Suitland, MD 20233 USA

This document reports the results of research and analysis undertaken by the U.S. Census Bureau staff. This document is released to inform interested parties of ongoing research and to encourage discussion of work in progress. This research is a part of the U.S. Census Bureau's Longitudinal Employer-Household Dynamics Program (LEHD), which is partially supported by the National Science Foundation Grant SES-9978093 to Cornell University (Cornell Institute for Social and Economic Research), the National Institute on Aging Grant 5 R01 AG018854-02, and the Alfred P. Sloan Foundation. The views expressed herein are attributable only to the author(s) and do not represent the views of the U.S. Census Bureau, its program sponsors or data providers. The U.S. Census Bureau supports external researchers use of these data through the Research Data Centers (see www.ces.census.gov). For other questions regarding the data, please contact Jeremy S. Wu, Program Manager, U.S. Census Bureau, LEHD Program, Center for Economic Studies, Room 6H141, 4600 Silver Hill Rd., Suitland, MD 20233, USA. <http://lehd.did.census.gov>.

1.1 Data flow view of LEHD Infrastructure 12

5.1 GAL Processing 134

Chapter 1.

Overview of LEHD Infrastructure

The Longitudinal Employer-Household Dynamics (LEHD) Infrastructure files available in the Research Data Center (RDC) is structured as individual components. A big-picture overview of it can be found at <http://lehd.did.census.gov/led/library/techpapers/tp-2006-01.pdf>. Figure 1.1 provides an overview of the flow of data elements through the LEHD data creation process.

Currently, the core outputs of the data creation process are the Quarterly Workforce Indicators (QWI), shown in Figure 1.1, and the OnTheMap (OTM) data. The LEHD Infrastructure files in the RDC environment do not contain any public-use data (both the aggregated QWI and the OTM data are available to the general public), nor does it contain any information related to the disclosure limitation measures used in the QWI (for more information on the disclosure limitation techniques, see Abowd et al. (2006) and Abowd et al. (2006) for a discussion).

1.1 UPDATES

This is the first release of the LEHD Infrastructure files. It contains data that covers the years up to and including 2004Q1. We refer to it as the 'S2004' snapshot of the LEHD Infrastructure files. The data was pulled from LEHD archives as a coherent ensemble over the course of 2005 and 2006.

Improvements are made to the files, fixing minor data inconsistencies or updating documentation. To identify the version of the files in the data archive, a file called *version.txt* is at the root of each data directory, e.g., *u2w/version.txt*. The file will contain the name of the data, the snapshot number, and the date stamp of the most recent file within the data. As of the writing of this document,

```
./brb/version.txt: BRB S2004 2005-06-23
./ecf/version.txt: ECF S2004 2007-05-17
./ehf/version.txt: EHF S2004 2006-03-29
./gal/version.txt: GAL S2004 2008-03-27
./icf/version.txt: ICF S2004 2007-06-01
./u2w/version.txt: U2W S2004 2008-03-27
./qwi/version.txt: QWI S2004 2007-03-30
./spf/version.txt: SPF S2004 2006-06-28
./es202/version.txt: ES202 S2004 2007-02-09
./ecft26/version.txt: ECFT26 S2004 2007-05-17
./galt26/version.txt: GALT26 S2004 2008-03-07
./icft26/version.txt: ICFT26 S2004 2007-06-03
```

Plans are to update the LEHD Infrastructure files every two-three years, as resources to build it become available. The next update is planned to occur starting in 2008Q1, containing all available states at that time in regular LEHD production, and covering years up to and including 2007Q1. Due to the post-processing required to make researcher-friendly files, and the quantity of data that needs to be moved into the RDC environment, we expect the 'S2007' version to become available in early 2009.

Figure 1.1: Data flow view of LEHD Infrastructure

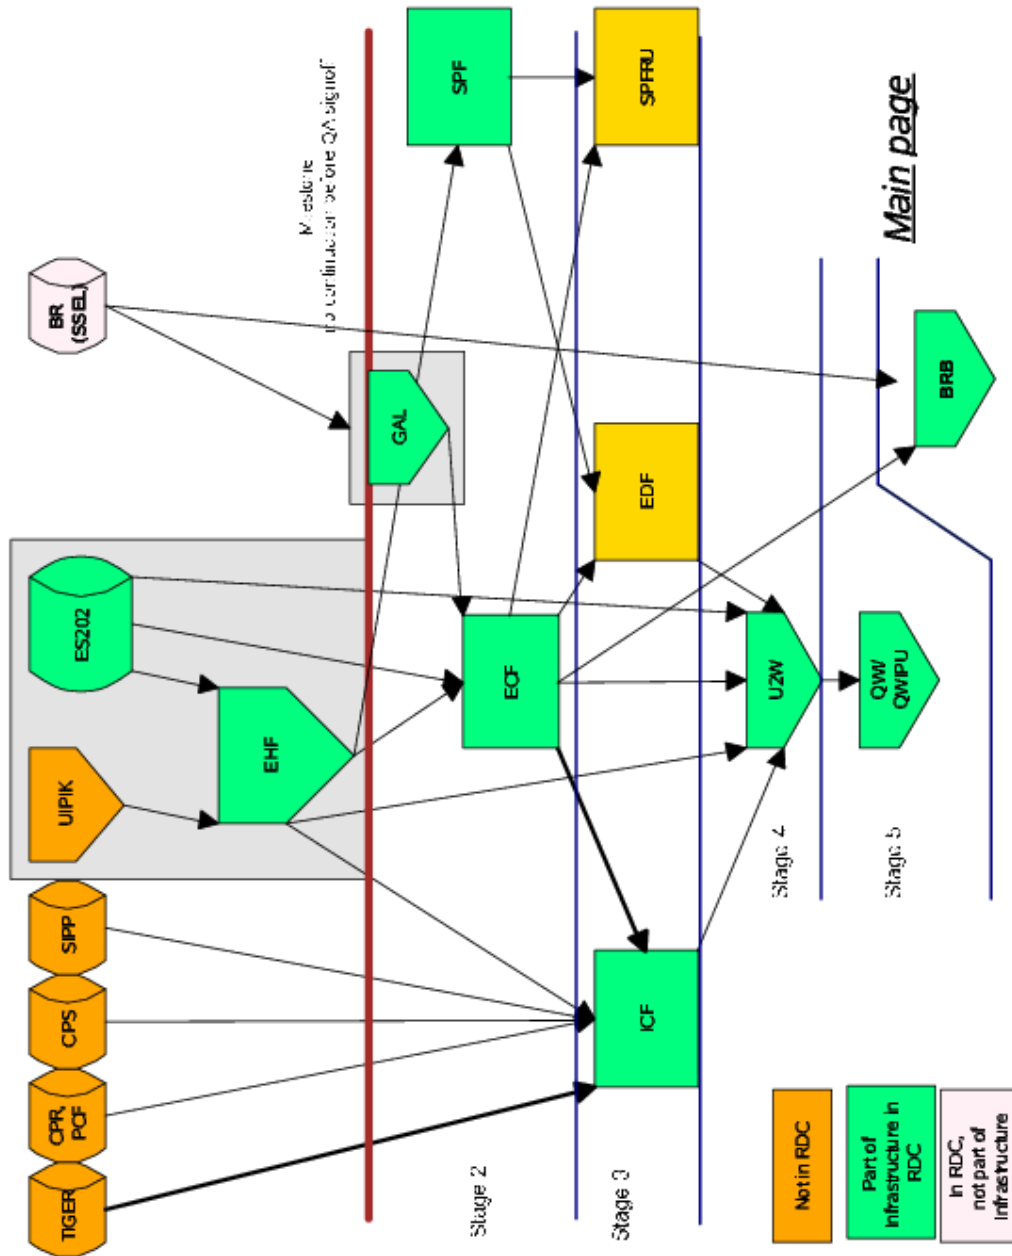

Table 1.1: LEHD components

Name and abbreviation	CES abbr. if different	Name of FTI version	CES abbreviation of FTI version
Business Register Bridge (BRB)		(all)	
Employer Characteristics File (ECF)		ECFT26	ect
Employment History Files (EHF)			
ES-202 (ES-202)	es2	ECFT26	ect
Individual Characteristics File (ICF)		ICFT26	ict
Geocoded Address List (GAL)		GALT26	gat
Quarterly Workforce Indicators (QWI) (establishment level)			
Successor-Predecessor File (SPF)			
Unit-to-Worker Impute (U2W)			

1.2 TREATMENT OF FEDERAL TAX INFORMATION

Some components have Title-26 protected variables, which are kept as separate components for tracking and monitoring purposes, but are not documented separately. Such T26 components need to be requested separately, and as of the writing of this documentation, will trigger additional proposal review. Table 1.1 shows the nine components and their Federal Tax Information ([FTI](#)) counterparts, if present, as they are available in the [RDC](#).

1.3 IDENTIFIERS

In general, linkages between the different files are created using deterministic match-merge techniques. Person, firm, and establishment identifiers allow users to link all LEHD Infrastructure files. Throughout, all Social Security Numbers ([SSNs](#)) have been replaced by Protected Identity Keys ([PIKs](#)) - no [SSNs](#) are available anywhere in this data. In addition to within [LEHD](#) identifiers such as the [PIK](#), the [ICF](#) also contains additional person identifiers linking to Census survey data: (Current Population Survey ([CPS](#)), and Survey of Income and Program Participation ([SIPP](#))). Note that these are generally the Census-internal identifiers and may not have a direct correspondence to the identifiers on the public-use files.

Firm identifiers are called State employer identification numbers ([SEINs](#)). The identifiers are constructed internally by [LEHD](#), and generally, but not always, reflect an entity reporting unemployment insurance ([UI](#)) taxes to state authorities. “Establishments” (more precisely: reporting units) are identified by SEIN reporting unit ([SEINUNIT](#)). Establishments and firms are structured as one would expect with establishments listed hierarchically within each firm. Therefore to uniquely identify an establishment both the [SEIN](#) and [SEINUNIT](#) must be used. The firm and establishment identifiers are state and firm-structure-specific - within the LEHD Infrastructure files, there is no straightforward method of linking units of a firm with multiple tax reporting entities ([SEINs](#)). Although the vast majority of firms have only one SEIN, a firm, depending on its structure may have multiple [SEINs](#) operating both within and across state boundaries. Although the federal Employer Identification Number ([EIN](#)) is available and can be used to link [SEINs](#) within and across states, the [EIN](#) suffers from similar problems as the [SEIN](#). The identifier is not necessarily unique within a firm, is designed for tax reporting, and the structure of [EINs](#) within a firm is arbitrary. The Census Bureau recognizes the limitations of administrative identifiers and has addressed this problem on the Business Register ([BR](#)). The [BRB](#) is used to link to the Business Register ([BR](#)) and other Census economic data. Note that the [BRB](#) is in general a many-to-many link file. The [BRB](#) does permit assigning all [SEINs](#) and [SEINUNITs](#) to a common *alpha* (the overall firm identifier in the [BR](#)). However, exact identifier-based establishment-to-establishment matches between [BR](#) and [LEHD](#) data are generally not possible for establishments part of multi-establishment firms.

For any further information, refer to the component-specific documentation.

1.4 AVAILABILITY OF DATA

Availability of LEHD Infrastructure files is conditional on (i) the data files having been processed in the LEHD QWI Production system, and subsequently integrated into the LEHD Infrastructure and (ii) permission for use in research having been granted by LEHD's state partner.

The standard Memorandum of Understanding (MOU) between the Census Bureau and its state partners precludes access to person and firm names and physical addresses as provided in the ES-202 data. As described below, there are geographic identifiers that are derived in the GAL that can be used for analysis and integrating data for appropriate and approved purposes.

As of August 20, 2008, 31 states have been processed for the complete set of LEHD data files and integrated. The GAL is available for all 50 states plus the District of Columbia, but certain crosswalks do not exist if ES-202 records were not available for that state. As of February 1, 2008, 30 states have granted permission to use the files in the RDC network. Table 1.2 lists permissions by state. LEHD continues to work on expanding the list of permissions. Check with the RDC administrators for the most up-to-date list.

In general, LEHD Infrastructure files are available from 2000 onwards. However, the availability of historical data prior to 2000 varies significantly across states. Table 1.3 tabulates the availability by component and state in the S2004 snapshot. This table should be cross-referenced with Table 1.2 when evaluating the feasibility of a project.

Wyoming	8	14
					(0.09)	(0.04)						

Number of files for each data set group and state. Aggregate size of all files in GB in parentheses.

Files not currently available may become available in the next update to the LEHD Infrastructure (see Section 1.1). At the time of writing of this document, we expect the next version to contain up to 46 states. Availability of core Infrastructure files is dependent on a state's participation in the Local Employment Dynamics (LED) program. The latest participant list can be found at the LEHD website at <http://lehd.did.census.gov>.

1.5 PROCESSING FILES

LEHD Infrastructure files are significantly larger than even traditionally large research files such as the decennial census. In the current version, in all available states and years combined, information on 754,775,697 jobs is presented. There are 226,639,116 quarterly observations on firms. Careful planning is required to ensure that adequate resources are available. To facilitate researchers in this endeavor, the research versions of the LEHD Infrastructure files in the RDC environment have additional random variables that allow for the selection of uniform random subsamples of firms (SEIN), establishments (SEINUNIT), and individuals (PIK). No such random variable is available on the EHF, since there is no single good strategy for selecting jobs. Tables in the documentation for individual components also contains information about the size on-disk of each file.

1.6 DISCLOSURE LIMITATION

Special disclosure and data use rules apply to analyses based on the micro-data from the LEHD Infrastructure file system. These data underlie the QWI, and research results are therefore subject to restrictions that insure the QWI disclosure limitation mechanism is not compromised. Disclosure limitation for the QWI uses noise infusion of the micro-data. The Disclosure Review Board (DRB) does not allow the release of any tabulations for sub-state geography that do not use the QWI noise infusion process. In addition, the required noise factors have not been placed on the RDC snapshot files as part of the DRB's normal rules limiting access to the specific parameters of its approved disclosure limitation methods. Only the DRB may approve the release of tabular output from the LEHD infrastructure file system. Sub-state geography tables will not be approved. National or multi-state tables may be approved provided they do not compromise the protection system. Model-based output is normally allowed. The chief disclosure officer for the RDC network will coordinate the reviews.

The underlying micro-data in the LEHD infrastructure file system were provided to the Census Bureau by states' Labor Market Information (LMI) offices under Memoranda of Understanding (also called Data Use Agreements) negotiated with each state. This process is part of the LED federal/state partnership, and places additional restrictions on the results that may be published. Current members of the LED partnership are shown on the LEHD main web page.

Publicly disclosing a single state's data, or any sub-state information such as Metropolitan Statistical Area (MSA) or Core-Based Statistical Area (CBSA), in identifiable form requires the permission of the state's LMI officer. When reporting results from studies that include multiple states, the results should be pooled across the states. State-specific controls can be included, but no coefficients therefrom reported. The identity of the LED member states is obviously not confidential. You may say which states were used in your analysis, and that you controlled for state-specific factors. The chief disclosure officer for the RDC network will review compliance with this requirement in consultation with the Assistant Division Chief for LEHD.

Chapter 2.

Business Register Bridge (BRB)

2.1 OVERVIEW

2.1.1 Definition of BRB

The [LEHD](#) employer-level data are at an establishment-level and can be linked to Census Bureau establishment and firm level micro data (e.g. Economic Censuses and Surveys) via this bridge . The bridge provides a crosswalk at various levels of business-unit aggregation. The most detailed exact crosswalk is at an [EIN](#), State, 4-digit industry, county level. The bridge includes the full list of establishments in the [LEHD](#) data and in the [BR](#) that are associated with the business units (e.g., [EIN](#)/4-digit SIC/State/County) in the crosswalk and measures of activity (e.g., employment, sales) that can be used to aggregate the establishment level data.

2.1.2 Update frequency

Updates occur annually.

2.1.3 Acquisition process

The Business Register Bridge ([BRB](#)) requires presence of Business Register ([BR](#)) (see the [BR](#) codebook, yearly acquisition) and the [ECF](#) (quarterly updates).

2.1.4 Processing description

Extracts of the Business Register ([BR](#)) and the [ECF](#) are built, properly aggregated, and output into a single file. A more detailed description is available in Section [2.3](#).

2.1.5 Naming conventions

Three data files are produced and transferred. The data files from this process conform to [LEHD](#) naming conventions and are called

- [brb.us_xwalk](#): the actual bridge, by year, at different levels of aggregation.
- [brb.us_ecflist](#): list of [SEINUNIT](#)s on the [ECF](#), by quarter
- [brb.us_brlist](#): list of [EIN](#)s on the [BR](#), by year

Once on the Center for Economic Studies ([CES](#)) system, these files are identified as “LEHD-BRB” and renamed to

- [lehd.us_brb](#): the actual Business Register Bridge ([BRB](#)), by year, at different levels of aggregation.
- [lehd.us_brb_ecflist](#): list of [SEINUNIT](#)s on the [ECF](#), by quarter

- lehd_us_brb_brlist: list of EINs on the BR, by year

2.2 DETAILS

2.3 CHARACTERIZING THE BRIDGE BETWEEN LEHD DATA AND CENSUS BUSINESS DATA

2.3.1 General Description

One of the many advantages of the [LEHD](#) database is the ability it offers to link information from Census Bureau business-level surveys (such as the Annual Survey of Manufacturers ([ASM](#)), or Business Expenditure Survey ([BES](#))) to the set of workers employed by these units. The *LEHD Business Register Bridge (BRB)* provides researchers with the tool to make this linkage.

The [LEHD](#) data available through the [RDCs](#) is described in detail in other documents. In this document, we provide a description of the [BRB](#) itself as well as an overview of the business data that is available through this link.

The primary bridge between the [LEHD](#) data and the business data is the U.S. Census Bureau's annual Business Register ([BR](#)), a list of establishments the Bureau uses to develop the initial mailing list for the economic censuses and surveys. The [BR](#) contains data from several different sources. Primarily, however, the [BR](#) contains very reliable information on business identifiers, business organizational structure, and business location. All of this detail helps us to form links to the [LEHD](#) data.

Unfortunately, we are not able to directly form establishment-to-establishment linkages between [LEHD](#) data and the [BR](#). The establishment identification system for the Business Register is the same as for all other Census Bureau business data products but different from the [LEHD](#) establishment identifier. Unfortunately, there is no one best way to form linkages between these data sources. There are many alternatives, and the optimal linking strategy depends on the research objective. To provide researchers with as much flexibility as possible, the [BRB](#) has been constructed as a crosswalk that allows for a number of different ways to integrate these data sources

2.3.2 File Structure and Contents

2.3.2.1 Identifiers

We use three types of identifying variables in the construction of the crosswalk file. These are: business identifier, geographic information, and industry code. Employer Identification Number ([EIN](#)) is a nine-digit taxpayer identification number assigned by the Internal Revenue Service ([IRS](#)). It is a unique identifier for single units but not for multi-units. Geographic information such as state or county is available. 1987 Standard Industry Classification ([SIC](#)) codes are available in 4-digit level

2.3.2.2 Unit of observation

The unit of observation on the [BRB](#) file is a unique [EIN](#)-State-SIC4-County record. All unique combinations of these identifiers that are found on either the [LEHD](#) data, the [BR](#), or both will appear on the crosswalk.

We will use the [EIN](#) with 15 different combinations of geographic and industry information as follows:

- EIN
- EIN/SIC1
- EIN/SIC2
- EIN/SIC3
- EIN/SIC4
- EIN/STATE
- EIN/STATE/SIC1

- EIN/STATE/SIC2
- EIN/STATE/SIC3
- EIN/STATE/SIC4
- EIN/STATE/COUNTY
- EIN/STATE/COUNTY/SIC1
- EIN/STATE/COUNTY/SIC2
- EIN/STATE/COUNTY/SIC3
- EIN/STATE/COUNTY/SIC4

2.3.2.3 Structure of output files

For complete technical description, see Section 2.5.

Crosswalk file The crosswalk file contains the following variables

Alpha: Ten-digit enterprise identifier

County: Three-digit county identifier

EIN: Nine-digit employer identifier

Flag_xxx: 15 one-digit match type flags. These flags represent the status of the match corresponding to each level of aggregation, one flag per unique id variable combination. Each flag takes on the value “M”, “L”, or “B”. For example, `flag_e_c_2` is the flag variable when we use [EIN/County/SIC2](#) as linking unit and `flag_e_s_4` is the flag when we use [EIN/State/SIC4](#) as unit of matching.

M means that the business unit at this level of aggregation is matched.

L means that this business unit is observed only in the [LEHD](#) database.

B means that this business unit is observed only in the Business Register.

[EIN/County/SIC4](#) is the most disaggregate level of aggregation we can use to match. So, it is obvious that if the flag value for the [EIN State SIC4 County](#) match is “M” then all 15 flags are “M”.

SIC1: one-digit 1987 SIC

SIC2: two-digit 1987 SIC

SIC3: three-digit 1987 SIC

SIC4: four-digit 1987 SIC

State: Two-digit state abbreviation (e.g. md)

Stgeo: Two-digit State FIPS code (e.g. 24)

Year: Calendar year

List files List files link different business identifiers that are only observed in one database to one of the fifteen level of aggregation used in matching

Business Register Identifiers: Census File Number (**CFN**), Permanent Plant Number (**PPN**), Alpha, etc. are captured on `brb_us_brlist.sas7bdat`

LEHD Identifiers: **SEIN**, **SEINUNIT**, etc. are captured on `brb_us_ecflist.sas7bdat`. *IMPORTANT:* The **ECF** list file is a quarterly file, not a yearly file!

2.3.3 How to Use The BRB

2.3.3.1 Some considerations

Because there are many ways to use the **BRB**, finding the optimal way to use it for any given research project requires some researcher planning. The steps outlined here summarize the experience of the **LEHD** researcher staff in using this crosswalk for a variety of different research projects.

Before making use of the **BRB**, there are a number of questions a researcher must address, and the answer to these questions will determine how the **BRB** will be used. To illustrate this point, we take a research topic and cover, step by step, the decisions a researcher would face when identifying the best way to make use of the **BRB** to build an analytic dataset for the project.

Because there is not a common establishment ID variable on the Census and **LEHD** business files, the link between the files must be formed at a level of aggregation that is, for many multi-unit businesses, higher than an establishment. Both the set of link variables as well as the unit of observation for the analytic dataset must be selected by the researcher. Note that these need not be the same.

2.3.3.2 Choosing the Link Variables

As noted, the **BRB** identifies all variables – state, county, and one-, two-, three-, and four-digit industry code – on which an **EIN** found among **LEHD** workforce traits and an **EIN** found on Census business data agree. In addition to **EIN**, any (or none) of these link variables may be chosen to merge together workforce traits and other business traits for analysis. When making this decision, observation counts in the resulting matched dataset as well as other factors should be considered. For example, if the analysis will focus on particular industries or regions, researchers may wish to require that linked business data agree on SIC or on state and county. In this case, any **EIN** the **BRB** indicates to be found on both files but not agreeing on state or industry would not be included in analysis. As we will discuss in the next section, it should be noted that the link variables do not necessarily determine the unit of observation for the analysis

2.3.3.3 Choosing the Base File and Unit of Observation

There are three types of ways the **LEHD** data may be combined with Census business data to create research-ready datasets. These types are:

1. **LEHD** workforce traits (such as worker churning rates) at the establishment level (or higher) may be linked to more highly aggregated Census business traits (such as labor productivity). In this situation, the **LEHD** establishments form the “base file.”
2. Establishment-level Census business traits (such as technology spending relative to a scaling measure) may be linked to more highly aggregated **LEHD** workforce traits. Here, Census data (such as the Annual Survey of Manufacturers) form the base file.
3. Traits aggregated on both sides may be combined using the crosswalk.

In short, researchers linking **LEHD** workforce traits to other Census business files may choose to aggregate **LEHD** traits, other business traits, or both. Note that by “aggregate,” we mean that establishment-level data should be aggregated to the level of the link (**EIN**-county, 4-digit **SIC**, for example), or higher. The

researcher must decide on which side (workforce traits or other business characteristics) it is important to preserve more detail.

2.3.3.4 Example

Suppose we are interested in exploring how worker turnover impacts labor productivity for restaurants. There are two key decisions regarding identifier variables that must be made. Link traits as well as the unit of observation must be chosen. We hope to make it very clear that the two decisions need not be the same, and both will vary with the nature of the research question

A. Choosing the Link Level Because we are interested in restaurants only and because this is a two-digit industry trait, we will most likely want to use records from the [BRB](#) where `flag_e.2` (at a minimum)='M'. Noting that county-level match rates are high and that a franchised restaurant in downtown Chicago may behave very differently from the same franchise in rural Illinois, we may also require that observations entering our sample all agree on state and county as well and thus choose only to keep those [BRB](#) records where `flag_e.c.2`='M'

B. Choosing the Base File, Supplemental Files, and Unit of Observation From which data source – Census business data or [LEHD](#) data – would we like to preserve the most detailed data? Some researchers may in fact choose to sacrifice detail on both sides in favor of uniformity of variable construction. Regardless, because all variables that will characterize the unit of observation are available from other files, the [BRB](#) is not needed to obtain them. However, the unit of observation and the linkage unit are closely tied.

For this example, our goal is to characterize variation in labor productivity across restaurants and to determine if those with more worker turnover are less productive. Thus, we will most likely select Census business data as our “base” data source and will link establishment detail on productivity and other business traits to more aggregated workforce traits (in this example, the [LEHD](#) workforce aggregated would be the “supplemental” file). Note that this linking assumes that worker churning is similar for all restaurants in the same [EIN](#) state and county

2.3.3.5 Summary of How to Use This File:

Step 1 Make an extract from the [BRB](#) sub-setting on all records for each state and year that have a value of “M” for the match flag corresponding to these match variables. The variables to keep include all ID variables needed to make the match. For example, if we sub-set on `flag_e.c.2`='M', the match variables we keep from the [BRB](#) will be:

- EIN
- State
- SIC2
- County
- Year

CAUTION: One should make sure to sort the crosswalk to get unique observation per linking unit when using linking units less detailed than [EIN/County/SIC4](#).

Step 2 Some Base and supplemental files have all the necessary variables such as [EIN](#), State, SIC2, County, and Year. For example, the [ASM](#) and Census of Manufactures ([CM](#)) have these link variables as well as establishment identifiers such as [CFN](#) and [PPN](#). In this case we can match the extract from the [BRB](#) with the base file or supplement file (after some aggregation). However, some files do have their own identifiers but not all link variables. In this case, we have to get additional variables from the list files we provide before

CHAPTER 2. BUSINESS REGISTER BRIDGE (BRB)

matching the extract from the BRB with the files of interest. For example, some files have only CFN and year but not EIN. Thus, we must first obtain the CFN from BR list file before matching.

Step 3 Select a base file (Census business data or LEHD business data), a supplemental file, and a unit of observation for the final analytic dataset. The base file should be the file from which we could like to preserve the most detail (if aggregation level differences within the same observation are desired).

Step 4 From the base file, pull off all observations (matching by the link variables selecting in Step 2) that match to the BRB extract. If allowing for more detailed data from the base file, the dataset resulting from this step will have more observations than the BRB extract.

Step 5 If the LEHD data has been selected as the base file in Step 3, some collection of Census business data files will be used to construct the supplemental file. The most dis-aggregated level of detail that may be maintained on the supplemental file is defined by the link variables (EIN, state, one-digit SIC, county and year in this example). If the business data variables of interest are reported on the files at this level of aggregation or smaller (typically this will be at an establishment level), then the business data must be aggregated to the level defined by the link variables. Note that some business files contain records reported at higher levels of aggregation. In these cases, no additional aggregation is needed in the construction of the supplemental file. CAUTION: When adding variables at a higher level of aggregation, it is often preferred to use ratios of variables from the same dataset rather than levels of one variable only. For example, rather than using aggregated sales, it is often preferable to weight sales at each establishment by some fraction (where the fractions for each establishment sum to one) before aggregating across establishments.

Step 6 Link the supplemental file to the joined base file and BRB extract. Use the same variables used to define the level of aggregation of the supplemental file.

Step 7 The construction of the analytic dataset is now complete. Note, however, that not all records in the dataset need be constructed at the same level of aggregation.

2.3.4 Some warnings and caveats

2.3.4.1 Active establishments

In the construction of the crosswalk, duplicates and non-active establishments are deleted (not included) based on Census activity flags from the BR. Invalid, missing, illegible, or out-of-scope industry code, invalid geography, or even zero payroll are *not* grounds for exclusion from the BRB. In particular, invalid codes can and do appear on the BR, and are carried through unchanged.

2.3.4.2 Discrepancies in geo and industry codes

There may be discrepancies between the BR and ES-202 based data for a variety of reasons. Processing issues imply that geo and industry codes may be missing or out of bounds on BR, especially for entrants. It is an open question whether the ES-202 might get information on industry and geo faster than the BR. Note that there is some evidence that suggests that this is the case: Census currently receives a list of industry codes from Bureau of Labor Statistics (BLS) (from its ES-202 processing) for new EINs. Census has typically found these industry codes to be more reliable than either the PBA (principal business activity from income tax forms for businesses) codes they receive from IRS or the industry codes from Social Security Administration (SSA) extracted from the SS-4 form (the form used to apply for an EIN).

In terms of preference, the preference ordering that Census typically uses for industry codes is:

1. Direct Census collection in economic censuses or annual surveys (for most businesses this means only once every five years).

2. [BLS](#) codes
3. [SSA](#) codes
4. [IRS](#) codes

2.4 DATA SET DESCRIPTIONS

2.4.1 Naming scheme

There are three files in the BRB group:

```
brb_us_brlist.sas7bdat  
brb_us_ecflist.sas7bdat  
brb_us_xwalk.sas7bdat
```

us indicates that these are files of national scope. All BRB files are considered [FTI](#).

2.4.2 Data location

The files are stored in a directory underneath the general LEHD directory structure:

```
brb/us/
```

On the RDC network, the directory can be found under

```
/mixed/lehd/current
```

2.6 NOTES

Chapter 3.

Employer Characteristics File (ECF)

3.1 OVERVIEW

3.1.1 General Overview

The Employer Characteristics File ([ECF](#)) consolidates most firm level information (size, location, industry, etc.) into two easily accessible files. The firm or [SEIN](#) level file contains one record for every YEAR QUARTER a firm is present in either the ES-202 or the [UI](#), with more detailed information available for the establishments of multi-unit firms in the [SEIN SEINUNIT](#) file. The [SEIN](#) file is built up from the [SEINUNIT](#) file and contains no additional information, but should be viewed merely as an easier and/or more efficient way to access firm level data.

3.1.2 Input Files

- The ES202 data from the states is the primary input to the [ECF](#) file creation process.
- [UI](#) data is also used to supplement information on the ES202. As part of the creation of the Employment History Files ([EHF](#)), `ehf_sein_employment` is created. This file contains E (end of period employment), B (beginning of period employment), M (employed anytime in the quarter), and W1 (total wages) calculated similarly to the same measures on the QWI (see Abowd et al., 2006, ming).
- [GAL](#) data containing lat/long coordinates of the establishments, plus county, wib and pmsa geo also.
- Existing files with permanent distortion factors must be available if data for the state has been officially released. (these files are not available in the [RDC](#) network.
- [SIC](#) and [NAICS](#) impute datasets: available upon demand.
- BLS-derived control totals, produced by the [EHF](#).

3.1.3 Program Overview

First data is read in from the yearly ES202 files and stacked one on top of the other. General and state specific consistency checks are then performed. The COUNTY, NAICS, and EIN data are checked for invalid values. The SIC invalid check is a little more sophisticated. If a 4 digit SIC code is present, but is not valid, then the SIC code undergoes a conditional impute based on the first 2 or 3 digits. If the first 2 or 3 digits are not valid either, then SIC is set to missing (this value will eventually be filled).

The ES202 data contains a “master” record for multi-unit firms that must be removed. Information in the master record is preserved if data is not available in the establishment records (data is initially allocated equally to each establishment). Various inconsistencies in the record structure are also dealt with, such as 2 records (master and establishment) appearing for a single-unit.

The [UI](#) data is integrated with the ES202 data and totals are calculated at the SEIN YEAR QUARTER level.

Using both [UI](#) and ES202 data a “best” series of variables for payroll and employment is created.

The allocation process implemented above (master to establishments) does not incorporate any information on the structure of the firm. A flat prior is used in the allocation process (each establishment is assumed to have equal employment and payroll). We improve on this by examining firms with allocated data that previously reported as a multi-unit. The structure of their reports from a previous quarter is then used to allocate payroll and employment. The new records are integrated back into the data, hopefully improving longitudinal consistency at the establishment level.

At this point, the SEIN YEAR QUARTER SEINUNIT dataset record structure is finalized.

The [GAL](#) is brought into the [ECF](#) (this used to be the separate [LEG](#) process).

The COUNTY, SIC, NAICS, and EIN data are transformed from long to wide format for each [SEINUNIT](#). This dataset is used to fill missing values in these variables with information from other periods for the same establishment.

The modal COUNTY, SIC, NAICS, OWNER_CODE, and EIN are calculated (both establishment and employment weighted) for each [SEIN](#) in a given YEAR and QUARTER.

The [SEIN](#) level mode variables (SIC, NAICS, etc) are then transformed from long to wide and the missing values are filled with data from the closest YEAR and QUARTER, if available.

At this point, if an [SEIN](#) mode variable has a missing value, then that missing value must be present for every YEAR and QUARTER. The distribution of employment across 4 digit SIC in 1997 is calculated and is used to impute the industry code for each [SEIN](#) with missing SIC. These SIC codes are also assigned to the [SEINUNIT](#) level data.

The weights are calculated, based on the expanded BLS controltotals acquired from the [EHF](#).

The final step is to apply fuzz (noise distortion) factors to each dataset. The fuzz factor process is done separately for the [SEIN](#) and the [SEINUNIT](#) data. Once this is completed the datasets are written to their final location and the master fuzz files are updated.

3.2 ECF FILES AND TITLE 26 IN THE RDC ENVIRONMENT

Because some data elements on the internal-use [ECF](#) are considered Title 26-protected, the structure of the files has been slightly modified for the [RDC](#) environment to facilitate and streamline project proposals by clearly identifying files without any Title 26-protected data (from Fall 2006 onwards).

All Title 26-protected information has been stripped out of the main [ECF](#) files, and stored in strip files with the same record count, but only those variables that are Title 26 protected.

Users will find all Title 13-protected content in the directories

```
ecf/ecf_XX_sein.sas7bdat
ecf/ecf_XX_seinunit.sas7bdat
```

Title 26-protected content can be found in

```
ecft26/ecf_XX_sein_t26.sas7bdat
ecft26/ecf_XX_seinunit_t26.sas7bdat
```

Sample code to merge the two types of files back together again is listed in [Section 3.5](#).

3.3 DATA SET DESCRIPTIONS

3.3.1 Naming scheme

There are four files in the ECF/ECFT26 group:

```
ecf_zz_sein.sas7bdat
ecf_zz_seinunit.sas7bdat
ecf_zz_sein_t26.sas7bdat
ecf_zz_seinunit_t26.sas7bdat
```

ZZ stands for the state postal abbreviation. Files with `_t26` contain [FTI](#), are stored in separate subdirectories and require a separate set of permissions. They are of little use without the regular ECF group data. You will find zero-observation SAS datasets attached to this document - see the attachment tab.

3.3.2 Data location

The files are stored in two main directories, with state-specific subdirectories:

```
ecf/ZZ/      for most files
ecft26/ZZ    for files with Title 26 protected content
```

On the RDC network, both directories can be found under

```
/mixed/lehd/current
```

3.3.3 Main SEINUNIT dataset: ecf_zz_seinunit

SEINUNIT-level file, with some SEIN-level variables available.

Record identifier: SEIN SEINUNIT YEAR QUARTER

Sort order: SEIN SEINUNIT YEAR QUARTER

File indexes: SEIN_YEAR_QUARTER_SEINUNIT (on ia64 systems only)

Entity “establishment” or [SESA](#)

Unique Entity Key SEIN SEINUNIT

Note that SEINUNIT is only unique within any given time period within SEIN.

3.3.4 Main SEIN dataset: ecf_zz_sein

SEIN-level file, with variables aggregated from the establishment level.

Record identifier: SEIN YEAR QUARTER

Sort order: SEIN YEAR QUARTER

File indexes: none

Entity “firm”

Unique Entity Key SEIN

Note that SEIN is unique within any given time period across all states, but may not be uniquely identify an entity over time within a state, as the underlying UI account numbers can and do get re-used.

3.3.7 Details on variables

sein Variables read in from the ES202 yearly files.

12 digit firm identifier (first 2 digits are the state FIPS code)

year

quarter

seinunit 5 digit code identifying the establishment. Generally used in combination with the SEIN to uniquely identify an establishment. The identifier itself is only unique within a firm or SEIN.

owner_code see ES_OWNER_CODE

EIN

county

SIC

NAICS

empl_month1

empl_month2

empl_month3

total_wages End of variables read in from the ES202 yearly files.

Sein_bad 0 = SEIN contains only characters 0-9

1 = SEIN contains a character outside the above range

Ein_bad 0 = EIN contains only characters 0-9

1 = EIN contains a character outside the above range

Valid_ein 0 = first 2 digits of EIN do not represent a valid IRS Revenue district code

1 = first 2 digits are valid

Ein_defect 0 = no defect found

1 = EIN it is all nines or all zeros

2 = ein_bad=1, EIN contains characters outside the range 0-9

3 = EIN is a 7 digit or less number. An EIN must be at least eight characters

4 = valid_ein=0, the first two digits of the EIN do not represent a valid IRS Revenue district code

Sic_invalid 0 = SIC is OK

1 = SIC not valid

2 = first 2 digits valid, last 2 digits imputed

3 = first 3 digits valid, last digit imputed

CHAPTER 3. EMPLOYER CHARACTERISTICS FILE (ECF)

NUM_RECORDS 1-N = the number of records for each SEIN in a given year and quarter

All_miss_(pay,emp1,emp2,emp3,sic,county) 0 = at least one or more subunits has data
1 = all subunits have missing data

num_estabs 1-N = the number of establishments for each SEIN in a given year and quarter

multi_unit 0 = not a multi unit
1 = multi unit

impute_(wage,emp1,emp2,emp3,sic,county) 0 = data not available or imputation unnecessary
1 = data available in master record and no data in subunits

no_(wages,emp1,emp2,emp3,sic,county) 0 = data available in either master record or subunits
1 = no data in either master record or subunits

master_(wage,emp1,emp2,emp3,sic,county) Information contained in the master record is stored here

seinunit_type 0 = seinunit="00000"
1 = seinunit~="00000"

seinsize_m variables read in from the [UI SEIN YEAR QUARTER](#) summary file.
Count of PIK level wage records that appear at an SEIN in a given YEAR QUARTER.

seinsize_b Count of PIK level wage records that appear at an SEIN in both the current and previous YEAR QUARTER

seinsize_e Count of PIK level wage records that appear at an SEIN in both the current and subsequent YEAR QUARTER.

Payroll Sum of earnings for PIK level wage records at the SEIN in a given YEAR QUARTER.

ever_(multi,wages,emp1,emp2,emp3) 0 = the SEIN never reports data on the ES202
1 = the SEIN is a multi unit at some time or reports payroll or employment at some time during the observed period on the ES202.

sein_(emp1,emp2,emp3,wages) SEIN level totals for payroll and employment from the ES202

multi_first_year The first year when an SEIN appears as a multi unit on the ES202

multi_first_quarter The first quarter when an SEIN appears as a multi unit on the ES202

in_UI 0 = SEIN is not on the [UI](#) in a given year and quarter
1 = SEIN appears on the [UI](#) in given year and quarter

in_202 0 = SEIN is not on the ES202 a given year and quarter
1 = SEIN appears on the ES202 in a given year and quarter

source 1 = UI only

2 = ES202 only

3 = both UI and ES202

ever_202 0 = not on ES202

1 = SEIN appears on the ES202 at some time during observed period

yr_qtr A 6 character sequential year variable. Format is YYYY:Q. A 4 digit year, a colon, and a 1 digit quarter.

emp(1,2,3)_UI Attempt to create the best possible approximation of ES202 employment and payroll using UI data.

Emp1_UI = seinsize_b if available, then seinsize_e, and finally seinsize_m.

Emp2_UI = seinsize_b if available, then seinsize_e, and finally seinsize_m.

Emp1_UI = seinsize_e if available, then seinsize_b, and finally seinsize_m.

best_(wages,emp1,emp2,emp3) My best estimate of payroll and employment for a subunit using as much information available in the UI and ES202. I use both contemporaneous information and information about the firm in other years and quarters. If information is available in the ES202 then that data takes precedence over information in the UI.

best_flag NOTE: The best_flag variable when combined with the structure_fix variable can be used to identify the type of edits and data source of the best_xx variables.

0 = no wage or employment information on the ES202 or UI

In both UI and ES202 1 = SU, ES202 wages, UI employment is used 2 = SU, UI wages, ES202 employment is used 3 = SU, ES202 wages and employment are used 4 = SU, UI wages and employment are used

In ES202 only 5 = SU, ES202 wages and employment are used

In UI only 6 = SU, UI wages and employment are used

In both UI and ES202 7 = MU, ES202 wages, UI employment allocated based on ES202 wages 8 = MU, UI payroll allocated based on ES202 employment, ES202 employment is used 9 = MU, ES202 wages and employment are used 10 = MU, UI payroll and employment allocated equally across all establishments

In ES202 only 11 = MU, ES202 wages and employment are used

In UI only for multi-units does not exist

info_202 0 = no ES202 info

1 = only wages available on ES202

2 = only employment available on ES202

3 = both wages and employment available on ES202

noemp_202 0 = positive ES202 employment

1 = employment is not >0 on the ES202

emp_202_miss 0 = not in the ES202 and non-missing ES202 employment

1 = in the ES202 and all ES202 employment is missing.

special_handle 0 = no special handling required

1 = in_UI=1 and in_202=0 and ever_multi=1

2 = in_UI=0 and in_202=1 and impute_data=1

3 = in_UI=1 and in_202=1 and no_data=1 and multi_unit=1

4 = in_UI=1 and in_202=1 and impute_data=1

no_get_data 0 = get_XX=1 for at least one variable

1 = get_XX=0 for all variables

data_avail 0 = no data available

1 = in_202=1 and some subunit data available that period

impute_data 0 = no allocation of master to subunit that period

1 = allocation of master to subunit that period

no_data 0 = data available

1 = no data in master or subunit available that period

get_(wages,emp1,emp2,emp3) 0 = special_handle=0 or special_handle=1 and no subunit wages available in other periods

1 = special_handle=0 and subunit data is available in other periods

(wages,emp1,emp2,emp3)_202 Renamed sein_XX variables on the special_handle_06.sas7bdat dataset. This is necessary in the next program when I match a record with missing subunit information the to another record in another year and quarter.

Wages_UI Payroll is renamed similarly to emp(1,2,3)_UI variables.

qtime_master Continuous quarter time from 1985 quarter 1 for the record for which I am trying to determine subunit structure.

qtime_first The first quarter in continuous time that an SEIN appears as a multi unit

year_found The closest year that contains subunit structure

quarter_found The closest quarter that contains subunit structure

Stop 0 = record not found

1 = record with subunit structure found

best_(wages,emp1,emp2,emp3) Update of original values computed in 05_best_vars.sas. My best estimate of payroll and employment for a subunit using as much information available in the UI and ES202. I use both contemporaneous information and information about the firm in other years and quarters. If information is available in the ES202 then that data takes precedence over information in the UI.

sein_best_(wages, emp1, emp2, emp3) SEIN YEAR QUARTER summaries of the best_XX variables.

structure_fix NOTE: The `best_flag` variable when combined with the `structure_fix` variable can be used to identify the type of edits and data source of the `best_xx` variables.

0 = record not selected for structure imputation

1 = record selected for structure imputation

leg_state See the LEG documentation for more information on these variables

leg_county

leg_wib

leg_msapmsa

leg_geo_qual

leg_longitude

leg_latitude

leg_flag_geo

es_state FIPS code of the state

es_ein cleaned SEINUNIT EIN

9 digit federal firm identifier. Generally not unique within a state. There may be multiple state level firms for a given federal firm identifier.

es_county cleaned SEINUNIT county

3 digit FIPS county code.

es_naics cleaned SEINUNIT NAICS

es_owner_code cleaned SEINUNIT ownership code

1 = Federal Government

2 = State Government

3 = Local Government

5 = Private Sector

es_sic cleaned SEINUNIT SIC

es_(sic, naics, county, owner_code, ein)_miss 0 = Variable is not missing

1 = Variable is missing before using information from other quarters.

2 = Variable is not missing after search for off quarter information.

`mode_es_XXX_emp+4` = Variable is missing, filled with the SEIN employment weighted mode value.

es_(sic, naics, county, owner_code, ein)_flag Missing = No information in other quarters

0 = Variable is not missing in current quarter

i0 = quarter after the current quarter where replacement value is found

j0 = quarter before the current quarter where replacement value is found

CHAPTER 3. EMPLOYER CHARACTERISTICS FILE (ECF)

mode_(es_sic, es_naics, es_county, es_owner_code, es_ein, leg_wib, leg_msapmsa, leg_state, leg_county, leg_subctygeo) The modal value of the variable in an SEIN YEAR QUARTER (unit weighted)

mode_(es_sic, es_naics, es_county, es_owner_code, es_ein, leg_wib, leg_msapmsa, leg_state, leg_county, leg_subctygeo)_emp The modal value of the variable in an SEIN YEAR QUARTER (employment weighted)

Place **SIC, NAICS, COUNTY, ownership code, EIN and LEG SEIN level variables in arrays**

mode_es_(sic, naics, county, owner_code, ein)_miss 0 = Variable is not missing

1 = Variable is missing before using information from other quarters.

2 = Variable is not missing after search for off quarter information.

6 = Variable is missing, filled with imputed value. Currently only used for SIC.

11 = variable missing, but value set to 5. Currently only used for owner_code. Assume records with missing ownership codes are private firms.

mode_es_(sic, naics, county, owner_code, ein)_emp_miss 0 = Variable is not missing

1 = Variable is missing before using information from other quarters.

2 = Variable is missing, filled with off quarter information.

5 = Variable is missing, filled with the corresponding unit weighted value

6 = Variable is missing, filled with imputed value. Currently only used for SIC.

11 = variable missing, but value set to 5. Currently only used for owner_code. Assume records with missing ownership codes are private firms.

mode_es_(sic, naics, county, owner_code, ein)_flag Missing = No information in other quarters

0 = Variable is not missing in current quarter

¿0 = quarter after the current quarter where replacement value is found

¡0 = quarter before the current quarter where replacement value is found

SEIN mode variables missing values are replaced. Missing codes are adjusted. See program 13 for an explanation of valid values.

SEINUNIT mode variables missing values are replaced. Missing codes are adjusted. See program 10 for an explanation of valid values.

es_sic_div SIC divisions (A, B, C,, Z)

ES_SIC_2 First 2 digits of the 4 digit SIC

ES_SIC_3 First 3 digits of the 4 digit SIC

ES_NAICS_2 First 2 digits of the 6 digit NAICS

ES_NAICS_3 First 3 digits of the 6 digit NAICS

Only temporary variables used in the calculation of the weights are created.

qwi_unit_weight = Final [ECF](#) weight. See technical documentation for the weights for detailed information.

Suppressed for confidentiality

No new variables are created.

DATE_(SEIN, SEINUNIT)_FUZZ SAS date value for when the fuzz factor was created.

UPDATE_NUMBER_(SEIN, SEINUNIT) Sequential update number. The first time the ECF is created all fuzz factors receive a value of 0. The value is incremented by 1 each time any fuzz factors are added to the master file.

3.4 NAICS CODES ON THE ECF

Enhanced North American Industry Coding System (NAICS) variables are available on all ECF since February 2003. The variable list below shows that there are 75 new variables for NAICS alone. The variables can be differentiated mainly by the source(s) and coding system used in their creation. There are two sources of data; the ES202 and the Longitudinal Data Base (LDB) from the BLS; and two coding systems; NAICS1997 and NAICS2002 (see the Census web site for more info.). Every NAICS variable uses at least one source and one coding system.

The ESO and FNL variables are of primary importance to the user community. The ESO variables use ONLY information from the ES202 and ignore any information that may be available on the LDB (see Section 3.4.2 for some analysis on why this may be preferred). The FNL variables incorporate information from both the ES202 and the LDB, with the LDB being the dominant source. The ES_NAICS_FNL1997 and ES_NAICS_FNL2002 should be used to create the QWI estimates. Neither the ESO and the FNL variables contain missing values.

3.4.1 A note on naming conventions

The variable naming conventions used for internal LEHD files, from which the RDC version of the ECF is derived, stems from the early days of the LEHD program in 1999, and the ES-202 file layout at the time. Since then, the BLS and its partners have implemented a name change for NAICS-related variables (see *ES-202 Technical Memorandum No. S-02-01*):

- NAICS → NSTA (NAICS-SIC Treatment of Auxiliaries)
- AUXNAICS → NAICS (official NAICS coding)

At LEHD, the internal ES202 variable naming scheme for NAICS/NAICS_AUX remains unchanged for compatibility reasons, and this naming scheme carries through into the ECF. Please keep this in mind while reading this document, and while using the ECF.

3.4.2 LDB versus LEHD NAICS backcoding

The LDB algorithm is to some extent a black box and testing has shown that it does a relatively poor job of capturing firm industry changes that occurred during the 1990's. In fact, the LDB appears to be a simple backfill that does not take into account a firm's entire SIC history.

Although some of the SIC changes over time may be spurious, a firm's SIC code history contains valuable information that we have attempted to preserve in our imputation algorithm. Overall, the effect of the different approaches is relatively small, since very few firms change industry, in particular relative to the proportion of firms that change geography.

In the following, we present a summary of research done on the ESO vs. FNL NAICS codes.

The NAICS_LDB variable is used for about 85% of the records for Illinois, the rest are filled with information from the ES202 (not sure why only 85% of the records on our ES202 files are in the LDB). The results weighted by employment are about the same suggesting that activity was not a criterion for being included on the LDB). First and not surprisingly, in later years and quarters (1999+) when NAICS is actively coded by the states, the codes look almost identical when available.

Second, there is little variation in the LDB NAICS codes over time compared with SIC. Among all of the active SEIN SEINUNITs over the period, a little over 8% experience at least one SIC change compared with about 1.5% on the LDB (almost all of these are 1999+). While this is not entirely unexpected, it is

CHAPTER 3. EMPLOYER CHARACTERISTICS FILE (ECF)

something to keep in mind when comparing NAICS_FNL versus SIC or NAICS_ESO employment totals. Many of these changes in industry appear to be real and are not captured on the LDB.

One effect of this is that as we go back in time a larger portion of employment can be found in NAICS_FNL codes that are different than one would expect given the SIC code on the ECF. For example, in 1990 about 13% of employment is in a NAICS_FNL code that is different than what we would expect based on the SIC. By 2001 this number falls to 3%. The ES202 based NAICS variable does a better job tracking SIC, since more SIC information is used in putting it together (about 3% consistently over the period).

The main source of the discrepancy is due to entities that experience a change in their SIC code prior to 2000. The LDB appears to ignore this change, while the ESO NAICS variable uses an SIC based impute for these SEINUNITS. The result is a series that exhibits similar patterns of change over time as SIC, while still preserving the value added in the NAICS codes for entities that did not experience a change.

Also, users should keep in mind that for early years (¡1997) some of the NAICS industries have yet to come into existence. I have no estimates on the prevalence of this problem.

3.4.3 Variable List

Variable Name	Source	Notes

3.4.4 Coding of MISS and SRC

Each new NAICS variable has several associated variables of which the miss and src variable are the most important.

3.4.4.1 MISS Variable Codes

If information from another period is used, the flag variable reports how many quarters away the NAICS value was found. Values greater than six should only appear in SEINUNIT level variables. If NAICS is missing for all quarters, then the SEINUNIT value has been filled with the SEIN value. The SEINUNIT codes represent the SEIN value +5.

Table 3.6: MISS Variable Codes

0	=	Valid value available in that period
1	=	Missing
1.5	=	(1999 and earlier only) Filled using impute based on SIC due to an SIC change over the period.
2	=	Filled using own code from another period
3	=	Filled from another source contemporaneously
5	=	Filled using the non-employ weight mode (SEIN mode var only)
6	=	Unconditionally imputed (SEIN mode var only)
6	=	NAICS imputed using SIC unconditional impute (SEIN mode var only)
7	=	Filled using the SEIN mode from another period (sic, fnl and eso vars only)
11	=	Filled using unconditional impute of SEIN value (sic, fnl and eso vars only)

3.4.4.2 SRC Variable Codes

The ESO and FNL variables use the following source codes. If more detail is desired about the source of the NAICS code, the user must look to the SRC code for that source. For example, if the ESO source code for ES_NAICS_ESO1997 says NCS, then the actual SRC information will be found in ES_NAICS1997_SRC.

Table 3.7: SRC Variable: ESO, FNL

AUX	=	Source is the ES202 NAICS AUX variable
LDB	=	Source is the LDB NAICS variable
NCS	=	Source is the ES202 NAICS variable
SIC	=	Source is the ES202 SIC code

The AUX, LDB and standard NAICS codes have the following source variables.

Table 3.8: SRC Variable: AUX, LDB, NAICS

SIC	=	Source is the ES202 SIC code
NO2	=	Source is a NAICS 2002 Code
N97	=	Source is a NAICS 1997 Code

3.4.5 NAICS algorithm precedence ordering

Four basic sources of industry information are available on the ECF; NAICS, NAICS_AUX, SIC, and the NAICS_LDB. The NAICS, NAICS_AUX, and NAICS_LDB missing values were filled using the following

preference ordering. SIC is filled similarly, except miss=1.5 is not used and NAICS, not SIC, would be the basis for the impute when miss=3.

1. Valid 6 digit industry code (miss=0)
2. Imputed code based on first 3,4, or 5 digits when no valid six digit code is available in another period (miss=0)
3. Imputed code based on contemporaneous SIC if SIC changed prior to 2000 (miss=1.5)
4. Valid 6 digit code from another period (miss=2)
5. Valid code from another source (for example if NAICS1997 is missing, NAICS2002 or SIC may be available) (miss=3)
6. Use SEIN mode value (miss=5,7)
7. Unconditional impute (miss=6,11)

3.4.6 ESO and FNL variables

The ESO and FNL variables are made up of combinations of the various sources of industry information. The ESO variable uses the NAICS and NAICS_AUX variables as input. Information from the variable with the lowest MISS value is preferred although in case of a tie the NAICS_AUX value is used.

The FNL variable uses the ESO and LDB variables. Information from the variable with the lowest MISS value is preferred although in case of a tie the NAICS_LDB value is used. Keep in mind that although the source of an ESO or FNL variable may be equal to NCS, the actual source can only be ascertained by going back to the original.

3.4.7 Employment Flag Variable Codes

All current uses of the ECF have been forced to assume that employment and payroll information has been reported by the firm, although under certain conditions the ES202 processing specifications require imputation of missing values. The flag values below allow the user to determine when imputation has occurred.

The master record contains valuable information that has been preserved in the master_empl_month1_flg-master_total_wages_flg variables. For example, one should theoretically be able to distinguish 0 prorated codes from 0 unknowns by looking at multi units with masters that reported (code=1) and subunits with a zero.

The following information stems from an email exchange between Kevin McKinney (U.S. Census Bureau) and George Putnam (Illinois) on 12/15/2003.

Employment Flag Variable Codes Prior to late 1995:

- 0 = *unknown*
- 1 = *not imputed*
- 2 = *imputed (including prorated multiple worksite data)*

Late 1995 or early 1996:

- 0 = *prorated data (multiple worksites)*
- 1 = *actual or not imputed data*
- 2 = *estimated data*

1997 first quarter forward (ES202 processing manual, Appendix B):

<i>Blank</i>	=	<i>reported data</i>
<i>R</i>	=	<i>reported data</i>
<i>A</i>	=	<i>estimated from CES report</i>
<i>C</i>	=	<i>changed (re-reported)</i>
<i>D</i>	=	<i>reported from missing data notice</i>
<i>E</i>	=	<i>imputed single unit employment or imputed worksite employment prorated from imputed parent record</i>
<i>H</i>	=	<i>hand-imputed (not system generated)</i>
<i>L</i>	=	<i>late reported (overrides prior imputation)</i>
<i>M</i>	=	<i>missing data</i>
<i>N</i>	=	<i>zero-filled pending resolution of long-term delinquent reporter</i>
<i>P</i>	=	<i>prorated from reported master to worksite</i>
<i>S</i>	=	<i>aggregated master from reported MWR or EDI data</i>
<i>W</i>	=	<i>estimated from wage record employment</i>
<i>X</i>	=	<i>non-numeric employment zero-filled pending further action</i>

3.4.8 Multi-Unit Code or MEEI

The MULTI_UNIT variable on the ECF is determined by counting the number of SEINUNIT records for a given SEIN once the master records have been removed. However, some multiunit firms refuse to report detailed information for their sub-units and appear as single units on the ECF. The table below provides an estimate of the magnitude of multiunit firms refusing to report detailed unit information using data from Illinois.

MULTI_UNIT_CODE	MULTI_UNIT	
	0	1
1	1,483,808	0
2	1	0
3	120	155859
4	5808	0
5	0	33
6	13899	0

Prior to 1997 (ES202 processing manual sent from George Putnam):

- 1 = Single establishment unit
- 2 = Multi-unit master record
- 3 = Subunit establishment level record for a multi-unit employer
- 4 = Multi-establishment employer reporting as a single unit due to unavailability of data, including refusals
- 5 = A subunit record that actually represents a combination of establishments; finer level breakouts are not yet available
- 6 = Known multi establishment employer reporting as a single unit and not solicited for disaggregation because of small employment (< 10) in all secondary establishments combined

1997 first quarter forward (ES202 processing manual, Appendix B):

- 1 = Single establishment unit
- 2 = Multi-unit master record
- 3 = Subunit establishment level record for a multi-unit employer
- 4 = Multi-establishment employer reporting as a single unit due to unavailability of data, including refusals
- 5 = A subunit record that actually represents a combination of establishments; finer level breakouts are not yet available
- 6 = Known multi establishment employer reporting as a single unit and not solicited for disaggregation because of small employment (j 10) in all secondary establishments combined

3.4.9 Auxiliary Code

This variable gives detailed information about firm locations that do not directly engage in production related activities.

Prior to 1997 (ES202 processing manual sent from George Putnam):

- 0 = Unknown
- 1 = Central administrative office
- 2 = Performs research, development or testing services
- 3 = Provides storage or warehouse services
- 5 = Does not provide auxiliary services, it is an operating establishment
- 9 = Performs auxiliary services that are not described above

1997 first quarter forward (ES202 processing manual, Appendix B):

- 0 = Auxiliary status not known
- 1 = Central administrative office
- 2 = Performs research, development or testing services
- 3 = Provides storage or warehouse services
- 5 = Does not provide auxiliary services, it is an operating establishment
- 6 = Headquarters
- 7 = Administrative, Other than Headquarters
- 9 = Performs auxiliary services that are not described above

3.4.10 Summary information on datasets

Table 3.9: File information, by state , by group , for ECF

State	Group	Number of datafiles	Records	Filesizes (MB)	Start	End

3.5 HELPFUL PROGRAMS

The following programs might be found to be useful when using the data.

3.5.1 Combining regular ECF data with ECF T26 files

The following program was used to verify that the T26 data split from the ECF for California cleanly matches back on. It can be used by researchers wishing to integrate the T26 into their ECF-based analytical files.

```

/* Time-stamp: <07/05/04 16:16:00 vilhuber> */
/* $Id: 02.04.combine_ecf.sas 125 2007-05-05 12:55:33Z vilhu001 $ */

%macro combine_ecf(state=,inlib=WORK,int26=WORK,incc=WORK);

libname INLIB "/mixedtmp/lehd/s2004/ecf/&state./";
libname INT26 "/mixedtmp/lehd/s2004/ecft26/&state./";
libname INCC "/mixedtmp/lehd3/s2004/ecfcc/&state./";
libname INPUTS (&inlib.,&int26,&incc.);

libname ORIG "/mixedtmp/lehd2/s2004_obsolete/ecf_commingled/&state./" access=readonly;

proc sort data= ORIG.ecf_&state._sein out=work.ecf_sein_orig(compress=yes);
by sein year quarter;
run;

data work.merged_sein(sortedby=sein year quarter);
merge INPUTS.ecf_&state._sein INPUTS.ecf_&state._sein_cc;
by sein year quarter;
run;

%if &int26^= %then %do;
    data work.merged_sein(sortedby=sein year quarter);
    update work.merged_sein INPUTS.ecf_&state._sein_t26;
    by sein year quarter;
    run;
    %end;

proc contents data=work.ecf_sein_orig;
run;
proc contents data=work.merged_sein;
run;

proc compare data=work.ecf_sein_orig briefsummary compare=work.merged_sein;
run;

proc sort data= ORIG.ecf_&state._seinunit out= work.ecf_seinunit_orig(compress=yes);
by sein seinunit year quarter;
run;

data work.merged_seinunit(sortedby=sein seinunit year quarter);
merge INPUTS.ecf_&state._seinunit INPUTS.ecf_&state._seinunit_cc ;
by sein seinunit year quarter;
run;

%if &int26^= %then %do;
    data work.merged_seinunit(sortedby=sein seinunit year quarter);
    update work.merged_seinunit INPUTS.ecf_&state._seinunit_t26;
    by sein seinunit year quarter;
    run;
    %end;

```

```
proc contents data=work.ecf_seinunit_orig;
run;
proc contents data=work.merged_seinunit;
run;

proc compare data=work.ecf_seinunit_orig briefsummary compare=work.merged_seinunit;
run;

%mend;

/* only relevant for CA */
%combine_ecf(state=ca, inlib=INLIB, int26=INT26, incc=INCC);
```

3.5.2 Selecting a random sample of establishments

The ECF files can be large, and researchers may wish to analyze only a random subsample of firms. The variables `SAMPLE_SEIN` and `SAMPLE_SEINUNIT` can be used to select a random sample of the ECF. To do this in a space-efficient way, the following code can be used as a template.

```
%let state=tx;
libname INLIB "/mixedtmp/lehd/s2004/ecf/&state./";

data mydata/view=mydata;
  set INLIB.ecf_&state._seinunit
      (where=(sample_seinunit <= 0.05));
run;

proc reg data=mydata;
model y= x w z;
run;
```

The code above uses a `VIEW`, which means the dataset is constructed on the fly as it is used in the analysis procedure. Although overall disk usage is not necessarily smaller when using random access (as the SAS regression procedure apparently does), it is still faster. For other processes using sequential access only, in particular simple `DATA` steps, a view will be space-efficient because only the relevant observations are streamed into any intermediate data files.

3.6 NOTES

- In the current (S2004) files, there are no `es_galid` or `leg_galid` variables on the NC and NM ECF_state.seinunit files. *Solution:* Use the GAL_state_xwvk_YYYY files if needing to link to the GAL.

Chapter 4.

Employment History Files (EHF)

4.1 OVERVIEW

The Employment History Files (EHF) are designed to store the complete in-state work history for each individual that appears in the UI wage records. The EHF for each state contains one record for each employee-employer combination—a job—in that state in each year. Both annual and quarterly earnings variables are available in the EHF. Individuals who are employed, but never have strictly positive earnings at their employing SEIN (a theoretical possibility) in a given year do not have a record in the EHF for that year. To facilitate analysis, the EHF data are restructured into another file containing one observation per job (PIK-SEIN combination), with all quarterly earnings and activity information available on that record. The restructured file is called the Person History File (PHF). It should be noted that the actual file structure is at the PIK-SEIN-SEINUNIT-YEAR level for the EHF, and at the PIK-SEIN-SEINUNIT level for the PHF. Although only one state (Minnesota) has non-zero values for SEINUNIT, this allows the file structure to be homogeneous across states. An active job within a quarter, the primary job-level economic activity measure, is defined as having strictly positive quarterly earnings for the individual-employer pair that define the job.

A time-series similar to the aggregated job data, but based on observed activity (positive employment) in the ES-202 records, is available and computed at the SEINUNIT level (Unit History File, UHF) and the SEIN level (SEIN History File, SHF).

4.2 INPUT FILES

4.2.1 Wage records: UI

Wage records correspond to the report of an individual's UI-covered earnings by an employing entity, identified by a state UI account number (called the [SEIN](#) in the LEHD system). An individual's UI wage record is retained in the processing if at least one employer reports earnings of at least one dollar for that individual during the quarter. Thus, an in-scope job must produce at least one dollar of UI-covered earnings during a given quarter in the LEHD universe. Maximum earnings reported are defined in a specific state's unemployment insurance system, and observed top-coding varies across states and over time.

A record is completed with information on the individual's Social Security Number (later replaced with the [PIK](#) within the LEHD system), first name, last name, and middle initial. A few states include additional information: the firm's reporting unit or establishment ([SEINUNIT](#)), available for Minnesota, and a crucial component to the Unit-to-Worker impute described later; weeks worked, available for some years in Florida; hours worked, available for Washington and Minnesota state.

Current UI wage records are reported for the quarter that ended approximately six months prior to the reporting date at Census (the first day of the calendar quarter). Wage records are also reported for the quarter that the state considers "final" in the sense that revisions to its administrative UI wage record data base after that date are relatively rare. This quarter typically ends nine months prior to the reporting date. Historical UI wage records were assembled by the partner states from their administrative record backup systems.

4.2.2 Employer reports: ES-202

The employer reports are based on information from each state's Department of Employment Security. The data are collected as part of the Covered Employment and Wages ([CEW](#)) program, also known as the [ES-202](#) program, which is jointly administered by the [BLS](#) and the Employment Security Agencies in a federal-state partnership. This cooperative program between the states and the federal government collects employment, payroll, and economic activity, and physical location information from employers covered by state unemployment insurance programs and from employers subject to the reporting requirements of the [ES-202](#) system. The employer and work place reports from this system are the same as the data reported to the [BLS](#) as part of the Quarterly Census of Employment and Wages ([QCEW](#)), but are referred to in the LEHD system by their old acronym "ES-202." The universe for these data is a 'reporting unit,' which is the [QCEW](#) establishment—the place where the employees actually perform their work. Most employers have one establishment ('single-units'), but most employment is with employers who have multiple establishments ('multi-units'). One report per establishment per quarter is filed. These data are also used to compile the [QCEW](#) and the Business Employment Dynamics ([BED](#)) data at the [BLS](#).

The information contained in the [ES-202](#) reports has increased substantially over the years. Employers report wages subject to statutory payroll taxes on this form, together with some other information. Common to all years, and critical to LEHD processing, are information on the employer's identity (the [SEIN](#)), the reporting unit's identify ([SEINUNIT](#)), ownership information, employment on the 12th of each month covered by the quarter, and total wages paid over the course of the quarter. Additional information pertains to industry classifications (initially [SIC](#), and later [NAICS](#)). Other information include the federal [EIN](#), geography both at a high level (county or [MSA](#)) and low level (physical location street address and mailing address). A recent expansion of the standard report's record layout has increased the informational content substantially. The LEHD Infrastructure File system is, fundamentally, a job-based frame designed to be represent the universe of individual-employer pairs covered by state unemployment insurance system reporting requirements. Thus, the underlying data are wage records extracted from Unemployment Insurance (UI) administrative files from each LED partner state. In addition to the UI wage records, LED partner states also deliver an extract of the file reported to the Bureau of Labor Statistic's Quarterly Census of Employment and Wages ([QCEW](#), formerly known as [ES-202](#)). These data are received by LEHD on a quarterly basis, with historical time series extending back to the early 1990s for many states.

4.3 DATA SET DESCRIPTIONS

4.3.1 Naming scheme

All files start with ehf:

```
ehf_zz_controltotals.sas7bdat
ehf_zz_phf.sas7bdat
ehf_zz.sas7bdat
ehf_zz_sein_employment.sas7bdat
ehf_zz_shf.sas7bdat
ehf_zz_uhf.sas7bdat
ehf_zz_uniqpik.sas7bdat
```

ZZ stands for the state postal abbreviation. The main [EHF](#) file has no suffix, other files have a suffix. You will find zero-observation SAS datasets attached to this document - see the attachment tab.

4.3.2 Data location

The files are stored in two main directories, with state-specific subdirectories:

```
ehf/ZZ/          for most files
```

No files in the [EHF](#) process contain Title 26 data. On the RDC network, the directory can be found under
`/mixed/lehd/current`

4.3.3 UI-based Output Files

4.3.3.1 EHF

The [EHF](#) is designed to store the complete in-state work history for each individual that appears in the [UI](#) wage records. The [EHF](#) for each state contains one record for each employee-employer combination in that state in each year. Every individual who is employed during a given year will then have one observation per employer for that year. Annual earnings and quarterly earnings variables are present on the file. The presence of positive quarterly earnings is used in the job flow analysis not only to compute earnings and payroll statistics but also to determine an individual's employment status each quarter.

The [EHF](#) (`ehf.&state.`) is organized by [PIK-SEIN-SEINUNIT-YEAR](#). Note that all states except Minnesota ([MN](#)) have `SEINUNIT='00000'`, so this reverts back to [PIK-SEIN-YEAR](#) for all states except [MN](#).

Record identifier [PIK-SEIN-SEINUNIT-YEAR](#)

Sort order [PIK-SEIN-SEINUNIT-YEAR](#)

Entity Job

Unique Entity Key [PIK-SEIN-SEINUNIT](#)

Field name	Data dictionary reference name	Starting position	Field size	Data type

State UI Reporting Unit Number	SEINUNIT	00053	5	A/N
Type of source	SOURCETP	00039	2	A/N

4.3.3.2 (proto-)PHF

The proto PHF is a reformatted version of the EHF. Rather than having one record per year, the PHF is organized by “job”, or unique employee-employer combination, identified by PIK-SEIN(-SEINUNIT), with complete historical arrays for earnings and employment status. It is not to be confused with the PHF_B of the QWI sequence, which is augmented with information from the U2W process for non-MN states.

The PHF (`ehf_&state_.phf`) is organized by PIK-SEIN-SEINUNIT. Note that all states except MN have SEINUNIT='00000', so this reverts back to PIK-SEIN for all states except MN.

Record identifier PIK-SEIN-SEINUNIT

Sort order PIK-SEIN-SEINUNIT

4.3.3.3 UNIQUIK file

The UNIQUIK file is an input to the ICF. It also contains some diagnostic information, such as the number of records overall per [PIK](#). It used to be produced by the (legacy) UIPIK sequence (called `ssnall` there).

The UNIQUIK file (`ehf.&state..uniqpik`) is organized by [PIK](#).

Record identifier [PIK](#)

Sort order [PIK](#)

Entity Person

Unique Entity Key [PIK](#)

Field name	Data dictionary reference name	Starting position	Field size	Data type
Illegal SSN Range Flag	SSNFLAG	00000	1	A/N
Protected Identification Key	PIK	00001	9	A/N
cut=substr(pik,1,2)	CUT	00010	9	A/N

4.3.3.4 SEIN_EMPLOYMENT

The SEIN_EMPLOYMENT is a SEIN-level measure of employment based on UI data.

The SEIN_EMPLOYMENT file (ehf_&state._sein_employment) is organized by SEIN-YEAR. No SEI-NUNIT version exists.

Record identifier SEIN-YEAR

Sort order SEIN-YEAR

Entity Firm

Unique Entity Key SEIN

Field name	Data dictionary reference name	Starting position	Field size	Data type
Beginning of quarter employment	B	00016	8	N
Beginning of quarter employment	E	00008	8	N
Flow employment	M	00000	8	N
Quarter	QUARTER	00035	3	N
State Employer Identification Number	SEIN	00038	12	A/N
Total earnings during the quarter	W1	00024	8	N
Year	YEAR	00032	3	N
Year-Quarter YYYY:Q	YR_QTR	00050	6	A/N

4.3.4 ES202-based Output Files**4.3.4.1 UHF**

The UHF (Unit History File) used to be produced by the SPF (prior to version 3.1.12). It contains a full history of activity for each [SEIN-SEINUNIT](#) (wide file). It is still used as an input to the SPF. It replaces `seinunit_history_es.sas7bdat`.

The UHF file (`ehf_&state._uhf`) is organized by [SEIN-SEINUNIT](#).

Record identifier [SEIN-SEINUNIT](#)

Sort order [SEIN-SEINUNIT](#)

Entity Establishment

Unique Entity Key [SEIN-SEINUNIT](#)

4.3.4.2 SHF

The SHF (SEIN History File) used to be produced by the SPF (prior to version 3.1.12) as an internal file only. It contains a full history of activity for each SEIN (wide file). It is still used as an input to the SPF. It replaces `sein_history_es.sas7bdat`.

The SHF file (`ehf.&state._shf`) is organized by SEIN.

Record identifier SEIN

Sort order SEIN

Entity Firm

Unique Entity Key SEIN

4.4 NOTES

Table 4.8: UI/EHF Summary of Information and Known Issues with Data Coverage and Quality

State	Known Data Quality Issues (UI/EHF)	Recommendation to Researchers
CA	None	
CO	60-70% hole in UI data in 1993:3. 20% unresolved identifier mismatch on UI in [90:1-90:3]	Researchers should generally avoid use of pre-1994 EHF data in CO.
FL	(1) There appear to be changes being made in the firm identifiers on the ES202 and UI data in the mid-to-late 1990s. Specifically it looks as though some changes are made on the identifiers in the ES202 in 1996 and in 1997 the UI data is corrected in kind. In the ES202 data, 14% of firms die in 1995:4 and are born in 1996:1, indicating a shift in some firm identifiers. A similar change in magnitude occurs in the UI data between 1997:1 and 1997:4. Between these years, the rate of match between the UI and ES202 SEINs is somewhat poor (10% of UI SEINs do not appear on the ES202 between 1996:1 and 1997:3), although it is quite good both before and after. (2) The match between the ES202 and UI data is not good in 2002:4-2003:3, with 13-20% of UI SEINs not appearing in the ES-202 data.	While not a big enough problem to recommend avoiding use of these date ranges in FL, be aware that changes in firm identifiers in the mid-1990s will bias worker flow measures during this period.
IA	None	
ID	1990 UI data has firm identifier problems on approximately 40% of the records. Because of these problems, this year is not included in the EHF.	Researchers should generally avoid use of 1990 ID EHF data, which should not be too much of an issue as ES202 information is missing for this year in ID.
IL	Small hole in UI data in 1990:1 (10% missing). 1992:1 and 1993:1 are also missing UI wage records.	Note to researchers: These problems bias worker flows in those quarters, also full quarter employment in early years of IL data.
IN	None	
KS	Large holes in KS UI data at 1990:1 (50% missing) and 1992:4 (25% missing)	Researchers should generally avoid use of 1990 and 1992 KS EHF data; this problem will also bias full quarter employment and flows in 1993.
KY	UI identifier problem in 2000:3-2001:2 likely, due to 10%, 15% death rates in 2000:3, 2000:4, followed by 11%, 14% birth rates in 2001:1 and 2001:2. (Normal is 3-7% births/deaths in a particular quarter)	Note to researchers: These problems bias worker flows in those quarters, also full quarter employment during 2000-2001 KY data.
MD	None	
ME	None	
MN	None	
MO	1994:4 UI data is small (approximately 70% sample).	Researchers should generally avoid use of 1994 MO EHF data; this problem will also bias some full quarter employment and flows measures in 1995.
MT		

(cont)

State	Known Data Quality Issues (UI/EHF)	Recommendation to Researchers
NC	<p>* ES202 show persistently lower employment than UI, by about 14%, except for 1991:1-1992:3 (around 0%) and 2002:1-2002:4 (5-8%). Warnings are generated when it goes above 15%. * Payroll is typically 6-8% higher on ES202 compared to UI except for 1991:1-1992:3, where it is 20-30% higher. There are also significant, but not as large deviations in 2002:1-2003:1. * Based on the BLS PU records, the ES202 data series looks fine: ES202 sums rarely go above 1% (Test 13-1 and 13-2)</p> <p>Conclusion: we are still missing wage records in the early periods, and some in later periods as well. The most recent wage records actually look coherent with the longest time series, but 2002 is a small problem.</p>	Note to Researchers: Similar to problems in early years of IL, these issues bias worker flows in those quarters, also full quarter employment.
NJ	Small holes in NJ UI data at 1998:3 (5%) and 1999:1 (8-10%) and 2003:1 (10%)	Note to Researchers: Problem probably small enough to ignore for most research purposes.
NM	None	
OK	None	
OR	1994:1 is small, but not terribly so.	Note to Researchers: Problem probably small enough to ignore for most research purposes.
PA	UI wage records are 1% sample for 1996:4	Note to Researchers: Generally avoid use of 1996 PA annual earnings (particularly earnings changes between 1995-1996, 1996-1997, which will be biased), this problem will also bias some flows and full quarter employment measures in 1996 and 1997.
TX	None	
VA	1998:1 is small, and 1998:2 also looks on the small side.	Note to Researchers: Problems probably small enough to ignore for most research purposes.
WA	None	
WI	None	
WV	None	

Chapter 5.

Geo-coded Address List (GAL)

5.1 OVERVIEW

5.1.1 Definition of GAL

The Geocoded Address List (GAL) is a data set containing unique commercial and residential addresses in a state geocoded to the Census Block and latitude/longitude coordinates. It consists of the address list (GAL) and a crosswalk for each processed file-year. The GAL contains each unique address, identified by a GAL identifier called `galid`, its geocodes, a flag for each file-year in which it appears, data quality indicators, and data processing information, including the release date of the Geographic Reference File (GRF). The GAL Crosswalk contains the ID of each input entity and the ID of its address (`galid`).

Input Data The input data consists of addresses, geocodes, and coordinates. Currently, the source files providing addresses consist of the following (future work will add the Non-employer file):

ACS-POW	American Community Survey Place of Work (2001 and later)
AHS	American Housing Survey (2002)
ES202	Employment Security form 202 (all available years 1990 and later)
SSEL	Business Register (Standard Statistical Establishment List 1990 and later)
MAF	Master Address File (the year following the year of the desired geographic vintage)

Geocodes The source files providing geocodes and coordinates are the following:

GCP	the databases of Group1's Geographic Coding Plus software
MAF	Master Address File
GRF-C	Geographic Reference File, Codes (encompassed in the BMF)
WIB-C	Workforce Investment Board, Codes (encompassed in the BMF)
BMF	Block Map File

5.1.2 Update frequency

The internal use GAL is produced monthly. The RDC version is produced occasionally, usually at the same time as the other LEHD-provided RDC files.

5.1.3 Acquisition process

In the S2004 Infrastructure Files, the most recent available GAL at the time of transfer is used. In the future, the RDC version of the GAL will be produced as part of the LEHD Infrastructure files, and will be coordinated with other LEHD Infrastructure files.

5.1.4 Processing description

All internal processing variables (parsed addresses in particular) are available on the RDC. All crosswalks to input files (for instance, the BR) are available as well. Note that a researcher needs to request the input files separately, and not all input files may be available in the RDC environment.

The Census-internal GAL is considered commingled data, *i.e.*, it contains information protected both under Title 13 and Title 26. Because projects requesting Title 26 data are handled differently from projects requesting only Title 13 information, the GAL is split. Before transferring the GAL to the RDC environment, all variables that refer to Title 26 data are split off, and stored in a separate file (`gal.ZZ_t26flags.sas7bdat`, Section 5.3.5). Furthermore, all records sourced exclusively from Title 26 data are removed from the main GAL dataset, and stored separately (`gal.ZZ.t26.sas7bdat`, Section 5.3.4). Section 5.4.1 describes the program used to split the data from the internal-use commingled file. Section 5.4.2 provides a sample program to join all three components together again.

5.2 DETAILS

The following document was prepared by Marc Roemer, U.S. Census Bureau. It provides a general overview of how the GAL files are created.

The Geocoded Address List (GAL) is a data set containing unique commercial and residential addresses in a state geocoded to the Census Block and latitude/longitude coordinates. The file encompasses addresses from the state ES202 data, the Business Register, the Census Bureau's Master Address File (MAF), the American Community Survey Place of Work file (ACS-POW), and others. Addresses from these source files go through Code1, Vality standardizer, Vality matching for unduplication, and several other steps in SAS. This document refers to one year's data from a source file as a file-year (for example, the 1995 ES202).

The job stream follows the steps below using the indicated software.

- Step 1: Create input (SAS).
- Step 2: Standardize and geocode addresses (Code1).
- Step 3: Parse and standardize address elements (Vality Standardize).
- Step 4: Match addresses, flag masters and duplicates (Vality Unduplicate).
- Step 5: Create preliminary crosswalk and unique address list with address identifier (SAS).
- Step 6: Set file-year flags, create GAL Crosswalks containing the input identifier and address identifier (SAS).
- Step 7: Retrieve and derive block codes and coordinates from the MAF (SAS).
- Step 8: Impute block within known tract (SAS).
- Step 9: Create GAL by adding higher-level geocodes by block (SAS).
- Step 10: Delete intermediate data files and create links.

The final output consists of the address list and a crosswalk for each processed file-year. The GAL contains each address, its geocodes, a flag for each file-year in which it appears, data quality indicators, and data processing information. The GAL Crosswalk contains the ID of each input entity and the ID of its address. The following section describes the GAL's content.

5.2.1 Important Variables

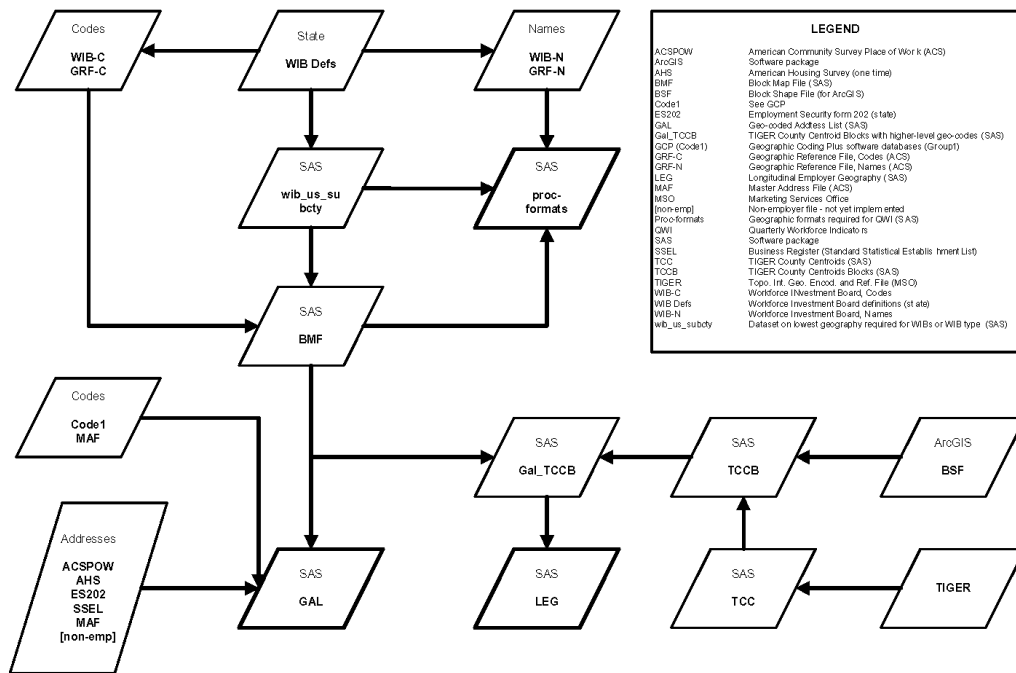

Unique identifier The variable `galid` is the unique address identifier on the GAL, a 26-character string consisting of the letter 'A' in the first column followed by the 2-character state FIPS code and a zero-padded sequential number. The `galid` is created each time a GAL is created. There's no consistency in the `galid` between versions or vintages of the GAL.

Geographic vintage The release date (year) of the GRF identifies the geographic vintage. In the GAL the vintage becomes the variable `a_vintage`.

Geographic codes The variable `a_geocode` is `FIPS-state(2)||FIPS-county(3)||Census-tract(6)`, and it uniquely identifies the Census tract in the U.S. The tract is the lowest level of geography recommended for analysis. The Census block within the tract is `a_block`. The uncertainties in block-coding make block-level analysis questionable. However, geocoding to the block allows us to add all the higher-level geocodes to the addresses. The variable `a_block_src` generated in Steps 7 and 8 describes the source of the block-code.

Figure 5.1: GAL Processing

Flowchart for Adding WIBs to GAL/LEG Processing - 09/12/05

Source: Longitudinal Employer-Household Dynamics (LEHD) Program, Census Bureau

Value	Typical Percent	Meaning
C	12.20	Code1, or the address matches an address for which Code1 supplied the block code
M	81.86	The MAF - the address is a MAF address or matches a MAF address
E	0.00	The MAF, the street address is exactly the same as a MAF address in the same tract
W	0.03	The MAF, the street address is between 2 MAF addresses on the same block face
O	1.23	Imputed by the distribution of commercial addresses in the tract
S	1.17	Imputed by the distribution of residential addresses in the tract
I	0.01	Imputed by the distribution of mixed-use addresses in the tract
D	0.00	Imputed by the distribution of all addresses in the tract
missing	3.50	Block code is missing

In all states observed so far except California, no address required the 'D' method. That is, almost every tract where an address lacks a block code contains commercial, residential, and mixed-use addresses.

The Census Bureau splits blocks to accommodate changes in political boundaries. Most commonly, these are place boundaries (a place is a city, village, or similar municipality). The resulting block parts are identified by 2 suffixes, each taking a value from A to Z. The GAL assigns the block part directly from the MAF, or by adopting the one whose internal point is closest to the address by the straight-line distance. The variables `a_block_suf1` and `a_block_suf2` identify the block part, and `a_block_suf_src` generated in Step 9 describes the method used to assign it.

Value	Typical Percent	Meaning
A	1.50	Assigned by distance
M	4.18	The MAF - the address is a MAF address or matches a MAF address
missing	94.32	Not a split block

The GAL also provides the following basic geographic variables:

<code>a_scccc</code>	FIPS-state(2) FIPS-county (3)
<code>a_st</code>	FIPS state (2)
<code>a_cty</code>	FIPS county within the state (3)
<code>a_tract</code>	Census tract within the county (6)

Higher-level geographic codes originate from the Block Map File (BMF) and attach to the GAL in Step 9. The BMF is an extract of the GRF-C (Geographic Reference File - Codes). All these geocodes are character variables. FIPS (Federal Information Processing Standard) codes are unique within the U.S.; Census codes are not.

<code>a.fipsmcd</code>	5-digit FIPS Minor Civil Division (a division of a county)
<code>a.mcd</code>	3-digit Census Minor Civil Division (a division of a county)
<code>a.fipspl</code>	5-digit FIPS Place
<code>a.place</code>	4-digit Census Place
<code>a.msapmsa</code>	Metropolitan-Statistical-Area(4) Primary-Metropolitan-Statistical-Area(4)
<code>a.wib</code>	6-digit Workforce Investment Board area

Geographic coordinates The coordinates of each address are in the variables `a_latitude` and `a_longitude`. These variables are numeric with 6 implied decimals (divide by 1,000,000 to convert them). The coordinates are not as accurate as 6 decimal places implies. An indication of their quality is in the variable `a_geoqual`, a numeric variable taking values from 1 to 9 and generated in Steps 7, 8, and 9:

Value	Typical Percent	Meaning
1	80.15	Rooftop or MAF (most accurate)
2	1.59	ZIP4 or block face, block face is certain
3	10.12	Block group is certain
4	4.65	Tract is certain
9	3.50	Coordinates are missing

The format 'agqual' provided by 'format_geo.sas' in '/programs/projects/auxiliary/Formats' contains the meanings of the `a_geoqual` values listed above.

Two other variables give information about the coordinates. The flag `a_latlong_src` indicates their source:

Value	Typical Percent	Meaning
B	14.77	Block (or block part) internal point
C	70.04	Code1
D	0.03	Derived
M	11.66	the MAF
missing	3.50	Coordinates are missing

Few addresses have `a_latlong_src` equal to 'D'. Deriving coordinates occurs only if they're still missing after Code1 processing and direct extraction from the MAF, but the tract is known. In this case, the flag `a_latlong_drv` generated in Step 7 describes the derivation method:

Value	Typical Percent	Meaning
F	0.00	Adopted from the only address on the block face
P	0.04	Extrapolated between 2 addresses on the block face
missing	99.96	Derivation not performed

In GAL Version 1, deriving coordinates and block codes by these methods was an important means of block-coding. It rarely operates now, since Code1 began providing block codes. Nevertheless, GAL Version 3 still exhausts all methods of assigning block-codes and coordinates before resorting to imputation.

File-year flags A set of flags generated in Step 6 indicates what file-years an address appears in. The names of the flags conform to the naming convention `[f][yyyy]` for the source file `[f]` and year `[yyyy]`, where `[f]` takes the following values:

Business Register	f = b
ES202	f = e
Master Address File	f = m
American Community Survey - Place of Work	f = p
American Housing Survey	f = h

For example, the flag variable `b1997` equals 1 if the address is on the 1997 Business Register; otherwise it equals 0. Note that if a [LEHD] state partner supplies 1991 ES202 data with no address information, `e1991` will be 0 for all addresses. Typically, the `e[yyyy]` flags equal 1 for between 3 and 6 percent of addresses, the `b[yyyy]` flags equal 1 for between 4 and 10 percent, and the `m[yyyy]` flag is 1 for between 80 and 90 percent. The `p[yyyy]` and `h[yyyy]` flags equal 1 for less than 1 percent of addresses because the ACS-POW and AHS data are sample surveys.

5.2.2 Other Variables

occupant_type The variable `occupant_type`, recoded from the file-year flags in Step 8, indicates whether an address is commercial, residential, or mixed-use.

bigsrcid The tracking ID `bigsrcid`, created in Step 1, uniquely identifies the entity that supplied the address. It consists of `[f]`, `[yyyy]`, the unique ID from the input file, zero-padding, and for some source files, a flag indicating which set of variables supplied the address. For addresses originating in the Business Register, another flag indicates the single-unit data set or the multi-unit data set. This tracking ID variable is useful for debugging.

This variable is only available GAL_ZZ_2003_T26FLAGS.

srcmast A diagnostic variable `srcmast` contains `[f][yyyy]`, indicating the file-year that supplied this address. Bear in mind that it's often arbitrary which observation becomes the master address for a set of duplicates in Step 1 and Step 4, so `bigsrcid` and `srcmast` don't indicate anything special about an address or an entity. They simply identify the origin of an address that became a master address in unduplication.

This variable is only available GAL_ZZ_2003_T26FLAGS.

Code 1 variables The names of Code1 variables contain the prefix `c1_`. They impart mostly diagnostic information from Code1 processing. They could be useful for development work or address research.

For records sourced exclusively from the BR, these variables are available on GAL_ZZ_2003_T26. For records sourced exclusively from the ES202! (ES202!), some variables were blanked on GAL_ZZ_2003 and are available on GAL_ZZ_2003_ES202ONLY to Census personnel only. Code1 diagnostic codes remain available to all researchers.

Vality variables The parsed address elements from Step 3 sit in the variables named with the prefix `v_`. They could be useful for development work, particularly in improving the parsing routine.

For records sourced exclusively from the BR, these variables are available on GAL_ZZ_2003_T26. For records sourced exclusively from the ES202!, some variables were blanked on GAL_ZZ_2003 and are available on GAL_ZZ_2003_ES202ONLY to Census personnel only. Vality diagnostic codes remain available to all researchers.

5.2.3 Accessing the GAL: the GAL Crosswalks

The GAL Crosswalks allow you to extract geographic and address information about any entity whose address went into the GAL. Each crosswalk contains the identifiers of the entity, its `galid`, and sometimes flags. To attach geocodes, coordinates, or address information to an entity, merge the GAL Crosswalk to the GAL by `galid`, outputting only observations existing on the GAL Crosswalk. Then merge the resulting file to the entities of interest using the entity identifiers. An entity whose address wasn't processed (because it's out of state or lacks address information) will have blank GAL data.

- For the AHS, the entity ID variables are `control` and `year`.
- For the ES202, the entity ID variables are `sein`, `seinunit`, `year`, and `quarter`. The flag variable `e_flag` indicates whether the address came from the `address_street1`, `address_state`, and `address_zip9` variables (`e_flag=P` for physical address) or from the `ui_address_street1`, `ui_address_state`, and `ui_address_zip9` variables (`e_flag=M` for mailing address).
- For the ACS-POW data, the entity ID variables are `acsfileseq`, `cmid`, `seq`, and `pnum`.
- For the Business Register, the entity ID variables are `cfm`, `year`, and `singmult`. The flag variable `singmult` indicates whether the entity resides in the single-unit (su) or the multi-unit (mu) data set. Another flag variable `b_flag` indicates whether the address originated from the variables `pstreet`,

pplce, pst, and pzip (b_flag=P for physical address) or street, plce, st, and zip (b_flag=M for mailing address). .

- For the MAF, mafid and year identify entities.

5.2.4 Resources for geographic information

The best place for information about Census geography is

<http://www.census.gov/geo/www/reference.html>.

Especially informative is the Geographic Areas Reference Manual (GARM), at

<http://www.census.gov/geo/www/garm.html>

5.3 DATA SET DESCRIPTIONS

5.3.1 Naming scheme

All GAL files are labelled with the geovintage used in the creation, i.e., *2003*, and except for the main dataset, a suffix, composed of a dataset abbreviation and a calendar year:

```
gal_zz_2003.sas7bdat
gal_zz_2003_t26flags.sas7bdat
gal_zz_2003_t26.sas7bdat
gal_zz_2003_acspow_2001.sas7bdat
gal_zz_2003_ahs_2002.sas7bdat
gal_zz_2003_br_2001.sas7bdat
gal_zz_2003_maf_2004.sas7bdat
gal_zz_2003_xwlk_2001.sas7bdat
gal_zz_2003_es202only.sas7bdat
```

ZZ stands for the state postal abbreviation, and YYYY for a calendar year. Not all files are available for all states. In particular, LEHD-related crosswalks are only available for states actively participating with LEHD at the time of creation of the GAL.

Suffix	Crosswalk to:	Availability
acspow	American Community Survey Place-of-Work Coding	2001-2005
ahs	American Housing Survey	as of 2002
br	Business Register (ex-SSEL)	1990-2001
maf	(Census) Master Address File	as of 2004
xwalk	LEHD ES-202	varies by state; consult LEHD-ES-202 documentation

Files with suffixes `t26`, `t26flags`, and `tccb` are not cross-walks. Consult Sections [5.3.4](#), [5.3.5](#), and [5.3.7](#), respectively.

5.3.2 Data location

The files are stored in two main directories, with state-specific subdirectories:

```
gal/ZZ/      for most files
galt26/ZZ   for files with Title 26 protected content
```

On the RDC network, both directories can be found under

```
/mixed/lehd/current
```

Files reserved for Census internal projects can be found in

```
galcc/ZZ
```

For the exact location, consult with the RDC administrator.

5.3.3 Main dataset: GAL_ZZ_2003

This file does not contain data protected exclusively under Title 26. Consult Section 5.3.4 and 5.3.5. This file also does not report any address data sourced exclusively from ES-202. If a field contains address data sourced exclusively from ES-202, the values have been blanked on this file, and preserved in GAL_ZZ_2003_ES202ONLY (see Section 5.3.6).

Record identifier: GALID

```

5.5 NOTES

Chapter 6.

Individual Characteristics File (ICF)

6.1 OVERVIEW

The *Individual Characteristics File* (ICF) for each state contains one record for every person who is ever employed in that state over the time period spanned by the state's unemployment insurance records.

The ICF is constructed in the following manner. First, the universe of individuals is defined by compiling the list of unique PIKs from the EHF. Demographic information from the PCF is then merged on by PIK, and records without a valid match flagged. PIK-survey identifier crosswalks link the CPS and SIPP ID variables into the ICF, and sex and age information from the CPS is used to complement and verify the PCF-provided information.

6.1.1 Age and sex imputation

Approximately 3% of the PIKs found in the UI wage records do not link to the PCF. Multiple imputation methods are used to impute date of birth and sex for these individuals. To impute sex, the probability of being male is estimated using a state-specific logit model:

$$P(\text{male}) = f(X_{is}\beta_s) \quad (6.1)$$

where X_{is} contains a full set of yearly log earnings and squared log earnings, and full set of employment indicators covering the time period spanned by the state's records, for each individual i with strictly positive earnings within state s and non-missing PCF sex. The state-specific $\hat{\beta}_s$ as estimated from Equation (6.1) is then used to predict the probability of being male for individuals with missing sex within state s , and sex is assigned as

$$\text{male if } X_{is}\hat{\beta}_s \geq \mu_l \quad (6.2)$$

where $\mu_l \sim U[0, 1]$ is one of $l = 1, \dots, 10$ independent draws from the distribution. Thus, each individual with missing sex is assigned ten independent missing data implicates, all of which are used in the QWI processing.¹

The imputation of date of birth is done in a similar fashion using a multinomial logit to predict the probability of being in one of eight age categories and then assigning an age based on this probability and the distribution of ages within the category. Again, the missing data imputation occurs ten times.

If an individual is missing sex or birth date in the PCF, but not in the CPS, then the CPS values are used, not the imputed values. Also, before the imputation model for date of birth is implemented, basic editing of the date of birth variable takes place to account for obvious coding errors, such as a negative age at the time when UI earnings are first reported for the individual. In those relatively rare cases where the date

¹Note that this imputation does not account for estimation error in $\hat{\beta}$. This was one of the first missing data imputations developed at LEHD. At the time, techniques for sampling from the posterior predictive distribution of a binary outcome where the likelihood function is based on a logistic regression were not feasible on the LEHD computer system. Since only three percent of the observations in the ICF are subject to this missing data edit, it was implemented as described in the text. A longitudinal, enhanced ICF is under development. All missing data imputations in the new ICF will be performed by sampling from an appropriate posterior predictive distribution. This will properly account for estimation error.

of birth information is deemed unrealistic, it is set to missing and imputed based on the model described above.

6.1.2 Place of residence imputation

Place of residence information on the ICF is derived from the StARS (Statistical Administrative Records System), which for the vast majority of the individuals found in the UI wage records contains information on the place of residence down to the exact geographical coordinates. However, in less than ten percent of all cases the geography information is incomplete or missing. The QWI estimation relies on completed place of residence information. Because this information is a critical conditioning variable in the unit-to-worker (U2W) imputation model, all missing residential addresses are imputed.

County of residence is imputed based on a categorical model of the data that is a fully-saturated contingency table. Separately for each state, unique combinations of categories of sex, age, race, income and county of work are used to form $i = 1, \dots, I$ populations. For each sample i , the probability of residing in a particular county as of 1999, π_{ij} , is estimated by the sample proportion, $p_{ij} = n_{ij}/n_i$, where $j = 1, \dots, J$ indexes all the counties in the state plus an extra category for out-of-state residents.

County of residence is then imputed based on

$$county = j \text{ if } P_{ij-1} \leq u_k < P_{ij}$$

where P_i is the CDF corresponding to p_i for the i th population and $\mu_{kl} \sim U[0, 1]$ is one of $k = 1, \dots, 10$ independent draws for the l th individual belonging to the i th population.²

In its current version no geography below the county level is imputed and in those cases where exact geographical coordinates are incomplete the centroid of the finest geographical area is used. Thus, in cases where no geography information is available this amounts to the centroid of the imputed county. Geographical coordinates are not assigned to individuals whose county of residence has been imputed to be out-of-state.

6.1.3 Education imputation

The imputation model for education relies on a statistical match between the Decennial Census 1990 and LEHD data. The probability of belonging to one of 13 education categories is estimated using 1990 Decennial data conditional on characteristics that are common to both Decennial and LEHD data, using a state-specific logit model:

$$P(educat) = f(Z_{is}\gamma_s) \tag{6.3}$$

where Z_{is} contains age categories, earnings categories, and industry dummies for individuals age 14 and older in the 1990 Census Long Form residing in the state being estimated, and who reported strictly positive wage earnings. The education category is imputed based on

$$educat = j \text{ if } cp_{j-1} \leq \mu_l < cp_j$$

where $cp_j = Z_{is}\hat{\gamma}_s$ and $\mu_l \sim U[0, 1]$ is one of $l = 11, \dots, 20$ independent draws, and $i \in EHF$.³

²The longitudinal, enhanced ICF that is under development augments the model in the text with a Dirichlet prior distribution for the P_{ij} s. The imputations are then made by sampling from the posterior predictive distribution, which is also Dirichlet.

³In the longitudinally enhanced ICF that is under development, this imputation is replaced by a probabilistic record link to Census 2000 long form data. Approximately one person in six acquires directly reported educational attainment as of 2000. The remaining individuals get 10 multiple imputations from a Dirichlet-Multinomial posterior predictive distribution.

6.2 DATA SET DESCRIPTIONS

6.2.1 Unique record identifier

The unique record identifier within each ICF file is the **P! (P!)IK**. However, in the current ICF scheme, a person may have (possibly inconsistent) records in multiple states. Each file therefore also contains a **state** variable. The combination **PIK - state** is unique across all states, within the set of ICF files, and should be used when concatenating or otherwise combining records from multiple states.

6.2.2 Naming scheme

There are five files in the ICF/ICFT26 group:

```
icf_zz.sas7bdat
icf_zz_implicates_age_sex.sas7bdat
icf_zz_implicates_county.sas7bdat
icf_zz_implicates_education.sas7bdat
icf_zz_t26.sas7bdat
```

ZZ stands for the state postal abbreviation. You will find zero-observation SAS datasets attached to this document - see the attachment tab.

6.2.3 Data location

The files are stored in two main directories, with state-specific subdirectories:

```
icf/ZZ/      for most files
icft26/ZZ   for files with Title 26 protected content
```

On the RDC network, both directories can be found under

```
/mixed/lehd/current
```

6.2.4 Main dataset: ICF_zz

This is the core dataset, containing all observed non-FTI and the first implicate for imputed variables.

6.2.6 Residence implicates: ICF_zz_implicates_county

The first implicate is stored on the main ICF file as COUNTY_LIVE. Imputed values are flagged there by an appropriate flag COUNTYLIVEIMPUTED. Other implicates are found in this file, and can be merged on when required.

6.2.8 Title 26 information: ICF_zz_t26

FTI has been removed from the core ICF, and stored separately. Note that in the RDC network, this file is stored under a separate set of permissions, and if users require access to this information, need to request access to an additional group. T26 variables are starred below.

6.3 HELPFUL PROGRAMS

The following programs might be found to be useful when using the data.

6.3.1 Recombining T26 data with the core ICF

The following program allows users to combine the Title 26 variables with the core ICF. This program was used in slightly modified form for quality assurance during the preparation of the data for the RDC environment.

```

/* Time-stamp: <07/05/03 23:49:08 vilhuber> */
/* $Id: 02.02.combine_icf_t26.sas 121 2007-05-04 12:18:17Z vilhu001 $ */

%macro combine_icf_t26(state=,inlib=WORK,int26=WORK);

libname INLIB "/mixedtmp/lehd/s2004/icf/&state.";
libname INT26 "/mixedtmp/lehd/s2004/icft26/&state.";
libname INPUTS (&inlib., &int26.);

libname ORIG "/mixedtmp/lehd2/s2004_obsolete/icf_commingled/&state/" access=readonly;

proc sort data= ORIG.icf_&state out= icf_orig(compress=yes);
by pik;
run;

data work.merged(sortedby=pik state);
merge INPUTS.icf_&state._t26 INPUTS.icf_&state.;
by pik state;
run;

proc contents data=icf_orig;
run;
proc contents data=work.merged;
run;

*proc compare data=icf_orig briefsummary compare=work.merged;
*run;
%mend;

/* example - this works for all states */
libname temp '/temporary/saswork1/snapshot';
options mprint symbolgen;
%combine_icf_t26(state=al,inlib=INLIB,int26=INT26);

```

6.3.2 Selecting a random subsample of persons

The following program allows users to select a random sample of approximately one percent of individuals on the ICF. It relies on the fact that the first two characters of the PIK are approximately uniformly distributed on [00,99]. Note that 'AA' is a valid value for the first two characters and denotes individuals for whom no valid SSN was on file. Occurrence of such "pseudo-PIKs" varies by state.

```
%let state=ca;
libname INLIB "/mixed/lehd/s2004/icf/&state.";

data my_icf;
  set INLIB.icf_&state.(where=(substr(PIK,1,2)='01'));
run;
```

6.4 NOTES

Chapter 7.

Quarterly Workforce Indicators - SEINUNIT file (QWI)

7.1 OVERVIEW

The [QWI](#) are a set of economic indicators – including employment, job creation, wages, and worker turnover – that can be queried by different levels of geography – state, county, metro, and workforce investment area – as well as by detailed industry, gender, and age of workers. The SEINUNIT file is the core dataset from which publication tables are tabulated. Public-use tabulations are not available in the [RDC](#).

7.2 DATA SET DESCRIPTIONS

7.2.1 Coverage of QWI

QWI data are available for all states that are LED-state partners, however, not every state is currently a LED-state partner. The QWI are built upon wage records in the UI system and information from state ES-202 data. The universe of QWI data is UI-covered earnings. UI coverage is broad, covering over 90% of total wage and salary civilian jobs.

When QWI private industry employment numbers are compared with other employment data, exclusions to UI coverage should be taken into account. Federal government employment is not generally included. Exempted employment varies slightly from state to state due to variations in state unemployment laws, but generally also excludes many farmers and agricultural employees, domestic workers, self-employed non-agricultural workers, members of the Armed Services, some state and local government employees as well as certain types of nonprofit employers and religious organizations (which are given a choice of coverage or noncoverage in a number of states). See “[Employment that is not covered by state unemployment](#)” (LEHD TP-2007-04) for a more detailed discussion.

7.2.2 Naming scheme

Describe the naming scheme.

qwi_zz_seinunit.sas7bdat

ZZ stands for the state postal abbreviation, and YYYY for a calendar year. You will find zero-observation SAS datasets attached to this document - see the attachment tab.

7.2.3 Data location

The files are stored in two main directories, with state-specific subdirectories:

qwi/ZZ/

On the RDC network, the directory can be found under

/mixed/lehd/current

7.2.4 Main dataset: QWI_ZZ_SEINUNIT

The QWI_ZZ_SEINUNIT file (LEHD internal name: UFFb) is a file at the SEINUNIT level, providing detailed statistics for an establishment (SEIN + SEINUNIT) at every combination of SEX x AGEGROUP. Age groups are defined using the WIA categorization. The agegroup and sex margins are represented as variable arrays in the UFFb.

7.3 NOTES

- Alabama (AL), Kansas (KS), and South Carolina (SC) are currently missing from data archive. A request has been put in to include them.

Chapter 8.

Unit-to-Worker Impute - Job location impute (U2W)

8.1 OVERVIEW

A primary objective of the QWI is to provide employment, job and worker flows, and wage measures at a very detailed levels of geography (place-of-work) and industry. The structure of the administrative data received by LEHD from state partners, however, poses a challenge to achieving this goal. QWI measures are primarily based on the processing of UI wage records which report, with the exception of Minnesota, only the legal employer (SEIN) of the workers. The ES-202 micro-data, however, are comprised of establishment-level records which provide the geographic and industry detail needed to produce the QWI. For employers operating only one establishment within a state, the assignment of establishment-level characteristics to UI wage records is straightforward because there is no distinction between the employer and the establishment. However, approximately 30 to 40 percent of state-level employment is concentrated in employers that operate more than one establishment in that state. For these multi-unit employers, the SEIN on workers' wage records identifies the legal employer in the ES-202 data, but not the employing establishment (place-of-work). Thus, establishment level characteristics—geography and industry, in particular—are missing data for these multi-unit job histories.

In order to impute establishment-level characteristics to job histories of multi-unit employers, a non-ignorable missing data model with multiple imputation was developed. The model imputes establishment-of-employment using two key characteristics available in the LEHD Infrastructure Files: 1) distance between place-of-work and place-of-residence and 2) the distribution of employment across establishments of multi-unit employers. The distance to work model is estimated using data from Minnesota, where both the SEIN and SEINUNIT identifiers appear on a UI wage record. Then, the posterior distribution of the parameters from this estimation, combined with the actual SEIN and SEINUNIT employment histories from the ES-202 data, are used for multiple imputation of the SEINUNIT associated with for workers in a given SEIN in the data from states other than Minnesota.¹ Emerging from this process is an output file, called the Unit-to-Worker (U2W) file, containing ten imputed establishments for each worker of a multi-unit employer. These implicates are then used in the downstream processing of the QWI.

The U2W process relies on information from each of the four Infrastructure Files—ECF, GAL, EHF, and ICF—as well as the auxiliary SPF file. Within the ECF, the universe of multi-unit employers is identified. For these employers, the ECF also provides establishment-level employment, date-of-birth, and geocodes (which are acquired from the GAL). The SPF contains information on predecessor relationships which may lead to the revision of date-of-birth implied by the ECF. Finally, job histories in the EHF in conjunction with place-of-residence information stored in the ICF provide the necessary worker information needed to estimate and apply the imputation model.

¹The actual SEINUNIT coded on the UI wage records is used for Minnesota, and would be used for any other state that provided such data. Note that there are occasional, and rare, discrepancies between the unit structure on the Minnesota wage records and the unit structure on the Minnesota ES-202 data for the same quarter. These discrepancies are resolved during the initial processing of the Minnesota data in its state-specific readin procedures.

8.1.1 A probability model for employment location

8.1.1.1 Definitions

Let $i = 1, \dots, I$ index workers, $j = 1, \dots, J$ index employers (SEINs), and $t = 1, \dots, T$ index time (quarters). Let R_{jt} denote the number of active establishments at employer j in quarter t , let $\mathfrak{R} = \max_{j,t} R_{jt}$, and $r = 1, \dots, \mathfrak{R}$ index establishments. Note that the index r is nested within j . Let N_{jrt} denote the quarter t employment of establishment r in employer j . Finally, if worker i was employed at employer j in t , denote by y_{ijt} the establishment at which the worker was employed.

Let \mathcal{J}_t denote the set of employers active in quarter t , let \mathcal{I}_{jt} denote the set of individuals employed at employer j in quarter t , let \mathcal{R}_{jt} denote the set of active ($N_{jrt} > 0$) establishments at employer j in t , and let $\mathcal{R}_{jt}^i \subset \mathcal{R}_{jt}$ denote the set of active establishments that are feasible for worker i . Feasibility is defined as follows. An establishment $r \in \mathcal{R}_{jt}^i$ if $N_{jrs} > 0$ for every quarter s that i was employed at j .

8.1.1.2 The probability model

Let $p_{ijrt} = \Pr(y_{ijt} = r)$. At the core of the model is the probability statement:

$$p_{ijrt} = \frac{e^{\alpha_{jrt} + x'_{ijrt}\beta}}{\sum_{s \in \mathcal{R}_{jt}^i} e^{\alpha_{jst} + x'_{ijst}\beta}} \quad (8.1)$$

where α_{jrt} is a establishment- and quarter-specific effect, x_{ijrt} is a time-varying vector of characteristics of the worker and establishment, and β measures the effect of characteristics on the probability of being employed at a particular establishment. In the current implementation, x_{ijrt} is a linear spline in the (great-circle) distance between worker i 's residence and the physical location of establishment r . The spline has knots at 25, 50, and 100 miles.

Using (8.1), the following likelihood is defined

$$p(y|\alpha, \beta, x) = \prod_{t=1}^T \prod_{j \in \mathcal{J}_t} \prod_{i \in \mathcal{I}_{jt}} \prod_{r \in \mathcal{R}_{jt}^i} (p_{ijrt})^{d_{ijrt}} \quad (8.2)$$

where

$$d_{ijrt} = \begin{cases} 1 & \text{if } y_{ijt} = r \\ 0 & \text{otherwise} \end{cases} \quad (8.3)$$

and where y is the appropriately-dimensional vector of the outcome variables y_{ijt} , α is the appropriately-dimensional vector of the α_{jrt} , and x is the appropriately-dimensional matrix of characteristics x_{ijrt} . For α_{jrt} , a hierarchical Bayesian model based on employment counts N_{jrt} is specified.

The object of interest is the joint posterior distribution of α and β . A uniform prior on β , $p(\beta) \propto 1$ is assumed. The characterization of $p(\alpha, \beta|x, y, N)$ is based on the factorization

$$\begin{aligned} p(\alpha, \beta|x, y, N) &= p(\alpha|N) p(\beta|\alpha, x, y) \\ &\propto p(\alpha|N) p(\beta) p(y|\alpha, \beta, x) \\ &\propto p(\alpha|N) p(y|\alpha, \beta, x). \end{aligned} \quad (8.4)$$

Thus, the joint posterior (8.4) is completely characterized by the posterior of α and the likelihood of y in (8.2). Note (8.2) and (8.4) assume that the employment counts N affect employment location y only through the parameters α .

8.1.1.3 Estimation

The joint posterior $p(\alpha, \beta|x, y, N)$ is approximated at the posterior mode. In particular, we estimate the posterior mode of $p(\beta|\alpha, x, y)$ evaluated at the posterior mode of α . From these we compute the posterior

modal values of the α_{jrt} , then, maximize the log posterior density

$$\log p(\beta|\alpha, x, y) \propto \sum_{t=1}^T \sum_{j \in \mathcal{J}_t} \sum_{i \in \mathcal{I}_{jt}} \sum_{r \in \mathcal{R}_{jt}^i} d_{ijrt} \left(\alpha_{jrt} + x'_{ijrt} \beta - \log \left(\sum_{s \in \mathcal{R}_{jt}^i} e^{\alpha_{jst} + x'_{ijst} \beta} \right) \right) \quad (8.5)$$

which is evaluated at the posterior modal values of the α_{jrt} , using a modified Newton-Raphson method. The mode-finding exercise is based on the gradient and Hessian of (8.5). In practice, (8.5) is estimated for three employer employment size classes: 1-100 employees, 101-500 employees, and greater than 500 employees, using data for Minnesota.

8.1.2 Imputing place of work

After estimating the probability model using Minnesota data, the posterior distribution of the estimated β parameters is combined with the entity specific posterior distribution of the α parameters in the imputation process for other states. A brief outline of the imputation method, as it relates to the probability model previously discussed, is provided in this section. Emphasis is placed on not only the imputation process itself, but also the preparation of input data.

8.1.2.1 Sketch of the imputation method

Ignoring temporal considerations, 10 implicates are generated as follows. First, using the posterior mean and variance of β estimated from the Minnesota data, we take 10 draws of β from the normal approximation (at the mode) to $p(\beta|\alpha, x, y)$. Next, using ES-202 employment counts for the establishments, we compute 10 values of α_{jt} based on the hierarchical model for these parameters. Note that these are draws from the exact posterior distribution of the α_{jrt} . The drawn values of α and β are used to draw 10 imputed values of place of work from the asymptotic approximation to the posterior predictive distribution

$$p(\tilde{y}|x, y) = \int \int p(\tilde{y}|\alpha, \beta, x, y) p(\alpha|N) p(\beta|\alpha, x, y) d\alpha d\beta. \quad (8.6)$$

8.1.2.2 Implementation

Establishment data Using state-level micro-data, the set of employers (SEINs) that ever operate more than one establishment in a given quarter is identified; these SEINs represent the set of ever-multi-unit employers defined above as the set \mathcal{J}_t . For each of these employers, its establishment-level records are identified. For each establishment, latitude and longitude coordinates, parent employer (SEIN) employment, and ES-202 month-one employment² for the entire history of the establishment are retained. Those establishments with positive month-one employment in a given quarter characterize \mathcal{R}_{jt} , the set of all active establishments. An establishment birth date is identified and, in most cases, is the first quarter in the ES-202 time series in which the establishment has positive month-one employment. For some employers, predecessor relationships are identified in the SPF; in those instances, the establishment date-of-birth is adjusted to coincided with that of the predecessor's.

Worker data The EHF provides the earnings histories for employees of the ever-multi-unit employers. For each in-scope job (a worker-employer pair), one observation is generated for the *end* of each job spell, where a job spell is defined as a continuum of quarters of positive earnings for worker at a particular employer during which there are no more than 3 consecutive periods of non-positive earnings.³ The start date of the

²In rare instances where no ES-202 employment is available, an alternative employment measure based on UI wage record counts may be used.

³A new hire is defined in the QWI as a worker who accedes to a firm in the current period but was not employed by the same firm in any of the 4 previous periods. A new job spell is created if, for example, a worker leaves a firm for more than 4 quarters and is subsequently re-employed by the same firm.

job history is identified as the first quarter of positive earnings; the end date is the last date of positive earnings.⁴ These job spells characterize the set \mathcal{I}_{jt}

Candidates Once the universe of establishments and workers is identified, data are combined and *a priori* restrictions and feasibility assumptions are imposed. For each quarter of the date series, the history of every job spell that *ends in that quarter* is compared to the history of *every* active (in terms of ES-202 first month employment) establishment of the employing employer (SEIN). The start date of the job spell is compared to the birth date of each establishment. Establishments that were born after the start of a job spell are immediately discarded from the set of candidate establishments. The remaining establishments constitute the set $\mathcal{R}_{jt}^i \subset \mathcal{R}_{jt}$ for a job spell (worker) at a given employer.⁵

Given the structure of the pairing of job spells with candidate establishments, it is clear that within job spell changes of establishment are ruled-out. An establishment is imputed once for each job spell,⁶ thereby creating no spurious labor market transitions.

Imputation and output data Once the input data are organized, a set of 10 imputed establishment identifiers are generated for each job spell ending in every quarter for which both ES-202 and UI wage records exist. For each quarter, implicate, and size class, $s = 1, 2, 3$, the parameters on the linear spline in distance between place-of-work and place-of-residence $\hat{\beta}^s$ are sampled from the normal approximation of the posterior predictive distribution of β^s conditional on Minnesota (MN)

$$p(\beta^s | \alpha_{MN}, x_{MN}, y_{MN}) \quad (8.7)$$

The draws from this distribution vary across implicates, but not across time, employers, and individuals. Next, for each employer j at time t , a set of $\hat{\alpha}_{jrt}$ are drawn from

$$p(\alpha_{ST} | N_{ST}) \quad (8.8)$$

which are based on the ES-202 month-one employment totals (N_{jrt}) for all candidate establishments $r_{jt} \subset \mathcal{R}_{jt}$ at employer j within the state (ST) being processed. The initial draws of $\hat{\alpha}_{jrt}$ from this distribution vary across time and employers but not across job spells. Combining (8.7) and (8.8) yields

$$\begin{aligned} & p(\alpha_{ST} | N_{ST}) p(\beta^s | \alpha_{MN}, x_{MN}, y_{MN}) \\ & \approx p(\alpha_{ST} | N_{ST}) p(\beta^s | \alpha_{ST}, x_{ST}, y_{ST}) \\ & = p(\alpha_{ST}, \beta_{ST} | x_{ST}, y_{ST}, N_{ST}), \end{aligned} \quad (8.9)$$

an approximation of the joint posterior distribution of α and β^s (8.4) conditional on data from the state being processed.

The draws $\hat{\beta}^s$ and $\hat{\alpha}_{jrt}$ in conjunction with the establishment, employer, and job spell data are used to construct the p_{ijrt} in (8.1) for all candidate establishments $r \in \mathcal{R}_{jt}^i$. For each job spell and candidate establishment combination, the $\hat{\beta}^s$ are applied to the calculated distance between place-of-residence (of the worker holding the job spell) and the location of the establishment, where the choice of $\hat{\beta}^s$ depends on the size class of the establishment's parent employer. For each combination an $\hat{\alpha}_{jrt}$ is drawn which is based primarily on the size (in terms of employment) of the establishment relative to other active establishments at the parent employer. In conjunction, these determine the conditional probability p_{ijrt} of a candidate establishment's assignment to a given job spell. Finally, from this distribution of probabilities is drawn an establishment of employment.

⁴By definition, an end-date for a job spell is not assigned in cases where a quarter of positive earnings at a firm is succeeded by 4 or fewer quarters of non-employment and subsequent re-employment by the same firm.

⁵The sample of UI wage and QCEW data chosen for processing of the QWI is such that the start and end dates are the same. Birth and death dates of establishments are, more precisely, the dates associated with the beginning and ending of employment activity observed in the data. The same is true for the dates assigned to the job spells.

⁶More specifically, an establishment is imputed to a job spell only once within each implicate.

CHAPTER 8. UNIT-TO-WORKER IMPUTE - JOB LOCATION IMPUTE (U2W)

The imputation process yields a data file containing a set of 10 imputed establishment identifiers for each job spell. In a very small set of cases, the model fails to impute an establishment to a job spell. This is often due to unanticipated idiosyncrasies in the underlying administrative data. Furthermore, across states, the proportion of these failures relative to successful imputation is well under 0.5%. For these job spells, a dummy establishment identifier is assigned and in downstream processing, the employment-weighted modal employer-level characteristics are used.

8.2 DATA SET DESCRIPTIONS

8.2.1 Naming scheme

The U2W contains a single file per state:

`u2w_zz.sas7bdat`

ZZ stands for the state postal abbreviation. You will find zero-observation SAS datasets attached to this document - see the attachment tab.

8.2.2 Data location

The files are stored in a main directory, with state-specific subdirectories:

`u2w/ZZ/`

On the RDC network, the directory can be found under

`/mixed/lehd/current`

8.2.3 Main dataset: u2w_zz

This files contain the 10 imputed establishment identifiers are generated for each job spell.

Record identifier PIK SEIN NEW_HIST_FLAG

Sort order PIK SEIN NEW_HIST_FLAG

Entity Job spell

Unique Entity Key PIK SEIN

Field name	Data dictionary reference name	Starting position	Field size	Data type
Start of spell YYYY.F (e.g. 2000Q2 = 2000.25)	FIRST_DATE	00008	3	N
End of spell YYYY.F (e.g. 2000Q4 = 2000.75)	LAST_DATE	00011	3	N
