

March 13, 2000

Mr. M. Wadley
President, Nuclear Generation
Northern States Power Company
414 Nicollet Mall
Minneapolis, MN 55401

Dear Mr. Wadley:

SUBJECT: NRC PRAIRIE ISLAND RADIATION SAFETY INSPECTION REPORT
50-282/2000002(DRS); 50-306/2000002(DRS)

On February 18, 2000, the NRC completed an inspection at your Prairie Island Nuclear Generating Plant, Units 1 and 2. The results of this inspection were discussed on February 18, 2000, with Mr. Don Shuelke and other members of your staff. The enclosed report presents the results of that inspection. Based on the results of this inspection, no significant inspection findings or violations were identified.

The inspection was an examination of activities under your license as they relate to radiation protection and to compliance with the Commission's rules and regulations and with the conditions of your license. Within those areas, the inspection consisted of a selective examination of procedures and representative records, interviews with personnel, and observation of activities in progress. Specifically, this inspection evaluated the occupational radiation safety program and focused on access control to radiologically significant areas and radiation monitoring instrumentation.

In accordance with 10 CFR 2.790 of the NRC's "Rules of Practice," a copy of this letter and its enclosure will be placed in the NRC Public Document Room.

We will gladly discuss any questions you have concerning this inspection.

Sincerely,

/RA/

Wayne Slawinski, Acting Chief
Plant Support Branch

Docket Nos. 50-282; 50-306
License Nos. DPR-42; DPR-60

Enclosure: Inspection Report 50-282/2000002(DRS);
50-306/2000002(DRS)

U.S. NUCLEAR REGULATORY COMMISSION

REGION III

Docket Nos: 50-282; 50-306
License Nos: DPR-42; DPR-60

Report No: 50-282/2000002(DRS); 50-306/2000002(DRS)

Licensee: Northern States Power Company

Facility: Prairie Island Nuclear Generating Plant, Units 1 & 2

Location: 1717 Wakonade Drive East
Welch, MN 55089

Dates: February 14-18, 2000

Inspectors: John E. House, Senior Radiation Specialist
Mark W. Mitchell, Radiation Specialist

Approved by: Wayne Slawinski, Acting Chief, Plant Support Branch
Division of Reactor Safety

NRC's REVISED REACTOR OVERSIGHT PROCESS

The federal Nuclear Regulatory Commission (NRC) recently revamped its inspection, assessment, and enforcement programs for commercial nuclear power plants. The new process takes into account improvements in the performance of the nuclear industry over the past 25 years and improved approaches of inspecting and assessing safety performance at NRC licensed plants.

The new process monitors licensee performance in three broad areas (called strategic performance areas): reactor safety (avoiding accidents and reducing the consequences of accidents if they occur), radiation safety (protecting plant employees and the public during routine operations), and safeguards (protecting the plant against sabotage or other security threats). The process focuses on licensee performance within each of seven cornerstones of safety in the three areas:

Reactor Safety	Radiation Safety	Safeguards
! Initiating Events	! Occupational	! Physical Protection
! Mitigating Systems	! Public	
! Barrier Integrity		
! Emergency Preparedness		

To monitor these seven cornerstones of safety, the NRC uses two processes that generate information about the safety significance of plant operations: inspections and performance indicators. Inspection findings will be evaluated according to their potential significance for safety, using the Significance Determination Process, and assigned colors of GREEN, WHITE, YELLOW or RED. GREEN findings are indicative of issues that, while they may not be desirable, represent very low safety significance. WHITE findings indicate issues that are of low to moderate safety significance. YELLOW findings are issues that are of substantial safety significance. RED findings represent issues that are of high safety significance with a significant reduction in safety margin.

Performance indicator data will be compared to established criteria for measuring licensee performance in terms of potential safety. Based on prescribed thresholds, the indicators will be classified by color representing varying levels of performance and incremental degradation in safety: GREEN, WHITE, YELLOW, and RED. GREEN indicators represent performance at a level requiring no additional NRC oversight beyond the baseline inspections. WHITE corresponds to performance that may result in increased NRC oversight. YELLOW represents performance that minimally reduces safety margin and requires even more NRC oversight. And RED indicates performance that represents a significant reduction in safety margin but still provides adequate protection to public health and safety.

The assessment process integrates performance indicators and inspection so the agency can reach objective conclusions regarding overall plant performance. The agency will use an Action Matrix to determine in a systematic, predictable manner which regulatory actions should be taken based on a licensee's performance. The NRC's actions in response to the significance (as represented by the color) of issues will be the same for performance indicators as for inspection findings. As a licensee's safety performance degrades, the NRC will take more and increasingly significant action, which can include shutting down a plant, as described in the Action Matrix.

More information can be found at: <http://www.nrc.gov/NRR/OVERSIGHT/index.html>.

SUMMARY OF FINDINGS

Prairie Island Nuclear Generating Plant, Units 1 & 2
NRC Inspection Report 50-282/2000002(DRS); 50-306/2000002(DRS)

The report covers a 1-week period of announced inspection by two regional radiation specialists. This inspection focused on occupational radiation safety and included a review of the access control program, radiation worker practices, and radiological instrumentation.

RADIATION SAFETY

Cornerstone: Occupational Radiation Safety

- There were no inspection findings identified or documented.

Report Details

2. RADIATION SAFETY

Cornerstone: Occupational Radiation Safety

2OS1 Access Control

.1 Plant Walkdowns and Radiological Boundary Verifications

a. Inspection Scope

The inspectors performed walkdowns of the radiologically controlled area (RCA) to verify the adequacy of radiological boundaries and postings. Specifically, the inspectors performed confirmatory radiation measurements in the Reactor, Auxiliary, and Radwaste Buildings to verify that radiologically significant work areas (high radiation areas (HRAs), radiation areas, and airborne radioactivity areas) were properly posted and controlled.

b. Observations and Findings

There were no findings identified and documented during this inspection.

.2 Reviews of Radiation Work Permits

a. Inspection Scope

The inspectors reviewed radiation work permits (RWPs) and electronic dosimeter (ED) alarm set points for both dose rate and accumulated dose to verify that adequate work controls were in place to maintain worker exposures ALARA (as-low-as-is-reasonably-achievable).

b. Observations and Findings

There were no findings identified and documented during this inspection.

.3 Reviews of Radiologically Significant Work

a. Inspection Scope

The inspectors reviewed the conduct of radiologically significant work activities in the RCA. Specifically, the inspectors verified the adequacy of radiological controls (e.g., radiation work permits and ALARA reviews), surveys, and ALARA pre-job briefings for the following work activities:

- (1) Reactor containment entry at power; and
- (2) Post-Accident Sampling System (PASS) grab sampling during training exercise.

b. Observations and Findings

There were no findings identified and documented during this inspection.

2OS3 Radiation Monitoring Instrumentation

.1 Source Tests and Calibration of Radiological Instrumentation

a. Inspection Scope

The inspectors verified that area radiation monitors (ARMs) were located as described in the Updated Final Safety Analysis Report and that the ARMs were appropriately calibrated. The inspectors reviewed calibration records for selected portable radiation survey instruments and continuous air monitors, and observed source checks of tool monitors and whole body friskers. In addition, the inspectors observed the use of instrumentation during collection of a liquid PASS sample during a training exercise.

b. Observations and Findings

There were no findings identified and documented during this inspection.

.2 Radiation Protection Technician Instrument Use

a. Inspection Scope

The inspectors verified the calibration of selected radiation survey instruments and observed radiation protection (RP) technicians' selection and operational checks of portable radiation survey instruments for several jobs requiring technician job coverage.

b. Observations and Findings

There were no findings identified and documented during this inspection.

2OS4 Radiation Worker Performance

a. Inspection Scope

During work evolutions (Section 2OS1.3), the inspectors observed radiological control practices of personnel within the RCA.

b. Observations and Findings

There were no findings identified and documented during this inspection.

4. OTHER ACTIVITIES

4OA1 Identification and Resolution of Problems

a. Inspection Scope

The inspectors reviewed the licensee's self-assessments and audits, which had been performed during the previous 12-months. In addition, the inspectors reviewed condition reports (CRs) concerning RP technician performance, radiation worker practices, radiological instrumentation, and control of HRAs, which had been initiated since January of 1999.

b. Observations and Findings

There were no findings identified and documented during this inspection.

4OA5 Management Meetings

.1 Exit Meeting Summary

The inspectors presented the inspection results to Mr. D. Shuelke and other members of licensee management at the conclusion of the inspection on February 18, 2000. The licensee acknowledged the findings presented and did not identify any information discussed as proprietary.
