The convective cloud population

An aerial photograph showing a vast expanse of convective clouds over a landscape. The clouds are dense and dark, with some bright, illuminated areas where the sun is hitting them. The background shows a horizon line with a mix of blue and white sky.

What do we know?

What role have radars played?

What comes next?

Before Satellites

Visual Observation

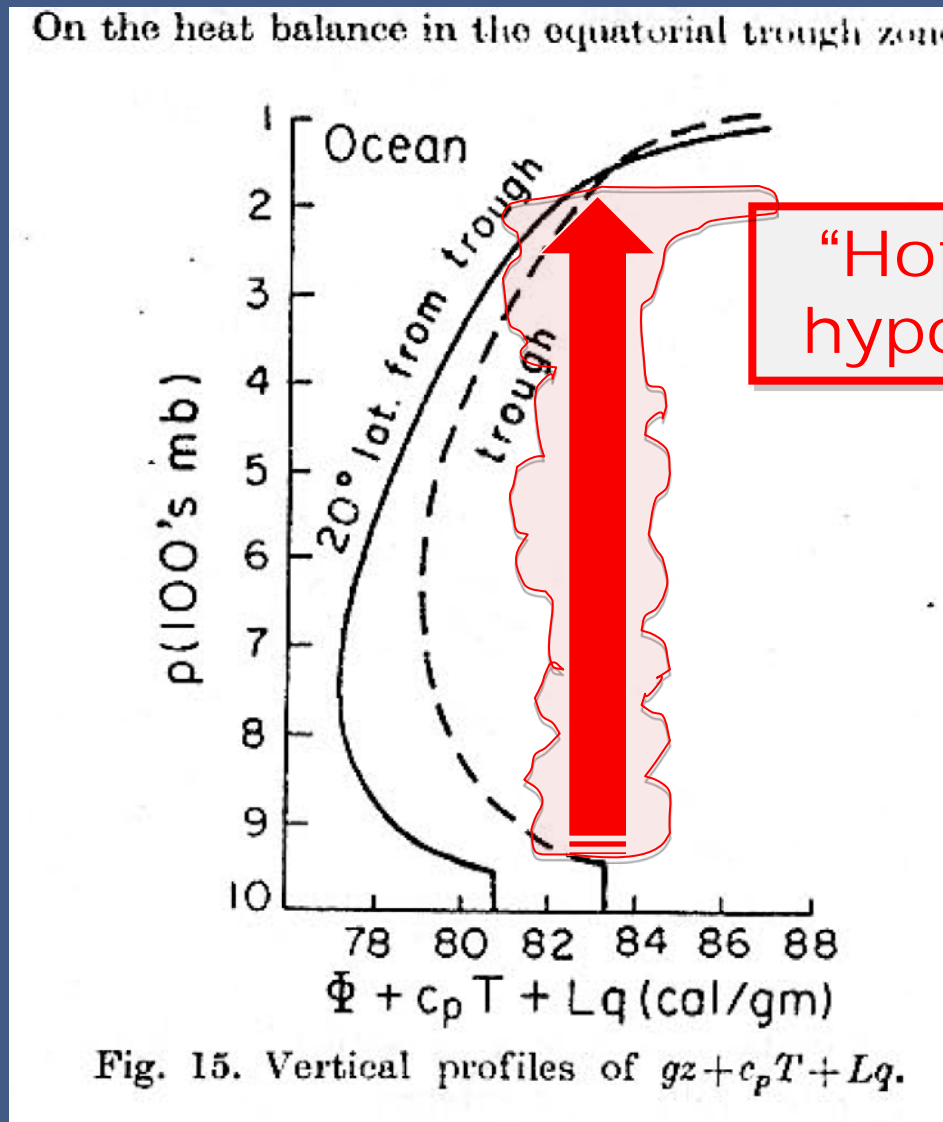

A photograph of a sky with various cloud types. The sky is a deep blue, and the clouds are white and grey. The clouds are arranged in a way that shows different types: Cumulonimbus, Cumulus congestus, and Small cumulus.

Radar Supersite Approach

Will document many aspects of the convective population

A dramatic sky with dark, heavy clouds and a bright light source breaking through, creating a silhouette effect. The text "Summary & Conclusions" is centered in the middle of the image.

Summary & Conclusions

Timeline of progress

Pre-satellite era

→ Hot towers and smaller clouds

Radars in field projects

→ MCSs, squall lines, stratiform precipitation

Precipitation radar in space

→ Global patterns—convective, stratiform, shallow, MCSs

Cloud radars

→ ARM—layers, trimodality, anvils of MCSs

→ CloudSat—global distributions of MCSs, anvils, ...

Dual wavelength

→ Water vapor

What we've learned

Spectrum of convective cloud types and sizes covers a wide range of types and sizes of convective entities

- **Mesoscale systems with stratiform rain**
- **Top-heavy heating profiles**
- **Multimodal size distributions**
- **Shallow isolated cells**
- **Structures of large anvil clouds**
- **Global variability of the population**

Where we are going

How does convective population project onto larger-scale dynamics?

- **Latent heating profiles**
- **Radiative heating profiles in anvils of MCSs**
- **Nonprecipitating convective clouds**
- **Relation between humidity field and cloud population evolution**
- **Role of clouds in MJO, ENSO, monsoon, & coupled equatorial waves**

(ii) There is some evidence which suggests the existence of short-lived mesoscale organization of cumulus convection (e.g., Zipser, 1969). If this is true in general, further modification of the formulation will be needed.
