## Introduction

The Virginia Forest Highway Program is allocated a limited amount of funding each year from the Federal Highway Administration to make improvements to the roadway network. While an important part of maintaining the Forest Highway network, these funds represent only a portion of the identified funding need.

In 2009, the Tri-Party Program set out to develop guidelines for a Long Range Transportation Plan (LRTP) for the Virginia Forest Highway Network, which encompasses the George Washington and Jefferson National Forests. A primary aim of this undertaking was the creation of a more systematic means of prioritizing investments in the Forest Highway network, with an eye toward more efficient allocation of limited resources. To that end, the Tri-Party Program hired a consultant team to develop a process for evaluating projects and prioritizing investments in Virginia Forest Highway network.

The consultant team's work resulted in the identification of over-arching goals to guide the LRTP process and specific criteria for identifying the areas of greatest need on the Forest Highway network. The maps included in the appendix of this report use the best and most recent available data to highlight those Forest Highway segments that might be considered candidates for improvement.

## Forest Highway Program and Tri-Party Program

The Federal Highway Act of 1921 established Forest Highways throughout the United States. Forest Highways initially were defined as those forest roads which serve the national forests and also serve the communities within and adjacent to the national forests. The 1978 Surface Transportation Assistance Act (STAA) redefined the term Forest Highway to mean "a forest road under the jurisdiction of, and maintained by, a public authority, and open to public travel."

The Forest Highway Program is a federal program administered by FHWA's Federal Lands Highway Division in cooperation with the appropriate Forest Service region and the State Department of Transportation. This Tri-Party Program of FHWA, the Forest Service, and the State DOT evaluates and selects projects for the Forest Highway Program. The Tri-Party Program meets annually to review the Forest Highway Program and to consider any adjustments in schedules and funding as needed.

In Virginia, Forest Highways are public roads that are owned by the state, and are a subset of the overall road system. They provide safe and adequate access to George Washington and Jefferson National Forests – the state's only National Forests – and support economic development activities for local residents. The Virginia Forest Highway Network receives an annual allocation of \$2 million to be used for planning, federal lands highway research, preliminary and construction engineering, and construction. Maintenance is not an eligible activity for Forest Highway program funding.

The FHWA Eastern Federal Lands Highway Division, the Forest Service, and the Virginia Department of Transportation (VDOT) comprise the Tri-Party team in Virginia. Eastern Federal Lands, the Forest Service, and VDOT jointly determine the priorities for the Forest Highway Program.

## George Washington and Jefferson National Forests

The George Washington and Jefferson National Forests contain nearly 1.8 million acres of public land, representing one of the largest blocks of public land in the eastern United States. Of that acreage, nearly 1.65 million acres are located in Virginia: 956,222 acres in George Washington National Forest and 690,000 acres in Jefferson National Forest. The two forests were administratively combined in 1995.

In Virginia, these National Forests are located approximately parallel to Interstate 81, and run from Front Royal in northwestern Virginia to the Kentucky and North Carolina borders in the southwestern part of the state. The two National Forests are spread across 32 counties in Virginia (Table 1).

**Table 1: Counties Containing the George Washington and Jefferson National Forests**

Forest	Counties
George Washington NF	Alleghany, Amherst, Bath, Botetourt, Frederick, Highland, Nelson, Page, Rockbridge, Rockingham, Shenandoah, Warren
Jefferson NF	Bedford, Bland, Botetourt, Carroll, Craig, Dickenson, Giles, Grayson, Lee, Montgomery, Pulaski, Roanoke, Rockbridge, Russell, Scott, Smyth, Tazewell, Washington, Wise, Wythe

In Virginia, George Washington and Jefferson National Forests are traversed by more than 1,107 miles of Forest Highways, including the Blue Ridge Parkway. The Virginia Forest Highway network provides access to sites within the forests and connections to several major transportation routes, including multiple interstates and numerous U.S. highways. The forests are situated adjacent to a major north-south transportation corridor, Interstate 81, which crosses the forests in multiple places. Two other interstates (I-64 and I-77) also run through the forests. Portions of the forests are located within 30 miles of the Washington, D.C. metropolitan area and within 75 miles of the Richmond metropolitan area.

## Existing Conditions

The accompanying set of maps illustrates existing conditions and trends on the Virginia Forest Highway Network according to each of the aforementioned criteria. The maps are arranged by goal, and include several overview maps of the study area and demographic data. The final map displays the composite scores for the Forest Highway segments.

### Goal 1: Access and Mobility

County demographic data were examined for the counties in the vicinity of the forests, and are reflected in accompanying maps. The data reveal that a number of counties around the forests are projected to have relatively high populations by 2030, due in large part to population

centers in Roanoke, Lynchburg, and northern Virginia. A considerable number of Forest Highway segments are located within 25 miles of multiple high population counties.

Data on road surface quality were analyzed for more than 738 miles of Forest Highways. The majority of roadways were classified as Fair or better. See Table 3 for findings from this analysis.

**Table 3: Road Surface Quality on the Virginia Forest Highway Network**

Surface Quality	Miles	Percent of FH Network
Excellent	11	1.5%
Good	153	20.7%
Fair	394	53.3%
Poor	181	24.5%

Data on road surface type were analyzed for more than 1,031 miles of Forest Highways. The data show that 71.7% of the Virginia Forest Highways are paved. See Table 4 for findings from this analysis.

**Table 4: Road Surface Type on Virginia Forest Highway Network**

Surface Type	Miles	Percent of FH Network
Chip Seal	376	36.4%
Bituminous Concrete	364	35.3%
Gravel	292	28.3%

## Goal 2: Safety

Crash data over a five-year period (2003-2007) show that there were 70 fatal crashes on Forest Highways during that period. The data also show that nearly half of the 643 Forest Highway road segments had less than one crash per million vehicle miles traveled (VMT). See Table 5 for findings on this criterion.

**Table 5: Crash Density on Virginia Forest Highway Network**

Crashes per Million VMT	Road Segments	Percent of Total Segments
More than 10	55	8.5%
5-10	69	10.7%
1-5	210	32.7%
Less than 1	309	48.1%

Safety data also reveals that, of the 361 Forest Highway bridges for which data were available, 76 bridges are rated as deficient, with 18 bridges qualifying for replacement and 58 bridges qualifying for rehabilitation. Road segments with deficient bridges receive higher priority than segments with no deficient bridges, with greatest priority given to segments containing bridges that qualify for replacement.

## Goal 3: Resource Protection

An examination of road surface type and flood plain data reveals that nearly 6% of the Forest Highway network with a gravel surface was located within a flood plain. Higher priority is assigned to gravel road segments in which some or all of the segment is located in a flood plain. See Table 6 for findings on this criterion.

**Table 6: Surface Type and Flood Plain Status on Virginia Forest Highway Network**

Road Surface and Status	Miles	Percent of FH Network
Gravel, Located in Flood Plain	61	5.9%
Paved, Located in Flood Plain	265	25.7%
Paved, Not in Flood Plain	705	68.4%

Data for the other Resource Protection criteria show that 15.2% of Forest Highway road segments are located within one mile of a wilderness area, and 20.9% are located within one mile of a river designated as wild or scenic. Road segments within one mile of these protected resources are assigned lower priority.

## Process for Prioritizing Forest Highway Investments

### Identification of Goals and Criteria for LRTP Process

Through preliminary discussions and subsequent revisions at a one-day workshop in Edinburg, VA, the Tri-Party team agreed to a set of goals to establish a solid foundation for the LRTP. The goals reflect the Tri-Party team's priorities for the Forest Highway network. These goals will enable the team to prioritize transportation improvements within the National Forests based on a data-driven needs assessment for each Forest Highway link.

The Tri-Party team identified three goals to guide the LRTP process:

- Goal 1: Access and Mobility – Enhance access and mobility for multiple purposes in the National Forests, including recreational visits, commercial uses, and through trips.
- Goal 2: Safety – Improve the safety of the Forest Highway system
- Goal 3: Resource Protection – Preserve natural resources

After establishing the overall goals for the LRTP process, the Tri-Party team developed criteria for each goal as a way to evaluate the need for improvements on each Forest Highway link (i.e. distinct roadway segments). The criteria within each goal reflect both the team's priorities for the Forest Highway network and the available data. The team later assigned weights to each criteria based on perceived importance of each criteria to the overall planning process.

#### **Goal 1: Access and Mobility**

- Criterion 1: Existing traffic volume
- Criterion 2: Proximity to high population counties in 2030
- Criterion 3: Proximity to high priority recreation sites
- Criterion 4: Status as a major commercial route
- Criterion 5: Pavement condition

#### **Goal 2: Safety**

- Criterion 1: Crashes per Vehicle Miles Traveled (2003 to 2007)
- Criterion 2: Number of fatal crashes (2003 to 2007)
- Criterion 3: For links including bridges, do the bridges qualify for rehabilitation?
- Criterion 4: For links including bridges, do the bridges qualify for replacement?

**Goal 3: Resource Protection**

- Criterion 1: Whether the Forest Highway link is a gravel surface that is in a flood plain
- Criterion 2: Proximity of the road link to wilderness areas
- Criterion 3: Proximity of the road link to wild and scenic rivers

Each criterion is intended to capture some aspect of the system's needs to assist the Tri-Party team in prioritizing Forest Highway improvements. To provide greater clarity to the evaluation process for each goal, the way that each criterion articulates need is described below.

**Goal 1: Access and Mobility**

- Criterion 1: Existing Traffic Volume – One component of improving access and mobility is to target projects that improve travel for the greatest number of people. Traffic volumes provide an indication of which Forest Highway links receive the greatest use based on existing travel patterns. Therefore, road links with higher traffic volumes indicate a greater existing travel demand and should receive priority over road links with lower traffic volumes.
- Criterion 2: Proximity to High Population Counties in 2030 – Similar to Criterion 1, one component of improving access and mobility is to target projects that improve travel for the greatest number of people. Therefore, road links that are within 25 miles of future high population centers generally indicate the potential for greater future travel demand and should receive priority over road links that are further from high population centers.
- Criterion 3: Proximity to High Priority Recreation Sites – Another component of improving access and mobility is to target improvements on the Forest Highway links that lead to the destinations of greatest interest to people in the National Forest. As recreation is a major priority for the George Washington and Jefferson National Forests, enhancing access and mobility to those sites with the highest levels of usage is a major concern. Road links that are within five miles of high priority recreation sites indicate the potential for greater travel demand and should receive higher priority than road links that are further from these sites.
- Criterion 4: Status as a Major Commercial Route – Economic development is also a key component of access and mobility. Those Forest Highway links that are identified as major commercial routes will be prioritized over links that are not major commercial routes.
- Criterion 5: Pavement Condition – The quality of the pavement condition is also a major factor in providing high-quality access and mobility on Forest Highway links. Therefore, Forest Highway links with lower pavement condition ratings will receive higher priority than links with higher ratings.

**Goal 2: Safety**

- Criterion 1: Crashes per Vehicle Miles Traveled (2003 to 2007) – Safety is often evaluated by looking at the history of crashes to indicate where safety issues may exist. Forest Highway links that have the greatest number of crashes per vehicle mile traveled may indicate that a condition exists that is affecting the safety of the roadway. Links with the highest number of crashes per vehicle mile traveled will be prioritized for improvements.
- Criterion 2: Number of Fatal Crashes (2003 to 2007) – Forest Highway links that have the highest number of fatal crashes may also indicate that a condition exists that is affecting the safety of the roadway. Links with the highest number of fatal crashes will be prioritized for improvements.
- Criterion 3: Bridges qualifying for rehabilitation – Links containing one or more bridge that qualifies for rehabilitation, based on their sufficiency rating as determined by VDOT, will be prioritized over segments with bridges that are in good condition.
- Criterion 4: Bridges qualifying for replacement – Links containing one or more bridge that qualifies for replacement, based on their sufficiency rating as determined by VDOT, will be prioritized over segments with bridges that are in good condition.

**Goal 3: Resource Protection**

- Criterion 1: Gravel roads in a flood plain – Forest Highway links that have a gravel surface can affect the quality of water resources when flooding carries the gravel into water bodies. Therefore, to protect water quality, those gravel links located in flood plains will be prioritized for improvements.
- Criterion 2: Proximity of the road link to wilderness areas – Forest Highway links in or near wilderness areas may negatively impact natural resources in a variety of ways, such as noise pollution, air pollution, and potential collisions with wildlife. Therefore, those road links located within one mile of wilderness areas will be deemphasized as travel routes and will receive a lower priority for improvements.
- Criterion 3: Proximity of the road link to Wild and Scenic Rivers – Wild and Scenic Rivers have been designated as such in an effort to preserve scenic, recreational, habitat, cultural or historic value. Forest Highway links in or near Wild and Scenic Rivers may negatively impact natural resources in a variety of ways, such as noise, air pollution and runoff. Therefore, those road links located within one mile of wilderness areas will be deemphasized as travel routes and will receive a lower priority for improvements.

## Weighting of Goals and Criteria

After establishing the goals and criteria, the Tri-Party team members determined that, based on the missions and priorities of their respective agencies, the three goals did not deserve equal consideration in guiding the LRTP process. The team therefore prioritized the goals and criteria to give greater weight to those deemed most important to the Forest Highway network. Improving the safety of the Forest Highway network was considered the most important goal, followed closely by access and mobility. The Tri-Party team considered resource protection to be of lesser importance. The team agreed to weight each goal as follows:

- Goal 1: Access and Mobility – 40%
- Goal 2: Safety – 45%
- Goal 3: Resource Protection – 15%

Within each goal, the criteria were ranked and assigned a weight. Table 2 lists the overall weighting for each goal and criterion.

**Table 2: Weighting of Goals and Criteria for Virginia Forest Highway Network**

Goal/Criterion	Weight	Interpretation
<b>Goal 1: Access and Mobility</b>	<b>40%</b>	
Criterion 1: Existing Traffic Volume	8%	Higher volume road segments receive <b>higher priority</b>
Criterion 2: Proximity to High Population Counties in 2030	8%	Road segments near multiple high population counties receive <b>higher priority</b>
Criterion 3: Proximity to Priority Recreation Sites	9%	Road segments near priority recreation sites receive <b>higher priority</b>
Criterion 4: Status as a major commercial route	8%	Road segments designated as major commercial routes receive <b>higher priority</b>
Criterion 5: Pavement condition	7%	Road segments with poorer pavement condition receive <b>higher priority</b>
<b>Goal 2: Safety</b>	<b>45%</b>	
Criterion 1: Crashes per Million VMT (2003 to 2007)	8%	Road segments with higher crashes per million VMT receive <b>higher priority</b>
Criterion 2: Number of fatal crashes (2003 to 2007)	17%	Road segments with fatal crashes receive <b>higher priority</b>
Criterion 3: Bridges qualifying for rehabilitation	8%	Road segments with one or more deficient bridges receive <b>higher priority</b>
Criterion 4: Bridges qualifying for replacement	17%	Road segments with one or more deficient bridges receive <b>higher priority</b>
<b>Goal 3: Resource Protection</b>	<b>15%</b>	
Criterion 1: Gravel roads in a flood plain	5%	Gravel surface road segments located in a flood plain receive <b>higher priority</b>
Criterion 2: Proximity of road link to wilderness areas	5%	Road segments located near wilderness areas receive <b>lower priority</b>
Criterion 3: Proximity of road link to wild and scenic rivers	5%	Road segments located near wild and scenic rivers receive <b>lower priority</b>

## **Forest Highway Segment Composite Scores**

In order to develop units that would allow for meaningful analysis, the Consultant Team divided the more than 1,100 miles of Virginia Forest Highways into 643 road segments. Each segment was evaluated based on the weighted criteria above. Each road segment then received a composite score, which reflected the priority of each Forest Highway segment relative to the other segments.

The Tri-Party team thus was able to use a data-driven process to identify and prioritize Forest Highway segments as candidates for improvement. Perhaps most importantly, this process is consistent with the goals of the three agencies involved in administering the Virginia Forest Highways Program.

## **Evaluation of Results**

Using the results of the data analysis discussed above, each Forest Highway link has been prioritized based on its need. This evaluation is intended to serve as a guide for assisting the Tri-Agency Project Team in determining which Forest Highway projects should be funded. As evaluations of this sort are sometimes blind to other important considerations, it is important to take into account other variables beyond the ones included in this analysis. These variables include project cost, right-of-way availability, environmental processes, VDOT district priorities, political priorities, and system needs.

## **Project Level Considerations**

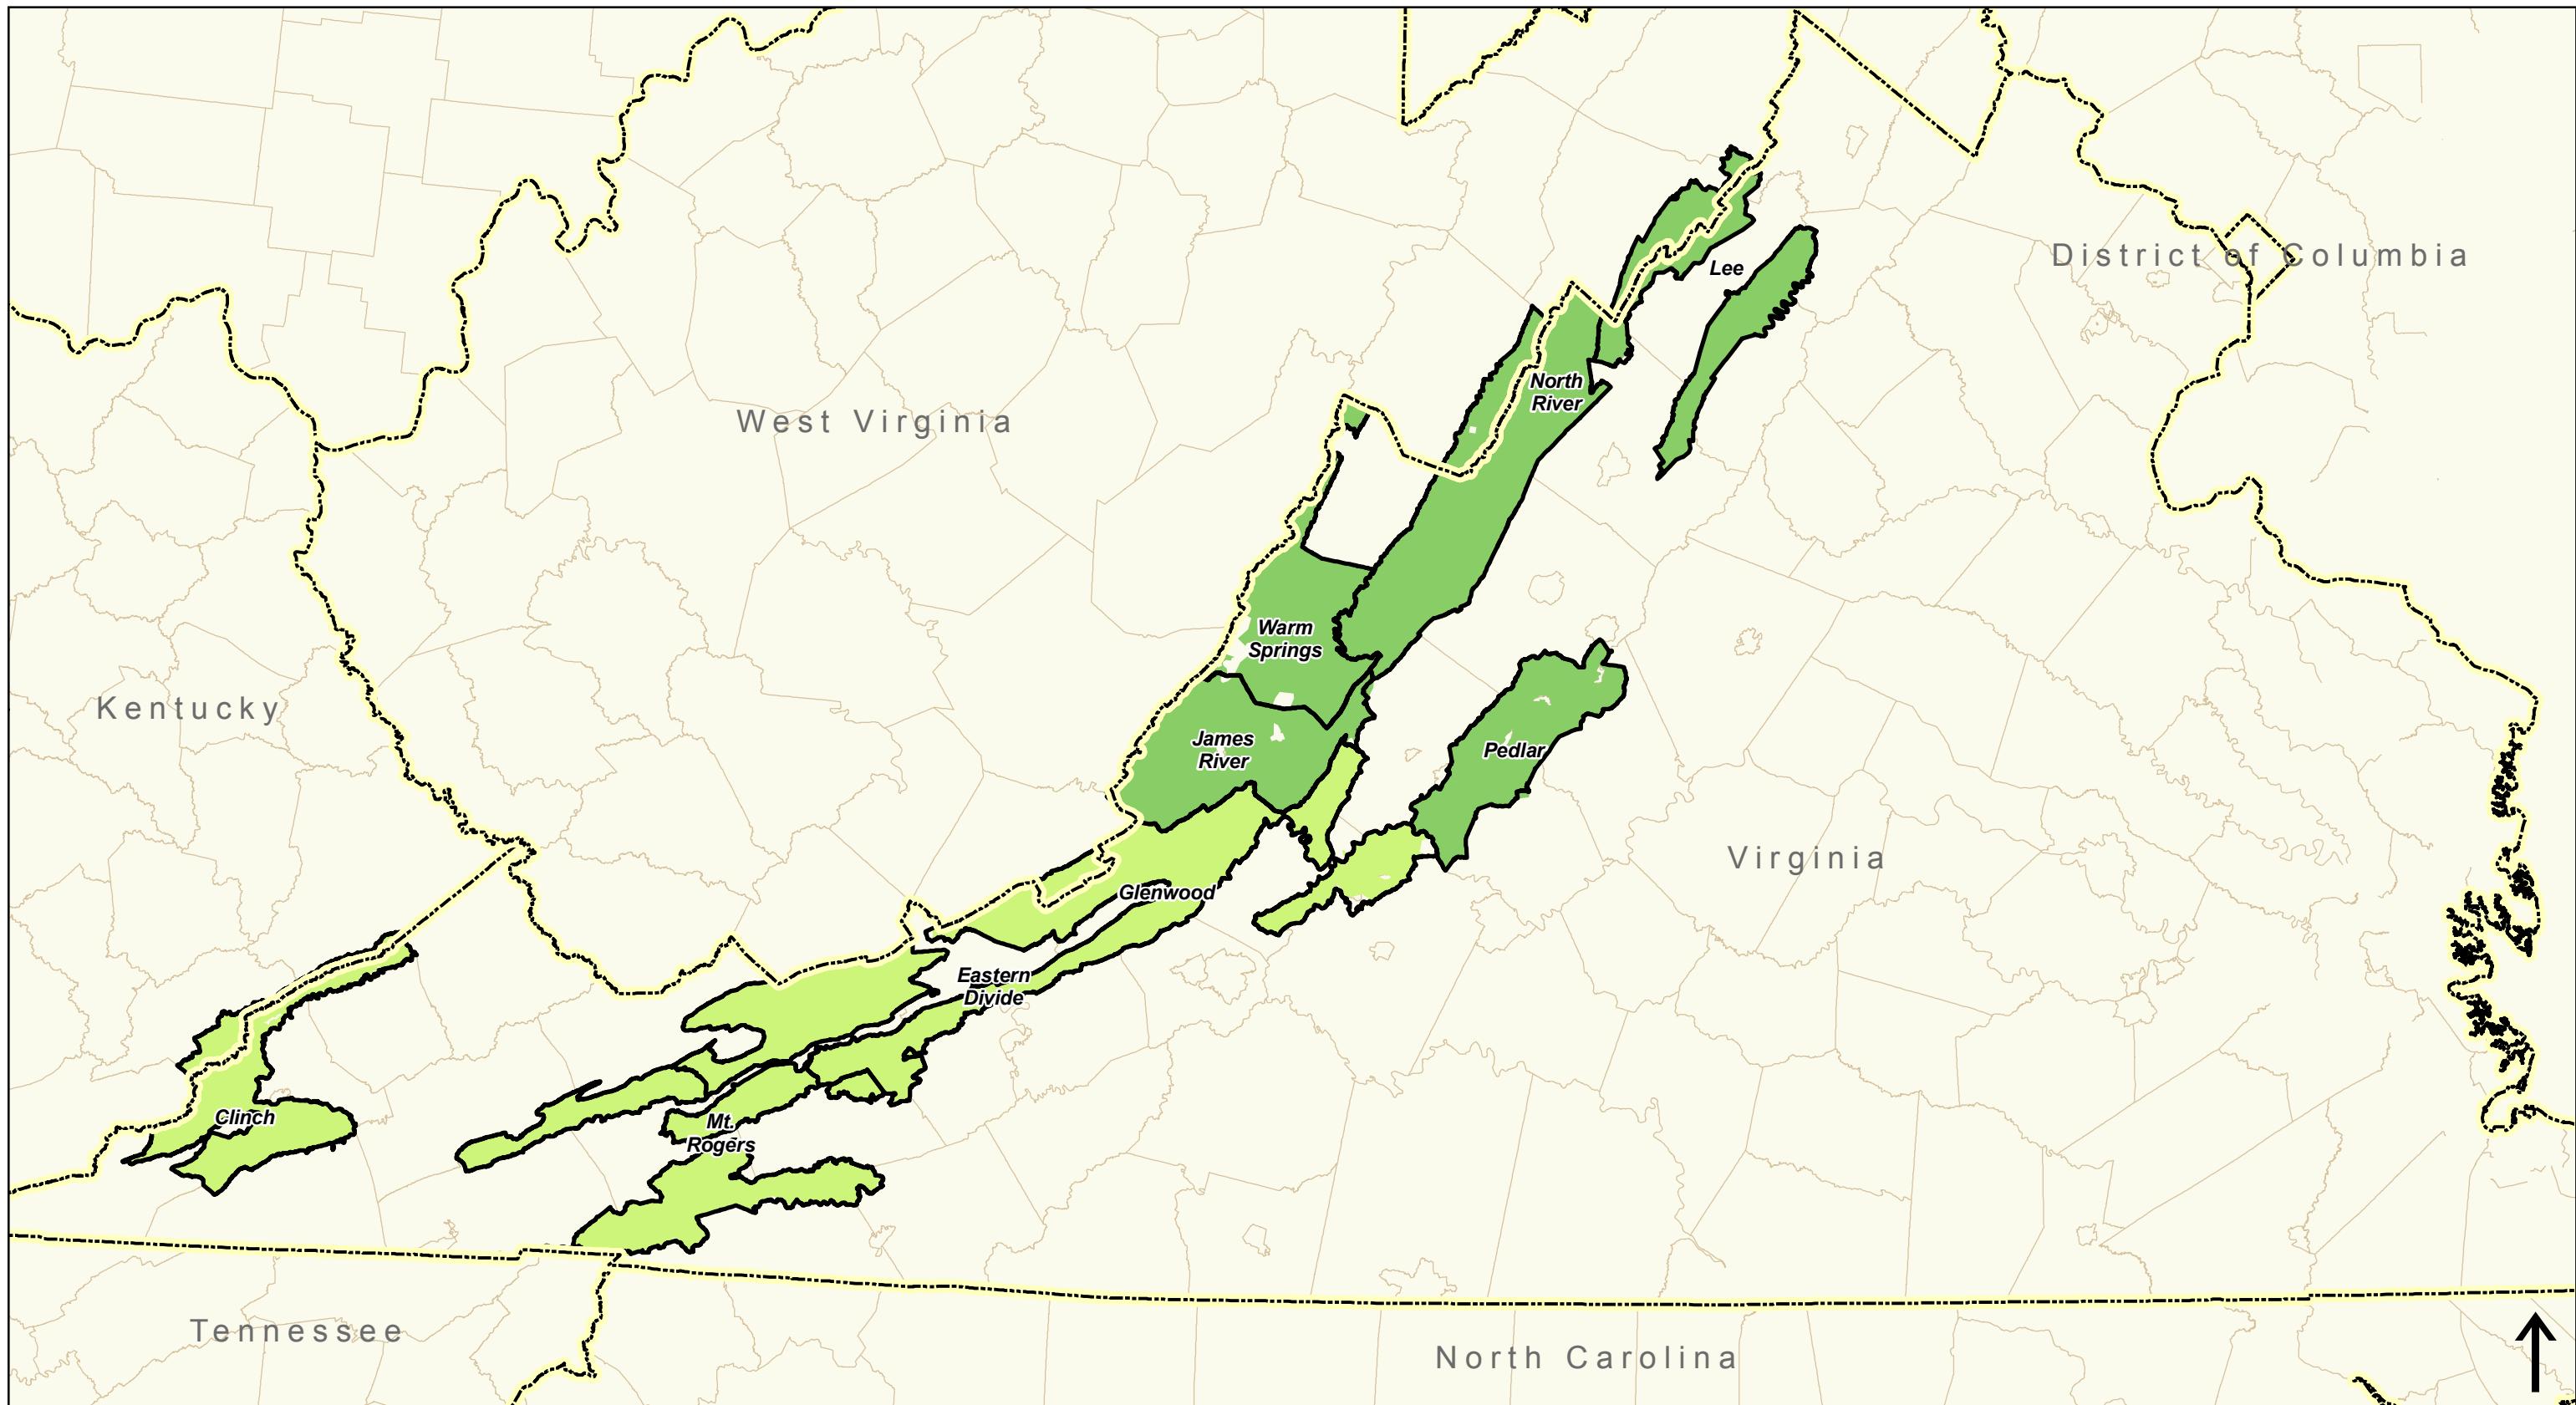

The Tri-Agency team recognized that two separate processes are necessary to evaluate and fund Forest Highway projects. The first process is to prioritize Forest Highway links based on need. This is the process that was developed during the one-day meeting and is described in this report.

A second process includes project-specific design criteria. This process is conducted after projects are selected, during the design phase. Project-specific design criteria could include visual impacts, roadway geometrics to improve safety, and location within environmentally sensitive areas.

## Recommendations

As a follow-up to the evaluation process, some additional steps for the LRTP have been identified.

- Per a Memorandum of Understanding with VDOT, the Tri-Party Program will need to determine an efficient means of incorporating the Virginia Forest Highway Program LRTP, including the application of the data-driven needs analysis outlined in this report, into the statewide planning effort. It is recommended that this process be initiated as soon as possible, as it may be a time-consuming effort involving multiple stakeholders and agencies.
- As part of the LRTP process, the Tri-Party team is expected to conduct public outreach to generate input into the development of the LRTP. The first phase of the public outreach strategy should focus on internal stakeholders, such as Planning District Commissions and Forest Rangers. The feedback obtained in the first phase can inform a broader outreach campaign to be undertaken in a later phase.
- Going forward, it is recommended that the Tri-Party team conduct periodic updates to the LRTP, evaluating new data, updating existing data, and considering potential improvements to the criteria every two to three years.

A horizontal scale bar representing distance in miles. The scale is marked at 0, 2, 4, and 8 miles. A thick black line spans the entire length of the scale, with a thin white line segment positioned between the 0 and 2 marks.

## Legend

- The legend consists of four entries: 'State Boundary' with a yellow dashed line icon; 'Priority Recreation Sites' with a black triangle icon; and two 'National Forest' entries ('George Washington NF' and 'Jefferson NF') represented by green rectangular icons.

A horizontal scale bar with numerical markings at 0, 2, 4, and 8. The segment between 0 and 2 is black, the segment between 2 and 4 is white, and the segment between 4 and 8 is black. The word "Miles" is written vertically next to the 8 mark.

## Legend

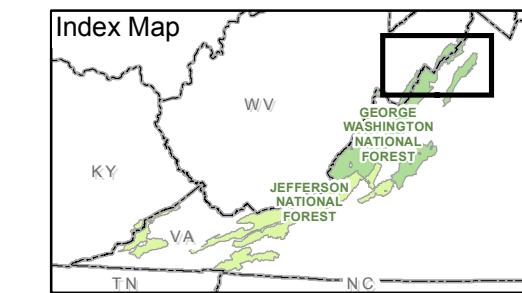

-  State Boundary
  -  George Washington National Forest
  -  Jefferson National Forest

#### Pavement Conditions

- The legend consists of four horizontal bars with corresponding labels:
  - Poor (<=60)
  - Fair (61-84)
  - Good (85-94)
  - Excellent (95-100)

## Bridge Conditions

- Structurally Sufficient
  - Qualifies for Rehabilitation
  - Qualifies for Replacement
  - No Data

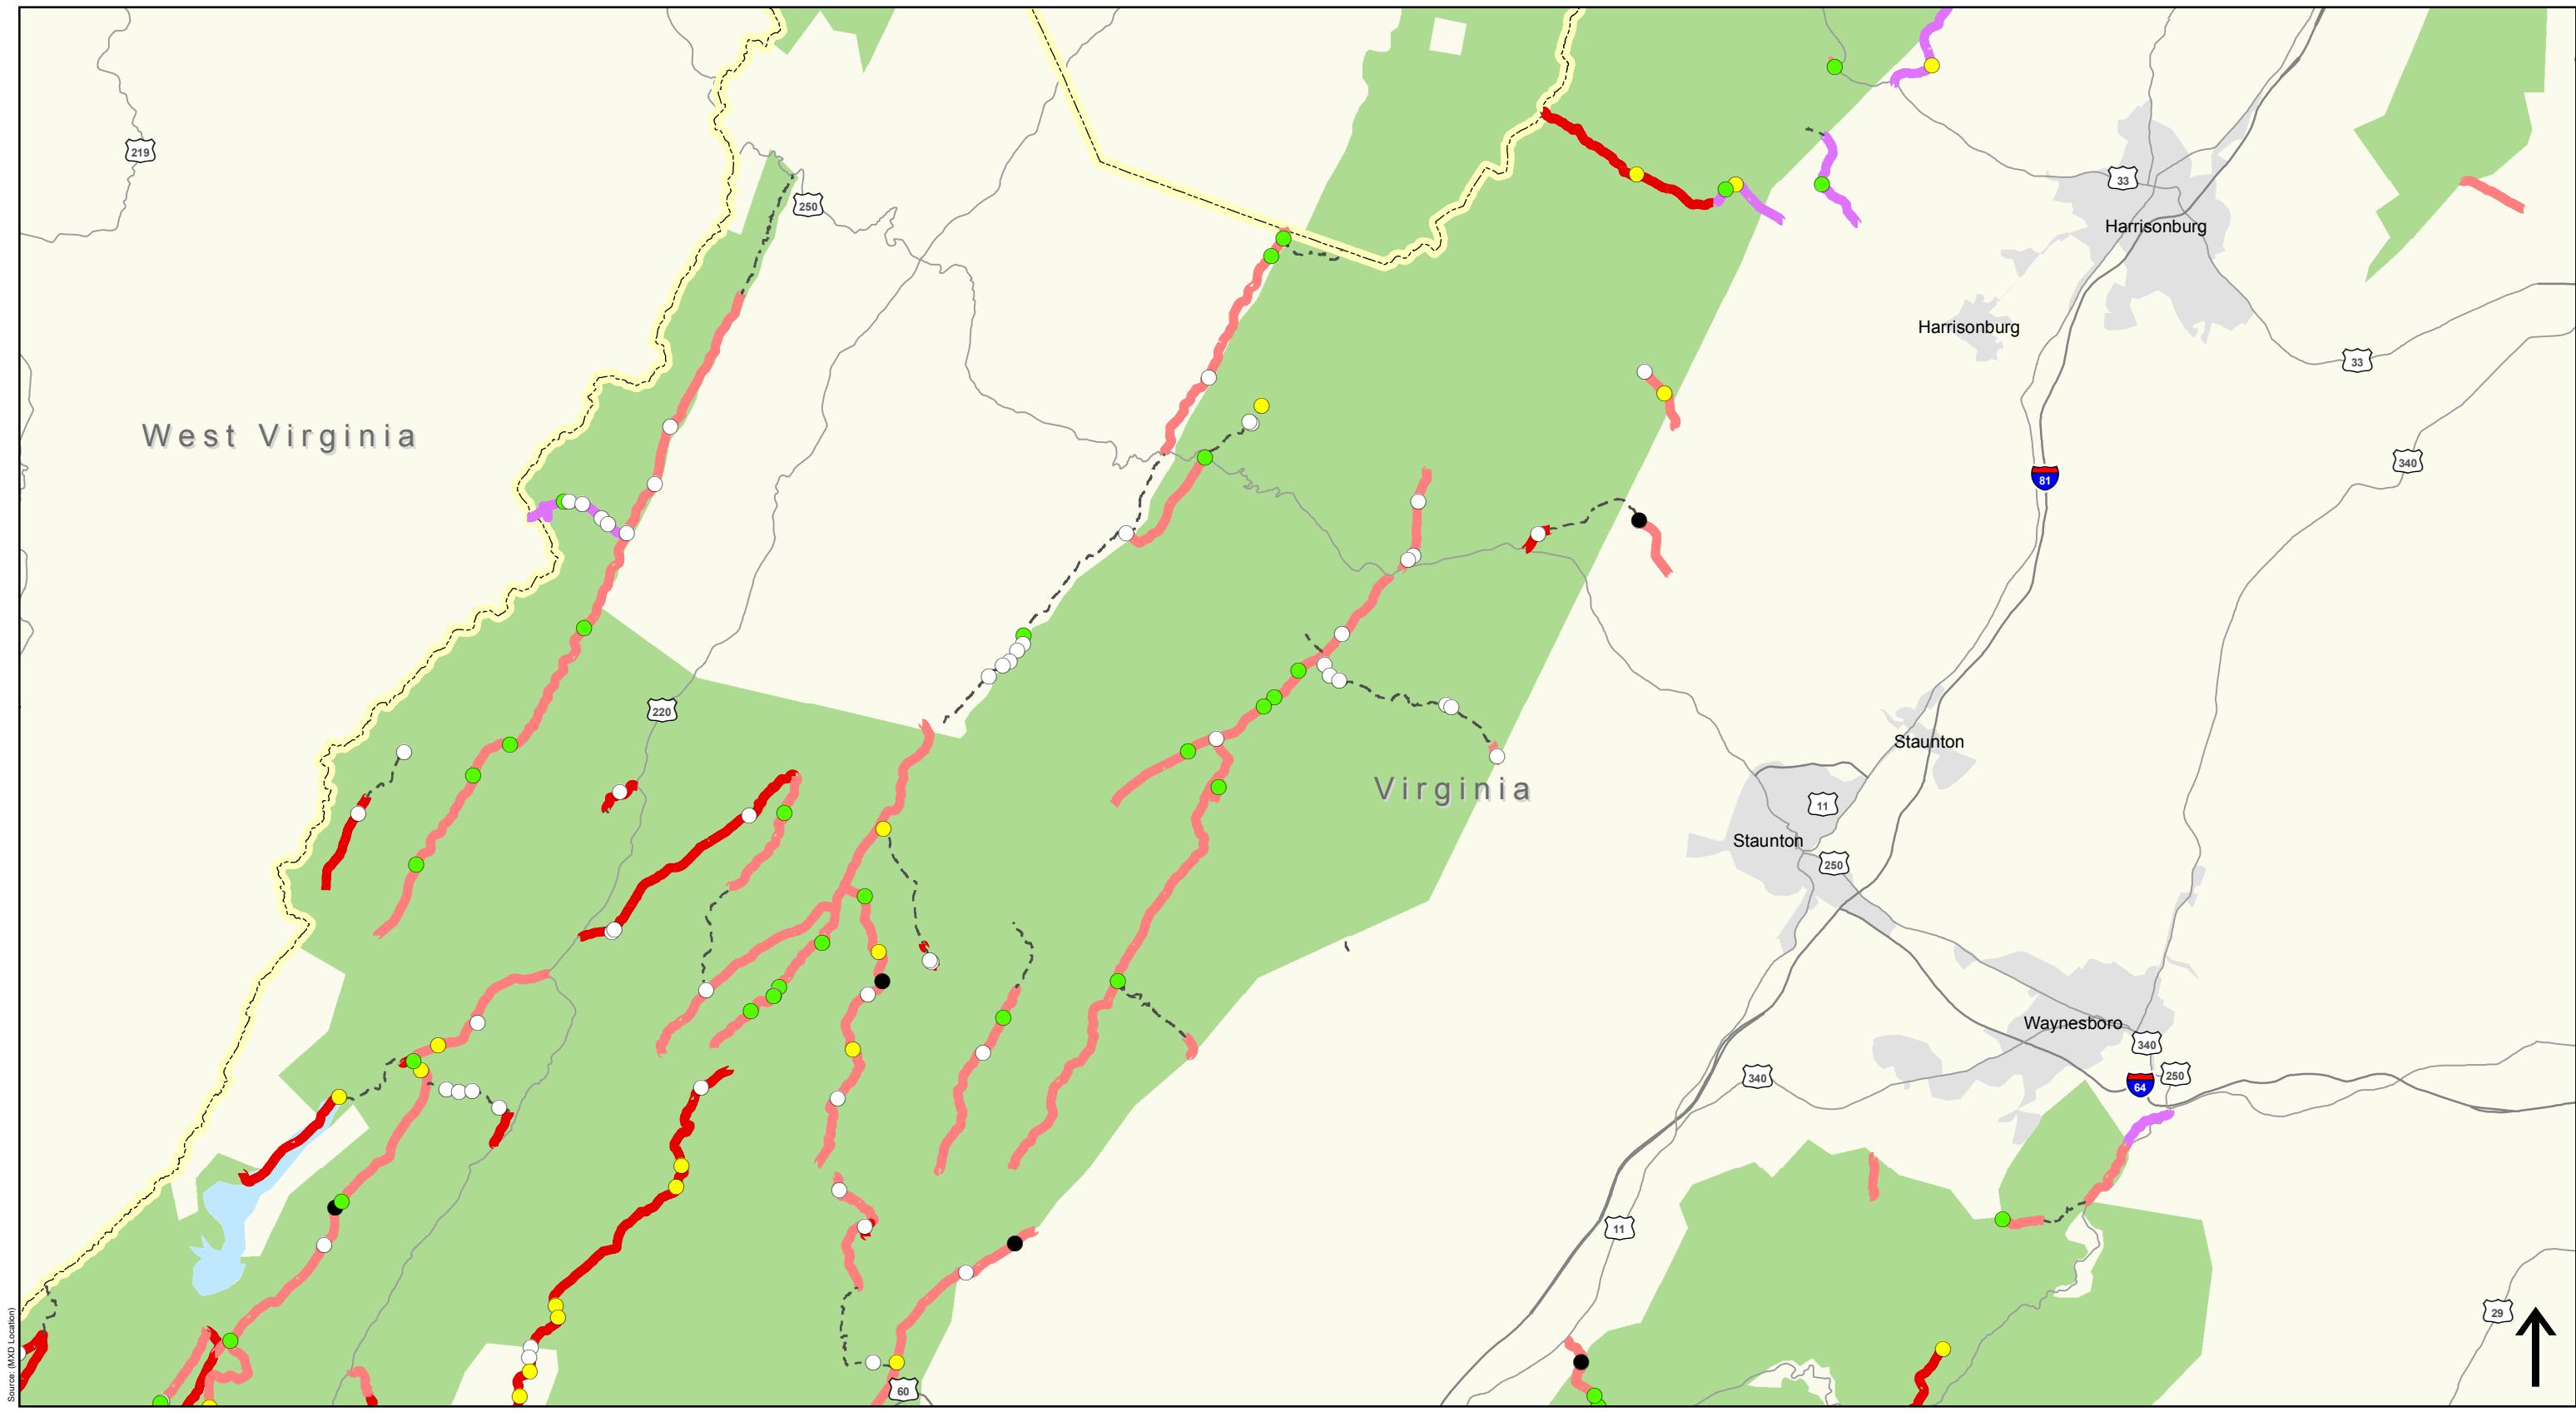

## Goal 4: System Preservation **Infrastructure Conditions**

## Map 1 - Existing Pavement and Bridge Conditions

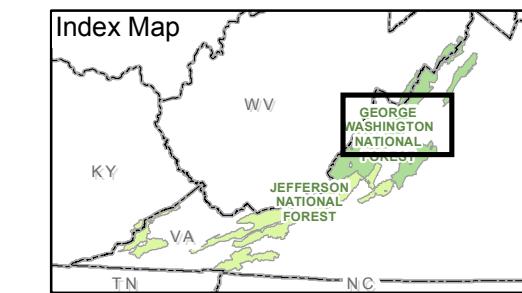

View 1 of 6
