

Gas phase measurements and transport modeling tools to classify air masses at Detling

Scott Herndon, Jon Franklin, Berk Knighton, Mark Zahniser, Andrew Freedman, John Jayne, Paola Massoli, Ed Fortner, Puneet Chhabra, Felipe Lopez-Hilfiker, Claudia Mohr, Joel Thornton, Dubey Manvendra, Allison Aiken, Kyle Gorkowski, Sally Ng, Tim Martin, Rich Coulter, Doug Worsnop and Leah Williams

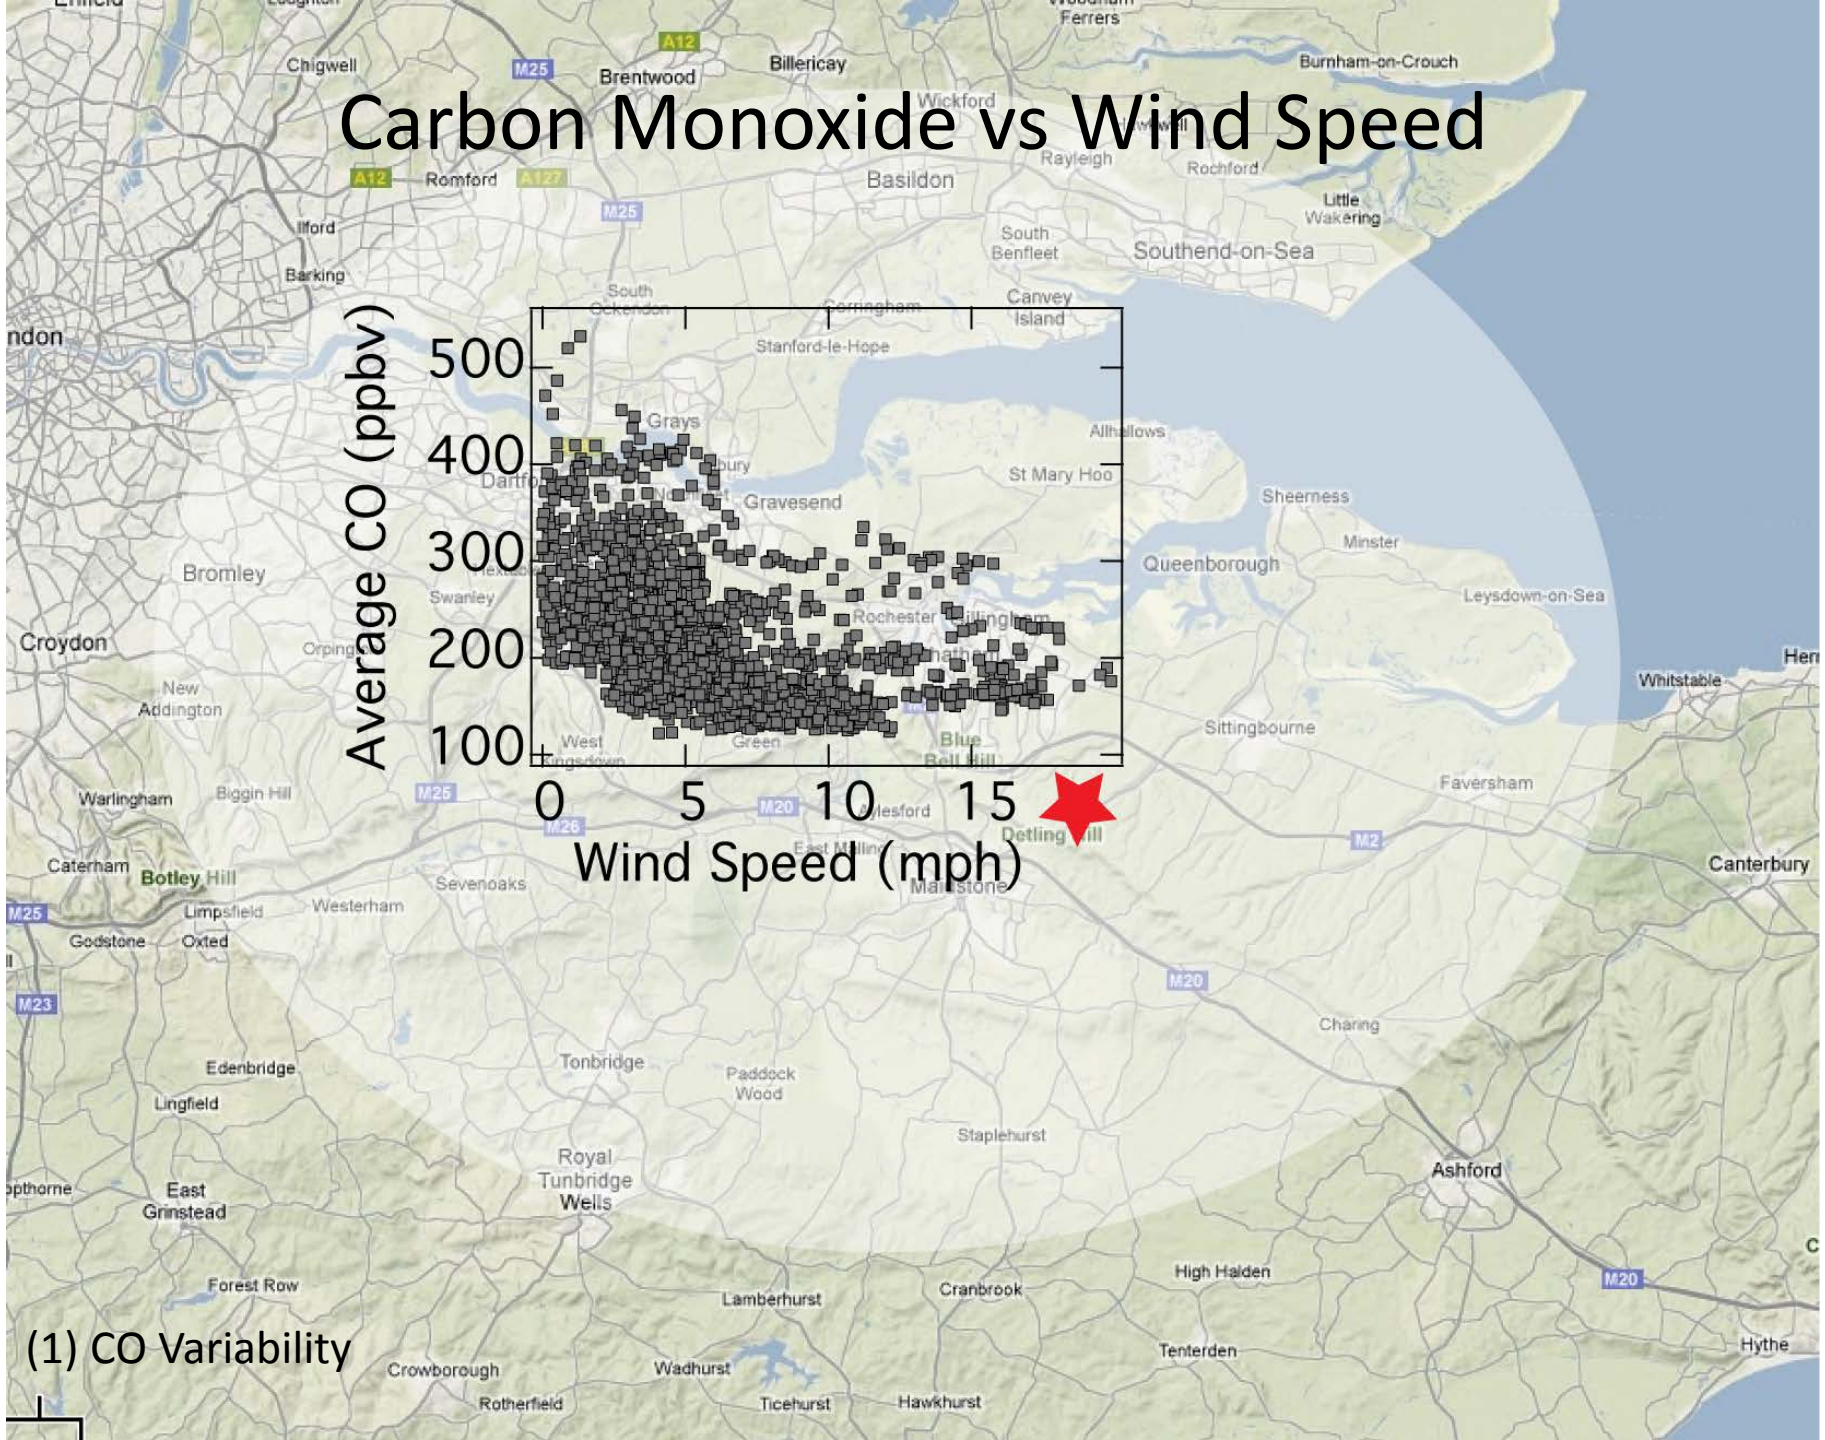

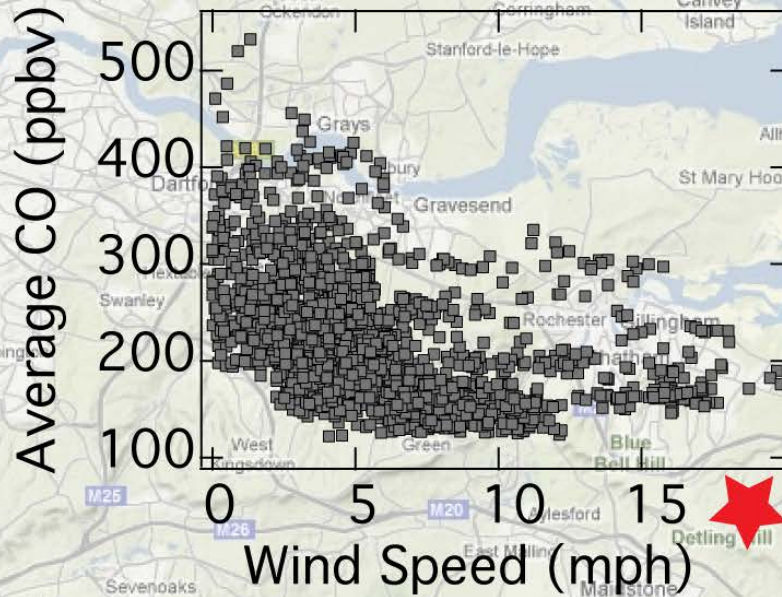

Independent determination of *time*

Gas phase measurements and transport modeling tools to evaluate *time* in the context of aerosol processing

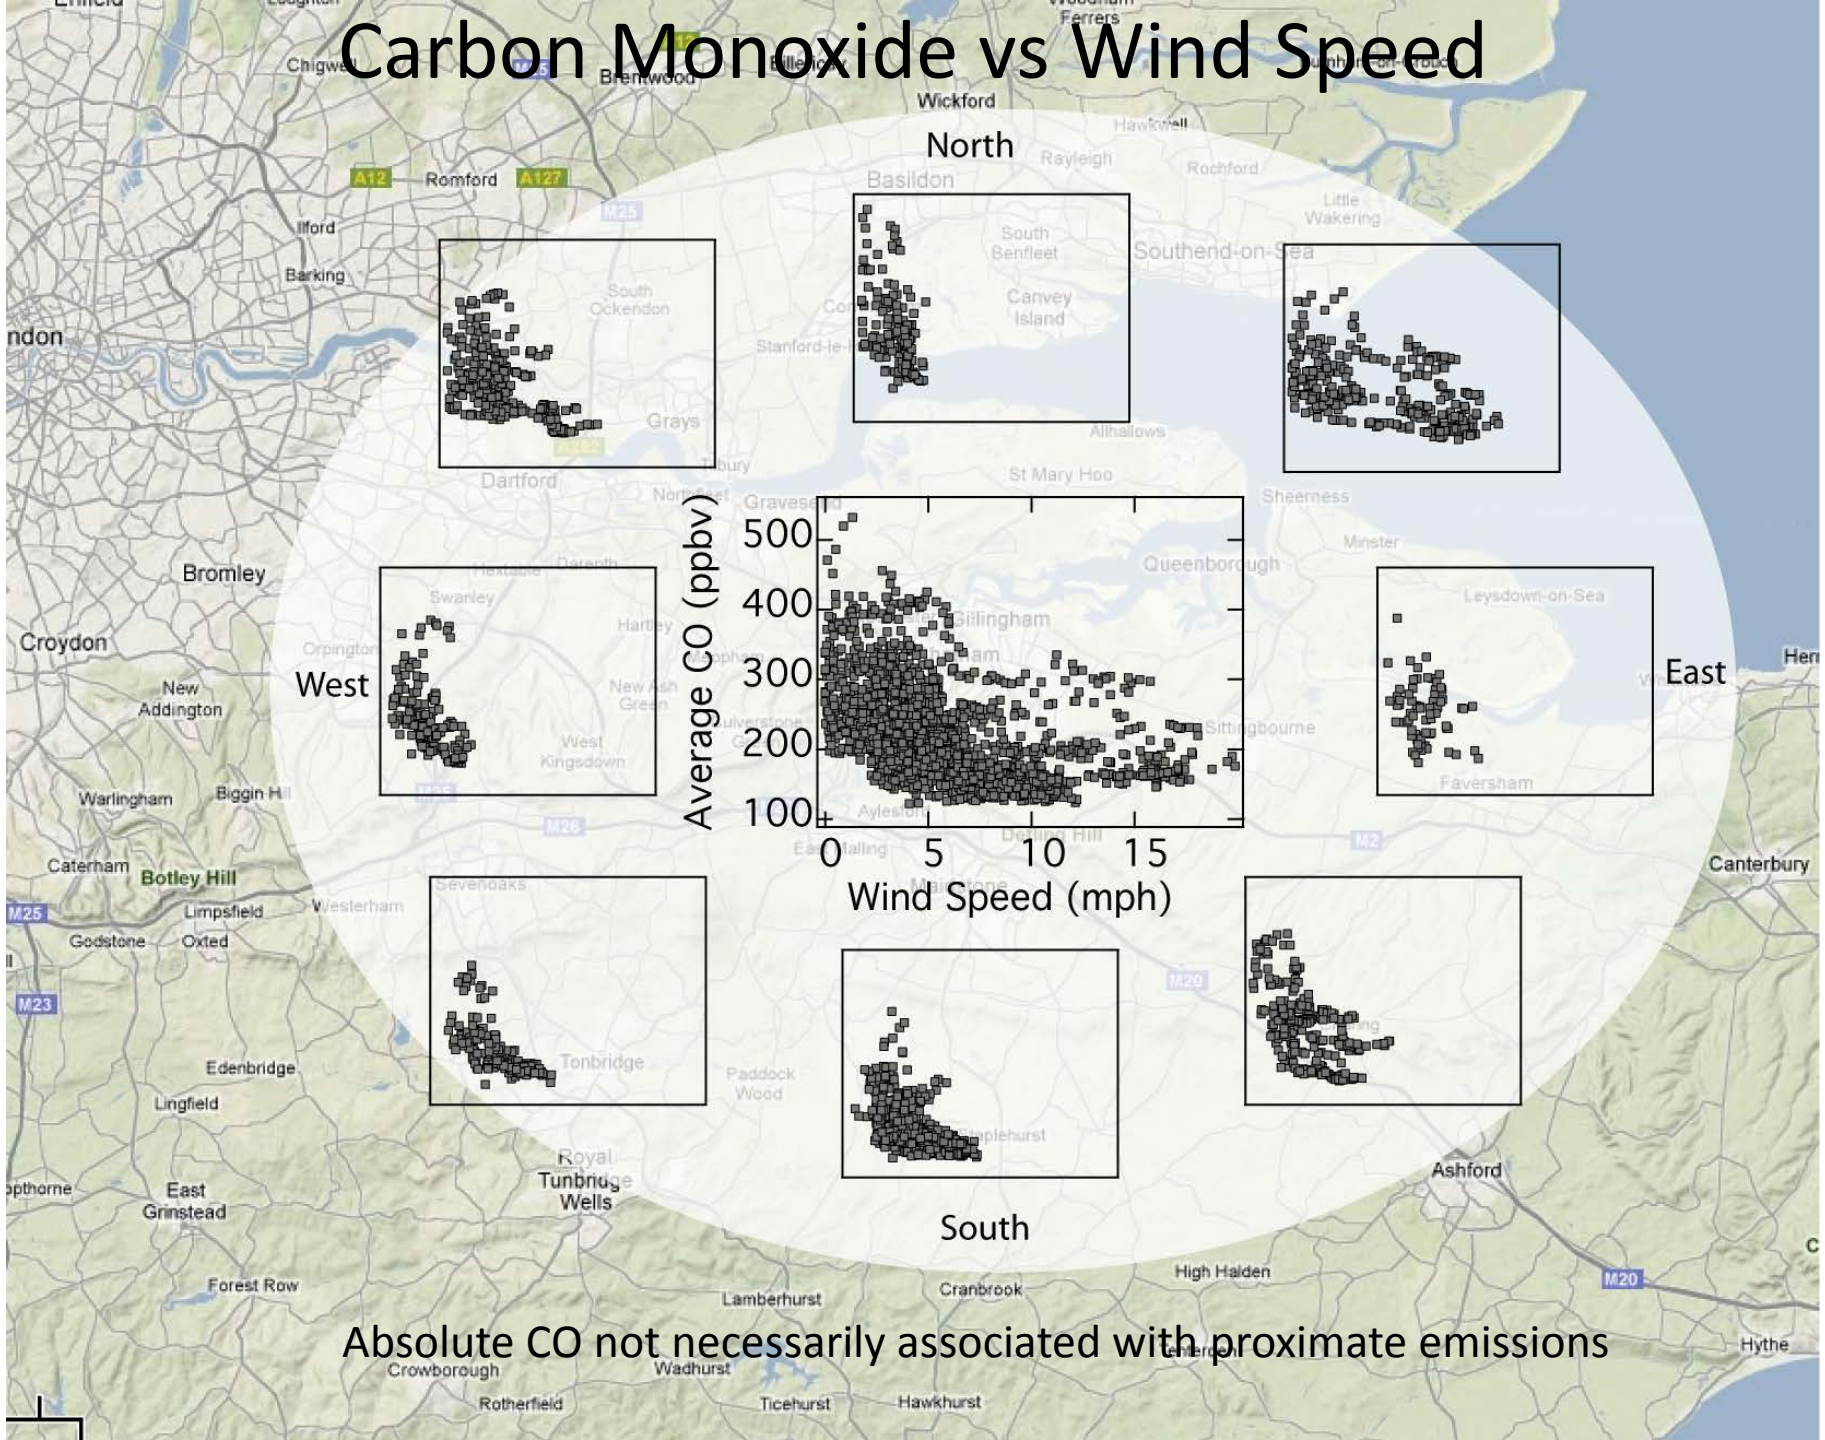

- ① Carbon Monoxide variability
- ② HYSPLIT
- ③ Photochemical Clock via aromatic ratios
- ④ Putting it together and Future Steps

Carbon Monoxide vs Wind Speed

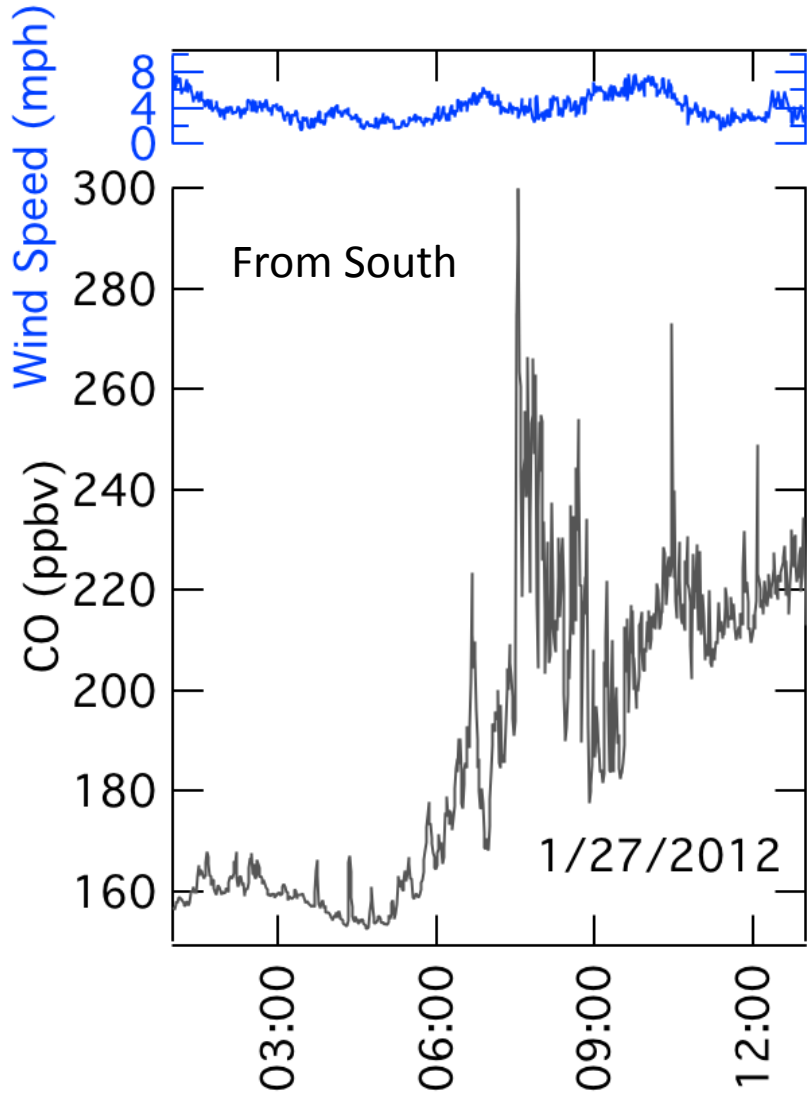

(1) CO Variability

Carbon Monoxide vs Wind Speed

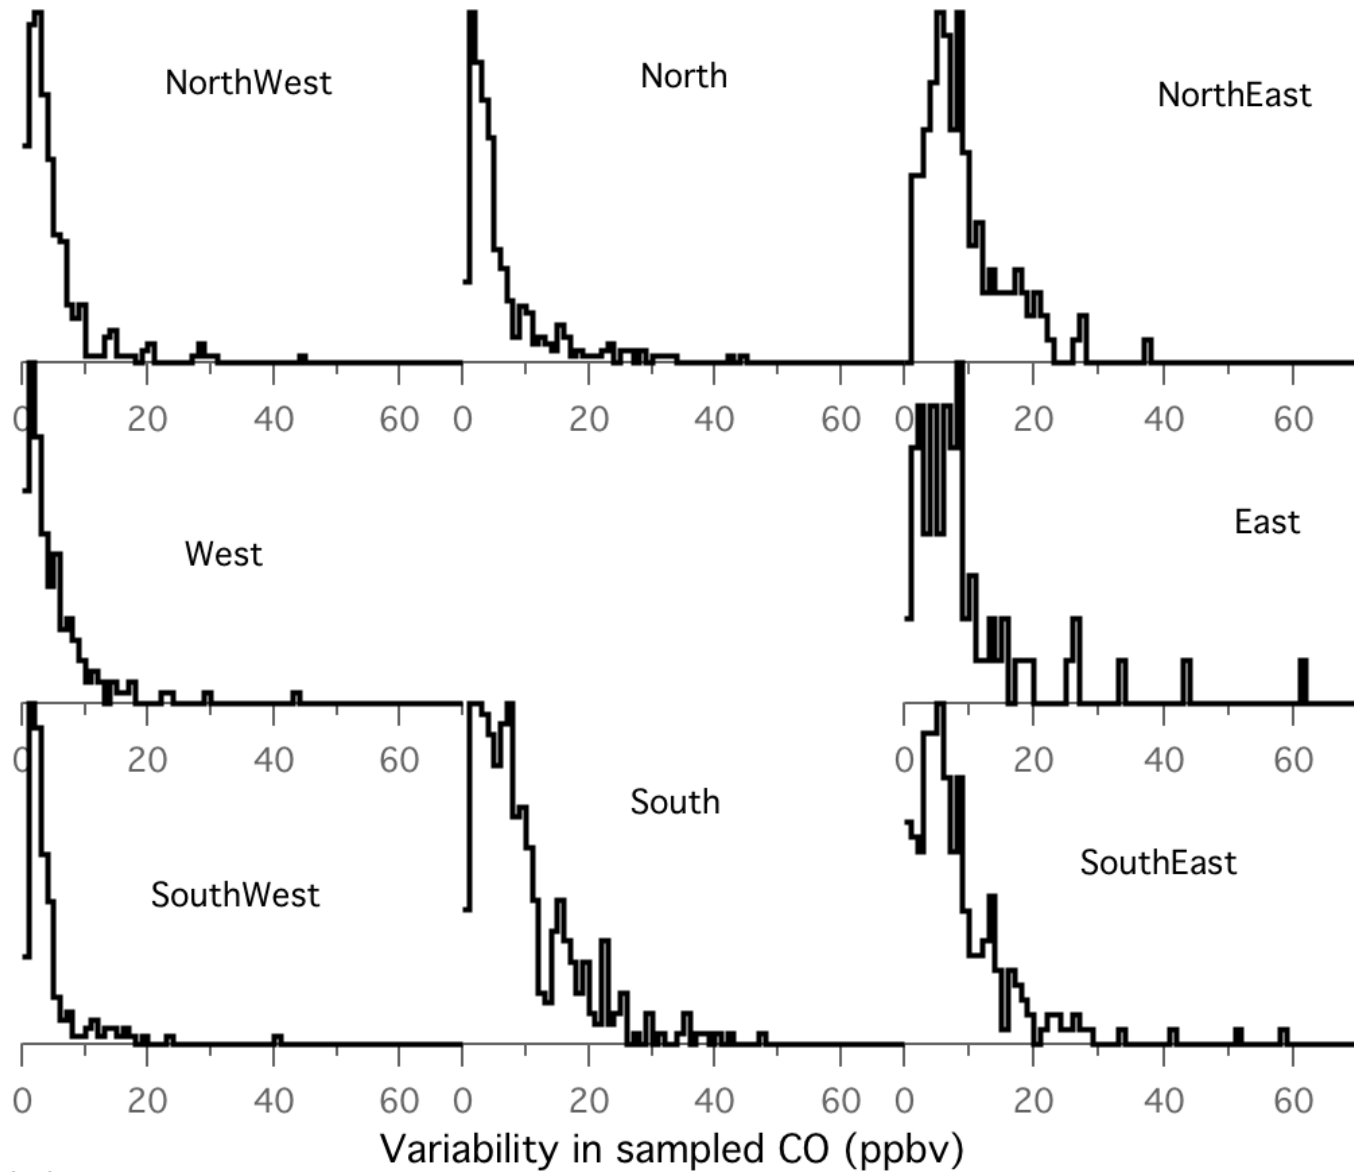

Absolute CO not necessarily associated with proximate emissions

Can CO variability be more indicative of proximity?

(1) CO Variability

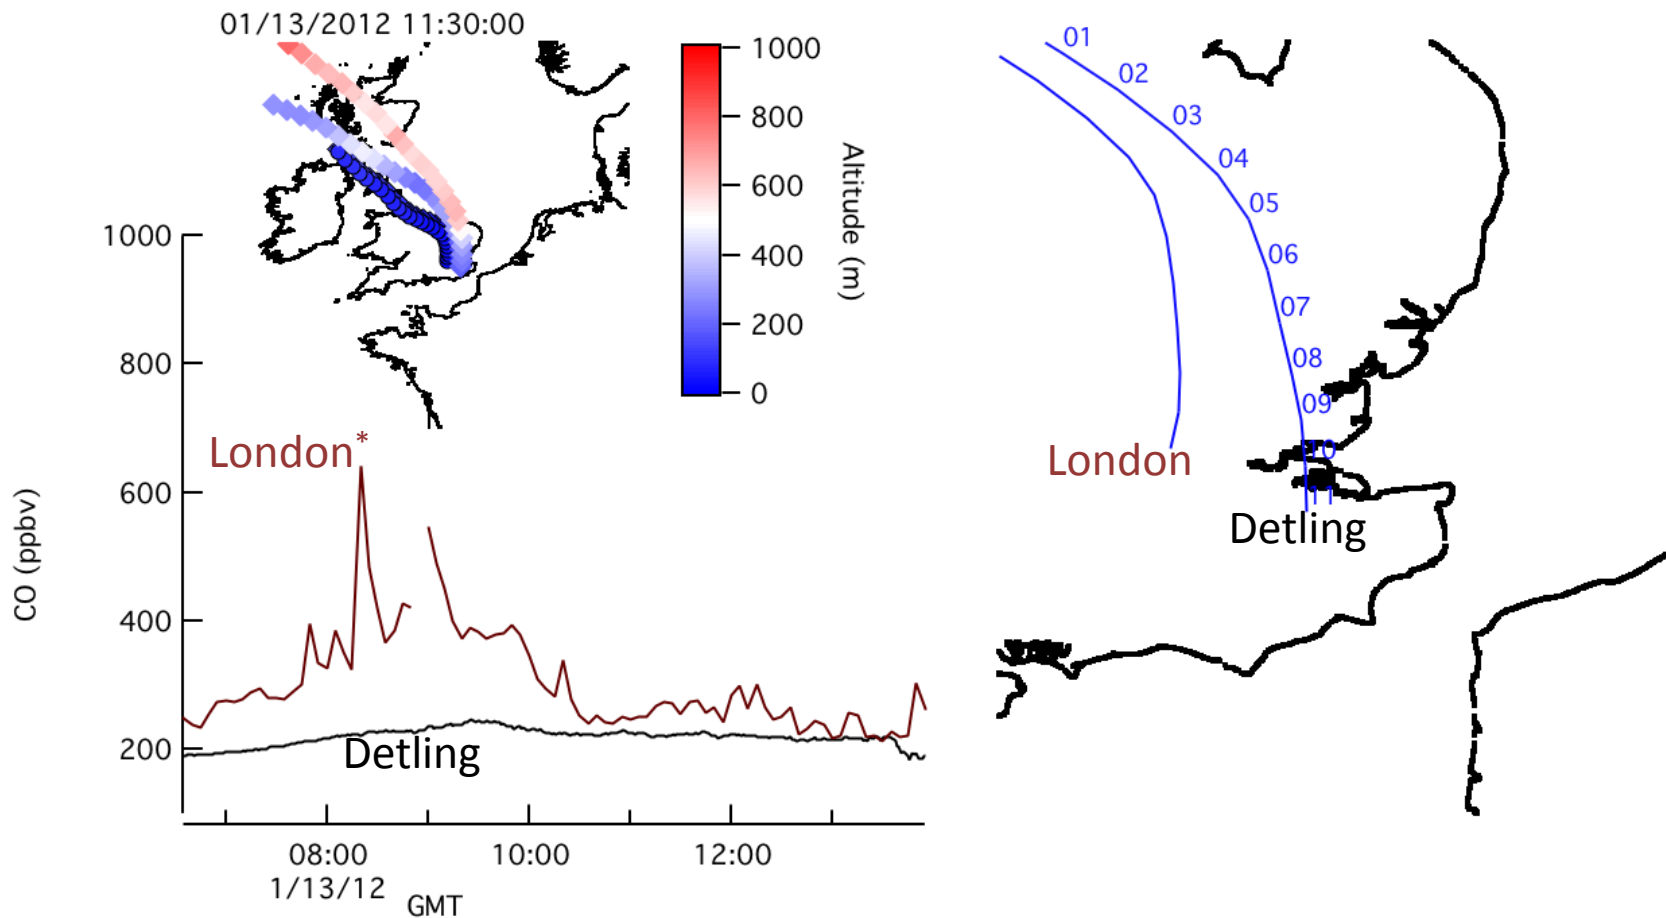

Can CO variability be more indicative of proximity?

(1) CO Variability

HYSPLIT

Hybrid Single Particle Lagrangian Integrated Trajectory

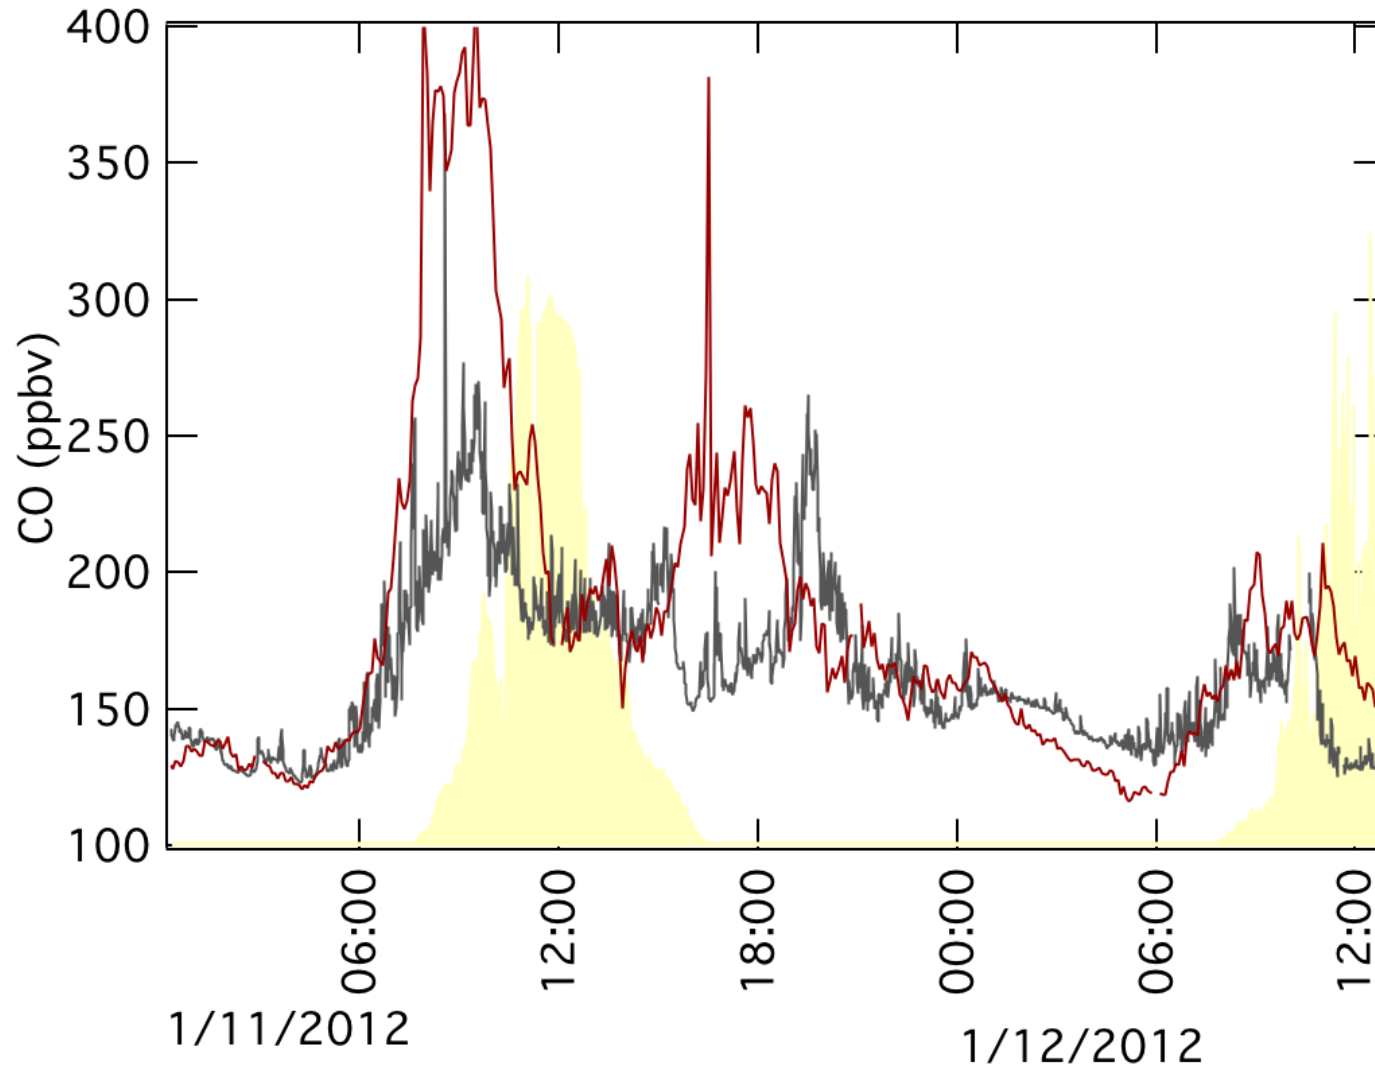

*North Kensington CO data from James Lee

HYSPLIT Citations: Draxler, R.R., and G.D. Hess, 1997: Description of the HYSPLIT_4 modeling system. NOAA Tech. Memo. ERL ARL-224, NOAA Air Resources Laboratory, Silver Spring, MD, 24 pp. and Rolph, G.D., 2012. Real-time Environmental Applications and Display sYstem (READY) Website (<http://ready.arl.noaa.gov>). (2) Transport Calculations

London vs Detling

(2) Transport Calculations

Spatial average along back-trajectory

CO elevated due to transport from Northern Europe
relative to transport from Atlantic

(2) Transport Calculations

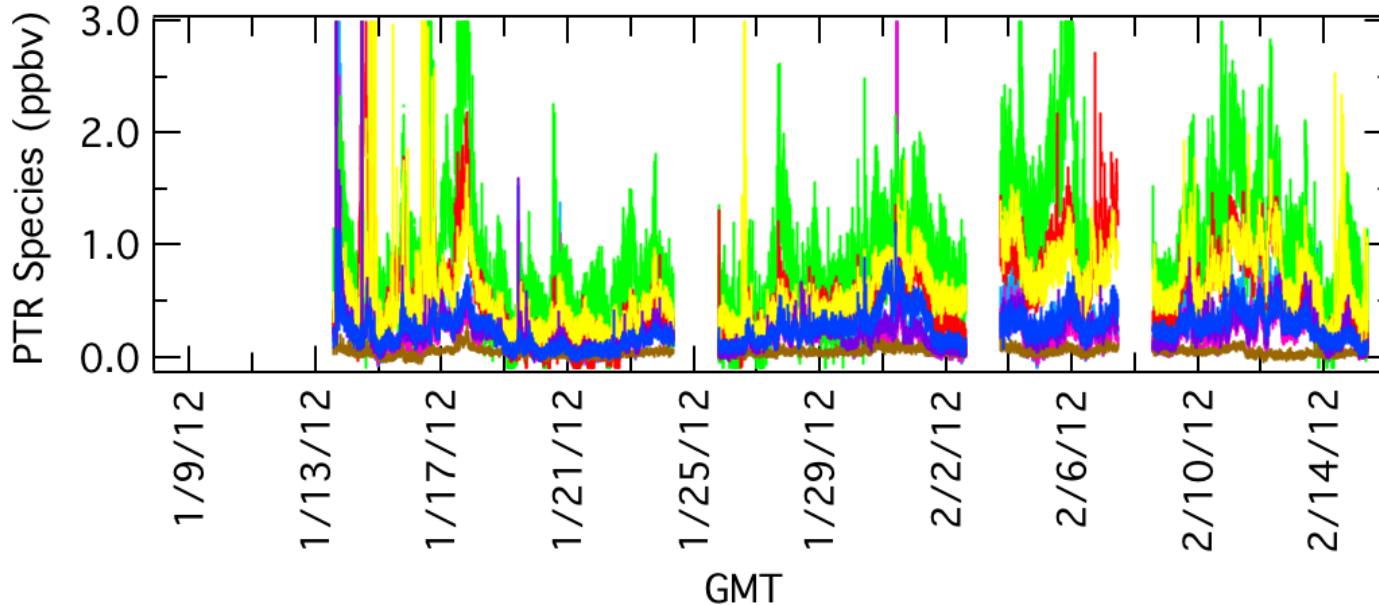

Photochemical Clock using VOC Ratios

$$\Delta t [\text{OH}] = 1/(k_{\text{VOC}} - k_{\text{benzene}}) [\ln\{\text{VOC}_0/\text{Benzene}_0\} - \ln\{\text{VOC}_t/\text{Benzene}_t\}]$$

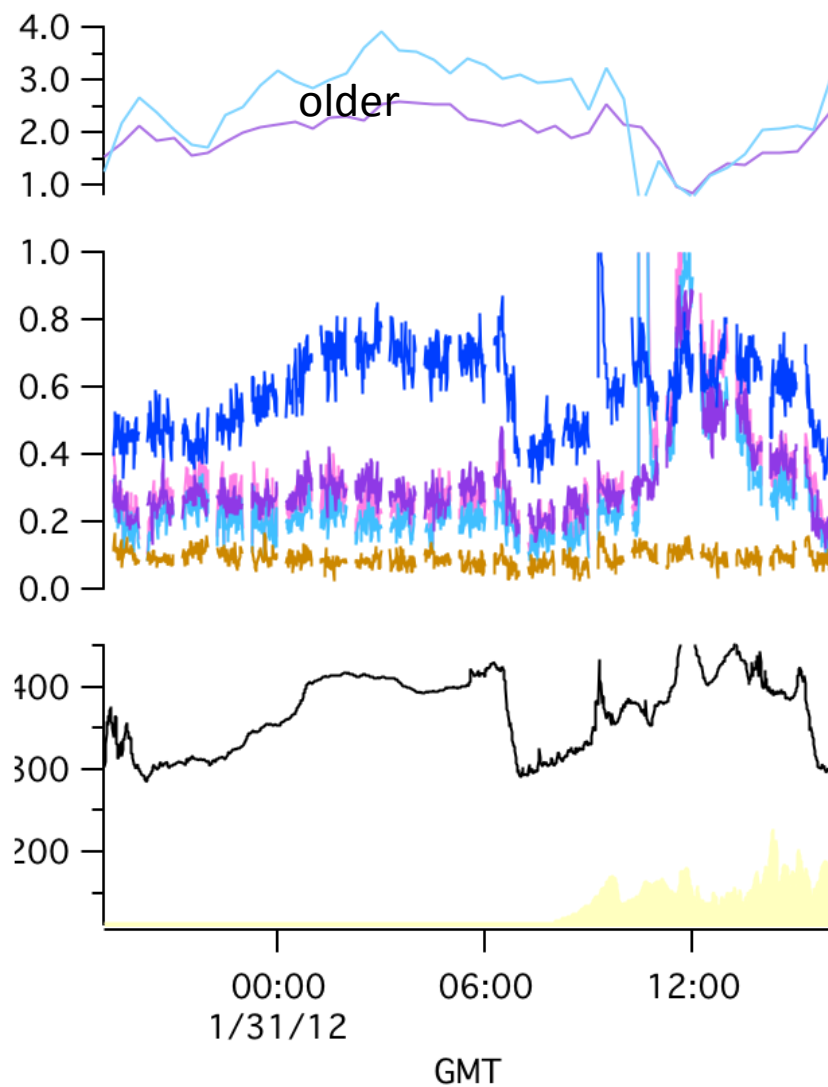

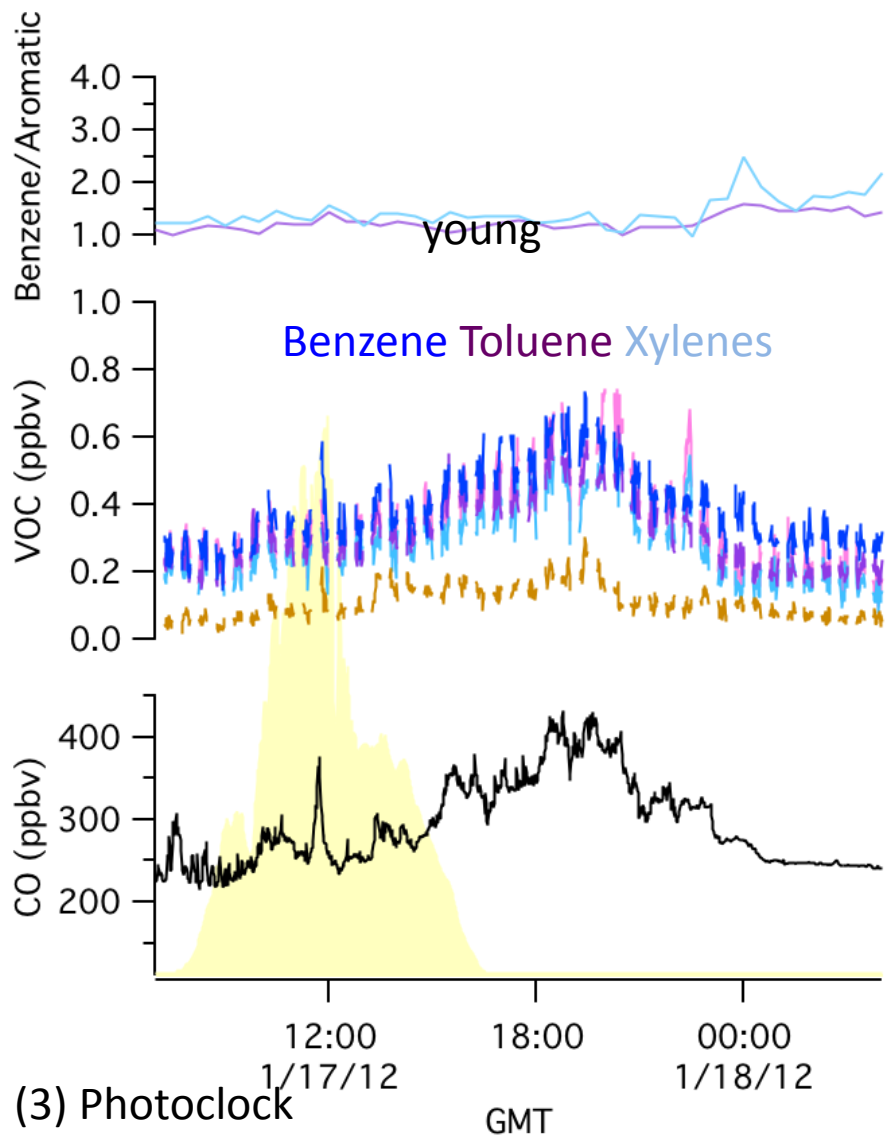

Emission Ratio

Measured Ratio

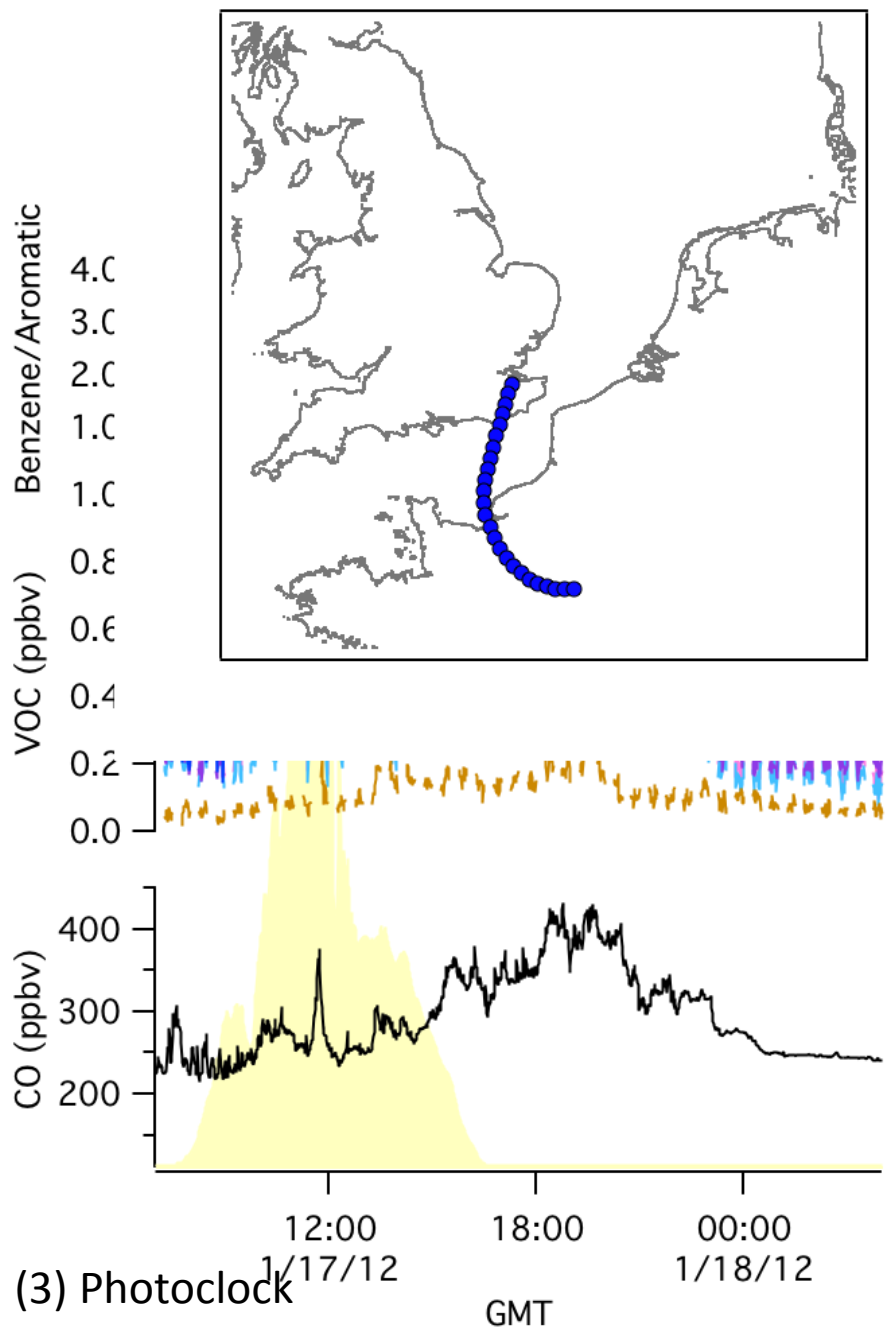

Mixing time scale couples with advection time scale. What does Δt mean?

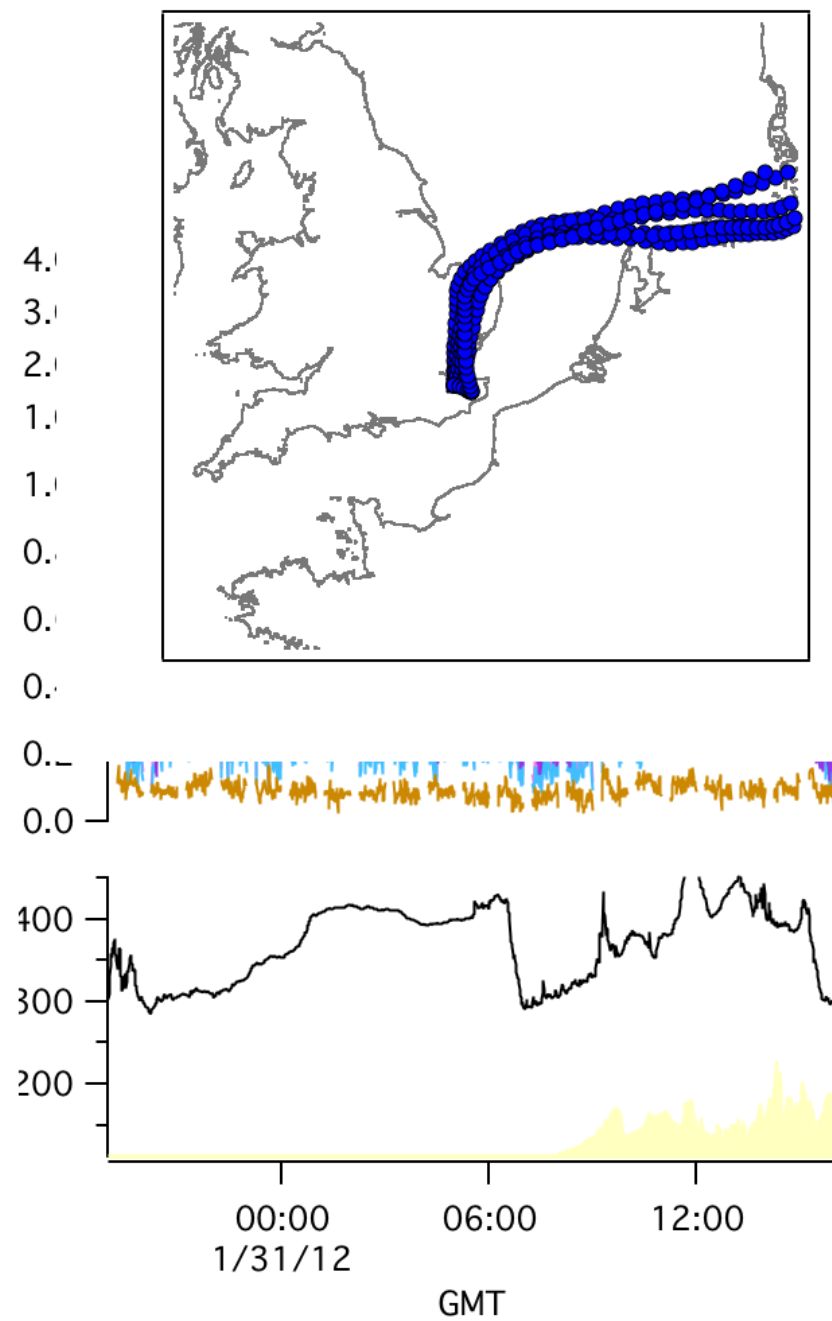

Benzene to Toluene

HYSPLIT and VOC Clock

(3) Photoclock

Summary

- Measured CO variability can be used to signal “close” emissions
- Greater CO mixing ratios are not necessarily “close” CO
- HYSPLIT is adequate to help qualitatively assign transport
 - London and Detling have same CO when transport brings Atlantic airmass to Southern England
- Benzene/Aromatic “Clock” can constrain transport scale, maybe

Future Work

- Verify local wind with ANL and assimilate nearby real wind data
- Produce quantitative vector representing emissions from road(s)
- Attribute CO -> remote, European transport, London outflow
- Couple these representations of mixing and processing *time* with PM properties

gas phase measurements at Detling

Long-lived air mass tracer compounds:

carbon monoxide (CO)

carbon dioxide (CO₂)

methane (CH₄)

nitrous oxide (N₂O)

sulfur dioxide (SO₂)

Oxides of nitrogen and ozone:

ozone (O₃)

nitric oxide (NO)

nitrogen dioxide (NO₂)

nitryl chloride (ClNO₂)

dinitrogen pentoxide (N₂O₅)

total NO_y <= *Thanks David!*

Hydrocarbons:

benzene, toluene, other aromatics

acetonitrile

methanol

isoprene, alpha pinene

formaldehyde, acetaldehyde,

acetone

methyl vinyl ketone, methacrolein

GC-FID Hydrocarbons:

TENAX preconcentration

C5+
