entanglement

Holography

Key idea: \Rightarrow Implement r as an extra dimension, and map to a local theory in $d + 2$ spacetime dimensions.

Holography

For a relativistic CFT in d spatial dimensions, the metric in the holographic space is fixed by demanding the scale transformation ($i = 1 \dots d$)

$$x_i \rightarrow \zeta x_i \quad , \quad t \rightarrow \zeta t \quad , \quad ds \rightarrow ds$$

Holography

This gives the unique metric

$$ds^2 = \frac{1}{r^2} (-dt^2 + dr^2 + dx_i^2)$$

This is the metric of anti-de Sitter space AdS_{d+2} .

AdS/CFT correspondence

AdS/CFT correspondence

AdS/CFT correspondence

Associate entanglement entropy with an observer in the enclosed spacetime region, who cannot observe “outside” : *i.e.* the region is surrounded by an imaginary horizon.

AdS/CFT correspondence

The entropy of this region is bounded by its surface area
(Bekenstein-Hawking-'t Hooft-Susskind)

AdS/CFT correspondence

Holography

Holography

Consider a metric which transforms under rescaling as

$$x_i \rightarrow \zeta x_i, \quad t \rightarrow \zeta^z t, \quad ds \rightarrow \zeta^{\theta/d} ds.$$

Recall: conformal matter has $\theta = 0$, $z = 1$, and the metric is anti-de Sitter

Holography

Consider a metric which transforms under rescaling as

$$x_i \rightarrow \zeta x_i, \quad t \rightarrow \zeta^z t, \quad ds \rightarrow \zeta^{\theta/d} ds.$$

The value $\theta = d - 1$ reproduces *all* the essential characteristics of the **entropy** and **entanglement entropy** of a Bose metal.

N. Ogawa, T. Takayanagi, and T. Ugajin, JHEP **1201**, 125 (2012).

L. Huijse, S. Sachdev, B. Swingle, Physical Review B **85**, 035121 (2012)

Holography

Consider a metric which transforms under rescaling as

$$x_i \rightarrow \zeta x_i, \quad t \rightarrow \zeta^z t, \quad ds \rightarrow \zeta^{\theta/d} ds.$$

The null-energy condition of gravity yields $z \geq 1 + \theta/d$. In $d = 2$, this corresponds to $z \geq 3/2$ (recall: field theory yields $z = 3/2$!)

N. Ogawa, T. Takayanagi, and T. Ugajin, JHEP **1201**, 125 (2012).

L. Huijse, S. Sachdev, B. Swingle, Physical Review B **85**, 035121 (2012)

Holographic theory of a Bose metal

Hidden Fermi surfaces of “quarks”

Fully fractionalized state has all the electric flux exiting to the horizon at $r = \infty$

Conclusions

Realizations of many-particle
entanglement:
 Z_2 spin liquids and
conformal quantum critical points

Conclusions

More complex examples in metallic states are experimentally ubiquitous, but pose difficult strong-coupling problems to conventional methods of field theory

Conclusions

String theory and gravity in emergent dimensions offer a remarkable new approach to describing states with many-particle quantum entanglement.

Much recent progress offers hope of a holographic description of “strange metals”
