VOC	volatile organic compound

1. INTRODUCTION

This report summarizes the groundwater monitoring and groundwater extraction and treatment system activities conducted during 2009 at the Santa Susana Field Laboratory (SSFL) located in Ventura County, California (Figure 1). This report is intended to fulfill the requirements of multiple regulatory programs being implemented at SSFL. These include requirements addressed in the Post-Closure Permit monitoring program approved by the California Environmental Protection Agency Department of Toxic Substances Control (DTSC), and the Leaking Underground Fuel Tank (LUFT) monitoring program overseen by DTSC. Specific requirements include performance of detection monitoring, evaluation monitoring, and interim corrective action monitoring as described in the SSFL (Facility) Post-Closure Permits and per the requirements of Title 22, California Code of Regulations (22 CCR), sections 66264.97 through 66264.99. The monitoring also complies with the Consent Order for Corrective Action issued on 16 August 2007 by DTSC (2007).

Monitoring activities conducted during the year included:

- measurement of water levels
- collection and laboratory analysis of groundwater samples
- measurement of groundwater extraction and treatment system water levels, pumping rates, and volumes

Historical data were summarized in previous reports by Groundwater Resources Consultants (GWRC, 2000) and Haley & Aldrich (2001 through 2010).

The scope of this annual report includes the following as required per the Post-Closure Permits and 22 CCR, sections 66264.97 through 66264.99:

- summary of water level measurements
- discussion of the rates and direction of groundwater movement
- summary of results of laboratory analyses of water samples
- summary of groundwater extraction volumes and extraction well water levels and flow rates
- summary of results of laboratory analyses of permitted treatment system influent and effluent water samples
- water level hydrographs
- groundwater elevation contour map of the Chatsworth Formation water table surface for October 2009
- contaminant concentration posting maps for the year 2009
- contaminant concentration versus time plots for 2000 through 2009

Additional groundwater monitoring was performed during the year as part of the Surficial Media Operable Unit Resource Conservation and Recovery Act (RCRA) Facility Investigation (SMOU RFI), and the Chatsworth Formation Operable Unit (CFOU) investigation (Montgomery Watson, 2000b). Groundwater samples were also collected for the analysis of radionuclide activities from select Area IV wells for the United States Department of Energy (DOE) and the Energy Technology Engineering Center (ETEC).

Light non-aqueous phase liquid (LNAPL) was measured in well RD-49A, and LNAPL samples were collected and analyzed in August 2009.

Groundwater samples were also collected in December 2009 for the analysis of Appendix IX constituents and radionuclides from the extraction wells proposed for Interim Measures (MWH, 2009a). Results of the sampling and analysis of these wells will be reported separately.

1.1 Report Organization

Groundwater monitoring results, including analytical results and water levels, are presented in Section 2. Section 3 discusses remedial systems at SSFL, and Section 4 discusses surface water discharge monitoring at National Pollutant Discharge Elimination System (NPDES) Outfalls 001 and 002.

2. GROUNDWATER MONITORING

Monitoring wells are scheduled to be sampled quarterly, semiannually, or annually in accordance with the current Sampling and Analysis Plan (SAP) for the Facility (GWRC, 1995a, 1995b). The exceptions include former SSFL water supply wells, wells where Westbay or FLUTe (Flexible Liner Underground Technologies, LLC) systems are installed, and piezometers. Figure 2 shows the locations of the wells. Figure 3 shows the locations of piezometers. Groundwater elevation contours for the first-encountered water in the Chatsworth Formation, as determined from groundwater levels measured during the fourth quarter, are shown in Figure 4.

Additional subsurface investigations have been conducted at SSFL as part of ongoing operable unit characterization programs. Groundwater characterization results and data interpretations from these additional investigations were transmitted to the DTSC in mid-December 2009 as presented in the "Draft Site-wide Groundwater Remedial Report" (MWH, 2009b) and the complementary "Draft Site Conceptual Model for the Migration and Fate of Contaminants in Groundwater at the Santa Susana Field Laboratory, Simi, California" (Cherry, McWhorter, and Parker, 2009). As a result of these ongoing investigations, additional information on site geology and groundwater conditions has become available. To the extent practicable, this new information is incorporated into quarterly and annual groundwater monitoring reports.

Site geology is summarized and illustrated on Figure 5. Data collected throughout SSFL indicate that geologic features may impact groundwater flow directions and rates (MWH, 2002, 2007b). The geologic features depicted on Figure 5 reflect the understanding and interpretation of both the stratigraphy and structure at SSFL and are based on nearly 10 years of field and office evaluations.

The following subsections provide a review of groundwater levels, and groundwater quality results and trends. Annual precipitation, year 2009 water level measurements, and historical water level hydrographs for select wells are presented in Tables I and II, and Appendix A, respectively. Hydrographs representing vertical profiles of 2009 water levels in wells installed with FLUTe and Westbay systems were prepared by MWH and are presented in Appendix A. Well construction details are summarized in Appendix C. FLUTe system, Westbay system, and piezometers construction details also are presented in Appendix C.

Groundwater quality results and trends (as presented in Tables V through XVII, Appendices E and F, and Figures 6 through 39) are discussed in Section 2.2.

2.1 Groundwater Occurrence, Elevations, and Flow Directions

Groundwater occurs at SSFL in alluvium, weathered bedrock, and unweathered bedrock (Montgomery Watson, 2000a; MWH, 2009b). First-encountered groundwater may be observed in any of these media under water table conditions. For the purposes of this report, "near-surface groundwater" is defined as groundwater that is present in the alluvium and weathered bedrock, and groundwater that occurs in the unweathered bedrock is referred to as "Chatsworth Formation groundwater".

Near-surface groundwater is indicated to have a limited areal extent at SSFL, typically occurring in alluvial drainages (topographic lows) and valleys (e.g., Burro Flats in Area IV, Figure 40). In many areas within SSFL, where near-surface groundwater exists, the near-surface and Chatsworth Formation groundwater appear to be vertically continuous and not separated by a vadose zone (MWH, 2003, 2009b).

Based on data collected to date, perched groundwater is also indicated to exist at locations within SSFL (MWH, 2003, 2009b). At these locations, a vadose zone within the Chatsworth Formation apparently separates near-surface and Chatsworth Formation groundwater.

2.1.1 Near-Surface Groundwater

Near-surface water level measurements were conducted at all but one of the shallow wells, and at the Engineering Chemistry Laboratory (ECL) French Drain and ECL Sump during 2009 (Table II and Appendix A). During 2009, water levels were also measured at a number of piezometers installed at the Facility (Table II). Near-surface groundwater elevations followed the general historical trend, highest during the late winter and spring rainy season, and lowest during the summer and early fall dry months.

Near-surface groundwater is indicated to occur in Quaternary alluvium distributed primarily in the Burro Flats area (Figures 5 and 40) and along ephemeral drainages, and in the upper weathered portion of the Chatsworth Formation. The alluvium is indicated to generally consist of unconsolidated sand, silt, and clay. This occurrence of near-surface groundwater is discontinuous at the Facility. Some portions of the alluvium and upper weathered Chatsworth Formation are saturated only during and immediately following a wet season.

Discharge of water to Facility storage reservoirs and channels as part of site operations can also affect groundwater levels in shallow wells. Most of these types of discharges have ceased.

For the 2009 water year, a total of 10.80 inches of precipitation was measured, approximately 40% below average since 1960 (Table I). A water year begins on October 1 of the previous calendar year and concludes on September 30.

Water level data from shallow wells continue to indicate that the lateral component of near-surface groundwater movement is generally a reflection of surface topography. Groundwater movement within the canyon areas is generally indicated in the same direction as surface flow in the canyons. Downward vertical movement of near-surface groundwater into the Chatsworth Formation bedrock is also indicated to occur (MWH, 2003).

2.1.2 Chatsworth Formation

The principal water bearing system at the Facility is the fractured Chatsworth Formation, predominantly composed of weak- to well-cemented sandstone with interbeds of siltstone and claystone. Several hydraulically significant features such as fault zones and shale beds are present at SSFL and may act as aquitards or otherwise influence the groundwater flow system (Montgomery Watson, 2000a; MWH, 2002, 2007).

2.1.2.1 Groundwater Elevations and Flow Conditions

Water level elevations were measured during the year at all but one of the Chatsworth Formation wells (Table II and Appendix A).

Water level elevations measured in Chatsworth Formation monitor wells during 2009 ranged from approximately 1,224 feet above mean sea level (MSL) at well RD-75 to about 1,894 feet above MSL at well RD-42 (Table II, Figure 4).

Discrete depth-interval water level data from Westbay- and FLUTe-equipped wells were collected by dataloggers and are presented in Table II and Appendix A.

The water level contour map, presented as Figure 4, was prepared using October 2009 water level elevations from the shallowest well in each Chatsworth Formation cluster, and from individual Chatsworth Formation wells at non-cluster locations. Groundwater levels in Chatsworth Formation wells were generally lower during the fourth quarter 2009 than during the fourth quarter 2008 (Haley & Aldrich, 2009a; Appendix A). The elevation of first water in the multi-port devices in some wells appears to vary from that previously observed in the open well boreholes.

The groundwater elevation contour map, Figure 4, is provided to satisfy, in part, the requirements of 22 CCR, section 66264.97 for determining groundwater flow rates and directions. A groundwater elevation contour map can be used in simple hydrogeologic settings to depict variations in the elevation of the water table surface, which can in turn be used to interpret apparent relative directions of groundwater flow. However, the groundwater elevation contours depicted in Figure 4 are not used to infer groundwater flow directions or rates of groundwater movement for the following reasons, among others:

- Several hydraulically significant features such as fault zones and shale beds are present at SSFL and may act as impediments to groundwater flow across them. Accordingly, while significant variations in the elevation of groundwater are present at SSFL, these differences may not necessarily indicate preferred directions of groundwater flow.

- Some water level elevations depicted may not represent the elevation of the first occurrence of groundwater due to the relatively long, open intervals of some of the monitoring wells. The water levels shown represent average heads over the screened or open interval.

- Groundwater flow directions and rates in fractured rock are likely influenced by the bedrock fracture network and characteristics of the bedrock matrix and possibly the orientation of structural features and stratigraphy.

- Estimates of groundwater flow rates and three-dimensional groundwater flow directions from areas within SSFL were made and are presented in the "Draft Site-wide Groundwater Remedial Investigation Report" (MWH, 2009b).

2.2 Groundwater Quality Results

The groundwater monitoring program at SSFL fulfills the requirements of multiple programs prescribed by:

- the Post-Closure Permits (DTSC, 1995);
- Class 1 and Class 2 Permit Modifications of the Post-Closure Permits (DTSC, 2001);
- the LUFT program overseen by DTSC;
- various characterization efforts conducted at SSFL including the CFOU groundwater investigation (Montgomery Watson, 2000b) and the SMOU RFI program (Ogden, 2000); and
- the Consent Order for Corrective Action issued on 16 August 2007 by DTSC (2007).

The Post-Closure Permit (PCP) monitoring programs include the Evaluation Monitoring Program and the Detection Monitoring Program (DTSC, 2001). Groundwater water quality monitoring conducted for the PCP monitoring program during the year included:

The Detection Monitoring Program:

- quarterly VOC sampling and analysis at detection monitoring and background wells;

The Evaluation Monitoring Program:

- annual Appendix IX and semiannual VOC sampling and analysis at point of compliance wells; and
- semiannual VOC sampling and analysis at evaluation monitoring and interim corrective action wells.

At five-year intervals, the Post-Closure Permit requires constituent of concern (COC) monitoring at wells in the Evaluation Monitoring and Detection Monitoring Programs. The last five-year COC monitoring required by the 1995 Post-Closure Permits was conducted in 2005 (Haley & Aldrich, 2006).

Monitoring for the various characterization efforts in progress at SSFL was conducted during the year as listed in Table IV.

Analyses Performed

The water quality analyses performed pursuant to the various monitoring programs are presented in Table IV.

During the year, both unfiltered (total dissolved and suspended solids) and filtered (dissolved solids) samples were collected for radionuclide analysis, except for tritium analyses. Unfiltered samples were collected for tritium analysis. Dissolved radionuclide samples were filtered using a 0.45 micron filter to remove suspended solids and preserved in the field prior to submittal to the laboratory for analysis. Total radionuclide samples were preserved in the field, but were not filtered.

DTSC collected split samples from Chatsworth Formation well WS-09 during the third and fourth quarters for the analysis of VOCs including 1,4-dioxane, gross alpha, gross beta, tritium, strontium-90 (Sr-90), filtered metals, hexavalent chromium, semi-volatile organic compounds (SVOCs), perchlorate, and dioxins and furans. Analytical results for WS-09 groundwater samples collected by Haley & Aldrich are reported in Tables VII, IX, X, XI, XII, and XVI.

Light non-aqueous phase liquid (LNAPL) was measured in well RD-49A, and LNAPL samples were collected and analyzed in August 2009. During the fourth quarter, measurements were made to determine if LNAPL was present in 13 wells and piezometers located in the vicinity of the ALFA test stands.

Groundwater samples were also collected for the analysis of Appendix IX constituents and radionuclides from the extraction wells proposed for Interim Measures in December 2009. Results of the sampling and analysis will be reported separately.

Reporting of Results

Groundwater sampling results for individual constituents are compared to drinking water limits for discussion purposes based on the availability of the following, in descending order of priority:

- Maximum Contaminant Levels (MCLs) promulgated by the Safe Drinking Water Act (SDWA) and 22 CCR, sections 64431 through 64449 and 64672 (California Department of Public Health [DPH], 2008);
- Regulatory action levels (RALs) for lead and copper (DPH, 2008);
- Notification levels (NLs; DPH, 2007b);

- Archived advisory levels (AALs; DPH, 2007a); and
- Secondary Maximum Contaminant Levels (SMCLs) which address aesthetics, such as taste and odor (USEPA, 2009).

It is important to note that groundwater at SSFL is not used as a drinking water supply. References to MCLs, RALs, NLs, AALs, and SMCLs are for purposes of discussion only.

Analytical results with concentrations greater than the method detection limit (MDL) but less than the reporting limit are qualified (flagged as estimated with a "J") to indicate the uncertainty associated with the quantification of these data. The approved Sampling and Analysis Plan (SAP) specifies analytical methods which are not sufficiently sensitive to detect the constituents of concern 1,4-dioxane (EPA Method 8260) and n-nitrosodimethylamine (NDMA; EPA Method 8270C) at the California Department of Public Health (DPH) notification levels. Therefore, Boeing uses more sensitive DPH-approved analytical methods, including EPA Method 8260-SIM for 1,4-dioxane and EPA Method 1625M for NDMA.

Pursuant to the groundwater monitoring program, groundwater samples were collected during 2009 from shallow and Chatsworth Formation wells, and off-site wells. A summary of the analyses conducted at individual wells during 2009 is presented in Table B-I of Appendix B.

Water quality results for groundwater samples are tabulated in Tables V through XVII. Constituents detected for the first time in groundwater sampled from individual locations are presented in Table V. Constituents previously detected in groundwater sampled from each location but reported at new maximum concentrations are presented in Table VI. If an analytical result triggered permit-required re-sampling, this is discussed below and summarized in Table XVIII.

Analytical results for trichloroethene (TCE) and cis-1,2-dichloroethene (cis-1,2-DCE), the most prevalent COCs detected in groundwater samples collected from the site, are posted on Figures 6 through 9 for near-surface and Chatsworth Formation groundwater. Maximum concentrations of constituents of concern detected during 2009 plus the formerly detected COCs ethylbenzene, m- & p-xylenes, and o-xylene are posted on Figures 10 through 13 and 15 through 36. Figures are not presented for the constituents of concern that were not detected in groundwater samples collected during 2009. Figure 14 presents maximum perchlorate concentrations detected during the year. Figure 37 presents wells sampled for Appendix IX constituents during 2009 excluding the December sampling of proposed Interim Measures extraction wells. Concentrations of Appendix IX constituents detected during the year are posted on Figures 38 and 39.

Concentration versus time plots for constituents of concern at permitted wells are presented in Appendix F.

2.2.1 Near-Surface Groundwater

Groundwater samples collected from shallow wells and piezometers as part of the groundwater monitoring program in 2009 are listed in Table IV. Some shallow wells scheduled for groundwater sampling were dry or contained insufficient water for sampling when monitored (Table II and Appendix A). Analytical results are summarized in Tables V through XVII. The analytical results were within historical ranges (GWRC, 2000; Haley & Aldrich, 2001 through 2010; MWH, 2003), with the exceptions noted below. Deviations from historical water quality results for analytes greater than the reporting limits are discussed below. Results of verification sampling are discussed below and in section 2.2.4.

2.2.1.1 LUFT Program

Shallow wells RS-01, RS-30, RS-31, and RS-32 were scheduled for semiannual LUFT program sampling during 2009. These wells had insufficient water for sampling during the year. The next semiannual monitoring of shallow LUFT program wells is scheduled for the first quarter 2010.

2.2.1.2 Evaluation Monitoring Program/Interim Corrective Action Program

VOC concentrations detected in groundwater samples collected from shallow evaluation monitoring wells and interim corrective action wells during the year were within historical ranges (Table VII) except for first-time detected analytes (Table V), or analytes reported at concentrations above previously reported maximum concentrations (Table VI), or both.

Results of verification sampling conducted during the year are presented in Table XVIII. Verification sampling results indicated that:

- Chloroethane was not detected in groundwater samples collected from interim corrective action well ES-21 during the second quarter.

- 1,1,2-Trichloroethane and chloroform were not detected in groundwater samples collected from evaluation monitoring well HAR-11 during the first quarter. Shallow well HAR-11 was sampled using procedures from the 1995 SAP (GWRC, 1995a, 1995b) after a Snap Sampler system had been installed and removed during the third and fourth quarters 2008 (Haley & Aldrich, 2009a).

Some evaluation monitoring wells and interim correction action wells were sampled for additional constituents as part of other monitoring programs, and those results are discussed in the respective sections within this report.

Under the 1995 Post-Closure Permits, evaluation monitoring wells and interim corrective action wells are scheduled to be monitored semiannually for VOCs and every five years for COCs.

2.2.1.3 Point of Compliance Program

Shallow point of compliance wells SH-04, RS-08, HAR-14, and HAR-15 were scheduled for Appendix IX monitoring during the second quarter 2009. RS-08 and SH-04 had insufficient water for sampling during the second, third, and fourth quarters. Results of the monitoring are reported in Section 2.2.3 and Table XIII.

Verification samples scheduled for the analysis of chlorinated pesticides at well SH-04 could not be collected because this well had insufficient water for sampling during the year. Verification samples (primary, duplicate, split, and field blank) will be rescheduled for the first quarter 2010 to determine if chlorinated pesticide detections reported in SH-04 groundwater samples during the second quarter 2008 are repeatable in consecutive groundwater samples.

Under the 1995 Post-Closure Permits, point of compliance wells are scheduled for semiannual VOC sampling and analysis during the second and fourth quarters.

2.2.1.4 Near-Surface Groundwater Radiochemistry Analyses

During the year, near-surface groundwater samples were collected from select wells for the analysis of gross alpha and gross beta radioactivity, tritium, gamma-emitting radionuclides, strontium-90 (Sr-90), and isotopic uranium (Table IX).

During the year, both unfiltered (total dissolved and suspended solids) and filtered (dissolved solids) samples were collected for radionuclide analysis, except for tritium analyses. Unfiltered samples were collected for tritium analysis. Dissolved radionuclide samples were filtered using a 0.45 micron filter to remove suspended solids and preserved in the field prior to submittal to the laboratory for analysis. Total radionuclide samples were preserved in the field, but were not filtered.

A comparison was made of radionuclide detects in sample pairs where both the filtered and unfiltered samples from a well were analyzed during 2009. Sample pairs in which a radionuclide was detected in only the filtered or unfiltered sample, or was not detected in either sample, were not included in this analysis. Comparisons were made on the reported activity and did not include the error or a range of standard deviation. Additional pairs of filtered and unfiltered radionuclide detects would be required to conduct a robust statistical analysis.

	2009 Near-Surface Groundwater Sample Count			
Radionuclide (detected in both the filtered and unfiltered samples)	Filtered activity < Unfiltered activity	Filtered activity = Unfiltered activity	Filtered activity > Unfiltered activity	Total
Gamma-emitting radionuclides	Not applicable			
Gross alpha	3	0	0	3
Gross beta	1	0	1	2
Strontium-90	Not applicable			
Tritium	Not applicable			
Uranium-233/234	2	0	0	2
Uranium-235	1	0	1	2
Uranium-238	1	1	0	2

Not applicable: Only unfiltered samples were collected for tritium analysis. For other radionuclides, detectable activity was not reported in both the filtered and unfiltered samples.

Gross Alpha Activity

The gross alpha activities in near-surface groundwater samples collected during the year were less than the drinking water MCL of 15 picoCuries per liter (pCi/L) and were within the activity range of past samples collected from these wells (Haley & Aldrich, 2009a). Calculations of adjusted gross alpha are presented in Table IX for samples where isotopic uranium activity and gross alpha activity were analyzed.

Gross Beta Activity

The gross beta activities in near-surface groundwater samples collected during the year were less than the drinking water MCL of 50 pCi/L and were within the activity range of past samples collected from these wells (Haley & Aldrich, 2009a).

Tritium Activity

The tritium activities in near-surface groundwater samples collected during the year were less than the drinking water MCL of 20,000 pCi/L and were within the activity range of past samples collected from these wells (Haley & Aldrich, 2009a).

Gamma Emitters

Gamma-emitting radionuclide activities were not detected in near-surface groundwater samples collected during the year.

Strontium-90

Sr-90 was not detected in near-surface groundwater samples collected during the year.

Uranium

The uranium isotope activities in near-surface groundwater samples collected during the year were less than the drinking water MCL of 20 pCi/L and were within the activity range of past samples (Haley & Aldrich, 2009a). The uranium isotope activities in near surface groundwater samples collected during the year appeared to be naturally occurring uranium as indicated by the activity ratios of uranium-234:uranium-238 (U-234:U-238). Naturally occurring uranium (non-enriched and non-processed) has a U-234:U-238 activity ratio of approximately 1:1 (Federal Register, 2000).

2.2.1.5 Other Monitoring

Some shallow Facility wells sampled during the year were not part of the LUFT, evaluation, interim corrective action, or point of compliance programs. These wells are not included in any prescribed monitoring program. Results of this monitoring are summarized in Section A.

In support of the SMOU RFI program, groundwater samples were collected from piezometers and shallow wells as part of the data gap investigation for SMOU Reporting Groups as listed in Table IV. SMOU RFI monitoring results are summarized in Section B below.

A. *Other Monitoring Results* – Analytical results for VOCs and metals were within historical ranges.

B. *SMOU RFI Data Gap Results* - Groundwater samples were collected from piezometers and shallow wells as part of the data gap investigations for SMOU RFI Reporting Groups as listed in Table IV. Results are summarized in Tables VII, VIII, X, XI, XII, XIV, XV, XVI, and XVII.

Hexavalent chromium, SVOCs, polycyclic aromatic hydrocarbons (PAHs), perchlorate, and polychlorinated biphenyls (PCBs) were not detected (Tables X, XI, XII, and XVI).

Where detected, NDMA concentrations were below the NDMA NL of 0.01 micrograms per liter (μg/L) (Table XI).

Where detected, formaldehyde concentrations were below the formaldehyde NL of 100 μg/L (Table XIV).

Results of analyses for VOCs including 1,4-dioxane are reported in Table VII. Results of analyses for diesel range organics (DROs) and gasoline range organics (GROs) are reported in Table VIII. Results of analyses for dioxins and furans are reported in Table XVI. Results of analyses for hydrazines are reported in Table XVII.

Inorganic constituent concentrations were not greater than drinking water MCLs with the following exceptions (Table XV):

- Nitrate was detected at concentrations greater than the drinking water MCL of 45 milligrams per liter (mg/L) in the groundwater samples collected from piezometer PZ-103 during the third and fourth quarters at concentrations of 55 J and 58 mg/L, respectively. The nitrate concentrations in PZ-103 groundwater were within the concentration range of past samples collected from PZ-103 (Haley & Aldrich, 2009a).

Results for filtered and unfiltered metals analyzed for the SMOU RFI program were below MCLs and NLs except as noted in Table X.

Some analytes were detected for the first time in the groundwater samples collected for the SMOU RFI data gaps investigation (Table V).

Concentrations of some analytes detected in near-surface groundwater samples collected for the SMOU RFI program during the year were greater than previously reported concentrations (Table VI).

Results of verification sampling conducted during the year are presented in Table XVIII. Verification sampling results indicated that

- Chlorinated pesticides analyzed in primary, duplicate, and split groundwater samples collected from well SH-08 occurred in one or two samples (0.0033 J to 0.0022 J μg/L) during the second quarter. None of the individual pesticides were confirmed in all three samples. Previously detected pesticides from samples collected in May 2008 (Haley & Aldrich, 2009a) were not detected in the second quarter samples except for aldrin and alpha-BHC at concentrations ranging up to an estimated 0.0079 and 0.0033 μg/L, respectively.

Verification samples scheduled for the analysis for chlorinated pesticides at SH-02, SH-03, SH-04, SH-05, and SH-09 could not be collected during the year because these wells had insufficient water for sampling. Verification samples (primary, duplicate, split, field blank, and equipment rinsate) will be

rescheduled for the first quarter 2010 to determine if chlorinated pesticide detections reported in shallow well groundwater samples during 2008 are repeatable in consecutive groundwater samples.

2.2.2 Chatsworth Formation

Analytical results of Chatsworth Formation groundwater samples collected during 2009 are summarized in Tables V through XVII. Overall, results were consistent with historical results (GWRC, 2000; Haley & Aldrich, 2001 through 2009a). Deviations from past water quality results for analytes reported above the reporting limits are discussed below. Results of verification sampling are discussed below and in section 2.2.4.

Chatsworth Formation groundwater samples collected as part of the groundwater monitoring program in 2009 are listed in Table IV.

Per the Post-Closure Permits, Appendix IX monitoring of background well RD-06 and detection well RD-37 occurred during the third quarter 2009 as a result of the confirmed presence of carbon disulfide and cis-1,2-dichloroethene (cis-1,2-DCE), respectively, in verification groundwater samples collected during the second quarter 2009. On June 12, 2009, carbon disulfide and cis-1,2-DCE were verified at low levels (parts per billion, ppb) in groundwater samples collected from wells RD-06 (carbon disulfide) and RD-37 (cis-1,2-DCE) as part of the Detection Monitoring program. Current permit conditions required Boeing to propose an alternate Background monitoring well (RD-69) and an alternate Detection monitoring well (RD-70). RD-06 and RD-37 were monitored pursuant to the evaluation monitoring program beginning in the third quarter 2009 (Boeing, 2009b).

2.2.2.1 LUFT Program

VOC and gasoline range organics (GRO) analytical results for the semiannual sampling of Chatsworth Formation wells monitored under the LUFT program were within historical ranges during 2009 (Tables VII and VIII) except for first-time detected analytes (Table V), or analytes reported at concentrations above previously reported maximum concentrations (Table VI), or both.

Results of verification sampling conducted during the year are presented in Table XVIII. Verification sampling results indicated that

- cis-1,2-DCE was detected in the primary and duplicate groundwater samples collected from detection monitoring well RD-37 during the second quarter at estimated concentrations of 0.1 μg/L and 0.1 μg/L, respectively. cis-1,2-DCE was not detected in the split sample. cis-1,2-DCE was not detected in samples collected from well RD-37 during the third and fourth quarters.

Chatsworth Formation wells RD-36A and RD-38A were scheduled for semiannual LUFT program sampling during 2009. These wells had insufficient water for sampling during the year.

The next semiannual monitoring of Chatsworth Formation LUFT program wells is scheduled for the first quarter 2010.

2.2.2.2 Detection Monitoring Program

VOCs were not detected above reporting limits in groundwater samples collected from detection monitoring and background wells during 2009 (Table VII) with the following exceptions:

- Carbon disulfide was detected at a concentration of 0.8 μg/L in groundwater collected from background monitoring well RD-06 during the first quarter. Carbon disulfide was detected in primary, duplicate, and split groundwater samples collected from RD-06 during the second quarter at estimated concentrations of 0.4 μg/L, 0.5 μg/L, and 0.63 μg/L, respectively. Carbon disulfide was not detected in samples collected from well RD-06 during the third quarter. The California drinking water NL for carbon disulfide is 160 μg/L.

- TCE was detected at a concentration of 0.9 μg/L in groundwater collected from background monitoring well RD-06 during the first quarter. The MCL for TCE is 5 μg/L. TCE was not detected in verification groundwater samples (primary, duplicate, split, and field blank) that were collected and analyzed during the second quarter 2009.

Per the Post-Closure Permits, Appendix IX monitoring of background well RD-06 occurred during third quarter 2009. RD-06 was monitored pursuant to the evaluation monitoring program beginning in the third quarter 2009 (Boeing, 2009b).

VOCs detected at estimated concentrations below the reporting limit in groundwater samples collected during the year included:

- Bromoform and dibromochloromethane were detected at estimated concentrations of 0.3 μg/L and 0.2 μg/L, respectively, in the samples collected from detection monitoring well RD-43A during the third quarter. The California drinking water MCL for total trihalomethanes (bromoform, chloroform, bromodichloromethane, and dibromochloromethane) is 80 μg/L. Neither bromoform nor dibromochloromethane were detected in verification groundwater samples (primary, duplicate, split, and field blank) that were collected and analyzed during the fourth quarter 2009.

- Chloromethane was detected in the groundwater sample collected from detection monitoring well RD-51C for the first time (Table V) during the first quarter. Neither a drinking water MCL nor a California NL have been established for chloromethane. Chloromethane was not detected in verification samples (primary, duplicate, split, and field blank) that were collected and analyzed in the second quarter. Chloromethane was not detected in samples collected from well RD-51C during the third and fourth quarters.

- Chloromethane was detected at estimated concentrations of 0.3 μg/L in the duplicate sample collected from background monitoring well RD-06 and 0.2 μg/L in the primary sample collected from background monitoring well RD-67 during the second quarter. Neither a drinking water MCL nor a California NL have been established for chloromethane. Chloromethane was not detected in verification samples (primary, duplicate, split, and field blank) that were collected and analyzed from well RD-67 in third quarter. RD-06 was monitored pursuant to the evaluation monitoring program beginning in the third quarter

2009 (Boeing, 2009b). Chloromethane was not detected in samples from RD-06 in the third quarter.

- cis-1,2-DCE was detected in the groundwater sample collected from detection monitoring well RD-37 for the first time at an estimated concentration of 0.1 μg/L (Table V) during the first quarter. cis-1,2-DCE was detected in primary and duplicate samples when verification samples (primary, duplicate, split, and field blank) were collected and analyzed in the second quarter. cis-1,2-DCE was not detected in the split sample. cis-1,2-DCE was not detected in samples collected from well RD-37 during the third and fourth quarters. The MCL for cis-1,2-DCE is 6 μg/L.

  Per the Post-Closure Permits, Appendix IX monitoring of background well RD-37 occurred during the third quarter. RD-37 was monitored pursuant to the evaluation monitoring program beginning in the third quarter (Boeing, 2009b).

- Tetrachloroethene was detected for the first time in groundwater samples collected from detection monitoring well RD-43C during the fourth quarter at an estimated concentration of 0.23 μg/L. The MCL for tetrachloroethene is 5 μg/L. Verification sampling (primary, duplicate, split, and field blank) will be scheduled for first quarter 2010 to determine if the tetrachloroethene detection reported in the RD-43C groundwater sample is repeatable in consecutive groundwater samples.

- TCE was detected in primary and duplicate groundwater samples collected from background monitoring well RD-13 during the first, second, and third quarters at estimated concentrations ranging up to 0.3 μg/L. These concentrations are consistent with past samples collected from RD-13 since 2000 (Haley & Aldrich, 2001). TCE was not detected in samples collected from well RD-13 during the fourth quarter. The MCL for TCE is 5 μg/L.

- Vinyl chloride was detected at estimated concentrations ranging up to 0.2 μg/L in the groundwater samples collected from detection monitoring well RD-70 during the first, second, and third quarters. These concentrations are consistent with past samples collected from RD-70 (Haley & Aldrich, 2009a, 2009b, 2009c). Vinyl chloride was not detected in samples collected from well RD-70 during the fourth quarter. The California drinking water MCL for vinyl chloride is 0.5 μg/L.

Carbon disulfide concentrations were within historical ranges in groundwater collected from detection monitoring and background wells except for first-time detected analytes (Table V), or analytes reported at concentrations above previously reported maximum concentrations (Table VI), or both.

Proposed as a replacement background well for RD-06 (Boeing, 2009c), well RD-69 was scheduled for one year of quarterly groundwater sampling and analysis of constituents of concern and background monitoring parameters per the Post-Closure Permits beginning in the fourth quarter 2009.

NDMA was not detected in groundwater samples collected from well RD-69 (Table XIV). VOCs, 1,4-dioxane, and SVOCs were not detected in RD-69 groundwater (Tables VII, XI, and XIV).

Other constituents of concern in groundwater samples collected from background well RD-69 were less than detectable concentrations except for formaldehyde which at a concentration of 110 μg/L exceeded the California drinking water NL of 100 μg/L (Table XIV).

Background monitoring parameters in RD-69 groundwater (Table XI) did not exceed primary drinking water MCLs.

Verification samples scheduled at detection monitoring well RD-39A could not be collected during the year because the well did not contain sufficient water to collect representative samples. TCE was detected in the RD-39A groundwater sample at 1 μg/L during the first quarter 2007 (Haley & Aldrich, 2008). Verification sampling at RD-39A will be scheduled for the first quarter 2010 to determine if TCE is repeatable in consecutive groundwater samples.

Some detection monitoring and background wells were sampled for additional constituents as part of other monitoring programs, and those results are discussed in the respective sections within this report.

Under the 1995 Post-Closure Permits, Chatsworth Formation detection monitoring and background wells are scheduled to be monitored quarterly for VOCs and every five years for COCs.

2.2.2.3 Evaluation Monitoring Program/Interim Corrective Action Program

Concentrations of VOCs in groundwater samples collected from Chatsworth Formation evaluation monitoring wells and interim corrective action wells sampled during 2009 (Table VII) were within historical ranges except for first-time detected analytes (Table V), or analytes reported at concentrations above previously reported maximum concentrations (Table VI), or both.

Results of verification sampling conducted during 2009 are presented in Table XVIII. Verification sampling results indicated that

- Chloromethane was not detected in groundwater samples collected from evaluation monitoring wells RD-26 or RD-51B during the second quarter or subsequent quarters.

Per the Post-Closure Permits, samples collected from evaluation monitoring wells RD-06 and RD-37 were analyzed for Appendix IX constituents for the first time during the third quarter (Table XIII). Metals concentrations in RD-06 and RD-37 groundwater samples were below drinking water MCLs, NLs, and RALs.

Inorganic constituents were not detected in RD-06 and RD-37 groundwater samples except for the following first-time detected analytes (Table V):

- Cyanide was detected in a groundwater sample collected from evaluation monitoring well RD-06 for the first time during the third quarter. The concentration was below the California drinking water MCL. Verification samples scheduled for the analysis of cyanide at well RD-06 could not be collected during the fourth quarter because this well required maintenance. Verification samples (primary, duplicate, split, and field blank) will be

rescheduled for the first quarter 2010 to determine if the cyanide detection reported in the RD-06 groundwater sample during the third quarter 2009 are repeatable in consecutive groundwater samples.

- Sulfide was detected in groundwater samples collected from evaluation monitoring well RD-37 for the first time during the third quarter. Neither a drinking water MCL nor a California NL have been established for sulfide.

VOCs, SVOCs, and pesticides were not detected above method detection limits in samples collected from evaluation monitoring wells RD-06 and RD-37 during the third quarter except for the following first-time detected analytes (Table V):

- Gamma-BHC (Lindane) was detected in a groundwater sample collected from evaluation monitoring well RD-06 for the first time. The concentration was below the California drinking water MCL. Verification samples scheduled for the analysis of gamma-BHC at well RD-06 could not be collected during the fourth quarter because this well required maintenance. Verification samples (primary, duplicate, split, and field blank) will be rescheduled for the first quarter 2010 to determine if the gamma-BHC detection reported in the RD-06 groundwater sample during the third quarter is repeatable in consecutive groundwater samples.

- 2,4,5-TP (Silvex) was detected in a groundwater sample collected from evaluation monitoring well RD-37 for the first time. The concentration was below the California drinking water MCL. Results of verification sampling conducted during the fourth quarter indicated that 2,4,5-TP was not detected in groundwater samples collected from well RD-37 (Table XVIII).

- 1,4-Dioxane was detected in groundwater samples collected from evaluation monitoring well RD-37 for the first time. The concentrations were below the California drinking water NL.

- 1,2,3,4,6,7,8,9-Octachlorodibenzo-p-dioxin (OCDD) was detected in a groundwater sample collected from evaluation monitoring well RD-37 for the first time. When converted to 2,3,7,8-Tetrachlorodibenzo-p-dioxin toxic equivalency (2,3,7,8-TCDD TEQ) (van den Berg et al., 2006), the concentration of the detected congener in the groundwater samples collected from RD-37 was less than the drinking water MCL of 30 picograms per liter (pg/L) for 2,3,7,8-TCDD. Results of verification sampling results conducted during the fourth quarter indicated that common laboratory contaminant OCDD was not detected in groundwater samples collected from well RD-37 (Table XVIII).

Under the 1995 Post-Closure Permits, evaluation monitoring wells and interim corrective action wells are scheduled to be monitored semiannually for VOCs and every five years for COCs.

2.2.2.4 Chatsworth Formation Operable Unit Constituents of Concern Analyses

As part of the ongoing CFOU investigation, quarterly groundwater sampling and analysis for constituents of concern was conducted at 26 wells located in seven areas: Canyon, Bowl, Alfa, Bravo, ELV/B204, Delta, and System Test Laboratory IV (STL

IV) (Figures 2 and 40). Groundwater samples for perchlorate analysis were also collected from these wells, although not part of the CFOU sampling plan.

During 2009, 25 of the 26 CFOU investigation wells were sampled for the analysis of COCs (Table XIV). RD-51A had insufficient water for sampling during the year.

Fluoride and nitrate concentrations were below drinking water MCLs of 2.0 mg/L and 45 mg/L, respectively, in groundwater samples collected from wells in the CFOU investigation during 2009. Formaldehyde concentrations were below the California drinking water NL of 100 μg/L. Ammonia concentrations detected in 2009 ranged up to 1.4 mg/L, which was detected in the RD-04 groundwater sample during the third quarter. Neither a drinking water MCL nor a California NL have been established for ammonia.

NDMA concentrations were within historical ranges in groundwater samples collected from CFOU investigation wells during 2009 except for concentrations above previously reported maximum concentrations reported in wells HAR-18 and WS-09 (Table VI). NDMA was detected at concentrations equal to or greater than the California drinking water NL of 0.01 μg/L in groundwater samples collected from wells HAR-07, HAR-08, HAR-18, HAR-20, RD-01, and RD-49B (Tables XI and XIV).

VOC concentrations, including 1,4-dioxane, were within historical ranges in groundwater collected from the CFOU investigation wells during the year (Table VII) except for first-time detected analytes (Table V), or analytes reported at concentrations above previously reported maximum concentrations (Table VI), or both:

- Chloromethane was detected in groundwater samples collected from evaluation monitoring well RD-51B and detection monitoring well RD-51C for the first time during the first quarter. Chloromethane was not detected in verification samples (primary, duplicate, split, and field blank) from wells RD-51B and RD-51C in the second quarter.

- Chloromethane was detected in groundwater samples collected from evaluation monitoring well RD-49C for the first time during the second quarter.

- cis-1,2-DCE was detected at new maximum concentrations in interim corrective action wells RD-04 and RD-09 during the third quarter.

- Vinyl chloride was detected at a new maximum concentration in interim corrective action well HAR-18 during the third quarter.

SVOCs were not detected in groundwater samples collected from CFOU investigation wells in 2009 with the exception of NDMA and the following SVOC detections (Table XI):

- Bis(2-ethylhexyl) phthalate, a common laboratory contaminant (USEPA, 2008), was detected in the groundwater samples collected from wells HAR-18, HAR-20, RD-01, RD-02, RD-49A, RD-49C, RD-58A, RD-58B, and WS-06 during the year. The California MCL for bis(2-ethylhexyl) phthalate is 4 μg/L. The laboratory contaminant detections of bis(2-ethylhexyl) phthalate were above this screening value.

- Phenol was detected in the groundwater sample collected from CFOU investigation well HAR-07 for the first time in the fourth quarter (Table V). The concentration was below the California Archived Advisory Level (AAL). Verification sampling (primary, duplicate, split, and field blank) will be scheduled for first quarter 2010 to determine if the phenol detection reported in the HAR-07 groundwater sample is repeatable in consecutive groundwater samples.

Perchlorate concentrations in groundwater samples collected from CFOU investigation wells during the year were within historical ranges (Table XII) except for first-time detected perchlorate (Table V), or perchlorate reported at concentrations above previously reported maximum concentrations (Table VI), or both:

- Perchlorate was detected in groundwater samples collected from well HAR-20 for the first time during the first quarter. The MCL for perchlorate is 6 μg/L. Perchlorate was not detected in follow-up samples (primary, duplicate, and split samples) collected during the second quarter.

2.2.2.5 Monitoring of Perimeter Wells and Private Off-Site Wells and Springs

Analytical results indicated that VOCs were not detected above the reporting limits in groundwater samples collected from perimeter wells and private off-site wells during 2009 (Table VII) with the following exception:

- Toluene was detected in the groundwater sample collected from the FLUTe system installed in perimeter well RD-50 at a concentration of 4.7 μg/L during the first quarter and 1.9 μg/L during the third quarter. Toluene was not detected in groundwater samples collected prior to FLUTe installation at well RD-50. The MCL for toluene is 150 μg/L.

NDMA was not detected in groundwater collected from private off-site well OS-28 during 2009 (Table XI). Results of analyses for cyanide and dissolved metals in groundwater samples collected during the year from perimeter wells were within historical ranges (Table X).

Results of analyses for isopropyl alcohol, DROs, and dissolved metals in groundwater samples collected from perimeter wells as part of SMOU RFI data gap investigations are discussed in Section 2.2.2.8.

2.2.2.6 Point of Compliance Program

Chatsworth Formation point of compliance wells HAR-07, HAR-16, and HAR-17 were sampled for annual Appendix IX monitoring during the second quarter 2009. Appendix IX analytical results are discussed in Section 2.2.3 and presented in Table XIII and Figures 38 and 39.

Results of verification sampling conducted during the year are presented in Table XVIII. Verification sampling results indicated that

- 1,2,3,4,6,7,8-HpCDF was not detected in groundwater samples collected from point of compliance well HAR-17 during the third quarter.

Under the 1995 Post-Closure Permits, point of compliance wells are scheduled for semiannual VOC sampling and analysis during the second and fourth quarters.

2.2.2.7 Chatsworth Formation Radiochemistry Analyses

During 2009, Chatsworth Formation groundwater samples were collected from select wells for the analysis of gross alpha and gross beta radioactivity, gamma-emitting radionuclides, Sr-90, tritium, and isotopic uranium (Table IX).

Results of analyses are compared to California drinking water MCLs for discussion purposes only. Groundwater at SSFL is not used as a drinking water supply.

During 2009, both unfiltered (total dissolved and suspended solids) and filtered (dissolved solids) samples were collected for analysis, except for tritium analyses. Unfiltered samples were collected for tritium analysis. Dissolved radionuclide samples were filtered using a 0.45 micron filter to remove suspended solids and preserved in the field prior to submittal to the laboratory for analysis. Total radionuclide samples were preserved in the field, but were not filtered.

A comparison was made of radionuclide detects in sample pairs where both the filtered and unfiltered samples from a well were analyzed during 2009. Sample pairs in which a radionuclide was detected in only the filtered or unfiltered sample, or was not detected in either sample, were not included in this analysis. Comparisons were made on the reported activity and did not include the error or a range of standard deviation. Filtering does not appear to result in any consistent reduction in sample activity. Additional pairs of filtered and unfiltered radionuclide detects would be required to conduct a robust statistical analysis.

	2009 Chatsworth Formation Groundwater Sample Count			
Radionuclide (detected in both the filtered and unfiltered samples)	Filtered activity < Unfiltered activity	Filtered activity = Unfiltered activity	Filtered activity > Unfiltered activity	Total
Gamma-emitting radionuclides	Not applicable			
Gross alpha	26	0	11	37
Gross beta	27	0	26	53
Strontium-90	Not applicable			
Tritium	Not applicable			
Uranium-233/234	1	0	2	3
Uranium-235	1	0	2	3
Uranium-238	1	0	2	3

Not applicable: Only unfiltered samples were collected for tritium analysis. For other radionuclides, detectable activity was not reported in both the filtered and unfiltered samples.

Groundwater samples were also collected for the analysis of radionuclide activities from the proposed extraction wells for Interim Measures in December 2009. These results will be reported separately.

Gross Alpha Activity

The gross alpha activities in Chatsworth Formation groundwater samples collected during 2009 were less than the drinking water MCL of 15 pCi/L when adjusted for uranium activities pursuant to EPA drinking water regulations (Federal Register, 2000). Uranium samples were not collected for fourth quarter WS-09 well. Gross alpha activities were within historical ranges except for first-time detected gross alpha (Table V), or gross alpha reported at activities above previously reported maximum activities (Table VI), or both. Calculations of adjusted gross alpha are presented in Table IX for samples where isotopic uranium activity and gross alpha activity were analyzed.

Gross Beta Activity

The gross beta activities in Chatsworth Formation groundwater samples collected during 2009 were less than the drinking water MCL of 50 pCi/L. Gross beta activities were within historical ranges except for first-time detected gross beta (Table V), or gross beta reported at activities above previously reported maximum activities (Table VI), or both.

Gamma Emitters

Gamma-emitting radionuclide activities were not detected in Chatsworth Formation groundwater samples collected during 2009 except for americium-241 in well RD-33B, potassium-40 in wells RD-15, RD-22, RD-33B, RD-34A, RD-34B, RD-63, and RD-64, and cesium-137 in wells RD-17, RD-23, and RD-27 during the first quarter (Haley & Aldrich, 2009b). After recount and data reduction, the Cs-137 results for RD-17, RD-23, and RD-27 were confirmed while the other results (K-40 and Am-241) were not detected above their respective minimum detectable activities (MDAs). The detected Cs-137 activities represented the first time Cs-137 has been detected in groundwater samples collected from each of these wells (Table V). The detections are not consistent with prior analyses, particularly the presence of gamma-emitters in the dissolved fraction. Groundwater samples were collected from RD-17, RD-23, and RD-27 in July 2009 and analyzed for gamma-emitting radionuclides, and Cs-137 was not detected in any sample. Changes were identified and reported in an errata issued for the first quarter 2009 report (Haley & Aldrich, 2010).

Tritium Activity

The tritium activities in Chatsworth Formation groundwater samples collected during 2009 were less than the drinking water MCL of 20,000 pCi/L and within the activity range of past samples collected from these wells (Haley & Aldrich, 2009a).

Strontium-90

Sr-90 activities were not detected in Chatsworth Formation groundwater samples collected during 2009 with the following exception:

- Sr-90 was detected in groundwater samples collected from well WS-09 for the first time during the fourth quarter (Table V). Concentrations were below California drinking water MCL. Eberline Services verified the initial sample results and confirmed that sample results were correctly reported. This sample was recounted three times and each recount confirmed the Sr-90 detect.

Validation also confirmed the Sr-90 detect. Verification sampling (primary, duplicate, split, and field blank) will be scheduled for first quarter 2010 to determine if the Sr-90 detection reported in the WS-09 groundwater sample is repeatable in consecutive groundwater samples.

Uranium

The sum of uranium isotope activities in Chatsworth Formation groundwater samples were detected at activities greater than the drinking water MCL of 20 pCi/L in groundwater samples collected from well RD-07 FLUTe port Z3 during the first and third quarters. The uranium isotope activities for all samples were within the activity range of past samples except for activities listed in Table VI. The uranium isotope activities in Chatsworth Formation groundwater samples collected during 2009 appeared to be naturally occurring uranium as indicated by the activity ratios of uranium-234:uranium-238 (U-234:U-238). Naturally occurring uranium (non-enriched and non-processed) has a U-234:U-238 activity ratio of approximately 1:1 (Federal Register, 2000).

2.2.2.8 Other Monitoring

Some Chatsworth Formation Facility wells sampled during the quarter were not perimeter wells, were not part of the CFOU investigation, nor the LUFT, detection monitoring, evaluation monitoring, interim corrective action, or point of compliance programs. These wells are not included in any prescribed monitoring program. Results of this monitoring are summarized in Section A through C below.

In support of the SMOU RFI program, groundwater samples were collected from Chatsworth Formation wells as part of the data gap investigation for SMOU Reporting as listed in Table IV. SMOU RFI monitoring results are summarized in Section B below.

Wells located in the vicinity of the ALFA test stands were monitored for LNAPL. Results are summarized in Section C below.

A. *Other Monitoring* - Results of analyses for VOCs, fuel hydrocarbons, and metals and cyanide are reported on Tables VII, VIII, and X, respectively.

Analytical results for VOCs, fuel hydrocarbons, metals, and cyanide were within historical ranges except for first-time detected analytes (Table V), or analytes reported at concentrations above previously reported maximum concentrations (Table VI), or both.

DTSC collected split samples for Chatsworth Formation well WS-09 during the third and fourth quarters for the analysis of VOCs including 1,4-dioxane, gross alpha, gross beta, tritium, Sr-90, filtered metals, hexavalent chromium, SVOCs, perchlorate, and dioxins and furans. Analytical results for WS-09 groundwater samples collected by Haley & Aldrich are reported in Tables VII, IX, X, XI, XII, and XVI. Analytical results for WS-09 were within historical ranges except for first-time detected analytes (Table V), or analytes reported at concentrations above previously reported maximum concentrations (Table VI), or both.

Results of analyses for dissolved and total iron and manganese collected at Chatsworth Formation well WS-09A during the third quarter for treatability investigations are reported on Table X.

B. *SMOU RFI Data Gap* - Groundwater samples were collected from Chatsworth Formation wells as part of the data gap investigations for SMOU RFI Reporting Groups as listed in Table IV. Results are summarized in Tables VII, VIII, X, XI, XII, XIV, XVI, and XVII.

Isopropyl alcohol, hexavalent chromium, SVOCs, PAHs, nitroaromatics, nitramines, NDMA, perchlorate, PCBs, and hydrazines were not detected (Tables VII, X, XI, XII, XVI, and XVII).

Where detected, formaldehyde concentrations were below the formaldehyde NL of 100 μg/L (Table XIV).

Results of analyses for VOCs are reported in Table VII. Results of analyses for DROs are reported in Table VIII.

Results for filtered metals analyzed for the SMOU RFI program were below MCLs and NLs except where indicated in Table X.

Arsenic was detected in the filtered groundwater sample collected from SMOU RFI well RD-44 for the first time during the fourth quarter (Table V). The concentration was below the California drinking water MCL. Verification sampling (primary, duplicate, split, and field blank) will be scheduled for first quarter 2010 to determine if the arsenic detection reported in the RD-44 groundwater sample is repeatable in consecutive groundwater samples.

Dioxins and furans were not detected in groundwater samples collected from RD-07 and RD-20 with the exceptions noted in Table XVI. When converted to 2,3,7,8-tetrachlorodibenzo-p-dioxin (2,3,7,8-TCDD) toxic equivalency (TEQ) (van den Berg et al., 2006), the concentrations of the detected dioxin and furan congeners in Chatsworth Formation groundwater samples were less than the drinking water MCL of 30 pg/L for 2,3,7,8-TCDD.

Some analytes were detected for the first time in the groundwater samples collected for the SMOU RFI data gaps investigation (Table V).

Concentrations of some analytes detected in Chatsworth Formation groundwater samples collected for the SMOU RFI program during the year were greater than previously reported concentrations (Table VI).

C. *LNAPL* - On 05 August 2009, light non-aqueous phase liquid (LNAPL) was measured in well RD-49A. The thickness was determined to be 0.03 feet at a depth of 25.80 to 25.83 feet below the measuring point. A sample of the LNAPL was collected and submitted to Lancaster Laboratories and analyzed for Total Petroleum Hydrocarbons by EPA method 8015.

Lancaster reported results in the following carbon ranges:

RD-49A LNAPL, 05 August 2009		
Carbon Range	Result (mg/L)	% of Total
C8-11	53 J	1.7%
C12-14	1200 J	38%
C15-20	1600 J	51%
C21-30	290 J	9.4%
C8-30	3100	---

J = Estimated value. Analyte is detected at a level less than the reporting limit and greater than or equal to the MDL.

The chemical composition suggests a middle distillate similar to jet fuel. Based on the chemical use in the area and distribution of petroleum hydrocarbons in soil samples in the vicinity of the ALFA test stands, the LNAPL is suspected to be liquid petroleum rocket propellant.

During the fourth quarter, measurements were made to determine if LNAPL was present in 13 wells and piezometers located in the vicinity of the ALFA test stands including HAR-09, HAR-11, PZ-049, PZ-059, PZ-060, PZ-061, PZ-070, PZ-153, PZ-154, PZ-155, PZ-156, RD-49A, and RS-08.

LNAPL was indicated in PZ-059 and RD-49A.

Well Identifier	Depth to LNAPL (feet)	Depth to Water (feet)	LNAPL Thickness (feet)
PZ-059	24.89	24.90	0.01
RD-49A	26.10	26.13	0.03

2.2.3 Appendix IX Sampling

During the second quarter 2009, the seven point of compliance wells (shallow wells SH-04, RS-08, HAR-14, and HAR-15; and Chatsworth Formation wells HAR-07, HAR-16, and HAR-17) were scheduled for sampling and analysis of Appendix IX constituents. Shallow wells SH-04 and RS-08 contained insufficient water for sampling (Table II). The point of compliance wells were also scheduled for semiannual sampling of VOCs during the fourth quarter.

Appendix IX analytical results are presented in Table XIII. Appendix IX analytical results for point of compliance wells were within historical ranges except for first-time detected analytes (Table V), or analytes reported at concentrations above previously reported maximum concentrations (Table VI), or both.

1,2,3,4,6,7,8-Heptachlorodibenzofuran (1,2,3,4,6,7,8-HpCDF) was detected for the first time in the duplicate groundwater sample collected from point of compliance well HAR-17 (Table V). When converted to 2,3,7,8-TCDD TEQ (van den Berg et al., 2006), the concentration of the detected furan congener in the groundwater samples collected from HAR-17 was less than the drinking water MCL of 30 pg/L for 2,3,7,8-TCDD. Verification sampling results conducted during the third quarter indicated that 1,2,3,4,6,7,8-HpCDF was not detected in groundwater samples collected from point of compliance well HAR-17.

Verification samples scheduled for the analysis of chlorinated pesticides at well SH-04 could not be collected during the year because this well did not contain sufficient water to collect

representative samples. Verification samples (primary, duplicate, split, and field blank) will be scheduled for the first quarter 2010 to determine if chlorinated pesticide detections reported in SH-04 groundwater samples during the second quarter 2008 are repeatable in consecutive groundwater samples (Haley & Aldrich, 2009a).

Per the 1995 Post-Closure Permits, the point of compliance wells are scheduled to be monitored annually for Appendix IX constituents and semiannually for VOCs.

Groundwater samples were also collected for the analysis of Appendix IX constituents from the extraction wells proposed for Interim Measures in December 2009. Results will be reported separately.

2.2.4 Results of 2009 Verification Sampling

Table XVIII summarizes the results of 2009 verification sampling and analyses.

Verification groundwater samples (primary, field duplicate, split, and field blank samples) were collected and analyzed during the year following detections of analytes in groundwater samples collected during prior quarters.

Verification sampling results indicated that the targeted constituents were not repeatable in consecutive groundwater samples.

2.2.5 Scheduled 2009 Verification Sampling

Table XVIII summarizes the scheduled 2009 verification and follow-up sampling groundwater monitoring schedule.

The schedule for quarterly groundwater monitoring complied with that specified in the 1995 Post-Closure Permits. Previous results indicated that additional sampling was to be scheduled to confirm if select constituents are detectable in groundwater samples.

2.2.6 Proposed First Quarter 2010 Groundwater Monitoring Schedule

Table XVIII summarizes the proposed first quarter 2010 verification and follow-up sampling groundwater monitoring schedule.

The schedule proposed for the first quarter 2010 groundwater monitoring complies with that specified in the 1995 Post-Closure Permits. The fourth quarter 2009 and previous results indicated that additional sampling be scheduled for the first quarter 2010 to confirm if select constituents are detectable in groundwater samples.

2.2.7 Quality Assurance and Quality Control

Appendix D presents the quality assurance assessment for 2009.

Boeing has performed additional quality assurance and quality control (QA/QC) analyses to assess the presence of NDMA in surface water and groundwater samples, laboratory-supplied trip blanks, field blanks, locally-supplied municipal drinking water, and method blanks.

The analytical results produced from this additional QA/QC sampling in the past indicated that NDMA was sometimes detected in QC samples at concentrations below the NL of 0.010 μg/L, but above the MDLs, indicative of the introduction of the compound from field sampling procedures or analytical laboratory processes, thus leading to false positive readings. To minimize the reporting of false positive readings, NDMA analytical results from EPA Method 1625M were previously presented at the reporting limit of 0.010 μg/L. Continuous process improvements in the field and laboratory procedures have reduced the magnitude and frequency of detects in QC samples. As a result, NDMA results from EPA Method 1625M are now presented at the reporting limit of 0.005 μg/L.

FLUTe systems are installed in wells RD-07, RD-21, RD-22, RD-23, RD-33A, RD-50, RD-54A, RD-57, RD-64, and RD-65. Benzene, chlorobenzene, ethylbenzene, and toluene reported in groundwater samples collected from some of these wells may be chemicals introduced by FLUTe system components (Table VII). Groundwater samples collected from these wells prior to FLUTe installation using the procedures described in the SAP did not have detectable concentrations of these compounds (GWRC, 2000; Haley & Aldrich, 2001, 2002a, 2003a). Based on communication with FLUTe system designer Carl Keller, concentrations of benzene and toluene have been observed in groundwater samples collected with FLUTe systems at other sites and may be attributed to equipment components (Keller, personal communication, 2003). Potential FLUTe-equipment contaminants are qualified "F" for benzene and toluene, or "S" (Suspect) for chlorobenzene and ethylbenzene.

3. REMEDIAL SYSTEMS

3.1 Remedial Systems Activities

There are five permitted remedial systems (Alfa, Bravo, Delta, STL-IV, and WS-05 Area) at SSFL. None were in operation during 2009. The Area I Road and Canyon air-stripping units (ASUs) and the RD-09 ultraviolet (UV)/hydrogen peroxide system were placed on "stand-by" status in 2001 as part of a Post-Closure Permit modification granted by DTSC (DTSC, 2001). Operation of the Delta system was discontinued in August 2007, and operation of the WS-05 Area UV/hydrogen peroxide system was discontinued in December 2007. Construction permitting for a new treatment system was initiated in October 2007, and construction is slated for completion in 2010. Operational data for each permitted system during the quarter are presented in monthly reports from EnviroSolve Corporation (2009a through 2010b).

The shallow and Chatsworth Formation extraction wells were not in operation during the year. Cumulative groundwater extraction volumes and cumulative VOC mass removed by each treatment system through 2008 were previously summarized (Haley & Aldrich, 2009a). Cumulative extraction volume and VOC mass removal at each permitted system are presented in Appendix G, Figures G-1 to G-6.

Monthly groundwater level monitoring has been suspended at the inactive extraction wells.

In July 2008, Boeing, NASA, and DOE submitted a revised Work Plan to DTSC for groundwater Interim Measures at SSFL. The objective of the work plan is to comply with DTSC's requirements for conducting groundwater Interim Measures at SSFL as specified in the 16 May 2008 letter (DTSC, 2008a). Comments by DTSC on the Interim Measures work plan (MWH, 2008) were received in November 2008 (DTSC, 2008b). An addendum to the Interim Measures work plan was submitted on 30 January 2009 (Boeing, 2009a) and is pending review by DTSC.

4. SURFACE WATER DISCHARGE

Surface water discharge is regulated by NPDES permit No. CA-0001309. Discharge limits and results of water quality analyses of surface water samples collected at Outfalls 001 and 002 (Figure 40) during 2009 are presented in Appendix G, Tables G-I through G-VI. Discharge Monitoring Reports (DMR) for the SSFL NPDES outfalls are available at www.boeing.com\aboutus\environment\santa_susana\water_quality.html.

TABLE I

SUMMARY OF ANNUAL RAINFALL
MEASURED AT THE SANTA SUSANA FIELD LABORATORY, 1960-2009
BOEING SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY, CALIFORNIA

Water Year Ending in	Precipitation (inches)	Water Year Ending in	Precipitation (inches)
1960	10.52	1985	9.64
1961	6.18	1986	23.55
1962	24.79	1987	6.27
1963	13.74	1988	17.75
1964	9.96	1989	9.46
1965	16.06	1990	8.38
1966	27.18	1991	15.10
1967	23.99	1992	32.21
1968	19.54	1993	36.23
1969	32.11	1994	12.52
1970	11.81	1995	29.91
1971	16.79	1996	21.81
1972	8.68	1997	15.44
1973	20.69	1998	41.24
1974	16.11	1999	8.84
1975	16.58	2000	12.07
1976	10.99	2001	17.05
1977	13.91	2002	5.70
1978	40.06	2003	25.65
1979	22.96	2004	16.93
1980	28.61	2005	28.60
1981	16.25	2006	21.97
1982	12.11	2007	6.15
1983	40.93	2008	15.72
1984	9.50	2009	10.80

Average Annual Precipitation (1960-2009) = 18.38 Inches

NOTE: Precipitation reported annually for the period of October of the prior year through September of the calendar year indicated. Precipitation was adjusted for Water Years 2001-2008 to be consistent with data reported by MWH in "Draft Site-Wide Groundwater Remedial Investigation Report, Santa Susana Field Laboratory, Ventura County, California." December 2009.

TABLE II
SUMMARY OF WATER LEVEL DATA, 2009
BOEING SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY, CALIFORNIA

Well Identifier	Geological Unit	Date of Measurement	Reference Point Elevation (feet above MSL)	Depth to Water (feet)	Static Water Level Elevation (feet above MSL)	Notes
ECL Sump	Shallow	02/03/2009	1511.00	10.44	1500.56

See last page of table for notes and abbreviations.

TABLE II
NOTES AND ABBREVIATIONS

1. (A) = Artesian with hydrostatic head above land surface.

2. (C) = Depth to water measured from top of casing. During the monitoring period, pumps had been removed from several wells to allow hydrogeologic testing. Measuring point elevation not adjusted.

3. (ft btc) = Feet below top of casing.

4. MSL = Mean Sea Level.

5. NM = Not measured.

6. PZ = piezometer

7. UTM = Unable to measure.

8. --- = No data available or not applicable.

9. Chatsworth = Chatsworth Formation geological unit.

10. Shallow = Near-surface groundwater geological unit.

11. (*) = Unable to measure due to the following:
    - OS-24 The partially removed FLUTe system prevented water level measurement.
    - PZ-084 Access restrictions.
    - PZ-085A Access restrictions.
    - PZ-085B Access restrictions.
    - PZ-087A Access restrictions.
    - PZ-087B Access restrictions.
    - RD-02 Access restrictions.
    - RD-14 Obstruction in casing prevented water level measurement.
    - RD-30 Vault welded shut to prevent surface water from infiltrating the well.
    - RD-45A Partial collapse prevented water level measurement.
    - RD-68B Open valve prevented pressure reading of artesian water level.
    - RS-28 Vault welded shut to prevent surface water from infiltrating the well.

12. Static water level elevations were calculated using the following equation:
    $E_W = E - D + C$

    Where:
    - E_W = Elevation of water above mean sea level (feet)
    - E = *Elevation above sea level at point of measurement (feet)*
    - D = *Depth to water (feet)*
    - C = *Calibration correction factor (feet)*

13. (1) = FLUTe installed in well. Water levels recorded by dataloggers at saturated ports were provided by MWH for the following wells:

14. (2) = Westbay installed in well. Water levels recorded by cable probe were provided by MWH for the wells listed below.

A "Zone" is the designation given to a section of the Westbay that includes a measuring port and a pumping port. A pumping port enables the zone to be purged.

A "QA" is a section of the Westbay that only has a measuring port. This interval can be sampled, but not purged.

TABLE III
WATER QUALITY FOOTNOTES, 2009
BOEING SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY, CALIFORNIA

LCS/LCSD	=	Laboratory control sample/Laboratory control sample duplicate.
LNAPL	=	Light non-aqueous phase liquid.
MCL	=	Maximum Contaminant Level, California primary drinking water standard.
MDA	=	Minimum detectable activity.
NA	=	Not applicable; no MCL promulgated.
ND	=	Not detected. Constituent not detected in one or both samples. RPD calculation not applicable.
NL	=	Advisory California Notification Level for unregulated chemical contaminants.
NV	=	Not valid. An RPD calculation is not valid since at least one of the laboratories reported a detected concentration less than or equal to the product of five times the reporting limit times the dilution factor.
RAL	=	Regulatory Action Level to be met at a customer tap.
RPD	=	Replicate percent difference. RPDs were calculated only if the detected concentration exceeded the product of five times the reporting limit times the dilution factor.

$$\left|((X_1 - X_2)/X_{ave})\right| \times 100$$

X_1 = primary concentration observed;
X_2 = split concentration observed; and
X_{ave} = average concentration = $((X_1 - X_2)/ 2)$

Well OS-09 has been also referred to as Brandeis-Bardin Campus "Bathtub Well No. 1".

n-Nitrosodiphenylamine decomposes in the GC inlet forming diphenylamine. The result reported for n-Nitrosodiphenylamine represents the combined total of both compounds.

Any radionuclide activity detected is reported by the laboratory, though the reported activity may be less than the overall laboratory error.
Radionuclide analytical results that are less than the instrument background count are shown as negative values.

As discussed in Appendix D, project specific MDAs were not always attained due in part to matrix conditions
(e.g., dissolved and suspended solids) and limitations in the prescribed analytical methods (e.g., sample volumes, counting times).

Laboratory

Eberline	=	Eberline Services of Richmond, California.
GEL	=	General Engineering Laboratories of Charleston, South Carolina.
Lancaster	=	Lancaster Laboratories of Lancaster, Pennsylvania.
TA-Denver	=	TestAmerica of Arvada, Colorado.
TA-Irvine	=	TestAmerica of Irvine, California.
TA-Knoxville	=	TestAmerica of Knoxville, Tennessee.
TA-N.Canton	=	TestAmerica of North Canton, Ohio.
Truesdail	=	Truesdail Laboratories, Inc. of Tustin, California.
Weck	=	Weck Laboratories of City of Industry, California.

TABLE III
WATER QUALITY FOOTNOTES, 2009
BOEING SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY, CALIFORNIA

Sample Preparation

Dissolved sample	=	Dissolved metal and radionuclide samples were filtered using a 0.45 micron filter and preserved in the field.
Total sample	=	Total metal and radionuclide samples were preserved in the field, but were not filtered. Tritium samples were not filtered and were not preserved in the field.

Cyanide samples were not filtered.

Qualifier and Analysis Codes

---	=	Analysis not performed.
*	=	First time detected and first time analyzed for the detected analyte.
B	=	Analyte was detected in the associated method blank.
F	=	Sampled through multi-level FLUTe ports. Footnoted results are not representative of past groundwater samples, and may have been introduced in the FLUTe samples by compressed nitrogen gas, electrical tape and/or FLUTe components.
J	=	Estimated value. Result may receive a J flag for the following reasons: - Analyte (non-radiological) is detected at a level less than the RL and greater than or equal to the MDL. - Analyte (radiological) is detected at a level less than contract-required MDA and greater than or equal to the MDA. - Quality control deficiencies have compromised result accuracy (see Appendix D for details).
L	=	Laboratory contaminant.
Q	=	Estimated maximum concentration.
R	=	Rejected result (see Appendix D for details).
S	=	Suspect result. Result is not representative of past groundwater samples.
U	=	Not detected above the MDL or MDA. Numerical value represents the MDL for non-radiological data and the radionuclide activity for radiological data.
UJ	=	Not detected. Estimated detection limit as a result of analytical quality control deficiencies (see Appendix D for details).
Z	=	FLUTe sample port number.

Geological Unit

Chatsworth	=	Chatsworth Formation geological unit.
Shallow	=	Near-surface groundwater geological unit.

Units

mg/L	=	Milligrams per liter.
NTU	=	Nephelometric turbidity units.
pCi/L	=	PicoCuries per liter.
pg/L	=	Picograms per liter.
ug/L	=	Micrograms per liter.

TABLE III
WATER QUALITY FOOTNOTES, 2009
BOEING SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY, CALIFORNIA

Water Quality Criteria

AAL	=	Archived Advisory Level.
MCL	=	Maximum Contaminant Level, California primary drinking water standard.
NA	=	Not applicable; no MCL promulgated.
NL	=	Advisory California Notification Level for unregulated chemical contaminants.
RAL	=	Regulatory Action Level to be met at a customer tap.
SMCL	=	California Secondary Drinking Water MCL. SMCL limits for chloride and sulfate are listed in order of Recommended, Upper, and Short Term limits.
Total	=	MCL for sum of xylene isomers, PCBs, 1,3-dichloropropene isomers, uranium isotopes or all chromium valences.
TTHM	=	MCL for total trihalomethanes including bromoform, chloroform, bromodichloromethane, and dibromochloromethane.

AALs, MCLs, SMCLs, RALs, and NLs are from the California Department of Public Health (2006, 2007a, 2007b, 2008).

The pH SMCL is from the Environmental Protection Agency (2009).

Bolded results on Table V First-Time Detects, Table VI Updated Maximum Concentrations, Table IX Radionuclide, Table X Metals, and Table XV Inorganics are detected greater than the MCL or NL.

Monitoring Program

AreaIV	Area IV general monitoring (non-permit). Variable monitoring parameters and frequency.
Background	Background Wells, Post-Closure Permit. Monitored for VOCs on a quarterly basis.
CFOU RFI	Chatsworth Formation Operable Unit RCRA Facility Investigation. Constituents of Concern and Perchlorate monitored on a quarterly basis.
Detection	Detection Monitoring Program, Post-Closure Permit. Monitored for VOCs on a quarterly basis.
Evaluation	Evaluation Monitoring Program, Post-Closure Permit. Monitored for VOCs on a semiannual basis.
POC-AppIX	Point of Compliance Wells, Post-Closure Permit. Monitored for Appendix IX constituents on an annual basis and VOCs on a semiannual basis.
ICA	Interim Corrective Action Wells, Post-Closure Permit. Monitored for VOCs on a semiannual basis.
LUFT	Leaking Underground Fuel Tank sampling. Monitored for VOCs and fuels on a semiannual basis.
Off-site	Non-permit offsite wells. Variable monitoring parameters and frequency.
Perimeter	Perimeter Wells, Non-Permit. Monitored for VOCs on a quarterly or semiannual basis.
POC	Point of Compliance Wells, Post-Closure Permit. Monitored for Appendix IX constituents on an annual basis and VOCs on a semiannual basis.
SMOU RFI	Surficial Media Operable Unit RCRA Facility Investigation. Variable monitoring parameters and frequency.
Voluntary	Other non-permit sampling. Variable monitoring parameters and frequency.

TABLE III
WATER QUALITY FOOTNOTES, 2009
BOEING SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY, CALIFORNIA

Background Parameters	EPA Method
Alkalinity as CaCO3	SM2320B
Ammonia-N	350.3
Chloride, Fluoride, Nitrate, Sulfate	300.0
Metals (dissolved): Calcium, Iron, Magnesium, Manganese, Potassium, Sodium, Strontium, Zinc	6010B
pH	9040B
Specific conductivity	120.1
Total Dissolved Solids	160.1
Turbidity	180.1

Dioxin and Furan Analytes		
1,2,3,4,6,7,8-HpCDF	=	1,2,3,4,6,7,8-Heptachlorodibenzofuran
1,2,3,4,6,7,8-HpCDD	=	1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin
1,2,3,4,7,8,9-HpCDF	=	1,2,3,4,7,8,9-Heptachlorodibenzofuran
1,2,3,4,7,8-HxCDF	=	1,2,3,4,7,8-Hexachlorodibenzofuran
1,2,3,4,7,8-HxCDD	=	1,2,3,4,7,8-Hexachlorodibenzo-p-dioxin
1,2,3,6,7,8-HxCDF	=	1,2,3,6,7,8-Hexachlorodibenzofuran
1,2,3,6,7,8-HxCDD	=	1,2,3,6,7,8-Hexachlorodibenzo-p-dioxin
1,2,3,7,8,9-HxCDF	=	1,2,3,7,8,9-Hexachlorodibenzofuran
1,2,3,7,8,9-HxCDD	=	1,2,3,7,8,9-Hexachlorodibenzo-p-dioxin
1,2,3,7,8-PeCDF	=	1,2,3,7,8-Pentachlorodibenzofuran
1,2,3,7,8-PeCDD	=	1,2,3,7,8-Pentachlorodibenzo-p-dioxin
2,3,4,6,7,8-HxCDF	=	2,3,4,6,7,8-Hexachlorodibenzofuran
2,3,4,7,8-PeCDF	=	2,3,4,7,8-Pentachlorodibenzofuran
2,3,7,8-TCDD	=	2,3,7,8-Tetrachlorodibenzo-p-dioxin
2,3,7,8-TCDD TEQ	=	2,3,7,8-Tetrachlorodibenzo-p-dioxin toxic equivalency
2,3,7,8-TCDF	=	2,3,7,8-Tetrachlorodibenzofuran
OCDF	=	1,2,3,4,6,7,8,9-Octachlorodibenzofuran
OCDD	=	1,2,3,4,6,7,8,9-Octachlorodibenzo-p-dioxin

2,3,7,8-TCDD TEQs were calculated using 2005 toxic equivalency factors (van den Berg et al., 2006).

When one or more dioxin congeners are detected, the 2,3,7,8-TCDD TEQ is the sum of the products of the detected dioxin congener concentration multiplied by that congener's toxic equivalency factor (TEF). When all dioxin congeners are not detected, the TEQ is the sum of the products of dioxin congener concentration at the MDL multiplied by that congener's TEF.

Organophosphorous compounds	8141A	TA-Denver	Lancaster	TA-Denver	Lancaster	TA-Denver	Lancaster	---	---
Pentachlorophenol*	8270SIM	TA-Denver	None	TA-Denver	None	TA-Denver	None	---	---
Polychlorinated biphenyl (PCBs)	8082	TA-Denver	Lancaster	TA-Denver	Lancaster	TA-Denver	Lancaster	---	---
Semi-volatile organic compounds (SVOCs)	8270C	TA-Denver	Lancaster	TA-Denver	Lancaster	TA-Denver	Lancaster	---	---
Sulfide	376.2	TA-Denver	Lancaster	TA-Denver	Lancaster	TA-Denver	Lancaster	---	---
Volatile organic compounds (VOCs)	8260B	TA-Denver	Lancaster	TA-Denver	Lancaster	TA-Denver	Lancaster	---	---

Primary samples collected during the second quarter at point of compliance well HAR-07 for fluoride, nitrate, and perchlorate were analyzed by TA-Denver.
Primary samples collected during the third quarter at point of compliance well HAR-07 for 1,4-dioxane, VOCs, and SVOCs were analyzed by Lancaster.
*These analyses were conducted for HAR-07 water samples in the third quarter 2009 because there was insufficient sample volume to collect these analyses in the second quarter 2009.

TABLE XIII
SUMMARY OF ANALYSES FOR APPENDIX IX CONSTITUENTS, 2009
BOEING SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY CALIFORNIA

Volatile Organic Compounds						
Well Identifier:			**RD-06**	**RD-06**	**RD-37**	**RD-37**
Sample Type:			Primary	Duplicate	Primary	Split
Geological Unit:			Chatsworth	Chatsworth	Chatsworth	Chatsworth
Lab Name:			TA-Denver	TA-Denver	TA-Denver	Lancaster
Collection Date:			7/13/2009	7/13/2009	7/13/2009	7/13/2009
Analyte	**Units**	**MCL**				
Tetrachloroethene	ug/L	5	0.2 U	0.2 U	0.2 U	0.8 U
Toluene	ug/L	150	0.17 U	0.17 U	0.17 U	0.7 U
trans-1,2-Dichloroethene	ug/L	10	0.15 U	0.15 U	0.15 U	0.8 U
trans-1,3-Dichloropropene	ug/L	0.5(total)	0.19 U	0.19 U	0.19 U	1 U
trans-1,4-Dichloro-2-butene	ug/L	NA	0.8 U	0.8 U	0.8 U	15 U
Trichloroethene	ug/L	5	0.16 U	0.16 U	0.16 U	0.5 U
Trichlorofluoromethane	ug/L	150	0.29 U	0.29 U	0.29 U	0.5 U
Vinyl acetate	ug/L	NA	0.94 U	0.94 U	0.94 U	2 U
Vinyl chloride	ug/L	0.5	0.4 U	0.4 U	0.4 U	0.5 U

See Table III for notes and abbreviations.

1600	APPROXIMATE CONTOUR OF EQUAL WATER LEVEL ELEVATION, IN FEET ABOVE MEAN SEA LEVEL. CONTOUR INTERVAL 50 FEET.
1622.60	WATER LEVEL ELEVATION, IN FEET ABOVE MEAN SEA LEVEL.
1654.31	WATER LEVEL ELEVATION, IN FEET ABOVE MEAN SEA LEVEL. WATER LEVEL NOT USED TO GENERATE CONTOUR LINES.
UTM	UNABLE TO MEASURE

LEGEND FOR GEOLOGY: REFER TO FIGURE 5, GEOLOGIC MAP.

- KUCC — GEOLOGIC UNIT
- MARKER BED
- KLCS — GEOLOGIC UNIT

GEOLOGY PROVIDED BY MWH, *"DRAFT SITE-WIDE GROUNDWATER REMEDIAL INVESTIGATION REPORT, SANTA SUSANA FIELD LABORATORY, VENTURA COUNTY, CALIFORNIA"*, DECEMBER 2009.

WATER LEVEL ELEVATIONS ARE PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY AND ARE NOT INTENDED TO INFER GROUNDWATER FLOW CONDITIONS. THE LATERAL DIRECTION OF GROUNDWATER MOVEMENT CANNOT BE ASCERTAINED FROM THE CONTOUR LINES BECAUSE OF STRATIGRAPHIC AND STRUCTURAL PROPERTIES OF THE BEDROCK.

CONTOURS ARE BASED ON MEASURED WATER LEVELS IN CONVENTIONAL WELLS. ACTUAL WATER LEVELS IN THE SUBSURFACE WILL VARY FROM THOSE SHOWN.

LEGEND

- SAMPLE LOCATION
- RCRA IMPOUNDMENT

J = ESTIMATED VALUE. ANALYTE DETECTED AT A LEVEL LESS THAN THE REPORTING LIMIT (RL) AND GREATER THAN OR EQUAL TO THE METHOD DETECTION LIMIT (MDL), OR CONCENTRATION ESTIMATED DUE TO ANALYTICAL QUALITY CONTROL DEFICIENCIES (SEE APPENDIX D FOR DETAILS).

CONCENTRATIONS OF DETECTED ORGANIC CONSTITUENTS ARE IN ug/L.

ONLY DATA FROM PRIMARY SAMPLES ARE PRESENTED ON THIS FIGURE.

SPA = STORABLE PROPELLANT AREA
ABSP = ALFA BRAVO SKIM POND
ECL = ENGINEERING CHEMISTRY LAB
STL IV = SYSTEMS TEST LABORATORY IV
APTF = ADVANCED PROPULSION TEST FACILITY

GROUNDWATER SAMPLES WERE ALSO COLLECTED FROM PROPOSED INTERIM MEASURE EXTRACTION WELLS IN DECEMBER 2009 FOR THE ANALYSIS OF APPENDIX IX CONSTITUENTS. RESULTS OF THESE ANALYSES WILL BE REPORTED SEPARATELY.

APPENDIX A
WATER LEVEL HYDROGRAPHS

NOTES

1. Hydrographs were created with data downloaded from the Boeing Environmental Data Management System (BEDMS) with the exception of FLUTe or Westbay system hydrographs. FLUTe and Westbay hydrographs were provided by MWH.

2. Water elevations for wells that were dry at the time of measurement are represented as the approximate elevation of the bottom of the well.

3. A FLUTe system hydrographs were not available for well RD-07 because the transducer was inoperable.

4. Water levels for the following types of ports were not graphed on FLUTe hydrographs:
   - A port that was consistently dry.
   - An uneverted port.
   - A port with a consistently malfunctioning transducer.

5. MPE = Measuring point (MP) elevation.

6. ft. MSL = Feet above mean sea level.

Groundwater Monitoring Schedule 1

Tables

B-I Summary of Sampling and Analyses Quarterly Groundwater Monitoring Program, 2009

APPENDIX B

GROUNDWATER MONITORING SCHEDULE

The groundwater monitoring program for 2009 was conducted to fulfill the requirements of multiple regulatory programs prescribed by:

- the Post-Closure Permits (DTSC, 1995);
- Class 1 and Class 2 Permit Modifications of the Post-Closure Permits (DTSC, 2001);
- the LUFT program overseen by DTSC;
- various characterization efforts conducted at SSFL including the CFOU RFI groundwater investigation (Montgomery Watson, 2000b) and the SMOU RFI program (Ogden, 2000); and
- the Consent Order for Corrective Action issued on 16 August 2007 by DTSC (2007b).

Table B-I presents a summary of the actual analytical program conducted on the quarterly groundwater samples in 2009. The actual program varied from the required schedule due to groundwater level changes and requested additions to the monitoring schedule.

See last three pages of Table B-I for notes and abbreviations.

ANALYTICAL METHODS

1625M	=	N-Nitrosodimethylamine, modified EPA method 1625.
300.0	=	EPA method 300.0 for inorganics. Table B-I includes: 300.0-Fluoride 300.0-Full 300.0-Nitrate-NO3
300.0-Full	=	EPA Method 300.0 for bromide, chloride, fluoride, nitrate-NO3, and sulfate.
314.0	=	Perchlorate, EPA method 314.0.
350.3-Ammonia-N	=	EPA method 350.3 for ammonia as nitrogen.
376.2-Sulfide	=	EPA method 376.2 for Sulfide
504.1 (DBCP, EDB)	=	EPA method 504.1 for 1,2-dibromo-3-chloropropane and 1,2-dibromoethane.
6010B-Fe,Mn-Dissolved	=	EPA method 6010B for dissolved iron and manganese. Dissolved metals were filtered and acidified in the field.
6010B-Fe,Mn-Total	=	EPA method 6010B for total iron and manganese. Total metals were acidified in the field.
7196A, Dissolved	=	EPA method 7196 for hexavalent chromium. Dissolved hexavalent chromium was filtered and acidified in the field.
8015B (EFH)	=	EPA method 8015 revised for diesal range organics.
8015B (GRO)	=	EPA method 8015 revised for gasoline range organics.
8081A pesticides	=	EPA method 8081A for pesticides.
8081A-AppIX	=	EPA method 8081A for Appendix IX organochlorine pesticides.
8082	=	EPA method 8082 for polychlorinated biphenyls (PCBs).
8141A	=	EPA method 8141A for organophosphorous pesticides.
8151A	=	EPA method 8151A for chlorinated herbicides.
8260B	=	EPA method 8260B for volatile organic compounds.
8260B-A+A	=	EPA method 8260B for volatile organic compounds for acrolein and acrylonitrile.
8260B-AppIX	=	EPA method 8260B for Appendix IX volatile organic compounds.
8260B (IPA)	=	EPA method 8260B for isopropanol.
8260SIM	=	EPA method 8260SIM for 1,4-dioxane.
8270C	=	EPA method 8270C for base/neutral and acid organic compounds.
8270C-AppIX	=	EPA method 8270C for Appendix IX base/neutral and acid organic compounds.
8270C-PAHs	=	EPA method 8270C for polynuclear aromatic hydrocarbons (PAHs).
8270SIM-PCP	=	EPA method 8270SIM for pentachlorophenol.
8290	=	EPA method 8290 for dioxins and furans.
8315A-Formaldehyde	=	EPA method 8315 for formaldehyde.
8315M-Hydrazines	=	EPA method 8315M for hydrazines.
8321A-Hexachlorophene	=	EPA method 8321A for hexachlorophene.
8330	=	EPA method 8330 for nitroaromatics and nitramines.
9012-Cyanide, Total	=	EPA method 9012 for total cyanide.
9040B	=	EPA method 9040B for pH.
AppIX	=	Appendix IX, see below.
COCs	=	Constituents of concern (table 3 of post-closure permits plus 1,3-dinitrobenzene). Includes EPA methods 8260B, 8260SIM, 8270C, 1625M, 8315A, 300.0, and 350.3.
General Minerals-Background	=	General minerals, including dissolved metals: calcium, iron, magnesium, manganese, potassium, sodium, strontium, and zinc; alkalinity as CaCO3, chloride, fluoride, nitrate, sulfate, total dissolved solids, pH, specific conductance, and turbidity. Includes EPA methods 6010B, 300.0, 160.1, 9040B, 120.1, 180.1, and method SM2320B. Dissolved metals were filtered and acidified in the field.
Metals, diss (App IX)	=	Metals including barium, cobalt, tin, vanadium, and zinc using EPA method 6010B; antimony, arsenic, beryllium, cadmium, chromium, copper, lead, nickel, selenium, silver, and thallium using EPA method 6020; and mercury using EPA method 7470A. Dissolved metals ("diss") were filtered and acidified in the field.
Metals, dissolved and Metals, total	=	Metals including antimony, arsenic, beryllium, cadmium, chromium, copper, lead, nickel, selenium, silver, and thallium, using EPA method 6020; barium, cobalt, iron, manganese, molybdenum, vanadium, and zinc using EPA method 6010B; and mercury using EPA method 7470A. Dissolved metals ("diss") were filtered and acidified in the field. Total metals were acidified in the field.
Metals, diss (DTSC)	=	Includes all metals listed above and additional metals including aluminum, boron, magnesium, strontium, and tin using EPA method 6010B. Dissolved metals ("diss") were filtered and acidified in the field.

Metals-RFI G2, diss	=	Metals including antimony, arsenic, beryllium, cadmium, chromium, copper, lead, nickel, selenium, silver, and thallium using EPA method 6020; aluminum, barium, cobalt, iron, manganese, molybdenum, vanadium, and zinc using EPA method 6010B; and mercury using EPA method 7470A. Dissolved metals ("diss") were filtered and acidified in the field.
Zr	=	Zirconium was additionally analyzed at this well using EPA method 6010B.
Sr	=	Strontium was additionally analyzed at this well using EPA method 6010B.
SRL 524M-TCP	=	EPA Method for 1,2,3-Trichloropropane.

APPENDIX IX CONSTITUENTS

The laboratory uses the most current methods which may be updated from methods listed in Appendix IX (California Code of Regulations(22 CCR), Title 22, Sections 66264.800 through 66264.801, Appendix IX, Ground-water Monitoring List).

APPENDIX IX analyses include:
EPA method 8260B for volatile organic compounds
EPA method 8260SIM for 1,4-dioxane
EPA method 8270C for base/neutral and acid organic compounds
EPA method 8081A for organochlorine pesticides
EPA method 8082 for polychlorinated biphenyls (PCBs)
EPA method 8141A for organophosphorous pesticides
EPA method 8151A for chlorinated herbicides
EPA method 6010B/6020 for metals (Sb, As, Ba, Be, Cd, Cr, Co, Cu, Pb, Ni, Se, Ag, Tl, Sn, V, Zn)
EPA method 504.1 for 1,2-dibromoethane (EDB) and 1,2-dibromo-3-chloropropane (DBCP)
EPA method 7470A for mercury
EPA method 9012 for total cyanide
EPA method 376.2 for sulfide
EPA method 1625M for N-nitrosodimethylamine
EPA method 8290 for dioxins and furans
EPA method 8321A for hexachlorophene
SRL 524M-TCP for 1,2,3-trichloropropane

Radiochemical Parameters

900.0	=	EPA method 900.0 for gross alpha and beta radioactivity
901.1	=	EPA method 901.1 for gamma-emitting radionuclides: Sb-125, Ba-133, Cs-134, Cs-137, Co-60, Eu-152, Eu-154, Eu-155, Mn-54, K-40, and Na-22. The gamma-emitting radionuclides sampled during first quarter include those radionuclides listed above and additionally include Am-241 and Ra-228.
905.0	=	EPA method 905.0 for Sr-90
906.0	=	EPA method 906.0 for tritium
908.0	=	EPA method 908.0 for isotopic uranium

Note: An equivalent or superior in-house laboratory procedure is considered acceptable for EPA methodology. Lab used the most current promulgated version of each EPA method.

Dissolved radionuclide samples were filtered using a 0.45 micron filter and preserved in the field.
Total radionuclide samples were preserved in the field, but were not filtered.
Tritium samples were not filtered.

Select radiochemistry analyses were performed per EPA drinking water regulations:
1) if gross alpha activity exceeded 15 pCi/l, then isotopic uranium was analyzed by EPA method 908.0;
2) if gross beta activity exceeded 50 pCi/l, then K-40 and Sr-90 were analyzed by EPA methods 901.1 and 905.0, respectively.

TABLE I
NOTES AND ABBREVIATIONS

1. Depth/intervals are measured in feet below land surface.
2. Well OS-01 was converted to well RD-68B in 1997.
3. (---) = No casing installed over the borehole interval specified; open hole.
4. (v) = Top of well below land surface, installed inside zero-grade vault.
5. S = Spring; construction data not applicable.
6. UL-N = Undeveloped land in northern part of Facility.
7. UL-S = Undeveloped land in southern part of Facility.
8. OS = Off-site.

TABLE C-II
NOTES AND ABBREVIATIONS

1. ft btc = Feet below top of casing.
2. ft msl = Feet above mean sea level.
3. NA = Not applicable
4. -- = No FLUTe port installed.

5. HAR-01, HAR-16, HAR-24, RD-38A, RD-39A, RD-53, and RD-73 have/had alternating open and blank intervals at 5-foot frequencies (i.e., 5 feet open then 5 feet closed).

6. RD-07, RD-10, RD-21, RD-22, RD-23, RD-31, RD-33A, RD-45A, RD-50, RD-54A, RD-57, RD-64, RD-65, RD-66, RD-71, RD-72, and OS-24 have/had alternating open and blank intervals at 10-foot frequencies (i.e., 10 feet open then 10 feet closed).

Notes:

The difference between the total depth and the bottom of the sand interval was filled with sloughed native material and/or bentonite.

[a] The screen for this port is perpendicular to the well casing and covers the open bottom end; therefore, the screened section is a discrete depth.

bgs - Below ground surface
MP - Measuring point
UDL - undeveloped land

Notes:

The difference between the total depth and the bottom of the sand interval was filled with sloughed native material and/or bentonite.

[a] The screen for this port is perpendicular to the well casing and covers the open bottom end; therefore, the screened section is a discrete depth.

bgs - Below ground surface
MP - Measuring point
UDL - undeveloped land

1	Data Usability Summary Reports (on CD)

1. OVERVIEW

Field and laboratory data were reviewed for consistency with the procedures outlined in the *Groundwater Monitoring, Quality Assurance Project Plan, Santa Susana Field Laboratory* (GWRC, 1995c) following each 2009 quarterly groundwater sampling event. Results of the review are discussed in the following sections. The analytical data were validated pursuant to the process summarized in Section 3.2 of this Appendix.

2. INTRODUCTION

2.1 Quality Assurance/Quality Control (QA/QC) Procedures

Following each quarterly groundwater sampling event, field and laboratory data are reviewed for consistency with procedures outlined in the *Groundwater Monitoring, Quality Assurance Project Plan, Santa Susana Field Laboratory* (GWRC, 1995c). As the project develops, it is anticipated that the quality assurance assessment conducted following each quarterly event may be modified. The current procedures include reviewing field forms and documentation and evaluating whether field data were complete. Analytical data were reviewed by the laboratory for precision, accuracy, representativeness, and comparability as part of its standard Quality Assurance/Quality Control (QA/QC) program. QA/QC data were reported as part of the laboratory data package. Analytical data also were reviewed by Haley & Aldrich for data representativeness, reproducibility, completeness, erroneous data, and discrepancies.

Laboratories used during the year included

Laboratory	Abbreviation	Location
Eberline Services	Eberline	Richmond, California
General Engineering Laboratories	GEL	Charleston, South Carolina
Lancaster Laboratories	Lancaster	Lancaster, Pennsylvania
TestAmerica-Denver	TA-Denver	Arvada, Colorado
TestAmerica-Irvine	TA-Irvine	Irvine, California
TestAmerica-Knoxville	TA-Knoxville	Knoxville, Tennessee
Truesdail Laboratories, Inc.	Truesdail	Tustin, California
Weck Laboratories	Weck	City of Industry, California

Laboratories serving as primary versus split laboratories are identified in Table III.

Haley & Aldrich field and analytical data reviews are summarized in the following section.

Percent completeness (% C) values presented in this summary were calculated using the following equation:

$$\% \, C = \frac{\text{Number of Valid (Usable) Measurements}}{\text{Number of Measurements Planned}} \times 100$$

3. QA/QC EVALUATION

3.1 Field Data

3.1.1 Pre-Sampling Water Levels

During each quarterly sampling event, facility wells, three private off-site wells, and a number of piezometers were scheduled for water level monitoring prior to sampling. Monitoring attempts are summarized below. During the first quarter, nine wells were not monitored because the vault was welded shut to prevent surface water from infiltrating the well (2 wells), FLUTe systems prevented access (2 wells), dataloggers were inoperable (2 wells), open valve prevented pressure reading of artesian water level (1 well), partial collapse prevented water level measurement (1 well), and monitoring was not attempted (1 well). During the second quarter, five wells were not monitored because the vault was welded shut to prevent surface water from infiltrating the well (2 wells), FLUTe systems prevented access (1 well), datalogger was not installed (1 well), and an obstruction in the casing prevented water level measurement (1 well). During the third quarter, four wells were not monitored because the vault was welded shut to prevent surface water from infiltrating the well (2 wells), the FLUTe systems prevented access (1 well), and the datalogger was not installed (1 well). During the fourth quarter, ten wells were not monitored because the vault was welded shut to prevent surface water from infiltrating the well (2 wells), the FLUTe systems prevented access (1 well), site activities restricted access (6 wells), and the datalogger was not installed (1 well).

Water Level Monitoring	First Quarter 2009	Second Quarter 2009	Third Quarter 2009	Fourth Quarter 2009
Number of locations scheduled	320	306	288	328
Number of locations monitored	311	301	284	318
Completeness value	97%	98%	99%	97%

3.1.2 Groundwater Sample Collection

During each quarterly sampling event, the number of wells and piezometers scheduled for sampling ranged from 190 to 234. Of the locations scheduled for sampling, the percentage sampled each quarter ranged from 42% to 61%. Samples were not collected at a number of locations because the wells or piezometers were dry, contained inadequate water for sampling purposes, were inaccessible, or the well equipment malfunctioned.

Comparing the number of wells that could be sampled versus the schedule, the field completeness value for water sample collection during 2009 was 100%.

3.1.3 QA/QC Sample Collection

The QA/QC sample collection targets are listed in the Quality Assurance Project Plan (QAPP) (GWRC, 1995c) and the SMOU RFI QAPP (MECx, 2009). During 2009, the QA/QC targets were met except where wells contained inadequate water for QA/QC sampling purposes; for some analytical methods (350.3, 7196A, 8270SIM-pentachlorophenol, 8315-formaldehyde, 8315-hydrazines, and 8321A-hexachlorophene) which were not available at the pre-qualified split laboratories; or where monitoring was not attempted.

Percent Completeness for QA/QC Sample Collection								
QA/QC Samples	QAPP (GWRC, 1995c)				SMOU RFI QAPP (MECx, 2009)			
	1st	2nd	3rd	4th	1st	2nd	3rd	4th
Duplicate samples	90%	82%	100%	100%	83%	100%	83%	84%
Split samples	96%	69%	94%	100%	88%	82%	67%	100%
matrix spike and matrix spike duplicate (MS/MSD) samples	100%	72%	94%	86%	84%	95%	88%	78%
Trip blanks	100%	91%	100%	100%	100%	91%	100%	100%
VOC field blanks	95%	76%	90%	95%	95%	76%	90%	95%
Field blanks (other than VOCs)	60%	69%	97%	100%	94%	100%	88%	94%
Field blank-rinsate	NA	NA	NA	NA	75%	82%	94%	82%

NA = Not applicable. QC samples were collected using dedicated equipment.

3.1.4 Water Quality Parameter Measurements

Each water quality parameter (pH, temperature, electrical conductivity, and turbidity) is scheduled to be measured at least three times before sample collection. At 3 wells, one or more field parameters were not measured three times prior to sampling during the year. The quarterly completeness value for field parameters measured at least three times prior to sample collection ranged from 99% to 100%.

3.2 Analytical Data

All laboratories were certified by the California Department of Public Health Environmental Laboratory Accreditation Program.

3.2.1 Comparison with Historical Water Quality Data

Some analyte concentrations increased or decreased in groundwater samples collected during the year with respect to prior results, but most values were within the range of historical data. A summary of results is included in Section 2.2 of this report.

During the year, the laboratories were requested to confirm suspect results.

Results of verification sampling results are summarized in Section 2.2.4 of this report.

3.2.2 Lab Performance Comparison

Results of the split sample analyses are presented in Table D-I. Replicate percent differences (RPDs) were calculated for each analyte detected by both the primary and split laboratories if the analyte concentration exceeded the product of five times the reporting limit (RL) times the dilution factor. The RPD value calculated for 2009 split sample analyses ranged from 0% to 27%.

$$RPD = \left|((X_1 - X_2)/X_{ave})\right| \times 100$$

X_1 = value of first result;
X_2 = value of second result; and
X_{ave} = average concentration = $((X_1 + X_2) / 2)$

3.2.3 Field Duplicate Sample Precision

Results of analyses were precise as indicated by the RPDs of field duplicate samples (Table D-II). RPD values calculated for 2009 duplicate samples ranged from 0% to 46%.

3.2.4 Data Representativeness, Reproducibility, and Completeness

Data representativeness, reproducibility, and completeness of results were evaluated by verifying the following:

- all locations were sampled as scheduled,
- samples were properly collected and preserved (if required),
- procedures to maintain the integrity of samples during shipment were followed,
- sample dilutions were properly conducted,
- chain-of-custody records were complete when submitted or changed appropriately, and
- laboratory QA/QC data were obtained for each sample submitted.

All locations were sampled as scheduled except at locations where wells contained insufficient water volume, where equipment problems were encountered, or where wells were inaccessible. All samples were preserved (where necessary) and shipped following acceptable procedures. Samples from wells with previous TCE concentrations exceeding 3,000 μg/L were segregated during storage and shipment.

A few chain-of-custody forms were not completed satisfactorily. Because the laboratories were notified of the deficiencies immediately following sample submission, all samples submitted were identified correctly and analyzed according to the monitoring schedule. Field personnel were informed of the custody form deficiencies and provided a copy of the corrected custody form.

All samples were received appropriately, identified correctly, and analyzed according to the monitoring requirements.

3.2.5 Contract-Required Minimum Detectable Activity

Project laboratory analysis technical specifications, including Minimum Detectable Activities (MDAs), have been developed to aid in the collection of high quality data and to be consistent with EPA Drinking Water regulations (Federal Register, 2000). Non-attainment of the MDA technical specifications is due in part to matrix conditions and in part to limitations in the prescribed analytical methods. Matrix conditions, including concentrations of dissolved and suspended solids, impact the homogeneity of the samples and limit method counting efficiency. Additionally, prescribed analytical methods call for specified sample volumes and counting times that further limit the ability to attain the project MDAs.

During the year, the radiochemistry laboratories were able to meet the contract-required MDAs.

3.2.6 Data Usability Summary

Analytical results for groundwater samples, trip blank samples, field blank samples, and site specific matrix spike and matrix spike duplicate samples (MS/MSD) were reviewed to evaluate

the data usability. These data were assessed in accordance with guidance from the EPA "USEPA Contract Laboratory Program National Functional Guidelines for Low Concentration Organic Data Review" (OSWER 9240.1-34, USEPA-540-R-00-006, June 2001), "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review" (OSWER 9240.1-46, USEPA-540-R-08-01, June 2008)", "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review" (EPA 540-R-01-008, July 2002), and the EPA Method specific protocol criteria, where applicable. Radiochemical data were assessed in accordance with protocols established for the U.S. Department of Energy, "Evaluation of Radiochemical Data Usability" (Paar & Porterfield, 1997).

Chain of custody documentation was completed by Haley & Aldrich personnel during the performance of sampling activities conducted at SSFL. The external chain of custody documents were completed appropriately upon sample transfer to analytical laboratory personnel.

A review of the chain of custody documents indicated that the sample custody remained intact through the analytical process and the reported results are representative of the samples collected at SSFL. The chain of custody documents are provided with each laboratory report.

The following items and criteria applicable to the QA/QC data and sample analysis data listed above were reviewed. Data Usability Summary Reports (DUSRs) are provided in Attachment 1 on the enclosed CD. Results requiring a change in the data qualifier are summarized in Table D-III.

- Preservation and Analytical Holding Time Compliance
- Method Blank, Trip Blank, and Field Blank Sample Analyses
- Surrogate Compound Recoveries
- Laboratory Control Sample Analyses
- Matrix Spike Sample Analyses
- Sample Data Reporting Procedures
- Laboratory Data Qualification Procedures

3.2.6.1 Sample Data Reporting

Laboratory analytical reports contain laboratory specific data qualifiers. When an analysis was performed without dilution, the reporting limit was based on the most recent MDL study conducted by the contract laboratory. The reporting limit values for the dilution analyses were adjusted for the level of dilution performed. Values presented for target analytes detected at concentrations below the reporting limit but above the MDL were flagged with a "J" as estimated values. No corrective action is recommended.

3.2.6.2 Data Qualifiers

The use of the data qualifiers is intended to aid users in their interpretation of the sample results. Laboratory specific data qualifiers were assigned by the laboratories to the reported results in accordance with each laboratory's standard operating procedures. However, some data qualifiers used by the laboratories do not correspond with standard EPA guidance as referenced in this document. The recommended EPA data qualifiers should preclude the use of the laboratory specific qualifiers so that comparability of the

reported results can be achieved if future analyses are performed at other laboratory facilities.

3.2.6.3 Summary

The results presented in each laboratory report were found to be compliant with the data quality objectives (DQOs) for the project and usable, with the exceptions noted in Table D-III. Based on this review, the data usability is 100%, with the exceptions noted in Table D-III.

DATA USABILITY SUMMARY REPORTS (ON CD)

Data Usability Summary Report (DUSR)
BOEING SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1131576

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008) and/or
  USEPA National Functional Guidelines for Low Concentration Organic Data Review (EPA 540-R-04-004)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996, or Standard Methods for the Examination of Water and Wastewater, Eds 18-20.

This DUSR pertains to the following samples:

Sample ID
RD-51B_020909_01_L
RD-04_020909_78_L
RD-51B_020909_19_L
RD-51B_020909_78_L

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	VOCs	EPA 8260B/624	14 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- GC/MS Instrument Performance Check
- Initial Calibration Procedures
- Continuing Calibration Procedures
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Internal Standard Recoveries
- Target Compound Identification
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

GC/MS Instrument Performance Check

GC/MS instrument performance checks for the instruments used in the analysis of project samples fell within method specific criteria without exception. No qualification of the data is recommended.

Initial Calibration Procedures

Initial instrument calibration procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. Nc Qualification of the data is recommended.

Continuing Calibration Procedures

Continuing calibration verification (CCV) procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. No Qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
RD-04_020909_78_L	Acetone	3.3 ug/L	RD-51B_020909_01_L	33.0 ug/L
RD-51B_020909_19_L	Methylene chloride	0.4 ug/L	RD-51B_020909_01_L	4.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria. No qualification of the data is recommended.

Internal Standard Recoveries

Internal Standard compounds were added to each sample matrix prior to the analysis of organic parameters to quantify the amount of the target compounds detected within each sample. The calculated response of each IS compound fell within the QA/QC criteria of +100% and – 50% of the corresponding CCV standard. No qualification of the data is recommended.

Target Compound Identification

GC/MS qualitative analysis for organic parameters was performed to remove mis-identifications of the target compounds. The relative retention times (RRT) of all reported target compounds were within +/- 0.06 RRT units of the associated calibration standard RRT, and all ions present in the reference standard spectrum at a relative intensity greater than 10 percent were also present in the sample spectrum. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Samples that contain results between the MDL and RL were flagged as estimated, "J", by the laboratory. The data user should be aware that there is a possibility of false positive or mis-identification at the quantitation levels. The laboratory also qualified results when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
BOEING SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1131770

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008) and/or
  USEPA National Functional Guidelines for Low Concentration Organic Data Review (EPA 540-R-04-004)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996, or Standard Methods for the Examination of Water and Wastewater, Eds 18-20.

This DUSR pertains to the following samples:

Sample ID
WS-05_021009_01_L
RD-51C_021009_01_L
WS-05_021009_78_L
RD-51C_021009_19_L
RD-51C_021009_78_L
WS-09_021009_78_L

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	VOCs	EPA 8260B/624	14 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- GC/MS Instrument Performance Check
- Initial Calibration Procedures
- Continuing Calibration Procedures
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Internal Standard Recoveries

- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

GC/MS Instrument Performance Check

GC/MS instrument performance checks for the instruments used in the analysis of project samples fell within method specific criteria without exception. No qualification of the data is recommended.

Initial Calibration Procedures

Initial instrument calibration procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. Nc Qualification of the data is recommended.

Continuing Calibration Procedures

Continuing calibration verification (CCV) procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. No Qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
RD-51C_021009_19_L	Methylene Chloride	0.3 ug/L	RD-51C_021009_01_L	3.0 ug/L
RD-51C_021009_78_L	Acetone	3.3 ug/L	WS-05_021009_01_L RD-51C_021009_01_L	33.0 ug/L
WS-05_021009_78_L	Methylene Chloride Toluene	0.4 ug/L 0.1 ug/L	WS-05_021009_01_L RD-51C_021009_01_L	4.0 ug/L 0.5 ug/L
RD-51C_021009_78_L	Acetone	3.2 ug/L	WS-05_021009_01_L RD-51C_021009_01_L	32.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
LCS (C090482AA)	Chloromethane Chloroethane	64 - 136 71 - 125	144 127	WS-05_021009_78_L RD-51C_021009_19_L WS-09_021009_78_L

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

Internal Standard Recoveries

Internal Standard compounds were added to each sample matrix prior to the analysis of organic parameters to quantify the amount of the target compounds detected within each sample. The calculated response of each IS compound fell within the QA/QC criteria of +100% and – 50% of the corresponding CCV standard. No qualification of the data is recommended.

Target Compound Identification

GC/MS qualitative analysis for organic parameters was performed to remove mis-identifications of the target compounds. The relative retention times (RRT) of all reported target compounds were within +/- 0.06 RRT units of the associated calibration standard RRT, and all ions present in the reference standard spectrum at a relative intensity greater than 10 percent were also present in the sample spectrum. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria. No qualification of the data is recommended.

Internal Standard Recoveries

Internal Standard compounds were added to each sample matrix prior to the analysis of organic parameters to quantify the amount of the target compounds detected within each sample. The calculated response of each IS compound fell within the QA/QC criteria of +100% and – 50% of the corresponding CCV standard. No qualification of the data is recommended.

Target Compound Identification

GC/MS qualitative analysis for organic parameters was performed to remove mis-identifications of the target compounds. The relative retention times (RRT) of all reported target compounds were within +/- 0.06 RRT units of the associated calibration standard RRT, and all ions present in the reference standard spectrum at a relative intensity greater than 10 percent were also present in the sample spectrum. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
BOEING SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1132638

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008) and/or
  USEPA National Functional Guidelines for Low Concentration Organic Data Review (EPA 540-R-04-004)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996, or Standard Methods for the Examination of Water and Wastewater, Eds 18-20.

This DUSR pertains to the following samples:

Sample ID
RD-26_021709_01_L
OS-16_021709_78_L
RD-26_021709_78_L
HAR-20_021709_78_L

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	VOCs	EPA 8260B/624	14 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- GC/MS Instrument Performance Check
- Initial Calibration Procedures
- Continuing Calibration Procedures
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Internal Standard Recoveries
- Target Compound Identification
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

GC/MS Instrument Performance Check

GC/MS instrument performance checks for the instruments used in the analysis of project samples fell within method specific criteria without exception. No qualification of the data is recommended.

Initial Calibration Procedures

Initial instrument calibration procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. Nc Qualification of the data is recommended.

Continuing Calibration Procedures

Continuing calibration verification (CCV) procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. No Qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
OS-16_021709_78_L	Acetone	3.5 ug/L	RD-26_021709_01_L	35.0 ug/L
	Methylene chloride	0.3 ug/L		3.0 ug/L
RD-26_021709_78_L	Acetone	3.1 ug/L	RD-26_021709_01_L	31.0 ug/L
RD-26_021709_78_L	Methylene chloride	0.5 ug/L	RD-26_021709_01_L	5.0 ug/L
	Toluene	0.1 ug/L		0.5 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria. No qualification of the data is recommended.

Internal Standard Recoveries

Internal Standard compounds were added to each sample matrix prior to the analysis of organic parameters to quantify the amount of the target compounds detected within each sample. The calculated response of each IS compound fell within the QA/QC criteria of +100% and – 50% of the corresponding CCV standard. No qualification of the data is recommended.

Target Compound Identification

GC/MS qualitative analysis for organic parameters was performed to remove mis-identifications of the target compounds. The relative retention times (RRT) of all reported target compounds were within +/- 0.06 RRT units of the associated calibration standard RRT, and all ions present in the reference standard spectrum at a relative intensity greater than 10 percent were also present in the sample spectrum. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed

for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
BOEING SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1133047

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008) and/or
  USEPA National Functional Guidelines for Low Concentration Organic Data Review (EPA 540-R-04-004)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996, or Standard Methods for the Examination of Water and Wastewater, Eds 18-20.

This DUSR pertains to the following samples:

Sample ID
RD-37_021909_01_L
RD-37_021909_78_L
HAR-22_021909_78_L

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	VOCs	EPA 8260B/624	14 days

Data Usability Summary Report (DUSR)
BOEING SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1133423

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996, or Standard Methods for the Examination of Water and Wastewater, Eds 18-20.

This DUSR pertains to the following samples:

Sample ID
RD-64(Z8)_022309_01_L

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	ICP/MS Metals	EPA 6020/200.8	180 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Initial Calibration Procedures
- Continuing Calibration Procedures
- Blank Sample Analysis
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Duplicate Sample Analysis
- ICP Interference Check Sample Performance
- ICP Serial Dilution Replicate Percent Difference
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Initial Calibration Procedures

Initial instrument calibration procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. Nc Qualification of the data is recommended.

Continuing Calibration Procedures

Continuing calibration verification (CCV) procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. No Qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target analytes were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples. No

qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria. No qualification of the data is recommended.

Duplicate Sample Analysis

The replicate percent difference (RPD) was evaluated for each duplicate sample pair to monitor the reproducibility of the data. The RPD for each sample pair was within the QA/QC limit of 30% for aqueous samples and 50% for solid matrices, for those target analytes with sample concentrations >5X the MDL. No qualification of the data is recommended.

ICP Interference Check Sample Performance

The results of the ICP Interference Check Samples analyzed concurrently with the project samples were all within the acceptance criteria +/- 20% of true value as prescribed by USEPA guidance. No qualification of the data is recommended.

ICP Serial Dilution Replicate Percent Difference

The results of the ICP Serial Dilution samples analyzed concurrently with the project samples were in accordance with the EPA QA acceptance criteria of less than 10% RPD for those target analytes with sample concentrations >50X the MDL, with the following exception(s):

Serial Dilution ID	Target Analyte(s)	%D	Affected Sample(s)
*03963L	Arsenic	16	RD-64(Z8)_022309_01_L

Action:
For serial dilution %D results >10%, qualify results > the MDL as "J" and non-detects as "UJ".

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria. No qualification of the data is recommended.

Internal Standard Recoveries

Internal Standard compounds were added to each sample matrix prior to the analysis of organic parameters to quantify the amount of the target compounds detected within each sample. The calculated response of each IS compound fell within the QA/QC criteria of +100% and – 50% of the corresponding CCV standard. No qualification of the data is recommended.

Target Compound Identification

GC/MS qualitative analysis for organic parameters was performed to remove mis-identifications of the target compounds. The relative retention times (RRT) of all reported target compounds were within +/- 0.06 RRT units of the associated calibration standard RRT, and all ions present in the reference standard spectrum at a relative intensity greater than 10 percent were also present in the sample spectrum. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing SSFL
Analytical Laboratory: Eberline Analytical Corporation - Richmond, CA
Sample Delivery Group # R903002-8951

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996, or Standard Methods for the Examination of Water and Wastewater, Eds 18-20.

This DUSR pertains to the following samples:

Sample ID
RD-17_022509_01_DISS_E
RD-23(Z2)_022409_01_DISS_E

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	Gamma Spectroscopy	EPA 901.1	N/A

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Initial Calibration Procedures
- Continuing Calibration Procedures
- Blank Sample Analysis
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Duplicate Sample Analysis
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Initial Calibration Procedures

Initial instrument calibration procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. Nc Qualification of the data is recommended.

Continuing Calibration Procedures

Continuing calibration verification (CCV) procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. No Qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target analytes were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples. No

qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria. No qualification of the data is recommended.

Duplicate Sample Analysis

The replicate percent difference (RPD) was evaluated for each duplicate sample pair to monitor the reproducibility of the data. The RPD for each sample pair was within the QA/QC limit of 30% for aqueous samples and 50% for solid matrices, for those target analytes with sample concentrations >5X the MDL. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Samples that contain results between the MDL and RL were flagged as estimated, "J", by the laboratory. The data user should be aware that there is a possibility of false positive or mis-identification at the quantitation levels. The laboratory also qualified results when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing SSFL
Analytical Laboratory: Weck Laboratories – Industry, CA
Sample Delivery Group # SDG Number

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008) and/or
  USEPA National Functional Guidelines for Low Concentration Organic Data Review (EPA 540-R-04-004)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996, or Standard Methods for the Examination of Water and Wastewater, Eds 18-20.

This DUSR pertains to the following samples:

Sample ID
HAR-18_030409_01_W

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	NDMA	EPA 1625C(M)	7 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Initial Calibration Procedures
- Continuing Calibration Procedures
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Target Compound Identification
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Initial Calibration Procedures

Initial instrument calibration procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. Nc Qualification of the data is recommended.

Continuing Calibration Procedures

Continuing calibration verification (CCV) procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. No Qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target analytes were

not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples. No qualification of the data is recommended.

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria. No qualification of the data is recommended.

Target Compound Identification

GC/MS qualitative analysis for organic parameters was performed to remove mis-identifications of the target compounds. The relative retention times (RRT) of all reported target compounds were within +/- 0.06 RRT units of the associated calibration standard RRT, and all ions present in the reference standard spectrum at a relative intensity greater than 10 percent were also present in the sample spectrum. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Samples that contain results between the MDL and RL were flagged as estimated, "J", by the laboratory. The data user should be aware that there is a possibility of false positive or mis-identification at the quantitation levels. The laboratory also qualified results when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996, or Standard Methods for the Examination of Water and Wastewater, Eds 18-20.

This DUSR pertains to the following samples:

Sample ID
PZ-122_021909_03_DISS_TAD

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	ICP/MS Metals	EPA 6020/200.8	180 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Initial Calibration Procedures
- Continuing Calibration Procedures
- Blank Sample Analysis
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Duplicate Sample Analysis
- ICP Interference Check Sample Performance
- ICP Serial Dilution Replicate Percent Difference
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Initial Calibration Procedures

Initial instrument calibration procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. Nc Qualification of the data is recommended.

Continuing Calibration Procedures

Continuing calibration verification (CCV) procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. No Qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target analytes were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples. No

qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria. No qualification of the data is recommended.

Duplicate Sample Analysis

The replicate percent difference (RPD) was evaluated for each duplicate sample pair to monitor the reproducibility of the data. The RPD for each sample pair was within the QA/QC limit of 30% for aqueous samples and 50% for solid matrices, for those target analytes with sample concentrations >5X the MDL. No qualification of the data is recommended.

ICP Interference Check Sample Performance

The results of the ICP Interference Check Samples analyzed concurrently with the project samples were all within the acceptance criteria +/- 20% of true value as prescribed by USEPA guidance. No qualification of the data is recommended.

ICP Serial Dilution Replicate Percent Difference

The results of the ICP Serial Dilution samples analyzed concurrently with the project samples were in accordance with the EPA QA acceptance criteria of less than 10% RPD for those target analytes with sample concentrations >50X the MDL. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

GC/MS Instrument Performance Check

GC/MS instrument performance checks for the instruments used in the analysis of project samples fell within method specific criteria without exception. No qualification of the data is recommended.

Initial Calibration Procedures

Initial instrument calibration procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. Nc Qualification of the data is recommended.

Continuing Calibration Procedures

Continuing calibration verification (CCV) procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. No Qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target analytes were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples. No qualification of the data is recommended.

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Internal Standard Recoveries

Internal Standard compounds were added to each sample matrix prior to the analysis of organic parameters to quantify the amount of the target compounds detected within each sample. The calculated response of each IS compound fell within the QA/QC criteria of +100% and – 50% of the corresponding CCV standard. No qualification of the data is recommended.

Target Compound Identification

GC/MS qualitative analysis for organic parameters was performed to remove mis-identifications of the target compounds. The relative retention times (RRT) of all reported target compounds were within +/- 0.06 RRT units of the associated calibration standard RRT, and all ions present in the reference standard spectrum at a relative intensity greater than 10 percent were also present in the sample spectrum. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
BOEING SSFL
Analytical Laboratory: TestAmerica, Inc. – Denver, CO
Sample Delivery Group # D9C060330

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008) and/or
  USEPA National Functional Guidelines for Low Concentration Organic Data Review (EPA 540-R-04-004)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996, or Standard Methods for the Examination of Water and Wastewater, Eds 18-20.

This DUSR pertains to the following samples:

Sample ID
RD-91_030509_03_TAD

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	VOCs	EPA 8260B/624	14 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- GC/MS Instrument Performance Check
- Initial Calibration Procedures
- Continuing Calibration Procedures
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Internal Standard Recoveries
- Target Compound Identification
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

GC/MS Instrument Performance Check

GC/MS instrument performance checks for the instruments used in the analysis of project samples fell within method specific criteria without exception. No qualification of the data is recommended.

Initial Calibration Procedures

Initial instrument calibration procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. No Qualification of the data is recommended.

Continuing Calibration Procedures

Continuing calibration verification (CCV) procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. No Qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target analytes were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples. No qualification of the data is recommended.

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria. No qualification of the data is recommended.

Internal Standard Recoveries

Internal Standard compounds were added to each sample matrix prior to the analysis of organic parameters to quantify the amount of the target compounds detected within each sample. The calculated response of each IS compound fell within the QA/QC criteria of +100% and – 50% of the corresponding CCV standard. No qualification of the data is recommended.

Target Compound Identification

GC/MS qualitative analysis for organic parameters was performed to remove mis-identifications of the target compounds. The relative retention times (RRT) of all reported target compounds were within +/- 0.06 RRT units of the associated calibration standard RRT, and all ions present in the reference standard spectrum at a relative intensity greater than 10 percent were also present in the sample spectrum. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
RD-04_020909_78_L	Acetone	3.3 J ug/L	All Project Samples	33.0 ug/L
RD-51B_020909_19_L	Methylene chloride	0.4 J ug/L	RD-51B_020909_01_L	4.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
Y090492AA-MS	Trichloroethene	83 - 136	74	RD-04_020909_01_L RD-04_020909_36_L

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a "B". If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the "B" qualifier was not carried forward for database input; if less than the 10X or 5X rule the "B" qualifier was replaced with a "U". The "J" qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1131770

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)
- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996.

This DUSR pertains to the following samples:

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for

each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
PZ-120_021009_19_L	Methylene chloride	0.3 J ug/L	All Project Samples	3.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for

each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value

RD-49B_021109_78_L	Acetone	3.0 J ug/L	All Project Samples	3.0 ug/L
OS-26_021109_78_L	Acetone	3.5 J ug/L	All Project Samples	35.0 ug/L

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
09045WAB026-BLK	bis(2-Ethylhexyl)phthalate	9.0 ug/L	All Project Samples	90.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

LCS ID / Project Sample MS	Type	Target Analyte(s)	%R	Affected Sample(s)	Positive Results	Non Detect (ND)
09043196601B-MS	MS	Fluoride ion	116	All Project Samples		

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a “B”. If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the “B” qualifier was not carried forward for database input; if less than the 10X or 5X rule the “B” qualifier was replaced with a “U”. The “J” qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1132242

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)
- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996.

This DUSR pertains to the following samples:

Sample ID	Sample ID
PZ-026_021209_01_L	WS-09A_021209_36_L
PZ-027_021209_01_L	WS-09A_021209_78_L

11.	Perchlorate	EPA 314.0	28 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for

each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
RD-52B_021209_19_L	Methylene chloride	0.3 J ug/L	RD-52B_021209_01_L	3.0 ug/L
RD-52B_021209_78_L	Acetone	3.1 J ug/L	All Project Samples	31.0 ug/L
WS-09A_021209_78_L	Acetone	3.5 J ug/L	All Project Samples	35.0 ug/L
RD-41B_021209_78_L	Acetone	3.2 J ug/L	All Project Samples	32.0 ug/L

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
09045WAB026-BLK	bis(2-Ethylhexyl)phthalate	9.0 ug/L	RD-41B_021209_01_L RD-55B_021209_01_L WS-09A_021209_01_L	90.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
Y090492AA-LCS	1,1,1-Trichloroethane	83 - 127	78	RD-41B_021209_01_L RD-55B_021209_01_L WS-09A_021209_01_L

	4-Nitrophenol	10 - 109	119	
	N-Nitrosodimethylamine	45 - 81	102	

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

LCS ID / Project Sample MS	Type	Target Analyte(s)	%R	Affected Sample(s)	Positive Results	Non Detect (ND)
09049196602B-MS	MS	Chloride ion	116	HAR-20_021709_01_L		
	MS	Sulfate ion	116	PZ-109_021709_01_L		
	MS	Fluoride ion	153		J	
	MS	Nitrate ion	111			

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a "B". If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the "B" qualifier was not carried forward for database input; if less than the 10X or 5X rule the "B" qualifier was replaced with a "U". The "J" qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1132816

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)
- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996.

This DUSR pertains to the following samples:

Sample ID	Sample ID
HAR-04_021809_01_L	RD-36D_021809_36_L
HAR-04_021809_78_L	RD-41A_021809_01_L
HAR-27_021809_01_L	RD-43B_021809_01_L
HAR-27_021809_01_L	RD-43B_021809_19_L

RD-36B_021809_78_L	
RD-36D_021809_01_L	

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	VOCs	EPA 8260B/624	14 days
2.	ICP Metals	EPA 6010B/200.7	180 days
3.	ICP/MS Metals	EPA 6020/200.8	180 days
4.	Mercury	EPA 7470A	28 days
5.	Formaldehyde	EPA 8315	3 days ext/ 3 days analysis
6.	SVOCs (BNAs)	EPA 8270C/625	7 days ext/40 days analysis
7.	Perchlorate	EPA 314.0	28 days
8.	1,4-Dioxane	GC/MS Isotope Dilution	7 days
9.	Chromium VI	EPA 218.6	24 hours
10.	Bromide	EPA 300.0/320.1	28 days
11.	Chloride	EPA 300.0/SM 4500-Cl	28 days
12.	Fluoride	EPA 300.0	28 days
13.	Nitrogen, Nitrate (NO3)	EPA 300.0/SM 4500-NO3	48 hours
14.	Sulfate	EPA 300.0/375.4	28 days
15.	Nitrogen, Ammonia (NH3)	EPA 350.2/SM 4500-NH3 B/E	28 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
RD-36B_021809_78_L	Acetone	3.3 J ug/L	All Project Samples	33.0 ug/L
	Methylene chloride	0.3 J ug/L		3.0 ug/L
RD-43B_021809_19_L	Methylene chloride	0.4 J ug/L	RD-43B_021809_19_L	4.0 ug/L
RD-43B_021809_78_L	Acetone	3.6 J ug/L	All Project Samples	36.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
G090511AA-MS	Dibromochloromethane	80 - 146	79	RD-43C_021809_01_L

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)

09052WAA026-LCS	N-Nitosodimethylamine	47 - 80	101	All Project Samples
	Butylbenzylphthalate	71 - 100	102	
	Benzo(a)anthracene	82 - 96	98	

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a "B". If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the "B" qualifier was not carried forward for database input; if less than the 10X or 5X rule the "B" qualifier was replaced with a "U". The "J" qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1133047

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)
- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996.

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project

sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
RD-07(Z3)_022009_78_L	Methylene chloride	0.6 ug/L	All Project Samples	6.0 ug/L
RD-63_022009_78_L	Methylene chloride	0.6 ug/L	All Project Samples	6.0 ug/L
RD-98_022009_19_L	Methylene chloride	0.5 J ug/L	RD-98_022009_01_L	5.0 ug/L

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
090566050004A-BLK	Lead	0.000054 J mg/L	All Project Samples	0.00054 mg/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
Y090563AA-MSD	Trichloroethene	88 - 125	153	RD-63_022009_01_L
Y090563AA-MS	1,4-Dichlorobenzene	83 - 113	114	RD-63_022009_01_L

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and

compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a “B”. If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the “B” qualifier was not carried forward for database input; if less than the 10X or 5X rule the “B” qualifier was replaced with a “U”. The “J” qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1133423

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)
- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996.

This DUSR pertains to the following samples:

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	VOCs	EPA 8260B/624	14 days
2.	ICP Metals	EPA 6010B/200.7	180 days
3.	ICP/MS Metals	EPA 6020/200.8	180 days
4.	Mercury	EPA 7470A	28 days
5.	Formaldehyde	EPA 8315	3 days ext/ 3 days analysis
6.	PAHs	EPA 8310	7 days ext/40 days analysis
7.	Cyanide, Total	EPA 335.2	14 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
RD-22(Z2)_022309_78_L	Methylene chloride	0.5 ug/L	All Project Samples	5.0 ug/L
RD-36C_022309_78_L	Methylene chloride	0.4 J ug/L	All Project Samples	4.0 ug/L

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
090566050004A-BLK	Lead	0.000054 J mg/L	All Project Samples	0.00054 mg/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
C090561AA-MS	trans-1,2-Dichloroethene	88 - 127	128	RD-22(Z2)_022309_01_L
	1,3-Dichlorobenzene	83 - 117	119	RD-22(Z2)_022309_78_L
				RD-56B_022309_01_L
				RD-45C_022309_01_L
				RD-56B_022309_78_L
				RD-54B_022309_01_L
				RD-54B_022309_36_L
				RD-36C_022309_78_L
Y090563AA-MSD	Trichloroethene	88 - 125	153	RD-36C_022309_01_L
				RD-64(Z8)_022309_01_L
				RD-64(Z8)_022309_19_L
				RD-65(Z5)_022309_01_L
Y090563AA-MS	1,4-Dichlorobenzene	83 - 113	114	RD-36C_022309_01_L
				RD-64(Z8)_022309_01_L
				RD-64(Z8)_022309_19_L
				RD-65(Z5)_022309_01_L

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
09052WAC026-LCS	N-Nitrosodimethylamine	42 - 50	85	All Project Samples
09052WAC026-MS	Phenol	10 - 83	101	All Project Samples
	N-Nitrosodimethylamine	45 - 81	87	
09052WAC026-MSD	Phenol	10 - 83	99	All Project Samples
	N-Nitrosodimethylamine	45 - 81	92	

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a "B". If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the "B" qualifier was not carried forward for database input; if less than the 10X or 5X rule the "B" qualifier was replaced with a "U". The "J" qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1133620

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)
- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996.

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
RD-01_022509_78_L	Methylene chloride	0.3 J ug/L	All Project Samples	3.0 ug/L
RD-33A(Z2)_022509_78_L	Methylene chloride	0.4 J ug/L	All Project Samples	4.0 ug/L
RD-17_022509_78_L	Methylene chloride	0.4 J ug/L	All Project Samples	4.0 ug/L
WS-04A_022509_19_L	Methylene chloride	0.4 J ug/L	WS-04A_022509_01_L	4.0 ug/L

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
090586050005A-BLK	Lead	0.000096 J mg/L	All Project Samples	0.00096 mg/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
09061WAG026- LCS	N-Nitrosodimethylamine	47 - 80	87	All Project Samples
	Benzo(a)anthracene	82 - 96	97	
09061WAG026- LCSD	2,4-Dimethylphenol	80 - 107	108	All Project Samples
	N-Nitrosodimethylamine	47 - 80	87	
	Butylbenzylphthalate	71 - 100	101	

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than

10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a "B". If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the "B" qualifier was not carried forward for database input; if less than the 10X or 5X rule the "B" qualifier was replaced with a "U". The "J" qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1134032

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)
- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996.

This DUSR pertains to the following samples:

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	VOCs	EPA 8260B/624	14 days
2.	ICP Metals	EPA 6010B/200.7	180 days
3.	ICP/MS Metals	EPA 6020/200.8	180 days
4.	Mercury	EPA 7470A	28 days
5.	Formaldehyde	EPA 8315	3 days ext/ 3 days analysis
6.	SVOCs (BNAs)	EPA 8270C/625	7 days ext/40 days analysis
7.	Perchlorate	EPA 314.0	28 days
8.	Fluoride	EPA 300.0	28 days
9.	Nitrogen, Ammonia (NH3)	EPA 350.2/SM 4500-NH3 B/E	28 days
10.	Volatile Fuels, GRO	EPA 8015	14 days
11.	1,4-Dioxane	GC/MS Isotope Dilution	7 days
12.	Chromium VI (Hexavalent Chromium)	EPA 7196A/7199	24 hours
13.	Bromide	EPA 300.0/320.1	28 days
14.	Chloride	EPA 300.0/SM 4500-Cl	28 days
15.	Sulfate	EPA 300.0/375.4	28 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
RD-02_022609_78_L	Methylene chloride	0.3 J ug/L	All Project Samples	3.0 ug/L
RD-10_022609_78_L	Methylene chloride	0.5 J ug/L	All Project Samples	5.0 ug/L
RD-71_022609_78_L	Methylene chloride	0.3 J ug/L	All Project Samples	3.0 ug/L
HAR-11_022609_19_L	Methylene chloride	0.5 J ug/L	All Project Samples	5.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
C090621AA-LCS	Bromoform	71 - 121	122	All Project Samples HAR-11_022609_01_L HAR-11_022609_19_L RD-02_022609_78_L RD-10_022609_78_L RD-48C_022609_01_L RD-62_022609_01_L RD-71_022609_01_L RD-71_022609_78_L
C090621AB-LCS	Bromoform	71 - 121	122	HAR-11_022609_36_L
Y090631AA-MS	cis-1,2-Dichloroethene	85 - 125	62	RD-02_022609_01_L RD-02_022609_36_L RD-10_022609_01_L

				RD-02_022609_36_L RD-10_022609_01_L

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
09061WAG026- LCS	N-Nitrosodimethylamine	47 - 80	87	All Project Samples

	N-Nitrosodimethylamine	47 - 80	87	RD-49C_021109_01_L
	Butylbenzylphthalate	71 - 100	101	RD-49C_021109_01_L
				RD-58B_021109_36_L
09045WAB026-MSD	Phenol	10 - 83	94	RD-49B_021109_01_L
	4-Nitrophenol	10 - 109	114	RD-49C_021109_01_L
	N-Nitrosodimethylamine	45 - 81	90	RD-58B_021109_01_L
	N-Nitrosodiphenylamine	72 - 124	127	RD-58B_021109_36_L
	bis(2-Ethylhexyl)phthalate	72 - 122	274	

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a "B". If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the "B" qualifier was not carried forward for database input; if less than the 10X or 5X rule the "B" qualifier was replaced with a "U". The "J" qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

RD-47_022409_01_L
RD-47_022409_78_L

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	VOCs	EPA 8260B/624	14 days
2.	Volatile Fuels, GRO	EPA 8015	14 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
HAR-16_022409_78_L	Methylene chloride	0.5 J ug/L	All Project Samples	5.0 ug/L
RD-47_022409_78_L	Methylene chloride	0.4 J ug/L	All Project Samples	4.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
C090621AA-LCS	Trichloroethene	71 - 121	122	HAR-16_022409_78_L RD-47_022409_01_L RD-47_022409_78_L RD-38B_022409_01_L

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a "B". 10.	1,4-Dioxane	GC/MS Isotope Dilution	7 days
11.	Purgeable Halocarbons/Aromatics	EPA 8260(8021B list)	14 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
HAR-26_030209_78_L	Methylene chloride	0.4 J ug/L	All Project Samples	4.0 ug/L
RD-44_030209_19_L	Methylene chloride	0.3 J ug/L	RD-44_030209_01_L	3.0 ug/L
RD-44_030209_78_L	Methylene chloride	0.3 J ug/L	All Project Samples	3.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
09066WAB026- LCS	2,4-Dimethylphenol	80 - 107	110	RD-44_030209_01_L
	N-Nitrosodimethylamine	47 - 80	88	
	Bezidine	20 - 109	111	
09066wAB026- LCSD	N-Nitrosodimethylamine	47 - 80	88	RD-44_030209_01_L

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

LCS ID / Project Sample MS	Type	Target Analyte(s)	%R	Affected Sample(s)	Positive Results	Non Detect (ND)
090636050001A-LCS	LCS	Antimony	111	RD-41C_030209_01_L		

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a “B”. If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the “B” qualifier was not carried forward for database input; if less than the 10X or 5X rule the “B” qualifier was replaced with a “U”. The “J” qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1134513

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)
- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996.

This DUSR pertains to the following samples:

- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds

were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
OS-02_030309_78_L	Methylene chloride	0.4 J ug/L	All Project Samples	4.0 ug/L
OS-09_030309_78_L	Methylene chloride	0.4 J ug/L	All Project Samples	4.0 ug/L
RD-68A_030309_19_L	Methylene chloride	0.5 J ug/L	RD-68A_030309_01_L	5.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a "B". If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the "B" qualifier was not carried forward for database input; if less than the 10X or 5X rule the "B" qualifier was replaced with a "U". The "J" qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1134723

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)
- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996.

This DUSR pertains to the following samples:

Sample ID	Sample ID
ES-21_030409_01_L	RD-48B_030409_01_L

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
HAR-18_030409_78_L	Methylene chloride	0.5 J ug/L	All Project Samples	5.0 ug/L
RD-43A_030409_78_L	Methylene chloride	0.3 J ug/L	All Project Samples	3.0 ug/L
RS-18_030409_19_L	Acetone	9 J ug/L	RS-18_030409_01_L	90.0 ug/L
	2-Butanone	3.0		30.0
RS-18_030409_78_L	Methylene chloride	0.4 J ug/L	All Project Samples	4.0 ug/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
09066WAB026- LCS	2,4-Dimethylphenol	80 - 107	110	All Project Samples
	N-Nitrosodimethylamine	47 - 80	88	
	Bezidine	20 - 109	111	
09066WAB026- LCSD	N-Nitrosodimethylamine	47 - 80	88	All Project Samples

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a “B”. If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the “B” qualifier was not carried forward for database input; if less than the 10X or 5X rule the “B” qualifier was replaced with a “U”. The “J” qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
RD-29_030509_19_L	Methylene chloride	0.5 J ug/L	RD-29_030509_01_L	5.0 ug/L
RD-69_030509_78_L	Methylene chloride	0.3 J ug/L	All Project Samples	3.0 ug/L
RD-91_030509_78_L	Methylene chloride	0.3 J ug/L	All Project Samples	3.0 ug/L
RD-33B_030509_78_L	Methylene chloride	0.2 J ug/L	All Project Samples	2.0 ug/L

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
090686050001A-BLK	Copper	0.00093 J mg/L	All Project Samples	0.0093 mg/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
Y090711AA-MS	cis-1,2-Dichloroethene	85 - 125	77	HAR-07_030509_01_L
	Trichloroethene	88 - 125	63	RD-49A_030509_01_L
				RD-58A_030509_01_L
				RD-91_030509_01_L
Y090711AA-MSD	cis-1,2-Dichloroethene	85 - 125	177	HAR-07_030509_01_L
	trans-1,2-Dichloroethene	87 - 125	130	RD-49A_030509_01_L
	Trichloroethene	88 - 125	265	RD-58A_030509_01_L
				RD-91_030509_01_L

Action:

If the LCS %R is greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the LCS %R is less than the lower acceptance limit associated target analyte positive results are qualified "J" and non-detects are qualified "R". If the MS/MSD is from a project sample and the %R greater than the upper acceptance limit, associated target analyte positive results are qualified "J" and non-detects should not be qualified. If the MS/MSD %R is >10%, but less than the lower acceptance limit, associated analyte positive results are qualified "J" and non-detects are qualified "UJ". If the MS/MSD %R is less than 10% associated target analyte positive results are qualified "J" and non-detects are qualified "R". MS/MSD qualifiers are only applied to affected samples of the same matrix. If the MS/MSD is a LAB sample do not qualify project samples.

LCS ID / Project Sample MS	Target Analyte(s)	%R Criteria	%R	Affected Sample(s)
09066WAB026- LCS	2,4-Dimethylphenol	80 - 107	110	HAR-07_030509_01_L
	N-Nitrosodimethylamine	47 - 80	88	RD-49A_030509_01_L

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a "B". If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the "B" qualifier was not carried forward for database input; if less than the 10X or 5X rule the "B" qualifier was replaced with a "U". The "J" qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1135099

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)
- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996.

This DUSR pertains to the following samples:

Sample ID
OS-25_030609_01_L
OS-25_030609_78_L
RD-27_030609_01_DISS_L
RD-27_030609_01_L
RD-27_030609_19_L
RD-27_030609_78_L

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	VOCs	EPA 8260B/624	14 days
2.	ICP Metals	EPA 6010B/200.7	180 days
3.	ICP/MS Metals	EPA 6020/200.8	180 days
4.	Mercury	EPA 7470A	28 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target compounds were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
OS-25_030609_78_L	Methylene chloride	0.3 J ug/L	All Project Samples	3.0 ug/L

RD-27_030609_19_L	Methylene chloride	0.4 J ug/L	RD-27_030609_01_L	4.0 ug/L
RD-27_030609_78_L	Methylene chloride	0.3 J ug/L	All Project Samples	3.0 ug/L

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Flag sample results with a "U" if < to this value
090686050001A-BLK	Copper	0.00093 J mg/L	All Project Samples	0.0093 mg/L

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters by EPA Methods 8260B, 8270C and/or 8082 to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. In a few instances, sample extracts required dilution prior to analysis to either improve instrument performance by minimizing matrix interference or enable quantification of the detected target analytes within the instrument calibration range. Where applicable, the laboratory qualified the reported results indicating the system monitoring compound recovery could not be calculated due to a sample extract dilution. In cases where the instrument resolution appeared to be unaffected by the diluted sample matrix, the sample results were accepted without qualification. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Type	Target Analyte(s)	%R	Affected Sample(s)	Positive Results	Non Detect (ND)
090686050001A-LCS	LCS	Antimony	111	All Project Samples		

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Data qualifiers were assigned by the laboratory to the reported results to identify target analytes detected below the reporting limit but above the method detection limit, and/or when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Organic analyses samples that contained concentrations of target analytes at a reportable level in the associated method blanks were flagged by the laboratory with a "B". If the target analyte concentration was greater than 10 times (10X) the amount in any blank for the common laboratory contaminants or 5 times (5X) the amount for other target compounds, the "B" qualifier was not carried forward for database input; if less than the 10X or 5X rule the "B" qualifier was replaced with a "U". The "J" qualifier, which indicates an estimated value because the result was between the MDL and RL was carried through to the database.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Data Usability Summary Report (DUSR)
Boeing-SSFL
Analytical Laboratory: Lancaster Laboratories - Lancaster, PA
Sample Delivery Group # 1135345

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004)
- USEPA National Functional Guidelines for Organic Data Review (EPA 540/R-99/008)

and method protocol criteria where applicable as prescribed by "Test Methods for Evaluating Solid Waste", SW846, Update III, 1996.

This DUSR pertains to the following samples:

Sample ID
OS-27_030909_01_L
OS-27_030909_36_L
RD-13_030909_01_L
RD-13_030909_19_L
RD-13_030909_36_L
OS-27_030909_19_L
OS-27_030909_78_L
HAR-23_030909_01_L
HAR-23_030909_78_L
HAR-24_030909_01_L
HAR-24_030909_36_L

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	VOCs	EPA 8260B/624	14 days
2.	Formaldehyde	EPA 8315	3 days ext/ 3 days analysis
3.	Perchlorate	EPA 314.0	28 days
4.	Nitroaromatics / Amines	EPA 8330	7 days ext/40 days analysis

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Holding Times
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Sample Data Reporting Format
- Data Qualifiers
- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

Blank Sample Analysis
