## OCC's Quarterly Report on Bank Trading and Derivatives Activities First Quarter 2012

### Executive Summary

- Insured U.S. commercial banks and savings associations reported trading revenues of \$7.0 billion in the first quarter, 5% lower than \$7.4 billion in the first quarter of 2011. Trading revenues in the first quarter of 2012 were 178% higher than in the fourth quarter of 2011.
- Credit exposure from derivatives fell in the first quarter. Net current credit exposure decreased 12%, or \$53 billion, to \$377 billion.
- Trading risk exposure, as measured by Value-at-Risk (VaR), at the 5 largest trading companies totaled \$564 million, 16.7% lower than in the first quarter of 2011.
- For the third consecutive quarter, the notional amount of derivatives held by insured U.S. commercial banks and savings associations fell. Notional derivatives fell \$3 trillion, or 1.2%, from the fourth quarter of 2011, to \$228 trillion. Notional derivatives continue to fall due to trade compression efforts in credit and interest rate contracts.
- Derivative contracts remain concentrated in interest rate products, which comprise 81% of total derivative notional amounts. Credit derivatives, which represent 6% of total derivatives notionals, fell 5% to \$14 trillion.

---

The OCC's quarterly report on trading revenues and bank derivatives activities is based on Call Report information provided by all insured U.S. commercial banks and trust companies, reports filed by U.S. financial holding companies, and other published data. Beginning in the first quarter of 2012, savings associations reported their financial results in the Call Reports. As a result, their trading and derivatives activity is now included in the OCC's quarterly derivatives report.

A total of 1,291 insured U.S. commercial banks and savings associations reported derivatives activities at the end of the first quarter, an increase of 213 (of which 192 were savings associations) from the prior quarter. Derivatives activity in the U.S. banking system continues to be dominated by a small group of large financial institutions. Four large commercial banks represent 93% of the total banking industry notional amounts and 81% of industry net current credit exposure.

The OCC and other supervisors have examiners on-site at the largest banks to continuously evaluate the credit, market, operational, reputation, and compliance risks of bank derivatives activities. In addition to the OCC's on-site supervisory activities, the OCC continues to work with other financial supervisors and major market participants to address infrastructure issues in OTC derivatives, including development of objectives and milestones for stronger trade processing and improved market transparency across all OTC derivatives categories.

### Revenues

Insured U.S. commercial banks and savings associations reported \$7.0 billion in trading revenues in the first quarter, 178% higher than in the fourth quarter of 2011, but 5% lower than \$7.4 billion in the first quarter of 2011. Improvements in the general macroeconomic and risk outlook led to healthy client demand that

supported first quarter trading revenues. Trading revenues in the first quarter are typically the strongest of the year, as business demand and trading volume increase from the seasonally slow year-end period. In the 12 full years beginning in 2000, first quarter trading revenues have been the strongest of the year 7 times, and second strongest 4 times. Over that same period, 37% of total trading revenues have come in the first quarter.

Relative to the fourth quarter, stronger first quarter revenues were driven by seasonal rebounds in interest rate/foreign exchange and commodity trading revenues. Combined interest rate and FX revenues, typically the driver of bank trading revenues, totaled \$7.1 billion, 224% higher than \$2.2 billion in the fourth quarter. Credit trading revenues, the most volatile component of overall trading revenues, were \$1.0 billion lower.

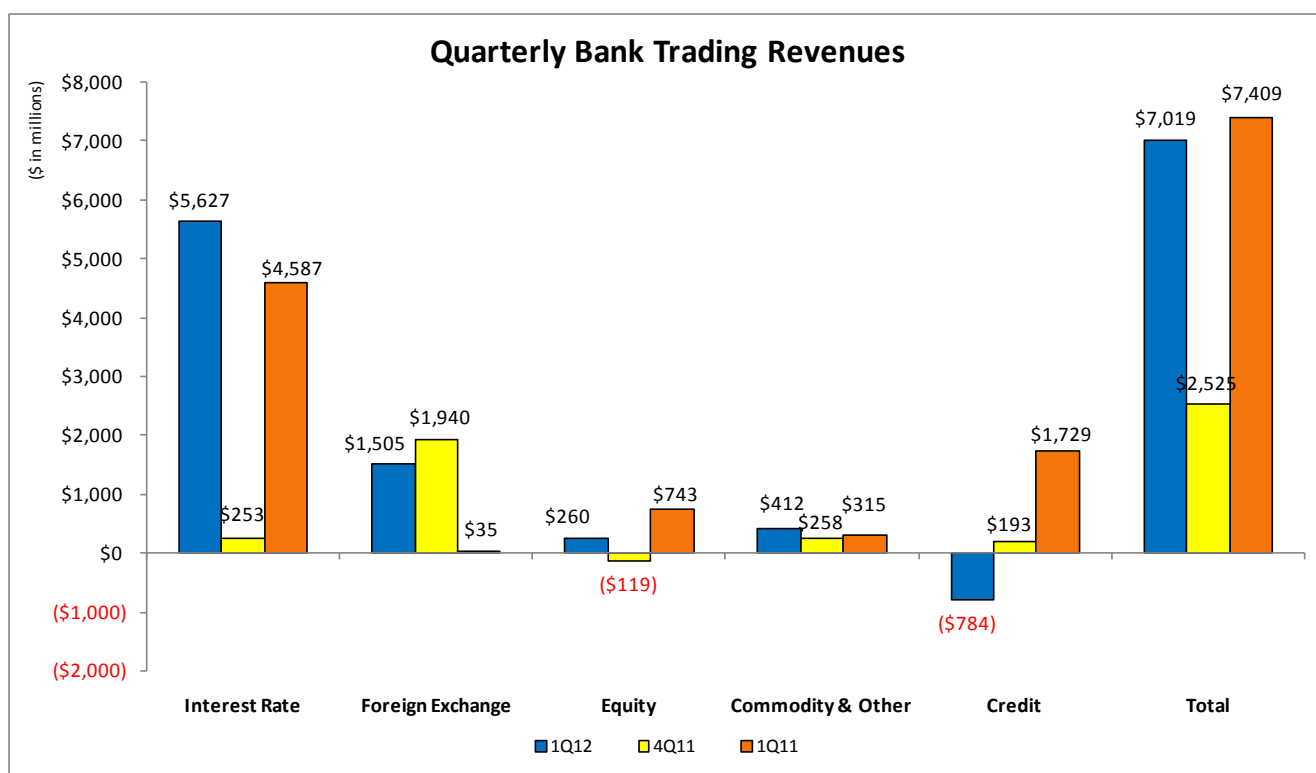

The 5% (\$390 million) fall in trading revenues compared to the first quarter of 2011 resulted from weaker credit trading results. Revenues from credit intermediation activities were \$2.5 billion lower in the first quarter of 2012 than in 2011, which was offset by a \$2.5 billion increase in interest rate/FX revenues. Revenues from equity intermediation were \$0.5 billion lower.

### Holding Company Trading Revenues<sup>1</sup>

To get a more complete picture of trading revenues in the banking system, it is useful to consider consolidated holding company trading performance. As illustrated in the table below, consolidated holding company trading revenues of \$18.9 billion in the first quarter of 2012 were 268% higher than fourth quarter revenues, and 151% higher (\$11.4 billion) than in the first quarter of 2011. Trading revenues were sharply higher across product sectors in the first quarter of 2012. Interest rate and FX revenues were \$9.6 billion this quarter, compared to \$3.4 billion in the fourth quarter and \$2.6 billion in last year's first quarter. Equity revenues of \$5.7 billion in the first quarter of 2012 were 87% higher than in both the fourth quarter and the first quarter of 2011.

Holding Co. Trading Revenue	1Q12	4Q11	Change 1Q12 vs. 4Q11	% Change 1Q12 vs. 4Q11	1Q11	Change 1Q12 vs. 1Q11	% Change 1Q12 vs. 1Q11

Interest Rate	7,608	324	7,284	2248%	(1,595)	9,203	577%
Foreign Exchange	2,005	3,034	(1,028)	-34%	4,194	(2,188)	-52%
Equity	5,684	3,047	2,637	87%	3,035	2,649	87%
Commodity & Other	2,265	1,646	619	38%	1,622	643	40%
Credit	1,333	(2,912)	4,245	146%	271	1,063	393%
<b>Total HC Trading Revenues</b>	<b>18,896</b>	<b>5,139</b>	<b>13,757</b>	<b>268%</b>	<b>7,526</b>	<b>11,370</b>	<b>151%</b>

Prior to the financial crisis, bank trading revenues typically ranged from 60-80% of consolidated holding company trading revenues. Since the financial crisis, and the adoption of bank charters by the former investment banks, the percentage of bank trading revenues to consolidated company revenues has fallen into a range of 30-50%. This decline reflects the significant amount of trading activity by the former investment banks that, while included in holding company results, remains outside the insured commercial bank. More

<sup>1</sup> The OCC's Quarterly Report on Bank Trading and Derivatives Activities focuses on the activity and performance of insured commercial banks. Discussion of consolidated bank holding company activity and performance is limited to this section, as well as the data in Table 2 and Graph 5D.

generally, insured commercial banks and savings associations have more limited legal authorities than do their holding companies, particularly in commodity and equity products.

In the first quarter, bank trading revenues represented 37% of consolidated company trading revenues, compared to 49% in the fourth quarter. The decline in the bank contribution to holding company revenues is attributable to stronger equity, credit and commodity revenue at the consolidated company level. Equity and commodity trading revenues are a much bigger component of trading revenues at the consolidated company than in the insured commercial bank.

## **Credit Risk**

Credit risk is a significant risk in bank derivatives trading activities. The notional amount of a derivative contract is a reference amount from which contractual payments will be derived, but it is generally not an amount at risk. The credit risk in a derivative contract is a function of a number of variables, such as whether counterparties exchange notional principal, the volatility of the underlying market factors (interest rate, currency, commodity, equity or corporate reference entity), the maturity and liquidity of the contract, and the creditworthiness of the counterparty.

Credit risk in derivatives differs from credit risk in loans due to the more uncertain nature of the potential credit exposure. With a funded loan, the amount at risk is the amount advanced to the borrower. The credit risk is unilateral; the bank faces the credit exposure of the borrower. However, in most derivatives transactions, such as swaps (which make up the bulk of bank derivatives contracts), the credit exposure is bilateral. Each party to the contract may (and, if the contract has a long enough tenor, probably will) have a current credit exposure to the other party at various points in time over the contract's life. Moreover, because the credit exposure is a function of movements in market factors, banks do not know, and can only estimate, how much the value of the derivative contract might be at various points of time in the future.

The first step to measuring credit exposure in derivative contracts involves identifying those contracts where a bank would lose value if the counterparty to a contract defaulted today. The total of all contracts with positive value (i.e., derivatives receivables) to the bank is the gross positive fair value (GPFV) and represents an initial measurement of credit exposure. The total of all contracts with negative value (i.e., derivatives payables) to the bank is the gross negative fair value (GNFV) and represents a measurement of the exposure the bank poses to its counterparties.

\$ in billions	Gross Positive Fair Values				Gross Negative Fair Values			
	1Q12	4Q11	Change	%Change	1Q12	4Q11	Change	%Change
Interest Rates	3,771	4,478	(707)	-16%	3,677	4,388	(711)	-16%
FX	412	503	(90)	-18%	417	477	(60)	-13%
Equity	84	77	7	9%	84	75	9	11%
Commodity	54	53	1	2%	56	55	1	3%
Credit	293	418	(125)	-30%	288	404	(116)	-29%
Total	4,614	5,528	(915)	-17%	4,522	5,400	(877)	-16%

Gross positive fair values (i.e., derivatives receivables) decreased 17%, or \$915 billion, to \$4.6 trillion in the first quarter. Receivables from interest rate contracts, which make up 82% of gross derivatives receivables (and hence are the dominant source of credit exposure), decreased 16%, or \$707 billion, due to higher interest rates during the quarter. Because banks hedge the market risk of their derivatives portfolios, the decrease in gross positive fair values was offset by a similar decrease in gross negative fair values (i.e., derivatives payables). Derivatives payables decreased 16%, or \$877 billion, to \$4.5 trillion, with payables declining across interest rates, FX and credit contracts, consistent with the decline in receivables on those same asset classes.

For a portfolio of contracts with a single counterparty where the bank has a legally enforceable bilateral netting agreement, contracts with negative values may be used to offset contracts with positive values. This process generates a “net” current credit exposure (NCCE), as shown in the example below:

Counterparty A Portfolio	# of Contracts	Value of Contracts	Credit Measure/Metric
Contracts With Positive Value	6	\$500	Gross Positive Fair Value
Contracts With Negative Value	4	\$350	Gross Negative Fair Value
Total Contracts	10	\$150	Net Current Credit Exposure (NCCE) to Counterparty A

A bank’s net current credit exposure across all counterparties will therefore be the sum of the gross positive fair values for counterparties without legally certain bilateral netting arrangements (this may be due to the use of non-standardized documentation or jurisdiction considerations) and the bilaterally netted current credit exposure for counterparties with legal certainty regarding the enforceability of netting agreements.

Net current credit exposure is the primary metric used by the OCC to evaluate credit risk in bank derivatives activities. NCCE for insured U.S. commercial banks and saving associations decreased 12% (\$53 billion) to \$377 billion in the first quarter, as the \$915 billion decrease in gross receivables (GPFV) exceeded the \$862 billion decrease in the dollar amount of netting benefits. NCCE peaked at \$800 billion at the end of 2008, during the financial crisis, when interest rates had plunged and credit spreads were very high. Legally enforceable netting agreements allowed banks to reduce GPFV exposures by 91.8% (\$4.2 trillion) in the first quarter, down from the record 92.2% in the fourth quarter. Notwithstanding the decline in NCCE, credit exposures from derivatives remains elevated, and very sensitive to declines in interest rates and increases in credit spreads.

\$ in billions	1Q12	4Q11	Change	%
Gross Positive Fair Value (GPFV)	4,614	5,528	(915)	-17%
Netting Benefits	4,236	5,098	(862)	-17%
<b>Netted Current Credit Exposure (NCCE)</b>	<b>377</b>	<b>430</b>	<b>(53)</b>	<b>-12%</b>
Potential Future Exposure (PFE)	748	767	(19)	-2%
Total Credit Exposure (TCE)	1,126	1,198	(72)	-6%
Netting Benefit %	91.8%	92.2%	-0.4%	0%
10 Year Interest Swap Rate	2.23%	2.04%	0.19%	9%
Dollar Index Spot	79.0	80.2	(1.2)	-1%
Credit Derivative Index - North America Inv Grade	87.0	119.9	(32.9)	-27%
Credit Derivative Index - High Volatility	172.3	252.8	(80.6)	-32%
Russell 3000 Index Fund (RAY)	834.1	742.6	91.5	12%
Dow Jones-UBS Commodity Index (DJUBS)	141.9	140.7	1.2	1%

Note: Numbers may not add due to rounding.

The second step in evaluating credit risk involves an estimation of how much the value of a given derivative contract might change in the bank’s favor over the remaining life of the contract; this is referred to as the “potential future exposure” (PFE). PFE decreased 2% (\$19 billion) in the first quarter to \$748 billion, due to a decline in the notional amount of credit and interest rate contracts. The total credit exposure (PFE plus the net current credit exposure) decreased 6% in the first quarter to \$1.1 trillion.

The distribution of NCCE in the banking system is concentrated in banks/securities firms (57%) and corporations (36%). Exposure to hedge funds, sovereign governments and monoline financial firms is very small (6% in total). However, the sheer size of aggregate counterparty exposures results in the potential for major losses even in sectors where exposure is a small percentage of the total. For example, notwithstanding the minimal share of NCCE to monolines, banks suffered material losses on these exposures during the credit crisis. Because banks have taken credit charges (via credit valuation adjustments) to completely write down

their monoline exposures, current credit exposures to monolines are now virtually 0% of total net current credit exposure. Sovereign credit exposures are also a small component (5%) of net current credit exposure and, like monoline exposures, are largely unsecured. These exposures are an increasing area of focus for bank supervisors as they review counterparty credit risk.

Net Current Credit Exposure By Counterparty Type as a % of Total NCCE	Banks & Securities Firms	Monoline Financial Firms	Hedge Funds	Sovereign Governments	Corp and All Other Counterparties	Total
Total Commercial Banks	57%	0%	1%	5%	36%	100%
Top 4 Commercial Banks	59%	0%	1%	6%	33%	100%

A more risk sensitive measure of credit exposure would also consider the value of collateral held against counterparty exposures. Commercial banks and savings associations with total assets greater than \$10 billion report the fair value of collateral held against various classifications of counterparty exposure.

Reporting banks held collateral against 67% of total NCCE at the end of the first quarter, up from 66% in the fourth quarter of 2011. Credit exposures to banks/securities firms and hedge funds are well secured. Banks held collateral against 88% of their current exposure to banks and securities firms, up from 87% in the fourth quarter. Collateral held against hedge fund exposures increased to 312% in the first quarter, from 245% in the fourth quarter. Hedge fund exposures have always been very well secured, because banks take "initial margin" on transactions with hedge funds, in addition to fully securing any current credit exposure. Collateral coverage of corporate, monoline and sovereign exposures is much less than for financial institutions and hedge funds.

FV of Collateral to Net Current Credit Exposure	Banks & Securities Firms	Monoline Financial Firms	Hedge Funds	Sovereign Governments	Corp and All Other Counterparties	Overall FV/NCCE
Total Commercial Banks	88%	6%	312%	15%	32%	67%

Collateral quality held by banks is very high and liquid, with 81.3% held in cash (both U.S. dollar and non-dollar), and an additional 9.1% held in U.S. Treasuries and government agencies.

Fair Value of Collateral	Cash U.S. Dollar	Cash Other	U.S. Treas Securities	U.S. Gov't Agency	Corp Bonds	Equity Securities	All Other Collateral	Total
Collateral Composition (%)	47.4%	33.9%	3.0%	6.1%	0.5%	0.9%	8.3%	100.0%

Key credit performance metrics for derivatives receivables were mixed in the first quarter, with slightly higher charge-offs but lower volumes of past due contracts. The fair value of derivatives contracts past due 30 days or more decreased 32% to \$25 million. Past-due derivative contracts represent 0.01% of NCCE. Banks charged-off \$76 million in derivatives receivables in the first quarter, up from \$69 million in the fourth quarter. Though the volume of charge-offs increased in the first quarter, 2 fewer banks reported charge-offs of derivatives exposures (21 versus 23). Charge-offs in the first quarter of 2012 represented 0.02% of the net current credit exposure from derivative contracts, the same as in the fourth quarter. [See Graph 5C.] For comparison purposes, Commercial and Industrial (C&I) loan net charge-offs decreased \$488 million, or 21%, to \$1.9 billion, in the first quarter. Net C&I charge-offs were 0.14% of total C&I loans in the first quarter, down from 0.19% in the fourth quarter.

The level of charge-offs of derivatives credit exposures is typically much less than for C&I exposures. Two factors account for the historically favorable charge-off performance of derivatives. First, the credit quality of the typical derivatives counterparty is higher than the credit quality of the typical C&I borrower. Second, most of the large credit exposures from derivatives, whether from other dealers, large non-dealer banks, or hedge funds are collateralized daily, typically by cash and/or government securities.

## **Market Risk**

Banks control market risk in trading operations primarily by establishing limits against potential losses. Value-at-Risk (VaR) is a statistical measure that banks use to quantify the maximum expected loss, over a specified horizon and at a certain confidence level, in normal markets. It is important to emphasize that VaR is not the maximum potential loss; it provides a loss estimate at a specified confidence level. A VaR of \$50 million at 99% confidence measured over one trading day, for example, indicates that a trading loss of greater than \$50 million

in the next day on that portfolio should occur only once in every 100 trading days under normal market conditions. Since VaR does not measure the maximum potential loss, banks stress test trading portfolios to assess the potential for loss beyond the VaR measure. Banks and supervisors have been working to expand the use of stress analyses to complement the VaR risk measurement process that is typically used when assessing a bank's exposure to market risk.

\$ in millions	JPMorgan Chase & Co.	Citigroup Inc.	Bank of America Corp.	The Goldman Sachs Group	Morgan Stanley
Average VaR Q1'12	\$170	\$131	\$84	\$95	\$84
Average VaR Q1'11	\$88	\$171	\$184	\$113	\$121
Change in Avg VaR Q1'12 vs Q1'11	\$106	(\$40)	(\$100)	(\$18)	(\$37)
% Change in Avg VaR Q1'12 vs Q1'11	93%	-23%	-54%	-16%	-31%
3-31-12 Equity Capital	\$189,728	\$181,820	\$232,499	\$71,656	\$62,324
2011 Net Income	\$18,976	\$11,067	\$1,446	\$4,442	\$4,110
Avg VaR Q1'12 / Equity	0.09%	0.1%	0.0%	0.1%	0.1%
Avg VaR Q1'12 / 2011 Net Income	0.9%	1.2%	5.8%	2.1%	2.0%

Data Source: 10K & 10Q SEC Reports.

The large trading banks disclose average VaR data in published financial reports. To provide perspective on the market risk of trading activities, it is useful to compare the VaR numbers over time, and to equity capital and net income. As shown in the table above, market risks reported by the five largest banking companies, as measured by VaR, are small as a percentage of their capital. Because of mergers, and VaR measurement systems incorporating higher volatility price changes throughout the credit crisis (compared to the very low volatility environment prior to the crisis), bank VaR measures had generally increased throughout the credit crisis. After the peak of the financial crisis, as more normal market conditions emerged and volatility declined, bank VaR measures have broadly trended lower.

The VaR data in the table above reflect the VaR of all activities in the large dealer firms. In the past, our reports have used only the VaR related to trading/intermediation activities. The large dealers also measure risk, using VaR, for non-trading activities such as hedging mortgage servicing rights. Effective with this report, the VaR data above reflect the aggregate VaR of each dealer firm, for both trading and non-trading activities. As a result, the VaR measures are higher than in our previous reports.

Concerns about the quality of European sovereign debt have led market participants to increasingly focus on the health of the banking system in Europe. Those European concerns, combined with uncertainty about the impact on derivatives markets from legislative changes and progress on reducing the U.S. budget deficit, led large dealers to actively reduce risk throughout 2011, and this broad trend has continued in 2012. Aggregate average VaR measures across the five largest dealer firms totaled \$564 million for the first quarter of 2012, 16.7% lower than \$677 million in the first quarter of 2011.

Because of methodological differences in calculating VaR, readers are cautioned that a higher VaR figure at a particular bank may not necessarily imply that the bank has more trading risk than another bank with a lower VaR. For example, JP Morgan, Goldman Sachs and Morgan Stanley calculate VaR using a 95% confidence interval. If those firms used a 99% confidence interval, as does Bank of America and Citigroup, their VaR estimates would be meaningfully higher. The data series used to measure risk also is an important factor in the calculated risk measure. Firms using a longer period over which to measure risk may include the higher volatility period of the financial crisis, and therefore their measured VaR will be higher than firms that use a less volatile data series. Indeed, one major reason for the decline in VaR at large trading firms is the lower volatility environment that has prevailed since the end of the financial crisis. The VaR measure for a single portfolio of exposures will be different if the time period used to measure risk is not the same.

To test the effectiveness of VaR measurement systems, trading institutions track the number of times that daily losses exceed VaR estimates. Under the Market Risk Rule that establishes regulatory capital requirements for U.S. commercial banks and savings associations with significant trading activities, a bank's capital requirement for market risk is based on its VaR measured at a 99% confidence level and assuming a 10-day holding period. Banks back-test their VaR measure by comparing the actual daily profit or loss to the VaR measure. The results of the back-test determine the size of the multiplier applied to the VaR measure in the risk-based capital calculation. The multiplier adds a safety factor to the capital requirements. An "exception" occurs when a

dealer has a daily loss in excess of its VaR measure. Some banks disclose the number of such “exceptions” in their published financial reports. Because of the unusually high market volatility and large write-downs in CDOs during the financial crisis, as well as poor market liquidity, a number of banks experienced back-test exceptions and therefore an increase in their capital multiplier. Currently, however, none of the large dealer banks hold additional capital for market risk based upon an increased multiplier, as the incidence of back-test exceptions no longer requires it.

## Credit Derivatives

Credit derivatives decreased 5% in the first quarter to \$14 trillion. Credit derivatives outstanding remain below the peak of \$16.4 trillion in the first quarter of 2008. From year-end 2003 to 2008, credit derivative contracts grew at a 100% compounded annual growth rate. Industry efforts to eliminate offsetting trades (“trade compression”), as well as reduced demand for structured products, has led to a decline in credit derivative notionals. Tables 11 and 12 provide detail on individual bank holdings of credit derivatives by product and maturity, as well as the credit quality of the underlying reference entities. As shown in the first chart below, credit default swaps are the dominant product at 97% of all credit derivatives notionals. [See charts below, Tables 11 and 12, and Graph 10.]

Note: Beginning 1Q07, credit exposures are broken out as a separate category.  
Data Source: Call Reports.

Contracts referencing investment grade entities with maturities from 1-5 years represent the largest segment of the market at 39% of all credit derivatives notionals, down from 40% at end of the fourth quarter of 2011. Contracts of all tenors that reference investment grade entities are 61% of the market, up from 59% in the fourth quarter. [See chart on right above.]

The notional amount for the 43 insured U.S. commercial banks and savings associations that sold credit protection (i.e., assumed credit risk) was \$7 trillion, down 4% (\$294 billion) from the fourth quarter. The notional amount for the 35 banks that purchased credit protection (i.e., hedged credit risk) was \$7 trillion, a decrease of 6% (\$414 billion). [See Tables 1, 3, 11 and 12 and Graphs 2, 3 and 4.]

## Notionals

Changes in notional volumes are generally reasonable reflections of business activity, and therefore can provide insight into potential revenue and operational issues. However, the notional amount of derivatives contracts does not provide a useful measure of either market or credit risks.

The notional amount of derivatives contracts held by insured U.S. commercial banks and savings associations in the first quarter fell, for a third consecutive quarter, by \$3 trillion (1.2%) to \$227.8 trillion from the fourth quarter. The decline in notionals is entirely due to a \$7.6 trillion decline (5.2%) in swap contracts, reflecting

ongoing trade compression efforts. Trade compression aggregates a large number of swap contracts with similar factors, such as risk or cash flows, into fewer trades. Compression removes economic redundancy in a derivatives book, and also reduces both operational risks and capital costs for large dealers. Trade compression efforts have focused on interest rate and credit derivatives, each of which fell in the first quarter. Interest rate contracts fell by \$3.8 trillion (2%) to \$184 trillion, while credit derivative contracts (as noted above) fell \$700 billion (5%) to \$14.1 trillion.

The four banks with the most derivatives activity hold 93% of all derivatives, while the largest 25 banks account for nearly 100% of all contracts. [See Tables 3, 5 and Graph 4.]

Note: Beginning 1Q07, credit exposures are broken out as a separate category.  
Data Source: Call Reports.

Interest rate contracts comprise 81% of total derivatives. FX and credit derivatives are 12% and 6%, respectively, of total notionals.

\$ in billions	1Q12	4Q11	\$ Change	% Change	% of Total Derivatives
Interest Rate Contracts	183,742	187,509	(3,767)	-2%	81%
Foreign Exchange Contracts	26,816	25,436	1,379	5%	12%
Equity Contracts	1,899	1,589	310	20%	1%

## **GLOSSARY OF TERMS**

**Bilateral Netting:** A legally enforceable arrangement between a bank and a counterparty that creates a single legal obligation covering all included individual contracts. This means that a bank's receivable or payable, in the event of the default or insolvency of one of the parties, would be the net sum of all positive and negative fair values of contracts included in the bilateral netting arrangement.

**Credit Derivative:** A financial contract that allows a party to take, or reduce, credit exposure (generally on a bond, loan or index). Our derivatives survey includes over-the-counter (OTC) credit derivatives, such as credit default swaps, total return swaps, and credit spread options.

**Derivative:** A financial contract whose value is derived from the performance of underlying market factors, such as interest rates, currency exchange rates, commodity, credit, and equity prices. Derivative transactions include a wide assortment of financial contracts including structured debt obligations and deposits, swaps, futures, options, caps, floors, collars, forwards and various combinations thereof.

**Gross Negative Fair Value (GNFV):** The sum total of the fair values of contracts where the bank owes money to its counterparties, without taking into account netting. This represents the maximum losses the bank's counterparties would incur if the bank defaults and there is no netting of contracts, and no bank collateral was held by the counterparties. Gross negative fair values associated with credit derivatives are included.

**Gross Positive Fair Value (GPFV):** The sum total of the fair values of contracts where the bank is owed money by its counterparties, without taking into account netting. This represents the maximum losses a bank could incur if all its counterparties default and there is no netting of contracts, and the bank holds no counterparty collateral. Gross positive fair values associated with credit derivatives are included.

**Net Current Credit Exposure (NCCE):** For a portfolio of derivative contracts, NCCE is the gross positive fair value of contracts less the dollar amount of netting benefits. On any individual contract, current credit exposure (CCE) is the fair value of the contract if positive, and zero when the fair value is negative or zero. NCCE is also the net amount owed to banks if all contracts were immediately liquidated.

**Notional Amount:** The nominal or face amount that is used to calculate payments made on swaps and other risk management products. This amount generally does not change hands and is thus referred to as notional.

**Over-the-Counter Derivative Contracts:** Privately negotiated derivative contracts that are transacted off organized exchanges.

**Potential Future Exposure (PFE):** An estimate of what the current credit exposure (CCE) could be over time, based upon a supervisory formula in the agencies' risk-based capital rules. PFE is generally determined by multiplying the notional amount of the contract by a credit conversion factor that is based upon the underlying market factor (e.g., interest rates, commodity prices, equity prices, etc.) and the contract's remaining maturity. However, the risk-based capital rules permit banks to adjust the formulaic PFE measure by the "net to gross ratio," which proxies the risk-reduction benefits attributable to a valid bilateral netting contract. PFE data in this report uses the amounts upon which banks hold risk-based capital.

**Total Credit Exposure (TCE):** The sum total of net current credit exposure (NCCE) and potential future exposure (PFE).

**Total Risk-Based Capital:** The sum of tier 1 plus tier 2 capital. Tier 1 capital consists of common shareholders' equity, perpetual preferred shareholders' equity with noncumulative dividends, retained earnings, and minority interests in the equity accounts of consolidated subsidiaries. Tier 2 capital consists of subordinated debt, intermediate-term preferred stock, cumulative and long-term preferred stock, and a portion of a bank's allowance for loan and lease losses.

Note: Currently, the Call Report does not differentiate credit derivatives by over the counter or exchange traded. Credit derivatives have been included in the "over the counter" category as well as in the sum of total derivatives here.

Note: "Foreign Exchange" does not include spot fx.

Note: "Other" is defined as the sum of commodity and equity contracts.

Note: Numbers may not add due to rounding.

Commercial banks also hold on-balance sheet assets in volumes that are multiples of bank capital. For example:

EXPOSURES FROM OTHER ASSETS ALL COMMERCIAL BANKS & SAVINGS ASSOCIATIONS	EXPOSURE TO RISK BASED CAPITAL
1-4 FAMILY MORTGAGES	170%
C&I LOANS	97%
SECURITIES NOT IN TRADING ACCOUNT	203%

Note: Total credit exposure is defined as the credit equivalent amount from derivative contracts (RC-R line 54), which is the sum of netted current credit exposure and PFE.

Note: The total credit exposure to capital ratio is calculated using risk based capital (tier one plus tier two capital).

Note: Currently, the Call Report does not differentiate credit derivatives by contract type. Credit derivatives have been included in the sum of total derivatives here.

Note: Numbers may not add due to rounding.

Data source: Call Reports, Schedule RC-R.
