

2008 Minerals Yearbook

CLAY AND SHALE [ADVANCE RELEASE]

CLAY AND SHALE

By Robert L. Virta

Domestic survey data and tables were prepared by Danielle L. Militello, statistical assistant, and Maria Arguelles, statistical assistant; and the world production tables were prepared by Linder Roberts, international data coordinator.

The amount of clay sold or used by domestic producers in 2008 was 33.2 million metric tons (Mt) valued at \$1.67 billion compared with 36.7 Mt valued at \$1.75 billion in 2007 (table 1). Common clay and shale accounted for 53% of the tonnage, and kaolin accounted for 54% of the value (tables 1, 5, and 8). In 2008, exports were 4.79 Mt valued at \$978 million compared with 5.65 Mt valued at \$928 million in 2007. Imports of clays were 239,000 metric tons (t) valued at \$119 million in 2008 compared with 231,000 t valued at \$73.9 million in 2007 (tables 1, 14, 15).

Production

About 180 companies mined clay and shale in the United States in 2008. The 20 leading companies, many with multiple operations, accounted for 56% of the tonnage and 82% of the value for all types of clay produced and sold or used. Clay production was reported in all States except Alaska, Delaware, Hawaii, Idaho, New Hampshire, Rhode Island, Vermont, and Wisconsin (table 2). Companies not participating in the U.S. Geological Survey (USGS) canvass of the clay and shale industry probably mined clay for construction uses in States for which no production was reported.

The 10 leading producer States were, in decreasing order of tonnage, Georgia, Wyoming, Texas, Alabama, North Carolina, Missouri, Virginia, Ohio, Mississippi, and Arkansas. The 10 leading producer companies were, in alphabetical order, American Colloid Co. (bentonite); BASF Corp. (bentonite, fuller's earth, and kaolin); General Shale Products Corp. (common clay and shale); Imerys SA (ball clay and kaolin); KaMin LLC (formerly J.M. Huber Corp., kaolin); Nestle Purina PetCare Co. (bentonite); Oil-Dri Corp. of America (fuller's earth); Texas Industries Inc. (common clay and shale); Thiele Kaolin Co. (kaolin); and Unimin Corp. (ball clay and kaolin).

Most clay was mined in the United States by open pit methods; less than 1% of U.S. clay output originated from underground mines. All underground production was in Ohio, from underclays associated with subterranean coal.

Domestic production data for clays were developed by the USGS from a voluntary survey of U.S. operations. Responses to the survey and company production data available from other sources accounted for approximately 60% of the total clay and shale tonnage sold or used quantity listed in table 1. Most nonrespondents were producers of common clay and shale. Production data for the nonrespondents were estimated from published reports, preliminary survey information, or reported prior-year production levels adjusted by trends in the industry and employment hours as reported by the Mine Safety and Health Administration.

Ball Clay.—In 2008, four companies mined ball clay in four States. Production of domestic ball clay was 967,000 t valued

at \$44.3 million compared with 1.07 Mt valued at \$49.0 million in 2007 (table 3). Operations in Tennessee supplied 59% of the production, followed by, in descending order of tonnage, Texas, Mississippi, and Kentucky. One producer reported a small amount of production in Indiana, but this probably was fire clay rather than ball clay. Ball clay sales declined because of reduced demand for ceramic tile and sanitaryware by the slumping building industry.

Bentonite.—In 2008, 21 companies produced bentonite in 11 States. About 5.03 Mt valued at \$247 million was sold or used compared with 4.82 Mt valued at \$252 million of bentonite sold or used in 2007 (table 4). Production of nonswelling bentonite decreased to 172,000 t valued at \$10.4 million in 2008 from 219,000 t valued at \$11.1 million in 2007. Alabama led in the production of nonswelling bentonite, followed by, in descending order of tonnage, Mississippi, Arizona, California, Colorado, and Nevada.

Production of swelling bentonite was 4.86 Mt valued at \$237 million in 2008, an increase from 4.60 Mt valued at \$241 million in 2007. Wyoming led in the production of swelling bentonite, followed by Montana, Utah, Texas, California, Oregon, and Nevada. Sales increased primarily because of higher demand for bentonite for drilling mud and pet litter applications.

Elementis Specialties Inc. (a division of Elementis plc) announced plans to expand its capacity for spray dry products at its Newberry Springs, CA, facility. The spray dryer and associated equipment was scheduled to be installed in 2009. The expansion permits Elementis to expand production of its organoclays (Elementis Specialties Inc., 2008).

Rock Springs Mineral Processing, Inc. and U.S. Bentonite Processing, Inc. received a \$10 million loan from the U.S. Department of Agriculture Rural Development division to build two processing plants in Arminto and Bucknam, WY. The plants were to employ 100 workers when completed (U.S. Department of Agriculture, 2008).

ZEOX Corp. increased its holdings in ZEOX Performance Materials, LLC (ZPM) by acquiring an additional 8% of shares from Cheto Partners, LLC. With the acquisition, ZEOX controlled 59% of ZPM. ZPM mines saponite from a Burro Creek, AZ, deposit for use in water treatment and rheology control applications (ZEOX Corp., 2008).

Common Clay and Shale.—In 2008, 129 companies produced common clay and shale in 43 States and Puerto Rico. In States not reporting production, common clay and shale probably was mined and sold for construction uses by companies not participating in the USGS canvass of the clay and shale industry.

Domestic sales or use of common clay and shale decreased to 17.5 Mt valued at \$202 million in 2008 compared with 20.6 Mt

valued at \$216 million in 2007 (table 5). The major producing States were, in descending order of tonnage, Texas, Alabama, North Carolina, Ohio, Georgia, Arkansas, Virginia, Oklahoma, New York, and Indiana. The tonnage of common clay and shale sold or used declined because of decreased building activity in 2008.

Boral Bricks Inc. opened a brick manufacturing plant in Terra Haute, IN. The plant, fueled using methane from a nearby landfill, had the capacity to produce 120 million bricks per year and featured robotic setting and packaging. The plant used shale from a nearby coal mining property in the manufacturing process (Boral Bricks Inc., 2008).

Acme Brick Co. purchased Ochs Brick Co., which operated a 60-million-brick-per-year plant in Springfield, MN. The purchase provided Acme Brick with the opportunity to expand its operations into the Midwest brick market (Ceramic Industry, 2008).

Fire Clay.—Fire clay producers were mostly refractory product manufacturers that used the clays in firebrick and various heavy-clay products. In 2008, six firms mined fire clay in four States. Fire clay sold or used by domestic producers decreased to 447,000 t valued at \$17.7 million from 565,000 t valued at \$23.8 million in 2007 (table 6). Missouri was the leading producing State, followed by, in descending order of tonnage, California, Ohio, and South Carolina. There was a significant decline in production because of reduced sales of fire clay for the manufacture of products used by the building market.

Fuller's Earth.—In 2008, 15 companies produced fuller's earth in 11 States. Fuller's earth deposits occur in grades ranging from palygorskite (attapulgite) in western Florida to montmorillonite, further northward into southwestern Georgia. Gellant grades of attapulgite, used as thickeners in such items as drilling muds and paints, are in western Florida and southwestern Georgia. Absorbent grades of attapulgite are further north in Georgia. Absorbent grades of attapulgite are grouped with the montmorillonite variety of fuller's earth in table 7 to be consistent with past reporting.

Gellant-grade attapulgite was mined or sold in the Florida Panhandle and southwestern Georgia by two companies. Attapulgite production was withheld to avoid revealing company proprietary data but production decreased in 2008 from 245,000 t valued at \$36.5 million in 2007 (table 7). Florida led in the production of attapulgite, followed by Georgia. Sepiolite, although not a fuller's earth, was mined in Nevada and included in the total for gellant-grade attapulgite to avoid disclosing company proprietary data.

Production of the montmorillonite variety of fuller's earth decreased slightly to 2.35 Mt valued at \$231 million in 2008 compared with 2.36 Mt valued at \$211 million in 2007 (table 7). Montmorillonite-type fuller's earth was produced, in decreasing order of tonnage, in Georgia, Missouri, Mississippi, Virginia, California, Illinois, Tennessee, Florida, Kansas, Nevada, and Texas.

Kaolin.—In 2008, 16 firms mined kaolin in 9 States. Domestic production was 6.74 Mt valued at \$900 million compared with 7.11 Mt valued at \$959 million in 2007 (table 8). Declines were seen in several markets, although the largest

losses were in sales to the paper filler and coating markets. The leading producer State was Georgia, followed by, in descending order of tonnage, South Carolina, Alabama, Arkansas, Nevada, Texas, Florida, North Carolina, and California.

Of the 6.74 Mt sold or used in 2008, 3.08 Mt was reported as water washed, 1.39 Mt was calcined, 1.13 Mt was airfloat, 1.07 Mt was delaminated, and 78,000 t was unprocessed (table 8). This compares with 3.26 Mt of water washed, 1.39 Mt of calcined, 1.18 Mt of airfloat, 1.14 Mt of delaminated, and 135,000 t of unprocessed in 2007 (table 8). Pigment-grade (low-temperature calcined kaolin) accounted for more than 50% of the tonnage of the total calcined kaolin sales. Companies in Georgia accounted for nearly all the pigment-grade calcined kaolin produced in 2008. A small amount also was produced in Texas.

Kaolin production in Georgia was reported to be 6.29 Mt valued at \$872 million in 2008 compared with 6.57 Mt valued at \$924 million in 2007. Approximately 3.00 Mt of Georgia kaolin production was sold as water washed, 1.36 Mt was calcined (high- and low-temperature calcined kaolin), 1.07 Mt was delaminated, and 859,000 t was airfloat in 2008. This compares with 3.19 Mt water washed, 1.29 Mt calcined, 1.14 Mt delaminated, and 948,000 t airfloat in 2007 (table 9). Production in South Carolina was 199,000 t valued at \$11.3 million in 2008 compared with 297,000 t valued at \$17.6 million in 2007 (table 10). Decreased sales to paper- and construction-related markets affected sales in Georgia. Decreased sales to rubber- and construction-related markets affected sales in South Carolina.

IMin Partners, a private equity capital fund, purchased the kaolin operations of Huber Engineered Materials (a subsidiary of J.M. Huber Corp). Huber Engineering produced kaolin for paper and industrial customers. The company operated as KaMin LLC (KaMin LLC, 2008a).

KaMin announced plans to restructure its kaolin operations in Georgia and to reduce its hydrous production capacity and eliminate selected paper grades at its Sandersville, GA, operation. The reduction was in response to reduced demand from the paper market (Industrial Minerals, 2008f; KaMin, 2008b).

Imerys SA idled its calcined kaolin capacity at its Dry Branch, GA, facility and transferred its calcined kaolin operations to Sandersville. The Imerys facility at Sandersville, in turn, was restructured with some reduction in product capacities and staff, in response to changing market conditions. Imerys also added a refractory clay calciner at its Andersonville, GA, facility (Imerys SA, 2008b, 2009, p. 6; Industrial Minerals, 2008e).

Imerys North America Ceramics sold its Edgar, FL, facility to Edgar Minerals, Inc. Imerys will be the sole marketing agent of the specialty kaolin products produced at the Edgar plant (Imerys, 2008a).

Active Minerals International, LLC (AMI) purchased Southeastern Kaolin Co., which had a mine and mill near Aiken, GA. AMI planned to expand sales in Asia and North America. The purchase of Southeastern Kaolin, combined with AMI's 2003 purchase of Wilkinson Kaolin Associates, LLC, gave AMI a total production capacity of more than 600,000 metric tons per year (t/yr) (Active Minerals International, LLC, undated).

Golden Gate Capital completed its acquisition of U.S. Silica Co. from Harbinger Capital Partners. U.S. Silica produced kaolin and silica from its operation in Kosse, TX; feldspar from its Montpelier, VA, operation; and silica from several other operations throughout the eastern and central United States. U.S. Silica sells its products into the ceramics, foundry, and filtration markets (Golden Gate Capital, 2008; Industrial Minerals, 2009).

BASF announced a reduction in greenhouse emissions and energy costs at its McIntyre, GA, facility. The company upgraded insulation on process equipment, reduced electrical consumption on its compressed air circuits, and, by reducing the water content of its process slurries, cut energy costs associated with heating the slurries. The company estimated that its energy needs were reduced by 582 billion British thermal units per year (Btu/yr), equivalent to reducing CO₂ emissions by 57,300 t/yr. Modifications to calcining, centrifugation, burners, and spray drying units and improved heat recovery were expected to reduce energy consumption by an additional 740 billion Btu/yr (BASF Corp., 2008).

Beta Minerals Inc. acquired the kaolin assets of Erdene Materials Corp. (EMC) near Sparta, GA. In exchange, Erdene Resource Development Corp. (the parent company of EMC) received about 72% of shares issued by Beta Minerals. Deepstep Kaolin Co. LLC, a partner of EMC in the venture, held 6% of shares in Beta Minerals. The kaolin reserves controlled by Beta Minerals were 24.7 Mt. The company expected to focus sales in ceramic markets. After completion of the deal in February 2009, Beta Minerals became Advanced Primary Minerals Corp. (Beta Minerals Inc., 2008; Industrial Minerals, 2008c, e; Erdene Resources Development Corp., 2009).

Daleco Resources Corp. filed a plan of operation with the U.S. Forest Service for its Sierra County, NM, operation. The company continued to work on technology for processing its kaolin and tested the suitability of trial hydrous and calcined kaolin grades in paint formulations. The company determined the grades were suitable for flat interior latex paints (Daleco Resources Corp., 2007, 2008).

Consumption

Ball Clay.—Ball clay sold or used in 2008, including exports, was 967,000 t, a decrease from 1.07 Mt in 2007. The principal domestic ball clay markets were, in decreasing order by tonnage, floor and wall tile and sanitaryware (table 3). Other uses for ball clay, in decreasing order by tonnage, were miscellaneous ceramics; fillers, extenders, and binders; fiberglass; electric porcelain; roofing granules; pottery; catalysts; firebrick; fine china; animal feed; miscellaneous refractory products; rubber; brick; and adhesives. Sales to markets such as adhesives, catalysts, fiberglass, and rubber may include kaolin mined or purchased by the ball clay producers.

Bentonite.—In 2008, domestic sales and use were 4.13 Mt and total sales (domestic and export) were 5.03 Mt compared with domestic sales of 3.96 Mt and total sales of 4.82 Mt in 2007 (table 4). Major domestic markets for bentonite were, in decreasing order by tonnage, pet waste absorbent, drilling mud, iron ore pelletizing, and foundry sand. Total sales (domestic and exports) of bentonite were approximately 849,000 t for foundry sand bond (more than 95% was swelling bentonite).

In addition to domestic sales of 1.00 Mt of swelling bentonite for pet waste absorbent and 717,000 t for pelletizing iron ore, significant quantities (which were concealed in table 4) of swelling bentonite also were exported to these same end-use markets. Other markets for bentonite were, in decreasing order by tonnage, miscellaneous civil engineering and sealing; waterproofing and sealing; water treatment and filtering; animal feed; oil and grease absorbents; paint; adhesives; miscellaneous fillers, extenders, and binders; miscellaneous chemical manufacturing; fiber glass; cosmetic, medical, and pharmaceutical; pesticide carrier; filtering, clarifying, and decolorizing minerals, oils, and greases; fertilizer carrier; miscellaneous refractory products; and miscellaneous ceramics.

The major domestic markets for swelling bentonite were, in decreasing order, pet waste absorbents, drilling mud, iron ore pelletizing, foundry sand, civil engineering and sealing, waterproofing and sealing, and water treatment. Major export markets for swelling bentonite were, in decreasing order, foundry sand, pet waste absorbent, drilling mud, and iron ore pelletizing. The major domestic use for nonswelling bentonite was in water treatment and filtering.

For the smaller markets, swelling bentonite accounted for more than 95% of the bentonite sold for animal feed, cosmetics, fertilizers, miscellaneous ceramics, miscellaneous chemical manufacturing applications, medical, oil and grease absorbents, paint, and waterproofing but less than 30% of the bentonite sold for pesticide carriers and water treatment and filtering.

Common Clay and Shale.—Consumption of common clay and shale decreased to 17.5 Mt from 20.6 Mt in 2007. Brick manufacture remained the leading market for common clay and shale, followed by, in descending order of tonnage, lightweight aggregate and portland cement (table 5). Other lesser markets, in descending order of tonnage, were refractory mortar and cement, ceramic floor tile, roofing granules, flue linings, miscellaneous refractory products, civil engineering, drain tile, flower pots, sewer pipe, and fire brick.

Sales of common clay and shale declined by 15% in response to reduced demand by the commercial and residential building industries. Residential and nonresidential construction, on which the common clay and shale industry is dependent, decreased in value to \$1.08 trillion in 2008 from \$1.14 trillion in 2007 (U.S. Census Bureau, 2009a).

Fire Clay.—Consumption of fire clay decreased to 447,000 t in 2008 from 565,000 t in 2007. Demand from the construction industry for heavy-clay products manufactured using fire clay declined (table 6). Fire clays were used in grogs and calcines; high-alumina brick and specialties; ramming and gunning mixes; refractory products, such as firebrick and block; mixes and mortars; and saggars. Fire clays also were used to produce such items as brick and pottery. Markets for fire clay were, in descending order of tonnage, portland cement, refractory calcines and grogs, lightweight aggregate, floor and wall tile, refractory mortar and cement, common brick applications, pottery, and miscellaneous clay applications.

Fuller's Earth.—Consumption of montmorillonite-type fuller's earth was 2.35 Mt in 2008 compared with 2.36 Mt in 2007 (table 7). Data for attapulgite-type fuller's earth was withheld in 2008 to avoid disclosing company proprietary data.

Domestic markets for montmorillonite-type fuller's earth were, in descending order of tonnage, pet waste absorbents; oil and grease absorbents; miscellaneous absorbents; miscellaneous civil engineering and sealing; filler, extender, and binder uses; pesticide carrier; clarifying, decolorizing, and filtering of oils and greases; animal feed; and fertilizer carrier; paint; adhesives; cosmetic, medical, and pharmaceutical uses; waterproofing and sealing; and water treatment. Absorbent applications accounted for more than 60% of sales of montmorillonite-type fuller's earth. The leading export market was pet waste absorbents.

Domestic markets for attapulgite-type fuller's earth were, in decreasing order, filler, extender, and binder uses; miscellaneous absorbents; drilling mud; clarifying, decolorizing, and filtering of mineral oils and greases; pesticide carrier; animal feed; adhesives; paint; oil and grease absorbents; fertilizer carrier; desiccant; cosmetic, medical, and pharmaceutical applications; and waterproofing and sealing. The first three applications accounted for more than 60% of sales of attapulgite. The major export markets were pesticide carriers, paint, and drilling mud.

Montmorillonite grades accounted for more than 75% of sales of fuller's earth for animal feed; clarifying, decolorizing, and filtering of oils and greases; miscellaneous civil engineering; oil and grease absorbents; pesticide carriers; pet waste absorbents; and exported products. Attapulgite accounted for most of the sales for adhesives, cosmetic, medical, and pharmaceutical applications; drilling mud; and paint.

Kaolin.—Consumption of kaolin decreased to 6.74 Mt in 2008 from 7.11 Mt in 2007 (table 8). The major domestic markets for kaolin were, in descending order of tonnage, paper coating and filling, refractory products, catalyst manufacture, fiberglass, paint, rubber, heavy-clay products (brick and portland cement), miscellaneous ceramics, and ceramic floor and wall tile. Major export markets were paper coating and filling, paint, and rubber (table 11).

Paper coating and filling markets accounted for 59% of kaolin sales in 2008 but also accounted for the bulk of the decline in kaolin sales in 2008. Catalysts markets increased with the growth in petroleum refining. Construction-related markets, such as fiberglass, paint, portland cement, and sanitaryware declined in 2008 in response to weak housing markets. Paint and rubber markets were affected negatively by a decline in automotive sales. The increase in refractory sales appears to be the result of better accounting by a major producer in 2008 rather than an actual increase in sales. Refractory markets probably declined with the decline in demand for aluminum, cement, glass, lime, and steel, all large users of clay-based refractory products, by yearend 2008.

Sales of kaolin from Georgia were 6.29 Mt in 2008 compared with 6.57 Mt in 2007. Major domestic markets for kaolin from Georgia were, in descending order by tonnage, paper coating, refractory products, other ceramics, fiberglass, paper filling, paint, catalyst manufacture, rubber, floor and wall tile, and plastics. The major export market for Georgia kaolin was in paper applications (table 9). Sales of kaolin from South Carolina were 199,000 t in 2008 compared with 297,000 t in 2007 (table 10). Major domestic markets for kaolin from South Carolina were, in descending order of tonnage, catalyst manufacture, rubber, brick, fiberglass, paper, plastics, pesticide carrier,

portland cement, adhesives, sanitaryware, roofing granules, firebrick, pottery, and animal feed. The major export market for kaolin from South Carolina was rubber applications.

Uses.—By application, consumption of clays was as follows:

Absorbent Uses.—Sales reported by producers for absorbent uses were 3.17 Mt in 2008 compared with 3.22 Mt in 2007. Sales of bentonite and fuller's earth for absorbent applications decreased slightly in 2008. Production within the heavy manufacturing industries declined so oil and grease absorbent demand decreased slightly.

Fuller's earth accounted for 58% of the clay used for absorbents, followed by bentonite. Pet waste absorbents accounted for 77% of absorbent consumption, followed by oil and grease absorbents (13%), and miscellaneous absorbent applications (10%). Fuller's earth was the predominant clay used for oil and grease absorbent applications. Bentonite accounted for 51% of pet waste absorbent sales and fuller's earth accounted for 49%.

Ceramics.—All varieties of clays were used in ceramics. Demand for clay in the manufacture of ceramics, ranging from china to sanitaryware to roofing granules, was 1.91 Mt in 2008 compared with 2.12 Mt in 2007. The leading ceramics markets were ceramic floor and wall tile (35%), miscellaneous ceramics (18%), catalyst (16%), roofing granules (13%), sanitaryware (12%), and pottery, electrical porcelain, and fine china (1% each). Ball clay accounted for 41% of the clay used in ceramics; kaolin, 33%; and common clay and shale, 24%. A small amount of bentonite also was used in the manufacture of ceramics. Ball clay dominated the electrical porcelain and sanitaryware markets. Common clay and shale was the predominant category of clay used in roofing granules. Kaolin dominated the catalyst market. Ball clay, common clay and shale, and kaolin were the predominant clays used in floor and wall tile manufacture, and ball clay and kaolin dominated the fine china market.

In 2008, apparent consumption of clay floor and wall tile in the United States was 197 million square meters valued at \$2.29 billion compared with 157 million square meters valued at \$1.83 billion in 2007. Because stocks are not taken into consideration, the increase in apparent consumption may not have been as great as calculated. Domestic producers shipped 45.1 million square meters of clay floor and wall tile in 2008 compared with 50.6 million square meters in 2007. In 2008, exports of clay floor and wall tile were 4.69 million square meters valued at \$43.5 million compared with 4.41 million square meters valued at \$41.9 million in 2007. Imports of clay floor and wall tile were 157 million square meters valued at \$1.62 billion in 2008, compared with 111 million square meters valued at \$1.07 billion in 2007. Although apparent consumption of clay floor and wall tile increased by 25% in 2008 compared with that of 2007, consumption remained well below the level of 2006 because of reduced commercial and residential housing construction in the United States in 2007 and 2008 (table 5; U.S. Census Bureau, 2009b).

The U.S. International Trade Commission (undated) reported that 10.8 million square meters of glazed and unglazed ceramic tile with sides measuring less than 7 centimeters [Harmonized Tariff Schedule (HTS) of the United States Codes 6907.10.00, 6908.10.10, 6908.10.20, and 6908.10.50] valued at \$108 million

was imported in 2008 compared with 19.9 million square meters valued at \$154 million in 2007. Brazil, China, Italy, Mexico, and Spain were the major sources of all varieties of imported ceramic tile.

Imports of ceramic baths, bidets, flush tanks, lavatories, sinks, toilet bowls, and other ceramic sanitary fixtures decreased in 2008. The U.S. International Trade Commission (undated) reported imports to be 28.7 million units compared with 34.0 million units in 2007. China and Mexico were the major sources of imported sanitaryware, supplying 77% of the units imported into the United States.

Construction.—Common clays and shale were used to manufacture a wide variety of construction materials, including expanded aggregates, hydraulic cement, and structural clay products.

Expanded Clay and Shale.—Approximately 3.93 Mt of clay and shale was used in the production of lightweight aggregates in 2008, the same as in 2007 (table 12). More than 99% of clay used to manufacture lightweight aggregates was common clay and shale. A small amount of fire clay also was used. Lightweight aggregates were used in concrete block, structural concrete, and highway surfacing, in decreasing order of tons consumed.

Hydraulic Cement.—Clays provide the alumina and silica required to manufacture hydraulic cements. In 2008, approximately 2.90 Mt of clays was consumed in the production of cement compared with 3.25 Mt in 2007. Reduced construction activity in 2008 caused the large decline in sales for cement manufacture. In descending order of tonnage, common clay and shale, fire clay, and kaolin were used in the manufacture of portland cement clinker. About 94% of the clay consumed by the cement industry was common clay and shale.

Structural Clay Products.—Approximately 9.37 Mt of clays was used in the manufacture of structural clay products, such as building brick, roofing tile, and sewer pipe compared with 12.2 Mt in 2007. Common and face brick accounted for about 97% of this total. Other markets were, in descending order of tonnage, flue linings, flower pots, drain tile, and sewer pipe. About 99% of the clay used to manufacture structural clay products was common clay and shale. Small amounts of ball clay, fire clay, and kaolin also were used.

In 2008, domestic producers shipped 5.05 billion building and face bricks compared with 7.24 billion bricks in 2007. About 81,600 t of vitrified clay sewer pipe and fittings valued at \$34.1 million was shipped in 2008 compared with 122,000 t valued at \$55.7 million in 2007 (U.S. Census Bureau, 2009b, p. 2).

Drilling Mud.—Sales of bentonite for drilling mud applications were 954,000 t (domestic) and 223,000 t (exported) compared with 912,000 t and 204,000 t in 2007, respectively. Attapulgite-type fuller's earth also was sold for drilling mud applications. Swelling-type bentonite accounted for more than 95% of the clay used in drilling mud. Bentonite is used most commonly with rotary rig drilling. The average number of rotary rigs in Canada and the United States operating at yearend 2008 increased slightly to 2,257 compared with 2,111 in 2007 (Baker Hughes Inc., 2009).

Fiberglass.—Sales of clays, including exports, to the fiberglass and mineral wool industry were 297,000 t in 2008

compared with 362,000 t in 2007. Most of the clay used for fiberglass was kaolin. For comparison, sales of ground industrial sand for fiberglass manufacture declined to 805,000 t in 2008 from 968,000 t in 2007. Sales of unground industrial sand for fiberglass manufacture were withheld for 2008 to avoid revealing company proprietary data but sales in 2007 were 530,000 t (Dolley, 2009). The declines were associated with decreased sales of fiberglass for commercial and housing construction and product manufacturing.

Fillers, Extenders, and Binders.—Clays are used as fillers, extenders, and binders in a wide variety of products, such as adhesives, flooring products, paint, paper, and rubber. About 3.53 Mt of clays was sold for use as fillers, extenders, and binders in the United States compared with 4.10 Mt in 2007. An additional 2.02 Mt of clays was exported for filler and extender applications in 2008 compared with 2.02 Mt in 2007. Paper coating and filling accounted for 61% of domestic sales, followed by paint (9%), rubber (5%), animal feed (4%), pesticide carriers (3%), and adhesives and plastics (2% each). Cosmetic, medical, and pharmaceutical and fertilizer carrier each accounted for less than 2% of the domestic fillers and extenders markets. Decreased sales to paper coating and filling markets and rubber in 2008 accounted for most of the decline in sales to fillers, extenders, and binder markets. Sales to construction-related filler markets such as caulk, joint compounds, and paint also declined.

Kaolin accounted for approximately 85% of the clay used in domestic and export filler and extender applications, followed by fuller's earth (6%), common clay and shale (5%), bentonite (4%), and ball clay (less than 1%). Bentonite was the predominant clay used for cosmetic, medical, and pharmaceutical applications; fuller's earth dominated in fertilizer and pesticide applications. Bentonite and fuller's earth dominated sales for animal feed. Kaolin was the predominant clay used for adhesives, paint, paper, plastics, and rubber markets.

The U.S. Census Bureau (2009c) reported shipments of paint and coatings for 2008 to be 4.62 billion liters (1.22 billion gallons) compared with 5.11 billion liters (1.35 billion gallons) in 2007. Of this amount, architectural paints, the major market for paint-grade fillers, was 2.58 billion liters (682 million gallons) in 2008 compared with 2.94 billion liters (777 million gallons) in 2007.

Iron Ore Pelletizing.—Sales of clays for iron ore pelletizing applications reported by producers were 786,000 t (717,000 t used domestically and 69,400 t exported) in 2008 compared with 747,000 t in 2007. The world economic recession began to adversely affect production of iron ore in mid- to late-2008 (Jorgenson, 2009). However, iron ore pelletizing operations continued to purchase bentonite through yearend 2008. Swelling bentonite was the only type of clay used for this application.

Paper Products.—Total sales for paper declined to 4.00 Mt in 2008 from 4.40 Mt in 2007 owing to the impact of the global economic recession on the paper industry. Declines in advertising in magazines and newspapers contributed to reduced paper demand as did reduced product shipments with lesser demand for packaging. Kaolin accounted for all the clay sales used for paper coating (1.89 Mt sold domestically and 1.76

Mt exported), and essentially all the clay used for paper filling (250,000 t sold domestically and 110,000 t exported).

Refractory Products.—Producers reported that 2.43 Mt of clays was used for the manufacture of refractory products in 2008 (1.58 Mt with foundry sand excluded) compared with 2.31 Mt in 2007 (1.41 Mt with foundry sand excluded). Foundry sand accounted for 35% of domestic sales and all export sales under the refractory category. Other refractory markets for clays were firebrick; grogs and calcines; high-alumina brick and kiln furniture; and refractory mortar and cement. About 259,000 t were exported for refractory applications.

Kaolin accounted for 804,000 t of refractory sales, followed by bentonite (853,000 t), common clay and shale (596,000 t), fire clay (data withheld), and ball clay (data withheld).

The U.S. Census Bureau (2009e) reported the value of apparent consumption of clay refractory products was \$1 billion in 2008 compared with \$965 million in 2007. Clay refractory shipments were valued at \$1 billion in 2008 compared with \$965 million in 2007. Shipments of unshaped clay refractory bonding mortars were 664,000 t valued at \$459 million compared with 668,000 t valued at \$418 million in 2007. Shipments of unshaped clay refractory products were followed by fireclay, high alumina, and insulating brick shapes (totaling 436,000 t valued at \$501 million in 2008 compared with 490,000 t valued at \$513 million in 2007). The remainder was other refractory clay raw materials and refractory materials sold in lump or ground form.

Prices

All of the major producers of specialty clays announced price increases in response to increasing material, energy, and freight costs. Announced increases ranged from 5% to 15%. The increased cost of sulfuric acid resulted in BASF Catalysts LLC (a division of BASF SE) to increase prices of some of its sulfuric acid-based bleaching earth products by 25% to 35%. In addition to these increases, a 25% to 35% sulfuric-acid surcharge was added to all acid-activated mineral adsorbent products produced at its Jackson, MS, plant (Chemical Week, 2008).

Ball Clay.—The average value for ball clay reported by domestic producers was \$46 per metric ton. The average value for exported ball clay was \$70 per metric ton. The average value for imported ball clay was \$179 per ton.

Bentonite.—The average value reported by domestic producers for nonswelling bentonite was \$60 per ton. The average value for swelling bentonite was \$49 per ton. The average value for all bentonite was \$49 per ton. The average value of exported bentonite was \$148 per ton. The average value of imported bentonite was \$443 per ton.

The price of crude Wyoming bentonite, shipped in bulk quantities in railcars, was \$44 to \$100 per ton; foundry-grade, bagged, railcars, \$70 to \$90 per ton; and American Petroleum Institute (API)-grade, bagged, railcars, \$70 to \$100 per ton. The price for bentonite, India, crushed, dried, loose in bulk, was \$43 to \$53 per ton for API-grade; \$36 to \$38 per ton for pet litter grade; and \$59 to \$76 per ton for foundry grade (Industrial Minerals, 2008h).

Common Clay and Shale.—The average value for all common clay and shale produced in the United States was \$12 per ton. The unit value of clay and shale used to produce lightweight aggregate was \$27 per ton. Average prices for lightweight aggregate produced from clay and shale ranged from \$30 to \$70 per ton for most applications.

Fire Clay.—The average value for fire clay reported by domestic producers was \$40 per ton. The average value of exported fire clay was \$126 per ton. The average value of imported fire clay was \$94 per ton.

Fuller's Earth.—The average value of attapulgite-type fuller's earth was withheld in 2008 to avoid revealing company proprietary data but the value decreased from \$149 in 2007. The average value of montmorillonite-type fuller's earth was \$98 per ton, an increase from \$89 in 2007. The average value for all fuller's earth was concealed in 2008 but increased slightly from \$95 per ton in 2007. The average value of exported fuller's earth was \$347 per ton. The average value of imported fuller's earth was \$100 per ton.

Kaolin.—The average value of kaolin was \$134 per ton for all kaolin grades. The average value for airfloat was \$71 per ton; delaminated, \$135 per ton; unprocessed, \$20 per ton; and water washed, \$134 per ton. Values for refractory-grade (high-temperature calcined) and pigment-grade (low-temperature calcined) kaolin were withheld to avoid revealing company proprietary data. Refractory-grade (high-temperature calcined) kaolin was valued at slightly less than \$39 per ton in 2007; pigment-grade (low-temperature calcined) kaolin was valued at slightly more than \$289 per ton in 2007; and all types of calcined kaolin combined were valued at \$187 per ton compared with \$201 per ton in 2007. More lower-valued refractory-grade kaolin was sold in 2008, resulting in a lower combined value than in 2007. The average value of exported kaolin was \$205 per ton. The average value of the imported kaolin was \$238 per ton.

The price of filler-grade kaolin from Georgia, shipped in bulk, was \$80 to \$100 per ton; coating, bulk, \$95 to \$185 per ton; sanitaryware-grade, bagged, \$65 to \$75 per ton; tableware-grade, bagged, \$125 per ton; and calcined, bulk, \$320 to \$375 per ton (Industrial Minerals, 2008h).

Foreign Trade

Ball Clay.—Ball clay exports were 65,000 t valued at \$4.58 million in 2008 compared with 83,000 t valued at \$5.61 million in 2007, according to the U.S. Census Bureau (table 14). Producers reported exports of 255,000 t. Most of the difference in exports reported by ball clay producers and the U.S. Census Bureau was likely accounted for by shipments to Mexico. The water weight of slurry shipments (about 30% to 35% of the shipment weight) may also account for a portion of the extra tonnage reported by producers. Imports were 2,000 t valued at \$358,000 (table 15).

Bentonite.—As reported by the U.S. Census Bureau, bentonite exports decreased to 1.09 Mt valued at \$161 million in 2008 from 1.43 Mt valued at \$158 million in 2007 (table 14). Exports to Canada, Japan, and the Netherlands declined

significantly, partially in response to the global recession. Changes in trade with other countries were relatively minor. Domestic bentonite producers reported exports of 819,000 t (table 4). Much of the discrepancy between data reported by producers and that reported by the U.S. Census Bureau probably resulted from producers including a large portion of the exports destined for Canadian and Mexican markets (419,000 t) under domestic sales. In addition, some bentonite is packaged domestically and then exported as a finished product, such as cat litter. Sales through U.S. brokers, where producers are unaware if the bentonite is used domestically or exported, could also explain this discrepancy.

Bentonite imports consisted mainly of untreated bentonite clay and chemically or artificially activated materials. Imports of untreated bentonite were 7,000 t valued at \$3.10 million. Imports of chemically activated material were 29,000 t valued at \$23.4 million (table 15).

Fire Clay.—In 2008, exports decreased to 393,000 t valued at \$49.6 million compared with 425,000 t valued at \$47.7 million in 2007 (table 14). At least 59% of the exports reported by the U.S. Census Bureau under the HTS code for fire clay was thought to be refractory-grade kaolin rather than fire clay based on the locations of ports from which the material was exported. Imports were 92 t valued at \$94,000 (table 15).

Fuller's Earth.—In 2008, exports decreased to 127,000 t valued at \$44.1 million compared with 134,000 t valued at \$37.7 million in 2007 (table 14). Exports to Japan increased and those to other countries declined or remained unchanged. Imports of decolorizing earth and fuller's earth were 1,000 t valued at \$100,000 in 2008 (table 15).

Kaolin.—In 2008, 2.96 Mt of kaolin valued at \$606 million was exported compared with 3.30 Mt valued at \$615 million in 2007 (table 14). Producers reported exports of 2.09 Mt (table 11). Much of the 445,000 t destined for Canada and 264,000 t for Mexico probably was reported under domestic consumption. Sales through U.S. brokers, where producers are unaware if the kaolin is used domestically or exported, also could explain this discrepancy.

Kaolin imports were an estimated 194,000 t of kaolin valued at \$46.1 million in 2008 compared with 194,000 t valued at \$48.5 million in 2007 (table 15). About 93% of the kaolin was imported from Brazil followed by the United Kingdom. Imports from Brazil were primarily for paper coating applications, and those from the United Kingdom were primarily for paper filler applications.

World Review

World production of bentonite was approximately 11.7 Mt (table 16). Fuller's earth production was 3.52 Mt (table 17). Kaolin production was about 36.3 Mt (table 18); this includes ball clay from Australia and crude kaolin ore production tonnages from many other countries. World sales of processed kaolin were estimated to be between 22 and 24 Mt, after excluding 4 Mt for Uzbekistan, 3.1 Mt for Germany, 2.9 Mt for the Czech Republic, 1.4 Mt each for Bulgaria and Ukraine, 300,000 t each for Turkey and Vietnam, 200,000 t for Egypt, and 100,000 t each for Australia and Iran, to account for processing losses. The United States continued to be the leading supplier

of processed clay for sale, followed by Greece, Turkey, and the Commonwealth of Independent States for bentonite; Spain for fuller's earth; and Brazil and the United Kingdom for kaolin. Spain led all countries in the production of sepiolite. The United States remained the leading producer of attapulgite, followed by Senegal.

Belgium.—Imerys partnered with Sea-invest to build a 1 Mt/yr seaport terminal in Antwerp. The \$126 million seaport was designed to handle 600,000 t/yr of kaolin in bulk, dry, or slurry form. Imerys backed the development of the terminal when it curtailed production of paper coating-grades of kaolin in the United Kingdom and began supplying European markets from its operations in Brazil (Industrial Minerals, 2008d).

Brazil.—Companhia Vale do Rio Doce (Vale) announced reductions in production at its two subsidiary kaolin operations in Brazil. CADAM S.A., in the State of Amapá, reduced production by 30%. Pará Pigmentos S.A. reduced production at its operations in the State of Pará by 200,000 t/yr. These reductions were effective on January 1, 2009. The reductions were in response to weak market demand (Companhia Vale do Rio Doce, 2009, p. 18).

Bulgaria.—Kaolin Plc, one of Bulgaria's leading industrial minerals producers, announced plans for staff reductions of 10% owing to reduced global demand for kaolin and other industrial minerals. The company also reduced output of some products to reduce expenditures (Kaolin AD, 2008).

Canada.—Whitemud Resources Inc. commissioned its \$50 million, 200,000 t/yr metakaolin plant in Saskatchewan. The company processed kaolin from its Gollier Creek Mine to produce metakaolin for use in concrete for construction applications. The company indicated that metakaolin can replace up to 20% of the portland cement used to manufacture concrete (Industrial Minerals, 2008k; Whitemud Resources Inc., 2008).

China.—Production data for bentonite is not generally available for China because of the lack of a comprehensive producer survey. Production was estimated to be about 3.1 Mt in 2007, the last year for which such information was available. About 50% was thought to be used in foundry applications, 25% for drilling muds, 8% for iron ore pelletizing, 3% for pet litter, and the remainder for civil engineering and other applications (Wan, 2008).

India.—Ashapura Minechem Ltd., the leading bentonite producer in India, was developing a kaolin mine and building a processing plant near Thiruvananthapuram, in the State of Kerala. The company was stockpiling raw kaolin from its mine and local suppliers while its 200,000 t/yr plant was under construction. The plant was scheduled to reach full capacity in 2009. Ashapura planned to produce air float kaolin for ceramics and refractories; lump kaolin for ceramics; and hydrous and hydrous calcined kaolin for paper applications. Ashapura also mined kaolin in the State of Gujarat (Industrial Minerals, 2008a).

Italy.—Süd-Chemie AG and IMIC SpA formed a joint venture (Süd-Chemie IMIC Italia Srl) to supply the foundry and construction industries with bentonite products. IMIC, which has processing plants in Milan and Pavia with a combined capacity of 100,000 t/yr, transferred its foundry and construction operations into the joint venture. Süd-Chemie held a 75% controlling share (Industrial Minerals, 2008j).

Morocco.—S&B Industrial Minerals SA continued work on its \$44 million, 150,000-t/yr plant in the Nador. The plant was to be operated as S&B Industrial Minerals Morocco S.A.R.L. and conduct the initial processing of white bentonite from nearby mines. Product from the Nador plant will be shipped to another S&B facility in Neuss, Germany, for additional processing. The bentonite was to be sold for detergent, paint, and paper applications. When completed, the plant could supply the total world consumption of white bentonite, which was estimated to be 150,000 t/yr (Industrial Minerals, 2008i).

Russia.—AMCOL International Corp. acquired a minority share in Bentonit Group, the leading Russian producer of bentonite for drilling mud, foundry sand bond, and iron ore pelletizing applications. Bentonit Group has bentonite reserves in the Siberian and Ural regions of Russia and Azerbaijan (AMCOL International Corp., 2008).

Turkey.—Laviosa Chimica Mineraria SpA announced plans to build a 50,000 t/yr plant in north-central Turkey. The plant was expected initially to produce dried, granulated bentonite, some of which could be further processed at one of Laviosa's processing plants in Italy. Sales were to focus on cat litter, detergent, and paper markets in Asia and Europe (Industrial Minerals, 2008b, g)

Turkmenistan.—A kaolin plant began operations in the Balkan province of Djebel. The plant processed kaolin from nearby mines, supplying finished product for ceramics and refractory products and had a capacity of 20,000 t/yr (Turkmenistan.ru, 2008).

Outlook

The clay and shale industries were greatly affected by the world recession that began in 2008. Sales of ball clay, common clay and shale, and fire clay have experienced the most negative impact as demand for brick and ceramic products used in home construction declined following the collapse of the U.S. housing market, which began in 2006 (tables 3, 5; U.S. Census Bureau, 2009d). Kaolin was affected not only by reduced sales to its construction segment but also by the continued decline in demand from the paper industry. The impact of the recession did not affect as many of the markets for bentonite and fuller's earth as it did other clay types until late 2008 or early 2009. The markets for bentonite and fuller's earth were relatively unchanged from those of 2007.

Economic analysts suggested that the U.S. recession was easing in the financial sector, but construction and manufacturing industries continued to operate at reduced levels, and unemployment remained problematic through much of 2009. Some indices indicated that housing may have begun at least a weak recovery in late 2009, but there continue to be concerns about the viability of many Alternative-A and option adjustable rate (Option ARM) mortgages, which tended to be larger mortgages. Defaults on Alternative-A mortgages had begun to increase, and many Option ARM rates started to reset in late 2009 (Condon, 2009; Dunphy, 2009; McDonald, 2009; Rooney, 2009; Aversa, 2010; Kilgore, 2010).

In 2008, privately owned housing starts in the United States were 904,000 units compared with 1.36 million units in 2007, a 33% decline. This is the third year of decline from the record

set in 2005 (U.S. Census Bureau, 2009d). Although starts increased slightly in early 2009, they were still far below the record setting pace seen prior to 2005. Defaults on existing mortgages continued to be high, with more predicted as the job market continued to remain poor. Tightened credit for loans also continued to hamper growth in industry and housing. All of these factors probably will continue to adversely affect sales to construction-oriented markets for clay-based products such as adhesives, clay brick, drain tile, portland cement, ceramic tile, lightweight aggregate, paint, fiberglass, roofing granules, sanitaryware, and sewer pipe. As a result, sales of ball clay, common clay and shale, and kaolin, for construction-oriented applications may decline again in 2009. Use of fire clay for the manufacture of portland cement and heavy-clay products also may decline. With indications of a slight rebound in housing starts beginning to appear in mid-2009, sales of these construction materials may increase very slightly in 2010.

Absorbent markets, particularly pet waste absorbents, usually a relatively safe haven for the bentonite and fuller's earth industries, were beginning to show signs of weakening. Pet waste absorbent sales declined for fuller's earth in 2008, and major bentonite and fuller's earth producers indicated decreases in sales in the first half of 2009 as a result of reduced consumer spending. Oil absorbent use also may decline slightly as heavy manufacturing industries continue to operate at reduced levels in response to the continuing downturn in the overall world economy.

Drilling for oil increased slightly worldwide in 2008, but demand for bentonite and fuller's earth for drilling mud applications declined in 2009 as oil prices decreased. If the global recession continues, this trend may persist, resulting in little growth in drilling mud sales in 2010.

A slackened worldwide demand for steel for construction and industrial manufacturing, as a result of fiscal crisis, could result in decreased sales of bentonite for pelletizing iron ore in 2009. Similarly, sales of bentonite and fuller's earth for foundry applications could decline in 2009 because heavy industry did not appear to have begun its recovery from the economic recession until late in 2009. Sales of fire clay for refractory products, which declined slightly through 2008 owing to idling of many industrial manufacturing furnaces and other high-temperature equipment in such industries as cement, glass, lime, and steel, during the economic recession, may decline again in 2009. With the turnaround in the world economies moving at a slow pace, little or no growth in sales were expected in 2010.

The leading markets for kaolin, paper coating and filling, continued to be affected by a slow paper industry in the United States and foreign competition in overseas markets. In North America, shipments of printing and writing paper declined 8.2% (Pulp and Paper Network, LLC, 2009a). The Confederation of European Paper Industries member countries indicated that its output of board and paper declined 4% from that of 2007 (Pulp and Paper Network, LLC, 2009b). Sales of kaolin for paper applications were expected to decline slightly through 2010.

^eEstimated. ^fRevised. W Withheld to avoid disclosing company proprietary data; included in "Other."

¹Includes extruded and other brick.

²Data are rounded to no more than three significant digits; may not add to totals shown.

³Extruded brick only.

⁴Includes all other States and data represented by symbol W. Excludes Alaska, Nevada, New Hampshire, Rhode Island, Vermont, and Wisconsin.

TABLE 14
U.S. EXPORTS OF CLAYS, BY TYPE^{1,2}

(Thousand metric tons and thousand dollars)

Material	2007		2008		Principal destinations in 2008
	Quantity	Value	Quantity	Value	
Ball clay	83	5,610	65	4,580	Mexico, 48%; Venezuela, 10%; Costa Rica, 6%.
Bentonite	1,430	158,000	1,090	161,000	Canada, 35%; Japan, 17%; Netherlands, 16%.
Fire clay	425	47,700	393	49,600	Mexico, 46%; Luxembourg, 30%; Japan, 16%.
Fuller's earth	134	37,700	127	44,100	Japan, 31%; Italy, 6%; Netherlands, 4%.
Kaolin	3,300	615,000	2,960	606,000	Japan, 21%; Canada, 15%; Finland, 10%; Mexico, 9%.
Clays, n.e.c.	279	63,600	153	112,000	Canada, 53%; Mexico, 9%; Japan, 6%.
Total	5,650	928,000	4,790	978,000	

¹Data are rounded to no more than three significant digits; may not add to totals shown.

²The Harmonized Tariff Schedule of the United States (HTS) codes for ball clay, fuller's earth, and clays, n.e.c. changed January 2007. Lower reported exports of ball clay and clays, n.e.c. in 2007 perhaps is do to accounting problems under the new HTS codes rather than an actual decrease in export tonnages.
