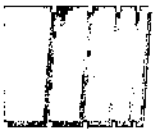
Special Assistant

Dr. Bernard Rostker

- Appointed November 12, 1996 by the Deputy Secretary of Defense
- 180 team members

Gulf War Illnesses Mission

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate to understand and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DoD adapts doctrine, policy and procedures to reduce risks for troops in the future.



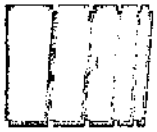
Who Served in the Gulf War

697,000 U.S. service members

ARMY	50%
NAVY	23%
MARINE	15%
AIR FORCE	12%

259,000 Coalition Forces

Source: Presidential Advisory Committee on Veterans Illnesses, Final Report



Who Served in the Gulf War

MALE	93%
FEMALE	7%
ACTIVE	83%
RESERVE/NATIONAL GUARD	17%
OFFICER	10%
ENLISTED	90%

< 26 years old - 55%; 26-35 years old - 32%; > 35 years old - 13%

Medical Support

Largest emergency health care system since WW II

- 41,000 medical personnel
- 18,000 beds
  - 2 hospital ships
  - 63 combat zone hospitals

source: CENTCOM Publications - Commander-in-chief US CENTCOM "Desert Shield/Desert Storm Facts, Figures, Quotes and Anecdotes 7 AUG 90-11 APR 91," prepared by CENTCOM PAO

Medical Support

- 27,000 hospitalizations in theater
- 8,000 medical evacuations
- ????? outpatient visits

U.S. Deaths

Non-Battle	224
Battle	148

Symptoms

Tiredness

Rashes

Headaches

Muscle aches

Joint pains

Abdominal pain

Diarrhea

Hair loss

Memory loss

Sleep disturbance

Depression

Concentration problems

Medical Evaluations

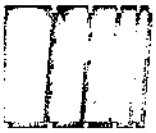
- Comprehensive Clinical Evaluation Program (CCEP)

Total Participants	55,883	
Decline examination	15,899	
Examined		39,984
♦ Veterans Affairs Registry -examined		79,710
Total Examined		**119,694**

Source: OASD (Health Affairs) 28 Jul 00 VA Registry 25 Jul 00

Diagnosis Distribution

Categories	CCEP (%)	VA Registry (%)
Healthy	10	12
Symptomatic	90	88
Medically explained	80	80
Medically unexplained	**20**	**20**



Physician Message Sent

"Your laboratory, x-ray and physical exams results are normal."

Patient Messages Received

"There's nothing wrong with you!"
"It's all in your head!"
"You're faking these symptoms!"

Office of the Special Assistant

Epidemiology Studies

	Deployed (%)	Non-Deployed (%)
Medical separation (Aug 91 - Dec 93)	**2.20**	**2.56**
Hospitalizations (Aug 91 - Sep 93)	**21.6**	**21.6**
Hospitalizations unexplained illnesses (Aug 91 - Apr 96)	**1.21**	**1.27**
Birth Defects (Aug 91 - Sep 93)	**7.45**	**7.59**
Mortality (Aug 91 - Sep 93)	**.025**	**.023**

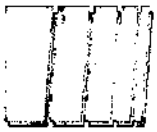
Possible Causes

CHEMICAL WARFARE	BIOLOGICAL WARFARE
PESTICIDES	OIL WELL FIRES
VACCINES	DEPLETED URANIUM
PYRIDOSTIMINE BROMIDE	INFECTIOUS DISEASES
STRESS	COCKTAIL EFFECT

Lessons Learned

CHEMICAL WARFARE

- 14,000 M8 units
- False Positives
- In and out of MOPP, no explanations
- Alarms turned off
- No need to know
- Brain Damage

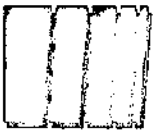


Lessons Learned

CHEMICAL WARFARE

BIOLOGICAL WARFARE

- Navy Forward Laboratory
- No positive cultures



Lessons Learned

CHEMICAL WARFARE

BIOLOGICAL WARFARE

PESTICIDES

- DEET, permethrin, organophosphates
- Unapproved items: flea collars, SNIP

Lessons Learned

CHEMICAL WARFARE

BIOLOGICAL WARFARE

PESTICIDES

OIL WELL FIRES

- Soot, ash, black cloud
- No information
- EPA monitoring March 91
- Particulates, no toxic fumes

Lessons Learned

CHEMICAL WARFARE

BIOLOGICAL WARFARE

PESTICIDES

OIL WELL FIRES

VACCINES

- Vaccines "secret"
- No records
- No explanations
- Squalene

Lessons Learned

CHEMICAL WARFARE

PESTICIDES

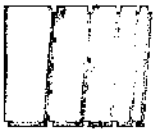
VACCINES

BIOLOGICAL WARFARE

OIL WELL FIRES

DEPLETED URANIUM

- Tank armor, penetrators
- No training
- Heavy metal, proximal tubule
- Surveillance of most exposed



Lessons Learned

CHEMICAL WARFARE

BIOLOGICAL WARFARE

PESTICIDES

OIL WELL FIRES

VACCINES

DEPLETED URANIUM

PYRIDOSTIGMINE BROMIDE

- Soman prophylaxis
- Not FDA approved use
- Recognized side effects
- Medical confusion
- No explanations, no records
- Varied protocols

Lessons Learned

CHEMICAL WARFARE

PESTICIDES

VACCINES

PYRIDOSTIGMINE BROMIDE

BIOLOGICAL WARFARE

OIL WELL FIRES

DEPLETED URANIUM

INFECTIOUS DISEASES

- 12 malaria, 32 leishmaniasis
- Diarrhea, URI's
- *Mycoplasma fermentans incognitus*

Lessons Learned

CHEMICAL WARFARE

BIOLOGICAL WARFARE

PESTICIDES

OIL WELL FIRES

VACCINES

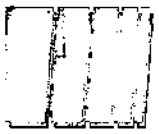
DEPLETED URANIUM

PYRIDOSTIGMINE BROMIDE

INFECTIOUS DISEASES

STRESS

- NO DoD policy that "stress is the cause of symptoms"
- CNN, communications home
- Uncertainties
- Profiles are stress of chronic disease
- PTSD rate lower than Vietnam
- Stress can amplify already existing symptoms



Lessons Learned

CHEMICAL WARFARE

PESTICIDES

VACCINES

PYRIDOSTIGMINE BROMIDE

STRESS

BIOLOGICAL WARFARE

OIL WELL FIRES

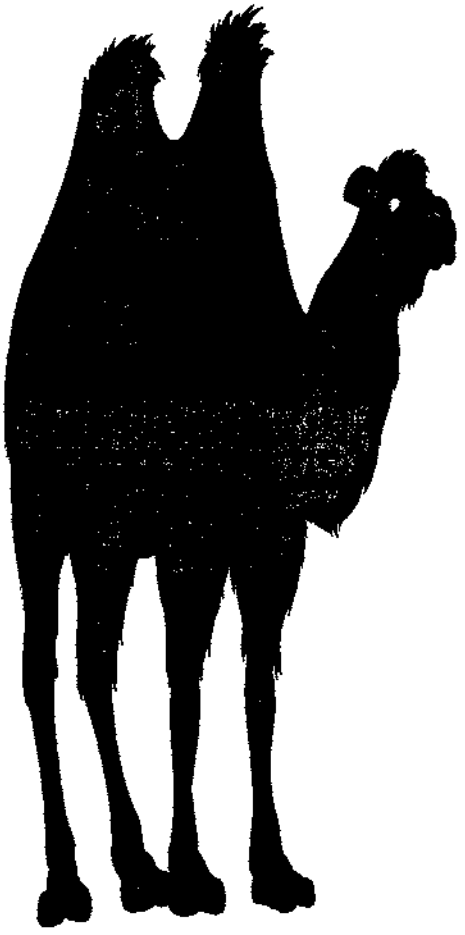
DEPLETED URANIUM

INFECTIOUS DISEASES

COCKTAIL EFFECT

- No scientific evidence yet

THE BLACK CAMEL



Office of the Special Assistant

Possible Causes

- Normal disease rate
- New disease paradigm - a Black Camel

Major Lesson Learned from the Gulf War

DoD Does Not Deal Well With Non-Traditional Issues

Office of the Special Assistant

Deployments

- Unexpected and rapid personnel movement
- Personal and family hardships
- Stress in the field
  - Missile attacks
  - Chem-bio attacks
  - Witnessing death/atrocities
  - Harsh Living Conditions
  - Foreign cultures
  - Racial/ethnic hatred
- Inadequate communication
- No answers to questions after returning

Office of the Special Assistant

Where Do We Go From Here?

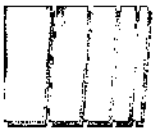
- Concept - Deployment Medicine Clinics
  - Connected to all deployment sites
  - Source for pre and post deployment information
  - Information for family members
- Concept - Education on Vaccines
  - Start updating electronic record entrance
  - Validate accuracy with leave/bonus requests
  - Internet linkage to CDC for recommendations
- Concept - ????

Understanding Today's Military Member

- 55% are married
- 46% have children
- 40% of the 1.3 million children are < 6 years old
- 6% are single parents
- 8% care for elder parents
- 14% are women

Concerns of the Deployed Member

- Importance of the mission
- Recognition by others of his/her role
- Ability to express fears/concerns/problems to leadership
- Recognition for performance



Successful Mission

- Knew why I was there and agreed
- Knew what to do
- Knew how to do it
- Had what I needed to do it
- Did it well
- Was appreciated for my contribution
- Returned proud I had been there

Distribution of CCEP Diagnoses by Major ICD-9 Categories

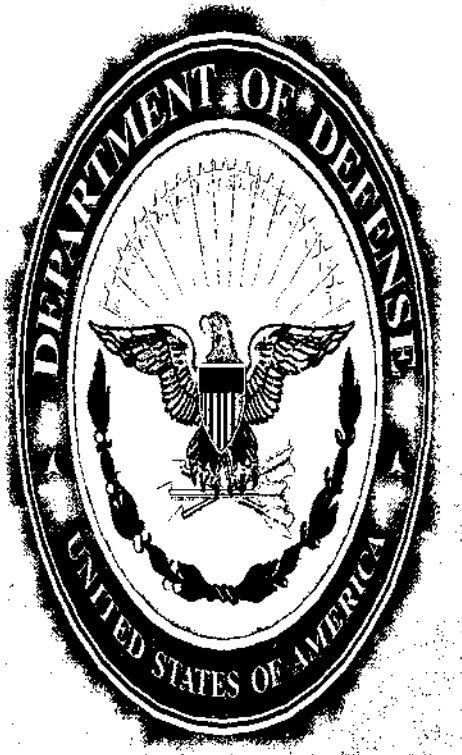
Office of the Special Assistant to the Secretary of Defense



for Gulf War Illnesses, Medical Readiness and Military Deployments

DSN 761-1078 fax 703-578-8501

email: brostker@gwillness.osd.mil

Briefing Overview

- Mission Statement
- The Gulf War
- Post Gulf War Issues
- Searching for answers
- Lessons Learned
- Force Health Protection
- Bottom Line
- Obtaining help and information

Vision of Special Assistant for Gulf War Illnesses, Medical Readiness, and Military Deployments

- The Department of Defense recognizes the right of those involved in deployments to receive information that enables them to make informed decisions about their health.
- We will develop and disseminate such information in a relevant and timely fashion.
- We will work with others in the Defense Department to incorporate lessons from previous deployments to foster the well-being of deployed forces.

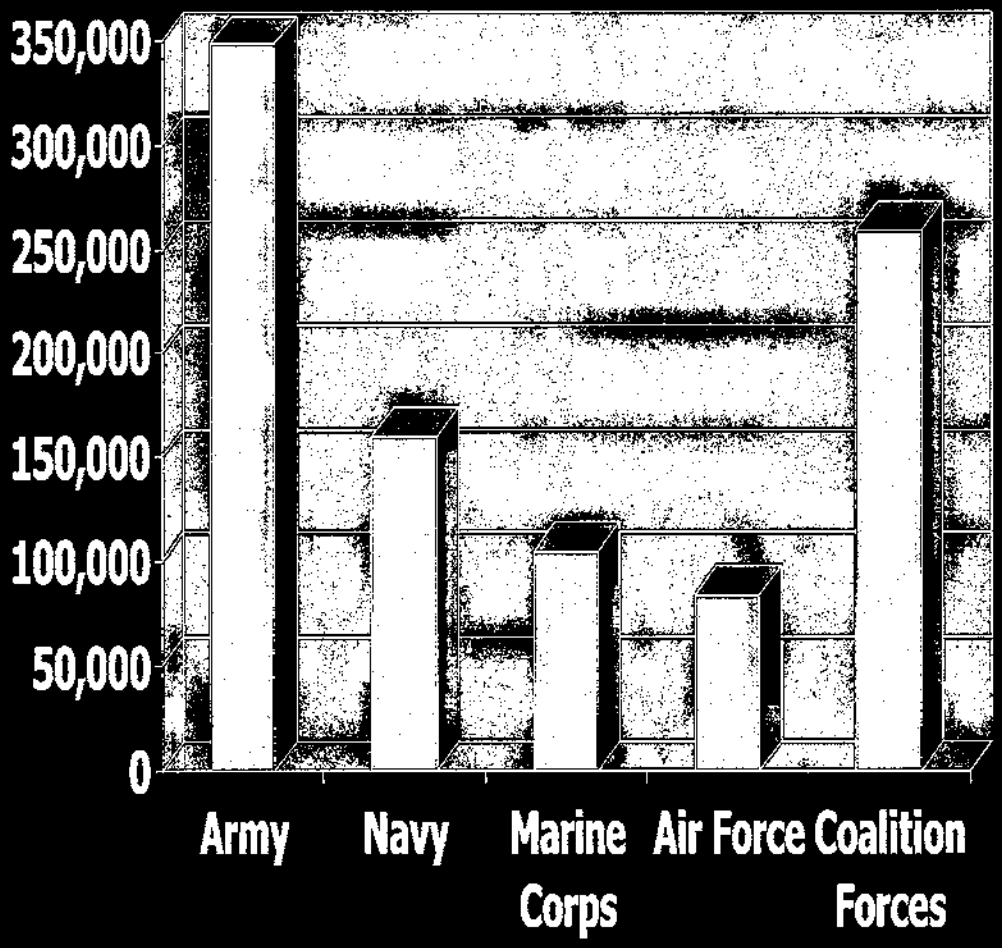
Gulf War Illnesses Mission

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops in the future.

Why Should I Care

- Lessons from the Gulf War about dirty battlefields
- You must protect yourself against hazards
- You will be leading Gulf War vets
- You are responsible for force protection
  - What are the dangers of the dirty battlefield?
  - How good are our detectors and MOPP gear?
  - How do we determine if we are exposed?
  - Will our counter-fire put us at risk?
  - How do we identify captured CW/BW?
  - What if my fighting vehicle is hit with DU?

Gulf War Theater Forces



697,000 U.S. service members

1 in 7 Veterans Reported Symptoms Since The War

Most frequently reported symptoms

- Joint pain
- Headaches
- Sleep disorders
- Depression
- Fatigue
- Memory loss
- Rash
- Muscle pain

Communication Breakdown

- Veterans with real health problems
- Healthcare professionals unable to provide answers
- Government slow to recognize the reality of problems

Confounding Issues

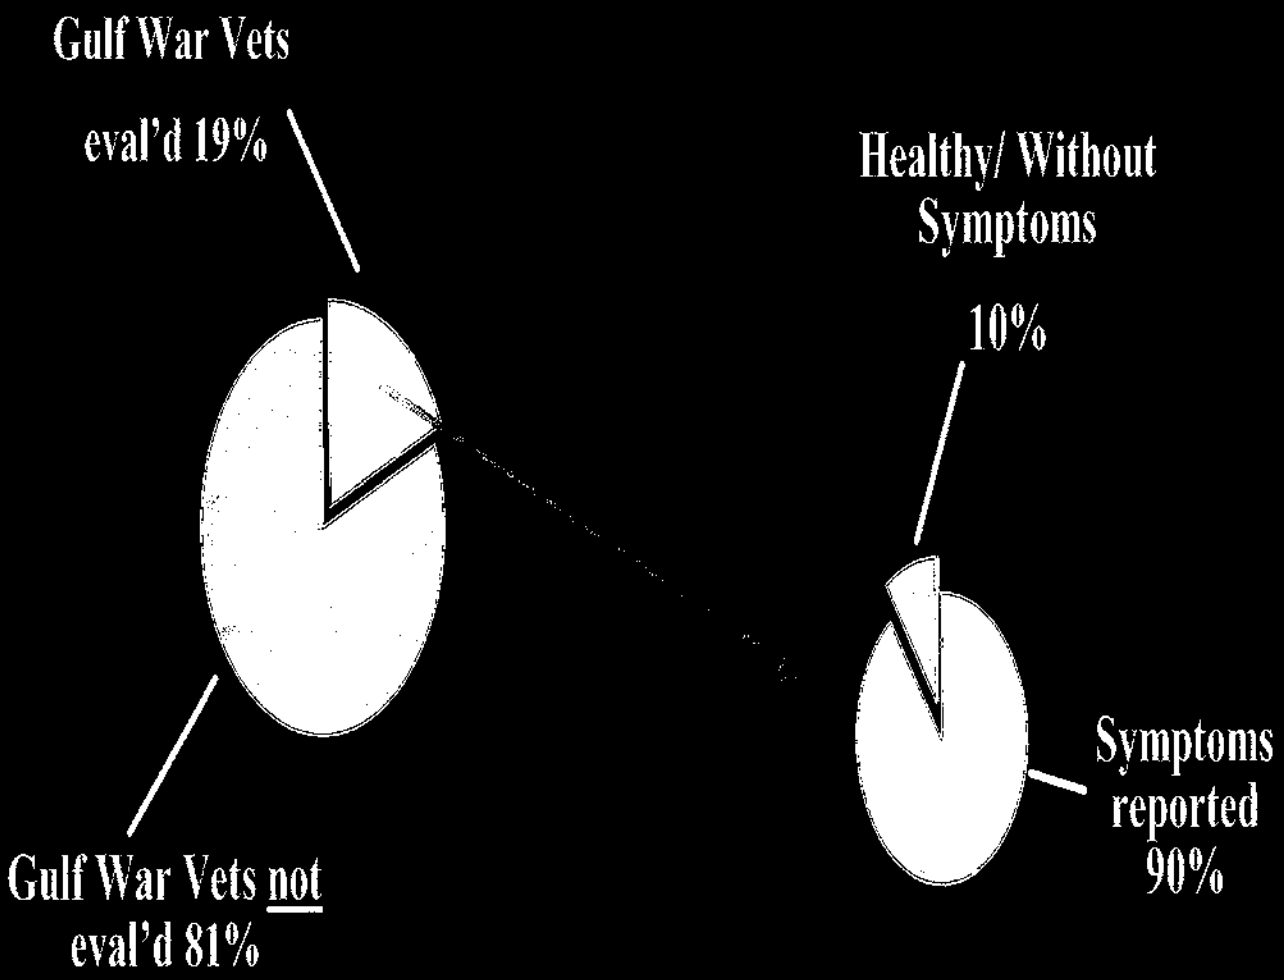
- No clustering
- No symptom consistency; variable onset
- No new disease or links between exposures and symptoms
- No long term study

Taking Care of Service Members

- DoD Comprehensive Clinical Evaluation Program
  - Gulf War vets (active, Guard/Reserve, retired)
  - Active service member deployed to SWA since war ended
  - Family members
  - Civilian employees
- VA Persian Gulf Registry
  - Gulf War vets (left service prior to retirement)
  - Service members deployed to SWA and left service before retirement
  - Evaluation for family members
- Available to *all* service members deploying to South West Asia
  - Most people evaluated can be treated

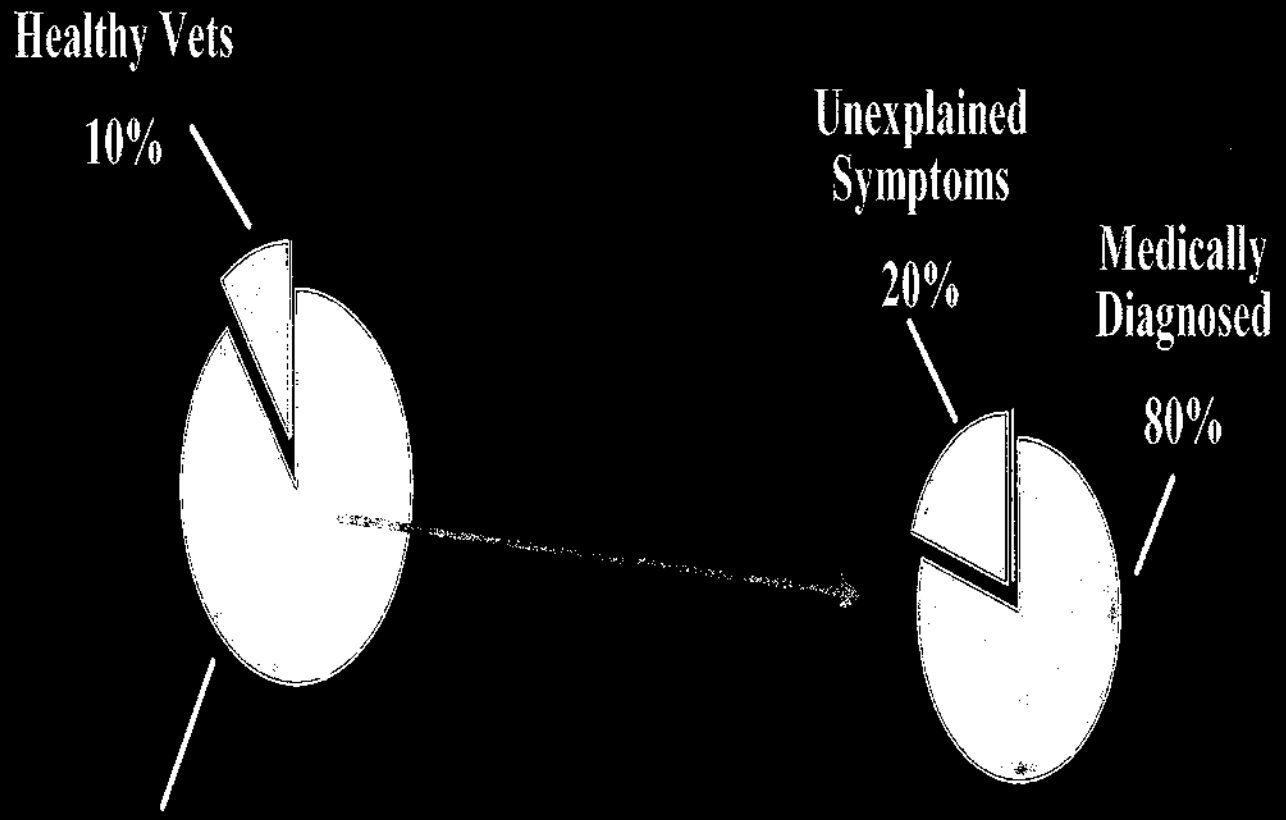
Don't Tough It Out!

Evaluation Distribution of 697,000 CCEP/VA



Diagnosis Distribution of Evaluated Veterans

CCEP/VA



Don't tough it out!

OSAGWI Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
    - 99,000 vets notified
- Environmental:
  - Depleted uranium (DU), Oil well fires, Pesticides
    - Science doesn't support DU or Oil Well fires as causes
    - Still examining particulates and pesticides
- Medical issues:
  - Vaccines, PB, records, policy
- Persian Gulf War Veterans Coordinating Board-Scientific Research
  - 180+ studies sponsored by DoD, HHS & DVA
  - Science shows no exposure cause or effect relationship yet!

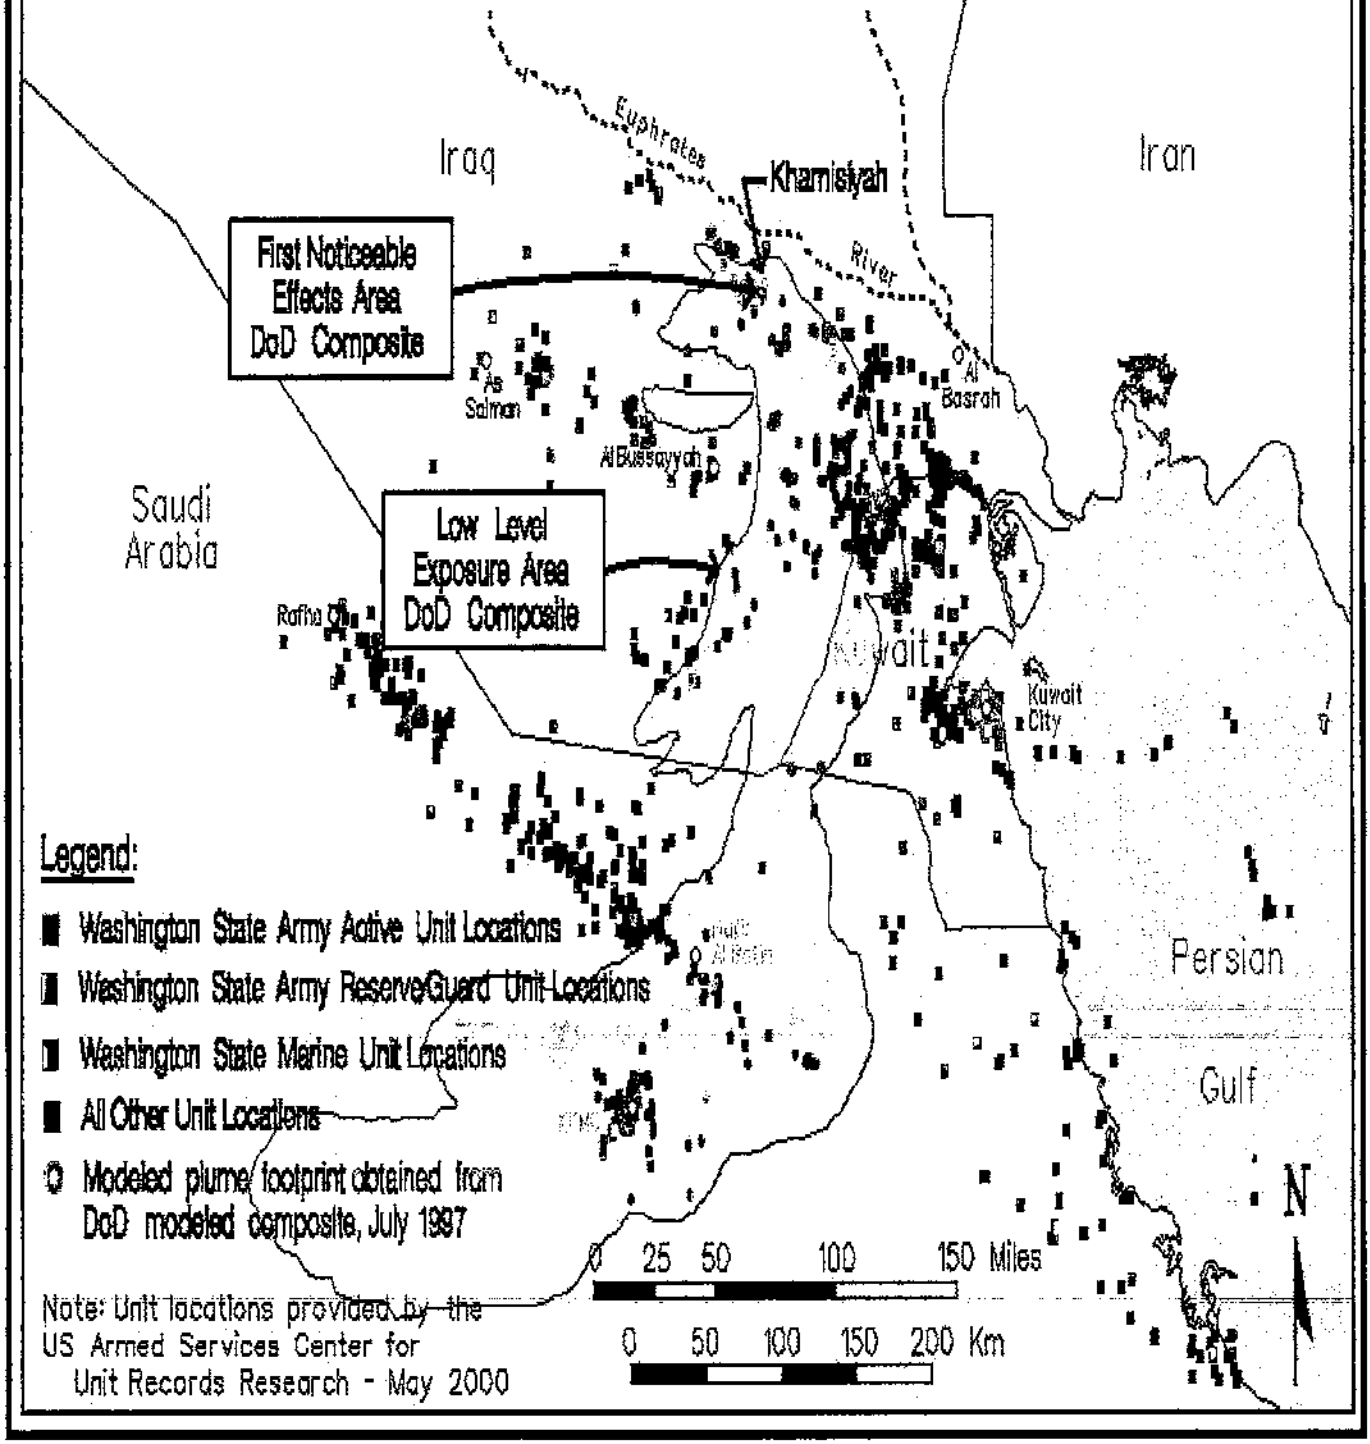
A New Reality –
The Dirty Battlefield

- What enemy may do to us
  - Chemical/Bio threat, Man made environmental hazards (Oil Well Fires)
- What the environment may do to us
  - Infectious diseases, insects, environmental risks (desert, jungle)
- What we may do to ourselves
  - Pesticides, Stressors, Investigational New Drugs, PB

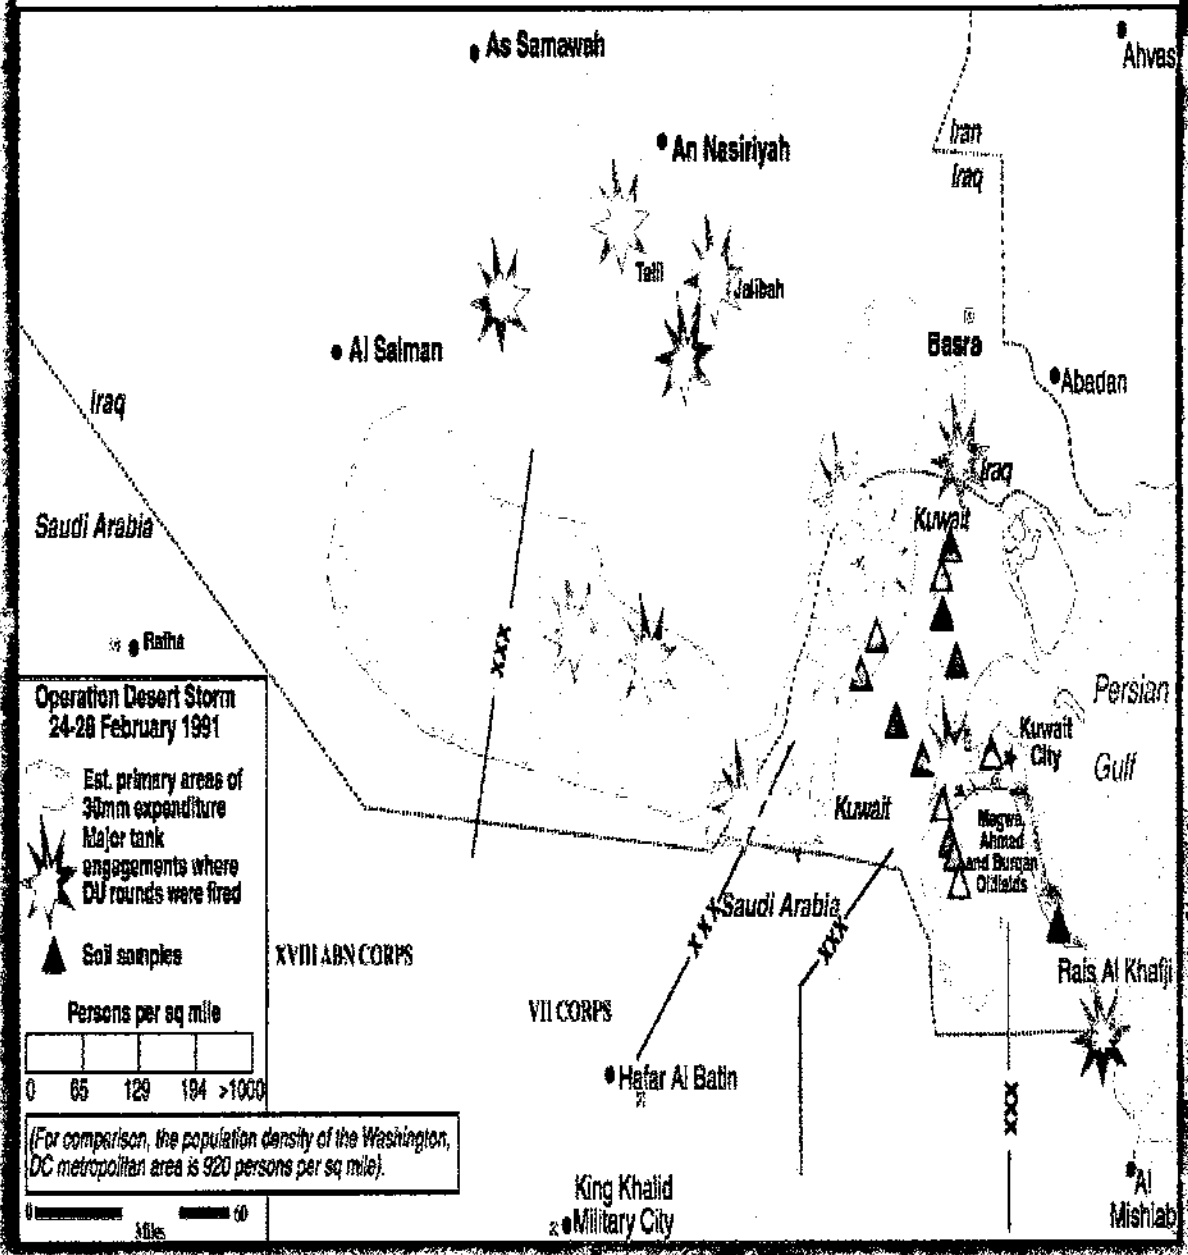
Current and future conflicts and humanitarian deployments have and will have these challenges

Day 2, 11 March 1991

Modeled Exposure Khamisiyah Pit Demolition for Seattle Outreach Visit



Primary Areas of DU Expenditure



DU Exposure Issues

- Radiation
- Consequences of exposure
- Heavy metal toxicity
- Reproductive effect
- Contamination of theater

Gulf War Investigation Results

- Poor intelligence about Iraq's CW/BW weapons
- Not enough vaccines and no explanation given
- Limited environmental survey
- Information about nerve agent pre-treatment (PB) wasn't given to troops
- Inadequate training about DU or CW detectors
  - Training could have averted unnecessary exposure to DU and anxiety resulting from false alarms
- *Veterans re-deployed and left service without thorough medical exam or debrief*

Applying Lessons Learned

You

- Train self and others to recognize and avoid hazards
- Improve feedback and cross talk
- You are your own best health advocate

Your Unit

- CW/BW detection:earlier with fewer false positives
- Create, relate and save operational, NBC, and medical records
- Adapt to reduce risks and train to reduce future risks such as DU
- Debrief to explain what happened
- Monitor service members' health & environment

Force Health Protection

Pre-deployment

- Verify DNA sample on file
- Collect pre-deployment blood sample
- Verify HIV test is current
- Verify Immunizations up to date
- Verify current physical exam
- Complete Health questionnaire

Deployment

- Routine disease/injury reporting
- Forward medical laboratory
- Immunization tracking
- Environmental monitoring

Post Deployment

- Collect blood sample
- Medical debriefs
- Complete health questionnaire
- Screening exams as needed

You are your own best health advocate!

Anthrax

- Anthrax - an offensive BW agent
  - Inhalation anthrax is highly lethal
  - Easy to develop and weaponize
  - Remains viable for long periods
  - At least seven potential adversaries suspected of researching, developing and/or weaponizing anthrax.
- We have a safe and effective vaccine

Vaccination against anthrax is critical for your protection

Anthrax Vaccine Program

- Licensed by the FDA since 1970
- Dosing schedule is six doses over 18 months
  - 0, 2, 4 weeks, 6, 12, 18 months, plus annual booster
- Shortages in stockpiled doses require temporary slowdown of AVIP
  - No new vaccine available from renovated facility until FDA approves [new vaccine lots] safety and effectiveness
  - Vaccinations continue for service members assigned or deployed at least 30 days in highest threat areas
  - Next scheduled doses for those <u>not</u> in high threat areas will be deferred until sufficient doses are available

(877) GET-VACC DSN: 761-5101

www.anthrax.osd.mil

www.aviationmedicine.com

Pyridostigmine Bromide

- Threat - Soman is deadly nerve agent
- PB is the only known pretreatment against Soman.
  - Auto injectors alone will not save you
- Issues have been raised about PB
  - Further research is ongoing
- Only President can authorize its use without informed consent

Conclusions about PB

- We cannot rule out pyridostigmine bromide as a contributor to increased health symptoms in Gulf War veterans.
- Further research is needed to determine the effectiveness of the current dose of PB against Soman.
- Additional research about safety and effectiveness of PB for humans is needed.

Bottom Line

- You will deploy on missions to dirty areas
- Everyone is responsible for force protection
- Evaluating PB and pesticides as contributors to GW vets' symptoms
- Lessons learned from the Gulf War affect today's doctrine and deployments
- You are your own best health advocate
- Vets should not tough it out; get examined
- Vaccination against anthrax protects you

Obtaining Help and Information

- GWIMRMD Veterans' Helpline (800) 497-6261
- Comprehensive Clinical Evaluation Program (800) 796-9699
- MAMC CCEP (253) 968-3172
- Veterans Affairs Persian Gulf Registry program (800) 749-8387

Anthrax

- Inhalation anthrax is deadly
- Biological warfare agent of choice:
  - Cheap and easy to produce
  - Can be dispersed in air by a variety of methods
  - Odorless, colorless, tasteless, difficult to detect
  - Flu-like symptoms early, rapid deterioration, and death
- MOPP 4 prevents exposure
- Antibiotics work before symptoms appear

Vaccination against anthrax is critical for your protection

Briefing Overview

- Organization - Mission Statement
- Why should I care?
- Symptoms and Illnesses
- Looking for causes
- Gulf War Lessons Learned
- Force Health Protection
- Obtaining help and information

Special Assistant for Gulf War Illnesses

Dr. Bernard Rostker

- Appointed November 12, 1996 by the Deputy Secretary of Defense
- 180 team members

Mission of the Special Assistant

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate to understand and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops deploying now and in the future.

Why Should I Care?

- Lessons from the Gulf War about dirty battlefields.
- You must protect yourself against hazards.
- You will be working with or leading Gulf War vets.
- You will probably deploy overseas.
- You are responsible for force protection.

Who Served in the Gulf War

697,000 U.S. service members

Army	348,000	50%
Navy	160,000	23%
Marine	105,000	15%
Air Force	84,000	12%

259,000 Coalition Forces

Who Served in the Gulf War

MALE	93%
FEMALE	7%
ACTIVE	83%
RESERVE/NATIONAL GUARD	17%
OFFICER	10%
ENLISTED	90%

< 26 years old - 55%; 26-35 years old - 32%; > 35 years old - 13%

Medical Support

Largest emergency health care system since WW II

41,000 medical personnel

- 18,000 beds

- 2 hospital ships

- 63 combat zone hospitals

source: CENTCOM Publications - Commander-in-chief US CENTCOM "Desert Shield/Desert Storm Facts, Figures, Quotes and Anecdotes 7 AUG 90-11 APR 91," prepared by CENTCOM PAO

Medical Support

- Over 27,000 hospitalizations in theater
- 8,000 medical evacuations
- ????? outpatient visits

U.S. Deaths

Battle deaths	148
Non-battle deaths	224

Post War

Shortly after re-deployment, many individuals in units reported common symptoms

- Aching joints
- Headaches
- Rashes
- Sleep disorders
- Diarrhea
- Hair loss
- Memory loss
- Fatigue

Physician Message Sent

"Your laboratory, x-ray and physical exams results are normal."

Patient Messages Received

"There's nothing wrong with you!"

"It's all in your head!"

"You're faking these symptoms!"

Confounding Issues

- No clustering
- No symptom consistency
- Variable onset
- No long term study
- As yet - no new disease or links between exposures and symptoms

Looking for Causes

The Dirty Battlefield

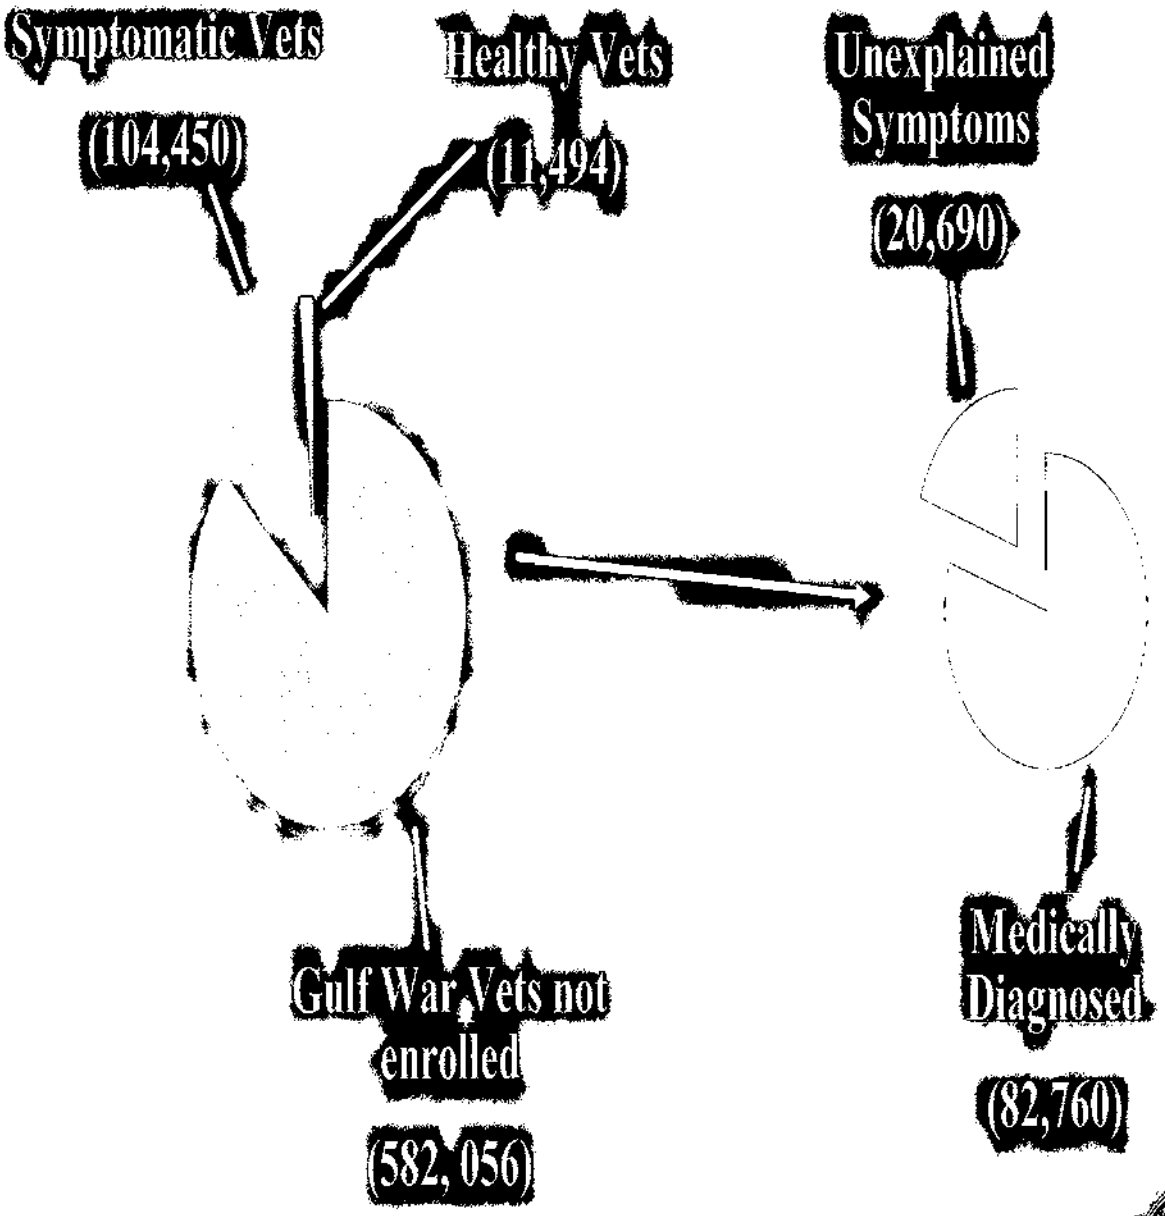
- What Iraq may have done to us.
  - Oil Well Fires, Chem/Bio threat
- What the environment may have done to us.
  - Sand, Insects, Infectious diseases
- What we may have done to ourselves.
  - Pesticides, Pyridostigmine Bromide
- Challenges in future conflicts and humanitarian deployments.

OSAGWI Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
- Environmental:
  - Depleted uranium (DU), Oil well fires, Pesticides
- Medical issues and lessons learned:
  - Vaccines, PB, records, policy
    - "Cocktail" effect

Diagnosis Distribution/697,000 Deployed

CCEP/VA Participants



Epidemiology Studies

	Deployed (%)	Non-Deployed (%)
Medical separation (Aug 91 - Dec 93)	2.20	2.56
Hospitalizations (Aug 91 - Sep 93)	21.6	21.6
Hospitalizations unexplained illnesses (Aug 91 - Apr 96)	1.21	1.27
Birth Defects (Aug 91 - Sep 93)	7.45	7.59
Mortality (Aug 91 - Sep 93)	.025	.023

Proactive Measures - You

- Recognize and contend with potential hazards:
  - Improve intel notification
  - Train all personnel
  - Reduce adverse effects of and stress from potential exposures
  - Understand the environment and culture before deploying
- Improve feedback and cross talk

Proactive Measures - Your Unit

- Improve expedient demolition of munitions
- CW/BW detection: earlier with fewer false positives
- Improve operational and medical records handling
- Adapt for the future
  - Retain individual unit locations and records
  - DU training
  - Improved medical surveillance
  - Force health protection

Force Health Protection

Pre-deployment

- Verify DNA sample on file
- Pre-deployment serum sample
- Verify HIV test in last 12 months
- Immunizations
- Verify current physical exam
- Health questionnaire

Deployment

- Routine disease/injury reporting
- Forward medical laboratory
- Immunization tracking
- Environmental monitoring

Post Deployment

- Collect serum sample
- Medical debriefs
- Complete health questionnaire
- Screening exams as needed

Future Equipment

- Personal Information Carrier (PIC)
- Biological Integrated Detection System (BIDS)
- Automatic Chemical Agent Alarm (ACADA)
- Medic Cam - Tele medicine

Anthrax Vaccine

- What is Anthrax?
  - Bacteria
  - Easily obtained, stored and weaponized
  - Deadly - (skin vs inhaled exposure)
- Vaccine is safe and necessary!
  - FDA Licensed in 1970
  - Used for many years to protect textile mill workers
  - Recommended by Centers for Disease Control (CDC):
    - Workers occupationally exposed to anthrax (labs, mills)
    - Treatment of anyone exposed to anthrax aerosols
    - Only known pretreatment and protection against exposure

Anthrax Vaccine

- DoD Policy - mandatory for total force
  - Phased implementation
- Phase I - SWA and Korea (now)
- Phase II - Early deploying forces to SWA and Korea (8/99)
- Phase III - Total force (early 2000's)
- Vaccine series:
  - 0, 2, 4 weeks; then 6, 12, 18 months; annual booster
  - 1,147,349 doses, 211 adverse reactions=0.018% (01 Oct 99)
    - 155 systemic reactions, 56 local reactions

- DoD anthrax web site: www.anthrax.osd.mil

Obtaining help and information

- Comprehensive Clinical Evaluation Program (CCEP)
  - 1-800-796-9699
- Veterans Affair registry program
  - 1-800-749-8387
- Town Hall

Briefing Overview

- Organization - Mission Statement
- Why should I care?
- Symptoms and Illnesses
- Looking for causes
- Gulf War Lessons Learned
- Force Health Protection
- Help and information

Special Assistant for Gulf War Illnesses

Dr. Bernard Rostker

- Appointed November 12, 1996 by the Deputy Secretary of Defense
- 180 team members

Mission of the Special Assistant

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate to understand and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops in the future.

Why Should I Care?

- Lessons from the Gulf War about dirty battlefields.
- You must protect yourself against hazards.
- You will be working with or leading Gulf War vets.
- You will probably deploy overseas.
- You are responsible for force protection.

Who Served in the Gulf War

697,000 U.S. service members

Army	348,000	50%
Navy	160,000	23%
Marine	105,000	15%
Air Force	84,000	12%

259,000 Coalition Forces

Who Served in the Gulf War

MALE	93%
FEMALE	7%
ACTIVE	83%
RESERVE/NATIONAL GUARD	17%
OFFICER	10%
ENLISTED	90%

< 26 years old - 55%; 26-35 years old - 32%; > 35 years old - 13%

Medical Support

- Largest emergency health care system since WW II
- 41,000 medical personnel
- 18,000 beds
- 2 hospital ships
- 63 combat zone hospitals

source: CENTCOM Publications - Commander-in-chief US CENTCOM "Desert Shield/Desert Storm Facts, Figures, Quotes and Anecdotes 7 AUG 90-11 APR 91," prepared by CENTCOM PAO

Medical Support

U.S. Deaths

Battle deaths	148
Non-battle deaths	224

Post War

Shortly after re-deployment, many individuals in units reported common symptoms

- Aching joints
- Headaches
- Rashes
- Sleep disorders
- Diarrhea
- Hair loss
- Memory loss
- Fatigue

Physician Message Sent

"Your laboratory, x-ray and physical exams results are normal."

Patient Messages Received

"There's nothing wrong with you!"

"It's all in your head!"

"You're faking these symptoms!"

Confounding Issues

- No clustering
- No symptom consistency
- Variable onset
- No long term study
- As yet - no new disease or links between exposures and symptoms

Looking for Causes

The Dirty Battlefield

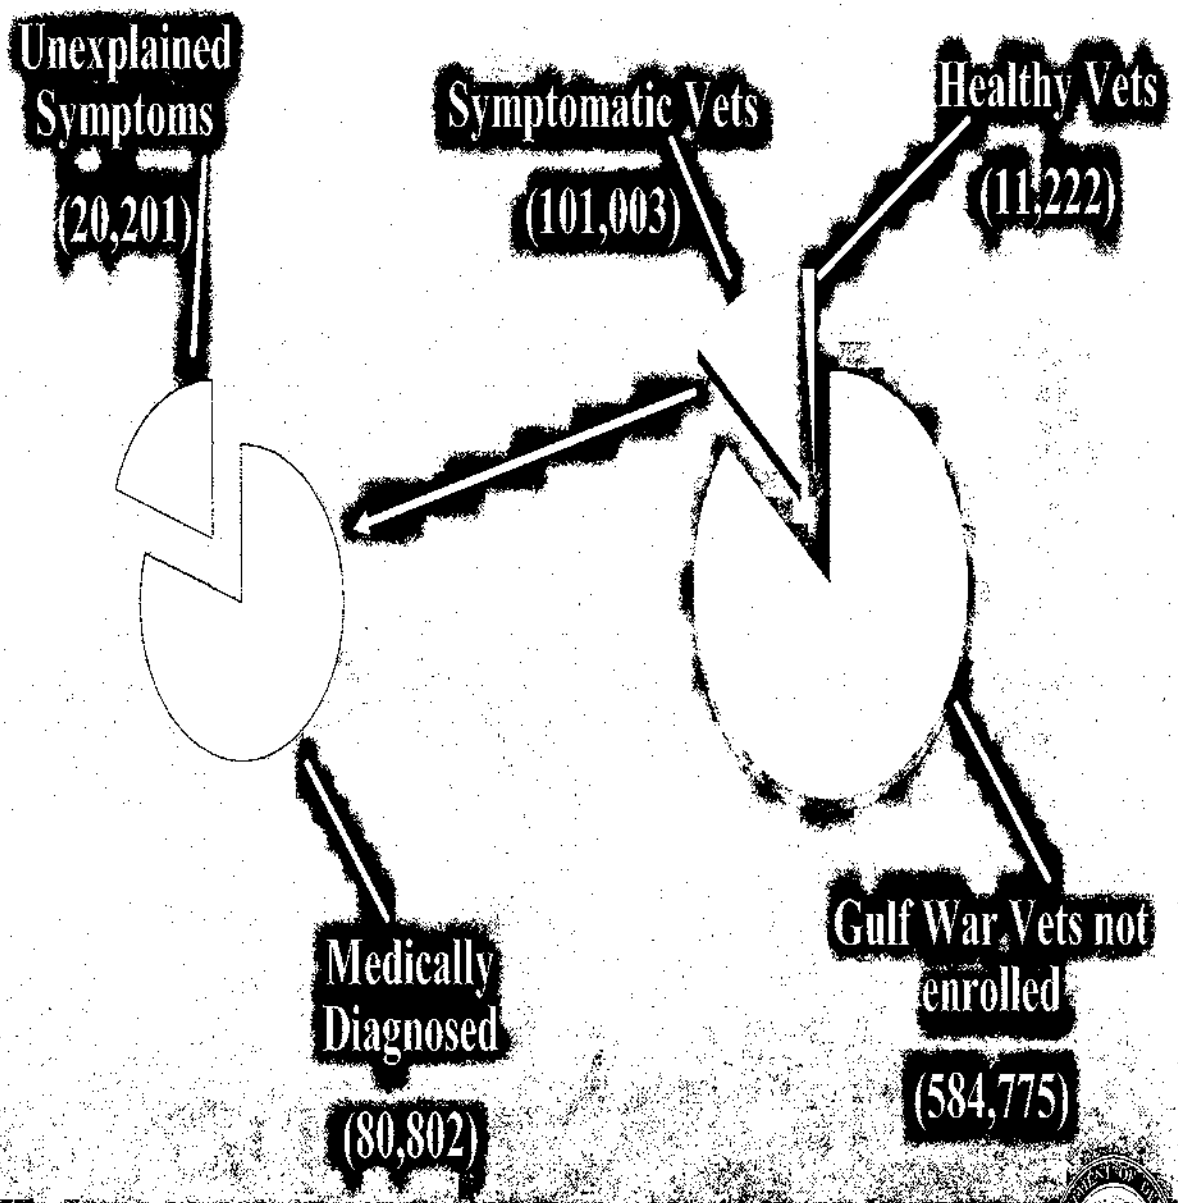
- What Iraq may have done to us.
  - Oil Well Fires
- What the environment may have done to us.
  - Sand, Infectious diseases
- What we may have done to ourselves.
  - Pesticides, Pyridostigmine Bromide
- Challenges in the future from low-tech pariah states to the revolution in military affairs.

OSAGWI Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
- Environmental:
  - Depleted uranium (DU), Oil well fires, Pesticides
- Medical issues and lessons learned:
  - Vaccines, PB, records, policy
    - "Cocktail" effect

Diagnosis Distribution/697,000 Deployed

CCEP/VA Participants



Epidemiology Studies

	Deployed (%)	Non-Deployed (%)
Medical separation (Aug 91 - Dec 93)	2.20	2.56
Hospitalizations (Aug 91 - Sep 93)	21.6	21.6
Hospitalizations unexplained illnesses (Aug 91 - Apr 96)	1.21	1.27
Birth Defects (Aug 91 - Sep 93)	7.45	7.59
Mortality (Aug 91 - Sep 93)	.025	.023

Proactive Measures - You

- Recognize and contend with potential hazards:
  - Improve intel notification
  - Train all personnel
  - Reduce adverse effects of and stress from potential exposures
  - Understand the environment and culture before deploying
- Improve feedback and cross talk

Proactive Measures - Your Unit

- Improve expedient demolition of munitions
- CW/BW detection: earlier with fewer false positives
- Improve operational and medical records handling
- Adapt for the future
  - Retain individual unit locations and records
  - DU training
  - Improved medical surveillance
  - Force health protection

Force Health Protection

Pre-deployment

- Verify DNA sample on file
- Pre-deployment serum sample
- Verify HIV test in last 12 months
- Immunizations
- Verify current physical exam
- Health questionnaire

Deployment

- Routine disease/injury reporting
- Forward medical laboratory
- Immunization tracking
- Environmental monitoring

Post Deployment

- Collect serum sample
- Medical debriefs
- Complete health questionnaire
- Screening exams as needed

Future Equipment

- Personal Information Carrier (PIC)
- Biological Integrated Detection System (BIDS)
- Automatic Chemical Agent Alarm (ACADA)
- Medic Cam - Tele medicine

Anthrax Vaccine

- What is Anthrax?
- Vaccine is safe and necessary!
  - FDA Licensed in 1970
  - Used for many years to protect textile mill workers
  - Recommended by Centers for Disease Control (CDC):
    - Workers occupationally exposed to anthrax (labs, mills)
    - Treatment of anyone exposed to anthrax aerosols
    - Only known pretreatment and protection against exposure

Anthrax Vaccine

- DoD Policy - mandatory for total force
  - Phased implementation
- Phase I - SWA and Korea (now)
- Phase II - Early deploying forces to SWA and Korea (8/99)
- Phase III - Total force (early 2000's)
- Vaccine series:
  - 0, 2, 4 weeks; then 6, 12, 18 months; annual booster
  - 891,260 doses, 79 adverse reactions=0.009% (2 Jun 99)
    - 44 systemic reactions, 35 local reactions

- DoD anthrax web site: www.defenselink.mil/specials/Anthrax

Obtaining help and information

- Comprehensive Clinical Evaluation Program (CCEP)
  - 1-800-796-9699
- Veterans Affair registry program
  - 1-800-749-8387
- Town Hall
  - Thursday, Aug 26 at the Haszard Auditorium, 1900hrs
- Displays
  - P.X., Ireland Army Community Hospital
- Contact managers

Bottom Line

- Gulf War Veterans key for our work
- You must protect yourself on the Dirty Battlefield
- Anyone deployed to South West Asia is eligible for CCEP
- Don't tough it out - Get signed up and evaluated
- You are your best health advocate
- Apply these lessons learned

email: brostker@gwillness.osd.mil

Briefing Overview

- Mission Statement
- The Gulf War
- Searching for Answers
- Lessons Learned
- Force Health Protection
- Bottom Line
- Obtaining Help and Information

Vision of the Special Assistant for Gulf War Illnesses, Medical Readiness, and Military Deployments

- The Department of Defense recognizes the right of those involved in deployments to receive information that enables them to make informed decisions about their health
- We will develop and disseminate such information in a relevant and timely fashion
- We will work with others in the Defense Department to incorporate lessons from previous deployments to foster the well-being of deployed forces

Gulf War Illnesses Mission

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops in the future.

Gulf War Theater

- August 1990 to July 1991
- 697,000 US service members
- More than 27,000 hospitalizations
- 148 battle deaths
- 224 non-battle deaths

1 in 7 Veterans Reported Symptoms Since the War

Most frequently reported symptoms

- Joint pain
- Headaches
- Sleep disorders
- Depression
- Fatigue
- Memory loss
- Rash
- Muscle pain

Communication Breakdown

- Veterans with real health problems
- Healthcare professionals unable to provide answers
- Government slow to recognize the reality of problems

Confounding Issues

- No clustering
- No symptom consistency; variable onset
- No new disease or links between exposures and symptoms
- No long term study

Taking Care of Service Members

- **DoD Comprehensive Clinical Evaluation Program**
  - Gulf War vets (active, Guard/Reserve, retired)
  - Active service member deployed to SWA since war ended
  - Family members
  - DoD civilians
- **VA Persian Gulf Registry**
  - Gulf War vets (left service prior to retirement)
  - Service members deployed to SWA and left service before retirement
  - Evaluation for family members
- **Available to *all* service members deploying to South West Asia**

Don't Tough It Out!

OSAGWI Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
    - 99,000 vets notified
- Environmental:
  - Depleted uranium (DU), Oil well fires, Pesticides
- Medical issues:
  - Vaccines, PB, records, policy
- Scientific research under PGVCB
  - 180+ studies sponsored by DoD, DVA, & HHS
  - No cause and effect relationship shown so far

Investigation Results

- Gulf War
  - No offensive CW/BW use
  - Not enough vaccines and no explanation given
  - Limited environmental surveys
  - Information about nerve agent pre-treatment (PB) wasn't given to troops
  - Inadequate training
    - *Veterans returned home and left service without thorough medical exam or debrief*

The Dirty Battlefield

- What enemy may do to us
  - Chemical/Bio threat, man-made environmental hazards (oil well fires)
- What the environment may do to us
  - Infectious diseases, insects, environmental risks (desert, jungle)
- What we may do to ourselves
  - Accidents, pesticides, investigational new drugs, PB

Current and future conflicts and humanitarian deployments have and will have these challenges

Applying Lessons Learned

- Train self and others to recognize and avoid hazards
- Monitor service member's health & environment
- Improve feedback and cross talk
- Know your equipment strengths and weaknesses
- Create, relate and save operational, NBC, and medical records
- Adapt to reduce risks and train to reduce future risks such as DU

Force Health Protection

- Pre-deployment
  - Medical screening/surveillance and briefings
- Deployment
  - Record keeping
  - Monitor environment and personnel
- Post Deployment
  - Medical screening and unit debriefing

Anthrax

- We have a safe and effective vaccine

- Anthrax - an offensive BW agent
  - Inhalation anthrax is highly lethal
  - Easy to develop and weaponize
  - Remains viable for long periods

Vaccination against anthrax is critical for your protection

Anthrax Vaccine Program

- Licensed by the FDA since 1970
- Dosing schedule: 0, 2, 4 weeks, 6, 12, 18 months, plus annual booster
- Shortages in stockpiled doses require temporary slowdown of AVIP

(877) GET-VACC DSN: 761-5101

www.anthrax.osd.mil

www.aviationmedicine.com

Pyridostigmine Bromide

- Threat - Soman is deadly nerve agent
- PB is the only known pretreatment against Soman
  - Auto injectors alone will not save you
- Issues have been raised about PB
  - Further research is ongoing
- Only President can authorize its use without informed consent

Bottom Line

- Lessons learned from the Gulf War affect today's doctrine and deployments
- You will deploy on missions
- Everyone is responsible for force protection
- You are your own best health advocate
- Vets should not tough it out; get examined

Briefing Overview

- Mission Statement
- The Gulf War
- Post Gulf War Issues
- Searching for answers
- Lessons Learned
- Force Health Protection
- Bottom Line
- Obtaining help and information

Vision of Special Assistant for Gulf War Illnesses, Medical Readiness, and Military Deployments

- The Department of Defense recognizes the right of those involved in deployments to receive information that enables them to make informed decisions about their health.
- We will develop and disseminate such information in a relevant and timely fashion.
- We will work with others in the Defense Department to incorporate lessons from previous deployments to foster the well-being of deployed forces.

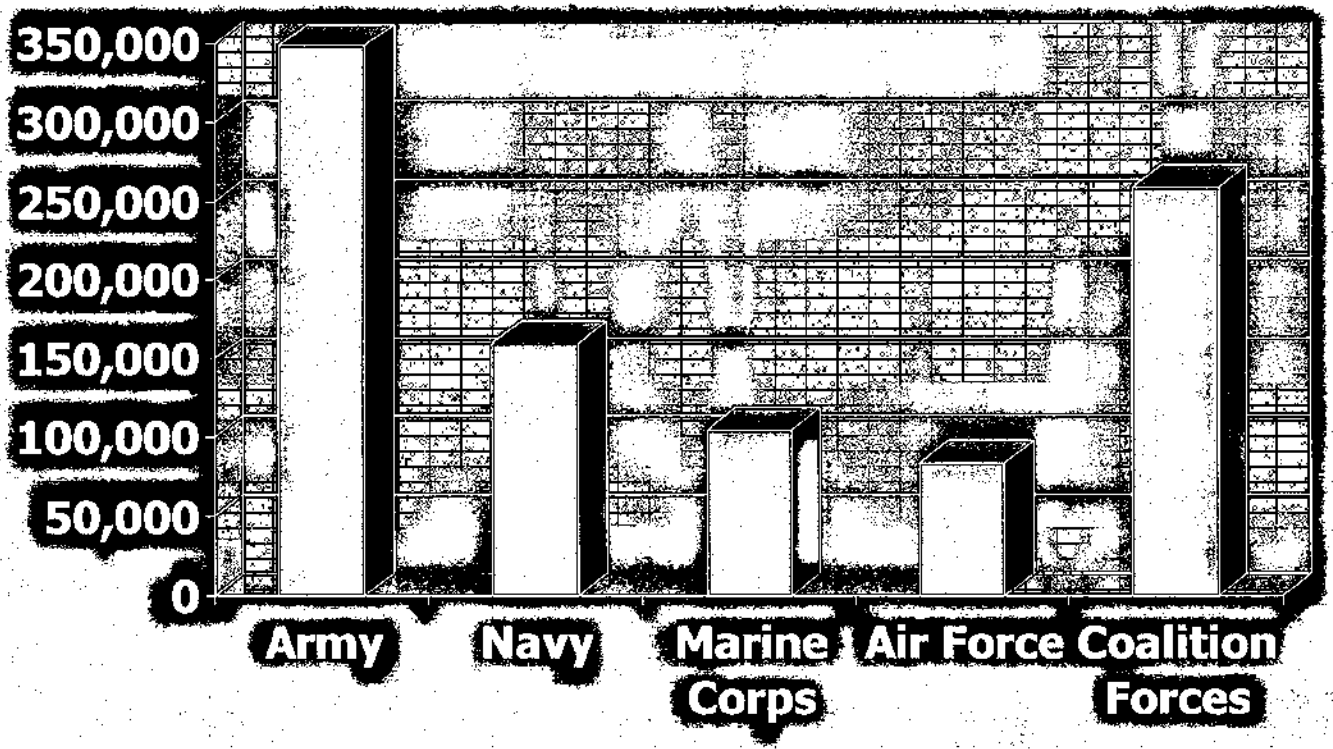
Gulf War Illnesses Mission

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops in the future.

Why Should I Care

- Lessons from the Gulf War about dirty battlefields
- You must protect yourself against hazards
- You will be leading Gulf War vets
- You are responsible for force protection
  - What are the dangers of the dirty battlefield?
  - How good are our detectors and MOPP gear?
  - How do we determine if we are exposed?
  - Will our counter-fire put us at risk?
  - How do we identify captured CW/BW?
  - What if my fighting vehicle is hit with DU?

Gulf War Theater Forces



697,000 U.S. service members

Veterans' Health Concerns

Since re-deployment, one in seven veterans report common symptoms

- Joint pain
- Headaches
- Sleep disorders
- Depression
- Fatigue
- Memory loss
- Rash
- Muscle pain

and many other symptoms

Communication Breakdown

- Veterans with real health problems
- Healthcare professionals unable to provide answers
- Government slow to recognize the reality of problems

Confounding Issues

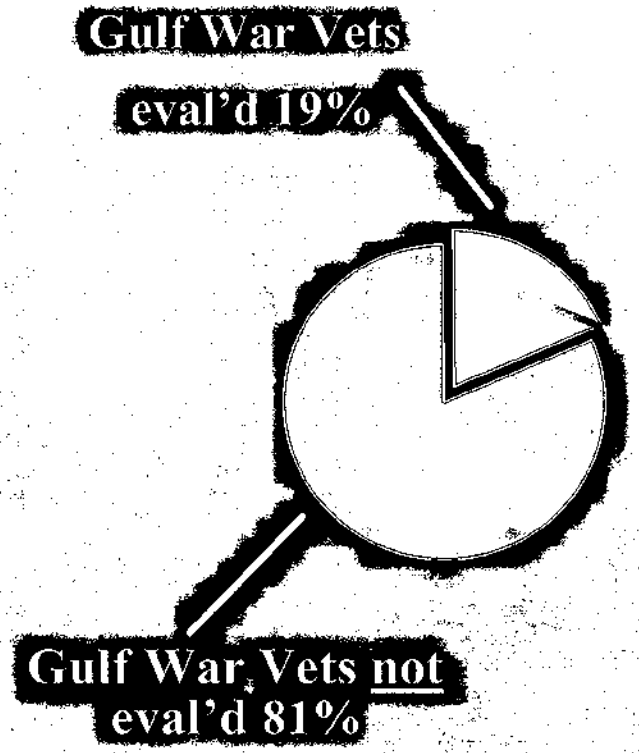
- No clustering
- No symptom consistency; variable onset
- No new disease or links between exposures and symptoms
- No long term study

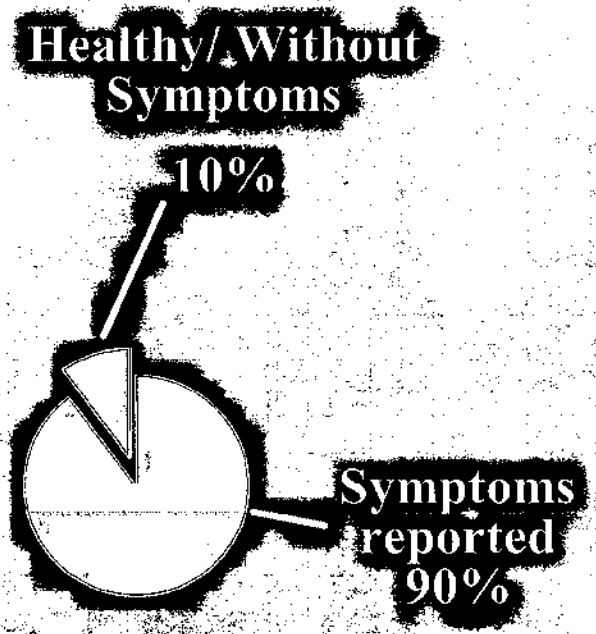
Taking Care of Service Members

- **DoD Comprehensive Clinical Evaluation Program**
  - Gulf War vets (active, Guard/Reserve, retired)
  - Active service member deployed to SWA since war ended
  - Family members
  - Civilian employees
- **VA Persian Gulf Registry**
  - Gulf War vets (left service prior to retirement)
  - Service members deployed to SWA and left service before retirement
  - Evaluation for family members
- **Available to *all* service members deploying to South West Asia**
  - Most people evaluated can be treated

Don't Tough It Out!

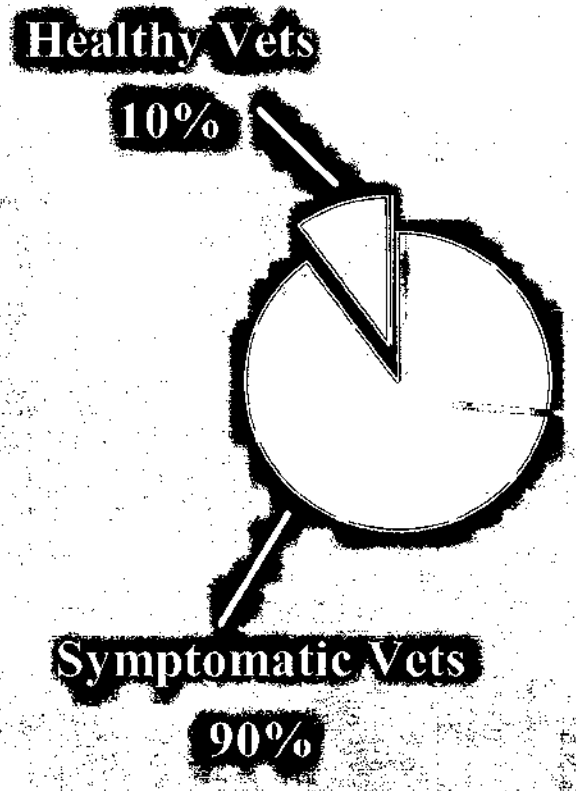
Evaluation Distribution of 697,000 CCEP/VA

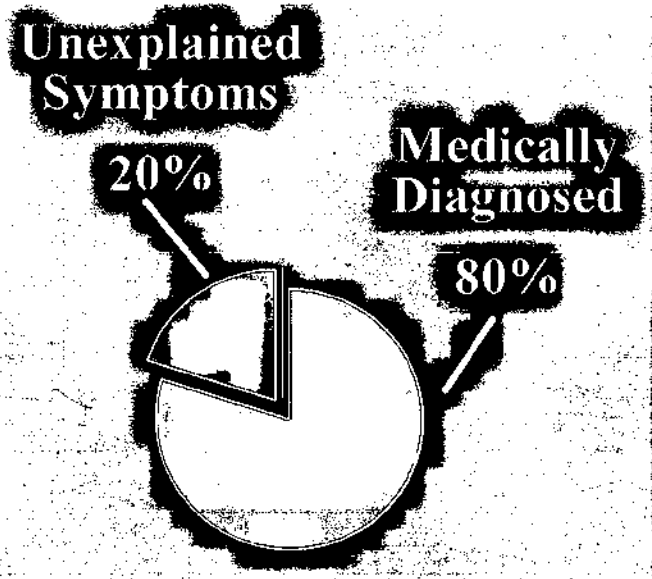




Diagnosis Distribution of Evaluated Veterans

CCEP/VA





Don't tough it out!

OSAGWI Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
    - 99,000 vets notified
- Environmental:
  - Depleted uranium (DU), Oil well fires, Pesticides
    - Science doesn't support DU or Oil Well fires as causes
    - Still examining particulates and pesticides
- Medical issues:
  - Vaccines, PB, records, policy
- Persian Gulf War Veterans Coordinating Board-Scientific Research
  - 180+ studies sponsored by DoD, HHS & DVA
  - Science shows no exposure cause or effect relationship yet!

A New Reality =
The Dirty Battlefield

- What enemy may do to us
  - Chemical/Bio threat, Man made environmental hazards (Oil Well Fires)
- What the environment may do to us
  - Infectious diseases, insects, environmental risks (desert, jungle)
- What we may do to ourselves
  - Pesticides, Stressors, Investigational New Drugs, PB
  - Current and future conflicts and humanitarian deployments have and will have these challenges

Gulf War Investigation Results

- Poor intelligence about Iraq's CW/BW weapons
- Not enough vaccines and no explanation given
- Limited environmental survey
- Information about nerve agent pre-treatment (PB) wasn't given to troops
- Inadequate training about DU or CW detectors
  - Training could have averted unnecessary exposure to DU and anxiety resulting from false alarms
- *Veterans re-deployed and left service without thorough medical exam or debrief*

Applying Lessons Learned

You

- Train self and others to recognize and avoid hazards
- Improve feedback and cross talk
- You are your own best health advocate

Your Unit

- CW/BW detection:earlier with fewer false positives
- Create, relate and save operational, NBC, and medical records
- Adapt to reduce risks and train to reduce future risks such as DU
- Debrief to explain what happened
- Monitor service members' health & environment

Force Health Protection

Pre-deployment

- Verify DNA sample on file
- Collect pre-deployment blood sample
- Verify HIV test is current
- Verify Immunizations up to date
- Verify current physical exam
- Complete Health questionnaire

Deployment

- Routine disease/injury reporting
- Forward medical laboratory
- Immunization tracking
- Environmental monitoring

Post Deployment

- Collect blood sample
- Medical debriefs
- Complete health questionnaire
- Screening exams as needed

You are your own best health advocate!

Anthrax

- Anthrax - an offensive BW agent
  - Inhalation anthrax is highly lethal
  - Easy to develop and weaponize
  - Remains viable for long periods
  - At least seven potential adversaries suspected of researching, developing and/or weaponizing anthrax.
- We have a safe and effective vaccine

Anthrax

- Inhalation anthrax is deadly
- Biological warfare agent of choice:
  - Cheap and easy to produce
  - Can be dispersed in air by a variety of methods
  - Odorless, colorless, tasteless, difficult to detect
  - Flu-like symptoms early, rapid deterioration, and death
- MOPP 4 prevents exposure
- Antibiotics work before symptoms appear

Vaccination against anthrax is critical for your protection

Anthrax Vaccine Program

- Licensed by the FDA since 1970
- Dosing schedule is six doses over 18 months
  - 0, 2, 4 weeks, 6, 12, 18 months, plus annual booster
- Shortages in stockpiled doses require temporary slowdown of AVIP
  - No new vaccine available from renovated facility until FDA approves [new vaccine lots] safety and effectiveness
  - Vaccinations continue for service members assigned or deployed at least 30 days in highest threat areas
  - Next scheduled doses for those <u>not</u> in high threat areas will be deferred until sufficient doses are available

(877) GET-VACC DSN: 761-5101

www.anthrax.osd.mil

www.aviationmedicine.com

Pyridostigmine Bromide

- Threat - Soman is deadly nerve agent
- PB is the only known pretreatment against Soman.
  - Auto injectors alone will not save you
- Issues have been raised about PB
  - Further research is ongoing
- Only President can authorize its use without informed consent

Conclusions about PB

- We cannot rule out pyridostigmine bromide as a contributor to increased health symptoms in Gulf War veterans.
- Further research is needed to determine the effectiveness of the current dose of PB against Soman.
- Additional research about safety and effectiveness of PB for humans is needed.

Bottom Line

- You will deploy on missions to dirty areas
- Everyone is responsible for force protection
- Evaluating PB and pesticides as contributors to GW vets' symptoms
- Lessons learned from the Gulf War affect today's doctrine and deployments
- You are your own best health advocate
- Vets should not tough it out; get examined
- Vaccination against anthrax protects you

OFFICE OF THE UNDER SECRETARY OF DEFENSE
PERSONNEL AND READINESS
4000 DEFENSE PENTAGON
WASHINGTON, DC 20301-4000

SPECIAL ASSISTANT FOR
GULF WAR ILLNESSES,
MEDICAL READINESS, AND
MILITARY DEPLOYMENTS

NOV 2 0 2001

Mr. Kirt P. Love
The Desert Storm Battle Registry
P.O. Box 77381
Washington, D.C. 20013-7381

Dear Mr. Love:

This is in response to your November 3, 2001, e-mail note in which you provided comments on several topics and requested a public meeting with our organization on the anthrax vaccine program and the American military NBC mask.

We read your comments on our article and other topics with interest. We disagree with your statement that the Department of Defense is providing our servicemembers with substandard equipment. The new mask is being developed based on the biological and chemical threats we face today. Those closest to the program believe it will provide our soldiers the best chance of survival on the "dirty" battlefields of tomorrow.

Your claim that the Department of Defense does not recommend the anthrax vaccine for the general public is in error. Medical experts in the military and at the Centers for Disease Control and Prevention continue to support the anthrax vaccine as both safe and effective. It is the preferred method of defense against all anthrax exposures and provides the only safe and proven protection prior to exposure. It also provides, in combination with antibiotics, the most effective treatment for those who have already been exposed to anthrax spores. It is also a known fact that the current stock of vaccine, which is insufficient to support a wide-scale vaccination program for the general public, has been reserved for the military. The vaccine could not possibly be made available to the general public until full-scale production begins again.

We recommend you contact staff members at the Anthrax Vaccine Information Program about your concerns on the anthrax vaccine. They are the lead agency on this issue and can be reached at (800) 438-8222. However, I will be glad to meet with you at a time that is convenient to both of us to discuss your concerns and then will pass them on to the appropriate agency for consideration. Please call me to schedule the date and time.

Sincerely,

Barbara A. Goodno
Deputy for Public Affairs

Pentagon Mobilizes: Special Assistant for Gulf War Illnesses

Dr. Bernard Rostker

- Appointed November 12, 1996 by the Deputy Secretary of Defense
- 180 team members

Mission of the Special Assistant

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate to understand and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops in the future.

Why Should I Care?

- Lessons from the Gulf War about dirty battlefields.
- You must protect yourself against hazards.
- You will be working with or leading Gulf War vets.
- You will probably deploy overseas.
- You are responsible for force protection.

Myths versus Reality

Cover up	Open process & oversight
Not listening	Solicit eyewitness reports
Destroy records	Found missing records
20,000 veterans dead	6,186 veterans dead
No assistance to vets	Evaluation and care
"Syndrome"	More than 40 illnesses
CW or DU cause	Many possible causes
Brass doesn't care	Force Protection efforts
	Tough choices
	Cultural changes

U.S. Deaths

Battle deaths	148
Non-battle deaths	224
Hospitalizations	Over 27,000

Post War

Shortly after re-deployment, many individuals in a few units reported common symptoms

- Aching joints
- Headaches
- Rashes
- Sleep disorders
- Diarrhea
- Hair loss
- Memory loss
- Fatigue

Physician Message Sent

"Your laboratory, x-ray and physical exams results are normal."

Patient Messages Received

"There's nothing wrong with you!"

"It's all in your head!"

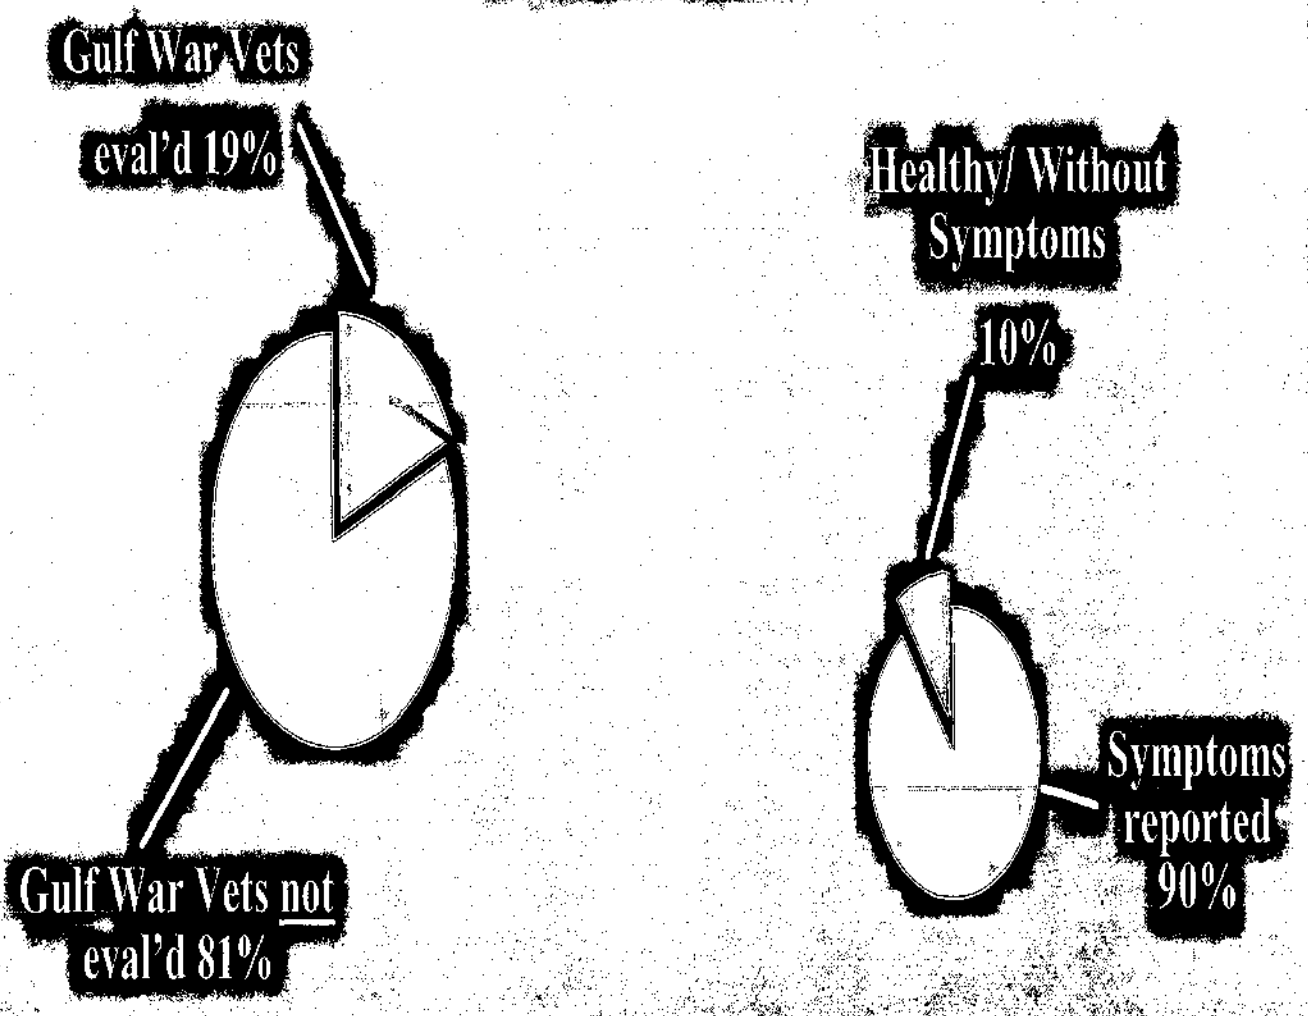
"You're faking these symptoms!"

Confounding Issues

- No clustering
- No symptom consistency
- Variable onset
- No longitudinal evaluation
- As yet - no new disease or links between exposures and symptoms

Evaluation Distribution of 697,000

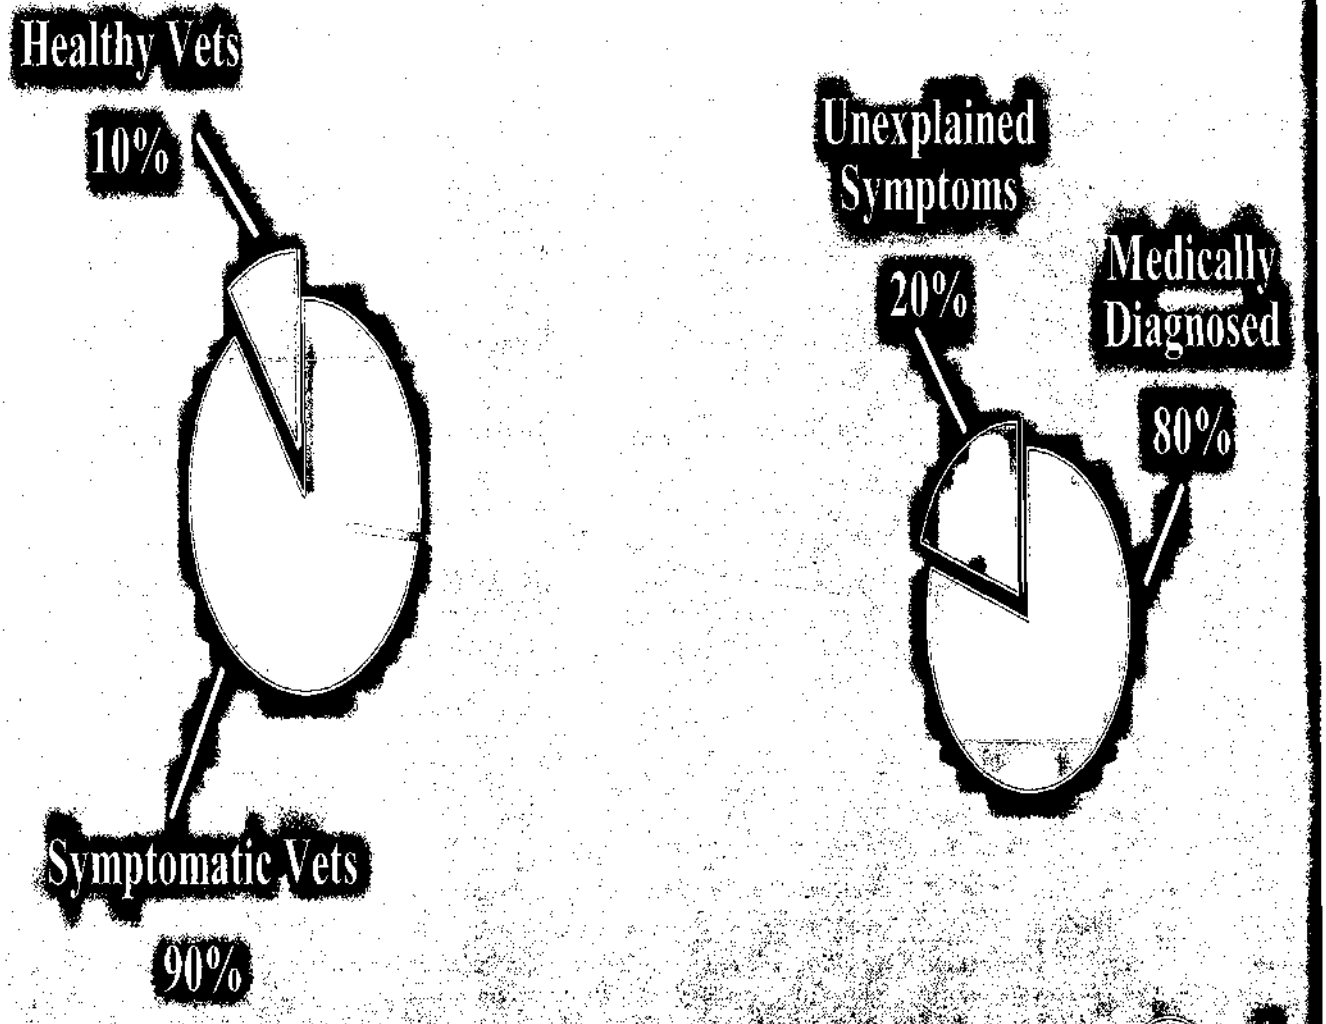
CCEP/VA



Office of the Special Assistant for Gulf War Illnesses

Diagnosis Distribution of Evaluated Veterans

CCEP/VA



Office of the Special Assistant for Gulf War Illnesses

Diagnosis Distribution

116,655 participants	CCEP/VA*
Healthy	10% - 11,665
Symptomatic (Sick)	90% - 104,990
Medically explained and treatable	80% - 93,324
Medically unexplained	20% - 23,331

As of Dec 99

*Comprehensive Clinical Evaluation Program (CCEP) and Dept. of Veteran's Affairs Registry, programs to provide health care to soldiers and veterans.

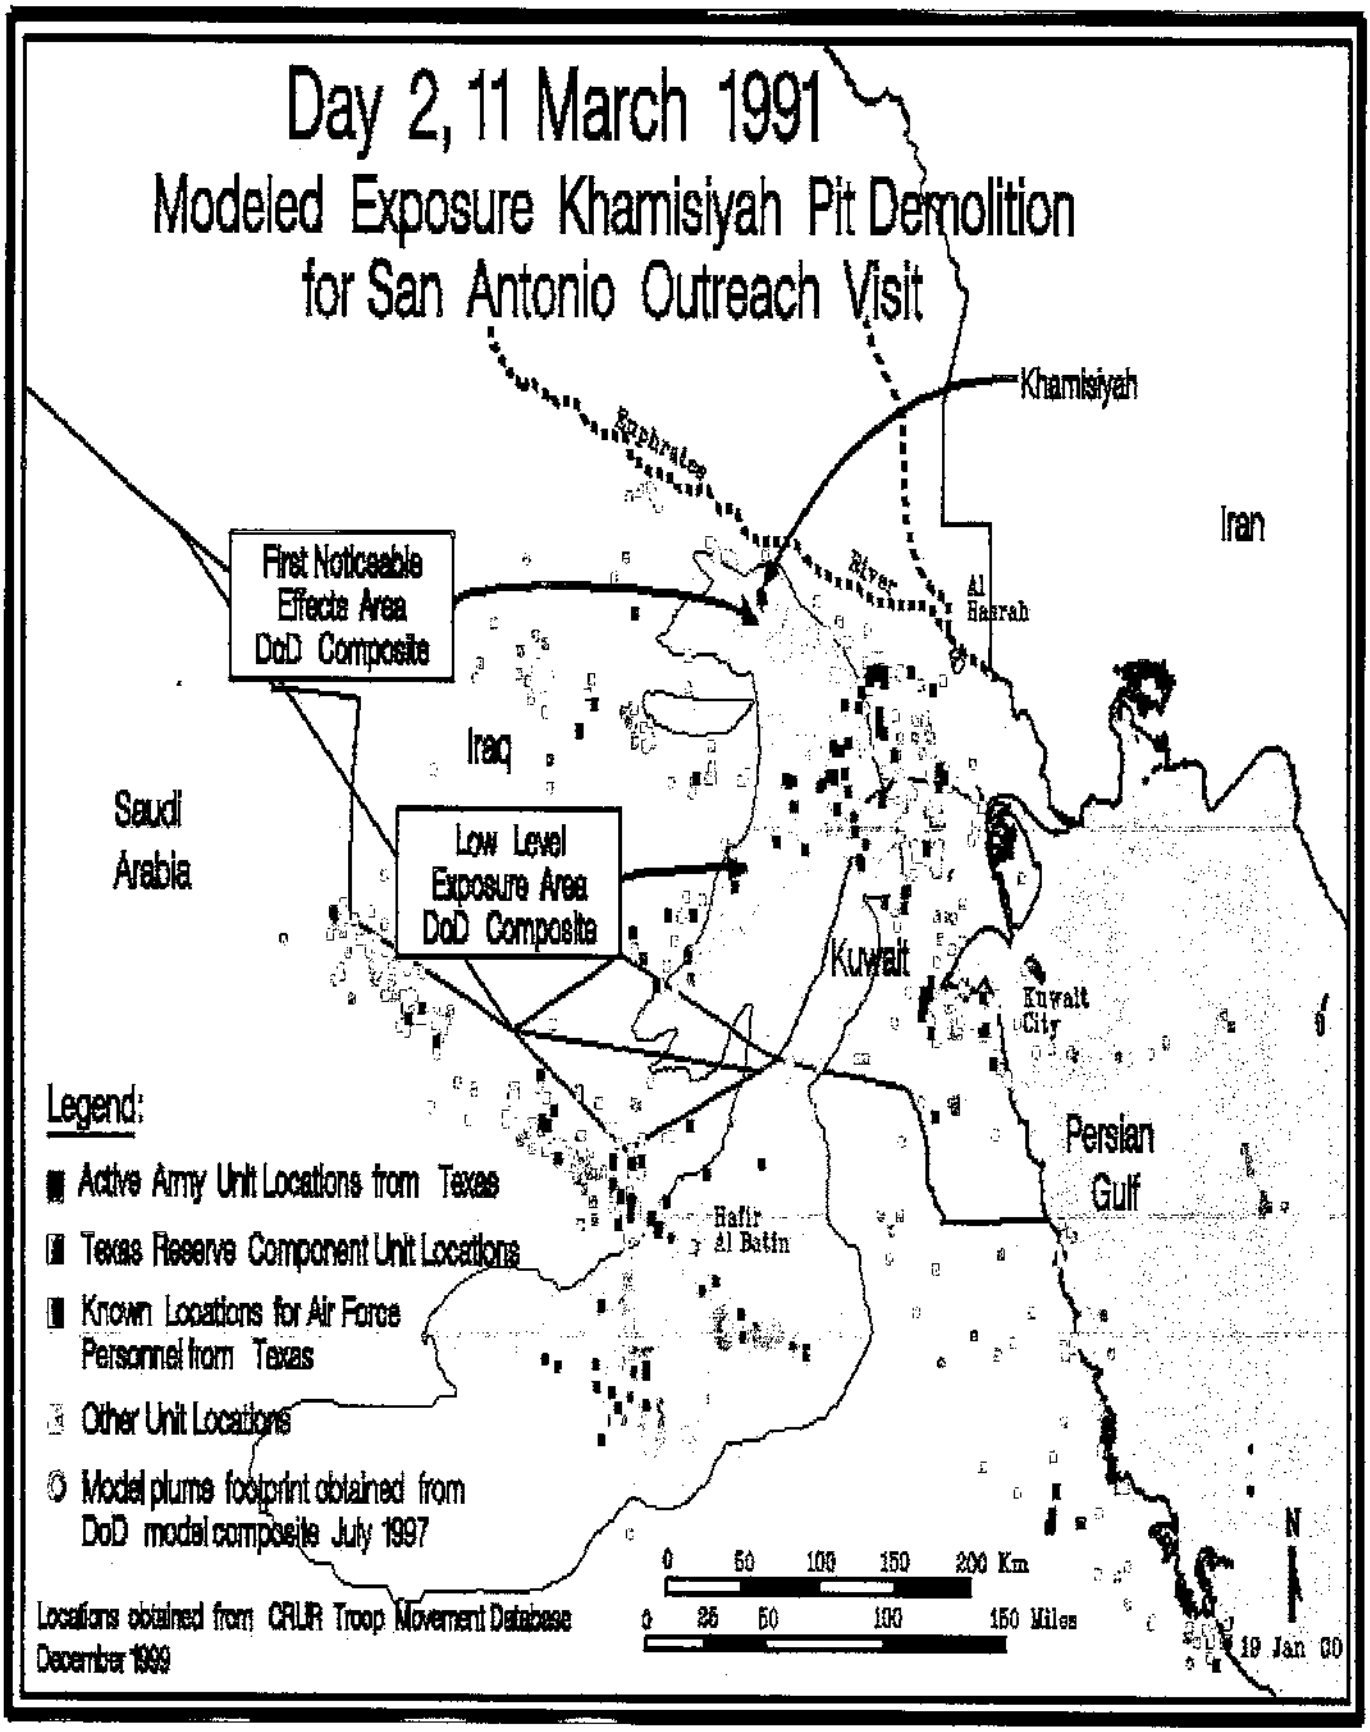
Looking for Causes

The Dirty Battlefield

- What Iraq may have done to us.
  - Oil Well Fires, Stress
- What the environment may have done to us.
  - Sand; Infectious diseases, bad food and water
- What we may have done to ourselves.
  - Pesticides, Pyridostigmine Bromide, Low levels of CW agent, DU
- Challenges in the future range from low-tech pariah states to the revolution in military affairs.

OSAGWI Investigations

- Chemical/biological warfare:
  - Focus in 1997; 16 papers
  - Watershed is Khamisiyah
- Environmental:
  - Focus in 1998
  - Oil well fires, pesticides, depleted uranium (DU)



Day 2, 11 March 1991

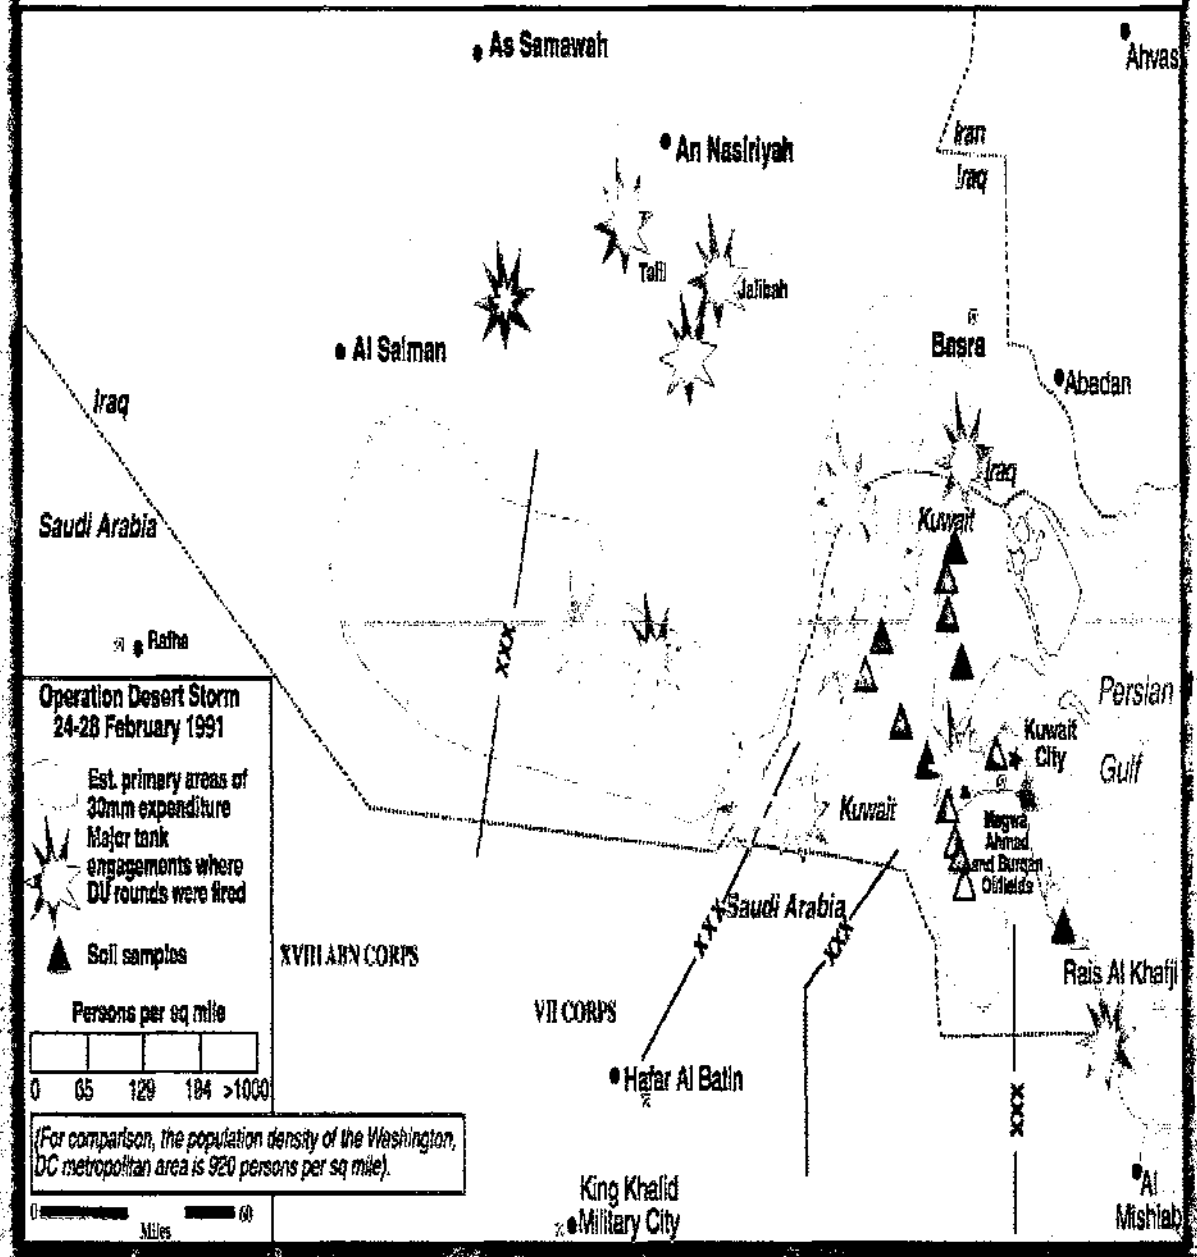
Primary Areas of DU Expenditure



Investigator's Message Sent

"The symptoms described were not consistent with symptoms associated with exposure to chemical warfare agents or depleted uranium."

Veteran's Messages Received

"You're wrong!"

"You can't possibly be sick because of this!"

DU Exposure Issues

- Radiation
- Heavy metal toxicity
- Consequences of exposure
- Reproductive effect
- Contamination of theater

DU Awareness Training

- Current CTT Task (031-503-1017)
- Better information is now available
  - Chemical toxicity vice radioactivity
  - Continue the mission
  - Respiratory protection for extended exposure
- Training support packages being updated
  - Includes updating the common task & GTA
  - Additional training for specialists
- Use existing training management system

OSAGWI Investigations

- Medical issues and lessons learned:
  - Focus in 1999
    - Vaccines, PB, records, policy
    - DU training
    - Managing hazards

Proactive Measures - You

- Recognize and contend with potential hazards:
  - Improve intel notification
  - Train all personnel
  - Reduce adverse effects of and stress from potential exposures
  - Understand the environment and culture before deploying
- Improve feedback and cross talk

Operational Lessons - Your Unit

- Improve expedient demolition of munitions
- CW/BW detection: earlier with fewer false positives
- Relate CW to operational and medical records
- Adapt for the future
  - Retain individual unit locations and records
  - DU training
  - Improved medical surveillance
  - Force health protection

Force Health Protection

Pre-deployment

- Verify DNA sample on file
- Collect pre-deployment blood sample
- Verify HIV test is current
- Verify Immunizations up to date
- Verify current physical exam
- Complete Health questionnaire

Deployment

- Routine disease/injury reporting
- Forward medical laboratory
- Immunization tracking
- Environmental monitoring

Post Deployment

- Collect blood sample
- Medical debriefs
- Complete health questionnaire
- Screening exams as needed

Anthrax Vaccine

- What is Anthrax?
- Vaccine is safe and necessary
  - FDA Licensed in 1970
  - Used for many years to protect textile mill workers
  - Recommended by Centers for Disease Control (CDC):
    - Workers occupationally exposed to anthrax (labs, mills)
    - Treatment of anyone exposed to anthrax aerosols
    - Only known pretreatment and protection against exposure

Immunizations

- Anthrax Vaccination program
  - Vaccine is FDA licensed since 1970 and proven safe
  - Only known protection against exposure
  - Necessary because of real threat
    - Easily produced and weaponized
- Current program statistics
  - Vaccine series 0, 2, 4 weeks; then 6, 12, 18 months; annual booster
  - 1,370,914 doses provided to 387,067 people (22 Dec 99)
    - 65 reactions resulted in loss of duty for less than 24 hrs.
    - 6 reactions resulted in hospitalization
      - All six were allergic, inflammation reactions

Anthrax information -- www.anthrax.osd.mil

1-800-GET-VACC

Obtaining help and information

- Comprehensive Clinical Evaluation program (CCEP) 1-800-796-9699
- Veterans Affair Persian Gulf registry program 1-800-749-8387
- Hotline for OSAGWI 1-800-497-6261

http://www.gulflink.osd.mil

Outreach team

- Town Hall
  - 1900, Thursday, Feb. 4, Blesse Auditorium, Willis Hall, Fort Sam Houston
- Displays
  - Fort Sam Houston P.X., BAMC, Wilford Hall
- Contact managers

Bottom Line

- Gulf War Veterans key for our work
- You must protect yourself on the Dirty Battlefield
- Anyone deployed to South West Asia is eligible for CCEP
- Don't tough it out - Get signed up and evaluated
- You are your best health advocate
- Apply these lessons learned

Summary

- Work continues: "leave no stone unturned"
- We rely on Gulf War veterans:
  - To give us leads
  - To check our accuracy
- We rely on today's force – including you:
  - To ensure GW vets get proper testing and treatment
  - To apply lessons learned to the future

Briefing Overview

- Organization - Mission Statement
- Why should I care?
- Symptoms and Illnesses
- Looking for causes
- Gulf War Lessons Learned
- Force Health Protection
- Help and information

Special Assistant for Gulf War Illnesses

Dr. Bernard Rostker

- Appointed November 12, 1996 by the Deputy Secretary of Defense
- 180 team members

Mission of the Special Assistant

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate to understand and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops in the future.

Why Should I Care?

- Lessons from the Gulf War about dirty battlefields.
- You must protect yourself against hazards.
- You will be working with or leading Gulf War vets.
- You will probably deploy overseas.
- You are responsible for force protection.

Who Served in the Gulf War

697,000 U.S. service members

Army	348,000	50%
Navy	160,000	23%
Marine	105,000	15%
Air Force	84,000	12%

259,000 Coalition Forces

U.S. Deaths

Battle deaths	148
Non-battle deaths	224
Hospitalizations	27,000

Post War

Shortly after re-deployment, many individuals in units reported common symptoms

- Aching joints
- Headaches
- Rashes
- Sleep disorders
- Diarrhea
- Hair loss
- Memory loss
- Fatigue

Physician Message Sent

"Your laboratory, x-ray and physical exams results are normal."

Patient Messages Received

"There's nothing wrong with you!"

"It's all in your head!"

"You're faking these symptoms!"

Confounding Issues

- No clustering
- No symptom consistency
- Variable onset
- No long term study
- As yet - no new disease or links between exposures and symptoms

Looking for Causes

The Dirty Battlefield

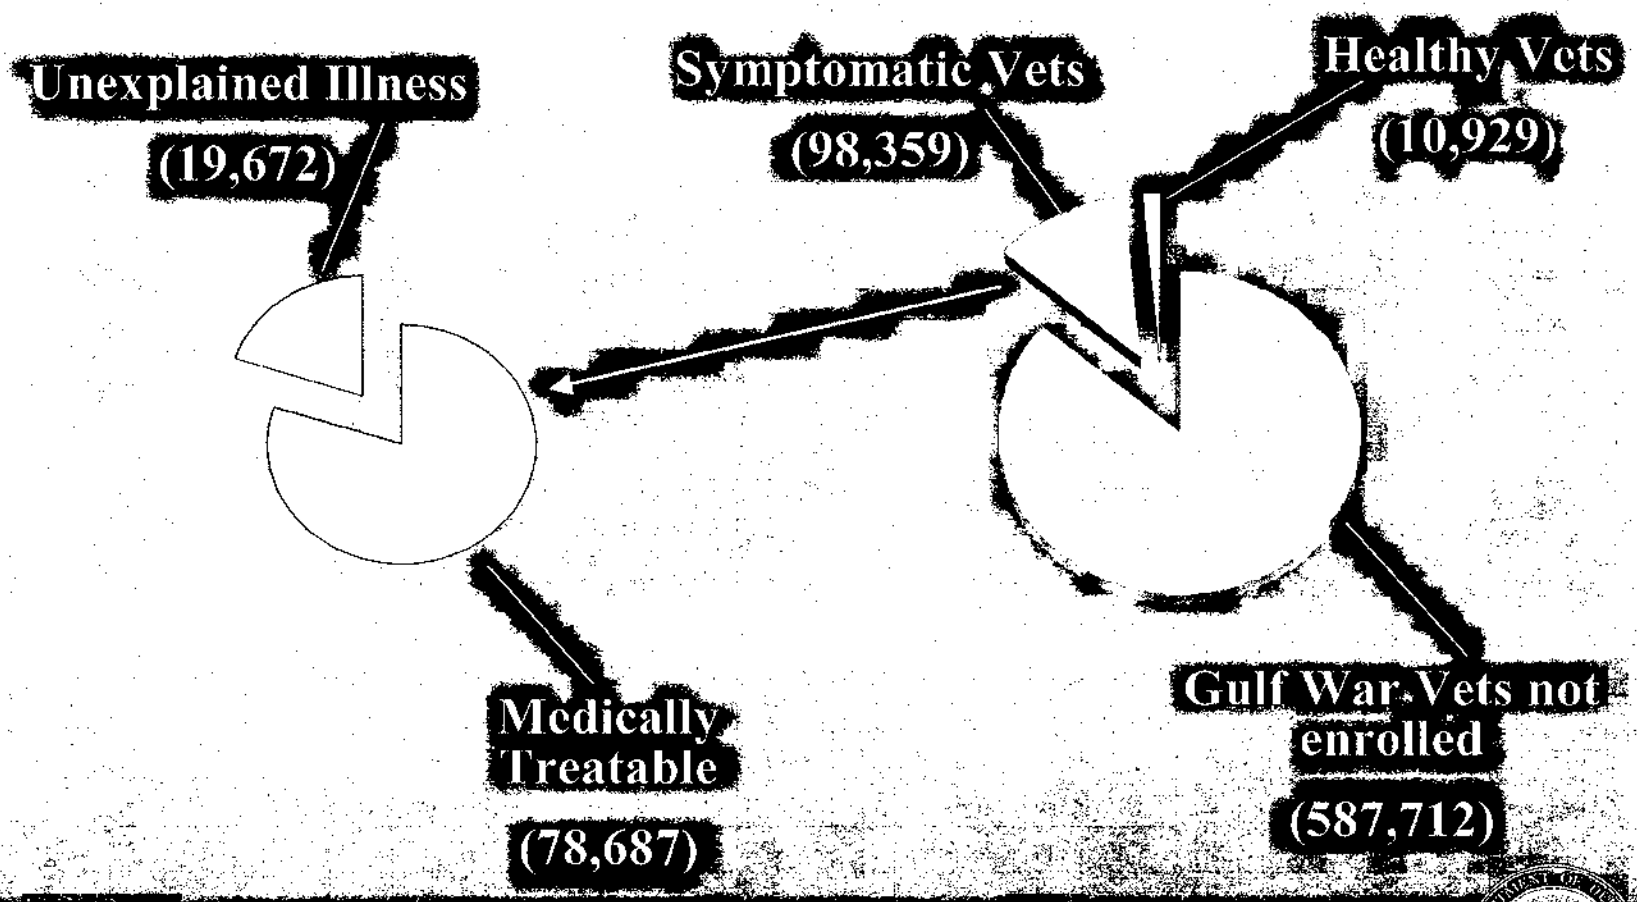
- What Iraq may have done to us.
  - Oil Well Fires
- What the environment may have done to us.
  - Sand, Infectious diseases
- What we may have done to ourselves.
  - Pesticides, Pyridostigmine Bromide
- Challenges in the future from low-tech pariah states to the revolution in military affairs.

OSAGWI Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
- Environmental:
  - Depleted uranium (DU), Oil well fires, Pesticides
- Medical issues and lessons learned:
  - Vaccines, PB, records, policy
    - "Cocktail" effect

Diagnosis Distribution/697,000 Deployed

CCEP/VA Participants



Proactive Measures - You

- Recognize and contend with potential hazards:
  - Improve intel notification
  - Train all personnel
  - Reduce adverse effects of and stress from potential exposures
  - Understand the environment and culture before deploying
- Improve feedback and cross talk

Proactive Measures - Your Unit

- Improve expedient demolition of munitions
- CW/BW detection: earlier with fewer false positives
- Improve operational and medical records handling
- Adapt for the future
  - Retain individual unit locations and records
  - DU training
  - Improved medical surveillance
  - Force health protection

Force Health Protection

Pre-deployment

- Verify DNA sample on file
- Pre-deployment serum sample
- Verify HIV test in last 12 months
- Immunizations
- Verify current physical exam
- Health questionnaire

Deployment

- Routine disease/injury reporting
- Forward medical laboratory
- Immunization tracking
- Environmental monitoring

Post Deployment

- Collect serum sample
- Medical debriefs
- Complete health questionnaire
- Screening exams as needed

Future Equipment

- Personal Information Carrier (PIC)
- Biological Integrated Detection System (BIDS)
- Automatic Chemical Agent Alarm (ACADA)
- Medic Cam - Tele medicine

Anthrax Vaccine

- What is Anthrax?
- Vaccine is safe and necessary!
  - FDA Licensed in 1970
  - Used for many years to protect textile mill workers
  - Recommended by Centers for Disease Control (CDC):
    - Workers occupationally exposed to anthrax (labs, mills)
    - Treatment of anyone exposed to anthrax aerosols
    - Only known pretreatment and protection against exposure

Anthrax Vaccine

- DoD Policy - mandatory for total force
  - Phased implementation
- Phase I - SWA and Korea (now)
- Phase II - Early deploying forces to SWA and Korea (8/99)
- Phase III - Total force (early 2000's)
- Vaccine series:
  - 0, 2, 4 weeks; then 6, 12, 18 months; annual booster
  - 754,863 doses, 49 adverse reactions=0.006%
    - 23 systemic reactions, 26 local reactions

- DoD anthrax web site: www.defenselink.mil/specials/Anthrax

Obtaining help and information

- Comprehensive Clinical Evaluation Program (CCEP)
  - 1-800-796-9699
- Veterans Affair registry program
  - 1-800-749-8387
- Town Hall

- What the environment may have done to us.
  - Sand, Infectious diseases
- What we may have done to ourselves.
  - Pesticides, Pyridostigmine Bromide
- Challenges in the future.

OSAGWI Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
- Environmental:
  - Depleted uranium (DU)
- Medical issues and lessons learned:
  - Vaccines, PB, records, policy
    - "Cocktail" effect

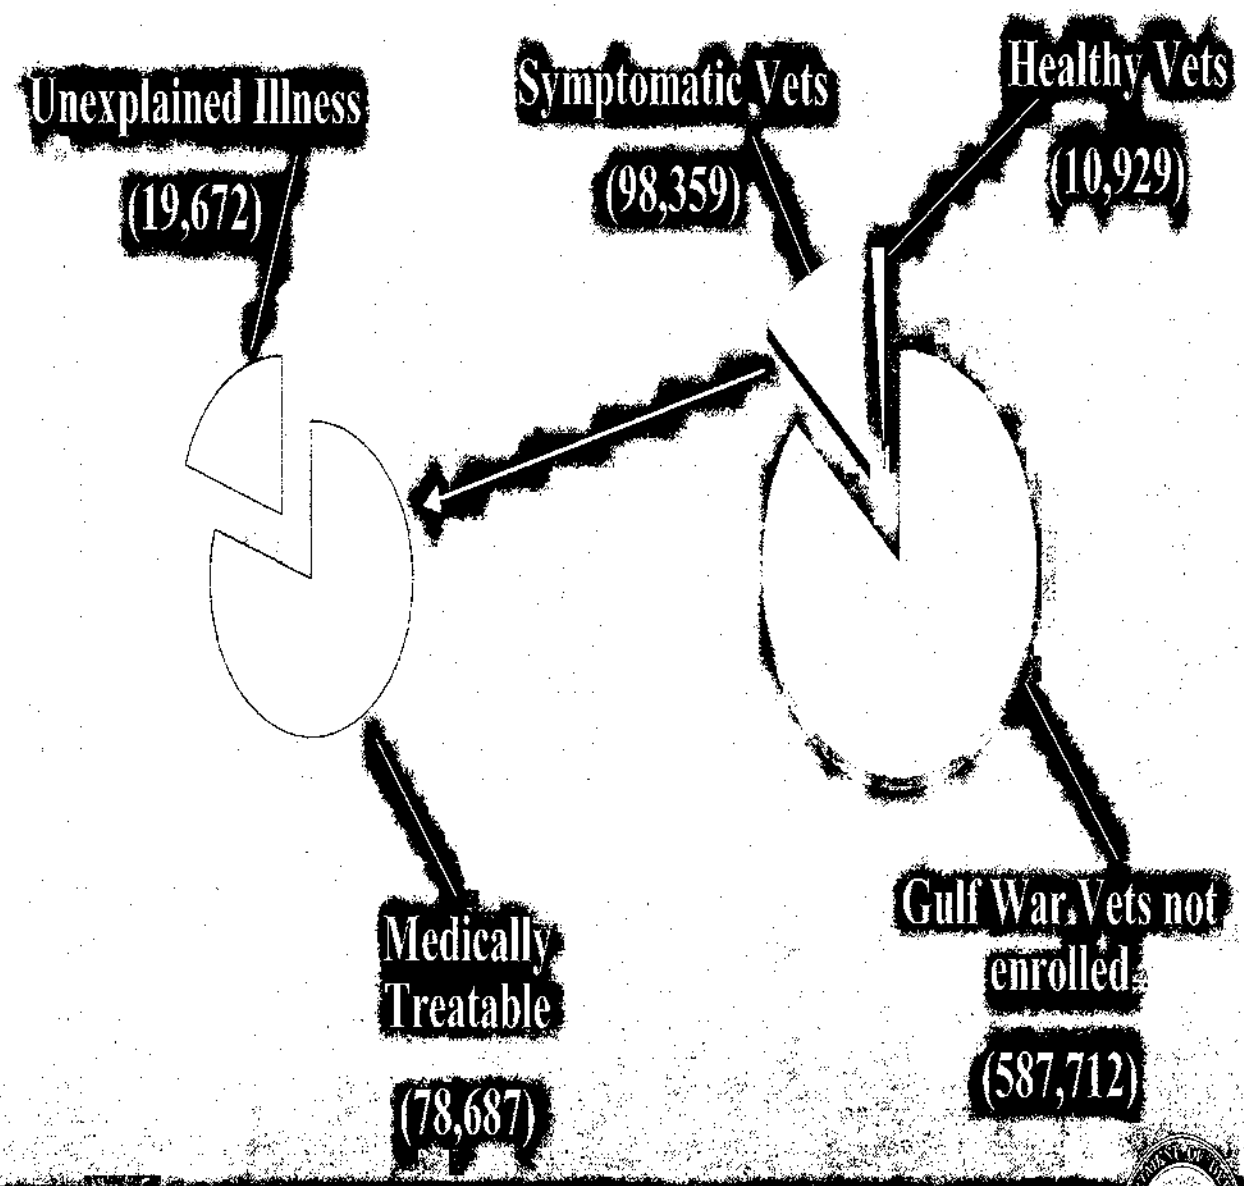
Diagnosis Distribution/697,000 Deployed

CCEP/VA Participants



Proactive Measures - You

- Recognize and contend with potential hazards:
  - Improve intel notification.
  - Train all personnel.
  - Reduce adverse effects of and stress from potential exposures.
  - Understand the environment and culture before deploying.
- Improve feedback and cross talk.

Proactive Measures - Your Unit

- Improve expedient demolition of munitions
- CW/BW detection: earlier with fewer false positives
- Improve operational and medical records handling
- Adapt for the future
  - Retain individual unit locations and records
  - DU training
  - Improved medical surveillance
  - Force health protection

Force Health Protection

Pre-deployment

- Verify DNA sample on file
- Pre-deployment serum sample
- Verify HIV test in last 12 months
- Immunizations
- Verify current physical exam
- Health questionnaire

Deployment

- Routine disease/injury reporting
- Forward medical laboratory
- Immunization tracking
- Environmental monitoring

Post Deployment

- Collect serum sample
- Medical debriefs
- Complete health questionnaire
- Screening exams as needed

Future Equipment

- Personal Information Carrier (PIC)
- Biological Integrated Detection System (BIDS)
- Automatic Chemical Agent Alarm (ACADA)
- Medic Cam - Tele medicine

Anthrax Vaccine

- What is Anthrax?
- Vaccine is safe and necessary!
  - FDA Licensed in 1970
  - Used for many years to protect textile mill workers
  - Recommended by Centers for Disease Control (CDC):
    - Workers occupationally exposed to anthrax (labs, mills)
    - Treatment of anyone exposed to anthrax aerosols
    - Only known pretreatment and protection against exposure

Anthrax Vaccine

- DoD Policy - mandatory for total force
  - Phased implementation
- Phase I - SWA and Korea (now)
- Phase II - Early deploying forces to SWA and Korea (8/99)
- Phase III - Total force (early 2000's)
- Vaccine series:
  - 0, 2, 4 weeks; then 6, 12, 18 months; annual booster
  - 754,863 doses, 49 adverse reactions=0.006%
    - 23 systemic reactions, 26 local reactions
- DoD anthrax web site: www.defenselink.mil/specials/Anthrax

Obtaining help and information

- Comprehensive Clinical Evaluation Program (CCEP)
  - 1-800-796-9699
- Veterans Affair registry program
  - 1-800-749-8387
- Town Hall
  - Thursday, May 13th at the Woodruff Theater
- Displays
  - P.X. and Winn Army Community Hospital
- Contact managers

Bottom Line

- Gulf War Veterans key for our work
- You must protect yourself on the Dirty Battlefield
- Anyone deployed to South West Asia is eligible for CCEP
- Don't tough it out - 80% are treated
- You are your best health advocate
- DU = "Silver Bullet" but handle it properly
- Anthrax shots - will protect you and they are safe
- Apply these Lessons Learned

Special Assistant for Gulf War Illnesses

Dr. Bernard Rostker

- Appointed November 12, 1996 by the Deputy Secretary of Defense
- 180 team members

Mission of the Special Assistant

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate to understand and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops in the future.

Who Served in the Gulf War

697,000 U.S. service members

Army	348,000	50%
Navy	160,000	23%
Marine	105,000	15%
Air Force	84,000	12%

259,000 Coalition Forces

U.S. Deaths

Battle deaths	148
Non-battle deaths	224
Hospitalizations	27,000

Post War

Shortly after re-deployment, many individuals in units reported common symptoms

- Aching joints
- Headaches
- Rashes
- Sleep disorders
- Diarrhea
- Hair loss
- Memory loss
- Fatigue

Physician Message Sent

"Your laboratory, x-ray and physical exams results are normal."

Patient Messages Received

"There's nothing wrong with you!"

"It's all in your head!"

"You're faking these symptoms!"

Confounding Issues

- No clustering
- No symptom consistency
- Variable onset
- No long term study
- As yet - no new disease or links between exposures and symptoms

Myths versus Reality

Cover up	Open process
Not listening	Solicit eyewitness reports
Destroy records	Significant oversight
20,000 veterans dead	5,773 veterans dead
No assistance to vets	Evaluation and care
"Syndrome"	More than 40 illnesses
CW or DU cause	Many possible causes
Brass doesn't care	Force Protection efforts
	Tough choices
	Cultural changes

Looking for Causes

The Dirty Battlefield

- What Iraq may have done to us.
  - Oil Well Fires
- What the environment may have done to us.
  - Sand, Infectious diseases
- What we may have done to ourselves.
  - Pesticides, Pyridostigmine Bromide
- Challenges in the future from low-tech pariah states to the revolution in military affairs.

Potential Causes

- Chemical warfare agent
- Biological warfare agent
- Pesticides
- Oil well fires
- Vaccines
- Depleted uranium
- Pyridostigmine bromide
- Infectious disease
- Stress
- "Cocktail" effect

30+ offered as possible causes

OSAGWI Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident

Pentagon Mobilizes: Special Assistant for Gulf War Illnesses

Dr. Bernard Rostker

- Appointed November 12, 1996 by the Deputy Secretary of Defense
- 180 team members

Mission of the Special Assistant

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate to understand and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops in the future.

Why Should I Care?

- Lessons from the Gulf War about dirty battlefields.
- You must protect yourself against hazards.
- You will be working with or leading Gulf War vets.
- You will probably deploy overseas.
- You are responsible for force protection.

Myths versus Reality

Cover up	Open process & oversight
Not listening	Solicit eyewitness reports
Destroy records	Found missing records
20,000 veterans dead	5,773 veterans dead
No assistance to vets	Evaluation and care
"Syndrome"	More than 40 illnesses
CW or DU cause	Many possible causes
Brass doesn't care	Force Protection efforts
	Tough choices
	Cultural changes

U.S. Deaths

Battle deaths	148
Non-battle deaths	224
Hospitalizations	27,000

Post War

Shortly after re-deployment, many individuals in a few units reported common symptoms

- Aching joints
- Headaches
- Rashes
- Sleep disorders
- Diarrhea
- Hair loss
- Memory loss
- Fatigue

Physician Message Sent

"Your laboratory, x-ray, and physical exams results are normal."

Patient Messages Received

"There's nothing wrong with you!"

"It's all in your head!"

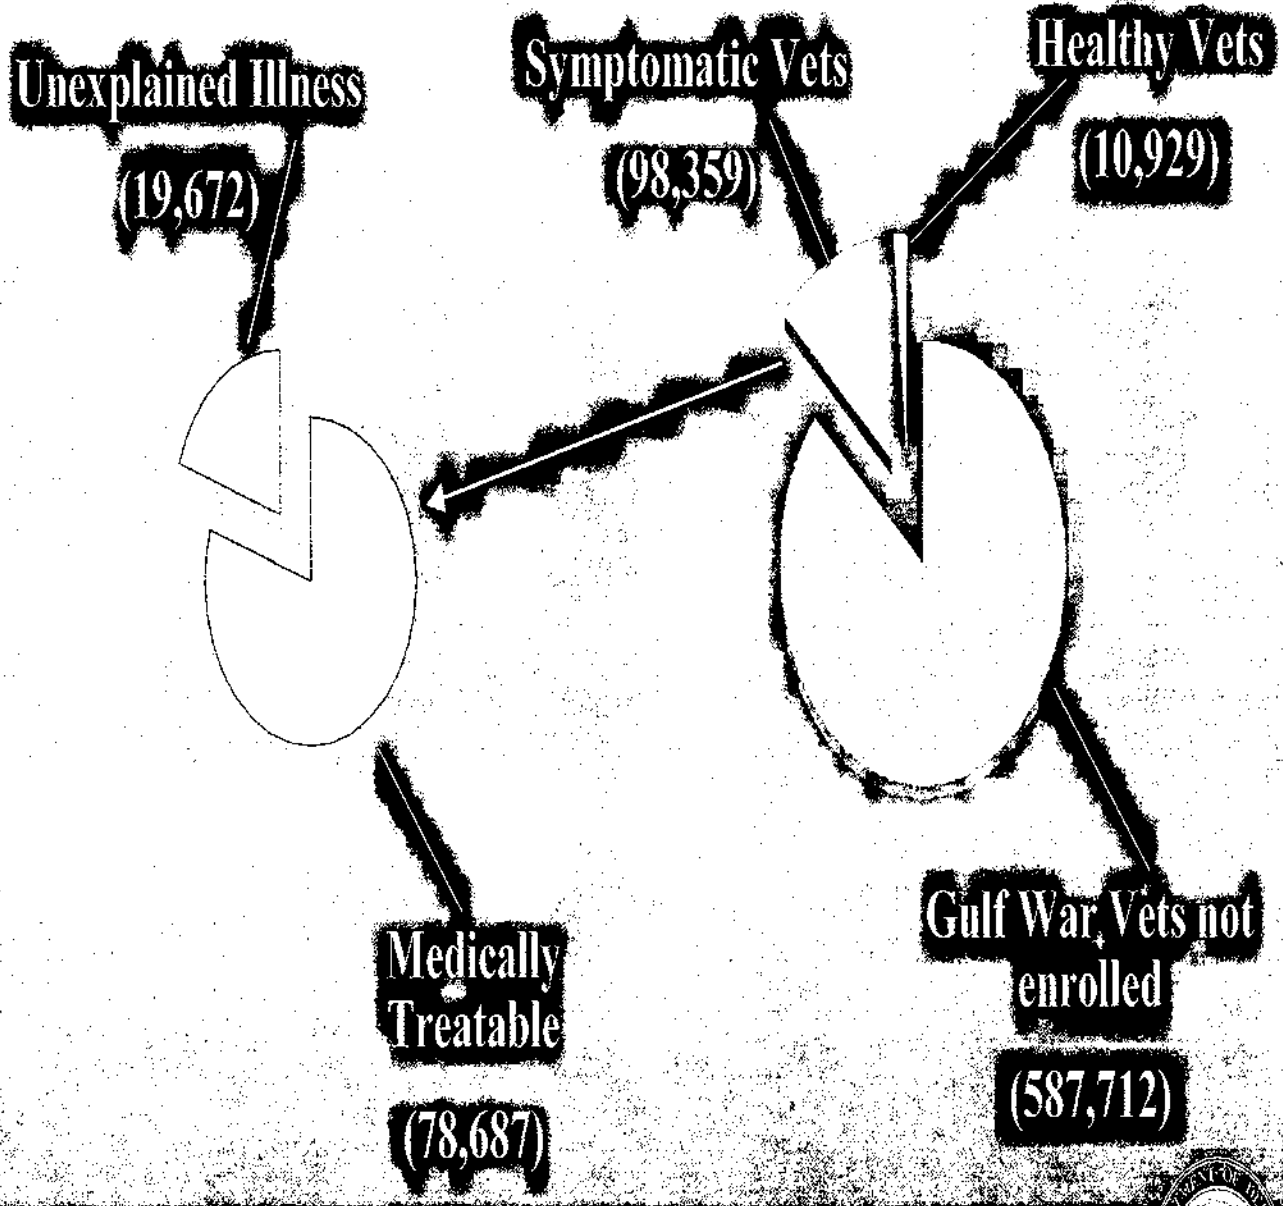
"You're faking these symptoms!"

Confounding Issues

- No clustering
- No symptom consistency
- Variable onset
- No longitudinal evaluation
- As yet - no new disease or links between exposures and symptoms

Diagnosis Distribution/697,000 Deployed

CCEP/VA Participants



Looking for Causes

The Dirty Battlefield

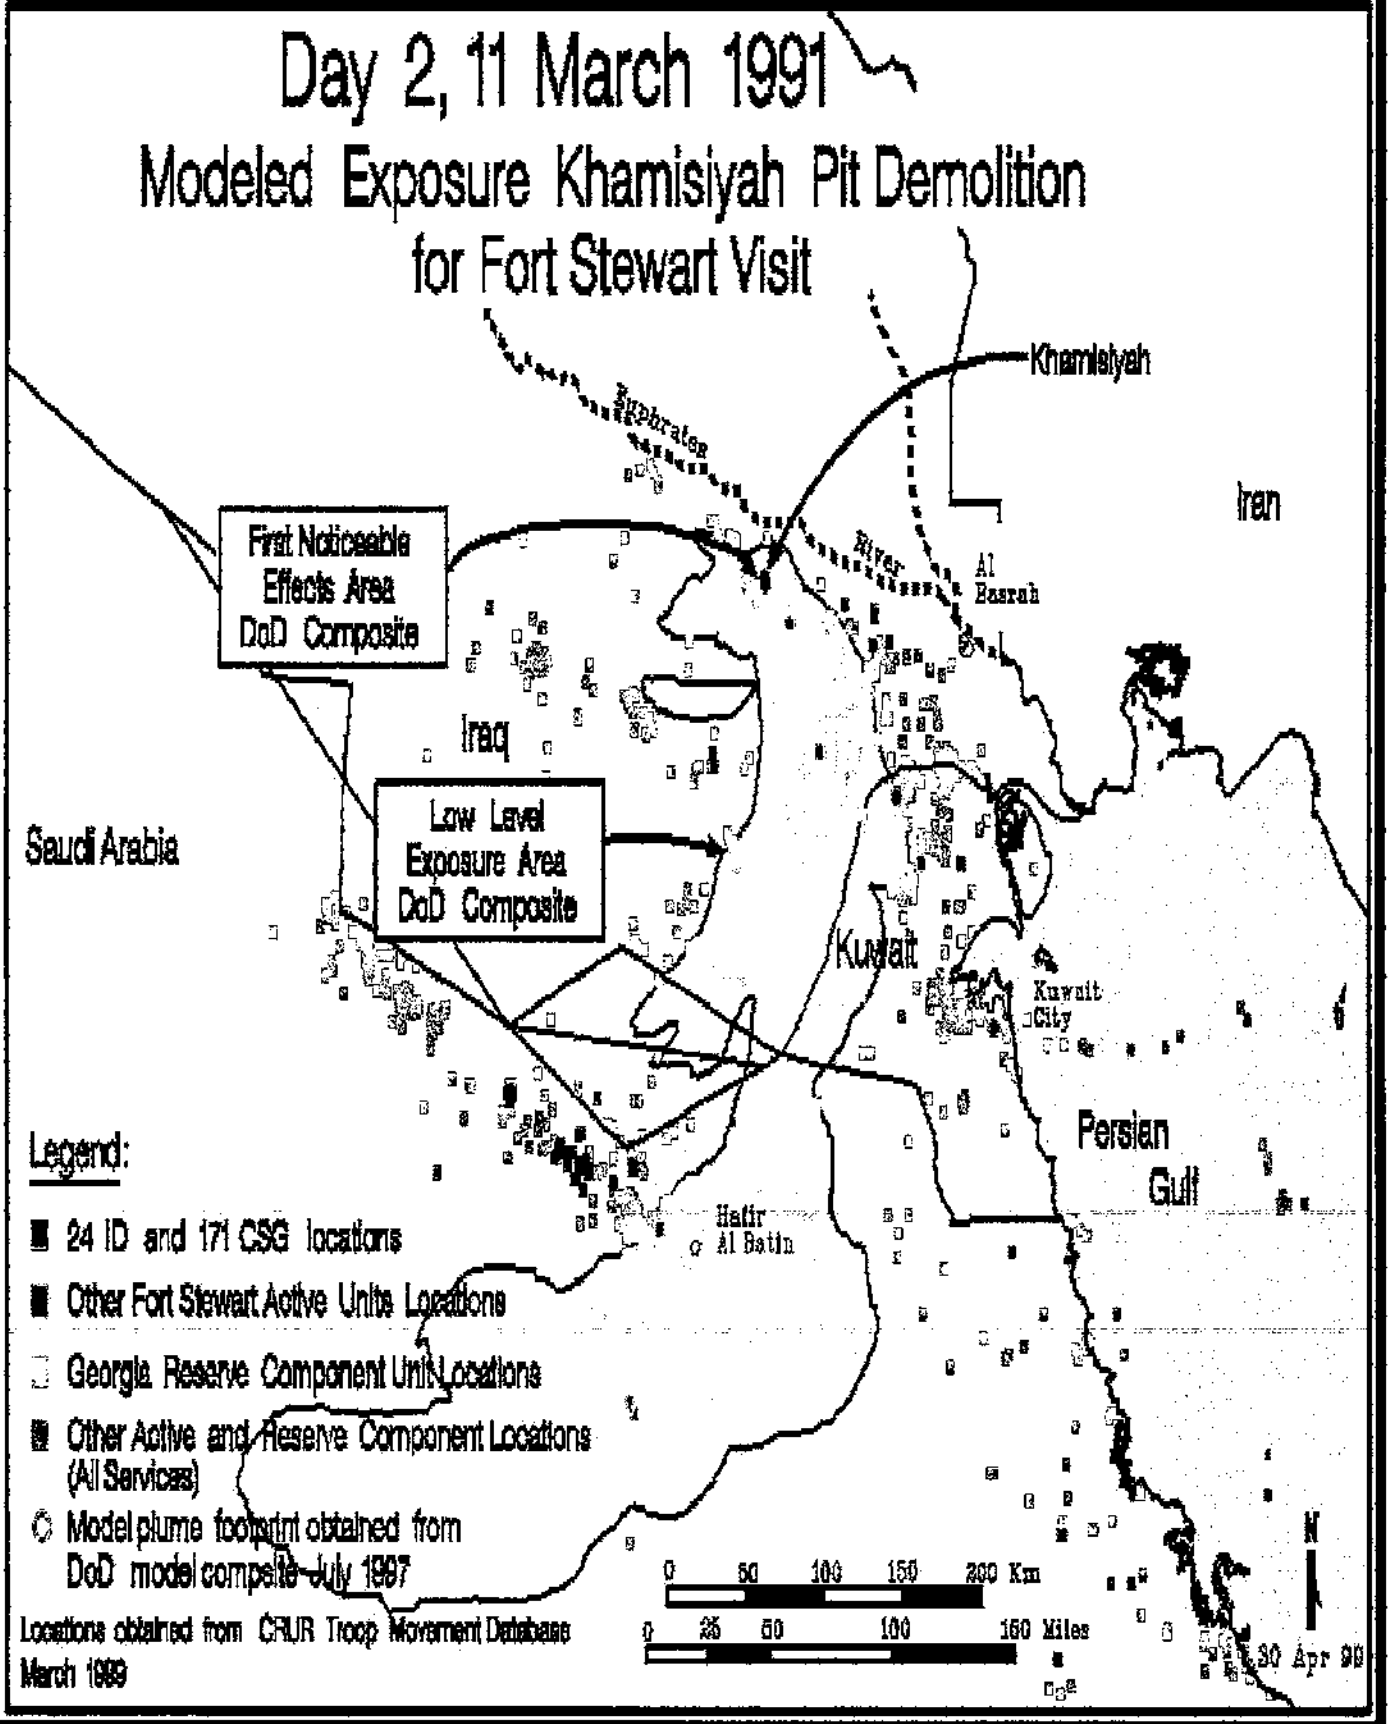
- What Iraq may have done to us.
  - Oil Well Fires, Stress
- What the environment may have done to us.
  - Sand, Infectious diseases, bad food and water
- What we may have done to ourselves.
  - Pesticides, Pyridostigmine Bromide, Low levels of CW agent, DU
- Challenges in the future range from low-tech pariah states to the revolution in military affairs.

OSAGWI Investigations

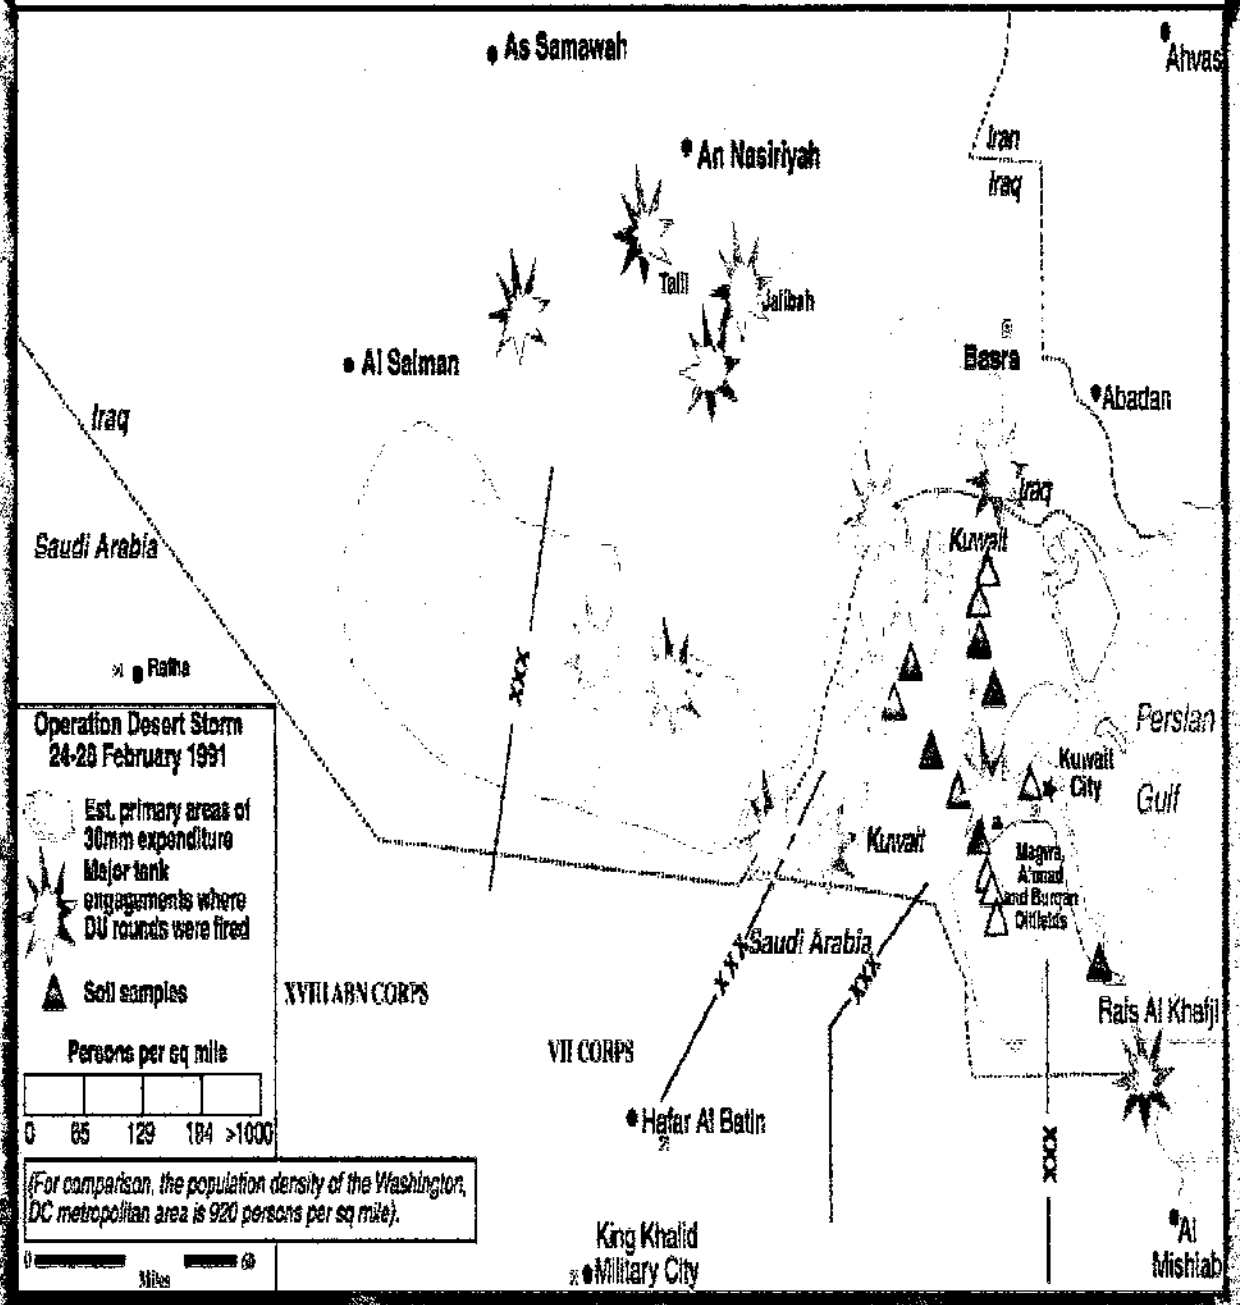
- **Chemical/biological warfare:**
  - Focus in 1997; 16 papers
  - Watershed is Khamisiyah
- **Environmental:**
  - Focus in 1998
  - Oil well fires, pesticides, depleted uranium (DU)

Day 2, 11 March 1991

Modeled Exposure Khamisiyah Pit Demolition for Fort Stewart Visit



Primary Areas of DU Expenditure



Investigator's Message Sent

"The symptoms described were not consistent with symptoms associated with exposure to chemical warfare agents or depleted uranium."

Veteran's Messages Received

"You're wrong!"

"You can't possibly be sick because of this!"

DU Exposure Issues

- Radiation
- Heavy metal toxicity
- Consequences of exposure
- Reproductive effect
- Contamination of theater

DU Awareness Training

- Current CTT Task (031-503-1017)
- Better information is now available
  - Chemical toxicity vice radioactivity
  - Continue the mission
  - Respiratory protection for extended exposure
- Training support packages being updated
  - Includes updating the common task & GTA
  - Additional training for specialists
- Use existing training management system

OSAGWI Investigations

- Medical issues and lessons learned:
  - Focus in 1999
    - Vaccines, PB, records, policy
    - DU training
    - Managing hazards

Proactive Measures - You

- Recognize and contend with potential hazards:
  - Improve intel notification
  - Train all personnel
  - Reduce adverse effects of and stress from potential exposures
  - Understand the environment and culture before deploying
- Improve feedback and cross talk

Operational Lessons - Your Unit

- Improve expedient demolition of munitions
- CW/BW detection: earlier with fewer false positives
- Relate CW to operational and medical records
- Adapt for the future
  - Retain individual unit locations and records
  - DU training
  - Improved medical surveillance
  - Force health protection

Force Health Protection

Pre-deployment

- Verify DNA sample on file
- Pre-deployment serum sample
- Verify HIV test in last 12 months
- Immunizations
- Verify current physical exam
- Health questionnaire

Deployment

- Routine disease/injury reporting
- Forward medical laboratory
- Immunization tracking
- Environmental monitoring

Post Deployment

- Collect serum sample
- Medical debriefs
- Complete health questionnaire
- Screening exams as needed

Anthrax Vaccine

- What is Anthrax?
- Vaccine is safe and necessary
  - FDA Licensed in 1970
  - Used for many years to protect textile mill workers
  - Recommended by Centers for Disease Control (CDC):
    - Workers occupationally exposed to anthrax (labs, mills)
    - Treatment of anyone exposed to anthrax aerosols
    - Only known pretreatment and protection against exposure

Anthrax Vaccination Program

- Phase I - SWA and Korea (now)
- Phase II - Early deploying forces to SWA and Korea (8/99)
- Phase III - Total force (early 2000's)
- 254,459 vaccinated - 754,863 doses (April 99)
- 49 adverse reactions = 0.006% (April 99)
  - 23 systemic reactions, 26 local reactions
- Complete supplemental testing on vaccine prior to release
- Plant renovation completed
- DoD anthrax web site: www.defenselink.mil/specials/Anthrax

Obtaining help and information

- Comprehensive Clinical Evaluation Program (CCEP)
  - 1-800-796-9699

Briefing Overview

- Mission Statement
- The Gulf War
- Post Gulf War Issues
- Searching for answers
- Lessons Learned
- Force Health Protection
- Bottom Line
- Obtaining help and information

Our Mission

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate to understand and explain illnesses in Gulf War veterans
- Ensure DOD adopts doctrine, policy and procedures to reduce health risks for troops deploying now and in the future

Gulf War Theater

- August 1990 to July 1991
- 697,000 US service members
- More then 27,000 hospitalizations
- 148 battle deaths
- 224 non-battle deaths

Veterans' concerns

Most frequently reported symptoms since re-deployment

- Joint pain
- Headaches
- Sleep disorders
- Depression
- Fatigue
- Memory loss
- Rash
- Muscle pain

and many others

Communication Breakdown

- Veterans with real health problems
- Healthcare professionals unable to provide answers
- Government slow to recognize the reality of problems

Confounding Issues

- No clustering
- No symptom consistency; variable onset
- No new disease or links between exposures and symptoms
- No long term study

Taking Care of Service Members

- **DoD Comprehensive Clinical Evaluation Program**
  - Gulf War vets (active, Guard/Reserve, retired)
  - Active service member deployed to SWA since war ended
  - Family members
- **VA Persian Gulf Registry**
  - Gulf War vets (left service prior to retirement)
  - Service members deployed to SWA and left service before retirement
  - Evaluation for family members

Available to *all* service members deploying to South West Asia

Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
    - 99,000 vets notified
- Environmental:
  - Depleted uranium (DU), Oil well fires, Pesticides
    - Science doesn't support DU or Oil Well fires as causes.
    - Still examining particulates and pesticides
- Medical issues:
  - Vaccines, PB, records, policy
- Scientific research
  - 145 studies sponsored by DoD & DVA
  - Multiple exposures

A New Reality =
The Dirty Battlefield

- What enemy may do to us
  - Chemical/Bio threat, Man made environmental hazards (Oil Well Fires)
- What the environment may do to us
  - Infectious diseases, insects, environmental risks (desert, jungle)
- What we may do to ourselves
  - Pesticides, Stressors, Investigational New Drug

Current and future conflicts and humanitarian deployments have and will have these challenges

Investigation Results

- Gulf War
  - Not enough vaccines and no explanation given
  - Limited environmental survey
  - Information about nerve agent pre-treatment (PB) wasn't given to troops
  - Inadequate training on limitations of FOX vehicle, M8A1 alarm and M256 kit
  - Veterans re-deployed and left service without thorough medical exam or debrief

Applying Lessons Learned

You

- Train self and others to recognize and avoid hazards
- Improve feedback and cross talk
- You are your own best health advocate

Your Unit

- Monitor service member's health
- Monitor the environment
- CW/BW detection: earlier with fewer false positives
- Create, relate and save operational, NBC, and medical records
- Adapt and train to reduce future risks

Force Health Protection - A Joint Concept

- Medical screening/surveillance
- Record keeping - Personal information carriers
- Integrate Force Health Protection into operational requirements
- Follow up to deployment

Anthrax

- Inhalation anthrax is deadly
- Biological warfare agent of choice:
  - Cheap and easy to produce
  - Can be dispersed in air by a variety of weapons
  - Odorless, colorless, tasteless, difficult to detect
  - Flu-like symptoms early, rapid deterioration, and death

Vaccination against anthrax is critical for your protection

Anthrax Vaccine Program

- Licensed by the FDA since 1970
  - Safely administered in the U.S. to at-risk veterinarians, laboratory workers, and livestock handlers
- No dead or live anthrax bacteria
  - Cannot cause anthrax disease
  - Contains protective antigen (PA)
- Shot schedule: 0, 2, 4 weeks, 6, 12, 18 months, plus annual booster

1-877-GET-VACC

www.anthrax.osd.mil

www.aviationmedicine.com

Pyridostigmine Bromide

- Threat - Soman is deadly nerve agent
- PB is the only known pretreatment against Soman.
  - Auto injectors alone will not save you
- Issues have been raised about PB
  - Further research is ongoing
- Only President can authorize its use without informed consent

Bottom Line

- Lessons learned from the Gulf War affect today's doctrine and deployments
- You will deploy on missions
- Everyone is responsible for force protection
- You are your own best health advocate

Outreach team

RAND study on PB drew on Comprehensive Sources

- ~10,000 Titles
- ~6,000 Abstracts
- ~2,000 Documents Read
- ~1,000 Citations
- ~80 Interviews
- Documents declassified by British

Conclusions about PB

- We cannot rule out pyridostigmine bromide as a contributor to increased health symptoms in Gulf War veterans.
- Further research is needed to determine the effectiveness of the current dose of PB against Soman.
- Additional research about safety and effectiveness of PB for humans is urgently needed.

Office of the Special Assistant to the Deputy Secretary of Defense

for Gulf War Illnesses

800-497-6261 fax 703-578-8501

email: brostker@gwillness.osd.mil

Briefing Overview

- Mission Statement
- Why should you care?
- The Gulf War
- Post Gulf War
- Searching for answers
- Gulf War Lessons Learned
- Joint Concept - Force Health Protection
- Obtaining help and information

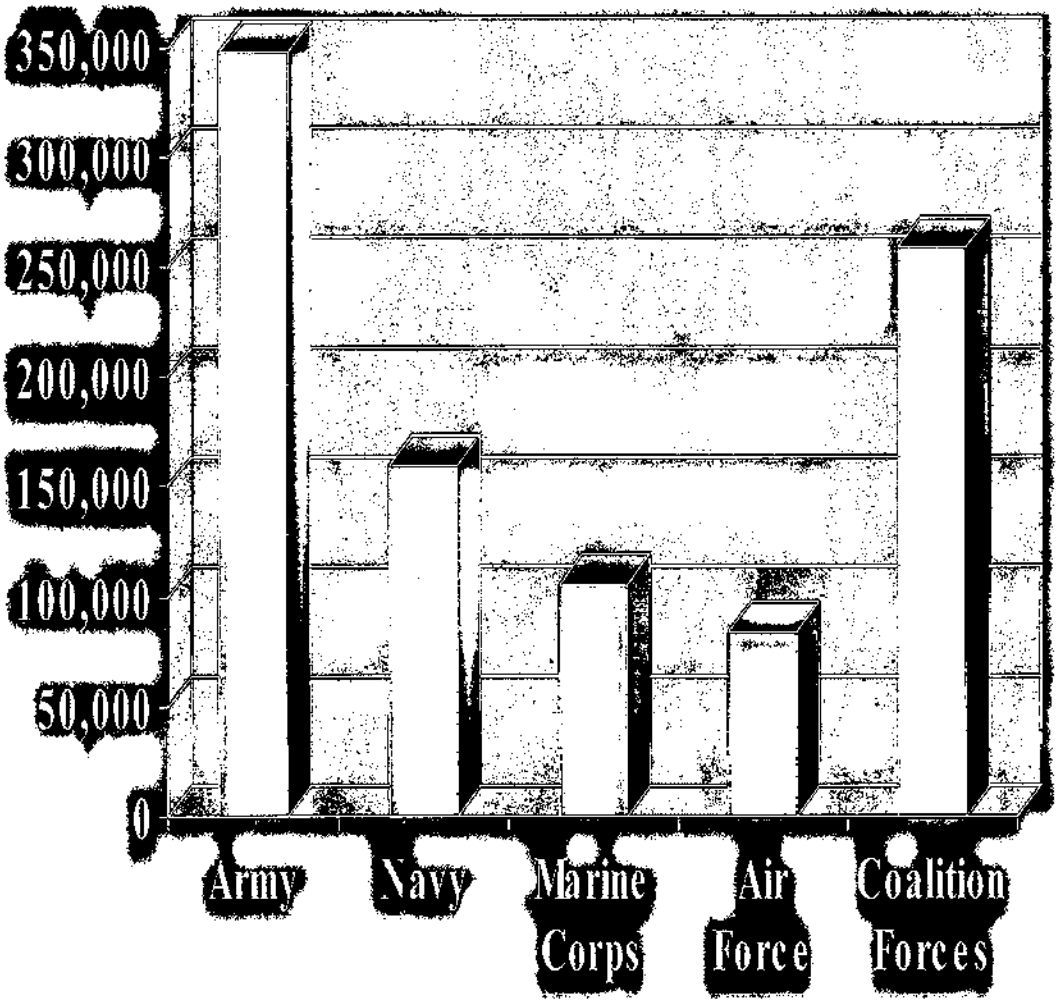
Our Mission

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate to understand and explain illnesses in Gulf War veterans
- Ensure DOD adopts doctrine, policy and procedures to reduce health risks for troops deploying now and in the future

Why Should You Care?

- Lessons learned from the Gulf War affect today's doctrine and deployments.
- You will deploy overseas.
- You must protect yourself and others against CW/BW agents and other health hazards.
- Everyone is responsible for force protection.

Gulf War Theater Forces



697,000 U.S. service members

Gulf War Theater

- August 1990 to July 1991
- 697,000 US service members
- More then 27,000 hospitalizations
- 148 battle deaths
- 224 non-battle deaths

Veterans' concerns

Most frequently reported symptoms by one in seven veterans since re-deployment

- Joint pain
- Headaches
- Sleep disorders
- Depression
- Fatigue
- Memory loss
- Rash
- Muscle pain

and many others

Office of the Special Assistant for Gulf War Illnesses

Communication Breakdown

- Veterans with real health problems
- Healthcare professionals unable to provide answers
- Government slow to recognize the reality of problems

Confounding Issues

- No clustering
- No symptom consistency; variable onset
- No new disease or links between exposures and symptoms
- No long term study

DoD recognizes problem

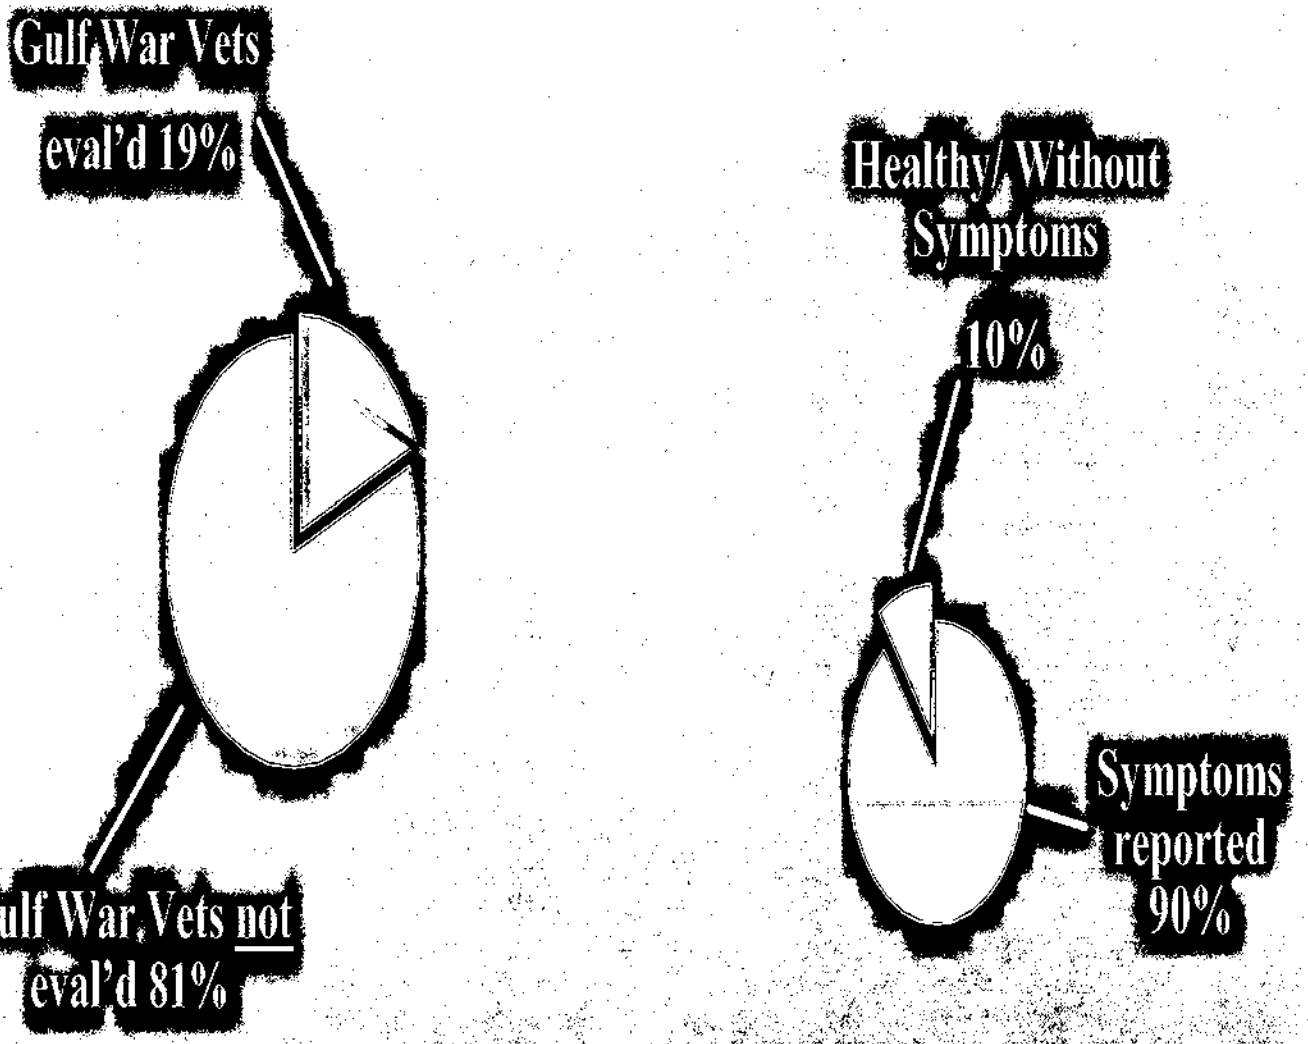
- CCEP established 1994
- OSAGWI created November 1996
  - Investigates all potential health hazards and possible causes.
- Extensive scientific research
  - DoD, VA, private
- Lessons learned identified and applied
- DoD develops Force Health Protection concept

Taking Care of Service Members

- DoD Comprehensive Clinical Evaluation Program
  - Gulf War vets (active, Guard/Reserve, retired)
  - Active service member deployed to SWA since war ended
  - Family members
- VA Persian Gulf Registry
  - Gulf War vets (left service prior to retirement)
  - Service members deployed to SWA and left service before retirement
  - Evaluation for family members

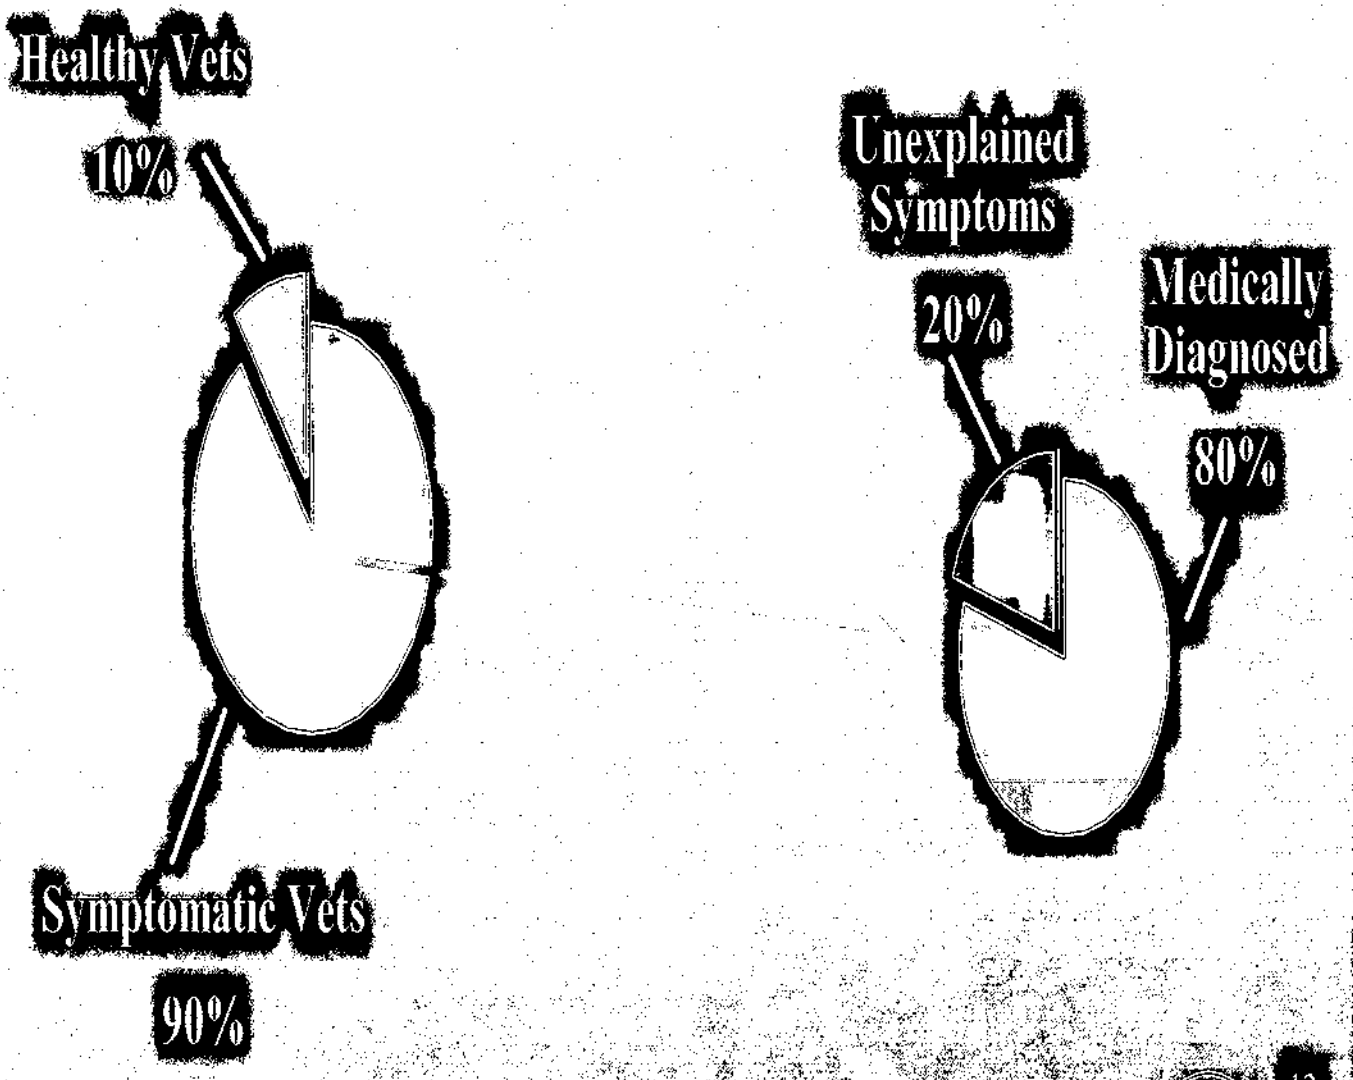
Available to *all* service members deploying to South West Asia

Evaluation Distribution of 697,000 CCEP/VA



Diagnosis Distribution of Evaluated Veterans

CCEP/VA



Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
    - 99,000 vets notified
- Environmental:
  - Depleted uranium (DU), Oil well fires, Pesticides
    - Science doesn't support DU or Oil Well fires as causes.
    - Still examining particulates and pesticides
- Medical issues:
  - Vaccines, PB, records, policy
- Scientific research
  - 145 studies sponsored by DoD & DVA
  - Multiple exposures

A New Reality – The Dirty Battlefield

- What enemy may do to us
  - Chemical/Bio threat, Man made environmental hazards (Oil Well Fires)
- What the environment may do to us
  - Infectious diseases, insects, environmental risks (desert, jungle)
- What we may do to ourselves
  - Pesticides, Stressors, Investigational New Drug

Current and future conflicts and humanitarian deployments have and will have these challenges

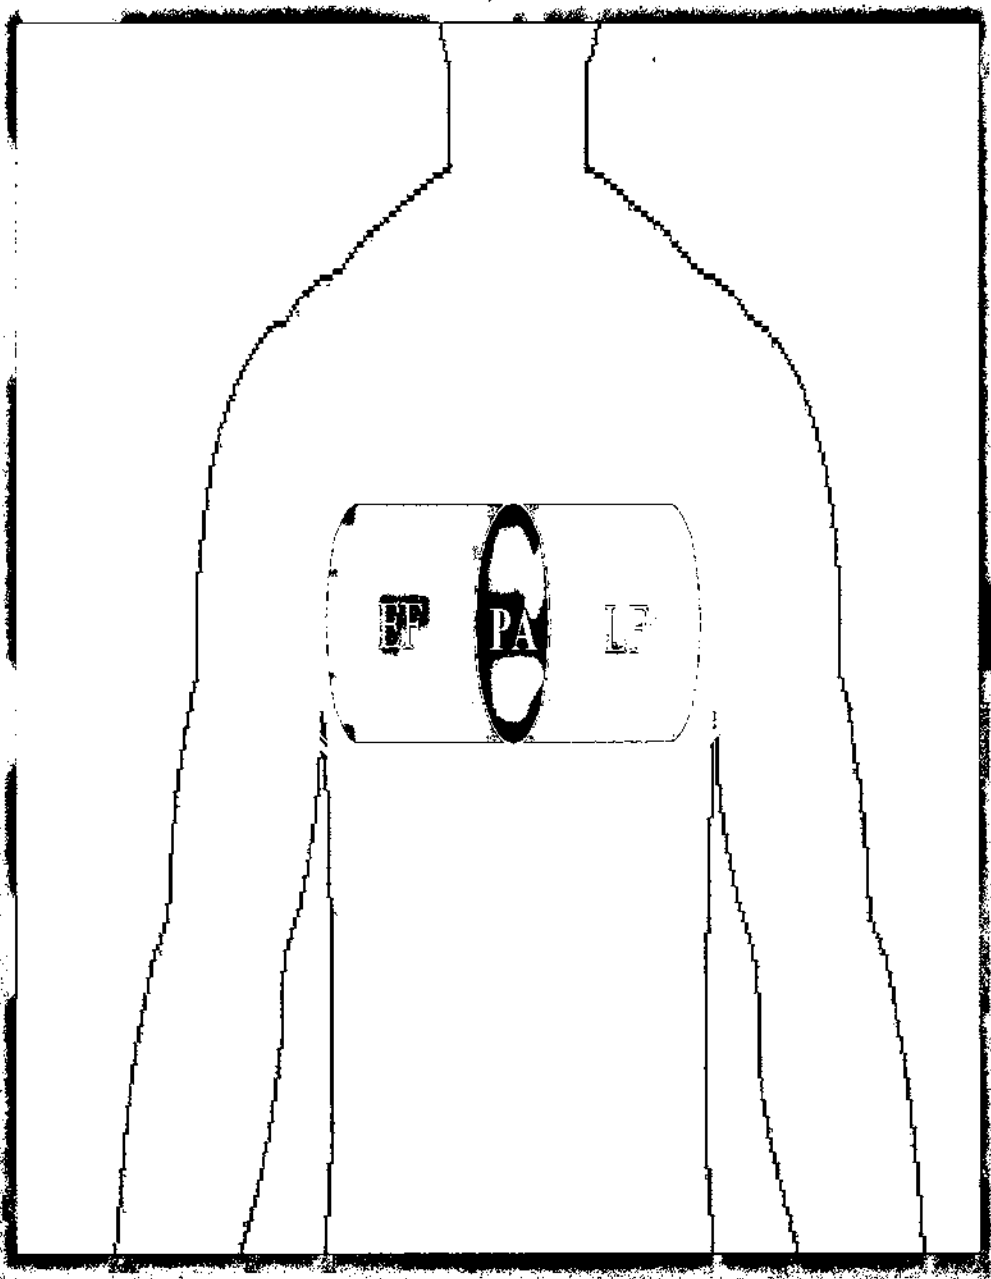
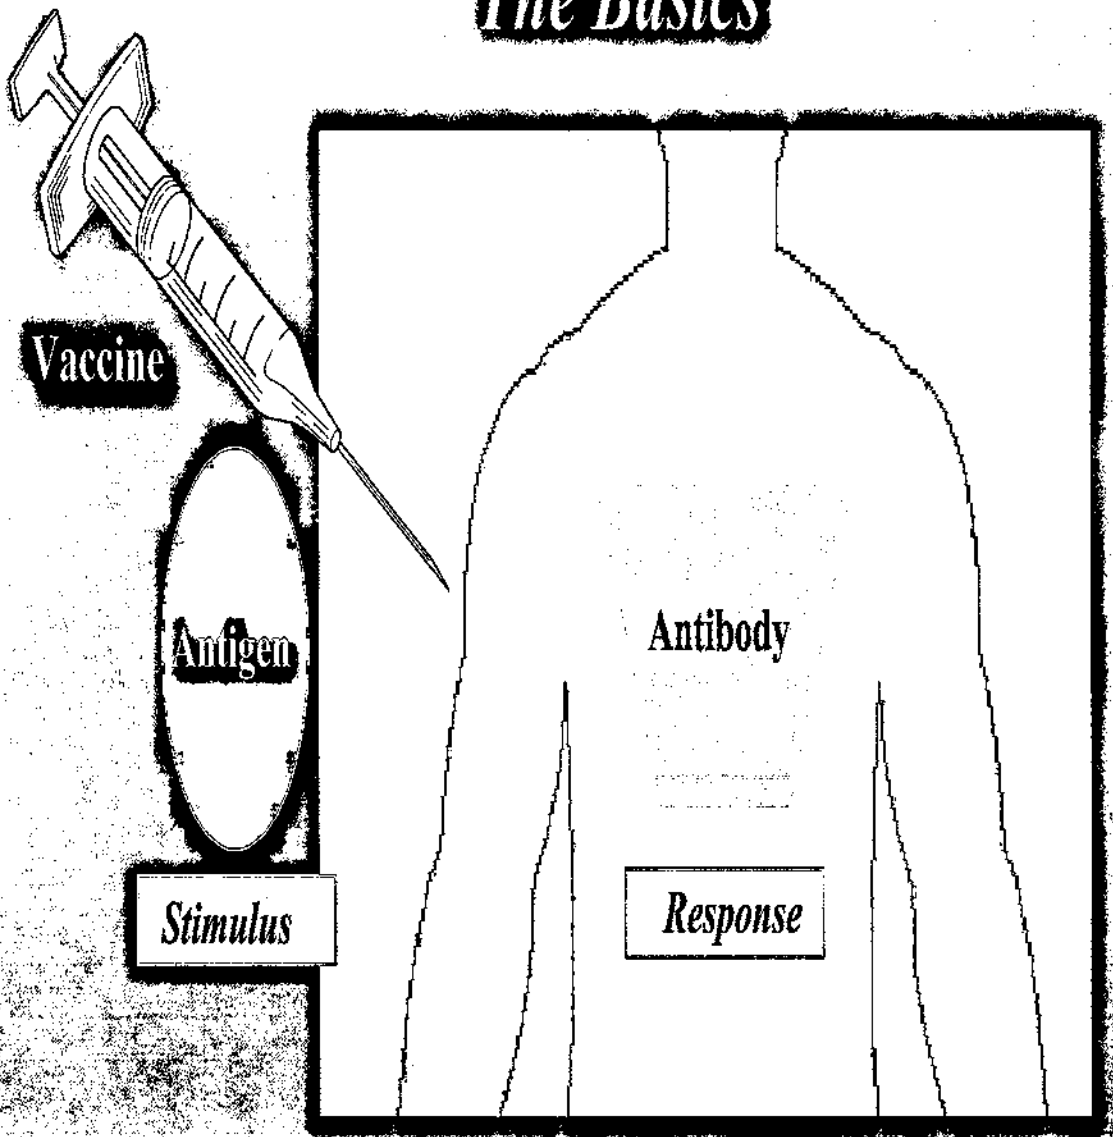
ANTHRAX BACTERIA ATTACK



= Death

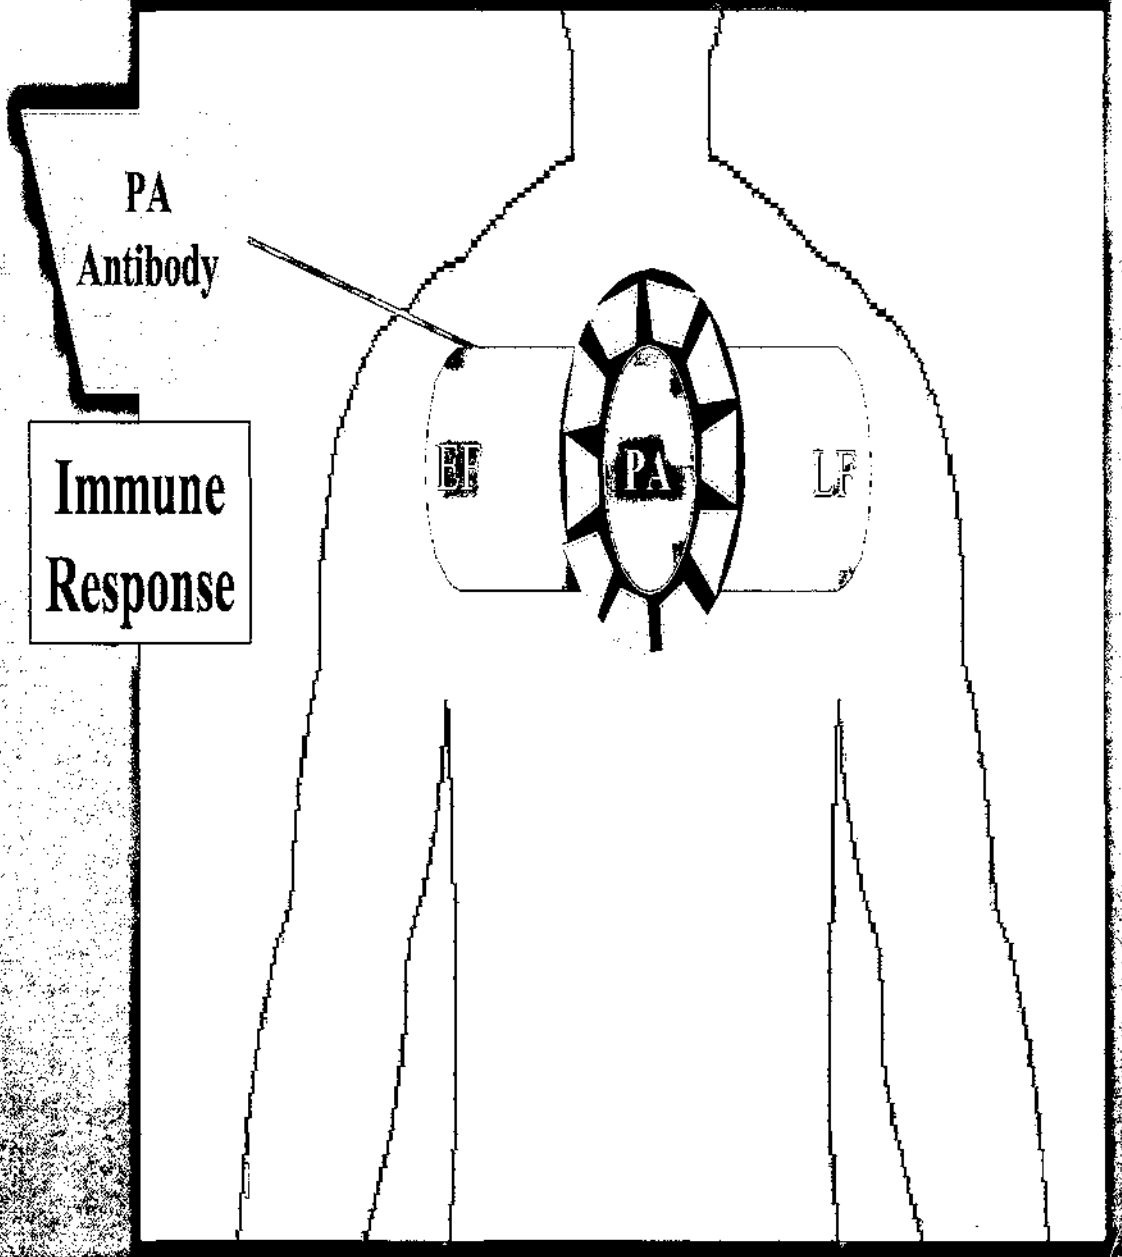
IMMUNE SYSTEM ACTIVATION BY VACCINE

The Basics



AFTER ANTHRAX VACCINE

Antibodies at Work



Immunizations

- Anthrax Vaccination program
  - Vaccine is FDA licensed since 1970 and proven safe
  - Only known protection against exposure
  - Necessary because of real threat
    - Easily produced and weaponized
- Current program statistics
  - Vaccine series 0, 2, 4 weeks; then 6, 12, 18 months; annual booster
  - 1,547,457 doses provided to 415,376 people (10 Mar 00)
    - 65 reactions resulted in loss of duty for less than 24 hrs.
    - 6 reactions resulted in hospitalization
      - All six were allergic, inflammation reactions

Force Health Protection-

A Joint Concept

Pre-deployment

- Verify DNA sample on file
- Pre-deployment blood sample
- Verify HIV test is current
- Verify immunizations are current
- Verify current physical exam
- Complete a health questionnaire

During deployment

- Routine disease/injury reporting
- Forward medical laboratory
- Immunization tracking
- Environmental monitoring

Post Deployment

- Collect blood sample
- Medical debriefs
- Complete health questionnaire
- Screening exams as needed

RAND study on PB drew on Comprehensive Sources

- ~10,000 Titles
- ~6,000 Abstracts
- ~2,000 Documents Read
- ~1,000 Citations
- ~80 Interviews
- Documents declassified by British

Conclusions about PB

- We cannot rule out pyridostigmine bromide as a contributor to increased health symptoms in Gulf War veterans.
- Further research is needed to determine the effectiveness of the current dose of PB against Soman.
- Additional research about safety and effectiveness of PB for humans is urgently needed.

Deployment Health

- **Short Term Health Consequences**
  - Clinics, Hospitals
- **Long Term Health Consequences**
  - Locations, Exposures, Medical Records

The Gulf War

What Have We Learned ?

Lessons Learned from the Gulf War

- Information about health risks not always provided to Commanders
- Inconsistent dissemination of information on non-traditional issues

- Training on non-traditional threats and equipment capabilities varied
- Inconsistent health screening of troops before & after deployment
- Medical records a challenge

Summary of Research Results
Gulf War Veterans

- Medically undiagnosed physical symptoms more frequent (2-3 times) in Gulf War veterans (British, Canadians, Americans)
- No new syndrome or set of symptoms unique to Gulf War veterans
- No increase in rates of:
  - Diagnosed diseases
  - Hospitalizations
  - Deaths
  - Birth defects

Guiding Principles

To preserve the health of deployed forces, we believe:

- Lessons learned must be implemented at all levels to avoid mistakes in future deployments.
- Openness is essential in earning the trust of our personnel, their families and the American public.
- A fit and healthy force must have information that promotes an understanding of potential health threats and ensures preventive action.
- Feedback from those deployed is key to understanding health related incidents.

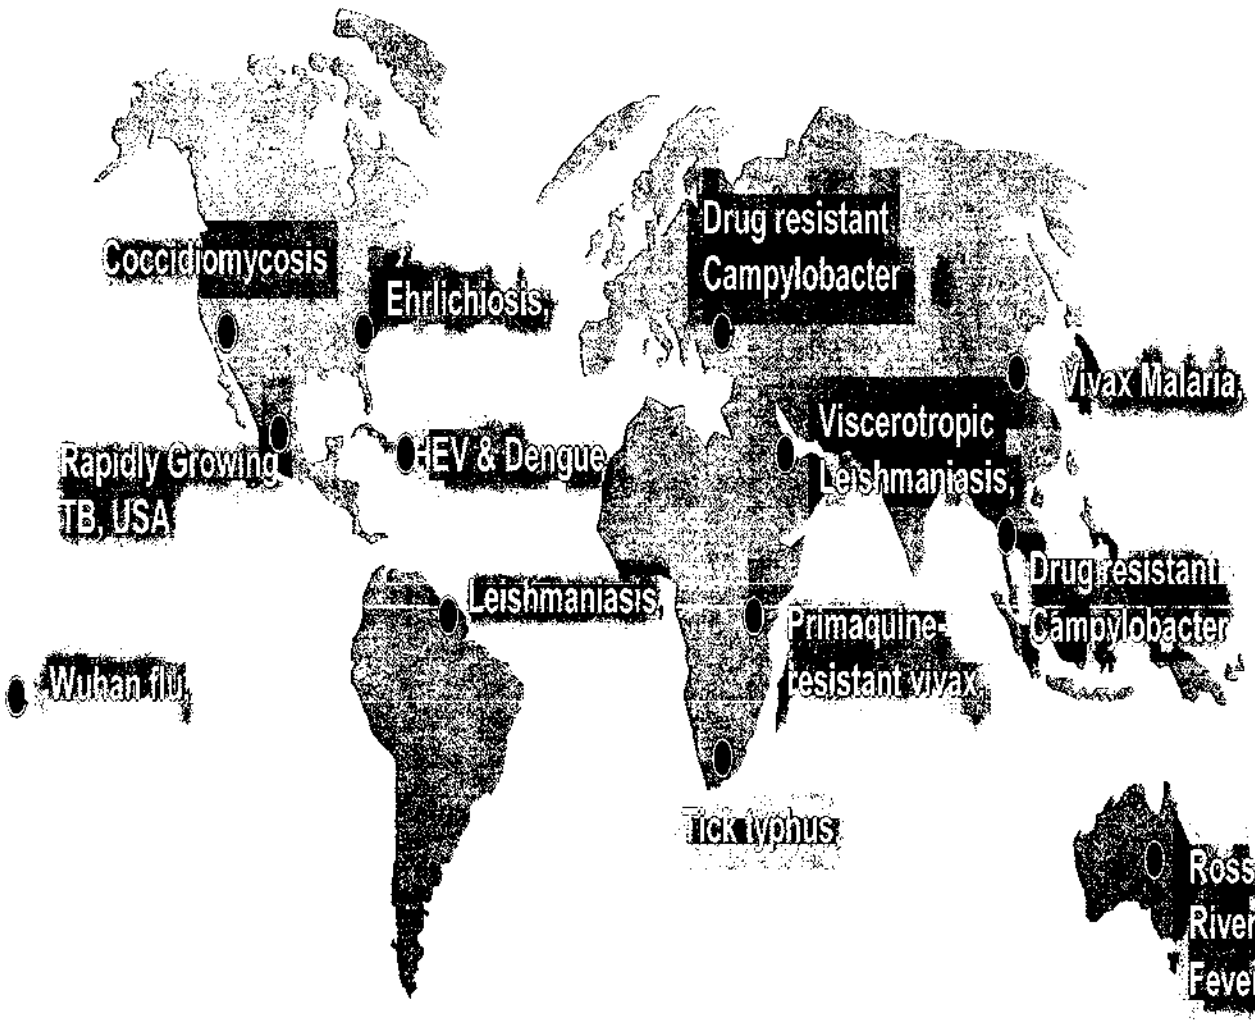
A coordinated, joint-service program to facilitate the early recognition and control of emerging and reemerging infectious disease threats

- THERE HAS BEEN A DETERIORATION IN THE LOCAL PUBLIC HEALTH INFRASTRUCTURES THAT MONITOR AND RESPOND TO DISEASE OUTBREAKS

- THE U.S. SHOULD LEAD THE EFFORT TO FORGE AN INTERNATIONAL PARTNERSHIP TO ADDRESS EMERGING INFECTIOUS DISEASES SINCE WE ARE AT THE FOREFRONT OF COMPUTER COMMUNICATIONS AND BIOMEDICAL RESEARCH

"The mission of DoD will be expanded to include support of global surveillance, training, research, and response to emerging infectious disease threats.

?



Coccidiomycosis
Ehrlichiosis
Drug resistant Campylobacter
Vivax Malaria
Rapidly Growing TB, USA
HEV & Dengue
Viscerotropic Leishmaniasis
Drug resistant Campylobacter
Leishmaniasis
Primaquine-resistant vivax
Wuhan flu

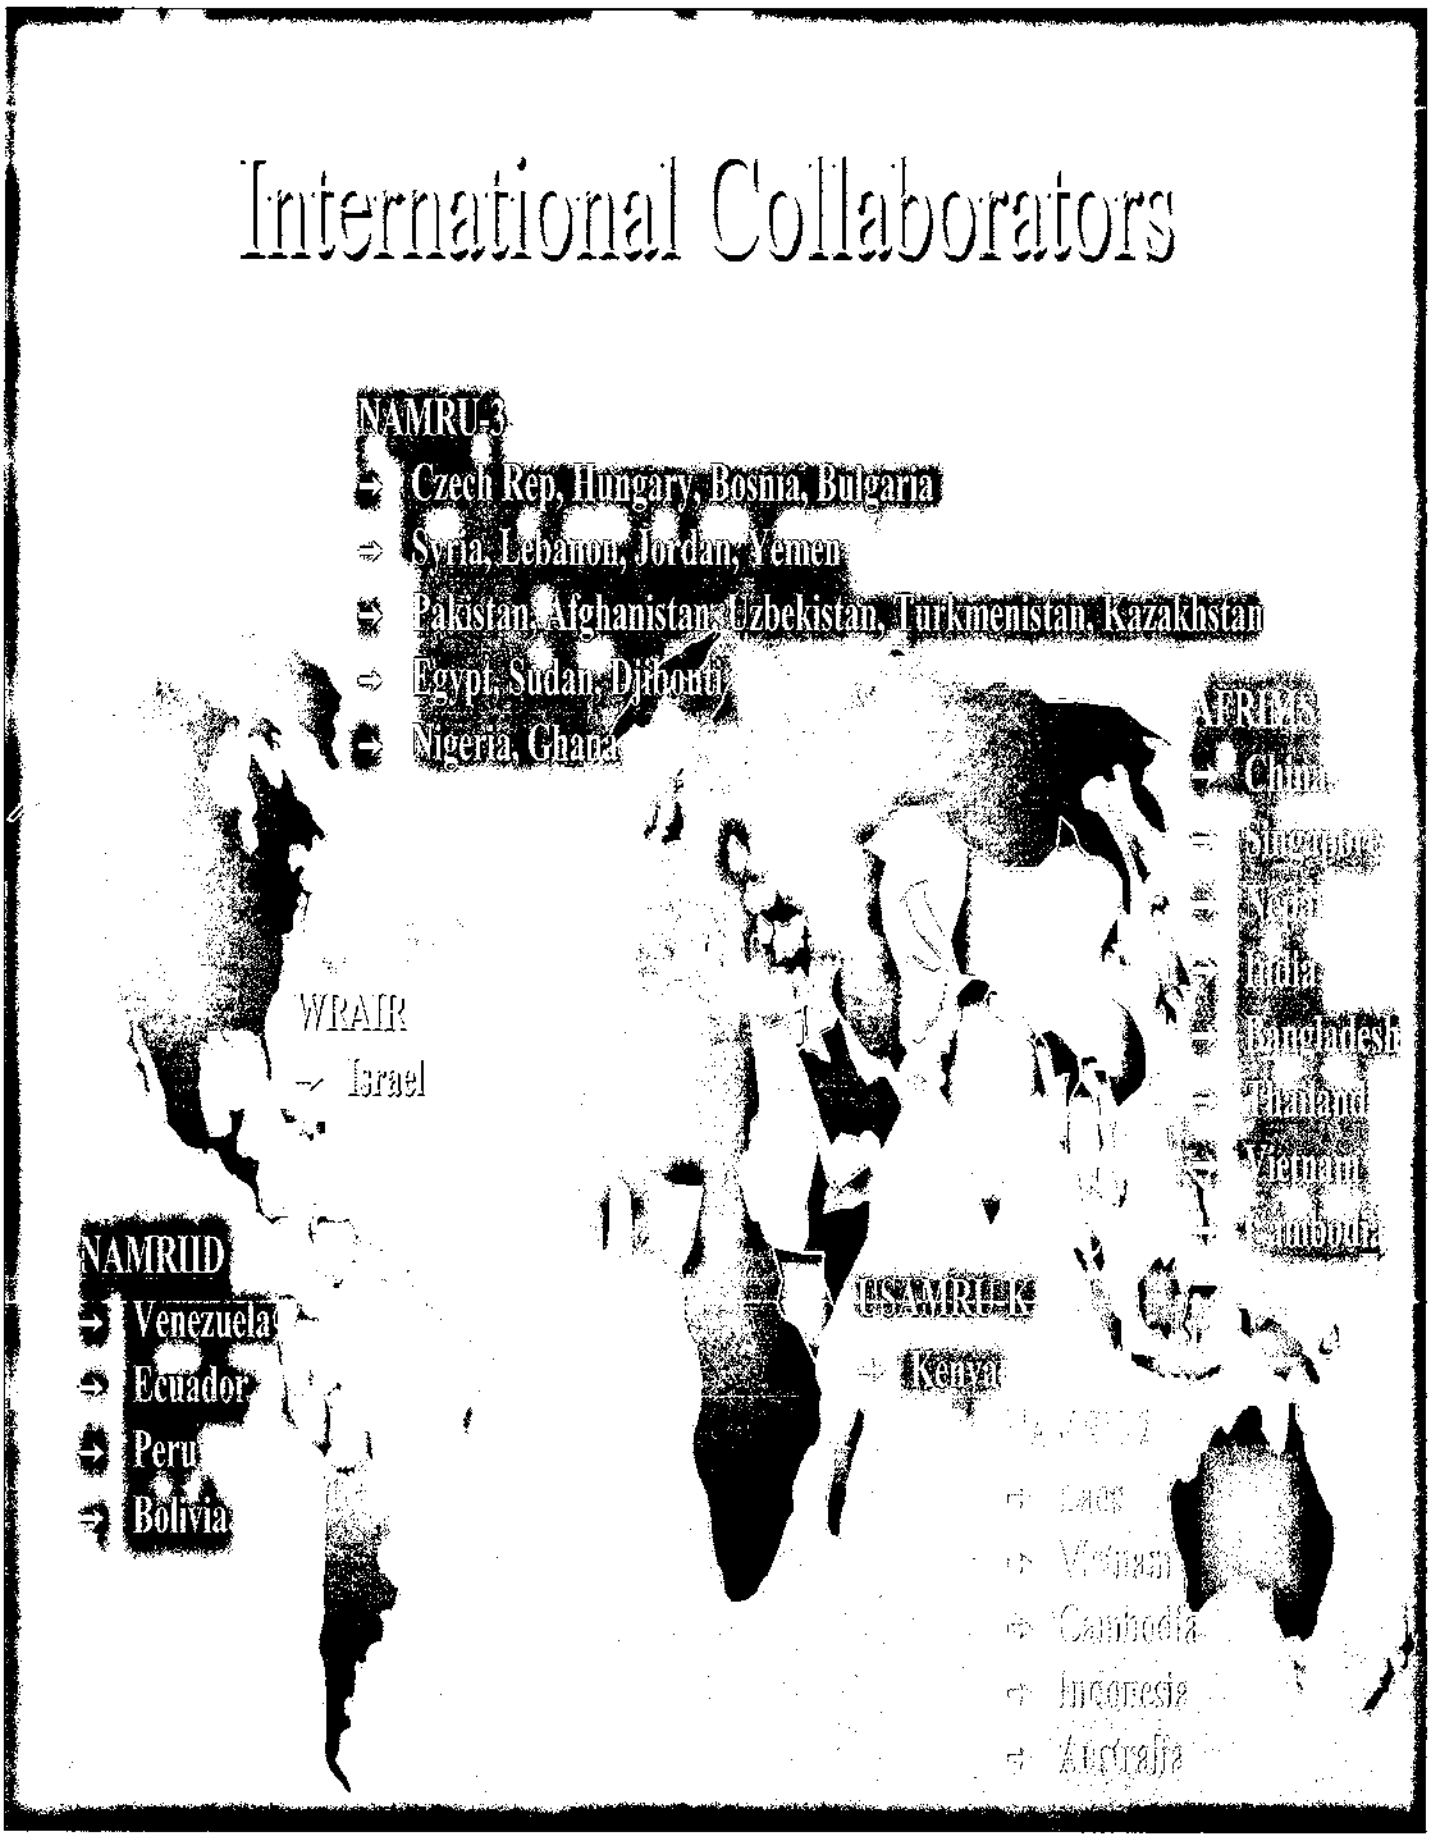
Ross River Fever

- Extensive Infectious Disease Expertise
- World-Wide State-of-the-Art Communications
- Cutting Edge Field Diagnostic Reagents
- Special Drugs and Vaccines
- Globally Deployed Forces Under Medical Surveillance

International Collaborators



Regional Hubs for Sentinel Surveillance Networks

Response to outbreaks

Training of local nationals and US public health personnel

Building Global Capacity

- New and Emerging Infections
- Malaria
- Enteric Infections
- Dengue and Hemorrhagic Fever Viruses
- Rickettsia
- HIV-1
- Experimental Therapeutics

- Drug-resistant malaria
- Antibiotic-resistant enteric pathogens
- Influenza
- Hemorrhagic and other febrile infections

- Goal is to promote, facilitate, and coordinate the development of public health infrastructure

- Objective is the establishment of laboratory-based sentinel surveillance networks for emerging infectious diseases

- Ministries of Health
- US State Department
- CDC, NIH, USAID, NASA, FDA, USDA
- WHO, PAHO, UNAIDS
- Public and Private Universities

- Strengthens internal, DoD, host nation, and regional infrastructure
- Focuses on transfer of epidemiologic and microbiologic skills for locally supportable surveillance
- Facilitates replication of uniform surveillance procedures at other sites and subsequently enhanced data pooling
- Facilitates timely recognition and collaboration in outbreak control

- Improves medical threat assessments
- Enhances control of pandemic influenza and drug-resistant organisms
- Identifies relatively unusual infectious threats to troops
- Helps prevent epidemics during mobilization and training
- Helps prevent destabilizing effects on foreign governments
- Reduces post-deployment EID importations (esp. nosocomial spread)
- Reduces demand for costly humanitarian assistance
- Validates the effectiveness of preventive measures

USACHPPM

DA Policy

Applicable to:

- The accidental or deliberate release of non-weaponized Toxic Industrial Materials (TIMs), hazardous physical agents, ionizing and non-ionizing radiological hazards
- Environmental contaminants to include vector- and arthropod-borne threats, and residues naturally occurring or from US forces activities, non-US military forces, local national governments, or local national activities.
- The TIMs or hazardous physical agents currently being generated as a by-product of the activities of US forces or other concerns

DA Policy Key Elements

Commanders are required:

- To adhere, in non-deployed situations, to Federal, State, and host nation statutory and regulatory laws
- To adhere, in deployed situations, to garrison OEH standards, so far as the tactical situation permits.
- To use the ORM process to minimize the total risk to personnel
- To consider both short-term and long-term health risks to personnel
- To ensure that any decisions to override peacetime regulatory occupational and environmental health standards are documented, archived and reevaluated on a recurring basis.

Joint Environmental Surveillance Workgroup

- Formed at the direction of the Joint Preventive Medicine Policy Group to:
  - review, develop, and recommend functional aspects of environmental surveillance policy.
- Executive Membership:
  - U.S. Army Center for Health Promotion and Preventive Medicine
  - US Air Force Institute for Environment, Safety and Occupational Health Risk Analysis
  - U.S. Navy Environmental Health Center
  - Armed Forces Medical Intelligence Center
  - J-4 Medical Readiness Division

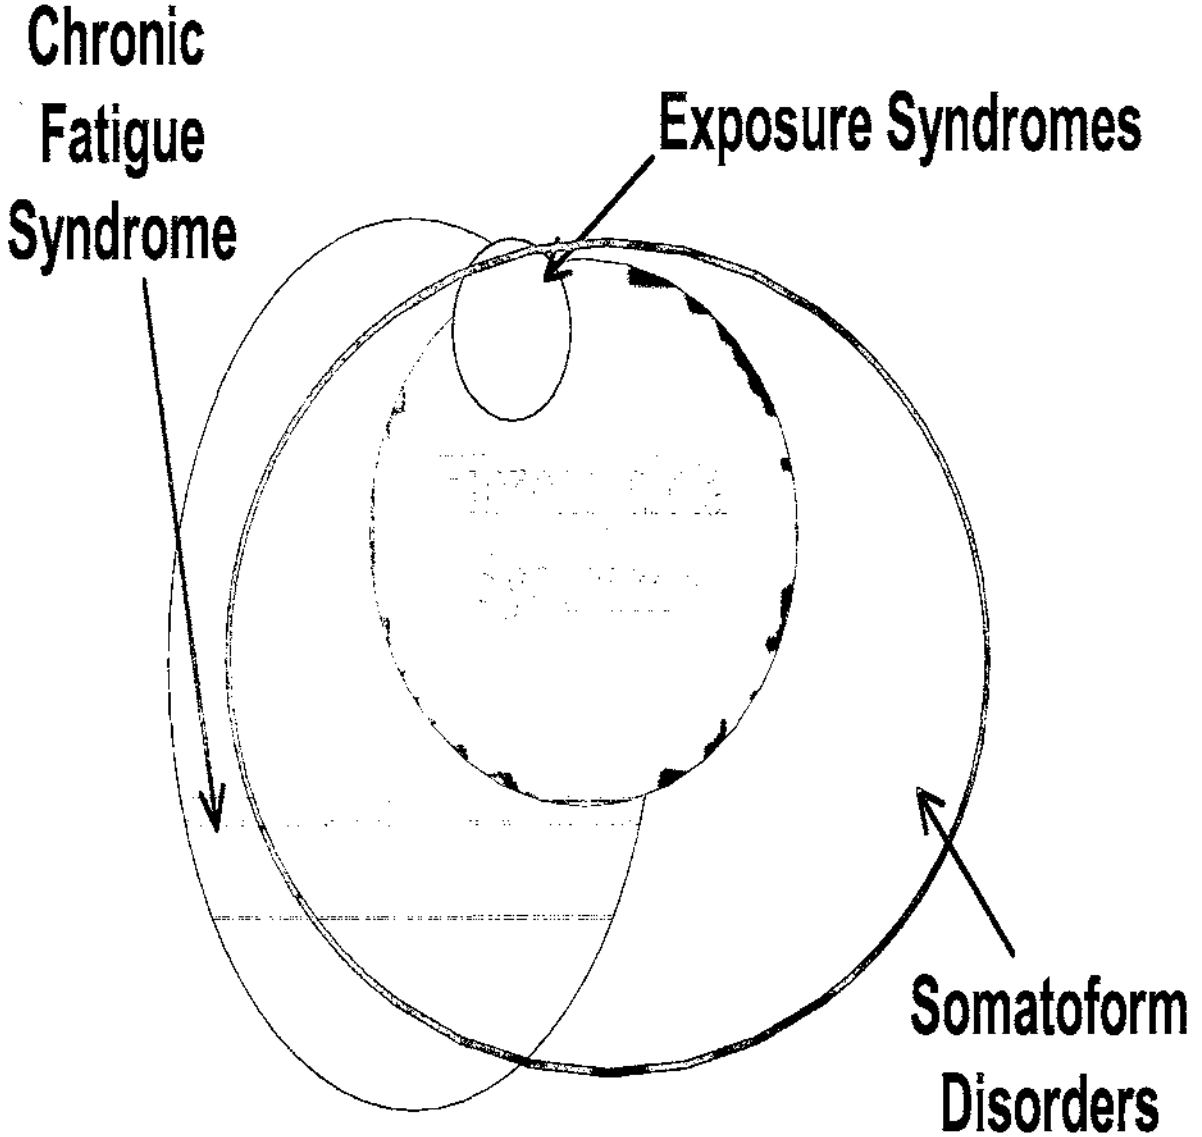
Symptom Based Disorders

One Syndrome or Many



DoD Deployment Health Clinical Center

What is the Cause?
The Place for Interpretive Space

- No causes are proven
- Many putative causes are plausible
- Complicated "stress" dialogue
- Methodological problems plague research
  - the challenge of baseline data
  - the obscuring effect of time
  - the problem of "caseness"
  - "moving target" of exposure measurement
  - issues of privacy and confidentiality

Contested Illnesses & Exposures

Exposures with plausible health consequences or illnesses that are based on symptoms alone that become a matter of public debate, political controversy, or litigation.

Rate the degree to which you believe "Persian Gulf Illness" is:

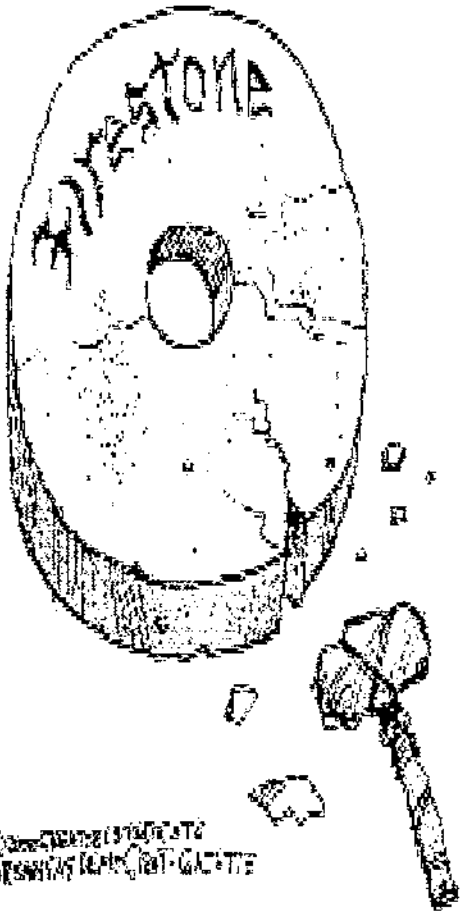
THE WHEEL, THOUGH, STILL NEEDS SOME WORK



Good Technical Outcome, Poor Service Experience

A Verdict on Contemporary Medical Care?

Leon Eisenberg, MD

IN THE CLINICAL CROSSROADS IN THIS ISSUE OF THE JOURNAL, the deserving Dr Jennifer Daley rates the care the patient received as "good technical outcome, poor service experience."

No one will quarrel with the accuracy of the judgment rendered, but what a sad commentary—and understatement—about what happened to the patient. Most physicians and patients, and undoubtedly Ms G herself, would prefer that result to a rating of "good service experience, poor technical outcome" after such surgery, an outcome that was commonly the case with knee surgery 20 years ago, before orthopedic methods improved so remarkably. Being able to take a 3-week hiking trip after knee surgery is a tribute to modern orthopedics no less than to the skill of her surgeon.

But must there be an inverse relationship between technical outcome and service experience? Clearly not. Yet public dissatisfaction with care received has been increasing in recent years despite the greater and greater proficiency of medical and surgical specialists in reducing morbidity and mortality. Why might that be so? Some disinter-

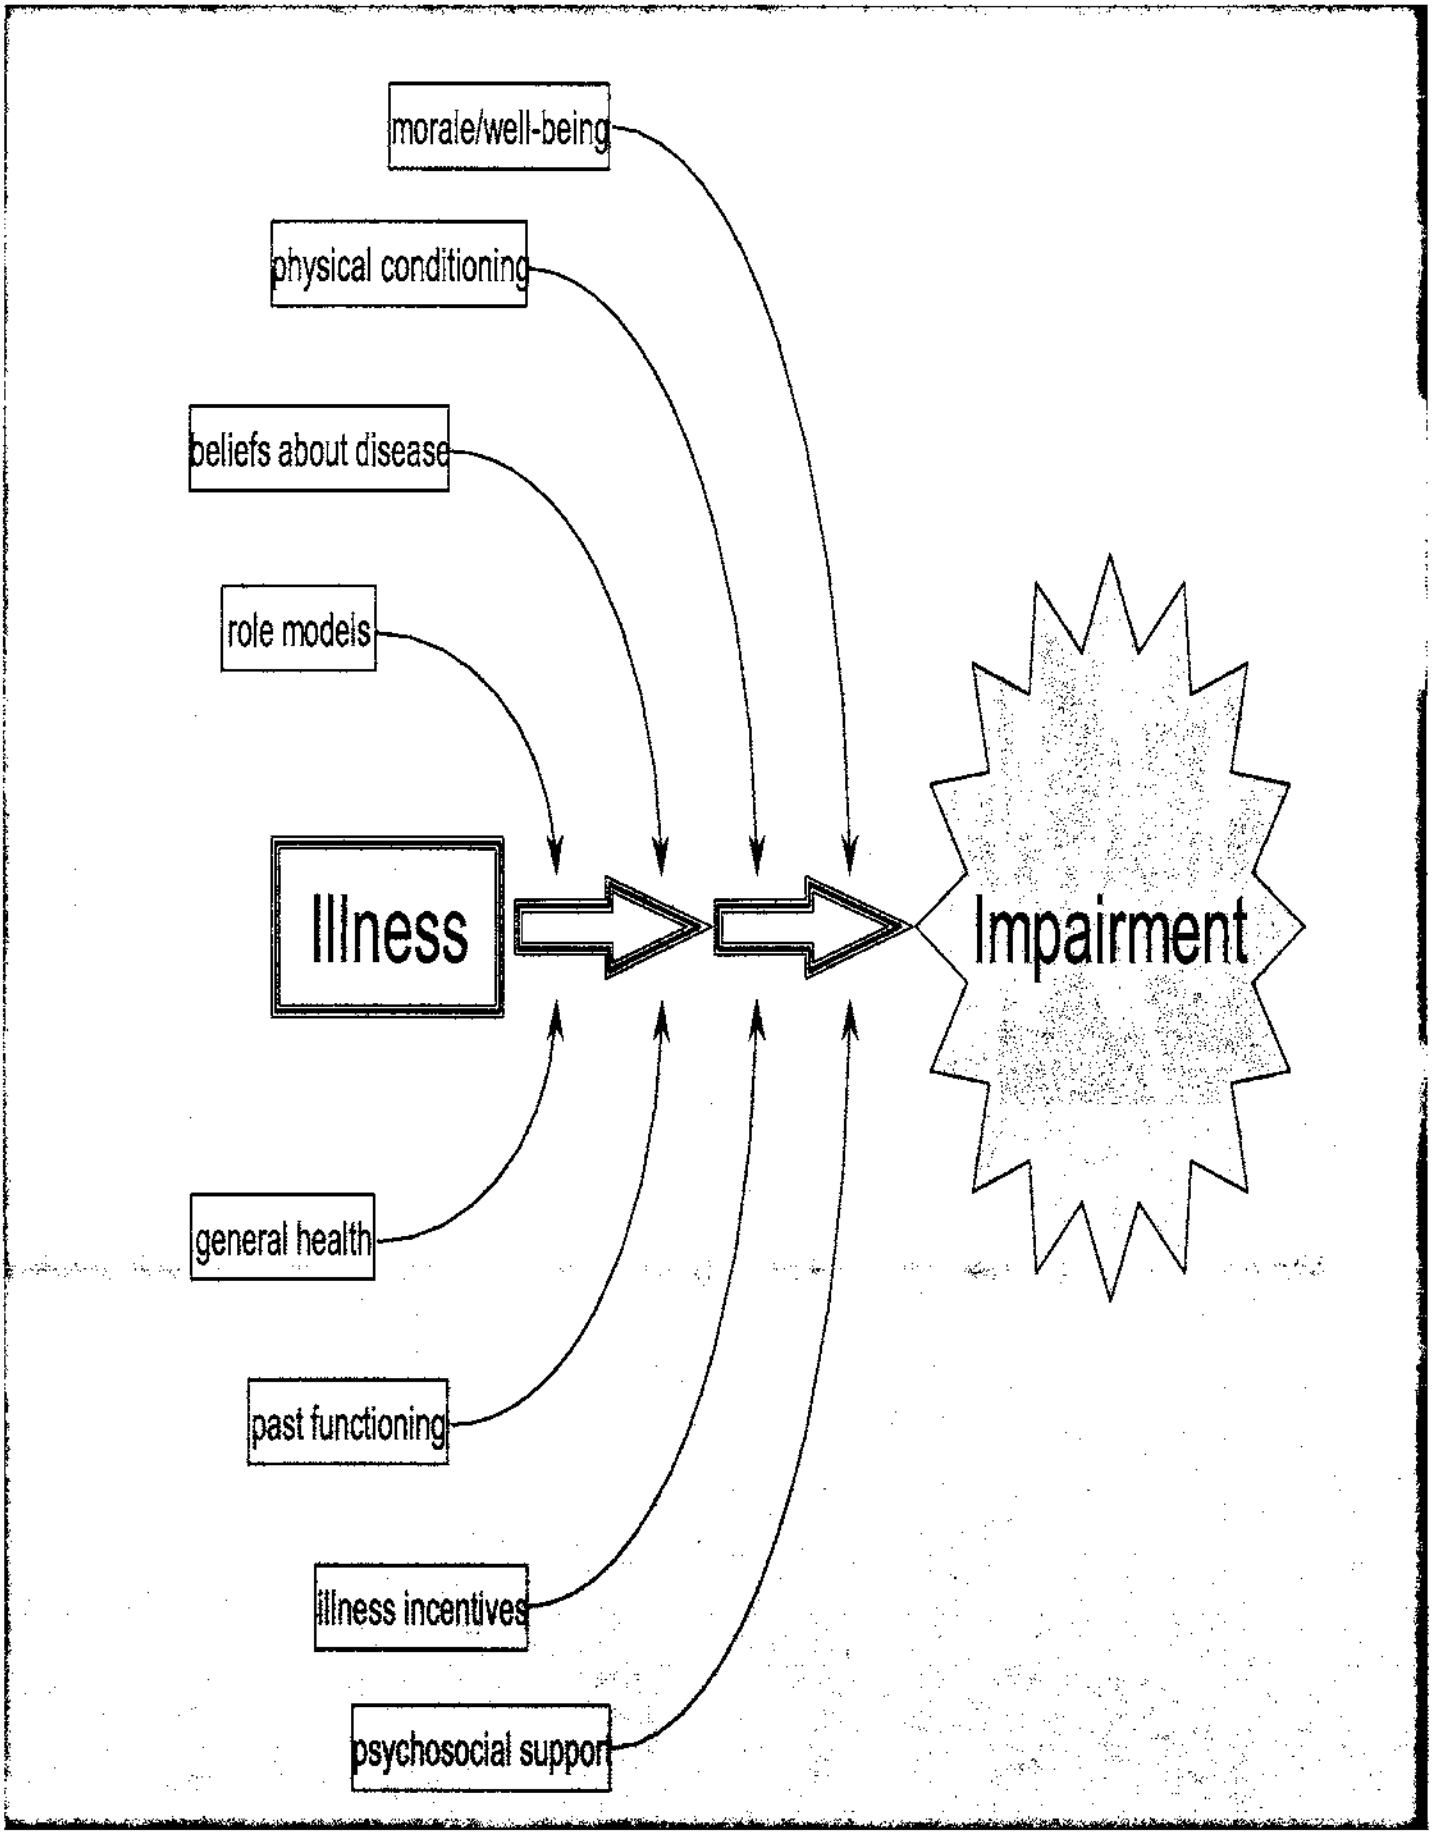
The Goal: Collaborative Care

The primary goal is for patient & provider to *collaborate* in a joint effort to *activate* positive health-related behaviors. The two parties *negotiate* exact & explicit behavioral goals. They *monitor* progress using behavioral indices (e.g., symptom reports, quality of life estimates, or capacity to function and fulfill roles). Follow-up is *planned*, explicit, and valued over acute assessment.



morale/well-being
physical conditioning
beliefs about disease
role models
Illness
Impairment
general health
past functioning
illness incentives
psychosocial support

How Do We Get There From Here?

- Clinical experience
- Clinically relevant research
- Collation of clinical evidence
- Evidence-based practice guidelines
- Guideline implementation
- Pragmatic studies of implementation
- Recursive cycle

DoD Center of Excellence for Post-deployment Care

Three New DoD-VA Clinical Practice Guidelines

- Post-Deployment Health Evaluation & Management
- Unexplained Symptoms: Chronic Pain & Fatigue
- Post-Traumatic Stress Disorder

DoD & VA Practice Guideline Development...

- Is multiorganizational
- Is multidisciplinary
- Involves military personnel and veterans
- Systematically employs best evidence and independent policy recommendations
- Is recursive

Introduction To Guideline Features

- ❑ military-unique "fifth vital sign"
- ❑ stepped care approach
- ❑ clinically-based risk communication
- ❑ web-based clinician support
- ❑ longitudinal follow-up guidance
- ❑ outcomes monitoring
- ❑ supporting "Center of Excellence"

Military Unique Fifth Vital Sign

"Is your visit today related to war or deployment?" (yes–no–maybe)

- vital sign for all visits except wellness care (e.g., periodic health examination, preventive care visits)
- patient-based rather than clinician-based
- 1% or less of patients say 'yes'

What is Stepped Care?

Explicit organizing of a care continuum.
Sequencing – intensity, cost versus benefit
Matching – based on identified need

Matching patient to "step" (level of care
Previously used strategies
Problem trajectory.

Stepped Clinically-Based Risk Communication Strategy

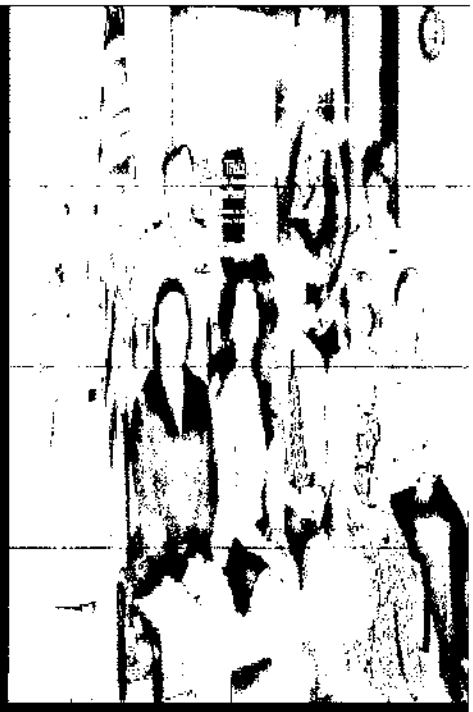
- **The Recruit Assessment Program**
- **The Millennium Cohort Study**

Clinical Trials Center



- VA / DoD Cooperative Study 475 - Antibiotic Treatment of Gulf War Veteran Illnesses - double blind, placebo-controlled study.
- VA / DoD Cooperative Study 470 - Exercise, Cognitive Therapy Trial - controlled evaluation of multiple modalities to reduce symptoms.
- A controlled trial of the effects of combination therapy with DEET/PBPermethrinon symptoms andneurocognitivefunction.
- An assessment of relationship between obesity and past adenovirus infections.

The DoD Birth and Infant Health Registry

US Senate Committee on Veterans' Affairs recommended "establishing a birth defects registry for the military to gather data on possible reproductive health effects stemming from battle field exposures"

Report of the special investigation on Gulf War illnesses, 1998, Washington, DC.

Additional support for the Registry

- Committee to Review the Health Consequences of Services Durin the Persian Gulf War (1996)
- The Presidential Advisory Committee on Gulf War Veterans' Illnesses, *Special Report* (1997)
- OPNAVINST 5100.23D

Justification for Birth and Infant Health Registries

Birth defects are common

- ♦ may be present in >15% of all conceptions.
- ♦ major defects are found in 3-4% of live births.

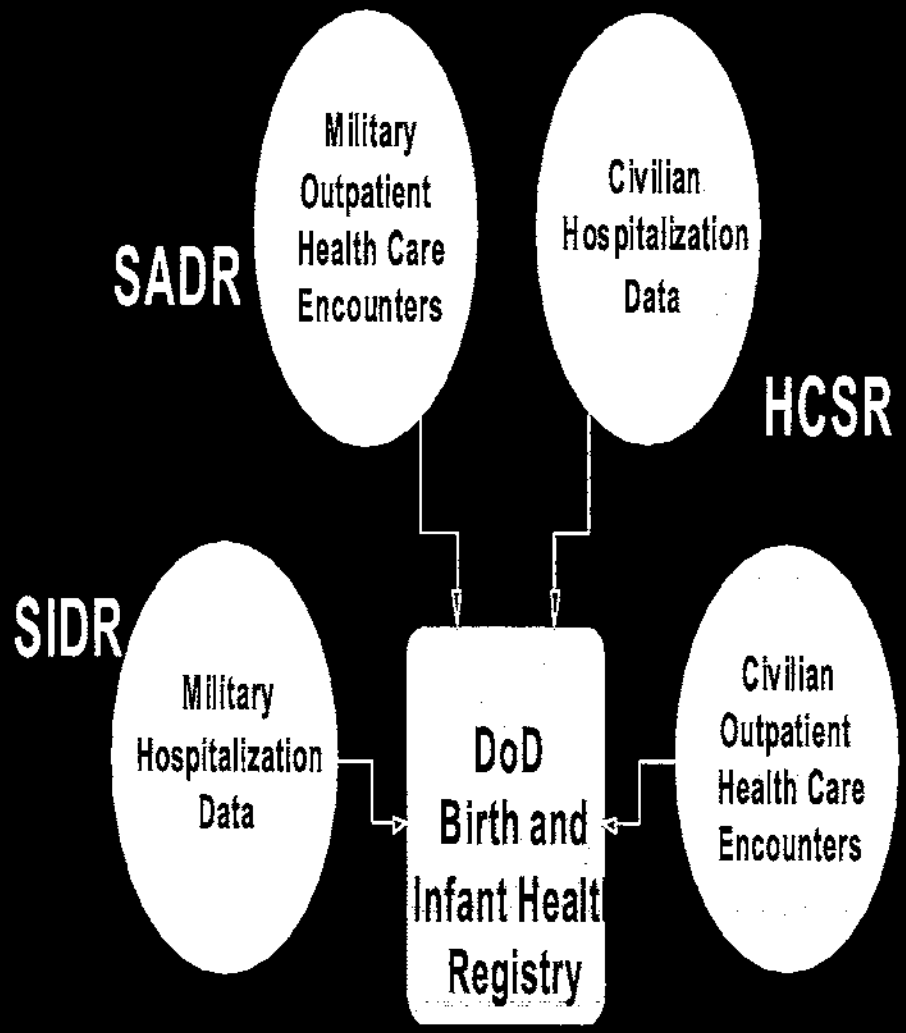
Birth defects are costly

- ♦ account for 25-30% of all pediatric hospitalizations.
- ♦ leading cause of infant mortality in the US.

Birth defects are concerning

- ♦ 38 states have birth defect registries.
- ♦ occupational and environmental exposures concern both parents and policymakers.

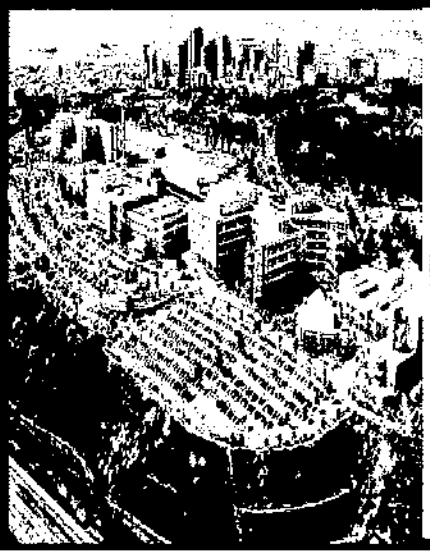
DoD Birth and Infant Health Registry Methodology



- Capture complete data on all births and health care encounters.
- Use standard definitions of outcomes, per CDC and state programs

Validation of DoD Birth and Infant Health Data

- Professional abstractors assigned to one of the largest DoD health care facilities, Naval Medical Center, San Diego.
- Data reviewed on over 3700 live births each year.
- Assess both over-reporting and under-reporting of birth defects in the electronic surveillance system.
- Find 93% complete data agreement. Most errors are miscoding of diagnoses; under-reporting of defects very rare.



DoD Birth and Infant Health Registry Results

- More than 90,000 births occur each year within the military.
- DoD births occur in all 50 states and >20 foreign countries.
- By simple linking to Defense Manpower Data Center data, the Registry can analyze birth defects by
  - geographic location of birth,
  - parents' past duty stations,
  - parents' occupational codes,
  - parents' deployments,
  - other exposures (e.g., anthrax vaccination)

DoD Birth and Infant Health Registry Results

- Overall prevalence of major defects among DoD-sponsored births has been found to be 3-4%.

- Most commonly diagnosed birth defects include:
  - patent ductus arteriosis
  - hypospadias & epispadias
  - atrial septal defect
  - ventricular septal defect

- Overall prevalence and types of defects are consistent with civilian birth defects surveillance data.

- DoD's ability to link data to parental environmental and occupational exposure data is a unique attribute -- *proving valuable in more detailed analyses.*

The Recruit Assessment Program

Collection of baseline health data on all military members is recognized as essential for:

- understanding health risks prior to entrance,
- understanding how service-related exposures (especially deployments) affect health,
- developing early intervention and prevention programs to protect health and readiness.

The Recruit Assessment Program

RAP survey content includes:

- demographic data
- clinical and medical history
- family history
- psychosocial history
- occupational history
- substance abuse and risk factor screens

Standard survey instruments used as much as possible.

- Linking demographic data to other systems, to speed recruit in-processing, makes RAP acceptable to training community.
- Project originally championed by CAPT C. Hajg Hyams, MC, USN(ret); now embraced by many throughout DoD.

The Recruit Assessment Program

Current Program Status

- Initiated at MCRD-San Diego June 20
- ~ 10,000 recruits entered.
- Survey honed to 11 pages (25 minutes)
- Initial test-retest results look sound.
- Prevalence of previously-studied factor appears consistent (e.g., 35% of recrui report being smokers)

- Fort Jackson (Army) now actively engaged (via CHPPM and WRAIR).
- Parris Island (Marines), Lackland (Air Force), and Great Lakes (Navy) all pursuing RAP implementation.
- For the future: other Army sites (Forts Leonard Wood, Benning, Knox, Sill) and all officer accession points.

The Millennium Cohort Study

- Section 743 of the FY1999 Strom Thurmond Act authorized the Secretary of Defense to establish a... *longitudinal study to evaluate data on the health conditions of members of the Armed Forces upon their return from deployment.*

MILLENNIUM COHORT STUDY

The Millennium Cohort Study

- Capitalize on new and planned DoD surveillance and health care data policy changes
- Use data sources that were not available at the time of the Gulf War
- Add future deployment data as covariates
- For the first time, actually measure deployment impact prospectively

The Millennium Cohort Study

Methods

- Probability-based cross-sectional survey of 100,000 (3.2%) of the 2.7M US service personnel who were on duty as of October 2000
- Re-survey population at 3-year intervals through 2022

  [Address-finding mail outs done annually]
- FY2004 and FY2007 - add new accession cohorts
- Assist in Force Health Protection modification such that initial survey data is adopted as DoD policy by 2011
- Other investigators may use these core data or augment serial samples with new data instruments

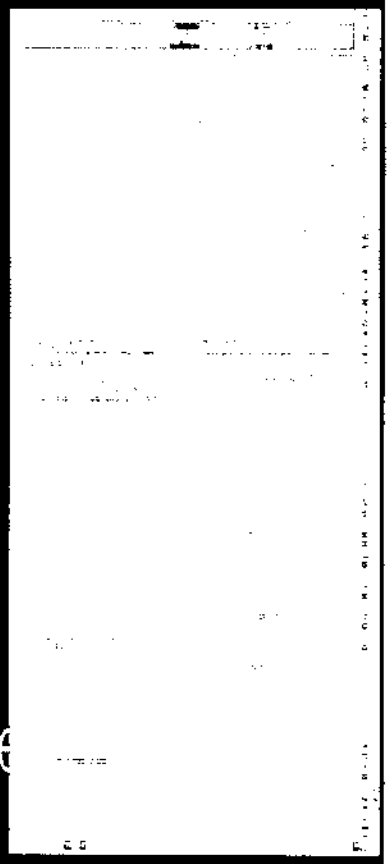
The Millennium Cohort Study

Some data sets to be linked to core survey data:

- Demographic and deployment data (DMDC)
- Immunizations
- Outpatient care
- Hospitalizations
- Birth Defects Registry data
- VA disability data
- Mortality data

The Millennium Cohort Study

Strategies to Maximize Participation



- Pretest survey in focus groups
- Simple, mark-sense questionnaire
- TraditionaDillmanmail methods:
  pre-survey introductory postcard,
  up to 3 survey mailings,
  telephone interview of non-responde
- Toll-free number for questions
- Annual address finding (DEERS, IRS, etc)
- Incentives (coaster, key chains, T-shirts)

Website wwwmillenniumcohordrg

Provides information anoption for survey completion.

The Millennium Cohort Study

Current status

- Pilot survey completed in spring 2001
- Full survey launched in Aug 2001
- Beginning 2nd mailing cycle. >29,000 respondents.
- Nearly 50% responded via website.

The Millennium Cohort Study

Oversight and Management

- DoD Research Program Office (DDRE) funding
- Protocols designed with expert external consultation
- AIBS external review
- Scientific Steering and Advisory Committee review
- Research Working Group of the MVHCB review

Pneumococcal Vaccine Trial

- Double-blind, placebo-controlled t
  of 23-valent pneumococcal vaccine in
  military recruits.

- Vaccine, FDA-approved, commonl
  given to elderly. 7-valent vaccine
  given to infants since 2000. Vacci
  value in healthy young adults uncl

- One of the largest vaccine trials in military history
  (nearly 200,000 people will be enrolled). Underway at 4 sites.

- Collaborators include Mayo Clinic and CDC. Results of great inte
  to military and civilian public health professionals.

Global Emerging Infection Surveillance

Accomplishments of the Gregory C. Gray Laboratory

- Mycoplasma pneumoniae (Mil Med, 1997)
- Bordetella pertussis (Clin Infect Dis, 1997)
- Azithromycin trial (Clin Infect Dis, 1998)
- DoD respiratory threats (Emerg Infect Dis, 1999)
- Ft Jackson outbreak (Emerg Infect Dis, 1999)
- Ft Benning outbreak (MSMR, 1999)
- Navy Respiratory Disease Laboratory (Mil Med, 2000)
- Adenovirus orphaned vaccine (Clin Infect Dis 2001)
- USS Arkansas flu outbreak (Emerg Infect Dis 2001)
- Pertussis PCR (Mol Cell Probes 2001)
- Adenovirus DNA testing (J Med Micro 2001)
- USNA study (Mil Med 2001)
- BUDS study (Clin Infect Dis 2001)
- Pneumococcal vaccine study (Mil Med 2001)
- Pneumococcal surveillance (JID 2001)
- Adenovirus serotyping (J Clin Micro 2001)
- Adenovirus 7&3 outbreak (Clin Infect Dis 2001)
- Adenovirus deaths (MMWR 2001)

- CAP Certification (since 1999)

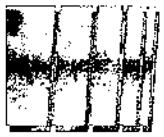
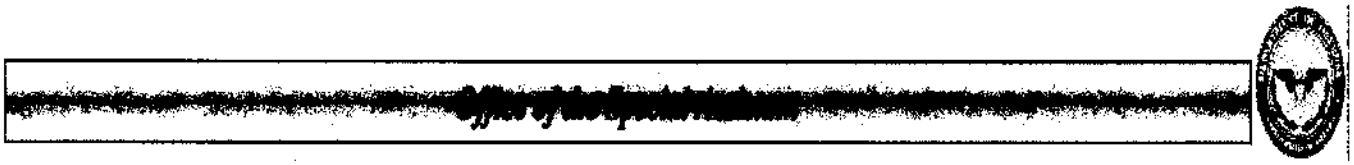
Mortality (Aug 91 - Sep 93)	**.025**	**.023**



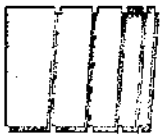
Possible Causes

CHEMICAL WARFARE	BIOLOGICAL WARFARE
PESTICIDES	OIL WELL FIRES
VACCINES	DEPLETED URANIUM
PYRIDOSTIMINE BROMIDE	INFECTIOUS DISEASES
STRESS	COCKTAIL EFFECT



Major Lesson Learned from the Gulf War

DoD Does Not Deal Well With Non-Traditional Issues



Understanding Today's Military Member

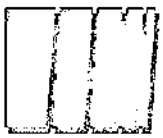
- 55% are married
- 46% have children
- 40% of the 1.3 million children are < 6 years old
- 6% are single parents
- 8% care for elder parents
- 14% are women

Deployments

- Unexpected and rapid personnel movement
- Personal and family hardships
- Stress in the field
  - Missile attacks
  - Chem-bio attacks
  - Witnessing death/atrocities
  - Harsh Living Conditions
  - Foreign cultures
  - Racial/ethnic hatred
- Inadequate communication
- No answers to questions after returning

Concerns of the Deployed Member

- Importance of the mission
- Recognition by others of his/her role
- Ability to express fears/concerns/problems to leadership
- Recognition for performance



Successful Mission

- Knew why I was there and agreed
- Knew what to do
- Knew how to do it
- Had what I needed to do it
- Did it well
- Was appreciated for my contribution
- Returned proud I had been there

Where Do We Go From Here?

- Concept - Deployment Medicine Clinics
  - Connected to all deployment sites
  - Source for pre and post deployment information
  - Information for family members
- Concept - Education on Vaccines
  - Start updating electronic record entrance
  - Validate accuracy with leave/bonus requests
  - Internet linkage to CDC for recommendations
- Concept - ????

Medical Personal Information Center (PIC)

Office of the Special Assistant to the Deputy Secretary of Defense for Gulf War Illnesses

Anthrax

- Inhalation anthrax is deadly
- Biological warfare agent of choice:
  - Cheap and easy to produce
  - Can be dispersed in air by a variety of weapons
  - Odorless, colorless, tasteless, difficult to detect
  - Flu-like symptoms early, rapid deterioration, and death
- MOPP 4 prevents exposure
- Antibiotics work before symptoms appear

Vaccination against anthrax is critical for your protection

Anthrax Vaccination Program

- Phase I - SWA and Korea (now)
- Phase II - Early deploying forces to SWA and Korea
- Phase III - Total force
- 432,918 vaccinated - 1,637,853 doses (19 Apr 00)

Major Lesson Learned from the Gulf War

DoD Does Not Deal Well With Non-Traditional Issues

Office of the Special Assistant to the Deputy Secretary of Defense for Gulf War Illnesses

Deployments

- Unexpected and rapid personnel movement
- Personal and family hardships
- Stress in the field
  - Missile attacks
  - Chem-bio attacks
  - Witnessing death/atrocities
  - Harsh Living Conditions
  - Foreign cultures
  - Racial/ethnic hatred
- Inadequate communication
- No answers to questions after returning

Force Health Protection

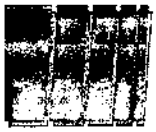
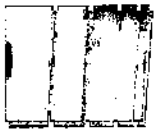
Understanding Today's Military Member

- 55% are married
- 46% have children
- 40% of the 1.3 million children are < 6 years old
- 6% are single parents
- 8% care for elder parents
- 14% are women



Today's Military Member

- Better informed
- More demanding
- Concerned
- Concerned about military medicine
- Wants high technology answers



Today's Deployments

- Increased by 60%
- Personnel and Budget Decreased by 34%
- Trained to be Warfighters
- High Technology Weapons, Communications
- Assignments
  - Peacekeepers
  - Drug Interdiction
  - Humanitarian Relief
  - CB Terrorism Response
- Targets for Random Acts of Violence

Concerns on the Deployed Member

- Importance of the mission
- Recognition by others of his/her role
- Ability to express fears/concerns/problems to leadership
- Recognition for performance

Successful Mission

- Knew why I was there and agreed
- Knew what to do
- Knew how to do it
- Had what I needed to do it
- Did it well
- Was appreciated for my contribution
- Returned proud I had been there

Recent Developments

- Military Veterans Health Coordinating Board
  - DoD, VA, HHS
- VA National Center for Military Deployment Health Research
- DoD Center for Deployment Medicine
  - Naval Health Research Center
  - Walter Reed Center for Deployment Medicine
  - Center for Health Promotion & Preventive Medicine

Office of the Special Assistant for Military Deployments

- Respond to veterans' deployment health related questions
- Facilitate assimilation of health related lessons learned
- Assure effectiveness of DoD programs protecting health during deployment

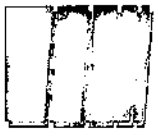
Special Assistant for Gulf War Illnesses

Dr. Bernard Rostker

- Appointed November 12, 1996 by the Deputy Secretary of Defense
- 180 team members



Mission of the Special Assistant

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate to understand and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DoD adapts doctrine, policy and procedures to reduce risks for troops in the future.

Who Served in the Gulf War

INFO MEMO

November 29, 2001 2:45 PM

FOR: SPECIAL ASSISTANT FOR GULF WAR ILLNESSES, MEDICAL READINESS, AND MILITARY DEPLOYMENTS

FROM: Michael E. Kilpatrick, M.D., Director, Deployment Health Support

SUBJECT: GulfLINK

- A recent *New York Times* news article (Tab A) reports that two Pakistani scientists were detained and a number of anthrax-related documents found in their office. Among those identified in the article were documents attributed to a "... Web site devoted to better informing Persian Gulf war veterans...."
- Without seeing the documents, we are unable to determine if, in fact, the referenced site is GulfLINK. However, we reviewed the content of our web site, and found that it is possible that the cited documents are posted there.
- From the description in the news story, we believe the reference is to information on anthrax provided in our An Nasiriyah Southwest Ammunition Storage Point case narrative final report, published January 13, 2000, footnote 121 (Tabs B1-B3). The same information is in the amended An Nasiriyah Southwest Ammunition Storage Point case narrative final report, published September 28, 2000, footnote 119 (Tabs C1-C3).
- In both cases, the primary reference was from the U.S. Army Medical Research Institute of Infectious Diseases handbook, published in July 1998 (Tabs B2 and C2), supported by the October 1999 web site of the DoD Anthrax Vaccine Immunization Program (Tabs B3 and C3).
- We anticipate no further media interest.

2 Pakistanis Linked To Papers On Anthrax Weapons

By Douglas Frantz with David Rohde

ISLAMABAD, Pakistan, Nov. 27 — Pakistan said today that it had detained two retired nuclear scientists after the recent discovery in offices they had used in Afghanistan of documents describing ways to use anthrax as a weapon and other suspicious material.

The scientists, Sultan Bashiruddin Mahmood and Chaudry Abdul Majeed, were first questioned in October after American intelligence officers expressed concern about trips the two had made to the Afghan capital, Kabul. They were interrogated about their ties to the Taliban.

After he retired from Pakistan's Atomic Energy Agency in 1998, Mr. Mahmood founded a private relief organization, Ummah Tameer-e-Nau, that operated in Afghanistan.

Documents from the organization's Kabul offices examined by The New York Times have been found over the past several days describing the history of anthrax and a Pentagon program to immunize all members of the United States military against anthrax attacks.

Also found were a box of gas masks, a diagram showing a plane shooting down a weather balloon and promotional material from militant Islamic groups. These findings were first reported last week in the British daily The Evening Standard.

Plans for building a balloon and what appeared to be a rocket were found on a piece of paper along with empty steel tubes and parts of a rocket-propelled grenade. A container of helium sat on a work bench.

The diagrams of the balloons seem to show a possible method for slowly dispersing some type of biological or chemical agent from the air. Words scribbled in the diagram appear to say "cyanide."

One diagram found in the Kabul offices show four balloons flying together in tandem with a box around them. The box appears to show how the agent would be dispersed across a wide area.

The house, like others in the Afghan capital apparently used by Osama bin Laden's terrorist network, Al Qaeda, seems to have been hastily abandoned when the Taliban fled Kabul two weeks ago. It is not clear who may have been in the house since then.

Referring to the scientists, Maj. Gen. Rashid Qureshi, the top Pakistani military spokesman, said today in Islamabad: "Both of them are under detention." He declined to elaborate, but officials said the new detentions related to the discoveries in Kabul.

The first arrest of the scientists last month was linked to American suspicions that Pakistan's nuclear weapons technology could have found its way into the hands of Osama bin Laden, Al Qaeda or the Taliban.

An American intelligence official said today that the first interrogation of the two Pakistani scientists has resulted in an assessment that Mr. Mahmood and Mr. Majeed did not know enough to help build a nuclear weapon. "These two guys were nuclear scientists who didn't know how to build one themselves," the American official said. "If you had to have guys go bad these are the guys you'd want — they didn't know much."

Neither of the Pakistani scientists has been charged with any wrongdoing. Their families have said they are innocent and that their interest in Afghanistan was humanitarian. The families have written to government officials protesting their interrogation and earlier detention.

They had been released after the initial questioning in October, but remained under loose house arrest. The new detentions indicate that concern about their activities in Afghanistan have intensified.

Mr. Mahmood and Mr. Majeed worked for the relief organization, whose official purpose was to upgrade roads, build flour mills and carry out other projects to assist Afghanistan. Both spent a considerable amount of time in Afghanistan.

Maj. Gen. Qureshi, the military spokesman, said of their new detention: "When we have completed the investigation, I'm sure the details will be coming out."

The diagrams in the Kabul offices of the relief organization were detailed. One had an arrow pointing to a balloon and the word "wireless" written next to it, suggesting that some type of communications device might be used as a trigger. Other diagrams had the word "SAM-7" and "Stinger" written near the balloon, suggesting that the two types of anti- aircraft missiles could be fired at the balloon to get it to release it contents.

Nearly all of the information found about anthrax in the house came from the United States military. The copies of the military paper describing the anthrax immunization program and expansion of anthrax vaccine production in Michigan were all from original documents, not documents downloaded from the Internet.

Someone had written a half dozen stars across the top of the Michigan study, suggesting that they found it valuable.

Whoever was conducting the research also effectively mined United States military Web sites for information. Copies of a printout of the first page of a military Web site devoted to better informing Persian Gulf war veterans with related illnesses were found in the house.

The site offers highly detailed descriptions of how Anthrax can be used as a weapon and spread through artillery shells, airplanes and trucks. It lists what size of anthrax dose kills people who have been immunized, and refers readers to more detailed academic studies on anthrax.

The house used by Mr. Mahmood's organization, one of three adjacent structures occupied by Pakistani scientists in the Wasi Akbar Khan section of Kabul, the city's wealthy diplomatic corner, it is an unremarkable two-story cinderblock home.

Books and toys suggest that children recently lived in the house. A young girl's second-grade English literature workbook lay on the living room floor surrounded by mounds of abandoned clothing. There was no hint of the effort underway in the workroom upstairs Mr. Mahmood was a director-general of nuclear power plants for the Atomic Energy Agency and Mr. Majeed was once director of uranium-enrichment laboratories.

Pakistani officials said earlier that neither man was affiliated with its nuclear weapons program. President Pervez Musharraf of Pakistan repeated the denial in a television interview on Monday.

But Pakistani newspapers have reported that Mr. Mahmood was involved in developing the atomic bombs Pakistan tested in its western desert in May 1998. Western intelligence agencies estimate that Pakistan has a stockpile of about 20 nuclear weapons.

Shortly after the Sept. 11 attacks on the United States, a team of American law enforcement and intelligence officials raised the safety of Pakistan's nuclear weapons in discussions in Islamabad with Pakistani officials.

The papers and blackboard drawings found in a Kabul house appear to describe the Taliban's notions for dispersing biological and possibly chemical agents by balloons and other methods. Those concepts are backed up by rudimentary calculations and information from Department of Defense Web sites and at

least one report prepared for the United States military on anthrax vaccines.

The report, prepared by Science Applications International Corporation, a private research firm with contracts with the Pentagon, was not classified, said Zuraidah Hashim, a spokeswoman for the firm, in Frederick, Md. It was titled "Renovation of Facilities and Increased Anthrax Vaccine Production at the Michigan Biologic Products Institute."

"This report was not a how-to manual of any kind," Ms. Hashim said. "It was not a report that gave instruction of how to produce anthrax or anthrax vaccine." Instead, Ms. Hashim called it "an evaluation report" on the institute's vaccine program.

The papers also contained copies of Web pages with information on anthrax. An internet search on phrases on the pages quickly led to Department of Defense and other sites with relatively detailed information on anthrax and biological weaponry.

One page correctly explains the difference between cutaneous, gastrointestinal and inhalation anthrax and shows a photograph of former Defense Secretary William S. Cohen at a press conference holding a five-pound bag of sugar, which the caption indicates is the amount of anthrax needed to destroy half the population of Washington, D.C.

The drawings on a wallboard are more difficult to interpret, but they appear, in part, to illustrate the dispersal of an agent by balloons. Why the Taliban considered that concept is unknown, but terror experts said it was far from an ideal method.

For one thing, said Dr. Ashok Gadgil, a biological terror expert and senior staff scientist at Lawrence Berkeley National Laboratory, agents released outdoors would be so widely dispersed as to be useless in many circumstances. Pinpoint release of the agents over, say, a city, would be difficult with a balloon.

"It's a very poor way to release something that you hope to release at a particular urban site," Dr. Gadgil said. "It doesn't sound like a very good game plan."

Glossary

Anthrax

Anthrax is a disease normally associated with plant-eating animals (sheep, goats, cattle, and to a lesser degree swine). It is caused by the bacteria *Bacillus anthracis*. Transmission is made through scratches or abrasions of the skin, wounds, inhalation of spores, eating insufficiently-cooked infected meat, or by flies. Recovery from a mild exposure to the disease may be followed by immunity. However, when anthrax is used as a biological weapon, breathing anthrax spores infects people with inhalation anthrax disease.

Symptoms of inhalation anthrax can begin as early as 24 hours after breathing the spores. Initial symptoms include fever, cough, and weakness and usually progress to breathing problems, shock, and death. The spores are very stable and may remain viable for many years in soil and water, and they can resist sunlight for varying periods of time.[121]

ANTHRAX

SUMMARY

Signs and Symptoms: Incubation period is 1-6 days. Fever, malaise, fatigue, cough and mild chest discomfort is followed by severe respiratory distress with dyspnea, diaphoresis, stridor, and cyanosis. Shock and death occurs within 24-36 hours after onset of severe symptoms.

Diagnosis: Physical findings are non-specific. A widened mediastinum may be seen on CXR. Detectable by Gram stain of the blood and by blood culture late in the course of illness.

Treatment: Although effectiveness may be limited after symptoms are present, high dose antibiotic treatment with penicillin, ciprofloxacin, or doxycycline should be undertaken. Supportive therapy may be necessary.

Prophylaxis: An FDA licensed vaccine is available. Vaccine schedule is 0.5 ml SC at 0, 2, 4 weeks, then 6, 12, and 18 months for the primary series, followed by annual boosters. Oral ciprofloxacin or doxycycline for known or imminent exposure.

Isolation and Decontamination: Standard precautions for healthcare workers. After an invasive procedure or autopsy is performed, the instruments and area used should be thoroughly disinfected with a sporicidal agent (chlorine).

OVERVIEW

Bacillus anthracis, the causative agent of Anthrax, is a rod-shaped, gram-positive, sporulating organism with the spores constituting the usual infective form. Anthrax is primarily a zoonotic disease of herbivores, with cattle, sheep and horses being the usual domesticated animal hosts, but other animals may be infected. Human disease may be contracted by handling contaminated hair, wool, hides, flesh, blood and excreta of infected animals and from manufactured products such as bone meal, as well as by purposeful dissemination of spores. Infection is introduced through scratches or abrasions of the skin, wounds, inhalation of spores, eating insufficiently cooked infected meat, or by flies. All human populations are susceptible. Recovery from an attack of the disease may be followed by immunity. The spores are very stable and may remain viable for many years in soil and water. They will resist sunlight for varying periods.

HISTORY AND SIGNIFICANCE

Anthrax spores were weaponized by the United States in the 1950's and 1960's before the old U.S. offensive program was terminated. Other countries have weaponized this agent or are suspected of doing so. The anthrax bacterium is easy to cultivate and spore production is readily induced. Spores are highly resistant to sunlight, heat and disinfectants - properties which could be advantageous when choosing a bacterial weapon. Iraq admitted to a United Nations inspection team in August of 1991 that it had performed research on the offensive use of *B. anthracis* prior to the Persian Gulf War of 1991, and in 1995 Iraq admitted to weaponizing anthrax. This agent could be produced in either a wet or dried form, stabilized for weaponization by an adversary and delivered as an aerosol cloud either from a line source such as an aircraft flying upwind of friendly positions, or as a point source from a spray device. Coverage of a large ground area could also be theoretically facilitated by multiple spray bomblets disseminated from a missile warhead at a predetermined height above the ground.

CLINICAL FEATURES

Anthrax presents as three distinct clinical syndromes in man: cutaneous, inhalational, and gastrointestinal disease. The cutaneous form (also referred to as malignant pustule) occurs most frequently on the hands and forearms of persons working with infected livestock. It begins with a papule followed by formation of a blister-like fluid-filled vesicle. The vesicle typically dries and forms a coal-black scab, hence the term anthrax (Greek for coal). Sometimes this local infection will develop into a systemic infection which is often fatal. Endemic inhalational anthrax, known as Woolsorters’ disease, is a rare infection contracted by inhalation of the spores. It occurs mainly among workers handling infected hides, wool, and furs. The intestinal form, which is also very rare in man, is contracted by the ingestion of insufficiently cooked meat from infected animals. In man, the mortality of untreated cutaneous anthrax ranges up to 25 per cent; in inhalational and intestinal cases, the case fatality rate is almost 100 percent.

DIAGNOSIS

After an incubation period of 1-6 days, presumably dependent upon the dose and strain of inhaled organisms, the onset of inhalation anthrax is gradual and nonspecific. Fever, malaise, and fatigue may be present, sometimes in association with a nonproductive cough and mild chest discomfort. These initial symptoms are often followed by a short period of improvement (hours to 2-3 days), followed by the abrupt development of severe respiratory distress with dyspnea, diaphoresis, stridor, and cyanosis. Shock and death usually follow within 24-36 hours after the onset of respiratory distress. Physical findings are typically non-specific. The chest X-ray may reveal a widened mediastinum ± pleural effusions late in the disease in about 55% of the cases, but typically is without infiltrates. *Bacillus anthracis* will be detectable by Gram stain of the blood and by

blood culture with routine media, but often not until late in the course of the illness. Only vegetative encapsulated bacilli are present during infection. Spores are not found within the body unless it is open to ambient air. Studies of inhalation anthrax in non-human primates (rhesus monkey) showed that bacilli and toxin appear in the blood late on day 2 or early on day 3 post-exposure. Toxin production parallels the appearance of bacilli in the blood and tests are available to rapidly detect the toxin. Concurrently with the appearance of anthrax, the WBC count becomes elevated and remains so until death.

MEDICAL MANAGEMENT

Almost all inhalational anthrax cases in which treatment was begun after patients were significantly symptomatic have been fatal, regardless of treatment. Penicillin has been regarded as the treatment of choice, with 2 million units given intravenously every 2 hours. Tetracyclines and erythromycin have been recommended in penicillin allergic patients. The vast majority of naturally-occurring anthrax strains are sensitive *in vitro* to penicillin. However, penicillin-resistant strains exist naturally, and one has been recovered from a fatal human case. Moreover, it might not be difficult for an adversary to induce resistance to penicillin, tetracyclines, erythromycin, and many other antibiotics through laboratory manipulation of organisms. All naturally occurring strains tested to date have been sensitive to erythromycin, chloramphenicol, gentamicin, and ciprofloxacin. In the absence of information concerning antibiotic sensitivity, treatment should be instituted at the earliest signs of disease with intravenous ciprofloxacin (400 mg q 8-12 hrs) or intravenous doxycycline (200 mg initially, followed by 100 mg q 12 hrs). Supportive therapy for shock, fluid volume deficit, and adequacy of airway may all be needed.

Standard Precautions should be practiced. After an invasive procedure or autopsy, the instruments and area used should be thoroughly disinfected with a sporicidal agent. Iodine can be used, but must be used at disinfectant strengths, as antiseptic-strength iodophors are not usually sporicidal. Chlorine, in the form of sodium or calcium hypochlorite, can also be used, but with the caution that the activity of hypochlorites is greatly reduced in the presence of organic material.

PROPHYLAXIS

Vaccine: A licensed vaccine is derived from sterile culture fluid supernatant taken from an attenuated strain. The vaccination series consists of six 0.5 ml doses SC at 0, 2, and 4 weeks, then 6, 12 and 18 months, followed by yearly boosters. Limited human data suggest that the vaccine protects against cutaneous anthrax. There is insufficient data to know its efficacy against inhalational anthrax in humans, although studies in rhesus monkeys indicate that good protection can be afforded after only two doses (15 days apart) for up to 2 years. However, it should be emphasized that the vaccine series should be completed according to the routine 6 dose primary series. As with all vaccines, the degree of protection depends upon the magnitude of the challenge dose; vaccine-induced protection could presumably be overwhelmed by extremely high spore challenge.

Contraindications for use of this vaccine include hypersensitivity reaction to a previous dose of vaccine and age < 18 or > 65. Reasons for temporary deferment of the vaccine include pregnancy; active infection with fever; or a course of immune suppressing drugs such as steroids. Reactogenicity is mild to moderate. Up to 6 percent of recipients will experience mild discomfort at the inoculation site for up to 72 hours (e.g., tenderness, erythema, edema, pruritus), while less than 1 percent will experience more severe local reactions, potentially limiting use of the arm for 1-2 days. Modest systemic reactions (e.g., myalgia, malaise, low-grade fever) are uncommon, and severe systemic reactions such as anaphylaxis, which precludes additional vaccination, are rare. The vaccine should be stored between 2-6 °C (refrigerator temperature, not frozen).

Antibiotics: The choice of antibiotics for prophylaxis is difficult to make; for example, it seems relatively easy to induce penicillin and tetracycline resistance in the laboratory. Therefore, prophylaxis with ciprofloxacin (500 mg po bid) or doxycycline (100 mg po bid) is recommended. If personnel are unvaccinated, a single 0.5 ml dose of vaccine should also be given subcutaneously. Should the attack be confirmed as anthrax, antibiotics should be continued for at least 4 weeks in all those exposed, and until all those exposed have received three doses of the vaccine. Two additional 0.5 ml doses of vaccine should be given 2 weeks apart in the unvaccinated; those previously vaccinated with fewer than three doses should receive a single 0.5 ml booster, while vaccination probably is not necessary for those who have received the initial three-doses of the primary series, within the previous six months. Upon discontinuation of antibiotics, patients should be closely observed; if clinical signs of anthrax occur, patients should be treated as indicated above. If vaccine is not available, antibiotics should be continued beyond 4 weeks and withdrawn under medical observation. Optimally, patients should have medical care available upon discontinuation of antibiotics, from a fixed medical care facility with intensive care capabilities and infectious disease consultants.

THE BACTERIA

WHAT YOU NEED TO KNOW

Anthrax is an infectious bacterial disease spread by contact with infected animals, handling infected products, eating infected meat, or breathing weapon-dispersed anthrax spores.

METHOD OF DELIVERY

Projectiles Missiles, Artillery shells

Sprayers Aircraft, Trucks

Hand-held aerosols

Defense Secretary William Cohen holds a 5-pound bag of sugar to show the amount of the biological weapon anthrax that could destroy half the

Why is it a threat?

Anthrax spores are the top choice in biological weapons for "germ warfare."

Anthrax is effective as a biological weapon because:

- Anthrax is almost always DEADLY if not treated early.
- Spores can be produced in large quantities using basic knowledge of biology.
- Spores can be stored for decades without losing viability.
- Spores can be easily spread in the air by missiles, rockets, artillery, aerial bombs & sprayers.

We KNOW there are potential adversaries developing it as a weapon.

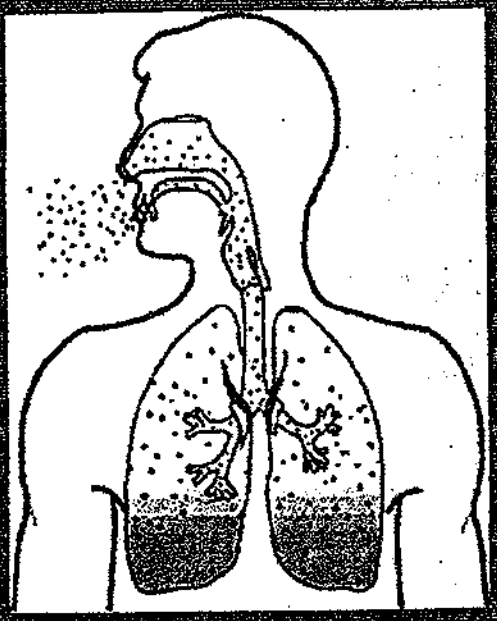
- At least 7 of our potential adversaries have worked to develop an offensive biological warfare capability using anthrax.
- Iraq has admitted to producing and weaponizing anthrax.

There is no indication of exposure.

- There is no cloud or color.
- There is no smell.
- There is no taste.
- There is no indication of an attack when dispersed by aerosol spray.

There is no effective treatment for unvaccinated victims of

- Shock and death occur within 24-36 hours



How it works: The airborne anthrax spores are inhaled and lodge in the lungs. There, they move to local lymph nodes, multiply and produce toxins that spread through the body via the bloodstream.

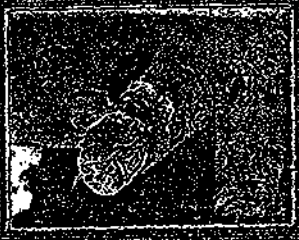
agent to manufacture.



Cutaneous Anthrax

How it works: The airborne anthrax spores are inhaled and lodge in the lungs. There, they move to local lymph nodes, multiply and produce toxins that spread through the

Symptoms of inhalation anthrax include:

- Flu-like aches & pains
- Fever, malaise, fatigue, cough and mild chest discomfort followed by severe difficulty breathing

Diagnosed by:

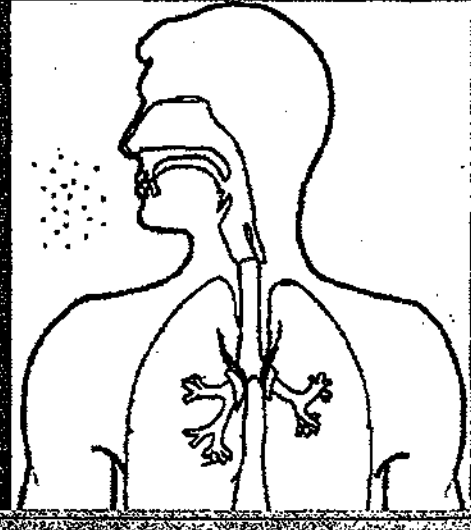
- Isolating the bacteria from blood, other body fluids or skin lesions
- Blood culture, measuring specific antibodies late in the course of the disease

Treatment:

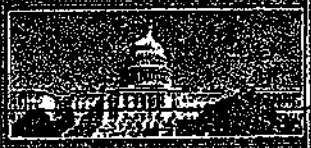
- Treatment is usually not effective after symptoms are present
- High dose antibiotic treatment can lower the death rate slightly

What it does:

- The disease occurs when spores enter lungs, migrate to the lymph nodes, change to the bacterial forms, multiply, and produce toxins
- These toxins cause bleeding and destruction of structures in the middle of the chest (medical term: hemorrahgic necrotizing mediastinitis)
- Shock and death occur within 24-36 hours



destroy half the population of Washington, D.C.



There is no effective treatment for unvaccinated victims of inhalational anthrax.

- Antibiotics will suppress infection only if administered early after exposure -- usually within the first 24 - 48 hours.
- By the time symptoms develop, it is highly likely death will occur despite the best efforts of modern medical science.
- 99% lethal to unprotected individuals.

What it is:

Bacillus Anthracis

- Anthrax is produced by the bacteria *Bacillus anthracis*. A tough protective coat allows the bacteria to survive for decades as spores.
- Anthrax is dangerous because, it is:
- Highly lethal
- One of the easiest biological agents to manufacture
- Relatively easy to develop as a weapon
- Easily spread in the air over a large area
- Easily stored and dangerous for a long period

- Three types of Anthrax diseases:
  - **Cutaneous Anthrax** - caused by contact with infected animals or contaminated animal products
  - **Gastrointestinal Anthrax** - caused by ingestion of contaminated meat
  - **Inhalation Anthrax** - caused by inhalation of anthrax spores (*MOST DEADLY - BIGGEST THREAT*)

Incubation period - 1 to 6 days

Anthrax is the easiest biological agent to manufacture.

Symptoms of inhalation anthrax include:

- Flu-like aches & pains
- Fever, malaise, fatigue, cough and mild chest discomfort followed by severe difficulty breathing

Cutaneous Anthrax

Diagnosed by:

- Isolating the bacteria from blood, other body fluids or skin lesions
- Blood culture, measuring specific antibodies late in the course of the disease

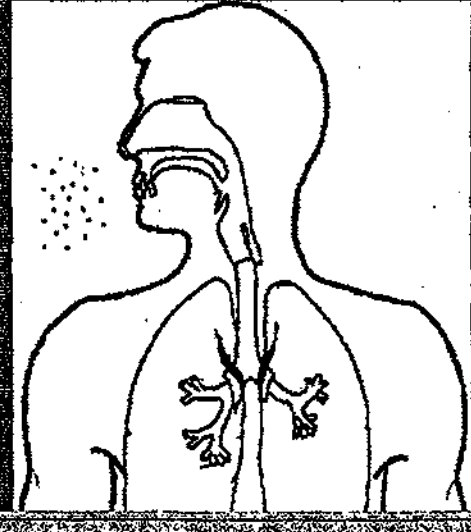
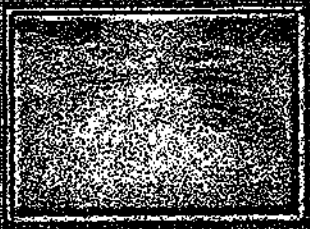
What it does:

- The disease occurs when spores enter lungs, migrate to the lymph nodes, change to the bacterial forms, multiply, and produce toxins
- These toxins cause bleeding and destruction of structures in the middle of the chest (medical term: hemorrhagic necrotizing mediastinitis)
- Shock and death occur within 24-36 hours



How it works: The airborne anthrax spores are inhaled and lodge in the lungs. There, they move to local lymph nodes, multiply and produce toxins that spread through the body via the bloodstream.



- Shock and death occur within 24-36 hours.[1]

FOR: SPECIAL ASSISTANT FOR GULF WAR ILLNESSES, MEDICAL READINESS, AND MILITARY DEPLOYMENTS

FROM: Michael E. Kilpatrick, M.D., Director, Deployment Health Support

SUBJECT: GulfLINK

- A recent *New York Times* news article (Tab A) reports that two Pakistani scientists were detained and a number of anthrax-related documents found in their office. Among those identified in the article were documents attributed to a "... Web site devoted to better informing Persian Gulf war veterans...."
- Without seeing the documents, we are unable to determine if, in fact, the referenced site is GulfLINK. However, we reviewed the content of our web site, and found that it is possible that the cited documents are posted there.
- From the description in the news story, we believe the reference is to information on anthrax provided in our An Nasiriyah Southwest Ammunition Storage Point case narrative final report, published January 13, 2000, footnote 121 (Tabs B1-B3). The same information is in the amended An Nasiriyah Southwest Ammunition Storage Point case narrative final report, published September 28, 2000, footnote 119 (Tabs C1-C3).
- In both cases, the primary reference was from the U.S. Army Medical Research Institute of Infectious Diseases handbook, published in July 1998 (Tabs B2 and C2), supported by the October 1999 web site of the DoD Anthrax Vaccine Immunization Program (Tabs B3 and C3).
- We anticipate no further media interest.

2 Pakistanis Linked To Papers On Anthrax Weapons

By Douglas Frantz with David Rohde

ISLAMABAD, Pakistan, Nov. 27 — Pakistan said today that it had detained two retired nuclear scientists after the recent discovery in offices they had used in Afghanistan of documents describing ways to use anthrax as a weapon and other suspicious material.

The scientists, Sultan Bashiruddin Mahmood and Chaudry Abdul Majeed, were first questioned in October after American intelligence officers expressed concern about trips the two had made to the Afghan capital, Kabul. They were interrogated about their ties to the Taliban.

After he retired from Pakistan's Atomic Energy Agency in 1998, Mr. Mahmood founded a private relief organization, Ummah Tameer-e-Nau, that operated in Afghanistan.

Documents from the organization's Kabul offices examined by The New York Times have been found over the past several days describing the history of anthrax and a Pentagon program to immunize all members of the United States military against anthrax attacks.

Also found were a box of gas masks, a diagram showing a plane shooting down a weather balloon and promotional material from militant Islamic groups. These findings were first reported last week in the British daily The Evening Standard.

Plans for building a balloon and what appeared to be a rocket were found on a piece of paper along with empty steel tubes and parts of a rocket-propelled grenade. A container of helium sat on a work bench.

The diagrams of the balloons seem to show a possible method for slowly dispersing some type of biological or chemical agent from the air. Words scribbled in the diagram appear to say "cyanide."

One diagram found in the Kabul offices show four balloons flying together in tandem with a box around them. The box appears to show how the agent would be dispersed across a wide area.

The house, like others in the Afghan capital apparently used by Osama bin Laden's terrorist network, Al Qaeda, seems to have been hastily abandoned when the Taliban fled Kabul two weeks ago. It is not clear who may have been in the house since then.

Referring to the scientists, Maj. Gen. Rashid Qureshi, the top Pakistani military spokesman, said today in Islamabad: "Both of them are under detention." He declined to elaborate, but officials said the new detentions related to the discoveries in Kabul.

The first arrest of the scientists last month was linked to American suspicions that Pakistan's nuclear weapons technology could have found its way into the hands of Osama bin Laden, Al Qaeda or the Taliban.

An American intelligence official said today that the first interrogation of the two Pakistani scientists has resulted in an assessment that Mr. Mahmood and Mr. Majeed did not know enough to help build a nuclear weapon. "These two guys were nuclear scientists who didn't know how to build one themselves," the American official said. "If you had to have guys go bad these are the guys you'd want — they didn't know much."

Neither of the Pakistani scientists has been charged with any wrongdoing. Their families have said they are innocent and that their interest in Afghanistan was humanitarian. The families have written to government officials protesting their interrogation and earlier detention.

They had been released after the initial questioning in October, but remained under loose house arrest. The new detentions indicate that concern about their activities in Afghanistan have intensified.

Mr. Mahmood and Mr. Majeed worked for the relief organization, whose official purpose was to upgrade roads, build flour mills and carry out other projects to assist Afghanistan. Both spent a considerable amount of time in Afghanistan.

Maj. Gen. Qureshi, the military spokesman, said of their new detention: "When we have completed the investigation, I'm sure the details will be coming out."

The diagrams in the Kabul offices of the relief organization were detailed. One had an arrow pointing to a balloon and the word "wireless" written next to it, suggesting that some type of communications device might be used as a trigger. Other diagrams had the word "SAM-7" and "Stinger" written near the balloon, suggesting that the two types of anti- aircraft missiles could be fired at the balloon to get it to release it contents.

Nearly all of the information found about anthrax in the house came from the United States military. The copies of the military paper describing the anthrax immunization program and expansion of anthrax vaccine production in Michigan were all from original documents, not documents downloaded from the Internet.

Someone had written a half dozen stars across the top of the Michigan study, suggesting that they found it valuable.

Whoever was conducting the research also effectively mined United States military Web sites for information. Copies of a printout of the first page of a military Web site devoted to better informing Persian Gulf war veterans with related illnesses were found in the house.

The site offers highly detailed descriptions of how Anthrax can be used as a weapon and spread through artillery shells, airplanes and trucks. It lists what size of anthrax dose kills people who have been immunized, and refers readers to more detailed academic studies on anthrax.

The house used by Mr. Mahmood's organization, one of three adjacent structures occupied by Pakistani scientists in the Wasi Akbar Khan section of Kabul, the city's wealthy diplomatic corner, it is an unremarkable two-story cinderblock home.

Books and toys suggest that children recently lived in the house. A young girl's second-grade English literature workbook lay on the living room floor surrounded by mounds of abandoned clothing. There was no hint of the effort underway in the workroom upstairs Mr. Mahmood was a director-general of nuclear power plants for the Atomic Energy Agency and Mr. Majeed was once director of uranium-enrichment laboratories.

Pakistani officials said earlier that neither man was affiliated with its nuclear weapons program. President Pervez Musharraf of Pakistan repeated the denial in a television interview on Monday.

But Pakistani newspapers have reported that Mr. Mahmood was involved in developing the atomic bombs Pakistan tested in its western desert in May 1998. Western intelligence agencies estimate that Pakistan has a stockpile of about 20 nuclear weapons.

Shortly after the Sept. 11 attacks on the United States, a team of American law enforcement and intelligence officials raised the safety of Pakistan's nuclear weapons in discussions in Islamabad with Pakistani officials.

The papers and blackboard drawings found in a Kabul house appear to describe the Taliban's notions for dispersing biological and possibly chemical agents by balloons and other methods. Those concepts are backed up by rudimentary calculations and information from Department of Defense Web sites and at

least one report prepared for the United States military on anthrax vaccines.

The report, prepared by Science Applications International Corporation, a private research firm with contracts with the Pentagon, was not classified, said Zuraidah Hashim, a spokeswoman for the firm, in Frederick, Md. It was titled "Renovation of Facilities and Increased Anthrax Vaccine Production at the Michigan Biologic Products Institute."

"This report was not a how-to manual of any kind," Ms. Hashim said. "It was not a report that gave instruction of how to produce anthrax or anthrax vaccine." Instead, Ms. Hashim called it "an evaluation report" on the institute's vaccine program.

The papers also contained copies of Web pages with information on anthrax. An internet search on phrases on the pages quickly led to Department of Defense and other sites with relatively detailed information on anthrax and biological weaponry.

One page correctly explains the difference between cutaneous, gastrointestinal and inhalation anthrax and shows a photograph of former Defense Secretary William S. Cohen at a press conference holding a five-pound bag of sugar, which the caption indicates is the amount of anthrax needed to destroy half the population of Washington, D.C.

The drawings on a wallboard are more difficult to interpret, but they appear, in part, to illustrate the dispersal of an agent by balloons. Why the Taliban considered that concept is unknown, but terror experts said it was far from an ideal method.

For one thing, said Dr. Ashok Gadgil, a biological terror expert and senior staff scientist at Lawrence Berkeley National Laboratory, agents released outdoors would be so widely dispersed as to be useless in many circumstances. Pinpoint release of the agents over, say, a city, would be difficult with a balloon.

"It's a very poor way to release something that you hope to release at a particular urban site," Dr. Gadgil said. "It doesn't sound like a very good game plan."

Glossary

Anthrax

Anthrax is a disease normally associated with plant-eating animals (sheep, goats, cattle, and to a lesser degree swine). It is caused by the bacteria *Bacillus anthracis*. Transmission is made through scratches or abrasions of the skin, wounds, inhalation of spores, eating insufficiently-cooked infected meat, or by flies. Recovery from a mild exposure to the disease may be followed by immunity. However, when anthrax is used as a biological weapon, breathing anthrax spores infects people with inhalation anthrax disease.

Symptoms of inhalation anthrax can begin as early as 24 hours after breathing the spores. Initial symptoms include fever, cough, and weakness and usually progress to breathing problems, shock, and death. The spores are very stable and may remain viable for many years in soil and water, and they can resist sunlight for varying periods of time.[121]

ANTHRAX

SUMMARY

Signs and Symptoms: Incubation period is 1-6 days. Fever, malaise, fatigue, cough and mild chest discomfort is followed by severe respiratory distress with dyspnea, diaphoresis, stridor, and cyanosis. Shock and death occurs within 24-36 hours after onset of severe symptoms.

Diagnosis: Physical findings are non-specific. A widened mediastinum may be seen on CXR. Detectable by Gram stain of the blood and by blood culture late in the course of illness.

Treatment: Although effectiveness may be limited after symptoms are present, high dose antibiotic treatment with penicillin, ciprofloxacin, or doxycycline should be undertaken. Supportive therapy may be necessary.

Prophylaxis: An FDA licensed vaccine is available. Vaccine schedule is 0.5 ml SC at 0, 2, 4 weeks, then 6, 12, and 18 months for the primary series, followed by annual boosters. Oral ciprofloxacin or doxycycline for known or imminent exposure.

Isolation and Decontamination: Standard precautions for healthcare workers. After an invasive procedure or autopsy is performed, the instruments and area used should be thoroughly disinfected with a sporicidal agent (chlorine).

OVERVIEW

Bacillus anthracis, the causative agent of Anthrax, is a rod-shaped, gram-positive, sporulating organism with the spores constituting the usual infective form. Anthrax is primarily a zoonotic disease of herbivores, with cattle, sheep and horses being the usual domesticated animal hosts, but other animals may be infected. Human disease may be contracted by handling contaminated hair, wool, hides, flesh, blood and excreta of infected animals and from manufactured products such as bone meal, as well as by purposeful dissemination of spores. Infection is introduced through scratches or abrasions of the skin, wounds, inhalation of spores, eating insufficiently cooked infected meat, or by flies. All human populations are susceptible. Recovery from an attack of the disease may be followed by immunity. The spores are very stable and may remain viable for many years in soil and water. They will resist sunlight for varying periods.

HISTORY AND SIGNIFICANCE

Anthrax spores were weaponized by the United States in the 1950's and 1960's before the old U.S. offensive program was terminated. Other countries have weaponized this agent or are suspected of doing so. The anthrax bacterium is easy to cultivate and spore production is readily induced. Spores are highly resistant to sunlight, heat and disinfectants - properties which could be advantageous when choosing a bacterial weapon. Iraq admitted to a United Nations inspection team in August of 1991 that it had performed research on the offensive use of *B. anthracis* prior to the Persian Gulf War of 1991, and in 1995 Iraq admitted to weaponizing anthrax. This agent could be produced in either a wet or dried form, stabilized for weaponization by an adversary and delivered as an aerosol cloud either from a line source such as an aircraft flying upwind of friendly positions, or as a point source from a spray device. Coverage of a large ground area could also be theoretically facilitated by multiple spray bomblets disseminated from a missile warhead at a predetermined height above the ground.

CLINICAL FEATURES

Anthrax presents as three distinct clinical syndromes in man: cutaneous, inhalational, and gastrointestinal disease. The cutaneous form (also referred to as malignant pustule) occurs most frequently on the hands and forearms of persons working with infected livestock. It begins with a papule followed by formation of a blister-like fluid-filled vesicle. The vesicle typically dries and forms a coal-black scab, hence the term anthrax (Greek for coal). Sometimes this local infection will develop into a systemic infection which is often fatal. Endemic inhalational anthrax, known as Woolsorters’ disease, is a rare infection contracted by inhalation of the spores. It occurs mainly among workers handling infected hides, wool, and furs. The intestinal form, which is also very rare in man, is contracted by the ingestion of insufficiently cooked meat from infected animals. In man, the mortality of untreated cutaneous anthrax ranges up to 25 per cent; in inhalational and intestinal cases, the case fatality rate is almost 100 percent.

DIAGNOSIS

After an incubation period of 1-6 days, presumably dependent upon the dose and strain of inhaled organisms, the onset of inhalation anthrax is gradual and nonspecific. Fever, malaise, and fatigue may be present, sometimes in association with a nonproductive cough and mild chest discomfort. These initial symptoms are often followed by a short period of improvement (hours to 2-3 days), followed by the abrupt development of severe respiratory distress with dyspnea, diaphoresis, stridor, and cyanosis. Shock and death usually follow within 24-36 hours after the onset of respiratory distress. Physical findings are typically non-specific. The chest X-ray may reveal a widened mediastinum ± pleural effusions late in the disease in about 55% of the cases, but typically is without infiltrates. *Bacillus anthracis* will be detectable by Gram stain of the blood and by

blood culture with routine media, but often not until late in the course of the illness. Only vegetative encapsulated bacilli are present during infection. Spores are not found within the body unless it is open to ambient air. Studies of inhalation anthrax in non-human primates (rhesus monkey) showed that bacilli and toxin appear in the blood late on day 2 or early on day 3 post-exposure. Toxin production parallels the appearance of bacilli in the blood and tests are available to rapidly detect the toxin. Concurrently with the appearance of anthrax, the WBC count becomes elevated and remains so until death.

MEDICAL MANAGEMENT

Almost all inhalational anthrax cases in which treatment was begun after patients were significantly symptomatic have been fatal, regardless of treatment. Penicillin has been regarded as the treatment of choice, with 2 million units given intravenously every 2 hours. Tetracyclines and erythromycin have been recommended in penicillin allergic patients. The vast majority of naturally-occurring anthrax strains are sensitive *in vitro* to penicillin. However, penicillin-resistant strains exist naturally, and one has been recovered from a fatal human case. Moreover, it might not be difficult for an adversary to induce resistance to penicillin, tetracyclines, erythromycin, and many other antibiotics through laboratory manipulation of organisms. All naturally occurring strains tested to date have been sensitive to erythromycin, chloramphenicol, gentamicin, and ciprofloxacin. In the absence of information concerning antibiotic sensitivity, treatment should be instituted at the earliest signs of disease with intravenous ciprofloxacin (400 mg q 8-12 hrs) or intravenous doxycycline (200 mg initially, followed by 100 mg q 12 hrs). Supportive therapy for shock, fluid volume deficit, and adequacy of airway may all be needed.

Standard Precautions should be practiced. After an invasive procedure or autopsy, the instruments and area used should be thoroughly disinfected with a sporicidal agent. Iodine can be used, but must be used at disinfectant strengths, as antiseptic-strength iodophors are not usually sporicidal. Chlorine, in the form of sodium or calcium hypochlorite, can also be used, but with the caution that the activity of hypochlorites is greatly reduced in the presence of organic material.

PROPHYLAXIS

Vaccine: A licensed vaccine is derived from sterile culture fluid supernatant taken from an attenuated strain. The vaccination series consists of six 0.5 ml doses SC at 0, 2, and 4 weeks, then 6, 12 and 18 months, followed by yearly boosters. Limited human data suggest that the vaccine protects against cutaneous anthrax. There is insufficient data to know its efficacy against inhalational anthrax in humans, although studies in rhesus monkeys indicate that good protection can be afforded after only two doses (15 days apart) for up to 2 years. However, it should be emphasized that the vaccine series should be completed according to the routine 6 dose primary series. As with all vaccines, the degree of protection depends upon the magnitude of the challenge dose; vaccine-induced protection could presumably be overwhelmed by extremely high spore challenge.

Contraindications for use of this vaccine include hypersensitivity reaction to a previous dose of vaccine and age < 18 or > 65. Reasons for temporary deferment of the vaccine include pregnancy; active infection with fever; or a course of immune suppressing drugs such as steroids. Reactogenicity is mild to moderate. Up to 6 percent of recipients will experience mild discomfort at the inoculation site for up to 72 hours (e.g., tenderness, erythema, edema, pruritus), while less than 1 percent will experience more severe local reactions, potentially limiting use of the arm for 1-2 days. Modest systemic reactions (e.g., myalgia, malaise, low-grade fever) are uncommon, and severe systemic reactions such as anaphylaxis, which precludes additional vaccination, are rare. The vaccine should be stored between 2-6 °C (refrigerator temperature, not frozen).

Antibiotics: The choice of antibiotics for prophylaxis is difficult to make; for example, it seems relatively easy to induce penicillin and tetracycline resistance in the laboratory. Therefore, prophylaxis with ciprofloxacin (500 mg po bid) or doxycycline (100 mg po bid) is recommended. If personnel are unvaccinated, a single 0.5 ml dose of vaccine should also be given subcutaneously. Should the attack be confirmed as anthrax, antibiotics should be continued for at least 4 weeks in all those exposed, and until all those exposed have received three doses of the vaccine. Two additional 0.5 ml doses of vaccine should be given 2 weeks apart in the unvaccinated; those previously vaccinated with fewer than three doses should receive a single 0.5 ml booster, while vaccination probably is not necessary for those who have received the initial three-doses of the primary series, within the previous six months. Upon discontinuation of antibiotics, patients should be closely observed; if clinical signs of anthrax occur, patients should be treated as indicated above. If vaccine is not available, antibiotics should be continued beyond 4 weeks and withdrawn under medical observation. Optimally, patients should have medical care available upon discontinuation of antibiotics, from a fixed medical care facility with intensive care capabilities and infectious disease consultants.

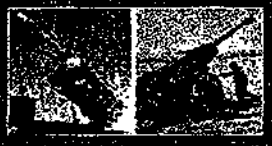
THE BACTERIA

WHAT YOU NEED TO KNOW

Anthrax is an infectious bacterial disease spread by contact with infected animals, handling infected products, eating infected meat, or breathing weapon-dispersed anthrax spores.

METHOD OF DELIVERY



Projectiles Missiles, Artilery shells

Sprayers Aircraft, Trucks,

Hand-held aerosols

Defense Secretary William Cohen holds a 5-pound bag of sugar to show the amount of the biological weapon - anthrax that could destroy half the

Why is it a threat?

Anthrax spores are the top choice in biological weapons for "germ warfare."

Anthrax is effective as a biological weapon because:

- Anthrax is almost always DEADLY if not treated early.
- Spores can be produced in large quantities using basic knowledge of biology.
- Spores can be stored for decades without losing viability.
- Spores can be easily spread in the air by missiles, rockets, artillery, aerial bombs & sprayers.

We KNOW there are potential adversaries developing it as a weapon.

- At least 7 of our potential adversaries have worked to develop an offensive biological warfare capability using anthrax.
- Iraq has admitted to producing and weaponizing anthrax.

There is no indication of exposure.

- There is no cloud or color.
- There is no smell.
- There is no taste.
- There is no indication of an attack when dispersed by aerosol spray.

There is no effective treatment for unvaccinated victims of

destroy half the population of Washington, D.C.

There is no effective treatment for unvaccinated victims of inhalational anthrax.

- Antibiotics will suppress infection only if administered early after exposure -- usually within the first 24 - 48 hours.
- By the time symptoms develop, it is highly likely death will occur despite the best efforts of modern medical science.
- 99% lethal to unprotected individuals.

What it is:

- Anthrax is produced by the bacteria *Bacillus anthracis*. A tough protective coat allows the bacteria to survive for decades as spores.
- Anthrax is dangerous because it is:
- Highly lethal
- One of the easiest biological agents to manufacture
- Relatively easy to develop as a weapon
- Easily spread in the air over a large area
- Easily stored and dangerous for a long period

Bacillus Anthracis

- Three types of Anthrax diseases:
  - Cutaneous Anthrax - caused by contact with infected animals or contaminated animal products.
  - Gastrointestinal Anthrax - caused by ingest on of contaminated meat.
  - Inhalation Anthrax - caused by inhalation o' anthrax spores.**MOST DEADLY - BIGGEST THREAT**

Anthrax is the easiest biological agent to manufacture.

Incubation period - 1 to 6 days

Symptoms of inhalation anthrax include:

- Flu-like aches & pains
- Fever, malaise, fatigue, cough and mild chest discomfort - followed by severe difficulty breathing

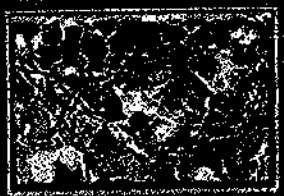
Cutaneous Anthrax

Diagnosed by:

- Isolating the bacteria from blood, other body fluids or skin lesions
- Blood culture, measuring specific antibodies late in the course of the disease

agent to manufacture.

Cutaneous Anthrax



How it works: The airborne anthrax spores are inhaled and lodge in the lungs. There, they move to local lymph nodes, multiply and produce toxins that spread through the

Symptoms of inhalation anthrax include:

- Flu-like aches & pains
- Fever, malaise, fatigue, cough and mild chest discomfort followed by severe difficulty breathing

Diagnosed by:

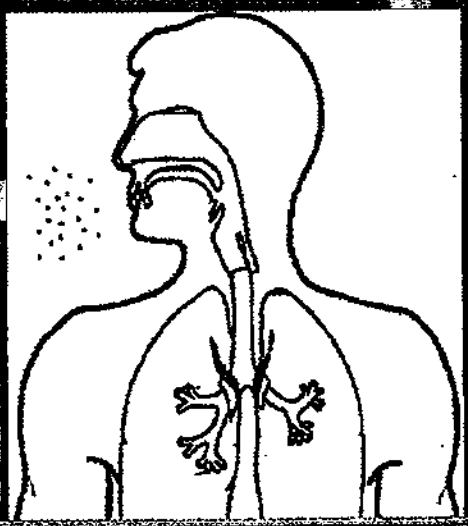
- Isolating the bacteria from blood, other body fluids or skin lesions
- Blood culture; measuring specific antibodies late in the course of the disease

Treatment:

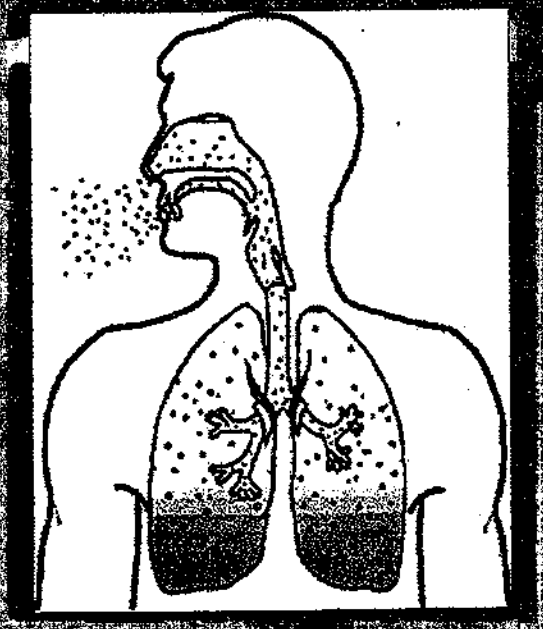
- Treatment is usually not effective after symptoms are present
- High dose antibiotic treatment--can lower the death rate slightly

What it does:

- The disease occurs when spores enter lungs, migrate to the lymph nodes, change to the bacterial forms, multiply, and produce toxins
- These toxins cause bleeding and destruction of structures in the middle of the chest (medical term: hemorrahgic necrotizing mediastinitis).
- Shock and death occur within 24-36 hours



- Shock and death occur within 24-36 hours



How it works: The airborne anthrax spores are inhaled and lodge in the lungs. There, they move to local lymph nodes, multiply and produce toxins that spread through the bloodstream.

Briefing Overview

- Mission Statement
- The Gulf War
- Searching for Answers
- Lessons Learned
- Force Health Protection
- Bottom Line
- Obtaining Help and Information

Vision of the Special Assistant for Gulf War Illnesses, Medical Readiness, and Military Deployments

- The Department of Defense recognizes the right of those involved in deployments to receive information that enables them to make informed decisions about their health
- We will develop and disseminate such information in a relevant and timely fashion
- We will work with others in the Defense Department to incorporate lessons from previous deployments to foster the well-being of deployed forces

Gulf War Illnesses Mission

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops in the future.

Gulf War Theater

- August 1990 to July 1991
- 697,000 US service members
- More than 27,000 hospitalizations
- 148 battle deaths
- 224 non-battle deaths

1 in 7 Veterans Reported Symptoms Since the War

Most frequently reported symptoms

- Joint pain
- Headaches
- Sleep disorders
- Depression
- Fatigue
- Memory loss
- Rash
- Muscle pain

Communication Breakdown

- Veterans with real health problems
- Healthcare professionals unable to provide answers
- Government slow to recognize the reality of problems

Confounding Issues

- No clustering
- No symptom consistency; variable onset
- No new disease or links between exposures and symptoms
- No long term study

Taking Care of Service Members

- DoD Comprehensive Clinical Evaluation Program
  - Gulf War vets (active, Guard/Reserve, retired)
  - Active service member deployed to SWA since war ended
  - Family members
  - DoD civilians
- VA Persian Gulf Registry
  - Gulf War vets (left service prior to retirement)
  - Service members deployed to SWA and left service before retirement
  - Evaluation for family members
- Available to *all* service members deploying to South West Asia

Don't Tough It Out!

OSAGWI Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
    - 99,000 vets notified
- Environmental:
  - Depleted uranium (DU), Oil well fires, Pesticides
- Medical issues:
  - Vaccines, PB, records, policy
- Scientific research under PGVCB
  - 190+ studies sponsored by DoD, DVA, & HHS
  - No cause and effect relationship shown so far

Investigation Results

- Gulf War
  - No offensive CW/BW use
  - Not enough vaccines and no explanation given
  - Limited environmental surveys
  - Information about nerve agent pre-treatment (PB) wasn't given to troops
  - Inadequate training
    - *Veterans returned home and left service without thorough medical exam or debrief*

The Dirty Battlefield

- What enemy may do to us
  - Chemical/Bio threat, man-made environmental hazards (oil well fires)
- What the environment may do to us
  - Infectious diseases, insects, environmental risks (desert, jungle)
- What we may do to ourselves
  - Accidents, pesticides, investigational new drugs, PB

Current and future conflicts and humanitarian deployments have and will have these challenges

Applying Lessons Learned

- Train self and others to recognize and avoid hazards
- Monitor service member's health & environment
- Improve feedback and cross talk
- Know your equipment strengths and weaknesses
- Create, relate and save operational, NBC, and medical records
- Adapt to reduce risks and train to reduce future risks such as DU

Force Health Protection

- Pre-deployment
  - Medical screening/surveillance and briefings
- Deployment
  - Record keeping
  - Monitor environment and personnel
- Post Deployment
  - Medical screening and unit debriefing

Anthrax

- We have a safe and effective vaccine

- Anthrax - an offensive BW agent
  - Inhalation anthrax is highly lethal
  - Easy to develop and weaponize
  - Remains viable for long periods

Vaccination against anthrax is critical for your protection

Anthrax Vaccine Program

- Licensed by the FDA since 1970
- Dosing schedule: 0, 2, 4 weeks, 6, 12, 18 months, plus annual booster
- Shortages in stockpiled doses require temporary slowdown of AVIP

(877) GET-VACC DSN: 761-5101
www.anthrax.osd.mil
www.aviationmedicine.com

Pyridostigmine Bromide

- Threat - Soman is deadly nerve agent
- PB is the only known pretreatment against Soman
  - Auto injectors alone will not save you
- Issues have been raised about PB
  - Further research is ongoing
- Only President can authorize its use without informed consent

Bottom Line

- Lessons learned from the Gulf War affect today's doctrine and deployments
- You will deploy on missions
- Everyone is responsible for force protection
- You are your own best health advocate
- Vets should not tough it out; get examined

Obtaining help and information

- Comprehensive Clinical Evaluation program

Briefing Overview

- Mission Statement
- The Gulf War
- Post Gulf War Issues
- Searching for answers
- Lessons Learned
- Force Health Protection
- Bottom Line
- Obtaining help and information

Vision of Special Assistant for Gulf War Illnesses, Medical Readiness, and Military Deployments

- The Department of Defense recognizes the right of those involved in deployments to receive information that enables them to make informed decisions about their health.
- We will develop and disseminate such information in a relevant and timely fashion.
- We will work with others in the Defense Department to incorporate lessons from previous deployments to foster the well-being of deployed forces.

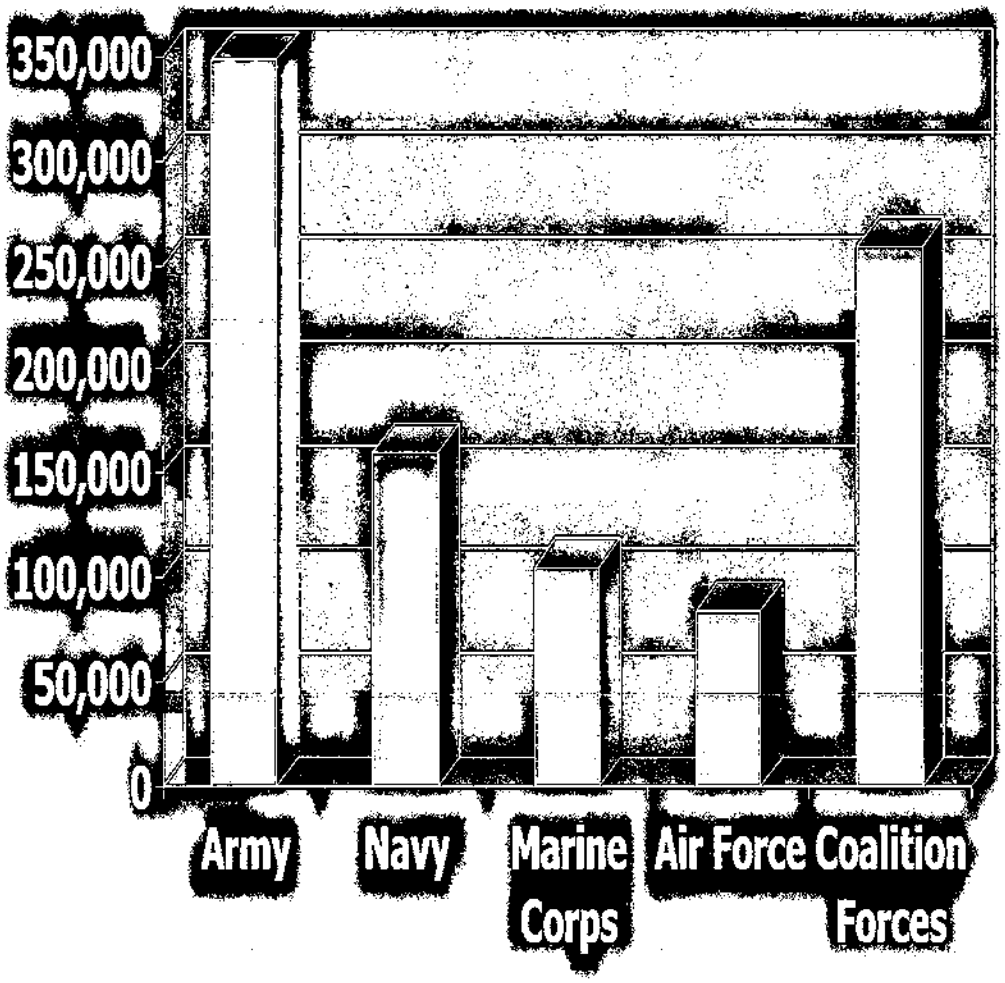
Gulf War Illnesses Mission

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops in the future.

Why Should I Care

- Lessons from the Gulf War about dirty battlefields
- You must protect yourself against hazards
- You will be leading Gulf War vets
- You are responsible for force protection
  - What are the dangers of the dirty battlefield?
  - How good are our detectors and MOPP gear?
  - How do we determine if we are exposed?
  - Will attacking enemy CW/BW stockpiles put us at risk?

Gulf War Theater Forces



697,000 U.S. service members

1 in 7 Veterans Reported Symptoms Since The War

Most frequently reported symptoms

- Joint pain
- Headaches
- Sleep disorders
- Depression
- Fatigue
- Memory loss
- Rash
- Muscle pain

Office of the Special Assistant

Communication Breakdown

- Veterans with real health problems
- Healthcare professionals unable to provide answers
- Government slow to recognize the reality of problems

Confounding Issues

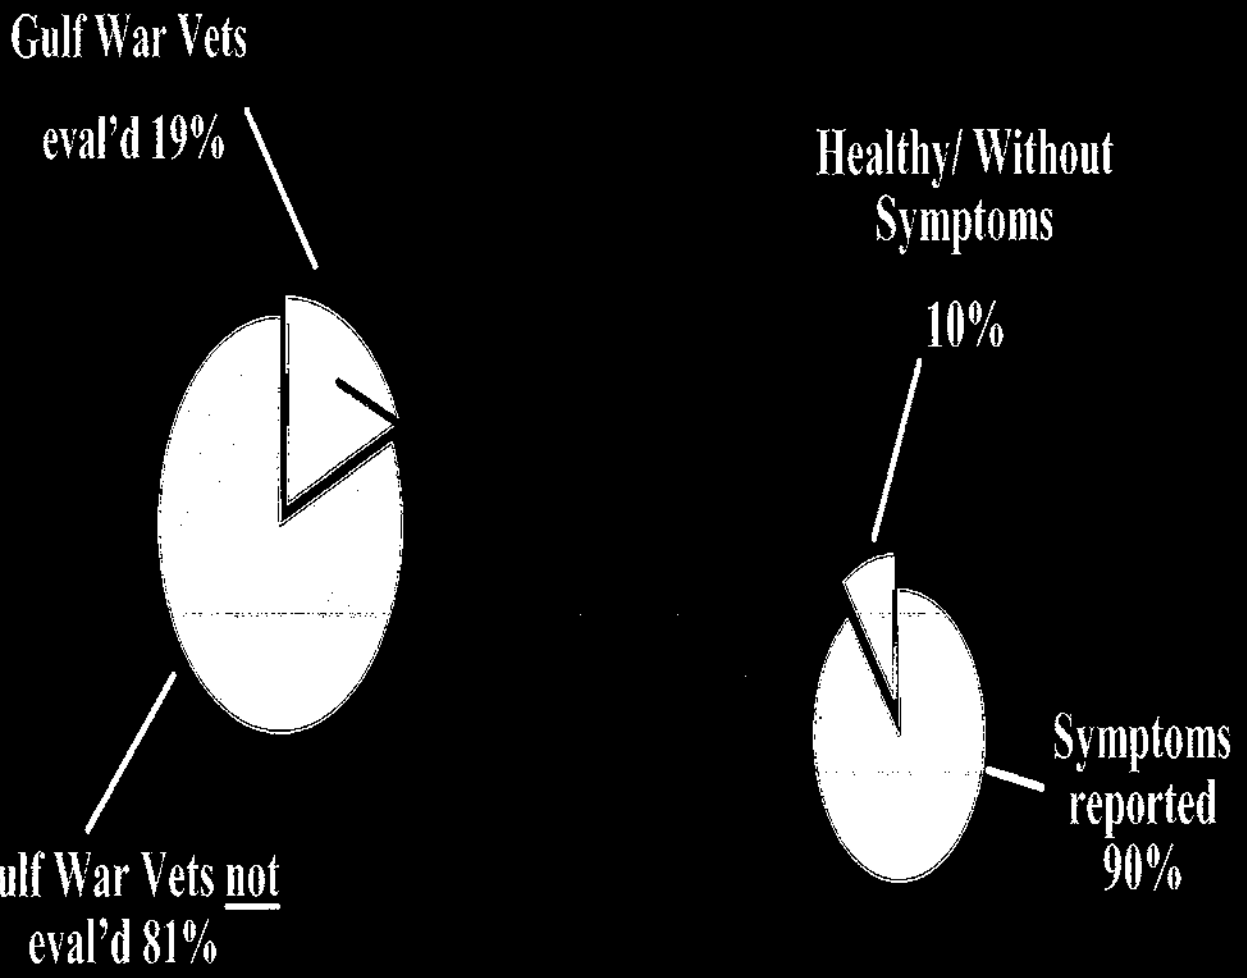
- No clustering
- No symptom consistency; variable onset
- No new disease or links between exposures and symptoms
- No long term study

Taking Care of Service Members

- DoD Comprehensive Clinical Evaluation Program
  - Gulf War vets (active, Guard/Reserve, retired)
  - Active service member deployed to SWA since war ended
  - Family members
  - Civilian employees
- VA Persian Gulf Registry
  - Gulf War vets (left service prior to retirement)
  - Service members deployed to SWA and left service before retirement
  - Evaluation for family members
- Available to *all* service members deploying to South West Asia
  - Most people evaluated can be treated

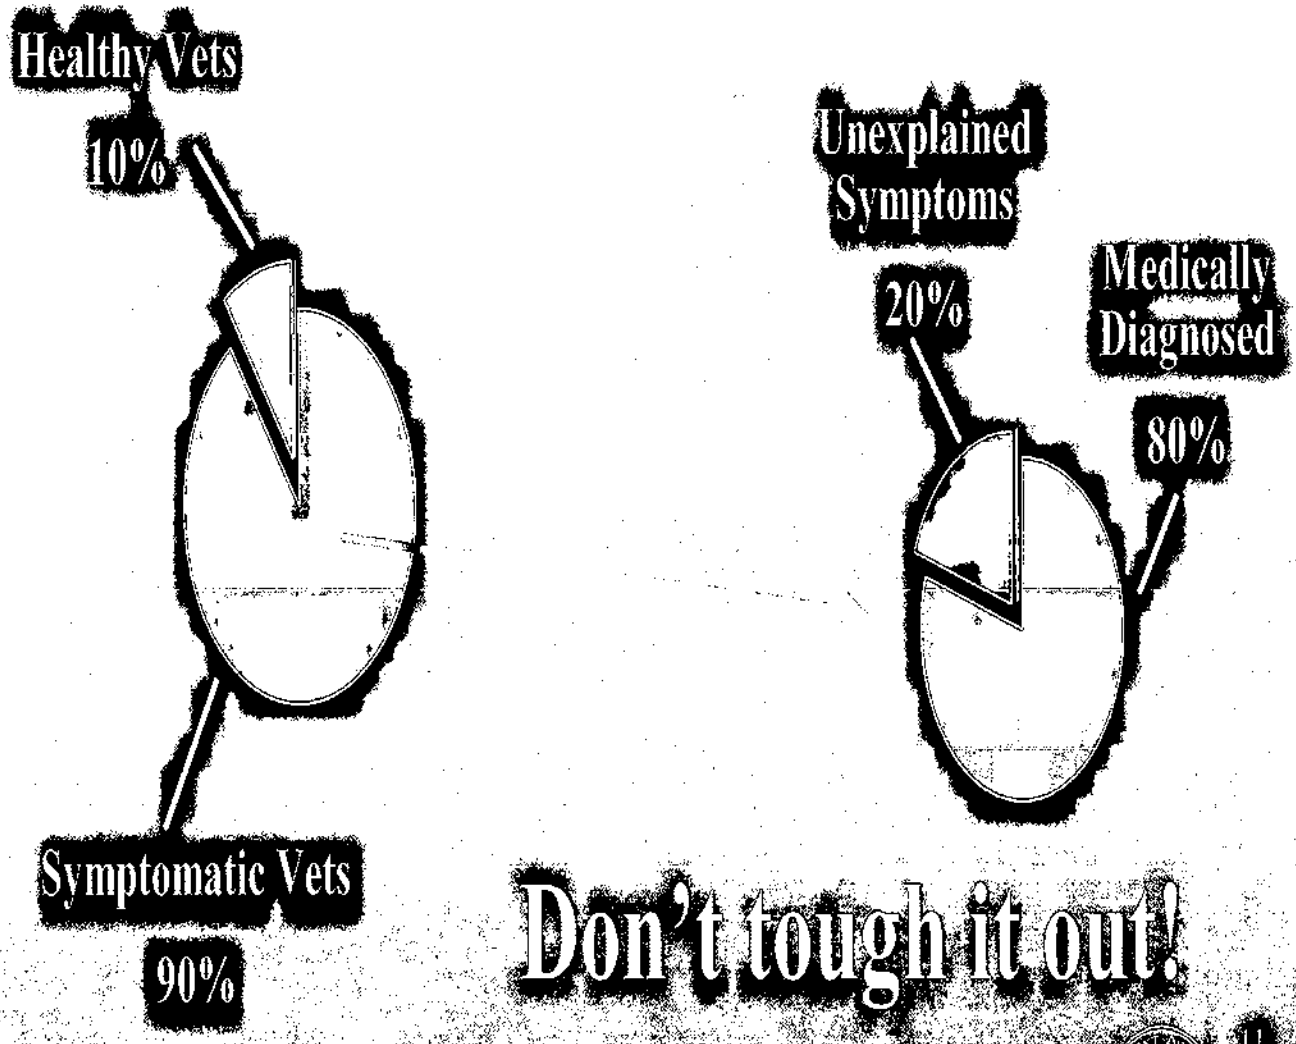
Don't Tough It Out!

Evaluation Distribution of 697,000 CCEP/VA



Diagnosis Distribution of Evaluated Veterans

CCEP/VA



Don't tough it out!

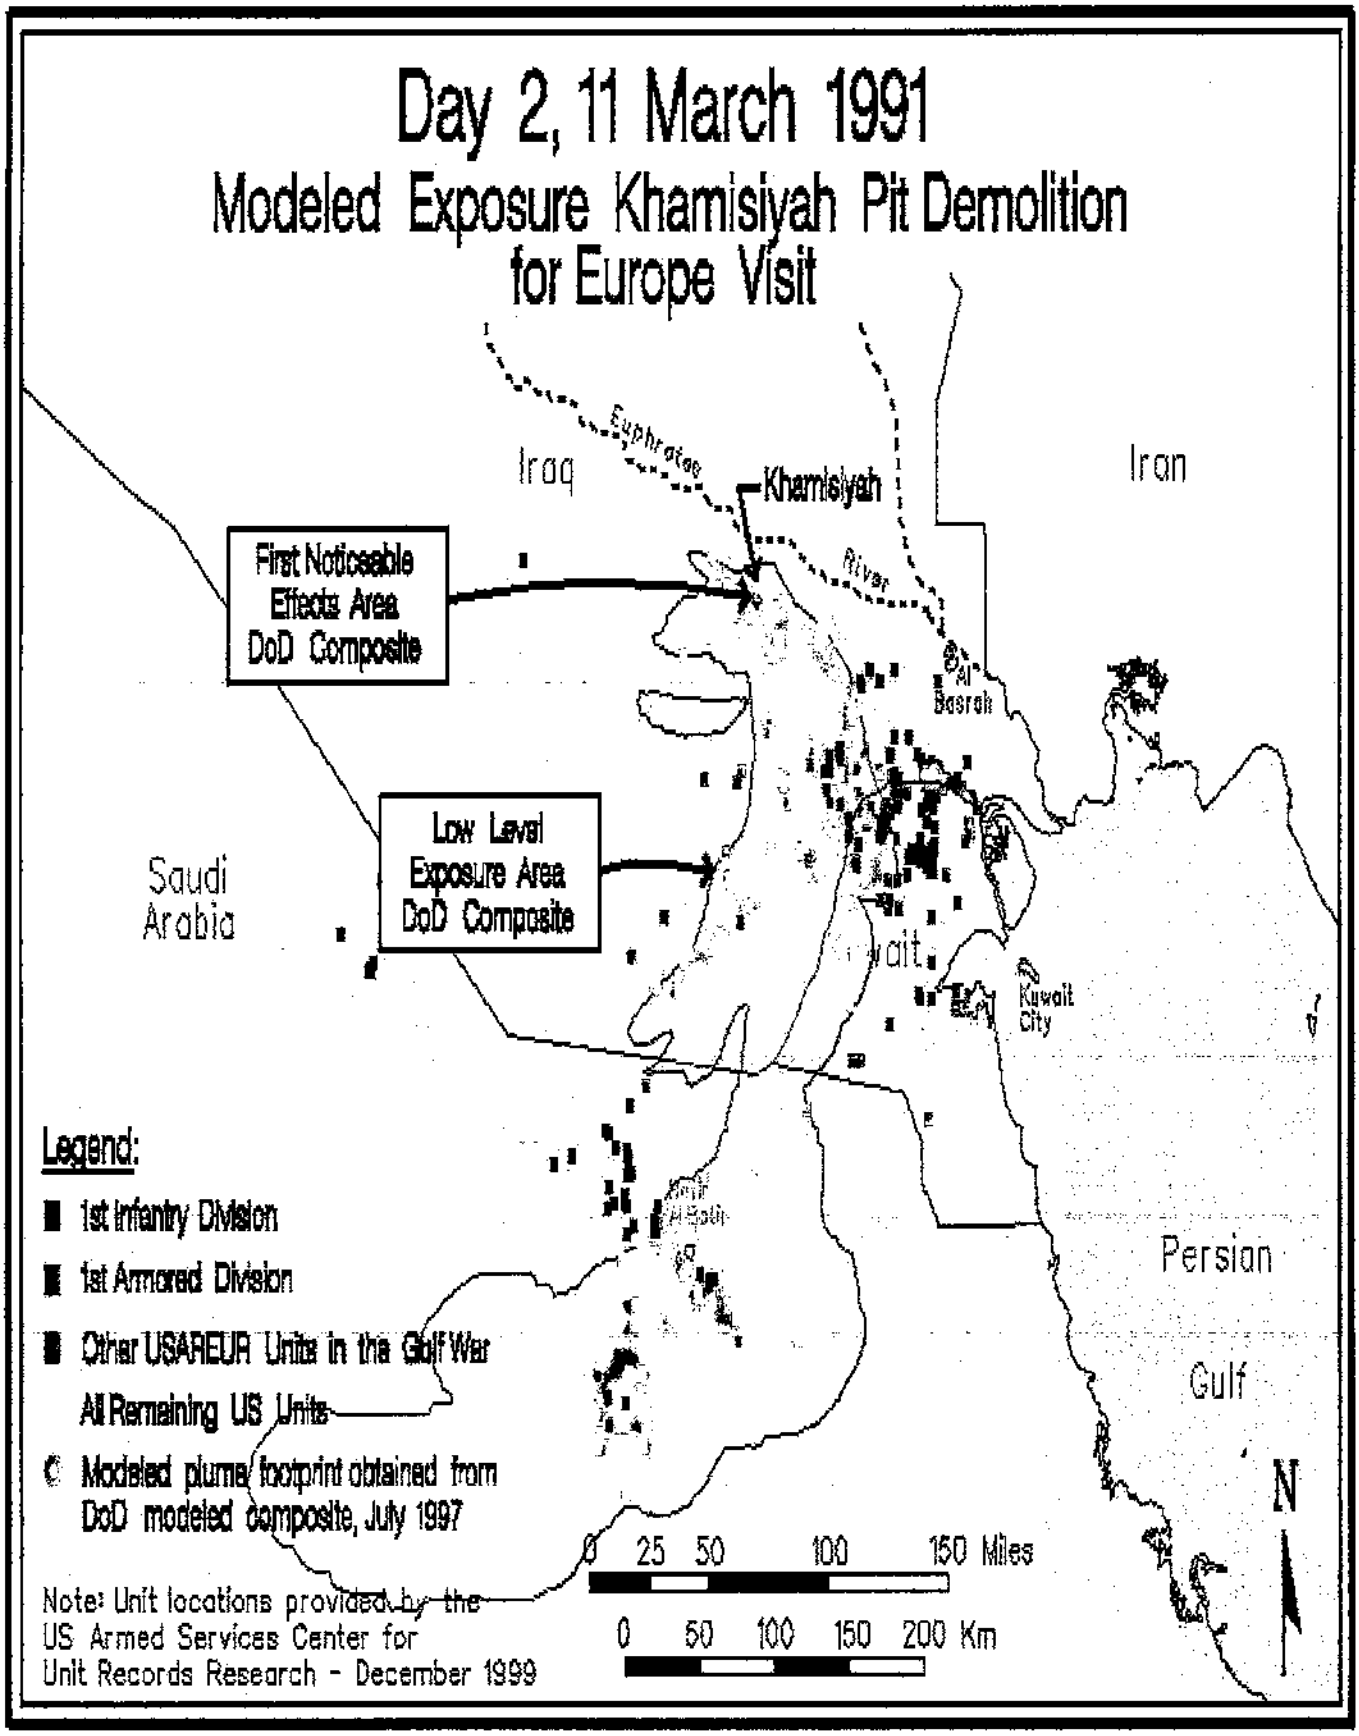
OSAGWI Investigations

- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
    - 99,000 vets notified
- Environmental:
  - Depleted uranium (DU), Oil well fires, Pesticides
    - Science doesn't support DU or Oil Well fires as causes
    - Still examining particulates and pesticides
- Medical issues:
  - Vaccines, PB, records, policy
- Persian Gulf War Veterans Coordinating Board-Scientific Research
  - 190+ studies sponsored by DoD, HHS & DVA
  - Science shows no exposure cause or effect relationship yet!

A New Reality --
The Dirty Battlefield

- What enemy may do to us
  - Chemical/Bio threat, Man made environmental hazards (Oil Well Fires)
- What the environment may do to us
  - Infectious diseases, insects, environmental risks (desert, jungle)
- What we may do to ourselves
  - Pesticides, Stressors, Investigational New Drugs, PB

Current and future conflicts and humanitarian deployments have and will have these challenges



Day 2, 11 March 1991
Modeled Exposure Khamisiyah Pit Demolition for Europe Visit

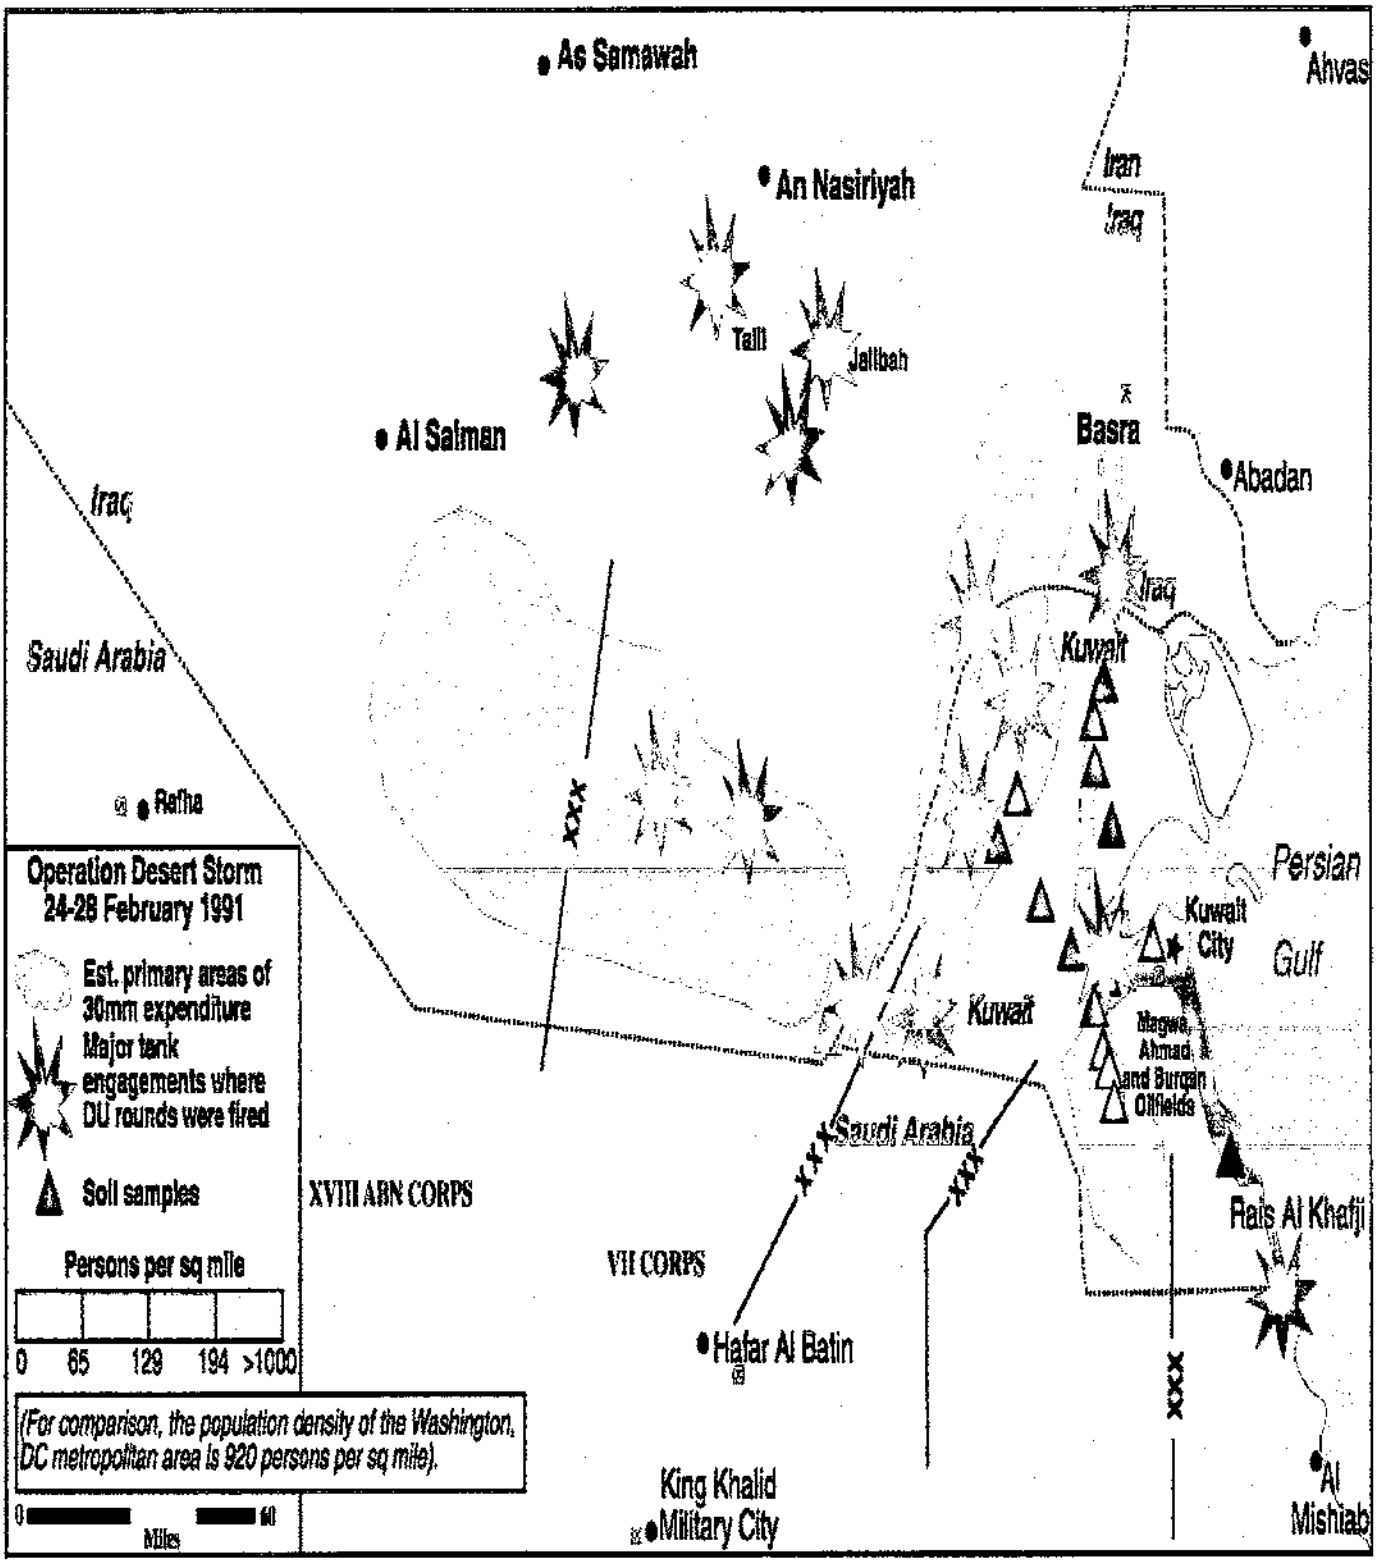
All Remaining US Units
Modeled plume footprint obtained from DoD modeled composite, July 1997
0 25 50 100 150 Miles
0 50 100 150 200 Km
N
Note: Unit locations provided by the US Armed Services Center for Unit Records Research - December 1999

Primary Areas of DU Expenditure



DU Exposure Issues

- Radiation
- Consequences of exposure
- Heavy metal toxicity
- Reproductive effect
- Contamination of theater

WHAT THE GULF WAR EXPERIENCE TAUGHT US

- Commanders need to have *greater sensitivity* to non-traditional risks on the modern battlefield
- The demands of Force Health Protection require a *proactive approach*
- The key to maintaining trust and credibility with servicemembers and their families is *responsive communication*
- Commanders should be *risk managers*, rather than consequence managers

Enhanced Unity of Effort

LEADERSHIP

- Unit Leaders rarely understood their central role in risk management (especially risk communication)
- If unaddressed, perceptions and fears can produce unanticipated consequences
- Staff response to exposure risks and events lacked coordination and cohesion
- Unity of effort problematic among Medical, Safety, and Line staffs

LEADERS MUST MANAGE RISK TO PROTECT HEALTH

Applying Lessons Learned

You

- Train self and others to recognize and avoid hazards
- Improve feedback and cross talk
- You are your own best health advocate

Your Unit

- CW/BW detection:earlier with fewer false positives
- Create, relate and save operational, NBC, and medical records
- Adapt to reduce risks and train to reduce future risks such as DU
- Debrief to explain what happened
- Monitor service members' health & environment

Force Health Protection

Pre-deployment

- Verify DNA sample on file
- Collect pre-deployment blood sample
- Verify HIV test is current
- Verify Immunizations up to date
- Verify current physical exam
- Complete Health questionnaire

Deployment

- Routine disease/injury reporting
- Forward medical laboratory
- Immunization tracking
- Environmental monitoring

Post Deployment

- Collect blood sample
- Medical debriefs
- Complete health questionnaire
- Screening exams as needed

You are your own best health advocate!

Anthrax

- Anthrax - an offensive BW agent
  - Inhalation anthrax is highly lethal
  - Easy to develop and weaponize
  - Remains viable for long periods
  - At least seven potential adversaries suspected of researching, developing and/or weaponizing anthrax.
- We have a safe and effective vaccine

Vaccination against anthrax is critical for your protection

Anthrax Vaccine Program

- Licensed by the FDA since 1970
- Dosing schedule is six doses over 18 months
  - 0, 2, 4 weeks, 6, 12, 18 months, plus annual booster
- Shortages in stockpiled doses require temporary slowdown of AVIP
  - No new vaccine available from renovated facility until FDA approves [new vaccine lots] safety and effectiveness
  - Vaccinations continue for service members assigned or deployed at least 30 days in highest threat areas
  - Next scheduled doses for those <u>not</u> in high threat areas will be deferred until sufficient doses are available

(877) GET-VACC DSN: 761-5101

www.anthrax.osd.mil

www.aviationmedicine.com

Pyridostigmine Bromide

- Threat - Soman is deadly nerve agent
- PB is the only known pretreatment against Soman.
  - Auto injectors alone will not save you
- Issues have been raised about PB
  - Further research is ongoing
- Only President can authorize its use without informed consent

Conclusions about PB

- We cannot rule out pyridostigmine bromide as a contributor to increased health symptoms in Gulf War veterans.
- Further research is needed to determine the effectiveness of the current dose of PB against Soman.
- Additional research about safety and effectiveness of PB for humans is needed.

Bottom Line

- Lessons learned from the Gulf War affect today's doctrine and deployments
- Leaders must manage risk to protect health
- Everyone is responsible for force protection
- You are your own best health advocate
- Vets should not tough it out; get examined
- Vaccination against anthrax protects you

Obtaining help and information

- Comprehensive Clinical Evaluation program

Back-up Slides

Myths versus Reality

Cover up	Open process & oversight
Not listening	Solicit eyewitness reports
Destroy records	Found missing records
20,000 veterans dead	6,686 veterans dead
No assistance to vets	Evaluation and care
"Syndrome"	Normal spectrum of illnesses known
CW or DU cause	Evaluating many possible causes
Brass doesn't care	Force Protection efforts
	Tough choices
	Cultural changes

A National Effort

- **OVERSIGHT:** Presidential, 7 Congressional Committees, VSOs, Veterans, the Media
- **INVESTIGATIONS:** IGs, GAO, SIU
- **DoD:** ASDs, Special Assistants, DIA, the Surgeons General
- **OUTSIDE AGENCIES:** CIA, VA, HHS, GWVCB, CDC
- **DECLASSIFICATION:** CIA, DIA, and the Services
- **TECHNICAL PROJECTS:** Dugway, Edgewood, Picatinny, CHPPM, Think tanks, outside experts

Gulf War Investigation Results

- Poor intelligence about Iraq's CW/BW weapons
- Not enough vaccines and no explanation given
- Limited environmental survey
- Information about nerve agent pre-treatment (PB) wasn't given to troops
- Inadequate training about DU or CW detectors
  - Training could have averted unnecessary exposure to DU and anxiety resulting from false alarms
- *Veterans re-deployed and left service without thorough medical exam or debrief*

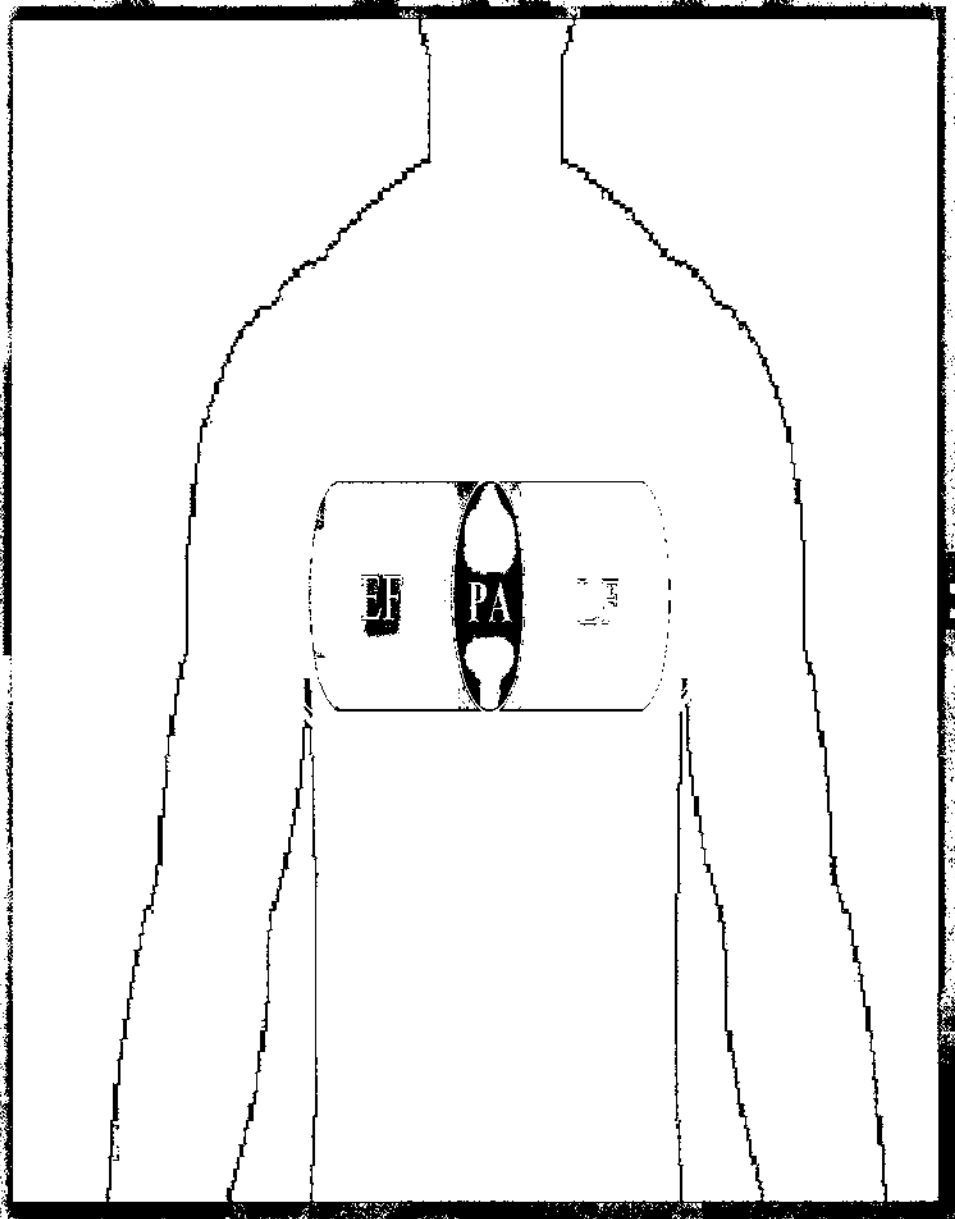
Anthrax

- Inhalation anthrax is deadly
- Biological warfare agent of choice:
  - Cheap and easy to produce
  - Can be dispersed in air by a variety of methods
  - Odorless, colorless, tasteless, difficult to detect
  - Flu-like symptoms early, rapid deterioration, and death
- MOPP 4 prevents exposure
- Antibiotics work before symptoms appear

Vaccination against anthrax is critical for your protection

ANTHRAX BACTERIA ATTACK



= Death

Briefing

- Organization - Mission Statement
- Why should I care?
- Symptoms and Illnesses
- Looking for causes
- Gulf War Lessons Learned
- Force Health Protection
- Help and information

Special Assistant for Gulf War Illnesses

Dr. Bernard Rostker

- Appointed November 12, 1996 by the Deputy Secretary of Defense
- 180 team members

Mission of the Special Assistant

- Ensure Gulf War veterans are properly cared for: "people are our first concern"
- Investigate to understand and explain Gulf War illnesses: "leave no stone unturned"
- Ensure DOD adopts doctrine, policy and procedures to reduce risks for troops in the future.

Myths versus Reality

Cover up	Open process
Not listening	Solicit eyewitness reports
Destroy records	Significant oversight
20,000 veterans dead	5,773 veterans dead
No assistance to vets	Evaluation and care
"Syndrome"	More than 40 illnesses
CW or DU cause	Many possible causes
Brass doesn't care	Force Protection efforts
	Tough choices
	Cultural changes

Why Should I Care?

- Lessons from the Gulf War about dirty battlefields.
- You must protect yourself against hazards.
- You will be working with or leading Gulf War vets.
- You will probably deploy overseas.
- You are responsible for force protection.

Who Served in the Gulf War

697,000 U.S. service members

Army	348,000	50%
Navy	160,000	23%
Marine	105,000	15%
Air Force	84,000	12%

259,000 Coalition Forces

U.S. Deaths

Battle deaths	148
Non-battle deaths	224
Hospitalizations	27,000

Post War

Shortly after re-deployment, many individuals in units reported common symptoms

- Aching joints
- Headaches
- Rashes
- Sleep disorders
- Diarrhea
- Hair loss
- Memory loss
- Fatigue

Confounding Issues

- No clustering
- No symptom consistency
- Variable onset
- No long term study
- As yet - no new disease or links between exposures and symptoms

Physician Message Sent

"Your laboratory, x-ray and physical exams results are normal."

Patient Messages Received

"There's nothing wrong with you!"

"It's all in your head!"

"You're faking these symptoms!"

Looking for Causes

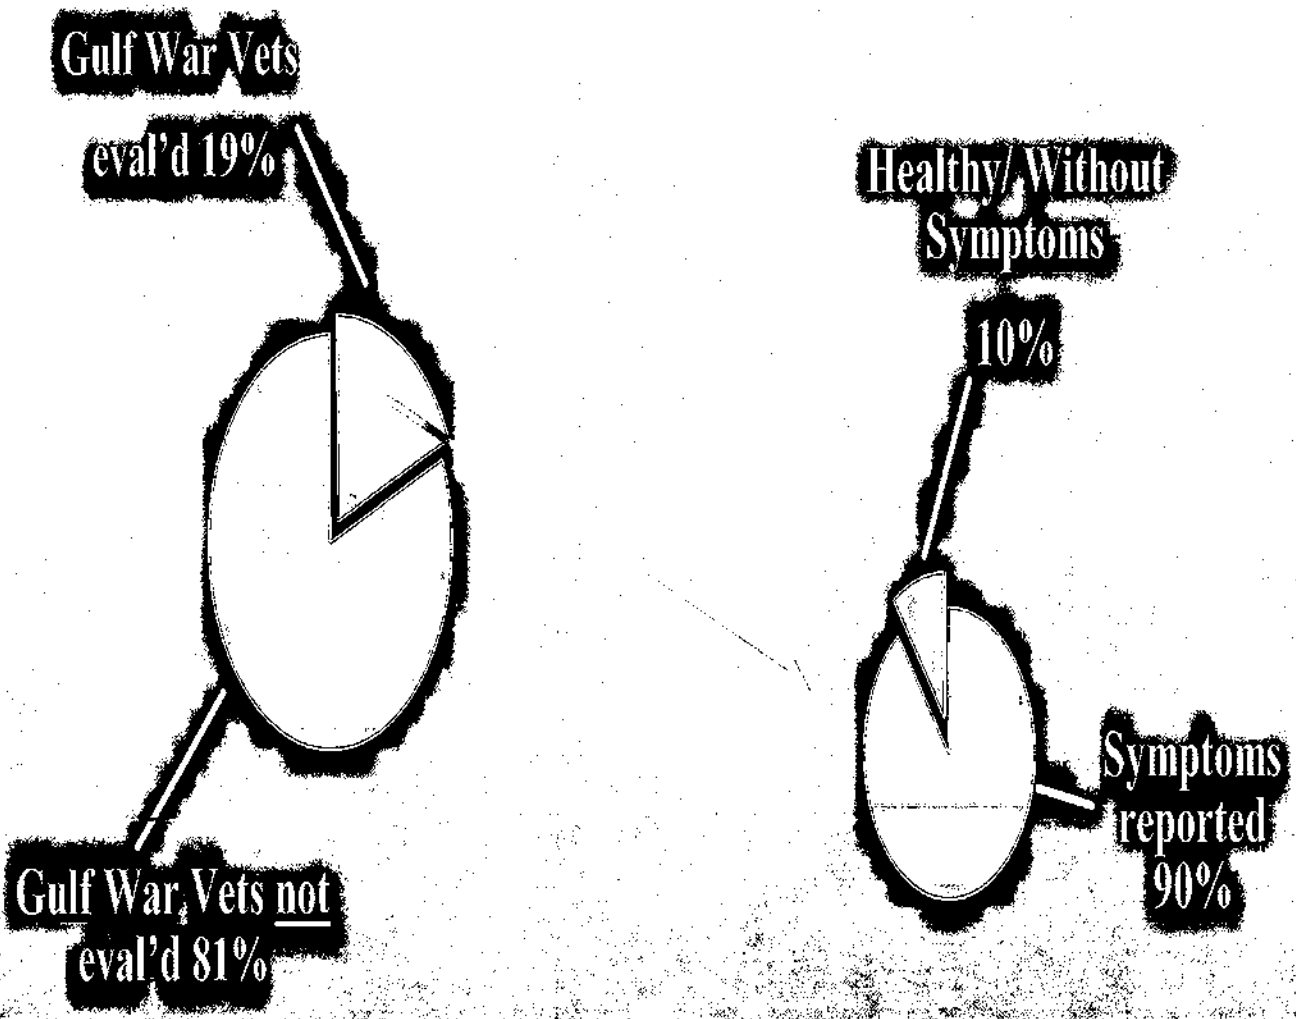
The Dirty Battlefield

- What Iraq may have done to us.
  - Oil Well Fires
- What the environment may have done to us.
  - Sand, Infectious diseases
- What we may have done to ourselves.
  - Pesticides, Pyridostigmine Bromide
- Challenges in the future.

OSAGWI Investigations

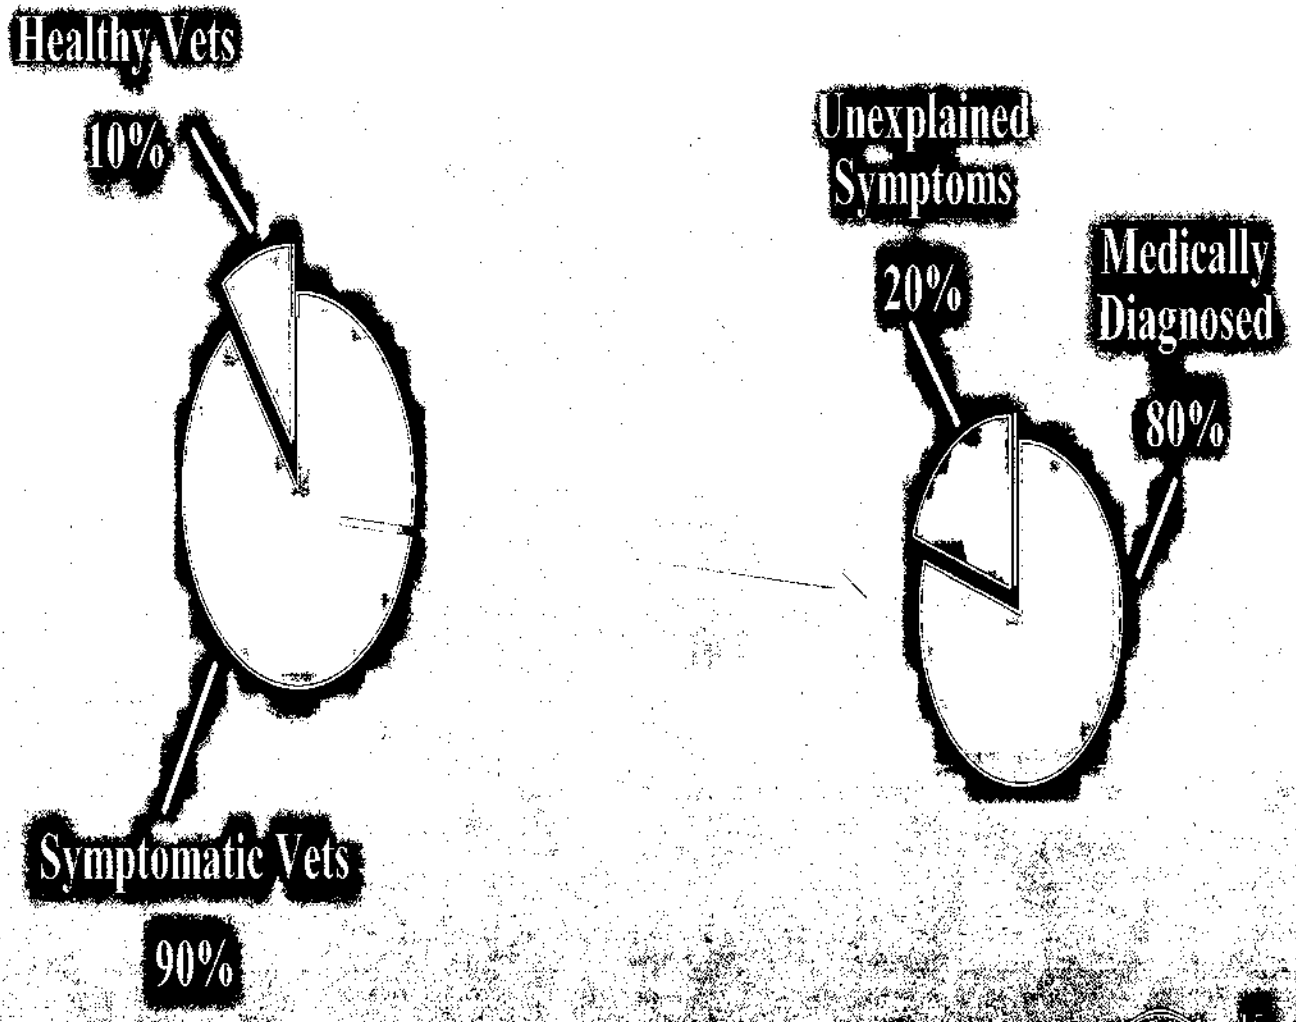
- Chemical/biological warfare:
  - Chemical warfare agent - Khamisiyah incident
- Environmental:
  - Depleted uranium (DU)
- Medical issues and lessons learned:
  - Vaccines, PB, records, policy
    - "Cocktail" effect

Evaluation Distribution of 69,000 CCEP/VA



Diagnosis Distribution of Evaluated Veterans

CCEP/VA



Proactive Measures - You

- Recognize and contend with potential hazards:
  - Improve intel notification.
  - Train all personnel.
  - Reduce adverse effects of and stress from potential exposures.
  - Understand the environment and culture before deploying.
- Improve feedback and cross talk.

Proactive Measures - Your Unit

- Improve expedient demolition of munitions
- CW/BW detection: earlier with fewer false positives
- Improve operational and medical records handling
- Adapt for the future
  - Retain individual unit locations and records
  - DU training
  - Improved medical surveillance
  - Force health protection

Force Health Protection

Pre-deployment

- Verify DNA sample on file
- Pre-deployment serum sample
- Verify HIV test in last 12 months
- Immunizations
- Verify current physical exam
- Health questionnaire

Deployment

- Routine disease/injury reporting
- Forward medical laboratory
- Immunization tracking
- Environmental monitoring

Post Deployment

- Collect serum sample
- Medical debriefs
- Complete health questionnaire
- Screening exams as needed

Future Equipment

- Personal Information Carrier (PIC)
- Biological Integrated Detection System (BIDS)
- Automatic Chemical Agent Alarm (ACADA)
- Medic Cam - Tele medicine

Anthrax Vaccine

- What is Anthrax?
- Vaccine is safe and necessary!
  - FDA Licensed in 1970
  - Used for many years to protect textile mill workers
  - Recommended by Centers for Disease Control (CDC):
    - Workers occupationally exposed to anthrax (labs, mills)
    - Treatment of anyone exposed to anthrax aerosols
    - Only known pretreatment and protection against exposure

Anthrax Vaccine

- DoD Policy - mandatory for total force
  - Phased implementation
- Phase I - SWA and Korea (now)
- Phase II - Early deploying forces to SWA and Korea (now)
- Phase III - Total force (early 2000's)
- Vaccine series:
  - 0, 2, 4 weeks; then 6, 12, 18 months; annual booster
- Reported reactions (18 Aug 99 per DoD/Health Affairs):
  - 1,060,278 doses, 157 adverse reactions=0.015%
- DoD anthrax web site: www.anthrax.osd.mil

Obtaining Help and Information

- Comprehensive Clinical Evaluation Program (CCEP)
  - 1-800-796-9699
- Veterans Affair registry program
  - 1-800-749-8387
- Contact managers

Bottom Line

- Gulf War Veterans key for our work
- Apply lessons learned
- You must protect yourself on the Dirty Battlefield
- Anyone deployed to South West Asia is eligible for CCEP *(family members included)*
- Don't tough it out - Get signed up and evaluated
- You are your best health advocate

USMC		0	0		0

9 8 7 14

38 adverse reactions of 529,247 vaccinations given = .007%

- Duration 24 - 48 hours
- Local redness and hardness 1 to 2 centimeters

Moderate

- Local redness and hardness 5 centimeters
- Subcutaneous nodule at injection site

- Swelling at injection site and entire forearm

- Malaise
- Chills and fever
- Anaphylaxis

VAERS

- Loss of duty > 24 hours
- Hospitalization

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

Anthrax Vaccine Clinical Outcomes

- **Armed Forces Epidemiological Board review of VAERS–3 Aug 98**
  - Recommended no change in current DoD AVIP
- **TAMC Survey - Korea PROFIS**
  - Sample size–603 soldiers
  - 3 VAERS reports–none hospitalized, 1 missed 24 hours duty
    - < 5% sought any medical attention for any symptom/side effects
- **Vaccine External Review Panel of Adverse Events**
  - Oversight--Vaccine Injury Compensation Program, Health Resource Services Administration, DHHS
  - Report due mid-Feb 99

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

Working The Internet

- **Anthrax vaccine disinformation**
  - 3 main anti-AVIP web sites; major source of disinformation
  - Television--focused on refusals
  - Press--focused on refusals
- **DoD initiatives to counter disinformation**
  - New DoD anthrax web site: www.defenselink.mil/specials/anthrax
    - Highest number of "hits" (13%) in the Defenselink "specials" category
    - Accessed 700 times/day (25-50% more than anti-AVIP sites)
  - Enhanced anthrax website (cost implications)
    - Enhanced web architecture; position within commercial search engines
    - Focused on AD, spouses, parents, scientific community, press, media
    - Feedback mechanisms
      - & Live chat rooms, bulletin boards
      - & Organized "frequently asked questions"
      - & Dedicated 1-800 number

ANTHRAX VACCINE IMMUNIZATION PROGRAM

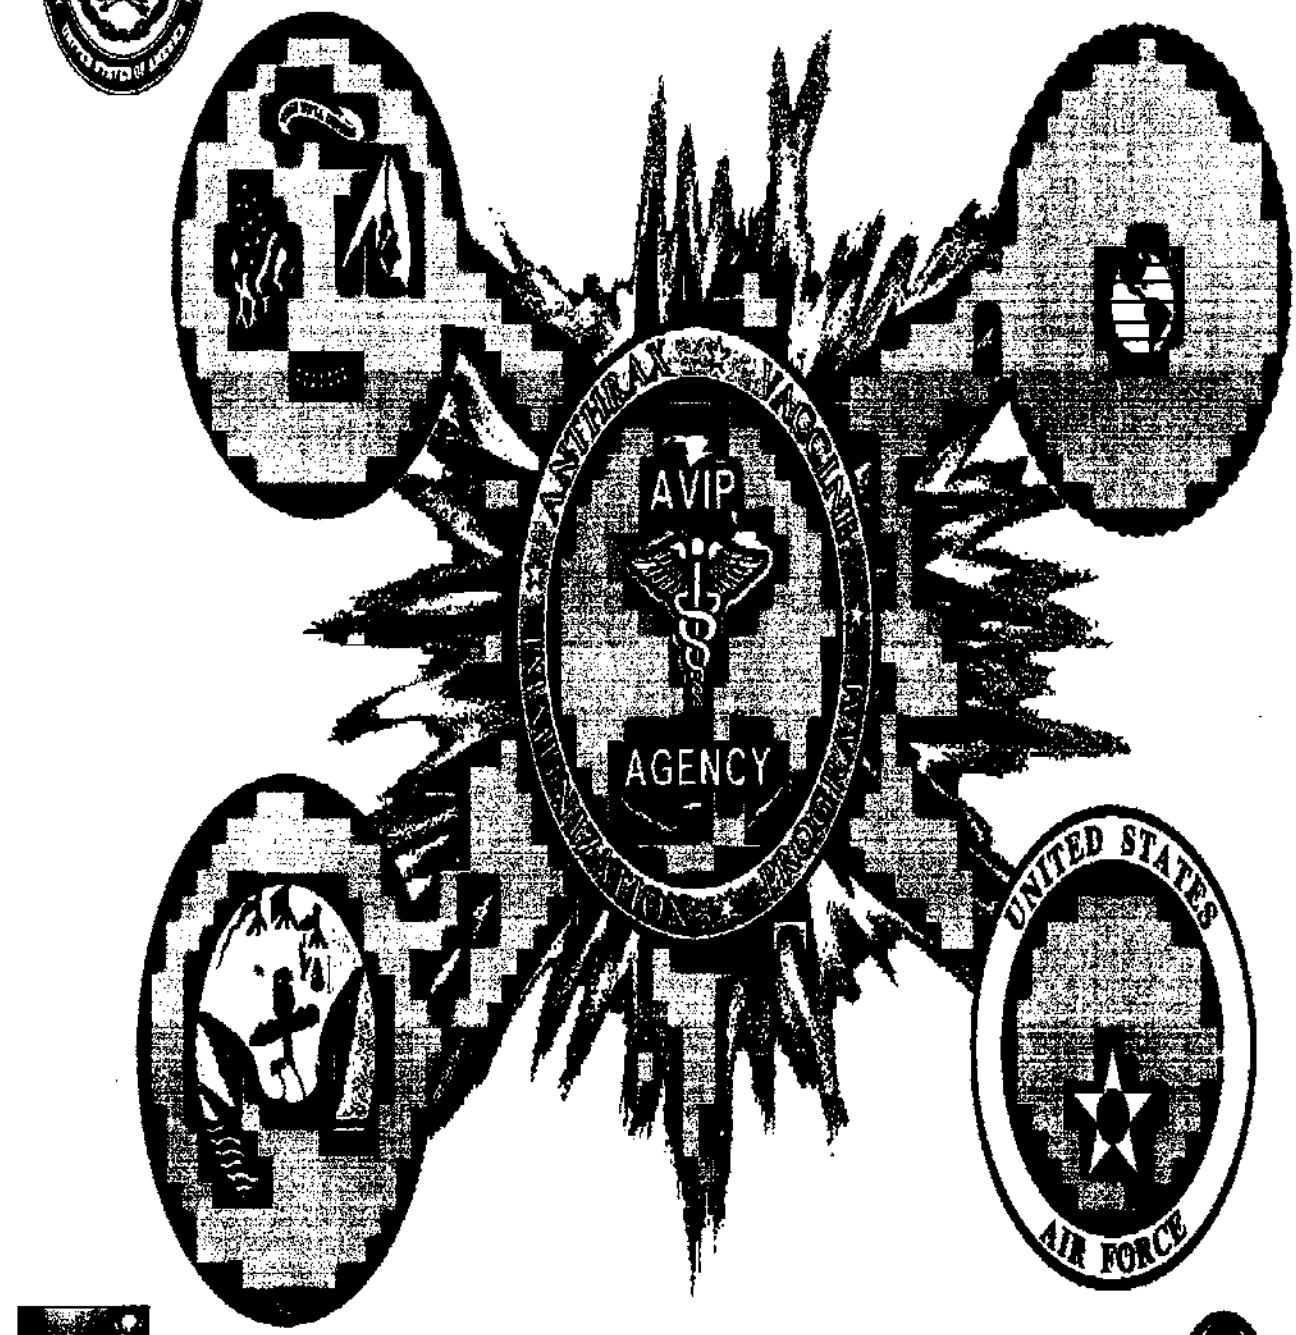
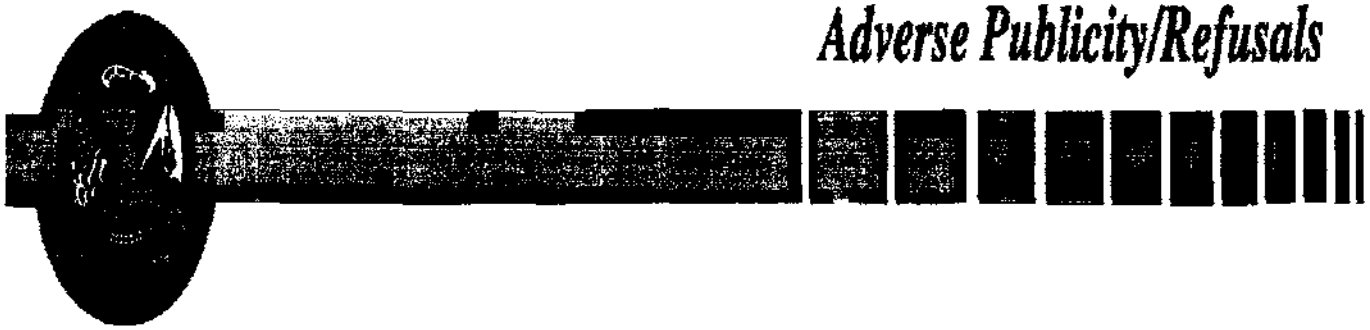
Service Presentations



ANTHRAX VACCINE
IMMUNIZATION PROGRAM AVIP

Adverse Publicity/Refusals



- 9 Army refusals after extensive education/re-education/counseling
  - 8 refusals in Korea
  - 1 refusal at Ft Stewart, GA

- Revision of AR 600-20, Army Command Policy
  - Under normal circumstances, will not forcibly vaccinate
  - Clear guidance to commanders on management of soldier refusals
  - Use minimum force necessary to vaccinate soldiers only under conditions of imminent threat
    - Imminent threat determined by GCMCA
    - May be delegated by GCMCA to O-5 commanders and above
  - Status--Pending approval by CSA and SECARMY, estimate action complete and ALARACT message in Feb 99.

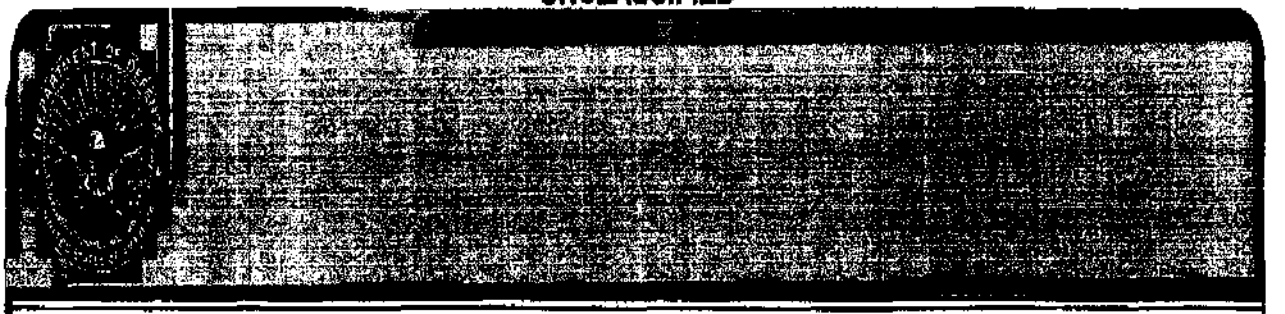
MEDICAL HISTORICAL - JPO-BIODEFENSE BRIEFING ON ANTHRAX VACCINE

11/7/96

- Anthrax Vaccine (Licensed and Produced by MBPI)
  - 6,000 Doses Available at Outset
  - 400,000 Doses Delivered During ODSS
  - Production Capacity - One 100 Liter Fermentor
- Botulinum Pentavalent Toxoid (A-E) Vaccine (IND and Produced by MBPI)
  - 30,000 Doses Available at Outset
  - 190,000 Doses Delivered During ODSS
  - No Operational Production Capacity in U.S.



Surg Gen Office Vaccine Prod'n Facility

- May 1991 - Army SGO Initiative to Build a VPF
- September 1992 - PDM for FY94 Funds to Construct VPF
- June 1993 - ADM Directs Establishment of JPO-BD
- January 1994 - Independent Government Analysis Favors COCO Facility
- April 1994 - DoD/Industry Conference to Determine Level of Industry Interest in Producing BD Vaccines
- May 1994 - ADM Directs Assessment of Best Approach for BD Vaccine Production
- January 1995 - Prime System Contractor Approach Developed. DEPSECDEF Supports Concept
- April 1995 - SSC Agrees with Prime System Approach. Army Defines Stockpile of BD Vaccines
- May 1995 - ADM Directs Prime System Approach for Contracting
- January 1996 - PBD 724 Directs Prime System Approach IAW ADM
- August 1996 - RFP Released for JVAP Prime System Contractor

Acquisition Decision Memo

JPO-BioDefense

- Stockpile
  - 1.2M Troop Equivalent Doses for 2 High Threat Biological Warfare Agents (BWA) (Will have this by March 97) Have to work hard for But.
  - 0.3M Troop Equivalent Doses for all Other BWA
- Likely Additional Requirements
  - Annual Immunization
  - Commander's Reserve (add 50% to Stockpile)

- Prime Systems Contract
  - Single Integrator Responsible for:
    - > Advanced Development
    - > FDA Licensure
    - > Production
    - > Testing
    - > Post Marketing Surveillance
  - Single Information Management Database
  - Individual Vaccines May Be Subcontracted
- Project Office at Ft Detrick

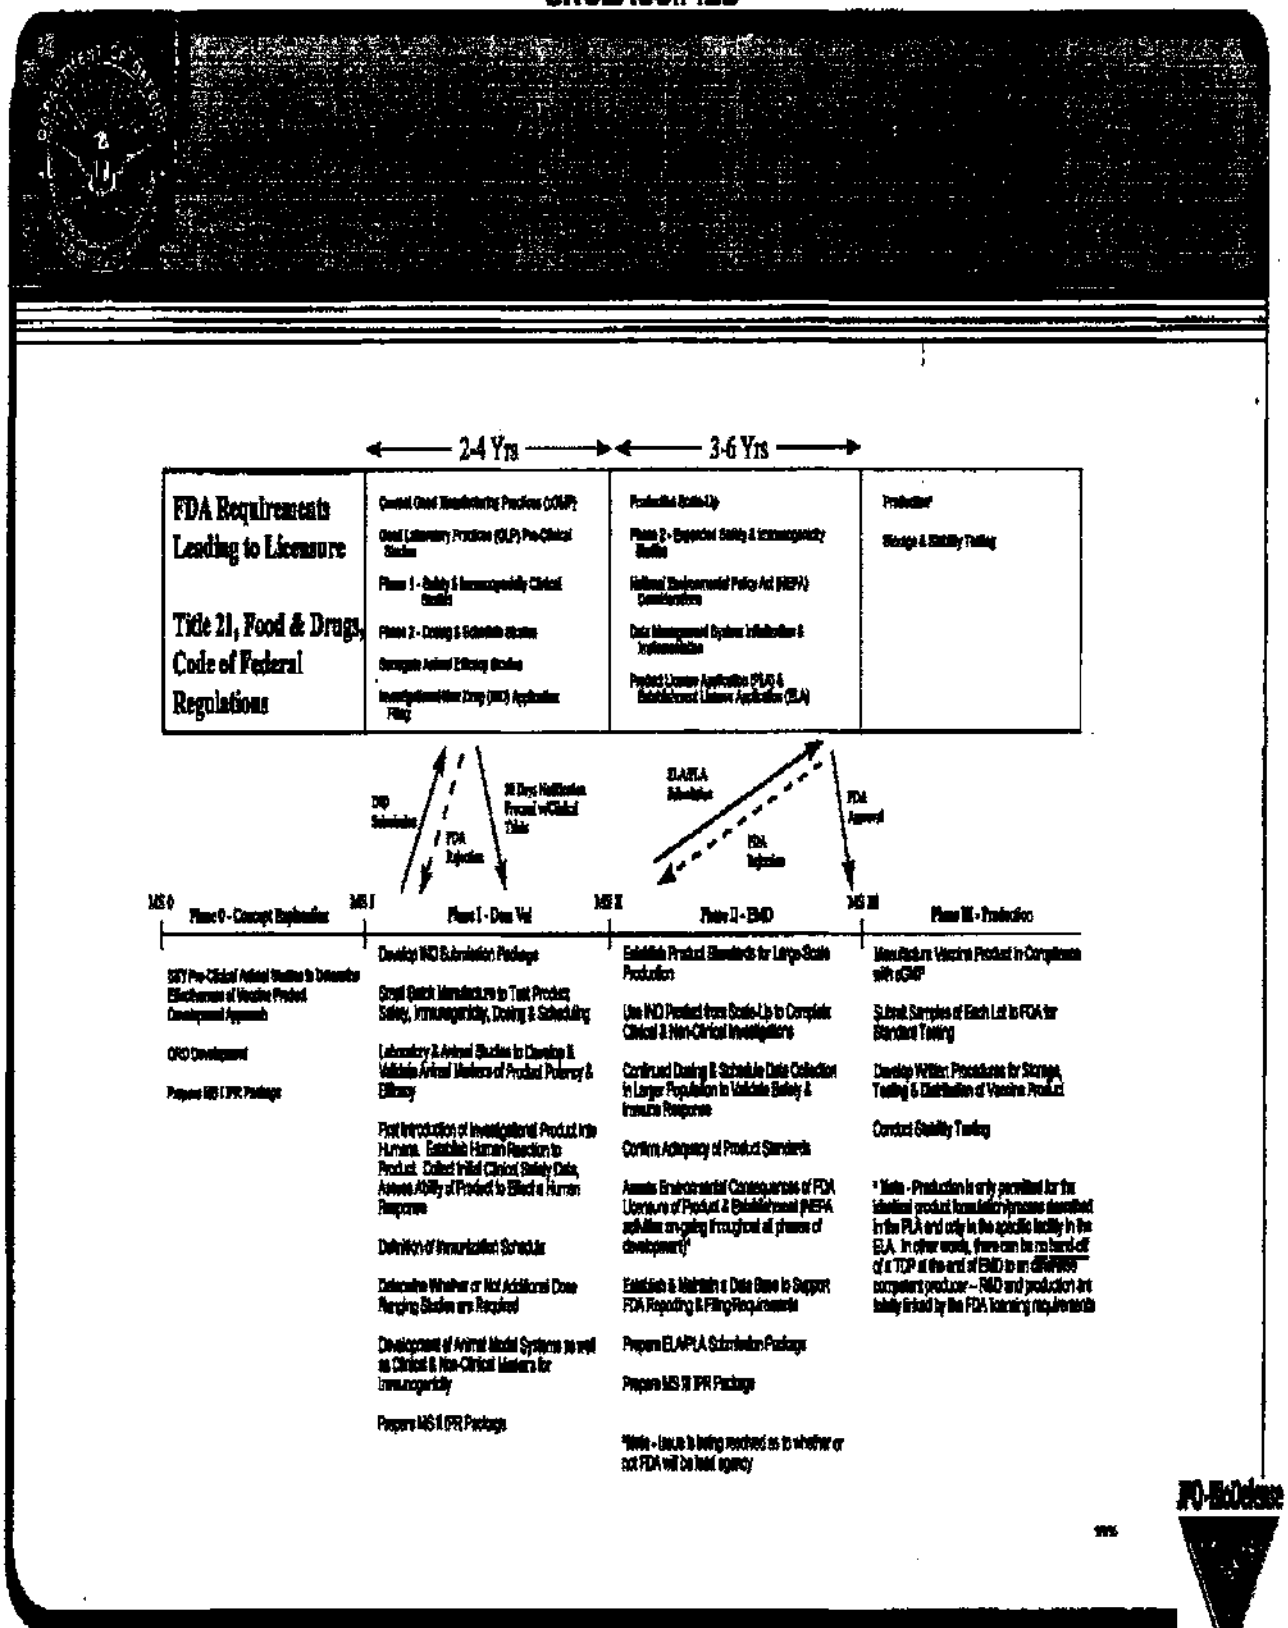
Legend:
Phase I - PD&RR
Phase II - EMD
Phase III - Production
Warm Base Production, Storage & Testing



2-4 Yrs
3-6 Yrs
FDA Requirements Leading to Licensure
Title 21, Food & Drugs, Code of Federal Regulations
Control Good Manufacturing Practices (CGMP)
Good Laboratory Practices (GLP) Pre-Clinical Studies
Phase 1 - Safety & Immunogenicity Clinical Studies
Phase 2 - Dosing & Schedule Studies
Surrogate Animal Efficacy Studies
Investigational New Drug (IND) Application Filing
Production Scale-Up
Phase 3 - Expanded Safety & Immunogenicity Studies
National Environmental Policy Act (NEPA) Considerations
Data Management System Initialization & Implementation
Product License Application (PLA) & Establishment License Application (ELA)
Production*
Storage & Stability Testing
IND Submission
FDA Rejection
90 Days Notification Prior to Clinical Trials
ELA/PLA Submission
FDA Rejection
FDA Approval
MS 0
Phase 0 - Concept Exploration
MS I
Phase I - Dose Val
MS II
Phase II - EMD
MS III
Phase III - Production
SBIR Pre-Clinical Animal Studies to Determine Effectiveness of Vaccine Product Development Approach
CRO Development
Prepare MS I IPR Package
Develop IND Submission Package
Small Batch Manufacture to Test Product Safety, Immunogenicity, Dosing & Scheduling
Laboratory & Animal Studies to Develop & Validate Animal Models of Product Potency & Efficacy
First Introduction of Investigational Product into Humans. Establish Human Reaction to Product. Collect Initial Clinical Safety Data, Assess Ability of Product to Effect a Human Response
Definition of Immunization Schedule
Determine Whether or Not Additional Dose Ranging Studies are Required
Development of Animal Model Systems as well as Clinical & Non-Clinical Markers for Immunogenicity
Prepare MS II IPR Package
Establish Product Standards for Large-Scale Production
Use IND Product from Scale-Up to Complete Clinical & Non-Clinical Investigations
Continued Dosing & Schedule Data Collection in Larger Population to Validate Safety & Immune Response
Confirm Adequacy of Product Standards
Assess Environmental Consequences of FDA Licensure of Product & Establishment (NEPA activities on-going throughout all phases of development)*
Establish & Maintain a Data Base to Support FDA Reporting & Filing Requirements
Prepare ELA/PLA Submission Package
Prepare MS III IPR Package
*Note - Issue is being resolved as to whether or not FDA will be lead agency
Manufacture Vaccine Product in Compliance with cGMP
Submit Samples of Each Lot to FDA for Standard Testing
Develop Written Procedures for Storage, Testing & Distribution of Vaccine Product
Conduct Stability Testing
* Note - Production is only permitted for the identical product manufacturing process described in the PLA and only in the specific facility in the ELA. In other words, there can be no hand-off of a TDP at the end of EMD to an alternate competent producer -- R&D and production are totally linked by the FDA licensing requirements
WRS

- Production of the Licensed Anthrax Vaccine
- Reduction from 6 to 2 Immunization Regime for Anthrax Vaccine
- Licensing of the Existing Bot Tox Pentavalent Vaccine
- Studies on Long Term Effects of Multiple Immunizations with BD Vaccines

GOCO Option

Ft. Vaccine

- ***Why Started?*** **Lessons From ODSS**
  - No Surge Capacity for BD Vaccines
  - Limited Industry Interest
- ***Why Stopped?*** **DOD and Congressional Directives**
  - Need for Dedicated DOD Facility?
  - Most Economical Approach?

ADM Directed Cost/Benefit Analysis

COCO Option

- ***Why Started?*** **Cheaper**
- ***Why Modified?*** **Affordability**
  - $450M Unfunded Requirement FY96-01
  - Industry Survey

Prime (Systems) Contract

- ***Why Started?*** **Optimum Resource Utilization**
  - Reduces Requirement for New Facilitization
  - Most BD Vaccines Already Produced by Industry
  - Enhances Competition

ANTHRAX VACCINE ADVERSE EVENTS
DoD-General VAERS-1 Reports

As of 23 June 99

SYSTEMIC REACTIONS

1) USAF DMSS 3 VAERS 113512	FEVER, MALAISE	**QTRS 24 HRS/RESOLVED**
2) USN DMSS 4 VAERS 111835	GUILLIAN-BARRE SYNDROME	**HOSP/RECOVERED**
3) USAF DMSS 5 VAERS 113514	POTENTIAL ALLERGIC RXTN, RASH ON TRUNK	RESOLVED
4) USAF DMSS 6 VAERS 112155	FDA GENERATED AS SECOND REPORT for VAERS # 112156	RESOLVED
5) USAF DMSS 7 VAERS 112156	DIZZINESS, NAUSEA, DIARRHEA DOUBLE VISION	RESOLVED
6) USA DMSS 9 VAERS 114365	URTICARIA ON BACK, CHEST ARM	RESOLVED
7) USA DMSS 12 VAERS 113595	COMPLAINED OF DIZZINESS AND EMESIS 7 DAYS FOLLOWING VAQCCINATION	NO TREATMENT/RTD
8) USAF DMSS 13 VAERS 113746	SYNCOPE AND CHEST PAIN	NO TX/RESOLVED
9) USAF DMSS 14 VAERS 113740	NUMBNESS AND TINGLING TO RT SIDE OF FACE, BACK, SHOULDER, AND ARM	NO TX/RESOLVED
10) USA DMSS 17 VAERS 115375	CHEST PAIN, SOB, ARTHRALGIA, ACHES, CHILLLS, FEVER 3-4 DAYS	**QUARTERS/RESOLVED**
11) USA DMSS 19 VAERS 115374	MYALAGIA, KINETIC TREMORS, LF FLEXOR DIGITORUM, PROFUNDUS WEAKNESS	TREATED/RESOLVING
12) USN DMSS 25 VAERS 115540	EMESIS, SOB, SYNCOPE (7 MIN POST VAC) FLAGGED	**QUARTERS/RESOLVED**

13) USN DMSS 37 VAERS 117106	ANGIOEDEMA LF JAW	**HOSP/RESOLVING**
14) USA DMSS 38 VAERS	WORSENING OF UNDERLYING AUTOIMMUNE DIEASE (ANKYLOSING SPONDYLITIS)	TREATED/RESOLVING
15) USAF DMSS 39 VAERS	ANGIOEDEMA FROM NECK DOWN	TREATED/RESOLVED
16) USA DMSS 40 VAERS	NUMBNESS IN 4TH & 5TH LEFT DIGIT WITH SMALL AMOUNT OF WEAKNESS	NO TREATMENT
17) USA DMSS 41 VAERS 120109	SLE	**HOSP/SOME RESIDUAL**
18) USMC DMSS 42 VAERS	URTICARIA, HOT FLASHES, LIGHT HEADED	TREATED/RESOLVING
19) USAF DMSS 43 VAERS 119382	NAUSEA, VOMITING, CHILLS LASTING 4-5 HOURS	TREATED/RESOLVED
20) USAF DMSS 44 VAERS 120453	PT HAD MASAL AND EYE DRAINAGE, EDEMA OF TONGUE AND THROAT NO SOB	TREATED/RESOLVED
21) USAF DMSS 45 VAERS 119383	URTICARIA 12 HOURS POST VACCINATION	TREATED/RESOLVING
22) USA DMSS 48 VAERS 118777	URTICARIA x 24HRS	TREATED/RESOLVED
23) USA DMSS 49 VAERS 117197	SEVERE HA, NECK PAIN	**HOSP/RESOLVED**
24) USN DMSS 51 VAERS 115895	FACIAL BURNING SENSATION, ITCHING REDNESS, DRY AND PEELING	TREATED/RESOLVED
25) USMC DMSS 53 VAERS 118818	UPPER BODY ITCHING AND RASH	TREATED/RESOLVED
26) USA DMSS 54 VAERS 122087	INTERMITTENT FASCICULATIONS, LID TWITCHING, NUMBNESS, TINGLING OF ARMS	RESOLVED
27) USA DMSS 55 VAERS 122086	LEFT TO RIGHT ARM PAIN AND DISTAL WEAKNESS THAT PERSISTS	TREATED/RESOLVING

28) USMC DMSS 56 VAERS 121164	URTICARA AND DYSPNEA 24 HOURS AFTER SHOT, BRONCHIOLITIS	**QTRS 14 DAYS/RESOLVING**
29) USN DMSS 57 VAERS 117881	HA FOR 4-5 DAYS, FEVER AND NAUSEA 8-10 HOURS AFTER 1ST AND 2ND SHOT	RESOLVED
30) USA DMSS 59 VAERS 121457	CHILL, SWEATING AND MALAISE x 2 DAYS	RESOLVED
31) USA DMSS 60 VAERS	ARTHRALGIA IN LEFT HIP B 1ST MCP, MTP	RESOLVED
32) USAF DMSS 61 VAERS 121874	HA, DIARREHEA, FATIGUE, SHORTNESS OF BREATH	RESOLVED
33) USAF DMSS 62 VAERS 121872	DIARREHEA, HA, WEAKNESS, SLEEPLESSNESS FATIGUE, SKIN BLISTERS	RESOLVED
34) USAF DMSS 63 VAERS 121876	ABDOMINAL CRAMPS, MIGRAINES, NAUSEA FATIGUE, INSOMNIA, DIZZINESS, MEMORY LOSS SHORTNESS OF BREATH, CONFUSION	RESOLVED
35) USAF DMSS 64 VAERS 121873	HA, DIARRHEA, SKIN BLISTERS, SHORTNESS OF BREATH	RESOLVED
36) USAF DMSS 66 VAERS 121012	ABDOMINAL CRAMPS, MIGRAINES, NAUSEA, FATIGUE, INSOMNIA, DIZZINESS, MEMORY LOSS STATE OF CONFUSION, SOB	RESOLVED
37) USMC DMSS 68 VAERS 120947	DIFFUSE RASH 72 HR POST VACCINATION TYPE-4 DELAYED REACTION	RESOLVED
38) USA DMSS 69 VAERS 120760	PAPULAR RASH AT INJECTION SITE WITH EACH VACCINATION, GENERALIZED RASH WITH PURITIS & DERMATITIS AFTE 3RD VACCINATION	RESOLVED
39) USA DMSS 70 VAERS 122048	NAUSEA, VOMITTING, HA, TENDERNESS AT INJECTION SITE X3 DAYS	RESOLVED
40) USA (C) DMSS 71 VAERS 122047	13X10 AREA OF EDEMA, PAIN, DECREASE RANGE OF MOTION, FLU-LIKE SYMPTOMS, TEMP > 100 DEGREE,	RESOLVED
41) USA DMSS 73 VAERS 122045	PRURITIS AND ERUPTION OF PAPULAR, ERYTHEMATOUS BEGAN ON LEGS AND SPREAD CIPHALAD	RESOLVED
42) USA DMSS 74	HERPES ZOSTER AFTER VACCINATION	RESOLVED

VAERS 122044		
43) USA DMSS 75 VAERS 122043	GENERALIZED PRURITIS, ERYTHEMATOUS HIVES OVER TRUNK, ARMS, LEGS 1 HR AFTER VACCINATION	RESOLVED
44) USA DMSS 78 VAERS 120761	15MM SWELLING AT INJECTION SITE, HA, NAUSEA, VOMITING 6 HRS AFTER VACCINATION	RESOLVED
45) USA (C) DMSS 79 VAERS 120758	NAUSEA, CHILLS, FEVER WITHIN AN HOUR OF VACCINATION, LOW GRADE FEVER X24 HOURS, TACHYCARDIA, RESOLVED WITHIN 24 HRS	RESOLVED
46) USA (C) DMSS 81 VAERS 120157	LOSS OF COORDINATION OF UPPER AND LOWER EXTREMITIES, VERTIGO, NAUSEA, LOSS OF VISION IN R EYE, DIZZINESS	**HOSP/RESOLVING**
47) USA DMSS 82 VAERS 120589	ERYTHEMA MULTIFORME	RESOLVED
48) USN DMSS 83 VAERS 122269	UNSPECIFIED SPONDYLARTHROPATHY	UNKNOWN
49) USMC DMSS 86 VAERS 120563	HIVES, SOB, COUGH ONE DAY POST VACCINATION ANTHRAX VACCINE SKIN TEST NEGATIVE	UNKNOWN
50) USN DMSS 87 VAERS 122237	POST SECOND VACCINATION, ACHING JOINTS, HA X5 DAYS, CHILLS, FEVER 101-103 DEGREE	RESOLVED
51) USMC DMSS 88 VAERS	DEVELOPED ITCHING, URTICARIAL RASH ON FACE ARMS, BACK, BUTTOCKS, LEGS, 15 MIN POST 2ND VACCINATION	RESOLVED
52) USMC DMSS 89 VAERS	RASH DEVELOPED I DAY AFTER 3RD VACCINATION ON ARMS, FACE, NECK, RED ITHCY BLISTERS SCABS POSSIBLE CONTACT DERMATITIS	RESOLVED
53) USN DMSS 90 VAERS	HIVES ALL OVER 5 WEEKS AFTER 3RD VACCINATION LARGE HIVE AT INJECTION SITE	RESOLVED
54) USAF DMSS 91 VAERS 121290	HA X9 DAYS POST 1ST VACCINATION, HIVES, BILATERAL UPPER EXTREMITY, CHEST AND BACK. MILD PURITIS SEVERE HA X4 DAYS POST 2ND VACCINATION	RESOLVED
55) USAF DMSS 93 VAERS 121014	BODY ACHES, JOINT PAIN, HA, CHEST PAIN, DIARRHEA STOMACH CRAMPS, FLU-LIKE SYMPTOMS, BLISTERS IN MOUTH, SWEATING OR CHILLS, TREMOR, COUGH	SELF GENERATED/ SAUGHT TX AT CIVILIAN PHYSICIAN
56)USAF DMSS 94 VAERS 121320	24HR POST VACCINATION, HIVES AND SOB BEGAN, FATIGUE 4HRS POST VACCINATION	RESOLVED
57) USAF DMSS 95 VAERS 120280	HIVES, TICHING, REDNESS AT FACE	RESOLVED

58) USAF DMSS 96 VAERS 120463	ITCHING AND THICKENING OF THE TONGUE, INJECTION SITE HOT AND ERYTHEMIC APPROX. 1-3/4" WITH SPASM REFERRAL TO ALLERGY	RESOLVED
59) USAF DMSS 97 VAERS 119698	>10X10CM LOCAL RXTN, IRRITABILITY, NAUSEA RESTLESS, PURITIS RASH ON LEGS AND BACK	RESOLVED
60) USAF DMSS 98 VAERS 121152	NAUSEA, VOMITING, DIARRHEA, BODY ACHES, FEVER CHILLS 10 DAYS POST VACCINATION	RESOLVED
61) USAF DMSS 99 VAERS 120911	JOINT & MUSCLE ACHES, CHILLS, DIZZINESS, NAUSEA WEAKNESS, SHAKES, DIFFICULTY BREATHING, EAR, N NOSE AND THROAT SORENESS, HA, DIARRHEA, BACKACHE	UNKNOWN/SELF GENERATED
62) USAF DMSS 100 VAERS 121198	BLOOD GLUCOSE 700+ POST 5TH VACCINATION NVICP PANEL-UNRELATED TO VACCINE	**HOSP/UNKNOWN**
63) USA DMSS 101 VAERS 121197	EXHAUSTIVE FATIGUE, MALAISE WITHIN 24 HR, SOB WEAK, HA	**QRTRS/RESOLVED**
64) USMC DMSS 102 VAERS 120562	HIVES 24 POST 1ST VACCINATION	RESOLVED
65) USA DMSS 103 VAERS	FAINT SANDPAPER-LIKE RASH ON LEFT FLANK AXILLA POST VACCINATION 5-7 DAYS LATER. SIMILAR RASH POST 2ND VACCINATION ON RIGHT FLANK	RESOLVED

LOCAL REACTIONS

1) USAF DMSS 1 VAERS 107470	LOCAL MODERATE/REDNESS, PAIN, SWELLING AT INJECTION SITE	**HOSP/RESOLVED**
2) USAF DMSS 2 VAERS 113513	LOCAL SEVERE/NODULE TO LEFT DELTOID AT INJECTION SITE NO DRAINAGE, REDNESS, OR TENDERNESS	RESOLVED
3) USN DMSS 8 VAERS 110504	LOCAL SEVERE/RED, PAINFUL ARM AT INJECTION SITE	RESOLVED
4) USA DMSS 10 VAERS 114514	ERYTHEMA, INDURATION, MYALIGIA, HA TIMES 3 DAYS	NO TX/RTD
5) USA DMSS 11 VAERS 114513	ERYTHEMA AND PURITIS	RESOLVED
6) USAF DMSS 15 VAERS 113745	ERYTHEMA AT INJECTION SITE LOCAL MILD	RESOLVED
7) USAF DMSS 16 VAERS 113742	ERYTHEMA, REDNESS, TENDERNESS AT INJECTION SITE	RESOLVED
8) USA DMSS 18 VAERS 115376	PURITIS AND PAIN, SWELLING TO FOREARM AND ENCIRCLING ¾ OF THE ARM, LASTED 10-11 DAYS	RESOLVED
9) USAF DMSS 20 VAERS 116135	ERYTHEMA, NODULE, PURITIS AT INJECTION SITE, LOCAL MODERATE	NO TREATMENT
10) USA DMSS 21 VAERS 115560	MILD LOCAL FLU LIKE SYMPTOMS	NO TX/RTD
11) USA DMSS 22 VAERS 115561	MILD LOCAL FLU LIKE SYMPTOMS	SELF GENERATED/NO TREATMENT SAUGHT
12) USA DMSS 23 VAERS 115537	URTICARIA, SORE SWOLLEN ARM	SELF GENERATED/ TREATED/RTD
13) USA DMSS 24 VAERS 115541	MILD LOCAL FLU LIKE SYMPTOMS	TREATED/RTD
14) USA DMSS 26 VAERS 116086	RUE ERYTHEMA, SWELLING, PRURITIC ARM AND CHEST	TREATED/RESOLVED
15) USA	LUE ERYTHEMA 22X30 CM, LIMITED	TREATED/RESOLVED

DMSS 27 VAERS 116085	ARM MOTION	
16) USA DMSS 28 VAERS 116082	ERYTHEMA 14X14 CM AT INJECTION SITE PROGRESSING TO ENTIRE ARM	TREATED/RESOLVED
17) USA DMSS 29 VAERS 116078	URTICARIA ON ARMS, NECK AND TORSO TIMES 2 WEEKS	TREATED/RESOLVING
18) DOD-CIV DMSS 30 VAERS 116058	ERYTHEMA 30 CM EXTENSION TO HAND LIMITATION OF MOTION	**HOSP/RESOLVED**
19) USA DMSS 31 VAERS 116081	LOCAL REACTION AT INJECTION SITE	TREATED/RESOLVED
20) USA DMSS 32 VAERS 116116	LOCAL SWELLING 18 X 14 CM	NOT TX/RESOLVED
21) USA DMSS 33 VAERS 116084	ERYTHEMA/SWELLING AT INJECTION SITE TO FOREARM	NO TX/RESOLVING
22) USA DMSS 34 VAERS 116083	SWELLING 7 PAIN AT INJECTION SITE	NO TX/RESOLVED
23) USA DMSS 35 VAERS 116118	ERYTHEMA/INDURATION 22X26 CM AT INJECTION SITE	NO TX/RESOLVED
24) USN DMSS 36 VAERS 117143	SEVERE LOCAL – ERYTHEMA VESTICULAR ERUPTION	TREATED/RESOLVING
25) USA DMSS 46 VAERS 118758	SWELLING AND PAIN AT INJECTION SITE	NO TREATMENT
26) USAF DMSS 47 VAERS 118527	130MM X 90MM ERYTHEMA, LOCAL MODERATE	NO TREATMENT
27) USA DMSS 50 VAERS 121383	SWELLING, WARMTH, SORENESS AT INJECTION SITE	NO TREATMENT
28) USN DMSS 52 VAERS 118714	2 DAYS AFTER SHOT RIGHT ARM SWOLLEN, ITCHY AND SORE. EDEMA, HYSN PAIN AT INJECTION SITE, PRURITUS	RESOLVED
29) USAF DMSS 58 VAERS	LEFT ARM SWELLING TO ENTIRE ARM AND FOREARM WITHIN 48 HOURS OF VACCINATION SEVERE LOCAL	**HOSP/RESOLVING**
30) USAF DMSS 85	SEVERE LOCAL REACTION - R+ RADIAL NERVE RADICULOPATHY	RESOLVED

VAERS 121893

31) USA DMSS 67 VAERS 120776	PRURITIS, ERYTHEMA ON RIGHT ARM SWELLED AFTER THIRD VACCINATION SEVERE LOCAL REACTION	RESOLVED
32) USAF DMSS 72 VAERS 122046	INCREASE PAIN AND REDNESS AT INJECTION SITE, MILD LOCAL REACTION	RESOLVED
33) USN DMSS 76 VAERS 122042	EDEMA, ERYTHEMA AT INJECTION SITE	RESOLVED
34) USAF DMSS 77 VAERS 120759	½ DOLLAR SIZE AREA OF ITCHING AFTER 15 MINUTES POST VACCINATION, ERYTHEMA EXTENDED FROM SHOULDER TO ELBOW, MODERATE REACTION	RESOLVED
35) USAF DMSS 80 VAERS	PURITIS, SWELLING AT SITE, LEFT 37 CM AND RIGHT 32 CM IN UNAFFECTED ARM, ERYTHEMA 2 DAYS AFTER 2ND VACCINATION	RESOLVED
36) USN DMSS 84 VAERS 120468	PURITIS AND ERYTHEMA AT THE INJECTION SITE, TENDER, 4X4CM FOLLOWED BY A 5X5CM AREA ERYTHEMA	RESOLVING
37)USMC DMSS 85 VAERS 120487	LEFT ARM EDEMA, ERYTHEMA, PURITIS POST 2ND VACCINATION AFTER 2-3 DAYS. LASTING 5 DAYS, SWELLING OF ENTIRE ARM	RESOLVED
38) USAF DMSS 92 VAERS	LOCALIZED EDEMA, ERYTHEMA AND PRURITIS	RESOLVED

OPERATION DESERT STORM
(AMSA UNVAILIDATED)

ODS	JOINT PAIN, FATIGUE, RASH DYSPNEA	HOSP/RESOLVED
ODS	RASH, FATIGUE, DYSPNEA	RESOLVED
ODS	ABD PAIN, FATIGUE, JOINT PAIN	HOSP/RESOLVED
ODS	RASH, JOINT PAINS, FATIGUE, LYMPH NODE SWELLING	RESOLVED

Anthrax Vaccine Immunization Program

Executive Overview Brief to the National Academy Of Sciences Institute Of Medicine

2 October 1998

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

AGENDA

- **Background**
  - ➤ SECDEF Direction
  - ➤ Concept of Execution
  - ➤ Total Force AVIP
  - ➤ Immunization Tracking Systems
  - ➤ Roles and Responsibilities
- **Vaccine Acquisition, Stockpiling and Distribution**
- **Clinical Outcomes**
- **Service Member Refusals**
- **Current Topics**
- **Force Immunization Status**

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

BACKGROUND

- **Anthrax - A Significant Battlefield Threat**
  - ➤ Routes of Infection - Ingest, Skin, Inhale (99% Lethal)
- **Anthrax Countermeasures**
  - ➤ Vaccine - Safe, Effective, 28 yr Record, Fully FDA Licensed
  - ➤ Protocol - 6 Doses Over 18 Mos; Annual Booster
- **Key Directives**
  - ➤ Nov 93 DOD 6205.3, Immunization Programs for Biological Warfare Defense
  - ➤ Dec 97 SECDEF Press Announcement
  - ➤ Mar 98 SECDEF Approved SWA Accelerated Program
  - ➤ May 98 SECDEF Approved Total Force Program

ANTHRAX KILLS VACCINATION PROTECTS

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

BACKGROUND: SECDEF DIRECTION/STATUS

- **Vaccinate the Total Force With Anthrax Vaccine Beginning With Forces Assigned or Rotating to High Threat Areas. Four Preconditions:**

	STATUS	RESP	EC DATE	STATUS
1. Supplemental Testing		JPO-BD	1QFY99	Dr. Gilbreath, JPO-BD Supply Testing Ongoing;
2. Tracking System	Co[redacted]te	J4(MRD)	15 Jul 98	RADM Cowan, J4(MRD) Services' ITSs in Place
3. Op/Comms Plans	Co[redacted]te	J5	29 Apr 98	LTC Brown, J5 Service Approved Plans in Place
4. Independent Review	Co[redacted]te	Dr. Burrow	2 Mar 98	CAPT Mateczun, OASD(HA) Complete

ANTHRAX KILLS VACCINATION PROTECTS

On Track/No Impediment to Completion

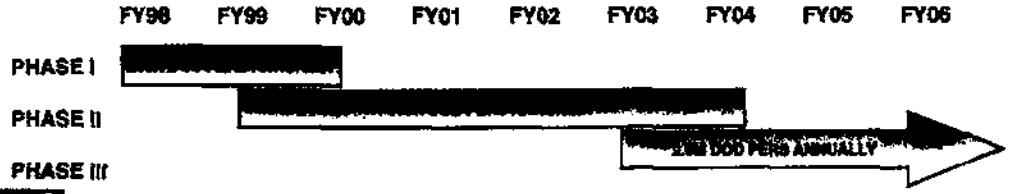
Delayed/Minor Impediment

Delayed/Major Impediment

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

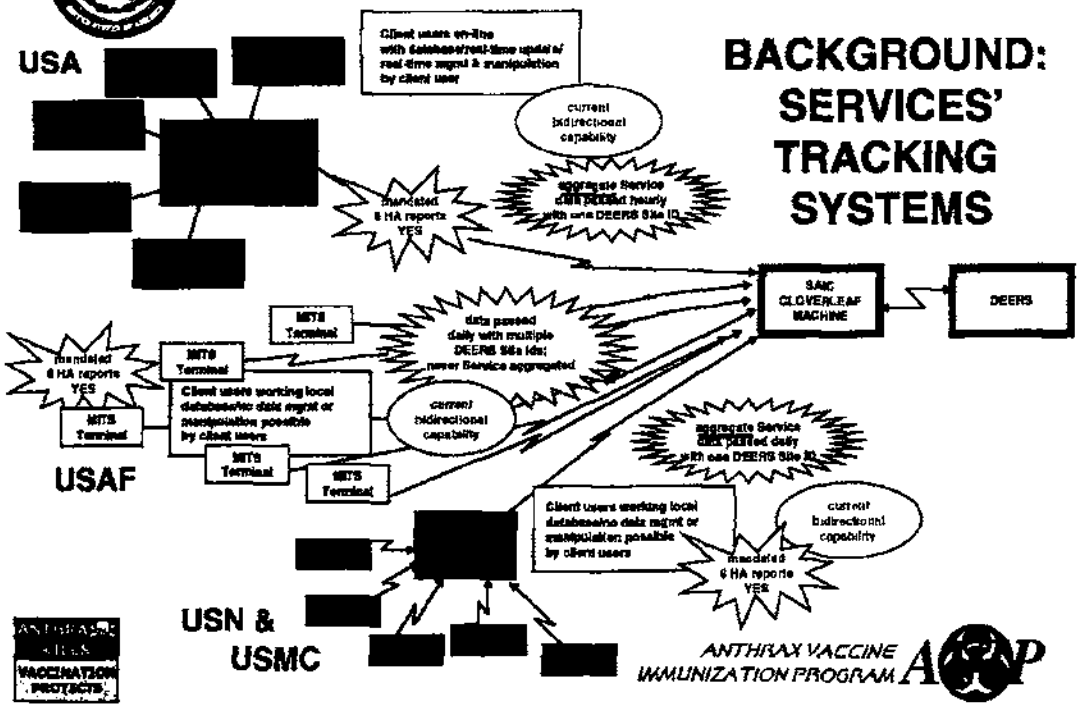
BACKGROUND: CONCEPT OF EXECUTION

- Phased Execution Across the Total Force
  - Phase I. Forces Assigned or Rotating to High Threat Areas of SWA and Korea
  - Phase II. Early Deploying Forces (C to C+35) Into High Threat Areas of SWA and Korea; RC Demo Project
  - Phase III. Remainder of Total Force, Accessions, and Program Sustainment



ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

BACKGROUND: SERVICES' TRACKING SYSTEMS



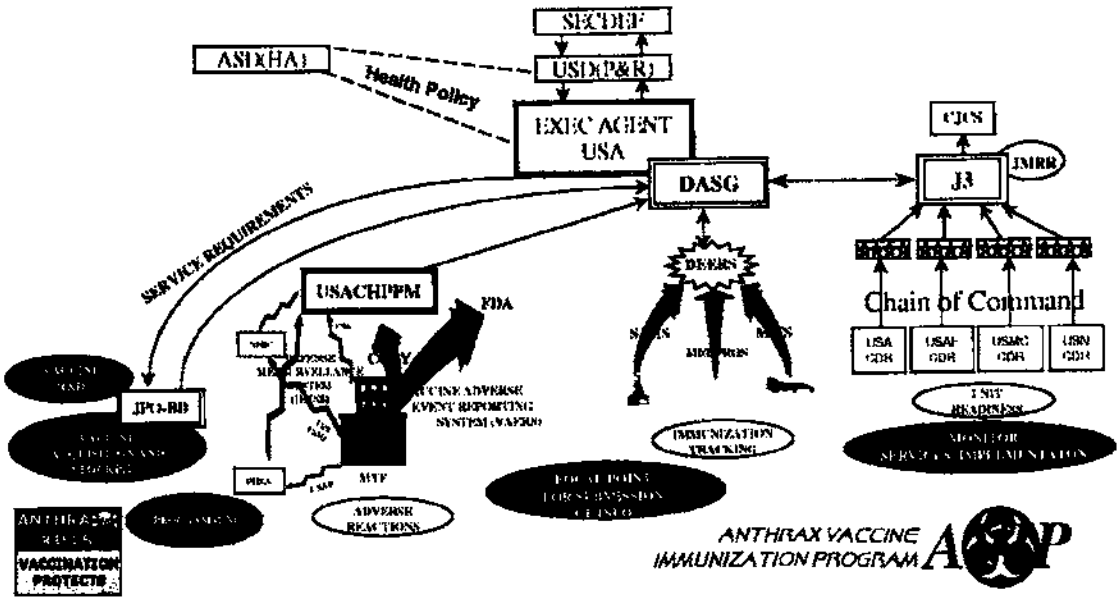
ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

BACKGROUND: ROLES AND RESPONSIBILITIES

- USD (P&R) - Monitors Implementation
- SECARMY - DOD Executive Agent
  - ➤ Vaccine Acquisition/Stockpiling/Programming
  - ➤ Vaccine Research/Development
  - ➤ Focal Point for Information Submission
  - ➤ Monitor Services' Implementation
  - ➤ Qtrly Report to USD (P&R)
- Service Secretaries
  - ➤ Implement, Monitor, Evaluate, Document Their Own AVIP
  - ➤ Coordination/Report Information to Executive Agent
- Unit Commanders - Ensure Personnel Receive/Report Req'd Vaccinations
- Med Treatment Facilities/Command Surgeons
  - ➤ Train/Equip Medics to Vaccinate
  - ➤ Policies/Procedures for Immunization Records

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

BACKGROUND: EXECUTIVE AGENCY RESPONSIBILITIES AND INFORMATION FLOW



ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

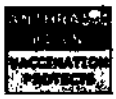
Phase I Implementation

- Began 16 Aug 98
- Continues SWA-Focused AVIP
- Begins Korea-Focused AVIP
- PCS Orders to SWA/Korea Will Reflect Anthrax Vaccination Requirement
- Continue Worldwide Centrally-Managed AVA Distribution
  - ➤ Setting New World-Class Shipping Standards
  - ➤ Presenting New Challenges (Shipment to Japan)
  - ➤ Meeting All Service Requirements

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

Implementation In Korea

- CINC's Execution Began With Flawless "Wet Run" 24-25 Aug 98
- Main Force Vaccinations Began 9 Sep 98
- Vaccine In Place To Support All Service Requirements For First Three Doses
- Immunization Tracking...
  - ➤ USAF: MITS, Already In Place
  - ➤ USA: MEDPROS, Trained and Tested
  - ➤ USMC/USN: SAMS and MEDPROS, Location Dependent



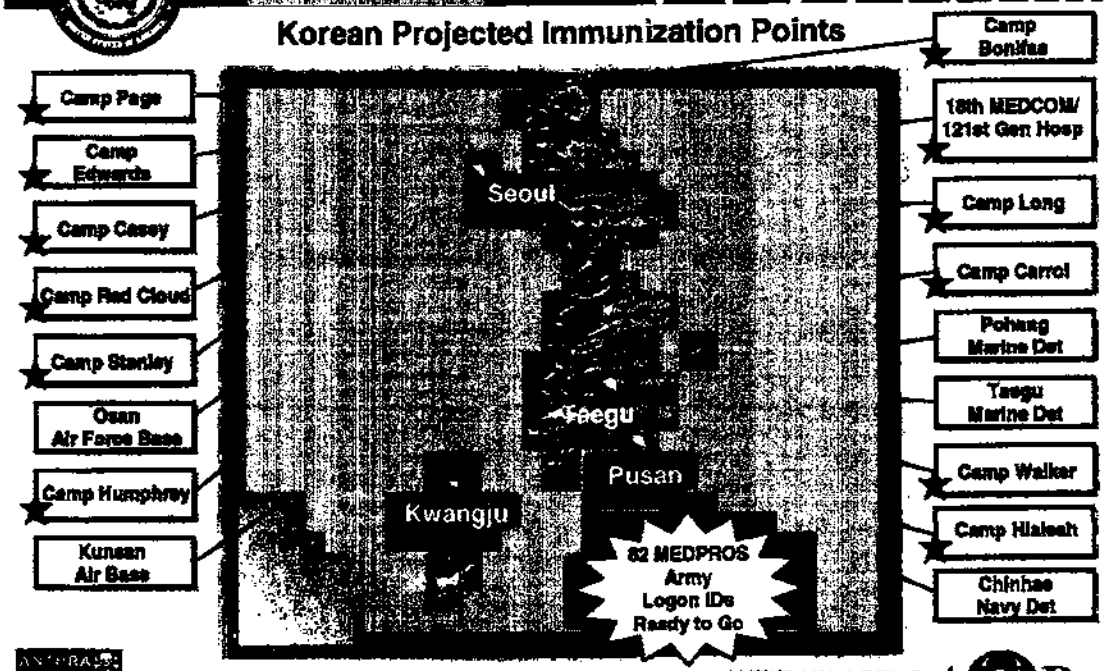
ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

Implementation in Korea
(continued)

- **USFK CINC's Communication Plan**
  - Solid, Aggressive Plan
  - Conscious Decision To Begin 24 Aug After Ulchi Focus Lens
  - Characterized By Active PAO and Command Support
  - Trifolds Given To Each Service Member
  - Commanders' Briefings To All Service Members BEFORE 9 Sep Start
  - Multiple Newspaper Articles
  - 6 TV Spots Aired Total Of 400 Times

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

Korean Projected Immunization Points



★ MEDPROS - Aug 98 Formal Training

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

Function: Vaccine Acquisition and Stockpiling

INDICATOR	STATUS/METRIC
Stockpile Supplemental Testing	**Testing Ongoing;** ➢ 8 Lots/ 800K Doses Supplementally Tested, Packaged and Labeled ➢ All Doses Completed By 1QFY99 - On Schedule
Plant Renovation	**Renovation and FDA Certification** ➢ Began Mar 98; Renovation To Be Completed Jan 99 ➢ New Vaccine Available After FDA Certification Process, 4QFY99
Plant Privatization	**Michigan State Administration Board** ➢ Transfer of Deed Complete ➢ Became BioPort Corporation effective 6 Sep 98
New Production/Expansion Contract	**Currently Negotiating Contract;** ➢ Target Completion Of Negotiated Contract 4QFY98 ➢ Expansion Completed FY04 Will Double Production Cap. to 32 Lots/Year ≅ 6.4M Doses/Year

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

Frequently Asked Questions

Los Alamos Claims of Resistant Russian Strain of Anthrax

- There is no experimental data to suggest that mixtures of anthrax strains, such as those alleged by Russian scientists, is resistant to the FDA-licensed vaccine used by the US military
- Under OSD Cooperative Threat Reduction Program, we are involved with State Center for Applied Microbiology at Obolensk, Russia

Severe Disciplinary Action Against Service Members

- FHP issue--like wearing body armor or protective mask
- Failure to follow lawful orders is a commanders issue

"Off Label Use" is You Don't Complete the Series

- No off label use if a person doesn't elect to complete series or is no longer eligible

Why Not a Voluntary Program

- The threat is real--half or one quarter of a vaccinated force attacked with a BW agent still results in a failed mission
- Long history of compulsory vaccination--tetanus, typhoid, and yellow fever was required of soldiers in WWII resulting in 0 cases of yellow fever, 12 cases of tetanus (despite 2.7M hospital admissions for wounds and injuries) and 0.05 cases per thousand of typhoid (compared to 0.42 per thousand-in WWI)

ANTHRAX VACCINE
IMMUNIZATION PROGRAM AVIP

Other parameters such as fibrin degradation products, fibrinogen, activated partial thromboplastin time, prothrombin time, and platelets were not affected.

Discussion

A human anthrax vaccine must protect against all forms of anthrax, including inhalation anthrax, which, although rare, is usually fatal. The data in this study demonstrate that the MDPH vaccine is highly efficacious against inhalation anthrax in rhesus monkeys. The rhesus monkey is a useful model for inhalation anthrax in humans, although there is currently no known surrogate marker or in vitro correlate of immunity that allows direct comparison of immunity in humans to that in monkeys. Although the current vaccine regimen in humans calls for doses at 0, 2, and 4 weeks, 6 months, 12 months, 18 months, and then yearly thereafter, in this study only two doses of vaccine, at 0 and 2 weeks, were required to provide substantial protection for almost 2 years. Based on this study's data, the MDPH human anthrax vaccine confers substantial protection against inhalation anthrax, and the recommended immunization regimen may be able to be reduced with respect to the number of doses.

PA is a major component of MDPH, and previous efficacy studies[13] demonstrated that PA must be present in a non-living anthrax vaccine or produced in a live vaccine. Other components such as edema factor, lethal factor, and cell-surface antigens may be present in some lots of MDPH and might affect the vaccine's efficacy. MDPH contains as an adjuvant aluminum hydroxide (Alhydrogel), which is a good stimulator of humoral immunity, but not cell-mediated immunity[1]. The high level of efficacy of MDPH in rhesus monkeys suggests that humoral immunity is important in the specific resistance of rhesus monkeys to anthrax. In guinea pigs, however, intramuscular immunization with MDPH only partially protects against a challenge with anthrax spores[6-10].

These findings suggest that the importance of various specific immune mechanisms against inhalation anthrax may vary in different animal species, or that the ability of the licensed human anthrax vaccine to stimulate cell-mediated immunity may be greater in some species than others.

Table 1. Protection of rhesus monkeys by MDPH from aerosol challenge by B. anthracis Ames spores

Time after first immunization	LD_{50}	Survived/total (%)		Time to death in days (range)
8 weeks[a]				
MDPH	255-760[b]	10/10	(100)	----
PBS	189-419[c]	0/5	(0)	3-5
38 weeks				
MDPH	161-247[d]	3/3	(100)	-----
100 weeks				
MDPH	290-557[e]	7/10	(70)	4
PBS	211-439[f]	0/2	(0)	4

[a]Monkeys were immunized intramuscularly at 0 and 2 wk with 0.5 ml of MDPH human anthrax vaccine. [b]Mean LD_{50} = 407. [c]All surviving monkeys had negative bacterial cultures through 10 days after challenge. [d]Mean LD_{50} = 320. [e]Mean LD_{50} = 393. Mean LD_{50} = 350. [f]One of the seven surviving monkeys had a positive bacterial culture (days 2-6) after challenge. [g]Mean LD_{50} = 523.

Table 2. Anti-PA ELISA titers of immunized monkeys

Time after first immunization	Geometric mean titers
0 weeks[a]	ND[b]
2 weeks[a] (before second immunization)	14
8 weeks[a] (before 8-wk challenge)	919
10 weeks[a] (2 weeks after challenge)	7,879
99 weeks[c] (1 week before 100-wk challenge)	200
102 weeks[d] (2 weeks after 100-wk challenge)	25,265

[a] ELISA performed by using indirect method
[b] ND = Not detectable.
[c] Not previously challenged at 8 weeks or 38 weeks.
[d] ELISA performed by using direct method. Titers obtained by the direct method gave values which were approximately 1.71-fold greater than those obtained by the indirect method

Frequently Asked Questions

Bio Weapons Arms Race

- Threat is real and consequences grave
- 810 adversaries suspected of weaponizing--twice the number since 1972 BWC
- Admissions of BW capability by USSR post cold war
- Discovery of Iraq's capability
- Aum Shinrikyo's use in the Tokyo sub-

Allegations of Expired and Contaminated Vaccine

- All lots are approved and released by the FDA
- All lots completed supplemental testing for potency, purity, sterility, and general safety with oversight from an independent agency

Plant Concerns--Who Inspects and Poor Inspection Results

- DoD conducts audits of those they are contracted with, but that in no way obviates the FDA from conducting their periodic required inspections
- FDA cited problems, but never closed the facility--plant has completed modernization of production suites and increased capacity as of Jan
- FDA will soon conduct followup inspection

ANTHRAX *VACCINE*
IMMUNIZATION PROGRAM AVIP

Frequently Asked Questions

Long Term Cancer and Fertility Studies

- Extracted from product insert--virtually no vaccine has been studied longitudinally for cancer or reproductive health
- Prevailing scientific knowledge is that vaccines do not contribute to these problems
- Polio, yellow fever, Hep A, Hep B, Tetanus, Diphtheria, Typhoid, MMR have similar product insert statements

GWI Link

- The IOM, PAC, VA, and NIH have investigated the cause of GWI and concluded that the anthrax vaccine does not explain the long term chronic effects

Efficacy Studies Against Inhalation Mode of Transportation

- Field studies conducted in late 1950's demonstrated efficacy in humans--unethical to continue
- Animal modes studies are extremely compelling--Rhesus monkeys with only two doses have survived lethal challenges (90-400 times the LD 50) up to 2 years later

ANTHRAX VACCINE IMMUNIZATION PROGRAM AVIP

Background: "A Grave and Emerging Threat"

● Anthrax as an Offensive BW Agent

- Highly lethal - aerosolized BW agent anthrax is estimated at 99 percent
- Easy to produce in large quantities
- Relatively easy to develop as a weapon
- Easily spread in the air over a large area
- Easily stored and dangerous for a long period
- "The Poor Nation's Atom Bomb"
- ***At least 10 countries suspected of weaponizing anthrax***

● Three Modes of Transmission

B. anthracis is not dermally lethal.

- **Cutaneous** - skin contact with infected animals or contaminated animal products.
- **Intestinal** - ingestion of spores.
- **Inhalation** - caused by inhalation of anthrax spores

Americans Becoming Aware of Bioterrorism Threat

Reuters
16-FEB-99

WASHINGTON, Feb 16 (Reuters) - Americans are waking up to the threat of bioterrorism, but growing public awareness of the issue may also be giving ideas to extremists, experts told a conference on Tuesday.

"It may not happen immediately, but somewhere, sometime in the future, terrorists may well threaten to use, or attempt to use, a biological weapon against the United States," Health and Human Services Secretary Donna Shalala said in opening the conference on bioterrorism.

The growing interest in bioterrorism was clear as people overflowed from the packed conference, organised by Johns Hopkins University and the Health and Human Services Department (HHS). Delegates ranged from intelligence experts to local emergency services officials.

"Over the last couple of years there has been a lot of interest developing," Col. Edward Eitzen, chief of operational medicine at the U.S. Army Medical Research Institute of Infectious Diseases, said in an interview.

But it was not just the government taking note, he said.

"Over the last several years we're seeing terrorist interest in this sort of thing," Eitzen added.

Experts told the conference that growing public awareness of bioterrorism inevitably generated ideas by countries like Iraq and groups like the Aum Shinri Kyo cult, which released poison gas on the Tokyo subway in 1995.

Consultant Kyle Olson of Research Planning Inc. told the group that Aum leader Shoko Asahara got his idea for a sarin gas attack partly from watching television reports about the care U.S. troops were taking in preparing for Iraq's biological and chemical weapons ahead of the 1990-91 Gulf War.

"He saw the greatest military force in the world taking extreme precautions about a third-rate country's biological weapons capability," Olson said.

The Aum group's subway attack killed 12 people and injured betweer

3,800 and 6,000 others.

"It's clear that terrorists are interested in weapons of mass destruction," said Jessica Stern, a former member of the National Security Council, who is now with the Council on Foreign Relations.

But she said she thought a low-tech assault -- similar to the salmonella poisoning of Oregon salad bars in 1984 by members of the Rajneesh group -- was more likely than someone setting off an anthrax bomb over New York City.

Religious and millennium cults were the most likely to try to take that route, Stern said.

"Some want to mimic God. Some want to mimic Hitler," she said. "Others want to mimic other terrorists and we see that in hoaxes."

Stern detailed more than 40 incidents in which people were threatened with anthrax. Usually a brown powder was sent in an envelope with a note saying the recipient had just been exposed to anthrax. Although some people were treated with antibiotics, no one became ill.

There were 37 such incidents in 1998, compared to one in 1997. Stern said more such incidents were likely as the threat of bioterrorism got more attention.

Experts also said countries like Iraq and the nations of the former Soviet Union maintained their capability to attack the United States. If they could not challenge the United States with conventional weapons, the experts said, they might turn to chemical and biological weapons of mass destruction.

"Currently the United States is unprepared to deal with a bioterrorist attack," said David Siegrist, an expert in biological terrorism at the Potomac Institute for Policy Studies, a nonprofit organisation.

He said U.N. inspectors and the US. government believed Iraq maintained a biological weapons capability despite repeated military strikes targeting its weapons industry.

Thousands of pounds (kilograms) of the medium used to grow biological warfare agents remained unaccounted for by Iraq, he said.

Aum Shinrikyo-according to NYTimes

- **BW was first weapon of choice. Produced by its Ministry of Health and Welfare. Full record not knowable--murder of key figure and destruction of records.**
- **Acquired botulinum from Japanese wilderness in March 1990 and a month later sent 3 spray trucks to crisscross Tokyo to attack 4 targets, including US naval base and Narita airport.**
- **Then acquired anthrax stock from a local university. In June and July 1993 slurry pumped from roof. Then again tried truck delivery.**
- **Returned to bot in March 1995 for a subway attack. Failure led to use of sarin 5 days later.**
- **2 buildings for bio production, with a 3rd under construction. At least one l-ton fermenter. 160 barrels of peptone. Traveled to Zaire for Ebola. Evidence of production of Q Fever. [No use of 1500 microbe banks.] Downloaded Brookhaven databank for molecular design of toxins. Bought associated software & hardware. Russian connection?**

ANTHRAX

SUMMARY

Signs and Symptoms: Incubation period is 1-6 days. Fever, malaise, fatigue, cough and mild chest discomfort is followed by severe respiratory distress with dyspnea, diaphoresis, stridor, and cyanosis. Shock and death occurs within 24-36 hours after onset of severe symptoms.

Diagnosis: Physical findings are non-specific. A widened mediastinum may be seen on CXR. Detectable by Gram stain of the blood and by blood culture late in the course of illness

Treatment: Although effectiveness may be limited after symptoms are present, high dose antibiotic treatment with penicillin, ciprofloxacin. or doxycycline should be undertaken. Supportive therapy may be necessary.

Prophylaxis: An FDA licensed vaccine is available. Vaccine schedule is 0.5 ml SC at 0, 2, 4 weeks, then 6, 12, and 16 months for the primary series, followed by annual boosters. Oral ciprofloxacin or doxycycline for known or imminent exposure.

Isolation and Decontamination: Standard precautions for healthcare workers. After an invasive procedure or autopsy is performed, the instruments and area used should be thoroughly disinfected with a sporicidal agent (chlorine).

OVERVIEW

Bacillus anthracis, the causative agent of Anthrax, is a rod-shaped, gram-positive, sporulating organism with the spores constituting the usual infective form. Anthrax is primarily a zoonotic disease of herbivores, with cattle, sheep and horses being the usual domesticated animal hosts, but other animals may be infected. Human disease may be contracted by handling contaminated hair, wool, hides, flesh, blood and excreta of infected animals and from manufactured products such as bone meal, as well as by purposeful dissemination of spores. Infection is introduced through scratches or abrasions of the skin, wounds, inhalation of spores, eating insufficiently cooked infected meat, or by flies. All human populations are susceptible. Recovery from an attack of the disease may be followed by immunity. The spores are very stable and may remain viable for many years in soil and water. They will resist sunlight for varying periods.

HISTORY AND SIGNIFICANCE

Anthrax spores were weaponized by the United States in the 1950's and 1960's before the old US. offensive program was terminated. Other countries have weaponized this agent or are suspected of doing so. The anthrax bacterium is easy to cultivate and spore production is readily induced. Spores are highly resistant to sunlight. heat and disinfectants - properties which could be advantageous when choosing a bacterial weapon, Iraq admitted to a United Nations inspection team in August of 1991 that it had performed research on the offensive use of *B. anthracis* prior to the Persian Gulf War of 1991, and in 1995 Iraq admitted to weaponizing anthrax. This agent could be produced in either a wet or dried form, stabilized for weaponization by an adversary and delivered as an aerosol cloud either from a line source such as an aircraft flying upwind of friendly positions, or as a point source from a spray device. Coverage of a large ground area could also be theoretically facilitated by multiple spray bomblets disseminated from a missile warhead at a predetermined height above the ground.

CLINICAL FEATURES

Anthrax presents as three distinct clinical syndromes in man: cutaneous, inhalational, and gastrointestinal disease. The cutaneous form (also referred to as malignant pustule) occurs most frequently on the hands and forearms of persons working with infected livestock. It begins with a papule followed by formation of a blister-like fluid-filled vesicle. The vesicle typically dries and forms a coal-black scab, hence the term anthrax (Greek for coal). Sometimes this local infection will develop into a systemic infection which is often fatal. Endemic inhalational anthrax, known as 'woolsorters' disease, is a rare infection contracted by inhalation of the spores. It occurs mainly among workers handling infected hides, wool, and furs. The intestinal form, which is also very rare in man, is contracted by the ingestion of insufficiently cooked meat from infected animals. In man, the mortality of untreated cutaneous anthrax ranges up to 25 per cent; in inhalational and intestinal cases, the case fatality rate is almost 100 percent.

DIAGNOSIS

After an incubation period of 1-6 days, presumably dependent upon the dose and strain of inhaled organisms, the onset of inhalation anthrax is gradual and nonspecific. Fever, malaise, and fatigue may be present, sometimes in association with a nonproductive cough and mild chest discomfort. These initial symptoms are often followed by a short period of improvement (hours to 2-3 days), followed by the abrupt development of severe respiratory distress with dyspnea, diaphoresis, stridor, and cyanosis. Shock and death usually follow within 24-36 hours after the onset of respiratory distress. Physical findings are

Anthrax Vaccine Research Program

Part B: Non-hunk Primate Study

Institute of Medicine
January 7, 2002

Jairam Lingappa
David Ashford
Meningitis and Special Pathogens Branch, NCID, CDC

Overview of this Presentation

- Review original NHP study design
- Comments from FDA, IOM and Expert Committees
- Modified NHP study/application to Human Clinical Study
- Integration with ongoing VDRS
- Issues to be discussed

AVRP Principal Objective

Use non-inferiority to the licensed regimen to compare alternative AVA regimens in humans

- Use animal challenge to support conclusions
  - Relate challenge outcomes at specific times to regimens and time points in the human study
  - Use challenge data to assess need for booster doses
- Evaluate immunological correlates of protection

FDA Issues for AVRP Animal Studies

- Does human AVA dose overstimulate macaques?
  - Demonstrate human dose not inappropriate for macaques

Original NHP Study Objectives

- Vaccine Dose Ranging Study (VDRS)
  - Compare immunogenicity of AVA doses
- Immunogenicity & Challenge Study (ICS)
  - Evaluate protection at different times conferred by regimens w/ or w/o booster doses
  - Identify immunologic correlates of protection

Original NHP VDRS

- Select the vaccine dose to be used for macaques

Group	Route	Dosage	N*	Schedule
1	IM	1	10	0-4 wks, 6 mns
2	IM	1:5	10	0-4 wks, 6 mns
3	IM	1:10	10	0-4 wks, 6 mns
4	IM	1:20	10	0-4 wks, 6 mns
5	IM	1:40	10	0-4 wks, 6 mns

* 2 controls per group

Original NHP ICS

- Use selected dose from VDRS to assess regimens

Group	Route	Number/ group*	Schedule**	Aerosol Challenge***
1	IM	10	0-4wks, 6 mns	12 mns
2	IM	10	0-4wks, 6 mns	18 mns
3	IM	10	0-4wks, 6-18 mns	42 mns
4	IM	10	0-4wks, 6 mns	42 mns

* 2 controls for each group
** Blood samples collected at various points
*** Ames Strain, 200 to 300 LD-50s

VDRS/ICS Study Design Concerns

- Evaluation of "appropriateness" of dose?
- How to bridge results to humans?
- Underpowered study due to likely low number of "vaccine failures"?
- Interim IOM report recommended input from expert panels

NHP and Statistics Expert Committees

- Statistics Committee (October 1-2,2001)
  - Donald Rubin, PhD, Harvard University
  - Stephen Self, PhD, Fred Hutchinson Cancer Institute
  - Greg Ridgeway PhD, Rand Corporation
- NHP Committee (October 4-5, 2001)
  - C. Scott Giebink, PhD, University of Minnesota
  - Porter Anderson, PhD, University of Rochester (retired)

Statistics Expert Committee Comments

- Selection of an "appropriate" AVA dose for NHPs is irrelevant to the study objectives
- Study is underpowered to assess specific comparisons between study arms
  - Total number of animals is low
  - Number of vaccine failures will be low

Statistics Expert Committee Recommendations

Do not focus NHP study on specific regimens

Do not use vaccine dose dilutions to select macaque dose

Do use animals to relate immune response elicited by AVA to survival

- Use vaccine dose dilutions (or other methods) to result in a varied NHP immune response
- Relate immune response to outcome from challenge

Apply relationship to human study

NHP Expert Committee Recommendations

- Concurred with recommendations of Statistics Expert Committee

Modified NHP Study-Design

Use vaccine dose dilutions to vary NHP immune response

Relate level of immunologic factors to NHP survival
- Challenge **NHPs** at **selected times after vaccination**
- **Regression analysis of immunologic factors vs. NHP survival**

Apply this relationship to the human clinical study to predict protection of **vaccinees**

CDC SAFER • HEALTHIER • PEOPLE™

CDC SAFER • HEALTHIER • PEOPLE™

Assumptions to Bridge to Human Study

Changes in immune response from varying vaccine dose are relevant to protection

The NHP immunogenicity-survival curve can be used to predict protection in humans

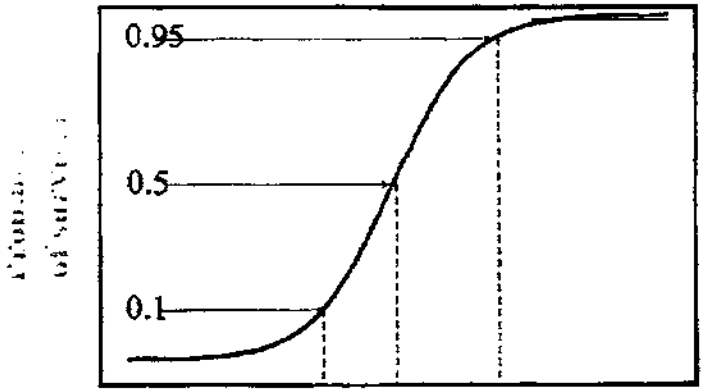
CDC SAFER • HEALTHIER • PEOPLE™

Human Clinical Study

- Primary endpoints are still:
  - Geometric mean concentration of anti-PA antibody
  - 4-fold rise of anti-PA antibody titers
  - Comparison of regimens by non-inferiority to licensed regimen
- Modified NHP study applies correlates of protection data to support human study

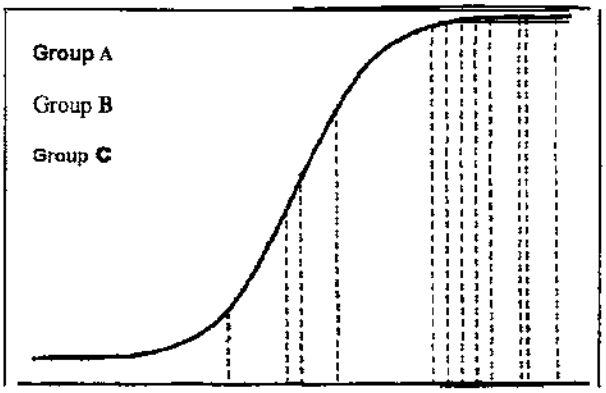
CDC SAFER • HEALTHIER • PEOPLE™

Human Clincal Study: Predicting Individual Survival Probability



CDC SAFER • HEALTHIER • PEOPLE™

Hypothetical Relationship of Human Study Groups to Predicted Survival



CDC SAFER • HEALTHIER • PEOPLE™

Modified NHP Study-Design

- Use vaccine dose dilutions to vary NHP immune response
- Relate level of immunologic factors to NHP survival
  - Challenge NHPs at selected times after vaccination
  - Regression analysis of immunologic factors vs. NHP survival
- Apply this relationship to human clinical study to predict protection of vaccinees

CDC SAFER • HEALTHIER • PEOPLE™

Modified NHP Study Details

- Challenge times
- Allocation of animals to vaccination dilution groups

CDC SAFER • HEALTHIER • PEOPLE™

Issues Affecting Selection of Challenge Times

- At 12 months - macaques protected* with high antibody titers
  At 24 months - continued protection* with no antibody present
  No data for challenge several years after vaccination
  1:12 dilution dose yields* deaths at 12 month challenge

  Early VDRS data will be helpful at further defining challenge times

* 2-dose regimen

CDC SAFER • HEALTHIER • PEOPLE™

Modified NHP Study

Dose*	Total #	Challenge Times**		
		Early	Middle	Late
Full dose	13	0	5	9
1:5	21	7	6	8
1:10	20	7	6	7
1:20	22	8	7	7
1:40	16	9	7	0

****Measured from start of vaccination**

CDC SAFER • HEALTHIER • PEOPLE™

Integration of Current VDRS: Maximize Efficiency

- 60 existing VDRS **NHPs now** 9 months from start of vaccination
  - Allocate to challenge at middle and late challenges
- 48 animals vaccinated during 2002
  - Allocate to challenge at early and middle challenges
  - Adjust vaccination times so challenges can be grouped (several additional animals)

CDC SAFER • HEALTHIER • PEOPLE™

Summary

- Concerns expressed about VDRS/ICS study design
- Modified NHP study recommended by statistics experts
  - Use vaccine dose dilution to vary immune response
  - Relate immune response to survival
  - Apply relationship to human study to predict survival probability
- Modified study can be integrated with current VDRS
  - Allocate existing VDRS animals to later challenge
  - Time vaccination of new animals to allow challenges to be grouped

MEMORANDUM FOR SECRETARY OF THE ARMY

SUBJECT: Notice of GAO Final Testimony without Recommendations

Reference: GAO Testimony, GAO/T-NSIAD-99-148, "MEDICAL READINESS: Safety and Efficacy of the Anthrax Vaccine," April 29, 1999 (GAO Code 713030/OSD Case 1828)

The GAO recently forwarded copies of the referenced testimony to the DoD. A copy is enclosed for your information and review. The DoD was not afforded an opportunity to comment on the draft testimony.

The GAO has advised that the testimony is only an interim product for the referenced review. A full report is planned at the completion of the audit. Accordingly, underlying GAO code 713030 should remain open.

Since the testimony is essentially informational and contains no recommendations, DoD comments are not required and no further action is necessary. However, if you determine that a DoD response to the testimony is needed, please advise us by June 4 and we will jointly establish a schedule for developing and coordinating the proposed response. Otherwise, we will close the case without further action.

If you have questions, please contact my action officer for this case, Mr. (b)(6), (b)(6), e-mail (b)(6) @dodig.osd.mil>. If he is not available, contact Mr. (b)(6), (b)(6). Our fax number is (b)(6).

Safety and Efficacy of the Anthrax Vaccine

Statement of Kwai-Cheung Chan, Director, Special Studies and Evaluations, National Security and International Affairs Division

Mr. Chairman and Members of the Subcommittee:

We are pleased to be here today to discuss the results of our ongoing examination of the safety and efficacy[1] of the anthrax vaccine, which is being done at your request. My testimony presents preliminary findings on (1) the short- and long-term safety of the vaccine, (2) the efficacy of the vaccine, and (3) problems the Food and Drug Administration (FDA) found in the vaccine production facility in Michigan that could compromise the safety, efficacy, and quality of the vaccine. We plan to issue the final report on our review this fall.

As you know, concerns have been raised about the Department of Defense's (DOD) anthrax immunization program since the Department began vaccinating the first of 2.4 million active duty and reserve members. For example, some Gulf War veterans are suffering from unexplained illnesses that they believe might have been caused by anthrax vaccines that they received during the war. Also, some active duty military personnel expressed concerns regarding the safety and efficacy of the anthrax vaccine after the FDA found problems during the inspection of the facility that was manufacturing the anthrax vaccine. With this background, I will discuss our results.

Results in Brief

The anthrax vaccine being given to U.S. military personnel was licensed in 1970. Before the vaccine was licensed, the vaccine and the manufacturing process were changed, creating a similar vaccine, produced by the Michigan Department of Public Health (MDPH), which was the one eventually licensed.[2] The safety study conducted before licensing used both the original vaccine and MDPH vaccine. Knowledge to date about the safety of the vaccine includes the results of the original study and a 1998 DOD study of 500 vaccine recipients. While these studies identified varying

[1]Safety means relative freedom from harmful effects to persons affected directly or indirectly by a product that has been prudently administered, taking into considerations the character of the product in relation to the condition of the recipient at the time. Efficacy is not an absolute term. It is a measure of a product's ability to produce a given response. An effective vaccine will provide a certain degree of protection for a certain period of time.

[2]The original license for the production of anthrax vaccine was issued to MDPH. In 1995, the facility changed its name to the Michigan Biologic Products Institute. In 1998, the facility was sold, and its name was change to BioPort. The term MDPH will be used to refer to the licensed facility throughout this testimony.

rates of adverse reactions, they did not question the safety of the vaccine. The long-term safety of the vaccine has not yet been studied.

Prior to the time of licensing, no human efficacy testing of the MDPH vaccine was performed. However, a study was done on the efficacy of the original vaccine. This study concluded that the vaccine provided protection to humans against anthrax penetrating the skin. In the 1980s, DOD began testing the efficacy of the licensed vaccine on animals, focusing on its protection against inhalation anthrax. DOD recognizes that correlating the results of animal studies to humans is necessary and told us that it is planning research in this area.

Careful control of the manufacturing process is essential to ensure the quality of the product. The FDA inspections of the facility where the licensed vaccine was manufactured uncovered numerous problems. The facility received warning letters from FDA, including one in March 1997 stating its intent to revoke the facility's license. The facility closed its plant in 1998 and is now being renovated. FDA requires the manufacturer to meet specifications for sterility, stability, purity, and potency. In addition to the lot release testing required by FDA, DOD is conducting supplemental testing of each lot from this plant before distributing the vaccine.

Background

The nature and magnitude of the military threat of biological warfare (BW) has not changed since 1990, both in terms of the number of countries suspected of developing BW capability, the types of BW agents they possess, and their ability to weaponize and deliver those BW agents. Inhalation anthrax is considered by DOD to be the primary BW threat because of its lethality, ease of production, and weaponization.

The original anthrax vaccine was developed by George Wright in the 1950s and first produced on a large scale by Merck. After a 1962 study on the vaccine's effects in mill workers, its manufacturing process was changed, and MDPH took over as the vaccine's producer. This changed vaccine was licensed in 1970 by the Division of Biologics, National Institute of Health, to be manufactured by MDPH.

Vaccines have three distinguishing features that contrast with those of chemical drugs. First, either they have no clearly chemically defined composition, or simple chemical analysis is insufficient for effective characterization. Second, proper evaluation of them (qualitatively or quantitatively) is usually done by measuring their effects *in vivo* (in the

living organism). Finally, quality cannot be guaranteed from final tests on random samples but only from a combination of in-process tests, end-product tests, and strict controls of the entire manufacturing process.

Vaccine Safety

Studies have been performed to examine the safety of both the original vaccine and the licensed vaccine. These two vaccines were made using different processes and have different data to support their safety. While these studies identified varying rates of adverse reactions, they did not question the safety of the vaccine. The long-term safety of the vaccine has not yet been studied.

Data on Safety of the Original Vaccine

A study on the original vaccine's safety was done by Philip Brachman and published in 1962.[3] Brachman reported on 379 subjects that received this vaccine. About 35 percent had local reactions, a figure that varied during the inoculation series. Some recipients developed more severe edema that extended to the mid-forearm or wrist. Two individuals had systemic reactions in addition to the edema. The researchers actively collected data on adverse reactions to the vaccine, and the study concluded that individual reactions to the vaccine were relatively minor.

Data on Safety of the Licensed Vaccine

After the original vaccine was developed, MDPH was granted a license for a similar vaccine that differed from the original vaccine in three ways. First, the manufacturing process changed when MDPH took over. Second, the strain of anthrax that Merck used to grow the original vaccine was changed, and another strain was used to grow the MDPH vaccine. Finally, to increase the yield of the protective antigen (which is believed to be an important part of the vaccine's protective effects), the ingredients used to make vaccine were changed from the original vaccine.

Four safety studies have been done that include the licensed vaccine. The results of those studies are presented in table 1. The Center for Disease Control collected data on the Investigational New Drug (IND) study, DOD collected data for both the Pittman study and the Tripler Army Medical Center (TAMC) Anthrax Survey, and DOD is currently collecting reports on

[3]P.S. Brachman et al., Field evaluation of a human anthrax vaccine, American Journal of Public Health, vol. 52 (1962), pp. 632-645.

adverse events. The number of adverse reactions appears to depends, in part, upon whether the mechanism for monitoring reactions is active or passive. (Active monitoring means that the vaccine recipients are contacted to ascertain any adverse reactions after vaccine administration; passive monitoring means that the onus is on the vaccine recipients to report any adverse reactions after vaccine administration.) None of the studies questioned the vaccine's safety.

Table 1: Reactions to Licensed Anthrax Vaccine Reported in Various Studies

			Local reactions (percent)		Systemic reactions (percent)	
Study	Type of reporting	Number vaccinated (or doses)	Mild	Moderate/ severe	Mild	Moderate/ severe
IND	Active/passive	3,984[a]	6 – 20[b]	1 – 10[b]	None[b]	.05[b]
Pittman (1997)	Active	508	16	5	29[c]	14
TAMC (1998)	Active	536	Not addressed	Not addressed	43[d]	5
DOD (Current monitoring)	Passive	223,000[e]	e	e	e	e

[a]This number represents the number of study participants who received the first dose of the licensed vaccine.

[b]These figures represent the percentage of people who experienced this type of reaction during the study, even if they had previously been inoculated with the Merck vaccine.

[c]This figure also includes persons who had reactions of "unknown" severity.

[d]This figure represents the frequency of the most common side effect, myalgia.

[e]DOD testified that as of March 16, 1999, more than 223,000 servicemember have been immunized. There had been 42 reports on adverse effects submitted to the FDA and CDC. Only seven servicemembers required hospitalization or experienced loss of duty for more than 24 hours.

Vaccine Efficacy

Studies on the efficacy of the original and the licensed vaccines have been limited to a study of the efficacy of the original vaccine for humans, and studies of the efficacy of the licensed vaccine for animals. The study on the original vaccine concluded that the vaccine offered protection against anthrax penetrating human skin. The studies on the licensed vaccine focused on the efficacy of the vaccine in protecting animals against inhalation of anthrax. These studies, while showing some positive results, may not be extrapolated to humans. DOD is planning to conduct such correlating studies.

Human Efficacy Study

The only study of the efficacy of the vaccine for humans was performed by Brachman, using the original vaccine. The Brachman study claimed that the vaccine gave 93 percent (and a lower confidence limit of 65 percent) protection against anthrax penetrating the skin. It found that the number of individuals who contracted anthrax by inhalation was too low to assess the efficacy of the vaccine against this form.

Because the vaccine used in the Brachman study was different from the licensed vaccine, additional data were submitted to the Division of Biologics, Department of Health, Education, and Welfare (HEW), to support the license application for the MDPH vaccine. In a February 1969 memorandum, an HEW committee concluded that based on the data, the assumption of efficacy appeared speculative. Similarly, a 1991 Army document noted that "it would be scientifically incorrect to assume that this (*licensed*) vaccine would be totally efficacious under different circumstances, that is, beyond the parameters of the study design." Thus, assuming that the epidemiological evidence from the original vaccine is applicable to the licensed vaccine, we can conclude that the licensed vaccine is efficacious against cutaneous exposure but that testing still needs to be conducted on inhalation anthrax. In the absence of a specific study, efficacy of the licensed vaccine for humans has been inferred from other data, including a reduction in the incidence of anthrax following immunization of at-risk individuals and from animal experiments.

Animal Efficacy Studies of Licensed Vaccines

Beginning in the late 1980s, DOD began studying the efficacy of vaccines on animals, using guinea pigs, rabbits, and monkeys. All of these studies support the view that in these animals, the licensed vaccine can protect against exposure to some strains of anthrax either by inoculation or inhalation. It is clear, however, that animal species differ in their susceptibility. Studies of guinea pigs show that some anthrax strains are more or less resistant to vaccines for humans (both the U.S. and U.K. versions) but are protected by the live spore veterinary vaccine.[4]

[4]P.C.B Turnbull, et al., Development of antibodies to protective antigen and lethal factor components in humans and guinea pigs and their relevance to protective immunity, Infectious Immunology, vol. 52 (1988) pp. 356-363.

Research using monkeys showed for the first time that monkeys could be protected against aerosol exposure.[5] However, in both the guinea pig and monkey studies, protection did not correlate with levels of antibodies to a protective antigen. Several studies have shown no direct comparison of immunity in humans to that in monkeys. Study findings suggest that "the importance of various specific immune mechanisms against inhalation anthrax may vary in different animal species or . . . the ability of the licensed human vaccine to stimulate cell-mediated immunity may be greater in some species than others." A 1998 study comes to the same conclusion and emphasizes the need for further studies. In animals, the lack of correlation of protection with antibodies to protective antigen has some important consequences.

DOD recognizes the importance of establishing a correlate of immunity in humans. Recently, it has sought to develop a serologic correlate of immunity in an animal model to use for humans.

Vaccine Manufacturing Process

The quality of a vaccine is closely linked to its manufacturing process, which must be rigorously controlled to ensure that batches of vaccines produced on different occasions are of reproducible and consistent quality. In general, quality is achieved by applying the current good manufacturing practice. This process is not static but involves manufacturers and regulators in a continuing process of assessment and upgrades as scientific progress, technical development, and experience help to identify deficiencies and make improvements possible. Such principles also apply to the facilities and equipment in which products are manufactured.

Accordingly, vaccine production is very highly regulated to ensure that the products are of consistent quality and safe and effective for the purpose(s) for which regulatory approval was granted. Until 1993, FDA inspectors did not inspect the MDPH facility where the anthrax vaccine was made. According to FDA, access was not granted because its inspectors had not been vaccinated against anthrax.

FDA's inspections of the MDPH facility found a number of deficiencies. The deficiencies that FDA identified in its February 1998 inspection fall

[5]B.E. Ivins, et al., Efficacy of a standard human anthrax vaccine against Bacillus anthracis aerosol challenge in rhesus monkeys, in "Proceedings of the International Workshop on Anthrax, Salisbury Medical Bulletin, Special Supplement no. 87 (1996) pp. 125-126.

broadly into two categories: those that, although serious, might affect only one or a limited number of batches that were produced when the deficiency was extent and those of a generic nature that could compromise the safety and efficacy of any or all batches. DOD had also identified deficiencies during a March 1992 inspection, including the absence of stability studies. In 1998, MDPH closed its plant, which is now being renovated. DOD has directed that supplemental testing be done on the lots of vaccine in the current inventory.

Mr. Chairman, this concludes my statement. I will be happy to answer any questions you or members of the Subcommittee may have.

Ordering Information

The first copy of each GAO report and testimony is free. Additional copies are $2 each. Orders should be sent to the following address, accompanied by a check or money order made out to the Superintendent of Documents, when necessary, VISA and MasterCard credit cards are accepted, also.

Orders for 100 or more copies to be mailed to a single address are discounted 25 percent.

Orders by mail:

U.S. General Accounting Office
P.O. Box 37050
Washington, DC 20013

or visit:

Room 1100
700 4th St. NW (corner of 4th and G Sts. NW)
U.S. General Accounting Office
Washington, DC

Orders may also be placed by calling (202) 512-6000
or by using fax number (202) 512-6061, or TDD (202) 512-2537.

Each day, GAO issues a list of newly available reports and testimony. To receive facsimile copies of the daily list or any list from the past 30 days, please call (202) 512-6000 using a touchtone phone. A recorded menu will provide information on how to obtain these lists.

For information on how to access GAO reports on the INTERNET, send an e-mail message with "info" in the body to:

MEMORANDUM FOR SECRETARY OF THE ARMY

SUBJECT: General Accounting Office Letter, "Various Issues Involving the Anthrax Vaccine," (GAO Code 713048): NOTIFICATION OF GAO REVIEW

The Department of Defense (DoD) recently received the enclosed General Accounting Office (GAO) notification letter announcing a new review. At the request of Chairman Dan Burton, House Committee on Government Reform, the GAO plans to assess several issues concerning the anthrax vaccine as discussed in the GAO letter.

The DoD Directive 7650.2 designates this office as the central DoD liaison for tasking, controlling, and monitoring GAO survey, review, and report activities. The enclosed Information Sheet describes the specific DoD procedures for tasking GAO surveys/reviews and the DoD Primary Action Office (PAO) responsibilities.

Your office is the PAO for the review. We have been advised that (b)(6), located in the Office of the Army Surgeon General, is your action officer for this case. An identification of the collateral action offices (CAOs) follows this memorandum. The CAOs are requested to provide Col Gerber and this office, if they have not already done so, with the name, phone number, fax number, and mailing address of their action officers as soon as possible.

An entrance conference for this review was held on August 30 in conjunction with the entrance conference for the related GAO review of adverse reactions to the anthrax vaccine, GAO Code 713047. Staying informed on GAO survey/review activity depends on the PAO, the other involved DoD components, and this office working closely together. Your full support is requested in these efforts to prevent surprises related to the GAO review and to ensure that the DoD obtains the maximum benefits from the GAO work.

If you have questions, please contact my action officer for this case, Mr. (b)(6), (b)(6), e-mail (b)(6) @dodig.osd.mil>.

If he is not available, please call Mr. (b)(6), (b)(6) (b)(6). Our fax number is (b)(6).

August 30, 1999

The Honorable William S. Cohen
The Secretary of Defense

Attention: DOD Office of the Inspector General
Deputy Director for GAO Affairs

Dear Mr. Secretary:

This is to advise you that the U.S. General Accounting Office is beginning a study examining various aspects of anthrax vaccine. The assignment code is 713048. This study is in response to a request from Chairman Dan Burton, House Government Reform Committee.

The objectives of the study include addressing the following issues:

1) What scientific information is required by the Food and Drug Administration for administration of a vaccine to children and pregnant or lactating women? Were these studies conducted for the anthrax vaccine?

2) What is the ongoing Biological Warfare vaccine research? How has the Department of Defense addressed these issues?

3) What proportion of pilots at select bases have resigned or become sick as a result of the administration of the anthrax vaccine? What characteristics are important to consider for a diverse and representative sample of pilots impacted by the anthrax immunization program?

4) What ongoing studies are being conducted by the Department of Defense to follow the health of members who have experienced adverse events?

5) Is the Department of Veterans Affairs treating patients with health conditions resulting from the anthrax vaccine, or other vaccines? Are there any long-term follow-up studies?

6) How accurate and scientifically valid is the information the Department of Defense is disseminating to the public and its members on the safety and efficacy of the anthrax vaccine? This should include a review of the web sites, brochures, and the video that has been tested in Hawaii?

If you have any questions regarding this work, please contact me at (b)(6), or (b)(6), Assistant Director, at (b)(6)

Sincerely yours,

(b)(6)

Director, Special Studies and Evaluations

INFORMATION SHEET
(Revised 11/96)

DoD PROCEDURES FOR PROCESSING, MONITORING, AND MANAGING GENERAL ACCOUNTING OFFICE (GAO) SURVEYS AND REVIEWS
(References: DoD Directives 7650.1, 7650.2)

1. GAO Notification Letters of Surveys and Reviews

Before contacting DoD officials to initiate new survey/review work, the GAO has agreed to issue a notification letter to the Secretary of Defense, Attention: OIG, DoD, Deputy Director for GAO Affairs. The notification letter includes the objectives of the planned work and a six digit GAO assignment code. When the GAO staffs contact DoD personnel, they should be asked if they have properly announced their work with a notification letter through the OIG, DoD. The GAO staffs should be prepared to provide a copy of the notification letter on request. The DoD personnel should verify that the GAO work has been announced within the Department. They can contact the appropriate component audit liaison, collateral action office, or this office. If the GAO work has been announced, this office can telefax a copy of the GAO notification letter along with the DoD official announcement. Meetings should not be scheduled nor information released until the GAO work is properly announced. All questions or special arrangements on GAO surveys and reviews should be coordinated with GAO Affairs-- the address, phone number and telefax number is as follows:

Office of the Inspector General, DoD
Deputy Director for GAO Affairs
400 Army Navy Drive, Room 539A
Arlington, VA 22202-2884

Commercial: (b)(6) DSN: (b)(6)
Telefax: DSN:
Telefax: DSN:

2. GAO Notices of Visit and Security Clearances

Besides the GAO notification letter, the GAO should notify appropriate agency officials about 10 days before any proposed visit using the "Notice of GAO Visit" form. The GAO should provide a copy of that form to GAO Affairs. In cases of unusual urgency, the GAO should make arrangements with the agency officials by phone. The responsibility for assuring that a GAO representative has the proper clearance to review/receive classified information rests with the DoD individual providing the information.

If a GAO representative does not provide the notice of visit or if the DoD contact needs additional information, the assigned GAO Affairs action officer should be contacted for assistance.

3. **Tasking of GAO Surveys and Reviews**

On receipt of a GAO notification letter, GAO Affairs identifies the primary action office (PAO) and a PAO point of contact through discussions with DoD component audit liaison offices and DoD officials. For most surveys/reviews, the PAO is at the Office of the Secretary of Defense (OSD) staff level. The OIG issues a tasking memorandum assigning responsibility for the GAO effort to the PAO with copies to identified collateral action offices (CAO).

The DoD component audit liaisons receive action or information copies of the GAO Affairs tasking memorandum for further distribution to the appropriate offices. The memorandum is given wide distribution to help identify action offices and inform them of the GAO review. This is important so that the correct DoD components attend the GAO entrance, interim status, and exit meetings.

4. **GAO Entrance, Interim Status, and Exit Meetings**

The GAO Affairs action officer will work with the PAO and the CAO to arrange a joint, headquarters level entrance meeting. The purpose of the entrance meeting is to provide the PAO, CAOs and other DoD components with details about the GAO review. It is an opportunity to ask questions and provide the GAO the names of DoD points of contact.

The PAO, CAO, and GAO Affairs should work together to help ensure that (1) interim status and exit meetings are held, when appropriate, (2) the PAO, CAO, and OIG action officers attend such meetings, and (3) the meetings include all key DoD officials. The PAO and CAO action officers, through their ongoing contacts with the GAO, should be alert to the need for interim status and exit meetings, and should advise GAO Affairs in advance so that appropriate actions can be taken to facilitate the meeting.

Before any interim status or exit meeting at the headquarters level, the GAO usually holds separate meetings at the field activity level. Action officers at the field level should advise the PAO of such meetings through the component CAO or the component audit liaison.

The purpose of interim status and exit meetings with the GAO is to provide the DoD an opportunity to discuss the accuracy and completeness of the GAO work results and to avoid surprises to the DoD. The GAO Affairs action officer will normally ask for an exit meeting before the GAO issues a draft or final report.

The interim status and exit meetings are particularly important because these meetings may be the only DoD opportunity to comment on GAO work that could result in budget reductions or program direction decisions by the Congress. The GAO Affairs action officer will ask the GAO to provide work products (fact sheets, draft reports, advance testimony, or other written documents not officially issued) before the meetings to better prepare DoD officials in providing accurate and complete comments.

The DoD officials' comments provided at interim status and exit meetings are unofficial. The only official DoD comments (whether oral or written) are those that are properly coordinated with all the appropriate DoD offices through the OIG, DoD.

5. Access to Records

Under 31 U.S.C. 716(a), the GAO has broad access rights. The DoD Directives 7650.1 and 7650.2 provide the DoD policy and procedures regarding GAO access to records. Both oral and written requests from GAO representatives should be handled informally. Efforts should be made to accommodate the GAO needs at the lowest organization level possible.

If it is unclear what information the GAO is requesting orally, it may be appropriate to ask the GAO to put its request in writing, listing the specific documents requested and explaining the need in connection with the survey or review. While oral requests should be acceptable, written requests can help clarify the information desired.

The DoD components and action officers should not deny the GAO access without further checking through the appropriate channels. Depending on the document(s) requested, that could include: officials in the chain of command, the component legal office, the audit liaison office, the PAO, and the appropriate OSD general counsel's office. The GAO Affairs action officer will provide assistance as necessary, working with DoD component liaison officials in processing action requests and arranging meetings between DoD and GAO representatives.

If informal attempts fail and the GAO decides to pursue its request, the Comptroller General, by law, may issue a formal demand letter to the Secretary of Defense. By law, the DoD has 20 days to respond to the GAO. If after 20 days full access has not been granted, the Comptroller General may file a written report with the President of the United States, the Director of the Office of Management and Budget, and the Attorney General. Following that, the Comptroller General may seek a court order to compel the release of Federal records or subpoena nonfederal records.

6. GAO Questionnaires and other Data Collection Instruments

All questionnaires and other data collection instruments should be coordinated with the Deputy Director for GAO Affairs before distribution within the DoD. Any DoD component or official receiving GAO questionnaires or other data collection instruments should ask the GAO staff if they have properly coordinated the instrument through the OIG. Responses should not be provided nor information released until the GAO has properly coordinated its work.

7. Termination of Surveys/Reviews

The GAO should notify the DoD through the Deputy Director for GAO Affairs when it decides to terminate a survey or review without issuing an external report. The GAO sometimes overlooks issuing a termination letter to the DoD. If the PAO or CAO action officers learn that GAO work is terminated, they should alert GAO Affairs.

MEMORANDUM FOR SECRETARY OF THE ARMY

SUBJECT: General Accounting Office Letter, "DoD Efforts to Address Adverse Reactions to the Anthrax Vaccine," (GAO Code 713047): NOTIFICATION OF GAO REVIEW

On August 19, 1999, the Department of Defense (DoD) received the enclosed General Accounting Office (GAO) notification letter announcing a new review. At the request of Representative Jan Schakowsky, the GAO plans to evaluate how the DoD has addressed adverse reactions to the anthrax vaccine, with a particular emphasis on different rates of reactions between men and women.

The DoD Directive 7650.2 designates this office as the central DoD liaison for tasking, controlling, and monitoring GAO survey, review, and report activities. The enclosed Information Sheet describes the specific DoD procedures for tasking GAO surveys/reviews and the DoD Primary Action Office (PAO) responsibilities.

Your office is the PAO for the review. We have been advised that (b)(6) located in the Office of the Army Surgeon General, is your action officer for this case. An identification of the collateral action offices (CAOs) follows this memorandum. The CAOs are requested to provide Col Gerber and this office, if they have not already done so, with the name, phone number, fax number, and mailing address of their action officers as soon as possible.

This office has contacted the GAO to arrange a joint, headquarters level entrance meeting so that the GAO can identify and discuss its detailed work plans and begin work. The entrance conference is scheduled for Monday, August 30 at 10:00 in room 691, Skyline 6. Each action office should send a representative to the entrance conference, as appropriate.

Staying informed on GAO survey/review activity depends on the PAO, the other involved DoD components, and this office working closely together. Your full support is requested in these efforts to prevent surprises related to the GAO review and to ensure that the DoD obtains the maximum benefits from the GAO work.

AUG 24 1999

If you have questions, please contact my action officer for this case, Mr. (b)(6), (b)(6), e-mail (b)(6)@dodig.osd.mil>. If he is not available, please call Mr. (b)(6), (b)(6). Our fax number is (b)(6)

Attention: DOD Office of the Inspector General
Deputy Director for GAO Affairs

Dear Mr. Secretary:

This is to advise you that the U.S. General Accounting Office is beginning a study examining how DOD has addressed adverse reactions to the anthrax vaccine, with a particular emphasis on different rates of such reactions between men and women. The assignment code is 713047. This study is in response to a request from Representative Jan Schakowsky, a member of the Government Reform Committee.

The objectives of the study include addressing the following three major issues:

1) to what extent do gender differences exist with regard to anthrax vaccine, what scientific research has been done with regard to this issue, and how have those military personnel who developed adverse reactions to anthrax vaccine been treated by DOD medical personnel;

2) To what extent does DOD incorporate women in military medical research (past and ongoing); and

3) What strategies has DOD developed for management of adverse reactions for vaccines.

If you have any questions regarding this work, please contact me at (b)(6) or (b)(6), Assistant Director, at (b)(6).

Sincerely yours,

(b)(6)

Director, Special Studies and Evaluations

Issues Concerning the Anthrax Vaccine

Statement of Kwai-Cheung Chan, Director Special Studies and Evaluations, National Security and International Affairs Division

GAO/T-NSIAD-99-226

Mr. Chairman and Members of the Subcommittee:

We are pleased to be here today to share the results of our work on the anthrax vaccine. As you know, questions have been raised about the Department of Defense's (DOD) anthrax immunization program because of concerns related to (1) the safety and efficacy of the vaccine and (2) problems found over the past few years by the Food and Drug Administration (FDA) during its inspection of the facility that was manufacturing the vaccine. We reported our findings on these issues to you in previous testimonies.[1]

In December 1997, the Secretary of Defense announced that all U.S. forces would be inoculated against the potential use of anthrax on the battlefield. Although a version of the anthrax vaccine was shown to be effective against cutaneous exposure, the vaccine has not been tested against inhalation anthrax in humans. DOD has recognized that some of the concerns about using the current vaccine might be mitigated in the future through actions such as testing and research and adjustments to the program based on new data.

As requested, we will discuss (1) the extent to which data support the need for six initial shots and an annual booster of the anthrax vaccine, (2) the relative merits and weaknesses of a passive surveillance system in determining adverse events,[2] (3) the available data on differences in adverse reaction rates between men and women receiving the anthrax vaccine, and (4) the disadvantages of the current vaccine and the status of federal efforts to develop an improved anthrax vaccine.

Results in Brief

No studies have been done to determine the optimum number of doses of the anthrax vaccine. A study done during the early 1950s showed that animals could be protected against cutaneous anthrax using a three-dose schedule. However, the number of doses was increased to six when three people who had received three doses of the vaccine were infected after exposure to anthrax. In a study of the vaccine's human efficacy published

[1] Medical Readiness: Safety and Efficacy of the Anthrax Vaccine (GAO/T-NSIAD-99-148, Apr. 29, 1999) and Contract Management: Observations on DOD's Financial Relationship With the Anthrax Vaccine Manufacturer (GAO/T-NSIAD-99-214, June 30, 1999).

[2] Clinical events reported to a passive surveillance system are usually termed adverse events rather than adverse reactions because causally-related events to the vaccine is not usually possible.

in 1962, a six-dose schedule was used, and the researchers concluded that the vaccine provided protection against cutaneous exposure to anthrax.[3] In 1998, the current manufacturer of the vaccine submitted an FDA application (Investigational New Drug) to determine whether the number of shots in the initial schedule could be reduced from six to five. Although annual boosters are given, the need for this frequency and the amount of the booster dose has also not been evaluated.

DOD submits data on adverse events associated with the anthrax vaccine to the Vaccine Adverse Events Reporting System (VAERS).[4] This system has several advantages. It alerts FDA/CDC to previously unreported or unexpected increases in reported adverse events. It is also a relatively affordable way to supplement the data collected on vaccines before they are licensed. However, it is a passive surveillance system, which means that FDA/CDC must rely on vaccine recipients or their health care providers to report any adverse events after receiving the vaccine; studies show that adverse events are reported significantly less than they would be in an active surveillance system. In an active system, which is generally more costly to administer, vaccine recipients are monitored to find out if they had any adverse events after being inoculated.

In addition to reporting data to VAERS, DOD has conducted three efforts to actively collect data on adverse reactions after servicemembers received the anthrax vaccine. Data from these efforts show that women reported twice the rate of adverse reactions than men for both local (e.g., swelling) and systemic (e.g., malaise and chills) reactions. In addition, a higher proportion of women than men reported making an outpatient medical visit after a vaccination, and more than twice the percentage of women reported that they missed one or more duty shifts after their vaccinations than did men.

The anthrax vaccine has several disadvantages. The amount of protective antigen in the vaccine cannot be precisely measured, and it varies from lot to lot. Also, the requirement for a six-dose schedule and annual booster shots, rather than a smaller number of doses, complicates the logistics of inoculating all of DOD's troops and increases the cost of the vaccine program. Knowledge of anthrax infection and studies of experimental

[3]P.S. Brachman et al., "Field evaluation of a human anthrax vaccine," American Journal of Public Health, vol. 52 (1962), pp. 632-645.

[4]The system is an FDA/Centers for Disease Control and Prevention (CDC) system.

anthrax vaccines indicate that a second-generation vaccine with a more precise amount of protective antigen could be developed and that fewer doses of the vaccine would be required. However, a second-generation vaccine has not been fully tested, and the testing required for licensing alone would take about 3 years. FDA approval of the manufacturing of the vaccine would take longer. In 1995, the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID)[5] developed a second-generation recombinant vaccine (that is, a vaccine produced through DNA extraction) against anthrax. The vaccine was tested on animals, but clinical trials were not conducted in humans. DOD currently considers such a vaccine an unfunded requirement. The Department of Health and Human Services recently funded several active research grants to develop a second-generation recombinant vaccine because of a perceived growing bioterrorism concern. In developing a new vaccine, researchers also believe they should consider the impact of new and engineered strains of anthrax.

Background

DOD currently plans to vaccinate all 2.4 million servicemembers against anthrax using the vaccine licensed in 1970 by the Division of Biologics Standards, National Institutes of Health (NIH). As of July 14, 1999, more than 300,000 servicemembers had received at least one dose of the vaccine. Initial immunization consists of three shots given at 0, 2, and 4 weeks followed by three additional shots given at 6, 12, and 18 months.

Some studies have been done on the short-term effects of the licensed vaccine. We previously testified that the number of adverse reactions reported in these studies partly depended on whether an active or passive surveillance system was used to monitor adverse reactions.[6] Also, we reported that the long-term safety of the vaccine has not been investigated but that DOD is considering a study to examine long-term effects of the vaccine.

[5]USAMRIID, an organization of the U.S. Army Medical Research and Materiel Command, conducts research to develop strategies, products, information, procedures, and training programs for medical defense against biological warfare threats and naturally occurring infectious diseases that require special containment. It is located at Fort Detrick, Maryland.

[6]Medical Readiness (GAO/T-NSIAD-99-148, Apr. 29, 1999).

Data on the Need for Six Shots Are Not Available

The original inoculation schedule of three doses was based on a regimen developed using animals in the early 1950s. However, three people (two in Fort Detrick and one in a private wool mill) who received three doses of the vaccine became infected after exposure to anthrax. The number of doses was then increased to six for the human efficacy study published in 1962. The study did not provide enough information to determine whether the vaccine was effective against inhalation anthrax. There were no studies done to determine the optimum number of doses of the vaccine. Also, according to DOD researchers, the choice of six doses was arbitrary. The license for the vaccine, which was granted to the Michigan Department of Public Health (MDPH),[7] calls for the six-dose schedule and annual boosters used in the human efficacy study, and DOD has followed this regimen. In September 1998, BioPort submitted to FDA an application (Investigational New Drug) to determine whether the number of shots in the initial schedule could be reduced from six to five.

In November 1971, the Division of Biologics Standards, NIH, noted an apparent increase in reports of adverse reactions after individuals received booster shots. The Division considered it advisable to reevaluate the need for annual boosters and possibly the amount of the booster dose. Although the record is unclear as to whether or not NIH requested a reevaluation, to date, no such reevaluation has been done.

The Relative Merits and Weaknesses of Passive Surveillance Systems in Determining Adverse Events

DOD submits data on adverse events associated with the anthrax vaccine to VAERS. VAERS is a passive surveillance system to alert FDA and CDC of adverse events that may be associated with licensed vaccines. Information is voluntarily reported to VAERS by health care providers, patients, or families, who are encouraged to report any adverse events after a person receives a vaccine.

VAERS has several advantages. It is a relatively affordable way to supplement data on short-term adverse events that are collected using active means during the clinical trials before a vaccine is licensed. Most important, however, VAERS serves as a signal for the detection of previously unreported adverse events and/or unexpected increases in

[7]MDPH was granted the original license to produce the anthrax vaccine. In 1995, the facility changed its name to the Michigan Biologic Products Institute. In 1998, the facility was sold, and its name was changed to BioPort.

reported events. Prelicensing clinical trials are limited in detecting the range of adverse reactions because of the small samples, short durations, and the homogeneous population used as subjects. In addition, both the general public and doctors can report adverse events to the system, and the data is open to public scrutiny.

VAERS also has several disadvantages. Studies show that adverse events are often underreported in a passive surveillance system.[5] A former FDA commissioner acknowledged the underreporting of adverse events in passive surveillance systems and cited one study showing that "only about 1 percent of serious events" attributable to drug reactions are reported to FDA.[6] Reporting of adverse events appears to depend on several factors, such as the clinical seriousness of the event, the length of time between the shots and the event, and health care workers' awareness of and obligation to report particular adverse events. Also, outcomes with delayed onset after vaccination or outcomes not generally recognized to be associated with vaccination are often underreported. According to the National Vaccine Information Center, there is no mechanism within VAERS for a 1-, 3-, or 10-year follow-up to evaluate vaccine reactions that have a long latency period. According to CDC, the limitations of VAERS data suggest it is not a valid source for assessing the rate of adverse events.

In an active surveillance system, health care workers monitor people that have been vaccinated to find out if they have had adverse reactions. Such systems are generally used during clinical trials and are more costly to administer than passive systems because of the additional infrastructure and personnel required. However, such systems are sometimes used to obtain information when questions arise about the safety of a vaccine after licensing.

Scott, et al., "Rhode Island Physicians' Recognition and Reporting of Adverse Drug Reactions," Rhode Island Medical Journal, vol. 70 (1987), pp. 311-316.

Women Report More Adverse Reactions Than Men

In addition to DOD's reporting of adverse events to VAERS, DOD has conducted three efforts to actively collect data that can be used to examine gender differences in adverse reactions after servicemembers have received the anthrax vaccine. The first effort, conducted by USAMRIID, included data on shots given at Fort Detrick during 1977-96. The second effort, conducted in 1999 by a DOD physician stationed in Korea, was a survey given to servicemembers when they reported for their initial six-dose schedule of shots; it asked questions about their reactions to the previous shot. Results from this effort reflect the researcher's preliminary analysis of the data. The third effort, conducted in 1998-99 at Tripler Army Medical Center, Hawaii, included a survey on adverse reactions to the first three shots when individuals reported for their fourth shot and later included a follow-up survey on adverse reactions to the fourth shot. None of the efforts used a control group. Also, all three relied on self-reported data and were not adjusted for factors such as occupation, physical activity level, and age. Because of differences in the way data were collected, reaction rates are not strictly comparable among the different efforts.

According to the data gathered in all three efforts, a higher proportion of females reported reactions to the anthrax vaccine than did their male counterparts. Tables 1 and 2 summarize the rates of reported reactions to the vaccine during the two efforts at Fort Detrick and in Korea. The researchers at Fort Detrick determined that the statistical difference was significant[10] in the reported reaction rates of males and females after their second and subsequent shots. The researchers for the other two efforts did not report whether the difference in reported reaction rates was statistically significant.

[10]Tests of significance deal with the question of whether a difference is real or just a chance variation. It does not deal with the question of how important the difference is or what caused the difference. The test does not check the design of the study. If a test is significant at the 99-percent level, the results could be due to chance 1 percent of the time.

Table 1: Gender Differences in the Reported Rate of Reactions to the Anthrax Vaccine, From Fort Detrick Data (1977-98)

Dose number	Males percent (number of doses)	Females percent (number of doses)
First	3.75 (1,013)	3.86 (259)
Second	3.06[a] (979)	7.29[a] (247)
Third	1.71[a] (938)	5.06[a] (237)
Fourth and subsequent	3.40[b] (5062)	7.06[b] (737)

Note: As a result of GAO's recalculation, the percentages reflect minor differences from those reported by the researcher.

[a]The gender difference in reported reaction rates is statistically significant at the 99-percent confidence level.

[b]The gender difference in reported reaction rates is statistically significant at the 99.99-percent confidence level.

Source: DOD.

Table 2: Preliminary Data on Gender Differences in the Reported Rate of Reactions to the Anthrax Vaccine, From Korea Survey (1999)

Dose number	Males percent (number of doses)	Females percent (number of doses)
First	42.1 (2036)	71.8 (495)
Second	44.4 (1953)	74.0 (474)

Note: This represents a preliminary analysis of the data by the researcher, and at the time of our review, data on reactions to the third shot were not available.

Source: DOD.

The data gathered in Korea shows that after the first two shots, more than twice the proportion of women reported the systemic reactions of fever, malaise, or chills than men (see table 3).

Table 3: Preliminary Data on Gender Differences in Systemic Reactions, From Korea Survey (1999)

Numbers in percent

	Fever		Malaise		Chills	
Dose number	Male	Female	Male	Female	Male	Female
First	0.9	2.8	6.0	15.6	1.5	5.5
Second	1.7	4.8	7.1	15.4	1.9	4.0

Note: This represents a preliminary analysis of the data by the researcher, and at the time of our review, data on reactions to the third dose were not available.

Source: DOD.

The Tripler effort also demonstrates gender differences in reported reactions (see table 4). These data show that a higher proportion of women reported making an outpatient visit after a vaccination than their male counterparts. In addition, more than twice the proportion of women reported that they missed one or more duty shifts after their vaccinations than did males.

Table 4: Gender Differences in Reported Local Reactions, Outpatient Medical Visits, and Missed Duty, From Tripler Army Medical Center Survey (1998-99)

Numbers in percent

Reaction	Dose 1	Dose 2	Dose 3	Dose 4
Moderate to severe redness				
Male	17.5	20.4	17.2	31.6
Female	49.1	46.9	51.4	39.8
Swelling of lower arm				
Male	9.7	9.5	9.2	7.1
Female	13.4	13.5	13.0	8.4
Pain limiting motion of elbow				
Male	9.7	8.7	7.6	7.9
Female	17.1	13.5	11.7	8.6
Localized itching				
Male	25.2	25.7	24.5	27.7
Female	62.6	60.4	57.9	39.2
Lump or knot				
Male	63.9	64.4	60.5	65.5
Female	89.9	87.8	83.6	73.2
Muscle soreness				
Male	66.6	64.7	61.8	60.4
Female	79.7	76.4	70.8	61.6
Outpatient medical visit				
Male	5.3	2.0	2.7	
Female	10.0	13.8	3.9	[a]
Missed one or more shifts of duty				
Male	2.2	2.0	0.9	
Female	5.0	5.1	3.9	[a]

Note: Between 421 and 471 men and between 74 and 83 women responded to each question on the survey.

[a]Data were not available.

Status of Federal Efforts to Develop a Second-Generation Anthrax Vaccine

According to researchers and the Institute of Medicine of the National Academy of Sciences, the current anthrax vaccine has several disadvantages.[11] The amount of protective antigen in the vaccine is variable from lot to lot because the manufacturing process cannot precisely quantify the antigen.[12] Also, there is some evidence that the current anthrax vaccine may have diminished efficacy against certain virulent strains of anthrax (*Bacillus anthracis*). And the required six-dose schedule and annual boosters complicate the logistics of inoculating all of DOD's troops and increase the cost of the vaccine program.

According to DOD research, a second-generation recombinant vaccine created with a process that is fully defined, quantified, and controlled in terms of protective antigen, can be developed and that fewer doses could be required.[13] DOD research also shows that a recombinant vaccine could be created using modern techniques to produce highly purified protective antigen. This process not only would remove unwanted bacterial proteins but also would enable precise amounts of the purified protective antigen to be incorporated into the vaccine. A further potential benefit is that, compared to the current vaccine, the protective antigen could be produced in a nonspore-forming organism. As a result, according to DOD officials, manufacturers could use their buildings and equipment to produce the anthrax vaccine as well as other vaccines.

In 1995, USAMRIID developed a new recombinant protective antigen vaccine against anthrax. This vaccine was successfully tested in experiments using animals but has not been tested on humans. USAMRIID officials stated that this testing would take about 3 years, and FDA approval of the manufacturing of the vaccine could take years longer. DOD considers further development of this vaccine candidate an unfunded requirement. In response to the perceived threat of bioterrorism, the

Singh et al., "Study of Immunization Against Anthrax with the Purified Recombinant Protective Antigen of *Bacillus anthracis*," Journal of Infection and Immunity, vol. 66 (1998), pp. 3447-3448.

Department of Health and Human Services' National Institute of Allergy and Infectious Diseases formed a working group to develop and test a second-generation anthrax vaccine. The Institute recently funded several active research grants in this regard.

In developing a second-generation recombinant anthrax vaccine, researchers believe they will need to address the additional problem of whether strains of deliberately engineered or naturally occurring anthrax can overcome the protective immunity of such a vaccine. A variation in virulence among anthrax strains and a variation in relative resistance to vaccine-induced immunity has been observed in experiments on animals. However, the reasons for the variation have not been scientifically proven.

Mr. Chairman, this concludes my formal statement. If you or other members of the Subcommittee have any questions, we will be pleased to answer them.

Contacts and Acknowledgments

For future contacts regarding this testimony, please contact Kwai-Cheung Chan at 512-3652. Individuals making key contributions to this testimony included Sushil Sharma, Howard Deshong, and Nancy Ragsdale.

Ordering Information

The first copy of each GAO report and testimony is free. Additional copies are $2 each. Orders should be sent to the following address, accompanied by a check or money order made out to the Superintendent of Documents, when necessary, VISA and MasterCard credit cards are accepted, also.

Orders for 100 or more copies to be mailed to a single address are discounted 25 percent.

Orders by mail:

MEMORANDUM FOR SECRETARY OF THE ARMY

SUBJECT: Notice of GAO Final Letter Report without Recommendations

Reference: GAO Final Report, GAO/NSIAD-00-54R, "Safety and Efficacy of the Anthrax Vaccine," November 4, 1999 (GAO Code 713057/OSD Case 1916-A)

The GAO recently forwarded copies of the referenced letter report to the DoD. A copy is enclosed for your information and review. The DoD was not provided an opportunity to comment on a draft of the report.

The GAO did not perform additional review work in the DoD to prepare the letter. Rather, the GAO drew from information developed under prior GAO reviews. It also reflects information that was included in the referenced GAO testimonies presented earlier this year.

As the final report contains no recommendations, DoD comments are not required. However, if you determine that an official DoD response to the letter report is needed, please advise us by December 17 and we will jointly establish a schedule for developing and coordinating the proposed response. Otherwise, we will close the case without further action.

We are also providing copies of the final report and this memorandum to the collateral action officers (CAOs) and to your action officer, (b)(6). If you have questions, please contact my action officer, Mr. (b)(6) at (b)(6), e-mail (b)(6)@dodig.osd.mil. If he is unavailable, contact Mr. (b)(6) at (b)(6). Our fax number is (b)(6).

The Honorable Steve Buyer
Chairman, Subcommittee on Military Personnel
Committee on Armed Services
House of Representatives

Subject: Summary of GAO's Findings on the Safety and Efficacy of the Anthrax Vaccine

Dear Mr. Chairman:

Concerns have been raised about the Department of Defense's (DOD) anthrax immunization program since DOD began vaccinating its 2.4 million active duty and reserve members in 1998. At your request, we are providing you with information we have previously reported concerning (1) the need for a six-shot regimen and annual booster shots, (2) the long- and short-term safety of the vaccine, (3) the efficacy of the vaccine and (4) the extent to which problems the Food and Drug Administration (FDA) found in the vaccine production facility in Michigan could compromise the safety, efficacy, and quality of the vaccine.[1] We are also providing for you the three testimonies that are the source of the information we are providing you today.

BACKGROUND

The original anthrax vaccine was developed in the 1950s and was first produced on a large scale by the Merck Pharmaceutical Corporation. In 1962, a study was published on the safety and efficacy of the Merck vaccine against cutaneous anthrax in wool mill workers. Later, the Michigan Department of Public Health took over as the vaccine's producer but the manufacturing process, the strain, and the ingredients differed from the Merck vaccine. This changed vaccine, which is the vaccine currently being given to U.S. military personnel, was licensed in 1970 by the Division of Biologics Standards, National Institutes of Health. FDA is currently responsible for licensing new vaccines and ensuring vaccine safety.

[1] *Medical Readiness: Safety and Efficacy of the Anthrax Vaccine* (GAO/T-NSIAD-99-148, Apr. 29, 1999); *Medical Readiness: Issues Concerning Anthrax Vaccine* (GAO/T-NSIAD-99-226, July 21, 1999); and *Anthrax Vaccine: Safety and Efficacy Issues* (GAO/T-NSIAD-00-48, Oct. 12, 1999).

As of July 1999, more than 315,000 service members had received at least one dose of the vaccine. Initial immunization consists of three shots given at 0, 2, and 4 weeks followed by three additional shots given at 6, 12, and 18 months.

SUMMARY OF OUR KEY FINDINGS

Our work has identified that data on the current immunization schedule and the vaccine's safety and efficacy is limited in some areas. Moreover, FDA has identified some deficiencies concerning the manufacturer's controls over the vaccine's quality. DOD and the company that purchased the vaccine production facility in 1998 have several efforts planned or underway to address these issues.

Data on the Need For Six Shots and Annual Boosters Are Unavailable

No studies have been done to determine the optimum number of doses of the anthrax vaccine. A three-dose regimen was used initially for the original vaccine based on a regimen developed using animals in the early 1950s. However, the number of doses was increased to six after three people who received three doses of the vaccine became infected. The licensed vaccine adopted this schedule and DOD has followed this regimen. Although annual boosters are required, the need for annual booster shots has not been evaluated.

Long-term and Short-term Safety of the Vaccine

The long-term safety of the licensed vaccine has not been studied. However, DOD is designing studies to examine the vaccine's long-term effects.

With regard to short-term safety, according to FDA officials, data from two studies conducted prior to licensing of the current anthrax vaccine are difficult to interpret since one study used the original vaccine, and part of the study population in the other study had already received the original vaccine.

Post-licensing data on safety are limited because only a limited number of doses—about 68,000—were distributed by the manufacturer from 1974 through 1989. Also FDA did not establish its Vaccine Adverse Event Reporting System (VAERS) until 1990. This system, which DOD uses, alerts FDA and the Centers for Disease Control to increases in adverse events.[2] However, it is a passive surveillance system, which means that FDA and the Centers for Disease Control must rely on vaccine recipients or their health care providers to report any adverse events after receiving the vaccine. Studies show that adverse events are reported significantly less frequently with passive surveillance systems than they would be in an active system where vaccine recipients are monitored to find out if they had any adverse effects.

[2]Clinical events reported to a passive surveillance system such as FDA's are usually termed adverse events rather than adverse reactions because there is usually insufficient evidence that the vaccine, rather than other health conditions, caused the reported events.

DOD has recently conducted two studies using active monitoring where DOD personnel contacted the vaccine recipients directly to find out if they had any adverse reactions. Data from these studies, conducted in 1998 and 1999, showed that a higher proportion of women reported both local and systemic reactions to the vaccine than their male counterparts. In addition, data from one of the studies showed that more than twice the proportion of women reported that they missed one or more duty shifts after their vaccinations than did males.

Vaccine Efficacy

A study on the efficacy of the original vaccine concluded that it provided protection to humans against anthrax penetrating the skin but did not provide sufficient data to determine its effectiveness against anthrax that was inhaled. Beginning in the late 1980's, DOD began studying the efficacy of the licensed anthrax vaccine on animals, using guinea pigs, rabbits, and monkeys. All of these studies support the view that in these animals, the licensed vaccine can protect against exposure to some but not all strains of anthrax either by inoculation or inhalation. It is clear, however, that animal species differ in their susceptibility. Studies of guinea pigs show that some anthrax strains are more or less resistant to vaccines for humans but are protected by the live spore veterinary vaccine.

Research using monkeys showed for the first time that monkeys could be protected against aerosol exposure. However, several studies have shown no direct comparison of immunity in humans to that in monkeys. DOD officials recognize that correlating the results of animal studies to humans is necessary and told us that DOD is planning research in this area. DOD also plans to develop a second generation anthrax vaccine, and as part of this effort, it will need to address whether strains of deliberately engineered or naturally occurring anthrax can overcome the protective immunity of such a vaccine.

Problems with the Vaccine Manufacturing Process

With regard to the manufacturing process, it is important to note that the quality of a vaccine is closely linked to its manufacturing process, which must be rigorously controlled to ensure that batches of vaccines produced on different occasions are of consistent quality. Accordingly, vaccine production is highly regulated to ensure that the products are of consistent quality and safe and effective for the purpose(s) for which regulatory approval was granted. Until 1993, FDA inspectors did not inspect the Michigan Department of Public Health facility where the anthrax vaccine was made. According to FDA, access was not granted because its inspectors had not been vaccinated against anthrax. DOD conducted inspections, however, and identified deficiencies during a March 1992 inspection.

FDA's inspections of the vaccine production facility in 1996 and 1998 found a number of deficiencies. The deficiencies that FDA identified in its February 1998 inspection fall broadly into two categories: those that might affect only one or a limited number of batches that were produced and those that could compromise the

safety and efficacy of any or all batches. In 1998, the manufacturer shut down the facility for renovation. A new company, which purchased the facility in mid-1998, is addressing the issues identified by FDA.

If you need additional information on these issues, please call me on (b)(6) or (b)(6) Assistant Director, on (b)(6)

Sincerely yours,

(b)(6)

Director, Special Studies and Evaluations

MEMORANDUM FOR SECRETARY OF THE ARMY

SUBJECT: Notification of GAO Review

Reference: GAO Letter, "DoD's Anthrax Vaccine Immunization Program," January 14, 2000 (GAO Code 713059)

On January 27, 2000, the GAO announced plans to begin the referenced review, which is the latest in a series of reviews dealing with various aspects of the anthrax vaccine issue. The referenced review was mandated in the FY 2000 Defense Appropriations Conference Report and will address (1) the program's effects on military morale, retention, and recruiting, (2) civilian costs and burdens associated with adverse reactions of Reserve members, (3) the adequacy of long and short term health monitoring, and (4) an assessment of the anthrax threat. A copy of the GAO letter is enclosed.

In accordance with DoD Directive 7650.2, we have identified your office as DoD's primary action office (PAO) for the review. Enclosed is an information sheet that explains PAO and collateral action office (CAO) responsibilities and provides guidance for working with GAO.

We will be coordinating with your action officer to arrange an entrance conference so that the GAO can discuss its objectives and its audit plan for the review. Each CAO will be notified when the meeting arrangements are made and should plan to send a representative to the entrance conference, as appropriate. In addition, each CAO should provide us and the PAO listed below with the name, e-mail address, phone and fax numbers, and mailing address of their action officer, if they have not already done so.

Your action officer for this case is COL Fred Gerber, (b)(6), Office of the Army Surgeon General. If you have questions, please contact my action officer, Mr. (b)(6) at (b)(6), e-mail (b)(6) @dodig.osd.mil>. If he is not available, please call Mr. (b)(6) at (b)(6). Our fax number is (b)(6).

United States General Accounting Office
Washington, DC 20548

National Security and
International Affairs Division

January 14, 2000

The Honorable William Cohen
The Secretary of Defense

Attention: DOD Office of the Inspector General
Deputy Director for GAO Affairs

Dear Mr. Secretary:

As mandated in the Fiscal Year 2000 Defense Appropriations Conference Report (106-371), the General Accounting Office is initiating a review of DOD's Anthrax Vaccine Immunization Program (AVIP). Specifically, we have been asked to report on (1) the program's effects on military morale, retention, and recruiting, (2) the civilian costs and burdens associated with adverse reactions of reserve component members, (3) the adequacy of long/short term health monitoring, and (4) the assessment of the anthrax threat. The work will be conducted under assignment code 713059.

If you should have any questions regarding this work, please contact me on (b)(6) (b)(or my Assistant Director, (b)(6), on (b)(6).

Sincerely yours,

(b)(6)

Director, Special Studies
and Evaluations

INFORMATION SHEET
(Revised 11/96)

DoD PROCEDURES FOR PROCESSING, MONITORING, AND MANAGING GENERAL ACCOUNTING OFFICE (GAO) SURVEYS AND REVIEWS
(References: DoD Directives 7650.1, 7650.2)

1. GAO Notification Letters of Surveys and Reviews

Before contacting DoD officials to initiate new survey/review work, the GAO has agreed to issue a notification letter to the Secretary of Defense, Attention: DIG, DoD, Deputy Director for GAO Affairs. The notification letter includes the objectives of the planned work and a six digit GAO assignment code. When the GAO staffs contact DoD personnel, they should be asked if they have properly announced their work with a notification letter through the OIG, DoD. The GAO staffs should be prepared to provide a copy of the notification letter on request. The DoD personnel should verify that the GAO work has been announced within the Department. They can contact the appropriate component audit liaison, collateral action office, or this office. If the GAO work has been announced, this office can telefax a copy of the GAO notification letter along with the DoD official announcement. Meetings should not be scheduled nor information released until the GAO work is properly announced. All questions or special arrangements on GAO surveys and reviews should be coordinated with GAO Affairs-- the address, phone number and telefax number is as follows:

Office of the Inspector General, DoD
Deputy Director for GAO Affairs
400 Army Navy Drive, Room 539A
Arlington, VA 22202-2884

Commercial:	(b)(6)	DSN:	(b)(6)
Telefax:		DSN:	
Telefax:		DSN:	

2. GAO Notices of Visit and Security Clearances

Besides the GAO notification letter, the GAO should notify appropriate agency officials about 10 days before any proposed visit using the "Notice of GAO Visit" form. The GAO should provide a copy of that form to GAO Affairs. In cases of unusual urgency, the GAO should make arrangements with the agency officials by phone. The responsibility for assuring that a GAO representative has the proper clearance to review/receive classified information rests with the DoD individual providing the information.

If a GAO representative does not provide the notice of visit or if the DoD contact needs additional information, the assigned GAO Affairs action officer should be contacted for assistance.

3. Tasking of GAO Surveys and Reviews

On receipt of a GAO notification letter, GAO Affairs identifies the primary action office (PAO) and a PAO point of contact through discussions with DoD component audit liaison offices and DoD officials. For most surveys/reviews, the PAO is at the Office of the Secretary of Defense (OSD) staff level. The OIG issues a tasking memorandum assigning responsibility for the GAO effort to the PAO with copies to identified collateral action offices (CAO).

The DoD component audit liaisons receive action or information copies of the GAO Affairs tasking memorandum for further distribution to the appropriate offices. The memorandum is given wide distribution to help identify action offices and inform them of the GAO review. This is important so that the correct DoD components attend the GAO entrance, interim status, and exit meetings.

4. GAO Entrance, Interim Status, and Exit Meetings

The GAO Affairs action officer will work with the PAO and the CAO to arrange a joint, headquarters level entrance meeting. The purpose of the entrance meeting is to provide the PAO, CAOs and other DoD components with details about the GAO review. It is an opportunity to ask questions and provide the GAO the names of DoD points of contact.

The PAO, CAO, and GAO Affairs should work together to help ensure that (1) interim status and exit meetings are held, when appropriate, (2) the PAO, CAO, and OIG action officers attend such meetings, and (3) the meetings include all key DoD officials. The PAO and CAO action officers, through their ongoing contacts with the GAO, should be alert to the need for interim status and exit meetings, and should advise GAO Affairs in advance so that appropriate actions can be taken to facilitate the meeting.

Before any interim status or exit meeting at the headquarters level, the GAO usually holds separate meetings at the field activity level. Action officers at the field level should advise the PAO of such meetings through the component CAO or the component audit liaison.

The purpose of interim status and exit meetings with the GAO is to provide the DoD an opportunity to discuss the accuracy and completeness of the GAO work results and to avoid surprises to the DoD. The GAO Affairs action officer will normally ask for an exit meeting before the GAO issues a draft or final report.

The interim status and exit meetings are particularly important because these meetings may be the only DoD opportunity to comment on GAO work that could result in budget reductions or program direction decisions by the Congress. The GAO Affairs action officer will ask the GAO to provide work products (fact sheets, draft reports, advance testimony, or other written documents not officially issued) before the meetings to better prepare DoD officials in providing accurate and complete comments.

The DoD officials' comments provided at interim status and exit meetings are unofficial. The only official DoD comments (whether oral or written) are those that are properly coordinated with all the appropriate DoD offices through the OIG, DoD.

5. **Access to Records**

Under 31 U.S.C. 716(a), the GAO has broad access rights. The DoD Directives 7650.1 and 7650.2 provide the DoD policy and procedures regarding GAO access to records. Both oral and written requests from GAO representatives should be handled informally. Efforts should be made to accommodate the GAO needs at the lowest organization level possible.

If it is unclear what information the GAO is requesting orally, it may be appropriate to ask the GAO to put its request in writing, listing the specific documents requested and explaining the need in connection with the survey or review. While oral requests should be acceptable, written requests can help clarify the information desired.

The DoD components and action officers should not deny the GAO access without further checking through the appropriate channels. Depending on the document(s) requested, that could include: officials in the chain of command, the component legal office, the audit liaison office, the PAO, and the appropriate OSD general counsel's office. The GAO Affairs action officer will provide assistance as necessary, working with DoD component liaison officials in processing action requests and arranging meetings between DoD and GAO representatives.

If informal attempts fail and the GAO decides to pursue its request, the Comptroller General, by law, may issue a formal demand letter to the Secretary of Defense. By law, the DoD has 20 days to respond to the GAO. If after 20 days full access has not been granted, the Comptroller General may file a written report with the President of the United States, the Director of the Office of Management and Budget, and the Attorney General. Following that, the Comptroller General may seek a court order to compel the release of Federal records or subpoena nonfederal records.

6. GAO Questionnaires and other Data Collection Instruments

All questionnaires and other data collection instruments should be coordinated with the Deputy Director for GAO Affairs before distribution within the DoD. Any DoD component or official receiving GAO questionnaires or other data collection instruments should ask the GAO staff if they have properly coordinated the instrument through the OIG. Responses should not be provided nor information released until the GAO has properly coordinated its work.

7. Termination of Surveys/Reviews

The GAO should notify the DoD through the Deputy Director for GAO Affairs when it decides to terminate a survey or review without issuing an external report. The GAO sometimes overlooks issuing a termination letter to the DoD. If the PAO or CAO action officers learn that GAO work is terminated, they should alert GAO Affairs.

NOTICE OF GAO ENTRANCE CONFERENCE

To addressees, per fax sheet:

REFERENCE: GAO audit "DoD's Anthrax Vaccine Immunization Program," (GAO Code 713059)

- The entrance conference with the GAO for the referenced new review has now been set. The meeting will be Tuesday, February 15, at 14:00 in room 640, Skyline 6. The DoDIG and Army request you send a representative to this important meeting.

- This entrance conference is our opportunity to better understand GAO's objectives in this latest anthrax review and to influence the direction the GAO work may take. Please be prepared for an open discussion of how the GAO can best achieve their objectives.

- The DoD primary action officer is (b)(6), Army Surgeon General's office, (b)(6). His fax is (b)(6).

Please call myself or COL Gerber if you have any questions.

ANTHRAX VACCINE

Preliminary Results of GAO's Survey of Guard/Reserve Pilots and Aircrew Members

Statement of Kwai-Cheung Chan, Director
Applied Research and Methods

GAO-01 -92T

Mr. Chairman and Members of the Subcommittee:

We are pleased to be here today to discuss the preliminary results of the ongoing work we are doing at your request on the Department of Defense's (DOD) Anthrax Vaccine Immunization Program. As you know, numerous concerns have been raised about the program since DOD began vaccinating its 2.4 million active duty and reserve members in 1998.[1] Of particular concern was the program's potential impact on the Air National Guard and Air Force Reserve's retention of trained and experienced personnel.

In response to your request, we are examining the impact of the vaccination program on retention, the basic views of Guard and Reserve pilots and other aircrew members regarding the program, and the extent of adverse reactions experienced by anthrax vaccine recipients. These components provide essential support to critical defense operations on a worldwide basis. They provide strategic and tactical airlift, aerial refueling, aeromedical evacuation, and augment DOD's overall fighter force.

To conduct our work, we developed, pretested, and validated a questionnaire that was sent to 1,253 randomly selected Guard and Reserve pilots and other aircrew members. These included pilots, flight engineers, loadmasters, navigators, crew chiefs, and others. Collectively, they represent about 13,000 servicemembers of the total fiscal year 1999 end strength of approximately 176,000, which includes about 29,000 officers and 147,000. enlisted personnel. We shared the draft questionnaire with DOD program officials and their medical experts and incorporated appropriate comments and suggestions. We administered the survey on an anonymous basis between May and September 2000. The overall response rate was 66 percent. Our methodology is described in detail in appendix 1. The information we are presenting today has been weighted to represent the population of Guard and Reserve pilots and other aircrew members who are currently active and assigned to a unit.

Summary

While many factors can influence an individual's decision to leave the military, surveyed Guard and Reserve pilots and aircrew members cited the anthrax immunization as a key reason for leaving or otherwise changing their military status. Since September 1998, an estimated

[1] We have previously reported on a *number of* concerns regarding the safety and efficacy of the anthrax vaccine and other *related* matters. (See appendix III).

25 percent of the pilots and aircrew members of the Guard and Reserve in this population transferred to another unit (primarily in a non-flying position), left the military, or moved to inactive status. While several reasons influenced their decision when asked to rank the one most important factor, the anthrax immunization was the highest, followed by other employment opportunities, and family reasons. Further, about one in five (18 percent) left before qualifying for military retirement benefits. Additionally, 18 percent of those still participating in or assigned to a unit reported their intentions to leave within the next 6 months. These individuals also ranked the anthrax immunization as the most important factor for their decision to leave, followed by unit workload and family reasons. Each of these groups-those who have left and those who plan to do so-had accumulated an average of more than 3,000 flight hours, which symbolizes a seasoned and experienced workforce.

On our survey, most Guard and Reserve pilots and aircrew members expressed a positive view toward general immunizations. Almost three out of four believe that immunizations are effective (74 percent), and more than half believe immunizations to be safe (60 percent). However, their views on the anthrax immunization program and potential biological warfare immunizations in the future are very different. For example, two out of three reported little or no support for the anthrax program (65 percent). Despite DOD's high-visibility campaign to educate servicemembers, about the anthrax immunization program, only about one in four believes that the information provided on DOD's anthrax Web site is timely (25 percent), 19 percent believe it to be complete, and 17 percent believe it to be accurate. Just 1 in 10 (11 percent) believe the information to be unbiased. Further, three out of four indicated they would not or probably would not take the shots if the anthrax immunization program were voluntary (76 percent). Eighty-seven percent, or almost 9 out of 10, indicated they would or probably would have safety concerns if additional vaccines for other biological warfare agents were added to the military immunization program.

Forty-two percent of the respondents reported that they had received one or more anthrax shots. Of those taking the shots, 86 percent reported experiencing some type of local or systemic reactions, for example, a knot in the arm or joint pain. For some reactions, the reported duration was more than 7 days (for example, limited arm/body motion and joint pain). Some of these reactions could have implications for work performance. About one-third (36 percent) reported that they had been provided information concerning what action to take in the event of side effects or reactions. But 71 percent reported being unaware of the Food and Drug Administration's Adverse Events Reporting System which is a passive

surveillance system to alert the Food and Drug Administration and the Center for Disease Control and Prevention of adverse events that may be associated with licensed vaccines. Further, about 60 percent of those experiencing reactions had not discussed them with military health care personnel or their supervisors-some citing fear of the loss of flight status, possible adverse effects on their military or civilian careers, and ridicule as reasons for nondisclosure (49 percent).

Background

In December 1997, the Secretary of Defense announced that all U.S. forces would be inoculated against the potential use of anthrax on the battlefield. In August 1998, DOD began immunizing its 2.4 million U.S. military personnel-including active and reserve component personnel-with a licensed anthrax vaccine. This program is mandatory. Some members of the armed forces have expressed concerns regarding the safety and efficacy of the anthrax vaccine. Those refusing the vaccine have been disciplined under service-specific policies for disobeying a lawful order. Anecdotal information suggests that an unknown number of Reservists and National Guard members have resigned or transferred to units or non-flying positions that do not require anthrax vaccinations at this time. DOD does not collect uniform records on such changes in status.

Congress and the Department of Defense have become increasingly concerned about the readiness of U.S. armed forces. Key reasons for this concern are the increasing pace (tempo) of operations due to deployments, parts shortages and maintenance backlogs, and past problems in recruiting and retaining quality people. The reserve components are experiencing difficulties in filling their ranks with new recruits at a time when DOD is relying on them more heavily to support operations around the world. Specifically, the retention of pilots and other aircrew members has been and continues to be a problem that could impact readiness. The impact of an exodus of Guard and Reserve pilots and aircrew members would be significant. Without adequate numbers of pilots and aircrew, the Guard and Reserve could not support the active force in its worldwide operations. In addition, it costs the military an average of almost $6 million to train and develop a fully qualified experienced aviator, which the Air Force suggests takes about 9 years.

Anthrax Is a Key Factor Affecting Individual Decisions to Change Military Status

Twenty-five percent of the pilots and aircrew members of the Guard and Reserve we surveyed have transferred to another unit, left the military, or moved to inactive status. Of these, 25 percent ranked anthrax immunization as the most important factor influencing their decision to leave or transfer followed by other employment opportunities at 16 percent and family reasons at 16 percent. The general military immunization program was cited as the least important reason for a change in their military duty status. Further, about one in five (18 percent) left before they had qualified for a military retirement. Forty-three percent of those who separated or are no longer in military flying status because of the anthrax program indicated that they would or probably would consider returning to a unit or to military flying status if the anthrax vaccination program were not mandatory.

Of those who are still in Guard and Reserve units, 18 percent reported that they planned to leave the military within the next 6 months. Again, when asked to rank the most important factor for their decision to leave, the anthrax immunization was the most frequently reported reason (61 percent), followed by heavy unit workload and family reasons. Each of these groups (that is, those who left and those who intend to leave) had in excess of 3,000 flight hours, which symbolizes a seasoned and experienced workforce.

Anthrax Vaccine Immunization Program Is Not Widely Supported

Most Guard and Reserve pilots and aircrew members support immunization programs in general; however, relatively few appear to support the anthrax program or future immunization programs for other biological warfare agents. Almost three out of four (74 percent) of the pilots and aircrew members of the Guard and Reserve believe that immunizations in general are moderately to very effective, and 60 percent believe that immunizations are moderately to very safe. On the other hand, 65 percent, or two out of three servicemembers, reported little or no support for the anthrax immunization.

DOD has employed a high-visibility campaign to educate servicemembers about the program and has taken steps to address the controversy surrounding the program. In addition, it expanded its communications efforts by updating the program's Internet site, opening a toll-free anthrax information line and forming a speakers' bureau of anthrax experts. DOD also updated briefings for installation leaders and medical personnel to provide more detailed information on the anthrax threat. We had previously reported in October 1999 that servicemembers were not

satisfied with the information provided to them.[2] In our current survey, relatively few respondents reported being moderately to very satisfied with the information provided at the DOD Web site. For example, only 19 percent were satisfied with the completeness of the information 17 percent were satisfied with the information's accuracy, and 25 percent were satisfied with its timeliness. Just 11 percent were satisfied that the information was unbiased.

In terms of all information provided by DOD to servicemembers on the anthrax program through the Web site and other sources, 39 percent indicated that they were moderately to very satisfied with the information provided on the military anthrax threat. On the other hand, only 12 percent were moderately to very satisfied with the information received about the vaccine's long-term safety.

Seventy-six percent of survey respondents indicated that they would not or probably would not take the shots if the anthrax immunization program were voluntary. Just 11 percent reported they would or probably would take the shot on a voluntary basis. About 13 percent were uncertain. Further, 87 percent reported that they would or probably would have concerns about safety if additional vaccines for other biological warfare agents were added to military immunization requirements.

Most Adverse Events to Anthrax Immunizations Are Not Reported

Adverse events are adverse outcomes for which a cause and effect relationship with an exposure (to a vaccine or a medication) has not yet been determined. DOD has used data from the Vaccine Adverse Event Reporting System to monitor adverse events (or reactions) to anthrax vaccinations. It is a 'passive" surveillance system, which relies on vaccine recipients or their health care providers to report any adverse events after receiving the vaccine. Studies show that significantly fewer adverse events are reported under a passive system when compared to an active surveillance system in which vaccine recipients are actively monitored to identify and track any adverse reactions to a vaccine.

Forty-two percent of the respondents reported that they had received one or more anthrax shots. Of these, 86 percent reported experiencing side effects or adverse reactions. About 60 percent indicated that they had not discussed any side effect to the anthrax vaccine with military health care personnel or their supervisors-some (49 percent) citing as their reasons

[2]Medical Readiness: DOD Faces Challenges in Implementing Its Anthrax Vaccine Immunization Program (GAO/NSIAD-00-36, October 1999).

fear of losing their flight status, adverse effects on their military or civilian careers, and ridicule. Seventy-one percent reported that they were unaware of the Food and Drug Administration's Vaccine Adverse Events Reporting System. Slightly less than 6 percent of those who had a reaction reported to this system.

Our survey showed that for some local and systemic reactions (for example, a knot or lump in the vaccinated arm and joint pain), the reported duration was more than 7 days. (See table 1 in app. II for a list of reported reactions). The prevalence and duration of the reported symptoms varied widely. A number of reported symptoms are expected reactions to the anthrax vaccine; however, their frequency and duration was more than DOD reported (0.007 percent). For example, two out of three reported burning in the vaccinated arm (79 percent) and a knot or a lump in the vaccinated arm (82 percent). Also, 10 percent reported swelling in the arm lasting for more than 7 days, and 6 percent reported arm pain and limited motion for more than 7 days. Six percent reported extreme fatigue, and 7 percent reported joint pain lasting for more than 7 days.

These reported reactions are significant because they could potentially impact individual ability to carry out military duties. However, 60 percent of those who experiencing reactions had not discussed them with military health care personnel or their supervisors. Forty-nine percent did not report because the reactions were not severe enough; however, another 49 percent did not report because of the fear of losing flight status, possible adverse effects on their military and civilian careers, and a fear of ridicule. Since many **individuals** are not reporting their reactions to military medical personnel or to the Vaccine Adverse Events Reporting System, the actual duration, the extent or impact on units and individuals, and the ultimate resolution of these reactions are unknown.

Because we had limited time to analyze all of the data we obtained, we will provide additional detailed analyses of the data to the **Committee** in a later report. Other issues such as impact of anthrax vaccine program on morale and quality of life will also be addressed in that report.

Mr. Chairman, this concludes my prepared statement. I would be happy to answer any questions you have at this time.

Contacts and Acknowledgments

For future questions regarding this testimony, please contact Kwai-cheung Chan at (202) 512-3652. Other individuals making key contributions to this testimony includes **Sushil** K. Shanna, Ph.D., **DrPH.** Foy D. Wicker and Stanley J. **Kostyla.**

Scope and Methodology

The best way to reliably assess the pulse and views of military members is by surveying a representative sample of personnel. This year, we developed and administered such a survey that was designed to obtain the views of selected Air National Guard and Air Force Reserve personnel regarding issues associated with the DOD's Anthrax Vaccine Immunization Program (AVIP). The survey was mailed in May 2000 to a random sample of 1,258 personnel. As of September 7, 2000,829 individuals had completed and returned the survey. Our work was conducted in accordance with generally accepted government auditing standards.

Questionnaire Development

The survey was developed with the assistance of discussion groups made up of pilots and other aircrew members of the Air National Guard and Air Force Reserve. It was pretested at **Andrews** Air Force Base, Maryland, and further pretested and refined at Guard and Reserve units located in Hartford, Connecticut; **Newburg**, New York; Madison, Wisconsin: Battle Creek Michigan; Memphis, Tennessee; Travis Air Force Base, California; March Air Force Reserve Base, California; Fort Wayne, Indiana; and, Dover, Delaware

Sample Construction

The sample consisted of 1,253 Air National Guard and Air Force Reserve aircrew personnel who were in the service at any time between September 1998 and February 2000. Our sample was drawn from pilot and aircrew member populations provided by the Air National Guard and Air Force Reserve in early 2000. In addition the Anthrax Vaccine Immunization Program **Office** provided information as to vaccination status. For the sample design, personnel in our universe were categorized by two factors: military status (left versus on board) and vaccine status (shot versus no shot). The sample was adjusted for groups with differing expected rates of survey completion and adjusted to provide a level of precision of ± 7 percentage points.

Survey Administration

As of September 7, 2000, we had received 828 responses from eligible respondents, an overall response rate of 66 percent. We used a contractor to create a database based on reported responses. We validated the data provided to us by the contractor to ensure accuracy.

Weighting Responses and Potential Nonresponse Bias

The survey responses were weighted to reflect the Air National Guard and Air Force Reserve population for the survey. This weighting procedure adjusts for the different proportions of individuals sampled from each cell and the actual response rate for that cell in the sample design. The survey results assume that nonrespondents would have answered like respondents. This assumption involves some unknown risk of nonresponse bias. Weighting can be used to statistically adjust for differing sampling rates and response rates; however, weighting cannot adjust for possible differences between those who do and those who do not respond to a survey.

Prevalence of Local and Systemic Adverse Reactions by Duration

Type of reaction	<1 Day	1-3 Days	4-7 Days	> 7 Days	Total
Local	Percent	Percent	Percent	Percent	Percent
Redness 2.5 inches or less	21	20	7	5	53
Redness >2.5 inches	5	12	10	6	33
Swelling in arm	16	16	11	10	55
Burning in arm	60	14	3	3	79
Arm Pain limited motion	20	22	11	6	59
Itching in arm	18	10	7	5	40

MEMORANDUM FOR SECRETARY OF THE ARMY

SUBJECT: Notice of GAO Final Testimony without Recommendations

Reference: GAO Testimony, GAO/T-NSIAD-00-48, "ANTHRAX VACCINE: Safety and Efficacy Issues," October 12, 1999 (GAO Code 713049/OSD Case 1916)

The Department of Defense (DoD) recently received copies of the referenced testimony from the General Accounting Office (GAO). A copy is enclosed for your information.

The GAO presented the testimony before the House Committee on Government Reform. Earlier in 1999, the GAO presented two related testimonies concerning the anthrax vaccine, designated GAO/T-NSIAD-99-148 and GAO/T-NSIAD-99-226. The GAO advised that the subject testimony completes its work for underlying code 713030 and no further reporting is planned.

Since the GAO testimony contains no recommendations, DoD comments are not required. It is, therefore, being provided for information only; no DoD action is required.

We are also providing copies of the testimony and this memorandum to the collateral action officers and to your action officer (b)(6), (b)(6). If you have questions, please contact my action officer for this case, Mr. (b)(6), (b)(6), e-mail (b)(6) @dodig.osd.mil>. If he is not available, contact Mr. (b)(6), (b)(6). Our fax number is (b)(6).

Safety and Efficacy Issues

Statement of Kwai-Cheung Chan, Director, Special Studies and Evaluations, National Security and International Affairs Division

OSD CASE # 1911

G A O

Accountability * Integrity * Reliability

GAO/T-NSIAD-00-48

Mr. Chairman and Members of the Subcommittee:

We are pleased to be here today to discuss the results of our ongoing examination of the safety and efficacy[1] of the anthrax vaccine. My testimony is based on previous studies[2] we have conducted to determine (1) the need for a six-shot regimen and annual booster shots, (2) the long- and short-term safety of the vaccine, (3) the efficacy of the vaccine and (4) the extent to which problems the Food and Drug Administration (FDA) found in the vaccine production facility in Michigan could compromise the safety, efficacy, and quality of the vaccine. Finally, I would like to discuss the effects of the anthrax vaccine on children, pregnant women or lactating women.

As you know, concerns have been raised about the Department of Defense's (DOD) anthrax immunization program since DOD began vaccinating its 2.4 million active duty and reserve members in 1998. For example, some active and reserve military personnel expressed concerns regarding the safety and efficacy of the anthrax vaccine after the FDA found problems during the inspection of the vaccine production facility. In addition, some Gulf War veterans are suffering from unexplained illnesses that they believe might have been caused by anthrax vaccinations received during the war.

The original anthrax vaccine was developed in the 1950s and was first produced on a large scale by the Merck Pharmaceutical Corporation. After a 1962 study on the vaccine's effect on mill workers, its manufacturing process was changed and the Michigan Department of Public Health took over as the vaccine's producer. This changed vaccine, which is the vaccine being given to U.S. military personnel, was licensed in 1970 by the Division of Biologics Standards, National Institutes of Health. FDA is currently responsible for licensing new vaccines and ensuring vaccine safety.

[1]Safety means relative freedom from harmful effects to persons affected directly or indirectly by a product that has been prudently administered, taking into consideration the character of the product in relation to the condition of the recipient at the time. Efficacy is a measure of a product's ability to produce a given response. An effective vaccine will provide a certain degree of protection for a certain period of time.

[2]See *Medical Readiness: Issues Concerning the Anthrax Vaccine* (GAO/T-NSIAD-99-226, July 21, 1999) and *Medical Readiness: Safety and Efficacy of the Anthrax Vaccine* (GAO/T-NSIAD-99-148, April 29, 1999).

Summary

No studies have been done to determine the optimum number of doses of the anthrax vaccine. Although annual boosters are given, the need for a six-shot regimen and annual booster shots have not been evaluated.

The long-term safety of the licensed vaccine has not been studied. However, DOD is designing studies to examine the vaccine's long-term effects. Data on the prevalence and duration of short-term reactions to the vaccine are limited but suggest that women experience a higher rate of adverse reactions than do men. FDA's system for collecting data on adverse events associated with the vaccine, which DOD uses, relies on vaccine recipients or their health care providers to report adverse events.[3] Body Text?[4] Brachman reported on 379 subjects that received this vaccine. The study concluded that individual reactions to the vaccine were relatively minor. About 35 percent had local reactions, a figure that varied during the inoculation series. Some recipients developed more severe edema, or swelling, that extended to the mid-forearm or wrist. Two individuals had systemic reactions in addition to the edema. In addition to this study, some data was collected to support licensing of the vaccine but is of limited use because some participants had already received the earlier vaccine and it is not possible to identify who received which vaccine.

Post-licensing data are limited because only a limited number of doses—about 68,000—were distributed by the manufacturer from 1974 through 1989. Also, FDA did not establish its Vaccine Adverse Event Reporting System until 1990. This system, which DOD uses, alerts FDA and the Centers for Disease Control to increases in adverse events. However, it is a passive surveillance system, which means that FDA and the Centers for Disease Control must rely on vaccine recipients or their health care providers to report any adverse events after receiving the vaccine. Studies show that adverse events are reported significantly less frequently with passive surveillance systems than they would be in an active system where vaccine recipients are monitored to find out if they had any adverse effects.

[3]Clinical events reported to a passive surveillance system such as FDA's are usually termed adverse events rather than adverse reactions because there is usually insufficient evidence that the vaccine, rather than other health conditions, caused the reported events.

[4]P.S. Brachman et al., "Field Evaluation of a Human Anthrax Vaccine," American Journal of Public Health, vol. 52 (1962), pp. 632-645.

Since DOD's mandatory inoculation program began in 1998, DOD has conducted two efforts to actively collect data on the short-term safety of the vaccine. These data also allow one to examine gender differences in adverse reactions after servicemembers have received the anthrax vaccine. The first effort, conducted in 1999 by a DOD physician stationed in Korea, was a survey given to service members when they reported for their initial six-dose schedule of shots; it asked questions about their reactions to the previous shot. Results from this effort reflect the researcher's preliminary analysis of the data. The second effort, conducted in 1998-99 at Tripler Army Medical Center, Hawaii, included a survey on adverse reactions to the first three shots when individuals reported for their fourth shot and later included a follow-up survey on adverse reactions to the fourth shot.

According to the data gathered in both efforts, a higher proportion of females reported reactions to the anthrax vaccine than did their male counterparts. Table 1 summarizes the rates of all reported reactions to the vaccine in Korea. The data show that a higher proportion of females reported reactions than males.

Table 1: Preliminary Data on Gender Differences in the Reported Rate of Adverse Reactions to the Anthrax Vaccine, From Korea Survey (1999)

Dose	Males Percent (number of doses)	Females Percent (number of doses)
First	42.1 (2036)	71.6 (495)
Second	44.4 (1953)	74.0 (474)

Note: This represents a preliminary analysis of the data by the researcher, and at the time of our review, data on reactions to the third shot were not available.

Source: DOD 1999.

The data gathered in Korea also show that after the first two shots, more than twice the proportion of women than men reported systemic reactions of fever, malaise, or chills than did men (see table 2).

Table 2: Preliminary Data on Gender Differences in Systemic Reactions, From Korea Survey (1999)

	Fever		Malaise		Chills	
Dose number	Male (percent)	Female (percent)	Male (percent)	Female (percent)	Male (percent)	Female (percent)
First	0.9	2.8	6.0	15.6	1.5	5.5
Second	1.7	4.8	7.1	15.4	1.9	4.0

Note: This represents a preliminary analysis of the data by the researcher, and at the time of our review, data on reactions to the third dose were not available.

Source: DOD.

The Tripler survey also demonstrates gender differences in reported reactions (see table 3). These data show that a higher proportion of women reported making an outpatient visit after a vaccination than their male counterparts. In addition, more than twice the proportion of women reported that they missed one or more duty shifts after their vaccinations than did males. In light of the fact no gender specific data were available from the pre-licensure studies, these findings underscore the need for monitoring to better understand the specific effects of this vaccine in different groups.

Table 3: Gender Differences in Reported Local Reactions, Outpatient Medical Visits, and Missed Duty, From Tripler Army Medical Center Survey (1998-99)

Reaction		Dose 1 (percent)	Dose 2 (percent)	Dose 3 (percent)	Dose 4 (percent)
Moderate to severe redness	(m)	17.5	20.4	17.2	31.6
	(f)	49.1	46.9	51.4	39.8
Swelling of lower arm	(m)	9.7	9.5	9.2	7.1
	(f)	13.4	13.5	13.0	8.4
Pain limiting motion of elbow	(m)	9.7	8.7	7.6	7.9
	(f)	17.1	13.5	11.7	8.6
Localized itching	(m)	25.2	25.7	24.5	27.7
	(f)	62.6	60.4	57.9	39.2
Lump or knot	(m)	63.9	64.4	60.5	65.5
	(f)	89.9	87.8	83.6	73.2
Muscle soreness	(m)	86.6	84.7	61.8	60.4
	(f)	79.7	76.4	70.8	61.6
Outpatient medical visit	(m)	5.3	2.0	2.7	[a]
	(f)	10.0	13.8	3.9	
Missed one or more shifts of duty	(m)	2.2	2.0	0.9	[a]
	(f)	5.0	5.1	3.9	

Note: Between 421 and 471 men and between 74 and 83 women responded to each question on the survey.

Vaccine Efficacy

Studies on the efficacy of anthrax vaccine have been limited to a study of the efficacy of the earlier vaccine for humans, and studies of the efficacy of the licensed vaccine for animals. The only study of the efficacy of the vaccine for humans was performed by Brachman, using the original vaccine. The Brachman study claimed that the vaccine gave 93 percent (and a lower confidence limit of 65 percent) protection against anthrax penetrating the skin. It found that the number of individuals who contracted anthrax by inhalation was too low to assess the efficacy of the vaccine against this form. There has been no specific study of the efficacy of the licensed vaccine in humans. Rather, its efficacy in humans has been inferred from other data, including a reduction in the incidence of anthrax following immunization of at-risk individuals and from animal experiments.

Beginning in the late 1980s, DOD began studying the efficacy of the licensed anthrax vaccine on animals, using guinea pigs, rabbits, and monkeys. All of these studies support the view that in these animals, the licensed vaccine can protect against exposure to some strains of anthrax either by inoculation or inhalation. It is clear, however, that animal species differ in their susceptibility. Studies of guinea pigs show that some anthrax strains are more or less resistant to vaccines for humans but are protected by the live spore veterinary vaccine.[5]

Research using monkeys showed for the first time that monkeys could be protected against aerosol exposure.[6] However, several studies have shown no direct comparison of immunity in humans to that in monkeys. DOD officials recognize that correlating the results of animal studies to humans is necessary and told us that DOD is planning research in this area. DOD also plans to develop a second generation anthrax vaccine, and as part of this effort, it will need to address whether strains of deliberately engineered or naturally occurring anthrax can overcome the protective immunity of such a vaccine. A variation in virulence among anthrax strains and a variation in relative resistance to vaccine-induced immunity have been observed in experiments on animals. However, the reasons for the variation have not been scientifically proven.

Vaccine Manufacturing Process

The quality of a vaccine is closely linked to its manufacturing process, which must be rigorously controlled to ensure that batches of vaccines produced on different occasions are of consistent quality. Accordingly, vaccine production is very highly regulated to ensure that the products are of consistent quality and safe and effective for the purpose(s) for which regulatory approval was granted. Until 1993, FDA inspectors did not inspect the MDPH facility where the anthrax vaccine was made. According to FDA, access was not granted because its inspectors had not been vaccinated against anthrax. DOD conducted inspections, however, and identified deficiencies during a March 1992 inspection, including the absence of stability studies.

[5]P.C.B Turnbull, et al., "Development of antibodies to protective antigen and lethal factor components in humans and guinea pigs and their relevance to protective immunity," Infectious Immunology, vol. 52 (1988) pp.356-363.

[6]B.E. Ivins, et al., "Efficacy of a standard human anthrax vaccine against Bacillus anthracis aerosol challenge in rhesus monkeys," Proceedings of the International Workshop on Anthrax, Salisbury Medical Bulletin, Special Supplement no. 87 (1996) pp.125-126.

FDA's subsequent inspections of the production facility in 1997 and 1998 found a number of deficiencies. The deficiencies that FDA identified in its February 1998 inspection fall broadly into two categories: those that might affect only one or a limited number of batches and those of a generic nature that could compromise the safety and efficacy of any or all batches. The facility received warning letters from FDA, including one in March 1997 stating its intent to revoke the facility's license. In 1998, the manufacturer closed its plant, which is now being renovated. DOD has directed that supplemental testing for purity, potency, sterility and safety be done on the lots approved by FDA before the current vaccination program began.

Effects of the Vaccine on Children and Pregnant and Lactating Women

The anthrax vaccine is not intended to be administered to children, pregnant or lactating women, and consequently no studies have been conducted to determine the specific effects of administering the anthrax vaccine to these groups. Before approving vaccines or drugs for marketing, FDA currently requires the submission of clinical data broken down by (among other things) gender and age. FDA then evaluates these data to determine efficacy and safety for specific subgroups of the general population. In addition, depending on FDA's assessment of clinical data, specific labeling requirements pertaining to potential effects on pregnant women, nursing mothers and pediatric use may also be required. However, the Division of Biologics, National Institutes of Health, which licensed the vaccine in 1970, did not require the submission of data broken down this way.

Mr. Chairman, this concludes my statement. I will be happy to answer any questions you may have.

Contacts and Acknowledgments

For future contacts regarding this testimony, please contact Kwai-Cheung Chan at (202) 512-3652. Individuals making key contributions to this testimony included Sushil K. Sharma, Jonathan R. Tumin, and Howard Deshong.

Ordering Information

The first copy of each GAO report and testimony is free. Additional copies are $2 each. Orders should be sent to the following address, accompanied by a check or money order made out to the Superintendent of Documents, when necessary, VISA and MasterCard credit cards are accepted, also.

Orders for 100 or more copies to be mailed to a single address are discounted 25 percent.

Orders by mail:

U.S. General Accounting Office
P.O. Box 37050
Washington, DC 20013

or visit:

Room 1100
700 4th St. NW (corner of 4th and G Sts. NW)

ANTHRAX VACCINE

Safety and Efficacy Issues

Statement of Kwai-Cheung Chan, Director, Special Studies and Evaluations, National Security and International Affairs Division

GAO/T-NSIAD-00-48

Mr. Chairman and Members of the Subcommittee:

We are pleased to be here today to discuss the results of our ongoing examination of the safety and efficacy[1] of the anthrax vaccine. My testimony is based on previous studies[2] we have conducted to determine (1) the need for a six-shot regimen and annual booster shots, (2) the long- and short-term safety of the vaccine, (3) the efficacy of the vaccine and (4) the extent to which problems the Food and Drug Administration (FDA) found in the vaccine production facility in Michigan could compromise the safety, efficacy, and quality of the vaccine. Finally, I would like to discuss the effects of the anthrax vaccine on children, pregnant women or lactating women.

As you know, concerns have been raised about the Department of Defense's (DOD) anthrax immunization program since DOD began vaccinating its 2.4 million active duty and reserve members in 1998. For example, some active and reserve military personnel expressed concerns regarding the safety and efficacy of the anthrax vaccine after the FDA found problems during the inspection of the vaccine production facility. In addition, some Gulf War veterans are suffering from unexplained illnesses that they believe might have been caused by anthrax vaccinations received during the war.

The original anthrax vaccine was developed in the 1950s and was first produced on a large scale by the Merck Pharmaceutical Corporation. After a 1962 study on the vaccine's effect on mill workers, its manufacturing process was changed and the Michigan Department of Public Health took over as the vaccine's producer. This changed vaccine, which is the vaccine being given to U.S. military personnel, was licensed in 1970 by the Division of Biologics Standards, National Institutes of Health. FDA is currently responsible for licensing new vaccines and ensuring vaccine safety.

[1]Safety means relative freedom from harmful effects to persons affected directly or indirectly by a product that has been prudently administered, taking into consideration the character of the product in relation to the condition of the recipient at the time. Efficacy is a measure of a product's ability to produce a given response. An effective vaccine will provide a certain degree of protection for a certain period of time.

[2]See *Medical Readiness: Issues Concerning the Anthrax Vaccine* (GAO/T-NSIAD-99-226, July 21, 1999) and *Medical Readiness: Safety and Efficacy of the Anthrax Vaccine* (GAO/T-NSIAD-99-148, April 29, 1999).

Summary

No studies have been done to determine the optimum number of doses of the anthrax vaccine. Although annual boosters are given, the need for a six-shot regimen and annual booster shots have not been evaluated.

The long-term safety of the licensed vaccine has not been studied. However, DOD is designing studies to examine the vaccine's long-term effects. Data on the prevalence and duration of short-term reactions to the vaccine are limited but suggest that women experience a higher rate of adverse reactions than do men. FDA's system for collecting data on adverse events associated with the vaccine, which DOD uses, relies on vaccine recipients or their health care providers to report adverse events.[3] Studies have shown that such systems may not accurately reflect the incidence of events due to underreporting. However, data from two recent DOD efforts to identify the prevalence of adverse events associated with anthrax vaccine show that a higher proportion of women reported both local and systemic reactions to the vaccine than their male counterparts. In addition, more than twice the proportion of women reported that they missed one or more duty shifts after their vaccinations than did males.

A study on the efficacy of the earlier vaccine concluded that it provided protection to humans against anthrax penetrating the skin but did not provide information to determine its effectiveness against inhalation anthrax. In the 1980's, DOD began testing the efficacy of the licensed vaccine in animals, focusing on its protection against inhalation anthrax. The studies showed that the vaccine protected some animals against inhalation anthrax. However, the level of protection varied for different species and the results cannot be extrapolated to humans. DOD recognizes that correlating the results of animal studies to humans is necessary and told us that it is planning research in this area. DOD also plans to develop a second generation anthrax vaccine and, as part of this effort, will need to address whether strains of deliberately engineered or naturally occurring anthrax can overcome the protective immunity of such a vaccine.

FDA's inspections of the vaccine production facility in 1997 and 1998 found a number of deficiencies. The deficiencies that FDA identified in its February 1998 inspection fall broadly into two categories: those that might

[3]Clinical events reported to a passive surveillance system such as FDA's are usually termed adverse events rather than adverse reactions because there is usually insufficient evidence that the vaccine, rather than other health conditions, caused the reported events.

affect only one or a limited number of batches that were produced and those that could compromise the safety and efficacy of any or all batches. The facility was shut down in early 1998. A new company, which purchased the facility in mid-1998, is addressing these issues.

Finally, you expressed concerns about the effects of the anthrax vaccine on children, pregnant women, or lactating women. The anthrax vaccine is not intended to be administered to children, pregnant women, or lactating women. No studies have been conducted on the vaccine's effects on these groups.

Background

In December 1997, the Secretary of Defense announced that all U.S. forces would be inoculated against the potential use of anthrax on the battlefield. Initial immunization consists of three shots given at 0, 2, and 4 weeks followed by three additional shots given at 6, 12, and 18 months. DOD has recognized that some of the concerns about using the current vaccine might be mitigated in the future through actions such as testing and research and adjustments to the program based on new data.

The inspection process for ensuring vaccine safety is more stringent and complex than for chemical drug because vaccines have three distinguishing features. First, either they have no clearly chemically defined composition, or chemical analysis is extremely difficult. Second, proper evaluation of vaccines generally requires measuring their effects in animals. Finally, quality cannot be guaranteed from final tests on random samples but only from a combination of in-process tests, end-product tests, and strict controls of the entire manufacturing process.

From the 1970s until 1998, DOD had been procuring the anthrax vaccine from a facility owned by the State of Michigan, the only facility in the country licensed to produce the vaccine. In 1997 and 1998, FDA identified numerous manufacturing problems at the facility. In response to concerns about the potential loss of anthrax vaccine production, DOD began funding renovation of the facility. Production facilities were shut down in early 1998. In the summer of 1998, the State of Michigan sold the facility to the BioPort Corporation for $25 million. DOD contracts were then transferred to BioPort. BioPort is addressing manufacturing problems.

Data on the Need for Six Shots and Annual Boosters Are Not Available

No studies have been done to determine the optimum number of doses of the anthrax vaccine. The immunization schedule of three doses used for the earlier vaccine was based on a regimen developed using animals in the early 1950s. However, the number of doses was arbitrarily increased to six when three people (two at Fort Detrick and one in a private wool mill) who received three doses of the vaccine became infected after exposure to anthrax. In a study of the vaccine's human efficacy published in 1962, a six-dose schedule was used, and the researchers concluded that the vaccine provided protection against anthrax penetrating the skin. The study did not provide enough information to determine whether the vaccine was effective against inhalation anthrax. The license for the vaccine, which was granted in 1970, calls for the six-dose schedule and annual boosters used in the human efficacy study, and DOD has followed this regimen. In September 1998, the manufacturer submitted an Investigational New Drug application to FDA to determine whether the number of shots in the initial schedule could be reduced from six to five.

In November 1971, the Division of Biologics Standards, National Institutes of Health, noted an apparent increase in reports of adverse reactions after individuals received booster shots. The Division considered it advisable to reevaluate the need for annual boosters and possibly the amount of the booster dose. Although the record is unclear as to whether or not the Division requested the manufacturer to conduct a reevaluation, no such reevaluation has been done to date.

Vaccine Safety

The long-term safety of the licensed vaccine has not been studied. However, DOD is designing studies to examine the vaccine's long-term effects.

With regard to short-term safety, data on the prevalence and duration of short-term reactions to the vaccine are limited but suggest that women experience a higher rate of adverse reactions than men. A study on the earlier vaccine's safety was done by Philip Brachman and published in 1962.[4] Brachman reported on 379 subjects that received this vaccine. The study concluded that individual reactions to the vaccine were relatively minor. About 35 percent had local reactions, a figure that varied during the

[4]P.S. Brachman et al., "Field Evaluation of a Human Anthrax Vaccine," *American Journal of Public Health*, vol. 52 (1962), pp. 632-645.

inoculation series. Some recipients developed more severe edema, or swelling, that extended to the mid-forearm or wrist. Two individuals had systemic reactions in addition to the edema. In addition to this study, some data was collected to support licensing of the vaccine but is of limited use because some participants had already received the earlier vaccine and it is not possible to identify who received which vaccine.

Post-licensing data are limited because only a limited number of doses—about 68,000—were distributed by the manufacturer from 1974 through 1989. Also, FDA did not establish its Vaccine Adverse Event Reporting System until 1990. This system, which DOD uses, alerts FDA and the Centers for Disease Control to increases in adverse events. However, it is a passive surveillance system, which means that FDA and the Centers for Disease Control must rely on vaccine recipients or their health care providers to report any adverse events after receiving the vaccine. Studies show that adverse events are reported significantly less frequently with passive surveillance systems than they would be in an active system where vaccine recipients are monitored to find out if they had any adverse effects.

Since DOD's mandatory inoculation program began in 1998, DOD has conducted two efforts to actively collect data on the short-term safety of the vaccine. These data also allow one to examine gender differences in adverse reactions after servicemembers have received the anthrax vaccine. The first effort, conducted in 1999 by a DOD physician stationed in Korea, was a survey given to service members when they reported for their initial six-dose schedule of shots; it asked questions about their reactions to the previous shot. Results from this effort reflect the researcher's preliminary analysis of the data. The second effort, conducted in 1998-99 at Tripler Army Medical Center, Hawaii, included a survey on adverse reactions to the first three shots when individuals reported for their fourth shot and later included a follow-up survey on adverse reactions to the fourth shot.

According to the data gathered in both efforts, a higher proportion of females reported reactions to the anthrax vaccine than did their male counterparts. Table 1 summarizes the rates of all reported reactions to the vaccine in Korea. The data show that a higher proportion of females reported reactions than males.

Table 1: Preliminary Data on Gender Differences in the Reported Rate of Adverse Reactions to the Anthrax Vaccine, From Korea Survey (1999)

Dose	Males Percent (number of doses)	Females Percent (number of doses)
First	42.1 (2036)	71.6 (495)
Second	44.4 (1953)	74.0 (474)

Note: This represents a preliminary analysis of the data by the researcher, and at the time of our review, data on reactions to the third shot were not available.

Source: DOD 1999.

The data gathered in Korea also show that after the first two shots, more than twice the proportion of women than men reported systemic reactions of fever, malaise, or chills than did men (see table 2).

Table 2: Preliminary Data on Gender Differences in Systemic Reactions, From Korea Survey (1999)

	Fever		Malaise		Chills	
Dose number	Male (percent)	Female (percent)	Male (percent)	Female (percent)	Male (percent)	Female (percent)
First	0.9	2.8	6.0	15.6	1.5	5.5
Second	1.7	4.8	7.1	15.4	1.9	4.0

Note: This represents a preliminary analysis of the data by the researcher, and at the time of our review, data on reactions to the third dose were not available.

Source: DOD.

The Tripler survey also demonstrates gender differences in reported reactions (see table 3). These data show that a higher proportion of women reported making an outpatient visit after a vaccination than their male counterparts. In addition, more than twice the proportion of women reported that they missed one or more duty shifts after their vaccinations than did males. In light of the fact no gender specific data were available from the pre-licensure studies, these findings underscore the need for monitoring to better understand the specific effects of this vaccine in different groups.

Table 3: Gender Differences in Reported Local Reactions, Outpatient Medical Visits, and Missed Duty, From Tripler Army Medical Center Survey (1998-99)

Reaction		Dose 1 (percent)	Dose 2 (percent)	Dose 3 (percent)	Dose 4 (percent)
Moderate to severe redness	(m)	17.5	20.4	17.2	31.6
	(f)	49.1	46.9	51.4	39.8
Swelling of lower arm	(m)	9.7	9.5	9.2	7.1
	(f)	19.4	13.5	13.0	8.4
Pain limiting motion of elbow	(m)	9.7	8.7	7.6	7.9
	(f)	17.1	13.5	11.7	8.6
Localized itching	(m)	25.2	25.7	24.5	27.7
	(f)	62.6	60.4	57.9	39.2
Lump or knot	(m)	63.9	64.4	60.5	65.5
	(f)	89.9	87.8	83.6	73.2
Muscle soreness	(m)	66.6	64.7	61.8	60.4
	(f)	79.7	76.4	70.8	61.6
Outpatient medical visit	(m)	5.3	2.0	2.7	[a]
	(f)	10.0	13.8	3.9	
Missed one or more shifts of duty	(m)	2.2	2.0	0.9	[a]
	(f)	5.0	5.1	3.9	

Note: Between 421 and 471 men and between 74 and 83 women responded to each question on the survey.

[a]Data were not available

Vaccine Efficacy

Studies on the efficacy of anthrax vaccine have been limited to a study of the efficacy of the earlier vaccine for humans, and studies of the efficacy of the licensed vaccine for animals. The only study of the efficacy of the vaccine for humans was performed by Brachman, using the original vaccine. The Brachman study claimed that the vaccine gave 93 percent (and a lower confidence limit of 65 percent) protection against anthrax penetrating the skin. It found that the number of individuals who contracted anthrax by inhalation was too low to assess the efficacy of the vaccine against this form. There has been no specific study of the efficacy of the licensed vaccine in humans. Rather, its efficacy in humans has been inferred from other data, including a reduction in the incidence of anthrax following immunization of at-risk individuals and from animal experiments.

Beginning in the late 1980s, DOD began studying the efficacy of the licensed anthrax vaccine on animals, using guinea pigs, rabbits, and monkeys. All of these studies support the view that in these animals, the licensed vaccine can protect against exposure to some strains of anthrax either by inoculation or inhalation. It is clear, however, that animal species differ in their susceptibility. Studies of guinea pigs show that some anthrax strains are more or less resistant to vaccines for humans but are protected by the live spore veterinary vaccine.[5]

Research using monkeys showed for the first time that monkeys could be protected against aerosol exposure.[6] However, several studies have shown no direct comparison of immunity in humans to that in monkeys. DOD officials recognize that correlating the results of animal studies to humans is necessary and told us that DOD is planning research in this area. DOD also plans to develop a second generation anthrax vaccine, and as part of this effort, it will need to address whether strains of deliberately engineered or naturally occurring anthrax can overcome the protective immunity of such a vaccine. A variation in virulence among anthrax strains and a variation in relative resistance to vaccine-induced immunity have been observed in experiments on animals. However, the reasons for the variation have not been scientifically proven.

Vaccine Manufacturing Process

The quality of a vaccine is closely linked to its manufacturing process, which must be rigorously controlled to ensure that batches of vaccines produced on different occasions are of consistent quality. Accordingly, vaccine production is very highly regulated to ensure that the products are of consistent quality and safe and effective for the purpose(s) for which regulatory approval was granted. Until 1993, FDA inspectors did not inspect the MDPH facility where the anthrax vaccine was made. According to FDA, access was not granted because its inspectors had not been vaccinated against anthrax. DOD conducted inspections, however, and identified deficiencies during a March 1992 inspection, including the absence of stability studies.

[5]P.C.B Turnbull, et al., "Development of antibodies to protective antigen and lethal factor components in humans and guinea pigs and their relevance to protective immunity," *Infectious Immunology*, vol. 52 (1988) pp.356-363.

[6]B.E. Ivins, et al., "Efficacy of a standard human anthrax vaccine against Bacillus anthracis aerosol challenge in rhesus monkeys," *Proceedings of the International Workshop on Anthrax, Salisbury Medical Bulletin*, Special Supplement no. 87 (1996) pp.125-126.

FDA's subsequent inspections of the production facility in 1997 and 1998 found a number of deficiencies. The deficiencies that FDA identified in its February 1998 inspection fall broadly into two categories: those that might affect only one or a limited number of batches and those of a generic nature that could compromise the safety and efficacy of any or all batches. The facility received warning letters from FDA, including one in March 1997 stating its intent to revoke the facility's license. In 1998, the manufacturer closed its plant, which is now being renovated. DOD has directed that supplemental testing for purity, potency, sterility and safety be done on the lots approved by FDA before the current vaccination program began.

Effects of the Vaccine on Children and Pregnant and Lactating Women

The anthrax vaccine is not intended to be administered to children, pregnant or lactating women, and consequently no studies have been conducted to determine the specific effects of administering the anthrax vaccine to these groups. Before approving vaccines or drugs for marketing, FDA currently requires the submission of clinical data broken down by (among other things) gender and age. FDA then evaluates these data to determine efficacy and safety for specific subgroups of the general population. In addition, depending on FDA's assessment of clinical data, specific labeling requirements pertaining to potential effects on pregnant women, nursing mothers and pediatric use may also be required. However, the Division of Biologics, National Institutes of Health, which licensed the vaccine in 1970, did not require the submission of data broken down this way.

Mr. Chairman, this concludes my statement. I will be happy to answer any questions you may have.

Contacts and Acknowledgments

For future contacts regarding this testimony, please contact Kwai-Cheung Chan at (202) 512-3652. Individuals making key contributions to this testimony included Sushil K. Sharma, Jonathan R. Tumin, and Howard Deshong.

Ordering Information

The first copy of each GAO report and testimony is free. Additional copies are $2 each. Orders should be sent to the following address, accompanied by a check or money order made out to the Superintendent of Documents, when necessary, VISA and MasterCard credit cards are accepted, also.

Orders for 100 or more copies to be mailed to a single address are discounted 25 percent.

Orders by mail:

U.S. General Accounting Office
P.O. Box 37050
Washington, DC 20013

or visit:

Room 1100
700 4th St. NW (corner of 4th and G Sts. NW)
U.S. General Accounting Office
Washington, DC

Orders may also be placed by calling (202) 512-6000 or by using fax number (202) 512-6061, or TDD (202) 512-2537.

Each day, GAO issues a list of newly available reports and testimony. To receive facsimile copies of the daily list or any list from the past 30 days, please call (202) 512-6000 using a touchtone phone. A recorded menu will provide information on how to obtain these lists.

For information on how to access GAO reports on the INTERNET, send an e-mail message with "info" in the body to:

GAO

Survey of Issues Associated with the Anthrax Vaccine Immunization Program

Introduction

The United States General Accounting Office (GAO) is the independent investigative arm of the Congress. It is not affiliated with the Department of Defense or the Military Services. The Chairman of the House Committee on Government Reform has asked the GAO to gather information on the views of current and former members of the Guard and Reserve concerning the military's Anthrax Vaccine Immunization Program (AVIP). We are also collecting general background information, specific information from those who have received the immunizations, and information on other issues related to the administration of the program.

Following the instructions provided, please complete the questionnaire in its entirety. At the end of the questionnaire you may provide any additional written comments you may have.

Thank you in advance for your cooperation.

Privacy Protection

GAO will take steps to protect the privacy of the information you provide. For that reason, we have purposely not asked you to provide information that can readily or easily identify you. Your responses **will be aggregated in our report, and you will not be personally identified.**

Return to:

GAO
Room 4015
441 G Street NW
Washington, D.C.
20548

ATTN: Anthrax

Directions for Completing This Survey

The survey should take about 20 to 30 minutes to complete. We encourage you to answer each question as honestly and as completely as possible. Providing information is voluntary; however, your views on these issues are very important to the Congress.

Before choosing a" answer, please read each question and all possible response choices carefully. You may use a pen or pencil to mark your answers.

Some response choices are followed by a skip instruction. This instruction, to skip to another question following a response choice, is there to save you time and to prevent you from answering questions that don't apply to you. If you select a response that is followed by "→*Skip to Question _*," please skip to the question indicated and do&answer any questions between your current answer and the specified question.

You will be asked to supply two types of answers.

- Most often, you should check only one answer, but a few questions may ask you to *"Check all that apply."* For this type of question, you should place a check mark in the circle(s) next to the one or more answers that best describes your situation or your opinion. Where we ask for your opinion, there are no right or wrong answers. Your honest opinions are what we seek.
- A second type of question asks you to write a short answer or a more detailed statement. If you need additional space for your answer, it is provided on the last page of the survey. Be sure to indicate the question number when you write any additional comments on the last page.

Points of Contact

If you have any questions about the survey, you may contact either (1) (b)(6) by e-mail (b)(6) @gao.gov) or telephone (b)(6) or (2) (b)(6) at (b)(6) @gao.gov) and (b)(6) (b)(6)

Background and Current Status

1. Of what service are you currently **a** member? If you **are** no longer in the service, of what service were you last a member? *(check one)*
   0 Air National Guard
   0 Air Force Reserve
   0 **Army** Guard
   0 Army Reserve
   0 Naval Reserve
   0 Marine Forces Reserve

2. Are you now, **or** were you last assigned as an AGR or Technician? *(check one)*
   0 Yes
   0 No

3. What is your current military status? *(check one)*
   0 Assigned to unit (Guard or Reserve)
   0 Inactive (IRR or IMA)
   0 Separated
   0 Retired
   0 Other @lease specify): _____

4. What is your current **paygrade** or, if you have separated from the military, what was your **paygrade** at the time of your separation? *(check one)*

   Military
   0 E1-E3
   0 **E4 – E6**
   0 **E7 – E9**
   0 01-03
   0 04 and above
   General Schedule
   0 **GS1 – GS5**
   0 **GS6 – GS8**
   0 **GS9 – GS12**
   0 **GS13** and above
   Wage Grade
   0 **WG1 – WG5**
   0 **WG6 – WG8**
   0 **WG9 – WG12**
   0 **WG13 – WG15**

5. Are you currently employed in a flying position with the commercial, corporate, or general aviation sector? *(check one)*
   0 Yes
   O *No*

Change in Military Status

6. Have you changed your military status (e.g., transferred to another unit, left the military, or moved to inactive status) since March **1, 1998?** *(check one)*
   0 Yes
   *0 No →**Skip** to Question 20*

7. *0"* what approximate date did you last change your military status? (enter *the month and year, e.g., "06/98")*

   ____/____
   M M / Y Y

8. What **was** your last change in military status? *(check one)*
   0 Transferred to another unit
   0 Moved to inactive **status**
   0 Left the military
   0 Other (please *specify*): _____

9. When you last changed status, approximately how long had you served in the military? (enter *the number of years and months)*

   ____ **years** _ *months*

10. When you last changed status, were you in a military flying position? *(check one)*
    0 Yes
    *0 No →**Skip** to Question 14*

11. When you last changed status, approximately how many military flying hours bad you accumulated?

    _____ hours

12. What was your duty position when you last changed status? *(check one)*
    0 Pilot
    0 Flight Engineer
    0 Loadmaster
    0 Navigator
    0 Crew chief
    0 Flight attendant
    0 other *(**please** specify):* _____

13. If you were a pilot, what crew position did you hold when you last changed status? *(check one)*
    0 Not applicable, not a pilot
    0 Flight examiner
    0 Flight instructor
    0 Aircraft commander
    0 First pilot
    0 Co-pilot
    0 Other (*please* specify): _____

Reasons for Change in Military Status

14. What official reason(s) did you provide in your paperwork **and/or** exit interview regarding your last change in status? ***(check all that apply)***
    - 0 None
    - 0 Eligible for retirement
    - 0 Family reasons
    - 0 Other employment opportunity
    - 0 Heavy unit workload (general OPTEMPO)
    - 0 Unit morale
    - 0 Individual morale
    - 0 Military immunization program in general
    - 0 Anthrax immunization
    - 0 Other @lease ***specify):*** _____

15. Did the real reason(s) for your lost change in status match the official reason(s) provided to the military in **your** paperwork and/or exit interview? ***(check one)***
    0 Yes
    0 No *(please **explain):*** _____

16. To what extent did each of the following factors influence your decision to change your status or leave the military? ***(check one circle for each item)***

To little or no extent	*To some extent*	*To a moderate extent*	*To a great extent*	*To a very great extent*

37. Did the military provide you with information concerning what action you should take in the event you experienced side effects from or reactions to the anthrax vaccination? *(check one)*

0 Yes
0 No
0 Don't know/can't remember

38. Were you exempted from taking any of the anthrax vaccine **shots?** *(check* one)

0 Yes
0 No ***→Skip to Question** 40*

39. Why were you exempted from taking the anthrax vaccine shots? *(check&that apply)*

0 Chronic illness not associated with the vaccine
0 Chronic illness associated with the vaccine
0 Local reaction to the vaccine
0 Pregnancy
0 Other @lease explain):_____

_____

40. If the anthrax vaccine immunization program were voluntary, would **you** volunteer to take the shots? *(check one)*

0 Yes
0 Probably yes
0 Uncertain
0 Probably no
0 No

41. Have you received any of the anthrax vaccine shots? *(check one)*

0 Yes
*0 No →Skip to **Question** 57*

42. How many anthrax vaccine shots have you received? (enter the *number of shots including the **annual** booster)*

_____ shots

43. When did you receive your **first** shot? (enter *the month and year, e.g., "08/99")*

__/__
M M/ Y Y

44. **Did you experience <u>any</u> side effects from or reactions to any of the shots (such as redness, swelling, fever, headaches, or any of the side effects or reactions listed on the chart in Question 45 below)?** *(check one)*
0 Yes
*0 No →**Skip** to Question 57*

45. **For each shot, indicate <u>all</u> of the side effects or reactions that you experienced. If you had no side effects or reactions to any given shot, check "None" in the box for that shot.** *Under each shot number, indicate the duration of the side effects or reactions you experienced by coding with the appropriate letter code shown on the right.*

<u>S</u> – for Short duration reactions lasting less than 24 hours.
M-for <u>M</u>edium duration reactions lasting from 1 to 3 days,
L-for <u>L</u>ong duration reactions lasting 4 to 7 days, and
<u>E</u> -for Extended duration reactions lasting <u>over</u> 7 days

Side Effect(s) or Reaction(s)	Shot number						
	1	2	3	4	5	6	Booster
a. None *(check if there were no side effects/reactions)*							
Local Reactions:							
b. Redness (2.5" or less in diameter)							
c. Redness (greater than 2.5" in diameter)							
d. Swelling in arm							
e. Burning sensation in arm							
f. Arm pain/limited motion							
g. Itching in arm							
h. Knot/lump in arm							
Systemic and other reactions:							
i. Chills							
j. Fever

- ***At the same time, please mail back the enclosedpostcard <u>separately.</u> This will guarantee that we cannot associate your name with your survey and, at the same time, let as know that you have returned the survey.***

Presidential Advisory Committee on Gulf War Veterans' Illnesses
Final Report

Chapter Four

GULF WAR RISK FACTORS

U.S. service members potentially were exposed to a broad range of risk factors during the Gulf War. The Committee evaluated the potential health effects of several suspected risk factors, which were selected based on our charter, previous reports on Gulf War veterans' illnesses, and expert and stakeholder testimony at meetings held nationwide. We also have attempted to analyze the extent and likelihood of exposure to these risk factors during the Gulf War. In most instances, however, exposure data have been difficult to obtain or nonexistent. This chapter reports the Committee's findings on the following risk factors:

- pesticides,
- chemical warfare agents,
- biological warfare agents,
- vaccines,
- pyridostigmine bromide,
- infectious diseases,
- depleted uranium,
- oil-well fire smoke,
- petroleum products, and
- psychological and physiological stress.

The chapter first reports what is known currently about possible U.S. troop exposure to each risk factor. Following this analysis, we discuss health effects known to date, and we present our findings and recommendations in the final section of this chapter.

EXPOSURE TO RISK FACTORS IN THE GULF

As described in the Committee's *Interim Report*, few exposure data exist on many key Gulf War risk factors. In fact, for most of the risk factors we analyzed, the only exposure information available today is anecdotal recollections of Gulf War veterans. As a consequence, it will be difficult to link, in a scientifically valid manner, any adverse health outcomes detected by ongoing research to specific exposures or risk factors. As noted in chapter 2, the Committee has concluded that DOD's Persian Gulf Registry of Unit Locations will be of little use for investigating questions about Gulf War veterans' health issues and is certainly an inadequate substitute for missing exposure data.

Exposure to Pesticides

Precise records exist for pesticides DOD shipped to the Gulf region (table 4-1). All pesticides shipped were approved by EPA or FDA for general use in the United States at the time of the Gulf War. U.S. consumers can purchase these at grocery, gardening, and other stores in products such as: OFF® and Cutters® (DEET), Raid® Ant and Roach Killer Spray and Raid® Yard Guard (permethrin), Black Flag® Insect Spray (Baygon), permethrin spray for treating clothes, and a variety of Ortho® brand and other name brands of gardening products containing carbaryl, diazinon, malathion, chlorpyrifos, and permethrin.

While DOD can document what pesticides were shipped-and how much-there are virtually no records available today on how these pesticides were used in the Gulf region. DOD made no provisions for collecting or keeping distribution or use records of U.S.-shipped and approved products. Reports from a few veterans about the use of other, locally obtained, unapproved pesticides are impossible for the Committee to followup.

Assuming DOD adhered to its policies on pesticide use, its programs closely parallel those established by EPA and FDA regulations for domestic pesticide use. According to DOD policy, the majority of U.S. service members had access to two pesticides: permethrin in a spray can (for treating uniforms) and DEET liquid or stick as a personal mosquito and fly repellent. DOD reports about 2.2 spray-cans of permethrin and 2.0 tubes of DEET (33 percent formulation) were shipped to the Gulf for each U.S. service member. According to DOD, U.S. troops were not provided with permethrin pretreated uniforms. All other pesticides shipped to the Gulf region were to be used only by specifically trained individuals or for special applications. For example, lindane apparently was used nearly exclusively on Iraqi prisoners of war as a delousing agent.

Exposure to Chemical Warfare Agents

DOD has fully acknowledged one case of CW agent exposure. U.S. Army Sergeant Fisher was exposed to a small amount of mustard agent while patrolling an Iraqi bunker during the war. Diagnosis was made on the basis of small chemical burns on his arms consistent with mustard exposure.[52] DOD also has confirmed nerve agent detections by Czech units, but has identified neither sources nor potentially exposed U.S. troops.[13,119] DOD has confirmed release of nerve agent at Khamisiyah in March 1991, and the Committee has concluded that troops near the demolition activity should be presumed to have been exposed to some level of nerve agent (see chapter 2). The Committee does not presume, however, that this implies long-term health effects in those exposed. DOD continues to investigate other reported CW agent detections.

Except for the Fisher incident, DOD reports in-theater medical surveillance observed no immediate or characteristic poisoning symptoms from any exposure to CW agents. According to representatives from the U.S. Army Medical Corps, which was responsible for training medical personnel to be alert during the war for signs and symptoms of CW agent exposures, characteristic poisoning from nerve agents such as sarin and soman were not seen by medical personnel during the Gulf War.[52] At least one other DOD medical repre

sentative, however, posits that a presumption of low-level exposure to OP nerve agents should be made when evaluating unexplained medical problems reported by some Gulf War veterans.[13]

Exposure to Biological Warfare Agents

Based on classified and public information currently available, the Committee has concluded there is no persuasive evidence that U.S. troops were exposed to BW agents during the Gulf War.[35,51,52,119,148,274] We note our determination is based on imperfect information. For instance, the United Nations cannot verify the quantities and weaponization status of Iraqi BW products because Iraq claims it unilaterally destroyed all its biological weapons. Additionally, the United States did not deploy a real-time BW agent detection system during the war.

Two salient factors, however, led to the Committee's conclusion. First, there were no verified detections of anthrax or botulinum toxin during the war. Second, stateside examination of soil samples and enzyme assays did not reveal the presence of BW agents. The Committee's review of U.S. Army hospital admissions records identified one admission for anthrax (a disease indigenous to the Gulf region) and none for botulinum poisoning.[342,343] DOD has investigated reports of dead animals that might have succumbed to biological agents, and we concur with the finding that the evidence does not implicate BW agents. Finally, UNSCOM reported to the Committee that Iraqi officials have denied any use of biological weapons during the war and that its own assessment supports this claim.

Exposure to Vaccines

DOD estimates approximately 150,000 U.S. military personnel received at least one anthrax vaccination, and about 8,000 service members received at least one dose of BT vaccine during the Gulf War. As noted in the Interim Report, however, medical recordkeeping on these and other matters was woefully inadequate.

Exposure to Pyridostigmine Bromide

All U.S. troops received blister packs containing PB pills during the Gulf War. The pills were intended to be self-administered upon a unit commander's order. DOD estimates approximately 250,000personnel took at least some PB during the Gulf War.[118] As noted in the Interim Report, accurate assessment of PB exposure of U.S. troops is not possible today because no records were kept of self-administered medications.

Exposure to Infectious Diseases

Infectious diseases endemic to the Gulf region include shigellosis, malaria, sandfly fever, and cutaneous leishmaniasis.[6,65,90,187] Along with

these infectious diseases, DOD medical personnel also monitored troops for dengue, Sindbis, West Nile fever, Rift Valley fever, and Congo-Crimean hemorrhagic fever.[90,293]

According to DOD, no cases of sandfly fever were reported during Operations Desert Shield/Desert Storm. Medical personnel saw seven individuals with malaria, one with West Nile fever, and none with rickettsial or other arthropod-borne viral illnesses; arthropod-borne viral diseases endemic to the Gulf are not known to cause chronic infection or disease. The documented low rates of infection among U.S. troops suggest exposures were minimal and/or preventive measures were effective.

Exposure to Depleted Uranium

According to the Office of the Army Surgeon General, 36 U.S. service members are known to have been exposed to DU when wounded in "friendly fire" incidents involving DU munitions.[112,267] VA reports it believes about two dozen of these individuals retain embedded DU shrapnel in their bodies.

In addition to exposure through "friendly fire" incidents, a review by the U.S. General Accounting Office concluded that several dozen service members were exposed to DU while retrieving or servicing vehicles damaged by DU munitions.[267,306] This number comprises about two dozen Army National Guard soldiers from the 144th Service and Supply Company who have reported they were unknowingly exposed to DU-contaminated debris while working with combat vehicles hit by DU munitions. Another two dozen soldiers from the 24th Infantry Division have reported they were unknowingly exposed to such debris in the course of vehicle recovery and maintenance operations.[96,97,267,306]

Although DOD had appropriate procedures for protecting personnel who worked with DU contaminated vehicles during the Gulf War, apparently few U.S. service personnel were adequately trained in these procedures. U.S. service personnel also could have been exposed to DU if they inhaled DU dust particles during incidental contact with vehicles destroyed by DU munitions, or if they lived or worked in areas contaminated with DU dust from accidental munitions fires. Thus, unnecessary exposure of many individuals could have occurred.[15,18,20,27,42 44,57,141,142,161,186,191,203,226,260,267,306]

With the exception of individuals who retain embedded DU munitions fragments, it is not possible to use *in vivo* monitoring today to develop accurate assessments of DU exposure in the Gulf. Whole-body counting to detect photons of x-ray or gamma radiation cannot be used to test for DU: The equipment is not designed to detect the low energy photons associated with DU decay.87 Moreover, the time that has elapsed since the Gulf War is long compared to the body's retention rate of uranium-i.e., it would be difficult to detect DU even with more sophisticated equipment performing specialized tests such as lung counts.[87,259]

Exposure to Oil-well Fire Smoke

In contrast to other risk factors, exposure to oil-well fire smoke is better characterized. Many U.S. service members who remained in the Gulf after the oil well fires started could have been exposed to oil-well fire smoke. The burning wells were located in eastern Kuwait, with the majority to the south of Kuwait City. Smoke plumes rose and combined in a "superplume" that could be seen for hundreds of kilometers and sometimes even partially blocked out the sun. Occasionally, smoke plumes touched down to the ground, sometimes enveloping nearby troops. Exact exposure levels for individual soldiers are not certain, but local and regional exposure information is available for oil well fires.

Multiple U.S. and international agencies performed extensive air monitoring during the fires and did not find pollutant levels likely to cause long-term health effects:

- A U.S. Interagency Air Assessment team-comprised of scientists from EPA, the National Oceanographic and Atmospheric Administration, and DHHS-arrived in Kuwait in March 1991 to assess the potential health effects of the oil well fires.[311]
- Scientists from 12 countries, including Kuwait and neighboring countries, were involved in a data collection effort overseen by the World Meteorological Organization.[339]
- The U.S. Army's Environmental Hygiene Agency carried out the largest effort, collecting nearly 4,000 ambient air and soil samples from May to December 1991.[265]

The data indicate that, despite the dramatic appearance of the oil plumes, pollutant levels were surprisingly low. All groups found that levels of nitrogen oxides, carbon monoxide, sulfur dioxide, hydrogen sulfide, other pollutant gases, and polycyclic aromatic hydrocarbons (PAHs) were lower than anticipated and did not exceed those seen in urban air in a typical U.S. industrial city.[89,289,302,339]

High levels of airborne particulate matter (sand and soot), however, were observed frequently at several monitoring sites. Analysis of samples suggested particles were mostly sand-based materials; high levels of airborne sand particulates are typical for this region of the world. Within the samples of particulate matter, levels of PAHs and toxic metals were low.[84,265]

Samples were collected during at least one instance when the smoke plume had touched down, providing "worst case" exposure data. Although airborne contaminants were detectable, they were surprisingly low compared to current U.S. occupational standards for these contaminants-even within the plume touchdown.[84,265,266]

Various biological samples also were collected from troops or other personnel working in Kuwait while the fires burned. One CDC study found blood levels of volatile organic compounds (VOCs) in firefighters were significantly higher than those in a U.S. reference population,[55] but individuals in Kuwait City, about 20 km from oil fires, had VOC levels approximately that of the reference group. These data are limited by small sample size and the short half-life of VOCs in service members' blood, but they suggest oil-well fire smoke did not significantly increase VOC exposures in troops in the Kuwait City area when most of the fires were active.

Blood and urine samples collected from a group of U.S. service members before, during, and after their 1991 deployment to Kuwait were analyzed for VOCs, PAH-DNA adducts, metals, and sister chromatid exchange (SCE) frequency in lymphocytes.265 Pulmonary function tests and questionnaires also were administered. Levels of metals, VOCs, and PAH-DNA adducts showed no changes or showed decreases in troops living in Kuwait compared to troops living in Germany, with few exceptions. Lead levels in blood were not statistically significantly altered during deployment to the Gulf region.*

Exposure to Petroleum Products

Few specific data exist about possible exposures of U.S. service members to petroleum fuels or their combustion products. Operating the vehicles and machinery used in the Gulf War involved exposure to petroleum-based material. Petroleum fuels also were used for burning wastes and trash, dust suppression, and fueling stoves and tent heaters; none of these uses is unique to the Gulf War. Such uses, however, probably led to increased petroleum vapor and combustion product exposures. Thus, some U.S. service members were exposed to petroleum materials, including benzene, toluene, xylene, ethyl benzene, and combustion products including carbon monoxide, sulfur dioxide, nitrogen dioxide, particulates, lead, and other pollutants.

The U.S. Army's air monitoring (and blood monitoring done by CDC in a small study) found no evidence of elevated exposure to VOCs (including petroleum materials).[55,265] Still, some service members clearly experienced short-term, elevated exposures to petroleum fuels. For example, diesel was sprayed on the ground to suppress dust from the fine sand found in the Gulf region. A U.S. Central Command document lists crude oil/waste oil as the least desirable option for dust suppression, but does not mention diesel fuel.[280] One U.S. Army sanitary engineer testified to the NIH Technology Assessment Panel in 1994 that units used water or diesel fuel for dust suppression during the war.[100] He described one brigade dumping 30,000 gallons of diesel fuel on the roads daily, and said U.S. service members living in tents near the roads-and particularly truck drivers carrying out the spraying-complained of nausea from breathing the resulting fumes. As a result, the preventive medicine person to whom they complained obtained respirators for the drivers' use.[101] Another occupational group that could have experienced some risk of elevated exposures to petroleum products during the Gulf War were those who worked at military "Petroleum, Oils, and Lubricants" points where these materials were distributed.

The fuel used most widely during the war for both vehicles and equipment was Jet A-1, an internationally used kerosene-based aviation fuel provided at no cost by the Saudi Arabian government. Of the 1.8 billion gallons of fuel used during Operations Desert Shield/Desert Storm, roughly 75 percent was jet fuel (mostly Jet A-1), 24 percent was diesel fuel, and 1 percent was gasoline.[248] The gasoline used during Operations Desert Shield/Desert Storm was commercial leaded gasoline refined to Saudi Arabia's national standard.[135]

Combustion products from heaters used in poorly ventilated areas also are a general exposure concern for Gulf War participants. Burning leaded fuels indoors without proper ventilation-e.g., heaters in tents-could have caused increased lead exposure. Kerosene heaters, widely used in the United States, also could have been significant sources of exposure to nitric oxides, sulfur dioxide, inorganic combustion gases, carbon monoxide, and particles when used with inadequate ventilation.[165] During the war, four hospitalizations in U.S. Army field hospitals occurred because of asphyxiation from carbon monoxide.[342,343]

Exposure to Psychological and Physiological Stress

U.S. service members encountered many stressors during the Gulf War, including short deployment notice, uncertainty about length of deployment, isolation and separation from family, a polluted environment, poor living conditions with little privacy or social outlets, prolonged work hours, decreased income and worry about job retention, fear of SCUD missile and chemical and biological weapon attacks, anticipation of high casualty rates and torture, frequent CW agent alarms

that often required a defensive posture and full chemical gear, and dealing with casualties and dead bodies.

Even when the war was over, many veterans experienced postdeployment stress on their return from the Gulf. These included financial and employment difficulties, unresolved military pay issues, the revelation of cases of leishmaniasis and the consequent temporary ban on blood donations, increasing numbers of health complaints and "unexplained illnesses," and media accounts of apparent increased numbers of birth defects and cancer.

HEALTH EFFECTS OF GULF WAR RISK FACTORS

The Committee undertook a comprehensive analysis of the health effects of the ten Gulf War risk factors for which we examined possible exposures. Our analysis of possible health effects was performed independently of whether exposures were undocumented, imprecise, or known. That is, we considered the possible health consequences of a range of scenarios from high-level to low-level exposure and from single to multiple event and chronic or continuing exposure. The Committee also considered short-term and long-term health effects, including symptoms that might have appeared while service members were still in the KTO and symptoms that might not have appeared until sometime after the service members left the Gulf. The Committee's search for possible health effects extended to all organ systems and to cancer and noncancer outcomes.

Our examination of health effects drew on three types of sources: scientific literature; briefings and workshops with recognized experts; and information presented at Committee meetings. The Committee reviewed human exposure (mostly occupational) data and laboratory animal data. We found extensive scientific literature describing the human health effects for all the risk factors investigated, including CW agents, for which we initially had anticipated would have significant data gaps. The breadth and depth of information generally were sufficient** to make conclusions about the short- and long-term health effects that would be anticipated for U.S. service members exposed to a particular risk factor during the Gulf War.The information available in these sources, however, represents the boundaries of the Committee's investigation. We conducted no primary research and elected not to base our findings on research not yet subjected to peer review.

Finally, the Committee drew conclusions about the role of each risk factor in Gulf War veterans' illnesses based on comparison of the known health effects of the risk factor to the symptoms reported by Gulf War veterans. Symptoms reported by Gulf War veterans used in these comparisons were based on DOD's CCEP and VA's Persian Gulf Health Registry (see table 3-2).

Pesticides

As noted earlier in this chapter, pesticides DOD shipped for use during the Gulf War fell into five major categories: OP pesticides, methyl carbamate pesticides, organochlorine pesticides (lindane), pyrethroid pesticides (chiefly permethrin), and DEET.

Organophosphorus pesticides. Several OP pesticides were used during the Gulf War, including chlorpyrifos, diazinon, dichlorvos, and malathion. When administered in high doses, OP pesticides cause irreversible inhibition of acetylcholinesterase, an enzyme crucial to normal nerve and nerve/muscle function. Inhibiting acetylcholinesterase leads to unique and highly characteristic poisoning symptoms. Immediate symptoms of OP poisoning in humans usually develop within four hours of exposure and include narrowing of the pupil of the eye (miosis), headache, nausea, dizziness, anxiety, and restlessness. Severe and rapid onset poisoning symptoms include muscle twitching, weakness, tremor, incoordination, vomiting, abdominal cramps, diarrhea, sweating, salivation, tearing, runny nose, and production of phlegm. Life-threatening symptoms include unconsciousness, incontinence, convulsions, and depression of breathing function. According to DOD, its medical monitoring and surveillance efforts reported no cases of immediate and severe OP poisoning symptoms in U.S. military personnel during the Gulf War.

Some individuals who recover from immediate and severe OP poisoning show long-term (lasting more than a year), subtle, neuropsychological abnormalities that can be detected using a battery of standardized neuropsychological tests. In an epidemiologic study of such long-term effects, severely poisoned individuals showed clear but subtle differences in intellectual functioning, academic skills, abstraction and flexibility of thinking, and simple motor skills. For example, about a five point difference in IQ was measured in severely poisoned versus control subjects.

Neurophysiologic effects were less apparent; abnormalities were found only in measurements of memory, abstraction, and mood and on one test of motor reflexes.221 These effects could not be detected, however, in a subset of the same worker population that had been exposed to doses of OP pesticides that were too low to cause the symptoms of immediate and severe poisoning.241 Other studies of low-level occupational exposures reinforce the finding that these types of long-term effects present solely in the aftermath of severe and immediate OP agent poisoning.[4,241]

Some OP pesticides that are no longer sold in the United States have been associated with human cases of a second type of delayed toxic effect called organophosphate-induced delayed neurotoxicity (OPIDN, sometimes referred to as delayed neuropathy). Initial symptoms are muscular incoordination progressing to numbness, tingling, fatigue or a cramp-like pain in the calf muscles, and even moderate to severe muscular weakness and paralysis.[7,117] Typically, effects occur 7 to 14 days following recovery from immediate and severe poisoning by the OP pesticide and involve neuropathologic lesions and degeneration of the nerve axon and myelin nerve sheath in both the central and peripheral nervous systems;[117] these effects are easy to measure in a clinical setting. In general, OPIDN caused by OP pesticide poisoning is associated with immediate poisoning symptoms.

All OP pesticides sold in the United States today are routinely screened for OPIDN toxicity with a standardized hen assay used by EPA; the hen is a laboratory animal especially sensitive to OPIDN effects. For some OP agents, these effects only can be observed by giving the hen extremely high doses that would rapidly lead to death, but then keeping the hen alive through the use of protective drugs such as atropine. Many investigators conclude any OP agent theoretically could cause this effect at sufficiently high doses, but that, in fact, immediate toxic effects cause death before delayed effects can be seen.[117] None of the pesticides DOD shipped to the Gulf War test positive for OPIDN in standard EPA screens.

Methyl carbamate pesticides. Methyl carbamate insecticides shipped for use during the Gulf War included propxur (Baygon®), carbaryl (Sevin®), and methomyl (Lannate®). These insecticides reversibly inhibit acetylcholinesterase, which leads to poisoning effects similar to OP poisoning. Poisoning with methyl carbamates tends to be of much shorter duration-with a greater margin of safety between symptom-producing and lethal doses-compared to OP pesticides, which bind permanently with acetylcholinesterase.

Pyrethroid pesticides. DOD shipped the pyrethroid insecticide permethrin to the Gulf for use as an insect repellent. Permethrin is used widely in the United States as the active ingredient in personal care products, such as shampoos and lotions, and for treating clothes to make them insect repellent. There are few reported poisonings of humans by permethrin, most likely because such a large dose is required to cause poisoning. Humans rapidly detoxify and excrete permethrin. Clinical signs of immediate permethrin poisoning following large oral doses become evident within two hours and include incoordination, ataxia, hyperactivity, and convulsions, followed by prostration, paralysis, and death.[171] Unlike OP pesticides, the Committee found no reports of long-term effects from permethrin poisoning in humans.

A National Research Council (NRC) subcommittee that reviewed possible health problems for military personnel wearing permethrin-treated military clothing concluded it is unlikely that soldiers using such uniforms would experience adverse health effects at the suggested exposure levels. The subcommittee concluded, "the weight of evidence shows that permethrin is unlikely to be a skin irritant or skin sensitizer for military personnel who are exposed to it dermally from wearing permethrin impregnated [uniforms]." The estimated "no observable adverse effect level" for immediate neurotoxic effects in humans from daily exposure is 200 milligram (mg)/kilogram, which is approximately three million times greater than estimated dermal exposure from permethrin treated uniforms.[171] NRC's worst-case estimate of lifetime carcinogenicity risk for humans wearing permethrin treated uniforms was less than 2 in 1,000,000.

In laboratory animal studies, dermal absorption of permethrin is low, although scientists observe neurotoxic effects if the substance is injected.[171,301] Most, but not all, studies have reported permethrin does not cause damage to genetic material in a wide variety of standard measurement systems. Permethrin is neurotoxic to laboratory animals at high oral doses. Rats fed permethrin at 6,000 mg/kg for 14 days showed fragmented and swollen sciatic nerve axons and myelin degeneration. However, nerve conduction studies in 23 permethrin workers showed no evidence of nerve impairment associated with permethrin exposure.[171] Rodent bioassays of chronic exposure to permethrin showed carcinogenic effects, such as liver and lung adenomas and lung carcinomas in mice, but data on human carcinogenicity of permethrin are lacking.

Organochlorine pesticides. DOD shipped one organochlorine pesticide, lindane, to the Gulf region. Lindane, once widely used as an agricultural insecticide in the United States, is still available as a lotion to treat head and body lice and scabies.[283,301] Lindane is dermally absorbed, stored in body fat, and only slowly leaves the body. Reports document that a few people who have used large amounts of lindane on their skin have had blood disorders and even seizures. Under conditions of extremely high exposure, lindane can cause liver and kidney disease.

Some pregnant laboratory animals orally treated with the maximum tolerated dose (the dose just below that causing immediate and severe toxicity) showed a statistical increase in the number of fetuses with extra limbs, indicating that lindane is a teratogen for this laboratory animal strain. Lindane has not been shown to be a human carcinogen, although long-term oral exposure of lindane to certain species and strains of laboratory rodents has been reported to cause liver cancer.[283] Hence, DHHS has determined that lindane should be viewed as a human carcinogen.

DEET. DEET, first introduced in 1955, continues to be a widely used liquid insect repellent in the United States, and DOD shipped approximately two 2-oz tubes per U.S. service member during the Gulf War. According to EPA, 50 to 100 million Americans use DEET-containing insect repellents annually. Relative to most pesticides, DEET has notably low immediate toxicity.[190,301] Although generally well tolerated when used as an insect repellent applied to human skin, about five to nine percent is absorbed through skin, and reports exist of tingling, mild irritation, and occasional skin peeling following repeated application.[301] Topically applied DEET is rapidly eliminated, mostly in the urine. In the past 35 years a few reports in the medical literature suggest rare neurotoxic effects.[190] In adult humans, ingestion of enormous doses of DEET has been associated with immediate toxic effects, including tremors, generalized seizures, and coma, although no long-term effects of poisoning have been reported.[320] (For possible synergistic effects, see section on PB later in this chapter.)

Rats continuously fed DEET up to the maximum tolerated dose over three generations showed a slight increase in the high-dose animals in a single neurological abnormality-a slight increase in exploratory locomotor activity-and no histopathologic central nervous and peripheral nervous system changes of significance.[190] Other reports indicate that rats fed the maximum tolerated dose of DEET can show severe and often fatal prostration accompanied by a brain myelinopathy.[320]

What do we conclude about the risks of pesticides to Gulf War veterans? According to DOD, after-action reports from in-theater medical personnel did not reveal any U.S. troops reporting symptoms that would indicate pesticide poisoning. Evidence from studies of humans poisoned by OP pesticides suggests that low-level exposures that do not cause signs and symptoms of immediate and severe poisoning will not result in long-term health effects. Thus, the Committee concludes it is unlikely that health effects and symptoms reported today by Gulf War veterans are the result of exposure to pesticides during the Gulf War. Lindane is an animal liver carcinogen, but it is too early to see an elevated liver cancer rate in Gulf War veterans.

Chemical Warfare Agents

At the time of the Gulf War, the U.S. military believed Iraq had weapons that could deliver OP nerve agents, including sarin, soman, and VX, and mustard (blister) agents. Hence, U.S. forces were supplied with protective gear, detectors, and prophylactic drugs to protect against the known consequences of exposure.

Immediate signs and symptoms of nerve agent poisoning. OP nerve agents are designed to incapacitate and kill humans. Inhalation exposure to these agents leads to immediate effects, including miosis, runny nose, and increased salivation. Immediate effects following skin exposure include local sweating and muscle twitching. Eye exposure rapidly produces miosis, which often is associated with eye pain, headache, and blurred vision.[264] In fact, miosis is the most sensitive and specific immediate response to acute poisoning in humans, and this reaction has served as the basis for establishing allowable occupational concentrations for CW nerve agents. Higher doses of these agents cause more severe effects, including convulsions, neuromuscular blockage, profuse airway obstruction and apnea-developing within one to two minutes of exposure.[77] Death occurs due to respiratory paralysis. The effects of nerve agent poisoning (figure 4-1) are virtually identical to those of severe OP-pesticide poisoning.

Data on human effects of CW nerve agent poisoning derive largely from human experiments carried out by the U.S. Army from the 1940s to the 1960s. Table 4-2 illustrates the type of information on immediate poisoning effects from low-level exposures to the OP nerve agent sarin.

Immediate signs and symptoms of mustard agent poisoning. With mustard agents, poisoning symptoms are severe irritation and tissue damage to eyes, skin,

and respiratory and gastrointestinal (GI) tracts. Usually the onset of symptoms is delayed for some hours after exposure.

One report of Iraqi use of mustard agent against Iranian troops in 1984 documented health effects in more than 5,000 Iranian casualties. Affected individuals had first to third degree burns over 20 to 70 percent of the total skin surface. Eye exposure caused tearing, severe conjunctivitis, and temporary loss of vision. Corneal abrasion was nearly always present, and photophobia and blurred vision developed in some cases. Upper airway involvement due to chemical burning of the throat led to pharyngitis and tracheobronchitis. These effects were quite severe, and this group suffered approximately 15 percent mortality. Those who survived the initial symptoms later experienced various GI complaints, including nausea, vomiting, and diarrhea. After five to seven days, hematologic problems were the greatest health threat to survivors.[105]

Long-term health effects of exposure to CW nerve agents. Two NRC reports addressed possible long-term morbidity and mortality in about 1,400 servicemen intentionally exposed to CW nerve agents in experiments conducted over a 20-year period ending in 1975. The possibilities of excess cancer risk and adverse mental, neurologic, hepatic, and reproductive effects were reviewed. Both NRC analyses concluded that no evidence exists that CW nerve agents cause long-term, adverse human health effects at the doses tested. The doses were nonlethal, but were high enough to cause clinical effects (such as miosis). NRC reported that both analyses had the power to detect any major health effects had they been present. A statistically significant increase in admissions to VA hospitals for malignant neoplasms was detected, with the caveat that admission numbers were small, showed no dose relationship, and no clustering of specific chemicals in relation to tumor site.[174,175]

Numerous studies in humans and animals report that survival from severe, immediate poisoning by OP nerve agents (including OP pesticides) can be associated with measurable, long-term neurological effects. One study of 77 industrial workers exposed to levels of sarin that caused immediate toxicity showed slight alterations in electroencephalograms (EEGs) one year after exposure. The study also reported, however, that trained experts could not distinguish an individual EEG from an exposed individual from an EEG of a person who had not been exposed, and that no clear relationship existed between alterations in EEG frequency spectrum and alterations in brain function.[22] A 1975 review by Lohs of the effects of CW agents in humans similarly reported long-lasting effects following severe, immediate OP pesticide and CW agent poisoning.[140]

CW nerve agents do not show OPIDN toxicity as measured in EPA's standardized hen bioassay for evaluating OP pesticides, except with extremely high doses (10 to 100 times the lethal dose) where immediate and severe toxic effects, including death, are seen.[117] Because OP CW nerve agents are chemically similar to OP pesticides and affect the same enzyme system in the body, similar long-term health effects would likely occur in the aftermath of immediate, severe poisoning with sarin, soman, or VX-i.e., the subtle, but measurable, neurophysiological and neuropsychological effects described earlier in this chapter. Again, these health effects did not occur in populations that had been exposed to subclinical amounts of OP pesticides. Current scientific evidence suggests that subclinical exposure to OP CW nerve agents does not result in long-term neurophysiological and neuropsychological health effects. Ongoing research at the Boston and Portland Environmental Hazards Research Centers is investigating the possibility of such effects in Gulf War veterans.

Long-term health effects of exposure to mustard agents. Based on epidemiologic research, humans exposed to mustard agent are at increased risk for lung cancer.[98,287] Several other reviews of human exposure to mustard agent during World War I (WWI) and other wars also indicate veterans exposed to mustard agents during the Gulf War could experience other respiratory problems as well.[98,287]

During World War II (WWII), more than 60,000 U.S. service members were used as human test subjects and exposed to mustard agents, including at least 4,000 individuals exposed to high concentrations of these agents.[98] An Institute of Medicine (IOM) review concluded that several specific chronic diseases are causally associated with mustard agent exposure. These include various respiratory cancers, skin cancer, chronic skin ulceration and scar formation, chronic respiratory disease including asthma, chronic bronchitis, emphysema, chronic eye diseases, and various psychological disorders including PTSD. IOM also found suggestive evidence (weaker than the associations for the conditions just mentioned) that exposure to mustard agent was associated with leukemia. Finally, IOM also analyzed two studies that examined the link between mustard and reproductive dysfunction, but determined that the database could not be used to make conclusions about human reproductive health effects.[98]

What do we conclude about the risks of CW agents to Gulf War veterans? Current scientific literature indicates that when exposure to OP CW agents results in immediate and severe poisoning, long-term, subtle neuropsychological and neurophysiological effects could occur. Available scientific evidence does not indicate that such long-term effects occur in humans following low-level exposures, but the amount of data from either human or animal research on low-level exposures is minimal. Long-term effects in humans exposed to mustard agents include an elevated risk of lung cancer beginning decades after exposure. Based on available data, it is unlikely the health effects reported by Gulf War veterans today are the result of exposure to OP or mustard CW agents during the Gulf War. Ongoing or planned federally-funded studies focused specifically on low-level exposures and delayed neurotoxicity of CW agents should elucidate gaps in knowledge and eliminate uncertainty and/or identify new directions for research.

Biological Warfare Agents

The U.S. military prepared for the possibility that Iraq might use two BW agents-anthrax and botulinum toxin-against U.S. service members during the Gulf War. After the war, new data revealed Iraq had also weaponized aflatoxin. The Committee evaluated the potential health effects of these three BW agents on the long-term health of Gulf War veterans.

Anthrax. Anthrax is a bacterial disease most often found in cattle and sheep. Human infection can occur by contact with infected animals or by inhalation of spores from infected animal products (e.g., as hides or wool). Left untreated the disease usually is fatal. After exposure, the anthrax bacteria travel to the intestines and other areas where they cause severe tissue damage. Initial symptoms include nonspecific malaise, low grade fever, and nonproductive cough. Initially, anthrax can be difficult to diagnose because symptoms, although severe, are not specific.[103] As the disease progresses, symptoms include high fever, labored breathing, choking cough, and vomiting; death usually occurs within four days.[276] Terminal symptoms include abrupt onset of shortness of breath, harsh breathing, skin turning blue, excessively rapid heartbeat, and rapid progression to shock and death. Cases of pulmonary anthrax caused by inhalation of aerosolized spores (which would be the case in a military use) are almost invariably fatal if not treated immediately with antibiotics. Exposure to small numbers of infecting spores can increase the incubation time of the disease from a few days to several weeks, but if infection occurs, the disease progresses toward death in the same manner as for high-level exposure.[103,276] No long-term effects have been reported in persons successfully treated for anthrax.

Botulinum toxin. Botulinum toxin is a group of related, highly poisonous protein agents isolated from fermentation of the bacterium *Clostridium botulinum,* which naturally occurs in soil and can grow in many meats and vegetables. Botulinum toxin is fast-acting, usually producing symptoms within 18 to 36 hours after ingestion. Death occurs in 80 percent of an exposed population after one to three days.[276] Botulinum toxin blocks neuromuscular conduction by binding to receptor sites on motor nerve terminals and by inhibiting the release of acetylcholine. Symptoms at high exposure levels can include respiratory distress and respiratory paralysis, which may persist for six to eight months.[117] Disability progresses from difficulty in walking and swallowing and impaired vision and speech to convulsions. Ultimately, symptoms include paralysis of the respiratory muscles, suffocation, and death-all within a few hours or days, depending on the amount of toxin ingested.[276] In cases of accidental exposure in the general population, the fatality rate is 35 to 65 percent and is fatal in three to ten days.[117] Botulism antitoxin can be effective if administered within days of exposure.[276] The Committee found no scientific literature suggesting adverse long-term health effects from low-level exposure to botulinum toxin.

In fact, botulinum toxin has conventional medical therapeutic uses. Botox® is an FDA-approved, purified, type A botulinum toxin, and injecting it into the muscle of patients causes a localized, temporary denervation and muscle paralysis. Such an effect is therapeutically useful for treating a number of conditions, including blepharospasm (an involuntary recurrent spasm of both eyelids) and for use in certain types of eye surgery. Studies on thousands of adults treated with Botox® have shown only mild side effects-e.g., a diffuse skin rash lasting several days-as a result of the localized muscle paralysis effects of the toxin. The only long-term effect reported is a slight reduction in the effectiveness of Botox® due to a person's natural immune responses.

Aflatoxin. Aflatoxin is a naturally occurring toxic metabolite from certain fungi that sometimes occur on grains, peanuts, and other foods stored under certain conditions.[117] Aflatoxin ingestion can result in immediate, toxic effects in many different species, and death results from acute liver toxicity.[29,117] Aflatoxicosis in humans has been reported following ingestion of aflatoxin contaminated food, and symptoms include vomiting, abdominal pain, pulmonary edema, gastrointestinal hemorrhage, convulsions, coma, and death.[29] Several epidemiologic studies suggest aflatoxin causes liver cancer in humans. The only documented health effect that could be expected from low-level exposure to aflatoxin would be an increased prevalence of liver cancer years to decades after exposure.

What do we conclude about the risks of BW agents to Gulf War veterans? In cases where an individual survives exposure to anthrax or botulinum toxin, no known, long-term health consequences exist. The Committee concludes it is unlikely the health effects reported today by Gulf War veterans are the result of exposures to BW agents. Aflatoxin, however, is a liver carcinogen, and increased rates of liver cancer could result decades following low-level exposure, although available evidence reviewed by the Committee does not indicate such exposures occurred during the Gulf War (see chapter 2).

Anthrax and Botulinum Toxoid Vaccines

Before U.S. troops deployed to the Gulf region, they received a standard series of inoculations against infectious diseases-e.g., cholera, typhoid, tetanus, diphtheria, polio, and measles-that might be given to any U.S. citizen traveling to these regions. After arriving in the Gulf War region, some U.S. service members received two additional vaccines for protection against the BW agents anthrax and botulinum toxin.

Anthrax vaccine. In 1970, FDA licensed anthrax vaccine to protect civilian workers against possible infection by anthrax bacteria. Since 1967 and before the Gulf War, more than 20,000 inoculations had been routinely administered to at-risk populations, including laboratory personnel who work with the bacteria that causes anthrax, persons in industries that work with animal hides and wool (which can be a source of anthrax infection), and veterinarians who come in contact with anthrax-infected animals.

Although active long-term safety surveillance is not generally part of the FDA vaccine licensing process, the FDA encourages U.S. health care providers and the law requires manufacturers to report serious adverse reactions for all licensed vaccines.[305] FDA has not received data that raise concerns about the safety of the anthrax vaccine.

Historical data for short-term health effects of the anthrax vaccine indicate up to six percent of recipients experience mild discomfort, including tenderness, redness, swelling or itching at the inoculation site for up to 72 hours. Fewer than one percent experience a more severe local reaction that potentially limits the use of the arm for one to two days. Systemic reactions, e.g., fever, malaise, are uncommon (about 0.1 percent).[102,103]

According to DOD, medical monitoring and surveillance conducted during the Gulf War found the expected short-term side effects of anthrax vaccines occurring at approximately the historical rates.[53] A single hospitalization for a vaccination site infection was reported. DOD points out that precise information about all possible short-term side effects is unknown, however, because of difficulties in collecting such data during and after the Gulf War.

Botulinum toxoid vaccine. Botulinum toxoid (BT) vaccine has been used for more than 25 years to protect industry and laboratory workers from occupational exposure to the extremely poisonous botulinum toxins. All civilian vaccinations have been administered under an investigational new drug (IND) application sponsored by CDC. For both civilian and military use, BT vaccine remains in "investigational" status-i.e., not yet licensed by FDA.

Since 1970, as part of the IND evaluation, FDA has reviewed information from CDC about the cumulative safety record for BT vaccine. Records of more than 10,000 administered vaccine doses (including approximately 2,200 in the five years before the Gulf War) indicate that treated individuals experience only local side effects often associated with many types of vaccinations. These effects, primarily at the injection site, include local pain, tenderness, swelling, redness, and itching. Systemic reactions such as temporary fever, tiredness, headache, or muscle pain also can occur. Rarely, reactions include soreness of the arm sufficient to leave individuals unable to perform duties for a day or two or development of a lump at the injection site that generally resolves within several weeks. Such adverse reactions also are observed with other licensed toxoid vaccines, such as diphtheria and tetanus toxoids.[53,102]

The U.S. Army examined the frequency of side effects of BT vaccinations seen in some U.S. service members. In one report of 237 Gulf War veterans who had received BT vaccine, 2.5 percent had systemic reactions. This rate parallels that recorded by the U.S. Army and CDC prior to the Gulf War.[127]

Precautions against contaminants. The Committee examined the hypothesis that Gulf War veterans' illnesses could be the result of contamination of anthrax

vaccine lots by *Mycoplasma incognitus*.[182] Discussions with staff of FDA, Walter Reed Army Medical Center, U.S. Army Medical Research and Materiel Command, academic experts, and the manufacturer of the vaccines indicate that *Mycoplasma* could not survive in the anthrax and BT vaccines.[136,138,168,303] *Mycoplasma* is difficult to grow, and the culture media used to produce Anthrax and BT vaccines do not contain serum, an essential ingredient for *Mycoplasma* growth. In addition, the vaccines are preserved and/or processed with other products that create a hostile environment for *Mycoplasma*, including:

- formaldehyde (anthrax and BT vaccines),
- benzethonium chloride (anthrax vaccine only),
- isotonic saline solution (BT vaccine only), and
- Thimerosal (BT vaccine only).

The Committee concludes it is unlikely that *Mycoplasma* organisms contaminated anthrax vaccine or BT vaccine.

Health effects of multiple vaccines. The human immune system has evolved the capability to deal with thousands of foreign substances, to sort them out, and to regulate immune response. Humans live among a vast population of hostile microorganisms, and vaccinations-even multiple, contemporaneous vaccinations-are a small part of total immune stimulation. Individual vaccines can cause adverse effects, but several studies of the effects of giving multiple vaccinations at one time have found no adverse effects associated with the practice. Research on this issue continues, but based on available evidence, the Committee believes it is unlikely that multiple vaccines are responsible for illnesses reported today by Gulf War veterans.[202,219,268]

What do we conclude about the risks of vaccines to Gulf War veterans? The Committee concludes it is unlikely that health effects reported by Gulf War veterans today are the result of exposures to the BT or anthrax vaccines, used alone or in combination.

Pyridostigmine Bromide

PB is a pretreatment drug used to protect against the CW nerve agent soman. By itself PB is not protective against CW nerve agent poisoning. Used as a pretreatment, however, PB might enhance the antidote effects of the standard atropine and 2-PAM treatments used by the U.S. military for nerve agent poisoning.[269]

Since 1955, FDA has approved PB for use by persons suffering from myasthenia gravis. No long-term health problems thought to be associated with PB have been reported for persons with myasthenia gravis who regularly take PB over many years or decades.[196,220] DOD filed a New Drug Application in May 1996, but PB currently has the status of an IND for nerve gas pretreatment use.

According to FDA, its conclusion that PB was safe for use by U.S. service members during the Gulf War was based largely on the extensive cumulative experience with this drug in patients with myasthenia gravis. Typically these patients are treated with PB doses of up to 1,500 mg per day for many years, compared to the prescribed dose of 90 mg per day for a maximum of seven days use during the Gulf War. Reported side effects of PB include increased salivation, increased tearing, urinary urgency and frequency, nausea, vomiting, muscle weakness, abdominal cramps and diarrhea.[167] These effects disappear when individuals stop taking PB.

Data from one DOD retrospective study on 30 medical support officers of the 18th Airborne Corps reveal a similar range of short-term health effects from PB. The 18th Airborne Corps instructed 1,650 soldiers (6.5 percent women) to take PB tablets at the onset of Operation Desert Storm in January 1991. Half those surveyed reported gastrointestinal symptoms, 5 to 30 percent reported increased urinary urgency and frequency, and fewer than 5 percent reported headaches and tingling of extremities. The need for a medical visit was reported by less than 1 percent, and the decision to discontinue use based on medical advice was reported by less than 0.1 percent. As with myasthenia patients, DOD reported that side effects ceased when PB use was discontinued.[110] Other retrospective studies found similar results.[32,270]

A survey of 213 Israeli soldiers asked about possible symptoms of PB and their severity. The most frequent health complaints reported were generally mild and nonspecific, including dry mouth, general malaise, fatigue, and weakness, which appeared about 1.6 hours after taking the medication and recurred after each intake. For this group the typical side effects associated with PB, such as nausea, abdominal pain, frequent urination and runny nose, were infrequent.[228]

DOD recently completed a study begun in November 1994 that looked at differential tolerances to PB between women and men.[128,296] Ninety subjects, equally divided by gender and in three weight classes, took 30 mg of PB every 8 hours for 21 days (plus one dose). PB was found to be safe and well-tolerated. All side effects were mild and resolved with no intervention. Headaches, dizziness, nausea, rash, and hair loss were reported in both drug and placebo groups. Diarrhea and abdominal pain were reported in the PB group only (four study participants). Overall, the occurrence of adverse effects did not differ between active and placebo subjects, nor were differences observed among gender or weight groups. Results from a 1-year followup, indicated no long-term effects except possibly a skin rash that resolved with treatment.[128]

DOD continues to seek FDA approval to use PB for the protection of U.S. troops against CW agents. To support this approval process, DOD has sponsored various research efforts since 1984 to gather information on the effects of PB pretreatment on healthy individuals. To date, DOD reports no serious or long-term reactions from this research.

Genetic predisposition to PB sensitivity. Some scientists suggest that persons who are genetically unable to produce the plasma enzyme butyryl cholinesterase (BuChE) could be more sensitive to PB's known side effects, and at least one apparent case has been reported.[139] The estimated frequency in the general population of persons unable to produce BuChE is about 0.03 percent. Exposure to PB (or similar compounds) could causeimmediate and marked health effects in these individuals. Based on studies of PB-related compounds in BuChE deficient individuals, however, symptoms vanish when exposure to PB is removed. Limited population genetic data indicate that about four percent of all people have slightly reduced ability to produce functional BuChE. It is unclear whether these individuals could be more susceptible to temporary PB side effects.[1,67,68,71,139,192,193,224,269]

Synergistic effects. Concern has been raised about the possibility of increased health problems from PB when it is combined with other risk factors. Some

researchers have hypothesized that PB in combination with stress may create central nervous system effects.[59,170,228] The insect repellent DEET and the insecticide permethrin are most often mentioned as cofactors with PB for Gulf War illnesses.

After the Gulf War, one U.S. Department of Agriculture researcher conducted a study on synergistic effects of various chemicals, including DEET and PB, on cockroaches. DEET showed a four-fold increase on the lethality of PB-i.e., it took one fourth as much PB to kill cockroaches in the presence of a sublethal dose of DEET.[314] In 1996, another researcher reported that PB given at near lethal levels to chickens could increase the toxicity of DEET and permethrin.[1] Under these conditions, nervous system damage to the chickens was reported. A 1995 DOD study with rats reported that PB caused a slight increase in lethality of DEET and permethrin when compared to expected additive values.[263]

These three studies report enhanced toxic effects from PB, DEET, and permethrin in combination. However, doses used in the laboratory experiments were far greater than exposures U.S. service members could have experienced during the Gulf War. Moreover, for DEET and permethrin, the routes of administration were not comparable to that used by U.S. service members in the Gulf War. For example, in the chicken model, DEET and permethrin were injected underneath the skin and, in the rat study, they were administered orally. During the war, DEET should have been applied to the skin, and permethrin should have been applied to the uniform.

These studies did not address the effect PB, DEET, and permethrin-individually or in combination-would have on morbidity in humans and what illnesses might be induced by such use. Neither did the studies answer whether there would have been detectable harmful effects in humans in-theater under the likely operational use by U.S. troops.

Some researchers suggest the immediate toxicity of the OP pesticides available to Gulf War veterans could have been increased from coexposure to PB,[1,150,151] leading to the well-characterized, long-term signs and symptoms of immediate and severe poisoning described earlier in this chapter. As previously mentioned, however, DOD reports that on-site medical personnel did not observe any immediate and severe effects of OP poisoning among U.S. service members, and the current scientific knowledge base indicates that long-term health effects do not occur in the absence of immediate poisoning.

In setting priorities for new research projects on Gulf War veterans' health issues, a subcommittee of the RWG of the Coordinating Board gave priority to toxicology studies on subtoxic exposures to PB and pesticides, either alone or in combination. Several federally funded studies now underway are assessing combined exposure to PB and other chemical risk factors.

What do we conclude about the risks of PB to Gulf War veterans? Given the extensive cumulative experience with the use of PB in patients with myasthenia gravis and data collected from military personnel, the Committee concludes it is unlikely that health effects reported today by Gulf War veterans are the result of exposure simply to PB. Ongoing federally funded studies should help the scientific community draw conclusions about the synergistic effects of PB and other risk factors.

Endemic Infectious Diseases

During WWII, British military units were stationed in the Gulf region and based on this experience documented the nature of endemic infectious diseases. Thus, the U.S. command was concerned about diseases, including shigellosis, malaria, sandfly fever, and cutaneous leishmaniasis.[6,65,90,187] For example, cutaneous leishmaniasis, known locally as the Baghdad boil, is endemic to that area; 80 to 90 percent of people in some parts of Southwest Asia have scars from previous attacks.[187] During WWII, rates of sandfly fever were 3 to 10 percent of all troops in the Middle East, and in some units it exceeded 50 percent.[187] Infectious diseases during the Gulf War, however, were not a major cause of sickness or lost work time.[90] During the Gulf War, only one death due to infectious disease (meningococcal meningitis) was reported.[342,343]

Experts attribute the lack of a problem with infectious diseases during the Gulf War to a comprehensive infrastructure of medical care and preventive medicine efforts.[90,185,271,273,293] DOD took measures to minimize infectious disease risk, including strict monitoring of drinking water purity, inspecting food sources and supplies, maintaining field camp sanitation, and instituting an insect vector control program. U.S. service members received booster doses of routine vaccinations, including typhoid, meningococcus and, during the fall, influenza. Immune gamma globulin was used to prevent Hepatitis A, and the small number of troops who entered Iraq near the Euphrates River valley received drug prophylaxis for malaria.

Most of the combat troops were isolated in barren desert locations, distant from rivers, oases, and urban areas. Additionally, maximum troop deployment occurred during the cooler winter months, which provided the least favorable conditions for the transmission of insect-borne diseases.[90,185] Indeed, the majority of the 12 individuals who developed viscerotropic leishmaniasis had been deployed to urban areas.[145]

Diagnosis of infectious diseases in-theater. Short-term diarrhea was a common symptom among troops in-theater. Most cases were mild, traveler's-type diarrhea that resolved spontaneously without antibiotics after a few days.[64,90] Gastroenteritis among outpatients decreased from four percent per week early in the deployment to less than 0.5 percent per week after U.S. medical command tightened control of food sources-especially imposing a ban on locally-grown fresh fruits and vegetables. The most common organisms identified in service members with diarrhea severe enough to warrant cultures were *Shigella sonnei* and *Escherichia coli*. DOD reports no confirmed cases in-theater of food-borne, diarrheal diseases, such as cholera, typhoid fever, or giardiasis.[90]

DOD medical personnel evaluated U.S. service members for several diseases transmitted by insects, including leishmaniasis, sandfly fever, malaria, dengue, Sindbis, West Nile fever, Rift Valley fever, and Congo-Crimean hemorrhagic fever.[90,293] As noted, sandfly fever had been a major concern, but no cases were seen during the Gulf War. DOD reports detecting seven cases of malaria and one case of West Nile fever, a mosquito-borne viral illness. No rickettsial illnesses and no cases of other arthropod-borne viral illnesses were identified.

Viscerotropic leishmaniasis (VL) and cutaneous leishmaniasis (CL) are the only endemic infectious diseases demonstrated to cause chronic morbidity among a number of Gulf War service members. These diseases are transmitted through the bites of sand flies; person-to-person infection does not occur. Thirty-two cases of leishmaniasis were diagnosed among U.S. troops, consisting of 12 cases of VL and 20 cases of CL.[145,277] CL causes a characteristic ulcerative or nodular skin rash that can persist for more than a year without treatment. And, while VL can be difficult to confirm, it is not considered to be a cause of widespread illness in

Gulf War veterans. All veterans diagnosed with VL, except one, have experienced the signs characteristic of the disease.[90,146,293]

It is unlikely that veterans in the Registry or CCEP who have unexplained illnesses are suffering from VL. The incidence of VL during the Gulf War and the five years since has been low (12 of 697,000), and other sandfly-borne infectious diseases in the troops have been absent.[90,278] Additionally, individuals with unexplained illnesses also lack signs and symptoms characteristic of VL. VL can sometimes occur following a prolonged incubation period (more than 18 to 24 months); there is also a risk of activation of latent infections in immunosuppressed persons.[65,90,146] To date, DOD and VA report that delayed onset of VL has not occurred.

From August 1990 through July 1991, the U.S. Army deployed approximately 347,000 individuals to the Gulf region. Based on information from U.S. Army field hospitals, the only infectious diseases that caused 30 or more each of approximately 14,000 admissions were pneumonia, intestinal infections, inflammation of the testes and/or epididymus, chicken pox, and kidney infections.[342,343]

What do we conclude about the risks of infectious diseases to Gulf War veterans? Based on a review of the rates and types of the diseases diagnosed during and after the Gulf War, the Committee concludes it is unlikely that infectious diseases endemic to the Gulf region are responsible for long term health effects in Gulf War veterans, except in a small, known number of individuals.

Depleted Uranium

Uranium is a naturally occurring, chemically toxic, and radioactive element composed of three isotopes. Relative to other radionuclides, natural uranium is only slightly radioactive because of its low specific activity.[288] When the uranium isotope used for nuclear reactors and weapons is extracted from natural uranium, DU is the byproduct.

DU is nearly twice as dense as lead-a property used to improve the performance of both armor and armor penetrating munitions. During the Gulf War, some U.S. tanks and U.S. aircraft fired DU munitions, which produced shrapnel and an aerosolized dust on impact with armor or on ignition in accidental munitions fires. DU retains natural uranium's toxicological properties and approximately half its radiological activity.[267] Most of DU's radiation cannot penetrate skin, and DU poses little threat to human health while it is external to the body.[288]

Because it is slightly radioactive, natural uranium is considered to be a potential carcinogen-albeit with a small cancer risk relative to other radionuclides.[288] Taken together, human and animal studies do not indicate conclusively that natural uranium causes cancer in humans. Epidemiologic studies of uranium miners experiencing extremely high, lifetime, occupational exposures to uranium show an increase in mortality due to lung cancer, but such cancers are thought to be caused by miners' concurrent exposures to radioactive radon gas and its decay products, tobacco smoke, silica and other dusts, or exhaust fumes from diesel engines.[172,321] Animal studies conclude that exposure to uranium for long periods of time does not result in increased incidence of cancer, except in the case of one study. This study found prolonged (more than five years) inhalation of high levels of uranium dioxide led to lung neoplasms in dogs.[130,131]

The chemical toxicity of uranium as a heavy metal is well characterized. In fact, the kidney is the most sensitive organ affected by exposure to uranium and is the critical target organ for risk assessment.[133,218,322,341] For this reason, uranium exposure is regulated based on its chemicaltoxicity and not its radiological properties.[129,156] Even so, more than 50 years of occupational health data from uranium miners reveal little epidemiologic evidence of excess kidney disease among workers exposed for years or decades.[322]

The health risks of internalized uranium or DU particles depend on dose, exposure pathway, and solubility of the ingested particle. Ingestion of insoluble uranium compounds poses little health hazard because they pass rapidly through the body and are eliminated in the feces. However, animal studies have shown that ingestion of large doses of relatively soluble uranium compounds are associated with kidney toxicity.[129,288] Inhaled uranium particles that are nonrespirable are cleared from the respiratory tract and either expelled from the body (cough) or swallowed and passed to the GI tract. Respirable and relatively soluble particles are cleared to blood and can affect kidney toxicity.[14,129] Less soluble particles can remain in the lung longer and in theory could pose a radiological hazard. The U.S. Army has conducted tests to characterize aerosols associated with DU munitions impacts with armor and with accidental DU munitions fires; it concluded a service member's risk exceeds civilian safety standards only when he or she is inside a vehicle when it is penetrated by DU munitions.[39,96,97] The adequacy of the research supporting this conclusion has been questioned by some reviewers.[229,267]

No studies of long-term human health effects of uranium metal implanted in tissue exist. Nevertheless, toxic effects are likely to be similar to the kidney toxicity observed from inhaled or ingested uranium. To date, VA has reported no kidney toxicity among soldiers wounded by DU fragments in friendly fire episodes.[112] VA currently monitors the health of approximately 30 veterans suspected of retaining embedded DU fragments, and the U.S. Army Medical Research and Materiel Command is funding animals studies to investigate the health hazards associated with short- and long-term exposure to DU metal fragments.[296]

What do we conclude about the risks of DU to Gulf War veterans? The Committee concludes it is unlikely that health effects reported by Gulf War veterans today are the result of exposure to DU during the Gulf War. Since uranium is a potential carcinogen, it is possible that exposure to DU during the Gulf War could lead to a slight increase in the risk for lung cancer after decades following the end of the war.

Oil-well Fire Smoke

At the end of the Gulf War, more than 600 Kuwaiti oil wells and several pools of spilled oil were left burning after being ignited by retreating Iraqi troops. Huge, dramatic plumes of billowing smoke from these fires rose high into the atmosphere. Occasionally the smoke remained low to the ground, in some cases enveloping U.S. military personnel.

Some chemicals contained in oil-well fire smoke, such as benzene and PAHs, are human carcinogens. As described earlier in this chapter, the amounts of these pollutants in the air were low. Hence, their contribution to excess cancer risk would be expected to be small and increased rates of cancers likely would not result.

The U.S. Army used EPA's standardized methodology to estimate cancer and noncancer risks from the oil-well fire smoke.[265] It concluded "the potential for significant long-term adverse health effects for the exposed DOD troop or civilian employee populations is minimal." Risks from cancers were estimated not to exceed two excess cancers per one million people exposed, a value well within EPA's acceptable range.

Noncancer risks from smoke exposure were calculated as Hazard Indices (HI). When the HI exceeds 1.0, there can be concern about potential noncarcinogenic health effects. In Saudi Arabia, the HI ranged from 0.6 to 2.0, while in Kuwait it ranged from 2.0 to 5.0. Most of this noncancer risk was contributed by inhalation of VOCs, particularly benzene. The U.S. Army concluded that risk of noncarcinogenic health effects among the U.S. service members was low since HIs are based on EPA toxicity values that are set far below levels thought to cause health effects and that also account for sensitive subpopulations such as children and the elderly. A congressional Office of Technology Assessment analysis of the U.S. Army's risk assessment methods and findings concluded "the risks to health from exposure to the smoke and the background air contaminants in the Persian Gulf are likely to be extremely small."[275]

Oil-well fire smoke appears not to have caused observable changes in lung tissue. Researchers at the Armed Forces Institute of Pathology found no significant differences when they compared lung tissue from autopsies of 33 U.S. service members who died after the start of the oil well fires to lung tissue from autopsies of soldiers who died before the fires.[164]

Information has been gathered from 110 firefighters working for private companies in the Kuwaiti oil fields in 1991. Individuals were deployed for 28-day periods, working daily at the well heads without breathing-protection equipment. Most were over 30 years old and had 10 or more years experience fighting similar well fires, many of them in Kuwait and elsewhere in Southwest Asia. No cases of illnesses resembling those reported by Gulf War veterans were reported, nor have such complaints been observed among thousands of oil-well firefighters who have spent years experiencing similar exposures.[60,61]

Known immediate health effects from inhaling large amounts of smoke and particulates are primarily respiratory, including coughing, wheezing, increased airway resistance, and respiratory infections. Toxic gases that can be found in oil-well fire smoke-such as hydrogen sulfide and sulfur dioxide-can cause eye and nose irritation, decreased pulmonary function, and increased airway reactivity.[312,315] Nevertheless, these toxic gases were not detected at high levels during the fires.[89,289,302,339] High levels of airborne particulates, which sometimes occurred in the Gulf region, are associated with increased rates of asthma and can exacerbate other chronic respiratory conditions. With chronic (months or years) exposure to particulates, there is increased risk of some loss in lung function or chronic bronchitis, especially in cigarette smokers.

What do we conclude about the risks of oil-well fires to Gulf War veterans? Based on research on human and animal health effects of exposure to air pollutants and on currently available exposure data, the Committee concludes it is unlikely exposure to oil-well fire smoke is responsible for symptoms reported today by Gulf War veterans. Although smoke from the oil-well fires did not include levels of carcinogens that would be expected to increase cancer rates among Gulf War participants, VA mortality studies will include cancer surveillance.

Petroleum Products

Diesel, kerosene, gasoline, jet fuel, and other petroleum-based fuels were widely used during the Gulf War for dust suppression, waste incineration, and for fueling vehicles, stoves, heaters and generators. U.S. service members in certain jobs were occupationally exposed to petroleum fuel vapors and combustion products, such as toluene, xylene, benzene, ethyl benzene, carbon monoxide, sulfur dioxide, nitrogen dioxide, particulates, lead, and other pollutants. Additionally, in some areas near the Kuwaiti oil-well fires, unburned crude oil drizzled down, covering the ground and troops below.[242]

Petroleum fuels are a complex mixture of aliphatic hydrocarbons and aromatic hydrocarbons such as benzene and PAHs. These fuels also commonly contain various additives, like lead. When burned, petroleum fuels produce a variety of potentially hazardous combustion products. High-level, short-term exposures to fuel solvents can cause immediate effects. In most cases, however, complete recovery occurs when the exposure ceases.[5,286]

U.S. service members could have been exposed to petroleum fuels by inhalation, ingesting contaminated water or dust, and skin contact. Inhalation exposure could depress the central nervous system (CNS). Symptoms include short-term effects ranging from fatigue, headache, nausea, blurred vision, and dizziness, to convulsions, paralysis, and loss of consciousness depending on the dose.[282,312] Again, exposure to high, nonlethal levels usually is followed by complete recovery, although rare cases of permanent brain damage after massive exposure have been reported.[117,205,282]

Prolonged breathing of diesel fuel vapors can damage kidneys or lower blood clotting ability.[284] Studies of workers occupationally exposed to certain hydrocarbon solvents in petroleum fuels suggest that long-term high-dose exposure over 12 to 14 years can lead to neurotoxic effects.[117,285] For example, psychomotor disturbances, visual memory and perception, and visuomotor learning ability were significantly affected in exposed gasoline-pump workers compared to matched controls, particularly workers exposed for more than a year.[125] Some studies suggest there are neurotoxic effects from long-term exposure, including decrements in memory, cognitive functioning, and sometimes neuromotor functions.[117] Other researchers, however, have challenged the existence of what is sometimes referred to as "chronic toxic encephalopathy," and uncertainty exists about CNS effects from long-term, low-level exposures to solvents.[69]

Benzene makes up about one percent of U.S. gasoline and up to five percent of European formulations. It is a known human carcinogen that is associated with certain types of leukemia. Nevertheless, more than 55 published epidemiologic studies of workers exposed occupationally to hydrocarbons such as gasoline generally do not replicate the carcinogenic effects reported for experimental animals.[157,282] Recent studies of refinery workers also do not reveal a clear association between gasoline production and leukemia.[88,282] Still, based on the limited evidence from animal studies and the presence of benzene in gasoline, the International Agency for Research on Cancer (IARC) concluded that gasoline is possibly carcinogenic to humans. It is not known if other petroleum products cause cancer in humans. IARC believes there are insufficient data to assess whether light fuel oils or light diesel fuels cause cancer in humans. However, IARC has determined that occupational exposure to fuel oils during petroleum refining is probably carcinogenic to humans.[284]

Although ingesting small amounts of fuel oils is unlikely to cause significant symptoms, ingesting fuel oils in larger quantities can cause vomiting, diarrhea, swelling of the stomach, stomach cramps, coughing, drowsiness, restlessness, irritability, and unconsciousness.[284] Ingestion of fuel oils can be accompanied (during vomiting) by aspiration of some of the material into the lungs, which can produce a chemical pneumonitis.

Skin exposure to large amounts of oil can physically clog pores and hair follicles, compromising body heat loss. Long-term exposure can cause acne and other skin problems. With high concentration or extended exposure, lighter components of crude oil or other fuel oils can defat the skin, leading to redness and itching or dermatitis.[284,312]

Exposure to the normal combustion products of petroleum fuels is also a health concern. Limited epidemiologic evidence indicates daily use of kerosene stoves for cooking or heating does not cause breathing problems for most people.[284] If insufficiently vented, however, carbon monoxide generated from fuel oil combustion can build up, causing drowsiness, nausea, and even asphyxiation. Individuals exposed to unvented combustion of fuels containing lead could experience health effects ranging from subtle biochemical changes in blood to severe CNS effects at high doses. Occupational exposure to inorganic lead is associated with subjective signs of neurotoxicity such as forgetfulness, lethargy, and weakness. These neurological signs and symptoms occur at about the same blood lead levels as other overt signs of lead intoxication, such as gastrointestinal complaints like abdominal pain, nausea, and vomiting.[286]

What do we conclude about the risks of petroleum products to Gulf War veterans? While certain subsets of Gulf War service members could have experienced occupational exposures to petroleum products that would entail increased risks of health effects, it is unlikely that health effects reported today by Gulf War veterans are due to exposure to petroleum products during the war.

Psychological and Physiological Stress

Virtually all Gulf War participants were exposed to a wide range of stressors associated with the war. Throughout human history, observers have noted a correlation between the horrors of war and "mysterious" illnesses in soldiers and veterans.[91] Only recently, however, have the broad range of symptoms for such illnesses been recognized as serious, physiological effects of stress.

Unexplained illnesses in soldiers were widely interpreted as a form of malingering until the 1940s. When WWII veterans experienced many of the same symptoms seen in WWI, Charles Samuel Dyers coined the term "shell shock." He began to study and write about what actually happened to the minds and bodies of soldiers on and off the battlefield. Physicians began to describe psychosomatic symptoms-physical disorders caused or influenced by a psychological state-as the normal and expected consequences of experiencing fear and fright, and recognized the relationship between intense emotion and bodily changes.

During this period, a telling example came to light that illustrated how traumatic experience can lead to a decline in physical health. A group of merchant marines in Norway during WWII were preselected for their excellent physical and mental health. Yet after exposure to extraordinary stress, they showed a sharp decline in their health. Many had symptoms of chronic fatigue, chronic pain, impotence, and irritability.

Today, scientists are beginning to unravel the physiological connection between the brain and various other parts of the human body. Recent animal and human studies reveal numerous pathways connecting the brain to the rest of the body, through which psychological stress can be physically expressed.[31] Animal studies demonstrate that stress can have measurable effects on the brain, immune system, cardiovascular system, and various hormonal responses. Although the human body can adapt to normal stresses, if the stress lasts longer it can be expressed in a variety of physical illness symptoms.[155] Some researchers suspect that the inadequate production of stress hormones and stress response occurs in some (not all) humans with CFS and PTSD.[31]

Based on this understanding and supported by decades of clinical observations, physicians recognize that many physical, as well as psychological, diagnoses are the consequences of stress. This connection is not limited to soldiers only. Experts now know that conventional stressors, such as bereavement, family problems, financial and job problems, domestic or other violence, can cause significant and long-term physical health effects.[76,184]

Physicians and scientists also note substantial variability in the human response to stress. One individual's reaction to trauma could be hypertension; in another individual, the reaction to similar trauma might be severe anxiety. A number of medical diagnoses are linked with stress, including somatoform disorders, CFS and FM. These conditions share many overlapping features, and each diagnosis depends on meeting specific case definitions. Significant evidence supports the likelihood of a physiological, stress-related origin for many of these ailments.

What do we conclude about the risks of stress to Gulf War veterans? The Committee concludes that stress does not cause a unique illness or set of symptoms. Stress can contribute to a broad range of physiological and psychological illnesses. Stress is likely to be an important contributing factor to the broad range of illnesses currently being reported by Gulf War veterans.

SUMMARY

The Committee has examined exposure and, independently, expected health effects for ten Gulf War risk factors: pesticides, CW agents, BW agents, vaccines, PB, infectious disease, DU, oil-well fire smoke, petroleum products, and psychological and physiological stress. In our evaluation, we used the substantial amount of relevant scientific information available in published peer reviewed literature, interviews with experts, invited testimony, public comment, and discussions with scientific experts in academic and government agencies. For most of the risk factors evaluated, the Committee has determined-even in the absence of exposure data-they are unlikely to be associated with the health problems currently reported by Gulf War veterans. Based on its review, the Committee makes the following findings and recommendations.

FINDINGS

- Although some veterans clearly have service-connected illnesses, current scientific evidence does not support a causal link between the symptoms and illnesses reported today by Gulf War veterans and exposures while in the Gulf region to the following environmental risk factors assessed by the Committee: pesticides, chemical warfare agents, biological warfare agents, vaccines, pyridostigmine bromide, infectious diseases, depleted uranium, oil-well fires and smoke, and petroleum products. Some of these risk factors explain specific, diagnosed illness in a few Gulf War veterans, for example, leishmaniasis has been diagnosed in 32 individuals. Prudence requires further investigation of some areas of uncertainty, such as the long-term effects of low-level exposure to chemical warfare agents and the synergistic effects of exposure to pyridostigmine bromide and other risk factors.
- A number of Gulf War risk factors-e.g., mustard agent, aflatoxin, and certain petroleum products-are potential human carcinogens that could cause

increased rates of cancer beginning decades after exposure.
- Stress is known to affect the brain, immune system, cardiovascular system, and various hormonal responses. Stress manifests in diverse ways, and is likely to be an important contributing factor to the broad range of physiological and psychological illnesses currently being reported by Gulf War veterans.

RECOMMENDATIONS

- DOD and VA should perform long-term mortality studies of Gulf War veterans appropriate for investigating cancer rates in the Gulf War veteran population in the coming decades.
- The entire federal research portfolio should place greater emphasis on basic and applied research on the physiologic effects of stress and stress-related disorders.

*As noted, individuals in this group also were assessed for SCEs, which were found to increase with deployment to Kuwait and remain elevated even after the return to Germany.[154] SCEs are a sensitive measure of DNA damage and repair and occur at a background rate in normal cells, but increase with exposures to DNA damaging agents. It is not clear what exposures in Kuwait could have led to the observed increases, since elevated SCEs are a nonspecific measure that can reflect exposure to infections and vaccinations, or to dietary, occupational, or environmental mutagens.

**In chapter 2, we identify those areas for which we believe new research data could fill in current gaps in knowledge.

DOD Continues to Face Challenges in Implementing Its Anthrax Vaccine Immunization Program

Statement of Carol R. Schuster, Associate Director
National Security Preparedness Issues
National Security and International Affairs Division

GAO/T-NSIAD-00-157

Mr. Chairman and Members of the Committee:

We are pleased to be here today to discuss our past work on the Department of Defense's (DOD) anthrax vaccine immunization program. As you know, DOD regards the biological agent anthrax, an infectious disease that is 99-percent lethal if inhaled by unprotected humans, as the single greatest biological weapon threat to U.S. military forces. DOD considers vaccination one of the measures critical to protecting U.S. forces against such weapons. In December 1997, the Secretary of Defense announced a plan to immunize all active and reserve military personnel with a licensed anthrax vaccine. In August 1998, DOD began immunizing all 2.4 million U.S. military personnel—including all active and reserve personnel—against anthrax.

Today we would like to provide a brief update on three key findings of our October 1999 report. The findings relate to vaccine supply, medical records, and efforts to educate servicemembers about the program.[1] We have also reviewed other aspects of the anthrax vaccine immunization program, including the safety and efficacy of the vaccine and the contracts with the manufacturer. Our related reports are listed in an attachment to this statement.

Summary

In October 1999, we reported on challenges to implementing DOD's anthrax immunization program. First, we noted that supply problems caused by the manufacturer's inability to obtain Food and Drug Administration (FDA) approval to distribute vaccine manufactured at its renovated facility and problems testing previously stockpiled vaccine jeopardized DOD's schedule for vaccinating all 2.4 million servicemembers. Today, this fundamental requirement of the program—maintaining an adequate supply of vaccine—has not yet been met. The manufacturer has not yet obtained FDA approval to distribute vaccine produced at its renovated facility, and this approval is not expected until late 2000. Program officials expect the current supply to last until July 2000. Although program officials expect FDA to approve the release of previously stockpiled vaccine before the available supply is depleted, this expectation may be optimistic given past testing problems. DOD is vaccinating only personnel who are being deployed to high-threat areas and has delayed vaccinations of personnel in units scheduled for early deployment. If the manufacturer does not obtain FDA approvals as

[1] *Medical Readiness: DOD Faces Challenges in Implementing Its Anthrax Vaccine Immunization Program* (GAO/NSIAD-00-36, Oct. 22, 1999).

expected, DOD may be forced to halt vaccinations, at least temporarily. Moreover, DOD still lacks a contingency plan in the event supply problems are not resolved in time.

Second, we reported that DOD's recording and tracking system of servicemembers who receive vaccinations is an improvement over the system used during the Gulf War and in Bosnia but that DOD was not meeting its requirement to record vaccination data consistently both in paper records and in its central database. DOD reported that it planned to take further steps to improve its central database. Also, we recommended that DOD collect data on the number of servicemembers refusing the vaccine so that it can better understand servicemembers' concerns. To date, the Army has drafted a policy to collect data every 3 months. The other services are not planning to require periodic reporting but will provide data on vaccine refusals when requested.

Finally, we reported on the results of our survey, which showed that servicemembers wanted more information on long-term side effects and procedures for reporting possible side effects from the vaccine. DOD has taken initiatives to carry out a high-visibility education campaign to inform servicemembers about the vaccine program. For example, it has implemented a speakers' bureau, has updated its Internet site, and is sponsoring studies of health effects related to the vaccine.

Supply Problems Jeopardize Vaccination Program

As of March 2000, DOD had administered at least 1.6 million anthrax vaccinations to about 419,000 servicemembers, but supply problems jeopardize its schedule for vaccinating all 2.4 million servicemembers.[2] As of April 10, 2000, DOD had approximately 273,000 doses of vaccine tested and available for use. Assuming the program continues to administer vaccines at its current rate of about 75,000 doses per month, DOD officials estimate that the supply will be depleted by July 2000 unless more lots[3] of vaccine are made available. The supply can only be increased if FDA grants permission for the sole manufacturer to release vaccine produced

[2] The vaccination program is scheduled to be implemented in three phases. Phase 1—begun in 1998—includes vaccinations of servicemembers assigned or rotating to high-threat areas. Phase 2—originally scheduled to begin in January 2000 but not yet begun—includes vaccinations for early deploying units. Phase 3 includes vaccinations for the remainder of the force. The regimen for the vaccine is an initial series of three vaccinations at 2-week intervals, followed by a series of three vaccinations at 6-month intervals, with annual boosters thereafter.

[3] A lot contains approximately 200,000 doses, but at the start of the program some lots contained fewer doses because of previous commercial sales and military use.

at its renovated facility or the vaccines stockpiled before the renovation are successfully tested and released by FDA. There are problems in both areas.

First, the manufacturer, BioPort Corporation,[4] Lansing, Michigan, has yet to receive FDA approval of its manufacturing processes following a 17-month shutdown of the facility for renovation. Until BioPort obtains this approval and additional approvals for the release of each lot, it cannot release lots produced after the renovation.[5] According to a DOD contractor's assessment of a November 1999 FDA inspection report, the FDA identified 30 deficiencies, largely dealing with BioPort not fully complying with FDA Good Manufacturing Practice regulations. The assessment noted that there may be at least two significant issues BioPort must address, namely implementing a program to validate vaccine manufacturing and testing processes and systems to ensure product quality. DOD has taken several initiatives to support and oversee BioPort's efforts to obtain FDA approval. According to a contracting official, DOD intends to order BioPort to stop production of the vaccine and focus efforts on measures to validate the manufacturing process. DOD also plans to assist BioPort by funding consultants to help BioPort obtain FDA approval and to keep the facility operating at a low level. DOD officials estimate BioPort will not obtain FDA approval of its manufacturing processes until late 2000. BioPort's inability to obtain FDA approval of its anthrax production processes has led to serious cash flow problems. Further delays will only exacerbate these problems.

Second, unless the currently available 273,000 doses are augmented with additional approved vaccine from the stockpile, the program will be without vaccine from July through late 2000 (or whenever BioPort obtains FDA approval) if it continues administering vaccinations at its current rate. When the manufacturer suspended production in January 1998 to undertake renovations, it still had 40 lots of anthrax vaccine stockpiled at its plant. Of these, 31 had passed all the tests and had received FDA approval for release. To ensure that no changes had taken place in the approved vaccine since FDA granted approval, DOD decided to subject the 31 approved lots to a series of supplemental tests for purity, potency, sterility, and safety. Since supplemental testing began in January 1998, 11

[4] In 1998, the facility was sold and the manufacturer's name was changed from Michigan Biologic Products Institute to BioPort Corporation. Plans for renovation began under the former name.

[5] According to a program official, the lots tested to obtain FDA approval of the new facility's manufacturing processes will also be tested for release and should therefore be immediately available. FDA will have to approve future lots produced after the renovation individually.

of the 31 lots have been made available for use; but 20 lots are still unavailable due to test failures or problems with the tests themselves. For example, some vaccine lots did not contain sufficient levels of a required preservative (test failure), while testing of other lots may have been invalidated because underweight guinea pigs were used as test subjects (test problems). For the remaining nine lots produced just before the renovation shutdown, BioPort needed only to obtain the normal FDA approval for release. As of April 10, 2000, five of these nine lots had been approved for release. In sum, only 16 of the 40 vaccine lots in the stockpile have been released, and according to program officials, almost all have already been used by the program.

Program officials plan to conduct tests on and obtain FDA approval for release of a limited number of stockpiled lots, thus augmenting the currently available doses before they are depleted. They estimate that this will provide sufficient vaccine to continue the program until FDA grants permission to release lots produced after BioPort's renovation, possibly by late 2000. Our analysis shows that DOD's time frames for testing and gaining FDA approval of these stockpiled lots may be optimistic. For example, it assumes that FDA will expedite approval of a revised testing protocol and final test results and that BioPort will not encounter testing problems as it has in the past.

Because of the limited vaccine supply, DOD is vaccinating only personnel who have deployed to high-threat areas and has delayed vaccinations of personnel in units scheduled for early deployment. The original date to begin vaccinating this latter population was January 2000. In response to our recommendation, DOD drafted a contingency plan to ensure the continued, measured implementation of the program, but the Office of the Secretary of Defense has not yet approved this plan.

Recording and Tracking of Vaccinations Have Improved, but Further Improvements Are Possible

In October 1999, we reported that DOD's recording and tracking system for the anthrax vaccination program is an improvement over the system used during the Gulf War and in Bosnia. However, DOD was not meeting its requirement to record vaccination data consistently both in paper records maintained at its installations and in electronic records in its central database. We compared servicemembers' vaccination records from DOD's central database with paper records at four military installations.[6] At three sites, we found that between 85 and 97 percent of paper and electronic records agreed on the number of anthrax vaccinations that had been administered. At two sites, however, matches were lower (between 17 and 69 percent) for the date of the vaccination and the vaccine's lot number. Matches in all categories were much lower at the fourth installation, with match rates of 22 percent for the number of vaccinations, 17 percent for the vaccination date, and 8 percent for the lot number.

These problems were caused in part by delays in updating data on information in the central database. For example, delays in updating data on individuals' duty stations impeded DOD's ability to use its central database to manage vaccination schedules and assess unit readiness. Commanders need updated duty station information to ensure that their personnel receive vaccinations on time and are ready for deployment. An accurate centralized database is also important for tracking which vaccine lots are administered, should health concerns about a specific lot emerge. In its response to our report, DOD said it would take aggressive steps to ensure the timely and accurate updating of personnel data in the database.

In addition, at the time of our review, DOD had not collected data on personnel who refused vaccination or left the service to avoid vaccination. DOD thus did not have an important tool to gauge the extent of resistance to the program and target training resources to give servicemembers needed and wanted information. In its response to our report, DOD said that it was reviewing a draft policy memorandum on reporting servicemembers' refusals to be vaccinated. In April 2000, a program official told us that this policy will apply only to the Army and will require major commands to provide quarterly reports on soldiers who refuse the vaccine. The other services are not planning to require periodic reporting but will

[6] We visited one location per service where a large number (more than 1,000) of vaccinations had been given: Fort Stewart, Hinesville, Georgia, for the Army; the *USS Eisenhower*, Norfolk Navy Shipyard, Portsmouth, Virginia, for the Navy; Langley Air Force Base, Hampton, Virginia, for the Air Force; and Camp Lejuene, Jacksonville, North Carolina, for the Marine Corps.

provide data on vaccine refusals when requested. According to the program official, a servicemember is considered to have refused the vaccine only after he or she initially declines the vaccine, receives education and counseling (either verbally or in writing), and then disobeys a direct order to take the vaccine.

DOD Has an Extensive Education Campaign and Has Begun to Monitor Its Effectiveness

DOD and the services have used a variety of measures to educate servicemembers about the program and have taken steps to address controversy surrounding the program. However, our survey of 249 servicemembers at the four military installations between December 1998 and March 1999 indicated that many of them wanted more information on the program. More than two-thirds of survey respondents reported that the information they received on the reasons for the program, vaccination requirements and schedules, and consequences of refusing the vaccination was at least moderately helpful. However, over half said they either received no information on possible long-term side effects and procedures for reporting side effects or found the information less than moderately helpful. Although many respondents wanted more information on long-term side effects, data on this topic is limited because no long-term studies have been carried out.

At the time of our survey, DOD had not monitored the effectiveness of its educational campaign. But after our survey, DOD initiated several steps to improve its educational campaign. It established a communications division to focus on servicemembers' information needs. The division updated the program's Internet site and set up a toll-free information line and a traveling speakers' bureau of experts on anthrax and the vaccine. DOD has also begun monitoring its educational efforts. Specifically, the program now surveys servicemembers who have begun or are scheduled to begin the series of anthrax vaccinations. The survey collects information on the availability, timeliness, and effectiveness of the program's educational materials.

In its comments to our October report, DOD stated that it had taken several actions to improve guidance and training on reporting adverse events associated with the vaccine.[7] These actions included updating or developing briefings and fact sheets required to be given to

[7] Adverse events are outcomes for which a cause-and-effect relationship with an exposure (to a vaccine or a medication) has not yet objectively been determined. An adverse event becomes an adverse reaction once objective evidence is available to establish a cause-and-effect link between an exposure and an adverse outcome.

servicemembers and clinicians and providing links to adverse event reporting forms through DOD's anthrax vaccine Internet site. We have not assessed these actions or evaluated their impact on the reporting of adverse health events.

To address questions regarding the safety of the anthrax vaccine, DOD established a Longitudinal Studies Concept Committee to define research needs and identify subsequent research designs. The Committee, which includes members from DOD, FDA, the Centers for Disease Control and Prevention, and the Armed Forces Epidemiological Board, met in August and September 1999 and recommended some research designs. One of the studies being planned is a prospective study of servicemembers that will follow the health effects over multiple years of vaccine and non-vaccine recipients. This study is scheduled to begin in 2001.

Mr. Chairman and Members of the Committee, this concludes our formal statement. We would be happy to answer any questions you may have.

The Department of Defense (DOD) regards the biological agent anthrax, an infectious disease that is 99-percent lethal if inhaled by unprotected humans, as the single greatest biological weapon threat to U.S. military forces. To counter this threat, the Secretary of Defense announced in December 1997 a plan to immunize all active and reserve military personnel with a licensed anthrax vaccine. The Secretary stipulated that immunizations would not begin until DOD (1) established a means of testing the vaccine over and above tests required by the Food and Drug Administration (FDA), (2) developed a system for tracking vaccinations, (3) approved operational and communication plans for the vaccination program, and (4) had an outside expert review the health and medical aspects of the program. In May 1998, the Secretary announced that his conditions had been met, and in August 1998, DOD began immunizations, giving first priority to personnel deployable to southwest and northeast Asia, areas where U.S. forces are considered at high risk of exposure to anthrax.

The vaccination program has been the subject of increasing controversy. Public debate has centered on whether the vaccine is safe and effective, and whether it is prudent to rely on only one vaccine manufacturer. Since the Secretary's announcement, we have reviewed various aspects of the program. In April 1999, we testified on research on the vaccine's safety and efficacy, noting the lack of studies on long-term safety and on human efficacy testing against inhaled anthrax.[1] In June 1999, we reported on DOD's financial relationship with the sole-source vaccine manufacturer

[1] *Medical Readiness: Safety and Efficacy of the Anthrax Vaccine* (GAO/T-NSIAD-99-148, Apr. 29, 1999).

and attributed the manufacturer's serious cash-flow problems to an overly optimistic business plan.[2] The following month, we reported that DOD's data on adverse reactions resulting from vaccinations indicated that female servicemembers reported such events in greater numbers than male servicemembers and that no studies had been done to determine the optimum number of doses of the vaccine.[3] We also noted that DOD had conducted some research on a second-generation anthrax vaccine but considered such research an unfunded requirement and that the Department of Health and Human Services had recently funded several research grants to develop a second-generation vaccine.

Although the policy to vaccinate the entire force has been questioned, our review focussed on the implementation of the vaccination program as established by DOD. Given the program's scope, DOD's poor medical record-keeping during the Gulf War, and serious previous shortcomings at the vaccine manufacturing facility, you asked us to review DOD's implementation of the vaccination program as it is currently structured. Specifically, as you requested, we assessed DOD's

- ability to maintain an adequate supply of anthrax vaccine for its immunization schedule,
- system for recording and tracking servicemembers' vaccinations,
- efforts to monitor possible adverse reactions to anthrax vaccinations, and
- steps to educate servicemembers about the program.

To assess the vaccine supply, we reviewed the quantity of vaccine in stockpile, the status of efforts to test the stockpiled vaccine, and schedules for producing new vaccine. To assess DOD's tracking of servicemembers' vaccinations, we compared electronic and paper records of vaccinations at four locations (one per service). To assess tracking of adverse reactions, we evaluated DOD's data on adverse reactions and interviewed medical personnel and vaccine recipients. Finally, to assess DOD's education efforts, we surveyed vaccine recipients during our four site visits and discussed education efforts with commanders and program officials. A detailed discussion of our scope and methodology is in appendix I.

[3] *Medical Readiness: Issues Concerning the Anthrax Vaccine* (GAO/T-NSIAD-99-226, July 21, 1999).

Results in Brief

As of July 1999, DOD had given about 1 million anthrax vaccinations to more than 315,000 servicemembers, but supply problems jeopardize its schedule for vaccinating all 2.4 million servicemembers, and DOD lacks a contingency plan in the event these problems are not resolved in time. Test failures[4] and problems in the testing itself have slowed or precluded release of 26 of the 40 vaccine lots since testing began in January 1998. In all, only 14 lots[5] have been released to DOD since January 1998, and most of these have already been used. Moreover, the manufacturer has yet to receive FDA permission to release lots produced after restarting operations in May 1999 following a 17-month shutdown for renovations. As a result, DOD has fallen behind its original schedule by 5 months, and it risks further disruption if more vaccine does not become available by August 2000. DOD's plans for maintaining an adequate supply of vaccine are optimistic, given testing problems, and assume that FDA will grant approval of tested lots in less time than in the past. Consequently, DOD may not be able to augment its stock of usable vaccine as currently planned. The manufacturer's financial problems, which had threatened vaccine supply, have been recently mitigated by a renegotiated contract, but financial concerns could re-emerge if there are further delays in releasing vaccine. Although DOD has considered options, should the vaccine manufacturer have further delays in or lose its ability to produce FDA-approved vaccine, DOD does not have a formal contingency plan to deal with such possibilities.

DOD has a new recording and tracking system for vaccinations that is better than the one used during the Gulf War and in Bosnia, but DOD is not meeting its requirement to record vaccination data consistently in paper records and in its central database. Our comparison of records from DOD's central database and files at three military installations showed that 85 to 97 percent of paper and electronic records agreed on the number of anthrax vaccinations given to servicemembers, but agreement was lower at two of those sites—ranging from 17 to 69 percent—for dates and lot numbers. Agreement in all categories was much lower at a fourth installation, with match rates of 8 to 22 percent, in part because individuals' duty stations had not been updated. This data is vital for (1) scheduling the

[4]Before some of the stockpiled lots can be released, FDA must approve the results of its required lab tests. Other stockpiled lots received FDA approval some years ago but must now pass supplemental tests before DOD can use them.

[5]Each lot includes roughly 200,000 doses.

FDA-licensed regimen of six vaccinations and boosters and (2) tracking who receives vaccinations from a specific lot, should health concerns about a lot later emerge. Delays in updating data on individuals' duty stations have impeded DOD's ability to use its central database to manage vaccination schedules and assess unit readiness. Commanders need updated duty station information to ensure their personnel receive vaccinations on time so that they may be ready for deployment. In addition, DOD does not collect data on those refusing vaccination or leaving the service to avoid vaccination. This leaves DOD without an important tool to gauge the extent of resistance to the program and target training resources to provide servicemembers with the information they want.

DOD has used data from the Vaccine Adverse Event Reporting System to monitor adverse reactions (or events) to anthrax vaccinations. The system relies on medical personnel or servicemembers to provide needed data. However, DOD has not systematically informed these personnel on how to provide needed data into the system. As a result, DOD may not have data on adverse reactions (or events) that is important for monitoring vaccine safety. DOD uses the number of data entries into the system to determine an adverse reaction rate. However, this data does not provide sufficient basis for reporting a reaction rate because the information is inadequate to directly link the health condition of a servicemember to the anthrax vaccination. Moreover, such events may be underreported. Further, preliminary data from DOD surveys of vaccine recipients indicates a greater rate of reaction than is indicated by the reporting system, which reported 215 adverse events after over 978,000 vaccinations as of July 1999. The reaction rates reported by DOD surveys varied (between 21 and 70 percent), in part due to methodological limitations such as lack of control groups or adjustments for factors such as physical activity and age. DOD has reported that there is no evidence of a pattern of serious, long-lasting adverse reactions.

DOD has employed a high-visibility campaign to educate servicemembers about the program and has taken steps to address the controversy surrounding the program. In addition, it recently expanded its communications efforts by updating the program's Internet site, opening a toll-free anthrax information line, and forming a speakers' bureau of anthrax experts. However, a survey we performed at four military installations, though not projectible beyond the 249 respondents, indicated that servicemembers want more information about some issues related to the program. More than two-thirds of survey respondents reported that the information they received on reasons for the program, shot requirements

and schedules, and consequences of refusals was at least moderately helpful. However, over half said they either received no information on possible long-term side effects and procedures for reporting side effects or found the information less than moderately helpful. Although many respondents wanted more information on long-term side effects, data on this topic is limited because no long-term studies have been carried out. DOD officials recently discussed conducting additional studies to increase their understanding of possible long-term health effects.

This report includes recommendations to the Secretary of Defense to develop plans in the event that the vaccine does not become available as currently anticipated, to provide guidance for the consistent reporting of adverse events, and to establish data collection measures that allow the program to monitor performance and target training and research resources.

Background

According to the Chairman of the Joint Chiefs of Staff, anthrax is the greatest biological weapon threat. DOD considers vaccination one of the measures critical to protecting U.S. forces against such weapons. As a result, it has begun immunizing all U.S. military personnel—about 2.4 million servicemembers, including all active and reserve—against anthrax. The Secretary of the Army is the Executive Agent of the program, which is being implemented in three phases to vaccinate the entire force by 2004.

- Phase 1—begun in 1998 and ongoing: 423,000 members assigned or rotating to high-threat areas have begun or will begin vaccinations.[6]
- Phase 2—slated to begin in January 2000: early deploying units—about 1 million personnel—begin vaccinations.
- Phase 3—the remaining approximately 1 million personnel begin vaccinations.

The regimen for this vaccine is an initial series of three vaccinations at 2-week intervals, followed by a series of three vaccinations at 6-month intervals, with annual boosters thereafter.

[6]DOD had planned to begin vaccinations in southwest and northeast Asia in the summer of 1998. However, in March 1998, when hostilities in southwest Asia seemed likely, DOD began vaccinating personnel stationed there ahead of schedule.

Production and Testing of Anthrax Vaccine

The anthrax vaccine was licensed in 1970 to protect occupational groups such as veterinarians, meat packers, wool workers, and health officials who might come into contact with the disease primarily through the skin. Its effectiveness against inhalation anthrax in humans has not been proven, as it would be unethical to conduct such studies on humans. However, as we reported in our April 1999 testimony,[7] studies on the efficacy of the vaccine in guinea pigs, rabbits, and monkeys support the view that the vaccine can protect against exposure to inhaled anthrax in these animals, but the correlation of that protection to humans has not been established. DOD recently sought to develop an animal model to establish such a correlation.

DOD currently procures the anthrax vaccine solely from one private manufacturer, BioPort Corporation. Formerly, the facility was known as the Biologic Products Division of the Michigan Department of Public Health, then the Michigan Biologic Products Institute. The manufacturer is the only FDA-licensed anthrax vaccine manufacturer in the United States. BioPort produces the vaccine in lots individually numbered for tracking purposes. Each lot generally consists of about 20,000 vials containing 10 doses each. The lots must be tested according to standard FDA protocols for purity, potency, sterility, and safety.[8] Successful results are then submitted to the FDA for review. If the test results satisfy FDA, it assigns each approved lot an expiration date and notifies the manufacturer that the lot can be released for use.

This vaccine has a 3-year shelf life, measured by FDA from the date it passed the FDA's potency test. The manufacturer can request a 3-year extension of the shelf life by retesting for potency and submitting passing results to FDA for approval. FDA also allows retesting of lots that initially fail potency tests, provided the reason for the failure is investigated and explained and the retested vaccine meets appropriate standards. Once a

[7] *Medical Readiness* (GAO/T-NSIAD-99-148, Apr. 29, 1999).

[8] According to the Code of Federal Regulations (21 C.F.R. section 600), purity is the relative freedom from extraneous matter in the finished product; potency is the specific ability or capacity of a product as indicated by appropriate laboratory tests or adequately controlled clinical data; sterility is the freedom from viable contaminating microorganisms; and safety is the relative freedom from harmful effects to persons affected, directly or indirectly, by a product when prudently administered, taking into consideration the recipient's condition at the time.

vial of vaccine is labeled for shipment, its expiration date is changed to a maximum of 1 year (not to exceed its 3-year shelf life).[9]

In March 1997, the FDA cited the manufacturer for repeated deviations from applicable standards. According to DOD, in January 1998 the manufacturer stopped production as part of a previously scheduled renovation plan to support the production, testing, and stockpiling of the anthrax vaccine. These renovations were largely funded by DOD. When the manufacturer suspended production, it still had 40 lots of anthrax vaccine stored at its plant. Of these, 31 had already passed all the tests and had received FDA approval for release.[10] Nine had not yet been tested. DOD decided to subject the 31 approved lots to a series of supplemental tests for purity, potency, sterility, and safety as a prudent safeguard.[11] DOD contracted with an independent firm to oversee the supplemental tests, which were conducted by BioPort. DOD also decided that the remaining nine lots would not need to undergo supplemental testing, as these had never been released and would be undergoing FDA-mandated testing for the first time.

BioPort resumed production of vaccine in the renovated facility in May 1999. As part of its effort to receive FDA approval of its renovations and operational changes, BioPort must submit test data to demonstrate that the lots produced are consistent with each other and with anthrax vaccine previously produced in the old facility. Once these new lots, called consistency lots, pass the FDA tests, and once FDA, upon inspecting the facility and operations and reviewing the test results, approves the renovations and consistency lots, BioPort will be permitted to resume full commercial operations—i.e., sell its newly produced vaccine. Without

[9]In April 1999, 59 Marines were notified that they had received vaccine three weeks after its expiration date. Both the FDA and the Armed Forces Epidemiological Board determined that there was no concern over the safety or effectiveness of the vaccine. Those notified were nonetheless given an option of receiving an additional vaccination if they had concerns about the vaccine's efficacy. The Marine Corps followed up with a message reminding Marine commanders of the procedures for checking expiration dates on all vials of vaccine. Further, refresher training was implemented at the base in question and was strongly recommended for other medical units.

[10]At the start of the program in March 1998, some of these 31 lots contained fewer than 20,000 vials because of previous commercial sales and military use.

[11]As we noted in our April 1999 testimony, quality cannot be guaranteed from final tests alone, only from a combination of in-process tests, end-product tests, and strict controls of the entire manufacturing process.

FDA's approval of its renovations and successful completion of tests on consistency lots, however, Bioport can produce vaccine but cannot release it for use.

Packing and Shipping the Vaccine

DOD manages the transport of anthrax vaccine from BioPort to initial military recipients. To obtain its goal of zero defects and to maintain vaccine accountability, DOD and BioPort designed a packing and shipping protocol that maintains the temperature-sensitive vaccine within a constant temperature range during transport.[12] Most anthrax vaccine is shipped via commercial carriers. It is packaged in temperature-monitored boxes for domestic shipments and in refrigerated containers for international shipments. Appendix II describes the packing and shipping protocol.

Recording, Tracking, and Reporting Immunizations

As of July 1999, DOD had given about 1 million anthrax vaccinations to over 315,000 servicemembers. To meet the requirement for a system to track servicemembers receiving anthrax vaccinations, DOD's Defense Manpower Data Center added anthrax data fields to an existing DOD-wide database of personal, service-related, benefits, and residence information. This database, the Defense Enrollment Eligibility Reporting System (DEERS), now includes fields to record, among other things, the date and lot number of each anthrax vaccination given to each servicemember. Also, each service developed its own interim database to fully document vaccination information at locations where vaccinations are performed and to electronically send the information to DEERS, the central repository for such information.[13] DOD planned to use an upgrade of its Composite Health Care System to replace the interim service-specific tracking systems. Both the service interim systems and DEERS were designed to be used by unit commanders to ensure that their personnel receive their vaccinations according to schedule and by the services to report vaccination rates in their joint monthly readiness reports.

According to the services' implementation guidelines, vaccination information is to be recorded on two paper forms—the servicemember's

[12]In June 1998, on the basis of temperature testing, BioPort increased the temperature range for safe shipment of the vaccine from 2° to 8° Celsius to 1° to 25° Celsius.

[13]The Marine Corps uses the Navy's database.

medical record and form PHS-731, commonly known as the yellow shot record. The medical record is the property of the government, and the yellow shot record belongs to the individual. Procedures for yellow shot records varied at the installations we visited. For example, at the Air Force location, servicemembers were not given their vaccination unless they had their yellow shot record, while other locations did not have this requirement. Planning guidance issued by the Joint Staff also required the Joint Staff Inspector General to review compliance with requirements to document anthrax vaccinations. The review includes a random sample of medical records for personnel who received vaccinations between March and August 1998. The Inspector General's review was assigned in May 1998, and a report is scheduled to be issued later this year, but preliminary results were not yet available at the end of our review.

Tracking Adverse Reactions to the Vaccine

DOD submits data on adverse events temporally associated with the anthrax vaccine to the Vaccine Adverse Event Reporting System (VAERS). VAERS is a passive surveillance system, meaning that it alerts FDA and the Centers for Disease Control and Prevention of adverse events that may be associated with licensed vaccines through information voluntarily reported by health care providers, patients, or families. VAERS also serves as a warning signal for detection of previously unreported, unusual adverse events and/or unexpected increases in reported events. A panel of experts commissioned by the program reviews all VAERS reports after they have been submitted to FDA to identify any signaling event that would identify problems stemming from the anthrax vaccine. As of July 1999, the panel had found no pattern of causality stemming from the use of the anthrax vaccine.

Supply Problems Jeopardize DOD's Vaccination Schedule

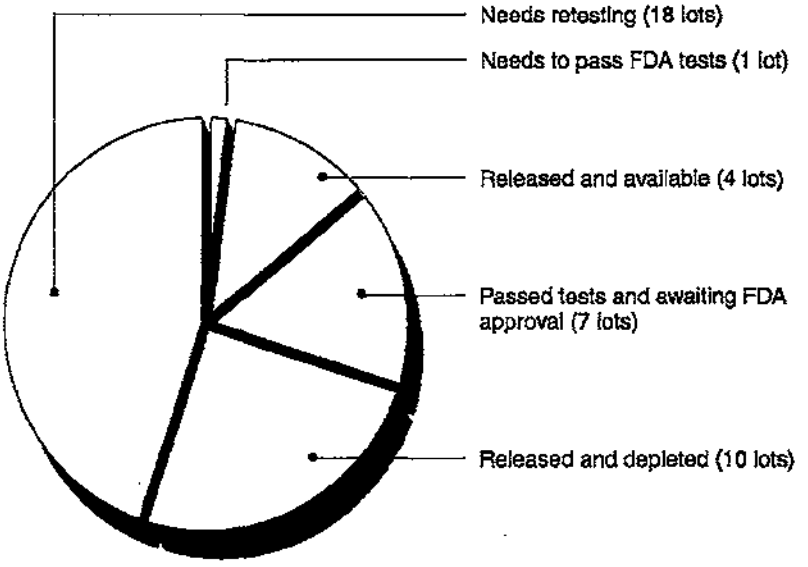
The most critical component of the program, an adequate supply of vaccine, is threatened by testing delays and possible loss of production capability. Testing problems have already delayed release of stockpiled vaccine,[14] many lots of which are still unavailable for use. BioPort has also fallen behind schedule in submitting to FDA test results on the lots produced after it resumed operations in May 1999. If testing problems are not resolved soon, or if FDA withholds approval of BioPort's renovations or newly produced lots, DOD will have difficulty in (1) providing phase 1 vaccinations beyond August 2000 and (2) beginning phase 2, which has already been delayed 5 months. BioPort also faces financial problems and some security weaknesses that put the supply of vaccine at risk. On the positive side, the program has nearly eliminated loss of vaccine in transit to the field thanks to a highly successful shipping and packing system. However, despite the risks to the vaccine supply, DOD has not prepared a formal, written contingency plan for vaccinating servicemembers should a steady supply be further delayed or disrupted.

Testing Problems Have Delayed Release of Vaccine

As of June 23, 1999, 26 of the 40 stockpiled vaccine lots were still not available for use (see fig. 1). Most of these—18 lots—had undergone but not passed all the supplemental tests or had to be retested. An additional lot needed to pass FDA-mandated tests. Seven other lots passed supplemental or FDA tests but had not yet received FDA approval. In all, of the original 40 lots, only 14 had been released for use since the program began, and 10 of these had been depleted.

[14]Although the original stockpile contained 31 lots, we use the term "stockpile" to refer to all anthrax vaccine—40 lots in all—stored at BioPort before production restarted in May 1999.

Figure 1: Status of Testing for 40 Lots Produced Prior to Shutdown for Renovations



DOD data as of June 23, 1999

When supplemental testing began in January 1998, program officials expected to receive the first positive results by April of that year. However, problems with testing processes, failure of vaccines to pass tests, and limited testing resources delayed or precluded the release of 18 lots. All 18 lots have passed safety tests but have at least one unresolved issue with purity, potency, or sterility.

- Nine lots failed purity tests because the amount of preservative used in the vaccine did not meet FDA standards.[15] DOD is considering permanently removing these lots from the stockpile, given the time and resources it would take to resolve the issue.

[15]BioPort has discussed with FDA completing studies that would enable the manufacturer to request FDA approval of release of those lots with less preservative (phemerol) than currently required. If these studies show that lower amounts of the preservative are effective, and if FDA, after reviewing the data, approves lowering the standard, DOD may be able to use some or all of these nine lots.

- Three lots initially failed sterility tests, then passed them, but FDA cited serious concerns about the lots. According to program officials, the lots will probably not be retested and will likely be withdrawn from the stockpile.
- Fourteen lots still need to pass potency tests. For two of these, test results were invalid due to problems in the test procedures, causing BioPort to suspend all further potency tests until the problems were resolved. At DOD's request, an outside scientific team reviewed the test procedures and recommended several corrective measures.[16] BioPort adopted the team's recommendations, which took several months to implement. In all, most potency testing was delayed 6 to 9 months. The remaining 12 lots have undergone valid testing but have not passed it.

Table 1 summarizes the tests needed for the 18 lots that have not yet passed supplemental testing.

Table 1: Status of 18 Stockpiled Lots Subject to Supplemental Testing

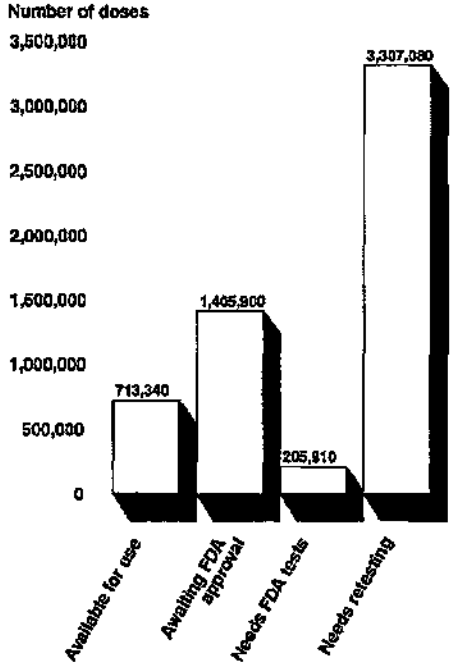
Supplemental tests needed	Number of lots
Potency	6
Potency and sterility	3
Potency and purity	5
Purity	4
Total	**18**

Source: DOD.

Although testing is performed by lots, vaccination schedules are predicated on the number of doses available. To understand the implications of these testing problems for DOD's vaccination program, therefore, it is necessary to assess available doses—especially because the number of doses in a lot varies. As of June 23, 1999, 5.6 million doses remained in the stockpile at BioPort, but 4.9 million (88 percent) of these were unavailable for use (see fig. 2).

[16]The team suspected but could not confirm that at least some of the variances were due to changes in (1) the size, age, and sex of the test subjects (guinea pigs); (2) a saline solution used in the tests; and (3) the strain of anthrax used in the control group.

Figure 2: Status of Doses Remaining in Stockpile



DOD data as of June 23, 1999

Note: Does not include almost 2 million doses that have been released and shipped to installations.

- More than 3 million doses cannot be released unless BioPort retests its lots, achieves successful results, and receives FDA approval to release them. According to program officials, lots containing a total of over 2.2 million of these doses are not likely to be ever retested due to the aforementioned purity and sterility test results.
- More than 1.4 million doses unavailable to DOD are awaiting FDA approval of successful testing, and program officials expected to successfully test and request FDA approval for an additional almost 206,000 doses needing FDA tests before October 1999.

In summary, as of June 23, 1999, only 713,000 doses in the stockpile were available for use, and more than half of them—about 416,000 doses—will expire in February and April 2000. On the basis of DOD's estimates of doses required per month, the 713,000 doses would sustain phase 1 of the program through December 1999. This estimate does not include doses

already delivered to the field and not yet administered. However, typically, no more than a 3-month supply of vaccine is delivered to a location, which means that the program could be sustained at best through March 2000, on the basis of both delivered and available stockpiled vaccine doses.

Program officials are not concerned about the status of the stockpiled vaccine. At the time of our review, they expected FDA to grant release of stockpiled lots containing a total of 1.6 million doses before October 1999, and they projected this would sustain the program through August 2000. This expectation assumes a quick and positive response by FDA. Program officials also expected to retest and submit some other lots in early 2000. However, this expectation seems optimistic. According to these same officials, BioPort's limited testing resources, overburdened by competing demands, are now being concentrated on obtaining FDA approval of renovations. Consequently, performing more supplemental tests is a far lower priority for both BioPort and DOD.

BioPort Renovations Are Behind Schedule and Have Delayed the Program's Second Phase

A 5-month delay in completing renovations caused BioPort to delay production startup from January 1999 to May 1999. This delay, coupled with testing problems and workload, have in turn delayed production and approval of vaccine consistency lots. Indeed, BioPort has not yet performed FDA-mandated testing on any of the consistency lots, and as a consequence, no test results have been submitted to FDA for approval.

In late July, program officials expected BioPort to submit successful results for the first consistency lots by September 1999 and expected FDA to approve renovations, which involves an inspection of the facility, and permit release of these lots by January 2000. This would allow the program to begin its second phase 5 months after its scheduled August 1999 starting date. Although BioPort officials say they are coordinating more closely with FDA now, this expectation seems optimistic. FDA is required to review and provide a response to the manufacturer regarding test results within 4 to 6 months, but approval is not automatic. Our analysis of past test approval periods for potency tests of stockpiled lots,[17] showed that the time from successful test completion to FDA approval has averaged 10 months. This period, which includes any delays between test completion

[17]The period measured was from the date the manufacturer completed lot potency tests to the date FDA approved the results of those tests. BioPort needs approval of potency test results as well as approval of its renovations which are separate FDA approval processes.

and the manufacturer's submission to FDA, ranged from 2 to 29 months and lasted more than 8 months for almost half of the lots analyzed. Should FDA question the test results or raise other production issues, release of new production could be delayed beyond January 2000. Indeed, FDA concurs that this date for approval of renovations and release of lots is optimistic.

BioPort's Finances and Physical Security Could Threaten Vaccine Supply

Although somewhat mitigated by recent contract renegotiations, BioPort's financial problems have reduced the program's vaccine supply in the short term and may threaten future supplies altogether if production does not resume. BioPort must improve its financial health if DOD is to retain this sole source of anthrax vaccine. In June 1999[18] we testified about several problems at BioPort: (1) renovation delays reduced expected revenues, causing a serious cash-flow problem; (2) the company lacked the cash reserves and the ability to obtain commercial financing at reasonable rates to cover operating expenses; (3) its accounting system was inadequate; and (4) the company projected a significant operating loss for the year ending December 1999. As a short-term measure to generate revenues to improve its financial health, BioPort received authorization from DOD to sell 70,000 doses of anthrax vaccine to other customers,[19] even though it was not fully meeting its contractual delivery requirements at the time. This action diminished the potential supply available to U.S. forces. Moreover, on the basis of renegotiation of its contract with DOD, BioPort (1) will provide DOD with fewer doses of the vaccine than its original contract stipulated to better reflect its production capabilities and (2) will be permitted to increase its private sales to increase revenues. DOD officials stated that this reduced availability will still meet the program's needs.

Although not as pressing as its financial problems, the physical security of BioPort's facility presents some risk to the vaccine supply. In 1998, the Defense Special Weapons Agency reviewed security at what was then the Michigan Biologics Products Institute and recommended numerous physical and operational measures to correct weaknesses. BioPort implemented many of these, including improvements of doors, locks, and fences, but rejected other measures it considered "beyond the scope of a

[18]*Contract Management* (GAO/T-NSIAD-99-214, June 30, 1999).

[19]BioPort sells these doses at a significantly higher price than the DOD contract price. DOD has approved the sale of 30,000 doses to the Canadian Armed Forces, and BioPort intends to sell the remaining 40,000 doses to other potential customers. These sales would also require approval under export control regulations.

biotechnology business." These included such measures as increasing surveillance and modifying existing structures. According to BioPort, if DOD considers further security measures important, it must also consider funding them. In the opinion of DOD's program officials, most of the remaining security recommendations are relatively minor in nature and of less concern than BioPort's production problems. DOD is determining the most effective means of addressing and funding any high-cost security measures at BioPort. At the time of our review, however, DOD did not have plans to implement these measures. Absent a specific implementation plan, it is unclear when or if these security weaknesses would be addressed.

Well Designed and Administered Packing and Shipping Eliminate Vaccine Losses in Transit

DOD and BioPort have worked closely together to solve the challenges of shipping the temperature-sensitive anthrax vaccine to all sorts of climates in all types of weather. Although a transport problem in the first shipment of vaccine (to a U.S. base in Germany) led DOD to destroy 20,000 vials rather than risk distributing vaccine that had been subjected to below-standard temperatures, the program has had extremely few losses since. Learning from this incident, program officials and the manufacturer developed a packaging protocol that maintains a safe temperature range that is continuously monitored from within the container. They also devised a shipping system that uses commercial carriers and constantly tracks packages in transit. Shipments are kept small to limit loss from misplacement or deliberate destruction. According to the program's data, 99.8 percent of all shipped vials arrived safely after the new procedures were implemented.[20] Given this excellent record, DOD is adapting the program's shipping protocol for other environmentally sensitive pharmaceuticals that it manages.

DOD Lacks Contingency Plans for Disruption or Loss of Production

Program officials acknowledge that BioPort has had testing, production, financial, and security problems, but they have developed no formal contingency plans to ensure that vaccinations continue if the supply of vaccine is disrupted or lost. These officials believe that enough stockpiled lots have been released to maintain phase 1 through August 2000. However, implementation of phase 2, which depends on new production and release of vaccine, has already been postponed by 5 months to January 2000, and

[20]This excludes the first shipment of 20,000 vials (464 vials destroyed of 197,487 shipped as of July 2, 1999). Including that first shipment, the program's total success rate is still 90.6 percent of shipped vials and 99.2 percent of all shipments.

even this new date may be unrealistic. If the testing and other problems continue to delay vaccine production and release, DOD will find it difficult to provide vaccinations in the latter part of 2000 and beyond.

Program officials have considered how to adjust for limited delays in releases of the current supply, but they have no formal back-up plans in case of major delays in release of new lots. Several alternatives to the current phase 1 schedule may be possible, should BioPort be seriously delayed in obtaining FDA approval of its renovations. These alternatives range from redistributing vials already sent to the field to suspending all further vaccinations except for forces in the highest-risk theaters. However, program officials could not provide formal criteria for implementing various alternatives, nor could they cite measures of potential advantages such as how long a specific alternative might extend the program or how many personnel it might maintain.

The program also has no contingency plan should BioPort lose its production capability outright, either through FDA rejection of its renovations, financial failure, or destruction by natural catastrophe or hostile agent. Program officials did consider construction of new and completely redundant production facilities, but this alternative was seen as too costly and time-consuming. As we noted in an earlier report, development of a second-generation vaccine that may provide other manufacturing alternatives has begun, but DOD research in the area remains unfunded.[21] The Department of Health and Human Services recently funded several research grants in the area. However, licensing a new facility or developing a second-generation vaccine would take several years—too long to offset any major loss of production by BioPort during the program's timeline. At present, DOD has no means of continuing immunizations with anything other than what is available from the BioPort stockpile, most of which still needs to pass tests before it can be used.

[21] *Medical Readiness* (GAO/T-NSIAD-99-226, July 21, 1999).

Recording and Tracking Vaccinations Has Improved, but Further Improvements Possible

DOD is more capable of recording and tracking vaccinations today than it was during the Gulf War in 1991 or the Bosnia operations in 1995. However, DOD is not meeting its requirement to consistently record vaccination data in its centralized database and paper records. Such inconsistencies could cause vaccinations to be given off schedule or hinder subsequent investigations should questions arise about a specific vaccine lot. Also, delays in updating data on servicemembers' duty stations, as well as shortcomings in how the services update the DEERS database, have limited the utility of the database for determining individual vaccination schedules and assessing unit readiness. While DOD tracks vaccination exemptions (including waivers and deferrals) for medical reasons such as pregnancy or administrative leave, it does not monitor refusals or voluntary departures from the service that may be due to vaccine-related concerns. As a result, DOD is not able to use the information to monitor all aspects of the program's implementation.

Vaccinations Recorded, but Some Data Is Incomplete

The Gulf War and the concerns it subsequently generated about Gulf War illnesses highlighted shortcomings in DOD's systems for recording and tracking medical data, including vaccination records. In 1997, we reported that DOD had improved its medical surveillance during operations in Bosnia but that documentation of vaccinations was one area still needing improvement.[22]

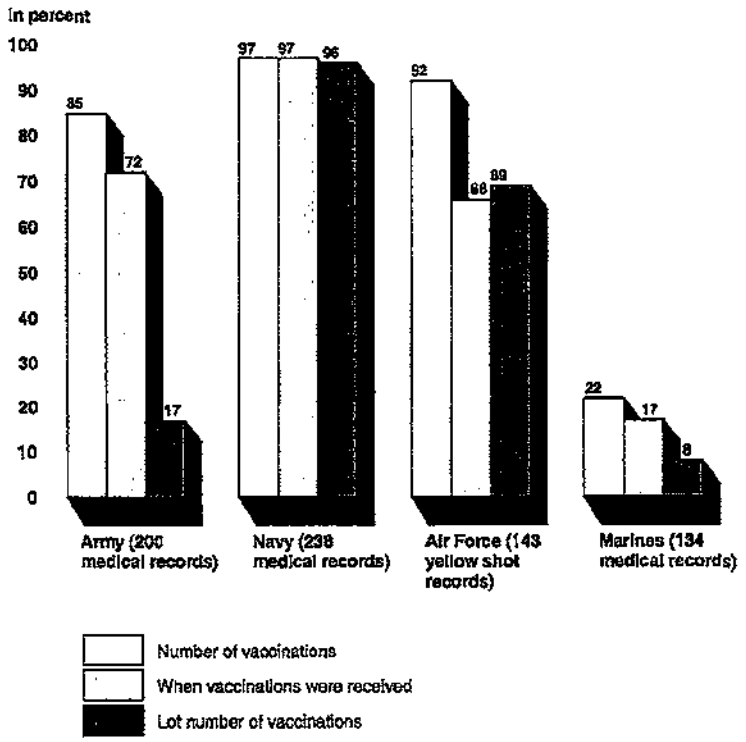
In following up on this deficiency, we found that DOD has improved its ability to record and centrally collect vaccination information. Our comparison of DEERS data and paper medical records at four military installations[23] (one per service) indicated that, except at the Marine Corps installation, the numbers of vaccinations were recorded consistently.

[22]*Defense Health Care: Medical Surveillance Improved Since Gulf War, but Mixed Results in Bosnia* (GAO/NSIAD-97-136, May 13, 1997). Our comparison of a centralized list of vaccine recipients with their medical records in five units revealed that vaccinations had not been recorded in 24 percent of medical records. Three of the five units failed to record vaccinations in more than 30 percent of medical records.

[23]We visited one location per service where a large number (more than 1,000) of vaccinations had been given: Fort Stewart in Hinesville, Georgia, for the Army; the USS Eisenhower, Norfolk Navy Shipyard, Portsmouth, Virginia, for the Navy; Langley Air Force Base, Hampton, Virginia, for the Air Force; and Camp Lejuene, Jacksonville, North Carolina, for the Marine Corps. Our sample of records cannot be generalized. See appendix I for more information on our scope and methodology.

However, agreement between the two systems was not as high when matching specific dates of vaccinations and vaccination lot numbers. Inconsistency in dates could lead to vaccinations being given off-schedule and to inaccurate readiness reports. Inconsistent or missing lot information could hinder investigations, should concerns arise about a specific lot. Also, information that is not recorded in paper records makes it difficult to address adverse reactions needing immediate care or determine the validity of subsequent claims for disability compensation. Figure 3 summarizes the agreement between electronic and paper information on vaccinations by service.

Figure 3: Comparison of Paper and DEERS Records



Source: GAO.

We made the following observations:

- The Army base's low match rate for lot numbers was due to the fact that lot numbers were not recorded in the medical records for about 60 percent of vaccinations. Despite this omission, the base did record lot numbers in DEERS, and only 1 percent of vaccinations recorded in DEERS were without lot numbers.
- The fact that almost all ship personnel received vaccinations on the same days while deployed at sea contributed to the high match rate between DEERS and medical records on the Navy vessel.
- As shown in figure 3, unlike the other installations we visited, the Air Force base relied primarily on the yellow shot record, not the medical record, for recording vaccinations on paper. Less than 5 percent of vaccinations, dates, or lot numbers in the medical records matched information in DEERS. Officials at the site said the yellow shot records were smaller and therefore easier to carry on deployment. However, unlike the yellow shot record, the medical record is government property and should be complete because it serves as evidence for determining veterans' disability compensation. The commander of the medical group at the base told us he planned to have the information in the electronic records printed and entered in the medical records, but this had not been done at the time of our review.
- Marine Corps officials were unable to provide specific reasons for the low match rate with DEERS but noted that (1) neither DEERS nor the Navy database are optimized to handle the frequent changes in units of the Marine Corps—as a result, DEERS did not list all the Marines deployed at Camp Lejeune; (2) lack of training on the Navy database—introduced to the Marine Corps in March 1998, the same month that anthrax vaccinations began—could have contributed to inconsistencies; and (3) the Navy system uses the date the vaccinations are entered into the system as the default, causing inaccuracies if vaccinations are not entered into the system the same day they are given.

Services' Use of DEERS Limits Its Utility

DEERS was envisioned as a major source of reports on program implementation. However, concerns about the timeliness and accuracy of data in DEERS have caused service representatives to rely on interim, service-specific tracking systems, and other systems to track and report vaccination information. For example, Army and Navy officials said they had concerns about DEERS data because duty station information was not updated, in some cases for as long as 6 to 9 months, in DEERS.

Problems we encountered obtaining medical records for our review also demonstrated some of the weaknesses in duty station information. For example, we found that DEERS did not list all servicemembers assigned to a particular duty station. We obtained personnel rosters for Fort Stewart and Camp Lejeune from Army and Marine Corps personnel databases. We compared a sample 300 records from these two lists with the DEERS roster of servicemembers assigned to the two duty stations and found that the DEERS database only listed 210 (70 percent) of Fort Stewart personnel and 111 (37 percent) of Camp Lejeune personnel.

Army and Air Force officials told us they rely on service-specific tracking systems rather than DEERS to obtain more timely information for both day-to-day management of vaccinations and quarterly servicewide readiness reports. Navy and Marine Corps officials told us that because of shortcomings in the Navy tracking system, they rely on reports from individual commanders to manage and obtain servicewide data. Officials from all four services and the program noted that since the start of the program, service-level systems have improved and are more responsive to commanders' reporting needs.

According to Defense Manpower Data Center (DMDC) officials, delays in updating DEERS are caused partly by service personnel systems not providing timely data to DEERS. In May 1999, the officials told us they and the services had taken steps to update duty station information more promptly. We were unable to test the effectiveness of these changes because they were instituted after our analysis. DMDC officials also noted that some data inconsistencies and delays in resolving errors could have been avoided if the services had followed the original design of the tracking system, which allows medical providers to be linked directly to DEERS through their service-level systems. Such direct linkage (1) ensures that servicemembers' vaccination records are updated regardless of whether they are vaccinated by their own or another service and (2) minimizes the impact of mistakes (such as entering the wrong social security number or recording the same vaccination twice) by providing immediate feedback to the user in case of error. However, the Army and Navy have adopted systems that do not directly link to DEERS. Instead, Army, Navy, and Marine Corps data are transmitted to central servers in their service-specific systems, which then upload the data to DEERS. This can cause delays in correcting errors. DMDC officials reported that the Air Force, thanks to its direct linkage to DEERS, receives far fewer error messages and has to do fewer follow-ups than the other services. DMDC

produces lists of errors each day but has not analyzed how frequently different errors occur.

DOD plans to eventually transition the service-specific databases to a common system. It has begun testing and in 2000 will install the Composite Health Care System II (CHCS-II), which, among other things, is designed to interface with DEERS for updating vaccination data. According to DMDC officials, the system will ensure consistent data quality across services. However, it is unclear when the services will abandon their interim, service-specific databases in favor of CHCS-II. Service officials said they were reluctant to move to the new system because it will rely on DEERS for vaccination and duty station data and will not be under the control of the individual services for program upgrades. Moreover, CHCS-II is not intended for use by deployed units, so it cannot be used on locations such as Navy ships. DOD has established a team with representatives from all services that meets regularly to address problems associated with vaccine tracking systems.

Goal Performance Measures Do Not Include Exemptions and Refusals

DOD set a timeliness goal of vaccinating 90 percent of all servicemembers no more than 30 days after their vaccinations are due according to the licensed regimen.[24] As of July 1999, all services (except the Army) had met or exceeded that goal. The Army had a 78-percent compliance rate at that time. The data used to calculate the percentage of "on-time shots," however, does not include exemptions or refusals.

Servicemembers can receive exemptions from vaccinations for medical reasons (e.g., pregnancy) or administrative reasons (e.g., extended leave to change duty stations). Exemptions accounted for about 5 percent or less of those who received at least one injection, according to service officials. As for refusals, the program collected anecdotal data on refusals until January 1999, but the effort was labor-intensive because it entailed surveying individual commanders. Due to the small number of refusals–82 after almost 172,000 servicemembers had received one or more injections–senior Army officials decided the effort was not productive and halted data collection. Moreover, reports of refusals did not list personnel who

[24]DOD's policy is to adhere to the approved immunization schedule and to make deviations to the schedule the exception rather than the rule. According to DOD policy, the effect of deviations from this schedule on the efficacy of the vaccine is unknown, but in general, the greater the deviation, the less certain the protective effect in humans.

voluntarily left the services due to concerns about the vaccine. Although the refusal number at the time may have been low, lack of data limits the program's ability to gauge the effectiveness of its education efforts and to effectively respond to any increase in opposition to the vaccine.

According to written guidance from the Army and Navy and our discussions with Air Force and Marine Corps officials, servicemembers who refuse vaccination are initially provided additional education. Servicemembers who continue to refuse are given a direct order, which, if disobeyed, can lead to disciplinary action—including discharge—at the commander's discretion. The Air Force, the only service with a database to track such information, plans to collect data on disciplinary actions taken against those who refuse vaccination, but it has not yet begun to do so. A provision in the National Defense Authorization Act for Fiscal Year 2000 requires an exit survey of all servicemembers leaving military service to collect data on, among other things, their reasons for leaving.[25] This is also a potential source of anthrax refusal data.

Possible Adverse Events Are Monitored, but DOD's Use of Data May Be Misleading

DOD monitors possible reactions (or adverse events)[26] to anthrax vaccinations primarily by using VAERS. However, reports of such events may be incomplete because servicemembers have not been fully informed about reporting procedures. Moreover, DOD has used the VAERS data to report a rate of reaction to the vaccine. This is misleading because of potential underreporting of events to VAERS, and the potential for overstating the reaction rate because reports sent to VAERS are not confirmed to be causally linked to the vaccination. Preliminary data from DOD studies of adverse events indicates a higher rate of possible reactions than is reported by VAERS, but the reporting rates in these studies varied and the studies have methodological limitations. Thus, DOD does not have reliable information on the extent of adverse reactions. DOD reported that adverse events have been few in relation to the number of vaccinations and that there is no evidence of a pattern of serious, long-lasting adverse

[25]See section 581 of Public Law 100-65, October 5, 1999.

[26]Adverse events are adverse outcomes for which a cause and effect relationship with an exposure (to a vaccine or a medication) has not yet objectively been determined. An adverse event becomes an adverse reaction once objective evidence is available to establish a cause-and-effect link between an exposure and an adverse outcome.

reactions. DOD medical personnel have drafted additional clarifying guidance on treating and reporting adverse reactions to the vaccine.

Medical Staff and Servicemembers Are Not Well Informed About Reporting Adverse Events

According to testimony by DOD officials, as of July 1999, 215 adverse events[27] had been reported to VAERS after about 978,000 vaccinations. VAERS is a so-called passive surveillance system, meaning that it relies on medical personnel or individuals to report adverse events they think resulted from a vaccination. DOD medical personnel are required to file a VAERS report for reactions that cause a servicemember either to lose more than 24 hours of duty time or to need hospitalization.[28] DOD reported, and FDA officials commented, that this requirement exceeds FDA requirements, which only require vaccine manufacturers, not physicians, to report to VAERS, though reporting by physicians is encouraged.

Nonetheless, VAERS data may be incomplete because DOD medical staff and servicemembers have not received the guidance needed to submit VAERS reports. Medical officials at a May 1999 conference convened by the program to discuss clinical issues expressed concern that they had not received clear guidance on how and when to complete VAERS forms. According to DOD officials, medical personnel may also report any other reaction they think might be caused by the vaccine, but because this is not stated explicitly in DOD's guidance on vaccinations, some medical personnel may be unsure about which reactions to report.

Servicemembers and their relatives may also report directly to VAERS any adverse events they suspect are related to a vaccine. DOD, however, prefers that VAERS reports be filed through its medical providers to ensure that data is sufficiently detailed to identify and understand trends. A program official acknowledged that anthrax vaccine educational materials initially did not explain how to self-report adverse events. Moreover, of the 249 servicemembers we surveyed,[29] 44 percent (110) told us they had received no information on how to report adverse reactions.

[27]Military medical personnel reported 109 of these.

[28]Of 174 reports reviewed by DOD, 20 met this criteria.

[29]As noted in appendix I, respondents were not randomly selected, and thus the data cannot be projected beyond those surveyed.

In April 1999, DOD updated its briefings to include information on reporting adverse events. It is also revising regulations to (1) make reporting requirements more inclusive, (2) clarify patient and provider roles and responsibilities, and (3) explain how to obtain and process VAERS forms. In addition, in July 1999, DOD disseminated draft clinical guidelines for the management of anthrax vaccine adverse events that outlines clinical protocols, pre-treatments, specialty referral processes, contraindications, categorization of local and systemic reactions and associated treatment algorithms, and directions for reporting to VAERS.

DOD Has Used Adverse Event Data Incorrectly

In presenting reaction rate data, program and DOD officials have shown reactions reported to VAERS as a percentage of all vaccinations. They did so in several briefings to GAO and congressional staff, in prepared testimony, and on the program's Internet site. However, according to FDA guidance, incidents in the VAERS database reflect a temporal, not necessarily a causal, relationship with vaccination and thus should not be used to calculate the incidence of reactions. DOD's use of such a percentage is an inaccurate representation of the true reaction rate because (1) not all adverse events prove to be adverse reactions and (2) studies have shown that reactions are often underreported in passive surveillance systems such as VAERS, though the extent of possible underreporting is unknown. As of July 1999, DOD updated its briefing information to more accurately describe adverse events reported to VAERS simply as a VAERS report rate.

Other Data on Adverse Events Varies

In studies where vaccine recipients were surveyed about their reactions to the vaccine, adverse reactions were reported at a much higher rate than adverse events reported to VAERS, though these studies have methodological limitations. A 1962 study of the vaccine indicated that mild local reactions (swelling of up to 5 centimeters) were reported in 30 percent of recipients and moderate local reactions (swelling of greater than 5 centimeters) were reported in 4 percent of vaccine recipients.[30] DOD has conducted several subsequent studies of adverse reactions using active

[30]As we testified in April 1999, data from this study was based on a different vaccine than the one eventually licensed. FDA reported that the method of preparing the licensed product was similar but not identical to the vaccine used in the study and that production changes for the licensed vaccine were "minor."

monitoring, and preliminary results vary.[31] For example, according to DOD testimony, 70 percent of respondents in a 1998 survey of 603 medical personnel who had received the vaccine reported a local reaction to the anthrax vaccine. In another 1997 study, 16 percent (81 respondents) of 508 servicemembers receiving the vaccine reported mild local reactions, while 5 percent (25 respondents) had moderate to severe local reactions. As we testified in July 1999, data from other DOD studies also indicated that women reported a higher rate of adverse reactions than men. These studies relied on self-reported data, did not use control groups, and were not adjusted for factors such as occupation, physical activity level, and age.

According to our survey, when asked if they had had any side effects due to the anthrax vaccine, 45 percent of recipients (111 respondents) reported they had,[32] and 30 percent (74 respondents) reported swelling at the injection site, the most frequently cited symptom. Of those who reported reactions, less than 5 percent (5 respondents)[33] said they had missed work or a planned activity due to the symptoms, and 13 percent (14 respondents) sought medical treatment. Further, the percentage of female servicemembers who reported side effects was considerably higher than that of male servicemembers (64 percent of the 36 women surveyed against 42 percent of the 210 men surveyed).

On August 24, 1999, the program convened a team of civilian and military experts to design a set of studies to assess the long-term safety of the anthrax vaccine. Another long-term study is underway to determine whether individuals who received multiple vaccines, including anthrax vaccine, during their past employment at Fort Detrick, Maryland, have had any long-term health effects. A total of 570 study and control volunteers have been enrolled in this case-control study that began in 1996.

[31]In active monitoring, vaccine recipients are contacted to ascertain if there were any adverse reactions to the vaccine after vaccine administration. See *Medical Readiness* (GAO/T-NSIAD-99-148, Apr. 29, 1999).

[32]Other reactions cited by the 111 respondents included redness at the injection site (12 respondents, or 11 percent), nausea (4 respondents, or 4 percent), loss of appetite (2 respondents, or 2 percent), headaches (6 respondents, or 5 percent),and infections (3 respondents, or 3 percent). Respondents were not limited to one response.

[33]The symptoms reported by these five individuals included burning sensations, colds, need for more sleep, memory problems, fevers, headaches, nausea, lower blood pressure, viral infections, fainting spells, chronic sinus problems never previously experienced, fevers, and blood in the stools.

DOD Has an Extensive Education Campaign but Has Not Systematically Monitored the Results of Its Efforts

DOD and the services have used a variety of measures to educate servicemembers about the program and have taken steps to address controversy surrounding the program. However, many respondents to our survey indicated that they had not received information on some topics related to the program and desired additional information. The program recently established a communications division to implement plans to address the expressed desire for more information. More effective monitoring of servicemembers' understanding of the program, including the number of refusals to take the vaccine, would help DOD redirect educational efforts to those areas where additional information is needed.

Many Servicemembers Have Received Some Information but Want More on Long-term Side Effects

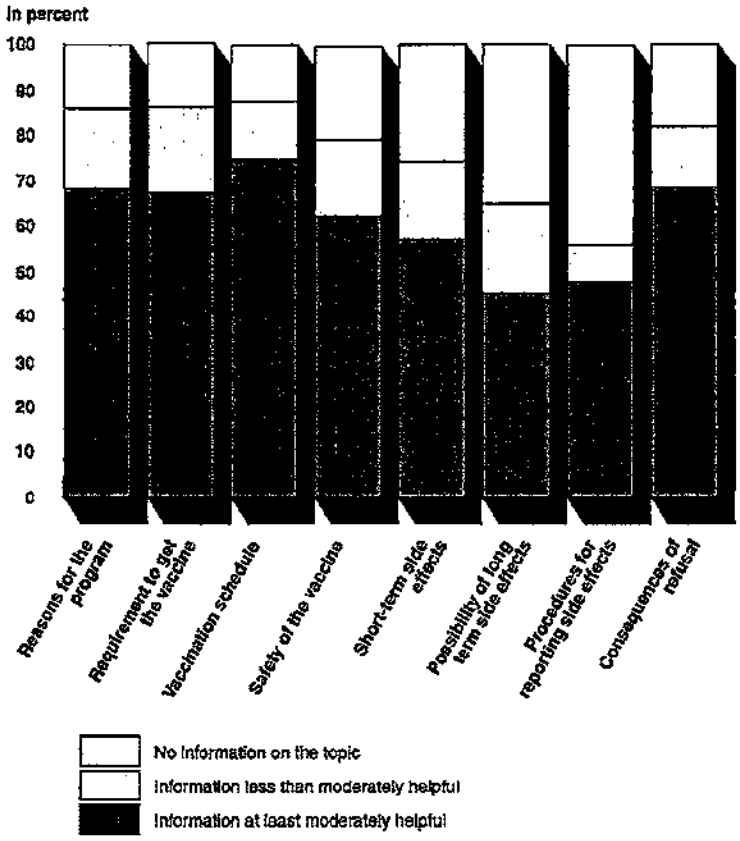
DOD and the services have made the vaccination program a high priority. At the four military installations we visited, the commanders established procedures for administering vaccinations and providing information. In addition to giving briefings and distributing pamphlets, the commanders expected health care professionals and staff to play key roles in providing expert advice to servicemembers. Further, after having briefed servicemembers about the threat of anthrax, the safety of the vaccine, and the requirement for the vaccine, commanders often highlighted the importance and safety of the vaccine by being among the first to receive it, often in the servicemembers' presence. As shown in table 2, according to our survey of 249 servicemembers (not projectible beyond those surveyed), respondents reported that command briefings and medical staff were their primary sources of information.

Table 2: Survey on Sources of Anthrax Vaccine Program Information

	Percentage of respondents reporting the following as their primary source of information				
	Command briefing	Medical staff	Radio, television, or print media	Other sources	Percentage reporting they received no information on the topic
Reasons for the anthrax vaccine program	41	19	11	15	14
Requirement for all servicemembers to get the anthrax vaccine	51	10	14	11	13
Vaccination schedule	30	47	2	9	11
Safety of the vaccine and the extent it offers protection against anthrax	20	29	9	21	21
Short-term side effects that may occur	13	38	6	18	25
Remote possibility of long-term side effects	9	23	8	16	44
Procedures for reporting side effects	16	35	1	4	44
Consequences of refusing the vaccine	54	3	14	12	16

Our survey also showed that for many topics, servicemembers found information they received at least moderately helpful, but information related to long-term side effects and procedures for reporting side effects was not as helpful to many respondents. Figure 4 shows how helpful respondents found information they received about each topic.

Figure 4: Respondents' Assessment of Helpfulness of Information



Source: GAO.

According to our survey, at least 57 percent of respondents reported that the information they received on the reasons for the program, the requirement for the vaccine, the consequences of refusing the vaccine, the vaccination schedule, the protection the vaccine offers against anthrax, and the short-term effects the vaccine may have was moderately or very helpful. There were some areas, however, where many servicemembers either received no information or desired additional information. Our survey showed that only 35 and 47 percent of respondents, respectively, said the information they received on the possibility of long-term adverse effects and on reporting adverse reactions was at least moderately helpful, and 44 percent said they had not received information on the remote

possibility of long-term side effects. Further, when asked what additional information they wanted, 43 percent (106 respondents) reported a desire for information on long-term side effects.

Many of the respondents who said they wanted information on possible long-term adverse reactions also reported experiencing some side effects. Fifty-nine of the 111 respondents (53 percent) who reported experiencing short-term reactions said they wanted information on the possibility of long-term adverse effects. Air Force servicemembers represented almost 70 percent of this group.

The wish for information on possible long-term adverse reactions was also highlighted in May 1999, when a commander temporarily halted anthrax vaccinations at Dover Air Force Base, Delaware, until he determined that servicemembers' questions on the vaccine's safety and its possible health risks had been satisfactorily addressed. The questions were spurred by a magazine article about an unauthorized additive, squalene, alleged to have been used in some vaccine lots and about the alleged relationship between the vaccine and Gulf War illnesses. Following an initial meeting at which servicemembers raised these questions but were unsatisfied with the responses, several DOD, Air Force, and Army personnel knowledgeable of the program, including the Air Force Surgeon General, provided responses in a second set of meetings. These experts reported that independent laboratory tests performed on the specific lots cited by the media had failed to find squalene. Subsequently, Dover officials resumed anthrax vaccinations. Further analysis of all of 13 additional lots also found no evidence of squalene.

Concerns similar to those expressed at Dover have been reportedly voiced at other installations. A primary reason for dissatisfaction with information about long-term side effects appears to be that research has not been done to address the topic. According to program officials, such studies have recently been discussed but are not yet funded or underway.

Program Recently Established a Communications Division

The program has recently established a communications division to focus on servicemembers' information needs. The division updated the program's Internet site and established a toll-free information line and a traveling speakers' bureau of experts on anthrax and the vaccine. The communications division was also instrumental in updating briefings for installation leaders and medical personnel to provide more detailed information on the threat of anthrax. DOD expects these briefings to

respond effectively to commanders' and medical staff's needs by countering misinformation in the media and on the Internet.

The communications division plans to periodically obtain feedback on implementation of its plan, which includes surveys carried out by DOD and service program staff while on site visits to convey key messages and ensure consistency of information. Program staff, including some from the communications division, conducted the first survey in July 1999 and plan to conduct surveys at seven other sites to be visited by December 31, 1999. The surveys will not be projectible but are expected to provide useful information on the implementation of the communications plan. In July 1999, the program submitted a budget proposal for program evaluation and research to include an annual evaluation of communications effectiveness and clinical issues. The proposal did not include linking vaccine refusals to program effectiveness.

Conclusions

DOD's policy decision to vaccinate the entire force against anthrax has presented many challenges. DOD has made progress in implementing the anthrax vaccination program, but several challenges remain. As of July 1999, DOD had administered more than 1 million vaccinations to over 315,000 servicemembers. DOD has taken steps to ensure that vaccine lots are recently tested for purity, potency, sterility, and safety before they are released for use. Vaccinations are recorded in a central database (an improvement over past record keeping); data on the program's implementation progress is collected; reported adverse events are monitored; servicemembers receive information on the program; and the manufacturer's contract has been restructured to help improve its financial condition.

The first challenge, however, is to develop a formal plan for vaccinating servicemembers should the anthrax vaccine supply not be available as currently anticipated. If BioPort, the sole-source supplier of the vaccine, is unable to obtain FDA approval to release stockpiled or newly produced vaccine, DOD will not be able to vaccinate the entire force as planned. Developing a formal plan would help DOD consider (1) various contingencies, including options for altering the three phases of the program, should the vaccine supply become limited and (2) strategies to mitigate the risk of loss of the sole-source manufacturer, including strategies to acquire a second production source or develop a second-generation vaccine.

Second, while DOD has improved its recording and tracking of vaccinations, shortcomings remain in documenting vaccinations in paper medical records and in establishing a DOD-wide database useful to commanders for tracking vaccinations. To ensure that servicemembers obtain the health care they need, especially if they experience short- or long-term adverse events associated with vaccinations, DOD must keep paper and electronic medical records accurate and current. Also, because the anthrax immunization regimen requires several vaccinations over a short period and annual boosters, it is critical that commanders have timely information about servicemembers in their units who are scheduled for vaccinations. Because the DOD-wide database, the Defense Enrollment Eligibility Reporting System, lacks current data on servicemembers' duty stations, commanders do not find it useful for scheduling individual vaccinations or determining the status of vaccinations for their unit as a whole. DOD's plan to incorporate vaccine tracking in an upgrade to its Composite Health Care System program will be of limited use to commanders if it does not give them some of the capabilities of the service-level systems.

Third, measures used to track program implementation omit important data needed to assess overall performance such as refusals. Program officials, however, have discontinued monitoring refusals, even though such data would help monitor possible lack of acceptance of the program. Moreover, previous reports of refusals did not include personnel leaving the services because of concern about the anthrax vaccine. If collected during exit interviews scheduled in 2000, this data could provide another indicator of possible resistance to the program.

Fourth, data on adverse events may be underreported, making it difficult to continuously monitor vaccine safety. DOD has updated educational material on reporting adverse events, and monitoring the effectiveness of efforts to distribute this information to servicemembers would help ensure adverse events are consistently reported.

Fifth, servicemembers clearly want more information on the possibility of long-term side effects. Because the vaccination program is a mandatory, servicewide program, it is essential that servicemembers be given the fullest information possible on these side effects. Although DOD officials have recently discussed potential studies on possible long-term side effects of the vaccine, none have been designed or funded.

Finally, program officials have not systematically monitored their education efforts. Informing servicemembers about the risks of anthrax, the protection the vaccine affords, and the vaccine's safety and efficacy is critical to the long-term success of the program. While the program has provided information on some of these topics and has established a communications division dedicated to improving communications with and education of servicemembers, monitoring the effectiveness of such efforts is important for allocating education resources. Officials plan to obtain feedback on their new efforts but have not yet designed and implemented a systematic strategy to help assess overall progress in meeting communications goals. Further, because data on refusals to receive the vaccine is no longer being collected, it is difficult to better target educational efforts and address emerging concerns.

These problems need to be resolved if the program is to succeed in vaccinating the entire force against anthrax.

Recommendations

To address the challenges DOD faces in vaccinating its total force against anthrax, we recommend that the Secretary of Defense direct the Secretary of the Army, as Executive Agent for the anthrax vaccination program, to

- prepare a formal, written plan that addresses strategies to deal with (1) contingencies for vaccinating servicemembers if the supply of anthrax vaccine is not augmented with new production and (2) the risks associated with reliance on a single vaccine manufacturer;
- routinely collect and report, among other program performance measures, data on the number of servicemembers refusing to take the vaccine;
- improve DOD guidance and training on how to report adverse events to the Vaccine Adverse Event Reporting System and refrain from inappropriately using data from the system to report an adverse reaction rate;
- design and conduct a study on possible long-term side effects of the anthrax vaccine and develop a communications plan to provide servicemembers information on the status of this effort; and
- continue improvements in educational efforts by regularly surveying vaccine recipients and addressing their educational needs.

In addition, we recommend that the Secretary of Defense direct the Defense Manpower Data Center to

- assess the timeliness of personnel duty station data in the Defense Enrollment Eligibility Reporting System to determine where time lags occur in obtaining data and take or recommend steps to resolve untimely submissions,
- review service requirements for recording and tracking medical data and incorporate plans to address these requirements in future upgrades of the Composite Health Care System, and
- include the response "to avoid the mandatory anthrax vaccine" (or words to that effect) among answers to questions on the reasons for resigning from the military in the DOD-wide exit survey to be administered in 2000.

Agency Comments

In written comments on a draft of this report, DOD generally concurred with the report findings and recommendations, emphasized several areas of concern, and described recent or proposed actions to implement recommendations made in our report. DOD also provided technical comments which we incorporated as appropriate.

DOD commented that we did not fully discuss some key aspects and successes of the anthrax immunization program. For example, DOD stated that it keeps three paper records to ensure that immunizations are documented and that no other organization in the world can match this accomplishment. Our report recognizes that DOD has made improvements to its systems for recording and tracking vaccinations but notes that further improvements are needed to ensure that data are recorded in an accurate and timely manner. DOD also stated that the report, "did not mention the excellent long-term safety record of the vaccine examined over a period of 44 years." Our report notes that GAO's recent work on this issue found that data on the vaccine's long-term safety is limited. In our previous work, we found that while some studies have spanned many years, they focus on short-term reactions to the vaccine. For example, a 20-year study on reactions to the vaccine only reported on symptoms that began within 48 hours of the vaccination. Moreover, DOD has indicated that additional data on the vaccine's long-term safety would be beneficial and has established a committee to identify and plan additional research on this issue.

Finally, DOD noted several actions it has taken or plans to take to implement our recommendations such as using existing data to develop a written plan to address possible vaccine shortages and improving DOD guidance and training on how to report adverse events to the Vaccine Adverse Event Reporting System. Regarding our recommendation that

DOD use a DOD-wide exit survey to query members whether the requirement to receive the vaccine affected their decision to resign, DOD noted that it is not appropriate to single out anthrax vaccinations as a potential reason for departing the military because it is a "leading" question and would produce survey bias. Rather, DOD believes that focus groups and surveys of individuals who refuse to take the vaccine are more appropriate assessment tools. We believe that DOD should pursue other methods, such as focus groups, to determine the possible impact of the anthrax vaccine program on retention but believe that a response category about the anthrax vaccine could be included on DOD's exit survey since it will be one of many possible reasons for leaving the military.

We are sending copies of this report to Representative Bob Stump, Chairman, and Representative Lane Evans, Ranking Minority Member, House Committee on Veterans' Affairs. We are also sending copies to the Honorable William S. Cohen, Secretary of Defense; the Honorable Louis Caldera, Secretary of the Army; the Honorable Richard Danzig, Secretary of the Navy; the Honorable F. Whitten Peters, Secretary of the Air Force; General James L. Jones, Commandant of the Marine Corps and Dr. Jane E. Henney, Commissioner of Food and Drugs. Copies will also be made available to others upon request.

Please contact me at (202) 512-3958 if you have any questions concerning this report. Key contacts and major contributors to this report are listed in appendix V.

Carol R. Schuster
Associate Director, National Security
Preparedness Issues

Scope and Methodology

To conduct our review, we interviewed officials and obtained documents from the Army Office of the Surgeon General's Anthrax Vaccine Immunization Program; the Joint Program Office for Biological Defense; the Naval Medical Information Management Center; the Offices of the Judge Advocates General for the Army, the Navy, Marine Corps, and the Air Force; and the Joint Staff. We also obtained information and discussed the program with officials from the Defense Manpower Data Center (DMDC) in Seaside, California, and Arlington, Virginia; U.S. Air Force Air Combat Command, Langley, Virginia; U.S. Navy Space and Warfare Systems Command, Chesapeake, Virginia; medical and command personnel at Fort Stewart, Georgia; USS Eisenhower, Norfolk Naval Shipyard, Portsmouth, Virginia; Langley Air Force Base, Virginia; and Camp Lejeune, Jacksonville, North Carolina. In addition, we interviewed officials and obtained documents from BioPort Corporation in Lansing, Michigan; and the Food and Drug Administration (FDA) in Rockville, Maryland.

To determine the availability of the vaccine and its impact on program schedules, we reviewed and summarized data on vaccine lot status, including supplemental test results, lot quantities, lot expiration dates, and results of initial lot release testing. We analyzed assumptions of projections for vaccine production and usage and compared them with program schedules and past testing data. We also discussed measures for securing and shipping the vaccine with officials from BioPort, the U.S. Army Medical Materiel Agency, and one installation at each service.

To assess systems for recording and tracking vaccinations, we selected one installation from each service where a large number of vaccinations had been given (at least 1,000) and randomly selected 300 service members who had received at least one injection of the vaccination series.[1] We then compared the information on the paper records with data from the Defense Enrollment Eligibility Reporting System (DEERS). Table 3 summarizes the installations visited, records reviewed, and time frames of our collection of DEERS and paper data.

[1]Files for the Fort Stewart location inadvertently included the records for the first 300 social security numbers, and therefore were not random.

Table 3: Collection and Review of Electronic and Paper Records

Service location visited	Population that received at least one vaccination	Medical records reviewed	Yellow shot records reviewed	Date DEERS data was received	Date(s) paper record data was reviewed
Army: Fort Stewart, GA	8,751	200	197	1 Dec. 1998	14-17 Dec. 1998
Navy: *USS Eisenhower*, VA	2,108	238	1	2 Feb. 1999	16-17 Feb. 1999
Air Force: Langley AFB, VA	1,273	186	143	9 Nov. 1999	30 Nov. 1998
Marines: Camp Lejeune, NC	1,842	134	4	10 Mar. 1999	15-18 Mar. 1998

Source: GAO.

We compared the vaccination number, date, and lot number contained in the DEERS database with data on paper records—the medical record and yellow shot records available on site. A mismatch of any vaccination for each category was considered a mismatch for the entire record. Because our samples included only those who had received at least one injection, our analyses did not examine the possible condition that a servicemember received an injection but did not have it recorded in DEERS. Further, although our initial sample of records was designed to project our results to the installations we visited with a precision of ±5 percent at a 95-percent confidence level, operational limitations in the field—most notably the unavailability of some records because of deployments and transfers—did not allow us to review sufficient records to generalize our results to all personnel at the four installations with a reasonable level of confidence.

To evaluate the reporting of vaccine-related adverse events, we reviewed FDA requirements for the Vaccine Adverse Event Reporting System (VAERS), obtained reports of adverse events from the program, discussed reporting procedures with medical and command personnel at the four military installations we visited, and reviewed additional Department of Defense (DOD) studies on adverse events. In addition, we attended the May 1999 Annual DOD Conference for Biological Warfare Defense Immunizations.

To assess education initiatives of the program, we reviewed guidance and service plans to determine education requirements; collected and reviewed educational material used at the military installations we visited, discussed education efforts with command and medical personnel at each installation and with FDA officials, and surveyed a total of 249 servicemembers at those installations. We did not evaluate the accuracy of information

provided to vaccine recipients but used the survey to determine what information was available to servicemembers and how helpful they found the information. Questionnaire respondents were, with three exceptions, vaccine recipients who were available at the time of our site visits. Because the respondents were not randomly selected, their responses cannot be projected. Details of the questionnaire and responses are in appendix III. We also discussed program plans for future communications and education initiatives with program officials.

We conducted our review from July 1998 through July 1999 in accordance with generally accepted government auditing standards.

Packaging and Shipping Protocol

This appendix describes DOD's packaging and shipping protocol for transporting anthrax vaccine from BioPort to military sites. DOD's packing and shipping goals are to have zero defects (such as package damage that would ruin the vaccine) and zero loss of accountability (such as packages disappearing due to mishandling or theft).

Packaging

BioPort packages vials of anthrax vaccine according to the protocol designed by DOD and BioPort to maintain doses within an acceptable temperature range (1–25°C). The vials are shipped in an insulated container along with gelatin cold-packs, a digital monitor that records the temperature every 5 minutes throughout transit, an addressed envelope for return of the monitor, and an address label for return of the packaging materials to BioPort. In tests of the temperature monitor, DOD found its failure rate to be just under 1 percent—usually due to a mechanical or electrical problem. There are several layers in each container:

- The first layer is composed of two gelatin cold-packs. In spring and fall, one of the packs is frozen before packing; in summer, both are frozen. In winter, neither is frozen.
- The second layer is made of cold-packs that are never frozen before shipping. The vaccine vials and the temperature monitor are packed between the second and third layers.
- The third layer holds two more cold-packs cooled to 4°C.

The highest temperature recorded since use of this protocol began (in a shipment sent to southwest Asia) has been 16°C.

Shipping

DOD's shipments of anthrax vaccine are managed by the U.S. Army Medical Materiel Agency (USAMMA). Shipments in the continental United States, nearly all of which are by air, are performed by Federal Express. Some overseas shipments are also carried by Federal Express, but most are delivered by DHL World Wide Express. Should either Federal Express or DHL World Wide Express go on strike, the other carrier would take over delivery of shipments.

The shipping label on each box has a code to track the package, giving DOD "total asset visibility." As part of its Priority Alert program, Federal Express gives DOD's shipments priority and aggressively pursues solutions to problems that arise. The shipping box carries fluorescent "Priority Alert"

labels on all sides to notify handlers that the box must be moved first and never bumped. If a Priority Alert shipment is held up by problems with Federal Express' transportation vehicles, the company immediately arranges with a common carrier to move the shipment. Federal Express employees take procedural problems uncovered through this program directly to the company's managers for priority resolution.

Federal Express has given USAMMA a computer system to track shipments, and pagers are used for the two organizations to maintain 24-hour communication. BioPort enters information on an outgoing vaccine shipment into the Federal Express system, establishing instant visibility. The program can also generate reports that identify, among other things, systemic problems with shipments to a particular military installation. USAMMA, thus alerted, can check with the site and clarify the situation. Special software, PC Track, will soon link USAMMA to Federal Express' mainframe computer and provide more communication regarding shipments.

USAMMA notifies military recipients beforehand of imminent shipments and gives instructions to alert local security about the shipment and verify that proper refrigeration will be available in the receiving area. USAMMA also faxes them a checklist to be used when the shipment arrives. Upon receipt, the recipient visually inspects the package for damage. If damaged, the recipient is to refuse shipment and contact USAMMA. The military recipient then refrigerates the vaccine at 2–8°C in a restricted area and returns the monitor to USAMMA. The recipient awaits authorization from USAMMA, which checks that temperature data recorded by the monitor did not exceed temperature tolerances before releasing the vaccine. If the package's interior temperature has been too high or low at any point in transit, it shows up on the monitor's read-out as a positive or negative spike (if the box were opened en route, for example, a positive spike would be recorded). Any deviation is recorded on a special form and sent to BioPort for assessment.

When a shipping problem occurs, USAMMA conducts a risk analysis that runs through an "if/then" protocol. Also, whenever a route is changed, USAMMA runs a test shipment of one vial.

Survey of Servicemember Views of the Anthrax Vaccine Immunization Program

We surveyed vaccine recipients in all four services about the anthrax vaccine program and obtained responses from 249 active duty servicemembers: 18 percent (44) in the Army, 12 percent (31) in the Navy, 34 percent (85) in the Air Force, and 36 percent (89) in the Marine Corps. Because our survey participants were not randomly selected, the survey results cannot be projected to a larger military population.

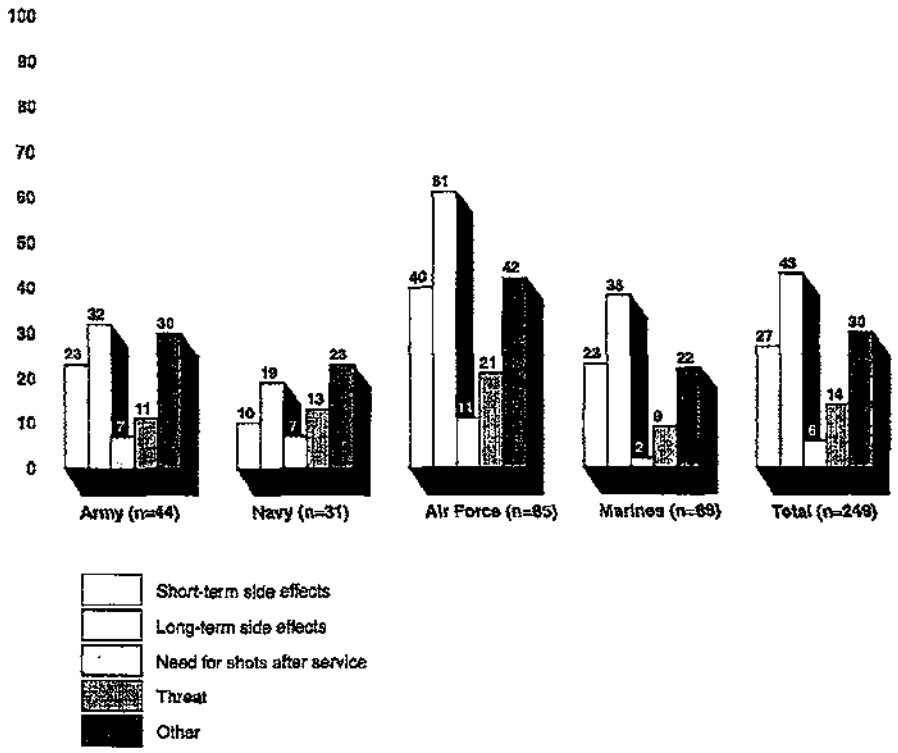
- About 89 percent (220) were enlistees and 11 percent (28) officers.[1]
- 56 percent (140) were between the ages of 18 and 25, the other 44 percent were almost equally distributed between the ages of 26 and 33 and 34 and 49. Most participants in the Army, the Navy, and the Marine Corps were between 18 and 25, while those in the Air Force tended to be older.
- About 86 percent (213) were men.
- Approximately 65 percent (162) identified themselves as Caucasian, 22 percent (54) as Black, and the remaining 13 percent (32) as either Hispanic American, Native American, or Asian American. One participant did not respond to the question.
- The number of respondents for each question varied because they were instructed to skip questions that did not apply to their individual case.

Servicemembers Wanted Information on Possible Long-term Effects of the Vaccine and Other Issues

Two-thirds (164) of survey participants said they wanted information they had not received, including information on temporary or short-term side effects of the vaccine, possible long-term side effects, the vaccination routine after active duty, the anthrax threat, or other information. Participants from all four services also said they wanted information they had not received, especially on possible long-term side effects (about 43 percent—106—of all participants). Relative to their peers from the other services, a higher proportion of Air Force participants expressed a need for information they had not received, particularly on possible long-term side effects (see fig. 5).

[1] One participant in the survey did not indicate military rank.

Figure 5: Percentage of Participants Wanting More Information

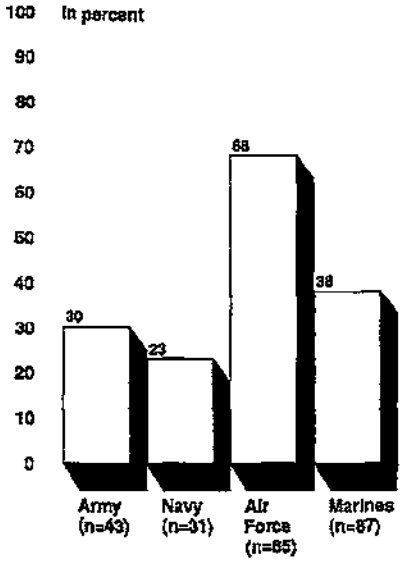


Source: GAO.

Examples of topics not listed in the survey about which respondents wanted more information included why more than three vaccinations are necessary, whether the vaccine has been tested by a qualified source, the history of the vaccine, the anthrax disease, and the extent to which the vaccine has been used to immunize humans.

Figure 6 shows the percentage of participants, by service, who responded that they experienced reactions. The Air Force had the highest rate (68 percent, or 58 out of 85 respondents).

Figure 6: Percentage of Respondents Reporting Short-term Adverse Effects, by Service



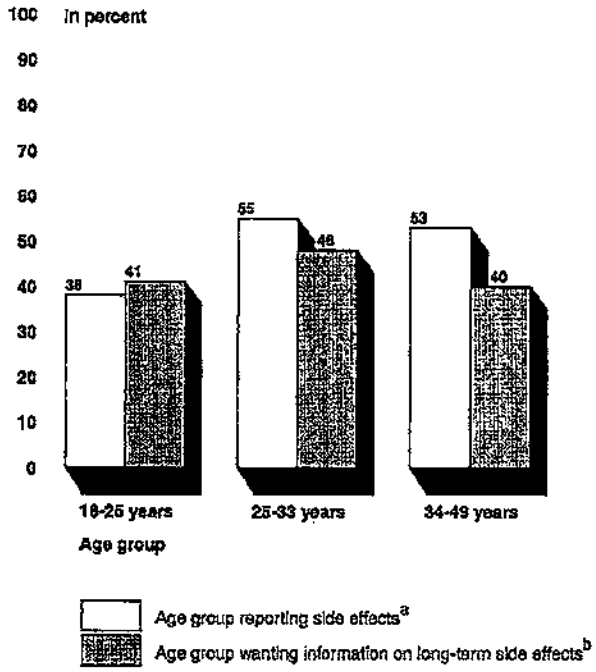
Note: Does not include three respondents who had not received their first shot.

Source: GAO.

Of the 111 survey participants who said they had experienced short-term reactions, 57 percent (59) said they wanted information on possible long-term adverse effects.

Figure 7 shows the percentage of participants in three age groups who reported having adverse effects and who said they wanted more information on possible long-term effects.

Figure 7: Percentage of Respondents Reporting Adverse Effects and Wanting Information, by Age Group



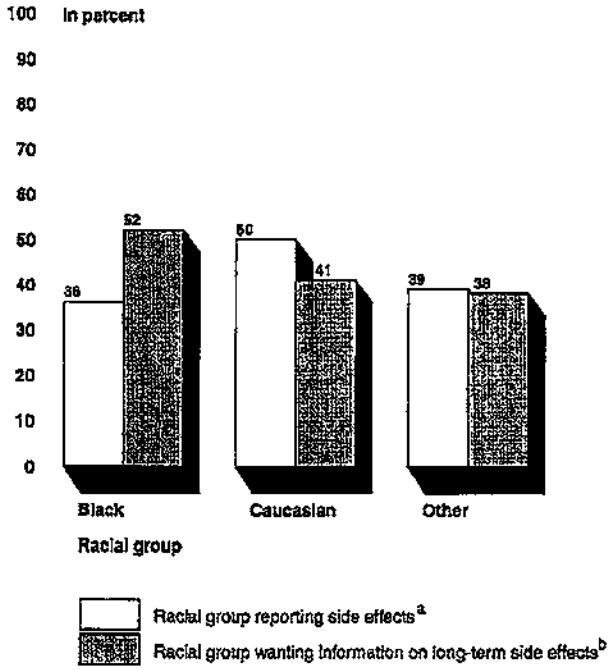
[a] Excludes three respondents who had not yet received their first vaccination. The numbers in each group are: 18 to 25 years, 138 respondents; 25 to 33 years, 55 respondents; 34 to 49 years, 53 respondents.

[b] Includes all respondents. The numbers in each group are: 18 to 25 years, 140 respondents; 25 to 33 years, 56 respondents; 34 to 49 years, 53 respondents.

Source: GAO.

As shown in figure 8, participants in all race categories said they had experienced adverse effects and wanted information on possible long-term adverse effects.

Figure 8: Percentage of Respondents Reporting Adverse Effects and Wanting Information, by Race



[a] Does not include one respondent who did not specify race and three who had not received their vaccination. The numbers for each group are: Black, 53 respondents; Caucasian, 161 respondents; other, 31 respondents.

[b] Does not include one respondent who did not specify race. The numbers for each group are: Black, 53 respondents; Caucasian, 162 respondents; other, 32 respondents.

Comments From the Department of Defense

DEPARTMENT OF THE ARMY
OFFICE OF THE SURGEON GENERAL
5109 LEESBURG PIKE
FALLS CHURCH, VA 22041-3258

REPLY TO ATTENTION OF

0 1 OCT 1999

Office of the Surgeon General

Mr. Norman J. Rabkin
Director, National Security Preparedness Issues
National Security and International Affairs Division
U.S. General Accounting Office
Washington, D.C. 20548

Dear Mr. Rabkin:

This is the Department of Defense (DOD) response to the GAO draft report "MEDICAL READINESS: DOD Faces Challenges in Implementing Its Anthrax Vaccine Immunization Program", dated 3 September 1999 (GAO Code 703254/OSD Case 1688).

While DOD generally concurs with the draft report findings and recommendations, the report did not fully characterize some key aspects and successes of the AVIP. In 18 months of implementation, DOD immunized 340,000 Service Members representing over 1,121,000 immunizations. Although the GAO report focused on the DEERS data repository, it was the Service Immunization Tracking Systems, by design, which successfully tracked each of these immunizations from over 1,200 locations and 5,100 separate units worldwide. At least three paper records serve as redundant safety measures to ensure immunizations are documented. There isn't a State, Federal or private sector health agency in the world that can match this DOD accomplishment.

The GAO investigation acknowledged the grave and urgent danger facing Service Members from the lethal threat of anthrax, but did not mention the excellent long-term safety record of the vaccine, examined over a period of 44 years, in over nine studies or surveys, involving 14,284 patients and 45,742 administered doses. Adding the 1.1 million doses given since March 1998 and analysis of adverse events by an outside panel of national vaccine experts, using national reporting instruments, the vaccine demonstrates a compelling safety record. And while we did not produce a formal written "plan" dealing with an endless array of possible vaccine delivery events and contingencies, the AVIP Agency does have a March 1999 algorithm which addresses the trigger points and options for ensuring continued, measured implementation of the AVIP.

Additional technical comments have been provided directly to the GAO staff for incorporation into the report. Our specific responses to your recommendations are enclosed. We appreciated the opportunity to work with the GAO survey team and the ability to comment on the draft report.

Sincerely,

Ronald R Blanck

Ronald R. Blanck
Lieutenant General, US Army
The Surgeon General

Enclosure
As stated

Printed on Recycled Paper

GAO DRAFT REPORT-DATED SEPTEMBER 3, 1999
GAO CODE 703254/OSD CASE 1888

"MEDICAL READINESS: DOD Faces Challenges in Implementing Its Anthrax Vaccine Immunization Program"

DEPARTMENT OF DEFENSE COMMENTS

To address the challenges DOD faces in vaccinating its total force against anthrax, the GAO recommended that the Secretary of Defense direct the Secretary of the Army, as Executive Agent for the anthrax vaccination program to:

Now on p. 35.

Recommendation 1: Prepare a formal, written plan that addresses strategies to deal with (1) contingencies for vaccinating service members if the supply of anthrax vaccine is not augmented with new production and (2) the risks associated with reliance on a single vaccine manufacturer. (p. 29/GAO Draft Report)

DoD Response: Concur. DOD will transform the current contingency algorithm chart with trigger points and options for ensuring continued, measured implementation into a formal written plan to satisfy the GAO review.

Now on p. 35.

Recommendation 2: Routinely collect and report, among other program performance measures, data on the number of service members refusing to take the vaccine. (p. 29/GAO Draft Report)

DoD Response: A draft policy memorandum, subject: Reporting Service Members Refusing the Anthrax Vaccine, is currently being staffed with the AVIP Executive Agent's General Officer Synchronization Team.

Now on p. 35.

Recommendation 3: Improve DoD guidance and training on how to report adverse events to the Vaccine Adverse Event Reporting System, and refrain from inappropriately using data from the system to report adverse reaction rate (p. 29/GAO Draft Report).

DoD Response: Concur. DOD initiated several actions in the past six months:

1. Apr 99, updated DOD "Force Health Protection Against Anthrax Leaders Briefing", required to be given to all DOD Service Members and DOD Emergency Essential civilians by supervisors, commanders prior to receiving the anthrax immunization. Slides 12, 13, 14 clearly state, for both the AC and RC, "any vaccine associated adverse event may be reported through VAERS by either the patient or provider...in writing or by calling 1.800.822.7967...reporting instructions are available on the Internet at http://www.fda.gov/cber/vaers.htm."

1

2. Apr 99, updated DOD "Anthrax Vaccine Immunization Program Health Care Providers Briefing". Slides 31,32, 33 provide clinical guidelines for VAERS reporting in addition to the guidance provided in the Leaders Briefing above.

3. DOD Policy Memo "Policy for Reporting Adverse Reactions Associated with the Anthrax Vaccine Immunization Program (AVIP)" created 30 Jun 98, staffed with the Services 21 Apr 99, outlines clinical protocols and algorithms for submitting VAERS; also requires submission of an "Anthrax Vaccine Adverse Reaction Supplemental Form". The memo is currently at ASD (HA) for signature.

4. 20 Jul 99, ASD (HA) Memorandum - Ensuring Reservists Have Full Access to Department of Defense (DOD) Medical Treatment Facilities (MTF) for Treatment and Evaluation of Adverse Events from DOD Directed Immunizations, clearly outlines patient or provider submission of Form VAERS-1 with phone numbers, Internet address, etc.

5. DOD Clinician Anthrax Vaccine Guidelines FACT SHEET outlines anthrax vaccine clinical protocols, pre-treatments, specialty referral process, contraindications, categorization of mild, moderate, severe and systemic reactions and associated treatment algorithms. The FACT Sheet clearly outlines enhanced patient or provider Form VAERS-1 reporting with all associated phone and access numbers.

6. AVIP Agency prominently posts Form VAERS-1 reporting options, sources of information, downloadable copies of the form on the anthrax Internet website www.anthrax.osd.mil and silent training aids distributed to Service Members receiving the anthrax immunization.

7. AVIP Agency established links from the DOD anthrax web site to the Food and Drug Administration VAERS information page to facilitate direct FDA reporting.

8. AVIP Agency 1.877.GETVACC Anthrax Information Line, implemented 9 August 1999, routinely provides information on patient or provider reporting of adverse events and Form VAERS-1 access and processing.

9. AVIP Speaker's Bureau/Open House Site Visits prominently discusses patient or provider VAERS reporting access, options and process during their tour.

10. Revised and simplified the AVIP VAERS summary data chart posted on the www.anthrax.osd.mil Internet site.

11. Each of the Services disseminated Service-wide messages to the field outlining VAERS reporting procedures, encouraging Service Member, Health Care Provider or guardian submission of Form VAERS-1 for any vaccine adverse event.

2

12. Sep 99, updated the new DOD quad fold information brochure "What Everyone Needs to Know About The Anthrax Vaccine" (replaces the three current versions of the Tri-fold) given to every Service Member, family member and Civilian prior to immunization. Now provides updated VAERS reporting access, procedures, phone numbers and web site information.

13. The Service Surgeon Generals included VAERS reporting procedures in all major Service/Joint medical proceedings, conferences, etc.

14. Additionally, the Anthrax Vaccine Expert Committee (AVEC) continues to review every anthrax vaccine Form VAERS-1 submission to monitor the safety of the program.

Now on p. 35.

Recommendation 4: Design and conduct a study on possible long-term side effects of the anthrax vaccine and develop a communication plan to provide servicemembers information on the status of this effort. (p. 30/GAO Draft Report)

DoD Response: Concur. DOD established a Longitudinal Studies Concept Committee to explore relevant questions regarding the safety of the anthrax vaccine, define research needs and identify subsequent research design. The Committee consists of DOD, FDA, CDC and Armed Forces Epidemiological Board (AFEB) representatives and met on 24 Aug and 22 Sep 99. The Committee defined gaps in knowledge, set a research agenda and recommended appropriate scientific designs to answer these questions, including comparison groups, statistical methods and ethical oversight. These designs will draw from traditional scientific approaches: surveys, database studies, records reviews, or other methods, depending on the specific question to be answered. Some studies can likely be completed in a few months; others will require several years. DOD programmed $2M to fund this Longitudinal Studies concept in the fiscal year 2000 Program Objective Memorandum and appropriate amounts in subsequent years.

Now on p. 35.

Recommendation 5: Continue improvement of educational efforts by regularly surveying vaccine recipients and addressing educational needs. (p. 30/GAO Draft Report).

DoD Response: Concur. DOD recently sponsored development of a Public Health award winning educational survey for administration to service members who started or are scheduled to start the vaccination series. This survey collects information about the availability, timeliness and effectiveness of AVIP educational materials prior to and during the period that service members are receiving anthrax vaccinations. DOD already collected hundreds of surveys and continues to collect them through multiple venues. Additionally, the AVIP Agency collects informal survey information from telephone calls to the toll free information line and from emails received from AVIP web site users. Collectively,

this survey data is providing insightful information regarding the effectiveness of educational information efforts. DOD plans to expand survey collection and research efforts.

Now on p. 36.

Recommendation 6: Assess the timeliness of personnel duty station data in the Defense Enrollment Eligibility Reporting System to determine where time lags occur in obtaining data and take or recommend steps to resolve untimely submissions. (p. 30/GAO Draft Report)

DoD Response: Concur. We will take aggressive steps through the AVIP Executive Agent to ensure the timely and accurate updating of personnel data in both the Service Immunization Tracking Systems and DEERS.

Now on p. 36.

Recommendation 7: Review service requirements for recording and tracking medical data and incorporate plans to address these requirements in future upgrades to the Composite Health Care System. (p. 30/GAO Draft Report)

DoD Response: Concur. The Services have already developed/employed excellent automated systems for recording, managing and reporting immunization data at the unit level in the 18 months since AVIP execution. These Service systems allow us to track the over 340,000 Service Members and 1,120,000 immunizations given at 1,200 locations within 9,100 separate units worldwide. At least two or more paper back-up systems offer additional redundancy for assured recording of immunizations. DEERS serves AVIP as the final repository for this data. The AVIP Executive Agent will aggressively pursue standardization, simplification and training of all current Service Immunization Tracking Systems into a successor, joint service, long-term immunization tracking system. We have already identified the Service functional requirements needed by unit commanders, supervisors and medical personnel at both home station and deployed locations worldwide.

Now on p. 36.

Recommendation 8: Include response "to avoid the mandatory anthrax vaccine" (or words to that effect) among answers to questions on the reasons for resigning from the military in a DoD-wide exit survey expected to be administered in 2000. (p. 30/GAO Draft Report)

DoD Response: Partially concur. An exit survey to assess overall recruiting and retention issues should be conducted. However, it is not appropriate to single out anthrax vaccinations as a reason for departing the military any more than the potential hundreds of other reasons for leaving the service. A question of this nature is "leading", produces survey bias and fails to capture the multi-faceted and complex nature of why service members depart the military. Our survey construction experts indicate the use of "focus groups" and other population sampling vehicles to assess the impact of the AVIP on retention is a far more appropriate assessment process.

Defense Health Care: Medical Surveillance Improved Since Gulf War, But Mixed Results in Bosnia (GAO/NSIAD-97-136, May 13, 1997)

Ordering Information

The first copy of each GAO report and testimony is free. Additional copies are $2 each. Orders should be sent to the following address, accompanied by a check or money order made out to the Superintendent of Documents, when necessary, VISA and MasterCard credit cards are accepted, also.

Orders for 100 or more copies to be mailed to a single address are discounted 25 percent.

Orders by mail:

U.S. General Accounting Office
P.O. Box 37050
Washington, DC 20013

or visit:

Room 1100
700 4th St. NW (corner of 4th and G Sts. NW)
U.S. General Accounting Office
Washington, DC

Orders may also be placed by calling (202) 512-6000
or by using fax number (202) 512-6061, or TDD (202) 512-2537.

Each day, GAO issues a list of newly available reports and testimony. To receive facsimile copies of the daily list or any list from the past 30 days, please call (202) 512-6000 using a touchtone phone. A recorded menu will provide information on how to obtain these lists.

For information on how to access GAO reports on the INTERNET, send an e-mail message with "info" in the body to:

CHEMICAL AND BIOLOGICAL DEFENSE

Observations on DOD's Plans To Protect U.S. Forces

Statement of Mark E. Gebicke, Director, Military Operations and Capabilities Issues, National Security and International Affairs Division

GAO/T-NSIAD-98-83

GAO Form 160 (12/91)
OPR:OIMC/PCC

Mr. Chairman and Members of the Committee:

We are pleased to be here today to discuss the Department of Defense's (DOD) continuing efforts to protect U.S. military forces against chemical and biological weapons, including its plan to inoculate all U.S. military forces against anthrax. As we learned from the Gulf War, U.S. forces were inadequately prepared for surviving and operating in a chemically or biologically contaminated environment. More recently, we found that deficiencies in medical record-keeping have hampered the conduct of epidemiological research to the point that DOD cannot provide precise, accurate, and conclusive answers regarding the causes of Gulf War veterans' illness.

Today, I will first briefly discuss the fundamental shortcomings in DOD's protection of its forces against chemical and biological warfare.[1] Then, I will discuss DOD's proposed anthrax immunization program.

SUMMARY

In examining DOD's experience in preparing its forces to defend against potential chemical and biological agent attacks during the Gulf War, we identified numerous problems. Specifically, we found shortages in individual protective equipment; inadequate chemical and biological agent detection devices; inadequate command emphasis on chemical and biological capabilities; and deficiencies in medical personnel training, and supplies.

While many deficiencies noted during the Gulf War remain unaddressed today, DOD has increasingly acknowledged and accepted the urgency of developing a capability to deal with the chemical and biological threat to its forces. Both the Congress and DOD have acted to provide greater protection for U.S. forces. Their actions have resulted in

[1]Appendix I provides a list of the unclassified GAO reports on DOD's chemical and biological capabilities. We have also issued three classified reports on this issue.

increased funding, and the fielding of more and better chemical and biological defense equipment. DOD must address remaining critical deficiencies if U.S. forces are to be provided with the resources necessary to better protect themselves. For example, DOD needs to decide on major policy and doctrine issues, improve and increase its capability to detect toxic agents, provide forces with improved and sufficient numbers of individual protective equipment, and deal with problems of collective protection and decontamination.

DOD is now embarking on a major effort to protect U.S. forces from the threat of the deadly biological agent anthrax. Its program to immunize millions of active and reserve forces against anthrax, ensuring that each receives the prescribed vaccinations in the proper time sequence, will be a challenge. However, if DOD considers lessons learned from previous, smaller-sized immunization programs and from the medical record-keeping errors in the Gulf War and in Bosnia in formulating detailed implementation plans, it can reduce the risks and improve the prospects for successfully managing the program.

PROTECTING FORCES AGAINST CHEMICAL AND BIOLOGICAL AGENTS POSES CONTINUING CHALLENGES

In 1996, we reported that military units then designated for early deployment faced many of the same chemical and biological defense problems that Gulf War veterans had experienced.[2] During the Gulf War, units and individuals deployed to the theater without all of the chemical and biological detection, decontamination, and protective equipment needed to operate in a contaminated environment. Some units did not have sufficient quantities or the needed sizes of protective clothing, and chemical detector paper and decontamination kits in some instances had passed their expiration dates. While the 6-month Operation Desert Shield buildup time allowed DOD to correct some of these

[2]Chemical and Biological Defense: Emphasis Remains Insufficient to Resolve Continuing Problems (GAO/NSIAD-96-103, March 29, 1996).

problems, had chemical or biological weapons been used during this period, some units might have suffered significant, unnecessary casualties.

We further reported that DOD's progress in chemical and biological research and development was slower than planned, training of Army and Marine Corps forces was inadequate, there was little evidence that joint training and exercises included chemical and biological defense elements, stocks of vaccines for biological agents were in short supply, and medical units lacked necessary chemical and biological defense equipment and training. We believe these deficiencies were a result of, and would not be corrected without, changes in emphasis on the part of senior military leadership.

We have also reviewed DOD's ability to protect critical ports and airfields overseas. Although I cannot fully discuss our findings in this open hearing because of their sensitive nature, I can say that there are deficiencies in doctrine, policy, equipment, and training for the defense of critical ports and airfields.

Congress and DOD have taken action that have improved U.S. forces' ability to survive and operate if chemical and biological agents are used against them. For example, DOD has requested and Congress has approved increased funding for chemical and biological defense. Numerous efforts are currently underway that should provide our servicemembers with new chemical and biological defense equipment and capabilities over the next 5 years. These include the production and fielding of improved protective masks, body garments, and systems to better detect biological and chemical agents. In addition, several commanders in chief recently increased their emphasis on various aspects of chemical and biological defense by, for example, increasing stocks of chemical defense equipment and incorporating more chemical and biological defense scenarios in major military exercises.

Still, DOD must address remaining critical deficiencies that affect its ability to protect forces from chemical and biological attack. DOD's doctrine and policy are inadequate

regarding responsibility for the chemical and biological defense of overseas airfields and ports critical to the deployment, reinforcement, and logistical support of U. S. forces in the event of a conflict. As a result, questions are unresolved regarding the provision of the force structure and equipment needed to protect these facilities. Also, unresolved doctrinal, policy, and equipment questions persist regarding the return of chemically or biologically contaminated strategic lift aircraft and ships and the protection of both essential and nonessential civilians in high-threat areas overseas. Moreover, DOD has insufficient quantities of biological agent vaccines to protect U.S. forces, and servicemembers deployed in high-threat areas overseas normally have no biological agent detection capability. Also, collective protection facilities and equipment and agent detection systems are generally insufficient to protect the force.

DOD's PROGRAM TO IMMUNIZE FORCES AGAINST ANTHRAX

Anthrax is an infectious disease that afflicts certain animals, especially cattle and sheep. The anthrax vaccine was licensed by the Food and Drug Administration (FDA) in 1970 to protect veterinarians, meat packers, wool workers, and health officials who might come in contact with anthrax. (FDA licensure of a vaccine means that it has been tested and proven to be safe and effective in humans.) The vaccine has been routinely administered to populations at risk for several years.

The Chairman of the Joint Chiefs of Staff considers anthrax to be the greatest biological weapons threat to U.S. military forces. After a 3-year study, the Secretary of Defense concluded that vaccination is the safest way to protect U.S. forces against a threat that is 99 percent lethal to unprotected individuals. Accordingly, in December 1997, DOD announced plans to vaccinate all U.S. military personnel (including active, reserve, and national guard servicemembers) against the biological warfare agent anthrax. The Michigan Biologic Products Institute is under contract with DOD to supply the vaccine for the DOD immunization program.

While the vaccine will be centrally procured, administering the vaccinations will be decentralized at multiple DOD facilities worldwide. Initially, DOD planned to begin administering the program in the summer of 1998 to about 165,000 servicemembers and DOD mission-essential personnel located in Southwest Asia and Northeast Asia, which are the areas with the greatest biological warfare threat from anthrax. Prior to beginning the immunizations, DOD wanted time to (1) perform testing of the vaccine to ensure its sterility, safety, potency, and purity; (2) implement a system to track personnel who receive the vaccinations; (3) approve plans to administer the immunizations and inform military personnel of the program; and (4) have the program reviewed by an independent expert. However, DOD accelerated the anthrax vaccination schedule. In March 1998, DOD began immunizing forces stationed in the Persian Gulf because of the possibility of hostilities occurring in that region. DOD plans to vaccinate the remaining active and reserve force over the next several years. In addition, DOD plans to decide whether the program should be extended to others, such as host nation personnel, civilian contractors, and dependents.

In accordance with the FDA licensure regimen for this vaccine, DOD plans to provide an initial series of three vaccinations at 2-week intervals, a second series of three vaccinations at 6-month intervals, and annual booster vaccinations to maintain immunity against anthrax. DOD recognizes that immunizing the entire force with multiple vaccinations will be difficult and involves significant administrative and logistical issues. DOD's program will involve administering anthrax vaccinations to about 2.4 million personnel around the world--a total of about 14.4 million vaccinations for the current force. In addition, personnel entering military service will also be immunized. Thus, DOD envisions the program to continue indefinitely.

Personnel Data Systems to Identify Servicemembers Requiring Vaccinations Must be Accurate

To ensure that all servicemembers receive the required vaccinations, it is important for DOD to have accurate and reliable personnel data systems showing where all servicemembers are located, especially those deployed to overseas locations.

Our work in examining the Operation Joint Endeavor medical surveillance program in Bosnia surfaced concerns about the accuracy of the deployment database used for determining which servicemembers required postdeployment medical assessments. More specifically, DOD officials expressed concerns about the accuracy of the DOD-wide database that was used to identify Air Force and Navy personnel who deployed to Bosnia. Air Force officials told us that the Air Force had supplied information to DOD's database on servicemembers it planned to deploy but that many of them never deployed and the database was not corrected. We were also told that data on servicemembers assigned to two Navy construction battalions that deployed to Bosnia did not appear in the database. DOD officials told us that they were concerned about the accuracy of the deployment database and planned to address the problem.

Sufficient Command Emphasis Needed to Ensure Program Implementation

Because DOD plans to administer anthrax vaccinations in a decentralized manner at multiple locations involving both operational and medical personnel, high-level commanders need to emphasize the importance of the program to ensure that it is carried out within the time schedule for administering the vaccinations. Careful attention to the administration of vaccines is critical because the vaccinations must be given at specific intervals over an 18-month period to achieve maximum protection.

In the past, a lack of command emphasis hindered DOD's successful implementation of medical programs. For example, we found that the Army had not done many postdeployment medical assessments of active duty personnel who had deployed to Bosnia. We also found that assessments done were, on average, not done within the 30-day time frame DOD established. Our work disclosed that it took an average of 98 days to complete the assessments.

In addition, the Bosnia medical surveillance plan also required servicemembers to undergo a tuberculin test at about 90 days following departure from the theater. Our work disclosed that the test took an average of 142 days.

These problems occurred because command officials did not emphasize the importance of the assessments and medical personnel did not have the authority to require servicemembers to go to medical clinics for assessments. Reliance upon unit commanders to require servicemembers to get the assessments was not effective for the Bosnia deployment.

Medical Records Documenting Vaccinations Must be Complete

Medical records documenting all care (including vaccinations) for servicemembers are essential for the delivery of high-quality medical care. DOD regulations require documentation in a servicemember's permanent medical record of all immunizations and visits made to health units.

The Presidential Advisory Committee on Persian Gulf War Veterans' Illnesses and the Institute of Medicine reported problems concerning the completeness and accuracy of medical record-keeping during the Gulf War. Research efforts to determine the causes of what has become known as veterans' Gulf War illnesses have been hampered by, among other things, incomplete medical records showing immunizations and other health services

provided to servicemembers while deployed. The Institute of Medicine characterized DOD's medical records as fragmented, disorganized, and incomplete.

We tested the completeness of medical records for selected active duty Army servicemembers who had deployed under Operation Joint Endeavor. We found that many of the medical records were incomplete in that they lacked documentation on (1) medical surveillance assessments conducted, (2) tick-borne encephalitis vaccinations given, and (3) visits made to in-theater health units. More specifically, we found that 19 percent of the post-deployment in-theater medical assessments and 9 percent of the postdeployment home unit medical assessments were not documented in the medical records. These documentation problems were attributed to the fact that this was a paper-based system that relied upon servicemembers to hand carry assessment forms from the theater to their home unit, which maintained the permanent medical record.

Regarding the documentation of tick-borne encephalitis vaccine in Bosnia, servicemembers deploying to regions where the threat of this disease was prevalent were given the choice of being inoculated with this investigational drug vaccine.[3] We found that 141 (24 percent) of the 588 medical records reviewed for servicemembers who had received the vaccine lacked required documentation.

Our tests of the completeness of the permanent medical records for servicemembers' visits made to battalion aid stations in Bosnia showed similar problems. Specifically, we found that there was no documentation in the medical records for 44 (29.3 percent) of the 150 visits we reviewed. Army officials mentioned that permanent medical records were still paper-based and that information was subject to being misfiled or lost. They also pointed out that servicemembers had deployed to the theater with only an abstract of their permanent medical records and that any medical documentation generated in the theater

[3]An investigational drug is a new drug or product regulated by FDA that has not been licensed for general use in the United States.

was to have been routed back to the servicemembers' home units for inclusion into their medical records.

DOD officials told us that a solution to these documentation problems would be the development of a deployable, computerized patient record. DOD has a project underway to have a paperless computerized medical record for every active duty servicemember by fiscal year 2000.

Centralized Database for Monitoring Program Implementation Must be Accurate

Without an adequate centralized monitoring system, DOD will not have reasonable assurances that the program is being implemented as planned. For Operation Joint Endeavor, DOD established a centralized database to track the services' progress in implementing its medical surveillance program. Medical units processing medical assessments were required to send copies of assessment forms to the DOD office maintaining the centralized database in the United States.

In testing the completeness of the centralized database for in-theater and home unit postdeployment medical assessments conducted for 618 servicemembers, we found that the database understated the number of assessments done. More specifically, it omitted 12 percent of the in-theater medical assessments and 52 percent of the home unit medical assessments.

DOD officials told us that they plan to use a new automated system for tracking implementation of the anthrax immunization program from locations around the world. The automated system is still being developed.

Efficient Inventory Controls Are Necessary to Ensure Sufficiency of Vaccine Supply

To ensure that military personnel will receive vaccinations in a timely manner and to effectively manage the program, it is important for DOD to maintain an efficient inventory control system. This system is needed to ensure that (1) sufficient supplies of vaccines will be available at the various worldwide immunization sites; (2) vaccines that are older than their 1-year shelf life are destroyed; and (3) records of vaccines received, administered, and destroyed are kept to allow for monitoring and tracking.

For the Bosnia deployment, DOD experienced problems in accounting for the inventory of the tick-borne encephalitis vaccine. DOD had to comply with strict FDA regulations regarding its use because it was still being tested as an investigational new drug. Regulations required DOD to fully account for vaccine inventories, including the number of doses administered and the number of doses destroyed.

In the spring of 1996, officials from the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID) went to Bosnia to review the procedures being used to administer the tick-borne encephalitis vaccine. These officials found that no record of vaccine disposition was being maintained and recommended that all vaccination sites perform a physical inventory and maintain data on vaccines on hand, used, and destroyed. USAMRIID officials met with considerable resistance from some medical personnel responsible for administering the vaccine about the need to keep proper records. They told us that some of the personnel seemed more interested in administering the vaccine than in keeping necessary records.

Our work on the Bosnia deployment in 1997 showed that the problems identified by USAMRIID had not been corrected. More specifically, DOD could not account for more than 3,000 (20 percent) of the total number of doses sent to Bosnia. Since our report was issued in April 1997, officials from the Office of the Army Surgeon General informed

us that most of the missing doses had been destroyed and only 242 doses remained unaccounted for.

CONCLUSIONS

In conclusion, we believe that DOD has moved in the right direction in increasing its emphasis on improving its chemical and biological defense capabilities. Increased emphasis by the commanders in chief in their areas of responsibility, a DOD-wide spending increase leading to increased numbers of fielded chemical and biological detection and protective equipment, and planned procurements of equipment over the next several years will make U.S. forces better prepared to deal with chemical and biological weapons than in the past. However, greater diligence and more action is needed by DOD to maintain progress toward achieving a level of protection for our forces that will enable us to achieve wartime objectives. This latest initiative to immunize the forces against anthrax represents a clear recognition of this threat to U.S. servicemembers. But DOD must overcome past deficiencies in its medical record-keeping practices and make sure supplies of vaccine are available if this new program is to be successful. In this regard, we reiterate that DOD needs to have the means to (1) identify those servicemembers that require immunization, (2) ensure sufficient command emphasis to guarantee that those identified for immunization are immunized, (3) maintain accurate an accurate medical record of immunizations for each servicemember, (4) manage large-scale immunizations through accurate central databases, and (5) ensure that vaccine inventories are appropriately controlled to ensure that sufficient supplies are on hand.

- - - - - - -

This concludes my prepared remarks. We would be happy to respond to any questions the Committee may have.

Safety Review of Anthrax Vaccine, 2 April 2001
Compiled by the Anthrax Vaccine Immunization Program (AVIP) Agency

To date, 13 human studies have assessed the safety of anthrax vaccination. These studies, some stretching back almost 50 years, reported adverse events after vaccination in varying degrees of detail. The following paragraphs report, to the extent information is available, the design characteristics of these studies, the number of men and women participating, and specific findings.

Among the studies described below, one of two vaccine formulations was used. The Brachman study and the early Fort Detrick studies used anthrax vaccine manufactured according to the original 1950s formula developed at Fort Detrick, Maryland. Research on this vaccine has been repeatedly accepted by the Food & Drug Administration (FDA) as relevant to the understanding of the safety profile of the current anthrax vaccine, developed in the 1960s.

In the 1960s, the production process for anthrax vaccine was improved to increase the concentration of the active ingredient, known as "protective antigen" (increasing the vaccine's potency), and to decrease the amount of other bacterial components in the vaccine (eg, proteins called edema factor or lethal factor), thus increasing purity. This purer, more potent vaccine, manufactured in Lansing, Michigan, was licensed by the National Institutes of Health in 1970. This license was reaffirmed by FDA in 1985 (*Fed Reg* 1985;50:51002-117 http://www.anthrax.osd.mil/Site_Files/articles/Indexclinical/Fed_register.htm).

The CDC observational study involved people who received either the original vaccine or the improved vaccine, or both. The other studies described below used anthrax vaccine manufactured according to the improved 1960s formula, the same vaccine used throughout the United States today.

Details of each study appear on following pages. The 13 studies include:

a. The Brachman Study (pivotal field trial evaluating safety and efficacy).

b. The CDC Observational Study (the follow-on open-label study between the Brachman study and vaccine licensing in 1970).

c. Fort Detrick Multi-Dose, Multi-Vaccine Safety Studies (evaluations of Army laboratory workers vaccinated hundreds of times with dozens of vaccines).

d. Fort Detrick Special Immunization Program (SIP) Safety Study (continuation of the previous study among more workers into modern times).

e. Fort Bragg Booster Study (evaluation of additional doses of anthrax vaccine among soldiers vaccinated several years earlier during the Persian Gulf War).

f. USAMRIID Reduced-Dose / Route-Change Study (study of anthrax vaccine administered by two different injectable routes of administration).

g. Canadian Forces Safety Survey (study of Canadian Service Members).

h. TAMC-600 Survey (study of adverse events after anthrax vaccination of medical personnel at Tripler Army Medical Center).

i. U.S. Forces Korea Records (study of adverse events among personnel there).

j. USAF Vision Study (a study of visual acuity among vaccinated and unvaccinated air crew members).

k. USAF Air Combat Command Study, Langley Air Force Base (study of outpatient medical care among Air Force personnel after return from Southwest Asia).

l. Reports involving Anthrax Vaccine Submitted to the FDA/CDC Vaccine Adverse Event Reporting System (VAERS).

m. Defense Medical Surveillance System (comparison of hospitalization and outpatient visit rates for those vaccinated and unvaccinated against anthrax).

SUMMARY: Anthrax vaccine prevents anthrax. Anthrax vaccine does not prevent other health problems. This is evident in the similar rates of hospitalization among Service Members vaccinated or unvaccinated against anthrax (section M).

Like all vaccines, anthrax vaccine may cause soreness, redness, itching, swelling, and lumps at the injection site. About 30% of men and 60% of women report mild local reactions, but these reactions usually last only a few days. Lumps can persist a few weeks, but eventually go away. For both genders, between 1% and 5% report moderate reactions of 1 to 5 inches in diameter. Larger reactions occur after about one in a hundred vaccinees or less. Beyond the injection site, from 5% to 35% will notice rashes (16%), headaches (14% to 25%), joint aches (12% to 15%), malaise (6% to 17%), muscle aches (3% to 34%), nausea (3% to 9%), chills (2% to 6%), fever (1% to 5%). Again, these symptoms usually go away after a few days.

The vaccine's product labeling ("package insert") indicates that systemic effects occur in 0.2% of vaccine recipients. This value of 0.2% is unusually low compared to other vaccines and compared to modern data collection with the licensed anthrax vaccine. The low value probably reflects a "threshold effect" of counting only cases of substantial adverse events, in contrast to mild adverse events.

To monitor rare or unexpected adverse events associated in time to any vaccine, DOD health care providers have participated in the Vaccine Adverse Event Reporting System (VAERS), since its inception in 1990. In addition, each VAERS report is reviewed by an independent panel of civilian physicians. To date, this panel has detected no patterns of unexpected adverse events related to anthrax vaccination.

There are no known long-term patterns of side effects from the anthrax vaccine, based on an ongoing series of studies at Fort Detrick, Maryland, and elsewhere. The first report in this series was published in 1958.

Despite the extensive body of knowledge regarding the safety of anthrax vaccine, safety monitoring continues, as is prudent for all vaccines and medications.

a. The Brachman Study

Citation: PS Brachman, H Gold, SA Plotkin, FR Fekety, M Werrin, NR Ingram. Field evaluation of human anthrax vaccine. *American Journal of Public Health* 1962; volume 52: pages 632-45. http://www.anthrax.osd.mil/site_files/articles/indexclinical/brachman.pdf

Investigators: Epidemiologists at the Communicable Disease Center, Johns Hopkins Hospital, Philadelphia Department of Public Health.

Period of Observation: 1955 to 1959

Participants: 1,249 people total, gender unspecified, of whom 379 received anthrax vaccine. At least 3 of the 26 cases of anthrax detected in this study occurred in women.

Vaccine Studied: Fort Detrick formulation

Study Design: Randomized, placebo-controlled trial of anthrax vaccine among mill workers in northeastern U.S. who processed raw imported goat hair.

Findings: "The typical reaction was mild and did not cause any interruption of work."

(a) Injection-site ("local") Reactions:

Mild local reactions, consisting of 1 to 2 cm of redness, plus slight local tenderness, occurred in about 30% of recipients within 24 hours after vaccination. Itching were noted less commonly. "In general, all signs and symptoms disappeared within the next 24 to 48 hours. In many of the cases, this minimal degree of local reaction would not have been noticed by the inoculee had not his arm been examined at 24 and 48 hours after inoculation."

Moderate local inflammation (a defensive reaction to irritation) (> 5 cm in diameter), occurred in 4% of recipients.

Large local reactions occurred less frequently and consisted of extensive swelling of the forearm, in addition to local inflammation. "Three individuals experienced edema extending from the deltoid to the mid-forearm and, in one case, to the wrist, with a definite collection of fluid in the bursa of the elbow. This extensive edema disappeared within three to five days."

(b) Events Beyond the Injection Site ("systemic"): Brachman, et al., did not differentiate between nonserious and serious events. Systemic events occurred in fewer than two per thousand (< 0.2%) recipients, including "...two individuals who experienced, along with the edema-producing local reactions, some malaise of 24 hours' duration." Even less frequently, fever and chills were noted.

(c) Events or effects by gender: Brachman, et al., did not differentiate between men and women in describing adverse events.

(d) Length of time to resolution: Brachman reported no adverse events persisting beyond five days, except that "A few inoculees developed small, firm, painless nodules at the site of injections which persisted for several weeks." They also noted that "Half of these edema-producing reactions were maximum at 24 hours, and the remainder at 48 hours.

b. The CDC Observational Study

Citation: FDA Panel on Review of Bacterial Vaccines & Toxoids: Food & Drug Administration. Biological products; Bacterial vaccines and toxoids; Implementation of efficacy review. *Federal Register* 1985; volume 50: pages 51002-117. <http://www.anthrax.osd.mil/Site_Files/articles/Indexclinical/Fed_register.htm>

Investigators: Data collected under DBS-IND#180 by CDC. Data submitted to NIH Division of Biological Standardization as part of the license application for anthrax vaccine. This license was granted in 1970.

Period of Observation: 1962 to 1972

Participants: about 7,000 people, gender unspecified, involving about 16,000 doses of anthrax vaccine. At least 227 of these people received 10 or more annual booster doses.

Vaccine Studied: Mixture of people receiving the Fort Detrick formulation and the Lansing formulation

Study Design: Observational study assessing use of vaccine in industrial high-risk settings. Side-effect data was collected on vaccinees, but not on any control subjects. CDC collected and analyzed reports of cases of anthrax disease from around the United States (which showed disease in unvaccinated people and no disease in vaccinated people).

Findings: "Local reactions are typically mild.... Only a few systemic reactions with marked chills and fever have been recorded. All reactions reported have been self-limited." "Severe local reactions and systemic reactions are relatively rare."

(a) Injection-site ("local") Reactions:
Mild local reactions ($\leq$ 3 cm) were reported after 3% to 20% of doses administered.
Moderate reactions ($>$ 3 cm to $<$ 12 cm) were reported after 1% to 3% of doses.
Large reactions ($\geq$ 12 cm) were reported after fewer than 1% of doses.

(b) Events Beyond the Injection Site ("systemic"): Report authors did not differentiate between nonserious and serious events. Systemic reactions, reported in four individuals (fewer than 6 per 10,000 doses), consisted of fever, chills, nausea and general body aches, which resolved spontaneously.

(c) Events or effects by gender: Report authors did not differentiate between men and women in describing adverse events.

(d) Length of time to resolution: Authors did not report persistent adverse events.

c. Fort Detrick Multi-Dose, Multi-Vaccine Safety Studies

Citation: Richard N. Peeler, Leighton E. Cluff, Robert W. Trever. Hyper-immunization of man. *Bulletin of the Johns Hopkins Hospital* 1958; volume 103: pages 183-98.
Investigators: Scientists at the Johns Hopkins University
Period of Observation: 1944 to 1956 (mean: 10.4 years)
Participants: 99 men (range: 28 to 65 years old, mean: 40.1 years), 0 women, 99 people total, recipients of multiple immunizations against anthrax, botulism, brucellosis, diphtheria, Eastern equine encephalitis, influenza, plague, poliomyelitis, psittacosis, Q fever, Rift Valley fever, Rocky Mountain spotted fever, smallpox, tetanus, tularemia, typhus, Venezuelan equine encephalitis, Western equine encephalitis, and yellow fever, totaling 36 to 74 milliliters of vaccines, plus multiple skin tests to detect hypersensitivity to microbial antigens. [For comparison, note that the six doses of anthrax vaccine in the primary series total 3 ml.]

* * *

http://www.anthrax.osd.mil/Site_Files/articles/INDEXclinical/anthraxlibrary/Intensive.pdf
Investigators: Scientists at the Johns Hopkins University
Period of Observation: 1944 to 1962 (mean: 15.3 years)
Participants: 76 men (subset of 99 reported above), who received 42 to 102 ml of vaccines (mean: 74 ml)

* * *

Citation: Charles S. White III, William H. Adler, Virginia G. McGann. Repeated immunization: Possible adverse effects: Reevaluation of human subjects at 25 years. *Annals of Internal Medicine* 1974; volume 81: pages 594-600.
http://www.anthrax.osd.mil/Site_Files/articles/INDEXclinical/anthraxlibrary/Repeated.pdf
Investigators: Scientists at the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID), Fort Detrick, Maryland
Period of Observation: 1944 to 1971
Participants: 97 men (subset of 99 reported above), who received 52 to 134 ml of vaccines (mean: 97 ml), plus 6 to 93 skin tests (mean: 55), compared to 26 age- and gender-matched, unvaccinated control subjects
Vaccine Studied: Mixture of people receiving the Fort Detrick formulation and the Lansing formulation

Study Design: Cohort study, occupational setting. The third study includes a small control group.
Findings: While there were some minor elevations in liver and kidney function tests and white blood cell counts in these men, none of these men developed any unusual diseases or unexplained symptoms that could be attributed to the repeated doses of multiple vaccines.

(a) Injection-site ("local") Reactions: Not the subject of these studies.
(b) Events Beyond the Injection Site ("systemic"): Several laboratory abnormalities were noted (including elevated white blood cell counts and elevated liver function tests). Many of these abnormalities were transient and not detected in the 1974 study.

"It is of prime significance that long-term follow-up examination of these intensively immunized men failed to demonstrate any evidence of illness attributable to the immunizations. There is no indication that intensive immunization interfered with the ability to produce adequate antibody titers after antigenic challenge."

The 1974 study concluded "These data and the accompanying evaluation of an intensively immunized population provide evidence that no obvious adverse effects result from repeated immunization. ... Thus, this group provides reassurance that schedules for routine immunization with a diversity of vaccines should not produce untoward effects merely because of frequency of inoculation."

(c) Events or effects by gender: Not applicable.

(d) Length of time to resolution: Not applicable, no long-term health effects found.

d. Fort Detrick Special Immunization Program (SIP) Safety Study

Citation: None, data analysis in progress, manuscript in development
Investigators: Scientists at the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID), Fort Detrick, Maryland
Period of Observation: 1973 to present
Participants: 1,255 men, 335 women, 1,590 people total, who received 10,451 doses of anthrax vaccine, assessed at the USAMRIID Special Immunizations Clinic (occupational-health clinic)
Vaccine Studied: Lansing formulation

Study Design: Cohort study of repeatedly vaccinated laboratory workers, with data based on visits to an occupational health clinic (the USAMRIID Special Immunizations Clinic).
Findings: All local and systemic events resolved without extensive time lost from work, hospitalization or long-term effects. These employees continue to be examined and tested annually for medical conditions since their last visit, yet no diseases or unexplained symptoms have been observed that would not be expected in an unvaccinated group of comparable age and other demographic characteristics.

(a) Injection-site ("local") Reactions: 4% of doses resulted in a local reaction consisting of redness, induration (an area of hardened tissue), itching, and soft or puffy swelling (edema) at the injection site. Mild, moderate, and Large reactions were not differentiated in this analysis.

(b) Events Beyond the Injection Site ("systemic"): Systemic reactions of headache, fever, chills, malaise (discomfort, uneasiness), muscle and joint aches occurred after 4 per 1,000 doses. Fifty systemic events noted above were classified as nonserious. One serious systemic event was reported in this study, a woman who developed multiple sclerosis. [Background: About 10,000 people are diagnosed with multiple sclerosis each year in the United States.] Her case resolved in 6 weeks and she returned to duty. All systemic events resolved without extensive time lost from work, hospitalization or long-term effects.

(c) Events or effects by gender: Adverse events were reported by 2% to 4% of men and 4% to 7% of women.

(d) Length of time to resolution: All local and systemic events resolved without extensive time lost from work, hospitalization or long-term effects.

e. Fort Bragg Booster Study

Citation: None, data collection and analysis in progress
Investigators: Scientists at the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID), Fort Detrick, Maryland
Period of Observation: 1992 to 1993
Participants: 490 men, 0 women, 490 people total, U.S. Army Special Operations Command soldiers at Fort Bragg, North Carolina
Vaccine Studied: Lansing formulation

Study Design: USAMRIID investigators actively assessed the safety of booster doses of anthrax vaccine, given to Special Operations soldiers previously vaccinated against anthrax and botulism during the Persian Gulf War of 1990-91. All 490 were assessed for vaccine safety; 281 were assessed for immunogenicity.
Findings: No adverse event caused lost time from work or hospitalization and all reactions resolved without lasting consequences.
(a) Injection-site ("local") Reactions:
Mild: Of these soldiers, 21% had local redness and/or swelling in the arm where the booster vaccination was administered.
Moderate: In 5%, the redness and/or swelling was $\geq$ 5 cm.
Large: None described.
(b) Events Beyond the Injection Site ("systemic"): One or more systemic reactions occurred in 44% of recipients during the first 30 days after vaccination, most commonly muscle aches (30%), malaise (16%), headache (16%), rash (16%), or joint aches (12%). We should note that these troops were engaged in a field exercise at the time of this study. Therefore, the role of the anthrax vaccination cannot reasonably be separated from the rigorous physical exertion commonly associated with Special Forces field deployments.
(c) Events or effects by gender: Not applicable.
(d) Length of time to resolution: No adverse event caused lost time from work or hospitalization and all reactions resolved without lasting consequences.

f. USAMRIID Reduced-Dose / Route-Change Study

Citation: None. Technical report prepared for Food & Drug Administration. Manuscript in preparation
Investigators: Scientists at the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID), Fort Detrick, Maryland
Period of Observation: 1998 (enlarged study in planning)
Participants: 109 men, 64 women, 173 people total
Vaccine Studied: Lansing formulation

Study Design: USAMRIID actively collected safety data during a pilot study to evaluate a reduced schedule for administering the anthrax vaccine. The safety of anthrax vaccination was studied in three groups of people: (1) some got the standard schedule of the first three doses (0, 2, 4 weeks) into the subcutaneous fat layer under the skin, (2) others received two doses given subcutaneously, (3) a third group received two injections into the muscle in the upper arm. All these volunteers gave informed consent for the procedure.

Findings: This study provides evidence that local adverse events are less common when the intramuscular route is used to administer anthrax vaccine, compared to the subcutaneous route.

(a) Injection-site ("local") Reactions: Redness and swelling at the injection site occurred more commonly among those given subcutaneous injections, compared to intramuscular injections. Male vaccine recipients developed injection-site reactions less frequently after subcutaneous injection (5% to 32%) than female vaccine recipients (39% to 69%), but the rates were comparably low for both genders when the vaccine was given by intramuscular injection (0% to 7%). Subcutaneous nodules, which resolved spontaneously, were common among recipients of subcutaneous injections, but were not observed among recipients of intramuscular injections. Subcutaneous nodules were usually not noticed by the vaccinee and resolved spontaneously.

(b) Events Beyond the Injection Site ("systemic"): Systemic adverse events were uncommon and their incidence did not differ among the three groups. After the first dose, the side effects noted were headache (14%); malaise (9%); loss of appetite (3%); nausea or vomiting (3%); muscle ache (3%); itching (3%) and low grade fever (3%). All of these reactions were graded as nonserious; none were serious events.

(c) Events or effects by gender: Male vaccine recipients developed injection-site reactions less frequently after subcutaneous injection (5% to 32%) than female vaccine recipients (39% to 69%), but the rates were comparably low for both genders when the vaccine was given by intramuscular injection (0% to 7%).

(d) Length of time to resolution: Not specifically described, but temporary duration was common, as in other studies.

g. Canadian Forces Safety Survey

Citation: None, unpublished
Investigators: Canadian military physicians, Canadian Forces Medical Group, Ottawa
Period of Observation: February to May 1998
Participants: 576 people total, gender unspecified, members of three Canadian Forces units deployed to the Persian Gulf during Operation Determination who received 1,676 doses of anthrax vaccine (1, 2, or 3 doses per person)
Vaccine Studied: Lansing formulation

Study Design: Actively monitored study of adverse events after anthrax vaccination.
Findings:

(a) Injection-site ("local") Reactions:
Mild (1 to 5 cm): after 4.4% of doses, reported by 12.7% of recipients
Moderate (> 5 to 12 cm): after 0.2% of doses, reported by 0.5% of recipients
Large: none reported

(b) Events Beyond the Injection Site ("systemic"): Systemic reactions occurred after 2.2% of doses, reported by 5.7% of recipients. Reported systemic events included headache (13 reports), flu-like gastrointestinal symptoms (9), fever with or without chills (5), fout taste in mouth (3), and neurologic symptom (1, temporary, not considered serious). Two individuals reported heartburn after each of three vaccine doses. . One individual reported a persistent lump (nodule) at the injection site and multiple nodules at several distant sites, but it is unknown whether those lumps existed unnoticed before the vaccination. One medical officer noted several cases of fever and chills, with or without malaise; in all cases these events resolved within 2 to 5 days.

(c) Events or effects by gender: Not described

(d) Length of time to resolution: In all cases except the persistent nodule, these events resolved within 2 to 5 days.

h. TAMC-600 Survey

Citation: Centers for Disease Control & Prevention. Surveillance for adverse events associated with anthrax vaccination - U.S. Department of Defense, 1998-2000. *Morbidity & Mortality Weekly Report* 2000;49(Apr 28):341-5. Reprinted in *JAMA* 2000;283:2648-9. http://www.cdc.gov/epo/mmwr/preview/mmwrhtml/mm4916a1.htm

Investigators: Preventive Medicine Division, Tripler Army Medical Center (TAMC), Honolulu, Hawaii

Period of Observation: 1998 to 2000 (and ongoing)

Participants: 418 men, 184 women, 602 people total; physicians, nurses, medics and other medical-support personnel who augment U.S. medical forces in Korea in military contingencies. Mean age 28 years.

Vaccine Studied: Lansing formulation

Study Design: Prospective, population-based, self-reported survey. The people surveyed are a highly educated, medically experienced population, more able than the norm to describe adverse events and with more ready access to care than other populations.

Findings: Regardless of gender, most adverse events after vaccination were mild and self-limited. The results for all systemic complaints did not substantially vary between dose #1, dose #2, dose #3, and dose #4.

(a) Injection-site ("local") Reactions:

Mild, redness < 5 cm (35% to 40%). Women reported more localized itching (39% to 63%), compared to men (25% to 28%). Women developed more subcutaneous nodules (73% to 90%), compared to men (61% to 66%).

Moderate, redness 5 to 10 cm (20% to 25%).

Large, redness > 10 cm (5% to 10%). Moderate to large injection-site reactions were more common among women (40% to 51%) than among men (17% to 32%). Women reported more swelling of the lower arm (8% to 14%), compared to men (7% to 10%)

(b) Events Beyond the Injection Site ("systemic"): Women reported muscle soreness more often (62% to 80%), compared to men (60% to 67%). About 20% of men and women reported symptoms that they personally judged could be ignored; 15% reported symptoms that affected their activity for a short time but did not limit their ability to perform duties; 8% reported symptoms that affected their activity for a short time that was relieved by self-treatment with nonprescription medication; and fewer than 2% reported that their symptoms were unrelieved by medication and that their ability to perform their duties was limited for a short time.

(c) Events or effects by gender: Injection-site and systemic events occurred more frequently among women than men, but events in both genders were similar in resolving on their own over the course of a few days without residual consequences. Between 4% and 14% of women had an outpatient medical visit, compared to 2% to 5% of men.

(d) Length of time to resolution: Muscle aches typically lasted between 7 hours and 3 days.

i. U.S. Forces Korea Records

Citation: Centers for Disease Control & Prevention. Surveillance for adverse events associated with anthrax vaccination - U.S. Department of Defense, 1998-2000. *Morbidity & Mortality Weekly Report (MMWR)* 2000;49(Apr 28):341-5. Reprinted in *JAMA* 2000;283:2648-9. http://www.cdc.gov/epo/mmwr/preview/mmwrhtml/mm4916a1.htm
Investigators: Department of Preventive Medicine, 121st Evacuation Hospital, Seoul, Korea
Period of Observation: 1998 to 1999
Participants: 2,036 men, 495 women, 2,531 people total
Vaccine Studied: Lansing formulation

Study Design: Systematic recording of self-reported surveys when personnel returned for subsequent doses of anthrax vaccine.
Findings: Regardless of gender, almost all reported events were localized or minor, self-limited, and did not lead to impairment of work performance.
(a) Injection-site ("local") Reactions: Women reported knots (nodules) more frequently (62% to 68%) than did men (42% to 44%).
Mild (redness < 5 cm): Women (12% to 14%), men (8% to 10%)
Moderate (redness 5 to 12 cm): Women (15% to 18%), men (5% to 8%)
Large (redness > 12 cm): Women (3% to 6%), men (1% to 3%)
(b) Events Beyond the Injection Site ("systemic"): Itching was reported by 22% to 40% of women and 7% to 9% of men. Fever was reported by 3% to 5% of women and 1% to 2% of men. Chills were reported by 4% to 6% of women and 2% of men. Malaise was reported by 15% to 16% of women and 6% to 7% of men. Overall, 1.9% reported that their work activity had been limited to some extent or were placed on limited duty. Only 0.3% reported losing one or more days of duty; 0.5% consulted a clinic for the reaction. One individual required hospitalization (analyzed under VAERS, below).
(c) Events or effects by gender: Overall, 72% to 74% of women and 42% to 44% of men reported at least one adverse event after the first or second doses of anthrax vaccine.
(d) Length of time to resolution: Almost all reported events were localized or minor, self-limited, and did not lead to impairment of work performance.

j. USAF Vision Study

Citation: None, manuscript under development
Investigators: Force Health Protection and Surveillance Division, Institute for Environment, Safety, & Occupational Health Risk Analysis (IERA/RSRH). Personnel were seen and the Aeromedical Consult Service, United States Air Force School of Aerospace Medicine (USAFSAM/AFC)

PHASE I
Period of Observation: 1998 to 1999
Participants: 178 case subjects with vision change (161 men and 17 women) and 1,803 control subjects without vision change (1,744 men and 59 women), 1,981 people total, USAF aircrew members, deployed worldwide
Vaccine Studied: Lansing formulation

Study Design: Aviators who suffered a change in vision sufficient to jeopardize flying status were enrolled as cases, with ten age-matched controls identified from automated records of physical examinations. Next, the vaccination status of cases and controls were determined from the anthrax vaccination database.
Findings: Seventeen of 95 cases (18%) had received at least one dose of anthrax vaccine, compared to 451 of 1,060 control aviators (43%). The resulting odds ratio of 0.30 (95% confidence interval: 0.18 to 0.52) suggests that vaccination is not associated with vision change. Technically, the value less than one (with a confidence interval that excludes one) implies that vaccination is protective against vision change, but such a phenomenon is not biologically plausible.
(a) Injection-site ("local") Reactions: Not applicable.
(b) Events Beyond the Injection Site ("systemic"): Vaccination is not associated with vision change.
(c) Events or effects by gender: Not applicable, no effect observed.
(d) Length of time to resolution: Not applicable, no effect observed.

PHASE II
Period of Observation: 1998 to 1999
Participants: 448 case subjects with vision change and 510 control subjects without vision change, 958 people total, USAF aircrew members, deployed worldwide
Vaccine Studied: Lansing formulation

Study Design: medical records with pairs of physical examination data were collected that recorded changes in visual acuity. Next, the vaccination status of cases and controls were determined from the anthrax vaccination database.
Findings: 109 of 448 aviators (24.4%) with visual acuity change had been vaccinated against anthrax, compared to 134 of 510 (26.3%) of aviators without visual acuity change. The resulting odds ratio of 0.90 (95% confidence interval: 0.68 to 1.20) suggests that there is no association between anthrax vaccination and changes in visual acuity.
(a) Injection-site ("local") Reactions: Not applicable.
(b) Events Beyond the Injection Site ("systemic"): Vaccination is not associated with vision change.
(c) Events or effects by gender: Not applicable, no effect observed.
(d) Length of time to resolution: Not applicable, no effect observed.

k. USAF Air Combat Command Study, Langley Air Force Base

Citation: None, manuscript under development
Investigators: USAF Air Combat Command, 1st Aerospace Medicine Squadron, Langley AFB, Virginia
Period of Observation: 1998
Participants: 1,130 vaccinated men, 212 vaccinated women, 1,342 total vaccinated personnel; compared to 3,231 unvaccinated men, 613 unvaccinated women, 3,845 total unvaccinated personnel, 5,187 people total, USAF personnel deployed to Southwest Asia between January and September 1998
Vaccine Studied: Lansing formulation

Study Design: Electronic records of anthrax vaccination were compared with electronic records of ambulatory medical visits among vaccinated and unvaccinated personnel who had returned from Southwest Asia in the previous 6 months.
Findings: No statistically significant associations between anthrax vaccination and any ambulatory diagnosis were found. These diagnoses included allergy, arthropathy, circulatory, dermatological, digestive, endocrine, headache/neurological, hearing, infectious/parasitic, injuries, mental health, musculoskeletal, nasal, neoplastic, ocular, reproductive, respiratory, sleep disorders, urinary, unexplained illness, or more than one diagnosis.
(a) Injection-site ("local") Reactions: Not applicable. No effects observed.
(b) Events Beyond the Injection Site ("systemic"): No effects observed.
(c) Events or effects by gender: Investigator reports no difference in findings when men and women are considered separately. No effects observed.
(d) Length of time to resolution: Not applicable. No effects observed.

I. Reports involving Anthrax Vaccine Submitted to the FDA/CDC Vaccine Adverse Event Reporting System (VAERS)

Citation: Centers for Disease Control & Prevention. Surveillance for adverse events associated with anthrax vaccination - U.S. Department of Defense, 1998-2000. *Morbidity & Mortality Weekly Report (MMWR)* 2000;49(Apr 28):341-5. Reprinted in *JAMA* 2000;283:2648-9. http://www.cdc.gov/epo/mmwr/preview/mmwrhtml/mm4916a1.htm. Data collection and analysis ongoing, publication of an independent report is underway, under the aegis of DHHS.

Investigators: Civilian medical experts convened by DHHS Health Resources & Services Administration

Period of Observation: 1990 to present

Participants: 1,472 vaccine recipients reflected in 1,550 VAERS reports (1,530 when duplicates are omitted), as of April 3, 2001

Vaccine Studied: Lansing formulation

Note: The most detailed information on VAERS reports is maintained by the Food & Drug Administration (FDA) and the Centers for Disease Control & Prevention (CDC). The following analysis is based on VAERS information made available to the DoD. Questions involving more detailed analyses should be referred to DHHS.

Study Design: DoD relays all reports (whether initiated by vaccinee, guardian, health-care provider, or any other source) of adverse events after any vaccination to the Food & Drug Administration. FDA also receives VAERS reports from other sources. FDA's VAERS staff seeks additional medical records, if needed, and follows subjects of these reports to gather information about symptom resolution.

At the request of DoD, the Department of Health and Human Services (HHS) established an Anthrax Vaccine Expert Committee (AVEC) in October 1998 to review VAERS forms related to anthrax vaccine. The AVEC independently reviews all anthrax vaccine-related reports received by VAERS. The AVEC meets every 3 to 6 weeks, along with representatives of DoD, CDC, FDA, and HHS, to review all the new anthrax adverse events reports submitted in the interim. The AVEC reviews the quality of the submitted information, evaluates the reported event in the context of expected and unexpected adverse events to vaccines, and assesses the cause-and-effect relationship of the event with the anthrax vaccine. The AVEC also looks for any clinically significant patterns in the aggregate data.

Findings: To date, the AVEC reports that it has found nothing unexpected in the side-effect profile of anthrax vaccine. The chairman of the AVEC stated "Based on the review of these adverse events, it is apparent that it is safe to continue the anthrax vaccine immunization program of the Department of Defense and it is appropriate to continue to monitor the vaccine adverse events reports and review the safety of the vaccine on an ongoing basis."

As of April 3, 2001, the independent AVEC reviewed 1,530 unique VAERS reports related to anthrax vaccination. The 1,530 reports were grouped into three main categories, based on effect on the vaccine recipient's functional status: hospitalization, loss of duty $\geq$ 24 hours, and other (reports involving neither hospitalization nor loss of duty $\geq$ 24 hours).

Fifty-five of the 1,530 reports involved hospitalization; the civilian panel found that 11 of the 55 "very likely/certainly" or "probably" were caused by anthrax vaccine. All eleven involved allergic, inflammation reactions at the injection site.

For background, the other 44 hospitalizations (those not categorized as "very likely/certainly" or "probably" caused by anthrax) vaccine involved the following diagnoses:

Abdominal pain (1-"unclassifiable" according to AVEC)
Acute encephalitis (1-"unrelated" according to AVEC)
Angioedema (1-"unrelated" according to AVEC)
Aplastic Anemia (1- "unclassifiable" according to AVEC)
Atrial fibrillation (1-"unlikely," 1-"unclassifiable" according to AVEC)
Bipolar psychiatric disorder (1--"unclassifiable," 1-"unrelated" according to AVEC)
Black-out episode (1-"unrelated" according to AVEC)
Cardiac arrest (1-"unrelated" according to AVEC)
Cardiomyopathy with atrial fibrillation (1-"unlikely," 1-"unrelated" according to AVEC)
Diabetes mellitus, insulin-requiring (1-"unclassifiable" according to AVEC)
Diabetes mellitus, non-insulin-requiring (1-"unrelated" according to AVEC)
Dysethesias (T1 and below) (1-"unclassifiable" according to AVEC)
Dyspnea (2-"unclassifiable" according to AVEC)
Endocarditis with perirectal abscess (1-"unrelated" according to AVEC)
Fatigue and injection-site inflammation (1-"possible" according to AVEC)
Febrile illness (1-"unrelated" according to AVEC)
Guillain-Barré syndrome (GBS, 3-"unclassifiable," 2-"unrelated" according to AVEC)
Idiopathic thrombocytopenic purpura (ITP, 1-"unclassifiable" according to AVEC)
Inflammation over olecranon process (1-"unrelated" according to AVEC)
Liver abscess with *E. coli* septicemia (1-"unrelated" according to AVEC)
Intestinal surgery (appendectomy) (1-"unrelated" according to AVEC)
Meningitis, aseptic (1-"unrelated" according to AVEC)
Meningitis, viral (1-"unclassifiable" according to AVEC)
Meningitis, unspecified (1-"unrelated" according to AVEC)
Multiple sclerosis (1-"unlikely" according to AVEC)
Neurological symptoms (facial weakness, slurred speech) (1-"unlikely" according to AVEC)
Neutropenia, fever (2-"unclassifiable" according to AVEC)
Pemphigus vulgaris (1-"unlikely" according to AVEC)
Rash (1-"possible" according to AVEC)
Seizure (1-"unrelated" according to AVEC)
Syncope (1-"unrelated" according to AVEC)
Systemic lupus erythematosus (1-"unlikely" according to AVEC)
Toxic epidermal necrolysis syndrome (1-"unrelated" according to AVEC)
Viral-like syndrome (2-"unrelated" according to AVEC)

Another 146 reports involved loss of duty ≥ 24 hours (but did not involve hospitalization); the civilian panel found that 86 of the 146 certainly or probably were caused by anthrax vaccine. These 86 reports described injection-site reactions (50 reports), various rashes (9), acute allergic reactions (9), viral-like symptoms (8), itching (2), gastroenteritis (2), muscle aches (2), bronchiolitis obliterans (1), temporary tingling (1), photophobia (1), and swollen lymph nodes (1). Some reports described multiple symptoms.

The balance of the 1,530 reports, 1,329, involved neither hospitalization nor loss of duty ≥ 24 hours. All were reviewed by the AVEC, which found no patterns of unexpected adverse events.

* * *

Separate analyses performed by the Anthrax Vaccine Immunization Program Agency indicate there has been no clinically meaningful correlation between anthrax vaccine and reports of adverse events involving hospitalization (all 55 reports) or loss of duty ≥ 24 hours (all

186 reports) based on (a) geographic clustering, (b) vaccine lot (manufacturing batch), or (c) Active- vs. Reserve Component status.

No VAERS reports have been submitted regarding microbial contamination of vaccine vials.

(c) Events or effects by gender: A separate analysis performed by the Anthrax Vaccine Immunization Program Agency indicate that there has been no correlation between anthrax vaccine and reports of adverse events involving hospitalization (for any cause, not just reports judged by the AVEC to be caused by the vaccine), based on gender.

(d) Length of time to resolution: Based on information available to the Anthrax Vaccine Immunization Program Agency (some of which includes records with information redacted by the FDA), all personnel described by VAERS reports judged by the AVEC to be "very likely/certainly" or "probably" caused by anthrax vaccine have recovered or are recovering.

m. Defense Medical Surveillance System (comparison of hospitalization rates for selected diagnoses before and after introduction of Anthrax Vaccine Immunization Program)

The Defense Medical Surveillance System (DMSS) is a longitudinal, relational database of personnel and demographic data, augmented with military experience and medical event data for active-duty personnel in each of the military services. The DMSS is coordinated by the Army Medical Surveillance Activity (AMSA), a component of the US Army Center for Health Promotion & Preventive Medicine (USACHPPM).

I. *TRENDS OVER TIME*

The rate of hospitalization for any cause among Service Members assigned to US Forces Korea shows a steady decline since 1993, despite introduction of a hepatitis A vaccination program in 1996 and the anthrax vaccination program in 1998. These data are especially meaningful, given that all military personnel in Korea are now vaccinated against anthrax. The evidence shows that there has not been an increase in hospitalizations in a theater where all Service members were vaccinated against anthrax and all hospitalizations are recorded electronically.

The rate of death due to illness for any cause at any location among active-duty Service Members has stayed steady or declined slightly, despite introduction of a hepatitis A vaccination program in 1996 and the anthrax vaccination program in 1998.

The rates of hospitalization for diagnoses alleged to be related to anthrax vaccination (including leukemia, Guillain-Barré syndrome, erythema multiforme, thyroid disorders, multiple sclerosis, lupus erythematosus, and aortic aneurysm) are essentially unchanged since 1993, despite introduction of a hepatitis A vaccination program in 1996 and the anthrax vaccination program in 1998.

Analysis of trends over time is helpful, but is not as meaningful a comparison as when the health experiences of vaccinated and unvaccinated Service Members are contrasted directly. Such analyses appears in the next section.

II. *DIRECT COMPARISONS OF VACCINATED & UNVACCINATED PEOPLE*

The most scientifically powerful evidence for the safety of this vaccine comes from the Defense Medical Surveillance System which establishes that anthrax-vaccinated personnel and unvaccinated personnel are hospitalized and visit outpatient clinics at basically the same rates, both overall and for each organ system of the body. For example, one per 35 anthrax-vaccinated people are hospitalized each year, compared to one per 28 unvaccinated people hospitalized per year. Anthrax-vaccinated personnel are as healthy (and as sick) as unvaccinated personnel.

Automated records of immunization and hospitalization were linked electronically. This analysis consisted of 515,389 person-years of experience in the anthrax vaccinated group and 2,873,751 person-years experience in the unvaccinated group. A person-year is analogous to a man-hour. Effectively, it is the experience of one person followed for one year of time. Two people followed for 6 months each also constitutes a person-year.

Rates of hospitalization for each of 16 major diagnostic categories among anthrax vaccine recipients were contrasted with Service Members (SMs) who have not received anthrax vaccine. The rate of hospitalization for each of the 16 major diagnostic categories was the same for SMs vaccinated or unvaccinated against anthrax. These categories include Blood and Blood Formation, Circulatory, Complications of Pregnancy, Digestive, Endocrine / Immunology / Metabolic, Genitourinary-Female, Genitourinary-Male, Infectious Disease, Mental Health, Musculoskeletal / Connective Tissue, Neoplasms, Nervous System, Respiratory, Skin, Injury or Poisoning, and Ill-Defined Conditions.

The accompanying table shows the rate of hospitalization for each category per 100,000 Service Members per year, differentiating people vaccinated or unvaccinated against anthrax. The next column shows the ratio (the unadjusted ratio) of these two rates. If the rates among two groups are the same, the ratio is one.

The column labeled "adjusted ratio" uses the standard statistical method known as regression to remove the effects of age, gender, rank, deployment, service, ethnicity, previous hospitalization, calendar year, and occupation. Statistical adjustment simplifies the comparison to just the effect of the vaccine, holding other effects constant, providing an apples-to-apples comparison. The adjusted ratio is a more specific measure of the relationship between anthrax vaccination and hospitalization.

To account for the inherent variability in measures such as these, the 95% confidence interval is provided. The 95% confidence intervals (CIs) are the range of values within which the true value would lie 95% of the time, if you repeated the analysis multiple times. The 95% CIs shown are for the adjusted rate ratios. For a rate ratio to find a "statistically significant elevation," the confidence interval would have to be entirely above 1.00.

Finding: Assessing specific categories of hospitalization, rate ratios for vaccinated active-duty Service Members are comparable to SMs unvaccinated against anthrax. The rates of hospitalization are essentially the same for vaccinated and unvaccinated Service Members.

Within these 16 broad categories of hospitalization, specific diagnoses are of interest. Another accompanying table shows the rates of hospitalization for various disorders alleged to be associated with anthrax vaccination. The accompanying table shows data for lymphatic cancers (such as leukemia), thyroid disorders, multiple sclerosis, Guillain-Barré syndrome, disorders of the ear, asthma, ulcers or gastritis, joint problems (arthropathies), diffuse disorders of connective tissue (e.g., lupus erythematosus), heart rhythm, or complications of surgery or medical care not elsewhere classified. As with the major categories above, no rate ratio is elevated for vaccinated active-duty Service Members, compared to SMs unvaccinated against anthrax. Again, the rates of hospitalization are essentially the same for SMs vaccinated or unvaccinated against anthrax.

Similarly, rates of outpatient medical visits (ambulatory visits) for each major diagnostic category among anthrax vaccine recipients was contrasted with Service Members (SMs) who have not received anthrax vaccine. The rate of outpatient visits for each major diagnostic category was comparable for SMs vaccinated or unvaccinated against anthrax.

Again, within these broad categories of outpatient medical visits, specific diagnoses are of interest. Another accompanying table shows the rates of outpatient visits for various disorders alleged to be associated with anthrax vaccination. The accompanying table shows data for thyroiditis, hypothyroidism, multiple sclerosis, Guillain-Barré syndrome, visual disturbances,

vertigo, asthma, migraine, rheumatoid arthritis, lupus erythematosus, heart rhythm, atherosclerosis, diabetes mellitus, testicular dysfunction, ulcerative colitis, erythema multiforme. As with the major categories above, none of these rate ratios is elevated for vaccinated active-duty Service Members, compared to SMs unvaccinated against anthrax. The rates of outpatient medical visits are essentially the same for SMs vaccinated or unvaccinated against anthrax.

Gender-Specific Effects: When these analytic approaches are repeated looking at men and women separately, we again find that

a. anthrax-vaccinated women have comparable rates of hospitalization and outpatient medical visits, compared to unvaccinated women.

b. anthrax-vaccinated men have comparable rates of hospitalization and outpatient medical visits, compared to unvaccinated men.

PHYSICIAN/HEALTH CAREY PROVIDER FACT SHEET'

Anthrax Vaccine & Antibiotic Availability Program

I. PROGRAM SYNOPSIS

The purpose of this program is to provide post-exposure prophylaxis for participants following suspected or confirmed exposure to ***B. anthracis*** spores. Under this program, Anthrax Vaccine Adsorbed (AVA) will be administered intramuscular (IM) for children (younger than 18 years old) and subcutaneous (SQ) for adults. All participants will have signed an informed consent form before being allowed to participate in the program.

The objectives of this program are: 1) to provide antibiotic, or anthrax vaccine and antibiotic (ciprofloxacin, doxycycline, or amoxicillin) for the treatment of suspected or confirmed exposure to ***B. anthracis*** spores; 2) to collect data on adverse reactions to the vaccine and/or the antibiotic ; and 3) to collect data on any anthrax-related infections in the Program population **after** administration of the anthrax vaccine and antibiotics.

This is an multi-site program for the administration of antibiotics or antibiotics with concomitant use of 3-doses of anthrax vaccine intended for implementation when an 'antibiotics only' post-exposure prophylaxis regimen for 60 days has been previously recommended. This is a regimen that is not licensed by the FDA. Enrollment in the program is open-ended. Because this program will be implemented only in a contingency, the specific number of participants to be enrolled cannot be projected, although a range of 100 to 10,000 participants has been adopted for planning purposes. This is a rough estimate and is not designed for the purpose of providing support for a labeling change for Anthrax Vaccine Adsorbed.

The rationale for the program is based not on controlled clinical studies but rather on highly controlled animal studies. Because exposure to ***B. anthracis*** during a contingency will not be similarly controlled, the outcome for humans receiving the antibiotic or antibiotic and vaccine regimen may not be comparable. The purpose of this program is to make antibiotics or antibiotics plus vaccine available for participants following exposure to ***B. anthracis*** spores. We do not know if there is a risk of disease among people who have been exposed to anthrax spores and have taken 60 days of antibiotics. However, if

[1] This fact sheet does not substitute for the "Clinical Procedure Manual," but serves as a brief summary of the program and critical vaccine safety issues. Participating physicians should contact their Site Coordinator for a procedure manual, if necessary.

there is such a risk, then either 40 days of additional antibiotics or 40 days of additional antibiotics and the vaccine may be of benefit in reducing this risk of disease.

The intent of this program is for contingency use of antibiotics or antibiotics with anthrax vaccine in a post-exposure setting, not to support a labeling change for the licensed anthrax vaccine.

The anthrax vaccine to be used under this program is classified as an Investigational New Drug (IND) because (1) the medical indication for post-exposure prophylaxis is not included in the approved package insert, (2) the dosing schedules include vaccination schedules that are outside the parameters of the approved package insert (3) unreleased lots of the vaccine may be used with this program, and (4) certain antibiotics are not approved for post-exposure prophylaxis for anthrax and (5) no antibiotics are approved for beyond 60 days of post-exposure prophylaxis for anthrax. The Food and Drug Administration (FDA) will review data provided by the Sponsor on specific lots of vaccine intended for use under this program. Only lots that meet the FDA criteria will be administered. The source of vaccine for this program will be from one of the following categories: unreleased lots from the original production facility that meet FDA criteria, or unreleased lots from the renovated production facility that meet FDA criteria. The program, consent form, and progress reports will undergo continual review by the CDC Investigational Review Board (IRB) at least annually in accordance with Title 2 1, Code of Federal Regulations (CFR) Part 56.109.

II. Counseling patients about participation in the program

This program is intended to make antibiotics or antibiotics and anthrax vaccine available to all people who may have been exposed to anthrax spores and who were advised to complete a 60-day course of drugs. DHHS is not making any recommendation whether an individual should or should not take this vaccine or additional antibiotics. DHHS is making the vaccine and antibiotics available to allow patients in consultation with physicians to decide whether or not they wish to participate.

Factors relevant to the decision to participate include exposure dose, risk of inhalation anthrax, antibiotic adherence, side effect tolerance, and overall health status. People who may have had exposure to higher numbers of anthrax spores include:

- People who had significant contact with an anthrax-laced powder or envelope.
- People who worked in areas where someone became infected with inhaled anthrax.
- People in environments heavily contaminated with anthrax.

These groups include 70 Capitol Hill workers exposed to the letter setn to Senate Majority Leader Tom Daschle as well as workers in Washington's central Brentwood and New Jersey's Hamilton Township postal facilities and AMI Building in Florida.

Individuals must carefully examine the risks and benefits of choosing to take the antibiotics and vaccine; or continue on an antibiotic for an additional 40 days; or cease taking antibiotics at this time. All persons should maintain close contact with their healthcare provider. A synopsis of adverse effects and possible benefits is presented in the patient "Informed Consent" document.

Antibiotic Safety Sheets are provided separately.

III. ANTIBIOTICS (PATIENT INFORMATION)

Neither ciprofloxacin nor doxycycline are licensed by the FDA for use beyond 60 days for post-exposure prophylaxis of inhalational anthrax. Amoxicillin is not licensed for any post-exposure prophylactic regimens for inhalational anthrax.

CIPROFLOXACIN

Ciprofloxacin (**CIPRO®**) is approved by the Food and Drug Administration (FDA) to treat and protect individuals who become exposed to ***Bacillus anthracis*** spores administered as an aerosol. The recommended treatment after exposure to inhalational anthrax is 500 mg given orally every 12 hours for 60 days. The antibiotic should not be given to anyone who has had a serious allergic reaction to ciprofloxacin or other antibiotics in the quinolone family.

How to take CIPRO: Take CIPRO with food (excluding milk or yogurt) and at least one large glass of water. The antibiotic works best when the amount of medicine in your body is kept at a constant level, so take 1 tablet every 12 hours for 60 days. If you take any of the following-zinc, iron, sucralfate, **Videx®** (didanosine), and antacids that contain magnesium, calcium, or aluminum-take them 6 hours before or 2 hours after taking CIPRO.

Side effects: CIPRO may cause stomach upset, loss of appetite, diarrhea, nausea, drowsiness, or headache during the first few days as your body adjusts to the medication. If these symptoms persist or become severe, inform your health care provider. Promptly report new pain or tenderness (tendonitis) in arms or legs. Ruptured tendons have been reported after administration of CIPRO. Also report any vision changes, restlessness, ringing in the ears, or mental changes. In the unlikely event that you have an allergic reaction to this antibiotic, seek immediate medical attention. Symptoms of an allergic reaction include rash, itching, swelling, fever, or trouble breathing. If you notice any other effects, contact your health care provider promptly.

Precautions: Before taking CIPRO, tell your health care provider if you have a medical history of epilepsy, kidney disease, tendon problems, nervous system disorders, liver disease, blood vessel problems, and any drug allergies. Use caution driving or performing tasks requiring alertness if this medication makes you dizzy or lightheaded. Alcohol can make the condition **worse.** CTPRO can increase sensitivity to sunlight, so avoid prolonged sun exposure. Wear protective clothing and a sunscreen to minimize sun sensitivity. The safety of ciprofloxacin, to the unborn baby is not known. However,

adverse drug effects have been reported in young animals given ciprofloxacin or doxycycline (such as bone and joint changes). If you are pregnant or could become pregnant you should inform program personnel.
Drug Interactions: Tell your health care provider of all medications that you are using (both prescription and nonprescription), especially of other antibiotics, theophylline, warfarin, cyclosporine, live bacterial vaccines, probenecid, sucralfate, quinapril, didanosine, iron, zinc, and antacids that contain magnesium, aluminum, or calcium.

Caution: CIPRO may increase or extend the effects of caffeine and theophylline.

DOXYCYCLINE

Doxycycline is approved by the FDA to treat anthrax disease but not explicitly for post-exposure prophylaxis. The recommended treatment is 100 mg given orally every 12 hours for 60 days after exposure to anthrax spores. The antibiotic should not be given to anyone who has had a serious allergic reaction to any tetracycline product.

How to Take Doxycycline: Take doxycycline with food and at least one glass of water. The antibiotic works best when the amount of medicine in your body is kept at a constant level, so take I tablet every 12 hours. Do not lie down for at least I hour after taking this drug.

Side Effects: Doxycycline may cause nausea or diarrhea. In the unlikely event that you have an allergic reaction to this antibiotic, seek immediate medical attention. Although the occurrence is unlikely, dark urine, yellowing of the eyes or skin, persistent sore throat or fever, unusual bleeding or bruising, unusual fatigue, white patches in the mouth, or unusual vaginal discharge/itching should be reported immediately to your health care provider. Use of tetracycline during the last half of pregnancy may cause permanent discoloration of the teeth of offspring. If you have an allergic reaction to this antibiotic, seek immediate medical attention. Symptoms of an allergic reaction include rash, itching, swelling, fever, or trouble breathing. If you notice any other effects, contact your health care provider,

Precautions: Before taking doxycycline, tell your health care provider if you have a medical history of yeast infections of the mouth, kidney or liver problems, esophagus problems or trouble swallowing (hiatal hernia or reflux/heartburn), and any drug allergies. Use of this antibiotic for prolonged periods may result in an infection (e.g., oral, bladder, or vaginal yeast infection). Doxycycline can increase sensitivity to sunlight, so avoid prolonged sun exposure. Wear protective clothing and a sunscreen to minimize sun sensitivity. Avoid taking antacids containing magnesium, aluminum, or calcium; sucralfate; iron preparations; or vitamin (zinc) products within 3 hours of taking this antibiotic.

Drug Interactions: Tell your health care provider of all medications that you are using (both prescription and nonprescription), especially antibiotics (penicillins/cephalosporins such as cefuroxime), antacids, vitamins/minerals (such as zinc), iron supplements, bismuth subsalicylate, sucralfate, carbamazepine, phenytoin, barbiturates like phenobarbital, blood thinners like warfarin, or methoxyflurane. Use of doxycycline may make birth control pills less effective.

AMOXICILLIN

This drug belongs to the broad class of penicillin drugs. You have been given this drug for protection against possible exposure to anthrax. You have been provided a limited supply of medicine. Local emergency health workers or your healthcare provider will inform you if you need more medicine after you finish this supply. If so, upon your follow-up visit, you will be told how to get more medicine. You will be told if no more medicine is needed. You may also be switched from this medicine to a different medicine.

Take this medicine as prescribed, This drug is usually given in three daily doses (500 mg in adults) and may follow you getting a 10-14 day course of another antibiotic for prevention of anthrax (ciprofloxacin or doxycycline). Amoxicillin is used for anthrax prevention when specific anthrax prevention drugs such as doxycycline and ciprofloxacin are contraindicated and there is low antimicrobial load (prophylaxis and localized cutaneous anthrax in pediatric, pregnant or lactating patients). Special dosing instructions for children are oral amoxicillin 80 mg/kg of body mass per day divided every 8 hours (not to exceed 500 mg three times daily).

Keep taking your medicine, even if you feel okay, unless your doctor tells you to stop. If you stop taking this medicine too soon, you may become ill.

Amoxicillin is assumed to be effective with penicillin-sensitive anthrax bacteria. There is only limited experience available using it to treat anthrax infection. In addition, the FDA has not approved its use specifically for prevention of this infection, and there is concern that standard oral doses may achieve less than desired drug levels.

How to take Amoxil ® Amoxil is available as capsules, tablets and powder for oral suspension intended for oral administration.
Capsules contain 250 mg or 500 mg amoxicillin. Tablets contain 500 mg or 875 mg amoxicillin. Chewable tablets contain 125 mg, 250 mg or 400 mg amoxicillin.

Side effects: As with other penicillins, amoxicillin may cause stomach upset, diarrhea, nausea and vomiting during the first few days as your body adjusts to the medication. If these symptoms persist or become severe, inform your health care provider. If you have an allergic reaction to this antibiotic, seek immediate medical attention. Symptoms of an allergic reaction include rash, itching, hives, fever, or trouble breathing. If you notice any other effects, contact your health care provider.

Precautions: Before taking amoxicillin, tell your health care provider if you have asthma, any other illnesses or any allet'gies, especially to penicillin or other antibiotics. Use of this antibiotic for prolonged periods may result in yeast or other infection.

Drug Interactions: Tell your health care provider of all medications that you are using (both prescription and nonprescription), especially tetracycline products.

IV. VACCINE

A. Anthrax Vaccine Adsorbed (AVA)

Anthrax Vaccine Adsorbed (AVA) is produced by BioPort Corporation (formerly Michigan Biologic Products Institute and Michigan Department of Public Health) in Lansing, Michigan. It has been licensed for pre-exposure prophylaxis by the U.S. Food and Drug Administration since 1970. AVA is a sterile product made from filtrates of microaerophilic cultures of an avirulent, nonencapsulated strain of Bacillus ***anthracis, which*** elaborates the protective antigen during the growth period. It contains no whole bacteria, neither live nor dead, so it is impossible to contract anthrax from the vaccine. The cultures are grown in a synthetic liquid medium and the final product is prepared from sterile filtered culture fluid. The protective antigen (PA) in the vaccine is the common disease-causing protein in all anthrax strains that cause disease; therefore, the vaccine is expected to provide protection against all strains of ***B. anthracis.*** The potency of FDA-licensed lots of AVA is confirmed according to the U.S. Food and Drug regulations (21 CFR 620.23). The final product contains no more than 2.4 mg aluminum hydroxide (equivalent to 0.83 mg aluminum) per 0.5 mL dose. The aluminum hydroxide adjuvant in the vaccine increases the number of antibodies that the body makes in response to vaccination. Formaldehyde, in a final concentration not to exceed0.02%, and benzethonium chloride, 0.0025%, are added as preservatives.

The anthrax vaccine is supplied in 5.2-mL vials containing approximately 10 doses each. Each vial of unreleased vaccine will be labeled for human administration and will include the following statement: "Caution: New Drug – Limited by Federal law to investigational use." This cautionary statement will not appear on vials of FDA-released vaccine. The vaccine should be stored at 2°C to 8°C (35.6°F to 46.4°F). It should not be frozen.

B. Efficacy of the Anthrax Vaccine

The efficacy of anthrax vaccine for **post-exposure prophylaxis has not been evaluated in** humans.

The effectiveness of the anthrax vaccine for pre-exposure prophylaxis is based on human and animal research. Although the number of subjects getting the vaccine in these pre-exposure studies has been small, they suggest efficacy of 90-95%.

C. Contraindications for Use of AVA

Contraindications for preexposure use of AVA include pregnancy, immunosuppression including HIV, hypersensitivity to AVA and age < 18 years.

FDA has allowed use of AVA for post-exposure prophylaxis in this program. The risks of instituting post-exposure prophylaxis with AVA in this program among people for whom pre-exposure AVA is contraindicated should be weighed against the risk of anthrax disease.

Precautions

1. General: Epinephrine solution, 1: 1000, should always be available for immediate use in case an anaphylactic reaction should occur, even though such reactions are rare.

2. Carcinogenesis, Mutagenesis, Impairment of Fertility: Studies have not been performed to ascertain whether Anthrax Vaccine Adsorbed has carcinogenic action or any effect on fertility.

3. Pregnancy: Although unconfirmed, a recent preliminary study suggests that the vaccine may be linked with an increase in the number of birth defects when given during pregnancy. At this time no one knows for sure whether this vaccine can cause fetal harm.

D. **Safety of AVA**

Several studies have shown that anthrax vaccine is safe, with an incidence of side effects after injection similar to that of other common vaccines. As with any medication, all vaccines will occasionally cause adverse reactions. Usually these are mild, like a sore arm or "flu"-like symptoms.
Based on data obtained during 30 years of experience with anthrax vaccine, it is expected that up to 30% of men and 60% of women receiving the vaccine will experience some mild adverse effects, for example:

Redness: reddish discoloration around injection site, visible by sight;

Swelling: soft raised area on the skin, detectable by observation and/or touch;

Lump or "knot": hard spot on the skin, detectable by observation and/or touch;

Bruise: bluish/black discoloration of skin at injection site, visible by sight;

Warmth: area at injection site associated with elevated temperature, detectable by touch;

Soreness: a state of unusual sensitivity to touch or pressure;

Itching on arm: an unpleasant cutaneous sensation provoking the desire to scratch or rub the skin.

Arm motion limitation: unable to perform normal range of motions in the arm.

Loss of appetite: a lack of appetite even though there is a physical need for food, and sometimes associated with weight loss;

Headache: participantive feeling of sharp/dull throbbing/constant discomfort in head and/or neck;

Fatigue: a feeling of tiredness or exhaustion;

Muscle ache: participantive feeling of muscle pain;

Joint swelling or pain: participantive feeling pain or stiffness in a joint;

Itching: area other than injection site/more generalized associated with an itching sensation;

Nausea/Vomiting: feeling sick to the stomach; may be accompanied by vomiting (throwing up);

Diarrhea or stomach pains: watery or loose stools are passed more often then normal;

Chills: shivering, a sensation of cold or an episode of shivering with paleness and feeling of coldness;

Shortness of breath: participantive feeling of difficulty breathing;

Fever: elevated temperature (generally above 98.6); may be accompanied by chills;

Rash or Hives: an irritation on the skin (red bumps)

Fainting: temporarily unconscious

E. Serious Adverse Events

A serious adverse event (SAE) is any untoward medical occurrence that results in any of the following outcomes:

1. death
2. life-threatening adverse event
3. in-patient hospitalization or prolongation of existing hospitalization
4. persistent or significant disability/incapacitation
5. congenital anomaly/birth defect

Important medical events that may not result in death, be life-threatening, or require hospitalization may be considered **SAEs** when, based on appropriate medical judgment, they may jeopardize the participant and may require medical or surgical intervention to prevent the occurrence of any of the five outcomes listed above.

In the event of an **SAE,** the Site Coordinator or their designee should notify the Clinical Project Manager with 24 hours of their notification of the **SAE.** Additionally, the Site Coordinator or their designee will Fax the VAERS Form and/or the MEDWATCH Form, with the appropriate cover sheet(s), to the CPC, CDC (FAX: 1-866-639-8548) and submit the form(s) either by mail and/or FAX to VAERS and or MEDWATCH (see forms for appropriate FAX number and address). The forms provided to the participants for reporting **AEs** have been specifically pre-labeled with their **IND** number, site code, and participant numbers. Only these pre-labeled forms should be used for reporting **AEs** under this program.

IV. Questions and Problems

For the period of the first 6-weeks after enrollment, the participants should direct questions to their Site Coordinators. If the Site Coordinators are unable to satisfactorily answer the question and/or need additional information, they should contact the Clinical Project Manager, Dr. McNeil. Additional questions may be directed to the CDC hotline: 1-888-246-2675 (English) or 1-888-246-2857 (Spanish).

On February 17, 2000, the Subcommittee on National Security, Veterans Affairs, and International Relations, Committee on Government Reform released a report prepared by the majority staff regarding the DoD Anthrax Vaccination Immunization Program. This report, which contains five findings and five recommendations, has been proposed for consideration and adoption by the full Committee. DoD's response follows:

February 17, 2000

ANTHRAX FACTS

- Anthrax is a deadly biological weapon that represents a real and present danger to U.S. service personnel.
- Anthrax vaccine was licensed by the FDA nearly 30 years ago as safe and effective in preventing this extremely lethal disease. It was revalidated in 1980 when biomedical responsibility was transferred from NIH to the FDA. The vaccine is neither "experimental" nor "investigational."
- The Secretary of Defense, after assuring a program of high quality, directed the Anthrax Vaccine Immunization Program for the Total Force.
- The number of vaccinations given to date exceeds 1.4 million doses, with few serious adverse events.
- Reports of adverse events are consistent with expectations based on previous research studies and in line with experiences with commonly used vaccines and compare favorably with those of other required vaccines, including those we give to our children.
- The evidence of vaccine protection in humans and animals against aerosol exposure to anthrax is persuasive and this has been so stated by the FDA.
- Concerns about previous deficiencies by the production facility in meeting current Good Manufacturing Practices have been addressed by FDA action, DoD assistance to the facility, and a supplemental testing program on the safety, sterility, purity, and potency of the vaccine. This is a totally new facility owned and operated by a new licensee. The inspections and certifications are very thorough, very demanding and are not accomplished overnight.
- Hypotheses and Internet rumors about squalene in anthrax vaccine are false.
- In balancing the risks of immunization versus risks from failing to vaccinate, the scales tip decidedly in favor of immunization.
- The United States government must protect the Armed Forces against clear biological-warfare threats, whenever safe and effective vaccines are available.

COMMENTS ON THE REPORT *FINDINGS*

REPORT FINDING 1. The AVIP is well intentioned, but it is an over broad response to the known threat.

KEY POINTS:

- We are pleased to note that the report recognizes the "known threat" and affirms the program as "well-intentioned."
- However, we disagree that it is "overbroad" -- unlike other vaccines which we can offer troops one dose as they deploy--with a 6-dose series over 18 months as the only licensed protocol. We MUST begin vaccinating NOW for FUTURE protection of the ENTIRE force. Before it's too late.
- Everyone is subject to future deployment/we depend highly on both active and reserve components -- anything other than vaccination of entire force is unwarranted risk.

BACKGROUND:

- Former Director of the CIA, James Woolsey, referred to it as "the single most dangerous threat to our national security in the foreseeable future."
- At least seven potential adversaries have an offensive capability to use or active R&D programs to obtain this biological weapon.
- Known intelligence subsequent to Desert Shield/Desert Storm confirms both Iraq's offensive BW capability to deliver anthrax and their intent to use it. Russia and some former Soviet states have an even greater capability.
- The former USSR in the post-Cold War era admitted that their anthrax production provided enough agent to kill every person on earth several times over.

FINDING 2. The anthrax vaccine is vulnerable to supply shortages and price increases.

KEY POINTS:

- SOLE SOURCE SUPPLIER IS NOT UNIQUE TO ANTHRAX VACCINE; 40% of US vaccines are sole source:
- Adult and deployment--Yellow Fever, Typhoid, Cholera, Plague
- Children et al--Measles, Mumps, Rubella, Chicken Pox, Polio
- The price paid by DoD per dose of Anthrax Vaccine Adsorbed (AVA) is cheaper than almost all civilian vaccine prices and is less expensive per dose than several CDC purchased doses for national childhood vaccine program.
- DoD is always cognizant of supply vulnerability. There is not enough anthrax vaccine to immunize everyone at once; therefore, the DoD has a phased implementation, starting with personnel at greatest risk, assigned and

deploying to the two high threat areas of Korea and SWA. Per the original AVIP Plan, Phase II will not be started until DoD has established assured production at BioPort.

BAGKGROUND:

- The management of production, supplemental testing schedules, labeling and other factors contributed to the phased schedule of vaccinations. This phased approach ensures that sufficient vaccine is first available to forces that are most at risk from a biological warfare attack, and that an adequate supply exists to support unexpected worldwide contingencies and international crises.

FINDING 3. DoD's execution of AVIP is logistically too complex to succeed.

KEY POINTS:

Yes, it is logistically complex, but WE ARE SUCCEEDING!

- 1.45M doses administered to over 400,000 service members, EE civilians
- Automated tracking system records it ALL (largest such successful effort by any health care organization world wide): every single dose administered by name, SSAN, date administered, lot number, health care provider, route of administration, dose amount
- World class shipping/distribution system has worldwide industry attention--we know location of every dose, by lot number-- unprecedented temperature controlled environment monitored throughout shipment
- Unprecedented education effort from the beginning continues to grow and mature consistent with service member feedback
- Unprecedented worldwide command attention supported by immunization tracking system focused on service members receiving all 6 doses consistent with package insert

BACKGROUND:

Immunizations are tracked and recorded in four places: the individual's shot record (PHS 731); the individual's health record; the Services' automated immunization tracking system; and the Defense Enrollment Eligibility Reporting System (DEERS) which is the central repository.

The DEERS repository provides a worldwide capability to download immunization data for all Service members. This is very unique to DoD. No other health care system can provide this type of data access for their customers.

FINDING 4. Anthrax vaccine safety is not monitored adequately.

KEY POINTS:

- DoD has aggressive, multi-faceted surveillance program to assess and monitor vaccine safety, which was presented in testimony to the Subcommittee on National Security, Veterans Affairs and International Relations Committee on Government Reform, July 21, 1999. DoD testimony on safety monitoring was not recognized in the subcommittee

report.
- DoD employs monitoring by three scientific method categories: clinical studies (ongoing and planned); database analysis of vaccine recipient automated medical records (ongoing); and spontaneous reports (VAERS).
- DoD employs FDA/CDC VAERS reporting with unprecedented redundant review and assessment by civilian expert medical panel--the Anthrax Vaccine Expert Committee.

BACKGROUND:

- Safety data to date includes at least 12 human studies assessing the safety of anthrax vaccine. These studies, some published, some unpublished, but all made available to the GAO, stretch back almost 50 years.
- Report acknowledges active monitoring in two of these studies: Tripler Army Medical Center and Pittman et al, Fort Detrick, both active surveillance, which are DoD directed studies.
- Like all vaccines, anthrax vaccine may cause soreness, redness, itching, swelling, and lumps at the injection site. About 30% of men and 60% of women report mild local reactions, but these reactions usually last only a few days. Lumps can persist a few weeks, but eventually go away. For both genders, between 1% and 5% report moderate reactions of 1 to 5 inches in diameter. Larger reactions occur after about one in a hundred vaccines or less. Beyond the injection site, from 5% to 35% will notice muscle aches, joint aches, chills, fever, headaches, nausea, loss of appetite, malaise, or related symptoms. Again, these symptoms usually go away after a few days.

To monitor rare or unexpected adverse events associated in time to any vaccine, DoD health care providers have participated in the Vaccine Adverse Event Reporting System (VAERS), established by the Department of Health and Human Services, since its inception in 1990. In addition, each VAERS report is reviewed by an independent panel of civilian physicians. To date, this panel has detected no patterns of unexpected adverse events related to anthrax vaccination.

FINDING 5. Vaccine efficacy against biowarfare is uncertain.

KEY POINTS:

- Anthrax vaccine is a FDA-licensed product: has been since 1970 and is neither "experimental" nor "investigational."
- FDA-approved package insert recommends usage in man to protect against Bacillus anthracis --not just cutaneous; all forms of the disease.
- FDA reaffirmed efficacy and safety of anthrax vaccine in multiple testimonies both to Congressman Shays' and Burton's committees during 1999--part of the Congressional Record.

BACKGROUND:

- The current U.S. licensed anthrax vaccine is considered to be highly effective against naturally occurring strains of anthrax, including antibiotic-resistant-strains. This is because anthrax vaccine targets the key disease-causing protein common to all strains of anthrax, the Protective Antigen.
- In a letter from the FDA to the Assistant Secretary of Defense (Health Affairs) dated March 13,1997, the FDA states:

> "While there is a paucity (scarcity) of data regarding the effectiveness of anthrax vaccine for prevention of inhalation anthrax, the current package insert does not preclude this use. The original efficacy trial clearly showed that the vaccine

conferred a high level of protection against cutaneous exposure. None of the 5 inhalation cases in this trial occurred in anthrax vaccine recipients, but these data alone are insufficient to allow definitive statistical conclusions. Results from animal challenge studies have also indicated that pre-exposure administration of anthrax vaccine protects against inhalation anthrax. Therefore, I believe your interpretation is not inconsistent with the current label."

COMMENTS ON THE REPORT *RECOMMENDATIONS*

RECOMMENDATION 1. Force-wide mandatory AVIP should be suspended immediately.

KEY POINTS:

- DoD is firmly committed to maintaining a healthy and fit force and preventing needless casualties—for the Total Force—not just part of the force.
- Vaccination with a FDA-licensed product is a pillar of our Force Health Protection Strategy.
- Like wearing body armor, mandatory protection through vaccination is not an individual decision—to do otherwise risks not only the individual, but his comrades serving with him, his unit, and its mission.

BACKGROUND:

- A partially vaccinated force that suffers half or one-quarter casualties after an anthrax attack virtually guarantees a failed mission and unconscionable combat losses.
- Anthrax vaccination is no different than any other Force Health Protection issue—like wearing armor, a protective mask, or receiving the dozens of other immunizations required of Service Members before deployment to foreign countries.

RECOMMENDATION 2. DoD should accelerate research and development of a second generation recombinant vaccine.

KEY POINT:

- Agree and ongoing: Research and development of a second generation recombinant vaccine has been accelerated and is currently ongoing.

RECOMMENDATION 3. DoD should pursue testing of shorter shot regimen.

KEY POINTS:

- Agree and ongoing.
- DoD has worked toward this goal for several years: US Army Medical Research Institute of Infectious Diseases (USAMRIID) actively collected data during a pilot study to evaluate a reduced dosing schedule and change in route of administration; findings presented to the FDA in Fall 1998.
- DoD, in collaboration with the CDC, with Congressional funding is now developing the

research protocols and design of the definitive clinical research to evaluate a reduced dosing schedule and change in route of administration.

RECOMMENDATION 4. DoD should enroll all recipients in comprehensive evaluation and treatment program for long-term studies.

KEY POINTS:

- Through its automated immunization tracking system database, ALL DoD anthrax vaccine recipients are recorded and anthrax vaccine doses tracked as they begin the anthrax vaccination series. This will facilitate all ongoing and planned evaluation and treatment programs for long-term studies.

BACKGROUND:

- The Department of Defense continues to monitor the safety of the vaccine during program execution. The Army is conducting a longitudinal, prospective study using a cohort of 600 soldiers stationed at Tripler Army Medical Center. The intent is to identify side effects that may be temporally associated with anthrax vaccinations. To date, the results have closely correlated with historical data in medical literature.
- The Anthrax Vaccine Expert Committee (AVEC), a panel of civilian physician experts convened by the Department of Health and Human Services Health Resources & Services Administration reviews all VAERS reports submitted to the FDA. This independent external review panel meets every 4-6 weeks. To date, the committee has identified no unexpected events after anthrax vaccination.
- The nearly 50 years of study experience with anthrax vaccine in the United States demonstrates the vaccine has a similar side-effect profile, compared to other commonly used vaccines.

RECOMMENDATION 5. Use of the anthrax vaccine for force protection against biowarfare should be considered experimental and undertaken only pursuant to FDA regulations for investigational new drugs.

KEY POINTS:

- **Anthrax vaccine is a FDA-licensed product; has been since 1970— neither "experimental" nor "investigational."**
- **FDA-approved package insert recommends usage in man to protect against *Bacillus anthracis*—not just cutaneous: all forms of the disease.**
- **FDA reaffirmed efficacy and safety of anthrax vaccine in multiple testimonies both to Congressman Shays' and Burton's committees during 1999—part of the Congressional Record.**

BACKGROUND:

- **The current U.S. licensed anthrax vaccine is considered to be highly effective against naturally occurring strains of anthrax, including antibiotic-resistant strains. This is because anthrax vaccine targets the key disease-causing protein common to all strains of anthrax, the Protective Antigen.**
- **In a letter from the FDA to the Assistant Secretary of Defense (Health Affairs) dated March 13, 1997 the FDA states "While there is a paucity of data regarding the effectiveness of anthrax vaccine for prevention of inhalation anthrax, the**

current package insert does not preclude this use. The original efficacy trial clearly showed that the vaccine conferred a high level of protection against cutaneous exposure. None of the 5 inhalation cases in this trial occurred in anthrax vaccine recipients, but these data alone are insufficient to allow definitive statistical conclusions. Results from animal challenge studies have also indicated that pre-exposure administration of anthrax vaccine protects against inhalation anthrax. Therefore, I believe your interpretation is not inconsistent with the current label."

IN CONCLUSION

- The threat of anthrax is real. If exposed and unprotected, we will in all likelihood die.
- It is colorless, odorless, tasteless and very difficult to detect. Our Servicemen and women go to war every day under the delivery umbrella of weaponized anthrax. There is safe and effective vaccine that has been certified, re-certified, and reviewed many times, by the FDA, the agency our nation depends on to do so.
- No one has ever died from taking the anthrax vaccine shot; but many could die because they had not been vaccinated and were exposed.
- We agree with the sub-committee that a better version can be developed, probably requiring fewer shots.
- We are actively pursuing such a vaccine with a funded, aggressive program, but it will take several months to a few years to develop it and gain certification.
- We cannot send out troops into harm's way during that time without the safe and effective protection, which is available today.
- This is not an experimental program; it is protection by a properly proven product from a deadly threat.

Pg. 42

Anthrax And The Internet

By Colonel Mark F. Cancian, U.S. Marine Corps Reserve

"After three years of study it was found that vaccination was the safest way to protect a highly mobile military against a threat of anthrax spores that are 99% lethal for unprotected persons." --DoD Policy Statement (www.anthrax.osd.mil)

". . . .Vaccinating service members with a shoddily produced vaccine with a poor record of effectiveness and [which] may be dangerous is neither good medical practice nor sound military strategy. -- Dr. M. Nass (www.dissident.org)

What's going on here? Dueling web sites and dissenting opinions! In part, this is nothing new. Service members frequently have been caught up in policy debates, medical and otherwise. There is, however, a new facet: the rise of the Internet as a communications medium that amplifies other leadership challenges, skepticism about government, the widespread acceptance of conspiracy theories, the surge of issue activists, and the blurring of the line between fact and fiction, all occurring in a post-Cold War strategic situation where military needs are not as pressing. The environment for leadership is changing, and military leaders must change with it.

The Anthrax Debate

Anthrax is a highly lethal disease caused by bacteria and normally associated with plant-eating animals. Humans can be infected by direct contact with infected animals and animal products. Anthrax was weaponized about 50 years ago, and DoD believes about seven countries have anthrax as a biological weapon.

A vaccine against anthrax was developed about 40 years ago and has been in use since 1970 when it was licensed by the Food and Drug Administration. Annually, it is given to several thousand people who might be exposed to natural anthrax—veterinarians and people working with high-risk animal products.

In 1998, after a two-year review, the Secretary of Defense decided to inoculate service members against anthrax, beginning with those deploying to threat areas. His rationale was as follows[1]:

*Anthrax is highly lethal and likely to be used in future conflicts.[2]

*Passive measures such as gas masks are useful but do not provide sufficient protection.

*The vaccine is effective against all known strains of anthrax.

*The vaccine is safe, having been thoroughly tested. Acknowledged production problems are being fixed. Side effects are minor (sore arms, redness). There are no known fatalities from vaccination.

*Military and civilian society routinely inoculate against a variety of diseases. Failing to inoculate service members against a known threat would be irresponsible.

From the beginning critics have raised questions. These criticisms cover a lot of ground because they come from many different sources[3], but the main concerns are as follows:

*Anthrax has never been used in war and, even if used, is unlikely to be an effective weapon.

*Defensive measures like gas masks and antibiotics will provide sufficient protection.

*The vaccine is not effective against most strains of anthrax, especially bioengineered strains.

*The vaccine's long-term effects have not been adequately investigated.

*The vaccine's production facility is unsafe.

The impact of this debate is real. A few hundred service members have refused to take the vaccine and been disciplined. While representing only a small fraction of the total number inoculated, these "resistors" have received considerable media attention, magnified by antivaccination activists. For example:

*"A group of 23 sailors from a Norfolk-based aircraft carrier have refused to take anthrax shots ordered by the Pentagon, joining a small but growing number of servicemembers who have declined the inoculation. . . ." (Washington Post, 12 March 1999, www.washingtonpost.com)

*"A Marine has gone to federal court to seek a hardship discharge . . .[on account of] his mother [who] suffers severe anxiety, panic attacks and depression because she distrusted the anthrax vaccine. . . .el'm not going to let the government shoot my son up with poison and take him from me,' she said." (Pittsburgh Post-Gazette, 21 November, 1999, post-gazette.com/regionstate/19991123anthrax5.asp)[4]

As a result the case against the vaccine has received wide attention. Congress has held hearings on the issue, and a few members have recommended that the vaccination program be made voluntary.

The Internet

The Internet has been the catalyst for this controversy. Once limited to the technologically sophisticated, Internet access is now as common as the telephone. Usage has risen from just 300,000 in 1990 to 4.8 million in 1995 to 60 million today, and is increasing by 2 million per month.[5] Certainly the Internet has shaped the debate about anthrax vaccinations. "The Internet has brought the largest government agency to its knees," observed one Internet authority. "An Army of invisible detractors can keep the most powerful fighting machine in history on the defensive."[6] Then-Deputy Secretary of Defense John Hamre essentially agreed: "There's an awful lot of just absolute nothing but rumormongering [on the Net]."

The Web's openness is one of its most exciting qualities. Everything is there--the good, the bad, the interesting, and the mundane. Anyone can post anything. For a society that prizes the free flow of information and ideas, this is wonderful. The practical problem is that everything posted acquires a certain credibility just by being on the Web, clearly formatted and attractively presented. As a former Director of the National Security Agency once noted, "B.S. at the speed of light is still B.S."[7]

This unfiltered dissemination of information is new. Traditional communications media--like newspapers, magazines, and television--have certain standards about what they report. They may sometimes fail to meet these standards, but the standards about evidence, sources, and attribution are in place. There are no such standards for the Net. Further, if traditional communications media err, there are mechanisms for challenging them--letters-to-the-editor, ombudsmen, direct appeals to the editors. On the Net there is no presiding authority, no referee. Indeed, the problem of Net credibility has become serious enough that there are now sites dedicated to debunking net hoaxes.

The Navy and Marine Corps are wiring all bases for Internet access, with most offices already connected and even sailors aboard ship getting connected.[8] This not only promises to transform our way of doing business but also opens all the benefits of cyberspace to sailors and Marines, an important recruiting incentive and quality-of-life enhancement for a networked generation. It also, however, exposes sailors and Marines to all the messages in cyberspace. A search done on "anthrax vaccine" will turn up all the official sites as well as all the resistor sites. In the past it was possible, but difficult, for antimilitary groups to reach service members directly, and in every conflict they tried. Senior officers remember the antimilitary activities outside base gates during the Vietnam War, and the Marine Corps archives contain

antiwar leaflets given to troops headed for Nicaragua in the 1920s. Direct access, however, was difficult. Groups had to physically hand out pamphlets or take some other very direct, and visible, action. The Net goes around the traditional gatekeepers--base police, policy makers, department heads, NCOs, and petty officers. Groups can target service members on the Net without it being visible in the usual ways. There is a whole level of communications, like the barracks rumor mills, occurring below the level of the military leadership's visibility. The antivaccine movement delivered their message directly to service members and raised fears before the DoD realized it and fought back.

What happens on the Net is anonymous. People are known only by nicknames and cryptic e-mail addresses--"superdog" or "rspz123@aol.com." In traditional society, one could also maintain anonymity, but it took effort and was difficult. Now it is easy. People can hold conversations in chat rooms, explore Web sites, and exchange e-mail all without being known. Net posters are frequently anonymous as well. Some Web sites lack any attribution; others refer to obscure individuals or to vague organizations without any details except perhaps an e-mail address.

Speed and accessibility of information do not in themselves challenge military leadership. They do, however, facilitate and amplify certain social trends, such as distrust of government, that tend to undermine authority and that make military leadership more difficult.

Distrust of Government

The increasing distrust of government is a phenomenon that long has been recognized and that needs little elaboration. It is enough to say that in 1960 confidence in government was 75% while today it is 30%.[9] Vietnam, Watergate, oil crises, environmental alarms, and presidential impeachments have taken their toll. In the military specifically, activists point to nuclear weapons testing on troops, combat forces exposed to Agent Orange in Vietnam and the lingering mystery surrounding Gulf War disease as evidence that the government cannot be trusted.

Distrust of government can intensify a penchant for conspiracy theories. Although always present in the United States--suspicions about freemasons and the Catholic church were common in the 18th and 19th centuries--these have received a major boost in recent years, driven by various coverups: some real, others fanciful.

The Web abounds in conspiracy theories. Although Princess Diana and the CIA seem to have a special prominence here, the military is also a frequent subject. A few examples give a flavor for what is out there:

* "It is planned that the United States shall be permanently without an Army, Navy, and an Air Force. The Internal Security Forces that are to be assigned the duty of keeping order may or may not be U.S. citizens. Martial rule shall prevail throughout the United States." (www.libertygunrights.com)

* "'Operation Rain Dance' was set in motion by the Department of the Army, an Air Force Special Research Unit, and biomedics of the U.S. Navy. . . . SB-17 was a virus they were working on to target and kill only Native Americans. Do you remember the 7-9 Navaho Indians who died of mysterious circumstances? The experiment was a success." (ftp.shout.net/pub/users/bigred/vol11)

Anthrax is no exception. There is dark talk of "medical experiments" and corporate conspiracies. The broader point is that for any controversial public issue there will spring from the fertile mind of some citizens the very darkest interpretation, and that view will be on the Net for all to see.

Activists

To gain a political foothold in a democracy, an issue needs a group of activists who will take the time and invest the resources to get visibility for that issue. Articulate and energetic individuals, such as Rachel Carson (Silent Spring) and Upton Sinclair (The Jungle), always have had an impact on the politics of specific issues. The Internet now facilitates this process. A Web site puts out information for the curious. Chat rooms build awareness and make converts.[10] E-mail groups get people organized and

activated. Chain e-mails act like petitions with each addressee signing on if he or she agrees and forwarding it to others.[11] A recent example of this is Jody Williams and the effort to ban antipersonnel landmines. She built an international arms control movement in large part through the Internet (www.icbl.org). Indeed, there are Web sites dedicated to activism in general (www.berkshire.net/~ifas/activist). Anthrax too has its activists. Certain names keep popping up at "resistor" Web sites.[12]

The extreme version of activism is an inducement to hysteria. Activists have long known that publicizing mere "concerns" may not sufficiently energize an electorate, so they turn to more extreme measures. As a result many anti-anthrax vaccine Web sites contain extreme language: "human guinea pigs," "experimental drugs," and "poison." Even the scientific community is not immune. Though believing in the scientific method as an ideal, many scientists also hold strong political beliefs. As one scientist candidly stated,

On the one hand, as scientists, we are ethically bound to the scientific method, in effect promising to tell the truth, the whole truth and nothing but--which means we must include all the doubts, caveats, and ifs, ands, and buts. On the other hand we are human beings as well. . . . and like most people we'd like to see the world a better place. . . . To do that we need to get broad based support, to capture the public's imagination. . . . so we have to offer up scary scenarios, make simplified, dramatic statements, and make little mention of the doubts we have.[13]

Not surprisingly controversies have frequently erupted over "junk science"--the abuse of scientific evidence for political purposes (www.junkscience.com).

Hysteria, panic, and rebellion driven by rumor are nothing new. In 1789, the Great Fear gripped revolutionary France wherein thousands of peasants were convinced that angry mobs of Parisian revolutionaries were going to invade the countryside. In 1857, British native troops in India, the Sepoys, rebelled over rumors that the new Enfield cartridges were greased with pork fat (forbidden to Moslems) or cow fat (forbidden to Hindus) and that even touching them would make a trooper religiously unclean. What is new is the speed and reach that modern technology, especially the Internet and e-mail, bring to these fears, concerns and controversies.

The Challenge for Military Leadership

Politically, the Cold War spoiled the military. Certainly there were bitter debates about weapons, budgets, and policies. But underlying these debates was a shared and universal assumption that the dangers to the nation were great and immediate, the responsibilities of the military were immense and that, therefore, tinkering with military personnel policies was risky and best minimized. Today, although the world remains unstable and dangerous, the threats are less immediate to the average citizen. It is hard for Americans to imagine a really serious conflict such as Korea or Vietnam, to say nothing of a world war. The memories are instead of Desert Storm and Kosovo--apparently easy victories with few casualties. Anthrax and other threats seem abstract and unreal.

Further, fewer and fewer Americans have served in the military and therefore have a hard time seeing it as anything except an extension of their own civilian experience. As a result there seems little reason to compromise civilian standards for military necessity--whether regarding environmental laws, the role of homosexuals, or in this case, vaccination. Not only will this continue, it will become more acute as memories of the Cold War fade further. Military leaders will struggle to justify policies that require sacrifice in some dimension when the average citizen sees little need for compromise.

So what are military leaders to do? First, as long as a policy exists, leaders must firmly implement that policy. To do less invites anarchy. Resistors frequently complain, "I'm willing to face enemy fire, but I'm not willing to be a guinea pig in a medical experiment." One sympathizes with people facing the shock of the unexpected. Military history is full of examples where seasoned units broke in panic because of threat from an unexpected direction. But to sympathize is not to excuse. At commissioning and at every promotion an officer is charged "to observe and follow such orders and directions as may be given by the President of the United States of America or other superior officers. . . ." There is no fine print saying

that a member will only be asked to do "a," "b," and "c" but not "d," "e," and "f".

More harshly, there is a question about courage and reliability. Once someone indicates that they will only obey only the orders they regard as justified, reasonable, and safe, they have indicated their unreliability. And where does it stop? However much they protest that it is just this one order, the precedent is set. It is a slippery slope until all orders are second-guessed.

Leaders have a special responsibility. In some instances officers refusing the shots encouraged their troops to also refuse shots. This literally is mutiny, defined in the Uniform Code of Military Justice as, "refusing, in concert with any other person, to obey orders. . . ." Calling such behavior mutiny is politically incorrect, the term being so harsh. Nevertheless, that is what the behavior is, and it cannot be tolerated.

Merely implementing policy is not enough. Leaders also must recognize the new challenges and take steps to ensure voluntary and willing compliance with orders.

The first requirement is for education at the unit level. What frustrated British drill sergeants during the French and Indian War still frustrates military leaders: it is not enough just to give American troops an order. A leader must explain why. Conversely, this is the U.S. military's great strength--intelligent compliance, not just blind obedience. For controversial issues like anthrax shots this means that a conscious educational effort will be necessary. The leadership needs to take direct action to explain why a policy is being implemented; the troops will not absorb this by osmosis. For anthrax vaccinations this is now belatedly under way. Having the ship's doctor or the battalion surgeon talk with the troops for an hour before every shot of the series may be all that is needed. But clearly an order from the chief or the gunny to "line up and get your shot, it's good for you" is not enough.

The second requirement is Net presence. Information campaigns in cyberspace are the same as campaigns in traditional media. They require a broad approach, persistence, rapid reaction, and credibility. Such campaigns begin by producing one's own Web sites. The DoD, in general, and the Navy, specifically, have very sophisticated Web sites and are now aggressively defending anthrax vaccination on the web. Further, the DoD has recognized that one site is not enough. An effective campaign requires using multiple sites. A search on "anthrax vaccination" now turns up a dozen DoD sites, which overwhelm "resistor" sites. It is like a traditional media campaign where putting out a single press release is not enough. Further, Net presence must be part of a broad approach employing traditional media, hot lines, brochures, and op-ed pieces, all of which the DoD is now doing, though belatedly. Persistence and rapid reaction mean that this is an extended campaign, not a single battle. The Web is no different from traditional media campaigns where unfavorable or inaccurate stories require immediate response. Sites are not constructed once for all time, like a book, but need to be updated frequently in response to the latest events. Finally, credibility is vital. There's no substitute for clear facts, scientific evidence and specific citations.

Another requirement is advance warning. The DoD has a fairly sophisticated process for keeping an eye on what the traditional media are saying. Every morning the Current News[14] produces a compendium of major articles relating to national security. Public-affairs personnel participate in policy discussions and keep senior officials advised about media events and strategies. It is time to expand that effort to the Net. Whether this is part of "information operations" or "public affairs" is not important. What is important is to keep an eye on the Net and to react quickly to what is there. The first inkling of an unfavorable Net rumor should not be a newspaper headline.

Censorship is not an answer. It may be tempting to block access on government computers to dissident Web sites by using software filters. This is a hopeless task, like trying to control what books or newspapers the troops read. Which sites to block? It is impossible to separate "legitimate" policy discussion from "illegitimate" agitation and trying to do so will produce endless, and embarrassing, arguments. It is better to have rules about appropriate Web surfing during duty hours--and leave the policy at that.

Finally, there is the emotional aspect. In scientific arguments the discussions center around evidence,

facts and logical inference. Without question these are important. But the emotional side also is valid. People want to feel supported, cared for, and valued. This should not be overlooked in the scientific debate.

This discussion has looked at the institution's side of this phenomenon. What about individuals who face a policy they find intolerable? What recourse do they have? Today, for some, it is the anthrax vaccination, but tomorrow, for others, it could be another Balkans intervention or gays serving openly in the military. In the course of their careers many officers will face policies they find unwise, unjust, or even abhorrent.

As difficult as it may be practically, resignation should not be dismissed. There is too minor a tradition in the U.S. armed forces of resigning on principal. Many officers, particularly senior officers, convince themselves that they can do more on the inside. At bottom, there is a deep arrogance in such a belief, because it implies that those coming after would not have the same ability or commitment. General Harold K. Johnson, Army Chief of Staff 1964-1968, articulated this at the end of his life. When asked if he had any regrets about his career, he said he regretted not having resigned over the inept handling of the Vietnam War. "I made the typical mistake of believing I could do more for the country if I stayed in than if I got out. I am now going to my grave with that lapse in moral courage on my back."[15]

For many servicemembers, however, the responsibilities of family, lingering doubts about the absolute correctness of their views, and the love of service make resignation an unacceptable option. For them there is still the option of speaking out through professional writing. Proceedings, along with other professional magazines, publishes article after article taking issue with some element of established policy--warfighting doctrine, procurement plans, personnel policies, the entire gamut of military concerns. Indeed, professional magazines would have no role without this ability to raise issues and disagree with existing policies. The discussions in Proceedings about the role of women in the naval services and the conduct of senior leadership, sparked in part by James Webb's sharp commentaries, show that even sensitive and politically incorrect topics can be discussed. For anthrax vaccination, as with other cutting-edge policy issues, there is a legitimate policy debate. Are the risk and effort of giving the vaccines, however small, worth the gain in protection? How really likely and effective is biological warfare? There must be avenues for servicemembers to discuss important issues.

There is, nevertheless, a unwritten rule about what is discussed "inside the family" and what is discussed outside. It is one thing for active-duty personnel to make arguments in professional magazines and to use their ranks in signing them. It is another to write op-ed pieces for the local paper. This kind of public advocacy is really lobbying and is best left to retirees and civilians.

If the anthrax situation was unique--the result of special circumstances unlikely to be repeated--then it would be of narrow and limited interest. But it is not. The conditions that brought this controversy forth--skepticism about government, the widespread acceptance of conspiracy theories, the surge of issue activists, and the blurring of the line between fact and fiction--will go on. The Cold War consensus about the military will continue to fade. Most important, as the Internet becomes ever more accessible, it will bring on more controversies. They will become challenges for every military leader.

And this is a new kind of challenge--not visible in traditional ways, disseminated raw and unfiltered, sometimes going beyond data and facts. An effective response does not require a new kind of leadership but an extension of existing principles into a new realm.

INSTITUTE OF MEDICINE

Gulf War and Health

Volume 1. Depleted Uranium, Sarin, Pyridostigmine Bromide, Vaccines

Introduction

On a bright, clear morning on Friday, 24 August 1990, three Canadian ships slipped from their births in Halifax harbour to begin an historic voyage. Air and ground colleagues soon joined these 932 sailors in the hugest military deployment since the Korean War. The length of the mission was uncertain, with personnel being told to expect to be away for two years. They faced seasoned Republican Guards, with a promise of "the mother of all battles." Excitement blended with fear. The uncertainties and the threats were enormous. Their deployment marked a new beginning for the intensity of operational missions that Canadians were to embark upon over the next ten years. Life as a member of the Canadian Forces would never be the same.

Few sailors who left that day would ever have dreamed that a decade later the nature of what they had been exposed to and the consequences to their health of those exposures would be the subject of such an enormous controversy - the last battle of the Gulf War. Last month those same sailors gathered in Halifax to reminisce on what they had been through, both on their deployment and in the years that had followed. For many, questions and worries remained. Their future seemed clouded. As fate would have it, September 2000 saw the release of a comprehensive report into their health by one of the most prestigious medical bodies in the United States, the Institute of Medicine (IOM). Would the answers these veterans sought be finally given to them?

In the hours following the press conference, I was contacted several times by individuals from Canada and the United States as to what my impressions were of the report that had just been released. This was surprising and flattering at the same time. The miracles of modern technology had prevented us from establishing an electronic link with the authors at their press conference. Canadian investigators were blind as to what was said and what important points the authors wanted to emphasize with their very large audience. Further technological tribulations resulted in a delay of several hours before I could open the first attachment of the downloaded **prepublication** copy.

My impressions? Profound disappointment. I have only read the first few chapters, but the thread seems the same. This delay of several hours has given me a chance to sit back and reflect on what I have read, and how I should react to it. I am not naïve enough to believe that what I think will have any influence on how the medical and scientific community receives this report. Instead of a purely analytical approach, therefore, I believe I can indulge myself and be more philosophical. I can share my experiences with helping Gulf War veterans over the past decade and what I think this report will mean to

them. The report has generated many frustrations in me. I am sure it will be no better for my patients.

The Canadian Study

Two hundred and 71 words. A mail out questionnaire that tried to capture the entire Canadian Gulf War cohort rated 271 words in this comprehensive review. What is disheartening, is that with those 271 words, the authors still managed to miss the significance of what they had read in the Goss Gilroy Inc. study. In fact, in those 271 words, they even managed to get something wrong. The authors note "A subset of Canadian veterans who could not have been exposed to many of the agents because they were based at sea, reported symptoms as frequently as did land-based veterans in this study." The first crew of HMCS Protecteur was not, in fact, based at sea. By the time the air war began in January of 1991, these Gulf War veterans were already back in Canada. Their illness rate and symptom pattern is the same as all other Gulf War veterans. They were not exposed to depleted uranium, sarin, pyridostigmine bromide or novel vaccines such as anthrax or plague. This is surely not inconsequential information. That this fact is not even mentioned is puzzling and disappointing.

The only Canadians near the battlefields were the 536 personnel with 1 Canadian Field Hospital 80 kilometers from the Iraqi border at Al Qaysumah. The other 4000 Canadian Gulf War veterans were at least 400 kilometers away. The illness rate in all Canadian units is the same. In terms of putative "exposures," the fact that 4000 Canadian Gulf War veterans were at least 400 kilometers away when Iraqi vehicles were targeted by depleted uranium projectiles and yet have the same illness types and rate as their colleagues at 1 Canadian Field Hospital must be significant. In actual fact, to make the point even more forceful, there were only 2200 Canadian Gulf War veterans on the ground during the air and ground conflict. In other words, 2800 Canadian Gulf War veterans were back in Canada when the war was going on. This must have some meaning in terms of exposures and their alleged relationship to subsequent ill health.

Peer-Reviewed Published Literature

The IOM adopted a policy of using only peer-reviewed published literature to form its conclusions. They also note, however, that they consulted widely with interested groups and did use non-peer-reviewed publications for background. Canada, despite its small contribution to the Gulf War in terms of numbers has arguably some of the best information available of all the Coalition countries in terms of exposures and health outcomes. It is disappointing Canadian insights were not sought in researching this report. The significance of the Protecteur data might have been drawn to the author's attention and might have strengthened the conclusions they were able to make.

Focus Groups

Veterans and leaders of veterans' organizations were consulted many times during this study. The purpose of using focus groups is to ensure the investigators in fact address the

concerns of the population being studied. It is important that they receive answers to questions they might have. Their fears may not be valid, but they are legitimate. The IOM has done a commendable job in reaching out and ensuring the primary stakeholders were not forgotten.

There exists, however, another large group who also have legitimate concerns about the direction research has taken to date and the state of knowledge that currently exists with respect to Gulf War health issues. This group is the physicians who talk with, evaluate and manage Gulf War patients on a regular basis. Over the years this group has learned a lot. In particular, I believe they have insights into veteran issues that the veterans themselves may not be able to articulate. Peer-reviewed medical journals were consulted. The very same physicians who deal with patients on a daily basis often write these journal articles. There are impressions and opinions formed, however, that never make it into peer-reviewed medical journals. It is not clear that the authors of this report sought this invaluable experience. If not, I believe this to be a mistake.

Unexplained Illnesses

There existed in Ottawa, prior to the Gulf War, a clinic that saw patients with fatigue, memory and concentration difficulties, joint pains, sleep disturbances, headaches, abdominal pain and diarrhea, rashes and shortness of breath. This clinic had a national referral base. Such patients are perplexing to establishment medicine physicians who often have difficulties dealing with them. Physicians from mainstream medicine interested in seeing and following them are few and far between. I know this because it was I who had established this clinic.

I loathe the term chronic fatigue syndrome. It implies a homogeneity and understanding of this population that simply does not exist. In my previous life as a general practitioner I had attracted a large group of patients with non-specific somatic complaints that defied diagnoses. Following my specialty training it only seemed natural that my interest in this area would continue. That interest has now spanned 12 years.

When I finish what I believe are very comprehensive evaluations of these fatigue patients I sit down and talk to them. Often I gain valuable insights from their significant others. These significant others often have much to contribute as to what is going on and what their own concerns might be. By the time patients have reached me their problems often span several years. When they ask me what has caused their problems I have a simple answer. "I don't know."

That is not to say I am unfamiliar with their problems, that I do not understand the frustrations they have encountered seeking a diagnosis, or that I cannot help them. Indeed, in most cases I can. What I offer them is a very powerful therapeutic tool - reassurance. In many cases they are seeing a physician for the first time whose practice largely consists of patients with the same types of complaints. I will not abandon them, I will try to help, they will not die or even get worse, and they can get better. The strength of this therapeutic tool is awesome.

Dr Charles Engel has recently hypothesized that clinicians see patients through the lens of what they "know" and are familiar with. If a patient with multiple somatic complaints does not fit the construct of a standard psychiatric diagnosis then psychiatrists will view them as being within the "turf" of their internal medicine colleagues, and vice versa. The result? In many cases the patient does not fit into the standard shopping list of disorders for any specialty. They "belong" to no one.

It was not surprising that a Gulf War patient was referred to my chronic fatigue clinic in August of 1991. It was not surprising to me that I was asked to establish a separate Gulf War Clinic in April of 1995. I have seen and intensely investigated over 100 Gulf War patients since that time. I have never seen a Gulf War patient with a diagnosis that I have not also made in Canadians who never served in the Gulf. Through the "lens" of my own practice, Gulf War patients have the same types of problems as the majority of my non-Gulf War patient practice.

In a practice that consists largely of patients with non-specific somatic complaints, it is not hard to find a diagnosis that "fits." There are many broadly defined, poorly understood disorders such as chronic fatigue syndrome, fibromyalgia, soft tissue pain syndrome and myofascial pain syndrome that are suitable for the patients I have seen. The specific label attached is actually irrelevant because the management is virtually identical. No Canadian Gulf War veteran has ever left my clinic without a diagnosis.

The question remains: "Do these diagnoses 'explain' their problems." The answer of course is simple. No. That is not the same, however, as saying that there is no understanding, knowledge or predictability as to how the patient will do. In my fatigue practice, the diagnoses I make do not 'explain' the problems from an etiological perspective. These diagnoses do not prevent me from offering reassurance and comfort to my patients.

When I make a diagnosis of multiple sclerosis in patients, I cannot tell them why they were unfortunate enough to come down with this problem. I do not know what causes MS. The etiology is 'unexplainable' to me. There are, however, physical abnormalities that I can point to that somehow are reassuring to the patient and the public at large. This somehow 'demystifies' the diagnosis.

In my fatigue practice I cannot 'explain' to my patients what has caused them to be unwell. I have my own theories, but no proof. There are no physical abnormalities that I can point to; nevertheless, I do not find these diagnoses to be any more 'mysterious' than my MS patients' diagnoses. I have grown quite comfortable over the years managing my fatigue patients without benefit of absolute certainty. I can offer them reassurance. I can deal with their worries.

The term 'unexplained illness,' however, conjures up very different emotions and fears in non-physicians, especially in the context of the Gulf War. It equates to 'mysterious' and the 'unknown.' People are afraid of what they do not know or understand. This term, as innocuous as it may seem to clinicians, is anything but to a worried patient.

The Canadian Gulf War Clinic closed in December of 1997. Clinics were opened up across Canada in January of 1998 to assess veterans of any deployment, whether currently serving, or not. The reason? Gulf War diagnoses were no different from diagnoses being made in Canadian veterans of all Canadian deployments. In fact, I have seen more Somalia veterans with non-specific somatic complaints than Gulf War veterans. This is either because there is a previously undescribed "Somalia syndrome" or because I happen to run a satellite clinic at the base Somalia veterans deployed from. The point? Peacekeepers return with medical problems from the types of missions we currently send them on. These are perhaps 'unexplainable,' however; they are certainly not 'mysterious' or even unexpected. The only 'exposure' common to all is the fact these Peacekeepers have been sent to areas of conflict. I would hope each would not, in the future, rate is own 'syndrome' label.

Worry

Several expert scientific panels have reviewed the evidence regarding Gulf War health issues and have concluded that many of the diagnoses could be attributable to stress reactions. This is a concept many veterans cannot understand, and indeed, I believe there is a better term - worry. Veterans were worried when they went to the Gulf War. The extensive media coverage of their subsequent health issues, often sensational and rarely accurate, has only heightened this worry. I am convinced that worry can make people unwell. I can safely predict an influx of patients whenever the media carries another story telling Canadian veterans they are going to die a slow and horrible death. It does not matter the mission. Few Croatian veterans were seen at any of our clinics until the media raised the specter of 'red dirt contaminated with PCBs.'

In my practice, the greatest benefit I can offer my patients is to alleviate their worry. As a practitioner who continues to see Gulf War veterans, there was nothing in the Institute of Medicine Report that I could use to reassure them. Quite the opposite in fact. Ten years after the Gulf War and after some of the most intensive investigations ever undertaken it is a sad commentary that patients can be left with the feeling that we are almost right back at square one. I believe in fact there is much to reassure our patients about. Unfortunately, this does not seem to come through in the report.

Categories of Evidence

The IOM has assigned a weighting factor to the evidence it has reviewed with five subsequent categories of association. This is an attractive, time-honoured and valuable way to review scientific information. It is a system, however, that is not well understood by the layman. In the case of the IOM report, categories are assigned that may reflect the peer-reviewed articles published, but do not fully encompass the known epidemiological facts.

It is stated, for example, that for depleted uranium, there is no association between exposure to uranium and clinically significant renal dysfunction or lung cancer at cumulative internal radiation levels lower than 200 mSv. It states there is

inadequate/insufficient evidence to determine whether an association exists for virtually all other health outcomes. This does not, I think, reflect what physicians managing patients might advise them based on known exposure information or known health outcomes in Gulf War veterans.

Four thousand Canadian Gulf War veterans served at least 400 kilometers from the battlefields. This is a long way for dust to blow. Members of 1 Canadian Field Hospital, a group comprising only 12% of all our Gulf War veterans were 80 kilometers away. Most of the Iraqi vehicles hit by depleted uranium rounds were destroyed between February 24 and February 28, 1991. Even at the Field Hospital, the prevailing southwesterly winds meant the personnel were virtually always upwind. Even so, 80 kilometers is also a long way for dust to blow.

I follow a patient whose wife has had two children with minor congenital abnormalities of the genitourinary system. This patient served 400 kilometers from the battlefields. I feel quite comfortable in saying to this individual that these anomalies have nothing to with depleted uranium. Should the patient read the IOM report, he will note there is inadequate/insufficient evidence to say one way or the other as to whether this is true, or not. Should I testify in front of a National Inquiry into Gulf War health issues I will advise them that I am confident that this member's children were not adversely affected by the genotoxic effects of depleted uranium, the IOM report notwithstanding. I can state this because I believe Canadian epidemiological data with respect to unit locations makes depleted uranium an implausible culprit. Also, I am unaware of any data showing an increased incidence of congenital anomalies in Gulf War veterans in general. My "opinion" in this matter is certainly not likely to carry the cachet of the IOM in the eyes of a National Inquiry. My "opinion" is not likely to sway many journalists, either.

The Invisible Kitten

Absence of evidence is not proof of absence. This is a favorite line with special interest groups on a variety of health issues. In nicely captures the fact that scientists and clinicians avoid use of the terms "never" or "always." We can never know anything with certainty. I do not know if the comet Hale-Bopp was controlled by an alien space ship, or not. Members of the Heaven's Gate Cult were certainly convinced that it was. Based on what I know, I could be reasonably confident in counseling a member of this cult against committing suicide to attain a higher level of existence. My knowledge of this fact, however, is not absolute.

If someone were to tell me there was an invisible kitten outside my office window I am reasonably confidant that this is not likely. I cannot, however, prove that one is not there. In regards to depleted uranium and the health of Canadian Gulf War veterans, I am comfortable that depleted uranium is not a factor in any of their illnesses. I would suspect the IOM would hold a similar opinion. Unfortunately, this does not come across in their report. Too many doors are left wide open. Patients are not reassured about health issues that a review of the evidence would indicate are not likely related to Gulf War exposures.

Gulf War Research

Research is exciting and interesting. To researchers. My read of Gulf War veterans is they are tired of endless studies that conclude: "I don't know." Ten years have elapsed since the Gulf War. It is unfortunate the medical and scientific community cannot be more forthright in statements about which exposures are or are not likely to be associated with an adverse health outcome. Such forthrightness is, of course, not in keeping with an inquiring open scientific mind. Veterans are denied the reassurance they seek. They continue to worry. More research is funded which can be reasonably predicted will not categorically rule in or out any environmental exposure being associated with an adverse health outcome.

I enjoy research, especially when others do it. I can now be reasonably confidant that I will be reading about Gulf War research papers for many decades to come. I will never be out of a job in terms of responding to them. I will be paid a lot of money. My wife and children will be happy. The Gulf War veterans? They will remain worried.

Conclusions

I have not touched on other environmental exposures reviewed by the IOM. My comments would be the same. The first crew of HMCS Protecteur never took pyridostigmine bromide. The second crew did. The illness rate is the same. I am reasonably confident that PB is not a factor in the health of Gulf War veterans. There were no Canadian units within 300 miles of the Khamisiyah weapons depot when it was destroyed. I am reasonably confident that sarin is not a factor in the health of Canadian Gulf War veterans. The only Canadian unit to receive anthrax vaccine was 1 Canadian Field Hospital. The illness rate at 1 Canadian Field Hospital is identical to the illness rate of all other Canadian units. I am reasonably confident that anthrax is not a factor in the illnesses of Canadian Gulf War veterans. No Canadians received botulinum toxoid. I am reasonably confident that botulinum toxoid is not a factor in the illnesses of Canadian Gulf War veterans. Members of the second crew of HMCS Protecteur received all their vaccines in Canada before deploying to the Gulf. Members of 1 Canadian Field Hospital received multiple vaccines while in Saudi Arabia. The illness rate in both groups is the same. I am reasonably confidant that receiving multiple vaccines while deployed is not associated with adverse health outcomes.

My own ten-year anniversary of deploying to the Gulf War is coming up. It seems like a lifetime ago. I have learned much. That I would ever have embarked down such a path in life as fate has directed me would never have entered my wildest dreams. I continue to follow Gulf War veterans and give them as much reassurance as I can. It is disappointing that 10 years after this conflict a study is released that does not offer similar reassurance. A colleague of mine who has also reviewed the IOM report commented: "At least the special interest groups won't go away feeling happy about the report." This may in fact be true, but I am unconvinced. In any case, it is a sad day when the best that can be said is that no one will be happy about such a landmark report. Gulf War patients will not

have their worries relieved. Special interest groups will not be able to hold the study up as supporting their theories. Physicians will not be able to look to the report to offer their patients any reassurance. I will not be mentioning this report when I meet with my patients. That, in itself, says it all.

Tomorrow is another day. I will have a chance to review the report in the detail that it deserves. I do not see this report as being a tool I can use in helping my patients. I will move on and leave it behind. For those who asked, you have my thoughts.

Prepared by: Col Ken Scott
Position: Director of Medical Policy
Date: IOM Release Date +1 : 08 September 2000

Questions Concerning Anthrax Vaccine

Q1: What is in the Anthrax Vaccine?

A1: The Anthrax Vaccine is a sterile product made from filtrates of cultures of an avirulent, nonencapsulated, nonproteolytic V770-NP1-R strain of *Bacillus anthracis.* The cultures are grown in a synthetic liquid medium and the final product is prepared from sterile filtered culture fluid. These filtrates from the culture fluid are cell-free and contain the factor known as protective antigen (PA), which is produced by the bacteria during cell growth. Aluminum hydroxide gel adsorption is used to isolate the PA from the culture filtrate. The final product contains no more than 2.4mg aluminum hydroxide per 0.5ml dose (equivalent to 0.83mg of elemental aluminum per 0.05ml dose). Aluminum hydroxide is used as an adjuvant. The solvent used in the final product is 0.85% sodium chloride. Formaldehyde, in a final concentration not to exceed 0.02% and benzethonium chloride, 0.0025%, are added later in the process as preservatives. The final product is packaged in sterile multidose glass vials containing ten 0.5ml doses per 5ml. The product is produced in conformance with U.S. Food and Drug Administration regulations (21 CFR 620.34 - 620.24).[1, 2]

Q2: When the Anthrax Vaccine is injected into a person, what does the immune system produce?

A2: The body's first contact with an organism or a foreign material (antigen) such as a vaccine stimulates the body to activate its nonspecific and specific immune response systems.

The nonspecific immune response system consist of inflammation, phagocytosis, and complement production. Inflammation is a complex series of events that occur as the body attempts to maintain normal equilibrium. Vasoactive substances, including histamine, are released. These substances induce vasodilatation, increase local blood flow, and allow the release of fluid and protein into the tissues. The proteins help by clotting extracellular and lymphatic fluid to delay spread of bacterial or toxic products. The classic symptoms of inflammation are erythema (redness) from blood-vessel dilation, edema from excess fluids in the soft tissues, and swelling from accumulation of fluid and cells. Phagocytic cells are stimulated to mobilize to the site of the cell injury, or in this case, immunization. These phagocytic cells (monocytes and macrophages) adhere to the offending particles and ingest it (phagocytosis). Complement are proteins that circulate in the body in an inactive form. They can be activated to cause pooling of cells necessary for immune activity by attracting them to the area of inflammation.

If the nonspecific immune system does not completely protect the individual, the specific immune response system produces immunity primarily by the mechanisms of specificity and memory. The B and T lymphocytes are the major mediators of the specific immune response, and are told what to do by the macrophages. Macrophages

process the antigen into a form that the components of the specific immune response system recognizes and presents the antigen to them. T lymphocytes are responsible for developing immunity to infections caused by microorganisms that live and multiply within the cells. T lymphocytes also help regulate the effects of B lymphocytes. B lymphocytes produce antibodies to the antigen. Specificity refers to the ability of T or B lymphocytes to react exclusively to the presence of a particular molecular configuration of a substance and not to react to other substances. Once a lymphocyte recognizes and reacts to an antigen, more of those specific lymphocytes are produced by the body. Memory is the property of evoking a more vigorous specific immune response upon reexposure to a particular antigen. This response has two processes. The first process is the proliferation of both B and T lymphocytes to the antigen on first exposure. Some of these lymphocytes go on to form sensitized lymphocytes or antibodies, which decrease with time. The second process occurs when other lymphocytes form a more persistent population of memory cells. Each reexposure causes a quicker and more intense response.

Inactive vaccines, such as the anthrax vaccine, do not replicate and are generally less efficient in inducing an immune response than live vaccines. Multiple doses of the inactive vaccine must be given to stimulate the primary and secondary responses necessary to produce long lasting immunity. This is why the anthrax vaccine must be given in the six dose series, with annual boosters.[3]

Q3: How does this then protect the person against anthrax infection in the future?

A3: Once a person has been immunized with the anthrax vaccine their immune response system will recognize the anthrax bacteria as an antigen. The non-specific and specific immune response systems respond immediately to begin to produce or activate monocytes, macrophages, phagocytes, complement, B and T lymphocytes, and antibodies.

Additionally, the body's first line of defense includes physical barriers, like intact skin, mucus, respiratory cilia, as well as biochemical defenses such as lysozyme, gastric acids, and lactic acid. The respiratory system has cilia (small hair-like structures) which work to try to sweep away inhaled substances. The membranes lining the interior surfaces of the body can trap foreign substances and inhibit them from penetrating the cells. These membranes produce mucus which contain enzymes (lysozyme) which breakdown the cell walls of bacteria, thus killing them. Acids in the gastric system and produced by the skin can also kill the bacteria.[4]

Q4: What happens to the ingredients in the anthrax vaccine after they are injected into the body?

A4: The main ingredient in the vaccine is 0.85% sodium chloride solution, which is absorbed into the cells. Water and salt (sodium chloride) are part of the normal body.

[4] Koeller J and Tami J eds. Concepts in Immunology and Immunotherapeutics, 2nd Edition, American Society of Hospital Pharmacists, Bethesda, Maryland, 1992.

The preservatives are recognized as non-self and are eliminated mainly by phagocytosis, due to their very low concentrations, although a small immune response could be produced. The PA and the aluminum hydroxide are immediately recognized by the body as antigens and thereby trigger the immune system to respond.

Q5: Are there, or can there be made, strains of anthrax that the immune response to the current anthrax vaccine will not protect against?

A5: Virulent strains of *Bacillus anthracis* produces two virulence factors. A bacterial capsule and a three-part exotoxin. The three distinct antigenic components of the exotoxin are:

Factor I is known as **edema factor (EF)** which is the protein necessary for the edema producing activity of the toxin.

Factor II is known as **protective antigen (PA)** because in induces protective antitoxin antibodies to be formed in guinea pigs. PA is the binder for the anthrax toxin.

Factor III is known as **lethal factor (LF)** because it is the protein necessary for the lethal effects of the anthrax toxin.

In order for either the EF or LF to produce their toxic effects, it must be combined with PA. PA+EF produce edema. LF+PA produces lethal activity. EF+LF is inactive. EF+LF+PA produces edema and necrosis and is lethal. Without PA the bacteria cannot produce toxin.

The Russians published a study indicating that genes transferred from the related *Bacillus cereus* bacteria can act to enable *Bacillus anthracis* to evade the protective effect of the live attenuated Russian vaccine in a rodent model. Genetic manipulation of the *Bacillus anthracis* bacteria is possible, however all virulent strains of the bacteria produce the three factors of the toxin (EF, PA, and LF). The current U.S. anthrax vaccine induces the human body to produce antibodies to PA. Which means that the vaccine would work against all virulent strains of anthrax.

Q6: Are there records on who/what organizations bought the anthrax vaccine since 1970?

A6: The manufacturer maintains records of who purchased the vaccine. Most of the vaccine since 1990 was purchased by the U.S. Army, including during and since Operations Desert Shield/Storm. The U.S. Army Medical Materiel Agency along with U.S. Army Medical Research Institute for Infectious Diseases have maintained records to whom they have distributed the vaccine.

Q7: How long must human recipients of an experimental vaccine be followed before FDA approves a vaccine? This assumes vaccinees have been shown to be protected from a naturally occurring disease.

A7: The FDA requires new drugs and vaccines to undergo several phases of clinical trials (testing in people) for safety and effectiveness. Each investigative protocol is unique, where the size of the patient population studies and their duration can differ

from product to product, or the disease state for which the drug/vaccine is being developed.

Phase I trials evaluate basic safety and identify only very serious or very common adverse events. These trials are small, with usually 20 to 100 patients enrolled. These trials last only a few months.

Phase II trials allows for more information on safety and preliminary information on effectiveness to be collected. Phase II trials include several hundred patients and last anywhere from several months to two years. The trials are discontinued if severe reactions or a lack of effectiveness surfaces during the first two phases.

Phase III trials expand to measure effectiveness and safety in several hundred to several thousand patients. Phase III may last months to years, depending on the product.

If the manufacturer believes that there is sufficient and adequate data to show that their product is safe and effective for its intended use, they may submit and application to the U.S. Food and Drug Administration for licensure of the product (product license) and for licensure of the manufacturing plant (establishment license).[5]

Q8: Why was the Michigan Biological/BioPort anthrax vaccine production facility shut down?

A8: The production plant was shut down to undergo a planned modernization of their equipment and to ensure that they were able to comply with the good manufacturing practices required by the U.S Food and Drug Administration, OSHA, and other state and local regulations imposed upon manufacturers of biological products. The new production line (equipment and process), as well as the lots of new product will have to be inspected and certified/licensed by the U.S. Food and Drug Administration before any newly produced lots can be sold.

Q9: How does the anthrax vaccine used in the United States differ/compare with the anthrax vaccine used by the British?

A9: The vaccine used by the British is an aluminum salts precipitated cell-free filtrate of Sterne strain cultures grown to as to maximize the PA content. It is produced by the Centre (sic) for Applied Microbiology and Research at Porton Down, Wiltshire. The vaccine was licensed by the Secretary of State for Health, as Medicines Control Agency product license 1511/0037, since 1979. The US vaccine is an aluminum hydroxide adsorbed cell-free filtrate of cultures of a noncapsulating, nonproteolytic derivative of strain V770. Both vaccines use the PA as the main component, therefore work identically. The main difference between the US and UK utilization of the vaccines was that the British administered their anthrax vaccine at the same time as a pertussis vaccine. This co-administration of anthrax and pertussis vaccines was intended to boost the response to the anthrax vaccine. The U.S. forces were not given the pertussis vaccine.[6]

Q10: What anthrax vaccine are the Israelis testing?

A10: The Israeli Ministry of Defense has purchased the anthrax vaccine produced by BioPort Corporation.

Q11: What were the four criteria Secretary of Defense Cohen placed on the anthrax vaccine before he ordered it to be mandatory?

A11: On 15 December 1997, Secretary of Defense Cohen approved the plan to immunize the total force against anthrax contingent on the successful completion of four conditions: (1) supplemental testing, consistent with U.S. Food and Drug Administration standards, of anthrax vaccine lots in the stockpile to assure their potency, purity, sterility, and general safety; (2) approval of the Services' implementation plans that describe how they plan to administer their respective anthrax vaccination program and communications plans to inform military personnel of the overall program; (3) implementation of a system for fully tracking anthrax vaccinations; and (4) review of the health and medical aspects of the program by an independent expert.

Q12: When and how were the criteria met?

A12: Secretary of Defense Cohen approved implementation of the Anthrax Vaccine Immunization Program for the total force on 18 MAY 1998, based upon successful completion of the Services implementation and communication plans, supplemental testing, tracking system, and independent review.

The supplemental testing was overseen by an independent, third party organization called Mitretek Systems, Incorporated. The testing included (1) General Safety, based upon the FDA's 21 Code of Federal Regulations (CFR) section 610.11 requirements; (2) Potency, based upon 21 CFR 620.23 requirements; (3) Sterility, based upon 21 CFR 610.12 requirements; and (4) Purity, there are no formal CFR requirements, however the lots were tested for their content of aluminum, phenol, chloride, and formaldehyde.

The independent review of the program was completed on 19 February 1998 by Dr. Gerard Burrow. In his report he concluded that the FDA licensed anthrax vaccine appears to be safe and offers the best available protection against anthrax as a biological warfare agent.

Q13: What were Dr. Burrow's qualifications to conduct an independent review?

A13: Dr. Gerard Burrow serves as the Special Advisor for Health Affairs to the President of Yale University. Dr. Burrow previously chaired the Institute of Medicine Committee on Health Consequences of Persian Gulf War Service.

Q14: Where and from whom did Dr. Burrow obtain data/information to decide the anthrax vaccine supply was safe?

A14: Dr. Burrow consulted with nationally recognized experts in allergy, immunology and infectious diseases. He met with, reviewed, and discussed the anthrax vaccine implementation plan with personnel from the Department of Defense.

Q15: How is the anthrax vaccine stored and how is the expiration date determined for each method of storage?

A15: The commercial packaging of the anthrax vaccine should be stored under refrigeration between 35 to 46 degrees Fahrenheit (2 to 8 degrees C). The vaccine should not be frozen. The vaccine is shipped under refrigerated conditions using specially designed refrigerated shipping containers (VaxiCool ®), which has a temperature monitoring device. The FDA has set the acceptable shipping range for the anthrax vaccine at 1 to 25 degrees C (34 to 77 degrees F). The vaccine is to be placed in refrigeration upon receipt at it's final destination. The U.S. Army Medical Materiel Agency (USAMMA) is responsible for shipping the anthrax vaccine to all DoD agencies and commands. USAMMA has developed standard operating procedures (SOP) for ordering, shipping, and final disposition of the vaccine. The SOP can be obtained from the USAMMA web page (http://www.armymedicine.army.mil/USAMMA)

Q16: What has to happen to a lot of anthrax vaccine to have the expiration date extended?

A16: The manufacturer may formally request and receive an extension of the expiration dating on individual lots of its products from the U.S. Food and Drug Administration. The FDA examines data provided by the manufacturer on the potency, sterility, and purity of the lot(s) for which the extensions are being requested. If the data supports the extension and all federal requirements have been met, the FDA can grant the extension.

Q17: Are the records from the testing to extend the expiration date for a lot of anthrax vaccine part of the public record?

A17: The records are not published in the public domain. These records are proprietary information held by the manufacturer. However, the manufacturer may provide the information to responsible organizations or persons on a case-by-case basis.

Q18: It has been alleged that several lots of anthrax vaccine were found to be contaminated. What are the facts on testing of those lots?

A18: A number of recent articles in magazines and newspapers have incorrectly reported that certain lots or vials of anthrax vaccine that were administered to our Service members or shipped to military facilities were expired or contaminated (i.e., anthrax vaccine lots FAV020, FAV030, and FAV016). At no time have expired or

contaminated lots or vials of anthrax vaccine been administered to our Service members or shipped by DoD to any military facilities.

Anthrax vaccine lot number FAV020 was originally approved for release by the FDA in 1994, with an expiration date in 1996. The manufacturer of the FDA-licensed anthrax vaccine, BioPort (MBPI), requested an extension of the expiration date and conducted additional potency testing on lot number FAV020 in 1996 in order to meet FDA's requirements for extending the expiration date. This potency testing was satisfactory and FDA subsequently re-released lot number FAV020 with the expiration date extended until 1999. The extension of the expiration date on anthrax vaccine lot number FAV020 involved the manufacturer, MBPI, and the FDA. The DoD was not involved in the extension of anthrax lot number FAV020. Any manufacturer of a pharmaceutical or biological product can request and receive an extension from the FDA on the expiration date of the product after federal requirements for product extension have been successfully met. It is not uncommon for a government or private-sector organization to use a pharmaceutical or biological product whose expiration date has been extended by the FDA.

Anthrax vaccine lot number FAV030 passed sterility testing conducted by the manufacturer and the data was provided to the FDA prior to lot release. The lot was subsequently approved for release by the FDA. The lot also underwent successful supplemental testing by the manufacturer, to include sterility testing. Supplemental testing by the manufacturer was overseen by a third party independent contractor and no evidence of contamination of any type was found.

Prior to shipment of anthrax vials to DoD, the manufacturer conducts routine 100 percent visual quality control checks on all anthrax vials as part of its Quality Assurance Program. It was during one of these routine quality control inspections that the manufacturer detected the presence of inert gasket or stopper material in a number of anthrax vials in lot FAV016. All anthrax vials in lot FAV016 that contained particulate gasket material were discarded. Lot release data on lot FAV016 was subsequently sent to the FDA and, upon review, the FDA released the lot for use. Prior to the decision to immunize US forces against anthrax and the initiation of DoD-mandated supplemental testing, a number of vials of lot FAV016 that were released by the FDA for use were shipped to DoD and used to immunize some Service members and DoD laboratory workers. At no time were any of the vials from lot FAV016 that were contaminated with particulate gasket material ever shipped to DoD as they had been previously discarded. During the FDA inspection of the manufacturer in February 1998, the FDA requested the manufacturer provide additional documentation on destruction of the original vials from lot FAV016 that contained the particulate material. As a good manufacturing practice, the manufacturer then quarantined all the remaining vials of lot FAV016 at the manufacturing facility pending collection of the documentation required by the FDA. In addition to meeting the FDA's requirement for documentation resulting from the February 1998 inspection, the remaining vials of lot FAV016 must also successfully complete supplemental testing before they will be removed from quarantine and shipped to the DoD for use. Since all vials of FAV016 previously shipped to DoD had been approved by the FDA for lot release and had been visually checked for particulate material by the manufacturer before shipment with those that were found to contain

particulate material discarded, no recall of vaccine lot FAV016 that had been shipped to DoD was instituted by the manufacturer nor was it requested by the FDA.[7]

Q19: Anthrax vaccine was tested and FDA approved to prevent cutaneous anthrax (skin infection), which is curable with antibiotic treatment. Why does FDA/DOD believe this anthrax vaccine will protect humans against inhalation anthrax, the most likely route of infection in a biological warfare/bioterrorism scenario?

A19: In 1985, a FDA Advisory Panel stated that there is sufficient evidence to conclude that the anthrax vaccine is effective under the limited circumstances for which this vaccine is employed. The FDA-approved package insert is silent on route of exposure, but recommends the vaccine for protection of individuals who may come in contact with animal products contaminated with *Bacillus anthracis* spores, or may be exposed to infected animals, or conduct research or diagnostic activities with *Bacillus anthracis*. In a March 13, 1997 letter to Dr. Stephen C. Joseph, then the Assistant Secretary of Defense for Health Affairs, the FDA confirmed that the pre-exposure administration of the FDA-licensed anthrax vaccine for the prevention of inhalation anthrax is not inconsistent with the current product label. The Committee on Infectious Diseases, American Academy of Pediatrics (1994), states that "the vaccine is effective in preventing or significantly reducing the occurrence of cutaneous and inhalation anthrax in adults."

Several studies performed at the USAMRIID have demonstrated the efficacy of the FDA-licensed anthrax vaccine against inhalation anthrax in rhesus monkey challenge studies. These animal studies showed that the FDA-approved anthrax vaccine provided greater than 95% protection against high-dose aerosol challenge with anthrax in the monkey model. Human antibody response to the FDA-licensed vaccine provides further suggestive evidence that the FDA-licensed anthrax vaccine will protect against inhalation anthrax.[8]

Q20: Why is the anthrax vaccine not FDA approved for use in individuals under 18, over 65, or who are pregnant or lactating?

A20: It is not recommended by the manufacturer for use in patients under 18 years old or over 65 years of age because no studies have been conducted in those populations, although there is no evidence of a lack of efficacy. Immunization of children and the elderly with the anthrax vaccine may be required in emergency situations.

The FDA places the anthrax vaccine in Category C for use in Pregnancy. It is not known if the anthrax vaccine or antibodies to the anthrax cross the placenta. Problems in pregnant women have not been documented and are unlikely. Use would be prudent in emergency situations. It is not known if the vaccine or it's corresponding

[7] Office of the Assistant Secretary of Defense (Health Affairs), Information on General and Commonly asked Questions About the Anthrax Vaccine and the DoD AVIP, 05 April 1999.

[8] Office of the Assistant Secretary of Defense (Health Affairs), Information on General and Commonly asked Questions About the Anthrax Vaccine and the DoD AVIP, 05 April 1999.

antibodies are excreted in breast milk. Problems in humans have not been documented and are unlikely.[9]

Q21: How is the protection from anthrax vaccine changed if there are delays (one month or more) in getting the first three shots? The second three shots? The annual booster?

A21: It is DoD policy to follow the anthrax vaccine dosing schedule approved by the FDA. However, deviations from the schedule for the anthrax vaccine for medical reasons, such as pregnancy or active infection, must be documented in the patient's medical record. While the vaccine schedule should be followed as closely as possible, if an individual is late for one dose, the next dose should be given as soon as possible, and the series should continue. The effect of specific deviations from the approved schedule on the efficacy of the vaccine is unknown. Prolonging the interval between vaccine doses is not expected to interfere with immunity achieved after the concluding dose of the basic six-shot series, but may delay the induction of immunity. The entire six-shot series is required for full protection, as determined by the FDA. Booster doses are given at one-year intervals if continued immunity is needed.

Q22: How is the human anthrax vaccine made? How is this different from the animal anthrax vaccine?

A22: The Anthrax Vaccine is a sterile product made from filtrates of cultures of an avirulent, nonencapsulated, nonproteolytic V770-NP1-R strain of *Bacillus anthracis.* The cultures are grown in a synthetic liquid medium and the final product is prepared from sterile filtered culture fluid. These filtrates from the culture fluid are cell-free and contain the factor known as protective antigen (PA), which is produced by the bacteria during cell growth. Aluminum hydroxide gel adsorption is used to isolate the PA from the culture filtrate. The final product contains no more than 2.4mg aluminum hydroxide per 0.5ml dose (equivalent to 0.83mg of elemental aluminum per 0.05ml dose). Aluminum hydroxide is used as an adjuvant. The solvent used in the final product is 0.85% sodium chloride. Formaldehyde, in a final concentration not to exceed 0.02% and benzethonium chloride, 0.0025%, are added later in the process as preservatives. The final product is packaged in sterile multidose glass vials containing ten 0.5ml doses per 5ml. The product is produced in conformance with U.S. Food and Drug Administration regulations (21 CFR 620.34 - 620.24).[10, 11]

The animal anthrax vaccine is a live spore vaccine using strain 34F2 (Sterne's strain). The attenuated live spore vaccines suffer from potency problems and variations in virulence resulting in inadvertent deaths among the vaccinated animals. The animal

Bioterrorism Alleging Use of Anthrax and Interim Guidelines for Management -- United States, 1998

From October 30 through December 23, 1998, CDC received reports of a series of bioterroristic threats of anthrax * exposure. Letters alleged to contain anthrax were sent to health clinics on October 30, 1998, in Indiana, Kentucky, and Tennessee. During December 17-23 in California, a letter alleged to contain anthrax was sent to a private business, and three telephone threats of anthrax contamination of ventilation systems were made to private and public buildings. All threats were hoaxes and are under investigation by the Federal Bureau of Investigation (FBI) and local law enforcement officials. The public health implications of these threats were investigated to assist in developing national public health guidelines for responding to bioterrorism. This report summarizes the findings of these investigations and provides interim guidance for public health authorities on bioterrorism related to anthrax.

Indiana

The threatening letter was opened by an administrative assistant, who called 911; police, fire, emergency medical services (EMS), and hazardous materials units (IIAZMAT) (i.e., first responders) were sent to the clinic, and the local FBI office was contacted. The letter was sealed in a plastic bag and collected by FBI. All 3 1 adults who were in the building when the letter was opened were considered possibly exposed to Bacillus anthracis spores and were detained for approximately 3 hours.

First responders in consultation with public health officials in the Marion County Health Department (MCHD) decontaminated the potentially exposed persons in a temporary shelter constructed on the scene. HAZMAT personnel used full protective gear with self-contained respirators (level A protection). The 3 1 occupants placed their clothing and personal effects in plastic bags and showered using soap and water plus a dilute bleach solution. The desktop where the letter *was* opened was washed with a 5% hypochlorite solution (i.e., standard household bleach). All 3 1 persons were transported to local emergency departments (EDs) to receive oral chemoprophylaxis with ciprofloxacin (500 mg twice daily); some underwent additional decontamination (i.e., showered again with soap and water) as required by hospital policy.

Public health officials from the MCHD collected contact information from all persons and informed them they would be notified when results from laboratory testing were available; arrangements also were made for counseling. The letter was taken by FBI to the Indiana State Department of Health Laboratory, where cultures for B. anthracis were negative. The next day, FBI transported the letter to the United States Army Medical Research Institute for Infectious

Diseases (USAMRIID), U.S. Department of Defense, in Ft. Detrick, Maryland, where direct fluorescent antibody testing and culture were negative.

Kentucky

The letter was opened by an administrative assistant; the assistant called the postal inspector and was advised to put the letter in a plastic bag. The postal inspector contacted the local FBI office and went to the clinic. FBI contacted the assistant fire chief who sent police, fire, EMS, and a HAZMAT unit to the clinic.

Jefferson County Health Department personnel recommended that the staff member and the postal inspector shower with soap and water at the clinic and obtain oral chemoprophylaxis (ciprofloxacin 500 mg twice daily) at a local ED. The Kentucky State Department for Public Health, FBI's Weapons of Mass Destruction Office, and USAMRIID advised that decontamination and oral chemoprophylaxis were not necessary for five other adults in the center who may have been exposed to the letter. The desktop where the envelope had been opened was decontaminated with a hypochlorite solution.

The letter was taken by FBI to a biosafety level 3 facility at the University of Louisville Hospital Clinical Microbiology Laboratory, where phase microscopy revealed no spores consistent with B. anthracis, and cultures were negative. The next day, FBI transported the letter to USAMRIID, where direct fluorescent antibody testing and culture were negative.

Tennessee

The letter was opened by an administrative assistant, who called the local police department; officers took custody of the letter and placed it in a plastic bag. A clinic administrator contacted CDC seeking advice about preventive health measures. CDC notified the local FBI field office and the Tennessee Department of Health regarding the threat. FBI took the letter from the local police department to USAMRIID, where tests were negative for B. anthracis. The administrative assistant and the responding police officer, both of whom had direct contact with the letter, received chemoprophylaxis.

California

During December 17-23, 1998, four threats alleging use of anthrax were reported in greater metropolitan Los Angeles. The response to all four threats involved the police and fire departments, EMS, HAZMAT, FBI, the County of Los Angeles Department of Health Services (CLADHS), the California Department of Health Services, and CDC.

The first threat was a letter mailed to a private business; all 28 adults considered at risk for exposure to B. anthracis were decontaminated at the scene and given chemoprophylaxis. The letter was transported by FBI to a CLADHS biosafety level 3 laboratory and cultured for B. anthracis; all cultures were negative.

In the second threat, a telephone caller to a government building claimed to have contaminated the building's air-handling system. Approximately 95 adults received chemoprophylaxis. First responders, FBI, and CLADHS jointly decided not to decontaminate involved persons.

In the third threat, a telephone caller to 911 claimed to have contaminated the air-handling system of a federal building with B. anthracis; 1200-1500 persons (at least one of whom was pregnant) and two children potentially were exposed. Contact information for potentially exposed persons was collected for follow-up. No one was decontaminated on the scene, and chemoprophylaxis was not recommended; all potentially exposed persons were asked to go home, wipe down the interiors of their potentially contaminated vehicles with a solution of one part bleach to 10 parts water, place their clothing in a plastic bag until results from laboratory testing were known, and then shower. Environmental samples taken from the air ducts of the building were cultured for B. anthracis at CLADHS; all cultures were negative.

In the fourth incident, an anonymous telephone caller to 911 claimed to have contaminated the air-handling system of an office building occupied by approximately 200 persons. FBI was contacted; the threat was deemed to have low credibility. FBI in conjunction with CLADHS decided that neither decontamination nor chemoprophylaxis was warranted. Environmental samples tested at CLADHS were negative for B. anthracis.

Editorial Note

Editorial Note: Anthrax is an acute infectious disease caused by the spore-forming bacterium B. anthracis. It occurs most frequently as an epizootic or enzootic disease of herbivores (e.g., cattle, goats, and sheep), which acquire spores from direct contact with contaminated soil. Humans usually become infected through contact with or ingestion or inhalation of B. anthracis spores from infected animals or their products (e.g., goat hair). Human-to-human transmission has not been documented.

Although all the threats alleging use of anthrax described in this report were hoaxes, they demonstrate settings where bioterrorism can occur and the potential public health impact. These threats required prompt action by health, law enforcement, and laboratory personnel. Coordination and communication across agencies are necessary to protect the public and first responders from credible biologic warfare and bioterrorism agents such as anthrax.

The spore form of B. anthracis is durable and can be delivered as an aerosol (1). The incubation period for anthrax is 2-60 days. Inhalation causes the most serious form of human anthrax, and although contemporary experience in humans is limited, mortality may be high even with appropriate therapy (T.V. Inglesby, D.A. Henderson, J.G. Bartlett, et al., Working Group for Civilian Biodefense, personal communication, 1998). The likelihood of developing cutaneous disease is low after exposure of B. anthracis spores to intact skin. The risk for "secondary"

anthrax through reaerosolization appears to be low in settings where B. anthracis spores were released unintentionally or were present at low levels (2). In situations where the threat for transmission of B. anthracis spores is deemed credible, decontamination of skin and potential fomites (e.g., clothing or desks) may be considered to reduce the risk for cutaneous and gastrointestinal forms of disease.

Planning for Response to Threats

The public health response to bioterrorism requires communication and coordination with first responders and law enforcement officials. State and local health departments should work with these groups to ensure that local disaster preparedness plans address bioterrorism; define the roles of each agency, including protection of first responders; and are tested through simulations. FBI has jurisdiction for bioterrorism response but recognizes the need to conduct epidemiologic investigations, define at-risk groups, and rapidly implement potentially life-saving medical and public health responses. When bioterrorism alleging use of anthrax or other agents occur, the local emergency response system should be activated by dialing 911 in most communities; in communities without 9 11 systems, local law enforcement authorities should be notified. The local FBI field office and local and state public health authorities also should be notified.

FBI will coordinate the collection of evidence (e.g., letters, packages, or air-handling system samples) and deliver materials to an FBI or U.S. Department of Defense laboratory for testing. To guide decision-making, test results identifying B. anthracis should be available as soon as possible, at least within 24-48 hours. Efforts are under way to assess and enhance the capabilities of state and local health department laboratories to fulfill the need for rapid analysis. Planning for laboratory testing should be part of bioterrorism preparedness by state and local public health, law enforcement, and first responder authorities in consultation with federal officials.

Public health officials, working with law enforcement and first response personnel, should determine the need for decontamination and postexposure prophylaxis. In most of the recent hoaxes purporting anthrax exposure, immediate postexposure decontamination and prophylaxis have not been indicated because of the lack of credibility of the threat. Public health officials should collect contact information for potentially exposed persons for notification of laboratory results or other follow-up. Potentially exposed persons should be given information about the signs and symptoms of illnesses associated with the biologic agent and about whom to contact and where to go should they develop illness.

Recommendations for Postexposure Prophylaxis

Postexposure prophylaxis for exposure to B. anthracis consists of chemoprophylaxis and vaccination. Oral fluoroquinolones are the drugs of choice for adults, including pregnant women (T.V. Inglesby, D.A. Henderson, J.G. Bartlett, et al., Working Group for Civilian Biodefense, personal communication, 1998; 3) (Table 1). If fluoroquinolones are not available or are contraindicated, doxycycline is acceptable. Children should receive prophylaxis with oral ciprofloxacin or oral doxycycline (T.V. Inglesby, D.A. Henderson, J.G. Bartlett, et al., Working Group for Civilian Biodefense, personal communication, 1998; 3) (Table 1). Prophylaxis should continue until B. anthracis exposure has been excluded.

Postexposure vaccination with an inactivated, cell-free anthrax vaccine (Bioport Corporation,

formerly Michigan Biologic Products Institute **) is indicated in conjunction with chemoprophylaxis following a proven biologic incident (T.V. Inglesby, D.A. Henderson, J.G. Bartlett, et al., Working Group for Civilian Biodefense, personal communication, 1998; 4). Postexposure vaccination consists of three injections: as soon as possible after exposure and at 2 and 4 weeks after exposure. Anthrax vaccine can be requested through CDC. Although this vaccine is now being administered routinely to U.S. military personnel, routine vaccination of civilian populations is not recommended. This vaccine has not been evaluated for safety and efficacy in children aged less than 18 years or adults aged greater than 60 years.

If decontamination is appropriate, persons should remove their clothing and personal effects, place all items in plastic bags, and shower using copious quantities of soap and water (5). Plastic bags with personal effects should be labeled clearly with the owner's name, contact telephone number, and inventory of the bag's contents. Personal items may be kept as evidence in a criminal trial or returned to the owner if the threat is unsubstantiated. For incidents involving possibly contaminated letters, the environment in direct contact with the letter or its contents should be decontaminated with a 0.5% hypochlorite solution (i.e., one part household bleach to 10 parts water) following a crime scene investigation. Personal effects may be decontaminated similarly.

CDC and other offices in the U.S. Department of Health and Human Services are working with state and local health departments, federal agencies, and nongovernmental organizations to improve the public health capacity to address bioterrorism and develop locality-specific response plans. CDC also can assist public health officials with decision-making if a threat occurs alleging the use of a biologic agent.

Note: To print large tables and graphs users may have to change their printer settings to landscape and use a small font size.

TABLE 1. Recommended postexposure prophylaxis for exposure to Bacillus anthracis*

Drug	Adults	Children+
Oral fluroquinolones		
One of the following:		
Ciprofloxacin	500 mg twice daily	20-30 mg per kg of body mass per day divided every 12 hours
Levofloxacin	500 mg once daily	Not recommended
Ofloxacin	400 mg twice daily	Not recommended
If fluoroquinolones are not available or are contraindicated		
Doxycycline	100 mg twice daily	5 mg per kg of body mass per day divided every 12 hours

* Prophylaxis should continue until exposure to B. anthracis has been excluded. If exposure is confirmed, prophylaxis should continue for 4 weeks and until three doses of vaccine have been administered or for 8 weeks if vaccine is not available.

+ Use of tetracyclines and fluoroquinolones in children has well-known adverse effects; these risks must be weighed carefully against the risk for developing life-threatening disease. If a release of B. anthracis is confirmed, children should receive oral amoxicillin 40 mg per kg of body mass per day divided every 8 hours (not to exceed 500 mg three times daily) as soon as penicillin susceptibility of the organism has been confirmed.

INFORMATION PAPER

DASG-HCA

22 Feb 01

SUBJECT: Acute Allergic Reactions After Anthrax Vaccination

1. PURPOSE. To describe the incidence of acute allergic reactions (also called anaphylaxis, anaphylactic reactions, or immediate hypersensitivity) after anthrax vaccination.

2. FACTS.

a. Acute allergic reactions include a wide spectrum of clinical conditions, ranging from mild to life-threatening. Anaphylaxis is the term properly used for immediate-type hypersensitivity reactions ("allergic reactions") involving a type of antibody called immunoglobulin E (IgE). Allergists use the term "immediate" because these reactions typically begin within seconds to minutes after the drug is administered. The outer limit for "immediate" is generally set at 2 hours after drug administration. Other kinds of allergic or hypersensitivity reactions (that are not anaphylactic reactions) can occur at later time periods.

b. The most severe, life-threatening form of anaphylaxis is called anaphylactic shock, which involves airway and cardiovascular collapse. Anaphylactic shock can occur after administration of many medications, including insulin, penicillin, other antibiotics, other medications, insect stings, common foods (e.g., peanuts), most vaccines, and other substances (e.g., latex). Food allergies are the most common cause of anaphylaxis seen in emergency rooms.

c. The frequency of anaphylactic shock is estimated as follows:

. once per 10,000 people per year overall (United Kingdom)
. once per 4,000 to 25,000 people receiving anesthesia
. once per 10,000 uses of X-ray contrast material
. once per 100,000 courses of penicillin
. once per 1 million vaccinations (range: 1 per 600,000 to 10 million doses)
. death after anaphylactic shock is even more rare than the statistics cited above.

d. As of 13 Feb 01, the Anthrax Vaccine Expert Committee (AVEC) convened by the Department of Health & Human Services (DHHS) had reviewed 1,487 reports of adverse events after anthrax vaccination, submitted to the Vaccine Adverse Event Reporting System (VAERS). These reports were independently reviewed for symptoms of anaphylactic reactions and the time of their onset after vaccination. Reports were considered without regard to AVEC judgments regarding cause-and-effect association (i.e., casting a broad net).

e. Anaphylactic shock was defined in advance (in consultation with allergists at the Walter Reed Army Medical Center) as life-threatening airway and/or vascular collapse. Through 13 Feb 01, no cases of anaphylactic shock were reported to VAERS after anthrax vaccination, During this interval, more than 2.0 million doses of anthrax vaccine were administered to more than 502,000 people.

f. Acute allergic reactions were defined in advance (in consultation with allergists at the Walter Reed Army Medical Center) as generalized itching (beyond the injection site) with symptoms of chest tightness, with or without evidence of hives, that began within 2 hours after anthrax vaccination. These reactions are suggestive of anaphylaxis. VAERS reports that mentioned the administration of epinephrine or antihistamines were also counted, because it is not uncommon to administer epinephrine or antihistamines (e.g., diphenhydramine, Benadryl®) at the first sign of acute allergic symptoms, to preclude progression of symptoms. As of 13 Feb 01, 15 cases consistent with acute allergic reactions have been reported to VAERS after

anthrax vaccination, during the time when 2.0 million doses of anthrax vaccine had been administered. Each of these 15 vaccine recipients recovered after prompt treatment. No specific lot of vaccine was associated with significantly more of these reactions than other lots, nor was any geographic clustering apparent.

g. Conclusion: No cases of anaphylactic shock have been reported after anthrax vaccination. As is expected with other vaccines, antibiotics, and other medications, anthrax vaccine is associated rarely with acute allergic reactions. Each of the reported cases recovered fully.

Approved by COL Randolph

INFORMATION PAPER

DASG-HCA
18 July 2000

SUBJECT: Antibody Response to Successive Doses of Anthrax Vaccine

1. PURPOSE. To describe the immune response to fewer than 6 doses of anthrax vaccine.

2. FACTS.

a. Many vaccines require multiple doses to achieve full immunity. With these vaccines, scientists recognize that each successive dose builds on the effect of earlier doses. Later doses build progressively higher levels of disease-fighting antibodies in the bloodstream, like climbing steps on a ladder or a staircase towards full protection.

b. Anthrax vaccine is administered in a six-dose basic series, with annual boosters thereafter, according to the dosing schedule approved by the Food & Drug Administration (FDA). Like other vaccines, each of the initial doses of anthrax vaccine stimulates increasingly higher amounts of anti-anthrax antibodies.

c. In early laboratory tests developed at the US Army Medical Research Institute of Infectious Diseases (USAMRIID) in the 1970s and 1980s, anti-anthrax antibodies developed in 47% of vaccine recipients after one dose of anthrax vaccine, 83% of vaccinees 2 weeks after the first three doses [Johnson-Winegar, *Journal of Clinical Microbiology* 1984;20:357-61], and 91% after 2 or more doses [Buchanon et al, *Journal of Immunology* 1971;107:1631-6].

d. In the late 1990s, USAMRIID developed a more sensitive test, a test able to detect smaller amounts of antibody. They found that one dose of anthrax vaccine produced detectable antibodies in 60% to 84% of recipients. After two doses, anti-anthrax antibodies were detected in 95% to 100% of anthrax vaccine recipients. These data are in a technical report submitted by USAMRIID via BioPort Corporation to the FDA. The data will be published in a series of scientific journals in due course. The first manuscript has appeared in the 15 Sep 2000 edition of the journal "Vaccine". See also: Brachman S, Friedlander AM. Anthrax. In: Plotkin SA, Orenstein WA, ed. *Vaccines*, 3rd ed. Philadelphia: W. B. Saunders, 1999:629-37.

e. In 1992-93, USAMRIID scientists drew blood on 281 Fort Bragg soldiers. These soldiers received 1, 2, or 3 doses of anthrax vaccine 18 to 24 months earlier during the Persian Gulf War of 1990-91. Next, these soldiers received one additional dose of anthrax vaccine. As depicted in the following table, 92% to 100% of these soldiers responded to a single dose of anthrax vaccine with increases in detectable antibody levels. A high antibody-response rate after a single booster dose of a vaccine shows that the immune system remembers the previous vaccinations, even if antibodies were not detected just before the booster dose.

Table 1. Proportion Of Troops Responding To One Dose Of Anthrax Vaccine in 1992-93, 18 To 24 Months After Previous Incomplete Doses Of Anthrax Vaccine

Category	1 previous vaccination	2 previous vaccinations	3 previous vaccinations	Total
	13 soldiers	197 soldiers	71 soldiers	281 soldiers
# with detectable antibodies before 1992-93 vaccination	3 soldiers (23% of 13)	47 soldiers (24% of 197)	36 soldiers (51% of 71)	86 soldiers (30% of 281)
# with detectable antibodies 30 days after 1992-93 vaccination	12 soldiers (92% of 13)	196 soldiers (99.5% of 197)	71 soldiers (100% of 71)	279 soldiers (99.3% of 281)

f. Antibody responses to anthrax vaccine require careful interpretation. The concentration of anti-anthrax antibodies that protects humans from anthrax disease is not precisely known. Similarly, the antibody level that protects against some other diseases is also unknown (e.g., pertussis, Lyme disease, meningococcal, pneumococcal, typhoid, mumps, poliovirus, yellow fever). The laboratory test that indicates whether someone is protected from disease is sometimes referred to as the "clinical correlate of immunity."

g. USAMRIID and the Centers for Disease Control & Prevention (CDC) are jointly investigating the clinical correlate of immunity for anthrax vaccine. Much of the effort involves animal research in which lab tests (such as antibody levels) will be evaluated to find the dividing line that separates survivors from the deceased.

INFORMATION PAPER

DASG-HCA
27 November 2000

SUBJECT: Information for Healthcare Providers on the Additional Temporary Slowing and Future Resumption of the Anthrax Vaccine Immunization Program (AVIP)

1. Purpose. To inform Immunization Clinic Staff and Vaccine Providers about the Further Revision of the AVIP.

2. Current Situation.

a. In 1996, the Department of Defense (DoD) identified anthrax as the number-one biological-warfare threat. To counter this grave and urgent threat, DoD implemented the AVIP. We are short of vaccine necessary to sustain the current program. Due to this, there will be a slow down of the execution of the program. DoD will continue to protect personnel at highest risk.

b. Effective 27 November 2000, DoD will further reduce the number of personnel receiving anthrax vaccination. Vaccination will now be limited to personnel assigned or deployed on the ground in Southwest Asia (Kuwait, Saudi Arabia, Bahrain, Jordan, Qatar, Oman, United Arab Emirates, Yemen, and Israel) for more than 30 consecutive days and those personnel afloat in the Persian Gulf who have the potential of being committed ashore. Anthrax vaccinations of other personnel will resume when adequate FDA-released supplies of vaccine become available.

c. On-hand, open anthrax vaccine vials will be used at their current location to continue the immunization series for individuals already in the program, until this category of supply is exhausted. The U.S. Army Medical Material Agency (USAMMA) will provide redistribution instructions to move un-opened vials to support the SWA mission. Follow shipping instructions carefully to prevent improper conditions during transit.

d. Some Service Members will have received fewer than the FDA-recognized 6-dose series. DoD wants its personnel to receive all six doses and to receive annual boosters. DoD is obliged by the shortage to defer additional vaccinations until vaccine supply is restored.

e. The six-dose basic series of anthrax vaccine, with annual boosters thereafter, provides full protection. Receiving fewer than six doses provides the recipient some level of anthrax-fighting antibodies, enhancing personal, around-the-clock immunity. Each dose of vaccine is like climbing another step in a staircase or a ladder. Getting several doses provides valuable, although partial protection.

f. It is not physically harmful to the individual to get less than the recommended number of doses in any vaccine schedule. Public-health experts agree on this. The only concern is that a person is not considered fully protected until after the six-dose basic series.

g. Once the anthrax vaccine supply is restored, people whose dosing schedule was interrupted will not need to start the series over from the beginning. Memory cells of the immune system remember how many shots people receive. One simply resumes the anthrax vaccination series where he or she left off and adjusts the timing for the next dose. This is a long-held finding of the CDC's Advisory Committee on Immunization Practice (ACIP), as well as that of our civilian advisors on the Armed Forces Epidemiological Board (AFEB). [*MMWR* 1994;43(RR-1):1-38 ftp://ftp.cdc.gov/pub/Publications/mmwr/rr/rr4301.pdf] DoD is also consulting with the FDA on planning resumption of full-scale program implementation.

h. All anthrax vaccinations must be entered into each Service's Immunization Tracking System (ITS). For the Army, this is MEDPROS; for the Air Force, MITS; and for the Navy and Marine

Corps, SAMS. As soon as possible, enter any backlog of immunizations that have not yet been entered.

i. Clinics must continue to perform quality-improvement evaluation of clinical practices that enhance immunization delivery.

j. To minimize waste in vaccinating, use a syringe and needle with little hub space. We recommend the following items:

NSN	Description	Unit of Issue
6515-00-655-5751	5/8 inch, 25 gauge needle	PG
6515-00-982-4206	Tuberculin, lcc syringe	PG
6515-00-982-4205	Needle and Syringe Hypo lcc	PG

For more detailed logistic information, consult with your service representatives, or contact the US Army Medical Material Agency's website: http://www.armymedicine.army.mil/usamma/anthrax/antxhome.htm.

k. We will rely on the other pillars of our Force Health Protection Program (i.e., protective gear, biological-agent detectors, and antibiotics) to help protect those Service Members who have not completed the anthrax vaccination series.

l. DoD is aggressively seeking a second U.S. source for anthrax vaccine. By having a second source, DoD can have greater confidence and comfort that a sufficient supply of safe and effective vaccine will be available in the future.

m. Clinical questions regarding anthrax vaccines can be addressed through immunology and/or preventive medicine consultants. Additional information is available from the Anthrax Vaccine Immunization Program Agency, www.anthrax.osd.mil, 877-GET-VACC, avip@otsg.amedd.army.mil.

3. Additional Background information.

a. The United States has confronted similar shortages of vaccine over the years. The United States experienced a delay in supply of influenza vaccine in Fall 2000 due largely to manufacturing issues. The CDC's Advisory Committee on Immunization Practices considered how best to prioritize a limited supply of influenza vaccine at its June 2000 meeting in Atlanta. There is currently a complete outage of adenovirus vaccine,, plague vaccine, and the intradermal form of rabies vaccine. This type of rabies vaccine is available to neither military nor civilian customers.

b. The most notable example of a similar U.S. vaccine shortage came in 1984-85 with the national shortage of diphtheria-tetanus-pertussis (DTP) vaccine given in a 5-dose series to the nation's children. Public health experts and pediatricians agreed that the proper thing to do was to administer the first three doses in the DTP series to infants, but to postpone doses given later in childhood until supply was restored." [*MMWR* 1984;33:695-6, 1985;34:103-4, 1985;34:231-2]

Anthrax Vaccine and Drugs Availability Program for Persons Possibly Exposed to Inhaled Spores

Consent Form (Adults)

Background:

People who breathe in large numbers of anthrax spores may be at risk for developing anthrax infections in their lungs. Such infections are very serious and possibly fatal. As you know, you may have been exposed to spores during the recent anthrax attack.

Antibiotics (drugs) can prevent anthrax infection in people exposed to spores. Not much is known about people who may have been exposed to very large numbers of spores, such as those in post offices or government buildings during the recent attacks, because this situation has never occurred before. The current recommendation to try to prevent infections in exposed individuals is to take drugs for 60 days. Some scientists and doctors have recommended the drugs be taken for longer than 60 days. Whether or not 60 days of drugs is enough is not known, because spores can stay in the body for a long time and may be hard to get rid of. FDA has not approved use of any drug for more than 60 days to prevent anthrax disease. There are risks from taking drugs for a long time.

There is also a vaccine for anthrax to immunize persons at risk of exposure to anthrax spores. We do not know if giving anthrax vaccine along with drugs after a person is exposed to anthrax spores is better than giving drugs alone to prevent the disease. The Food and Drug Administration (FDA) has not approved anthrax vaccine for this use. There are risks to taking the vaccine.

Because people like you may have been exposed to large numbers of anthrax spores, the Department of Health and Human Services (DHHS) is making anthrax vaccine available to those exposed who may want to take it to prevent anthrax disease, even though it has not been tested or shown to be effective for this use.

Purpose of the Program:

This program is intended to make the vaccine and additional drugs available to all people who may have been exposed to anthrax spores and who were advised to complete a 60-day course of drugs. It is very important that you understand that this use of the vaccine has never been tested in people and no one knows if it offers any additional protection from infection. The vaccine is only available through this program.

Description of the Program:

Although the current recommendation to prevent anthrax is to take drugs for 60 days, everyone who decides to take part in this program will receive an additional 40 days of drugs to try to reduce the chances of anthrax infection. You may also take the vaccine if you wish.

You do not need to take the vaccine to receive the drugs. In addition, you can choose to stop taking drugs at the end of 60 days and not take part in this program.

Before you decide to take part in this program, there are several important things that you should know. You should read this form very carefully with a member of the program staff or your doctor and make sure that you know the risks and possible benefits before you agree to take part in this program.

- **Anthrax vaccine has not been shown to prevent infection when given to people after exposure to anthrax spores.**
- **The FDA has not approved the use of any antibiotic for more than 60 days or the use of amoxicillin for the prevention of anthrax.**
- **The vaccine that you will receive in this program has not been approved by the Food and Drug Administration (FDA) for this use and is considered investigational.**
- **FDA has not approved this lot of vaccine (Lot FAV-063) because the company's license to produce the vaccine is under review. This lot of vaccine has passed all of the vaccine maker's tests for use in humans.**
- **You should not consider the vaccine as treatment for anthrax. The vaccine as given in this program has not been shown to give long term protection against anthrax.**
- **You may have undesirable side effects from taking the vaccine.**

Because the vaccine is not approved for this use, FDA considers this a clinical investigation and regulations require the collection of health information from you in order to watch for side effects or other problems. In addition, we will watch for any cases of anthrax.

DHHS is not making any recommendation whether you should or should not take this vaccine. DHHS is making the vaccine available to you to allow you to decide whether or not you wish to use the vaccine.

If you decide to take the vaccine, you will get three shots of vaccine under the skin of your upper arm. You will get one shot every two weeks. Each shot is small (0.5cc), one-tenth of a teaspoon. You will get all of your vaccine shots in one month.

In addition to the vaccine, you will also be given a 15-day supply of drugs. You will be asked to return for a follow-up visit two weeks later to get the rest of your 40-day supply.

Do not stop taking the drugs without first talking to program staff or your doctor.

Everyone in the program will be asked to keep a diary about their health for the first six-weeks after starting the program. You will also receive a phone call from the CDC staff at 2-months, 6-months, 1-year and 2-years after joining the program to keep track of how you are doing and any problems you may have.

You will be asked to take part in this program for a period of two years. Your taking part in this program is completely voluntary. You may drop out any time without penalty or loss of benefits to which you are entitled.

Possible Risks:

Anthrax Vaccine:
The most common side effects are a sharp stinging or burning in your arm right after the shot. This pain usually goes away within a minute. Like many vaccines, the anthrax vaccine can cause soreness, redness, itching, and swelling in the arm that can last up to a week. A lump at the site is common. It usually goes away in a few weeks without treatment. From 5% to 35% of people who get the vaccine will have muscle aches, joint aches, headaches, malaise, rashes, chills, low-grade fever, or nausea. These symptoms usually go away within a week.

Any vaccine can cause serious problems, which may require a hospital stay. For anthrax vaccine, these serious problems, such as allergic reactions, happen less than once in every 100,000 doses. Some people have reported serious chronic illnesses like Guillan-Barre Syndrome (a muscle weakness disease), chronic joint diseases or had miscarriages and infertility after getting the anthrax vaccine. Data from over 500,000 people worldwide who did get the anthrax vaccine so far suggests that people who get the vaccine have the same chance of getting these health problems as people who do not get the vaccine.

The anthrax vaccine cannot give you anthrax disease.

Although unconfirmed, a recent preliminary study suggests that the vaccine may be linked with an increase in the number of birth defects when given during pregnancy. At this time no one knows for sure whether this vaccine can cause fetal harm.

If you have the Human Immunodeficiency Virus (HIV) or another health problem that affects your immune system (such as if you are being given drugs to treat cancer), seek the advice of your program site coordinator or your personal doctor about how any medical problems you might have may be affected by receiving anthrax vaccine. New findings that we discover in this program will be reported to the site program coordinator and provided to you by them.

Antibiotic Use:
Drugs may have side effects. Read the fact sheets on the three drugs. These describe the risks from taking each drug. Women should take note of potential problems to use of drugs during pregnancy. Follow medical advice carefully.

Please report any side effects you have in the first 6 weeks to your site program coordinator (as listed on your emergency contact sheet). After 6 weeks, please report side effects that you have by mailing a Vaccine Adverse Events Reporting Form (VAERS) to the address on the form (PO Box 110 Rockville MD 20849-1100) and fax the VAERS form and Cover Sheet to the CDC's Central Processing Center at 1-404-639-8548. You will also need to report these side effects to MedWatch by calling1-800-FDA-1088 or by faxing the MedWatch form to 1-800-FDA-0178.

Possible Benefits:

We do not know if there is a risk of disease among people who have been exposed to anthrax spores and have taken 60 days of antibiotics. However, if there is such a risk, then either 40 days

of additional antibiotics or 40 days of additional antibiotics and the vaccine may be of benefit in reducing the risk of disease.

Alternatives:

Anthrax vaccine is only available to you at this time through this program.

If you do not want to take the vaccine, you may continue to take drugs either through this program or through your doctor.

You also have the choice to not take extra drugs.

Costs:

Participants in this program will receive free of charge the vaccine and/or drugs and all services necessary to administer the vaccine. You will be responsible for your routine medical costs and charges not related to this program.

Injury:

If you are hurt as a result of being in this program, treatment will not be provided by HHS and may not be provided by [this site]. You (or your insurer, Medicare, or Medicaid) will be expected to pay for any care that is needed. By signing this consent form and agreeing to be in this program, you are not giving up any of your rights. If you believe that you have been injured, please contact the National Immunization Information Hotline at 1-800-232-2522 (for Spanish speakers, call 1800-232-0233) for information on your rights and advice on how to proceed.

Privacy:

Your privacy will be protected to the extent legally possible. Information obtained from this program may be published. We would not publish your name or other information that would identify you personally. The CDC, (local site), the vaccine maker, and the FDA will be allowed to review medical and program records as part of their duty to protect people involved in this program.

<u>If you have any questions:</u>
If you have any questions about this program or want to report any side effects, you may contact the site program coordinator. If you have questions regarding your rights as a program participant, you may contact CDC Deputy Associate Director for Science (1-800-584-8814).

Consent:

A member of the program staff has explained this document in detail to me, and I freely consent to join this program. I understand the following:

- I may continue to take drugs alone to prevent anthrax disease and that these are likely to be effective so long as I continue medication.

- If I choose to receive the vaccine as given in this program, I am unlikely to develop long-lasting immunity to anthrax.
- There have been no human studies to date that have shown whether the vaccine can be effective when given after exposure to anthrax spores.
- The anthrax vaccine or the drugs can cause rare serious adverse reactions.
- The doctors in charge may remove me from the program without my consent, if it is in my best interest medically.
- The risks and benefits of taking this vaccine.
- That I may refuse to join or may drop out at any time without penalty or loss of benefits.

I have been given the time to ask questions freely and had them answered to my satisfaction. I have been given a copy of this informed consent form. I understand that nothing contained in this informed consent waives any of my legal rights as a volunteer.

Please check one:

CHARTER

DoD Select Agents Response Task Force

1. PURPOSE. The Department of Defense (DoD) Select Agents Response Task Force (SARTF) will develop near-term, detailed contingency medical plans for protecting against, and responding to a smallpox outbreak or influenza pandemic affecting DoD installations or units both in CONUS or OCONUS. These plans will be coordinated with response plans being developed by the Department of Health and Humans Services. The Task Force will be co-chaired by Health Affairs and the Anthrax Vaccine Immunization Program Agency.

2. BACKGROUND. In the May 28, 2002 memorandum (Subject: Support for an Accelerated Vaccine Planning Effort), the ASD(HA) tasked each Service to nominate one expert from clinical medicine, medical planning, and medical logistics by June 3, 2002 to be on the task force. HA will then select one person from each of the Services' nominees to be members of the task force on a full-time basis for 4 months. The task force will be established June 11, 2002 and end on October 11, 2002.

3. ASSUMPTIONS.

- The task force will operate from June 11, 2002 until October 11, 2002.
- Office space, automation and administrative support will be provided for the task force members.
- No TDY funds will be available for nominees from outside the DC-metropolitan area. TDY funds for such individuals nominated by the Services who are selected to serve on the task force will have to be provided by the nominating Service.
- TDY funds to support the activities of the task force members (e.g., any meetings at the Centers for Disease Control and Prevention in Atlanta) will be provided by Health Affairs.
- Task force members will have at least a "Secret" clearance.
- The vaccines available to be utilized in response to a smallpox event will be INDs. The contingency plans will be adjusted when approved vaccines become available.

4. GOALS. The goals of the DoD Select Agents Response Task Force are:

- Develop an executable, detailed DoD Smallpox Response Plan using the CDC Smallpox Response Plan as a template with details specific to DoD situations;

- Develop an executable, detailed DoD Pandemic Influenza Response plan using the CDC Pandemic Response Plan as a template with details specific to DoD situations;

- Initiate reiterative planning at the Service-level such that detailed, Service implementation plans in support of the DoD plan are complete by the end of the same 4-month period;

- Coordinate/integrate DoD plans with HHS/CDC plans as appropriate;

- Provide recommendations for institutionalizing the planning process for any other select agents;

- Provide final plans by October 1, 2002.

5. MEMBERSHIP. Membership will consist of 2 co-chairs and 1 selected nominee from each of the Services for a total of 5 members. Based on recommendations from the task force chairs, technical/expert working groups will be established as needed to assist the in the performance of its functions. In addition, the task force members may request the advice of DoD and non-DoD experts to enable it to carry on its work.

6. MEETINGS. Members selected to the task force will be temporarily assigned for a period of 4 months beginning June 11, 2002, and ending October 11, 2002. The co-chairs will determine formal meetings of the task force. The first meeting of the task force will be on June 11, 2002.

WORKING GROUPS. Continuing or ad hoc working groups shall be established as needed. The co-chairs of the SARTF shall appoint members and designate one of them to serve as the chairperson. When necessary, a work group may request the advice of DoD and non-DoD consultants to enable it to carry on its work.

7. SUPPORT AGENCY. The Anthrax Vaccine Immunization Program Agency, Office of the Surgeon General, Department of the Army, has agreed to, and the Deployment Health Support Directorate, Tricare Management Agency shall also be responsible for providing administrative and staff support of the DoD SARTF. Details of that support will be coordinated by the directors of those agencies. Administrative support is defined as budgeting, funding, fiscal control, manpower control and utilization, personnel administration, security administration, space, facilities, supplies automation support, and other administrative services.

8. REPORTING CHAIN. Members of the task force will report to the Health Affairs co-chair. The co-chairs will report to the Deputy Assistant Secretary of Defense for Force Health Protection & Readiness.

9. INDIVIDUAL PROCUREMENTS. The SARTF is not authorized to advise on individual procurement actions. No matter shall be assigned to the SARTF for its consideration that would require any member of the SARTF or working groups to participate personally and substantially

in the conduct of any specific procurement or place him or her in the position of acting as a "procurement official," as that term is defined pursuant to law.

10. DELIVERABLES.

- An executable, detailed DoD Contingency Smallpox Response Plan by October 1, 2002;
- An executable, detailed DoD Contingency Pandemic Influenza Response Plan by October 1, 2002;
- Recommendations to institutionalize this planning process for other select agents;
- At least monthly progress reports and briefings to the DASD(FHP&R) and others as directed;

11. DURATION OF THE DOD SELECT AGENTS RESPONSE TASK FORCE. This charter will expire on October 11, 2002, unless renewed, or terminated earlier, by the ASDHA.

William Winkenwerder, Jr., M.D.
Assistant Secretary of Defense for Health Affairs

ASD(HA) Approval Date:

THE ASSISTANT SECRETARY OF DEFENSE

WASHINGTON, D. C. 20301-1200

MAY 2 8 2002

HEALTH AFFAIRS

MEMORANDUM FOR ASSISTANT SECRETARY OF THE ARMY (M&RA)
ASSISTANT SECRETARY OF THE NAVY (M&RA)
ASSISTANT SECRETARY OF THE AIR FORCE (M&RA)

SUBJECT: Support for an Accelerated Vaccine Planning Effort

REFERENCES: (a) DoD Directive 6205.3, "DoD Immunization Program for Biological Warfare Defense," November 26, 1993
(b) DoD Directive 5136.1, "Assistant Secretary of Defense for Health Affairs (ASD(HA))," May 27, 1994
(c) DoD Instruction 6205.2, "Immunization Requirements," October 9, 1986

Action is under way to increase interagency vaccine policy coordination to support development, production, distribution and use of vaccines for protection against biological warfare agents and other threats to public health. Within DoD, the Deputy Secretary of Defense is directing our support. In anticipation of the establishment of a more formal structure, we must immediately accelerate DoD planning and actions necessary to protect against such threats. Our initial efforts will focus on establishing a near-term contingency plan for responding to select disease outbreaks.

In order to accelerate our work, I am, under the authorities of references (a), (b), and (c), establishing a task force with the objective of submitting detailed contingency plans by October 1, 2002, with monthly interim reports to the USD(P&R). There are two immediate actions that require your assistance and support:

1. The Army, as Executive Agent for the DoD Immunization Program for Biological Warfare Defense, will have the lead for supporting the task force. This builds upon the excellent work of the Anthrax Vaccine Immunization Program (AVIP) Agency, which has already taken on broader vaccine program roles.

2. The task force will be established June 11, 2002 to develop detailed contingency plans for addressing select disease outbreaks. This task force will work full-time for four months to produce the required plans. I request that each Military Department identify appropriate military medical experts to participate on this task force. Please nominate one expert for each of the following: clinical medicine, preventive medicine, medical planning, and medical logistics by Monday, June 3, 2002. We will select one individual from each Service for participation in the task force.

This task force will work closely with representatives from the Department of Health and Human Services, and with other representatives from across the federal government. The Deputy Assistant Secretary of Defense (Force Health Protection and Readiness) will oversee the task force and report to me. I plan to work in close collaboration with the Assistant Secretary for Health, Department of Health and Human Services who has expressed a strong interest to establish joint collaboration now. The Under Secretary of Defense (Personnel & Readiness) has asked for an initial report within 4 weeks.

A meeting will be held on June 11, 2002 with the task force to further outline the requirements and expectations. My POC is COL Terry Rauch, (b)(6).

MEMORANDUM FOR SECRETARY OF THE ARMY

SUBJECT: Operational Planning for Smallpox Attack

Tom —

In your role as DoD Executive Agent for the Immunization Program for Biological Warfare Defense, I request your assistance in directing a tri-Service, multidisciplinary process team for operational planning of the Department's preparedness and response to a smallpox attack.

Our vaccine requirements and other medical assets must be correlated to a concept of operations that clearly defines our response to biowarfare attacks. Consequence management of a smallpox outbreak requires intense medical planning that is nested in an overarching operational plan. By defining our response based upon tactical assets, logistics, and doctrine, we can more effectively craft vaccine policies and other force health protection measures that support our operational objectives. In addition, it will be necessary to address how we will synchronize our efforts with other agencies involved in the Federal Response Plan. However, our initial focus should be upon the specific roles and responsibilities of DoD for ensuring the protection and readiness of the force.

In the near-term, this team should focus on the following subject areas:

- A review of existing doctrine that identifies appropriate combat health support for a smallpox attack, and the additional medical assets and policies necessary to effectively support this contingency.

- A concept of operations for DoD's medical response to domestic acts of bioterrorism involving smallpox and the necessary medical services—vaccines, evacuation assets, patient decontamination, medical logistics distribution, and other policies—that will effectively support this contingency.

- An outline of what protective measures we can implement immediately (within the next 30 days) with current resources and other constraints, and then what we can accomplish over time—3 months, 6 months, 1 year, 18 months, and 2 years.

While this initiative will focus on medical issues, it will benefit from a broad range of occupational expertise from the Services to address other relevant aspects of disaster consequence management. This planning will be valuable for the Department in shaping policy decisions, resource requirements, and training standards for these

scenarios. Additionally, it will create an operational template and planning guide for our interface with other federal agencies for responding to a biological warfare attack.

I request a concept and milestone presentation on these plans at the Executive Council for DoD Medical Programs (a regularly scheduled meeting involving medical leadership of the Services, TRICARE, Joint Staff, and Health Affairs Policy Staff) on March 6, 2002. My point of contact on this issue is Ms. Ellen Embrey, my Deputy Assistant Secretary of Defense (Force Health Protection and Readiness), at (b)(6) (b)(. I will continue to maintain oversight over this effort, and schedule subsequent meetings and planning sessions on this subject through direct coordination with the Army Surgeon General. Thank you for your assistance on this issue, and I look forward to continued dialogue on how we might proceed on this initiative.

David S. C. Chu

MEMORANDUM FOR SECRETARY OF THE ARMY

THROUGH: USD (Personnel & Readiness)

SUBJECT: Force Health Protection Recommendations for Smallpox Virus

Reference: DoDD 6205.3 DoD Immunization Program for Biological Warfare Defense

In accordance with the above Directive, I request that the Secretary of the Army, as the DoD Executive Agent for the Immunization Program for Biological Warfare Defense, provide me with recommendations to enhance total force protection against smallpox virus. These recommendations will facilitate my subsequent instructions to the Military Departments on the immunization of DoD personnel. The recommendations should address information on obtaining a portion of the current licensed vaccine stockpile, storage and distribution of the vaccine, and a plan for its use and the use of Vaccinia immune globulin. I request this information be provided within 30 days of the date of this memorandum. My point of contact for this is COL Jerry Jennings, (b)(6).

J. Jarrett Clinton, MD, MPH
Acting Assistant Secretary

USD(AT&L)

Myths and Facts About Anthrax Vaccine

- MYTH: Anthrax vaccine is dangerous and can cause death.
  FACT: Medical experts agree: no deaths and only rare serious side effects have been caused by anthrax vaccine. The Department of Defense, Food and Drug Administration, Centers for Disease Control and Prevention, and an independent panel of civilian physicians review reports of death or serious illness that might possibly be associated with anthrax vaccination. These groups all agree that anthrax vaccine is not associated with any unexpected patterns of adverse events. The National Academy of Sciences' Institute of Medicine reported in March 2002, "There is no evidence that life-threatening or permanently disabling immediate-onset adverse events occur at higher rates in individuals who have received AVA [U.S. anthrax vaccine] than in the general population." In rare cases, patients experience serious adverse effects; these are treated and followed appropriately.

- MYTH: Anthrax vaccine causes terrible side effects.
  FACT: Based on over 30 years of anthrax vaccine use, we know that severe, albeit transient, injection site reactions do occur. It is known that from 30 to 60 percent of people who receive anthrax vaccine will develop an injection site reaction (less than one inch). About 1 in 100 develops a reaction five inches in diameter or larger. The rate of side effects away from the injection site is about the same as other vaccines: from 5 to 35 percent, with these events going away within a few days. The National Academy of Sciences' Institute of Medicine reported in March 2002, "Local events, especially redness, swelling, or nodules at the injection site, are associated with receipt of AVA [U.S. anthrax vaccine], are similar to the events observed following receipt of other vaccines currently in use by adults, and are fairly common" and "There is no evidence that life-threatening or permanently disabling immediate-onset adverse events occur at higher rates in individuals who have received AVA than in the general population."

- MYTH: Women have long-term side effects from anthrax vaccine more than men.
  FACT: Women experience more small injection site reactions than men. For skin reactions smaller than one inch in diameter, the likelihood is 60 percent for women and 30 percent for men. For side effects away from the injection site, the rates for men and women are about the same.

- MYTH: Antibiotics are more effective than anthrax vaccine.
  FACT: There is no better round-the-clock protection against anthrax infection than the anthrax vaccine. Antibiotics are effective when started immediately or very soon after exposure. However, not all exposures can be predicted in advance or even determined in very early stages, particularly in certain military situations. In such situations, the consequences for military personnel and their mission could be dire. This is not a risk DoD can afford to take. DoD will therefore vaccinate ahead of time for the best protection.

- MYTH: Anthrax vaccine only protects against cutaneous anthrax.
  FACT: While no vaccine is 100% effective, this vaccine will greatly reduce the risk of contracting anthrax regardless of route of exposure. Based on human and animal data, the National Academy of Sciences' Institute of Medicine concluded in March 2002 that anthrax vaccine is "an effective vaccine for the protection of humans against anthrax, including inhalational anthrax, caused by all known or plausible engineered strains of *Bacillus anthracis*."

- MYTH: Anthrax vaccine won't protect against all strains of anthrax.
  FACT: Every disease-causing strain of *Bacillus anthracis* produces the same protein, a protein that is required to cause disease. The vaccine induces the production of antibodies that neutralize that protein. The National Academy of Sciences' Institute of Medicine concluded in March 2002 that "it is unlikely that either naturally-occurring or anthrax strains with bioengineered protective antigen could both evade AVA [the U.S. anthrax vaccine] and cause the toxicity associated with anthrax."

- MYTH: Some lots of anthrax vaccine cause more problems than other lots.
  FACT: Based on self-administered surveys and spontaneous reports, lot-to-lot comparisons in the various human safety studies performed to date found no meaningful differences based on lot. No vial of anthrax vaccine was distributed by the manufacturer without lot-specific manufacturing and testing data, explicitly reviewed and approved by the Food and Drug Administration (FDA). The Department of Defense uses only vaccine lots that the FDA released as meeting all applicable standards.

- MYTH: The anthrax vaccine is based on old technology.
  FACT: Anthrax vaccine was invented using mid-century technology that also led to highly successful vaccines against tetanus, diphtheria, and other infectious diseases. Today's manufacturing of anthrax vaccine by BioPort meets all current Food and Drug Administration standards of production.

- MYTH: The Department of Defense added squalene, an oil naturally produced in the human body and by bacteria, to the vaccine in 1990-91 to stretch the supply.
  FACT: No one added squalene to anthrax vaccine. Food and Drug Administration (FDA) scientists found trace quantities of squalene in anthrax, diphtheria, and tetanus vaccines (less than the natural level of squalene in the human bloodstream). The FDA notes that these minute quantities could have come from the bacteria involved or from processing during FDA tests (squalene is present in the oil in fingerprints). The FDA called the squalene in vaccines "naturally occurring and safe."

- MYTH: The Food and Drug Administration revoked the license of BioPort, the Department of Defense's vaccine supplier, because of manufacturing problems.
  FACT: BioPort's predecessor, the Michigan Biological Products Institute (MBPI), owned by the State of Michigan, approved renovations in 1995 for the Lansing

facility. In 1997, the Food and Drug Administration (FDA) issued a notice of intent to revoke licenses issued to MBPI. MBPI responded within 30 days with a strategic plan for compliance to FDA standards. The manufacturer voluntarily closed the anthrax vaccine production line in January 1998 for renovation. BioPort submitted a highly detailed set of quality control documents to FDA in fall 2001. FDA approved BioPort's facilities and processes, as they relate to the manufacture of anthrax vaccine, on January 31, 2002.

- MYTH: The Centers for Disease Control and Prevention use of anthrax vaccine to Congressional staff and U.S. Postal Service workers was "experimental" and "investigational," requiring informed consent, so the Department of Defense's use of anthrax vaccine requires consent from servicemembers as well.
  FACT: The Department of Defense's use of anthrax vaccine in the Anthrax Vaccine Immunization Program for pre-exposure prevention using six doses over eighteen months is consistent with the Food and Drug Administration-licensed use of the vaccine. The Centers for Disease Control and Prevention offer of anthrax vaccine for Congressional and U.S. Postal Service workers used anthrax vaccine for "post-exposure prophylaxis" in three doses. This is not a Food and Drug Administration-licensed use of the vaccine, therefore, in that case (post-exposure), the vaccine was administered under an "investigational new drug" protocol, with informed consent.

- MYTH: The anthrax vaccine can cause miscarriages.
  FACT: There is no study to support this claim. Consistent with the national standard and the Centers for Disease Control and Prevention recommendation, the Department of Defense policy does not vaccinate pregnant woman. Women who receive the vaccine get pregnant and deliver children at the same rates as unvaccinated women. A preliminary report (not yet published, not reviewed by peer scientists) suggested that women vaccinated during pregnancy might have an elevated rate of birth defects. However, medical scientists and study experts who have reviewed this preliminary information expressed concerns about the study's methods, and recommended further analysis. The Department of Defense is working with the Centers for Disease Control and Prevention to see if these preliminary data are accurate, or if they are not.

COMMENTS ABOUT ANTHRAX VACCINE

SAFETY AND EFFECTIVENESS

"The committee finds that the available evidence from studies with humans and animals, coupled with reasonable assumptions of analogy, shows that AVA [anthrax vaccine adsorbed] as licensed is an effective vaccine for the protection of humans against anthrax, including inhalational anthrax, caused by all known or plausible engineered strains of *B. anthracis*."

Institute of Medicine Report: *The Anthrax Vaccine: Is it Safe? Does it Work?* Washington, DC: National Academy of Sciences, March 6, 2002.

"The committee found no evidence that people face an increased risk of experiencing life-threatening or permanently disabling adverse events immediately after receiving AVA, when compared with the general population. Nor did it find any convincing evidence that people face elevated risk of developing adverse health effects over the longer term, although data are limited in this regard (as they are for all vaccines)."

Institute of Medicine Report: *The Anthrax Vaccine: Is it Safe? Does it Work?* Washington, DC: National Academy of Sciences, March 6, 2002.

"The range of reported side effects experienced by recipients of the anthrax vaccine are in line with previously published reports and compatible with similar vaccines. There are no convincing data demonstrating long-term adverse health impacts to recipients of anthrax vaccine, although additional studies are in progress."

Armed Forces Epidemiological Board (AFEB), civilian physicians and scientists advising the Surgeons General, report of March 1, 2002.

"The Food and Drug Administration's approval to resume production of the anthrax vaccine is welcome news for our fight against bioterrorism. For more than 30 years, the anthrax vaccine has been a safe and effective way to protect people from this deadly disease. Health officials did the right thing in providing vaccine to Congressional and postal workers. Anthrax spores can remain in the lungs for extended periods."

Louis W. Sullivan, M.D., president of the Morehouse School of Medicine, former secretary of health and human services from 1989-93, as published in *New York Times*, February 10, 2002.

"Evidence indicates that this vaccine is effective in preventing cutaneous and inhalational anthrax; it is recommended for laboratory workers who routinely work with *B. anthracis* and workers who handle potentially contaminated industrial raw materials. It may also be used to protect military personnel against potential exposure to anthrax used as a biological warfare agent. Annual booster injections are recommended if the risk of exposure continues."

James Chin, MD, MPH, Editor, *Control of Communicable Diseases Manual*, 17th Edition, 2000.

"The AFEB was concerned and somewhat surprised at the criticism surrounding the program given the high level of professionalism that had characterized this effort. ... Anthrax vaccine is a fully licensed FDA vaccine. The vaccine does cause local side effects, but has an excellent safety profile. The Anthrax Vaccine Immunization Program has carefully tabulated person-specific immunization data and has assiduously investigated reported complications associated with receipt of anthrax vaccine. These data have been regularly reviewed by the board and attest to the safety of the vaccine."

Armed Forces Epidemiological Board (AFEB), civilian physicians and scientists advising the Surgeons General (http://www.tricare.osd.mil/afeb/), report of March 29, 2000.

"I think what we can talk about is the vaccine and the studies that have been done to show both its safety and efficacy, and the FDA has been involved in those studies, and it is on that basis that we can say the vaccine is safe, and it's also effective."

David Satcher, MD, PhD, Surgeon General of the United States, To U.S. House of Representatives Committee on Government Reform, August 3, 1999.

"The only known effective prevention against anthrax is the anthrax vaccine. Treatment of cutaneous anthrax infection involves administration of antibiotics. In the case of pulmonary anthrax infection, therapy has been of limited benefit, except when given immediately after exposure."

Later, page 19, **"Mr. Chairman, we believe anthrax vaccine is a safe and effective vaccine for the prevention of anthrax disease – an often-fatal disease. Our confidence in this vaccine, like all vaccines, is based upon four components: first - the clinical trials and subsequent clinical laboratory experience with the vaccine; second - ongoing inspections of the manufacturing facility; third – our lot release requirements; and fourth - our ongoing collection of adverse event reports. We will continue our**

efforts in all four of these areas, with the anthrax vaccine and all vaccines, to assure that only safe products are on the market."

Kathryn C. Zoon, Ph.D., Director, Center For Biologics Evaluation And Research (CBER), Food & Drug Administration (FDA), To U.S. House of Representatives Subcommittee on National Security, Veterans' Affairs and International Relations, Committee on Government Reform, Hearing on DoD's Anthrax Vaccine Immunization Program, April 29, 1999.

"Mr. Chairman, we are aware that some people question the safety and efficacy of the anthrax vaccine. Let me be clear. We believe that for persons at high risk the licensed anthrax vaccine is safe and effective for the prevention of the often-fatal anthrax disease."

Kathryn C. Zoon, Ph.D., Director, Center for Biologics Evaluation and Research (CBER), Food & Drug Administration (FDA), To U.S. House of Representatives Subcommittee on National Security, Veterans' Affairs and International Relations, Committee on Government Reform, Hearing on DoD's Anthrax Vaccine Immunization Program, April 29, 1999.

"Killed anthrax vaccines appear to be effective in reducing the risk of contracting anthrax with a relatively low rate of adverse effects. Further research should be restricted to testing new vaccines only."

The Cochrane Collaboration, internationally respected group of scientists who apply principles called evidence-based medicine (http://www.cochrane.org), "The effectiveness and safety of vaccines against human anthrax: A systematic review," *Vaccine* 1998; volume *16:* pages 880-884

THREAT

"Anthrax represents the primary biological warfare threat to United States forces and interest. It is the most widely adopted agent in foreign biological warfare programs. An attack will likely come with little to no warning with potential catastrophic impact. Because of this, anthrax deserves its reputation as an effective and deadly biological warfare agent."

Rear Admiral Lowell Jacoby, United States Navy, Director of Intelligence, Joint Staff J2, To U.S. Senate Committee on Armed Services, Hearing to Review the DoD Anthrax Vaccine Immunization Program, April 13, 2000.

CONGRESSIONAL SUPPORT

"And in my view, there's no question when you move into an area of possible risk with anthrax that you should vaccinate."

Later. **"I've supported this program from that—from my perspective, my training and what I know about the disease. I think it would be unconscionable for us to knowingly allow our troops to be at risk from a credible, military threat of weaponized anthrax simply because misinformation and fear have seized control of this issue."**

Senator Wayne Allard, a veterinarian, U.S. Senate Committee on Armed Services, Hearing to Review the DoD Anthrax Vaccine Immunization Program, April 13, 2000.

COMMENTS FROM THE TROOPS

"I view the anthrax vaccine is similar to any other force protection measure that I receive or use. I may not need the protection every day, but I never know when I'll need it. Consequently, for my safety and the safety of my teammates, I want all the protection I can get."

Later. **"From my personal standpoint, and what I've observed in my team, taking the anthrax vaccine has not been an issue. I'm aware that there is information out that attempts to discredit this vaccine, however, I'm also aware that this is an FDA-approved vaccine and has been used successfully for years."**

Lieutenant (Junior Grade) Chris Rohrbach, United States Navy, Assistant Officer in Charge, Bravo Platoon, Special Warfare Group 8, Little Creek Virginia, To U.S. House of Representatives Subcommittee on Military Personnel, Committee on Armed Services, Hearing on the Anthrax Vaccine Immunization Program, September 30, 1999.

"I believe it's [the threat's] very real. In fact, I'd feel very uncomfortable going into, going in harm's way with a teammate of mine that hasn't been vaccinated against the anthrax. That is one more casualty I'll have to worry about. If he gets vaccinated for anthrax, that's, as far as I'm concerned, that's one less thing that I need to worry about."

Lieutenant James Randall, United States Navy, Head, Training Department, Special Warfare Group, To U.S. House of Representatives Subcommittee on Military Personnel, Committee on Armed Services, Hearing on the Anthrax Vaccine Immunization Program, September 30, 1999.

Department of Defense Policy

The Department of Defense will resume the Anthrax Vaccine Immunization Program (AVIP) consistent with U.S. Food and Drug Administration approved labeling and the best practice of medicine. Our policy is to immunize military personnel, Emergency-Essential DoD civilians and contractor personnel, assigned to or deployed for more than 15 days in higher threat areas whose performance is essential for certain mission critical capabilities.

Frequently Asked Questions

What Is Anthrax ?

- Anthrax is a robust spore-forming bacterium (*Bacillus anthracis*) that can be stored for years, loaded into a variety of weapons, and produced in large quantities without sophisticated equipment. Inhaled anthrax is 99% lethal in an unprotected, unvaccinated population, left untreated.

Is Anthrax A Biological Warfare Threat ?

- The threat is real and failure to prepare would result in grave consequences. A former Director of the Central Intelligence Agency, James Woolsey, referred to it as "the single most dangerous threat to our national security in the foreseeable future."
- Several countries have or are developing an offensive biological warfare capability using anthrax.
- What we know about Iraq's offensive biological warfare capability to deliver anthrax and their intent to use it: Iraq conducted weapons tests in 1990; biological warfare bombs and warheads were moved to forward locations during the Gulf War; thousands of pounds of anthrax agent were loaded into missiles, aerial bombs, and spray tanks; and blood testing of Iraqi defectors yielded evidence of immunization against anthrax.
- Admissions in the post-Cold War era of the former Soviet Union's massive biological warfare capability confirmed their anthrax and smallpox programs were highly developed.

Why Not A Voluntary Program For Servicemembers ?

- It is important that Department of Defense personnel whose duties are essential to mission critical capabilities are vaccinated against anthrax, both for their personal protection and for success of the military mission. So vaccination will be mandatory, except as provided under applicable medical and administrative exemption policies, similar to those DoD always had in place. Vaccination offers an extra layer of protection in addition to antibiotics and other measures that is needed for certain members of the Armed Forces.
- We provide many different vaccines and medical procedures on a mandatory basis, when it is known that the vaccine or medical measure is safe and effective, and exposure or possible exposure to an agent poses a real risk. Also, we fight and win as teams—if one or several team members in areas of higher risk are not vaccinated and fall victim to anthrax, they could jeopardize the lives of other team members and mission success.
- There is a long history of compulsory vaccination within the U.S. Armed Forces—tetanus, typhoid, and yellow fever vaccines were required of World War II soldiers with the following results:
  - 0 cases of yellow fever
  - 12 cases of tetanus—despite 2.7 million hospital admissions for wounds and injuries
  - 5 cases per 100,000 of typhoid fever—compared to 42 cases per 100,000 in World War I.
- The Centers for Disease Control and Prevention's (CDC) use of anthrax vaccine recently with Congressional and Postal Service employees was done with informed consent...some insist the Department of Defense should obtain informed consent of Service Members before anthrax vaccination. The Department of Defense's use of anthrax vaccine in the Anthrax Vaccine Immunization Program for pre-exposure prevention using six doses over 18 months is consistent with the Food and Drug Administration-licensed use of the vaccine. The Centers for Disease Control and Prevention offer of anthrax vaccine for Congressional and U.S. Postal Service workers used anthrax vaccine for "post-exposure prophylaxis" in three doses. This is not a Food and Drug Administration-licensed use of the vaccine. Therefore, in that case (post exposure), the vaccine was administered under an "investigational new drug" protocol, which required informed consent.

- Some persons say just use antibiotics instead of anthrax vaccine, but there is no better round-the-clock protection against anthrax infection than the anthrax vaccine. Antibiotics are effective when started immediately or very soon after exposure. However, not all exposures can be predicted in advance or even determined in very early stages, particularly in certain military situations. In such situations, the consequences for military personnel and their mission could be dire. This is not a risk we can afford to take. DoD will therefore vaccinate ahead of time for the best protection.

Is Disciplinary Action Taken Against Servicemembers Who Refuse ?

- We anticipate that very few, if any, servicemembers will refuse to be vaccinated given more recent knowledge about the threat of anthrax and also about the validated safety and effectiveness of the vaccine. However, we begin with the assumption that any servicemember covered by this new mandatory policy who refuses vaccination may be uninformed about the facts related to the deadly effects of the anthrax agent and the safe protection afforded by the vaccine. Our first action with those who might refuse the vaccine will be to determine their concern and provide information.
- This is a force health protection issue. If a servicemember continues to refuse the vaccine, then a commander will manage the situation as he or she would for any failure to obey a lawful order, including educating the members about the AVIP as appropriate.
- We expect servicemembers to comply with administration of this vaccine as for any other mandatory vaccination. It is comparable to an order to wear body armor during armed engagement, or to don a protective mask in a suspected chemically or biologically contaminated environment. Any servicemember who does not comply with these measures endangers his/her own health, and places both their unit and mission accomplishment at risk.
- Military and civilian judges uniformly have found orders for members to be vaccinated to be lawful orders.

Vaccine Efficacy Studies Against Anthrax ?

- Field studies conducted in the late 1950s by Centers for Disease Control and Prevention researchers demonstrated more than 90 percent vaccine effectiveness in humans (jointly against cutaneous and inhaled anthrax).
- Animal studies consistently demonstrate protection—non-human primates with only one or two doses survived lethal challenges over 500 times the median lethal dose (LD_{50}) up to 2 years later. In all, 62 of 65 vaccinated monkeys (95 percent) survived inhalation challenge, but 0 of 18 unvaccinated monkeys (0 percent) survived. Similarly, 114 of 117 vaccinated rabbits survived, but unvaccinated rabbits died.
- The Food and Drug Administration licensed anthrax vaccine as a safe and effective prevention against *Bacillus anthracis*—the bacterium causing anthrax. The Food and Drug Administration reaffirmed this position in numerous testimonies to Congressional committees over the past three years. Based on human and animal data, the National Academy of Sciences' Institute of Medicine concluded in March 2002 that anthrax vaccine is "an effective vaccine for the protection of humans against anthrax, including inhalational anthrax, caused by all known or plausible engineered strains of *Bacillus anthracis*."

Is Anthrax Vaccine Safe ?

- 18 safety studies of more than 500,000 vaccine recipients establish the safety of anthrax vaccine.
- Based on over 30 years of anthrax vaccine use, we know that severe, albeit transient, injection site reactions do occur. Mild injection site reactions, such as redness, swelling, and tenderness (less than one inch), occur in up to 30 percent of men and 60 percent of women. About 1 in 100 develops a reaction five inches or larger. Such symptoms resolve on their own in a few days.
- The rate of side effects away from the injection site—like fatigue, headache, muscle or joint pain—occur in 5 to 35 percent of vaccine recipients; again, they typically resolve within 24 to 48 hours. As the National Academy of Sciences noted in their March 2002 report, these rates are similar to other vaccines.
- Medical experts agree: no death and only rare serious side effects have been caused by anthrax vaccine. The Department of Defense, Food and Drug Administration, Centers for Disease Control and Prevention, and an independent panel of civilian physicians review every report of serious illness or death that might possibly be associated with anthrax vaccination. These groups all agree that anthrax vaccine is not associated with any unexpected patterns of adverse events. The National Academy of Sciences' Institute of Medicine reported in March 2002, "There is no evidence that life-threatening or permanently disabling immediate-onset adverse events occur at higher rates in individuals who have received AVA [U.S. anthrax vaccine] than in the general population." In rare cases, patients experience serious adverse effects; these are treated and followed appropriately.

- If a servicemember has a serious reaction to anthrax vaccine, he/she will be exempted from further doses and will receive full medical care. This policy is the same policy as for any vaccination or any service-connected event.
- As of May 2002, the Department of Defense administered more than 2.1 million doses of anthrax vaccine to more than 525,000 servicemembers, with very few serious adverse events.
- The anthrax vaccine was invented using mid-century technology that also led to highly successful vaccines against tetanus, diphtheria, and other infectious diseases. Today's manufacturing of anthrax vaccine by BioPort meets all current Food and Drug Administration standards of production.
- The Food and Drug Administration approved the renovations to BioPort's anthrax vaccine manufacturing facilities and processes. The license to manufacture anthrax vaccine has been valid without interruption since 1970. BioPort's license was amended and approved by the FDA to reflect the renovated facilities and processes.

Have Long-Term Cancer And Fertility Studies Been Conducted On Anthrax Vaccine ?

- Virtually no vaccine is studied longitudinally for cancer or effects on reproductive health, largely because such problems have not previously been seen with any vaccine. Prevailing scientific knowledge, based on literally billions of vaccinations administered since 1796, is that vaccines do not cause such problems; the manufacturing process and constituents of anthrax vaccine are essentially the same as other vaccines.
- Polio, hepatitis B, tetanus, diphtheria, typhoid, measles-mumps-rubella (MMR), and many other vaccines have nearly identical comments in their product labeling regarding the lack of long-term studies for cancer and fertility.

If Personnel Deferred Dosing During The "Slowdown," Do They Have To Start The 6-Shot Series Over Again?

- No. Based on experience with anthrax vaccine and other vaccines, there is no need to restart a multi-dose vaccine series. Civilian medical experts advising the Centers for Disease Control and Prevention recommend this practice. Each dose is like climbing a set of stairs toward full immunity. DoD will continue to study the protection conferred with fewer than six doses.

What About Allegations Of Expired And Contaminated Lots Of Vaccine?

- The Food and Drug Administration individually approves each lot before release.

Is DoD Planning To Use All Of The Anthrax Vaccine Produced By BioPort?

- No. DoD's policy took into account other national security considerations beyond the needs for military personnel. A certain amount of the produced vaccine will be reserved for contingency use by other federal agencies.
- The Office of Homeland Security heads the planning effort among federal agencies for contingency use of the vaccine.

Are There Vaccine Resistant Strains Of Anthrax ?

- Every disease-causing strain of *Bacillus anthracis* produces the same protein, a protein that is required to cause disease. The vaccine induces the production of antibiotics that neutralize that protein. The National Academy of Sciences' Institute of Medicine concluded in March 2002 that "it is unlikely that either naturally occurring or anthrax strains with bioengineered protective antigen could both evade AVA [the U.S. anthrax vaccine] and cause the toxicity associated with anthrax."

What About Squalene ?

- Squalene (a substance naturally found in the human body) has never been added to anthrax vaccine. Food and Drug Administration (FDA) scientists found trace quantities of squalene in anthrax, diphtheria, and tetanus vaccines (less than the natural level of squalene in the human bloodstream). The FDA notes that these minute quantities could have come from the bacteria involved or from processing during FDA tests (squalene is present in the oil in fingerprints). The FDA called squalene in vaccines "naturally occurring and safe."

Department of Defense Policy

The Department of Defense will resume the Anthrax Vaccine Immunization Program (AVIP) consistent with U.S. Food and Drug Administration approved labeling and the best practice of medicine. Our policy is to immunize military personnel, Emergency-Essential DoD civilians and contractor personnel, assigned to or deployed for more than 15 days in higher threat areas whose performance is essential for certain mission critical capabilities.

Frequently Asked Questions

What Is Anthrax ?

- Anthrax is a robust spore-forming bacterium (*Bacillus anthracis*) that can be stored for years, loaded into a variety of weapons, and produced in large quantities without sophisticated equipment. Inhaled anthrax is 99% lethal in an unprotected, unvaccinated population, left untreated.

Is Anthrax A Biological Warfare Threat ?

- The threat is real and failure to prepare would result in grave consequences. A former Director of the Central Intelligence Agency, James Woolsey, referred to it as "the single most dangerous threat to our national security in the foreseeable future."
- Several countries have or are developing an offensive biological warfare capability using anthrax.
- What we know about Iraq's offensive biological warfare capability to deliver anthrax and their intent to use it: Iraq conducted weapons tests in 1990; biological warfare bombs and warheads were moved to forward locations during the Gulf War; thousands of pounds of anthrax agent were loaded into missiles, aerial bombs, and spray tanks; and blood testing of Iraqi defectors yielded evidence of immunization against anthrax.
- Admissions in the post-Cold War era of the former Soviet Union's massive biological warfare capability confirmed their anthrax and smallpox programs were highly developed.

Why Not A Voluntary Program For Servicemembers ?

- It is important that Department of Defense personnel whose duties are essential to mission critical capabilities are vaccinated against anthrax, both for their personal protection and for success of the military mission. So vaccination will be mandatory, except as provided under applicable medical and administrative exemption policies, similar to those DoD always had in place. Vaccination offers an extra layer of protection in addition to antibiotics and other measures that is needed for certain members of the Armed Forces.
- We provide many different vaccines and medical procedures on a mandatory basis, when it is known that the vaccine or medical measure is safe and effective, and exposure or possible exposure to an agent poses a real risk. Also, we fight and win as teams—if one or several team members in areas of higher risk are not vaccinated and fall victim to anthrax, they could jeopardize the lives of other team members and mission success.
- There is a long history of compulsory vaccination within the U.S. Armed Forces—tetanus, typhoid, and yellow fever vaccines were required of World War II soldiers with the following results:
  - 0 cases of yellow fever
  - 12 cases of tetanus—despite 2.7 million hospital admissions for wounds and injuries
  - 5 cases per 100,000 of typhoid fever—compared to 42 cases per 100,000 in World War I.
- The Centers for Disease Control and Prevention's (CDC) use of anthrax vaccine recently with Congressional and Postal Service employees was done with informed consent...some insist the Department of Defense should obtain informed consent of Service Members before anthrax vaccination. The Department of Defense's use of anthrax vaccine in the Anthrax Vaccine Immunization Program for pre-exposure prevention using six doses over 18 months is consistent with the Food and Drug Administration-licensed use of the vaccine. The Centers for Disease Control and Prevention offer of anthrax vaccine for Congressional and U.S. Postal Service workers used anthrax vaccine for "post-exposure prophylaxis" in three doses. This is not a Food and Drug Administration-licensed use of the vaccine. Therefore, in that case (post exposure), the vaccine was administered under an "investigational new drug" protocol, which required informed consent.

- Some persons say just use antibiotics instead of anthrax vaccine, but there is no better round-the-clock protection against anthrax infection than the anthrax vaccine. Antibiotics are effective when started immediately or very soon after exposure. However, not all exposures can be predicted in advance or even determined in very early stages, particularly in certain military situations. In such situations, the consequences for military personnel and their mission could be dire. This is not a risk we can afford to take. DoD will therefore vaccinate ahead of time for the best protection.

Is Disciplinary Action Taken Against Servicemembers Who Refuse ?

- We anticipate that very few, if any, servicemembers will refuse to be vaccinated given more recent knowledge about the threat of anthrax and also about the validated safety and effectiveness of the vaccine. However, we begin with the assumption that any servicemember covered by this new mandatory policy who refuses vaccination may be uninformed about the facts related to the deadly effects of the anthrax agent and the safe protection afforded by the vaccine. Our first action with those who might refuse the vaccine will be to determine their concern and provide information.
- This is a force health protection issue. If a servicemember continues to refuse the vaccine, then a commander will manage the situation as he or she would for any failure to obey a lawful order, including educating the members about the AVIP as appropriate.
- We expect servicemembers to comply with administration of this vaccine as for any other mandatory vaccination. It is comparable to an order to wear body armor during armed engagement, or to don a protective mask in a suspected chemically or biologically contaminated environment. Any servicemember who does not comply with these measures endangers his/her own health, and places both their unit and mission accomplishment at risk.
- Military and civilian judges uniformly have found orders for members to be vaccinated to be lawful orders.

Vaccine Efficacy Studies Against Anthrax ?

- Field studies conducted in the late 1950s by Centers for Disease Control and Prevention researchers demonstrated more than 90 percent vaccine effectiveness in humans (jointly against cutaneous and inhaled anthrax).
- Animal studies consistently demonstrate protection—non-human primates with only one or two doses survived lethal challenges over 500 times the median lethal dose (LD_{50}) up to 2 years later. In all, 62 of 65 vaccinated monkeys (95 percent) survived inhalation challenge, but 0 of 18 unvaccinated monkeys (0 percent) survived. Similarly, 114 of 117 vaccinated rabbits survived, but unvaccinated rabbits died.
- The Food and Drug Administration licensed anthrax vaccine as a safe and effective prevention against *Bacillus anthracis*—the bacterium causing anthrax. The Food and Drug Administration reaffirmed this position in numerous testimonies to Congressional committees over the past three years. Based on human and animal data, the National Academy of Sciences' Institute of Medicine concluded in March 2002 that anthrax vaccine is "an effective vaccine for the protection of humans against anthrax, including inhalational anthrax, caused by all known or plausible engineered strains of *Bacillus anthracis*."

Is Anthrax Vaccine Safe ?

- 18 safety studies of more than 500,000 vaccine recipients establish the safety of anthrax vaccine.
- Based on over 30 years of anthrax vaccine use, we know that severe, albeit transient, injection site reactions do occur. Mild injection site reactions, such as redness, swelling, and tenderness (less than one inch), occur in up to 30 percent of men and 60 percent of women. About 1 in 100 develops a reaction five inches or larger. Such symptoms resolve on their own in a few days.
- The rate of side effects away from the injection site—like fatigue, headache, muscle or joint pain—occur in 5 to 35 percent of vaccine recipients; again, they typically resolve within 24 to 48 hours. As the National Academy of Sciences noted in their March 2002 report, these rates are similar to other vaccines.
- Medical experts agree: no death and only rare serious side effects have been caused by anthrax vaccine. The Department of Defense, Food and Drug Administration, Centers for Disease Control and Prevention, and an independent panel of civilian physicians review every report of serious illness or death that might possibly be associated with anthrax vaccination. These groups all agree that anthrax vaccine is not associated with any unexpected patterns of adverse events. The National Academy of Sciences' Institute of Medicine reported in March 2002, "There is no evidence that life-threatening or permanently disabling immediate-onset adverse events occur at higher rates in individuals who have received AVA [U.S. anthrax vaccine] than in the general population." In rare cases, patients experience serious adverse effects; these are treated and followed appropriately.

- If a servicemember has a serious reaction to anthrax vaccine, he/she will be exempted from further doses and will receive full medical care. This policy is the same policy as for any vaccination or any service-connected event.
- As of May 2002, the Department of Defense administered more than 2.1 million doses of anthrax vaccine to more than 525,000 servicemembers, with very few serious adverse events.
- The anthrax vaccine was invented using mid-century technology that also led to highly successful vaccines against tetanus, diphtheria, and other infectious diseases. Today's manufacturing of anthrax vaccine by BioPort meets all current Food and Drug Administration standards of production.
- The Food and Drug Administration approved the renovations to BioPort's anthrax vaccine manufacturing facilities and processes. The license to manufacture anthrax vaccine has been valid without interruption since 1970. BioPort's license was amended and approved by the FDA to reflect the renovated facilities and processes.

Have Long-Term Cancer And Fertility Studies Been Conducted On Anthrax Vaccine ?

- Virtually no vaccine is studied longitudinally for cancer or effects on reproductive health, largely because such problems have not previously been seen with any vaccine. Prevailing scientific knowledge, based on literally billions of vaccinations administered since 1796, is that vaccines do not cause such problems; the manufacturing process and constituents of anthrax vaccine are essentially the same as other vaccines.
- Polio, hepatitis B, tetanus, diphtheria, typhoid, measles-mumps-rubella (MMR), and many other vaccines have nearly identical comments in their product labeling regarding the lack of long-term studies for cancer and fertility.

If Personnel Deferred Dosing During The "Slowdown," Do They Have To Start The 6-Shot Series Over Again?

- No. Based on experience with anthrax vaccine and other vaccines, there is no need to restart a multi-dose vaccine series. Civilian medical experts advising the Centers for Disease Control and Prevention recommend this practice. Each dose is like climbing a set of stairs toward full immunity. DoD will continue to study the protection conferred with fewer than six doses.

What About Allegations Of Expired And Contaminated Lots Of Vaccine?

- The Food and Drug Administration individually approves each lot before release.

Is DoD Planning To Use All Of The Anthrax Vaccine Produced By BioPort?

- No. DoD's policy took into account other national security considerations beyond the needs for military personnel. A certain amount of the produced vaccine will be reserved for contingency use by other federal agencies.
- The Office of Homeland Security heads the planning effort among federal agencies for contingency use of the vaccine.

Are There Vaccine Resistant Strains Of Anthrax ?

- Every disease-causing strain of *Bacillus anthracis* produces the same protein, a protein that is required to cause disease. The vaccine induces the production of antibiotics that neutralize that protein. The National Academy of Sciences' Institute of Medicine concluded in March 2002 that "it is unlikely that either naturally occurring or anthrax strains with bioengineered protective antigen could both evade AVA [the U.S. anthrax vaccine] and cause the toxicity associated with anthrax."

What About Squalene ?

- Squalene (a substance naturally found in the human body) has never been added to anthrax vaccine. Food and Drug Administration (FDA) scientists found trace quantities of squalene in anthrax, diphtheria, and tetanus vaccines (less than the natural level of squalene in the human bloodstream). The FDA notes that these minute quantities could have come from the bacteria involved or from processing during FDA tests (squalene is present in the oil in fingerprints). The FDA called squalene in vaccines "naturally occurring and safe."

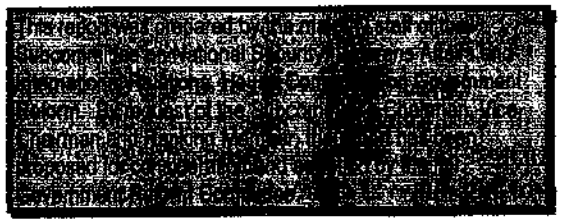
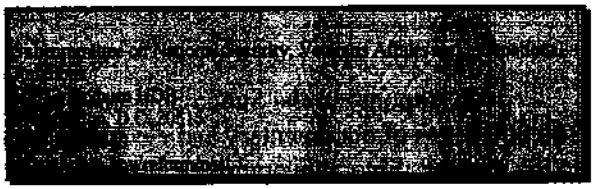
Discussion

Findings
Recommendations





February 17, 2000 (2:27PM)

THE DEPARTMENT OF DEFENSE
ANTHRAX VACCINE IMMUNIZATION PROGRAM:

UNPROVEN FORCE PROTECTION

Summary

Responding to service members= complaints of program insensitivity to adverse health effects, inadequate medical record keeping and heavy-handed program operation, the Subcommittee initiated an oversight investigation into the design and implementation of the Department of Defense (DOD) force-wide, mandatory Anthrax Vaccine Immunization Program (AVIP). Because the anthrax vaccine is still being studied as a potential causative or contributing factor in Gulf War veterans= illnesses[1], the Subcommittee measured the program against this standard: Any expanded use of the same vaccine should be undertaken only with the greatest care and only to the extent necessary.

As currently designed and implemented, the anthrax vaccine program fails on both counts. The AVIP lacks a consistent standard of care and is designed to reach far beyond those at risk.

Based on the testimonial and documentary record[2], the Subcommittee finds the AVIP a well-intentioned but overwrought response to the threat of anthrax as a biological weapon. Against the so-called Aasymmetric≅ threats to U.S. conventional military superiority posed by a growing range of chemical and biological weapons, the anthrax vaccine program represents a medical Maginot Line, a fixed fortification protecting against attack from only one direction.

---

[1] P.L. 105-277, Title XVI, sec. 1603(d).

[2] In response to the Subcommittee=s investigative requests, DOD provided more than 100,000 pages of documentary and electronic records on the anthrax vaccine program from 1991 to the present. Five Subcommittee hearings were held in 1999, encompassing 20 hours of testimony from 46 witnesses. The full Committee on Government Reform also heard testimony on the subject of vaccines for military defense on October 12, 1999.

Unrealistic Program

As a mandatory, force-wide countermeasure to the real threat of weaponized anthrax on the battlefield, the vaccine effort is unrealistic. It expands and distorts the use of invasive, dated medical technology to address perceived weaknesses in detection technology and external physical protection against biological attack. Born of a post-Gulf War panic over apparent weaknesses in chemical and biological (CB) warfare defenses, the AVIP is an unmanageably broad military undertaking built on a dangerously narrow scientific and medical foundation.

At best, the vaccine provides some measure of protection to most who receive it. Just how much protection is acquired, by whom, for how long and against what level of challenge are questions DOD answers with an excess of faith but a paucity of science.

Many members of the armed forces do not share that faith. They do not believe merely suggestive evidence of vaccine efficacy outweighs their concerns over the lack of evidence of long term vaccine safety. Nor do they trust DOD has learned the lessons of past military medical mistakes: atomic testing, Agent Orange, Persian Gulf War drugs and vaccines. Heavy handed, one-sided informational materials only fuel suspicions the program understates adverse reaction risks in order to magnify the relative, admittedly marginal, benefits of the vaccine.

As a military operation, the AVIP rests on weak conceptual and logistical footing. It suffers from poor planning, inflexible execution and over-extended supply lines. As a health care effort, the AVIP compromises the practice of medicine to achieve military objectives.

The decision to use the 1950's era vaccine, which requires an elaborate inoculation regime of six shots over 18 months, presents daunting, perhaps insurmountable, logistical challenges to reach a force of 2.4 million active duty and reserve component members. Research to support a shorter, more manageable inoculation regimen was not completed before the AVIP was launched. Development of a purer, potentially less reactogenic anthrax vaccine using recombinant technologies was not pursued aggressively.

Unstable Supply

The sole-source procurement strategy leaves the program vulnerable to supply shortages and price increases. Because Food and Drug Administration (FDA) regulations require a dedicated production facility for spore-based biologics, other pharmaceutical firms will not commit the time and capital needed to manufacture an old vaccine for a very limited market. As a result DOD and the sole vaccine maker are locked in a mutually dependent relationship.

The manufacturer, struggling to reopen a plant with a checkered regulatory history, clings to a captive customer. Threats to stop production render DOD unable to resist demands for extraordinary financial relief and pressure to permit the use of publicly funded improvements to monopolize the private domestic and foreign markets as well.

Uncertain Safety

Incurious reliance on FDA approval of the vaccine as Asafe≅ for occupational exposure blinds the program to potential adverse reaction trends in a vastly expanded, demographically diverse population of vaccine recipients. Adverse events following vaccination are reported by women at twice the rate among men. The vaccine may be as safe as many other approved products, but valid data to support, or refute, that proposition will not come from the AVIP. Preposterously low adverse report rates generated by DOD point to a program far more concerned with public relations than effective force protection or the practice of medicine.

The AVIP raises an ominous question: Who protects the force from ill-conceived force protection? The anthrax vaccine effort is designated a Acommander=s program≅ not a medical program, so DOD doctors appear unable to act as advocates for individual patients in the face of command pressure to meet force-wide inoculation levels. FDA regulations reach only the vaccine producer, the BioPort Corporation, not the activities of the vaccine purveyor, the Pentagon, although for purposes of the AVIP the distinction is meaningless.

Untested Efficacy

Administration of the anthrax vaccine for mass prophylaxis against biological warfare should be considered an off-label use of the product to treat an indication for which it is not explicitly licensed. DOD=s operational use of a standard of Afunctional protection≅ after three inoculations constitutes a *de facto* alteration of the approved six shot regimen. Both the new indication and the new schedule should be undertaken only pursuant to FDA regulations governing clinical trials of investigational new drugs (IND).

Under supervision of the FDA and an Institutional Review Board (IRB), DOD would be required to inform vaccine recipients adequately, obtain informed consent and gather data on vaccine safety consistently. If necessary, DOD could request the president waive the informed consent requirement for certain deployed personnel under the statute, regulation and Executive Order that provide far greater protections to service members than the process used for similar waivers during the Gulf War.[3]

[3] 10 U.S.C. 1107(f); 21 CFR Part 50; Executive Order of September 30, 1999 (No. 13139).

Findings in Brief

1. **The AVIP is a well-intentioned but over-broad response to the anthrax threat.** It represents a doctrinal departure overemphasizing the role of medical intervention in force protection.

2. **The AVIP is vulnerable to supply shortages and price increases.** The sole-source procurement of a vaccine that requires a dedicated production facility leaves DOD captive to old technology and a single, untested company. Research and development on a second-generation, recombinant vaccine would allow others to compete.

3. **The AVIP is logistically too complex to succeed.** Adherence to the rigid schedule of six inoculations over 18 months for 2.4 million members of a mobile force is unlikely, particularly in reserve components. Using an artificial standard that counts only shots more than 30 days overdue, DOD tolerates serious deviations from the Food and Drug Administration (FDA) approved schedule.

4. **Safety of the vaccine is not being monitored adequately.** The program is predisposed to ignore or understate potential safety problems due to reliance on a passive adverse event surveillance system and DOD institutional resistance to associating health effects with the vaccine.

5. **Efficacy of the vaccine against biological warfare is uncertain.** The vaccine was approved for protection against cutaneous (under the skin) infection in an occupational setting, not for use as mass protection against weaponized, aerosolized anthrax.

Recommendations in Brief

1. The force-wide, mandatory AVIP should be suspended until DOD obtains approval for use of an improved vaccine. To accomplish this:

    2. DOD should accelerate research and testing on a second-generation, recombinant anthrax vaccine; and,

    3. DOD should pursue testing of the safety and efficacy of a shorter anthrax inoculation regimen; and,

    4. DOD should enroll all anthrax vaccine recipients in a comprehensive clinical evaluation and treatment program for long term study.

5. While an improved vaccine is being developed, use of the current anthrax vaccine for force protection against biological warfare should be considered experimental and undertaken only pursuant to FDA regulations governing investigational testing for a new indication.

Background

The Program

On December 15, 1997, after what DOD described as Aa detailed, deliberative process≅ spanning almost four years[4], Secretary of Defense William S. Cohen announced a program to immunize all active duty personnel against anthrax, a bacterial disease that in spore form can be used as a biological weapon. The effort is called the Anthrax Vaccine Immunization Program (AVIP).[5]

The program was designed to be implemented in three phases[6]:

Phase I	(3/98 - 1/00)	Forces assigned or rotating to high threat areas	400,000
Phase II	(1/00 - 1/04)	Early deploying forces into high threat areas	1,000,000
Phase III	(10/02 - 9/06)	Remainder of the total force, boosters, etc.	1,000,000

The AVIP is a medical force protection effort undertaken by DOD pursuant to a 1993 policy calling for immunizations Aagainst validated biological warfare threat agents, for which suitable vaccines are available, in sufficient time to develop immunity before deployment to high-threat areas...≅[7]

[7] Department of Defense, DOD Directive 6205.3, ADOD Immunization Program for Biological Warfare Defense.≅ November 26, 1993. Other elements of force protection include

intelligence about threats, detection capability, physical protection (suits, masks, etc.), post-exposure treatment with antisera and antibiotics, and strategic deterrence. In the Gulf War, up to 150,000 U.S. service personnel received one or two doses of the anthrax vaccine along with other immunizations and medications. Due to poor or non-existent record keeping, however, DOD is unable to conduct a systematic follow-up on the health effects, if any, of the Gulf War vaccines.

According to the DOD news release announcing the vaccine program, AAfter a three year study, Secretary of Defense William S. Cohen concluded that the vaccination is the safest way to protect highly mobile U.S. military forces against a potential threat that is 99 percent lethal to unprotected individuals.≅[8] Cohen added, ATo be effective, medical force protection must be comprehensive, well documented and consistent. I have instructed the military to put such a program in place.≅[9]

Accordingly, Secretary Cohen set four conditions on the start of vaccinations:

1) supplemental testing to assure sterility, safety, potency and purity of the vaccine stockpile;
2) implementation of a system for fully tracking anthrax immunizations;
3) approval of operational plans to administer the vaccine and communications plans to inform military pers
4) review of medical aspects of the program by an independent expert.[10]

In 1998, supplemental testing of the anthrax vaccine stockpile began.[11] An elaborate interim record keeping and tracking system was designed to combine vaccination data from the three military services into an existing central data base, the Defense Enrollment Eligibility Reporting System (DEERS).[12] A more efficient, centralized immunization records system is under development.[13] Communication plans were approved centered around a Atri-fold≅ brochure to be given to service personnel.[14] An anthrax vaccine web site was also created.[15] A physician reviewed the AVIP program plans.[16]

In March 1998, at the request of the regional commander, 48,000 troops assigned to the Persian Gulf area began the vaccination series. On May 18, 1998, Secretary Cohen pronounced

the four conditions fulfilled and approved the total force program, which began in September with troops in Korea.[17]

DOD cited several factors to support the conclusion the anthrax vaccine is both safe for widespread use and effective against the most likely anthrax threat:

1) FDA approval and monitoring of the vaccine;
2) vaccine usage since approval;
3) assured production capacity;
4) independent medical review;
5) supplemental vaccine testing; and

6) vaccine tests in animals.[18]

FDA Approval of the Vaccine

The AVIP uses the only anthrax vaccine licensed for manufacture in the United States. Anthrax Vaccine Absorbed (AVA) was approved as safe in 1970 based on animal studies and one study of wool workers exposed to indeterminate levels of cutaneous (through skin) and airborne anthrax spores. The disease primarily infects grazing animals and the vaccine has been used since 1970 by some veterinarians, livestock workers and researchers at risk from exposure. The approved immunization process requires a fixed schedule of six injections over 18 months and an annual booster. The vaccine does not contain live anthrax bacteria, but challenges the immune system to mount a response to filtered elements of the killed bacteria absorbed into an adjuvant.[19]

Subsequent FDA review of the studies in 1985 concluded the vaccine was safe, Afairly well tolerated,= and effective against cutaneous anthrax, but that data from both human and animal tests was insufficient to support a finding of efficacy with regard to airborne exposure.[20] In analyzing the benefit/risk ratio of classifying the old vaccine as compliant under new FDA standards, the expert panel concluded, AThis vaccine is recommended for a ***limited, high-risk of exposure population*** along with other industrial safety measures designed to minimize contact with potentially contaminated material. The benefit-to-risk assessment is satisfactory *under the prevailing circumstances of use.*=[21] (emphasis added)

The sole producer of the vaccine is the Michigan Biologics Products Institute (MBPI), formerly the Michigan Public Health Department. Since licensure in 1970, FDA monitoring of the vaccine consisted of collecting adverse reaction data and conducting intermittent manufacturing plant inspections.

[21] *Ibid.*

While detailed information on inspection activities prior to 1990 is not readily available, FDA regulatory scrutiny of the manufacturer has been increasing since then. The Lansing, Michigan facility has been cited repeatedly by the FDA for quality control deficiencies and Anumerous significant deviations from the Federal Food, Drug and Cosmetic Act, FDA=s regulations and the standards in MBPI=s license.≅[22] In March 1997, the FDA warned MBPI that steps would be taken to revoke production licenses, including anthrax vaccine, unless immediate actions were taken to correct longstanding deficiencies.[23] In March 1998 the plant was closed for $1.8 million in renovations and a $15 million expansion funded by DOD.[24] Vaccine production resumed in May 1999, but neither the renovated facility nor any newly produced vaccine lots have been approved by the FDA.[25]

See also, prepared statement of BG Eddie Cain, Joint Program Manager, Joint Program Office for Biological Defense, NSVAIR Hearing (II), p. 68.

Under FDA regulations, stockpiled lots must be tested for potency at predetermined intervals. Potency test are done using guinea pigs by comparing the survival rates of animals vaccinated with the test lot(s) against those vaccinated with a previously manufactured control or Areference≅ lot. Potency test failures during the DOD supplemental testing program have raised questions regarding the validity of test procedures and the selection of reference lots.[27]

Assured Production Capacity

MPBI was purchased in September 1998 by the BioPort Corporation, a new company formed by private investors, including former Joint Chiefs Chairman Adm. William J. Crowe. The next month BioPort was awarded a DOD contract valued at $29 million to produce anthrax vaccine for the AVIP.[28] The contract (DAMD17-98-C 8052) provides for a one year Base Period and two option years. The contract provides for a full-term, fixed price, fixed annual quantity because Athe Government currently requires all the AVA [anthrax vaccine absorbed] that BioPort can produce.≅ Under the agreement, BioPort will receive progress payments at various stages of the anthrax vaccine production process.

On August 5, 1999, DOD announced the contract had been Arestructured≅ to increase the price by $24.1 million, including $18.7 million of advance payments.[29]

This contract, and earlier contracts with MPBI and MDPH, were accompanied by a justification and authorization for other than full and open competition (sole source). The sole source procurement was authorized because AMichigan Biologics Products Institute (MBPI) is the only organization in the U.S. with a Food and Drug Administration (FDA) License to

manufacture AVA≅ and A[d]ue to the time and expense required to produce a licenced product, investing in alternate manufacturers is not considered to be an effective way of meeting the Government=s requirements.≅[30] DOD also indemnified MBPI/BioPort against liability arising from Athe risks of adverse reactions, or the failure to confer immunity against anthrax....≅[31]

[30] Joseph S. Little *A*Justification and Approval for Other than Full and Open Competition,≅ Anthrax Vaccine Absorbed, DAMD17-97-0014 (JPO 0836) May 20, 1997 (in subcommittee files).

[31] Memorandum of Decision, Secretary of the Army Louis Caldera, Authority Under Public Law 85-804 to include an Indemnification clause in Contract DAMD 17-91-C-1139 With Michigan Biologic Products Institute, September 3, 1998 (in subcommittee files).

Potential liability resulting from adverse events was a major issue for the anthrax vaccine manufacturer even when the vaccine was used by a only few hundred people each year. In 1986, Secretary of the Army John Marsh, Jr. authorized indemnification of the State of Michigan Department of Public Health, which would not provide the vaccine without indemnification due to Athe possibility that persons vaccinated may develop anaphylaxis or some unforeseen reaction of serious consequences, including death.≅[32]

In 1992, Secretary of the Army Togo West, Jr. approved a request to indemnify the anthrax vaccine manufacturer, the Michigan Biologics Product Institute (MBPI), against all liability arising from:

> Athe unusually hazardous risks associated with potentially severe adverse reactions and the potential lack of efficacy of the AVA. These concerns stem from: a) the *limited use of the vaccine to date*, i.e., tests prior to approval of the vaccine by the Food and Drug Administration are on *too small a scale to permit accurate assessment of types and severity of adverse reactions (only widespread use can provide this assessment)*; and b) insufficient experience in mass immunization programs to truly evaluate the efficacy of the vaccine. Moreover, there is no way to predict whether the pathogen against which the vaccine may be used will be sufficiently similar to the pathogen used in tests to ensure vaccine efficacy.≅[33] [emphasis added]

In 1998, Secretary of the Army Louis Caldera again authorized indemnification of MBPI because Athe size of the proposed vaccination program may reveal unforwarned idiosyncratic

[33] Memorandum of Decision, Secretary of the Army Togo West, Jr., Authority under P.L. 85-804 to Include an Indemnification Clause in Contract DAMD17-91-C-1139 with the Michigan Biologic Products Institute [undated] (in subcommittee files).

adverse reactions.≅[34] The contracting officer justified the later indemnification request, in part, because, ASince 1990, approximately 600,000 doses have been issued from MBPI=s stockpile. The limited use of AVA to date versus the large number of doses that are being stockpiled and subject to use may expand the data base to a point where the statistical significance of a predicted adverse reaction may become a reality.≅[35]

[34] See *supra* note 31.

[35] Joseph S. Little, Contracting Officer, AContracting Officer=s Request for Authorization for Indemnification Under Authority of Public Law 85-804,≅ Oct. 8, 1997, p. 3 (in subcommittee files).

Following the Gulf War, and prior to adoption of the DOD immunization policy in 1993, and the mandated AVIP in 1998, Pentagon officials considered and rejected alternative anthrax vaccine production sites.[36] Instead, an acquisition strategy was adopted focusing solely on the MBPI/BioPort vaccine.[37]

Vaccine Usage and Safety

DOD literature says the anthrax vaccine Ahas been safely and routinely administered in the United States to veterinarians, laboratory workers, and livestock handlers for more than twenty-five years.≅[38] Testimony at the March 24 hearing indicated between 100 and 300 civilians may receive the vaccine each year. Since approval, and prior to the AVIP, fewer than 68,000 doses had been distributed apart from stocks used in Operation Desert Storm.[39]

As with any vaccine, anthrax inoculation can cause adverse health events in some individuals, ranging from soreness or swelling at the injection site (local reactions) to fevers, chills, muscle aches and anaphylaxis[40] (systemic reactions). Local reaction may be mild,

[40] Anaphylaxis is one form of hypersensitivity to a drug or antigen. Anaphylactic shock is an often severe, sometimes fatal, physical reaction characterized by respiratory symptoms,

moderate or severe enough to require medical attention. Systemic reactions are generally considered clinically more significant. Reactions may increase in severity after successive injections.[41]

fainting, swelling and itching.

[41] Michigan Biologic Products Institute, AAnthrax Vaccine Absorbed: How Supplied, References, Description, Clinical Pharmacology, Indications and Usage, Contraindications, Warnings, Precautions, Adverse Reactions, Dosage and Administration,≅ FDA License No. 99, Rev. Feb. 1998 (in subcommittee files).

The AVA has been described as a relatively crude, imprecisely characterized vaccine, and estimates of reaction rates vary widely.[42] According to the FDA-approved AVA product labeling, 30 percent of vaccine recipients can be expected to suffer mild local reactions, 4 percent will incur moderate local reactions and less than .2 percent will experience systemic reactions.[43] In 1994 and 1995, DOD considered the need for a new anthrax vaccine Abased on the reactogenicity of the current vaccine.≅[44]

To avoid adverse reactions, the vaccine should not be given to those who experienced a severe reaction to a previous dose or to those with acute respiratory disease or an active infection. Immune compromised persons (i.e. HIV infected) may not respond to the vaccine. It is not recommended for pregnant women or for those under 18 or over 65 years of age.[45]

The Army Anthrax Vaccine Immunization Plan directs medical personnel to report severe adverse reactions (resulting in hospitalization or more than 24 hours lost from duty) through the Vaccine Adverse Events Reporting System (VAERS) administered by the Department of Health and Human Services (HHS).[46] Within HHS, VAERS is a joint project of the Centers for Disease Control (CDC) and the Food and Drug Administration (FDA).[47] VAERS guidance recommends recording any clinically significant symptoms occurring subsequent to vaccine administration, whether or not a causal relationship has been established between the vaccine and the adverse reaction.[48]

The Army Medical Surveillance Activity also receives copies of VAERS forms from all the uniformed Services and produces a quarterly report for the U.S. Army Medical Command.[49] The Army Surgeon General has requested the assistance of the HHS Vaccine Injury Compensation Program in evaluating all anthrax-related VAERS data.[50]

National Security, Veterans Affairs, and International Relations hearing of July 21, 1999) [hereinafter ANSVAIR Anthrax Hearing (IV)≡] [The Subcommittee hearing has not yet been printed. Page numbers in this and subsequent references to statements at this hearing refer to individual prepared written statements or the unofficial transcript, held in subcommittee files.] (prepared statement of Gen. Robert Claypool, p. 13-14).

The AVIP convened a clinical conference in May 1999 to discuss anthrax issues, including adverse events. Col. Renata Engler, M.D., Chief, Allergy-Immunology Department, Walter Reed Army Medical Center, presented data from ongoing research and case studies showing higher adverse reaction rates in women.[51] Also discussed at the conference was the Army Surgeon General=s proposed longitudinal cohort study to assess near-term and long-term health effects of the anthrax vaccine.[52]

To convey important information about medical exemptions and adverse reactions, the Army implementation plan directs commanders and medical staff to provide recipients Aadequate information on the vaccine, its safety, its benefits, and the need for adherence to the immunization schedule prior to the first anthrax vaccination.≅[53] The other Service implementation plans contain identical or similar requirements.

On April 1, 1999, VAERS data (1990 to 1999) contained 101 reports of adverse events associated with anthrax inoculation, 14 of which were considered serious.[54] In May 1999, DOD reported a total of 123 VAERS filings with FDA, but included only 65 of those in the caculation of an adverse reaction rate of .007 percent of 890,888 vaccinations given to date. According to DOD, only 11 VAERS reports Amet strict reporting requirements.≅[55]

[55] Department of Defense, Briefing Slide:*A*Anthrax Vaccine Adverse Events-Vaccine Adverse Event Reporting System (VAERS) Military - Week Ending May 21, 1999" May 28,

1999 (in subcommittee files).

A review of the AVIP plans, and of basic literature on the anthrax vaccine, was conducted by Dr. Gerard N. Burrow, of the Yale University School of Medicine.[56] According to Dr. Burrow[57], he conducted his review over three months, read materials provided by DOD and interviewed Pentagon officials responsible for designing and implementing the program. On February 19, 1998, in a four page letter, he concluded, AThe anthrax vaccine appears to be safe and offers the best available protection against wild-type anthrax as a biological warfare agent.≅ The letter contains two paragraphs on safety and efficacy. Regarding the safety of the vaccine stockpile, all of which was manufactured under conditions cited by FDA as deficient, Dr. Burrow pointed to the DOD supplemental testing program, and the fact that AFDA directed MBPI to do a comprehensive review to demonstrate that deviations in biologic product lines did not impact anthrax vaccine quality and integrity. The results of this review should be available in the near future.≅[58] Regarding efficacy of the vaccine, the letter recites usage figures since approval in 1970 and cites the conclusion of an unpublished DOD study that Aunit effectiveness could best be preserved through the use of pre-deployment vaccination.≅[59]

In a letter to the Subcommittee in response to a request to testify on his review of the program, Dr. Burrow wrote:

> Unfortunately, I do not believe I can make a significant contribution to the work of your Committee. I chaired the Institute of Medicine Committee that reviewed the Defense Department program for clinical care of Gulf War veterans in active service and interacted with personnel in the Office of Health Affairs. The Defense Department was looking for someone to review the program in general and make suggestions, and I accepted out of patriotism. I was very clear that ***I had no expertise in Anthrax*** and they were clear that they were looking for a general oversight of the vaccination program.
>
> I visited the Pentagon on a number of occasions, talked with a variety of people in and out of government and presented my report which you have to the Secretary on March 2, 1998. ***I had no access to classified information.*** ...≅[60] (emphasis added)

Supplemental Testing

---

[56] See *supra* note 16.

[57] In an April 16, 1999 telephone conversation with Subcommittee staff, Dr. Burrow said his charge was a general review of the program, and that as an internist, he has little experience with vaccines. His primary recommendation was the use of focus groups of military personnel to determine appropriate communication strategies.

[58] See *supra* note 16.

[59] *Ibid.*

[60] Letter from Dr. Gerard N. Burrow, Yale University School of Medicine, to Rep. Christopher Shays, April 26, 1999 (in subcommittee files).

To address concerns over the age and quality of stockpiled vaccine, DOD undertook an effort to re-test the product before use. A contractor was retained to conduct supplemental testing of vaccine lots, all of which had been manufactured in an aging production facility, and some of which had been approved by the FDA for use beyond the initial expiration date.

Mitretek Systems Inc. reviewed vaccine production records and observed additional testing conducted by BioPort personnel.[61] Of the 31 vaccine lots[62] subjected by DOD to supplemental testing, 18 remained unavailable as of July, 1999 due to unresolved purity, potency or sterility issues.[63]

Some involved in the program opposed supplemental testing as redundant and likely to cause more problems than it solved by establishing a self-imposed vaccine safety standard in addition to FDA lot-release criteria.[64] Their concerns were validated when the supplemental testing program appears to have overwhelmed the MBPI/BioPort testing capabilities, producing anomalous results and delaying the program.[65] Once the testing problems became apparent, vaccine lots not technically in the stockpile when the AVIP was announced were not subjected to the supplemental assays under the rationale the FDA was requiring the same tests for lot release.[66] All the lots submitted for supplemental testing had also undergone the same FDA lot

release protocols.

Animal Data on Efficacy

DOD=s determination the vaccine affords protection against virtually all strains of airborne anthrax spores rests primarily on studies of vaccinated animals (guinea pigs, rabbits and monkeys) challenged with various strains of the disease.[67] But widely varied results within and between animal species suggest variable modes of protection not necessarily correlated to antibody levels stimulated by the vaccine.[68] Without a proven model in animals that is known to correlate to protection in humans, animal data remains only suggestive.

[67] Testimony of Dr. Sue Bailey, DOD Assistant Secretary for Health Affairs, NSVAIR Anthrax Hearing (I), p. 11.

[68] Prepared statement of Dr. Meryl Nass, NSVAIR Anthrax Hearing (II) p. 108-111.

Vaccine-acquired anthrax immunity may also be limited or overwhelmed when the subject is challenged with variant anthrax stains.[69] A report by the Senate Committee on Veterans= Affairs concluded that:

> Adata suggests that the vaccine can protect humans against inhaled anthrax but to date there is inadequate information to judge how well it works, particularly against weaponized anthrax, which could cause exposure to greater concentrations of anthrax than has occurred among workers exposed on the job.≅[70]

In response to questions regarding the efficacy of the vaccine against antibiotic resistant or genetically altered anthrax strains, DOD said

> AThe current US-licensed anthrax vaccine is considered to be highly effective against naturally occurring strains of anthrax, including antibiotic resistant strains. The development of genetically engineered organisms using anthrax or any other biological warfare agent is a potential threat that must be evaluated carefully. We are not aware, however, of any information to suggest that these modified strains have been used in any context other than the research laboratory.≅[71]

When one U.S. laboratory studying the release of anthrax at Sverdlovsk implied the Russian mixtures of anthrax strains might overcome the protection afforded by the anthrax vaccine, DOD persuaded the author Ato correct the press release to make it more accurate. The modification stated, in part, Athere is no experimental data or evidence to suggest that such a mixture is resistant to the FDA-licensed anthrax vaccine used by the US military.≅[72]

Opposition to the AVIP

Some have refused the vaccine. Active duty personnel have been disciplined under service-specific policies for refusing a lawful order. Reservists and National Guard members have resigned or transferred to units or Anon-mobility≅ positions which do not require the vaccine. The DOD does not collect uniform records on refusals, but media reports indicate more than 300

Michael Shepard, NSVAIR Anthrax Hearing (II), p. 193; testimony of Major Cheryl Hansen, NSVAIR Anthrax Hearing (V), p. 31.

Gulf War Veterans Act of 1998, enacted as Title XVI of the 1998 Omnibus Appropriations Act, P.L. 105-277. The law directs IOM to review associations between illnesses and wartime exposures that warrant a presumption of service-connection for sick Gulf War veterans.[76] That study is ongoing.

Efforts to meet Secretary Cohen=s four preconditions to AVIP implementation, intended to address likely reservations about the program, have only served to intensify concerns:[77]

1. Problems with supplemental testing underscore vaccine safety and production issues. The failure to test all lots produced before the plant closed suggests to some the promise of supplemental testing was not fulfilled.

[76] P.L. 105-277, title XVI.

[77] Letter from Reps. Benjamin Gilman (NY), et. al. to Defense Secretary William Cohen, July 20, 1999, p. 1 (in subcommittee files).

2. The prerequisite communication effort engenders resentment and mistrust as simplistic DOD attempts at education and risk communication portray very limited vaccine use as Aroutine≅[78] and attack those with legitimate questions as Aparanoics≅[79] and simple-minded victims of Internet propaganda.[80]

3. Delays in posting data to the tracking system reduce its value as a real time indicator of medical readiness and increases tolerance of deviations in the FDA approved inoculation regimen.[81]

4. Contrary to subsequent DOD characterizations, the promised outside, expert, scientific review of the program was only very general in nature.[82]

Others question the necessity of the program, asking whether it betrays a lack of confidence in deterrence and other force protection elements, and suggesting a vaccine program makes anthrax attack more, not less, likely.[83]

[83] Testimony of Capt. Thomas Rempfer, NSVAIR Anthrax Hearing (I), p. 40-41; testimony of Maj. Russell Dingle, NSVAIR Anthrax Hearing (I), p.49.

Hearings and Legislative Proposals

On March 24, 1999 the Subcommittee on National Security, Veterans Affairs and International Relations held the first of five hearings on the Department of Defense (DOD) Anthrax Vaccination Immunization Program (AVIP). Entitled, AOversight of the Anthrax Vaccine Inoculation Program,≅ the hearing examined the effectiveness and efficiency of the AVIP as a medical force protection measure, a record keeping initiative and long term procurement. The Subcommittee heard testimony from Dr. Sue Bailey, Assistant Secretary for Health Affairs, U.S. Department of Defense, accompanied by, Lt. Gen. Ronald R. Blanck, U.S. Army; Rear Admiral Todd Fisher, Deputy Surgeon General U.S. Navy; and Lt. Gen. Charles H. Roadman, II, U.S. Air Force; Capt. Thomas Rempfer, Connecticut Air National Guard; Maj. Russell Dingle, Connecticut Air National Guard; Pfc. Stephen M. Lundbom, U.S. Marine Corps; Attorney Mark Zaid; Col. Redmond Handy, Member Reserve Officer Association; and Lorene K. Greenleaf.

On April 29, 1999, the Subcommittee held a hearing on the AVIP entitled, AAnthrax (II): Safety and Efficacy of the Mandatory Vaccine.≅ The purpose of this hearing was to examine the vaccine=s safety and effectiveness against an aerosolized biological weapons attack. Individuals who testified disputed the Department of Defense claim the vaccine is unquestionably safe for force wide use. Some who testified are experiencing serious illnesses they associate with the anthrax vaccine. Testimony was received from Kwai-Cheung Chan, Director, Special Studies and Evaluations Section, National Security and International Affairs Division, General Accounting Office; Dr. Katherine Zoon, Director, Center for Biologics Evaluation and Research, Food and Drug Administration; Dr. Michael Gilbreath, Medical Project Manager, Joint Program Office for Biological Defense; Dr. Robert Myers, Chief Operating Officer, BioPort Corporation; Dr. Meryl Nass; David Churchill; Randi Martin-Allaire; Roberta Groll; and Michael Shepard.

On June 30, 1999 the Subcommittee held a hearing entitled, A Oversight of DOD Sole Source Anthrax Vaccine Procurement.≅ The primary focus was to examine AVIP acquisition strategies and procurement activities pursued by the Department of Defense to purchase the vaccine. Issues examined included the technical and financial ability of BioPort to supply the vaccine at the contracted price, and the effect of management problems on the safety and the quality of the vaccine produced. Testimony was given by Louis J. Rodrigues, Director, Defense Acquisition Issues, National Security and International Affairs Division, General Accounting Office; David Oliver, Jr., Principal Deputy Under Secretary of Defense for Acquisition and Technology, Department of Defense; and Fuad El-Hibri, Chief Executive Officer, BioPort Corporation.

On July 21, 1999, the National Security Subcommittee held its fourth hearing on the AVIP. Entitled, AAnthrax Vaccine Adverse Reactions,≅ the hearing focused on the program=s willingness to recognize and ability to treat adverse reactions to the vaccine in military personnel.

[redacted]

the joint FDA/CDC Vaccine Adverse Event Reporting System (VAERS), under-reports adverse events and adverse vaccine reactions. Testifying at this hearing were CPT Michelle Piel, USAF; LT Richard Rovet, USAF; SGT Robert Soska, USA; CPT Jon Richter, USAR; Kwai-Cheung Chan, Director, Special Studies and Evaluations Section, National Security and International Affairs Division, General Accounting Office; MG Robert Claypool, Deputy Assistant Secretary for Health Operations Policy, Department of Defense accompanied by, RADM Michael Cowen, Deputy Director for Medical Readiness, Joint Staff, Department of Defense; and COL Renata Engler, Chief, Allergy-Immunology Department, Walter Reed Army Medical Center; and Dr. Susan Ellenberg, Director, Division of Biostatistics and Epidemiology, Center for Biologics Evaluation and Research, Food and Drug Administration.

The Subcommittee held its fifth hearing on the AVIP on September 29, 1999 entitled, AImpact of the Anthrax Vaccine Program on Reserve and National Guard Units.≅ The hearing examined the implementation of the AVIP in reserve component units and the impact of the program on retention, readiness and morale. Testifying at the hearing were Lt. Col. Thomas Heemstra, Indiana Air National Guard; Maj. Cheryl Hansen, Air Force Reserves; Capt. David Panzera, New York Air National Guard; Tech. Sgt. William Mangiere, New York Air National Guard; Charles Cragin, Acting Assistant Secretary for Reserve Affairs, Department of Defense, accompanied by, Maj. Gen. Paul Weaver, Jr., Director, Air National Guard, Department of Defense; Col. Frederick Gerber, Director, Health Care Operations, Office of the Army Surgeon General, Department of Defense; and Col. James Dougherty, Air Surgeon, National Guard Bureau, Department of Defense.

In the first session of the 106 Congress, two bills were introduced regarding the anthrax vaccine program:

Rep. Walter Jones (NC) introduced HR 2543 on July 16, 1999. Entitled AThe American Military Health Protection Act,≅ the bill would instruct the Department of Defense to make the anthrax vaccination immunization program voluntary for all members of the Armed Forces until the FDA has approved a new anthrax vaccine for humans or the FDA has approved a new, reduced course of shots for the current anthrax vaccine. This bill was referred to the Committee on Armed Services.

Rep. Benjamin Gilman (NY), introduced HR 2548 on July 19, 1999, cosponsored by Reps. Sue Kelly (NY) and Bob Filner (CA). HR 2548 would suspend further implementation of the Department of Defense anthrax vaccination program until the vaccine is determined to be safe and effective through a study by the National Institutes of Health. The Department of Defense Anthrax Vaccination Moratorium Act was referred to the Committee on Armed Services and to the Committee on Commerce.

The FY2000 Defense Appropriations Act (HR 2561) contained a provision directing the Comptroller General to report on: effects on morale, retention and recruiting; the civilian costs and burdens associated with adverse reactions for members of the reserve components; adequacy of long and short term health monitoring; assessment of the anthrax threat, including but not

limited to foreign doctrine, weaponization, quality of intelligence, and other biological threats. DOD was directed to contract with the National Research Council to conduct studies on: vaccine adverse events and adverse reactions, particularly among women; vaccine efficacy against inhalation anthrax; correlation of animal models to safety and efficacy in humans; research gaps; and other matters.

Discussion

Findings

1. The AVIP is a well-intentioned but over-broad response to the anthrax threat. It represents a doctrinal departure overemphasizing the role of pre-exposure medical intervention in force protection.

DOD bases the scope of AVIP on the scope of the threat, and the perceived need for additional, individual force protection to meet that threat. Threat assessment requires objective and subjective analyses of U.S. vulnerability, enemy capacity, and enemy intentions. AA threat analysis, the first step in determining risk, identifies and evaluates each threat on the basis of various factors, such as its capability and intent to attack an asset, the likelihood of a successful attack, and its lethality.≅[84]

Since the King of Athens poisoned his enemy=s wells in 600 BC and Alexander the Great hurled diseased animal corpses over the walls of a besieged city, ground forces have been vulnerable to casualties caused by natural or pernicious exposure to chemical and biological pathogens.[85] But in the absence of proven capability and intent to use biological weapons, vulnerability alone does not constitute a validated threat for purposes of determining appropriate and effective countermeasures.

Appropriately, much of the information regarding the BW capabilities and intentions of potential adversaries, and even allies, is classified. As a result, most public descriptions of the anthrax threat focus on the general vulnerability of unprotected forces to anthrax attack, the general ease and availability of anthrax production and the likely lethality of a successful anthrax attack.

[85] Dr. Stephen C. Joseph, Assistant Secretary of Defense for Health Affairs, ABiological Warfare - INFORMATION MEMORANDUM≅ (undated) p.2 (in subcommittee files).

According to various unclassified DOD statements, more than ten countries Ahave, or are developing, a biological warfare capability.≅[86] Those nations are: China, Iran, Iraq, Israel, Libya, North Korea, South Korea, Syria, Taiwan and Russia. Other public lists also include Egypt, Cuba, Japan, and the former Soviet states in Eastern Europe that may have inherited bio-warfare capabilities.[87] For purposes of the AVIP, AThe high threat areas validated by our intelligence community for the potential use of anthrax as a biological weapon of mass destruction includes [sic] Korea, Israel, Jordan, Kuwait, Saudi Arabia, Bahrain, Qatar, Oman, UAE and Yemen.≅[88] Anthrax is not seen as a threat in the Balkans.[89]

Other descriptions of the anthrax threat focus on the relative ease of acquisition, mass production and weaponization of the stable, long-lasting anthrax microbe. According to DOD, production of biological warfare agents does not require specialized equipment or advanced technology. Biological agents are more potent and efficient than chemical weapons, and can be delivered through a variety of means. Legitimate uses (i.e. vaccine manufacture) for Adual use≅ production technologies make counter-proliferation strategies difficult to implement

[89] *Ibid.*

successfully.[90]

Secretary Cohen told Members, AAnthrax poses a clear and present danger to our armed forces. It is the weapon of choice for germ warfare because it is easy to weaponize and is as lethal as the Ebola virus. At least seven potential adversaries have worked to develop the offensive use of anthrax.≅[91]

In testimony before a subcommittee of the House Armed Services Committee, Deputy Secretary of Defense John Hamre said, ACurrently, at least ten nation states and two terrorist groups are known to possess, or have in development, a biological warfare capability.≅[92]

---

[90]See *supra* note 86. The release of deadly chemical sarin gas in Tokyo by the Aum Shinrikyo cult highlighted the terrorist, and by implication, the military threat posed by chemical and biological weapons. But subsequently acquired information regarding the cult=s unsuccessful attempts to use biological agents is seen by some as a counter to the argument those agents are not technically challenging to produce and deploy.

[91]See *supra* note 66.

[92] Prepared statement of Hon. John J. Hamre, Deputy Secretary of Defense, submitted to the Subcommittee on Military Personnel, House Committee on Armed Services, p. 2, September 30, 1999.

DOD testimony to the Subcommittee portrayed the threat similarly: AAs identified by the Chairman of the Joint Chiefs of Staff, anthrax is a major threat to our troops. Anthrax is the primary biological warfare threat faced by U.S. forces. More than 10 countries, including Iraq, have or are suspected of developing this biological warfare capability. Anthrax is the biological weapon most likely to be encountered because it is highly lethal, easy to produce in large quantities, and relatively easy to develop as a weapon.≅[93]

The AVIP tri-fold brochure describes the threat as follows:

> ABiological weapons are maintained by several countries around the world. Use of these weapons could cause widespread illness among unprotected military forces.
>
> Anthrax is the biological weapon most likely to be encountered because it is:
> X Highly lethal
> X Easy to produce in large quantities
> X Relatively easy to develop as a weapon
> X Easily spread over a large area
> x Easily stored and dangerous for a long time≅[94]

Clearly, DOD has determined the threat is real and imminent, and has concluded it would be irresponsible not to deploy an available countermeasure to protect the lives and fighting capability of U.S. forces.[95]

But similar statements on the threat have been made by DOD for many years. According to GAO testimony, AThe nature and magnitude of the military threat of biological warfare (BW) has not changed since 1990, both in terms of the number of countries suspected of developing BW capability, the types of BW agents they possess, and their ability to weaponize and deliver those BW agents. Inhalation anthrax is considered by DOD to be the primary BW threat because

[94] See *supra* note 14.

[95] Prepared statement of Dr. Sue Bailey, DOD Assistant Secretary for Health Affairs, NSVAIR Anthrax Hearing (I), p. 13.

of its lethality, ease of production, and weaponization.≅[96]

[96] Prepared statement of Kwai-Cheung Chan, Director, Special Studies and Evaluation Section, National Security and International Affairs Division, U.S. General Accounting Office, NSVAIR Anthrax Hearing (II), p. 12.

According to unclassified briefing materials assessing the anthrax threat, anthrax stocks and weaponized anthrax have been confirmed only in Southwest Asia. A stock of anthrax has been confirmed in Northeast Asia. Capacity to produce and weaponize anthrax elsewhere (South Asia or transnational) is suspected but unconfirmed.[97]

Assessment of the Iraqi threat concludes that substantial anthrax production capacity exists but exceeds the ability to weaponize. While Iraq appears likely to be able to launch a BW attack using AL HUSSEIN ballistic missiles, aircraft delivery is seen as less likely due to U.S. and Coalition air superiority.[98] So Saddam would be Aunlikely to use WMD unless he perceives regime=s survival at stake.≅[99]

So the threat remains tactically limited and regional. The AVIP is universal.

Several factors appear to have fueled the 1997 decision to launch a mandatory, force-wide program to address a long acknowledged, regionally-based threat.

After the Gulf War, the Department of Defense undertook what is now characterized as Aa detailed, deliberative process≅[100] over more than three years that culminated in the conditional decision to implement a mandatory, force-wide anthrax immunization program. AAfter a three year study, the Department has concluded that the vaccination is the only safe way to protect highly mobile U.S. military forces against a potential threat that is 99 percent lethal to

unprotected individuals.≅[101]

That study was conducted, for the most part, behind closed doors. However, the documentation provided to the subcommittee by DOD[102] describes a process more predetermined than deliberative, as the obvious operational benefits of passive, pre-exposure protection (versus cumbersome protective masks and suits), and the Iraqi threat, drove the decision to use the only vaccine currently available.[103]

[101] Letter from Sandra K. Stuart, Assistant Secretary of Defense (Legislative Affairs) to The Honorable Christopher Shays (CT), p.1, December 15, 1997.

[102] Letter from Rep.Christopher Shays, Chairman, Subcommittee on National Security, Veterans Affairs and International Relations, House Committee on Government Reform to Secretary of Defense William Cohen, May 12, 1999 (in subcommittee files)

[103] Department of Defesne, Information Paper ADOD Biological Warfare Force Protection,≅ December 15, 1997, p. 2 (in subcommittee files).

In November 1993, DOD Directive 6205.3 set out a broad policy supporting immunization research, development, testing, acquisition and stockpiling of vaccines against current and emerging biological warfare threats. The directive required immunization only of Adesignated≅ or Aprogrammed≅ personnel against agents Afor which suitable vaccines are available, in sufficient time to develop immunity before deployment to high threat areas....≅[104]

With regard to anthrax, DOD conducted research and program planning to develop an Aimproved anthrax vaccine≅ (IAV) that would generate immunity against the known threat in a reasonable time. According to a DOD Operational Requirements Document (ORD), the need for an improved vaccine was identified in the MNS (Mission Needs Statement) for Medical Defense Against Chemical and Biological Warfare Agents in August 1994 and in the MNS for Department of Defense Biological Defense in August 1992.[105]

The mission profile for the improved vaccine called only for inoculation of deployed and rapid deployment units Abased on intelligence estimates of the potential for use of specific BW agents against U.S. forces. ... Other military personnel will be vaccinated prior to departure to BW threat areas. An accelerated immunization program will be conducted under certain alert or mobilization conditions.≅[106]

Shortcomings of the currently licensed vaccine were seen as the Aserious logistical obstacles, especially for reserve forces≅ posed by the approved six-shot schedule and reports that suggest Athis vaccine may not provide universal protection against all anthrax strains.≅[107] Minimum standards for the improved vaccine included generation of a protective immune response within 14 days of administering three inoculations.

Briefing materials produced by the U.S. Army Medical Research Institute of Infectious Disease (USAMRIID) in 1994 listed the following problems with the current vaccine:

Prolonged immunization schedule

Reactogenicity:

---

[104] See *supra* note 7, p. 2.

[105] Department of Defense, AOperational Requirements Document (ORD) for Improved Anthrax Vaccine,≅ Oct. 2, 1995, p. 1 (in subcommittee files).

[106] *Ibid.*, p. B-1.

[107] *Ibid.*, p. 2.

Systemic reactions: .7 - 1.3%
Significant local reactions: 2.4 -3.9% (5.9%)

Vaccine components completely undefined in terms of characterization and quantitation of the PA, and other bacterial products and constituents present

Significant lot-to-lot variation in the PA immunogen content
Human trials with similar but not identical vaccine showed protection against cutaneous anthrax but insufficient data to show efficacy against inhalation anthrax

Made from spore-forming strain requiring dedicated production facility[108]

Minutes of a May 1994 USAMRIID meeting addressed Athe Army=s need for a new Anthrax vaccine. This need is based on reactogenicity of the current vaccine, the desire to make a vaccine with defined and well characterized components, and the need to produce a vaccine which does not require a BL-3[109] containment for production or a dedicated production facility, since *B. anthracis* is a spore former.≅[110]

Iraq=s 1995 declarations to the United Nations Special Commission (UNSCOM) described Aa substantial BW program≅[111] including 8,000 liters of anthrax, 6,000 of which Iraq claimed to have weaponized in missile warheads, aerial bombs, rockets, remote-control aircraft and agricultural sprayers mounted on planes and helicopters.[112] At the same time, DOD interest in an improved anthrax vaccine diminished sharply. Reservations about the suitability of the old vaccine were put aside once it was made the centerpiece of the proposed immunization effort.

The vaccine program is just one element of the Joint Biological Warfare Defense concept encompassing:

X detection and warning
X individual (masks, suits) and collective protection (sealed command and control facilities)
X medical (vaccines) countermeasures to prevent disease
X contamination avoidance

[112] *Ibid.*

X decontamination[113]

Treaties, anti-proliferation regimes, as well as the prospect of tactical and nuclear retaliation, are also meant to deter use of chemical an biological weapons.

[113] *Ibid.*, p. 7.

These are meant to be parts of an Aintegrated and overlapping systems approach to BW defense[114] in which both military and medical considerations dictate a hierarchy of force protection measures emphasizing contamination avoidance and physical protection over medical intervention and decontamination. One statement of chem/bio defense doctrine ranks force protection strategies as follows:

> A... The most effective and singularly most important prophylaxis in defense against biological warfare agents is physical protection. Preventing exposure of the respiratory tract and mucous membranes ... to infectious and/or toxic aerosols through use of a full-face respirator will prevent exposure, and should, theoretically, obviate the need for additional measures. Chemical protective masks effectively filter biological hazards.
>
> ... All medical prophylactic modalities described should be viewed only as secondary (i.e. backup), and are not be relied upon as primary protective measures. Agent exposures near the source of dissemination will be high, and likely to overwhelm any medical protective measure.≅[115]

The AVIP makes medical prophylaxis a primary aspect of force protection and CBW deterrence. In testimony, the DOD Assistant Secretary for Health Affairs put the proposition quite directly: AOur greatest and prime biological enemy today is anthrax. And our strongest weapon against anthrax is vaccination.≅[116] The Navy=s Deputy Surgeon General added:

> AWe are fortunate to have a time tested, safe and effective vaccine to provide an

---

[114]DOD, *Medical Defense Against Biological Material*, (undated) p. 1.

[115]*Ibid.* The section on Prophylaxis and Therapy continues: AThe precise efficacy of available medical countermeasures has, of course, never been evaluated in actual field circumstances, but is largely inferred from laboratory studies on nonhuman primates. While these extrapolations may be inexact, the strongly support the efficacy of vaccines and drugs at some agent dose.≅ (emphasis original)

[116]Testimony of Lt. Gen. Charles H. Roadman, Surgeon General, USAF, NSVAIR Anthrax Hearing (I), p.17.

important element of the body armor needed to defend our personnel against weaponized anthrax. Anthrax has now joined other immunizations received by our Service men and women to protect against disease threats just as important as wearing a gas mask or carrying a rifle when on the battlefield.≅[117]

[117]Testimony of R.Adm. Todd Fisher, Deputy Surgeon General, USN, NSVAIR Anthrax Hearing (I), p17.

The Air Force Surgeon General expressed a similar rationale: AIn addition to the potential human cost, mass casualties would degrade our military mission, military capability and mission accomplishment. We would not send people into battle without helmets and weapons. So we should also provide the best armor against biological dangers that we can. That armor is immunization.≅[118]

But some service members see an important difference between the physical body armor worn in battle, which can be removed, and medical prophylaxis, which cannot. AThe body armor that our Department of Defense refers to is perceived by many service members as >tin foil armor=.≅[119]

Primary reliance on medical intervention may also undermine confidence in other elements of the force protection hierarchy. One hearing witnesses asked if the vaccine might not Acreate a facade of force protection≅ provoking an adversary to even more lethal chem/bio or conventional attack.[120] He noted:

> AThese foundations of force protection rely on a credible willingness to use force. This resolve won the Cold War and it won the Gulf War. Abandoning this time tested doctrine and emphasizing the inevitability of biological attack to advocate a defensive anthrax vaccination policy may inadvertently result in legitimizing biological warfare.≅[121]

The vaccine policy also reflects a lack of confidence in current force protection equipment. Physical barriers, effective against all toxins and microbes if used properly and in time, are now viewed as Alikely to remain only partially effective for the foreseeable future.≅[122] Protective suits and masks Adegrade individual operating capabilities and force effectiveness ...≅[123] The

[123] *Ibid.*

purpose of the current doctrine on bio/chemical defense Ais to maintain combat operations unencumbered by contamination and the wearing of the protective gear.≅[124]

[124]See *supra* note 103.

Even this doctrinal reliance on the primacy of medical protection does not necessarily demand the universal, pre-deployment inoculation that characterizes the AVIP. Throughout the policy deliberation process, the option was considered to hold vaccines in stockpiles and defer actual immunization until mobilization to a threat area.[125] As late as September 1997, decision memoranda to the Under Secretary of Defense contained a recommendation to: AMaintain the planning guidance for total force immunization as a contingency plan, ready for finalizing, coordination, and approval at the appropriate time based on: (a) resolution, in conjunction with the FDA, of facility production issues; and/or (b) changes in the validated anthrax biological warfare threat.≅[126]

The decision to launch the force-wide, mandatory immunization program, despite well documented misgivings about the vaccine and the capacity of the vaccine manufacturer, seems to have been driven by a genuine concern to avoid casualties, a military requirement for theoretically uniform protection within deployed units, an expansive view of demands on U.S. troop mobility, and the daunting logistics of the chosen vaccine.

AWhy is it essential that the anthrax immunization be mandatory? Military commanders have the responsibility to ensure the health and safety of their troops and to carry out their mission responsibilities. Anthrax is a serious threat. We have a safe and efficacious vaccine. To not use the vaccine constitutes a failure to protect our troops and a risk to carrying out military missions.≅[127] According to DOD, AWe are morally obligated to provide the best protection we are capable of providing to our troops -- in the case of protection against anthrax, there is a vaccine to provide individual immunity to this biological warfare agent.≅[128] According to Dr

---

[125] Dr. Edward D. Martin, et. al., Acting Assistant Secretary of Defense (Health Affairs), Department of Defense, AMemorandum for Deputy Secretary of Defense - Anthrax Vaccination Implementation Plan - ACTION MEMORANDUM,≅ p. 1, Sept. 19, 1997 (in subcommittee files).

[126] *Ibid.*, p. 2.

[127] Prepared statement of Dr. Sue Bailey, Assistant Secretary of Defense for Health Affairs, NSVAIR Anthrax Hearing (I), p. 10.

[128] DOD, *Public Affairs Talking Points*, p. 1, December 15, 1997.

Bailey, ALike other vaccines that are required to prepare military personnel for deployment, the anthrax vaccine is mandatory.≅[129]

[129] Prepared statement of Dr. Sue Bailey, Assistant Secretary of Defense for Health Affairs, NSVAIR Anthrax Hearing (I), p. 10.

But the anthrax vaccine requirement differs from general military immunization and chemoprophylaxis policy in two significant respects. Other inoculations are required pursuant to medical, not military command authority,[130] and they are required primarily to maintain and protect the health of personnel from naturally occurring diseases or pathogens endemic to specific duty or deployment areas. Although the threat of natural anthrax Aremains a significant problem in numerous countries throughout Africa, the Middle East, Europe and Asia,≅[131] the general military immunization policy contains no reference to the anthrax vaccine.

When asked how the U.S. program compared to the approach of allied forces, such as Great Britain which began a voluntary program, or Israel which appears to rely primarily on antibiotic treatments, the Pentagon responded, ADOD does not base its policies on those of our allies or coalition partners.≅[132] Because Aour Armed Forces must be prepared to conduct successful military operations worldwide at a moments [sic] notice,≅ DOD believes the Amandatory AVIP is clearly in our best interests and strongly supports our national security and military strategies.≅[133]

But there will be exceptions. A July 1999 Defense Threat Reduction Agency policy on anthrax immunization says:

> ADeploying civilian employees who decline to participate in the DTRA-AVIP will be required to execute a AStatement of Informed Declination≅ attesting to the Agency=s offer of anthrax immunization and the individual=s decision to decline. By signing this statement, the employee acknowledges and willingly assumes the enhanced medical risk associated with travel to affected regions without receiving the recommended vaccinations. Hence, his/her deployment to these regions in support or mission requirements will not necessarily be precluded. This statement will become a part of the individual=s permanent Occupational Health Record.≅[134]

One of the primary reasons for the mandatory AVIP is the perceived need for consistent levels of force protection within and between deployed units to guarantee military effectiveness. Field commanders need to know the capabilities of their members. But even the force-wide, mandatory anthrax vaccine program is unlikely to meet that need. DOD concluded, but cannot

[134] Defense Threat Reduction Agency, *Policy Memorandum 99-22*, July 23, 1999, p. 2 (in subcommittee files).

prove, that individual antibody response to the vaccine equals protection from anthrax attack. That is, DOD believes the more anthrax-fighting antibodies produced, the more medical Abody armor≡ has been acquired. Animal studies suggest this may be the case for some species, but no correlate has been found in humans to permit extrapolation of this conclusion.[135]

[135] Prepared statement of Kwai-Cheung Chan, NSVAIR Anthrax Hearing (II), p.17.

In any event, DOD does not test military personnel for antibody levels to determine the extent to which members of a unit may have acquired protection against anthrax. Uniform protection is also unlikely because individual immunological response to the vaccine can vary substantially due to a variety of factors, including gender, and contemporaneous administration of other vaccines or medicines.[136] Nevertheless, DOD concludes enrollment in the AVIP equals protection for purposes of satisfying the need for uniform force protection.[137]

And, the very factors cited by DOD as necessitating universal AVIP coverage may actually work against that goal. Rapid mobility and the mixture of active and reserve forces mean individuals bring variable levels of protection to their assignments, depending on the number of shots taken to date and their individual immune system response. Some people don=t respond to the vaccine at all.[138] So, beyond the general proposition that vaccinated individuals are likely to have some protection against some level of attack, the AVIP will not assure a commander that a unit is uniformly or even substantially protected. In tactical terms, the protection afforded by vaccination would be needed only during the time between detection and the order to deploy individual and collective physical protective measures (suits, masks, tents, etc.). Better detection capability, improved masks and a battlefield doctrine to deploy protective measures earlier could limit or eliminate the need even for that small window of protection provided by the vaccine.

[136] Testimony of Col. Renata Engler, Chief, Allergy-Immunology Service, Walter Reed Army Medical Center, NSVAIR Anthrax Hearing (IV), p. 173.

[137] See *supra* note 46, p. 1.

[138] Investigational New Drug (IND) application for Anthrax Vaccine Adsorbed (AVA) submitted by Michigan Biologic Products Institute, Lansing, Michigan, September 20, 1996, pp. 28 -29 (in subcommittee files).

2. The AVIP is vulnerable to supply shortages and price increases. The sole-source procurement of a vaccine that requires a dedicated production facility leaves DOD captive to old technology and a single, untested company. Research and development on a second-generation, recombinant vaccine would allow others to compete.

DOD has built a force-wide program on the narrowest possible industrial base.

According to GAO, AThe most critical component of the program, an adequate supply of vaccine, is threatened by testing delays and possible loss of production capability.≅[139] Moreover, GAO found ADOD=s plans for maintaining an adequate supply of vaccine are optimistic ... and assume that FDA will grant approval of tested lots in less time than in the past.≅[140] Despite the possibility of further delays or a recurrence of financial problems at BioPort, ADOD does not have a formal contingency plan to deal with such possibilities.≅[141]

When DOD launched the AVIP, subject to the Secretary=s four conditions including supplemental testing, MBPI/BioPort held 40 lots of vaccine, roughly the equivalent of 8 million doses, or enough vaccine to provide 1.3 million people the full six-shot regimen (assuming all lots were used before the expiration of original or extended label dating). But problems in the supplemental testing program delayed or precluded release of 18 lots.[142] GAO found:

> AIn summary, as of June 23, 1999, only 713,000 doses in the stockpile were available for use, and more than half of them - about 416,000 doses - will expire in February and April 2000. On the basis of DOD=s estimates of doses required per month, the 713,000 doses would sustain phase 1 of the program through December 1999.≅[143]

---

[139] See *supra* note 26, p. 12

[140] *Ibid.*, p. 5.

[141] *Ibid.*

[142] *Ibid.*, p. 13.

[143] *Ibid.*, p. 15; Including an estimated three-month supply already delivered to the field at

the time of this estimate, GAO concluded the program could be sustained at best through March 2000.

But even that delayed schedule may be optimistic. FDA inspectional findings on the renovated facility contain a number of observations repeated from the February 1998 inspection.[144] FDA considered those earlier findings Asignificant≅ and took issue with DOD officials characterizing cGMP matters as mere Abookkeeping difficulties≅ in public statements.[145] If problems with the renovated facility are determined to be significant enough to bar release of vaccine lots produced since May 1999,[146] DOD could face severe shortages.

Because resumption of vaccine production has been delayed longer than anticipated by plant renovations and efforts to meet FDA compliance requirements, implementation of Phase II of the AVIP, scheduled to begin in early 2000, has been delayed Ain the range of six to 12 months.≅[147]

---

[144] FDA Form 483, November 15-23, 1999 (in subcommittee files). See also, *Stars and Stripes*, ACohen Defends Mandatory Anthrax Shots After Ordering FDA-Related Suspension,≅ p. 1, Dec. 20, 1999.

[145] E-mails between Food and Drug Administration and Department of Defense dated August 31 - September 1, 1999 (in subcommittee files).

[146] Production of consistency lots began in the renovated and expanded BioPort facility in May 1999. Data on consistency lots is submitted to FDA to validate the production process. Other lots have also been produced by BioPort in the expanded facility, but use of those at risk lots depends on FDA approval of the facility license supplement, an amendment to the license regarding the potency test and approval of test data on each lot.

[147] Dr. Sue Bailey, Department of Defense News Briefing, December 13, 1999, p.

In addition to production problems and delays, BioPort may not be a reliable financial partner in the vaccine enterprise. At the Subcommittee=s request, the General Accounting Office (GAO) examined the structure and status of the financial relationship between DOD and BioPort.[148] They reviewed the contract documents, proposals and analyses done in connection with DOD procurement of the anthrax vaccine.[149]

[148]Letter to David Walker, Comptroller General, U.S. General Accounting Office from Rep. Christopher Shays, Chairman, Subcommittee on National Security, Veterans Affairs and International Relations, House Committee on Government Reform, May 13, 1999 (in subcommittee files).

[149]*Contract Management - Observations on DOD=s Financial Relationship with the Anthrax Vaccine Manufacturer*, Prepared statement of Louis J. Rodrigues, Director, Defense Acquisition Issues, National Security and International Relations Division, GAO, GAO/T-NSIAD-99-24, June 30, 1999.

Only nine months after entering into the agreement, BioPort=s ability to perform under the contract was in doubt.[150] In June 1999, the Defense Contract Audit Agency (DCAA) completed an audit of BioPort=s financial condition and reached a similar conclusion.[151] According to GAO, estimates contained in BioPort=s business plan and contract proposal have proven highly optimistic.[152]

As a result, BioPort had to request emergency assistance from DOD and major modifications to the contract.[153] In order to remain able to produce vaccine for the AVIP, BioPort sought and received an advance payment of $10 million, a significant per-dose price increase and DOD

[152] Prepared statement of Louis J. Rodrigues, Director, Defense Acquisition Issues, National Security and International Relations Division, GAO, NSVAIR Anthrax Hearing (III), p. 7.

[153] DOD Briefing Slides, ABioPort Contract - Anthrax Vaccine,≅ June 2, 1999 (in subcommittee files). See also, BioPort Corporation media release, AAnthrax Vaccine Manufacturer Calls for Fair and Reasonable Cotract,≅ June 30, 1999 (in subcommitee files).

permission to sell up to 300,000 doses each year on the open market, despite the fact those doses would be produced using government furnished equipment under the DOD contract.[154] DOD also authorized BioPort=s sale of up to 70,000 doses from the vaccine produced under the prior contract but either released or deemed never part of the stockpile.[155]

This early, extraordinary relief was necessary because production delays reduced estimated income. And, the procurement had to be done by means of a fixed price contract because neither side to the contract knew what it actually cost to produce the vaccine.[156] In its transition from a state-owned facility to a private enterprise, MBPI/BioPort has not fully implemented promised cost control and cost accounting systems to support a more appropriate cost-reimbursement procurement.

[154] Testimony of The Honorable David R. Oliver, Jr., Principal Deputy Under Secretary of Defense for Acquisition and Technology, NSVAIR Anthrax Hearing (III), p. 65.

[155] Testimony of The Honorable David R. Oliver, Jr., Principal Deputy Under Secretary of Defense for Acquisition and Technology, NSVAIR Anthrax Hearing (III), pp. 64-65. See also, DOD Briefing Slides, AAnthrax Vaccine Absorbed Information Brief,≅ June 4, 1999 (in subcommittee files). The briefing contained the following points: AMs. Spector advised that doese in the inventory that have been paid for cannot be used by BioPort for Private/Foreign Sales≅ and ARelease doses from stockpile for private sales - JPO/OSD action (very political).≅

[156] Testimony of Louis J. Rodrigues, Director, Defense Acquisition Issues, National Security and International Relations Division, GAO, NSVAIR Anthrax Hearing (III), p. 28.

GAO also found the dependent relationship between DOD and BioPort unusual and risky. While sole-source procurements for vaccines may be common, those producers usually have other product lines generating income from other customers. In this case, problems with the production and delivery of the one vaccine put the corporation in an extemely bad financial position.[157]

One vaccine producer operating a single production site also points to security risks. GAO observed, ABut if we are relying upon this vaccine as part of the backbone of our defensive biological program, the question of vulnerability to a single site becomes an issue. If you made a decision with respect to that vulnerability that led you to want to have an alternative site, then we probably should be looking at establishing a second source.=[158]

Following the Gulf War, and prior to adoption of the DOD immunization policy (1993) and the mandated AVIP (1998), Pentagon officials considered and rejected alternative anthrax vaccine production sites.[159] Instead, an acquisition strategy was adopted focusing solely on the MBPI/BioPort vaccine.[160]

Since 1993, DOD has focused almost exclusively on the older, FDA approved vaccine, to the exclusion of development work on newer, recombinant vaccine formulations. Not surprisingly, DOD market surveys detected little interest by other pharmaceutical or biologics companies in producing the older anthrax vaccine under a licence from MBPI. So it appears DOD=s sole source justification may be self-validating, in that there is only one AVA producer because the single largest vaccine customer has decided to deal with only one producer.

Other manufacturers would be more likely to express an interest in recombinant vaccine production because it can be done more safely and efficiently than older vaccine formulation methods involving live bacteria. But DOD decided not to emphasize recombinant anthrax vaccine development due to the lengthy (6 to 8 years) development and approval time, and potential high costs.

Yet, had DOD officials elected to pursue second-generation anthrax vaccine development aggressively six years ago, they would be nearing completion on a newer, purer anthrax vaccine. BioPort=s current financial demands, and the company=s power to hold the AVIP hostage in the future, appear to undermine DOD=s determination the MBPI/BioPort acquisition strategy would

[157] *Ibid.*, p. 16.

[158] *Ibid.*, p. 15.

[159] See *supra* note 36, p. 1.

[160] See *supra* note 37.

prove more affordable than new vaccine development.

One legal review of the BioPort contract sole source justification suggested DOD add a reference to ways competition might be increased by utilizing alternative technologies to produce the anthrax vaccine. The suggestion was not incorporated in the final document.[161]

It appears the choice of the MBPI vaccine for use in the AVIP may also have been premised on DOD and the manufacturer obtaining FDA approval to reduce the lengthy shot course from 6 shots over 18 months, to just 2 or 3 inoculations over 6 weeks. DOD developed a detailed program to gain approval for a shortened AVA shot course due to problematic levels of systemic (0.7 to 1.3 percent) and significant local reactions (2.4 to 3.9 percent) associated with the prolonged immunization schedule.[162] An Investigational New Drug (IND) application was filed on September 20, 1996 at the FDA to study a reduced anthrax vaccine shot course, but design of a definitive comparison study has never been submitted.[163]

So now, having foregone opportunities to improve or diversify anthrax vaccine production capacity, both DOD and BioPort are in a fiscal squeeze. Having made a substantial investment in MBPI and BioPort, DOD now faces hard, costly choices between sustaining the sole FDA licensed manufacturer of the anthrax vaccine, which may prove inadequate, and/or embarking on the establishment and licensure of another. In future budgets, DOD must consider to fund Adeveloping a second source to BioPort or developing a different approach to solve the anthrax

problem and don=t take that money and put it against solving another bio-threatΨ.≅[164]

While these alternatives are being reviewed, the mandatory force-wide program to provide protection against what DOD characterizes as the pre-eminent biological warfare threat is on a very uncertain procurement footing. Without more extraordinary DOD assistance, BioPort appears financially incapable of capitalizing and sustaining a highly technical, heavily regulated manufacturing process. The same financial pressures that hindered MBPI=s ability to comply with FDA good manufacturing practices could also continue to affect BioPort=s capacity to produce a safe and effective product on schedule.

[164]Testimony of The Honorable David R. Oliver, Jr., Principal Deputy Under Secretary of Defense for Acquisition and Technology, NSVAIR Anthrax Hearing (III), p. 69.

3. The AVIP is logistically too complex to succeed. Adherence to the rigid schedule of six inoculations over 18 months for 2.4 million members of a mobile force is unlikely, particularly in reserve components. Using an artificial standard that counts only shots more than 30 days overdue, DOD tolerates serious deviations from the Food and Drug Administration (FDA) approved schedule.

No other vaccine required by DOD for force health or combat protection demands so complex an administration schedule.[165] The FDA approved inoculation regime is six shots over 18 months, with a subcutaneous injection of AVA to be given as follows:

#1 B start of series
#2 B two weeks later
#3 B one month after start of series
#4 B six months after start of series
#5 B one year after start of series
#6 B 18 months after start of series.
Booster B annually after completion of initial series.[166]

The ability to track immunizations and meet this schedule was one of Secretary Cohen=s four preconditions to the AVIP. But even the Secretary of Defense received his fourth inoculation three weeks before it was due.[167]

In an effort to comply with the elaborate timetable, DOD administers a three-tiered record keeping system. Each inoculation should be recorded on the individual service member=s shot record.[168] Data recorded should include the date and AVA lot number. The same data is also entered into one of the service branch medical systems.[169] Finally, the service branch systems periodically forward inoculation data to the Defense Enrollment Eligibility Reporting System

[165] See *supra* note 130.

(DEERS), a pre-existing facility modified to serve as an interim access point for centralized AVIP data. In the future, DOD plans to centralize AVIP data using an upgrade of the Composite Health Care System now under development.[170]

[170] See *supra* note 26, p. 10.

This system was designed to address problems with medical record keeping encountered during Operation Desert Shield, Desert Storm and in Bosnia.[171] However, while GAO found some improvements in vaccination records, a sampling of AVIP tracking at four locations discovered varying levels of discrepancies between paper and electronic data. According to GAO:

> AInconsistency in dates could lead to vaccinations being given off-schedule and to inaccurate readiness reports. Inconsistent or missing lot information could hinder investigations, should concerns arise over a specific lot. Also, information that is not recorded in paper records makes it difficult to address adverse reactions needing immediate care or determine the validity of subsequent claims for disability compensation.≅[172]

GAO also found use of DEERS data more limited than anticipated. ADEERS was envisioned as a major source of reports on program implementation. However, concerns about the timeliness and accuracy of data in DEERS have cause service representatives to rely on interim, service-specific tracking systems, and other systems to track and report vaccination information.≅[173] Specific concerns centered on duty station data, found in some cases to be updated only six to nine months late.[174] This severely limits the utility of DEERS as a tool to generate unit compliance or readiness reports, since the database often does not reflect current unit membership. Readiness estimates based on AVIP tracking data are Astill suspect,≅ according to an internal DOD document.[175]

The difficulties of tracking anthrax vaccinations in the active force are compounded in

[174] *Ibid.*

[175] E-mails from Maj. Guy Strawder dated February 17, 1999 (in subcommittee files).

reserve component units,[176] given changing unit memberships and monthly training schedules unlikely to match the inoculation regime. This difficulty was anticipated,[177] but DOD acknowledged in testimony that compliance with the FDA inoculation schedule in reserve component units was lower than in the active force due to less frequent drill schedules and timing of access to military medical facilities for purposes of receiving the vaccine.[178]

---

[176] Reserve components consist of Army, Navy, Air Force and Marine reserve units as well as Army and Air National Guard units. Reserve units are elements of the national military. National Guard units are state militias unless federalized.

[177] See *supra* note 108.

[178] Prepared statement of Charles L. Cragin, Acting Assistant Secretary for Reserve Affairs, DOD, NSVAIR Anthrax Hearing (V), p. 5-7; testimony of Charles L. Cragin, NSVAIR Anthrax Hearing (V), p. 150.

As the logistical challenges of vaccine compliance increase, so do the risks of deviations from the approved schedule. While the effect of schedule deviations is another unknown element of the AVIP, DOD concludes Athe greater the deviation the less certain the protective effect in humans.≅[179] Nevertheless, ADOD set a timeliness goal of vaccinating 90 percent of all service members no more than 30 days after their vaccinations are due....≅[180] DOD reports meeting that goal.[181]

On August 4, 1999 the Subcommittee requested data on vaccine regimen compliance in all reserve component units then enrolled in the vaccine program. The DEERS reports provided to the Subcommittee contained shot records on 32,681 individuals who had received one or more inoculations prior to July 31, 1999. Almost half (15,625) the individuals listed were overdue to receive an inoculation. In some cases, entire units had missed the schedule by a month or more. A summary of the data follows:

Branch/Res. Comp	# Enrolled	# Overdue	%Overdue
AFReserves	8931	2954	33
AIRNG	9246	2482	27
ArmyNG	2441	1443	59

USNReserves	3531	3118	88[182]

[179] Memorandum on APolicy Deviation from Anthrax Vaccine Immunization Schedule≅ from the Department of Defense dated September 11, 1998, p. 1 (in subcommittee files).

[180]See *supra* note 26, p. 24. See also, testimony of Charles L. Cragin, Acting Assistant Secretary for Reserve Affairs, DOD, NSVAIR Anthrax Hearing (V), p. 150.

[181] Department of Defense, AAnthrax Vaccine Immunization Program Quarterly Review,≅ Jan. 22, 1999, p. 9 (in subcommittee files).

[182] Letter and accompanying computer diskette from Charles L. Cragin to Rep. Christopher Shays dated August 23, 1999 (in subcommittee files).

The Air Surgeon, Col. James Dougherty, disputed the accuracy of the DEERS data. In an e-mail reacting to a media report of poor compliance in a Connecticut Air National Guard unit, he said Aall the data are inaccurate≅ because the DEERS system is updated weeks after shots are actually administered.[183] DOD also said the data showing overdue inoculations was inflated due to the inadvertent inclusion of Individual Ready Reserve forces, service members who are separated from military service but available for call-up.[184] Nevertheless, according to an internal DOD document, readiness estimates based on AVIP tracking data are Astill suspect.≅[185]

If the centralized tracking system cannot provide a real-time picture of the inoculation status of the entire force, or individual units, it fails to meet the operational standard set by the Secretary as a condition of AVIP implementation.

The data provided to the Subcommittee by DOD also showed most reserve component members receive the first three inoculations on schedule, with compliance deviations occurring with regard to subsequent shots.[186] That may not be entirely inadvertent. DOD documents contain the statement ASoldiers with 3 or more vaccinations are Protected.≅[187] The DOD position that Afunctional protection≅[188] is provided after only three of the six required inoculations sets a deployability standard against which reserve component commanders are measured. Once members of a unit have received three shots, there appears to be little incentive to press for further compliance with an increasingly unpopular program.

There is little scientific evidence to support the theory that three shots protect as well as six. DOD expended significant time and resources in 1994 and 1995 on plans and programs to demonstrate the safety and efficacy of a shorter anthrax inoculation regime, and a different route of administration. An Investigational New Drug (IND) application was filed to guide further animal studies and clinical trials in humans. But the effort appears to have all but abandoned when planning for the AVIP began. Support for the FDA application to reduce the shot course seems to have been redirected to vaccine acquisition and AVIP logistics.

In September 1999, the Director of the FDA Center for Biologics Evaluation and Research, Dr. Katherine Zoon, wrote to Dr. Sue Bailey, Assistant Secretary of Defense for Health Affairs

[183] E-mails from James Dougherty dated September 1, 1999. (in subcommittee files)

[184] Testimony of Charles L. Cragin, Acting Assistant Secretary for Reserve Affairs, NSVAIR Anthrax Hearing (V), p. 104 (in subcommittee files).

[185] See *supra* note 175.

[186] See *supra* note 182.

[187] See *supra* note 134, p. 2, and e-mails from Department of Defense personnel dated February 17 - April 14, 1999 (in subcommittee files); If the manufacturer of a pharmaceutical or biologic product advised patients or physicians that half the FDA approved dosage or administration regimen was as effective against the labeled indication, it would be a serious violation of FDA regulations.

[188] See *supra* note 134, p. 2.

regarding data showing significant deviations from the AVA administration routine:

> A... Because we are unaware of any data demonstrating that any deviation from the approval intervals of doses found in the approved labeling will provide protection from anthrax infection, we strongly recommend that the Anthrax Vaccine Immunization Program follow the FDA approved schedule.≅[189]

Prior to the administration of each shot, medical personnel are directed to provide information on the vaccine and the program, and to inform each recipient regarding the health factors that should exclude a person.[190] Exclusionary factors include severe reaction to a previous shot, active infection, pregnancy, current immuno-suppression.[191] Service members should also be informed regarding the identification and reporting of adverse health events suffered subsequent to inoculation.[192]

But GAO found medical staff and service members were not well informed about reporting adverse events and found more than forty percent of those sampled had not received information on how to report vaccine related adverse events.[193] Testimony by service members reflected the GAO findings.

Ms. Randi Martin-Allaire, a civilian employee of the Michigan Air National Guard told the Subcommittee, AI was on antibiotics at the time I received by fourth injection, and was never asked if I was on any type of medication or antibiotics.≅[194] Her colleagues described similar miscues and confusion over the standards for identifying and treating vaccine adverse reactions.[195]

Service members report AVIP information and briefings seem designed to persuade, not educate. The inability of Air Force briefers to answer service members= questions led one commander to suspend the vaccination program until the Air Force Surgeon General personally intervened.[196] Vaccine recipients also report mass inoculations during which no questions

regarding current health status are asked and noVAERS forms made available.[197]

[197] E-mails and meeting notes (in subcommittee files).

The AVIP is made more complex by the need to address growing resistance to the vaccine, specifically in reserve component units. The impact of the AVIP on retention in reserve component units could be significant. Informal surveys by service members suggest the Air National Guard may suffer air crew attrition of thirty percent or more.[198] To date, the Defense Department has not acknowledged any unusual pattern of resignations attributable to the AVIP.[199]

It is not clear where the Department might look to discern such a pattern. DOD collects no centralized data on refusals or resignations attributable to the vaccine program. Some service members also said unit commanders openly discouraged attribution of resignations or transfers to the AVIP.[200] An Air Force Reserve Interim Anthrax Policy forbids the approval of transfer requests made by anyone scheduled or directed to begin the anthrax immunizations.[201]

GAO was critical of this lack of monitoring to determine the effectiveness of the AVIP communications effort.[202] Without data on refusals, AIt is difficult to better target educational efforts and address emerging concerns. These problems need to be resolved *if the program is to succeed* in vaccinating the entire force against anthrax.≅[203] (emphasis added)

DOD developed a detailed program to gain approval for a shortened AVA shot course to address the logistical challenge of the six-shot regime and to reduce problematic levels of systemic (0.7 to 1.3 percent) and significant local reactions (2.4 to 3.9 percent) associated with the prolonged immunization schedule.[204] An Investigational New Drug (IND) application was filed on September 20, 1996 at the FDA to study a reduced anthrax vaccine shot course, but

design of a definitive comparison study has not yet been submitted.

4. Safety of the vaccine is not being monitored adequately. The program is predisposed to ignore or understate potential safety problems due to reliance on a passive adverse event surveillance system and DOD institutional resistance to associating health effects with the vaccine.

Based on data gathered during limited occupational use since licensure, the AVA can be considered nominally safe. But the vastly expanded use of the vaccine for a new purpose requires a proactive approach to emerging safety issues. That approach is not now a part of the AVIP.

As with any vaccine, anthrax inoculation can cause adverse health events in some individuals, ranging from soreness or swelling at the injection site (local reactions) to fevers, chills, muscle aches and anaphylaxis[205] (systemic reactions). Local reaction may be mild, moderate or severe enough to require medical attention. Systemic reactions are generally considered clinically more significant. Reactions may increase in severity after successive injections.[206]

More inoculations means more reactions. An immunization program using a vaccine requiring six shots and annual boosters should be prepared to deal with some number and variety of adverse health effects. Despite having been licensed for almost 30 years, the vaccine had not been widely used prior to the Gulf War.[207] As noted previously, lack of adequate medical record

[205] Hypersensitivity to a drug or antigen. Anaphylactic shock is an often severe, sometimes fatal, physical reaction characterized by respiratory symptoms, fainting, swelling and itching.

[206] See *supra* note 41.

keeping prevents systematic study of that cohort for health effects possibly associated with the anthrax vaccine and other medicines and toxins. The vaccine is being studied as a potential factor in Gulf War veterans= illnesses.[208] As GAO noted, AThe long term safety of the vaccine has not yet been studied.=[209]

53.

[208] See supra note 1.

[209] Prepared statement of Kwai-Cheung Chan, Director, Special Studies and Evaluation Section, National Security and International Relations Division, GAO, NSVAIR Anthrax Hearing (II), p. 11.

The AVA has been described as a relatively crude, imprecisely characterized vaccine, and estimates of reaction rates vary widely.[210] According to the FDA-approved AVA product labeling, 30 percent of vaccine recipients can be expected to suffer mild local reactions, 4 percent will incur moderate local reactions and less than .2 percent will experience systemic reactions.[211] In 1994 and `95, DOD considered the need for a new anthrax vaccine Abased on the reactogenicity of the current vaccine.≅[212]

In April 29, 1999 testimony[213] before the Subcommittee, the General Accounting Office (GAO) summarized studies of anthrax vaccine reactions, finding rates of systemic reactions ranging from .05 percent to 48 percent. (Table 1, below)

Table I: Reactions to Licensed Anthrax Vaccine Reported in Various Studies

Study	Type of Reporting	Number Vaccinated	Local reactions (percent)		Systemic reactions (percent)	
		(or doses)	Mild	Moderate / Severe	Mild	Moderate / Severe
IND	Active / Passive	3,984[a]	6 B 20[b]	1 B 10[b]	None[b]	.05[b]
Pittman (1997)	Active	508	16	5	29[c]	14
TAMC (1998)	Active	536	Not Addressed		43[d]	5
DOD (Current monitoring)	Passive	223,000[b]	[e]	[e]	[e]	[e]

[a]This number represents the number of study participants who received the first dose of the licensed vaccine.
[b]These figures represent the percentage of people who experienced this type of reaction during the study, even if they had previously been inoculated with the Merck vaccine.
[c]This figure also includes persons who had reactions of "unknown" severity.
[d]This figure represents the frequency of the most common side effect, myalgia.

[212] AMinutes of FDA Meeting of 5 May 94 Concerning Production and Purification of PA from Delta Sterne,≅ Department of the Army, May 19, 1994, p. 1.

[213] Prepared statement of Kwai-Cheung Chan, Director, Special Studies and Evaluation Section, National Security and International Relations Division, GAO, NSVAIR Anthrax Hearing (II), p. 16.

[9]DOD testified that as of March 16, 1999, more than 223,000 service member have been immunized. There had been 42 reports on adverse effects submitted to the FDA and CDC. Only seven service members required hospitalization or experienced loss of duty for more than 24 hours.

In later testimony, GAO also observed:

> In addition to reporting to VAERS, DOD has conducted three efforts to actively collect data on adverse reactions after service members received the anthrax vaccine. Data from these efforts show that women reported twice the rate of adverse reactions than men for both local (e.g. swelling) and systemic (e.g. malaise and chills) reactions. In addition, a higher proportion of women than men reported making an outpatient medical visit after a vaccination, and more than twice the percentage of women reported that they missed one or more duty shifts after their vaccinations than did men.[214]

Captain Michelle L. Piel believes she suffered an adverse reaction to the anthrax vaccine. Fatigue, dizziness, joint pain and severe cold-like symptoms following her first two inoculations resulted in the loss of flight status. When she suggested submitting a report to VAERS, she testified, AMy request met reluctance.≅[215] Because her symptoms did not fall within the range of expected vaccine reactions, doctors as Dover Air Force Base did not associate her illness to the AVA. She concluded, AThis is a major reason why adverse events from the anthrax vaccine are underreported.≅[216] She added, Alt didn=t make sense to me. I was too sick to fly. I was too sick to get another shot. But my illness wasn=t reportable on a VAERS form?≅[217]

When others at Dover suspected health effects might be linked to the vaccine, efforts to report a trend Awere met with resistance and discouragement from within Dover=s medical

community.≅[218] According to Capt. Piel, AIt took 6 months to reach the right, highly specialized doctors to begin to diagnose my immune system problems.≅[219]

[218] *Ibid.*

[219] *Ibid.*, p. 4.

At the reaction rates cited by the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID),[220] the anthrax vaccine program, when implemented across the entire 2.4 million member force, could produce 31,200 systemic reactions and up to 93,600 severe local reactions. Recently, the Army Surgeon General conceded that, ASystemic events occur in five to 35 percent of anthrax-vaccine recipients.≅[221] At the range of systemic reactions found by DOD in the Tripler Army Medical Center active surveillance study, the AVIP could generate over one million systemic reactions, many thousands of which will require medical management and treatment.[222]

Given that prospect, it might have been expected by service members that an integral part of the AVIP would be highly sensitive active and passive surveillance systems to Apermit accurate assessments of types and severity of adverse reactions≅[223] because Aonly widespread use can provide this assessment.≅[224] That was one factor which lead DOD to indemnify the vaccine manufacturer against the Aunusually hazardous risks≅ of vaccine production.[225]

To better quantify those risks, and to detect adverse reaction trends early, the program design could have included detailed medical protocols on screening, vaccine administration and adverse events. The AVIP could have assembled and trained a multi-disciplinary network of health professionals to manage the anticipated adverse event caseload. It could have provided each recipient with a simple, one page vaccine information sheet on adverse events and drug inter-actions of the type routinely provided with childhood vaccines. The AVIP could have designed and initiated the controlled, cohort studies only now being discussed to learn more about reaction rate differences by age and gender.[226]

The AVIP does not include those safety elements.

Instead, the program now relies primarily on an adverse event surveillance and reporting system known to understate the nature and extent of health effects associated with vaccine administration. Access to immunologists and allergists is limited geographically. Not until one year after the program began did DOD update briefing materials to include information on reporting adverse events and revise program regulations to make reporting requirements more inclusive, clarify patient and provider responsibilities, and explain how to process a Vaccine

Adverse Event Reporting System (VAERS) form. Only in July 1999 did DOD distribute draft clinical guidelines that outline clinical protocols, pre-treatments, specialty referral processes, contraindications, categorizations of local and systemic reactions and associated treatment algorithms.[227]

[227] Prepared statement of Maj. Gen. G. Robert Claypool, Deputy Assistant Secretary for Health Operations Policy, DOD, NSVAIR Anthrax Hearing (IV), p. 12 (in subcommittee files).

According to GAO testimony, studies have shown passive systems sometimes capture only one percent of adverse events temporally or causally related to use of a medical device or vaccine. Reports also vary in quality and utility due to inconsistencies in identifying and interpreting health effects as vaccine related. A passive system is useful as a Asentinel≅ to alert clinicians to unexpected events.[228] AIt does not tell you how often, with what severity, or does not establish causality. The limitations are very well accepted.≅[229]

Because passive systems are voluntary, the data generated are subject to a self-selection bias, in that trends in volunteered data cannot be extrapolated as if representative of an entire cohort or population. As a result, information from a passive reporting system, like VAERS, is not an appropriate source of data for use in generating adverse reaction rates.

Nevertheless, AVIP reports and DOD public statements portray the ratio of VAERS reports to inoculations given as an adverse reaction rate.

> AIn presenting reaction rate data, program and DOD officials have shown reactions reported to VAERS as a percentage of all vaccinations. They did so in several briefings to GAO and congressional staff, in prepared testimony, and on the program=s Internet site. However, according to FDA guidance, incidents in the VAERS database reflect a temporal, not necessarily a causal, relationship with vaccination and thus should not be used to calculate the incidence of reactions.≅[230]

GAO found, AThis is misleading because of potential underreporting of events to VAERS, and the potential for overstating the reaction rate because reports sent to VAERS are not confirmed to be causally linked to the vaccination.≅[231] The potential for overreporting is

[231] *Ibid.*

limited, however, by DOD screening of VAERS reports before inclusion in quarterly AVIP figures. In this regard, GAO concluded, AThus, DOD does not have reliable information on the extent of adverse reactions.≅[232]

[232] *Ibid.*

Even if useful to gauge short term reactions, passive reporting systems are also unlikely to capture long term or chronic health effects or syndromes, since providers and vaccine recipients do not generally associate an illness with an event far removed in time.[233] But many service members are concerned over possible long term health effects of the anthrax vaccine, alone or in combination with other treatments and exposures.[234] According to GAO, AA primary reason for dissatisfaction with information about long-term side effects appears to be that research has not been done to address the topic. According to program officials, such studies have recently been discussed but are not yet funded or underway.=[235]

The AVIP=s strict VAERS reporting requirements of hospitalization or more than 24 hours absence from duty limit the scope of any safety surveillance to severe, short term reactions. This overly narrow interpretation of adverse event data could result in DOD missing the types and severity of adverse reactions only widespread use would otherwise reveal. The Astatistical significance of a predicted adverse reaction=[236] will only become apparent if the statistics are permitted to capture the full range of available data.

A system already known for underreporting can be made even less reliable in the hands of an institutional culture resistant, even hostile, to reports attributing ill health to the anthrax vaccine. Air Force Lieutenant Richard Rovet, while serving as Health Care Integrator for the Flight Medicine Clinic at Dover AFB, noted a number of individuals reporting potentially vaccine-related symptoms: dizziness, ringing in the ears, joint pain, muscle aches, memory impairment, fatigue, numbness, prolonged fever and chills, localized and persistent rashes.[237] He said there was significant confusion in the field regarding reportable reactions Aespecially in

regard to what constitutes systemic reaction.≅[238] Lt. Rovet testified medical providers saw the issue of identifying vaccine reactions Apolitically sensitive and like to avoid it.≅[239]

[238] Testimony of Lt. Richard Rovet, NSVIAR Anthrax Hearing (IV), p. 25 (in subcommittee files).

[239] *Ibid.*

That resistance reduces what few incentives already motivate military personnel to report sick. Particularly when complaining of symptoms of unknown origin, a service member risks the label Amalingerer≅ or Adepressed.≅[240] If seeking care seems a dead end, Awhy risk your flying status if you are just suffering some of the mild symptoms of joint pain or you feel a little bit tired? Why should you go to the doctor is you feel you can continue to operate an airplane? And that is why people don=t come forward.≅[241]

An Air Force Reservist, Capt. Jon Richter, also suffered chronic symptoms he attributed to the vaccine. While he came forward, he testified there is little incentive for others do so. AI was encountering more of my squadron mates who were vaccinated that said they too had experienced various reactions, including tinnitus, dizziness, muscle and joint pain, and, in one case, gray-outs. However, most were attempting to keep it low profile and did not readily discuss these matters for fear of reprisal.≅[242] AWord travels fast. Morale is at an all time low. People are trigger shy about coming forward with their symptoms. There is an air of fear and distrust prevalent throughout.≅[243]

A reluctance to acknowledge vaccine related health effects could also block access to the immunologists and allergists experienced in the diagnosis and treatment of adverse reactions. This can be a more acute problem for National Guard and Reserve members whose level of access to military medicine, particularly specialists, for vaccine matters is uncertain. Witnesses at the Subcommittee=s April 29 hearing from the Michigan Air National Guard described a difficult and time consuming process to gain access to medical personnel with relevant expertise.[244]

According to the Dr. Renata Engler, Chief Immunologist at the Water Reed Army Medical Center, and a consultant to the AVIP, AVaccine administration is serious business and deserves more care and training of those who deliver the service.≅[245] One critical issue, she said, Ais that stakeholders who understand the clinical issues have NOT been represented in the organizational policy development.≅[246] AThere is a problem that the organization does NOT

have a forum for experienced, ongoing clinical input into the many problems that surround immunization delivery and adverse reaction management.≅[247] (emphasis original)

[247] *Ibid.*

Those problems include recognition of potentially life-threatening hypersensitive reactions, use of pre-treatments to mitigate vaccine reactions and the criteria to be applied to determine temporary or permanent medical exemption, or waiver, from the AVIP. At the first DOD conference on biological warfare immunizations, held in May 1999, Dr. Engler made a presentation on the clinical challenges posed by the AVIP. She summarized several case studies of those who had suffered adverse reactions to the anthrax vaccine, with data from Walter Reed Army Medical Center, data from Dr. Hoffman=s study in Korea, and patient profiles from Dover AFB.[248] In her slide presentation, she noted a Afear of military medical establishment≅ and concluded the AVIP message should be, AEvery service member deserves the same quality of care as ANY OTHER PATIENT: investigate problems proactively & objectively, validate suffering, knowledge base and unknowns. Vaccines are drugs & NOT 100% safe.≅[249]

Regarding the availability of medical deferrals and waivers, Dr. Engler asked, AShould medical waivers become a punitive event? ... Do we want rigid administrative guidelines that polarize and antagonize service members with problems? Can we acknowledge risk & include choice of affected AD in final disposition? Does every service member have to be immunized or is there room for a benefit risk ratio discussion?≅[250]

Room for that discussion may be limited. The risk/benefit decision underlying the AVIP can conflict with the clinician=s duty to weigh the risks and benefits to the individual patient. In an e-mail exchange with Col. Fred Gerber, operational head of the AVIP, Dr. Engler posed the following example:

> AA rash within 2 hours of the vaccine could represent an increased risk for life threatening anaphylaxis with next dose - if you ignore this and do not handle it appropriately and a subsequent dose results in significant harm, you are outside the standard of care and would NOT be excused by the >active duty= blanket. Our specialty has worked with this type of patient and achieved successful and safe subsequent vaccination but this requires expertise and very carefully prepared informed consent. ETHICALLY, you cannot expose a soldier to a medical treatment if he/she is at increased risk for harm from it and yes we do waiver people for serious vaccine reactions from future reactions and they continue on active duty for the most part. Anthrax brings unique urgency to the scenario and a group discussion on these issues with an ethicist is crucial.≅[251] (emphasis original)

---

[248] See *supra* note 51, pp. 3-7.
[249] *Ibid.*, p. 12.
[250] *Ibid.*
[251] See *supra* note 245.

Col. Gerber, while disclaiming any purview over clinical issues, was unwilling to acknowledge that safety considerations might need to overcome the AVIP imperative in some number of cases:

> ANot sure I agree with what you=ve presented Renata. If ... she had a rash within 2 hrs of shot #1 ... [w]hy would that exempt her from getting rest of series and going to Korea? Who should go in her place? Those become the issues. Korea is one of the two AVIP Phase I High Threat Areas ... everyone is at increased risk for exposure to anthrax there. By your algorithm, when we get to Phase II of the AVIP, new soldiers coming into service would be put out of service because of an adverse reaction to anthrax ... what about an adverse to any of the other 17 immunizations? ... Call it like you see it, but I wouldn=t quickly exempt soldiers from worldwide assignments who have rashes, pain, swelling, etc. Let=s face it, AVA is one of many soldiers have to take. The more exotic vaccines are yet to come. ... Does a rash in 2 hours mean you can=t get any more immunizations without additional clinical follow-up/eval? I=m not sure it does.≅[252]

Concerns about the short and long term safety of the anthrax vaccine are legitimate. It is disingenuous for DOD to say 30 years of use has seen no serious short-term or chronic adverse health effects associated with the vaccine. For most of that time, no one was looking.

The short-term adverse reaction rates contained in the FDA-approved labeling were derived from data gathered during testing of an earlier, less reactogenic anthrax vaccine. FDA only establish the Vaccine Adverse Event Reporting System in 1990. That passive surveillance system, while useful to detect sentinel events or clusters for further study, understates the extent of reactions. Limited use of the vaccine since licensure has yielded limited information that suggests higher reaction rates, particularly in women.[253]

Since the AVIP began, DOD has undertaken two active follow-up surveys of vaccine recipients, one in Korea and another at Tripler Army Medical Center, Hawaii. The results of both studies indicates both local and systemic reactions at generally higher rates than described in the product labeling. According to GAO, AThe data gathered in Korea also show that after the first two shots, more than twice the proportion of women than men reported systemic reactions of

fever, malaise, or chills than did men.[254] The Tripler survey also demonstrates gender differences in reported reactions.[255]

[254] *Ibid.*, p. 3.
[255] *Ibid.*, p. 4.

Service members= concerns about the impact of manufacturing process lapses on vaccine quality and safety are well placed. For biological products, the process is the product. A[Q]uality cannot be guarantees from final tests on random samples but only from a combination of in-process tests, end-product tests, and strict controls of the entire manufacturing process.=[256] At BioPort, and its predecessor the Michigan Biologics Products Institute, those controls were found to be less than strict.

The long-term safety of the licensed vaccine has not been studied.[257] It is of little comfort to service members that no other vaccines have been subject to any post-licensure longitudinal study. Unlike more modern vaccines, the AVA was approved before animal toxicity studies were even required. As a result, Astudies have not been performed to evaluate the effect of AVA on carcinogenesis, mutagenesis or impairment of fertility. Animal reproduction studies have not been conducted with AVA. Neither is it known whether AVA can cause fetal harm when administered to a pregnant woman or whether it can affect reproductive capacity.=[258]

It is unlikely the current anthrax would be approvable under modern regulatory standards for the safety and efficacy of biological products. It seems unlikely BioPort will be able to achieve and sustain modern manufacturing standards for safe vaccines.

[257] *Ibid.*, p. 11.

[258] See supra note 138, pp. 87-88.

5. Efficacy of the vaccine against biological warfare is uncertain. The vaccine was approved for protection against cutaneous (under the skin) infection in an occupational setting, not for use as mass protection against weaponized, aerosolized anthrax.

Uncertainties about safety might be more readily accepted if there were no questions about the effectiveness of the anthrax vaccine. Safety risks would be tolerable if the benefits were unquestioned. But there are questions. The proposition that the AVA will provide effective protection against the most likely form of weaponized anthrax, aerosolized spores in significant quantities, is unproven.

And, until there is an anthrax attack, the proposition must remain unproven. The industrial settings in which anthrax was a threat have all but disappeared.[259] It would be unethical to expose human test subjects to a lethal agent. So, based on proven efficacy against indeterminate levels of cutaneous exposure in a industrial setting, it can only be assumed the vaccine provides equivalent protection against high levels of inhalation exposure.

That assumption is supported by data from tests on vaccinated animals who survive aerosol challenge. But different survival rates between animal species, and between anthrax strains, raise more questions than the vaccine answers about the actual physiological mechanism of protection. Without a way to correlate animal data to human protection (i.e. PA antibody titers), efficacy of the vaccine may never be more than suggested or inferred.

According to GAO:

[259] Only research and testing facilities now present an occupational setting posing a danger of anthrax exposure.

AStudies on the efficacy of anthrax vaccine have been limited to a study of the efficacy of the earlier version for humans and studies of the efficacy of the licensed vaccine for animals. The only study of the efficacy of the vaccine for humans was performed by Brachman, using the original vaccine. The Brachman study claimed that the vaccine gave 93 percent (and a lower confidence limit of 65 percent) protection against anthrax penetrating the skin. It found that the number of individuals who contracted anthrax by inhalation was too low to assess the efficacy of the vaccine against this form. There has been no specific study of the efficacy of the licensed vaccine in humans. Rather, its efficacy in humans has been inferred from other data, including a reduction in the incidence of anthrax following immunization of at-risk individuals and from animal experiments.≅[260]

All the DOD animal studies support the view that the licensed vaccine can protect some animals against exposure to some strains of anthrax either by inoculation or inhalation. But animal species differ in susceptibility.[261] In testimony submitted to the Subcommittee, Dr. Meryl Nass summarized the available data from animal studies of anthrax vaccine efficacy. AOne can see varying survival rates from 0 - 100% depending upon the strain of anthrax used and possibly other parameters of the experiment. Survival rates in guinea pigs varied from 23% to 71% when they were exposed to inhaled anthrax.≅[262] Studies in mice showed survival rates between no higher than ten percent.[263]

In concluding the current vaccine is effective against aerosol challenge, DOD relies primarily on studies using rhesus monkeys. AThese animal studies showed that the FDA-approved anthrax vaccine provided greater than 95% protection against high-dose aerosol challenge with anthrax in the monkey model. Human antibody response to the FDA-licensed vaccine provides further suggestive evidence that the FDA-licensed anthrax vaccine will protect against inhalation anthrax.≅[264]

But, according to GAO, Aseveral studies have shown no direct comparison of immunity in humans to that in monkeys.≅[265] In fact, the one immunized monkey that died in the DOD studies Ahad a low antibody titer similar to other monkeys that lived following a lethal aerosol

challenge.=[266]

[266] See *supra* note 138, p. 90.

One study comparing the efficacy of a live spore vaccine to a PA-based vaccine, like the AVA, concluded, AImmunization with cell-free preparations which contained components of that anthrax toxin did not provide adequate protective response against some challenge isolates of *B. anthracis*. The fact that the spore vaccine provided protection against all isolates tested suggests that other antigens may play a role in active immunity.≅[267]

DOD resists that suggestion because confidence in the efficacy of the current anthrax vaccine in humans, against all known strains, depends heavily on the conclusions 1) that the antibody response to the one antigen, PA,[268] protects against the toxic mechanism of all natural anthrax, and 2) that the antibody response in animals correlates to a similar protective response in humans.

The lack of a immunological correlate of protection against anthrax limits the extent of efficacy claims that can be made about the current vaccine, and it poses a profound challenge to the studies needed to approve an improved vaccine or a shorter AVA shot course. In describing the challenges to demonstration of efficacy for proposed changes in the dose and use of the current anthrax vaccine, DOD noted:

> APresently there are no precise serological or other immunological correlates of protection to enable conclusions to be drawn from immunization studies in man. The extrapolation from animal studies to humans likewise is seriously complicated by this fact. ...≅
>
> AThe demonstration in some animal models that protection with the present vaccine varies across challenge strains further complicates studies and limits the breadth of efficacy claims that can be made.≅
>
> ATo date, no animal or other potency test has been demonstrated to be well correlated with protection of humans. ***The potency test required for the present vaccine[269] has not been well correlated to efficacy in humans and it is doubtful that it can be.***≅ (emphasis added)
>
> AIt has recently been stated that the antigenic components of the licensed vaccine are not well defined and that there is lot to lot variation in the level of protective antigen. Because of these points, efficacy studies will likely have to include

---

[267] Stephen F. Little and Gregory B. Knudson, AComparative Efficacy of Bacillus anthracis Live Spore Vaccine and Protective Antigen Vaccine against Anthrax in the Guinea Pig,≅ *Infection and Immunity*, May 1986, Vol. 52, No. 2, p. 511.

[268] Protective antigen (PA) is one of three proteins involved in the mechanism of anthrax toxicity.

[269] The current potency test uses guinea pigs.

multiple lots to demonstrate consistency of protection.≅[270]

[270] See *supra* note 138, p. 45 (presentation slide entitled, AChallenges to Demonstration of Efficacy for the Proposed Changes in Dose and Use of Anthrax Vaccine,≅ included in supporting documentation to MBPI IND application) (in subcommittee files).

Regarding efficacy, one author of an anthrax vaccine study wrote, AMy concern is not the long-term health effects of this vaccine, but rather that it is not efficacious against all strains of *B. anthracis*. If I were the scientific director of an offensive BW program for a government hostile to the U.S., I would direct my investigators to repeat this experiment, screening a larger number of *B. anthracis* isolates until a strain was isolated that would kill immunized animals, and then use that vaccine resistant strain as the stock for producing spores to be used in filling BW submunitions.≅[271]

Genetically engineered anthrax strains could also defeat the current vaccine if the resulting organism caused disease in new ways. Reports that Russian scientists successfully inserted genes into a virulent anthrax strain were received by DOD with some skepticism. Col. Gerald Parker, then-commander of USAMRIID, was quoted as saying the claims needed to be evaluated Ato learn whether the advance is theoretical or practical, and whether it could sidestep the American anthrax vaccine.≅[272] Taking a more skeptical approach to threat assessment than DOD uses with regard to natural anthrax, Col. Parker added, AIt=s one thing to do this in the lab. But its a whole different thing to produce it in large quantities to be used as a weapon. That would be very difficult.≅[273]

Concerns about the efficacy, and by implication the necessity, of the vaccine are legitimate given the extent of unproven, unknown, and perhaps unknowable, aspects of the protection afforded. The vaccine almost certainly could be overwhelmed by a high-dose aerosol exposure. Immunized troops near an initial release point could still suffer significant casualties. The vaccine may have diminished effect against highly virulent strains, or combinations of strains. The vaccine may provide no protection against genetically engineered anthrax.

[273] *Ibid.*

1. The force-wide, mandatory AVIP should be suspended until DOD obtains approval for use of an improved vaccine.

Recommendations

The anthrax vaccine program is not sustainable in its present form. Due to the lack of assured production, AVIP Phase II has already been delayed. Confidence in the quality of the vaccine stockpile is low and the capacity to procure sufficient new production remains highly doubtful. The program should be suspended while contingency plans for allocation of available vaccine are formalized and research is conducted to obtain a safer, more effective vaccine.

Signaling an awareness the anthrax immunization effort was on weak conceptual and logistical footing from the start, Secretary Cohen announced four preconditions to the start of the program: supplemental vaccine testing, an adequate tracking system, completed implementation and communication plans and an independent scientific review. Those were appropriate. Had they been more scrupulously addressed, the AVIP might be a very different, much better program.

The military anthrax immunization program should have been conditioned on completion of the same level of research and testing required of other battlefield systems. We would not ask U.S. forces to fight using rifles designed in the 1950's. We should not ask them to rely on 1950's era medical technology, when modern science has the capacity to produce an improved vaccine. Much has changed in the biologics industry since the AVA was first approved in 1970. As evidenced by FDA inspectional findings in 1998 and 1999, not enough has changed at the vaccine production facility to bring it into full compliance with modern manufacturing standards. It is doubtful the AVA would be approved by the FDA today.

As additional assurance the anthrax immunization program is as safe as possible, DOD should test the vaccine for toxicity, mutagenicity, carcinogenicity and reproductive effects in animals. The current AVIP should be suspended while those studies, and other steps recommended by the Subcommittee, are undertaken.

The AVIP should be suspended because it lacks an essential element in a medical program: trust. However well-intentioned, the anthrax vaccine effort is viewed by many with suspicion. It is seen as another chapter in a long, unhappy history of military medical malfeasance in which the healing arts are corrupted to serve a lethal purpose.

The fundamental rationale for the AVIP - that something, even an old, questionably effective vaccine, is better than nothing - gives little comfort to those who daily see their forebears and colleagues grow sicker from radiation testing, Agent Orange and Gulf War illnesses. If the noble experiment fails, if the vaccine ultimately causes more casualties than

weaponized anthrax, many men and women in uniform do not believe their government will acknowledge their sacrifice or treat their wounds.

Trust must be earned. It can be earned only with a degree of candor and openness that has not been the hallmark of the AVIP to date. While claiming a new awareness of the need for effective risk communication, the Pentagon still reverts to absolutist declarations, heavy handed propaganda, and *ad hominem* attacks whenever the risks of the anthrax vaccine are communicated too effectively or persistently. In a culture based on a chain of command and the power to compel, attempts at persuasion and education often devolve into intimidation. Labeling opponents Aparanoics≅[274] and ridiculing the intelligence or courage of those with legitimate questions[275] are not the methods of modern risk communication.

Nowhere is DOD=s failure to communicate the relative risks and benefits of the AVIP more obvious than in reserve component units. The bulk of vocal resistance to the AVIP has arisen in the few Reserve and National Guard units included in Phase I. Those service members have more options than active duty personnel. If they conclude the anthrax vaccine poses more risk than benefit to their civilian and military careers, they can resign, or seek a transfer to a non-mobility position. Many have done so.

DOD appears to be in denial on this issue, ignoring clear signs the anthrax program is having, and will certainly have, a substantial impact on retention and morale in reserve component units. At the Subcommittee=s September 29, 1999 hearing on the subject, Maj. Gen. Paul Weaver, Director, Air National Guard, testified there had been Aone known refusal documented.≅[276] Previously, the Subcommittee had received testimony and correspondence from several members of Air Guard units who had refused the vaccine, more than one of whom were in the hearing room when Gen. Weaver made that statement.

---

[274] See *supra* note 79.

[275] See *supra* note 80.

[276] Testimony of MG Paul Weaver, Director, Air National Guard, NSVAIR Anthrax Hearing (V), p. 119.

Principal Deputy Assistant Secretary of Defense (Reserve Affairs) Charles Cragin testified the impact of the AVIP on retention was Anegligible≅[277] despite having been given information just days before that more than half the air crew in one unit has submitted resignations attributable directly to the anthrax program.[278] At the same hearing, Mr. Cragin conceded Athe Department=s efforts to inform and educate reserve personnel about the anthrax protection program were not initially as robust as they should have been.≅[279]

Until much more is known about the true impact of a mandatory vaccine program on retention, readiness and morale in the most voluntary sector of the all-volunteer U.S. armed forces, the AVIP should be suspended.

Rather than risk long term health impairment, some service members would be willing to consider the vaccine-preventable risk of anthrax among the inherent, unavoidable risks of military service. They do not have that option, an opportunity to assume risk made available to essential civilian employees of the Defense Threat Reduction Agency.[280]

Others view this force protection effort as an untested medical solution to a purely mechanical problem - contamination prevention and avoidance - better solved by physical rather than pharmacological technology. With regard to the anthrax vaccine, DOD appears to accept more unknowns and greater technological risks than would be tolerated in any combat weapon system. As a result, some service members are not convinced this Acommander=s program≅ is for their long-term protection as much as for battlefield convenience and the preservation of short-term mission capability while under anthrax attack. Suspension of the AVIP would allow DOD to focus more attention and resources on development and deployment of chemical defense doctrine, tactics, detection capability as well as individual and collective protection equipment effective against all threats.

The Subcommittee makes no recommendations regarding the status of those service members who left the armed forces voluntarily, or as the result of disciplinary actions, due to the

anthrax vaccine program. Just as each service branch, operating under the Uniform Code of Military Justice, determined its own approach to vaccine refusals, each should determine through its own processes what appeals, if any, might be available in the event the AVIP is restructured or suspended.

recombinant anthrax vaccine.

Despite the Aclear and present danger≅[281] posed to U.S. troops by anthrax as a biological weapon, DOD considers development of an improved anthrax vaccine Aan unfunded requirement.≅[282] Had that requirement been addressed more aggressively after the Persian Gulf War, the eight to ten year development, testing and FDA approval process now posited by DOD as an potential barrier to a new vaccine could have already been breached.

Although an improved vaccine based on recombinant technology may not necessarily have better safety characteristics than the current vaccine,[283] it would address two other problems plaguing the AVIP. Production of a second vaccine, at a second site, would diversify the industrial capacity to support so critical a program, making vaccine supplies more abundant and more secure from attack. And, because recombinant techniques do not require extensive dedicated facilities, capital costs can be allocated across more than one product, increasing the likelihood other manufacturers would compete for DOD contracts.

The second generation vaccine studied by DOD was also more consistently characterized in terms of PA content than the AVA[284]. Lot-to-lot consistency would address one challenge noted by DOD to demonstrating efficacy of a vaccine that cannot be tested in humans.[285] It would also give commanders greater confidence that vaccinated troops, to the greatest extent possible, have achieved a more uniform level of protection.

[285] See *supra* note 108.

David Oliver, Principal Deputy Under secretary of Defense for Acquisition and Technology, said in testimony that DOD would be reviewing procurement options with regard to a second AVA production site versus a new vaccine. He suggested, however, that funds spent on an improved anthrax vaccine would limit funds available to address other bio-threats.[286] That trade-off puts anthrax on a par with other biological agents in terms of threat, when in fact DOD considers anthrax the pre-eminent bio-threat. Budgets estimates for the Joint Vaccine Acquisition Program (JVAP) indicate DOD anticipates procurement of limited, deployment-contingent stocks of vaccines against other biological weapons, making anthrax the only agent targeted for universal immunization. Improving the medical prophylaxis against the primary threat should be a DOD funding priority.

DOD concedes, AIn the case of anthrax vaccine, the current FDA-licensed vaccine is not ideal. The vaccine was developed in the 1950's and 1960's by the state-of-the-art procedures at that time, and licensed in 1970. Advances in biotechnology and genetic engineering may enable improvements in the vaccine that allow fewer doses or use of highly purified protective antigen. The DoD scientists are pursuing both of these objectives. A highly-purified recombinant protective antigen vaccine has shown efficacy in animal models.≅[287]

But DOD is unwilling to wait for the research, development and FDA approval processes,[288] even though DOD believes Awithin a year we will get FDA approval for reduced dose based on the science.≅[289]

To address the domestic bioterrorism threat, the Department of Health and Human Services= National Institute of Allergy and Infectious Diseases formed a working group to develop and test a second generation anthrax vaccine, and the Institute has funded some research. DOD should support those efforts.

[286] Testimony of The Honorable David R. Oliver, Jr., NSVAIR Anthrax Hearing (III), pp. 68-69.

[287] Department of Defense, AInformation About the Anthrax Vaccine and the Anthrax Vaccine Immunization Program,≅ prepared by the AVIP Agency, January 25, 2000, pp. 12-13 (available at: http://www.anthrax.osd.mil) (in subcommittee files).

[288] *Ibid.*

[289] Testimony of Col. Fred Gerber, Director, Health Care Operations, Office of the Army Surgeon General, NSVAIR Anthrax Hearing (V), p. 153.

With regard to an improved anthrax vaccine, the American Public Health Association adopted a policy statement in November 1999 urging DOD to Adelay any further immunization against anthrax using the current vaccine or at least to make immunization voluntary≅[290] and to convene a commission of military and non-military public health experts to review safety and efficacy evidence for the current vaccine, attempt to determine when an improved vaccine might be available, and make recommendations about continuation of the current program.[291] Their recommendations were based on the concern Athat mandatory immunization with a vaccine of unproved efficacy when an improved vaccine may soon be available, is contrary to public health principles and may adversely effect the acceptance of voluntary or mandatory immunization programs in which there is good evidence of efficacy and safety....≅[292]

---

[290] AAnthrax Immunization,≅ American Public Health Association, Policy Statement No. 9930, Nov. 10, 1999.

[291] *Ibid.*

[292] *Ibid.*

3. DOD should pursue testing of the safety and efficacy of a shorter anthrax inoculation regimen.

A shorter shot course could reduce the cost of the immunization program, simplify delivery logistics, and lower the incidence of adverse reactions.

According to GAO testimony, ANo studies have been done to determine the optimum number of doses of the anthrax vaccine.≅[293] The original inoculation schedule of three doses was based on a regimen developed using animals in the early 1950s. However, three people who received three doses of a weaker formulation of the vaccine became infected after exposure to anthrax. The number of doses was then arbitrarily increased to six, the number used in the only human efficacy study published in 1962, and thus the number approved by FDA.[294]

Even if a prolonged, multi-shot regimen is necessary to generate an initial immune response, the annual booster may be unnecessary. GAO noted:

> AIn November 1971, the Division of Biologics Standards, NIH, noted an apparent increase in reports of adverse reactions after individuals received booster shots. The Division considered it advisable to reevaluate the need for annual boosters and possibly the amount of the booster dose. Although the record is unclear as to whether or not NIH requested a reevaluation, to date, no such reevaluation has been done.≅[295]

The 1993 DOD Directive on biological warfare defense mandates immunization Aagainst validated biological warfare threat agents, for which *suitable* vaccines are available, in sufficient

[293]Testimony of Kwai-Cheung Chan, Director, Special Studies and Evaluation Section, National Security and International Affairs Division, GAO, NSVAIR Anthrax Hearing (IV), p. 97.

[294] Prepared statement of Kwai-Cheung Chan, Director, Special Studies and Evaluation Section, National Security and International Affairs Division, GAO, NSVAIR Anthrax Hearing (IV), p. 5.

[295] *Ibid.*, p. 6.

time to develop immunity before deployment to high threat areas....≅[296] (emphasis added) For this purpose, Asuitable≅ should not just mean FDA approved, but demonstrably as safe and effective as possible for the intended military use. A vaccine that takes 18 months, and annual boosters, to confer immunity should not be considered suitable under the policy.

[296] See *supra* note 7.

In 1995, the Joint Program Manager for Biological Defense reported, AThe immunization schedule of 6 shots over 18 months has stopped the approval process for an annual immunization program against this high threat biological warfare agent. Moreover, it has been used by critics to question the relevance of the biological defense (BD) vaccine program to the DOD.≅[297]

If the time to develop immunity could be reduced substantially, use of the anthrax vaccine would be safer and could be targeted far more effectively to forces deploying to high threat areas.

Based on animal studies and research into the immunological response to the vaccine in humans, DOD concludes most persons acquire the bulk of whatever protection is achieved after two or three shots.[298] DOD documents assert that three inoculations provide functional protection, and the services= AVIP implementation plans set as Adesirable≅ the goal that Aall personnel assigned to high threat areas receive their first three shots prior to deployment.≅[299] In the interest of reducing adverse reactions, particularly in persons whose immune systems have already mounted a complete response to the vaccine, DOD should put its belief in the efficacy of a reduced shot course to the test of rigorous scientific trials.

To the extent those efficacy studies were put aside due to the lack of a correlates of human immunity, that challenge will have to be overcome in any event as DOD attempts to develop and deploy other vaccines against other bio-threats. That work might as well be done in support of a safer vaccine against the primary biological warfare threat, anthrax.

In terms of increased safety, there is also some evidence an intravenous injection would

---

[297] Col. John C. Doesburg, Joint Program Manager for Biological Defense, Memorandum on AUrgent Requirement for Integrated Command Support to Revise the Immunization Schedule for Anthrax Vaccine≅ (JPO 0045) from the Department of the Army, November 17, 1995 (in subcommittee files).

[298] Testimony of Maj. Gen. Robert Claypool, Deputy Assistant Secretary for Health Operations Policy, NSVAIR Anthrax Hearing (IV), p. 179; Arthur M. Friedlander, Philip R. Pittman, and Gerald W. Parker, AAnthrax Vaccine: Evidence for Safety and Efficacy Against Inhalational Anthrax,≅ The Journal of the American Medical Association, December 8, 1999, Vol. 282, No. 22, pp. 2104-2106.

[299] See *supra* note 46, p. 1, sec. 1(a)(8).

produce fewer side effects and adverse reactions than subcutaneous administration. DOD expended significant time and resources in 1994 and 1995 on plans and programs to demonstrate the safety and efficacy of a shorter anthrax inoculation regime, and a different route of administration, but appears to have all but abandoned those efforts when planning for the AVIP began. Support for the FDA application to reduce the shot course seems to have been redirected to vaccine acquisition and AVIP logistics.

4. DOD should enroll all anthrax vaccine recipients in a comprehensive clinical evaluation and treatment program for long term study.

DOD only recently began Ato design a set of studies to better evaluate the long term safety of the anthrax vaccine ... to conform with present-day, post-marketing practices≅[300] While employing active surveillance techniques, these will be cohort studies because A[i]t would be labor-intensive, cost-prohibitive, and would not conform to civilian expectations for us to use this in all 2.4 million service personnel whom we will administer the vaccine to.≅[301] According to Gen. Claypool, DOD will also use linked databases to conduct active surveillance of vaccine recipients, using DEERS and Athe large medical database residing at a tri-service defense medical surveillance system here in the National Capital region of the Walter Reed installation.≅[302]

But these steps, coming more than one year after AVIP implementation, are not enough to monitor the impact of the vaccine program on military health. Having missed the opportunity to study the large cohort of service members who received the AVA during Operations Desert Shield and Desert Storm, DOD has an obligation to reach beyond Acivilian expectations≅ to evaluate the safety of this vaccine.

Particularly for members of reserve component units, access to primary care and specialists at military facilities can be limited. According to DOD, adverse events after the anthrax vaccine are Aline of duty illnesses.≅[303] Therefore,

> Aa member of the Reserve Component may present themselves for initial treatment and evaluation at any military treatment facility, after vaccination during a period of duty. The member will be examined and provided necessary medical care. Once treatment is rendered or the individual=s emergent condition is stabilized, a Line of Duty and/or Notice of Eligibility status will be determined by the member=s unit, as required. No treatment beyond that justified to stabilize the condition or emergency is authorized until Service connection is validated.≅

---

[300] Testimony of Maj. Gen. Robert Claypool, Deputy Assistant Secretary for Health Operations Policy, NSVAIR Anthrax Hearing (IV), p. 108.

[301] *Ibid.*

[302] *Ibid.*, p. 109.

[303] Dr. Sue Bailey, AWhat Everyone Needs to Know about the Anthrax Vaccine≅ quarterfold brochure, Department of Defense, November 1, 1999, p. 3 (in subcommittee files).

But requiring an immediate determination of service-connection for vaccine related health effects means many short term, and most long term, adverse reactions will not be monitored by DOD physicians. The causal attribution of health effects to inoculations is difficult, becomes more difficult over time, and remains unlikely in a military program institutionally resistant to any suggestion the vaccine is not safe. Service members should not bear the burden of proof the vaccine caused their ill-health subsequent to inoculation. The process of proving service-connection has frustrated Gulf War veterans= efforts to obtain accurate diagnoses, effective treatments and fair compensation for their unexplained illnesses. It should not be repeated in the AVIP.

Enrollment of every vaccine recipient in a clinical evaluation and treatment protocol would allow DOD to capture a unique and valuable data set for use in their longitudinal studies, avoiding disputes over cohort selection bias and other methodological issues. The evaluation and treatment program could also be the vehicle for assembly of the multidisciplinary teams envisioned by Dr. Engler[304] to develop and implement clinical protocols and maintain a consistent standard of care in the AVIP. It would also help assure service members the vaccine program, as a medical force protection effort, has as its primary purpose the protection of the health of the force.

[304] E-mails from Col. Renata Engler dated December 4-8, 1998 (in subcommittee files).

5. While an improved vaccine is being developed, use of the current anthrax vaccine for force protection against biological warfare should be considered experimental and undertaken only pursuant to FDA regulations governing investigational testing for a new indication.

Under FDA regulations, use of an FDA-approved product in an unapproved way, or for an unapproved purpose, can only be undertaken pursuant to clinical trial protocols contained in Investigational New Drug (IND) applications.[305] IND protocols must be approved by an Institutional Review Board charged to monitor the scientific credibility and ethical soundness (i.e. patient protections) of the trial. FDA must agree the trial proves the product is safe and effective for the proposed use. Informed consent must be obtained from persons enrolled in IND drug or vaccine trials.

If DOD proposed to use the anthrax vaccine against a disease or indication not currently described in the FDA-approved product labeling (i.e high blood pressure), an IND application would be required. If DOD proposed to alter the FDA-approved AVA inoculation regimen (i.e. by eliminating one or more of the six shots), and IND would be required.

Despite the fact the vaccine was approved as safe and subsequently deemed effective only against cutaneous anthrax infection, DOD asserts use of the FDA-approved AVA as prophylaxis against weaponized, inhalation anthrax does not constitute an off-label use against a new indication because A[w]hile the package insert for this vaccine is nonspecific as to the route of exposure, DOD has long interpreted the scope of the license to include inhalation exposure, including that which would occur in a biological warfare context.≅[306]

While some in DOD may have interpreted the scope of MBPI=s FDA license to include inhalation anthrax by implication, others proceeded as if explicit labeling for the indication would be necessary. Throughout development of the anthrax policy that eventually became the AVIP, some in DOD interpreted FDA regulations as requiring approval of both a reduced number of inoculations and the new indication. A 1995 memo states:

[305] 21 CFR Part 312.

[306] Letter from Dr. Stephen C. Joseph to Dr. Michael A. Friedman dated March 4, 1997 (in subcommittee files).

> AThe use of a reduced schedule to protect service members from aerosol exposure to anthrax can only legally be done if the FDA licenses the vaccine for that specific schedule and indication. ... Obtaining FDA license approval for a specific immunization schedule change and for a labeled indication change (aerosol challenge) must provide data that establish safety of two doses of the vaccine given at 0 to 4 weeks since this schedule does not mimic the current schedule of 0, 2 and 4 weeks. More extensive problems exist in demonstrating vaccine efficacy against an aerosol challenge.≅[307]

In September 1996, the vaccine manufacturer, MBPI, submitted an IND application which said, AThe ultimate purpose of this IND is to obtain a *specific indication for inhalation anthrax* and a reduced vaccination schedule.≅[308] (emphasis added) Briefing slides produced by USAMRIID in October 1997 reference two separate objectives to be met in a supplement to the AVA license:

X Supplement to AVA license to reduce the number of immunizations and change the route of immunization.

X Supplement AVA license to explicitly include inhalational anthrax as an indication.[309]

Since 1997, the *Department of Defense Nuclear/Biological/Chemical (NBC) Defense - Annual Report to Congress* has referred to medical CBW countermeasures proven safe because they have Abeen widely used to treat other medical conditions.≅[310] The report cites pyridostigmine

bromide, the botulinum toxoid vaccine, both used for CB prophylaxis only pursuant to INDs, and the anthrax vaccine. But DOD=s interpretation of the current AVA labeling rests on the conclusion there is but one indication - anthrax infection acquired by any means. Against what Aother medical condition= was the anthrax vaccine used to prove its safety?

> When DOD asked the FDA to concur with the implicit inclusion of inhalation anthrax in the current product labeling, the response was affirmative but tepid. FDA Lead Deputy Commissioner Michael Friedman wrote: AWhile there is a paucity of data regarding the effectiveness of Anthrax Vaccine for prevention of inhalation anthrax, the current package insert does not preclude this use. The original efficacy trail clearly showed that the vaccine conferred a high level of protection against cutaneous exposure. None of the 5 inhalation cases in this trial occurred in Anthrax Vaccine recipients, but these data alone are insufficient to allow definitive statistical conclusions. Results from animal challenge studies have also indicated that pre-exposure administration of Anthrax Vaccine protects against inhalation anthrax.

Defense Nuclear/Biological/Chemical (NBC) Defense - Annual Report to Congress, March 1997, pp. 3-4 to 3-5.

Therefore, I believe your interpretation is not inconsistent with the current label.≅[311]

It was on this basis DOD proceeded to design the AVIP without informed consent procedures, or an informed consent waiver, and without other elements of a clinical trial such as consistent data gathering and detailed health outcome monitoring.

DOD was aware of the extensive problems confronting the effort to prove vaccine efficacy for the new indication, most notably that A...no animal or other potency tests has [sic] been demonstrated to be well correlated with protection of humans.≅[312] DOD conducted, and plans to continue, studies attempting to validate an animal model so findings can be extrapolated to humans.

In launching the AVIP, DOD did not confront those problems but sidestepped them by concluding use of the vaccine to prevent anthrax infection, however acquired, would not require an IND as long as the approved inoculation schedule was followed. So the AVIP=s cumbersome logistics, additional costs, and increased risk of adverse reactions all flow directly from an unwillingness to do the research and testing to develop a better vaccine or improve the safety and efficacy of the current AVA.

That research and testing will have to be done in any event. In 1997 DOD told Congress:

---

[311] Letter from Dr. Michael A. Friedman to Dr. Stephen C. Joseph dated March 13, 1997 (in subcommittee files).

[312] See *supra* note 307, p. 2. The memo continues, AThe potency test required for the present vaccine has not been well correlated to efficacy in humans.≅ The current potency test uses guinea pigs. Tests challenging different animal species with a range of anthrax strains showed the vaccine provides varied levels of protection. Against some strains, vaccinated guinea pigs and mice suffered 100 mortality. In DOD studies using nonhuman primates (rhesus monkeys) between 88 and 100 percent of the vaccinated animals survived.

> ADOD complies with all Food, Drug and Cosmetic Act requirements. The Food and Drug Administration (FDA) requires large-scale field trials in human subjects to demonstrate efficacy of drug and biologicals prior to licensure. There are, however, legal and ethical constraints that preclude such efficacy studies for NBC countermeasures. Field studies of efficacy cannot be performed, since exposure to most NBC agents does not usually occur naturally. Moreover, the high lethality and/or toxicity of NBC agents also makes it unethical to expose human subjects in controlled efficacy studies usually required by the FDA for product licensure (*e.g.*, test of effectiveness of the product against the threat in humans). For these reasons, ***many NBC countermeasures are likely to remain in an Investigational New Drug (IND) status, requiring their administration under provisions of an approved protocol and with written informed consent*** from their service members. In contingency situations, DOD may request a waiver of informed consent from the FDA. DOD continues to work with the FDA to seek alternative methods for demonstrating safety and efficacy of NBC medical countermeasures and to obtain their licensure.≅[313] (emphasis added)

Given the predicted likelihood NBC vaccines will be available only in IND status for some years to come, DOD will need to develop the capacity to conduct broad-based clinical trials and effectively communicate risk/benefit assessments through informed consent processes. In the interests of deploying a safer, presumably more effective vaccine against the pre-eminent biological warfare threat, DOD should be willing to develop that capacity now. Instead, DOD has chosen to address the primary threat with a dated, secondary countermeasure with substantial unknowns regarding quality, safety and efficacy.

In prescribing the vaccine, DOD is engaging in the practice of medicine. AIt is true doctors can use drugs off label. It is never true they can do so without informed consent of the patient... You are not immunized from getting informed consent.≅[314] If DOD were to concede administration of AVA against inhalational battlefield exposure is an off label use, informed consent would be required. The AVIP could be transformed, for most, into a voluntary program, with limited mandatory usage of the vaccine possible only pursuant to a carefully monitored informed consent waiver.

---

[313] See *supra*, note 310, 1998 Report, p. 3-4.

[314] Testimony of Arthur Caplan, Ph.D., *Force Protection: Improving Safeguards for Administration of Investigational New Drugs to Members of the Armed Forces*, 106th Cong. 1st sess. (1999), unofficial transcript, p. 77 (subcommittee on National Security, Veterans Affairs and International Relations hearing of November 9, 1999) (in subcommittee files).

In a statement submitted to the Subcommittee, the Association of American Physicians and Surgeons asserted:

> AA distinction must be made between treatment and experimentation. It may be asserted that anthrax vaccine (unlike pyridostigmine bromide as used in the Gulf War or anti-botulinum vaccine) constitutes >treatment,= or that it is not experimental because of being declared safe and effective by FDA. ... In fact, the anthrax vaccine was licensed by the FDA before efficacy studies were required. Its efficacy against inhalational anthrax has been questioned.... British epidemiologist suggested that troops be publicly randomized to receive active vaccine or placebo, clearly implying that many consider the vaccine to be experimental.≅[315]

The AAPS recommended a careful examination of the medical ethics involved in military, and civilian, vaccination efforts, noting the entire point of informed consent in combat is >not to prevent soldiers from obtaining whatever protection may be afforded them by an investigational agent that has not been adequately tested, but rather, it is to give them the choice of whether they think the >protection= is worth the risks of adverse effects= ≅[316]

Although DOD=s track record administering INDs or informed consent waivers is not exemplary,[317] current procedural safeguards, adopted since the Gulf War, provide far more

---

[315] Submitted statement of Dr. Jane M Orient, Executive Director, Association of American Physicians and Surgeons, NSVAIR Anthrax Hearing (I), p. 119, citing the *European Journal of Epidemiology* 4:12-19, 1998 and Ness AR, Harvey I, Gunnell D, Smigh GD: AAll troops sent to Gulf should be randomized to receive anthrax vaccination or placebo.≅ *British Medical Journal* 316:1322, 1998.

[318] *Ibid.* (quoting Grodin MA, Annas GJ: *Journal of the American Medical Association* 277:712-713, 1997).

[317] In 1990, DOD requested authority to administer IND products, pyridostigmine bromide and botulinum toxoid vaccine, to certain military personnel. DOD also requested a waiver of informed consent requirements in connection with the use of those products by the armed forces. The FDA granted the DOD requests under the terms of an interim rule establishing the procedures and conditions under which informed consent waivers could be obtained by DOD. But DOD did not meet the conditions FDA placed on the waivers, failing to provide information to individual service members about the IND products and failing to keep the medical records necessary to fulfill the protocols and capture data about the safety of the drugs. Despite some improvements in medical record keeping, DOD=s next use of an IND vaccine showed similar problems. In 1997, the General Accounting Office observed Anearly one fourth of the soldiers who received an investigational tick-borne encephalitis vaccine before deploying to Bosnia did not have this information noted in their files.≅ (ADefense Health Care: Medical Surveillance Improved Since Gulf War, but Mixed Results in Bosnia,≅ [GAO/NSIAD-97-136] U.S. General

protection to service members receiving investigational products than the AVIP now provides.

Accounting Office, May 13, 1997, p. 33.)

In November, 1997 the Subcommittee proposed, and the full Government Reform and Oversight Committee approved, an oversight report on Gulf War veterans= illnesses containing 18 findings and 18 recommendations.[318] Among them was the finding that A[t]he FDA was passive in granting and failing to enforce the conditions of a waiver to permit use of PB by DOD≅ and the recommendation that AFDA should grant a waiver of informed consent requirements for the use of experimental or investigational drugs by DOD only upon receipt of a Presidential finding of efficacy and need.≅[319]

Legislation reflecting that recommendation was introduced in both chambers of Congress.[320] The 1999 Defense Authorization Act contained provisions, codified at 10 USC 1107(f), implementing the recommendation by strengthening notice requirements and by requiring a presidential authorization for any waiver of informed consent.

In view of the new statutory provision, FDA on October 5, 1999 revoked the 1990 interim final rule and issued a new regulation to govern DOD compliance with IND conditions and informed consent waivers.[321]

On September 30, 1999 the White House issued Executive Order 13139 establishing the procedures by which the president would comply with the new law.[322] The EO says A[w]aivers of informed consent will be granted only when absolutely necessary≅ and only upon a written determination by the president that obtaining consent is not feasible, is contrary to the best

[322] Executive Order of September 30, 1999, AImproving Health Protection of Military Personnel Participating in Particular Military Operations≅ No. 13139, The White House, Washington, D.C.

interest of the service member or is not in the interest of national security. In the event a waiver is granted, the DOD Secretary must notify Congress and publish a notice in the Federal Register. No waiver may last more than one year. Waivers may be renewed based on a new, fully documented request.≅[323]

The statute establishes clear U.S. policy that waiver of informed consent in military operations is deemed appropriate and necessary under certain circumstances. The statute, the FDA interim rule and EO 13139 describe, and limit, those circumstances and attempt to ensure any decision to use IND drugs or vaccines without informed consent is as open as possible, supported by sufficient information and authorized at the highest level.

The new regime for waiving informed consent requirements appears far more rigorous and transparent than the system employed under the original interim rule. The statute is very explicit in describing the information that must be provided to each individual service member being given an IND drug or vaccine. The written information must include a clear statement the substance is investigational, the reason the drug or vaccine is considered necessary, information regarding possible side effects and drug interactions, and any other information FDA may require as part of the IND protocol.

That is more clinically useful information than the AVIP now routinely conveys. Consistently providing balanced risk/benefit assessments in an IND setting would also move DOD closer to its stated goal of more effective risk communication. According to an article linked to the DOD AVIP web site:

[323] *Ibid.*

APeople are different. One size does not fit all when it comes to explaining risk. Some prefer short, simple messages about a vaccine's benefits and risks.8,12,68 These people, presumably a majority of the population, will be satisfied with the summary information comprising the Vaccine Information Sheets (VISs) published by the Centers for Disease Control and Prevention. Others want more detailed information. Some will scour the literature to explore every fact they can find. The goal of risk communication involving vaccines should be informed consent.68 True consent to vaccination is only possible if the individual has received all the information he or she wants and understands that information. Then an informed vaccine decision can be made. Providing this information demonstrates respect for the individual. From the clinician's perspective, the consent process can be part of the efforts to identify contraindications to vaccination (e.g., severe hypersensitivity, immunodeficiency).≅[324]

The FDA Abelieves that exceptions from the informed consent requirement should apply rarely and only when sufficient additional protections are provided to the military personnel affected.≅[325] The agency also expresses the view that DOD should pursue drug development through normal regulatory procedures, despite the obvious difficulty of acquiring efficacy data regarding chemical and biological warfare exposures. In the future, requests for informed consent waivers must be accompanied by a history and projected time line for full scale development of the drug or vaccine in question.[326] No more waiting until the eve of war to shortcut a process that could have been underway for months or years.

Under the new law, only the president may waive prior consent requirements, and only after certifying in writing that obtaining consent is not feasible, is contrary to the best interest of the service member, or is not in the interest of national security. With regard to the first two

[326] *Ibid.*

justifications, the president must apply the standards and criteria used by the FDA for waivers. Those standards and criteria are detailed in the new FDA interim rule. To meet them, the Secretary of Defense must document for the president all the scientific data, threat assessment, lack of alternatives, and conditions under which the IND product will be used.

The FDA regulation strengthens the role of the Institutional Review Board (IRB) in approving and monitoring the IND protocols for which waivers are granted. IRBs are panels charged with assuring that clinical trials have legitimate scientific goals and that protocols protect human subjects. Under the regulation, an IRB must review all aspects of the proposed IND and waiver. Significantly, the IRB must include at least three members who are not employees of the federal government. This should add some element of independent review to DOD waiver requests. The rule also requires detailed certifications from DOD regarding record keeping systems, medical staff training, and communication of benefits and risks.

The Executive Order of September 30, 1999 mirrors the FDA regulation in many respects, requiring the DOD Secretary to support a waiver request with written justification, rationale, and proof of IRB review. The Assistant to the President for National Security Affairs and the Assistant to the President for Science and Technology must also review the request. After approval of a waiver, the EO requires monitoring and periodic reports on compliance with IND protocols and waiver conditions.

These more explicit and elaborate procedures address many of the problems noted in the execution of the Gulf War waivers. If applied rigorously, those safeguards could also form the basis for a mandatory anthrax vaccine program for certain deployed forces, Special Forces, or other elements determined by the president to warrant vaccination in the interests of national security. The remainder of the force could choose to enroll in an IND protocol[327] or assume the risks of biological warfare not addressed by individual and collective protection, detection, battle tactics and deterrence.

In July 1999, the *Air Force Times* editorialized it was time to AStop Mandatory Anthrax Inoculations≅ because the manufacturer appeared unreliable, and because:

[327] Open protocols could be established for the on-going trial of a reduced vaccine regimen or a trial of a purer vaccine.

AMore research is needed to understand the long-term risk of using the anthrax vaccine. And now, long after initiating the vaccination program, the Pentagon is finally planning such a long-term study of the vaccine=s health effects. That=s good, but until those risks are understood, the Pentagon should proceed with caution -- not reckless abandon.≅[328]

The editorial concluded Athe risks of the vaccine are outweighed by the risk of contracting anthrax≅[329] and advised service members to take the shots. ABut in the absence of empirical evidence proving the vaccine=s long-term safety, the troops should be given the chance to decline. Give them the information they need make wise, informed decisions for themselves. Let those who decline live with what they consider a reasonable risk.≅[330]

I have not received the JS Form 136 or draft DJS comments (which will change based on your input), but wanted to get these documents out so that you can begin reviewing them.

Please note, the JS was asked to comment on the protocol (including all of the appropriate appendixes) and not on the implementation guidelines. A copy of the JS comments submitted on 4 Apr 01 with the actions taken by MRMC
is attached also.

Please let me know if you have any questions.

Thanks,

(b)(6)

MCMR-UMP (70-1r)

MEMORANDUM FOR Dr. J. Jarrett Clinton, Assistant Secretary of Defense for Health Affairs, 1000 Defense Pentagon, Washington, D.C. 20301-1200

SUBJECT: Review of the Draft Contingency Protocol for Vaccination of Volunteers with Anthrax Vaccine Absorbed after Possible Exposure to Bacillus Anthracis Spores

1. Reference memorandum, The Joint Staff, DJSM-0256-01, 4 April 2001, SAB.

2. Referenced memorandum included comments on subject protocol provided by the Joint Staff. The comments have been reviewed and incorporated, as applicable, into the contingency protocol. Additionally, comments received from representatives of the Services and Commanders in Chief during the Joint Staff/Army Office of The Surgeon General co-sponsored Joint Medical Nuclear, Biological, and Chemical (JNBC) Readiness Conference, 30 April-4 May, have been incorporated.

3. Enclosed for restaffing is the updated version of the protocol (enclosure 1). Enclosure 2 is an item-by-item summary of the review and disposition of comments received in referenced memorandum.

4. During the JNBC Readiness Conference, the attendees agreed that there should be a separation between the protocol and an implementation plan. Most of the concerns expressed by the representatives were not related to the protocol, but rather to how things would be done. Based on this concern, draft Implementation Guidance was prepared during the conference (enclosure 3). Suggest that this guidance be submitted for staffing along with the protocol.

5. My point of contact for this action is (b)(6) or DSN (b)(6), email: (b)(6)@amedd.army.mil.

3 Encls

JOHN S. PARKER
Major General, MC
Commanding

337

Reference: same as above

Background: The Assistant Secretary of Defense for Health Affairs (HA) requested that a protocol be prepared to allow the use of the Anthrax Vaccine Absorbed (AVA), in conjunction with antibiotics, for post-exposure to Anthrax. A protocol was prepared and staffed out to the Services and the CinCs by HA. Comments were received and incorporated into the protocol. Additionally, comments were received during a conference co-sponsored by the Joint Staff and the Army Office of The Surgeon General. These comments have also been incorporated. This document forwards the updated protocol, along with an item-by-item description of the resolution of the comments received back from the CinCs and Services. Additionally, during the Joint Conference (above), the CinC and Service representatives determined that their real concern was not with the protocol, but rather how they would implement it. A Draft Implementation Guidance document was prepared and is enclosed as well.

Recommendation: CG sign and forward package to HA.

Clinical Study Monitor: TBD

Medical Monitor: Anthrax Vaccine Expert Committee

Date of Issue:

This protocol will be conducted as written and in compliance with International Conference on Harmonisation Guidelines for Good Clinical Practice and other applicable regulatory requirements.

STUDY SYNOPOSIS

The purpose of this protocol is strictly to provide treatment for subjects following suspected or confirmed exposure to *B. anthracis* spores. The intent of this protocol is for contingency use of anthrax vaccine in a postexposure setting, not to support a labeling change for the licensed anthrax vaccine. All subjects will have signed an informed consent form before being allowed to participate in the protocol.

The endpoint of this protocol is the collection and analysis of all adverse events (AEs), including local and systemic reactions to the vaccine and clinical cases of anthrax in the study population after administration of the anthrax vaccine.

The anthrax vaccine to be used under this protocol is classified as an Investigational New Drug (IND) because (1) the medical indication for postexposure prophylaxis is not included in the approved package insert, (2) the dosing schedules described for certain anticipated circumstances include vaccination schedules that are outside the parameters of the approved package insert, and (3) some unreleased lots of the vaccine may be used with this protocol. The FDA will review and select each lot of vaccine that will be used under this protocol. The source of vaccine may be from one of the following categories: FDA-released lots of anthrax vaccine, unreleased lots from the original production facility that are acceptable to FDA for this protocol, or unreleased lots from the renovated production facility that are acceptable to FDA for this protocol. When available, licensed lots of vaccine will be used. The protocol will remain active up to a maximum of 5 years.

2.0 BACKGROUND INFORMATION

Anthrax disease is a zoonotic infection caused by the spore-forming *Bacillus anthracis*. Depending on the route of infection, anthrax disease can occur in three forms: cutaneous, gastrointestinal, and inhalational [1]. Humans become infected by contact with infected animals or contaminated animal products [2, 3]. Inhalational anthrax is the most lethal form of the disease because of the difficulty in establishing the diagnosis and the rapid progression of the disease. Hemorrhagic mediastinitis, toxemia, and massive pulmonary edema give rise to a fatality rate of almost 100% if untreated [4]. Mortality may exceed 80% after symptoms occur, despite treatment.

Research on anthrax as a biological weapon (BW) began in the early 1900s [5]. *B. anthracis* is considered to be the most likely biological warfare agent because of the ability of *B. anthracis* spores to infect via the respiratory route, the high mortality of inhalational anthrax, and the greater stability of *B. anthracis* spores when compared with other potential biological warfare agents [4-8]. At least 17 nations are believed to have offensive biological weapons programs [5]; however, the number working with anthrax is unknown [9]. The lethal potential of aerosolized anthrax was demonstrated with 68 deaths and 79 cases of anthrax during the 1979 accidental aerosolized release of *B. anthracis* spores from a military microbiology facility in Sverdlovosk in the former Soviet Union [10].

The Persian Gulf War of 1991 heightened the military's awareness that anthrax spores could be used as an effective biological warfare agent. Lyophilized spores can be stored almost indefinitely, can be dispersed in air by a variety of weapons, and are difficult to detect because they are odorless, colorless, and tasteless. Iraq admitted to a United Nations inspection team in 1995 that it had secretly manufactured and stockpiled massive amounts of *B. anthracis* spores for an offensive biological warfare program prior to the Persian Gulf War [11]. Other countries hostile to Western democracies—Iran and North Korea—possess or are pursuing offensive BW capabilities.

According to the Centers for Disease Control and Prevention (CDC) Advisory Committee on Immunization Practices (ACIP) Recommendations for Use of Anthrax Vaccine in the United States, primary and secondary aerosolization of *B. anthracis* spores are important considerations in the deliberate release of *B. anthracis* spores [12]. Primary aerosolization results from the initial release of the spores; secondary aerosolization results from disturbance of the particles that have settled from the primary release by wind or human and animal activities. Service personnel may be exposed by direct aerosolization and then again by secondary aerosolization.

The infectious dose of *B. anthracis* in humans is not precisely known. Estimates based on data from primates for the infectious dose by the respiratory route are that 8,000 to 50,000 spores are required to cause inhalational anthrax in humans [13, 14]. The influence of strain or host factors on this infectious dose is not completely understood. The incubation period for inhalational anthrax in humans has been reported to range from 1 to 43 days [10]. Studies in nonhuman primates indicate that inhaled spores do not immediately germinate within the alveolar recesses but reside there potentially for weeks until taken up by alveolar macrophages. Spores then germinate and begin replication within the macrophages. Antibiotics are effective against

germinating or vegetative *B. anthracis* but are not effective against the spore form of the organism. The disease may be prevented as long as a therapeutic antibiotic level is maintained to kill germinating *B. anthracis* organisms [12].

Executive Order 13139 of 30 September 1999 [15] mandates that military personnel in operations where they could potentially be exposed to a range of weapons, including biological as well as endemic diseases, be provided with safe and effective vaccines and treatments to negate or minimize their effects. The Anthrax Vaccine Immunization Program (AVIP) sponsored by the Department of Defense (DoD) addresses the prophylactic immunization of military service personnel to protect them against anthrax. Anthrax Vaccine Adsorbed (AVA) is recommended for pre-exposure prophylaxis. The current regimen consists of three subcutaneous (SC) injections, 0.5 ml each, given 2 weeks apart followed by three additional SC injections at 6, 12, and 18 months.

Studies have shown that 83% of human vaccinees develop a vaccine-induced antibody response after two doses of the vaccine. Greater than 95% develop a fourfold rise from baseline in antibody titer after three doses [12]. In addition to an anthrax pre-exposure program, DoD believes that a treatment vaccination program is also needed for individuals who potentially have been exposed to *B. anthracis* spores. Such individuals could include

- Anthrax-vaccine naive personnel
- Personnel who have not completed the primary series of anthrax vaccinations at 0, 2, and 4 weeks
- Personnel who are due for a booster anthrax vaccination

For early treatment of exposure to *B. anthracis* spores, the CDC and ACIP [12, 16] recommends combined chemoprophylaxis and vaccination. This recommendation is based on an extensive review of the literature and professional opinion. The FDA has approved ciprofloxacin to reduce the incidence or progression of inhalational anthrax following exposure to aerosolized *B. anthracis* [17]. In addition, ciprofloxacin has shown in vitro activity against *B. anthracis* and has been shown to be effective when administered in combination with anthrax vaccine in postexposure studies in nonhuman primates [18, 19]. The FDA had previously approved penicillin and doxycycline for the treatment of symptomatic anthrax [7, 16, 20]. Antibiotics are effective against the germinated form of *B. anthracis*, but are not effective against the spore form of the organism.

This is an open-label (no control), multi-site contingency protocol for the administration of anthrax vaccine and concomitant use of antibiotics to treat volunteers following confirmed exposure to *B. anthracis* spores—a regimen that currently is not explicitly approved by the FDA. Enrollment in the protocol is open-ended. Because this protocol will be implemented only in a contingency, the specific number of subjects to be enrolled cannot be projected, although a range of 100 to 5,000 subjects has been adopted for planning purposes. This is a rough estimate and is not designed for the purpose of providing support for a labeling change for Anthrax Vaccine Adsorbed.

The rationale for the protocol is based not on controlled clinical studies but rather on highly controlled animal studies. Because exposure to *B. anthracis* during a contingency will not be similarly controlled, the outcome for humans receiving the antibiotic and vaccine regimen may not be comparable. The purpose of this protocol is strictly to provide treatment for subjects following suspected or confirmed exposure to *B. anthracis* spores. The intent of this protocol is for contingency use of anthrax vaccine in a postexposure setting, not to support a labeling change for the licensed anthrax vaccine. All subjects will have signed an informed consent form before being allowed to participate in the protocol.

The endpoint of this protocol is the collection and analysis of all adverse events (AEs), including local and systemic reactions to the vaccine and clinical cases of anthrax in the study population after administration of the anthrax vaccine.

The anthrax vaccine to be used under this protocol is classified as an Investigational New Drug (IND) because (1) the medical indication for postexposure prophylaxis is not included in the approved package insert, (2) the dosing schedules described for certain anticipated circumstances include vaccination schedules that are outside the parameters of the approved package insert, and (3) some unreleased lots of the vaccine may be used with this protocol. The FDA will review and select each lot of vaccine that will be used under this protocol. The source of vaccine may be from one of the following categories: FDA-released lots of anthrax vaccine, unreleased lots from the original production facility that are acceptable to FDA for this protocol, or unreleased lots from the renovated production facility that are acceptable to FDA for this protocol. When available, licensed lots of vaccine will be used. The protocol will remain active up to a maximum of 5 years.

2.1 Product Description

Anthrax Vaccine Adsorbed (AVA) is produced by BioPort Corporation (formerly Michigan Biologic Products Institute and Michigan Department of Public Health), Lansing, Michigan [21]. AVA is prepared from a cell-free culture filtrate, which contains no bacteria. A toxigenic, nonencapsulated strain, V770-NP1-R, is used to prepare the vaccine [22]. The filtrate contains a mix of cellular products, including PA (protective antigen) [23, 24] and is adsorbed to aluminum hydroxide as an adjuvant [21]. The amounts of PA and other proteins per 0.5-mL dose are variable, and all three toxin components (lethal factor [LF], edema factor [EF], and PA) are present in the product [25]. The final product contains no more than 0.83 mg aluminum per 0.5 mL dose. Formaldehyde (final concentration ≤0.02%) is added as a stabilizer to the preservative, benzethonium chloride (0.0025%) [21].

The anthrax vaccine is supplied in 5.2-mL vials containing 10 doses each. Each vial will be labeled for human administration and will include the following statement: "Caution: New Drug – Limited by Federal law to investigational use." The vaccine should be stored at 2°C to 8°C (35.6°F to 46.4°F). It should not be frozen.

2.2 Summary of Nonclinical and Clinical Findings

2.2.1 Nonclinical Studies

2.2.1.1 Efficacy Studies

The efficacy of anthrax vaccines against challenge with *B. anthracis* spores has been tested in a limited number of studies using guinea pigs, nonhuman primates, and rabbits [27]. In a series of studies in the guinea pig model, AVA gave variable protection against intramuscular challenge (0%-100% survival) but modest protection against aerosol challenge (20%-26% survival) [26-31]. In studies conducted in the nonhuman primate model, 62 of 65 (95%) vaccinated with AVA survived an aerosol challenge, whereas 0 of 18 control (unvaccinated) animals did not survive [26, 32-37]. In two studies in the rabbit model, 114 of 117 rabbits (95%) survived lethal aerosol challenge, whereas 0 of 28 controls survived the challenge [32].

2.2.1.2 Postexposure Studies

In the mid-1950s, studies in monkeys demonstrated that treatment with penicillin for 5 or 10 days, beginning on day 1 after exposure to aerosolized anthrax spores, was protective during drug therapy [38]. However, the animals died when the antibiotic was discontinued because the antibiotic did not inhibit sporulation. Long-term protection was afforded only when penicillin therapy was combined with postexposure vaccination.

In response to the military's concern about a potential anthrax threat, the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID) undertook a study to determine whether a prolonged course of postexposure antibiotics with or without vaccination would protect monkeys exposed to a lethal aerosol challenge of *B. anthracis* spores when the antibiotic was discontinued [39]. Beginning on day 1 after aerosol exposure to *B. anthracis* Vollum 1B spores, six groups of 10 rhesus monkeys were given penicillin, ciprofloxacin, doxycycline, doxycycline plus vaccine, vaccine alone, or saline. The antibiotics were administered for 30 days, and the anthrax vaccine was given on days 1 and 15 of the antibiotic regimen.

As shown in Table 1, each antibiotic regimen completely protected animals while on therapy and provided significant long-term protection upon discontinuance of the drug. The results also showed that complete long-term survival, after discontinuance of antibiotics, occurred when postexposure antibiotic treatment was combined with vaccination, confirming previous reports [38, 40].

All animals survived while undergoing antibiotic prophylaxis. Three animals treated with penicillin died on days 9, 12, and 20 after antibiotics were discontinued (days 39, 42, and 50 after exposure). A single animal in the doxycycline group died of inhalation anthrax 28 days after discontinuing treatment (day 58), and one animal in the ciprofloxacin group died 6 days after discontinuation of therapy (day 36).

Table 1. Survival of Monkeys after Postexposure Treatment of Inhalational Anthrax

Treatment	Anthrax deaths	*P* vs. control
Control, saline	9/10	
Anthrax vaccine, 0.5 mL	8/10	>.1
Penicillin, 180,000 units	3/10	<.02
Ciprofloxacin, 125 mg	1/9*	<.002
Doxycycline, 30 mg	1/10	<.002
Doxycycline, 30 mg + anthrax vaccine, 0.5 mL	0/9**	<.0002

* One animal died 5 days after exposure from aspiration pneumonia, had no evidence of anthrax at autopsy, and was excluded from analysis.

** One animal died 6 days after discontinuing doxycycline with no evidence of anthrax on autopsy. Cause of death unknown; the animal was excluded from analysis.

None of the animals treated with antibiotics alone developed an immune response to anthrax. However, antibiotic treatment begun early after exposure did prevent infection from fully developing. Only animals that had been vaccinated seroconverted after aerosol challenge. A serologic response also has been observed in humans who recover from established clinical anthrax after treatment [41, 42] and in monkeys after vaccination. The only animals resistant to a second aerosol challenge were those that had been vaccinated and had seroconverted. Animals protected by antibiotic treatment against the initial infection were susceptible to reinfection. This agrees with a previous report in which animals treated with antibiotics after exposure and hyperimmunized with five doses of vaccine were protected upon rechallenge [42].

2.2.2 Clinical Studies

2.2.2.1 Efficacy Studies

The only clinical study conducted to evaluate efficacy used a vaccine similar to AVA [43]. Both that vaccine and the current vaccine contain protective antigen (PA) as the principal ingredient. A single blind, placebo-controlled study was conducted from 1955-1959 in goat hair workers at risk for cutaneous anthrax in one New Hampshire and three Pennsylvania mills. Vaccination resulted in a statistically significant reduction in the incidence of anthrax in the vaccinated (1 cutaneous and 0 inhalational cases) compared with the placebo group (13 cutaneous and 2 inhalational cases)—92.5% efficacy with a 95% confidence interval of 65% to 100%. An additional three cases of inhalational anthrax were reported in unvaccinated workers who did not participate in the study.

Five cases of inhalational anthrax occurred among 448 unvaccinated workers at the mill where the outbreak occurred (combining both placebo recipients and the unvaccinated observational group), with zero cases among 149 fully vaccinated workers. Despite the trend toward efficacy, the number of cases of inhalational anthrax was insufficient for the difference between the vaccinated and unvaccinated groups to be conclusive statistically (p = 0.34; a USAMRIID calculation, not included in original publication).

Further evidence of efficacy in humans was reported by an advisory panel to the FDA in 1985, based on CDC data collected between 1962 and 1974 [44]. The panel identified 27 cases of anthrax in at-risk industrial settings. Three cases occurred in unvaccinated persons who worked near a goat hair mill. The remaining 24 cases were mill workers; three were partially immunized (one with 1 dose, two with 2 doses); the remaining 21 were unvaccinated. Based on these data, no cases of anthrax have been reported in fully vaccinated subjects at risk of infection. These observations lend further support to the efficacy of the vaccine.

More recently, a Phase 2, open-label study of various dosing regimens of AVA was conducted [45]. The intent of the study was to compare (1) a reduced dosage regimen with the licensed (control) regimen (0.5 mL, subcutaneous (SC) injections given at 0, 2, and 4 weeks) and (2) intramuscular (IM) with SC administration. The results of the study that relate to the proposed contingency protocol are presented. They include the immunogenicity results of the initial SC three-dose series of AVA in the control group (21 men and 7 women) and the safety data on the 203 doses of AVA that were administered SC: 132 doses to men and 71 doses to women.

Immune response to AVA was determined by quantitation of antibody specific for *B. anthracis* PA using a validated enzyme-linked immunosorbent assay (ELISA). A PA-specific IgG concentration >25 µg/mL or a titer ≥1:200 was considered above the minimum limit of quantitation and indicative of an immune response. This assay was chosen because peak PA-specific IgG concentration correlated with protection against inhalational anthrax in a rabbit model [46].

Table 2 presents the antibody response rates in the control group after administration of the first three doses of the licensed regimen at 0, 2, and 4 weeks. The overall rates are cumulative (responded in at least a one time interval up to 8 weeks). The group demonstrated a rapid increase in antibody concentration after administration of the second dose of AVA and achieved 100% seroconversion after administration of the third injection.

Table 2. Antibody Response Rates after Administration of the First Three Doses of AVA at Weeks 0, 2, and 4

Schedule	N	Response	Number of Antibody Responses above Threshold (%)			
			0-2 weeks	3-4 weeks	5-8 weeks[a]	0-8 weeks
0-2-4 SC	28	Titer ≥1:200	10/28 (36)	26/28 (93)	26/26 (100)	28/28 (100)
	28	IgG 25 µg/mL	4/28 (14)	24/28 (86)	26/26 (100)	28/28 (100)

[a] Denominators differ from N values in some cases because samples were not collected from all volunteers at each interval.

Figure 1 presents the antibody response of the control group from 0 to 84 weeks. Based on this antibody response, three doses of vaccine administered at 0, 2, and 4 weeks should afford maximum protection in the shortest time interval.

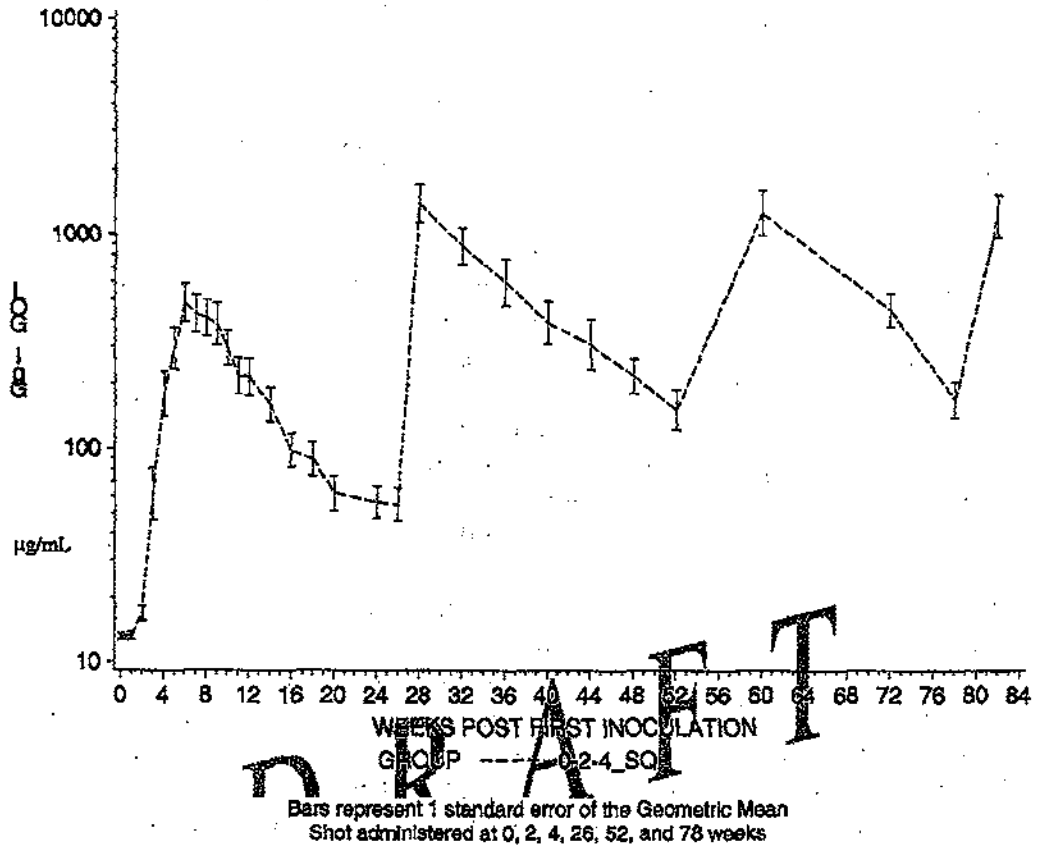

Figure 1. Anti-PA IgG Concentration: Licensed Vaccination Schedule (n = 28)

The duration of immunity is unknown in humans. Animal data suggest that the duration of efficacy of two injections may be between 1 and 2 years [24, 28, 29].

2.2.2.2 Safety Studies

Safety data for AVA are based on adverse event (AE) data, 13 clinical safety studies involving 366,000 vaccine recipients, including passive surveillance for AEs through the FDA's Vaccine Adverse Event Reporting System (VAERS), plus the concurrence of 5 independent review panels, as well as ongoing surveillance. Some of the most robust evidence of the safety of anthrax vaccine comes from the Defense Medical Surveillance System (DMSS), which shows that anthrax-vaccinated and unvaccinated personnel are hospitalized at the same rates.

In AVA prelicensure evaluations, 6,986 people received 16,435 doses—9,893 primary (6) doses and 6,542 annual booster doses [47].

Local reactions: Mild local reactions—erythema, edema, and induration <30 mm—occurred after 20% of vaccinations. Moderate local reactions—edema and induration of 30 to 120 mm—occurred after 3% of vaccinations. Severe local reactions—edema or induration >120 mm—occurred after 1% of vaccinations [47]. Brachman et al. [43] found mild reactions in 30% and

moderate local reactions in 4% of 379 vaccine recipients in their study of the alum-precipitated precursor vaccine to the AVA.

Systemic reactions: Systemic reactions, consisting of fever, chills, body aches, or nausea, occurred in less than 0.05% (4/~7,000) of vaccinees [47]. In the Brachman et al. study [43], systemic reactions occurred in 0.2% of vaccine recipients.

Safety data are available from AVIP. As of July 2000, nearly 460,000 service members had received 1,830,000 doses of AVA. The Morbidity and Mortality Weekly Report (MMWR) of 28 April 2000 [48] reported on three of DoD's completed or ongoing surveys. Based on results of the survey conducted in Korea, women tended to have higher rates of local reactions than men. A self-administered questionnaire was used to assess the frequency and nature of AVA adverse events in a cohort of U.S. military health care workers in the Korea Medical Augmentee Program. Results showed a gradual decline in the number of subjects experiencing systemic reactions from approximately 8% of 595 after the first dose, 5% of 585 after the second dose, and approximately 3% of 536 after the third and fourth doses.

DoD uses the FDA VAERS-1 form to report events potentially related to any vaccination to VAERS and to each military service's disease reporting system. VAERS reports related to anthrax vaccinations are consolidated for AVIP by the Defense Medical Surveillance System. At DoD's request, Department of Health and Human Services (DHHS) established the Anthrax Vaccine Expert Committee (AVEC), a panel of civilian academic medical experts, to review all VAERS-1 reports related to the anthrax vaccine, including those reported directly to FDA or CDC. As of September 2000, 1,152 VAERS-1 reports had been reviewed by AVEC [www.anthrax.osd.mil/Site Files/articles/INDEXclinical/safety_reviews.htm]. Of these, 46 involved hospitalization, 10 of which were "very likely/certainly" or "probably" caused by anthrax vaccine. All 10 involved allergic, inflammatory reactions at the injection site. The other 36 hospitalizations were categorized as unrelated, unlikely, or unclassifiable. Another 169 reports involved a loss of duty >24 hours (but did not involve hospitalization); the civilian panel found that 114 of the 169 certainly or probably were caused by anthrax vaccine. These 114 reports described injection-site reactions (71), various rashes (16), viral-like symptoms (9), acute allergic reactions (7), itching (4), gastroenteritis (2), angioedema (1), muscle aches (1), temporary tingling (1), photophobia (1), and swollen lymph nodes (1). Some reports described multiple symptoms. The balance of the 1,152 reports, 592, were categorized as other than serious, involving neither hospitalization nor loss of duty >24 hours.

Separate analyses performed by the AVIP indicated no correlation between anthrax vaccine and reports of significant adverse events (involving hospitalization or loss of duty) based on (a) geographic clustering, (b) vaccine lot (manufacturing batch), or (c) active vs. reserve component status. No VAERS-1 reports have been submitted that relate to microbial contamination of vaccine vials. No deaths have been causally linked to the anthrax vaccine.

A serious AE, as defined by the FDA (21 CFR 600.80), results in death, hospitalization, permanent disability, or is life threatening. Post-licensure VAERS reports of serious AEs have included cellulitis (3), pneumonia (3), Guillain-Barré syndrome (2), seizures (2), cardiomyopathy (2), systemic angioedema (1), transverse myelitis (1), and myelitis (1) [CDC and FDA,

unpublished data, 1999]. An analysis of VAERS data showed no pattern of serious AEs clearly associated with the vaccine.

In the Phase 2 study comparing dosing schedules, volunteers were monitored for AEs [46]. Specifically, each volunteer was scheduled for evaluation approximately 30 minutes after administration of AVA and 1-3 days, 1 week, and 1 month after vaccination. Reactions were reported up to 30 days after each dose. AE data on subjects in the control group (licensed, SC regimen) and subjects in the comparator study arms who received SC injections are presented. The most common local AE following administration of the first three doses was tenderness at the injection site (70%), followed by SC nodules (38%), and erythema (36%). No abscess or necrosis was observed at the injection site for any treatment group.

The rates of occurrence of local and systemic AEs after administration of AVA during this study are presented for both genders in Table 3. Although the number of AVA doses administered was too small for significance, a number of local reactions, including tenderness, SC nodules, erythema, and induration tended to decrease in frequency as the frequency of doses (up to three) increased. Pruritus and edema showed a slight tendency to increase as the number of doses (both genders) increased. No measurable trend was observed for the reactions warmth and edema. Systemic AEs after each dose of AVA were generally few with headache and malaise being the most common. No trend was noted regarding frequency of systemic AEs and number of doses (up to three) of AVA.

Table 3. Local and Systemic AVA-Related Adverse Events after SC Administration of AVA at Weeks 0, 2, and 4

Reaction	Dose*		
	1	2	3
Local			
Tenderness	74 (73%)	54 (71%)	15 (58%)
SC nodule	44 (44%)	32 (42%)	1 (4%)
Erythema	45 (45%)	26 (34%)	3 (12%)
Warmth	16 (16%)	12 (55%)	5 (19%)
Induration	17 (17%)	12 (16%)	2 (8%)
Pruritus	12 (12%)	12 (16%)	5 (19%)
Arm motion limitation	9 (9%)	6 (8%)	3 (12%)
Edema	3 (3%)	5 (7%)	2 (8%)
Axillary node, tender	1 (1%)	0	0
Systemic			
Anorexia	2 (2%)	1(1%)	0
Fever	2 (2%)	2 93%)	1 (4%)
General pruritus	3 (3%)	2 (3%)	0
Headache	13 (13%)	6 (8%)	1 (4%)
Malaise	8 (8%)	10 (13%)	1 (4%)
Myalgia	4 (4%)	4 (5%)	1 (4%)
Nausea	3 (3%)	2 (3%)	0
Respiratory difficulty	4 (4%)	1 (1%)	0

*Total number of doses administered: 203: dose 1, 101; dose 2, 76; dose 3, 26.

As shown in Table 4, the occurrence of local, vaccine-related adverse events was related to gender (doses 1, 2, and 3 combined). Local AEs associated with SC administration, such as SC nodules, erythema, induration, and edema were more common in females than in males, and systemic vaccine-related AEs after administration were independent of gender.

Table 4. Local and Systemic AVA-Related Adverse Events for Each Gender after SC Administration of the First Three Doses of AVA at Weeks 0, 2, and 4

Reaction	Gender	Reaction Present*
Local		
Tenderness	Female	60 (84.5%)
	Male	83 (62.9%)
SC nodule	Female	45 (63.4%)
	Male	32 (24.2%)
Erythema	Female	45 (63.4%)
	Male	29 (22.0%)
Warmth	Female	25 (35.2%)
	Male	8 (6.1%)
Induration	Female	27 (38.0%)
	Male	4 (3.0%)
Pruritus	Female	21 (29.6%)
	Male	8 (6.1%)
Arm motion limitation	Female	7 (9.9%)
	Male	11 (8.3%)
Edema	Female	7 (9.9%)
	Male	3 (2.3%)
Axillary node, tender	Female	0
	Male	1 (0.8%)
Systemic		
Headache	Female	8 (11.3%)
	Male	12 (9.1%)
Anorexia	Female	0
	Male	3 (2.3%)
Malaise	Female	6 (8.5%)
	Male	13 (9.8%)
Myalgia	Female	5 (7.0%)
	Male	4 (3.0%)
Nausea	Female	2 (2.9%)
	Male	3 (2.3%)
Respiratory difficulty	Female	1 (1.4%)
	Male	4 (3.0%)
General pruritus	Female	2 (2.8%)
	Male	3 (2.3%)
Fever	Female	1 (1.4%)
	Male	4 (3.0%)

*Total number of doses administered = 203: 132 to males and 71 to females.

A series of independent civilian review panels have confirmed the value of anthrax vaccination. The first was the Panel on Review of Bacterial Vaccines and Toxoids (advising FDA) [49]. The Armed Forces Epidemiological Board (AFEB) has repeatedly endorsed the anthrax vaccination of military service personnel. The Working Group on Civilian Biodefense issued recommendations for use of anthrax vaccine in response to terrorist incidents [7]. The Anthrax Vaccine Expert Committee (AVEC) found no unexpected adverse events in its review of VAERS reports involving anthrax vaccine for causal associations and reports [26, 48].

Adverse events following anthrax vaccination have been assessed in studies conducted by DoD in the context of the routine anthrax vaccination program. At U.S. Forces, Korea, data were collected at the time of anthrax vaccination from 4,348 service personnel regarding adverse events experienced from a previous dose of anthrax vaccine. Most reported events were localized, minor, and self-limited. After the first or second dose, 1.9% reported limitations in work performance or had been placed on limited duty. Only 0.3% reported ≥1 day lost from work; 0.5% consulted a clinic for evaluation; and one person (0.025) required hospitalization for an injection-site reaction. Adverse events were reported more commonly among women than among men.

A second study at Tripler Army Medical Center, Hawaii, assessed adverse events among 603 military healthcare workers. Rates of events that resulted in seeking medical advice or taking time off from work were 7.9% after the first dose; 5.1% after the second dose; 3.0% after the third dose; and 3.1% after the fourth dose. Events most commonly reported include muscle or joint aches, headache, and fatigue [48]. However, these studies are subject to several methodological limitations, including sample size, the limited ability to detect adverse events, loss to follow-up, exemption of vaccine recipients with previous adverse events observational bias, and the absence of unvaccinated control groups [49].

2.3 Risks and Benefits

2.3.1 Risks to Subjects

This vaccine has been safely administered in the United States since 1970. However, as with other vaccines, minor reactions are common. Serious adverse events occur rarely after any vaccination. A sharp, stinging sensation immediately upon injection of the anthrax vaccine is common; however, it generally dissipates within the first minute. Like all vaccines, the anthrax vaccine may cause soreness, redness, itching, and swelling at the injection site. Up to 30% of men and 60% of women report mild local reactions, but these reactions usually last only a few days. For both genders, between 1% and 5% report reactions of 1 to 5 inches in diameter. Larger reactions occur about once per 100 vaccinations. A lump at the site occurs commonly, usually lasting for a few weeks, before resolving without treatment.

Beyond the injection site, from 5% to 35% will notice muscle aches, joint aches, headaches, malaise, rashes, chills, low-grade fever, nausea, or related symptoms. These symptoms are usually resolved in less than a week.

Any vaccine can cause serious reactions, such as those requiring hospitalization. For anthrax vaccine, they happen less than once per 100,000 doses. Severe allergic reactions occur less than once per 100,000 doses.

Vaccinees should discuss with the military health care provider whether antihistamines or pain relievers before or after vaccination could help reduce erythema, induration, swelling, and itching at the site of injection. Vaccinees should be told to promptly report adverse events to a military health care provider before receiving additional vaccinations.

As for long-term effects, nearly 1,600 laboratory workers at Fort Detrick, Maryland, have received approximately 10,500 doses of anthrax vaccine since 1973 [Pittman, unpublished data] under the Special Immunizations Program at USAMRIID. Over 20 lots of vaccine have been used during this 25-year period, and a number of individuals have received over 20 doses of anthrax vaccine. None developed unexplained symptoms due to repeated doses of this or other vaccines they received. From this program and other monitoring, no patterns of delayed side effects to anthrax vaccine have been found. Monitoring continues.

A history of a severe reaction to a previous dose of anthrax vaccine is generally an exclusionary criterion. However, because of the nearly 100% fatality from inhalational exposure to anthrax, the vaccine could be administered in conjunction with symptomatic treatment.

While formal clinical studies have not been performed to determine whether this vaccine is carcinogenic or has any effect on fertility, it should be noted that no nonliving vaccine has been found to be carcinogenic or to affect fertility. Furthermore, observational studies of health effects manifested in military hospitalization databases indicate that anthrax vaccine has no effect on rates of cancer or reproductive health problems. The effects of AVA on animal reproduction have not been tested, and it is not known whether the vaccine can cause fetal harm when administered to a pregnant woman or affect reproductive capacity [20]. However, there has been no evidence of infertility, miscarriages, or other reproductive problems with the use of inactivated vaccines, beyond what is expected among unvaccinated individuals.

Vaccinations are routinely deferred until after pregnancy, unless, as in this contingency protocol, immunity is needed during pregnancy. Tetanus, meningococcal, hepatitis B, and influenza vaccines, for example, are specifically recommended for susceptible women during their pregnancy. As with many other vaccines licensed in the United States, specific studies of possible reproductive side effects from use of anthrax vaccine have not been performed.

Because the anthrax vaccine is a sterile, cell-free (filtered) bacterial vaccine, it is noninfectious and is not expected to cause any harm to a fetus. If the anthrax vaccine is inadvertently given to a pregnant woman, no adverse pregnancy outcome or fetal harm is expected. If a pregnant woman is known to have been exposed to *B. anthracis* spores, she will be given the opportunity to take the anthrax vaccine as a potential lifesaving measure.

Immunosuppressed individuals may not be adequately immunized. Also individuals receiving a concurrent course of therapy that depresses the immune response, such as corticosteroids, may not be adequately immunized if the recommended dosage schedule is followed.

As with any vaccine administration and no matter what precautions are taken, the risk of a serious, or even life-threatening, allergic reaction or infection with an unknown adventitious agent exists. To the extent possible during contingencies, emergency equipment will be available to handle acute adverse reactions as per standard medical practice.

Less likely, but possible, is the theoretical chance of Guillain-Barré syndrome (GBS). GBS was associated with campylobacter infections, as well as the influenza vaccine formulations in 1976, 1993, and 1994. CDC reports that 95% of GBS cases are not temporally associated with the administration of vaccines. Approximately 3,500 cases are recorded per year in the United States and Canada. Patients generally present with weakness and loss of lower extremity reflexes. GBS usually occurs as an ascending motor neuron process. The lower extremities are usually involved first and are more severely affected than the upper extremities. The bulbar musculature may be involved as well. GBS is a motor neuron disease, but sensory symptoms may occur along with radicular pain. With appropriate care, the death rate from GBS may be 3%-4%. Approximately 85% of patients make a complete or nearly complete recovery. Management includes supportive care, plasmapheresis, and administration of high-dose immunoglobulins.

No cause-and-effect relationship between anthrax vaccination and GBS has been found. Between March 1998 and January 2001, during the time when 2 million doses of anthrax vaccine were administered, five cases of GBS in subjects vaccinated with AVA were reported to VAERS. The independent civilian AVIP judged one of these cases unrelated to anthrax vaccine (due largely to an inconsistent time course) and the other four cases as unclassifiable (being indistinguishable from the rate of GBS expected in the general population).

2.3.2 Risks to Personnel and the Environment

This protocol presents no known hazards to the personnel other than those normally associated with routine vaccination of human subjects. The principal risks to personnel in the clinical setting are those associated with needle sticks. The risk of contracting anthrax from handling needles is nonexistent.

No risks to the environment are known other than those associated with the generation of biohazardous wastes attendant to vaccination. All biohazardous wastes will be disposed of as stipulated in the Logistics Annex (Appendix A).

2.3.3 Benefits to Subjects

Potential benefits of administration of the anthrax vaccine to previously unvaccinated people after potential exposure to anthrax is that vaccination may provide an additional degree of protection against relapse after discontinuation of antibiotic treatment and would likely protect against a subsequent exposure to *B. anthracis* spores. Previous recipients of anthrax vaccine could benefit against relapse if they are due for a vaccination or if they have not kept their vaccinations current. The benefit of adhering to the prescribed antibiotic regimen cannot be overstated. Strict compliance with both the antibiotic and vaccine dosing schedule could mean the difference between life and death.

2.3.4 Alternatives to Vaccination

Antibiotics, if taken as prescribed, can be effective if exposure to *B. anthracis* spores is detected. Once symptoms of anthrax develop, giving antibiotics reduces the risk of death only slightly—from 99% to 80% lethality. The ACIP recommends postexposure prophylaxis following aerosol exposure to *B. anthracis* spores. Prophylaxis may consist of antibiotic therapy alone or a combination of antibiotic therapy and vaccination.

Individual protective masks (gas masks) and collective protection systems (NBC MOPP suit) provide excellent front-line defense, but their effective use requires rapid and early detection of the agent. Current detection devices do not provide appropriate early warning to allow timely use of personal protective equipment.

2.4 Description of and Justification for Route of Administration, Dosage, Dosage Regimen, and Treatment Periods

Detailed instructions for the administration of the anthrax vaccine are provided in the package insert of the licensed product [22] and at www.armymedicine.army.mil/usamma/anthrax/antxhome.htm. The contents of each vial should be inspected for particulate matter or discoloration. Then each vial should be gently but thoroughly shaken to ensure homogeneous distribution of the contents. More agitation will be needed the first time the vial is used compared with subsequent uses. However, shaking to the point of foaming may degrade the vaccine. Vials should be shaken to resuspend their contents if they have not been moved for 30 or more minutes.

A 0.5-mL dose of vaccine should be drawn into a 1.0-mL tuberculin syringe using sterile technique. Other syringes may have a larger hub space, preventing 10 doses from being withdrawn from a 10-dose, 5.2-mL vial. For SC injections, 5/8-inch, 25- to 27-gauge needles are recommended. The prefilling of large numbers of syringes with anthrax vaccine is rarely advantageous. If prefilled syringes are used, they should be gently shaken if they have not been moved for 30 or more minutes.

The injection site should be cleaned per local procedures. Universal precautions should be observed for infection control. According to CDC, gloves are not required when administering injections, but local infection-control policies should be observed. The vaccine should be injected into the SC tissue of the deltoid or triceps area of the upper arm, typically with the needle at a 45° angle to the skin. Jet-injector immunization devices must not be used. To the extent possible, doses will be administered in alternate arms to minimize discomfort. Left-right-left is a common sequence. Properly stored vials may be used after opening until the labeled expiration date.

Although the primary focus of this protocol is the vaccination of AVA-naïve individuals, the protocol is also intended for individuals who are at various AVIP dosing points when they have been or are presumed to have been exposed to *B. anthracis* spores. Accordingly, anthrax vaccine-naïve subjects will receive three doses at weeks 0, 2, and 4 then continue with the FDA-labeled schedule

- Subjects who have had fewer than three doses will receive two more doses at weeks 0 and 2, then continue with the FDA-labeled schedule
- Subjects who have had three doses will receive an immediate booster dose, then continue with the FDA-labeled schedule
- Subjects who have received four or more doses will receive an immediate booster dose, then continue with the FDA schedule.
- If a subject's record (paper or automated record) is not available, the subject will be assumed to be unvaccinated. In such instances, vaccination will begin with dose 1. An antibiotic will be started as well. If a subject's records are subsequently located, the next dose will be given according to the licensed schedule.

Subjects who have been or potentially have been exposed to *B. anthracis* spores and who do not have their vaccination records immediately available should receive a single dose of vaccine, then continue with the FDA-labeled schedule once their records are obtained.

According to DoD Medical Considerations set forth in the AVIP plan [www.armymedicine.army.mil/usamma/anthrax/antxhome.htm], commanders are responsible for assuring that unit personnel are available at the appropriate times for vaccination. The timing of all subsequent doses must be based on the date the last dose was given, not when it was originally scheduled. It will not be necessary to restart the entire primary series (weeks 0, 2, and 4 and months 6, 12, and 18) due to any prolonged interval between doses. Subjects who risk potential re-exposure to *B. anthracis* spores will be advised to complete the FDA-labeled dosing schedule for the licensed vaccine after their participation in the protocol.

It is acknowledged that there may be some degree of "overimmunization." However, it is preferable to provide the best possible chance to protect each individual exposed to this deadly agent. Considering the risk of "underimmunization" versus the benefit of boosting the immune response by administering an extra dose, we believe strongly favors boosting.

2.5 Compliance Statement

This contingency protocol will be conducted as written and in compliance with the ICH Guideline for Good Clinical Practice (GCP) and other applicable regulatory, DoD, and FDA requirements.

2.6 Study Population

For this contingency protocol, service members include all medically deployable active and reserve component service members as well as U.S. government employees, contractors, other U.S. personnel, and dependents (>18 and <65 years of age) who potentially have been exposed to *B. anthracis* spores. Allied military forces and local nationals also will be eligible to receive the anthrax vaccine. Because this protocol will be implemented only in a contingency, the specific number of subjects to be enrolled cannot be projected, although a range of 100 to 5,000 has been adopted for planning purposes. However, there could be scenarios in which more than 5,000 individuals could be enrolled.

3.0 PROTOCOL OBJECTIVES

The objectives of this protocol are:

- to provide anthrax vaccine to volunteers who are receiving an antibiotic (ciprofloxacin, doxycycline, or penicillin V potassium) for the early treatment of confirmed exposure to *B. anthracis* spores
- to collect data on local and systemic reactions to the vaccine and clinical cases of anthrax in the study population after administration of the anthrax vaccine.

4.0 PROTOCOL DESIGN

According to DoD Directive No. 6200.2 (August 1, 2000), if no FDA-approved biologic is available to counter a particular threat, DoD components may request approval of the Secretary of Defense (SecDef) to use an IND product. Such a request must be justified based on the available evidence of the safety and efficacy of the product and the nature and degree of the threat to personnel. The SecDef ordered the implementation of a plan to protect service personnel after exposure to *B. anthracis* spores. This protocol has been reviewed and recommended for approval by the USAMRIID Human Use Committee (HUC) and the Army Surgeon General's Human Subjects Research Review Board (HSRRB). If approved by the Surgeon General of the Army and in the absence of a clinical hold by the FDA, the SecDef may approve the use of the anthrax vaccine IND. The chain of command for this contingency protocol is shown in Figure 2.

Preparatory steps to administer vaccine under this protocol would commence on *possible, probable,* or *suspected* exposure to *B. anthracis* spores (Figure 3). Actual administration of

vaccine under this protocol would occur only upon *confirmed* exposure. According to the decision-making process shown in Figure 4, if exposure *to B. anthracis* is *possible*, the SecDef will direct affected unified commands to integrate the protocol into operational plans and the prepositioning of material (antibiotics and anthrax vaccine). The SecDef's order will be directed through the Chairman of the Joint Chiefs of Staff (CJCS), in coordination with the Assistant Secretary of Defense (Health Affairs), Under Secretary of Defense (Policy), Secretary of the Army as Executive Agent, and DoD General Counsel [DoD Directive 6200.2, Section 4.2.1]. If exposure to *B. anthracis* spores is *probable*, the Unified CINC will consult with the Joint Task Force (JTF)/Service Principal Investigator (PI) regarding a request to the SecDef for authority to initiate the protocol. A CINC's request will be made through the CJCS who will make the necessary coordinations as describe above.

Suspected exposure to *B. anthracis* spores would be based on evidence of use or on findings of field detectors or field laboratories. In the case of a suspected exposure, the Unified CINC, in consultation with the JTF/Service PI, will order the initiation of self-administered antibiotics, and advise the SecDef of the decision. In the event that the suspected exposure cannot be confirmed or is ruled out, the Unified CINC will order the JTF/Service PI to halt the self-administration of antibiotics and advise the SecDef of that decision.

Confirmed exposure to *B. anthracis* spores would be based on one or more of the following: classical clinical findings of exposure, casualties from exposure, laboratory confirmation of exposure, or environmental confirmation of exposure. In the case of confirmed exposure, the Unified CINC, in consultation with the JTF/Service PI, will order service members to complete the 60-day antibiotic regimen and order the implementation of the anthrax vaccination protocol. Preliminary laboratory identification can be made within 24 hours after receipt of specimens at USAMRIID with confirmation of results in 72 hours. Upon this determination, any eligible individual who is presumed to have been exposed and who has volunteered to participate will be vaccinated in accordance with this protocol.

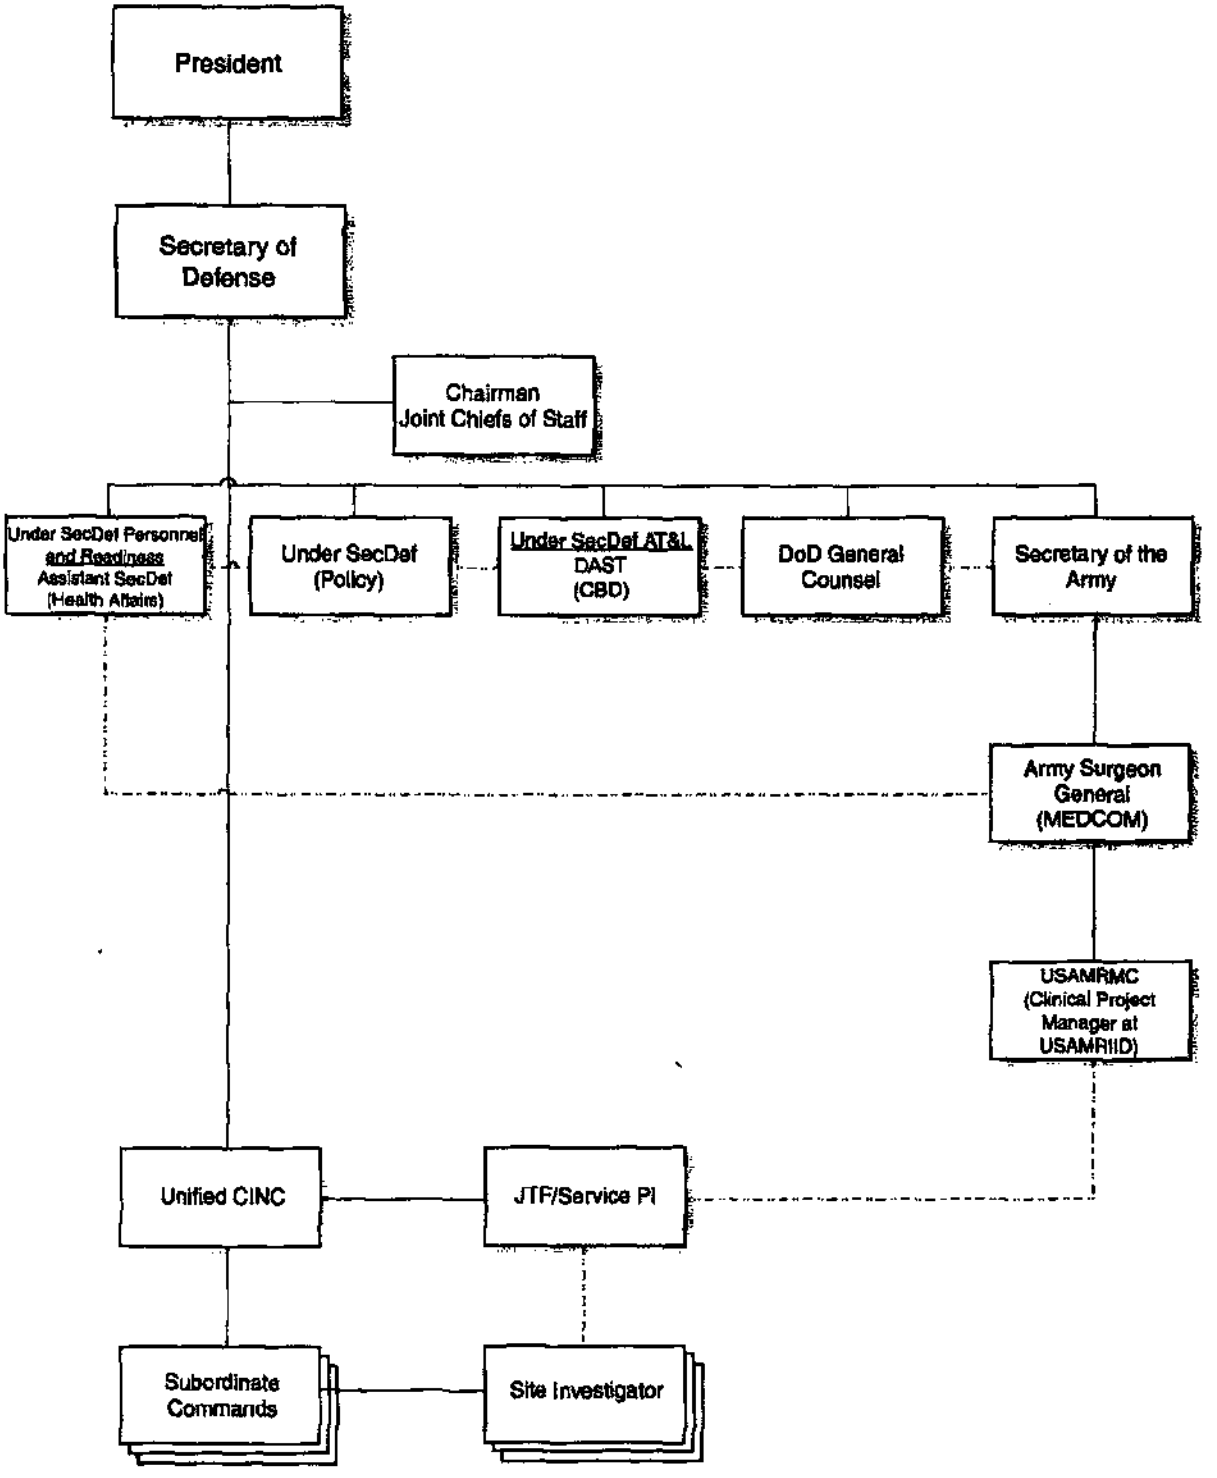

Figure 2. Chain of Command for Anthrax Vaccine Contingency Protocol

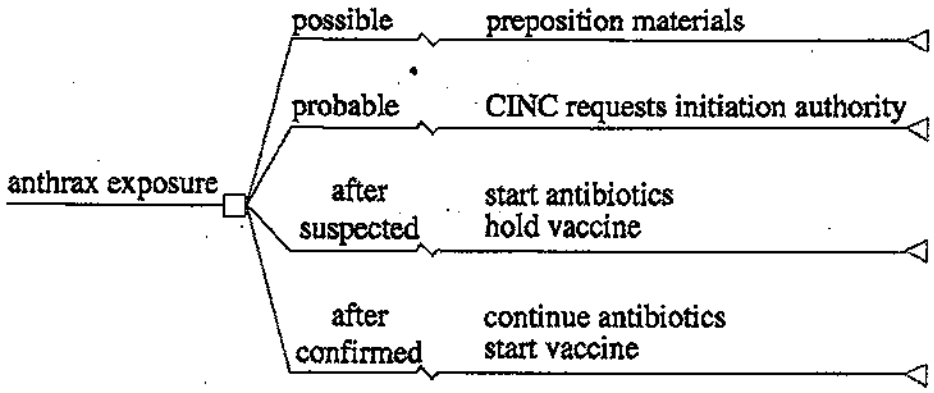

Figure 3. Decision Tree for Anthrax Vaccine Contingency Protocol

This space intentionally left blank.

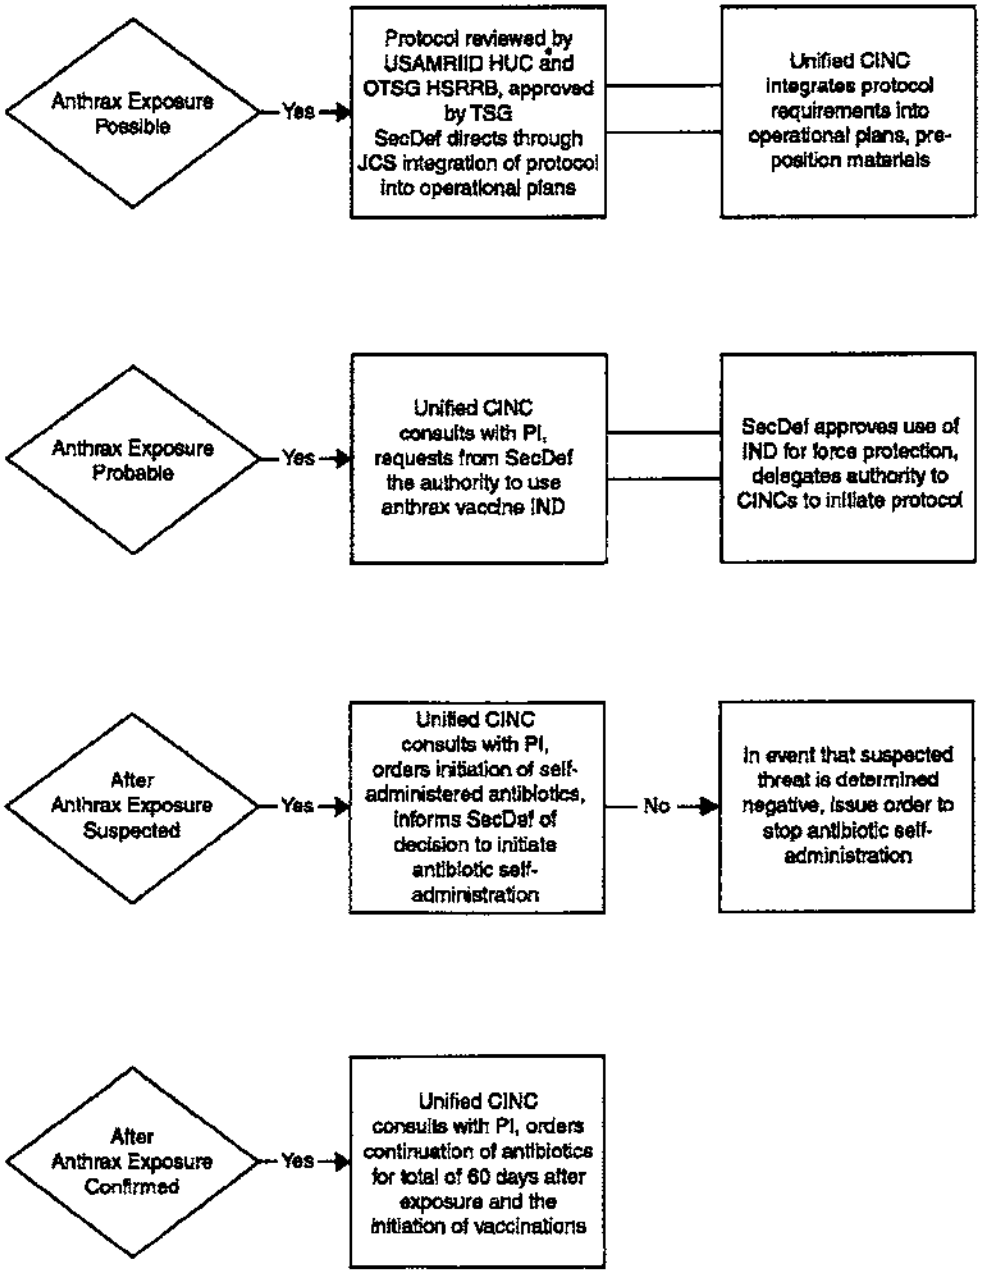

Figure 4. Decision-Making Process for Anthrax Vaccine Contingency Protocol

Responsibilities of Unified CINC:

1. Designate GCP-trained JTF/Service PIs who could be called upon immediately should a threat of exposure to *B. anthracis* spores necessitate activation of the anthrax vaccine contingency protocol
2. Assess the threat of exposure to *B. anthracis* spores of service personnel under the Unified CINC
3. Request approval from SecDef to implement the anthrax contingency protocol
4. Designate additional JTF/Service component PIs, if necessary
5. Order the JTF/Service PI to activate anthrax contingency protocol
6. Inform SecDef of decisions related to the execution of the protocol
7. If appropriate, request waiver of informed consent through SecDef to the President

Responsibilities of Services:

1. Provide uniform education to service members about the anthrax contingency protocol
2. Provide GCP protocol-specific training to JTF/Service PIs
3. Provide storage distribution, disposition, and accountability of anthrax vaccine
4. Provide QC/QA of protocol documentation

Responsibilities of JTF/Service PI:

1. Be trained in GCP (responsibility of USAMMDA)
2. Sign FDA Form 1572 (see Appendix B)
3. Upon being notified by Unified CINC of probable, suspected, or confirmed exposure to *B. anthracis* spores, order antibiotics to be dispensed and vaccination teams to be deployed
4. Assign Investigators to vaccination sites

Responsibilities of Site Investigator:

1. Be trained in GCP (responsibility of USAMMDA)
2. Assign an individual at the vaccination site responsibility for documenting vaccine storage, accountability, and distribution, and disposition.
3. Present or appoint GCP-trained designee to present informed consent information and sign ICF
4. Dispense or oversee dispensing of antibiotics
5. Administer or oversee administration of vaccine
6. Oversee or assign responsibility for ensuring subjects receive requisite vaccinations
7. Oversee entry of vaccination data into AVIP database
8. Complete or oversee completion of AE forms and protocol deviation forms
9. Report protocol deviations in accordance with protocol and JTF/Service PI
10. Report serious and unexpected AEs in accordance with protocol and JTF/Service PI
11. Submit SAE follow-up reports in accordance with protocol and JTF/Service PI

Figure 5. Responsibilities Associated with Anthrax Vaccine Contingency Protocol

Responsibilities of Clinical Project Manager:

1. Be trained in GCP
2. Be responsible for repository of all contingency protocol documentation, including Subjective Response Forms, vaccine accountability documents, informed consent forms, Six-Month Follow-up Questionnaire, protocol deviation forms, VAERS forms (AEs)
3. Submit safety reports to RCQ
4. Submit IND annual reports to the RCQ
5. Track data being entered in the service immunization tracking systems, which are compiled by the DEERS database
6. Retain sufficient data for subject follow-up (VRDB)
7. Oversee integration of original data entered by each service into a single database at USAMRIID
8. Forward copies of serious and unexpected AEs to the RCQ, HSRRB, and USAMRIID's Human Use Committee

Responsibilities of Secretary of Defense:

1. Approve/disapprove CINC request to implement the protocol. The SecDef has authority under DODD 6200.2, Section 4.2, to approve protocols for use on volunteers who give informed consent.
2. Request a waiver of informed consent from the President of the United States when necessary in accordance with DODD 6200.2, Section 4.3

Figure 5. Responsibilities Associated with Anthrax Vaccine Contingency Protocol (cont.)

Active monitoring will be accomplished by means of a Subjective Response Form (Appendix C), which will be given to each anthrax vaccine-naïve subject prior to administration of doses 2 and 3. The form will address the subject's state of health during the previous 2-week period. The form will also include a self-assessment of the subject's compliance with the concomitant antibiotic regimen. The forms will be addressed to the Clinical Project Manager, USAMRIID. The data will be entered into the study database and become part of the analysis of safety.

USAMMDA will conduct long-term safety follow-up of subjects who participated in this contingency protocol. Approximately 6 months after receiving the anthrax vaccine under the contingency protocol, 100% of vaccinees (up to a maximum of 3,000) plus 10% of the additional study population will be asked to complete a follow-up questionnaire (Appendix C) about their state of health since their participation in the protocol. They may be sent a postcard with a toll-free number to call, be surveyed by telephone, be mailed a questionnaire to complete, or be given an Internet site to complete the questionnaire on-line. As with the Subjective Response Form, responses to the Follow-up Questionnaire will be entered into the study database and become part of the analysis of safety.

4.1 Protocol Endpoint

The endpoint of this contingency protocol is the collection and analysis of all adverse events, including local and systemic reactions and clinical cases of anthrax disease in the study population after the administration of the anthrax vaccine.

4.2 Type of Protocol

This is an open-label, multi-site contingency protocol for the administration of antibiotics and anthrax vaccine designed for early treatment of volunteers after confirmed or presumed exposure to aerosolized *B. anthracis* spores.

4.3 Measures to Avoid Bias

Not applicable.

4.4 Description of Protocol Treatment

All individuals presumed to have been exposed to *B. anthracis* spores will be given a Baseline Health Questionnaire (Appendix D) to complete and up to a 60-day supply of antibiotic chemoprophylaxis (see Section 6.4, Concomitant Medications/Treatment). After signing an Informed Consent Form (ICF), they will receive anthrax vaccine according to the dosing schedule in Section 2.4.

4.5 Study Duration

The protocol will remain active up to a maximum of 5 years to enable DoD to protect the health of volunteers, including active and reserve component service members, as well as U.S. government employees, contractors, other U.S. personnel, dependents (>18 and <65 years of age), and allied military forces and local nationals who are presumed exposed to *B. anthracis* spores.

4.6 Protocol Termination

The protocol may be terminated at any time if the subjects' safety and health may be compromised by its continuation. The Principal Investigator or Sponsor may make this determination.

4.7 Product Accountability

4.7.1 Vaccine Accountability

The Sponsor will be responsible for distribution of the vaccine, through the Focused Distribution Management Branch (FDMB) of USAMMA, to all supporting medical supply activities of all services or organizations participating in this protocol. The sponsor will have ultimate responsibility for vaccine accountability. General procedures for vaccine ordering, shipping, storing, controlling, accounting, and disposition processes are described in the Logistics Annex, Appendix A. Additional information is available on the USAMMA AVIP web site at www.armymedicine.army.mil/usamma/anthrax/antxhome.htm.

The Investigator at each vaccination site will assign an individual the responsibility for documenting vaccine storage, accountability, and distribution, including maintenance of logs of

vaccine receipt, temperature maintenance, list of doses by vaccine lot administered (by subject), and amount of remaining vaccine before final disposition (Appendix A, Logistics Annex). These documents will be maintained in the protocol file, which will be sent to the Clinical Project Manager at USAMRIID at the termination of the contingency protocol.

All unopened vials will be accounted for and returned to the sponsor's representative (USAMMDA). After being properly documented, all used vaccine, partially used vials, and all paraphernalia used in the conduct of this protocol will be disposed of according to instructions in Appendix A for drug accountability and handling medical equipment or waste.

4.7.2 Antibiotic Accountability

The antibiotics to be distributed in this protocol are considered concomitant medications. The respective Services will manage the supply and distribution of these antibiotics within the normal medical supply channels in the same manner as all other pharmaceuticals (Appendix A).

4.8 Treatment Randomization Codes

All participants will receive a supply of antibiotics. All participants will receive the anthrax vaccine providing they have signed the ICF and meet eligibility criteria.

4.9 Source Data

The following data fields will be completed via service automated immunization tracking systems (AITSs) and will serve as the Case Report Form for subjects enrolled in the contingency protocol. The service AITSs are MedPROS (Army), SAMS (Navy & Marine Corps), and MITS (Air Force) tracking systems.

1. Immunization Table
   - Date of immunization
   - SSN of receiving individual
   - CDC code for immunization
   - CDC code for manufacturer
   - Volume of vaccine administered
   - Lot number of immunization batch
   - Delivery means of vaccine
   - Adverse reaction to immunization
   - Supervising medical individual
   - SSN for supervising medical individual
   - Location administered
   - Calculated next due date
   - Series number, route of administration (e.g., SC, ID, IM, etc.)

2. Temporary Personnel Table (for non-U.S. service volunteers)
   - Service or military personal class
   - SSN of soldier/individual
   - Unit identification code
   - Individual rank
   - Individual name
   - Date of birth
   - Job code
   - National identity number or other ID number

3. Immunization Validation Table
   - Descriptor code used in Service
   - CDC code for immunization
   - Short name for immunization (CDC)
   - Full immunization name (CDC)
   - Total immunizations in series
   - Number of immunizations
   - Standard dose for immunization
   - Standard route for administration
   - Booster requirement
   - Required interval for each immunization

The data will be integrated into the Defense Eligibility Enrollment Report System (DEERS) for subsequent analysis and long-term record keeping. Ethnicity and gender of service members will be captured at the DEERS level. Ethnicity and gender of non-service members will be captured on the Informed Consent Form. The forms will be forwarded to the Clinical Project Manager, USAMRIID, for entry into the contingency protocol database.

Each service has a back-up plan for data entry if the electricity fails or if a contingency precludes the use of computers. The required information will be entered in the individual paper medical record or paper shot record for subsequent entry into the service-specific electronic database.

Other source data include

- Baseline Health Questionnaire
- Informed Consent Form
- Patient Medical Records (including laboratory results)
- Subjective Response Form (record of reaction(s) after dose 1 and dose 2 of anthrax vaccine and compliance with antibiotic regimen)
- Six-Month Follow-up Questionnaire—internet web site, form letter, telephone contact
- VAERS-1 form

Because of the difficulty of maintaining case report files in a contingency, paper forms, e.g., Baseline Health Questionnaire and protocol deviation forms, will be prelabeled for forwarding directly to the Clinical Project Manager, USAMRIID.

5.0 SELECTION AND WITHDRAWAL OF SUBJECTS

5.1 Inclusion Criteria

Subjects must be presumed to have been exposed to *B. anthracis* spores.

Subjects either must have begun chemoprophylaxis with antibiotics (see Section 6.4, Concomitant Medications) or begin chemoprophylaxis concurrently with the administration of the first dose of anthrax vaccine.

Subjects, including dependents, must be between 18 (17 years old if active duty) and 65 years of age to receive anthrax vaccine.

Subjects must sign and date the ICF before receiving the anthrax vaccine.

5.2 Exclusion Criteria

A history of a severe reaction to a previous dose of anthrax vaccine is generally an exclusionary criterion. However, because of the nearly 100% fatality from inhalational exposure to *B. anthracis* spores, the vaccine can be administered with symptomatic treatment.

Pregnancy is also generally an exclusionary criterion. However, pregnant or lactating women should be given the option of taking the vaccine if the Investigator believes it is warranted because of probable exposure to *B. anthracis* spores (see Section 2.3, Risks and Benefits).

HIV infection is also an exclusionary criterion by current DoD policy. However, nonvaccinated individuals with HIV infection who are exposed to *B. anthracis* spores should be vaccinated, even though the adequacy of the immune response to the vaccine in these persons is unknown.

5.3 Voluntary Withdrawal

Subjects who refuse treatment may withdraw at any time without penalty or loss of benefits to which they are otherwise entitled. Counseling will be provided about the subject's health if he/she decides to discontinue participation in the protocol. Additional medical advice in the best interest of the individual subject will be provided. Specifically, subjects will be told *"Do not stop taking antibiotics on your own because this will allow the bacteria to emerge and cause potentially lethal disease."*

5.4 Removal of Subjects from Study

The Investigator or Medical Monitor will determine which subjects will be withdrawn from the contingency protocol.

6.0 TREATMENT OF SUBJECTS

6.1 Protocol Procedures

Prior to deployment and periodically during deployment, service members will receive standardized instruction on the potential need for the contingency protocol and information on the anthrax vaccine and each of the three antibiotics that could be administered in the event of exposure to *B. anthracis* spores. Medical personnel under the supervision of a GCP-trained Investigator will dispense the antibiotic either in advance of or concurrently with the administration of the vaccine at a designated military medical treatment facility. The individual dispensing the antibiotic will caution subjects that their lives could depend on the antibiotic being taken each day precisely as prescribed. Subjects experiencing a reaction to the antibiotic prescribed should report immediately to their health care provider. Under no circumstance should they discontinue taking the antibiotic until instructed by the health care provider.

Once anthrax exposure is considered **probable**, potentially affected individuals will be given the information paper on the anthrax vaccine and an information paper that describes each of three antibiotics that could be administered. Once anthrax exposure is **suspected**, potentially affected individuals will be asked to review the previously provided information papers. At this time, they will be given an ICF to read (ask questions and understand) and sign as per 21 CFR and ICH guideline for GCP. A copy of the signed and dated ICF will be given to each subject. The Investigator or designee will ask each subject to complete the Baseline Health Questionnaire (Appendix D) prior to administration of the first dose of anthrax vaccine. The subject will be told to present the signed copy of the ICF to the Investigator or designee prior to administration of each subsequently scheduled dose of anthrax vaccine. Subjects will have to sign and date a new ICF if they are not able to present a copy of the original signed and dated form. Once the Investigator or designee has determined that subjects have signed the ICF and are determined to be eligible to participate in the contingency protocol, they will be administered a dose of anthrax vaccine as per instructions in Section 2.4. A person on site will be assigned the responsibility of entering the data for each vaccination into the service-specific computerized database. Data on non-U.S. subjects will be collected by the respective service that administered the vaccine. Subjects will be observed for a minimum of 30 minutes, and any local or systemic reactions will be documented a VAERS-1 form, which will serve as the AE form for this contingency protocol (see Section 8).

Subjects scheduled to receive doses 2 and 3 at weeks 2 and 4 will be given a Subjective Response Form (Appendix B) to complete prior to receiving dose 2 and dose 3. Subjects will be asked to assess their reaction(s), if any, to the previous injection (dose 1 or 2). All vaccinees will be advised that they may also report adverse reactions that might be related to the vaccine to the Investigator or designee prior to completing the response form at the second or third visit. All subjects will have to report any reactions occurring after administration of all subsequent doses of anthrax vaccine directly to the Investigator or designee.

After concluding their participation in the contingency protocol, subjects who will be at risk of future exposure to *B. anthracis* spores will be advised to complete the FDA-labeled regimen of

the licensed product. All military personnel will be notified by means of the vaccination databases of their respective services when they are due for their next dose of anthrax vaccine.

Subjects will be advised in the ICF that they could be selected for a follow-up safety survey approximately 6 months after their participation in the contingency protocol. One hundred percent of vaccinees (up to a maximum of 3,000) will be asked to complete a questionnaire (see Section 4 and Appendix C for details).

6.2 Protocol Deviation Procedures

All deviations from the protocol and actions taken will be recorded on a Protocol Deviation Form (Appendix E) and placed in the regulatory file at the military medical facility administering the vaccine. The Investigator will be responsible for identifying and recording all deviations, which are defined as isolated occurrences involving a procedure that did not follow the protocol or protocol-specific procedure. These deviations will be reported to the Clinical Project Manager as soon after their occurrence as possible. The Clinical Project Manager will submit the deviations to Regulatory Compliance and Quality (RCQ), which will submit them in the IND annual report to the FDA.

At the end of the contingency protocol, vaccination records will be reviewed to determine which subjects were vaccinated off schedule and a follow-up plan will be formulated.

6.3 Protocol Modifications

Any change or modification to the protocol that affects participants, objectives, design, procedures, or significant administrative aspects will require a formal amendment to the protocol. Such amendments will be agreed upon and approved by the Sponsor, the USAMRIID HUC and the HSRRB prior to implementation. The ICF must be revised to concur with any amendment, as appropriate, and must also be reviewed and approved with the amendment. A subject already enrolled in the protocol will be informed about the revision and asked to sign the revised ICF if the modification directly affects the subject. A copy of the revised, signed (with date) ICF will be given to the subject. All original versions of the ICF will be retained as part of the subject's permanent record and a copy retained at USAMRIID.

Administrative changes to the protocol are corrections and/or clarifications that have no effect on the way the study is to be conducted. These administrative changes will be agreed upon by the Sponsor and the Clinical Project Manager and will be documented. The HUC/HSRRB will be notified in writing of administrative changes prior to implementation.

6.4 Concomitant Medications/Treatment

6.4.1 General

Restrictions on the use of concomitant medications or treatment during this protocol are related to the administration of ciprofloxacin, doxycycline, or penicillin and are presented in Section 6.4.2. Use of immune-suppressing medications should be annotated in the subject's records.

Other vaccines, if required, may be administered concurrently with the anthrax vaccine, using separate syringes and different anatomic sites. Expected reactions to vaccines may be additive when the anthrax vaccine is administered with other vaccines.

6.4.2 Antibiotics

Prior to or concurrently with the administration of the anthrax vaccine, the Investigator or designee will dispense up to a 60-day supply of antibiotic to individuals potentially exposed to *B. anthracis* spores. Recommendations for selecting an antibiotic in this protocol are listed in Table 5, and each antibiotic is discussed in the following sections.

Table 5. Recommendations in Order of Priority for Selecting an Antibiotic after Exposure to *B. anthracis* Spores

Antibiotic	Dose	Duration
1. Ciprofloxacin	500 mg every 12 hours	60 days postexposure
2. Doxycycline	100 mg bid every 12 hours	60 days postexposure
3. Penicillin V Potassium (PenVK)	500 mg every 6 hours	60 days postexposure

Notes:
1. If subject is allergic to the antibiotic initially prescribed, revert to the next available antibiotic.
2. If supply of antibiotic is insufficient, revert to the next available antibiotic.
3. If supplies of ciprofloxacin are exhausted, and subjects are started on doxycycline or PenVK, switch non-allergic subjects to ciprofloxacin when supplies of ciprofloxacin become available.

The antibiotic of choice is ciprofloxacin for postexposure to anthrax spores. Doxycycline is recommended as the second choice. These two antibiotics have the advantage of twice daily administration, which should increase compliance. For pregnant females and those allergic to ciprofloxacin and doxycycline, penicillin is recommended, although it must be administered four times daily. However, strict compliance with daily dosing will be emphasized for all regimens.

6.4.2.1 Ciprofloxacin

The FDA recently approved ciprofloxacin to reduce the incidence or progression of inhalational anthrax following exposure to aerosolized *B. anthracis* spores. The recommended adult dosage for postexposure inhalational anthrax is 500 mg given orally every 12 hours for 60 days. Ciprofloxacin is contraindicated in persons with a history of hypersensitivity to ciprofloxacin or any member of the quinolone class of antimicrobial agents.

Subjects are to take ciprofloxacin with food (excluding milk or yogurt) and at least 8 oz of water. Subjects taking zinc, iron, sucralfate, Videx® (didanosine), and antacids containing magnesium, aluminum, or calcium should take them 6 hours before or 2 hours after taking ciprofloxacin. Ciprofloxacin may be associated with hypersensitivity reactions, so skin rashes or other allergic reactions should be reported immediately. It can increase sensitivity to sunlight, so prolonged exposure to sunlight should be avoided. Ciprofloxacin may cause lightheadedness or dizziness,

so care should be taken when operating machinery or vehicles or engaging in activities requiring mental alertness. Pain, inflammation, and ruptured tendons have been reported after administration of ciprofloxacin. Of special note, ciprofloxacin also may increase the effects of caffeine and theophylline, which may result from reduced clearance and prolongation of their serum half-lives.

A more detailed description of the side effects, precautions, and drug interactions is included in the Antibiotic Information Paper (Appendix H).

6.4.2.2 Doxycycline

FDA has approved doxycycline for the treatment of anthrax disease but not for postexposure prophylaxis. Doxycycline is contraindicated in persons with a previous hypersensitivity reaction to any of the tetracyclines. Subjects are to take a 100-mg oral dose of doxycycline with food and at least 8 oz of water every 12 hours for 60 days after exposure to *B. anthracis* spores unless otherwise instructed by the Investigator. As with ciprofloxacin, doxycycline may be associated with hypersensitivity reactions, so skin rashes or other allergic reactions should be reported immediately. It can increase sensitivity to sunlight, so prolonged exposure to sunlight should be avoided. Subjects should drink fluids liberally and should not take antacids containing magnesium, aluminum, or calcium, products containing iron, or multivitamins containing zinc. Concurrent use of a tetracycline may render oral contraceptives less effective. In addition, use of a tetracycline during tooth development (last half of pregnancy) may cause permanent discoloration of the teeth of offspring.

A more detailed description of the side effects, precautions, and drug interactions is included in the Antibiotic Information Paper (Appendix H).

6.4.2.3 Penicillin V Potassium

Penicillin is approved by the FDA for the treatment of anthrax disease but not for postexposure prophylaxis. Penicillin is contraindicated in persons with a previous hypersensitivity reaction to any penicillin. Subjects are to take an oral dose of 500 mg on an empty stomach with 8 oz of water every 6 hours for 60 days after exposure to *B. anthracis* spores unless otherwise instructed by the Investigator. A previous hypersensitivity reaction to any penicillin is a contraindication. Penicillin should be used with caution in individuals with histories of significant allergies and/or asthma. The most common reactions to oral penicillin are nausea, vomiting, epigastric distress, diarrhea, and black hairy tongue. Hypersensitivity reactions include skin eruptions, urticaria, and other serum-sickness-like reactions. Penicillin may be taken with or without meals.

A more detailed description of the side effects, precautions, and drug interactions is included in the Antibiotic Information Paper (Appendix H).

6.5 Procedures for Monitoring Subject Compliance

After the administration of each of the first two doses of vaccine at weeks 0 and 2, each subject will be given a Subjective Response Form to document compliance with the antibiotic regimen as well as reaction to the anthrax vaccine (Appendix C) to complete just before the next vaccination. The service-specific databases being used for this protocol will automatically retrieve the names of personnel who are due to receive an anthrax vaccination. The Investigator at each vaccination site will assign a medical care giver the responsibility for ensuring that subjects complete the requisite number of vaccinations.

Monitoring/ensuring that subjects complete the requisite number of vaccinations must be a partnership among the subjects themselves, their commanders or other unit leaders, and the medical community, especially considering the stress of implementing this protocol within military operations.

7.0 ASSESSMENT OF EFFICACY

Assessing the efficacy of the anthrax vaccine for the early treatment of exposure to *B. anthracis* spores is not an endpoint of this protocol (see Section 9). The occurrence of any cases of anthrax disease during the contingency protocol will be evaluated as an adverse event (see Section 8). To the extent possible, the cause of any deaths that occur during the course of the protocol will be determined.

8.0 ASSESSMENT OF SAFETY

The Clinical Project Manager will be responsible for the real-time collection and evaluation of safety data. All AEs recorded during the protocol—whether or not considered to be related to administration of the anthrax vaccine—will be included in the data analysis. Each AE will be documented on a VAERS-1 form (Appendix F), which will be submitted from the field to the Clinical Project Manager. The project manager will report all AEs that are considered serious or unexpected that are considered to be associated with the use of the vaccine to RCQ, which will submit them to the FDA (see Section 8.5). The FDA will be advised of the aggregate incidence of injection site reactions albeit not on individual VAERS reports.

The frequency and incidence rates of all events that might be related to vaccine administration or prescribed antibiotics that are documented by the Investigator or designee on the VAERS-1 form and service-specific databases, as well as events recorded by subjects on Subjective Response Forms and Follow-up Questionnaires, will be analyzed. AE data recorded for the active monitoring group will also be included.

Possible occurrences of anthrax disease and all deaths occurring during the protocol will be recorded as AEs, and their relationship to demographic characteristics of the vaccinees, number of doses received, vaccine lots, and concomitant medications will be analyzed. The outcome of all AEs will be documented to the extent possible during a contingency. Investigators and their

designees will be instructed on the importance of recording the antibiotic prescribed to the subject in Block 17 of the VAERS-1 form for a subject experiencing an AE during the protocol.

Note: Although injection site reactions to the vaccine will be apparent, systemic reactions to the vaccine may not be distinguishable from the onset of the infection.

8.1 Definitions of Adverse Events

An AE is any untoward medical occurrence in a patient or clinical investigation subject administered an investigational drug (vaccine) that does not necessarily have a causal relationship with this treatment. An AE, therefore, can be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease temporally associated with the use of an investigational product (e.g., a specific lot of anthrax vaccine) whether or not causally related to the vaccine. Loss of duty greater than 24 hours is a mandatory VAERS reporting criterion.

A serious adverse event (SAE) is any untoward medical occurrence that results in any of the following outcomes:

1. death
2. life-threatening AE
3. in-patient hospitalization or prolongation of existing hospitalization
4. persistent or significant disability/incapacitation
5. congenital anomaly/birth defect

Important medical events that may not result in death, be life-threatening, or require hospitalization may be considered SAEs when, based on appropriate medical judgment, they may jeopardize the patient or subject and may require medical or surgical intervention to prevent one of the outcomes listed in this definition.

An unexpected adverse event is an adverse reaction, the nature or severity of which is not consistent with the applicable product information or any AE that has not been documented previously as an event to be expected, i.e., nature, frequency, or intensity, with administration of this test article (vaccine).

8.2 Possible AEs with the Administration of the Anthrax Vaccine

The following statements about adverse reactions are paraphrased from the Package Insert for AVA (the licensed anthrax vaccine) and the previously cited DoD data:

- Like all other vaccines, the anthrax vaccine may cause soreness, redness, itching, and swelling at the injection site. Up to 30% of men and 60% of women report mild local reactions, which usually last only a few days and consist of a small ring of erythema, 1-2 cm in diameter, plus slight local tenderness. For both genders, between 1% and 5% report reactions of 1 to 5 inches in diameter. Larger reactions occur in about one per

100 vaccinees. A lump at the site occurs commonly, usually lasting a few weeks before resolving without intervention.

- From 5% to 35% of vaccinees will experience systemic reactions, including muscle aches, joint aches, headaches, malaise, rashes, chills, low-grade fever, nausea, or related symptoms. However, these symptoms usually resolve in less that a week.
- Any vaccine can cause serious reactions requiring hospitalization. For the anthrax vaccine, they happen <1 per 100,000 doses.

Before administering the anthrax vaccine, the Investigator should determine the type of reaction the volunteer experienced after previous anthrax vaccination(s). The Investigator or designee and the volunteer should assess whether antihistamines or pain relievers before or after vaccination would help reduce bothersome symptoms. In addition, epinephrine or other suitable emergency medications will be available for treating acute allergic adverse reactions.

8.3 Assessing AEs

Volunteered and observed AEs will be recorded in the volunteer health records, in addition to any protocol-specific records. These include AEs that the subject reports spontaneously and those observed by the Investigator. Figure 6 is a decision tree for the Investigators to use in assessing AEs that may occur during the contingency protocol.

8.3.1 Intensity

Regardless of the classification of an AE as serious or not, its severity must be assessed according to the following categories:

- Mild — Does not interfere with routine activities
- Moderate — Interferes with routine activities
- Severe — Unable to perform routine activities

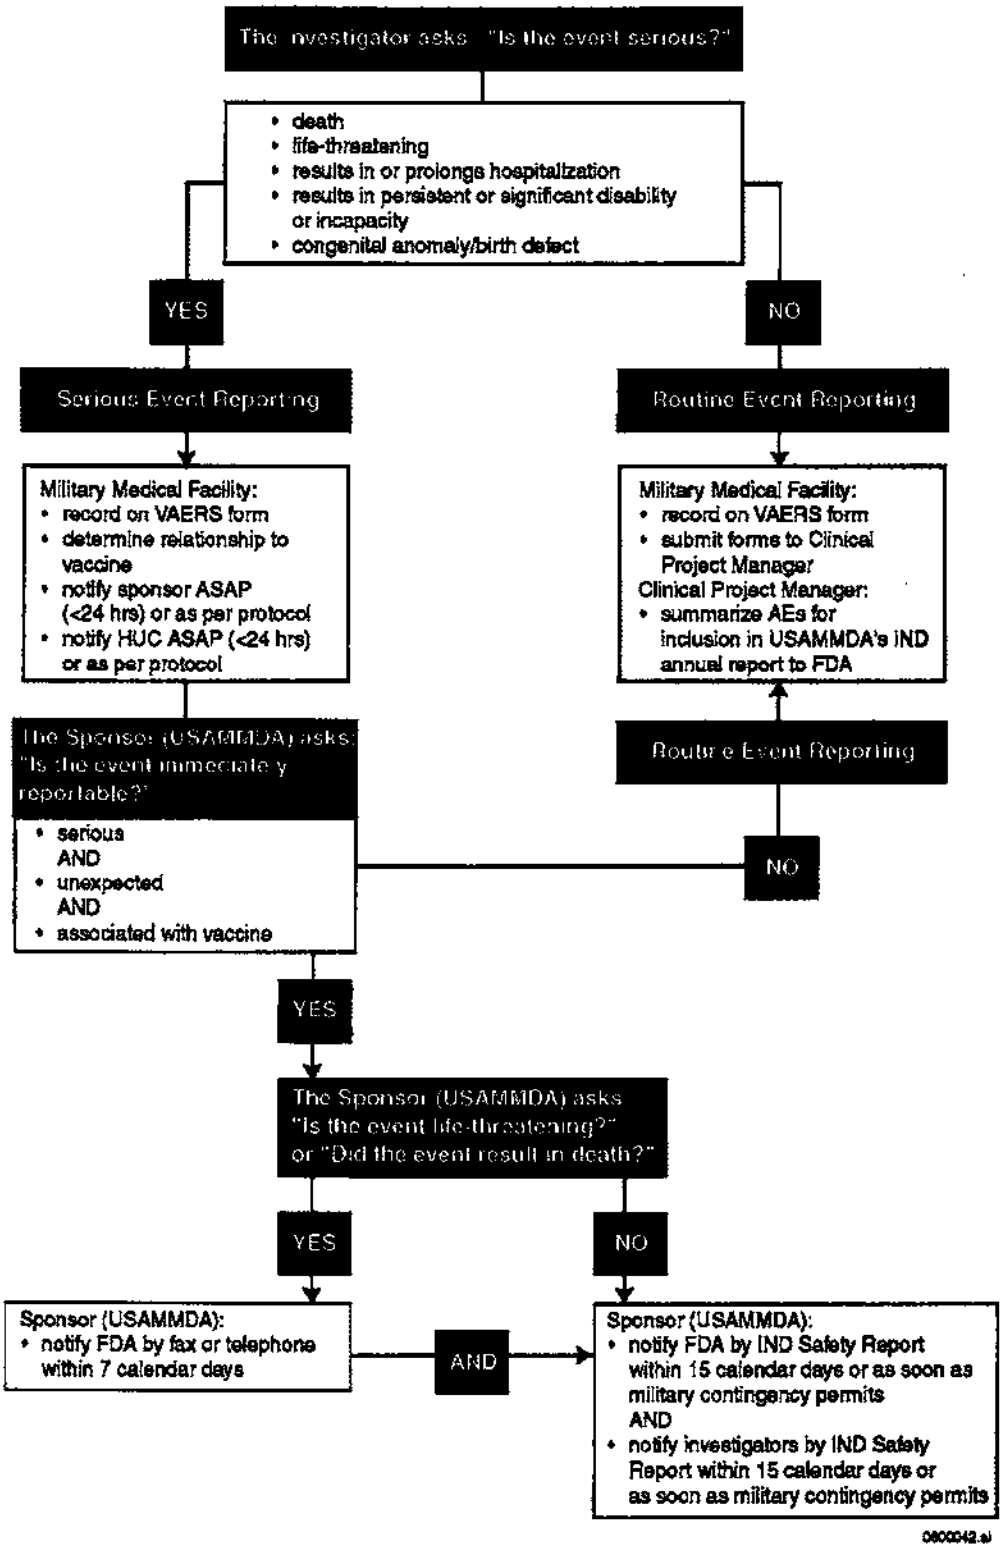

Figure 6. Decision-Making Diagram for the Reporting of Adverse Events—Anthrax Vaccine Contingency Protocol

8.3.2 Causality

Categories of interrelationship between administration of the vaccine and a given or observed reaction are defined in Table 6.

Table 6. AE Causality Assessment Criteria

Category	Definition
Definite	Events occurring within a timely manner after administration of the vaccine that are known sequelae to the administration of the vaccine and follow a previously documented pattern of reaction but for which no other explanation is known. This category applies to those AEs that the investigator believes are incontrovertibly related to the vaccine.
Probable	Any event occurring in a timely manner after administration of the vaccine that follows a known pattern of reaction to the vaccine and for which no other explanation is known. This category applies to those AEs that, after careful medical consideration at the time they are evaluated, are believed with a high degree of certainty to be related to the vaccine.
Possible	Any event occurring in a timely manner after administration of the vaccine that does not follow a known pattern of reaction and for which no other explanation is known. This category applies to those AEs that, after careful medical consideration at the time they are evaluated, are considered unlikely to be related but cannot be ruled out with certainty.
Unlikely	In general, this category can be considered applicable to those AEs that, after careful medical consideration at the time they are evaluated, are considered to be unrelated to administration of the vaccine.
Not related	Any AE for which there is evidence that an alternative etiology exists or for which no timely relationship exists to the administration of the vaccine and the AE does not follow any previously documented pattern. This category applies to those AEs that, after careful medical consideration, are clearly and incontrovertibly due to causes other than the vaccine.
Unclassifiable	There is insufficient information about the AE to allow for an assessment of causality.

The criteria to be used in making the assessment are:

- temporal relationship between administration of the vaccine and the AE
- known safety profile of the vaccine
- evidence of alternative cause(s)

Note: Only a physician can make this determination.

8.4 Recording AEs

The following information must be recorded for each AE on the VAERS-1 form in the designated blocks (in brackets), and SAEs will be reported as per instructions in Section 8.5:

- Subject's name and SSN (add to address line)
- Investigator's name and name of medical treatment facility
- Subject's date of birth [3], age [4], gender [5], and ethnicity (add to [7])
- Vaccine lot [13] and dates of administration [10]
- Date and time of onset [11]
- Signs, symptoms, and severity [7, 8]
- Continuous vs. intermittent reaction [7]
- Relationship to vaccine [7]
- Intervention/treatment [7]
- Concomitant medication(s), including dose, route, frequency, and beginning and ending dates [7]
- Date and time of resolution [7]

All blocks on the VAERS-1 form that are relevant to the AE should be completed.

Limited AE data will also be entered into the service-specific databases (MEDPROS, Army; SAMS, Navy/Marines; and MITS, Air Force).

8.5 Reporting AEs

An Investigator must telephone, fax, or e-mail SERIOUS and UNEXPECTED AEs within 24 hours (or as soon as possible given the contingency) to:

U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID)
Clinical Project Manager
Telephone:
Fax:
e-mail:

The Clinical Project Manager will forward AE information to:

U.S. Army Medical Research and Materiel Command (USAMRMC)
Office of Regulatory Compliance and Quality
Telephone: (301) 619-2165
Fax: (301) 619-7803
e-mail:

U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID)
Chairman, USAMRIID Human Use Committee
Telephone: (301) 619-4723
Fax: (301) 619-2312
e-mail:

An Investigator must submit a written follow-up report within 3 working days (or as soon as possible given the contingency) of the onset of an SAE to:

U.S. Army Medical Research and Materiel Command (USAMRMC)
Office of Regulatory Compliance and Quality
504 Scott Street
Fort Detrick, MD 21702-5012
Fax: (301) 619-7803
e-mail:

The Sponsor's Representative, USAMMDA, will prepare a form 1571 and forward it along with the safety report to RCQ. RCQ with notify the FDA by phone or fax within 7 calendar days of receipt of an initial report of an SAE and also must notify the FDA (through RCQ) and all PIs in writing within 15 calendar days of being notified of an SAE.

An attempt will be made to follow up subjects for whom an AE was reported but whose resolution was not documented during the contingency in order to ascertain the status or resolution of the AE.

8.6 AE Follow-Up

All AEs will be followed to resolution to the extent possible given the contingency regardless of whether the subjects are still participating in the contingency protocol. For all individuals who can be followed, outcomes may be classified as recovered, persists (i.e., chronic condition diagnosed, other infectious disease, trauma), died, or lost to follow-up.

Nonserious AEs will be reported to the FDA in the IND annual report prepared by the Clinical Project Manager.

8.7 AE Monitoring

A Medical Monitor (Unit Medical Officer [Army] or equivalent organizational medical officer for Navy, Air Force, and Marine Corps units) at each site is required to investigate all serious and unexpected AEs associated with the contingency protocol and provide an unbiased written report of the event within 10 calendar days of the initial report (unless contingencies delay it) to the Clinical Project Manager at USAMRIID. At a minimum, the Medical Monitor should also indicate whether he/she concurs with the details of the report provided by the Investigator. The Medical Monitor is also required to submit AE findings to the HSRRB. The specific functions of the Medical Monitor are described in Section 11.2.

Representatives of the Army, Navy, and Air Force Offices of the Surgeons General and USAMMDA, as the Sponsor's representative, are also entitled to review research records as part of their responsibility to protect human subjects in research.

9.0 STATISTICS

All subjects enrolled in this contingency protocol will be included in the evaluation of safety.

The number of subjects will depend on the documented or perceived exposure to *B. anthracis*.

Data entered into the MEDPROS, SAMS, and MITS databases will be evaluated for compliance with the vaccination schedule and the relationship of AEs to vaccine doses. The analysis will include standard tabulation of demographic, vaccination, and AE data, as well as the antibiotic administered. All AE data entered into the VAERS-1 forms including Investigator-determined causality, will be analyzed.

Assessment of vaccine efficacy is not a major objective of this protocol. However, as part of the assessment of safety, the number of doses of anthrax vaccine received, the vaccine production lot, and the temporal relationship to onset of disease will be studied in subjects who develop anthrax disease while participating in this contingency protocol.

10.0 DIRECT ACCESS TO SOURCE DATA/DOCUMENTS

Representatives of the Army, Navy, and Air Force Offices of the Surgeons General, USAMMDA as the Sponsor's representative, and the FDA will be permitted to photocopy and review medical and protocol records related to this protocol as part of their responsibility to protect human subjects enrolled in DoD-sponsored clinical studies.

11.0 QUALITY CONTROL AND QUALITY ASSURANCE

11.1 Clinical Study Monitor

The Quality Assurance Division, USAMMDA, will provide retrospective monitoring of the anthrax vaccine contingency protocol (Appendix G). No prospective monitoring is planned. The study will be monitored for GCP compliance, verifying adherence to the protocol and the completeness and exactness of data entry at the conclusion of the contingency protocol. The monitor will audit the investigation study files, volunteer consent forms, service-specific databases (i.e., case report forms), VAERS-1 forms, original source documents, and logistical records upon their arrival at the permanent record site (USAMRIID). Upon completion of each review, the monitor will brief the Clinical Project Manager and PIs of findings and issues in need of resolution for future contingencies requiring the use of IND products. A written report of the findings and recommendations will be circulated and provided to USAMMDA, as the Sponsor's Representative.

11.2 Medical Monitor

The Unit Medical Officer (or equivalent organizational medical officer for Navy, Air Force, and Marine Corps units) will assume the role of Medical Monitor at the vaccination sites for subjects enrolled in this protocol. Unit Medical Officers will provide care (as they would for any other

medical necessity) for volunteers experiencing AEs associated with the anthrax vaccine. Situations permitting, a person from USAMMDA could conduct an on-site audit. The AVEC will assume the role of Medical Monitor (data safety monitoring board)—reviewing all adverse events that are reported during the execution of the contingency protocol. This is the role that the committee currently performs for the AVIP.

12.0 ETHICS

12.1 Good Clinical Practice

The procedures set forth in this protocol are designed to ensure that the Sponsor and all protocol personnel abide by the Code of Federal Regulations (in particular, 21 CFR, Parts 56, 312, 314, and 601) and ICH Guideline for GCP. All Principal Investigators and Investigators will receive GCP instruction. The PI for each JTF/Service confirms this by signing this protocol and FDA Form 1572.

12.2 Informed Consent

Written informed consent, in compliance with 21 CFR 50, will be obtained before any protocol-related procedures are initiated. Subjects will receive information papers (Appendix H) about the anthrax vaccine and the antibiotics together with the ICF (Appendix I). Instructions about the uses of IND products during a military contingency, in general, and the anthrax vaccine, specifically, will be given to service members prior to deployment and periodically post-deployment. Appendix J contains samples of standardized instructional manuals that will be given to service members. DoD's quadfold brochure and CDC's Vaccine Information Statement (VIS) on anthrax vaccination may be used as training aids to provide additional information. A GCP-trained investigator will present the protocol in lay terms to the subject singly or in groups. Questions will then be solicited on the nature of the protocol, the means by which it is to be accomplished, and the risks to the participants. Any question that cannot be answered will be referred to another Investigator. Informed consent will be obtained from each subject. No subject will be expected to grant consent until questions have been answered to his/her satisfaction. Subjects should understand that the lots of anthrax vaccine to be administered postexposure to *B. anthracis* spores under this protocol are considered to be an investigational drug. Informed consent includes the principle that it is critical that the subject be informed about the principal potential risks and benefits. This information will allow subjects to make a personal risk-versus-benefit decision and understand the following general principles:

1. Participation is entirely voluntary.
2. Subjects may withdraw from participation at any time without penalty or loss of benefits to which they are otherwise entitled.
3. Refusal to participate involves no penalty.
4. The individual is free to ask any questions that will allow him/her to understand the nature of the protocol.

Before being enrolled in this contingency protocol, all subjects will sign (with date) an ICF prior to undergoing any protocol-related procedure. This consent form must include the subject's full

name, home of record, telephone number, social security number or local identification number, gender, and date of birth. The ICF must be dated, witnessed, and retained by the Investigator as part of the protocol records at the military medical facility administering the vaccine. Should the protocol be modified, the subject consent form may be revised to reflect the changes of the protocol. Each volunteer will receive a copy of the signed ICF and any revised ICF, read and signed (with date) by the subject. This copy should be presented at the subject's next duty station if transferred before receiving the requisite number of doses of vaccine. If the signed form is lost, the volunteer will be required to sign and date a new ICF before receiving subsequent doses.

12.3 Approval of Study Protocol

Before a clinical protocol can be initiated, the protocol and other required documents will be submitted to the OPDRA Quality Assurance Unit, the Sponsor's Representative, and USAMRIID Scientific Review Committee; approved by the USAMRIID HUC Institutional Review Board (IRB) and the HSRRB; and submitted to the FDA for consideration and acceptance.

12.4 Confidentiality

Subjects will be identified in the service-specific databases by their personal social security number, date of birth, home of record, and telephone number. Subjects will be advised that they could be contacted at later dates for follow-up. This follow-up includes safety surveillance for the benefit of service members. The Privacy Act (5 USC § 552a) statement related to the establishment of a database with information retrievable by the Social Security number of service members is included in the ICF.

Representatives of the Army, Navy, and Air Force Offices of the Surgeons General, USAMMDA as the Sponsor's representative, and the FDA are eligible to photocopy and review medical and research records related to this protocol as a part of their responsibility to protect human subjects in clinical research.

No personal data will be used in any external communication or publication.

12.5 Confidential Follow-Up

The Clinical Project Manager is responsible for retaining sufficient information about each subject (i.e., name, home of record, telephone number, social security number, date of birth, and identity in the protocol, dates of participation) so that USAMMDA as the Sponsor's representative, representatives of the Army, Navy, and Air Force Offices of the Surgeons General, and the FDA may access this information if necessary. This information will be captured and retained in the database at USAMRIID dedicated for this protocol. The Clinical Project Manager will maintain protocol records in accordance with GCP and ICH guidelines.

Information on individual subjects needed to support the Volunteer Registry Database will be maintained by the respective services for a minimum of 75 years.

13.0 DATA HANDLING AND RECORDKEEPING

All protocol data will be handled in compliance with ICH Guideline for GCP. Clinical data, if collected during the course of a subject's participation in the protocol, will be entered into the individual's protocol record. All original data entered by each service into its database will be forwarded for integration into a single database.

14.0 FINANCING AND INSURANCE

The Department of Defense is funding this clinical protocol. Should a subject be injured as a direct result of participating in this protocol, he/she will be entitled to medical care at no cost for that injury. Injury compensation is based on the "personnel" status of the volunteer. Military personnel are generally eligible for disability compensation for any injuries or illnesses incurred in the line of duty. Civilian personnel of the U.S. Government and of contractors are generally eligible for disability compensation for injuries or illnesses incurred within the scope of employment. Injury compensation beyond the scope of these disability compensation programs is not available. Injury compensation for volunteers who do not have a personnel status that includes compensation coverage is not available. The subject should understand that this does not constitute a waiver or release of legal rights. This issue is addressed in the ICF and will be discussed with the subject by the Investigator or designee at the vaccination site.

15.0 PUBLICATION POLICY

All data collected during the course of this protocol may be published in the open medical or military literature with the identity of the volunteers protected.

16.0 WAIVER REQUESTS UNDER 21 CFR 312

16.1 21 CFR 312.53 (b) – Control of Drug

A waiver has been requested in a separate letter to the FDA of the requirement for the Sponsor to ship investigational new drugs (anthrax vaccine) only to Investigators participating in the investigation.

The Logistics Annex (Appendix A) includes a system for control of the anthrax vaccine that will allow a retrospective analysis of records (at the termination of the contingency protocol) to track the disposition of all vaccine.

16.2 21 CFR 312.64 (a) and (c) – Investigator Reports

A waiver has been requested in a separate letter to the FDA of the requirement for submission of annual progress reports and a final report from individual Investigators.

The Clinical Project Manager will collect data and submit adequate reports as described in 21 CFR 312.62.

17.0 SIGNATURE OF JTF/SERVICE PRINCIPAL INVESTIGATOR

Contingency Protocol for Vaccination of Volunteers with Anthrax Vaccine Adsorbed (AVA) after Possible Exposure to *Bacillus anthracis* Spores

I have read the foregoing protocol and agree to conduct the protocol as outlined herein in accordance with the ICH Guideline for GCP and applicable FDA, DoD, and U.S. Army regulations.

APPENDIX A

Logistics Annex

APPENDIX A

LOGISTICS ANNEX

1. General. The Focused Distribution Management Branch (FDMB) at the U.S. Army Medical Materiel Agency (USAMMA) will coordinate the distribution of the Anthrax Vaccine to all supporting medical supply activities of all Services or organizations participating in this protocol. All activities must become familiar with the vaccine ordering, shipping, storing, controlling, accounting, and disposition processes discussed in this annex. Additional information is available on the USAMMA AVIP web site at http://www.armymedicine.army.mil/usamma/anthrax/antxhome.htm.

The Anthrax Vaccine to be used under this protocol is considered an investigational new drug. It must be handled using strict procedures meeting rigorous regulatory requirements for logistical tracking. Activities will track the issuing of this vaccine like a controlled substance and must be capable of documenting all issuing of vaccine from the wholesale level down to vaccination sites. Vaccination sites will employ the Services vaccination tracking systems to document administration of Anthrax Vaccine to subjects under this protocol. This annex presents information pertaining to all portions of the logistical tracking process beginning with requisitions and ending with disposition of expired/suspended vaccine.

2. Requisitioning. The FDMB will not accept automated requisitions for Anthrax Vaccine being requested under this protocol. Vaccination centers must submit requests to their supporting logistics activity, which will validate the requirements and submit the formal requisition to their strategic logistics agency, which serves as their Service Anthrax Vaccine Control Center using a DD Form 1348-6 or acceptable alternative. A sample DD Form 1348-6 is attached. Service Anthrax Vaccine Control Centers are as follows: Navy and Marine Corps – Navy Medical Logistics Command (NAVMEDLOGCOM), Air Force – Air Force Medical Logistics Office (AFMLO), Army – U.S. Army Medical Materiel Agency (USAMMA).

a. Vaccination Centers must request vaccine through their supporting medical supply channels. Medical supply officers must prepare the appropriate request for faxing to their Service Anthrax Vaccine Control Center.

b. The following information must be provided on the DD Form 1348-6 or appropriate alternative: NSN – 6505-01-399-6828; Document Number (including requisitioner, date, and serial number); priority – 02; Name of item requested – Anthrax Vaccine for IND, 5.2ml vial; unit of issue – VI; Quantity – enter quantity required. Additionally, provide the following additional information to ensure proper delivery:

1) Requester's name,
2) Requester's telephone number (commercial and DSN if available),
3) Requester's fax number,
4) Person who will be the shipment point of contact (POC),

5) POC telephone number (commercial and DSN if available),
6) POC fax number,
7) POC e-mail (if available),
8) Alternate POC information (identical information as requested for the primary POC), and
9) Shipping address (unit or facility, street address, city, state and zip code). Individuals experiencing difficulties providing this information should contact USAMMA at (301) 619-4121/4128/4411/4318/4198/4320. DSN is 343.

c. Navy & Marine Corps requesters must submit their requisitions to NAVMEDLOGCOM. Air Force requesters must submit their requisitions to AFMLO. Army and non-DoD requesters must submit their requests via fax to USAMMA at (301) 619-4468.

d. USAMMA will contact customers immediately if requests are incomplete or illegible to complete to requisition process.

3. Shipping.

a. The FDMB will contact the receiving units prior to their scheduled shipment. At the time of this call, the FDMB and the receiving unit will discuss all handling requirements for the Anthrax vaccine. The activity should notify all personnel in their receiving area and central receiving mail drop-off area. They should clear all gate or Post requirements. The FDMB advises the activity to track the shipment using the DHL or Federal Express web site (www.DHL.com or www.fedex.com) or by calling 1-800-345-3579 (DHL) or 1-800-463-3339 (Fed Ex). The FDMB also tracks each shipment. The FDMB provides the activity their DHL tracking numbers upon notification from the manufacturer (BioPort Corp). Customers must ensure they have appropriate refrigeration available for storage of the vaccine or the FDMB cannot ship to the site. After calling the activity, the FDMB will fax them a copy of the vaccine receipt matrix and handling instructions. A sample of each is attached. The receiving activity must complete all requirements specified on the receiving matrix.

b. The FDMB will release the vaccine from the manufacturer (BioPort Corp) and have it packaged and shipped directly to the vaccination center requesting the vaccine.

c. Upon receipt of the vaccine, the activity must inspect the package for damage before release from DHL or Federal Express. If the package is damaged, the activity should refuse the shipment and call the FDMB immediately.

d. If the receiving activity has an urgent need to vaccinate its personnel immediately upon receipt of the vaccine, then the following steps must be followed.

1) Upon receipt of the shipment the receiving site must contact the FDMB **before opening the package.**
2) The FDMB staff will explain procedures for conducting a check on the shipment's cold-chain maintenance status, which is recorded by the TempTale temperature-monitoring device, enclosed in each Anthrax vaccine shipment.
3) After completing this procedure the receiving activity must promptly remove the TempTale from the shipping container and follow the steps exactly as described by the FDMB staff (within 5 minutes of opening the shipping container).
4) The response from the TempTale (either Green Light or Red Light) will be relayed back to the FDMB staff person, who will either provide verbal

authorization to release the vaccine for immediate use, or will tell the receiving activity that further inspection is required.

5) The receiving activity will inspect the vaccine, and place it in an approved storage refrigerator.

e. If immediate release of the vaccine is not necessary, activities should remove the vaccine, inspect it, and store as above and then contact the FDMB to acknowledge receipt of the shipment and quantity received, and confirm the express-mail air bill number for the return envelope.

f. The receiving site must express mail return the TempTale monitor to USAMMA using the enclosed pre-addressed, overnight express mail envelope.

g. Upon receipt, USAMMA will download the temperature data from the TempTale. Once validated the vaccine will be released by the FDMB, first telephonically, then with a follow-up faxed confirmation.

h. The receiving site must repack all other contents of the box, attach the pre-addressed shipping label to the box and send it back to BioPort via FedEx/DHL.

i. USAMMA will not provide release of vaccine for administration unless a proper green light release is performed on the TempTale monitor or the monitor is received, downloaded and approved by the USAMMA Pharmacy Consultant.

4. Storing. Like most vaccines, anthrax vaccine must be stored in the refrigerator at 2 to 8 degrees Celsius (36 – 46 degrees Fahrenheit). DO NOT FREEZE. If Anthrax vaccine is exposed to temperatures above or below this level for >1 hour, contact USAMMA at DSN 343-4128/4121/4411/4198/4318/4320 or 301-619-4128/4121/4411/4198/4318/4320 for disposition instructions. Anthrax vaccine is particularly susceptible to freezing temperatures, which rapidly make the vaccine unusable. Anthrax vaccine can tolerate short exposures to other temperatures without degradation. USAMMA provides guidance on unusual storage conditions or distribution emergencies.

5. Emergency Storage.

a. During situations when normal refrigeration systems break down, every effort must be taken to minimize loss of vaccine due to breaks in the cold-chain.

b. In the case of power failure or breakdown of proper storage facilities, the FDMB will assist in establishing alternative emergency storage plans. The FDMB has several Vaxicools, approved temporary storage refrigeration units, located around the world. These Vaxicools can be utilized until existing storage facilities are returned to proper operating order or replaced. When a power failure or loss of storage is discovered, the FDMB must be notified immediately. FDMB personnel will assist with risk assessment, recommend actions to be taken, and assist with redistribution of vaccine or delivery of a Vaxicool to temporarily store the vaccine. Service POCs should be

contacted shortly after the initial contact with the FDMB to inform them of the situation.

Redistribution. Guidance for redistribution can be obtained from www.armymedicine.army.mil/usamma. The Focused Distribution Management Branch (FDMB) must be contacted prior to redistribution of the Anthrax vaccine. FDMB personnel must ensure maintenance of cold-chain throughout redistribution and will provide release authorization when redistribution is completed. The effective movement of the vaccine requires constant maintenance of the appropriate storage temperature. To ensure this requirement, the vaccine will be moved in a refrigerated container. Information on these containers can be obtained from the above mentioned web site.

a. The FDMB will provide the losing activity detailed packing instructions for the VaxiCool® or VaxiPac® container; gaining activities will be provided receiving and processing matrix for the transported vaccine.

b. An empty VaxiCool® or VaxiPac® container with shipping labels and a serial numbered security band will be sent to the losing activity. If the container is damaged, refuse receipt and notify FDMB immediately with details of refusal.

c. If the container is in satisfactory condition, receive and process documents and pack vaccine in accordance with information provided.

d. With the provided pre-addressed, overnight express-mail label, send the VaxiCool® or VaxiPac® to the gaining unit. Call FDMB to confirm overnight express-mail label account number, airbill and security band serial number for the shipment.

e. Upon receipt of the vaccine, the gaining activity will immediately inspect the VaxiCool® or VaxiPac®, security band for serial number accuracy and contents for damage. If the container or contents are damaged, refuse shipment and notify the FDMB immediately with details. If container is in satisfactory condition, receive and immediately secure vaccine in the required refrigerated storage environment (2° to 8° Celsius or 36° to 46° Fahrenheit). **DO NOT FREEZE.** Call FDMB to confirm receipt.

f. Process documents and vaccine in accordance with the information provided. **Request commercial carrier to wait for the VaxiCool® or VaxiPac®.** Ship container back to FDMB, USAMMA using the provided pre-addressed, overnight, express-mail label. Call FDMB, USAMMA, to confirm overnight express-mail label account number and air bill serial number for the VaxiCool®.

g. Establish stock record accountability of vaccine IAW Service regulations.

h. **DO NOT RELEASE THE VACCINE TO END-USER UNTIL AUTHORIZED BY THE FDMB.**

7. Control and Accountability. Because this product is not FDA-approved it must be handled in accordance with the control and accountability procedures of an investigational pharmaceutical.

   a. Logistics activities must maintain readily retrievable records showing receipts and issues to supported activities/clinics/vaccination sites. This information must include the lot number and expiration date of the vials received or issued. Logistics sites not possessing an automated method that can readily retrieve reports of this information should implement manual procedures as would be used for controlled substances.

   b. Immunization sites must also maintain readily retrievable records showing receipts from their supporting logistics activities, including lot number and expiration date, and local administration records showing consumption of the vaccine they have received (i.e., number of doses administered). Individual dosage administration will be recorded in the Service-specific AVIP systems in operation at the vaccination sites. Vaccination sites not possessing an automated method that can readily retrieve reports on the receipt and gross usage of vaccine should implement manual procedures as would be used for controlled substances.

   c. The FDMB and all other activities receiving anthrax vaccine must provide hard copy supply status reports to USAMMDA on a monthly basis. These data will include the information discussed above (receipts, issues and immunization documentation) as well as an updated, validated inventory and will be gathered with a closing date of the last day of each month. Activities will forward/fax these data to USAMMDA for inclusion in the protocol case files NLT the 7th of each month. The USAMMDA fax number is (301) 619-2304 (DSN – 343).

8. Disposal. Activities have responsibility for disposal and destruction of unusable vaccine. The FDMB must be contacted prior to destruction of any vaccine issued under this protocol. Activities will report on-hand vaccine inventories to be destroyed to their respective logistic agencies. The report will include information regarding lot numbers and quantities. The Anthrax vaccine is considered non-hazardous waste. DO NOT DISCHARGE THIS ITEM INTO A SANITARY SEWER.

   a. The disposal code for item 6505-01-399-6828 (Anthrax Vaccine Adsorbed) is CA01 (provided by U.S. Army Center for Health Promotion and Preventive Medicine, Aberdeen Proving Ground, MD).

   b. Methods for disposal are as follows:

      1. AUTOCLAVE/SANITARY LANDFILL. Autoclave this item at 120 degrees Celsius for 60 minutes at 15 psi prior to burial in a permitted sanitary landfill.

      2. INCINERATION. Mix this disposal item and incinerate. To prevent the production of excessive air pollutants, the disposal item or combination of similar

items shall not exceed 10 percent by weight of the total waste load charged to the incinerator at any one time.

3. CONTRACTOR. In accordance with local policy and procedures for contractor-designated medical waste disposal. The activity will prepare a certificate of destruction to document disposal actions before handoff to a local contractor for final disposition.

4. The following procedures are in place in the event the aforementioned disposal methods are not available or immediate disposal is necessary:

    (a) Contact the FDMB and provide information regarding lot numbers and quantities. The FDMB will provide a pre-addressed, overnight, express-mail container with packing procedures.
    (b) Remove each vial from its package.
    (c) Tear or shred the insert and package and dispose of as regular waste.
    (d) Deface the label on each vial with red permanent marker.
    (e) The activity will pack the container according to instructions provided and mail the container to FDMB.
    (f) The activity will call FDMB, USAMMA, to confirm overnight express-mail account number and air bill serial number for the container.

c. Activities will prepare a certificate of destruction to document disposal actions and fax a copy to the FDMB and to USAMMDA within 24 hours after final disposition. Activities must also prepare an executive summary that documents the circumstances surrounding the wasting of the vaccine and what actions have been taken to prevent loss of vaccine in the future.

d. Those charged with the disposal and destruction should address all questions or concerns to USAMMA Pharmacy Consultant.

Anthrax Vaccine Receiving and Processing Matrix for Receiving Official

1. **PURPOSE:** To give detailed instructions on the receiving and processing of the Anthrax Vaccine.
2. **GENERAL INFORMATION:** The Secretary of Defense has assigned the Army as the Executive Agent for the Anthrax Immunization Program. The Surgeon General of the Army is responsible for command and control of this program. The delegated receiving Official or Authorized Alternate is responsible for the receipt, processing, storage, security, and subsequent release to the end-user of this vaccine. This matrix details the necessary receiving and handling instructions to be followed by each Receiving Official or Authorized Alternate. This vaccine must be handled as a critical medical materiel item requiring the utmost control. **Due to the sensitivity of this vaccine, the Receiving Official or Authorized Alternate may be held pecuniarily liable for any damage or spoilage caused by negligence.**

STEP	CRITICAL EVENT
1	Receiving Official contacted prior to shipment from their Medical Logistics Agency (USAMMA/ AFMLO/NAVMEDLOGCOM) to verify ship-to address and convey any special preliminary receipt instruction to the Focused Distribution Management Branch (FDMB).
2	Receiving Official faxed a copy of this matrix and handling instructions a day prior to shipment.
3	FDMB calls Receiving Official or Authorized Alternate prior to shipment and verifies: 1. Address and any other alternate receiving officials 2. Receipt time of vaccine (1000-1200 the next day). 3. Expected time of phone call (1500-1630 day of shipment) from FDMB w/FedEx/DHL tracking/airbill#. 4. They have been contacted by their Medical Logistics Agency (AFMLO/NAVMEDLOGCOM/USAMMA) to confirm vaccine delivery.
4	FDMB provides the Receiving Official a brief on the details and potential risk associated with receipt of this shipment: 1. All personnel in receiving area are aware of the incoming vaccine shipment and a policy is put in to place to contact the Receiving Official or Authorized Alternate immediately for signature. 2. Clear all facilities (Post/Camp/Clinic) security requirements (gate guards notified). 3. Notify central receiving mail drop off locations of incoming vaccine shipment from FedEx/DHL. 4. Verify that proper refrigeration is available in the receiving area with constant temperature monitoring capability and proper backup if necessary. 5. Start tracking and call FedEx or DHL by 0800 the next day (www.DHL.com and/or 1-800-345-3579 or www.fedex.com and/or 1-800-463-3339). 6. Contact FDMB if delivery is not made by 1200.
5	Upon Receipt of the vaccine, the Receiving Official or Authorized Alternate will: 1. Call FDMB to confirm receipt. 2. Check for damage (If damaged then refuse shipment contact FDMB). 3. Remove handling instruction information paper, FedEx/DHL envelope (for TempTale return to USAMMA), and FedEx/DHL label (addressed to BioPort for box return) from the box. Request FedEx/DHL carrier wait for TempTale. 4. Put TempTale in the FedEx/DHL envelope and hand back to FedEx/DHL carrier. Send via Priority Overnight. 5. Immediately secure vaccine in the required refrigerated storage environment (2 to 8° Celsius, which is equivalent to 36 to 46° Fahrenheit). DO NOT FREEZE. 6. Provide FDMB with TempTale FedEx/DHL tracking/airbill #. 7. Enclose all packaging contents in shipping box and put FedEx/DHL label on box (for return to BioPort). Call FedEx/DHL for pickup. Send via Priority Overnight **8. Assure stock record accountability for the vaccine is established IAW Service regulations.** **9. DO NOT RELEASE THE VACCINE TO END-USER UNTIL AUTHORIZED BY THE FDMB.**
6	FDMB will upon receipt and examination of the TempTale: 1. Phone Receiving Official or Authorized Alternate with results. 2. Fax Anthrax Document Release Form to Receiving Official.
7	Receiving Official will close shipment with their Medical Logistics Agency.

HANDLING INSTRUCTIONS OF ANTHRAX VACCINE SHIPMENT INFORMATION PAPER

1. **PURPOSE:** To give detailed instructions on the receiving and processing of the Anthrax Vaccine.

2. **GENERAL INFORMATION:** The Secretary of Defense has assigned the Army as the Executive Agent for the Anthrax Immunization Program. The Surgeon General of the Army is responsible for command and control of this program. This paper details the necessary receiving and handling instructions to be followed by each activity. This vaccine must be handled as a critical medical materiel item requiring the utmost control.

3. **ANTHRAX VACCINE INFORMATION:** The vaccine must be refrigerated and maintained at temperatures between 2 to 8 degrees Centigrade (36 to 46 degrees Fahrenheit). DO NOT FREEZE. The refrigerator must be monitored electronically or manually and recorded on a routine basis. The stock number for this vaccine is 6505-01-399-6828.

4. **SHIPPING INFORMATION:** All shipments will originate from Bio Port, in Lansing, MI. The carrier will be DHL or FedEx. Shipment tracking information for DHL is available via the Internet at www.DHL.com or 1-800-225-5345 and for Federal Express at www.fedex.com or 1-800-463-3339. USAMMA will notify each receiving activity with the shipment tracking number (air bill number).

5. **RECEIPT INFORMATION:** Upon receipt of the package:
   1. Inspect the package and contents for damage.
      a. If contents are damaged, refuse receipt and notify USAMMA immediately with details of refusal.
      b. If contents are in satisfactory condition, receive and process documents in accordance with local procedures.
      c. Open shipping container and remove the digital temperature control monitor (TempTale©) included in every container. Place vaccine in Refrigerator.
      d. In the provided pre-addressed, DHL envelope, send the monitor back to USAMMA using Priority Overnight. **Return the provided envelope Priority Overnight before COB the day of receipt.**
      e. Call USAMMA to confirm receipt of vaccine and provide the priority overnight airbill number for the TempTale.

   2. **DO NOT RELEASE VACCINE TO END-USER UNTIL AUTHORIZED BY USAMMA.** (Release authorization will be electronically transmitted to the receiving activity once the temperature control monitors are received, downloaded and approved by USAMMA staff pharmacist.)

6. **SECURING SHIPMENT:**
   1. **DO NOT FREEZE!** Vaccines must be refrigerated at temperatures between 2 to 8 degrees Celsius (36-46 degrees Fahrenheit).
      a. **The receiving activity will not release the vaccines from refrigerated storage until they receive authorization from USAMMA.**

7. **POINTS OF CONTACT:** Mr. Dave Orgler, Mrs. Bonnie Pereschuk, Mrs. Kandi Barnhart, Mrs. Toscha Stanley, Mrs. Jackie Graff and Mrs. Kitty Reese. ANTIBIOTIC LOGISTICS FOR THE ANTHRAX VACCINE CONTINGENCY PROTOCOL

The antibiotics employed in this protocol are considered concomitant medications. The Services will manage the supply and distribution of these antibiotics within the normal medical supply channels in the same manner as all other pharmaceuticals. These agents are incorporated as part of the Army Division-Ready Brigade Sets, which are designed to support 5,000 troops each and are included in Army Prepositioned Stocks. The other Services have similar Prepositioned stocks of materiel to support rapid deployment to multiple theaters of operation.

Ciprofloxacin is approved to reduce the incidence or progression of inhalational anthrax following exposure to aerosolized *B. Anthracis* spores, whereas doxycycline and penicillin are approved for treatment of anthrax disease but not for post-exposure prophylaxis. As such they are not considered investigational agents under this protocol. These antibiotics are also indicated for many other diseases and as such are not solely designated as Medical Biological Defense Materiel. These agents will be managed within normal medical logistics channels down to the Division (Division Medical Supply Office) level, and then further issued to line as well as medical units for eventual issue/prescribing at the battalion/company level. These products are purchased in several package sizes and configurations; therefore, repackaging for individual issue, including appropriate labeling for individual issue, must be completed at the unit level.

When employed under this protocol, the antibiotic issued to an individual will be documented on the informed consent form. Prescriptions will contain appropriate labeling to ensure directions for use are clearly conveyed to the individual, with emphasis placed on continuing therapy until directed to stop by medical authorities, and to seek medical care should adverse reactions occur. The gathering of safety information concerning the combination of vaccine and antibiotics is a key component of this protocol; therefore, troops must be vigilant in their detection and reporting of adverse events.

Quality Control and Assurance

APPENDIX G
QUALITY CONTROL AND ASSURANCE

1. GENERAL

The Quality Assurance Division, U.S. Army Medical Materiel Development Activity (USAMMDA) will provide retrospective monitoring for the anthrax vaccine contingency protocol. No prospective monitoring is planned. The protocol will be monitored for GCP compliance, verifying adherence to the protocol and the completeness and exactness of data entry at the conclusion of each contingency. The monitor will review the protocol files, volunteer consent forms, service-specific databases (case report forms), original source documents, and logistical records upon arrival at USAMRIID, the permanent record site. Upon completion of each review, the monitor will brief the Clinical Project Manager of findings and issues in need of resolution. A written report of the findings and recommendations will be circulated and provided to USAMMDA, the Sponsor's Representative.

2. SUBJECT DOCUMENT FILE REVIEW PLAN

USAMMDA's Quality Assurance Division personnel will monitor the protocol records at Fort Detrick, Maryland. The records will be reviewed at the completion of the protocol for each contingency, with each monitor reviewing no more than 50 records per day.

3. QUALITY ASSURANCE MONITOR

USAMMDA's Quality Assurance Division will monitor items listed on the Quality Assurance Office Anthrax Contingency Protocol, see Attachment I.

APPENDIX H

Anthrax Vaccine Information Paper
Antibiotic Information Paper

ANTHRAX VACCINE INFORMATION PAPER

Background on Anthrax

Anthrax has been recognized as an illness for centuries. The spores that cause anthrax can survive in soil for decades. The disease used to be common where livestock grazed. Animal anthrax is controlled with a vaccine for cattle and other animals. Natural human infection usually results from people touching infected animals or animal by-products. In addition, rarely, there are occupational cases of inhalational anthrax due to the inhalation of aerosolized anthrax spores. Inhalational anthrax is the most lethal form of anthrax, because it is difficult to diagnose and because it progresses so rapidly.

Threat

Anthrax spores are a known biological weapon. In fact, anthrax tops the Department of Defense (DoD) biological threat list. An aerosol of anthrax is odorless, colorless, tasteless, and difficult to detect. It is easy and cheap to produce. Anthrax spores can be stored for a long time and can be dispersed by a variety of weapons. Small amounts of anthrax can produce large numbers of casualties among unprotected people. For example, the accidental aerosolized release of anthrax spores from a military microbiology facility in the former Soviet Union in 1979 resulted in at least 79 cases of anthrax infection and 68 human deaths.

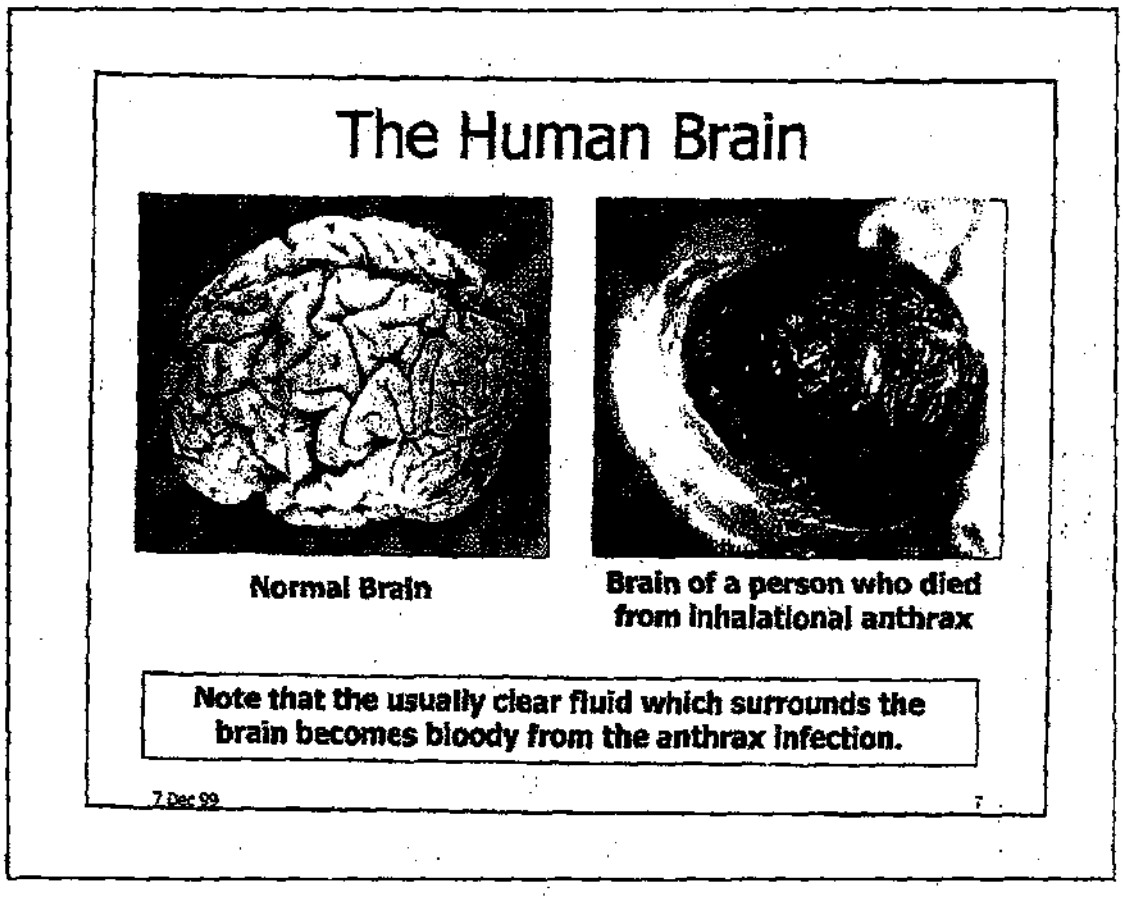
Inhalational Anthrax

Inhalational anthrax occurs when anthrax spores enter the body through the lungs. Spores go to the lymph system where bacteria multiply and produce deadly toxins. The toxins cause bleeding and destruction of the brain or vital organs in the chest. Most people die as a result. Figure 1 compares a normal brain with a brain of a person who died from inhalational anthrax. The initial symptoms of inhalational anthrax include sore throat, mild fever, and muscle aches. Symptoms can rapidly progress to severe difficulty breathing and shock. After symptoms appear, about 80% of people with inhalational anthrax die, even if they get treated with antibiotics. Inhalational anthrax does not spread from person to person.

Anthrax Vaccine

The anthrax vaccine (Anthrax Vaccine Adsorbed) is manufactured by BioPort Corporation, Lansing, Michigan. It has been licensed for preexposure prophylaxis by the U.S. Food and Drug Administration since 1970. The vaccine is a sterile product made from bacteria (*Bacillus anthracis)* that are avirulent (cannot cause disease themselves). It contains no whole bacteria, neither live nor dead, so it is impossible to contract the disease from the anthrax vaccine. The vaccine contains protective antigen (PA), which is the common disease-causing protein in all anthrax strains that cause disease, so the vaccine is expected to provide protection against all strains. The vaccine is deposited on the surface of a chemical called aluminum hydroxide to increase the number of antibodies that the body makes in response to vaccination. Benzethonium chloride and formaldehyde are added as preservatives.

The anthrax vaccine to be used in the contingency protocol is classified as an Investigational New Drug (IND) because (1) administration after exposure to anthrax spores has not been approved by the FDA, (2) some of the dosing schedules include vaccinations at times that are outside the schedule approved by the FDA, and (3) some unreleased lots of the vaccine may be used with this protocol. The FDA will have reviewed the safety and potency of and accepted any unreleased lots used in this protocol.



The standard dosing schedule of anthrax vaccine involves three doses at 2-week intervals, followed by three more doses given at 5- to 6-month intervals, plus annual boosters. Subjects participating in the contingency protocol will be given the number of doses sufficient for post-prophylaxis treatment rather than the complete series of vaccinations needed for protection. As few as two doses produce a rapid increase in the number of protective anti-anthrax antibodies in the bloodstream. Three doses of vaccine given 2 weeks apart should provide antibodies in the shortest period of time. Antibiotics protect against anthrax in the short term, whereas vaccination provides more durable protection.

Efficacy of the Anthrax Vaccine

The potential effectiveness of the anthrax vaccine for treatment after aerosolized exposure to anthrax spores is based on human and animal research. The only clinical study to evaluate

protection of a vaccine containing protective antigen was conducted from 1955 to 1959 in goat hair workers at risk for anthrax. People who were fully vaccinated developed anthrax disease 92.5% less often than those not vaccinated. An outbreak of inhalational anthrax occurred at one mill during the study. Five cases of inhalational anthrax occurred among 448 unvaccinated workers at that mill (combining both placebo recipients and the unvaccinated observation group), compared to no cases among 149 fully vaccinated workers at that mill. Despite the trend toward efficacy, the number of cases of inhalational anthrax was too low for the difference between the vaccinated and unvaccinated groups to be conclusive statistically.

The anthrax vaccine provided more than 95% protection in rhesus monkeys against inhaled anthrax spores. In five studies of rhesus monkeys given either one or two doses of anthrax vaccine, 62 of 65 vaccinated animals (95%) survived a lethal aerosol challenge with hundreds of times the median fatal dose. In the various studies in monkeys, 18 unvaccinated animals were challenged, but none survived.

Safety of Anthrax Vaccine

Several studies have shown that anthrax vaccine is safe, with an incidence of side effects after injection similar to that of other common vaccines. As with any medication, all vaccines will occasionally cause adverse reactions. Usually these are mild, like a sore arm or "flu"-like symptoms. No deaths have been caused by anthrax vaccination.

Based on data obtained during 30 years of experience with anthrax vaccine, it is expected that up to 30% of men and 60% of women receiving the vaccine will experience some mild adverse effects at the *injection site*, for example:

- A sharp, stinging or burning sensation immediately upon injection is common, usually lasting less than 1 minute
- Redness, itching, swelling (lasting a few days):
  - Less than 1 inch: men up to 30%, women up to 60%
  - 1 to 5 inches: 1% to 5%
  - Greater than 5 inches: up to 1%; in these cases, swelling may extend below the elbow
- Soreness, tenderness, or local pain in 8% to 19%
- Lump: 30% to 90% (may persist a few weeks)
- Women tend to have higher rates of local reactions than men
- For both men and women, most injection-site reactions last 1 to 3 days and go away on their own.
- The frequency of tenderness, lumps, and redness tends to decrease as the frequency of injections (up to three) increase, whereas itching and swelling tend to increase.

These rates of adverse reactions are similar to those for other vaccines, including the generally mandatory childhood vaccines, DTP (diphtheria-tetanus-pertussis), MMR (measles-mumps-rubella), and other vaccines, such as hepatitis A and yellow fever, administered to military personnel.

The following *systemic events* (reactions away from the injection site) have been reported:

- From 5% to 35% will notice:
  - Muscle aches, joint aches, chills, low-grade fever, no appetite, headaches, nausea, malaise, related symptoms
  - These symptoms usually go away in a few days, less than a week
- Serious allergic reactions occur (less than 1 per 100,000 doses)
- Reactions requiring hospitalization occur less than once per 100,000 doses.

In a study conducted in Hawaii, the number of subjects experiencing systemic reactions declined from about 8% after the first dose, to 5% after the second dose, and 3% after the third and fourth doses. These systemic reactions are similar to those experienced by recipients of other vaccines, such as the hepatitis A vaccine (pain in 22% to 51%, headache in 15%) and the typhoid Vi vaccine (pain in 27% to 56%, malaise in 4% to 37%, fever in 2% to 11%, and headache in 11% to 27%).

As for long-term effects, nearly 1,600 laboratory workers at Fort Detrick, Maryland, have received approximately 10,500 doses of anthrax vaccine since the early 1970s. A number of individuals have received over 20 doses of anthrax vaccine. None developed unexplained symptoms due to repeated doses of this or other vaccines they received. No patterns of delayed side effects to anthrax vaccine have been found.

As of January 2001, about 2 million doses of anthrax vaccine had been administered to about 500,000 service members.

The Department of Defense uses the FDA's Vaccine Adverse Event Reporting System (VAERS) to report events potentially related to any vaccination. The Anthrax Vaccine Expert Committee, (AVEC), a panel of civilian academic medical experts, reviews all VAERS reports related to anthrax vaccine. As of October 2000, AVEC had reviewed 1,203 VAERS-1 reports. Of these, 48 involved hospitalization, 10 of which were certainly or probably caused by anthrax vaccine. All 10 involved allergic, inflammatory reactions at the injection site. Another 172 involved loss of duty for more than 24 hours, and the remaining 983 were categorized as other than serious, involving neither hospitalization nor loss of duty of more than 24 hours.

Use of Vaccine as Part of Post-Exposure Treatment

The use of anthrax vaccine after a person is exposed to anthrax spores is not specifically identified in the product labeling approved by the FDA. This means that the FDA has not evaluated the safety and efficacy of anthrax vaccine for the prevention of anthrax disease when used after exposure to anthrax spores. However, because the objective of producing anthrax antibodies in the blood stream is the same both before and after exposure, the Advisory Committee on Immunization Practices of the Center for Disease Control and Prevention recommends a combination of antibiotic therapy and vaccination according to a standard schedule (0, 2, and 4 weeks). The Committee's recommendation is based on studies in monkeys that have shown antibiotics in combination with post-exposure vaccination to be effective in preventing disease after exposure to anthrax spores. In one study, groups of monkeys received

(a) one of three antibiotics, (b) vaccine alone, or (c) an antibiotic and anthrax vaccine. Antibiotics were given for 30 days, and the anthrax vaccine was injected on days 1 and 15 of the antibiotic schedule. Two important points: first, in each group where an antibiotic alone was given (without vaccine), once the antibiotic was stopped, some animals died from inhalational anthrax as far out as 28 days after stopping the antibiotic (58 days after the exposure). Secondly, none of the monkeys given antiobiotics alone developed antibodies to anthrax although antibiotics did prevent infection from fully developing. Only the vaccinated monkeys survived exposure to anthrax spores after the antibiotics were stopped. When exposed to anthrax spores a second time, only animals that were vaccinated and had antibodies to anthrax survived. Because the duration of protection from vaccination is not known, persons at risk may require additional vaccinations should subsequent exposures occur. The side effects associated with using the anthrax vaccine after exposure should be the same as those associated with pre-exposure administration. In the monkey studies, adverse reactions with the antibiotic-vaccine treatment did not differ from those that occurred when either was administered alone.

Conclusion

Anthrax is a deadly biological weapon. For 30 years, the anthrax vaccine has been used to prevent this extremely lethal disease. The number of vaccinations given to date exceeds 2 million doses, with few serious adverse events. The reports of adverse events are consistent with expectations based on previous research studies and in line with experiences with commonly used vaccines. The risks of using anthrax vaccine in combination with antibiotics should not differ from the risks of receiving the antibiotic and the vaccine alone. Efficacy of the post-exposure antibiotic-vaccine regimen has been shown to result in long-term survival in studies conducted in rhesus monkeys.

You may obtain additional information about the anthrax vaccine from your health care provider or the AVIP web site: http://www.anthrax.osd.mil

Individuals who decide not to participate in or to withdraw from the anthrax vaccine contingency protocol are advised to complete the antibiotic prescribed to prevent *B. anthracis* spores from emerging and causing potentially lethal disease.

ANTIBIOTIC INFORMATION PAPER
for
ANTHRAX VACCINE CONTINGENCY PROTOCOL

The antibiotics ciprofloxacin, doxycycline, or penicillin are the drugs of choice for the treatment of anthrax, including inhalational anthrax, which is the most lethal form of the disease. Treatment needs to begin before symptoms appear. Use of the antibiotics can keep individuals alive until their bodies can build a long-lasting immunity to anthrax via vaccination. After symptoms appear, however, inhalational anthrax is almost always fatal, regardless of treatment. Because taking an antibiotic could be the difference between life and death, each dose must be taken as ordered for 60 days unless otherwise instructed by a health care provider.

CIPROFLOXACIN

Ciprofloxacin (CIPRO®) is approved by the Food and Drug Administration (FDA) to treat and protect individuals who become exposed to *Bacillus anthracis* spores administered as an aerosol. The recommended treatment after exposure to inhalational anthrax is 500 mg given orally every 12 hours for 60 days. The antibiotic should not be given to anyone who has had a serious allergic reaction to ciprofloxacin or other antibiotics in the quinolone family.

How to take CIPRO: Take CIPRO with food (excluding milk or yogurt) and at least one large glass of water. The antibiotic works best when the amount of medicine in your body is kept at a constant level, so take 1 tablet every 12 hours for 60 days. If you take any of the following—zinc, iron, sucralfate, Videx® (didanosine), and antacids that contain magnesium, calcium, or aluminum—take them 6 hours before or 2 hours after taking CIPRO.

Side effects: CIPRO may cause stomach upset, loss of appetite, diarrhea, nausea, drowsiness, or headache during the first few days as your body adjusts to the medication. If these symptoms persist or become severe, inform your health care provider. Promptly report new pain or tenderness (tendonitis) in arms or legs. Also report any vision changes, restlessness, ringing in the ears, or mental changes. In the unlikely event that you have an allergic reaction to this antibiotic, seek immediate medical attention. Symptoms of an allergic reaction include rash, itching, swelling, fever, or trouble breathing. If you notice any other effects, contact your health care provider promptly.

Precautions: Before taking CIPRO, tell your health care provider if you have a medical history of epilepsy, kidney disease, tendon problems, nervous system disorders, liver disease, blood vessel problems, and any drug allergies. Use caution driving or performing tasks requiring alertness if this medication makes you dizzy or lightheaded. Alcohol can make the condition worse. CIPRO can increase sensitivity to sunlight, so avoid prolonged sun exposure. Wear protective clothing and a sunscreen to minimize sun sensitivity. This medication may be taken during pregnancy.

Drug Interactions: Tell your health care provider of all medications that you are using (both prescription and nonprescription), especially of other antibiotics, theophylline, warfarin, cyclosporine, live bacterial vaccines, probenecid, sucralfate, quinapril, didanosine, iron, zinc, and antacids that contain magnesium, aluminum, or calcium.

Caution: CIPRO may increase or extend the effects of caffeine and theophylline.

DOXYCYCLINE

Doxycycline is approved by the FDA to treat anthrax. The recommended treatment is 100 mg given orally every 12 hours for 60 days. The antibiotic should not be given to anyone who has had a serious allergic reaction to any tetracycline product.

How to Take Doxycycline: Take doxycycline with food and at least one glass of water. The antibiotic works best when the amount of medicine in your body is kept at a constant level, so take 1 tablet every 12 hours. Do not lie down for at least 1 hour after taking this drug. Avoid taking antacids containing magnesium, aluminum, or calcium; sucralfate; iron preparations; or vitamin (zinc) products within 3 hours of taking this antibiotic.

Side Effects: Doxycycline may cause nausea or diarrhea. In the unlikely event that you have an allergic reaction to this antibiotic, seek immediate medical attention. Although the occurrence is unlikely, dark urine, yellowing of the eyes or skin, persistent sore throat or fever, unusual bleeding or bruising, unusual fatigue, white patches in the mouth, or unusual vaginal discharge/itching should be reported immediately to your health care provider. Use of tetracycline during the last half of pregnancy may cause permanent discoloration of the teeth of offspring. If you have an allergic reaction to this antibiotic, seek immediate medical attention. Symptoms of an allergic reaction include rash, itching, swelling, fever, or trouble breathing. If you notice any other effects, contact your health care provider.

Precautions: Before taking doxycycline, tell your health care provider if you have a medical history of yeast infections of the mouth, kidney or liver problems, esophagus problems or trouble swallowing (hiatal hernia or reflux/heartburn), and any drug allergies. Use of this antibiotic for prolonged periods may result in an infection (e.g., oral, bladder, or vaginal yeast infection). Doxycycline can increase sensitivity to sunlight, so avoid prolonged sun exposure. Wear protective clothing and a sunscreen to minimize sun sensitivity.

Drug Interactions: Tell your health care provider of all medications that you are using (both prescription and nonprescription), especially antibiotics (penicillins/cephalosporins such as cefuroxime), antacids, vitamins/minerals (such as zinc), iron supplements, bismuth subsalicylate, sucralfate, carbamazepine, phenytoin, barbiturates like phenobarbital, blood thinners like warfarin, or methoxyflurane. Use of doxycycline may make birth control pills less effective.

PENICILLIN V POTASSIUM

Penicillin V Potassium (Pen VK) is approved by the FDA to treat anthrax. The recommended treatment is 500 mg given orally every 6 hours for 60 days. The antibiotic should not be given to anyone who has had a serious allergic reaction to any penicillin.

How to Take Pen VK: Take Pen VK on an empty stomach (1 hour before or 3 hours after meals) with at least one glass of water. The antibiotic works best when the amount of medicine in your body is kept at a constant level, so take 1 tablet every 6 hours.

Side Effects: Pen VK may cause stomach upset, diarrhea, nausea, and vomiting during the first few days as your body adjusts to the medication. If these symptoms persist or become severe, inform your health care provider. If you have an allergic reaction to this antibiotic, see immediate medical attention. Symptoms of an allergic reaction include rash, itching, hives, fever, or trouble breathing. If you notice any other effects, contact your health care provider.

Precautions: Before taking Pen VK, tell your health care provider if you have asthma, any other illnesses or any allergies, especially to penicillin or other antibiotics. Use of this antibiotic for prolonged periods may result in an infection (e.g., oral, bladder, or vaginal yeast infection). Use of penicillin may make birth control pills less effective.

Drug Interactions: Tell your health care provider of all medications that you are using (both prescription and nonprescription), especially tetracycline products. Use of penicillin may make birth control pills less effective.

Do NOT stop these antibiotics without the approval of your health care provider.

APPENDIX I

Informed Consent Form

INFORMED CONSENT FORM

Contingency Protocol for Vaccination of Volunteers with Anthrax Vaccine Adsorbed (AVA) to Protect against *Bacillus anthracis* Spores

A. Basis for Participation

You are being asked to provide your consent to an investigational treatment for your exposure to anthrax spores. According to current recommendations from the Centers for Disease Control and Prevention (CDC), the best treatment after exposure to anthrax is a combination of an antibiotic and anthrax vaccine. The Food and Drug Administration (FDA) has licensed Anthrax Vaccine Adsorbed (AVA) to be given to people before they face potential exposure to *Bacillus anthracis* spores (the cause of anthrax disease). However, FDA has not licensed the vaccine for post-exposure treatment or for use in combination with antibiotics. Such use is, therefore, considered investigational and requires your consent to receive the anthrax vaccine.

The basis for recommending antibiotic and vaccine together comes from strictly controlled studies in monkeys, not from studies in humans. Because human exposure to anthrax spores cannot be controlled, the survival of people receiving the antibiotic and vaccine together may not be the same as in the animal studies. The studies in monkeys showed antibiotics in combination with post-exposure vaccination to be effective in preventing anthrax disease. After exposure to anthrax spores, monkeys given antibiotics alone were only protected from disease during treatment (some animals died after stopping the antibiotic), whereas monkeys given antibiotics and vaccine survived after they stopped receiving antibiotics. This means that these animals developed immunity against anthrax and continued to be protected even after stopping the antibiotic.

The anthrax vaccine to be used in this study is classified as an Investigational New Drug (IND) because (1) administration after exposure to anthrax spores has not been approved by the FDA, (2) some of the dosing schedules include vaccinations at times that are outside the schedule approved by the FDA, and (3) some unreleased lots of the vaccine may be used with this protocol.

You are being asked to volunteer to be vaccinated with doses of AVA that the FDA has not released. These doses will be replaced with FDA licensed and released doses of anthrax vaccine as soon as they become available. All antibiotics to be used in this protocol have been approved by the FDA: ciprofloxacin for treatment and prevention of anthrax after exposure to aerosolized anthrax spores and doxycycline and penicillin V potassium for treatment of anthrax.

You have been given information papers on the anthrax vaccine and the three antibiotics that may be used in this protocol. If you have questions about anything in them, ask your health care provider for an explanation. This Informed Consent Form (ICF) explains the purpose of the protocol, the procedures involved, information on the potential benefits and risks, and alternatives to participation. Your rights as a participant in this protocol are outlined. Please read this document thoroughly and ask any questions that may occur to you relating to your participation. Your signature on this document indicates that you agree to participate in the protocol.

It is essential that you understand that:

- Taking part in this protocol is entirely voluntary.
- Refusal to participate will involve no penalty or loss of any benefits to which you are otherwise entitled.
- You may withdraw from the protocol at any time without penalty or loss of benefits to which you are otherwise entitled.

If you decide to withdraw from the protocol, you will be encouraged to complete the antibiotic prescribed for treatment of exposure to *B. anthracis* spores.

B. Principal Investigator/Investigator

_____
(Name, Title, Location)

Note: This section must be filled in before you sign this form.

C. Purpose of the Study

- To provide anthrax vaccine to volunteers who are receiving antibiotics for the early treatment of exposure to *B. anthracis* spores.
- To collect data on all adverse events, including local and systemic reactions to the vaccine and clinical cases of anthrax in the study population after administration of the vaccine.

D. Anthrax Vaccine

The vaccine to be used in this study (described in the Anthrax Vaccine Information Paper) was manufactured by BioPort Corporation, Lansing, Michigan. The schedule for giving the vaccine under this protocol is the same as the schedule for the licensed vaccine. AVA has been licensed by the FDA since 1970 to be given to people before they face potential exposure to anthrax spores. In this protocol, the vaccine is considered to be investigational because (1) it is being given after potential exposure to anthrax spores and along with an antibiotic, (2) the dosing schedule has been modified, and (3) unreleased lots of vaccine may be used. The FDA will have reviewed the safety and potency of and accepted any unreleased lots used in the protocol.

E. Alternatives to Receiving Anthrax Vaccine

Protective clothing and gas masks can provide excellent frontline defense, but their effective use requires rapid and early detection of the anthrax spores. Clothing and masks do not protect the body from spores that have been inhaled. Current detection devices are not sufficient to completely protect against the threat.

Ciprofloxacin, doxycycline, or penicillin V potassium, if taken as prescribed, can be effective if exposure to anthrax spores is detected. The CDC recommends post-exposure prophylaxis after aerosol exposure to anthrax spores. This may consist of antibiotic therapy alone or a combination of antibiotic therapy and vaccination. This recommendation is based on an extensive review of studies conducted in monkeys, and professional opinion. The recommended antibiotics include ciprofloxacin, doxycycline, and penicillin V potassium. FDA has approved ciprofloxacin to reduce the incidence or progression of inhalational anthrax following aerosol exposure to anthrax spores. FDA also has approved doxycycline and penicillin V potassium for treatment of anthrax disease.

Once symptoms of anthrax develop, giving antibiotics reduces the risk of death only slightly.

F. Potential Benefit

The benefit of following the prescribed antibiotic regimen cannot be overstated. Strict compliance with both the antibiotic and vaccine dosing schedule could mean the difference between life or death. If you have never received the anthrax vaccine, vaccination may provide an additional degree of protection against relapse after you discontinue antibiotic treatment. In addition, vaccination could protect against a subsequent exposure to anthrax spores. Previous recipients of anthrax vaccine could benefit against relapse if they are due for a vaccination or if they have not kept their vaccinations current.

G. Study Procedures

You must be at least 18 years of age (17 years old if active duty) and presumed to have been exposed to anthrax spores. You must have read the Anthrax Vaccine and Antibiotic Information Papers, and you must sign and date this Informed Consent Form before you can receive the anthrax vaccine.

Before or at the same time that you receive the first dose of the anthrax vaccine, you will be given a 60-day supply of an antibiotic (check the one you have been asked to take): ☐ ciprofloxacin, ☐ doxycycline, or ☐ penicillin V potassium (PenVK). You may receive the 60-day supply of antibiotics in one or several increments, depending on supply levels. You must tell the health care provider if you are allergic to any of the antibiotics being used in this protocol. It will be your responsibility to complete the 60-day supply of antibiotic.

If you decide not to participate in or to withdraw from this contingency protocol, you will be advised to complete the antibiotic prescribed for treatment of exposure to *B. anthracis* spores because stopping the antibiotic would allow the bacteria to emerge and cause potentially lethal disease.

In this protocol, you will not receive the full 18-month vaccine regimen needed for protection, but only those doses sufficient for post-prophylaxis treatment. You will be injected under the skin (subcutaneous) in the upper arm (deltoid region) with 0.5 mL of the anthrax vaccine. To the extent possible, doses will be administered in alternate arms to minimize discomfort. If you have never received anthrax vaccine, you will be given an initial dose, then one dose at week 2, and one dose at week 4. If you have received fewer than three doses, you will receive an initial dose and another dose at week 2. If you have received three doses, you will receive an immediate booster dose, then continue with the FDA-labeled schedule (at 6, 12, or 18 months or an annual booster). You will remain at the vaccination site for at least 30 minutes after each injection to be observed for any immediate adverse reactions to the anthrax vaccine. You are instructed to report adverse reactions that you think might be related to the administration of the vaccine to your health care provider.

If this is the first time you have been given the anthrax vaccine, you will receive a survey form so you can report any reactions you might have after vaccination. We also want to know whether you took the antibiotic as prescribed. You will be asked to complete the form before you receive your next scheduled vaccination (at weeks 2 and 4). You are instructed to report any adverse reactions that affect your ability to carry out your duties to your health care provider.

H. Duration of the Study

You will remain in the contingency protocol until the contingency protocol has ended, until you have completed the required number of vaccinations, or as instructed by your health care provider. Six months after the protocol has ended, you may be among approximately 3,000 volunteers to be sent a follow-up form to report the experience with the antibiotic-vaccine regimen. You will receive instructions via mail, telephone, or e-mail for completing and submitting the form.

I. Potential Risks and Discomforts

Antibiotics: Take ciprofloxacin with food (excluding milk or yogurt) and at least one large glass of water. Do not drink liquids that contain caffeine because the antibiotic can increase the effect of the caffeine. Do not take ciprofloxacin with sucralfate, Videx® (didanosine), magnesium/aluminum antacids, or products containing calcium, iron, or zinc (take 6 hours before or 2 hours after taking ciprofloxacin). Immediately contact your medical care provider at the first sign of a rash or other allergic reaction. Report any pain, inflammation, or rupture of a tendon. Ciprofloxacin can increase sensitivity to sunlight, so avoid excessive exposure to sunlight. Ciprofloxacin may cause dizziness, so you should know how you react to the antibiotic before engaging in activities requiring mental alertness or coordination.

Take doxycycline with food and at least one large glass of water. Do not take doxycycline with magnesium/aluminum antacids or products containing calcium, iron, or zinc. Immediately contact your medical care provider at the first sign of a rash or other allergic reaction. Doxycycline can increase sensitivity to sunlight, so avoid excessive sunlight. Oral contraceptives may be less effective when taken with this class of drug. Use of doxycycline during the last half of pregnancy may cause permanent discoloration of the teeth of offspring.

Take PenVK on an empty stomach with at least one large glass of water. You should not take PenVK if you have had a previous reaction to any penicillin. Let your medical care provider know if you have a history of allergies or asthma. Immediately contact your medical care provider at the first sign of a rash or other allergic reaction. Other reactions that you might experience include nausea, vomiting, stomach upset, and diarrhea. Oral contraceptives may be less effective when taken with this class of drug.

Do not stop taking antibiotics on your own because this will allow the bacteria to emerge and cause potentially lethal disease. Volunteer initials: _____

Vaccine: The anthrax vaccine has been safely administered in the United States since 1970. As with other vaccines, minor reactions are common. A sharp stinging or burning sensation immediately upon injection of the anthrax vaccine is common; however, it generally goes away within the first minute. Serious adverse events occur rarely after any vaccination. Like all vaccines, the anthrax vaccine may cause soreness, redness, itching, and swelling at the injection site. Up to 30% of men and 60% of women report mild local reactions, but these reactions usually last only a few days. For both men and women, between 1% and 5% report reactions of 1 to 5 inches in diameter. Larger reactions occur about once per 100 vaccinees. A lump at the site occurs commonly, usually lasting for a few weeks, before resolving without treatment.

Beyond the injection site, from 5% to 35% will notice muscle aches, joint aches, headaches, malaise, rashes, chills, low-grade fever, nausea, or related symptoms. These symptoms usually disappear in less than a week. Any vaccine can cause serious reactions, such as those requiring hospitalization. For anthrax vaccine, they happen less than once per 100,000 doses. Severe allergic reactions occur less than once per 100,000 doses.

Discuss with your health care provider whether antihistamines or pain relievers before or after vaccination might help reduce bothersome symptoms. Promptly report adverse reactions to your health care provider before receiving additional vaccinations.

If you had an acute allergic reaction to a previous dose of anthrax vaccine, you would generally be excluded from future vaccinations. A severe reaction is defined as an acute allergic reaction consisting of

a rash, swelling of the face and mouth, and difficulty in breathing. However, because of the high fatality rate from inhalational exposure to anthrax spores, you would still qualify for this protocol. Vaccinations are routinely deferred until after pregnancy, unless, as in this contingency protocol, immunity is needed during pregnancy. If you are pregnant, you will be given the opportunity to take the anthrax vaccine, along with the antibiotic, as a lifesaving measure to protect you and your unborn baby.

If you are HIV-positive or are otherwise immunosuppressed, you may not be adequately protected with the proposed vaccination schedule. Check with your health care provider. Also if you are receiving any therapy such as corticosteroids that depresses the immune response, you may not be adequately protected by the recommended dosage schedule. Please inform your health care provider and ask for specific advice.

Formal studies have not been conducted to determine whether anthrax vaccine is carcinogenic or has any effect on fertility. No nonliving vaccine has been found to cause cancer or to affect fertility. Furthermore, there has been no evidence of infertility, miscarriages, or other reproductive problems with the use of the anthrax vaccine.

There is a theoretical chance of Guillain-Barré syndrome (GBS), which is an inflammation of nerves that can cause muscle weakness and/or paralysis. However, the CDC reports that 95% of GBS cases are not associated in time with vaccination. No cause-and-effect relationship between anthrax vaccination and GBS has been found. Between March 1998 and January 2001, during the time when 2 million doses of anthrax vaccine were administered, five cases of GBS in anthrax-vaccinated people were reported to VAERS. The independent civilian Anthrax Vaccine Expert Committee judged one of the cases as unrelated to anthrax vaccine and the other four cases as unclassifiable (not different from the rate of GBS expected in the general unvaccinated population).

J. Safeguards for Your Protection
Good clinical practices and professional patient care will be used during this protocol. The medical personnel are trained to treat vaccine-related emergencies should any occur. Significant new findings discovered during the course of your participation that may relate to your willingness to continue participation will be provided through the chain of command or through other information channels as appropriate.

K. Compensation
You will not be paid for participating in this protocol.

The U.S. Department of Defense is funding this contingency protocol. Should you be injured as a direct result of participating in this research project, you will receive medical care, at no cost to you, for that injury. Injury compensation is based on the "personnel" status of the volunteer. Military personnel are generally eligible for disability compensation for any injuries or illnesses incurred in the line of duty. Civilian personnel of the U.S. Government and of contractors are generally eligible for disability compensation for injuries or illnesses incurred within the scope of employment. Injury compensation beyond the scope of these disability compensation programs is not available. Injury compensation for volunteers who do not have a personnel status that includes compensation coverage is not available. You should also understand that this is not a waiver or release of your legal rights.

L. Confidentiality
All information collected during this protocol will be confidential. No information such as your name or Social Security number that identifies you specifically will be made public. The U.S. Army Medical Materiel Development Activity (the study Sponsor's representative); representatives of the Army, Navy,

and Air Force Offices of the Surgeons General; and the FDA will be permitted to photocopy and review medical and study records related to this protocol as part of their responsibility to protect human subjects enrolled in clinical protocols. The information about your participation in this protocol will be retained in a DoD database for a minimum of 75 years.

M. Consent

I have read this informed consent document and freely consent to participate in this contingency protocol. I have read the information papers given to me on anthrax vaccine and the antibiotics to be used in this protocol. I have been told the nature of the protocol and that I am a voluntary participant. I agree to adhere to the procedures outlined in this consent form. I have been told how long I will be expected to participate. I also have been told that the physician in charge may remove me from the protocol without my consent either because of my failure to follow the protocol requirements or if the physician believes it is in my best interest medically. I understand the risks and benefits associated with my participation in this protocol. I further understand that I may refuse to participate or may discontinue participation at any time without penalty or loss of benefits to which I am otherwise entitled. I have been given the opportunity to ask questions freely and had them answered to my satisfaction. I acknowledge that I have been given a copy of this signed and dated informed consent form.

I understand that nothing contained in this informed consent waives any of my legal rights as a volunteer.

If I have any questions regarding my rights as a volunteer, I may contact the Chairman, Human Use Committee (301) 619-4723 or:

_____

If I have questions regarding my safety or health, I may contact

_____

(Name of Investigator at Military Medical Facility)

or U.S. Army Medical Research and Materiel Command, Office of Regulatory Compliance and Quality, 504 Scott Street, Fort Detrick, MD 21702-5012, (301) 619-2165.

In the event of a protocol-related injury, I may contact:

_____

(Name of Investigator at Military Medical Facility)

or Office of Regulatory Compliance and Quality (301) 619-2165.

N. Privacy Act Information, Authority: 10 USC 3013, 44 USC 3101, 10 USC 1071-1087

PRINCIPAL PURPOSE: To document the provision of educational information on the use of anthrax vaccine and for participation in the "Contingency Protocol for Vaccination of Volunteers with Anthrax Vaccine Adsorbed (AVA) to Protect against *Bacillus anthracis* Spores."

ROUTINE USES: The SSN and home address will be used for identification and locating purposes. Information derived from the protocol will be used to document your participation. This information will be retained by the respective military services for a period of at least 75 years. Information will also be used to allow follow-up evaluation and analysis of medical conditions resulting from your participation.

DISCLOSURE: The furnishing of your SSN and home address is mandatory and necessary to provide identification and to contact you if future information indicates that your health may be adversely affected.

Your signature below constitutes consent to disclosing data to the U.S. Army Medical Materiel Development Activity (the study Sponsor's representative); representatives of the Army, Navy, and Air Force Offices of the Surgeons General; and the FDA.

Printed Name of Volunteer Subject	Date of Birth
	SSN
Signature of Volunteer Subject	Date/Time
Permanent Address of Volunteer Subject	Ethnicity of Non-Service Personnel: White, Black, Hispanic, Asian, Other (specify)
Printed Name of Person Conducting Consent Interview	Gender of Non-Service Personnel
Signature of Person Conducting Consent Interview*	Date
Printed Name of Witness	
Signature of Witness**	Date

*If the consent information was provided to a volunteer who does not speak or read English, the person conducting the interview should indicate that the information was presented in the subject's language: _____.

**Witness should be able to understand both English and the volunteer's language.

APPENDIX J

Sample Instructional Materials

ENCLOSURE

JOINT STAFF COMMENTS ON THE CONTINGENCY PROTOCOL FOR VACCINATION OF VOLUNTEERS WITH ANTHRAX VACCINE ADSORBED (AVA) AFTER POSSIBLE EXPOSURE TO *BACILLUS ANTHRACIS* SPORES.

1. Section 2.0

a. Page 3, first paragraph, last sentence. Change as follows: "Anthrax Vaccine Adsorbed (AVA) . . . ."

REASON: Completeness. This is the first time the abbreviation is used within the document.

Changed

b. Page 3, third paragraph, first sentence. Change as follows: ". . . the CDC and ACIP (12, 16) . . . ."

REASON: Completeness

Changed

c. Page 3, fifth paragraph, fourth sentence. Delete and substitute the following:

"The intent of this protocol is for contingency use of anthrax vaccine in a post-exposure setting, not to support a labeling change for the licensed anthrax vaccine."

REASON: Allows the use of information collected while stating the proper intent of the protocol.

Changed

d. Page 4, first paragraph. Comment: Define the timeframe and when data collection will cease, so that analysis and reporting to FDA can begin and end.

REASON: Clarity of the research design.

Added: Upon termination of the contingency, a cohort of volunteers will be sent a follow-up questionnaire to describe their experience during implementation of the protocol. The Clinical Project Manager will analyze the questionnaire data as well as the protocol data and prepare a final report for submission to the Food and Drug Administration (FDA).

2. Section 2.2.2.2

a. Page 8, first paragraph. Add to the end of paragraph the following statement: "Some of the most robust evidence of the safety of anthrax vaccine comes from the Defense Medical Surveillance System (DMSS), which shows that anthrax-vaccinated and –unvaccinated personnel are hospitalized at the same rates."

Added

b. Page 9, fourth paragraph, last sentence. Change as follows: "No deaths have been causally linked to the ~~resulted from~~ anthrax vaccine."

Changed

c. Page 12, first paragraph, last sentence. Change as follows: "Anthrax Vaccine Expert Committee (AVEC) found no . . . ."

REASON: Accuracy. The DMSS constitutes a capability more robust than VAERS for post-marketing surveillance of health events potentially associated with the anthrax vaccine. The ACIP recommendations note two deaths were reported through VAERS as of publication date, but were not "causally associated".

Changed

3. Section 2.3.4

a. Page 14, first paragraph, third line. Change as follows: ". . . .The ~~AVIP~~ ACIP recommends . . . ."

REASON: The ACIP is a more authoritative reference than the AVIP and adds credibility to the statements as a civilian advisory group.

Changed

b. Page 14, second paragraph. Change as follows: "~~Protective clothing and gas masks can~~ Individual protective masks (gas masks) and collective protection systems (NBC MOPP suit) provide excellent . . . ."

REASON: Protective clothing provides minimal protection against anthrax spores. However individual protective masks and collective protection systems provide inhalation protection against anthrax spores. The correct terminology should be used, however the document should also be written in lay language.

Changed

4. Page 16, Table 5, Anthrax Vaccine Administration Guideline for Post-Exposure Prophylaxis

a. Page 16, doses 4 through 6, second and third columns. Change as follows: "~~14 days~~6 month" and "~~2 weeks~~6 months."

b. Page 16, dose 7, second and third columns. Change as follows: "~~14 days~~ 12 months" and "~~2 weeks~~ 12 months."

REASON: Consistency with the current anthrax program. The current dosage schedule for doses 4 through 6 are given at a 6 month interval with subsequent doses being required annually.

c. Page 16, Notes section. Add the following:

"In a "vaccine tight" environment, triage emphasis should be given to those who have not received doses 1, 2, and 3 before considering boosting of those who have received four or more doses of the vaccine."
Changed

REASON: Large amounts of vaccine might be squandered by boosting of those who have nearly completed the full vaccine schedule.

No changes made: The table was deleted. The new schedule is described on page 16, Post-NBC Conf. Version.

5. Page 17, section 2.7, References, item 13. Change as follows: "United States, 2000 (~~draft~~December 15, 2000)."

REASON: Accuracy

Changed

6. Section 4.0

a. Page 20, first paragraph, third sentence. Change as follows: "The Secretary of Defense ordered the implementation of a plan ~~(contingency protocol under an IND)~~ to protect service . . . ."

Changed

b. Page 20, first paragraph, fifth sentence. Change as follows: ". . . The Surgeon General of the Army and the absence . . ."

Changed

c. Page 24, Figure 5, Responsibilities Associated with Anthrax Vaccine Contingency Protocol

(1) Responsibilities of the Combatant CINC section: Add the following:

"3. Request approval from SECDEF to implement the anthrax contingency protocol.

Added

4. Inform SECDEF of decisions related to the execution of the protocol."

REASON: IAW DODD 6200.2 the implementation authority rests with SECDEF, not the CINC. The CINC is responsible for informing the SECDEF of any decision made after the SECDEF gives approval to execute the protocol.

Added

(2) Page 24, Responsibilities of Site Investigator, item 11. Change as follows: ". . . AEs to ~~RCQ, USAMRIID Human Use Committee, and~~ Clinical Project Manager."

Changed

(3) Page 24, Responsibilities of Clinical Project Manager section. Add the following: "8. Forward copies of serious and unexpected AEs to the RCQ, HSRRB and USAMRIID's Human Use Committee."

REASON: The Clinical Project Manager should be responsible for forwarding the information to the RCQ and USAMRIID Human Use Committee. This will reduce the reporting requirements for the Site Investigator and require him/her to only have one primary office to report all information/reports. By centralizing the reporting, this will help to ensure the information is forward to the proper agencies/committees.

Added

(4) Page 24, end of figure. Add the following:

"Responsibilities of the Secretary of Defense:

1. To approve/disapprove CINC request to implement the protocol. The Secretary of Defense has the authority under DODD 6200.2 Section 4.2 to approve protocols for use on volunteers who give informed consent.
2. Request a waiver of informed consent from the President of the

3. United States when necessary IAW DODD 6200.2 Section 4.3."

Added

d. Page 25, end of paragraph 2. Add the following:

"To reduce bias, a comparable control group of personnel who did not participate in the protocol will be surveyed six months after receiving the influenza vaccine, for comparison."

REASON: Clarity, completeness and consistency. Avoids confusion with other Service Surgeons General. This portion of the protocol should show all of the key responsibilities. Under DODD 6200.2, the SECDEF does have the ability to request the President waive the requirement for informed consent. The SECDEF must personally request the waiver. The protocol should recognize this option and address the steps when necessary. Improves study design by adding a bias control measure for the survey.

Not added: Will be tasked to an epidemiology group; not to be incorporated in IND

7. Section 4.9

a. Page 27, 4.9 Source Data section, first paragraph. Delete and substitute the following:

"The following data fields will be completed via Service automated immunization tracking systems (AITSs) and will serve as the Case Report Form for subjects enrolled in the contingency protocol: The Service AITSs are: MEDPROS (Army), SAMS (Navy & Marine Corp), and MITS (Air Force)."

Changed

b. Page 27, Immunization Table, subparagraph 1. Add the following:

"Series Number, Route of administration (e.g., SC, ID, IM, etc.)."

Added

c. Page 27, Temporary Personnel Table, subparagraph 2. Add the following:

"National Identity Number or other ID number."

Added

d. Page 27, subparagraph 3, first bullet. Change as follows: ". . . used in ~~MODS~~Service AITS."

Changed

e. Page 28, subparagraph 4, first bullet. Change as follows: "used in ~~MODS~~Service AITS."

REASON: Accuracy, completeness and clarity. The protocol can be given to non-US service volunteers. Thus the protocol must comply with the requirements of DODI 6205.4, Section 5.5.4.1 Immunization of Other Than US Forces for Category 2 through 4 personnel.

NOT CHANGED: Items 4 and 5 (Lot Validation Table and Manufacturer Validation Table) were deleted from Post-HSRRB version.

8. Page 29, section 5.3. Comment: Clearly define the withdrawal (voluntary and involuntary) criteria for the protocol. Identify the documentation requirements when an individual is withdrawn from the protocol. Individuals who do not desire to take non-FDA-released AVA will be allowed (indeed, encouraged) to take the antibiotic regimen. Added as per Info Papers and ICF

Added the following:
5.3 Voluntary Withdrawal

Subjects who refuse treatment may withdraw at any time without penalty or loss of benefits to which they are otherwise entitled. Counseling will be provided about the subject's health if he/she decides to discontinue participation in the protocol. Additional medical advice in the best interest of the individual subject will be provided. Specifically, subjects will be told "*Do not stop taking antibiotics on your own because this will allow the bacteria to emerge and cause potentially lethal disease.*"

5.4 Removal of Subjects from Study

The Investigator or Medical Monitor will determine which subjects are to be withdrawn from the contingency protocol.

9. Page 30, section 6.1, third paragraph, first sentence. Change as follows: ". . . further exposure to *B. anthracis* spores ~~should~~ will be advised to complete the FDA . . . ."

REASON: Clarity

Changed

10. Page 33, section 6.5, end of paragraph. Add the following:

"Monitoring/ensuring that subjects complete the requisite number of vaccinations must be a partnership among the subjects, themselves, their commanders or other unit leaders, and the medical community, especially considering the stress of implementing this protocol within military operations."

REASON: Accuracy

Added

11. Page 34, section 8.0. Comment: Describe plans that establish accountability for documentation of protocol treatments in individual medical records of vaccine recipients. Address the documentation of adverse events during a military operation in the health record. The protocol must establish accountability for tasks. As written, this section loosely requires AE outcome documentation (paragraph 3).

To be incorporated in the Implementation Plan.

12. Page 34, section 8.1, end of first paragraph. Add the following:

"Loss of duty greater than 24 hours is a mandatory VAERS reporting criteria."

REASON: Accuracy

Added

13. Page 35,section 8.3. Add the following:

"Volunteered and observed AEs will be recorded in the volunteer health records in addition to any protocol specific records."

REASON: Clarity

Added

14. Section 8.5

a. Page 38, Clinical Project Manager. Change as follows: Move the Clinical Project Manager at USAMRIID to the top of the addressee list for serious and unexpected AEs.

Added

b. Page 38, after the Clinical Project Manager. Add the following statement: "The USAMRIID Clinical Project Manager will forward AE information to:"

Added

c. Page 38, Clinical Project Manager. Add the telephone #, fax #, and email address information to the Clinical Project Manager after the position has been filled.

REASON: The Clinical Project Manager works within the same organization as the US Army Medical Research and Materiel Command (USAMRMC) Office of Regulatory Compliance and Quality and the US. Army Medical Research Institute of Infectious Diseases (USAMRIID) Chairman, USAMRIID Human Use Committee. He/she can forward this information to these committees. This will reduce administrative burden on deployed operational units and help to ensure each committee receives the necessary information. Deployed operational units will not be able to forward AE information for central collection without it.

To be added when protocol is finalized.

15. Page 39, section 8.7, first sentence. Change as follows: "review." Replace with "investigate." Delete "Human Subjects Research Review Board (HSRRB)." Replace with "Clinical Project Manager at the USAMRIID."

REASON: Accuracy. The medical officer will likely be called on to examine and possibly treat the affected individual. This is not a technical review. To help ensure compliance with the protocol, the deployed operational units should deal with only one office. The Clinical Project Manager at USAMRIID will need to have this information anyway and can forward the report to the HSRRB. This change will simplify the flow of information from the deployed unit to the central collection point.

Changed

16. Page 40, section 12.1, first sentence. Change as follows: ". . . by the Code of Federal Regulations (in particular parts 21, 56, 314, and 601 of CFR 312) and ICH . . . ."

REASON: The protocol should clearly identify applicable CFRs.

Changed

17. Page 41, section 12.2, paragraph 1, second sentence. Add the following:

"DoD's quad-fold brochure and CDC's Vaccine Information Statement (VIS) on anthrax vaccination may be used as training aids to provide additional information."

REASON: Uniformity and consistency of information by utilizing existing resources.

Added

18. Sections 12.4 and 12.5 (Confidentiality and Confidential Follow-up)

a. Page 42. Comment: Ensure compliance with the Privacy Act (5 U.S.C § 552a) if establishing any database of service members with data retrievable by their social security numbers. See AR 340-21, The Army Privacy Program, 5 July 1985, paragraph 4-6.

Added the following to the ICF:
N. Privacy Act Information, Authority: 10 USC 3013, 44 USC 3101, 10 USC 1071-1087
PRINCIPAL PURPOSE: To document the provision of educational information on the use of anthrax vaccine and for participation in the "Contingency Protocol for Vaccination of Volunteers with Anthrax Vaccine Adsorbed (AVA) to Protect against *Bacillus anthracis* Spores."
ROUTINE USES: The SSN and home address will be used for identification and locating purposes. Information derived from the protocol will be used to document your participation. This information will be retained by the respective military services for a period of at least 75 years. Information will also be used to allow follow-up evaluation and analysis of medical conditions resulting from your participation.
DISCLOSURE: The furnishing of your SSN and home address is mandatory and necessary to provide identification and to contact you if future information indicates that your health may be adversely affected.

Your signature below constitutes consent to disclosing data to the U.S. Army medical Materiel Development Activity (the study Sponsor's representative), representatives of the Army, Navy, and Air Force Offices of the Surgeons General, and the FDA.

b. Page 42. Comment: Ensure that the listing in sections 12.4 and 12.5 of those individuals who will have access to these records is the same as that on the Informed Consent Form.

Added the following:

The U.S. Army Medical Materiel Development Activity (the study Sponsor's representative), representatives of the Army, Navy, and Air Force Offices of the Surgeons General, and the FDA are entitled to photocopy. . . .

c. Page 42. Comment: Explicitly state on the informed consent form all of the parties who will have access to the data (consistent with sections 12.4 and 12.5).

Stated

d. Page 42. Comment: The Privacy Act also requires that a Privacy Act statement be furnished to individuals whenever personal information is requested from them that will become part of a system of records retrievable by their names or personal identifiers. See AR 340-21, paragraph 4-2 for a list of required data. See also AR 15-6, Appendix B for additional guidance on drafting a systems notice.

Issue addressed (see above)

e. Page 42. Add the following:

"Your signature below constitutes consent to disclosing this data to these individuals."

REASON: Accuracy, consistency and to ensure compliance with the Privacy Act. Per AR 340-21, Chapter 3, the Army is prohibited from disclosing a record from a system of records without obtaining the prior written consent of the data subject, except, for example, when disclosure is made to officers and employees of DOD who have a need for the record in the performance of their duties (the so-called "need-to-know" exception to the Privacy Act), or permitted by a routine use that has been published in the Federal Register. Any invocation of the "need-to-know" exception must be documented by the official responsible for invoking it.

Added

19. Page 42, section 14.0 and section K of the Informed Consent Form. Comment: Consult with US Army Medical Research and Materiel Command (USAMRMC) legal counsel to determine whether the passage "Should a subject be injured as a direct result of participating in this protocol, he/she will be entitled to medical care at no cost for that injury. The subject will not receive any injury compensation, only medical care" should be changed to "The subject will not receive any injury compensation beyond that provided by law."

The sentence was revised as follows: ...at no cost for that injury. Injury compensation is based on the "personnel" status of the volunteer. Military personnel are generally eligible for disability compensation for any injuries or illnesses incurred in the line of duty. Civilian personnel of the U.S. Government and of contractors are generally eligible for disability compensation for injuries or illnesses incurred with the scope of employment. Injury compensation beyond the scope of these disability compensation programs is not available. Injury compensation for volunteers who do not have a personnel status that includes compensation coverage is not available. The subject should understand. . .

Further, request USAMRMC counsel coordinate with the Office of Workers Compensation to determine if they have any provisions affecting civilians who are exposed to anthrax and to develop plans to accommodate medical care for civilian and contractor personnel who are injured as a direct result of participating in the protocol. It is likely that questions about such care will arise during the briefing for the informed consent and unit support personnel will need to know how to care for members who need to exercise this component of the protocol.

Revision incorporates civilian requirements.

20. Appendix Section. Comment: Add a copy of the FDA Form 1572, instructions on how to fill this form out, and how to obtain a copy of the form through the internet and/or mail. The protocol should be inclusive and provide the Principal Investigators a copy of each form they must complete.

Added as Appendix B

21. Appendix A, Logistic Annex

a. Page A-2, second paragraph, first line. Change as follows: ". . . Vaccine to be used under this protocol may not have ~~not~~ been released . . . ."

REASON: Accuracy. If vaccine which has been released is available, then this vaccine will be used. If FDA released vaccine is not available, then non-FDA released vaccine will be use.

The post-HSRRB version of the first line was changed to "The Anthrax Vaccine to be used under this protocol is considered an investigational new drug."

b. Pages A-3 and A-4. Comment: Provide an agency email account when possible.

(1) Add the following: "Navy and Marine Corps".

Added

(2) Change as follows: ". . . "bhomman@~~nml10~~us.med.navy.mil"; "Lt ~~Byron Owens~~ Scott Spratt"; ". . ~~bowens@nml10.med.navy.mil~~ smspratt@us.med.navy.mil"; and "mbrown@~~nml10~~us.med.navy.mil".

REASON: Accuracy. The vaccine may or may not have been released. Avoids any unnecessary limitations on the protocol. Providing agency email accounts will allow field units to forward the necessary information once individuals PCS.

Changed

c. Page A-3, subparagraph e. Comment: Ensure a mechanism is in place to keep the POC listing current and accurate.
Recommend referencing the USAMMA website (http://www.armymedicine.army.mil/USAMMA/anthrax/poc.stm) in the protocol.

Added as first item under Anthrax Vaccine Points of Contact

USAMMA must ensure changes and updates are posted on the website in a timely manner as necessary.

Web site updated regularly

d. Page A-13, paragraph 2. Comment: The first sentence states: "The antibiotics Ciprofloxacin, Doxycycline and Penicillin are all approved by the FDA for either the prevention or treatment of disease caused by *B. Anthracis*. As such, they are not considered investigational agents under this protocol." This statement is contradictory to the statement on page 33 (6.4.2.3.), "Penicillin is approved by the FDA for the treatment of anthrax disease but not for post-exposure prophylaxis." Clarify which statement is correct and then make necessary changes to ensure consistency throughout the protocol.

REASON: Accuracy and clarity

Revised wording: Ciprofloxacin is approved to reduce the incidence or progression of inhalational anthrax following exposure to aerosolized *B. anthracis* spores, whereas doxycycline and penicillin are approved for treatment of anthrax disease but not for post-exposure prophylaxis.

22. Appendix B

a. Page B-3, after "Number of anthrax vaccinations received:" Change the blank line with check boxes, indicating the number of potential doses. "__1 __2 __3 __4 __5 __6 __7 or more."

In post-HSRRB version, blank line replaced with "enter the anthrax vaccine dose number(s) in the boxes to the left."

b. Page B-3, "Experience with antibiotic" section. Delete "Yes No". Replace with check boxes listing "__<5 __5-10 __11-20 __21-40 __41-60 __61-80 __81-100 __101-120."

REASON: Check boxes give more easily analyzed information than free text entries. An estimate of the total number of antibiotic doses taken is more informative assessment of compliance than a simple yes or no answer.

Replaced and added +120 (to accommodate PenVK dosage schedule)

23. Appendix C

a. Page C-2, after the line "Do you smoke?" Add the following: "Do you drink alcohol? How many drinks per week?" Then list in check box format several options.

Reference to alcohol was deleted in earlier version.

b. Page C-2, after last question, "How many doses have you taken? Add the following check boxes "<5, 5-10, 11-20, 21-40, 41-60, 61-80, 81-100, and 101-120."

REASON: Alcohol use is an important contributor to the overall health status along with tobacco use. Check boxes give more easily analyzed information than free text entries.

Replaced and added +120 (to accommodate PenVK dosage schedule)

24. Appendix G

a. Page G-6, Precaution paragraph. Comment: Include information about avoiding excessive sunlight/photosensitivity while taking Doxycycline.

Added: "Doxycyline can increase sensitivity to sunlight."

b. Page G-6, Drug Interactions paragraph. Add the following: "Doxycycline can increase sensitivity to sunlight."

This section addresses drug-drug interactions and Precaution section address sun sensitivity.

c. Page G-6. Comment: Include a summary paragraph to summarize the important points at the end of the consent form (e.g. how to avoid excessive sunlight, be aware of dizziness, decreased effectiveness of birth control pills, how and when to take the medications).

Already stated in Information Papers and relevant section of the ICF

d. Page G-7, Drug Interactions paragraph. Add the following: "Penicillin can increase sensitivity to sunlight."

Added this statement to Precautions section, but not to Drug Interactions

e. Informed Consent Form

(1) Comment: Create three separate Informed Consent Forms. Version 1 is for use of FDA released vaccine, version 2 is for use with non-FDA released vaccine, and version 3 is for when either FDA released or non-FDA released vaccine will be available. In each case the third paragraph under sub-paragraph A must be adjusted to correctly identify which vaccine (FDA released or non released) is being used. The third version could use a check box style question such as: "You will be given a dose of vaccine from (check the one that describes the vaccine) __ FDA released AVA vaccine or __ non-FDA released AVA vaccine but which the FDA agrees may be used in this protocol." For version 2 and 3, add a paragraph that describes why the protocol is using non-FDA release AVA vaccine.

Three ICFs not prepared: As released lots of vaccine become available, the ICF can be revised during the annual review of the protocol.

(2) Paragraph G, subparagraph 3. Delete "or triceps."

Deleted

(3) Comment: Add the risks of no treatment.

New third Paragraph: If you decide not to participate in or to withdraw from this contingency protocol, you will be advised to complete the antibiotic prescribed for treatment of exposure to *B. anthracis* spores because stopping the antibiotic would allow the bacteria to emerge and cause potentially lethal disease.

(4) Second page (page unnumbered), paragraph 2. Comment: The protocol addresses taking all the antibiotics together. This part of the form suggests that volunteers may take any one antibiotic only. The protocol and consent form must be consistent.

Protocol and ICF made consistent

Section 6.4.2, , Paragraph 1, second sentence: Recommendations for selecting an antibiotic. . . . ICF, Section E, Paragraph 2, First sentence: Cirofloxacin, doxycycline, or penicillin V potassium, if taken as prescribed. . . .

Deleted sentence 3: The recommended antibiotics include. . . .

(5) Third page (page unnumbered). Comment: Ensure information on the antibiotics is consistent with the previous antibiotic information. Each drug that imposes effects from excessive sunlight and affects the effectiveness of oral contraceptives needs to so state at every point these drug factors are mentioned. Include tips on managing oneself when taking these drugs (e.g. use of sunscreen, coincident use of supplemental contraceptives, etc.).

Information stated in Information Papers

(6) Fifth page (page unnumbered). Comment: Add information about how the volunteer may get the information about his/her participation.

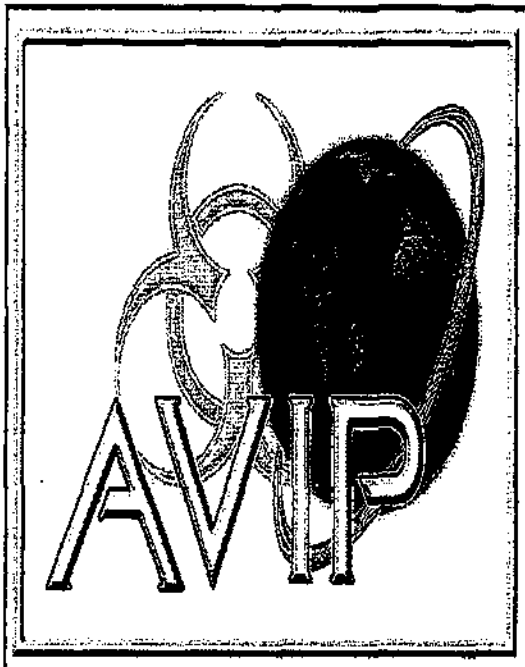
Under Section M, referred volunteers to RCQ

(7) Section N, fifth page (page unnumbered). Comment: List the organization and address for the Regulatory Compliance and Quality Office. Added

(8) Comment: Add to the protocol a discussion of the status of participants while they are under treatment (e.g., need for isolation of those exposed, hazardous material management).

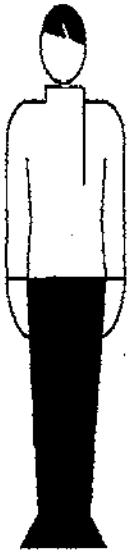
REASON: Completeness and accuracy. The precautions for use of Doxycycline are not correct. As per the Physician Desk Reference 2001, sun exposure (photo-sensitivity) is a possible side effect from the use of quinolones however it is a warning in Doxcycline use and should be included in all antibiotic precautions. The injection should be into the deltoid area stated in protocol to avoid possible ulnar neuropathy. The protocol can be used with either FDA release or non-FDA release vaccine. Recipients need to be aware of which category of vaccine they are receiving and why they are receiving non-FDA released vaccine.

Not added: Not within the scope of the protocol.



Anthrax Vaccine Immunization Program

Life-Saving Treatment after Anthrax Exposure:



Important Information About Anthrax Vaccine

Anthrax

- Natural anthrax is primarily a disease (
- Anthrax is a known biological weapon.
- Inhalational anthrax is highly lethal.
- Antibiotics plus vaccination against ant
  critical for <u>your</u> protection.
- Anthrax vaccine is safe and effective a
  series, based on decades of experi

  anthrax vaccine is safe and effecti

15 Jun 01

Anthrax Vaccine After Exposure

- You may have been exposed to anthrax, a lethal disease.
- The Centers for Disease Control & Prevention (CDC) recommends that people in your situation receive antibiotics, plus at least 3 doses of anthrax vaccine.
- The Food & Drug Administration (FDA) has not yet licensed the use of 3 doses of anthrax vaccine for protection after exposure to anthrax (POST-exposure use). Therefore, FDA considers using anthrax vaccine in a 3-shot series an Investigational New Drug (IND) use.
- Depending on supply, the anthrax vaccine available for you may have passed some or all of the usual tests FDA requires. These tests are required before FDA permits manufacturers to ship vaccines under normal conditions.

Protection from Anthr
Antibiotics Plus Anthrax \

- Take 30 to 60 days of antibiotics (eg, cip as directed by your medical personnel.
- Previously unvaccinated people can choo or not to take the IND anthrax vaccine.*
- Antibiotics PLUS vaccine provides the bes long-term protection, the best chance of

(Events Away from the Injection S

- From 5% to 35% will notice:
  - Muscle aches, joint aches, chills, low-grac no appetite, headaches, nausea, malaise, symptoms
  - Women report these symptoms more ofte
  - These symptoms usually go away in a fev than a week
- Serious allergic reactions occur after a

  < 1 per 100,000 doses

Injection-Site Reaction Systemic Events

- Ask your health-care provider whethe acetaminophen, antihistamines, or oth medications may help reduce bothersc symptoms.
- Report adverse events after vaccinatic care provider promptly, before additio vaccinations.

Adverse Event Reporting

- Vaccine Adverse Event Reporting System (VAERS)
  - FDA reviews 100% of adverse-event reports submitted to either FDA or DoD
  - Anyone can submit a Form VAERS-1
- DoD requires a Form VAERS-1 submission for:
  - Loss of duty greater than 24 hours
  - Hospitalization
  - Suspected vaccine vial contamination
- Other submissions permitted
- Form VAERS-1 may be obtained from:
  - 1-800-822-7967 or www.vaers.org

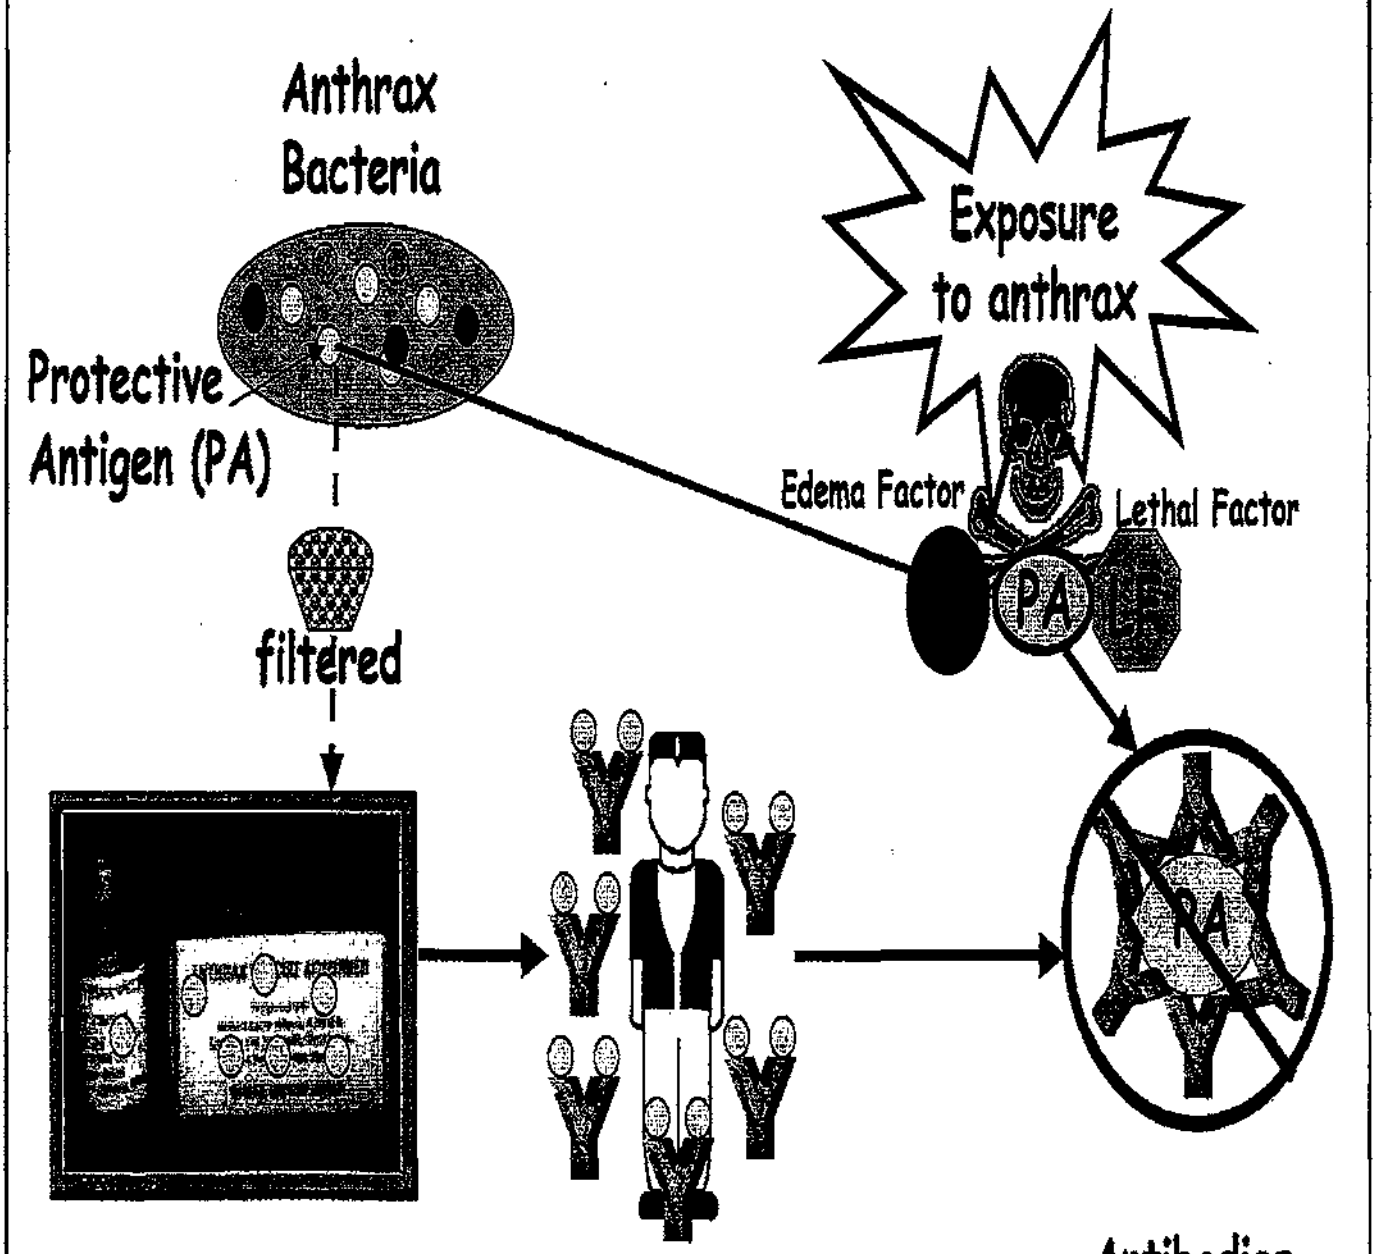
Background Slides

Inhalational Anthrax

- Inhalational anthrax occurs when spores enter the body through the lungs
- Not transmitted person to person
- Spores migrate to lymph system where bacteria multiply and produce lethal toxins
- Toxins cause bleeding and destruction of the brain or vital organs in the chest, resulting in death

How Anthrax Vaccine Prevents Disease



Vaccine contains PA, extracted from anthrax bacteria.

Immune system develops antibodies (Y) to PA, protection from disease.

Antibodies "neutralize" PA, common part of anthrax toxins.

Long-Term Studies

- More than 1,500 Fort Detrick laboratory workers vaccinated against anthrax
  - Followed for up to 10 - 20 years
  - None developed unexplained symptoms due to repeated doses of anthrax vaccine or any other vaccines they received
  - Employees followed annually
- Additional studies are underway to gather more information

MEMORANDUM FOR DIRECTOR, JOINT STAFF
DEPUTY ASSISTANT TO THE SECRETARY OF DEFENSE (CHEMICAL AND BIOLOGICAL DEFENSE)
GENERAL COUNSEL (ATTENTION: Mr (b)(6))

SUBJECT: Review of the Draft Contingency Protocol for Vaccination of Volunteers with Anthrax Vaccine Absorbed after Possible Exposure to Bacillus Anthracis Spores

The Assistant Secretary of Defense for Health Affairs (HA) requested that a protocol be prepared to allow the use of the Anthrax Vaccine Absorbed (AVA), in conjunction with antibiotics, for post-exposure to Anthrax.

A protocol was prepared, and staffed by OASD(HA)to the Services and the Commanders in Chief (CINCs) through J-4, Medical Readiness. Comments were received and incorporated into the protocol. Additionally, comments were received during a conference co-sponsored by the Joint Staff and the Army Office of The Surgeon General. These comments have also been incorporated.

This document forwards the updated protocol, along with an item-by-item description of the resolution of the comments received back from the CINCs and Services. Additionally, during the Joint Conference (above), the CINC and Service representatives determined that their real concern was not with the protocol, but rather how they would implement it. A Draft Implementation Guidance document was prepared and is enclosed as well.

Request your review and comment or concurrence with the attached protocol so that it can be forwarded for final approval to the Food and Drug Administration and the Human Subjects Research Review Board. The coordination is required NLT July 31, 2001. My point of contact is (b)(6) , Program Director for Health Science Policy. He can be reached at (b)(6) or by e-mail at (b)(6) @ha.osd.mil.

A Draft Implementation Guidance document was prepared and is enclosed as well. The coordination is required NLT July 31, 2001.

RECOMMENDATION: Sign the memorandum.

IMPLEMENTATION GUIDANCE
USE OF INVESTIGATIONAL DRUGS FOR FORCE HEALTH PROTECTION

Purpose: To provide guidance to CINCs and Services for the implementation of investigational new drug (IND) protocols required for force health protection.

Scope: Guidance provided is intended to serve as a range of potential solutions to assist in the development of implementation plans for force protection protocols. CINCs are responsible for requesting use of INDs in accordance with DoD Directive 6200.2. CINCs are also responsible for providing broadly defined requirements for use of INDs in OPPLANS. Service components are responsible for resourcing and executing IND protocols required to fulfill assigned missions identified in OPPLANS.

Background: According to Department of Defense Directive 6200.2, Use of Investigational New Drugs for Force Health Protection, it is the policy of the Department of Defense to make preferential use of products approved by the FDA to provide needed medical countermeasures against to chemical, biological, or radiological warfare and endemic disease threats. However, when no safe and effective FDA-approved drug is available against a particular health threat, DoD components may request approval of the Secretary of Defense to use an investigational product. It is DoD policy that the use of investigational drugs will comply with applicable laws and regulations. Furthermore, any request for a waiver of informed consent must be approved by the President in accordance with procedures described in Executive Order 13139 and 21 CFR 50.23(d).

FDA-required protocols have been written for the use of two investigational new drug products. The protocol is written in the common format of drug research that describes rationale, objectives for using the product, the statistical design, and methodology for the distribution of the medicine and collection of information. To assist military planners in the use of these investigational products, implementation guidance is provided that describes procedures to follow with products that are either medic administered (e.g., anthrax vaccine) or service member administered (e.g., pyridostigmine bromide for pretreatment against the nerve agent soman).

The anthrax vaccine protocol describes procedures for the administration of anthrax vaccine adsorbed in combination with ciprofloxacin as an early treatment for personnel exposed to the anthrax virus to prevent the onset of symptoms. Anthrax vaccine will be used under investigational status if approved lots of vaccine are not available and because the use of anthrax vaccine after exposure is not an approved use of the product. Regardless of prior immunizations with the anthrax vaccine, all exposed personnel are to receive at least one immunization. The schedule for immunizations is described in paragraph 2.4 of the protocol. Anthrax vaccine is being provided under an investigational drug status because the use of anthrax vaccine for early treatment is not an FDA approved indication and because vaccine lots used for this purpose may not have passed all criteria for release. However, animal studies provide strong evidence that the

use of anthrax vaccine in combination with ciprofloxacin may be effective in humans. Informed consent is to be obtained from individuals prior to immunization with the anthrax vaccine.

The pyridostigmine bromide protocol describes procedures for the use of PB as a nerve agent pretreatment to protect service members from the nerve agent soman. PB is to be taken when there is an imminent threat of nerve agent exposure to pre-treat nerve endings to allow the antidotes of 2-PAM and atropine to work effectively. The dose of PB is one tablet every eight hours. Administration is not to go beyond 14 days. Service members are to discontinue use of PB after exposure to nerve agents. Specific procedures are described in the information sheet (pages 1-8 of the protocol). PB is provided under an investigational drug status because the use of PB for nerve agent pretreatment is not an FDA approved indication. PB is approved by the FDA for use in a disease called myasthenia gravis. Animal studies provide strong evidence that the use of PB may be effective in humans in the pretreatment against soman.

Guidance:

1. Considerations for requesting use of IND protocols (CINC responsibilities):

- CINCs should identify whether INDs are required for AOR OPPLANS. Consideration should be given to the expected potential benefit (lives saved, mission completion, etc.) as compared to costs associated with the use of INDs (personnel, time, and fiscal resources).
- Develop mechanism to request authority for use of INDs consistent with requirements identified in DoD Directive 6200.2 (Figure 1).
- Identify broadly stated criteria for initiation of INDs in operational plans (Figure 2).
- Identify a Principal Investigator (PI) for JTFs organized for contingency OPPLANS (Figure 3).
- For protocols in which a waiver of informed consent is warranted, submit request through the Joint Chiefs of Staff to the Secretary of Defense.
- Cost/Benefit considerations for use of INDs
  - Benefits
    - Potential to save lives
    - Potential to maintain unit integrity to fulfill mission accomplishment
  - Costs
    - Logistical support required for implementation
    - Document education and informed consent in medical record
    - Information system updates to record IND use
    - Training investigators
    - Training service personnel
    - Public Affairs support
    - Time required for implementation and time required to obtain waiver of informed consent
    - Any potential for long term health consequence from use of the IND product

2. Service and CINC responsibilities -- Education of military leadership

- Inform leaders at all levels of the basic requirements for use of INDs (as described in Executive Order 13139 (section 5) and DoD Directive 6200.2 (section 4.8.4)).
- Make execution of IND protocols a Commander's program.

3. Service responsibilities

- Education of service members
    - Services will develop mechanisms to provide any protocol specific briefings or videotapes developed as part of the protocol to inform service members and other potential protocol participants of the purpose of using the investigational product.
    - Services will identify trained health care providers to be available to answer service member questions regarding the particular investigational product.
    - Services will communicate to service members the availability of any protocol specific telephone "hot-lines" and e-mail addresses available for additional questions.
    - Services will "market" the use of the investigational product well in advance (to the extent possible) to combat the challenges of negative perceptions and potential negative information programs from organizations traditionally opposed to use of INDs (e.g., Citizen-Soldier).
    - Services should develop systems to educate early and often. Start with general information regarding use of INDs in military operations as part of normal health care briefings. Provide more specific information on annual basis as part of regularly scheduled threat or NBC briefings. Information to be updated as required based on threat or new knowledge about IND products.

- Education of health care providers
    - Institute training in Good Clinical Practices (GCP) that will be developed for specific military contingency IND protocols
    - Provide GCP training through variety of sources, e.g., web-based, CD-ROM, training institutions, incorporated into USAMRICD and USAMRIID satellite courses, and as part of organizational training.
    - Document GCP training in credentialing files.
    - Allow a protocol specific SMART team to assist in implementation and execution of protocol if military mission allows sufficient time and prioritization in TPFDL for insertion. Include quality assurance (QA) component as part of SMART team.

- Documentation of informed consent
    - Provide informed consent as part of pre-deployment health assessment when possible.
    - A signed copy of the consent form must be given back to the service member, a copy is also to be included in the service member health records and the original

is to be forwarded back to the U.S. Army Medical Research and Materiel Command for inclusion in the study records. Specific details regarding routing of informed consent forms are described in each protocol.

- Forward deployed forces should be provided informed consent on regular basis for threats in the AOR.
- For service members that refuse informed consent at time of pre-deployment or health assessment, provide opportunity for them to change mind when faced with threat.
- Informed consent to be obtained by a GCP-trained health care provider (physicians, physician assistants, nurses, pharmacists, and licensed practical nurses should be trained in GCP to facilitate this process).
- When the use of an investigational product is to be voluntary, the availability of an ombudsman to ensure voluntary consent should be considered. Unit chaplains are well suited to fulfill this role.
- When the use of the investigational product is voluntary, services should not differentiate service members who refuse consent when assigning missions.

- Documentation of participation, control, and accountability -- For self-administered products, e.g., pyridostigmine bromide (PB).

  - Current solutions

    - Differences among service components with regard to issuing PB – some units issue through medical channels and others issue through NBC channels; therefore, follow service specific procedures.
    - Use paper system for recording participation until automated systems are available for deployed forces – Use unit rosters to document that service members were provided the product at any of the following points:
    - Point of issue – can be issued at NBC Room as forward deployed unit or at theater in-processing for deploying units or individuals
    - For medical channel controlled – document via medical/corpsman/or medical treatment facility
    - Use SF600 for initial recording, transfer information to existing automated system at later date if not readily available. Use overprinted SF600 with stamp of data fields to be collected to document participation. File the SF600 in the medical record upon return to home station.
    - Record how many tablets are returned at end of operation and record the difference between amount issued and returned as the amount taken.

  - Future solutions. As the use of medical information technologies mature, many manual tasks may be automated to include the use of bar-coded packages of investigational products to record distribution, receipt and administration of investigational products.

- Documentation of Administration -- For Medic-Administered Products, e.g., anthrax vaccine, absorbed (AVA)
  - Current solutions – Use existing service data systems (MedPROS, SAMS, MITS) to record administration of AVA. This solution may be complicated due to the availability and functionality of data terminals as well as the ability to enter data in a timely manner.
  - Future solutions – Next generation medical information systems may be employed as fielded (e.g., Joint Services Automated System in combination with the Personal Information Carrier).
- Other considerations for recording participation – Participation lists may be classified. Hold list until end of operation; grant access to lists based on security clearance. Organizations maintaining classified lists will need to maintain system to allow for long-term follow-up consistent with other protocol requirements.
- Collecting adverse event information
  - Per instructions in specific protocol, use existing FDA forms such as VAERS and MEDWATCH to collect information on investigational vaccines and drugs. Protocols to reflect routing of adverse event forms to Service PI. Each service to identify methods to record adverse events in medical records.
- Long-term follow-up
  - Use existing requirements for health status assessment as identified in DoD Directives for collecting information on long-term health effects.
  - USAMRMC to collect protocol specific information after completion of military operations using subjective response forms identified in protocol. Services will provide resources necessary to allow collection of follow-up information (e.g., updated address rosters for location purposes).
- Designating PI
  - CINC surgeon coordinates identification of PIs. Identify PI overall in charge per JTF. Identify PI for each service component based on size and scope of operation. Physicians at lower levels of care are classified as sub-investigators (not required to sign FDA Form 1572).
- Quality Assurance
  - To the maximum extent that operational plans allow, services need to consider the presence of QA personnel in each phase of protocol execution.
    - QA personnel can identify problems in execution and correct deficiencies early.
    - QA presence at education and informed consent process to ensure appropriate provision and documentation of education and consent.

    - QA presence during execution to ensure appropriate documentation.
    - QA presence during follow-up phases to audit documentation and follow-up on missing data.
- QA plans should include self-assessment based on forms provided and use of existing QC personnel assigned to MTFs in event that QA personnel are not deployed early enough due to competing TPFDL requirements.
- Plan to insert QA personnel with SMART teams. QA is force-multiplier for protocol execution and should be early in TPFDL.

Document is set for Permanent Archival

(b)(6)

Attached below are the comments provided by (b)(6), which I have forwarded to the AVIP office. One set pertains to an earlier version that (b)(6) provided in March and the other attachment contains his most recent comments. In addition to these comments, I attended the videoteleconference on Friday at which I orally reinforced the written comments and discussed some other items of interest to the participants. The VTC included the AVIP office, MRMC (LTC (b)(6)), and ASA (M&RA). This action is now closed, although we may see a revised protocol later.

Requested comment on **Contingency Protocol for Vaccination of Volunteers with Anthrax Vaccine Adsorbed (AVA) to Protect against *Bacillus anthracis* Spores,** 5/15/01 draft, received July 19, 2001.

Frank: Here are some comments on this more recent draft and attachments. Also sending you my comments on the earlier draft. Hopefully there is not much repetition. I have spoken to (b)(6) *in the interim and I do understand some of the many constraints in constructing this protocol. Sorry I just received it today and will not be here for the conference tomorrow. Tom*

- Record keeping. (See also my earlier comments.) There may be weaknesses in the reliance on automated recordkeeping for vaccine administered under these circumstances. To the best of my knowledge, the services automated recordkeeping systems are not all up to this task. Even if they could (amidst the anticipated chaos) capture the active duty personnel this way, could you rely on these systems for the reserve personnel? And how about the civilians? The services paper record systems, both individual records and rosters, proved inadequate during the Gulf War for a variety of reasons. One suggestion for a more suitable "back-up" is to create a *simple* roster template (only spaces for the information you *must* have) that can be distributed to the points of administration, completed, and collected, with the data transferred to your electronic database at another time. Sorry to be so simplistic, but I have yet to find a Gulf War immunization roster with the essential information, and documentation of administration is, after all, the starting point for this study. Finally, you may also need to detail the collection and forwarding system, since recording the event is only one part of the problem.
- Informed consent. (See also my earlier comments.) This proposal still mentions only voluntary use accompanied by informed consent. If it is clear that a request for waiver of informed consent will not be requested under these conditions, I would delete mention of it under *Responsibilities of the Secretary of Defense* (p. 25, par. #2). (There might be some degradation of the military operation if there were failures to volunteer. On the other hand, there would probably not be any shortage of volunteers under the circumstances of a confirmed exposure.) If there is a chance that a waiver may be requested, the entire protocol would have to better reflect this possibility.
- Age inclusion and exclusion. Have you considered adding the young and old to the *Exclusion Criteria* (p. 29, par. 5.2), then adding an option for them to take the vaccine as you did with pregnant women? After all, it may be difficult to deny the ambassador, or perhaps the young military or civilian dependents under these circumstances.
- Purpose. From conversations with (b)(I understand there are problems in stating what would seem to be the real usefulness of the study, i.e., the effects of post-exposure vaccination on the reduction/prevention of anthrax disease. (There are already far easier and more controllable ways to expand the information on acute adverse effects.) But do you have to consider the occurrence of anthrax disease as an *adverse event* (p. 34, par. 7.0)? Like studying an investigational meningococcal vaccine in the midst of an epidemic and saying you are just looking for adverse reactions?
- On the *Subjective Response Form* (app. C-2), maybe avoid describing the right-hand column as kind(s) of *reactions*, since they may or may not be related to the vaccine. The check boxes on the next form (app. C-3) are still a bit confusing. If you need it this way, maybe include a text box with an example of a completed one.
- The *Baseline Health Questionnaire* might be difficult to complete under the circumstances (app. D-2). Any option to complete it later?
- Would delete the human brain photo on the *Information Paper* (app. H-3) The hype could be considered coercive rather than informative.
- At eight pages, the *Informed Consent Form* is just too long (app. I) This might be a committee product also, but I would reduce to maximum of one or two pages. Maybe have available access to more detail, if requested (as you would with an investigator's brochure in an ordinary clinical trial).

(b)(6)
Medical Issues
July 19, 2001

Requested comment on **Contingency Protocol for Vaccination of Volunteers with Anthrax Vaccine Adsorbed (AVA) to Protect against *Bacillus anthracis* Spores,** 1/31/01 draft, received March 26, 2001.

Frank: Here are some comments on this research protocol. The first two are in areas where OSAGWI has some experience from the Gulf War, so comments from this office might be most appropriate. The following ones are more about the purpose and design of the study, and you could delete them, if you think many other reviewers have already made these comments—or are better equipped to do so. This is not an easy reading protocol. The generally accepted elements of a clinical investigation (title, purpose, plan of study, hypothesis, research questions, IND status, etc.) do not seem clear or clearly organized. I'm still not entirely sure whether the portion I received (without the appendixes and consent form) is intended to be part of an IRB or IND submission, or something else. (b)

Comments from OSAGWI experience:

- Record keeping. The experience of the Gulf War demonstrated an inability to maintain under field conditions the records required for investigational product use and good research. The investigator(s) will need to detail how this research requirement will be satisfied. It is not enough to simply say that the records will be kept, or point in the direction of existing DOD record keeping systems (electronic or paper), as experience has shown these systems to be unsatisfactory for investigational product research under deployment conditions. Record keeping provisions will be necessary for both data collection and for transfer of key elements to the individual health records. These requirements cannot be waived.
- Informed Consent. There was confusion during the Gulf War about whether investigational products were mandatory or voluntary, and a negative impact from that confusion. This proposal mentions only voluntary use accompanied by informed consent. It is not clear whether a request for waiver of informed consent is anticipated. If a waiver is anticipated, or may be requested at the time of use, this should be stated in the protocol. In this case, the research proposal should include an *information sheet* rather than a *consent form* (perhaps both if there is uncertainty about the requirement for informed consent), and some preconditioning risk communication. If the vaccine is only to be given on a voluntary basis, there might be concerns about degradation of the military operation by vaccine refusals, one reason for creating a mechanism for the waiver of informed consent during the Gulf War deployment. All of this, of course, applies only to military personnel; the inclusion of other than military subjects would further complicate this issue. Finally, it is questionable whether one could truly satisfy the elements of informed consent under the anticipated chaotic scene of a confirmed exposure, although this might be lessened in some study subjects by earlier risk communication. Fear alone would probably drive most subjects to the vaccine.

General Comments: (The authors may already have these comments from other reviewers.)

- The purpose of the study is confusing to me. For whatever reason, there seems to be a preoccupation with the study of short-term adverse events from the vaccine and less interest in the study of the post-exposure vaccination on the reduction/prevention of anthrax disease. The investigators indicate that the protocol is strictly to provide treatment, that the study data is not intended to support a labeling change, that the efficacy of anthrax vaccine for early treatment of exposure is not an endpoint of the study, and that the occurrence of any cases of anthrax disease will be evaluated as an adverse event (?). The distinction between treatment and research is an old and not very productive argument, unless this protocol can be classified under a Treatment IND. To me there is valuable information to be gained on the effectiveness of anthrax vaccine given in addition to antibiotic in preventing disease following anthrax inhalational exposure. Even if animal investigation and surrogate markers will allow approval for use in these indications, we should not pass up the opportunity to accomplish careful research in humans under conditions not otherwise possible.
- Presumably this will be use of an approved product for an unapproved indication, and so would require IND status for this approved product. It seems this will be further complicated by the intention to use existing lots of vaccine that have not been released by the FDA, at least until there are sufficient stocks of released vaccine. The reasons why the vaccine lots have not been released may be of importance for both the safety of the subjects and the validity of the study results (E.g., if these preparations are more or less immunogenic or reactogenic, study results may be more difficult to interpret.)

- Th investigators may want to ensure that the methods of observing and recording adverse reactions/events are similar to those of earlier and ongoing studies, so that the information can be validly compared. There seems to be no provision for long term follow-up of the subjects. This might be an opportunity to study both short and long term adverse reactions/events in a group of subjects who will be in stress at the time of vaccination, and perhaps (and this is a long shot) shed some additional light on the hypothesis and limited research about the potential additive health effects of stress and immunizations. If we are just talking acute effects of the vaccine, there are already far easier and more controllable ways to expand this information.

If it is clear that a request for waiver of informed consent will not be requested under these conditions, I would delete mention of it under *Responsibilities of the Secretary of Defense* (p. 25, par. #2). (There might be some degradation of the military operation if there were failures to volunteer. On the other hand, there would probably not be any shortage of volunteers under the circumstances of a confirmed exposure.) If there is a chance that a waiver may be requested, the entire protocol would have to better reflect this possibility.
- Age inclusion and exclusion. Have you considered adding the young and old to the *Exclusion Criteria* (p. 29, par. 5.2), then adding an option for them to take the vaccine as you did with pregnant women? After all, it may be difficult to deny the ambassador, or perhaps the young military or civilian dependents under these circumstances.
- Purpose. From conversations with John, I understand there are problems in stating what would seem to be the real usefulness of the study, i.e., the effects of post-exposure vaccination on the reduction/prevention of anthrax disease. (There are already far easier and more controllable ways to expand the information on acute adverse effects.) But do you have to consider the occurrence of anthrax disease as an *adverse event* (p. 34, par. 7.0)? Like studying an investigational meningococcal vaccine in the midst of an epidemic and saying you are just looking for adverse reactions?
- On the *Subjective Response Form* (app. C-2), maybe avoid describing the right-hand column as kind(s) of *reactions*, since they may or may not be related to the vaccine. The check boxes on the next form (app. C-3) are still a bit confusing. If you need it this way, maybe include a text box with an example of a completed one.
- The *Baseline Health Questionnaire* might be difficult to complete under the circumstances (app. D-2). Any option to complete it later?
- Would delete the human brain photo on the *Information Paper* (app. H-3) The hype could be considered coercive rather than informative.
- At eight pages, the *Informed Consent Form* is just too long (app. I) This might be a committee product also, but I would reduce to maximum of one or two pages. Maybe have available access to more detail, if requested (as you would with an investigator's brochure in an ordinary clinical trial).

(b)(6)

Medical Issues
July 19, 2001

- Specify OMSS-based f/u at 3000 recipients.
- Monitoring: OMSS would work for death hosp. Toleration. For rare events, would not suffice. N/3 is detectable.
- Survey will screen for non-serious events.
- Long term follow-up? Use OMSS
- Sent to MVNCB?

Requested comment on **Contingency Protocol for Vaccination of Volunteers with Anthrax Vaccine Adsorbed (AVA) to Protect against *Bacillus anthracis* Spores,** 1/31/01 draft, received March 26, 2001.

Frank: Here are some comments on this research protocol. The first two are in areas where OSAGWI has some experience from the Gulf War, so comments from this office might be most appropriate. The following ones are more about the purpose and design of the study, and you could delete them, if you think many other reviewers have already made these comments—or are better equipped to do so. This is not an easy reading protocol. The generally accepted elements of a clinical investigation (title, purpose, plan of study, hypothesis, research questions, IND status, etc.) do not seem clear or clearly organized. I'm still not entirely sure whether the portion I received (without the appendixes and consent form) is intended to be part of an IRB or IND submission, or something else. (b)(

Comments from OSAGWI experience:

- Record keeping. The experience of the Gulf War demonstrated an inability to maintain under field conditions the records required for investigational product use and good research. The investigator(s) will need to detail how this research requirement will be satisfied. It is not enough to simply say that the records will be kept, or point in the direction of existing DOD record keeping systems (electronic or paper), as experience has shown these systems to be unsatisfactory for investigational product research under deployment conditions. Record keeping provisions will be necessary for both data collection and for transfer of key elements to the individual health records. These requirements cannot be waived.
- Informed Consent. There was confusion during the Gulf War about whether investigational products were mandatory or voluntary, and a negative impact from that confusion. This proposal mentions only voluntary use accompanied by informed consent. It is not clear whether a request for waiver of informed consent is anticipated. If a waiver is anticipated, or may be requested at the time of use, this should be stated in the protocol. In this case, the research proposal should include an *information sheet* rather than a *consent form* (perhaps both if there is uncertainty about the requirement for informed consent), and some preconditioning risk communication. If the vaccine is only to be given on a voluntary basis, there might be concerns about degradation of the military operation by vaccine refusals, one reason for creating a mechanism for the waiver of informed consent during the Gulf War deployment. All of this, of course, applies only to military personnel; the inclusion of other than military subjects would further complicate this issue. Finally, it is questionable whether one could truly satisfy the elements of informed consent under the anticipated chaotic scene of a confirmed exposure, although this might be lessened in some study subjects by earlier risk communication. Fear alone would probably drive most subjects to the vaccine.

General Comments: (The authors may already have these comments from other reviewers.)

- The purpose of the study is confusing to me. For whatever reason, there seems to be a preoccupation with the study of short-term adverse events from the vaccine and less interest in the study of the post-exposure vaccination on the reduction/prevention of anthrax disease. The investigators indicate that the protocol is strictly to provide treatment, that the study data is not intended to support a labeling change, that the efficacy of anthrax vaccine for early treatment of exposure is not an endpoint of the study, and that the occurrence of any cases of anthrax disease will be evaluated as an adverse event (?). The distinction between treatment and research is an old and not very productive argument, unless this protocol can be classified under a Treatment IND. To me there is valuable information to be gained on the effectiveness of anthrax vaccine given in addition to antibiotic in preventing disease following anthrax inhalational exposure. Even if animal investigation and surrogate markers will allow approval for use in these indications, we should not pass up the opportunity to accomplish careful research in humans under conditions not otherwise possible.
- Presumably, this will be use of an approved product for an unapproved indication, and so would require IND status for this approved product. It seems this will be further complicated by the intention to use existing lots of vaccine that have not been released by the FDA, at least until there are sufficient stocks of released vaccine. The reasons why the vaccine lots have not been released may be of importance for both the safety of the subjects and the validity of the study results (E.g., if these preparations are more or less immunogenic or reactogenic, study results may be more difficult to interpret.)

- Th investigators may want to ensure that the methods of observing and recording adverse reactions/events are similar to those of earlier and ongoing studies, so that the information can be validly compared. There seems to be no provision for long term follow-up of the subjects. This might be an opportunity to study both short and long term adverse reactions/events in a group of subjects who will be in stress at the time of vaccination, and perhaps (and this is a long shot) shed some additional light on the hypothesis and limited research about the potential additive health effects of stress and immunizations. If we are just talking acute effects of the vaccine, there are already far easier and more controllable ways to expand this information.

MEMORANDUM FOR THE ASSISTANT SECRETARY OF DEFENSE (HEALTH AFFAIRS)

Subject. Exception to Policy for Priority II Anthrax Vaccinations for Selected AMC Personnel

1. Recommend approval of AMC's request (Enclosure A) that selected personnel be approved for anthrax immunizations as an exception to policy.

2 Personnel to be vaccinated under the exception would include strategic airlift crews, Ravens (security forces that travel with the aircraft and protect crews while on the ground at foreign airfields) and tactical airlift control elements (TALCEs) -- an estimated 4,250 personnel, including Active and Reserve Component personnel.

3 Service members are expected to deploy to designated higher-threat areas (HTAs) for more than 15 cumulative days in a 12-month period and are at heightened risk of anthrax exposure This request is supported by USCENTCOM, USEUCOM and USTRANSCOM

4. The Army, as the executive agent for the DOD Immunization Program for Biological Warfare Defense, concurred with critical comment (Enclosure B) Although vaccination of personnel who are in an HTA for cumulative deployments of greater than 15 days in a 12-month period was supported, the Army indicated that vaccinations should begin on an individual basis when the individual is first notified of a deployment or deploys into one of the HTAs for the first time

5 While this approach may be feasible for some Active Component personnel, significant advance planning is required to administer vaccinations to Reserve Component personnel Combined with the relatively short notice inherent in many airlift missions, it seems prudent to give the AMC commander discretion to vaccinate these personnel prior to actual notice of a deployment if it is deemed that they have a high probability of being deployed to an HTA. Furthermore, many of these personnel are expected to require smallpox immunizations under the current smallpox vaccination policy, and it will be much simpler logistically to administer both vaccinations at the same time.

6 TALCE personnel are subject to deployment at less than 12 hours notice to austere fields where medical logistic support to conduct vaccinations is often lacking. Therefore, immediate vaccination of those who are deemed to have a high probability of deploying to an HTA should be authorized.

7 Other Active personnel who have deployed to one of the designated HTAs within the past 12 months should also be authorized for immediate vaccination All other personnel should begin vaccinations as soon as they are designated for deployment to an HTA

MEMORANDUM FOR DIRECTOR, JOINT STAFF

SUBJECT Exception to Policy for Priority II Anthrax Vaccinations for Selected AMC Personnel

Request Joint Staff action on the attached Exception to Policy (ETP) request from AMC/SG (Attachment 1) Current DoD policy for requesting ETP for Priority II anthrax vaccinations requires recommendation from Combatant Commander, with final approval from ASD/HA in consultation with the Chairman, Joint Chiefs of Staff (USD/P&R Memo, 6 Aug 02) (Attachment 2)

Current DoD policy for Priority II anthrax vaccination requires personnel to be assigned or deployed to a higher threat area (HTA) greater than 15 consecutive days AMC strategic airlift aircrews, Ravens and Tactical Airlift Control Elements (TALCEs) are not usually in a HTA greater than 15 *consecutive* days, and therefore, are not authorized to receive anthrax vaccine under Priority Group II However, since many of the designated AMC personnel are in a HTA greater than 15 *cumulative* days, their risk for possible anthrax exposure is increased Therefore, request an ETP for AMC strategic airlift aircrews, Ravens and TALCEs (an estimated 4,250 personnel, including AD and ARC personnel) to receive anthrax vaccine now

Air Staff POCs on this issue are Brig Gen Robert Smolen, HQ USAF/XON (DSN (b)(6) , e-mail: (b)(6) @pentagon af mil) and Col Deneice Van Hook, HQ USAF/SGZP (DSN (b)(6) 5, e-mail (b)(6) @pentagon af mil)

MEMORANDUM FOR HQ AFMOA/SG

FROM HQ AMC/SG
203 West Losey Street, Suite 1600
Scott AFB IL 62225-5219

SUBJECT Request for Strategic Airlift Mission Exception to Policy Anthrax Vaccine Implementation Plan (AVIP)

1 Strategic air mobility assets routinely transit geographic areas identified as higher threat areas (HTAs) for anthrax, but are not included in the Air Force AVIP plan Due to their unique missions, AMC/SG requests an Exception to Policy, in accordance with Annex B of the Air Force AVIP 2002 Implementation Plan AMC has identified three specific missions for ETPs Tactical Airlift Control Elements (TALCEs), Strategic Airlift Aircrew Members, and Ravens

2 TALCFs, including their associated Global Reach Liaison (GRL) teams, are subject to rapid deployment (less than 12 hours notice) to austere fields in HTAs on average for 45 days TALCEs lack adequate pre-deployment time to provide an initial anthrax vaccination series (i e shots 1, 2 and 3) Additionally, they often lack the medical logistics support necessary to vaccinate in the field due to their far forward laydown Because of their mission criticality and logistical circumstances, TALCEs should be identified as Priority Two personnel

3 Due to the nature of strategic airlift, aircrew members assigned to this mission are unlikely to remain in place for 15 days or longer, but can be reasonably expected to exceed 15 cumulative days in a 12-month period IAW with instructions in Annex B of the Air Force AVIP 2002 plan, request that AMC and AMC gained C-5, C-17 C-141, and special airlift mission (C-32, C-37, C-40) crewmembers be granted an ETP to initiate immediate anthrax vaccination In addition, ETP to vaccinate Security Forces Ravens is also requested Ravens are specially trained security forces that travel with these aircraft and protect them while on the ground at foreign airfields These flyers and security forces should be identified as Priority Two personnel

4 The Command Surgeon, Headquarters Air Mobility Command, estimates the total number of affected personnel as 4,250 Please refer to the attached point paper for further details Should your staff have any questions, my POC is Lt Col (b)(6) DSN (b)(6) or (b)(6) @scott.af.mil

AVIP ETP Point Paper

POINT PAPER

ON

ANTHRAX VACCINE FOR STRATEGIC AIRLIFTERS

- The Air Force AVIP 2002 Implementation Plan directs anthrax vaccination for personnel assigned 15 consecutive days or longer to Higher Threat Areas (HTAs)
  - AVIP Plan specifically identifies vaccination policy for special missions and those assigned to HTAs and deployed as part of AEF buckets
  - AVIP Plan does not address those military personnel frequently transiting HTAs but not residing for ≥ 15 consecutive days – a frequent occurrence for strategic airlifters
  - AVIP Plan Annex B allows MAJCOM to submit Exception to Policy (ETP)
    - Plan specifically suggests strategic airlift personnel be considered for ETP when personnel can be expected to accumulate 15 days in a 12-month period
- C-5, C-17, C-141 and special airlift mission crewmembers routinely fly into the HTAs and are expected to exceed 15 days in a 12-month period It would be appropriate to vaccinate them based on their frequent exposure/rotation through these HTA
- Ravens, security forces accompanying these aircraft, provide aircraft security at off-station airfields, are also expected to exceed 15 days cumulative days in HTAs, and require similar anthrax vaccine protection
- Tactical Airlift Control Elements (TALCEs) and Global Reach Laydown teams provide initial aerial port, aircraft maintenance, and C2 for strategic airlift at far forward bases
  - Demanding mission has 12-hour deployment notice for 45-day missions
  - Do not have robust medical support, including routine access to vaccinations
  - They are AEF enablers, not tied to an AEF bucket, subject to deployment at any time
- Based on AMC functional inputs, AMC/SG estimates total AMC and AMC-gained personnel included in these proposals to be 4,250
  - Aircrew (1,000 Active Duty/ 2,350 Air Reserve Component), Ravens (250/220), TALCEs (430 all AD)
- Recommendation. Identify Strategic Airlift Aircrew, Ravens, and TALCEs as AVIP priority two personnel for immediate vaccination to adequately protect them prior to deployment

MEMORANDUM FOR SECRETARY, JOINT STAFF, ATTN: J-4 (Health Service Support Division), LTC (b)(6)

SUBJECT: Exception to Policy for Anthrax Vaccination for Selected AMC Personnel. (SJS 03-00355)

1. Concur only subject to the following critical comment

2. Critical comment We agree that certain personnel of the USAF Air Mobility Command (AMC) may be at increased risk of *Bacillus anthracis* exposure based on cumulative deployments of greater than 15 days in a twelve-month period; however, anthrax vaccinations should not begin to the entire force of 4,250 personnel immediately on approval of this request. Vaccinations should only begin on an individual basis, when that individual is first notified of deployment or deploys into one of the CJCS-designated High Threat Areas (HTA) for the first time Any deviation from this concept will result in a non-concurrence.

Rationale: The alert status of AMC's subject personnel does not justify immediate vaccination Their alert status is no different than other Services' alert forces (e.g., Division Ready Brigades within Army Divisions), which are not being vaccinated. Rather, on notice of actual deployment these forces begin vaccinating if they fall within the other parameters of the DoD Anthrax Vaccine Immunization Program policy.

Further, current DoD contingency AVA requirements, coupled with competing AVA requests from both U S Federal Agencies and foreign nations, constrain DoD's anthrax vaccine supplies until May 03

ACTION MEMO

February 27, 2003, 4:00 P.M.

FOR: ASSISTANT SECRETARY OF DEFENSE (HEALTH AFFAIRS)

FROM: Ms. Ellen P. Embrey, DASD, Force Health Protection and Readiness

SUBJECT: Request for Coordination on Exception to Policy for Priority-2 Anthrax Vaccinations for Selected Air Force Air Mobility Command (AMC) Personnel.

- The Director, Joint Staff endorsed a recommendation by the Air Force to vaccinate selected AMC personnel against anthrax as an exception to policy (TAB B).
- This request includes 4,250 personnel, including strategic airlift crews, Ravens (security forces that protect aircraft and aircrews while transiting foreign airfields), and tactical airlift control elements (TALCEs).
- MILVAX is concerned that all personnel will be immediately vaccinated.

RECOMMENDATION: Sign memorandum requesting coordination at TAB A.

COORDINATION: TAB C.

MEMORANDUM FOR DEPUTY UNDER SECRETARY OF DEFENSE (TSP&CP)
DEPUTY TO THE ASSISTANT SECRETARY OF DEFENSE (CBD)

SUBJECT: Exception to Policy for Priority-2 Anthrax Vaccinations for Selected Air Force Air Mobility Command (AMC) Personnel.

Request coordination no later than COB Friday, February 28, on the attached draft action memo and exception to policy memorandum for selected AMC personnel.

The draft memorandum grants an exception to policy for priority-2 anthrax vaccinations that was requested by the Air Force and endorsed by the Joint Staff for selected Air Mobility Command personnel. These selected mission personnel may be in high risk threat areas for a 15-day cumulative or greater time frame.

If you have any questions regarding this matter, please contact CDR (b)(6) at (b)(6) Please fax your coordination to (b)(6).

William Winkenwerder Jr., MD

THE ASSISTANT SECRETARY OF DEFENSE
WASHINGTON, DC 20301-1200

HEALTH AFFAIRS

MEMORANDUM FOR DIRECTOR, THE JOINT STAFF
COMMANDER, AIR MOBILITY COMMAND

SUBJECT: Exception to Policy for Priority-2 Anthrax Vaccinations for Selected Air Force Air Mobility Command (AMC) Personnel.

REFERENCE: Under Secretary of Defense (Personnel and Readiness) memorandum, "Policy on Administrative Issues Related to the Anthrax Vaccine Immunization Program (AVIP)," August 6, 2002.

In accordance with the above reference, an exception to policy is approved for Tactical Airlift Control Elements (TALCEs), Strategic Airlift Aircrew Members, and Security Forces Ravens. Begin vaccinating strategic airlift crews now, and Raven security and Tactical Airlift Control Element personnel when they receive their first order to a designated high threat area.

Execution of this vaccination program is per previously published clinical and administrative guidelines and consistent with existing Service implementation plans. The Secretary of the Army remains the Executive Agent for the Anthrax Vaccine Immunization Program (AVIP). Questions regarding this matter shall be directed to COL Gaston Randolph, Director of the MILVAX-AVIP agency a(b)(6).

Memorandum Number 085-03

MEMORANDUM FOR SECRETARY, JOINT STAFF, ATTN: J-4 (Health Service Support Division), LTC Jones

SUBJECT: Exception to Policy for Anthrax Vaccination for Selected AMC Personnel, (SJS 03-00355)

1. Concur only subject to the following critical comment

2. Critical comment We agree that certain personnel of the USAF Air Mobility Command (AMC) may be at increased risk of *Bacillus anthracis* exposure based on cumulative deployments of greater than 15 days in a twelve-month period; however, anthrax vaccinations should not begin to the entire force of 4,250 personnel immediately on approval of this request. Vaccinations should only begin on an individual basis, when that individual is first notified of deployment or deploys into one of the CJCS-designated High Threat Areas (HTA) for the first time Any deviation from this concept will result in a non-concurrence.

Rationale: The alert status of AMC's subject personnel does not justify immediate vaccination Their alert status is no different than other Services' alert forces (e.g , Division Ready Brigades within Army Divisions), which are not being vaccinated. Rather, on notice of actual deployment these forces begin vaccinating if they fall within the other parameters of the DoD Anthrax Vaccine Immunization Program policy.

Further, current DoD contingency AVA requirements, coupled with competing AVA requests from both U S Federal Agencies and foreign nations, constrain DoD's anthrax vaccine supplies until May 03

MEMORANDUM FOR DIRECTOR, THE JOINT STAFF
COMMANDER, AIR MOBILITY COMMAND

SUBJECT: Request for Exception to Policy for Priority II Anthrax Vaccinations for Selected AMC Personnel

REFERENCE: Under Secretary of Defense (Personnel and Readiness) memorandum, "Policy on Administrative Issues Related to the Anthrax Vaccine Immunization Program (AVIP)," August 6, 2002

In accordance with the above reference, an exception to policy is approved for Tactical Airlift Control Elements (TALCEs), Strategic Airlift Aircrew Members, and Security Forces Ravens to be immediately vaccinated against anthrax.

Execution of this vaccination program is per previously published clinical and administrative guidelines and consistent with existing Service implementation plans. The Secretary of the Army remains the Executive Agent for the Anthrax Vaccine Immunization Program (AVIP). Questions regarding this matter shall be directed to COL Gaston Randolph, Director of the MILVAX-AVIP agency. He can be reached at (b)(6).

MEMORANDUM FOR THE ASSISTANT SECRETARY OF DEFENSE (HEALTH AFFAIRS)

Subject: Designation of US Coast Guard's National Strike Force as an Anthrax Vaccination Immunization Program (AVIP) Special Mission Unit

1. The US Coast Guard has requested that the members of its National Strike Force be designated as a Special Mission Unit (Priority 1) under the DOD AVIP (enclosure).

2. The Coast Guard has assigned 213 active duty personnel into three National Strike Teams (NSTs) capable of providing critical response and decontamination support to facilities contaminated with anthrax spores. In the past, this unit has deployed and supported activities such as decontamination of the Hart building in Washington, D.C. The Coast Guard has stated that the NSTs will continue to respond to anthrax contamination in the foreseeable future.

3. This request was coordinated with the Army as the executive agency for the DOD Immunization Program for Biological Warfare Defense.

4. I concur in this request and recommend that the USCG National Strike Force be designated as a special mission unit and that all personnel assigned to this unit receive anthrax immunizations based on that priority.

JAMES A. HAWKINS

MEMORANDUM

TJ BARRETT
Acting

From THOMAS H COLLINS
COMDT (G-C)

Reply to G-WK
Attn of. RADM Joyce Johnson
(b)(6)

To Department of Defense, Joint Staff, ATTN Joint Staff Surgeon

Subj DESIGNATION OF U.S COAST GUARD'S NATIONAL STRIKE FORCE AS AN AVIP SPECIAL MISSION UNIT

Ref (a) COMDTINST M6230 3A, Coast Guard Anthrax Vaccine Immunization Program (AVIP), page 2
(b) CDC document, Antimicrobial Prophylaxis to Prevent Anthrax Among Decontamination/Cleanup workers Responding to an Intentional Distribution of *Bacillus anthracis*, dtd 22 Oct 01

1 I request that the U S Coast Guard's National Strike Force be designated as an AVIP Special Mission Unit As per reference (a), this will mandate anthrax immunization as a priority 1 unit The U S Coast Guard's National Strike Force includes 213 deployable active duty members divided into three different response teams (National Strike Teams (NSTs)). One mission performed in October-December 2001 was to respond to and perform decontamination efforts in areas known to be contaminated with anthrax Under current mission profiles, the NSTs will respond to anthrax contamination sites for the foreseeable future

2 Reference (b) describes the potential for breaches of protection and the contamination of workers using appropriate personal protection equipment Due to this potential for increased exposure during repeated deployments into contaminated anthrax areas, we request Anthrax vaccine to immunize Strike Team members that are at-risk of exposure due to mission requirements Designation as a Special Mission Unit will allow these at-risk military members to receive licensed anthrax vaccine IAW reference (a), thus ensuring maximum protection for our personnel with the potential to be repeatedly exposed to anthrax contaminated sites.

3 It is our intention to utilize only NST members who have been immunized with the anthrax vaccine as our primary responders to anthrax decontamination sites in the future. Currently, only six Strike Team personnel have begun the anthrax vaccine series Immunizing all Strike Team personnel will ensure that we are ready to respond immediately to any future anthrax contamination site Current projections to start most personnel with three doses of vaccine and bring those previously started in the program up-to-date would require 633 doses

4 My Point of Contact for this matter is RADM Joyce M Johnson at (b)(6)

MAR 1 8 2003

MEMORANDUM FOR DIRECTOR, THE JOINT STAFF
COMMANDANT OF THE U S COAST GUARD

SUBJECT Designation of U S Coast Guard's National Strike Force for Anthrax Vaccine Immunization Program (AVIP)

REFERENCE: Deputy Secretary of Defense "Reintroduction of the Anthrax Vaccine Immunization Program (AVIP)," June 28, 2002

The referenced memorandum authorizes inclusion in the AVIP of additional personnel at higher risk of exposure to anthrax based on performance of critical capabilities.

The increasing threat of the use of weapons of mass destruction makes it essential that we have a critical response and decontamination capability like the U S Coast Guard's National Strike Force.

Therefore, I approve inclusion of the U.S Coast Guard's National Strike Force, involving approximately 213 active duty members, in current AVIP implementation. Execution of the AVIP for these personnel is under the authority of the Commandant of the Coast Guard.

This determination is effective immediately COL Gaston Randolph, Director of the AVIP-MILVAX Agency is the point of contact for any question on this matter He can be contacted at (b)(6)

FOR: DEPUTY ASSISTANT SECRETARY OF DEFENSE (FORCE HEALTH PROTECTION & READINESS)

FROM: COL David Adams, Program Director, Strategic Plans and Policy

SUBJECT: Joint Operational Concept for Biological Warfare Defense

- The Joint Staff/J8 is staffing a proposed joint staff policy memo (TAB B) containing an operational concept for biological warfare defense. This appears to be bridge guidance until a formal joint doctrine publication is produced. There are many areas that impact the health service support capabilities of the DoD. While the document presents a good first start, it has some serious shortcomings. TAB A provides our comments on the document.

RECOMMENDATION: FHP&R sign the memo at TAB A to forward our comments to the J8.

COORDINATION: TAB C

DEC 0 4 2002

MEMORANDUM FOR JOINT STAFF/J8 (JRO-CBRND)

SUBJECT: Joint Operational Concept for Biological Warfare Defense

Thank you for the opportunity to review the Joint Operational Concept for Biological Warfare Defense document provided in your memorandum dated November 8, 2002. We believe that the document contains the basis for a useful operational concept, but it requires some additional work. The document should not only bridge the guidance shortfall until the publication of a revised Joint Publication 3-1 1, but should also provide the justification and framework for joint tactics, techniques, and procedures on biological warfare defense.

Our specific comments are attached. My point of contact is COL Dan Sulka, Program Director, Operational Health Support, (b)(6)

Ellen P. Embrey
Deputy Assistant Secretary of Defense
Force Health Protection and Readiness

Attachment: As stated

Comments: Joint Operational Concept for Biological Warfare Defense

General

(Critical) There are numerous areas in the main body and in the appendixes where "issues" are raised but not resolved. To be consistent with the stated purpose of the document, any text that raises issues or identifies shortfalls must be re-written to provide policy guidance or a solution.

(Critical) Appendix D contains an exhaustive list of statements of shortfalls or actions that must be accomplished in order for this policy and concept of operations to be successfully applied. These "assumptions," for which the CONOPS will not be executable, must instead be stated in a directive manner with specific responsibility for the enabling task identified. The joint staff can do this for the Combatant Commanders and to a degree the service components. However, OSD and Defense Agencies' responsibilities should be stated up front in the main document in a section titled "assumptions."

(Major) Overall structure of the document is flawed. The appendixes contain critical information that should be in the body of the document and the main document contains details that should be addressed in an appendix.

(Major) It is way too long and should be edited and structured to focus the appropriate content to the appropriate audience. As it stands, responsibilities for activities are unclear. It should be organized to state specific responsibilities and activities of:

- OCONUS (deployed) combatant commanders and their service components executing current bio-defense activities during contingency operations.

- OCONUS combatant commanders and service components in garrison/training to include responsibility for overseas family members, DOD civilians and support contractors.

- CONUS (but including AK and HI combatant commanders/ Service components) and the military services executing Title 10 base operations and domestic force protection.

- CONUS (including AK and HI) Combatant Commanders (NORTHCOM, STRATCOM, JFCOM) and military services for support of Homeland Defense and DOD support of Department of Homeland Security and other federal agency bio-defense missions and responses.

(Major) The document does an inadequate job articulating the intelligence function and assigning responsibilities at the strategic, operational and tactical levels for biological warfare intelligence. The intelligence prep of the battle space should be part of the "Sense" grouping of activities.

(Major) The document should have a single comprehensive and integrated threat section; currently, discussion of the threats, means of dispersal, agent effectiveness, and vulnerabilities is scattered throughout the document. It should be organized based on the structure suggested above.

(Major) Although the document is comprehensive and touches on the things that it needs to touch on, it does not tie together the roles and responsibilities that the operational, training and doctrine, materiel development and medical communities all have in executing a coordinated whole. As written, each would appear to be able to execute their roles and responsibilities independently and perhaps at odds with the others.

(Major) There are a number of "The Commander/Combatant Command will determine their capability to" or "their priority for" statements throughout the document along with a clear admission (page 14) that these organizations do not have the personnel qualified to do either task. If this is the case, this operational concept needs to articulate the linkages and assist in determining achievable capability (there aren't enough detectors to go around, regardless of how important a particular commander feels his particular mission is) and a meaningful and executable priority list.

(Major) The document does not address patient evacuation guidelines.

(Significant) Throughout the document there is reference to the JCS Threat list. Since this is a classified document, there should be instruction in the document on how to gain access.

(Administrative) There should be a reference section. There should be a glossary because many terms are introduced or used that may not be familiar to the general audience for this policy memo.

Specific:

(Major) Page 1: The use of the term "principle" is overused, incorrect, and confusing. Sense, Shape, Shield, and Sustain are major groupings of activities; the categories of other actions listed under each of these should be called "components." There are a number of true strategic/operational principles buried in the document that should be elevated. These include "maintain and maximize mission accomplishment" (Page 2), "simultaneous execution of B W activities" (Page 2), "BW defense is an ongoing process not just a contingency mission for overseas deployed forces" (Page 2), "must include integration of military and civilian elements, local and federal agencies as well as allied or host nation" (Page 2.), "situational awareness" (Page 3), and "non-proliferation and counter-proliferation" (Page 4).

(Significant) Page 1, "SHAPE": Include a discussion or the model of operational risk management found in a variety of current DoD publications, to include Joint Staff memorandum MCM 0006-02 dated Feb 02, 2002, to describe the "implications to the joint force commander."

(Critical) Page 1, "SHAPE": There appears in the fifth line the phrase, "...envisions critical sense, shield, and sustain end states." Neither in this paragraph nor elsewhere in the document are these "end states" clearly articulated. This is absolutely critical later (page 12) in the discussion of "Commander's Guidance" and "commanders intent" of which end state is the most critical element.

(Significant) Page 4, "SHAPE": Vaccines should be included in this list because they also shape vulnerabilities.

(Major) Page 4, para a: "Move Intelligence Preparation of the Battle Space (Strategic/ Operational biological warfare Vulnerability Analysis)" from "SHAPE" to the "SENSE." This will be consistent with page 1 treatment of intelligence. In addition, split this into two functions: "Intelligence Preparation of the Battle Space" and "Strategic /Operational Biological Warfare Vulnerability Analysis." There are more functional inputs in the vulnerability analysis business than intelligence. These include operational, political, and medical. Also, keep "vulnerability analysis" in "SHAPE."

(Significant) Page 5, "SHIELD": Include Medical Countermeasures.

(Critical) Page 5, para b: There needs to be a much more comprehensive albeit generic articulation of the threat. The critical problem with the current text is that it only addresses characteristics of scale and effectiveness of a "biological attack." This policy memo is titled "biological warfare"; the level of discussion of threat should be at the warfare theory level initially and then address the current strategic/political nature of BW, e.g. use by nation states through non-nation actors. The anthrax "attacks" in the fall of 2001, for example, may have been a criminal act but not biological warfare. For the echelons of DoD and other federal agencies this memo touches, these are critical distinctions.

(Critical) Page 6, first line: The idea of BW fusion centers appears for the first time here and follows many other times in the document. As this memo intends to establish a concept of operation for BW defense and this element appears to be a critical component of it, this document must better define what this fusion center does, how and where it is organized in the joint force commanders headquarters, and establish staff leadership/responsibility for B W defense operations.

(Significant) Page 6, para c: Re-title this paragraph to "environmental surveillance." Preventive medicine personnel do many types of this work, but in some Services, other communities are involved. This will also help distinguish this function from Page 7, para d, titled "Medical Surveillance," much of which is also the responsibility of the preventive medicine community.

(Significant) Page 8, "Biological Detection Operations": This section should address false alarms and/or alarm verification.

(Administrative) Page 11: "ATP-45" is not defined.

(Major) Page 12, para a: Disassociate "Intell Prep of the Battle Space" from vulnerability analysis and move it to "SENSE" discussion. Include discussion of operational risk management paradigm in the remaining text of this paragraph.

(Major) Page 12, para a, third paragraph: Delete the word "permanent" from the description of the biological warfare red team unless the document here or somewhere else assigns this responsibility for organizing and resourcing this capability to an organization.

(Major) Page 13: "Specific biological warfare medical and technical defense priorities for mission accomplishment must be established before the actual initiation of biological warfare" sounds very much like we intend to initiate offensive biological warfare. This sentence should be rewritten.

(Critical) Page 14, para f: There is inadequate description of readiness measures and reporting requirements and associated metrics. This needs to be a more important, probably stand-alone, portion of the document.

(Critical) Page 14 para h: Delete "information management" from the title as it will confuse the IT community. More importantly, this paragraph must briefly discuss the concept of risk communication as a function of command information and public affairs.

(Major) Page 14, para i, last two lines: These state the Services and Combatant Commanders establish requirements for BW defense experts. Instead, it should state that the Combatant Commanders, through the current requirements generation process (e.g. JWCA / JROC) establish requirements for "biological warfare defense capabilities." The Services must develop the force structure, materiel, and personnel to fulfill the requirements.

(Major) Page 16: Vaccinations and public knowledge of the use of countermeasures may have a deterrent effect on enemy biological agent use.

(Major) Page 16: This section should address plans for mortuary services for contaminated bodies.

(Major) Page 18: At this point in the document it is clear the concept of operations has not fully recognized the seminal difference between chemical and biological weapons, i.e. the time between exposure and onset of effects. It is difficult to point out each instance that leads up to this cumulative sense, but it is most obvious in the area of physical collective and individual protection. The discussions of physical protection do recognize, in passing, that for biological weapons, wearing a mask or remaining in a collective shelter will be a long-term experience. However, they then launch into the resource constraints of providing this for all who need it rather than the wholesale impracticality of determining when to start and stop providing protection or how to control the resulting panic. Appendix A does a better job of facing this head on, but still glosses over the previous threat assessment that any attack will be covert rather than obvious.

(Major) Page 18-19: There may be a need here for guidance on sanitizing the mask and changing filters.

(Significant) Page 21, 4th para: Incorrect use of the term "levels of care" despite the attempt in a footnote to clarify. Should not attempt to create a new definition, instead replace with phrase "standards of care" here and in paragraph above.

(Major) Page 23, **para** e: This paragraph should briefly articulate the conceptual difference between chemical warfare decontamination and biological warfare restoration (cleaning/ disinfecting) to establish the foundation later for the joint tactics, techniques, and procedures. It is a good discussion of standards, but must be placed in the context of a CONOPS for restoring the environment back to a "safe" condition, whether that is a building, a room, or a base.

(Critical) Appendix A, "Near Term Implementation": If this appendix is retained substantially, it must be formatted to specifically identify organizational and /or command responsibility for each of the actions.

(Significant) Page A-4, **para** b: Use of the term "units" is confusing. The document should indicate the size of unit as companies or squadrons that may not **resourced** to execute the tasks that follow.

(Major) Page A-5, **para** e: The policy must define what "detection of a biological attack" means in order to start the six-hour prophylaxis clock. Does it involve laboratory confirmation?

(Major) Page A-5, **para** e: Remove the example for smallpox; too much detail for this section. If the JCS policy needs to address specific biological warfare agents, it should do so in an appendix or annex and reference any OSD policy details/guidance on the particular vaccine.

(Major) Page A-6, **para f:** This paragraph introduces a "waiver" without explanation. The waiver process should be included. It is unclear if the paragraph refers to the waiver of informed consent (which requires presidential action), waiver of restrictions on reporting, or what.

(Major) Page A-6, **para** h: This paragraph addresses quarantine. There should be similar discussion concerning evacuation or non-combatant evacuation operations as options to protect forces/DOD members from BW attack.

(Critical) Page A-7, **para** j : As written, this paragraph states that "until medical surveillance in **DoD** is standardized and **routine...all MTFs** will sample **from** 10 percent of all persons exhibiting non-specific flu-like symptoms, and analyze . . . samples for the agents on the JCS threat list." This is an onerous and unreasonable requirement knowing that the majority of visits to treatment facilities fall into the "non-specific flu-like symptoms" category. If the intent of the paragraph is to have this occur only when directed by the Commander, it should be rewritten. It should also clarify which commander.

(Significant) Page A-7, **para** k: There should be discussion and guidance on writing Status of Forces Agreements and alliance procedures to permit transportation of biological samples.

(Major) Page A-8, **para** n: The concept should define "first responders" in both a domestic operations context as well as in a military context, i.e. define of a military first responder.

(Major) Page A-9, **para** b: There is no day-to-day garrison /training base DNBI reporting. The requirement exists only in JCS MCM 0006-02 for contingency/deployed operations. There is, however, a reportable medical events system based on the HHS model.

(Major) Page A-l 1, **para** 5: This post-attack list omits the critical function of cleaning, disinfecting, and validation/confirmation of these efforts.

(Significant) Page B-1&2: Increase the scale of the graphic and provide step-by-step guidelines for use of the scale. Suggest doing a single page for each BW agent and include other **agent-**spccific information such as agent characteristics, possible delivery mechanisms, health effects, etc. Then, rename the appendix.

TO DJS	THRU	ORIG SUSPENSE	20 Dec 02

SUBJECT Joint Operational Concept for Biological Warfare Defense

EXECUTIVE SUMMARY

1. Purpose. To obtain the **DJS** signature on Memorandum for the Chairman, approving the release of the Joint Operational Concept for Biological Warfare (BW) Defense.

2. Discussion

a. The DPG-04 tasked the CJCS with the development of a BW CONOPS. The J8/ JRO and the J5/ Nuc&CP contracted with the Institute for Defense Analysis (IDA) to facilitate the development of a BW Defense Operational Concept, which better meets the DPG intent. The DPG-04 also tasks the USD (AT&L), in conjunction with the Joint Staff, with developing alternative funding strategies to allow the implementation of the BW defense concept.

b. The completed Joint Operational Concept for BW Defense is broad enough to be applied to military operations, force protection, and homeland security but is primarily focused on the Joint Force Commanders' operations. It creates an operational framework that permits the Services and Combatant Commands to develop more detailed CONOPS and doctrine, while also delivering the USD (AT&L) the operational requirements to initiate development of funding strategies.

3. Recommendation. DJS sign Memorandum for the Chairman, approving the release of the Joint Operational Concept for Biological Warfare (BW) Defense.

MEMORANDUM FOR: Distribution List

Subject: Joint Operational Concept for Biological Warfare Defense

1. The Joint Operational Concept for Biological Warfare (BW) Defense is based on broad principles, not on specific capabilities. This interim guidance is provided under the guidance of the Chairman of the Joint Chiefs of Staff. It sets forth guidance to supplement existing doctrine to govern joint activities and performance of the Armed Forces of the United States in joint operations and multinational and interagency operations. This fills a current void in joint doctrine and will serve as the initial concept that will formalized through a follow-on revision of Joint Publication 3- 11 "Joint Doctrine for Operations in a Nuclear, Biological, and Chemical (NBC) Environments."

2. The scope of this document is to provide an operational framework that assist the Joint Force Commander and their staff in successfully conducting military operations and providing force protection for forces that are both mobile (air, sea, and land) and positioned at fixed sites against an adversary's use of biological weapons. This concept addresses issues involving biological agents directed against the US armed forces personnel and equipment, not those employed specifically against civilian populations, crops, and livestock. The principles contained within apply to joint, multi-national, and interagency operations.

3. The purpose of this document in Enclosure A is to provide joint force commanders with a guide to facilitate successfully plan and execute operations in a biological environment. It also provides the foundation for future joint, multi-service, service doctrine, and tactics, techniques, procedures (TTPs). Additionally, it supports developing future operational capabilities. This concept enables the identification of integrated solutions across the Joint Doctrine, Organization, Training, Material, Leader Development, Personnel, and Facilities (DOTMLPF) domain.

4. The document is organized under four operational principles for Chemical, Biological, Radiological, and Nuclear (CBRN) defense; SENSE, SHAPE, SHIELD, and SUSTAIN. These principles provide a framework that support joint operations more effectively that the current doctrinal framework of "Avoid – Protect – Decon" which does not fully incorporate the challenges of biological warfare defense, nor does it provide the necessary flexibility to address the challenges that a capabilities based force could face on a future battlefield. SENSE, SHAPE, SHIELD, and SUSTAIN are more overarching and flexible and will be incorporated into future CBRN doctrinal revisions.

5. The Joint Staff points of contact is [redacted] (b)(6)

AN OPERATIONAL CONCEPT FOR BIOLOGICAL DEFENSE

NOVEMBER 5, 2002

TABLE OF CONTENTS

1. Introduction

This document recommends an initial operational concept for biological defense. While biological agent may be directly introduced into food and water or delivered by a vector; this concept concentrates on **aerosolized** biological agent defense. The concept melds existing medical and veterinary procedures for food, water, and vectors into the overall biological defense operational concept. This operational concept organizes biological defense under four principles: Sense, Shape, Shield, and Sustain. The definitions of these principles follow.

Sense

Provides the current biological warfare situation by collecting operational, intelligence, and logistical information, by detecting sampling, and by identifying biological agents in air, water, on land, and on surfaces in flora, fauna, and personnel. This principle includes the capability to diagnose and quantify the hazard. The capability also enables the continued monitoring and identification of biological agent hazards in support of operational planning and execution, shielding, and sustaining decisions. Sense is the key enabler for shaping the battlespace, using knowledge-based human and artificial intelligence.

Shape

Provides the capability to characterize the biological hazard, and its implications to the joint force commander. This biological hazard characterization is the process by which the joint force commander develops a clear understanding of the current and predicted biological warfare defense situation; envisions critical sense, shield, and sustain end states; and visualizes the sequence of events that moves the joint force from its current state to those end states. The shaping process assimilates manually and automatically collected information from military forces, coalition allies, host nation, and non-governmental organizations in near real time to inform operational courses of action. Shaping the battlespace accomplishes the mission.

Shield

Prevents or reduces biological casualties by reducing and/or preventing exposure to biological agent through physical protection or by providing medical prophylaxis from the agent effects. Shielding maintains force capability.

Sustain

Maintains combat power. Capabilities identified in this area are applicable to medical and non-medical operations. Sustain the force recognizes that personnel/units may become exposed to, or have to operate in, a contaminated environment, thus requiring the ability to treat ill personnel or reconstitute units/facilities to pre-incident operational capability as soon as possible.

These principles are not listed in any priority, and they must be executed simultaneously. Each principle has several individual elements under it (see section 2.a., Organization). For example, under the principle of Sense are the elements of medical surveillance and biological detector operations. Note from Figure 1 (page 3) that all principles are interconnected:

2. Operational Concept

For maximum effectiveness, a biological warfare defense operational concept must be standard among the Combatant Commands and Services, and must be well coordinated with other military and civilian entities. The operational concept objective is to maintain and maximize mission accomplishment in the face of biological warfare attacks. Implementing this operational concept requires joint standards, joint actionable criteria, and joint. procedures for biological defense and biological attack warning. The concept must be implemented through all levels of command. This implementation will be costly (in dollars and people) and will require time. Biological warfare has enormous potential to negate military and civilian capability. It will have significant national and international political impact, as well as a public relations or public confidence impact. The use of biological weapons may change public responses or population behavior in a time of crisis.

The implications of biological warfare defense are much broader than just defending the active military. The use of biological agents[1] against military installations will expose civilians and family members on the installation, as well as civilians and/or non-U.S. forces in the surrounding area. Biological defense is more than a joint and combined operation; it is an ongoing process that includes all members of the U.S. military, family members, civilian employees, and local, state, and national government agencies of the United States, as well as the military and civilian elements of other countries, especially allies.

[1] In this operational concept, biological agents are any preparation of disease-causing organisms or toxins that can be disseminated into the environment to affect humans, plants, or animals. Additionally, in some cases the disease itself can be spread by vectors, which are living hosts such as mosquitoes or humans, and which can transmit a disease to other humans, plants, or animals.

CONOPS

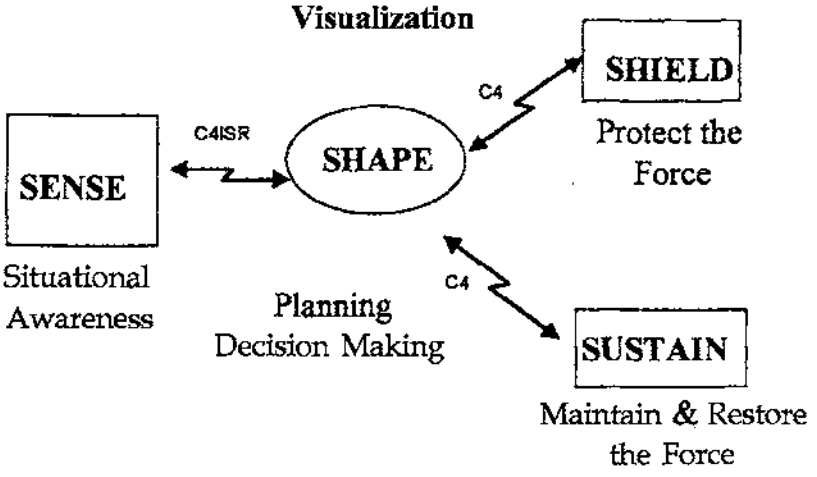

Figure 1. Operational Concept Principles

In today's asymmetric environment, the highest probability of biological weapon use will likely be covert release, as opposed to use of standard military delivery systems2 (e.g., aircraft and missiles). Attacks on civilian targets also can have significant impact on military effectiveness without causing military casualties. These effects could range from denial of civilian facilities and movement restrictions to loss of infrastructure and industrial base.

The principles of biological defense stated in this document – Sense, Shape, Shield, and Sustain – apply across the spectrum of combat and non-combat operations, from a major theater of war (joint maneuver forces and facilities in active combat) to CONUS installations in peacetime.

Implementation of the principles and elements at the tactical level will vary by priority, resources, and mission. For example, biological warfare situational awareness in some units or installations may be more heavily focused on epidemiological detection due to the scarcity of technical detection devices. Counterproliferation and non-proliferation actions, while not 100 percent effective , defend the force and civilians against biological warfare. This operational concept recognizes the contribution of major, more conventional counterproliferation actions such as missile defense and counter-force operations, but does not address them specifically. It also recognizes that,

---

[2] The United States' overwhelming technical and operational military capability will most likely cause a potential enemy to choose covert delivery systems, such as special operations personnel on foot or using cars or small private craft for sea or air delivery.

across the Combatant Commands and Services, there are many biological defense initiatives under way.

Non-proliferation and counterproliferation plans and policies are an integral part of defeating the biological warfare threat. These actions, normally in the purview of regional Combatant Commands, national level government agencies, and the senior political leadership of the country, are essential to all biological warfare defense capabilities. Any actions that prevent the possible initiation of a biological warfare capability or remediation of an attack enhance the biological warfare defense capability of the force.

a. Organization. The following sections of this document discuss the four principles and their included elements. These principles, and the elements of each, are listed below.

- **SENSE: Gain and Maintain Biological Warfare Defense Situational Awareness**

  Environmental surveillance
  Medical surveillance
  Epidemiological analysis and detection
  Conventional combat surveillance and intelligence
  Biological agent detection operations
  sampling
  Identification
  Warning and reporting

- **SHAPE: Minimize U.S. vulnerabilities to Biological Warfare Agents by influencing U.S., Allied, and opponent capabilities**

  Intelligence Preparation of the Battle Space (Strategic/ Operational biological warfare Vulnerability Analysis)
  Commanders Guidance
  Planning
  Prioritization
  Alternative Courses of Action for Mission Accomplishment
  Readiness
  Information Operations
  Public Relations, Media Relations and Information Management
  Education, Training, and Exercise
  Liaison and Communication
  Decision-making and criteria
  Non-proliferation and counterproliferation
  Biological Defense
  Operational/ Fusion Centers
  Special Considerations

- SHIELD: **Protect the Force**

  Individual protection
  Collective protection
  Medical Protection
  Conventional Defense

- SUSTAIN: **Maintain or restore military operations; focused logistics**

  Medical treatment
  Quarantine
  Individual Replacement and Unit Replacement
  Logistics
  Decontamination
  Mortuary Affairs

b. Threat. The scale of biological attacks can vary from a biological agent employed as an assassination weapon against an individual; in food and water against a limited target; in a covert aerosol against a fixed facility; or released as a long-line-source, eventually covering thousands of square kilometers. The primary threat to military operations is aerosolized biological agent. The effectiveness of an aerosol attack can vary enormously (see Appendix C for technical considerations). This variability is, in general, unpredictable. Commanders should assume that third world countries and non-state actors are at least as capable as the U.S. biological warfare program was in the 1960s.

3. Sense: Gain and Maintain Biological Warfare Defense Situational Awareness

The elements of sensing the battle space for biological warfare defense operations are discussed below. Situational awareness, as with all military actions, is required for mission success. Situational awareness for biological defense derives from several sources: aerosol background surveillance, meteorological surveillance, medical surveillance, conventional combat situational awareness (air defense radars, etc.), intelligence, logistical status, force readiness status, and technical biological detection (biological detection devices). Situational awareness specifically includes awareness of possible attacks against agricultural or other economic targets. Biological warfare defense situational awareness must be established and maintained by Commanders at all levels.

Biological warfare situational awareness requires the dedication of assets to maintain a current picture, as close to real time as possible, of any indicator of biological warfare use, as well as a worldwide picture of background events and environments that may hide or indicate biological weapon use. Data must be

collected, processed, correlated, and reviewed in central fusion centers to integrate multiple and unique indicators of biological weapon use. These data must be recorded and validated for potential forensic use or for determining attack attribution. These same centers must be able to differentiate endemic disease outbreaks from biological attacks.

The elements of biological warfare situational awareness are detailed below. The assets required vary from biological detection units to epidemiologists, meteorologists, veterinarians, physicians, specialized biological warfare defense experts, unique intelligence and environmental collection systems, laboratories, and logistical support for systems, units, and personnel. Personnel assets include appropriate liaison to and from other nations, other U.S. government agencies, and state and local authorities, etc.

a. Aerosol Background Surveillance

Current and future biological detection and identification capability is and will be affected by the environmental background; for example, the amount of organic and inorganic material in the air. Aerosol background data are required to support the implementation of detection plans within areas of responsibility (AORs) and will assist in determining detection strategies and tactics, techniques, and procedures (TTPs) at the operational and user level. The interaction of environmental background must be understood and defined to maximize the capability of technical detection and identification systems.

b. Meteorological Surveillance

Meteorology- is a significant variable in biological warfare offense and defense planning. Meteorological conditions determine where and if an agent cloud will travel significant distances downwind (10 -100 kilometers (km)) or only cover a local area (less than 10 km downwind travel). Changes in wind speed and humidity may change detector system performance; changes in humidity can change agent characteristics such as particle size or decay rate. Commanders and staffs must be aware of meteorological conditions at their level, the level above and the level below their commands. As well as comprehensive real-time meteorology, detailed meteorological records must be maintained for post-attack analysis.

c. Preventive Medicine Surveillance

Non-aerosol risks from biological agent include contamination of food and water and other items that personnel regularly come into contact with. Monitoring these potential routes of entry, which we term "preventative medicine surveillance," must be conducted on a regular basis. The Services currently field teams that test air, water, soil, flora and fauna for endemic disease hazards. Information from these activities must be fused with traditional biological weapon intelligence and information to provide a more

complete biological hazard picture, as well as to guard against non-aerosol attacks.

d. Medical Surveillance

As part of their routine operations, Combatant Commands, with their components, must conduct AOR-wide medical surveillance. Medical surveillance is a feature of biological warfare defense situational awareness. The "background" level of illness must be known to determine changes indicative of a biological warfare attack. The medical surveillance system will be standardized throughout the AOR, and to the extent possible coordinated with existing U.S. regional and national system(s) and those of other countries. At a minimum, input from other non-U.S. national systems will be collected and monitored as a source of medical surveillance. The medical surveillance system must provide timely information on the specifics of morbidity in the U.S. and allied force structure, the U.S. population, and the population of other nations as appropriate to the AOR.

e. Epidemiological Analysis and Detection

Epidemiological analysis is the study and processing of data/indications provided by medical surveillance. This analysis processes the surveillance data provided and determines when there are "anomalies" in the normal or expected incidents of disease. Epidemiological detection – the outcome of the analysis – is the identification of a pattern of disease within a population of people as a result of a biological attack. For the near future, epidemiological detection will be the most likely source of information on forces exposed to biological agents.

The actions possible after an epidemiological detection are more limited than those taken after a technical detection since operational reaction time is lost and personnel are already casualties. The response options are prophylaxis, treatment, and alternative courses of action for mission accomplishment. In general, prophylaxis will be ineffective for those personnel already showing signs of disease. There already will be a demand on the medical treatment system without the opportunity to prepare for the initial influx of casualties. Although casualties are the first indication of a biological warfare attack, other units or areas may be protected by immediate prophylaxis, or medical treatment responses may be initiated.

There must be initial standard criteria – common among the Combatant Commands and Services – that define and determine that an attack has occurred, based on epidemiological analysis of medical surveillance data. The number of criteria must be limited and rapidly available for decision-making. Reaction to a biological warfare attack must be rapid. The more numerous and more complex the criteria, the longer the reaction time before response may be initiated, and the less effective the response.

f. Conventional Combat Surveillance and Intelligence

Conventional combat indications and warning (such as an air defense attack warning, increased meteorological radar activity, etc.) must be collected and monitored as part of biological warfare situational awareness. While not definitive, when fused with other data, such as current meteorology, this level of information can contribute to indications and warning of a biological agent release.

Biological agents may be effectively delivered by any conventional military system. However, larger, longer-range systems such as aircraft and missiles are more efficient than are small arms and artillery. Current information on aircraft flight paths, ship tracks, and missile paths also may provide an indication of a biological weapon attack and the basis for initiating protection. For example, an aircraft or a ship track perpendicular to the wind and upwind of the force may be a biological agent release indicator. Detection units may then be placed on a different collection schedule,3 or forces may assume a higher physical protection level. As an example, current Air Force doctrine tells all airbase personnel to take protection in the event of an enemy missile launch. Other installations or units may be directed to adopt the same doctrine given the short flight time for missile impact in AORs.

Commanders routinely access and use intelligence and, in general, understand the process for establishing collection requirements and the sources of intelligence. Biological defense requires more emphasis on the unique area of medical intelligence and personnel who understand the field.

g. Biological Agent Detection Operations

Biological agent detection operations consist of the employment of biological detection devices. Current biological detectors are limited in number and capability. Once the operational and strategic vulnerability analysis is completed, employment of these limited assets may be planned for greatest operational payoff (see section 4. 3.). Other issues for detection include detector capability in the local AOR environment, forward positioning of detection assets in peacetime, and scheduling detection units in the strategic flow of forces.

The Combatant Commands should prioritize the employment of available biological detection capability. Currently, there is no DoD process or system that provides information on the configuration and density of biological agent

[3] This operational concept recommends continuous use of all available biological detection assets. Depending on the technology in use, Commanders may wish to change the normal processing and analytical cycle for samples within a time-distance proximity to a suspicious conventional delivery system (aircraft missile etc.).

detection assets and the resulting effectiveness. Joint and Service analytical resources should be tasked to assist in detector placement guidance.

When a biological detection system indicates the presence of a biological agent, either by specific identification or by generic agent[4] presence indicators, response must be initiated based on pre-existing criteria. Current systems such as the BIDS, BIDS P3I, IBDS, Portal Shield, and JBPDS[5] provide agent-specific identification as an output. The BIDS and BIDS P3I can provide generic information of possible agent presence. The M-94 LRBSDS provides generic attack indication based on aerosol cloud shape. Recently, a commercial off-the-shelf (COTS) collection process has been established using a dry filter aerosol collector called a Dry Filter Unit (DFU). The aerosol material is continuously collected and then manually dissolved into liquid and tested by a DoD detector kit (hand held assay) or forwarded to a laboratory for testing. Laboratory testing of DFU samples provides greater sensitivity and specificity than does the hand-held assay.

There is no standard for response based on type and number of biological detection system indications. Guidance must be provided on number and type of indications for action, and what action to take. For example, to reduce false alarm rates, some current systems require two positive identifications before declaring a biological attack. Currently, the action then is to assume MOPP 4 (Mission-Oriented Protective Posture-4). Given the time lag of todays biological point detection capability, Commanders may wish to consider different actions, e.g., not masking but initiating immediate prophylaxis.

h. Sampling

Sampling is the process of collecting material from the environment or from personnel. Environmental samples will likely provide agent (the organism or toxin) along with growth media, fillers, natural background material, etc. Medical samples taken from exposed personnel will likely provide the organism, toxin, or markers of their presence. The reasons for sampling range from agent/ disease identification to providing senior political leaders with scientific evidence of a biological agent attack.

---

[4] For the purposes of this paper, identification means specifying the pathogen or toxin to the disease level; e.g., botulinurn toxin, not botulinum toxin type A. A generic agent presence indicator is a single or multiple set of device outputs, such as the presence of organic particles; size, shape, and distribution of organism sizes; etc.; that could indicate the presence of agent in the environment.

[5] BIDS, Biological Detection System; BIDS P3I, BIDS Preplanned Product Improvement; IBDS, Interim Biological Detection System; JBPDS, Joint Biological Point Detection System; LRBSDS, Long Range Biological Stand-off Detection System.

Within the AOR and across the Components. Commanders must establish standard procedures for sample collection, handling, chain of custody, transportation, and processing. The preparation, preservation, and transportation of samples and the material required to do so must beavailable and standardized throughout the force. Allies should be encouraged to adopt the U.S.-defined method. Allied laboratories offer additional capabilities that the Commander should consider. Guidance for sampling must be promulgated and implemented throughout the force.

i. Identification

For operational purposes, identification means specifying the disease-causing organism or toxin at the "disease level," e.g., anthrax, plague, SEB toxin, etc. Identification is important for all aspects of biological warfare defense because it is the start of effect characterization and specific countermeasures. Currently, there is an informal hierarchy of identification definitions within DoD. Terms such as "presumptive," "silver standard," and "gold standard" identification are used, but not defined. Further, there are no criteria for action based on this informal identification hierarchy. The Services and Combatant Commands should consider standardizing technical detector identification and medical identification with the national laboratory response network. For example, an automated detector or a hand-held assay might be comparable to a level A laboratory, while the USAMRIID laboratory would be a level D facility. This congruence between the military and civilian systems will avoid possible confusion and enhance both homeland defense and military-oriented biological defense.

The definition- of identification must be standardized. Because identification can come from multiple technical or medical sources, the definition must be keyed to its source and must include such information as sensitivity, probability of false positive/false negative identification, etc. Within the AOR, these standards are necessary to provide information with a known confidence level that will assist Commanders in developing actionable criteria.

The identification of the agent, the source of the identification, and when it occurs drive the options available to the Combatant Commander. For example, if a technical detector indicates anthrax, there is some period of time to implement prophylaxis. Additionally, since the agent/disease is known, the best available prophylactic can be chosen, and disease-specific treatment preparations can be initiated. If the identification is for an agent that does not have prophylaxis available, alternative courses of action for mission accomplishment may be implemented and agent-specific personnel treatment regimes may be prepared. If the Commander must wait for identification from epidemiological or medical sources, the same actions generally apply, except the options for response are now time-constrained; alternate courses of action for mission accomplishment and casualty treatment become priorities.

Laboratory assets are the most reliable contributors or enablers of identification. Given the political sensitivity of nations when addressing the transport and analyses of potential biological agent samples, laboratory capability must be available in each country within the AOR where significant U.S. forces are deployed.

j. Warning and Reporting

Warning and reporting are required to coordinate and enhance surveillance, detection, and identification, as well as to take advantage of information to minimize personnel exposure.

Within the AOR, a standard joint system of reporting suspected and actual biological attacks must be established. The Commander must specify what information is required, who issues warnings and reports, whom they should be sent to, and what circumstances require the issuance of warnings and reports. For example, under current ATP-45 procedures, biological agent detection in one city or area of the AOR would not be forwarded throughout the entire AOR. **While the Regional Command or Theater Commander may have** such procedures, there is no overall standard. Further, within the AOR, this system must be capable of incorporating *warnings* **from** non-DoD and non-U.S. sources as *well as warning* non-DoD and non-U.S. organizations, e.g., local U.S. civilian organizations, coalition allies, other non-allied countries, etc.

The Combatant Commands must determine criteria for issuing warnings and reports. These criteria are a basis for actions taken, and are based on situational awareness.

The ability to conduct warning and reporting requires that warning and reporting centers be established (see page 16, section m.). These centers also can serve as or be part of the data/intelligence fusion centers for all information/data that contribute to the determination of biological weapon use. At the theater level, there must be a specified warning and reporting center for biological warfare defense, empowered to provide information to senior DoD leadership. Warnings and reports, if inadvertently made public, could influence policy, resources, and politics.

4. Shape: Minimize U.S. Vulnerabilities to Biological Warfare Agents by Influencing U.S., Allied, and Opponent Capabilities; Shape the Battle Space by Biological Defense Actions and Plans

The elements of shaping the battle space for biological defense are discussed below. Shaping is much broader and more detailed in implementation than can be described here. While this operational concept specifically addresses how to shape biological defense, biological defense shapes the overall battle space. Shaping is the command, leadership, planning, and intellectual aspect of biological defense

a. Intelligence Preparation of the Battle Space (Strategic/ Operational Biological Warfare Vulnerability Analysis)

All operations involve intelligence preparation of the battle space. In the case of biological weapons, the force must look at strategic mission accomplishment and how biological warfare could be used to counter strategic success, as well as more detailed vulnerability analysis at operational and tactical levels. Within a specific AOR, the effects of terrain, climatology,. population demographics, and time must be analyzed to determine potential impacts on missionaccomplishment.

These vulnerability analyses should examine all facets of the operational plans (OPLANS), assigned and implied missions, and how, where, and when mission accomplishment could be negated or disrupted by biological agent attacks. Examples could include the loss of an early deploying carrier, or an attack on a continental United States (CONUS) facility, such as a force projection node, a satellite control center, or a long-range bomber base. It is important to note that some key operational facilities are not DoD controlled, but nonetheless require biological defense protection.

As the Combatant Commands and Components conduct their vulnerability analyses, the Commands should coordinate with OSD and JS to conduct an overarching review of OPLAN interaction, as well as other biological warfare vulnerabilities of the national military strategy. This must be an ongoing process with a permanent biological warfare red team in place to identify military vulnerabilities. An example of a red teams investigation might be the effect of biological agent release on the national/international civil air transportation system while the U.S. is conducting or preparing to conduct a major theater deployment.

b. Commanders Guidance

The Commanders guidance or intent is integral to military planning and operations. All Services, all Soldiers, Sailors, Airmen, and Marines are familiar with the concept and the implementation of Commanders guidance. In the case of biological warfare defense, this is a new and unique area for Commanders to state their intent. Few Commanders have a true working knowledge of biological warfare weapons and agent effects. Further, few Commands have staffs with adequate expertise to assist Commanders in biological warfare defense. Not only does the Commander have to critically assess and determine risk from biological warfare, but also he/she must be able to understand the technical and medical implications of biological warfare defense. Commanders, particularly at the operational level, will be required to provide guidance for biological warfare defense operations across the Service Components and subordinate units that have varying biological warfare defense capability. Ultimately it is the Commander who decides the level of

biological warfare defense and asset allocation. Specific areas that could be included in the Commanders guidance are detailed in the section 4.k. below.

c. Planning

For biological defense as with all other activities, planning is central to the successful initiation and continuity for all operations. Biological defense planning must be integrated throughout the planning cycle, taking into consideration threats and vulnerabilities. It is critical in addressing the logistical, medical, host nation, and coalition issues that will arise and it must extend down from the strategic/operational level to the tactical implementation level. Plans must include sufficient guidance to standardize biological warfare defense operations, including medical operations, across the AOR and Component Commands. Depending on the AOR, both U.S. and non-U.S. forces, other government agencies, non-government agencies, and state and local agencies may have to be involved in biological warfare defense planning and execution.

d. Prioritization

While normally conducted in the planning process, operational prioritization is emphasized separately in this operational concept because of the potential for disruption as a result of a biological attack. While mission accomplishment priorities are not expected to change in a biological environment, operational and logistical priorities may. Specific biological warfare medical and technical defense priorities for mission accomplishment must be established before the actual initiation of biological warfare, remembering that such warfare can be delivered covertly by non-traditional systems in "peacetime." Priorities could include placement of medical and detection units earlier in the time-phased force deployment list (TPFDL), allocating air defense, allocating additional ground security forces, or assigning mobile detection units.

e. Alternative Courses of Action for Mission Accomplishment

In addition to planning for the implementation of biological defense measures, plans also must be in place to continue mission accomplishment and to assure a strategic force flow, despite a successful attack. Mission accomplishment contingency plans must begin with those elements (personnel, units, facilities, schedules) identified in vulnerability analyses and the potential effect of biological weapon attacks on those elements and on mission accomplishment. Once this has been done, alternative courses of action must be prepared and resourced. Biological warfare may require unit replacement of U.S. or coalition forces, the use of alternative facilities, or the substitution of capabilities on a large scale; alternative courses of action also must address the loss of allied or neutral bases or over-flight routes.

f. Readiness

Within the AOR and extending to supporting Commands and Services, a system must be established for measuring and reporting biological defense readiness. This readiness-reporting requirement may be combined with or integrated into existing procedures or systems. What constitutes biological warfare defense readiness must be defined and promulgated; example readiness indicators could include: prepared and resourced plans and current operations; status of situational awareness capability; the ability to provide prophylaxis; the ability to treat biological casualties; and the status of biological warfare defense personnel.

g. Information Operations

Information Operations (IO) are applied to all realms of combat and peacetime operations. Biological defense IO missions range from depriving an opponent the capability to develop and target biological weapons to depriving the opponent any information on the effectiveness of an attack.

h. Public Relations, Media Relations, and Information Management

Because of the uniqueness of biological warfare and the associated fear of the unknown, information management must be in place, and releasable information must be prepared and standardized before any incident takes place. Information must be internally coordinated across DoD and with U.S. local, state, and federal agencies; standardized and coordinated nationally with other organizations, such as the Center for Disease Control and Prevention (CDC) and state and local authorities; consistent and objective in its dissemination to the force, and to the public; and available to the public in the area of responsibility. Commanders must establish criteria and guidelines for what is releasable and when to release information.

i. Education, Training, and Exercise

Implementing the operational concept presented in this paper requires personnel specifically educated and trained in biological defense and supporting academic disciplines, such as meteorology, medicine, and biology. Once the biological defense operational concept is implemented, it must be aggressively, realistically, and regularly exercised and translated throughout multi-Service and Service-specific doctrine.

The Services have dedicated NBC defense personnel, but no biological defense experts per se; rather, current NBC defense personnel are generalists, or specialists in chemical warfare defense. The DoD has a limited expertise, generally found in highly qualified medical or acquisition personnel.

The Services and the Combatant Commands must establish requirements for biological warfare defense experts and associated personnel, to include the

number of positions to be filled, position/performance criteria, and requisite education.

The Combatant Commands, the Components, and the Services must ensure that adequate and realistic biological warfare defense exercises are adequately resourced and conducted, and that biological warfare defense is properly integrated into other exercises. Exercising responses to biological warfare attack can be extremely difficult; large numbers of personnel are required to act as patients or to support medical operations. While not all biological warfare defense exercises are conducive to the general training of the entire force, they are extremely important to the realistic training and appraisal of biological defense capability.

j. Liaison and Communication

Liaison is a normally implemented military process; however, for biological defense, the liaison and communication requirements may be quite different. Many biological warfare defense issues will be medical and may involve the CDC, the Department of Health and Human Services (DHHS), and the Food and Drug Administration (FDA) in the U.S. and similar national organizations through out the AOR. Liaison for biological warfare defense will call for special talents (infectious disease physicians, epidemiologists, etc.) and also will require language skills or translators. Because of the sensational nature and fear associated with biological warfare effects, special liaisons may be required at the national political level, as well as with the media, across the AOR.

k. Decision-making Criteria

Decision (or action) criteria must be established and standardized before any biological warfare attack; some of the more important decision criteria, and related decisions Commanders must make, follow:

- Establish criteria for action, based on:
  - o epidemiological detection
  - o the output of technical biological detection devices
  - o indications and warning
  - o identification.
- Establish a set of standard definitions and performance descriptors for identification.
- Determine warning and reporting criteria, based on current capabilities[6] and mission risk tolerance.

[6] Current capabilities mean those assets, systems, doctrines, units, personnel, etc., in the force today.

- Establish physical protection criteria, based on mission accomplishment and risk and criteria for masking and unmasking.
- Maintain a list of approved and investigational new drugs (IND), as well as standard guidance for such issues as informed consent. Maintain planning guidance on the expected effectiveness of prophylaxis.
- Deterrnine the requirements for prophylaxes, resource the capabilities to prophylax personnel, and establish criteria for administration.
- Establish requirements for and capabilities to treat personnel at all levels of care (e.g., from heroic care to field expedient care; this criterion refers to the quality and quantity of care provided the patients, not level 1,2,3 medical facilities). This operational concept assumes the medical system will be overwhelmed and unable to provide the normal high. quality of care planned for "conventional" warfare, with respectively fewer trauma cases. Combatant Commands and the Services must plan for and resource the medical treatment of mass biological casualties.
- Establish criteria for residual biological agent safety and contamination determination.

Before and during the decision-making process, Commanders should realize that there always will be considerable uncertainty in a biological warfare situation. Unknowns and assumptions must be explicitly specified. For example, the extent of the attack, the infectivity of the agent, and the effectiveness of prophylaxis and treatments all will be unknown to different degrees. More information will become available over time, allowing refinement or reconsideration of actions;. however, actions must be implemented early, taking into account this high level of uncertainty.

1. Non-proliferation and Counterproliferation

Non-proliferation and counterproliferation plans, policies, and actions are an integral part of shaping the environment. These actions – normally within the purview of Regional Combatant Commands, national level government agencies, and the senior political leadership of the country – are essential to the shaping process. Counter force and active defense resources provide significant capability; these capabilities and the plans for their employment must be considered and coordinated with biological defense capabilities and plans.

m. Biological Defense Operational/ Fusion Centers

Commanders should establish biological warfare defense centers as a critical component of existing operations centers in the force, maintaining the common biological defense operational picture and manned with biological warfare defense experts who can analyze relevant data and provide the Commander recommendations on appropriate countermeasures taken in response to an attack. These centers should be the Commanders primary advisors for implementing the elements within the principles of sense, shape, shield, and sustain.

n. Special Considerations

Although the Regional Commands are guided by the requirements of their specific AORs, TRANSCOM has uniquely broad concerns encompassing not only the biological defenses of each theater, but also the health and safety standards of the U.S., countries through which personnel and materiel must transit, and countries from which the United States requires overflight permission. In order to carry out the missions of moving personnel and equipment to and from the region of conflict, TRANSCOM will have to apply the principles and elements of this operational concept to its facilities worldwide. This will entail especially broad coordination with all Combatant Commands, as well as with U.S. and foreign governmental agencies.

5. Shield: Protect the Force

Shielding encompasses those direct physical measures that *prevent exposure* ofpersonnel to agent and/or disease, and direct medical actions that *prevent the occurrence of* the disease. The requirements to protect active military forces, family members, civilian employees, contract employees, etc., regardless of location and nationality, must be taken into account. This operational concept supports implementation of DoD Memorandum September 5, 2002; Subject: Preparedness of the U.S. Military Installations and Facilities Worldwide Against Chemical, Biological. Radiological, Nuclear and High-Yield Explosive (CBRNE) Attack [Reference 1].

Physical protection describes any means of preventing direct physical exposure from agent; it normally is composed of individual protection and collective protection. For biological agents, the primary goal of physical protection is the prevention of agent inhalation since, for most agents, inhalation exposure causes the most severe manifestation of the disease. Physical protection, particularly individual physical protection, may degrade task performance, thus degrading unit and facility performance; the degree of degradation depends on the type of physical protection, level of training, acclimatization, duration of protection, work activity, and meteorological conditions.

Once the vulnerability analyses are completed and those personnel, units, and facilities critical for mission accomplishment have been identified, the mission-specific requirements for physical protection must be determined. For example, based on vulnerability and mission criticality, units or facilities that currently do not have collective or individual protection could be issued DoD individual protective equipment or provided COTS equipment to reduce exposure and risk.

a. Individual Protection

Traditionally, individual protection has been synonymous with MOPP gear. MOPP gear provides extremely good protection from biological agents but, in fact, only the mask is normally required. The most important aspect is timing: when to put it on and when to take it off.

The criteria for masking must consider the threat, the source of the biological agent warning, meteorological conditions, the agent, and the mission risk. Masking after epidemiological identification has no benefit unless the agent is contagious[7]; masking after point sensor identification may have benefit, depending on meteorological conditions, position of detection, position of personnel, and the time elapsed between when warning was received and the individual masked.[8]

Currently, there are no standard unmasking procedures after a biological attack. Unmasking guidance must be developed based on source of warning, point(s) of detection, time since warning, unit position, etc. Criteria should be standard among the Combatant Commands and Services, except for the mission risk component.

Commanders may opt for COTS individual protection devices such as dust masks, surgical masks etc.; if properly chosen and worn during an attack, these devices will reduce the level of exposure. COTS protective equipment will not prevent all causalities but, depending on the agent, may reduce the number of lethalities and the total number of affected personnel. Since it is unlikely that personnel will know an attack is occurring, individual protection may have to warn on a continuous basis (see Appendix A for near-term guidance.) The decision to utilize commercial off-the-shelf masks requires further technical analysis to ensure adequate protection and the development

[7] Masks will limit exposure from airborne particulate matter. AOR and local medical and operational SOPs are required to address the procedures for contagious personnel/ agents in operational settings.

[8] If the weather is extremely calm, agent may stay in the area of release for hours; masking would reduce initial exposure. For other than "calm" conditions, masking in the immediate area following warning likely does not reduce exposure. Masking personnel in downwind areas should reduce exposure given adequate warning time.

of TTPs. *The best respiratory protection is the standard military issue protective mask.*

Because individual protection also is the first response for chemical warfare and radiological warfare protection, masking and unmasking procedures for chemical, biological, and radiological (CBR) defense must be coordinated across Combatant Commands and Services to ensure proper protection from all three threats, while at the same time avoiding confusion.

b. Collective Protection

Traditionally, collective protection describes the prevention of biological agent entry into facilities, rooms, or vehicles. Collective protection systems normally provide filtered air with sufficient over-pressure to prevent agent seepage into the protected space; collective protection facilities require air locks and entry-exit procedures.

Unless the facilities are operational at all times, the issue of when to start and when to stop operating collective protective systems, or when to enter and when to exit such facilities, is paramount. The best way to avoid exposure is to operate collective protection continuously and have as many personnel in collective protection as possible. Given resource limitations and mission accomplishment requirements, the Commander should publish priorities for collective protection installation and guidance for operation.

c. Medical Protection

Given the capability of biological weapons to cause mass casualties and the limitations of technical detection, medical protection will be the primary biological warfare defense response. These measures must be planned, prepared, and, in some cases, implemented prior to exposure.

Prophylaxes are those medical measures taken to prevent the occurrence of a disease; they may be administered pre- or post-exposure, depending on the particular agent and specific medical countermeasure(s). For example, the anthrax vaccine is a prophylaxis administered pre-exposure. Ciprofloxicin, administered post-exposure but before symptoms appear, also is an accepted prophylaxis for anthrax. Administering prophylaxes requires careful planning and preparation, not just from an operational and logistical perspective but also for medical and legal reasons.[9] (See Appendix B for graphics portraying

[9] Law and regulation approve drugs for a specific "purpose and application." Before a particular drug has full FDA approval, it is described as an "investigational new drug" (IND). Using a drug for a purpose for which it was not approved is considered "off label." IND and off-label use require the informed and voluntary consent of the person receiving the drug.

information on the course of diseases and time windows for detection and prophylaxis administration.)

There is no standard reference for the effectiveness of prophylaxis (how often the disease is prevented or to what degree symptoms are reduced). Standard accepted planning guidance is required to estimate the effectiveness of prophylaxis. Each Command should develop planning information that includes the expected percent of personnel casualties avoided given administration of prophylaxis, by time after exposure (one day, two days etc.) and by agents, relevant to their AOR, from the JCS threat list.

A list of approved drugs and investigational new drugs for prophylaxis and treatment of biological agent exposure must be centrally maintained and coordinated among the Combatant Commands and the Services. It is imperative that OSD and JS maintain ongoing coordination with the FDA and other government agencies as required, thus ensuring the best and most timely information is available to the Commands and Services who will have to execute prophylaxis. Plans must be in place that address all aspects of prophylactic implementation, conform with the requirements for informed consent, state how much material is required, where it is stored, how soon can it can be administered, what the possible side effects are, what might be possible political considerations to U.S. implementation, etc. Prophylaxis includes pre-exposure vaccination; given the threat of biological weapon use, the pre-exposure administration of an effective vaccine to the force enhances mission accomplishment, increases survival, and reduces logistical demands.

d. Conventional Defense

All aspects of conventional defense shield the force from biologic&l warfare attacks; each aircraft or missile destroyed before reaching the target eliminates a potential biological warfare threat. Local security, physical security, and patrolling all deter covert releases or increase the chance of intercepting the release before it happens. Security forces, military and civilian, must be educated on biological warfare agents and possible covert or field-expedient release mechanisms.

6. Sustain: Maintain or Restore Military Operations

Restoration operations encompass those actions required to bring the force, or portions of the force, back to pre-biological attack capability. These operations include actions ranging from medical treatment of personnel to unit replacement to decontamination..

a. Medical Treatment

Medical treatment describes those medical measures taken when personnel show signs of illness. Treatments vary for different diseases; some diseases caused by biological agents have no specific treatments. For example, the agent

SEB, a toxin of *Staphylococcus Aureus* bacteria, was weaponized in the now-defunct U.S. offensive program and still has no specific treatment. Where there is no specific treatment to counter a disease, medical personnel treat to alleviate or lessen symptoms. Toxins, with the exception of botulinum, and viral diseases generally are treated symptomatically rather than with agent/ disease-specific medical countermeasures. Antibiotics are typically used to treat bacterial infections.

The current military medical system has a dual mission: to maintain the health of the peacetime force, including family members and retirees, and to support the force in wartime by saving life and limb and, where possible, returning personnel to duty. The current medical force structure and procedures are based on historical trauma workloads and are not designed to support mass casualties from infectious agents or toxins. For example, all personnel on fiied facilities such as air-bases or base clusters, or amphibious forces afloat, could be exposed to agent and require treatment; ground maneuver forces'treatment requirements could range from a battalion to major portions of a deployed corps.

The requirements for and the capability to treat patients at the various levels of care, in terms of required medical personnel, units, and material, must be determined, as a successful biological attack will dramatically increase medical requirements. The capability to provide care and the level of care provided must be balanced against the vulnerability analysis, available resources, mission accomplishment, and medical treatment requirements.

Levels of care[10] must be established and standardized throughout the AOR. Current military medical assets could and would provide "heroic" care to a small number of biological casualties, but the potential for biological warfare mass casualties is so great and so varied that Commanders must recognize that, at some level of resources, care must be constrained. Medical planners also should anticipate an increase in the "worried well" – those persons who are concerned but are not suffering psychological effects – as well as those persons exhibiting the psychological effects of biological warfare on the force. Medical doctrine must specifically address the response to mass biological warfare casualties.

Once capability and planning requirements are determined, medical contingency planning must be initiated. As a minimum, plans must address the capabilities to treat personnel, requirements for force structure, evacuation policy/ capability, quarantine, and the resulting effect on mission accomplishment. Evacuation of personnel exposed to biological warfare agents or potentially exposed to biological warfare agents also may be a sensitive political issue: while most biological warfare agents are not contagious, there is a generalized fear of biological warfare. Non-U.S. national and/or U.S. state

[10] As stated earlier, level of care refers to quality and quantity of care, not the facility level.

and local authorities may deny passage of patients through territories pending some assurance of safe passage, etc. Commanders may be required to maintain large numbers of casualties or potentially exposed personnel in theater (in medical facilities or transient facilities), increasing the demand for force structure and resources. Additionally, depending on the agents and course of disease, evacuation assets may be extremely limited due to requirements for specialized equipment, such as respirators onboard aircraft or limitations on contracted commercial assets to transport biological warfare casualties.

Additionally, medical facilities/units may require augmentation by non-medical personnel to provide non-medical support, e.g., laundry, cleaning, feeding, etc. Augmentation of medical assets must be factored into biological warfare defense planning and other operational requirements. A further, consideration should be the possible use of "in-unit care," defined as supporting sick personnel with food, shelter, sanitation, and medication (if available and feasible) without the supervision of medical personnel within the individual's assigned unit.[11]

b. Quarantine

Quarantine of a facility or a unit poses a diverse set of challenges, from the national political level through the tactical level. Combatant Commands not only will have to establish and maintain quarantine, they also will have to deal with the political and public reactions and ramifications in their respective AORs. Contingency plans for quarantine should consider mission accomplishment, legal status of civilians in quarantine area, support for the quarantined areas or organizations, quarantine enforcement, and public relations.

c. Individual Replacement and Unit Replacement

Depending on the scale of the attack, the agent, its effectiveness, etc., Commands may be faced with the requirement to replace individual personnel or entire units to maintain mission capability. Commanders should establish key individual and unit skills' and capabilities' replacement priorities, as well as plans to replace such individuals or units.

d. Logistics

There is a logistical component to all elements of this operational concept. Some elements, such as biological detection operations and prophylaxis, may have special requirements for timeliness and storage/ transportation conditions; for example, refrigeration may be required to maintain shelf life. Medical treatments for mass biological warfare casualties

[11] By definition, this is not "military medical care," Medical care is provided within the military medical system.

will create a logistical demand not normally planned for or resourced. Additionally, conducting logistical operations in a biological warfare environment may be constrained or complicated by medical and legal requirements in addition to the effects and risks of biological warfare on logistical capability.

e. Decontamination

The issue of decontamination and risk standards are not new or unique to biological warfare defense. DoD-wide and perhaps DOD/national interagency standards must be established. Biological safety and exposure standards pose a difficult problem: the DoD standard must be acceptable and scientifically defensible in the U.S. and among other nations. And whatever standards are eventually adopted, there must be a commensurate public relations effort to ensure public acceptance and acceptance of risk for military operations. These standards must be thoroughly coordinated and interwoven through the operational concept to ensure all facets are executable. In the absence of DoD standards, Combatant Commanders should establish AOR-specific standards and coordinate among the Commands and Services.

f. Mortuary Operations

Fatalities caused by biological warfare may have unique mortuary requirements. There is the possibility of negative public and other non-U.S. government reaction to the handling and transport of these casualties due to the fear of the unknown, and biological warfare in general. All Commands and agencies must have plans and resources to properly process, inter, and transport mass fatalities while considering operational necessity, human dignity, and family and public feelings and emotions.

APPENDIX A

NEAR-TERM IMPLEMENTATION

1. Introduction

This Appendix summarizes aspects of the operational concept and is designed to apply to current operations; it recommends specific actions and criteria based on current biological warfare defense capabilities.

A current capability approach to biological defense and a chronology is presented below; specific actions then are presented. The key issues discussed are before exposure/ attack planning; resourcing; and rehearsing.

2. Kev Points

The importance of actions taken before the event cannot be over-emphasized. Prior planning and rapid execution are imperative; it is better to act and be wrong than not to act. Even if prophylaxis is under way, it can be halted if there is a subsequent determination of no agent exposure/attack.

Large numbers of increasingly ill and dying personnel and the resulting degradation of operational capability likely will characterize biological attacks. Effects of biological attacks can be mitigated by:

- 3 pre-exposure prophylaxis that provide immunity for some agents
- the use of collective and individual protection during the attack
- 3 prompt post-exposure prophylaxis for some agents.

Maintaining key military capability requires that units/facilities plan for and implement protective measures in advance of need.

Biological agents are invisible and have no taste, smell, or other obvious signature. Moreover, because small amounts of agent can have widespread effects, it is particularly suitable for covert dissemination. Currently, the only way to know that biological agents are present is through the use of tactical point detectors. Several types of detectors exist, but all operational detectors provide indication that an attack has taken place, rather than warning of approaching agent. Hence, current detectors cannot be used to trigger the use of individual or collective protection systems. For some agents, however, this indication is sufficiently rapid that post-exposure medical measures can be effective if implemented quickly. In the absence of tactical detectors, the fact that an attack occurred will be apparent only when increasing numbers of individuals become sick and are diagnosed with agent-induced diseases. At this point, it usually will be too late to preserve unit operational capability. Unit replacement or alternative courses of action are required for mission accomplishment.

A current capability approach to biological defense is outlined here:

- 3 Identify and prioritize key units and facilities that must be protected from biological agents to help guide the allocation of resources.

- Plan against biological attacks. Planning encompasses use of detection systems, laboratory support, medical preparations, and determination of actions to be taken in the event of biological attack. Identify those events that would signal a biological attack has occurred. For all units, but especially for those units for which prompt detection and protection might be lacking, prepare contingency plans in the event that a biological attack renders the unit non-mission-capable.
- Vaccinate or pre-treat all personnel against threat agents where such measures can be taken.
- Deploy and operate tactical detectors at critical sites. Because of the covert threat, operate those detectors continuously.
- Where collective protection exists, operate it continuously.
- Conduct medical surveillance and epidemiological analysis continuously
- Establish a biological warfare identification laboratory capability in each country within each AOR. An in-country laboratory capability eliminates the need for cross-border transportation of suspected biological warfare agent samples.
- Ensure that post-exposure prophylaxes are available and can be applied to potentially exposed personnel within no more than six hours after detection, including the decision time to use them.
- For critical units and facilities, consider the continuous or shift-based use of respiratory masks to protect against agents for which treatments are not available or where detectors are not present.
- Be prepared to handle mass biological casualties, prep&e medical contingency plans, exercise and rehearse the plans, and stock the required material.
- Tram all personnel, military and civilian, on biological warfare threats consequences, and response plans.

2. Before

This section is a summary of actions taken before the attack. Planning, resourcing, and exercising these actions/procedures will allow immediate and more effective transition to immediate after the attack actions.

a. Knowledge / People

Commanders will establish a core of personnel with the appropriate knowledge to plan and execute biological defense (including medical) through consequence management. Personnel should be organic to the facility and/or the organization and be full time, as opposed to part time or additional duty.

b. Establish Current Biological Warfare Defense Capabilities

Commanders of installations and units will establish their current biological defense capabilities; this includes the ability to determine an attack has occurred and to respond to such an attack. Evaluation for consequence management will be conducted on the basis of assumed exposure for the personnel at the unit and/or facility, as required by Reference 1. This assessment will be conducted for the agents on the JCS threat list that apply for the specific AOR, and should establish criteria for requesting augmentation as required.

c. Threat, Risk, and Response

It is imperative to establish a threat and response process based on the capability to defend against biological warfare, the mission, and acceptable risk. Response must include alternative operational courses of action to replace functions, facilities, or units not operationally ready because of a biological attack. Traditional physical security measures should always be included in assessing and countering the risk of a biological warfare attack.

Today, there is no standard DoD threat assessment for biological attacks. Given this, biological warfare defense options are extremely limited. At least in the near- and mid-term, Commanders will not be able to sense a biological attack in sufficient time to protect most personnel before exposure. (Units and installations that are exceptionally large may be able to warn some personnel who are a great distance downwind, based on the reaction time of current sensors. See Figure A-1 .) For installations/ units with technical biological detection capability, the determination of detection duty cycle and risk is imperative. Current technical detection capability will, at best, provide after-the-fact exposure information. For small installations, e.g., a small Air Force Base or Kaserne 3 km by 5 km, assuming collective or individual protection is likely a moot point after an attack has been determined. However, for a large deployed formation such as an Army Corps or Marine Corps Expeditionary Brigade, a warning from detection that results in assuming protection may avoid and or at least reduce exposure levels.

For small installations and facilities, there are very few sets of meteorological conditions that would negate a biological attack. There is no current method to determine the metrology and attack characteristics (type release, agent, decay rate, etc.) combinations that could negate the effectiveness of a potential biological release. If the Commanders estimate that the risk of biological attack is significant enough to employ a detector, then all detectors available should be employed, and if detection operations are warranted, all collective protection systems should be employed. Reducing the number of functioning detectors at any installation, even in non-optimal meteorological conditions, only decreases the chances of detection.

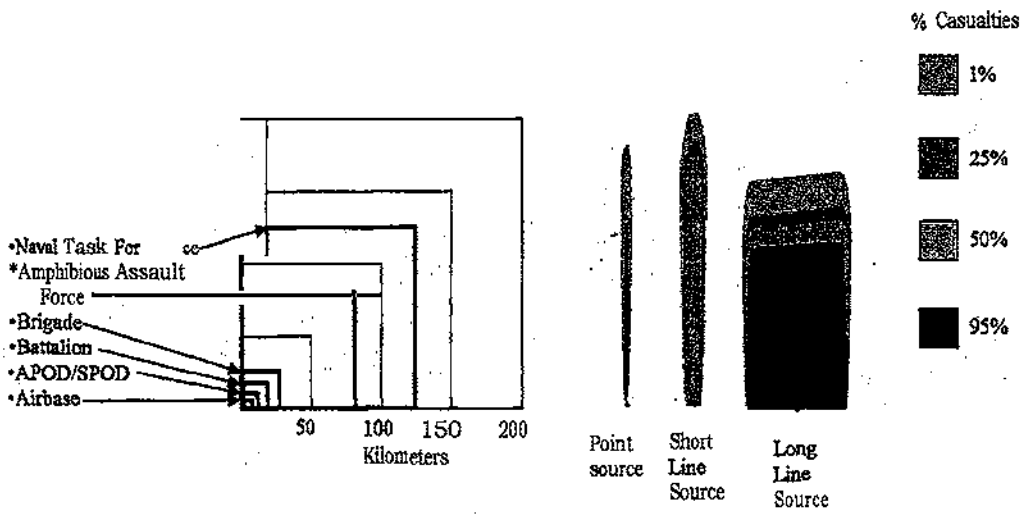

Figure A- 1. Attack and Target Size Example

If the risk of personnel degradation is considered unacceptable, Commanders should consider masking personnel by shift, or maintaining personnel in masks continuously to retain mission capability. DoD standard issue chemical biological radiological (CBR) protective masks provide the best respiratory protection in any operational CBR defense effort; however, if Commanders opt for COTS masks, they should have a protection factor of at least 100. Dry agents and highly infectious agents demand higher protection factors. Standard protective masks, when properly fitted, provide sufficient protection to avoid almost all exposures; COTS masks, depending on the type and fitting, will reduce exposure but not as effectively as military issue protective masks.[1] For installations/units without technical detection, with the exception of collective protection and shift or continuous masking, biological warfare defense response is limited to medical surveillance and consequence management.

For units, installations, and facilities without biological detection capability, planning and preparation for consequence management are the best near-term

[1] ECBC Interim Technical Memorandum Protection Factor and Saturation Testing of Commercial Negative Pressure Half Mask Respirators 9 November 2001; Defense Research Establishment Suffield Ralston, Alberta, Suffield Memorandum No 187, Assessment of Commercial Alternatives to the C4 Mask for use in Moderate to High Risk Biological Scenarios) In the limited test cites, surgical-type masks have been shown to have a protection factor of from 3-7. More sophisticated commercial dust/vapor masks can have a protection factor in the 100s to 1000. Protection factor is the ratio of outside to inside concentration for the particulate matter of interest.

courses of action. Commanders must always assume that biological warfare agents can be used covertly and successfully to attack their units/facilities.

d. Prioritize

Based on assigned mission, Commanders of installations and units will prioritize biological warfare defense to provide maximum mission accomplishment when resources are not available to prevent 100 percent exposure, or to provide 100 percent prophylaxis and treatment in a consequence management response. Prioritization also should include continuity of command and control, maintenance of biological defense capabilities, and the continuation of essential services. At operational levels, prioritization should focus on mission accomplishment and support of the attacked units.

e. Prophylaxis

Commanders will plan for, preposition resources for, and initiate administration of prophylaxis for bacterial agents/diseases within six hours after detection of a biological attack. Detection, even though it currently will not provide warning to prevent exposure, will provide sufficient warning to administer prophylaxis for bacterial agents with prior preparation and stockpiling. For those units without detection, or for attacks below the sensitivity level of the detectors, casualties will be the first indication of an attack. When this occurs, an especially rapid response is required; therefore, a six-hour criterion is chosen.

For viral agents, the only available non-IND prophylaxis is for smallpox. CDC maintains the vaccine and will issue/ship in the instance of a confirmed smallpox outbreak. Commanders will plan for and resource the administration of smallpox vaccine immediately upon receipt from the CDC; i.e., 24 hours after identification of the attack.

Combatant Commands must prepare, resource[2], and exercise plans for the distribution and administration of smallpox vaccine in OCONUS. As required,

[2] Note that smallpox inoculations are administered differently from current 'injection'-type inoculations (intra-muscular or sub-cutaneous). The process of scarification administers smallpox vaccine. Scarification requires personnel trained to 'scarify' (make small cuts in the skin) an inoculation area with a bifurcated (two pronged) needle, thus introducing the 'vaccine' into the body. The site, when properly inoculated, elicits a local immune response. The inoculation site must be 'read' several days later to verify the proper immune reaction. Administration of the smallpox vaccine to a population requires medical personnel trained in proper administration and follow-on confirmation of this vaccine.

these plans should address the stockpiling of the smallpox vaccine in the AOR, or AOR/Command-specific plans to move vaccine from CDC facilities to the AOR. Commands should assume and execute the requirement to vaccinate all personnel rather than wait for epidemiological determinations; vaccination priority should be to the facility/unit with known cases, by order of mission accomplishment priority and by epidemiological evidence.

There is a limited capability response for botulinum toxin using an IND antitoxin or the toxoid. Response time to deliver the material to any installation in the AOR should be twelve hours. Each installation/unit will have in place the appropriate IND protocols, supporting plans, and resources to administer the antitoxin/toxoid. Planning for the quantities of botulinum antitoxin should be based on 10 percent of the population of the largest facility or unit.

f. Investigational New Drugs

The prophylactic use of some drugs has not yet been approved by the FDA for that specific purpose; it is considered "off label use;" further, some other medical countermeasure may be investigational and not yet FDA approved. In all IND cases, without wavier or specific legal circumstance, individual notification and consent forms (informed consent) are required prior to administering the drugs under the supervision of a principle investigator (could be a Command surgeon). Individual records and follow-up medical assessment are required after the administration of IND drugs. Combatant Commands and Services must prepare, coordinate, and plan for implementation to the tactical level.

g. Treatment

Local Commanders will plan for and resource, within their capabilities, the ability to treat all personnel enumerated in Reference **1.** Operational level Commanders will plan for and resource for the treatment of all personnel, based on the largest eligible population in their AOR. Resource and capability requirements will be based- on the consequence management assessment discussed above.

h. Quarantine

Each installation/unit will plan for quarantine; this planning should include, but not be limited to, legal authority; personnel tracking and accountability; ensuring continuity of essential services; criteria to initiate quarantine; extent of quarantine; enforcement of quarantine interaction with local, state, and federal agencies and /or their host nation equivalents; support of quarantined personnel; legal issues; mission impact; etc. Operational and strategic level Commanders will plan for mission accomplishment in quarantine situations and to support quarantined units/facilities. Strategic

level and operational level Commanders will designate lower level Commanders with authority to implement quarantine on military facilities and provide policy for quarantine implementation.

i. Liaison

Each installation/unit will establish the appropriate liaison with higher, lower, and adjacent units. More importantly, liaison and points of contact must be established, documented, and exercised with the appropriate local, state, and federal officials who may assist in the detection of or response to a biological attack. OSD/JS will establish and promulgate standard procedures for federal-level coordination with Service entities and other federal or non-U.S. national, state, and local agencies. The Services and operational level Commanders will implement these procedures.

j. Medical Surveillance and Medical Sampling

Until medical surveillance in DoD is standardized and routine as a biological warfare detection system, and when directed by the Commander, all **MTFs** will sample from 10 percent of all persons exhibiting non-specific flu-like symptoms, and analyze (or forward to the appropriate laboratory for analysis) samples for the agents on the JCS threat list. Many military installations do not have U.S. military treatment facilities on site; installation Commanders, operational level Commanders, and Services that have forces and facilities not served by an MTF will determine if sampling is necessary based on the mission priority of the facility/unit, and will establish an interim medical surveillance system. Additionally, Commanders must review mutual support agreements with off-installation support activities and identify requirements in the event of a biological attack. Mutual support agreements must be exercised regularly.

Operational level Commanders and the Services will establish procedures for the surveillance of Reserve and National Guard units based on their priority to mission-essential OPLAN execution.

k. Establish Laboratory Capability

The issue of transporting suspected or confirmed biological agent samples across international boundaries becomes more problematic every day. The denial of landing/movement rights for vehicles (air/land/water) transporting samples could, at a minimum, delay definitive defensive actions or, at worst, render the samples useless. Initial sample analysis results, produced by a technology more sensitive and more specific than fielded DoD tactical identification systems, must be available no latter than 12 hours after receipt of the sample. The Combatant/Regional Commands should establish sufficient laboratory capability in each country where U.S. forces are deployed to enable all defense operational and medical actions/decisions. Commanders should

consider the use of ship laboratory capability as a possible political and operational solution.

1. Actions and Criteria for Actions

Each facility/organization will establish an action list or standard operating procedure (SOP) for identification of a biological attack, and the response to such an attack. This should be synchronized with the installations anti-terrorism/force protection weapons of mass destruction plan. Examples of material included in this SOP include biological detector employment procedures; medical surveillance procedures; point of contact for information; prophylaxis and treatment regimes; assistance augmentation; notification and warning procedures; public relations guidance; physical security; initial quarantine preparation actions; etc. An action list should be prepared for each specific agent on the AOR/JCS threat list and should be standardized across the AOR to the extent possible. All procedures, SOPs, etc., will be included in installation/unit operational or emergency operations centers.

m. Exercise and Training

Each installation/unit will plan and execute exercises for all aspects of biological defense at least once every 12 months; this includes all interactions with the local, state, and federal agencies. Operational level Commanders will exercise all support plans and alternative mission accomplishment plans.

Training requirements – individual, group, and unit – will be identified, resourced, and executed. The planning, training, and exercise for biological warfare defense must be integrated into all aspects of operations. Response will vary in scale from procedures for handling suspicious packages to enforcing and supporting quarantine for large units or groups of units, as well as civilian interface.

n. First Responders

This operational concept does not specifically address the role of first responders in biological warfare defense; while they have a role, it is well documented for normal operations and there has been copious guidance published recently for such personnel at the TTP level.

3. Daily Activities

This section discusses actions that should occur daily. Each facility/unit should include biological warfare defense and consequence management in all daily operations, briefings, and staff meetings.

a. Detection Duty Cycle

Detector duty cycle will be reviewed at least daily for those units/facilities with the capability; detector duty cycle and readiness states will be included in daily situational and staff briefings at all levels.

b. Medical Surveillance

Medical surveillance will be executed daily for those units/facilities with the capability. If necessary, facilities and units will maintain internal records of disease and non-battle injury (DNBI) rates on a daily basis and institute a system to analyze the data daily. Combatant Commanders will establish criteria for action based on change in these rates.

In general, eligible personnel usually refrain from attending sick call, acute minor illness clinics, etc., on an individual basis until they decide they really need medical advice. For biological defense, all personnel should be encouraged to seek medical assistance at the earliest opportunity. This greatly increases medical workload but may be the only way to increase the probability of early clinical detection and identification of a biological attack. Commands may wish to encourage a "if you feel sick, go to the clinic" approach to facilitate early medical screening.

c. Collective Protection Duty Cycle

Collective protection duty cycle and readiness states will be included in daily situational and staff briefings at all levels.

d. Operational and Physical Security Emphasis on Biological Warfare Defense

All normal operational security, conventional defensive actions, and physical security actions enhance biological warfare defense. Commanders should ensure that physical security personnel are particularly knowledgeable on the possible indicators/means of covert biological warfare dissemination. Operational and physical security are executed daily and reviewed daily as threat levels (conventional) change.

e. Environmental Monitoring and Archiving

All meteorological data and any other environment data must be preserved, on a daily basis, for use in forensic and post exposure operational decision-making. There- should be standard data recording and preservation procedures throughout the AOR.

4. During

Actions taken during an attack are limited to those cases where there is evidence of a possible attack; this includes overt attacks by a conventional delivery system or conventional munitions. For example., if there is a ballistic missile or aircraft attack warning, personnel should be masked or enter collective protection as a precaution against biological attack. Local Commanders should establish "all-clear" criteria based on cloud time of arrival and pass time assumptions for agents derived from Allied Technical Publication 45. Placing personnel in field-expedient collective or individual protection may be effective in reducing exposure. Personnel must leave the field-expedient enclosure after the all-clear (using the ATP-45 assumptions). While tests indicate field-expedient measures may reduce exposure, they do not eliminate exposure. There is no current system to assess the effectiveness of field-expedient measures other than in a laboratory. Such measures may be employed as required, but protection assumptions should not be included in consequence management requirements planning.

a. Alert and Warning to Others

All attacks by conventional delivery systems or conventional munitions are reported throughout the chain of command, as well as laterally. Units/facilities should initiate biological warfare defense actions based on possible biological warfare inclusion in "conventional" attacks; as an example, activating the sampling team given the possibility of SCUD impacts. Commanders with biological detection assets will warn other units and organizations based on procedures outlined in ATP-45. Civilian entities in the U.S. and, where applicable, foreign civilian and military authorities must be warned as well. Operational level commanders will publish guidance for issuing warning, both in CONUS and OCONUS.

b. Sample Collection, Transportation, and Analysis

Commanders at all levels will establish, resource, tram, and exercise for the collection of possible biological warfare samples. SOPs for existing military detectors and detection kits will be formalized by operational Commanders and coordinated across AORs. Procedures also must be established to sample during any event that could cause the dissemination of a biological agent;

these include but are not limited to bomb, missile impact, high explosive covert detonations, unusual spray devises, etc. Across the AOR, laboratory support must be in place and managed to serve units as they deploy or maneuver. Transportation of samples across international boundaries or in some instances between states/local jurisdictions may be politically sensitive.

5. After

The list below enumerates actions taken after an attack (these actions have been discussed in the "Before" section of this Appendix). The list is provided as the basis of a checklist for unit or facility use.

Attack determination

- Detection
  - Medical surveillance disease or symptoms
  - Other warning, explosion scud etc

ID agent / disease

- Detectors
- Clinically
- Sampling

Warn as appropriate

Initiate prophylaxis as appropriate

Initiate treatment as appropriate

Coordinate and communicate; Up chain of command; Outward liaison local, etc.

PR, internal and external

Ensure operational infrastructure

Mission triage reassignment

Obtain augmentation

Contagion control

Control access

Enforce hygiene and safety awareness

APPENDIX B

AGENT RESPONSE TIME LINES

The relative times of occurrence pictured in the accompanying figures are not precise. For example, in a best-case scenario, technical detectors provide information at 1 hour and 24 hours,[1] as shown. Realistically, there is some unknown probability that the devices will detect the agent release. Similarly, the time range for onset and outcome of the disease are approximate and shown in the absence of treatment. Data on the effects of these agents on humans from a biological agent instead of the naturally induced form of the disease are sparse. Secondary infections from contagious agents are not shown.

Note the time ranges for medical detection. These time ranges include detection based on surveillance of disease incidence, clinical diagnosis, and clinical laboratory identification. The actions of medical personnel and their ability to commit resources can move the "detection" along this continuum.

Finally, the figure displays the significance of post-exposure prophylaxis by indicating the timeframe during which it is effective. The earlier prophylaxis is implemented, the more successful it will be at preventing disease.

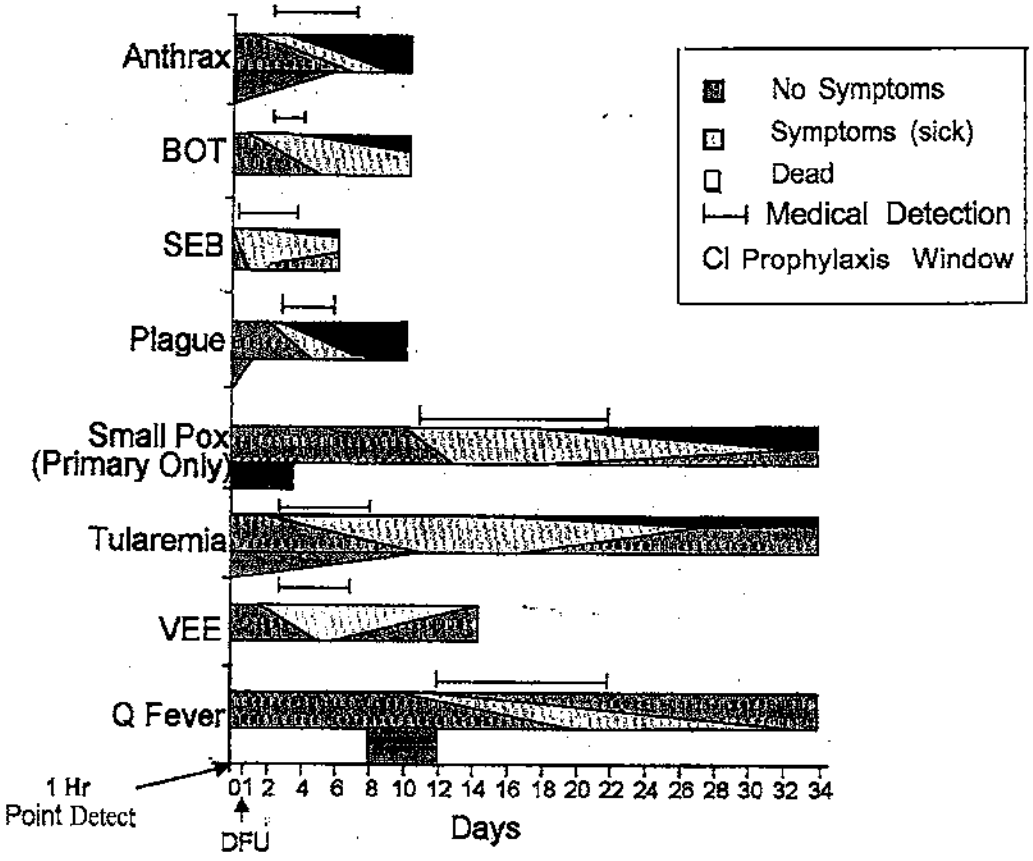
The information presented is for that portion of the exposed population that is infected/intoxicated by an attack, i.e., those personnel who will eventually become casualties or fatalities. The actual number of personnel affected by any attack will vary greatly. In each figure, the green portion of the bar represents those who are not sick but will become ill; the yellow represents those who are ill; the red represents those who become fatalities. Note that in several cases, a second green portion on the right side of the bar shows recovery. Technical detection times are indicated on the horizontal time axis and a black line above each agent bar represents medical detection times. The "prophylaxis window" is shown in purple. For agent such as anthrax and plague, when prophylaxis becomes less effective with the passage of time, the bar is shown diminishing at an angle. Where prophylaxis may be administered effectively any time within a window, as shown for smallpox and Q fever, the bar is as a rectangle. Where there is no bar, the administration of prophylaxis is ineffective

The rule of thumb for biological defense is: take action as early as possible, whether it is protection, prophylaxis, or implementing alternative courses of action for mission accomplishment.

---

[1] Automated biological detection systems such as the BIDS and Portal Shield are assumed to provide hourly output, while systems such as the dry filter unit (DFU) are assumed to provide output every 24 hours (12 hour collection and 12 hours to transport and analyze).

Time Course of Disease:
Indicating Detection and Prophylaxis Window



APPENDIX C

TECHNICAL DESCRIPTION OF BIOLOGICAL AGENTS

This Appendix is extracted from "Force Protection And Operations In a Biological Warfare Environment, Commanders Guidelines," dated 18 June 2002, pages 5 through 15 and has been modified for presentation. It is used by permission of the Policy Division, Directorate of Nuclear and Counter proliferation, Deputy Chief of Staff, Air and Space Operations, HQ USAF.

1. Understanding the Characteristics of the Biological Threat

Because BW events and agents vary so dramatically, a "one size fits all" response to a BW event will not work. The Commander must be conversant with the basic technical parameters associated with BW in order to think through and to shape an effective response.

To aid in developing this understanding, this section covers:

- **Basic inforination on biological agents, including the types of agents, their characteristics, and how agents incapacitate or kill**
- **Likely delivery systems**
- **Operational impacts, including conditions that affect the potential intensity and duration of an event, and the number of personnel likely to be affected**
- **Trigger events indicating that a BW event has likely occurred**
- **Mitigation strategies and their limitations**

a. Agent Characteristics

Biological agents are organisms or chemicals produced by organisms that affect humans in different ways. Some kill while others incapacitate; some act quickly while others incubate for several weeks; and some are contagious while others are not. Vaccinations, prophylaxis (medicines given before sickness), and treatments (after sickness) exist for some, but not for other. Before assessing impacts of biological weapons, one must first understand the nature of likely biological agents and how they work.

Types of Agents

Biological agents are either pathogens or toxins. Pathogens are microorganisms that directly attack human tissue and biological processes and include three categories: bacteria, viruses, and Rickettsia.

Pathogens vary **in their characteristics and in their treatments.**

- *Bacteria (e.g.,* **anthrax, tularemia, plague) are living single cell organisms, which can grow and reproduce in the environment, in plants, animals, or humans. Bacteria are susceptible to antibiotics, but can develop resistance to antibiotics as strains evolve in nature, or as the result of the intentional genetic manipulation of strains. Vaccines exist for some bacteria as well.**
- *Viruses (e.g.,* **VEE, smallpox) are smaller than bacteria, do not grow, and require a living host cell to make new copies of themselves. Antibiotics have no effect on viruses, but anti-viral agents such as vaccines can limit some viral illnesses.**

- *Rickettsia (e.g.,* **Q-fever, Rocky Mountain Spotted Fever) are intermediate in size, contain nearly everything necessary to make new copies of themselves, but rely on infected cells to make new copies. Antibiotics are effective against Rickettsia.**

- *Toxins are* **poisonous substances naturally produced by bacteria, plants, fungi, snakes, insects, and other living organisms. Common toxins include Botulinum toxin (produced by bacteria); Staphylococcus Enterotoxin B, or SEB (produced by bacteria); and ricin (produced by a plant). Toxins act to destroy organisms by overwhelming the organism's ability to rid itself of the poison it produces (intoxication). Bacteria can destroy organism via both infection and intoxication. Plants, fungi, snakes, insects, and other living organisms intoxicate their victims via more direct means (injection, contact, ingestion), while viruses have no ability to intoxicate whatsoever.**

Agent Effects

How devastating a BW agent will be on the human body depends on a number of variables. Note: minor changes in any one variable can result in a significant difference in the effectiveness of the attack, as well as in the effectiveness of the appropriate response.

Key variables include:

- ***Exposure levels.*** Since many medical countermeasures are time sensitive, how much of a particular pathogen or toxin an individual is exposed to affects both the lethality and the timing of the onset of symptoms.

- **How *the biological agent enters the body.*** The point of entry of the pathogen or the toxin often determines the lethality of the disease or poison. For example, anthrax has three possible points of entry: openings in the skin (cutaneous anthrax), ingestion (gastrointestinal anthrax), or inhalation (inhalational or pulmonary anthrax). The three forms of anthrax differ in number of organisms necessary to cause infection, fatality rate, and responsiveness to antibiotic therapy after onset of symptoms.

- ***Time to onset of symptoms and incubation periods.*** Some agents work within hours while others have incubation periods as long as several weeks. This matters because it complicates determining whether or when an attack occurred, how widespread are the effects, and what are the available treatment strategies.

- ***Extent of communicability.*** Certain diseases, such as smallpox and hemorrhagic fever, which are contagious, pose a greater challenge. These

challenges include the risk to those in close contact – including medical caregivers and the problems of separating the ill from those susceptible to becoming ill if exposed.

- ***Incapacitation v. lethality.*** Some agents kill while others only incapacitate their victims. Again, treatment and operational strategies are influenced by these factors. Where fatalities occur, there are varying periods of incapacitation prior to death.

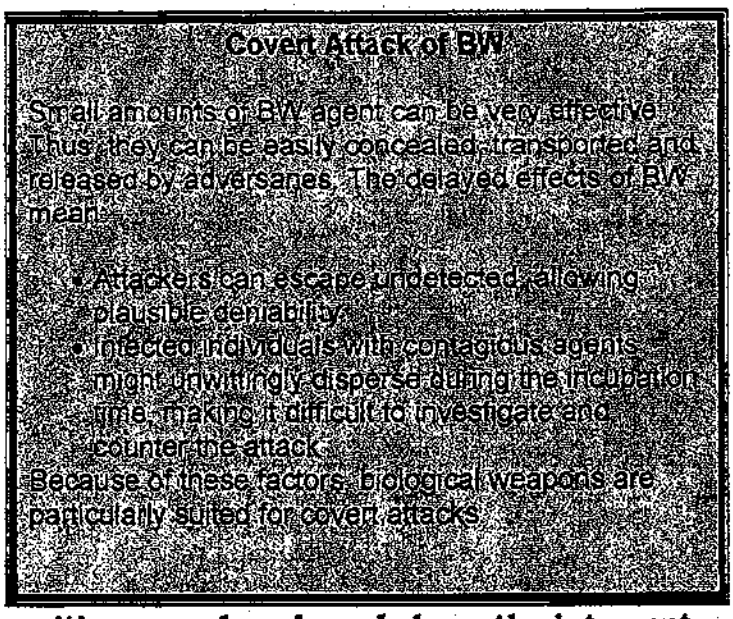
b. Weaponization and Dissemination

Knowing how an agent can be disseminated is critical to shaping an effective response because the size, shape, intensity and overall effectiveness of the agent deposition pattern is influenced by the delivery method. The attacker is likely to consider a number of issues when choosing a means of delivery, including ease of accessing and cost of weapons systems, size of targeted area, likelihood of successful delivery (i.e. penetration of defenses, susceptibility to meteorological uncertainties), covertness, and safety to the delivery tear-n.

Weaponized BW Deliver-v

- **Theater** ballistic missiles *(TBMs)* **are a viable delivery means for many agents. With bulk warheads, release can be explosive or line release.**

- *Submunitions* **The size of the submunition pattern allows area targets to be more effectively contaminated. Coordinated salvos of TBMs, which would likely ensure at least one missile penetrating active defenses, pose even a greater challenge. Intercepted bulk-filled missiles do not affect the targeted airbase. However, in many designs, the submunitions may be released above the intercept altitude – or only a small number of the submunitions become damaged by current active defense systems.**



- *Ground sprayers can also* **be used to deliver agent. Because ground sprayer attacks will be initiated relatively close to the target, precise, real-time wind data can be used to select a place and time of release to optimize accuracy. Ground sprayers can be stationary or vehicle-mounted. If released from a moving vehicle, the resulting line source can cover a very large area, but attackers risk being detected.**
- *Aircraft sprayers,* **as an airborne line source, can yield dosage patterns that cover very large areas. Since these patterns can be several hundred kilometers long, agents can be released far upwind of the intended target area. Remote releases may allow attackers to avoid having to penetrate air defenses. Warning and alert of attacks of this type depend on the ability to closely monitor enemy air traffic patterns and identify suspicious flight profiles.**
- *Mortar, artillery, and multiple rocket launchers (MRLs) are* **well suited to deliver biological agents. Artillery attacks can deliver an extremely large amount of agent very accurately. Shells filled with biological agents can be used in a combined attack with chemical and conventional explosive shells, making it difficult to recognize the event as a BW attack.**

Other Means of BW Delivery

In addition to weapons-associated delivery of BW, BW can be disseminated through other means.

- ***Vector-mediated delivery*** occurs when insects or other animals are utilized to disseminate BW agents. Vector-mediated delivery allows for clandestine release that is hard to identify or to attribute to a specific adversary. The Japanese used plague-infected fleas with devastating effect against the Chinese. As recently as 2000, there was concern that West Nile Encephalitis was a deliberate biological event until it was proven to be an endemic event.
- ***Fomite spread.*** Using inanimate objects (fomites) to spread agents is another potential way to disseminate biological agents, such as smallpox. Evidence suggests that while the primary means of transmission of smallpox is person-to-person contact, smallpox virons can also be spread via human contact with contaminated surfaces or by aerosolization, increasing the hazard of the spread of contagion. The recent case of anthrax-mixed powders shows the efficacy of fomite spread.
- ***Food or consumer product contamination.*** Food or other products for human consumption are also a group vulnerable to BW contamination. Many can be laced with pathogens, such as the

salad bar contaminated with Salmonella to keep voters away from the polls. Another example would be the inadvertent contamination in a meat processing plant utilized by a food chain for their hamburger supply that resulted in E. coli illnesses. Other products can be spiked with poisons, as was the case with the injection of Chilean grapes with cyanide in March, 1989 or the Tylenol product tampering cases of in the 1980s.

- ***Water contamination.*** Water supplies are a potential means for biological attack since some pathogens can grow in water, survive for considerable lengths of time, or survive normal chlorination and filtration treatments in municipal water supply systems. Similarly, toxins, which are generally unresponsive to normal water treatment, can be transported via water supplies. However, the amount of agent required having an operational impact make this a less likely means of delivery. On the other hand, attacking a specific building by creating a high-pressure "tap" of the water supply is technically straightforward and requires less agent.

c. Operational and Force Protection Impacts

It is critical to note that biological weapons differ from chemical weapons in operationally significant ways that dictate different responses and risk trade-offs. A few key differences are illustrated in the following table.

		BIOLOGICAL
Release/Site of Weapon	Quickly discovered, possible to cordon off contaminated/ attack areas	Difficult to identify, probably not possible or useful to cordon off area of attack
Manifestation of Symptoms	Rapid, usually minutes to hours after an attack	Delayed, usually days to weeks after an attack (except toxins)
Distribution of Affected Patients	Downwind area near point of release	Widely and rapidly spread, difficult to track or predict
Signatures	Easily observed (colored residue, dead foliage, pungent odor, dead insect and animal life)	Typically no characteristic signatures immediately after attack
Medical Counter-	Chemical antidotes	Limited vaccines, antibodies, and/or antitoxins and

[redacted]		antivirals for some agents
[redacted]	After decontamination and or weathering, no further need for protective measures or risk of further contamination	Patient isolation / quaran tine crucial if communicable disease is involved

A biological attack is a very complex process that depends on several technical factors, all of which determine its operational impact. These factors fall into three categories: lethality factors, environmental factors, and source factors.

Lethality

The lethality of an agent, or the rate at which it kills its victims, has an obvious impact on force protection and operations. Many factors contribute to the lethality of event, including agent effects, discussed in Section A above. Of additional note:

- Potency. The potency of the agent will partially dictate the number of casualties relative to agent delivered. Highly infective agents are more lethal because less mass is required.
- ***Particle*** Size. Only small particles (1-10 microns) will reach the lower lungs, where they can cause harm. Size is a function of how the agent is manufactured and processed for weaponization.
- ***Means of entering the body.*** Almost all BW agents are more effective if inhaled. For physical reasons, different sized particles will become embedded in different parts of the respiratory system. Therefore, for any batch of agent, the distribution of particle size is a key lethality factor. Anthrax is a good example. The lower respiratory system provides the conditions for anthrax to survive, grow, and multiply. Anthrax spores must reach this area to cause inhalational anthrax and only particles from 1-5 microns will reach these areas with high efficiency. Therefore, lethal dose is dependent on particle size distribution. Other agents infect different sections of the respiratory system and must be released in appropriate particle sizes to be effective.

Source Factors

Source factors expand the number of possible scenarios that must be considered before a response is structured. More specifically, source factors include fill type (or how the agent is manufactured) and release mechanism.

- ***Fill*** type. Agents can be produced in a variety of forms depending on the manufacturing process. For example, anthrax can be manufactured as a

wet slurry or as a dry powder. Anthrax transport and diffusion is much more efficient as a dry powder than as a wet slurry, but it is more difficult to weaponize and to handle. Thus, how it is manufactured depends on the expertise of the attacker and his equipment/infrastructure.

- ***Release mechanism.*** The mechanism for release has a significant impact on how much of the agent survives the release event and the size, shape and concentration of the pattern of dispersion.

Environmental Factors

Environmental factors encompass agents' interaction with the ambient environment, from the point of release until inhaled by a human. Environmental factors will dictate the size, shape, dosage at inhalation, height of agent deposition, and concentration of agent deposition patterns on the ground. Thus, environmental and weather conditions can be extremely critical to determining how effective the attack will be, particularly with certain delivery systems. Some have suggested that this factor is so critical that weather and time of day can provide a guide to protection options in a high threat situation. More specifically:

Environmental and weather conditions can be extremely critical to determining how effective the attack will be, particularly with certain delivery systems. Some have suggested that this factor is so critical that weather and time of day can provide a guide to protection options in a high threat situation.

- ***Wind speed and direction. Since*** BW agents are released as small particles and aerosols, they tend to move with the winds. Stronger winds move the clouds faster, resulting in lower exposure. In calm conditions, **the** agent cloud stays close to the release site. This results in a significantly higher risk of exposure, which lasts until the wind speed increases enough to move the agent containing air package downwind. However, these wind conditions can actually lead to larger casualties depending on position of personnel and the type agent. A very infectious agent moving rapidly over terrain will expose more people but at an effective level to cause casualties. The same release, lingering in a smaller area will effect less personnel overall. All interactions for BW are agent specific
- ***Atmospheric stability, layering and mixing.*** A successful attack requires the agent mixing with air. This is caused by turbulence in the atmosphere. Stable layers restrict vertical movement of agent particles, **so** agent released below an inversion remains available for inhalation, and causes a higher likelihood of exposure. Agent released above an inversion may not be able to penetrate the inversion layer, so mixing

down to the ground would occur only when the inversion layer is broken-- perhaps at dawn-- well downwind from the release point.

- ***Terrain.*** Landforms, buildings and surface coverings (trees, brush, sand, asphalt) influence the channeling of local wind, and affect spatial agent distribution.

- ***Rates of biological decay or inactivation in the atmosphere.*** Biological agents decay in the atmosphere at different rates based on heat, humidity, and exposure to UV light, but most will survive for relatively short periods (minutes to hours) in the open atmosphere. The relatively low rate of biological decay of anthrax spores makes anthrax an attractive BW agent. Anthrax can survive between 1 and 2 days in the air. Since UV light is the primary cause of anthrax spore decay, night attacks would likely be most effective, but daytime attacks can still be effective on a fixed site target. SEB and Ricin decay very little. Ricin is not very toxic, so this benefit is offset.

- **Rates of decay in soil, water, and on surfaces.** In a weaponized release, the level of deposition onto ground surfaces is very low. Agent survival on surfaces is an important characteristic for considering the risk from reaerosolization and the need for decontamination. Anthrax spores and smallpox virons have been found to be quite stable in soil (many years).

- ***Time of day.*** Because each agent biologically decays at a different rate depending on temperature, humidity, and UV light intensity, the time of day affects the operational impacts of an attack. In general, nighttime or early morning, with its lower temperatures and UV light, provides the best conditions for successful BW attacks because of lower biological decay – and because neutral and inversion conditions – especially with low wind speeds – result in agent clouds which maintain lower physical decay (i.e. spreading of the biological agent over time.)..

- *Potential for reaerosolization.* **Most biological agents are not persistent, and will decay within hours or days under exposure to the environment. However, anthrax spores can survive in a non-vegetative state for years if embedded just beneath the surface where they would be shielded from W radiation, temperature, and humidity effects. Some evidence, including the recent experience with anthrax, suggests that, if disturbed, anthrax can reaerosolize, possibly generating a local dosage hazard.**

APPENDIX D

HIGH-LEVEL AND CROSS-CUTTING ACTIONS REQUIRED TO IMPLEMENT A DOD-WIDE OPERATIONAL CONCEPT FOR BIOLOGICAL DEFENSE

Traditionally, operational concepts, doctrine, tactics, techniques, and procedures have been a Service responsibility. As warfare became global (e.g., total war, attacking civilian population centers and strategic industries) and military technology became more complex and capable (ballistic missiles, nuclear weapons, stealth, biological weapons, etc.), more and greater multi-Service and joint doctrine has evolved. Biological defense particularly calls for broad, all-encompassing doctrine. However, to effectively derive and implement such a doctrine and then implement it at the TTP level; many issues must be addressed at the senior policy and joint operational level. This Appendix lists many of the issues that must be addressed from the top down, and standardized across the Department of Defense, for both operational warfare and homeland defense/force protection. Today, there is no one center of operational and scientific expertise responsible for biological defense. Without such an operationally empowered focal point, it will be difficult if not impossible to implement the operational concept described in the body of this paper.

- OSD and the JS must establish a central point of expertise for biological defense operations and leadership at the national military level.
- OSD, Joint Staff, Combatant Commands, and the Services must conduct strategic vulnerability analyses, identifying those assets that must be protected from biological warfare effects.
- OSD and JS must establish a biological warfare red team capability to identify national military vulnerabilities to biological warfare attacks.
- OSD, JS, Combatant Commands, and Services must establish appropriate biological warfare surveillance assets (personnel, units, and systems), processes, and fusion centers.
- JS and Combatant Commands must implement a system to characterize the worldwide environmental background as it pertains to biological defense/ detection, with initial priority based on current threat information and OPLANS.
- OSD and JS must provide the Combatant Commands standardized decision aids to assist in epidemiological detection.
- OSD, JS, Combatant Commands, and Services must implement a single, worldwide medical surveillance system.
- The Combatant Commands must establish common criteria for action, based on indications and warning.
- The Combatant Commands and Services must plan for the deployment and support of biological detection systems. Additionally, specific common biological detection doctrine and decision aids relating risk, technical capability, cost, and operational effectiveness,

etc., must be developed/ coordinated by OSD and JS and provided to the Combatant Commands and Services.

- JS, Combatant Commands, and Services must establish common criteria for action, based on the output of technical biological detection devices.
- JS, Combatant Commands, and Services must establish criteria for action, based on epidemiological detection.
- OSD and JS must establish standard procedures for sample collection, handling, transportation, and processing. The Combatant Commands and the Services must implement the sampling procedures as established by OSD/ JS.
- OSD and the JS must establish a set of standard definitions and performance descriptors for identification.
- Combatant Commands and Services must establish common criteria for action, based on identification.
- OSD and JS must establish and maintain a worldwide joint military biological warfare warning and reporting system above and beyond that specified in the U.S.-approved version of the Allied Technical Publication-45.
- Combatant Commands and Services must determine warning and reporting criteria, based on current capabilities and mission risk tolerance.
- OSD, JS, the Services, and the Combatant Commands must establish and maintain biological warfare warning and reporting centers.
- Combatant Commands and Services must develop physical protection criteria based on mission accomplishment and risk.
- Combatant Commands and Services must establish criteria for masking and unmasking.
- Combatant Commands and the Services must maintain collective protection in continuous operation, or establish standard criteria for initiating and ceasing collective protection.
- OSD and JS must develop and provide the Combatant Commands and Services with a list of approved and investigational new drugs for prophylactic use, as well as standard guidance for such issues as informed consent. Additionally, this document should include planning guidance on the expected effectiveness of prophylaxis.
- OSD and JS, in coordination with the Combatant Commands and Services, must determine the requirements for prophylaxes, resource the capabilities to prophylax personnel, and establish criteria for administration.

- 3 Combatant Commands and the Services must plan for and resource the medical treatment of mass biological casualties.
- 3 Combatant Commands and the Services must establish their requirements for and their capabilities to treat personnel at the various levels of care (heroic, optimal, etc.)
- 3 OSD, JS, and Combatant Commands assess the requirement for replacements, individual and unit, in coordination with the Services. This action should be linked to the strategic vulnerability analysis, resources, and mission accomplishment
- 3 OSD and JS, in coordination with the Combatant Commands, Services, and concerned federal agencies, must develop standards for biological warfare agent decontamination, risk guidance, and, as required, guidance for the retrograde of personnel and material from an active biological warfare theater.

❖ OSD and JS must prepare the overall information plan for biological warfare defense and coordinate with the Services and Combatant Commands for implementation.

- 3 Combatant Commands, in coordination with OSD, JS and the Services, must develop and resource alternative operational plans to maintain mission accomplishment within a biological warfare environment.
- 3 OSD, JS, and the Services must establish and resource the appropriate professional education and provide the Combatant Commands, OSD, JS, and the Services qualified biological warfare defense experts.
- 3 OSD, JS, the Combatant Commands, and the Services must ensure adequate and realistic biological warfare defense exercises are conducted and biological warfare defense is properly integrated into other exercises.
- 3 OSD, JS, the Combatant Commands, and the Services must establish a system for measuring and reporting biological defense readiness.
- :* OSD, JS, Combatant Commands, and the Services must track personnel movements (units, groups, or individuals) in sufficient time and detail to implement medical countermeasures.
- 3 JS must establish a set of unique and standard definitions for biological warfare defense terms, a lexicon, and update the JCS Pub 1-02, The Dictionary of Military Terms, accordingly.
- 3 OSD, JS, Combatant Commands, and the Services need to understand, assess, and plan for the implications of biological warfare attacks on agriculture or other economic targets such as fuel; DoD specialty manufacturing facilities, etc.

- OSD must publish comprehensive guidance for mortuary affairs; the JS, Combatant Commands and Services must implement the guidance.
- OSD must establish and publish a comprehensive vaccine policy.
- OSD must obtain the required Service end strength increases to support implementation of this operational concept.
- Combatant Commanders and Services must publish priorities for collective protection installation and guidance for operation.
- The Combatant Commands, Services, JS, and OSD must derive standard planning guidance to estimate the effectiveness of prophylaxis.

STANDARDIZED COMMENT MATRIX PRIMER

The matrix below is a Word document table to be used as a template for submitting comments on draft publications and draft program directives. Except as noted below, an entry is required in each of the columns. To facilitate consolidating matrixes from various sources, do not adjust the column widths. Use the column headings in the document header as a guide to adjust column widths.

Column 1 – ITEM
Numeric order of comments. Accomplish when all comments from all sources are entered and sorted. To number the matrix rows, highlight this column only and then select the numbering ICON on the formatting tool bar.

Column 2 - #
Used to track comments by source. Manually enter numbers from the first comment to the last comment. These numbers will stay with the comment and will not change when consolidated with other comments.

Column 3 – SOURCE

J1 -J-1
J2 - J-2
J3 - J-3
J4 - J-4
J5 - J-5
J6 - J-6
J7 - J-7
J8 - J-8
USA – US Army
USN – US Navy
USMC – US Marine Corps
USAF - US Air Force
USCG – US Coast Guard
CENTCOM - US Central Command
EUCOM - US European Command
JFCOM - US Joint Forces Command
PACOM - US Pacific Command
SOCOM - US Special Operations Command
SOUTHCOM - US Southern Command
SPACECOM - US Space Command
STRATCOM - US Strategic Command
TRANSCOM - US Transportation Command
DTRA – Defense Threat Reduction Agency
DIA – Defense Intelligence Agency
DLA – Defense Logistics Agency
MDO – Missile Defense Organization
NSA – National Security Agency
DISA – Defense Information Systems Agency
NIMA – National Imagery and Mapping Agency
LC – Joint Staff Office of Legal Counsel

Column 4 – TYPE
C – Critical (Contentious issue that will cause non-concurrence with publication)
M – Major (Incorrect material that may cause non-concurrence with publication)
S – Substantive (Factually incorrect material)
A Administrative (grammar, punctuation, style, etc.)

Column 5 – PAGE
Page numbers expressed in decimal form using the following convention:
(Page I-2 = 1.02, Page IV-56 = 4.56, etc.) Enables proper sorting.

0 – General Comments
0.xx - Preface, TOC, Executive Summary (Page i = 0.01, Page XI = 0.11)
1.xx – Chapter I
2.xx – Chapter II
3.xx - Chapter III
x.xx – Chapter x, etc.
51.xx – Appendix A
52.xx – Appendix B
52.01.xx - Annex A to Appendix B
53.xx – Appendix C, etc.
99.xx – Glossary

NOTE: For Program Directives enter the page number as a whole number, (1, 2, 3, etc.) PDs are normally sorted by paragraph and line number and the page number helps to find the paragraph.

Column 6 – PARA
Paragraph number that pertains to the comment expressed. (i.e. 4a, 6g, etc.)

NOTE: An entry in this column should be used when commenting on draft program directives. An entry is optional for comments on draft joint publications.

Column 7 – LINE
Line number on the designated page that pertains to the comment, expressed in decimal form (i.e., line 1=1, line 4-5 = 4.5, line 45-67 = 45.67, etc.) For figures where there is no line number, use "F" with the figure number expressed in decimal form (i.e. figure II-2 as line number F2.02). For appendices, use the "F" and the appendix letter with the figure number (i.e appendix D, figure 13 as line number FD. 13; appendix C, annex A, figure 7 as line number FCA.07)

Column 8 – COMMENT
Comment text in line-in-line-out format according to JSM 57 11.01A, *Joint Staff Correspondence Preparation* (Examples are provided in JP 1-01, Annex A to Appendix E). To facilitate adjudication of comments, copy complete sentences into the matrix so that it may not be necessary to refer back to the publication to understand the rationale for the change. Do not use Tools, Track Changes mode to edit the comments in the matrix. Include deleted material in the comment in the strike through mode. Add material in the comment with underlining. Do not combine separate comments into one long comment in the matrix, (i.e. 5 comments rolled up into one).

Column 9 - RATIONALE
Provide concise objective explanation of the rationale for the comment.

Column 10 - DECISION
A - Accept
R – Reject (Rationale required for rejection.)
M - Accept with modification (Rationale required for modification.)

NOTE: This column is for the LA and JSDS use only. No rationale required for accepted items. Rationale for rejection is placed in the rationale comment box and highlighted for clarity. For modifications, the complete modified language will be placed (and annotated) as the bottom entry for that item in the "Comments" column and the rationale for the modification placed in the rationale comment box and highlighted for clarity.

TIPS AND TRICKS OF **THE** TRADE

Headers and Footers

1. Publication name
2. Classification (Unclassified/Secret/ etc.)
3. Column headings
4. Filename (insert **from** header/footer drop down menu)
5. As of "date" (insert from header/footer drop down menu-manually enter date when **finalized** for tracking purposes)
6. Page X of Y (insert from header/footer drop down menu-manually enter last page number for Y when finalized-tracks total # of pages and does not default back to actual page #)

Combining Matrixes

1. Select all and correct for font and font size (Times New Roman, #10).
2. Copy one entire matrix and paste it a few lines below the last row of another matrix.
3. Adjust column widths as necessary to match one matrix with the other (use the column headings in the document header as a guide).
4. Merge the matrices into one by deleting the lines between the two.

Item (row) numbering (automatic numbering)

1. Highlight column number 1 from top to bottom.
2. Delete the existing number and then renumber by selecting automatic line numbering on the formatting tool bar.

Sorting

1. Select: "Table" on top menu **toolbar**.
2. Select: "Sort."
3. Select: "Sort by, Column 5 (Page column), Number, Ascending."
4. Select: "Then by, Column 7 (Line column), Number, Ascending."
5. Select: "Then by, Column 4 (Type column), Text, Descending."

Executive Summaries

Do not make comments on the executive summary until the FC. Main body text will be copied and pasted into the executive summary reducing the amount of time spent on making the two accurate. The contractor with LA and/or JSDS input will include an executive summary in the FC released for review and comment.

[illegible]		UR		[illegible]	[illegible]	[illegible]	COMMENT	RATIONALE	DECISION (A/R/M)
1.	1	J7	M	0.0			General Comment. The definition of "apportionment (air)" was changed in the revision to JP 3-0. This new definition is provided in the glossary but it is not used in the text. The text still speaks of apportionment by geographic areas. This should be corrected throughout the text. Specific comments will follow.	Consistency with JP 1-02 and 3-0.	A
2.	2	J7	A	1.01	1	19	Change to read as follows: "The ~~J~~joint ~~F~~force ~~C~~commander (JFC) may retain C2 of joint air operations and use the joint staff to plan, and execute on the JFC's behalf. The JFC may also organize and conduct air operations through the Service Component Commanders ~~to the joint task force (JTF)~~. This publication addresses **operational relationships, policies and procedures** for C2 of joint air operations through the **designation of a joint force air component commander (JFACC) or use of the JFC's staff.**"	Correctness. This publication applies to all levels of JFCs. The publication does address the JFC staff option.	A
3.	3	J7	A	1.01	1	28	Change to read as follows: ". . .the designation of a joint force air component commander (JFACC). Commanders of unified commands, subordinate unified commands, and ~~joint task forces (~~JTFs~~)~~ should establish implementation policies . . ."	Add period for correctness. Correct use of acronym. R-Acronym established earlier.	R
4.	4	J7	C	1.11	2	51	Change to read as follows: "Joint forces are organized on the principles of centralized planning and direction and decentralized execution. ~~However, in joint air operations, unity of effort is accomplished through centralized control coupled with decentralized execution. Centralized control amplifies on 1's key consideration of centralized planning places the responsibility and authority planning, directing and coordinating a military operation or group/category of operations under a single commander.~~ Centralized ~~control~~ planning and direction does not confer command authority over assets. Command authorities are defined by the JFC. Centralized ~~control~~ planning and direction is essential for ~~effective employment of all available forces~~ controlling and coordinating the efforts of the forces." **Modify to read as follows**: "Joint forces are organized on the principles of centralized planning and direction and decentralized execution. However, in joint air operations, unity of effort is accomplished through centralized control coupled with decentralized execution. Centralized planning and direction does not confer command authority over assets. Command authorities are defined by the JFC. Centralized	Consistency with JP 1, Chapter V, para 5c, JP 0-2, Chapter V, para 1c, and JP 3-0, Chapter II, para 6a. This concept has been changed in joint doctrine and must be changed in this publication. **LA/JSDS Mod**: The correct joint doctrine terminology is centralized planning and direction and decentralized execution.	M

ITEM	#	SOURCE	TYPE	PAGE	PARA	LINE	COMMENT	RATIONALE	DECISION (A/R/M)
							planning and direction-is essential for effective employment of all available forces."		
5.	1	JCS/LC	S	2.04		F2.02	Change figure and caption of figure to read: "Objectives of Air Space Control."	Accuracy and consistency with Fig. II-3 on page II-5.	A
6.	2	JCS/LC	A	2.06		80	Change to read "(IOs) s, PVOs . . ."	Typo.	A
7.	3	JCS/LC	A	3.02		F3.01	Replace "objectives" with "objectives;" change to read: "JFACC/JFC"; and replace "Attach" with "Attack."	Typos.	
8.	4	JCS/LC	A	3.10		1	Change to read: ". . . assigns weights to the criteria for comparison."	Correct grammar.	A
9.	5	JCS/LC	A	3.10		2	Replace "principals" with "principles."	Typo: **R** -Original language is correct.	R
10.	6	JCS/LC	A	3.13		33	Add colon after "following"	Typo. **R** -Colon is incorrect.	R.
11.	7	JCS/LC	A	3.20		80.82	Change to read: "(within Combat Plans). The GAT identifies and prioritizes ~~which will identify and prioritize~~ specific targets that meet the JFC's objectives and the component's subobjectives . . ."	As drafted, sentence is a confusing run-on sentence. Edited for clarity and typos.	A
12.	5	J7	S	52.02	3b	71	Change to read as follows: "The JFACC must **exploit the unique characteristics of all air capabilities and/or forces made available for tasking** to achieve assigned objectives as rapidly and as effectively as possible."	Consistency with previous sentence.	A
13.	6	J7	A	53.03	Quote	40	Change to read as follows: "**. . .and** to spark the advance of our ground troops by visual and radar **cooperation**."	Correctness.	A

DALLAS, TEXAS 75251

March 22, 2001

Mr. Karl Rove
Senior Advisor to the President of the United States
The White House
West Wing, 2nd Floor
1600 Pennsylvania Avenue, NW
Washington, DC 20502

Dear Karl,

Attached (Exhibit A) is the information you requested about the people in the Pentagon whose mission has been to ignore the Gulf War illnesses and label them as stress.

On page 22, the last page, I have included a list of all the acronyms of the different units in the Pentagon.

I suggest that as you read this document, you put the last page beside it so you can easily identify the acronyms.

In addition, I have included (Exhibit B), a booklet prepared by two Air Force Academy graduates on the anthrax vaccine problem, and a packet of news stories (Exhibit C) that reveals a great deal about the company in Michigan, Bioport.

Sincerely,

Ross Perot

- Ethics and examples of the breakdown
- Impact of AVIP on military culture and on civil-military relations

J. Recommendations

Section A
Executive Summary

Excerpt from the Feb. 17th, 2000 National Security Subcommittee's Report –HR 106-556 –"Unproven Force Protection:"[1]

"The AVIP should be suspended because it lacks an essential element in a medical program: trust. However well-intentioned, the anthrax vaccine effort is viewed by many with suspicion. It is seen as another chapter in a long, unhappy history of military medical malfeasance in which the healing arts are corrupted to serve a lethal purpose."

The Anthrax Vaccine Immunization Program (AVIP) is a Department of Defense (DOD) force protection program designed to counter the use of anthrax as a biological weapon by America's enemies. However, the program is rife with problems, foremost being the mandated use of an antiquated vaccine, not properly licensed to protect against biological warfare exposures, and originating from a manufacturer failing to garner FDA approval. An orderly, scientific, and medically sound approach to force protection against anthrax was abandoned in 1997. As a result, a poorly designed and inadequate vaccine became the centerpiece of the AVIP.

By using the vaccine Servicemembers rights under the law, previously acknowledged by Senate Report 103-97 and internal DoD review, were ignored. Critical and highly trained personnel were forced to leave the services, despite serious safety, efficacy and legal issues being raised in the field concerning the vaccine. Others who partook of the AVIP became ill, some severely, many testifying to Congressional committees. An unprecedented and expensive education campaign was launched rivaling the budget of the vaccine program itself.

Senior military and defense department officials often unknowingly compromised their integrity due to a lack of knowledge of the critical issues and facts in order to prop up the seriously flawed program. Throughout the dilemma rhetoric and spin supplanted the critical analysis of the legitimate safety and legality issues presented by the anthrax vaccine. These events have made the AVIP a number one topic of discussion throughout military ranks. Accordingly, AVIP represents a top priority for the new administration in an effort to secure modern force protection measures for our troops, and restore the crucial element of trust required within our fighting force.

Force protection against biological weapons is a laudable goal. For many years, DOD officials and military medical experts worked on developing such a program for the biological agent anthrax. U.S. Army researchers first developed the anthrax vaccine absorbed (AVA) in the 1940's, with continuing work and refinement of the vaccine formula throughout the 1960's. AVA was licensed in 1970, although the normal licensing procedures and requirements were never met. From 1970 until just prior to the Gulf War

[1] House Committee on Government Reform report, "Unproven Force Protection", 17 Feb 2000, p.95
See: http://www.house.gov/reform/ns/reports/anthrax1.pdf

AVA was rarely manufactured and used almost exclusively for military research. Reports indicate a total production in those twenty years of less than 70,000 doses.

A 1985 FDA review of AVA published in the Federal Register found that little data supported the safety and efficacy of the vaccine, in fact there was no clinical evidence for the licensed vaccine, only for a similar, but earlier version of the vaccine. Regardless, FDA found that based on the extremely small and specific group of individuals requiring the vaccine, it was safe and effective. The review also noted that there was no scientific data to show effectiveness against inhalation exposure.

Coincidentally, at the same time as the 1985 FDA review, the U.S. Army sent out a Request for Proposal (RFP) for a contract to develop a new anthrax vaccine, because the current vaccine had too many adverse reactions and was not suitable to a biowarfare environment. In 1989, the U.S. Army again stated these limitations in answering questions before Senate Government Affairs Committee hearings (Sen. Glenn) on the escalation of the biowarfare threat.

Realizing that the current vaccine was inadequate for use as a force protection measure, DOD and the manufacturer set out to reduce the adverse reaction rate and to license the vaccine for inhalation exposure. The U.S. Army developed a plan in 1995 for just those purposes. Explaining the reason for this plan the U.S. Army writes that the current vaccine "is not licensed" for inhalation exposure. The appropriate paperwork was submitted to FDA in 1996 and remains unapproved to this day.

Shortly after SECDEF Cohen arrived, this methodical, scientific, and lawful approach was abandoned, either for expediency or because of insurmountable regulatory and scientific hurdles. In an unprecedented move, an Assistant Secretary of Defense for Health Affairs circumvented the regulatory process and obtained a legally irrelevant memo from a new "acting" FDA Commissioner to provide a basis or approval for commencing the AVIP. The process was circumvented because the legally required data for approving a vaccine, a controlled human field trial, could not be ethically gathered. In order to commence a mandatory program, absent a regulatory approval, the FDA memo was the expedient solution.

AVA, long known to be a highly reactive and unlicensed vaccine of limited effectiveness, became the centerpiece for the AVIP. A vastly larger population would use AVA, despite strict limits in its license according to the Federal Register and product label, and further, the use against inhalation anthrax was previously acknowledged as unlicensed. As a "commander's program" the military medical community was effectively taken out of the loop and discouraged from practicing medicine. The administration of the vaccine was an order to be followed, not a medical treatment to be discussed in a classic doctor/patient relationship. Informed consent for the "off label" use of the vaccine was not an option.

Because of the exponentially greater need for vaccine, the manufacturer quadrupled production capacity. This was accomplished by replacing the existing licensed facility with all new and unlicensed equipment. Additionally, key production methods changed,

namely in the sterility and protective antigen extraction steps. Many of these changes were approved after the fact, contrary to FDA regulations. Others were never approved, as is reported in the several FDA Inspection Reports from 1990 onward. A long litany of other FDA regulatory infractions adds to the list of violations, whether scientific or compliance, that render this vaccine an adulterated and illegal product.

Servicemembers who became aware of these issues of non-compliance or of the off-label use have been systematically punished for discovering what was previously DOD's official medical and scientific position on the vaccine. In the small percentage of Guard and Reserve units to mandate the vaccine, large numbers have opted to leave, rather than risk the illnesses occurring amongst the various services. Active duty members, without the option of leaving, are being sent to jail and dishonorably discharged for taking the position previously held by the most senior of DOD's medical and science officials.

The Food and Drug Administration has been less than consistent in its position on AVA and the AVIP. Its inspection reports are scathing, and the plant was shut down as a result, yet the vaccine that came from this unacceptable facility was previously labeled as "approved." It would appear that FDA is using its discretion to overlook numerous violations in the production of the vaccine and the inappropriate and haphazard manner in which the vaccine program is being implemented.

The program is so sensitive that any appearance of a 'PR' problem is fought aggressively. Adverse reactions are high (known prior to the implementation of the program), as evidenced by the highest percentage of Vaccine Adverse Event Reports (VAERS) for any vaccine in history. Many Servicemembers are referred to clinics, hospitals, even Walter Reed Medical for treatment of unknown ailments. When AVA is mentioned as a possible cause, servicemembers are treated as disloyal soldiers because their medical conditions are a threat to the program.

Ask the DOD however, and they deny anything out of the ordinary, as noted by Senator Richard Shelby's previous investigation of Gulf War Illness[2]:

"While I have not yet determined the reason for this apparent aversion to full disclosure by DOD, the staff working on this issue from our committee has been constantly challenged by the Department's evasiveness, inconsistency, and reluctance to work toward a common goal here."
"I can only conclude, Mr. President [of the Senate], that when dealing with the Department of Defense on this issue, you have to ask the right question to receive the right answer. I do not believe they understand that we are only seeking the truth in a way to help our veterans."

The AVIP, as with any other force wide program, must be assessed for the risks versus the benefits of such a program. DOD's stated reason for this program is the increased

[2] Senator Shelby's Conclusions On The Persian Gulf Syndrome, US Senate, 17 Mar 1994, Congressional Record page S3098.
See: http://www.gulflink.osd.mil/czech_french/czfr_refs/n08en014/s3098.htm

threat of an aerosolized anthrax attack on U.S. Forces. GAO and others disagree. Their assessment is that the threat has not changed since before the Gulf War. The risk of adverse reactions to the loss of troops from an attack must also be considered. Again, DOD and GAO disagree. DOD insists the loss of highly skilled pilots and others has not impacted the readiness of the military. Again, GAO disagrees. Morale has plummeted since 1998 with the anthrax vaccine surfacing as a primary cause. DOD's abysmal history of care for its' own troops is captured in the 1994 Senate Hearing (SR103-97):[3]

"For at least 50 years, DOD has intentionally exposed military personnel to potentially dangerous substances, often in secret."

"DOD has repeatedly failed to comply with required ethical standards when using human subjects in military research during war or threat of war."

In early 1999, Army Surgeon General, LTG (Dr.) Ronald Blanck (D.O.) clearly acknowledged DoD's credibility problems[4]:

"I think it speaks to the undercurrent of distrust of the government and the military," said Lt. Gen. Ronald R. Blanck, the surgeon general of the Army, the service that oversees the vaccination program. "Agent Orange. Nuclear tests in the '50s. People say, 'How can you say this is safe?' Clearly, we have a credibility problem."

Opposition to the anthrax vaccine policy has arisen as military members, legislators, and citizens -- often parents, have discovered that the foundations of the DoD's Anthrax Vaccine Immunization Program (AVIP) are not based on the truth. Contrary to DoD assertions, the anthrax vaccine was never tested and approved according to standards in federal law, was modified without FDA approval, and was not approved for the use or indication the DoD is mandating under AVIP.

Questions about the inconsistencies in the DoD's mantra of safety and effectiveness were met with denials, discipline and discharges. These actions contrast with the ethical and safety standards to which military members are accustomed when dealing with issues that affect the well being of the troops. To this day most military commanders are not aware of these truths about the vaccine as the DoD's propaganda efforts to educate the troops label all opposition as "internet misinformation."

To the contrary, Congressional, GAO, State, and Institute of Medicine investigations have validated the concerns of military servicemembers opposed to the anthrax vaccine policy. The reality is that the anthrax vaccine plant remains closed today, just as it was in 1998 when the shots and controversy began.

Section B
Chronology[5]

1970 government approval. 2 November 1970. Despite a lack of efficacy testing, the Public Health Service (FDA predecessor) licensed the anthrax vaccine.[6]

- **Anthrax vaccine license granted despite not conducting a valid controlled human field trial.** Data from an earlier trial (known as the Brachman Study, using a different vaccine prepared by Merck, Sharp, & Dohme) was provided to satisfy the efficacy requirements established by the Public Health Service (PHS), but after the license was granted. Federal law required testing for efficacy in humans before licensure. The Michigan Department of Public Health attempted an efficacy study of the anthrax vaccine being used by DoD today that Public Health Service found unsatisfactory.

- **The GAO has reported that the current vaccine differs from the vaccine used in the Brachman efficacy studies in three ways[7].**

  - First, the Michigan Department of Public Health (MDPH) manufacturing process differs from that used for the Brachman Study vaccine.

  - Second, the strain of anthrax used to grow the MDPH vaccine is different form the strain used for the Brachman Study vaccine.

  - Finally, to increase the yield of protective antigen (believed to be an important part of the vaccine's protective effects), the ingredients and/or formulation used to make the vaccine were changed.[8]

1980's DoD statements. DoD documentation in the 1980's, absent the political pressure associated with AVIP, contains objective statements about the safety and efficacy of the anthrax vaccine being used today:

- **1985 US Army RFP.** A 1985 Army "request for proposal" to solicit a new anthrax vaccine from the biologics industry candidly discussed the safety and

[8] FDA's predecessor's letters - http://www.house.gov/reform/hearings/healthcare/00.10.03/timeline.doc

efficacy of the MCPH vaccine, its high adverse reaction rate, and its questionable efficacy against different strains of anthrax[9]:

*"There is an operational requirement to develop a safe and effective product which will protect US troops against exposure from virulent strains of Bacillus anthracis. **There is no vaccine in current use which will safely and effectively protect military personnel against exposure to this hazardous bacterial agent.**"*

*"A licensed vaccine against anthrax, which appears to afford some protection from the disease, is currently available for human use...**The vaccine is, however, highly reactogenic, requires multiple boosters to maintain immunity and may not be protective against all strains of the anthrax bacillus.**"*

1985 FDA Product Review -- Given the lack of a controlled human field trial noted in the original 1968 to 1970 correspondence (despite the NIH and PHS requesting this required data), **a proposed rule for a specific product review of the anthrax vaccine absorbed was published in the Federal Register on 13 December 1985. However, a final rule fully licensing the vaccine has never been published,** ostensibly because no human efficacy data on this vaccine was ever provided to the FDA as requested by the PHS in 1970[10]:

- December 13, 1985 -- FDA Specific Product Review of the Anthrax Vaccine Absorbed as printed in the Federal Register, CFR 620 -- *"Anthrax vaccine ... **efficacy against inhalation anthrax is not well documented.**"*

*"**The vaccine manufactured by the Michigan Department of Public Health has not been employed in a controlled field trial. Brachman employed a similar vaccine prepared by Merck Sharp & Dohme for Fort Detrick in a placebo-controlled field trial in mills processing imported goat hair. ... No meaningful assessment of its value against inhalation anthrax is possible due to its low incidence.**"*

1989 Office of the Secretary of Defense (OSD) letter to Senator Glenn. A 1989 letter from then-Assistant Secretary of Defense Robert B. Barker to Senator John Glenn reiterated the safety and efficacy problems with the vaccine[11]:

*"**Current vaccines, particularly the anthrax vaccine, do not readily lend themselves to use in mass troop immunization for a variety of reasons: the***

[9] Request for Proposals (RFP) No. DAMD 17-85-R-0078, US Army Medical Research Acquisition Activity, Fort Detrick, Frederick, MD, 16 May 1985

[10] 13 December 1985 FDA Product Review and Proposed Rule, CFR 620; http://www.house.gov/reform/hearings/healthcare/00.10.03/timeline.doc

[11] Letter from former Assistant Secretary of Defense Robert B. Barker to former U.S. Sen. John Glenn, chairman of the Senate Governmental Affairs Committee, 24 Aug 1989, transcript of Senate Hearing 101-744. The letter and quotes from Barker to Glenn are on page 474 and 480.

requirement in many cases for multiple immunizations to accomplish protective immunity, a higher than desirable rate of reactogenicity, and, in some cases, lack of strong enough efficacy against infection by the aerosol route of exposure."

March 1990 – Army Doctors describe the anthrax vaccine as an "unlicensed experimental vaccine."

- Col. (Dr.) Takafuji of the Army Surgeon General office and Col. (Dr.). Philip K. Russell of Fort Detrick, in an article titled "Military Immunizations," describe the anthrax vaccine as a ***"limited use vaccine ... unlicensed experimental vaccine"*** (Infectious Disease Clinics of North America, 3/90, p. 156)

- **This description of the anthrax vaccine by key US Army physicians means that its use requires informed consent or a Presidential waiver of informed consent.** Yet in the Gulf War and in the current AVIP program DoD asserts that the vaccine is "FDA-approved" and therefore does not require informed consent.

1994 Senate Report 103-97. In February 1994 then-MG Ronald Blanck (later Army Surgeon General) acknowledged a possible link between the anthrax vaccine and Gulf war Illness to Senate Veterans Affairs Committee investigators[12]:

- ***"Although anthrax vaccine had been considered approved prior to the Persian Gulf War, it was rarely used. Therefore, its safety, particularly when given to thousands of soldiers in conjunction with other vaccines, is not well established. Anthrax vaccine should continue to be considered as a potential cause for undiagnosed illnesses in Persian Gulf military personnel because many of the support troops received anthrax vaccine, and because the DoD believes that the incidence of undiagnosed illnesses in support troops may be higher than that in combat troops."***

The Senate Veterans Affairs Committee concluded in their Dec 1994 report[13]:

- ***"Records of anthrax vaccinations are not suitable to evaluate safety...However, the vaccine's effectiveness against inhaled anthrax is unknown. Unfortunately, when anthrax is used as a biological weapon, it is likely to be aerosolized and thus inhaled. Therefore, the efficacy of the vaccine against biological warfare is unknown. ... The vaccine should therefore be considered investigational when used as a protection against biological warfare."***

---

[12] Maj. Gen. Ronald Blanck, Commanding General, Walter Reed Army Hospital, to Committee staff, 414 Russell Senate Office Bldg., Washington, DC, 4 Feb 1994, from Senate Report 103-97, 8 Dec 94, page 35.
[13] Senate Veterans Affairs Committee staff report 103-97, 414 Russell Senate Office Bldg., Washington, DC, 4 Feb 1994, from Senate Report 103-97, 8 Dec 94, Note 61-63.

After the implementation of AVIP, LTG Blanck disavowed his testimony to the Senate Veterans Affairs Committee.[14]

1994 and 1999 -- Medical textbook "Vaccines". In 1994, Col. (Dr.) Arthur Friedlander, the Army's chief anthrax vaccine researcher at Ft. Detrick, co-authored a chapter on the anthrax vaccine in a medical textbook, "Vaccines", and acknowledged the shortcomings of the vaccine used for AVIP, including its high reactogenicity[15]:

- ***"The current vaccine against anthrax is unsatisfactory for several reasons. The vaccine is composed of an undefined crude culture of supernatant adsorbed to aluminum hydroxide. There has been no quantification of the protective antigen content of the vaccine or of any of the other constituents, so the degree of purity is unknown. Standardization is determined by an animal potency test. The undefined nature of the vaccine and the presence of constituents that may be undesirable may account for the level of reactogenicity observed. The vaccine is also less than optimal in that six doses are required over 18 months, followed by annual boosters. There is also evidence in experimental animals that the vaccine may be less effective against some strains of anthrax. Clearly a vaccine that is completely defined, that is less reactogenic, and that requires on or two doses to produce long-lasting immunity would be highly desirable."***

1995 SAIC Corporation contracted to develop an Army plan to obtain FDA approval for a license amendment to include aerosolized anthrax exposure. In September 1995 the Army contracted SAIC Corporation to submit a plan to the Army that would enable them to obtain FDA licensure of the vaccine for inhalation anthrax. **SAIC's plan clearly identified the legal status of the vaccine -- which inferred a substantial informed consent obstacle for DoD unless scientific tests were developed to satisfy federal regulatory requirements** pertaining to the safety and efficacy of the vaccine[16]:

- ***"This vaccine is not licensed for aerosol exposure expected in a biological warfare environment."***

1995 JPOBD (Joint Program Office for Biological Defense) meeting. In October 1995 the Army held its first meeting to develop a course of action to obtain FDA licensure of the vaccine for inhalation anthrax so that they could begin a mass immunization program. The meeting minutes clearly indicate that the Army knew it

[14] LTG Ronald Blanck, U.S. Army Surgeon General, letter to the editor, Washington Times, 14 Mar 2000.
[15] A.M Friedlander and P.S. Brachman, "Vaccines", ed. Plotkin and Mortimer, 1994 edition chapter 26, pg. 737
[16] SAIC Corporation plan, 29 Sep 1995, enclosure to memorandum from Dr. Anna Johnson-Winegar (US Army) to Dr. Robert Myers (MDPH), US Army Medical Research and Material Command, Fort Detrick, Frederick, MD, 5 Oct 1995.

had to obtain FDA approval of a new licensed indication for inhalation anthrax, that the efficacy tests used to license the vaccine were for a different vaccine, and that there was no scientific data to support this change by FDA.[17]

- *"A meeting was held on 20 Oct 1995 to discuss the process for modifying the MDPH anthrax vaccine license to indicate a reduced number of injections and to expand the indication to include protection against aerosol challenge of spores."*

- *"COL Friedlander said that the original series of 6 doses was established in the 1950's for an anthrax vaccine similar to but not identical with the MDPH vaccine."*

- *"Studies of vaccine (not MDPH product) effectiveness in humans working in tanneries showed protection against cutaneous disease, but there was insufficient data to demonstrate protection against inhalation disease."*

BG Busby, the Joint Program Manager for Biological Defense, concluded the meeting with comments that allude to the doctrinal motivations Army personnel had in implementing the AVIP program and identifies the start of an aggressive campaign to sell the policy and the vaccine on which it is based.

- *"BG Busby addressed a need to make the case that anthrax is currently the principal biological warfare threat. By protecting against anthrax and other BW threats, the vaccines serve as a deterrent."*

1996 IND (Investigational New Drug) Application submitted by MBPI, the anthrax vaccine manufacturer, to obtain inhalation anthrax approval. **This IND application is still pending with the FDA.** The Investigational New Drug application was specifically for anthrax vaccine absorbed (AVA) and the modification sought by the manufacturer, at the request of and with DoD assistance, will apply regardless where the anthrax vaccine is manufactured. The IND lists three reasons for the application: a change in indication to include inhalation anthrax, a change of dosage, and a change in route of administration.

Summary: The IND application was submitted following an Army, Joint Staff, and OSD staff process in which there was concurrence that it was necessary to obtain FDA approval of a new licensed indication for inhalation anthrax before DoD could

[17] LTC David Danley, "Minutes of the Meeting on Changing the Food and Drug Administration License for the Michigan Department of Public Health (MDPH) Anthrax Vaccine to Meet Military Requirements", held on 20 Oct 1995 meeting; Joint Program Office for Biological Defense memorandum, 13 Nov 1995.

start mass anthrax vaccinations.[18] That consensus was reversed within a month of Mr. Cohen being confirmed as SecDef, following DoD pressure on FDA to give permission to begin use of the anthrax vaccine for inhalation anthrax without obtaining a new licensed indication or completing the scientific investigation proposed by the Army in the IND application.[19]

1993 - 1999 FDA Inspections: DoD and the Army have long been aware of the anthrax vaccine's significant shortcomings, and the FDA began its reporting of problems with a series of inspections in the post-Gulf War era that continue to this day. According to the GAO, the FDA did not inspect the anthrax vaccine manufacturing facility from 1970 when the vaccine was licensed until 1993. Both the former and current anthrax vaccine production facility have consistently failed FDA inspections with "significant deviations" from current good manufacturing practices (CGMPs) required by FDA regulations on the following inspection dates:[20]

- May 4 - May 7, 1993
- May 31- June 3, 1994
- April 24 - May 5, 1995
- Nov 18 - Nov 27, 1997
- Feb 4 - Feb 20, 1998
- Nov 15 - Nov 23, 1999 (current facility)

Before the announcement of the AVIP policy, FDA had communicated the seriousness of these deficiencies to the manufacturer (MDPH, MBPI and Bioport) and to the US Army in:

- An FDA letter dated 22 Dec 1993.
- An FDA Warning Letter dated 31 Aug 1995
- An FDA "Notice of Intent to Revoke" (NOIR) MBPI's license dated 11 Mar 1997.

19 Feb 1998 -- DoD's "independent expert" review of anthrax program is announced as complete.

- DoD received a report on the anthrax vaccine policy from Dr. Gerard Burrow of Yale University. Dr. Burrow, a professor of gynecology, had been asked by now-Deputy Secretary of Defense Rudy DeLeon to act as an "independent expert" to review the proposed AVIP, and Burrow's "approval" was made a prerequisite by Secretary of Defense Cohen for DoD to proceed with immunizations. Dr. Burrow

[18] LTC David Danley, "Minutes of the Meeting on Changing the Food and Drug Administration License for the Michigan Department of Public Health (MDPH) Anthrax Vaccine to Meet Military Requirements", held on 20 Oct 1995 meeting; Joint Program Office for Biological Defense memorandum, 13 Nov 1995.
[19] Dr. Stephen C. Joseph, DoD ASD/Health Affairs, letter to FDA Lead Deputy Commissioner Michael Friedman, 4 Mar 1997
[20] FDA/CBER Office of Compliance and Biologics Quality, inspections of Bioport -- http://www.house.gov/reform/hearings/healthcare/00.10.03/accountability.doc

concluded, *"The anthrax vaccine appears to be safe and offers the best available protection against wild-type anthrax as a biological warfare agent."*[21]

- Yet when Dr. Burrow was asked by Congress to testify about his review at a 29 April 1999 hearing, he declined. In a 26 April 1999 letter to Representative Christopher Shays (R-CT), Burrow stated: *"The Defense Department was looking for some [sic] to review the program in general and make suggestions, and I accepted out of patriotism. I was very clear that I had no expertise in Anthrax and they were very clear they were looking for a general oversight of the vaccination program."*

20 Feb 1998 FDA inspection report begins: "The manufacturing process for Anthrax Vaccine is not validated."[22]

- The FDA report documented numerous instances of redating vaccine lots that had either expired or failed potency testing. All of the vaccine given to US troops under the AVIP to-date has come from a stockpile that was manufactured or re-dated during the 1993-1998 period of repeated failed FDA inspections.

- In January 1998, just a few weeks before the FDA was to return to the anthrax vaccine manufacturer, MBPI (now Bioport, Inc), unilaterally stopped production of the anthrax vaccine -- according to DoD because of "renovations". However, in testimony before the House Armed Services Committee on 13 Jul 2000, DoD representatives acknowledged that the FDA would not have allowed any more anthrax vaccine production from the former Michigan production line.[23]

1998 Secretary of the Army Indemnification Letter – In September 1998 DoD granted indemnification to the anthrax vaccine manufacturer. While DoD press statements implied that indemnification was common practice, this had last occurred with the Swine Flu vaccine in 1976.[24]

- *"The obligation assumed by MBPI under this contract involves unusually hazardous risks associated with the potential for adverse reactions in some recipients and the possibility that the desired immunological effect will not be obtained by all recipients. Although AVA has been extensively tested under the auspices of the Food and Drug Administration, the size of the proposed vaccination program may reveal unforewarned idiosyncratic adverse reactions.*

Moreover, there is no way to be certain that the pathogen used in tests measuring vaccine efficacy will be sufficiently similar to the pathogen that U.S. forces might encounter to confer immunity. These concerns, coupled with the uncertain and evolving state of product liability law with regard to vaccines, lead me to the conclusion that the performance of this contract will subject MBPI to certain unusually hazardous risks."

1999 update of 1996 Investigational New Drug (IND) Application – On 29 Jan 1999 BioPort Corporation submitted a progress report containing meeting minutes referring to studies related to the 1996 Investigational New Drug (IND) application. The FDA Form 1571 on which the submission is made lists "inhalation anthrax" (not a change in dosage or route of administration) as the only reason covered under this submission.[25] The form also lists Army personnel at Ft. Detrick who are responsible for the investigation supporting the changed indication.

One year after the announcement of a mandatory anthrax vaccination program the new owner of the anthrax vaccine plant, BioPort, acknowledged in their update to the FDA that the vaccine was not licensed for the purpose for which DoD was using it. This acknowledgement means that DoD's use of the anthrax vaccine required informed consent. Despite this, DoD officials have repeatedly attempted to infer that the IND application submitted to FDA was only for a change of dosage and route of administration -- not a new indication for inhalation anthrax. BioPort's CEO also failed to mention this primary reason for the IND application during his 30 Jun 1999 testimony before Congress.

5 Oct 1999 FDA Notice of Proposed Rulemaking (NPRM)[26] -- proposed, never enacted -- On 5 Oct 1999 FDA issued a Notice of Proposed Rulemaking (NPRM) to change the licensing requirements for biowarfare drugs and vaccines. During Congressional testimony on 9 Nov 1999 William Raub, Ph.D., HHS Deputy Assistant Secretary For Science Policy, explained why[27]:

"...FDA is proposing to amend its new drug and biological product regulations to identify the information needed to provide substantial evidence of the efficacy of new drug and biological products used to reduce or prevent the toxicity of chemical, biological, radiological, or nuclear substances. This proposal would apply when the traditional efficacy studies in humans are not feasible and cannot be ethically conducted under FDA's regulations for adequate and well-controlled studies in humans...In these situations, certain new drug and biological products that are intended to reduce or prevent serious or life-threatening conditions could be approved for marketing based on evidence of effectiveness derived

from appropriate studies in animals, without adequate and well-controlled efficacy studies in humans (21 CFR 314.126)[28]."

The FDA NPRM is a tacit admission that anthrax vaccine is an investigational new drug, because it cannot meet FDA regulatory requirements for progressing to a fully licensed status for its intended use by DoD.

FDA's proposal to introduce a different licensing standard for biowarfare drugs and vaccines is in concert with a recommendation made by two Army doctors in a 1992 article. They explained[29]:

"For products designed to product against chemical and biological agents, a clear demonstration of efficacy would require exposure to humans to these lethal agents. Since this practice would be unethical and immoral, these products never advanced beyond the investigational stage."

Two years after the Anthrax vaccine policy was announced the FDA took steps to legally sanction it, and other drugs and vaccines likely to be developed under the $325 million Joint Vaccine Acquisition Program. Despite proposing a new rule, however, FDA has taken no further action to enact it in federal law. Until it does, use of the anthrax vaccine for inhalation exposure is not recognized or approved as one of its' intended uses and therefore requires informed consent.

23 Nov 1999 – FDA inspects BioPort's new manufacturing facility – <u>again</u> begins: "The manufacturing process for the production of Anthrax Vaccine Adsorbed is not validated." – An FDA inspection of the anthrax vaccine manufacturer conducted 15-23 Nov 1999 reiterated once again the failure to meet FDA standards.

- The FDA <u>again</u> begins: *"The manufacturing process for the production of Anthrax Vaccine Adsorbed is not validated."*

- At a 13 Apr 2000 Senate Armed Services Committee hearing DoD officials admitted that they do not expect the FDA to certify the new anthrax vaccine production facility until late 2000 – nearly three years after the old facility was shutdown.[30]

- By the fall of 2000 the manufacturer's certification is slipped at least an additional year to mid to late 2001 based on problems in the manufacturer's packaging and labeling operation discovered during an October 2000 FDA inspection. The FDA also noted the manufacturer had failed to investigate adverse reactions.[31]

[31] http://www.fda.gov/ora/frequent/bioport483.pdf

3 April 2000 Congressional Report (draft released on 17 Feb 2000)– After multiple Congressional hearings concerning the AVIP controversy, the full Committee on Government Reform adopts the National Security Subcommittee report, titled "Unproven Force Protection", recommending suspension of the experimental anthrax program.[32]

- House Government Reform Committee Findings:

  *1. **The AVIP is a well-intentioned but over-broad response** to the anthrax threat. It represents a doctrinal departure over emphasizing the role of medical intervention in force protection.*
  *2. **The AVIP is vulnerable to supply shortages and price increases.** The sole-source procurement of a vaccine that requires a dedicated production facility leaves DOD captive to old technology and a single, untested company. Research and development on a second-generation, recombinant vaccine would allow others to compete.*
  *3. **The AVIP is logistically too complex to succeed.** Adherence to the rigid schedule of six inoculations over 18 months for 2.4 million members of a mobile force is unlikely, particularly in reserve components. Using an artificial standard that counts only shots more than 30 days overdue, DOD tolerates serious deviations from the Food and Drug Administration (FDA) approved schedule.*
  *4. **Safety of the vaccine is not being monitored adequately.** The program is predisposed to ignore or understate potential safety problems due to reliance on a passive adverse event surveillance system and DOD institutional resistance to associating health effects with the vaccine.*
  *5. **Efficacy of the vaccine against biological warfare is uncertain.** The vaccine was approved for protection against cutaneous (under the skin) infection in an occupational setting, not for use as mass protection against weaponized, aerosolized anthrax.*

- House Government Reform Committee Recommendations:

  *1. **The force-wide, mandatory AVIP should be suspended** until DOD obtains approval for use of an improved vaccine. To accomplish this:*
  2. DOD should accelerate research and testing on a second-generation, recombinant anthrax vaccine; and,
  3. DOD should pursue testing of the safety and efficacy of a shorter anthrax inoculation regimen; and,
  4. DOD should enroll all anthrax vaccine recipients in a comprehensive clinical evaluation and treatment program for long term study.
  *5. **While an improved vaccine is being developed, use of the current anthrax vaccine for force protection against biological warfare should be considered***

Section C

Legal issue #1 – Informed consent

The first legal issue will be explored based on violations of existing law, Presidential executive order, regulations and directives; and further by the false testimony under oath by senior DoD officials and experts to possible obscure the relevant issues.

Illegal Program: AVIP in its mandatory form is in violation of 10 USC 1107, EO 13139, and DODD 6200.2 by failing to provide US armed forces members informed consent with the use of an experimental or investigational vaccine. Both SR 103-97 and HR 106-556 deemed the use of the anthrax vaccine as "experimental" and / or "investigational" following lessons learned from the Gulf War. DoD recognized the experimental nature of the anthrax vaccine before the 1997 initiation of the AVIP. The subsequent policy process behind the implementation of the AVIP clearly attempts to circumvent the requirements of the regulations, and later the specific requirements of the US Code, Executive Order, and DoD Directive, as well as the rights of US Servicemembers under these laws, regulations or directives.

False statements: False statements have been made under oath by at least two senior military officers, LtGen. Ronald Blaack, US Army, Retired; and Colonel Arthur Friedlander, US Army. These officer's false testimony regarding the IND (Investigational New Drug Application) for the Anthrax Vaccine Absorbed (AVA) obstructed the regulatory and legal bodies receiving the testimony from accurately assessing the legal issues involved. Further, Col. Friedlander's false testimony occurred across international borders as a representative of the US Military, tarnishing our nation's and military's reputation and credibility. Both officers have testified to Congress and sacrificed our nation's armed forces creditability and integrity in the eyes of our Congressional representatives and its military members.

Charge 1: AVIP violates Informed Consent rights of US Armed Forces members, contrary to US Law, Executive Order and DoD Directive:

1. 1999 Law on informed consent for US Servicemembers – 10 USC 1107.

2. September 29, 1999 Executive Order by President Clinton – EO 13139.

3. August 1, 2000 DoD Directive 6200.2 codifies USC and EO requirements.

Background:

Statement of John J. Michels, Jr. – before the House Government Reform Committee, 3 Oct 2000[41]:

"The 1970 NIH-approved license for AV indicates that it was approved as a prophylaxis only against cutaneous exposure to anthrax for a specific methodology of administration, and a specific vaccination schedule. (See: PHS / NIH approval paperwork submitted in Congressional Testimony by Dr. Claussen, October 12, 1999; House Committee on Government Reform; also See: Federal Register, December 13 1985, previously provided to the DoD IG on 16 JAN 01).

Recognizing the need for certification for pulmonary infections, in 1995 the Michigan Department of Public Health ("MDPH") and the Army discussed establishing a plan for Investigational New Drug approval by the FDA. [See: Anthrax Vaccine License Amendment Project Plan briefing slides (October 20, 1995]. The briefing slides clearly show that the Army was well-aware that the AV, in order to meet the above-described legal requirements for licensure, had to pass through the IND application process in order to become fully licensed as a prophylaxis for pulmonary anthrax. The focus of the proposed plan was to get approval from the FDA for a change to the immunization schedule (in this case to a series of three doses of vaccine versus the prescribed six) and to change the labeling to reflect that the vaccine was properly administered as protection against pulmonary or airborne anthrax.

In fact, less than one year from the date of the briefing, on September 20, 1996, MBPI filed an Investigational New Drug application with the FDA. The application identified the three areas where the current license would be modified – showing a new designation for "inhalation anthrax", changing the "route of administration", and changing the "vaccination schedule". The application indicates that it is an "initial" investigational new drug application. (See: Previously provided IND Application, dated September 20, 1996, to DoD IG on 16 JAN 00).

Thus, as the DoD was preparing to kick-off its anthrax vaccination program, the sole producer of anthrax vaccine recognized that its product, as labeled, was not legally viable and undertook the appropriate steps to change product use labeling, method of administration, and vaccination schedule. These substantial changes in how this drug was to be used rendered it an IND. This is explicitly acknowledged by the September 20, 1996 application by MBPL MBPI or Bioport has never withdrawn that application, nor has it ever been modified or acted on in any way. In fact the application was modified / updated in Jan. 1999 to include a single indication change: "Inhalation Anthrax."

[41] John J. Michels, Esq., testimony before the House Government Reform Committee, 3 Oct 2000. See: http://www.house.gov/reform/hearings/healthcare/00.10.03/michels.htm

The formal record of the anthrax program is littered with references to the vaccine's IND status. For example, as the Army began to move forward to try and license the vaccine as a prophylaxis against inhaled or pulmonary anthrax, it followed up its October 1995 meeting with a series of meetings designed to request that MBPI file an IND application for the vaccine. On November 13, 1995 the Joint Program Manager for Biological Defense, Army Brigadier General Walter L. Busbee, instructed the Joint Program Office for Biological Defense that the DoD needed to "...develop a ... package for initiating and completing an amendment to MDPH anthrax license for: (1) reduced immunization schedule, (2) immunization by the intramuscular route, and (3) indication for protection against an aerosol challenge". Minutes of the Meeting on Changing the Food and Drug Administration License for the Michigan Department of Public Health (MDPH) Anthrax Vaccine to Meet Military Requirements (November 13, 1995), Atch. 6. As late as June 30, 1999, in testimony before the House Subcommittee on National Security, Veterans Affairs and International Relations, Atch 7, at 12, Mr. Fuad El-Hibri, President and CEO of Bioport, stated

> [w]e continue to hold an Investigational New Drug application - IND 6847 – to improve administration of the anthrax vaccine.

The use of the AV as currently contemplated by DoD is a clear change in how the drug was to be originally used and for which it was licensed, rendering the AV an IND. There can be no doubt that "administration of the anthrax vaccine for mass prophylaxis in Biological Warfare should be considered an off-label use of the product to treat an indication for which it is not explicitly licensed... both the new indication and the new schedule should be undertaken only pursuant to FDA regulations governing clinical trials on investigational new drugs". The Department of Defense Anthrax Vaccination Immunization Program: Unproven Force Protection, p.3, House of Representatives Government Oversight Committee (March 9, 2000) Atch. 8.

This current vaccine is obviously a "new" drug under any FDA standard. Moreover, the Anthrax Vaccine is apparently is not even the same substance originally tested and approved by NIH. This bizarre conclusion is borne out in a GAO report dated April 29, 1999, entitled Medical Readiness: Safety and Efficacy of the Anthrax Vaccine, Atch. 9 where, at p. 3, it was revealed that the AVIP vaccine being administered to DoD members is not the same vaccine as originally tested prior to 1970. The import of this fact cannot be emphasized enough; the vaccine in current DoD inventories is NOT the same chemical compound as the original compound tested in advance of the 1970 NIH approval.

Accordingly, there can be absolutely no claim by DoD that the AV is anything but an IND. This fact is recognized by the AV's manufacturer, Bioport, in its IND application, which is still current and pending, and by the complete failure of Bioport, DoD or any other entity to provide verifiable clinical testing showing that the AV is either safe or effective, in humans, as a prophylaxis to pulmonary anthrax. The FDA testing regimen, which has not been waived or excepted for the AV, federal statutes,

and federal case law, all point to the inescapable determination that the AV is an IND as it is currently being used on members of the Armed Forces without their informed consent.

As a work around, it becomes apparent that the Department of Defense recognized that the manufacturer's inability to gain certification for its manufacturing process from the FDA due to failure to comply with CGMPs (current good manufacturing practices), as well as the inability to gain IND approval due to lack of efficacy testing against inhalation anthrax IAW regulations. As a result the Assistant SECDEF for Health Affairs, Mr. Stephen Joseph wrote a letter to FDA Lead Commissioner Michael Friedman on 4 Mar 1997 maintaining that Anthrax Vaccine Absorbed had been long recognized as approved for inhalation anthrax protection. This new commissioner accepted the DoD's request. On 13 Mar 1997 FDA Lead Commissioner Michael Friedman offered to ASD/Health Affairs Stephen Joseph a letter on FDA letterhead with the language DoD felt they needed to circumvent the regulatory requirements – the language specifically said the the DoD's use for the vaccine, "was not inconsistent" with the product's license. As the GAO noted in House Congressional Hearing on 11 October 2000, this also did not maintain that the use was "consistent" with the AVA's label or license.

Further, the Code of Federal Regulations, specifically 21 CFR 10.85 – Advisory Opinions – explains precisely why the 13 Mar 1997 letter by FDA Lead Deputy Commissioner is legally irrelevant – yet this is the primary justification the DoD uses to maintain product approval:

> *"A statement made or advice provided by an FDA employee constitutes an advisory opinion only if it is issued in writing under this section. A statement or advice given by an FDA employee orally, or given in writing but not under this section or Sec. 10.90, is an informal communication that represents the best judgment of that employee at that time but does not constitute an advisory opinion, does not necessarily represent the formal position of FDA, and does not bind or otherwise obligate or commit the agency to the views expressed."*[42]

The FDA personal memo of 13 March 1997 didn't proceed through this or any other process that complies with the requirements of the regulations or current laws. It appears to be a quick fix for a vaccine that was to be the foundation of a multi-level biowarfare vaccine force protection program."

---

[42] 21 CFR 10.85, "Advisory Opinions"
See: http://frwebgate.access.gpo.gov/cgi-bin/get-cfr.cgi?TITLE=21&PART=10&SECTION=85&YEAR=1999&TYPE=TEXT

Specific Background on Charge 1, Item 1 – 1999 Law on informed consent for US Servicemembers – 10 USC 1107:

A determination that the AVA is an IND renders inescapable the conclusion that service members as a consequence of federal law and service regulations must give their informed consent prior to submitting to vaccinations. Despite the complexities of these requirements, Servicemembers cannot be denied this right unless the President waives their informed consent. This has not happened. This argument is codified in the laws of the land as of 1999 and the passage of Title 10, Section 1107 of the US Code:

The Federal Statute:

10 U.S.C. § 1107 (1999) entitled "Notice of Use of an Investigational New Drug or a Drug Unapproved for its Applied Use" specifically provides:

> A – Notice Required. - (1) Whenever the Secretary of Defense requests or requires a member of the armed forces to receive an ***investigational new drug or a drug unapproved for its applied use***, the Secretary shall provide the member with notice containing the information specified in subsection (d).
>
> ***E – Limitation and Waiver. - (1) In the case of the administration of an investigational new drug or a drug unapproved for its applied use to a member of the armed forces in connection with the member's participation in a particular military operation, the requirement that the member provide prior consent to receive the drug in accordance with the prior consent requirement imposed under section 505(i)(4) of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 355(i)(4)) may be waived only by the President.*** The President may grant such a waiver only if the President determines, in writing, that obtaining consent –
>
> 1. Is not feasible;
> 2. Is contrary to the best interests of the member; or
> 3. Is not in the interests of national security. (Emphasis added).

Specific Background on Charge 1, Item 2 – The Executive Order of the President:

An Executive Order is a lawful order of the Commander-in-Chief of the United States Armed Forces. On September 30, 1999, the President issued Executive Order 13139, entitled "Improving Health Protection of Military Personnel Participating in Particular Military Operations". EO 13139 reiterates many of the requirements of federal law and specifically provides in part:

> Sec. 2. Administration of Investigational New Drugs to Members of the Armed Forces. (a) The Secretary of Defense (Secretary) shall collect

intelligence on potential health threats that might be encountered in an area of operations. The Secretary shall work together with the Secretary of Health and Human Services to ensure appropriate countermeasures are developed. ***When the Secretary considers an investigational new drug or a drug unapproved for its intended use (investigational drug) to represent the most appropriate countermeasure, it shall be studied through scientifically based research and development protocols to determine whether it is safe and effective for its intended use.*** (b) It is the expectation that the United States Government will administer products approved for their intended use by the Food and Drug Administration (FDA). However, in the event that the Secretary considers a product to represent the most appropriate countermeasure for diseases endemic to the area of operations or to protect against possible chemical, biological, or radiological weapons, but the product has not yet been approved by the FDA for its intended use, the product may, under certain circumstances and strict controls, be administered to provide potential protection for the health and well-being of deployed military personnel in order to ensure the success of the military operation. The provisions of 21 CFR Part 312 contain the FDA requirements for investigational new drugs.

Sec. 3. Informed Consent Requirements and Waiver Provisions.

A -- Before administering an investigational drug to members of the Armed Forces, the Department of Defense (DoD) must obtain informed consent from each individual unless the Secretary can justify to the President a need for a waiver of informed consent in accordance with 10 U.S.C. 1107(f). Waivers of informed consent will be granted only when absolutely necessary. (Emphasis added).

In addition, the provisions of 21 C.F.R. §§ 50, 312 (October 5, 1999) support both the federal statute and the Executive Order by specifically noting situations where the informed consent requirements may be waived. Echoing 10 U.S.C. § 1107, the Regulations note that only the President of the United States may waive the informed consent requirements mandated by his Executive Order and federal law. Waiver is allowed only if one of three preconditions is met -- if obtaining informed consent is not feasible; if obtaining informed consent is contrary to the best interests of the recipient; or if informed consent is contrary to national security interests. The President has yet to issue any such waivers, or even initiate action to do so regarding the AVA.

Specific Background on Charge 1, Item 3 – DoD Directive 6200.2:

Reiterating both Federal Law, Executive Order and standing FDA Regulations, the Department of Defense coordinated it's own Directive in August of 2000, which DoD is also in violation of by using AVA without informed consent or with a Presidential waiver:

Department of Defense DIRECTIVE – NUMBER 6200.2 – SUBJECT: Use of Investigational New Drugs for Force Health Protection – i.e., requirements to comply with Federal Law and applicable Executive Orders.

References: (a) Section 1107 of title 10, United States Code (b) Executive Order 13139, "Improving Health Protection of Military Personnel Participating in Particular Military Operations," September 30, 1999 (c) Title 21, Code of Federal Regulations, Parts 50, 56, 312, Subpart I of Part 314, Subpart G of Part 601, current edition (d) House Report No. 105-736, Conference Report to Accompany Proposed Strom Thurmond National Defense Authorization Act for Fiscal Year 1999, page 685 (e) through (f), see enclosure

1. PURPOSE – This Directive: 1.1. Establishes policy and assigns responsibility for compliance with references (a) through (c) for the use of investigational new drugs for force health protection. 1.2. Designates the Secretary of the Army as the DoD Executive Agent for the use of investigational new drugs for force health protection.
2. APPLICABILITY AND SCOPE – This Directive: 2.1. Applies to the Office of the Secretary of Defense, the Military Departments, the Chairman of the Joint Chiefs of Staff, the Combatant Commands, the Office of the Inspector General of the Department of Defense, the Defense Agencies, the DoD Field Activities and all other organizational entities within the Department of Defense.
2.2. Applies to all uses of investigational new drugs by the Department of Defense for force health protection.
3. DEFINITIONS – 3.2. Investigational New Drug (IND). A drug or biological product subject to the FDA regulations at 21 CFR Part 312 (reference (c)), including: 3.2.1. A drug not approved or a biological product not licensed by the FDA. 3.2.2. A drug unapproved for its applied use.

Charge 2: False Testimony

False testimony to Congress and to a Canadian Courts-martial concerning the IND issue misrepresents the issue surrounding AVA's use without informed consent:

#1 – COL Arthur Friedlander's false testimony to a Canadian court-martial

COL Friedlander's vague answers in his trial testimony (below), while under oath, consistently attempt to deny any knowledge of the primary purpose of the 20 Sep 1996 Investigational New drug application prepared by USAMRIID for the anthrax vaccine manufacturer – to obtain a new licensed indication for inhalation anthrax.

Excerpted testimony from 30 Mar 2000, questioning by Assistant Defence Counsel Jill Duncan and answers by Colonel (Dr.) Arthur Friedlander, U.S. Army (USAMRIID, Ft. Detrick, MD):[43]

MINUTES OF PROCEEDINGS
STANDING COURT MARTIAL

For the trial of K72 142 802 Ex-Sergeant Michael Richard KIPLING, Canadian Forces, Regular Force, held at 17 Wing Winnipeg, Manitoba on the 15th, 16th, 17th, 22nd, 23rd, 24th, 25th, 28th and 29th days of February 2000; and the 27th, 28th, 29th, 30th and 31st days of March 2000; and the 26th day of April 2000; and the 5th day of May 2000.

MILITARY JUDGE
F26 089 814 Colonel G.L. Brais, Office of the Chief Military Judge.

Assistant Defence Counsel Duncan:
Q.**If I'm going to suggest to you, sir, that the drug was licenced for cutaneous anthrax only and that there has been a subsequent amendment for coverage for inhalation anthrax, would you agree with me or disagree with me?**

Colonel Friedlander:
A. I'm not aware of that.

Q. Okay. I'm going to show you something, sir, that seems to suggest at least--I'll give you a copy.

[43] Canadian court-martial trial transcript, Judge G.L. Brais, 30 Mar 2000, Office of the Chief Military Judge, Canadian Forces

A. Uh-huh.

ASSISTANT DEFENCE COUNSEL: Oh, I've given you the copy for the judge. I'll just refer, Your Honour, if I might to where I want the witness to attend to and then I'll show it to Your Honour.

MILITARY JUDGE: Yeah, but I'd like to know what it is first, before you have the witness ...

ASSISTANT DEFENCE COUNSEL:
Q. It's off of the web and it indicates that it's an article from the *Belleville News-Democrat* newspaper, March 27th, the year 2000?

A. Uh-huh.

Q. Have you seen this newspaper article, sir?

A. No, no.

Q. In particular, the fifth paragraph, it says that the office, and this is referring to the Joint Program Office for Biological Defense, quote: "managed and funded efforts leading to the submission of a Biologic Licensure Application amendment to the FDA,' including data to support its proposal 'to license the vaccine to provide protection against aerosol exposure to anthrax.'". Is that something you're familiar with, sir, or would you disagree with that statement?

A. I'm not sure the details of this, I do know that there were questions that were raised, since there are no direct studies in humans with this vaccine, and that a statement was made by the FDA that the use of the vaccine in the Gulf War against the threat of aerosol use of spores was not inconsistent with the product licence.

ASSISTANT DEFENCE COUNSEL: Okay. I don't know whether my learned friend has any objection to tendering this into evidence; the witness has referred to it.

MILITARY JUDGE: Well, you've, sort of, put the cart before the horse. But, you know, I mean, I wanted to see the document before you questioned the witness on it. I guess there was no objection, so now it's done.

PROSECUTOR: Your Honour, I would object to this. He has responded to ...

MILITARY JUDGE: Well, it's too late, its done, I've heard it. I've heard it, now it's a question of weight.

PROSECUTOR: Well, ...

ASSISTANT DEFENCE COUNSEL: Okay, I'll proceed then. This is not a document that was offered by this gentleman, so I'll just leave it at that.

Q. But, sir, when you say that it's not inconsistent with inhalational anthrax, that's something slightly different than saying it was licenced for inhalational anthrax, wouldn't you agree?

A. I can read to you what it says in the product insert about anthrax, and I think that the question is what you mean by "contact".

Q. Okay. Well, my question to you actually, sir, was: To say that it's not inconsistent with inhalational anthrax is different than saying this drug is--or this vaccine is for inhalational anthrax?

A. That's for the person who wrote that statement to--I mean, the interpretation of that, I'm not here to interpret that statement, I didn't make that statement.

Q. If I was to suggest to you, sir, that we've heard evidence that the vaccine was licenced for cutaneous anthrax and that there was an application placing the drug into IND status with the FDA for three reasons: one, is to change for inhalational anthrax; two, was to change the route of administration; and, three, to change the scheduling of the drugs, would you agree with that or do you know?

A. I know that there have been studies dealing with trying to reduce the number of doses and to look at the route of administration.

Q. So are you saying, sir, that you're not familiar with what I've said, or you disagree with it?

A. No, no. I don't know that--I'd have to look back at the documents that you're referring to.

Q. Okay. So you're not saying the drug is not in an IND status for those three variations?

A. You know, I'm not clear what you're saying in terms of--I mean, I'm not quite clear what that means, in other words. There are studies that have been done, that I'm involved with, looking at reducing the number of doses and changing the route of administration.

Q. Okay. That's not actually what I'm asking, sir?

A. Yes.

Q. Okay. Maybe if I can make myself clearer: We've heard evidence that the drug was licenced for cutaneous anthrax and that it's now been proposed, presumably by DOD, to make three changes: one, is make it a countermeasure for inhalational anthrax as opposed to cutaneous; two, change the route of administration; and, three, the schedule of dosages, and that because it's an amendment, the drug has gone into IND status for that purpose?

A. You know, I can't answer that question. You have to talk to the people actually directing that study.

Q. So you're saying you're not sure?

A. That's right.

Comment: The DoD documents provided to the DoD IG, and detailed in the previously listed chronology, reflect that despite Col. Friedlander assertion that he was "not aware" of the purpose of the Investigational New Drug application filed on 20 Sep 1996, on at least three occasions he was present at DoD meetings during which he specifically briefed the three reasons for the IND application, including an FDA license amendment to add an indication for inhalation anthrax:

1. **20 Oct 1995 briefing.** Colonel Friedlander presented a briefing at a meeting held by the Joint Program Office for Biological Defense on 20 Oct 1995. The meeting was a strategy session held by DoD and manufacturer representatives to develop a gameplan for "Changing the Food and Drug Administration License for the Michigan Department of Public Health (MDPH) Anthrax Vaccine to Meet Military Requirements."[44] According to the meeting minutes, Col Friedlander:

   - *"...presented a briefing covering the three topics: (1) evidence for a reduction in the number of doses of anthrax vaccine, (2) evidence for vaccine efficacy against an aerosol challenge [inhalation anthrax], and (3) progress towards an in vitro correlate of immunity."*

   - ***"Dr. Friedlander agreed that the surrogate animal model needed to be established", which followed his acknowledgment that "there was insufficient data to demonstrate protection against inhalation disease."***

[44] LTC David Danley, "Minutes of the Meeting on Changing the Food and Drug Administration License for the Michigan Department of Public Health (MDPH) Anthrax Vaccine to Meet Military Requirements", held on 20 Oct 1995 meeting; Joint Program Office for Biological Defense memorandum, 13 Nov 1995.

- Last, a briefing slide from this meeting titled, "Immediate Objectives for Anthrax Vaccine Licensure", explained the purpose of the IND to be prepared by the Army: *"To obtain a [FDA] Product License Application Supplement approval for a specific immunization schedule change...and for a labeled indication change [such as the indication for use in protection against aerosol challenge)."*

2. **9 Feb 1996 briefing.** At a follow-up meeting on 9 Feb 1996 Col. Friedlander presented another briefing titled "Research Plan to Support Reduction in Dosage of Licensed Anthrax Vaccine (AVA) and Indication for Aerosol Exposure". This clearly demonstrates that Col. Friedlander was integrally involved in the preparation of the investigation protocol prepared by the US Army, and which the manufacturer ultimately submitted to the FDA on 20 Sep 1996. The meeting minutes show that Friedlander discussed the need for the study to show a correlation between animal and human immune response to the vaccine – a recognition that the anthrax vaccine had never demonstrated efficacy for inhalation anthrax in humans which is the legal requirement for licensure.[45]

3. **10 Nov 1997 briefing.** Col. Friedlander presented another briefing to DoD and contractor representatives on 10 Nov 1997 titled: "Supplement to AVA License". This was 14 months after the submission of the IND application by the manufacturer. The briefing slides clearly show the three changes sought (including an indication for inhalation anthrax] and that Col. Friedlander was responsible for the pre-clinical portions of these studies intended to obtain FDA approval for these changes.[46]

4. **15 Dec 1998 briefing** concerning the update to the IND application. A meeting was held and Col. Friedlander was listed as an attendee in which the IND application status was the primary topic. The only reason listed as a new "indication" on the IND application was "inhalation anthrax."

Col. Friedlander's testimony stands contrary to his presence at these meetings and his intimate knowledge of the IND application. This IND application update, dated 29 January 1999, was submitted in the very month military pilots in the Connecticut Air National Guard were being forced out of their combat positions due to their unanswered questions about the illegal nature of the AVIP mandate.

[46] Col (Dr.) Arthur Friedlander, briefing titled "Supplement to AVA License" (slides), meeting attended by USAMRIID and contractor representatives, 10 Nov 1997

#2 – LTG Ronald Blanck false testimony to Congress

Further evidence of attempts to deny knowledge of the IND application came in testimony to the Senate Armed Service's Committee on 13 April 2000. **In testimony before Congress LTG Ronald Blanck, then-Army Surgeon General, misrepresented the purpose of the Investigational New Drug application prepared by the Army for the manufacturer.** The Senator who queried LTG Blanck was unfamiliar with the Food, Drug, and Cosmetic Act and accepted LTG Blanck's testimony without question. Therefore, he did not pursue the fundamental issue – that the Army knew that the anthrax vaccine is not licensed for inhalation anthrax and that it had prepared an IND application for the vaccine manufacturer to submit to the FDA on 20 Sep 1996 to satisfy a legal standard that it later ignored.

Excerpted verbatim testimony before the Senate Armed Services Committee, 13 Apr 2000:

> SEN. ROBERTS: General Blanck, the annual Congressionally mandated chemical and biological defense program report to Congress submitted on March 15, 2000, states: "The Department submitted data to the FDA last year to license the vaccine to provide protection against aerosol exposure to anthrax." My question is why is the Department seeking a license for the vaccine when the license for the anthrax vaccine has existed since 1970?
>
> GEN. BLANCK: It is really for the facility, not for the vaccine per se.
>
> SEN. ROBERTS: Oh, I see, okay. All right. That clears that up.

Legal Issue #1 – Informed Consent – Conclusion:

To the contrary, these two examples of misleading and false testimony do not clear things up. These examples of false testimony over the pivotal issue of the IND status of the anthrax vaccine go straight to the core of the legal issues involved. By not answering these questions in a forthright manner the legal concerns of both the Canadian Court and the US Congress were obstructed by these US Army officers. Further, the chain of events in the chronology and the awareness by the US Army that the anthrax vaccine was inadequate and unlicensed make it painfully clear that the Anthrax Vaccine Absorbed and the Anthrax Vaccine Immunization Program, testimonials, education programs, and UCMJ action against US Servicemembers all stand contrary to the Law, Executive Order, DoD Directives, and every military member's oath to uphold the Constitution and the laws of the land.

Section D
Legal Issue #2 – Adulteration

History of Anthrax Vaccine Adsorbed.

The Search. The search in the Western hemisphere for a vaccine protective against *Bacillus anthracis* began in earnest in the mid-1940's with Gladstone[47] in the United Kingdom and Cromartie[48] in the United States. Identification studies, production studies, and animal trials continued through the 1940's and into the early 1960's. The first human use of an anthrax vaccine in the United States was chronicled in 1954[49].

The Vaccine.

The first field trial of a human anthrax vaccine, known as the Brachman Study, was conducted from 1955-1959 at four goat hair-processing mills in the Northeast U.S. The findings were published in 1962[50]. Development of the vaccine continued unabated during this time and in 1965 a patent was granted to the U.S. Army[51] for an anthrax antigen [vaccine]. ***It is this vaccine, not the vaccine used in the Brachman study for which a license was sought.***

An application to license this vaccine was submitted in 1967. A study was conducted in Talladega using this patented vaccine (the results have never been published). Correspondence between the investigators and the National Institutes of Health indicate problems with the study. In January 1968 the Acting Chief of the study, Dr. Philip Coleman, wrote[52]

- ***"As to the efficacy of the vaccine, we have no real method of determining the protection afforded."***

[52] Philip Coleman, Acting Chief, Investigational Vaccines Activity , letter to Division of Biologics Standards, National Institutes of Health, 25 January 1968.

A 6 February 1969 memorandum from the licensing oversight committee to Dr. Margaret Pittman, of HEW, chides the study efforts by stating[53]:

- *"The lack of cases of anthrax in an uncontrolled population of approximately 600 persons in the Talladega mill can hardly be accepted as scientific evidence for efficacy of the vaccine."*

On 10 February 1969 Dr. Pittman recommended licensure of the vaccine but wrote[54]

- ***"It was noted also that clinical data establishing efficacy of the product had not been submitted and that data be requested from NCDC*** [National Communicable Disease Center]."

On 2 November 1970 license approval was recommended by the Department of Health, Education, and Welfare **without any efficacy data.**[55] The License was granted on 10 November 1970. At some point the efficacy data from the earlier Brachman Study was submitted and accepted (no documentation of this has been uncovered). The Brachman Study is referenced on the approved package insert. **It is important to realize that the vaccine used in the Brachman Study differed from the licensed vaccine in strain, formulation, and production method.**

The license for biologic products actually consists of two separate applications, the establishment license application (ELA), and the product license application (PLA). FDA requires that both applications be approved simultaneously for a license to be granted.

The vaccine was ostensibly developed to protect mill workers in danger of contact with anthrax spores from handling contaminated animal products. Shortly after the vaccine was licensed, the mills began closing as the garment industry changed. The risk of exposure and infection from anthrax spores by the general public disappeared. **The vaccine's use became limited to experiments on laboratory animals, the researchers conducting the experiments, and the staff at the manufacturing plant.**

The FDA and Anthrax Vaccine Adsorbed.

The FDA completed a review of biologic products (vaccines) in 1985 and published a Proposed Rule in the Federal Register on 13 December 1985.[56] This proposed rule was the result of a review of the safety, efficacy, and labeling of bacterial vaccines and toxoids with standards of potency. AVA is such a product. The FDA review of AVA severely limits its endorsement of the product.[57]

---

[53] Ad Hoc Committee letter to Dr. Margaret Pittman, 6 February 1969.
[54] Dr. Margaret Pittman, letter to Dr. Sam Gibson, 10 February 1969.
[55] HEW memorandum from Margaret Pittman to Reference No. file 67-70. 2 November 1970.
[56] Federal Register, Vol. 50, No. 240, pp51002 et seq.
[57] Federal Register, Vol. 50, No. 240, page 51038.

- *"In general, safety of this product is not a major concern, especially considering its very limited distribution..."*

- *"Immunization with this vaccine is indicated only for certain occupational groups with risk of uncontrollable or unavoidable exposure to the organism. It is recommended for individuals who come in contact with imported animal hides, furs, wool, hair (especially goat hair), bristles, and bone meal, as well as laboratory workers involved in ongoing studies on the organism."*

- *"Anthrax vaccine poses no serious special problems other than the fact that its efficacy against inhalation anthrax is not well documented."*

- *"The Panel believes that there is sufficient evidence to conclude* that *anthrax vaccine is safe and effective under the limited circumstances for which this vaccine is employed."*

The FDA made the following critique of the licensed vaccine in the 1985 review.

- *"The vaccine manufactured by the Michigan Department of Public Health has not been employed in a controlled field trial."*

- *"The labeling seems generally adequate. There is a conflict, however, with additional standards for anthrax vaccine. Section 620.24(a) defines a total primary immunizing dose as 3 single doses of 0.5 mL. The labeling defines primary immunization as 6 doses..."*

- *"Labeling revisions in accordance with this Report are recommended."*

FDA recognized a discrepancy and recommended that the labeling be changed. The additional standards, published in the Code of Federal Regulations, were the standard approved by FDA. FDA noted that the labeling indicated six doses where the additional standards indicated three doses.

A review of late-1960's Annual Progress Reports on the licensing study indicates that the primary dosing schedule was three doses.[58] **The labeling has never been changed, the DOD has followed the six-dose schedule, and the FDA has not commented on or corrected this glaring discrepancy.**

The Manufacturer.

The Michigan Department of Public Health (MDPH), holder of the one U.S. license for anthrax vaccine adsorbed, produced the vaccine sporadically throughout the 1970's and

[58] NCDC Annual Progress Report to the Director, Division of Biologic Standards, 1 October 1968.

1980's. The first large DOD contract occurred in 1988, with three additional DOD contracts through 1998. The Michigan Department of Public Health semi-privatized its Biologics Division into the Michigan Biologic Products Institute in 1997. They in turn sold the facility and its licenses to BioPort in 1998. During the Gulf War there was an effort by the US Army to obtain FDA approval of other manufacturer's under the MDPH license. Although at least on contract was awarded and the manufacturer was indemnified by the Secretary of the Army[59], the Army claims these entities made no vaccine.

Until the 1988 contract with DOD, production of AVA was infrequent, a batch being produced every three to four years, the largest being 7500 doses. MDPH had one production line that they alternately used for other vaccine products. A requirement to drastically increase production for the DOD contracts required an expansion of the production facility.

Originally one production line was built around a 100-liter glass-lined fermentor. Two new stainless steel fermentors (production lines) were added in 1990. The original production line was replaced in 1991 with two additional stainless steel fermentors (production lines). These four fermentors produced AVA until the facility was shut down in January 1998.

The new production lines used different equipment than that approved for the original facility. **The manufacturer was aware of the need to gain FDA approval for this new equipment and an FDA official communicated to Dr. Myers, Responsible Head for MDPH, that the new equipment was considered a major change to the ELA.**[60] MDPH applied for an amendment to the ELA in December 1990[61], after the first two fermentors had been installed. The FDA approved this amendment to the ELA in 1993.[62] **No ELA amendment for the two fermentors installed in 1991 was ever sought or made. Additionally, MDPH did not seek to amend their PLA with this change of equipment.**

The type of filter used in the sterilization process was also changed at this time. There were no amendments sought to the ELA or PLA.

Once the additional production lines became operational, MDPH mixed the batches coming off the lines to form a final anthrax vaccine (FAV). Prior to the additional lines the vaccine was merely called Lot3, Lot4, etc. After the new lines were operational, the vaccine released for distribution was called Lot FAV001, FAV002, etc.

Throughout this time frame, MDPH made other changes, to include changing the reference standard, applying for a change to the potency test, changing the amounts of

[62] CBER letter to MDPH granting approval of new equipment, 27 July 1993.

preservative, etc. FDA approved most of these changes. However, an application to change the reference standard was never made.

Plans for a new facility began during the mid-1990's and in January 1998, BioPort stopped producing AVA. The production facility was razed shortly thereafter. BioPort has made AVA in the new facility, but awaits FDA approval of the new facility and the vaccine produced there.

The FDA and the Manufacturer.

FDA regularly inspected MDPH. These inspections document a pattern of non-compliance with current good manufacturing practices (cGMP), not only with AVA, but also with every product the manufacturer made. **Every inspection of MDPH resulted in discrepancies ranging from unsanitary conditions and unapproved procedures to non-compliance with current Good Manufacturing Practices (GMP), contaminated products, and changing equipment and products without approval.** For example:

1988.[63]

- *"There is no written procedure for assessing stability characteristics of final biological products."*

- *"No direct physical accountability for packaged undated anthrax vaccine which was stored alongside of packaged and dated vaccine with the same lot number. Nine hundred and six vials of unfinished vaccine were distributed freely in 3 cardboard boxes with unknown number of vials in each carton. Removal of vials as needed was not indicated."*

1990.[64]

- *"Anthrax prod. fac. was observed to be in a state of general disrepair in that there was: (A)Paint peeling from the walls (B)Exposed light fixtures (C)Cracked ceiling (D)Exposed raceways (E)Dirt & filth & dust on overhead pipes (F)Cluttered work space."*

- *"Anthrax prod. records are inconsistent in that procedures used to formulate Lot #21 are different from those used to formulate Lots #25, 26 & 27 in that media is autoclaved for sterilization for Lot #21 and filtered for sterilization for Lots #25, 26 & 27."*

1992.[65]

- ***"Changes in the manufacturing methods for...were not submitted as amendments to the product license application prior to releasing the material for distribution..."***

[63] FDA Form 483 Inspectional Observations, 26-27 April 1988.
[64] MDPH letter to CBER responding to FDA inspectional observations made on 12-13 September 1990, 10 October 1990.
[65] FDA Form 483 Inspectional Observations, 29-31 July 1992.

- *"No SOP* [standard operating procedure] *exists to describe procedures for handling potentially infectious material..."*

1993.[66]

- ***"There are insufficient personnel to assure compliance with current GMP regulations, e.g., failure to report changes in manufacturing, failure to maintain calibration records adequately, failure to adequately validate equipment used in the formulation or testing of product."***

1994.[67]

- ***"There are insufficient personnel to assure compliance with current GMP regulations, e.g., failure to maintain calibration records adequately, failure to maintain environmental controls adequately in that production area temperatures were above 80°F, and failure to submit changes to CBER."***

- *"There is no annual review of production batch records* [anthrax]*."*

- *"Raw material* [anthrax vaccine materials] *stored in an unapproved warehouse, building (redacted) i.e., no ELA* [establishment license application] *supplement has been submitted for this area."*

1995.[68]

- ***"the company did not inform FDA of the procedural and equipment change during the production of..."***

- *"facilities and equipment were not adequate."*

- *"SOP's did not exist for many procedures."*

- *"SOP's were incomplete or incorrect."*

- *"SOP's were not adhered to."*

- *"Frequent contamination during vaccine manufacturing was documented but not investigated."*

The CBER Inspection Task Force recommended the issuance of a Warning Letter to MDPH on 22 June 1995. A Warning Letter was issued to MDPH on 31 August 1995.

---

[66] FDA Form 483 Inspectional Observations, 4-7 May 1993.
[67] FDA Form 483 Inspectional Observations, 31 May – 3 June 1994.
[68] FDA Form 483 Inspectional Observations, 23 April 1995 – 5 May 1995.

1996.[69]

- *"The firm had not completed cleaning validation studies for routine cleaning procedures on multi-use equipment."*

- *"Validation studies to demonstrate microbial retention and compatibility have not been conducted for sterilizing filters..."*

- *"There was condensate dripping onto open* (redacted) *tanks..."*

- *"There was no procedure for clean-up of live rabies virus spills..."*

The anthrax production facility was not inspected because "*It comes under military Inspection.*"[70]

1997.[71]

- CBER issues a "Notice of Intent to Revoke" citation to Michigan Biologic Products Institute on 11 March 1997. The Army responds by sending in a team to assist the manufacturer develop a "strategic compliance plan."

1998.[72]

- In anticipation of an FDA inspection following up on their threat to revoke the manufacturer's license, MBPI "voluntarily" shut down production in January 1998. On 4 February 1998 the FDA returned to inspect the facility, and issued a report concluding: ***"The manufacturing process for Anthrax Vaccine is not validated."***

- *"There are no written procedures , including specifications, for the examination, rejection, and disposition of Anthrax and Rabies."*

- *"Prior to August 1997, the (redacted) filters used for harvest of Anthrax vaccine were neither validated nor integrity tested. This filter is the only sterile filtration step in the Anthrax manufacturing process."*

- *"There is no written justification for redating lots of Anthrax vaccine that have expired."*

- *"The firm does not trend multiple contaminations with microorganisms in sublots."*

As a result of this inspection, MBPI "voluntarily" quarantined 11 lots of AVA. The failure of FDA to recall the quarantined vaccine and order it destroyed resulted in some of it being shipped to the Canadian military and being used on their servicemembers.[73]

Another inspection took place in October 1998, finding:[74]

- *"Stability testing has not always been performed in accordance with stability protocols, for example..."*

- *"CBER has not been notified in accordance with Error and Accident reporting of the following..."*

- *"On 6/30/98, the firm installed a new reaction tank mixer on Tank (redacted). There is no data documenting that the new mixer is equivalent to the old mixer, including mixing profiles. In addition, CBER has not been notified of this change."*

1999.[75]

- FDA finding: ***"The manufacturing process for Anthrax Vaccine Adsorbed is not validated."***

Thirty observations were noted. The inspection report ends with this comment.

- ***"The observations noted in this FDA-483 are not an exhaustive listing of objectionable conditions. Under the law, your firm is responsible for conducting internal self-audits to identify and correct any and all violations of the GMP regulation."***

2000.[76]

- *"The design and construction...do not assure sterility of products filled..."*

- *"The following product lots failed initial sterility testing for release or for stability testing...Investigations into these initial sterility failures are incomplete..."*

- *"Investigations are incomplete, inaccurate, or not conducted."*

- ***"There is no assurance equipment is operating as designed."***

Adulteration.

a) The law.

Anthrax Vaccine adsorbed is a biologic product designed for human consumption. Biologic products are regulated by the Public Health Service Act (PHS) and the Federal Food, Drug, and Cosmetic Act (FDCA). 42 USC Section 262 describes the regulation of

---

[74] FDA Form 483 Inspectional Observations, 19-23 October 1998

[75] FDA Form 483 Inspectional Observations, 25-23 November 1999.

[76] FDA Form 483 Inspectional Observations, 10-26 October 2000.

biologic products according to the PHS. Chapter 9 of Title 21 of the U.S. Code contains the FDCA. The FDCA provides the following definition of an adulterated drug:[77]

- *"A drug shall be deemed to adulterated (a)(1) (A) if it has been prepared, packed, or held under insanitary conditions whereby it may have been contaminated with filth, or whereby it may have been rendered injurious to health; or (B) if it is a drug and the methods used in, or the facilities or controls for, its manufacture, processing, packing, or holding do not conform to or are not operated or administered in conformity with current good manufacturing practice to assure that such drug meets the requirements of this chapter as to safety and has the identity and strength, and meets the quality and purity characteristics, which it purports or is represented to possess"*

The Federal Food, Drug, and Cosmetic Act provides a definition of a misbranded drug:[78]

- *"A drug or device shall be deemed to be misbranded – (a) False or misleading label. If its labeling is false or misleading in any particular."*

The Federal Food, Drug, and Cosmetic Act also establishes prohibited acts related to adulteration and misbranding:[79]

- *"The following acts and the causing thereof are prohibited: (a) The introduction or delivery for introduction into interstate commerce of any food, drug, device, or cosmetic that is adulterated or misbranded."*

The Code of Federal Regulations set forth the current good manufacturing practice regulations in manufacturing, processing, packing, and holding of drugs. 21 C.F.R. § 210.1(b) describes the status of the current good manufacturing practices regulation.

- *"The failure to comply with any regulation set forth in this part and in parts 211 through 226 of this chapter in the manufacture, processing, packing, or holding of a drug shall render such drug to be adulterated under section 501(a)(2)(B) of the act and such drug, as well as the person who is responsible for the failure to comply, shall be subject to regulatory action.*

21 C.F.R. § 210.2(a) describes the applicability of the current good manufacturing practices regulation.

- *"The regulations in this part and in parts 211 and 226 of this chapter as they may pertain to a drug and in parts 600 through 680 of this chapter as they may pertain to*

[79] 21 U.S.C. § 331
See: http://www4.law.cornell.edu/uscode/21/331.html

a biologic product for human use, shall be considered to supplement, not supersede, each other, unless the regulations explicitly provide otherwise."

Part 600 of 21 C.F.R. deals with Biologics. The only portion of Part 600 that "*explicitly provides otherwise*" concerns applications for the establishment and product licenses for a therapeutic DNA plasmid product, therapeutic synthetic peptide product of 40 or fewer amino acids, monoclonal antibody product for in vivo use or therapeutic recombinant DNA-derived products. All other biologics regulations are supplemented by the current good manufacturing practices regulations cited above.

21 C.F.R. § 601.12 reads in part:

- *"(a) General. As provided by this section, an applicant shall inform Food and Drug Administration (FDA) about each change in the product, production process, quality controls, equipment, facilities, responsible personnel, or labeling, established in the approved license. **Before distributing a product made using a change, an applicant shall demonstrate through appropriate validation and/or other clinical and/or non-clinical laboratory studies, the lack of adverse effect of the change on the identity, strength, quality, purity, or potency of the product as they may relate to the safety or effectiveness of the product.**"*

- *"(b) Changes requiring supplemental submission and approval prior to distribution of the product made using the change (major changes). (1) A supplement shall be submitted for any change in the product, production process, quality controls, equipment, facilities, or responsible personnel that has a substantial potential to have an adverse effect on the identity, strength, quality, purity, or potency of the product as they may relate to the safety and effectiveness of the product. (2) These changes include but are not limited to: (i) Changes in the qualitative or quantitative formulation or other specifications as provided in the approved application or in the regulations; (vi) Changes which may affect product sterility assurance, such as changes in product or component sterilization method(s), or an addition, deletion or substitution of steps in a aseptic processing operation."*

Adulteration.

b) The Fermentors.

The anthrax vaccine (AVA) produced by MDPH since 1990, by MBPI when they took over the operations in 1996, and the stockpile currently owned by BioPort is adulterated. **The product is adulterated for many reasons.**

The fermentors added in 1990 were considered a major change. Ms. Devine, an FDA employee, informed MDPH's executive director, Dr. Myers, of this in the summer of 1990. The request to amend the ELA was made in December 1990. This amendment was finally approved in July 1993, two and one half years after the facility had been modified.

During this time frame, MDPH was producing and *distributing* AVA without the *prior approval* required IAW 21 C.F.R. § 610.12 above.

The fermentors added in 1991 are also considered a major change. An independent review of the facility by a DoD contractor in February 1996 noted that two of the fermentors had not been supplemented [approved], and if FDA found out they could expect severe consequences.[30] This means that ***all the AVA produced and distributed since these two additional fermentors were installed in 1991 is adulterated.***

Adulteration.

c) The Filters.

Along with the new fermentors came new filters. As referenced in the above CFR, *"Changes which may affect product sterility assurance, such as changes in product or component sterilization method(s)" require prior approval.* No such amendment was sought. FDA made note of this in their February 1998 inspection report:

- *"Prior to August 1997, the* [redacted] *filters used for harvest of Anthrax vaccine were neither validated nor integrity tested. This filter is the only sterile filtration step in the Anthrax manufacturing process."*

- *"I questioned W. White, D. Slabbekoorn, and T. Wilsey regarding the filters used prior to this validation. Each reported that the filters used prior to the introduction of the* [redacted] *filters had not been integrity validated nor were they routinely integrity tested."*

Filters were approved in August 1997. However, the February 1998 inspection revealed that the validation process used to gain the approval was not valid.

- *"Validation of microbial retention by the* (redacted) *filters used for harvest of Anthrax vaccine was performed only with* (redacted) *media, which is used in tetanus production. Studies were not performed using Anthrax product or media."*

Adulteration.

d) Redating.

Biologic products have expiration dates as described in Part 600 of 21 C.F.R. Modifications to the expiration dates shall be made only upon written approval, in the form of a supplement [amendment] of the product license, issued by the Director of the Center for Biologics Evaluation and Research. Expiration dates are also regulated under the current good manufacturing practices as described in 21 C.F.R. § 211.137, which states in part:

---

[30] Kenner Associates report to SAIC, 26 February 1996.

- *"To assure that a drug product meets applicable standards of identity, strength, quality, and purity at the time of use, it shall bear an expiration date determined by appropriate stability testing described in §211.166."*

21 C.F.R. § 211.166 states in part:

- *"There shall be a written stability testing program designed to assess the stability characteristics of drug products. The results of such stability testing shall be used in determining appropriate storage conditions and expiration dates."*

In 1997, MBPI relabeled 1.5 million doses of AVA. MBPI took vials of AVA that were already labeled with an expiration date and soaked the labels off. They then relabeled the vials with new expiration dates. ***These 1.5 million doses of AVA are adulterated for several reasons.***

- MBPI had no approved stability testing program at the time this relabeling occurred, as observed in the February 1998 FDA inspection.

- MBPI had no approved procedures for removing and relabeling filled vials of vaccine.

- MBPI had no procedure, approved or otherwise, for reconciling the vials with the original Lot once the labels were removed. In other words, MBPI could not assure that the vials would be re-identified correctly, i.e. FAV008, or FAV009, etc.

MBPI also redated bulk vaccine that had expired without justification or approved procedures. ***These doses, too are adulterated.***

Both of these practices, relabeling and redating, require a supplement to the product license IAW 21 C.F.R. § 610.53(d). No supplement was sought or approved at the time of these events. Current good manufacturing practice regulations require compliance with these parts of the C.F.R.. As stated above, non-compliance renders the drug adulterated.

Adulteration.

e) Mislabeling.

The Lot number or control number of a drug is an important regulatory requirement. As such 21 C.F.R. § 202.18 states the requirements.

- *"The lot number on the label of a drug should be capable of yielding the entire manufacturing history on the package. An incorrect lot number may be regarded as causing the article to be misbranded."*

Additionally, the current good manufacturing practices regulation defines "Lot number" as:

- *"any distinctive combination of letter, numbers, or symbols, or any combination of them, from which the complete history of the manufacture, processing, packing, holding, and distribution of a batch or lot of drug product or other material can be determined."*

On several occasions, MBPI sought and CBER approved the extension of the expiration date of a Lot of AVA. CBER's approval notice amended the Lot number. For example, MBPI sought to redate Lot FAV020. CBER approved the extension of the expiration date and renamed the Lot FAV020a, to indicate this Lot as different from the original FAV020.

MBPI failed to put the correct Lot number on the labels of the redated vaccine. This failure to correctly identify the vaccine contained within makes it difficult if not impossible for the label to provide *"the entire manufacturing history"* as required by § 202.18, ***causing the vaccine so labeled to be considered misbranded,*** or as required by the current good manufacturing practices regulations ***causing the vaccine so labeled to be considered adulterated.***

Both of these acts are prohibited under the U.S. Code § 331 as described above.

Adulteration.

1) New Drug Application requirement.

The FDCA defines "new drug" in two ways. 21 U.S.C. § 321(p)(2) states:

- *"Any drug... the composition of which is such that such drug, as a result of investigations to determine its safety and effectiveness for use under such conditions, has become so recognized, but which has not, otherwise than in such investigations, been used to a material extent or for a material time under such conditions."*

21 C.F.R. § 310.4 (h) further defines "new drug" as:

- ***"The newness of a drug may arise by reason (among other things) of (5) The newness of a dosage, or method or duration of administration or application, or other condition of use prescribed, recommended, or suggested in the labeling of the drug, even though such drug when used in other dosage, or other method or duration of administration or application, or different condition, is not a new drug."***

AVA has been licensed since 1970. In the first twenty years approximately 70,000 doses were made. The use of the vaccine was essentially limited to military researchers and test

animals. With the use of the vaccine for inhalation anthrax during the 1990-91 Gulf War, a vastly larger population began taking the drug. This new "application", or use, is an example of the US Code definition of a new drug.

In addition to a new population, the drug was being used (applied) for an indication that was not "*prescribed, recommended, or suggested in the labeling.*" This, too, renders the vaccine a "new drug".

The rules and regulations for new drugs are lengthy and involved. Suffice to say that MDPH, MBPI, and BioPort are not in compliance with these rules and regulations.

The manufacturer has produced and distributed to the DOD an unlicensed and unapproved new drug from 1990 to the present.

Adulteration.

g) The patent.

The AVA license is based on United States Patent, No. 3,208,909. This patent specifies the equipment used in the manufacture of AVA. When the facility was enlarged and the type of equipment used to produce AVA was changed, the vaccine was no longer being made in accordance with the patent (license). The AVA produced without a patented procedure is considered a new drug. Section 355 of the U.S. Code describes such a drug and the requirements for approval and licensure. MDPH and MBPI did not file applications based on this section of the Code. To date, BioPort has not done so either.

Section E
On-going litigation

Background: Cases run the gamut from all charges being dropped to currently imprisoned US Marines, to an on-going General Court-Martial of an Air Force officer and physician.

1. **Ft. Hood soldier** – charges dropped in October. Army doctor had attempted to ascribe soldier's adverse reaction to an allergy after a possible causal relationship to the vaccine had been noted in the soldier's medical records. Doctors at Walter Reed advised Army prosecutors they had limited chance of success because the vaccine is contraindicated following an adverse reaction, so the soldier should not have been ordered to get any more shots.

2. **Ft. Bragg soldier** – convicted in October, imprisoned in a high-security jail at Camp Lejeune for 30 days, given a bad conduct discharge, reduction in rank and forfeitures of pay, and loss of all GI Bill benefits.[81]

3. **Comparative punishments:** anthrax refusal vs. other offenses. Refusal to take the anthrax vaccine is being punished more severely than first-time illegal drug offenses. Where active duty soldiers have been imprisoned, members of the Guard and Reserve have been coerced out of their positions without due process or discharge boards.

4. **Ruling by Navy Marine Corps Court of Criminal Appeals.**

   NMCCA heard five different cases on extraordinary writ. All five of the writs were heard and the cases stayed pending the ruling by the appeals court. Ultimately the court denied the writs, lifted the stays, and the cases docketed for court so that the court-martials may proceed. David Ponder, Jason Stonewall, Vitalino Arroyo, Ocean Rose, and Matthew Perry were all docketed for the month of January 2001. The NMCCA essentially decided in all of the cases that it was not a judicial usurpation of power for the judge to decide that the order is lawful as a matter of law. Court held that all of the petitioners had failed to show a clear and indisputable right to the relief requested. The appeals court did not preclude direct appellate review of the issue, but did tip their hand as to their view of the vaccine's status.

   Defense counsel believes that the court erred in several respects in its analysis of the Executive Order (EO 13139) and in the way that it ignored the federal statutes. Additionally, there is no analysis on the issue of military precedents and the fact that the DoD has internal regulations requiring informed consent for use of an IND or a drug unapproved for its applied use. See 32 CFR 219.[82] Also, there are numerous

See: http://205.107.108.244//cgi-bin/news/display.pl?month=10&index=n17thrax.htm&year=2000

[82] 32 CFR 219, "Protection of Human Subjects"
See: http://www.access.gpo.gov/nara/cfr/waisidx_00/32cfr219_00.html

DoD and BUMED Instructions that address IND's and the right every servicemember has to informed consent to medical treatment (See BUMED Inst and DoDD 6200.2, etc.).

5. **Status of appeal by Seaman David Ponder and the case of Dr. John Buck, USAF** – and additional USMC cases:

The ruling by the military judges on the Navy Marine Court of Criminal Appeals is subject to appeal to the Court of Appeals for the Armed Forces (CAAF), a panel of civilian federal judges. In late December 2000 defense counsel filed a writ-appeal of the NMCCA decision. In this petition, counsel is again asking for a stay of the proceedings until the case can be decided, as well as dismissal of the charge, or at least, an opportunity to put on evidence in court that establishes the drug as investigational or unapproved for its applied use.

The plethora of cases and UCMJ action just prior to the change of administrations is problematic for the new Secretary of Defense. By upholding the imprisonments that occurred prior to the 20th of January 2001, the new administration carries the risk of being implicated in the implementation and UCMJ action surrounding an illegal order. *The sheer quantity of cases and unprecedented terms of imprisonment after no* imprisonments for since the summer of 1999 are equally troubling.

The current case and pending court-martial of Dr. John Buck, USAF MD and Emergency Room physician, presents an impasse for the new leadership in the Department of Defense. To allow a UCMJ action to proceed that began in the previous administration's tenure, and to allow for the first time all the arguments about the illegality of the vaccine and the order to be presented by the defense, affords an opportunity to let the UCMJ make a ruling based on the full set a facts.

If the case of Dr. John Buck finds the order to be in violation of the US Code, the Executive Order, and DoD Directive, through the use of a suspect and possibly adulterated product, the case can serve as a precedent for the new civilian leadership in the Department of Defense to reverse all previous adverse personnel actions caused by the AVIP.

By allowing disciplinary action set forth by the previous SECDEF, the current leadership can finish the AVIP ethical dilemma once and for all by allowing the UCMJ to vindicate the servicemembers involved in this travesty.

Section F
Food and Drug Administration

Introduction. The regulatory system that governs new drug development is relatively new. Prior to 1906, there was no effective regulation in existence. From 1938, when the Food and Drug Administration first received broad statutory authority to regulate interstate shipment of unapproved new drugs for investigational use, until 1962, when the Kefauver-Harris Amendments were enacted, the FDA exercised virtually no direct control over the clinical development of new drugs.

Initial Regulation. The purpose of the Federal Food, Drug and Cosmetic Act is to limit interstate commerce in drugs to those that are safe and effective.

Originally enacted as the Federal Food and Drugs Act of 1906, the act prohibited adulterated or misbranded food or drugs from interstate commerce. However, the 1906 Act was very inadequate. False statements made about a drug by its manufacturer (i.e., public advertising) were not considered as misbranding by the courts. Additionally, the Act did not grant authority to ban unsafe drugs. For a drug to be legal under the 1906 law, it only had to meet the standards for composition of the United States Pharmacopoeia or the National Formulary. The Bureau of Chemistry enforced this law.

Sulfanilamide Disaster of 1937. It was not until after the sulfanilamide disaster of 1937 that the Act was modified. Soldiers originally used sulfanilamide. As a powder, it was sprinkled over a wound to prevent infection. A manufacturer decided to expand the antiinfective use of the drug by mixing the sulfanilamide with diethylene glycol, the same substance used today as antifreeze in car radiators, and marketed it as an elixir for sore throats. No clinical tests were performed prior to marketing. There were 107 reported deaths from this product.

Food, Drug, and Cosmetic Act of 1938. Subsequently, the Federal Food, Drug, and Cosmetic Act of 1938 was enacted which extended government's control over advertising and labeling. More importantly, it authorized the Food and Drug Administration (for the first time) to establish a regulatory system for obtaining pre-marketing clearance of an investigational new drug. Manufacturers were now required to submit a new drug application (NDA) containing evidence that a drug was safe for its intended use.

However, the FDA established a system of minimal regulation. These regulations, which remained in effect without change until 1963, left the protection of human subjects almost entirely to the discretion of sponsors and investigators. For example, it did not require a notice for conducting investigational trials to be submitted to the FDA, it did not require pre-clinical safety studies prior to administration of a drug into humans, and it did not require informed consent of test subjects.

There was a continued lack of adequate control over advertising. More importantly, there continued to be no government control over investigational plans prior to the submission

of a new drug application. As a result, abuses occurred. For example, people were administered investigational drugs without being told that they were participating in an experiment.

Role of the American Medical Association in Legislative Actions. The American Medical Association (AMA) had campaigned vigorously for the first food and drug law of 1906. They were a powerful force in achieving the passage of strong legislation. Relationships between the AMA and federal agencies regulating drugs were very close as they lobbied together to advance legislative decisions regarding the regulation of new drug development. When the 1938 Act was passed, the AMA was disappointed that it was not stronger. In 1953, it proposed a bill that eventually passed, authorizing the FDA to inspect pharmaceutical laboratories without first obtaining permission from the proprietor.

In 1959, Senator Kefauver began his hearings on the prices of drugs and the practices of the drug industry. The AMA, however, totally opposed the proposals for a change in the laws. **Specifically, the AMA was against the provision that a drug manufacturer had to prove claims of efficacy before he could market the drug.** They also were against the provision requiring the Secretary of Health, Education and Welfare to make determinations of what was the relative efficacy of structurally related drugs. **Relationships with the federal agencies disintegrated. The AMA became increasingly critical, especially of over-regulation.**

Thalidomide Disaster of 1962. In 1962, thalidomide, a sleeping pill developed and widely used abroad for several years, was being studied for use in the United States. The FDA did not approve this drug for marketing in the U.S. because of the safety clearance requirements in the Federal Food, Drug, and Cosmetic Act, and because of the refusal of an FDA medical officer, Dr. Frances Kelsey, to clear the drug on what she believed to be inadequate safety evidence provided by the manufacturer.

However, although the drug was restricted to investigational use in the U.S., the sponsoring pharmaceutical company widely distributed it to doctors for their use. Subsequently, it was reported to clearly be a human teratogen which caused malformations in many European children. Children were being born without arms or with other severe deformities. A series of lawsuits demonstrated that, in general, prescribers of drugs had been relying on manufacturers for information pertaining to the drugs, and that this information in some instances had been based on inadequate testing, or even on deliberate falsification and deception. **The Kefauver-Harris amendments of 1962 were finally enacted as a result of this incident.**

Kefauver-Harris Amendments of 1962. The Drug Amendments of 1962 included several important policy innovations.

First, it required that all clinical testing of investigational drugs be conducted under applications submitted to the FDA (Investigational New Drug Applications). Additionally, sponsors were required to submit reports of pre-clinical studies to justify

their proposed clinical testing in humans, obtain informed consent from test subjects prior to their entry into a study, and report all findings resulting from the investigational studies to the FDA.

Second, Good Manufacturing Practices (GMP) were established. Any drug would be considered adulterated if a manufacturer produced the drug without adhering to such practices.

Prescription drug advertising was placed under the supervision of the FDA.

Third, the 1962 amendments required that all new drugs must be shown to be effective, in addition to being safe, for their intended use, prior to marketing. The standard for scientific evidence acceptable for demonstrating substantial effectiveness was defined by Congress as:

- *"adequate and well controlled investigations, including clinical investigations, conducted by experts qualified by scientific training and experience to evaluate the effectiveness of the drug involved, on the basis of which it could be fairly and responsible be concluded by such experts that the drug will have the effect it purports or is represented to have under the conditions of use prescribed, recommended, or suggested in the labeling."*

The FDA had actually proposed new regulations before the 1962 amendments were enacted, and it issued final rules three months after the new law took effect. These regulations are the broad outlines of the investigational drug regulatory system that remains in effect today.

Note that despite the 1962 amendments, until 1973 when DBS was put under FDA, they did not necessarily require efficacy data for approval, and this is how anthrax vaccine slipped in without good efficacy data, despite Congress's explicitly instructing otherwise in law a decade beforehand.

FDA Culture and Vaccines.

The former DBS (Division of Biologics Standards) was involuntarily transferred to FDA from the Public Health Service in 1973. Its transfer was triggered by the failed Polio vaccine release, on the grounds that old world style management encumbered it. The DBS was viewed as incapable of protecting the public health because it was too closely involved with the industry it was supposed to regulate ("unholy marriages"). That merger only lasted a few years and resulted in de-merging and the reestablishment of a Center for Biologics Evaluation and Research (CBER).

When the FDA assumed responsibility for regulation of vaccines in the early 1970's, there were clearly two cultures in the FDA. These were driven by two statutes, one for the regulation of pharmaceutical drugs (Food Drug and Cosmetic Act) and one for the

regulation of biological products such as vaccines and blood and blood products (Public Health Service Act).

The FDA's vaccine culture was based on a dual mandate to both promote public health and to regulate vaccine manufacturers. This culture is analogous the culture within the FAA before the ValuJet crash in the Everglades: the regulatory entity, FAA, only knew how to regulate companies that self-regulated and sought to nurture weak, start-up airlines. The FDA's ambivalent regulatory relationship with a state-owned manufacturer (MDPH) of the limited-use anthrax vaccine used almost solely by the military, and which no private company would produce, represented an inherent conflict between the FDA's dual role.

Licensing.

In the drug process, a firm (1) Registers, and (2) Lists its products. This is covered under section 510 of the FD&C Act. The C.F.R. covers the requirements for changes, the frequency for updating drug lists, etc. Biological manufacturers are required to Register and List, but in addition, the Product License and Establishment License are mandatory. This is a quirk in the dual-statutes involved – FD&C Act for both drugs and biologicals, and Sec. 351 of the PHS Act for Biologicals.

Summary: There are no inherently safe (safety: 1938) or effective (efficacy: 1962) prescription drugs or vaccines, only those which are not "*adulterated*" or "*misbranded*" within the *meaning of the Act when* labeled, *used or administered in* accordance with an FDA approved New Drug Application (IND/NDA) or FDA approved Product License Application (PLA) for marketed biologicals.

Investigational New Drug Applications and Product License Amendments.

Anthrax Vaccine Adsorbed is not an Investigational New Drug (IND). ***It is a licensed biological product legally marketed for the uses and indications in its approved labeling.*** The problem arises for DOD in that aerosolized exposure is not included in the currently approved labeling. The manufacturer needs to gain approval for the aerosolized exposure indication through a supplement to the Product License Amendment (PLA).

The regulatory scheme calls for a supplemental PLA to be approved by FDA to permit distribution for use under certain conditions, in this case, aerosol exposure. This is supposed to be approved ***before*** such use. ***This has not been done, and under normal enforcement procedures such a firm would be ordered by FDA to cease and desist, or action would be taken to revoke its license.***

The IND/NDA or PLA supplement is the mechanism whereby those prescription drugs "*not generally recognized, among experts qualified by scientific training and experience*" are evaluated with respect to "*the safety and effectiveness of drugs, as safe and effective for use under the conditions prescribed, recommended or suggested in the labeling thereof.*" (FD&C Act Section 201 (p)(1)).

A PLA or an NDA is like a contract with the FDA. Compliance with the terms and conditions specified within the PLA or NDA is the assurance that the firms' product will not be considered to be (1) adulterated, or (2) misbranded, within the meaning of the FD&C Act.

If the firm or establishment does not comply with the PLA or NDA, then the firm can be subject to (1) License revocation for a biological, or (2) withdrawal of an NDA.

In addition, the firm can be prosecuted for non-compliance with Current Good Manufacturing Practices (CGMP), or products manufactured during a period of non-compliance with CGMP may be considered to be adulterated, and subject to seizure (a court ordered action accomplished by a US Marshall).

New Drug Applications (NDAs).

Twice during the history of the FD&C Act amendments (1938 and 1962) provisions were made for the so-called "Grand fathering" or exemption of drugs from the New Drug Provisions of the Act for those prescription drugs which were marketed prior to the effective dates of the amendments (1938 & 1962). This would have "Grand fathered" or declared such drugs as Not-New Drugs; however these provisions have never been used.

There are no prescription drugs or biologicals on the market that are grandfathered as "Not-New Drugs" therefore, there are no inherently safe or effective drugs.

Only the FDA can make a determination as to whether or not a drug (or vaccine) is a "new drug". This decision was rendered by the Supreme Court in one of several landmark cases decided back in the 1970's.

Section G
Medicine

Gulf War Illness – DoD has avoided investigations of a link to vaccines. At least four panels, the Defense Science Board, the National Institute of Health, the Institute of Medicine, and later, the Presidential Advisory Commission on Gulf War Illness reviewed possible causal factors in Gulf War Illness. Although the IOM recommended further study on vaccines, none was funded.

An August 1995 report by the federal interagency (DoD, HHS, DVA, and EPA) Persian Gulf Veterans Coordinating Board observed[83]:

- *"...approximately 150,000 troops received at least one dose of anthrax vaccine and about 8,000 received at least one dose of botulinum toxoid. Both vaccines have been used for many years without adverse effects. **All three review panels stated that no long-term adverse effects have been documented or would be expected. Further study of the potential adverse effects of vaccines in this population is not recommended by any of the three panels, nor is it endorsed in this plan.**"*

DoD has misrepresented previous reviews as scientifically valid investigations when no research was ever conducted. DoD has consistently defended the anthrax vaccine by stating that these groups have "found no evidence" of a causal relationship between anthrax vaccine and Gulf war Illness. Former Army Surgeon General LTG Ronald Blanck, publicly defending the anthrax vaccine in a March 2000 op-ed, stating[84]:

- *'These panels have included the Presidential Advisory Commission, the Defense Science Board, the National Institutes of Health and the Institute of Medicine. They all have concluded that there is no evidence of a connection between the illnesses and any of the vaccines, either singly or in combination."*

Statements by LTG Blanck and other DoD officials incorrectly imply that these panels' conclusions were based on scientific investigation. **The panels "found no evidence" because neither they, nor DoD, have ever published the results of a scientific investigation to determine whether a link exists between anthrax vaccine and Gulf War Illness in US troops.**

[84] LTG Ronald Blanck, U.S. Army Surgeon General, letter to the editor, Washington Times, 14 Mar 2000.

Gulf War Illness– UK (Unwin) study linking vaccination to GWI. The US Department of Defense funded a study (for over $1 million) of 8,195 British Gulf War-era veterans. Its findings included[85]:

- *"The Gulf War cohort reported symptoms and disorders significantly more frequently than those in the Bosnia and Era cohorts, which were similar...Gulf War veterans were more likely than the Bosnia cohort to have substantial fatigue, symptoms of post-traumatic stress, and psychological distress, and were twice as likely to reach the CDC case definition [of Gulf War Illness.]...Vaccination against biological warfare and multiple routine vaccinations were associated with all outcomes."*

- *"Service in the Gulf War was associated with various health problems over and above those associated with deployment to an unfamiliar hostile environment. Since associations of ill health with adverse events and exposures were found in all cohorts, however, they may not be unique and causally implicated in the Gulf War-related illness. A specific mechanism may link vaccination against biological warfare agents and later ill health, but the risks of illness must be considered against the protection of servicemen."*

During testimony before the Senate Armed Services Committee on 13 Apr 2000, then-Army Surgeon General LTG Ronald Blanck denied knowledge of the Unwin study.[86] He was not asked, nor did he explain why DoD has never funded a similar study.

Gulf War Illness– Kansas study linking vaccination to GWI. The state of Kansas Commission of Veterans Affairs funded a study of 2,030 Gulf War era veterans. Despite over $150 million spent on Gulf War Illness research, DoD has never conducted a comparable study on US servicemembers. The Kansas study concluded[87]:

- *'Gulf War Illness, defined as having chronic symptoms in three of six domains, occurred in 34% of PGW veterans, 12% of non-PGW veterans who reported receiving vaccines during the war, and 4% of non-PGW veterans who did not receive vaccines. The prevalence of Gulf War illness was lowest among PGW veterans who served on board ship (21%) and highest among those who were in Iraq and/or Kuwait (42%). Among PGW veterans who served away from battlefield areas, Gulf War Illness was least prevalent among those who departed the region prior to*

the war (9%) and most prevalent among those who departed in June or July of 1991 (41%). Observed patterns suggest that excess morbidity among Gulf War veterans is associated with characteristics of their wartime service, and that vaccines used during the war may be a contributing factor."

- *"A relation between vaccinations and illness has been observed among Gulf War veterans from the United Kingdom and Canada, and a mechanism for an association of illness with multiple vaccinations has been proposed. The prevalence of multisymptom illness was associated with reports by veterans from the United Kingdom of receiving vaccines against biologic warfare agents (anthrax, plague, pertussis adjuvant) and with receiving multiple vaccinations during deployment. A 1998 study of Canadian Gulf War veterans found a significant association between receiving "nonroutine immunizations" (anthrax, plague) and several symptom-defined outcomes."*

Gulf War illness – French study. On 13 Sep 2000 Defense Minister Alain Richard announced the creation of an independent commission into the health of the French military servicemembers who participated in the Gulf War. The commission's first hearing occurred on 2 Nov 2000 and it is tasked to investigate all health risks that French soldiers were exposed to during the Gulf War.[88]

- *"Armed forces medical corps spokesman Colonel Michel Estripeau, himself a doctor, said France's belief that allied troops were victims of their own protective measures were based on a long series of meetings with U.S. medical experts..."About 100,000 of the 600,000 Americans who served in the Gulf complain of ailments that have tentatively been lumped under the Gulf War syndrome heading. No one has yet come to definitive conclusions but we note that of 25,000 Frenchmen who served in the Gulf, only 180 have ailments whose origin could be in question. The only really major difference between the two groups is vaccinations," he said."*[89]

Institute of Medicine studies. Three studies – one complete. One already standing IOM committee issued a letter report on the safety of the anthrax vaccine in March 2000. Two additional IOM study panels have been convened in response to a mandate from Congress in the FY2000 defense legislation for a National Research Council study of the safety and efficacy of the anthrax vaccine.

1. **Committee on "Health Effects Associated with Exposures During the Gulf War".** Because of immediate concern over anthrax vaccine safety issues, the IOM offered to draw relevant information from an ongoing study of Gulf War exposures funded by the Department of Veterans Affairs. With the agreement of the Department of

Veterans Affairs, the IOM was able to produce this letter report that summarizes the committee's literature review on the safety of the anthrax vaccine. Its findings were[90]:

- *"There is a paucity of published peer-reviewed literature on the safety of the anthrax vaccine.'*
- *"The published studies have found transient local and systemic effects (primarily erythema, edema, or induration) of the anthrax vaccine. There have been no studies of the anthrax vaccine in which the long-term health outcomes have been systematically evaluated with active surveillance."*
- *"The committee concludes that in the peer-reviewed literature there is inadequate/ insufficient evidence to determine whether an association does or does not exist between anthrax vaccination and long-term adverse health outcomes."*

2. **Committee on "The Safety and Efficacy of Anthrax Vaccine for the U.S. Military."** The committee will analyze available information, hold workshops and make specific recommendations on technical aspects regarding the safety and efficacy of the licensed anthrax vaccine. The issues addressed in this 24 month study include: the types and severity of adverse reactions, including gender differences; long-term health implications; inhalational efficacy of the vaccine against all known anthrax strains; correlation of animal models to safety and effectiveness in humans; validation of the manufacturing process focusing on, but not limited to, discrepancies identified by the Food and Drug Administration in February 1998; definition of vaccine components in terms of the protective antigen and other bacterial products and constituents; and identification of gaps in existing research.[91]

Significantly, this committee will neither conduct, nor sponsor, any research.

3. **Committee on "Review of the CDC Anthrax Vaccine Safety and Efficacy Collaborative Research Program.** This committee will advise the Centers for Disease Control and Prevention (CDC) on the completeness and appropriateness of the CDC plan to respond to the Congressional mandate to study the safety and efficacy of anthrax vaccine, addressing: (1) risk factors for adverse reactions, including gender differences; (2) determining immunologic correlates of protection and documenting vaccine efficacy; (3) optimizing the vaccination schedule and routes of administration to assure efficacy while minimizing the number of doses required and the occurrence of adverse events. The CDC, the National Institutes of Health (NIH), and the Department of Defense (DOD) are directed by Congress to collaborate and cooperate fully in this 24-month study.[92]

Significantly, this committee will only provide advice for the Centers for Disease Control's study of the anthrax vaccine, conducted in concert with DoD. There will be no independent, non-governmental study by an outside entity.

Potential conflict of interest on two IOM study panels. Two researchers who conducted and authored the original efficacy study of a similar anthrax vaccine in New England mills in the 1950's were named to the IOM study committees. Additionally, a study director of one panel has co-authored a recent study with Army medical researchers. These personnel assignments place the researchers in a position to control the study agenda and influence the discussion in ways that those opposed to the anthrax vaccine cannot.

1. **Concerns about the Committee on "The Safety and Efficacy of Anthrax Vaccine for the U.S. Military."** The IOM preliminarily named Dr. Stanley Plotkin to the advisory committee that provides expert advice to this study committee. After an objection by Rep. Dan Burton, Dr. Plotkin was removed from the committee before its first meeting. Congressman Burton wrote[92]:

   - *"To alleviate concerns that may be raised about your study's results, I strongly encourage you to insure that no member of the IOM Anthrax Vaccine Committee has the slightest appearance of a conflict of interest. In particular, I am concerned about the inclusion of Dr. Stanley Plotkin on the study's advisory committee. I am aware of Dr. Plotkin's distinguished career in vaccine research and his role in developing the rubella vaccine. However, **Dr. Plotkin was also one of the authors of the only peer-reviewed anthrax vaccine efficacy study, published by Dr. Brachman, et.al., in 1962. Dr. Plotkin's inclusion in your advisory committee allows him an opportunity to influence your committee's analysis of the original efficacy study of the anthrax vaccine that opponents of the vaccine will not be afforded.** This could place in jeopardy the credibility of the results of the IOM's two-year study."*

   - Further, the study director of this committee, Dr. Lois Joellenbeck, co-authored a study last year with the former director of the Army's medical research establishment at Ft. Detrick, MajGen (Dr.) Philip Russell. Her close collaboration with DoD medical personnel again raises concerns as to whether dissenting views will be given the opportunity for a fair unbiased hearing during the IOM's review of the safety and efficacy of the anthrax vaccine.[93]

2. **Concerns about the Committee on the "Review of the CDC Anthrax Vaccine Safety and Efficacy Collaborative Research Program."** The IOM named Dr.

Philip Brachman to chair the committee which will oversee the review of unpublished CDC and DoD safety and efficacy data on the anthrax vaccine. Despite an objection by Rep. Dan Burton, Dr. Brachman remains on this committee. Congressman Burton wrote[95]:

> *"Dr. Philip Brachman has been selected to chair the second IOM anthrax vaccine committee. I am aware of Dr. Brachman's distinguished career at CDC and Emory University. However, Dr. Brachman was also the lead author of three of four papers describing the only human anthrax vaccine efficacy study in the published medical literature. **Dr. Brachman also has had a long professional relationship with key Army researchers at Ft. Detrick, MD, including co-authoring the chapter on anthrax vaccine in the medical textbook "Vaccines" [ed. Plotkin, et.al.] with Colonel (Dr.) Arthur Friedlander. According to IOM's Dr. Lois Joellenbeck, Dr. Plotkin was removed from participating in the first IOM Committee because "the IOM and National Academies had decided that Dr. Plotkin should not serve as a member of the committee because of his role as an author on a paper important to the committee's work." How then can it be appropriate for Dr. Brachman – the lead author of the same study – to be chosen to chair this second committee which will review the work of those with whom he has a close professional relationship?"***

Institute of Medicine – 1999 Report on "*Strategies to Protect the Health of Deployed U.S. Forces*". This report is the result of a three-year study by the Institute of Medicine in response to a 1996 request by former Deputy Secretary of Defense John White to the leadership of the National Research Council. One of the two co-authors of the study was Dr. Philip Russell (MajGen, USA, ret.), former commander of the Army's medical research facility at Ft. Detrick and assistant Surgeon General of the Army before he retired. Dr. Russell's report makes the following frank assessment of the anthrax vaccine and its manufacturer[96]:

> ***"The manufacturer of the current anthrax vaccine, BioPort, has had problems meeting regulatory requirements and standards, resulting in a costly program to upgrade the manufacturing process and facility so that it meets U.S. Food and Drug Administration (FDA) standards. Since this vaccine is made by a process devised more than 40 years ago, it is far from the optimal product possible today using modern biotechnology production and purification methods. The current vaccine requires multiple doses and contains many extraneous proteins. A much more efficient vaccine that has a uniform content and that requires fewer doses can be developed. The Committee on R&D Needs for Improving Civilian Medical Response to Chemical and Biological Terrorism Incidents recommended that a second-generation vaccine be developed for civilian use (Institute of Medicine,***

*1999c). **Developing a second-generation anthrax vaccine would be an appropriate action for DoD as well.**"*

Centers for Disease Control -- December 2000 recommendations of the Advisory Committee on Immunization Practices (ACIP). The ACIP is a standing committee tasked by the Centers for Disease Control to issue recommendations on the appropriate use of vaccines in the United States. **Ignoring the UK (Unwin) and Kansas (Steele) studies, CDC incorrectly claims that there is no scientific evidence of a correlation between anthrax vaccine and Gulf War Illness.** Further, neither of the studies cited by CDC below looked at anthrax vaccine as a potential causal factor. Claiming an absence of specific scientific studies that might provide scientific evidence of a correlation, CDC then recommends the use of the vaccine on the basis that "scientific evidence does not support" a connection between anthrax vaccine and Gulf War Illness. It recently issued recommendations on the use of anthrax vaccine.[97]
