## Foreword

The material contained in the Radiation Therapy Design Guide is the culmination of a partnering effort by the Department of Veterans Affairs Veterans Health Administration and the Facilities Quality Office. The goal of the Design Guide is to ensure the quality of VA facilities while controlling construction and operating costs.

This document is intended to be used as a guide and as a supplement to current technical manuals and other VA criteria in the planning of Radiation Therapy Service. Radiation Therapy Service is referred to as Radiation Therapy throughout this document. **The Design Guide is not to be used as a standard design, and the use of this Design Guide does not limit the project Architect's and Engineer's responsibilities to develop a complete and accurate project design that best meets the user's needs and the applicable code requirements.**

Lloyd H. Siegel, FAIA  
Director, Strategic Management Office  
Office of Construction & Facilities Management  
*Washington, DC*

## Acknowledgements

The following individuals are those whose guidance, insight, advice and expertise made the update and revision of the Radiation Therapy Design Guide possible:

### Facilities Management Office

Lloyd H. Siegel, FAIA  
*ACFMO for Strategic Management*  
*Washington, DC*

Kurt Knight  
*Director Facilities Quality Service*  
*VHACO (181A)*  
*Washington, DC*

Donald L. Myers, AIA, NCARB  
*Senior Architect Facilities Quality Service*  
*VHACO (181A)*  
*Washington, DC*

### Radiation Therapy Advisory Group

Betty M Hall BS (R) (T)  
*GV (Sonny) Montgomery Medical Center*  
*1500 East Woodrow Wilson Blvd.*  
*Jackson, MS 39216*

### Prime Consultant

#### Cannon Design

Jose M. Silva, AIA, Project Principal

Ronald Villasante, Assoc. AIA, CAP

Scott Speser, NCARB, LEED

Millard Berry III, PE, LEED

Ronald Curtis, PE

Michael Dlugosz, PE

Ryszard K. Druzcz, PE

J. Joe Scott, CPD

Elizabeth Randolph

Blake Bowen

### Radiology / Imaging Specialty Sub-consultants

#### Junk Architects / MRI-Planning

Tobias Gilk, M Arch

Robert Junk, AIA, AHRA

## Introduction

The Radiation Therapy Design Guide was developed as a tool to assist Contracting Officers, Medical Center Staff, and Architects and Planners with the design and construction of Radiation Therapy Medicine facilities. It is not intended to be project specific; but rather provide an overview with respect to the design and construction of Radiation Therapy facilities.

Guide plates for various rooms within Radiation Therapy are included in this chapter to illustrate typical VA furniture, equipment, and personnel space needs. They are not project specific as it is not possible to foresee future requirements. The project specific space program is the basis of design for an individual project. It is important to note that the guide plates are intended as a generic graphic representation only.

Equipment manufacturers should be consulted for actual dimensions, utilities, shielding, and other requirements as they relate to specified equipment. Use of this design guide does not supersede the project architects' and engineers' responsibilities to develop a complete and accurate design that meets the user's needs and complies with appropriate code requirements.

## Definitions

CT Simulation: A CT procedure in which the specific pathology is localized within the patient, who is placed in a precise and reproducible position, for use in treatment planning for radiation therapies. CT Simulation utilizes conventional a CT Scanner outfitted with specific simulation hardware and software.

External Radiation Therapy: The use of high-energy penetrating wave or particle beams used to damage or destroy cancerous cells. External Radiation Therapy may also be used as a form of treatment for some non-cancerous diseases, and is frequently delivered on a recurring outpatient basis. High-energy beams do not leave the patient 'radioactive' and there are no concerns about exposure of the patient to other persons post-treatment. See Linear Accelerator.

Intensity Modulated Radiation Therapy (IMRT): IMRT is an advanced external beam radiation therapy which utilizes computer images to match radiation to the size and shape of a tumor. Through the use of multiple smaller beams from different angles and of varying intensities, IMRT varies the shape of the radiation delivered to the treatment area, minimizing damage to surrounding healthy tissue. See Stereotactic Radiosurgery.

Internal Radiation Therapy: The use of low-level radioactive implants or 'seeds' to deliver radiation to local tissue structures. Frequently implanted in tumors, the radioactive decay damages or destroys the immediately surrounding tissue. Implants are specifically chosen to match the prescribed radiation dose necessary to damage the tumor while protecting the surrounding healthy tissues. Radioactive implants are placed surgically. Depending upon the implant's intensity, patients may be 'radioactive' for a period of time post-implantation and may need to remain in hospital, segregated from others until the radioactive decay reduces the strength of the implant.

Linear Accelerator (Linac): Device which produces and delivers high-energy beams which, in the hospital setting, is used to damage or destroy targeted tissues or structures, frequently cancerous tumors, within the patient's body. See Stereotactic Radiosurgery.

Picture Archiving and Communication System (PACS): The digital capture, transfer and storage of diagnostic images. A PACS system consists of workstations for interpretation, image/data producing modalities, a web server for distribution, printers for file records, image servers for information transfer and holding, and an archive of off-line information. A computer network is needed to support each of these devices.

Stereotactic Radiosurgery: The process by which lower-intensity radiation beams are projected to the tumor or target area from multiple points of origin. This allows relatively high radiation doses to the target area while exposing the surrounding tissues to significantly lower levels of radiation energy. Stereotactic Radiosurgery equipment is available in both frame-based systems for treatment of head and neck, and frameless systems which can treat any anatomic area.

Treatment Planning: Following precise identification of the position, size and shape of a tumor or target area, typically through MR or CT based simulation, the optimal means of radiation therapy is planned in which the precise radiation doses are delivered to target areas while minimizing the radiation exposure to adjacent and surrounding tissues. This plan is typically mapped out three dimensionally and computer plotted to guide radiation therapy / radiosurgery.
