1	Parcel G	Section 2.1	Final Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Sections 2.2.1 and 2.2.2. SulTech. November 30, 2007.

In 1974, the Navy ceased shipyard operations at HPS and transferred control of the property to its Office of the Supervisor of Shipbuilding, Conversion, and Repair in San Francisco. The shipyard remained relatively unused until 1976. From 1976 to 1986, the Navy leased 98 percent of HPS to a private ship repair company, Triple A Machine Shop, Inc. (Triple A). Triple A leased the property from July 1, 1976, through June 30, 1986; however, Triple A did not vacate the property until March 1987. During the lease period, Triple A used dry docks, berths, machine shops, power plants, offices, and warehouses to repair commercial and naval vessels. Triple A also subleased portions of the property to other businesses.

In 1987, the Navy resumed occupancy of HPS. Many of the subtenants under Triple A's lease remained as Navy tenants, including those using facilities for maritime, industrial, and artistic purposes. From November 1985 to August 1989, several Navy surface ships were docked at the shipyard.

Because hazardous materials from past shipyard operations had been released into the environment, HPS was included on the National Priorities List in 1989 as a Superfund site pursuant to CERCLA as amended by the Superfund Amendments and Reauthorization Act of 1986. In 1991, HPS was slated for closure under the Defense Base Closure and Realignment Act of 1990. HPS was designated as a "B" site by the Agency for Toxic Substances and Disease Registry (ATSDR) in 1991, which meant that ATSDR determined that HPS posed no imminent threats to human health but had the potential to pose long-term threats to human health (ATSDR 1991). On April 1, 1994, the HPS mission as a shipyard officially ended under the Defense Base Closure and Realignment Act of 1990.

The Naval Facilities Engineering Command, Engineering Field Activities West, in San Bruno, California, had initial oversight of the base closure management. After closure of Engineering Field Activity West in 2000, the oversight authority was transferred to the Naval Facilities Engineering Command, Southwest Division, in San Diego, California. Ongoing work at HPS is currently overseen by BRAC Program Management Office West, in San Diego, California.

2.2 HPS AND PARCEL D SETTING

The following subsections summarize the setting of HPS and Parcel D, including (1) land use, (2) historic areas, (3) climate, (4) topography and surface water drainage, (5) ecology, (6) soils, (7) geology, (8) hydrogeology, and (9) groundwater beneficial use. A detailed description of the HPS setting is presented in Section 3.0 of the draft final Parcel D RI report (PRC, LFR, and U&A 1996). Detailed updates on the geology and hydrogeology of Parcel D are also provided in the Phase II and III groundwater data gaps investigation (GDGI) reports (Tetra Tech EM Inc. [Tetra Tech] 2001b, 2003a).

2.2.1 HPS, Surrounding Area, and Parcel D Land Use

The Bayview/Hunters Point district of San Francisco bounds the HPS promontory on the north and west, and the Bay borders HPS on the south and east. The Bayview/Hunters Point district is

a low-density demographic area where about half the residents own their homes. More than half of the land in the San Francisco Bayview/Hunters Point district is used for industrial purposes.

The land at HPS was formerly divided into three distinct functional areas: (1) the industrial production area, which consisted of the waterfront and shop facilities for the structural machinery, electrical, and HPS service groups; (2) the industrial support area, which consisted of supply and public works facilities; and (3) the nonindustrial area, which consists of former residential facilities for Navy personnel, recreational areas, and a restaurant.

Parcel D is bounded by other portions of HPS and by the Bay. Most land at Parcel D was formerly part of the industrial support area and was used for shipping, ship repair, and office and commercial activities. Portions of Parcel D were also used by the Naval Radiological Defense Laboratory (NRDL). The docks at Parcel D were formerly part of the industrial production area. The historical and current uses of buildings at Parcel D are summarized in Table 2-1. This table also includes the radiological contamination potential at these buildings or building sites, as listed in the Historical Radiological Assessment (Radiological Affairs Support Office [RASO] 2004). According to the Redevelopment Plan (San Francisco Redevelopment Agency 1997), Parcel D will be zoned for the following reuses: educational and cultural, mixed uses, research and development, open space, industrial, and maritime industrial. The proposed reuse areas are shown on Figure ES-1.

2.2.2 Parcel D Historic Areas

The 450-ton bridge crane at the Regunning Pier (IR-32) is the only structure in Parcel D with the potential for inclusion on the National Register of Historic Places (PRC, LFR, and U&A 1996). As a result, any proposed remedial action performed at IR-32 will comply with the substantive requirements of the National Historic Preservation Act.

2.2.3 Parcel D Climate

The climate in the HPS area is characterized by partly cloudy, cool summers with little precipitation and mostly clear, mild winters with moderate precipitation. The prevailing wind direction is west to east (Brown and Caldwell 1995). The average wind speed is 10 miles per hour, and the usual maximum wind speed is 20 miles per hour. Normal annual rainfall in San Francisco, as monitored at the San Francisco Federal Building, is 20 inches (National Oceanic and Atmospheric Administration [NOAA] 2005).

2.2.4 Parcel D Topography and Surface Water Drainage

More than 80 percent of HPS consists of relatively level lowlands, which was mostly constructed by placing borrowed fill material from the surrounding hills along the margin of the Bay. Nearly 100 percent of Parcel D is located in the lowlands, with surface elevations between 0 to 10 feet above mean sea level. Figure 2-2 shows ground surface elevation contours for Parcel D.

2	Installation Restoration (IR) Sites	Section 2.1	Parcel D Remedial Investigation Report, Hunters Point Shipyard, San Francisco, California. Sections 4.3, 4.8 to 4.10, 4.15, 4.18, 4.26 to 4.28, and 4.32. PRC Environmental Management, Inc., Levine-Fricke-Recon, and Uribe & Associates. October 25, 1996.

4.3 IR-09: PICKLING AND PLATE YARD

Site IR-09 was initially identified during the IAS conducted in 1984 as IAS Site 8, under the Navy's NACIP program (WESTEC 1984). In 1992, when HPS sites were reclassified into operable units, the Pickling and Plate Yard was placed in OU II as Site IR-09 (PRC 1995).

Site IR-09, which covers approximately 2.75 acres, is located in the north-central portion of Parcel D, at the north end of Hussey Street, between Buildings 411 and 402 (Figure 4.3-1). Structures formerly located at the yard consist of three below-grade, brick-lined pickling tanks, plate drying racks, plate storage racks, and an overhead crane system. The open concrete secondary containment vault that housed the pickling tanks remains at IR-09. Most of the ground surface is covered by concrete or asphalt pavement, which is in poor condition. Underground utilities at the site include a shallow storm drain system for drainage within the yard, and storm drain and sanitary sewer systems beneath Hussey Street. A utility trench containing steam lines is located in the northern portion of the yard (HLA 1992e).

Between 1947 and 1973, the Pickling and Plate Yard was used by the Navy for industrial metal finishing and painting. Chemicals used at IR-09 included zinc chromate (paint primer), sodium dichromate, and sulfuric and phosphoric acids. Steel plates were dipped in acid tanks (pickled), dried on racks, and painted with zinc-chromate-based, corrosion-resistant primer. The painting operations left a residue of zinc chromate primer on the drying racks, the lower part of the overhead crane structure, and the ground surface (HLA 1992e). During plating operations at the site, approximately 15,000 gallons of spent acid rinse water was reportedly discharged, per month, to the (then) combined storm drain and sanitary sewer system (WESTEC 1992e). Currently, several tenants occupy the buildings bordering IR-09 (PRC 1995).

Between November 1994 and January 1996, removal actions were performed at IR-09 under the 1991 removal action plan (RAP). These removal actions included: (1) removing plate storage and drying racks, (2) dismantling and removing three steel pickling tanks, including the brick lining, (3) removing zinc chromate primer residue from racks and structures, (4) removing the overhead crane structure, and (5) removing the vegetation with primer residue. The zinc chromate primer residue, the racks made of concrete, the bricks from the pickling tank lining, and the vegetation growing through the pavement were disposed of at a RCRA hazardous waste facility. The steel racks were cleaned of zinc chromate primer

residue and were sold as scrap. The removal action construction summary report is currently being prepared by HLA.

Asphalt patching of the IR-09 ground surface was completed in March 1996. Prior to completion of the asphalt patching and the removal of the zinc chromate primer residue, runoff from IR-09 was collected in catch basins, stored in tanks, and sampled for metals before it was periodically discharged to the sanitary sewer system. The above ground tanks used for storage of runoff were demobilized from the site upon completion of the removal action tasks.

As part of the removal action, three samples of zinc chromate primer residue were collected from the drying racks and analyzed in June 1990 (Navy 1991). In addition, liquid samples were collected from each of the pickling tanks and from the containment vault. All of the samples were analyzed for pH, hexavalent chromium, SVOCs, and metals. The pickling tank and containment vault samples were also analyzed for TPH-extractable (HLA 1990b, 1992e).

Potential contaminant sources at IR-09 consist of:

- Release of spent acid rinse water from plating operations discharged monthly to the formerly combined sanitary and storm drain sewer system. This rinse water is thought to have contained a variety of metals
- Zinc chromate primer residue from painting operations formerly on the ground surface and various structures at IR-09
- Leakage from pickling tanks or acid dip tanks. The pickling tank liquids are thought to have contained a variety of metals

RI field investigations, physical characteristics, analytical results, the nature and extent of contamination, contaminant fate and transport, a site-specific risk assessment, and conclusions and recommendations for IR-09 are discussed in the following sections.

4.8 IR-33 NORTH: BUILDINGS 302, 302A, AND 304 AND FORMER USTs S-304 AND S-305

IR-33 North was initially identified in 1984 during the initial assessment study (WESTEC 1984). In 1990, the site was designated PA-33 during a preliminary assessment (HLA 1990a). In 1995, the site was redesignated IR-33 North in compliance with the base-wide IR program (PRC 1995).

IR-33 North is located in the northeastern portion of Parcel D, and is bounded by Moreell and Cochrane Streets, and Spear Avenue. The site covers approximately 4.5 acres and consists of Buildings 302, 302A, and 304, and former USTs S-304 and S-305 (Figure 4.8-1).

Building 302 was used by the Navy as a transportation shop for repair of automotive and locomotive equipment. Two hydraulic lifts are located inside the eastern portion of this building; two aboveground, waste oil storage tanks, with an unknown total capacity were located outside the northeast corner of the building; and two dip tanks, filled with a dark, oily liquid are currently located outside the west side of the building. The bottoms of the dip tanks are below grade (HLA 1995b). The BCP indicated that the two aboveground waste oil tanks have been removed but does not list a removal date (PRC 1995). A third aboveground storage tank containing oil, and with an unknown capacity, was also identified in the BCP (PRC 1995). This tank is not currently in use (PRC 1993). Wastewater containing detergent, degreaser, and decarbonizer, generated from cleaning automotive equipment inside Building 302, was regularly discharged from drains inside the building, into the (formerly) combined storm drain and sanitary sewer system (WESTEC 1984). During a 1988 survey, it was noted that an elevated tank (emitting a strong odor), a sump, and a spill area of unknown origin were present at Building 302 (ERM-WEST 1988). Building 302 is currently vacant (PRC 1995).

Building 302A was the former transportation shop annex. This building was used by the Navy for vehicle repair, sandblasting, and painting operations. Hydraulic lifts are present in Building 302A and between Buildings 302A and 304 (HLA 1995b). An interconnected floor drain and sump are located inside Building 302A. Building 302A was formerly occupied by Universal Painting and Sandblasting, a civilian tenant. However, the building is currently vacant (HLA 1994b, PRC 1995). During investigations conducted in 1984 and 1988, waste oil, diesel fuel, antifreeze, paints, and chlorinated solvents were inventoried at Buildings 302 and 302A (ERM-WEST 1988).

Building 304 was formerly used by the Navy as a service station. Petroleum hydrocarbon compounds, including oils, fuels, and hydraulic fluid, were used at this building during operations (HLA 1994b). During a 1988 survey, mobile tanks, with unknown contents, were noted outside this building (ERM-WEST 1988). The BCP indicated that the mobile tanks were removed (PRC 1995). However, a removal date was not listed. During an investigation conducted in 1990, petroleum hydrocarbon staining was noted on the ground surface near the sump located between Buildings 302A and 304 (HLA 1990a). Building 304 is currently vacant (PRC 1995).

Two USTs (S-304 and S-305) were located adjacent to Building 304 (Figure 4.8.1). These tanks were removed in August 1991, during Phase I of the HPS UST program (PRC 1992b, 1994). The two 7,000-gallon tanks were used to store gasoline, and were connected to two sets of dispenser pumps located on a concrete pad near Building 304. Two vent pipes and two product pipes extended from the tanks to Building 304 and the dispenser island, respectively.

Potential contaminant sources identified at IR-33 North include:

- Waste oil storage tanks and sumps at Building 302
- Wastewater containing detergents, degreasers, and decarbonizers at Building 302
- Waste oil, diesel fuel, antifreeze, paints, and solvents stored at Building 302A
- Oils, fuels, and hydraulic fluids used at Building 304
- Gasoline from former USTs S-304 and S-305

RI field investigations, physical characteristics, analytical results, the nature and extent of contamination, contaminant fate and transport, a site-specific risk assessment, and a conclusions and recommendations for IR-33 North are discussed in the following sections.

4.8.1 RI Field Investigations

In 1984, WESTEC conducted the initial assessment study at IR-33 North. The study consisted primarily of assessment of records and visual inspections of chemical handling and disposal practices at HPS. The study concluded that waste chemicals had been discharged from Building 302 into the combined storm

4.9 IR-33 SOUTH: BUILDINGS 364, 365, 411, 417, 418, AND 424

In 1990, the site was designated PA-33 during a preliminary assessment (HLA 1990a). In 1994, during the site inspection, IR-33 was divided into north and south portions for presentation purposes (HLA 1994b). In 1994, sites SA-116 and SA-125 were included within IR-33 South due to their proximity to the site (PRC 1995). In 1995, the site was redesignated IR-33 South in compliance with the basewide IR program (PRC 1995).

Site IR-33 South is located in the central portion of Parcel D, between Hussey and Cochrane Streets. The site covers approximately six acres and consists of Buildings 364, 365, 411, 417, 418, and 424, and the immediate areas surrounding these buildings (HLA 1994b).

Building 364, located in the southeast portion of the site, was formerly a National Radiological Defense Laboratory used for biological experiments. This building contained a radioactive effluent storage tank sump (HLA 1994b). Cesium 137 was identified inside this building (HLA 1994b). Two concrete-lined utility trenches, located outside of this building, lead to a concrete sump outside the building. In 1992, a radiological investigation conducted by PRC indicated that radioactive surface activity in one of the utility trenches exceeded U.S. Atomic Energy Commission guidelines. Access to sumps and trenches were deemed to be too hazardous for additional investigation (PRC 1992a). Currently, Building 364 is used by Young Laboratories as a metallurgy, and metal extraction and analysis shop (HLA 1994b).

SA-125 consists of Building 365, which was formerly used by the Navy as an office for pipe fitters. This building is located in the southeast portion of the site. A radiological survey, conducted at this building, did not indicate elevated radiation levels (RASO 1995). Five small, grated floor drains are located inside Building 365. Underground piping associated with these drains, appear to drain toward the northwest corner of the building, into a sewer vault located outside of Building 365 (HLA 1994a). Currently, Building 365 is unoccupied (PRC 1995).

Building 411, which covers most of IR-33 South, was formerly a steel, shipfitter's, boilermakers, and welder's and burner's shop. The building was used by the Navy for machining and welding operations. During operations in this building, wastewater, generated from rinse water and chemical tanks, was discharged through floor drains, into the combined storm drain and sanitary sewer systems. This

wastewater contained sulfuric acid, sodium chloride, a rust inhibitor, sodium dichromate, phosphoric acid, and cleaner (WESTEC 1984). During the SI in 1993, 10 floor vaults, 11 sumps, and a false floor in the welding area were exposed, when most of the equipment was removed from this building. The integrity of these vaults and sumps, some of which contained unknown liquids and debris when exposed, is unknown (HLA 1994b). Sierra Western Equipment, Eric Lansdown, and Christian Engineering currently occupy Building 411 for storage and a workshop (PRC 1995).

SA-116 consists of Building 417 (Acetylene Manifolding Facility), Building 418 (Welding Facility), and Building 424 (Oxygen Cylinder Charging Facility). Since 1983, Hydro-Chem has used SA-116 as a staging area for hazardous waste hauling activities, steam-clean and perform light maintenance on trucks and trailers, to store equipment and products, and to temporarily store RCRA hazardous waste (HLA 1994a). Only truck exteriors are steam cleaned in the yard (HLA 1994a). A paved area north of Building 418 is used to clean hoses; a storage shed in a vehicle repair area is used to store flammable materials; and a Hydro-Chem storage yard to the south contains drums of RCRA hazardous waste, hazardous product drums, and empty drums stored on both pallets and on asphalt pavement. The asphalt pavement in the Hydro-Chem Storage yard area was observed to be stained, cracked, and degraded, and it was noted that containers staged without secondary containment were stored in the Hydro-Chem Storage yard near storm drains (HLA 1994a).

Potential contaminant sources identified at IR-33 South include metals, VOCs, SVOCs, pesticides/PCBs, and petroleum hydrocarbons associated with the storage of RCRA hazardous wastes, and hazardous products.

RI field investigations, physical characteristics, analytical results, the nature and extent of contamination, contaminant fate and transport, a site-specific risk assessment, and a conclusions and recommendations for IR-33 South are discussed in the following sections.

4.10 IR-34: BUILDINGS 351, 351A AND 366

Site IR-34 was initially identified during the preliminary assessment study in 1990z as PA-34 (HLA 1990a). In 1995, the site was redesignated IR-34 in compliance with the basewide IR program (PRC 1995).

Site IR-34 is located near the central portion of Parcel D, between Cochrane and Morrel Streets. The site covers approximately 5 acres and consists of Buildings 351, 351A, and 366, and the immediate areas surrounding the buildings (Figure 4.10-1).

Building 351 was the former Electronics Shop. The facility was used for maintenance, including cleaning and painting, of electronic equipment. During operations at this facility, detergent containing small quantities of TCE was discharged through floor drains into the combined storm drain and sanitary sewer systems. During a 1988 survey of the building, abandoned paint spray booths, one electrical transformer (not containing PCBs), and chemicals were noted at Building 351. Chemicals inventoried during this survey included TCE. Past tenants occupying Building 351 have included ornament and brass products vendors, a painter/sculptor, and a valve and fitting repair operation. The valve and fitting repair operation housed two 55-gallon solvent drums and two 55-gallon oil drums within the building (WESTEC 1984 and ERM-West 1988). Building 351 is currently vacant (PRC 1995).

Building 351A, the former Naval Radiological Defense Laboratory (NRDL), was used by the Navy for the repair of electronic equipment (PRC 1995). Activities in this building included cleaning electronic equipment, which generated wastewater containing Chem-mist detergent, thinner, and solvent. Wastewater from these operations was discharged, through drains within the building, into the combined storm drain and sanitary sewer systems (WESTEC 1984). Two incidents of radiation-related contamination within Building 351A have been documented, and decontamination of the building from these incidents was accomplished to the level of 200 counts per minute removable activity. The NRDL found beta-emitting contaminants in various portions of (above ground) drain piping associated with this building. Decontamination of these drain pipes has not yet been conducted. Building 351A is currently vacant (PRC 1995). B

In April 1996, a cesium-137 spill area located outside the southern portion of Building 351A was excavated. The excavation of asphalt and soil was conducted by Chem Nuclear. The excavation was approximately 20 by 30 feet with an average depth of 5 inches bgs. The asphalt and soil were placed in two 55-gallon drums. The excavated material was disposed of off-site.

Building 366 was the former Boat and Plastics Shop. The facility was used for boat maintenance and repair, and plastics repair. Batteries were stored in an area north of this building. During operations at this facility, painting and washing wastewater containing epoxies, solvents (ketones), waste oil, and hydraulic fluid was discharged through floor drains into the combined storm drain and sanitary sewer systems. In the past, Dymax Packaging used a portion of the building for paper carton manufacturing (WESTEC 1984). Building 366 is currently used by Christianson Tool Company for metals fabrication (PRC 1995).

Potential contaminant sources identified at IR-34 include:

- Detergents, thinners, solvents, epoxies, waste oil, and hydraulic fluid from operations at Buildings 351, 351A, and 366
- Electrolyte solutions containing metals from battery storage near Building 366

RI field investigations, geology and hydrogeology, analytical results, the nature and extent of contaminants, contaminant fate and transport, the site specific risk assessment, and conclusions and recommendations for IR-34, are discussed in the following sections.

4.10.1 RI Field Investigations

In 1984, WESTEC conducted the initial assessment study at Buildings 351 and 366. The study consisted primarily of assessment of records and visual inspections of chemical handling and disposal practices at buildings located at the site. The study concluded that wastewater from Buildings 351 and 366 was discharged through floor drains into the combined storm drain and sanitary sewer systems. No recommendations for the site were presented in the IAS report (WESTEC 1984).

4.15 IR-37: BUILDINGS 401, 423, 435, 436, AND 437 AND USTs S-435(1) AND S-435(2)

Site IR-37 was initially identified as PA-37 during the 1990 preliminary assessment (HLA 1990a). In 1994, site SA-117, which included Buildings 435 and 437, was included in PA-37 (HLA 1994a). In 1995, the site was redesignated IR-37 in compliance with the basewide IR program (PRC 1995).

Site IR-37 is located in the northwest portion of Parcel D, between "H" and Hussey streets and Spear Avenue. The site covers approximately 3 acres and consists of Buildings 401, 423, 435, 436, and 437 and former USTs S-435(1) and S-435(2) (Figure 4.15-1).

Building 401 was used by the Navy as a Public Works shop until 1974. Specific Navy operations at the building are unknown. During a 1988 survey, minor paint spills were observed inside the building. Currently, portions of the building are used as a cabinet building shop, as a metal fabrication and sheet metal shop, for furniture storage, and as an artist's studio (HLA 1995a).

Building 423 was used by the Navy as a Compressor Hut and for Paint Storage. It is currently not being used (PRC 1995).

Building 435, a wood-frame building with a concrete floor, was used by the Navy for equipment storage until 1974. A paint booth, a small workshop area, and a concrete dry vault in the floor, are located inside Building 435. During the 1993 site assessment, oil-stained asphalt and oil on exposed soil were observed east of Building 435. During Navy operations, wastewater, containing various paints and thinners, was discharged through drains in Building 435 to the combined storm drain and sanitary sewer systems (ERM West 1988). Building 435 has been leased to West Edge for the past 13 years, and is currently used to store furniture, paint, and vehicles (WESTEC 1984, ERM West 1988, and HLA 1994b). The east end of Building 435 is rented by a carpenter for storage (HLA 1994a, PRC 1995).

Building 436 was used by the Navy as a painting and paint storage facility until 1974. Wastewater containing detergent and sodium hydroxide, generated from garbage can cleaning operations, was discharged through drains in Building 436 to the combined storm drain and sanitary sewer systems. Currently, the building is used to store wood, building materials, paints, and solvents (HLA 1995a).

Building 437 is a wood-frame and tin shed with an exposed soil floor. During the 1993 site assessment, stained soil was observed east of this building. Building 437 was used by for pipe storage but is currently not in use (HLA 1994a, PRC 1995).

Two USTs, S-435(1) and S-435(2), were formerly located approximately 15 feet east of Building 435. The tanks, with a combined capacity of 1,500 gallons, were used to store solvents. During removal of the tanks in 1991, soil samples were collected from the UST excavation and analyzed for metals, SVOCs, VOCs, pesticides and PCBs, TPH-d, TPH-g, organic lead, and ethylene dibromide. Groundwater was not encountered in the excavation. Soil sample analytical results indicated that elevated concentrations of copper (160 to 201 mg/kg), lead (22.8 to 30.3 mg/kg), and zinc (153 to 214 mg/kg) were present in the soil at concentrations exceeding screening criteria. Total xylenes were detected in one soil sample at 11 μg/kg and TPH-g and TPH-d were detected at 6.7 and 130 mg/kg, respectively, in one soil sample. Pesticides, PCBs, and SVOCs were not detected in the soil samples. Following the tank removal, alternating layers of PVC liner and soil were used to backfill the excavation (PRC 1992b, 1994).

Potential contaminant sources identified at IR-37 include:

- Paints, thinners, and solvents from operations at Buildings 401 and 453
- Waste oil near Buildings 436 and 437
- Metals in soil near the former USTs

RI field investigations, geology and hydrogeology, analytical results, the nature and extent of contaminants, contaminant fate and transport, the site specific risk assessment, and conclusions and recommendations for IR-37 are discussed in the following sections.

4.15.1 RI Field Investigations

In 1984, WESTEC conducted the initial assessment study at Buildings 435 and 436. The study consisted primarily of assessment of records and visual inspections of chemical handling and disposal practices. The study concluded that waste chemicals had been discharged from these buildings into the combined storm drain and sanitary sewer systems. No recommendations were presented in the IAS report (WESTEC 1984).

4.18 IR-44: BUILDINGS 408, 409, 410, 438, AND LARGE METAL SHED

Site IR-44 was initially identified during the 1990 preliminary assessment as PA-44 (HLA 1990a). Buildings 408, 409, and 438, were identified, during an SA conducted in 1994, as SA-126. In 1995, PA-44 and SA-126 were combined and redesignated IR-44 in compliance with the basewide IR program (PRC 1995).

Site IR-44 is located in the central portion of Parcel D, between Hussey, Manseau, and Cochrane Streets. The site covers approximately 2.5 acres, is entirely paved, and consists of Buildings 408, 409, 410, 438, a large (unnumbered) metal shed located in the eastern portion of the site, and the area surrounding these structures (Figure 4.18-1).

Building 408 was used by the Navy as a furnace shelter and oven drying facility. Buildings 409 and 410 comprised the welder motor hut, and were used to house a welder motor generator that supplied power for the welding stations outside the buildings, to the north and west. Building 438, the metal spray shelter, was used to heat and then spray metal parts with a metal coating (HLA 1994a, 1994b).

A fume-hood structure with two metal spray shelter chambers that vented to the exterior of the building, was located inside Building 438 (HLA 1994a). These chambers were used to spray metal parts with a metal paint coating. Water from a tank reservoir located between Buildings 408 and 438 was used periodically to flush these chambers. The water drained through metal grates in the bottom of the chambers into small tanks which, in turn, appeared to drain outside, east and west of Building 438, onto stained asphalt (HLA 1994a). The spray chambers were removed prior to February 1996.

The large, unnumbered metal shed in the eastern portion of the site was apparently used to store sandblast abrasive. In 1994, large piles of sandblast abrasive were observed inside the four buildings (HLA 1994a). However, a site inspection conducted in February 1996 revealed that the sandblast abrasive piles had been removed. Currently, all five buildings at the site are unoccupied (PRC 1995).

Potential contaminant sources identified at IR-44 include paints and metals used in the spray shelters, and materials used in sandblasting operations.

RI field investigations, geology and hydrogeology, analytical results, the nature and extent of contaminants, contaminant fate and transport, the site-specific risk assessment, and conclusions and recommendations for IR-44 are discussed in the following sections.

4.18.1 RI Field Investigations

In 1990, a preliminary assessment was conducted at PA-44. This assessment involved record reviews and a limited number of site visits. The preliminary assessment recommended IR-44 as a low priority for further investigations (HLA 1990a).

In March 1993, an SI was performed at IR-44. Field activities during this investigation consisted of subsurface soil sample collection, and collection of source characterization samples, including storm drain sediment and sandblast abrasive. Based on the sample analytical results, the SI recommended additional investigation of the storm drains (IR-50, Section 4.21), and that the sandblast abrasive at IR-44 be included in the Navy's sandblast grit fixation program. Because the entire site is paved with concrete and potential leaching of contaminants from the sandblast abrasive through the concrete appeared to be unlikely, investigation of the soil beneath the concrete was deemed unwarranted (HLA 1994b).

Between August and November 1994, an SA was conducted at HPS to identify sites that were not included in the IR program, and that may have previously been contaminated. The SA identified Buildings 408, 409, and 438 (SA-126), and proposed soil and groundwater sample collection at the ends of the discharge pipes from Building 438. During the SA, two soil borings and one monitoring well were drilled within the IR-44 site boundaries, and one monitoring well was drilled within 10 feet, outside of the IR-44 site boundaries. In addition, two borings (PA45HA01 and PA45HA02) were hand-augered adjacent to steam lines, also within the IR-44 site boundaries. Soil samples were not collected from the hand-augered borings because, based on visual observations, releases from the steam lines were not suspected. The analytical results from samples collected from the soil borings and monitoring wells are included in Section 4.18-3 (RI Analytical Results).

Additional investigation of IR-44 was conducted between August 1995 and March 1996. The investigation consisted of source (sediment), soil, and groundwater sampling to evaluate potential contaminants at the site, and aquifer characterization to evaluate specific hydrogeologic parameters. All field activities

4.26 IR-65: CARBON DIOXIDE REFILLING STATION

Site IR-65 was initially identified during the 1994 site assessment as SA-123 (HLA 1994a). In 1995, the site was redesignated IR-65 in compliance with the basewide IR program (PRC 1995).

Site IR-65 is located in the north central portion of Parcel D, near the intersection of Moreell and Manseau Streets. The site covers approximately 0.1 acre, and consists of Building 324 and the immediate area surrounding the building (Figure 4.26-1). Building 324, formerly a carbon dioxide refilling station, was used to clean and fill fire extinguishers. The building, which is divided into northern and southern portions, contains two large unidentified pieces of equipment and a work bench. An empty concrete vault (or sump) is located in the southwest corner, inside the northern portion of the building; the condition of this vault has not been established. During the SA, the northern portion of the building was leased as an art studio (HLA 1994a). The northern and southern portions of the building are currently vacant (PRC 1995).

A small elevated tank and rack, used for cleaning and storing carbon dioxide canisters (fire extinguishers) is located outside and adjacent to the south end of Building 324. During the SA, it was noted that a sign labeled "chlorine solution" was posted near the tank. Drain piping for the elevated tank, which is attached to the storage rack, runs to the west end of Building 324 and is connected to a larger pipe that discharges onto the asphalt surface at the southwest corner of the building. An electrical transformer, without a label indicating PCB testing, is also located outside the southwest corner of the building; no oil staining was noted near the transformer (HLA 1994a). Navy operations at Building 324 ended in 1974.

Potential contaminant sources identified at IR-65 include:

- Solutions used in the elevated cleaning tank
- Leakage and/or spillage of PCBs from the electrical transformer

RI field investigations, geology and hydrogeology, analytical results, the nature and extent of contaminants, contaminant fate and transport, the site specific risk assessment, and conclusions and recommendations for IR-65 are discussed in the following sections.

4.27 IR-66: BUILDING 407 (STOREHOUSE AND VEHICLE STORAGE YARD)

Site IR-66 was initially identified as SA-127 during the 1994 site assessment (HLA 1994a). In 1995, the site was redesignated IR-66 in compliance with the basewide IR program (PRC 1995).

IR-66 is located in the central portion of Parcel D, between Hussey and "H" Streets. The site covers approximately 2 acres, and consists of Building 407, a two-storied concrete structure with a concrete floor, and a soil and gravel covered yard located across the railroad tracks, north of Building 407 (Figure 4.27-1). Building 407 was used by the Navy as a warehouse to store miscellaneous unidentified equipment, and is currently used by Allied Moving and Storage Company to store furniture. The yard was used for vehicle maintenance and storage. During the SA, minor oil staining was observed in this yard (HLA 1994a).

The only potential contaminant sources identified at IR-66 were petroleum hydrocarbons from oil stains in the soil and gravel covered yard.

RI field investigations, geology and hydrogeology, analytical results, the nature and extent of contaminants, contaminant fate and transport, the site specific risk assessment, and conclusions and recommendations for IR-66 are discussed in the following sections.

4.27.1 RI Field Investigations

In 1988, ERM-West conducted a fence-to-fence survey and inventory of known and suspected hazardous materials at HPS (HLA 1990). Navy and tenant facilities, including Building 407, were inspected at this time. The survey did not include sampling or field testing of inventoried materials. During the survey, it was noted that waste oil and paint were stored inside Building 407 (HLA 1994a).

Between March and April 1994, IR-66 was included in the SA, as SA-127. SA field activities included a records and documents search for potential past contaminant releases and an on-site inspection for evidence of potential contaminant releases at the investigated sites. Based on the results of the records search and observed potential releases of contaminants to the environment, IR-66 (SA-127) was recommended for further investigation (HLA 1994b).

4.28 IR-67: BUILDING 439 (SHEET METAL SHOP) AND SURROUNDING AREA

Site IR-67 was initially identified, during a 1994 site assessment, as SA-128 (HLA 1994a). In 1995, the site was redesignated IR-67 in compliance with the basewide IR program (PRC 1995).

Site IR-67 is located in the central portion of Parcel D, between "H", Hussey, and Manseau Streets. The site covers approximately 3.5 acres and consists of Building 439 and the immediate area surrounding this building (Figure 4.28-1) Building 439 is a two-story concrete and metal structure with a concrete floor, constructed in 1974 as a sheet metal shop. However, the building was used by the Navy only as a warehouse. During a 1989 survey, chemicals including chlorinated solvents, PCBs, copper, naphthalene, and waste oil, were identified inside Building 439 (HLA 1994a). A drum containing PCBs, stored inside the building, was noted during the SA. This drum was subsequently removed. However, the removal date is unknown (HLA 1994a).

Five dip tanks (see Figure 4.28-1A), situated 4 feet below grade, and two spray painting booths are located in the northwest portion of Building 439. A large, grate-covered floor sump is located adjacent to the dip tanks, and a sandblasting room is located south of the dip tanks. According to engineering plans, the dip tanks drain through underground piping into two waste USTs located outside the west side of Building 439. During the SA it was noted that the dip tanks, painting booths, and sump appeared to be in new condition (no staining) and to have never been used. Building 439 was used as a cardboard box manufacturing facility and as a warehouse between 1985 and 1990. The building has been vacant since 1990 (HLA 1994a).

The two waste USTs (see Figure 4.28-1A), intended to store acid and alkaline waste, are located outside of Building 439, opposite the dip tank room. The tanks are constructed of 1-foot-thick reinforced concrete and are lined with cast iron. The combined capacity of the two tanks is approximately 13,000 gallons in October 1995, during sampling of the tank contents, it was noted that the acid waste tank contained approximately 5.5 feet of liquid, and the alkaline waste tank contained approximately 0.5 foot of liquid (Uribe 1995). The source of the liquid in the two tanks is unknown, but may be attributed to surface water leaking into the tanks through the tank covers or infiltration of groundwater into the tanks (HLA 1994a).

A below-grade concrete vault is located outside of Building 439 opposite the paint booth room (see Figure 4.28-1A), along the west side of the building. Steam and condensate lines enter the western side of this vault. The portions of the steam and condensate lines leading into Building 439 from the vault were cut and removed on an unknown date. A floor drain is present in the bottom of the vault. According to engineering plans, a pipe leads from the vault drain to the storm drain line running beneath 'H' Street. During the SA, it was noted that no sediment or standing liquid were present on the vault floor (HLA 1994a).

Navy engineering plans indicate that a "flash tank" (see Figure 4.28-1A), with a capacity of approximately 12.5 gallons, was located outside of Building 439, approximately 20 feet north of the concrete vault. This tank was removed on an unknown date. Influent into the flash tank consisted of steam system condensate water from Building 439. Liquids from the flash tank discharged to a drain centered in a concrete pad beneath the flash tank. The liquids, subsequently, drained to the storm drain system line running beneath "H" Street (HLA 1994a).

Potential contaminant sources identified at IR-67 include metals, SVOCs, and petroleum hydrocarbons in the two waste USTs.

RI field investigations, geology and hydrogeology, analytical results, the nature and extent of contaminants, contaminant fate and transport, the site specific risk assessment, and conclusions and recommendations for IR-67 are discussed in the following sections.

4.28.1 RI Field Investigations

In 1988, ERM-West conducted a fence-to-fence survey and inventory of known and suspected hazardous materials at HPS. Navy and tenant facilities, including Building 439, were inspected at this time. The survey did not include sampling or field testing of inventoried materials. Inventoried chemicals stored by the Navy inside Building 439 included chlorinated solvents, PCBs, copper, naphthalene, and waste oil (HLA 1990a).

Between March and April 1994, a site assessment was conducted at IR-67. SA field activities included a records and documents search for potential past contaminant releases and an on-site inspection for evidence

4.32 IR-71: CRANE DISMANTLING AND STORAGE YARD

Site IR-71 was initially identified during a 1994 site assessment as SA-140 (HLA 1994a). In 1995, the site was redesignated IR-71 in compliance with the basewide IR program (PRC 1995).

Site IR-71 is located in the east-central portion of Parcel D, near the intersection of Manseau and Cochrane Streets. The site covers approximately one acre, and consists of an open yard with three metal sheds (Figure 4.32-1). The entire ground surface at the site consists of exposed soil. Site IR-71 is currently used for storage of complete and partially dismantled cranes. The three sheds contain electrical equipment and dismantled crane motors, and crane parts and crane equipment are stored on wood pallets over exposed soil (HLA 1994a).

Site IR-71 has been divided into two areas. The northern portion of the site, nearest Cochrane Street, comprises Area I. Fuel tanks removed from cranes were stored on wood pallets over exposed soil in this area. Fuel stored in the tanks, in addition to lubricating and waste oil from the dismantled crane equipment, reportedly leaked into the soil in Area I. Two metal sheds, used to house crane parts, are located in Area I. The southern portion of the site, nearest Manseau Street, comprises Area II. The soil is stained with oil and fuel from the aboveground tanks believed to have been stored in this area. Black- and tan-colored sand is also present in the single large shed, located in Area II. This sand is believed to be associated with sandblasting operations (HLA 1994a).

Potential contaminant sources identified at IR-71 include:

- Petroleum hydrocarbons from waste and lubricating oils, and fuel
- Metals from possible sandblast abrasive

RI field investigations, geology and hydrogeology, analytical results, the nature and extent of contaminants, contaminant fate and transport, the site specific risk assessment, and conclusions and recommendations for IR-71 are discussed in the following sections.

Item	Reference or Phrase in ROD	Location in ROD	Identification of Referenced Document Available in the Administrative Record[1]
3	Hydrostratigraphic units	Section 2.2	Final Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Sections 2.2.7 and 2.2.8. SulTech. November 30, 2007.

No other potential terrestrial receptors or habitat have been identified at Parcel D. It is unlikely that Parcel D will contain terrestrial habitat in the future because its proposed reuse is primarily industrial.

2.2.6 Parcel D Soils

Soils at HPS are either the result of (1) weathered material from nearby rock formations and sediments from the Bay or (2) imported fill material placed at HPS during its development. The area northwest of Parcel D is primarily covered by upland soils, which are moderate to steeply sloped terrains. Parcel D is primarily lowland soils, which are flat to gently sloped urban developed lands. These lowland soils are susceptible to subsidence by natural compaction or during moderate to strong earthquakes. Soils at HPS are described in detail in Appendix H of the draft final Parcel D RI report (PRC, LFR, and U&A 1996). Figure 2-4 shows the distribution of soils at HPS.

2.2.7 Parcel D Geology

The peninsula forming HPS is within a northwest-trending belt of Franciscan Complex bedrock known as the Hunters Point Shear Zone. In some locations, the Marin Headlands Terrane underlies this shear zone. HPS is underlain by five geologic units, the youngest of Quaternary age, and the oldest, the Franciscan Complex bedrock, of Jurassic-Cretaceous age. In general, the stratigraphic sequence of these geologic units, from youngest (shallowest) to oldest (deepest), is as follows: Artificial Fill; Undifferentiated Upper Sand Deposits; Bay Mud Deposits; Undifferentiated Sedimentary Deposits; and Franciscan Complex Bedrock. The locations of the fill material, the colluvium, alluvium and landslide debris, and the chert, shale, sandstone, volcanic, and serpentine bedrock units at HPS are shown on Figure 2-5.

The Navy believes that the practice of using quarried local rock for fill at HPS is similar to construction practices in the same bedrock formations used elsewhere in San Francisco. The Navy observed that a wide range of concentrations of metals are found in similar chert, basalt, and serpentinite bedrock formations in other areas of San Francisco based on sampling that the Navy conducted in 2003 at areas outside of HPS. This information is summarized in a report titled “Draft Metals Concentrations in Franciscan Bedrock Outcrops” (Tetra Tech and Innovative Technical Solutions, Inc. [ITSI] 2004).

In the Tetra Tech and ITSI 2004 report, the Navy studied the ambient concentrations of metals in bedrock and bedrock-derived soil from three nonindustrial sites in San Francisco. These three sites have a similar geologic setting to HPS and contain serpentinite or chert and basalt bedrock

typical of the Franciscan Complex. The sites included the two Franciscan Complex subunits that form the HPS peninsula: the Hunters Point Shear Zone and the Marin Headlands Terrane. The investigation included about 30 rock and soil samples from each of the three sites (91 samples total) that were analyzed for metals using a standard analytical suite of EPA methods. The study found elevated concentrations of arsenic, iron, and manganese associated with chert bedrock and elevated nickel concentrations associated with serpentinite. The chemical composition of soil at the three sites was found to be similar to the chemical composition of rock. Of the 91 samples collected, none met the cleanup standards for unrestricted residential reuse at HPS because of the elevated ambient concentrations of these metals in the serpentinite bedrock and its derived soils. Based on this study, the Navy believes that the elevated concentrations of metals in the soils at HPS as represented by the HPALs, is also a result of the ambient metals concentrations in a serpentinite sourced fill material.

The draft final Parcel D RI report presented cross sections (see Figures 3.7-10 through 3.7-15 of that report) that depict the relationship of the various geologic units at the site (PRC, LFR, and U&A 1996). The geologic interpretations presented in the cross sections were updated in the 2002 draft Parcel D revised D FS based on data collected during the Phases I and II GDGI (Tetra Tech 2001a, 2001b). The cross section location map and the updated cross sections are presented on Figures 2-6 and 2-7.

The following description of the geologic setting at Parcel D summarizes the information presented on the updated cross sections. The bedrock at Parcel D is mainly composed of serpentinite belonging to the Hunters Point Shear Zone of the Franciscan Complex (Tetra Tech 2001b). The depth to Franciscan Complex Bedrock from the ground surface in Parcel D varies from less than 1 foot in the northern area to more than 120 feet in the southeastern area. Undifferentiated Sedimentary Deposits overlie bedrock over much of Parcel D, occurring beneath Bay Mud Deposits or, rarely, directly beneath Artificial Fill; these deposits range up to 80 feet thick. Bay Mud Deposits underlie most (about 80 percent) of Parcel D, except for a strip along the northern margin of the site. Where present, Bay Mud Deposits are typically 20 to 30 feet thick and are thickest (up to 40 feet) beneath the southeastern part of the parcel. Undifferentiated Upper Sand Deposits are discontinuous beneath Parcel D. These deposits generally overlie Bay Mud, but may interfinger with Bay Mud Deposits and, in a few localities, directly overlie Undifferentiated Sedimentary Deposits. The Undifferentiated Upper Sand Deposits generally range from a few feet to up to 40 feet thick. Artificial Fill overlies all of the naturally occurring units and ranges from approximately 2 feet thick in the north to 40 feet thick in the middle of Parcel D. In most of Parcel D, the artificial fill ranges from 20 to 30 feet thick. The thickness of the Artificial Fill and all sedimentary deposits generally increases toward the Bay. Table 2-2 summarizes the geology at each IR site located within Parcel D.

2.2.8 Parcel D Hydrogeology

This section summarizes the hydrostratigraphic units, groundwater flow patterns, and hydraulic characteristics of the main hydrogeologic units. Detailed descriptions of the hydrogeology at Parcel D are presented in the RI (PRC, LFR, and U&A 1996; PRC and LFR 1997) and Phase II and III GDGI reports (Tetra Tech 2001b, 2003a).

2.2.8.1 Hydrostratigraphic Units

The hydrostratigraphic units at HPS are (1) the A-aquifer, (2) the aquitard, (3) the B-aquifer, and (4) the deep bedrock water-bearing zone. Cross sections presented on Figure 2-7 show the hydrostratigraphic units in different colors, except for the deep (fractured) bedrock water-bearing zone, which is shown in white. The shallow (weathered) bedrock water-bearing zone near the boundary between the non-Navy property to the north and Parcel D (shown on the left side of cross section A-A' on Figure 2-7) and at other locations is hydraulically connected with the A-aquifer and therefore is considered part of the A-aquifer in this location.

Shallow, unconfined groundwater occurs continuously across all of Parcel D in the A-aquifer. The A-aquifer at Parcel D consists mainly of unconsolidated artificial fill material that overlies the aquitard and bedrock. Undifferentiated Upper Sand is also part of the A-aquifer at some locations. Based on the cross sections shown on Figure 2-7, the A-aquifer consists mostly of sandy gravel and gravelly sand with limited zones of low-permeability sandy clay. Significant portions of the A-aquifer are also made up of less permeable fill. The A-aquifer typically ranges from 10 to 40 feet thick, but averages approximately 25 feet thick.

The aquitard is generally made up of silts and clays of the Bay Mud and Undifferentiated Sedimentary deposits. The aquitard ranges from 0 to 100 feet thick, but is most commonly 40 to 80 feet thick (see Figure 2-7). The aquitard is absent in the northern part of Parcel D where the A-aquifer is in direct contact with the bedrock and is thickest in the southeastern part of the parcel. The aquitard inhibits groundwater communication between the A-aquifer and the B-aquifer.

The B-aquifer is associated with the Undifferentiated Sedimentary deposits and consists of small, laterally discontinuous permeable sediment lenses of gravel, sand, silty sand, or clayey sand intermingled with the aquitard. The largest B-aquifer area is present near the center of Parcel D. The B-aquifer area at this location is estimated to be approximately 1,500 feet wide by 1,000 feet long, and is shown at its appropriate depth in cross sections A-A' and C-C' (see Figure 2-7). The B-aquifer varies from 20 to 30 feet thick. Groundwater in the discontinuous B-aquifer areas is under confined conditions. Table 2-2 summarizes the hydrogeologic units underlying each IR site.

2.2.8.2 Groundwater Flow Patterns and Tidal Effects

More than 85 percent of the ground surface at Parcel D is covered by pavement and buildings; as a result, most precipitation is channeled into the storm drain system. Unpaved areas may serve as localized vertical recharge areas. Leaking water lines also serve as limited sources of localized recharge. Base flow from the uplands north of Parcel D provides lateral groundwater recharge across the northern boundary of the parcel. Groundwater discharges directly to the Bay (1) along the shoreline, which is significantly modified by the presence of impermeable dry docks and sea walls in some areas, and (2) through permeable or semipermeable utility line corridors. In the past, groundwater that entered the sanitary sewer was discharged to the local publicly owned treatment works. Currently, the sanitary sewer system has been disconnected, and the sanitary sewers are being removed as part of a radiological removal action.

Groundwater flow patterns at Parcel D are complex because they are affected by (1) a groundwater sink located near the former western boundary of Parcel D (this area is now in Parcel E); (2) a groundwater mound located near the current western boundary of Parcel D (beneath IR-33, IR-44, IR-66, and IR-67); (3) leaks of groundwater into former sanitary sewers or storm drains; (4) recharge from water supply lines; and (5) tides in the Bay. Most groundwater at Parcel D flows toward the Bay, except in the western portion of Parcel D, which historically has flowed away from the mound and toward the groundwater sink in Parcel E (see Figure 2-8), where groundwater elevations are below mean sea level. The sink is believed to be caused by leaks of groundwater into sanitary sewer lines, which was then pumped off site to the local publicly owned treatment works, thereby lowering groundwater levels in the area. Flow patterns are anticipated to change as the sewer and storm drain lines are removed. Figure 2-9 shows the groundwater elevation contours from groundwater monitoring in March 2007.

The investigation of the bedrock underlying Parcel D has been limited and included areas where shallow bedrock and colluvium are hydraulically connected to the A-aquifer. In addition, the deep borings at Parcel D indicate the deeper bedrock underlying the Undifferentiated Sedimentary deposits consists mostly of fractured and moderately to strongly weathered serpentinite. Direct vertical hydraulic communication between the A-aquifer and the B-aquifer is inhibited because of the thick aquitard that separates them (see Figure 2-7). In addition, an upward vertical hydraulic gradient was observed at most well pairs installed at Parcel D (Tetra Tech 2004). Therefore, at Parcel D, migration of groundwater from the A-aquifer to the B-aquifer is considered minimal.

Tidal influence is the periodic fluctuation in the elevation of the groundwater table with time, caused by tide fluctuations in the Bay. Tidal influence may also include mixing or diluting groundwater with bay water, but the mixing usually does not occur as far inland as the fluctuations in groundwater elevation. The tidal influence zone is defined as the area where the maximum tidal fluctuation (difference in groundwater elevation between consecutive high and low tides) exceeds 0.10 foot. Based on tidal influence studies conducted during the RI (PRC, LFR, and U&A 1996) and the phase III GDGI (Tetra Tech 2003a), the tidal influence zone extends inland up to about 500 feet. Storm drains and utility corridors that are submerged below the water table could locally increase the magnitude of the tidal influence and the distance inland that is affected. Figure 2-3 shows the storm and sanitary sewer utility lines that are below the water table. The storm and sanitary sewer utility lines at Parcel D are scheduled for removal during 2007 and 2008.

2.2.8.3 Hydraulic Characteristics

The hydraulic conductivity of the A-aquifer at Parcel D typically ranges from 1 to 21 feet per day. The hydraulic conductivity was estimated based on data from slug and pumping tests performed during the RI (PRC, LFR, and U&A 1996). The minimum and maximum reported hydraulic conductivity values for IR sites located within Parcel D are 0.025 and 580 feet per day. The wide range of reported hydraulic conductivities indicates that the aquifer matrix is very

heterogeneous. The A-aquifer consists primarily of heterogeneous artificial fill materials that vary from clay to silt to sand to gravel.

The estimated groundwater velocities at Parcel D range from 1.5 to 31 feet per year. These velocities were calculated using the typical intermediate value of hydraulic gradient for the A-aquifer throughout Parcel D of 0.001 (PRC, LFR, and U&A 1996) and an assumed effective porosity for the A-aquifer of 0.25. No slug test or pumping test evaluations were performed for the B-aquifer within Parcel D. However, slug tests were performed in two monitoring wells in the underlying fractured bedrock water-bearing zone at IR-09 in the north-central area of Parcel D (PRC, LFR, and U&A 1996), with estimated hydraulic conductivities ranging from 0.025 to 3.7 feet per day. In general, groundwater velocities in the fractured bedrock water-bearing zone is expected to be low because the flow occurs mostly through fractures that are likely filled with residual clays and silts (PRC, LFR, and U&A 1996).

2.2.9 Groundwater Beneficial Use Evaluation

This section summarizes the beneficial use evaluation conducted for groundwater underlying Parcel D. The complete beneficial use evaluation is presented in Appendix D. The potential beneficial uses of Parcel D groundwater have been evaluated several times in the past (see Appendix D; Tetra Tech 2001c). In 2003, the Navy concluded that A-aquifer groundwater at Parcel D is unsuitable for use as a potential source of drinking water based on an evaluation of site-specific factors (Navy 2003). In 2003, the Water Board concurred with the Navy's determination that the A-aquifer at HPS is not a potential drinking water source (Water Board 2003). EPA, however, did not concur and required that federal criteria also be used to assess if Parcel D groundwater could be considered a potential drinking water source.

EPA considers groundwater to be a potential source of drinking water if the following criteria are met:

- The total dissolved solids (TDS) concentration is less than 10,000 milligrams per liter (mg/L)
- A minimum well yield of 150 gallons per day or 0.104 gallon per minute can be achieved

Figure 2-10 presents the maximum TDS concentrations detected in A-aquifer groundwater monitoring wells at Parcel D. As shown on Figure 2-10, TDS concentrations exceed 10,000 mg/L along the Parcel D shoreline and are less than 10,000 mg/L in the central and northwestern part of the parcel. The federal TDS criterion was applied separately to each IR site at Parcel D in this FS report. Based on this criterion, groundwater underlying all or part of the following 17 IR sites could be considered potential sources of drinking water: IR-09, IR-16, IR-17, IR-32, IR-33 North and South, IR-34, IR-37, IR-44, IR-48, IR-53, IR-55, IR-65, IR-66, IR-67, IR-68, IR-69, and IR-70. Based on known hydrogeologic conditions at Parcel D, it is assumed that a minimum well yield of 150 gallons per day could also be achieved from

storm drain system and discharged through outfalls to the Bay. The storm drain system at HPS consists of 10 major drainage areas. Five of these storm water drainage areas are located completely or partially within Parcel D. In addition, eight smaller isolated drainage areas are located in Parcel D, each with an independent outfall (PRC, LFR, and U&A 1996). Approximately 10 percent of the HPS surface is not served by the storm drain system, including the undeveloped shoreline, some pier areas, and a trailer parking lot. No naturally occurring drainage channels remain at HPS. Pre-existing drainage channels were filled in or modified by construction over the years. The location and distribution of the storm drain and sanitary sewer lines at Parcel D are presented on Figure 2-3. The Navy has begun to remove the storm drain and sanitary sewer lines throughout Parcel D; completion is planned for 2008.

2.2.5 Parcel D Ecology

Several hundred types of plants and animals are believed to live at or near HPS, including terrestrial and marine plants and algae; benthic and water column-dwelling marine animals such as clams, mussels, amphipods, and fish; insects; amphibians; reptiles; birds; and mammals. No threatened or endangered species are known to inhabit HPS or its vicinity (Environmental Science Associates 1987). Parcel D ecology is limited to those plant and animal species adapted to the industrial environment. For example, the 450-ton bridge crane could provide nesting locations for peregrine falcons, which would also prey on smaller birds (RASO 2004). Viable terrestrial habitat is inhibited at Parcel D because approximately 85 percent of the ground surface is covered by pavement and industrial buildings. Physical structures at Parcel D, such as docks and piers, may serve as artificial habitats for estuarine life.

In the spring of 2004, an individual burrowing owl (*Athene cunicularia*) was sighted at Parcel D. Burrowing owls are listed as "Species of Special Concern" by the California Department of Fish and Game (2004). Species of special concern status applies to animals not listed under the federal or state Endangered Species Act, but which nonetheless are declining at a rate that could result in listing, or have historically occurred in low numbers and known threats to their persistence currently exist.

The burrowing owl was identified prior to implementing a time-critical removal action (TCRA) for removing stockpiled soil at Parcel D (see Section 2.4). The owl's burrow was observed on the ground in the area of the soil stockpiles and was not within the stockpiled soil. Appropriate measures were taken during the field activities for the TCRA to minimize the impacts to the burrowing owl's habitat (Tetra Tech 2004; Navy 2004).

In March 2005, the Navy surveyed Parcel D and determined that a burrowing owl was present at the site. The Navy decided that the burrowing owl would be relocated because excavation and removals were planned for the summer of 2005 at the adjacent Parcel E and because future remediation of Parcel D could include remedies that potentially could affect the owl.

As a result, in April 2005, the owl was relocated off Parcel D using a passive relocation method. Passive relocation involves installing a one-way door in the burrows, so that the owl can leave but not reenter, and collapsing the burrows 48 hours after the door is in place. The Navy consulted with Peter Bloom of the California Department of Fish and Game to conduct this passive relocation project in accordance with California Department of Fish and Game guidelines.

No other potential terrestrial receptors or habitat have been identified at Parcel D. It is unlikely that Parcel D will contain terrestrial habitat in the future because its proposed reuse is primarily industrial.

2.2.6 Parcel D Soils

Soils at HPS are either the result of (1) weathered material from nearby rock formations and sediments from the Bay or (2) imported fill material placed at HPS during its development. The area northwest of Parcel D is primarily covered by upland soils, which are moderate to steeply sloped terrains. Parcel D is primarily lowland soils, which are flat to gently sloped urban developed lands. These lowland soils are susceptible to subsidence by natural compaction or during moderate to strong earthquakes. Soils at HPS are described in detail in Appendix H of the draft final Parcel D RI report (PRC, LFR, and U&A 1996). Figure 2-4 shows the distribution of soils at HPS.

2.2.7 Parcel D Geology

The peninsula forming HPS is within a northwest-trending belt of Franciscan Complex bedrock known as the Hunters Point Shear Zone. In some locations, the Marin Headlands Terrane underlies this shear zone. HPS is underlain by five geologic units, the youngest of Quaternary age, and the oldest, the Franciscan Complex bedrock, of Jurassic-Cretaceous age. In general, the stratigraphic sequence of these geologic units, from youngest (shallowest) to oldest (deepest), is as follows: Artificial Fill; Undifferentiated Upper Sand Deposits; Bay Mud Deposits; Undifferentiated Sedimentary Deposits; and Franciscan Complex Bedrock. The locations of the fill material, the colluvium, alluvium and landslide debris, and the chert, shale, sandstone, volcanic, and serpentine bedrock units at HPS are shown on Figure 2-5.

The Navy believes that the practice of using quarried local rock for fill at HPS is similar to construction practices in the same bedrock formations used elsewhere in San Francisco. The Navy observed that a wide range of concentrations of metals are found in similar chert, basalt, and serpentinite bedrock formations in other areas of San Francisco based on sampling that the Navy conducted in 2003 at areas outside of HPS. This information is summarized in a report titled “Draft Metals Concentrations in Franciscan Bedrock Outcrops” (Tetra Tech and Innovative Technical Solutions, Inc. [ITSI] 2004).

In the Tetra Tech and ITSI 2004 report, the Navy studied the ambient concentrations of metals in bedrock and bedrock-derived soil from three nonindustrial sites in San Francisco. These three sites have a similar geologic setting to HPS and contain serpentinite or chert and basalt bedrock

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane

SUMMARY OF SOIL ANALYTICAL TESTS - IR-09
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CHROM	CHROMIUM VI
CYAN	Cyanide
DIOXIN	Dioxins and Furans
O&G	Total oil and grease
PAH	Polynuclear aromatic hydrocarbons
PCTMST	Percent moisture
PEST	Pesticides/polychlorinated biphenyls
PHYS	Physical characteristic
SALIN	Salinity
SVOC	Semivolatile organic compounds
SOLIDS	Total dissolved solids
TOC	Total organic carbon
TMICROB	Coliform
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
VOC	Volatile organic compounds

TABLE 4.3-5 (Continued)

STATISTICAL SUMMARY OF SOIL ANALYTICAL RESULTS - IR-09
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
HPAL	Hunters Point ambient level
MG/KG	Milligram per kilogram
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PHYS	Physical characteristic
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 55.850 to 1743.823, 12.344 to 163.992, and 42.467 to 4835.920 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

SOIL ANALYTICAL RESULTS - IR-09
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

%	Percent
bgs	Below ground surface
mg/kg	Milligram per kilogram
NA	Not analyzed
ND()	Not detected (detection limit in parentheses)
µg/kg	Microgram per kilogram
*	Detected concentration greater than U.S. Environmental Protection Agency Region IX preliminary remediation goals (PRG) for residential use
#	Detected concentration greater than U.S. Environmental Protection Agency Region IX PRG for industrial use
α	Detected concentration greater than the Hunters Point ambient level.
	Detected concentration greater than at least one screening criterion.

TABLE 4.3-8A (Continued)

STATISTICAL SUMMARY OF MONITORING WELL GROUNDWATER A-AQUIFER ANALYTICAL RESULTS - IR-09
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
MCL	Maximum contaminant level
NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

j Most probable number of organisms per 100 milliliters (mpn/100 mL)

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 184.041 to 236.341, 30.252 to 36.510, and 219.147 to 309.178 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

j Most probable number of organisms per 100 milliliters (mpn/100 mL)

TABLE 4.8-9

OTHER WATER ANALYTICAL RESULTS - IR-33 NORTH
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Station Number	PA50SN405	PA50SN405
Sample Number	9317B103	9317B104
Sample Date	04/27/93	04/27/93
Metal (ug/L)		
ANTIMONY	20.6 *δ	ND (13.8)
BARIUM	57.0	68.8
CALCIUM	ND (39.7)	218,000
IRON	212	238
LEAD	4.2 *	ND (13.0)
MAGNESIUM	277,000	587,000
MANGANESE	846 *	623 *
POTASSIUM	59,700	173,000
SELENIUM	25.2	ND (22.0)
SODIUM	2,070,000	4,470,000
VANADIUM	4.8	ND (1.9)
Semivolatile Organic Compound (ug/L)		
4-METHYLPHENOL	ND (10)	28
Coliform (mpn/100 mL)		
FECAL COLIFORM	1,600	1,600

Notes:

mpn/100 mL	Most probable number of organisms per 100 milliliters
NA	Not analyzed
ND()	Not detected (detection limit in parentheses)
µg/L	Microgram per liter
*	Detected concentration greater than U.S. Environmental Protection Agency Region IX preliminary remediation goals (PRG) for tap water
δ	Detected concentration greater than maximum contaminant level (MCL) U.S. Environmental Protection Agency Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent
▒	Detected concentration greater than at least one screening criterion.

TABLE 4.8-11 (Continued)

STATISTICAL SUMMARY OF SOIL ANALYTICAL RESULTS - IR-33 NORTH
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
HPAL	Hunters Point ambient level
MG/KG	Milligram per kilogram
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PHYS	Physical characteristic
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 86.078 to 1753.710, 17.087 to 164.690, and 77.017 to 4873.683 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

TABLE 4.8-14 (Continued)

STATISTICAL SUMMARY OF MONITORING WELL GROUNDWATER ANALYTICAL RESULTS - IR-33 NORTH
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
MCL	Maximum contaminant level
NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

j Most probable number of organisms per 100 milliliters (mpn/100 mL)

STATISTICAL SUMMARY OF HYDROPUNCH GROUNDWATER ANALYTICAL RESULTS - IR-33 NORTH HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
MCL	Maximum contaminant level
NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

TABLE 4.9-5 (Continued)

STATISTICAL SUMMARY OF SOIL ANALYTICAL RESULTS - IR-33 SOUTH
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
HPAL	Hunters Point ambient level
MG/KG	Milligram per kilogram
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PHYS	Physical characteristic
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 25.745 to 1550.829, 6.896 to 150.154, and 14.628 to 4115.240 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

j Most probable number of organisms per 100 grams (mpn/100 g)

SOIL ANALYTICAL RESULTS - IR-33 SOUTH
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Station Number	PA33MW37A	PA33MW37A	PA33SS52	PA33SS57	PA45TA08	PA50B015	PA50TA11
Sampling Depth (feet bgs)	11.75	16.75	4.50	5.25	5.75	8.25	6.25
Sample Number	9309A643	9309A644	9310J393	9310J394	9322P222	9330H504	9327P231
Sample Date	03/02/93	03/02/93	03/12/93	03/12/93	06/03/93	07/26/93	07/07/93
Percent Moisture (%)							
% SOLIDS	NA	NA	84.5	69.9	89.2	86.0	92.1
pH (pH units)							
PH	8.0	7.9	8.9	8.5	9.4	8.4	8.0

Notes:

%	Percent
bgs	Below ground surface
mg/kg	Milligram per kilogram
NA	Not analyzed
ND()	Not detected (detection limit in parentheses)
µg/kg	Microgram per kilogram
*	Detected concentration greater than U.S. Environmental Protection Agency Region IX preliminary remediation goals (PRG) for residential use
#	Detected concentration greater than U.S. Environmental Protection Agency Region IX PRG for industrial use
α	Detected concentration greater than the Hunters Point ambient level.
▒	Detected concentration greater than at least one screening criterion.

TABLE 4.9-8 (Continued)

STATISTICAL SUMMARY OF MONITORING WELL GROUNDWATER ANALYTICAL RESULTS - IR-33 SOUTH HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
MCL	Maximum contaminant level
NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

TABLE 4.10-2 (Continued)

STATISTICAL SUMMARY OF STORM DRAIN SEDIMENT ANALYTICAL RESULTS - IR-34
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
HPAL	Hunters Point ambient level
MG/KG	Milligram per kilogram
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PHYS	Physical characteristic
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 141.648 to 151.308, 24.848 to 26.111, and 152.851 to 167.377 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

TABLE 4.10-5 (Continued)

STATISTICAL SUMMARY OF SOIL ANALYTICAL RESULTS - IR-34
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
HPAL	Hunters Point ambient level
MG/KG	Milligram per kilogram
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PHYS	Physical characteristic
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 49.382 to 532.471, 11.253 to 67.231, and 35.850 to 945.373 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

STATISTICAL SUMMARY OF MONITORING WELL GROUNDWATER ANALYTICAL RESULTS - IR-34
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
MCL	Maximum contaminant level
NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene

STATISTICAL SUMMARY OF STORM DRAIN SEDIMENT ANALYTICAL RESULTS - IR-37
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
HPAL	Hunters Point ambient level
MG/KG	Milligram per kilogram
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PHYS	Physical characteristic
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 133.575 to 354.850, 23.775 to 49.555, and 140.993 to 540.860 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

TABLE 4.15-8 (Continued)

STATISTICAL SUMMARY OF SOIL ANALYTICAL RESULTS - IR-37
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
HPAL	Hunters Point ambient level
MG/KG	Milligram per kilogram
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PHYS	Physical characteristic
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 55.850 to 1827.084, 12.344 to 169.843, and 42.467 to 5156.421 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

STATISTICAL SUMMARY OF MONITORING WELL GROUNDWATER ANALYTICAL RESULTS - IR-37
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
MCL	Maximum contaminant level
NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

TABLE 4.18-2 (Continued)

STATISTICAL SUMMARY OF STORM DRAIN SEDIMENT ANALYTICAL RESULTS - IR-44
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
HPAL	Hunters Point ambient level
MG/KG	Milligram per kilogram
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PHYS	Physical characteristic
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 160.697 to 211.311, 27.320 to 33.563, and 181.834 to 265.039 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Station Number	PA44SB01	PA44SB04
Sampling Depth (feet bgs)	0.00	0.00
Sample Number	9309A634	9309A637
Sample Date	03/01/93	03/01/93
pH (pH units)		
PH	7.9	7.9

Notes:

bgs Below ground surface
mg/kg Milligram per kilogram
NA Not analyzed
ND() Not detected (detection limit in parentheses)
µg/kg Microgram per kilogram

* Detected concentration greater than U.S. Environmental Protection Agency Region IX preliminary remediation goals (PRG) for residential use
\# Detected concentration greater than U.S. Environmental Protection Agency Region IX PRG for industrial use
α Detected concentration greater than the Hunters Point ambient level.

 Detected concentration greater than at least one screening criterion.

TABLE 4.18-8 (Continued)

STATISTICAL SUMMARY OF SOIL ANALYTICAL RESULTS - IR-44
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
HPAL	Hunters Point ambient level
MG/KG	Milligram per kilogram
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PHYS	Physical characteristic
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 84.312 to 1114.669, 16.823 to 117.149, and 74.851 to 2612.582 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

TABLE 4.18-11 (Continued)

STATISTICAL SUMMARY OF MONITORING WELL GROUNDWATER ANALYTICAL RESULTS - IR-44
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
MCL	Maximum contaminant level
NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

j Most probable number of organisms per 100 milliliters (mpn/100 mL)

STATISTICAL SUMMARY OF HYDROPUNCH GROUNDWATER ANALYTICAL RESULTS - IR-44
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
MCL	Maximum contaminant level
NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

PEST	Pesticide/polychlorinated biphenyl
PHYS	Physical characteristic
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 183.850 to 353.381, 30.229 to 49.401, and 218.833 to 537.781 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

TABLE 4.26-5 (Continued)

STATISTICAL SUMMARY OF MONITORING WELL GROUNDWATER ANALYTICAL RESULTS - IR-65
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
MCL	Maximum contaminant level
NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

Notes:

NA	Not analyzed
ND()	Not detected (detection limit in parentheses)
µg/L	Microgram per liter
*	Detected concentration greater than U.S. Environmental Protection Agency Region IX preliminary remediation goals (PRG) for tap water
ß	Detected concentration greater than National Ambient Water Quality Criteria (NAWQC) based on 4-day average study of saltwater aquatic life
δ	Detected concentration greater than maximum contaminant level (MCL) U.S. Environmental Protection Agency Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent
▒	Detected concentration greater than at least one screening criterion.

TABLE 4.27-2 (Continued)

STATISTICAL SUMMARY OF SOIL ANALYTICAL RESULTS - IR-66
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
HPAL	Hunters Point ambient level
MG/KG	Milligram per kilogram
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PHYS	Physical characteristic
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/KG	Microgram per kilogram
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 104.953 to 1493.683, 19.834 to 145.975, and 101.176 to 3908.058 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

STATISTICAL SUMMARY OF OTHER WATER ANALYTICAL RESULTS - IR-67
HUNTERS POINT SHIPYARD, PARCEL D REMEDIAL INVESTIGATION

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
MCL	Maximum contaminant level
NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

Notes:

CYAN	Cyanide
EPA	U.S. Environmental Protection Agency
MCL	Maximum contaminant level
NAWQC	National Ambient Water Quality Criteria
O&G	Total oil and grease
PCTMST	Percent moisture
PEST	Pesticide/polychlorinated biphenyl
PPT	Parts per thousand
PRG	Preliminary remediation goal
SALIN	Salinity
SVOC	Semivolatile organic compound
TMICROB	Coliform
TOC	Total organic carbon
TPHEXT	Total petroleum hydrocarbons-extractable
TPHPRG	Total petroleum hydrocarbons-purgeable
TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than residential PRG

f Total number of samples showing concentrations greater than industrial PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

g Total number of samples showing concentrations greater than HPAL

h HPALs for chromium, cobalt, and nickel are based on the concentration of magnesium in each sample; thus, no single value applies to all samples. The range of HPAL values for chromium, cobalt, and nickel are 122.672 to 122.672, 22.301 to 22.301, and 125.404 to 125.404 mg/kg respectively.

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

TRPH	Total recoverable petroleum hydrocarbons
UG/L	Microgram per liter
VOC	Volatile organic compound

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

a Organic results of less than 10 are reported to one significant figure, and results of greater than or equal to 10 are reported to two significant figures. Inorganic results of less than 10 are reported to two significant figures, and results of greater than or equal to 10 are reported to three significant figures. Values that are not nondetects are compared to screening criteria before the significant figure rule is applied. Both the value and the screening criteria are then rounded for reporting purposes.

b Blank boxes indicate that screening critera have not been established for these analytes.

c Total number of samples analyzed

d Total number of samples showing concentrations greater than detection limit

e Total number of samples showing concentrations greater than tap water PRG
California-modified PRGs were used for the following analytes: 1,2-Dibromo-3-chloropropane, benzo[a]pyrene, benzo[k]fluoranthene, cadmium, chromium VI, chrysene, lead, nickel, and tetrachloroethylene (PCE).
For the analytes listed below, Region IX PRGs are not available; therefore, PRGs for similar chemicals were used as follows:

Analyte:	Similar Analyte:
2-Methylnapthalene	Naphthalene
Acenaphthylene	Acenaphthene
Alpha-chlordane	Chlordane
Aroclor-1260	Polychlorinated biphenyls
Benzo(g,h,i)perylene	Naphthalene
Delta BHC	HCH-technical
Endosulfan I	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Gamma-chlordane	Chlordane
Phenanthrene	Naphthalene

f EPA Title 40 Code of Federal Regulations or California Code of Regulations Title 22 MCL used, whichever is more stringent

g Total number of samples showing concentrations greater than MCL

h Total number of samples showing concentrations greater than NAWQC;
NAWQC based on 4-day average study of saltwater aquatic life

i Total number of samples showing concentrations greater than TPH, TRPH, or O&G screening level, not PRG value

TABLE 2-4: HISTORY OF IDENTIFYING AND EVALUATING FURTHER ACTIONS AT SOIL SITES IN PARCEL D

Revised Feasibility Study Report for Parcel D, Hunters Point Shipyard, San Francisco, California

IR Site	Remediation or De Minimis Area	Identifying Action
IR-08	RA 8-4	**FS:** Two areas at IR-08 (RA 8-1 and RA8-2) were identified for further action based on arsenic, benzo(a)pyrene, and Aroclor-1260. RA 8-4 (boring IR08B018A) was not specifically identified. IR-08 was identified as requiring action based on a the spill of PCB-containing waste oil onto soil during construction of Building 606 in 1988. IR-08 is now part of Parcel E, although RA 8-4 is in Parcel D. The Navy conducted an interim removal action at IR-08 in an area that is now part of Parcel E. About 1,255 cubic yards of soil was excavated to depths ranging from 3 to 10 feet bgs from an area measuring 50 by 150 feet (Barajas 2007). **RMR**: Based on site-specific conditions and the RMR criteria, no remedial action recommended at IR-08B018A. **TCRA SAP:** The Navy proposed additional investigation based on the detection Aroclor-1260 in one sample from location IR08B018A. **TCRA CR 1:** Excavated 13 cubic yards of soil; maximum depth 3 feet bgs.
IR-09	RA 9-1	**FS:** RA 9-1 (borings IR09B001 through IR09B009 and IR09PPY1) identified as requiring action for arsenic, beryllium, lead, nickel, PAHs, and PCBs. **RMR**: Based on site-specific conditions and the RMR criteria, no remedial action recommended for arsenic, beryllium, lead, nickel, PAHs, and PCBs; however, agencies requested further investigation for hexavalent chromium at four soil borings (IR09B003, IR09B006, IR09B007, and IR09B011) in which total chromium concentrations exceeded the sample-specific HPAL. **TCRA SAP:** The four soil borings identified in the RMR as requiring further investigation were designated as new *de minimis* areas: DM 6864 (IR09B003), DM 6965 (IR09B006), DM 6967 (IR09B007), and DM 7167 (IR09B011). Delineation sampling concluded that no remedial action was required for hexavalent chromium. **TCRA CR 1:** Analysis of TCRA samples did not detect hexavalent chromium or total chromium at concentrations above the TCRA industrial cleanup goals. No excavation performed.
	RA 9-2	**FS:** RA 9-2 (borings IR09B016 and IR09B017) identified as requiring action for arsenic and PAHs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action required for arsenic and PAHs.
	RA 9-3	**FS:** RA 9-3 (borings IR09B019, IR09B020, IR09B022, IR09B023, IR09B023A, IR09B024, IR09MW35A, IR09P35AA, and IR09P35AB) identified as requiring action for metals. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action required for metals.
	DM 6864	**FS:** Identified as part of RA 9-1 (above). **RMR:** Redesignated as the areas surrounding boring IR09B003 requiring further investigation for hexavalent chromium. **TCRA SAP:** Delineation sampling concluded that no remedial action was required for hexavalent chromium. **TCRA CR 1:** Analysis of TCRA samples did not detect hexavalent chromium or total chromium at concentrations above TCRA industrial cleanup goals. No excavation performed.

TABLE 2-4: HISTORY OF IDENTIFYING AND EVALUATING FURTHER ACTIONS AT SOIL SITES IN PARCEL D (CONTINUED)
Revised Feasibility Study Report for Parcel D, Hunters Point Shipyard, San Francisco, California

IR Site	Remediation or De Minimis Area	Identifying Action
	DM 6965	**FS:** Identified as part of RA 9-1 (above). **RMR:** Redesignated as the areas surrounding boring IR09B006 requiring further investigation for hexavalent chromium. **TCRA SAP:** Delineation sampling concluded that no remedial action was required for hexavalent chromium. **TCRA CR 1:** Analysis of TCRA samples did not detect hexavalent chromium or total chromium at concentrations above TCRA industrial cleanup goals. No excavation performed.
	DM 6967	**FS:** Identified as part of RA 9-1 (above). **RMR:** Redesignated as the areas surrounding boring IR09B007 requiring further investigation for hexavalent chromium. **TCRA SAP:** Delineation sampling concluded that no remedial action was required for hexavalent chromium. **TCRA CR 1:** Analysis of TCRA samples did not detect hexavalent chromium or total chromium at concentrations above TCRA industrial cleanup goals. No excavation performed.
IR-09 (cont.)	DM 7167	**FS:** Identified as part of RA 9-1 (above). **RMR:** Redesignated as the areas surrounding boring IR09B011 requiring further investigation for hexavalent chromium. **TCRA SAP:** Delineation sampling concluded that no remedial action was required for hexavalent chromium. **TCRA CR 1:** Analysis of TCRA samples did not detect hexavalent chromium or total chromium at concentrations above TCRA industrial cleanup goals. No excavation performed.
IR-16	NA	**FS:** Identified arsenic, lead, and PCBs as requiring remediation. **EE Removal Action:** EE-15/16, an irregular-shaped area approximately 990 square feet, was excavated to a depth of 2 feet bgs. **RMR:** Based on previous removal actions (EE-15/16), site-specific conditions, and the RMR criteria, no further remedial action recommended for arsenic, lead, and PCBs.
IR-17	NA	**FS:** Identified arsenic, lead, and PCBs as requiring remediation. **TCRA CR 2:** Nine stockpiles (SPD-23 through SPD-31) within and in close proximity to IR-17 were removed as part of the TCRA conducted in 2004. The stockpiles were over-excavated by 0.5 foot bgs because they were located on unpaved soil, and confirmation samples were collected at the bottom of the excavation footprints. Analytical results for benzo(a)pyrene from the confirmation samples collected at SPD-23 and SPD-31 exceeded the TCRA screening criterion. In addition, a fuel line area identified in TCRA CR 1 south of IR-17(DM BK32) was excavated as part of TCRA CR 2 to remove PAH and petroleum contamination in soil. This excavation was 35 feet wide by 110 feet long by 10 feet deep, and approximately 1,759 cubic yards of soil was removed. All analytical results for sidewall and bottom confirmation samples collected from this excavation were below TCRA screening criteria.

TABLE 2-4: HISTORY OF IDENTIFYING AND EVALUATING FURTHER ACTIONS AT SOIL SITES IN PARCEL D (CONTINUED)
Revised Feasibility Study Report for Parcel D, Hunters Point Shipyard, San Francisco, California

IR Site	Remediation or De Minimis Area	Identifying Action
IR-22	DM 9654	**FS:** DM 9654 (test pit PA45TA09) identified as requiring remedial action for PAHs. **Parcel D RMR:** Due to parcel boundary changes, DM 9654 is now in site IR-57 of Parcel C. **Parcel C RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for PAHs.
	DM 9562	**FS:** DM 9562 (boring IR22B014) identified as requiring action for beryllium. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for beryllium.
	DM 9752	**FS:** DM 9752 (boring IR22B003) identified as requiring action for arsenic. **Parcel D RMR:** Due to parcel boundary changes, DM 9752 is now in IR-57 of Parcel C.
	DM 9759	**FS:** DM 9759 (boring IR22B012) identified as requiring action for PAHs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for PAHs.
	DM 10956	**FS:** DM 10956 (boring IR51B032) identified as requiring action for PCBs and PAHs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for PCBs or PAHs.
IR-32	DM 11367	**FS:** DM 11367 (boring PA32B003) identified as requiring action for PAHs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for PAHs.
IR-33	RA 33N-1	**FS:** RA 33N-1 (borings IR33B069, IR33B070, IR33B091, and IR33MW61A) identified as requiring action for PAHs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for PAHs.
	DM 7353	**FS:** DM 7353 (boring IR33B105) identified as requiring action for hexavalent chromium. **EE Removal Action:** EE-12, a triangular area approximately 34 by 25 by 28 feet, was excavated to a depth of 10 feet bgs. Approximately 160 cubic yards was disposed of off site. **RMR:** Based on the previous removal action (EE-12), site-specific conditions, and RMR criteria, no further remedial action recommended for hexavalent chromium.
	DM 7453	**FS:** DM 7453 (surface sample PA33SS11) identified as requiring action for lead. **EE Removal Action:** EE-12, a triangular area approximately 34 by 25 by 28 feet, was excavated to a depth of 10 feet bgs. **RMR:** Based on the previous removal action (EE-12), site-specific conditions, and RMR criteria, no further remedial action recommended for lead.
	DM 7560	**FS:** DM 7560 (boring IR33B087) identified as requiring action for hexavalent chromium. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for hexavalent chromium.
	DM 7657	**FS:** DM 7657 (boring IR33B062) identified as requiring further action for arsenic and beryllium. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for arsenic or beryllium.

TABLE 2-4: HISTORY OF IDENTIFYING AND EVALUATING FURTHER ACTIONS AT SOIL SITES IN PARCEL D (CONTINUED)
Revised Feasibility Study Report for Parcel D, Hunters Point Shipyard, San Francisco, California

IR Site	Remediation or De Minimis Area	Identifying Action
IR-33 (cont.)	RA 33S-1	**FS:** RA 33S-1(borings IR33B092 and IR33B094) identified as requiring action for arsenic, PAHs, and PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for arsenic, PAHs, and PCBs.
	RA 33S-2	**FS:** RA 33S-2 (boring PA33B053) identified as requiring action for arsenic, PAHs, and PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for arsenic, PAHs, and PCBs.
	RA 33S-3	**FS:** RA 33S-3 (boring IR33B096) identified as requiring action for PAHs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for PAHs.
	DM 8169	**FS:** DM 8169 (surface sample PA33SS57) identified as requiring action for hexavalent chromium. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for hexavalent chromium.
IR-34	DM 8258	**FS:** DM 8258 (boring IR34B023) identified as requiring action for PAHs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for PAHs.
IR-35	RA 35-1	**FS:** RA 35-1 (surface samples IR35SS14, IR35SS15, and IR35SS16) identified as requiring action for PAHs and PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for PAHs and PCBs.
	DM 9363	**FS:** DM 9363 (surface sample PA35SS06) identified as requiring action for PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for PCBs.
IR-37	RA 37-1	**FS:** RA 37-1 (borings IR37B014, IR37B015, and IR37B017 and surface sample PA37SS09) identified as requiring action for PAHs and PCBs. **EE Removal Action:** EE-14, an area approximately 26 by 13 feet, was excavated to a depth of 3 feet bgs. **RMR:** Based on the previous removal action (EE-14), no further remedial action recommended for PAHs; however, further investigation required for manganese. **TCRA SAP:** Determined further investigation was required for manganese and PCBs. Delineation sampling concluded no further remedial action recommended for manganese; however, further action was required for PCBs. **TCRA CR 1:** Excavated 25 cubic yards of soil; maximum depth of 4 feet bgs.
	RA 37-2	**FS:** RA 37-2 (borings IR37B010 and IR37B013) identified as requiring action for arsenic, beryllium, nickel, PAHs, and PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no action recommended for arsenic, beryllium, PAHs, and PCBs; however, further action required for antimony. **TCRA SAP:** Determined further investigation required for antimony. Delineation sampling concluded further remedial action recommended for antimony. **TCRA CR 1:** Excavated 44 cubic yards of soil; maximum depth of 8 feet bgs.

TABLE 2-4: HISTORY OF IDENTIFYING AND EVALUATING FURTHER ACTIONS AT SOIL SITES IN PARCEL D (CONTINUED)
Revised Feasibility Study Report for Parcel D, Hunters Point Shipyard, San Francisco, California

IR Site	Remediation or De Minimis Area	Identifying Action
IR-37 (cont.)	DM 6671	**RMR:** DM 6671 identified in RMR as the area surrounding surface sample IR37SS08 requiring further investigation for manganese. **TCRA SAP:** Determined further investigation required for manganese. Delineation sampling concluded no remedial action recommended for manganese. **TCRA CR 1:** Analysis of TCRA samples indicated that concentrations of manganese are due to the presence of chert or chert fragments. No excavation recommended.
	DM 6771	**RMR:** DM 6771 identified in the RMR as the area surrounding boring IR37B021 requiring further investigation for manganese. **TCRA SAP:** Determined further investigation required for manganese. Delineation sampling concluded no remedial action recommended for manganese. **TCRA CR 1:** Analysis of TCRA samples did not detect manganese at concentrations above TCRA cleanup goals. No excavation recommended.
IR-44	NA	**FS:** Identified no areas requiring action.
IR-45	NA	**FS:** Areas requiring action are identified for the IR site in which the steam lines are physically located with petroleum hydrocarbon compounds, including PAHs, as chemicals of concern. **TCRA:** Removed and disposed of 2,100 feet of petroleum-contaminated steam line and closed 14,500 feet of steam line in place.
IR-48	NA	**FS:** Identified no areas requiring action.
IR-50	NA	**FS:** Areas requiring action are identified for the IR site in which the storm and sanitary sewer lines are physically located. **Removal Action:** Cleaned out and disposed of 1,200 tons of sediments removed from the storm drain system.
IR-51	NA	**FS:** Areas requiring action are identified for the IR site in which the former transformer sites are physically located. **Cleanup Action:** 1988 action removed 12 transformers from Parcel D. In addition, 48 transformers stored in the yard adjacent to Buildings 524 were removed and disposed of off site.
IR-53	RA 53-1	**FS:** RA 53-1 (borings IR53B019 through IR53B026 and surface samples PA53SS09 and PA53SS10) identified as requiring action for arsenic, lead, and PCBs. **EE Removal Action:** EE-15/16, an irregular-shaped area approximately 990 square feet, was excavated to a depth of 2 feet bgs. **RMR:** Based on previous removal actions (EE-15/16), site-specific conditions, and current RMR criteria, no further remedial action recommended for arsenic, lead, and PCBs.
	RA 53-2	**FS:** RA 53-2 (borings IR53B013 through IR53B017 and surface samples PA53SS03, PA53SS04, and PA53SS12) identified as requiring action for arsenic, beryllium, PAHs, and PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for arsenic, beryllium, PAHs, and PCBs.
	RA 53-3	**FS:** RA 53-3 (borings IR53B018 and IR53B018A) identified as requiring action for arsenic, beryllium, PAHs, and PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for arsenic, beryllium, and PCBs. However, a new DM area (DM 11260) surrounding boring IR53B018A determined to require further investigation for PAHs.

TABLE 2-4: HISTORY OF IDENTIFYING AND EVALUATING FURTHER ACTIONS AT SOIL SITES IN PARCEL D (CONTINUED)
Revised Feasibility Study Report for Parcel D, Hunters Point Shipyard, San Francisco, California

IR Site	Remediation or De Minimis Area	Identifying Action
IR-53 (cont.)	DM 11260	**RMR:** Identified as the area surrounding boring IR53B018A requiring further investigation for PAHs. **TCRA SAP:** Determined further investigation required for PAHs. Delineation sampling confirmed that further action required for PAHs. **TCRA CR 1:** Excavated 6 cubic yards of soil; maximum depth of 3 feet bgs.
IR-55	RA 55-1	**FS:** RA 55-1 (borings IR55B019, IR55B020, IR55B021, and IR55MW02A, and test pit sample PA55TA04) identified as requiring action for arsenic, lead, PAHs, and PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for arsenic, PAHs, and PCBs; however, a new DM area (DM 10676) surrounding boring IR55B016 determined to require further investigation for lead.
	DM 10383	**FS:** DM 10383 (test pit PA55TA10) identified as requiring action for arsenic and PAHs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for arsenic and PAHs.
	DM 10676	**RMR:** Identified as the area surrounding boring IR55B016 requiring further investigation for lead. **TCRA SAP:** Determined further investigation required for lead. Delineation sampling confirmed further action required for lead. **TCRA CR 1:** Excavated 7 cubic yards of soil; maximum depth of 3 feet bgs.
IR-65	DM 8866	**FS:** DM 8866 (borings IR65B001 and IR65B004) identified as requiring further action for arsenic and PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for PCBs; however, further investigation required for arsenic. **TCRA SAP:** Determined further investigation required for arsenic. Delineation sampling confirmed action required for arsenic. **TCRA CR 1:** Excavated 12 cubic yards of soil; maximum depth of 3 feet bgs.
IR-66	NA	**FS:** Identified no areas requiring action.
IR-67	NA	**FS:** Identified no areas requiring action.
IR-68	RA 68-1	**FS:** RA 68-1 (borings IR68B001 through IR68B009) identified as requiring action for arsenic, PAHs, and PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for arsenic, PAHs, and PCBs.
IR-69	RA 69-1	**FS:** RA 69-1 (borings IR69B001 through IR69B006) identified as requiring action for arsenic, lead, and PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no further remedial action recommended for arsenic, lead, and PCBs.
IR-70	RA 70-1	**FS:** RA 70-1 (borings IR70B005 and IR70MW04A; surface samples IR70SS01, IR70SS02, and IR70SS03; and test pit sample PA45TA11) identified as requiring action for arsenic, hexavalent chromium, PAHs, and PCBs. **RMR:** Based on site-specific conditions and RMR criteria, no remedial action recommended for arsenic, hexavalent chromium, PAHs, and PCBs.

TABLE 2-4: HISTORY OF IDENTIFYING AND EVALUATING FURTHER ACTIONS AT SOIL SITES IN PARCEL D (CONTINUED)

Item	Reference or Phrase in ROD	Location in ROD	Identification of Referenced Document Available in the Administrative Record[1]
7	Impacted or non-impacted	Table 1	Final Historical Radiological Assessment, History of the Use of General Radioactive Materials, 1939 – 2003. Section 1.2. Naval Sea Systems Command. October 2004.

(NAVSEA) offices, with different historical controls and practices, that manage NNPP radioactive material and G-RAM.

1.2 HRA METHODOLOGY

The primary purpose of the HRA is to designate sites as impacted or non-impacted. An impacted site is one that has potential for radioactive contamination based on historical information, or is know to contain or have contained radioactive contamination. In many instances, designation as impacted does not confirm that radioactive contamination is present; only that the possibility exists and must be investigated. If contamination is found at an HPS-impacted site, measures will be taken to remove the contamination to below release levels. Because of the extensive use of radioactive materials by the Naval Radiological Defense Laboratory (NRDL), former NRDL facilities have been included as impacted sites. Once a site is designated as impacted, it remains "impacted" even after any residual contamination is removed.

A non-impacted site is one, based on historical documentation or results of previous radiological survey information, where there is no reasonable possibility for residual radioactive contamination. If new historical information becomes available or contamination is found at a non-impacted site, the site would be redesignated as "impacted."

To designate sites as impacted or non-impacted, the HRA defines the extent of past radiological operations, assesses the likelihood of potential contamination and potential contamination migration pathways, and recommends future actions. As well as being used to designate impacted sites, this information can be used to support removal actions within the context of the U.S. Environmental Protection Agency's (EPA) CERCLA process. As such, this HRA includes:

- Initial classification of areas that are impacted by radiological operations
- Historical information about radiological operations, investigations, and surveys
- Identification of potential, likely or known sources of radioactive material, radioactive contamination, and areas of use
- Assessments of the likelihood of areas of residual contamination

- Assessments of the likelihood of contamination migration
- Identification of sites that need further action as opposed to those posing no risk to human health or the environment from radiological operations
- Recommendations for future radiological investigations and remediation processes

The Navy researched multiple federal and personal archives to obtain information for preparation of the HRA. This research was supplemented by interviews of personnel with knowledge of radiological operations at HPS. Historical information was compared with evaluations made during site reconnaissance.

1.3 HISTORY

This HRA covers 64 years of radiological history at HPS from 1939 through June 2003. However, the shipyard only functioned as an active Navy-run repair facility from 1939 through 1974. After HPS ceased to function as an operational Navy shipyard in 1974, some HPS buildings and structures were leased to private tenants and Navy-related entities, the largest of which was Triple A Machine Shop, Inc. (Triple A), for ship repair operations. Buildings at HPS have also been leased for maritime and non-maritime industrial and artistic purposes. In addition, the Navy continued to use some buildings and structures for on-site oversight activities. The Navy resumed operation of the shipyard in 1986, when HPS was assigned as an annex to Naval Station Treasure Island. Throughout its history, HPS has been the subject of many radiological investigations. These investigations continue today.

Shipyard operations were permanently terminated on 29 December 1989. In 1991, HPS was placed on the Navy's BRAC list and its mission as a Navy shipyard ended on 1 April 1994. Engineering Field Activity West, Naval Facilities Engineering Command (EFA WEST), San Bruno, California, had initial oversight of base closure management of HPS. After closure of EFA WEST, this oversight authority was transferred to Southwest Division, Naval Facilities Engineering Command (SWDIV) in San Diego, California. SWDIV continues to manage the site today.

Details of the radiological history of HPS are provided in Section 6.0. Historical radiological operations included the following:

12	Radiologically impacted sites	Section 2.3	Final Historical Radiological Assessment, History of the Use of General Radioactive Materials, 1939 – 2003. Sections 8.3.4.6, 8.3.4.7, 8.3.4.8, 8.3.4.9, 8.3.4.10, 8.3.4.12, and 8.3.4.13. Naval Sea Systems Command. October 2004.

8.3.4.6 Building 351

Site Description: Building 351 is a WW II era reinforced concrete shop building constructed in 1945 and enlarged at a later date. The core building is three stories, with a flat roof and a five-story tower at the northwest corner **(HRA-1118, p 170)**. A building site plan is provided in Figure 8.3.4.4 above, and a floor plan is provided in Figure 8.3.4.6FP (first and second floors).

Former Uses: Electronics work area/shop **(HRA-1327 Encl 1, p 1; HRA-4667)**, optical laboratories **(HRA-1327 Encl, 1 p 1)**, NRDL Materials and Accounts Division **(HRA-1586)**, NRDL Technical Information Division **(HRA-1990, p 3; HRA-2928, p 2)**, BUMED storeroom **(HRA-2002, p 6)**, NRDL Office Services Branch **(HRA-2083, p 3)**, NRDL Thermal Branch **(HRA-2083, p 4)**, machine shop (on first floor), NRDL Engineering Division, NRDL library, sampling laboratory, general research laboratories, and biological research laboratories.

Current Uses: Unoccupied.

Radionuclides of Concern: Cs-137, Ra-226, Sr-90, and Th-232.

Previous Radiological Investigations:

2002 NWT Phase V investigations. Surveys complete.

1955 NRDL surveyed. Cleared: below release limits of the period.

Contamination Potential: Likely.

Contaminated Media:

Surface Soil: None
Subsurface Soil: None
Sediment: Low
Surface Water: None
Groundwater: None
Air: None
Structures: Moderate
Drainage Systems: Low

Potential Migration Pathways:

Surface Soil: None
Subsurface Soil: None
Sediment: Low
Surface Water: None
Groundwater: None
Air: None
Structures: Low
Drainage Systems: Low

Recommended Actions: Review Final Status Survey Report.

Figure 8.3.4.6 FP
Building 351 - Floor Plan

8.3.4.7 Building 351A

Site Description: Building 351A is an addition connected to the south end of Building 351. It is a one-story concrete building constructed over a crawlspace. A building site plan is provided in Figure 8.3.4.4 above, and a floor plan is provided in Figure 8.3.4.7FP.

Former Uses: NRDL Chemical Technology Division **(HRA-1963, p 6; HRA-2065, p 3)**, headquarters guard post **(HRA-2069, p 4)**, NRDL Physical Security, NRDL Applied Research Branch, NRDL Chemical Technology Division, NRDL administrative offices, NRDL Nuclear and Physical Chemistry Branch, NRDL Chemical and Physics Branch **(HRA-2928, pp 2, 4, 5)**, NRDL Analytical and Standards Branch, instrument repair facility, metrology laboratory, electronics shop annex **(HRA-4667)**, material storage area, instrument calibration laboratory, and radiography shop.

Current Uses: Unoccupied.

Radionuclides of Concern: Cs-137, Pu-239, Ra-226, Sr-90, and Th-232.

Previous Radiological Investigations:

2002 NWT Phase V investigation. Upper level surveys complete. Drain piping and small amounts of soil in crawlspace removed and disposed of due to Cs-137 contamination. Drainpipe removed across Cochran Street. Resurvey complete. Contamination remains outside the back steps of the building.

1955 NRDL Survey. Cleared to release limits for the period for return to shipyard except for drain lines left in place.

Contamination Potential: Known-Continued Access.

Contaminated Media:

Surface Soil: Moderate
Subsurface Soil: Moderate from drain line leakage.
Sediment: Moderate
Surface Water: None
Groundwater: None
Air: None
Structures: Moderate (crawlspace)
Drainage Systems: Moderate (crawlspace)

Potential Migration Pathways:

Surface Soil: Moderate
Subsurface Soil: Moderate from drain line leakage.
Sediment: Low
Surface Water: None
Groundwater: None
Air: None
Structures: Low (crawlspace)
Drainage Systems: Low (crawlspace)

Recommended Actions: Remediate known area of contamination. Complete Final Status Survey.

Figure 8.3.4.7 FP
Building 351A - Floor Plan

8.3.4.8 Building 364

Site Description: Building 364 measures approximately 40 feet by 50 feet. A liquid radioactive waste collection area to the rear of the building contained a subsurface sump with a pumphouse on a concrete pad and two holding tanks. A building site plan is provided in Figure 8.3.4.4 above, and a floor plan is provided in Figure 8.3.4.8FP.

Former Uses: Animal irradiation facility, Liquid Radioactive Waste Collection Facility **(HRA-136; HRA-147; HRA-590)**, hot cell **(HRA-48; HRA-147; HRA-1331)**, Research Animal Facility **(HRA-48, p 8; HRA-600 Encl 3)**, storage building **(HRA-1331, p 1; HRA-4667)**, isotope processing and decontamination studies **(HRA-1095)**, and general research laboratory. Formerly leased by Young Laboratories.

Current Uses: Unoccupied.

Radionuclides of Concern: Co-60, Cs-137, Pu-239, Ra-226, Sr-90, and U-235.

Previous Radiological Investigations:

2002 NWT Phase V investigations. Cs-137 detected on building surfaces, piping in building crawlspace, and piping/trench outside rear of building. Areas remediated and resurveyed. Alpha and beta contamination remains in Room 107.

2001 NWT removal of waste tank pit. Areas met contemporary release criteria.

2001 NWT completes removal actions (peanut area) based on revised release limits. Surveys completed.

1996 ATG removal of "peanut spill" area. Subsequent survey and samples met the release criteria of the period.

1991 PRC Phase I investigations. Identified peanut area as exceeding release limits for the period.

1979 RASO survey. Decontamination and resurvey. Met release limits for the period.

1978 RASO survey. Noted areas of elevated activity. Decontaminated.

1969 AEC. Survey for clearance 24 December 1969, which included the yard and pit. Pipe outside building was concreted and allowed to remain in place. Areas met release criteria of the period.

Contamination Potential: Known-Restricted Access to Room 107

Contaminated Media:

Surface Soil: High
Subsurface Soil: Moderate
Sediment: High
Surface Water: None
Groundwater: None
Air: None
Structures: High
Drainage Systems: High

Potential Migration Pathways:

Surface Soil: Moderate
Subsurface Soil: Low
Sediment: Moderate
Surface Water: None
Groundwater: None
Air: None
Structures: Moderate
Drainage Systems: Moderate

Recommended Actions: Remediate known areas of contamination. Final Status Survey following remediation.

Structures: Low
Drainage Systems: Low

Recommended Actions: Review Final Status Survey Report.

8.3.4.10 Building 366 (Former Building 351B)

Site Description: Building 366 is a large corrugated metal, gable-roofed Butler-type structure, measuring approximately 280 feet by 130 feet. A building site plan is provided in Figure 8.3.4.10.

Former Uses: NRDL instrument calibration **(HRA-1036; HRA-1485)**; administrative offices **(HRA-1327, p 2)**; Applied Research and Technical Development Branches **(HRA-2022, p 6)**; administrative offices moved from D-19, 20, and 21 in 1952 **(HRA-1586)**; Radiological Safety Branch **(HRA-2018, p 5)**; Management Planning Division **(HRA-2030, p 3)**; Nucleonics Division **(HRA-2928, p 5)**; Instruments Evaluation Section; general laboratories; Chemical Research Laboratory; shipyard radiography shop; Boat/Plastic Shop **(HRA-4667)**; other military/Navy Branch Project Officers Station **(HRA-2928, p 1)**; and NRDL Management Engineering and Comptroller Department **(HRA-2928, p 1)**.

Current Uses: Leased to San Francisco Redevelopment Agency. Currently used by 29 artists from The Point artists' colony.

Radionuclides of Concern: Cs-137, Ra-226, and Sr-90.

Previous Radiological Investigations:

2002/2003	Phase V investigations. Ventilation ducting and inactive floor drain indicated Cs-137 exceeding release limits. Remediation required.
2001	NWT Survey. No activity above background, but the survey protocol did not meet Phase V survey requirements.
1955	NRDL Surveys. Cleared below release limits by NRDL.

Contamination Potential: Known-Continued Access.

Contaminated Media:

Surface Soil: None
Subsurface Soil: None
Sediment: Moderate
Surface Water: None
Groundwater: None
Air: None
Structures: Moderate
Drainage Systems: Moderate

Potential Migration Pathways:

Surface Soil: None
Subsurface Soil: None
Sediment: Low
Surface Water: None
Groundwater: None
Air: None
Structures: Low
Drainage Systems: Low

Recommended Actions: Remediate known areas of contamination. Conduct Final Status Survey.

Figure 8.3.4.10

8.3.4.12 Building 408

Site Description: Building 408 houses a furnace/smelter that was constructed in 1947. The building is the equivalent of three stories at its northern side, dropping to one story at the south. It is open-sided on the north. Most of the east and west sides are sided in transite, a corrugated asbestos-concrete material. A firebrick-lined hearth occupies most of the open area at the north. Natural gas burners exist on the east and west sides of the hearth. A pair of smokestacks extends from the lower rear segment of the building. A building site plan is provided in Figure 8.3.4.12.

Former Uses: Furnace-smelter **(HRA-1118, pp 153, 154)**.

Current Uses: Unused.

Radionuclides of Concern: Ra-226 from prior smelting operations and natural thorium in the firebrick.

Previous Radiological Investigations: None.

Contamination Potential: Likely.

Contaminated Media:

Surface Soil: None
Subsurface Soil: None
Sediment: None
Surface Water: None
Groundwater: None
Air: None
Structures: Moderate
Drainage Systems: None

Potential Migration Pathways:

Surface Soil: None
Subsurface Soil: None
Sediment: None
Surface Water: None
Groundwater: None
Air: None
Structures: Low
Drainage Systems: None

Recommended Actions: Scoping Survey. Characterization Survey if contamination is found. Final Status Survey if no contamination is found or following remediation if that is necessary.

Figure 8.3.4.12

8.3.4.13 Building 411

Site Description: Building 411 is a large curtain-walled, steel-framed building with a flat roof, located in the southern waterfront area. The building includes a saw-toothed series of rooftop monitors as well as bands of steel industrial sash and large glazed industrial doors. The building has two levels, with a taller segment to the north **(HRA-1118, pp 143-145)**. A building site plan is provided in Figure 8.3.4.12 above.

Former Uses: Source storage **(HRA-548, p 2)**, civilian cafeteria, radiography shop, Shipfitters and Boilermakers Shop, and Ship Repair Shop.

Current Uses: Eric Lansdown (The Doll House) and Sierra Western Equipment.

Radionuclides of Concern: Co-60, Cs-137, and Ra-226.

Previous Radiological Investigations:

2002 NWT Phase V investigations. Ra-226 found on second floor was within release limits. Surveys complete.

Item	Reference or Phrase in ROD	Location in ROD	Identification of Referenced Document Available in the Administrative Record[1]
13	Beneficial use	Section 2.4	Final Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Section 2.2.9. SulTech. November 30, 2007.

The estimated groundwater velocities at Parcel D range from 1.5 to 31 feet per year. These velocities were calculated using the typical intermediate value of hydraulic gradient for the A-aquifer throughout Parcel D of 0.001 (PRC, LFR, and U&A 1996) and an assumed effective porosity for the A-aquifer of 0.25. No slug test or pumping test evaluations were performed for the B-aquifer within Parcel D. However, slug tests were performed in two monitoring wells in the underlying fractured bedrock water-bearing zone at IR-09 in the north-central area of Parcel D (PRC, LFR, and U&A 1996), with estimated hydraulic conductivities ranging from 0.025 to 3.7 feet per day. In general, groundwater velocities in the fractured bedrock water-bearing zone is expected to be low because the flow occurs mostly through fractures that are likely filled with residual clays and silts (PRC, LFR, and U&A 1996).

2.2.9 Groundwater Beneficial Use Evaluation

This section summarizes the beneficial use evaluation conducted for groundwater underlying Parcel D. The complete beneficial use evaluation is presented in Appendix D. The potential beneficial uses of Parcel D groundwater have been evaluated several times in the past (see Appendix D; Tetra Tech 2001c). In 2003, the Navy concluded that A-aquifer groundwater at Parcel D is unsuitable for use as a potential source of drinking water based on an evaluation of site-specific factors (Navy 2003). In 2003, the Water Board concurred with the Navy's determination that the A-aquifer at HPS is not a potential drinking water source (Water Board 2003). EPA, however, did not concur and required that federal criteria also be used to assess if Parcel D groundwater could be considered a potential drinking water source.

EPA considers groundwater to be a potential source of drinking water if the following criteria are met:

- The total dissolved solids (TDS) concentration is less than 10,000 milligrams per liter (mg/L)
- A minimum well yield of 150 gallons per day or 0.104 gallon per minute can be achieved

Figure 2-10 presents the maximum TDS concentrations detected in A-aquifer groundwater monitoring wells at Parcel D. As shown on Figure 2-10, TDS concentrations exceed 10,000 mg/L along the Parcel D shoreline and are less than 10,000 mg/L in the central and northwestern part of the parcel. The federal TDS criterion was applied separately to each IR site at Parcel D in this FS report. Based on this criterion, groundwater underlying all or part of the following 17 IR sites could be considered potential sources of drinking water: IR-09, IR-16, IR-17, IR-32, IR-33 North and South, IR-34, IR-37, IR-44, IR-48, IR-53, IR-55, IR-65, IR-66, IR-67, IR-68, IR-69, and IR-70. Based on known hydrogeologic conditions at Parcel D, it is assumed that a minimum well yield of 150 gallons per day could also be achieved from

A-aquifer wells at these IR sites (PRC, LFR, and U&A 1996). A-aquifer groundwater in these areas was further evaluated against the site-specific factors below.

In a 1999 letter, EPA provided the Navy with additional guidelines for applying the federal criteria (EPA 1999a). An attachment to the letter (referred to as "Enclosure 5") listed site-specific factors that can be considered in deciding whether all or portions of an aquifer should be considered a potential source of drinking water. This letter is provided as an attachment to Appendix D. These factors include the following: (1) aquifer thickness, (2) TDS levels measured, (3) groundwater yield, (4) proximity to saltwater and the potential for saltwater intrusion, (5) the quality of underlying water-bearing units, (6) the existence of institutional controls on well construction or aquifer use, (7) information on current and historical use of the aquifer on the base or in the community surrounding the base, and (8) the cost of cleanup to federal drinking water standards. In addition, the BCT considered depth to groundwater a relevant site-specific factor because shallow aquifers are susceptible to contamination and may not be suitable sources of drinking water as a result.

The Navy evaluated seven of the eight factors listed above. Not included was factor number five, the quality of underlying water-bearing units. Quality of underlying water-bearing units was not considered because the B-aquifer at Parcel D is isolated and limited, and the deep bedrock water-bearing zone at Parcel D was not identified or investigated.

Table 2-3 summarizes the results of each of the eight site-specific factor evaluations and the overall potential for the A-aquifer to be used as a source of drinking water in each of the IR sites that meet the federal TDS criterion. The Navy believes that the A-aquifer underlying each of these sites has no potential to be used as a source of drinking water, based on the eight evaluation factors in Table 2-3, and on the key criteria presented below.

- **Aquifer thickness and depth to groundwater:** Generally, the depth to groundwater for the A-aquifer is less than 10 feet across Parcel D. The average thickness of the A-aquifer is approximately 25 feet, with a maximum thickness of approximately 40 feet (see Figure 2-7). Together, these two site-specific factors indicate the A-aquifer at Parcel D is very shallow and of limited extent, and therefore may not be suitable as a potential source of drinking water.

- **Existence of institutional controls on well construction or aquifer use:** California Department of Water Resources Bulletins 74-81 and 74-90 provide standards for well construction in California (Department of Water Resources 1981, 1991). These bulletins indicate that an individual domestic well must have a minimum seal of at least 20 feet from the ground surface, and a community water supply well must have a minimum seal of at least 50 feet from the surface for the wells to be used for water supply. Wells installed in the A-aquifer would not meet the minimum well seal requirements because of the shallow depth to groundwater at Parcel D (less than 10 feet). These well construction standards also prohibit installation of domestic wells within 50 feet of a storm drain or sanitary sewer line. Figure 2-11 shows areas of Parcel D that are beyond 50 feet of a sewer line and meet the TDS requirements.

As shown on Figure 2-11, most of Parcel D is within the 50-foot buffer zone from the sewer lines. Although these lines will be removed by the Navy, this figure shows the likely density of sewer lines that would be installed by the City and County of San Francisco during redevelopment of HPS. As a result, installation of domestic wells would be prohibited in many portions of the A-aquifer at Parcel D. Also, the City and County of San Francisco regulations prohibit installation of domestic wells within city boundaries. Based on the existence of these local and state institutional controls that prohibit or severely restrict locations where new potable wells can be installed, there is low potential for use as a source of drinking water because of these institutional controls.

- **Proximity to saltwater and actual TDS values:** Although a large portion of the A-aquifer at Parcel D meets the federal TDS criterion (10,000 mg/L) to be considered as a potential source of drinking water, the actual TDS values are still high. Additionally, much of Parcel D is near the Bay, which contains saltwater or brackish water. Together, these two site-specific factors suggest that TDS values will increase as a result of saltwater intrusion if significant quantities of water are withdrawn from the A-aquifer at Parcel D. They further suggest that this aquifer will ultimately not be suitable for use as a source of drinking water. Based on these site-specific factors, the A-aquifer at Parcel D is considered to have low potential for use as a source of drinking water.

- **Historical and Current Groundwater Use:** A-aquifer groundwater at HPS has never been and is not currently used as a drinking water source (PRC, LFR, and U&A 1996). San Francisco currently obtains its municipal water supply from the Hetch Hetchy watershed in the Sierra Nevada and plans to continue using the Hetch Hetchy watershed as a drinking water source in the reasonably foreseeable future (Tetra Tech 1999). Based on historical and current use, A-aquifer groundwater at HPS has low potential to be used as a future drinking water source.

- **Cost of Cleanup to Federal Drinking Water Standards**: Antimony, arsenic, chromium, magnesium, nickel, thallium, zinc, and other metals are components of the Franciscan Formation bedrock and bedrock-derived fill that underlies HPS. The A-aquifer contains fill material derived from the Franciscan Formation. During the RI, Hunters Point groundwater ambient levels (HGAL) were estimated for naturally occurring metals (PRC, LFR and U&A, 1996). The HGALs for antimony, arsenic and thallium exceed their respective maximum contaminant levels (MCL), even though these MCLs are federal drinking water standards. While the Navy has not calculated the cost to reduce concentrations of these naturally occurring metals to below MCLs in groundwater, the cost would likely be prohibitive, and it may be technically impracticable to do so. Based upon this site-specific factor, there is low potential for the A-aquifer groundwater at HPS to be used as a drinking water source.

As shown on Figures 2-7 and 2-12, the B-aquifer is present in only a few small, laterally discontinuous areas at Parcel D. The largest area of the B-aquifer at Parcel D is near the center of Parcel D and is interpreted to be 20 feet thick, 1,500 feet wide, and 1,000 feet long. TDS

concentrations in groundwater samples collected in this area of the B-aquifer were generally below state and federal TDS criteria. Figure 2-12 presents the maximum TDS values detected in the B-aquifer monitoring wells. Based on the TDS data alone, the B-aquifer at Parcel D would be considered suitable as a potential source of drinking water. The evaluation of other site-specific factors in this area indicated that the B-aquifer has low potential for use as a source of drinking water. These other site-specific factors include (1) the limited volume and storage capacity of the confined B-aquifer, (2) the existence of institutional controls that prohibit installing water supply wells within City and County of San Francisco limits and locating wells within 50 feet of a sanitary sewer or storm drain (see Figure 2-12), and (3) the current and historical uses of the B-aquifer (which has never been used for water supply at HPS). Therefore, the B-aquifer is considered to have a low potential for use as a source of drinking water. However, because of agreements made with the BCT on the HHRA, the groundwater ingestion pathway is included in the risk assessment for the B-aquifer. This assumption provides an additional layer of conservatism for the protection of human health at HPS.

2.3 PARCEL D INVESTIGATION HISTORY

Parcel D has been investigated following the CERCLA process. Parcel D underwent a sequence of initial investigations from 1988 to 1996. Investigations began with a preliminary assessment, which involved record searches, interviews, and limited field investigations. Sites that required further investigation were considered during the site inspection phase, which involved collection and evaluation of additional field data. Finally, sites that required even further investigation were considered during the RI phase. The RI was followed by a FS, proposed plan, ROD, risk management review (RMR), and revised FS. The following subsections summarize the significant aspects of the RI, FS, proposed plan, ROD, RMR, and revised FS.

Table 2-4 briefly describes each IR site at Parcel D and summarizes past cleanup actions and recommendations presented in past reports for Parcel D. Detailed descriptions and findings can be found in the original documents. In the various investigations and reports, areas requiring remediation were given unique alpha-numeric identifiers. Large areas were called remediation areas and their identifiers started with "RA." Small areas were called "*de minimis*" areas and their identifiers started with "DM." In order to present information consistent with previous reports, Table 2-4 includes these alpha-numeric identifiers.

2.3.1 Remedial Investigation

A draft final Parcel D RI was completed on October 25, 1996, and addressed the original 27 IR sites in Parcel D (PRC, LFR, and U&A 1996). The RI became final on January 31, 1997, following submission of responses to agencies' comments on the draft final version (Tetra Tech 1997b). The two most significant aspects of the RI report are (1) the site characterization of contaminants and (2) the HHRA. No ecological risk assessment was conducted because there is no ecological habitat of concern at Parcel D because most of the parcel is an industrial setting covered by buildings or pavement.

CONCEPTUAL SITE MODEL

Revised Feasibility Study Report for Parcel D

Item	Reference or Phrase in ROD	Location in ROD	Identification of Referenced Document Available in the Administrative Record[1]
15	HHRA	Section 2.5.1	Final Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Appendix B, Section B5.0. SulTech. November 30, 2007.

Two sets of COPCs for groundwater were identified for the IR-33, IR-71, and IR-09 risk plumes and for each residential and industrial grid associated with non-plume wells. The first set of COPCs for groundwater was limited to all detected volatile chemicals, for purposes of evaluating the groundwater vapor intrusion exposure pathway for residential and industrial receptors. For this HHRA, volatile chemicals are defined as those chemicals with a molecular weight less than 200 grams per mole and Henry's Law Constant greater than 10^{-5} atmosphere-cubic meters per mole (EPA 2004a). A second set of COPCs for groundwater was also identified using the two steps outlined above, and includes both volatile and non-volatile chemicals for purposes of evaluating groundwater exposures to the construction worker in the A-aquifer and to residential receptors from domestic use of the B-aquifer.

As recommended by Cal/EPA (1993), data for specific total petroleum hydrocarbon indicator chemicals (for example, benzene, toluene, benzo(a)pyrene) were used to assess potential human health risk from total petroleum hydrocarbons contamination. Nonchemical-specific data for total petroleum hydrocarbons should be excluded from evaluation in the risk assessment because they are considered to be inadequate and insufficient to evaluate risk from total petroleum hydrocarbon contamination (Cal/EPA 1993); therefore, non-specific total petroleum hydrocarbon compounds were not identified as COPCs for this HHRA.

Tables B1-1, B1-2, B1-3, and B1-4 of Attachment B1 present analytical data summary statistics for each total risk COPC. Tables B2-1, B2-3, and B2-4 of Attachment B2 present analytical data summary statistics for each incremental risk COPC. Tables B3-1 through B3-7 of Attachment B3 list the COPCs for groundwater and present analytical data summary statistics for each groundwater COPC. In these tables, statistics are developed separately for each grid with analytical data.

B5.0 EXPOSURE ASSESSMENT

An exposure assessment identifies potential human receptors that could be exposed to site-related chemicals, as well as the routes, magnitude, frequency, and duration of the potential exposures. The principal objective of this evaluation is to identify reasonable maximum exposures (RME). As defined by EPA (1989), the RME is the maximum exposure that is reasonably expected to occur at a site. The potential human receptors and potentially complete exposure pathways for the identified receptors were presented in Section B3.0, Conceptual Site Model. The remainder of this section describes the process used to estimate EPCs and to quantify pathway-specific RME chemical intakes for each receptor. Central tendency exposures were not evaluated in this revised baseline HHRA.

B5.1 EXPOSURE POINTS AND EXPOSURE POINT CONCENTRATIONS

Potential exposure points are identified on the basis of anticipated population activity patterns and the relationship of the activities to the presence of contaminated media. A location is identified as an exposure point if a human might contact (for example, ingest) a contaminated medium (for example, soil) at that location. For evaluation of exposures to soil and exposure to

groundwater not associated with risk plumes, each residential and industrial grid was considered a separate exposure point for this HHRA. For each of the groundwater risk plumes (IR-33, IR-71, and IR-09), the area encompassed by each risk plume (see Attachment B3 to this appendix) was considered a separate groundwater exposure point. Potential exposure to COPCs is assumed to occur uniformly throughout each exposure point.

The concentration in the medium (for example, subsurface soil) that a receptor may be exposed to is called the EPC. EPCs were calculated for all COPCs in all media sampled: surface soils (0 to 2 feet bgs), subsurface soils (0 to 10 feet bgs), A-aquifer groundwater, and B-aquifer groundwater. The methods used to calculate EPCs for soil and groundwater are described below in Sections B5.1.1 and B5.1.2.

As shown in the conceptual site model (see Figure B-1), chemicals in soil may be transferred to outdoor air from wind erosion or volatilization, or to vegetation from root uptake. Chemicals in groundwater may be transferred to outdoor air in a construction trench from volatilization, indoor air from vapor intrusion, and indoor air from volatilization of groundwater during domestic use. Sample data for outdoor and indoor air, and vegetation were not available for Parcel D. EPCs in outdoor air (from volatile and particulate chemicals in soil), outdoor air in a construction trench (from volatile chemicals in groundwater), indoor air (from groundwater vapor intrusion), and homegrown produce (from root uptake of chemicals in soil) were estimated using the methods described in Section B5.1.3.

B5.1.1 EPCs for Soil

The 95 percent upper confidence limit (95 UCL) of the arithmetic mean was used as the EPC for each soil COPC, unless the maximum value was less than the 95 UCL, in which case, the maximum concentration was used as the EPC. The 95 UCL for each soil COPC in each grid was calculated using the following methodology. This methodology is consistent with the approach used for the soil HHRA in the Draft Final RI Report for Parcel D (PRC, LFR, and U&A 1996), and follows the methodology recently re-established for soil HHRAs for HPS (Tetra Tech 2003; Navy 2004):

- Statistical testing was conducted to determine data distribution for sample sizes with a minimum of four samples and four detections. For samples sizes less than or equal to 50 with at least four detections, the Shapiro-Wilk W-test was used to determine the distribution of the data. For sample sizes greater than or equal to 50 with at least four detections, the D'Agostino test was used to determine the distribution of the data.

- For data found to be normally or lognormally distributed, 95 UCLs were calculated using EPA (1992) guidance.

- If distribution testing showed that data follow a non-parametric distribution, then a 95 UCL was calculated for both a normal and lognormal distribution following EPA guidance (EPA 1992) and the higher of the two 95 UCL values was selected as the representative 95 UCL. Nondetected results for COPCs were incorporated into calculation of 95 UCL concentrations by using one-half of the sample quantitation limit as a proxy concentration for nondetected results (EPA 1989).

- For samples sizes with less than four samples, distribution testing was not conducted and the maximum concentration was used as the EPC.

EPCs for each total risk assessment COPC in surface soil and subsurface soil are shown in Tables B1-1, B1-2, B1-3, and B1-4 of Attachment B1. EPCs for each incremental risk assessment COPC in surface soil and subsurface soil are shown in Tables B2-1, B2-2, B2-3, and B2-4 of Attachment B2. These tables also present the results of the distribution testing for each COPC and the calculated 95 UCLs.

Although more recent guidance regarding calculation of EPCs is available (see Section B5.1.2), the previous guidance provided by EPA (1992) was used to calculate EPCs for soil in this revised HHRA in accordance with the recent methodology established for soil HHRAs for HPS (Tetra Tech 2003; Navy 2004). In many cases, because of the relatively few sample points and detections for each grid (that is, less than four samples and four detected results), the maximum concentration is used as the EPC, resulting in a conservative estimate of potential risks.

B5.1.2 EPCs for Groundwater

Separate EPCs for groundwater were developed to evaluate exposure areas associated with risk plumes and exposure areas not associated with risk plumes (see Section B4.3.2). To evaluate exposures associated with the IR-09, IR-33, and IR-71 risk plumes, the lesser of the 95 UCL or maximum concentration was used as the EPC for each COPC present in each risk plume. The methods used to calculate 95 UCLs for each risk plume are described below. Tables B3-1, B3-2, and B3-3 and Table B3-6 of Attachment B3 present analytical data summary statistics for each risk plume-based exposure area.

For exposure areas not associated with risk plumes (that is, for areas with monitoring wells that do not fall within the risk plume boundaries delineated in Attachment B3), the maximum detected concentration was used as the EPC. Tables B3-4, B3-5, and B3-7 of Attachment B3 present analytical data summary statistics, including maximum concentrations (EPCs), for exposure areas not associated with risk plumes.

The methods used to calculate EPCs for groundwater associated with risk plumes is based on more recent EPA methodology (*ProUCL Version 3.0 User Guide* [Singh, Singh, and Maichle 2004]). This methodology incorporates the Lilliefors Test, rather than the D'Agostino Test, to determine distributions for data sets exceeding 50 samples. Because the groundwater data set for the HHRA consisted of samples collected over a number of years (that is, the last 12 rounds of

sampling), to reduce the influence of historical nondetected results on the EPCs, only detected results were used for calculation of the EPCs for groundwater. Nondetected results (that is, U- and UJ-qualified data), were not included in the EPC calculation. For data sets with fewer than six samples, statistical estimations lack statistical power and cannot be confidently estimated (EPA 2000). Therefore, the maximum detected concentration was used as the EPC for data sets with fewer than six detections, rather than six samples. A 95 UCL was used as the EPC for COPCs in groundwater associated with risk plumes for data sets consisting of six or more detections. The following methods were used to calculate the underlying distribution for each chemical, population summary statistics, and EPCs.

Distribution tests: Distribution testing was conducted for all samples with at least six measurements. Formal tests were conducted using well-established goodness-of-fit tests. The Shapiro-Wilk W-Test ($n \leq 50$) and Lilliefors Test ($n > 50$) were used to evaluate normal and lognormal distributions. The Anderson-Darling and Kolmogorov-Smirnov Test were used to evaluate gamma distributions (Singh, Singh, and Maichle 2004; EPA 2002b). A Type I error rate (α) of 0.05 (equivalent to 5 percent) was used to interpret the significance of each test. A Type I error rate of 0.05 means that there is a 5 percent chance that the null hypothesis will be rejected when it is true, leading to the false conclusion.

Chemical data confirmed as following a normal, lognormal, or gamma distribution based on the outcome of the two goodness-of-fit tests are listed as "normal (N)", "lognormal (L)," or "gamma (G)" in the summary tables (see Tables B2-1, B2-2, and B2-3 and Table B2-6 of Attachment B2). Chemical data that were not confirmed as following one of these three distributions are listed as "nonparametric (NP)" in the summary tables.

Calculation of Population Parameters and Selection of the EPC: The one-sided UCLs on the mean were calculated for chemicals with at least six samples. Recommendations in Singh, Singh, and Maichle (2004) are based on three properties measured for individual samples: (1) best-fit distribution, (2) relative degree of skewness, and (3) relative sample size. The recommendations for calculating an EPC for normal, gamma, lognormal, and nonparametric distributions are provided by the ProUCL software (EPA 2004b). EPCs for data that follow a normal distribution or that exhibit low skewness (standard deviation of the natural logarithms of the data less than 0.50) are based on calculation of a UCL using the Student's t- statistic. After a sample-by-sample evaluation of the three properties described above, a UCL is calculated based on one of the parametric or nonparametric methods listed below.

Parametric Methods	Nonparametric Methods	
Student's t UCL	Chebyshev inequality UCL	Central Limit Theorem
Approximate gamma UCL	Bootstrap t UCL	Modified-t statistic
Adjusted gamma UCL	Hall's bootstrap UCL	Adjusted-CLT
Land's H-UCL	Modified-t UCL	Percentile bootstrap
Minimum Variance Unbiased Estimator (MVUE) Chebyshev UCL	Standard Bootstrap UCL	Jackknife UCL

The UCL calculated using the MVUE Chebyshev or nonparametric Chebyshev method can be based on a 95, 97.5, or 99 percent one-sided UCL. The 95 UCLs calculated for groundwater are shown in Tables B3-1, B3-2, and B3-3 and Table B3-6 of Attachment B3. These tables also present the results of the distribution testing for each chemical. If the calculated 95 UCL was greater than the maximum concentration, then the maximum concentration was used as the EPC.

B5.1.3 Exposure Point Concentrations for Media Not Sampled

As discussed in Sections B3.0 and B5.1, COPCs in soil and groundwater may be transferred to outdoor air, indoor air, and vegetation (homegrown produce) from the following transfer mechanisms:

- Wind erosion of particulate chemicals from soil to outdoor air
- Volatilization from soil to outdoor air
- Vapor intrusion from groundwater to indoor air
- Volatilization from groundwater to indoor air during domestic use
- Volatilization from groundwater to outdoor air in a construction trench
- Uptake of chemicals in soil through plant roots into homegrown produce

Samples were not collected for outdoor air, indoor air, or vegetation at Parcel D. In the absence of direct measurements of chemical concentrations in air and vegetation, models were used to estimate EPCs in outdoor air, indoor air, and homegrown produce as a result of the above transfer mechanisms. These models are discussed below. EPCs for indoor air as a result of vapor intrusion of groundwater and volatilization from domestic use of groundwater were not calculated because a risk-based screening assessment was used to quantify risks from exposure to COPCs in groundwater (see Section B7.2).

B5.1.3.1 Outdoor Air – Particulate COPCs Released from Soil

EPCs of particulates released from soil to outdoor air were estimated using soil EPCs as the source term and the methodology provided by EPA Region 9 in its memorandum describing the derivation of PRGs (EPA 2004a). To derive the EPCs in outdoor air, the EPC for soil was multiplied by the reciprocal of the EPA (2004a) default particulate emission factor of 1.316E+09 cubic meters per kilogram, which is a non-chemical-specific value that relates chemical concentrations in soil to airborne concentrations that may be inhaled.

B5.1.3.2 Outdoor Air – Volatile COPCs Released from Soil

Chemical-specific volatilization factors, which relate concentrations of volatile chemicals in soil to airborne concentrations that may be inhaled, were used to estimate concentrations in outdoor air from volatile COPCs in soil. Volatilization factors were taken from the EPA Region 9 guidance (EPA 2004a) and are summarized in Table B-2. To estimate EPCs in outdoor air, the soil EPC was multiplied by the reciprocal of the volatilization factor.

B5.1.3.3 Indoor Air – Vapor Intrusion of Volatile COPCs in Groundwater

Subsurface vapor intrusion of volatile COPCs in groundwater into a hypothetical residential or standard industrial building was evaluated for the industrial and residential exposure scenarios. A risk-based screening assessment was used to calculate risks from groundwater vapor intrusion, based on groundwater EPCs developed for each A-aquifer risk plume and non-plume exposure area, and risk-based screening levels (RBSL). Section B7.2 provides further details on this approach. Because a risk-based screening assessment approach was used to evaluate groundwater vapor intrusion, EPCs were not modeled for indoor air from EPCs in groundwater.

B5.1.3.4 Indoor Air – Volatilization of COPCs in Groundwater during Domestic Use

Volatilization of volatile COPCs in groundwater into household air during domestic use of groundwater was evaluated for the residential exposure scenario, based on groundwater EPCs developed for the B-aquifer. A risk-based screening assessment was used to calculate risks from domestic use of groundwater (see Section B7.2). Because a risk-based screening assessment approach was used to evaluate risks from domestic use of groundwater, EPCs were not developed for indoor air based on volatilization of COPCs in groundwater during domestic use.

B5.1.3.5 Outdoor Air – Volatile COPCs Released from Groundwater in a Construction Trench

Chemical-specific volatilization factors which relate concentrations of volatile chemicals in groundwater accumulated in a construction trench to airborne concentrations that may be inhaled by construction workers were used to estimate EPCs from volatile COPCs in groundwater. Calculation of the volatilization factors for this scenario were based on guidance from Virginia Department of Environmental Quality (2005), which provides a combination of a vadose zone model to estimate volatilization of gaseous COPCs from groundwater into a trench, and a box model to estimate dispersion of the COPCs from the air inside the trench into aboveground air. A full description of the models used to estimate volatilization into a construction trench is provided in Attachment B5 to this appendix.

B5.1.3.6 Homegrown Produce – Uptake of COPCs in Soil through Plant Roots

Ingestion of COPCs that are transferred from soil to homegrown produce via uptake through plant roots was evaluated for the residential exposure scenario. Direct measurements of chemical concentrations in homegrown produce are not available for Parcel D because homegrown produce is not currently grown at Parcel D. EPCs for homegrown produce were calculated based on EPCs for COPCs in soil and soil-to-plant uptake factors (UF) that estimate the root uptake of inorganic and organic chemicals in soil and translocation of chemicals to edible plant parts (U.S. Department of Energy 1984). Table B-3 lists the UFs for each COPC in soil.

For inorganic COPCs, UFs were obtained from U.S. Department of Energy (1984). To estimate EPCs in homegrown produce from inorganic COPCs, the soil EPC was multiplied by the UF.

For nonvolatile organic COPCs, equations from Cal/EPA were used to derive the UFs (Cal/EPA 2003). These equations relate the octanol-water partition coefficient (K_{ow}) and the organic carbon-water partition coefficient (K_{oc}) of the contaminant and the fraction of organic carbon (F_{oc}) in the soil to calculate the UF. The equation used to calculate the UF is as follows:

$$UF = \frac{(0.03 \times K_{ow} 0.77) + 0.82}{(K_{oc})(F_{oc})} \quad \text{(B-1)}$$

where

UF	=	Soil-to-plant uptake factor
K_{ow}	=	Octanol-water partition coefficient (cubic centimeters per gram)
K_{oc}	=	Organic carbon-water partition coefficient (cubic centimeters per gram)
F_{oc}	=	Fraction organic carbon in soil (unitless)

F_{oc} was assumed to be 0.1, a value appropriate to soil used for the production of food crops (Cal/EPA 2003). If K_{oc} values are unavailable, they were estimated based on chemical-specific K_{ow} values using the following equation (Lyman and others 1990):

$$Log\ K_{oc} = log\ K_{ow} - 0.21 \quad \text{(B-2)}$$

Consistent with EPA guidance, a correction factor was applied to lipophilic COPCs (EPA 1998). For this HHRA, lipophilic chemicals were defined as polychlorinated biphenyls, polynuclear aromatic hydrocarbons, pesticides, and semivolatile organic compounds. EPA (1998) recommends a correction factor of 0.01 for lipophilic COPCs (log K_{ow} greater than 4); that is, for lipophilic COPCs, the UF calculated using Equation B-1 should be multiplied by the correction factor of 0.01 to calculate a corrected UF. For COPCs with a log K_{ow} less than 4, EPA does not

recommend use of a correction factor. Table B-3 lists the UFs for nonvolatile organic COPCs derived using the above equations and the values and sources of the chemical data used to derive the UFs.

Risks associated with VOCs were not evaluated in the homegrown produce pathway. VOCs are typically low-molecular-weight chemicals that do not persist or bioaccumulate in the environment (EPA 1994b). In addition, VOCs are expected to be lost during soil tilling, planting, and food preparation activities such as peeling, cooking, and cleaning.

B5.2 CHEMICAL INTAKE ESTIMATES

Estimates of exposure are based on the EPCs (as described in Section B5.1) and scenario-specific assumptions and intake parameters. Consistent with EPA guidance (EPA 1995), exposure estimates (intakes) were calculated for an RME scenario for each receptor and exposure pathway and are expressed in terms of milligrams of chemical per kilogram body weight per day (mg/kg-day). The RME represents the highest exposure reasonably expected to occur and is calculated using the 95 UCL and the RME exposure parameters.

EPA-derived exposure algorithms were used to estimate the chemical intakes for each route of exposure. Equation 5-3 is a generic equation for calculating chemical intake as follows (EPA 1989):

$$I = \frac{C \times CR \times EF \times ED}{BW \times AT} \quad \text{(B-3)}$$

where

I	=	Intake: the amount of chemical at the exchange boundary (mg/kg-day)
C	=	Chemical concentration: the EPC (for example, mg/kg for soil)
CR	=	Contact rate: the amount of contaminated medium contacted per unit of time or event; may be the ingestion rate, inhalation rate, or dermal contact rate (for example, milligram per day for the ingestion rate of soil)
EF	=	Exposure frequency: how often the exposure occurs (days per year)
ED	=	Exposure duration: the number of years in which a receptor comes in contact with the contaminated medium (years)
BW	=	Body weight: the average body weight of the receptor over the exposure period (kilograms)
AT	=	Averaging time: the period over which exposure is averaged (days); for carcinogens, the averaging time is 25,550 days on the basis of a lifetime exposure of 70 years (average life expectancy), and for noncarcinogens, the averaging time is equal to the exposure duration multiplied by the number of days in a year (365 days)

Pathway-specific variations of Equation B-3 were used to calculate intakes of COPCs in soil for residential, industrial, recreational, and construction worker receptors, and COPCs in groundwater for construction worker receptors. Tables B-4 through B-9 present the pathway-specific equations and receptor-specific exposure assumptions used to calculate intakes. The calculation of chemical intake for the dermal contact with soil exposure pathway (all receptors) requires chemical-specific dermal absorption factors; these factors are shown in Table B-2. The calculation of chemical intake for the dermal contact with groundwater exposure pathway (construction worker) requires chemical-specific permeability constants; these factors are shown in Table B-10.

Chemical intakes for carcinogenic COPCs were calculated for a total exposure duration of 30 years for exposures scenarios for which both an adult and child receptor were evaluated (that is, residential and recreational). Chemical intakes were calculated separately for adult and child receptors; adult residential and recreational receptors were evaluated for an exposure duration of 24 years, and child residential and recreational receptors were evaluated for an exposure duration of 6 years. Calculated chemical intakes for each carcinogenic COPC were used to estimate separate cancer risks for adult receptors and child receptors; these risks were then summed to calculate the COPC-specific risk for the scenario. The cancer risk associated with exposure to a carcinogenic COPC for the residential exposure scenario was based on the COPC-specific cancer risk for the adult residential receptor summed with the COPC-specific cancer risk for the child residential receptor. In addition, the cancer risk associated with exposure to a carcinogenic COPC for the recreational exposure scenario was based on the COPC-specific cancer risk for the adult recreational receptor summed with the COPC-specific cancer risk for the child recreational receptor. Chemical intakes for noncarcinogenic COPCs were based on the chemical intake estimated for the child receptor because the intake for children of soil, groundwater, and air per unit body mass is higher than the intake for an adult receptor. (Hence, intake of noncarcinogenic COPCs for a child receptor is always higher than intake of noncarcinogenic COPCs for an adult receptor for similar exposures.)

Chemical intakes from groundwater exposure pathways for residential receptors (ingestion, inhalation during household use, and vapor intrusion) and industrial receptors (vapor intrusion) were not calculated because a risk-based screening assessment was used to quantify risks from exposure to COPCs in groundwater for these receptors (see Section B7.2).

B6.0 TOXICITY ASSESSMENT

The toxicity assessment identifies toxicity values used to quantify potential adverse health effects associated with exposure to COPCs at Parcel D. These toxicity values include references doses (RfD) for noncancer health effects and slope factors (SF) for estimating cancer risks. An RfD represents an estimated daily intake of a COPC that is expected to pose no appreciable risk of harmful effects to human health, including sensitive populations, over a lifetime. RfDs are specific to each chemical and exposure route such as inhalation or ingestion.

Item	Reference or Phrase in ROD	Location in ROD	Identification of Referenced Document Available in the Administrative Record[a]
16	Cancer risks and noncancer hazards	Section 2.5.1	Final Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Appendix B, Section B7.1 through B7.4. SulTech. November 30, 2007.

B6.4 LEAD

Because no RfD or SF is currently available for evaluating health risks from exposure to lead, the HHRA evaluated the potential for human health effects from exposure to lead by comparing EPCs for lead with a HPS-specific risk-based concentration for lead for residential and recreational receptors and the EPA Region 9 industrial PRG for lead for industrial and construction worker receptors. Section B7.4 and Attachment B6 detail the methodology used to evaluate lead.

B7.0 RISK CHARACTERIZATION METHODS

The final step in this revised baseline HHRA is the characterization of the potential risks associated with exposure to COPCs. Risks from exposure to soil for all receptors and from construction worker exposure to groundwater were characterized using the methodology provided in EPA (1989); Section B7.1 details this methodology. Risks from industrial and residential exposure to groundwater were characterized using a risk-based screening assessment approach; Section B7.2 presents this methodology. Section B7.3 discusses interpretation of hazard and risk levels. Section B7.4 discusses the risk characterization approach for lead. The results of the risk characterization for Parcel D are presented in Section B8.0.

B7.1 RISK CHARACTERIZATION FOR SOIL EXPOSURES AND CONSTRUCTION WORKER EXPOSURE TO GROUNDWATER

The general methodology for estimating cancer risks and HIs for soil exposures for all receptors and construction worker exposure to groundwater follows the methodology provided in EPA (1989) and is presented in Section B7.1.1 for cancer risks and in Section B7.1.2 for noncancer health hazards.

B7.1.1 Characterization of Cancer Risks

Risks associated with exposure to chemicals classified as carcinogens are estimated as the incremental probability that an individual will develop cancer over a lifetime as a direct result of an exposure (EPA 1989). The estimated risk is expressed as a unitless probability.

Three steps are used in estimating cancer risks for chemicals classified as carcinogens. First, the chemical intake is multiplied by the chemical-specific SF to derive a cancer risk estimate for a single chemical and pathway. The calculation is based on the following relationship:

$$\textit{Chemical-Specific Cancer Risk} = \textit{Intake (mg/kg-day)} \times \textit{SF (mg/kg-day)}^{-1} \qquad \text{(B-4)}$$

Second, the individual chemical cancer risks are assumed to be additive to estimate the cancer risk associated with exposure to multiple carcinogens for a single exposure pathway, as follows:

$$Pathway\text{-}Specific\ Cancer\ Risk = \sum Chemical\text{-}Specific\ Cancer\ Risk \quad \text{(B-5)}$$

Third, pathway-specific risks are summed for each receptor to estimate the total cancer risk. For exposures scenarios for which both an adult and child receptor are evaluated (that is, residential and recreational), the estimated cancer risk is based on the sum of the risk estimated for the adult receptor plus the child receptor. Hence, for the residential receptor, the estimated cancer risk is based on the sum of the risk estimated for the adult resident and the child resident. Likewise, for the recreational receptor, the estimated cancer risk is based on the sum of the risk estimated for the adult recreational user and the child recreational user.

B7.1.2 Characterization of Noncancer Hazards

The potential for exposure that may result in adverse health effects other than cancer is evaluated by comparing the intake with an RfD for chemicals that are not classified as carcinogens and for those carcinogens known to cause adverse health effects other than cancer. A three-step approach is used as described below:

Calculate a chemical-specific hazard quotient (HQ) based on the following equation:

$$Hazard\ Quotient = \frac{Intake\ (mg/kg\text{-}day)}{RfD\ (mg/kg\text{-}day)} \quad \text{(B-6)}$$

Next, sum the HQs for all chemicals to evaluate the potential for noncancer health effects from simultaneous exposure to multiple chemicals, yielding an HI as follows:

$$Hazard\ Index = \sum HQ \quad \text{(B-7)}$$

Third, sum pathway-specific HIs to estimate a total HI for each receptor.

The total noncancer HI for the residential and recreational receptors is based on the total HI estimated for the child receptor because the intake for children of soil, groundwater, and air per unit body mass is higher than the intake for an adult receptor. (Hence, noncancer HIs for a child receptor are always higher than noncancer HIs for an adult receptor for similar exposures.)

B7.2 Risk Characterization for Residential and Industrial Exposure to Groundwater

Residential and industrial receptors were evaluated for exposure to groundwater from vapor intrusion. Residential receptors were also evaluated for exposure to groundwater from domestic use. Based on agreement between the EPA, DTSC, and Navy, the assessment of risks from these exposure pathways is based on a risk-based screening assessment.

The risk-based screening assessment is a streamlined approach that uses the ratio of EPCs to RBSLs. For this HHRA, RBSLs for domestic use of groundwater (DU-RBSL), calculated based on the EPA (2004a) Region 9 methodology for development of tap water PRGs, were used to estimate cancer risks and noncancer hazard indices from residential exposure to B-aquifer groundwater. RBSLs for groundwater vapor intrusion (VI-RBSL), calculated based on the EPA (2002a) methodology for development of groundwater vapor intrusion screening concentrations, were used to estimate cancer risks and hazard indices from residential and industrial exposure to A-aquifer groundwater. The calculated RBSLs correspond to a cancer risk of 1×10^{-6} or an HI of 1 based on standardized equations that combine standard exposure assumptions and EPA and Cal/EPA toxicity values.

The risk estimates developed using the risk-based screening approach represent the risk for all exposure pathways evaluated by the RBSLs (that is, the exposure pathways evaluated by the EPA Region 9 tap water PRGs and EPA groundwater screening levels for groundwater vapor intrusion). These risk estimates are numerically equivalent to risk estimates obtained using the EPA (1989) "forward calculation methodology," which involves calculating risks using contaminant concentrations, exposure assumptions, and toxicity values (see Section B6.0), if the exposure pathways and assumptions used to derive the RBSLs are the same as those used in the forward calculations.

DU-RBSLs for domestic use were calculated based on the EPA (2004a) Region 9 methodology for development of tap water PRGs. The calculated DU-RBSLs are identical to the EPA Region 9 tap water PRGs with one exception: the toxicity values used for calculation of the DU-RBSLs are based on the toxicity value hierarchy described in Section B6.0. (Tables B-11 and B-12 list the toxicity criteria used to calculate DU-RBSLs.) The EPA tap water PRGs evaluate residential exposure to groundwater from ingestion and from inhalation of VOCs released from groundwater to indoor air during household use. Similar to the EPA tap water PRGs, the calculated DU-RBSLs do not account for exposure from dermal contact with groundwater; Section B9.4 addresses the uncertainties associated with exclusion of this exposure pathway on the risk results.

VI-RBSLs were calculated based on the EPA (2002a) methodology for development of groundwater vapor intrusion screening concentrations. The calculated VI-RBSLs are identical to the groundwater vapor intrusion screening concentrations provided in Table 2c of EPA's "Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (Subsurface Vapor Intrusion Guidance)" (EPA 2002a) with one exception: the toxicity values used for calculation of the VI-RBSLs are based on the toxicity value hierarchy described in Section B6.0. (Tables B-11 and B-12 list the toxicity criteria used to calculate DU-RBSLs.) The following factors were considered in the use of the EPA (2002a) methodology for developing screening levels for groundwater vapor intrusion in the risk-based screening assessment for groundwater; these factors also apply to the calculated VI-RBSLs:

- The screening concentrations provided in Table 2c of EPA (2002a) are based on generic attenuation factors that assume minimum reduction of contaminant concentrations due to diffusive, advective, and other attenuating mechanisms. These conditions are similar to groundwater and soil conditions at HPS, where groundwater is relatively shallow and vadose zone soils are fairly coarse (see Section 2.0 of the Parcel D Revised FS Report).

- The screening concentrations provided in Table 2c of EPA (2002a) for some chemicals are based on federal maximum contaminant levels; for these chemicals, a VI-RBSL was calculated following the methodology provided in EPA (2002a) for deriving screening concentrations for vapor intrusion, and the calculated VI-RBSL was used in lieu of the maximum contaminant level.

- The screening levels provided in Table 2c of EPA (2002a) are considered protective of residential exposure. For evaluation of industrial exposures, VI-RBSLs for industrial exposure via groundwater for industrial exposure via groundwater vapor intrusion were calculated using the methodology provided in EPA (2002a) and the assumptions provided in Table B-6 of this appendix for industrial worker exposure to air.

Table B-13 lists the calculated DU-RBSLs and VI-RBSLs for groundwater used for this HHRA. Table B-13 indicates in boldface when use of the toxicity hierarchy described in Section B6.0 results in a DU-RBSL that differs from the respective EPA (2004a) tap water PRG, or a vapor intrusion RBSL that differs from the respective EPA (2002a) groundwater vapor intrusion screening concentration.

Cancer risks and noncancer hazards were calculated by comparing site EPCs of each COPC to the corresponding RBSL, as detailed in the following text.

B7.2.1 Characterization of Cancer Risks

For COPCs that are carcinogens, the cancer risk associated with exposure to a single chemical is calculated as follows:

$$Cancer\ risk = (EPC/RBSL) \times 10^{-6} \qquad \text{(B-8)}$$

where:

EPC = Exposure point concentration (microgram per liter [µg/L])

RBSL = Risk-based screening level (µg/L)

At a given site, individuals may be exposed to more than one chemical. The total risk from exposure to multiple chemicals is calculated using the following equation:

$$Total\ risk = 10^{-6} \times \{EPC_1/RBSL_1 + EPC_2/RBSL_2 + \ldots EPC_n/RBSL_n\} \quad \text{(B-9)}$$

where:

Total risk = Total carcinogenic risk from exposure to all chemicals (unitless)

EPC_n = Exposure point concentration of chemical *n* (µg/L)

$RBSL_n$ = RBSL for chemical *n* (µg/L)

B7.2.2 Characterization of Noncancer Hazards

For COPCs not classified as carcinogens and for carcinogens known to cause adverse health effects other than cancer, the potential for receptors to develop adverse health effects is evaluated by comparing EPCs with noncancer RBSLs as follows:

$$Hazard\ quotient = EPC/RBSL \quad \text{(B-10)}$$

where

EPC = Exposure point concentration (µg/L)

RBSL = Risk-based screening level (µg/L)

To evaluate the potential for noncancer effects from exposure to multiple chemicals, the HQs for all chemicals are summed, yielding an HI as follows:

$$Hazard\ index = EPC_1/RBSL_1 + EPC_2/RBSL_2 + \ldots + EPC_n/RBSL_n \quad \text{(B-11)}$$

where:

EPC_n = Exposure point concentration of chemical *n* (µg/L)

$RBSL_n$ = RBSL for chemical *n* (µg/L)

B7.3 INTERPRETATION OF HAZARD AND RISK LEVELS

EPA guidance on exposure levels considered protective of human health is presented to aid in the interpretation of the results of the risk assessment. In the National Oil and Hazardous Substances Pollution Contingency Plan, EPA defined general remedial action goals for sites on the National Priorities List (Title 40 of the *Code of Federal Regulations* Part 300.430). The goals include a range for residual cancer risk, which is "an excess upper-bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6}," or 1 in 10,000 to 1 in 1,000,000. The goals set out in the National Oil and Hazardous Substances Pollution Contingency Plan are applied once a decision to remediate a site has been made. A more recent EPA directive (EPA 1991) provides additional guidance on the role of the HHRA in supporting risk management decisions, and in

particular, determining whether remedial action is necessary. Specifically, the guidance states, "Where cumulative carcinogenic risk to an individual based on reasonable maximum exposure for both current and future land use is less than 10^{-4}, and the noncancer HQ is less than 1, action generally is not warranted unless there are adverse environmental impacts." EPA Region 9 has stated, however, that action may be taken to address risks between 10^{-4} and 10^{-6}. In addition, DTSC has stated that it considers 1×10^{-6} as the point of departure for risk management decisions. To be protective of human health, the BCT has chosen to use 10^{-6}, the lower end of the residual 10^{-4} to 10^{-6} risk range set out in the National Oil and Hazardous Substances Pollution Contingency Plan, as a threshold level for cancer risks for HPS.

An HI of less than 1.0 indicates that adverse noncancer health effects are not expected. In accordance with EPA guidance (EPA 1989), the HHRA further evaluated exposure areas with total HIs that exceeded 1. Noncancer health effects associated with exposure to multiple COPCs may not be cumulative if the COPCs affect different target organs or systems within the body. Therefore, for exposure areas with HI values that exceeded 1 based on the summed HIs from multiple COPCs, the HHRA segregates the HI by target organ or system and assumes that the potential for noncancer health effects exists only if the highest total segregated HI for a target organ or system exceeded 1. Table B-14 identifies the target organs affected by each COPC for Parcel D; this information was used, as necessary, to segregate HIs by target organ. Information on target organs was obtained from Integrated Risk Information System (EPA 2005), Health Effects Assessment Summary Tables (EPA 1997), PPRTV database (EPA 2004c), and the Agency for Toxic Substances and Disease Registry (2005).

B7.4 EVALUATION OF LEAD

The HHRA evaluated the potential for human health effects from exposure to lead by comparing EPCs for lead with an HPS-specific risk-based concentration for lead (155 milligrams per kilogram [mg/kg]) for residential and recreational receptors and the EPA (2004a) Region 9 industrial PRG for lead (800 mg/kg) for industrial and construction worker receptors. The HPS risk-based concentration for lead was developed using the Cal/EPA (1999b) LeadSpread model and EPA's Integrated Exposure Uptake Biokinetic model. The methodology for development of the HPS risk-based concentration for lead is presented in Attachment B6 to this appendix. The Region 9 industrial PRG for lead was developed by EPA using EPA's adult lead model (EPA 1996). These models are designed to predict the soil lead concentration associated with a target blood lead level of 10 micrograms per deciliter, the EPA threshold level of concern (EPA 1994a). Adverse health effects are not expected to occur from exposure to lead below the risk-based concentration or PRG.

B8.0 RESULTS OF THE HUMAN HEALTH RISK ASSESSMENT

This section summarizes the results of this revised baseline HHRA for Parcel D. Future residential, industrial, construction worker, and recreational receptors were evaluated in the HHRA. For soil exposures, both total and incremental risks were evaluated in the HHRA. Results of the total risk evaluation include risks and hazards for metals present at or below ambient levels (that is, HPALs).

Item	Reference or Phrase in ROD	Location in ROD	Identification of Referenced Document Available in the Administrative Record[1]
17	Total and incremental risks	Section 2.5.1	Final Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Section 3.1. SulTech. November 30, 2007.

3.0 RISK EVALUATION SUMMARY AND REMEDIATION GOALS

This section summarizes the potential human health and environmental risks from exposure to chemicals present in soil and groundwater at Parcel D, identifies COCs for human health and environmental endpoints, and presents remediation goals for the identified COCs. The nature and extent of contamination of soil and groundwater at Parcel D is presented in Section 2.0.

3.1 HUMAN HEALTH RISK ASSESSMENT

A revised baseline HHRA was conducted for Parcel D. The objectives of the revised HHRA were to:

- Estimate the potential human health risks associated with potential future land use scenarios
- Identify the environmental media and contaminants that pose the primary health concerns
- Identify the environmental media and contaminants that are likely to pose little or no threat to human health
- Provide a foundation for assessing the need for further response actions

The original HHRA for Parcel D was conducted in 1996 as part of the RI for Parcel D (PRC, LFR, and U&A 1996). Since the RI was completed, additional data were collected at Parcel D during the TCRA in 2000 and 2001(Tetra Tech and IT Corp. 2001). Tetra Tech revised the original HHRA in 2002 as part of the draft revised FS to supplement the original HHRA with the soil data collected during the 2000 and 2001 TCRA. An additional TCRA in 2004 resulted in additional soil excavation and soil data collection (Tetra Tech and ITSI 2005). The HHRA presented in this FS report revises the HHRA presented in the 2002 draft revised FS report to account for the soil data collected during the 2004 TCRA and to incorporate changes in regulatory guidance and toxicological criteria that have occurred since the original HHRA was prepared in 1996. Soil data associated with sampling locations excavated and removed from HPS during the 2000, 2001, and 2004 TCRAs, as well as non-TCRAs for HPS, are excluded from this HHRA. Data for soil associated with sampling locations that have not been removed, including unremoved confirmation samples collected after removal actions, are included in the HHRA. In addition, groundwater data collected since the 2002 HHRA through quarter 18 (June 2004) as part of the basewide groundwater monitoring program for HPS are included in this HHRA. Lastly, the HHRA was revised based on HPS BCT agreements during 2003 and 2004.

The HHRA calculated cancer risks and noncancer hazards from exposure to chemicals of potential concern (COPC) in all affected environmental media for each pathway identified as potentially complete. Appendix B details the HHRA methodology and results for evaluating the COPC and assessing the COCs. This section provides an overview of the exposure scenarios and pathways evaluated in the HHRA and summarizes the results. In addition, remediation goals are presented for the COCs for Parcel D, as identified from the results of the HHRA.

3.1.1 Exposure Scenarios and Pathways

The Redevelopment Plan outlines the planned reuses for Parcel D (San Francisco Redevelopment Agency 1997). To help identify the areas of Parcel D associated with specific planned reuses, Parcel D was divided into redevelopment blocks. Each redevelopment block was then assigned a redevelopment block number. Figure 3-1 shows the locations of each of the redevelopment blocks assigned to Parcel D, the associated redevelopment block number, and the specific planned reuse for each redevelopment block. According to the Redevelopment Plan, most of the planned reuse for Parcel D is industrial (San Francisco Redevelopment Agency 1997). Other planned reuses of Parcel D include open space and mixed use—that is, reuse that consists of both residential and industrial use (San Francisco Redevelopment Agency 1997). Evaluation of the recently proposed football stadium plan at Parcel D was not part of the scope of this document. However, information provided in this FS is relevant to a stadium reuse plan. The HHRA includes scenarios for alternative reuse, including industrial reuse and recreational reuse for the entire parcel. The industrial reuse scenario is conservative for the areas of the stadium complex that are regularly occupied, and the recreational scenario is appropriate for the remainder.

The table below summarizes the planned reuses for each redevelopment block at Parcel D.

Redevelopment Block	Planned Reuse	Associated Exposure Scenario for HHRA
DMI-1	Maritime Industrial	Industrial
30B	Industrial	
37	Industrial	
38	Industrial	
42	Industrial	
29	Educational/Cultural	
DOS-1	Open Space	Recreational
39	Open Space	
A	Research and Development	Residential
30A	Mixed Use	

Based on the planned reuses for Parcel D, and the likelihood that excavation and trenching activities will be required to develop Parcel D for the planned reuses, the following receptors were selected for evaluation in the HHRA for Parcel D:

- Resident (adult and child)
- Industrial worker (adult)
- Recreational user (adult and child)
- Construction worker (adult)

Table 3-1 presents an exposure matrix that summarizes the exposure pathways identified as potentially complete for each of these receptors. Both direct exposure pathways (for example, ingestion) and indirect exposure pathways (for example, ingestion of home-grown produce) were identified as potentially complete (see Table 3-1).

For purposes of the HHRA, each redevelopment block at Parcel D was divided into 0.5-acre exposure areas (approximately 150 feet by 150 feet) and 2,500-square foot exposure areas. The 0.5-acre exposure area size was selected by the HPS BCT and City and County of San Francisco as a reasonable estimate for a light industrial lot in the Bay area. The 2,500-square foot exposure area was selected by the BCT as a reasonable estimate for a residential lot because it is a minimum residential lot size for a single-family home allowed by the San Francisco planning code (City and County of San Francisco 1995). This HHRA refers to each 0.5-acre exposure area at Parcel D as an "industrial grid" and each 2,500-square foot exposure area as a "residential grid." For purposes of the HHRA, each grid was assigned a unique identification number, referred to as the "grid number."

Risks from exposure to soil were evaluated for each grid for which soil sampling data was collected and where the sampling locations have not been subject to removal actions. Grids with no soil sampling data were not sampled because no environmental releases are suspected in these areas. Residential grids were used to assess residential exposures, while industrial grids were used to assess industrial, recreational, and construction worker exposures.

Risks from exposure to COPCs in groundwater were assessed for the A- and B-aquifers. For the A-aquifer, residential and industrial exposure to groundwater from inhalation of volatile COPCs in groundwater that migrates through the subsurface to indoor air (vapor intrusion) is the only complete exposure pathway for the planned reuses of Parcel D. For the construction worker scenario, exposure to groundwater in the A-aquifer may occur during trenching activities. Residential exposure to groundwater in the A-aquifer from domestic use (such as ingestion) was not evaluated in the HHRA because the A-aquifer at HPS is not considered a potential source of drinking water (see Section 2.2.9). However, because groundwater in the B-aquifer is considered to be a low potential source of drinking water, residential exposure to groundwater was evaluated for the B-aquifer.

Risks from residential, industrial, and construction worker exposure to COPCs in the groundwater in the A-aquifer were assessed for three risk plume-based exposure areas: the IR-09 risk plume, the IR-33 risk plume, and the IR-71 risk plume. These risk plumes are present in the A-aquifer only. The risk plumes were developed using a specific methodology developed for the HHRA based on agreements made with the BCT (see Attachment B4, Figures B4-1 and B4-2). The risk plumes are based on historical as well as more recent data, incorporating the 12 most recent sampling results for each analyte at each well. Groundwater data collected at Parcel D through June 2004 were used to delineate these risk plumes. Because this methodology includes historical data over 10 years old, the risk plumes reflect a worst-case scenario of groundwater contamination. Current conditions differ from the risk plumes (see Figures 2-29 and 2-30). The IR-33 and IR-71 risk plumes are based on delineation of VOC concentrations to respective laboratory reporting limits. The IR-71 risk plume is based on delineation of chromium VI concentrations to the laboratory reporting limit for chromium VI. Chemical concentrations measured from some groundwater monitoring locations at Parcel D were not

associated with risk plumes; these nonplume-based locations were evaluated on a grid-basis, using the same grid system that was used in the HHRA to evaluate soil exposures. This methodology serves as an efficient mechanism to locate each nonplume exposure area, and is consistent with the grid-based approach used to locate and evaluate soil exposures.

Although risk plumes are not present in the B-aquifer at Parcel D, for purposes of assessing the HHRA COPCs, plume boundaries delineated for the A-aquifer were extrapolated vertically and applied to the B-aquifer; the extrapolated plume boundaries were used to represent exposure areas for the B-aquifer for the residential domestic use evaluation. Similar to the approach used for the A-aquifer, chemical concentrations measured from groundwater monitoring locations in the B-aquifer at Parcel D that fell outside of the extrapolated plume boundaries were evaluated as nonplume exposure areas, using the exposure area grids established for soil.

For each redevelopment block, risks from exposure to COPCs in soil and groundwater were evaluated both for the specific exposure scenario associated with the planned reuse of the redevelopment block, and for the other potential exposure scenarios identified for Parcel D, regardless of the planned reuse of the redevelopment block. Using this approach, for each redevelopment block, risks were evaluated for residential, industrial, recreational, and construction worker exposures. The HHRA results summarized in this section are for the specific planned reuse of each redevelopment block. For groundwater in the B-aquifer, which was evaluated for residential exposure from domestic use, HHRA results are based on each exposure area evaluated, regardless of planned reuse. Risks associated with construction worker exposure at each redevelopment block are also summarized in this section, as exposures under this scenario may potentially occur, regardless of the planned reuse of the redevelopment block. Appendix B contains the risks results for all exposure scenarios evaluated for each redevelopment block.

3.1.2 Total and Incremental Risks for Soil Exposure

Both total and incremental risks were evaluated for exposure to soil at Parcel D. For the total risk evaluation, all detected chemicals were included as COPCs regardless of concentration, except for the essential nutrients calcium, magnesium, potassium, and sodium. The total risk evaluation provides an estimate of the risks posed by all chemicals at the site, including those present at concentrations at or below ambient levels. For the incremental risk evaluation, the above essential nutrients and metals with maximum measured concentrations below HPALs were excluded as COPCs. The incremental risk evaluation provides an estimate of risks posed by all chemicals at the site, except those that do not exceed ambient levels.

3.1.3 Soil Risk Summary

This section summarizes the results of the total and incremental risk evaluations for soil, based on planned reuse.

3.1.3.1 Total Risk Evaluation

For the total risk evaluation, risks from exposure to COPCs in soil were assessed for both surface soil (0 to 2 feet bgs) and subsurface soil (0 to 10 feet bgs). Figures 3-2 and 3-3 summarize the grid-specific total risk results for surface and subsurface soil, respectively, based on the planned reuse of the redevelopment block associated with each grid. Figure 3-4 summarizes the grid-specific total risk results for construction worker exposure to soil. The results for each grid are shown relative to the cancer risk threshold of 1×10^{-6}, highest segregated noncancer HI threshold of 1.0, and HPS RBC for lead (155 mg/kg for residential and recreational receptors, and 800 mg/kg for industrial and construction worker receptors). The specific calculated total cancer risk and noncancer HI results for each grid are listed in Tables 3-2, 3-3, and 3-4.

The risk results shown in the above referenced figures and tables represent total risk; that is, all detected chemicals not considered essential human nutrients were included in the risk evaluation. The total risk for most exposure areas exceeds the cancer risk threshold of 1×10^{-6}. For exposure areas planned for residential reuse, the total HI for all areas for which data are available (one exposure area for surface soil; three exposure areas for subsurface soil) also exceeds the threshold HI of 1.0.

Tables 3-5, 3-6, and 3-7 present a risk characterization analysis for those grids for which the total cancer risk exceeds 1×10^{-6} or highest segregated HI exceeds 1.0. For each of these grids, the tables identify the COCs and present their contribution to the calculated total risks and hazards for each potentially complete exposure pathway.

The following chemicals are identified as COCs in at least one grid, based on planned reuse and results of the total risk evaluation for soil.

Exposure Scenario	Surface Soil COCs, Total Risk	Subsurface Soil COCs, Total Risk
Industrial[1]	Arsenic Benzo(a)pyrene Benzo(b)fluoranthene Lead	Arsenic Benzo(a)pyrene Benzo(b)fluoranthene Lead
Recreational[1]	Arsenic Benzo(a)pyrene	Not applicable
Residential[1]	Arsenic Iron Manganese Vanadium	Arsenic Iron Nickel Manganese Vanadium
Construction Worker[2]	Not applicable	Arsenic Benzo(a)pyrene Lead Manganese

Notes:

1 COCs identified for this exposure scenario are based on the planned reuse for Parcel D.

2 The construction worker exposure scenario is not associated with a specific planned reuse for Parcel D. Based on discussions and an agreement with the BCT, evaluation of construction worker exposure to soil was based on subsurface soil from 0 to 10 feet bgs, which includes surface soil (0 to 2 feet bgs) exposure.

3.1.3.2 Incremental Risk Evaluation

For the incremental risk evaluation, risks from exposure to COPCs in soil were assessed for both surface soil (0 to 2 feet bgs) and subsurface soil (0 to 10 feet bgs). Figures 3-5 and 3-6 summarize the grid-specific incremental risk results for surface and subsurface soil, respectively, based on the planned reuse of the redevelopment block associated with each grid. Figure 3-7 summarizes the grid-specific incremental risk results for construction worker exposure to soil. The specific calculated incremental cancer risk and noncancer HI results for each grid are listed in Tables 3-8, 3-9, and 3-10.

The risk results shown in the above referenced figures and tables represent incremental risk; that is, all detected chemicals except essential human nutrients and metals below HPALs were included in the risk evaluation. Under the incremental risk evaluation, the most exposure areas at Parcel D do not exceed the cancer risk threshold of 1×10^{-6} or the noncancer threshold HI of 1.0, based on planned reuse.

Tables 3-11, 3-12, and 3-13 present a risk characterization analysis for those grids for which the incremental cancer risk exceeds 1×10^{-6} or highest segregated HI exceeds 1.0. For each of these grids, the tables identify the COCs and present their contribution to the calculated incremental risks and hazards for each potentially complete exposure pathway.

The following chemicals are identified as COCs in at least one grid, based on planned reuse and results of the incremental risk evaluation for soil.

Exposure Scenario	Surface Soil COCs, Incremental Risk	Subsurface Soil COCs, Incremental Risk
Industrial[1]	Arsenic Benzo(a)pyrene Benzo(b)fluoranthene Lead	Arsenic Benzo(a)pyrene Benzo(b)fluoranthene Lead
Recreational[1]	Arsenic Benzo(a)pyrene	Not applicable
Residential[1]	Manganese	Manganese
Construction Worker[2]	Not applicable	Arsenic Benzo(a)pyrene Lead Manganese

Notes:

1 COCs identified for this exposure scenario are based on the planned reuse for Parcel D.

2 The construction worker exposure scenario is not associated with a specific planned reuse for Parcel D. Based on discussions and an agreement with the BCT, evaluation of construction worker exposure to soil was based on subsurface soil from 0 to 10 feet bgs, which includes surface soil (0 to 2 feet bgs) exposure.

3.1.4 Groundwater Risk Summary

Risks from exposure to COPCs in groundwater were assessed for the A- and B-aquifers. Figure 3-8 summarizes the groundwater risk results for each of the identified risk plumes and nonplume exposure areas within the A-aquifer, based on the planned reuse for each

redevelopment block. Figure 3-9 summarizes the risk results for construction worker exposure to groundwater, for both plume- and nonplume-based exposures. The results in the figures are shown relative to the cancer risk threshold of 1×10^{-6} and highest segregated noncancer HI of 1.0.

Tables 3-14 and 3-15 present a risk characterization analysis for those exposure areas for which the cancer risk exceeds 1×10^{-6} or the highest segregated HI exceeds 1.0, for the exposure scenarios associated with planned reuse and the construction worker scenario, respectively. These tables identify the groundwater COCs associated with each Parcel D risk plume and the percent contribution of each COC to the total cancer risk and HI calculated for each plume. Exposure areas not associated with risk plumes with COCs are also shown on Tables 3-14 and 3-15. The following chemicals are identified as COCs in groundwater in the A-aquifer, based on planned reuse.

Exposure Scenario	Groundwater COCs, A-Aquifer
Industrial[1]	Benzene, Carbon Tetrachloride, Chloroform, Naphthalene, Tetrachloroethene, Trichloroethene, and Xylenes
Recreational[1]	Not applicable
Residential[1]	Chloroform, Methylene Chloride, and Trichloroethene
Construction Worker[2]	Arsenic, Benzene, Naphthalene, Tetrachloroethene, and Xylenes

Notes:

1 COCs identified for this exposure scenario are based on the planned reuse for Parcel D.

2 The construction worker exposure scenario is not associated with a specific planned reuse for Parcel D

Evaluation of exposure to groundwater in the B-aquifer was limited to residential exposure from domestic use. No COCs were identified for domestic use in the B-aquifer.

Figure 3-10 shows the risk results from residential exposure to groundwater in the B-aquifer from domestic use. As discussed in the HHRA (see Appendix B), risks from exposure to groundwater in the B-aquifer were evaluated for each exposure area for which monitoring data for the B-aquifer are available, regardless of the specific planned reuse of the exposure area. In addition, although contaminant plumes have not been identified in the B-aquifer and hydraulic communication does not occur between the A- and B-aquifers at Parcel D, data collected from the B-aquifer were grouped using the same risk plume delineation boundaries developed to evaluate risks for the A-aquifer. This approach was selected to facilitate reporting of risk results over collocated exposure areas. One A-aquifer plume-based exposure area (IR-71) and two A-aquifer nonplume-exposure areas (grid numbers 082075 and 085079) were evaluated for exposure to groundwater in the B-aquifer. Cancer risks were below 1×10^{-6} and noncancer HIs were below 1.0 for each of these exposure areas in the B-aquifer; hence, COCs were not identified for the B-aquifer at Parcel D.

Notes:

	All concentrations shown in mg/kg.
<1	Less than 1
--	Not applicable or chemical is not a chemical of concern for this endpoint
*	Not available; comparison to ambient levels based on regression analysis
	Not evaluated because exposure pathway is incomplete

bgs	Below ground surface
C	Cancer effect
E/C	Educational/cultural (industrial exposure scenario)
EPC	Exposure point concentration
HI	Hazard index
HPAL	Hunters Point ambient level
HPS	Hunters Point Shipyard
IND	Industrial (industrial exposure scenario)
mg/kg	Milligrams per kilogram
MI	Maritime industrial (industrial exposure scenario)
MU	Mixed use (residential exposure scenario)
NC	Noncancer effect
PAH	Polynuclear aromatic hydrocarbon
PRG	Preliminary remediation goal
OS	Open space (recreational exposure scenario)
RME	Reasonable maximum exposure

21	Assumptions and uncertainties	Section 2.5.1	Final Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Appendix B, Section B9.0. SulTech. November 30, 2007.

B9.0 UNCERTAINTY ANALYSIS

Varying degrees of uncertainty at each stage of the HHRA arise from assumptions made in the risk assessment and the limitations of the data used to calculate risks. Uncertainty and variability are also inherent in the exposure assessment, toxicity values, and risk characterization. Table B-24 lists both general and site-specific uncertainties associated with this HHRA.

The effect of uncertainties is overestimation or underestimation of the actual cancer risk or HI. In general, the risk assessment process is based on use of conservative (health-protective) assumptions that when combined, are intended to overestimate the actual risk. However, a small possibility exists that risks were underestimated.

The remainder of this discussion focuses on the following uncertainties specific to this HHRA:

- The influence of metals in soil at or below ambient levels on this HHRA
- Use of a SF for TCE developed by Cal/EPA, rather than the EPA provisional SF for TCE
- Assumption that the exposure area for groundwater vapor intrusion risks is consistent with the risk plume boundaries delineated for groundwater COPCs
- Dermal contact with groundwater for the residential exposure scenario
- Use of generic, non-site-specific RBSLs to calculate risks from groundwater vapor intrusion.

B9.1 METALS IN SOIL BELOW AMBIENT LEVELS

To account for the contribution of naturally occurring concentrations of metals at HPS, both total risks and incremental risks were assessed for exposure to soil. The total risk evaluation for soil included all chemicals regardless of concentration, except for the essential nutrients calcium, magnesium, potassium, and sodium. For the incremental risk evaluation, the above essential nutrients and metals with maximum measured concentrations below HPALs were excluded as COPCs.

The differences in risk and hazard results between the total risk evaluation and the incremental risk evaluation are attributed to the risks and hazards associated with ambient levels of metals at HPS. At ambient concentrations (that is, HPALs), some metals at HPS are associated with cancer risks in excess of 1E-06 and noncancer hazards in excess of 1.0. Table B-25 presents the

cancer risks and noncancer hazards associated with exposure to metals at concentrations equal to HPALs; risks and hazards are presented in this table for each of the exposure scenarios associated with planned reuse (residential, industrial, recreational). As shown in Table B-25, the contribution of ambient levels of metals to cancer risk and HI estimates is significant. For example, the cancer risk associated with residential exposure to arsenic at a concentration equal to the HPAL for arsenic (11.1 mg/kg) is 2.9E-04. The HI associated with residential exposure to manganese at a concentration equal to the HPAL for manganese (1,431 mg/kg) is 1.7. Collectively, all metals at ambient levels contribute to a cancer risk of 3E-04 for a residential receptor, and 3E-05 for industrial and recreational receptors. For noncancer hazards, metals at ambient levels collectively contribute to an HI of 11 for residential receptors, 0.2 for industrial receptors, and 0.7 for recreational receptors.

This evaluation of risks and hazards associated with metals at HPALs shows that the total risk evaluation, which includes metals present at concentrations at or below HPALs, likely overestimates risks and hazards associated with Navy releases of chemicals, as concentrations of metals are at or below HPALs in many exposure areas at Parcel D. While the incremental risk evaluation excludes risks and hazards from metals for which maximum concentrations do not exceed HPALs, the results of the incremental evaluation should be considered with the information contained in Table B-25, as the contribution of ambient levels to risks and hazards at HPS is significant for some metals.

B9.2 SLOPE FACTOR FOR TCE

As discussed in Section B6.0, the provisional cancer SFs derived by EPA (2001) for TCE, although more conservative than the SFs derived by Cal/EPA, were not used in the HHRA. The draft risk assessment that is the basis for the provisional EPA SFs for TCE is being reviewed currently by the National Academy of Sciences, and as such, does not represent EPA policy. For this HHRA, the SFs developed by Cal/EPA were used to evaluate cancer risks from exposure to TCE. Uncertainties specific to the provisional cancer SFs for TCE were analyzed in this HHRA because the difference between the provisional SFs for TCE and the Cal/EPA SFs for TCE is significant, and can affect the risk results. Attachment B7 contains a detailed discussion of the uncertainties associated with the SFs for TCE.

B9.3 BOUNDARIES FOR VAPOR INTRUSION RISKS

As discussed in Section B4.3.2, risk plume boundaries for evaluation of groundwater vapor intrusion were established based on delineation of volatile COPCs in the A-aquifer to nondetectable (below reporting limit) levels, and vapor intrusion risks were applied to each residential and industrial grid encompassed by the boundaries of the risk plumes. This approach assumes that the exposure area for groundwater vapor intrusion risks is consistent with the risk plume boundaries; however; EPA states that it is reasonable to assume that subsurface vapors may migrate laterally up to 100 feet (EPA 2002a). Figure B-8 portrays the potential lateral extent, or 100-foot "inhalation risk buffer zone" to which the groundwater vapor intrusion risks calculated for Parcel D may extend. In this figure, the risk plume

boundaries delineated in Section B4.3.2 were expanded laterally in each direction by 100 feet to account for the distance that vapors may travel laterally from a groundwater source. This inhalation risk buffer zone was also applied to non-plume well locations with volatile COPCs (see Figure B-8).

Preferential pathways, which consist of utility conduits, subsurface drains, and buried pipelines that intersect vapor sources or vapor migration pathways, may allow subsurface vapors to migrate more than 100 feet laterally (EPA 2002a). These preferential pathways are considered significant if they are associated with a high gas permeability and are of sufficient volume and proximity to a building such that the pathways may influence vapor intrusion into the building (EPA 2002a). Figure B-9 shows the subsurface utilities at Parcel D; these utilities may influence the extent to which subsurface vapors may migrate beyond the 100-foot inhalation risk buffer zone depicted in Figure B-8.

B9.4 DERMAL CONTACT WITH GROUNDWATER FOR RESIDENTIAL SCENARIO

As discussed in Section B7.2, tap water PRGs were used in this HHRA to evaluate domestic use of groundwater for the residential receptor. The tap water PRGs are used to evaluate residential exposure to groundwater from ingestion and from inhalation of VOCs released from groundwater to indoor air during household use. The tap water PRGs are limited to an assessment of exposure to groundwater from the oral and inhalation exposure pathways, and do not account for exposure from the dermal exposure pathway.

To address the uncertainties associated with exclusion of the dermal exposure pathway on the risk results for residential domestic use of groundwater, the potential for intake of COPCs from the dermal exposure pathway relative to intake of COPCs from the oral exposure pathway was evaluated using information provided in EPA (2004d) on the relative percentage of dermal exposure compared to oral exposures for non-volatile COPCs. This information is presented in the table below for the non-volatile COPCs identified for the B-aquifer. In this table, exposure from the oral route is represented by ingestion of two liters of water per day (EPA 2004d). Although several volatile COPCs were identified for the B-aquifer, partitioning risks between oral and dermal exposures for volatile COPCs is not necessary because the tap water PRGs account for the inhalation route of exposure. Non-volatile COPCs for the B-aquifer were limited to metals. Information was not available for two metals identified as COPCs for the B-aquifer, molybdenum and zinc.

Chemical of Potential Concern	Dermal/Oral (%)*	Chemical of Potential Concern	Dermal/Oral (%)*
Barium	7.5	Nickel	2.6
Chromium	40	Selenium	1.8
Manganese	8.8	Vanadium	20

Source: EPA (2004d)

This evaluation shows that risks from exposure to groundwater in the B-aquifer, which were calculated using a risk-based screening assessment and EPA Region 9 tap water PRGs, may be slightly to moderately underestimated for some metals in the B-aquifer (from 1.8 for selenium to 40 percent for chromium). The potential for dermal noncancer hazards was assessed for the B-aquifer by applying the percentages above to the calculated dermal HIs for the B-aquifer (shown on Table B3-21 of Attachment B3); this assessment showed that none of the chemical-specific HIs calculated for each of the non-volatile COPCs in the B-aquifer (see Table B3-21 of Attachment B3) would exceed a threshold HI of 1.0. This assessment did not evaluate cancer risks because none of the non-volatile COPCs identified for the B-aquifer is associated with cancer effects.

B9.5 SCREENING LEVELS FOR GROUNDWATER VAPOR INTRUSION

Based on meetings between EPA, DTSC, and Navy in 2003 and 2004, VI-RBSLs that are based on the generic screening concentrations provided in Table 2c of EPA (2002a) were used in this HHRA to calculate risks for the groundwater vapor intrusion exposure pathway. This approach was used in lieu of site-specific modeling with the Johnson-Ettinger (1991) vapor model because the EPA (2002a) model assumptions (such a depth to groundwater and soil physical properties) used to calculate the generic screening criteria are similar to the properties of soil and groundwater at HPS. Site conditions at HPS (shallow depth to groundwater and coarse soils; see Section 2.0 of the Parcel D Revised FS Report) do not differ significantly enough from conditions assumed for the generic screening values to warrant detailed modeling using the Johnson-Ettinger model.

To evaluate whether use of the generic values would represent conditions at HPS and would not result in a significant overestimate of potential risks, the Navy evaluated risks from vapor intrusion for selected groundwater risk plumes at HPS using both generic EPA (2002a) risk-based screening values for vapor intrusion and site-specific modeling. The results of this evaluation showed that risks calculated ratiometrically using generic EPA risk-based vapor intrusion screening values are comparable to site-specific risks calculated using the Johnson-Ettinger model adjusted for HPS-specific values for depth to groundwater and physical properties of the soil. Risks calculated using the generic EPA screening values were higher than modeled results by approximately a factor of two. The difference results from an assumed basement exposure scenario in the generic EPA screening values, whereas the modeled results were based on a slab-on-grade exposure scenario because of the shallow depth to groundwater at HPS (roughly 7 to 8 feet bgs). This difference is not considered significant for risk results, which are represented by order-of-magnitude estimates.

TABLE H-1: SURFACE WATER QUALITY CRITERIA FOR THE SAN FRANCISCO BAY (CONTINUED)
Revised Feasibility Study Report for Parcel D, Hunters Point Shipyard, San Francisco, California

Notes: **Values shaded are those selected as screening criteria.**
Footnotes and references are detailed below.

-- No criterion available
ug/L Microgram per liter
BHC Benzene Hexachloride (Lindane)
DDD Dichlorodiphenyldichloroethane
DDE 1,1-dichloro-2,2-bis(p-chlorophenyl)ethylene
DDT 1,1,1-Trichloro-2,2-bis(p-chlorophenyl)ethane
TPH Total petroleum hydrocarbons

Footnotes:

a California Environmental Protection Agency, Regional Water Quality Control Board, San Francisco Bay Area Region (Water Board). 1995. "San Francisco Bay Basin Plan Water Quality Control Plan." June 21. Table 3-3 Water Quality Objectives for Toxic Pollutants for Surface Water With Salinities Greater Than 5 Parts Per Billion.
b From Water Board "Basin Plan" 4-Day Average (Chronic)
c From Water Board "Basin Plan" 24-Hour and 1-Hour Average (Acute)
d From Water Board "Basin Plan" Instantaneous Maximum
e From "Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (CTR) (EPA 2000) and "Water Quality Control Plan, San Francisco Bay Basin Region" (Water Board 1995). The most appropriate criteria were used.
f Criterion made more suitably protective by means of standard convention of lowering acute values by 80 percent and instantaneous values by 90 percent to make them more appropriate for use under chronic exposure scenarios.
g An acute criterion (EPA identified as Criteria Maximum Concentration [CMC]) is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed briefly without resulting in an unacceptable effect. The chronic concentration (EPA identified as Criterion Continuous Concentration [CCC]) is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed indefinitely without resulting in an unacceptable effect. The CMC and CCC are just two if the six parts of an aquatic life criterion; the other four parts are the acute averaging period, chronic averaging period, acute frequency of allowed exceedance, and chronic frequency of allowed exceedance. Because 304(a) aquatic life criteria are national guidance, they are intended to be protective of the vast majority of the aquatic communities in the United States (EPA 2002a).
h EPA National "AWQC Lowest Observed Effect Level (Chronic)" (Water Board 2000)
i EPA National "AWQC Lowest Observed Effect Level (Acute)" (Water Board 2000)
j EPA National "AWQC Lowest Observed Effect Level (Other)" (Water Board 2000)
k From "National Recommended Water Quality Criteria: 2002" (EPA 2002a) and "Revision of National Recommended Water Quality Criteria." (EPA 2002b), unless otherwise noted.
l From "Final Technical Memorandum Estimation of Ambient Concentrations of Metals in Groundwater" (Tetra Tech 2001)
m In instances where criteria from "Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (EPA 2000) refer to the "Water Quality Control Plan, San Francisco Bay Basin Region" (Water Board 1995), Water Board 1995 criteria were used. The Water Board 1995 criteria are distinguished by an "m" in the footnote column.
o Detailed application of this toxicity criterion may require the review and/or summation of analyte isomer, congener, or speciation results, as applicable. Please see applicable regulatory agency source document for additional detail.
p Water Board 1998
q Tetra Tech EM Inc. 1999
r Water Board 2000

The following lettered footnotes are derived from EPA "National Recommended Water Quality Criteria: 2002" (EPA 2002a), Table 1 - Priority Toxic Pollutants:

A This recommended water quality criterion was derived from data for arsenic (III), but is applied here to total arsenic, which might imply that arsenic (III) and arsenic (V) are equally toxic to aquatic life and that their toxicities are additive. In the arsenic criteria document (EPA 440/5-84-033, January 1985), Species Mean Acute Values (SMAVs) are given for both arsenic (III) and arsenic (V) for five species, and the ratios of the SMAVs for each species range from 0.6 to 1.7. Chronic values are available for both arsenic (III) and arsenic (V) for one species; for the fathead minnow, the chronic value for arsenic (V) is 0.29 times the chronic value for arsenic (III). No data are known to be available concerning whether the toxicities of the forms of arsenic to aquatic organisms are additive.
D Freshwater and saltwater criteria for metals are expressed in terms of the dissolved metal in the water column. The recommended water quality criteria value was calculated by using the previous 304(a) aquatic life criteria expressed in terms of total recoverable metal, and multiplying it by a conversion factor (CF). The term "Conversion Factor" (CF) represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column. (Conversion Factors for saltwater CCCs are currently unavailable. Conversion factors derived for saltwater CMCs have been used for both saltwater CMCs and CCCs). See "Office of Water Policy and Technical Guidance on Interpretation and Implementation of Aquatic Life Metals Criteria," October 1, 1993, by Martha G. Prothro, Acting Assistant Administrator for Water, available from the Water Resource center, USEPA, 401 M St., SW, mail code RC4100, Washington DC 20460; and 40CFR 131.36(b)(1). Conversion Factors applied in the table can be found in Appendix A to the Preamble - Conversion Factors for Dissolved Metals.
F The deviation of this value is presented in the Red Book (EPA 440/9-76-023, July 1976).
G The criterion is based on 304(a) aquatic life criterion issued in 1980 and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), Dichlorodiphenyltrichloroethane (DDT) (EPA 440/5-80-38), Endosulfan (EPA 440/5-80-046), Endrin (EPA 440/5-80-047), Heptachlor (EPA 440/5-80-052), Hexachlorocyclohexane (EPA 440/5-80-054), Silver (EPA 440/5-80-071), The minimum data requirements and derivation procedures were different in the 1980 Guidelines than in the 1985 Guidelines. For example, a "CMC" derived using the 1980 Guidelines was derived to be used as an instantaneous maximum. If assessment is to be done using an averaging period, the values given should be divided by 2 to obtain a value that is more comparable to a CMC derived using the 1985 Guidelines.
N This criterion applies to total polychlorinated biphenyls (e.g. the sum of all congener or all isomer or homolog or Aroclor analyses.)
Q This recommended water quality criterion is expressed as mg free cyanide (as CN)/L.
V This value was derived from data for heptachlor, and the criteria document provides insufficient data to estimate the relative toxicities of heptachlor and heptachlor epoxide.
Y This value was derived from data for endosulfan and is most appropriately applied to the sum of alpha-endosulfan and beta-endosulfan.
aa This criterion is based on a 304(a) aquatic life criterion issued in 1980 or 1986, and was issued in one of the following documents : Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endrin (EPA 4405-80-047), Heptachlor (EPA 440/5-80-052), Polychlorinated biphenyls (EPA 440/5-80-068), Toxaphene (EPA 440/5-86-006). This CCC is currently based on the Final Residue Value (FRV) procedure. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60 FR 15393-15399, March 23, 1995), the EPA no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria. Therefore, the EPA anticipates that future revisions of this CCC will not be based on FRV procedure.
bb This water quality criterion is based on a 304(a) aquatic life criterion that was derived using the 1985 Guidelines (*Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses*, PB85-227046, January 1985) and was issued in one of the following criteria documents: Arsenic (EPA 440/5-84-033), Cadmium (EPA 882-R-01-001), Chromium (EPA 440/5-84-029), Copper (EPA 440/5-84-031), Cyanide (EPA 440/5-84-028), Lead (EPA 440/5-84-027), Nickel (EPA 440/5-86-004), Pentachlorophenol (EPA 440/5-86-009), Toxaphene (EPA 440/5-86-006), Zinc (EPA 440/5-87-003).
cc When the concentration of dissolved organic carbon is elevated, copper is substantially less toxic, and use of Water-Effect Rations might be appropriate.
dd The selenium criteria document (EPA 440/5-87-006, September 1987) provides that if selenium is as toxic to saltwater fishes in the field as it is to freshwater fish in the field, the status of the fish community should be monitored whenever the concentration of selenium exceeds 5.0 mg/L in salt water because the saltwater CCC does not take into account uptake via the food chain.
ee This recommended water quality criterion was derived on page 43 of the mercury document (EPA 440/5-84-026, January1985). The saltwater CCC of 0.025 µg/L given on page 23 of the criteria document is based on the Final Residue Value procedure in the 1985 Guidelines. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60 FR 15393-15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria.
ff This recommended water quality criterion was derived in Ambient Water Quality Criteria Saltwater Copper Addendum (draft, April 14, 1995) and was promulgated in the Interim final National Toxics Rule (60 FR 22228-222237, May 4, 1995).
gg EPA is actively working on this criterion, and so this recommended water quality criterion may change substantially in the near future.
hh This recommended water quality criterion was derived from data for inorganic mercury (II), but is applied here to total mercury. If a substantial portion of the mercury in the water column is methylmercury, this criterion will probably be under protective. In addition, even though inorganic mercury is converted to methylmercury, and methylmercury bioaccumulates to a great extent, this criterion does not account for uptake via the food chain because sufficient data were not available when the criterion was derived.
ii This criterion applies to DDT and its metabolites (that is, the total concentration of DDT and its metabolites should not exceed this value.)

TABLE H-1: SURFACE WATER QUALITY CRITERIA FOR THE SAN FRANCISCO BAY (CONTINUED)

Revised Feasibility Study Report for Parcel D, Hunters Point Shipyard, San Francisco, California

The following lettered footnotes are derived from EPA "Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (EPA 2000).

ll This criterion is based on 304(a) aquatic life criterion issued in 1980, and was issued in one of the following documents: Aldrin/ Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endosulfan (EPA 440/5-80-046), Endrin (EPA 440/5-80-047), Heptochlor (440/5-80-025), Hexachlorocyclohexane (EPA 440/5/80/054), Silver (EPA 440/5-80-071) (originally footnote g in CTR).

mm Criteria for these metals are expressed as a function of the water-effect ratio (WER) (originally footnote l in the CTR).

nn No criterion for protection of human health from consumption of aquatic organisms (excluding water) was presented in the 1980 criteria document or in the 1986 Quality Criteria for Water. Nevertheless, sufficient information was presented in the 1980 document to allow a calculation of a criterion, even though the results of such calculations were not shown in the document.

oo These freshwater and saltwater criteria for metals are expressed in terms of dissolved fraction of the metal in the water column. Criterion values were calculated by using EPA's Clean Water Act 304(a) guidance values (described in the total recoverable fraction) and then applying the conversion factors in 131.36(b)() and (2).

pp These criteria were promulgated for specific waters in California in the National Toxics Rule (NTR). The specific waters to which the NTR criteria apply include Waters of the State defined as bays or estuaries, including the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. This section does not apply instead of the NTR for these criteria.

rr PCBs are a class of chemicals that include Aroclors 1242,1254,1221,1232,1248,1260, and 1016. The aquatic life criteria apply to the sum of this set of seven Aroclors.

The following numbered footnotes are derived from "A Compilation of Water Quality Goals" (Water Board 2000). These footnotes directly correlate with the source document.

1 Expressed as dissolved
2 Expressed as total recoverable
6 Pentavalent arsenic [As(V)] effects on plants.
20 For halomethanes
22 For chlorinated benzenes
23 Toxicity to a fish species exposed for 7.5 days
24 For dichlorobenzenes
27 For dichloroethylenes
28 For dichloropropanes
29 For dichloropropenes
38 Toxicity to algae occurs
45 For phthalate esters
48 For chlorinated naphthalenes
51 From U.S. Environmental Protection Agency, *Quality Criteria for Water* (1976) "The Red Book."
52 For polycyclic aromatic hydrocarbons
53 For dinitrotoluenes
56 For nitrosamines
68 Draft/tentative/provisional; applies only to second value if more than one value is listed.
82 A decrease in the number of algal cells occurs.
83 Adverse effects on a fish species exposed for 168 days.
88 For nitrophenols
95 For the pentavalent form
114 Developed as 24-hour average using 1980 EPA guidelines, but applied as 4-day average in the National Toxics Rule and/or Proposed California Toxics Rule.
115 Criterion most appropriately applied to the sum of alpha-endosulfan and beta-endosulfan.
116 Applies separately to Aroclors 1242, 1254, 1221, 1232, 1248, 1260, and 1016; based on carcinogenicity at 1-in-a-million risk level.
142 Criteria do not apply to waters subject to water quality objectives in Tables III-2A and III-2B of the San Francisco Bay Regional Water Quality Control Board's 1986 Basin Plan.
143 These criteria were promulgated for specific California waters in the National Toxics Rule.
144 The ambient level was set at or below the minimum reported detection limit.
145 The ambient concentration represents the 95th percentile of the distribution. Additionally, the 95th percentile of the distribution was calculated using distribution dependent formulae. For normal and lognormal distributions, the 95th percentile calculation used the parameters of the best-fitted regression line drawn through the detected values on the probability plot. For nonparametric distribution, the analytical formula was used (Gilbert 1987).

3.2 ENVIRONMENTAL EVALUATION

Chemicals present in both the A-aquifer and the B-aquifer groundwater at Parcel D were evaluated to assess potential environmental impacts to the Bay. This evaluation was completed as part of the derivation of trigger levels for chemicals that present a potential impact to the Bay in Appendix I. The first step of this evaluation consisted of a screening-level comparison of chemical concentrations measured in groundwater to surface water criteria and HGAL (for metals only). Appendix H lists available state and federal surface water criteria and summarizes the criteria selected for use in the screening-level evaluation. Although complete exposure pathways from known groundwater plumes at Parcel D to the Bay are not known to currently exist, a potential threat to the Bay exists if chemicals currently present in groundwater at concentrations above the screening criteria reach the Bay.

Concentrations of all chemicals detected in the A- and B-aquifers were compared to the selected screening criteria; those chemicals for which maximum concentrations exceeded screening criteria were identified as COPECs. This comparison is shown in Appendix H, Section H3.0. As shown in these tables, 12 COPECs were identified as a result of this comparison (9 metals; a VOC, ethylbenzene; an SVOC, acenaphthylene; and cyanide).

The next step of the environmental evaluation involved a well-by-well analysis of the analytical results for the 12 identified COPECs to assess potential threats to the Bay (see Appendix H, Section H3.0). Based on this evaluation, chromium VI and nickel were identified as COCs in the A-aquifer based on the environmental evaluation in Appendix H.

- **Chromium VI** is identified as a COC due to detections in both the defined plumes and in individual wells in the A-aquifer, which contain concentrations of this metal that consistently exceeded the surface water criteria. The locations of the elevated chromium VI concentrations are mostly near IR-09 where there was a known source of chromium from painting operations. Twenty-five samples contained concentrations exceeding the surface water criteria based on results from 171 groundwater samples collected from the A-aquifer at Parcel D. Consistent elevated concentrations of chromium VI were detected in wells IR09MW35A and IR09PPY1, and recent results exceeded the surface water screening criteria in groundwater from wells IR09MW63A and IR33MW61A. Chromium VI is also present in several other A-aquifer wells at Parcel D, although it does not exceed the surface water criteria. No chromium VI was detected in samples collected from the B-aquifer. The current locations of chromium VI in the A-aquifer groundwater at Parcel D are not near the Bay and do not appear to pose an immediate threat to the surface water.

- **Nickel** is identified as a COC due to detections in a single well that consistently exceeded surface water criteria, and historical detections of nickel in an adjacent well that also exceeded surface water criteria. These concentrations of nickel indicate a localized area of nickel-impacted groundwater. The source of the nickel is not known. 121 samples contained concentrations exceeding the surface water criteria, and 18 samples contained concentrations exceeding the HGAL for nickel, based on results from 275 groundwater samples collected at Parcel D. Consistent elevated concentrations of nickel were detected in well IR09P043A and sporadic detections of nickel that exceeded the HGAL were detected in other nearby wells. Nickel is also present in samples from several other A-aquifer wells at Parcel D. However, results from these samples do not exceed the respective HGAL, indicating natural concentrations of nickel from the native and non-native soils in contact with the A-aquifer. Nickel was not detected at concentrations exceeding the surface water criteria in the B-aquifer. The current location of elevated nickel in the A-aquifer groundwater at Parcel D is not near the Bay and does not appear to pose an immediate threat to the surface water.

The other 10 COPECs were not identified as COCs during the evaluation in Appendix H.

3.3 REMEDIATION GOALS AND GROUNDWATER TRIGGER LEVELS

Remediation goals were developed for the COCs identified for soil and groundwater, using the methodology described below. In accordance with CERCLA guidance, development of remediation goals for soil was limited to the COCs identified based on the incremental risk evaluation, which excludes the risks posed by metals at concentrations below ambient levels. Remedial goals for groundwater were developed based on the results of the HHRA accounting for the HGAL levels.

An ecological evaluation was performed to assess whether groundwater was impacting surface water. Trigger levels were developed for this pathway as part of this ecological evaluation for groundwater plumes identified as potential risks to the surface water of the Bay. The trigger levels are unique to each plume source, primarily based on the source width and the distance from the plume source to the Bay, and are a means of relating the surface water quality criteria to the groundwater. As explained below, the trigger levels would provide a means to determine when further studies or remedial action may be required to protect the Bay.

3.3.1 Soil

Remediation goals for COCs in soil were selected based on a comparison of the COC-specific RBC, the laboratory practical quantitation limit (PQL) based on standard EPA analytical methods, and the HPAL (metals only). The highest of these three concentrations was selected as the remediation goal for soil for each COC. Exposure scenario-specific RBCs were calculated based on a target cancer risk level of 1×10^{-6} and target noncancer HI of 1.0, consistent with the exposure pathways and assumptions used in the HHRA to assess risks. Table 3-16 presents the remediation goals for COCs in soil.

H1.0 INTRODUCTION

This appendix summarizes the screening evaluation of chemicals detected in groundwater at Parcel D. This evaluation was developed because chemicals in groundwater at Hunters Point Shipyard (HPS) have the potential to affect surface waters if they migrate and discharge to San Francisco Bay at sufficiently high concentrations. Surface water quality criteria, such as the National Ambient Water Quality Criteria (NAWQC) and the California Toxics Rule (CTR), have been developed to protect the environment, including marine organisms, from effects caused by chemicals in surface water. The beneficial uses of groundwater do not include maintenance of freshwater or marine organisms because these organisms do not live in groundwater. No water quality criteria for the protection of organisms exist for groundwater; therefore, alternative water quality criteria for groundwater must be developed to evaluate the potential for chemicals in groundwater at HPS to result in effects to the bay.

There are no surface water bodies on Parcel D; however, the Navy evaluated federal and state surface water quality criteria as potential applicable or relevant and appropriate requirements (ARAR) for Parcel D because groundwater discharges to the bay. The Navy has concluded that the state standards promulgated in Table 3-3 of the Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) and the federal standards promulgated in the CTR are potential ARARs for the A- and B-aquifers at Parcel D to be met at the interface of groundwater and the bay. Conversely, the Navy has concluded that the guidelines in the National Recommended Water Quality Criteria (NRWQC) (U.S. Environmental Protection Agency [EPA] 2006) and the NAWQC are not ARARs for the interface of the A- and B-aquifer groundwater and the bay because other standards (such as Table 3-3 and CTR) are better suited to Parcel D. (Refer to Section D2.1.3 in Appendix D for a detailed discussion of ARARs for surface water.) All of these standards apply to surface water; none of them applies to groundwater. Therefore, these potential ARARs for surface water would be applied to the surface water at the interface of A- and B-aquifer groundwater but would not be used to set cleanup standards for in situ A- or B-aquifer groundwater at Parcel D.

The evaluations in this appendix consider both ARAR-based surface water quality criteria (Table 3-3 and CTR) and non-ARAR-based criteria (NRWQC and NAWQC) for screening data at Parcel D to provide a comprehensive analysis based on agreements with the regulatory agencies. However, chemicals of concern (COC) are identified based on ARARs (Table 3-3 and CTR), as well as on the screening evaluation. The identified COCs will be included in the remedial design during preparation of the groundwater monitoring plan.

The nearest surface water body to Parcel D, where CTR is applicable, is the bay. Chemicals in groundwater at Parcel D could affect surface water quality as the contaminated groundwater migrates and discharges to the bay. Therefore, the Navy developed trigger levels at various inland locations to ensure surface water quality criteria are not exceeded if groundwater at Parcel D discharges to the bay. These trigger levels are intended to prevent discharging chemicals to the bay at concentrations sufficient to affect the surface water quality. The trigger levels are intended to serve as comparison values for groundwater to indicate when additional evaluation may be necessary. The development of the trigger levels is discussed in Appendix I;

however, the appropriate surface water quality criteria to use for the bay near Parcel D had to be selected before the inland concentrations could be developed. Once these criteria were selected, the surface water quality criteria were screened against the chemical concentrations in groundwater to identify the chemicals that would be considered chemicals of potential ecological concern (COPEC) for surface water quality. Site-specific data were then evaluated to identify COCs in groundwater.

Section H2.0 of this appendix identifies the surface water quality criteria that are protective of marine organisms in the bay under long-term (chronic) exposure scenarios. Section H3.0 summarizes the results of the screening of concentrations in groundwater at Parcel D with the appropriate surface water quality criteria, highlighting chemicals where the maximum concentrations in groundwater exceeded the surface water quality criteria for the bay, and identifies COCs for groundwater. These chemicals were then further evaluated, considering frequency of detection and location to select COCs. A series of tables presents this evaluation. Section H4.0 summarizes the review of uncertainty related to the use of promulgated surface water quality criteria for the bay. Section H5.0 presents the results of the evaluation, listing the COCs. References for this appendix are provided in Section H6.0.

H2.0 SELECTION OF SURFACE WATER QUALITY SCREENING CRITERIA

Surface water quality criteria are not applicable to groundwater; however, potential impacts to the bay could occur if concentrations of chemicals in groundwater that exceed surface water quality criteria were to discharge to surface waters. This highly conservative screening method minimizes the potential that discharge of groundwater from Parcel D would affect marine organisms in the bay.

As directed by Section 304(a) of the Clean Water Act, EPA develops and publishes NRWQC as guidance to states and tribes for the promulgation of their respective surface water quality standards (EPA 2006). The law requires that these criteria be based on the latest scientific knowledge. State and regional regulatory agencies responsible for monitoring and maintaining beneficial use of the waters of the state often adopt national criteria, with modifications that reflect regional conditions, including naturally occurring (ambient) concentrations of metals or other variables. As noted in Section H1.0, criteria from the Basin Plan and the CTR are ARARs, while the other criteria are not.

Surface water quality criteria selected for consideration at HPS were compiled through a review of published regulatory standards, goals, and guidance, including those established by the San Francisco Bay Regional Water Quality Control Board (Water Board) in "Water Quality Control Plan, San Francisco Bay Basin Region" (Water Board 2006a) and "A Compilation of Water Quality Goals" (Marshack 2007); the EPA in the CTR (EPA 2000) and NRWQC (EPA 2006); and other sources, as appropriate (Water Board 1998). Although only the Basin Plan and the CTR are applicable, this wider screening evaluation was completed at the request of the Base Realignment and Closure Cleanup Team. Table H-1 presents this compilation of surface water quality criteria and the relevant sources for each criterion.

The compilation and selection of surface water quality criteria to be used for a preliminary screening of the groundwater data are described in Section H2.1. Because the only available criterion for chromium was based on chromium VI, the U.S. Department of the Navy (Navy) derived a surface water quality criterion for chromium III for this project; the methods and rationale for the derivation of the chromium III value are presented in Section H2.2. Like the NAWQC and NRWQC, the criterion for chromium III is not an ARAR. Results for groundwater samples at Parcel D also were compared with Hunters Point groundwater ambient levels (HGAL) to distinguish site-related chemicals from those present at ambient concentrations (PRC Environmental Management, Inc. 1996), as discussed in Section H2.3.

H2.1 COMPILATION AND SELECTION OF SURFACE WATER QUALITY CRITERIA

Two levels of protectiveness, differentiated by estimates of exposure duration, are addressed by surface water quality criteria. Acute exposure is generally defined as less than 96 hours, while chronic exposure is a period of time longer than acute exposure, and includes durations up to the organism's entire lifetime. In general, the acute exposure criteria are much higher than the chronic exposure criteria because of the much shorter exposure duration under the acute scenario. The surface water quality criteria are not simply numerical targets; the criteria specify a magnitude, duration, and frequency to be met in order to provide protection of marine organisms. For example, chronic criteria are applied as a limit on the 4-day average concentration in the environment. Both the acute and chronic criteria are values that are not to be exceeded more than once in 3 years.

The connection between groundwater at Parcel D and the bay is assumed to be complete. However, selection of appropriate surface water quality criteria (acute or chronic) for the protection of marine organisms at a given site requires that the exposure scenario be defined. Normally, short-term exposure to a groundwater discharge prior to dilution in the receiving waters would be considered an acute exposure. This acute exposure could occur only very close to the discharge point. The longer-term exposures that occur within the receiving water, after dilution and mixing have occurred, are considered chronic exposures. However, for identifying the COPECs (1) the chronic (long-term) surface water criteria were used as screening criteria, and (2) no dilution of the groundwater within the bay was assumed. These two conditions cannot realistically co-occur because mixing of groundwater and the bay must occur as chronic exposure occurs (more than 96 hours); still, both assumptions are used initially to select COPECs. Although the Navy and the regulatory agencies debated the merits and drawbacks of adopting a conservative approach, the regulatory agencies' opinion was that a very high level of conservatism was required. The Navy therefore agreed to pursue this evaluation using several highly conservative assumptions.

Available surface water quality criteria are shown in Table H-1. For some chemicals, no chronic laboratory tests have been conducted, so the acute test results were adjusted to estimate a chronic value (by lowering the value by 80 percent [EPA 1986]). Acute exposure is represented by the criterion maximum concentration (CMC), which is an estimate of the highest concentration of a chemical in surface water to which an aquatic community can be exposed briefly (generally from 48 to 96 hours) without resulting in an unacceptable effect (EPA 2006).

Chronic exposure is represented by the criterion continuous concentration (CCC), which is an estimate of the highest concentration of a chemical in surface water to which an aquatic community can be exposed indefinitely without resulting in an unacceptable effect (EPA 2006).

As a practical matter, marine organisms in the bay will be exposed to undiluted groundwater only briefly and at the precise point of its entry to the bay. Even at the point of entry into the bay, some dilution of the chemical concentrations in groundwater will already have occurred within the tidal mixing zone that extends landward from the sediment-to-water interface. The acute exposure scenario best represents the actual exposure of organisms to chemicals in the groundwater plume living at the sediment-water interface because of the short time before groundwater mixes with the surrounding surface water. Once the expected mixing of discharged groundwater with receiving waters occurs, a chronic exposure scenario is more representative of conditions experienced by marine organisms.

The Water Board (2006b) has requested that the Navy focus on the point at which groundwater enters the bay rather than on the post-mixing conditions that prevail more generally; elimination of mixing within the bay adds a significant conservative element to the evaluation. Therefore, the acute exposure scenario, represented by the CMCs, is the most relevant and appropriate set of surface water criteria for this evaluation. However, the chronic surface water quality criteria were used for this evaluation to maintain consistency with agreements between the Navy and the Water Board to provide a highly conservative approach. Use of chronic instead of acute criteria adds a further degree of conservatism to the assessment. Uncertainties associated with use of the chronic criteria in an acute exposure scenario are discussed in Section H4.0.

A set of surface water quality criteria was selected for use in the screening-level evaluation from available regional, state, and federal surface water criteria, as shown in Table H-1. Individual toxicity criteria were selected using a methodology that sorts and selects criteria according to applicability and quality of data. First, criteria were sorted by applicability and quality of data into one of four tiers. Chronic exposure toxicity criteria were identified as most applicable for the exposure scenario at Parcel D and more protective (lower concentration values) than short-duration acute or instantaneous exposure toxicity criteria (higher concentration values). As a result, applicable chronic exposure toxicity criteria were placed in the first tier of applicability. Where more than one applicable toxicity value was available in the same tier, the most protective (lowest) value was selected for screening purposes.

If no first tier criterion was available for a specific chemical, an acute value was selected as a second tier criterion. Each acute criterion was made more protective by applying the standard convention of lowering the value by 80 percent to make the acute criteria more appropriate for use in chronic exposure scenarios (EPA 1986). Where no first or second tier criteria were available, instantaneous criteria were used as third tier criteria. Each instantaneous criterion was made more protective by lowering the value by 90 percent to make the instantaneous criteria more appropriate for use in chronic exposure scenarios (EPA 1986). The last column in Table H-1 indicates the surface water quality criteria that were selected as screening criteria for groundwater.

H2.2 DERIVATION OF CHROMIUM III WATER QUALITY CRITERIA

No marine chronic value for chromium III has been derived by the regulatory agencies responsible for maintaining water quality because chromium III is not considered a major environmental threat. As discussed later in this section, EPA (1980) found that data were not sufficient to justify setting a marine criterion for chromium III. Attention has been focused on chromium VI, for which toxic effects have been well demonstrated. Likewise, during the groundwater assessments at HPS, chromium III is not considered of great concern; however, concentrations of chromium III may increase as a byproduct of natural or induced degradation of the chromium VI plumes. Chromium III concentrations in groundwater will be screened against a derived chromium III surface water criterion. The chromium VI criteria are generally the only standards for chromium in marine surface water (EPA 2006). Instead of surface water criteria for chromium III in marine waters, states often use the chromium VI value as a default, with an acknowledgement that chromium III is considerably less toxic.

Although a wide variety of procedures has been used to derive surface water criteria, most of these procedures have been developed using some variation of the theoretical toxicological approach, which is an effects-based approach that relies on published toxicity data from the scientific literature.

EPA's formal protocol for deriving surface water criteria for the protection of marine organisms and their uses requires information on the physical and chemical properties of the substance under consideration, on its toxicity to aquatic plants and animals, on its bioaccumulation in marine organisms, and on its potential effects on consumers of aquatic biota (Stephan and others 1985). The formalized protocol includes specific procedures for calculating final acute values (FAV), final chronic values (FCV), final plant values (FPV), and final residue values (FRV) from the available data, provided that the minimum data requirements have been met. For example, derivation of a FAV for marine and estuarine waters requires acute toxicity data on at least eight families of marine organisms, including at least two families of chordates, five families of invertebrates, and one other family (such as a plant). The short-term CMC of the substance is then calculated by applying a safety factor (0.5) to the FAV. The lowest of the FCV, FPV, and FRV is used directly to establish the long-term mean CCC. The criteria are then subjected to critical review to evaluate the completeness of the data and the appropriateness of the results.

When EPA developed surface water criteria in the 1980s, it was known that chromium VI was the form of chromium that was most readily absorbed by living organisms, and that chromium III had low solubility and toxicity in saltwater. A review of the literature on toxicity of chromium III to marine organisms in EPA (1980) listed no chronic studies and only two acute studies (oyster and crab zoea). The data were considered insufficient at that time to support the development of an acute or chronic marine criterion for chromium III. A review of toxicity of chromium III to marine organisms yielded no new studies conducted since the original surface water criteria were developed. The available toxicity data are reviewed below.

The mean acute toxicity value for the oyster was 10,300 micrograms per liter (µg/L) of total recoverable chromium III (Calabrese 1973, as cited in EPA 1980); for crab zoea, the mean acute value was 56,000 µg/L. Based on these data, EPA (1980, page B-7) concluded that "…probably because of precipitation, a large amount of trivalent chromium must be added to saltwater to kill aquatic organisms." For example, polychaete worms exposed to 50,400 µg/L were killed, likely because of a drop in pH (4.5) from chromium precipitation. When pH was held stable, the worms survived and reproduced at the 50,400 µg/L exposure concentration (Mearns and others 1976, as cited in EPA 1980).

In a review of chromium III hazards to marine organisms, Eisler (1986) listed a range of acute toxicity values from 3,300 µg/L (fish, 96 hours) to 56,000 µg/L (crab, 96 hours). The only chronic value available (12,500 µg/L) was based on a 21-day test of the polychaete worm *Neanthes arenaceodentata*. In acute tests, this polychaete was the most sensitive species tested.

The lack of chronic marine data for chromium III requires that some assumptions be made to derive a surface water criterion for this metal. Acute criteria are typically reduced by 80 percent to make acute water criteria more appropriate for use in chronic exposure scenarios (EPA 1986). The table below presents acute toxicity data for marine species exposed to chromium III with adjustments for chronic exposure. The lowest chronic value for chromium III in marine water (400 µg/L) was selected as the surface water criterion for Parcel D. Use of chronic instead of acute criteria and use of the lowest estimated chronic value add a further degree of conservatism to the assessment, as agreed to with the regulatory agencies.

Chromium III Toxicity to Marine Organisms

Exposure			
Acute (µg/L)	**Estimated Chronic* (µg/L)**	**Effect**	**Reference**
2,000 to 105,000	400 to 21,000	Mean acute toxicity, multiple Species	EPA 1980
3,300 to 56,000	660 to 11,200	Acute (96 hours) toxicity, multiple species	Eisler 1986
10,300	2,060	Acute toxicity to American oyster	Calabrese 1973, as cited in EPA 1980
None	12,500 (actual chronic exposure)	Toxicity to *Neanthes arenaceodentata*	Eisler 1986
50,800	Not applicable	No effect on survival or reproduction in *Neanthes arenaceodentata*	Mearns and others, as cited in EPA 1980

Notes:

* Acute-to-chronic adjustment defined as a reduction of the acute level by 80 percent (EPA 1986).

H2.3 CONSIDERATION OF AMBIENT GROUNDWATER CONCENTRATIONS

Navy policy requires that regional background or ambient concentrations of chemicals be explicitly considered during the selection of COPECs (Navy 2004). To avoid selecting chemicals for which the allowable concentration in groundwater is less than the HGAL, the higher of the water quality criteria or the HGAL was selected as the water quality screening criterion that was used to identify COPECs. HGALs for metals are included in the groundwater screening presented in Section H3.0.

H3.0 GROUNDWATER SCREENING RESULTS

The data set used for the groundwater screening includes data through November 2004. Groundwater data are included from both the A-aquifer and the B-aquifer at Parcel D. (Refer to Section 2.2.8.1 of the main text of this Revised Feasibility Study [FS] Report for a discussion of the hydrogeology of Parcel D, and see Figure 2-8 for a cross section illustrating the relationships between the aquifers.) Groundwater data are available in Appendix A. Maximum concentrations of chemicals detected in both the A-aquifer and the B-aquifer groundwater at Parcel D were screened against the surface water quality screening criteria identified in Section H2.0 and in Table H-1. Chemicals were eliminated from the analysis when no surface water criteria or HGALs were available.

The chemicals in the following table were eliminated based on the lack of an established criterion for surface water quality.

Chemical Eliminated Because No Established Criterion for Surface Water Quality was Available	
1,1,2-Trichloroethane	Carbon disulfide
1,1-Dichloroethane	Chloride
2,4-Dimethylphenol	Cobalt
2-Hexanone	Dibenzofuran
2-Methylnaphthalene	Iron
2-Methyl-2-pentanone	Magnesium
4-Methylphenol	Manganese
Acetone	Molybdenum
Aluminum	Potassium
Antimony	Sodium
Barium	Vanadium
Beryllium	Xylene (total)
Bis(2-ethylhexyl)phthalate	Vinyl chloride
Calcium	

In the A-aquifer, chemicals detected at maximum concentrations that exceeded water quality screening criteria were identified as COPECs. Nine metals (see Table H-2); one volatile organic compound, ethylbenzene (see Table H-3); one semivolatile organic compound, acenaphthylene (see Table H-4); and cyanide (see Table H-5) were identified as COPECs in the A-aquifer samples because they exceeded the water quality screening criteria.

In the B-aquifer, only zinc exceeded water quality screening criteria, in a single sample collected in October 2000. As a result, no further environmental evaluation of B-aquifer groundwater was performed. All of the B-aquifer data are presented in Appendix A of this Revised FS Report.

Concentrations of each of the selected COPECs were further evaluated using the following criteria to evaluate the likelihood that they would affect the bay:

1. Do measured concentrations consistently exceed surface water quality criteria during subsequent sampling events?

2. When was the most recent sample collected that exceeded the surface water quality criterion?

3. Can concerns about the COPEC be eliminated based on professional judgment of the extent and degree of the interpreted effect to the groundwater? The extent and degree of effect was assessed by reviewing the locations of recently detected concentrations, the likelihood that recently detected concentrations pose a threat to the bay, and concentration trends on a well-by-well basis.

Finally, ARARs were reviewed to determine where chemical-specific ARARs are potentially applicable (see Appendix D of this Revised FS Report). The Navy has identified the substantive provisions of the CTR (Title 40 of the *Code of Federal Regulations* Section 131.38) as potentially applicable federal chemical-specific ARARs and Table 3-3 of the Basin Plan as potentially applicable state chemical-specific ARARs for surface water, at the interface of the groundwater and the bay.

These evaluation criteria were applied on a well-by-well basis for each well with detected concentrations of COPECs (see Tables H-5 and H-6).

H3.1 CHEMICALS ELIMINATED AS CHEMICALS OF POTENTIAL ECOLOGICAL CONCERN

Refinement of the list of COPECs included evaluation of the frequency of exceedance of the water quality screening level and the date the most recent exceedance was detected. The evaluation focused on the trend in detections—especially consistency, magnitude that a criterion was exceeded, and whether concentrations detected below the surface water quality criterion were found in samples collected after samples with concentrations that exceeded the criterion. Concentration data indicated that detections for all 12 COPECs at Parcel D that exceeded each surface water quality criterion were isolated and infrequent, but no COPECs were eliminated

based only on frequency of detection or date of sample collection. Nine COPECs were eliminated from further consideration based on the results presented below.

Chemical	Frequency of Exceedance	Table Reference	Date of Most Recent Exceedance*
Arsenic	3/223	H-2	Jan-94
Cadmium	3/223	H-2	Feb-96
Copper	8/224	H-2	Nov-04
Lead	8/220	H-2	Sep-04
Mercury	2/220	H-2	Feb-96
Zinc	8/229	H-2	Jan-01
Cyanide	7/113	H-5	Sep-94
Ethylbenzene	2/208	H-3	Feb-01
Acenaphthylene	1/226	H-4	Dec-91

Note:

* See Table H-6 for exceedances of criteria

H3.2 CHEMICALS OF CONCERN

Based on the chemical-specific ARARs and the well-by-well evaluation, chromium VI and nickel were identified as COCs. Each chemical is considered a COC for groundwater in the vicinity of the well where it exceeds the corresponding surface water quality criterion, but not for all groundwater at Parcel D.

Nickel concentrations consistently exceeded the HGAL during several continuous sampling events, suggesting that detections of nickel exceeding the HGAL may be caused by site-related activities (see Table H-2). Maximum concentrations in the analysis of chromium VI and nickel in groundwater also exceeded chronic water quality criteria, raising the possibility that marine organisms may be at risk if they were continuously exposed to undiluted groundwater discharged to the bay. It is important to note, however, that the maximum concentration of chromium VI is well below the acute surface water criterion of 1,100 µg/L. The acute criterion for nickel (74 µg/L) is not considered appropriate for HPS because it is lower than the HGAL. The distribution of chromium VI and nickel is described below.

H3.2.1 Chromium VI

Chromium VI was identified as a COC because it was detected in samples collected from both defined plumes and in individual wells in the A-aquifer at concentrations that consistently exceeded the chronic surface water criterion (50 µg/L). The locations of the elevated concentrations of chromium VI are mostly near Installation Restoration Site 09, where there was a known source of chromium from painting operations (see Figure 2-28 in this Revised FS Report for Parcel D). Of 171 groundwater samples collected at Parcel D, 25 samples contained

concentrations that exceeded the chronic surface water criterion for chromium VI (see Table H-2). Chromium VI was consistently elevated in wells IR09MW35A and IR09PPY1, and also in wells IR09MW63A and IR33MW61A (see Table H-2). Chromium VI was present at concentrations below the criterion in several other A-aquifer wells at Parcel D. No chromium VI was detected in samples collected from the B-aquifer.

H3.2.2 Nickel

Nickel was identified as a COC because of repeated exceedances of the HGAL in samples collected from a single well, as well as historical elevated detections of nickel in an adjacent well. These concentrations of nickel indicate a localized area of nickel-impacted groundwater. The source of the nickel is not known. Of the 275 groundwater samples collected at Parcel D from A-aquifer wells, 18 samples exceeded the HGAL (96.48 µg/L) for nickel.

Table H-6 shows consistent elevated concentrations of nickel in samples from wells IR09P043A and sporadic detections of nickel that exceeded the HGAL in other nearby wells (see Figure 2-28 in this Revised FS Report for Parcel D). Nickel is present at concentrations lower than the HGAL in samples from several other A-aquifer wells at Parcel D, reflecting natural concentrations of nickel from the native and non-native soils in contact with the A-aquifer. Nickel was not detected at concentrations exceeding the screening criterion (8.2 µg/L) in the B-aquifer.

H4.0 UNCERTAINTY

Uncertainty plays an important role in risk-based decision-making; therefore, uncertainty is incorporated explicitly into the characterization of potential risk posed by chromium VI and nickel in the A-aquifer at Parcel D. By design, this screening-level evaluation is centered on conservative default assumptions that result in overestimates of risk (EPA 1997). This section describes the magnitude and directional bias in known sources of uncertainty in this evaluation.

Uncertainty is generally defined as a component of risk or degree of hazard resulting from imperfect knowledge of the present or future state of the system under consideration (Suter 1993). Most uncertainty in environmental assessments can be categorized as follows:

- Mistakes in execution of assessment
- Imperfect knowledge of factors that could be known
- Inherent randomness of the natural environment

Compared with the strict numerical criteria that dominate human health evaluations, the use of ecological models and criteria tends to increase the level of uncertainty associated with a groundwater investigation. The sections below include brief reviews of some sources of uncertainty associated with the use of surface water criteria in relation to Parcel D groundwater.

H4.1 UNCERTAINTY IN DEVELOPMENT OF SURFACE WATER QUALITY CRITERIA

For marine organisms, the NRWQC are derived using a methodology published in "Guidelines for Deriving Numeric National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses" (Stephan and others 1985). Under these guidelines, criteria are developed from data quantifying the sensitivity of species to toxic compounds in controlled studies. Almost all of the data used to derive the criteria are from studies on animals and plants under controlled laboratory conditions. No adjustment for laboratory to field variance is typically made.

It is possible to conduct long-term sublethal laboratory tests to derive chronic water quality criteria. In reality, though, chronic toxicity tests are much more expensive than acute tests and are not as frequently conducted. For many chemicals, chronic toxicity testing data are inadequate to meet the minimum requirement of eight families of marine organisms to develop surface water criteria. In such instances, EPA allows the estimation of a chronic criterion from the FAV using ratios derived from studies in which both acute and chronic tests have been conducted simultaneously for the same species. Acute-to-chronic ratios are calculated for each set of parallel tests, then averaged (using the geometric mean) to arrive at the final acute-to-chronic ratio. The acute-to-chronic ratio is the ratio of the acute toxicity to chronic toxicity of a chemical or sample that can be used to predict acute toxicity from chronic data and vice-versa. Three studies with parallel testing are required to calculate a valid final ratio. The chronic criterion is then calculated from the FAV (not the acute criterion) by dividing it by the final acute-to-chronic ratio. Although the protocol is well-defined, the resulting chronic criterion may bear little relation to actual toxicity experienced by marine organisms in the field.

The saltwater criteria for metals are expressed in terms of dissolved metal in the water column, following EPA protocols. The chronic chromium VI criterion of 50 µg/L was back-calculated from the published dissolved value, which was derived by multiplying the total recoverable concentration by a conversion factor, such as the acute-to-chronic ratio.

For nickel, acute-to-chronic ratios vary widely within and among taxonomic groups. For example, acute-to-chronic ratios determined for soluble nickel for a single aquatic invertebrate (*Daphnia magna*), ranged from 14 to 122 with an average of 51. For a fish (fathead minnow), the acute-to-chronic ratios for soluble nickel ranged from 24 to 53, and for Mysid shrimp a single value of 5.5 was reported. However, the complexity of biological factors that control both acute and chronic responses, and the enormous variety of organism-specific chemistry, suggest that acute-to-chronic ratios should be used with caution, and that uncertainties will certainly limit the accuracy of the resulting water quality criteria (Nickel Institute 2006). The chronic water quality criterion for nickel was less than the HGAL, so the toxicity data were not even considered in this environmental evaluation. The uncertainty associated with predicting toxic effects of nickel in the surface receiving water (San Francisco Bay) illustrates the difficulty of making technically sound remedial decisions using a risk-based approach to an exposure scenario that does not actually occur.

H4.1.1 Speciation and Bioavailability of Chromium III in Receiving Water

Because local, state, and federal applicable or relevant and appropriate requirements do not provide criteria for chromium III in marine waters, most regulatory agencies, including those in California, default to using the chromium VI criteria for all species of chrome. However, chromium III is dramatically less toxic than chromium VI to polychaetes and crustaceans (but not to molluscs or teleosts) in saltwater (Eisler 1986). Given that chromium exists in two major valence states, depending upon the presence of oxygen in the sediment and the water column of the receiving water body, it is essential to distinguish between chromium III and chromium VI. Also, natural and induced degradation of chromium VI may result in increased chromium III concentrations. In saltwater, chromium III is relatively nontoxic and chromium VI is highly toxic. The current science indicates that reduction/oxidation conditions present within the water column and sediment govern the chemistry of chromium, as a recent investigation in Baltimore Harbor has demonstrated (Maryland Department of the Environment 2004). In Baltimore Harbor, low dissolved oxygen in the water column and high biological oxygen demand in the sediment pushed the conversion of chromium VI to chromium III (Maryland Department of the Environment 2004). Much of the chromium III adsorbed to the sediment, where it was involved in reactions that created stable oxides and hydroxides that were unavailable for partitioning into porewater (Maryland Department of Environment 2004).

Uncertainty related to speciation of chromium in receiving waters is by no means a trivial variable. Sensitivity of marine organisms to chromium VI and chromium III varies by several orders of magnitude. *Neanthes arenaceodentata*, a marine polychaete worm, is the most sensitive marine organism reported in the literature (Eisler 1986). Concentrations of chromium VI of less than 100 µg/L interfered with feeding, reproduction, and larval development (Eisler 1986). Yet this same marine species demonstrated no adverse reaction whatsoever to concentrations of chromium III more than 3 orders of magnitude greater than the effect level of chromium VI.

The two forms of chromium differ markedly in their availability to marine organisms. Because of its very low solubility in seawater, chromium III is not readily taken up by organisms. Barnacles (*Balanus* sp.) accumulated chromium VI in their tissues at concentrations up to 1,000 times greater than ambient concentrations. In contrast, chromium III was quickly removed by the filtering activity of the barnacle and was not concentrated in soft tissues. Instead, the barnacle eliminated chromium III via the digestive system, according to studies reported in Eisler (1986).

Studies such as these illustrate the technical flaws in adopting surface water criteria for chromium III developed using test results for chromium VI. The two chemicals are similar in name, but not in toxicity.

H4.1.2 Speciation and Bioavailability of Nickel in Receiving Water

The ultimate fate of nickel in the bay is controlled by physical and chemical properties of the surface water, including pH, oxidation/reduction potential, hardness, alkalinity, organic and inorganic ligands, and other cations that compete for binding sites, water temperature, and other factors.

The actual bioavailability and toxicity of dissolved nickel released in groundwater to the bay cannot be predicted using available data. The water quality criterion is lower than the background concentration of nickel in the groundwater at Parcel D. This lower value could mean that local conditions favor organisms that are tolerant to nickel, or that organisms that are sensitive to the toxic effects of nickel do not occur in the area. No site-specific tests of nickel toxicity were conducted, so this question remains unanswered. It is well known, however, that the background concentration of nickel in the bay sediment derived by the Water Board is higher than the effects range generally used to screen risk to estuarine organisms throughout the country (Long and others 1995; Water Board 1998).

The toxicity benchmarks for nickel, which are based on laboratory tests using specially constituted water, may be poor predictors of toxicity observed in the bay because the composition of water used for marine testing has a substantial influence on the outcome of the test. This is because of the large number of parameters that interact to control the bioavailability of the metal ion, allowing it to enter the organism or be adsorbed onto external membranes (Nickel Institute 2006). Use of the HGAL as the water quality screening criterion circumvents the issue of uncertainty in the toxicity benchmark, but does not provide a risk-based substitute for predicting or interpreting actual effects on the marine environment.

H5.0 SUMMARY AND CONCLUSIONS

Water quality criteria have been established for the protection of marine organisms in surface water and generally exist for both an acute and a chronic exposure scenario. These surface water criteria were evaluated, and appropriate surface water criteria for the protection of the bay were selected. Selection criteria included use of chronic criteria if available, use of acute criteria adjusted for chronic conditions if no chronic criteria exist, and selection of the lowest level of two criteria existing for the same exposure scenario.

Maximum concentrations of chemicals detected in both the A-aquifer and the B-aquifer groundwater at Parcel D were compared with the water quality screening criteria identified in Section H2.0 and presented in Table H-1. If no surface water criteria or HGALs were available, the chemicals were eliminated from the analysis. Based on the screening of chemical concentrations with surface water criteria and the well-by-well evaluation, chromium VI and nickel were identified as COCs. Nickel concentrations consistently exceeded the HGAL during several continuous sampling events, suggesting nickel detections that exceed the HGAL may be a result of site-related activities (see Table H-2). Maximum concentrations of chromium VI and nickel in groundwater also exceeded chronic water quality criteria, raising the possibility that marine organisms may be at risk if they were continuously exposed to undiluted groundwater

discharged to the bay that contained the concentrations of chromium VI and nickel found in the inland plumes at Parcel D. The Navy has established trigger levels to protect against effects on marine organisms in the bay (see Appendix I of this Revised FS Report for Parcel D).

TABLE H-1: SURFACE WATER QUALITY CRITERIA FOR THE SAN FRANCISCO BAY (CONTINUED)
Revised Feasibility Study Report for Parcel D, Hunters Point Shipyard, San Francisco, California

Notes: **Values shaded are those selected as screening criteria.**
Footnotes and references are detailed below.

-- No criterion available
ug/L Microgram per liter
BHC Benzene Hexachloride (Lindane)
DDD Dichlorodiphenyldichloroethane
DDE 1,1-dichloro-2,2-bis(p-chlorophenyl)ethylene
DDT 1,1,1-Trichloro-2,2-bis(p-chlorophenyl)ethane
TPH Total petroleum hydrocarbons

Footnotes:

a California Environmental Protection Agency, Regional Water Quality Control Board, San Francisco Bay Area Region (Water Board). 1995. "San Francisco Bay Basin Plan Water Quality Control Plan." June 21. Table 3-3 Water Quality Objectives for Toxic Pollutants for Surface Water With Salinities Greater Than 5 Parts Per Billion.
b From Water Board "Basin Plan" 4-Day Average (Chronic)
c From Water Board "Basin Plan" 24-Hour and 1-Hour Average (Acute)
d From Water Board "Basin Plan" Instantaneous Maximum
e From "Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (CTR) (EPA 2000) and "Water Quality Control Plan, San Francisco Bay Basin Region" (Water Board 1995). The most appropriate criteria were used.
f Criterion made more suitably protective by means of standard convention of lowering acute values by 80 percent and instantaneous values by 90 percent to make them more appropriate for use under chronic exposure scenarios.
g An acute criterion (EPA identified as Criteria Maximum Concentration [CMC]) is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed briefly without resulting in an unacceptable effect. The chronic concentration (EPA identified as Criterion Continuous Concentration [CCC]) is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed indefinitely without resulting in an unacceptable effect. The CMC and CCC are just two if the six parts of an aquatic life criterion; the other four parts are the acute averaging period, chronic averaging period, acute frequency of allowed exceedance, and chronic frequency of allowed exceedance. Because 304(a) aquatic life criteria are national guidance, they are intended to be protective of the vast majority of the aquatic communities in the United States (EPA 2002a).
h EPA National "AWQC Lowest Observed Effect Level (Chronic)" (Water Board 2000)
i EPA National "AWQC Lowest Observed Effect Level (Acute)" (Water Board 2000)
j EPA National "AWQC Lowest Observed Effect Level (Other)" (Water Board 2000)
k From "National Recommended Water Quality Criteria: 2002" (EPA 2002a) and "Revision of National Recommended Water Quality Criteria." (EPA 2002b), unless otherwise noted.
l From "Final Technical Memorandum Estimation of Ambient Concentrations of Metals in Groundwater" (Tetra Tech 2001)
m In instances where criteria from "Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (EPA 2000) refer to the "Water Quality Control Plan, San Francisco Bay Basin Region" (Water Board 1995), Water Board 1995 criteria were used. The Water Board 1995 criteria are distinguished by an "m" in the footnote column.
o Detailed application of this toxicity criterion may require the review and/or summation of analyte isomer, congener, or speciation results, as applicable. Please see applicable regulatory agency source document for additional detail.
p Water Board 1998
q Tetra Tech EM Inc. 1999
r Water Board 2000

The following lettered footnotes are derived from EPA "National Recommended Water Quality Criteria: 2002" (EPA 2002a), Table 1 - Priority Toxic Pollutants:

A This recommended water quality criterion was derived from data for arsenic (III), but is applied here to total arsenic, which might imply that arsenic (III) and arsenic (V) are equally toxic to aquatic life and that their toxicities are additive. In the arsenic criteria document (EPA 440/5-84-033, January 1985), Species Mean Acute Values (SMAVs) are given for both arsenic (III) and arsenic (V) for five species, and the ratios of the SMAVs for each species range from 0.6 to 1.7. Chronic values are available for both arsenic (III) and arsenic (V) for one species; for the fathead minnow, the chronic value for arsenic (V) is 0.29 times the chronic value for arsenic (III). No data are known to be available concerning whether the toxicities of the forms of arsenic to aquatic organisms are additive.
D Freshwater and saltwater criteria for metals are expressed in terms of the dissolved metal in the water column. The recommended water quality criteria value was calculated by using the previous 304(a) aquatic life criteria expressed in terms of total recoverable metal, and multiplying it by a conversion factor (CF). The term "Conversion Factor" (CF) represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column. (Conversion Factors for saltwater CCCs are currently unavailable. Conversion factors derived for saltwater CMCs have been used for both saltwater CMCs and CCCs). See "Office of Water Policy and Technical Guidance on Interpretation and Implementation of Aquatic Life Metals Criteria," October 1, 1993, by Martha G. Prothro, Acting Assistant Administrator for Water, available from the Water Resource center, USEPA, 401 M St., SW, mail code RC4100, Washington DC 20460; and 40CFR 131.36(b)(1). Conversion Factors applied in the table can be found in Appendix A to the Preamble - Conversion Factors for Dissolved Metals.
F The deviation of this value is presented in the Red Book (EPA 440/9-76-023, July 1976).
G The criterion is based on 304(a) aquatic life criterion issued in 1980 and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), Dichlorodiphenyltrichloroethane (DDT) (EPA 440/5-80-38), Endosulfan (EPA 440/5-80-046), Endrin (EPA 440/5-80-047), Heptachlor (EPA 440/5-80-052), Hexachlorocyclohexane (EPA 440/5-80-054), Silver (EPA 440/5-80-071), The minimum data requirements and derivation procedures were different in the 1980 Guidelines than in the 1985 Guidelines. For example, a "CMC" derived using the 1980 Guidelines was derived to be used as an instantaneous maximum. If assessment is to be done using an averaging period, the values given should be divided by 2 to obtain a value that is more comparable to a CMC derived using the 1985 Guidelines.
N This criterion applies to total polychlorinated biphenyls (e.g. the sum of all congener or all isomer or homolog or Aroclor analyses.)
Q This recommended water quality criterion is expressed as mg free cyanide (as CN)/L.
V This value was derived from data for heptachlor, and the criteria document provides insufficient data to estimate the relative toxicities of heptachlor and heptachlor epoxide.
Y This value was derived from data for endosulfan and is most appropriately applied to the sum of alpha-endosulfan and beta-endosulfan.
aa This criterion is based on a 304(a) aquatic life criterion issued in 1980 or 1986, and was issued in one of the following documents : Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endrin (EPA 4405-80-047), Heptachlor (EPA 440/5-80-052), Polychlorinated biphenyls (EPA 440/5-80-068), Toxaphene (EPA 440/5-86-006). This CCC is currently based on the Final Residue Value (FRV) procedure. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60 FR 15393-15399, March 23, 1995), the EPA no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria. Therefore, the EPA anticipates that future revisions of this CCC will not be based on FRV procedure.
bb This water quality criterion is based on a 304(a) aquatic life criterion that was derived using the 1985 Guidelines (*Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses*, PB85-227046, January 1985) and was issued in one of the following criteria documents: Arsenic (EPA 440/5-84-033), Cadmium (EPA 882-R-01-001), Chromium (EPA 440/5-84-029), Copper (EPA 440/5-84-031), Cyanide (EPA 440/5-84-028), Lead (EPA 440/5-84-027), Nickel (EPA 440/5-86-004), Pentachlorophenol (EPA 440/5-86-009), Toxaphene (EPA 440/5-86-006), Zinc (EPA 440/5-87-003).
cc When the concentration of dissolved organic carbon is elevated, copper is substantially less toxic, and use of Water-Effect Rations might be appropriate.
dd The selenium criteria document (EPA 440/5-87-006, September 1987) provides that if selenium is as toxic to saltwater fishes in the field as it is to freshwater fish in the field, the status of the fish community should be monitored whenever the concentration of selenium exceeds 5.0 mg/L in salt water because the saltwater CCC does not take into account uptake via the food chain.
ee This recommended water quality criterion was derived on page 43 of the mercury document (EPA 440/5-84-026, January1985). The saltwater CCC of 0.025 µg/L given on page 23 of the criteria document is based on the Final Residue Value procedure in the 1985 Guidelines. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60 FR 15393-15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria.
ff This recommended water quality criterion was derived in Ambient Water Quality Criteria Saltwater Copper Addendum (draft, April 14, 1995) and was promulgated in the Interim final National Toxics Rule (60 FR 22228-222237, May 4, 1995).
gg EPA is actively working on this criterion, and so this recommended water quality criterion may change substantially in the near future.
hh This recommended water quality criterion was derived from data for inorganic mercury (II), but is applied here to total mercury. If a substantial portion of the mercury in the water column is methylmercury, this criterion will probably be under protective. In addition, even though inorganic mercury is converted to methylmercury, and methylmercury bioaccumulates to a great extent, this criterion does not account for uptake via the food chain because sufficient data were not available when the criterion was derived.
ii This criterion applies to DDT and its metabolites (that is, the total concentration of DDT and its metabolites should not exceed this value.)

TABLE H-1: SURFACE WATER QUALITY CRITERIA FOR THE SAN FRANCISCO BAY (CONTINUED)

Revised Feasibility Study Report for Parcel D, Hunters Point Shipyard, San Francisco, California

The following lettered footnotes are derived from EPA "Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (EPA 2000).

ll This criterion is based on 304(a) aquatic life criterion issued in 1980, and was issued in one of the following documents: Aldrin/ Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endosulfan (EPA 440/5-80-046), Endrin (EPA 440/5-80-047), Heptochlor (440/5-80-025), Hexachlorocyclohexane (EPA 440/5/80/054), Silver (EPA 440/5-80-071) (originally footnote g in CTR).

mm Criteria for these metals are expressed as a function of the water-effect ratio (WER) (originally footnote l in the CTR).

nn No criterion for protection of human health from consumption of aquatic organisms (excluding water) was presented in the 1980 criteria document or in the 1986 Quality Criteria for Water. Nevertheless, sufficient information was presented in the 1980 document to allow a calculation of a criterion, even though the results of such calculations were not shown in the document.

oo These freshwater and saltwater criteria for metals are expressed in terms of dissolved fraction of the metal in the water column. Criterion values were calculated by using EPA's Clean Water Act 304(a) guidance values (described in the total recoverable fraction) and then applying the conversion factors in 131.36(b)() and (2).

pp These criteria were promulgated for specific waters in California in the National Toxics Rule (NTR). The specific waters to which the NTR criteria apply include Waters of the State defined as bays or estuaries, including the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. This section does not apply instead of the NTR for these criteria.

rr PCBs are a class of chemicals that include Aroclors 1242,1254,1221,1232,1248,1260, and 1016. The aquatic life criteria apply to the sum of this set of seven Aroclors.

The following numbered footnotes are derived from "A Compilation of Water Quality Goals" (Water Board 2000). These footnotes directly correlate with the source document.

1 Expressed as dissolved
2 Expressed as total recoverable
6 Pentavalent arsenic [As(V)] effects on plants.
20 For halomethanes
22 For chlorinated benzenes
23 Toxicity to a fish species exposed for 7.5 days
24 For dichlorobenzenes
27 For dichloroethylenes
28 For dichloropropanes
29 For dichloropropenes
38 Toxicity to algae occurs
45 For phthalate esters
48 For chlorinated naphthalenes
51 From U.S. Environmental Protection Agency, *Quality Criteria for Water* (1976) "The Red Book."
52 For polycyclic aromatic hydrocarbons
53 For dinitrotoluenes
56 For nitrosamines
68 Draft/tentative/provisional; applies only to second value if more than one value is listed.
82 A decrease in the number of algal cells occurs.
83 Adverse effects on a fish species exposed for 168 days.
88 For nitrophenols
95 For the pentavalent form
114 Developed as 24-hour average using 1980 EPA guidelines, but applied as 4-day average in the National Toxics Rule and/or Proposed California Toxics Rule.
115 Criterion most appropriately applied to the sum of alpha-endosulfan and beta-endosulfan.
116 Applies separately to Aroclors 1242, 1254, 1221, 1232, 1248, 1260, and 1016; based on carcinogenicity at 1-in-a-million risk level.
142 Criteria do not apply to waters subject to water quality objectives in Tables III-2A and III-2B of the San Francisco Bay Regional Water Quality Control Board's 1986 Basin Plan.
143 These criteria were promulgated for specific California waters in the National Toxics Rule.
144 The ambient level was set at or below the minimum reported detection limit.
145 The ambient concentration represents the 95th percentile of the distribution. Additionally, the 95th percentile of the distribution was calculated using distribution dependent formulae. For normal and lognormal distributions, the 95th percentile calculation used the parameters of the best-fitted regression line drawn through the detected values on the probability plot. For nonparametric distribution, the analytical formula was used (Gilbert 1987).

I1.0 INTRODUCTION

Chemicals present in groundwater at Hunters Point Shipyard (HPS) have the potential to cause degradation of surface waters as they migrate and discharge to the San Francisco Bay. No water quality criteria for the protection of organisms exist for groundwater; therefore, alternative screening criteria for groundwater must be developed to evaluate the potential for chemicals in groundwater to result in degradation of the adjacent surface water body (the bay).

In Appendix H of this Revised Feasibility Study (FS) Report, the analytical results of all detected analytes in the A- and B-aquifers are screened by a comparison with the applicable surface water criteria and an evaluation using engineering judgment. The results of this screening identified two metals, chromium VI and nickel, as chemicals of concern (COC) in groundwater that pose potential risk to the bay. Although the surface water criteria can be considered applicable or relevant and appropriate requirements (ARAR) for the surface water, and remediation goals can be derived for the surface water beyond the interface of the groundwater and the bay using these ARARs, these ARARs and remediation goals can not be directly applied to the groundwater at the inland plumes at HPS.

A variety of processes occur in the subsurface that serve to reduce chemical concentrations in groundwater as groundwater migrates toward a discharge point such as a lake, stream, or bay. These processes include hydrodynamic dispersion, sorption, chemical and biological transformation, dilution in the tidal mixing zone, and dilution upon discharge to a surface water body. Therefore, it is not appropriate to apply surface water criteria directly to groundwater; rather, surface water criteria apply only to surface waters. The purposes of this appendix are presented below.

1. Discuss the applicable toxicological and physicochemical factors relevant to developing trigger levels for Parcel D groundwater that would result in meeting the remediation goals at the point of compliance in the bay.

2. Review a variety of lines of evidence that indicate the magnitude of the reduction in chemical concentrations when groundwater discharges to the bay.

3. Based on items 1 and 2, develop appropriate trigger levels for groundwater that will ensure surface water criteria are not exceeded if groundwater at Parcel D comes in contact with marine organisms when it is discharged to the bay.

Section I2.0 of this appendix presents a review of the lines of evidence that indicate the magnitude of the reduction in chemical concentrations that can be expected as groundwater migrates toward a surface water body and when the groundwater discharges to the surface water body. Section I3.0 proposes trigger levels for groundwater based on the lines of evidence presented in Section I2.0 for each of the areas at Parcel D where groundwater concentrations exceeded surface water quality criteria. Section I4.0 presents a review of the uncertainty related to establishing trigger levels for groundwater that will meet the promulgated surface water quality criteria (ARARs) for the bay. Section I5.0 provides a summary and conclusions for the

development of trigger levels for groundwater for Parcel D. References for this appendix are provided in Section I6.0.

I2.0 LINES OF EVIDENCE FOR ATTENUATION OF CHEMICAL CONCENTRATIONS IN GROUNDWATER

As chemicals migrate through soil and groundwater, they are subjected to physical, chemical, and biological processes that tend to reduce their concentrations. These processes include sorption of chemicals to soil particles, volatilization, hydrodynamic dispersion and molecular diffusion, and chemical and biological transformation (biodegradation).

Additional reduction in chemical concentrations takes place in the tidal mixing zone near the shoreline. This is the zone where surface water from the bay moves inland through the aquifer, mixing with the groundwater. The net discharge of groundwater may not be changed by tidal influence, but rising tides introduce surface water into the aquifer so that the concentration of chemicals in the groundwater that discharges during low tide is reduced by near-shore mixing of the bay water and groundwater in the aquifer. Finally, concentrations of chemicals entering the bay with the discharging groundwater will be further reduced through dilution of groundwater with the bay water at the interface of the groundwater and the bay. This section of the appendix describes the attenuation of chemical concentrations in groundwater as it migrates through these three different zones, from the source areas through the tidal mixing zone and on to bay discharge points. As described below, the attenuation factors (AF) for the tidal mixing zone and for discharge to the surface water body are set to 1 (no attenuation) in this evaluation to provide a highly conservative approach, as agreed to with the regulatory agencies.

I2.1 ATTENUATION DURING GROUNDWATER TRANSPORT TO TIDAL MIXING ZONE

Groundwater modeling was performed to estimate peak concentrations of chemicals that may discharge to the bay for a variety of general plume widths and distances from the plume to the bay observed at HPS. Plume-specific modeling was performed for the four known plumes at Parcel D that contain the two COCs identified during the surface water quality screening: chromium VI and nickel. The methodology and results for the groundwater modeling are presented in Appendix G, and the surface water screening is presented in Appendix H. Based on the maximum detected concentration in the source area and predicted peak concentration at the point of discharge to the bay from the modeling results, an AF was calculated for each of the four plumes. The AF was derived by dividing the maximum source area concentration by the predicted peak concentration at the bay. These AFs are not chemical specific, but are plume-source and plume-location specific.

The U.S Environmental Protection Agency (EPA) analytical solute transport model BIOSCREEN (EPA 1997a) was used to predict maximum concentrations at the point of discharge. The sediment/bay interface was used as the point of discharge in the model and then to calculate AFs. BIOSCREEN can simulate adsorption and degradation processes during advective transport of the solute; however in this model, adsorption and degradation parameters were set to zero to ensure that hydrodynamic dispersion was the only mechanism causing a reduction in chemical concentrations in groundwater. By hydrodynamic modeling dispersion as

the only attenuation mechanism, the results can be applied to any chemical and the calculated AFs are not chemical-specific; however, the AFs are plume-specific based on the source width and distance from the source of the plume to the nearest receptor location. Considering only hydrodynamic dispersion for attenuation adds conservatism to the assessment, as agreed to with the regulatory agencies.

The intent of this modeling approach is to provide conservative estimates of the maximum groundwater concentrations expected at the points of discharge. Based on model sensitivity analysis, the values for input parameters were chosen to result in realistic, yet conservatively high, estimates of the maximum groundwater concentrations at the points of discharge, providing an added layer of conservatism to the calculations. The results of the modeling indicated a range of AFs, depending on the source width and the distance to receptors. A complete presentation of the modeling methodology and results is provided in Appendix G. The following table provides typical ranges of AFs calculated using the BIOSCREEN model for various plume widths and distances from the bay.

Source Width (feet)	Distance to Receptor (feet)	Attenuation Factor	Source Width (feet)	Distance to Receptor (feet)	Attenuation Factor
40	50	1.0	200	50	1.0
40	500	6.3	200	500	1.9
40	1,600	58.0	200	1,600	15.3
60	50	1.0	240	50	1.0
60	500	4.4	240	500	1.8
60	1,600	40.4	240	1,600	13.5
80	50	1.0	280	50	1.0
80	500	3.4	280	500	1.8
80	1,600	31.5	280	1,600	12.2
120	50	1.0	320	50	1.0
120	500	2.5	320	500	1.7
120	1,600	22.6	320	1,600	11.3
160	50	1.0	360	50	1.0
160	500	2.1	360	500	1.7
160	1,600	18.1	360	1,600	10.5

These data indicate that the amount of attenuation caused by hydrodynamic dispersion during groundwater transport can be quite significant, and the longer the travel distance (distance to receptor), the greater the AF.

I2.2 ATTENUATION IN THE TIDAL MIXING ZONE

Several studies in the vicinity of HPS attempted to quantify the amount of attenuation that occurs in the tidal mixing zone caused by dilution by seawater. These studies are discussed below.

The tidal mixing zone is defined as the area near and inland of the shoreline where groundwater and seawater mix as a result of tidal fluctuations. Groundwater flow in the tidal mixing zone can be fairly complex because of the diurnal nature of tides. At high tide, the flow direction may be from the shore inland, in response to the hydraulic gradient created by the high tide. Conversely, at low tide, the flow direction may be from land to the shore, in response to the hydraulic gradient created by the low tide. The tidally influenced water-level fluctuations change the direction of groundwater flow daily in the tidal mixing zone, and result in the movement of seawater back and forth in the tidal mixing zone. Assuming that seawater has lower concentrations than the groundwater that is discharging, a certain amount of attenuation of chemical concentrations in groundwater occurs because of the dilution of groundwater within the aquifer by the seawater.

I2.2.1 Modeling Conducted at Mission Bay, San Francisco

A one-dimensional mathematical model (ENVIRON International Corporation 1998) was developed for the area within a 50-foot distance from the bay fringe. The model simulated the influence of tides on chemical concentrations in groundwater as the groundwater flows toward the bay and was based on a method developed by Yim and Mohsen (1992). The model incorporated the effects of dilution, hydrodynamic dispersion, and sorption within the groundwater system. No dilution within the bay was considered. A total of 63 model runs was carried out to provide a sample of reasonable dispersivity characteristics, sorption parameters, and initial concentration distribution. The minimum attenuation predicted by the model over the last 50 feet to the bay was a factor of about 6.5, the maximum attenuation was 12.8, and the average attenuation was 9.7. As additional support for the model results, the authors used the real case where the tidal influences reduced the highest observed chemical concentration inland of 600 micrograms per liter (µg/L) to about 15 µg/L near the tidal river (which results in an AF of 40).

I2.2.2 Modeling Conducted Near Pier 64, San Francisco

Clayton Group Services (2001), in association with S.S. Papadopulos & Associates, Inc., developed a flow and transport model using MODFLOW and MT3D to evaluate attenuation of chemical concentrations in groundwater due to dilution associated with tidal mixing in the fill close to the bay. The base case model showed a 65 percent reduction (approximately a factor of 3) in the average concentration of chemicals in groundwater before it enters the bay, which is a more conservative result than the results from the model developed for Mission Bay. However, the estimated inland extent of mixing was only 30 feet into the aquifer from the Bay, as opposed to the 50 feet used for the Mission Bay model. Additionally, the Pier 64 model used a much higher hydraulic conductivity value (75 feet per day) than the Mission Bay model (2.8 feet per day). Data from HPS studies indicated that the tidal mixing zone is greater than 50

that hydraulic conductivities are generally on the order of 1 to 20 feet per day. Therefore, it appears that the modeling results from Mission Bay would be more representative of the conditions at HPS than the modeling results from near Pier 64.

I2.2.3 Tidal Mixing Study at Hunters Point Shipyard

The Navy studied the extent of tidal mixing within the A-aquifer at Parcel E at HPS in 2002 (Tetra Tech EM Inc. 2004). Specific conductance, a temperature-independent surrogate for salinity, was used to evaluate the relationship between fluctuations in salinity and tidal fluctuations. Fluctuations in specific conductance related to tidal fluctuations in water levels were observed along the Parcel E shoreline in a near-shore well (IR02MW206A1 located 70 feet from the bay in the area east of IR-03), but not in an inland well (IR15MW06A located 335 feet from the bay at IR-15). These data indicate that the tidal mixing zone in Parcel E extends at least 70 feet inland from the shoreline.

I2.3 ATTENUATION ON DISCHARGE TO BAY

When groundwater discharges to the bay, dilution of the chemical concentrations in groundwater likely occurs because of the relatively small volume of groundwater discharging into a large surface water body. However, measuring groundwater discharge is a difficult task and is seldom performed. It is also difficult to measure the chemical concentrations in the surface water body because of uncertainty about locations and depths for sampling and potential temporal variations in concentrations. Several agencies have assumed a 10 times dilution factor as a "rule of thumb" to account for the dilution in chemical concentrations that occurs when groundwater discharges to a surface water body. The following sections describe the approaches that these regulatory agencies have taken.

I2.3.1 National Oceanic and Atmospheric Administration Approach

The Coastal Protection and Restoration Division (CPRD) of National Oceanic and Atmospheric Administration (NOAA) is charged with protecting and restoring coastal habitats and resources affected by hazardous materials releases. CPRD works closely with EPA, Department of Defense, states, and other natural resource trustees throughout the Comprehensive Environmental Response, Compensation, and Liability Act remedial process to ensure that selected remedies are protective and that appropriate measures are implemented to restore NOAA trust resources (NOAA 2006a).

CPRD developed Screening Quick Reference Tables that present screening concentrations for inorganic and organic contaminants in various environmental media (NOAA 1999). The CPRD of NOAA discusses the comparison of screening of groundwater data with EPA's National Ambient Water Quality Criteria on the Frequently Asked Questions webpage, as follows (NOAA 2006b):

"Groundwater concentrations are also screened against AWQC (ambient water quality criteria). However, given the dilution expected during migration and upon discharge of groundwater to surface water, CPRD uses 10 times the applicable AWQC for screening."

Why does NOAA apply a default dilution factor of only 10x for the discharge of groundwater to surface water?

"We prefer to use site-specific information whenever it is available. But because such data have not been derived, we acknowledge that some level of dilution would occur. We chose to use a conservative, order of magnitude dilution factor for screening purposes to ensure a high degree of confidence that any contaminant source eliminated from further consideration is not likely to pose substantial risk. Conversely, this is not meant to imply that contaminant sources that do not pass this screening do pose risk."

The information presented on NOAA's website indicates that NOAA considers a 10 times dilution of groundwater concentrations during transport and discharge to surface water to be an appropriate, conservative estimate of the amount of attenuation in chemical concentrations that can be expected when groundwater discharges to a surface water body.

I2.3.2 U.S. Environmental Protection Agency Resource Conservation and Recovery Act Approach

The Resource Conservation and Recovery Act (RCRA) grants EPA and authorized states the authority to regulate hazardous waste management facilities that treat, store, or dispose of hazardous waste. The RCRA Corrective Action program uses Environmental Indicators (EI) to assess progress at RCRA sites. The EIs are a means of evaluating and reporting on the acceptability of current site conditions (that is, they are interim milestones and not final remedy or site closure goals). They are used to summarize and report on the site-wide environmental conditions at the RCRA Corrective Action Program's highest priority sites (that is, those on RCRA Cleanup Baseline). One of the EIs is "Migration of Contaminated Groundwater Under Control" (the "groundwater EI").

On the EPA RCRA Corrective Action Environmental Indicators – Frequently Asked Questions webpage (EPA 2006b), the following information is provided:

For the purpose of making a Groundwater Environmental Indicator determination, how do I address groundwater-to-surface-water interaction?

"In cases where groundwater is being discharged to surface water, you should, as a general matter, focus your groundwater environmental indicator evaluation on the question of whether or not contaminated groundwater is significantly impairing the quality of the surface water body. A positive environmental indicator determination would generally be appropriate where the groundwater is not significantly affecting the surface water body in a way that leads it to fail basic water-quality criteria."

Is the discharge of "contaminated" groundwater into surface water likely to be "insignificant?"

> *"In some cases, overseeing agencies are likely to be able to conclude that a release from groundwater into surface water will be "insignificant" – and therefore "under control" – based on the levels of contaminants in the groundwater, without consideration of the volume or flow of the surface water body. As a rule of thumb, we have found that, if the groundwater concentrations for all constituents are less than 10 times the appropriate surface water quality criteria for both human health and aquatic life, the current groundwater discharge should be "insignificant" for environmental indicator purposes. In this case, the regulator would conclude that the groundwater environmental indicator had been met (at least with respect to the discharge to surface water)."*

The information provided in the interim-final guidance and on the RCRA Corrective Action Program's webpages clearly indicate that for RCRA sites, it is appropriate to assume a 10 times dilution factor for estimating concentrations of contaminants in groundwater discharging into surface water bodies (EPA 2006a, 2006b).

I2.3.3 San Francisco Bay Regional Water Quality Control Board Approach

The San Francisco Bay Regional Water Quality Control Board (Water Board) has allowed a 10 times dilution factor in at least one instance: for the proposed Eastshore Park Property in Berkeley, Albany, and Richmond. In Site Cleanup Requirements Order No. 98-072 for Catellus Development Corporation and SF Pacific Property, Inc., the Water Board states "Action levels for groundwater are based on water quality objectives for saltwater species…In the uplands above the 50-foot shoreline buffer, groundwater action levels are ten times the water quality objectives. This multiple reflects the predicted attenuation of constituents in groundwater that occurs at the site as discussed in the Remediation and Risk Management Plan, given the chemical-specific characteristics, site-specific hydrogeological conditions, and the Board's prior experience with groundwater at various shoreline sites." The Water Board's position related to the Eastshore Park Property is that the 10 times dilution was a site-specific determination and is not directly applicable to HPS. The Water Board does not allow modeling to incorporate dilution of groundwater contaminants in surface water. Instead, the Water Board's position regarding attenuation of groundwater discharge to the bay at HPS is further discussed in a letter to the Navy dated March 16, 2006 (Water Board 2006).

I2.4 SUMMARY OF ATTENUATION MECHANISMS FOR CHEMICALS IN GROUNDWATER

There are three discrete zones where chemical concentrations in groundwater are reduced during groundwater transport from a source zone to the bay. These zones are (1) the area of groundwater transport to the tidal mixing zone, (2) the tidal mixing zone, and (3) zone of groundwater discharge to the bay. The mechanisms of attenuation and amount of attenuation in each of these three zones are different. As described below, the AFs for the tidal mixing zone

and for discharge to the surface water body are set to 1 (no attenuation) in this evaluation to provide a highly conservative approach, as agreed to with the regulatory agencies.

During groundwater transport, mechanisms such as sorption, biological and chemical transformation, and hydrodynamic dispersion are at work. Groundwater flow modeling conducted for Parcel D evaluated the amount of attenuation that would be expected due only to hydrodynamic dispersion in the groundwater transport zone. Under conservative assumptions (see Appendix G), the amount of attenuation that occurred ranged from a factor of 1 to 58, depending upon the width of the source area and the distance to the receptor. For small plume widths (40 feet), and distances of 500 feet and greater, AFs were greater than 6. For relatively large plume widths (170 feet) and distances of 500 feet and greater, AFs were greater than 2, and at distances of 1,000 feet, AFs were greater than 6, even with plume widths up to 340 feet. The chromium VI and nickel plumes identified at Parcel D were generally on the order of 60 feet wide, and were all greater than 1,000 feet from the bay.

Within the tidal mixing zone, at least two studies have been performed in the San Francisco Bay area that indicated dilution of chemical concentrations occurs in this zone. The Mission Bay study indicated AFs of 6.5 to 12.8, with an average value of 9.7 within a 50-foot tidal mixing zone. The study conducted near Pier 64 indicated a 65 percent reduction in chemical concentrations within a 30-foot tidal mixing zone. Tidal mixing studies conducted at HPS have indicated a tidal mixing zone of at least 70 feet. The hydraulic conductivities used for the Mission Bay (2.8 feet per day) and Pier 64 (75 feet per day) studies indicate that the Mission Bay study more closely reflects conditions at HPS.

When groundwater discharges into a surface water body, it is expected that some dilution of chemical concentrations in groundwater will occur because of the much larger volume of water in the surface water body as compared with the volume of groundwater discharge. However, measuring the actual amount of dilution that occurs upon groundwater discharge is difficult. NOAA, EPA, and the Water Board have all indicated that a 10 times dilution “rule of thumb” is appropriate to evaluate groundwater concentrations upland of the point of discharge, and the potential for this groundwater to negatively impact the surface water body. All three agencies have indicated that they consider the 10 times rule to be a conservative assessment of the amount of dilution that can be expected.

The amount of attenuation that occurs in each of these zones is not additive, it is multiplicative. However, the AFs for the tidal mixing zone and for discharge to the surface water body are set to 1 (no attenuation) in this evaluation to provide a highly conservative approach, as agreed to with the regulatory agencies.

I3.0 DEVELOPMENT OF PARCEL D TRIGGER LEVELS

This section of this appendix summarizes development of proposed trigger levels for each of the COCs identified in Appendix H. The trigger level development takes an extremely conservative approach because it does not take into account attenuation in the tidal mixing zone or attenuation from discharge to the surface water body. Instead, it relies exclusively on the hydrodynamic

dispersion calculated for the groundwater transport zone. Considering only hydrodynamic dispersion for attenuation adds conservatism to the assessment, as agreed to with the regulatory agencies. The resulting trigger levels therefore overestimate the potential impacts of the groundwater plumes on the bay.

Several installation restoration (IR) sites with concentrations of metals above the surface water quality screening criteria have been identified at Parcel D, as follows:

- IR-09 northern area, chromium VI
- IR-09 southern area, chromium VI and nickel
- IR-33 area, chromium VI

The nature and extent of these areas are discussed in more detail in Section 2.5.2 of this Revised FS Report. The groundwater modeling indicated that chemical concentrations in these source areas will attenuate as the groundwater migrates toward discharge points to the bay. The magnitude of the attenuation is a function of the distance of migration and the width of the source area.

Trigger levels can be derived for these source areas in Parcel D by multiplying the AF calculated for the source area by the appropriate surface water quality criteria for the COC or the HPS Hunters Point groundwater ambient level (HGAL), whichever is the greater. The modeling approach and resultant AFs are described in detail in Appendix G and summarized in Section I2.1. The table below summarizes the proposed trigger levels for these source areas and COCs.

Area	Attenuation Factor	HPS HGAL (µg/L)	Surface Water Quality Criteria (µg/L)[1]	Proposed Trigger Level at Source Well (µg/L)	Maximum Concentration at Source Well (µg/L)	Maximum Concentration Exceeds Proposed Trigger Level?
IR-09 North, chromium VI	12	Not Available	**50**	600	493	No
IR-09 South, chromium VI	18	Not Available	**50**	900	130	No
IR-09 South, nickel	16	**96.48**	8.2	1,544	636	No
IR-33, chromium VI	14	Not Available	**50**	700	250	No

Notes:

1 The selected surface water quality criteria are listed in Table H-1 of Appendix H, Preliminary Screening of Groundwater Impacts to San Francisco Bay, of this Revised Parcel D FS Report. The published sources are provided in the footnotes to Table H-1.

µg/L Micrograms per liter

These proposed trigger levels are extremely conservative because (1) they rely on conservative AFs calculated from groundwater flow modeling, and (2) they only take into account hydrodynamic dispersion during groundwater transport, and do not include attenuation in the tidal mixing zone or attenuation upon groundwater discharge to the surface water body. Considering only hydrodynamic dispersion for attenuation adds conservatism to the assessment and provides maximum protectiveness for the bay, as agreed to with the regulatory agencies.

As discussed in Section 5.3.2 of the main text of this Revised FS Report, the details of groundwater monitoring program will be identified during the remedial design. Inclusion of the source areas listed above in the groundwater monitoring program will be based on the concentrations observed in groundwater at these locations for a period of approximately 3 years (12 rounds of sampling) before the design is prepared. In addition, the Navy is planning a treatability study at Parcel D that will likely affect the concentrations in groundwater and the need for long-term monitoring. Complete discussions of these evaluations will be contained in the remedial design for review by the regulatory agencies.

The following additional evaluations may occur for the cases where the current data indicate concentrations consistently exceed a trigger level:

- Increasing the frequency of monitoring in the well where the trigger level was exceeded to evaluate whether the elevated level is persistent;
- Monitoring groundwater at a location farther downgradient to evaluate whether the attenuation estimated in establishing the trigger level has occurred;
- Using site-specific detailed information to more accurately estimate attenuation (including processes such as adsorption and degradation); or
- Implementing a selected remediation alternative for groundwater treatment.

Chemicals that are identified in the remedial design as requiring monitoring based on the trigger levels will follow a process similar to the process envisioned for other COCs (such as volatile organic compounds and chromium VI) in groundwater that is described in Section 5.3.2 of this Revised FS Report. This process will include regular monitoring followed by a "proof period" to demonstrate that concentrations are below the trigger level. Details of the groundwater monitoring plan will be developed during the remedial design, but are expected to include criteria (perhaps as a decision-tree matrix) to guide decisions for active treatment of groundwater in a case where a chemical concentration consistently exceeds a trigger level.

The uncertainty involved in the development of these trigger levels is described in the following section.

I4.0 UNCERTAINTY

Uncertainty plays an important role in risk-based decision-making; therefore, uncertainty is incorporated explicitly into the characterization of potential risk posed by chromium VI and nickel in the A-aquifer at Parcel D. By design, a screening-level evaluation is centered on conservative default assumptions that result in overestimates of risk (EPA 1997b). This section describes the magnitude and directional bias in known sources of uncertainty in this evaluation.

Uncertainty is generally defined as a component of risk or degree of hazard resulting from imperfect knowledge of the present or future state of the system under consideration (Suter 1993). Most uncertainty in environmental assessments can be categorized as follows:

- Mistakes in execution of assessment
- Imperfect knowledge of factors that could be known
- Inherent randomness of the natural environment

Compared with the strict numerical criteria that dominate human health evaluations, the use of ecological models and criteria tends to increase the level of uncertainty associated with a groundwater investigation. The sections below include brief reviews of some sources of uncertainty associated with the development of trigger levels for Parcel D groundwater.

I4.1 UNCERTAINTY IN DERIVING ATTENUATION FACTORS

The derivation of AFs for chromium VI and nickel in the Parcel D groundwater relies on estimates of physical, chemical, and biological conditions that prevail below the surface of the ground across a wide area of heterogeneous fill material. Processes such as sorption of chemicals to soil particles, volatilization, hydrodynamic dispersion and molecular diffusion, and chemical and biological transformation are complex processes that are difficult to precisely quantify even under controlled laboratory conditions.

Although general trends, such as the tendency for chemical concentrations to decrease as the groundwater moves away from the source of contamination, are understood, the precise measurements of the parameter values desired in the model are rarely available. Instead, conservative default values are substituted; or in some cases, a range of values is applied in an effort to bracket the correct value. For example, in the model described in Appendix G and summarized in Section I2.1 of this appendix, adsorption and degradation parameters were set to zero to ensure that hydrodynamic dispersion was the only mechanism causing a reduction in chemical concentrations in groundwater. This approach likely underestimates the reduction in chemical concentrations and results in a conservatively low AF.

Often the uncertainty in site-specific conditions is implicitly addressed in the decision not to attempt to quantify attenuation, but to default to a conservative value, such as the 10 times dilution recommended by NOAA (1999). The default value acknowledges the inherent uncertainty in site-specific conditions, and is intended to bias the decision-making process toward increased protectiveness. In some cases, the purposeful bias in parameter values used for the Parcel D assessment resulted in AFs that are even more conservative (lower) than the 10 times factor typically used by regulatory agencies (see Section I2.1).

I4.2 UNCERTAINTY IN CALCULATING TRIGGER LEVELS

Calculation of a trigger level for groundwater is a deceptively simple multiplication of the AF by the surface water quality screening criterion. However, as a product of two terms that are each the result of a series of estimates, the trigger level carries with it the uncertainties of the individual terms that contributed to the final equation. As discussed in Appendix H, Section H4.1, and in Section I4.1, neither the water quality criteria nor the AF are easily derived, bright-line quantities. On the contrary, these values are themselves derived via a process of estimation and back-calculation that is fraught with uncertainty.

The data set used to derive the AFs adds some uncertainty. In some cases, few measurements were collected at a location, or the only data available were collected many years ago. Both of these factors may limit the representativeness of the data evaluated for these wells. However, data for all wells were considered in the evaluation, and trigger levels were developed despite these limitations.

Even if it were assumed that both the surface water quality criteria and the AF were accurately estimated, the assumptions in the trigger level calculation would introduce additional uncertainty in the form of purposeful bias toward conservatism. The underlying assumption in the development of the trigger level is that the most sensitive life stage of the most sensitive marine organism known is exposed for its entire lifetime to the maximum concentration of chromium or nickel in groundwater, reduced only by the conservatively calculated AF. The calculation also assumes that 100 percent of the chromium VI and nickel remain in the dissolved state even after being discharged to the bay, despite expectations that some constituents may be quickly adsorbed to sediment.

I5.0 SUMMARY AND CONCLUSIONS

The direct application of surface water quality criteria to groundwater to protect aquatic organisms from groundwater discharging to a surface water body is inappropriate because chemical concentrations in groundwater will tend to attenuate as the groundwater migrates toward its discharge point. Furthermore, surface water quality criteria are not legally applicable to groundwater. However, the surface water quality criteria were applied to groundwater at Parcel D as screening levels to evaluate the potential for groundwater to impact the bay. This screening analysis found that chromium VI (in three areas) and nickel (in one of the chromium VI areas) were present at high enough concentrations to indicate a potential impact to the bay based on very conservative AF evaluations.

.For HPS, three discrete zones exist along the groundwater migration pathway: (1) the zone of groundwater transport from the source area to the tidal mixing zone, (2) the tidal mixing zone, and (3) the zone of groundwater discharge to the surface water body. Attenuation in the zone of groundwater transport occurs due to hydrodynamic dispersion, sorption, and biological and chemical transformation. Attenuation in the tidal mixing zone occurs due to these processes, and also due to dilution from the mixing of bay water with groundwater as high tides cause bay water to move inland into the aquifer. Attenuation in the groundwater discharge zone occurs primarily as a result of dilution with the much larger volume of water present in the surface water body. The AFs for the tidal mixing zone and for discharge to the surface water body are set to 1 (no attenuation) in this evaluation to provide a highly conservative approach, as agreed to with the regulatory agencies.

The amount of attenuation that occurs in each of these zones can be estimated, primarily using some type of modeling. Modeling results for the groundwater transport zone indicated that attenuation resulting from hydrodynamic dispersion alone can be substantial, depending on the width of the plume and the distance to the discharge point. AFs calculated from the model ranged from 1 (for plumes traveling 50 feet to a discharge point) to 58 (for a small plume of 40-foot source width traveling 1,600 feet to a discharge point). AFs based solely on hydrodynamic dispersion estimated for the chromium VI and nickel plumes at Parcel D ranged from 12 to 18.

Groundwater modeling performed to study the tidal mixing zone at other sites near HPS indicated AFs ranging from approximately 3 to 12 for tidal mixing zones that were 30 to 50 feet from the shoreline. Although no other modeling efforts to estimate the amount of dilution that occurs when groundwater discharges to the bay were identified, EPA, NOAA, and the Water Board have indicated that a dilution factor of 10 would be a conservative estimate of the amount of dilution that occurs when groundwater discharges to a surface water body.

Plume-specific trigger levels were developed by multiplying the appropriate AFs calculated for the groundwater transport zone and the surface water quality criteria selected for chromium VI and nickel, or the HGAL, whichever is the greater. These trigger levels reflected extremely conservative assumptions, as follows:

1. The groundwater modeling for the transport zone assumed no sorption or biological/chemical transformation reactions, and relied exclusively on hydrodynamic dispersion to simulate attenuation of chemical concentrations.

2. The AF did not include attenuation in the tidal mixing zone or attenuation upon discharge into the bay, and only included attenuation in the groundwater transport zone.

3. The surface water quality criteria selected for chromium VI was the chronic exposure scenario, even though the AF assumed there was no mixing of groundwater with the bay water. Under a no mixing scenario, the appropriate surface water quality criterion would be the acute scenario, which typically is a higher number.

Nevertheless, the Navy agreed to use highly conservative measures throughout this evaluation, as agreed to with the regulatory agencies.

When the resulting trigger levels were compared with the maximum concentrations in the plume source areas, none of the source concentrations exceeded their respective trigger level. The groundwater monitoring plan for Parcel D will address the need for monitoring in response to confirming the concentrations in the plume source areas, the temporal stability of the plumes, and the degree, if any, that the plumes are migrating toward the bay. Based on the calculated trigger levels, and the comparison with the plume source conditions, the amount of attenuation that is expected by the time groundwater from the plumes discharges to the bay will ensure that surface water quality criteria will not be exceeded at the points of discharge.

NRDL – Naval Radiological Defense Laboratory

Item	Reference or Phrase in ROD	Location in ROD	Identification of Referenced Document Available in the Administrative Record[1]
30	Radionuclides of concern	Section 2.5.3	Final Radiological Addendum to the Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Section 3.4, pages 3-2 through 3-5. Tetra Tech EC Inc. April 11, 2008.

For the potentially contaminated structure surfaces the exposure pathways are external radiation from contaminated surfaces and inhalation of re-suspended contaminated dust.

The exposure pathways for the impacted soils at Parcel D present a more complicated analysis. The complete pathways, based on the four criteria listed above, are external radiation, soil ingestion, inhalation, and drinking water ingestion (e.g., groundwater).

3.3 REMEDIATION GOALS

Remediation goals (RGs) are selected to achieve the RAOs. Table 3-2 identifies the RG for each ROC. The soil RGs were derived from the EPA preliminary remediation goals (PRGs) based on an increased lifetime cancer risk range of 10^{-6} to 10^{-4} for future use scenarios except for ^{226}Ra, which is based on an agreement with EPA (DON, 2006). The RGs for building and equipment surfaces were based on the AEC Reg Guide 1.86 to meet the 25 millirem per year (mrem/y) dose limits of the Nuclear Regulatory Commission. The water RGs were derived from *Radionuclides Notice of Data Availability Technical Document*, (EPA, 2000) by comparing the limits from two criteria and using the most conservative limit.

3.3.1 Constituents of Potential Concern

The ROCs, ^{137}Cs, ^{60}Co, ^{3}H, ^{232}Th, ^{235}U, ^{239}Pu, ^{226}Ra, and ^{90}Sr, have been associated with Parcel D radiologically-impacted buildings (NAVSEA, 2004). The ROCs, ^{137}Cs, ^{232}Th, ^{239}Pu, ^{226}Ra, and ^{90}Sr have been associated with Parcel D radiologically-impacted soils (NAVSEA, 2004). This information is summarized in Table 2-2.

3.3.2 Media of Concern

The media of concern are the remaining radiologically-impacted structures (274, 351, 351A, 364, 365, 366/351B, 401, 408, 411, 813, and 819); soils of former building sites (313, 313A, 317, 322 and 383 area); soils in outdoor areas (Gun Mole Pier and NRDL Site on Mahan Street); trenches resulting from sewer and storm line removal; soils of remediated storm drains and sanitary sewers; and groundwater.

3.4 RISK EVALUATION BY REDEVELOPMENT BLOCK

The following sections list the redevelopment blocks and associated evaluation scenario. Figure 2-3 shows the redevelopment blocks, impacted areas and structures, and planned reuses. The radiologically-impacted sites in Parcel D will be identified in each redevelopment block section. Radiologically-impacted sewer and storm drains are present throughout Parcel D and will not be individually listed for a particular development block. The residential scenario provided the

most conservative risk estimate and was therefore used to model the risk from ROCs associated with each redevelopment block.

3.4.1 Redevelopment Block A

Redevelopment Block A is located in the northern portion of Parcel D and is identified for research and development use. Redevelopment Block A includes radiologically-impacted buildings 813 (general warehouse and offices, supply storehouse, and Disaster Control Center) with ROC ^{90}Sr and 819 (Sewer Pump Station A) with ROCs ^{137}Cs and ^{226}Ra. Buildings 813 and 819 were evaluated using a Residual Radioactivity-Building (RESRAD-BUILD) residential exposure scenario.

3.4.2 Redevelopment Block 30A

Redevelopment Block 30A includes Building 401 and is in the northwestern portion of Parcel D. Redevelopment Block 30A includes radiologically-impacted Building 401. Building 401 has ROCs of ^{226}Ra from the collection and storage of radioluminescent devices.

Redevelopment Block 30A is identified for mixed-use reuse. Building 401 was evaluated using a RESRAD-BUILD residential exposure scenario.

3.4.3 Redevelopment Block 30B

Redevelopment Block 30B is in the west-central portion of Parcel D and is identified for industrial reuse. It does not include any radiologically-impacted buildings, former building sites, or outdoor areas, and therefore it was not evaluated.

3.4.4 Redevelopment Block 29

Redevelopment Block 29 is in the north-central portion of Parcel D and is identified for educational/cultural reuse. It does not include any radiologically-impacted buildings, former building sites, or outdoor areas, and therefore was not evaluated.

3.4.5 Redevelopment Block DOS-1

Redevelopment Block DOS-1 is in the northeastern corner of Parcel D and is identified for open space reuse. It does not include any radiologically-impacted buildings, former building sites, or outdoor areas, and therefore it was not evaluated.

3.4.6 Redevelopment Block 37

Redevelopment Block 37 is on the west-central area of Parcel D and is identified for industrial reuse. It does not include any radiologically-impacted buildings, former building sites, or outdoor areas, and therefore it was not evaluated.

3.4.7 Redevelopment Block 38

Redevelopment Block 38 is in the central portion of Parcel D. Redevelopment Block 38 includes radiologically-impacted Buildings 408 and 411. Building 408 (furnace-smelter) has ROCs of ^{226}Ra from prior smelting operations and natural thorium in the firebrick. Activities for Building 411 included radioactive source storage and radiography shop activities, and the ROCs are ^{60}Co, ^{137}Cs, and ^{226}Ra.

Redevelopment Block 38 is identified for industrial reuse. Building 408 will be surveyed and dismantled. Therefore, the former Building 408 site was evaluated using a RESRAD residential exposure scenario. Building 411 was evaluated using a RESRAD-BUILD residential exposure scenario.

3.4.8 Redevelopment Block 39

Redevelopment Block 39 is in the east-central portion of Parcel D. Redevelopment Block 39 includes radiologically-impacted Buildings 351, 351A, 364, 365, 366/351B, and former building site 317. Activities inside of Building 351 that may have been the cause of contamination were related to electronic work areas, industrial shops, and NRDL laboratories. The ROCs include ^{90}Sr, ^{137}Cs, ^{232}Th and ^{226}Ra. Activities at Building 351A included the NRDL chemical technology division and applied research branch. The ROCs are ^{90}Sr, ^{137}Cs, ^{232}Th, ^{239}Pu, and ^{226}Ra. Activities at Building 364 included animal irradiation, liquid radioactive waste collection, and hot cell work. The ROCs are ^{90}Sr, ^{137}Cs, ^{235}U, ^{239}Pu, and ^{226}Ra. Activities at Building 365 included personnel decontamination and personnel change house and office activities. The ROCs are ^{90}Sr, ^{137}Cs, ^{235}U, ^{239}Pu, and ^{226}Ra. Activities at Building 366/351B were the NRDL instrument calibration (sources) and offices. The ROCs are ^{90}Sr, ^{137}Cs, and ^{226}Ra. Activities at the former building 317 site included temporary animal quarters for the NRDL, and the ROCs are ^{90}Sr, ^{137}Cs, and ^{226}Ra.

Redevelopment Block 39 is identified for open space reuse. Buildings 364 and 365 will be surveyed and dismantled. Therefore, the former Building 364 and 365 sites were evaluated using a RESRAD residential exposure scenario. Buildings 351, 351A, and 366/351B were evaluated using a RESRAD-BUILD residential exposure scenario. The former site of Building 317 was evaluated using a RESRAD residential exposure scenario.

3.4.9 Redevelopment Block 42

Redevelopment Block 42 is in the south-central portion of Parcel D and is identified for industrial reuse. Redevelopment Block 42 does not include any radiologically-impacted buildings, former building sites, or outdoor areas, and therefore no evaluations were performed.

3.4.10 Redevelopment Block DMI-1

Redevelopment Block DMI-1 is in the southeastern portion of Parcel D. Redevelopment Block DMI-1 includes radiologically-impacted Building 274, former building sites 313, 313A, and 322, the building 383 area, and outdoor areas identified as Gun Mole Pier and the NRDL Site on Mahan Street. Activities at Building 274 included decontamination training and the ROCs are ^{90}Sr, ^{137}Cs, and ^{226}Ra. Activities at the Building 383 area included the collection and storage of radioluminescent devices. The ROCs are ^{90}Sr, ^{3}H, and ^{226}Ra. Activities at the former Building 313, 313A, and 322 sites included use as a NRDL stockroom, NRDL offices, the radiological instrument branch, training facilities, and storage locations. The ROCs are ^{90}Sr, ^{137}Cs, ^{232}Th, ^{239}Pu, and ^{226}Ra. Activities at the Gun Mole Pier included a radioactive pavement decontamination study, decontamination studies on NRDL Experimental Barge YFN-809 and on a contaminated B-17 aircraft. Decontamination facilities were also in a structure near Barge YFNX-16. The ex-INDEPENDENCE was berthed at the Gun Mole Pier and it was a loading point for radioactive wastes. An ocean disposal barge was also loaded from the Gun Mole Pier. The ROCs are ^{90}Sr, ^{137}Cs, ^{239}Pu, and ^{226}Ra. The NRDL Site on Mahan Street was used as a potential storage site of OPERATION CROSSROADS material. ROCs for the NRDL Site on Mahan Street are ^{90}Sr, ^{137}Cs, ^{239}Pu, and ^{226}Ra.

Redevelopment Block DMI-1 is identified for maritime-industrial reuse. Building 274 was evaluated using a RESRAD-BUILD residential exposure scenario. Former building sites 313, 313A, 322, the building 383 area and outdoor areas Gun Mole Pier and the NRDL Site on Mahan Street were evaluated using a RESRAD residential scenario.

3.5 ANALYSIS OF RADIOLOGICAL DOSE AND RISK

As described above, each radiologically-impacted site described above in each redevelopment block was modeled using either RESRAD or RESRAD-BUILD. Appendix A provides a discussion of the input parameters and modeling results for the radiological dose and risk for each radiologically-impacted site. The results were compared against the increased lifetime cancer risk range of 10^{-6} to 10^{-4} and the 25 mrem/y dose limits. Tables 3-3 and 3-4 provide a summary of the modeling results.

The modeling reported in Appendix A is based on the RGs. Actual calculated dose and risk will be based on field measurements from the final status survey results associated with each radiologically-impacted site. For example the risk calculated for survey units one and two of radiologically-impacted site of former Building 114 were calculated to be $4x10^{-7}$ and $2x10^{-7}$ respectively.

The modeling was performed with conservative input parameters to ensure that uncertainties would be minimized, and a separate set of models and results for uncertainty analysis would not be needed. Uncertainty analysis for the various modeling input parameters, as well as various assumptions required for the modeling, are discussed in Appendix A.

Item	Reference or Phrase in ROD	Location in ROD	Identification of Referenced Document Available in the Administrative Record[1]
31	General response actions (GRAs)	Section 2.8	Final Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Section 4.3, pages 4-15 and 4-16. SulTech. November 30, 2007.

Institutional Controls

Specific institutional control objectives are discussed in Section 5.0 with the discussion of each groundwater remedial alternative that may include institutional controls. Potential ARARs identified in Section 4.2.3 are also potential ARARs for the groundwater institutional controls.

4.3 GENERAL RESPONSE ACTIONS AND PROCESS OPTIONS ANALYSES

GRAs are categories of actions that are made up of specific process options. These GRAs are responses or remedies that will meet the RAOs to protect human health and the environment from the known contamination at Parcel D. Process options are specific technologies used to carry out a GRA. Section 4.3.1 describes the GRAs for Parcel D soil and groundwater, and Section 4.3.2 presents the results of the analysis for the proposed GRAs.

4.3.1 Development of General Response Actions

GRAs were derived from engineering judgment and past experience with remedial actions proven to be successful for the applicable COCs at Parcel D. Because the RAOs were developed based on the planned future land use, the GRAs were also developed considering the planned future land use of each redevelopment block. The GRAs for Parcel D and their respective process options are presented in Table 4-1 for soil and in Table 4-2 for groundwater. The following GRAs were identified to ensure that the soil and groundwater RAOs are met.

Soil

- No action – Required GRA for CERCLA evaluation
- Removal – Includes passive venting, excavating and off-site disposal of excavated soils as well as off-site disposal of stockpiled soil
- Treatment – Includes *in situ* and *ex situ* treatment of soils to reduce the toxicity of the contaminants
- Containment – Includes covering contaminated soils to break the direct exposure pathway
- Institutional controls – Includes legal and administrative mechanisms to restrict land use, and
- Access restrictions – Includes physical barriers such as fences and informational devices such as warning signs

Groundwater

- No action – Required GRA for CERCLA evaluation
- Treatment – Includes *in situ* and *ex situ* treatment of contaminated groundwater
- Removal – Includes pumping to remove the groundwater prior to disposal
- Containment – Includes installing slurry wall to control groundwater flow
- Institutional controls – Includes legal and administrative mechanisms to restrict groundwater use
- Access restrictions – Includes physical barriers such as fences and informational devices such as warning signs

Process options for these GRAs are evaluated below in Section 4.3.2.

4.3.2 Analysis of General Response Actions and Process Options

GRAs selected for this revised FS report underwent an initial screening and a subsequent detailed analysis. During the initial screening, the range of technology types and process options are evaluated with respect to technical implementability, site conditions, waste characteristics, contaminant properties, and the ability to meet NCP requirements and RAOs. The initial screening results are summarized in Tables 4-1 and 4-2 for soil and groundwater, respectively. Those GRAs and process options that were carried forward from the initial screening are then analyzed with respect to effectiveness, implementability, and cost. Table 4-3 summarizes the results of this detailed analysis. The screening and analysis of GRAs and process options is presented separately for soil and groundwater. Section 4.3.2.1 presents the analysis for the applicable soil process options, and Section 4.3.2.2 presents the analysis for the applicable groundwater process options.

4.3.2.1 Evaluation of Applicable Soil Process Options

Potentially applicable GRAs identified for soil at Parcel D consist of (1) no action, (2) institutional controls, (3) removal, (4) treatment, and (5) containment. The initial screening of process options for the remedial technology types for these soil GRAs is shown in Table 4-1. This table presents the various technology types, process options, and screening analysis results for each soil GRA. The rationale for those options eliminated from further evaluation is presented in Table 4-1; these options are not discussed further.

Four GRAs are retained for further evaluation including no action. The fifth GRA, treatment, was eliminated during the initial screening of process options for soil at Parcel D. Several treatment options were considered for the COCs in soil. However, none of the treatment options are implementable for ubiquitous metals that are present in bedrock-derived fill material at

5.0 DEVELOPMENT AND DESCRIPTION OF REMEDIAL ALTERNATIVES

This section presents potential remedial alternatives developed for soil and groundwater at Parcel D based on the GRAs and process options evaluated in Section 4.0. The NCP states that the development and evaluation of remedial alternatives will reflect the scope and complexity of the remedial actions under consideration with regards to the environmental issues defined at the site. The number and types of alternatives to be analyzed will be determined for each site by taking into account the scope and characteristics of the environmental issues at Parcel D.

5.1 DEVELOPMENT OF REMEDIAL ALTERNATIVES

Combinations of retained process options were developed into remedial alternatives that also satisfy the RAOs and meet the requirements of the ARARs. The remedial alternatives were derived using experience and engineering judgment to formulate process options into the most plausible site-specific remedial actions.

For soils remedial alternatives, the Navy's strategy is to remove the contaminated soils from the site by excavation and disposal wherever practical, and to remediate those soils that cannot be removed by preventing complete exposure pathways to the receptors. Based on the COCs identified in Section 3.0, and on their location and extent defined in Section 2.0, the lead- and PAH-contaminated soil can be removed, while the arsenic and manganese contamination will require remedial actions that prevent completion of exposure pathways. Various institutional controls are also integrated with each alternative to assure that the RAOs and ARARs are satisfied.

For groundwater remedial alternatives, the Navy's strategy is primarily to prevent complete exposure pathways to the receptors and to monitor the known impacted areas while the aquifer recovers. Various institutional controls are included in the groundwater remedial alternatives to assure that the RAOs and ARARs are satisfied. Two remedial alternatives that include *in situ* treatment are also considered. Only the A-aquifer is considered for these remedial alternatives because no COCs were identified in the B-aquifer.

Alternatives would become simpler under the recently stadium reuse plan at Parcel D. Fewer areas would be planned for excavation because of the change to the shallower 2-foot depth. An alternative that includes a cover would be similar under this reuse, but the type of cover would be determined in the RD stage. Groundwater alternatives would not be affected, except that the areas determined to require remediation would likely be smaller because of the recreational reuse.

Both soil and groundwater remedial alternatives include five-year reviews to confirm that the remedies are continuing to protect human health and the environment when residual concentrations of COCs are left in place. Costs for five-year reviews, as well as other long-term monitoring activities, are included in the cost estimates for all alternatives.

33	Nine evaluation criteria	Section 2.8.2	Final Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Section 6.0, pages 6-1 and 6-2. SulTech. November 30, 2007.

6.0 DETAILED ANALYSIS OF REMEDIAL ALTERNATIVES

This section provides a detailed analysis of each remedial alternative developed in Section 5.0. This information will be used to help select a final remedy for Parcel D. The alternatives are evaluated using criteria based on statutory requirements of CERCLA as amended by Superfund Amendments and Reauthorization Act, Section 121; the NCP; and "Guidance for Conducting Remedial Investigations and Feasibility Studies Under CERCLA" (EPA 1988).

The NCP specifies nine criteria to be used in the comparative analysis. The first two criteria are threshold criteria that must be satisfied in order for a remedy to be eligible for selection; the next five criteria are balancing criteria used to evaluate the comparative advantages and disadvantages of the remedies; and the final two criteria are modifying criteria generally taken into account after agency and public comments are received on the FS and proposed plan. The nine criteria are summarized below.

Overall protection of human health and the environment: This criterion describes how each alternative, as a whole, protects human health and the environment and indicates how each hazardous substance source is to be eliminated, reduced, or controlled.

Compliance with ARARs: This criterion evaluates each alternative's compliance with ARARs, or, if an ARAR waiver is required, how the waiver is justified. ARARs consider location-specific, chemical-specific, and action-specific concerns.

Long-term effectiveness and permanence: This criterion evaluates the effectiveness of each alternative in protecting human health and the environment after the remedial action is complete. Factors considered include magnitude of residual risks and adequacy and reliability of release controls.

Reduction of toxicity, mobility, or volume through treatment: This evaluation criterion addresses the statutory preference for selecting remedial actions that employ treatment technologies that permanently and significantly reduce toxicity, mobility, or volume of the hazardous substances as their principal element. This preference is satisfied when treatment is used to reduce the principal threats at a site through destruction of toxic contaminants, reduction of the total mass of toxic contaminants, irreversible reduction in contaminant mobility, or reduction of total volume of contaminated media.

Short-term effectiveness: This criterion addresses the effectiveness of each alternative in protecting human health and the environment during the construction and implementation phase. Factors considered include:

- Protection of the community during remedial actions
- Protection of the workers during construction

- Environmental impacts
- Time required to achieve response objectives (achieve protection for the site or individual elements associated with specific risks)

Implementability: This criterion addresses the technical and administrative feasibility of implementing an alternative and the availability of the required services and materials during its implementation. Factors considered include:

- Ability to construct and operate the technology
- Availability and reliability of the technology
- Ease of undertaking additional remedial action
- Administrative implementability
- Coordination activities with other agencies
- Monitoring considerations
- Availability of equipment and specialists

Cost: This criterion evaluates the present value of the capitol and operation and maintenance (O&M) costs for each alternative. Capital and O&M cost estimates are order-of-magnitude-level estimates and have an expected accuracy of minus 30 to plus 50 percent (EPA 2000b). Table 6-1 summarizes the cost for each alternative.

Community Acceptance: This criterion evaluates issues and concerns the public may have regarding each alternative. This criterion will be assessed following receipt of community comments on the FS and the proposed plan.

Regulatory Agency Acceptance: This criterion evaluates technical and administrative issues and concerns the regulatory agencies may have about each alternative. This criterion will be assessed following receipt of agency comments on the FS and the proposed plan.

In the following sections, each remedial alternative is evaluated in comparison to the two threshold and five balancing NCP criteria, and subsequently compared to other alternatives to assess the relative performance with respect to these criteria. Comparison to the two modifying criteria of community and regulatory acceptance will be included in the proposed plan and ROD for Parcel D; further discussion of these criteria is not included in this revised FS report. Soil remedial alternatives are evaluated individually in Section 6.1 and compared with each other in Section 6.2. Groundwater remedial alternatives are evaluated individually in Section 6.3 and compared with each other in Section 6.4.

41	Present-Worth Cost: $15,200,000	Table 6	Final Radiological Addendum to the Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Appendix B, Section 6.9, Page B.6-6. Tetra Tech EC Inc. April 11, 2008.

2. Each building (274, 351, 351A, 364, 365, 366/351B (considered two separate buildings), 401, and 411) is assumed to generate one disposal bin of material (e.g., flooring, ventilation piping, etc.) from dismantlement activities. Building 408 is assumed to generate 8 bins of waste due to firebrick removal and dismantlement activities and Building 364 is expected to generate 3 waste bins of material. Using a disposal cost of $11,880 per bin with the total cost $213,840.
3. Each former building site (313, 313A, 317, 322, 364, 365, 383 area, 408) survey unit is assumed to have two elevated areas resulting in the generation of 10 cubic feet (ft^3) of radiologically-impacted soil from each survey unit. The total volume of radiologically-impacted soil is estimated to be 240 ft^3 (8.89 cy). The cost of disposal is assumed to be $11,880 per bin, and based on 14 cy of soil per bin the total disposal cost is estimated to be $11,880.
4. The Gun Mole Pier and NRDL Site on Mahan Street will be divided into 1,000 square meter (m^2) survey units. The surface area of the two sites is approximately 76,473 m^2 (823,175 square feet) resulting in 77 survey units. The cost of performing the survey in each survey unit is assumed to be $6,500. This cost is based on the San Francisco "49ers" Parcel D proposal summary and results in an estimated cost of $500,500. Each survey unit is assumed to have two elevated areas resulting in the generation of 150 ft^3 of radiologically-impacted soil from each survey unit. The total volume of radiologically-impacted soil is estimated to be 11,550 ft^3 (428 cy). The cost of disposal is assumed to be $11,880 per bin, and based on 14 cy of soil per bin the total disposal cost is estimated to be $368,280.
5. Removal of the Parcel D sewer and storm drain systems is estimated to result in 60,000 cy of material to be excavated at an estimated cost of $330 per cy of material excavated. This results in a total excavation cost of $19,800,000.
6. It is assumed that 5 percent of the material excavated during the Parcel D sewer and storm drain system removal will be radiologically-impacted resulting in approximately 3,000 cy of material. The cost of disposal is assumed to be $11,880 per bin, and based on 14 cy of soil per bin the total disposal cost is estimated to be $2,554,200. Note this does not include cost associated with disposal of Comprehensive Environmental Response, Compensation, and Liability Act-impacted materials.

The table below provides a breakdown of the estimated cost for Alternative R-2.

Impacted Parcel D Building and former building site Surveys/Release	$ 1,969,500
Radiological soil screening and waste disposal for building and building sites	$ 213,840
Gun Mole Pier and NRDL Site Surveys and Remediation	**$** 868,780
Parcel D sewer and storm drain removal and disposal	**$** 22,354,200
20% Contingency	**$** 5,081,264
***Total Estimated Cost for Alternative R-2**	**$ 30,487,584***

Notes:

* Total estimated cost has been rounded to the nearest thousand. The expected accuracy is within the range of -30% to +50%.

Item	Reference or Phrase in ROD	Location in ROD	Identification of Referenced Document Available in the Administrative Record[4]
42	Institutional Controls	Section 2.9.2	Final Revised Feasibility Study for Parcel D, Hunters Point Shipyard, San Francisco, California. Section 4.0, pages 4-17 and 4-20. SulTech. November 30, 2007.

Parcel D at concentrations above remediation goals. For the relatively small volumes associated with the remaining COCs (lead and PAHs), treatment is not as cost-effective or as implementable as excavation.

Those process options retained during the initial screening were evaluated for effectiveness, implementability and cost and are discussed in this section. Table 4-3 summarizes the results for this evaluation.

No Action

The NCP requires that the no-action alternative be carried through the detailed analysis of alternatives. Under the no-action response, no remedial action is taken. Soil would be left as is without implementing any institutional controls, containment, removal, treatment, or other mitigating actions. Because soil at Parcel D poses a risk to human health and the environment under the anticipated future land use scenario, the no-action response would not be an effective alternative that meets the requirements of CERCLA. Because no action is taken, no cost is associated with this option. The no action option will be retained for further evaluation as a remedial alternative for comparison purposes only, as required under the NCP.

Institutional Controls in General

Institutional controls are legal and administrative mechanisms used to implement land use and access restrictions that are used to limit the exposure of future landowner(s) and/or user(s) of the property to hazardous substances present on the property, and to ensure the integrity of the remedial action. Institutional controls are required on a property where the selected remedial cleanup levels result in contamination remaining at the property above levels that allow for unlimited use and unrestricted exposure. Institutional controls would likely remain in place unless the remedial action taken would allow for unrestricted use of the property. Implementation of institutional controls includes requirements for monitoring and inspections, and reporting to ensure compliance with land use or activity restrictions.

Legal mechanisms include proprietary controls such as restrictive covenants, negative easements, equitable servitudes, and deed notices. Administrative mechanisms include notices, adopted local land use plans and ordinances, construction permitting, or other existing land use management systems that are intended to ensure compliance with land use or activity restrictions.

The Navy has determined that it will rely upon proprietary controls in the form of environmental restrictive covenants, as provided in the "Memorandum of Agreement Between the United States Department of the Navy and the California Department of Toxic Substances Control" and attached covenant models (Navy and DTSC 2000) (hereinafter referred to as the "Navy/DTSC MOA"). Appendix J contains the Navy/DTSC MOA.

More specifically, land use and activity restrictions will be incorporated into two separate legal instruments as provided in the Navy/DTSC MOA:

1 Restrictive covenants included in one or more Quitclaim Deeds from the Navy to the property recipient.

2 Restrictive covenants included in one or more "Covenant to Restrict Use of Property" entered into by the Navy and DTSC as provided in the Navy/DTSC MOA and consistent with the substantive provisions of Cal. Code Regs. tit. 22 § 67391.1.

The "Covenant(s) to Restrict Use of Property" will incorporate the land use restrictions into environmental restrictive covenants that run with the land and that are enforceable by DTSC against future transferees. The Quitclaim Deed(s) will include the identical land use and activity restrictions in environmental restrictive covenants that run with the land and that will be enforceable by the Navy against future transferees.

The activity restrictions in the "Covenant(s) to Restrict Use of Property" and Deeds shall be implemented through the Parcel D Risk Management Plan ("Parcel D RMP") to be prepared by the City of San Francisco and approved by the Navy and FFA Signatories. The Parcel D RMP shall be discussed in the Parcel D ROD and shall be attached to and incorporated by reference into the Covenant(s) to Restrict Use of Property and Deeds as an enforceable part thereof. It shall specify soil and groundwater management procedures for compliance with the remedy selected in the Parcel D ROD. The Parcel D RMP shall identify the roles of local, state, and federal government in administering the Parcel D RMP and shall include, but not be limited to, procedures for any necessary sampling and analysis requirements, worker health and safety requirements, and any necessary site-specific construction and/or use approvals that may be required.

In addition to being set forth in the Covenant and Deed(s) as described above, restrictions applied to specified portions of the property will be described in findings of suitability for transfer and findings of suitability for early transfer.

Access

The Deed and Covenant shall provide that the Navy and FFA Signatories and their authorized agents, employees, contractors and subcontractors shall have the right to enter upon HPS Parcel D to conduct investigations, tests, or surveys; inspect field activities; or construct, operate, and maintain any response or remedial action as required or necessary under the cleanup program, including but not limited to monitoring wells, pumping wells, treatment facilities, and cap/containment systems.

Implementation

The Navy shall address/describe institutional control implementation and maintenance actions including periodic inspections and reporting requirements in the preliminary and final RD reports to be developed and submitted to the FFA Signatories for review pursuant to the FFA. (See "Navy Principles and Procedures for Specifying, Monitoring and Enforcement of Land Use

Controls and Other Post-ROD Actions" attached to January 16, 2004 Department of Defense (DoD) memorandum titled "Comprehensive Environmental Response, Compensation and Liability Act [CERCLA] Record of Decision [ROD] and Post-ROD Policy.") The preliminary and final RD reports are primary documents as provided in Section 7.3 of the FFA.

Activity Restrictions that Apply Throughout Parcel D

The following sections describe the institutional control objectives to be achieved through activity restrictions throughout Parcel D in order to ensure that any necessary measures to protect human health and the environment and the integrity of the remedy have been undertaken.

Restricted Activities

The following restricted activities throughout HPS Parcel D must be conducted in accordance with the "Covenant(s) to Restrict Use of Property," Quitclaim Deed(s), the Parcel D RMP, and, if required, any other work plan or document approved in accordance with these referenced documents:

- "Land disturbing activity" which includes but is not limited to: (1) excavation of soil, (2) construction of roads, utilities, facilities, structures, and appurtenances of any kind, (3) demolition or removal of "hardscape" (for example, concrete roadways, parking lots, foundations, and sidewalks), (4) any activity that involves movement of soil to the surface from below the surface of the land, and (5) any other activity that causes or facilitates the movement of known contaminated groundwater.

- Alteration, disturbance, or removal of any component of a response or cleanup action (including but not limited to pump-and-treat facilities, revetment walls and shoreline protection, and soil cap/containment systems); groundwater extraction, injection, and monitoring wells and associated piping and equipment; or associated utilities.

- Extraction of groundwater and installation of new groundwater wells.

- Removal of or damage to security features (for example, locks on monitoring wells, survey monuments, fencing, signs, or monitoring equipment and associated pipelines and appurtenances).

Prohibited Activities

The following activities are prohibited throughout HPS Parcel D:

- Growing vegetables or fruits in native soil for human consumption.

- Use of groundwater.

Activity Restrictions Relating to VOC Vapors at Specific Locations within Parcel D

Any proposed construction of enclosed structures must be approved in accordance with the "Covenant to Restrict Use of the Property," Quitclaim Deed, and Parcel D RMP prior to the conduct of such activity within the area requiring institutional controls (ARIC) for VOC vapors in order to ensure that the risks of potential exposures to VOC vapors are reduced to acceptable levels that are adequately protective of human health. Initially, the ARIC will include all of Parcel D. This can be achieved through engineering controls or other design alternatives that meet the specifications set forth in the ROD, RD reports, land use control (LUC) RD report, and Parcel D RMP. The ARIC may be modified by the FFA Signatories as the soil contamination areas and groundwater contaminant plumes that are producing unacceptable vapor inhalation risks are reduced over time or in response to further soil, vapor, and groundwater sampling and analysis for VOCs that establishes that areas now included in the ARIC do not pose an unacceptable potential exposure risk to VOC vapors.

Additional Land Use Restrictions for Areas Designated Open Space, Educational/Cultural, and Maritime/Industrial

The following restricted land uses for property areas designated for open space, educational/cultural, and maritime/industrial land uses in the "Hunters Point Shipyard Redevelopment Plan" dated July 14, 1997 must be reviewed and approved by the FFA Signatories in accordance with the "Covenants to Restrict Use of the Property," Quitclaim Deed(s), and Parcel D RMP prior to use of the property for any of the restricted uses:

- A residence, including any mobile home or factory built housing, constructed or installed for use as residential human habitation,
- A hospital for humans,
- A school for persons under 21 years of age, or
- A daycare facility for children.

Removal

Removal is an effective process option for all contaminant groups associated with soil at Parcel D and involves removing and transporting contaminated material off site to a permitted treatment and disposal facility. To meet land disposal restrictions, some pretreatment such as stabilization may be required or preferred so that the most economical disposal option can be applied. Important considerations with the removal and disposal process option include excavation volume, fugitive emissions, hauling distance, and type of treatment/disposal facility for final deposition. Excavations will be to a maximum depth of 10 feet for industrial and residential land use and to a maximum depth of two feet for recreational land use. The excavation cleanup criteria would be specific to the reuse type and analyte-specific remediation goals specified in Section 4.1.1.1.
