produced positive results and the FAA is confident that airline safety will continue to benefit from this corrective action process.

AGING AIRCRAFT CENTER

Question. Acting Administrator Valentine, the overall safety of our commercial air fleet has been of interest to me for several years now. In fact, in my state of New Mexico, an exciting new technology is being developed to improve the safety of our aging air fleet at the Aging Aircraft Non-destructive Evaluation Center (AANC) in Albuquerque. This center has been supported by the FAA for the past six years and we are seeing substantial progress in developing new techniques to assess the structural integrity of our commercial air fleets.

In fact, in your own budget request, the Administration highlights this new technology by stating it will save our 700 man-hours per aircraft inspection over current methods. However, the Administration's budget proposes to reduce the level of funding for aging aircraft research from $13.9 million in fiscal year 1997 to $13 million in fiscal year 1998. I am puzzled by this Administration's policies regarding aviation safety. On one hand the President identifies commercial air safety as one of his top priorities, but on the other hand he produces a budget proposal that once again decreases funding for one of our most important aviation safety issues. Knowing that by the year 2000 more than 2500 commercial aircraft in the United States may be flying beyond their original design lives, I believe this is dangerous policy. Do you believe the Administration's current budget proposal is sufficient to continue our efforts in ensuring aircraft safety?

Answer. The fiscal year 1998 budget request does not represent a decrease in the aging aircraft program. Rather, it reflects an increase of $2.4 million in contract funds. The total dollar amount appropriated in fiscal year 1997 was $13.9 million, which included in-house costs. The fiscal year 1998 budget request of $13 million reflects contract funds only, as in-house costs are now part of a separate budget line item. The budget proposal is sufficient to continue our highest priority work in ensuring the safety of aging aircraft.

Question. What current activities will be sustained with these resources?

Answer. Our highest priority aging aircraft activities in structural integrity, and maintenance and inspection in testing, evaluation, demonstration, and validation will be conducted.

Question. What activities will be reduced or eliminated due to budget reductions?

Answer. No major activities will be reduced or eliminated at the proposed $200 million budget level.

Question. What is the Administration's proposed budget for the Aging Aircraft Non-destructive Evaluation Center in Albuquerque?

Answer. The budget requests approximately $3 million for inspection technology development and validation.

Question. Acting Administrator Valentine, the Gore Commission also identifies aging aircraft as a major concern for aviation safety. In fact, they recommend that we expand the current aging aircraft inspection program to include the effects of age on non-structural components of commercial aircraft. Does the FAA support this recommendation?

Answer. FAA currently is evaluating the Gore Commission recommendations regarding the effects of age on non-structural components of commercial aircraft. Where the results of the evaluation indicate a need, the FAA will expand the current aging aircraft safety program to include non-structural components.

Question. Understanding the limited amount of funding available under this program, how does the FAA propose to fund this extra work load?

Answer. The Gore Commission recommendations were received after the fiscal year 1998 budget was formulated. If a review of the Commission's recommendations indicates a need for increasing the scope of the current aging aircraft program to include non-structural system components, the FAA will identify the scope of the changes necessary along with funding requirements.

AIRCRAFT SAFETY RESEARCH

Question. One of the "Gore Commission" recommendations is to work in cooperation with the airlines and manufacturers to expand the FAA's Aging Aircraft program to cover non-structural systems. I believe this recommendation is on the mark based upon the innovative work being done at the FAA's Aging Aircraft Non-destructive Evaluation Center (AANC) in Albuquerque.

This Center has made significant and effective contributions to improvements in aircraft inspection and repair by transferring new technology from the laboratory to routine use by industry. AANC goes through a methodical process of testing, demonstrating and validating new techniques and provides support to industry to implement them. Their success is shown by contracts with other federal agencies, including the Coast Guard and Air Force, on aircraft inspection and repair issues.

It seems to me that the close collaboration with the FAA, AANC, and the industry ensures that the best inspection techniques are transferred to routine usage in the most expeditious fashion. AANC is also working closely with airlines and manufacturers to develop industry standards for composite structure inspection. NASA has stated its intention to devote a sizable share of its resources to improve aviation safety and security. What is the status of discussions between the FAA and NASA on how to proceed with policy?

Answer. Two years ago, in anticipation of the need for a closer working relationship, NASA and the FAA exchanged executive personnel for the sole purpose of enhancing aviation safety by developing cooperative programs of mutual interest to both agencies. During the early development stage of the NASA new initiative for aviation safety, FAA played a key role in its formulation and focus. The FAA and NASA maintain a continuing dialogue through quarterly meetings at the Associate Administrator level to ensure that policy matters are resolved at this highest level. These discussions will lead to a method of transition, coordinated programs, and integrated planning. Included in the discussion is the establishment of an appropriate management oversight team to ensure timely execution of newly formulated programs.

Question. What areas of expertise are most appropriate for the FAA to remain the lead agency in aviation safety and security?

Answer. FAA's primary mission is to provide a safe, secure, and efficient global aviation system that contributes to national security. Public confidence in the safety of both the aircraft used and the airspace system is paramount to the ultimate competitiveness of the U.S. aviation industry. The inherent safety of an aircraft is a function of its design integrity and its manufacturing quality administrated through a certification program to ensure compliance with prescribed standards. A key aspect, therefore, of the FAA's primary mission is to ensure the highest level of public safety while incorporating new technology. The FAA has areas of preeminent expertise, such as, fire safety, aeromedical research, and air traffic systems technology. The FAA is required to address research that examines limits, performance, and margins of safety provided by current and evolving equipment, products, and procedures. This category of research supports the FAA in identifying and evaluating deterioration of the safety systems. This research can also identify needed innovative product development. Through early participation in the research and product development cycle, the FAA can accelerate technology through the certification process.

The FAA established the National Resource Specialist (NRS) Program to maintain a cadre of highly specialized experts to provide technical leadership in the design development and application of regulatory policies and practices for certification of rapidly advancing technology. The NRS program influences the research agenda of U.S. and foreign aviation industries, military, academia, and other research institutions; and interacts with and assists other U.S. Government agencies and foreign civil aviation authorities in technology related issues.

NASA has a role to play in the orderly development and validation of this technology including one of providing information that may assist the FAA in determining certification criteria.

Question. Could you comment upon areas where NASA could make a unique contribution to aviation safety and security work?

Answer. NASA's primary mission lies in the early, higher technical risk phase of the technology research and development chain where aeronautical concepts are created, basic research conducted, and risk is reduced through concept verification and validation. These efforts are aimed at improving the usefulness, performance, speed, safety, and efficiency of aeronautical vehicles and at helping to ensure a safe and efficient airspace system. NASA also acts as a catalyst with industry and academia to preserve the role of the United States as a world leader in aeronautical science and technology. NASA, in cooperation with FAA, has recently embarked upon a new technology investment strategy over the next five years with aggressive goals to provide the technology to reduce accident rates by a factor of five within the next ten years. These new systems will include but are not limited to: improving situational awareness, improving flight crews interactions, detecting and displaying hazardous weather, preventing collisions, extending useful life of existing aircraft, and identifying problems before they become accidents. As the technology matures, NASA assumes a supporting role as user needs—including those of the industry, DOD, and

FAA—dictate the nature and pace of technology development, certification, and inspection.

Question. Do you believe there can be an effective "marriage" between the FAA and NASA research programs to advance aviation safety and security?

Answer. NASA and the FAA have worked together continually to leverage the limited research and development resources available to the aviation community for improving aviation safety. The two agencies closely coordinate their respective research programs through periodic reviews at both the working and the associate administrator levels. Each agency maintains its own research efforts focusing on the specific roles and responsibilities of each agency. Specific examples include the General Aviation Propulsion (GAP) Program to develop a coordinated series of activities to develop a certification basis for future low-cost general aviation light aircraft propulsion systems. Another example is the jointly supported Advanced General Aviation Transport Experiments (AGATE) program designed to develop new technologies in the years 1995–2000 for a new generation of safe, economically and environmentally compatible general aviation aircraft. The FAA and NASA have demonstrated that they can effectively enhance aviation safety through a coordinated effort between the two agencies.

Question. With constrained budgets, I am concerned about duplication of effort. Congress will want any research program to be well coordinated and avoid inefficiencies and duplication of FAA's research program. Are you confident that duplication of effort can be avoided within the Administration?

Answer. The FAA and NASA are redoubling their efforts to ensure that the current and planned research programs are complimentary and leverage each others expertise and unique facilities. Through continuous communications throughout the two agencies' work force, the FAA is confident that its research program is coordinated with NASA's research efforts and supports the needs of the aviation community within the resources available. The FAA and NASA will strive to improve the integrated planning and coordination of each others research programs, so that potential duplication and inefficiencies will not occur. The establishment of an oversight management team will ensure continuous review and accountability of the research dollars in a constrained budget environment.

MODERNIZATION OF AIR TRAFFIC CONTROL SYSTEM

Question. The Gore Commission also evaluated the FAA's progress on the modernization of the out dated Air Traffic Control System (ATC). I am very concerned with the FAA's inability to remain on schedule and produce a product which will significantly benefit the American air traveler. The Gore Commission recommends the FAA should develop a revised modernization plan and to have that system fully operational by the year 2005. Has the FAA began to develop a new strategic plan for the development and implementation for the modernization of the Air Traffic Control System? And if so, where specifically are you in that process.

Answer. The FAA has begun to develop a new strategic plan for modernization of the Air Traffic Control System. A first draft of this strategic plan for modernization is embodied in the proposed National Airspace System Architecture (Version 2.0), which was released for aviation community comments October 1996. The FAA and the aviation community, taking into account the comments received on Version 2.0 and the new Air Traffic Control System concept of operations, will collaboratively develop a baseline architecture (Version 3.0) by the end of 1997.

Question. Does the FAA believe it is possible to have the Air Traffic Control system completely modernized by the year 2005? And if so, how much additional funding would be necessary to complete the system on such a fast track?

Answer. The FAA has taken a preliminary look at modernizing the Air Traffic Control system by 2005, and is in the process of developing a comprehensive plan to include detailed cost and schedule milestones. Completion of the modernization plan is scheduled for August of this year.

USER FEES

Question. Mr. Valentine, the President's budget proposes that beginning in 1999, the current aviation excise tax will be replaced by a cost-based user fee system.

The proposal shows $27.2 billion being collected under this user fee proposal between 1999 and 2002.

What assumptions did the FAA use in determining the revenues that can be generated by a user fee proposal? Specifically, who would pay the user fee and how would it be collected? How would user fees be assessed on the traveling public?

Answer. Projected revenues were based on the recovery of costs for all FAA programs. Using 1998 as a baseline, future years reflect 3-percent annual growth ex-

cept for the Airport Improvement Program, which remains constant at $1 billion. Specific fees to be charged have not been determined and will be influenced by the recommendations of the National Civil Aviation Review Commission. How the user fees are assessed and collected will be based on several considerations, including whether the fees are paid before, after, or concurrent with the provision of services, the volume of payments to be made, and the size of individual payments.

Question. If the FAA has not finalized how these fees would be collected or imposed, how were these revenue figures generated?

Answer. Using 1998 as a baseline, a 3-percent inflation factor per year was applied to operations, facilities and equipment, and research. AIP was straight-lined at $1 billion. As the President formulates his budget each year, decisions will be made on a year-to-year basis to update these assumptions.

Question. Would it have been more advantageous for the FAA to wait until the final report of the National Civil Aviation Review Commission before making revenue projections for a cost-based user fee?

Answer. The Administration is assuming that the work of the Commission will be completed before the end of this fiscal year and recommendations provided to Congress and DOT. This will allow time to make any necessary changes in the proposal to establish and implement user fees.

Question. Mr. Valentine, the President's budget proposes that beginning in 1999, the aviation excise tax will be replaced with a cost-based user fee system.

However the President's budget does not show where these user fees will be spent within the FAA.

In what areas and in what amount will these new user fees be spent between 1999 and 2002?

Answer. User fees will provide funding for all FAA programs. As the budget is formulated each year by the President, assumptions will be updated and the estimates revised.

Question. If this information is not known, how did the FAA arrive at its budget request of $35.9 billion between 1999 and 2002?

Answer. Fiscal year 1998 was used as a baseline and a 3-percent inflation factor per year was applied to operations, facilities and equipment and research. AIP was straight-lined at $1 billion.

Question. What level of funding will the FAA recommend to the National Civil Aviation Review Commission for (a) FAA Operations, (b) FAA Facilities and Equipment, (c) FAA Research and Development, and (d) the Airport Improvement Program between 1999 and 2002?

Answer. As part of their independent assessment of the FAA's financial requirements, Coopers & Lybrand concluded that the FAA's projected needs of $59.8 billion for fiscal years 1997–2002 were reasonable in total assuming a "status quo operating environment." Coopers goes on to state that the "National Civil Aviation Review Commission and its Aviation Funding Task Force should use that basic premise as their starting point." An update of the $59.8 billion was provided to Coopers. This update of FAA's requirements to $61.9 billion reflects the fiscal year 1997 enacted level, the fiscal year 1998 request level, revised pay raise and inflation assumptions, a refined pricing model for Operations, and $500 million in needed staffing changes.

For the shorter period, fiscal year 1999 through 2002, the levels of funding provided to Coopers and Lybrand were as follows (in budget authority): Operations—$25.6 billion, Facilities and Equipment—$10.4 billion, Research, Engineering and Development—$1.7 billion, and Airport Improvement Program—$7.1 billion.

At this time the requirements level to be recommended to the National Civil Aviation Review Commission have not been determined. The requirements level may need to be updated to reflect the fiscal year 1999 budget submission to the Office of the Secretary of Transportation and the cost associated with the recommendations of the White House Commission on Aviation Safety and Security.

QUESTIONS SUBMITTED BY SENATOR GORTON

FLIGHT DATA RECORDERS

Question. In testimony before the Commerce Committee, and in response to questions raised by committee members, NTSB Chairman Hall addressed the issue of expanded parameters for flight data recorders. Chairman Hall mentioned that foreign carriers have ordered, and U.S. manufacturers have supplied, aircraft with more sophisticated flight data recorders than U.S. carriers are demanding. Chairman Hall intimated that cost was the only reason that domestic air carriers would continue to order aircraft with flight data recorders that meet only minimum FAA

standards. I understand, however, that carriers also have concerns about integrating aircraft with new systems into their fleets. For maintenance purposes, they want to maintain standardization within their fleets. Is this a valid concern on the part of the U.S. carriers? Does the FAA believe that its proposal for the industry transition to flight data recorders with expanded parameters takes this concern into account?

Answer. Yes, the proposed rule takes standardization of the fleet into account. The carriers would like to maintain a standardized equipage to minimize maintenance procedures, inventory, and to provide interchangeability of equipment between different types of aircraft. However, because all airplanes are not alike and later built airplanes have more functional capabilities with advanced technology, e.g. computers and data bases, the National Transportation Safety Board determined that the newer and more sophisticated airplanes can and should provide that information from those systems that automatically control more of the airplane operating functions.

EXPLOSIVES DETECTION EQUIPMENT DEPLOYMENT

Question. I understand that the Gore Commission and members of Congress have criticized the FAA for its heavy reliance on the CTX 5000 security equipment, to the exclusion of other advanced technologies. Since the bombing of Pan Am 103, Congress has consistently urged the interim deployment of commercially available explosive detection equipment, and has recognized the benefits of a mix of technologies. The FAA appears, however, to continue to spend the bulk of its appropriations on CTX technology. When does the FAA plan to make a significant purchase of advanced x-ray equipment to complement the deployment of CTX equipment? Do you think we can learn lessons from countries throughout the world that are spending millions of dollars on this type of equipment?

Answer. The Aviation Security Improvement Act of 1990 (Public Law 101–604) says that prior to a requirement for deployment of explosives detection systems (EDS), the FAA must certify that EDS performance meets standards based upon the amount and types of explosives that are likely to be used to cause catastrophic damage to commercial aircraft, derived from test results using independently developed test protocols. The Act further states that certified equipment must be able to detect such amounts under realistic air carrier operating conditions.

The FAA established a threat list of explosives and associated amounts that would cause catastrophic damage to an aircraft, in coordination with U.S. Government organizations, distinguished scientific bodies, and European Civil Aviation Conference member states and other key foreign governments. In November 1992, FAA issued the draft EDS standard in the Federal Register, and final certification test protocols were completed in May 1993 by the National Academy of Sciences. The FAA carefully developed and coordinated these standards with the scientific and intelligence communities, the aviation industry, and properly cleared manufacturers and vendors, then published the final unclassified portions in the Federal Register on September 10, 1993.

The InVision CTX 5000 was certified in December 1994. No other manufacturer has yet applied for certification testing. The FAA agrees with the results that the rigorous process mandated by law has produced, namely, the performance criteria and certification standards that both InVision Technologies models, the CTX 5000 and the CTX 5000SP, have met. The FAA and the Office of the Secretary of Transportation have encouraged other manufacturers to meet this standard, which has also been adopted as a goal by the European Civil Aviation Conference.

Other commercially available "less-than-certified" automated explosives detection equipment is being deployed in foreign airports. The FAA has assessed these devices and will continue to monitor the progress of these other deployments. The White House Commission on Aviation Safety and Security recommended that such equipment be deployed at U.S. airports and this will be done.

The FAA plans to award contracts for about 20 automated dual energy X-ray machines manufactured by Vivid Technologies of Woburn, Massachusetts; EG&G Astrophysics of Long Beach, California; and Heimann Systems of Wiesbaden, Germany, plus a quadrupole resonance device manufactured by Quantum Magnetics of San Diego, California.

Question. I believe that the FAA has requested $100 million in fiscal year 1999 and nothing in fiscal year 1998 for use in the enhancement of airport security at our nation's airports. How does the FAA plan to use these funds, as well as the remainder of the fiscal year 1997 funds available? How many explosive detection machines will be purchased with this money and how many airports will receive the

equipment? At the current time, how many airports have received explosives detection equipment and have it in use?

Answer. Using a portion of the $144 million for the purchase of equipment provided by the Omnibus Consolidated Appropriations Act of 1997, a contract was awarded to InVision Technologies in December 1996 for an initial delivery of 54 units that began in January 1997 for deployment at 25 airports. Newly purchased units are now in Chicago and New York airports and installations are underway in two other cities. InVision CTX 5000 airport demonstrations, arranged through grants to three air carriers that began in November 1995 in San Francisco, in Atlanta during the Olympics, and in Manila in September 1996, continue in parallel with these new acquisitions. The demonstrations were designed to validate cost models and gain real world operational data and experience on the deployment of EDS as envisioned by the Aviation Security Improvement Act of 1990. As these demonstrations are completed, the equipment will remain at those three airports.

An initial deployment of other types of advanced equipment began with the installation of trace explosives detection devices in Atlanta last year and continues today at Chicago, New York, and Washington area airports. The FAA plans to award contracts to purchase over 480 trace explosives detection devices, and about 20 automated dual energy X-ray machines manufactured by Vivid Technologies of Woburn, Massachusetts; EG&G Astrophysics of Long Beach, California; and Heimann Systems of Wiesbaden, Germany, plus a quadrupole resonance device manufactured by Quantum Magnetics of San Diego, California.

WIDE AREA AUGMENTATION SYSTEM (WAAS)

Question. A recent Flight Safety Foundation study concluded that the accident risk while flying a nonprecision approach was five times greater than that associated with flying a precision approach. I am told that nearly 70 regional carriers serve more than 150 airports with nonprecision approaches in the United States, including five airports in my home State of Washington (Friday Harbor, Lopez, Anacortes, Wenatchee and Pullman-Moscow). Both the Flight Safety Foundation and the Vice President's Commission on Aviation Safety and Security have identified augmented GPS navigation technology as key to improving aviation safety because it will make precision approaches possible at nearly every airport in the country. How committed is the FAA to implementation of augmented GPS navigation in the form of your Wide Area Augmentation Systems (WAAS)?

Answer. The FAA is fully committed to implementation of the WAAS. The FAA awarded a contract for $483.5 million to Hughes Aircraft Company, and is over one year into execution of that contract. The initial operational capability is due to be commissioned in 1999; full operational capability is due to be commissioned in 2001.

Question. This subcommittee has been told that one justification for the WAAS program is that it will allow the FAA to begin decommissioning ground-based navigation aids. What would be the effect on the FAA budget and user benefits if the WAAS program is not fully funded or the system implementation is delayed?

Answer. FAA policy, based upon a full WAAS capability in 2001, is to begin decommissioning ILS's and VOR/DME's in 2005 and to be complete by 2010. The cost avoidance from decommissioning ground-based navigation aids is approximately $150 million annually (1997 dollars) and is due to the elimination of operation and maintenance expenses. If WAAS full system implementation is delayed more than five years, more than $1 billion would be needed to upgrade or replace many of today's navigation aids.

User benefits from WAAS include the potential to remove other navigation avionics (e.g., VOR's, DME's, and NDB's) and the avoidance of the associated maintenance and training costs. The WAAS will also provide a precision approach capability at thousands of airports that today have no instrument approach or only a nonprecision approach. The accident risk while flying a nonprecision approach is estimated to be five times greater than that associated with flying a precision approach. WAAS implementation delays would delay these benefits and expose the users to the greater risks associated with nonprecision approaches for a longer time.

Question. Tony Broderick, former FAA Associate Administrator for Regulation and Certification, recently testified before the Aviation Subcommittee. He indicated that the original cost projections for the WAAS program were underestimated to the tune of approximately $300 million. Does the FAA plan to live up to its original commitment to deliver on the WAAS program with the capability that was envisioned at the time that its initial funding was requested? Specifically, will the system have adequate redundancy built in to be able to provide for "sole means" of navigation en route, in the terminal area, and for "near-Category 1" precision approaches and landings at any facility, without reliance on current ground-based navigation aids?

Will the system also provide for the use of Local Area Augmentation Systems (LAAS), which the airlines can use to land in extremely poor visibility conditions?

Answer. (a) Yes. FAA does plan to provide a WAAS with a full operational capability by 2001.

(b) Yes. The current performance requirements will support sole means of navigation for en route, terminal, non-precision approaches, and Category 1 precision approaches at qualified locations.

(c) The original WAAS cost estimate did not envision all costs related to safety certification and end-state technical complexities. The FAA is currently reviewing the total WAAS implementation strategy. Following that review, the agency will forward any proposed changes to the original baseline to Congress.

(d) The FAA WAAS is being developed independent of the LAAS. However, user equipment specifications are being developed to provide both WAAS and LAAS services from a single receiver. The FAA is also investigating future joint use of reference stations equipment at sites requiring both WAAS and LAAS data collection.

QUESTIONS SUBMITTED BY SENATOR FAIRCLOTH

AIR TRAFFIC CONTROL MODERNIZATION

Question. The Gore Commission recommended acceleration of the ATC modernization program. Why should we believe that FAA could manage an accelerated effort since it has struggled so mightily with achieving cost and schedule goals for its existing program?

Answer. With the accomplishment of acquisition reform, and the establishment of Integrated Product Teams, the FAA has significantly improved its capability to acquire and deploy systems. For example, for the following major system acquisitions, we have "delivered" 119/124 Airport Surface Radar-9's, 32/40 Airport Surface Detection Equipment-3, 42/47 Terminal Doppler Weather Radar, 38/41 Area Route Surveillance Radar-4, 142/149 Mode S, all Voice Switch Communication Systems, 143/183 Mark 20 Integrated Landing Systems, and other systems.

The Display Channel Complex Rehost (DCCR) program was initiated in 1995 to resolve unacceptable failure rates of Display Channel Complex (DCC) at 5 centers. The DCCR program began delivering equipment seven months ahead of schedule. Another major modernization effort, the Display System Replacement (DSR), which will replace air traffic controller displays in all of the Air Route Traffic Control Centers, is on schedule for initial deliveries in October 1998.

Question. One long-standing criticism of FAA's management of its ATC acquisitions is that the agency tried to develop overly complex, large projects. The Advanced Automation System is one often-cited example. In recognizing the validity of this criticism, FAA announced that it would begin to emphasize commercial off-the-shelf (COTS) acquisitions. One of FAA's largest and most visible acquisitions is the Standard Terminal Automation Replacement System (STARS). STARS was billed as mostly COTS technology, yet the agency's timetable for developing STARS stretches into the next century before FAA will be able to install a fully operational system. Please provide me with your definition of COTS.

Answer. The STARS concept is to enhance a commercially-available Air Traffic Control system to meet the FAA's operational requirements. The winning vendor proposed to supplement their existing design of 840 thousand lines of code with an additional 140 thousand lines to address the full complement of STARS requirements. The contract calls for delivery of an Initial System Capability for test in December 1997, and a Full System Capability in December 1998. Each of these releases will undergo approximately one year of testing before they become operational. The STARS hardware is configured using commercial products for all major system components.

Question. Our records indicate that the Congress appropriated over $3 billion for the Advanced Automation System acquisition before FAA restructured it in 1994. In light of the cancellation of the terminal and tower components of the acquisition and the scaling back of the en route component called the Display System Replacement, how many contract deliverables can be credited against the $3 billion? In other words, the balance was a loss to the taxpayers, isn't that correct?

Answer. The FAA spent $2.6 billion on the Advanced Automation System (AAS) program prior to its restructuring in 1994. While the FAA agrees that large amount of funding was invested in the AAS program, there were also many benefits derived from the program.

The Peripheral Adapter Module Replacement Item (PAMRI) was successfully completed with the installation of PAMRI in all 20 ARTCC's, the FAA Technical Center,

and the FAA Aeronautical Center. All efforts related to ARTCC Modernization, including expanding the control rooms, rehabilitating the ARTCC automation wing, and providing other upgrades to the facilities that were required to install ISSS remain a program requirement for DSR.

The Initial Sector Suite System (ISSS) was descoped and renamed the Display System Replacement (DSR) program. Over 40 percent of the ISSS developed software was transported and used for the DSR program. The common console design; the 20"x20" main display monitor (MDM) console, which was developed for AAS, has become a standard for Air Traffic Control displays; the monitor and control design; test support platforms at the FAA Technical Center and FAA Aeronautical Center; the Development and Demonstration Facility used for early user evaluations; the new centralized software support maintenance strategy; and the expansion of the FAA Technical Center test laboratory were all successes of the ISSS program and are being used today for the DSR program. The Oceanic program has reused a substantial amount of equipment that was procured for ISSS but not needed for DSR.

When the AAS program was restructured, the AERA segment of the program was nearing completion of development of the algorithms necessary to predict flight path conflicts in the future, which is the basis for the URET prototype systems that are presently being tested at two ARTCC's. The URET prototypes will transition to the Initial Conflict Probe program, which will implement operational systems at all ARTCC's. FAA has committed to full scale development of the Initial Conflict Probe.

The Tower Control Computer Complex (TCCC) segment of AAS was restructured to provide a modular approach to a full TCCC implementation. That program underwent subsequent restructuring based on the availability of F&E resources and FAA priorities. The contractor has completed all development required on that program and has a design that would provide a platform for Surface Movement Advisor (SMA). However, because of limited resources and other higher priority NAS Modernization programs, the TCCC program has been canceled.

Two segments of the AAS program, Area Control Computer Complex (ACCC) and Terminal Advanced Automation System (TAAS), were canceled at the time of the restructuring. A substantial amount of the hardware that was procured during the development phase of the ACCC and TAAS programs, including common consoles, MDM's, processors, and displays, has been reused by the Oceanic and other FAA automation programs. Additionally, some FAA test laboratories are making use of residual material.

In summary, the FAA has attempted to leverage hardware, software, and the sharing of lessons learned where appropriate to maximize the return on our investment and to minimize other program costs.

Question. Please prepare a detailed account of federal government efforts to recover the costs to the taxpayers of waste and mismanagement in the Advanced Automation System acquisition program from IBM and other parties.

Answer. When the AAS Program was terminated, there were multiple measures taken to ensure that the government's investment was protected. Full and independent audits were conducted of the prime contractor and every major subcontractor; all delivered equipment is being used in other FAA programs where appropriate or has been sent to the FAA Depot for reutilization and work-in-process inventory was identified and reintroduced back into the contractors inventory for use on continued FAA efforts. Approximately 95 percent of the equipment was reused and over 40 percent of the software was provided for use by other programs. These cost recovery measures resulted in cost avoidance or reductions in other program costs. Every effort was made to ensure that the governments investment was protected and that sunk cost were held to a minimum.

AIR TRAFFIC CONTROL MODERNIZATION

Question. Please prepare your best estimate of the costs to the taxpayers of waste and mismanagement in the Advanced Automation System acquisition program.

Answer. Approximately $514 million invested in AAS through fiscal year 1994 resulted in non-recoverable costs.

Non-Recoverable funding spent on AAS	$437,000,000
Sunk Cost on TCCC through fiscal year 1994	77,000,000
Total	514,000,000

Question. GAO reported in its 1996 report on FAA's culture that agency officials deliberately underestimated program costs and established unrealistic schedules to gain approval of funding for its projects. We have seen reports that the estimated costs of the Wide Area Augmentation System (WAAS) acquisition were underestimated for "convenience." Last month, GAO testified that it had evidence from sev-

eral sources that program cost estimates could climb significantly. What is the agency's position on the reliability of the original WAAS cost estimate. We also understand that the schedule is facing another slippage. Could you address any schedule baseline changes being considered or already decided on by FAA?

Answer. (a) The original WAAS cost estimate did not envision all costs related to safety certification and end-state technical complexities. The FAA is currently reviewing the total WAAS implementation strategy. Following that review, the agency will forward any proposed changes to the original baseline to Congress.

(b) The initial operational capability is planned to be commissioned in 1999, and the final operational capability is planned for November 2001. There will be some intermediate milestone changes that evolve because of the technical complexities, however, no end-state delivery changes are planned to the 2001 delivery date.

Question. GAO and others have pointed to weaknesses in contract oversight as an underlying cause for FAA's acquisition problems. Does FAA have the necessary talent to provide sufficient oversight of its major contracts? To what extent should FAA rely less on contractors to oversee contractors and more on its own staff?

Answer. We believe that FAA has a talented work force that over the years has been required to perform diverse functions including contract oversight. It has been recognized that this area of performance needs to be strengthened. Therefore, the FAA is conducting a pilot program to implement a competency-based learning system whose purpose is to develop a corps of acquisition professionals with the appropriate education, training, experience, skills, and attitudes to work successfully in a system with far fewer regulations that puts a premium on technical competence, judgment, creativity, and initiative. The plan is to hire, train, and retain individuals who can work as part of teams, who can operate with general guidelines where reason and common sense are more important than the ability to follow the rule book, and who have the specialized education and training to deal with some of the most sophisticated communications, navigation, and surveillance systems in the world. As a result, the FAA should be able to rely more on its work force and less on contractor support to perform oversight duties.

Question. GAO reported in March that the STARS acquisition was able to avoid a major increase in its F&E cost estimate only because FAA now projects its costs for STARS computer hardware to be 40 percent less than initially expected. Why would the estimate be so far off?

Answer. The commercial off-the-shelf (COTS) acquisition approach, seeking competition between various commercial applications, makes it far more difficult to accurately predict what hardware will be offered with the system, and how that hardware will be priced.

All three of the STARS offerors proposed some hardware evolution of the existing Air Traffic Control systems. Two of the vendors proposed a PC-based solution, while the third (the eventual winner) proposed a system based on more powerful workstations. The workstation solution uses more expensive hardware, but the FAA was offered a competitive price due to an agreement negotiated by the Prime Contractor with the workstation manufacturer.

The FAA estimate was based on a "nominal" system using a target number of processors and their catalog prices—the logic of the estimate is still valid. However, it is difficult to accurately predict vendors competitive strategies in system design and pricing, and incorporate that prediction into the estimate.

ASHEVILLE, NORTH CAROLINA AIRPORT

Question. I wrote to Secretary Peña November 13, 1996 to urge the FAA to approve the application of Asheville (NC) Airport for a $1.5 million AIP grant for an extended runway safety area. The current 450 foot safety area falls short of the 1000 foot area required for Group C–IV aircraft under FAA Advisory Circular 150/5300–13. As I noted, the Airport committed its entitlement monies to this project, and I am curious about the status of their application for discretionary funds. Please prepare a comprehensive answer to inform me of the status of this application and explain the basis for any decisions already made. I will also appreciate your efforts to keep my office updated of all developments in this matter.

Answer. The FAA has formulated a project, which includes Airport Improvement Program discretionary funds, to extend the runway safety area at Asheville (NC) Airport. You will be notified through the congressional notification process once coordination within the Department of Transportation has been completed.

SANFORD-LEE COUNTY AIRPORT

Question. The conference report that accompanied the 1997 transportation appropriations bill urged "expeditious consideration to accelerated construction of the new

Sanford-Lee County Airport in North Carolina in the hope that the project can be completed as quickly as possible." I sent a letter to Administrator Daschle on November 15, 1996, and I encouraged the FAA to act to accommodate this recommendation. The Administrator replied that this request is "being evaluated," and, as this was the last correspondence that I received about this project, I am quite eager to learn the result of this evaluation process. Please prepare a detailed answer to explain the status of this project and the basis for any decisions already made. I will also appreciate your efforts to keep my office updated of all developments in this matter.

Answer. The FAA has formulated a project under the AIP's State Block Grant Program (SBGP) for North Carolina, which will provide fiscal year 1997 discretionary funding for the new Sanford-Lee County Airport. You will be notified through the congressional notification process once coordination within the Department of Transportation has been completed. This project will supplement any AIP State apportionment funds which the State of North Carolina approves under the SBGP. The discretionary funding is in accordance with the funding schedule for fiscal year 1997 to meet the airport's target date for completion by mid-1999, based on future funds availability beyond fiscal year 1997.

QUESTIONS SUBMITTED BY SENATOR LAUTENBERG

FAA AND CERTIFICATION OF AIRLINES AND RELATED BUSINESSES

Question. The Gore Commission recognized that the FAA is sometimes too lenient when it comes to certifying airlines and contractors, especially when their safety and inspection records have been less than perfect. The Commission recommended that the FAA be more stringent in the certification of these aviation businesses. Do you agree with this recommendation? If so, what are you doing to change the way the FAA certifies these businesses?

Answer. The FAA is in the process of establishing a new organization to address concerns regarding the manner in which the FAA certificates air carriers. This Certification Standardization and Evaluation Team (CSET) will be dedicated to the standardization of original certification and follow up evaluation activities for all Federal Aviation Regulations Part 121 air carriers.

The CSET will change the way the FAA currently performs certification by providing a dedicated team of certification and inspection experts who have the specialized expertise and experience necessary to accomplish the objective of standardization. This team of experts will work in virtual offices facilitating a more flexible work environment capable of rapid response to certification and inspection issues. The CSET will establish evaluation guidelines and assist in the development and implementation of a comprehensive air carrier surveillance plan using statistical and scientific tools.

Question. Is the FAA contemplating adopting more strenuous inspection measures and increasing enforcement actions when you find sub-standard practices?

Answer. The ultimate goal of Flight Standards Service is to ensure the compliance of each air carrier with the Federal Aviation Regulations (FAR). If a certificated air carrier falls out of compliance in a particular area, the immediate concern is to correct the problem area and take measures to ensure that non-compliance does not happen again. As a result, it is felt that addressing the issues of certification requirements and targeted surveillance plans is a more responsive approach to continued compliance than simply applying more "strenuous" inspection measures and increased enforcement actions.

The FAA has several efforts underway that will change the way inspections of the FAR part 121 air carriers are conducted. In response to the FAA 90-Day Safety Review, the newly created Certification, Standardization, and Evaluation Team (CSET) will not only address standardizing the certification procedures for FAR part 121 air carriers, but also will follow up with a comprehensive surveillance plan tailored to each air carrier's specific operation. In addition, newly certificated air carriers will have a surveillance plan tailored to the specific needs of the air carrier based upon the circumstances encountered during the certification process. Surveillance plans will be based on analysis of historical safety data and targeted to the needs of the new air carrier. Air carriers that have been certificated within the last five years will have increased levels of surveillance based on the requirements in the National Work Program Guidelines.

Other changes include the Surveillance Improvement Project (SIP) work group that examines the methodology, the organization, and the conduct of existing surveillance procedures. The final report from the SIP should be available in June and

recommendations from the group may be incorporated into CSET. The FAA also has a new initiative to change the organizational structure of geographic surveillance to be more effective. The environmental inspections of each air carrier may be accomplished by inspectors who are trained experts in the procedures for that operator.

DE-EMPHASIZING COST-BENEFIT ANALYSIS IN PROMULGATING SAFETY REGULATIONS

Question. The Gore Commission recognized that critical safety reforms are not being implemented because they cannot pass the strict "cost-benefit" test which is required of all proposed regulations. The Commission recommended that, "Cost alone should not become dispositive in deciding aviation safety and security rulemaking issues." What is the FAA doing to carry out this recommendation?

Answer. The FAA agrees that cost alone should not be dispositive in deciding aviation safety and security rulemaking issues, and is preparing to issue a policy statement clarifying this principle. After coordinating with OST and OMB, the FAA plans to publish the statement this summer and will insure regulatory decisions fully comply with that policy.

Question. What specific pending rulemaking actions do you expect to be influenced by this change in policy?

Answer. The FAA expects that all current pending safety and security rulemaking actions will be evaluated in accordance with the Gore Commission recommendation. Several specific prominent rules that are publicly known to be forthcoming include the following:

—Revised Standards for Cargo or Baggage Compartments in Transport Category Airplanes (requirement for fire detection and suppression systems)
—Aging Aircraft Safety
—Identical Security Measures (U.S. and non-U.S. air carriers serving the U.S.)
—Certification of Security Screening Companies

TIMETABLE FOR IMPLEMENTING GORE COMMISSION RECOMMENDATIONS

Question. President Clinton officially accepted ALL of the safety and security recommendations of the Gore Commission. However, I am concerned that there is not an established timetable for implementation of each of the recommendations. By what date do you expect to have all of the recommendations fully implemented? Which of the recommendations will take the longest time to implement and why?

Answer. FAA and the Department of Transportation, working with a number of Federal agencies that lead on specific recommendations, have developed plans and a timetable for implementing the White House Commission recommendations. One of the 57 recommendations has already been fully implemented, and we expect up to 12 to be completed this year. Our current timetable assumes timely and adequate funding of those recommendations.

The recommendation that will take the longest to achieve is also the most costly, to modernize the air traffic management system by the year 2005. The current NAS Architecture calls for modernization by the year 2015. Modernization can be done more quickly, but it will require compression of both the schedule and the costs, and therefore substantially increased budgets from fiscal years 1998 through 2005.

FUNDING REQUIREMENTS TO IMPLEMENT GORE COMMISSION RECOMMENDATIONS

Question. At the end of last year, we added more than $225 million to the Continuing Resolution specifically to implement many of the measures recommended by the Gore Commission. This included funding for explosive detection systems, K–9 teams, threat assessments and other measures. Which specific Gore Commission recommendations do you believe still require additional appropriations above the current level?

Answer. Many recommendations, of course, are costly and will take time to complete. The final findings of the White House Commission are being reviewed to determine the details of implementation as well as the additional costs. By far the most costly unfunded item is modernizing the National Airspace System (NAS) by 2005, an acceleration from FAA's existing schedule of 2015. Other costly items include strengthening aviation human factors research, accelerating GPS use in NAS modernization, deploying explosives detection equipment, and completing other security related initiatives.

The White House Commission expects the National Civil Aviation Review Commission to explore innovative federal financing approaches, such as user fees, to finance an accelerated modernization of the NAS and design a new financing system for the FAA that would ensure adequate availability of funding.

Question. Are the costs of implementing all of these recommendations contained in your 1998 budget request? If not, why not?

Answer. No; funding is not included in the fiscal year 1998 budget submission for all of the recommendations since the budget was completed prior to issuance of the final recommendations. Funding requirements for fiscal year 1999 and thereafter will be requested through the normal budget process.

PASSENGER SECURITY MEASURES AND CIVIL LIBERTIES

Question. There have been concerns raised that the FAA's passenger "profiling" methods will be overly intrusive and discriminatory. The Gore Commission recommended that an independent body monitor these security measures and make recommendations to ensure that no groups are inappropriately subjected to heightened security measures. When do you expect this independent body to be established?

Answer. The Department of Transportation is proceeding with the White House Commission recommendation by arranging for the Department of Justice to review the design and implementation of the prototype automated profiling system known as Computer Assisted Passenger Screening or CAPS, which FAA developed with Northwest Airlines. An organizational meeting with senior representatives of the Department of Justice has been held and others are planned.

FAA's profiling requirements do not differentiate among U.S. citizens on the basis of factors such as race, religion, ethnicity or national origin. While confident that FAA procedures do not infringe upon civil liberties, the review of profiling that is underway by the Department of Justice will ensure no illegal discrimination occurs.

Question. What course of action will be available to passengers who feel they have been subjected to discriminatory or overly intrusive security measures?

Answer. Passengers who have questions or complaints about overly intrusive actions should first speak with airline representatives. Those representatives may not, however, discuss with passengers the specifics of any security measure, since to do so could damage the measure's effectiveness. If this conversation does not resolve passenger's concerns, then the passenger may call the FAA at 1–800–322–7873 if the issue deals with safety or security. Complaints concerning possible discrimination should be registered by writing the Department of Transportation Aviation Consumer Protection Division (C–75) or calling that office at 202–366–2220.

Question. Will individual passengers be able to find out why he or she is being subjected to additional security measures?

Answer. No. Neither the FAA nor the air carriers should discuss with passengers the specifics of any security measure, since to do so could damage the measure's effectiveness. In addition, a certain amount of randomness is included in applying security measures, particularly those noticeable to the traveling public. Persons should not be able to determine if they were subjected to additional security measures through profiling, at random, or for some other reason.

CONSOLIDATION OF ATLANTIC CITY TECH CENTER

Question. The Hughes Technical Center in Pomona, New Jersey, is the nation's premier aviation testing facility for security technology and human factors research. The Coopers & Lybrand study included a recommendation that the FAA look into consolidating the Hughes Technical Center at Atlantic City, New Jersey into the Monroney facility in Oklahoma City. Does the facility in Oklahoma have the capability to conduct the same research and development as the Tech Center in New Jersey?

Answer. The facility in Oklahoma does not have the capability to conduct the same research and development as the Technical Center. The missions of the Technical Center and the Aeronautical Center are focused in different areas. They require specific and unique facilities to accomplish each of the divergent missions.

The Aeronautical Center is devoted to centralized training and central warehousing and supply, and provides certain automated data processing services for national and local programs.

The Technical Center is the national scientific research and development facility for FAA. Center activities involve research, system development and integration in the areas of air traffic control, communications, navigation, airports, aircraft safety, and security. In addition, tenant organizations located at the Technical Center are involved in NAS operations support; flight inspection; independent operation test and evaluation; and the prevention of international terrorism.

Many of the facilities required to accomplish the Technical Center's mission are unique and not available at the Aeronautical Center or, in some cases, anywhere else in the world. Also, the Technical Center's technological capabilities go beyond

technical facilities. The Technical Center employs highly technical and scientific personnel who possess specialized training and background in critical disciplines directly related to NAS development and support. The comprehensive integration of all NAS components can be accomplished only at the Technical Center because of the collocation of its skilled professionals and specialized infrastructure.

Question. How much would it cost to abandon the existing Tech Center and rebuild the same infrastructure in Oklahoma?

Answer. The cost to abandon the existing Technical Center is estimated at $24 million; the rebuilding of the same infrastructure in Oklahoma is estimated at $900 million.

The William J. Hughes Technical Center is comprised of 180 individual, specialized buildings and structures on its 5,059-acre site. These technical laboratories and facilities include Test and Evaluation, Research and Development, administrative and storage facilities as well as numerous project test sites. The capitalization value of the buildings and infrastructure (roads, exterior utilities, etc.) is estimated to be $200 million.

The cost to rebuild the required structures and infrastructure in Oklahoma is estimated to be over $750 million. This estimate includes space requirements of approximately 1.35 million square feet; infrastructure costs; and architectural and engineering design and construction management costs.

Moving the Technical Center's mainframe computers and special systems to Oklahoma involves planning and design, disassembling, crating, and shipping costs, and reassembling the equipment at its destination. The cost for accomplishing the equipment move is estimated to be $125 million.

The abandonment cost relates to the Technical Center's Superfund responsibility, which includes cleanup of hazardous sites on the Center as well as the replacement of aged underground storage tanks. The ramifications of this designation are that the site cannot be transferred to another owner until the completion of the cleanup operation, regardless of whether the Technical Center relocates.

In addition to the rebuilding costs, the relocation of the Technical Center's existing talent would be an added financial burden to the relocation proposal. Also, a relocation would result in a significant adverse impact to the delivery schedule of every National Airspace System modernization program. In addition, aviation safety and security initiatives would be seriously jeopardized.

Question. Coopers & Lybrand justified its recommendation on the value of the land that could be sold if the FAA left the Atlantic City facility. I am mystified by this recommendation because it is a known fact that the facility is a Superfund site. Moreover, there is a reversionary clause in the FAA's lease that requires you to sell the entire facility to the Southern New Jersey Transportation Authority for only $55,000 if you ever leave the facility. To your knowledge, was Coopers & Lybrand aware of these facts when they issued their recommendation?

Answer. During Coopers & Lybrand's 2-day visit to the Technical Center, they did not ask questions that would provide any rationale for reaching their conclusion. Therefore, our assumption is that Coopers & Lybrand was unaware of these facts and based their recommendation on incomplete information and flawed analyses.

An early draft version of Coopers & Lybrand's assessment stated that the Technical Center is located on land that is probably worth significantly more than the book value used by the FAA. The Technical Center proved the assessment incorrect for the following reasons:

—The South Jersey Transportation Authority (SJTA) owns a right of reverter on over 4,000 acres of the total Technical Center acreage. If the U.S. Government no longer requires use of the Center's land, ownership (title) of these acres, including all improvements, will revert to SJTA for a total sum of $55,000.

—The Center is listed as a Superfund site. As such, the site cannot be transferred to another owner until the completion of an extensive and expensive cleanup operation.

This information was conveyed to Coopers & Lybrand and resulted in their removal of their core assumption for the consolidation recommendation. Coopers & Lybrand in their final revision recognized that the assets (land) of the Technical Center are not a means of financial benefit to the FAA to offset other agency funding needs.

Question. Based on these facts, do you see any scenario by which the FAA would choose to pull out of the Atlantic City Technical Center and consolidate operations in Oklahoma?

Answer. Based on the information gathered to date, there is no scenario that would justify the relocation and consolidation of the Atlantic City Technical Center with operations in Oklahoma.

PERSONNEL REFORM AND NEW YORK-NEW JERSEY CONTROLLER STAFFING SHORTAGES

Question. Two years ago, this Committee gave your agency unprecedented personnel reform authority. This was done so that you would have the necessary tools to get the appropriately trained people in the right place IMMEDIATELY. For years now, the FAA has made commitments to me to get the number of air traffic controllers at Newark Tower and at the New York Center and TRACON up to the authorized level. But you have missed deadline after deadline. Today, staffing at all three facilities is still below authorized levels. Given the far-reaching personnel reforms you were granted in 1995, what explains these continued delays in getting the right number of controllers in the right place?

Answer. Personnel reform was implemented in the FAA on April 1, 1996. Because of financial constraints most controller hiring was deferred to the second half of fiscal year 1997. Newark Tower is scheduled to receive seven controllers in fiscal year 1997, four of which are already onboard. Similarly, New York Air Route Traffic Control Center is scheduled to receive 42 of which at least 12 are onboard. New York TRACON will receive a total of 22 in fiscal year 1997, of which at least 4 are onboard.

Question. We continue to hear reports that controller trainees at these facilities cannot get fully qualified in their jobs because the senior controllers that are responsible for training them are too busy handling aircraft to conduct any training. Do you agree that this is a problem? What are you doing to address it?

Answer. In the past, this situation has occurred. We are currently implementing plans to increase staffing at New York area facilities. In addition, we have recently increased overtime funding for New York Center by $735,000 to optimize on-the-job training for the new hires.

We have also initiated additional management controls at New York Center including: (1) the establishment of a stand-alone training department; (2) establishment of a staff manager for training; (3) assignment of two training specialists and two data analysts to the training department; and (4) designation of six operations supervisors (one from each area) to assume collateral training duties.

Question. What is your new target date to get all of the facilities in my region staffed to the level called for by the FAA's own staffing plan.

Answer. The FAA has worked closely with the National Air Traffic Controllers Association to negotiate staffing levels for key Eastern Region facilities. The agreed upon target date for meeting these staffing levels is September 30, 1998.

CONVERGING RUNWAY DISPLAY AID (CRDA)

Question. The Converging Runway Display Aid (CRDA) is an important feature in the FAA's Automated Radar Tracking System that is being adapted at the New York TRACON. It allows the use of two runways during instrument weather conditions and would increase safety and capacity as well as reduce weather delays. I understand that the CRDA system on this one runway at Newark airport is scheduled to be implemented next month, May 1997, but this will only be on the southwest flow runway. Is the CRDA still scheduled for implementation on the Southwest flow runway in May 1997? When will CRDA be implemented on the other major runway which handles about 40 percent of total traffic?

Answer. All air traffic facets of the CRDA implementation have been completed and are in place. However, during shakedown testing an anomaly in the software surfaced. In the interest of safety, implementation of CRDA was delayed. Implementation of CRDA is pending further shakedown testing.

There is currently not a firm timeline for implementation of CRDA on Runway 4 and 11 at EWR. Development of procedures on this runway configuration are more complicated than the southwest flow. Airspace changes including rerouting aircraft and adjustments of major arrival flows for Newark and LaGuardia Airports will be necessary to accommodate a Runway 4 final vector position. This will require an environmental review/assessment which will be a lengthy process.

The geometry of this runway configuration is such that a 6–7 mile in trail spacing on the final approach course to Runway 4 would be required to accommodate CRDA which may or may not enhance the capacity of current operations. Also, Runway 11 arrival interact with the Runway 4L departures in instrument Flight Rules (IFR) weather which will delay departures as a result.

We will continue to evaluate the procedures, airspace changes, and environmental issues necessary for development and will keep the Users informed via our Capacity Enhancement Task Force process.

AIRPORT ACCESS AND AGGRESSIVE SECURITY TESTING

Question. There have been a number of well-publicized incidents including one at Newark, where the media have broken through airport security measures and gained access to vulnerable areas, such as the tarmac and the ramp. The FAA Authorization Act included a provision I authored directing the FAA to conduct unannounced, aggressive testing of airport and airline security programs. What has changed over the past six months to tighten security for airport personnel and seal these vulnerable areas?

Answer. FAA initiated a focused, three-phased investigative effort emphasizing auditing the background and access investigations conducted primarily by airport tenant organizations prior to granting access privileges to employees of such entities. The first phase involved an audit of representative tenant organizations at 41 major airports nationwide. This effort was designed to determine the nature and scope of the problem. The results indicated problems at 10 airports, and strong immediate corrective actions were initiated, to include appropriate enforcement actions. Voluntary actions by the involved airports included locking out entire batches of employees until questions concerning their background verifications had been completely resolved. This audit also resulted in an emergency rule allowing FAA to take action against individuals and/or employers for falsification or fraud in background documents.

A second-phase audit of 19 major airports was conducted by FAA during February, 1997. The results of that audit reflect improvement; however, some problem areas remain. Enforcement actions have been initiated against individuals found to have made false representations, as well as any airports and tenant organizations failing to properly discharge their responsibilities.

FAA is now preparing a third-phase effort designed to ensure and confirm that all Category X airports and their tenant organizations are complying with the access investigation rules. Beyond this focused effort, FAA field elements will continue to conduct scheduled and unscheduled assessments of compliance at all airports subject to the requirements of FAR 107.

Question. Have there been major enforcement actions against the airports with lax security as a result of these aggressive testing measures?

Answer. During February, a second-phase audit of 19 major airports was conducted. The first phase of this effort was initiated in November 1996, and continues to focus on the background and access investigations conducted by airport tenant organizations prior to seeking access privileges for employees. Although there were no major enforcement actions against airports during the second-phase audit, 27 investigations for falsification of records were initiated against airports, air carriers, tenants and individuals.

FAA continues to aggressively test air carriers and airports to determine compliance with current security directives and emergency amendments. Enforcement action has been initiated whenever our testing revealed instances of non-compliance. Actions taken have included maximum civil penalty, public notification when the amount of civil penalty recommended is $50,000 or more, and when appropriate, letters from the Administrator level to airline CEO's.

In addition to our on-going testing to evaluate compliance with security requirements, FAA continues to define and develop testing procedures for all aspects of the aviation security program. As these new procedures are completed, special agents will use them as part of their daily compliance monitoring. Additionally, with these procedures, FAA will conduct nationally directed special emphasis assessments designed to target specific aviation security areas over an established period of time.

IMPLEMENTING DOMESTIC PASSENGER BAG MATCH

Question. The FAA Authorization Bill and the Gore Commission both recommend implementing passenger bag-match on domestic flights to increase security. I also endorsed this program in my aviation security bill. The FAA and the major airlines conducted a study last year which estimated that it would cost $2.5 billion annually to apply bag-match domestically in the first year and $2.25 billion every year thereafter. A system of partial bag match of all passengers would cost $2 billion annually. Now that Phase I of your pilot project is complete, do those cost estimates still hold up?

Answer. The White House Commission recommended implementation of a full passenger-baggage match by December 31, 1997. It entails matching bags to passengers to ensure no unaccompanied bag enters the system, and passengers to bags to ensure that a bag is removed if the passenger does not board. The latter part of the procedure would initially be based upon profiling. FAA, the Air Transport Association, and the Commission staff developed a protocol to ensure that the on-going

bag match pilot test is unbiased and, with the application of existing system models, representative of the effects of systemwide implementation.

As you noted, the pilot test is proceeding in two phases. In the first phase, existing operational models were verified and continue to be refined by an independent third party. The air carriers then collected data for analysis and computer modeling. This collection process was monitored by an FAA observation team. The second phase consists of analyses of historical and other data, and includes live testing on actual flights in May. A report, which will address the cost estimates of bag match in the domestic system, will be finished in August 1997.

Question. Are there ways to further decrease the cost of implementing this critical security measure?

Answer. The White House Commission recommended implementation of a full passenger-baggage match by December 31, 1997. It entails matching bags to passengers to ensure no unaccompanied bag enters the system, and passengers to bags to ensure that a bag is removed if the passenger does not board. The latter part of the procedure would initially be based upon profiling. FAA, the Air Transport Association, and the Commission staff developed a protocol to ensure that the on-going bag match pilot test is unbiased and, with the application of existing system models, representative of the effects of systemwide implementation.

As you noted, the pilot test is proceeding in two phases. In the first phase, existing operational models were verified and continue to be refined by an independent third party. The air carriers then collected data for analysis and computer modeling. This collection process was monitored by an FAA observation team. Phase II, which is underway, consists of analyses of historical and other data, and includes live testing on actual flights. This phase is being monitored by a joint team of FAA and third party observers. Live tests are scheduled for May. The analysis of operational impacts will be available in July, and a refined estimate of the cost will be available in August 1997. Careful analysis of results may suggest ways of reducing costs, but it is still too early to project implementation costs or suggest cost reduction strategies.

Question. Will the Federal Aviation Administration (FAA) and the airlines be able to hold to the December 31, 1997, deadline to implement domestic bag-match nationwide?

Answer. The Commission's recommendation is that bag match, initially based on profiling, should be implemented no later than December 31, 1997. That recommendation remains our goal. The FAA and the airlines are moving forward rapidly in developing an automated profiling system, which is the key to adopting the Commission recommendation. We will not know until the end of July whether or not unforeseen technical difficulties remain for some carriers in implementing automated profiling. Moreover, refinements to the cost estimates, based on live testing, will be available in August 1997.

HAZARDOUS MATERIAL SHIPMENTS

Question. Although not a certainty, it appears that the Valujet crash was caused by the ignition of oxygen generators, a hazardous material, in the cargo bay of the aircraft. While a lot of attention was focused on the airline involved, it would seem that the shipper bears a distinct responsibility to correctly package and label hazardous materials. What has FAA done to address the shipment of hazardous materials upstream from the airline, beyond banning the shipment of these particular canisters?

Answer. The FAA has already taken a number of actions to address shipments of hazardous materials, particularly that carried in company materials (COMAT), before those shipments reach the airport. The FAA has:

—Launched an entirely new Dangerous Goods and Cargo Security Program funded with $13.5 million. The new program will have 118 full-time, highly trained, dedicated dangerous goods/cargo security FAA inspectors in addition to the 14 full-time inspectors it had before the ValuJet accident, along with 12 new attorneys. RSPA is adding 15 new inspectors and 2 new attorneys. Hiring and training are on target, and the first intensive air carrier inspections began on February 1. The inspections will include verification of training procedures.

—Developed a new inspection/incident data base to provide trend analysis information for targeting inspection and outreach efforts upstream to deter and interdict unauthorized shipments of hazardous materials.

—In cooperation with RSPA, distributed to nearly 5,000 aviation repair stations a "Safety Alert" providing explanatory information regarding the shipment of hazardous materials as part of air carrier COMAT and information detailing

the prohibition on the transport of oxygen generators as cargo aboard passenger aircraft

—Announced to the shipper community a policy of publicizing proposed civil penalty cases over $50,000.00 where particularly dangerous hazardous materials are involved. Two such violations have been publicized

—Proposed in the "Hazardous Materials Transportation Safety Reauthorization Act of 1997," a clarification of its authority to open suspect packages when there is a reasonable belief that the package contains a hazardous material.

—In cooperation with RSPA, produced a training video to provide guidance for air carriers and shippers, emphasizing their legal responsibilities for safe preparation and transportation of hazardous materials.

—Together with RSPA, designed and developed a passenger information brochure on restricted hazardous materials entitled "These Fly, These May Not." Over 5 million copies have already been distributed to passengers, travel agencies, shippers, U.S. and foreign air carriers, and multinational chemical and pharmaceutical manufacturers.

—Helped develop, market and present the Air Transportation Association (ATA) HAZMAT/COMAT workshop attended by 200 air carriers, freight forwarders, and shippers.

Question. What specific measures have you taken with shippers and packers to insure proper packaging, labeling and handling of hazardous materials?

Answer. The FAA is taking a number of steps which will extend its enforcement of the hazardous materials regulations to shippers and freight forwarders:

—The FAA has developed new hazardous materials inspection protocols which direct the focus for compliance to parties located "off the airport." Outreach letters will be directed to shippers whose hazardous materials shipments were examined during inspections at air carrier facilities. Follow-up inspections at these shippers premises will verify that only properly trained personnel are engaged in the handling and shipment of all hazardous materials.

—New outreach material is being developed in cooperation with RSPA, for example, a training video to provide guidance for air carriers and shippers, emphasizing their legal responsibilities for safe preparation and transportation of hazardous materials.

—In cooperation with RSPA, distributed to nearly 5,000 aviation repair stations a "Safety Alert" providing explanatory information regarding the shipment of hazardous materials as part of air carrier COMAT and information detailing the prohibition on the transport of oxygen generators as cargo aboard passenger aircraft

—FAA will soon begin inspections of both aviation repair stations and indirect air carriers (freight forwarders) to continue to push its compliance focus off the airport and upstream towards the shippers.

—FAA is developing a new automated inspection database designed to provide trend analysis information for targeting inspection and outreach efforts upstream to deter and interdict unauthorized shipments of hazardous materials. Initial modules of the database are already on-line with full development expected by December 1997.

SUBCOMMITTEE RECESS

Senator SHELBY. This hearing of the Subcommittee on Transportation is now recessed. The next subcommittee hearing will be held on Wednesday, May 7, at 10 a.m. in Dirksen 124. The topic of the hearing will be transportation infrastructure financing, including a discussion of innovative financing methods and the administration proposed transportation user fees.

I thank you.

[Whereupon, at 12:08 p.m., Wednesday, April 16, the subcommittee was recessed, to reconvene at 10:36 a.m., Wednesday, May 7.]

DEPARTMENT OF TRANSPORTATION AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

WEDNESDAY, MAY 7, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:36 a.m., in room SD–124, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senators Shelby, Domenici, Gorton, Faircloth, Lautenberg, and Reid.

PANEL 1

DEPARTMENT OF TRANSPORTATION

STATEMENT OF MORTIMER L. DOWNEY, DEPUTY SECRETARY, INNOVATIVE TRANSPORTATION FINANCING

GENERAL ACCOUNTING OFFICE

STATEMENT OF JOHN H. ANDERSON, JR., DIRECTOR, TRANSPORTATION ISSUES, RESOURCES, COMMUNITY, AND ECONOMIC DEVELOPMENT

OPENING REMARKS

Senator SHELBY. Our first panel is Mr. Mortimer Downey, Deputy Secretary, U.S. Department of Transportation; John Anderson, Director of Resources, Community, and Economic Development Division, General Accounting Office. Welcome to the committee.

This hearing will now come to order. Today the subcommittee will explore several broad issues related to financing Federal transportation programs. The three areas we will discuss are Federal Aviation Administration user fees, innovative financing proposals to leverage Federal investment in infrastructure, and Amtrak's current precarious financial condition.

Except for day-to-day operations, the Federal Aviation Administration derives its funding from the airport and airways trust fund, which is financed by the airline ticket tax. That tax expires at the end of fiscal year 1997 and the administration has proposed replacing the ticket tax with a cost-based user fee structure. This represents a major change in how financing is approached for this agency and many in Congress, myself included, are a little skeptical.

There are many questions that need to be answered before any funding decisions can be based on user fee assumptions. Whatever system of financing, however, that we adopt, it must meet at least three broad objectives: It must not increase the overall tax burden on the American people; it must not place a disproportionate burden on any one group; and it must be easy to administer. I know that the GAO has studied several of these issues and I look forward to hearing from them today.

Another issue of interest to the subcommittee is the administration's innovative financing proposals, which include the State infrastructure banks and the new transportation infrastructure credit enhancement program in the President's 1998 budget request. These programs are intended to support highway, transit, or rail projects that can be financed with loans or credit enhancements and which involve non-Federal investment partnerships.

Currently, only two States have actually begun projects with State Infrastructure Banks [SIB's] financing, and it appears that this approach to leveraged financing simply needs more time before it can be fully evaluated. In addition, the budget request and the NEXTEA reauthorization proposal both incorporate a change in Federal law that will permit States to levy tolls on interstate highways. I do not have to tell you how unpopular tolls are in my part of the country, or any part of the country for that matter.

In general, I hate to mention the terms "innovative financing" and "user fees" in the same breath. There is nothing particularly innovative about charging system users for something they have already paid for. I hope that Deputy Secretary Downey and Mr. Anderson from the General Accounting Office can explain these proposals and that the discussions during this first panel will further illuminate the issues before us.

Perhaps the most politically volatile issue we will discuss today is how and whether the Federal Government should continue to subsidize Amtrak. The administration has proposed spending about $767 million out of the highway trust fund to provide operating and capital assistance to Amtrak in fiscal year 1998. Ms. Jolene Molitoris, the Federal Railroad Administrator, will represent the Department's position on Amtrak funding, since Deputy Secretary Downey will need to leave the hearing. In addition, Amtrak's President, Tom Downs, will present the railroad's position, and Ms. Phyllis Scheinberg of GAO will give us the benefit of her extensive studies of Amtrak and the financial condition of the railroad.

I have several concerns regarding Amtrak. First, Amtrak has now been in existence for 26 years and they have never once during that period generated an annual profit. Moreover, Amtrak, with its huge Federal subsidy, accounts for only three-tenths of 1 percent of all annual intercity passenger trips in the United States, while intercity bus service attracts a ridership four times as great. I am not sure it makes sense to continue to pour millions of taxpayer dollars into a system which is used so little, but costs so much, especially when there are more efficient alternatives available. Finding a new bottomless source of revenue does not address the fundamental problems facing Amtrak.

I understand that Amtrak is operating under outdated labor policies which make the railroad's success very difficult. American

businesses all over the country have had to downsize during the past 10 years or so in order to stay competitive. However, Amtrak faces disincentives to reducing their work force to a size supported by the market because rail labor laws require the corporation to continue to pay a full salary for 6 years to any employee who loses his or her job as a result of service reductions.

I am a firm believer in markets. If there is a demand for passenger rail service, it will survive. In many areas of the country there is no doubt that a private company could operate a profitable rail service. But given Amtrak's poor track record, heavy debt load, massive capital requirements, and continued reliance on Federal operating subsidies, I question the merits of putting more and more of the taxpayers' hard-earned money into this system. I do not know of a single investor who would put his or her own money into an organization in such a bleak financial situation. I am not sure it is right to ask the taxpayers to pay for something with their tax dollars which they are so clearly not willing to pay for with their disposable income.

Amtrak President Tom Downs says in his statement that: "If the decision is simply to end Amtrak, we ought to face it head on and deal with the reality that comes with it." I believe that is certainly one option to explore.

Mr. Downey, your—excuse me, Harry. I did not see you. I apologize to you. Senator Reid.

STATEMENT OF SENATOR REID

Senator REID. Thank you a lot, Mr. Chairman. Because of the vote, I am not going to be able to stay for all the testimony. I appreciate your arranging this hearing in spite of the fact that we have not had our mark for what we are going to do with this subcommittee. This is an important subcommittee. I am very happy that you are getting some of these things looked at prior to our getting our mark.

Mr. Chairman, I would just say this before going to my prepared statement. I think we have to take a close look at Amtrak, I agree with you. But I also think we have to look at what is happening with our other forms of transportation in this country. Our airports are crowded and filled. Our highways are jammed to capacity. And we as a government help the airlines, we help people who drive on highways, in many different ways with Federal moneys.

We have to take a look at rail service. It is a way that we can increase the ability of people to travel. We are now working on rail service between Los Angeles and Las Vegas, to see if we can move more people through that very busy corridor than we have.

I think from distances of 200 to 500 miles we have to look at rail service as an alternative. I think if you look around the world, other countries, they have done a much better job with their rail service than have we. So I would hope that we would recognize that rail service is something that we need to work to try to make it better, and certainly not consider terminating it.

There is little doubt the issues we address in today's hearing are issues of great concern to every Member of both bodies, both the House and the Senate. Transportation represents a national concern. All of us have a stake in ensuring that America's transpor-

tation policies are coherent and they are efficient. More importantly, all have a vested interest in ensuring that the goals of our transportation policies are capable of being achieved.

This session of Congress will include extensive consideration of not only how we finance our national infrastructure, but also what our transportation policies should aim for as we head into the 21st century. Our transportation policies must recognize the importance of providing adequate dollars for improvement and maintenance of our infrastructure. The policy should not favor one region over another. Funding formulas should provide States with sufficient funding to meet the changing infrastructure needs they face.

While some push for devolution, all of us agree that Federal regulations have to recognize the need for greater flexibility at the State level. Because we have a national transportation policy, we must recognize that there are often unique interstate needs that otherwise would not be addressed but for a Federal program. I believe the unique regional perspective all of us bring to this issue will ultimately allow us to forge a coherent national policy.

I represent a State that happens to be the fastest growing State in the country. We have about 7,000 new people moving into the Las Vegas area each month. Because funding formulas are based on old census data, it is nearly impossible for Nevada to receive the proper financing necessary to accommodate this growth.

Nevada is also unique in that 87 percent of the land is owned by the Federal Government. To appreciate how much land this is, consider the fact that in the areas between our interstates—this is not the whole State of Nevada, but just between our two interstates—you can fit the States of New Jersey, Connecticut, Massachusetts, Rhode Island, Vermont, New Hampshire, and Delaware. That is a lot of land.

Because the Federal Government owns these lands, the State of Nevada receives little or no taxes from them, but still must provide the intercontinental activity across these areas. In order for all States to enjoy the benefit of our economy, we must be able to build and maintain these lines of commerce, and Federal lands programs are a source of much of the funding for these areas.

Nevada is also a bridge State. Much of the traffic is interstate. We play an important role in interstate commerce. But the need for improving and maintaining these interstates arises out of the damage caused by non-Nevada traffic, especially the big trucks. And we like to have the traffic coming from outside the State of Nevada, of course. But it is difficult for me to explain to my constituents why we are underfunding basic maintenance projects when we see first hand the infrastructure degradation caused by this out-of-State traffic on our interstates.

Finally, I am concerned that, while we have consistently articulated a coherent national transportation policy, we fail to provide the adequate funding necessary to support these policies. I am troubled by the current budgetary things that are being used with the highway trust fund. The trust fund programs, some of them are penny wise and pound foolish.

I have introduced legislation to take the highway trust fund off budget. I believe this action is necessary if we are to be serious about meeting our infrastructure needs. Our Nation's infrastruc-

ture represents the lifeline that fuels our economy. When we neglect to adequately provide for the health of this lifeline, all of us suffer. Whether it is unsafe and degraded roads or pollution caused from overcongestion, all of us are affected.

The price is not only the inconvenience of traversing a dilapidated infrastructure. Indeed, the real price is the increased cost all of us pay for goods and services because of the burdens placed on the steady flow of this stream of traffic. Similar to cholesterol buildup in arteries, eventually there is a steep price to pay.

I look forward to being a participant in rewriting a bill that will allow us to continue into the next millennium as the world's foremost economic powerhouse. The ranking member of this committee and I serve not only on this Appropriations Committee, but also on the authorizing committee, the Environment and Public Works Committee. By providing coherent, efficient, and flexible transportation policies, we will surely rise to the challenges of the 21st century. We have a big burden to bear. Thank you, Mr. Chairman.

Senator SHELBY. Senator Faircloth.

STATEMENT OF SENATOR FAIRCLOTH

Senator FAIRCLOTH. Thank you, Senator Shelby, and thank you for calling this hearing.

I have been concerned about the trend and talk by the Federal Government toward user fees. And I have even heard it referred to as "innovative financing." I do not know if there is anything innovative about adding a toll to a road. We have been doing that for 2,000 years. But it is nothing but a tax increase with a different name.

The political climate right now is not friendly to new taxes, certainly if we call them outright taxes. The Federal Government is already overtaxing the American people. But in this climate we wind up with a euphemism for a tax increase and we call it a user fee.

If we are going to put user fees on every service the Federal Government provides, which is the direction we are headed, then what are we going to use the regular income tax and the other sources of general revenue for? The White House has even proposed $300 million in user fees for the Federal Aviation Administration. And yet this same FAA cannot tell me, has not told me, and literally refuses to tell me or explain how $1 billion was squandered by IBM on the Advanced Automation Systems computers in the eighties and early nineties. A billion dollars was absolutely wasted, no recoverable value, and they simply refuse to talk about it. Yet they need $300 million in user fees.

The administration's proposal for surface transportation reauthorization includes a plan to let States impose tolls on interstates. This is simply another tax, on roads that have long since been paid for by the traveling public.

There are a lot of new user fees and new ways—and user fees are simply a new way to take money from the American public. Now, if you want to cut the cost of highways, of highway construction, I have a suggestion. I ran for 8 years the largest highway system in the Nation under one head. That is the North Carolina Highway Department, as all roads in that State are under one au-

thority—counties, city streets, all 78,000 miles under one system. So I have watched what runs up the cost of roads, and the Davis-Bacon requirements are one of the principal sources of cost escalation. They probably add 20 percent to the cost of construction.

It is a needless surcharge on construction projects. If we want to do something to expedite the building of highways, to improve the system, and to get more road for our money and better road, the first thing we could do is to eliminate the requirements of the Davis-Bacon Act.

Mr. Chairman, just one brief statement. I, as I said, have spent a lot of time watching highway construction, doing some, and running a highway department, and I have long been a strong advocate of highways. But I think the time has come and the time has clearly reached us that we are going to have to look at light rail transportation in different forms. And it is not as complex a problem as we might think it would be.

Most of the railroads were acquiring right-of-way in the 19th century. They acquired rights-of-way of 100 to 200 feet in many cases, when it requires 14 feet for a track. So much of the rail rights-of-way in this country could accommodate additional track, and certainly a lot of them have been abandoned. Double tracks were at one time necessary. Now only singles are used.

So this is the way we are going to have to begin to go in this country. We cannot simply keep adding lanes to interstates.

We are running out of right-of-way there.

So I strongly support a move to look at rail transportation.

Senator SHELBY. Senator Lautenberg.

STATEMENT OF SENATOR LAUTENBERG

Senator LAUTENBERG. Thank you, Mr. Chairman.

First, my apologies for my late arrival. As you know, Mr. Chairman, since we serve on a couple committees together, it is just that we have been trying to disprove the process—it is just impossible to put ourselves in the same place two or three times at the same moment. We are still trying to prove that the standard rules of physics do not apply.

Senator SHELBY. Senator, before you arrived, Senator Reid suggested you move New Jersey to Nevada.

Senator LAUTENBERG. Well, I think we are doing it one drop at a time and that is enough.

Thanks, Mr. Chairman. I was delighted to hear our colleague from North Carolina, if I heard correctly, speak on behalf of investments in rail. We need to consider that.

I appreciate your holding this hearing on Amtrak. The service is critical to the country at large, the Northeast corridor, my State of New Jersey.

This morning GAO has very sobering testimony regarding Amtrak's financial condition. They say in short, without a prompt and bold response, Amtrak could be bankrupt and shut down by summer 1998. That, frankly, is not an acceptable option. It is imperative that the subcommittee and the Senate arrive at a consensus about how to restructure Amtrak's financing to get the railroad on a sounder footing.

Amtrak's annual operating deficit is rising again, despite an aggressive cost-cutting program and its willingness to absorb a certain amount of cuts in its subsidy. Amtrak's revenues have suffered as a result of deeply discounted selective air route fares. Moreover, this committee has over the last 2 years cut the railroad's operating subsidy far below the levels identified by Amtrak as acceptable.

To its credit, Amtrak has attempted to address this shortfall by eliminating routes that lose the most money. However, this predictable and reasonable response by Amtrak, which any business would have undertaken, has often been challenged by Members of Congress and their constituents, who want their services to continue. And we understand that, but somebody has got to pay the freight, as they say.

That, Mr. Chairman, is the dilemma we face. I believe that Congress must make a decision this year whether we want to continue a national passenger rail system or end it. If we want to continue intercity rail service, we need to ask if we want a national system and, if so, how much we are willing to subsidize it and how much are we willing to invest to make it successful and stabilize its finances?

I would like to see a stable funding stream provided for Amtrak and have endorsed, along with Senator Roth, chairman of the Finance Committee, and others, earmarking one-half cent of the gas tax to do just that. Amtrak's Northeast corridor service is essential to the Northeast corridor and that entire region, and these routes are profitable in the short run. In fact, short-term profits from the corridor subsidize all of the unprofitable routes elsewhere in the country and make a national rail passenger system possible. All of the increased revenue to sustain national Amtrak service is expected to be generated by new high-speed rail service in the Northeast corridor.

As we contemplate the future of Amtrak, I would like to emphasize three points: No national intercity railroad operates without a subsidy, no place. Amtrak covers a larger portion of its operating costs than any other system in the world. These systems are subsidized because they are in the national public interest. In fact, every other mode of transportation in this Nation enjoys heavy subsidies, although some are more hidden or more indirect, and we ought to be honest about that.

If Amtrak fails, the Federal Government will be exposed to sizable shutdown costs and other liabilities that will exceed even the funding levels called for under the half-cent proposal. At least in the Northeast corridor, if Amtrak fails this subcommittee will have to make enormous new investments in highways and aviation facilities to provide an alternative to rail service. Without Amtrak service, we would have to add 7,500 fully booked 757's, or 10,000 fully booked DC–9's, for the year to the already congested airspace in our region.

Amtrak currently carries one-half of the combined air-rail market between New York and Washington. If we move those travelers off the rails, we are talking about multiple new lanes on I–95, more terminal space at area airports, perhaps even a new airport in Boston.

In closing, Mr. Chairman, these are the realities we should keep in mind when considering the substantial capital investment needed by Amtrak. Clearly, I believe it is an investment worth making and one which is critical to the functioning of one of the most densely populated regions of our country and one that deals with our national economic well-being as well.

Thanks very much, Mr. Chairman.

Senator SHELBY. Senator Gorton.

STATEMENT OF SENATOR GORTON

Senator GORTON. Mr. Chairman, it has got to be extremely frustrating to sit on the other side of the bench, not just in this hearing but in every hearing, for witnesses, and much more so for second panels, because by the time the second panel gets here there will probably be one Senator left, maybe if they are lucky two, simply because of the nature of our work here. I strongly suspect that I am going to add to that frustration and end up apologizing for it.

But I do want in my opening comments to ask for the comments, which I will read and see, of these witnesses and of the next witnesses on some of the questions which I think are fundamental to the talk about rail transportation that Senator Faircloth engaged in and the eloquent defense of Amtrak in which Senator Lautenberg engaged, because for the life of me I do not see the rationale of the way in which we treat various forms of transportation in the country and the kind of investments that we make in it.

So I would like you to tell me, Mr. Secretary, for example, how many passengers Amtrak carries during the course of a year, and maybe the passenger-miles that they are carried. My note here from my staff says it is about 55 million passengers. You can correct that. It does not have passenger-miles.

And you want between three-quarters of a billion dollars and $1 billion to subsidize that form of transportation, one that is not carried on very efficiently or very effectively. And that money you want out of the pockets of general taxpayers, those who use the system and those who do not.

I also want you to tell me how many passengers our privately owned commercial airlines carry in the course of the year and the number of passenger-miles involved. Again, my notes say 550 million passengers, that is to say 10 times the number of passengers on Amtrak and obviously far more miles on average. And yet you only want to give to the physical facilities of the airlines $1 billion.

[The information follows:]

In 1996, Amtrak carried about 20 million passengers resulting in about 5 billion passenger-miles. U.S. commercial airlines carried about 558 million domestic passengers in 1996 resulting in about 434 billion domestic passenger-miles.

Senator GORTON. But that money does not come from the general taxpayer. That comes from people who ride on the airlines and pay a ticket tax for it.

Now, what is the rationale of that ratio? I must say emotionally, with respect to Amtrak, that I agree with Senator Lautenberg. I think the idea of passenger rail service, a balanced system, is one I think I favor, and I am going to have to make an admission against interest now. Last year about this time of year, I flew to

Chicago one Friday and took the Empire Builder to Seattle, just to see what kind of service was being provided for me.

I must tell you very bluntly, it was a lousy experience. The service was not as good as the service is on United or one of the other airlines. No one ever told us why we were late when we were late or how long we were going to stop in any given place. But my feeling more than that was there was no way that that long-distance service could compete with air service on the cost per mile that it would operate. The crew was at least as large or larger per passenger than I would have found on United Airlines. The fare was higher, but not sufficiently higher by any means to make the difference between 4 hours and 48 hours, which was the length of the trip.

I just did not see, with all respect to Senator Lautenberg, how anyone, however efficiently they operated, could ever compete for passengers on long distances like that, unlike the situation between here and New York and perhaps Boston when there are new tracks.

But why is it that we will spend as much money in a direct subsidy to one-tenth of the passengers on Amtrak as we spend out of a trust fund on the facilities for airports? Why is it that the airport trust fund spending for facilities has dropped in half, according to this administration's requests, at a time at which the passenger use of the airlines has gone up by almost double? And why is it—and this second, I am not asking rhetorical questions; I am asking a very, very specific question. You tell us in your statement that user fees are the best way to promote efficiency in both the provision and consumption of FAA services. What is broken that we have to fix?

We have a present system that is a fuel tax and a ticket tax, that have at the very least the ability of great efficiency. It costs us almost nothing to collect them. The number of FTE's that are involved is extremely small. Obviously the cost of collecting user fees is going to be far higher. And are we not going to run into exactly the situation that some other countries that use user fees do, that pilots, particularly private pilots, are going to attempt to avoid the user fees by not using the services when in fact they really ought to use those services, and a distinct decline in safety in and among our aircraft?

Do we have a situation that is broken or are we trying to fix something that is not broken at all?

I put these questions to you. Whether I can stay and get all the answers, I think it is very important that we have the answers to each one of those.

Finally, going back to Amtrak again, at my behest and with the agreement of the former chairman, Senator Lautenberg, we asked you all for a study of the privatization of Amtrak last year in our committee report. We understand that that request does not meet with much enthusiasm and that we are probably going to just get regurgitated insider information that we had previously. But it does seem to me that for those who wish for the survival of passenger service in the United States that a very serious and thoughtful examination of whether or not the system can efficiently and effectively be privatized is in order, and that it is very much

in the interest of the administration to come up with some answers to those questions. And Lord knows we do not know the answers yet.

Senator SHELBY. Senator Domenici, happy birthday.

Senator DOMENICI. Thank you very much.

Senator SHELBY. 39 years old today.

Senator GORTON. He just told me he is ready to retire.

Senator SHELBY. No, no; he is just getting warmed up.

STATEMENT OF SENATOR DOMENICI

Senator DOMENICI. Frankly, Senator Lautenberg, Senator Graham met me on the floor and somebody said I was 65. He said: Oh, that is why you were so interested in putting in all those good things for the old folks in your budget. I told him it was both you and me, not just me, right.

Senator LAUTENBERG. I do not deny it.

Senator DOMENICI. Well, listen. If you all could answer the questions that Senator Gorton asked, I would leave the scene and just wait around and read the answers with great enthusiasm. I would add just one more question, however.

Ever since I have been serving on the Appropriations Committee and slightly before that, when we used to take a little more serious look at Amtrak in the budget process, it was a mystery to me as to why we could not change the system of compensating working men and women who are injured on the job from an ancient system Amtrak follows to the modern system that everybody else follows, to wit workman's compensation.

Now, I understand, if there are any labor union people in the audience, I have just been put on their whatever they call it list. But the truth of the matter is, in my opinion, there is no excuse to have one system of compensation which costs, according to what I know, so much more than workman's compensation, which is covering workers in all the other systems. I think that there ought to be some reforms that are serious forthcoming if there is an expectation that we are going to continue to subsidize this program.

Mr. Chairman, I would like to report to you, while the budget is not out yet, we heard your request loud and clear.

Senator SHELBY. Plea.

Senator DOMENICI. Your plea, yours at some times almost begging.

Senator SHELBY. Right.

Senator DOMENICI. It was very nice.

Senator SHELBY. Especially to the Budget Committee.

Senator DOMENICI. It is very nice to have that happen every now and then, when somebody does that to me.

Senator SHELBY. Well, were our prayers answered?

Senator DOMENICI. Yes.

Senator SHELBY. OK.

Senator DOMENICI. The bipartisan balanced budget agreement will accommodate a rather substantial increase. I cannot give you the number, but surely it is $8 to $10 billion over the President's numbers, which were way too low, and I think they knew that, so they are not objecting to this increase. In fact, as in some items, the Republicans will claim victory for things the administration

wanted and the administration will claim victory for the transportation funding, I assume.

Senator SHELBY. Nothing has changed, has it?

Senator DOMENICI. It seems like it is going to turn out all right.

I will not be here for the entire morning, but I commend you for the hearings and for the great work you are doing as the new chairman of the subcommittee.

Senator SHELBY. Secretary Downey.

STATEMENT OF MORTIMER L. DOWNEY

Mr. DOWNEY. Thank you, Mr. Chairman, and thank you for the opportunity to testify on the President's proposal.

Senator SHELBY. Let me mention this. Your entire written statement will be made part of the record, and if you will briefly summarize.

Mr. DOWNEY. Yes; I will do that. And before I begin my testimony, let me thank the subcommittee and the full committee for your prompt action on the emergency supplemental. The efforts that we have made together on this and in other disasters have made a real difference for hundreds of thousands of Americans. But disasters like those floods really make it clear how much we do depend on our transportation system. That is why we have worked with the Congress to increase Federal investment to record levels in infrastructure even as we are moving toward a balanced budget.

We recognize that Federal funding alone cannot meet all of our needs, and that is the reason for conceiving a set of strategies to make the most of Federal resources by cutting redtape and leveraging greater non-Federal investment. The first step we took in that was what we called the Partnership for Transportation Investment to attract new sources of funding and speed up project construction.

The National Highway System Act 2 years ago made a reality of our proposals for State Infrastructure Banks, which will use Federal seed money to provide loans and credit enhancements to highway and transit infrastructure projects. As these loans are repaid or as the financial exposure implied by credit enhancements expires, the funds will be available for additional cycles of projects. Banks in the 10 pilot States, as the chairman pointed out, are only now beginning operation, so there is limited experience with them. But we believe that they can leverage non-Federal funds at rates up to 4 to 1. We are now considering applications from 29 additional States for their State Infrastructure Banks. We expect to make decisions on them shortly.

The President's proposed 1998 budget and the reauthorization bill would carry us to the next generation of innovative finance. They would continue supporting State Infrastructure Banks by providing $150 million annually in seed money and $100 million annually for a new national transportation infrastructure credit enhancement program.

Finally, NEXTEA, our reauthorization bill, would provide for the first time a stable source of funding for Amtrak as it moves toward operating self-sufficiency. We want to provide direct funding for Amtrak from the highway trust fund and we wish to give States

the flexibility to use part of their Federal funding apportionments for Amtrak infrastructure.

We are also committed to adequately financing our aviation system needs. We want to work with the Congress and with the new National Civil Aviation Review Commission, which was recently appointed, to establish reliable long-term funding for the FAA so it can continue to provide the services the aviation system needs. In the meantime, Congress has authorized us to charge for air traffic services provided to those flying through our airspace but not using a U.S. airport, and these fees would become effective on May 19.

I recognize that this committee has added language in the emergency supplemental that would limit our authority to impose these fees, but we look forward to working with the Congress on this issue.

We also propose to collect an additional $300 million in new fees next year under the President's 1998 budget as a means to providing the necessary funding for a growing demand for air traffic services.

We are also exploring new ways to fund airport infrastructure. Last year Congress authorized airport development projects using new financial techniques, much in the way the Partnership for Transportation Investment set the stage for innovative finance in the surface modes. We will soon select five innovative financing projects from around the country for formal applications under the airports improvement program. These proposed projects include the construction of a safety-related building, new runways to provide additional capacity, and mitigation of airport noise. And each of the three innovative financing mechanisms the Congress authorized—payment of interest, credit enhancement, and a flexible non-Federal share—would be tested by at least one of the proposals.

Let me conclude my statement by reiterating our belief that these initiatives for surface transportation and for aviation will help give us the infrastructure and the equitable and efficient funding of services we need for a world-class transportation system. The partnership that we have forged with the Congress to make possible these innovations has been a successful one and we look forward to continuing to work with you in the coming months to build on this progress.

Thank you.

PREPARED STATEMENT

Senator SHELBY. Thank you, Mr. Downey. We have your complete statement and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF MORTIMER L. DOWNEY

Mr. Chairman, Members of the Subcommittee. Thank you for the opportunity to testify on the Department of Transportation's accomplishments and proposals with respect to innovative financing of transportation infrastructure.

OVERVIEW

President Clinton came to office dedicated to improving the Nation's transportation infrastructure because of its contribution to economic prosperity. He had declared during the 1992 campaign: "The 1980's saw the concrete foundations of the

United States crumble as the investment gap widened between America and our global competitors."

In the 21st century, Americans will compete in a truly global marketplace. This marketplace will be fiercely competitive, and our success as a Nation will be determined on how safely, reliably and cost-effectively we can move people, goods and information. Transportation accounts for about 11 percent of the United States gross domestic product—roughly comparable to health (14 percent) and food (12 percent)—and will affect our country's global competitiveness in the future.

Working with Congress, we have increased Federal transportation infrastructure investment to record levels. These investments have paid off in substantial improvements to the condition and performance of our highways and mass transit systems. But the Federal government alone can not close the investment gap, and President Clinton early on recognized that "the only way to lay the foundation for renewed American prosperity is to spur both public and private investment." His 1994 Executive Order setting out "Principles for Federal Infrastructure Investments," provides that:

> Agencies shall seek private sector participation in infrastructure investment and management. Innovative public-private initiatives can bring about greater private sector participation in the ownership, financing, construction, and operation of . . . infrastructure programs. . . . Consistent with the public interest, agencies should work with State and local entities to minimize legal and regulatory barriers to private sector participation in the provision of infrastructure facilities and services.

In response to the President's direction, the Department initiated the Partnership for Transportation Investment. Through that Partnership, we have supplemented our traditional surface transportation grant programs with innovative financing, stretching our transportation investments further. Our efforts, which have focused on public-private partnerships, have accelerated more than 74 projects with a total value exceeding $4.5 billion.

State Infrastructure Banks, proposed by the Administration and approved by Congress in the National Highway System Designation Act of 1995 (NHS Act), are now being established in 10 pilot states. The banks are beginning to offer new financing tools for a variety of transportation improvements—such as toll roads and intermodal terminals. As you well know, the fiscal year 1997 Transportation Appropriations Act gave us authority to select additional states to participate in the SIB's. We have received 26 applications from 29 states, including two multi-state applications, for additional SIB's and expect to make announcements on those applications shortly. While projects are just being initiated under the new SIB's so experience is limited, some have suggested a potential for as much as a 4-to-1 leveraging factor from funds deposited in SIB's.

With respect to other modes, financing all of our aviation system's needs—airports, airway facilities, security, and FAA operations—is a critical priority for us. With authority Congress provided in the Federal Aviation Reauthorization Act of 1996, we are soliciting and reviewing innovative financing proposals for airport development. We want to work with Congress to establish a reliable, long-term funding base so that the FAA can continue to provide the services our aviation system needs. As an interim measure until comprehensive financial reform is achieved, we are proposing $300 million in new user fees. Members have been appointed to the new National Civil Aviation Review Commission, and they are beginning their work to analyze aviation budget requirements and ways to fund them and to help us to reach a consensus on what course to take.

And we have proposed changes in the financing for Amtrak—to provide more stability in its direct funding by requesting contract authority (beginning in fiscal year 1999) from the Highway Trust Fund and to permit states to help meet Amtrak's financial needs from state apportionments of National Highway System and Surface Transportation Program funds where state officials see Amtrak as a key part of their transportation systems.

FEDERAL INVESTMENT

As Secretary Rodney Slater discussed with you, working with this Subcommittee and the entire Congress, over the past four years (fiscal years 1994–97) we have increased Federal investment in highways, transit systems, and other infrastructure to an average of $25.5 billion, more than 20 percent higher than the average during the previous four years. The Department is committed to a long-term infrastructure investment program and seeks the highest levels of investment within the context

of a balanced budget and the President's priorities. But we recognize that Federal investment alone can never close the investment gap.

As part of Secretary Slater's commitment to bring common sense government to the Department of Transportation in order to provide the people we serve with a Department that works better and costs less, we will continue to encourage more flexible, innovative funding to leverage Federal dollars for infrastructure investment—one subject of your hearing today.

INNOVATIVE FINANCING

Innovative financing is one of the Department's most significant success stories over the last four years. The Department initiated the Partnership for Transportation Investment in 1994. Under that initiative, we have supplemented our traditional grant programs with innovative financing. Our efforts have resulted in more than $1.2 billion in non-Federal investment in transportation infrastructure that would not have occurred without the financing concepts included under the Partnership.

As a result, projects like State Highway 190 in Texas cost less and will bring benefits to the economy sooner. In that case, the Texas DOT loaned $135 million in Federal-aid funds to the Texas Turnpike Authority, which was combined with almost $500 million in bond proceeds from the private sector. Construction on this project will be initiated over a decade earlier than originally planned and is expected to relieve existing congestion on other highways in the north Dallas area.

Also, the Massachusetts Bay Transportation Authority was granted advance construction authority to issue bonds to rebuild its heavy rail maintenance facility. This $236 million project was undertaken 30 months earlier as a result, with immediate construction savings of over $50 million. Each repair and overhaul from 1997 onward will take up to one-third less time to complete.

The Partnership initiative was based on the use of innovation within existing authority by the Federal Transit Administration and on the use of test and evaluation authority provided to the Federal Highway Administration under Section 307(a) of Title 23 of the United States Code. That section permits FHWA to engage in a wide range of research projects, including those related to infrastructure finance. As part of this research effort, FHWA provided states with flexibility on certain policies and procedures so that specific transportation projects could be advanced through the use of non-traditional financing concepts. The Partnership was designed and operated to give states the opportunity to propose and test those concepts that best met their needs. Projects that were advanced were those that were identified by state-level decision makers facing real world barriers to financing needed transportation improvements. No new Federal funds were made available; the focus of the Partnership has been to foster the identification and implementation of new, flexible strategies to overcome fiscal, institutional, and administrative obstacles faced in funding transportation projects.

The 74 projects have been both highway and intermodal projects. Because ISTEA broadened the availability of Federal-aid highway funds for non-highway projects, many of the projects that have been advanced have also involved other modes. For example, they have included installation of Intelligent Transportation System technologies, ferry purchases, intermodal facilities for truck-to-rail transfers, construction of a commuter rail station, and bike/pedestrian projects.

There have been eight major financing tools tested under the Partnership for Transportation Investment; those tools can be generally characterized as investment tools and cash flow tools. Investment tools are those that draw new sources of funds to transportation investment; cash flow tools aim to accelerate construction and completion of projects.

The most popular tools have been flexible match and advance construction, both of which were made a basic part of the Federal-aid highway program by the NHS Act. Prior to that, private contributions toward a project were deducted from the total project cost, and states had to provide the matching share of the remaining cost. Under the Partnership initiative, we permitted such contributions to be counted toward the state matching share. This innovation encouraged states to seek private partners since the states got the total benefit of the contributions. We also allowed some states to use tapered match where the Federal share is allowed to vary during the life of the project.

Under advance construction, states use state and local funds to construct projects while preserving those projects' eligibility for future Federal-aid reimbursement. However, conversion of such projects was to be made by the end of the ISTEA authorization period—that is, by the end of this fiscal year—and, when the project is converted, obligation of the full amount of Federal funds to be committed to the

project was required. The requirement to convert by the end of this year made advance construction less and less available as a tool as we got closer to the end of the ISTEA period. The requirement to obligate the full amount of Federal funds at the time of conversion limited the states' flexibility in using this tool. We allowed (and the NHS Act made the authority permanent) states to rely, within certain limits, on likely future-year apportionments beyond the current authorization period and to make partial conversions of such projects.

Tax advantaged leasing is another finance tool that has provided significant additional revenues to transit systems in several States. Since 1994, over $2.2 billion in equipment and facilities leasehold transactions (cross-border leases, domestic leases, and lease/leaseback) have provided over $143 million in cash benefits for the transit systems involved. This non-Federal cash has been used for these transit providers' long term capital investment programs.

A few states used other innovative financing tools such as lending some of their regularly apportioned Federal funds to revenue producing projects or using those funds to reimburse the cost of retiring bonds. Although these tools leveraged the greatest amount of non-Federal funds, they have been utilized less frequently because in many cases legal and institutional impediments must be overcome and because states chose not to divert grant funds previously programmed for other uses.

In addition to leveraging more non-Federal investment, the Partnership initiative has accelerated construction of these projects—by an average of 2.2 years. That means the benefits of these projects—typically, travel time savings, safety improvements, reduced vehicle operating costs for transportation users, and environmental and other social benefits for communities—are realized sooner.

The Partnership for Transportation Investment provided clear evidence of the potential for innovative financing tools to generate more total investment and accelerate construction of transportation projects that deliver benefits to transportation users and communities in general. It also demonstrated that there is strong interest at the state and local level in using these tools. That evidence contributed to inclusion of a number of new authorities to use innovative financing tools and of a State Infrastructure Bank pilot program in the NHS Act—an important step in making these tools broadly available to better meet the Nation's transportation needs.

STATE INFRASTRUCTURE BANKS

A SIB is a state or multi-state fund that can offer loans and credit enhancements to a wide variety of project sponsors. They are intended to support certain highway, transit, or rail projects that can be financed—in whole or in part—with loans or that can benefit from the provision of credit enhancement. As loans are repaid or the financial exposure implied by a credit enhancement expires, a SIB's initial capital is replenished, and it can support a new cycle of projects.

With the authority provided in the NHS Act, DOT selected ten states from among 15 applicants. We have established cooperative agreements with nine of those states: Arizona, Florida, Missouri, Ohio, Oklahoma, Oregon, South Carolina, Texas, and Virginia. California is still considering the best structure for its SIB.

With just five months having passed since most states signed cooperative agreements with us for chartering their SIB's, financial activity within the SIB's has gotten underway. Federal outlays to the SIB pilots (from regularly apportioned Federal-aid highway funds) totaled $65 million as of the end of February. Three loans have been made—two by Ohio totaling $20 million and one by Missouri for $1.2 million. Three other states—Florida, Oklahoma, and Oregon—intend to make project loans this fiscal year. Texas and Virginia may be able to offer loans this year, too.

This is a new way of advancing infrastructure improvements—for us and for the states, and, as we move forward, we are finding impediments as we thought we would and we are solving them. Arizona, Oklahoma, and Texas have found limitations in their enabling legislation for SIB's and are actively seeking remedies. South Carolina and Virginia are developing procedures for SIB operations and project selection and do not expect to request Federal capitalization funds until late in fiscal year 1997 or fiscal year 1998. California is exploring structural options for its SIB, including the possibility of solely providing third-party credit enhancements. This strategy would require California to obtain an investment grade rating for its SIB. The process to do so is underway but not yet completed.

While we are still in the start-up phase, our expectations are for a healthy level of SIB activity within the first ten pilots. Based on the states' plans, we expect to see $260 million in SIB assistance offered this fiscal year to support $940 million worth of projects. By the end of fiscal year 1998, we expect $324 million in assistance to be committed in support of $1.6 billion worth of projects. If those expecta-

tions hold true, by the end of fiscal year 1998, each SIB dollar would be supporting nearly $4 of non-Federal infrastructure investment.

As with the Partnership initiative, highway projects will likely form the bulk of SIB-assisted projects—about 75 percent of them based on current plans. But SIB's will also assist in construction of other projects such as intermodal facilities and improvement of rail transit infrastructure. For example, Missouri's SIB will use a Missouri DOT grant to capitalize its SIB transit account. The initial capitalization will support a loan for the Kiehl Center, a multi-modal terminal serving St. Louis, Missouri's transit system, the Bi-State Development Agency. The loan will be followed by a debt service line of credit, which will reduce the project's borrowing costs by over 200 basis points. This will be the first SIB transit account to be capitalized.

We expect that SIB's will be an important contributor to meeting the Nation's transportation needs. They can support locally and regionally significant projects that have access to a dedicated revenue stream but need flexible financial assistance to clear hurdles that would otherwise obstruct or delay their implementation. SIB's can do this by offering: lower cost financing than might otherwise be available, flexible repayment terms that can be tailored to a project's revenue stream, or credit enhancements that improve access to, or lower the cost of, debt financing. And the fact that SIB resources are recycled means that the benefits of SIB assistance—leveraging of other investment, lower project costs, and accelerated construction—can be realized repeatedly.

The fiscal year 1997 Transportation Appropriations Act authorized us to permit more States to establish SIB's and provided $150 million in seed money. Twenty-nine States have applied to establish additional SIB's. We expect to be announcing our decisions on those applications very shortly. At the same time, we will be announcing how the $150 million will be distributed among the first 10 pilot states and the new SIB states we are selecting with the authority in the Appropriations Act.

PROPOSALS FOR FISCAL YEAR 1998 AND BEYOND

The President's fiscal year 1998 budget and our proposal for ISTEA reauthorization—the National Economics Crossroads Transportation Efficiency Act of 1997, or NEXTEA—expand the innovative financing opportunities available to state and local governments by authorizing all states to establish SIB's, by providing $150 million in seed money for SIB's per year, and by creating a new Transportation Infrastructure Credit Enhancement Program funded at $100 million per year. This program is intended to assist in the funding of nationally significant transportation projects that otherwise might be delayed or not constructed at all because of their size or uncertainty over timing of revenues.

The proposed new Credit Enhancement Program would provide grants (limited to 20 percent of project costs), which could be supplemented by contributions from states or other entities, to establish a Revenue Stabilization Fund for each project selected. That Fund would be used to secure external debt financing or would be drawn upon if needed to pay debt service costs in the event project revenues are insufficient. These debts will not be considered "federally guaranteed" under the Internal Revenue Code, thus allowing the Program to be used in connection with either taxable or tax-exempt bond issues. Our vision is that the Credit Enhancement Program will complement the SIB's by encouraging the development of large, capital-intensive infrastructure facilities through public-private partnerships consisting of a state or local government and one or more private sector firms involved in the design, construction, or operation of the facility. Candidate projects that meet threshold eligibility criteria—relating to project size, access to user charges or other dedicated revenue streams, inclusion in a State's Transportation Improvement Program, ability to provide benefits of national significance, and demonstrated need that it cannot otherwise obtain financing on reasonable terms—would then be evaluated and selected based on the extent to which they would leverage private capital, their overall credit worthiness, and other program goals.

OTHER MODES

I have focused my remarks on surface transportation infrastructure, but I want to tell you briefly how we are applying innovative concepts for financing of our aviation programs and Amtrak.

Based on the success of the Partnership initiative in surface transportation, we asked Congress for authority similar to FHWA's test and evaluation authority to test innovative financing techniques for airport development. The Federal Aviation Reauthorization Act of 1996 permitted us to select ten airport development projects to demonstrate innovative financing techniques that were not otherwise permitted

by statute. Although FAA's innovative financing options available in this demonstration program are more limited than FHWA's have been under its test and evaluation authority, we are optimistic that the results will be positive.

In response to its invitation, FAA has received 12 written expressions of interest that contained sufficient detail on which to base a preliminary concept decision. A panel with expertise in airport financing has reviewed the proposals and recommended that five be advanced to the next step. I am pleased to announce today that these five applicants will be invited to provide additional detail to support formal applications for Airport Improvement Program funds.

The proposed projects include construction of a safety-related building, new runways to provide additional airport capacity, and mitigation of airport noise impacts. In addition, each of the three innovative financing mechanisms authorized under the 1996 Act—payment of interest, credit enhancement, and flexible non-Federal share—would be tested by at least one of the proposals.

We anticipate finding that these financing innovations will lead to greater leveraging power for limited Federal funds, acceleration of needed capital improvements, and overall cost savings in developing airport infrastructure. We look forward to sharing preliminary data on innovative financing benefits with the National Civil Aviation Review Commission later this summer.

As you know, we have been proposing for some time to change the financing structure for FAA from aviation excise taxes to cost-based user fees. In the long run, we believe that is the best way to promote efficiency in both the provision and consumption of FAA services and ensure that FAA will receive the resources it needs to be able to continue to provide the services that aviation users demand. FAA is critical to the operation of the civil aviation system in this country and for much of the airspace beyond our borders. Our economy, in turn, is dependent on the efficient and unconstrained use of that airspace. Congress has given us the authority to charge for the air traffic services provided to those flying through our airspace but not taking off or leaving from a U.S. airport. We have issued an interim final rule to collect those fees, and the fees will be effective May 19, 1997. In the President's fiscal year 1998 Budget, we propose to collect an additional $300 million in new fees next year. This proposal is an interim measure to provide the FAA with needed resources until comprehensive financial reforms can be implemented based on the work of the National Civil Aviation Review Commission. The FAA provides a variety of services the costs of which are not fully recovered under the current system of excise taxes (e.g., security, inspections, and air traffic services provided to general aviation jet aircraft and international air cargo carriers). These represent possible fees that could be authorized for fiscal year 1998.

We look forward to the recommendations of the National Civil Aviation Review Commission regarding the long-term financing of the FAA and to working with Congress on FAA financing.

We believe Amtrak is a key part of the Nation's intercity transportation system and that a combination of cost savings, revenue generation, and capital support is essential if Amtrak is to achieve eventual operating self-sufficiency. Our NEXTEA proposal requests contract authority (beginning in fiscal year 1999) for Amtrak from the Highway Trust Fund. The total level of capital support is directly tied to Amtrak's ability to reduce spending and increase revenues so as to reduce its reliance on Federal operating grants. The intent of this arrangement is to encourage Amtrak to operate in the most efficient and effective manner. Our NEXTEA proposal would also let states, for the first time, use their National Highway System and Surface Transportation Program funds for Amtrak infrastructure. We believe that is the right kind of expansion of the flexibility ISTEA provided six years ago. More and more, state officials see the individual transportation modes as part of a network to meet transportation needs, and permitting them to use Federal funds in the most effective way to meet those needs is the best use we can make of the funds.

CONCLUSION

As the President has said, when times change, so government must change. We recognize that there must be more investment in transportation infrastructure and the Federal government can and must find new ways to promote that investment. The success of the Partnership for Transportation Investment encouraged us to change our grant programs so that innovative financing tools are available to encourage more non-Federal investment. We appreciate Congress' support in helping make those tools available. They are the right way to ensure the Nation's transportation system is ready to meet the demands of the 21st Century.

AVIATION USER FEES

Senator GORTON. Mr. Downey, there has been a lot of discussion and criticism of the way in which the Federal Aviation Administration is currently financed. We have already been talking about it some. Basically, the ticket tax and general revenues. I expect this controversy will not subside as we move through the appropriation process. Last year Congress established the National Civil Aviation Commission to review this issue and to make recommendations to the Secretary of Transportation by August 1997.

Sir, what criteria will the Department use as it considers various user fees that are recommended by the National Civil Aviation Commission?

Mr. DOWNEY. We will be working with the Commission, and I am not sure what their recommendations will be. They are really beginning with a clean slate, looking at the needs of the system, looking at various means of financing it. I think the key issues will be ability to provide the funding necessary for FAA to meet a growing demand; second, equity among the classes of users; and third, efficiency in terms of the way the FAA does its business. As Senator Gorton raised the point of safety, we do not want a system of financing that would in any way detract from the safety of the system.

So we need to look at all of those. The Civil Aviation Commission has been appointed. They began their work about 2 weeks ago and we expect them to be able to meet their schedule.

Senator SHELBY. Mr. Anderson, do you have some comments?

STATEMENT OF JOHN H. ANDERSON, JR.

Mr. ANDERSON. Yes; I do. I will summarize my statement as well.

Senator SHELBY. Go ahead. It will be made part of the record.

Mr. ANDERSON. All right, thank you.

I appreciate the opportunity to testify today on three critical transportation financing issues facing the Congress and the administration: meeting the long-term financing needs of FAA, Amtrak's needs for Federal financial assistance, and innovative ways for financing highway construction. In my oral statement I will summarize the financing challenges presented by FAA and our Nation's highways, and my colleague Phyllis Scheinberg will discuss Amtrak's financial condition during today's second panel.

Major financing issues need to be resolved to improve the safety and security of our aviation system. Over the years we have identified numerous shortcomings in FAA's aviation safety and security programs. Following the crashes of ValuJet Flight 592 and TWA Flight 800, FAA and the Gore Commission also identified areas requiring action.

How these improvements will be funded, however, has yet to be addressed. FAA estimates that its needs will exceed projected funding levels over the next 5 years by $13 billion, which includes $4 billion to accelerate air traffic control modernization.

The administration has proposed that the current financing system, including the tax on domestic airline tickets, be replaced with user fees, and a national commission will examine this financing option. However, a user fee approach requires a good cost account-

ing system, which our work has shown FAA lacks. In a recent study, Coopers & Lybrand reported that, despite FAA's lacking a cost accounting system, it is possible on an interim basis for FAA to assign its costs to broad categories of users such as commercial airlines, general aviation, and the military. However, the study concluded that FAA did not currently have sufficiently detailed, reliable cost data to support a comprehensive user fee system.

If FAA is required to adopt a comprehensive system of user fees, it should first implement a modern cost accounting system that can reliably assign costs to specific users. FAA plans to implement such a system by October 1997. However, according to FAA, it will take at least 6 to 12 months after that before the agency can develop enough data to accurately assign costs to specific users.

Even with better cost data, a significant portion of FAA's costs may not be directly assignable to individual users, and policy decisions and judgments are going to have to be made about how to assign those costs. Different user groups are likely to have diverging opinions about what constitutes an equitable allocation of these costs.

Because the excise taxes that finance about three-fourths of FAA's budget lapse at the end of this fiscal year, the Congress will have to select a financing mechanism without knowing whether specific users are assigned their fair share of costs. The Congress could decide to extend the present excise tax system, modify it, or adopt a different one from numerous options, such as a fuel tax or enplanement fees. Deciding among these alternatives involves tradeoffs between their ease of administration, impact on the efficiency of the system, the ability to produce an equitable system in which users pay their fair share, and their impact on other policy goals.

In choosing how to finance FAA, these tradeoffs and the potential competitive impacts of new fees will need to be carefully studied by the National Commission and the Congress. When FAA develops more detailed and reliable cost data, the financing method that is initially chosen could be reexamined.

Similarly daunting challenges are presented by the financing of repairs and construction of our Nation's highways. DOT estimates that $16 billion in additional spending is needed annually just to maintain, not improve, the condition of the Nation's highways to 1993 levels. In order to stretch limited funds, the Congress in 1995 authorized a number of innovative financing mechanisms, including a State infrastructure bank pilot program.

SIB's serve as an umbrella under which a variety of innovative finance techniques can be implemented. Much like a bank, a SIB needs equity capital to get started and equity capital can be provided, at least in part, through Federal highway funds. Once capitalized, the SIB can offer a range of loans and credit options, such as loan guarantees and lines of credit, to public or private sponsors of transportation projects.

SIB's are intended to complement, not replace, traditional grant programs and provide States with increased flexibility to attract private investment in highway projects. For some States, however, barriers to establishing and effectively using a SIB remain. Michigan officials, for instance, told us that the State does not have the

constitutional authority to lend money to the private sector. As a result, the SIB program has been slow to start up. Only two States, Missouri and Ohio, have actually started projects under their SIB's.

To provide for greater participation, DOT's Fiscal Year 1997 Appropriations Act lifted the 10-State limit on establishing SIB's and provided $150 million in new seed money. Since the act's passage, DOT has received additional applications from 28 States and Puerto Rico.

Clearly, the SIB program will need time to develop and mature before its impact on meeting highway funding needs can be assessed. In our 1996 report we suggested that once SIB's begin operating FHWA could disseminate information on States' successes and failures with various financing options, which could help other States use them more effectively.

That concludes my oral statement and I would be glad to answer any questions.

PREPARED STATEMENT

Senator SHELBY. Thank you, Mr. Anderson. We have your complete statement and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF JOHN H. ANDERSON, JR.

Mr. Chairman and Members of the Subcommittee: We appreciate the opportunity to testify on three critical transportation financing issues facing the Congress and the administration: meeting the long-term funding needs of the Federal Aviation Administration (FAA), Amtrak, and the nation's highways. Each area presents formidable challenges that will stretch our limited resources; at the same time, pressures remain to reduce the federal budget. Overall, the $38 billion proposed in the Department of Transportation's (DOT) fiscal year 1998 budget to fund the Department represents about a 1-percent reduction from this year's enacted appropriation. In summary, we have found the following:

—Major financing issues need to be resolved to improve the safety and security of our nation's aviation system. FAA estimates that its needs will exceed projected funding levels by about $13 billion over the next 5 years. The Congress last year established a national commission to make recommendations by August 1997 on how best to finance FAA. Currently, FAA receives most of its funding from excise taxes, including a tax on domestic airline tickets, but those taxes lapse at the end of fiscal year 1997. The administration has proposed replacing the current system with user fees, and the national commission clearly will be examining this option. Developing such fees requires good data for assigning FAA's costs to specific users and policy decisions on such issues as how to allocate costs not directly related to any particular user. FAA currently lacks sufficient cost data, however, and will not start collecting better data until October 1997. As a result, better cost data will not be available before the excise taxes lapse or before initial decisions will have to be made about how to finance FAA. Deciding among the various financing alternatives involves tradeoffs between their (1) ease of administration, (2) impact on how efficiently the airport and airway system is used, (3) ability to produce an equitable system in which users pay their fair share, (4) potential competitive impacts, and (5) other policy goals.

—Amtrak remains in a very precarious financial position and continues to be heavily dependent on federal support to meet its operating and capital needs. Amtrak's passenger rail service has never been profitable and, through fiscal year 1997, the federal government has provided Amtrak with over $19 billion for operating and capital expenses. Amtrak projects that its fiscal year 1997 operating loss could be $783 million. While the corporation's goal is to eliminate the need for federal operating support by 2002, it is likely that Amtrak will continue to require substantial federal financial support—both operating and capital—beyond that time.

—DOT believes that current public spending on the capital needs of highways is inadequate and estimates that $16 billion in additional spending is needed an-

nually just to maintain—not improve—the condition of the nation's highways. State Infrastructure Banks offer the promise of helping to close the gap between transportation needs and available resources by sustaining and potentially expanding a fixed sum of federal capital. Benefits include expediting the completion of projects, recycling loan repayments to future projects, and obtaining financial support from the private sector and local communities. However, some state officials and industry experts are skeptical that such banks will produce these benefits and believe that (1) the number of projects with a sufficient revenue stream to repay the loans may be insufficient and (2) state infrastructure banks face impediments under state law. Only time will tell. This program is new, and only two states have begun projects under their state infrastructure bank.

ISSUES ASSOCIATED WITH ADDRESSING FAA'S FINANCIAL PROBLEMS AND DETERMINING THE BEST FUNDING MECHANISM

One of the most difficult financing problems confronting the Congress and the administration is how to adequately fund FAA to meet its mission over the long term. Over the years, we have issued numerous reports and testimonies that identified shortcomings in FAA's aviation safety and security programs.[1] These shortcomings include the insufficient training of FAA safety inspectors, inaccurate and incomplete aviation safety databases, and vulnerabilities in our aviation security systems. Similarly, in the wake of the May 1996 crash of Valujet Flight 592 and the July 1996 crash of TWA Flight 800, FAA and the White House Commission on Aviation Safety and Security (the Gore Commission) have concluded that a number of actions are needed to improve the safety and security of our aviation system.[2] However, how to fund these improvements has not been resolved.

Deciding how to meet FAA's funding needs involves not only determining what FAA's financial requirements are but choosing the best financing mechanism to meet those needs. Recognizing the seriousness of these issues, the Congress directed that a number of studies be completed. Under the Federal Aviation Reauthorization Act, enacted in October 1996, the Congress required (1) an independent assessment of FAA's financial needs and costs, which was performed by Coopers & Lybrand; (2) an assessment by GAO of airports' capital needs; and (3) an assessment by GAO of how air traffic control costs are allocated between FAA and the Department of Defense (DOD). The act established the National Civil Aviation Review Commission to, among other things, consider these studies and recommend to the Secretary of Transportation, by August 1997, how best to finance FAA.[3]

While its assessment of FAA's financial needs identified some areas for potential savings, Coopers & Lybrand concluded that FAA's estimates of its needs through 2002 were reasonable.[4] Table 1 compares FAA's estimated requirements with the agency's budget estimates for fiscal years 1998–2002, which were contained in the President's fiscal year 1998 budget.[5] In addition, FAA officials estimate that the almost $9 billion potential shortfall shown in table 1 could increase by an additional $4 billion as the agency tries to address the Gore Commission's recommendations to accelerate the modernization of the National Airspace System.

[3] The Secretary of Transportation is required to consult with the Secretary of the Treasury and report to the Congress by October 1997 on the Secretary's recommendations for funding FAA through 2002.

[4] "Federal Aviation Administration: Independent Financial Assessment," Coopers & Lybrand (Feb. 28, 1997).

[5] One component of FAA's requirements is funding a portion of the cost of developing our nation's airports. Last month, we reported that estimates of airports' annual capital needs during 1997–2001 ranged from $1.4 billion to $10.1 billion, depending on how needs are defined. See "Airport Development Needs: Estimating Future Costs" (GAO/RCED–97–99, Apr. 7, 1997).

[Dollars in billions]

Fiscal year	FAA's estimated requirements	FAA's projected budget	FAA's budget shortfall
1998	$8.46	$8.46	.....
1999	10.82	8.68	($2.14)
2000	11.22	8.91	(2.31)
2001	11.32	9.15	(2.17)
2002	11.50	9.39	(2.11)
Total	53.32	44.59	(8.73)

Source: FAA and the President's 1998 budget.

To help meet these financial challenges, the administration has proposed that the current approach to financing FAA be changed. Generally, three-quarters of FAA's funding comes from the Airport and Airway Trust Fund, which in turn, receives most of its funding from a 10-percent tax on the fares paid by passengers. The remainder of FAA's funding comes from the General Fund of the U.S. Treasury. In its fiscal year 1998 budget for FAA, the administration proposed replacing this system with usage-based fees starting in fiscal year 1999. The administration also proposed, as an interim step, $300 million in new user fees in addition to the $100 million in fees on foreign airlines' overflights of the United States that were authorized in fiscal year 1997. FAA has subsequently indicated that the new fees could potentially be charged for business aviation, international air cargo, and security activities. Similarly, a coalition of the nation's largest airlines advocate replacing the airline ticket tax with usage-based fees. These airlines believe that they pay more than their fair share of the costs incurred by FAA in running the airport and airway system and that competing low-fare airlines underpay.[6]

In our December 1996 report on the coalition's proposal to replace the ticket tax and in our February 1997 testimonies before the Senate Finance Committee and House Aviation Subcommittee, we stated our belief that, to the extent possible, commercial users of the nation's airspace should pay their share of the costs that they impose on the nation's airport and airway system.[7] We noted that because the airline ticket tax is computed based on the fares paid and not on factors that directly relate to FAA's costs for providing service, the extent to which the tax fairly allocates costs among system users is open to question. While many factors drive FAA's costs, we found that the coalition's proposal only incorporated factors that would substantially increase the taxes paid by low-fare and small airlines and decrease the taxes paid by the seven coalition airlines. We concluded that determining how best to finance FAA is a complex problem that requires careful study and good cost data. Our prior work has shown that FAA does not have an adequate cost-accounting system and, as a result, has limited capability to accumulate accurate, reliable cost data.[8]

On February 28, 1997, Coopers & Lybrand reported that despite FAA's lack of a cost-accounting system, it is possible, on an interim basis, to attribute FAA's costs to broad categories of users such as commercial airlines as a group or general aviation. However, Coopers & Lybrand concluded that FAA did not have sufficiently detailed or reliable cost data upon which to base a comprehensive system of new fees charged to specific users (e.g., particular airlines). It recommended that if FAA is required to adopt a comprehensive system of user fees, a modern cost-accounting system should be implemented to reliably assign costs to specific products and users. FAA is developing a cost-accounting system as required by the Federal Aviation Reauthorization Act of 1996 and plans to implement the system by October 1997. However, FAA's Manager, Cost Accounting System Division, told us that developing a sufficient amount of data to accurately assign costs to specific users will take at least 6 to 12 months after the system is implemented.

Because the airline ticket tax and other taxes that finance the Trust Fund lapse on September 30, 1997, better cost data will not be available before the Congress

[6] The coalition comprises the seven largest airlines—American Airlines, Continental Airlines, Delta Air Lines, Northwest Airlines, TWA, United Airlines, and US Airways.

[7] See "Airport and Airway Trust Fund: Issues Raised by Proposal to Replace the Airline Ticket Tax" (GAO/RCED–97–23, Dec. 9, 1996), "Issues and Options in Deciding to Reinstate or Replace the Airline Ticket Tax" (GAO/T–RCED–97–56, Feb. 4, 1997), and "Issues Related to Determining How Best to Finance FAA" (GAO/T–RCED–97–59, Feb. 5, 1997).

[8] See "Air Traffic Control: Improved Cost Information Needed to Make Billion Dollar Modernization Investment Decisions" (GAO/AIMD–97–20, Jan. 22, 1997).

is faced with the lapsing of those taxes. As a result, regardless of whether the Congress decides to extend the current excise taxes, modify them, or implement some other financing mechanism, it will not have assurance that specific users are assigned their fair share of costs. When more detailed cost data become available sometime in the future, a determination could be made to reexamine the financing method that is chosen.

Notwithstanding the limitations of FAA's cost data, the data that are currently available indicate that a large portion—55 percent—of FAA's costs are "common," or not directly related to any particular user. In our congressionally mandated April 1997 report on the allocation of air traffic control costs, we concluded that the method for allocating common costs could have a profound impact on the total cost shares assigned to system users.[9] We reported that in allocating common costs, assumptions and judgments must be made and that different user groups are likely to have diverging opinions about what constitutes an equitable allocation of those costs. We also reported that FAA and DOD strongly disagree about how FAA's common costs should be allocated.[10] In addition, we noted that whether and to what extent DOD's costs for providing air traffic services to civil users should be included in the development of user fees is another issue that would need to be resolved if the Congress instituted such fees. If DOD's costs are included, fees could be collected from civil users for the services provided by DOD, thereby providing an offset to what DOD may owe FAA.

In addition to retaining the ticket tax, there are numerous financing alternatives for the national commission, and ultimately the Congress, to consider. Possible options include taxing one or more of the general indicators of system use, such as departures, passenger enplanements, seats flown, fuel consumed, or a combination of these indicators. However, the potential competitive impact of using these indicators as a basis for allocating FAA's costs varies greatly depending on which indicator is used. For example, if a tax on passenger enplanements were adopted and designed to generate about the same amount of revenue as the ticket tax, the amount paid by the coalition of the nation's largest airlines would decline by about $251 million while the amount paid by competing airlines would increase by $269 million and commuter carriers by $61 million. In contrast, a fuel tax would keep the amount paid by the largest airlines and by competing airlines about the same as each paid under the ticket tax, but the amount paid by individual airlines would vary.

The various potential financing mechanisms for FAA, whether they be the $400 million in user fees contained in the administration's fiscal year 1998 budget or the longer-term options for replacing the ticket tax with usage-based fees, present policy tradeoffs between their ease of administration, impact on how efficiently the airport and airway system is used, ability to produce an equitable system in which users pay their fair share, and other policy goals. For example, a usage-based formula that combines several of the common system-usage indicators might provide the most exact method to ensure that all users pay their fair share of system costs. However, such a formula may also be so complex that it would be difficult to administer. By contrast, a fuel tax, while generally correlating to system use, would be less exact than more complex formulas but would be easier to administer. Likewise, taxing airlines for their use of the most congested airports may result in a more efficient use of the nation's airspace. However, because the coalition airlines are the primary users of these airports, this approach may not produce the most equitable result from their point of view.

Such tradeoffs and the potential competitive impacts of new fees will need to be carefully studied over the next several months by the national commission, the Secretary of Transportation, and the Congress. The financing mechanism that is finally selected should be relatively easy to administer and help ensure that, in the long term, FAA has a secure funding source, the nation's airports and airways are used as efficiently as possible, commercial users of the system pay their fair share, and a strong, competitive airline industry continues to exist. Ultimately, it is a policy call for the Congress to decide how to achieve these and other goals.

---

[9] "Air Traffic Control: Issues in Allocating Costs for Air Traffic Services to DOD and Other Users" (GAO/RCED–97–106, Apr. 25, 1997).

[10] DOD believes that it should not bear any of FAA's common costs because the Department is only a marginal user of FAA's air traffic services and has a minor impact on FAA's cost structure. Conversely, FAA believes that DOD should be assigned some portion of common costs because, like other users, DOD benefits from FAA's air traffic control infrastructure.

AMTRAK'S FINANCIAL CONDITION AND ITS QUEST FOR OPERATING SELF-SUFFICIENCY

Over the last several years, we have issued a number of reports and testified several times on Amtrak's financial condition.[11] Amtrak's passenger rail service has never been profitable and, through fiscal year 1997, the federal government has provided Amtrak over $19 billion for operating and capital expenses. In response to continually growing losses and a widening gap between operating deficits and federal subsidies, Amtrak developed its Strategic Business Plan. This plan, which has been revised several times, was designed to increase revenues and control cost growth and, at the same time, eliminate Amtrak's need for federal operating subsidies by 2002.

Our assessment of Amtrak's financial condition is that, despite some gains, the corporation is still in a very precarious position. It remains heavily dependent on federal support to meet its operating and capital needs. Although actions taken by Amtrak through its business plans have helped reduce Amtrak's net losses, Amtrak has struggled to reach net loss targets.[12] For example, Amtrak's plans for fiscal years 1995 and 1996 included actions to reduce its net loss by $195 million—from about $834 million in fiscal year 1994 (in current year dollars) to $639 million in fiscal year 1996.[13] By the end of fiscal year 1996, Amtrak's loss had declined to about $764 million; however, it was substantially more than planned. In addition, the relative gap between total revenues and total expenses has not significantly closed, and passenger revenues (adjusted for inflation)—which Amtrak has been relying on to help close the gap—have generally declined over the past several years (see apps. I and II). Similarly, the gap between operating deficits and federal operating subsidies rose in fiscal year 1996 to $82 million—the highest it had been in the last 9 years.[14]

Amtrak's continuing financial crisis can be seen in other measures as well. In February 1995, we reported that Amtrak's working capital—the difference between current assets and current liabilities—declined between fiscal years 1987 and 1994. Although Amtrak's working capital position improved in fiscal year 1995, it declined again in fiscal year 1996 to a $195 million deficit (see app. III). This decline reflects an increase in accounts payable, short-term debt, and capital lease obligations, among other items. A continued decline in working capital jeopardizes Amtrak's ability to pay immediate expenses. Amtrak's debt levels have also increased significantly (see app. IV). During fiscal years 1993 through 1996, Amtrak's debt and capital lease obligations nearly doubled—from about $527 million to about $987 million, in 1996 dollars. These debt levels do not include an additional $1 billion expected to be incurred beginning in fiscal year 1999 to finance 18 high-speed trainsets and related maintenance facilities for the Northeast Corridor and the acquisition of new locomotives.

It is important to note that servicing Amtrak's increased debt takes away from the federal financial operating support needed to cover future operating deficits. In fact, over the last 4 years, interest expenses have about tripled—from about $20.6 million in fiscal year 1993 to about $60.2 million in fiscal year 1996 (see app. V). Because Amtrak pays interest from federal operating assistance and principal from federal capital grants, this increase has absorbed more of the federal operating subsidy each year. During fiscal years 1993 through 1996, the percentage of federal operating subsidies used to pay interest expenses increased from about 6 to about 21 percent. As Amtrak assumes more debt to acquire equipment, the interest payments are likely to continue to consume an increasing portion of federal operating subsidies. Amtrak's fiscal year 1997 operating losses may be even higher than those in fiscal year 1996. As a result of unanticipated expenses and revenue shortfalls, at the end of the second quarter Amtrak projected that its actual fiscal year 1997 year-end net loss could be about $783 million.

---

[11] See "Intercity Passenger Rail: The Financial Viability of Amtrak Continues to Be Threatened" (GAO/T–RCED–97–94, Mar 13, 1997), "Amtrak's Strategic Business Plan: Progress to Date" (GAO/RCED–96–187, July 24, 1996), "Northeast Rail Corridor: Information on Users, Funding Sources, and Expenditures (GAO/RCED–96–144, June 27, 1996), "Amtrak: Early Progress Made in Implementing Strategic Business Plan, but Obstacles Remain" (GAO/T–RCED–95–227, June 16, 1995), and "Intercity Passenger Rail: Financial and Operating Conditions Threaten Amtrak's Long-Term Viability" (GAO/RCED–95–71, Feb. 6, 1995).

[12] "Net loss" is defined as total revenues minus total expenses.

[13] Net loss for fiscal year 1994 excludes a one-time charge of $244 million for accounting changes, restructuring costs, and other items.

[14] Operating deficit is the same as net loss, except noncash items (such as depreciation) and the one-time charge taken in fiscal year 1994 are excluded from total expenses.

Amtrak Has Large Capital Needs

Amtrak's goal of eliminating federal operating subsidies by 2002 is heavily dependent on capital investment. Such investment—the modernizing of property, plant, and equipment—will not only help Amtrak to retain revenue by improving the quality of existing service but will potentially increase revenues by attracting new riders.

Amtrak's capital investment needs are great—both to replace and modernize current physical assets and to complete new projects such as high-speed rail service on the Northeast Corridor. For example, in May 1996, the Federal Railroad Administration (FRA) and Amtrak estimated that about $2 billion would be needed over the next 3 to 5 years to recapitalize the south end of the Northeast Corridor and preserve its ability to operate in the near-term at existing service levels. FRA and Amtrak estimate that up to $6.7 billion may be needed over the next 20 years to recapitalize the Northeast Corridor and make improvements targeted to respond to high priority growth opportunities. Amtrak also estimates that an additional $1.4 billion will be needed to finish the high-speed rail project.

Our ongoing work indicates that Amtrak has made some progress in addressing its capital needs, but the going has been slow and, in some cases, Amtrak may be facing significant future costs. For example, in October 1996, about 53 percent of Amtrak's active fleet of 1,600 passenger cars averaged 20 years old or more and were at or approaching the end of their useful life. It is safe to assume that as this equipment continues to age, it will have more frequent failures and require more expensive repairs.

Finally, Amtrak will continue to find it difficult to take those actions necessary to further reduce its costs. During fiscal year 1995, Amtrak was successful in reducing and eliminating some routes and services. For example, Amtrak reduced the frequency of service on seven routes from daily to three or four times per week, and on nine other routes various segments were eliminated. Amtrak estimates that such actions saved about $54 million. However, Amtrak was less successful in making the route and service adjustments planned for fiscal year 1997. As a result, Amtrak estimates that its projected fiscal year 1997 net loss will increase by $13.5 million. Amtrak has also been unsuccessful in negotiating productivity improvements with labor unions.

Amtrak has staked its financial future on the ability to eliminate federal operating support by 2002 by increasing revenues, controlling costs, and providing customers with high-quality service. Although its business plans have helped reduce net losses, Amtrak continues to face significant challenges in accomplishing this goal, and it is likely Amtrak will continue to require substantial federal financial support—both operating and capital—well into the future.

INNOVATIVE HIGHWAY FINANCING THROUGH STATE INFRASTRUCTURE BANKS

In October 1996, we reported that total public spending on the capital needs for highways and bridges was approximately $40 billion in 1993—the most recent year for which data are available—and that DOT estimated that an additional $16 billion annually is needed just to maintain—not improve—the condition of the nation's highways at the 1993 level.[15] Moreover, postponing investment can increase costs; DOT estimated that deferring $1 in highway resurfacing for just 2 years can require spending $4 in highway reconstruction costs to repair the damage.

In order to stretch limited federal funds, the Congress in 1995 authorized some innovative uses of federal transportation funds. The National Highway System Designation Act of 1995 established a number of innovative financing mechanisms, including the authorization of a State Infrastructure Bank (SIB) Pilot Program for up to 10 states or multistate applicants—8 states were selected in April 1996, and 2 were selected in June 1996. Under this program, states can use up to 10 percent of most of their federal highway funds for fiscal years 1996–97 to establish their SIB's. This program was expanded by DOT's fiscal year 1997 appropriations act, which removed the 10-state limit and provided $150 million in new funds.

A SIB serves essentially as an umbrella under which a variety of innovative finance techniques can be implemented. Much like a bank, a SIB needs equity capital to get started, and equity capital can be provided at least in part through federal highway funds. Once capitalized, the SIB can offer a range of loans and credit options, such as loan guarantees and lines of credit. For example, through a revolving fund, states can lend money to public or private sponsors of transportation projects. Project-based revenues such as tolls or general revenues such as dedicated taxes can

[15] "State Infrastructure Banks: A Mechanism to Expand Federal Transportation Financing" (GAO/RCED–97–9, Oct. 31, 1996).

be used to repay loans with interest, and the repayments replenish the fund so that new loans can be supported. Thus, projects with sufficient potential revenue streams are needed to make a SIB viable.

Expected assistance for projects in the 10 states selected for the pilot program include loans, credit enhancement to support bonds, and lines of credit. In some cases, large projects that are already under way may be helped through SIB financial assistance. Examples of projects that the initial 10 pilot states are considering for financial assistance include the following:

—In Orange County, California, a $713 million project that includes construction of a 24-mile tollway may receive SIB assistance in the form of a $25 million line of credit that would replace an existing contingency fund. If the line of credit is used, plans are for it to be repaid through excess toll revenues.

—In Orlando, Florida, a $240 million project that will construct a 6-mile segment to complete a 56-mile beltway may receive a SIB loan in the amount of $20 million. Repayment of the loan would come from a mix of project-related and systemwide toll receipts and state transportation funds.

—In Myrtle Beach, South Carolina, a SIB loan is being considered to help construct a new $15 million bridge to Fantasy Harbor. The source for repaying the loan would be proceeds from an admission tax at the Fantasy Harbor entertainment complex.

SIB assistance is intended to complement, not replace, traditional transportation grant programs and provide states with increased flexibility to offer many types of financial assistance. As a result, projects could be completed more quickly, some projects could be built that would otherwise be delayed or infeasible if conventional federal grants were used, and private investment in transportation could be increased. Furthermore, a longer-term anticipated benefit is that repaid SIB loans can be "recycled" as a source of funds for future transportation projects. If states choose to leverage SIB funds, DOT has estimated that $2 billion in federal capital provided through SIB's could be expected to attract an additional $4 billion for transportation investments.

For some states, barriers to establishing and effectively using a SIB still remain. One example is the low number of projects that could generate sufficient revenue to repay loans made by SIB's. Officials from six of the states that we surveyed told us that an insufficient number of projects with a potential revenue stream would diminish the prospects that their state would participate in the SIB pilot program. Officials from 10 of 11 states that we talked to about this issue said they were considering tolls as a revenue source. However, state officials also told us that tolls would likely generate considerable negative reaction from political officials and the general public.

Some states expressed uncertainty regarding their legal or constitutional authority to establish a SIB or use some financing options that would involve the private sector. Michigan, for instance, said that it does not currently have the constitutional authority to lend money to the private sector. Another impediment can arise if the SIB exposes the state to debt. Backing SIB assistance with the full faith and credit of the state is not legally permitted in some states. Without that guarantee, SIB's will have to rely on the strength of their project portfolio and initial capitalization as the basis for borrowing. As such, they are likely to experience higher borrowing costs than if their portfolio was backed by the full faith and credit of the state. Bond-rating agencies will have to assess each portfolio on a case-by-case basis.

Finally, a principal federal barrier to attracting private capital is the fact that the Internal Revenue Code, with some exceptions, restricts private involvement in tax-exempt debt. In the case of state and local bonds, bondholders' interest earnings are exempt from federal taxes. However, the tax exemption does not apply to a bond issue if (1) the private sector uses more than 10 percent of the proceeds and finances more than 10 percent of the debt or (2) more than 5 percent of the proceeds or $5 million (whichever is less) is used to make loans to the private sector. A number of federal and state officials and academic experts told us that states that choose to leverage their banks will likely do so with tax-exempt debt because bondholders are willing to accept lower interest rates in exchange for the bonds' tax-exempt status.

The SIB program has been slow to start up. Only two states—Ohio and Missouri—have actually begun projects under their SIB. Nevertheless, since $150 million was provided and the 10-state restriction was lifted in DOT's fiscal year 1997 appropriations act, the agency has received applications from 28 states and Puerto Rico. The program will need time to develop and mature before a comprehensive assessment of SIB's impact on meeting transportation needs can be assessed. In our October 1996 report, we suggested that once SIB's begin operating, the Federal Highway Administration could disseminate information on states' successes and fail-

ures with various financing options and thus help states use SIB's more effectively and educate other states on the pros and cons of a SIB.

Mr. Chairman, that concludes our prepared statement. We would be happy to respond to any questions that your or other members might have.

AVIATION USER FEES

Senator SHELBY. Going back to you, Secretary Downey, do you anticipate, first, that the National Civil Aviation Review Commission will in fact report on user fees by August of this year?

Mr. DOWNEY. We are hopeful that they can do that. They understand the importance of the timetable and the fact that decisions have to be made. They are planning to meet on a quite regular basis between now and August.

Senator SHELBY. If they do, will that leave sufficient time for the administration to review the recommendations they make and for Congress to consider enactment of any new user fees before the end of the year? That is moving in August, September?

Mr. DOWNEY. We will be sharing what information we have, but the $300 million that is in the coming year's budget in our view is independent of what the Commission will recommend and should be considered on its own merits.

Senator SHELBY. Mr. Anderson, is it fair to say that any imaginable new user-specific fee, whether security fees, inspection fees, air traffic service fees, per-seat fees, or per-passenger fees, will create winners and losers in the airline industry and among the traveling public?

Mr. ANDERSON. There is no question. We have done various analyses of different alternatives for assessing fees, and there are winners and losers and they vary for each proposal.

Senator SHELBY. Who are the winners and losers?

Mr. ANDERSON. It varies depending upon which proposal you look at. For example, the coalition of the Nation's largest airlines about

1 year ago at this time put forth a proposal where the major airlines were going to be winners in terms of having their tax burdens reduced, but the low-fare other airlines were going to be big losers. We looked at that proposal and we had some critical comments about it.

Senator SHELBY. What does that do to the traveling public?

Mr. ANDERSON. Well, our biggest concern was it could have competitive impacts, because one of the reasons that we believe that airline deregulation overall has been a success is because of the competition that low-fare airlines have injected into the system.

Senator SHELBY. And brought down a lot of fares, has it not?

Mr. ANDERSON. Exactly. So one of the problems if you go to tampering with a system that is going to significantly shift that tax burden is you could upset the applecart, so to speak, in terms of the competition mechanisms that have been set up.

Senator SHELBY. So I guess the caveat is for us to be real careful in what we do if we do anything?

Mr. ANDERSON. Yes.

Senator SHELBY. Mr. Anderson, would you expect that user fees will alter behavior among the airlines?

Mr. ANDERSON. I think it could. This is one of the things Mr. Downey alluded to. You have to be real careful when you set up these fees that you do not have some unintended consequences coming out as a result. It could also affect the routes they serve.

Senator SHELBY. Have you considered some unintended consequences?

Mr. ANDERSON. Well, one of the things that has been talked about is if you actually have to—if, let us say, an airline has to pay for the amount of inspector time that FAA inspectors spend inspecting them, they might be attempting to get the inspectors out of there sooner so that they could reduce their inspection bill. Obviously you have to build in things to mitigate against that.

Senator SHELBY. Have you given any thought to how the various fees that might be considered could alter airline services' hub and spoke operations or traffic patterns? I know we talked about money, but I think that is very important.

Mr. ANDERSON. Sure. I think they could, and this is another reason why this is a complex problem that I do not think you want to jump to solutions too soon. If you change the fee structure, the profit on individual routes could change and the airlines could decide to serve different cities, that sort of thing. One of the things that we have been concerned about was, while airline deregulation overall has been a success, there clearly are pockets of pain out there that have not fully enjoyed the benefits of lower fares and increased service. If you are not careful, you could exacerbate that problem.

OTHER PROPOSED TRANSPORTATION USER FEES

Senator SHELBY. Mr. Downey, besides the FAA user fees, what other user fees are proposed in the President's 1998 budget request?

Mr. DOWNEY. The other fees that are proposed include railroad safety user fees, a proposal to reinstate the industrywide levy that had been in place up until 1 or 2 years ago, and an advance pro-

posal to consider icebreaking fees for the Coast Guard, not in the current budget but 1 year out from now.

Senator SHELBY. Mr. Downey, have any recognized user groups publicly supported this administration's interstate toll proposal that you know of?

Mr. DOWNEY. User groups I do not believe have, but we have heard from States and local governments that do have an interest in that proposal. They would be the ones to enact any tolls. This would not be a Federal toll. It is merely an opportunity for State and local government to finance transportation projects through this mechanism.

Senator SHELBY. Mr. Anderson, I understand the GAO has looked at some of these user fees. If any of these user fees are imposed on top of the current ticket and excise tax that we have, is it possible that some of the airlines or users might be paying twice for the same service?

Mr. ANDERSON. That is possible. I think that is one of the problems with going with an incremental approach as opposed to looking at it comprehensively, like I think the National Commission is doing. I think you can sort of see—I have had discussions with my staff—the proposal for the overflight fees, it is going through 1,000 cuts here as it is being examined. As you look at this thing piece by piece, you are not sure what changes are going to come down the road that might be an additional tax on the user. So I think a comprehensive look-see is the way to go with these things.

Senator SHELBY. The bottomline is we better be careful what we do for a lot of reasons?

Mr. ANDERSON. Yes, sir.

Senator SHELBY. Senator Lautenberg.

Senator LAUTENBERG. Thanks very much, Mr. Chairman.

I am sorry that Senator Gorton had to leave, but the record should reflect some of my concerns. I will talk about those for just a minute. In terms of comparing one transportation mode to another, I think you run into all kinds of extraneous debate. The fact is that we have to have intermodal balanced transportation services throughout our country, and you cannot suggest that one is more favored than the other because there is not a 10-to-1 ratio. I think that is, frankly, not a particularly reliable statistic to depend upon when you make decisions like we have.

If you look at aviation—and I like flying, I like flying in small airplanes, and I think that the aviation system has helped build our country perhaps more than any other because of the ability to get across the breadth of our huge Nation. But when I start thinking about what it takes to keep airlines going, the aviation system going, and I think of people paying parking fees of $15, $20, $50 to be at an airport so that they can take an airplane, I am forced to say, well, is that a direct subsidy of air travel? It certainly ought to be counted as part of it.

When I look at all the shops, and the rents in some of these places are fantastic, collecting a lot of fees. That goes to subsidize in part the whole of the aviation business. We are not counting that, but people are paying user fees effectively when they pay $2 for a coffee that you can get for 55 cents elsewhere.

The fact of the matter is that when we build special roads, special travel connections, to get to airports, that is a subsidy. For railroads we do not do that. I have not seen a railroad station that has a private road built to it. And if you want to see a glaring example, look at the Denver Airport, which I like. I think the Denver Airport is an excellent airport. But look at what we had to do to have access to that airport created. We spend hundreds of millions of dollars.

So those questions have to be answered. Unfortunately, since Senator Gorton is not here, I do not want to take advantage of his absence to ask the penetrating questions. But we will go on from here.

COST OF IMPLEMENTING GORE COMMISSION RECOMMENDATIONS

Mr. Downey, the Gore Commission's recommendation to accelerate the deployment of modern air traffic control equipment I frankly think was a wise one. We have seen what happens with our air traffic controllers. There is enough tension, enough stress in those towers, that we ought not to make their job more difficult as a result of outages in our air traffic control centers and towers in recent months because of the age of this antiquated equipment.

Is the administration, Mr. Anderson, committed to requesting the additional billions of dollars that are going to be necessary to fully follow the Gore Commission's recommendations? I ask you, Mr. Downey.

Mr. DOWNEY. You are correct, it will cost additional billions or at least a need to accelerate the billions of dollars already planned. And we are working that through the budget process, looking down to the next few years. Within the constraints, even with the good news from Senator Domenici, it will be hard, but we need to find it. The benefits of improving the air traffic control system, both in terms of safety and efficiency, are so great, we really need to make that investment.

That is one of the reasons why we have proposed user fees, because that may be a way to accelerate income in order to get those benefits sooner for the users.

Senator LAUTENBERG. The good news from Senator Domenici was offset by the bad news from Congressman Shuster, I think, in the paper this morning. And while I do not necessarily agree with Congressman or Chairman Shuster in a lot of things, the fact is I think it is fairly obvious that we need more money than is planned, even with the—I will not call it a bonus—with the largess that was discovered along the way, because it still leaves us short of what an extended baseline would look like running out 5 years. The system needs and deserves more than that.

FINANCING AMTRAK

Mr. Downey, your statement points out your request for contract authority from the highway trust fund for Amtrak beginning in fiscal 1999. How does your Amtrak proposal in NEXTEA compare to the one-half-cent proposal in terms of the funding that would be available, generally available to Amtrak over the next several years that would be capital funds?

Mr. DOWNEY. Our proposal is somewhat below the one-half cent. It phases it. It would increase capital investment in the outyears as Amtrak makes progress toward self-sufficiency, and I think by the fifth year it is roughly equivalent to the one-half cent.

Senator LAUTENBERG. Is it your view that once this contract authority is established, if NEXTEA is the version we subscribe to, Amtrak will be able to sign contracts for the total amount of the full funding of the contract authority assumed in the bill?

Mr. DOWNEY. I think in the same way a State is able to anticipate those funds and make financial arrangements for making use of them, we would expect Amtrak to be able to do the same thing.

Senator LAUTENBERG. A couple seconds more if I might, Mr. Chairman?

Senator SHELBY. Yes, sir; go right ahead.

Senator LAUTENBERG. Does your proposal assume that the Appropriations Committee is going to place obligations limits on this contract authority, just as we do on highway and transit programs?

Mr. DOWNEY. Certainly that has been the history of the highway and transit programs. We did not request such a limit, but we certainly would work with this committee on it. And I know your interest in seeing that the funds are used wisely.

Senator LAUTENBERG. As always.

USER FEES COVERAGE OF COSTS

I want to ask you this. Should we assume that, whatever new user fees are developed, that they will completely offset the savings gained from the continuation of the ticket tax?

Mr. DOWNEY. I really do not know the answer to that, because I am not sure about what the continuation of the user taxes would entail.

Senator LAUTENBERG. Right, but you would be projecting. Let us say, if you projected your own views, should they?

Mr. DOWNEY. If you look at the FAA's financing today, the ticket taxes, if collected for a full year on a regular basis, do not cover the entire cost to the FAA. So it would be our expectation that the user fees would come closer, hopefully, to 100 percent coverage of those costs. In that sense they would, if they replaced the ticket taxes, would more than add up to the ticket taxes, but they would create some relief on the general fund side.

Senator LAUTENBERG. Right. What I wanted to do there was just have you indicate, because I felt that it was necessary. There are going to be any number of combination of things and we ought not to be lulled into believing that, OK, everything is going to be paid for in direct user fees, you put down a buck and you would get 1 dollar's worth. I think you put down $1 right now and you get 100 dollars' worth, and I do not mind some of that because the aviation system is a national asset and we have to keep it going.

I do not think it ought to be just those who ride the planes, but rather society in general has to participate in some way. If you build a national highway system they do. If you build a national aviation system they do. And frankly, if you have a decent, functioning rail passenger service like all of us here would like to say, the public is going to have to chip in.

Thanks very much, Mr. Chairman.

Senator SHELBY. Thank you two gentlemen. We are probably going to have some questions for the record and we will keep that open for other members, too.

Mr. DOWNEY. We will be happy to.

Senator SHELBY. Some have already said that.

We thank you both.

Mr. DOWNEY. Thank you.

Mr. ANDERSON. Thank you.

PANEL 2

DEPARTMENT OF TRANSPORTATION

FEDERAL RAILROAD ADMINISTRATION

STATEMENT OF JOLENE MOLITORIS, ADMINISTRATOR

NATIONAL RAILROAD PASSENGER CORPORATION (AMTRAK)

STATEMENT OF THOMAS M. DOWNS, CHAIRMAN, PRESIDENT, AND CHIEF EXECUTIVE OFFICER

GENERAL ACCOUNTING OFFICE

STATEMENT OF PHYLLIS SCHEINBERG, ASSOCIATE DIRECTOR, RESOURCES, COMMUNITY, AND ECONOMIC DEVELOPMENT DIVISION

INTRODUCTION OF WITNESSES

Senator SHELBY. Our next panel will be Jolene Molitoris, Administrator, Federal Railroad Administration, Department of Transportation; Tom Downs, President, National Railroad Passenger Corporation (Amtrak); Phyllis Scheinberg, Associate Director, General Accounting Office, Resources, Community, and Economic Development Division.

Your entire written statements will be made part of the record and I would ask you to briefly summarize your remarks. Ms. Molitoris.

STATEMENT OF JOLENE MOLITORIS

Ms. MOLITORIS. Thank you, Mr. Chairman and members of the committee. I appreciate the opportunity to represent the Federal Railroad Administration before you today. I would like to testify concerning the financial commitment of the Clinton administration to Amtrak and especially about the fiscal year proposed 1998 budget.

We all know about the challenges that Amtrak is facing, not only to survive, Mr. Chairman, but to thrive, because that is the kind of system we all want. Let me comment that when we arrived 4 years ago we analyzed Amtrak and realized that it faced very serious challenges and set about the business of taking the very many necessary steps to help Amtrak become a very healthy organization. One of those steps that was very important was really developing a new leadership team, and of course you will be hearing from the leader of that team, Mr. Downs.

Although we have much, much more to do, as the GAO and our own records indicate, I think it is useful for the committee to at least hear a couple of highlights as to the kinds of movement in

a positive direction that we have had for Amtrak, and I think they may begin to respond to some of the comments that you made early on.

First of all with regard to Federal operating subsidies, I think the Congress and the administration have agreed to set as a goal zero Federal operating subsidies by the year 2002. That is a goal that has been begun to be achieved by cutting these Federal subsidies in half in the last 2 years. That I think is a significant achievement.

Second, Amtrak has divided its business into three strategic units so it can act like a business, better concentrate on the customers, and provide the kind of customer service that your colleague Senator Gorton did not find on his trip. I think if he took that trip today he would have a different experience.

Another very important issue——

Senator SHELBY. Do you recommend that I take it?

Ms. MOLITORIS. Absolutely, Mr. Chairman.

Senator SHELBY. I might do it.

Ms. MOLITORIS. I am sure Mr. Downs would recommend the same thing.

Senator SHELBY. I might do that.

Ms. MOLITORIS. I think a very important step, Mr. Chairman, was unbundling the whole financial information base at Amtrak, because when we arrived and when Mr. Downs arrived it was very, very difficult to understand the cost of individual pieces of the business, and I think that that very important piece of work has shown a big light on a lot of the issues that were not as visible before. But I think that we can only achieve a healthy company by looking at the facts as they really are.

I think the kind of business partnerships and entrepreneurial activities of Amtrak are very important for the committee to recognize. They have made some very important business partnerships, not only with States, which they have, but also with private entities, like Disney, Pepsi, United Airlines. For example, in just one small example, they had a partnership with Disney on the release of the video "Aristocats" and they had a coupon in that video. By tracking the coupons, they were able to see that through that one initiative alone they earned $13 million. So these private partnerships are ways to grow Amtrak into a healthy business.

Another important change is that States are taking a much more active, proactive partnership with Amtrak. In fact, the State investment in Amtrak operating assistance has almost doubled in the past year. And in State capital assistance, four States—California, Washington, North Carolina, and Pennsylvania—are actually partnering with Amtrak by buying equipment for them to use. This gives you the kind of indicator that States consider Amtrak vital for their transportation future.

I would believe another instance that is very important, and my guess is that Senator Gorton faced some of this. When we arrived and when Mr. Downs and his new team arrived, there were a lot of so-called heritage cars, Mr. Chairman. This is not a heritage that any of us would want to inherit. They were 40- or 50-year-old cars. We know that no airline would fly equipment that age. They had nonoperative bathrooms, they broke down a lot. We know

that—we knew that we had to change that situation if Amtrak was going to succeed.

So there has been substantial progress there, Mr. Chairman, ordering nearly 200 locomotives, 250 passenger cars, and these 40- and 50-year-old cars are almost now gone from the fleet, and I think that helps customer service.

As a result of aggressive pricing strategies in 1996, ticket yields were up by 10 percent. And since 1994, the last 2 full years, Amtrak's total revenue is up by $141 million. That is up 10 percent.

I think we should recognize the employees of Amtrak, because without recognizing the employees you do not recognize the people who are working day by day to make this railroad succeed. For example, this company was voted the most improved transportation company in the country in customer service. That happens because employees make it happen, and I think we should give them credit for that.

In addition, improved productivity of the work force. If you look at the Bear and Wilmington Shops, you see self-directed employee shops that are actually bringing new business to Amtrak because they are so good and so cost competitive.

Certainly last but not least, the high-speed rail initiatives, the new trainsets which the Vice President unveiled last April, the electrification project which was begun in July of last year, this is forecast to bring about $150 million of profit to Amtrak when they are fully implemented.

Finally, let me say, Mr. Chairman, the budget of the administration has no fat at all. As I said for the record to Mr. Wolf and I would like to say to you, the administration has made a very serious investment in Amtrak through the NEXTEA proposal and we want to say it is not padded. It is not like the old days, where we put in extra and Congress took out extra.

Mr. Downs will tell you that one of the challenges he faces financially is because there was a disconnect between the President's budget and the final appropriation last year, $115 million. And if we had been on the same wavelength, Mr. Downs' budget would have shown a surplus.

So I would like to say to you that our NEXTEA proposal, Mr. Downey has already said, represents about 96 percent of operating and 92 percent of capital of what Amtrak is requesting and what the one-half cent would give. So we think that in a time of budget cutting it really is a significant statement by the administration. Although we have just seen the fruits of the cooperation on the budget agreement, we know, as was said, there will be extra money, we do not know what the negotiation will end up with, but perhaps there would be an opportunity for some more money for Amtrak.

Finally, the administration is committed to a corporation that you all would be proud of, that we all would be proud of, a healthy company that is free of operating subsidy, and it is one of the safest railroad companies in the world, and we should underscore that because no operation in any transportation mode can be viable without reliable safety for the American people.

I appreciate the time with you, Mr. Chairman, and I would be happy to answer questions.

Senator SHELBY. Mr. Downs.

STATEMENT OF THOMAS M. DOWNS

Mr. DOWNS. Thank you, Mr. Chairman. It is a pleasure to be here. Senator Lautenberg.

At the risk of starting off with what seems like a superfluous note, there was a piece in this morning's New York Times that says:

> I was in Penn Station purchasing Amtrak tickets to Wilmington, DE, when a woman approached the agent at the next window. "Is it your job to sell me a ticket to anywhere I want to go?" she asked. "Yes, ma'am," he replied. "Where would you like to go?" "To hell and back," she said. Without batting an eye, the agent, with the utmost courtesy, consulted his computer and said, "I'm sorry, ma'am, but that train is completely sold out." [Laughter.]

I could spend this time reiterating how important Amtrak is, that we are 55 million passengers, that if you count intermediate stops in the Northeast corridor we are 70 percent of the combined air-rail traffic between Washington and New York. I could say that we are the essential lifeblood of urban and rural America in places like Anniston, AL, and Haver, MT, and Devil's Lake, ND.

Where, as Senator Gorton says, it is a long way from Seattle to Chicago, the difference is that our business is often 60-mile increments linking places like Minneapolis to places like Minot, ND, and that is lost in this debate.

We are the Nation's passenger railroad. We, Amtrak, are often held accountable for the things that have been done to this railroad. I believe the national Government is accountable for what has happened to Amtrak, good, bad, and indifferent. It is impossible to sort out our current financial position without at least telling part of the story in a slightly different way than perhaps Senator Shelby had characterized it earlier.

I have a chart I hope you all have. It is called "The Gap." We had an agreement between the Budget Committees, Mr. Kasich, Senator Domenici who was here earlier, about the 5-year glidepath to self-sufficiency. It looks like this [indicating]. In 1996, the glidepath number was supposed to be a $135 million reduction in operating subsidy for Amtrak. The Congress said: That is really neat; to give you something to shoot for, why do we not go ahead and reduce it by $210 million.

That had a cost and a consequence. It wrecked, in a sense, the business plan for the company.

[The chart follows:]

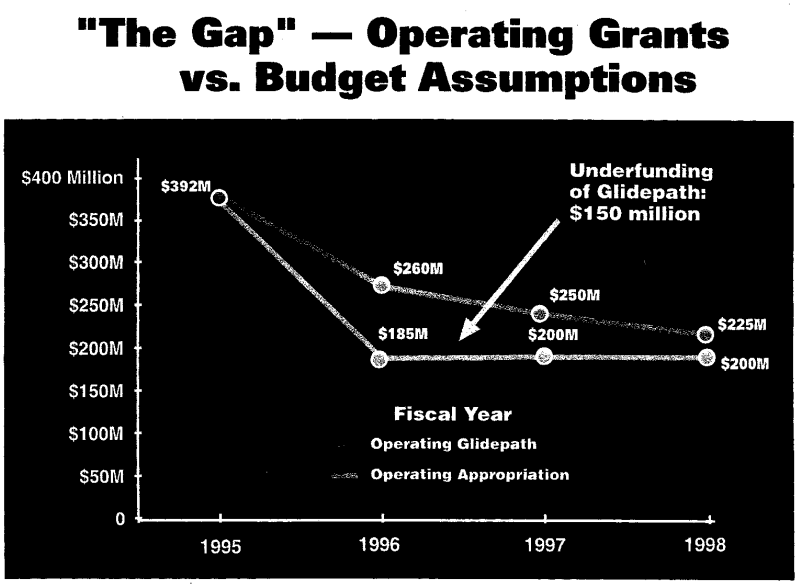

Chart 1

We started over. We said: OK, that makes it $250 million in 1997. Well, the answer is it is $200 million. We said: It is $225 million for 1998. The answer is probably going to be it is $200 million.

Underfunding a business plan has financial consequences. The financial consequences are we are running out of cash. The reason that we are out of cash is that in the 1980's the Congress told us, this company: Go borrow your money. Senator Shelby said nobody has invested, the private sector is not investing in this corporation. That is not true. All of our locomotives, all of our new passenger cars, and our high-speed trainsets are funded, not by Federal capital, but by private banking interests. Ironically, they are foreign banks, in France and Germany and Japan and Canada.

But borrowing those moneys is an expense for the company, particularly since we have to pay a premium for the money.

Chart 2 shows what happened to us from a capital standpoint. In 1986 our capital budget was $3 million. It was enough to fix broken windows maybe. In 1987 it zoomed all the way to $27 million. Both years, our depreciation account was one-quarter of a billion dollars. Clearly, we were directed to borrow the money that we needed for capital investments in this company.

[The chart follows:]

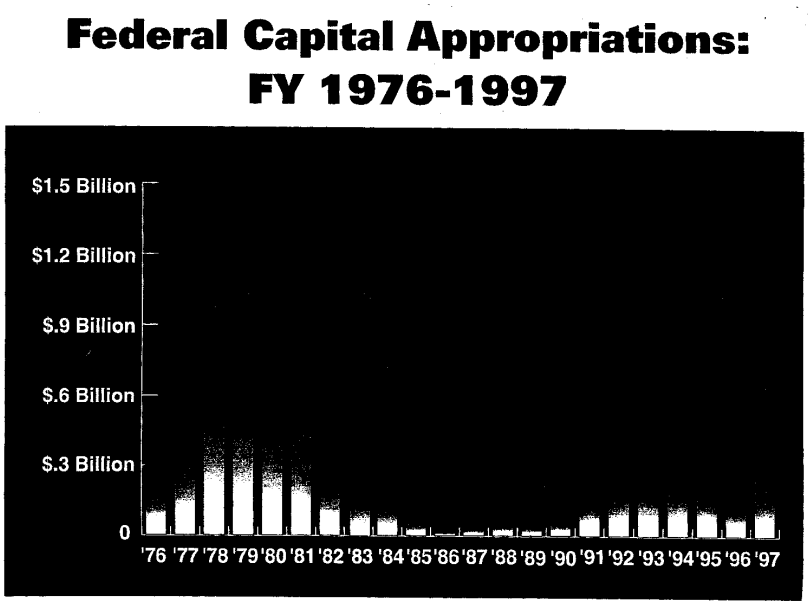

Chart 2

We did. We began to incur private sector investments. I do not consider it debt; I consider it investments in our future. That is chart 3.

[The chart follows:]

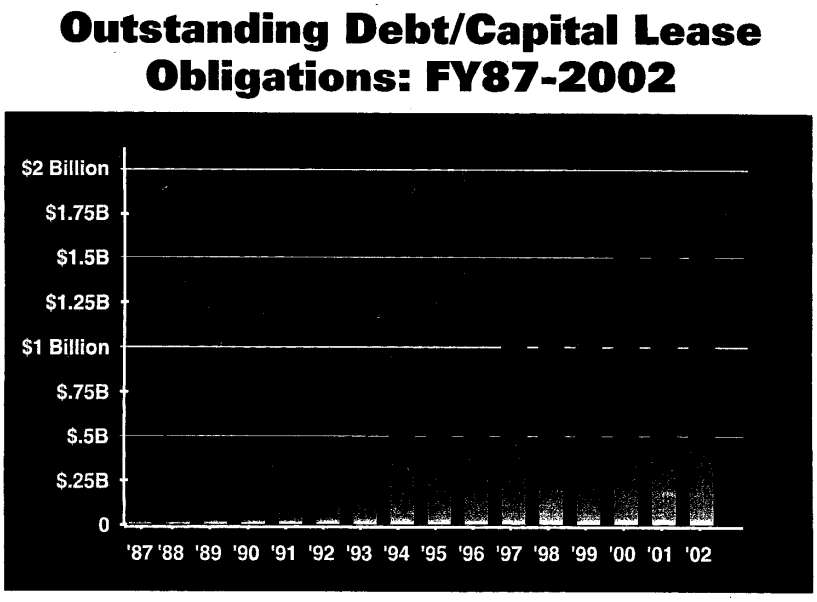

Chart 3

And what has happened about our principal and our debt yields a chart that looks like "Principal and Interest Payments," not unlike what is happening with the Federal budget. Our fastest growing expense, as GAO will point out, is principal and interest on that capital.

[The chart follows:]

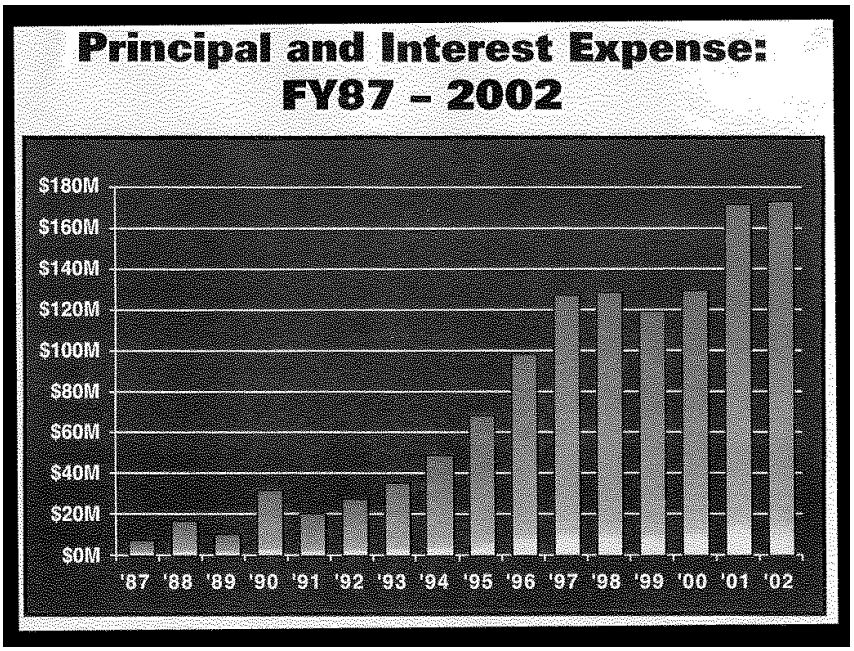

Chart 4

We have been told to make this a businesslike operation. We still believe it is part of a national transportation network and an asset, but we are told: Make it a business. I hope you have this last chart: "1987 to 1998, Percent of Expenses Covered by Federal Operating Support for Amtrak." In 1987 it was 34.6 percent, in 1998 it is 14.4 percent of expenses.

[The chart follows:]

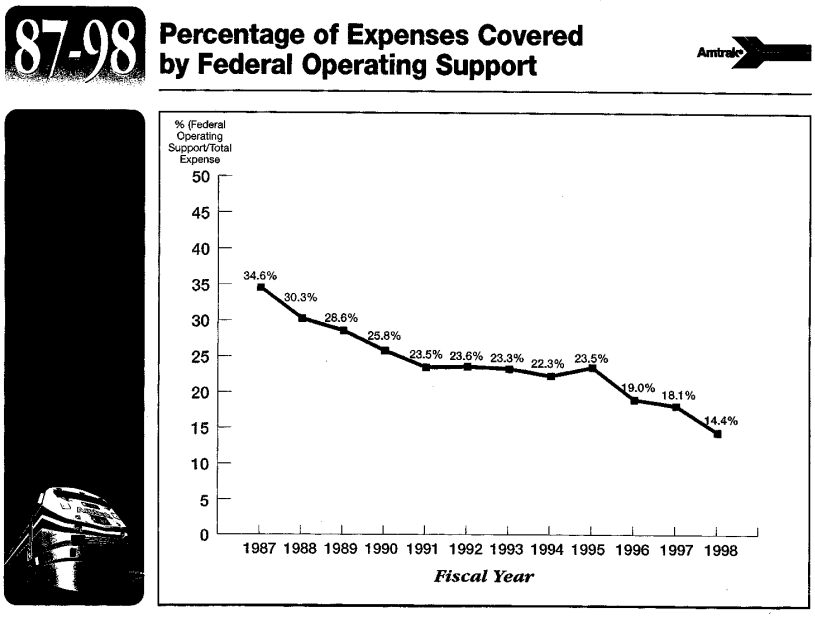

Chart 5

I would like to say that this company has done what the Congress has asked it to do. What we have not had is a concomitant response about defining clearly what the national role for Amtrak is, what purpose it fills in environmental, in mobility, in small urban and rural areas.

We have exhausted, I believe—and I would take exception only with one statement in Senator Shelby's opening remarks, that there is no doubt that a private company could operate a profitable rail service. Every private railroad in America proved that that was wrong in the 1960's and 1970's. They said, we cannot any longer operate rail passenger service as private businesses. I do not know of a single country in the world who can, private or public, operate an intercity rail passenger service at a break-even or profitable basis.

We have said: Recapitalize this railroad after a horrible depreciation cycle, which gives us bad equipment, bad plant, inefficient operations. We have said: Give us the right structure in law to operate the way you want. We will build high-speed rail to the point where that investment will yield, after all principal and interest payments, a net profit for this company of $150 million a year. That is working capital, that is an improvement on the bottomline.

We have said in our business plans that we are building in mail and express business, the business we put on the back of passenger trains, to help defray the expenses of long distance trains. In 1959, the last time that freight railroads in America on a fully allocated cost basis broke even on rail passenger service, 46 percent of the revenues of those passenger trains were mail and express. We would like to recreate that kind of environment, the old REA busi-

ness, without getting in the freight railroads business, without trying to be in economic warfare with anyone, that we can build a profitable relationship with the Post Office and express business. That is part of a business plan that we think makes sense for you all.

We have said clearly: The answer is recapitalize this railroad. Make a choice. If you cannot fund it, have the courage to face the consequences. Senator Shelby said that at the end of his remarks. It is one option to explore.

What has happened is that we have been told time and again, make it work, do it with less, do it without capital, keep selling tickets, sell disappointment to the American public, ignore the consequences of the undercapitalization. We have run out of time, we have run out of room, because we are now out of cash. It is time to choose.

Thank you, Mr. Chairman.

PREPARED STATEMENT

Senator SHELBY. Thank you, Mr. Downs. We have your complete statement and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF THOMAS M. DOWNS

Mr. Chair: Thank you for the opportunity to discuss Amtrak's fiscal year 1998 funding request, as well as the current financial condition of Amtrak and our vision for the future.

The current state of Amtrak, if it were boiled down to a single phrase, it would be, to borrow a line, "the best of times and worst of times." In the last two and one-half years, we have begun to put together the pieces for a viable national service which is operationally self-sufficient. We know that two years in the future, we will inaugurate the first high-speed rail service in America and usher in a new level of rail passenger service for our customers. And, in the next few months, I am hopeful that we will be sharing revenues with our freight partners by using Amtrak trains for the delivery of time-sensitive materials. Each of these endeavors is expected to generate large net-revenue benefits, help steady our finances, and make Amtrak far less dependent on federal resources.

The problem is that in the short term, I am not sure that we will remain solvent. Further, I do not believe that enough people realize or understand how close to extinction intercity rail service is in the United States.

I make this statement in stark terms because I want the attention of the Congress. The demise of Amtrak need not happen. In fact, it would be a national tragedy if it did. Unless we all, and I mean Amtrak, Congress and the Administration, work together during the next six months, we will likely be out of cash and out of business by the summer of 1998.

This Subcommittee has a major role to play in whether or not America has a national rail passenger system. The answer in the short term is adequate operating support, legislative reform, and dedicated capital. I have a fiduciary responsibility to make the right decisions and recommendations to make a national system work. But I need the help of this Committee and others in Congress.

Two years ago, the Administration and the new Congress indicated that if Amtrak was to survive, it would have to eliminate its dependence on federal operating support. We were faced with a daunting task. For some reason Amtrak, the only major mode of transportation which does not have a dedicated source of funding, is held to a higher standard than any other mode, all of which are dependent on the federal government for support and none of whom are called upon to defend themselves in terms of "profitability." We are also held to a higher standard than any other passenger rail system in the world, all of which rely on some level of federal support. Amtrak covers more of its operating costs—an estimated 84 percent—than any other passenger railroad in the world, and serves more than 93 percent of the continental states, while receiving less than 3 percent of all federal transportation spending.

I am not aware of any transportation system that supports itself solely through user fees. According to the US DOT, in fiscal year 1994 nearly $6 billion more was

spent on highways than was collected in user fees. In fiscal year 1995 nearly $8 billion more was spent on highways than was collected in user fees. It's not just highways—transit is exempt from the gas tax and received approximately $3 billion in gasoline revenues last year. No mode is self-financed.

Amtrak is an absolutely critical part of our national transportation system in both rural and urban areas. To provide some context, if we were an airline carrier, we would be the third largest in the United States. We carry almost half of the combined air-rail market between Washington, DC and New York, and when intermediate cities (such as Baltimore and Philadelphia) are included, Amtrak's share of the air-rail market rises to seventy percent. Loss of Amtrak service in this corridor would not only put a huge financial burden on the affected states, it would require another 7,500 fully-booked 757's to carry our passengers every year, or hundreds of thousands of cars added to already congested highways. If Amtrak disappeared tomorrow, there would be an additional 27,000 cars on the highway between Boston and New York every day. Between New York and Philadelphia, Amtrak service removes 18,000 cars from the highways every weekday.

That number—18,000 cars a day—does not include the thousands of commuter rail passengers, and their parked cars, that are carried on Amtrak's Northeast Corridor by commuter agencies such as New Jersey Transit (NJT) and the Southeastern Pennsylvania Transit Authority (SEPTA) every day. These commuter agencies could not operate if Amtrak did not maintain the track, bridges, signals and electric traction system on the Corridor. Above and beyond Amtrak's enumerated ridership, another 220 million commuter passengers ride on Amtrak's Corridor between Boston and Washington, DC every year. You can measure Amtrak's impact not only in the number of cars removed from the road, but also in terms of avoided costs—as reported in the Journal of Commerce last May, Amtrak's presence eliminates the need for twenty additional highway lanes in New York City, and ten new tunnels under the Hudson.

It's not just the urban corridors that depend on our service. Some 22 million of our 55 million passengers depend on Amtrak for travel between urban centers and rural locations some of which have no alternative modes of transportation. Some of the most persuasive appeals for flexibility for Amtrak and some of the strongest advocates for a dedicated trust fund have been elected officials from those states who are facing the elimination of Essential Air Service (EAS) or the disappearance of local bus service, and truly face the elimination of all other modes.

Finally, it also must be noted that Amtrak carries all these passengers even as the terms of relative investment by mode become more and more disparate. In real terms, spending for highways approached $20 billion last year while capital investment for Amtrak was less than $450 million. In relative terms, between fiscal year 1980 and fiscal year 1994, transportation outlays for highways increased seventy-three percent, aviation increased 170 percent, and transportation outlays for rail went down by sixty-two percent. In terms of growth, between 1982 and 1992 highway spending grew by five percent, aviation by ten percent, while rail decreased by nine percent. The overall funding amounts as well as the relative levels of investment should make one wonder how Amtrak has managed to maintain a fairly constant level of ridership, not why it hasn't increased its share. Amtrak has been accused of not serving enough of the travelling population, but that must be weighed against the price of not serving those travelers. It isn't just a matter of slightly more clogged roads or additional pollution. For some people it is the only way "to get there from here."

I both hope and expect that Amtrak will play an even larger role in America's transportation system in the future, as Congress, the states, and local planners work toward developing a more balanced transportation system which addresses the increased congestion, land use and clean air challenges.

At this point in time, however, playing a bigger role in our transportation system is a dream. I have had to call too many governors, mayors and Members of Congress over the past three years to tell them that I will be eliminating or reducing Amtrak service in their district, town or state. I relish making these calls even less than the recipients enjoy receiving them. I believe in a national passenger rail system, but years of disinvestment in the system are finally taking their toll. As GAO will confirm for you today, Amtrak is in difficult financial shape. We cannot preserve a national passenger rail system through yet another year of inadequate funding. I can also assure you that Amtrak will have to break its commitment to achieve independence from federal operating support if we are not given an adequate, reliable dedicated source of capital funding, and the requested level of declining operating support. As we have always said, operational self-sufficiency is absolutely dependent on adequate capital investment in the system.

How did we get into the financial condition GAO has described for you? Nearly a decade of inadequate appropriations, especially for capital investment, has caused us to borrow heavily from private banks. Amtrak also owns, operates, and maintains the majority of the Northeast Corridor, a critical transportation asset that carries more than 1,000 trains a day, including Amtrak, seven different commuter railroads, and freight. The Northeast Corridor is in the midst of a tremendous make over of transportation. Work is underway to introduce high-speed rail service to America. In preparation, investments have been made to upgrade and modernize the infrastructure—track, bridges, and structures—in the north end. This past spring, construction also started on the completion of a 75-year transportation plan—electrification north of New Haven. The high-speed rail program has been met enthusiastically by rail riders as well as investors. Significant capital investments are needed on the south end and a continued source of capital will be needed for the entire program if we are to have the highest return on this investment.

To provide some context, in the fall of 1994, we, as brand new managers of Amtrak, evaluated and came to grips with the corporation's financial fragility, and began taking the steps to avoid bankruptcy. Two years ago, I came up here and laid out for our authorizing committees a three-pronged approach which would reduce Amtrak's deficit, improve our operating ratio by making capital investments in our infrastructure, and reduce costs through legislative reform. We implemented a business plan at that time which internally generated nearly $400 million in savings on an annualized basis and re-engineered virtually every aspect of our operations.

To help us, we asked Congress to enact legislative reforms which would allow Amtrak to operate more like a business, and provide us with a dedicated source of capital funding and the requested level of operating support. These three items—Amtrak-controlled cost savings, legislative reforms, and establishment of a dedicated capital funding source—were the key to surviving, and doing so without operating support. Two years later, we have successfully advanced only one of the three prongs. Ours.

During the past two years, Amtrak has reduced costs, eliminated some of our poorest performing routes, retired old 1950's era equipment, eliminated a large number of positions, consolidated operations, rationalized our fare structure, and made countless productivity improvements. As important, we have restructured our service so that decisions are made closer to the passenger. We also improved our on-board services. The trains we are operating today are light years ahead of where they were in 1994. In addition, we have progressively managed to modernize our fleet of rolling stock, purchase new and more efficient locomotives, and have ordered the first generation of North American high-speed train sets, all with private capital. Our six-year strategic plan provides us with an innovative way out of our current financial predicament but has very little cash cushion. The plan, adopted by our Board of Directors last September, will require short-term borrowing simply to finance operations over the next three years of close to $180 million ($66 million this year). These borrowed funds will be paid back through profits generated from capital investments in high-speed rail implementation, locomotive replacement, reflecting and other critical capital projects which will generate new revenues, reduce expenses, and leverage new state and local support for trains. Without the capital investment, the revenue and savings will not be generated and the already difficult cash management task will be impossible to manage.

Unfortunately, neither the legislative reform nor the dedicated funding source was enacted last session, and we've been provided $125 million less than requested in operating grants over the past two years. The Senate Finance Committee came closest when it reported S. 1395, which redirected ½ cent of the federal fuel tax into a dedicated trust fund for Amtrak. Unfortunately, it was never taken up by the full Senate. However, companion legislation to accomplish the same thing has been introduced in both the House and the Senate this year. On this side, Senators Roth and Moynihan are the primary authors of S. 436, which takes ½ cent of the permanent 4.3 excise fuel tax, currently going toward the General Fund, and redirects it to an Intercity Passenger Rail Account. I believe their positions of leadership on the Finance Committee bode well for the future of the bill. I also want to publicly thank Senator Lautenberg for being a cosponsor of that bill. More recently, Senators Baucus and Warner introduced S. 634, which is more far reaching legislation and which includes the ½ cent provision.

As GAO testified two weeks ago, in the current fiscal environment, the best course is to provide a significant capital funding increase. It is the single best solution for both Amtrak and for the American taxpayer. It does not constitute a new tax—it is an existing one. It would increase the spending on transportation overall without taking dollars from any other mode, and most importantly, it would allow Amtrak to preserve the national system and attain operating self-sufficiency.

Congress must soon make a decision on whether or not it wants this country to have a national rail passenger system. If we go on without the necessary capital investment, it will be a decision by default, resulting in bankruptcy—which is a painful and messy way to implement policy.

If the decision is simply to end Amtrak, we ought to face it head on and deal with the reality that comes with it. There is no question that it has some significant costs. Dissolution of Amtrak by neglect would be irresponsible. Two years ago, the Budget Committee and others in Congress asked us what we thought the dissolution of Amtrak would cost the American taxpayer. At that time, we estimated that the costs would top out at, or above, $5 billion. This number, which included the mandatory labor protection costs, was later certified by the Congressional Budget Office.

In addition, the elimination of Amtrak would mean the loss of over 20,000 jobs, well over 1,500 pieces of equipment would have to be parked, mandatory labor protection be triggered, Railroad Retirement would be further burdened and the list goes on and on. Ironically, the dissolution of Amtrak would likely cost the American taxpayers nearly 20 percent more money than the entire five years of funding for a trust fund proposal. The latter solution has the bonus of creating a viable and less costly national rail passenger service.

At the same time, although there is a critical and immediate need, the picture is not all bleak. Between the 1st and 2nd quarter this year, Amtrak's year-end cash deficit projection, after five months of actual financial data, has improved from $96 million to $76 million. I also believe that the support exists in this Congress to finally put Amtrak on more equal footing with other modes. There are ten cosponsors of S. 436, three cosponsors of S. 634, and two other bills being introduced in the Senate which include the ½ cent provision. In addition, last year a non-binding "Sense of the Senate" amendment to the fiscal year 1997 Budget Resolution, supporting the creation of an Intercity Passenger Rail Account using ½ cent of the fuel tax, was adopted 57–43, and later included in the conference report. With the reauthorization of ISTEA approaching, I think the appropriate vehicle exists. The time is right.

I can share with you the vision of what Amtrak can be in a few years if a trust fund is provided. High-speed service will be operating in the Northeast, strong state investment and partnerships in the West, and profitable mail and express-laden long-distance trains connecting both coasts. The path to that is the half-cent and legislative reform that will allow Amtrak to maintain a national system, complete our high-speed rail initiatives, and develop the business partnerships with the freight railroads. Adequate operating funds and a dedicated capital funding source will deliver an Amtrak that will be, for the first time, free of federal operating support.

There are no simple solutions to Amtrak finances, but it is very clear that Amtrak cannot continue to go on as we have been, bleeding the corporation and trying to achieve prosperity by downsizing the system. I sat here two years ago and presented a workable plan to achieve operating self-sufficiency, and I sit here today with the same proposal, seeking your help. It is also very clear Congress cannot make Amtrak better simply by wishing it so.

Unfortunately, we no longer have the luxury of time. Without adequate resources there is only a limited amount of time that Amtrak can be held together and a national system preserved. The GAO report should be viewed as a call to action. Over the next few months, I hope we at Amtrak can work with this Committee, and the United States Congress, to save and strengthen this railroad for future generations of Americans.

I am enclosing a detailed summary of our fiscal year 1998 Grant Request, and I look forward to answering any questions the Committee may have.

EXPLANATION OF AMTRAK'S FISCAL YEAR 1998 REQUEST

Amtrak requests: $245 million in federal operating assistance; $751 million in federal capital (which includes funding for the Northeast Corridor); $142 million in excess RRTA for fiscal year 1998.

Operating Support

Amtrak is requesting $245.0 million in operating support in fiscal year 1998. It represents an increase of $45 million or 22.5 percent increase over the original appropriation for fiscal year 1997 of $200 million before the Omnibus Appropriations Act (OAA) of 1997. The $245 million is $20 million over the original glidepath amount for fiscal year 1998 in order to help compensate for the cumulative fiscal

years 1995–1997 underfunding and help limit the impacts of the fiscal year 1997 cash deficit on fiscal year 1998, keeping Amtrak on plan for fiscal years 1998–2002.

Excess RRTA Contribution for fiscal year 1998

The sum of $142.0 million represents the current estimate for actual mandatory excess RRTA liabilities in fiscal year 1998. The methodology for calculating the liability has been shared with OMB and was submitted to Congress and this Subcommittee on February 15. It is Amtrak's position that the excess RRTA liability should be fully funded by the federal government and not considered a part of federal operating support to Amtrak. The RRTA account of $142 million is a mandatory spending provision that has nothing to do with Amtrak's cost of providing rail passenger service. These costs are based on a federal formula that requires Amtrak to pay the retirement costs of former freight railroad employees who have never worked for Amtrak. These costs will exist whether or not Amtrak continues its operations and these payments rightfully belong in a mandatory account. As stated in the fiscal years 1997–2002 Strategic Business Plan, Amtrak must continue to either receive full reimbursement from the federal government for these federally mandated excess RRTA costs or be relieved from paying them altogether.

Federal Capital Support

The fiscal year 1998 grant request is $751 million or the equivalent of ½ cent of the existing federal motor fuels excise tax.[1] This is only 68 percent of Amtrak's fiscal year 1998 capital sources and 52 percent of our fiscal year 1998 needs. It is assumed that the difference between total needs and sources of funds can be commercially borrowed as long as a dedicated capital source is secured for the total amount over our planning period. Fiscal year 1998 is probably the most critical year for achieving the full implementation of high-speed rail in the Northeast Corridor in fiscal year 2000. Our February 15 grant request submission breaks this out in much greater detail.

STATEMENT OF PHYLLIS SCHEINBERG

Senator SHELBY. Ms. Scheinberg.

Ms. SCHEINBERG. Thank you, Mr. Chairman and Senator Lautenberg. I appreciate the opportunity to be here today to discuss Amtrak's financial condition.

As you know, Amtrak's passenger rail service has never been profitable and to date the Federal Government has provided Amtrak with over $19 billion for operating and capital expenses. In 1995, in response to continually growing losses, Amtrak developed a strategic plan to increase revenues and control cost growth, with the goal of eliminating its need for Federal operating subsidies by the year 2002.

On the positive side, Amtrak's actions to reduce some routes and services, cut management positions, and raise fares have helped improve its financial performance. For example, Amtrak's net operating losses—total revenues less total expenses—declined from over $1 billion to about three-quarters of a billion dollars in 1996.

Despite these efforts, Amtrak is projecting that its 1997 net losses may be even greater than those of last year. These losses are one indication that Amtrak is still in a very precarious financial position. It remains heavily dependent on Federal support to meet its operating and capital needs. Amtrak's expenses have exceeded its revenues by at least $760 million in every year since 1988. Amtrak had hoped that increases in passenger revenues would help close the gap, but for the most part passenger revenues have actually decreased when adjusted for inflation.

Furthermore, Amtrak's operating deficits exceed the Federal operating subsidy. In 1996 this gap reached $82 million, the highest

[1] April 11 scoring by CBO equals $800 million.

level of any of the last 9 years. To pay for the gap between operating deficits and Federal operating subsidies, Amtrak has had to draw upon its financial resources. To illustrate, Amtrak's working capital position indicates its ability to pay short-term bills out of current assets, such as cash and short-term receivables. Amtrak's working capital has decreased from a surplus position in the late 1980's to a deficit of $195 million in 1996. This affects Amtrak's ability to pay its bills over the short term.

A related concern is with Amtrak's debt level, which has doubled since 1993 from about one-half of a billion dollars to almost $1 billion. Amtrak expects to borrow an additional $1 billion in 1999 to finance high-speed trainsets and maintenance facilities.

As Amtrak's debt levels have increased, interest expenses on this debt have also increased. In fact, over the last 4 years annual interest expenses have tripled, from about $21 million to about $60 million. Interest expenses now consume over 21 percent of the Federal operating subsidy and will consume an even higher portion of its Federal operating subsidies as Amtrak assumes more debt.

Amtrak's goal of eliminating Federal operating subsidies by the year 2002 is heavily dependent on capital investment. For the Northeast corridor alone, Amtrak estimates that an additional $1.4 billion are needed to bring high-speed rail service between New York and Boston and about $2 billion are needed over the next few years for the south end of the corridor just to preserve the ability to operate at existing service levels.

However, an increasing portion of Amtrak's Federal capital subsidy is being devoted to debt service, capital overhauls, and legally mandated uses, such as equipment modifications and environmental cleanup. As a result, the portion of the capital grant available to meet general capital investment needs continues to shrink. In fiscal year 1997 only about 5 percent of Amtrak's Federal capital grant of $223 million is expected to be available for general capital needs.

Regarding the future, Amtrak anticipates significantly increased levels of Federal capital assistance, about $750 million per year, compared to the $478 million in capital funding that Amtrak received this year. However, even with increased capital funding, Amtrak will continue to find it difficult to take the actions that are necessary to further reduce its costs. While Amtrak was somewhat successful in making route and service adjustments in fiscal year 1995, it was less successful in 1997. Amtrak has also been unsuccessful in negotiating productivity improvements with labor.

To conclude, although Amtrak's business plans have helped reduce net losses, we see little hope for Amtrak to reach the goal of operating self-sufficiency by the year 2002. We believe that as currently constituted Amtrak will continue to require significant Federal financial support, both operating and capital, well into the future.

Mr. Chairman, thank you. That concludes my statement.

Senator SHELBY. Thank you.

FEDERAL GOVERNMENT'S LIABILITY IF AMTRAK LIQUIDATED

Ms. Molitoris, the Federal Government I understand has appropriated over $19 billion for Amtrak since the corporation's forma-

tion in 1971. If continued Federal funding was not provided this year for Amtrak, either by a dedicated trust fund or appropriation, what would the Federal Government's liability be in the event of a liquidation of the corporation?

Ms. MOLITORIS. Well, of course, Mr. Chairman——

Senator SHELBY. In that event?

Ms. MOLITORIS. We agree that the corporation is crucial to the transportation network of the country. Under the scenario that you paint, of course, there is a real danger of the loss of a true important transportation resource. That is the Northeast corridor, which, as I am sure you are aware, is a lifeline for hundreds of thousands of commuter travelers.

The agreement, the lease arrangement that Amtrak has with the Federal Government, is one of 1,000 years with a balloon payment at the end. So there is a question of technically the amount of value in 1997, considering that kind of a lease, is small and the concern, of course, would be when this was litigated, as it surely would be, what the decision of any court would be.

The Congress does have the ability by congressional action to accelerate that value to protect that asset for the Federal Government.

Mr. DOWNS. Mr. Chairman, if I might.

Senator SHELBY. Sure, Mr. Downs.

Mr. DOWNS. Two years ago the House Budget Committee asked that CBO score that scenario. It was $5 billion.

Senator SHELBY. It was $5 billion.

Mr. DOWNS. According to CBO.

Senator SHELBY. Scored at $5 billion.

Mr. DOWNS. Yes; $5 billion.

OPPORTUNITIES FOR PRIVATIZATION

Senator SHELBY. I understand that the Northeast corridor is profitable, is that correct?

Ms. MOLITORIS. The Metroliners, Mr. Chairman, on the Northeast corridor are for the first time in the history of the corporation making a profit, and I think that indicates the kind of progress the company is making.

Senator SHELBY. Is that an indication that the Northeast corridor could possibly be run by a private company if Amtrak were liquidated?

Ms. MOLITORIS. Well, I would comment, certainly with the kind of management that Amtrak is receiving, the Metroliners are very popular and are making a profit for the company.

I would like to comment for the record with regard to Senator Gorton's comments, that we are responsible for the privatization study that he requested and I want you to know that we are doing this in a very thoughtful way. We have already reached out with meetings with local and State governments and throughout the system, and we will be providing the Congress with that report in August. So I do not know where the Senator got his information, but, being the responsible party, I would like to make that statement.

Senator SHELBY. Well, that is good.

You did not suggest that a private company could profitably run a national railroad, did you?

Ms. MOLITORIS. What I would like to suggest is that I think the full report will do a better job of giving you all of the elements. I think it is interesting——

Senator SHELBY. When is that coming?

Ms. MOLITORIS. That is due in August, Mr. Chairman.

I could comment on efforts throughout the world in terms of privatization. I think it is very important for someone studying this issue to recognize that so-called privatization, which is defined in a variety of ways, in Britain, Germany, and elsewhere, Japan, almost exclusively involves the government owning and maintaining the right of way while the operational franchise for operating those systems then goes to a private company.

So I am not sure that most people who use the term "privatization" consider that kind of a split.

Senator SHELBY. It is some kind of a mix, anyway, is it not?

Ms. MOLITORIS. Yes; it is, sir.

AMTRAK'S FEDERAL SUBSIDY ON PER PASSENGER BASIS

Senator SHELBY. Ms. Scheinberg, how does the Federal subsidy per passenger for Amtrak, noncommuter passengers, compare to the Federal cost per passenger for commercial airline passengers? Is there any data available on Federal costs per passenger for intercity business service? Have you gotten any into that?

Ms. SCHEINBERG. I do not have information on the intercity bus service, but if you look at the general fund Federal subsidy to commercial airlines and if you look at that portion of the airline industry, it is about $1.50 per emplanement, and if you look at the Amtrak direct Federal subsidy it comes out to about $38 per passenger trip.

Senator SHELBY. It is $38?

Mr. DOWNS. Mr. Chairman, if I might.

Senator SHELBY. Mr. Downs.

Mr. DOWNS. The Congressional Research Service, at the request of Senator Pressler, was asked the same question. They did three comparisons. One was highways from general funds, including user fees. That is all local property, sales, and income tax. That was $79 per person in the United States on highway, according to CRS.

The second was Amtrak's. This was done on 1990 data to make sure that it was completely clean. CRS said the number was $27.

On aviation, they recognized that there was a $19 billion general fund subsidy to general domestic aviation before any user fees were imposed and the inability to quantify the subsidy that goes to aviation for the use of tax exempt bonding and property tax exemptions for airports as a business, but said it was probably in the billions of dollars as a subsidy.

It is a report that I would be glad to share with the committee.

AMTRAK'S LONG-TERM FUNDING NEEDS

Senator SHELBY. Mr. Downs, let us just assume for a moment a best case scenario. Let us say that Congress enacts the one-half-penny trust fund for capital expenses, that Amtrak is able to offset more of its operating losses with increased revenue from high-

speed services in the Northeast corridor and other savings and efficiencies realized along the way. A dedicated funding resource based on Federal gas tax revenues is authorized for only 5 years if it happens. What would you do when it goes away?

Mr. DOWNS. We have been told, and I have been asked this same question, will it be able to go away? And that was asked by Senator Warner, Senator Chafee, Senator Moynihan, Senator Roth in various hearings that I have been through in the last 3 weeks.

The answer is, We will probably have some need for some ongoing capital because no railroad, with the exception of the Illinois Central and the Norfolk Southern, in the United States makes its full cost of capital. Not even railroads as large as the Union Pacific-Southern Pacific, for instance, make their full cost of capital yet.

We have said that part of the key to that will be what the Congress decides to let States do with Federal transportation dollars about funding flexibility. It depends on what we can do about developing business alliances where others can make investments in us on a capital basis, for instance ongoing power distribution investments in the corridor based on an ability to partner with power companies in the Northeast.

We say we will need capital. We do not believe that it is necessary to extend the one-half-cent gas tax trust fund beyond its 5-year life. Senator Chafee has said that his expectation was that it would return to deficit reduction. Others have said that it is going to go into the highway trust fund account. Mr. Shuster has made it clear in his authorization bill that if it does include an authorization for a trust fund, it would be a 5-year limited life. Senate Finance has said the exact same thing.

Senator SHELBY. Do you see in the foreseeable future, Mr. Downs, any scenario where you would not need some kind of subsidy?

Mr. DOWNS. The only thing that we have said that we will continue to need is some way of funding excess railroad retirement long term. We have said that that is in effect a subsidy to the existing freight railroads.

Senator SHELBY. How much money are you talking about?

Mr. DOWNS. $145 million a year that Amtrak pays into railroad retirement above whatever its normal charges would be. There are 800,000 retired railroad employees in the United States, almost all of them freight railroad employees. There are 175,000 existing employees in the railroad industry, so the charges are pretty hefty. Most of those, 95 percent of those employees, are freight railroad employees.

We believe it is unfair to consider that a subsidy to Amtrak. If Amtrak went away tomorrow, those charges would be spread immediately to the freight railroads. We think that that needs to be addressed, not as a subsidy to Amtrak, but a subsidy to the railroad retirement system.

Senator SHELBY. Well, it certainly does not need to be hidden, does it?

Mr. DOWNS. No; it does not.

Senator SHELBY. Mr. Downs, in your testimony you state that Amtrak provides a necessary service for rural communities as well as urban corridors. Do you still believe that?

Mr. DOWNS. Absolutely, more than ever.

Senator SHELBY. Give us several examples?

Mr. DOWNS. I was meeting with some folks in Haver, MT. The mayor said: "You know, everybody, the rest of the world has kind of left us all behind. We do not have essential air service. We have a highway. Sometimes in the winter up here, it closes. If you cannot drive a car or a four-wheel vehicle, you do not have mobility up here. We do not have economic development resources like an airport. We do not have it in terms of the kind of rail system that the rest of the country, particularly the east and west coast, take for granted."

That railroad from Haver, MT, to Minot, ND, is an essential part of business development and local transportation for them, for seniors, for young people, and for the handicapped. He said it is just an essential part of the railroad business.

Anniston, AL, will say the same thing about connections to places like New Orleans and Birmingham. We do provide that linkage, and we are proud of it.

ROUTE PROFITABILITY

Senator SHELBY. Mr. Downs, it is my understanding that, of the Amtrak routes, the Metroliners between Washington, DC, and New York are the only profitable routes. Is that right?

Mr. DOWNS. On a fully allocated cost basis.

Senator SHELBY. OK.

Mr. DOWNS. The next closest is, I believe, AutoTrain.

Senator SHELBY. Have you thought about trying to close or realign some of your most unprofitable routes? That is just the way you do business, is it not?

Mr. DOWNS. We have. This committee stopped that process last year by saying that they thought we ought to defer those route closings for 6 months to give those States the opportunity to see if they wanted to partner. Those routes, particularly the Pioneer and the Desert Wind, Senator Reid's service, disappears on the 11th of this month. Service to eastern Oregon, Wyoming, Idaho, on the Pioneer disappears. The Texas legislature is still struggling with whether or not they are actually going to invest enough money to keep the Texas Eagle going until the 1st of October. If they do not, that service will go away.

We have said we have to do that. Everybody said be a business. We are now about 20 percent smaller than we were 36 months ago. We are several thousand employees smaller as a result of that. We think we are more efficient. But we have kept every one of those commitments about downsizing the railroad to make it more businesslike.

Ms. MOLITORIS. Mr. Chairman, if I might.

Senator SHELBY. Sure, go ahead.

Ms. MOLITORIS. I would like to comment on cutting your way to health. You mentioned, your comment was: That is the way you do business, is it not?

Senator SHELBY. Well, you do, but you do not cut your heart out.

Ms. MOLITORIS. Right, or the arteries, either.

And I want to make this comment. Certainly all the biggest and most profitable, most healthy passenger railroads in the world, es-

pecially in Japan, have an interesting mission statement, and that is—for example, Japan East, which makes more money than any other passenger railroad because they have almost unlimited passengers, that 50 percent of their revenues will come from nonpassenger sources.

Mr. Downs mentioned that the last time the rail passenger service was close to break-even it was because they had mail and express. It was not until just a few months ago that Amtrak was looking at even enhancing the mail and express that they already had.

So if you cut away vital routes, you cannot even have the opportunity for very valuable and important express service. So I want to just get for the record that that is not always as simple as it sounds. Some people think, well, you just cut, cut, cut until you somehow achieve health, and with this railroad that is not possible.

LABOR-RELATED COSTS

Senator SHELBY. Under current rail labor laws, I understand Amtrak is required to pay up to 6 years salary to anyone who loses their job as a result of Amtrak's reduction or terminating service. Would the administration support revising this provision to allow labor unions and Amtrak management to negotiate a more workable solution?

Ms. MOLITORIS. Well, Mr. Chairman——

Senator SHELBY. Have you thought about it?

Ms. MOLITORIS. In the discussions of last year the administration continued to support the opportunity for Amtrak management and labor to come to an agreement that was satisfactory to both. I think it is also—I would like to have for the record that C2, as it is called, is sometimes——

Senator SHELBY. The 6-year provision?

Ms. MOLITORIS. Yes, sir; is sometimes held out to be much more significant expense than it really ends up being. If the railroad closed everything, then that $5 billion that Mr. Downs mentioned would occur. But in fact, even in the route closings that the railroad has accomplished, the estimates of the cost were much more than they actually ended up being, something in the neighborhood of approximately $10,000 per person. So I think——

Senator SHELBY. So it is an overstatement thus far?

Ms. MOLITORIS. Well, I think that railroad labor wants this railroad to succeed and has a history of working to have good agreements with management. So I just want to point out that the facts do not always substantiate this, which is always pulled out as somehow the panacea for the health of the railroad.

Senator SHELBY. GAO, for example, stated that Amtrak has been unsuccessful in negotiating productivity improvements with the labor unions. Many of the same craft unions are represented at both freight rail and Amtrak labor negotiations and I know there is pressure from labor to secure equally favorable agreements with Amtrak—that would be logical—as have been secured with the freight railroads.

As a result, in the last 6 months many freight labor union agreements have been negotiated, while I understand that Amtrak is stuck at the table, bargaining still. Is that correct?

Ms. MOLITORIS. I think Mr. Downs is better able to respond to that.

Senator SHELBY. Mr. Downs, is that right?

Mr. DOWNS. We have 13 labor unions, 25 collective bargaining agreements. All of them have expired. Some of them have been expired for as long as 2½ years. You are absolutely right that part of the motivation with rail labor was to conclude their freight railroad contracts. Freight railroads had a lot more in terms of profits and could afford a better settlement, and they are also 90 percent of the employment in the rail labor industry. So it was important for them to finish those agreements first.

We have said that we were willing to do gain-sharing type contracts, that we are not asking for give-backs, not asking for fundamental changes in the way that the contracts are drawn. We have said, however, that if we can make changes in the way work rules are put together, around the way health care is provided, or in other areas, that we would count that in and that it would have zero impact on our business plan.

It has been very difficult because of the disparity between the impact of a freight railroad agreement on Amtrak. We have done some calculations. Over 5 years, the freight railroad agreement would cost Amtrak about $220 million. We have not got $220 million.

Ultimately, that issue may be resolved by Congress because, as you know, the Rail Labor Act says that if there is a release from mediation and there is a job action and the President deems it in the national interest, there is a Presidential emergency board appointed. They make a finding. If the parties still disagree at the end of that finding and they are released from further action, then the issue is brought here to Congress to resolve.

So ultimately, if the question is what assurance could the Congress have about a reasonable outcome on labor negotiations, this Congress will perhaps have the ultimate say about what those outcomes are.

Senator SHELBY. Senator Lautenberg, thanks for your indulgence.

ADMINISTRATION'S BUDGET REQUEST FOR AMTRAK

Senator LAUTENBERG. Thank you, Mr. Chairman. The questions were interesting ones and I think ought to be answered, and they were.

Ms. Molitoris, the administration's request for Amtrak for 1998 is substantially lower than the levels requested by Amtrak itself. If the administration's budget request was enacted, would that permit us to avoid the system shutdown that Mr. Downs has warned us about by the summer of 1998?

Ms. MOLITORIS. Mr. Chairman, Senator Lautenberg, the administration's budget is barebones. I have said that clearly. There is no fat in it at all. We need every cent.

Senator LAUTENBERG. Is there any marrow in it?

Ms. MOLITORIS. There is marrow.

Clearly, Senator Lautenberg, I think, given our challenges with deficit reduction, the administration has made a clear statement of support and has invested over the life of this administration more

in the last 4 years for Amtrak than in the previous 10. However, we recognize this will not be easy. The cash problem that Mr. Downs has raised he is addressing.

In all the years on the board since the Clinton administration has arrived, the projected deficits by Amtrak have always been in the neighborhood of $200 million or something in that area and the board has always asked for actions by management to address that deficit. The same continues to go on. We believe Amtrak is going to have to push hard with the administration's request, cut costs, increase the partnerships with States, increase the private sector partnerships. And there are many opportunities. We know that mail and express can produce some positive effects. We know some more partnerships with private industry can produce effects.

But we also know that it is going to be very, very tight for 1998. As I mentioned, we do not know at this time if the numbers that Mr. Downey mentioned of somewhere around $10 billion with $7 billion authority will net any more opportunity for Amtrak or not.

Senator LAUTENBERG. I think that I heard you say that—no.

Ms. MOLITORIS. I said yes, Mr. Chairman, and Senator Lautenberg.

Senator LAUTENBERG. Well, by the time we get finished with these partnerships and the agreements, and considering that there are political ramifications to every one of these decisions, I could have a full head of white hair by that time. It is going to take a long time, I would believe. I think we need more.

Mr. Downs, what do you—can you give us a little information about how you see the administration's budget request? Does it seem to be adequate to you?

Mr. DOWNS. There is a leading question.

Senator LAUTENBERG. Speak freely, young man. You are among friends.

Mr. DOWNS. Speak freely?

I had long and difficult arguments with the Office of Management and Budget over the President's budget request. We said we did not make the request for $245 million lightly. We did not make it because we thought that it was kind of a nice to do, pie in the sky kind of target. We explained that on a cash basis we would have a very difficult time making it at the administration's number.

The answer was: We are sorry; that is all the room there was in their budget. It was not necessarily a longer story about what they thought it meant or how this whole process looked over a couple of years. It was simply that there was no room in the inn for anything more.

It does make for a very difficult environment for labor contract negotiations. It creates no room. It makes it a shrinking sum pie. It makes for a kind of hostile, antagonistic environment with labor. Labor supported a larger number with the administration aggressively.

The sum of $200 million is one of the reasons why we will probably face a liquidity crisis at the end of fiscal 1998. We will be clearly challenged, I think is the right term, by a $200 million operating subsidy number.

Ms. SCHEINBERG. Senator Lautenberg, may I address the question?

Senator LAUTENBERG. Please, yes.

Ms. SCHEINBERG. I think the $43 million that the administration's budget or operating subsidy is lower than the Amtrak business plan assumes will require, if you follow the business plan assumptions, that that money—the lack of that $43 million will require Amtrak to further borrow for its short-term needs and lead to the crisis that Mr. Downs is discussing.

On the capital side, the administration's budget is $328 million lower than what Amtrak is assuming. That level of capital support will not allow Amtrak to make the capital improvements that it needs to improve the quality of service, to attract more riders and increase revenues.

Senator LAUTENBERG. This chart tells you something about the prospect of additional borrowing. We could get a larger page, of course. That would enable us to run the bar higher.

Mr. DOWNS. Senator, I think our bankers have told us that we are probably at the limits of our credit in terms of long-term borrowing, unless there is something unique that happens in our future, that we have probably exhausted all of our capabilities with the last round of high-speed trainsets.

Senator LAUTENBERG. I am glad that these charts are not my EKG, I can tell you that.

NORTHEAST CORRIDOR

Ms. Scheinberg, do you know of any investment that holds the kind of promise that the Northeast corridor high-speed project could offer in terms of generating substantial revenues to aid Amtrak's bottomline?

Ms. SCHEINBERG. The high-speed rail improvement project on the north end of the Northeast corridor is the best investment that Amtrak can make. As we discussed, the Metroliner is the only route that covers all its fully allocated costs, and Amtrak's plans are to extend that type of service to the north end of the corridor. By doing that and in making that investment, the hope is to generate the revenues that would cover, more than cover, the cost of that route and apply that surplus to the rest of the system.

Senator LAUTENBERG. So positive cash flow could result.

I have got to tell you something. I use Amtrak, Mr. Chairman, between here and Newark, and the Metroliner is good service. But it is not a great ride, the equipment. It is the only place I can go to find anything older than me around here. It bumps and it grinds. People try to do their best, but it is just not up to the kind of service that we ought to be offering.

With that, it is a pretty good investment in terms of railroad as we sit here. There is nothing else in the system that offers that kind of opportunity.

Ms. Molitoris, you were with me and Vice President Gore when we celebrated the signing of the new high speed train sets for the Northeast corridor. At the time the administration fully endorsed the goal of achieving 3-hour high speed service with the modern trainsets by the end of 1999, to be sure.

Do you believe that we can have that high-speed service—and 3 hours is not as good as it could be, but it would be good—based on the funding level that you have requested in your fiscal year 1998 budget?

Ms. MOLITORIS. Mr. Chairman, Senator Lautenberg, of course we need to look at the whole NEXTEA proposal to really look at how the administration plans to invest in those high-speed trains, because the NEXTEA proposal stretches out to the year 2003. And if you look at our total investment package, on the capital side we are suggesting 92 percent of what Amtrak itself is asking and 96 percent of the operating.

So I do not think it is insignificant. But I think we must say that the Federal funds cannot do it alone. There is no major transportation system that gets 100 percent of its funding from the Feds, and the board of Amtrak is working with management to continually focus on new ways to instigate additional revenue, cost cutting, and ways to achieve all the goals in the business plan.

The goal of the business plan is high-speed service, and of course we all want that because, as Ms. Scheinberg identified, it is going to be profitable, it is going to help the bottomline of Amtrak.

The difficulty that we are facing is the shorter term; 1998 will be very difficult. I think that the NEXTEA proposal clearly shows the investment and the support of those trainsets and the high-speed service. And I might comment that they are bending the steel now and those bodies will be ready for testing by the end of the summer.

Senator LAUTENBERG. So you said they got 90 percent of their request, Amtrak?

Ms. MOLITORIS. It totals 90 percent of what Amtrak——

Senator LAUTENBERG. So you are saying to this patient, you are going to get 90 percent of the oxygen you need, and if you are around here a couple years longer than we expect you to be you are going to get the full shot. Because you said they stretched out the service, so we cannot possibly execute all these refinements, develop all these plans, get them into place—the interest and debt payments here are overpowering—by the original date. So we are now going to, you said, maybe 2003 if I heard you?

Ms. MOLITORIS. No, sir; what I am saying to you is, if we are going to use your analogy of oxygen, that the Federal Government pharmacy will give 90 percent of the oxygen and they will have to get an extra tube of oxygen from other sources, another pharmacy.

The fact is there is a partnership that has to occur. The States are stepping up to the plate. I have mentioned that they have doubled their support of Amtrak in the last year. They are buying equipment because Amtrak is so important to them.

Senator LAUTENBERG. Because Amtrak is important, but it is also so deficient.

What happens in your judgment if the railroad does go into some default kind of position? What happens to commuter service? Is it affected? We have got New Jersey Transit, SEPTA, MTA, MARC, MBTA. Is there any impact at all on their operating costs, their ability to perform service?

Ms. MOLITORIS. Mr. Chairman, Senator Lautenberg, not only is there some, there is tremendous impact. In fact, I do not believe

the $5 billion reflects that kind of cost, because of course not only would Amtrak's service on the Northeast corridor be in danger, but the commuter services on the NEC would be in danger as well.

That is why we continually emphasize this is a partnership, and the importance of Amtrak cannot be evaluated by their passengers alone, because in fact on the Northeast corridor three-quarters of the passengers are commuter passengers.

Senator LAUTENBERG. So the partnership proposal is the one that says, if you want to keep this system going, that you are going to be the pharmacy necessary to keep this alive. So you can make your choice whether you just turn people to the highways and the airways and all that, and we will have to do it right away.

Ms. MOLITORIS. Mr. Chairman——

Senator LAUTENBERG. I would not want to be operating that pharmacy and to give you that decision, I must tell you.

What about the costs or the involvement of the freight railroads to this operating annual cost that we have? Do you get any assistance, Mr. Downs, from the freight railroad community in support of the one-half-cent proposal, for instance?

Mr. DOWNS. I thought you were going to say there for a minute, do we get any respect from the freight railroad industry. And the answer to that would be——

Senator LAUTENBERG. Rodney—and I am talking about, not Slater, Dangerfield. Do not expect respect also.

Mr. DOWNS. The American Association of Railroads' unofficial position, which I am not sure they have delivered as testimony for the record, is that because they pay 5.3 cents of diesel fuel tax to the deficit reduction fund at Treasury, they will likely oppose the creation of a one-half-cent gas tax trust fund for Amtrak if it includes any of the revenues that they pay to deficit reduction. They do not want to be paying into an Amtrak trust fund for any purpose.

I think that is a relatively convoluted argument. I have said that time and again. They cannot necessarily track where the revenue goes, into Treasury or into trust funds. But I have been unable to dissuade them from that.

At the same time, though, I have to say that we are having a lot of luck in developing working partnerships about the development of this new business, mail and express, with them. These will be joint ventures with them that will be very helpful to both of us. I think that their position so far on the trust fund is a bit murky.

Senator LAUTENBERG. If Amtrak does go under, the freights will have to pay some significant contribution to Amtrak's railroad retirement bill, will they not?

Mr. DOWNS. We currently pay total, management and employees and Federal payment, we pay $300 million a year into railroad retirement. If this railroad goes away, all of those costs, all $300 million, get absorbed into the railroad retirement fund and they are then spread to the freight railroads. Do they have an interest in not having that happen? You bet.

Senator LAUTENBERG. I would imagine.

Mr. Chairman, I have got a couple of other questions, but I do not want to keep our panel or the subcommittee here any longer. I think it is fairly obvious that more has to be done, and it cannot

just be new innovative partnership designs or the creation of new business opportunities, which are coming at a time which we would describe as under the gun.

I would hope that the administration will find a way to boost its transportation funding request to a more satisfactory level. I talk as a member of the negotiating committee on budget as well. But we have to make this investment. The communities are crying for it, the States are demanding it, and we are going to have to find a way to do it, Mr. Chairman.

Thank you very much.

Senator SHELBY. Thank you, Senator Lautenberg.

SUBMITTED QUESTIONS

There will be additional questions which will be submitted in writing, and we urge you to respond to them within a reasonable period of time.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR SHELBY

CAPITAL ASSETS AND EXPENSES

NORTHEAST CORRIDOR IMPROVEMENT PROJECT

Question. When does Amtrak anticipate the completion of Northeast Corridor (NEC) electrification and commencement of high-speed rail service throughout the Corridor? What is the end goal of this project?

Answer. The program is on schedule. Before the end of 1999, infrastructure and electrification will have been completed and Boston to Washington high-speed service will have begun, using electric power and no longer requiring a time consuming engine change in New Haven. The end goal of the program is to provide reliable high-speed rail service between Boston and New York in approximately three hours and between New York and Washington, DC, in under three hours.

Question. With the commencement of high-speed service throughout the Northeast Corridor, what increase in ridership and revenue does Amtrak expect to realize on an annual basis? Have any independent auditors or other interested parties corroborated these projections?

Answer. The revenue forecasts for high-speed rail service in the Northeast Corridor are based on extensive market analysis and modeling which incorporate all critical factors that drive market demand—travel time, trip frequency, fares, transportation alternatives and location of true passenger origination and destination.

The growth forecasted for high-speed rail is premised on significant travel time reductions that place the train trip in a competitive position with alternative transportation modes, service frequency increases, service reliability and quality improvements and a reasonable pricing structure that is competitive with, or complementary to, airfares.

Completion of electrification and high-speed rail investments (high horsepower locomotives, tilt-technology trainsets and infrastructure improvements) will reduce travel time between Boston and New York from four hours forty-five minutes to three hours. Southend travel time between New York and Washington, DC, will be reduced from three hours to two hours forty-five minutes.

The investment made to complete the electrification of the northend and the investment made to improve the track, signal, stations and other infrastructure will benefit both high-speed rail service as well as NortheastDirect service. Travel times for all trains will improve on the Corridor.

Service frequency increases drive a significant portion of forecasted revenue growth. The daily frequency of high-speed service increases on the northend from zero to eight roundtrips, while the current Metroliner service of 15-daily roundtrips on the southend will increase to high-speed service with 17-daily roundtrips. While this represents a 67 percent increase in roundtrips available, revenue estimates are not predicated on filling this to capacity.

Investments in equipment and infrastructure produce reliability improvements that strengthen Amtrak's products and increase revenues. Reduced infrastructure related delays and mechanical failures from employment of new, proven equipment will enhance on-time performance, the key factor to customer satisfaction. Less time will be devoted to maintenance and repair due to state-of-the-art diagnostic and communications systems and manufacturer-trained and -managed staff.

The NEC's current market share is 12 percent, with a 16 percent share of business travel and a 9 percent share on non-business travel. Current business travel along the Corridor is driven by the southend frequencies provided by the Metroliner service. When the market share is analyzed geographically, it is clear that Amtrak has the potential to increase ridership, particularly on the northend. The current market share for the north and south ends of the corridor are 7 percent and 16 percent respectively. Since there is no first class/high-speed service currently provided between Boston and New York, the advent of an incremental eight daily roundtrips high-speed trains will increase ridership and market share. To place the revenue forecasts in a market share perspective, the current market share of 12 percent needs only to grow to 14–15 percent for the forecasted revenues to be met.

Passenger rail provides amenities other modes do not offer, such as a level of interior comfort and access directly to and from urban centers. This access provides time savings and financial savings for travelers who do not need to arrange for transportation outside the urban core. These benefits have been considered in the assessment of comparative costs, value of alternate modes of transportation and the pricing for high-speed rail service.

From fiscal year 1996 to fiscal year 2000, ticket prices are assumed to be moderately inflated, with a premium then placed on first class service. Amtrak understands that high-speed rail will not compete pricewise with discount air carriers or short-lived promotional airfares. However, Amtrak's 2001 high-speed rail fares are very competitive with steady state airfares. Discount carriers that provide service in Northeast Corridor markets present an opportunity, not a risk, for Amtrak. Rather than compete with these airlines, Amtrak will be complementing the discount air service available in secondary markets. The NEC has already experienced revenue growth at stations that provide convenient access to these airports.

The resulting incremental revenue forecast for the full implementation of electrified service on the northend, and high-speed rail service throughout the Corridor totals $280 million annually. In fiscal year 2001, for example, these gross revenues will be partially offset by incremental operating costs and debt service of approximately $100 million, yielding net incremental benefits of approximately $180 million. Total ridership is expected to grow from the current volume of 11.1 million riders in fiscal year 1997 to 14.7 million riders in fiscal year 2001.

The assumptions used in the forecasting process are conservative and are supported by extensive market research, elasticity models, pricing analysis and sensitivity analysis. Three separate forecasting models have been used, with resulting revenue estimates within five percentage points of each other.

The best testament to the validity of the forecasts is that private, profitable corporations have partnered with Amtrak to finance the high-speed trainsets and maintenance facilities. This external funding stream was made possible because of the strength and legitimacy of the ridership and revenue forecasts.

Question. Amtrak estimates that $1,400,000.000 is needed to finish the Northeast Corridor high-speed rail project. How much total has been invested in the Northeast Corridor improvement project thus far? What is the year-to-year capital budget for improvements to the Northeast Corridor, beginning with fiscal year 1997 through fiscal year 2000?

Answer. The budget for the electrification and high-speed rail service program is $2.3 billion. Of this total, $810 million, or approximately 35 percent is being externally financed for trainset and maintenance facility costs. The remaining $1.5 billion is supported by Federal funds—$.9 billion has been appropriated to-date and $.6 billion is required to be funded.

These funding levels represent only the investment required for electrification and high-speed service. When state-of-good-repair, equipment overhaul, life/safety and other infrastructure needs are added to the electrification/high-speed rail requirements, the total capital program for fiscal year 1997 through fiscal year 2000 is estimated to be $597 million, $924 million, $557 million and $550 million respectively. This capital program is supported by federal funds, external financing and state/local funding. The Northeast Corridor's five-year capital program is premised on an average federal capital funding stream of $388 million per year.

Question. How much of Amtrak's $751,000,000 capital request for fiscal year 1998 would be utilized for improvements to the Northeast Corridor? Why doesn't the fis-

cal year 1998 federal grant request display NECIP funds versus general capital funds?

Answer. Based on the fiscal year 1997–2002 Strategic Capital Plan, the Northeast Corridor planned to invest $593 million in projects to be funded from federal capital sources and short-term borrowings. The breakdown between those two funding sources has not been determined. However, the process by which fiscal year 1998 capital projects will be chosen for funding (based on financial and non-financial factors), is currently underway, and with the completion of that process we will be able to determine exactly which Northeast Corridor projects would be funded, and from which sources.

The fiscal year 1998 Grant request does not request general capital and NECIP funding separately because Amtrak requested a dedicated source of capital equal to the revenues from ½ cent of the current gasoline tax (which at the time had been estimated to be $751 million). Those funds would be available to all organizational units within Amtrak and invested in the projects with the highest returns.

Question. Will Amtrak obligate all previously appropriated funds for the North Philadelphia station by September 1, 1997, as directed in the fiscal year 1997 conference report?

Answer. Amtrak has obligated all previously appropriated funds for the North Philadelphia station project.

Question. Over half of all Amtrak passengers use NEC services. What has been the Customer Satisfaction Index for the NEC in fiscal year 1994, fiscal year 1995 and fiscal year 1996?

Answer. Amtrak began measuring customer satisfaction in May 1996 through the use of monthly ridership surveys that measure customer satisfaction for fourteen characteristics of train service. The NEC Customer Satisfaction Index has risen from a score of 79 in May 1996 to the recent score of 85 in the second quarter of this fiscal year. These customer satisfaction statistics show a consistently improving trend line since the inception of the program for all NEC product lines. These increases are attributable in large measure to improved on-time performance and the NEC's priority focus on quality customer service.

Question. How much in revenues to Northeast Corridor operations return to Amtrak annually (fiscal years 1994, 1995, 1996 and projected end of 1997)? Do these figures include depreciation?

Answer. The Northeast Corridor Business Unit's first full year of operation was fiscal year 1995. In fiscal year 1995 and fiscal year 1996 the NEC contributed $1.3 million and $56.4 million in budget surpluses, respectively, to Amtrak's corporate-wide budget results ($12.4 million deficit in fiscal year 1995, $82.2 million deficit in fiscal year 1996). Amtrak's 1996 Annual report displays each Business Unit contribution to Amtrak's overall budget result for fiscal year 1995 and fiscal year 1996 (attached). The "budget result" is equal to all revenues and operating grants minus all expenses excluding depreciation, as reported in Amtrak's monthly and quarterly reports. The current year-end estimate (as of the end of May 1997) for NEC's fiscal year 1997 budget surplus is $109 million. This estimate includes eight months of actual financial results and four months of forecast.

TABLE 1: FISCAL YEARS 1995 AND 1996 OPERATING RESULTS BY MAJOR BUSINESS UNIT

[Dollars in millions]

Question. Recently, the FRA issued a notice of proposed rulemaking that would require improved safety in train cars and seats. What efforts have been devoted to assuring that the NECIP high-speed rail trainsets meet the letter and spirit of the rail safety rulemaking? Are safety engineers involved in developing the specifications for the trainsets?

Answer. Every aspect of existing and proposed rules for passenger equipment safety were included as performance requirements in the design and manufacture of the NECIP high-speed rail trainsets. The design of the trainsets is undergoing an intense safety analysis, forcing mitigation through design, and is complemented with a System Safety Plan (Amtrak's comprehensive management tool for implementing safe operations). Particular emphasis has been placed on passenger compartments, with an eye to maintaining the safest environments during all operating conditions. Examples include:

—Trainset structure is designed to manage and dissipate energy during a collision, creating "crumple" zones in non-passenger areas to keep passenger compartments intact.

—All windows on coaches will also be emergency exits.

—Lighted strips will illuminate aisles in event of power loss.

—Overhead luggage compartments will contain and secure carry-on items inside compartments, instead of on open shelves.

—Seats will conform to new standards for securement strength.

—On-board systems to monitor and control speed will include the latest requirements in proposed rulemaking relating to civil speed enforcement.

In addition, Amtrak is working with the FRA on a Notice of Particular Applicability to define the requirements of the new Advanced Civil Speed Enforcement System (ACSES), which will be incorporated into the new trainsets to enforce civil speed restrictions. This state-of-the-art system will constitute a fundamental improvement in safety on the Northeast Corridor and is an essential component of Amtrak's program to operate at speeds up to 150 mph.

The coordination between Amtrak and the FRA in the design of the high-speed trainsets has been extraordinary. During development of the trainset specifications between 1993 and 1996, Amtrak design and safety engineers met frequently with the FRA to review all safety issues and develop new safety standards for what will be the fastest trains operating in the United States. This iterative process resulted in changes to the specifications for the trainsets in 1994. The FRA has deemed the new trainsets to be the safest trains ever built.

The joint work on trainset safety spurred by the high-speed trainset procurement has had benefits for safety in the rest of the industry—this joint work has served as the basis for many of the changes the FRA is now seeking in its rulemaking for all passenger trains.

Question. Please detail how many new jobs will be created in American cities and communities through the manufacture, testing, and deployment of the new high-speed trainsets.

Answer. High-speed rail generates many direct and indirect jobs:

—100 suppliers from 23 states are benefiting from the contract for high-speed trainsets.

—Thousands of design and construction jobs have already been created by the contracts awarded for infrastructure and electrification work.

—Amtrak ridership is expected to grow from the current level of 11.1 million passengers per year to 14.7 million passengers annually due to the implementation of high-speed rail service. These customers will be delivered to the stations, city centers, and surrounding communities served by Amtrak and commuter rail, providing an engine for economic development. This has already happened on a smaller scale with Metroliner service. The advent of this transportation alternative has helped spur development in the New York to Washington D.C. corridor. Leaders in the political and business community in cities such as Philadelphia, Wilmington and Baltimore have also looked ahead and understand the potential that high-speed rail service brings. In Baltimore, the local business community, as well as the City and State, have joined Amtrak in investing in station improvements to handle an increasing number of passengers more quickly, safely, and easily. In Wilmington and in Philadelphia, local businesses and universities, the cities, states, and Amtrak are joining in distinct programs to redevelop the stations and their surrounding neighborhoods. High-speed rail service opens up enormous opportunities for economic growth to cities located on the north end of the Corridor that can take advantage of proximity to major city markets such as New York and Boston.

—The Coalition of Northeastern Governors has estimated that nearly 5,000 new jobs and $440 million per year will be generated indirectly in that region by

Amtrak's high-speed rail once it is up and running—businesses and communities enjoying an improved transportation system will be more productive.

Question. Please update the Committee on the recent offer by Guilford to purchase the Northeast Corridor.

Answer. The purchase offer was submitted by Guilford to the United States Secretary of Transportation, Amtrak's majority shareholder. The Secretary of Transportation is expected to formally respond.

OTHER CAPITAL ISSUES

Question. What is the statutory provision regarding cross-utilization of general capital funds for the Northeast Corridor Improvement Program? How much general capital funding has been crosswalked to NECIP in fiscal years 1995, 1996, and anticipated for 1997?

Answer. There is no statutory prohibition on Amtrak using general capital grants for NECIP. But NECIP grant funds may be used only for NECIP as defined in Pub. L. No. 104–205, 110 Stat. 2961 and 2963 (1996).

For fiscal year 1994, the last year for which appropriations for Amtrak were authorized, capital was authorized for NECIP and non-NECIP projects separately in 49 U.S.C. 24104(a). This may be the "provision regarding cross-utilization " which is referenced in the question.

General capital funds spent for track and structure programs on the Northeast Corridor total $17.2 million in fiscal year 1995; $0 in fiscal year 1996 and $0 in fiscal year 1997. During fiscal year 1995 and fiscal year 1996, $18.8 million and $17.2 million, respectively, was used to fund certain debt service principal, facility upgrades and mandatory environmental projects in the Northeast Corridor. This brought the total general capital expenditure "crosswalked" to NEC-related projects in fiscal year 1995 to $36 million, and in fiscal year 1996 $17.2 million. In fiscal year 1997, no general capital funds will be crosswalked from general capital to Northeast Corridor projects.

Question. Please display the total Corporation capital spending (including funding from all sources, not only federal) by strategic business unit, for fiscal years 1995, 1996, 1997, and anticipated for 1998.

Answer.

Capital Projects to be funded in fiscal year 1998 have yet to be determined.
Source: Capital Expenditure Reports

Question. Does Amtrak support the administration's request of $23,450,000 for Pennsylvania Station redevelopment (the Farley Building)? If the Corporation were to receive the administration's requested level of funding for capital expenses ($445,450,000) rather than the Corporation's requested level of $751,000,000, would Amtrak still want to earmark $23,450,000 for Pennsylvania Station redevelopment?

Answer. Amtrak supports the Administration's request of $23,450,000 for the Pennsylvania Station Redevelopment, including the redevelopment of the James A. Farley Post Office Building. If the funds are to be dedicated exclusively to the Farley portion of the Redevelopment project, the funds should be made available to the Pennsylvania Station Redevelopment Corporation, rather than to Amtrak. If the funds are to be used for the Pennsylvania Station portion of the Redevelopment project, they should be made available to Amtrak. It is Amtrak's preference to receive all capital funding without constraints on allowable uses, so that Amtrak can define priority allocations within its capital program. If Amtrak receives less capital

funding in fiscal year 1998 than requested, we will have to amend and prioritize our capital plan accordingly.

Question. Please prepare a summary of all non-track equipment and rolling stock assets, property, and other non-railroad assets owned by the Corporation, including market value, broken out by strategic business unit and grouped by type of asset. What is the debt secured by each of these assets?

Answer. The attached table summarizes property accounts gross book value by type of asset for Amtrak as a whole. To break out this information by SBU would result in a loss of information, as only a portion of it is tracked by SBU. In terms of market value, such information can only be provided by appraisals. Amtrak conducts market appraisals of its assets on an as-needed basis.

Also attached is a one page table indicating the assets which are financed, and the amount of debt outstanding as of May 1997.

Question. Please describe ongoing or planned commercial development of Corporation assets that Amtrak believes will net a profit in fiscal year 1998.

Answer. Amtrak is continuing to pursue numerous Commercial Development initiatives which create net profits for the corporation. These initiatives include commercial leasing of space within corporate owned stations and along the right-of-way, including leases for telecommunications purposes, parking leases and development, advertising sales and property sales and development. The net profit associated with Amtrak Commercial Development projects is estimated to be at least $33 million dollars in fiscal year 1998.

STRATEGIC CAPITAL PLAN

Question. A total of approximately $1,100,000,000 in capital funding is assumed by Amtrak for fiscal year 1998, $751,000,000 of which is to be provided by federal appropriations (through a dedicated trust fund or reserve fund, or directly appropriated funds). Amtrak's capital plan projects spending $1,440,000,000 in fiscal year 1998, for a capital net loss of $341,500,000. Does it make sense to deliberately set out to spend more than the "best case scenario" plans to bring into the capital program?

Answer. Amtrak has identified its investment needs based on the implementation of high-speed rail and other high return projects which will help move Amtrak toward operating self-sufficiency. The spending needs, as projected, approximately equal the revenue generated by the ½ cent of the existing gasoline tax. However, there are spending peaks and valleys in those projections which, if "smoothed," could create delays in completing critical programs. With a secure, dedicated source of capital funding such as a trust fund with revenues equal to those generated by ½ cent of the current gasoline tax and with contract authority, Amtrak anticipates that it would be able to obtain short-term financing for the shortfall in capital needs in fiscal year 1998. However, without the guarantee of such a stable source of capital funding, such short-term financing would likely not be possible.

Question. Please describe the current status of efforts to secure a dedicated trust fund or reserve fund for Amtrak.

Answer. The Amtrak Reserve Fund is included in Section 207 of H.Con.Res. 84, the concurrent congressional resolution on the budget, and codified in S. 949, the Senate-passed Revenue Reconciliation Act of 1997. S. 949 also establishes a three and one-half year, $2.323 billion Intercity Passenger Rail Fund, which is a deficit neutral and fully offset dedicated source of capital for Amtrak. This fund is subject to the annual appropriations process and is the key to Amtrak's survival.

STATE CONTRIBUTIONS TO CAPITAL NEEDS

Question. Amtrak plans that a portion of its capital needs are to be met through state and local financial contributions. For example, in 1995, Amtrak assumed state contributions would double over the years. To what extent have states increased their contributions since then?

Answer. Amtrak continues to expect a portion of its capital needs to be met through state and local financial contributions. Since 1995, the contributions are as follows (including future expectations):

1996	$89,100,000
1997	115,700,000
1998	49,300,000
1999	33,200,000
2000	50,000,000
2001	50,300,000
2002	50,300,000

While it may appear that future support is diminished, Amtrak has only included obligations from states and localities which have entered into agreements with Amtrak. Most state and local support is approved on a year-by year basis during the fiscal budgeting cycle, and we would expect the later years to increase accordingly.

Question. Does Amtrak still assume that state contributions will fully cover the cost of some state routes by fiscal year 1998? If so, what is the likelihood of this event occurring and what actions is Amtrak taking to bring this aspect of its plan to fruition?

Answer. In 1995, Amtrak began negotiations to have the relevant states reimburse Amtrak for fully allocated costs. The original goal was to have states assume fully allocated costs by fiscal year 1999. This policy proved unworkable because:

—it rapidly imposed costs for which the states have no dedicated funds.

—there are significant differences between the state services and each state's ability to contribute. For example, the Texas rail service differs greatly from the Pennsylvania service.

—Amtrak historically has not had a "one size fits all" agreement with our states.

Therefore, in late 1996, Amtrak developed an individually negotiated approach with each (former 403B states, and now Texas as a new contract service state). This allows for each state to develop a contract with its Strategic Business Unit that includes pricing for train operations, shared overhead expenses, state specific services (i.e. The Vermonter) and equipment lease costs. Beyond these changes, there are other negotiable items such as long term capital contributions, contract term incen-

tives and specific performance guarantees (such as the recent agreement with Illinois).

Amtrak's business plan through 2002, forecasts growth in state revenues (403B) from $32.6 million in fiscal year 1994 up to $73.6 million in 2002. Increased "flexible funding" in NEXTEA will be the mechanism which will enable states to cover a greater portion of the costs for rail services delivered by Amtrak.

REVENUE AND DEBT

Question. Please display the Corporation's total revenues by fiscal year for 1996, 1997, and requested for 1998, breaking out revenue in four subdivisions: (1) internally generated or prior existing funds; (2) federal appropriations further broken down by operating and capital; (3) state and local funds; and (4) external financing.

Answer.

REVENUES, APPROPRIATIONS, AND FINANCINGS

[Millions of dollars]

	Fiscal year—		
	1996	1997 forecast	Requested 1998
1. Prior existing funds [1]	N/A	N/A	N/A
2. Revenues	1,490.6	1,540.8	.....
3. Federal appropriations:			
Operating + excess RRTA	405.0	364.5	.....
Capital	345.0	398.0	.....
One-time grant	.....	80.0	.....
4. State and local funds	66.1	69.0	.....
5. External financing	188.5	213.3	.....

[1] Amtrak does not have existing revenue that carries over from year to year.
The fiscal year 1998 budget is a work in progress and there are no statistics for 1998.

Question. Please display the Corporation's total end-of-year debt load for the past ten fiscal years (1988–1997 projected), broken out by year.

Answer.

Debt obligation	*Balance*
1988 actual	$35,900,000
1989 actual	126,500,000
1990 actual	183,800,000
1991 actual	287,900,000
1992 actual	418,800,000
1993 actual	492,300,000
1994 actual	770,300,000
1995 actual	836,900,000
1996 actual	986,900,000
1997 projected [1]	1,216,200,000

[1] Fiscal year 1997 projection as of May 1997.

Question. Amtrak's debt level has significantly increased, correspondingly increasing interest payments. For example, over the last four years interest payments have tripled from about $20.6 million in fiscal year 1993 to about $60.2 million in fiscal year 1996. As Amtrak assumes more debt to acquire more equipment, what portion of the federal operating subsidy will be used for interest payments over the next five years?

Answer. Amtrak's current outyear projection as of July 3, 1997 for interest expense, based on all known financings, are as follows: Fiscal year 1998, $98,200,000; fiscal year 1999, $94,200,000; Fiscal year 2000, $114,400,000; Fiscal year 2001, $137,200,000; fiscal year 2002, $133,000,000; and fiscal year 2003, $127,900,000. However, how much of that will be funded by federal operating subsidy has yet to be determined. It clearly will not be the entire amount.

Question. How much current movement of freight railroads occurs over Amtrak-owned trackage? Please specifically detail where this occurs, which railroads utilize Amtrak's trackage, and what arrangements exist for recompense. How much revenue was generated by these arrangements in fiscal years 1995, 1996, and projected for 1997?

Answer. The current movement of freight railroads that occurs over Amtrak-owned trackage is approximately 22 million car miles per annum.

The locations where freight railroads utilize Amtrak's trackage is as follows:

—Northeast Corridor: Conrail; St. Lawrence & Hudson Railway (Delaware & Hudson Railway Company [1]); Springfield Terminal; Providence & Worcester; and Connecticut Southern Railroad.[2]

—Chicago (South Joint Tracks): Burlington Northern Santa Fe Railway Company; Illinois Central Railroad Company; and Consolidated Rail Corporation.

—Indiana and Michigan—Porter, Indiana, to Kalamazoo, Michigan: Consolidated Rail Corporation.

The arrangements that exist for recompensation are the various operating agreements between Amtrak and the freight railroads that specify rates per car mile. Those rates range from $0.33 cents per car mile in Michigan to $0.90 cents per car mile on the Northeast Corridor.

Revenue generated by these arrangements in fiscal years 1995, 1996 and projected for 1997 is as follows: Fiscal year 1995, $18,717,762; fiscal year 1996, $19,083,744; and fiscal year 1997 projected, $15,146,558.

Over the past ten years, thanks in large part to Senator Lautenberg's leadership with respect to rail safety, including his sponsorship of amendments to the Rail Safety Act of 1988, we have implemented many critical railroad operating safety measures across the Amtrak system and on the Northeast Corridor. These include:

—Speed control for Amtrak, commuter, and freight trains on the NEC.

—Random drug and alcohol testing for hours of service employees.

—Improvements to engineer certification and recertification processes.

—Improved audit and enforcement procedures.

Thanks to these efforts, Amtrak is prepared to safely support limited, selective, and compatible competitive freight access to ports along the Northeast Corridor that might flow from merger decisions.

The Northeast Corridor could play a role to help facilitate access to ports along the eastern seaboard, spur economic competitiveness and development in this region, and generate new commercial revenue in the context of declining federal operating support for Amtrak. However, Amtrak stresses that increased access would only be considered within the context of absolute and overriding protocols relating to operating safety. We are inflexible on this. This includes the measures listed above as well as assessment of the locations and time slots in the Northeast which may offer these opportunities—generally, those locations and periods of time that are lightly-used by passenger rail services.

Other than the primary concern of safety, two other concerns would also weigh heavily in our consideration of incremental freight access. One, on time performance for Amtrak and commuter trains on the Northeast Corridor will not be jeopardized. Two, any additional burden placed on Amtrak's infrastructure (tracks, bridges, etc.) by increased traffic or increased axle loads will be carefully established to ensure full compensation for wear and tear as well as useful life impacts.

Question. What commuter railroads currently operate over Amtrak-owned trackage? Please specifically detail where this occurs, which commuter railroads utilize Amtrak's trackage, and what arrangements exist for recompense. How much revenue was generated by these arrangements in fiscal years 1995, 1996, and projected for 1997?

Answer.

[Dollars in millions]

Commuter agency	Fiscal year—				
	1992	1993	1994	1995	1996
MBTA,[1] MA	$7.0	$7.4	$7.2	$14.7	$7.3
NJ Transit, NJ	25.4	26.7	28.9	28.3	25.5

Other	.....	0.1	.....	0.1	.....

[1] Service ended March 31, 1997.

[2] Service commenced September 23, 1996.

[Dollars in millions]

Commuter agency	Fiscal year—				
	1992	1993	1994	1995	1996
Total revenue	57.8	60.4	63.5	71.0	61.5

[1] Fiscal year 1995 includes a $7.5 million retro-active settlement covering fiscal year 1988 thru fiscal year 1995. The fiscal year 1997 revenues are still being developed.

ELECTRIC PROPULSION

[Dollars in millions]

Commuter agency	Fiscal year—				
	1992	1993	1994	1995	1996
NJ Transit	$13.2	$13.6	$13.0	$12.0	$11.2
SEPTA	7.8	7.8	7.7	6.9	10.6
Maryland DOT[1]	.....	.....	.....	.....	.....
Total revenue	21.0	21.4	20.7	18.9	21.8

[1] Maryland DOT Propulsion costs are in Contract Operations.

The Northeast Corridor is a critical and valued part of the region's transportation infrastructure. Over 1,200 commuter, freight and Amtrak trains daily use the corridor. Commuter railroad recompense is governed by principles laid down in federal statute and regulatory decisions.

More so than operating fees, investments in the extensive capital plant of the Northeast Corridor are critical to the survival of Amtrak and commuter railroads. Amtrak has aggressively pursued joint investment partnerships with commuter authorities to encourage increased investment in the capital asset of the Northeast Corridor.

One example of the joint capital investment partnerships which Amtrak is using as a model is the Amtrak and NJ Transit agreement which commits both parties to invest $25 million each for the next five years. This will give NJ Transit a direct voice in the decision making process for capital investments, guarantees investments from Amtrak for the benefit of New Jersey, and permits both entities a better ability to engage in long-term planning for the infrastructure needs of New Jersey. Similar capital partnership agreements have been developed in Maryland, Virginia, the District of Columbia, Delaware, New York and Pennsylvania.

Question. Amtrak has many ongoing strategies to decrease costs and/or generate additional revenue. For each of the following strategies, please estimate the annual savings or additional revenue for fiscal years 1998, 1999 and 2000.

Answer. The following table represents a preliminary estimate of the impact from revenue enhancements or cost reduction efforts based on the following Business Plan Actions for fiscal years 1998–2000. These estimates are from Amtrak's fiscal year 1998–2000 Business Plan which is currently being updated.

Business plan action	Fiscal year—		
	1998	1999	2000
High-speed rail	.....	(7.3)	93.1
Self service ticketing (NEC, West)	1.8	1.8	1.8
Procurement	7.7	8.3	8.9
Route and service changes	21.6	19.7	19.7
Real estate sales and leases	2.8	2.8	2.8
Insourcing and consulting (NEC)	1.0	1.5	2.0
Reduction in operating costs due to capital investment	(1)	.....	.....
Power wheeling (NEC)	15.6	34.5	36.5
Food and beverage initiative (NEC)	(3.0)	5.6	5.6

Business plan action	Fiscal year—		
	1998	1999	2000
Training (NEC, intercity)	(4.0)	(2.0)	(4.0)
Commuter—Total revenue	249.5	249. 9	250.3
State supported trains	77.6	78.7	79.3

[1] Fiscal year 1998 projects under review.

OPERATING EXPENSES—FUNDING ISSUES

Question. Please display the annual federal operating grant and mandatory passenger rail service payments for fiscal years 1988 through 1997.

Answer.

[Dollars in millions]

Fiscal year	Federal operating grant	Excess RRTA
1988	$580.8	([1])
1989	584.0	([1])
1990	520.1	([1])
1991	342.1	$144.8
1992	330.0	150.2
1993	350.0	147.0
1994	351.7	150.0
1995	392.0	150.0
1996	285.0	120.0
1997	222.5	142.0

[1] Included in Block Grant.

Question. What is the historical per passenger subsidy for non-commuter passengers per year by fiscal year since Amtrak's creation?

Answer. The historical per passenger (trip) subsidy for non-commuter passengers is shown below since 1971. Federal operating grants decreased from $587 in fiscal year 1986 to $285 in fiscal year 1996, a 51.4 percent decline. The subsidy per passenger decreased from $28.92 per passenger in fiscal year 1986 to $14.47 per passenger in fiscal year 1996, representing a 49.8 percent decline, or a nearly 50 percent improvement in efficiency.

	Federal operating grant (millions)	Noncommuter ridership (millions)	Subsidy per passenger
Calendar years 1971/72	$40	27.2	$1.47
Fiscal year:			
1974	147	18.4	7.97
1975	277	17.3	15.98
1976	462	17.8	25.96
1977	483	19.2	25.14
1978	536	18.9	28.36
1979	600	21.4	28.04
1980	650	21.2	30.68
1981	720	20.6	34.96
1982	[1] 735	19.0	38.68
1983	[1] 670	19.0	35.26
1984	[1] 716	19.9	36.00
1985	[1] 680	20.8	32.69
1986	587	20.3	28.92
1987	579	20.4	28.38
1988	532	21.5	24.74

	Federal operating grant (millions)	Noncommuter ridership (millions)	Subsidy per passenger
1989	554	21.4	25.89
1990	520	22.2	23.42
1991	343	22.0	15.59
1992	331	21.3	15.54
1993	351	22.1	15.88
1994	352	21.2	16.60
1995	392	20.7	18.94
1996	285	19.7	14.47

[1] Received as Block Grant rather than Operating Grant.

Question. Please prepare a table showing Amtrak's cost to operate each strategic business unit, for fiscal years 1996, 1997, and requested for 1998.

Answer.

1996

[Dollars in millions]

Operating expenses	Intercity	NEC	West	Corp/Svc	Total
Salaries	$16.4	$42.1	$12.4	$43.7	$114.6

Note: 1997 based on the eight months of actuals and four months of forecast.
Fiscal year 1998 business plan development is currently in progress.

Question. What is the current set cost which Amtrak must pay freight railroads to operate passenger rail over freight-owned trackage? How much of Amtrak's operating expenses went for this recompense in fiscal years 1994, 1995, and 1996? How much is estimated for fiscal year 1997?

Answer. The current expense which Amtrak must pay freight railroads to operate passenger rail over freight-owned trackage is the costing methodology employed under U.S.C. Title 49, Section 24308(a), the Rail Passenger Service Act.

The amount (and percentage) of Amtrak's operating expenses paid to the freight railroads to operate passenger rail over freight-owned trackage in fiscal years 1994, 1995 and 1996, and estimated for fiscal year 1997, is as follows: [3]

Fiscal year	Amount	Percent
1994	$89,728,000	3.7
1995	86,373,000	3.7
1996	84,246,000	3.6
1997 projected	88,946,000	3.6

Question. The Administration and the Congress have instructed Amtrak to be free from federal operating assistance by 2002. Although Amtrak has improved its bottom line by more than $300,000,000 over the last two years, significant improvements are necessary in the remaining years to meet the goal of operating self-sufficiency. Currently, Amtrak is significantly behind schedule in its plan to eliminate operating subsidies. In this regard, Amtrak's operating losses were $764,000,000 for fiscal year 1996, $125,000,000 more than planned for its business plan. How does Amtrak plan to get back on track and achieve all of its planned savings by 2002? What actions require legislative changes?

Answer. As noted in the question, Amtrak has improved its bottom line by over $300,000,000 on an annualized basis over the last two years. Yes, significant improvements are necessary in the remaining years if we are to meet the 2002 goal of operating independence. However, it should be noted that Amtrak has achieved this much of the plan without the three elements we have said were absolutely essential from the beginning: a secure and reliable source of dedicated capital; a declining level of operating support consistent with our business plan, and legislative relief from some of our statutory mandates. None of these things have occurred, yet we met and exceeded our target in the first year of our business plan. In the second year, despite having our operating needs underfunded by more than $125 million over the same two year period, we missed our plan target but more importantly, avoided losing any of the ground gained in fiscal year 1995. Should we in fact receive the dedicated source of capital we have sought, and an adequate amount of operating support as proposed in our Strategic Business Plan and included in the Congressional Budget Resolution, we do believe we can achieve independence from federal operating support by 2002.

Question. For over 25 years Amtrak has operated passenger rail service. With the exception of Metroliner service in fiscal year 1996, none of Amtrak's routes has made a profit or broken even, when all cost are allocated. What is the likelihood, given Amtrak's history, that the railroad can operate without federal operating funds?

Answer. As stated in the fiscal year 1997–2002 Strategic Business Plan as well as in the fiscal year 1998 Federal Grant Request, Amtrak's ability to operate without federal operating support is dependent on several key assumptions in order to meet that target by 2002. The implementation and operation of high-speed rail in 2000 will contribute $150–200 million, net of expense, to the corporation. Non-core business will contribute $50 million in fiscal year 1997, escalating to $80 million in the year 2002. Other key assumptions are the continued funding of excess mandatory RRTA payments at $142 million per year and a gradual reduction in federal operating support consistent with our request. Not included in the plan are initiatives such as significantly expanded mail and express. These will be included in the revised fiscal years 1998–2003 Strategic Business Plan. As we have consistently said, if we are provided with a secure and reliable source of capital, and the necessary legislative relief and declining levels of operating support, we will achieve the goal of operating self-sufficiency. Our Strategic Business Plan shows exactly how that will be achieved.

Question. Please provide the Committee a copy of the Working Group on Intercity Passenger Rail recommendations, released on June 23, 1997.

[3] Defined as total expenses as reported in Amtrak's applicable annual report.

Answer. "A New Vision for America's Passenger Rail" is attached.

A NEW VISION FOR AMERICA'S PASSENGER RAIL

INTRODUCTION

For millions of Americans, passenger trains signify more than just a means of transportation; they serve as potent symbols of our nation's heritage, environmental consciousness and collective hopes for a humane future. Many passionately argue that the United States has the capacity and indeed, the obligation, to create a world-class national passenger rail system to endorse these values and to arrest the growing unintended side-effects of automobiles and airplanes in our cities and countryside.

A more tangible and immediate argument for rail service can be weighed in straight financial terms. The United States is a diverse and increasingly mobile nation with a growing (as well as graying) population and an aging transportation infrastructure. It needs a well-integrated national transportation policy that offers a range of modal choices in order to maximize mobility and to minimize transportation costs, infrastructure funding requirements and environmental damage in a variety of settings.

Under the right conditions, passenger rail service can provide an attractive, financially sustainable transportation alternative that enhances efficiency of other modes (including cars, trucks, buses, airplanes and freight rail). Unfortunately, the conditions under which Amtrak currently operates do not allow for Amtrak to function as a true and equal alternative to other modes of transportation.

Amtrak is now awash in red ink, buffeted by conflicting missions and ballooning debt, and virtually starved for capital in both political and financial terms. Not surprisingly, revenues, ridership and service have ebbed despite valiant efforts by both management and labor to reverse these trends. Neither the Congress nor the Administration seems eager to increase or even continue Amtrak's subsidy, though each institution still exerts sizable control over its organization, operations and route structure. This control is often at odds with Amtrak's ability to operate efficiently and to maximize the value of its assets. Meanwhile, competing modes of transportation fight ruthlessly for every uncommitted traveler in Amtrak's shrinking market share.

Together these conditions create an untenable outlook for passenger rail in the United States. In the short range (the next 6 to 12 months), Amtrak faces a major liquidity crisis and probable bankruptcy. Unless the Congress moves swiftly to reconfirm the value of passenger rail service and dramatically restructure the way in which it is organized and operated, the substantial asset base of the existing system will permanently disappear by default, along with many vital long-range prospects for service.

A good measure of political and financial capital will be needed to avert this course; naturally, both elements are in short supply. Nevertheless, the U.S. government can claim a long and impressive tradition of large-scale problem solving, as in the creation of the interstate highway system and the notable improvement of the nation's air and water quality.

Genuine renewal of national passenger rail service will not be resolved by political rhetoric nor by periodic last-minute infusions of cash; rather, it requires that the Congress take a long, hard step back from the status quo in order to plot a viable, market-driven course for the future. The immediate pain and risks to existing rail service and jobs that may accompany this overhaul must be gauged carefully against the larger and longer-range havoc that assuredly would follow the further decline and liquidation of Amtrak.

More importantly, if passenger rail is to become a serious part of the nation's mobility strategy in the future—rather than a mere incantation of the past—it must operate in a profoundly more growth- and customer-oriented fashion. It must have the management tools, the flexibility, the incentives and the discipline posed by competition to vie with other modes of transportation on a level playing field.

CONTEXT

Fiscal

Amtrak has been in financial difficulty for most of its 26-year existence. In recent years, its financial condition has deteriorated to the point that Amtrak believes it may exhaust all sources of cash within the next 12 months. To reduce its continually growing losses and widening gap between operating deficits and federal subsidies, Amtrak developed its Strategic Business Plan. Although Amtrak has made some progress in implementing its business plan and cutting its losses, its financial

condition is still very precarious. Amtrak's financial measures continue to deteriorate. Financial targets have been missed, and substantial capital investment is needed.

Amtrak has lost over $700 million in each of the last 9 years. Amtrak has been relying on passenger revenues to help close the gap between revenues and expenses, but passenger revenues, when adjusted for inflation, have declined over the past several years. Half way through the current fiscal year, Amtrak began borrowing against its short-term line of credit to meet basic operating expenses, such as payroll. From 1993 to 1996, Amtrak's debt and capital lease obligations nearly doubled—from about $500 million to almost $1 billion dollars. Amtrak expects to incur another $1 billion in debt within the next 2 years to finance 18 train sets and related maintenance facilities for the Northeast Corridor and the acquisition of new locomotives. To service this increased debt, Amtrak must use a substantial portion of its federal operating subsidies that would otherwise be used to cover future operating deficits. Over the past 4 years, Amtrak's interest expenses have tripled from about $20 million to about $60 million.

The costs of an Amtrak bankruptcy cannot be underestimated. These include financial, social, and political. Every constituency would lose: state, local, and federal government, employees, customers, suppliers, taxpayers. The true cost of a bankruptcy would be billions of dollars. The resolution of such a bankruptcy is far from certain, as control of the process would be taken out of the hands of the government.

Support

After investing over $19 billion in Amtrak since 1971, Congress is losing patience with Amtrak's continued dependence on federal subsidies. Congress has promised to provide legislative reforms (labor, liability) and continued capital support in return for Amtrak's pledge to eliminate its need for federal operating subsidies by 2002. Amtrak has asked for a dedicated funding source for its capital needs, and there have been several bills introduced to accomplish this, but the outcome is uncertain.

While the Administration has stated its commitment to Amtrak's future, it has proposed a level of funding below Amtrak's stated needs to be provided from the Highway Trust Fund in its NEXTEA legislative proposal. The Administration's proposal would force Amtrak to compete with other surface transportation programs for the limited funding allowed by the budget from the Trust Fund. The Administration also supports the elimination of all federal operating subsidies for Amtrak by 2002. The current Congressional budget resolution makes additional resources for a possible inter-city rail trust fund contingent upon enactment of reform legislation.

The public's support for Amtrak is segmented among the geographic areas of the country. Its greatest support is in the Northeast, where Amtrak serves a substantial portion of the business travel between New York and Washington. In contrast, Amtrak's routes in other parts of the country are sparsely traveled. Amtrak's support among select user groups (retirees, leisure travelers), is higher than its support from the general population. Yet Amtrak's load factor (the percentage of seats filled) for fiscal year 1996 was 43.3 per cent on a system-wide basis, and ranged from 37.4 per cent to 47.3 per cent among its strategic business units. By comparison, a load factor around 60 per cent is generally considered the break-even point for airlines.

Access to freight railroads' facilities

Currently, Amtrak operates over the freight railroads' right-of-way for all routes except the Northeast Corridor, which Amtrak owns, and small route segments in New York State, Pennsylvania, and Michigan, also owned by Amtrak. Amtrak owned rights-of-way comprise less than 5 per cent of the company's current route system. Amtrak's access rights, in combination with its own right-of-way, form the nation's current intercity rail system, and therefore, these rights must be viewed as one of the most valuable of all of Amtrak's assets.

The freight railroads view the terms and conditions that govern Amtrak's access as entirely to their detriment, while Amtrak views its access rights as part of its compensation for having relieved the freight railroads of the obligation to provide passenger rail service. These viewpoints represent polar extremes and there needs to be satisfactory balance between the two positions.

There are three elements to the freight railroad/Amtrak relationship:

—*Access*—Amtrak has compulsory access to the freight railroads' right-of-way by virtue of a federal statute. In addition, by federal law, Amtrak must be given priority dispatching over freight trains.

—*Compensation*—Amtrak's payments to the freight railroads for its use of their right-of-way is specified by formula in federal statute according to incremental costs. The freight railroads claim that this formula forces them to subsidize Amtrak service.

—*Liability*—Current law and judicial interpretation of access agreements gives the freight railroads no protection against unlimited tort liability that comes with the presence of passenger trains on their tracks.

An additional element that exacerbates the freight/Amtrak relationship is the recent increase in freight traffic, which makes each train movement more valuable as capacity becomes constrained. The freight railroads claim that the incremental cost formula, in addition to not adequately covering the costs that Amtrak itself imposes, does not even address the opportunity cost of reduced freight movements due to Amtrak's presence. The freight railroads are very sensitive to new lines of business that Amtrak has proposed to undertake, such as hauling increased mail and express freight commodities that may encroach on their own business.

The Amtrak/freight relationship can be contrasted with the current system by which commuter authorities obtain access to freight railroad rights-of-way. Commuter railroads negotiate with the freight railroads at arms' length on a case-by-case basis with no federal statute compelling mandatory access. Compensation levels are established by mutual agreement. And in most cases, state law limits tort liability that can arise from a commuter rail accident.

A major task in designing a new format for intercity passenger rail will be to determine at what point in between the two options, i.e., the current Amtrak/freight relationship, and the freight/commuter relationship, a balance can be achieved that is fair and adequately provides for continued access by Amtrak and other potential intercity passenger rail operators.

Services and values

A renewed National Passenger Rail System (as one or more entities) should do two important things (in order of priority):

(1) Provide safe, reliable, comfortable convenient and financially-sound passenger rail service in all densely populated corridors of the United States that show declining air quality and presently or potentially intractable traffic congestion problems; and

(2) Encourage public/private development of attractive overnight passenger rail service, on a periodic basis throughout regions of the nation with significant cultural, historical and scenic character (e.g., a kind of "rolling national park") or where such service is justified on an economic basis.

The working group believes that a renewed passenger rail system should provide the maximum benefit to its customers and achieve operational excellence and efficiency. In addition, the system should be subjected to market discipline and financial accountability. Environmental protection and improvement, as well as national historic and cultural preservation should also be goals of a new passenger rail system.

RESTRUCTURING PROPOSAL

The working group believes that Intercity Passenger Rail is a major United States asset which is, for specific roles, superior to or complementary to competing modes. It should be supported and expanded. This, however, requires a commitment to broadened, secure investment in the basic infrastructure to permit competitive speeds and reliable operation in the major corridors of the country.

This infrastructure investment for passenger rail should properly be the responsibility of the Federal Government, as it is for the highways, ports, airports, and traffic control systems of the other modes. However, Amtrak is an anomaly. Competing modes do not own their infrastructure. Bus lines and autos use public highways, airlines use public airports, cruise ships use public waterway improvements. Thus, competing modes infrastructure needs are funded through long-established entities, e.g. FAA, FTA, the Corps of Engineers, etc. No such vehicle exists for the funding of passenger rail infrastructure. The working group recognizes that currently all major publicly owned rail infrastructure is in the Northeast Corridor, but it believes that there can be efficient use of Federal capital in rail for short and medium distance trips in several areas of the country.

While the working group believes that the costs of infrastructure investment and maintenance are properly the province of the Federal Government, it also believes that the operating costs of intercity rail travel should be met by its beneficiaries, particularly users and state and local governments and authorities. Again, this generally parallels competitive modes who are generally responsible for their operating costs. The working group also notes that typically several operators compete by using common public ports, highways, and airports, and this principle should be applicable to rail. Thus, opportunities for possible access by competitive operators in intercity passenger rail should be enhanced.

The working group believes that the separation of infrastructure ownership and management from passenger transportation responsibility is fundamental, and that it should be reflected in a basic division of governance. The separation of the infrastructure function from the passenger transportation function serves several purposes:

—It provides a clear demarcation between the ultimate federal infrastructure capital responsibility and the operating responsibility funded by beneficiaries. Accountability will therefore be made much clearer.

—It provides a mechanism whereby the merits of funding new rail corridor development can be assessed separately from criticism of the performance of the operator.

—It provides a mechanism to introduce new operators competitive to or comparative to Amtrak.

—It will enable Amtrak to focus its efforts on its principal day-to-day responsibility—providing and developing superior, efficient service to its users, not seeking support for its infrastructure capital program.

Amtrak's current responsibility for infrastructure planning, construction, and maintenance should therefore be separated from the responsibility of operating passenger service. Thus, a new federally owned corporation with its own governance would take responsibility for managing the track, signals, and other fixed infrastructure of the Northeast Corridor, along with capital investment in those new corridors that are envisioned for the future, while Amtrak would continue its passenger services operating role.

Initially Amtrak would be the only operator of intercity passenger transportation, but to encourage innovation and to match service to local interests, it would further decentralize by adding strategic business units in the Midwest and elsewhere. The working group also believes that the potential of intercity passenger rail will be improved if subject to competition from other modes and from other actual or potential providers of intercity passenger rail service and furthermore from a new focus on passenger service provision, as distinct from infrastructure management. Thus, eventually, provision would be made for other operators to compete with Amtrak on particular routes or in particular regions.

Establishing this newly structured passenger rail service environment will not be an instantaneous process, and therefore attention will need to be paid during the transitional period to ensuring a reasonable balance of benefits among various stakeholders in rail passenger service and among various regions of the country. Legislation to implement this proposal would provide that the infrastructure currently owned by Amtrak would be transferred to the new infrastructure management entity.

The new infrastructure management entity would:

—Determine infrastructure capital needs

—Request and expend Federal funding for passenger rail infrastructure

—Oversee rail operations on and manage its infrastructure

—Establish standards for selection of passenger rail operators.

In the long run, after standards for new passenger service operators are established, the infrastructure entity would establish competitive procedures for selecting passenger service operators and conduct competitions for the right to provide service. These procedures would provide for reasonable protection for employees adversely affected by the competition. We want to emphasize, however, that a properly structured reform of inter-city rail passenger service and the related infrastructure responsibilities offers real potential for stable, secure employment. The proposal is assumed to increase passenger rail jobs with the expansion of rail service in appropriate markets. Most of Amtrak's employees would continue to work under existing labor contracts. Some Amtrak employees, who currently work on infrastructure maintenance, would work for the new infrastructure entity, Amrail.

FUNDING

The working group assumes that there are essentially three alternatives: (1) no funding; (2) funding (with some minimal level of conditionality attached); and (3) bridge, or conditional funding. Clearly variations are possible, but all would include principal elements of one of these three alternatives.

The group has also assumed that the national passenger rail service contemplated is one where infrastructure management and development and passenger transportation services are non-overlapping and divided into two different operating entities.

The working group is also of the belief that fixed infrastructure capital funding and operating funding requirements must be viewed as distinct from one another. Additionally, both types of funding need to be more directed toward existing and po-

tential routes with the greatest demand and market potential, which are primarily the higher density inter-city corridors.

Fixed infrastructure capital funding amounts required would be determined by the new infrastructure manager and developer. The new entity would in turn request and expend federal funding for passenger rail infrastructure. Over the short term, the amount of such funding needs to be absolutely no less than called for in the Amtrak strategic plan. Longer term, these amounts must be increased significantly and placed in a more secure manner.

Operating funding requirements arise at the transportation service provider level, and in the group's view should be minimized through strict oversight and market discipline. Start-up operating funding requirements should be factored into the initial years of the operation, possibly for 5 years.

The group has identified two types of funding requirements: short term, or bridge funding, and longer term funding. These are discussed further below.

Alternative 1: No Funding ("Bankruptcy")

Based on statements made by both Amtrak senior management as well as several government transportation officials in the past six months, it appears irrefutable that (i) Amtrak is not financially self-sustainable, and; (ii) Amtrak has borrowings and other financial payment obligations that place it in real danger of bankruptcy if these obligations are not met.

The costs of an Amtrak bankruptcy cannot be underestimated. These include financial, social, and political. Every constituency would lose: state, local and federal government, employees, customers, suppliers, taxpayers. The true cost of a bankruptcy would cost billions of dollars. The resolution of such a bankruptcy is far from certain, as control of the process would be taken out of the hands of the government.

Although frequently used as a tool to precipitate wholesale corporate reorganization, bankruptcy for Amtrak would most likely ensue in chaos. This outcome should be seen as most undesirable.

Alternative 2: Funding (assumes encouragement of existing management to get on with their plan)

Amtrak has cost U.S. taxpayers almost $1 billion per year since its inception twenty six years ago. Funding has been irregular, and its operating plan impaired, resulting in yearly underfunding by Congress, and declining levels of corporate performance including bigger operating losses, fewer passengers, fewer routes, and poorer service. Monies marked for capital improvements have been spent on covering debt service, resulting in a chronic underinvestment for the future.

Many reforms were launched by the company in the 1993–94 period, aiming at reversing this decline. Broadly speaking, these have not paid off. Today, Amtrak finds itself once again cap in hand asking for money that it claims will support the achievement of a self-sufficiency plan that is generally acknowledged by many outside Amtrak as wholly unrealistic. Specifically, many if not most of the tenets of this plan (on which the funding request is predicated), include sources of revenue which are unproven on a broad scale (e.g. high speed trains, express delivery, freight carriage). Management is fighting with, or staving off, creditors, freight carriers, Congress, and labor, to name a few. Credibility is beyond repair without a real fresh start.

The Clinton Administration, and many within Congress, have put proposals forward to fund a portion of Amtrak's needs, but none would come close to solving Amtrak's problems. By Amtrak's own admission, this approach will merely postpone a true crisis. A true crisis would be akin to bankruptcy, with many of the attendant costs. In fact, Amtrak management has gone on the record stating that even if all of its request for funds was met, Amtrak would still be in an extremely precarious position.

It would seem logical to conclude from this that simply funding Amtrak when it is running with a poorly articulated plan and little hope of success would seem to be irrational, a true waste of taxpayers' money and in fact only serve to defer and potentially exacerbate the problems.

Alternative 3: Conditional Funding

The notion of conditional funding incorporates two concepts. Firstly, that bankruptcy must be avoided (i.e., funding must be made available) and secondly that such funding as is granted must be done within the context of the implementation of one or a set of mechanisms/reforms designed to improve the performance of Amtrak for its owner, users, and employees.

Such funding naturally breaks down in two parts: (i) short term funding to avert the immediate crisis and allow the reforms to be implemented; and (ii) longer term funding that allows for the flourishing of the model that is implemented. It is our

belief that alternative sources of funding will become accessible as a direct result of a credible reform process being implemented. Some of these are discussed further below.

How much money, for how long and from where?

Under (i) above, short term funding should be provided in an amount that lies between the current funding request of Amtrak and the Administration's proposal. This funding should be made to be as short term as possible to encourage urgency in implementing reform. A term of 12 to 18 months is seen as realistic. In other words, fund Amtrak exactly as much as it needs to avoid bankruptcy during the implementation of reforms over a specific and defined time period. This funding must be sourced from the readiest sources of cash, i.e., the normal Amtrak appropriation.

Regarding (ii) above, the amount required on a regular basis will depend on the plan adopted. Sources will vary depending on the use of funds, but the implementation of various reforms will certainly impact the funding sources available, as discussed further below. This funding should be regular and predictable, for greatest ease for both the recipient as well as the donor. It should be subject to periodic review, or certain performance or other events should trigger such a review.

In light of current budgetary constraints, and yet the clear need to provide a regular, predictable, and stable infusion of capital investment in inter-city passenger rail infrastructure, Congress should consider creative and innovative procedures for infrastructure assistance. Merely renewing calls for "dedicated" funding sources without exploring new and more adaptable funding mechanisms is unlikely to produce constructive results. In the past, many such proposals for "dedicated" funding have foundered on the philosophical objection of states with little or no inter-city passenger rail service to making forced tax contributions to states with substantial amounts of such service.

We have not attempted to select a single funding mechanism to recommend to the Congress. We are agreed that stability is an essential element of such funding, and that greater creativity needs to be exercised in selecting potential funding mechanisms. As part of our deliberations, we did discuss two examples of innovative funding mechanisms. Although we are not recommending these specific approaches, they are offered here as purely illustrative examples of the general type of non-traditional mechanisms we recommend the Congress examine.

First, one potential technique for addressing the perennial issue of fairness among "rail" and "non-rail" states might be to authorize at the federal level a state-option portion of the federal gasoline tax. This would permit states who wished-either alone or in concert with other participants in multi-state compacts-to participate directly in passenger rail capital funding to opt for some additional increment of gasoline tax to be used for this purpose.

Another example would be to expand and modernize the guaranteed loan programs of the 1976 Railroad Revitalization and Regulatory Reform ("4R") Act. These programs are already targeted toward rail infrastructure needs. Under current law, the "subsidy component" or "risk premium" supporting such guaranteed loans may be funded only through on-budget federal appropriations. If these functional equivalents of security deposits could be provided by outside entities (such as state governments or private parties), substantial amounts of infrastructure capital might be made available with minimal budgetary impact.

CONCLUSION

A majority of the working group is of the view that a division between infrastructure management and operations affords the best chance for the preservation and renewal of passenger rail service in this country. Amtrak has operated for too long under conditions that no business could endure. The problems do not lie with Amtrak management or Amtrak labor, but rather with the basic structure that was established when Amtrak was created in 1971. Amtrak's mission is vaguely defined, its funding has never been adequate for a true national system and it has been burdened with expensive legal mandates.

The majority believes that intercity rail should be placed on the same structural footing as other modes of transportation. This would include a stable and permanent commitment by the Federal Government to fund the infrastructure costs of intercity passenger rail. It would also mean the elimination of operating subsidies for operators of passenger rail, and the introduction of competition among these operators.

MINORITY COMMENTS

JAMES J. FLORIO AND CARL VAN HORN

The majority of the Working Group on Intercity Rail sets the right note at the outset of their report by emphasizing the important role that intercity passenger rail plays in reducing airport and highway congestion and improving air quality, and urges the preservation and enhancement of intercity passenger rail service in order to achieve these objectives. The report also advances the admirable goal of increasing the Nation's investment in intercity passenger rail infrastructure, especially in densely travelled corridors where high-speed rail service is a realistic alternative. The report proposes to achieve these goals by separating ownership of passenger rail infrastructure from responsibility for passenger rail operations. We have examined this proposal carefully, however, and have concluded that it is unlikely to solve the existing problems of intercity passenger rail service in the United States. In fact, we believe that, if adopted, it would create difficult new problems.

The majority report establishes two goals for reforming and restructuring Amtrak:

(1) Provide safe, reliable, comfortable, convenient, and financially sound passenger rail service in all densely populated corridors of the United States that show declining air quality and presently or potentially traffic congestion problems; and

(2) Encourage public/private development of attractive overnight passenger rail service, on a periodic basis, throughout regions of the nation with significant cultural, historical, and scenic character (e.g., a kind of "rolling national park").

We believe the proposals advanced by the majority report fail to achieve either goal. We believe that, if implemented, they are likely to reduce investment in passenger rail infrastructure and reduce service on most interstate routes, whether those routes are on high-density corridors or in regions of the country with significant cultural, historical, and scenic character.

We believe that our colleagues come at their proposal largely due to an unwarranted pessimism about Amtrak's prospects. They are unduly critical of Amtrak's management, unduly critical of Amtrak's Strategic Business Plan, and unduly critical of the market potential for Amtrak's services. The majority report is also unnecessarily pessimistic about Congressional support for Amtrak. Senator Roth has recently introduced legislation to create a $2 billion reserve fund for Amtrak that has attracted broad support in the Senate. While the majority report claims that there is "very little support for the long-distance routes," that is contradicted by the fact that the Senate added a special provision in last year's Omnibus Appropriations Act adding $22.5 million to Amtrak's appropriation to save four long-distance routes. Senator Lott has become a leading supporter of Amtrak, primarily because of his support for a long-distance route passing through the State of Mississippi.

There is No Compelling Rationale for Restructuring

The proponents of restructuring Amtrak have not put forth any compelling rationale for changing the current structure. The majority report cites four purposes that are served by their restructuring proposal; on closer examination, none of the four purposes is actually achieved.

First, the majority report suggests that the proposal would enhance accountability by providing "a clear demarcation between the ultimate infrastructure capital responsibility and the operating responsibility funded by beneficiaries." Yet the way in which the infrastructure entity is established would muddy this responsibility, because the infrastructure entity would be responsible not only for managing the infrastructure, but also for establishing standards for selecting operating companies. The "infrastructure" entity would thus be setting service standards for operations and be involved both as a supplier to the operating companies (by selling them access to the infrastructure) and as a regulator of those companies (by selecting who can use the infrastructure and what service standards they must meet). In any case, separating the infrastructure and operations roles is unlikely to enhance accountability. When problems develop, the operating companies are likely to blame the infrastructure company for failing to maintain the infrastructure properly, while the infrastructure company is likely to blame the operating companies. When both infrastructure and operations are the responsibility of the same company, accountability is clear and undivided. There is no one else to blame.

Second, our colleagues suggest that separating ownership of the rails from operations will create greater infrastructure investment from the public and private sector. They argue that having an entity whose sole responsibility is infrastructure will encourage Congress to invest more in high-speed rail infrastructure in appropriate high-density corridors around the country without being distracted by arguments about the performance of the rail service operator (Amtrak).

In our view, the impediment to high-speed rail has been constraints on the federal budget resulting in budget caps on all infrastructure investment, not structural problems with Amtrak. In 1994, the Congress declined to approve the Clinton Administration's request to finance high-speed rail development, despite the fact that these funds would have been spent independently of Amtrak. Since 1991, the Congress has declined to appropriate any of the $725 million authorized for maglev development by the Intermodal Surface Transportation Efficiency Act, none of which would have been managed by Amtrak. This year, Congress is considering a request for $300 million for development of the high-speed rail project in Florida, which would be managed independently of Amtrak; however, thus far the Florida congressional delegation has not strongly supported the request.

Third, our colleagues suggest that separating infrastructure management from operations will facilitate the introduction of new competitors to Amtrak. For virtually all of the Amtrak system, ownership of the infrastructure is already separate, in the hands of the freight railroads, so there are already opportunities for competition over the rails that Amtrak does not own. In any case, it is not clear why new competitors are needed, since there is plenty of competition already from other modes of transportation. As the majority report itself states in its Introduction, ". . . competing modes of transportation fight ruthlessly for every uncommitted traveler" who rides on Amtrak.

Fourth, the majority report also argues that separating infrastructure from operations will benefit Amtrak by eliminating the need for Amtrak to seek support for its infrastructure capital program. We believe this argument is exceedingly naive. Amtrak's success will still depend critically on the amount appropriated for the infrastructure program, so Amtrak will still need to expend resources lobbying for appropriations for it, just as trucking companies lobby for highway expenditures and airlines lobby for airport investments.

There are, perhaps, other reasons for advancing this restructuring proposal. Several members of the working group have cited, with approval, the recent British approach that separated infrastructure maintenance from operations. But the British model is not one to be emulated. Thus far, the British model has cost nearly $1 billion a year more in public funding than it did under its predecessor, BritRail. If the British model were applied to the U.S. it would in all likelihood lead either to substantially increased subsidy levels or to the elimination of all long distance trains as well as the elimination of many short-haul trains that require regional or multistate support. The best one can say at this point is that the jury is still out on the British experiment.

Another rationale for the proposal is that other modes of transportation operate privately-owned and operated vehicles on publicly-owned infrastructure. This is not uniformly true—mass transit receives federal subsidies both for its rolling stock and for its operating costs. But the proposal to separate ownership of infrastructure from operation of trains might be more appealing in an environment where the entire national rail infrastructure is owned by a single entity, and where several passenger rail operators compete on that infrastructure. Neither of those conditions obtains in the United States. Most rail infrastructure is owned by freight railroads, and the existence of competing passenger rail operators is only a distant potential. Our colleagues acknowledge those facts, but think that separation of infrastructure from operation will help to move us toward an environment where more infrastructure is publicly-owned and more operators compete on that infrastructure. For reasons which we shall discuss in more detail below, however, we think the proposal is unlikely to increase the extent of publicly owned infrastructure. We also think that the elimination of federal operating subsidy is likely to discourage most new private passenger rail operators from entering the market.

There are Serious Negative Effects of Restructuring

We believe that our colleagues's restructuring proposal not only lacks a clear rationale; it also is likely to have serious adverse effects on infrastructure investment and passenger rail service. We think it is likely both to reduce the level of infrastructure investment for passenger rail and, by reducing operating subsidies, dramatically curtail the level of interstate passenger rail service.

While the restructuring proposal is advanced with the intent of increasing infrastructure investment, the likelihood of Congress approving additional infrastructure funding under this proposal is undermined by the unequal distribution of infrastructure spending among the states. Virtually all of Amtrak's infrastructure spending is now done within the eight states of the Northeast Corridor. Other states are willing to support these expenditures because they receive a disproportionate share of the operating subsidies to keep trains running in their states. If federal operating subsidies were eliminated, as the proposal envisions, the other states would have

little reason to support infrastructure investment in the Northeast Corridor, and might cease such expenditures altogether. This could lead to the collapse of the high-speed rail project in the Northeast Corridor and the gradual erosion of conventional Northeast Corridor service as the infrastructure deteriorates.

Even if a handful of high-speed rail infrastructure projects were supported outside of the Northeast Corridor, this would still not produce enough support to keep the program going. While the proposal is advanced on the assumption of an increase in passenger rail infrastructure funding, it may thus result in a decrease in infrastructure funding.

The restructuring proposal's assumptions about operating subsidies would also have a seriously negative effect on the support for interstate passenger rail service, and would probably lead to most of that service being canceled. The proposal suggests that the new operating entity would receive no federal operating subsidy, would be required to pay for its own rolling stock, and would have to depend on voluntary payments from the states for any public operating subsidy it received. We think this proposal would make most long-distance trains and many short-haul trains that require regional or multi-state support unsupportable.

Amtrak believes that it can cover its operating costs, but only if the costs of acquiring rolling stock are treated as a capital cost to be paid for by public subsidy. No one who has studied Amtrak's cost structure believes that it can break even if it has to cover the costs of its rolling stock. If Amtrak cannot cover its costs, it must either cut routes or go to the states for operating subsidy. (If Amtrak cuts routes, this further undermines national support for federal infrastructure funding.)

We think Amtrak is unlikely to be able to generate substantial operating subsidies from the states. Amtrak's inability to obtain sufficient state support thus far is instructive. While state support for Amtrak has increased, it is still only $70 million in 1997 and the states continue to struggle over providing modest amounts of money. More than half of the state support comes from a single state—California. Two-thirds comes from two states (California and Illinois). All of it comes from 14 states. The States of Louisiana, Mississippi, and Alabama could not agree on how to divide up the $2 million cost of the *Gulf Coast Limited,* so none of them contributed anything, and the route was terminated, even though this is the sort of short haul service (from Mobile, AL, to New Orleans, LA) that states should find attractive. The State of Massachusetts would not contribute even $100,000 to support the *Vermonter* even though it serves the western part of the state. Vermont had to pay the full share (but in the absence of federal subsidies, the route would have been canceled, because Vermont only had to pay for the extension of service north from Springfield, MA). The proposal will likely lead to the elimination of most interstate routes outside of the Northeast Corridor; the few remaining routes are likely to be the relatively small number that fall entirely within one state, such as those in California.

Our colleagues assert that separation of infrastructure ownership from operations would enhance the efficient use of the infrastructure, but the experience of Amtrak and the freight railroads points to the opposite conclusion. Freight railroads defend their right to operate on their own privately owned rights-of-way because they believe strongly that the ownership of the right-of-way allows them to offer a more efficient and customer-oriented service than would be the case if they were tenants on a right-of-way owned by someone else. Clearly, one of Amtrak's problems over the years has been that it does not own most of its rights-of-way. Delays in Amtrak service are often due to operations of freight railroads. It is no accident that Amtrak has succeeded on the one right-of-way that it owns—the Northeast Corridor. We see no reason to endanger this success by separating ownership of the right-of-way from operation of the trains.

The restructuring proposal also suggests weakening what the report itself describes as "one of the most valuable of all of Amtrak's assets." Amtrak has guaranteed access to the Nation's freight railway system, and it is these rights of access that the "Context" section of the report describes as one of the "most valuable" assets cited above. Yet in the "Question-and-Answer" section of the report, these rights are put up for negotiation. "The panel believes that Congress should explore new alternatives that would fall between the current Amtrak arrangements [i.e., guaranteed access] and the present framework for commuter rail access [i.e., no guaranteed access] to freight rail infrastructure." We cannot see how giving away these critical access rights advances the cause of passenger rail transportation in the United States.

The Restructuring Proposal is Based on Erroneous Factual Statements

The analysis in the majority report is based in part on a number of unsupported factual assertions, some of which are contradicted by its own findings. The majority

report alleges, without foundation, that "Amtrak's Strategic Business Plan is generally acknowledged by many outside of Amtrak as wholly unrealistic." In fact, the outside parties that count, namely the bankers that are lending Amtrak money, do believe the plan is realistic, and that is why they are lending the $1 billion that Amtrak is borrowing for its Northeast Corridor high-speed rail service.

The majority report takes note of the reforms that Amtrak has instituted in the past three years and asserts, again without offering any evidence, "Broadly speaking, these [reforms] have not paid off." This does not appear to be the view of the states who work with Amtrak. The State of Wisconsin, for example, has written to the Working Group saying that "In recent years, Amtrak has taken more aggressive actions to improve the service, increase advertising, and increase eldership. These changes are reflective of the new attitude that is manifesting itself in Amtrak. Everyone at the company recognizes that they must please their customers if they are to continue as a company. They are working hard to do so." The letter also notes that ridership has doubled since the State contracted with Amtrak for passenger service. While ridership has declined nationally because Amtrak has been forced to eliminate routes due to federal budget cuts, traffic is generally growing on those routes that have been retained. Similarly, the State of Illinois has written to the Working Group stating that "Amtrak has shown the flexibility and will to make significant and tangible strides toward self-sufficiency and good business practices. We thus have reason to be hopeful for the future."

The Majority Report Proposes Confusing Information about Rail Labor Issues

The majority report for the most part ignores the controversial issue of labor protection and accident liability, because there was little consensus on these issues among the Working Group, and information had been presented to the Group indicating that these issues had inconsequential effects on Amtrak's financial status. Indeed, the majority report states in its conclusions that "The problems do not lie with Amtrak management or Amtrak labor. . . ." Yet, the report does not address what will happen to employees under the restructured system. Freight railroads operate under essentially the same labor protection provisions as Amtrak, and they find it possible to succeed in a competitive business. The fact is that Amtrak's recent experience in eliminating routes has shown that labor protection in practice has inconsequential costs. Amtrak does not use the flexibility it has now to contract out work and has never been able to show that it would actually save money if it had more flexibility. We believe that these labor provisions have little if any effect on Amtrak's financial status and should not be part of any Amtrak reform proposals. But more importantly, we believe that any proposal to restructure Amtrak should specifically address the future status of Amtrak's employees.

There Are Better Ways to Preserve and Enhance Intercity Passenger Rail Service in the United States

Congress has repeatedly urged Amtrak to make better use of its infrastructure and to reduce costs and lessen its dependence on operating support. Instead of embarking on an the uncertain path of restructuring, we believe that Amtrak should be given the next two to three years to implement several promising revenue-enhancing activities that could significantly improve its financial situation. These initiatives include high-speed rail in the Northeast Corridor, increased mail and express, and development of electric power initiatives, among others.

We believe that Amtrak's management has done a credible job of making Amtrak more efficient and more customer-focused. We believe that Amtrak has correctly seen that it must invest in new rolling stock to replace obsolete equipment that is unreliable and expensive to maintain. We believe that the Congress should support Amtrak's effort to reduce its costs and expand its market by providing it with the capital and operating support it needs and by eliminating statutory restrictions on Amtrak's operations.

First, Amtrak needs more capital support so that it does not have to borrow money on the private market at high interest rates. Clearly it makes more sense for Amtrak's capital costs to be financed at low government interest rates than at high private interest rates. In particular, Amtrak needs capital support to pay for and promptly begin service with its new high-speed rail service on the Northeast Corridor. While it is possible to dispute the exact estimates of the surplus that will be generated by this service, there is no doubt that this is a worthwhile investment for Amtrak and for the Nation.

Second, Amtrak needs sufficient operating subsidy so that it does not have to borrow short-term to meet its operating costs. Amtrak has reduced its operating costs by over $200 million since 1994. It is making good progress toward minimizing its need for operating subsidy. Reducing Amtrak's operating subsidy in the short run

simply forces Amtrak to borrow more, thus increasing its need for operating subsidy in the long run. A predictable, realistic glidepath to lower operating subsidy is the most sensible policy.

Third, Amtrak needs some basic revisions in its statutory authorization to clarify its authority and allow it to reduce its costs and increase its revenues. Amtrak currently is authorized to carry "mail and express" in addition to passengers, but "express" is never defined in the statute. Instead, "express" is defined by a long series of Interstate Commerce Commission decisions. The definition is obscure and subject to prolonged litigation. The freight railroads have opposed Amtrak's recent attempts to expand its express business and have threatened litigation to prevent Amtrak from increasing its revenues in this way. The freight railroads say they only want Amtrak to carry what is traditionally considered express—things like United Parcel Service (UPS) packages. But the freight railroads already carry a considerable amount of UPS packages by carrying UPS trailers on their flatcars. It would not make sense for the freight railroads for Amtrak to expand its business in an area that is already being served by the freight railroads.

Amtrak has proposed carrying cargoes like refrigerated perishables and other intermodal traffic requiring very tight delivery times. The railroads have opposed letting Amtrak carry this cargo because it is "freight," not "express." But the important point is whether the railroads have any realistic likelihood of carrying the cargo in question. If the freight railroads cannot meet the delivery schedules demanded by shippers, then they are not harmed by having Amtrak carry the cargo, regardless of whether it is "freight" or "express." We therefore recommend that the definition of "express" that Amtrak is authorized to carry be defined in statute as any cargo that existing freight railroads do not carry because they cannot routinely meet the delivery schedules or other criteria demanded by shippers.

Amtrak uses prodigious amounts of electrical power on the Northeast Corridor. The commuter railroads who use Amtrak's right-of-way use even more. Electrical power costs in the northeast are among the highest in the country. If Amtrak could buy power from distant suppliers who can generate power at lower costs, it could dramatically reduce its costs of service. Amtrak should further be permitted to make more efficient use of the natural distribution system created by its Northeast Corridor electrical grid to sell power to other users along its right-of-way. If Amtrak is to make more efficient use of its infrastructure, it needs to have the authority to use its infrastructure to reduce its costs and generate revenues.

Summary

In summary, despite the unanimous belief of the Working Group that intercity passenger rail is a valuable part of the Nation's transportation system, our colleagues' proposal could create a crisis in rail transportation in the one corridor where it is most vital, and lead to the erosion or collapse of rail service in other regions of the country. We believe that further analysis of the costs and benefits is needed before reaching the conclusion that intercity rail operating and infrastructure units should be separated. In our judgment, such a strategy would result in greater costs to the taxpayer, more bureaucracy, and fewer trains.

While our worst fears may not be realized, we strongly urge the Congress to undertake a more thorough analysis of the tools necessary for lowering costs and raising revenues before adopting their recommendations.

APPENDIX C

QUESTIONS AND ANSWERS CONCERNING THE PROPOSAL OF THE COMMITTEE ON TRANSPORTATION AND INFRASTRUCTURE WORKING GROUP ON INTERCITY RAIL

—Will the proposal lead to a reduction in Amtrak routes?

The proposal does not envision or call for a reduction in routes. In fact, it is hoped that with a more streamlined organizational structure, the lifting of Amtrak's current legal constraints, and increased infrastructure investment by Amrail, an expansion of intercity passenger rail service in appropriate markets will be possible.

—What level of federal funding does the proposal assume?

The working group believes that capital and operating funding requirements must be treated separately. Federal operating subsidies should be eliminated at least by 2002. In the short-term, operating bridge funding at a level between the Administration's request ($342M) and Amtrak's request ($387M) should be provided in order to avoid a bankruptcy.

Continued capital funding should be provided on a regular, predictable and permanent basis. The level should be on the order of that proposed in Amtrak's strate-

gic business plan (approximately $750M per year), although the working group believes non-federal sources, such as private and state/local funding would be available for at least a portion of this funding.

—What will happen to Amtrak's employees?

Employment levels will not decrease as a result of this proposal. In fact, the proposal is assumed to increase passenger rail jobs with the expansion of passenger rail service in appropriate markets.

Both Amtrak's employees and its management have been severely handicapped by the organizational structure of Amtrak as currently constituted. The working group views the proposed restructuring as an opportunity for both labor and management to be freed from these constraints and to explore new options for stable and growing employment.

Most of Amtrak's employees will continue to work for Amtrak under existing labor contracts. Some Amtrak employees, who currently work on infrastructure maintenance, would work for the new infrastructure entity, Amrail.

—How will the working group's proposal improve passenger rail service?

In the short-term, the proposal is aimed at averting an Amtrak bankruptcy, which is a real possibility if no legislative action is taken.

Over the longer-term, splitting operations from infrastructure management will enable Amtrak to focus its efforts on its principal day-to-day responsibility—providing and developing superior, efficient service to its users—not seeking support for its infrastructure capital program.

In addition, the working group believes that the introduction of competition from other providers of intercity passenger rail service will inject an element of market discipline in the provision of passenger rail service that is currently lacking.

Furthermore, Amrail, the new infrastructure management organization, would be responsible for developing new rail corridors outside the Northeast Corridor to provide high quality, higher-speed rail service in appropriate markets.

—Would providers of inter-city passenger rail service have access to freight railroads' rights-of-way outside the Northeast Corridor?

Amtrak currently has compulsory access by federal law and pays for that access under a statutory "incremental cost" formula that does not take into account the operational impact of passenger traffic on freight operations. In addition, the presence of Amtrak trains exposes the host railroad to unlimited tort liability from possible passenger train accidents. In sharp contrast to the present Amtrak access arrangements, publicly funded commuter railroads using freight railroads' tracks negotiate their access on a case-by-case basis, bargain the specific compensation to be paid, and typically bring with them the liability limitations of state laws governing publicly funded transit and commuter rail operations.

The panel believes that Congress should explore new alternatives that would fall between the current Amtrak arrangements and the present framework for commuter rail access to freight rail infrastructure. Liability protection should be a critical element of a new access regime. In addition, the panel has recommended long-term, stable federal assistance for infrastructure upgrades on and off the Northeast Corridor. This already occurs in the commuter rail field, where the Federal Transit Administration assists in capacity and signal improvements on freight railroad lines that also carry commuter rail traffic. We envision similar infrastructure projects focused on the passenger corridors around the country with the greatest market potential.

—Has anything like this ever been tried before?

Yes, other countries have restructured their rail systems by separating infrastructure management from transportation services, including Great Britain, Denmark, Sweden, the Netherlands, and Australia. Materials on the experiences of other countries are included in the appendices to the working group's report.

MAIL AND EXPRESS

Question. What is the size and make-up of Amtrak's current fleet of mail and express cars? Are there plans to acquire new cars for mail and express service? What funds are being utilized to purchase these cars?

Answer. Amtrak has a fleet of 138 active and 9 stored baggage cars that are used for passenger baggage, mail and express. Mail and express are also carried in Material Handling Cars (MHC's) for which the fleet includes 141 active and 2 stored cars. Last year 13 Roadrailer trailers (vehicles that operate on the rail and highway) were acquired, which are used primarily to transport mail. Amtrak is acquiring an additional 250 plain MHC's, 367 refrigerated MHC's and 283 Roadrailer trailers for the mail and express business this year. This equipment is being leased through private market financing

Question. For fiscal years 1995, 1996 and projected for 1997, please display the amount of revenue generated by Amtrak's mail service and by express service.

Answer.

Year	Mail revenue	Express revenue
1995	$57,300,000	$3,100,000
1996	63,000,000	3,100,000
1997 (proj.)	64,500,000	5,200,000

Question. How much does Amtrak expect to generate in mail and express business in the next five years (fiscal years 1998–2002), by year?

Answer. The 1998–2002 business plan will not be approved by Amtrak's board of directors until September, so specific numbers are not yet available. Because of the board's approval of the equipment acquisition (250 plain MHC's, 367 refrigerated MHC's and 283 Roadrailer trailers for mail and express business), 1998 pilot program express revenue will exceed $200 million. Plans are being developed which, if approved by Amtrak's Board, will result in potential annual mail revenue exceeding $200 million and an equivalent amount or higher in express revenue.

Question. Do you have agreements with any freight railroads to initiate this service? Which railroads? Which railroads are opposed to Amtrak performing this service?

Answer. Joint venture agreements are in various stages of discussion with Class I railroads and several smaller railroads to give them profitable opportunities to participate in aggressive growth of carload and trailerload express. Amtrak intends to increase its handling of premium shipments that are currently being transported by motor carriers and via air for which prices higher than railroad freight rates will be charged. Shippers have expressed strong interest in Amtrak's express service capabilities because it is tightly scheduled, relatively damage free, offered by a transcontinental carrier meaning no railroad to railroad interchange, and is highway transit time competitive while at the same time being more economical than highway or air. Mail and express business is currently carried over virtually all freight railroads over which Amtrak operates. It has been this way since Amtrak's inception. One railroad has publicly stated concerns about the possibility of Amtrak capturing business it now carries.

Question. What additional expenses are associated with the mail and freight program? What are the estimated first year profits?

Answer. Since the business is handled on passenger trains that are currently operating, as a way to help make them financially viable, incremental expenses are relatively limited. They include equipment leases, terminal costs and administrative costs. As train lengths increase there is an additional cost associated with additional locomotive power and fuel. First year contribution (incremental revenue less incremental expense) for the pilot express initiative is projected at $53 million.

Question. Why is it necessary to enter into agreements with freight railroads at all to provide mail and express service? Doesn't Amtrak have the authority and absolute right to operate over any track?

Answer. Amtrak wishes to enter into agreements with freight railroads in connection with the expansion of its express business because some of the accessory services required, such as terminal services, can be best provided by the freight railroads. In addition, Amtrak believes that railroad participation in its express business, through joint ventures or other contractual arrangements, will give railroads a financial incentive to achieve significantly improved on-time performance which also benefits passengers. Amtrak also believes that entering into agreements with railroads will enable it to avoid disputes over whether particular shipments it is handling constitute "express." Although Interstate Commerce Commission decisions support Amtrak's position that all of the business it plans to handle is in fact "express", litigation over this issue with freight railroads, which own the tracks over which Amtrak's trains operate, could delay Amtrak's efforts to expand the business. This would hamper Amtrak's ability to free itself from Federal operating subsidy, as it has been directed to do by the Administration and Congress, and would be inconsistent with Amtrak's objective of being viewed by those railroads as a valued partner whose operations provide a way for them to earn additional profits. Amtrak has the right to operate over any railroad's track and to carry mail and express business on its trains.

LABOR ISSUES

Question. How do the labor provisions affecting rail employees differ from those affecting airlines and intercity buses?

Answer. Amtrak is governed by the following legislative labor provisions which do not apply to airlines and/or intercity buses:

1. *Federal Employer's Liability Act.*—A fault-based workers compensation system, governing compensation for employee on-duty injuries.

2. *Railway Labor Act (also applies to airlines).*—Governing labor relations issues of employee representation, dispute resolution and negotiation of contracts.

3. *Railroad Retirement Act.*—Governing railroad employee retirement.

4. *Rail Passenger Service Act provisions.*—Governing employee protective conditions (Appendix C–2) and no furlough (except food and beverage) contracting out restrictions.

While airlines and intercity bus operations are affected by other laws covering workman's compensation, collective bargaining and retirement, Amtrak is uniquely covered by the legislative requirements outlined in item 4 above.

Question. GAO's testimony stated that Amtrak has been unsuccessful in negotiating productivity improvements with labor unions. Many of the same craft unions are represented at both freight rail and Amtrak labor negotiations, and there is pressure from labor to secure equally favorable agreements with Amtrak as have been secured with the freight railroads. As a result, in the last six months, many freight/labor union agreements have been negotiated, while Amtrak is stuck at the table. Do you believe that the labor unions fully appreciate how dire Amtrak's financial circumstances actually are? Are the union negotiating the railroad out of business?

Answer. With freight settlements in the background, it seems unlikely "concessionary" agreement can be reached voluntarily with some unions for political or union institutional reasons without Congressional action but it is difficult to characterize union beliefs in general or in total. We believe that all of our unions understand Amtrak is in financial difficulty. However, few, if any, unions accept the Congressional and Administration mandate that Amtrak be independent of federal operating support. Consequently, they do not accept Amtrak's Strategic Business Plan to achieve that independence. This non-acceptance exists despite the fact that our level of federal operating support has been cut in half—nearly 50 percent—over the past two fiscal years. Consequently, Amtrak has been unable to reach agreements providing for work rule and benefit reform necessary to help Amtrak live within an environment of declining federal operating support.

OPERATING COMMUTER RAILROADS

Question. What commuter railroads does Amtrak operate? What was the total revenue stream from these operations (broken out by commuter transit authority) for fiscal years 1994, 1995, 1996, and projected for fiscal year 1997?

Answer. Amtrak operates seven commuter operations. Those commuter services and revenues are noted below. (fiscal year 1997 figures still being developed.)

AMTRAK CONTRACT OPERATIONS OF COMMUTER TRAINS

[Dollars in millions]

Commuter agency	Fiscal year—				
	1992	1993	1994	1995	1996
MBTA (Boston)	$88.4	$96.4	$105.4	$124.0	$132.2
Maryland DOT	10.7	12.2	14.0	14.2	22.2
Northern Virginia	2.8	7.7	7.3	9.0	8.6
Connecticut DOT	5.3	5.8	6.0	6.1	6.5
Southern California	1.6	13.8	24.2	25.1	25.1
Peninsula Commuter	7.4	27.2	30.0	30.8	34.9
San Diego Commuter	.....	.....	0.2	6.2	5.8
Orange County, CA	1.8	1.5	0.5	.....	.....
Total revenue	118.0	164.6	187.6	215.4	235.4

RURAL SERVICE

Question. In Amtrak's testimony before the Committee on May 7th, President Downs stated that Amtrak provides a necessary service for rural communities as well as urban corridors. But considering the ridership figures and operating losses on many of these long-distance routes that serve rural communities, it seems clear that the railroad's rural constituency is not sold on Amtrak's necessity. Low income, young, and elderly passengers who generally have to watch their budgets more often travel by intercity buses, which have four times the ridership Amtrak does, rather than pay more per ticket for less frequent, more often delayed, train service. Can you make any compelling arguments for Amtrak's importance as a rural transportation alternative?

Answer. Passenger rail service is essential to many rural areas. Sixty-two million Americans live in small towns and rural areas. Amtrak serves over 530 communities nationwide many of which are in rural areas with few transportation options. While commercial air and bus carriers have found it economically infeasible to provide service to many smaller cities, intercity passenger trains can stop at areas with populations as low as 10,000–20,000 without significant cost or time loss. Amtrak serves thirty-three communities which have no air service, eighteen communities which have no bus service, and nine communities with neither air nor bus service.

COST TO LIQUIDATE

Question. How solid is the estimate of $5,000,000,000 in costs associated with liquidation of the railroad? Couldn't some employee dismissal cost be reduced?

Answer. The estimated cost associated with the liquidation of the railroad is approximately $6.2 billion. This is based on an analysis done by Amtrak in February 1995 and subsequently scored by the Congressional Budget Office on April 11, 1995. The original analysis estimates a "shut down" cost of $5.4 billion. The current estimate of $6.2 billion is higher primarily due to an escalation in the amount of financing obligations that Amtrak now has. In a shutdown situation, employee dismissal cost would be reduced primarily via "protected" employees getting jobs and giving up their protection payments.

UNPROFITABLE ROUTES

Question. Please update the Committee on the status of the five routes on which Amtrak planned to discontinue service last year, that then received 6-month extension funds in the fiscal year 1997 omnibus consolidated appropriations bill.

Answer. The five routes are the Texas Eagle, Pioneer, Desert Wind, Boston-Albany section of the Lake Shore Limited, and the Gulf Coast Limited.

The Gulf Coast Limited was discontinued on March 31, 1997 and the Pioneer and Desert Wind were discontinued on May 10, 1997. The Texas Eagle and Boston-Albany section of the Lakeshore Limited were extended through the end of the fiscal year based on arrangements with the states (loan from the state of Texas and a capital investment from the state of Massachusetts).

Question. Does Amtrak have plans to close or reduce service on additional routes? If yes, what routes would be affected and why? Does Amtrak expect that it will be successful in making these route adjustments?

Answer. Amtrak does not plan on closing additional routes. Our business plan calls for maintaining the national system.

STATES USING HIGHWAY FUND FLEXING

Question. If the successor surface transportation authorization bill includes provisions giving states the flexibility to use highway funds for Amtrak operations within the state, what is the likelihood of this increased flexibility being utilized by the states? What states have done this so far?

Answer. It seems clear that states would utilize the increased flexibility to spend a portion of their federal transportation allocation on Amtrak if they were allowed to do so. Many, many states have expressed their strong support for this, coast to coast, north to south, urban to rural. Governors who have made clear public statements on this issue range from Oregon to Delaware, West Virginia to Wisconsin, Michigan to Virginia. Right now public policy concerning the various transportation modes is incredibly skewed and distorts state and local decision making. The federal government offers generous matches for state investments in highway or transit service, but little or no funds to match state investment in rail passenger service. The result is states and localities are discouraged in investing in rail even when it is the best transportation solution for the area.

The only program exception is the ISTEA Enhancements program, which states can use for Amtrak stations, but not intercity rail operations. States have so far used more than $70 million for Amtrak station projects, and spent another $100 million of ISTEA funds on intermodal stations where Amtrak stops. Because states are currently not allowed to use their federal transportation funds for intercity passenger rail, only the State of Oregon, which was granted permission under specific conditions, is using Congestion Mitigation and Air Quality (CMAQ) funds to help support an Amtrak train.

STRATEGIC BUSINESS UNIT OPERATIONS

Question. Please prepare a table displaying, for each strategic business unit, the routes operated by name; by terminus city pairs (and system miles); by frequency of service; by total annual revenue in fiscal year 1996; by total annual expanses in fiscal year 1996; the profit/(loss) in dollars for each route; and the operating ration (expenses to revenue comparison).

NATIONAL RAILROAD PASSENGER SYSTEM FINANCIAL PERFORMANCE

REIMBURSABLE SERVICES

Question. In what reimbursable service agreements is Amtrak currently engaged? What revenues are associated with these agreements?

Answer. The major portion of Amtrak's reimbursable service agreements are in the NEC. The largest service agreement is with NJ Transit, a "new initiatives" agreement involving maintenance-of-way (M.O.W.) services which Amtrak undertakes for NJ Transit. Amtrak also has an agreement with the Long Island Rail Road (LIRR) for various M.O.W. tasks and a joint venture with the LIRR for Penn Station train control improvements.

Revenues associated with reimbursable arrangements are: Fiscal year 1995, $107,300,000; fiscal year 1996, $107,500,000; and fiscal year 1997, $90,878,000 (forecast).

SUBCOMMITTEE RECESS

Senator SHELBY. The hearing of the Subcommittee on Transportation is now recessed, to reconvene subject to the call of the Chair. Thank you.

[Whereupon, at 12:37 p.m., Wednesday, May 7, the subcommittee was recessed, to reconvene at 10:10 a.m., Thursday, June 12.]

DEPARTMENT OF TRANSPORTATION AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

THURSDAY, JUNE 12, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:10 a.m., in room SD–138, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senators Shelby, Domenici, Bennett, Faircloth, and Lautenberg.

Also present: Senator D'Amato.

PANEL 1

CONGRESSIONAL WITNESSES

STATEMENTS OF:

HON. ALFONSE M. D'AMATO, U.S. SENATOR FROM NEW YORK
HON. SUSAN MOLINARI, U.S. REPRESENTATIVE FROM NEW YORK
HON. PETER T. KING, U.S. REPRESENTATIVE FROM NEW YORK

NONDEPARTMENTAL WITNESS

STATEMENT OF DAN DONOVAN, CHIEF OF STAFF, ON BEHALF OF HON. GUY V. MOLINARI, BOROUGH PRESIDENT, STATEN ISLAND, NY

OPENING REMARKS OF SENATOR SHELBY

Senator SHELBY. The subcommittee will come to order.

I scheduled this hearing at the request of my friend and colleague, Senator D'Amato. I would like to welcome Members of the New York delegation, Senator D'Amato, Congressman King, former Congressman Guy Molinari, and Congresswoman Susan Molinari.

We are here today to talk about air traffic control staffing, specifically the situation in the Northeast. One of my top priorities as chairman of this subcommittee is to make sure that the United States has the safest air transportation system possible. Air travel among the general public is increasing every year, and I believe we must have adequate air traffic control staffing to meet this demand.

Our current air traffic control system is antiquated, and is in dire need of an overhaul. We gave the FAA the tools to reform its acquisition and personnel systems in the 1996 Appropriations Act.

We will be interested to hear the FAA explain how they are using these tools to address the problems in the New York-New Jersey area.

I should also point out that in this subcommittee's report accompanying the Fiscal Year 1997 Appropriations Act, we took note of staffing and equipment problems in the New York-New Jersey area and directed the FAA Administrator to report to us on the initiation of a local recruiting effort in this region.

We received that report yesterday afternoon, and it pointed out some of the difficulties of moving controllers up to higher level facilities in the New York-New Jersey areas. It also sets out some new initiatives that FAA plans to implement to increase the number of recruits from the immediate New Jersey and New York areas.

We are fortunate to have a great deal of institutional expertise in this matter in the members represented on the first panel, and in the ranking member of this subcommittee and former chairman, Senator Lautenberg. Senators D'Amato and Lautenberg both have a great deal of background and experience with air traffic controller staffing issues, and we are looking forward to hearing both of their comments.

The second panel today would include Mr. Barry Krasner, the president of the National Air Traffic Control Association, Mr. David Barger, a vice president of Continental Airlines from Newark, NJ; Mr. Raymond D. Maldonado with the FAA Control Tower at Newark International Airport; Mr. Tom Monaghan with the FAA Control Tower at JFK International Airport; Jack Johnson, Professional Airways Systems Specialists president; and Henry Brown, New York Systems Management Office PASS representative.

We will also be joined by Monte Belger, the Acting Deputy Administrator, Federal Aviation Administration; and Mr. Ron Morgan, Director of Air Traffic Service at the FAA.

The third panel today will consist of Mr. Charles Barclay, the president of the American Association of Airport Executives; Mr. Phil Boyer, president, Aircraft Owners and Pilots Association; and Mr. Edward Bolen, president of General Aviation Manufacturers Association.

Air traffic safety is critical to the health and security of this Nation. Americans deserve to have the highest level of confidence in their air traffic control system, and I am committed to help bring this about.

Again, I want to thank all the witnesses that will be participating here today, and before we hear from the first panel, I want to first ask the ranking member and any of the other members if they have any opening statements.

Senator Lautenberg.

STATEMENT OF SENATOR LAUTENBERG

Senator LAUTENBERG. Thank you very much, Mr. Chairman, and I commend you for calling this very important hearing to address the staffing and equipment modernization problems for air traffic facilities in the New Jersey-New York area.

I, too, want to welcome our colleagues both former and present, Senator D'Amato, with whom I have done lots of work on transpor-

tation matters. What happens in one State often immediately happens in the other.

I want to welcome our friends from commerce, and that includes all of them, even including the next Oprah Winfrey, Barbara Walters, name it as you will. We wish Susan Molinari well. I am sure she will succeed in that new venture, as she has in past ventures. All one has to do is look at that baby. Where is she? But we are delighted to have you here.

I have been voicing concern, along with others, over the staffing and equipment problems for several years, both individually and through this subcommittee. Now, there is not a deeper level of frustration that anyone holds than I do with the slow response to the clear need for increased staffing at our air traffic control towers, as well as the air traffic control center and TRACON in New York, and no one is more frustrated than I with the delays in modernizing the equipment our controllers must work with.

I am tired of the broken commitments, the missed targets, the waste of taxpayer dollars that went down the drain when the failed aviation advanced automation system did not work. I am tired of listening to reasons, excuses, if you will.

While recognizing that our air traffic control system is the safest in the world, we also have got to recognize that it remains so because of the exceptional effort by the air traffic controllers who face extremely challenging, indeed worsening conditions during an era of prosperity in the air, significant growth in traffic, and I am sure that everyone here agrees that safety must be the No. 1 issue in each and every decision on how aviation systems function.

But as I review the litany of excuses for staffing shortages and equipment replacement delays, I have to ask, are all parties putting safety first? In my view, when solutions to safety problems are at hand, it is the obligation of decisionmakers to, as the popular advertisement says, just do it, and no agency in the Federal Government is in a better situation to just do it than the FAA.

Two years ago, this subcommittee fought an uphill battle to implement meaningful personnel and procurement reforms for the Federal Aviation Administration. We fought on the Senate floor, as well as in conference. In the end, we succeeded in granting the FAA greater flexibility than currently applies to any other Federal agency, both in the manner in which it procures necessary equipment, and the manner in which it hires and assigns personnel.

We took these unprecedented steps in order to allow the FAA to act more like a business, but I can tell you, as a former chief executive of a sizable company, that I do not see the FAA functioning in quite businesslike form.

No successful chief executive would allow some facilities to be continually overstaffed while other critical facilities remain understaffed. They either move people, or they shift responsibilities from one facility to another, and that is not an easy assignment with the construction of our aviation system. They do not just wring their hands and offer excuses. They identify the right fix, and they just do it.

Apparently, the FAA can identify several facilities that are seriously understaffed, including the ones we are discussing today, but

the FAA also has several other facilities where staffing levels are above their authorized level.

Even before the enactment of personnel reform, the FAA had the authority to reassign people immediately to where they are needed. The time is long past due for the FAA to just go ahead and do it.

When it comes to the distribution of responsibility between facilities, there are opportunities at FAA's disposal right now to shift responsibilities from an understaffed and overworked air traffic control center to a neighboring center with adequate staff capacity. If the FAA believes this can be done in the interest of improving safety, then once again it is time for them to just do it.

At Newark International Airport we were making some progress with the FAA at reducing delays, but recently, and I use my own experiences as a yardstick, we have been singled out as the airport with the greatest number of delays in the Nation.

Well, part of this problem is related to area weather. An important part of the solution rests with the FAA's ability to deploy modern equipment and keep traffic moving safely in good weather and bad. When it comes to cutting through the bureaucracy and getting that equipment up and running at Newark, it is time for the FAA to just do it.

Finally, it must be said that in order to move rapidly on implementing these solutions, the FAA needs strong leadership, and needs it right now. It is unconscionable that it took until yesterday for the administration to announce their intent to nominate individuals for the position of FAA Administrator and Deputy Administrator. I say that with no disrespect to the current Acting Administrator, who I think has done an excellent job at the FAA.

They are doing the best they can, but we have not had a confirmed FAA Administrator for more than 7 months. We have not had a confirmed Deputy Administrator for more than 4 months. No business worth its salt would go ahead without a chief executive officer and a chief operating officer for such a long time, and I plan to do whatever I can to encourage the Senate to move these nominations as quickly as possible.

Thank you very much, Mr. Chairman.

Senator SHELBY. Senator Domenici.

STATEMENT OF SENATOR DOMENICI

Senator DOMENICI. Thank you very much, Mr. Chairman. I do not have a prepared statement. From time to time I might chime in indicating what the budget recommended for this year in this area.

Senator SHELBY. Absolutely. We would like to hear it, too.

Senator DOMENICI. Senator Lautenberg and I put the bipartisan budget agreement together, and there are some facts about funding expectations under the budget for the FAA that have some bearing.

Mr. Chairman, I am very pleased that you make the statement about what we ought to expect in the United States in terms of this system. I think I would like to add one other goal for your subcommittee that I hope you would clearly consider.

From time to time, agencies such as the FAA, IRS, and others have justification for their inability to get certain things done, and sometimes that is justifiably laid at our footsteps in Congress for

the way we fund or do not fund programs, or limitations we have placed on them. I think the issue is getting critical enough that before you have finished your markup, this subcommittee ought to be very sure that what we fund is indeed moving in a positive direction, not only from our individual eyes as Senators, but from the standpoint of those who have to put this behemoth together and make it work better.

Personally, I thank you for this hearing, and I welcome the New York delegation. Somehow from way out in New Mexico I have sort of been adopted by New York. Maybe it is because they have so many Italian people there. [Laughter.]

They invite me to be part of their Italian heritage. I welcome that, and I note that they are in predominance even here today.

In any event, I hope things can be worked out where you can be proud of what we do this year, that we make some strides that are positive with reference to the FAA both in terms of safety and modernization of equipment. I think it is imperative that we do that, be it for my State or your State or your cities. We just have to. It is the mode of transportation for people today that used to rely on other modes. They are all using airplanes today, airlines are growing, and we have to accommodate that.

Thanks very much.

Senator SHELBY. Senator Domenici, I believe that the Italians seated at the table like you personally, but they also know you are chairman of the Budget Committee, too. [Laughter.]

We also like you because you are a member of this subcommittee. You and Senator Lautenberg. You are the chairman of the Budget Committee. He is the ranking Democrat on the Budget Committee. We welcome you and we welcome your experience on this committee. You will have a lot to say.

Senator Bennett.

STATEMENT OF SENATOR BENNETT

Senator BENNETT. Thank you, Mr. Chairman.

I come to this issue with a strong personal sense of history. Some of you have heard this before, but I have discovered since coming to the Senate there is no such thing as repetition in the Senate, so I served in the Nixon administration at the Department of Transportation, and one of my first assignments was to lobby through the Congress the Airport Airways Act that created the airport airways trust fund.

We naively assumed when we created the trust fund, the ticket tax, the departure tax, and the rest of it to go into the trust fund, that we had put a financial base under the FAA that would make them immune from funding problems for all time, that from then on there would be a funding base to see to it that the air traffic control system would be properly staffed and properly equipped, no matter what happened to the ups and downs of the economy.

With all due respect to the Budget Committee and the unified budget, that has not happened, and Presidents, both Republican and Democrat, have reached into the airport airways trust fund under the process of the unified budget and taken money that it was the original intent of Congress would go to fund the air traffic control system, and they have used that money for other purposes.

As one who was charged with the responsibility of convincing Congress to create that trust fund in the first place, I am upset that the money has not been there and that the air traffic control system has been allowed to fall into the state that it now is. I have shared this before, but I think in this place it should be raised again.

Someone did a study of the computers in the Government to see how vulnerable they were to hackers who could break into the computer system and get at Government data, and they came back and said, every portion of the Government, the Defense Department, the IRS, every portion of the Government is subject to attack by outside hackers save one, and that one is the air traffic control system. Their equipment is so old and so obsolete and the software so unknown to today's hackers that they are immune from outside attack. [Laughter.]

Somehow I do not find that reassuring, and I am delighted that this hearing has been held, and I look forward to hearing from these witnesses.

Senator SHELBY. Senator D'Amato, your written statement and those of all of you will be made part of the written record in its entirety. You may proceed as you wish. Welcome to the committee. You have spent a lot of time on this committee yourself earlier in your Senate career.

STATEMENT OF SENATOR D'AMATO

Senator D'AMATO. Well, Mr. Chairman, let me thank you for not only holding this hearing but your moving to bring it on so quickly, given the tremendous thrust of business that you have to deal with, and it was only a matter of weeks ago that I requested the subcommittee hold hearings.

I would like to thank Congresswoman Molinari for appearing here today. The Borough President of Staten Island, her father and former Congressman Guy Molinari, who unfortunately was not feeling up to par to appear today, has sent in his place to testify his chief of staff, Dan Donovan. Guy Molinari has worked on aviation safety issues over the years when he was a Congressman and was on the Aviation Subcommittee. I would also like to welcome Congressman King, whose area and district takes in some of the people who work in the towers and the air traffic control centers.

Senator Lautenberg and I have worked over the years on a number of these aviation safety issues, and it is good to be here and to share some thoughts; however, I am sorry under these circumstances.

Senator Bennett raised a point that we will touch on with respect to the age and effectiveness of the equipment. It is a disaster, and a disaster ready to take place. It will happen, unless we do something.

Mr. Chairman, I want to thank you for giving us the opportunity to discuss the air traffic control situation in New York. I was going to read this speech, but I am going to just pick a couple of points out, because there is so much that has to be said, and I think my colleagues are going to touch on certain aspects of the problems and concerns that exist in New York's air traffic control facilities.

The current situation, I think, really came to our attention very vividly when a memorandum was leaked, a memorandum by Terry Bolerjack, who is the air traffic manager for the New York Center. I will ask for a copy of that memo, if you have not received it, to be made available.

This memo is in his language. I am certain he did not think that this was going to become public, because he would not have been as candid. But, Mr. Chairman, I went up there with Congressman King and Congressman Forbes and we saw the conditions at the New York Center. We have seen what's happening there.

Mr. Bolerjack is a man who deserves tremendous credit for calling to the attention of those working for him how serious the problem was. "Recent increases in New York Center operational errors and deviations have reached levels of grave concern." He did not mince words.

Now people will say, oh, well, these increases really were not levels of grave concern. Well, why did he say it? The man has been there for years.

"Analysis of these incidents has clearly established requirements for the immediate emplacement of improvements and refinements in our air traffic control [ATC] operations." He is specific here.

"The reduction of operational errors and deviations is our No. 1 priority." He is saying, we have got a problem here. This is our No. 1 priority.

"It is imperative that a concerted effort be made by the entire facility management team to immediately effect a substantial decrease in all categories of errors. The effective accomplishment of this priority will require both the commitment and best efforts of all of us."

Then the memo goes through what he is directing people to do, and he concludes with, "I regret that I must impose such a short deadline for this submission, but I firmly believe that we must take positive action in the earliest timeframe."

Coincidentally, my old roommate and Congressman and friend, Borough President Molinari, and Congresswoman Molinari, conducted a survey, and they got back a survey from nearly 200 air traffic controllers.

They are the controllers who try to man this outdated equipment, 26-plus years old. We ought to be ashamed of ourselves. Imagine a technology where controllers talk to each other and they can be disrupted at any one time. This is what you have in America in our skies.

Ask any pilot, and he will tell you the air traffic control system is a joke, it is a travesty, and the operation has been a travesty over the years. It has not gotten better. It has gotten worse.

Now, if you ask these people who will come up here and testify, the union representatives, what things are really like, let me tell you, they cannot tell you what it is like, because it means incredible consequences to them and to the people they represent. I am concerned that they could face unintended consequences where they could be shifted here, there, demoted up, down, or even possibly lose overtime.

Senator SHELBY. Mr. D'Amato, but you can tell us and tell the American people, and so can the Congress, Congressman King, and

Congresswoman Molinari, and tell the American people what it is like. That is why we are holding this hearing.

Senator D'AMATO. That is right, Senator, and I thank you. I think the American people thank you for giving us this opportunity, and I thank those who have come to us and shared some of this data and this information. It is incredible.

Let me just say that, over the last 8 months, airplanes carrying many hundreds of passengers have been coming too close to each other at the rate of more than three times each month. This is in the New York corridor, and it is a disaster waiting to happen.

The number of near misses has increased in the complex New York airspace by 26 percent. This is a problem. Senator Lautenberg alluded to it. It has gotten worse over the years. It has not gotten better. There have been six near misses since April—six near misses since April, including one this last week. Last year there were 760 incidents nationwide.

NEW YORK CONTROLLERS SURVEY

Now, the controllers and technicians that I spoke to have seen this taking place, and yet they feel powerless, and these incidents are taking place for two reasons. First, there are not enough fully trained controllers on the job, and second, the equipment that they are using is old and outdated.

Let me refer to a survey that was taken, a blind survey with no names, given to the controllers. The survey produced 182 responses.

Eighty-four percent of the respondents said that the morale was either low, or very low. These are the people whose lives we depend on—84 percent—that is a heck of a statement.

The controllers indicated that their workload is overwhelming. About 92 percent of the controllers surveyed said that they were required to handle more air traffic than was safe.

When asked what the most serious problems were, about two-thirds said they had too few fully trained controllers. Even the controllers that you have there in many cases are not fully trained.

Morale of the work force and outdated hardware were the next two areas of concern. Now, listen to this—amazing—40 percent of the personnel rated the overall safety of the air traffic system as poor, and an additional 4.9 percent said very poor, so you have 45 percent of the people who operate these systems saying that it was poor or very poor. We are talking about the safety of our people.

At the New York Center, which controls the airspace over New York, New Jersey, and parts of Pennsylvania and Maryland there are supposed to be 339 fully trained controllers. Today, there are 308, but of the 308, only 232 are fully trained.

Now, is it not interesting that today the FAA announces that they are going to hire 100 more controllers—and by the way, hiring 100 and getting them in there is far different than making a statement, as Senator Lautenberg knows. I dare say those 100 will not come online for who knows how long. It is not good enough to make such statements to satisfy Congress and then continue business as usual. But I fear that is what is taking place.

The number of fully trained controllers is more than one-third below the FAA's staffing standard, and I am not telling you that

the staffing standard is sufficient, but at their minimum levels they are one-third below. On any given day, there are supposed to be 190 controllers on hand; however, the New York Center typically runs 20 to 30 percent below that number. That is what is happening at the New York Center.

You are wondering why? Exhaustion, fatigue, greater airspace that they have to cover.

What's more, the FAA enacted a reduction in force program nationwide. Hundreds of positions were eliminated. The New York Center lost 34. These employees at the New York Center performed vital basic tasks, such as carrying data from station to station which enabled the controllers to do their job. With the loss of these positions, controller and controller trainees are forced to perform these additional tasks.

We have given them more airspace, we have given them more tasks, and they continue to have to use outdated equipment.

That is incredible, because let me tell you about the people who maintain the equipment. I did not know this until I toured the New York facility, and then one courageous person in front of everybody said, "Senator, don't forget the technicians, we are the people who take care of this equipment. Did you wonder why you are delayed when you come in from New York? Did you wonder why sometimes you were held 3 hours?"

I do not mind being held on the ground 3 hours, if it is a matter of safety; however, I do not enjoy it. But I did ask him, why? He said, "We only have 60 percent of the staff necessary to take care of these facilities."

He said, "Did you know that we operate sometimes without anyone here?" He said, "Do you know in terms of our testing of the equipment they keep extending the time because we do not have enough people, so we are not even checking on the equipment the way we should be?" So it is outdated equipment, it is old equipment, and we are cutting back on the people who maintain it and who keep it operational. You wonder why we have these outages? Incredible.

Let me talk about the outages, if I might, because it is interesting that just yesterday at 8:35 a.m., at Washington National the switching equipment which lets the airplanes communicate with the controllers at the tower facilities went out. I do not know if my colleagues know about that, because we fly out, basically, on weekends.

Well, why did this outage occur? It took them from 8:35 until 4:15 for the outage to be fixed. That was 8:35 in the morning to 4:15. They had 61 flight delays, lasting an average of 45 minutes, some much longer. Delays continued until after midnight, on practically the whole east coast. Why?

Well, I will tell you why. The FAA has the policy now which requires that an outside contractor must do the repair work on the equipment. They could not get the contractor there to do the job. Finally, a technician said, "listen, we will do it ourselves," but they had to wait for the contractor.

By the way, the FAA technicians on the job located the problem within 2 hours, so at 10:30 they located it. They could have fixed

it by 11:30 or so. The contractor wasn't there to fix it until 4:15. Now, that is the kind of thing that is going on regularly.

So the FAA today puts out this drivel to try and appease this committee—they say, oh, look, we have taken care of the New York problem. We want to hire 100 people. Baloney. Nonsense. Nonsense. The FAA says they are going to hire them, but how long before they get online? How many of them are fully trained? How many of them get up in those towers?

The busiest towers and air traffic facilities in the world, and they are going to put people who are not fully trained in them? Are you kidding? How many does the FAA have ready to go there? Where has been the hiring policy because this problem did not just develop yesterday, or the day before. This has been going on for years, and if you look at the numbers you will see where the staffing increased.

By the way, the FAA did increase staffing. Do you know where? Headquarters. Headquarters. That is where your budget money is going, Senator Domenici, instead of putting it out there in the field.

And do you know, they are cutting back on training? Cutting back on training. Incredible. What do you expect these poor people to do who are out there, the people who are managing this system like Mr. Bolerjack. What can he do if you do not give him enough personnel? What can he do if you do not give him people to maintain the equipment?

What can the people over here at National Airport do when the FAA relies on outside contractors? By the way, the FAA might say it saves money hiring outside contractors, but according to the GAO it does not. It costs more money. Each full-time technician hired saves the FAA $26,000 annually over the cost of keeping an outside contractor on the payroll. What are we doing?

You know, it sounds nice when you say, "hey, guess what, we have the private sector coming to help you here. We are going to save you money." It is not happening. You have got chaos and confusion, that is affecting the lives of people.

Senator SHELBY. Senator D'Amato, I think you are on a good point. Let us save lives here and train the people right, because we are not talking about that much money, but we are talking about a lot of lives.

Senator D'AMATO. Mr. Chairman, I am going to conclude my remarks, because I know Congresswoman Molinari and Congressman King have areas where they will touch on, but the fact of the matter is, you have got to have a fully trained work force that has sufficient numbers on staff doing the job. The FAA management at the top levels here in Washington are shortchanging the American people and endangering their lives. It is that simple.

Now, I am not telling you that it is an easy answer to get all sophisticated equipment, because that has been gummed up for years and years, but it is not a relatively difficult thing to make sure that the training facilities are operating at full capacity instead of cutting back. It's amazing. Whenever they need to save money, they stop training the air controllers and they stop training the air technicians.

By the way, we now maintain about 40,000 pieces of equipment and/or sites, and we have about 6,000 people who do that. We used

to maintain about 20,000 pieces of equipment and sites, and we had 11,000 people. So while we have doubled the number of facilities that have to be handled, we have reduced dramatically the number of online people. What's more, while they were reducing staff of the working people they were increasing staffing at central headquarters. That is what is taking place.

So I share this with you. I think this is going to have to be an ongoing process, Mr. Chairman, where your committee and others use their great power. You have started that by calling today's hearings, and I commend you for that.

If you do not watch the FAA day-in and day-out, if you do not encourage a line of communication between some of the frontline people who are out there doing the real work, you are never going to get this pertinent information and significant change will never get done. It will be a Band-Aid. It will be a press release. They have sent out a release, "we are going to hire 100 people. See, we are going to bring it up to staff."

Again, Senator Lautenberg has heard many of these promises over the years, and I commend him for never giving up, because we cannot. Once we turn away, it is business as usual. The situation is deteriorating. It is not getting better. It is deteriorating.

I thank you.

Senator SHELBY. Congresswoman Molinari.

STATEMENT OF CONGRESSWOMAN MOLINARI

Ms. MOLINARI. Yes; thank you very much, Mr. Chairman and members of the committee. I thank you for your time and interest, and certainly, Senator D'Amato, we thank you very much for bringing us here all together.

You know, every so often, as Senator D'Amato has said, we have a report that jolts airline passengers from their seats, because we have to determine that it is in fact in some cases unsafe to fly.

I would like to say to Senator Lautenberg that Dan and I were traveling this morning, and while we were waiting on the ground at Newark the pilot said to us that he had been a commercial pilot for 30 years and in the Air Force before that, and he had never seen a line of planes waiting to take off as long as we had to endure.

People are late for their meetings, people are late for their connections, and this happens routinely.

Over the past 12 years as a Member of Congress and a Staten Island Borough President, Guy Molinari has been addressing this problem. The serious and potentially dangerous problem that started amongst air traffic controllers at individual centers is now finally being addressed by the FAA we think—we hope.

As Senator D'Amato said, the catalyst for today's hearing was this internal FAA memorandum, which states clearly our current air traffic safety system is inadequately designed and staffed to handle the large volume of planes it must on a daily basis.

The catalyst to the memo was that during the past 6 months prior to this memo there were 24 incidents at New York Center where planes had come dangerously close to one another in flight. According to the center's manager, the problem had reached "levels of grave concern."

The response from the FAA was puzzling, but it is also very telling about their attitude. It described the dramatic increase in close calls as statistically unrelated to the shortage of air traffic controllers at New York Center. They concluded, overall safety has actually increased. That is right. They said overall safety has increased, even though one controller is now doing the work of two or four.

Now, that may be acceptable for the FAA, but that is clearly not acceptable for airline passengers.

Mr. Chairman, members of the committee, can any one of us believe one person can perform a better task requiring the work of four, when there has not been updated equipment to make that change? Will the FAA also have us believe that one wing is better than two?

The air traffic controllers, the people charged with the task of keeping the skies safe, do not agree with the FAA's bizarre explanation, and neither do I. There simply are not enough hands nor eyes to do the work, and as Senator Lautenberg has said, unfortunately this is not a new problem. Air traffic control facilities have been grossly understaffed since 1981, and over the past 16 years, the FAA has failed to develop an adequate solution.

A 1989 General Accounting Office study commissioned by then Congressman Guy Molinari surveyed FAA workers about safety and other conditions at their facilities. The GAO survey revealed great differences in the way air traffic controllers and the FAA viewed conditions at air traffic facilities. Not unexpectedly, controllers and supervisors received a critical shortage of full performance level controllers.

What does this do? The shortages forced controllers to handle unmanageable volumes of air traffic and work too long without a break.

These controllers also said that new workers receive inadequate training, and that the overall morale was low, and these factors hindered their ability to maintain the system safely. This is 1989.

The reason is simple to understand. Let us look at New York Center's one example among many. Last year, I visited the center and saw firsthand the problems and the fears expressed by the controllers. In an all-hands session during my tour the controllers cautioned that air traffic equipment was sometimes unreliable and often malfunctioning.

I saw a system, and I hope somebody is going to come up here who is going to explain it more professionally, called the ODAP system that deals with over the ocean, and basically all it does is type out little strips of paper that have the longitude and latitude of where planes are taking off. It then goes into almost like a puzzle game piece on a wall, and then it is up to that controller to study and measure and continuously focus and refocus.

In this age of technology, it is unconscionable that we do not have a computerized system that allows the air traffic controller to do the backup work but not the sustainable work, and it is also not uncommon for that system to go out completely, and then the air traffic controllers and the pilots are literally flying blind.

They warned equipment problems during this all-hands session, combined with staffing shortages, created an unprecedented situation for disaster.

Since 1981 the volume of air traffic handled by New York Center has increased 36 percent. Today, the New York Center route, the flights of 6,500 planes per day covering 35,000 square miles of the Eastern United States, over 3 million square miles of the Atlantic Ocean. That is their charge in this one center. It is huge.

Recent inventories show that we have a 45-percent reduction of air traffic controllers, so we have seen a tremendous increase in the amount of sky they have to cover, the amount of planes that are traveling, and a decrease in air traffic controllers.

To make matters worse, and I hope you ask the FAA to address this, the number of controllers at New York Center will be continuing to decrease. Nearly 60 percent of those controllers who are eligible to retire will do so within the next 2 years. Where is the backup plan to handle that pending crisis, when we have not fixed the pending crisis over the last 16 years?

Many others who came to the center from other parts of the country on a temporary basis for training would like to return to their facilities closer to home, so the number that they have is not even accurate, because they have said, based on the results of this report and the data provided by the FAA, they are out of there.

Moreover, with working conditions as dismal as they are, it is not surprising that the facility has difficulty retaining experienced controllers and attracting new ones.

Senator D'Amato referred to the fact that the FAA said they are going to hire all these new air traffic controllers. Senator Lautenberg will confirm every time Congress gets serious or the borough president gets serious and raises a red flag, a memo, a press release comes out from FAA saying they are increasing air traffic controller hiring, and then they do not have the program to train these air traffic controllers.

At New York Center, it takes 3 to 5 years to train an air traffic controller, because they bring them on, they take them off, they have shortages of actual air traffic controllers, nevertheless, the people to train them, so to say they are hiring 100 is not good enough. When will they be able to do the job?

This has been a longstanding problem at New York Center and other hard-to-staff facilities. Although the FAA initiated a pay incentive program in June 1989 to beef up its staff at such facilities, those pay incentives have since been reduced. In areas where it is so difficult, where the quality of life is more expensive, the FAA has to answer the question, what do we do to provide incentives to get air traffic controllers to those areas of the country?

It is hard to believe that the controller shortage was caused by a simple lack of funding, Senator Domenici. The FAA budget jumped over $800 million since 1991, to $4.1 billion in 1996. In 1997, its funding was again increased to $5.2 billion, and it will exceed $5.3 billion next year.

It is also hard to believe that incompetent management alone is the cause. In the past 16 years, the FAA has been headed by seven different administrators, and it is clearly, anyone can tell you, not the work force there.

I would suggest to you, Senators, that this situation would be more tragic, we would have more disasters, if it were not for the type of men and women who fill the positions of air traffic control-

lers who work overtime, who do all they can to make sure that the system works above and beyond the call of duty.

There is no doubt in my mind that we are cruising toward disaster if the FAA does not hire more controllers and have a program to train them at once.

Senators, let us not wait until a collision occurs. Let us not wait until another near miss becomes a tragic disaster. Let us please assess the problem now, and I thank you all very much for giving us this opportunity to bring this crisis and this level of frustration to your attention.

Thank you very much, Senators.

Senator SHELBY. Congressman King.

Ms. MOLINARI. Excuse me, Senator, before I go, I just want to make sure that the 1997 Air Traffic Controller Work Force Study that my dad and I performed is entered into the record.

PREPARED STATEMENT

Senator SHELBY. It will be made part of the record in its entirety along with your complete statement. Thank you.

Ms. MOLINARI. Thank you.

[The statement follows:]

PREPARED STATEMENT OF CONGRESSWOMAN MOLINARI

Chairman Shelby, Ranking Member Lautenberg, members of the Committee. Thank you for giving me the opportunity to testify today.

Every so often airline passengers are jolted from their seats by news that it is unsafe to fly. The most recent alarm, but one which Staten Island Borough President Molinari, has been sounding for more than a dozen years, is that air traffic control facilities are chronically understaffed. The epidemic has spread from low whispers among controllers at individual centers to the halls of the Federal Aviation Administration (FAA) itself.

The catalyst for today's hearing was an internal FAA memorandum. The memo said, clearly stated that the air traffic safety system today is unsafe. According to the memo, in the past six months there were 24 incidents at New York Center where planes had come dangerously close to one another while in flights. According to the Center's Manager, the problem had "reached levels of grave concern."

The response from the FAA was puzzling. It described the dramatic increase in "close calls" as statistically unrelated to the shortage of air traffic controllers at the New York Center. They concluded that overall safety is actually increased—that's right increased when one controller does the work of two or four. That may be acceptable for the FAA, but it is not acceptable for airline passengers.

The air traffic controllers—the people charged with the task of keeping the skies safe, do not agree with the FAA's bizarre explanation. There are simply not enough hands—or eyes—to do the work. And unfortunately, this is not a new problem. Air traffic control facilities have been grossly understaffed since 1981, and over the past 16 years the FAA has failed to develop an adequate solution.

A 1989 General Accounting Office ("GAO") study commissioned by Borough President Molinari while he was a member of Congress surveyed FAA workers about safety and other conditions at their facilities. The GAO survey revealed great differences in the way air traffic controllers and facility managers viewed conditions at FAA air traffic facilities. Not unexpectedly, controllers and their supervisors perceived a critical shortage of full performance level controllers.

These shortages, force controllers to handle unmanageable volumes of air traffic and work too long without a break. The controllers also said that new workers received inadequate training and that overall morale was low. And these factors hindered their ability to maintain system safety.

The reason is simple to understand. Let's look at New York Center as one example among many.

I visited the Center last year and saw first-hand the problems and fears expressed by the controllers. In an all-hands session during my tour of the facility, the controllers cautioned that the air traffic equipment was sometimes unreliable and often

malfunctioning. They warned that equipment problems—combined with staffing shortages created an unprecedented potential for disaster.

Since 1981, the volume of air traffic handled by the New York Center has increased 30 percent. Today, the New York Center routes the flights of 6,500 planes per day, covering 35,000 square miles of the eastern United States and over 3 million square miles of the Atlantic Ocean.

To make matters worse, the number of controllers at New York Center will be decreasing. Nearly 60 percent of those controllers who are eligible to retire within the next two years intend to do so. Many others, who came to the Center from other parts of the country on a temporary basis for training, would like to return to facilities that are closer to their home towns.

Moreover, with working conditions as dismal as they are, it is not surprising that the facility has difficulty retaining experienced controllers and attracting new ones.

This has been a long-standing problem at New York Center and at other hard-to-staff facilities. Although the FAA initiated a pay incentive program in June 1989 to beef up its staff at such facilities, those pay incentives have since been reduced.

In the face of this looming staff shortage, the FAA responded by closing its main training facility for controllers and technicians in Oklahoma.

It is hard to believe that the controller shortage was caused by lack of funding. The FAA's budget jumped over $800 million since 1991, to $4.1 billion in 1996. In 1997, its funding was increased to $5.2 billion and it will exceed $5.3 billion next year.

It is also hard to believe that incompetent management alone is the cause. In the past 16 years, the FAA has been headed by 7 different Administrators.

Today's hearing is the first step in repairing an air traffic safety system that is in trouble. There is no doubt in my mind that we are cruising toward disaster if the FAA does not hire more controllers at once.

Let's not wait until a collision occurs.

Let's not wait until another near miss becomes a tragic disaster.

Let's not wait until our air controller force is hanging by a thread.

The time to act is now. We must not delay.

[CLERK'S NOTE.—The 1997 Air Traffic Controller Work Force Study does not appear in the hearing record, but is available for review in the subcommittee's files.]

STATEMENT OF CONGRESSMAN KING

Senator SHELBY. Congressman King.

Mr. KING. Thank you, Senator Shelby. I really appreciate the opportunity to be here today. I thank you for convening this hearing. I also must commend my colleague, Senator D'Amato, for the tremendous leadership he has shown, and of course Congresswoman Molinari and Borough President Guy Molinari for never giving up on this issue. They realize how important it is, how vital it is, and they have just kept this fight going, and it is really essential that we try to rectify this tragic situation as soon as possible.

I would just like to say at the outset, though, Senator D'Amato says he does not mind waiting 3 hours on the runway on La Guardia Airport. I do, if I have to sit next to Senator D'Amato and I hear a 3-hour speech on ATM's and the FAA, and I get his entire litany of abuse that he was going to give to other people, and I have to listen to it for 3 hours on the runway. [Laughter.]

But this is a serious issue, and I just want to touch on a few points that Susan brought up, the fact about how there has been such a drastic increase by 35, 36 percent in the air traffic over the New York corridor, and yet there has been an even more significant decrease in the manpower levels of air traffic controllers, and you would think perhaps this can be explained by the fact that the technology has been improved so much we do not need as many air traffic controllers, but as Senator Bennett has pointed out, the technology is not up to par.

In fact, my understanding is that some of the technology is so antiquated that IBM does not even make the replacement parts for the equipment any more. That is how old this technology is, how outdated it is, and how antiquated it is.

Now, on a number of occasions I visited New York TRACON, I have visited La Guardia tower, and I have seen firsthand these air traffic controllers routinely work 6-day workweeks, they put in countless hours of overtime, I have observed radar terminals that were unmanned and other positions that were designed for two controllers being staffed by only one.

When I was out at the New York Center last month I was surprised to see controllers still using grease pens and plotting boards to map the position of planes under their surveillance.

The fact is, as Senator D'Amato said, these are tragedies waiting to happen. Thank God we have the outstanding personnel we do have among the air traffic controllers, but the bottomline is, there is only so long we can put off the inevitable, and the inevitable will be tragedy.

As Susan Molinari pointed out, in the last 6 months alone there has been 30 percent increases in near misses. I mean, 30 percent increase in near misses, and for the FAA to write that off as some sort of a statistical aberration I think shows the type of shortsightedness that is perhaps the root of this problem overall.

We have to address it. This hearing is absolutely vital in helping us come to a way to address it, and I certainly look forward to working with the members of this committee and also my New York colleagues, Senator D'Amato and Congresswoman Molinari. At least for the next 6 or 7 weeks, Susan, I look forward to working with you, and then I look forward to going on her TV show and explaining it to the public at large, how terrible the situation is in New York.

But very seriously, this is a vital matter that must be addressed, Senator, and I just want to thank you for convening this hearing today and as you said before, we have to save lives. We are talking about human lives, and no responsibility of a Member of Congress or a Member of the U.S. Senate can be more vital than saving American lives, and that is what we have to do, and that is what this hearing is all about.

I thank you, Senator.

Senator SHELBY. We now have Hon. Dan Donovan. He is the chief of staff of Guy Molinari, borough president, Staten Island, Long Island.

STATEMENT OF DAN DONOVAN

Mr. DONOVAN. The borough president regrets that he cannot be here to give this statement personally, and he has asked me to read the following:

Good morning. I am Staten Island Borough President and former Member of Congress Guy V. Molinari. I welcome the opportunity to share with you my thoughts on air traffic control staffing. Air traffic controllers are a special breed. They are dedicated professionals. No matter how difficult an assignment is given to them, the controllers will find a way to make it work. They are the ones most competent to identify problems in the system. I am therefore going to share with you their evaluation of the air traffic control system, particularly as it relates to the New York region.

As you know, in 1981 President Reagan fired 11,400 air traffic controllers for participating in an illegal strike called by the PATCO union. At that time, we were told that the FAA would rebuild the system within a relatively short period. Here we are, 16 years later, and staffing remains at less than desirable levels at many of our major and minor air traffic facilities throughout the country.

At the New York Center, prior to the 1981 strike there was a total of 514 controllers, including 405 FPL's, full performance level air traffic controllers.

Recently, the FAA and the union have agreed that the permanent staffing levels for controllers should be set at 374, and that a minimum of 335 controllers should be hired at that center by the end of the next fiscal year.

However, recent inventories show there are now only 281 controllers at New York Center, 229 of whom are fully qualified. That is a 45-percent reduction from 1981.

While it is true that the FAA has transferred some air space to other centers, you should also know that air traffic has increased 36 percent since the 1981 strike. What, then, do the controllers tell us?

In 1985, the General Accounting Office conducted an extensive survey of almost all air traffic facilities in the country. Seventeen percent of the controllers rated the system as poor or very poor nationwide. Forty-two percent said that the shortage of FPL's strongly hindered or somewhat hindered the safety of the air traffic system. Ninety-one percent believed the total number of FPL controllers was somewhat lower or much lower than needed.

In 1989, at my request, GAO conducted another survey entitled, "Aviation Safety. Serious Problems Continue to Trouble the Air Traffic Control Work Force." That title alone conveys a strong message.

Again, 16 percent of the controllers warned that the system was poor or very poor, virtually unchanged from 1985. Sixty-five percent believed they were handling too much traffic, and 43 percent indicated their morale was low, with even 36 percent of firstline supervisors labeling their morale low as well.

In the last few months, with the assistance of GAO and Congresswoman Molinari's office, I conducted a similar survey at New York Center. A total of 182 air traffic controllers responded and revealed the following.

On the critical issue of safety, 40 percent rated the overall safety of the air traffic system as poor or very poor, more than double the national finding in 1985 and 1989. Ninety-three percent of controllers said the shortage of developmental controllers puts the flying public in danger. Ninety-seven percent stated that the shortage of FPL's strongly hinders or somewhat hinders safety. Ninety-three percent of the controllers said that they were handling much more or somewhat more traffic than they should during peak hours.

And surprisingly—not surprisingly, excuse me, 84 percent said morale at New York Center was very low, or low, more than double the national figure from 1989.

Despite the many studies and many warnings in the past 16 years, the FAA has failed in its very important mission to provide adequate staffing of air traffic controllers, not only in the New York Center but in many other facilities nationwide. Too frequently, controllers pose the question of, does it take a midair collision to give us relief?

You might ask, what options are available? There have been different experiments tried by the FAA. They tried a 20-percent pay differential increase in 1989, which met with a fair amount of success. When the pay incentive was reduced to 12 percent, it did not work. Many of the controllers in the New York Center now are seeking transfers, since they do not come from the New York region. If the FAA does not implement adequate pay incentive programs, the only other solution is the proposal suggested by the NATCU Union, embark on an aggressive employee recruitment program among local residents. These are people with roots in the community, and they are less likely to seek a transfer out of State.

The proposal would have them serve 2 years at the center and then be assigned to the Oklahoma City Academy. When they graduate, they will be reassigned to the New York Center, and that would help alleviate the present problem where controllers are seeking transfers to their home region.

Let me close by saying that for too many years, I have been very troubled by this shortage of adequate staffing at many of our air traffic control facilities. I have lost faith in the FAA, and am convinced that only intervention by Congress will answer the problem. I am afraid that failure to act more aggressively will ultimately lead to tragedy, and that is something I am sure we all want to avoid.

Thank you, Mr. Chairman.

Senator SHELBY. Senator D'Amato, I take it from your testimony and the others here today and other information we have that it

is obvious that with the staffing issues, with the equipment failures and near failures in the New York-New Jersey area, the problem is getting a lot worse. It is not getting better. That is a given, is it not?

Senator D'AMATO. Mr. Chairman, yes, absolutely, you are right.

Senator SHELBY. If it is, if we accept that, what actions would you suggest, in addition to additional training, that FAA should take to rectify the problems in the New York-New Jersey area?

Senator D'AMATO. The first thing I think they should do is come in to see the Congress, the leadership of the Congress, and tell them that they have an important proposal. I would do this on a bipartisan basis, and explain to the leadership why it is in various areas obtaining proper staffing levels is such a problem. I do not know what the situation may or may not be in other high-cost and high-traffic areas.

Senator SHELBY. Like Atlanta, or Chicago?

Senator D'AMATO. Maybe Chicago, yes, or Los Angeles, because I would imagine you have the same kind of thing taking place. We should reinstitute a plan that would reward those who are going to work under these extraordinarily difficult situations, at least for the near future. We should reinstate a pay differential.

That would have to be explained with candor to the various leaders so that they would understand, and so this would not look like anything other than what it really is intended to do, that is, to retain people. If we do not, why would someone want to stay here or in any one of these high-cost, high-traffic regions, when they could go to an area—and I am not going to mention any particular area of the country—where one-tenth of the flights come in, and they get paid the same? You have to address the problem where you have one-half the staff looking to transfer out.

We also need to address the recruiting program. There are a number of wonderful technical schools that work in the area of training people to become pilots in the aviation industry. Recruit people from the New York-New Jersey region, from the area schools and in sufficient numbers to fill air traffic controller positions. The FAA just started a pilot program. Do you know how many people they are going to recruit? Ten. It is a joke.

If you look at how many people will be retiring, the FAA indicates that they think it is something in the nature of 211 people, but the GAO says, oh, no. It is going to be 560 by the year 2001, 2002. In other words, much more than what the FAA is anticipating. They always underestimate the problem.

And by the way, let me tell you what is happening at the training school in Oklahoma. Do you know what these turkeys did? As a matter of fact, they make turkeys have a bad name. Turkeys would not operate this way. It is incredible.

Anyway, here you have a nationwide shortage of fully trained people, and what does the FAA do, they close the training school whenever they have to save a couple of bucks. They should close the headquarters. Throw some people out of the headquarters. Do not close the training school which turns out these people. We need to know how many times in the past years they have done this.

And then they come to the Appropriations Committee, and Senator Lautenberg tries to find more money, and you, Mr. Chairman,

try to find more money to keep the training school open. That is where these turkeys go to save money. Incredible. Stop the outside contracts. Stop this kind of nonsense. This is poor, disastrous management.

Senator SHELBY. Congresswoman Molinari, do you have any comment?

Ms. MOLINARI. I would just reaffirm that obviously local recruiting is something that is very important to those of us in the region. Pay incentives have to be implemented to solve the immediate crisis, and the overall problem has to be dealt with in terms of long-term planning.

The situation that Senator D'Amato just described only results in the fact that we have no training pipeline. We may stick our finger in the dike for today and tomorrow, and then you know, 3 years from now we are back to where we started.

It is clear that management has the tools to make these projections, and if they are really concerned about air passenger safety, they would account for that with regard to the way they deal with training. That has never been done.

Senator SHELBY. Congressman King.

Mr. KING. I would just reaffirm what Senator D'Amato said. There does have to be some form of pay incentive.

Also, Senator, I think it is important to realize that one of the jobs of air traffic controllers is to train new controllers, and when they are overworked to begin with, it is hard for them to go about and do the necessary training that is required, and that inevitably slows down the training process, so I think all this is just a vicious circle we are going in.

Senator SHELBY. Senator Lautenberg.

Senator LAUTENBERG. Thanks, Mr. Chairman. Obviously, I listened with interest to the criticism of the system by my colleagues, for whom I have respect, and I tried to relate the often referenced analogies between how you run a business and how you run FAA or other Departments of Government.

I remember the time—I was not in the Senate at the time. I was running a company in New Jersey, that area, and I remember how pleased a lot of people were when they kicked out all those controllers. They had performed an illegal action, and they were gone, and there was almost—I would have to describe it as gloating, pleasure, happiness. We paid those suckers back.

Well, I would tell you, I listened to the criticism again, tried to be objective, and I ask, if it was your company, and you were breaking out of the windows, and breaking out of your capacity, would you say, for crying out loud, let us cut down the number of customers. We cannot take care of them. We are up to here.

If it was a theater you would not jam the place so full that if there was a fire or an incident, that you could not get out of there. If it was a swimming pool in a municipality you would not put so many kids in there just because there was a line outside. You would put up a sign—I have seen signs at the beaches, Long Island. No room. No parking. On your way.

Well, maybe it is time, and I would ask any of my colleagues at the table, do you want to cut down the volume of air traffic that we are carrying? What do you think?

Senator D'AMATO. Well, in essence, Senator, that is exactly what is taking place, because they are holding you for 3 hours, or they are delaying for 45 minutes, and they are putting people in huge lines, so that is what is taking place.

And I said to you initially, I said, oh, I am much more happy to wait the 3 hours than to put myself in more danger.

Senator LAUTENBERG. Ride Amtrak.

Senator D'AMATO. That is one alternative. But, the FAA is doing two things. Not only are they delaying, which I say, fine, as opposed to flying into a place where you may have a power outage, and the controllers cannot operate their equipment, but in addition, they are still operating the system in a dangerous manner, one that is absolutely not acceptable.

Senator LAUTENBERG. I would say this, that we have a comparison, if one wants to make one, the size of the theater and the amount of airspace. You can only fit so much traffic, and as opposed to a reaction, or perhaps it ought to be an action, and I am going to pursue this for a minute, because I want someone in here to say, enough. We cannot handle it, and you, airline A, B, and C, you are just going to have to limit the number of flights that you have.

Well, I mean, it is easy to sit here and scream about how dangerous and how casual, and how turkeyish, and what we want to do. These are not assassins. These are people who are trying to do a job, for crying out loud, and yes, we have made mistakes, and the mistakes have been as much on this side of the table as out there, when it comes to funding.

No; get outside contractors. We do not want any more Government bureaucracies managing our—give them the outside contractors, until the outside contractor screws up, and then we say, we have no control over those outside contractors.

I think we have to make up our minds. Do we believe in a Government that can handle its responsibilities, or do we just want to sit by and curse out everybody who tries their best to do a job?

This space may be a little bit dangerous. My kids fly in there, my daughter, my grandchild, Susan's child flies in that space. Why? It is because fundamentally we believe, despite some problems, that it is a darned good system, and we want it to continue to operate.

I would rather—if I am laying on my back in the street someplace, and they call up EMS and they dial 911, they say, hey, we need a technician, this guy's out cold, I would rather have them send a partially trained EMS person than no one, say we do not have fully trained—we are in a situation, my friends, one that requires our cooperation, just as well as pointing a finger.

And yes, I will tell you, FAA has been screwed up for a long time, and Congressman King, I tried to give FAA equipment. I was in the computer business. To give it to—rather, to give it to charities as a contribution. They would not take it, because it costs more to maintain it than the value of the equipment that FAA was using.

I do not want to lay off any of the blame that falls FAA's way, but some part of it really is on this side of the table.

And when it comes to allocating resources, when it comes to saying, listen, we just cannot handle that traffic, we cannot go any further, we have so much airspace, 35 percent increase in aviation constitutes all kinds of changes.

It is not simply that it is just 35 percent more, because if you could widen the airspace, if you could build larger airports—how many times have you had an occasion when you land in La Guardia, or Newark, or Washington, DC, and you sit and wait for a gate almost as long as the flight takes.

So the system is overburdened, and the question that we want to decide is whether or not, instead of just pointing fingers, we are going to do whatever we can to fix it by saying to Continental and American and United and Delta and Northwest, hey, guys, what you have got to do is you have got to cut back on your traffic, and then we will see what the American people say. That will be the real test.

It is easy to get them on your side when all you are doing is belting out criticism. See if the American people say, OK, if I cannot make my reservation today and it takes 2 weeks in advance to make it, I am going to be satisfied with that kind of a system.

No, my friends; this is a thing that we are all in together. Nobody is exempt. What we want to do is make sure that FAA has the resources. I would like to make sure FAA has a chief executive that is responsible for his or her actions. To maintain their job, that is the exclusive criteria.

I am with the party that has got the executive now. I would prefer that no Chief of our Government has the right to appoint an FAA Chairman, Chairperson, because I do not think that when the job requires the kind of long-range planning that this does—and I come out of a fairly good-sized company. We had 16,000 people when I left it. Decisions that had to have long-range results had to have long-range planning and long-range supervision, and you do not change skippers in the middle of the flight.

So I think, Mr. Chairman, I am glad to hear what is happening, but when you have an FAA Administrator turn over—we have seen them. They have come from the military, they have come from business, good performers, but they are gone before the projects begin to show their weakness.

We spent $2 billion on a program that absolutely failed with one of the finest companies in America, one of the finest. If you said, who is the best name, electronics and computers and so forth, the name springs to mind. We spent $2 billion with them and had no positive result, $2 billion out the window like that, so maybe we ought to stop managing this thing so closely, make our demands, provide the resources, and let the people who have to run it, run it.

Senator SHELBY. Senator Lautenberg, we are not here for blame. At least, I am not here to call names and say who is to blame, but we are here seeking solutions, and to prevent problems in the future.

We are interested in safety. I will work with you and other members of the committee to see that the FAA has the resources to hire, also to buy the proper equipment. We owe it to the American people to put safety above everything as far as airline passengers

are concerned, because we are, as you point out, all passengers, and we are family, and we are in it together.

Senator Domenici.

Senator DOMENICI. Mr. Chairman, since I have to leave shortly, I want to spread across the record, if I might—it will just take me 2 minutes. Senator Lautenberg and I are on the same side in putting this budget together.

Senator SHELBY. Well, as I said, I am glad both of you are here today. You both are members of this subcommittee and you run the Budget Committee.

Senator DOMENICI. I want to make sure that everybody knows, whatever the President requested for the FAA, we gave him. There was no effort to cut anything in the FAA budget. First, transportation was created as a priority item, a priority function of Government.

This particular area of Government was funded in the following manner. FAA operations, the President asked for $5.1 billion. We gave him that. Facilities and equipment, he asked for $2 billion, we gave him that—$2 billion.

Research and development, he asked for $200 million, we gave him that.

The airport improvement program was one area that Senator Lautenberg was very, very tough on, and we wanted to make sure we were doing as much as we could. Actually the President asked for $1 billion, we gave him $1.5 billion, so the total spending for the FAA is in excess of what the President asked for.

Mr. Chairman, you have some latitude in terms of moving these numbers around, whether it be the airport improvement program or another FAA account. If the committee wants to provide some programs less and put more in something else, that is the function of this subcommittee.

Senator SHELBY. If the Senator would yield, I am going to be working with Senator Lautenberg to make sure that we move the money to safety, and safety and nothing else.

Senator DOMENICI. I make this point because some people assume that when we put a budget together that we do not accept the administration's priorities and fund them to the maximum level where there have been problems.

This one and many others were funded at the President's level, assuming that the executive branch knows more than we do, at least for starters, as to what we ought to fund and where the problems are. I ask that my chart showing FAA funding in the budget agreement appear in the record.

Senator SHELBY. It will be made part of the record without objection.

[The information follows:]

FAA FUNDING IN THE BIPARTISAN BUDGET AGREEMENT

The Bipartisan Budget Agreement contains annual funding increases for the Federal Aviation Administration (FAA). Annual increases of three percent are assumed for FAA Operations, Facilities and Equipment, and Research, Development, and Engineering accounts.

These assumptions are the same as the FAA's budget request for these programs.

For the Airport Improvement Program (AIP), the capital construction account of the FAA, spending is frozen at its 1997 level of $1.46 billion through 2002. The

President's budget request had been to reduce this program to $1 billion in 1998 through 2002.

Total FAA funding will increase from its current $8.5 billion to $8.8 billion in 1998 under the Bipartisan Budget Agreement.

The Bipartisan Budget Agreement did not include the Administration's request to make the FAA fully funded by user fees beginning in 1999. The agreement does not include any new user fees for the FAA as proposed by the President.

[Dollars in billions]

	1997	1998	Five-year totals
FAA operations	$4.9	$5.1	$27.4
Facilities and equipment	1.9	2.0	10.5
Research and development	0.2	0.2	1.1
AIP	1.46	1.46	7.3
Total FAA spending	8.5	8.8	46.3

Senator DOMENICI. I thank the delegation from New York for appearing. I think you made a good case, and from my standpoint every now and then we need appearances like this to recall some of the serious problems we have got and get on with trying to solve them.

Thank you, Mr. Chairman.

Senator SHELBY. Senator Bennett.

Senator BENNETT. I cannot add anything to this. I think our colleagues have been very exhaustive, and I appreciate their coming.

Senator SHELBY. Senator Faircloth.

Senator FAIRCLOTH. Thank you, Mr. Chairman. I do not know that I can add a lot to what has been said. I apologize for coming late, but the thing that has bothered me, and I have been concerned about it right much, and I had Mr. Donahue and Mr. Mims from the FAA over in the office one day this week to talk about how we spent over $3 billion on this advanced automation system.

Senator LAUTENBERG. Far more, but $1 billion we know is pure waste.

Senator FAIRCLOTH. And yet we talk about money for training people. Now, I would think $2 billion would train a lot of people.

The people that did this purchasing for the FAA were not severely punished. They were transferred from further purchasing, after $2 billion, and Senator Lautenberg, I do not question that IBM and Big Blue has a great reputation, but for 10 years and $3 billion, they fiddled with this thing, and nothing happened except a total catastrophe, so what do they do, they sell the division that was building it.

Now, if that is not cutting your losses and getting rid of your bad publicity, I do not know what it is. I do not know who we go back to. IBM no longer even owns the thing.

Now, that might be—in the private sector that is known as taking a dive in the onion dip—taking cover.

So we talk about money, but somehow there has got to be responsibility for the money, and you try to trace this thing, and everybody gives you a plea of insanity. Nobody knows what happened, how you could spend $3 billion—$1 billion we could have been better to put in a pile and burn on the runway. It would have

given us more light than what we have gained by a $3 billion fiasco.

So when we talk about more money, that has been a Government problem forever, because no matter what the problem is, no matter how much stupidity or how much waste, pour more money in it and it has got to get better.

Now, I do not know whether IBM has any responsibility in this thing or not, but it would appear to me that they did. Any time that you waste $3 billion of the taxpayer's money, somebody has to have some responsibility, and be responsible, other than the pitiful statement that we transferred a few of the purchasing agents out of purchasing. That is the weakest excuse I have ever heard for throwing away $3 billion.

Mr. Chairman, I thank you.

Senator SHELBY. Thank you.

Thank you all for coming here. I know it has been exhausting. It gets a little warm, gets a little hot in here, but this is a worthwhile hearing, because I believe it points out what we need to do here in this committee, that is to make sure, Senator D'Amato, that the agency is properly funded, and then that they are properly accountable for what they do in hiring and buying equipment and everything that goes on with the safety of our traveling public.

Senator D'AMATO. Well, Mr. Chairman, let me thank you, and let me say, if I seem to be unduly harsh, I make no apology, absolutely none.

Let me tell you something. Look at the record, and when you look at the record, you see a pattern of persistent misallocation of resources. The training school should be turning out more people, absolutely. They should have been doing that years ago.

I did not say it is just the management that is in now, and of course you do not even have an Administrator. This has been a continuing pattern. I am not going to make any apology here.

And this business about whether or not you have too much traffic in the air, of course you do if you do not have enough people to work the traffic, and of course, when you are working people overtime. Of course, when you have a guy who is covering twice the area and twice the responsibility. Of course it is dangerous when you do not have sufficient technicians.

Just look at what happened yesterday. I do not have to be here to apologize for what took place at National Airport yesterday. We are all accountable for this, and indeed, I believe that if it were not for the Congress of the United States and your oversight, Mr. Chairman, this situation would have been worse. I commended you, Senator Lautenberg, for your attempt to handle this, but let me tell you what is taking place is that the situation has deteriorated, notwithstanding the promises that have been made by the FAA.

Now, that evaluation comes from the men and women who man these systems—good, decent, hardworking people. Also, I think we have to ask, how is it that a tower went out at 8:35 at one of the busiest airports in the Nation, National Airport, and did not come back online until 4:15? When I indicate what took place, I have to tell you, I do not make any apologies.

But, I have to ask why do we have so many problems with our current system? We talk about the delays, of course, and that is

why the planes were backed up. But if there was only one isolated example, then fine. These things happen. But this is not isolated. It is becoming more routine. Hence, Mr. Bolerjack's letter of warning.

I did not make that letter up. That gentleman meant every single word, and if you had him here now, he would have you think that this is the safest, the best operational situation that we ever had. Why do you think? Because the bosses are on his back. He is a good man.

I did not make up when he said that "increases in operational errors and deviations have reached levels of grave concern. The reduction of operational errors and deviations is our No. 1 priority. I regret I must impose such a short deadline for this submission." I have only taken three little sentences out. This is real.

Now, we have not come forth without there being a constructive suggestion as it relates to dealing with this, both short term and long term. Long term, you have got to see that the facilities for training people, whether they be the technicians or the controllers, are operating at full staffing levels and are operating and increasing the capacity as opposed to decreasing capacity. You cannot get away from that.

We are going to have to take those men and women and get them into the facilities, get them trained as quickly as possible, not just to meet a critical situation today, but for the future as well. Long term, we are going to have to see to it that where we have some of these areas where we have a difficult time getting the needed amount of staff that we meet our responsibility. I am not saying that because it happens to be in the New York/New Jersey area. Whether it is in Chicago or Los Angeles, we must ask how do we keep the people we have and how do we attract new applicants?

One of the ways is to go to the great technical schools that we have, as well as the universities and colleges where young people who live in the area and can train in the industry can be recruited. In this way, the likelihood of them staying in the area as opposed to coming in de novo is much greater. It makes common sense.

So I suggest that there are a number of alternatives, as opposed to what is taking place now, because the status quo will lead to trouble.

Senator SHELBY. The status quo is too dangerous.

Senator D'Amato, I want to tell you that this committee is going to do whatever it takes to properly fund the FAA, and we are also going to have oversight and make sure that this money that we send is spent for safety and safety and safety. The American people deserve nothing less.

Thank all of you for coming. If you want to join us, you can. I am sure you have got a busy schedule.

Senator D'AMATO. Thank you, Senator, and I want to thank you for your kindness and your cooperation, and I think that this committee can play a very important role in seeing to it that the resources that you do allocate are properly used, and that they do not close down the training center.

Senator SHELBY. And that we not waste billions of dollars of the hard-earned money of the taxpayers in buying services that are never used, as Senator Lautenberg pointed out. Thank you.

Senator D'AMATO. I thank the Chair.

Ms. MOLINARI. Thank you very much.

Senator D'AMATO. I thank the members of the subcommittee.

PANEL 2

NONDEPARTMENTAL WITNESSES

STATEMENTS OF:

BARRY KRASNER, PRESIDENT, NATIONAL AIR TRAFFIC CONTROL ASSOCIATION

DAVID BARGER, VICE PRESIDENT-NEWARK, CONTINENTAL AIRLINES

JACK JOHNSON, PRESIDENT, PROFESSIONAL AIRWAYS SYSTEM SPECIALISTS [PASS]

HENRY BROWN, NEW YORK SYSTEMS MANAGEMENT OFFICE, PASS

RAYMOND D. MALDONADO, FAA CONTROL TOWER, NEWARK INTERNATIONAL AIRPORT

TOM MONAGHAN, FAA CONTROL TOWER, JOHN F. KENNEDY INTERNATIONAL AIRPORT

DEPARTMENT OF TRANSPORTATION

FEDERAL AVIATION ADMINISTRATION

STATEMENT OF MONTE BELGER, ACTING DEPUTY ADMINISTRATOR

ACCOMPANIED BY RON MORGAN, DIRECTOR, AIR TRAFFIC SERVICE

INTRODUCTION OF WITNESSES

Senator SHELBY. Our next panel will be Mr. Barry Krasner, president, National Air Traffic Control Association; Mr. David Barger, vice president, Continental Airlines, Newark, NJ; Mr. Jack Johnson, president, Professional Airways System Specialists; Mr. Henry Brown, New York Systems Management Office; Mr. Raymond Maldonado, FAA Control Tower, Newark International Airport; Mr. Tom Monaghan, FAA Control Tower, Kennedy International Airport; Mr. Monte Belger, Acting Deputy Administrator, Federal Aviation Administration; Mr. Ron Morgan, Director, Air Traffic Service, Federal Aviation Administration.

This is a big panel. I know you are eager to get started, and we are eager to hear you. All of your written testimony will be made part of the record in its entirety, and if you would take about 3 or 4 minutes apiece to just orally suggest what you think we need to do, and we will listen to you. That will give us some time for some questions.

We will start with Mr. Barry Krasner.

STATEMENT OF BARRY KRASNER

Mr. KRASNER. Good morning, Mr. Chairman. I would like to thank you for the opportunity to address this subcommittee. I think what I found is in listening to all that was said before, I found myself going and frantically crossing things out that have al-

ready been said. So if you will bear with me, I will try to give you a little bit of a summary.

I represent the National Air Traffic Controllers Association, which is the organization that represents the Nation's air traffic controllers. The individuals I brought with me today, and that would be Ray Maldonado, who is a controller at Newark Tower; Tom Monaghan, a controller at Kennedy Tower; and Chris Bond, who is a controller at New York Center. These are truly the frontline controllers, and while I will deliver you the formal statement, then they are certainly available for any questions you may have, since they are the ones who work in the trenches, so to speak.

I would like to begin by echoing Senator Lautenberg's statement, because I never miss an opportunity to do this in talking about the air traffic controllers. I believe this Nation's air traffic controllers have justifiably earned the reputation of operating the safest and most efficient system in the world. And I appreciated hearing it from the good Senator from New Jersey, and I certainly hope that you and the members of the committee concur with this assessment and will certainly help us to build in these accomplishments, not only for the air traffic system but for the entire aviation community.

STAFFING SOLUTIONS

I come here today, and I want to talk about a number of issues. I have a lot more in my formal testimony. What I am really going to do, I guess, in this part is focus more on the staffing part, and I want to offer you some solutions, which we believe are viable solutions to the problem.

As Senator D'Amato said, this is not a new issue. In 1970, DOT Secretary Volpe charged the Carson Commission to study the air traffic controller career. In this study, Carson wrote that the system has experienced serious shortcomings, that the existing system will not change for a number of years. In the meantime, the controller will continue to bear a heavy burden in making an understaffed and underfinanced system work. This was in 1970. We are 27 years later, and it could have been written today.

I think as far as staffing goes, I think we have to be real clear on one thing. Insufficient staffing does impact current aviation safety. Now, we do believe that it limits future growth in aviation, it absolutely limits it. And growth in aviation accounts for too much of the gross national product for us to take this situation lightly.

As said before, air traffic operations have increased 36 percent since 1981. Controller numbers have continually decreased. Firstline supervisor numbers, on the other hand, are up over what they were. So we do not have to worry about being supervised, we only have to worry about who there is to supervise.

We believe the only thing that we can find to account for the lower numbers is the failed AAS system, which we heard a little about before. The only thing we could assume is that the system was meant to work under less controllers, there was never an intent to raise those numbers up again, and that after the failure of the AAS system we simply adopted that mode and never raised

those numbers back up again to the system we have now, which is the system we had prior to that.

Now, the GAO put out a report, 97–84, entitled "Aviation Safety: Opportunities Exist for FAA to Refine the Controller Staffing Process." That was published in April 1997. As part of that report, GAO cited some impediments to staffing facilities at required levels. A few of those impediments were limited ability to recruit staff locally, so that is a recognized problem. And another one was limited hiring in recent years has not kept the pipeline full. That, too, is a recognized problem.

I think one of the points that we are missing is the FAA has—well, starting in 1981, when there were 11,400 controllers fired, we had to replace a whole new work force. In doing so, we have since managed the FAA on the backs of the youth of those people. But most of those people were hired between 1981 and 1986, and we have to understand that if that is the case, given their retirement when they are eligible, then by the year 2009, 80 percent of the air traffic controllers in this system will be eligible for retirement. If we do not start hiring that pipeline now, then we are in serious trouble, especially when you consider it takes 3 to 5 years to train an air traffic controller once they leave the academy in Oklahoma City.

But the other point that I really wanted to make very strongly is while I appreciate the issue in New York, this is not a local problem. This is nationwide. New York happens to be the one that is high pressure enough to hit the media, high pressure enough to get before the Congress. But are we to forsake Van Nuys, CA, or Aspen, CO, or Meridian, MS, simply because they do not have the clout to find themselves on the front page of the New York Times? I think we do ourselves a great travesty if we do not look at this as a nationwide problem.

We have different problems in New York, and they center around retention of people, because clearly people do not want to be there because of the cost of living, unfamiliarity—except myself because I am from there—but that clearly is a problem. So you have to have a multifaceted kind of approach to it.

If you are going to bang that, Mr. Chairman, then I will end it before you do.

PREPARED STATEMENT

Senator SHELBY. Thank you, Mr. Krasner. We will insert your complete statement in the record.

[The statement follows:]

PREPARED STATEMENT OF BARRY KRASNER

Chairman Richard Shelby and members of the subcommittee, we are members of the National Air Traffic Controllers Association (NATCA) which represents over 14,000 air traffic controllers of the Federal Aviation Administration (FAA). I want to first thank you for this opportunity to appear before the appropriations subcommittee on transportation and also thank you for your past support of our issues.

NATCA's mission is to guarantee and improve aviation and air traffic safety, serve as an advocate for air traffic controllers, and promote competence and pride within our profession. We are also responsible for promoting technological advances, providing reliable and accurate information for air traffic controllers, and serving as a credible source of information for this committee, the traveling public, and the news media. Our goals include protecting the lives of aviation travelers, preserving

expensive equipment, and reducing mishap frequency and severity. The nation's air traffic controllers have justifiably earned the reputation of operating the safest and most efficient system in the world. I hope you and the members of the committee concur with our assessment and will help us to build on these accomplishments to enhance not only the air traffic system, but the entire aviation community.

In 1970, Department of Transportation Secretary Volpe charged the Corson commission to study the air traffic controller career. In it, Corson wrote, "This system has experienced serious shortcomings". . . and that the "existing system will not change for a number of years. In the meantime, the controller will continue to bear a heavy burden in making an understaffed and underfinanced system work." It is difficult to tell that this statement was made 27 years ago because not much has happened to improve the working conditions of the air traffic controllers.

The issues we would like to talk to you about today include staffing shortages in the New York area and across the country, and equipment shortfalls with regard to air traffic control technology.

STAFFING

Insufficient staffing impacts current aviation safety and will limit future growth in aviation. For example, since 1981, air traffic operations have increased 36 percent while the number of critical, front-line air traffic controllers has decreased by 1,914. These controllers represent an effective margin of safety and efficiency. To date, the only explanation for this deficiency we have found is the failure of the Advanced Automation System (AAS), which anticipated the need for fewer controllers when deployed. We can attest to the fact that today's controllers are showing the strain of chronic six-day work weeks, increased workload, and intense traffic conditions. In many cases, due to sector capacity, severe restrictions are imposed on air traffic to ensure safety. In certain air traffic sectors on a given day, controllers are stretched to the limit. This Congress recognized the controller staffing inadequacies and ordered FAA to request a study of the agency's staffing standard. The GAO report (97–84), entitled "Aviation Safely: Opportunities Exist for FAA to Refine the Controller Staffing Process," was published in April 1997. GAO cited FAA's impediments to staffing facilities at required levels, including: 1) holding funding to relocate and hire controllers until the end of the fiscal year, 2) limited ability to recruit staff locally, and 3) limited hiring in recent years has not kept the pipeline full.

The FAA has managed the current air traffic control system at the expense of the youth of 14,343 air traffic controllers, most of whom were hired between 1981 and 1986. To increase staffing levels to meet projected growth, it is imperative to recruit, select and train the air traffic controllers of the future now. In the best-case scenario, 80 percent of the controllers on duty today will become eligible for retirement by 2009; therefore, we must be prepared to completely replace the current work force over the next 12 years. With the current shortage of staff, the aviation system is subject to a decreasing margin of safety and increased delays and inefficiencies as controllers are forced to cope with increasing traffic volume and density—as they have for the past three decades.

Following is a breakdown of the 36,464 Air Traffic Services employees as of September 1996. In total 23,904 employees provide air traffic control operational services, support for those who actually provide air traffic control services, managerial and/or supervisory functions, administrative/operational support of field facilities, regions and headquarters, or other administrative assistance.

17,080 Controller Work Force (CWF)/Safety Work Force (includes line controllers and supervisors)

+6,824 Other Than Controller Work Force (OTCWF)/Non-safety

23,904 Total CWF and OTCWF

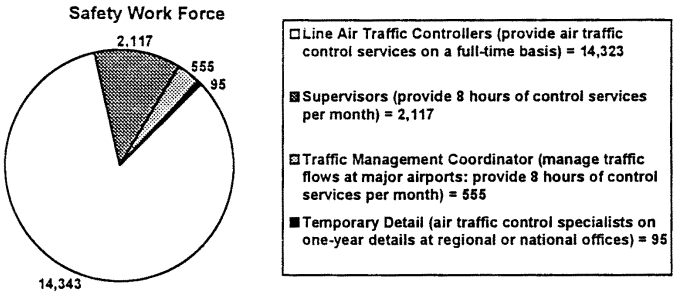

Figure 1: Total Safety Workforce = 17,080 (includes 14,343 line air traffic controllers)

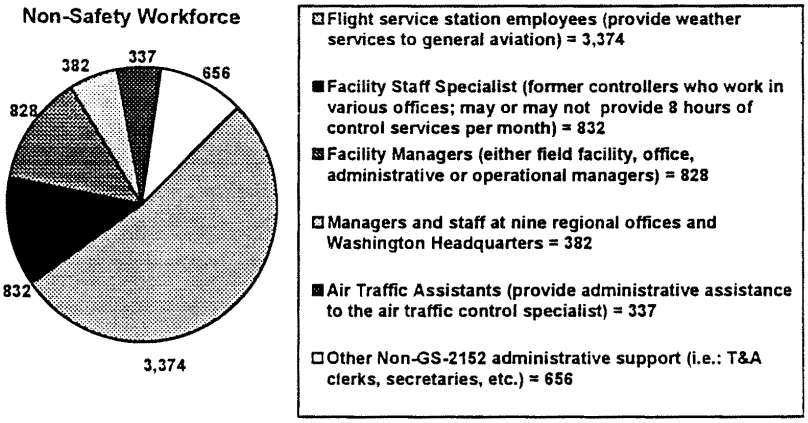

Figure 2: Total Non-Safety Workforce = 6,824

The FAA continues to misrepresent the true air traffic controller numbers by using misleading terminology. It claims to have 17,080 employees in the controller work force. However, when you remove supervisors and traffic management coordinators (who work air traffic control positions for only 96 hours per year), the controller work force drops to a true number of 14,343. The shortage of staff is further aggravated because full performance controllers must train developmental controllers in addition to working the airspace. In 1970, the Corson commission wrote, "The shortage of staff is further aggravated by the presence in busy facilities of a plethora of untrained developmentals whose training adds substantially to the workload of journeyman." I ask this committee and this Congress to be the ones to finally fix the long-standing training problems.

Prior to the 1981 PATCO strike, there were 16,220 line air traffic controllers, 2,121 supervisors and 169 traffic management coordinators, for a total of 18,510. Since 1981, the number of flights has increased by 36 percent system wide. The number of controllers today is only 14,343. The reason for this decline, aside from

neglecting to fully staff after the strike, is primarily due to early buy-outs offered only to managers, supervisors and office staff whose vacancies were then back-filled from the air traffic controller ranks.

As of April 1997, the New York En Route Air Traffic Control Center has had a dangerously low number of air traffic controllers. The FAA and NATCA have since signed an memorandum of understanding in which the FAA agrees to staff the center with 294 controllers by the end of fiscal year 1997 and 339 by the end of fiscal year 1998. This is a sign of progress on the complex issue of staffing numbers. The work ahead lies in solving the day-to-day problems of training and retention of work force. The answer we have proposed to the FAA is establishing a local hire program to recruit trainees from the New York area who want to remain in the area (see attached brief). FAA responded there is no need to adopt our proposal at this time because its solution—an influx of Midwestern students and former PATCO controllers is adequate. We disagree. Not only do you continue to breed a work force of individuals whose primary goal is to leave New York but also this method only exacerbates an already deficient training program. This training program is deficient because, for example, some have been stuck on the data positions for more than a year and have not had the opportunity to advance in the program. And, there are some who have been in the training program three to four years and have yet to certify. At a fully-staffed facility with a focused training program, training should be complete within two years; however, at an understaffed facility such as New York it can take up to six years. Staffing, together with the apprenticeship program, is the solution. NATCA's proposed apprenticeship program requires a two year commitment on the data control position—after which the FAA will send them to the academy for training and subsequent return to New York center as an air traffic controller. This helps the FAA by immediately removing the largest impediments in the training process and also allows the employee to gain confidence, experience and a comfort level in dealing with air traffic. This will help ensure successful completion to full performance level in an environment which now claims a minimum failure rate of 20 percent.

We would like a four to five year test period of the apprenticeship program. We believe this to be the answer, but the FAA refuses to explore it as a solution to New York's staffing problems. It has established a local hire program in San Juan—so why would we assume this is not a viable solution for New York?

Staffing shortages are by no means a problem solely characteristic of the New York area, they are indicative of a nationwide problem. For example, at the Meridian Approach Control in Mississippi, staffing shortages have impacted flight service for both the military and the public. In 1994 and 1995, the facility was authorized 17 full performance level controllers. In 1997 it was only authorized 14, but today it has only nine in actuality. The staffing is so limited that controllers cannot open positions—they have three, but are, at best, only staffed to operate two, and regularly only open one sector without enough staff to provide a second. On occasion, they have had the Memphis and Atlanta centers hold aircraft due to saturation of airspace. Saturation occurs most frequently when the Navy is flying missions and there is only one sector to monitor 13 frequencies at a time. Meridian approach control, in contrast, has plenty of supervisors, just not enough staff to supervise. The controllers they do employ operate on a massive overtime budget just to keep the two sectors working.

The fiscal year 1997 budget called for hiring 500 air traffic controllers. The FAA's historical attrition rate for the GS–2152 series (23,904) has been approximately 10 percent per year of those eligible. It is anticipated that 250 GS–2152 series employees will leave due to attrition in 1997. The recent GAO report (97–84) is concerned that FAA is overestimating the number of expected retirees; however, our numbers are based on the best information available and we need to get prepared for this eventuality because it takes three to five years to train FPL air traffic controller candidates. Also, the air traffic controller training program today has a minimum failure rate of approximately 20 percent. So, if the FAA hires 500 air traffic controller candidates today, with 250 lost to attrition and 100 training failures. we will have a net gain of approximately 75 full-performance level air traffic controllers in each of the years 2000 and 2001.

Between 2002 and 2007, 12,000–14,000 GS–2152 series employees will be eligible for retirement. Statistically speaking, the air traffic controller ranks will decline at an alarming rate starting in 2002. If you consider the lengthy training cycle necessary and the fact that we are currently understaffed by nearly 3,000 air traffic controllers, the critical need to immediately begin a massive hiring process is obvious.

Controllers are already stretched to maximum productivity and maximum workload levels. They run the safest, most comprehensive air traffic system in the world

with access 24 hours a day, 365 days a year. Yet, the number of controllers is lagging far behind the growth in air traffic volume. Clearly, something must be done to increase the staff of full-performance level air traffic controllers. We ask this committee to do everything in its power to increase funding for more controllers and increased staffing levels. The FAA can insert additional controllers on an MOUR but, without funding for across-the-board hiring, controllers will not be hired. Congress is a vital link to adequate staffing.

Productivity is at its highest ever for every full performance level controller—the same number of controllers are handling 36 percent more aircraft today than in 1981, so solutions must be found elsewhere. Some proposals include hiring controllers at the beginning of the fiscal year, instead of using the funds for other projects; reclassification of current grade levels and pay to a more equitable formula; hiring former PATCO employees; hiring air traffic assistants locally; and moving contract tower controllers to larger, busier facilities since they have experience.

The solution, for the vast majority of the country, is to accept the joint NATCA and FAA working group proposed standards, supported in earlier discussions with Office of Personnel Management (OPM) staff. It states the terminal and en route air traffic controller is a unique occupation requiring a classification standard that focuses on duties unique to the occupation, and distinguish the various levels of controller work with related levels of controller pay.

The current classification standard for air traffic controllers is over 18 years old. As a result of occupational changes in the control environment and substantial increases in the volume of air traffic over this period of time, the classification standard has become outmoded. It is now a deficient and inappropriate measure of the differences in the degree of difficulty among positions and the knowledge, skills, abilities, responsibilities, and accountability of controllers assigned to various control facilities throughout the country. The application of the current standard and related compensation system: 1) is based solely on volume of traffic. It does not recognize other complexities associated with the control of traffic; 2) results in all en route controllers located at centers within the contiguous 48 states having the same full-performance level (FPL) grade and pay, with huge differences in the demands on the air traffic controller depending on the center to which he/she is assigned; 3) provides no incentive—in fact, there is a disincentive—for controllers to move to hard-to-staff, more complex facilities; 4) results in large differences in annual pay for small differences in traffic; 5) results in no difference in annual pay among controllers where there are large differences in traffic density; and 6) does not provide coverage for controllers assigned to some categories of facilities (e.g. tower with BRITE, up/down terminals, CERAPS). The present standard is also non-specific in nature and permits manipulation of controller duties for classification purposes regardless of safety and/or efficiency consequences.

The proposed standard is unique to air traffic controllers (and closely related positions) and is easily understood. While pay for the proposed grades has not yet been determined, the reaction of all those personnel briefed about the proposed rankings of facilities (absent definitive FPL salary amounts) is that they provide internal equity. In addition, the proposed standard addresses and corrects deficiencies in the current standard by: 1) acknowledging the varying complexities associated with the different controller functions and different environments. It assigns different weights to the various types of control exercised, different categories of airspace, varying mixes of type of traffic, and other factors pertinent to the six categories of terminals. It also assigns different weights to departing/arriving aircraft, transitioning traffic, overflights, Visual Flight Rules (VFR) advisories, etc. in the centers; 2) providing at least 10 FPL grade levels instead of the current five. This, together with the new classification criteria, will assure that there will be an adequate incentive for controllers to move to the most difficult, hard-to-staff facilities; 3) there will not be significant differences in controller duties without an appropriate difference in controller pay; 4) there will not be minor differences in controller duties with large differences in controller pay; 5) all categories of control facilities will be specifically and appropriately addressed in the standard and related compensation system; and, lastly, 6) there will be at least three different FPL grade levels for controllers assigned to centers and each of the six categories of terminals.

We implore this committee to ensure adequate funding is provided for this new classification and compensation system. As you will recall, this committee requested that NATCA and FAA develop a new personnel system in the fiscal year 1996 transportation-appropriations bill (Public Law 104–50). Without additional compensation the new classification system will not work. Adequate funding is necessary to ensure that the goals and incentive of optimal staffing are met.

Current forecasts estimate a 5 percent annual increase in air traffic for the next 10 to 15 years. Without significant improvements, our present system will simply

be unable to cope with future demand. Further inefficiencies will result as the need to maintain the safety margin becomes even more critical. There is serious concern about the number of controllers that will be required to support current demands, let alone future growth.

TECHNOLOGY AND EQUIPMENT

The second issue I want to address is air traffic control technology and equipment. After many years of documented problems, the FAA must modernize the ancient air traffic control infrastructure. The equipment used by air traffic controllers is antiquated and fraught with increasing failures of critical safety technological components. The equipment that today's air traffic controllers must rely on, such as the Host computer system, surveillance radar and other navigational aids, are part of a system that regularly experiences failures and is at least 10 years behind in technology and procedures. At present, there are 20 en route centers with an average age of 35 years, and 50 major towers, average age 27 years. Equipment failures, overhaul, relocation and modifications caused approximately 1.4 million hours of outages in fiscal year 1994; in fiscal year 1995 the number grew to almost two million and over 2.5 million hours in fiscal year 1996. These delays come at a high cost—it is estimated that the 25 airports with greater than 20,000 hours in delays in 1995 each had $32 million in delay costs (Aviation System Capacity Plan).

The safety of today's air traffic control system relies mainly on the human element—the air traffic controller and the airways facilities technicians that continue to work very hard under adverse conditions to keep our deteriorating infrastructure functional. With no new workload-reducing technology in the foreseeable, each air traffic controller will work 62 percent more traffic than existed in 1981.

A major hindrance to the development and implementation of advanced equipment is that controllers—the end users—are not consulted enough in the development process. NATCA is concerned about the lack of human factors considerations in developing future technology and procedures. Air traffic controllers and their current work environment deserve careful study to accurately determine future requirements in both technology and ergonomics. It is absolutely necessary to establish a central authority to coordinate both the developing technology and attendant human factors issues. Presently, these responsibilities are separate and unequal within the FAA.

Projects currently underway demonstrate the need for a coordinated effort regarding new technology. For example, ergonomic factors may result in deployment delay of Display System Replacement (DSR). Another example is the National Route Program (NRP) which clearly demonstrates how not to implement a new procedure without modeling and analytical support. System development designed without the influence of controllers and human factors expertise will inevitably create hurdles down the road which will affect cost, schedule or performance, if not all three.

Most of the new technology merely replaces old unreliable equipment without adding to system capacity and in some cases actually increase controller workload. One small example, is the Voice Switching Communications System (VSCS), originally designed for use with the AAS equipment, hinders controllers' ability to post, read and mark flight progress strips.

In the early 1990's, the FAA initiated a program known as the Oceanic Automation System (OAS). The goal of the OAS was to develop and deploy interim replacement equipment at Oakland and New York Air Route Traffic Control Centers' oceanic areas. The OAS is nearing its final phase, with the final installation scheduled for late this year. Unfortunately, even after deployment of the OAS, our oceanic controllers are left using grease pencils. tissue and plotting boards.

In contrast, since the inception of the Center TRACON Automation System (CTAS), controllers have worked with Ames Research Center in production and development. It is the only piece of equipment in a long time that will be beneficial to air traffic controllers from a capacity standpoint. In Dallas/Ft. Worth CTAS is allowing controllers to handle 20 more aircraft per hour—a substantial productivity increase.

On February 12, the National Research Council released their report titled "Flight to the Future: Human Factors in Air Traffic Control," which concluded that human factors activities within the FAA are fragmented. We agree, and would add that human factors considerations, too often, come too late in the acquisition process to prevent the kind of mistakes that were made in the 1980's with AAS. Without the proper human factor focus and necessary resources to support it, the mistakes made in AAS are destined to be repeated. One key system, Standard Terminal Automation Replacement System (STARS), is an example of where a coordinated human factor approach would significantly increase the chances of the FAA deploying an

operationally-suitable system. Controllers were involved in STARS too late to help in the system's development, and, when they were included, were instructed by the agency to focus on fixing the system because it is unusable in its current state. These late changes to STARS have led to significant cost and schedule overruns. The June 6 issue of Aviation Daily said that the FAA informed Raytheon Electronic Systems that they are putting STARS in "high risk status" because of delays.

In its report, the National Research Council concludes that user participation is necessary for effective system development, but it is not a substitute for specialized human factors knowledge. It recommends that representative users and human factors specialists be included on product development teams and that the user inputs be systematized to the design process according to human factors test and evaluation procedures. We agree. We have long recognized that, while we are the world's best air traffic controllers, we are not world class system designers or human factors experts. We ask this subcommittee to direct the FAA to include early and significant participation by controllers in a coordinated human factors analysis in the development and deployment of air traffic control automation systems.

Presently, the air traffic is truly dependent on the professional and dedicated men and women who are responsible for the day-to-day operations of the system. However, due to inadequate support technology, the system is restrictive and creates significant problems for both controllers and the entire aviation community. Systemwide, the success of the process depends on the human element interpreting data generated by ancient technology which in some areas, creates instances where capacity is exceeded and aircraft must endure convoluted flight paths to maintain safety.

NATCA focuses on controller errors and the associated human factors. Presently, the system has about 750 reportable operational errors per year. This number has declined over the years from a high of approximately 900. However, the system must continue to strive for zero errors.

The FAA has a comprehensive system that tracks operational errors and this data will give the committee a valuable insight on the error rate for the entire air traffic system. Also, the FAA is able to issue reports on errors for any given air traffic facility. I do not have sufficient data to submit to the committee. I suggest the committee request the specific data from the FAA.

Controller errors constitute serious events that affect the safety of the entire air traffic system. Controllers desperately need decision support tools to cope with the increasing volume and demands of aircraft operations. Additionally, there needs to be a scientific study accomplished that focuses on human factors and why controllers commit errors. Numbers and types of errors can provide useful information, but do not identify the reasons for a controller's actions, nor how to prevent repeat errors.

Controllers need the tools to provide for increased capacity—without the necessary tools, both safety and capacity will be compromised. The impact of the aviation industry on the economy is $947 billion and is projected to be $1,446 billion by 2010—while the total "cost" of present air traffic service is only $3.9 billion—a small price to pay.

Cost savings in the near-term may increase risk in the long-term. Additionally, the following elements must form the cornerstone of any discussion:

—Safety is paramount—any proposal which could compromise safety must be rejected.

—Alternative funding strategies must be developed and implemented.

—Control, governance and oversight of the FAA must remain a government responsibility.

—Employee union involvement is essential for success of any transition.

These discussions will require much effort and great cooperation to become reality. Having said this, I cannot overstate the specific requirement: NATCA's position regarding change is "safety first!"

In conclusion, NATCA is prepared to play an even greater role in aviation safety; to strive for constant improvement in all aspects of aviation safety; to build coalitions with other nations and organizations to promote positions on safety and technology issues; and to work with the Executive and Legislative branches of government and the aviation industry for continual improvement of the national airspace system.

Thank you, Mr. Chairman and committee, for your time and consideration of our important issues. I will be happy to answer any questions.

[CLERK'S NOTE.—The attachments to Mr. Krasner's statement will not appear in the hearing record, but are available for review in the subcommittee's files.]

STATEMENT OF DAVID BARGER

Senator SHELBY. Mr. David Barger, Continental Airlines. Mr. Barger, if you will briefly sum up your oral statement, your written statement, if any, will be made part of the record.

Mr. BARGER. Thank you very much.

Good morning, Mr. Chairman and members of the subcommittee, and I certainly will summarize my written testimony, and thank you for submitting that for the record.

I am joined here by Jay Salter, our Continental vice president for operations out of Houston. Continental has hubs in Newark, Houston, and Cleveland, and several people were talking about Newark today, and it is only our Newark hub which imposes onerous delays on our overall system. My purpose today is to accomplish three tasks: One, to express Continental's strong support for the FAA work force, which provides the Nation's air carriers with a safe air transport system; two, to highlight flaws in FAA procedures and equipment priorities that leave Newark at a distinct disadvantage when it comes to air traffic management and delay issues; and three, most importantly, to advocate for a complete redesign of the New Jersey and New York airspace as soon as this is possible.

In the past year, Continental has won several awards which highlight the kind of quality service that we deliver to our customers. All these awards were accomplished with virtually the same personnel that have been in place at this airline over the past years. We believe that the similar case exists at the FAA in a similar position. FAA personnel are well trained and dedicated to maintaining a safe air transportation system here in the United States. Unfortunately, they do not have the tools and the resources they need to get the job done effectively, and therefore, despite their best efforts, they are unable to deliver a reliable and a consistent product.

Senator Lautenberg has gone to great lengths to work with the FAA, Continental, and other airlines which serve New York to identify and put in place the equipment, personnel, and procedures that can improve the air traffic control situation at Newark. We are grateful for his efforts. Frankly, it is only when he highlights an installation's schedule or prioritizes an item that the FAA adheres to any reasonable timeframe; for example, Senator Lautenberg, for the authorization and procurement for the instrument landing system on one of our long parallel runways in 1994, which is just installed this year, and again, on behalf of Continental we certainly thank him.

PROBLEMS WITH FAA INSTALLATION AND PROCEDURES

Despite these successes, I want to detail just a few examples of our frustration with the FAA's procedure to install valuable procedures and/or equipment that could improve the air traffic control system. We know that the FAA is committed to trying to improve the efficiency of the airspace system in the New York region, and we support any and all efforts made to achieve that goal. But the priorities and methods by which the Agency goes about accomplishing this goal are sometimes flawed.

Consider the following, and I will give you two examples that were submitted out of the five. First of all, if you consider the integrated terminal weather system [ITWS]—ITWS is a thunderstorm microburst detection and forecast movement system. Delay savings at Newark are estimated to be approximately 3,566 hours in delay minutes for Continental, alone. Unfortunately, installation of ITWS at Newark is not FAA's top priority, despite the extraordinary delays caused by thunderstorms in the New York area.

Discouraged by the FAA's protracted installation schedule, the airlines, in conjunction with the port authority, are proceeding with an independent procurement of this equipment at a cost of over $3 million. However, the picture here gets more complicated because the ITWS component is dependent on terminal doppler weather radar, commonly known as TDWR. Newark's TDWR is yet to be commissioned due to a manufacturing defect, and the fact that the TDWR's for JFK and La Guardia are caught up in a protracted environmental review process. Frankly, ITWS installation in the New York/New Jersey area will be ineffective without additional terminal doppler weather radar coverage.

Also, along the lines of ITWS, when you take a look at departure sequencing and engineering developmental models commonly known by the acronym DSEDM, as I mentioned in the previous example, thunderstorms cause severe disruptions to airline operations in the New Jersey and New York area. A root cause of the significant delays is FAA's inability to expeditiously develop and issue alternative routings which safely avoid the weather. This deficiency is due to the lack of automation equipment to handle the administrative burden of revising flight times. FAA needs to automate the departure pit at New York Center, as the existing equipment and procedures have been in use for over 20 years. To date, we have seen no evidence of the needed automation, and now the thunderstorm season is upon us once again.

Let me move on to my third and final point, and in closing and summarizing, at Continental we certainly feel that it is very important that this group take a very hard look and that the FAA take a very hard look in terms of a new redesign of the airspace serving the Northeast corridor. Before I close, I want to reemphasize that as frustrated as we have been with some of these automated and equipment issues, we are proud of the ongoing partnership we have attained with the FAA in our region. We appreciate all the FAA has done on behalf of Continental and our passengers. This partnership has had a positive impact.

Mr. Chairman, once again, I appreciate this opportunity to testify. Any attention paid to the New Jersey/New York airspace is welcome. Any action taken to bring in new equipment, hire additional personnel, or initiate innovative airspace design is even more welcome.

Jay and I would be happy to answer questions at the end of today's presentations. Thank you.

PREPARED STATEMENT

Senator SHELBY. Thank you, Mr. Barger. We will insert your complete statement in the record.

[The statement follows:]

PREPARED STATEMENT OF DAVID A. BARGER

Good Morning Mr. Chairman and Members of the Subcommittee. On behalf of my 37,500 colleagues at Continental Airlines, I want to thank you for giving me the opportunity to speak to you this morning. My name is David Barger and I am Vice President for the Newark hub, Continental's second largest hub. Jay Salter, Continental's Vice President for Operations Administration is accompanying me today. Continental is the nation's fifth largest airline with hubs in Newark, Houston and Cleveland but it is only our Newark hub which imposes consistent and onerous delays on our overall system. My purpose today is to accomplish three tasks: 1) to express Continental's strong support for the FAA work force which provides the nation's air carriers with a safe air transport system; 2) to highlight flaws in FAA procedures and equipment priorities that leave Newark at a distinct disadvantage when it comes to air traffic management and delay issues; and 3) to advocate for a complete redesign of the New Jersey/New York airspace as soon as it is humanly possible to complete.

In the past year, Continental Airlines has won several awards which highlight the kind of quality service that we deliver to our customers. These awards include Airline of the Year from Air Transport World, back to back J.D. Power Awards for Flights over 500 miles from Frequent Flyer Magazine and Best International Business Class by SmartMoney Magazine. All of these awards were accomplished with virtually the same personnel who were a part of this company when we did not operate on time or produce a reliable or consistent product. As our Chairman and CEO Gordon Bethune has said repeatedly, there were always good and talented people at Continental—they just needed to have good tools, a good plan and ample resources to get their jobs done. My point is simple—we view the FAA to be in a similar position today—there are plenty of good people to be found at the FAA. They are well trained and dedicated to maintaining a safe air transportation system here in the United States. Unfortunately, they do not have the tools or the resources they need to get their jobs done effectively and therefore, despite their best efforts, they are unable to deliver a reliable and consistent product to our mutual customers—the traveling and shipping public.

While we have been frustrated in the past with staffing levels at the Newark Tower, the New York TRACON, and the New York Air Route Traffic Control Center, we believe the FAA has begun to turn that issue around. Our single recommendation on the issue of staffing would be to urge the FAA to consider using the new personnel rules to establish a program where future air traffic controllers are hired locally. Our experience in the New York region is that many controllers who are brought in from across the country (whether they be rehires or newly graduated from college) are somewhat overwhelmed by the complexities of the New York system and its environs. Once they are fully trained, in many cases, they want to return to the area of the country from which they came. Hiring locally would mean that controllers would enter the job with a pre-existing commitment to the region—once they are fully trained, they might be more likely to stay in the area and those of us who serve the New Jersey/New York region would benefit from leaving a more seasoned and permanent work force.

For the balance of my statement, I would like to focus on equipment and procedures as they relate to delays at Newark International Airport. As you may have read in your local papers, Newark has just reclaimed the dubious honor of being the airport with the greatest number of air traffic control delays in the country. According to FAA statistics, delays at Newark more than doubled from 14,004 in 1995 to 28,454 in 1996. Newark's airport neighbors did not fare much better with La Guardia placing third and JFK placing 6th. Certainly there is a great deal of traffic moving in and out of these airports—on just one day last week, Newark had 1,400 operations; La Guardia had 1,080 operations; Kennedy had 1,060 operations; Teterboro had 750 operations; and White Plains had 765 operations. Our friends at the FAA will tell you that Continental's schedule does not help the Newark delay problem but in fact we regularly structure our schedule to minimize congestion and we frequently seek suggestions from FAA to make our operation more efficient. Nevertheless, the volume of operations in the New Jersey/New York airspace every day does not and should not justify the delays that we endure at Newark—rather the volume of passengers and cargo should serve as a challenge to the FAA to ensure their best equipment and their best personnel are devoted to delivering the safest, most efficient and reliable air traffic control service.

Let me explain why we care about delays. Not only is every minute of delay an inconvenience for our passengers, every one minute of delay costs Continental Airlines $28. This is a significant financial burden to impose on a company and it is an even greater logistical burden to impose on our employees as they try to cope

with the operational challenges that result from these endless delays—delays which are endemic to Newark in good weather and bad. I think my point is clear—it is unacceptable for the nation's ninth largest airport to be the nation's most delayed airport in seven out of the last ten years (and for the record, in the last twelve years, Newark has never been better than the third most delayed airport in the country!). Now, the issue is what can be done to fix this problem?

Senator Lautenberg has gone to great lengths to work with the FAA, Continental and the other airlines which serve Newark to identify and put in place the equipment, personnel and procedures that can improve the air traffic control situation at Newark. We are grateful for his efforts—frankly, it is only when he highlights an installation schedule or prioritizes an item, that the FAA adheres to any reasonable timeframe. For example, we can thank Senator Lautenberg for the installation of the Instrument Landing System for the commuter runway which was installed after a lengthy delay. We can also thank Senator Lautenberg for the authorization and procurement of the Instrument Landing System funded by this Committee in 1994 which was installed earlier this year on one of Newark's parallel runways.

Despite these successes, I want to detail a few examples of our frustration with the FAA's procedures to install valuable procedures and/or equipment that could improve the air traffic control system. We know that the FAA is committed to trying to improve efficiency of the airspace system in the New York region and we support any and all efforts made to achieve that goal. But the priorities and methods by which the agency goes about accomplishing this goal are sometimes flawed. Consider the following:

Example No. 1.—The FAA intends to install the Aircraft Situation Display equipment in the Newark Tower later this year. This equipment shows all the air traffic operating in the national airspace system and will permit air traffic facilities to more accurately predict arrival and departure demand and enable them to more efficiently manage the system. This equipment has been available for at least four years and will be of great use to the Newark Tower. What is beyond comprehension is the fact that Newark, which is first in delays, is last on the list of major airports to receive the equipment.

Example No. 2.—Information Display System-4 (IDS–4)—This equipment provides the controller with an accurate/timely display of critical information for operations in the entire New York Air Traffic Control system. The good news is that this equipment is also scheduled to be installed later this year. The bad news is that this equipment has been available at other locations for several years and that the next generation of this system has already been installed at the new TRACON at DFW, an airport that does not have anywhere near the delay problems as Newark.

Example No. 3.—An Instrument Landing System for Teterboro Runway 19. The installation of an ILS on Teterboro Runway 19 will eliminate conflicts between existing ILS approaches at Newark and Teterboro—presently, these procedures cannot be run simultaneously. FAA's attention to this project has been less than aggressive and in fact, they are just re-starting the environmental process after a lengthy delay.

Example No. 4.—The Integrated Terminal Weather System (ITWS). ITWS is a thunderstorm-microburst detection and forecast movement system. Delay savings at Newark are estimated to be approximately 3,566 hours (and a reduction in costs of $5.6 million) for Continental alone. Unfortunately, installation of ITWS at Newark is not FAA's top priority despite the extraordinary delays caused by thunderstorms in the New York area. ITWS will not be commissioned at Newark until 2002. Discouraged by the FAA's protracted installation schedule, the airlines, in conjunction with the Port Authority, are proceeding with an independent procurement of this equipment at an expected cost of over $3 million. However, the picture here gets more complicated because ITWS is dependent on Terminal Doppler Weather Radar (or TDWR). Newark's TDWR has yet to be commissioned due to a manufacturing defect and the fact that the TDWR's for JFK and LaGuardia are caught up in a protracted environmental review process. Frankly, ITWS installation in the New York/New Jersey area will be ineffective without additional TDWR coverage. By the way, the Committee should be aware that the accident that spawned microburst research and the development of TDWR and ITWS occurred at JFK.

A fifth and final example.—Departure Sequencing Engineering Development Model—DSEDM. As I mentioned in the previous example, thunderstorms cause severe disruptions to airline operations in the New Jersey/New York area. A root cause of the significant delays is FAA's inability to expeditiously develop and issue alternate routings which safely avoid the weather. This deficiency is due to the lack of automation equipment to handle the administrative burden of revising flight plans. FAA needs to automate the departure pit at New York Center as the existing equipment and procedures have been in use for twenty years. In fact, a recent inter-

nal FAA operational assessment report (October 1996) recommended quick introduction of automation at the New York Air Traffic Control Center departure "pit" (the coordination sector) to enable FAA to reroute aircraft more efficiently. To date we have seen no evidence of the needed automation and now the thunderstorm season is here again. We believe equipment and software associated with DSEDM, a developmental program, could be adapted and deployed for evaluation at the New York Center within six months of FAA authorization. Clearly, delays at Newark and the other New York airports will not decline significantly until this problem is addressed.

Each of these five examples serves as proof to us that the FAA, through their own process of setting priorities, is unintentionally contributing to Newark's delay problems. In our business, when we identify a problem critical to our operations, we apply the resources necessary to address that problem. And in fact, we have done so on several occasions at Newark. In this case, though the FAA's own statistics show that Newark has been the most delayed airport, we are not convinced that the FAA necessarily applies a "best efforts" approach. When they have the opportunity to install equipment that might reduce delays, such as those cases I have just cited, they have allowed projects to languish.

But let me move on to my third and final point. While much of this equipment would provide some relief to the delay problem in the New York airspace, we believe that a comprehensive redesign of the airspace holds the greatest promise for improvement. We are not alone in this belief. In a recent letter sent to FAA Managers in the Eastern and New England regions from the National Air Traffic Controllers Association (NATCA) Presidents in Boston and New York Centers, NATCA said "While there may be some short term solutions to pressing needs, it must be understood that they are just that, short term. The airspace system cannot function on a regular basis with a patchwork of interim fixes. These short term solutions must be part of a comprehensive well planned, permanent design that will accommodate existing and future technologies." We agree. It is absolutely imperative that this review be conducted with participation from all segments of the system as well as the communities. This is not a project that should be allowed to languish—it should receive the very highest priority within the FAA from both a funding and a personnel perspective. NATCA is right—all other fixes are just a temporary fix. I hope this Committee will add its voice to the chorus of support for radical overhaul of the New York airspace.

Before I close, I want to reemphasize that as frustrated as we have been with some of these equipment issues, we are proud of the ongoing partnership we have attained with the FAA in our region. We appreciate all that FAA has done on behalf of Continental and our passengers. This partnership has had a positive impact. Last Fall, with FAA's assistance, Continental assumed control of the taxiway system adjacent to Terminal C. It may not sound like much, but this action enabled Continental to improve the movement of aircraft in and around the ramp and tarmac. Furthermore, the FAA and Continental are cooperating on the design of the new Air Traffic Control Tower at Newark so that a ramp control facility could be placed in this space, at our expense. With these and other positive examples of the power of the airline/FAA partnership, Continental looks forward to the day when Newark is not consistently on the top of the list of our nation's most delayed airports.

Mr. Chairman, once again, I appreciate this opportunity to testify. Any hearing or any attention paid to the New Jersey/New York airspace is welcome—any action taken to bring in new equipment, hire additional personnel or initiate innovative airspace design is even more welcome. Jay and I would be happy to answer any questions you may have at this time.

STATEMENT OF JACK JOHNSON

Senator SHELBY. Our next panelist is Mr. Jack Johnson, president, Professional Airways Systems Specialists.

Mr. JOHNSON. Good morning, Chairman Shelby and members of the subcommittee. I will try to rapidly go through my points.

I am Jack Johnson. I am the president of the Professional Airways Systems Specialists. We represent over 10,000 FAA employees, including systems specialists more commonly known as technicians, safety inspectors in the flight standards area, and also the pilots who fly for the FAA. PASS is the exclusive representative for all those people. In today's testimony I will try to focus on how all

of this discussion about the air traffic control system relates to the folks that we represent.

As you are hearing about air traffic controllers, I would like you to remember that the air traffic controller's right hand is the FAA technician, and the FAA technicians have been there for years and years maintaining the obsolete equipment that is currently still in use by the FAA, and the air traffic controllers' confidence has always been there with the airways facilities technicians.

As Senator D'Amato said, we have gone from about 11,600 technicians to about 6,000 technicians, while we have gone from about 19,000 facilities and pieces of equipment to about 40,000. That is an awful lot of change, and we seem to be going in the wrong direction. As you heard Senator D'Amato say, this group of people, dedicated as they are, are very, very stressed. They do not have the people there, they do not cover all the shifts anymore, there is overtime that we are needing, the training dollars are just not there anymore, and our biggest problem is that they do not have people in the pipeline to fill for the 38 to 50 percent of the technicians that will be retiring over the next 3 to 5 years.

The poor planning and decisionmaking by the FAA around the advanced automation system has created a situation where we have the right work force for the wrong FAA air traffic control system. As you heard from Senator D'Amato, staffing decreases have forced the agency to adopt a costly and dangerous alternative to in-house maintenance—contracting out the maintenance. I would offer to you today that you cannot—you cannot—contract out the safety of your families, of the American people, and the national airspace system. That is not a good alternative. It is bad for Government, and it is bad for business.

In 1996, the existing 29 maintenance contracts cost the airway facilities piece of the FAA $47 million. The generated workload for that contracting maintenance was 503 employee years. If you equate that to the cost of the maintenance by the in-house staff, that would give us over 700 employee years. Typically the FAA will contract out the first few years of maintenance in order to get the training for the technicians out in the field.

The FAA just recently contracted with Raytheon to put in the standard terminal automation system [STARS], and we believe that while we are concurrently running the old system with the new system, there is a better way to train than to send everybody out to Oklahoma City one or two at a time. We can train right in the facility on the new equipment while it is being tested to make sure that it is going to do the job.

Mr. Henry Brown is seated next to me today. He is the technician from New York, and I would like to give him enough time to speak today, but I would also like to say that any questions that you might have, we will be glad to answer them, and we have submitted written testimony. Thank you.

PREPARED STATEMENT

Senator SHELBY. Thank you, Mr. Johnson. We will insert your complete statement in the record.

[The statement follows:]

PREPARED STATEMENT OF JACK JOHNSON

Chairman Shelby and Members of the Subcommittee: Good morning. My name is Jack Johnson, and I am the National President of the Professional Airways Systems Specialists (PASS). Seated next to me is Henry Brown, an Environmental Systems Specialist and PASS Representative from the New York Air Route Traffic Control Center. Mr. Brown will testify on FAA staffing, training, and equipment problems in the New York area. Thank you for inviting us here today.

As the exclusive representative for over 10,000 Systems Specialists, Flight Inspection Pilots, and Aviation Safety Inspectors working for the Federal Aviation Administration (FAA), PASS has a strong interest in FAA staffing levels. The services that our members perform range from systems maintenance, installation, and certification, to aviation and flight inspection. These dedicated men and women have a direct impact on the commercial and general aviation industries and on the safety, the efficiency, and the reliability of the air traffic control system.

Earlier this gear, PASS provided testimony to this Subcommittee on the FAA's Fiscal Year 1998 budget request, including information on each of our bargaining units. Today's testimony will focus specifically on our Systems Specialists—the men and women who form the backbone of the air traffic control system. We will explain how the FAA's choices to cut staffing and training, to contract out, and to attempt modernization without appropriate planning are misguided, waste money, and jeopardize the future safety and reliability of the National Airspace System (NAS).

STAFFING

Airway Facilities (AF) Systems Specialists (or Technicians, as they are more commonly known) are primarily responsible for the maintenance, repair, and operation of the air traffic control system. Yet, because their positions are not as visible as those of the Air Traffic Controllers, Systems Specialists are often overlooked. By no means, however, are they any less important; in fact, FAA Systems Specialists are the only people authorized to certify the operation and safety of facilities and to return the systems to service.

Just as critical to the safe operation of the air traffic control system are the FAA's Air Traffic Control Specialists employed in the agency's Flight Service Stations (FSS) throughout the country. These employees are represented by the National Association of Air Traffic Specialists (NAATS), and they provide pre-flight weather and flight planning information, in-flight updates, and aeronautical facility data to commercial, military, and general aviation pilots.

Today, there is a major shortfall in both AF an FSS staffing. In 1981, for example, 11,600 Systems Specialists were responsible for maintaining 19,000 FAA facilities and equipment. As of September 30, 1996, the entire field maintenance work force (including supervisors, managers, Systems Specialists, and support personnel) totaled 8,209;[1] there are now nearly 40,000 FAA facilities and equipment.

Meanwhile, between 1981 and 1995 (the most recent period for which the agency has provided accurate data), the FAA has systematically downsized the personnel working at its flight service stations by almost one thousand individuals: from some 3,500 to roughly 2,500. During this same period, the number of FSS management and supervisory personnel assigned to Flight Service has been reduced by only six through 1995.

The FAA's staffing standards indicate that an AF work force of 11,815 Technicians, logistical and support staff personnel, supervisors and managers will be needed for the current fiscal year. Yet, an analysis of AF staffing levels shows that, on average, each of the nine FAA regions experienced a 13.2 percent decline in staffing between fiscal year 1992 and fiscal year 1996. Ironically, FAA Headquarters and the Technical Center show a 72.63 percent staffing increase during this same timeframe.

Recently, at the request of Vice President Gore and the White House Aviation Safety and Security Commission, PASS calculated the number of FAA employees directly engaged in systems maintenance, as opposed to those who support systems maintenance. As of December 5, 1996, only 5,888 Airway Facilities employees provided hands-on maintenance of the entire National Airspace System (NAS). The FAA's staffing breakdown follows:

---

[1] Department of Transportation, Federal Aviation Administration, Administrator's Fact Book, November 1996.

	Fiscal year 1996
Field Maintenance: Employees in the Systems Management Offices (SMO), and Atlantic City and Oklahoma City Centers. They provide maintenance and certification of facilities, engineering, program and administrative support, management, and supervision	8,209
Planning and Technical Support: Employees located in Regional Offices, Centers, and FAA Headquarters. These employees manage national programs by providing engineering and program analysis, resource management, and administrative support	1,090
Total Operations (Systems Maintenance) Staffing	9,299

The true distribution of systems maintenance staffing, however, includes the number of supervisors and managers, the number of employees in support positions, and the number of employees directly engaged in maintenance of the NAS. PASS obtained the following data by contacting FAA field and regional offices directly:

	Fiscal year 1996
FAA Headquarters: Including Atlantic City and Oklahoma City Centers	885
Regional Offices: This includes regional offices only, without headquarters elements	841
SMO Offices: Includes the technical, program, and administrative support for the System Support Centers (SSC's), as well as the first-line supervisors of the field maintenance employees	1,685
AF Employees Providing Hands-On Maintenance of the NAS	5,888
Total Operations (Systems Maintenance) Staffing	9,299

As you can see, a very different picture is painted when "systems maintenance" staffing is distributed by operational structure. What this shows is the number of systems maintenance employees assigned to hands-on maintenance jobs is approximately 63 percent of the total systems maintenance work force. It is no wonder that AF overtime usage in fiscal year 1996 increased by fifteen percent for the systems maintenance work force.

Following is a breakdown of Airway Facilities staffing levels at selected SMO's nationwide. It is important to remember that the on-board staffing figures are inclusive and that the FAA does not track the number of Technicians that perform hands-on maintenance of the system. The on-board staffing levels below include at least 22 percent overhead; generated staffing refers to the amount of people the FAA calculates are needed to maintain all of the equipment in the SMO.

Liberty SMO: Includes JFK, La Guardia, Newark, Stewart, Islip, Teterboro, Morristown, Caldwell, and White Plains airports. Also: Riverhead Long Range Radar (LRR), New York Tracon, and New York Center. Generated Staffing, 377; Authorized Staffing, 275; On-Board Staffing, 266; and Retirement Eligible, 40 by end of fiscal year 1998.

Independence SMO: Includes Philadelphia, Syracuse, Allentown, Trenton, Atlantic City, Harrisburg, Wilkes Barre, Scranton airports. Also: facilities in Eastern New York (excluding New York City), eastern Pennsylvania, and New Jersey (excluding Newark). Generated Staffing, 309; Authorized Staffing, 228; On-Board Staffing, 208; and Retirement Eligible, 20 percent.

Pittsburgh SMO: Includes Greater Pittsburgh, Erie International, Buffalo International, Rochester International, Roanoke, Charleston, Huntington, Clarksburg, Allegheny County, Lynchburg, State College, Martinsburg, and DuBois airports. Also: Bedford LRR, Oakdale LRR, Clearfield LRR, Pittsburgh Tracon, Lambs Knoll, and Altoona Flight Service Station. Generated Staffing, 297; Authorized Staffing, 216; On-Board Staffing, 196; and Retirement Eligible, 20 percent by end of fiscal year 1997.

Los Angeles SMO: Includes Burbank, Los Angeles, Van Nuys (busiest general aviation airport in the world), Inyokern, Palmdale, Oxnard, Camarillo, and Santa Barbara airports. Also: Edwards Air Force Base, R2508 (military test range), Los Angeles Center, High Desert Tracon, 10 long range radars, and Hawthorne Flight Service Station. Generated Staffing, 327; Authorized Staffing, 202; On-Board Staffing, 200; and Retirement Eligible, 40 percent (Center), 30 percent.

Chesapeake SMO: Includes Andrews Air Force Base, Washington National, Dulles, BWI, Richmond, Norfolk, Charlottesville, Salisbury, Patrick Henry, Manassas, and Shenandoah airports. Also: Leesburg Center, Leesburg Flight Service Station, and Baltimore Tracon. Generated Staffing, 312; Authorized Staffing, 249; On-Board Staffing, 255; and Retirement Eligible, 40+.

Within a 1995 cost-benefit analysis for the NAS Infrastructure Management System (NIMS), the FAA acknowledged that "service and system management efficiencies will not make up for the shortfall in available AF personnel during the period 1997 through 2001. (Note: The shortfall in service and system management effectiveness will result in a reduction of overall AF facility and service operational availability.)"[2] Given the known impact of this staffing shortfall, why does the agency plan to hire only 25 additional Technicians in fiscal year 1998?

FAA management's poor planning and decisionmaking have led to today's staffing problems. First, the agency calculated the field staffing reductions that it believed the now defunct Advanced Automation System (AAS) would achieve. Then, it cut the field maintenance staff by not hiring Technicians to fill the pipeline. But the system never materialized.

Had the agency fulfilled the AAS promise, we may now have the correct number of employees. However, the agency terminated the AAS project, leaving us with the right work force for the wrong air traffic control system. Consequently, the use of overtime has increased; restoration times have grown; open watches are commonplace; contractor maintenance costs have skyrocketed; and training dollars have been slashed.

Mr. Chairman, if just one-fourth of the overhead in Airway Facilities (defined as support, managerial, or supervisory support not directly engaged in NAS maintenance) was converted to the true maintenance work force, it would mean 850 more employees in the pipeline who are eventually trained to maintain the NAS. This would be a fifteen percent increase in the number of field Technicians available to help keep our skies safe.

CONTRACTING OUT

Unfortunately, staffing decreases have forced the agency to adopt a costly and dangerous alternative to in-house maintenance—contracting out. The FAA is allowing maintenance on the NAS—which is an inherently governmental function—to be performed by private contractors. PASS believes the agency's decision to contract out the installation, repair, maintenance, and certification of FAA systems and equipment vital to the safe operation of air traffic is both bad government and bad business.

Both the FAA and the General Accounting Office have estimated that the agency would save approximately $45,000 per staff year if it utilized its in-house staff rather than contractor staff. Not only is contracting out more expensive to the agency, it is also counterproductive to the agency's mission. In fact, in testimony last year before Congress, the GAO concluded that one of the prime factors hindering the FAA's ability to bring new ATC systems on-line is its "inadequate oversight of contractor performance."[3]

In fiscal year 1996, the existing 29 maintenance contracts cost Airway Facilities $47,700,000. The generated workload for contract maintenance for fiscal year 1996 was 503.8 employee years (or "the number of people that would be required if FAA employees were to perform this workload in-house.") This equates to $94,680 per employee year.

Now, if this maintenance was actually done in-house, using the FAA's labor rate for Systems Specialists, $68,000 per employee year or 701.5 employee years of work could be realized. This equates either to a net increase of 198 Systems Specialists to be used in areas of staffing shortfalls or a net savings to the FAA of $13,433,600 for the same amount of work.

Typically, the FAA will contract out the first few years of maintenance of a new system simply because it cannot train our Technicians fast enough to support these new systems. Despite the fact that Congress legislated personnel and acquisition reform to give the FAA greater flexibility, the agency has failed to reform training.

Recently, the FAA contracted with Raytheon for the installation and maintenance of the Standard Terminal Automation Replacement System, or STARS, as it is commonly known. This system will replace aging radar display systems, controller workstations, and related equipment at about 170 FAA terminal ATC facilities by February 2005.

Assuming that Raytheon will perform most site preparation and installation work, the STARS contract is estimated to be worth $2.2 billion—$940 million for facility and engineering and $1.3 billion to operate and maintain the system. According to

[2] Federal Aviation Administration, Cost-Benefit Analysis of the National Airspace System (NAS) Infrastructure Management System (NIMS), October 1995. (Final Draft Copy).

[3] Kenneth Mead, Director, Transportation Issues, "Issues Related to FAA Reform," (General Accounting Office, August 2, 1995.)

the General Accounting Office (GAO), STARS costs could increase by $529 million over FAA's baseline.[4]

Just last week Aviation Daily reported that FAA officials overseeing implementation of STARS have told Raytheon they propose to elevate STARS software development to "high risk status" because of delays in meeting milestones. According to the article, a March report shows software development to be 75 percent behind schedule. "It is unclear how Raytheon could recover with the existing plan that increases in both size and complexity with each incremental build," the FAA told Raytheon.

Clearly, Technicians and Controllers should have been given hands-on involvement in this project from the onset; instead our roles have been limited. As such, PASS fully expects that the STARS project—like most FAA modernization efforts—will run over budget and take longer for deployment. Consequently, the agency will raid resources from other programs to cover the shortfalls.

The FAA is also missing the opportunity to save money by giving on-site training on STARS to AF Technicians. When appropriate, on-site training can save time and money because the cost of sending an instructor to one site, or a group of sites, is much less than sending fifteen or twenty Technicians to the Oklahoma City Academy.

STARS will be deployed with the current automation system, which would make on-site training of AF Technicians for a project of this magnitude not just appropriate, but extremely cost effective. However, the FAA has said it will contract out the first year of maintenance for STARS because it can't train enough people in time to assume the maintenance.

How long will this excuse be acceptable? Why would the agency spend millions of dollars on the STARS contract when the agency's AF Technicians can bring systems online faster and cheaper? The Display Complex Channel Rehost (DCCR) program, for example, was completed on time and $3 million under budget. The Voice Switching Control System (VSCS) was also commissioned on time and on budget. Technicians were responsible for both projects.

Until now, PASS has addressed contracting out as merely a "numbers" issue—or as a costly "Band-Aid" for the FAA's true staffing problems. We would now like to explain the dangers and the safety shortfalls that contracting out generates, for it is common knowledge at FAA facilities that contractors will always place their company's needs before the FAA's safety mission.

The National Airspace System is not just one piece of equipment. The NAS is a complex system which includes thousands of different smaller systems, many of which interface with one another. When contractors come into an FAA facility to maintain a piece of the NAS system, they often do not understand the effect they can have on the intricacies of the whole system and on the safety of the flying public.

AF Technicians have a proven track record, while private contractors often have failed to measure up to this high standard. An example of the satisfaction that FAA Technicians provide is evidenced in a letter to the FAA dated April 30, 1997. Mr. George Larson, Airport Director of the Jackson Hole, Wyoming Airport Board, writes:

"The Jackson Hole AWOS has been maintained by FAA Technicians for a considerable amount of time. It is evident that the maintenance performed by your people is far, far superior to the services performed by the previous contract with Qualmetrics.

Since AWOS is not the most reliable weather system available, it is extremely important to our Airport, commercial air carriers serving this airport, and all general aviation pilots that we can promptly and expertly repair our AWOS when necessary. Your Technicians always provide us with that assurance, unlike the previous outside contract effort."

Because our Systems Specialists work with the NAS equipment everyday and are the only people who can certify the systems, they understand the need to exhibit caution and to communicate with others before performing any maintenance on a system. There are also rules that Congress has imposed on our work force, such as strike prohibitions, that are not imposed on contractors. These rules help to ensure the safety of the air traffic control system. Increased demand on the NAS, combined with the attrition of the current work force, make it impossible to explain why the FAA would want to hire contractors instead of permanent workers.

Until contractors can guarantee immediate restoration and quality service—which PASS maintains will never happen—the FAA must return all maintenance to its

[4] Gerald Dillingham, Associate Director, Transportation Issues, General Accounting Office, "Air Traffic Control: Status of FAA's Standard Terminal Automation Replacement System Project," March 1997.

own personnel. The idea of having anyone outside of Airway Facilities employees conducting installation and operation of systems impacting live air traffic is unacceptable. The maintenance and operation of NAS systems that are used to separate traffic or to maintain safety are inherent governmental functions, whether the FAA owns the systems or not.

MODERNIZATION EFFORTS

Any discussion on air traffic control staffing levels must include a section on modernization, for without adequate Technician staffing levels and support, FAA modernization efforts will fail. For fiscal year 1998, the facilities and equipment (F&E) budget request is a three percent decrease from the fiscal year 1997 enacted level. F&E employees are directly involved in systems engineering and design. They are critical to the agency and will play a key role in modernization. PASS steadfastly believes that cutting the F&E budget is neither safe nor responsible.

There are now 2,869 new FAA systems and equipment (designated by the agency as units) in FAA storage/warehouses. In several instances, cuts in F&E funding are cited as the reason why delivery has been delayed to the field. For example, there are currently 439 Communications Facilities Enhancement radios (UHF and VHF transmitters/receivers) in storage. The project cost is $3,736,000. The reason for delay is cited by the FAA as "F&E funding shortfalls caused by cutbacks in funding for establishment or relocation of communications facilities."[5]

Similarly, because of "partial F&E funding provided in fiscal year 1996," 64 Doppler VHF Omnidirections Range (DVOR) systems are in storage. These systems cost $108,000 each for a project cost of $6,912,000. Unless F&E is funded at higher levels, more and more new systems will sit in boxes awaiting delivery to the field. Meanwhile, the current systems will age, and modernization goals will fail. The FAA has reached a stage where incremental improvement is not sufficient.

The White House Commission on Aviation Safety and Security found that the FAA's "proposed schedule for modernization is too slow to meet projected demands, and funding issues are not adequately addressed." This has been the case for years. Since the early 1980's, the FAA's modernization program has experienced substantial delays and cost overruns.

PASS believes the FAA can succeed in modernizing the air traffic control system by building on its proven strength—its employees. The same ingenuity and perseverance that now enable the men and women of PASS to keep the NAS running is what is needed to bring the FAA into the 21st century. Instead of telling these employees—who are stakeholders in the system—how they must change to be part of the future, the FAA should be asking its employees to show the agency the future.

According to the GAO, "in organizations with more constructive cultures, employees are more likely to involve others in decisions affecting them, openly share information, and resolve differences collaboratively." In the FAA, however, "ineffective coordination has caused the agency to acquire systems that cost more than anticipated and look longer to implement."[6]

PASS employees are a vital part of developing the future NAS and are the FAA's best insurance that this new system will work as advertised. But FAA management excludes its Technicians and Controllers—who are the subject matter experts in the field and the end users of the product—from devising and developing ATC modernization solutions and plans. Instead, they are merely asked to help implement management's plan.

CONCLUSION

PASS firmly believes that the status quo is no longer feasible. The FAA simply cannot maintain the world's safest airspace with shrinking budgets and reduced staffing levels. Nor can it turn over its maintenance responsibilities to contractors, masking the decision as cosmetic cost savings. The bottom line is that contracting out costs taxpayers many times more than what it costs the government to have federal employees provide the same services.

Senator Shelby and Members of this Subcommittee, PASS urges you to mandate that the FAA immediately increase Technician staffing levels, revamp training programs, and eliminate the costly practice of contracting out. These changes will lead to increased productivity and will ensure the safety and efficiency of the National Airspace System.

Thank you for your time and consideration. I would be more than happy to answer any questions that you may have.

STATEMENT OF MONTE BELGER

Senator SHELBY. The next witness is Mr. Monte Belger. He is the Acting Deputy Administrator, Federal Aviation Administration.

Mr. BELGER. Thank you, Mr. Chairman. I do have a prepared statement, and my staff has armed me with a barrage of numbers and statistics and data, but I would prefer just to take my time to talk to you about some of the things that have been discussed this morning.

First, there is no question that there is no disagreement between FAA management and the Air Traffic Controllers Union or the PASS Union in terms of these fundamental issues that we have talked about today. No one wants to fix this problem more than senior FAA management. No one wants to fix this problem more than I. I have spent an extraordinary amount of my personal time on the New York issues. I have been to the center, I have been to the TRACON, I have visited with Congresswoman Molinari, and have tried my best to understand from the big picture where we are there. And I am not here today to appease the committee nor to tell you that everything is OK, because it is not.

Senator SHELBY. Excuse me. I hope you are not here to appease us, but I hope you are here to tell us how you can fix a problem before we have a huge airline disaster in this country.

Mr. BELGER. I am going to do that, sir.

Senator SHELBY. I believe that is part of your responsibility.

Mr. BELGER. Yes, sir.

Do we have enough controllers at the New York facilities? The answer is no. Are we satisfied with either the staffing levels or the status of the equipment in the New York area? The answer is no. We will not be satisfied, I will not be satisfied, until we reach the target levels that we have established for staffing at each one of the facilities; will not be satisfied in the equipment area until we install the new computer systems in the center, which is on schedule and on budget and will happen in 1999 at the New York Center. I will not be satisfied until we complete the installation of the terminal automation modernization in all the terminals throughout the country. That will happen starting in the 1999 to 2003 timeframe.

Are we doing all that we can? I think we are. I do not think that we can install the new equipment any more quickly than the current schedule that we have. Are we doing all we can in the staffing area? I think we are. Do we have an agreement with the Air Traffic Controllers Union on target levels for staffing at the New York Center and the New York TRACON? Yes, we do. It is in Mr. Krasner's statement, although he did not refer to it, but we have an agreement for the first time in the history of relationships between the FAA and NATCA, and we are reaching those target levels. And the data is in the statement, and I will be glad to provide specific numbers, but we are committed to meeting those target levels at the New York Center and the New York TRACON at the end of this year and at the end of 1998.

AIR TRAFFIC CONTROLLER INCREASE

We will hire this year and next year, if our budget request for fiscal year 1998 is favorably received, 1,300 new controllers. That is more than we hired in the 5 previous years combined. We have the flexibility and the opportunity now to aggressively respond to these problems. We are not just hiring people, we are doing things as was suggested by the previous panel to build a pipeline in the New York metropolitan area from which we can draw, so that we are hiring people who want to be in that area. We want to hire people who want to be there. We want to hire people who have ties there, who do not want to go there and get trained and get the grade and go somewhere else. We want to hire people who want to be there in the New York and the New Jersey area.

We instituted last year, at my direction, what we call a co-op program, working with Dowling College and the College of Aeronautics at La Guardia, through which college students will come to the facilities to work part time. They get credit for it, and we hire them when they graduate, that clearly prepares them for the future. Do we have enough people in that program now? No; but it is just getting reinstituted after it was cut years ago by the FAA. We are also expanding the college training initiative program, which is a group of universities that train controllers for us, and we are trying to get colleges in the New York metropolitan area to do that.

Senator Lautenberg correctly admonished us to just do it. I think we are doing our best to just do it, and I am committed to doing that. Senator Lautenberg suggested that perhaps one of the things that might be looked at, and I can assure you we are looking at it, is potentially readjusting some of the work load and the airspace to equitably put the workload where the people are—and we are aggressively looking at that, and that is a potential option.

Is the air traffic control system in New York/New Jersey area safe? Well, of course it is. It is absolutely safe. My daughter just recently moved to Boston after living in Montclair, NJ, for several years. She flew out of Newark regularly on her business. That is the ultimate test for me. It is safe. At the end of the day, we will be judged by how safe the system is.

Do we agree with some suggestions that were made in the first panel that the pay system for both controllers and engineers and technicians ought to be changed so that it more accurately reflects the complexity and the value of the service provided? Yes, we do. And given the flexibility that we have in the personnel reform, we are doing that. We are working aggressively with both NATCA and PASS to develop new classification standards and pay schemes that will acknowledge that an individual working at the most complex facilities ought to be paid more than one working at a less complex facility.

But I should also put a balance to this whole discussion, and then I will pause, although I could speak for hours about the things that were said this morning. We have to put some counterbalance to this discussion. At the same time we are doing those things I said, are we also, as good stewards, looking at how we can reduce and control our operating costs? And yes, sir, I can assure you that we are.

I just spent a day and a half—a full day and a half—with the National Civil Aviation Review Commission, which was chartered by the Congress to look at how the FAA should be funded in the future. They, appropriately, are very concerned about our growing and escalating operating costs. We all should be concerned. NATCA should be concerned, PASS should be concerned. I can assure you I am concerned. We have to solve these problems in a way that also controls our growing operating costs.

This is not easy, but I can assure you all, I can assure the committee, and I can assure the American public, that we are committed to doing both those things, providing the safest system that we can. I want our air traffic controllers and technicians to have the very best equipment in the world, but we also have to do it in a way that is responsible to the taxpayers, and do the best we can to control our costs.

Thank you, sir.

PREPARED STATEMENT

Senator SHELBY. Thank you, Mr. Belger. We will insert your complete statement in the record.

[The statement follows:]

PREPARED STATEMENT OF MONTE R. BELGER

I welcome the opportunity to appear before you today to discuss the important issue of air traffic controller staffing. We in the FAA firmly believe that the primary reason that the United States is able to operate the world's safest and most complex air traffic control system is because of the excellent performance of the technicians and air traffic controllers who operate the air traffic system 24 hours a day. We are committed to maintaining an adequately sized and properly trained controller work force.

During the 1980's, the FAA hired large numbers of controllers as we rebuilt the controller work force from the strike of 1981. By 1992, the controller work force had been rebuilt, and at a level of 17,982, was several hundred controllers over the controller work force staffing standard requirement.

From 1993 through 1996, the controller work force was reduced primarily as a result of our successful initiative to contract the low activity level I airport traffic control towers. Once this initiative is completed, we will have effectively reduced the controller work force requirements by approximately 1,000 for an annual savings of approximately $25M, with no adverse impact on safety. During this period, controller hiring averaged only 100 per year because we were also reassigning approximately 200 controllers per year from the closed level I towers to higher level facilities.

The limited hiring over these years exacerbated staffing imbalances among some facilities. By the end of fiscal year 1996, the controller work force was at 17,080 including 14,360 air traffic controllers, 2,162 first line supervisors, and 558 traffic management coordinators. In the same period, the other-than-controller work force was reduced 24 percent from 8,959 in fiscal year 1992 to 6,824 at the end of fiscal year 1996.

The fiscal year 1997 budget recognized that the controller work force had to start growing again because there soon would no longer be controllers available from closing level I towers, and because of increases in forecasted traffic, new equipment, training, and retirements. Starting in fiscal year 1997, we plan for several years of increases to the controller work force to keep pace with increasing air traffic activity. This plan calls for the controller work force to increase to 17,300 in fiscal year 1997, with 14,560 air traffic controllers, and our fiscal year 1998 budget submittal requests a further increase to 17,800. This means we plan to hire 1,300 controllers in fiscal year 1997 and fiscal year 1998. The 1,300 includes the 750 increase in the size of the controller work force and 550 to replace attrition expected in fiscal year 1997 and 1998.

This growth means that annual controller hiring will be 500 in fiscal year 1997 and approximately 800 in fiscal year 1998. We fully expect to meet the hiring tar-

gets for fiscal year 1997, and we ask for your support to fund our request for hiring in fiscal year 1998.

The new controller hires will come from a variety of sources including former controllers, who became eligible for consideration for reemployment after President Clinton removed the ban on their employment with the FAA, veterans, cooperative education students, and graduates of the College Training Initiative.

We are concerned about maintaining adequate staffing at some large, complex facilities such as those in the New York area. In order to encourage controllers to move to these major facilities and to retain those already there, we implemented an interim incentive pay of 10 percent at seven key facilities in the New York, Chicago, and Oakland areas. In addition, after in-depth review of staffing requirements at the New York area facilities and the Washington Air Route Traffic Control Center, we have signed agreements with National Air Traffic Controllers Association (NATCA) on appropriate staffing levels for Washington Center, New York Center, and New York TRACON. We are targeting the fiscal year 1997 and fiscal year 1998 controller hires to ensure that the staffing levels agreed to are achieved. In the first eight months of fiscal year 1997, we have hired 31, 31, and 14 new controllers in the Washington Center, New York Center, and New York TRACON respectively.

We have focused on the New York facilities in the past few years. Even though the national CWF staffing levels decreased by 5.0 percent since 1992, staffing in the New York facilities increased by 3.4 percent, a net difference of 8.4 percent.

Operational errors are up at New York Center and New York TRACON. However, past studies have shown that there is no statistical significance between staffing and operational errors. These studies have indicated the following "key factors" generally exist in operational errors:

—Sectors were not combined when the incident occurred.

—The controller was working five to six aircraft.

—The controller's last day off was usually 2 days prior to the incident.

—The incident occurred in the third hour of the workday and overtime was not a factor.

One other area I would like to touch on briefly is the controller staffing standard. The controller staffing standard has been developed and refined over many years. It uses complex algorithms that calculate the controller staffing requirements facility by facility. It considers the amount of aircraft a controller can handle, the air traffic activity, and the number of sectors of airspace in use and various shift times. It also makes adjustments for the 7-day operations and the amount of time controllers are not available for work for such reasons as sick leave, annual leave, training, medical checks, union activity, work groups, and details. Finally, it calculates staffing requirements based on the 90th percentile day. That means it provides staffing adequate to handle activity on a facility's 37th busiest day of the year.

On the national level, the staffing standard is very accurate. It is less accurate at an individual facility and we estimate the facility accuracy to be plus or minus 10 percent. That is why we primarily use the staffing standard to support budget and resource requirements at the national and regional level. Regional Air Traffic Division managers consider local facility requirements along with the controller staffing standard when allocating controllers to specific facilities. The staffing standard is updated annually with the latest information on changes in air traffic activity projections and facility characteristics.

There have been several outside reviews of the controller staffing standard. The latest review was recently conducted at the direction of Congress by the National Research Council which is part of the National Academy of Sciences. The report was completed in April 1997. Its general findings were that the strategies for sampling, data collection, and model design are geared to the development of national staffing estimates and do not necessarily provide accurate predictions of staffing requirements at individual facility levels. Although the National Research Council found that it was unlikely that the staffing standard could be modified to provide precise stand-alone estimates of facility staffing requirements, it did make some recommendations for improving the process for determining staffing requirements. These recommendations included: Strengthening the headquarters staffing estimation process; developing a uniform regional approach for estimating facility staffing; establishing a headquarters oversight process for resolving differences between regional and headquarters estimates of staffing at specific facilities; and developing performance measures for testing the validity of facility staffing estimates. We agree with most of the National Research Council's recommendations and are already taking action on its suggestions.

In summary, let me reiterate that we are committed to maintaining adequate controller staffing levels to ensure continued safe and efficient operation of the air traffic control system. Your continued support, particularly for our fiscal year 1998 re-

quest to increase the size of the controller work force to 17,800, is essential if we are to meet that commitment.

Thank you for giving me the opportunity to appear before you, and I will be happy to answer any questions.

STATEMENT OF RAYMOND MALDONADO

Senator SHELBY. Mr. Maldonado, do you have a statement to give? If you would highlight, Mr. Maldonado, your statement, the whole statement will be in the record. Do you have anything to add?

Mr. MALDONADO. Well, let me first just say, Mr. Chairman and committee members, thank you for the invitation, privilege, and opportunity to speak before you this morning. I have been employed by the Federal Aviation Administration since 1989, and I am extremely proud of the work that I do and the profession that I have chosen. Air traffic controllers are the cornerstone of what should be the safest and most efficient air traffic system in the world. While I will not say that the system is unsafe, I will say that it is not as safe as it could or should be. Of course, this all relates, in my opinion, to some of the staffing problems and equipment problems that have hindered that distinction.

My draft was submitted, I guess. I am prepared to answer questions or offer testimony in the area of equipment, delays, and certainly staffing, to the best of my knowledge.

PREPARED STATEMENT

Senator SHELBY. We appreciate that, and I am sure we will have some. We will insert your complete statement in the record.

[The statement follows:]

PREPARED STATEMENT OF RAYMOND D. MALDONADO

Mr. Chairman and committee members, thank you for the invitation, opportunity and privilege to appear before you this morning. My name is Raymond Maldonado, I am an Air Traffic Control Specialist at the Newark Air Traffic Control Tower in New Jersey. I have been employed by the Federal Aviation Administration since 1989. Today I speak before you as the Newark Tower Representative of the National Air Traffic Controllers Association.

I am extremely proud of the work that I do and of the profession that I have chosen. Air Traffic Controllers are the cornerstone of what should be the safest and most efficient air traffic system in the world. While I will not say that the system is unsafe, I must say that it is not as safe or efficient as it could or should be. Controllers are the professionals that organize and expedite the flow of air traffic, and most importantly we prevent collisions between aircraft operating in the system.

Newark Tower operates 24 hours a day, 365 days a year providing air traffic control services to the aviation customers of Newark Airport, and radar service within a 6.5 mile radius of the airport. In 1991 Newark Tower had approximately 30 Air Traffic Control Specialists, the overtime budget was approximately $40,000 and the airport conducted roughly 380,000 operations. In 1996, five years later, Newark Tower had 27 working Air Traffic Control Specialists, the overtime allocation for fiscal year 1996 was $21,800 and the airport conducted over 454,000 operations. That translates to a 10 percent DECREASE in controller staffing, a nearly 50 percent DECREASE in overtime allocations, and an INCREASE of almost 20 percent in air traffic. Mr. Chairman, please believe me when I say that a lack of air traffic controller staffing, and the resources necessary to augment these shortfalls are a recipe for disaster.

Since 1991 the FAA has conducted four separate staffing studies designed to determine the staffing needs of Newark Tower. All of the studies called for staffing levels at or above Newark Tower's current authorization. The most recent study was a collaborative effort between NATCA and the FAA. It recommended the staffing level of controllers necessary to provide the level of service expected by the users

of Newark Airport should be between 37 and 41 specialists. Although authorizations have recently been adjusted, staffing levels for full performance level controllers throughout the NY/NJ metropolitan area still remain at approximately 70 percent of the authorizations.

Newark Tower currently staffs eight operational positions. A two week study conducted by NATCA in May 1996, revealed that four of those control positions, that is one half of the positions at Newark Tower, were combined with another control position almost 12 hours each day, between 7 a.m. and 11 p.m., our high traffic period. In the fall of 1996 a Federal Aviation Administration Operational Assessment Team stated in their report "critical positions were combined during some heavy traffic periods, the CBA (radar) position was closed and service was denied", and lastly they concluded that "combining positions appears to be the standard operating practice at Newark Air Traffic Control Tower". I assure you that even during periods of moderate traffic, combining two or more control positions under the responsibility of one Air Traffic Controller is not desirable nor is it safe.

The combining of positions dramatically increases workload and drastically diminishes the level of service and safety being provided. The FAA's own "Operational Error Reduction Plan" calls for the de-combining of positions which will help accomplish increased safety and efficiency. Additionally, the FAA's Operational Assessment Team also recommended the splitting or de-combining of critical positions. In July 1996 I myself was assigned the responsibilities of three air traffic controllers. It was because of this overburden that an aircraft under my control, inadvertently entered into and flew unmonitored approximately 10 miles through the most complex airspace in the world—directly above the island of Manhattan. When positions are combined because of inadequate staffing levels, relief breaks are reduced, time on position soars, and inattention to detail occurs. No one wants or needs a fatigued controller directing his or her flight, unfortunately in the NY/NJ metropolitan area this is the case more often than not. When controllers are overburdened, the safety of the flying public is compromised.

At facilities around the country that are short staffed, air traffic services are frequently denied or reduced and ultimately the end results are delayed flights. To our aviation customers, we know time is money. However it is only through the combined efforts of adequate staffing and reliable equipment that we can work to reduce delays.

A May 30, 1997 Newark Star Ledger article cited a Port Authority Study that states "delays cost EWR airport users 100 million dollars annually. Delays at all 3 of the major New York airports are estimated to cost the users 215 million dollars annually".

Although there are many future technological initiatives and equipment installations scheduled for Newark Airport, designed to help reduce delays, many of those initiatives such as Converging Runway Display Aid (CRDA) and Terminal Doppler Weather Radar, are months if not years away from actual implementation.

Our nation's Air Traffic Controllers service the world. The impact of an overburdened system is felt far beyond the boarding gate. Members of Congress have helped to raise awareness and have been instrumental in helping correct some of the problems throughout our air traffic system. While there is a tremendous amount of work that still needs to be done in other areas such as incentives, retention, hiring and technology, I am confident that with your support and assistance we can re-establish the type of air traffic system that our flying public expects and deserves.

Once again, thank you for your time, consideration and the opportunity to speak before you today.

STATEMENT OF TOM MONAGHAN

Senator SHELBY. Mr. Monaghan, do you have a statement to make?

Mr. MONAGHAN. Yes, Senator.

Senator SHELBY. I am sure we have got some questions. Your written statement will be made part of the record, if you have one.

Senator LAUTENBERG. You are in the Kennedy tower, is that right, Mr. Monaghan?

Mr. MONAGHAN. Yes, I am.

Chairman Shelby and members of the subcommittee, I am Thomas Monaghan, of the National Air Traffic Control Association. I am a control specialist at Kennedy tower and the NATCA representa-

tive for New York/New Jersey metropolitan control towers. These are some of the issues that have been affecting towers over the last couple of years.

The understaffing at smaller towers in the region, which traditionally provided staffing for the larger towers, being so low, in some cases it has taken up to 2 years once we do identify a controller, say at a Teeterboro tower to go to a Newark tower, 2 years to get that controller to that tower. In some cases at Kennedy I think it also took about 2 years. So we are not able to respond fast enough to the outflow of controllers from the metropolitan towers. And La Guardia tower, 60 percent of the controllers there are certified. They have lost 16 controllers over the last 3 years. They are going to lose another five this year. So in some cases we are moving the problem around.

The incentives that have been often mentioned have never been in place at the control towers in metropolitan New York/New Jersey area. So we just move it. And we need to have the most experienced people at all levels of the system. The same level of safety is necessary at the airports, TRACON, and center airspace.

When I did call around, just to try to get a handle on the attrition rate at other areas of the country, it seems that at Chicago O'Hare, where the incentive is in place at the tower, they suffer on average, maybe some years 4, some years none, but an average of 2 controllers a year move into other positions; as compared to La Guardia tower out of 33 controllers losing the 16 plus 5 coming up. That has to undermine the experience level both of the controllers who are working the traffic, and as they are also training the other controllers coming in.

So you have 2-year experience level controllers teaching people just coming into the system. In this airspace, in this complexity, it suffers errors not lightly. I mean, everything is threading the needle, and you have to have people with the experience level necessary to see this.

It is not that the controllers do not have the talent. It is not that they do not have what it takes. It is that often we just keep training them and they keep repeating the same errors. And it is very frustrating to people.

Senator SHELBY. Why? Why do they keep repeating the same errors?

Mr. MONAGHAN. Because as soon as they get to the experience level, sir, they move out either into FAA management, another locality, or a radar facility on Long Island, and then we start the whole process over again.

Senator SHELBY. OK. I see.

PROBLEMS WITH AIR TRAFFIC CONTROL

Mr. Belger, I want to assure you over at FAA from my standpoint as the chairman of this subcommittee, and Senator Lautenberg I believe would agree with this, I hope so, that we are going to do on this subcommittee everything we can—everything—to see that FAA is properly funded, that there will not be a shortage of money, because safety should not be bought and sold, not the safety of our traveling public in America. Would you agree with that?

Mr. BELGER. Absolutely. I think you have been responsive.

Senator SHELBY. And to use your words, we are not here to appease you, but we are here to assure you that we are going to work together to see that that is done. There cannot be ever any substitute for safety.

I realize that you have got to have trained quality personnel, you have got to pay them, you have got to keep them any way you can once they are trained. I think the American people deserve nothing less.

Now, are the problems, Mr. Belger, that have been outlined here today by the first panel and some of the others, dealing with New York and New Jersey areas, also common to some extent around the country in some of the busy airports like Chicago, Atlanta, Dallas, Los Angeles?

Mr. BELGER. The equipment problems that have been discussed today are common throughout the entire country. The equipment in the centers is old. It needs to be replaced. And as I say, we have a plan to do that. The equipment in the radar approach control facilities is old. It needs to be replaced, and we have a program to do that. And I believe we are doing that as quickly as we can.

In my opinion, the staffing situation is probably more acute in the New York area than it is in other locations. That is not to say that we do not have some staffing shortages in other locations, but a combination of factors make it very difficult to recruit as rapidly as we would like.

RECOMMENDATION ON COLLISION AVOIDANCE SYSTEM

Senator SHELBY. Mr. Belger, on a different topic, one of the recommendations I understand was made by the National Transportation Safety Board is for the FAA to require that all cargo plains be equipped with a collision avoidance system known as traffic advisory and collision avoidance system. These systems are currently required, it is my understanding, on all passenger planes carrying 10 or more people, is that right?

Mr. BELGER. Yes, sir; that is correct.

Senator SHELBY. The need to assess whether some type of collision avoidance system should be installed on cargo planes was highlighted, you recall, last month when a UPS cargo plane came within 7 seconds of colliding with Air Force One. Can you tell us if the FAA is reviewing whether air cargo aircraft, which there are a lot of in the country and in the world, should be required to be equipped with some type of collision avoidance system, and if not, why not?

Mr. BELGER. Yes, sir; we are reviewing that. That is very active on our plate. We have several petitions from groups asking us to require the use of collision avoidance systems on cargo aircraft.

Senator SHELBY. That is just common sense, is it not?

Mr. BELGER. There are two questions: One, should we require today the existing technology, TCAS, on cargo aircraft? And I should also say there are other types of aircraft on which we do not today require collision avoidance systems, either, business jets, business general aviation, the high end of general aviation we do not require today either. There is also a new technology which I have been told that the cargo industry is absolutely committed to, which is called the ADSB, which also provides a collision avoidance

system that will be compatible with the satellite technology of the future.

But the short answer is we are reviewing that. I expect that the Administrator will make some public decision regarding those petitions very soon, and I can assure you it is high on our priority list for review.

I can also say that I have seen an accident investigation report from the instance you referred to that occurred in the Shannon, Ireland, airspace, and the conclusion of the Irish investigative authorities, from the report I saw, was there was no collision potential in that incident even if——

Senator SHELBY. But it was reported that way, was it not?

Mr. BELGER. It was reported, yes, sir. A lot of things are reported for whatever reasons not necessarily related to the facts. But yes, sir; and we take all of those incidents very seriously, and we obviously followed up and found out what the Irish authorities learned from that incident.

EQUIPMENT FAILURE

Senator SHELBY. Mr. Belger, from your knowledge of the equipment failures occurring at the New York and New Jersey facilities—maybe it is New York—is this an increasing problem, or one which your organization, the FAA, is making progress toward correcting?

Mr. BELGER. As I said, we are not satisfied with where we are, but I do believe that we are making extraordinary progress. If you recall, a couple of summers ago we had a rash of incidents in the centers, a very significant one in the New York Center, that were caused by power outages. We have since that time replaced what we call a power conditioning system, which is nothing more than a super complex power conditioning system much like you would have on your computer to purify commercial power. In every one of the centers we have now done that. Those new systems are in place, and they are there.

We had problems also several years ago in the summer with five centers in particular that had the very oldest radar processing computers in the centers. The Administrator at that time made a decision to do a quick $60 million replacement program of those computer systems. That has now been done. This new interim computer system is in place in the five centers.

Senator SHELBY. But you do have backup power?

Mr. BELGER. Oh, absolutely. Absolutely, we have backup power.

Senator SHELBY. So if you had a power shortage, it should not affect you?

Mr. BELGER. I am one who says that any time we have to go to a backup system there is some degradation in service, we lose some capability. But I will also tell you that I think the backup systems are such that we will not let it get to the point where it causes a safety problem.

AIR TRAFFIC CONTROLLERS

Senator SHELBY. We received testimony this morning from the controllers at the New York facilities. They are working an extraordinary amount of overtime. Does this mean that most controllers

at the New York area and New Jersey facilities are working 50 to 60 hours a week, or more, and if so, is this safe? This is a highly stressed job.

Mr. BELGER. It is an extraordinarily important and stressful job. I think the scenario that we are seeing at New York Center is a safe scenario, as I have said before. I have asked Mr. Morgan, who is the Director of our Air Traffic Service, to look closely and analyze the staffing and the overtime situation at the New York Center, and with your permission I would ask him to answer the question more specifically.

Senator SHELBY. Mr. Belger, one last——

Mr. BELGER. I am sorry. I have asked Mr. Morgan to look at that very closely. With your permission, I would like for him to answer specifically.

Senator SHELBY. Let us hear him.

Mr. MORGAN. Good morning, Mr. Chairman.

In looking at the overtime situation at New York Center, what we have found is that we do use a significant amount of overtime. The two primary reasons for that overtime usage is to enhance our training capability. It takes more people when you use controllers to train than it does to just operate the facility.

Second, we have an agreement with the National Air Traffic Controllers Association to be able to allow them a certain period of time through the summer months that they are guaranteed leave, and it is our obligation, our commitment, to make good that memorandum that we have with them.

The particular overtime usage that we have, what we find is that the overtime is usually a voluntary type activity with the controller work force. At times it is mandated, but it is usually volunteers who utilize the overtime. When they are assigned 6-day workweeks, what we have found is that 60 percent of the controllers actually work a 6-day workweek when they are assigned. Others will combine that 6-day assigned workweek with either a day of annual leave or, if required, a day of sick leave, and what we find is that the other 40 percent are working less than a 6-day workweek, even though they are assigned that period of time.

Senator SHELBY. We appreciate that.

Mr. Belger, some airports that do not currently qualify for a contract tower have suggested a call-sharing partnership in which the FAA and the local airport would split the annual operating costs of a contract tower. This type of partnership between the FAA and the local airports could enhance aviation safety at a minimum cost to the FAA. What are your thoughts about this?

Mr. BELGER. I am very much in favor of those types of arrangements.

Senator SHELBY. This would also affect a lot of medium-sized cities.

Mr. BELGER. I am very much in favor of those types of arrangements, particularly if it will provide a service in the form of an air traffic control tower that we otherwise could not provide because it does not meet our criteria.

Senator SHELBY. Senator Lautenberg.

Senator LAUTENBERG. Thanks, Mr. Chairman.

Mr. Belger, and all of you, I am sorry that everybody did not have the opportunity to testify, but we have your statement in the record, and that will be examined thoroughly, and I tell you that we only lost the opportunity to hear the charm of your voices.

Senator SHELBY. And the substance of their statement.

Senator LAUTENBERG. Well, that is going to be in the record, I hope.

Senator SHELBY. That is right.

AIR TRAFFIC CONTROL SCHOOL

Senator LAUTENBERG. I want to ask you, Mr. Belger, you have heard some of the concerns expressed, and one of the things that was kind of addressed turkey roost was this school in Oklahoma. Now, to be candid, you and I both discussed this in a meeting that we had, and you gave me a reason as to why that facility was not being used. Can you, in short form, tell us why? And you did say that you are now using local educational institutions to try and grow controllers in the vicinity in which they are going to live after they get their jobs. So tell us about that.

Mr. BELGER. Yes, sir; from 1992 until this fiscal year, we hired into the controller work force, new controllers, on the average of less than 150 a year. Most of those that we did hire during that period were graduates of the college training programs that I spoke about, and those graduates go directly to the facilities where they begin on the job training, because they have already been trained in the universities on the basic principles of air traffic control.

The other category of folks that we hired from during those years were former military controllers and others who did not have to go through the basic training. We literally hired virtually no one. I will not say no one, but virtually no one at the entry level where they had to come up through the FAA's traditional training program. So that is the reason that we did not have an active ongoing initial training program at the academy.

I do believe that the reference in the first panel to closing down the training academy, although it was not perfectly clear to me, I do believe the reference was to airway facilities training for our technicians and engineers, and the decision was made earlier this year because of funding priorities to cancel some training courses—cancel all training courses. When I learned about that decision in a matter of 2 days we found the money and turned those courses back on.

But the short answer to your question is we have not had an initial training program because we have not been hiring people from those sources.

Senator LAUTENBERG. You have not been hiring people. Is it a necessary part of your development for controllers to have that facility?

Mr. BELGER. No, sir.

[Additional information follows:]

Since fiscal year 1992 the demand for controller trainees entering the system, who require developmental training, has been very low. The FAA has been meeting the hiring requirements through the College Training Initiative (CTI) program and, for the past couple of years, with rehired PATCO controllers.

During this same timeframe we have had a continuing (at times an increasing) need to provide advanced or post journeyman level training. While the CTI program

has met the demand for new hire training, the Academy has met the need for other types of training as well as courseware development and maintenance for ongoing resident courses at the Academy and field developmental training.

As the demand for increased hiring rises we plan to expand the CTI program to facilitate hiring from the local commuting area. And, we are developing a systematic approach for hiring ex-military controllers to take advantage of their background in air traffic control so that training time will be reduced to a minimum. We also plan to "spool" the Academy up to accomplish new hire developmental training. Our goal is to accomplish developmental training in a cost efficient manner while ensuring that all training needs are met.

Senator LAUTENBERG. How much does it cost to operate it?

Mr. BELGER. I can provide that sir, but I do not have that data with me.

Senator LAUTENBERG. Does anyone have it?

[No response.]

Mr. BELGER. We certainly can provide it.

[The information follows:]

The following information is regarding the Air Traffic Division only—not the FAA Academy as a whole. The cost to operate the fiscal year 1997 Air Traffic Training Program (AMA–500) includes the following: $3,312,000 is allocated for the per diem/travel for students; and $14,691,000 is allocated to support 126 FTE's and about 110 contractor FTE's.

Listed below is a partial list of accomplishments that will be made with the fiscal year 1997 dollars: 2,000 resident students trained; 24 percent initial qualification/developmental controller training 76 percent advanced/post journeyman level training; development/maintenance of 31 resident courses; development/maintenance of 36 non-resident conventional courses; development/maintenance of 20 CBI courses; development of the Precision Runway Monitor (PRM) system training simulator; development of site specific tower simulator capability; and development and support of the Technical Center tower simulator.

HIRING OF AIR TRAFFIC CONTROLLERS

Senator LAUTENBERG. For the information of the people within our voice and those who will examine the record, the fact is that it was a conscious decision not to reduce the number of controller recruits, but rather a decision to try and expedite better training and more familiarity with the area where a controller trained finally would be assigned. Is that the right phrase?

Mr. BELGER. That is true in part. The other fact is because of a variety of reasons we just were not hiring.

Senator LAUTENBERG. Now, you were not hiring because you did not want to or because you did not have them to hire?

Mr. BELGER. We did not have the money. We did not have the resources to hire more.

Senator LAUTENBERG. But you were hiring controllers during this period of time.

Mr. BELGER. Like I said, on the average of 150 or so, roughly, during that period. Now, I do not want to mislead. Do not let that statement that I said, we did not have the money, be any implication that I am blaming anybody. It is just that that is where we were.

Senator LAUTENBERG. I think it is important to understand what took place.

Mr. BELGER. That is where we were.

Senator LAUTENBERG. You said that advances in technology have brought about the need for fewer controllers to handle increased air traffic. What kind of advances are we talking about?

Mr. BELGER. If I said that, I was wrong. I am not sure I said that.

First of all, let me back up. If you go back to 1981——

Senator LAUTENBERG. I am sorry. No; you did not say it.

Mr. BELGER. Yes, sir; thank you. I do not think I agree with that.

Senator LAUTENBERG. It was Mr. Hinson. I just was testing your memory. [Laughter.]

It was Mr. Hinson who I wrote to, and I expressed concern about the decline of the size of the air controller work force and so forth. In response, he cited the improvements in technology, and I just wonder whether you can specify whether in fact maybe that statement was accurate at one time and not now.

Mr. BELGER. I certainly do not want to disagree with Mr. Hinson, the former Administrator, and so I would have to look at the context. But there have been improvements in technology which to some extent—in my opinion a very small extent, though—have improved our productivity over the years. The big increases in productivity over the years, if you go back to 1981, I think are the result of a better traffic management capability that we have today than we did in 1981.

But let me answer your question for the future. People talk about productivity, they talk about how are we going to be more productive in the future. The fact of the matter is the air traffic control work force today is extraordinarily productive—extraordinarily productive.

Senator LAUTENBERG. Have they picked up their capacity to handle the job significantly?

Mr. BELGER. Absolutely. Absolutely.

Senator LAUTENBERG. Is there a measurement by which we could——

Mr. BELGER. Yes, sir; I do not have it with me.

Senator LAUTENBERG. Is it 10 percent, 20 percent, or is it 26 percent?

Mr. BELGER. I will not state a number because I honestly do not remember, but I have a chart that shows operations per controller, and it shows it steadily going up.

Senator SHELBY. Would you furnish that for the record?

Mr. BELGER. Yes, sir; absolutely.

[The information follows:]

The attached charts show operations per controller work force (CWF) and operations per air traffic control specialist (ATCS). The data are presented for air route traffic control centers and airport traffic control towers. Data are actual for fiscal years 1993 to 1996 and estimated data for fiscal years 1997 and 1998.

The operations data for airport traffic control towers include instrument operation totals for air carrier, air taxi/commuter, general aviation, and military operations.

The air route traffic control center data include the number of instrument flight rules aircraft handled for air carrier, air taxi/commuter, general aviation, and military.

The CWF consists of air traffic control specialists (ATCS), first-line supervisors, and traffic management coordinators (TMC).

For May 1997 the CWF numbers were:

ATCS's	14,253
First-line Supervisors	2,208
TMC's	583
Total CWF	17,034

Mr. BELGER. Now, I will say, though, for the future, when we get this new infrastructure in place, when we get the new computer systems in the centers and we get the new computer systems in the terminals, then we will be able to, from a software standpoint, add a lot of functional capabilities which will have enormous productivity improvements. And when I say productivity improvements, I do not necessarily mean fewer controllers, I mean the ability to handle more aircraft.

OPERATIONAL ERRORS

Senator LAUTENBERG. You said earlier, and I just want to confirm, we have a larger number of operational errors than we have had in the past. Does it challenge the integrity of the system? Is it a modicum or a lot less safe than it was 10 years ago, 12 years ago? I am asking you that in the context of increased traffic, more activity, not only increased traffic but the controllers are concerned in the towers about ground movements and trucks on the airport, et cetera, et cetera. So with that, tell me.

Mr. BELGER. Well, a couple of facts first. If you look at operational errors nationwide first, for example, in 1996 there were 760 operational errors, last full year. The previous year there were 778. The previous year, 790. So you see a gradual decrease in operational errors. Now, that is in spite of increased traffic. So the rate of operational errors per 1,000 or 100,000 movements is going down, and that is a good trend. That is a very good trend. The air traffic control system is safer today than it was yesterday. It is safer than it was 10 years ago. It will be safer tomorrow because of the new equipment and things that are being added to the system.

It is also more complex. With increased operations comes increased complexity. So the challenge to our air traffic controllers and the challenge to us is to keep up with that. And we will not, as we have said repeatedly, we will not be able to keep up from an efficiency standpoint if we do not get these tools in place to keep up with an industry that is growing dramatically.

If you look at Newark, for example, for years publicized as one of the most delayed airports in the country, it is also today one of the fastest growing airports in the country. That presents a tremendous challenge.

STAFFING OF AIR TRAFFIC CONTROLLERS

Senator LAUTENBERG. It does, and I was on the Pan Am 103 study, and I have spent a lot of time with the information about TWA 800. The Pan Am 103 study, Senator D'Amato and I shared the investigation, we were in Lockerbie, Scotland, and we are very much concerned. And I fly a lot in the second seat, and I test the control system by talking every now and then. I get someone who sounds like they are talking a different language than I am, but maybe that is the way I sound to them.

But I can tell you, Mr. Chairman, and I fly through a busy space, I get quick response, I get lots of good alerts, traffic here and traffic there and where they are, and there is plenty of traffic around. I have problems spotting it sometimes, but they are letting me know that it is happening. And I come down to this: Can we continue to

overload—let me modify that—to load the system up without creating a condition that might have an occasional operational error? Not accident. Not accident. Because what we are doing is satisfying the public demand.

I can tell you that shortly after the accident, Mr. Chairman, Pan Am 103, known to be sabotaged, people were making commitments like the alter promises, I call them. Oh, I do not mind getting to the airport 2 hours and waiting. No, sir; if that plane is going to be safer, that is what I want to do. And when my kids are going to travel, I want them to be there 2 hours. And that lasted about 2 weeks, Mr. Chairman, because pretty soon people wanted it just the way they loved it—get your baggage to the curb, have the skycap take it away, get in the airplane, 5 minutes left to go, hey, that was not bad, yesterday I made it by 3 minutes.

The fact of the matter is that people make demands of the system. And I say to you—and I do not put this as a question, I do not want to put you on the spot. If we had less traffic, then obviously the work force, et cetera, could accommodate this with a significant breadth of comfort. But nobody wants to say that. Nobody wants to suggest that we are going to say to the business people, the recreational travel, the school traveler, that OK, you are only going to be able to fly three times a day Boston to New York, or three times a day Washington to New York.

So we are demanding an awful lot, and I think part of that has to be included in the discussion so that we know what is taking place.

Mr. Maldonado, between 1990 and 1996 Newark's air traffic jumped 32 percent while controller staffing decreased by 10 percent. Last year at this time the authorized level for controllers was 27. This year, however, the authorized level is 34. Now, I have assurances from FAA that Newark will be fully staffed by the end of September. Do you think that 34 is the right number of controllers for the Newark tower?

Mr. MALDONADO. Well, I am glad you raise that point. Mr. Belger mentioned that Newark airport is one of the fastest growing airports in the country. From a working air traffic controller's standpoint, I can tell you that that is very true. That is true.

Between 1991 and 1996 there have been approximately four staffing studies, staffing studies which were designed to determine the staffing needs for the airport at that time. One of those studies was a collaborative effort between the FAA and NATCA. That was the most recent one, and that was the only study that took into account future demands of the airport. That report stated that the need for air traffic controllers would be somewhere in the area of 40, or upward of 40, 41 controllers.

Senator LAUTENBERG. So even if we were able to be staffed at the current suggested levels, you think that we would actually need more than that target?

Mr. MALDONADO. Absolutely.

Senator LAUTENBERG. Mr. Belger.

Mr. BELGER. The target, as you accurately stated for Newark, for this year is 35. There are actually today 31 on board.

Senator LAUTENBERG. Thirty-one?

Mr. BELGER. Thirty-one on board. These are air traffic controllers. Now, it does not consider supervisors or others, 31 versus a target level of 35. And we have committed to you that we will meet that 35 by the end of this fiscal year.

Now, given the number of folks that we will hire next year, assuming our budget request is favorably received, we will have the ability to increase staffing at airports and at approach control facilities and at centers where the traffic justifies it. And if need be, we will do that.

Senator LAUTENBERG. So then you are not locked in at 34, 35?

Mr. BELGER. Oh, no, sir; no.

Senator LAUTENBERG. You could agree with Mr. Maldonado that maybe 40 is the required number to manage what we have got there?

Mr. BELGER. I will certainly agree to look at it, agree that air traffic will look at it with the local employees, who obviously know it better than we do in the headquarters, and make the right decision.

Senator LAUTENBERG. Well, we will take a look together, because I want to keep it in mind, and I think we ought to do that.

Yes, Mr. Maldonado.

Mr. MALDONADO. I would like to just provide you with the most current numbers. Right now Newark tower has 33 air traffic controllers in the building. Twenty-five of those are journeymen or full performance level controllers. Eight of those are training.

Senator LAUTENBERG. How many of those are up for retirement in the next couple of years, do you know?

Mr. MALDONADO. I believe approximately four. And I am sorry, that is within the next—I believe within the next 5 to 10 years, approximately four of those.

Senator LAUTENBERG. Oh, so that situation is manageable.

Mr. MALDONADO. Yes.

Mr. BELGER. Thank you. My data was the end of April, so you are right. Thank you for being more accurate.

Senator LAUTENBERG. We will have a chance to chat, as we do over the year, and I look forward to working with you, and I would say to all of you who work for FAA in the towers, either in inspections or what have you, you do a good job. I want you to keep on doing a good job. I want you to be honest if you have criticisms, if you have complaints, speak up, because it is the responsibility that you have. And barring anything else, we are going to try to give you the resources, we are going to try and give you the equipment, try and give you the process that you can operate by.

Mr. Brown, did you want to say something?

STATEMENT OF HENRY BROWN

Mr. BROWN. Yes, Senator; if I could impose myself upon the panel for just a second. I came down to testify in front of this esteemed group, and have not had the opportunity to do that, and I understand my written testimony will be placed within the record.

Senator SHELBY. Absolutely.

Mr. BROWN. But I feel my testimony in front of you would take on a different flavor, and it is unfortunate at this point that hear-

ing the questions and the responses from the other members at the table that my testimony would change dramatically at this point.

I would like to say that it seemed to have taken a decidedly air traffic controller turn. I am a technician. I am kind of the lowest person on the food chain, where the rubber meets the road, and I think it would have been beneficial to this group and this body to hear what I have to say.

Senator LAUTENBERG. I want to say this to you: I listened very carefully to what Mr. Johnson said, and I looked at his testimony, and we will, I promise you, look at yours. The staff will review it.

I use the term controller as a generic thing. Forgive me. I recognize that the technicians—today we heard about a power outage up in New York—I do not know whether that is true, Mr. Belger—yesterday a power outage here. You folks have a responsibility to work with those, have you not?

Mr. BROWN. Yes, sir; and I wanted to make comment about the answer to the power outage that was up in New York, because I am an environmental systems specialist. That is my job. I am a critical power systems specialist.

Senator SHELBY. Mr. Brown, would your testimony disagree with Mr. Johnson's testimony in any way?

Mr. BROWN. No, sir; I do not.

Senator SHELBY. What did you want to say?

Senator LAUTENBERG. Because now you have piqued our curiosity.

Senator SHELBY. Absolutely. [Laughter.]

Tell us what you want us to know. This is why you are here.

Mr. BROWN. Most of this has been covered by the rest of the members of the panels. From a purely New York perspective, and I appreciate the fact that Senator D'Amato and Congressmen Forbes and King came up to visit us to discuss this issue, we are running 40 percent under staff in the systems specialist area.

Senator LAUTENBERG. You have 60 percent of the people you need, you are saying.

Mr. BROWN. We have 63 percent, actually. These are the people that keep the equipment running for the air traffic controllers, and I would like to give you a visual, and the visual would be that you are flying in from Florida, you have come from visiting your mother, you are in thunderstorms, you have—I was buoyed by the fact that Mr. Belger said that he has agreed with NATCA to go ahead and make sure that their staffing needs are met, but we do not have that agreement with PASS and Mr. Belger, but you are flying into New York and you are in thunderstorms and you are reading the paper and you have got a fully staffed air traffic controller facility and they are handling traffic, and then they are looking at nothing. They have no scopes, they have no communications with the aircraft, and you are on that airplane, and it is 4:15 in the afternoon and it is a Friday afternoon, which is the busiest air traffic time in the New York area.

That scenario, we had. We had that scenario on May 25, 1995, when we lost one-third of the radar scopes at New York Center and we lost one-third of the communications to the aircraft for an entire 15 minutes. An aircraft traveling at 350 miles an hour goes a long way in 15 minutes. The saving grace to that problem was the fact

that it was late at night, there was very low air traffic, we managed to combine sectors to pick up what we needed to get, so we did not really run into a problem. Luck saved us there.

We are on the verge of being out of luck, and that is the point I am trying to make. If we have fully staffed air traffic controllers——

Senator LAUTENBERG. What do we have to do to correct that? Have back up—redundant power systems? What do we have to do?

Mr. BROWN. It had nothing to do with the redundant power system. The power system that failed was the brandnew ASEPS power system that has been installed. I was a member of Senator Paul Simon's blue ribbon report panel on that particular incident, and we made recommendations and I made recommendations as a specialist in that field on what needed to be done. Those things were not done. There are modifications that need to be made to that system.

Senator LAUTENBERG. I would ask you to submit your recommendations to this committee.

Senator SHELBY. We would like to hear it. If they were not done, we want to know why they were not done.

Senator LAUTENBERG. I used to run a computer company, and we had generators that were never used, but were always there in case we needed them, and when you are talking about sitting up there and not being able to get a response that says I do not know where you are, what is your altitude, where are you, what is your heading, well, here I am, and you are trying to figure out with a pencil and piece of paper where the other guys who were calling in almost screaming the same thing.

I just want to ask, if I may——

Senator SHELBY. Go right ahead.

REDESIGN OF AIRSPACE

Senator LAUTENBERG. Mr. Barger, thanks very much for coming and your patience. You have said that a comprehensive redesign of the airspace around the city, around New York/New Jersey, holds the greatest promise for improvements and minimizing delays at Newark. Now, how can the redesign of the space improve the air traffic capability and reduce delays? Would a redesign of the airspace automatically trigger a new series of outcries from surrounding communities regarding air noise?

When he finishes, Mr. Maldonado, listen carefully because I am going to ask you. We need to do this in a hurry because the chairman has been too gracious, and he is going to run out of patience.

Mr. BARGER. Senator, I appreciate the question. Really, from Continental's perspective, certainly the staffing issue has been discussed in the first two panels today. That was the first item we put forth. And also, we have touched on technological advancements, some that are out there today, some that are developing. That is in the testimony, as well, that we believe makes a great deal of sense, that the FAA take a very hard look at in terms of increasing technological capability in the Northeast region, specifically at Newark Airport.

Along those lines, a third piece, and everything has to be done in terms of partnering and working together, taking a comprehen-

sive look at the airspace to allow for things such as new technologies, which would again increase efficiencies.

Senator LAUTENBERG. That would shorten the space between aircraft, right?

Mr. BARGER. Yes; absolutely, it would. And we have certainly seen some advancements with, for example, global positioning. We are certainly seeing advancements with aircraft situational display.

Senator LAUTENBERG. How would that make a difference in the use of the airspace? I mean, here we are, now the power of the ground control—not the ground control, but the TRACON still has the airplane, and they know where they are.

Mr. BARGER. All of it really creates greater efficiency. And when we take a look at Newark Airport, just a clarification, we are actually at a level of operations at Newark Airport right about 1,450 per day that actually there used to be about 10 years ago, before some consolidations 10 years ago. So really, taking a look at the airspace in conjunction with technology and staffing, it really just creates better efficiencies and just tighter paths of aircraft up in our region.

Senator LAUTENBERG. Is a longer runway going to help?

Mr. BARGER. Well, a couple of things, and you touched on noise, and I certainly do not want to let that go away, because really——

Senator LAUTENBERG. I cannot.

Mr. BARGER. Absolutely—the whole issue of redesign also would take that into consideration, as well, combined with the new generation aircraft which is a quieter aircraft, and so there are many pieces that have to be taken in combination.

And just your comment on the longer runway, the extension certainly will help in terms of our runway 4 left 22 right. We look forward to expanding the outboard runway at some point in the future, as well.

Senator LAUTENBERG. Thanks, everybody.

NEW YORK TRACON INCIDENT

Mr. BELGER. Could I take less than 1 minute to respond to your question in the sense of full disclosure? We did have an occurrence in New York this morning. It was at the New York TRACON, and I will tell you what I know based on the note I was handed when we came up here, so that is all I know.

We were testing the new converging runway display aid [CRDA], which is a new software program we are trying to install to be used at Newark to improve the sequencing and spacing for arrivals. We were testing it at the TRACON. There was a problem as a result of the testing that we were doing, and that caused us to lose some of the capability.

I do not know any more than that at this point, but I can certainly give you all the details.

It was a software problem.

Mr. BROWN. Mr. Chairman, if I may beg your indulgence for 1 minute, please.

Senator SHELBY. Go ahead.

Mr. BROWN. The FAA announced this morning they are going to hire 100 new controllers in the New York area. That is four times as many as they are going to hire for 1998 in systems specialists

technicians. They are going to hire 1,300 controllers in 1998. They are going to hire 25 technicians.

Our pipeline is absolutely dry. We have nobody out there training in the technician area.

Senator LAUTENBERG. Mr. Brown, you are invited to come to my office—not at this moment—make an appointment, come in, if Senator Shelby——

Senator SHELBY. I will be glad to see him, too.

Senator LAUTENBERG. We will join in, and we want to talk to you. So follow on.

Senator SHELBY. We want to make sure that you, the technicians that make all the equipment run and keep it up and everything that goes with it, have the training and the personnel to make and feed the whole controller system.

Mr. BROWN. Yes; which is our need so we can supply the product we are supposed to supply to the air traffic controllers.

Senator SHELBY. Absolutely, because without you, they will not be able to function.

Mr. BROWN. That is correct.

Senator SHELBY. Thank you, gentlemen.

PANEL 3

NONDEPARTMENTAL WITNESSES

STATEMENTS OF:

CHARLES BARCLAY, PRESIDENT, AMERICAN ASSOCIATION OF AIRPORT EXECUTIVES, ALSO REPRESENTING AIRPORTS COUNCIL INTERNATIONAL

PHIL BOYER, PRESIDENT, AIRCRAFT OWNERS AND PILOTS ASSOCIATION

EDWARD BOLEN, PRESIDENT, GENERAL AVIATION MANUFACTURERS ASSOCIATION

INTRODUCTION OF WITNESSES

Senator SHELBY. Our last panel will be industry representatives, Mr. Charles Barclay, president, American Association of Airport Executives; Mr. Phil Boyer, president, Aircraft Owners and Pilots Association; and Mr. Edward Bolen, president, General Aviation Manufacturers Association. Mr. Barclay is also representing the Airports Council International here today.

Gentlemen, I know it has been a long morning. I think we have had a spirited hearing and a well-attended hearing, perhaps an intense hearing. All of your written testimony will be made part of the record in its entirety. You have had the benefit of the other testimony. If you will sum up what you want to say as briefly as possible, I think we would appreciate it.

Mr. Barclay, please proceed.

STATEMENT OF CHARLES BARCLAY

Mr. BARCLAY. Thank you, Mr. Chairman. I just would like to make two points about our testimony, and the first is to try to put the AIP request that we have before the committee in perspective.

The major cost driver for airports, of course, in the system is how many passengers there are. In the past 5 years we have seen passengers grow by over 20 percent. That is over 100 million new passengers in the system, while we have decreased our investment in airport infrastructure by over 20 percent.

In the next 5 years we are looking at another 165 million passengers coming into the system, but we are looking at an FAA request for a 31-percent decrease, on top of the 23-percent decrease we have had in the last 5 years.

Senator SHELBY. What does that mean? What does that mean, Mr. Barclay?

Mr. BARCLAY. We have gone from $1.9 billion down now to $1.45 billion, and thanks to the committee, they held it up there last year. The administration is saying take that down to $1 billion, but we are going to wind up, over that 10-year period of time, with the

equivalent of the population of the United States added onto the existing system flying.

Senator SHELBY. Tell the American people, and they will be watching this now, what this means, though. What is the significance of this?

Mr. BARCLAY. Right. And that is part of the perspective we want to build. The second largest economy in the world fits in a land mass the size of New England. Japan can use roads and railroads to run their internal economy.

Senator SHELBY. But we cannot.

Mr. BARCLAY. The United States, four time zones wide, has to have a high capacity, highly efficient air traffic control and airport system, or we simply cannot move goods and people and resources to compete.

Senator SHELBY. Our economy will not function without air.

Mr. BARCLAY. And that relative importance to us is going to get more important as more products speed up to keep up with semiconductor product cycles. So the speed of movement is driven for us by our economy.

We are investing less in infrastructure than any other G–7 country. And one of the points we have tried to make to the folks on the Budget Committee is that if you reduce the Federal deficit at the expense of creating an infrastructure deficit you have not done future generations any good at all.

Senator SHELBY. Mr. Barclay, let me just agree with you on what you are saying. We cannot afford to do that. We will not only reach a point and probably have diminishing returns. It is foolish. It is very foolish not to build the infrastructure, including air safety and everything that goes with it, is it not?

Mr. BARCLAY. Absolutely. We have to leave future generations the tools to create wealth in their society and to compete in a world economy. And in fact, most economists will tell you, the good type of debt to leave future generations by any country is debt for facilities that create wealth over the term of their indebtedness.

Senator SHELBY. But we are not creating debt here. We have got the money. It is a question will the Congress have the will to spend it in the right way, and the right way is always infrastructure and safety, is it not?

Mr. BARCLAY. Absolutely. Let me give you some comparisons, Mr. Chairman. The Government of Malaysia at Kuala Lumpur for one new airport is spending $3.8 billion. Munich, for one new airport, spent $6 billion. The Government of Hong Kong, a country with one-fiftieth of our economy, is spending $25 billion for one new airport, while we are sitting here debating a $1 to $1.5 billion program for 3,300 airports nationwide, after we have just discussed how important this capital system is to running our whole economy.

So if you just look at the scale of things, this perspective is very important to try to get through to the whole institution of Government. We know this committee understands that.

Our specific request is to please keep AIP as high as possible, at least to this year's level. We know that is difficult in this atmosphere, but the 31.5-percent request of the administration just will not work. Small airports in particular will be devastated. But

things like the noise program will be severely slashed, and it is that kind of program that we need to help get us the capacity at the larger airports, and from a safety point of view and a security point of view, the Gore Commission had recommended $500 million more in spending for airport security, but then the administration reduced the request for AIP by $500 million, and that just does not make sense.

Senator SHELBY. It does not make any sense.

Mr. BARCLAY. GAO found that for safety and security alone each year the needs are about $1.4 billion.

Senator SHELBY. But that is the least thing we owe to the American people, and the people from other countries that are coming to this country, and thinking they are coming safely. We should make sure they are safe, should we not, to the best of our ability?

Mr. BARCLAY. Absolutely, Mr. Chairman.

Thank you.

PREPARED STATEMENT

Senator SHELBY. Thank you, Mr. Barclay. We will insert your complete statement in the record.

[The statement follows:]

PREPARED STATEMENT OF CHARLES M. BARCLAY

Mr. Chairman and members of the subcommittee: I am Charles Barclay, President of the American Association of Airport Executives. I am pleased to be here today to present the views of AAAE and the Airports Council International-North America (ACI–NA) regarding fiscal year 1998 appropriations for the Federal Aviation Administration (FAA).

ACI–NA's members are the local, state and regional governing bodies that own and operate commercial service airports in the United States and Canada. ACI–NA member airports serve more than 90 percent of the U.S. domestic scheduled air passenger and cargo traffic and virtually all U.S. scheduled international travel. AAAE is the professional organization representing the men and women who manage primary, commercial service, reliever and general aviation airports which enplane 99 percent of the passengers in the United States.

To begin our testimony, we would like to thank this subcommittee, for its efforts on last year's bill. We recognize that the subcommittee was faced with the very difficult task of allocating too few federal resources among too many competing demands. We also want to express our gratitude for the full committee's decision last year to increase the AIP allocation from $1.4 billion to $1.46 billion after $60 million in increased outlays were made available as a result of the Congressional Budget Office "scoring" of the measure. Last year's enacted level for the Airport Improvement Program (AIP) of $1.46 billion represented a $10 million increase over the previous year. The fiscal year 1997 enacted level of $1.46 billion represented the first time in five years that the program received a funding increase, however modest. We recognize that in fiscal year 1998, you will be faced with a similarly difficult task in allocating resources.

Your task was not made any easier by the submission of the Administration's proposed aviation budget for fiscal year 1998. Of particular concern to the airport community is the proposal to reduce funding for the Airport Improvement Program by $460 million in a single year—a 31.5 percent reduction! This massive reduction in funding for airport safety, security, capacity and noise projects directly contradicts the Administration's aviation safety rhetoric. To further confuse the situation, less than one week after the submission of this budget request, the White House Commission on Aviation Safety and Security, headed by Vice President Gore, recommended spending an additional $500 million over five years on aviation security capital projects. We have yet to understand how these funds would be made available and from what source.

For the past two years, the Administration has recommended an artificially low AIP request and Congress has moved to increase funding for the program above the Administration's request. Unfortunately, Congress must once again restore funding

beyond the Administration's request if the AIP program is to remain viable and the safety and security projects that are needed across the country are to move forward.

INVESTMENT IN AIRPORT INFRASTRUCTURE IS VITAL

In order to achieve the goal of balancing the federal budget by 2002, Congress must continue to make difficult choices regarding hundreds of programs throughout government. Without significant entitlement reform, this task moves from the category of extremely difficult to nearly Herculean. Airports agree that as a part of this process, every program in the federal government needs to be "scrubbed" to ensure that not a single federal dollar is wasted and that the return on investment of federal funds is as significant as possible. We believe that funding airport infrastructure should, and does, score very high on those measures. But we must also remind the Congress, that aviation dollars are supposed to be dedicated fees paid into the aviation trust fund by the passengers and other users of the aviation system for the purpose of funding capital investment in a national aviation system. Therefore, every effort should be given to fully spending these revenues for the airport and air traffic control improvements that are desperately needed.

Airports are "economic engines" that generate and support local economic development by providing complete transportation services, stimulating business activity and investment, and creating jobs. As an example, Mr. Chairman, there are 15,000 jobs on or within 2 miles of the Huntsville International Airport and 28,600 indirect jobs. This example, of course, is repeated throughout the country many times over.

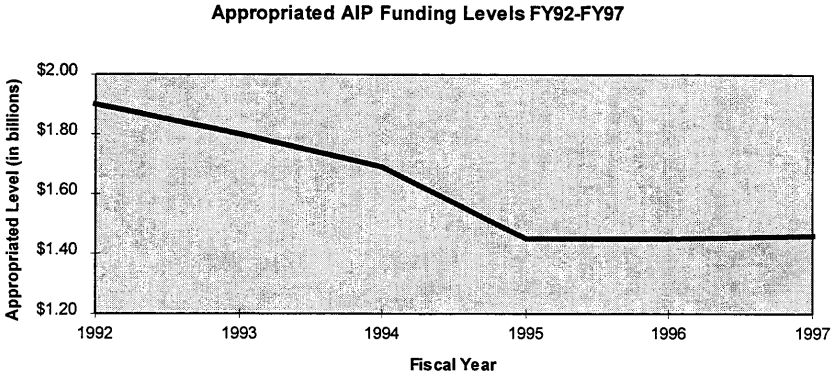
Today, the air transportation system is the linchpin of our national and local economies, essential to the safe transportation of people and goods, both domestically and internationally. As we move toward global economic competition, airport capacity in the United States is increasingly critical to our national economy. Germany and Japan may be our largest economic competitors, but in terms of size and geography, each can produce goods and services internally with modern systems of roads and railroads. The United States, due to its size and geography, must have an efficient, high capacity airport system to move its people and resources in order to compete. Ironically, we are in danger of seriously under-investing at a time when we can least afford it. With the expenditure of discretionary funds so constrained by the federal budget, we as a nation should maximize those expenditures on investments that will help our economy grow and on aviation facilities that will be available for use today, tomorrow and for years to come. We must build the infrastructure that will allow not only our generation, but our children and grandchildren the opportunity to compete and prosper in the global economy.

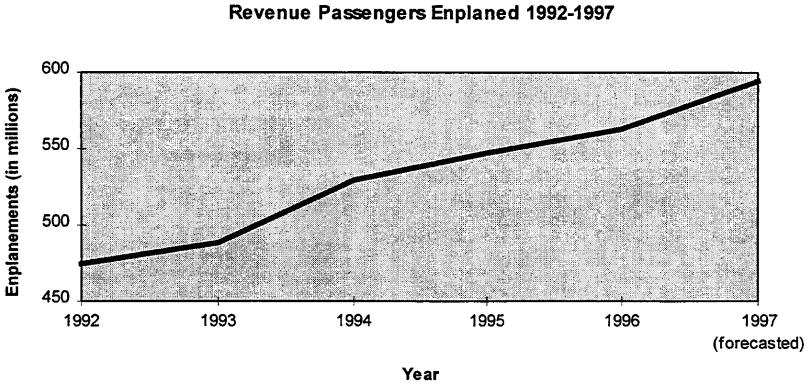
Since airline deregulation in 1978, the number of passengers using the domestic aviation system has exploded. Last year, around 575 million passengers were enplaned in the United States. In 1994, 528 million were enplaned and in 1993, 488 million were enplaned. The FAA projects that by 2002, the year we are hoping to achieve a balanced federal budget, that number will grow to 740 million and it will go over the 800 million mark sometime in 2005.

Already, we have significant capacity and delay problems in our system. Currently, there are 22 airports that are seriously congested, experiencing more than 20,000 hours of delay or more per year. These delays cost the airlines, alone, over half a billion dollars a year and impose tremendous costs and disruptions to millions of passengers and businesses. FAA forecasts that unless major airport capacity investments are made, this number of congested airports will grow to 32 in less than 10 years.

This means that over the next several years, as we move toward a balanced budget, we also have to somehow make sure that there is sufficient investment in our nation's airport infrastructure to handle not only the current passenger traffic but an additional 200 million passengers by the year 2002. This will be a major challenge. We as a nation cannot afford the billions of dollars in annual delay costs and lost productivity to the airlines, air travelers and businesses, nor can we afford to weaken our economic competitiveness abroad, by settling for an inefficient and inadequate air transportation system.

Congress has set a target date of balancing the federal budget by 2002. In this context, it is worth noting that it generally takes at least 5–7 years to undertake and complete an airport development project. That means that as politically difficult as it may be to provide an increase in airport construction funding in today's budgetary environment, it is absolutely imperative that Congress do just that. Without the increased investment, we cannot realistically hope to close the existing investment gap and will have no chance to build the infrastructure to meet the increased demand that will be placed on the system during this time period. We must act now. If we wait, the funding gap will be impossible to close.





AIRPORT CAPITAL DEVELOPMENT NEEDS CONTINUE TO GO UNMET

ACI–NA and AAAE have conducted numerous surveys to assess the capital development funding needs of all airports throughout the United States. The latest survey we conducted (in 1996) showed that U.S. airports required more than $10 billion each year over a six-year time period—at least $60 billion for needed capital improvement and capacity expansion projects. Of this $10 billion a year, only 60 percent ($6 billion dollars) are projects defined as eligible for AIP funding.

These projects are essential to increase capacity, improve safety and security, reduce delays for the traveling public, reduce aircraft noise for communities surrounding airports, help pay for unfunded federal mandates and regulations, and to build and improve facilities that will promote air service competition and the industry's economic health.

In April of 1997, the General Accounting Office (GAO) completed a report on airport development needs. The results of the GAO validated the AAAE/ACI–NA survey results. AAAE/ACI–NA have argued that total airport capital development needs in the U.S. are at least $10 billion a year; and GAO found $10.129 billion a year. AAAE/ACI–NA have argued that of that $10 billion a year, $6 billion is AIP-eligible; and GAO found $6.110 billion.
