New Orleans, LA 70160

Attention: Mr. Robert Tewis
Project Manager

Subject: Permit Modification to Emergency Permit MVN 2010-1066-ETT
“Pass a Loutré A” Borrow Area

Dear Mr. Tewis,

This document is being submitted by OCPR as a permit modification to NOD-20 emergency permit (MVN 2010-1066-ETT) for the proposed “Pass a Loutré A” borrow area. The purpose of this modification is to extend the borrow area in Pass a Loutré to include “Pass a Loutré A” immediately adjacent to the pre-approved Hopper Dredge Disposal Area (HDDA).

The proposed Pass a Loutré A borrow area is illustrated in the attached drawings. These drawings illustrate the proposed boundaries of the borrow area (plan view) and cross sections showing maximum dredge and equipment depths. As shown, the boundaries of the borrow area allow for avoidance buffers for potential submerged cultural resources and pipelines.

This request has been coordinated with the appropriate regulatory agencies to avoid impacts to potential submerged cultural resources and to assess potential sediment contaminants. Enclosed please find the State Historic Preservation Office clearance letter and cultural resources survey results. Also enclosed please find the letter report detailing the sediment sampling analysis results.

In an effort to not negatively impact the schedule for completion of the sand berm, we are in need of your acceptance or denial of this request as soon as possible. Please let me know if you need any additional information to assist in your review of this modification request.

Sincerely,

Kristi Cantu

OFFICE OF THE LIEUTENANT GOVERNOR
DEPARTMENT OF CULTURE, RECREATION & TOURISM
OFFICE OF CULTURAL DEVELOPMENT

PAM BREAUX
SECRETARY

4 August 2010

Mr. Bob Routon
Office of Coastal Protection and Restoration
450 Laurel Ave.
Baton Rouge, La 70801

Dear Mr. Routon;

The State Historic Preservation Office (SHPO) has reviewed a letter dated 1 August 2010 submitted by Tidewater Atlantic Research, Inc., to CP&E Coastal Geology and Geomatics, Inc., concerning remote sensing survey of the proposed Pass a Loutre survey area. The survey was conducted at 50 m intervals using magnetometer and side-scan sonar investigations. Although this line spacing does not meet the recommendations of the SHPO for underwater investigations and some smaller resources may not have been identified, the Office recognizes the urgency of the situation and believes that the methods used provide sufficient information to assess the potential for cultural resources to be present in the project area.

Survey of the Pass a Loutre area identified 237 magnetic anomalies within the project area. Two pipelines, one cable, several vessels, floating dredge pipe and their associated ground tackle represent 81 of the anomalies. An additional 123 anomalies represent small objects and do not have signatures characteristic of submerged cultural resources. Our office does not have any concerns for any of these anomalies.

Seven clusters of magnetic anomalies may potentially represent submerged cultural resources. In addition, one sonar target may also represent a submerged cultural resource. Tidewater Atlantic recommends, and SHPO concurs, that placing a 300 foot buffer around each cluster or target will allow them to be avoided during the dredging operation. In addition, Tidewater Atlantic's review of the available historic data for the Pass a Loutre channel indicates that many of these potential submerged cultural resources lie 40 or more feet below normal water level. If the dredging is restricted to less than 35 feet below surface, none of the potential submerged cultural resources will be impacted. Tidewater Atlantic recommends, and SHPO concurs, that if these strategies can be implemented, there will be no adverse affects to historic properties in the survey area.

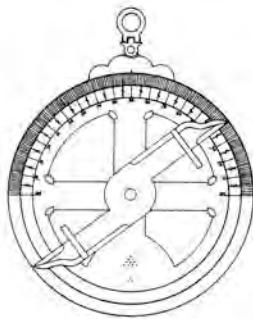

If you have any questions or concerns, please contact Dr. Chip McGimsey at cmcgimsey@crt.state.la.us, or [REDACTED]

Sincerely,

A handwritten signature in black ink, appearing to read "Phil Boggan".

1 August 2010

Jeffrey L. Andrews, PSM, CH
Vice President
CPE Coastal Geology and Geomatics
Coastal Planning & Engineering, Inc.
2481 NW Boca Raton Blvd.
Boca Raton, Florida 33431

Dear Mr. Andrews:

We reviewed the remote-sensing data for the Pass A Loutre survey area at Head of Passes (Figure 1). The submerged cultural resource survey was carried out at 50-meter line spacing. Analysis of the magnetometer data identified a total of 237 magnetic anomalies (Figure 2 & Table A). One charted pipeline and one uncharted pipeline are present in the survey area. The charted pipeline extends north to south across the survey area near the western end. The uncharted pipeline extends north to south across the survey area near the eastern end. A total of 46 anomalies are associated with pipelines in the survey area. A charted cable crosses the survey area between the two pipelines. Nineteen additional anomalies are associated with the cable crossing. Vessels, floating dredge pipe, and the associated ground tackle were responsible for another 16 anomalies along the north side of the western island.

Buffers are established around 7 concentrations of anomalies. Although it is impossible to determine whether those concentrations represent vessel remains or modern debris, the signature characteristics and spatial associations compare favorably with anomaly concentrations associated with historic shipwrecks. A total of 33 anomalies are included in buffers A, B, C, D, E, F and G (Figure 2).

Of the remaining 123 anomalies, 91 have signature characteristics indicative of small single objects. The characteristics of those anomalies indicate a potential association with small objects such as short sections of pipe, cable and chain or small anchors, drums, traps and other similar debris. Those anomalies are not recommended for avoidance. The final 32 anomalies have signature characteristics that are indicative of more substantial single or small multiple objects. However none are associated with anomalies on adjacent survey lines that might suggest an association with more complex material. Although it is not possible to better assess the nature of material generating those signatures, the scope of modern maritime activity in the project vicinity could be responsible for the deposition of many of those objects. Those anomalies are not recommended for avoidance.

Analysis of the sidescan sonar data (Figure 3 and Table B) provides only limited insight into the nature of material generating most of the magnetic anomalies. Aside from the images of moored vessels, dredge pipe and the associated ground tackle, only one sonar contact was associated with specific magnetic anomalies. PALSS-10 confirmed that wire was associated with anomalies 16, 17 and 142. One sonar contact, PALSS-17 was determined to be sufficiently complex to merit buffering (Buffer H) as potentially associated with the remains of a small vessel.

In assessing both the potential historical association of anomalies in the survey area and the impacts of dredging in the Pass A Loutre/Head of Passes survey area, consideration has been given to historical charted water depths. As early as 1839 water depths in the area surveyed by the Bureau of Topographical Engineers ranged from 42 to 53 feet (Figure 4). By 1874, depths in the project area ranged from 24 feet just downstream of a shoal near Head of the Passes to a maximum of 84 feet adjacent to the south shoreline. Along the south shoreline in the project area depths ranged from 64 to 84 feet (Figure 5).

By that time plans to restrict and channel the flow of water through Pass A Loutre were being considered and as early as 1881 sills were constructed across the river at Head of Passes to accomplish that objective (Figure 6). The sills channeled water along the south shore in the project area and depths documented as early as 1874 remained relatively constant through 1901 (Figure 7). By 1934 charted depths in the survey area ranged from 122 to 19 feet (Figure 8). A shoal building up along the southern shoreline appears to have been the origin of the two islands currently in the survey area. Above that shoal at Head of the Passes the water depth on the 1934 Chart reached 122 feet. Below the shoal depths along the south shoreline were charted at 54 and 61 feet.

Cartographic evidence indicates that the historical bottom in much of the project area was below 35 feet in the survey area. The islands now present are relatively modern features (Figure 9) that developed first as a charted shoal around 1900. That shoal migrated east over approximately 80 years to fill in much of the deepwater channel on the south side of the river.

Based on our assessment of the remote sensing data, anomaly clusters isolated by buffers should be avoided unless material generating those signatures can be identified and determined to have no historical significance. While it is difficult to determine if the remaining anomalies are associated with historic vessel remains on the basis of available data, the distribution, signature characteristics and nature and scope of current maritime activities in the study area indicate that modern debris is likely associated with most of the anomalies.

Pass A Loutre was one of the major routes for vessels entering the Mississippi until well into the 20th century. However, none of the charts examined identify shipwrecks in the project survey area. Only one obstruction appears on the contemporary navigation chart and it is not included on the 1934 chart. No AWOIS information could be found to document the nature of the obstruction.

Examination of the charts does indicate that historic vessel remains in the survey area could well lie below the depth of proposed dredging if dredge cuts are limited to 35 feet and are designed around the historical channel depths. Available charts dating as early as 1839 confirm that water depths in the channel were over 40 feet. Along the south shoreline charted depths were well in excess of 40 feet until shoaling developed into the islands that are present today. While no remote sensing data are available for the island locations, both formed in areas where historical water depths were in excess of 40 feet. If dredging in those areas is limited to 35 feet historically significant vessel remains should be protected.

Best regards,

Gordon P. Watts, Jr., Ph.D., RPA

St. Petersburg, FL 33701

RE: Sediment Sampling and Analysis Letter Report No. 5
Analytical Results for Samples Collected June 12 through 14, 2010
and June 19 through 25, 2010

Dear Mr. Suthard:

This Letter Report No. 5 presents the analytical results for the sediment samples and areas listed below.

- June 12, 2010 - Hewes Point Area 6 (Including Borrow Area 6a)
- June 13, 2010 - Re-Handling Area RH-2
- June 14, 2010 - Re-Handling Area 35-E
- June 19, 2010 - Hewes Point Area (Including Borrow Areas CH-A, CH-B and HD-A)
- June 20, 2010 - Hewes Point Area (Including Borrow Areas CH-A, CH-B and HD-A)
- June 21, 2010 - Hewes Point Area (Including Borrow Areas CH-A, CH-B and HD-A)
- June 21, 2010 - Re-Handling Area RH-1
- June 21, 2010 - Re-Handling Area RH-3
- June 22, 2010 - Re-Handling Area 25-5
- June 23, 2010 - Pass-a-Loutre Potential Borrow Area
- June 24, 2010 - Saint Bernard Shoals Borrow Area
- June 25, 2010 - Saint Bernard Shoals Borrow Area

General information for the sampling locations including sample location maps are presented in Attachment A. Analytical results are provided in Tables B-1 through B-12 in Attachment B.

Based on a comparison of the results reported to date with Louisiana Department of Environmental Quality (LDEQ) human health criteria for hydrocarbons in soil, the detected concentrations appear to be well below the screening levels considered protective of human health by LDEQ. The LDEQ soil criteria (Appendix M, UST Soil Screening Standards, Underground Storage Tank Closure/Change-in-Service Guidance Document, LDEQ, May 1,

Mr. Suthard
July 7, 2010
Page 2

2010) are provided in Attachment C. This comparison of the results to LDEQ human health screening criteria for soil should not be considered a comprehensive evaluation of the results.

The analytical results in the attached table were produced using US Environmental Protection Agency (USEPA) versions of the cited analytical methods. The analytical methods specified by LDEQ are modified versions of the USEPA methods and may group and report the TPH fractions (GRO/DRO/ORO) somewhat differently.

Please contact me at [REDACTED] if you have any questions.

Sincerely,

Terra Environmental
Services, Inc.

Attention: Mr. Robert Tewis
Project Manager

Subject: Permit Modification to Emergency Permit MVN 2010-1066-ETT
“Pass a Loutré A” Borrow Area

Dear Mr. Tewis,

This document is being submitted by OCPR as a permit modification to NOD-20 emergency permit (MVN 2010-1066-ETT) for the proposed “Pass a Loutré A” borrow area. The purpose of this modification is to extend the borrow area in Pass a Loutré to include “Pass a Loutré A” immediately adjacent to the pre-approved Hopper Dredge Disposal Area (HDDA).

The proposed Pass a Loutré A borrow area is illustrated in the attached drawings. These drawings illustrate the proposed boundaries of the borrow area (plan view) and cross sections showing maximum dredge and equipment depths. As shown, the boundaries of the borrow area allow for avoidance buffers for potential submerged cultural resources and pipelines.

This request has been coordinated with the appropriate regulatory agencies to avoid impacts to potential submerged cultural resources and to assess potential sediment contaminants. Enclosed please find the State Historic Preservation Office clearance letter and cultural resources survey results. Also enclosed please find the letter report detailing the sediment sampling analysis results.

In an effort to not negatively impact the schedule for completion of the sand berm, we are in need of your acceptance or denial of this request as soon as possible. Please let me know if you need any additional information to assist in your review of this modification request.

Sincerely,

Kristi Cantu
