LIST OF REVISIONS DURING PERMIT TERM

REV. NUMBER	REVISION DESCRIPTION	DATE APPROVED
------------------------	-----------------------------	--------------------------

SECTION 23 ROADS

BHP Navajo Coal Company (BNCC) will utilize both primary and ancillary roads in its mining operations for the Pinabete Mine Plan permit area (permit area). Roads classified as primary consist of roads used to transport coal and spoil, main access roads to the mining areas used by small and heavy equipment, and access roads to the support facilities. Roads classified as ancillary consist of roads used infrequently by small vehicles for accessing environmental monitoring stations, accessing ponds/water control structures, surveying, and power line service/inspections. The haul roads to topsoil stockpiles and temporary roads used during the construction of support facilities are also classified as ancillary roads. Ramps leading from the bottom of the pits to the intersection with the haul roads and roads in the active or immediate mining areas are not classified as either primary or ancillary roads.

23.1 Existing Roads

The use of existing roads will be limited to two-track roads that will be used to access environmental monitoring stations for collection of data. The locations of these roads are presented on [Exhibit 23.2-1](#). They are classified as ancillary roads. Their existing conditions are suitable for the intended use, so no modification or reconstruction is anticipated. The profiles of these roads closely follow the existing topography with no significant cuts or fills. To minimize additional disturbance and adverse environmental impacts, maintenance will be limited to occasional light blading, particularly after heavy precipitation events that may cause damages.

Some of these roads will eventually be disturbed or blocked due to construction of mine support facilities and mining activities. As construction of new mine roads is completed they will be reconnected to the newly constructed roads. The mine permit will be revised accordingly.

23.2 Primary Roads

All primary roads are designed, constructed, and maintained in a manner to facilitate safe operations and minimize adverse environmental impacts. Adequate drainage and erosion control structures are incorporated into the road designs. Information on each primary road segment is presented on [Table 23.2-1](#) and their locations are presented on [Exhibit 23.2-1](#).

23.2.1 Design Criteria

Primary roads are typically designed to meet the applicable performance standards of CFR 30 Subchapter K and the Mine Safety and Health Administration (MSHA) standards and requirements for roads.

Geometric Design

The geometric design of primary roads will be done in a manner to ensure the safe operation of small vehicles and heavy equipment. The layout of the vertical and horizontal curves is for safe sight and

stopping distances of the vehicles using the road. The geometric design (i.e., width, vertical/horizontal curves, crown, safety barriers, etc.) will comply with the design criteria outlined in "Design of Surface Mine Haulage Roads" (Kaufman and Ault 1977).

At elevated roadways, MSHA regulations require a safety barrier along the edge of the road that is capable of deflecting the largest vehicle back onto the road or prevent it from leaving the roadway. An acceptable barrier is an earth berm having a height equal to or greater than the axle height of the largest vehicle using the road. BNCC uses an earth safety berm in road designs at its Pinabete Mine Plan operations. On roads used by heavy mining equipment, whenever the road is elevated 4 feet or more, a 6-foot high safety berm is incorporated into the design template. On roads used by only small vehicles, a 3-foot high safety berm is used.

A 2% crown will be incorporated into the design template to divert surface runoff from the roadway into side ditches or to the toe of safety berms.

Road Structure

To design and construct the road structure to a recognized design criteria or standard would be economically unfeasible due to the very heavy wheel loads imposed by the heavy mining equipment.

Cut and Fill Side Slopes

The steepness of cut and embankment slopes shall be as follows:

1. Cut slopes will not be steeper than 2 horizontal: 1 vertical (2h:1v) in unconsolidated material and not steeper than 1h:1v in consolidated material.
2. Embankment slopes will be 4h:1v when the embankment height is less than 4 feet and 2h:1v with a safety berm when the embankment height is equal to or greater than 4 feet.

Embankment Slope Stability

The minimum static safety factor for road embankments shall be 1.3. To demonstrate this, slope stability analysis was performed on two worst-case scenarios (i.e., maximum embankment height and cut slope). Since all the embankments are to be constructed with similar soils, a worst-case analysis should be sufficient. Slope stability analyses are presented in [Appendix 23.A](#).

Design Storm

All required drainage and sediment control structures (i.e., culverts, side ditches, relief ditches, downdrains, etc.) are designed to pass the peak flow from the 10yr-6hr storm event or larger event.

Design Loads

Culverts and other buried structures within the roadway will be designed to withstand the dead load plus the maximum live surcharge load imposed upon it.

23.2.2 Construction

Road construction will not commence until the regulatory authority approves the designs. Prior to commencing construction, 1 foot of topdressing will be salvaged along the roadways. The salvaged topdressing will be removed and placed either in a stockpile or hauled directly onto a regraded area. If mining activities encroach onto a road and the road needs to be removed, the remaining topdressing beneath the road will be salvaged. Fugitive dust emitted from construction areas will be controlled by watering or by other proven means. The fugitive dust control plan is discussed in Section 40 (Environmental Protection).

Excavation

Excavation or cuts for roads shall conform to the following:

1. To keep surface disturbance to a minimum, the excavation will be limited to the lines and grades indicated on the design drawings.
2. Rock excavation may require blasting; appropriate permits will be obtained prior to commencing blasting activities.

Embankments

The construction of the embankments shall conform to the following:

1. Prior to beginning placement of fill material, the fill area will be cleared of trees, stumps, roots, boulders, vegetation, and rubbish.
2. Only approved suitable fill material free of debris, organic material, frozen matter, and excessive moisture or dryness will be used.
3. Fill material shall be placed in lifts and compacted before placing the next lift. registered professional engineer will specify the degree of compaction required and the thickness of the lifts. No additional lifts will be placed until the specified degree of compaction is achieved.

Installation of Culverts

To insure that the design strength of the culvert is developed, selected fill material shall be placed in lifts around the culvert and compacted. No additional lifts will be placed until the specified degree of compaction is achieved.

23.2.3 Drainage and Sediment Control

Primary roads are designed, constructed and maintained in a manner to minimize the contribution of additional suspended solids to surface runoff leaving the permit area. The primary roads will be located with minimal impact upon existing drainage channels.

Culverts are used unless site conditions or other factors dictate otherwise. At topographical lows or areas where roads intersect drainage channels, surface flows are routed through road embankments with culverts. The placement and orientation of culverts will be in a manner to minimize the alteration of the stream channel. If the stream channel is to be significantly altered, appropriate mitigation measures will be incorporated into the design to minimize the impacts. The inlet and outlet of culverts will be riprapped when required to prevent erosion.

All primary road culverts are designed to safely pass the peak discharge from a 10yr-6hr event or larger event. The watersheds for all the culverts are delineated from contour mapping. Soil curve numbers were determined using data from the Natural Resources Conservation Service soil surveys (Keetch 1980). The curve numbers assigned to the hydrologic groups are: A 65, B 78, C 87, and D 93. Using this data, a weighted curve number was calculated for the watersheds. The precipitation values for the design storm were obtained from the National Oceanic and Atmospheric Administration (NOAA) Atlas IV-New Mexico (NOAA 2006). The watersheds and culverts were modeled in SEDCAD to determine the peak flows and the culvert sizes required. If the results from the hydraulic analysis indicate the potential for erosion to occur at the inlet or outlet, riprap rock or other forms of protective lining will be installed.

At transitions from cut to fill a relief ditch is constructed to direct flows along the toe of the road embankment. Additional relief ditches may be needed at the safety berm termination points on the downstream end. The gradient of the relief ditches varies depending on the adjacent topography. The road crown, side ditches, and safety berms direct the surface flows into the relief ditches. The safety berms minimize uncontrolled flows down the slopes of road embankment. The relief ditch watersheds and geometric configuration of the ditches were modeled in SEDCAD to determine the peak flow and if any protective lining will be required in the ditch to control erosion. Only the relief ditches with steep grades and sufficient watershed area are analyzed.

The availability of rock size greater than D_{50} equal to 9 inches is very limited in the local area. Therefore, if results from the hydraulic analysis specify riprap size of D_{50} equal to 12 inches or greater, wire-enclosed riprap will be used in lieu of the size specified. D_{50} equal to 6-inches rock will be placed and enclosed with wire.

Hydrologic and channel information pertinent to the primary road culverts, downdrains, and relief ditches are presented on [Table 23.2-2](#). The appendices containing the supporting design data are referenced on the table. The location of the culverts, relief ditches, downdrains, and their corresponding watersheds are presented on [Exhibit 23.2-1](#).

23.2.4 Operation and Maintenance

Routine road maintenance consists of surface repairs; blading of side ditches and roadway surfaces; application of water and chemical road stabilizers; maintaining drainage control structures to design standards; and maintaining safety berms. Periodic inspections will be conducted to insure proper maintenance and safe operating conditions.

For description of fugitive dust control and the removal and reclamation of primary roads, refer to Section 40 (Environmental Protection) and Section 32 (Temporary Structures and Facilities Removal and Reclamation), respectively.

23.2.5 Removal and Reclamation

Refer to Section 32 (Temporary Structures and Facilities Removal and Reclamation) for removal and reclamation of primary roads.

23.3 Ancillary Roads

Ancillary roads are roads that are used infrequently by small vehicles for accessing environmental monitoring stations, accessing ponds/water control structures, surveying, and servicing/inspecting power lines. The haul roads to topdressing stockpiles and temporary roads used during the construction of the mine support facilities are also classified as ancillary roads; these are utilized infrequently during periods of topsoil removal and construction. They are designed, constructed, and maintained in a manner to minimize adverse environmental impacts. Information on each ancillary road segments is presented on [Table 23.3-1](#) and their locations are presented on [Exhibit 23.2-1](#).

23.3.1 Design, Construction, and Maintenance

New ancillary roads will be constructed to the typical cross section presented on [Exhibit 23.3-1](#). They will primarily be constructed with a motor grader. The road width is typically one blade wide for small vehicles and approximately 80 feet wide for topsoil haulage roads. Their profile will closely traverse the existing topography to minimize cuts and fills or surface disturbance. At topographic lows or where drainages are intersected, the road profile will be constructed flush with the flow line to prevent ponding and restriction of flows in existing drainage channels. In badland areas, it is not unusual to encounter minor drainages (small watersheds) with deeply incised channels. When the road alignment crosses this type of drainage, a culvert is installed to minimize the excavation and surface disturbance. If the results from the hydraulic

analysis indicate the potential for erosion to occur at the inlet or outlet, riprap rock or other forms of protective lining will be installed. Culverts and other drainage or required erosion control structures will be designed to pass the peak flow from the 2yr-6hr storm event. Typical road profiles at drainage crossings are presented on [Exhibit 23.3-1](#).

Hydrologic and channel information pertinent to the ancillary road culverts, and any other required drainage or erosion control structures are presented on [Table 23.3-2](#). The appendices containing the supporting design data are referenced on the table. All culvert locations and corresponding watersheds are presented on [Exhibit 23.2-1](#).

Ancillary roads constructed as described above and to the typical section do not require approval prior to construction. After construction, the actual alignment will be surveyed and added to [Exhibit 23.2-1](#).

Ancillary roads will be maintained in a manner to minimize adverse environmental impacts. To minimize additional surface disturbance, the maintenance is limited to occasional light blading particularly after heavy precipitation that may cause damage. The drainage control structures (i.e., culverts, riprap channels, etc.) will be properly maintained. Periodic inspections will be conducted to insure proper maintenance and safe operating conditions.

Fugitive dust emitted from ancillary roads is expected to be minimal since these roads will be infrequently used. Therefore, they will not be treated or watered to control dust.

For information on the removal and reclamation of ancillary roads, refer to Section 32 (Temporary Structures and Facilities Removal and Reclamation).

If deviations from the typical design, such as significant cuts and fills and the crossing of perennial or intermittent stream channels are required, a site-specific design will be developed for the road in order to demonstrate compliance with performance standards. The road design will be submitted to the regulatory authority for approval. Construction will not commence until the design is approved.

23.4 Information Collection and Analysis

Certified exhibits for Section 23 are available for review upon request at either the BNCC offices or the Office of Surface Mining Reclamation and Enforcement, Western Region technical office in Denver, Colorado. Certified as-built drawings will be kept on file at the mine site and made available upon request.

SRL-RD8	16+10	2.3	12	27
SRL-RD9	24+85	1.7	6	80

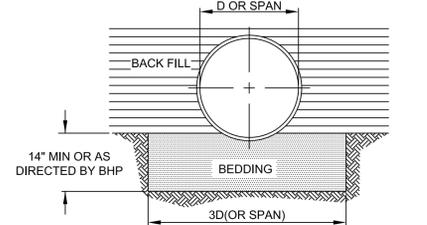

DROP INLET NOTES:
 1. PROVIDE DROP INLETS AT LOCATIONS SHOWN ON THE PLANS.
 2. REMOVE 10' +/- OF THE SAFETY BERM TO INSTALL THE DROP INLET. GRADE AREA TO DRAIN TO GRATE.
 3. 24" RISER TO BE FACTORY FABRICATED AS AN INTEGRAL PART OF THE CULVERT.
 4. CONCRETE COLLAR TO BE 10' SQUARE x 8" THICK WITH #5 BARS AT 12" E.W. CONCRETE SHALL ATTAIN A MINIMUM COMPRESSIVE STRENGTH OF 4000 PSI @ 28 DAYS AND SHALL BE PLACED WITH AN AIR CONTENT OF 5-8% AND A MAX. SLUMP OF 4".

DOWN DRAIN NOTES:
 1. PROVIDE DOWN DRAINS AT LOCATIONS SHOWN ON THE PLANS.
 2. REMOVE 10' +/- OF THE SAFETY BERM TO INSTALL THE DOWN DRAIN. GRADE AREA TO DRAIN TO GRATE.
 3. 24" RISER TO BE FACTORY FABRICATED AS AN INTEGRAL PART OF THE DRAIN.
 4. CONCRETE COLLAR TO BE 10' SQUARE x 8" THICK WITH #5 BARS AT 12" E.W. CONCRETE SHALL ATTAIN A MINIMUM COMPRESSIVE STRENGTH OF 4000 PSI @ 28 DAYS AND SHALL BE PLACED WITH AN AIR CONTENT OF 5-8% AND A MAX. SLUMP OF 4".

CULVERT NOTES:
 1. ALL DRAINAGE STRUCTURES SHALL BE STAKED AND GRADED TO DRAIN TO THE CONSTRUCTION LIMITS. EARTHEN DITCH BLOCKS, DIKES AND DITCHES MAY BE ADDED AT LOCATIONS DESIGNATED BY BHP AND/OR AS SHOWN ON THESE PLANS.
 2. ALL CULVERTS ARE TO BE INSTALLED AT THE NATURAL FLOWLINE OF THE WASH, ARROYO OR DITCH. IF PLAN ELEVATIONS DO NOT MATCH FIELD CONDITIONS CONTACT BNCC FOR DIRECTION BEFORE PROCEEDING.
 3. SHAPE AND GRADE DRAINAGE CHANNELS AS NECESSARY TO PROVIDE A SMOOTH CONNECTION BETWEEN FORD OR CULVERT AND EXISTING FEATURE.
 4. ALL CULVERTS ARE TO INCLUDE FLARED END SECTIONS AT BOTH ENDS UNLESS OTHERWISE NOTED. CULVERTS 3'-0" AND SMALLER TO INCLUDE SAFETY SLOPE END SECTIONS AT BOTH ENDS
 5. RIPRAP IS TO BE INSTALLED AT THE OUTLET END OF CULVERTS PER THE RIPRAP SCHEDULE IMMEDIATELY UPON COMPLETION OF CULVERT INSTALLATION.
 6. RIPRAP TO BE NON-ENCLOSED WITH MINIMUM DIMENSION AS SHOWN AND INSTALLED ON ENGINEERING FABRIC WITH A MINIMUM UNIT WEIGHT OF 8 OZ/SY.
 7. IN LIEU OF RIPRAP SHOWN CONTRACTOR MAY USE WIRE ENCLOSE RIPRAP CLASS A PER NMDOT STANDARD DRAWING 602-01-1/1.
 8. COST OF FABRIC, BEDDING AND BACKFILL TO BE CONSIDERED INCIDENTAL TO CULVERT INSTALLATION.

TYP. RIPRAP RUNDOWN
N.T.S.

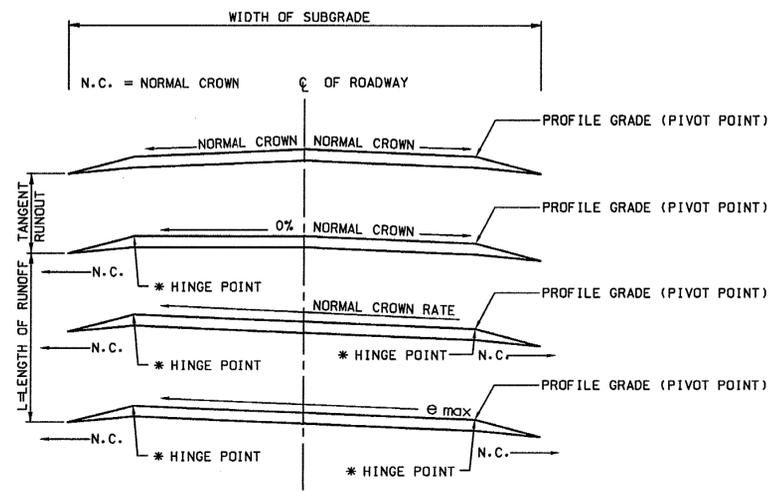

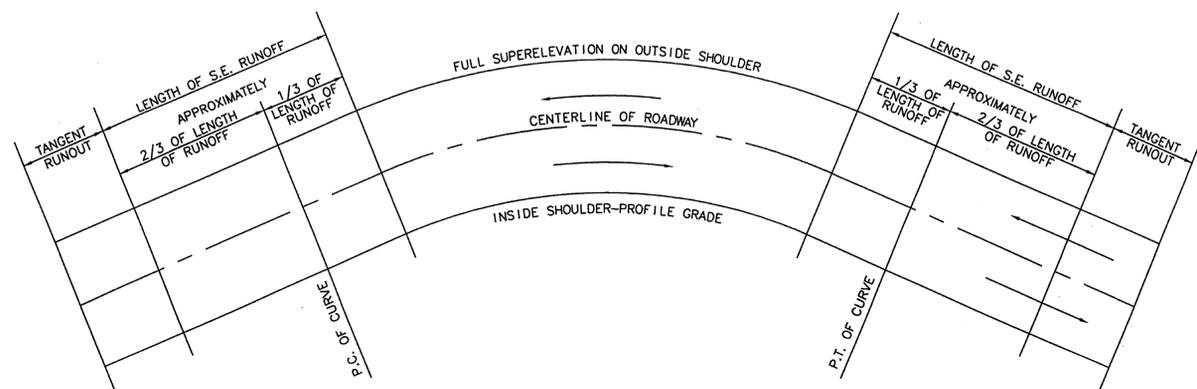

RIPRAP RUNDOWN NOTES:
 1. PROVIDE RIPRAP RUNDOWN AT LOCATIONS SHOWN ON THE PLANS.
 2. REMOVE 10' +/- OF THE SAFETY BERM TO INSTALL THE RIPRAP RUNDOWN. GRADE AREA TO DRAIN TO RUNDOWN.
 3. DIMENSIONS TO BE AS SHOWN UNLESS OTHERWISE SHOWN ON THE PLANS.

THE DESIGN FEATURES SHOWN ON THESE DESIGN PLANS ARE REASONABLE REPRESENTATIONS OF THE PROPOSED WORK BASED ON THE INFORMATION AVAILABLE AT THE TIME OF SUBMITTAL OF THIS PERMIT PACKAGE. ACTUAL CONSTRUCTION DETAILS MAY VARY FROM THOSE SHOWN.

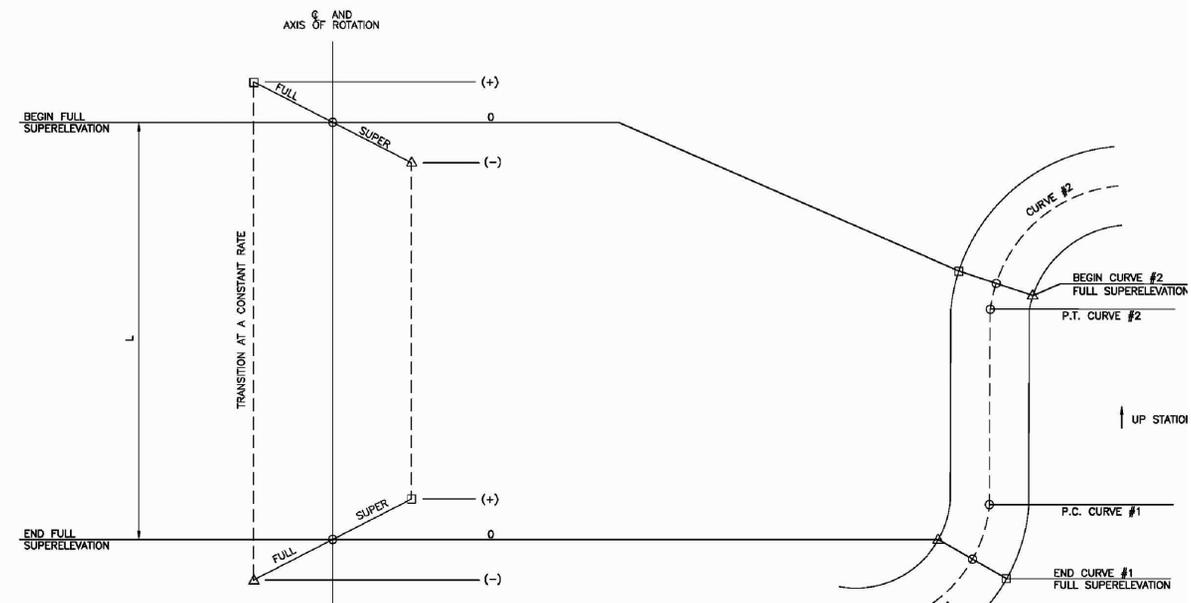

NOT ISSUED FOR CONSTRUCTION

CASE I - TWO-LANE ROADWAY

CASE I - TWO-LANE ROADWAY
(CURVE TO RIGHT; CURVE TO LEFT OPPOSITE HAND)
NOTE: SEE PLANS FOR ACTUAL TYPICAL SECTION

CASE 2
SEE NOTE 1

NOTES

- CASE 2 EXISTS WHEN THE TANGENT LENGTH BETWEEN TWO CURVES IS SHORTER THAN THE TANGENT RUNOUT DISTANCE REQUIRED FOR TRANSITIONING BETWEEN SUPERELEVATIONS FOR THOSE CURVES. WHEN THIS CASE EXISTS, TRANSITION AT A CONSTANT RATE FROM ONE SUPERELEVATION TO THE NEXT AS SHOWN.
- BUILD SUPERELEVATION INTO SUBGRADE AND CARRY THROUGH SHOULDERS
- L IS THE TRANSITION LENGTH BETWEEN FULL SUPERELEVATION AND FULL SUPERELEVATION.

LEGEND

- CENTERLINE/POINT OF ROTATION
- ◻ INSIDE EDGE OF PAVEMENT
- ◻ OUTSIDE EDGE OF PAVEMENT

GENERAL NOTES

- TANGENT RUNOUT - LENGTH OF HIGHWAY NEEDED TO ACCOMPLISH THE CHANGE IN CROSS SLOPE FROM A NORMAL CROWN SECTION TO A SECTION WITH THE ADVERSE CROWN REMOVED OR VICE VERSA.
- SUPERELEVATION RUNOFF - LENGTH OF HIGHWAY NEEDED TO ACCOMPLISH THE CHANGE IN CROSS SLOPE FROM A SECTION WITH ADVERSE CROWN REMOVED TO A FULLY SUPERELEVATED SECTION OR VICE VERSA.
- THE MAXIMUM SUPERELEVATION RATE TO BE USED IS ESTABLISHED FOR EACH INDIVIDUAL CURVE AND IS SHOWN IN THE PLANS. ANY DEVIATION IN THE PLACEMENT OF S.E. RUNOFF AND TANGENT RUNOUT DUE TO REVERSE CURVES OR COMPOUND CURVES WILL BE SPECIFIED IN THE PLANS.
- CASE 1: ON FINISHED GRADE AND SUBGRADE. (TANGENT RUNOUT) PIVOT SUPERELEVATION ABOUT CENTERLINE UNTIL RATE OF SLOPE EQUALS CROWN SLOPE THEN PIVOT ABOUT THE INSIDE SHOULDER.
- THE OUTSIDE DITCH ON SUPERELEVATION SECTIONS IS TO BE MODIFIED WHERE NECESSARY TO PROVIDE DRAINAGE. OTHERWISE THE DITCH SHALL CONFORM TO THE NORMAL DITCH SECTION SHOWN ON THE TYPICAL SECTION.
- CURVES SHALL BE WIDENED ACCORDING TO THE PAVEMENT WIDENING CHART IN THE AASHTO GUIDELINES. THE SUPERELEVATION RATE SHALL BE CONTINUOUS THROUGHOUT THE TOP WIDTH OF SURFACING.
- FOR MULTILANE DIVIDED HIGHWAYS WITH INDEPENDENT PROFILE CURVES AND/OR MEDIANS OVER 60 FT. THE SUPERELEVATION RATE FOR EACH ROADWAY SHALL BE DEVELOPED USING CASE 1.
- REFER TO CURRENT AASHTO GUIDELINES FOR APPROPRIATE RUNOFF LENGTH. ADJUSTMENTS NEED TO BE MADE FOR ADDITIONAL LANES AS REQUIRED BY CURRENT AASHTO GUIDELINES.
- TANGENT RUNOUT = $L \left(\frac{NC}{2e - NC} \right)$ ROUND UP TO NEAREST 10 FT.

WHERE NC = NORMAL CROWN
e = MAX. SUPERELEVATION
L = LENGTH OF SUPERELEVATION RUNOFF

- GENERAL NOTES**
- ALL WORKMANSHIP AND MATERIALS SHALL CONFORM TO THE NEW MEXICO DEPARTMENT OF TRANSPORTATION 2007 SPECIFICATIONS AND THE PROJECT SUPPLEMENTAL SPECIFICATIONS. IF CONSTRUCTION OCCURS DURING WINTER MONTHS, PAY SPECIAL ATTENTION TO THE COLD WEATHER REQUIREMENTS IN THE SPECIFICATIONS.
 - THE DESIGN FEATURES, INCLUDING HORIZONTAL AND VERTICAL ALIGNMENTS, TYPICAL SECTIONS, TURNOUTS, AND OTHER DESIGN DETAILS SHOWN ON THESE DESIGN PLANS, SHALL NOT BE ALTERED OR MODIFIED IN ANY WAY DURING CONSTRUCTION WITHOUT THE EXPRESSED, WRITTEN DIRECTION AND APPROVAL OF BHP NAVAJO COAL COMPANY. DRAINAGE STRUCTURES SHALL BE INSTALLED AS SHOWN ON THE PLANS WITH ONLY MINOR CORRECTIONS IN LOCATION, SKEW AND/OR ELEVATIONS AS NEEDED TO FIT FIELD CONDITIONS.
 - NO WORK SHALL BE PERFORMED OUTSIDE OF THE DESIGNATED DISTURBANCE LIMITS WITHOUT APPROVAL BY BHP NAVAJO COAL COMPANY.
 - A GENERAL SWPPP PLAN WILL BE PROVIDED BY BHP NAVAJO COAL COMPANY. THE CONTRACTOR SHALL PROVIDE AND SUBMIT A SITE SPECIFIC SWPPP PLAN INCLUDING THE NECESSARY SITE EROSION CONTROL PLANS AND DEVICES FOR INHIBITING DUST MOVEMENT AND SOIL EROSION OFF SITE DURING ALL PHASES OF CONSTRUCTION.
 - REMOVE TOPSOIL FROM SPECIFIED AREAS AND HAUL TO TOPSOIL STOCKPILE TS-405 AND/OR TS-406 LOCATED NEAR THE NORTH END OF THE ALIGNMENT. THE DEPTH OF TOPSOIL REMOVAL SHOWN ON THE PLANS IS APPROXIMATE. ACTUAL TOPSOIL STRIPPING IS TO BE COORDINATED WITH BHP NAVAJO COAL COMPANY'S EQ. SPECIALIST WHO WILL BE ON SITE TO ENSURE THAT ONLY MATERIAL MEETING TOPSOIL SPECS IS EXCAVATED.
 - TOPSOIL STOCKPILE TS-401, TS-402, AND TS-403 ARE APPROVED STOCKPILES IN NAVAJO MINE'S SMCRA PERMIT NUMBER NM-0003F (REFER TO EXHIBIT 11-11). BHP NAVAJO COAL COMPANY WILL OBTAIN APPROVAL FOR THE PROPOSED TOP SOIL STOCKPILE TS-404, TS-405, AND TS-406 FROM OSM IN THE SMCRA PERMIT PRIOR TO CONSTRUCTION.
 - ALL DRAINAGE STRUCTURES SHALL BE STAKED AND GRADED TO DRAIN TO THE CONSTRUCTION LIMITS. EARTHEN DITCH BLOCKS, DIKES AND DITCHES MAY BE ADDED AT LOCATIONS DESIGNATED BY THE OWNER AND/OR AS SHOWN ON THESE PLANS. AT ALL CULVERT INLETS AND OUTLETS, DRAINAGE SHALL BE GRADED AS NECESSARY TO PRODUCE SMOOTH FLOW/CONNECTIONS BETWEEN CULVERTS AND EXISTING WASHES/CHANNELS.
 - IMMEDIATELY PRIOR TO PLACING THE SURFACE COURSE, THE TOP 8 INCHES OF FINISHED SUBGRADE (INCLUDING TURNOUTS) SHALL BE CHECKED FOR COMPACTION AND GRADE. IF COMPACTION DOES NOT MEET THE MINIMUM SPECIFIED COMPACTION REQUIREMENTS, THE SUBGRADE SHALL BE MOISTURE CONDITIONED AND/OR SCARIFIED AS NEEDED AND RE-COMPACTED TO THE REQUIRED DENSITY. IN NO CASE SHALL ANY EMBANKMENT OR SURFACING MATERIAL BE PLACED ON FROZEN, MUDDY OR UNSTABLE NATURAL GROUND. THIS WORK SHALL BE CONSIDERED INCIDENTAL OBLIGATIONS OF THE CONTRACTOR.
 - THE LOCATIONS OF UTILITIES SHOWN IN THESE PLANS ARE APPROXIMATE AND ARE ONLY TO ASSIST THE CONTRACTOR IN COMPLETING THE WORK. THE CONTRACTOR SHALL VERIFY ALL UTILITIES AND THEIR LOCATIONS WITH THE UTILITY OWNERS PRIOR TO CONSTRUCTION. ANY UTILITIES DAMAGED DUE TO NEGLIGENCE OF THE CONTRACTOR SHALL BE RESTORED TO THE UTILITY OWNER'S REQUIREMENTS AT THE CONTRACTOR'S EXPENSE.
 - ANY EXISTING OR NEW ROADSIDE FEATURES OR OTHER IMPROVEMENTS NEGLIGENTLY DAMAGED BY THE CONTRACTOR DURING CONSTRUCTION SHALL BE RESTORED TO EQUAL OR BETTER CONDITION AT THE CONTRACTOR'S EXPENSE.
 - GRADE AND SHAPE THE NEW SHOULDER (AS REQUIRED) FROM THE SUBGRADE HINGE POINTS TO AND INCLUDING THE EXISTING DITCH LINE FOR THE CONSTRUCTION OF DITCH LINING AREAS, SLOPE PROTECTION, AND RIPRAP RUNDOWNS.
 - AT THE COMPLETION OF CONSTRUCTION, THE CONTRACTOR SHALL INSPECT THE INTERIOR OF ALL NEWLY INSTALLED DRAINAGE STRUCTURES. THESE IMPROVEMENTS SHALL BE MAINTAINED IN A CLEAN CONDITION, AND BE FREE OF SILT AND OTHER DEBRIS UNTIL FINAL ACCEPTANCE OF THE PROJECT.
 - CONSTRUCT FURROW DITCHES AND DITCH BLOCKS TO MATCH FIELD CONNECTIONS, AS DIRECTED BY BHP NAVAJO COAL COMPANY. CONSTRUCT FURROW DITCHES ALONG THE EXISTING ROADWAY WHERE DIRECTED BY BHP NAVAJO COAL COMPANY.
 - SEEDING SHALL BE APPLIED TO ALL DISTURBED AREAS OUTSIDE OF THE GRAVELED AREAS, INCLUDING OBLITERATED AREAS OF THE EXISTING ROAD, PER THE PROJECT SPECIFICATIONS.
 - THE OWNER WILL EMPLOY AN INDEPENDENT TESTING LABORATORY TO PROVIDE ALL THE MATERIALS QUALITY CONTROL TESTING AS OUTLINED IN THE CONTRACT DOCUMENTS. THE CONTRACTOR SHALL BE RESPONSIBLE FOR INITIATING, MAINTAINING, AND SUPERVISING ALL SAFETY PRECAUTIONS AND PROGRAMS IN CONNECTION WITH THE WORK, INCLUDING COMPLIANCE WITH ALL MSHA REGULATIONS AND BHP NAVAJO COAL COMPANY SAFETY POLICIES.
 - ALL CUT AND FILL SLOPES 2:1 OR STEEPER, ARE TO RECEIVE CLASS D EROSION CONTROL MATTING.

THESE PLANS ILLUSTRATE THE DESIGN OF THE PROPOSED EAST HAUL ROAD AND THE SERVICE ROAD LOOP AND ASSUME THAT IT WILL BE CONSTRUCTED CONCURRENTLY WITH THE BURNHAM SOUTH ROAD. SEE EXHIBIT 40.6-1 FOR THE DESIGN OF THE BURNHAM SOUTH ROAD. IF CONSTRUCTION IS NOT PERFORMED CONCURRENTLY PROVIDE TEMPORARY GRADING TO FACILITATE DRAINAGE.

RE: Slope Stability Evaluation
Navajo Mine Area 4 Coal Haulage Road
Fruitland, New Mexico
GEOMAT Project No. 112-1388

As you requested, GEOMAT Inc. has completed geotechnical engineering analyses to evaluate the stability of selected cut and fill slopes of the proposed coal haulage road to be constructed in Area 4 at Navajo Mine. Our analyses were based on the following understandings:

- Cut and Fill slopes: generally 2:1 Horizontal:Vertical (H:V), except that the slopes of the shoulders of the haul road will be 4:1 H:V,
- Slope of the roadway: 2 % to the shoulders from the center of the roadway
- Roadway and existing grade elevations: based on the roadway profile drawings Sheets 11 and 12 titled West Haulroad dated July 07.
- As requested, the cut slope used in the analysis is at station 460+00, where the cut will be approximately 57 ft,
- As requested, the fill slope used in the analysis is at station 520+90, where the fill will be approximately 60 ft,
- Where coal exists in the cut slope, for fire control purposes, the coal will be removed for an approximate horizontal distance of 20 feet and replaced with compacted fill,
- Strength properties of the native soils and the compacted fill material were based on information from the geotechnical engineering reports by Converse (Soil and Foundation Investigation Report, Converse Project No. 07-53190-01 dated July 10, 2008) and GEOMAT (Preliminary Geotechnical Engineering Report-BHP Navajo Mine Extension Project, GEOMAT Project No. 72-0466 and dated May 18, 2007)
- Strengths of the coal were estimated based on properties of the coal indicated in the above-referenced geotechnical engineering reports,
- A pseudo static seismic force of 0.1g was used in the analyses,
- The embankments were not considered to retain water or to be submerged,
- The loaded weight of the haul trucks (Kress 200C) and dragline (Model 8750 Walking Dragline) were simulated by dividing the weight of the vehicle over the area of the base of the wheels/tracks.
- OSM regulations require a minimum static safety factor of 1.3 for primary road embankments.
- The properties shown in the attached diagrams for cohesion, unit weight, and internal angle of friction of the compacted fill portion of the embankments are based upon laboratory values in the aforementioned Converse report. The actual compacted fill material used for the embankments should be sampled and tested to verify it conforms at a minimum to these properties.

Selection, placement and compaction of the fill soils should be as recommended in the aforementioned Converse report.

Slope stability analyses were performed with Galena Slope Stability Analysis System software, v4.02 and v5.02. Properties of the soil and rock materials that are expected to exist in the cut and fill sections are noted on the slope stability analysis sheets that are attached to this report.

The results of the analyses are summarized in the following table. Individual sheets showing the details of the calculations and the configuration of the slope used in the calculations are attached.

Slope	Pseudo Static Earthquake (%g)	Calculated Factor of Safety
Fill Slope w/o vehicle load	0.1	1.5
Fill Slope w/ Kress haul truck	0.1	1.4
Fill Slope w/ dragline	0.1	1.5
Cut Slope w/o vehicle loading	0.1	1.4
Cut Slope w/ dragline @ toe	0.1	1.4

As shown in the table, the calculated factors of safety for both the cut and fill slopes are either 1.4 or 1.5. Based on the required factor of safety of 1.3, both the cut and fill slopes are considered to have adequate factors of safety for the conditions analyzed.

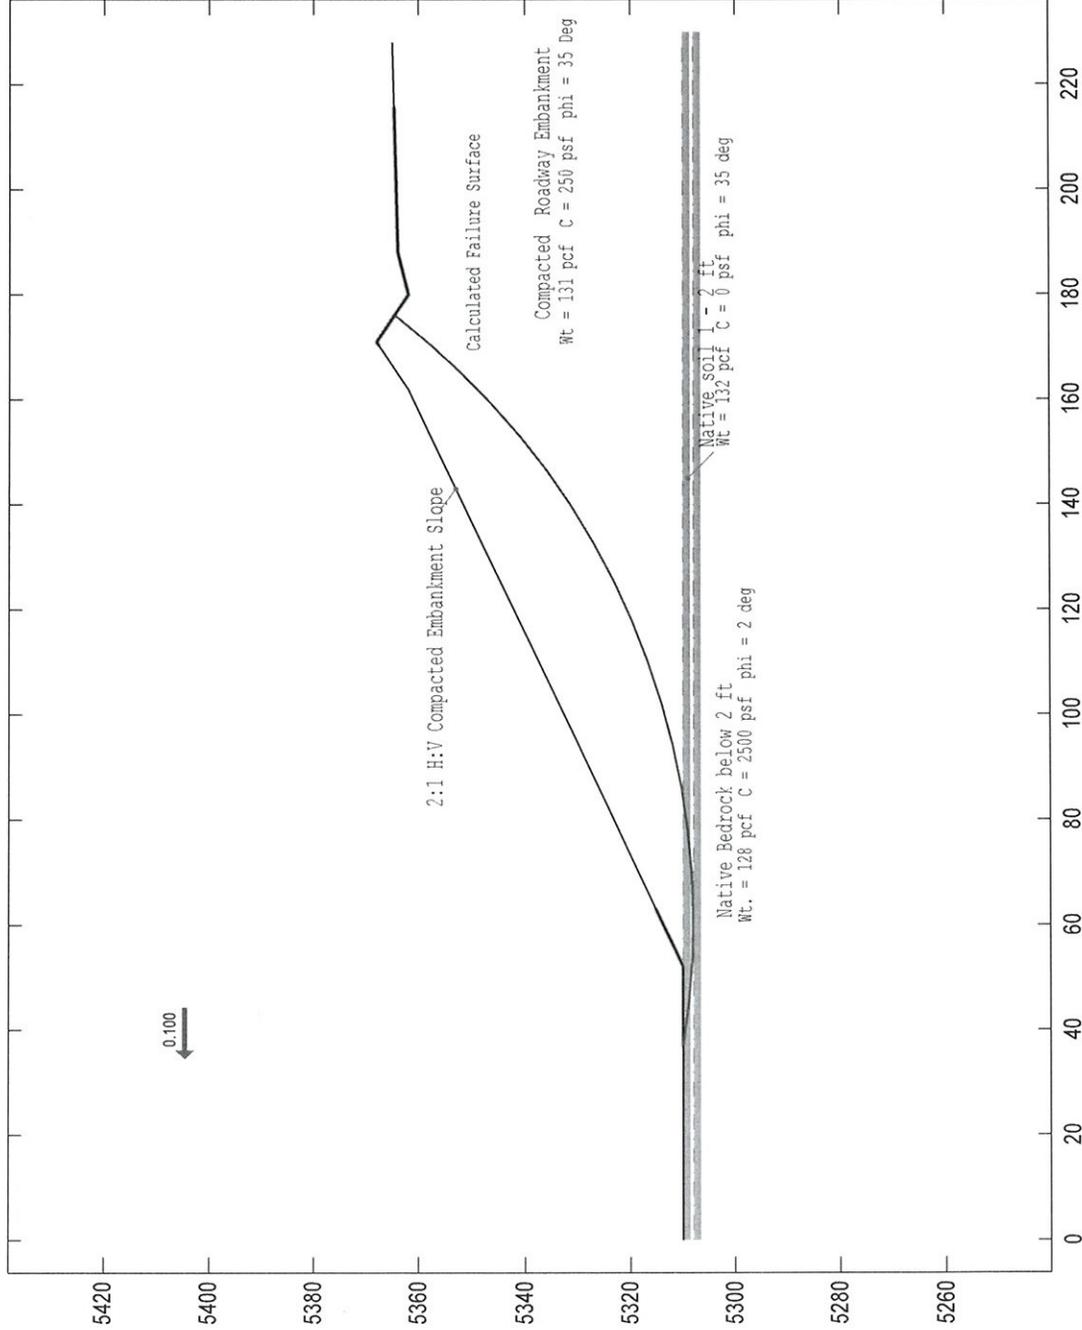

The nature and variation of materials may not become evident until construction. If variations then appear, it will be necessary to reevaluate the information in this report. Likewise, in the event that any changes in the nature, design, or location of the cut or fill slopes are made, the recommendations contained in this report shall not be considered valid unless the changes are reviewed and the recommendations of this report modified or verified in writing.

Thank you for the opportunity to work with you on this project. If you have any questions or need additional information, please let us know.

Sincerely yours,
GEOMAT Inc.

George A. Madrid, P.E.
President, Principal Engineer
9-21-11

HY-8 Culvert Analysis Report

CULVERT CP-409 – STATION 200+62

Culvert Data Summary - Culvert CP-409

Barrel Shape: Circular
Barrel Diameter: 3.50 ft
Barrel Material: Corrugated Steel
Embedment: 0.00 in
Barrel Manning's n: 0.0240
Inlet Type: Conventional
Inlet Edge Condition: Square Edge with Headwall
Inlet Depression: None

Site Data - Culvert CP-409

Site Data Option: Culvert Invert Data
Inlet Station: 0.00 ft
Inlet Elevation: 5301.62 ft
Outlet Station: 227.00 ft
Outlet Elevation: 5296.71 ft
Number of Barrels: 2

Table 1 - Culvert Summary Table: Culvert CP-409

#2	0.415	0.415	0.52	0.02
#1	2.612	2.612	3.30	0.10
#3	0.000	3.027	3.82	0.12

Structure Detail:

Structure #2 (Erodible Channel)

ROAD SIDE DITCH

Triangular Erodible Channel Inputs:

Material: Silt loam noncolloidal

Left Sideslope Ratio	Right Sideslope Ratio	Slope (%)	Manning's n	Freeboard Depth (ft)	Freeboard % of Depth	Freeboard Mult. x (VxD)	Limiting Velocity (fps)
3.0:1	2.0:1	0.3	0.0200	0.30			3.0

Erodible Channel Results:

	w/o Freeboard	w/ Freeboard
Design Discharge:	0.52 cfs	
Depth:	0.39 ft	0.69 ft
Top Width:	1.94 ft	3.44 ft
Velocity:	1.38 fps	
X-Section Area:	0.38 sq ft	
Hydraulic Radius:	0.180 ft	
Froude Number:	0.55	

Structure #1 (Erodible Channel)

ROAD SIDE DITCH

Triangular Erodible Channel Inputs:

Material: Silt loam noncolloidal

Left Sideslope Ratio	Right Sideslope Ratio	Slope (%)	Manning's n	Freeboard Depth (ft)	Freeboard % of Depth	Freeboard Mult. x (VxD)	Limiting Velocity (fps)
3.0:1	2.0:1	0.3	0.0200	0.30			3.0

Erodible Channel Results:

	w/o Freeboard	w/ Freeboard
Design Discharge:	3.30 cfs	
Depth:	0.77 ft	1.07 ft
Top Width:	3.87 ft	5.37 ft
Velocity:	2.20 fps	
X-Section Area:	1.50 sq ft	

	w/o Freeboard	w/ Freeboard
Hydraulic Radius:	0.360 ft	
Froude Number:	0.62	

Structure #3 (Riprap Channel)

RELIEF DITCH EHR-RD1

Trapezoidal Riprap Channel Inputs:

Material: Riprap

Bottom Width (ft)	Left Sideslope Ratio	Right Sideslope Ratio	Slope (%)	Freeboard Depth (ft)	Freeboard % of Depth	Freeboard Mult. x (VxD)
4.00	3.0:1	3.0:1	33.3	0.30		

Riprap Channel Results:

Simons/OSM Method - Steep Slope Design

	w/o Freeboard	w/ Freeboard
Design Discharge:	3.82 cfs	
Depth:	0.05 ft	0.35 ft
Top Width:	4.30 ft	6.10 ft
Velocity*:		
X-Section Area:	0.21 sq ft	
Hydraulic Radius:	0.049 ft	
Froude Number*:		
Manning's n*:		
Dmin:	4.00 in	
D50:	12.00 in	
Dmax:	15.00 in	

Velocity and Manning's n calculations may not apply for this method.

Subwatershed Hydrology Detail:
