PROCEEDINGS

MS. MUELLER:

Good evening. Thank you very much for joining us tonight. My name is Lee Mueller. I work with the Public Affairs Office of the Army Corps of Engineers.

As you can see, tonight is one of six public scoping meetings we're going to be holding throughout the month of April in partnership with the Coastal Protection and Restoration Authority of Louisiana. We'll be in southeast Louisiana and Mississippi.

This is the first large-scale long-term study being conducted under the LCA program. At this time, I would like to take the opportunity to recognize our elected official in the house, Representative Ray Garofalo.

Thank you for coming.

I want to give you a quick overview of what we'll be covering tonight.

We'll start with a general overview of the LCA Program. Then we'll move into,

kind of, a look at the foundation for the Mississippi Hydrodynamic & Delta Management Study. This piece of the presentation will be given by Renee Sanders. She's the Study Manager for CPRA.

From there, Cherie Price will come on up, and she'll continue a more detailed look at the Hydrodynamic & Delta Management Study. She is the Planner with the Army Corps of Engineers.

After that, Sandra Stiles from the Environmental Branch will go ahead and do a presentation on the formal NEPA process and formal scoping process, which is really why we're here tonight.

We will move into a kind of informal Q&A session. This is your chance to ask the team any questions you may have on the development of the study. We will give the answers to the best of our ability. The study is still in development. So if we don't know an answer for you, make sure to

get your contact information and get an answer to you at a later date. So this is your chance, really, to ask Q&A and get feedback with you guys.

So once we're done with Q&A, we'll move into the formal scoping session.

This is where you have the opportunity to submit a formal scoping comment.

These comments will be included in the scoping report and will be considered in the development of the Environmental Impact Statement.

So just to clarify, we have an informal Q&A and a formal scoping. And just to reiterate why we're here tonight, public input is a really important part of this process. And your input is very important in the development of this long-term large-scale study.

So with that, I'd like to turn it over to Renee Sanders.

(PRESENTATION BY RENEE SANDERS)

So you're going to hear a key phrase over and over again about a

long-term large-scale restoration
project. On behalf of the State, I
just want to welcome everybody and just
reiterate that we are very excited to
be working in conjunction with the
Corps of Engineers on this project.

The LCA Program stands for the Louisiana Coastal Area Program. It was finalized in 2004 and early 2005. The purpose of this study was to evaluate near-term projects, as well as long-term restoration projects. Near-term projects were things that could be completed within five to ten years. Large-scale long-term projects are things that will be completed afterwards.

This project is one of six of the long-term large-scale projects. It combines two of them, a hydrodynamic portion and a delta management portion. And we'll go into that a little bit greater detail on what each individual portion means and what it includes.

The map of the LCA projects here

are 15 critical near-term projects, two 1 2 of which have been built. Caernarvon and Davis Pond. The other 3 ones are in various stages. Some are 4 in design. Those include: White Ditch, Blind River, Amite, Terrebonne, to name 6 a few. And then there are some that are, as I mentioned, have already been built, Caernarvon and Davis Pond. they're currently undergoing modifications. So they're still in a study phase. Myrtle Grove is another project that's in the study phase. So we have various projects over different 14 stages of completion.

Next slide shows the proposed study area. It begins in the Gulf of Mexico, the Bird's Foot area, extends all the way to Vicksburg. The reason it extends that far north is that part of the model domain that we're going to use for the project needs to extend that far.

There's a little area southwest that, kind of, has a little tail on it. And that's to symbolize some of the
longshore drift that occurs along the
coast. So we wanted to capture as much
of the project area as we could all the
way up to Vicksburg and including that
longshore drift, that sediment and

8 Gulf of Mexico.

The project area will be refined once we know the individual project features. So this area will be condensed, and then we'll do a more intense study and analysis of different locations for features.

water nutrients that goes along the

So some quick facts on the project.

It was authorized under WRDA in 2007

under Sections 7003. And it will have

one Environmental Impact Statement that

will be at the end of the project.

That's to describe the benefits, as

well as the impacts of the project, and

be tiered off from the main

programmatic report that was completed

in 2004.

The cost share agreement for the

2

3

4

5

6

7

project was signed in August of 2011. It's a 50/50 cost share, meaning the State portion will be 50 percent of the total amount, which is the \$25.3 million. And the Corps will have 50 percent of that cost as well.

The project is expected to take

8 9

10

11 12

13

15

14

16 17

18

19 20

21 22

23

24

25

about five years. If we can condense that, that will be very beneficial to everyone involved because this is a very important project. That is the approximate timeline that we have allocated for the project.

And then the last thing is, again, this project will have one report, and it combines two of those large-scale studies: the hydrodynamic and the delta management portion.

So to look at the hydrodynamic portion of the project a little bit more detail is to evaluate the Mississippi River system. And when I say evaluate, it's looking at what resources are available in the river: the sediment, the nutrients, and the

freshwater. Where is it available?
Where can we best utilize those
resources? How do we implement the
best features to utilize those
resources? What tools do we need to
best study? How to implement these
processes. So it's kind of a little
bit of where is the resources, how do
we utilize it, and how do we move from
there.

And then the other portion of the study is to assess the operations in the Mississippi River and Tributaries system. And that essentially means we're going to evaluate ecosystem restoration, flood protection, navigation all on the same level.

So, traditionally, the river has been focused on navigation and flood protection services. This study will evaluate or elevate the importance of coastal restoration.

The delta management portion of this study will look at identifying specific features. So the hydrodynamic

part of it is focused on modeling, and where the resources are, and how those resources move around in the system.

The delta management side is going to look at, how do we implement those features, how do we evaluate the benefits and the impacts of these features to pick the best plan.

What was originally written in the 2004 report is that we would evaluate large-scale river diversions, and that would be anything or greater than 50,000 cfs. And we also look at alternative navigation alignments. And the third thing is that we would look at restoration features: outfall management, dredging. This also includes implementing features or analyzing features from the Master Plan.

Just to touch on the Master Plan,
this allows us the opportunity to
better implement where the projects
would be and what the CFS would be. Is
it a diversion? Is it a marsh creation

project? So this project is going to allow us to further analyze what was presented in the Master Plan.

The study will also help us define the analysis needed that we need to get to the point where we can issue permits for some of these projects, whether it's a diversion, whether it's marsh creation. And it's also going to allow us the information that we need to go to Congress to have these projects authorized.

(PRESENTATION BY CHERIE PRICE)

MS. CHERIE PRICE:

Thank you, Renee. I'm Cherie

Price. I am the Planner on the study,
along with Danny Weigand, with the

Corps of Engineers. I'd like to thank
everyone for coming out this evening.

We're really excited to hear from the
public on this important project.

I have a personal vested interest in this study since I was born, raised, and currently reside in coastal Louisiana or near coastal Louisiana.

And I'm going to start off with some of the challenges that we're going to face as we proceed on this study. So as Renee said earlier, there are, historically, there have been two primary focus areas or missions on the Mississippi River, which have been navigation and flood control, which the state and nation has benefitted greatly, as far as the navigation component and flood control. It's been very important in providing protection to communities up and down the Mississippi River.

And now with this study, we're looking at adding an additional layer of use on the river, looking at coastal restoration and trying to acquire as much of the river's resources, sediment, water, and nutrients, as we can to support restoration.

So we're all familiar with the issues that we face, including subsidence or land sinking and the erosional problems that we have in

coastal Louisiana. We're also finding that building diversions or trying to do restoration with artificial means, such as diversions or dedicated dredging is a very complex process. We have a lot to learn still. And we're hoping to be able to resolve some of those complexities and issues through this study.

Encroachment of the Gulf of Mexico.

We all know the Gulf is getting closer

and closer to some of our coastal

communities and that trend will

continue into the future. That is

something that we hope to offset in

certain areas.

So our basic picture, our overall study goal for this project is, basically, reconnect the river's resources to the delta areas surrounding the river and to provide sustainable restoration, not just restoration, but restoration that's going to stay there into the future over the 50-year period of analysis for

the study and even beyond that. We want to to that in balance with the current river uses of navigation and flood control.

specific. They're not as broad.

They're really going to focus in on trying to achieve some tangible results from the study. And the first one that we have is to really identify the Mississippi River resources that are available. What's out there. What can we use from the river. Once we get sediment from the river, how can we make it stay in some of the bay areas.

The next objective that we have is to provide a decision making framework. So that basically is going to include all the data and models that we will perform on the Mississippi River. It's a comprehensive set of models. I think it's unprecedented. It's beyond anything that's ever been done before on the lower river. And it's really going to help provide that

understanding that we've needed for so long.

So using those river models and basin models together will provide the understanding and framework for us to make more informed management decisions. And this study is not just specific to hydro delta management.

It's a programmatic study that's going to support other LCA near-term studies as well.

Opportunities. There's lots of opportunities here. As I mentioned earlier, we want to provide a systemwide data and tools to help make informed decisions to more effectively manage river resources and ways that's never been done previous. We've never looked at all three of these focus areas in unison together to see how they interact together, and what the effects will be doing large-scale dredging and implementing large-scale diversions on the river.

Reconnecting Mississippi River

That's kind of a repeat of 1 resources. 2 some of what I've mentioned earlier. But that's a big part of the study. 3 Increasing marsh elevation is going 4 5 to be very important to try to keep up 6 with the current subsidence and sealevel rise rates. We want to prevent 7 8 marshes from drowning and keep them 9 above water. And adjusting bayside hydrology is 10 11 basically avoiding waterlogging of the marshes and implementing outfall 12 management measures that institute 13 certain widths and depths in the bay 14 15 area to help promote sediment retention 16 and land building. With that, I'll turn it over to 17 18 Sandy Stiles, who will talk about the NEPA process. Thank you. 19 20 PRESENTATION BY SANDRA STILES) 21 MS. SANDRA STILES: 22 Good evening. I am actually a 23 stand-in for Bill Klein, who is the Environmental Manager of this study. 24

He's not feeling well; so I gladly

volunteered to attend. And then I
learned that I was speaking. So here I

am.

3

25

So the National Environmental
Policy Act of '69, basically, ensures
that environmental information is
available to the public and to
decision-makers prior to any decisions
being made.

Scoping is part of the NEPA process. Out of the National Environmental Policy Act of 1969, CEQ, the Council of Environmental Quality was set up. And they in turn developed regulations, 40:CFR:1500, which spelled out how Environmental Impact Statements would be done. And part of that was the scoping process in which it gives the public an opportunity right from the beginning of the study to have a forum for focusing what they'd like to see happen with a project and get their issues out there and addressed and get them involved in the project from the beginning all the way to the end.

So the Environmental Impact
Statement is what we're going to be
developing for this project. Any time
there's a major federal action, there's
the requirement to develop some kind of
Environmental Assessment. It can be an
EA, which is a smaller document or
Environmental Impact Statement, which
is far more complicated and goes into
more detail. And EIS is what we'll be
developing for this study.

The schedule of the EIS, the Notice of Intent was published in the Federal Register March 23, 2012, of this year. The scoping process is -- the Notice of Intent is part of the scoping process. And we're in the scoping process at this time.

And what will come out of the public meetings that we have scheduled over the next couple weeks, we'll develop a scoping report. And to get your comment into that scoping report, we ask that you submit, send to us, whether you do it here tonight, or you

fill out a card and send it in within 30 days so that we can develop the scoping report. And we'll mail that scoping report out to anybody that makes comments or requests a copy of the scoping report.

The draft EIS will be ready around November of 2015. Then the final EIS in January of 2016. And that will end with a record of decision.

so as I stated, the scoping includes the publication of the Notice of Intent in the Federal Register, and that was March 23; the public meetings inviting the public to participate, and we want to hear what you have to say about the study, the issues that you have, what resources you think are important are going to be affected, what should we be looking at. That really helps guide the study and tells us what we need to put into our environmental evaluation, what do we need to focus on, and what is maybe not so important we don't have to focus on

it in quite so much detail.

This is your opportunity to help guide the study, and we really value that. As I stated, there will be a public scoping report that will be developed once all of these six or so public meetings occur, and we gather everybody's input and develop it into a report. And we'll provide that out to everybody that's provided comments or that requests to see that.

Then Lee is going to lead us in a question and answer session.

(QUESTION & ANSWER SESSION)

MS. MEULLER:

As I described earlier, this is really your opportunity to ask the team members any questions you may have.

They are sitting in the front two rows here.

So with that, we just ask you to approach the mic, state your name so that we can capture it with the transcription service. And as I said, we'll do the best to answer your

questions. If you don't feel like we adequately answered it, we'll go ahead and make sure we get your contact information before we leave. We just ask that you raise your hand.

MR. WILLIAM FONTENOT:

My name is William Fontenot. I
live here in Baton Rouge. And I served
on several citizen advisory committees
for the U.S. Army Corps of Engineers,
the NOBRA Study, which is the New
Orleans Baton Rouge Wildlife Resource
Study.

And I think part of - it's really exciting that you're doing this project, and it is being done. I think part of the problem is that it's not a big enough area. This should include the Atchafalaya River Basin, Bayou Teche, Vermilion River. So this is not including a major part of the delta system of the Mississippi River.

You're also missing a major part of the upper river basin. I'm trying to think how to illustrate. You're

2

3

5

6 7

8

9

10 11

12

13

14

15

16

17

18

19 20

21

22

23

24

25

looking between the Gulf of Mexico and Vicksburg. And it would be kind of like if you went into a doctor's office, and the only thing the doctor was allowed to look at would be your foot. And you'd have to diagnose what's wrong with the patient by only looking at the foot.

There are about a million structures that have been built in the Mississippi River Basin. There are at least 43,000 major dams. And some of those have caused dramatic losses of sediment. There's an article written by the Associated Press writer just a few years called "Missouri River Sinking." And in it -- he was up in Kansas. And he said, the Missouri River, the lower part of the river below the last dams on the Missouri River has been scouring out the river. The whole river has dropped 8 to 12 feet. It's not less water. It's just the whole river is scouring out because no sediment is coming across the last

big dams. And so the river water gets
up in those dams, and it needs to do
something. So it's picking up the
sediment out of the river. And it's

5 bringing (inaudible) down.

That scouring of the Missouri River is making up for all the sediment which is probably now behind thousands of dams in the Missouri.

If you don't consider that as part of the whole system, you're only considering a tiny part of it. So I have the problem with the lack of information that's been provided and the lack of information that's being considered by the U.S. Army Corps of Engineers in this project. I got a lot of -- WRDA and a few other things.

I would certainly think that the seven members of Congress from

Louisiana would have talked about this and the two U.S. Senators.

I was in Congress. I think all the Congressional delegation from the Gulf Coast states were talking to us. I

don't think that happened.

MS. MEULLER:

Would you like Cherie Price to address your question about the Atchafalaya?

MR. WILLIAM FONTENOT:

Sure, yes. And I apologize for being so negative, but it's been a big concern of mine. I worked in the Attorney General's Office for 27 years in my job. What I did was try and help people understand how to deal with environmental problems. I think that it's impossible to solve the coastal problems in Louisiana without looking at the entire Mississippi River Basin. That's seven major rivers that drain the Mississippi, parts of 30 states.

MS. MUELLER:

It sounds like this would be appropriate for us to capture in the formal scoping period as well. So if you have any questions for Cherie, she can answer them. But then, once again, you have the formal scoping period.

1	MR. WILLIAM FONTENOT:
2	I'll be glad to.
3	MS. MUELLER:
4	Do you have any questions now?
5	MR. WILLIAM FONTENOT:
6	Is there a process where I need to
7	go meet with my members of Congressm
8	the two Senators? Is this all put in
9	stone that we're only going to look at
10	the main channel in the Mississippi
11	River and not include the Atchafalaya?
12	MS. CHERIE PRICE:
13	The Atchafalaya River,
14	specifically, looking at operation of
15	the Old River Control Structure and the
16	7030 split is actually also listed as
17	an LCA large-term, large-term, I'm
18	sorry, large-scale long-term study.
19	For this particular study, the decision
20	was made to focus primarily on the
21	Mississippi River just because of the
22	sheer magnitude of the work that's
23	involved and the date that's required.
24	There's data that we needed
25	historically on the lower river that

we've been missing for decades. And
this is our first opportunity to be
able to go in and collect data below

Baton Rouge to support the study.

And because of that, because of the extensive nature of the data collection and the modeling on the river, a decision was made to focus primarily on the Mississippi River at this time so that we would have a great product and science-based tools to make informed decisions off of on the Mississippi River. I don't know if that answered your question.

If we look at the Atchafalaya, it will take away from the Mississippi River effort that we're undertaking, and we would have to look at the effects of the entire Atchafalaya Basin and the effects on the Old River Control Structure as well.

MS. MUELLER:

Do you have another question?

MR. STEVEN PEYRONNIN:

This is an awfully formal informal

Q&A. I better state my name, Steven
Peyronnin. In thinking about the
context of the EIS, I guess I'm
curious, especially for anybody in this
room, the dynamic nature of, not only
the delta but coastal Louisiana, the
rate we're experiencing coastal land
loss and coastal change.

How is the EIS going to be captured, not aesthetic current condition of the landscape, to judge impacts it gets but in fact a time frame under which we would see continued degradation of that landscape and measure the potential impacts of this type of project against a future scenario without any additional action?

MS. CHERIE PRICE:

On all four studies, we're required to make comparisons between a future, it's called, a future without project scenario to a future with project scenario, which basically means, if no action were taken at year 50, then what would the landscape look like versus

different alternative scenarios that we would analyze through the study.

So we'll be required on both the Mississippi River modeling and on the bayside modeling to complete that analysis. And the future without project analysis will include the landscape change analysis.

And that's something we're going to work together with CPRA on, using methodologies that were applied in the State Master Plan to the study.

MR. SHERWOOD GAGLIANO:

Good evening. My name is Sherwood Gagliano. I've been involved in this process since the birth of NEPA in 1969 when I became project director for a contract between the Coastal Studies Institute and the New Orleans District Corps of Engineers to initially evaluate the effects of the proposed diversion of the flow of the river to Texas and New Mexico. That evolved into a five-year contract in which 25 technical reports were produced.

Toward the end of that, I believe we produced the first coastal restoration master plan for the state for the coastal zone that has virtually all of the elements of the current state's master plan.

I wish you good luck. I'm worn out. It's really encouraging to see bright, shiny faces because you've got a real challenge. Initially, the challenge was even getting the citizens of this state to recognize that the delta system was something beautiful and important and dynamic. And that was a long process, all of the things we kind of take for granted, all required, literally, years of debate and discussion.

One thing that I would urge is that you don't forget the body of knowledge that is the platform for what you're doing now. My biggest fear is that we're going to go back and recreate the same method and theory only to find that maybe it's not as good as the

first one. And I urge you to take
advantage of a few old heads like
myself, who are still able to
contribute something and are interested
in the outcome and don't blow us off.
We've got something to say.

And I know that the NEPA process has a mechanism for taking that into consideration. But public scoping meetings are a great device but they're not the only device. It's important that you get some of this historic knowledge into the basic planning sessions where the wording is not and the debates take place.

One thing that I'll just been appalled by in all the years that I've been involved in this is that the tendency of agencies, when given a charge by Congress, to go into a black box atmosphere and to, basically, sequester a team that they're isolated from the public until the draft is put on the table. And here it is, take it or leave it, you have 30 days to

comment on something that costs billions of dollars sometimes to do and took years to do. And the public just doesn't have the resources or ability to respond in that fashion. You got to get involved early on.

I wish you the best of luck. This is a great project. It's been long in coming. And we all citizens of this state applaud the effort. Thank you.

MS. MUELLER:

Thank you. Thank you for your comment.

MR. DARRYL PAUL WARD:

Darryl Paul Ward, Garden of Eden.

What I was wondering about is the

freshwater diversion and the sediment

of the plant life. Is there anything

in there for plant life for fuel and

for food? Because this is going to be

the new world of plants. And I want to

know want to know if the Army Corps of

Engineers are planning on anything of

this nature, plants?

MS. CHERIE PRICE:

Let me see if I understand your question. Are you wondering what the effect will be on sediment diversions and freshwater diversion on the vegetation and marsh areas?

MR. DARRYL PAUL WARD:

Yes. That and will anything be added to, in forms of plants for food or for fuel?

MS. CHERIE PRICE:

Well, let me handle the first part of your question first. So sediment diversions, generally, provide mineral sediments from the river which have nutritive value or biomass in marshes for below ground biomass and above ground biomass. So there will be a benefit to vegetation.

But there is a balance between how much water was put into the marshes and the effects that it will have on some of the vegetation that's there. And we also have Sandy, our environmental planner, provide more information on that, also, if you need more

information.

As far as plantings go, generally, when dredged material is placed for restoration purposes, it vegetates itself very quickly within six months to a year time frame. If there is a need for plantings for erosional purposes or something, that's some thing we would evaluate as part of the study?

MR. DARRYL PAUL WARD:

So y'all will evaluate that and put that into consideration?

MS. CHERIE PRICE:

But as far as using it for food,
that's not going to be part of the
study process. It would be more to
maintain a balanced ecosystem, marsh
health, and marsh integrity, that would
be more of the purpose of vegetative
plantings.

MR. DARRYL PAUL WARD:

Well, when y'all build a barrier island, something to stop the waves from coming, is there any vegetation

going to be on it? 1 2 MS. CHERIE PRICE: Well, one example is the island 3 that was created as part of the West 4 5 Bay Diversion. That island, in 6 particular, was one that vegetated very 7 quickly within six months to a year. 8 It was completely covered with 9 vegetation there. But if there's a need for it, that's something we'll be 10 11 evaluating. MR. DARRYL PAUL WARD: 12 13 Good. I wanted to bring this to your attention. 14 15 MS. MUELLER: 16 Do we have any more questions? Well, if we have something that 17 18 triggers your thoughts during scoping, the team will be around afterwards, and 19 you can talk to them one-on-one if you 20 21 have any further questions. 22 But now, we're going to go into the 23 more formal scoping process. 24 (FORMAL SCOPING PROCESS) 25 MS. SANDRA STILES:

So this is the part where we get to hear what you have to say in form of comments. We won't address any questions or answer your questions.

But this is your opportunity to tell us what you'd like to see in the study, look at what you think the important resources are. Here's some sample questions up here on the screen to help guide your thought process and some of the things we'd like to know.

There's a lot of things we can cover in the Environmental Impact
Statement. We use the scoping process to help us narrow down what's important to the community and the public. So this is your opportunity. So feel free to come on up.

Does anybody have a comment?

MR. RICHARD GOYER:

My name is Richard Goyer. My
comment would be to involve private
landowners in the process up front,
instead of trying to get support later
on after a decision has been made on

projected outcomes. 83 percent of our
coastal land is owned by private
landowners. And often times, they're

left completely out of the box and are not involved until somebody says, well,

6 we're going to do this with your land.

What are their rights to manage the land after it has been restored? So that is a very prime consideration.

These people own tens of thousands of acres of land. They're not just Joe's Hunting Camp. They are large concerns owning thousands of acres. And they

representatives, our parish presidents,
Congress. And they're often left out
of this mix in the process.

have the power of our state

So my advice, if you want to call ut that or comment, would be to involve landowners up-front so that they know what their benefits are and maybe what their constraints are. And are there chances for easement potentionally, for instance, to utilize their land. This has to be done, these studies.

And I conducted research for years. 1 2 The biggest problem is to find the landowner that would allow me to study 3 4 on their land without just going out 5 there and being a trespasser. And that 6 will become very important, as Dr. 7 Gagliano mentioned, in your study 8 objective --9 MS. SANDRA STILES: How do you --10 11 MR. RICHARD GOYER: -- and don't get them up-front. 12 You can call them in meetings, other 13 than just scoping process required by 14 15 NEPA. MS. SANDRA STILES: 16 17 What is your vision for 18 involvement? What do you think that would look like? 19 20 MR. RICHARD GOYER: 21 I would think that you would try to 22 identify the organizations that are 23 represented. For instance, there are 24 many foundations, non-profit 25 organizations, that are conducting

restoration projects of their own. I work for one, just as an example, St. Bernard Wetland Foundation as one of their board of directors. We are constantly doing restoration work within the geographic areas in the parish.

But we don't necessarily have an option to visit with Mr. Klein, personally, and say, okay, this is where we think we can do this, that, or the other thing, and what are my benefits, or what are my cons of this project. Are you going to dig a hole in my land? What resources do I have to do that? Somebody points a finger and says, this will happen. And yet, it's often without any provided input from the landowners.

MS. SANDRA STILES:

So, maybe, like a workshop forum or something that we invite the people to come a day, and we can talk about - MR. RICHARD GOYER:

A less formal version of the

scoping process. But begin with the people that are planning, you for instance. We don't need Colonel so and so or General so and so. We need the person who's planning the study to specifically find out what their interests are.

MS. SANDRA STILES;

Okay. Appreciate your comments.

MS. MAURA WOOD:

Hi. I'm Maura Wood with the

National Wildlife Federation. I'm very
happy to hear you say that restoration
and navigation and flood control will
be equal in the study. That's a very
important part of what needs to happen
here.

I also should come up and ask a question about the data collection that you're planning as part of this study. Hopefully, you're out there gathering data now. I know it takes a while. But we need to use this as an opportunity to fill some of the data gaps that, surprisingly, we have quite

large data gaps, even with this river
that's so closely watched.

And we need this information to be able to make these informed decisions that you're talking about on how we can create a system of management that includes all of the restoration features as well. And they can be part of the flood control system and the navigation maintenance as well.

I encourage you to look to the
State and the State Master Plan as the
model of how you can involve
stakeholders over time in the formation
of a plan in the framework development
team and in the focus groups.

You have an example there of how, what you've heard at least twice now tonight, you know, requested. And those requests come from the heart from people who care about the coast, who work on the coast, who depend on the coast, who grew up there like you, who have a tremendous amount of knowledge that is also a piece of what you need

to pull together in this study.

MS. SANDRA STILES:

What do you see as data gaps? You mentioned data gaps, data collection.

What kind of things do you think need to be captured?

MS. MAURA WOOD:

Well, for instance, one of the things on the Myrtle Grove Diversion that our NGO partnership and the State was able to do was a very site specific data collection looking at all of the parameters of the river right in that section where we want to put a diversion, not at Torbert's Landing, or not an annual average ratings curve, but right here at these times of year, what's happening, where's the current, where's the sediment, what does the river look like, how can we grab that sediment.

So we need very -- so where we're planning diversions, we need very specific information in those reaches of the river in particular.

MS. SANDRA STILES:

Thank you for your comments.

Anybody else have some comments?

Anything you'd like us to look at?

MR. WILLIAM FONTENOT:

William Fontenot, again, Baton
Rouge. I think what would be very
important in your Environmental Impact
Study is to identify what information
processes are missing. If a project is
focusing on a part of the country which
has been adversely impacted or greatly
altered by thousands of other projects
in other parts of the country. And I
think in some way of connecting those
things together leaves a tremendous
hole or void in your Environmental
Impact Statement.

Because you're not really identifying what the environment is that is impacting what's going on in coastal Louisiana. So it's only a partial Environmental Impact Statement is what you're proposing. And that's not bad that you're doing this project.

But I think it's important to identify
what is not included. So if somebody
reads it, they will understand or,
hopefully, be able to understand it, a
member of Congress from Ohio will be

able to, or Montana, or New York would

be able to look at this and say, oh,

these are some of the things we should

of included in the statute. And next

time look at this, identifying

something like this. We should be

looking at something more

comprehensive.

I think if you say this is the Environmental Impact Statement on restoration in coastal Louisiana without including part, a major part of the Delta where some land building has actually occurred one of the few places in the world that land building is occurring in the Delta. And you don't include information about all of the other 43,000 structures, major dams that built in this system, then the person reading it won't be able to

5

understand what information is not there. So I think that's part of what's missing in just about every environmental impact statement I've ever looked at, and I've looked at a lot of them.

It's hard for people to make an informed, get their thought process working. Dr. Gagliana is somebody, and people who have gotten up and spoken, are people you ought to be sitting around a table with saying, okay, what is it we oughth to be trying to do, and how can we have a much better outcome, a more complete document that will be useful that will use the work the individual groups that work on for decades. We've got in this room lots of people who worked on lots of things.

We need to find some way to get them and other folks, who have worked on these issues and studies to be able to bring their information to you and include their information in what they're looking at. Otherwise, you're only doing a one percent environmental impact statement.

MR. STEVEN PEYRONNIN:

Restore Coastal Louisiana. I guess to follow-up on the informal portion. I was very encouraged to hear that the environmental impact will look at a future without action. We've been looking at what's happening in coastal area of Louisiana. That's just one small component of our future without action.

Restoration of our cost is going to require bold action. We believe that this is the type of effort that is going to start that bold action. And given the level of collapse that we're experiencing, it's reasonable to expect there are going to be large-scale changes if ultimately the decision is made to move forward with a complete rethinking of how the river is managed. And from the Environmental Impact Statement, that can often be something

5

that sets the project back. But
measuring it for future without action,
what's happening in our coast, it's
clearly important that that be given
some contents.

And I bring that up, not just for the purpose of talking about habit or wetlands, but we're talking about the radical changes we might expect to see from a project of this nature to fisheries to communities to economies to navigation and floor control.

I say that, not from the

perspective of trying to simply

maintain the things the way they are,

primarily, flood control and

navigation. Because, as I think many

people are beginning to understand,

highest levels of the Corps, highest

levels of Congress, people who use

those resources, that those current

uses of the river are unsustainable in

their current operation. Sea-level

rise changes are shifting the epicenter

of the river. Dredging costs are

rising. Fuel costs aren't coming down
any time soon. Expansion of the Panama
Canal is going to mean increased
pressure in economic incentives for
maintaining depths of the river.

Those are all critical contextsensitive pieces that need to be
considered. When we look at the
challenge of re-engaging and
reconnecting this river to a delta,
that it's going to mean bold change
with the environment and our coast.
But that has to be measured against the
consequences, not just to the
environment, but to the very principles
of the MRNT (phonetic) if we do
nothing. Thank you.

MS. SANDRA STILES:

Thank you for your comment.

MR. DANIEL BECKER:

Daniel Becker. I wanted to know what you would do with the oilfield canals? Because most of this land that the projects takes place are in private land. And the oil canals are still

there. They're all dredged by dredge boats. And most of these projects that you propose have dredge boats as the source of the material that they're going to put back in there. And what are you going to do with all the spoilbanks that are just sitting there and you've already created a problem with the dredge boats by dredging canals once? How do you think more canals are going to be a solution?

And I don't think you have enough river sediment and that you can get it far enough away from the river to make that bit of good where you can just look on any map and google, and you'll see how many oilfield canals are there, canals on top of canals, turnaround canals.

So you can't dredge and fill over a pipeline. I once proposed a project to look at how many flow lines were in the state and to use some space shuttle data, ground penetrating radar. And I think it would be an interesting study

to know how many flow lines are in the 1 2 state. And they're full of naturally occurring radioactive material. 3 4 They're supposed to replace those flow 5 lines. So how are they going to 6 replace the flow line if you build 7 wetlands there? 8 And I think what they want to do is 9 play in their sandbox. They bought up a bunch of oyster leases to go play in, 10 and they're letting the oil companies 11 do whatever they want. 12 MS. SANDRA STILES: 13 14 What would you like to see happen 15 with those oil canals? Do you have 16 ideas? 17 MR. DANIEL BECKER: 18 I'm full of ideas. MS. SANDRA STILES: 19 20 This is the forum for them. 21 MR. DANIEL BECKER: 22 Well, I'll submit a project at the 23 proper time. And I've already 24 submitted a project for one of the 25 early CWPPRAs for demonstration.

2

3

4

5

just wanted to hear from you. Aren't

buried pipeline?

most of these projects taking place away from the oil and gas production areas because you can't bury a pipeline, you can't dredge over a

24

25

Pipeline canals are always going to be over open water conduits. It would be like having a pie that's running, and you cut holes off through it. pie leaks out. Well, you can do whatever you want with the river sediment. As long as these canals are there, the saltwater is going to continuously invade.

The No. 1 problem we have is saltwater invasion. Then you have freshwater plants die. And I'd like to say, most of these islands that you build are just vegetating by whatever grows there. They dredge these things 4 feet high. So you have a 4-foot high pile of sand. Anything will grow on First flood, saltwater takes over and kills all those plants.

So until you stop the saltwater from coming up all these millions of oilfield canals that we have, anything you do is going to be, just to preserve land can be a land building event.

So I'll tell you what you did was that you changed the definition of what a wetland was first. You had a proposed amendment. You voted on it. You changed the definition from wetland to coastal, which included roads, bridges.

The guy from CWPPRA just said he wanted more navigation. They can't bring supertankers up the Mississippi River anymore. The supertankers are going to go to Houston. They're closing the Port of New Orleans. They're going to build a millennium or some sort of port down by Fouchon. That's the main plan. The hardened loop is the offshore oil platform is the soft target. They're going to build that as a hardened

infrastructure.

1 Billy Nungesser already has his 2 dredge boat waiting at the mouth of the river to build the berm around Grand 3 4 The Dutch want to build it better berm around Grand Isle. I think 5 6 that's a waste of funds. And I think 7 your project is going to not help the 8 average fisherman that lives in the 9 area. And I mean you can study how much 10 11 river sediment is there. It's going to 12 change every year. They already have them, I'm sure, sediment gages and 13 structures like that in place. This is 14 15 the Corps of Engineers. They've been watching the river since I was born. 16 Thank you. 17 18 MS. SANDRA STILES: Thank you for your comment. 19 20 Anybody else? Come on up. 21 MR. SHERWOOD GAGLIANO: 22 Since some of the other speakers 23 have already set the precedent, I'll do

the same too. I have a prime

suggestion. Louisiana has a federally

24

25

approved coastal management program that's been authorized since the 1970s. Most of our coastal parishes have been in the effected area here have approved local government programs. And those are extremely effective as a forum for collecting ideas.

First of all, NEPA, as you well know, is a three-legged stool, social, economic, and environmental benefits have to be considered. And one of the big economic benefits is this coastal restoration effort, including the proponents that you're working on, is without a doubt the largest new industry is this state. It should employ people.

An important part of this should be to look ahead at what kind of jobs we're going to create to reach sustainability, mot just put these things out and walk away. We put them out and manage them and make sure they're operating properly, functioning properly. That requires a whole array

of skills.

We've got some indication of this, the BP Oil Spill. We had fishermen go out and apply oil booms and do tasks.

And we really didn't have a trained workforce for it. It worked, but it wasn't very efficient.

So what I'm suggesting is that we incorporate the local government coastal management programs, which are legally in place and have considerable weight because they make recommendations to local public officials. And local public officials can act on that, as the primary way of exchanging data and getting public input into this process.

And to forever demonstrate the importance of that, President Obama, a year or so ago, several years ago now, developed, made a strong commitment for restoration of hurricane damage to the Gulf Coast. And if you read the white paper documents that came out of these committees, they all say that what the

President says and those documents reflect is that we need vision plans that develop at local levels. And those vision plans in my view need to incorporate social, economic, and environmental benefits.

For example, St. Bernard Parish has been working -- first of all, they had the first coastal management program in the State of Louisiana that's been approved. That was in the 1970s. And they sill meet religiously at least once a month and look at permits to develop recommendations. And they are active. It was the efforts of that board and the citizens of that parish that recognized the danger of MRGO and, ultimately, resulted in having it closed.

So it is a platform, framework, for collecting information. And instead of waiting until the draft EIS is put in the public library, before you start working with the local folks, that's the (inaudible). Again, I really like

this forum. This is great, and you're on the right path. My name is Sherwood Gagliano.

MS. SANDRA STILES:

Anybody else like to come up and give a comment? I guess we're done with the comment portion then.

We have on the slide - they have cards that you can fill out to put your comments on and mail into us at a later time. You can do it by email, as noted up here on the slide. And then Bill Klein, he is the environmental manager. That's his contact information. And then the address on how you can mail in your comments to Bill.

And looks like we need to have them by May 4 in order to make it into the official scoping report. Although, I'd just like to note that scoping is occurring with the study throughout the study until the draft EIS goes out for public comment, and then in cases can go even beyond towards the final.

So while we're asking you to get

3

4

5

6

your comments to us so we can get it into the scoping report, it is something that occurs throughout the study. So we certainly welcome any ideas that you have throughout the study. We appreciate everybody coming out tonight.

7

MS. LEE MUELLER:

your input.

9

It is not our intention to build the study in a black box. So your continued participation is very important to us. Please visit lca.gov.

12

11

importante do ap. Traabe Vibre realigov.

13 14 We do have a project website up. A lot

15

Also, as a formal part of the draft,

of good information we put on there.

16

the study will be available in 2015.

17

our webpage. And then if you guys have

18 19

additional questions, these are some of

So this is just a screen shot of

20

the team members that will be available

21

to answer those questions. There will

22

also be available tonight. Thank you

23

very much for coming. We appreciate

24

25
