Section 1. Declaration

This Record of Decision (ROD) presents the selected remedy for Parcel E-2 at Hunters Point Naval Shipyard (HPNS) in San Francisco, California. HPNS was placed on the National Priorities List (NPL) in 1989 (U.S. Environmental Protection Agency [EPA] ID: CA71170090087). The remedy was selected in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980, as amended by the Superfund Amendments and Reauthorization Act (SARA) of 1986 (Title 42 United States Code Section (§) 9601, et seq.); and, to the extent practicable, the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (Title 40 Code of Federal Regulations Part 300). This decision is based on the Administrative Record file for this site¹. The Administrative Record Index is included in the electronic version of the ROD as [Attachment 1](#). The Department of the Navy (Navy) and EPA jointly selected the remedy for Parcel E-2. The California Department of Toxic Substances Control (DTSC) and the San Francisco Bay Regional Water Quality Control Board (Water Board) concur on the remedy for Parcel E-2. The Navy provides funding for site cleanups at HPNS. The Federal Facility Agreement (FFA) for HPNS documents how the Navy intends to meet and implement CERCLA in partnership with EPA, DTSC, and the Water Board.

Parcel E is one of six parcels (Parcels A through F) originally designated for environmental restoration. In September 2004, the Navy divided Parcel E into two parcels (Parcels E and E-2) to facilitate closure of the Parcel E-2 Landfill and its adjacent areas². Long-term use in Parcel E-2 consists of open space. Environmental investigations began at Parcel E, including Parcel E-2, in 1984. The Final Remedial Investigation (RI)/Feasibility Study (FS) Report was completed and submitted in 2011. This ROD documents the final remedial action for Parcel E-2 and does not include or affect any other sites at HPNS.

1.1. SELECTED REMEDY

The CERCLA remedial action selected in this ROD is necessary to protect the public health, welfare, or the environment from actual or potential releases of hazardous substances from Parcel E-2. The selected remedy for Parcel E-2 addresses the following contaminated media:

¹ **Blue text** identifies detailed site information available in the Administrative Record and listed in the References Table ([Attachment 2](#)). This ROD is also available on CD, whereby bold blue text serves as a hyperlink to reference information. The excerpts referenced by the hyperlinks are part of the ROD. The hyperlink will open a text box at the top of the screen. A blue box surrounds applicable information in the hyperlink. To the extent inconsistencies may exist between the referenced information attached to the ROD via hyperlinks and the information in the basic ROD itself, the language in the basic ROD controls.

² Discussions within this ROD (as well as the RI/FS Report and its radiological addendum) that reference documents published prior to September 2004 refer to the portion of Parcel E that became Parcel E-2.

- **Soil** – metals (antimony, arsenic, cadmium, copper, iron, lead, manganese, mercury, nickel, vanadium, and zinc), radionuclides (cesium-137 [^{137}Cs], cobalt-60 [^{60}Co], radium-226 [^{226}Ra], and strontium-90 [^{90}Sr]), pesticides, polychlorinated biphenyls (PCBs), semivolatile organic compounds (SVOCs), total petroleum hydrocarbons (TPH), and dioxins
- **Shoreline sediment** – metals (antimony, copper, lead, mercury, nickel, and zinc), radionuclides (^{226}Ra , ^{137}Cs , and ^{90}Sr), pesticides, and PCBs
- **Landfill gas** – methane and volatile organic compounds (VOCs)
- **Groundwater** – metals (arsenic, chromium VI, iron, lead, and thallium), radionuclides (^{226}Ra , ^{137}Cs , and ^{90}Sr), pesticides, PCBs, SVOCs, TPH, VOCs, and anions (such as ammonia and cyanide)

The selected remedy consists of the following actions to address risks posed by contaminated media:

- Remove and dispose of contaminated soil in selected areas that contain high concentrations of non-radioactive chemicals, and separate and dispose of materials and soil with radiological contamination found in these areas
- Perform radiological surveys throughout Parcel E-2 and separate and dispose of materials and soil with radiological contamination found during the surveys
- Install a soil cover over all of Parcel E-2, with a protective liner (consisting of a geomembrane with an overlying geocomposite drainage layer) where needed to minimize water seeping into the contaminated material
- Install below-ground barriers to limit groundwater flow from the landfill to San Francisco Bay, including a contingency action to hydraulically control groundwater (behind the barrier) if necessary to satisfy pertinent applicable or relevant and appropriate requirements (ARARs) (see [Section 2.9.4](#))
- Remove and treat landfill gas to prevent it from moving beyond the Parcel E-2 boundary
- Build a shoreline revetment
- Monitor and maintain the different parts of the selected remedy to ensure they are working properly
- Use institutional controls to restrict specific land uses and activities on Parcel E-2

1.2. STATUTORY DETERMINATIONS

The selected remedy is protective of human health and the environment, complies with federal and state statutes and regulations that are applicable or relevant and appropriate to the remedy, and is cost-effective. The selected remedy uses permanent solutions and alternative treatment (or resource recovery) technologies to the maximum extent practicable. It provides the best balance of tradeoffs relative to the

five balancing criteria and properly considers the two modifying criteria³. The selected remedy does not satisfy the statutory preference for treatment⁴ as a principal element because there is no cost-effective means of treating the large quantity of low-level soil contamination throughout Parcel E-2 and the small quantities of principal threat wastes at the PCB Hot Spot Area cannot be treated in a cost-effective manner. However, the principal threat wastes at the PCB Hot Spot Area are being excavated under a removal action that is scheduled to be completed in 2012. In addition, the protective liner and below-ground barriers are expected to reduce the mobility of contamination and natural attenuation mechanisms will reduce the toxicity, mobility, and volume of some contaminants. Statutory five-year reviews pursuant to CERCLA § 121 and the NCP will be conducted because the remedy will leave contamination in place at Parcel E-2 above concentrations that allow for unlimited use and unrestricted exposure.

1.3. DATA CERTIFICATION CHECKLIST

The following information is included in [Section 2](#) of this ROD. Additional information can be found in the Administrative Record file for this site:

- Chemicals of concern (COC) and chemicals of ecological concern (COECs) and their concentrations ([Sections 2.3 and 2.5](#)).
- Baseline risk represented by COCs and COECs ([Section 2.5](#)).
- Remediation goals established for COCs and COECs and the basis for these goals ([Sections 2.5 and 2.7](#)).
- Principal threat wastes ([Section 2.6](#)).
- Current and reasonably anticipated future land use assumptions and current and potential future beneficial uses of groundwater ([Section 2.4](#)).
- Potential land and groundwater use that will be available at Parcel E-2 as a result of the selected remedy ([Section 2.9.3](#)).
- Estimated capital costs, annual operation and maintenance, and total present worth costs; discount rate; and the number of years over which the remedy cost estimate is projected ([Section 2.8](#)).
- Key factors that led to selecting the remedy (e.g., a description of how the selected remedy provides the best balance of tradeoffs with respect to the balancing and modifying criteria, highlighting criteria key to the decision) ([Section 2.9.1](#)).

³ As defined in the NCP (Title 40 Code of Federal Regulations § 300.430[f][1][i]), the five primary balancing criteria are long-term effectiveness and permanence; reduction of toxicity, mobility, or volume through treatment; short-term effectiveness; implementability; and cost. State and community acceptance are modifying criteria that shall be considered in remedy selection.

⁴ As defined in the NCP (Title 40 Code of Federal Regulations § 300.5), "treatment technology" means any unit operation or series of unit operations that alters the composition of a hazardous substance or pollutant or contaminant through chemical, biological, or physical means so as to reduce toxicity, mobility, or volume of the contaminated materials being treated. Treatment technologies are an alternative to land disposal of hazardous wastes without treatment.

1.4. AUTHORIZING SIGNATURES

This signature sheet documents the Navy's and EPA's co-selection of the remedy in this ROD. This signature sheet also documents the State of California's (DTSC and Water Board) concurrence with this ROD.

Section 2. Decision Summary

2.1. SITE DESCRIPTION AND HISTORY

HPNS is located in southeastern San Francisco on a peninsula that extends east into San Francisco Bay (see [Figure 1](#)). HPNS consists of 866 acres: 420 acres on land and 446 acres under water in the San Francisco Bay. In 1940, the Navy obtained ownership of HPNS for shipbuilding, repair, and maintenance activities. After World War II, activities at HPNS shifted to submarine maintenance and repair. HPNS was also the site of the Naval Radiological Defense Laboratory (NRDL). A history of Navy radiological operations at HPNS is provided in Volume II of the Historical Radiological Assessment (HRA), and radiological operations at Parcel E-2 are summarized in [Section 2.2](#).

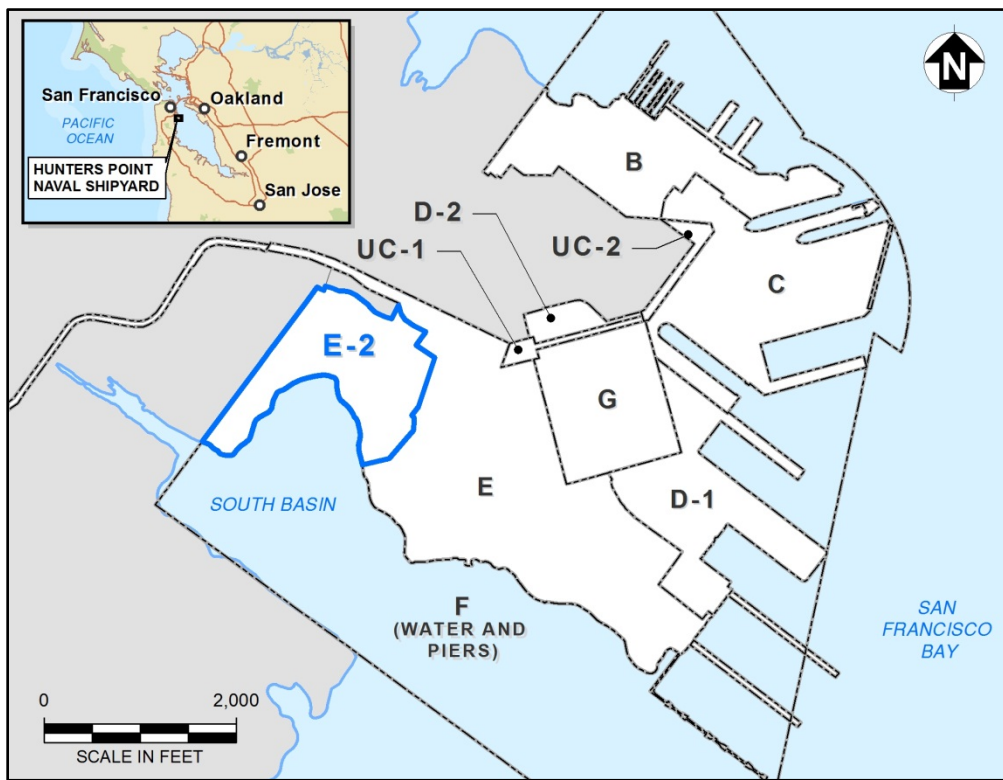

Figure 1. Facility and Parcel E-2 Location Map

HPNS was deactivated in 1974 and remained relatively unused until 1976. Between 1976 and 1986, the Navy leased most of HPNS to Triple A Machine Shop, Inc., a private ship repair company. In 1987, the Navy resumed occupancy of HPNS. Because past shipyard operations left hazardous substances on site, HPNS property was placed on the NPL in 1989 pursuant to CERCLA, as amended by the SARA. In 1991, HPNS was designated for closure pursuant to the Defense Base Closure and Realignment Act of

1990. Closure activities at HPNS involve conducting environmental remediation and making the property available for nondefense use.

Parcel E-2⁽¹⁾, which includes about 47 acres of shoreline and lowland coast along the southwestern portion of the shipyard (see [Figure 1](#)), consists of four distinct study areas that were designated to organize the information presented in the RI/FS Report (see [Figure 2](#)):

- The Parcel E-2 Landfill, located in the north-central part of Parcel E-2
- The Panhandle Area, located west and southwest of the Parcel E-2 Landfill
- The East Adjacent Area, located to the east of the Parcel E-2 Landfill
- The Shoreline Area, located at the edge of San Francisco Bay

A small portion of the Parcel E-2 Landfill extends north onto property owned by the University of California at San Francisco (UCSF) (see [Figure 2](#)).

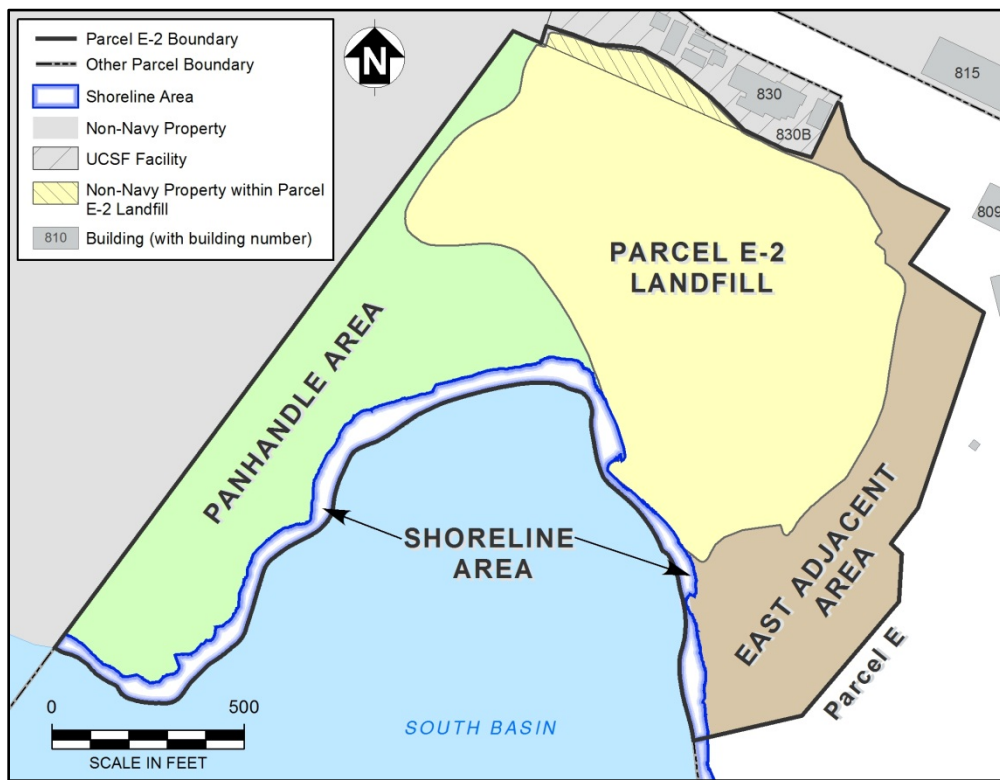

Figure 2. Parcel E-2 Areas

2.2. SITE CHARACTERISTICS

Parcel E-2 was created by filling in the bay margin with various materials, including native soil, rock, and sediments, as well as construction and industrial debris. The ground surface elevation at Parcel E-2 varies from approximately 30 feet above mean sea level (msl) in the northern portion of the parcel to a few feet above msl along the southwestern portion of the parcel. The **Parcel E-2 Landfill**⁽²⁾ is a 22-acre area

where the Navy disposed of various shipyard wastes from the mid-1950s to the early-1970s. These wastes include:

- Construction debris (including wood, steel, concrete, and soil)
- Municipal-type trash (including paper, plastic, and metal)
- Industrial waste (including sandblast waste, paint sludge, solvents, and PCB-containing waste oils)

The Navy's investigations showed that the landfill waste consists of mostly construction debris and trash, with smaller amounts of industrial waste. After the 22-acre landfill closed in the early 1970s, the Navy covered it with 2 to 5 feet of soil at that time. As detailed in [Section 2.3](#), the Navy has since performed several removal actions at Parcel E-2 to minimize potential exposure to hazardous chemicals. These actions included [construction of an additional interim landfill cap](#)⁽³⁾ over 14.5 acres of the landfill that was burned during an August 2000 brush fire at the Parcel E-2 Landfill. The interim landfill cap was constructed to inhibit oxygen migration into the waste to prevent more fires from occurring under the capped area. The total volume of soil cover over the 22-acre landfill at the date of signature of this ROD is estimated to be 393,500 cubic yards, and the volume of landfill waste is estimated to be 473,000 cubic yards.

[Fill materials in the East Adjacent, Panhandle, and Shoreline Areas of Parcel E-2](#)⁽⁴⁾ are distinct from the Parcel E-2 Landfill. Specifically, fill materials in the East Adjacent, Panhandle, and Shoreline Areas consist primarily of soil, sediment, and rock with isolated solid waste locations that are not contiguous with solid waste in the Parcel E-2 Landfill. The characteristics of the East Adjacent, Panhandle, and Shoreline Areas are described below.

- The East Adjacent Area was created by filling in San Francisco Bay prior to the 1950s with soil and construction debris. Some industrial waste was disposed of in parts of the East Adjacent Area, including an area referred to as the PCB Hot Spot Area. The PCB Hot Spot Area was partially addressed under an early removal action (see [Section 2.3](#)).
- The Panhandle Area was created by filling in San Francisco Bay in the 1950s with soil and construction debris. The Navy disposed of metal slag in a part of the Panhandle Area referred to as the Metal Slag Area. The Metal Slag Area was partially addressed under an early removal action (see [Section 2.3](#)). Also, the Navy tested ship-shielding technologies in another part of the Panhandle Area referred to as the Ship-Shielding Area.
- The Shoreline Area is adjacent to San Francisco Bay and contains contaminated sediments. Contaminated sediments above msl will be addressed by the selected remedy for Parcel E-2. Contaminated sediments below msl will be addressed by the selected remedy for Parcel F, the Navy's property offshore of HPNS.

The HRA identified [areas where low-level radiological material may be located](#)⁽⁵⁾ at Parcel E-2. These areas are shown on [Figure 3](#).

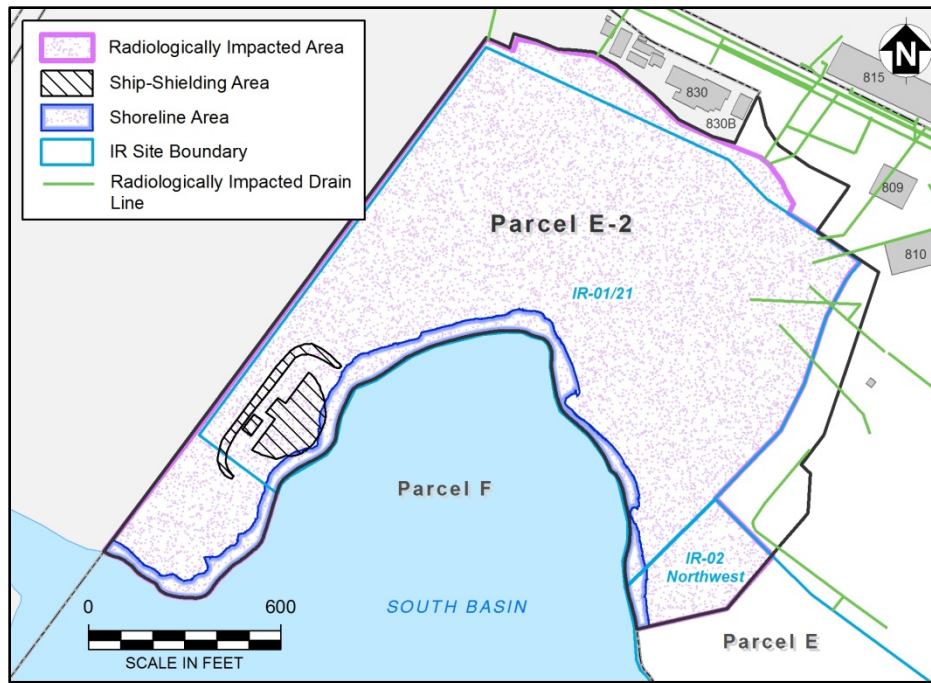

Figure 3. Radiologically Impacted Areas

The following **radiological operations**₍₆₎ were identified at Parcel E-2:

- Dials, gauges, and deck markers painted with radioactive paint (containing low levels of ^{226}Ra) to make the devices glow in the dark) were disposed of at the Parcel E-2 Landfill and portions of the Panhandle Area and the East Adjacent Area (located within Installation Restoration [IR] Sites 01/21 and 02).
- Industrial debris and metal slag with dials, gauges, and deck markers painted with radioactive paint were disposed of at the Metal Slag Area (removed during a previous removal action).
- Small amounts of low-level radionuclides may be present in drain lines in the eastern part of Parcel E-2. Potential releases of low-level radionuclides into drain lines at former NRDL buildings located outside of Parcel E-2 (in Parcel E) may have led to drain lines in the eastern part of Parcel E-2. The drain lines in Parcel E and any contamination in them are currently being excavated as part of an ongoing removal action being performed throughout HPNS.
- Materials used during radiological experiments by NRDL may have been disposed of at the Parcel E-2 Landfill and portions of the Panhandle Area and the East Adjacent Area (located within IR Sites 01/21 and 02). However, historical records presented in the HRA suggest that such material was strictly controlled, particularly after 1954 when the U.S. Atomic Energy Commission began regulating the use of radionuclides at HPNS. This information indicates that the volume of NRDL waste potentially disposed of in and around the Parcel E-2 Landfill was relatively low because most of these areas were filled after 1955.

- Sandblast waste from cleaning ships used during weapons testing in the South Pacific may have been disposed of at the Parcel E-2 Landfill, the Panhandle Area, and portions of the East Adjacent Area (located within IR Sites 01/21 and 02). However, historical records presented in the HRA indicate that waste with the highest levels of radioactivity was controlled and not disposed of anywhere at HPNS, including Parcel E-2.

The **hydrostratigraphy**⁽⁷⁾ of Parcel E-2 consists of four distinct units: the shallow A-aquifer, several aquitard zones, the deeper B-aquifer, and underlying bedrock water-bearing zone. An aquitard zone separates the A- and B-aquifer across most of Parcel E-2, except in the northwest corner. The presence of additional aquitard zones within the B-aquifer sediments isolate the uppermost portions of the B-aquifer (that are interconnected with the A-aquifer) from the lower portions of the B-aquifer. Groundwater is not currently used for any purpose at Parcel E-2. Groundwater in the A-aquifer is not suitable as a potential source of **drinking water**⁽⁸⁾. Based on an evaluation of site-specific conditions relative to pertinent regulatory criteria, groundwater in the B-aquifer has a moderate potential to be used as a future source of drinking water.

Groundwater flow patterns⁽⁹⁾ at Parcel E-2 are complex because they are potentially affected by (1) a

groundwater sink located in adjacent Parcel E; (2) leaks of groundwater into former sanitary sewers or storm drains; (3) recharge from water supply lines; and (4) tides in San Francisco Bay. Most groundwater at Parcel E-2 flows toward San Francisco Bay. In the northeastern portion of Parcel E-2, however, groundwater has historically flowed toward the groundwater sink in Parcel E, where groundwater elevations are below msl. The sink was likely caused by leaks of groundwater into sanitary sewer lines, which were then pumped to the off-site, publicly owned treatment works, thereby lowering groundwater levels in the area. Flow patterns continue to change now that pumping has been discontinued and as sewer and storm drain lines are removed throughout Parcel E and other HPNS parcels. Sewer and storm drain lines remain in the northern and eastern portions of Parcel E-2 (Figure 4).

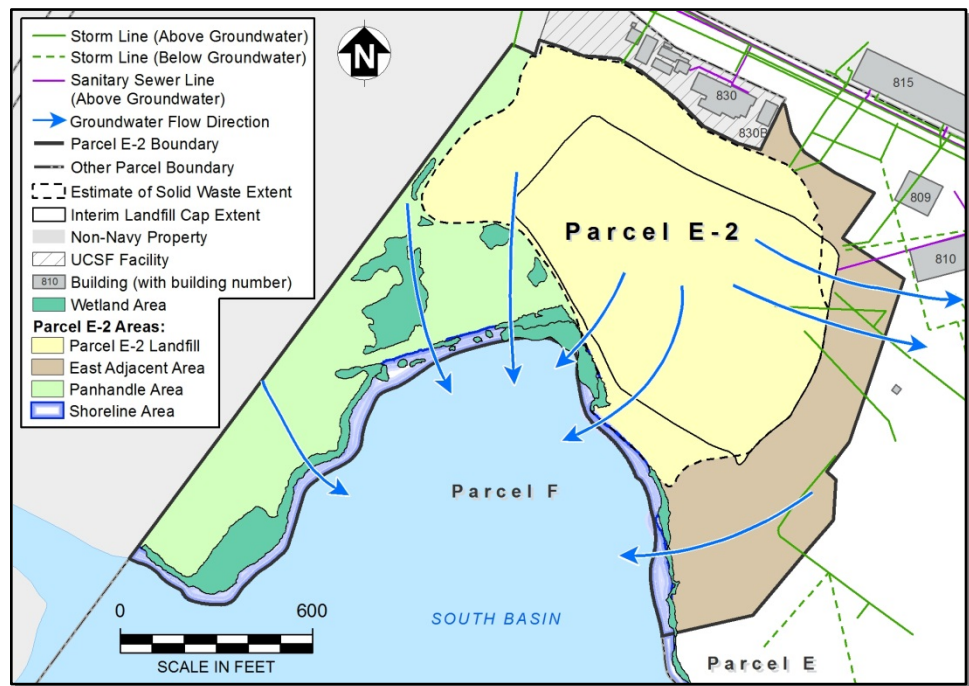

Figure 4. Parcel E-2 Existing Site Features

Parcel E-2 ecology⁽¹⁰⁾ includes terrestrial habitat, aquatic environments, and transitional wetlands. All of these ecological areas have been disturbed by human activities such as excavation, filling, and development, and support relatively few plant species. Birds, mammals, and reptiles have been observed in this parcel. No threatened or endangered species are known to inhabit Parcel E-2 or its immediate vicinity. Wetlands are located in the Panhandle Area and Shoreline Area (**Figure 4**). The existing wetlands provide habitat for wintering and migrating wildlife; however, their value in terms of social significance, effectiveness, and opportunity is low because the wetlands are located on manmade land that has been disturbed by human activities and contains chemical contamination.

2.3. PREVIOUS INVESTIGATIONS AND REMOVAL ACTIONS

Parcel E-2 was one of the first environmental investigation sites identified at HPNS during the Initial Assessment Study conducted by the Navy (1984), and the Navy has performed numerous **environmental investigations**⁽¹¹⁾ at Parcel E-2 since then. The Navy has collected extensive information during these investigations, as well as during ongoing environmental monitoring programs for groundwater and landfill gas, including:

- Over 2,000 soil samples and over 800 groundwater samples analyzed for various radionuclides and nonradioactive chemicals to determine the types and concentrations of chemicals
- Over 30 trenches and over 200 soil borings to identify the types of waste disposed of at Parcel E-2
- Over 3,000 soil gas and outdoor air samples analyzed for methane and other organic chemicals to track emissions from the landfill
- Special investigations to address the unique site conditions at Parcel E-2 that included identifying buried waste using special geophysical instruments, evaluating liquefaction potential, identifying existing wetlands, and analyzing shoreline sediment for various chemicals

Figures 5 and 6 shows the locations where samples were collected to analyze groundwater, soil, and landfill gas during the numerous site investigations. The RI/FS Report (May 5, 2011) and radiological addendum (March 4, 2011) summarize the results of the environmental investigations at Parcel E-2 and document how much is known about the site. The previous investigations provide sufficient information to evaluate site risks, develop remedial alternatives, and support the remedy decision made in this ROD.

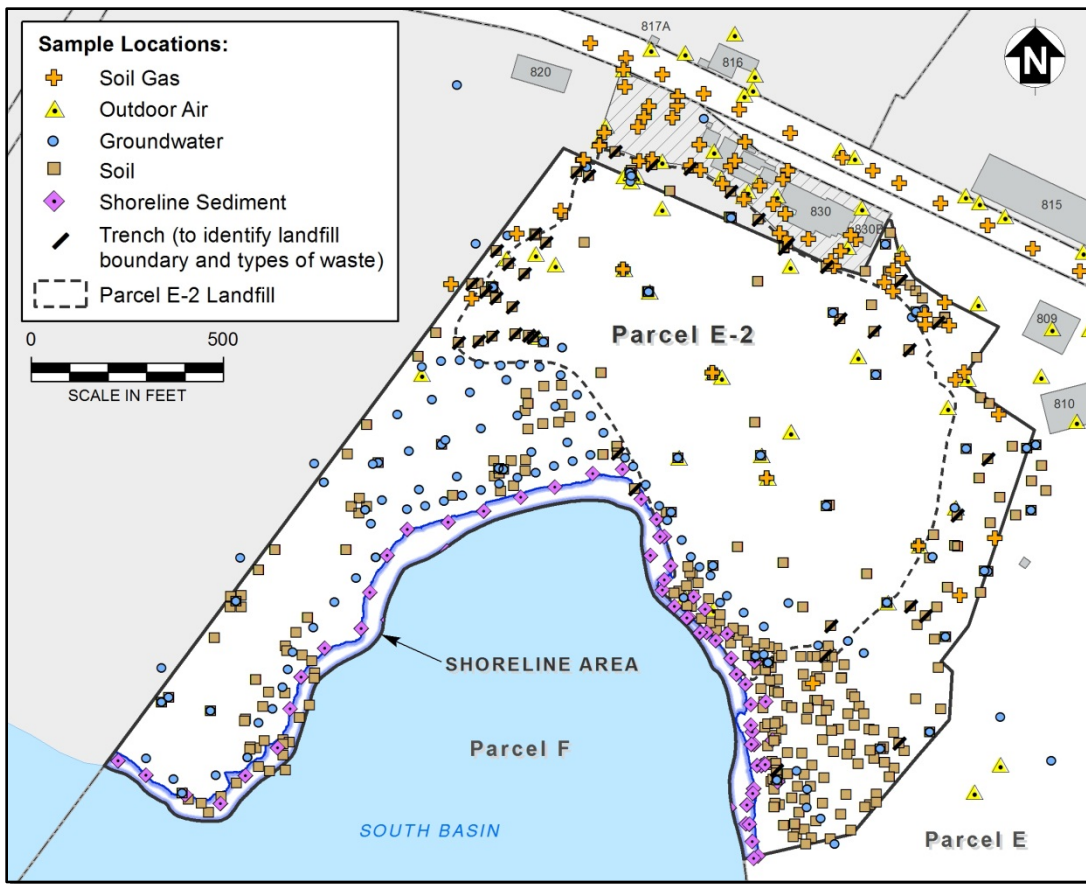

Figure 5. Previous Sampling Locations for Nonradioactive Chemicals

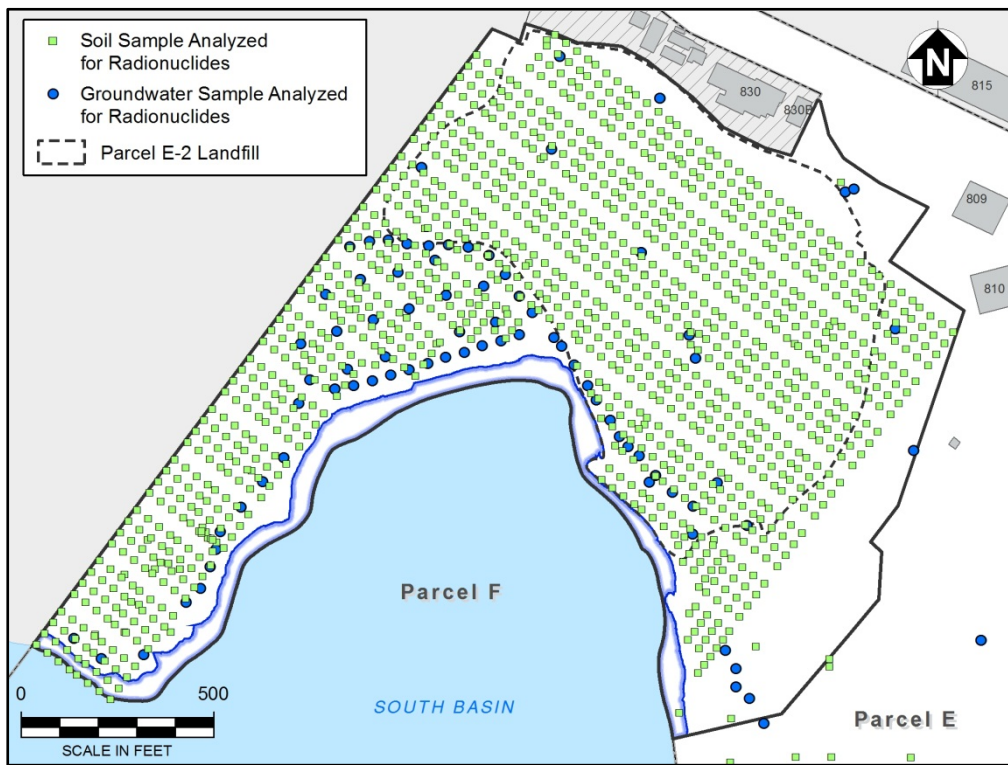

Figure 6. Previous Sampling Locations for Radionuclides

The Navy has also performed several removal actions at Parcel E-2 (Figure 7) to minimize potential exposure to hazardous chemicals. The previous excavations (as shown on Figure 7) successfully removed significant amounts of contamination from certain areas of Parcel E-2; however, contamination remains elsewhere at Parcel E-2, and the Navy initiated two additional time-critical removal actions (TCRAs) (at the PCB Hot Spot Area and the Ship-Shielding Area) to promptly address this contamination prior to the ROD. However, because the TCRAs are not complete at the date of ROD signature, the excavations will be completed as a remedial action pursuant to this ROD. Table 1 summarizes the previous studies, investigations, and removal actions conducted at Parcel E-2; Table 1 also describes the two ongoing TCRAs at the PCB Hot Spot Area and the Ship-Shielding Area.

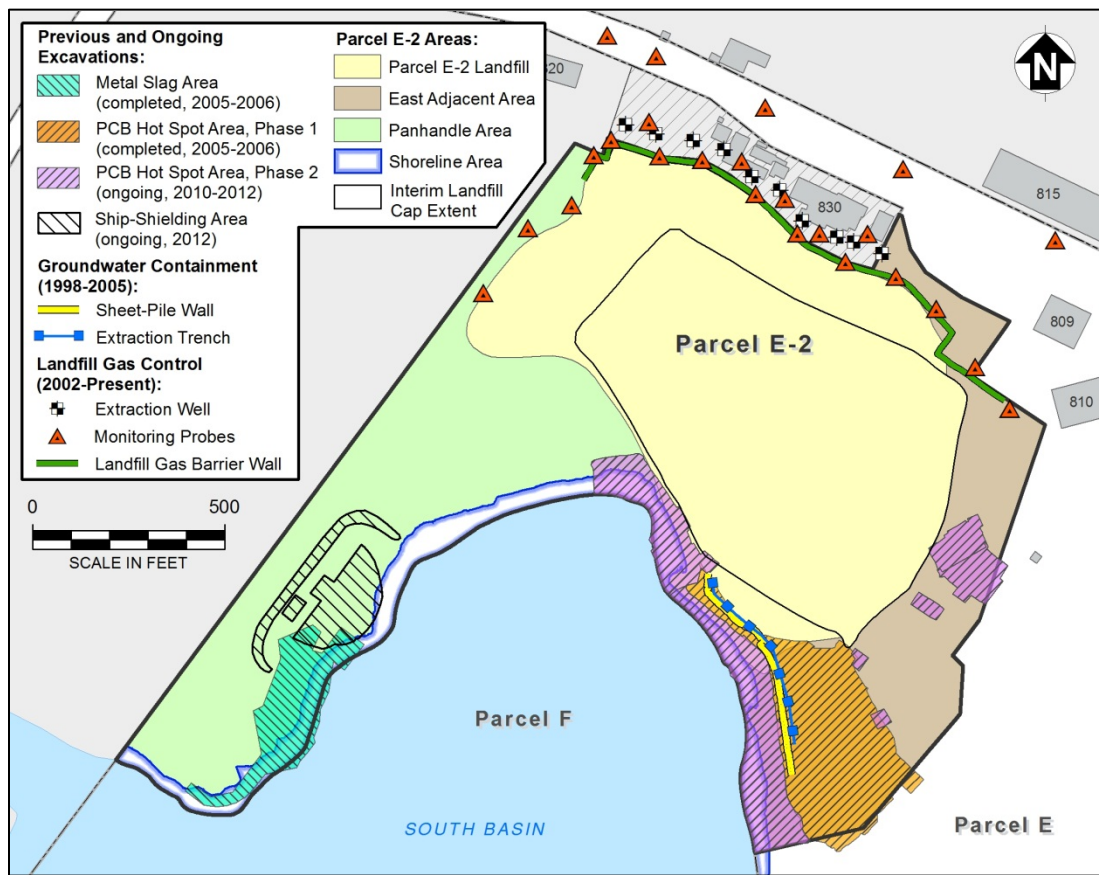

Figure 7. Removal Actions

Table 1. Previous Investigations and Removal Actions

Previous Investigation/ Removal Action ^a	Date(s)	Investigation/Removal Action Activities
Initial Assessment Survey	1984	Records reviews and a visual inspection of the landfill (IAS Site 3, later renamed IR Site 01/21) were conducted. The IAS concluded it was highly probable that chemicals from waste disposed of in the Parcel E-2 Landfill had reached groundwater and were migrating toward San Francisco Bay.
Confirmation Study/ Verification Step	1987	A geophysical survey, subsurface exploration using exploratory borings, and soil and groundwater sampling were conducted in the area of the landfill. The study concluded that soil at the Parcel E-2 Landfill contained various VOCs and SVOCs that were associated with petroleum products and some chlorinated organic solvents.
Area Study	1987	The study was conducted throughout HPNS to evaluate whether a release of hazardous substances to soil had occurred at construction sites outside the boundaries of previously identified investigation sites. The area study primarily concluded that soil within Study Area A, including Parcels E and E-2, contained naturally occurring asbestos derived from serpentine bedrock.
Solid Waste Air Quality Assessment Test	1988	The study included evaluation of meteorological conditions, ambient air quality, landfill gas compositions, surface gas emissions, and subsurface gas migration. Methane was detected in isolated pockets at IR Site 01/21 and at the northern edge of the IR Site 01/21 boundary (near the UCSF compound, but within the solid waste footprint).
OU-I RI	1988 – 1992	The Parcel E-2 Landfill progressed to the RI stage as IR Site 01/21 and was grouped (along with IR Sites 02 and 03 in Parcel E) into OU-I. The first phase of the OU-I RI (from 1988 to 1989) included a geophysical survey and test pit excavation to delineate the extent of landfill waste, a soil gas survey to evaluate the presence of VOCs in soil and groundwater, and installation of deep soil borings to define subsurface stratigraphy. Subsequent investigation phases involved sampling of soil and groundwater (performed from 1990 to 1992).
Radiological Investigations (Phases I and II)	1991 and 1993	During the Phase I investigation, nine radioactive point source anomalies associated with radium-containing devices were observed near the ground surface in the southwestern portion of Parcel E-2. During the Phase II investigation, trenches were excavated near these areas but no elevated gamma count rates were measured.
Parcel E RI/FS	1995 to 1998	The RI at the landfill was completed in conjunction with other Parcel E IR sites, and involved additional field investigation performed from October 1995 to June 1996. The Parcel E RI also included a baseline ERA and HHRA.
Groundwater Extraction System and Containment Barrier	1997 to 1998	A vertical sheet-pile wall and groundwater extraction system were installed at the southeast portion of Parcel E-2 to control contaminated groundwater next to San Francisco Bay. The sheet-pile wall, which remains in place, consists of interlocking steel panels and limits the flow of groundwater to the bay. The extraction system consisted of horizontal and vertical pipes and groundwater pumps, and removed contaminated groundwater that was transported to the off-site, publicly owned treatment works. The Navy operated the extraction system until 2005, when it was removed so that the contaminant source (i.e., the PCB Hot Spot Area) could be excavated and disposed of at one or more approved off-site landfills. During its 6 years of operation, extracted groundwater was tested for chemical contaminants and found to meet the City and County of San Francisco's requirements for direct discharge to the sewer system.
Interim Landfill Cap Construction	2000 to 2001	A protective liner and soil cover were installed over part of the landfill (about 14.5 acres) to stop smoldering below ground following a brush fire. The fire started on August 16, 2000, and was extinguished at the surface within 6 hours, but small areas continued to smolder below ground for approximately 1 month. Because the protective liner and soil cover limit oxygen from entering into the landfill, they prevent more fires from occurring under the capped area. An extensive air monitoring program was performed during cap construction to demonstrate that public health and the environment of the nearby community were not compromised by air emissions from the subsurface smoldering and landfill capping activities.

Table 1. Previous Investigations and Removal Actions *(continued)*

Previous Investigation/ Removal Action ^a	Date(s)	Investigation/Removal Action Activities
Groundwater Data Gaps Investigation	July 2000 to October 2002	The groundwater data gaps investigation was conducted in three phases between 2000 and 2002 to better define the extent of groundwater contamination at HPNS. Water level measurements and a tidal study were used to refine the Parcel E-2 hydrogeological conceptual model, and three rounds of groundwater monitoring were used to develop a basewide groundwater monitoring program.
Radiological Investigations, Phase V (and other interim investigations)	2001 to 2005	In 2001, a characterization survey of the Parcels E and E-2 shoreline was performed that identified the Metal Slag Area. The Phase V investigation was performed from 2002 to 2003 at Parcel E-2. Several areas with elevated levels of radioactivity were reported.
Nonstandard Data Gaps Investigation	October 2001 to November 2002	<p>Four separate investigations were conducted.</p> <ul style="list-style-type: none"> ▪ <u>Wetlands Delineation and Functions and Values Assessment (October 2001 to April 2002)</u>. Two wetland areas were identified at Parcel E-2: (1) about 2.4 acres of tidal wetlands along the shoreline and (2) about 1.3 acres of inland seasonal freshwater wetland in the Panhandle Area. The functions and values assessment found that the value of these wetlands is low. ▪ <u>Landfill Lateral Extent Evaluation (March to April 2002)</u>. Test pits and soil borings were installed to determine that the lateral extent of landfill waste is about 22 acres and the vertical extent varies from 5 to 25 feet thick. ▪ <u>Landfill Liquefaction Potential (April 2002)</u>. The evaluation indicated that most of the cohesionless soil layers (66 to 67 percent) would not liquefy during a MPE. The evaluation determined that, for the remaining soil layers that could liquefy during a MPE, lateral movement of soil below the waste would be less than 4 to 5 feet. The evaluation also concluded that, if containment were selected as the final remediation measure, further analysis would be required to properly design the landfill cap, and ensure the overall stability of the landfill site and other closure features. ▪ <u>Landfill Gas Characterization (April to November 2002)</u>. Ambient air and soil gas surveys were conducted, and GMP01 through GMP21 were installed and monitored on a weekly basis. Results from GMP monitoring indicated that methane, the main component of landfill gas, was present at levels that exceeded the LEL (5 percent by volume in air) in subsurface areas in the northern part of the landfill and aboveground at four areas on the UCSF compound. Trace concentrations of NMOCs were also detected in this area; however, a screening evaluation concluded that the detected levels of NMOCs did not pose an unacceptable risk to human health.
Landfill Gas TCRA	August 2002 to May 2003	A landfill gas barrier wall, monitoring probes, and extraction wells were installed along the northern Parcel E-2 boundary to control gas from moving past the landfill boundary. The barrier wall, which consists of thick interlocking plastic panels, limits landfill gas from moving past the wall and directs it into a collection trench. The monitoring probes are used to verify that landfill gas is properly controlled. The extraction wells, which were used from 2002 to 2003 to remove landfill gas that had migrated under the UCSF facility, are currently used for monitoring purposes only. The Navy continues to operate and maintain the barrier wall to control landfill gas.
Standard Data Gaps Investigation	September 2002 to February 2003	The Navy reviewed aerial photographs and logs from test pits, soil borings, monitoring wells, and GMPs from various investigations at Parcel E-2 to identify known and potential contaminant sources that required additional delineation. Results from the standard data gaps investigation were also used to delineate the PCB Hot Spot Area and to characterize the nature and extent of chemicals in sediment in the Shoreline Area.
Landfill Gas Monitoring and Control	May 2003 to Present	Landfill gas is being monitored on a regular basis under the Interim Landfill Gas Monitoring and Control Plan to verify that hazardous concentrations of landfill gas are not migrating beyond the fence line of the landfill and onto the UCSF compound. The landfill gas control system is operated using both passive venting and active extraction.

Table 1. Previous Investigations and Removal Actions *(continued)*

Previous Investigation/ Removal Action ^a	Date(s)	Investigation/Removal Action Activities
Interim Cap Inspection and Maintenance	July 2003 to Present	Inspection and maintenance of the interim landfill cap is performed in accordance with a site-specific operation and maintenance plan.
Stormwater Management and Monitoring	July 2003 to Present	Stormwater discharge in Parcel E-2 is managed in accordance with a site-specific plan that is reviewed and updated regularly.
Basewide Groundwater Monitoring Program	June 2004 to Present	The Navy monitors groundwater on a regular basis under this program to evaluate chemicals previously detected at concentrations that may pose a potential risk to human health and the environment.
Metal Slag Area Removal Action	June 2005 to May 2006	The TCRA at the Metal Slag Area was performed to remove metal slag and debris containing low-level radiological material, as well as non-radiological chemical contamination incidental to the area. Approximately 8,200 cubic yards of contaminated soil and sediment, including 119 cubic yards of material with radionuclides, were excavated from this area in the southwest portion of Parcel E-2 and disposed of at one or more approved off-site landfills.
PCB Hot Spot Area Removal Action (Phase 1)	June 2005 to September 2006	The TCRA at the PCB Hot Spot Area was designed to remove PCB- and petroleum hydrocarbon-contaminated soil and debris, possibly containing low-level radiological material. The removal action goals also included removal of free-phase petroleum hydrocarbons to a practical extent. Approximately 44,500 cubic yards of contaminated soil, including 611 cubic yards of material with radionuclides, was excavated from this area in the southeast portion of Parcel E-2 and disposed of at one or more approved off-site landfills.
Groundwater Investigation	September 2007 to June 2008	A focused groundwater investigation was performed to evaluate chemical (i.e., dissolved metals, PCBs, petroleum hydrocarbons, and ammonia) concentrations along the Parcel E-2 shoreline. Study areas included areas adjacent to the Parcel E-2 Landfill, the PCB Hot Spot Area, and Metal Slag Area. The scope of the investigation was expanded to include supplemental sampling for specific radionuclides.
PCB Hot Spot Area Removal Action (Phase 2)	March 2010 to present	The Phase 2 TCRA at the PCB Hot Spot Area was designed to remove contaminated soil and debris from the shoreline portion of the PCB Hot Spot Area, and other select hot spots identified in the RI/FS Report. Approximately 40,000 cubic yards of contaminated soil was excavated from areas not addressed during the Phase 1 TCRA. The excavated soil was disposed of at one or more approved off-site landfills. The fieldwork was completed in 2012.
Ship-Shielding Area Removal Action	May 2012 to present	The TCRA at the Ship-Shielding Area was designed to remove soil and debris potentially containing low-level radiological material (containing ⁶⁰ Co). Approximately 3,300 cubic yards of soil was excavated and screened for radioactivity. Low-level radiological material (containing ⁶⁰ Co) identified during the screening process was disposed of at an approved off-site landfill. The fieldwork was completed in 2012.

Notes:

^a = The documents listed are available in the Administrative Record and provide detailed information used to support remedy selection at Parcel E-2.

⁶⁰Co = cobalt-60

ERA = ecological risk assessment

FS = feasibility study

GMPs = gas monitoring probes

HHRA = human health risk assessment

HPNS = Hunters Point Naval Shipyard

IAS = initial site assessment

IR = Installation Restoration

LEL = lower explosive limit

MPE = maximum probable earthquake

NMOCs = nonmethane organic compounds

OU = Operable Unit

PCB = polychlorinated biphenyl

RI = remedial investigation

SVOCs = semivolatiles organic compounds

TCRA = time-critical removal action

UCSF = University of California San Francisco

VOCs = volatile organic compounds

Based on previous investigations and removal actions, the sources and extent of the remaining contamination in soil, sediment, landfill gas, and groundwater have been characterized adequately to select an appropriate remedy. This determination is consistent with [EPA guidance for CERCLA landfills^{\(12\)}](#), which presents a specialized RI/FS process intended to improve and accelerate the site characterization and remedy evaluation process and to ensure consistent evaluation of remedial alternatives at similar sites. This process, which was applied to the Parcel E-2 Landfill, is based on the rationale that the unique characteristics of landfills (such as the presence of large volumes of municipal wastes frequently co-disposed with industrial wastes) limit the selection of practicable remedial alternatives. Consistent with EPA guidance, further characterization of solid waste is not necessary or appropriate for selecting a remedy for the Parcel E-2 Landfill. In addition, characterization efforts in the East Adjacent, Panhandle, and Shoreline Areas have provided sufficient data to evaluate potential risks to humans and wildlife because past sampling locations have focused on the most likely contaminant sources (based on a comprehensive review of historic aerial photographs and any visual evidence of contamination), to the extent practical. [Sections 2.3.1, 2.3.2, 2.3.3, 2.3.4, and 2.3.5](#) summarize the nature and extent of nonradioactive contamination in soil, sediment, landfill gas, and groundwater. [Section 2.3.6](#) describes the nature and extent of radionuclides in soil, sediment, and groundwater at Parcel E-2.

2.3.1. Solid Waste and Soil in the Parcel E-2 Landfill

The Navy installed 28 soil borings and 18 monitoring wells and excavated 25 test pits within the Parcel E-2 Landfill to evaluate the nature and extent of contamination. Based on these investigations, the Navy determined that contiguous solid waste in the Parcel E-2 Landfill is composed primarily of municipal-type waste and construction debris. In addition to municipal-type waste and construction debris, historic information indicates that industrial wastes were also disposed of in or around the Parcel E-2 Landfill, including sandblast waste, radioluminescent devices, asbestos-containing debris, paint sludge, solvents, and waste oils. The characterization data suggest that the quantity of industrial waste within the Parcel E-2 Landfill is less than the quantity of municipal-type waste and construction debris.

The soil data set for the Parcel E-2 Landfill includes 333 soil samples collected from the intermittent soil fill mixed with the solid waste. Metals, SVOCs, VOCs, PCBs, pesticides, and petroleum hydrocarbons were detected at [concentrations exceeding the evaluation criteria^{\(13\)}](#) in soil samples collected at the Parcel E-2 Landfill. Nearly all of the chemicals detected in Parcel E-2 Landfill soil at concentrations exceeding the evaluation criteria were of a limited extent relative to the overall waste volume. These results indicate that lesser quantities of potentially hazardous industrial wastes are present in the landfill as compared with municipal-type waste and construction debris.

2.3.2. Soil and Isolated Solid Waste in the East Adjacent and Panhandle Areas

The nature and extent of solid waste in the East Adjacent and Panhandle Areas are distinct from the solid waste defined in the Parcel E-2 Landfill. Specifically, fill material in the East Adjacent and Panhandle Areas consists primarily of soil and rock with isolated solid waste locations that are not contiguous with

solid waste in the Parcel E-2 Landfill. Solid waste within the East Adjacent and Panhandle Areas consists of a heterogeneous distribution of construction debris and isolated locations of industrial wastes. The soil data set for the East Adjacent and Panhandle Areas includes 754 soil samples from 113 soil borings, 113 excavation grids within the PCB Hot Spot Area and Metal Slag Area, and 14 test pits. Metals, SVOCs, VOCs, pesticides, PCBs, dioxins and furans, and petroleum hydrocarbons were detected at **concentrations exceeding the evaluation criteria**⁽¹³⁾ in soil samples collected in the East Adjacent and Panhandle Areas. The noncontiguous and heterogeneous nature of the fill material within the East Adjacent and Panhandle Areas results in a high degree of uncertainty that this fill and the chemicals in soil can be delineated into discrete zones for remediation activities.

2.3.3. Shoreline Sediment

The sediment data set includes 100 samples collected from 50 locations along the Parcel E-2 shoreline. Shoreline sediment was found to contain concentrations of copper, lead, and PCBs that are a **potential source of contamination to Parcel F**⁽¹⁴⁾. In addition, benthic invertebrates, birds, and mammals are at risk from exposure to PCBs in surface sediments along the Parcel E-2 shoreline. Source control measures are warranted along the Parcel E-2 shoreline, particularly in the Metal Slag Area of the Panhandle Area and the Parcel E-2 Landfill, to control potential releases of copper, lead, and PCBs to Parcel F and to mitigate potential risk to benthic invertebrates, birds, and mammals in the shoreline. These conditions warrant the evaluation of remedial alternatives for intertidal sediments along the entire Parcel E-2 shoreline.

2.3.4. Landfill Gas

Landfill gas characterization⁽¹⁵⁾, which consisted of 57 temporary soil gas borings and 21 permanent gas monitoring probes, determined that elevated methane concentrations were present north of the Parcel E-2 Landfill (including property owned by UCSF). The Navy conducted a TCRA that was successful in (1) removing landfill gas and reducing subsurface methane concentrations at the UCSF compound and (2) controlling future migration of landfill gas to off-site areas. Data collected as part of the landfill gas characterization study, the TCRA, and ongoing landfill gas monitoring have adequately defined the nature and extent of landfill gas at Parcel E-2. Additional studies are planned, in conjunction with the remedial design (RD), to more thoroughly evaluate soil gas concentrations in the Panhandle Area and East Adjacent Area and to assess whether methane or non-methane organic compounds (NMOCs) are present in the areas at concentrations that may be hazardous to human health.

2.3.5. Groundwater

Groundwater conditions at Parcel E-2 have been the subject of multiple investigations performed from 1990 through 2008, and the groundwater data set consists of samples collected from 116 A-aquifer wells (including temporary monitoring wells) and 10 B-aquifer wells that were analyzed for various chemicals. Through data collected during these investigations, groundwater contamination has been confirmed in both the A-aquifer and uppermost B-aquifer. **Groundwater contaminants**⁽¹⁶⁾ include metals, SVOCs,

VOCs, pesticides, PCBs, petroleum hydrocarbons, and anions (such as ammonia and cyanide). Groundwater sampling results indicated that the concentrations and extent of contamination in the uppermost B-aquifer are less than observed in the A-aquifer because an aquitard is present beneath most of Parcel E-2. Primary potential migration pathways for contaminated groundwater include migration and discharge of A-aquifer groundwater into San Francisco Bay and wetlands and migration of A-aquifer groundwater (including the saturated waste layer) into the uppermost B-aquifer.

2.3.6. Radionuclides in Soil, Sediment, and Groundwater

Past **radiological investigations**⁽¹⁷⁾ have involved collection of over 1,000 soil samples within the upper 6 inches of the ground surface and analysis for a suite of 17 radionuclides. The investigation area was divided into 73 survey units (each 2,000 square meters, or 21,528 square feet); however, one entire survey unit was subsequently excavated during the Phase 1 TCRA at the PCB Hot Spot Area, resulting in data remaining from 72 of the original 73 survey units. Within each survey unit, pertinent statistics for each radionuclide of concern (ROC), including the mean and maximum activity levels and the 95th percent upper confidence limit of the mean activity level (95 UCL activity level), were calculated within each survey unit. For evaluation purposes, the 95 UCL activity levels for each ROC were compared against residential and outdoor worker remediation goals, as established in an action memorandum for the basewide radiological TCRA, to provide the following general assessment of the distribution of **ROCs in surface soil**⁽¹⁸⁾ at Parcel E-2.

- ¹³⁷Cs (an ROC in all radiologically impacted areas at Parcel E-2) – The extent of ¹³⁷Cs in surface soil is moderately extensive because the 95 UCL activity level exceeded the remediation goal (0.113 picocuries per gram [pCi/g]; residential and outdoor worker remediation goals are identical) in 16 out of 72 survey units.
- ²²⁶Ra (an ROC in all radiologically impacted areas at Parcel E-2) – The extent of ²²⁶Ra in surface soil is widespread because the 95 UCL activity level exceeded the remediation goal (1 pCi/g above background not to exceed 2 pCi/g; residential and outdoor worker remediation goals are identical) in 69 out of 72 survey units.
- ⁶⁰Co (an ROC in the Ship-Shielding Area at Parcel E-2) – The extent of ⁶⁰Co in surface soil is moderately extensive because the 95 UCL activity level exceeded the remediation goal for an outdoor worker (0.0602 pCi/g) in three of the eight survey units located in the vicinity of the Ship-Shielding Area. However, using the more conservative residential remediation goal (0.0361 pCi/g), the extent of ⁶⁰Co in surface soil in the vicinity of the Ship-Shielding Area is extensive because the 95 UCL activity level exceeded the remediation goal for residents in all eight of the survey units. As described in [Table 1](#), the Navy has initiated a TCRA in the Ship-Shielding Area to address potential ⁶⁰Co contamination. In planning the TCRA, the Navy **revised the remediation goal for ⁶⁰Co**⁽¹⁹⁾ (0.252 pCi/g); this change is further discussed in [Section 2.9.5](#).
- ⁹⁰Sr (an ROC in all radiologically impacted areas at Parcel E-2) – ⁹⁰Sr is not present in surface soil at radioactivity levels exceeding the outdoor worker remediation goal (10.8 pCi/g); however, using the more conservative residential remediation goal (0.331 pCi/g), the extent of ⁹⁰Sr in surface soil in Parcel E-2 is moderately extensive because the 95 UCL activity level exceeded the remediation goal for residents in 37 of the 72 survey units.

The extent of radioactive contamination in subsurface soil and shoreline sediment has not been completely defined; however, the selected remedy conservatively assumes, consistent with the findings of the HRA and radiological addendum to the RI/FS Report, that potential radionuclides (specifically, ^{137}Cs , ^{60}Co , ^{226}Ra , and ^{90}Sr) may be present in subsurface soil and shoreline sediment at Parcel E-2 and will therefore require remedial action. In addition, the RI/FS Report concluded that subsurface soil and shoreline sediment throughout Parcel E-2 contains nonradioactive chemicals that require remedial action. As a result, the selected remedy addresses the potential radionuclides and nonradioactive chemicals in subsurface soil and shoreline sediment at Parcel E-2.

The groundwater data set from two investigations, performed in 2002 and 2008, consists of samples collected from 78 A-aquifer wells and one B-aquifer well and analyzed for ^{137}Cs , ^{226}Ra , and ^{90}Sr . The **radionuclide groundwater data**⁽²⁰⁾ were evaluated by simple (non-statistical) threshold comparisons with a fixed standard (such as drinking water standards) and by statistical tests comparing the site data with fixed standards (one-sample statistical tests). Through these comparisons, the radiological addendum concluded that groundwater does not appear to have been impacted by radionuclides at activity levels that warrant remedial action. However, nonradioactive chemicals in groundwater within and in close proximity to the Parcel E-2 Landfill require remedial action, including monitoring, institutional controls, source removal, and containment. As a conservative measure, future monitoring will include analysis for radionuclides in groundwater to verify the conclusions of the radiological addendum.

2.4. CURRENT AND POTENTIAL FUTURE SITE USES

The data analysis, risk evaluations, and remedial alternatives presented in the RI/FS Report assumed that the **future reuse**⁽²¹⁾ of Parcel E-2 will be open space. This assumption was developed in consultation with the City and County of San Francisco based on the 1997 “Hunters Point Shipyard Redevelopment Plan.” Pursuant to the City and County of San Francisco’s **2010 amended Redevelopment Plan**⁽²²⁾, two small areas (less than 1 acre) in the East Adjacent Area were designated as part of the “Shipyard South Multi-Use District” and an adjacent roadway. The Shipyard South Multi-Use District may be used for recreational, industrial, and residential purposes, but these potential land uses were not anticipated during preparation of the RI/FS Report. The Navy, in consultation with the EPA, DTSC, the Water Board, and the City and County of San Francisco, concluded that a **boundary change between Parcels E and E-2**⁽²³⁾ was the most effective way to resolve this discrepancy. **Figure 8** presents the planned reuses within Parcel E-2 and identifies the boundary change between Parcels E and E-2. The revised boundary between Parcels E and E-2 results in the Shipyard South Multi-Use District no longer being located in Parcel E-2, and the planned reuse for Parcel E-2 is now limited to open space.

Figure 8. Planned Reuses

Groundwater in the A-aquifer, as discussed in the RI/FS Report, is not suitable for use as **drinking water**⁽⁸⁾. Exposures to the A-aquifer were evaluated based on transport of groundwater to San Francisco Bay. Groundwater in the B-aquifer was evaluated as a drinking water source, based on pertinent regulatory criteria, and was determined to have a moderate potential for use as drinking water.

2.5. SUMMARY OF SITE RISKS

Potential contamination at Parcel E-2 is mostly attributed to waste disposal activities by the Navy or other tenants except for several metals (such as arsenic, manganese, and nickel), which were found at concentrations consistent with ambient levels in the local serpentine bedrock. Contaminated media at Parcel E-2 consist of soil, soil gas (emanating from the landfill), groundwater, surface water runoff, and intertidal sediment. The primary contaminant transport mechanisms are (1) surface water runoff into San Francisco Bay, (2) water infiltration and percolation into subsurface soil and groundwater, and (3) landfill gas migration to off-site property. A general conceptual site model (CSM) for Parcel E-2 is provided on [Figure 9](#). Based on the CSM, Parcel E-2 was evaluated for potential risks to human health and the environment in the RI/FS Report and its radiological addendum. [Section 2.5.1](#) presents the results of the human health risk assessment (HHRA). [Section 2.5.2](#) presents the results of the ecological risk assessments.

Figure 9. Conceptual Site Model

2.5.1. Human Health Risk Assessment

Based on a [CSM for human health](#)⁽²⁴⁾, a [quantitative HHRA](#)⁽²⁵⁾ was completed for soil and groundwater at the Parcel E-2 Landfill and the East Adjacent and Panhandle Areas. In addition, risks to human health from NMOCs in landfill gas were evaluated using the Johnson and Ettinger vapor intrusion model. Potential [cancer risks and noncancer hazards](#)⁽²⁶⁾ were calculated based on reasonable maximum exposure (RME) assumptions recommended by EPA and DTSC. These assumptions are based on an RME rather than an average or medium range exposure assumption and provide a conservative and protective approach that estimates the highest health risks that are reasonably expected to occur at a site.

Cancer risk is the estimated probability that a person will develop cancer from exposure to site contaminants and is generally expressed as an upper-bound probability. For example, a 1 in 1,000,000 chance is a risk that for every 1,000,000 people, one additional cancer case may occur as a result of exposure to site contaminants. The Navy adopted a conservative approach at Parcel E-2 and evaluated action where potential risk exceeded 1 in 1,000,000, which meets the most conservative end of the risk management range established by EPA.

Noncancer hazard is the risk of health effects other than cancer, and is expressed as a number called the hazard index (HI). An HI of 1 or less is considered an acceptable exposure level for noncancer health hazards. The Navy evaluated action at Parcel E-2 areas with an HI greater than 1.

Both **total and incremental risks**⁽²⁷⁾ were evaluated for exposure to soil. For the total risk evaluation, all detected chemicals, including naturally occurring metals from the serpentine bedrock-derived fill material, were included as chemicals of potential concern regardless of their concentration. Only the essential nutrients calcium, magnesium, potassium, and sodium were not included as chemicals of potential concern. The total risk evaluation provides an estimate of the risks posed by chemicals and radionuclides at the site, including those present at concentrations at or less than ambient levels. For the incremental risk evaluation, the above essential nutrients and detected metals with maximum measured concentrations less than the Hunters Point ambient levels were excluded as chemicals of potential concern. The incremental risk evaluation provides an estimate of risks posed by metals and radionuclides present at the site that exceed the ambient levels.

Potential unacceptable risks include cancer risks and noncancer hazards for future receptors from exposure to soil or groundwater as discussed below. Potential unacceptable risk is defined as an excess lifetime cancer risk of greater than 1 in 1,000,000 or a segregated HI greater than 1 as calculated by the incremental risk evaluation.

Based on the **HHRA results for nonradioactive chemicals in soil and groundwater**⁽²⁸⁾, cancer risks exceeded 1 in 1,000,000 and noncancer hazards were greater than 1 (see **Tables 2 and 3**). In addition, **cancer risks from exposure to radionuclides in soil**⁽²⁹⁾ exceeded 1 in 1,000,000 (see **Table 2**). The highest cancer risks and noncancer hazards in soil were driven by PCB concentrations at the western and southwestern sidewall of the PCB Hot Spot Area, where the Phase 1 excavation activities stopped. Risk in this area is being addressed by the Phase 2 TCRA, which is scheduled to be completed in 2012 (see **Section 2.9.2** for further information on potential follow-on action in this area). The highest cancer risks and noncancer hazards in groundwater were estimated for future residents that could theoretically drink groundwater beneath Parcel E-2.

Table 2. Cancer Risks and Noncancer Hazards, Soil^a

Parcel E-2 Area	Exposure Scenario	Cancer Risk		Noncancer Hazard Index
		Nonradioactive Chemicals	Radionuclides	
Parcel E-2 Landfill	Recreational	2 in 10,000	2 in 10,000	20
Panhandle Area	Recreational	6 in 10,000	1 in 10,000	6
East Adjacent Area	Recreational	6 in 10,000	2 in 10,000	10

Notes:

a = Listed risk value is the highest calculated value for Parcel E-2; risk is based on conditions before cleanup.

Table 3. Cancer Risks and Noncancer Hazards, Soil Gas and Groundwater^{a,b}

Exposure Pathway	Exposure Scenario	Cancer Risk	Noncancer Hazard Index
Breathing Vapors from Landfill Gas	Residential/ Industrial ^c	6 in 10,000,000 (residential) 4 in 10,000,000 (industrial)	<1
Breathing Vapors from Groundwater	Construction Worker	1 in 10,000	<1
Drinking Groundwater	Residential ^d	5 in 1,000	80

Notes:

a = Listed risk value is the highest calculated value for Parcel E-2; risk is based on conditions before cleanup.

b = No complete exposure pathways for planned open space reuse; other pathways evaluated to conservatively estimate risk.

c = Evaluation used gas data collected north of the landfill for residential and industrial exposure scenarios.

d = Evaluation used shallow and deep groundwater data; groundwater is an unlikely source of drinking water because of high natural salt levels.

Estimated cancer risks from exposure to **NMOCs in landfill gas**⁽³⁰⁾ were less than 1 in 1,000,000 and noncancer hazards were less than 1 (see [Table 3](#)). Although remedial action is not required to mitigate cancer risks or noncancer hazards associated with landfill gas exposure, the selected remedy includes measures to ensure that methane concentrations are controlled within limits specified in California Code of Regulations (Cal. Code Regs.) Title (tit.) 27 § 20921(a). In addition, an NMOC action level of 500 parts per million by volume (ppmv) was developed, as part of the ongoing landfill gas monitoring program, to ensure that cancer risks and noncancer hazards remain within acceptable limits.

The HHRA specifies the **assumptions and uncertainties**⁽³¹⁾ inherent in the risk assessment process due to the number of samples collected or their location, the literature-based exposure and toxicity values used to calculate risk, and risk characterization across multiple media and exposure pathways. The effects of uncertainties are overestimation or underestimation of the actual cancer risk or HI. In general, the risk assessment process is based on the use of conservative (health protective) assumptions that when combined are intended to overestimate the actual risk.

2.5.2. Ecological Risk Assessment

The Navy performed a **screening-level ecological risk assessment**⁽³²⁾ (SLERA) to evaluate risks to wildlife (such as small mammals, birds, and marine life) from exposure to soil and sediment. The SLERA compared soil data against site-specific protective soil concentrations (PSCs) and ambient levels, and shoreline sediment data against various regulatory criteria (most notably, effects range-median values and ambient levels for San Francisco Bay). Based on comparison results, the Navy concluded that contaminated soil and shoreline sediment in Parcel E-2 pose a potential threat to wildlife. COECs include cadmium, copper, lead, manganese, mercury, nickel, vanadium, and zinc; polycyclic aromatic hydrocarbons; total dichlorodiphenyltrichloroethane (i.e., DDT); and total PCBs. The SLERA is a conservative assessment of potential risks to wildlife that was necessitated by the collection of additional data during the soil data gaps investigation in 2002. The Navy determined that the SLERA did not require further refinement because the original baseline ecological risk assessment, performed in 1997 as part of the original Parcel E RI (when Parcel E-2 was part of Parcel E), reached similar conclusions.

In addition, the Navy performed a SLERA to evaluate **risks to aquatic wildlife**⁽³³⁾ from exposure to potentially contaminated groundwater at Parcel E-2. Chemical concentrations in groundwater were screened against the assigned aquatic evaluation criteria, mainly comprising saltwater aquatic criteria, to identify chemicals of potential ecological concern (COPECs) for surface water quality. Site-specific data for select COPECs were then evaluated against **trigger levels**⁽³⁴⁾, consistent with the methods used in recent FS reports at other HPNS parcels, to further confirm if the COPECs needed to be addressed in remedial alternatives. Based on concentrations exceeding trigger levels (as adjusted based on ambient levels), the following chemicals (or groups of chemicals) pose a potential risk to aquatic wildlife exposed to potentially contaminated groundwater at Parcel E-2: copper, lead, and zinc; un-ionized ammonia, sulfide, and cyanide; PCBs; and TPH.

2.5.3. Basis for Response Action

The response action selected in this ROD is necessary to protect the public health, welfare, or the environment from actual or potential releases of hazardous substances into the environment. The Navy, in partnership with EPA, DTSC, and the Water Board, considered all pertinent factors in accordance with CERCLA and NCP remedy selection criteria and determined that remedial action is necessary to clean up soil, sediment, groundwater, landfill gas, and radiologically-impacted sanitary sewer and storm drain lines and soil at Parcel E-2. This determination was made because:

- Based on the HHRA results for **nonradioactive chemicals in soil**⁽³⁵⁾ and **groundwater**⁽³⁶⁾, cancer risks exceed 1 in 1,000,000 and noncancer hazards were greater than 1 (see [Tables 2 and 3](#)).
- Cancer risks from exposure to **radionuclides in soil**⁽³⁷⁾ exceed 1 in 1,000,000 (see [Table 2](#)).
- Methane concentrations in **landfill gas**⁽³⁸⁾ must be controlled within limits specified in Cal. Code Regs. tit. 27 § 20921(a).
- Based on the **SLERA results**⁽³⁹⁾, chemical concentrations in soil, shoreline sediment, and groundwater in Parcel E-2 pose a potential threat to wildlife.

The HHRA identified numerous nonradioactive COCs and several ROCs (specifically, ¹³⁷Cs, ⁶⁰Co, ²²⁶Ra, and ⁹⁰Sr) in soil present at concentrations that posed an unacceptable cancer risk or noncancer hazard. The elevated concentrations of several COCs (most notably lead and PCBs) and one ROC (²²⁶Ra) were found to be dispersed over large portions of Parcel E-2. The widespread extent of these COCs and ROC prompted the Navy to consider a combination of removal and containment options in developing potential response actions. Specifically, the Navy identified an approach that proposed removal of the soil areas that posed the most significant risk to humans, and proposed containment for the remaining soil areas that posed a lower risk to humans.

In identifying potential areas for removal, the Navy focused the list of COCs to those nonradioactive chemicals present at concentrations that exceeded the **remediation goals**⁽⁴⁰⁾, which generally correspond to a cancer risk of 1 in 1,000,000 or a noncancer HI of 1, by a factor of 10 or 100. Areas containing elevated nonradioactive COC concentrations pose the most significant risk to humans and are referred to as **hot spots**⁽⁴¹⁾. Similarly, the Navy focused the list of COECs in soil and sediment to those nonradioactive chemicals present at concentrations that exceeded the remediation goals (corresponding to PSCs and other pertinent regulatory criteria) by a factor of 10 or 100.

The hot spots identified based on the process described above were categorized based on their potential risk to humans and wildlife:

- Nearshore hot spots were determined to pose the most substantial risk because they are a continuing source to groundwater contamination and are located in close proximity to San Francisco Bay. For COCs and COECs at these locations, hot spot goals were established at 10 times the remediation goals.
- Upland hot spots were determined to pose a slightly lower risk because they do not appear to be a continuing source to groundwater contamination and are located farther inland from San Francisco Bay. For COCs and COECs at these locations, hot spot goals were established at 100 times the remediation goals.
- An area was identified that appears to be a continuing source of VOCs to groundwater. Although this source area does not pose a risk to future recreational users at Parcel E-2, it could migrate to the adjacent Parcel E property at concentrations that may pose an unacceptable risk to future occupants. For VOCs at these locations, hot spot goals were established equal to the remediation goals for future residential occupants (consistent with the planned reuse at the adjacent Parcel E property).

Figure 10 identifies the locations of COCs and COECs at the nearshore hot spots, upland hot spots, and VOC source area. The Navy is excavating some of the hot spots identified in the ROD pursuant to a Phase 2 TCRA Action Memorandum for the PCB Hot Spot Area (see Figure 7). However, because hot spot goals have not been achieved through excavation at the date of ROD signature, the excavations to achieve hot spot goals will be completed as a remedial action pursuant to this ROD (see Section 2.9.2 for further information on follow-on action in this area).

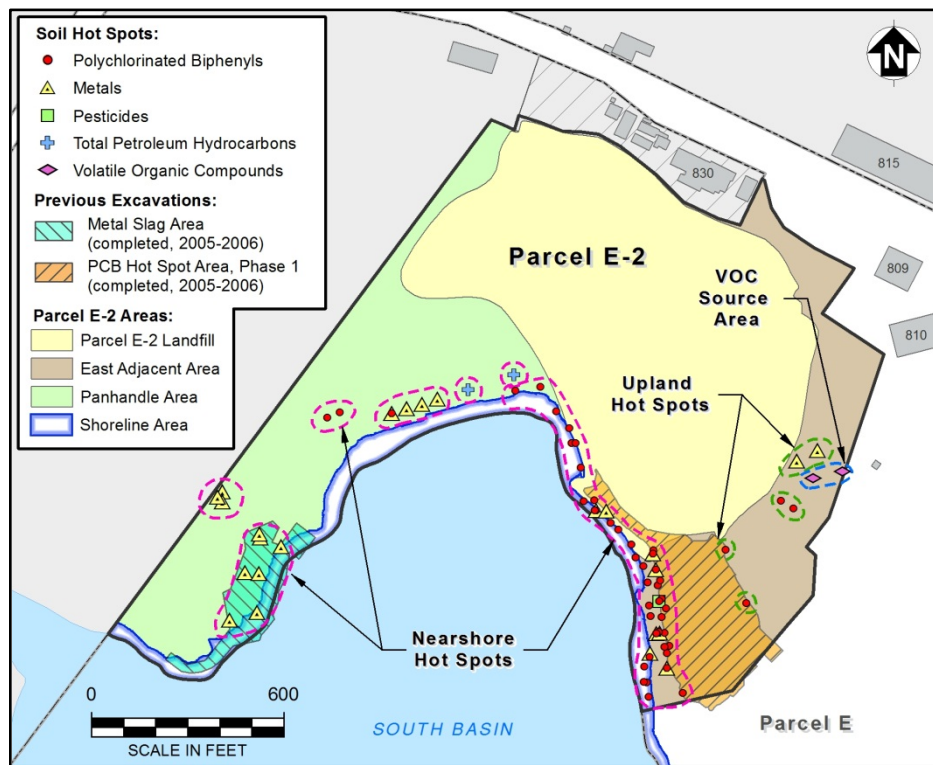

Table 4 identifies the COCs and COECs at the soil hot spots, along with the most stringent remediation goals and hot spot goals for each COC and COEC.

Table 4. Chemicals of Concern at Hot Spots

Hot Spot Category	Impacted Media	COC/COEC	Remediation Goal (mg/kg)	Hot Spot Goal (mg/kg)	Basis for Hot Spot Goal
Nearshore Hot Spots	Soil	Copper	470	4,700	10 times remediation goal for terrestrial wildlife ^a
		Heptachlor epoxide	0.21	2.1	10 times remediation goal for recreational users ^a
		Lead	197	1,970	10 times remediation goal for terrestrial wildlife ^a
		Total PCBs	0.74	7.4	10 times remediation goal for recreational users ^a
		Total TPH	3,500	3,500	TPH source criterion ^b
		Zinc	719	7,190	10 times remediation goal for terrestrial wildlife ^a
	Intertidal Sediment	Copper	270	2,700	10 times remediation goal for aquatic wildlife ^a
		Lead	218	2,180	10 times remediation goal for aquatic wildlife ^a
		Total PCBs	0.18	1.8	10 times remediation goal for aquatic wildlife ^a
		Total TPH	3,500	3,500	TPH source criterion ^b
Upland Hot Spots	Soil	Lead	197	19,700	100 times remediation goal for terrestrial wildlife ^a
		Total PCBs	0.74	74	100 times remediation goal for recreational users ^a
		Total TPH	3,500	3,500	TPH source criterion ^b
VOC Source Area	Soil	1,1-Dichloroethane	--	2.8	Residential RBC (for Parcel E) ^c
		Tetrachloroethene	--	0.48	Residential RBC (for Parcel E) ^c
		Trichloroethene	--	2.9	Residential RBC (for Parcel E) ^c
		Vinyl chloride	--	0.024	Residential RBC (for Parcel E) ^c

Notes:

- a Remediation goals for recreational users, terrestrial wildlife, and aquatic wildlife are detailed in Table 5.
- b The TPH source criterion represents the most conservative evaluation criterion for potential sources of groundwater contamination that may impact aquatic wildlife in San Francisco Bay, and is selected as the hotspot goal in areas where total TPH is known to be present in groundwater at concentrations exceeding the corresponding remediation goal (see Table 7 and Figure 11). The presence of total TPH at individual hot spots will be further evaluated in the remedial design.
- c Residential RBCs (for the select VOCs that are present in Parcel E-2 and impact groundwater at Parcel E at concentrations that pose a risk to humans) represent the most conservative evaluation criteria and are selected as hotspot goals to maximize the effectiveness of the VOC source removal effort and on the presumption that, based on available site data, the VOC source area is limited in volume (see Figure 10).

COC = chemical of concern

COEC = chemical of ecological concern

mg/kg = milligrams per kilogram

PCBs = polychlorinated biphenyls

RBC = risk-based criteria

TPH = total petroleum hydrocarbons

VOC = volatile organic compounds

-- = not applicable

The Navy focused the removal for ROCs to the surface of radiologically impacted areas in Parcel E-2 (see [Figure 3](#)) because these areas posed the most significant risk to future recreational users. Following cleanup of ROCs near the ground surface, a cover (comprised of clean imported soil and geosynthetic material) and institutional controls, would effectively prevent unacceptable exposures to remaining concentrations of COCs and ROCs.

The HHRA identified numerous nonradioactive COCs in groundwater present at concentrations that exceeded remediation goals corresponding to either a cancer risk level of 1 in 1,000,000 or a noncancer hazard index of 1. In evaluating potential response actions, the Navy determined that potential risks to humans from exposure to groundwater could be adequately addressed through institutional controls and monitoring. However, the SLERA identified several nonradioactive COPECs in groundwater that could migrate to San Francisco Bay at concentrations that exceed evaluation criteria for aquatic wildlife. The COPECs identified are copper, lead, and zinc; un-ionized ammonia, sulfide, and cyanide; PCBs; and TPH. [Figure 11](#) identifies the groundwater areas where COPECs are present at concentrations that pose a potential risk to aquatic wildlife. Remedial action, in the form of source removal, containment, and monitoring, is needed to address this potential risk, and will be further evaluated in the RD using results from the ongoing groundwater monitoring program. Un-ionized ammonia and sulfide are not shown on [Figure 11](#) because these COPECs are generated

during decomposition of organic matter (both naturally occurring and anthropogenic) in reducing environments, and are readily transformed to non-toxic compounds upon discharge to oxygenated surface water. Accordingly, neither source removal nor containment is needed to protect aquatic wildlife from exposure to these COPECs; however, monitoring for these COPECs will be performed to verify the protectiveness of the remedy. As discussed in [Section 2.3.6](#), the radiological addendum concluded that groundwater does not appear to have been impacted by

Figure 11. Groundwater Areas Posing a Potential Risk to Aquatic Wildlife

radionuclides at activity levels that warrant remedial action; however, because monitoring is being performed for various COCs and COPECs, future monitoring will include analysis for radionuclides in groundwater to verify the conclusions of the radiological addendum.

2.6. PRINCIPAL THREAT WASTE

According to EPA's "Guide to Principal Threat and Low Level Threat Wastes," principal threat wastes are those source materials considered to be highly toxic or highly mobile that generally cannot be reliably contained or would present a significant risk to human health or the environment should exposure occur. The Navy identified **potential hot spots within the northern and central portions of the Parcel E-2 Landfill**⁽⁴²⁾, but determined that these materials are not principal threat wastes because they (1) are located at relatively deep depths (8 to 17 feet below ground surface [bgs]); (2) have not migrated to A- or B-aquifer groundwater; (3) are located far from the Parcel E-2 shoreline (390 to 780 feet); and (4) are not connected with the PCB Hot Spot Area.

Following the Phase 1 TCRA at the PCB Hot Spot Area, remaining chemical concentrations were identified as potential principal threat wastes because (1) PCB and heptachlor epoxide concentrations exceed the remediation goals by more than 100 times and are located at relatively shallow depths (0.5 to 7 feet bgs); (2) PCB and heptachlor epoxide were reported in groundwater during a subsequent data gaps investigation in this area; and (3) the area is located along the Parcel E-2 shoreline. To promptly address this potential threat, the Navy initiated a Phase 2 TCRA in this area in 2010, which is scheduled to be completed in 2012 (see [Section 2.9.2](#) for further information on potential follow-on action in this area).

In addition, elevated lead concentrations in the East Adjacent Area were identified as potential principal threat wastes because concentrations exceed the remediation goals by more than 100 times and are located at relatively shallow depths (4 feet bgs). To promptly address this potential threat, the Navy added this area to the Phase 2 TCRA at the PCB Hot Spot Area. As discussed previously, the Phase 2 TCRA is scheduled to be completed in 2012 (see [Section 2.9.2](#) for further information on potential follow-on action in this area).

2.7. REMEDIAL ACTION OBJECTIVES

Remedial action objectives⁽⁴³⁾ (RAOs) are established based on attainment of regulatory requirements, standards, and guidance; contaminated media; COCs and COECs; potential receptors and exposure scenarios; and human health and ecological risks. Ultimately, the success of a remedial action is measured by its ability to meet the RAOs. Planned future land use is an important component in developing RAOs, and the RAOs for Parcel E-2 are based on future open space reuse.

The RAOs for Parcel E-2 were developed in conjunction with the regulatory agencies and are listed below by medium.

Soil and Sediment RAOs

1. Prevent human exposure to inorganic and organic chemicals at concentrations greater than remediation goals (see [Table 5](#)) for the following exposure pathways:
 - Ingestion of, outdoor inhalation of, and dermal exposure to solid waste, soil, or sediment from 0 to 2 feet bgs by recreational users throughout Parcel E-2.
 - Ingestion of, outdoor air inhalation of, and dermal exposure to solid waste, soil, or sediment from 0 to 10 feet bgs by construction workers throughout Parcel E-2.
2. Prevent ecological exposure to concentrations of inorganic and organic chemicals in solid waste or soil greater than remediation goals (see [Table 5](#)) from 0 to 3 feet bgs by terrestrial wildlife throughout Parcel E-2.
3. Prevent ecological exposure to concentrations of inorganic and organic chemicals in intertidal sediment greater than remediation goals (see [Table 5](#)) from 0 to 2.5 feet bgs by aquatic wildlife throughout the Shoreline Area.
4. Prevent exposure to ROCs at activity levels that exceed remediation goals (see [Table 6](#)) for all potentially complete exposure pathways.

Landfill Gas RAOs

1. Control methane concentrations to 5 percent (by volume in air) or less at subsurface points of compliance.
2. Control methane concentrations to 1.25 percent (by volume in air) or less in on-site structures (“on site” for this ROD is defined as any area within the subsurface points of compliance for landfill gas).
3. Prevent exposure to NMOCs at concentrations greater than 500 ppmv at the subsurface points of compliance.
4. Prevent exposure to NMOCs at concentrations greater than 5 ppmv above background levels in the breathing zone of on-site workers and visitors.

Groundwater RAOs, Domestic Use

1. Prevent exposure to groundwater that may contain COCs at concentrations greater than remediation goals (see [Table 7](#)) through the domestic use pathway.
2. Prevent or minimize migration of B-aquifer groundwater that may contain COCs at concentrations greater than remediation goals (see [Table 7](#)) beyond the **point of compliance**⁽⁴⁴⁾ (defined in the RI/FS Report at the downgradient boundary of Parcel E-2).

Groundwater RAOs, Construction Worker

1. Prevent or minimize dermal exposure to and vapor inhalation from A-aquifer groundwater containing COCs at concentrations greater than remediation goals (see [Table 7](#)) by construction workers.

Groundwater RAOs, Protection of Wildlife

1. Prevent or minimize migration of COPECs to prevent discharge that would result in concentrations greater than the corresponding **water quality criteria**₍₄₅₎ for aquatic wildlife.
2. Prevent or minimize migration of A-aquifer groundwater containing total TPH concentrations greater than the remediation goal (see [Table 7](#)) (where commingled with CERCLA substances) into San Francisco Bay.

Surface Water RAOs

1. Prevent or minimize migration of COPECs to prevent discharge that would result in concentrations greater than the corresponding **water quality criteria**₍₄₅₎ for aquatic wildlife.

[Table 5](#) lists the remediation goals for COCs and COECs in soil and sediment. [Table 6](#) lists the remediation goals for ROCs in soil and sediment, and reflects the **revised remediation goal for ⁶⁰Co**₍₁₉₎. [Table 7](#) lists the remediation goals for COCs and COECs in groundwater. With the exception of total TPH, chemicals in groundwater that may pose a risk to aquatic wildlife in San Francisco Bay (see [Figure 11](#)) are considered COPECs given the conservative nature of the groundwater SLERA (see [Section 2.5.2](#)). As such, groundwater remediation goals have not been developed for these COPECs. However, the groundwater COPECs are addressed under the selected remedy through source removal, containment, and monitoring actions.

Development of groundwater monitoring criteria for COPECs is problematic at this stage because of the conservative nature of the groundwater SLERA. The water quality criteria, as referenced in the groundwater RAO, are based on standards for aquatic wildlife in San Francisco Bay, apply to surface water at the interface of the A-aquifer groundwater, and do not apply to in-situ A-aquifer groundwater at Parcel E-2. Development of specific monitoring criteria for A-aquifer groundwater that address the potential risk to aquatic wildlife in San Francisco Bay requires a more refined fate and transport modeling to more rigorously assess the groundwater-to-surface water transport mechanism. Such refined modeling is not considered necessary to proceed with the ROD because, as stated above, the source removal, containment, and monitoring actions, as evaluated in the remedial alternatives, will address the potential risk to aquatic wildlife in San Francisco Bay. The Navy, with input from regulatory agencies, will develop specific monitoring criteria for A-aquifer groundwater and refine the fate and transport modeling, as needed to support development of the monitoring criteria, during the RD phase.

Table 5. Remediation Goals for Nonradioactive Chemicals in Soil and Sediment

Exposure Scenario	COC/COEC	Remediation Goal (mg/kg)	Exposure Scenario	COC/COEC	Remediation Goal (mg/kg)	
Recreational	Antimony	270	Construction Worker <i>(continued)</i>	Dioxin (TEQ)	0.00023	
	Aroclor-1242	0.74		Heptachlor epoxide	1	
	Aroclor-1248	0.74		Indeno(1,2,3-cd)pyrene	6.5	
	Aroclor-1254	0.74		Iron	93,000	
	Aroclor-1260	0.74		Lead	800	
	Arsenic	11.1		Manganese	6,900	
	Benzo(a)anthracene	1.3		Naphthalene	75	
	Benzo(a)pyrene	0.33		Total PCBs (non-dioxin)	2.1	
	Benzo(b)fluoranthene	1.3		Total TPH	3,500	
	Benzo(k)fluoranthene	1.3		Vanadium	310	
	Dieldrin	0.12		Terrestrial Wildlife	Cadmium	4.2
	Heptachlor epoxide	0.21			Copper	470
	Indeno(1,2,3-cd)pyrene	1.3			Lead	197
	Lead	155			Manganese	2,433
	Total PCBs (Non-Dioxin)	0.74			Mercury	1.0
Construction Worker	4,4'-DDT	45	Aquatic Wildlife	Nickel	1,941	
	Antimony	120		Vanadium	117	
	Aroclor-1016	7.4		Zinc	719	
	Aroclor-1242	2.1		Total DDT	3.53	
	Aroclor-1248	2.1		Total PCBs	37	
	Aroclor-1254	2.1		Total HMW PAHs	231	
	Aroclor-1260	2.1		Antimony	25	
	Arsenic	11.1		Copper	270	
	Benzo(a)anthracene	6.5		Lead	218	
	Benzo(a)pyrene	0.65		Mercury	0.71	
	Benzo(b)fluoranthene	6.5		Nickel	112	
	Benzo(k)fluoranthene	6.5		Zinc	410	
	Cadmium	150		Total DDTs	0.046	
	Copper	11,000		Dieldrin	0.008	
	Dibenz(a,h)anthracene	1.1		Endrin	0.045	
Dieldrin	0.57	Total PCBs	0.18			

Notes: The basis (risk-based or ambient level) for the remediation goals is presented in Sections 7 and 9 of the RI/FS Report.

COC = chemical of concern

COEC = chemical of ecological concern

DDT = dichlorodiphenyltrichloroethane

HMW = high-molecular weight

mg/kg = milligrams per kilogram

PAHs = polycyclic aromatic hydrocarbons

PCBs = polychlorinated biphenyls

TEQ = toxic equivalent

Table 6. Remediation Goals for Radionuclides in Soil and Sediment

Radionuclide of Concern	Exposure Scenario	
	Outdoor Worker (pCi/g)	Resident ^a (pCi/g)
Cesium-137	0.113	0.113
Cobalt-60	0.252 ^b	0.252 ^b
Radium-226	1.0 ^c	1.0 ^c
Strontium-90	10.8	0.331

Notes: The basis (risk-based) for the remediation goals is presented in Sections 7 and 9 of the radiological addendum.

a = Residential use is not planned for Parcel E-2, but residential goals are proposed as an additional level of protection.

b = Remediation goal for cobalt-60 was revised to support efficient laboratory gamma spectroscopy analysis of soil samples. This revised remediation goal maintains morbidity risks within the EPA-defined acceptable range and permits an exposure level that does not increase the risk of cancer from a potential exposure to cobalt-60.

c = Remediation goal is 1 pCi/g above background per agreement with EPA (established in "Final Basewide Radiological Removal Action, Action Memorandum – Revision 2006, Hunters Point Shipyard, San Francisco, California," dated April 21, 2006), and is consistent with the radiological-related remedies selected in the RODs for Parcels B, G, and D-1 and UC-1. The radium-226 background level for surface soil is 0.633 pCi/g. The radium-226 background level for storm drain and sewer lines is 0.485 pCi/g. The background levels for radium-226 may be reevaluated in the Parcel E-2 RD and are subject to regulatory agency approval.

EPA = U.S. Environmental Protection Agency

pCi/g = picocuries per gram

RD = remedial design

RODs = Records of Decision

Table 7. Remediation Goals for Groundwater

Exposure Scenario	COC/COEC	Remediation Goal (µg/L)	Exposure Scenario	COC/COEC	Remediation Goal (µg/L)
Construction Worker Exposure to Shallow Groundwater	Benzo(a)anthracene	0.67	Domestic Use of Deep Groundwater	Bis(2-ethylhexyl)phthalate	10
	Benzo(a)pyrene	0.05		beta-BHC	0.05
	Benzo(b)fluoranthene	0.45		Carbon tetrachloride	0.5
	Benzo(k)fluoranthene	0.45		Chloroform	80
	Dibenz(a,h)anthracene	0.05		Chromium VI	109
	Indeno(1,2,3-cd)pyrene	0.31		Chrysene	0.56
	Lead	15		Dibenz(a,h)anthracene	2
Domestic Use of Deep Groundwater	1,1-Dichloroethane	5		Dieldrin	0.02
	1,2,3-Trichloropropane	1		Heptachlor	0.01
	1,2-Dichloroethane	0.5		Heptachlor epoxide	0.01
	1,4-Dichlorobenzene	5		Heptachlor epoxide A	0.01
	4-Nitrophenol	3.4		Heptachlor epoxide B	0.01
	Aroclor-1016	0.5		Indeno(1,2,3-cd)pyrene	0.2
	Aroclor-1242	0.5		Iron	10,950
	Aroclor-1254	0.5		Lead	15
	Aroclor-1260	0.5		Methylene chloride	5
	Arsenic	10		Naphthalene	1
	Benzene	1	Tetrachloroethene	5	
	Benzo(a)anthracene	0.2	Thallium	2	
	Benzo(a)pyrene	0.2	Trichloroethene	5	
	Benzo(b)fluoranthene	0.2	Vinyl chloride	0.5	
	Benzo(k)fluoranthene	0.2	Wildlife in the bay	Total TPH (goals vary based on distance from the bay) ^a	1,400 to 20,000

Notes: The basis (risk-based, regulatory limit, or ambient level) for the remediation goals is presented in Sections 7 and 9 of the RI/FS Report.

^a =The distance-based TPH criteria are as follows:

Distance from shoreline (feet)	Total TPH (µg/L)	Distance from shoreline (feet)	Total TPH (µg/L)
0-<25	1,400	125-<150	6,949
25-<50	1,467	150-<175	9,539
50-<75	2,092	175-<200	12,604
75-<100	3,216	200-<225	16,145
100-<125	4,839	≥225	20,000

BHC = benzene hexachloride

COC = chemical of concern

COEC = chemical of ecological concern

TPH = total petroleum hydrocarbons

µg/L = micrograms per liter

2.8. DESCRIPTION AND EVALUATION OF REMEDIAL ALTERNATIVES

The Navy screened a range of **general response actions and remedial technologies**⁽⁴⁶⁾ and then, using the retained technologies, developed alternatives in the FS to address contamination at Parcel E-2. In developing the remedial alternatives, the Navy evaluated conditions at the Parcel E-2 Landfill relative to specific criteria established by EPA in their **presumptive remedy guidance**⁽⁴⁷⁾ for CERCLA landfills. The Navy determined that the Parcel E-2 Landfill meets all of the criteria specified in EPA's presumptive remedy guidance, and that the FS could be simplified to focus only on containment of the Parcel E-2 Landfill. However, based on feedback from members of the local community, the Navy chose to evaluate complete excavation of the landfill in the FS (Alternative 2) to provide information to support the community's review of potential remedial alternatives for Parcel E-2. In addition, the Navy evaluated several remedial alternatives (Alternatives 3, 4, and 5) involving containment with removal of nearshore and upland hot spots that, as described in [Section 2.5.3](#), are located outside of the Parcel E-2 Landfill and pose a significant risk to humans and wildlife.

2.8.1. Description of Remedial Alternatives

The remedial alternatives evaluated for Parcel E-2 are listed and briefly described below. [Table 8](#) on the following page describes the major components and cost of each remedial alternative identified for Parcel E-2.

- **Alternative 1 – No Action:** For this alternative, no remedial action would take place. The no action alternative is retained throughout the FS process as required by the NCP to provide a baseline for comparison with and evaluation of other alternatives.
- **Alternative 2 – Excavate and Dispose of Solid Waste, Soil, and Sediment (including monitoring, institutional controls, and unlined freshwater wetlands):** This alternative consists of removing all waste and contaminated soil from the 22-acre Parcel E-2 Landfill (up to 30 feet deep, which includes soil under the waste that may be contaminated) and all shallow soil and sediment from the Panhandle Area, East Adjacent Area, and Shoreline Area. The proposed excavation within the Panhandle Area, East Adjacent Area, and Shoreline Area would eliminate exposure to contamination, in accordance with the exposure depths specified in the risk assessments (3 to 4 feet deep in most areas), and would extend deeper in areas with known nonradiological chemical hot spots (up to 16 feet deep). Alternative 2 would involve excavating an estimated 1,166,000 cubic yards of waste, soil, and sediment from Parcel E-2 and disposing of it at one or more approved off-site landfills, as appropriate. Over 1,000,000 cubic yards of this estimated volume would be removed from the Parcel E-2 Landfill; this volume consists of an estimated 473,000 cubic yards of solid waste, 393,500 cubic yards of overlying soil cover, and 141,750 cubic yards of soil below the solid waste that is likely contaminated. The excavations would be backfilled with an estimated 400,000 cubic yards of clean imported soil, meeting stringent chemical and radiological acceptance criteria, that would result in lower final ground surface elevations (as compared to existing conditions).

Table 8. Remedial Alternatives

	Remedial Alternative Number and Key Components	Cost
1	No actions or costs; this alternative is required by CERCLA as a baseline for comparison with the other alternatives.	No cost
2	<p>Excavation and Off-Site Disposal: Excavate all waste and contaminated soil in the Parcel E-2 Landfill and all shallow waste, soil, and sediment in the Panhandle Area, East Adjacent Area, and Shoreline Area. Dispose of excavated waste and contaminated soil and sediment at an off-site landfill.</p> <p>Wetlands Restoration in Panhandle Area and Shoreline Area: Build new tidal and freshwater wetlands with appropriate soil and vegetation. Maintain and monitor wetlands.</p> <p>Groundwater Monitoring/ICs: Implement long-term monitoring of groundwater to assess whether chemicals are migrating and to monitor changes in ambient conditions. Impose ICs to limit the use of land or restrict activities that take place within an area.</p> <p>Additional Radiological Actions: Excavate potential radioactive contamination from (1) drain lines that extend into the East Adjacent Area but are located outside of the boundary of IR Site 01/21, and (2) berm in the Ship-Shielding Area. Dispose of excavated waste and soil at an off-site landfill. Perform final radiological surveys at all excavated areas prior to backfilling with clean, imported soil.</p>	<p>Capital Cost: \$363.2M₍₄₈₎ Total O&M Cost: \$3.8M Present-Worth Cost: \$351.5M (2.8% discount rate) Timeframe: 34 years <i>Note: Cost includes \$5.5M for radiological actions₍₄₉₎ that are common to each alternative.</i></p>
3	<p>Excavation and Off-Site Disposal: Excavate all radioactive contamination near the ground surface. Excavate select nearshore hot spots in the Panhandle Area, East Adjacent Area, and Shoreline Area. Dispose of excavated waste and soil at an off-site landfill.</p> <p>Excavation and On-Site Consolidation: Excavate soil and debris from the parts of the Panhandle Area planned for new wetlands, and excavate sediment and debris from the Shoreline Area. Consolidate excavated soil, sediment, and debris at Parcel E-2.</p> <p>Containment: Install soil cover over all of Parcel E-2 and place a protective liner under the soil cover in all areas except the new tidal wetlands in the Panhandle Area. Build shoreline revetment at the edge of the soil cover. Perform active landfill gas extraction and treatment. Install below-ground barrier and drain at western boundary to divert groundwater flow into the landfill. Inspect and maintain soil cover, protective liner, groundwater barrier/drain, and gas control system.</p> <p>Wetlands Restoration in Panhandle Area: Build new tidal wetlands with appropriate soil and vegetation, but without a liner and shoreline revetment. Build new freshwater wetlands with appropriate soil and vegetation, and with a liner and shoreline revetment. Maintain and monitor wetlands.</p> <p>Monitoring/ICs: Implement long-term monitoring of landfill gas, stormwater, and groundwater to assess whether chemicals are migrating and to monitor changes in ambient conditions. Impose ICs to limit the use of land or restrict activities that take place within an area.</p> <p>Additional Radiological Actions: Excavate potential radioactive contamination from (1) drain lines that extend into the East Adjacent Area but are located outside of the boundary of IR Site 01/21, and (2) berm in the Ship-Shielding Area. Dispose of excavated waste and soil at an off-site landfill. Perform final radiological surveys at all excavated areas prior to backfilling with clean, imported soil.</p>	<p>Capital Cost: \$62.4M₍₅₀₎ Total O&M Cost: \$26.0M Present-Worth Cost: \$78.4M (2.8% discount rate) Timeframe: 32 years <i>Note: Cost reflects the more expensive landfill gas treatment option (Option B); the specific treatment option will be identified in the remedial design. Cost also includes \$5.5M for radiological actions that are common to each alternative.</i></p>
4	<p><i>All of the same elements as Alternative 3, but would also include:</i></p> <p>Additional Excavation and Off-Site Disposal: Excavate additional nearshore and upland hot spots in the Panhandle Area, East Adjacent Area, and Shoreline Area (Tiers 3, 4, and 5 hot spots). Dispose of excavated waste and soil at an off-site landfill.</p> <p>Groundwater Containment: Build below-ground barrier along shoreline to better limit the flow of contaminated groundwater to San Francisco Bay. Extend the below-ground barrier south into the PCB Hot Spot Area, if needed to protect the bay.</p> <p>Natural Clay Liner for Freshwater Wetlands: New freshwater wetlands would be built with a natural clay liner.</p>	<p>Capital Cost: \$70.8M₍₅₁₎ Total O&M Cost: \$26.0M Present-Worth Cost: \$86.6M (2.8% discount rate) Timeframe: 32 years <i>Same notes as Alternative 3.</i></p>
5	<p><i>All of the same elements as Alternative 4, but would also include:</i></p> <p>No Liner for Freshwater Wetlands: New freshwater wetlands would be built without a liner.</p>	<p>Capital Cost: \$70.9M₍₅₂₎ Total O&M Cost: \$26.0M Present-Worth Cost: \$86.7M (2.8% discount rate) Timeframe: 32 years</p>

Notes:

CERCLA = Comprehensive Environmental Response, Compensation, and Liability Act

ICs = institutional controls

IR = Installation Restoration

O&M = operation and maintenance

PCB = Polychlorinated Biphenyl

- **Alternative 3 – Contain Solid Waste, Soil, and Sediment with Hot Spot Removal (including monitoring, institutional controls, and lined freshwater wetlands):** This alternative consists of removing contaminated soil from nearshore hot spots adjacent to the PCB Hot Spot and Metal Slag Areas and disposing of it at one or more approved off-site landfills, as appropriate, followed by covering the remaining soil, waste, and sediment with at least 2 feet of clean soil. Alternative 3 would involve excavating 15,500 cubic yards of waste, soil, and sediment from Parcel E-2 (up to 16 feet deep), with disposal at an approved off-site landfill. In addition, the entire parcel would be scanned for radioactivity to a depth of 1 foot, and radiological contamination near the ground surface would also be excavated and disposed of at one or more approved off-site landfills, as appropriate. Excavation would also be performed in the Panhandle Area to build new wetlands (both tidal and freshwater), and the excavated material would be screened to remove radiological contamination before placing it elsewhere on Parcel E-2. A minimum 2-foot-thick soil cover would be placed over all of Parcel E-2, and a protective liner, consisting of a geomembrane with an overlying geocomposite drainage layer, would be placed under the soil cover in all areas except the new tidal wetlands (the soil cover in the wetlands would be 4-foot-thick) to minimize water seeping into the contaminated material. Alternative 3 would include elements to control landfill gas and limit the flow of contaminated groundwater to San Francisco Bay.
- **Alternative 4 – Contain Solid Waste, Soil, Sediment, and Groundwater with Hot Spot Removal (including monitoring, institutional controls, and lined freshwater wetlands):** This alternative includes the same elements as Alternative 3, but includes removal of all hot spots and additional elements to contain groundwater. A total of 26,700 cubic yards of waste, soil, and sediment would be removed from Parcel E-2 (up to 16 feet deep) and disposed of at one or more approved off-site landfills, as appropriate. This is an additional 11,200 cubic yards compared to Alternative 3. Alternative 4 would also involve building a below-ground barrier near San Francisco Bay to better limit the flow of contaminated groundwater to the bay.
- **Alternative 5 – Contain Solid Waste, Soil, Sediment, and Groundwater with Hot Spot Removal (including monitoring, institutional controls, and unlined freshwater wetlands):** This alternative would have the same components as Alternative 4, but would include restoration of freshwater wetlands without a liner.

Alternatives 2, 3, 4, and 5 would each include the following additional components that are needed to meet the RAOs for radioactively contaminated media:

- Removal and remediation of sanitary sewer, storm drain, and septic sewer lines that extend into the East Adjacent Area but are located outside of the IR Site 01/21 boundary (see [Figure 3](#))
- Removal and remediation of the ship-shielding berm in the Panhandle Area
- Final radiological surveys of the excavated subgrade of Parcel E-2 prior to backfilling with soil meeting the radiological acceptance criteria

Following completion of the final radiological survey of the excavated subgrade, Alternatives 2, 3, 4, and 5 would each include installation of a demarcation layer within the IR Site 01/21 and 02 boundaries (see [Figure 3](#)) to identify remaining radiological hazardous substances at depth, prior to backfilling with clean imported soil. The demarcation layer would consist of a permeable geosynthetic material and magnetic marking tape to ensure proper identification of the bottom of the soil cap. Institutional controls, consisting of land use and activity restrictions, would be implemented to prevent exposure to potential residual contamination in soil left in place and to preserve the integrity of the soil cap.

Alternatives 2, 3, 4, and 5 would each include monitoring and maintenance that would be performed as long as necessary to protect human health and the environment.

2.8.2. Comparative Analysis of Alternatives

A comparative analysis of alternatives with respect to the **nine evaluation criteria**⁽⁵³⁾ is provided below. Table 9 provides a relative ranking of the alternatives.

Table 9. Relative Ranking of Remedial Alternatives

CERCLA Criteria	1 No Action	2 Excavate and Dispose of Solid Waste, Soil, and Sediment (including monitoring, institutional controls, and unlined freshwater wetlands)	3 Contain Solid Waste, Soil, and Sediment with Hot Spot Removal (including monitoring, institutional controls, and lined freshwater wetlands)	4 Contain Solid Waste, Soil, Sediment, and Groundwater with Hot Spot Removal (including monitoring, institutional controls, and lined freshwater wetlands)	5 ^a Contain Solid Waste, Soil, Sediment, and Groundwater with Hot Spot Removal (including monitoring, institutional controls, and unlined freshwater wetlands)
Threshold Criteria					
Overall Protection of Human Health and the Environment	No	Yes	Yes	Yes	Yes
Compliance with ARARs	N/A	Yes	Yes	Yes	Yes
Balancing Criteria					
Long-Term Effectiveness and Permanence					
Reduction in Toxicity, Mobility, or Volume Through Treatment					
Short-Term Effectiveness					
Implementability					
Present Worth Cost (\$M)	0	351.5	78.4	86.6	86.7
Modifying Criteria					
State Acceptance					
Community Acceptance					

Notes: Fill symbol by quarters from open (poor) to full (excellent).

a = Indicates preferred alternative

ARARs = applicable or relevant and appropriate requirements

CERCLA = Comprehensive Environmental Response, Compensation, and Liability Act

Threshold Criteria

Overall Protection of Human Health and the Environment. Alternatives 2, 3, 4, and 5 provide adequate protection of human health and the environment, thereby satisfying this threshold criterion and making these alternatives eligible for selection as the final remedial action. Alternative 1, the “no action” alternative, would not provide adequate protection of human health and the environment and is not eligible for selection as the final remedial action.

Compliance with ARARs. Alternatives 2, 3, 4, and 5 comply with state and federal ARARs, thereby satisfying this threshold criterion and making these alternatives eligible for selection as the final remedial action. ARARs do not apply to the no-action alternative.

Primary Balancing Criteria

Long-Term Effectiveness and Permanence. Alternatives 2, 3, 4, and 5 each would be effective in the long-term. Alternative 2 would be most effective in the long-term because waste, soil, and sediment posing an unacceptable risk would be excavated and moved to another landfill. Alternatives 3, 4, and 5 would each be effective in the long-term because the hot spot areas would be removed and the final soil cover, protective liner, and control systems (for landfill gas and groundwater) would protect people and wildlife from being exposed to remaining contamination. The final cover, liner, and control systems would be maintained as long as contamination that could pose an unacceptable risk remains at the site. Alternatives 4 and 5 each include additional actions (additional excavation and installation of the below-ground barrier near San Francisco Bay) that would make them more effective in the long-term when compared with Alternative 3.

Reduction in Toxicity, Mobility, or Volume through Treatment. Alternatives 2, 3, 4, and 5 would perform equally in the way they reduce the toxicity, mobility, and volume of contaminants through treatment. These alternatives focus on removing and/or containing contaminants at Parcel E-2 and do not involve a significant amount of treatment.

Short-Term Effectiveness. Because of its invasive nature, Alternative 2 would pose more short-term risks to site workers and the surrounding community than the containment remedies (Alternatives 3, 4, and 5). These risks could include exposure to dust, noise, contaminated material, objectionable odors, and increased construction traffic. Alternative 2 is estimated to span a 4-year period, during which excavation and disposal of solid waste, soil, and sediment would take place. This period is twice as long as the estimated 2-year construction period to implement Alternatives 3, 4, or 5, which involves construction of a cap and its associated control systems. Alternatives 3, 4, and 5 would also require less disruption of in-place solid waste, soil, and sediment than the excavation remedy. Based on these factors, the short-term effectiveness of Alternative 2 is deemed to be substantially lower than Alternatives 3, 4, and 5 (the containment alternatives), which are expected to have moderate to high short-term effectiveness. Alternative 1 would have the highest relative short-term effectiveness because it would not involve remediation activities that might pose risks to the community, workers, or the environment.

Implementability. Alternative 2 presents numerous technical barriers that must be overcome for successful implementation because of the size and scale of the proposed excavation, thus the implementability of this remedy is lower than Alternatives 3, 4, and 5. Various controls would need to be implemented to minimize acute risks to site workers associated with Alternative 2. The massive scale of the excavation effort, coupled with the heterogeneous site conditions, make such controls difficult to implement. In contrast, the technologies for constructing Alternatives 3, 4, and 5 are proven and accepted technologies. Based on these factors, the implementability of Alternatives 3, 4, and 5 far exceeds that of

Alternative 2, which has a low implementability. The no action alternative (Alternative 1) would have the highest relative implementability because no resources are required to implement this alternative and no known administrative considerations would affect its overall implementability.

Cost. Alternative 2 is the most costly (\$351.5 million) primarily because it includes the excavation and off-site disposal of over 1.1 million cubic yards of solid waste, soil, and sediment. In comparison, Alternatives 3, 4, and 5 have more moderate costs (ranging from \$78.4 to 86.7 million) for remedial construction and long-term operation, maintenance, and monitoring. Alternative 1 requires no action; therefore, no costs are associated with this alternative.

Modifying Criteria

State Acceptance. State involvement has been solicited throughout the CERCLA process. The State of California concurs with the Navy's selected remedial alternative (Alternative 5).

Community Acceptance. Community acceptance is evaluated based on comments received from the public during the public comment period for the proposed plan. The proposed plan, which identified Alternative 5 as the preferred remedial alternative, was presented to the community and discussed during a public meeting on September 20, 2011. Comments were also gathered during the public comment period from September 7 through November 21, 2011. In general, public comments expressed a preference for Alternative 2 and concerns regarding the long-term effectiveness of Alternatives 3, 4, and 5. However, segments of the community, represented by the former San Francisco Redevelopment Agency and the Mayor's Hunters Point Shipyard Citizens Advisory Committee, as well as a number of engaged residents who live in close proximity to HPNS, have expressed their support of Alternatives 4 and 5. [Attachment 3](#), the responsiveness summary, of this ROD addresses the public's comments and concerns about the selected remedial alternative at Parcel E-2 (Alternative 5). In addition, a group of technical experts, which was hired by the advisor of EPA's Technical Assistance Grant (TAG) for HPNS, performed an independent review of the draft ROD and other CERCLA documents for Parcel E-2 and provided input regarding the appropriateness of the selected remedy for Parcel E-2. [Attachment 4](#) compiles the input and recommendations from the technical experts and provides the corresponding responses from the Navy. In general, the technical experts concluded that the Navy has collected sufficient information regarding the nature and extent of contamination at Parcel E-2 and that the selected remedy should protect human health and the environment in accordance with regulatory standards. Additional information regarding the Navy's community participation efforts for Parcel E-2 is provided in [Section 2.10](#).

2.9. SELECTED REMEDY

2.9.1. Rationale for Selected Remedy

The selected remedy for Parcel E-2 is Alternative 5, Contain Solid Waste, Soil, Sediment, and Groundwater with Hot Spot Removal (including monitoring, institutional controls, and unlined freshwater wetlands). The remedy was selected based on an evaluation of the remedial alternatives, as described in [Section 2.8](#), relative

to the nine evaluation criteria. The selected remedy complies with the two threshold criteria, and provides the best balance of tradeoffs with respect to the five balancing criteria. The Navy's evaluation of the two modifying criteria did not warrant changes to the preferred alternative published in the proposed plan (Alternative 5). The State of California, through DTSC and the Water Board, and segments of the community, represented by the former San Francisco Redevelopment Agency and Mayor's Hunters Point Shipyard Citizens Advisory Committee, support Alternative 5. As detailed in [Attachment 3](#), the information presented by members of the community that do not support Alternative 5 does not justify modification of Alternative 5, or selection of a different alternative, based upon the community acceptance criteria. In addition, as detailed in [Attachment 4](#), a group of independent technical experts agreed with the Navy's determination that Alternative 5 would protect human health and the environment. The remedy will effectively reduce site risks by removing significant amounts of contaminants and safely containing the remaining material. The cover, landfill gas controls, and groundwater controls will prevent contact with hazardous materials at levels that might pose an unacceptable risk. The selected remedy will be designed to address potential sea level rise, erosion, and earthquakes and will meet the standards used at other landfills nationwide. In addition, the selected remedy will be subject to statutory reviews every 5 years, pursuant to CERCLA, to ensure that it remains protective of human health and the environment. The five-year reviews will consider multiple technical factors, including but not limited to potential sea level rise, erosion, and earthquakes. The selected remedy allows the property to be used in the future in a manner consistent with the 2010 amended Redevelopment Plan and includes monitoring and maintenance that would be performed as long as necessary to protect human health and the environment.

The Navy's selection of Alternative 5 is consistent with EPA's recommendation that containment actions are typically the best alternative for large landfill sites (greater than 10 acres) instead of removal or treatment actions. As described in [Sections 2.3 and 2.8](#), the Navy determined that the Parcel E-2 Landfill has been adequately characterized and meets all of the criteria specified in EPA's [presumptive remedy guidance](#)⁽⁴⁷⁾. However, the Navy's evaluation has exceeded the requirements of the presumptive remedy guidance by evaluating complete excavation of the landfill in the FS (Alternative 2) to explain the relative risks of that alternative compared to the containment alternatives (Alternatives 3, 4, and 5), thereby supporting the community's review of potential remedial alternatives for Parcel E-2.

2.9.2. Description of Selected Remedy

The selected remedy for Parcel E-2 consists of three primary components: (1) excavation of contaminated soil, sediment, and debris; (2) containment of remaining contamination; and (3) monitoring, maintenance, and institutional controls to protect human health and the environment and to ensure the integrity of the remedial action. The following sections describe the components of the selected remedy, which will be [further developed in the RD](#)⁽⁵⁴⁾.

2.9.2.1. Excavation of Soil, Sediment, and Debris

The selected remedy consists of removing nearshore and upland hot spots that pose a significant risk to humans and wildlife ([Figure 12](#)), with disposal at one or more approved off-site landfills, as appropriate,

and backfilling of the excavations with clean soil. The hotspot excavations will generally not extend deeper than 10 feet bgs, consistent with the maximum depth evaluated in the HHRA; however, excavations at select nearshore hot spots may extend as deep as 16 feet bgs if necessary to remove continuing sources to groundwater contamination, and in accordance with performance criteria to be provided in the RD. In addition to identifying future nearshore hot spots to be addressed during the remedial action, Figure 12 also shows several nearshore and upland hot spots that are currently being excavated pursuant to the Phase 2 TCRA Action Memorandum for the PCB Hot Spot Area. The excavation areas close to the Phase 1 excavation at the PCB Hot Spot Area, as discussed in Section 2.6, may contain principal threat wastes. The Phase 2 TCRA at the PCB Hot Spot Area is ongoing, and post-excavation results are not yet available at the date of ROD signature. Accordingly, the excavation to achieve hot spot goals (see Table 4) will be completed as a remedial action pursuant to this ROD. The RD will analyze the conditions after the TCRA, and will specify the additional hot spot removal necessary to meet the hot spot goals.

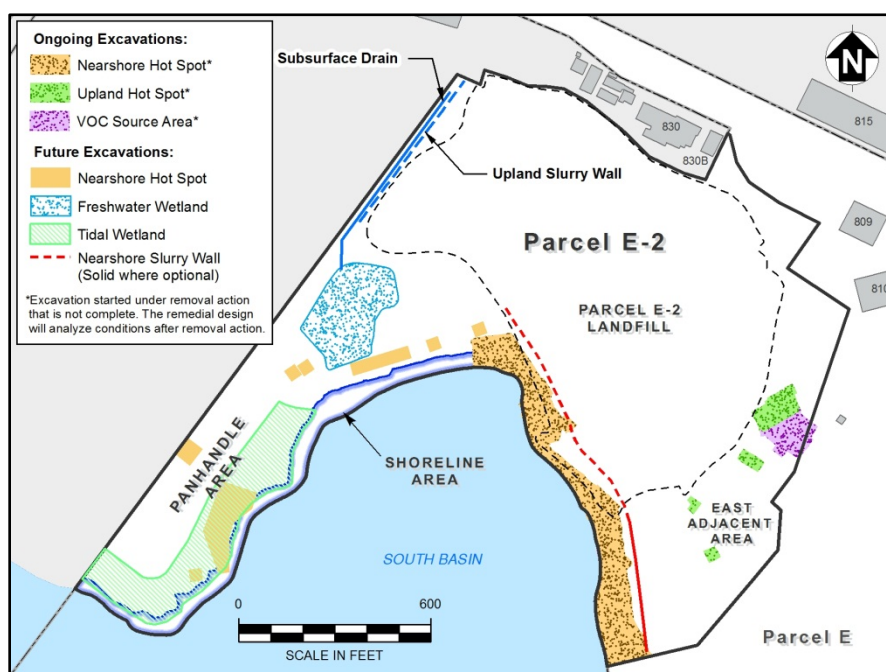

Figure 12. Hot Spot Excavations and Groundwater Containment Features

The RI/FS Report estimated the hotspot excavations to comprise 33,500 cubic yards of waste, soil, and sediment; however, this estimated volume has increased because of the site conditions encountered during the Phase 2 TCRA at the PCB Hot Spot Area. The lateral and vertical extent of hot spots would be refined through pre-excavation characterization to be performed during the RD. Following excavation, confirmation samples would be collected for analysis to verify that residual chemical concentrations were less than the hot spot goals. Upon receipt of acceptable confirmation sampling results, the excavations would be backfilled with clean imported soil that meets acceptance criteria (to be specified in the RD). Upon completion of excavation and achievement of the hot spot goals pursuant to the TCRA Action

Memorandum and the ROD, the Navy will construct the cover pursuant to the remedy selected in the ROD in order to achieve the final remediation goals through breaking the pathway of potential exposure.

Prior to constructing the cover, additional soil, sediment, and debris would be excavated to build **new wetlands**⁽⁵⁵⁾ in the Panhandle Area, and to build a rock revetment structure in the Shoreline Area (Figure 13). The wetlands are not required to prevent exposure to contaminants, but are being created to offset the loss of wetlands at Parcel E-2 and other areas at HPNS. The Panhandle Area is the best location to create wetlands at HPNS because of its location along the shore of the South Basin. A rock revetment structure, consisting of large rocks placed on the shoreline slope, is needed to prevent erosion and protect the edge of the covered upland area.

The selected remedy would include radiological screening to be performed in conjunction with the proposed excavation activities, as described below.

- Soil, sediment, and debris excavated at nearshore and upland hot spots (see Figure 12) would be screened to identify radiological contamination exceeding the remediation goals (see Table 6). Radiologically contaminated soil, sediment, or debris identified during the screening process would be removed and disposed of at one or more approved off-site landfills, as appropriate. Following the radiological screening process, the remaining material from the hot spots would be disposed of at one or more approved off-site landfills.
- Soil, sediment, and debris excavated to build the wetlands and rock revetment structure (see Figure 13) would also be screened to identify radiological contamination exceeding the remediation goals (see Table 6). Radiologically contaminated material identified during the screening process would be removed and disposed of at one or more approved off-site landfills, as appropriate. Following the radiological screening process, the remaining material from the excavations shown on Figure 13 would be placed elsewhere at Parcel E-2 (as a foundation layer for the final cover) because it contains low-level contamination that can be safely contained under the final cover.
- The existing soil cover at the Parcel E-2 Landfill (over the 14.5-acre interim landfill cap, see Figure 7) would be excavated to an appropriate depth (estimated to be 1 foot deep) and screened to identify radiological contamination exceeding the remediation goals (see Table 6). Radiologically contaminated soil identified during the screening process would be removed and disposed of at one or more approved off-site landfills, as appropriate. Following the radiological screening process, the remaining material from the existing soil cover would be placed elsewhere at Parcel E-2 as a foundation layer for the final cover.

Concurrent with the radiological screening of material excavated during the activities described above, the Navy would perform a final radiological surface survey throughout Parcel E-2 to identify and remove radiological contamination (exceeding the remediation goals in Table 6) to a depth of 1 foot (the maximum effective depth of the surface survey). Deeper soil excavation would be performed, if necessary, to ensure that the residual radiological risk at the final ground surface (following installation of a demarcation layer and soil cover) is acceptable. The residual radiological risk at the final ground surface (based on residential exposure) would be within the risk management range specified in the NCP (10^{-6} to 10^{-4}). In

preparing the RD, the Navy would work closely with the regulatory agencies to develop specific protocols for determining when deeper soil excavation is needed to ensure that the residual radiological risk at the final ground surface is acceptable. In addition, the Navy would perform radiological risk modeling, in conjunction with the final radiological surveys, to verify that the residual radiological risk is acceptable.

In addition, the Navy has initiated a TCRA to remove radioactive contamination (containing ^{60}Co) pursuant to a TCRA Action Memorandum for the Ship-Shielding Area (see Figure 7). Consistent with the remediation approach described above, the TCRA at the Ship-Shielding Area will identify and remove radiological contamination (containing ^{60}Co) exceeding the remediation goal (see Table 6) to a depth of 1 foot. The TCRA at the Ship-Shielding Area is ongoing, and post-excavation results are not available at the date of ROD signature. The RD will analyze the conditions after the TCRA, and will specify the additional excavation to achieve the remediation goals for all ROCs (see Table 6); if required, additional excavation to achieve the remediation goals would be completed as a remedial action pursuant to this ROD. In addition, the selected remedy would include **removal of the sanitary sewer, storm drain, and septic sewer lines**⁽⁵⁶⁾ that extend into the East Adjacent Area but are located outside of the IR Site 01/21 boundary (see Figure 3), and removal of radiological contamination exceeding the remediation goals within the trenches.

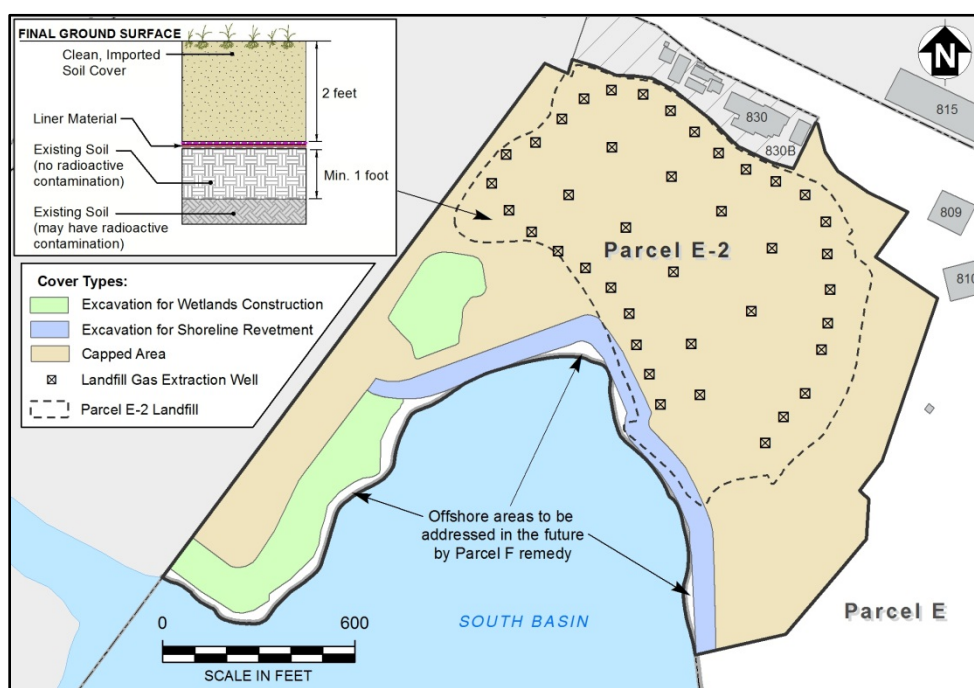

Figure 13. Excavation and Cover Plan

2.9.2.2. Containment of Remaining Contamination

Following completion of the final radiological survey and placement of radiologically screened material from the excavations shown on Figure 13, a minimum 2-foot-thick soil cover would be placed over all of Parcel E-2, including a small portion of the Parcel E-2 Landfill that extends north onto property owned by

UCSF (see [Figure 2](#)). In addition, a protective liner, consisting of a geomembrane with an overlying geocomposite drainage layer, would be placed under the soil cover in all areas except the new wetlands. The protective liner will minimize water seeping into the contaminated material, deter animals from burrowing under the cover, and serve as a visual marker for the bottom of the cover. A liner would not be used in the new wetlands, so that they function more naturally. To prevent exposure to contaminated material, the soil cover in the new wetlands would be 4 feet thick. The new protective liner would be contiguous with the existing landfill cap; however, portions of the existing landfill cap would be removed to achieve the design elevations, and a new protective liner would be constructed in these areas.

In conjunction with installation of the protective liner, a demarcation layer would be installed within radiologically impacted portions of the East Adjacent Area and throughout the Parcel E-2 Landfill, Panhandle Area, and Shoreline Area to identify remaining radiological hazardous substances at depth. The demarcation layer would consist of a permeable geosynthetic material and magnetic marking tape placed at the bottom of the soil cover. A demarcation layer would also be installed under the 4-foot-thick cover in the new wetlands. As described in [Section 2.9.2.1](#), the Navy would perform radiological risk modeling, using data from the final radiological surveys, to verify that residual radiological risk at the final ground surface (following installation of a demarcation layer and soil cover) is within the risk management range specified in the NCP (10^{-6} to 10^{-4}).

The selected remedy would expand the existing [landfill gas controls](#)⁽⁵⁷⁾, which focus on the northern edge of the Parcel E-2 Landfill, by actively removing and treating gas from the entire Parcel E-2 Landfill ([Figure 13](#)). The existing landfill gas controls have been effective as an interim measure in preventing off-site migration of landfill gases from Parcel E-2; however, the expanded system is necessary to effectively control landfill gas in the long-term. Extracted landfill gas would be treated by an enclosed flare and/or adsorbent material (such as a charcoal filter). An enclosed flare involves controlled burning of methane and low levels of other organic chemicals. An enclosed flare is the most common technology for treating landfill gas, and it limits the amount of methane (a greenhouse gas) that is released to the atmosphere. Adsorbent material is designed to capture NMOCs but not methane. The Navy currently uses a charcoal filter to capture NMOCs from the landfill gas control system. The Navy will further evaluate the treatment options during the design and will consult with the regulatory agencies and the community to determine which treatment option(s) will be used.

Flow of contaminated groundwater into San Francisco Bay would be limited by installing a [below-ground barrier and drain along the western boundary](#)⁽⁵⁸⁾ ([Figure 12](#)). This barrier and drain would divert groundwater flow into the landfill to the new freshwater wetland. Water entering the freshwater wetlands will be monitored to ensure compliance with the surface water RAO specified in [Section 2.7](#), as well as applicable freshwater water quality objectives (see [Attachment 5](#)). In addition, a [below-ground barrier would be installed near the shoreline](#)⁽⁵⁹⁾ and groundwater quality will be monitored at an appropriate location near the barrier (to be determined in the RD). The [groundwater would be hydraulically controlled if necessary](#)⁽⁶⁰⁾ to satisfy pertinent ARARs (see [Attachment 5](#)). Specifically, hydraulic control would be performed if necessary to keep contaminants from flowing into San Francisco

Bay at concentrations greater than the corresponding **water quality criteria**⁽⁴⁵⁾ for aquatic wildlife (to comply with the surface water RAO specified in [Section 2.7](#)). The RD will develop specific monitoring criteria for A-aquifer groundwater that address the potential risk to aquatic wildlife in San Francisco Bay.

The selected remedy includes a preliminary plan, developed with input from various technical experts that would **control soil movement during the maximum probable earthquake**⁽⁶¹⁾ (MPE). If present over a large enough area and depth, certain types of soil (sands and silts) can liquefy during an earthquake and cause the ground surface to move. The Navy studied the soil in and around the Parcel E-2 Landfill and found that most soil would not liquefy even during the MPE. Additionally, the soil layers that might liquefy would be controlled through proper design and construction of the final cover using methods that are well established for sites in the San Francisco Bay area. The Navy will further evaluate, including consulting with other technical experts, this very important part of the design to make sure that the final cover is built to withstand the appropriate design earthquake and comply with numerous other regulatory requirements for landfill covers.

Parcel E-2 is planned for open space that includes parks and restored wetlands. The covered upland area of Parcel E-2 would be accessible to pedestrians and may include part of the regional trail planned for the edge of San Francisco Bay. The new tidal wetlands would be combined with the planned wetland restoration at the non-Navy, California State Parks property immediately west of Parcel E-2 along Yosemite Slough. The shorelines adjacent to the upland area and the new tidal wetlands would require protection to make sure people and wildlife are not exposed to contaminated soil that is not excavated. The new tidal wetlands would have gradual slopes that can be protected by natural soil and vegetation. The upland area would have steeper slopes that require stronger protection with a rock revetment structure ([Figure 13](#)). The top of the revetment would extend high enough to protect against flooding from a **potential rise in sea level**⁽⁶²⁾, but would not obstruct pedestrians' views of San Francisco Bay because trails would be placed at about the same height as the top of the revetment. The bottom of the revetment would stop near the mean tide line, and the areas exposed during low tide would be natural sediment.

2.9.2.3. Monitoring, Maintenance, and Institutional Controls

The selected remedy includes the following monitoring and maintenance activities that would be performed as long as necessary to protect human health and the environment and to comply with the substantive provisions of pertinent state and federal ARARs (see [Attachment 5](#)):

- Groundwater monitoring will be performed, consistent with the requirements of Cal. Code Regs. tit. 22 § 66264.100(d) and § 66264.310(b)(3), to verify that chemical concentrations in groundwater do not exceed concentrations designated by the RAOs at the point of compliance.
- Landfill gas monitoring will be performed to meet the RAOs and to demonstrate compliance with Cal. Code Regs. tit. 27 § 20917 through § 20934.

- Stormwater and erosion controls will be installed and maintained as required under Cal. Code Regs. tit. 27 § 20365(c) and (d), and stormwater discharges will be monitored as required under Cal. Code Regs. tit. 22 § 66264.97(c)(1) and (c)(2)(B).
- The cover will be inspected and maintained to ensure its integrity as required under Cal. Code Regs. tit. 27 § 21180(a).

The long-term monitoring and maintenance program will be detailed in the post-closure operation and maintenance plan (OMP) for Parcel E-2, consistent with content requirements as provided in Cal. Code Regs. tit. 27 § 21800(c), and submitted for review and approval by EPA, DTSC, and the Water Board in conjunction with the RD. Regulatory agency oversight will continue during long-term operation and maintenance of the selected remedy. In addition, the selected remedy will be subject to statutory reviews every 5 years pursuant to CERCLA to ensure that it remains protective of human health and the environment.

The Navy would also implement institutional controls, which are legal and administrative mechanisms for the continued protection of human health and the environment. In Parcel E-2, the objectives of the institutional controls are to implement land use and activity restrictions that are used to limit the exposure of future landowner(s) or user(s) of the property to hazardous substances present on the property and in groundwater, and to ensure the integrity of the remedial action, including any current or future remedial or monitoring systems such as monitoring wells, landfill gas monitoring and collection systems, and subsurface groundwater control barriers. Institutional controls are required on a property where the selected remedial action results in contamination remaining at the property above levels that allow for unlimited use and unrestricted exposure. The institutional controls for Parcel E-2 will restrict the development, land use, and activities on Parcel E-2 property as described in this ROD. These institutional controls will be maintained until the concentrations of hazardous substances in soil and groundwater are at such levels to allow for unrestricted use and exposure. Implementation of Parcel E-2 institutional controls includes requirements for monitoring and inspections, and reporting to ensure compliance with land use or activity restrictions. Figure 14 presents the area requiring institutional controls (ARIC) for nonradioactive

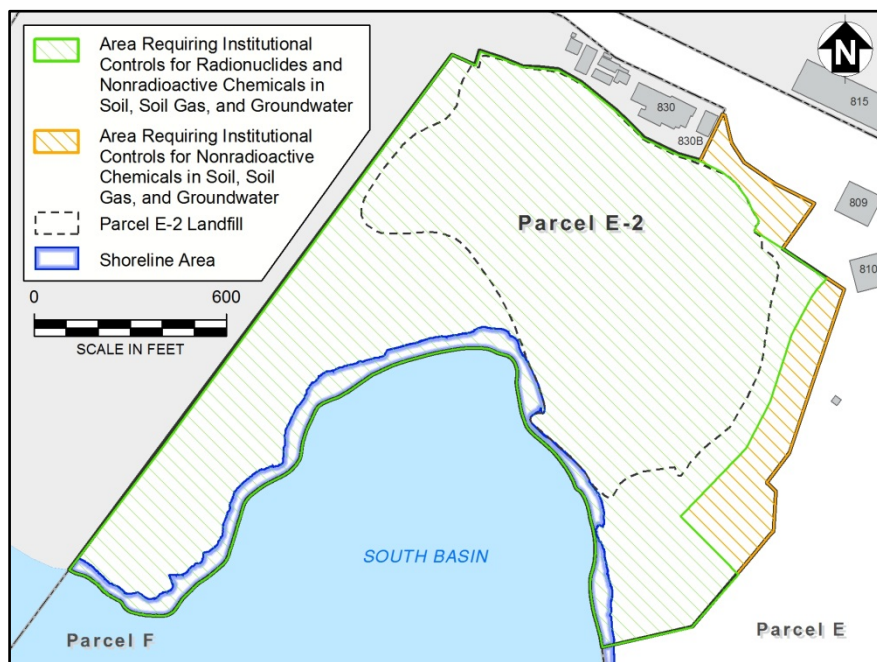

Figure 14. Area Requiring Institutional Controls

chemicals, which comprises all of Parcel E-2 including a small portion of the Parcel E-2 Landfill that extends north onto property owned by UCSF (see [Figure 2](#)). [Figure 14](#) also identifies the ARIC for radionuclides (green pattern on [Figure 14](#); also referred to as the radiological ARIC), which consists of all of Parcel E-2 except for portions of the East Adjacent Area located outside of the IR Site 01/21 boundary (see [Figure 3](#)). Outside of the radiological ARIC, potential radioactive contamination exceeding the remediation goals would be removed, thus these areas would not require institutional controls regarding exposure to radioactivity.

The Navy has determined that it will rely on proprietary controls in the form of environmental restrictive covenants as provided in the “Memorandum of Agreement between the United States Department of the Navy and the California Department of Toxic Substances Control” and attached covenant models (hereinafter referred to as the “Navy/DTSC MOA”).

More specifically, land use and activity restrictions will be incorporated into two separate legal instruments as provided in the Navy/DTSC MOA:

1. Restrictive covenants included in one or more Quitclaim Deeds from the Navy to the property recipient.
2. Restrictive covenants included in one or more “Covenant to Restrict Use of Property” entered into by the Navy and DTSC as provided in the Navy/DTSC MOA and consistent with the substantive provisions of Cal. Code Regs. tit. 22 § 67391.1.

The “Covenant(s) to Restrict Use of Property” will incorporate the land use and activity restrictions into environmental restrictive covenants that run with the land and that are enforceable by DTSC against future transferees. The Quitclaim Deed(s) will include the identical land use and activity restrictions in environmental restrictive covenants that run with the land and that will be enforceable by the Navy against future transferees.

The land use and activity restrictions in the “Covenant(s) to Restrict Use of Property” and Quitclaim Deed(s) shall be further defined in the land use control remedial design (LUC RD) report that would be prepared by the Navy and reviewed and approved by the other FFA signatories. The LUC RD report shall be referenced in the applicable Covenant to Restrict Use of Property and Deed. A risk management plan (RMP) may be prepared by the CCSF and approved by the FFA signatories that may set forth certain requirements and protocols used to conduct restricted activities.

In addition to being set forth in the “Covenant(s) to Restrict Use of Property” and Quitclaim Deed(s) as described above, restrictions applied to specified portions of the property will be described in findings of suitability to transfer. The Navy will also access the portion of the Parcel E-2 Landfill extending onto UCSF property (as identified on [Figure 8](#)) to perform the remedial action pursuant to easements, or another appropriate legal mechanism, entered into with UCSF. In addition, the Navy and regulatory agencies will also control use, through easements or another appropriate legal mechanism entered into with UCSF, of the portion of the Parcel E-2 Landfill extending onto UCSF property to ensure that its

future use is compatible with the selected remedy. Specific requirements for accessing or controlling use of the portion of the Parcel E-2 Landfill extending onto UCSF property will be specified in the LUC RD report.

Access

The Deed and Covenant shall provide that the Navy and other FFA signatories, where applicable, and for CDPH in the radiological ARIC (Figure 14), and their authorized agents, employees, contractors, and subcontractors shall have the right to enter upon HPNS Parcel E-2 to conduct investigations, tests, or surveys; inspect field activities; or construct, operate, and maintain any response or remedial action as required or necessary under the cleanup program, including but not limited to monitoring wells, pumping wells, treatment facilities, and cap and containment systems.

Implementation

The Navy shall address and describe implementation and maintenance actions for institutional controls, including periodic inspections and reporting requirements, in the preliminary and final RD reports to be developed and submitted to the other FFA signatories for review pursuant to the FFA (see “Navy Principles and Procedures for Specifying, Monitoring and Enforcement of Land Use Controls and Other Post-ROD Actions” attached to January 16, 2004 Department of Defense memorandum titled “Comprehensive Environmental Response, Compensation and Liability Act [CERCLA] Record of Decision [ROD] and Post-ROD Policy”). The preliminary and final RD reports are primary documents as provided in Section 7.3 of the FFA.

The Navy is responsible for implementing, maintaining, reporting on, and enforcing institutional controls. Although the Navy may later transfer these procedural responsibilities to another party by contract, property transfer agreement, or through other means, the Navy shall retain ultimate responsibility for remedy integrity.

Land Use and Activity Restrictions that Apply throughout Parcel E-2

The following paragraphs describe the institutional control objectives to be achieved through land use and activity restrictions throughout Parcel E-2 to ensure that any necessary measures to protect human health and the environment and the integrity of the remedy have been undertaken.

Land Use Restrictions

The Successor Agency to the San Francisco Redevelopment Agency has designated HPNS Parcel E-2 for open space reuse, consistent with the **2010 amended Redevelopment Plan**⁽²²⁾. Parcel E-2 shall be restricted to open space and recreational uses, unless written approval for other uses is granted by the FFA signatories. In addition, the following land uses are specifically prohibited in all Parcel E-2 areas, unless written approval for such uses is granted by the FFA signatories, in accordance with the Covenant(s) to Restrict Use of the Property, Quitclaim Deed(s), LUC RD report, and Parcel E-2 RMP, if deemed necessary:

- a. A residence, including any mobile home or factory built housing, constructed or installed for use as residential human habitation.
- b. A hospital for humans.
- c. A school for persons under 21 years of age.
- d. A daycare facility for children.
- e. Any permanently occupied human habitation, including those used for commercial or industrial purposes.

General Activity Restrictions

The following activities are restricted throughout HPNS Parcel E-2 and must be conducted in accordance with the “Covenant(s) to Restrict Use of Property,” Quitclaim Deed(s), the OMP, the LUC RD report and, if deemed necessary, the Parcel E-2 RMP and any other work plan or document approved in accordance with these referenced documents:

- a. “Land-disturbing activity,” which includes but is not limited to (1) excavation of soil; (2) construction of roads, utilities, facilities, structures, and appurtenances of any kind; (3) demolition or removal of “hardscape” (for example, concrete roadways, parking lots, foundations, and sidewalks); (4) any other activity that involves movement of soil to the surface from below the surface of the land; and (5) any other activity that causes or facilitates the movement of groundwater known to be contaminated with radionuclides or nonradioactive chemicals. Land-disturbing activities are not intended to include placement of additional clean, imported fill on top of the soil cover that the Navy will construct at HPNS Parcel E-2.
- b. Alteration, disturbance, or removal of any component of a response or cleanup action (including but not limited to pump-and-treat facilities, revetment walls and shoreline protection, and soil cap/containment systems); groundwater extraction, injection, and monitoring wells and associated piping and equipment; or associated utilities.
- c. Extraction of groundwater and installation of new groundwater wells.
- d. Removal of or damage to security features (e.g., locks on monitoring wells, survey monuments, fencing, signs, or monitoring equipment and associated pipelines and appurtenances).

In addition, the following activities are prohibited throughout HPNS Parcel E-2:

- a. Growing vegetables or fruits in native soil for human consumption.
- b. Use of or access to groundwater.

Additional Activity Restrictions Related to Radionuclides at Parcel E-2

Exposure to radionuclides in the radiological ARIC (Figure 14) would be prevented by three separate components: (1) an engineered cover, consisting of clean imported fill and (in all areas outside of the future wetlands) a low hydraulic conductivity layer, to provide adequate shielding against residual radioactivity; (2) permeable geosynthetic fabric to serve as a “demarcation layer” between soil cover and underlying soil with residual radioactivity; and (3) institutional controls to implement land use and

activity restrictions necessary to limit the exposure to radiological hazardous substances and to ensure the integrity of the remedial action.

In addition to the land use and activity restrictions specified above, the following activity restriction would apply in the radiological ARIC.

- a. Land-disturbing activities within the radiological ARIC, as defined above and including installation of water lines, storm drains, or sanitary sewers, below the demarcation layer, are strictly prohibited unless approved in writing by the FFA signatories and the California Department of Public Health (CDPH). Any proposed land-disturbing activity within the ARIC for radionuclides shall be required to be described in a work plan that will include but not be limited to a radiological work plan, the identification of a radiological safety specialist, a soil management plan, soil sampling and analysis requirements, and a plan for off-site disposal of any excavated radionuclides by the transferee in accordance with federal and state law. This work plan must also specify appropriate procedures for the proper identification and handling of material potentially presenting an explosive hazard. This work plan must be submitted to and approved in writing by the FFA signatories and CDPH in accordance with procedures (including dispute resolution procedures) and timeframes that will be set forth in the OMP and LUC RD report.
- b. Following implementation of an approved land-disturbing activity within the radiological ARIC, the integrity of the cover/cap must be restored upon completion of excavation as provided in the OMP, LUC RD report, or similar document. A completion report describing the details of the implementation of the work plan, sampling and analysis (if required), off-site disposal (if required), and the restoration of the integrity of the cover/cap must be submitted to and approved in writing by the FFA signatories and CDPH in accordance with procedures (including dispute resolution procedures) and timeframes that will be set forth in the OMP and LUC RD report.
- c. For land-disturbing activities, as defined above and including installation of water lines, storm drains, or sanitary sewers, above the demarcation layer, the LUC RD report, the OMP, or, if deemed necessary, the RMP or a project-specific work plan will list the procedures for ensuring that the cover is not disturbed or breached. The specific design of the cover shall be agreed to in the RD. Installation of water lines, storm drains, or sanitary sewers in any additional clean, imported fill placed on top of the soil cover that the Navy has constructed at the Property is not intended to be restricted if the property owner demarcates the interface between the pre-existing cover and any new imported soil.

At the time of transfer, the areas that require this restriction will be surveyed to define the legal metes and bounds for inclusion in the property transfer documents. No variance or exemption from this restriction shall be allowed unless written approval is provided by the FFA signatories and CDPH. The OMP or LUC RD report shall address any necessary additional soil and radiological management requirements, for example inspections, monitoring, and reporting requirements for portions of Parcel E-2 in the radiological ARIC.

Additional Activity Restrictions Related to Subsurface Gas at Parcel E-2

Any proposed construction of enclosed structures must be approved in accordance with the Covenant to Restrict Use of the Property, Quitclaim Deed(s), the LUC RD report and, if deemed necessary, the Parcel E-2 RMP prior to conducting such activities within the ARIC (Figure 14) to ensure compliance with the substantive provisions of Cal. Code Regs. tit. 27 § 21190(a), (b), (d), (e), (f) and (g), which require that postclosure land uses be designed and maintained to protect health and safety in areas affected by landfill gas migration. In particular, Cal. Code Regs. tit. 27 § 21190(g) specifies design and construction standards for “all on site construction within 1,000 feet of the boundary of any disposal area.” The Navy has determined that the substantive provisions of Cal. Code Regs. tit. 27 § 21190(g) are relevant and appropriate for future construction within the Parcel E-2 boundary, including the portion of the Parcel E-2 Landfill that extends onto UCSF property, because Parcel E-2 may be affected by subsurface gas emanating from the Parcel E-2 Landfill. However, these provisions are not relevant and appropriate to future off-site construction beyond the Parcel E-2 boundary because these areas are not affected by subsurface gas emanating from the Parcel E-2 Landfill. The interim gas control system and ongoing monitoring program are effectively controlling the migration of hazardous levels of landfill gas beyond the Parcel E-2 boundary. The permanent gas control system in the selected remedy would continue to control the migration of hazardous levels of landfill gas beyond the Parcel E-2 boundary.

Human health can be protected through engineered containment systems, such as landfill caps and gas control systems, or other design alternatives that meet the specifications set forth in the RD reports, the LUC RD report and, if deemed necessary, the Parcel E-2 RMP. The FFA signatories may modify the ARIC, which will initially include all of HPNS Parcel E-2, in response to further soil, vapor, and groundwater sampling and analysis that establishes that areas now included in the ARIC do not pose an unacceptable risk to human health.

2.9.3. Expected Outcomes of the Selected Remedy

Once the selected remedy has been implemented, risks to human health and the environment under the planned recreational use will be acceptable and the RAOs will be achieved. Excavation and off-site disposal of hot spots and radioactive contamination near the ground surface will reduce site risks, and the cover will prevent contact with remaining contamination that might pose an unacceptable risk. The liner will minimize water seeping into the contaminated material, deter animals from burrowing under the cover, and serve as a visual marker for the bottom of the cover. The landfill gas and groundwater controls will effectively limit the migration of hazardous chemicals at concentration that may pose an unacceptable risk. The selected remedy will take a relatively short period of time to implement and will use readily available technologies and labor. Following implementation, long-term monitoring and maintenance will ensure the continued protection of human health and the environment. In addition, institutional controls will restrict potential exposure to contaminated soil, sediment, landfill gas, and groundwater and the restrictions will be consistent with the planned future use of Parcel E-2.

2.9.4. Statutory Determinations

In accordance with the NCP, the selected remedy meets the following statutory determinations.

- **Protection of Human Health and the Environment** – The selected remedy will adequately protect human health and the environment by preventing exposure to COCs and COECs through the excavation of hot spots and radioactive contamination near the ground surface, installation and monitoring of a containment systems (including cover and landfill gas and groundwater controls), and the implementation of institutional controls.
- **Compliance with ARARs** – CERCLA § 121(d)(1) states that remedial actions on CERCLA sites must attain (or the decision document must justify the waiver of) any federal or more stringent state environmental standards, requirements, criteria, or limitations that are determined to be legally applicable or relevant and appropriate. The selected remedy for Parcel E-2 will comply with the substantive provisions of the federal and state requirements identified as ARARs. The chemical-, location-, and action-specific ARARs for the selected remedy are summarized in [Attachment 5](#).
- **Cost-Effectiveness** – As specified in the NCP, the cost-effectiveness of a remedy is determined in two steps. First, the overall effectiveness of a remedial alternative is determined by evaluating the following three of the five balancing criteria: (1) long-term effectiveness and permanence; (2) reduction in toxicity, mobility, or volume through treatment; and (3) short-term effectiveness. The overall effectiveness is then compared to cost to determine whether a remedy is cost-effective. The selected remedy has a high overall effectiveness because, relative to the other remedial alternatives (most notably Alternative 2), it offers a high degree of long-term effectiveness in a manner that minimizes short-term risks. In contrast, the high degree of long-term effectiveness of Alternative 2 is offset by significant short-term risks. Reduction in toxicity, mobility, or volume through treatment is not a decisive factor because Alternatives 2, 3, 4, and 5 focus on removing and/or containing contaminants at Parcel E-2 and do not involve a significant amount of treatment. The selected remedy will provide high overall effectiveness proportional to its costs, as demonstrated by the improved overall effectiveness of Alternative 5 relative to Alternative 3 for a modest (approximately 10 percent) incremental cost increase. Therefore, the selected remedy is considered cost-effective. In contrast, Alternative 2 is not considered cost-effective because its lower overall effectiveness (relative to Alternative 5) is accompanied by a significant incremental cost increase (over 300 percent relative to Alternatives 3, 4, and 5).
- **Utilization of Permanent Solution and Alternative Treatment Technologies (or Resource Recovery Technologies) to the Maximum Extent Practicable** – The Navy has determined that the selected containment remedy, combined with excavation of small quantities of more highly contaminated soil, represents the maximum extent to which permanent solutions and treatment are practicable at this site. The selected containment remedy (Alternative 5) provides the best balance of tradeoffs relative to the five balancing criteria: (1) long-term effectiveness and permanence; (2) reduction in toxicity, mobility, or volume through treatment; (3) short-term effectiveness; (4) implementability; (5) and cost. Alternative 5 provides a high degree of long-term effectiveness, although not as high as Alternative 2, because the hot spot areas would be removed and the final soil cover, protective liner, and control systems (for landfill gas and groundwater) would protect people and wildlife from being exposed to remaining contamination. Reduction in toxicity, mobility, or volume through treatment is not a decisive factor because

Alternatives 2, 3, 4, and 5 focus on removing and/or containing contaminants at Parcel E-2 and do not involve a significant amount of treatment. Alternative 5 provides the highest degree of short-term effectiveness and implementability because it uses proven and accepted technologies that can be implemented more quickly and readily than the other alternatives, most notably Alternative 2, thereby reducing the short-term risks to site workers and the surrounding community. Alternative 5 has comparable cost to Alternatives 3 and 4; Alternative 2 is significantly more expensive than Alternatives 3, 4, and 5. Relative to the two modifying criteria (state and community acceptance), Alternative 5 is accepted by the State of California and some segments of the local community; however, the overall community acceptance of Alternative 5 is poor because of the general preference for the more complete removal proposed under Alternative 2. In summary, Alternative 5 provides a combination of removal and containment that reduces risk sooner, is easier to implement and much more cost-effective than Alternative 2, and provides additional risk reduction as compared with Alternatives 3 and 4. The performance of Alternative 5 relative to the five balancing criteria, in addition to its acceptance by the state, outweigh the community's overall lack of acceptance for Alternative 5.

- **Preference for Treatment as a Principal Element** – The selected remedy does not satisfy the statutory preference for treatment⁵ as a principal element because there is no cost-effective means of treating the large quantity of low-level soil contamination throughout Parcel E-2 and the small quantities of principal threat wastes at the PCB Hot Spot Area cannot be treated in a cost-effective manner. Accordingly, none of the remedial alternatives proposed a significant amount of treatment. The principal threat wastes at the PCB Hot Spot Area are being excavated under a TCRA that is scheduled to be completed in 2012. The protective liner and below-ground barriers are expected to reduce the mobility of contamination, and natural attenuation mechanisms will reduce the toxicity, mobility, and volume of some contaminants.
- **Five-Year Review Requirements** – Statutory five-year reviews pursuant to CERCLA § 121 and the NCP will be conducted because the selected remedy will leave contamination in place at Parcel E-2 above levels that allow for unrestricted use and unlimited exposure. Five-year reviews for Parcel E-2 will follow the ongoing schedule of five-year reviews established for other remedies in place at HPNS.

2.9.5. Documentation of Significant Changes

The Proposed Plan and Draft ROD were released for public comment in September 2011 and March 2012, respectively. The documents identified Alternative 5 (involving the containment of solid waste, soil, sediment, and groundwater with hot spot removal) as the selected remedy for Parcel E-2. During the comment period on the Draft ROD, new information prompted the following changes:

⁵ As defined in the NCP (Title 40 Code of Federal Regulations § 300.5), “treatment technology” means any unit operation or series of unit operations that alters the composition of a hazardous substance or pollutant or contaminant through chemical, biological, or physical means so as to reduce toxicity, mobility, or volume of the contaminated materials being treated. Treatment technologies are an alternative to land disposal of hazardous wastes without treatment.

- **Boundary Change Between Parcels E and E-2** – Pursuant to the City and County of San Francisco’s **2010 amended Redevelopment Plan**⁽²²⁾, two small areas (less than 1 acre) in the East Adjacent Area were designated as part of the “Shipyards South Multi-Use District” and an adjacent roadway. The Shipyards South Multi-Use District may be used for recreational, industrial, and residential purposes, but these potential land uses were not anticipated during preparation of the RI/FS Report. The Navy, in consultation with the EPA, DTSC, the Water Board, and the City and County of San Francisco, concluded that a **boundary change between Parcels E and E-2**⁽²³⁾ was the most effective way to resolve this discrepancy. The revised boundary between Parcels E and E-2 results in the Shipyards South Multi-Use District no longer being located in Parcel E-2, and the planned reuse for Parcel E-2 is now limited to open space.
- **Revised Remediation Goal for ⁶⁰Co** – In planning the TCRA at the Ship-Shielding Area to address potential ⁶⁰Co contamination, the Navy identified that the remediation goal for ⁶⁰Co needed to be revised to support efficient laboratory gamma spectroscopy analysis of soil samples. As documented in the TCRA Action Memorandum for the Ship-Shielding Area, the Navy **revised the remediation goal for ⁶⁰Co**⁽¹⁹⁾ to 0.252 pCi/g (see [Table 6](#)). This activity level is adequately protective of human health and the environment.

The above listed changes are documented in this ROD pursuant to CERCLA § 117 and the NCP.

2.10. COMMUNITY PARTICIPATION

Community participation at HPNS includes public meetings, public information repositories, an IR Program website, newsletters and fact sheets, public notices, and site tours. The Community Involvement Plan for HPNS provides detailed information on community participation for the IR Program and documents interests, issues, and concerns raised by the community regarding ongoing investigation and cleanup activities at HPNS. The Navy held a community meeting on February 2, 2010, to solicit community input on updating the Community Involvement Plan for HPNS. The Navy used this input in preparing an update to the **Community Involvement Plan**⁽⁶³⁾, which was finalized in May 2011.

Starting in January 2010, the Navy began conducting bimonthly Community Technical Meetings to discuss the technical aspects of the CERCLA milestone documents with community members (and with participation from the Base Realignment and Closure [BRAC] Cleanup Team). Documents and relevant information relied upon in the remedy selection process are made available for public review in the public information repositories (listed at the end of this section) or on the **IR Program website**⁽⁶⁴⁾.

Community participation is also solicited through public mailings, including newsletters, fact sheets, public notices, and proposed plans, which are designed to broadly disseminate information throughout the local community. Public mailings for HPNS are sent to more than 2,000 groups and individuals that have added their names to the community mailing list, including residents in the local Hunters Point-Bayview community; city, state, and federal officials; regulatory agencies; and other interested groups and individuals. Previous updates and fact sheets have included general program information such as the status of environmental investigations and cleanup activities at each HPNS parcel. In addition, the Navy

has held periodic site tours of HPNS to better explain the status of cleanup activities to interested community members.

For Parcel E-2, a significant effort was made to inform the public of the remedy proposed in the Proposed Plan and selected in this ROD. Prior to making the Proposed Plan available for public review, a public notice of the meeting and availability of documents was placed in the *San Francisco Chronicle* on September 4, 2011. Additional public notices were placed in the September 2011 editions of two publications (the *San Francisco Bayview* and the *Sun-Reporter*) in the local Hunters Point-Bayview community. The Proposed Plan, along with **two associated fact sheets**⁽⁶⁵⁾, was distributed to recipients on the community mailing list beginning on September 2, 2011. An online advertisement was also placed on the *San Francisco Bayview* website to direct users to the IR Program website, where electronic copies of the Proposed Plan, fact sheets, and the RI/FS Report were made available.

In accordance with CERCLA § 113 and § 117, the Navy provided a public comment period from September 7, 2011, to November 21, 2011, for the proposed remedial action described in the Proposed Plan for Parcel E-2. A public meeting to present the Proposed Plan was held from 6:00 to 9:00 p.m. on September 20, 2011. At the public meeting, the Navy gave presentations on the conditions at Parcel E-2, and the representatives from the Navy and regulatory agencies were available to answer questions. A **transcript of the public meeting**⁽⁶⁶⁾ prepared by a court reporter is part of the administrative record for this ROD and is available on the CD for this ROD. The initial public comment period was scheduled to end on October 24, 2011, but was extended to November 21, 2011, at the request of several community members. Additional public notices of the extension to the public comment period were placed in the *San Francisco Chronicle*, the *San Francisco Bayview*, and the *Sun-Reporter*. Responses to spoken comments received during the public meeting and written comments received during the public comment period are included in the Responsiveness Summary in [Section 3](#).

Key supporting documents that pertain to Parcel E-2 and a complete index of all Navy HPNS documents are available at the following information repositories:

San Francisco Main Library

Section 3. Responsiveness Summary

The responsiveness summary is the third component of a ROD; its purpose is to summarize information about the views of the public and regulatory agencies on both the remedial alternatives and general concerns about Parcel E-2 submitted during the public comment period. It documents in the record how public comments were integrated into the decision-making process. The participants in the public meeting, held on September 20, 2011, included community members and representatives of the Navy, EPA, DTSC, and the Water Board. Questions and concerns received during the meeting were addressed at the meeting and are documented in the meeting transcript. Responses to comments provided at the meeting and received during the public comment period by the Navy, EPA, DTSC, or the Water Board are included in the responsiveness summary ([Attachment 3](#)). In addition, responses to comments received on the draft and draft final versions of this ROD are provided in [Attachment 4](#).

1	Parcel E-2	Section 2.1	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 2.1, pages 2-1 through 2-3. Record No. 4237. Proposed Plan for Parcel E-2, Hunters Point Naval Shipyard, San Francisco, California. Department of the Navy. September 2011. Page 1. Record No. 3580.
2	Parcel E-2 Landfill	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Sections 8.2.1.1 and 8.2.1.2, pages 8-5 through 8-7. Record No. 4237.
3	Construction of additional interim landfill cap	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Sections 3.8.4 and 3.7.3, pages 3-25, 3-26, and 3-29. Record No. 4237.
4	Fill materials in the East Adjacent, Panhandle, and Shoreline Areas of Parcel E-2	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 8.4.1, pages 8-22 through 8-24. Record No. 4237.
5	Areas where low-level radiological material may be located	Section 2.2	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRS. March 2011. Section 2.3, pages 2-5 through 2-8. Record No. 4260.
6	Radiological operations	Section 2.2	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRS. March 2011. Section 4.2, pages 4-3 through 4-6. Record No. 4260.
7	Hydrostratigraphy	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 2.2.1, pages 2-4 through 2-6. Record No. 4237.
8	Drinking water	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 2.2.6, pages 2-9 through 2-11. Record No. 4237.
9	Groundwater flow patterns	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 2.2.2, pages 2-9 through 2-11. Record No. 4237.
10	Parcel E-2 ecology	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 2.4, page 2-18. Record No. 4237.
11	Environmental investigations	Section 2.3	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 3, pages 3-1 and 3-2. Record No. 4237.
12	EPA guidance for CERCLA landfills	Section 2.3	"Presumptive Remedy for CERCLA Municipal Landfill Sites." Quick Reference Fact Sheet. EPA OSWER Directive 9355.0-49FS. EPA/540/F-93/035. September 1993. Pages 1 through 3. (<i>note: this guidance document was provided as Appendix H to the Final Remedial Investigation/Feasibility Study Report for Parcel E-2; Record No. 4237</i>) Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 8.2.3.1, pages 8-13 through 8-15. Record No. 4237.
13	Concentrations exceeding evaluation criteria	Sections 2.3.1 and 2.3.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Table 4-24. Record No. 4237

Item	Reference or Phrase in ROD	Location in ROD	Identification of the Referenced Document Available in the Administrative Record ¹
14	Potential source of contamination to Parcel F	Section 2.3.3	Draft Parcels E and E-2 Shoreline Characterization Technical Memorandum, Hunters Point Shipyard, San Francisco, California. SulTech. June 2007. Pages 24 and 25. (note: this document was accepted as final and was provided as Appendix G to the Final Remedial Investigation/Feasibility Study Report for Parcel E-2; Record No. 4237)
15	Landfill gas characterization	Section 2.3.4	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and Shaw. May 2011. Section 4.2.3, pages 4-16 through 4-22. Record No. 4237
16	Groundwater contaminants	Section 2.3.5	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and Shaw. May 2011. Section 5.8.1, pages 5-38 through 5-40. Record No. 4237
17	Radiological investigations	Section 2.3.6	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and RSRS. March 2011. Section 3.1, pages 3-1 through 3-10. Record No. 4260.
18	ROCs in surface soil	Section 2.3.6	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and RSRS. March 2011. Section 4.3, pages 4-7 and 4-8. Record No. 4260.
19	Revised the remediation goal for ⁶⁰ Co	Section 2.3.6	Final Action Memorandum, Time-Critical Removal Action for the Experimental Ship-Shielding Range, Parcel E-2, Hunters Point Naval Shipyard, San Francisco, California. Navy. May 2012. Appendix C, pages 1 through 3. Record No. 4417.
20	Radionuclide groundwater data	Section 2.3.6	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and RSRS. March 2011. Sections 5.1 through 5.3, pages 5-1 through 5-4. Record No. 4260.
21	Future reuse	Section 2.4	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and Shaw. May 2011. Section 1.15, page 1-17. Record No. 4237.
22	2010 amended redevelopment plan	Section 2.4	Hunters Point Shipyard Redevelopment Plan. City and County of San Francisco. Map 2, titled "Land Use Districts Map." August 3, 2010 (amendment to July 14, 1997 plan). http://www.sfdevelopment.org/index.aspx?page=160
23	Boundary change between Parcels E and E-2	Section 2.4	Boundary Change for Parcels E and E-2, Hunters Point Naval Shipyard, San Francisco, California. Letter from Navy to EPA, DTSC, and Water Board. August 28, 2012. Record No. 4487.
24	CSM for human health	Section 2.5.1	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and Shaw. May 2011. Appendix K, Figure K-1. Record No. 4237. Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and RSRS. March 2011. Appendix B, Figure B-1. Record No. 4260.
25	Quantitative HHRA	Section 2.5.1	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and Shaw. May 2011. Appendix K, Section K5.0, pages K-12 through K-18. Record No. 4237. Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and RSRS. Appendix B, Section B5, pages B-10 through B-13. Record No. 4260.

Item	Reference or Phrase in ROD	Location in ROD	Identification of the Referenced Document Available in the Administrative Record ¹
26	Cancer risks and noncancer hazards	Section 2.5.1	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Appendix K, Section K7.0, pages K-23 through K-27. Record No. 4237.
27	Total and incremental risks	Section 2.5.1	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Sections 7.1.2.1 and 7.1.2.2, pages 7-5 through 7-8. Record No. 4237. Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRS. Section 7.2, pages 7-2 through 7-4. Record No. 4260.
28	HHRA results for nonradioactive chemicals in soil and groundwater	Section 2.5.1	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Tables 7-4 and 7-5; Tables 7-8 through 7-12. Record No. 4237.
29	Cancer risks from exposure to radionuclides in soil	Section 2.5.1	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRS. Table 7 and Appendix B1. Record No. 4260.
30	NMOCs in landfill gas	Section 2.5.1	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 4.1.2.2, pages 4-6 and 4-7. Record No. 4237. Final Parcel E Nonstandard Data Gaps Investigation, Landfill Gas Characterization, Hunters Point Shipyard, San Francisco, California. TtEMI. December 2003. Appendix D, Attachment D-1. (<i>note: this document was provided as Appendix A to the Final Remedial Investigation/Feasibility Study Report for Parcel E-2; Record No. 4237</i>) Draft Removal Action Closeout Report, Parcel E Landfill Gas Time-Critical Removal Action, Hunters Point Shipyard, San Francisco, California. TtEMI. March 2004. Appendix G, Attachments G-1 through G-4. (<i>note: this document was accepted as final and was provided as Appendix F to the Final Remedial Investigation/Feasibility Study Report for Parcel E-2; Record No. 4237</i>)
31	Assumptions and uncertainties	Section 2.5.1	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Appendix K, Section K9.0, pages K-34 through K-36. Record No. 4237. Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRS. Appendix B, Section B6, pages B-14 and B-15. Record No. 4260.
32	Screening-level ecological risk assessment	Section 2.5.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 7.2, pages 7-11 through 7-15; Appendix L, Table L-7. Record No. 4237. Draft Parcels E and E-2 Shoreline Characterization Technical Memorandum, Hunters Point Shipyard, San Francisco, California. SulTech. June 2007. Appendix G, Table G-18. (<i>note: this document was accepted as final and was provided as Appendix G to the Final Remedial Investigation/Feasibility Study Report for Parcel E-2; Record No. 4237</i>)
33	Risks to aquatic wildlife	Section 2.5.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 7.3, pages 7-15 and 7-16; Table 7-18. Record No. 4237.

1	Parcel E-2	Section 2.1	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 2.1, pages 2-1 through 2-3. Record No. 4237. Proposed Plan for Parcel E-2, Hunters Point Naval Shipyard, San Francisco, California. Department of the Navy. September 2011. Page 1. Record No. 3580.

This section describes the site characteristics associated with Parcel E-2, including the site features; geologic, hydrogeologic, and hydrologic conditions; and ecologic conditions, such as terrestrial, wetland, and intertidal habitats². According to EPA guidance, characterization of a landfill's contents is not necessary or generally appropriate for selecting a response action for these sites when applying the presumptive remedy methodology for remedial alternatives evaluation (EPA, 1993a; Appendix H to this report). However, because Parcel E-2 is composed of a landfill, as well as adjacent areas (the Panhandle Area, East Adjacent Area, and Shoreline Area) containing noncontiguous waste deposits outside the primary landfill area, characterization data collected through March 2008 were used in the remedy evaluation process.

2.1. SITE FEATURES

Parcel E-2 encompasses approximately 47.4 acres at HPS. As described in Section 1, the parcel was divided into the following four areas:

- The "Landfill Area," which comprises the entire Parcel E-2 Landfill and its immediate perimeter
- The "Panhandle Area," located west and southwest of the Landfill Area
- The "East Adjacent Area," located to the east of the Landfill Area
- The "Shoreline Area," located at the interface with San Francisco Bay

The following subsections describe the surface features for each of the four areas listed above, including information about the types of solid waste believed to be present at each area. Numerous areas within Parcel E-2 are considered "radiologically impacted," which is discussed in further detail in Section 3.6.

2.1.1. Landfill Area

The 22-acre Landfill Area consists of two subareas: (1) a 14.5-acre interim landfill cap and (2) a 7.5-acre area that is covered with a 2-foot-thick soil layer. The interim cap, originally constructed to smother remnants of a waste layer fire that occurred in August 2000, consists of a multilayer system of sub-base soil, an HDPE membrane, a synthetic drainage layer, and topsoil (TtEMI, 2005b; Appendix E to this

² In September 2004, the Navy divided Parcel E into two parcels (E and E-2). Discussions within this report that reference documents published prior to September 2004 refer to the portion of Parcel E that became Parcel E-2.

report). The remaining 7.5 acres that were unaffected by the fire are covered by a 2-foot-thick soil layer that was placed in 1974 during a preliminary closure action.

Based on data from 26 soil borings, 12 monitoring wells, and 25 test pits extended within the Landfill Area, solid waste in the landfill is primarily municipal-type waste and construction debris. The solid waste includes wood, paper, plastic, metal, glass, asphalt, concrete, and bricks that are mixed with sand, clay, and gravel fill. Historic information indicates that industrial wastes, including sandblast waste, radioluminescent devices, asbestos-containing debris, paint sludge, solvents, and waste oils, were also disposed of in or around the Landfill Area (NEESA, 1984; NAVSEA, 2004). For simplicity, the debris and waste that make up the landfill are referred to as “solid waste” throughout the remainder of this report. The lateral and vertical extents of solid waste within the landfill were evaluated during previous investigations, as discussed in Section 3.2 of this RI/FS Report. The types of solid waste within the Landfill Area are discussed in more detail in Section 4.2.1.

The 14.5-acre interim landfill cap limits precipitation from percolating into portions of the solid waste, and the entire Landfill Area is sloped sufficiently for surface drainage that avoids ponding (drainage patterns are discussed in Section 2.3). The Navy performs inspection and maintenance of the interim landfill cap in accordance with a site-specific operation and maintenance (O&M) plan (TtEMI, 2003b).

In 2002, a landfill gas characterization study revealed that landfill gas had migrated north of the solid waste extent and onto the adjacent Navy and UCSF property. In response to this finding, a time-critical removal action (TCRA) was conducted to (1) reduce concentrations of subsurface methane north of the Parcel E-2 Landfill (under both Navy and UCSF property) to below 5 percent, and (2) prevent future landfill gas migration. The TCRA included installation and operation of a gas control, extraction, and treatment system; the TCRA is discussed in more detail in Section 3.8.5 of this RI/FS Report.

From 1997 to 1998, a 614-foot-long sheet-pile wall was constructed along the southern portion of the Landfill Area, to a depth ranging from 12 to 55 feet bgs, to reduce the potential for release of chemicals from the landfill into the bay. To reduce groundwater mounding behind the sheet-pile wall, a groundwater extraction system (GES) was installed at the same time to intercept, treat, and discharge groundwater to the municipal sewer system (IT, 1999); both features are shown on Figure 1-3 and are discussed in more detail in Section 3.8.3 of this RI/FS Report. These features targeted A-aquifer groundwater. The GES was deactivated in April 2005 to excavate contaminated soil adjacent to the sheet-pile wall and remains offline following implementation of the removal action in the PCB Hot Spot Area (TtFW, 2005a) (discussed in Section 3.8.8).

2.1.2. Panhandle Area

The Panhandle Area has a relatively flat topography and is covered by fill soil that contains noncontiguous pockets of solid waste. Waste at these locations is not contiguous with the Landfill Area and consists primarily of construction debris, with lesser quantities of industrial waste (discussed further in [Section 4.3.1](#)). The presence of isolated solid waste locations is largely because the Panhandle Area was reclaimed from the bay by filling using a combination of fill soil and waste materials (with larger proportions of fill soil as compared to the fill material within the Landfill Area). The interim landfill cap, that covers much of the Landfill Area, does not extend onto the Panhandle Area.

The Panhandle Area includes a drainage channel just outside the extent of landfill waste along the western perimeter of Parcel E-2 (see [Figure 1-4](#)). The drainage channel directs runoff south and discharges indirectly to the bay through low-lying seasonal wetlands southwest of the Parcel E-2 Landfill. The wetland areas are discussed in more detail in [Section 2.4.2](#).

The Panhandle Area contains areas of potential low-level radioactivity, including a former experimental ship-shielding area and the metal slag area. The metal slag area, which is in the southern peninsula of the Panhandle Area and extends into the Shoreline Area, was excavated under an interim removal action (see [Figure 1-3](#); [TtECI, 2007b](#)).

2.1.3. East Adjacent Area

Like the Panhandle Area, the East Adjacent Area has a relatively flat topography and includes solid waste locations intermixed with fill soil that are not contiguous with the Parcel E-2 Landfill. Waste at these locations is not contiguous with the Landfill Area and consists primarily of construction debris, with lesser quantities of industrial waste (discussed further in [Section 4.4.1](#)). The East Adjacent Area also includes an area containing potential low-level radioactive debris. The East Adjacent Area contains an area with PCB contamination, a portion of which was excavated under an interim removal action (see [Figure 1-3](#); [TtECI, 2007a](#)). The sheet-pile wall and associated GES extends from the Landfill Area into the East Adjacent Area ([Figure 1-3](#)). The interim gas control system also extends into the East Adjacent Area.

2.1.4. Shoreline Area

The Shoreline Area is the intertidal zone that contains areas covered with concrete riprap and other exposed shoreline containing sediments and emergent saline wetlands. The intertidal sediments present in the Shoreline Area were characterized during the SDGI, and the results are summarized in the Shoreline Characterization Technical Memorandum ([SulTech, 2007](#); [Appendix G](#) to this report). The metal slag area, discussed in the subsection above, also extends into the Shoreline Area and was previously excavated under an interim removal action ([Figure 1-3](#); [TtECI, 2007b](#)).

Hunters Point Naval Shipyard Parcel E-2

San Francisco, California

September 2011

NAVY ANNOUNCES PROPOSED PLAN

The U.S. Navy encourages the public to comment on its **Proposed Plan*** for cleanup of Parcel E-2 at Hunters Point Naval Shipyard (HPNS) in San Francisco, California. Parcel E-2 includes an unlined **solid waste** landfill along the shoreline in the southwest portion of the Shipyard (see Figure 1).

This Proposed Plan presents several remedial (cleanup) alternatives and identifies the Navy's **Preferred Alternative**. The Navy, in consultation with the U.S. Environmental Protection Agency (EPA), the California EPA Department of Toxic Substances Control (DTSC), and the San Francisco Bay Regional Water Quality Control Board (Water Board), will select a **remedial action** for the site in the **Record of Decision (ROD)** after reviewing and considering all information submitted during the public comment period. The Navy may modify the Preferred Alternative or select another remedial alternative presented in this Proposed Plan based on new information or public comments. Therefore, the public is encouraged to review and comment on all of the alternatives presented in this Proposed Plan. A final decision will not be made until all comments submitted during the review period are considered. See how to comment in the box below.

This Proposed Plan summarizes the remedial (cleanup) alternatives evaluated by the Navy and explains the basis for identifying the preferred alternative to address contamination at Parcel E-2 at HPNS (Figure 1). The Navy proposes the following actions to address hazardous substances in soil, shoreline sediment, **landfill gas**, and groundwater at Parcel E-2:

- Remove and dispose of contaminated soil in selected areas.
- Separate and dispose of materials and soil with **radiological contamination**.
- Install a **protective liner** and soil cover over all of Parcel E-2.
- Install a **below-ground barrier** to limit groundwater flow from the landfill to San Francisco Bay.
- Remove and treat landfill gas to prevent it from moving beyond the Parcel E-2 boundary.
- Build a shoreline **revetment**.
- Build new **wetlands**.
- Monitor and maintain the different parts of the preferred alternative (soil cover, shoreline revetment, wetlands, etc.) to ensure they are working properly.
- Use **institutional controls (IC)** to restrict specific land uses and activities on parcel E-2 (see page 21 for more details on ICs).

Public comments will be accepted from September 7 through October 24, 2011, and public comments can be submitted via mail, fax, or e-mail throughout the comment period. A public meeting will be held from 6:00 p.m. to 8:00 p.m. on September 20, 2011, at the Southeast Community Facility Commission Building in the Alex L. Pitcher, Jr. Room, located at 1800 Oakdale Avenue in San Francisco. Members of the public may submit written and oral comments on this Proposed Plan at the

public meeting. Written comments can be provided any time during the comment period but must be received no later than October 24, 2011. Please refer to page 20 for further information on how to provide comments.

How to Comment on the Proposed Plan for Parcel E-2

- Provide written comments no later than October 24, 2011, by one of the following methods:
 - E-mail: keith.s.forman@navy.mil
 - Fax: (619) 532-0995
 - Mail: See address on page 20
- Attend the public meeting and provide verbal or written comments:
 - September 20, 2011, from 6:00 p.m. to 8:00 p.m.
 - Southeast Community Facility Commission Building, Alex L. Pitcher, Jr. Room
 - 1800 Oakdale Avenue in San Francisco

2	Parcel E-2 Landfill	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and Shaw. May 2011. Sections 8.2.1.1 and 8.2.1.2, pages 8-5 through 8-7. Record No. 4237.
---	---------------------	-------------	--

from the previous investigations and removal actions described in [Section 3](#). The EPA's presumptive remedy guidance states that "characterization of a landfill's contents is not necessary or appropriate for selecting a response action for these sites except in limited cases; rather, existing data are used to determine whether the containment presumption is appropriate" (EPA, 1993a). EPA guidance provides a framework for determining whether the containment presumptive remedy applies to a specific military landfill (EPA, 1996). The first step is to evaluate the available information to determine the sources, types, and volumes of landfill wastes. The following subsections outline the available information for the Parcel E-2 Landfill to support this evaluation. The remaining steps in the decision framework are discussed in [Section 8.2.3](#).

8.2.1.1. Waste Types Encountered During Field Activities

Based on data from 28 soil borings, 18 monitoring wells, and 25 test pits extended within the Landfill Area ([Figures 3-1 and 3-2](#)), the contiguous solid waste is composed primarily of municipal-type waste and construction debris. The solid waste includes wood, paper, plastic, metal, glass, asphalt, concrete, and bricks that are mixed with sand, clay, and gravel fill. Construction debris (such as asphalt, concrete, and brick) is typically inert. Inert waste does not contain significant quantities of putrescible (i.e., decomposable) waste, and is not expected to generate leachate that would create potential risks to human health or the environment. The presence of construction debris, although typically considered an inert waste, was evaluated in conjunction with municipal-type waste because certain types of construction debris (most notably wood) and most municipal-type wastes readily biodegrade and may be considered putrescible.

In addition to municipal-type waste and construction debris, historic information indicates that industrial wastes were also disposed of in or around the Landfill Area, including sandblast waste, radioluminescent devices, asbestos-containing debris, paint sludge, solvents, and waste oils (NEESA, 1984; NAVSEA, 2004). The presence of some of these industrial wastes has been confirmed during the removal action at the PCB Hot Spot Area, which extends into a small portion the Landfill Area ([Figure 1-3](#)). Small quantities of LLRW from the disposal of radioluminescent devices and potentially radioactive sandblast waste have been encountered during implementation of the removal actions at the PCB Hot Spot Area (Navy, 2005b through 2005f; TtECI, 2007a). Out of a total excavated volume of 44,500 cubic yards, 533 cubic yards of soil and fire brick (1.2% by volume) was segregated as radiologically impacted. Also, 40 radiological devices, 78 cubic yards of metal debris, and 19 pieces of other radioactively contaminated debris were identified within the removal area (TtECI, 2007a). In addition, 41 pieces of MPPEH were encountered in the excavation area, consisting primarily of expended cartridge casings of various calibers and protective caps, but also included an empty 5-inch practice projectile and a 3-pound practice bomb (TtECI, 2010). Of the 41 MPPEH items discovered in the

removal area, 20 items were verified to not present an explosive hazard and were reclassified as MDAS. The remaining 21 MPPEH items appeared to have been subject to previous demilitarization actions and could not be completely inspected by UXO technicians for possible explosive hazards. Although the type, age, and condition of these 21 MPPEH items did not suggest a high potential for residual energetic material, the Navy, as a precautionary measure, properly handled, transported, and disposed of these items as either material documented as an explosive hazard (MDEH) (20 items consisting of expended cartridge casings of various calibers) or munitions and explosives of concern (MEC) (1 item, 3-pound practice bomb) (TtECI, 2010). The characterization data suggest that the quantity of industrial waste within the Landfill Area is less than the quantity of municipal-type waste and construction debris.

Additional information on subsurface conditions in the Landfill Area was obtained during installation of the sheet-pile wall in the southeast portion of Parcel E-2 (Figure 1-3). In September 1997, an obstruction was encountered at a depth of approximately 20 feet bgs, accompanied by a release of pressurized gas to the surface. The atmosphere in this area was monitored for health and safety purposes, specifically for explosive conditions (using an LEL meter) and various compounds, including natural gas, chlorine, and hydrogen sulfide (using colorimetric indicator tubes). Sporadic detections of atmospheric conditions above 10 percent of the LEL and chlorine gas above 5 ppm were encountered during health and safety monitoring. Approximately 80 feet of the sheet-pile wall (as originally designed) was realigned to avoid the subsurface obstructions. The alternate alignment consisted of an approximate 50-foot-long section that was off-set approximately 20 feet from the design alignment, with the remaining portion gradually angling back to the design alignment. The remainder of the sheet-pile wall was completed with no additional releases of subsurface gas (IT, 1999). These subsurface conditions may be indicative of solid waste at this location, and the sporadic detections of chlorine gas are a health and safety concern because they are above the permissible exposure limit (established by the Occupational Health and Safety Administration) of 1 ppm. However, no definitive conclusions on the nature of the potential waste at this depth can be drawn from the observed conditions.

8.2.1.2. Operating History

Overall, the operating history of the Parcel E-2 Landfill is not well documented (TtEMI, LFR, and U&A, 1997). The following items summarize the available historic information:

- The IAS indicated that, between 1958 and 1974, the Navy created the Parcel E-2 Landfill by placement of a variety of shipyard wastes, including construction debris, municipal-type solid waste, and industrial waste (including sandblast waste, paint sludge, solvents, and waste oils) (NEESA, 1984).
- The HRA indicated that the Parcel E-2 Landfill, along with other areas within Parcels E and E-2, was a disposal area for radioluminescent devices (primarily containing radium-226), and that the landfill was a potential disposal area for wastes from decontamination of ships used in atomic testing (NAVSEA, 2004)

- An oily waste area was identified on Navy drawings along the western perimeter of the Landfill Area (Navy, 1974). During preliminary closure activities in 1974, ponded liquid was removed and the top 6 inches of soil at the oily waste area was scarified before the soil cover was placed. Based on borings and exploratory trenches, this area also was partially filled with solid waste during closure; therefore, this area is included within the boundaries of solid waste at the Parcel E-2 Landfill (TtEMI, 2004f).
- Triple A allegedly disposed of industrial debris, sandblast waste, oily industrial sand, and asphalt over an area of approximately 5 acres along the shoreline of Parcel E-2. In addition, Triple A allegedly stored unlabeled, deteriorating, uncovered drums with their contents exposed to the elements in the southeast corner of Parcel E-2 (Figure 1-11; SFDA, 1986).
- Waste fuel and waste oil containing PCBs were used at the Parcel E-2 Landfill as dust suppressants (TtEMI, LFR, and U&A, 1997).

8.2.1.3. Nature and Extent of Chemicals in Soil

The soil data set within the Landfill Area was derived from 333 soil samples (26 soil borings, 27 excavation grids within the PCB Hot Spot Area, 12 monitoring wells, and 25 test pits) collected from the intermittent soil fill mixed within the solid waste. As discussed in Section 4.2.4, soil characterization data are used to assess the approximate lateral and vertical extent (relative to the landfill waste volume) of hazardous substances above the RIECs, and to provide a basis for determining whether lesser quantities of hazardous wastes are present in the landfill as compared with municipal wastes. In addition, the characterization data are used to identify potential hot spots (defined as locations containing chemical concentrations 100 times greater than the corresponding RIEC) within the Landfill Area and, based on criteria established by EPA, to determine whether these hot spots require more extensive characterization and development of remedial alternatives.

Metals, pesticides, PCBs, SVOCs, VOCs, and petroleum hydrocarbons were detected at concentrations exceeding the RIEC in soil samples collected at the Landfill Area. These exceedances are summarized below.

- Eight metals (antimony, arsenic, cadmium, chromium, copper, iron, lead, and vanadium) were detected at concentrations exceeding the RIECs at depths greater than 2 feet bgs. Only lead exceeded the RIEC at samples collected from 0 to 2 feet bgs. None of these exceedances were indicative of hot spots.
- Total high risk PCBs (consisting of all Aroclor compounds except Aroclor-1016) were detected at concentrations exceeding the RIEC in more than 30 percent of the samples collected within each depth range evaluated (0 to 2 feet bgs, 2 to 10 feet bgs, and greater than 10 feet bgs). Most of these exceedances were not indicative of hot spots; however, several samples contained PCBs at concentrations that were greater than 100 times the RIEC (0.74 mg/kg) and may be considered potential hot spots within the landfill (described further below).

3	Construction of additional interim landfill cap	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Sections 3.8.4 and 3.7.3, pages 3-25, 3-26, and 3-29. Record No. 4237.
---	---	-------------	--

of the groundwater mound. The evaluation recommended that surface water management controls be taken to prevent increased recharge and the resulting groundwater mound in the area of the former GES, and that more passive groundwater control measures, such as phytoremediation, be evaluated as an alternative to the former GES (IT, 2001). The remedial alternative analysis in the FS portion of this report (Sections 12 through 14) evaluates groundwater containment around the Parcel E-2 Landfill (and other nearshore contaminant sources to the bay) and the appropriate means of controlling groundwater (both upgradient and downgradient).

3.8.4. Landfill Cap Construction (2000 to 2001)

On August 16, 2000, a brush fire burned approximately 45 percent of the landfill surface area. The surface fire was extinguished within 6 hours, but small subsurface areas (less than 5 acres) continued to smolder for approximately 1 month after the fire was extinguished (ATSDR, 2001). As part of a TCRA, an interim cap was constructed to extinguish the fire and prevent the occurrence of future fires under the capped areas. Figure 1-3 shows the area burned by the fire and the area capped during the removal action. The interim cap consists of a multilayer system of sub-base soil, HDPE membrane, synthetic drainage layer, and topsoil. Because the interim cap effectively limits air intrusion into the landfill, the effect was a smothering of any smoldering subsurface areas remaining from the fire. In addition, the interim cap significantly reduces stormwater infiltration through the landfill, thereby reducing the potential for hazardous substances to leach out from the landfill. The interim cap encompasses approximately 14.5 acres and has been vegetated to stabilize surface soil and limit erosion. Additional information on construction of the interim cap is provided in the Final Removal Action Landfill Cap Closeout Report (TtEMI, 2005b; Appendix E of this report).

3.8.5. Landfill Gas Removal Action (2002 to 2003)

Based on the findings of the landfill gas characterization, a TCRA was conducted to address explosion hazards and human health risks associated with off-site migration of landfill gas. The TCRA was designed to achieve the following goals: (1) reduce concentrations of methane detected at the northern edge of the Parcel E-2 Landfill (in the subsurface under both Navy and UCSF property) to less than the LEL of 5 percent; and (2) prevent landfill gas migration onto the nearby UCSF compound, including methane and NMOCs. To achieve these goals, the TCRA consisted of installation and operation of a gas control, extraction, and treatment system.

The gas extraction system consists of 2 mobile extraction unit trailers, 10 extraction wells, and 5 GMPs on the UCSF compound. The gas control system was installed along the northern boundary of the landfill and consists of an HDPE barrier wall, a gas collection trench sealed (on top) with bentonite, a horizontal perforated gas collection pipe, five gas vents, and a mobile active extraction unit to assist venting when necessary. Figure 1-3 shows the major components of the gas extraction and control system; a conceptual

Phase II monitoring location). As a result, additional sampling was recommended to verify that the elevated concentrations were from off-site sources.

The Phase III outdoor air sampling was conducted in 1996 and focused on four locations from Phase II, including the one Parcel E-2 location. Two upwind sampling locations were established along the western boundary of Parcel E-2. The samples were analyzed for asbestos, metals, VOCs, and PCBs. Concentrations of asbestos, metals, and VOCs detected in the Phase III samples were similar to regional background concentrations, and concentrations of PCBs were two orders of magnitude lower than concentrations detected during Phase II. These findings supported the conclusion that removal of the sandblast waste pile in 1994 most likely contributed to the elevated concentrations of asbestos, metals, and PCBs detected during Phase II. In addition, the elevated VOC concentrations measured near IR Site 01/21 in the Phase II samples were not detected during the Phase III investigation. The Phase II and III air monitoring locations in and adjacent to Parcel E-2 are shown on [Figure 3-4](#).

3.7.3. Perimeter Air Monitoring Program, Landfill Cap Construction (2000 to 2001)

A grass fire burned on Parcel E-2 on August 16, 2000. After the surface fire was extinguished, subsurface smoldering was discovered. An initial 24-hour outdoor air sample was collected downwind of the fire area on August 31, 2000, and an air monitoring network was established around the perimeter of Parcel E-2 on September 8, 2000. Air samples were collected at seven stations to evaluate whether chemicals were migrating toward residents and commercial workers. The air monitoring locations established under the perimeter air monitoring program (PAMP) in and adjacent to Parcel E-2 are shown on [Figure 3-4](#).

The PAMP continued from September 8, 2000, until the cap was structurally completed on March 13, 2001. The objective of the PAMP at Parcel E was to identify any conditions requiring corrective measures necessary to ensure that public health and the environment of the nearby community were not compromised by air emissions from the subsurface smoldering and landfill capping activities.

Integrated air samples were collected for analysis of metals, VOCs, SVOCs, pesticides, PCBs, low-resolution and high-resolution dioxins and furans, chlorine compounds, and phosgene. A radioactivity sample was collected during a single sample period. During the PAMP, over 2,400 different analyses were conducted on the more than 1,700 samples collected from the seven-station monitoring network. Action levels for target chemicals were based on a combination of existing action levels established during the Parcel B soil remedial action and EPA Region 9 PRGs (now called regional screening levels).

The PAMP concluded that the PCB compound, Aroclor-1260, was the primary chemical detection that was directly attributable to landfill capping activities. Almost all of the Aroclor-1260 detections were at monitoring Station F, which was in the southeast corner of Parcel E-2 (near the PCB Hot Spot Area that was excavated in 2005 and 2006). Detections of Aroclor-1260 were attributed to construction activities

that disturbed surface soil in the area. Construction activities in the area were modified to minimize dust generation in the area. Similar precautions are being implemented during the ongoing removal action in the area, and perimeter air monitoring is also being performed.

Other conclusions from the PAMP included:

- Combustion products such as PAHs and dioxin and furans directly attributable to the fire were not prevalent and were below project duration PAMP action levels and PRGs.
- Of the more than 150 target chemicals or classes of compounds, 98 were not detected at any time during the PAMP. The following chemicals and classes of compounds were not detected: pesticides (except for one detection of endrin below action levels), chlorine or hydrogen chloride, phosgene, low resolution dioxins and furans, benzo(a)pyrene, cadmium, and vinyl chloride.
- Detected concentrations of lead, nickel, and high-resolution dioxins and furans were below the corresponding PAMP action levels and PRGs.
- Benzene and carbon tetrachloride were frequently detected, and observed concentrations exceeded project duration PAMP action levels or PRGs. These concentrations were attributed to outdoor air background concentrations because the project average concentrations of benzene and carbon tetrachloride were less than the corresponding background concentrations reported for the Bay Area Air Quality Management District (BAAQMD) outdoor air monitoring station on Arkansas Street in San Francisco.
- Bis(2-ethylhexyl)phthalate was frequently detected, and observed concentrations exceeded project duration PAMP action levels. However, the PRG was not exceeded. This chemical is ubiquitous in nature and is associated with PVC plastic, including gloves.
- Arsenic and manganese were frequently detected, and observed concentrations exceeded project duration PAMP action levels or PRGs or 24-hour PAMP action levels. These metals are naturally occurring in soil, and observed concentrations of these metals correlated with earth-moving activities during cap construction and wind direction.

The PAMP results are presented in Attachment A of the Final Removal Action Landfill Cap Closeout Report ([TtEMI, 2005b](#); [Appendix E](#) of this report). Information on construction of the interim landfill cap is presented in [Section 3.8](#).

3.7.4. Landfill Gas Characterization (2002)

As part of the NDGI, outdoor air and building atmosphere surveys were conducted to assess whether methane was present in outdoor air within 300 feet of the Parcel E-2 Landfill and in buildings or subterranean structures at concentrations exceeding 1.25 percent volume in air. Results of the outdoor air survey indicated that landfill gas was not present in the breathing zone or in building atmospheres within the landfill; within 300 feet of the landfill limit; or within surveyed, accessible buildings outside the 300-foot perimeter. The NDGI outdoor air monitoring locations in and adjacent to Parcel E-2 are shown

4	Fill materials in the East Adjacent, Panhandle, and Shoreline Areas of Parcel E-2	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 8.4.1, pages 8-22 through 8-24. Record No. 4237.
---	--	-------------	--

above 25 percent of the LEL. An investigation of this possible preferential pathway will be scoped, performed, and summarized as part of the RD process. This investigation may involve geophysical techniques and exploratory test pits.

Based on evaluation of available data from January 2004 through June 2010, the gas control system is functioning to control the migration of hazardous levels of methane beyond the northern fence line of the Parcel E-2 Landfill. In January and February 2006, hazardous levels of methane were detected at the fence line of the landfill. The Navy promptly performed active extraction to control the migration of hazardous levels of methane beyond the fence line of the landfill. The efficacy of the gas control system along the northern landfill boundary, as well as gas monitoring data (for both methane and NMOCs) from around the remainder of the landfill, supports the nature and extent of landfill gas as presented in this report.

The potential exists for methane, if not properly controlled, to migrate beyond the Parcel E-2 Landfill boundary at concentrations that may be hazardous to human health. Therefore, continued monitoring and control (through either passive or active methods) of methane should be included as part of any remedial alternative that leaves Landfill Area solid waste in place. Additional studies are planned, in conjunction with the RD, to more thoroughly evaluate soil gas concentrations in the Panhandle Area and East Adjacent Area and to assess whether methane or NMOCs are present in the areas at concentrations that may be hazardous to human health.

8.4. SOIL AND ISOLATED SOLID WASTE IN THE PANHANDLE AND EAST ADJACENT AREAS

The following subsections summarize the nature and extent of isolated solid waste locations ([Section 8.4.1](#)) and chemicals in soil ([Section 8.4.2](#)) found in the Panhandle and East Adjacent Areas. The risk assessments conducted in the adjacent areas are summarized in [Section 8.4.3](#), and an overview of the RI conclusions for the adjacent areas is presented in [Section 8.4.4](#).

8.4.1. Nature and Extent of Isolated Solid Waste Locations

The nature and extent of solid waste in the Panhandle and East Adjacent Areas is distinct from the solid waste defined in the Landfill Area. Specifically, fill material in the Panhandle and East Adjacent Areas consists primarily of soil and rock, with isolated solid waste locations that are not contiguous with solid waste in the Landfill Area. In addition, solid waste within the adjacent areas consists of inert construction debris, with isolated locations of industrial wastes (such as sandblast waste, metal slag, radioluminescent devices, and oily waste) and putrescible construction debris (such as wood). Although these waste types are also found in the Landfill Area, the municipal-type waste found in the Landfill Area is not found in the Panhandle and East Adjacent Areas.

The Navy reviewed aerial photographs and logs from more than 280 test pits, soil borings, monitoring wells, and GMPs from various investigations at and adjacent to Parcel E-2 to identify locations outside the landfill that contain industrial wastes, municipal-type wastes, or construction debris. Results of the evaluation are summarized in the table below and depicted on [Figure 4-1](#).

Waste Type	Number of Waste Locations in Panhandle Area ^a	Number of Waste Locations in East Adjacent Area ^a
Nonputrescible construction debris	28	10
Putrescible construction debris	20	21
Sandblast waste	0	9
Sandblast waste and putrescible construction debris	0	3
Total:	48 (87 total borings and test pits)	43 (117 total borings and test pits)

Notes:

- a Includes borings in the Shoreline Area in close proximity to the Panhandle and East Adjacent Areas, and also includes borings and test pits installed only to identify soil lithology (i.e., no soil samples were collected for chemical analysis).

Construction debris encountered in both the Panhandle and East Adjacent Areas include concrete, brick, wood, and asphalt, with limited amounts of ceramic, glass, and metals (primarily as wire or rebar in concrete). With the exception of wood, the remaining types of construction debris are considered inert and are not expected to generate methane gas or leachate that would create potential risks to human health or the environment.

Industrial wastes have been encountered in the Panhandle and East Adjacent Areas during the Metal Slag Area and PCB Hot Spot Area removal actions. Industrial wastes encountered within the Metal Slag Area (in the Panhandle Area) include metal slag and debris containing low-level radiological material and devices (TtECI, 2007b). All excavated soil and waste removed from the Metal Slag Area was handled and screened as potential LLRW based on the findings of the HRA (NAVSEA, 2004). Out of a total excavated volume of 8,200 cubic yards, approximately 74 cubic yards of soil and sediment was segregated as radiologically impacted. In addition, 32 radiological devices, 15 cubic yards of radiological debris (primarily fire bricks), and approximately 30 cubic yards of metal debris were identified within the removal area (Navy, 2006a and 2006b; TtECI, 2007b). In addition to this radiologically impacted debris, six waste drums were recovered from the removal area and were characterized prior to off-site disposal. The drums, which were discovered in varying degrees of deterioration, contained grease, soil, plastic, metal, and wood. Waste characterization data indicated that five of the six drums contained various chemicals, including PCBs and petroleum hydrocarbons; the sixth drum contained elevated activities of radium-226 (TtECI, 2007b).

Industrial wastes encountered within the PCB Hot Spot Area (in the East Adjacent Area) include oily wastes, radioluminescent devices, and sandblast waste (Navy, 2005b through 2005f). All excavated soil

and waste from the PCB Hot Spot Area removal action was handled and screened as potential LLRW based on the findings of the HRA (NAVSEA, 2004). Out of a total excavated volume of 44,500 cubic yards, 533 cubic yards of soil and fire brick was segregated as radiologically impacted. Also, 40 radiological devices, 78 cubic yards of metal debris, and 19 pieces of other radioactively contaminated debris were identified within the removal area (TtECI, 2007a).

Also, 110 drums and 537 assorted waste containers were recovered from the central portion of the PCB Hot Spot Area excavation and were characterized prior to off-site disposal. The drums, which were discovered in varying degrees of deterioration, contained grease, oil, soil, asphalt, and tar substances. Waste characterization data indicated that the drums contained various chemicals, including PCBs and pesticides. Two of the drums contained mixed waste with radiological contamination. The small containers contained various laboratory chemicals, ranging from strong acids and bases to solvents, alcohols, and inorganic salts (TtECI, 2007a). In addition, 41 pieces of MPPEH were encountered in the excavation area, consisting primarily of expended cartridge casings of various calibers and protective caps, but also included an empty 5-inch practice projectile and a 3-pound practice bomb (TtECI, 2010). Of the 41 MPPEH items discovered in the removal area, 20 items were verified to not present an explosive hazard and were reclassified as MDAS. The remaining 21 MPPEH items appeared to have been subject to previous demilitarization actions and could not be completely inspected by UXO technicians for possible explosive hazards. Although the type, age, and condition of these 21 MPPEH items did not suggest a high potential for residual energetic material, the Navy, as a precautionary measure, properly handled, transported, and disposed of these items as either material documented as an explosive hazard (MDEH) (20 items consisting of expended cartridge casings of various calibers) or munitions and explosives of concern (MEC) (1 item. 3-pound practice bomb) (TtECI, 2010).

The noncontiguous and heterogeneous nature of the fill material within the Panhandle and East Adjacent Areas results in a high degree of uncertainty that this fill and the chemicals in soil can be delineated into discrete zones for remediation activities.

8.4.2. Nature and Extent of Chemicals in Soil

The soil data set within the Panhandle and East Adjacent Areas was derived from 754 soil samples (113 soil borings, 113 excavation grids within the PCB Hot Spot Area and Metal Slag Area, and 14 test pits) collected within these areas. Metals, pesticides, PCBs, dioxins and furans, SVOCs, and petroleum hydrocarbons were detected at concentrations exceeding RIECs in soil samples collected in the Panhandle and East Adjacent Areas. A summary of these chemical detections above the RIECs is presented below.

5	Areas where low-level radiological material may be located	Section 2.2	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRs. March 2011. Section 2.3, pages 2-5 through 2-8. Record No. 4260.
---	---	-------------	---

The HRA concluded that low levels of radiological contamination exist within the confines of HPS. The review of previous radiological activities, cleanup actions, and release surveys identified no imminent threat or substantial risk to tenants or the environment of HPS or the local community (NAVSEA, 2004).

The HRA identified the following radiologically impacted areas at Parcel E-2 (Figure 3):

- Experimental Ship-Shielding Area
- IR Site 01/21 (which encompasses most of the land area at Parcel E-2)
- IR Site 02 (located partially within Parcel E-2)
- Metal Slag Area
- Parcel E-2 shoreline
- Sanitary sewer system
- Storm drain lines
- Septic sewer lines

Each radiologically impacted area is described in the sections below, and key information is provided on Table 1. As shown on Figure 3, most of the land area within Parcel E-2, except for small portions of the East Adjacent Area, is considered radiologically impacted.

2.3.1. Experimental Ship-Shielding Area

The Experimental Ship-Shielding Area is an open field area located in the Panhandle Area. Radioactive material was used in the area to conduct shielding experimentation for ships; more specifically, radiological experiments were performed to evaluate the shielding effectiveness of various construction materials (Atomic Energy Commission [AEC] 1960, 1961, and 1963). The former range comprises three parts: (1) a fan-shaped, post-exposure reflection/refraction field measuring 150 feet in radius; (2) a 60- by 35-foot site designated as Area A; and (3) a 60- by 50-foot area designated as Area B. The former range was enclosed on the west side by a soil berm. Documents reviewed during preparation of the HRA identified the following information regarding historic operations at the Experimental Ship-Shielding Area:

- The 1959 AEC Compliance Inspection Report states that one of the planned experiments would consist of a cobalt-60 (^{60}Co) source being “passed through a plastic tube laid just beneath the surface of the ground” (AEC, 1960).

- The 1961 AEC Compliance Inspection Report states that to simulate spread source radiation fields, an 100 curie ^{60}Co source was “pumped through plastic tubing laid in varying patterns on an asphalt-covered area” (AEC, 1961).
- The 1962 inspection report states that at the time of inspection, the tube “device was not in use,” and the tubing and ^{60}Co source were properly stored (AEC, 1963).

The ROCs at the ship-shielding area are ^{60}Co , cesium-137 (^{137}Cs), and radium-226 (^{226}Ra). The HRA concluded that potential contamination is likely in this area and recommended remediation of areas of elevated radioactivity (as identified during previous characterization surveys) and conducting a final status survey (NAVSEA, 2004). The Navy is planning to perform these actions under an interim removal action, currently scheduled to be implemented in 2011.

2.3.2. IR Site 01/21

IR Site 01/21 is the investigation area established in and around the Landfill Area during the early stages of the site characterization process. This site boundary was established prior to the Navy completing the site investigations that distinguished the Landfill Area from the Panhandle Area, East Adjacent Area, and Shoreline Area. As a result, the IR Site 01/21 boundary extends beyond the Landfill Area into adjoining portions of the Panhandle Area, East Adjacent Area, and Shoreline Area. The most common source of potential radioactive contamination at IR Site 01/21 is historic waste disposal activities. Documented disposal of low-level radiological waste at IR Site 01/21 includes disposal of radioluminescent commodity items (such as dials, gauges, and deck markers). Disposal of radioluminescent commodity items was not controlled by specific procedures until the late 1960s. Prior to that time, it was common practice to dispose of such items on-site, including at IR Site 01/21 (NAVSEA, 2004). Other suspected disposal of low-level radiological waste at IR Site 01/21 includes: (1) potential disposal of wastes from decontamination of ships used in atomic weapons testing (i.e., sandblast waste); (2) potential disposal of building debris from demolition of radiologically impacted buildings used by the Naval Radiological Defense Laboratory (NRDL); and (3) potential disposal of materials used in radiological experiments by NRDL. Available information regarding the quantities and types of materials potentially disposed of at IR Site 01/21 is discussed in the Sections 4.2.1 and 4.2.2.

The ROCs at IR Site 01/21 are ^{137}Cs , ^{226}Ra , and strontium-90 (^{90}Sr). The HRA concluded that contamination is known to exist in this area and recommended remediation of areas of elevated radioactivity (as identified during previous characterization surveys) and conducting a final status survey (NAVSEA, 2004).

2.3.3. IR Site 02

IR Site 02, which extends partially into the East Adjacent Area, is the investigation area established along the margin of San Francisco Bay during the early stages of the site characterization process. This site boundary was established prior to the Navy completing the site investigations that initially delineated

the PCB Hot Spot Area. When the Navy divided Parcel E into two parcels (E and E-2) in 2004, the Parcel E-2 boundary was drawn to include the portion of IR Site 02 containing the initial boundary of the PCB Hot Spot Area. Historical radiological operations at IR Site 02 included disposal of radioluminescent commodity items (such as dials, gauges, and deck markers), and potential disposal of wastes from decontamination of ships used in atomic weapons testing (i.e., sandblast waste).

An area containing a concentration of radioluminescent commodity items was discovered in IR Site 02 and removed during an interim removal action (TtECI, 2007c); however, this area is located entirely within the current boundary of Parcel E. The ROCs at IR Site 02 are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The HRA concluded that contamination is known to exist in this area and recommended a characterization survey, remediation of areas of elevated radioactivity, and conducting a final status survey (NAVSEA, 2004).

From 2005 to 2007, the Navy conducted a removal action at the PCB Hot Spot Area, which is discussed in detail in Section 3.2.2. Additional excavation along the western and southwestern sidewalls of the excavation (referred to as the shoreline portion of the PCB Hot Spot Area) was initiated in 2010 (Navy, 2010; Shaw, 2010), with work anticipated to be completed in 2011.

2.3.4. Metal Slag Area

The Metal Slag Area is an open field located in the Panhandle Area and Shoreline Area southwest of the Experimental Ship-Shielding Area. The Metal Slag Area contains wastes suspected to have originated from the metal foundry (Building 241 in Parcel C) and the smelter (Building 408 in Parcel D) when the shipyard was active. Waste in the Metal Slag Area includes industrial debris and metal slag with radioactive anomalies. The ROCs at the Metal Slag Area are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The Metal Slag Area was excavated under an interim removal action that is described in further detail in Section 3.2.1 (TtECI, 2007b).

2.3.5. Parcel E-2 Shoreline

The intertidal shoreline area in Parcels E and E-2 was surveyed for gamma radiation in 2001. This survey identified several areas of elevated radioactivity; as a result, the HRA concluded that contamination is known to exist in this area and recommended a characterization survey, remediation of areas of elevated radioactivity, and conducting a final status survey (NAVSEA, 2004). The ROCs at the Parcel E-2 shoreline are ^{137}Cs , ^{226}Ra , and ^{90}Sr . As discussed in the section above, the Navy removed metal slag with radioactive anomalies from the Metal Slag Area under an interim removal action (TtECI, 2007b). Additional excavation along the shoreline portion of the PCB Hot Spot Area was initiated in 2010 (Navy, 2010; Shaw, 2010), with work anticipated to be completed in 2011.

2.3.6. Sanitary Sewer System

Consistent with regulations at the time the NRDL operated at HPS, small amounts of low-level radioactive liquids may have been released into drains at NRDL buildings that discharged into the sanitary sewer system (NAVSEA, 2004). Evidence of such releases was initially found at Buildings 351A and 364 located in Parcel G, which prompted the Navy to initiate an interim removal action to remove and remediate potentially contaminated sanitary sewer lines throughout various HPS parcels (B, C, D-1, D-2, E, E-2, G, UC-1, and UC-2). The ROCs for the sanitary sewer system are ^{137}Cs , ^{226}Ra , and ^{90}Sr . As of October 2009, the Navy had removed sanitary sewer lines throughout Parcels B, D-2, G, UC-1, and UC-2. The portion of the sanitary sewer system that extends into Parcel E-2 has not yet been removed, but is considered by the HRA to likely be contaminated and is recommended for a characterization survey, followed by remediation of areas of elevated radioactivity and a final status survey (NAVSEA, 2004).

2.3.7. Storm Drain Lines

The original sanitary sewer system at HPS was combined with the storm drain system and used the same conveyance piping and 40 separate discharge outfalls into the bay. Three separate projects, beginning in 1958, were completed to separate the sanitary sewer and storm drain systems, but complete separation of the two systems was never achieved. Based on this history and the potential discharge of small amounts of low-level radioactive liquids into drains at NRDL buildings, the storm drain lines at HPS Parcels B, C, D-1, D-2, E, E-2, G, UC-1, and UC-2 are considered radiologically impacted and are being removed under an interim removal action concurrent with the sanitary sewer system. The ROCs for the storm drain lines are ^{137}Cs , ^{226}Ra , and ^{90}Sr . As of October 2009, the Navy had removed storm drain lines throughout Parcels B, D-2, G, UC-1, and UC-2. The storm drain lines that extend into Parcel E-2 have not yet been removed, but are considered by the HRA to likely be contaminated and are recommended for a characterization survey, followed by remediation of areas of elevated radioactivity and a final status survey (NAVSEA, 2004).

2.3.8. Septic Sewer Lines

Prior to construction of the sanitary sewer and storm drain system, individual buildings may have used septic drain fields to dispose of liquid wastes, including potentially small amounts of low-level radioactive liquids. Construction documentation for septic sewer lines does not exist; however, septic sewer lines were discovered during a radiological survey at the Building 707 “triangle area” (located in Parcel E) and sewer lines may be present at other radiologically impacted buildings. Although no radiologically impacted buildings are present at Parcel E-2, Building 810 is radiologically impacted and is located within an adjacent portion of Parcel E. Potential septic drain lines emanating from Building 810, if present, may extend onto Parcel E-2. The ROCs for the septic sewer lines are ^{137}Cs , ^{226}Ra , and ^{90}Sr . The septic sewer lines are considered by the HRA to likely be contaminated and are recommended for a characterization survey, followed by remediation of areas of elevated radioactivity and a final status survey (NAVSEA, 2004).

6	Radiological operations	Section 2.2	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRs. March 2011. Section 4.2, pages 4-3 through 4-6. Record No. 4260.
---	-------------------------	-------------	---

All soil samples were collected within the upper 6 inches of the ground surface. Although the surface soil data do not provide information on potential subsurface radioactive contamination, the existing data are considered adequate to (1) determine the extent of radioactive contamination in surface soil at Parcel E-2, and (2) support a screening-level HHRA based on the planned open space reuse of Parcel E-2. Based on the established HHRA methodology for HPS, future recreational users of open space areas are exposed only to surface soil from 0 to 2 feet bgs.

Limited subsurface soil data exist at the Metal Slag Area and PCB Hot Spot Area; however, as discussed in [Sections 3.2.1 and 3.2.2](#), these data were collected after the completion of excavation activities that successfully removed LLRW from the area. Therefore, the subsurface data are of limited use in determining the extent of subsurface contamination at other Parcel E-2 locations and are not discussed in detail within this addendum. Post-excavation soil data from the two removal action areas are presented in the final RACRs ([TtECI, 2007a and 2007b](#)).

Uncertainties related to the nature and extent evaluation are discussed in [Section 8](#). Section 8 discusses the extent to which these uncertainties affect the risk management decisions for Parcel E-2 and provides recommendations for the remedial option analysis.

4.2. POTENTIAL SOURCES OF RADIOACTIVE CONTAMINATION AND IMPACTED MEDIA

[Table 1](#) identifies each of the radiologically impacted areas at Parcel E-2 and the radionuclides of interest at each area. [Section 2.3](#) discussed the radiological operations at each impacted area and identified the potential sources of radioactive contamination. The most common source of potential radioactive contamination is historic waste disposal activities that occurred at various locations in Parcel E-2. Documented disposal of low-level radiological waste at Parcel E-2 includes:

- Disposal of radioluminescent commodity items (such as dials, gauges, and deck markers) within IR Sites 01/21 and 02
- Disposal of industrial debris and metal slag with radioactive anomalies at the Metal Slag Area (removed in 2005 and 2006 under an interim cleanup action, see [Section 3.2.1](#))
- Potential discharge of small amounts of low-level radioactive liquids into drains at NRDL buildings (potentially leading to sanitary sewer, storm drain, and septic sewer lines)

Disposal of radioluminescent commodity items was not controlled by specific procedures until the late 1960s. Prior to that time, it was common practice to dispose of such items on-site, including at IR Sites 01/21 and 02 ([NAVSEA, 2004](#)).

The HRA evaluated the potential for residual radioactive contamination at each impacted site based on historical information, previous radiological survey results, and site reconnaissance (NAVSEA, 2004). Table 3, as excerpted from the HRA, identifies the potential for various media (e.g., surface soil, subsurface soil, groundwater, etc.) to contain radioactive contamination. As shown in Table 3, surface and subsurface soil are the most likely media to contain radioactive contamination at Parcel E-2.

In addition to the documented disposal activities discussed above, other suspected disposal of low-level radiological waste includes:

- Potential disposal of wastes from decontamination of ships used in atomic weapons testing (i.e., sandblast waste) within IR Sites 01/21 and 02;
- Potential disposal of building debris from demolition of radiologically impacted buildings used by the NRDL within IR Site 01/21; and
- Potential disposal of materials used in radiological experiments by NRDL within IR Site 01/21.

Available information regarding the quantities and types of materials potentially disposed of at IR Site 01/21 is discussed in the sections below.

4.2.1. Disposal of Sandblast Waste Within IR Sites 01/21 and 02

Based on the information presented in the HRA (NAVSEA, 2004), sandblasting was performed to decontaminate ships that participated in atomic weapons testing and spent sandblast material (referred to as sandblast waste) may have been disposed of at the Landfill Area (as well as elsewhere at IR Site 01/21). Such sandblast waste may contain ^{137}Cs and ^{90}Sr (fission products from the detonation of atomic weapons). In addition, most sandblast material contains naturally occurring ^{226}Ra .

OPERATION CROSSROADS was an atomic weapons test conducted in 1946 that, following testing at Bikini Atoll in the Marshall Islands, returned ships to HPS for decontamination. As discussed in the HRA (NAVSEA, 2004), the most highly contaminated ships from OPERATION CROSSROADS were either sunk at Bikini Atoll (as a result of the detonation) or at the nearby Kwajalein Atoll.

Following initial decontamination at Kwajalein Atoll, the remaining ships were brought to HPS for decontamination (NAVSEA, 2004). Navy ships continued to participate in atomic weapons testing and return to HPS for decontamination sporadically in the 1950s and early 1960s (NAVSEA, 2004). The half-lives of both ^{137}Cs and ^{90}Sr are about 30 years, so these potential contaminants from atomic testing decontamination would have undergone approximately a 75 percent reduction by 2011.

The HRA includes the following additional information regarding sandblast waste (all information from the HRA [NAVSEA, 2004] unless otherwise noted):

- Sandblast waste from the decontamination of OPERATION CROSSROADS ships was disposed of at sea until December 1946. After that time, the Navy directed that biological growth (the most significant areas of radiologic contamination) be removed manually and disposed of at sea before general sandblasting. The sandblast waste was then deemed acceptable for unregulated disposal and may have been buried at HPS, including at the Landfill Area (as well as elsewhere at IR Site 01/21).
- The USS INDEPENDENCE, the last OPERATION CROSSROADS ship at HPS, was used for experimentation until it was loaded with radiologic waste and sunk at sea in January 1951.
- Aerial photographs indicate that most of the Landfill Area was filled after 1955 (see Figures 1-6 through 1-9 in the RI/FS Report) and therefore after decontamination of OPERATION CROSSROADS ships had ceased (in 1951).
- From 1952 to 1955, two ex-Liberty ships were modified to support the study of the effects of atomic weapons. The ships were used to provide support for research during weapons tests in the Pacific through the early 1960s. Following participation in the test, the ships would return to HPS for decontamination. For these ships, the HRA indicates that “sandblast material was to be controlled (collected and drummed as radioactive waste) during removal of ‘hot spots’ (not further defined). Once the hot spots were removed, the remaining sand could be disposed of in the Bay.”
- The HRA further indicates that “by 1956, a new directive regarding the disposal of liquids and sandblast material into the Bay stated that decontamination was to be *‘witnessed by shipyard personnel to prevent runoff of contaminated liquids or dumping of contaminated wastes into bay waters at dockside. All contaminated wastes shall be disposed of in accordance with existing regulations.’*” The disposal regulations are not defined in the HRA or supporting documents, so it not known whether radiologically contaminated sandblast waste was disposed at the Landfill Area (or elsewhere at IR Site 01/21) after 1955. The HRA did not identify records indicating the number of ships potentially decontaminated at HPS after 1955; only three atomic tests were performed in the Pacific Ocean from 1956 to 1962, at which point the United States ceased atmospheric atomic testing ([Radiochemistry Society, 2011](#)).

This information suggests that, while sandblast waste was probably disposed of at the Landfill Area (as well as elsewhere at IR Site 01/21), the sandblast waste with the highest levels of radioactivity from atomic testing was likely controlled and not disposed of at Parcel E-2.

Because of the potential for sandblast waste to contain radiological contamination, the Navy has implemented a field protocol to sample and analyze any sandblast waste encountered during intrusive activities at HPS. The protocol involves an initial analysis for ^{137}Cs and, if ^{137}Cs is identified, the waste is analyzed for ^{90}Sr . If both ^{137}Cs and ^{90}Sr are identified, then the waste is analyzed for alpha emitters (most notably, plutonium-239 and ^{235}U). This protocol was followed for sandblast waste found during previous removal actions at Parcels E and E-2 and neither ^{137}Cs nor ^{90}Sr were identified in sandblast waste at activity levels exceeding background levels. This finding is consistent with the operational history of the shipyard in that throughout shipyard operations (early 1940s through the early 1970s), abrasive sandblast material was commonly used to clean ships not associated with radiological operations.

4.2.2. Potential Disposal of NRDL Materials at IR Site 01/21

The NRDL maintained strict accountability and control of radioactive materials for which they were responsible under the direction of the Radiation Safety Committee. The use of radionuclides at HPS was controlled by the Navy, who first instituted a radiological controls program in 1946, and the AEC, which issued licenses starting in 1954 authorizing the use of radionuclides at HPS (although radium was exempt from AEC licensing requirements). For example, the HRA documents that many NRDL buildings had specific features (e.g., sumps, vaults, tanks, etc.) to control the storage of radiological materials prior to off-site disposal. In addition, the HRA documents that animal carcasses used in radiological tests were disposed of using two distinct methods (1) animals that had been dosed with radioactive material (e.g., through injection) were considered radioactive waste and were disposed of off-site and (2) animals exposed to ionizing radiation (e.g., through x-rays) were not considered radioactive waste and may have been disposed of at the Landfill Area (NAVSEA, 2004). However, it is possible that some radionuclides and radiological materials not controlled under the licenses were disposed of at the Landfill Area, particularly prior to the AEC licensing in 1954.

Review of historical aerial photographs (as presented on Figures 1-6 through 1-11 of the RI/FS Report) indicated that the volume of fill material placed in the Landfill Area prior to 1955 was relatively low, and that most of the fill was placed after 1955 (at which point radioactive materials at HPS were subject to AEC licensing requirements). This information suggests that the volume of NRDL waste potentially disposed of in the Landfill Area was relatively low.

The various radionuclides used at HPS, including those used by NRDL, are provided in Table 4-2 of the HRA (NAVSEA, 2004). The ROCs at HPS are identified in Table 4-3 of the HRA, along with their associated half-lives. Table 4-3 does not include many short-lived radionuclides, which have undergone more than 10 half-lives and are no longer ROCs. The HRA identified ROCs for each radiologically impacted site at HPS based on its operational history and available historic documentation; the list of site-specific ROCs are a subset of the comprehensive list of ROCs provided in Table 4-3 of the HRA (NAVSEA, 2004). Table 4 provides a comprehensive list of all current and former buildings at HPS formerly occupied by NRDL, the historic use and ROCs at each site, potential waste disposal activities, and the potential for residual radioactive contamination (as presented in the HRA). Based upon the available information provided in Table 4, the potential disposal volumes at IR Site 01/21 would have been small because (1) many NRDL buildings had specific features (e.g., sumps, vaults, tanks, etc.) to control the storage of radiological materials prior to off-site disposal and (2) review of aerial photographs indicated that most of the Landfill Area was filled after 1955 (see Figures 1-6 through 1-9 in the RI/FS Report). Accordingly, the ROCs for IR Site 01/21 are limited to ^{137}Cs , ^{226}Ra , and ^{90}Sr and do not include other ROCs potentially used by the NRDL.

7	Hydrostratigraphy	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 2.2.1, pages 2-4 through 2-6. Record No. 4237.
---	-------------------	-------------	--

Numerous field investigations have been performed to characterize and define the geology and hydrogeology at HPS. This subsection discusses the geologic and hydrogeologic conditions at Parcel E-2 based on the information derived from those investigations. The geologic descriptions presented in this subsection are interpreted from lithologic cross sections presented in the Landfill Lateral Extent Evaluation Report (TtEMI, 2004f). Hydrogeologic descriptions related to hydrostratigraphy, groundwater flow patterns, hydraulic characteristics, tidal effects, and total dissolved solids (TDS) are also presented in this subsection and are based primarily on information included in the Parcel E Groundwater Summary Report prepared following the Phase III GDGI (TtEMI, 2004c). This subsection also summarizes the evaluation of potential beneficial uses of groundwater at Parcel E-2.

2.2.1. Geologic and Hydrogeologic Units

The peninsula forming HPS is within a northwest-trending belt of the Franciscan Complex bedrock known as the Hunters Point Shear zone. The natural geology at HPS consists of unconsolidated Holocene sediments of estuarine and alluvial origin (Quaternary age) deposited on an uneven, eroded bedrock surface composed primarily of serpentinite (Jurassic-Cretaceous age). Artificial fill was deposited extensively over the natural sediments and bedrock during expansion of the shipyard in the early 1940s. Six individual geologic units have been identified at HPS. In general, the stratigraphic sequence of these geologic units, from youngest (shallowest) to oldest (deepest), is as follows: (1) Artificial Fill; (2) Slope Debris and Ravine Fill; (3) Undifferentiated Upper Sand Deposits; (4) Bay Mud; (5) Undifferentiated Sedimentary Deposits; and (6) Franciscan Complex Bedrock (TtEMI, 2004c). Figure 2-1 shows the surficial geologic units present at HPS, including the various subdivisions within the Franciscan Complex Bedrock. With the exception of Slope Debris and Ravine Fill, all other geologic units are present at Parcel E-2.

The hydrostratigraphy of Parcel E-2 consists of four distinct units, including three water-bearing units and one aquitard. The shallowest water-bearing unit is referred to as the A-aquifer. The A-aquifer is essentially manmade and consists primarily of Artificial Fill material, but also includes Undifferentiated Upper Sand Deposits. The A-aquifer is separated from the deeper water-bearing unit, referred to as the B-aquifer, by the Bay Mud in most locations across HPS. The B-aquifer consists of Undifferentiated Sedimentary Deposits underlying the Bay Mud. The upper weathered portions of the Franciscan Complex bedrock that directly underlie permeable Artificial Fill, Undifferentiated Upper Sand, and Undifferentiated Sedimentary deposits are considered part of the overlying aquifer (TtEMI, 2004c). The portions of saturated bedrock that are not in direct contact with the A- or B-aquifers are hydrostratigraphically classified as the bedrock water-bearing zone (WBZ) (TtEMI, 2004c). Flow in the bedrock WBZ generally occurs in localized, discontinuous fractures located below the upper portions of

bedrock (TtEMI, LFR, and U&A, 1997). The relationships between the stratigraphic and hydrostratigraphic units at Parcel E-2 are presented below.

Stratigraphic Unit	Corresponding Hydrostratigraphic Unit
Artificial Fill (Qaf)	A-aquifer ^a
Undifferentiated Upper Sand Deposits (Quus)	A-aquifer ^a
Bay Mud (Qbm)	Aquitard ^b
Undifferentiated Sedimentary Deposits (Qu)	B-aquifer ^c
Franciscan Complex Bedrock (KJfm)	Bedrock WBZ ^d

Notes:

- a Hydrostratigraphic unit comprises permeable portions of the Artificial Fill and Undifferentiated Upper Sand deposits, and includes weathered portions of the bedrock that directly underlie saturated Artificial Fill or Undifferentiated Upper Sand deposits and localized areas where Undifferentiated Upper Sand deposits are interbedded with Bay Mud deposits.
- b Hydrostratigraphic unit also includes low-permeability Artificial Fill deposits.
- c Unit comprises the permeable portions of the Undifferentiated Sedimentary deposits.
- d Unit consists of portions of saturated bedrock that are not in direct contact with the A- or B-aquifers.

Numerous field investigations at Parcel E-2 have provided geologic information that was used to define the subsurface stratigraphy and depth to bedrock at Parcel E-2. [Figure 2-2](#) is a map showing cross-section locations across Parcel E-2. [Figures 2-3 through 2-8](#) are the geologic cross-section diagrams of the Landfill Area that were presented in the Landfill Lateral Extent Evaluation Report (TtEMI, 2004f). [Figures 2-9, 2-10, and 2-11](#) are hydrogeologic cross-section diagrams that were originally presented in the Parcel E Groundwater Summary Report (TtEMI, 2004c). The hydrogeologic cross sections cover the Landfill Area, Panhandle Area, and East Adjacent Area, and depict the lithologic units and the relative permeabilities of these sediments to portray the hydrostratigraphy at Parcel E-2.

Because of the different purposes for each set of cross sections, the data set used to construct the hydrogeologic cross sections does not provide the same level of detail for the heterogeneous artificial fill as compared to the geologic cross sections. The geologic cross sections were originally prepared to depict the subsurface conditions in and immediately surrounding the landfill waste and, as such, focused on providing the greatest level of detail within the heterogeneous artificial fill. In contrast, the hydrogeologic cross sections were prepared to depict the overall hydrostratigraphy at Parcel E-2, with a focus on identifying permeable zones within the A- and B-aquifers.

An important geologic feature at Parcel E-2 is the bedrock surface that declines steeply from the northern portion to the southern portion of Parcel E-2 (cross section G-G', [Figure 2-9](#)). The bedrock within the Hunters Point Shear Zone has been subjected to intense tectonic activity resulting in a high degree of folding, faulting, and metamorphism. As a result, the top surface of the bedrock ranges from approximately 55 feet below ground surface (bgs) in the northern part of Parcel E-2 to greater than 280 feet bgs in the southern part of Parcel E-2. This is a decline of approximately 225 feet over the length

of the site, which corresponds to a horizontal distance of approximately 1,100 feet. Based on the bedrock depths reported above, overburden sediments and fill above the bedrock at Parcel E-2 vary from about 55 feet thick in the northeast portion of Parcel E-2 to greater than 280 feet thick in the southern portion. [Figure 2-12](#) shows the bedrock surface elevations at and adjacent to Parcel E-2.

Another important geologic feature at Parcel E-2 is the distribution of the Bay Mud Aquitard. The Bay Mud is present over most of Parcel E-2, except in the northwest corner. In this location, saturated Artificial Fill material and Undifferentiated Upper Sand Deposits (the A-aquifer) directly overlie the Undifferentiated Sediments (the B-aquifer); as a result, the A- and B-aquifers are in hydraulic communication at this location. However, as discussed in [Section 2.2.2.2](#), where the Bay Mud aquitard is present, potentiometric data indicate an upward flow potential between the A- and B-aquifers. Further, as shown in cross section G-G' ([Figure 2-9](#)), the presence of laterally continuous layers of silt and clay within the B-aquifer sediments serves to hydraulically isolate the uppermost portions of the B-aquifer (that are interconnected with the A-aquifer) from the lower portions of the B-aquifer. The Bay Mud Aquitard thickens away from upland areas in the northern portion of Parcel E-2, as shown on [Figure 2-13](#).

As part of the subsurface investigations that were conducted to gather the geologic and hydrogeologic data for Parcel E-2, monitoring wells were installed across the parcel in the A-aquifer and uppermost B-aquifer zones, and the well identifications are designated by “A” and “B” suffixes, respectively. These well identifications are consistent with the hydrostratigraphic interpretations made on [Figures 2-9, 2-10, and 2-11 \(TtEMI, 2004c\)](#). The Navy is monitoring groundwater in the A-aquifer and uppermost B-aquifer under the BGMP. Groundwater monitoring has not been required in the lower B-aquifer zone because (1) the degree of contamination in the uppermost B-aquifer is much lower than that in the A-aquifer (see [Section 5](#)); (2) the uppermost portions of the B-aquifer (that are interconnected with the A-aquifer) are hydraulically isolated from the lower portions of the B-aquifer; and (3) there is an upward vertical flow potential from the uppermost B-aquifer to the A-aquifer (see [Section 2.2.2.2](#)). Groundwater monitoring has not been required in the Parcel E-2 bedrock WBZ because the bedrock is relatively deep (greater than 55 feet bgs in the northern portion of Parcel E-2 to greater than 200 feet bgs in the southeast portion of Parcel E-2). In addition, the potential for downward migration of contamination into the bedrock WBZ is low because site stratigraphy within the B-aquifer limits hydraulic communication between the uppermost B-aquifer zone and the lower B-aquifer zone.

The following subsections provide more detail on each of the geologic units at Parcel E-2 and their relationships to their corresponding hydrogeologic units.

8	Drinking water	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 2.2.6, pages 2-9 through 2-11. Record No. 4237.
---	----------------	-------------	---

2.2.6. Groundwater Beneficial Reuse

According to the RWQCB Basin Plan, groundwater at Parcel E-2 has the following potential beneficial uses (RWQCB, 2007a):

- Agricultural water supply
- Industrial service and process water supply
- Municipal and domestic drinking water supply

Groundwater at Parcel E-2 is unlikely to be used for agricultural and industrial purposes due to generally high TDS, chloride, salinity, specific conductance, and hardness values in the A-aquifer and uppermost B-aquifer (see data in Appendix G of TtEMI, 2004c). According to the Basin Plan, site-by-site determinations of the freshwater replenishment beneficial use will be made. Freshwater replenishment has been determined to be a beneficial use of the groundwater at Parcel E-2; Appendix M evaluates the potential for chemicals in groundwater to pose a risk to aquatic life in the bay. Appendix I evaluates the beneficial uses of groundwater at Parcel E-2, with a specific focus on evaluating use of the A- and B-aquifers at Parcel E-2 as potential drinking water sources. The following subsections summarize the findings of this evaluation.

2.2.6.1. A-Aquifer Evaluation for Federal Criteria

Federal groundwater classification criteria identify three classes of groundwater (EPA, 1986). Class I groundwater is an irreplaceable source of drinking water or is ecologically vital. Class II groundwater is a current or potential source of drinking water that has other beneficial uses. Class III groundwater is not a potential source of drinking water and is of limited beneficial use. EPA considers groundwater to be Class I or Class II if the following criteria are met:

- The TDS concentration is less than 10,000 mg/L
- A minimum well yield of 150 gallons per day (gpd) or 0.104 gallon per minute is achievable

Transmissivities measured at Parcel E-2 during the RI (Table 2-2) suggest that the minimum well yield of 150 gpd would be met for the A-aquifer. Therefore, the classification of the A-aquifer relative to federal criteria focuses on measured TDS concentrations. Figure 2-20 presents the maximum historical TDS concentrations (from data collected through October 2002) detected in A-aquifer groundwater monitoring wells at Parcel E-2, along with contours for the federal TDS criteria. As shown on Figure 2-20, Class II groundwater exists throughout most of Parcel E-2 A-aquifer.

Appendix I evaluates various site-specific factors (SSF) to determine if conditions other than TDS concentrations affect the potential for Class II A-aquifer groundwater at Parcel E-2 to be used as a drinking water source. The NCP preamble allows for the application of SSFs to determine appropriate

remediation goals for Class I and II groundwater. As outlined in [Appendix I](#), a range of other SSFs make use of A-aquifer groundwater for water supply extremely unlikely. Principal among these are:

- Insufficient aquifer thickness to provide adequate supply
- Depth to groundwater too shallow to support a sanitary seal and adequate screened interval
- Lack of historical and current precedents for use of HPS groundwater for public water supply
- Existence of local and state institutional controls that prohibit or severely restrict locations where new potable wells can be installed
- Poor quality of underlying B-aquifer relative to drinking water standards

Considering these factors together, the weight of evidence indicates that the Class II A-aquifer at Parcel E-2 is not a potential source of water for municipal or domestic water supply.

2.2.6.2. A-Aquifer Evaluation for State Criteria

Under State Water Resources Control Board (SWRCB) Resolution No. 88-63, all groundwater is considered potentially suitable for municipal or domestic supply unless at least one of the following conditions applies ([SWRCB, 1988](#)):

- The TDS concentration exceeds 3,000 mg/L and the groundwater is not reasonably expected by RWQCB to supply a public water system
- The groundwater is contaminated, either by natural processes or by human activity, to the degree that it cannot reasonably be treated for domestic use
- The water source does not provide sufficient water to supply a single well capable of producing an average, sustained yield of 200 gpd

In response to a request by the [Navy \(2003\)](#), the RWQCB determined that the A-aquifer at HPS is not suitable or potentially suitable as a municipal or domestic water supply, and meets exemption criteria in SWRCB Resolution 88-63 and RWQCB Resolution 89-39 ([RWQCB, 2003c](#)). This determination is based on the following factors:

- TDS concentrations in A-aquifer groundwater exceed 3,000 mg/L
- Artificial fill composes most of the A-aquifer
- Naturally occurring dissolved metals concentrations have been estimated (Hunters Point groundwater ambient levels [HGAL]), and some of these metals concentrations exceed maximum contaminant levels (MCLs) for drinking water when the metal is at or below its HGAL
- There is no historical, present, or planned future use of groundwater at HPS
- Well construction requirements prohibit water supply wells in most parts of HPS
- Pumping would cause saltwater intrusion in areas where potable wells could conceivably be installed

2.2.6.3. B-Aquifer Evaluation

TDS data are available for the six wells installed in the uppermost B-aquifer in Parcel E-2, and maximum TDS concentrations in these wells ranged from 1,600 to 5,120 mg/L. Based on available TDS data, the B-aquifer at Parcel E-2 would be considered suitable as a potential drinking water source, and the evaluation of SSFs in [Appendix I](#) reveals that the B-aquifer in Parcel E-2 has moderate potential to be used as a drinking water source. Considering this conclusion and past agreements with the BCT on the HHRA, the groundwater ingestion pathway is included in the risk assessment for the B-aquifer. This assumption provides an additional layer of conservatism with respect to the protection of human health at Parcel E-2.

2.2.6.4. Bedrock Water-Bearing Zone Evaluation

As discussed in [Section 2.2.1](#), groundwater monitoring has not been required in the Parcel E-2 bedrock WBZ because the bedrock is relatively deep (greater than 55 feet bgs in the northern portion of Parcel E-2 to greater than 200 feet bgs in the southeast portion of Parcel E-2). Therefore, no direct data are available to assess the water quality or yield of the bedrock WBZ underlying Parcel E-2 relative to federal and state criteria.

2.3. HYDROLOGY

Precipitation is the main source of surface water runoff at HPS. Surface water runoff at HPS is greatest in the winter months (November through April), when rainfall often exceeds 4 inches per month. Precipitation is less than 0.1 inch per month from June through September, resulting in minimal runoff. Precipitation data from an on-site meteorological station are shown on [Figure 2-21](#). In addition to rainfall, the irrigation system for the interim landfill cap at Parcel E-2 is another potential source of surface water runoff. The irrigation system could potentially generate runoff if used excessively during dry months to maintain vegetation; however, the system is operated and maintained so that excessive watering does not occur ([ITSI, 2006h, 2007d, 2008d, 2010d, and 2010e](#)).

As discussed in [Section 1.6.2](#), surface water runoff at the landfill is managed in accordance with the SWDMP ([MARRS and MACTEC, 2009b](#)), which complies with the General Permit of the National Pollutant Discharge Elimination System (NPDES), as administered by the SWRCB. Monitoring is performed in accordance with the SWDMP, and various BMPs described in the SWDMP are used to limit erosion or unwanted discharges from the site ([MARRS and MACTEC, 2009b](#)). Surface water drainage patterns at Parcel E-2 and engineered BMPs are shown on [Figure 2-22](#) and described below.

In the western and northwestern portion of Parcel E-2, runoff is controlled by drainage channels constructed along the western perimeter of Parcel E-2. The channels direct runoff south and discharge indirectly to the bay through low-lying seasonal wetlands in the Panhandle Area southwest of the landfill.

9	Groundwater flow patterns	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 2.2.2, pages 2-9 through 2-11. Record No. 4237.
---	----------------------------------	-------------	---

2.2.1.4. Franciscan Complex Bedrock – The Bedrock Water-Bearing Zone

Bedrock in Parcel E-2 consists of the Franciscan Complex, with serpentinite as the most common component. Serpentine bedrock is often associated with metamorphic basalt called “greenstone,” which has a distinctive green color. Pockets of greywacke sandstones occur in some areas (TtEMI, 2004c). Figure 2-12 shows where serpentinite bedrock outcrops north of Parcel E-2. From the northern part of Parcel E-2, the bedrock plunges to the west and south. The depth to bedrock ranges from approximately 55 feet bgs in the northern part of Parcel E-2 to greater than 280 feet bgs in the southern part of Parcel E-2.

As discussed in Section 2.2.1, the upper weathered portions of the bedrock that directly underlie A- or B-aquifer sediments are considered part of the overlying aquifer. The highly weathered bedrock has low hardness, and has been described as both crumbling easily to sand-sized grains and as having weathered to clay (TtEMI, LFR, and U&A 1997; TtEMI, 2004c). Borings logs for gas monitoring probes (GMPs) installed in the upper weathered bedrock underlying Crisp Avenue (located approximately 150 feet north of Parcel E-2) demonstrate this variability. The portions of saturated bedrock that are not in direct contact with the A- or B-aquifers are hydrostratigraphically classified as the bedrock WBZ (TtEMI, 2004c). Flow in the bedrock WBZ generally occurs in localized, discontinuous fractures located below the upper portions of bedrock (TtEMI, LFR, and U&A, 1997).

2.2.2. Groundwater Flow

Groundwater flow patterns in the A-aquifer are regularly evaluated by collecting water level measurements at monitoring wells installed throughout Parcel E-2 and generating groundwater elevation maps as part of the BGMP. Construction details for the Parcel E-2 monitoring wells are summarized in Appendix J3. Historic groundwater elevations are presented in Appendix J4. A-aquifer groundwater elevations are measured using a methodology designed to reduce the influence of tidal effects on the general definition of the potentiometric surface; the methodology is described in the sampling and analysis plan for the BGMP (CE2-Kleinfelder Joint Venture, 2009c). Additionally, groundwater flow patterns within the uppermost B-aquifer and tidal influenced zone (TIZ) of the A-aquifer have been evaluated during previous investigations at the parcel. The following subsections discuss the groundwater flow patterns of these aquifers, as well as groundwater recharge and discharge for the A-aquifer and uppermost B-aquifer.

2.2.2.1. Horizontal Groundwater Flow

Across most of Parcel E-2, groundwater in the A-aquifer flows south toward the bay; however, flow in the northeast portion of Parcel E-2 flows east toward a groundwater depression that is east of the landfill, near the boundary between Parcels G and E (CE2-Kleinfelder Joint Venture, 2007f, 2008a, and 2008d). This groundwater depression is most likely the residual effect of groundwater infiltrating damaged sanitary sewer lines during pumping at a nearby lift station. The sanitary sewer lift station, located at the former Parcel A, ceased operation in May 2007. The lateral extent of the groundwater depression had decreased from approximately 73 acres in May 2007 to less than 0.1 acre in March 2009 (CE2-Kleinfelder Joint Venture, 2009d). The potentiometric surfaces shown on Figures 2-14 and 2-15 (CE2-Kleinfelder Joint Venture, 2007f and 2008a) do not incorporate removal of tidal effects; however, past tidal studies have shown that the general geometry of the potentiometric surface within the TIZ can be accurately represented without filtering out tidal effects (TtEMI, 2004c). Section 2.2.4 presents a more thorough discussion of tidal effects.

Other buried utility lines located below the groundwater table may also act as preferential groundwater flow pathways. As shown on Figures 2-14 and 2-15, sections of the storm drain system in adjacent Parcel E are submerged below the groundwater table and appear to be affecting A-aquifer flow patterns south of Building 810. The Navy is in the process of removing the existing sanitary sewer and storm drain lines across HPS. The potentiometric surface of the A-aquifer continues to be monitored quarterly under the BGMP to track possible changes in flow patterns of the A-aquifer.

Groundwater elevations in the uppermost B-aquifer, as measured in August 2007, are presented on Figure 2-16 (CE2-Kleinfelder Joint Venture, 2008a). Based on the groundwater elevations in the limited number of wells shown on Figure 2-16, groundwater in the uppermost B-aquifer flows to the southeast across most of Parcel E-2. B-aquifer groundwater elevations are monitored under the BGMP on a quarterly basis (CE2-Kleinfelder Joint Venture, 2008a and 2008d).

2.2.2.2. Vertical Groundwater Flow Potential

Figure 2-17 illustrates vertical flow potential by presenting hydrographs for well pairs screened in the A-aquifer and uppermost B-aquifer. Based on available water level data from 2004 to 2008, the vertical component of groundwater flow potential between the A-aquifer and the uppermost B-aquifer is upward at these well pairs (Figure 2-17). The available data suggest that, in addition to the presence of the Bay Mud aquitard, potential downward migration of contaminated groundwater from the A- to B-aquifer is limited by the upward groundwater flow potential (from the B- to A-aquifer).

2.2.2.3. Groundwater Recharge and Discharge

Groundwater recharge to the A-aquifer at Parcel E-2 is affected by vertical and lateral infiltration from within Parcel E-2, as well as groundwater flow from land upgradient of Parcel E-2. Recharge may also be contributed by leaking utility lines. Higher groundwater levels exist during the rainy season. Groundwater elevations measured in Parcel E-2 wells in March 2007 were on average 0.9 foot higher than in August 2007. A-aquifer groundwater discharge over the northeast portion of Parcel E-2 is directed eastward across Parcel E toward a groundwater depression near the Parcel E and Parcel G boundary. As discussed in [Section 2.2.2.1](#), deactivation of the sanitary sewer lift station has decreased the lateral extent of the groundwater depression from approximately 73 acres to 0.1 acre over a 21-month period ([CE2-Kleinfelder Joint Venture, 2009d](#)). The Navy continues to remove the existing sanitary sewer and storm drain lines across HPS, and the effect of this activity is being evaluated as part of the BGMP quarterly water level measurements. Groundwater near the Parcel E-2 shoreline discharges toward the bay.

The area hydraulically upgradient of Parcel E-2 is the primary source of recharge to the B-aquifer. This area consists of non-Navy industrial property to the west and northwest. The recharge source is groundwater flowing horizontally into the B-aquifer. The B-aquifer is hydraulically connected to and discharges to permeable zones underlying the bay.

2.2.2.4. Seasonal Groundwater Effects

Recent groundwater data for Parcel E-2 (four quarters from 2007 and the first quarter 2008) were evaluated as part of this RI/FS Report to assess seasonal effects in groundwater flow patterns or gradients ([CE2-Kleinfelder Joint Venture, 2007f, 2008a, and 2008d](#)). A-aquifer groundwater levels were highest in March 2007 ([Figure 2-14](#)), following the wet winter season, and lowest in August 2007, representing dry season conditions ([Figure 2-15](#)). Groundwater gradients measured across Parcel E-2 were somewhat lower in March 2007 (average of 0.014) than they were in August 2007 (average of 0.021). The overall direction of groundwater flow was consistent from season to season, with the primary seasonal difference being the somewhat shallower gradients across the landfill mass, with steeper gradients along the boundaries of the landfill area during the dry season (June and August) than during the wet season (March). Groundwater gradients are steepest on the south side of the landfill mass (toward the bay) and shallowest on the eastern side (toward Parcel E). Groundwater levels in the B-aquifer are slightly higher during the wet season as compared with the dry season ([Figure 2-17](#)); however, B-aquifer groundwater flow patterns and gradients do not appear to be significantly affected by the wet and dry seasons.

10	Parcel E-2 ecology	Section 2.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 2.4, page 2-18. Record No. 4237.
----	---------------------------	-------------	--

In the northeastern portion of Parcel E-2 (and portions of the UCSF property), runoff is controlled by drainage channels that direct runoff into one of two catch basins (Figure 2-22). Stormwater then flows east through a 12-inch-diameter polyvinyl chloride (PVC) pipe and discharges into the HPS storm sewer system, which ultimately discharges into the bay. Stormwater discharge is monitored at both catch basins (MARRS and MACTEC, 2009b).

In the eastern portion of Parcel E-2 (including the eastern portion of the interim landfill cap), runoff flows south into a low-lying area south of the interim landfill cap (Figure 2-22). This area was excavated and revegetated following the removal action at the PCB Hot Spot Area (TtECI, 2007a), as discussed in Section 3.8.8. The vegetation helps limit sediment runoff. In addition, the drainage swale at the southeast portion of the landfill, which diverts runoff from the eastern portion of the cap to the bay, was restored following the removal action (Figure 2-22).

In the central portion of Parcel E-2, most runoff flows to a riprap-lined swale in the center of the interim landfill cap and then discharges into the bay at the southern edge of the interim cap. The drainage structures in Parcel E-2 are presently capable of handling runoff from the 100-year, 24-hour storm event (estimated at 4 inches). To limit erosion, vegetation and other BMPs (such as silt fences, hay bales, fiber rolls, gravel or sandbags, and berms) have been established at Parcel E-2. Surface water runoff from Parcel E-2 will be controlled and monitored in accordance with the existing SWDMP until implementation of the final remedy for Parcel E-2 (MARRS and MACTEC, 2009b).

2.4. ECOLOGY

The ecology of Parcel E includes terrestrial habitat, aquatic environments, and transitional wetlands. All of these ecological areas have been disturbed by human activities such as excavation, filling, and development (Harding Lawson Associates [HLA], 1991). Habitat data from the Phase 1A ecological risk assessment (ERA) were used with data from a resurvey of Parcels E and E-2 in February 1997. The field survey results delineated the terrestrial habitats (industrial, ruderal, and non-native annual grassland) and the wetland and intertidal habitats (TtEMI, LFR, and U&A, 1997). In 2001 and 2002, ecological surveys were performed in the wetland and intertidal habitats at Parcel E-2 (TtEMI, 2003d; SulTech, 2007, Appendix G to this report), and are discussed in Sections 2.4.2 and 2.4.3 below. In 2004, a biological assessment was performed to support the removal actions at the Metal Slag Area and PCB Hot Spot Area (TtFW, 2004a).

11	Environmental investigations	Section 2.3	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 3, pages 3-1 and 3-2. Record No. 4237.
----	------------------------------	-------------	--

Section 3. Remedial Investigation Activities and Removal Actions

Multiple environmental investigations have been conducted at Parcel E-2⁴, beginning in 1984. These investigations included basewide investigations (such as the IAS), investigations performed throughout Parcel E (which was later subdivided into Parcels E and E-2), and landfill-specific investigations within Parcel E-2. The environmental investigations can be categorized into the following time frames:

Pre-Remedial Investigation Activities (1984 to 1988): The Parcel E-2 Landfill was initially identified as IAS Site 3 during the IAS conducted in 1984 under the NACIP program (NEESA, 1984). Additional investigations performed following the IAS included installation of nine monitoring wells (IR01MWI-1 through IR01MW-9) during the 1987 confirmation study and verification step.

Remedial Investigation Activities (1988 to 1996): The Parcel E-2 Landfill progressed to the RI stage as IR Site 1 and was grouped (along with IR Sites 02 and 03 in Parcel E) into Operable Unit (OU)-I. The first phase of the OU-I RI (from 1988 to 1989) consisted of reconnaissance activities, including a geophysical survey and test pit excavation to delineate the extent of landfill waste, a soil gas survey to evaluate the presence of VOCs in soil and groundwater, and installation of deep soil borings to define subsurface stratigraphy. Subsequent phases of the OU-I RI involved primary and contingency sampling of soil and groundwater from October 1990 to June 1992. Following the 1992 decision to align the HPS IR sites into parcels, the RI at the landfill was completed in conjunction with other Parcel E IR sites and involved additional field investigations performed from October 1995 to June 1996 (TtEMI, LFR, and U&A, 1997). In 1993, IR Site 1 was combined with IR Site 21. IR Site 21 was initially identified as a separate site during the RI/FS scoping process, but was later determined to be part of the landfill and thus was combined with IR Site 1.

Data Gaps Investigations (2000 to 2003): During preparation of the Parcel E RI and FS reports in 1997 and 1998, the Navy and regulatory agencies identified additional tasks to support the RD for Parcel E, most of which were specific to the Parcel E-2 Landfill. These tasks were performed during the NDGI, from October 2001 to September 2002, and included defining the nature and extent of landfill gas, refining the lateral extent of solid waste, evaluating liquefaction potential of the landfill, and delineating wetlands areas adjacent to the landfill. In addition, the Navy and the regulatory agencies decided that

⁴ In September 2004, the Navy divided Parcel E into two parcels (E and E-2). Discussions within this report that reference documents published prior to September 2004 refer to the portion of Parcel E that became Parcel E-2.

additional data for Parcel E were needed, including data from the area now referred to as Parcel E-2, to better define the nature and extent of chemicals in soil and groundwater. As discussed in [Section 1](#), these investigations included the GDGI, performed from July 2000 to October 2002, and the SDGI, performed from September 2002 to February 2003.

Landfill Compliance Monitoring (2003 to present): The Navy has implemented several environmental monitoring programs to help satisfy regulatory requirements (as outlined in 27 CCR) for Parcel E-2 until a final remedy is selected. As discussed in [Section 1.1.2](#), these programs include landfill gas control and monitoring, groundwater monitoring, landfill cover integrity monitoring and maintenance, and stormwater management and monitoring. Data from the ongoing monitoring provides information on current site conditions that is helpful in verifying the nature and extent conclusions from previous site investigations.

This RI/FS Report is based on information compiled from these past investigations and ongoing monitoring, rather than from a single RI field investigation. Analytical data from pre-RI investigations are not included in the RI data set; however, the results of these investigations were incorporated into the RI field program ([TtEMI](#), [LFR](#), and [U&A](#), 1997). [Table 3-1](#) summarizes the field activities performed during the RI and subsequent data gaps investigations and compliance monitoring.

In addition, this RI/FS Report also includes information from several interim removal actions that were performed in Parcel E-2. This section includes brief summaries of the methods, actions performed, and relevant results of the investigations and removal actions conducted at Parcel E-2.

Many of the previous investigations were summarized in reports that are drawn upon and either referenced or included as appendices to this report. Previous investigations and other IR Program activities were divided into the following categories to simplify their presentation in this section: pre-RI activities ([Section 3.1](#)); landfill investigations ([Section 3.2](#)); soil investigations in non-landfill areas, including the East Adjacent Area and the Panhandle Area ([Section 3.3](#)); groundwater investigations ([Section 3.4](#)); ecological assessments ([Section 3.5](#)); radiological assessments ([Section 3.6](#)); outdoor air monitoring ([Section 3.7](#)); previous removal actions ([Section 3.8](#)); and ongoing monitoring programs ([Section 3.9](#)). [Table 1-3](#) presents a chronology of all previous environmental investigations, as well as previous and ongoing remedial actions conducted at Parcel E-2.

3.1. PRE-REMEDIAL INVESTIGATION ACTIVITIES

The pre-RI activities are summarized in the following documents:

- “Geotechnical Investigation, Waste Disposal Sites” ([Lowney-Kaldveer Associates, 1973](#))
- “As-Built Drawings for Storm Sewer Interceptor Phase II, MILCON Project P-261B” ([Navy, 1974](#))

EPA guidance for
CERCLA landfills

Section 2.3

"Presumptive Remedy for CERCLA Municipal Landfill Sites." Quick Reference Fact Sheet. EPA OSWER Directive 9355.0-49FS. EPA/540/F-93/035. September 1993. Pages 1 through 3. (note: this guidance document was provided as Appendix H to the Final Remedial Investigation/Feasibility Study Report for Parcel E-2; Record No. 4237)
Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and Shaw. May 2011. Section 8.2.3.1, pages 8-13 through 8-15. Record No. 4237.

Sheet

Presumptive remedies are preferred technologies for common categories of sites, based on historical patterns of remedy selection and EPA's scientific and engineering evaluation of performance data on technology implementation. The objective of the presumptive remedies initiative is to use the program's past experience to streamline site investigation and speed up selection of cleanup actions. Over time presumptive remedies are expected to ensure consistency in remedy selection and reduce the cost and time required to clean up similar types of sites. Presumptive remedies are expected to be used at all appropriate sites except under unusual site-specific circumstances.

This directive establishes **containment** as the presumptive remedy for CERCLA municipal landfills. The framework for the presumptive remedy for these sites is presented in a streamlining manual entitled *Conducting Remedial Investigations/Feasibility Studies for CERCLA Municipal Landfill Sites*, February 1991 (OSWER Directive 9355. 3-11). This directive highlights and emphasizes the importance of certain streamlining principles related to the scoping (planning) stages of the remedial investigation/feasibility study (RI/FS) that were identified in the manual. The directive also provides clarification of and additional guidance in the following areas: (1) the level of detail appropriate for risk assessment of source areas at municipal landfills and (2) the characterization of hot spots.

BACKGROUND

Superfund has conducted pilot projects at four municipal landfill sites¹ on the National Priorities List (NPL) to evaluate the effectiveness of the manual *Conducting Remedial Investigations/Feasibility Studies for CERCLA Municipal Landfill Sites* (hereafter referred to as "the manual") as a streamlining tool and as the framework for the municipal landfill presumptive remedy. Consistent with the National Oil and Hazardous Substances Pollution Contingency Plan (or NCP), EPA's expectation was that containment technologies generally would be appropriate for municipal landfill waste because the volume and heterogeneity of the waste generally make treatment impracticable. The results of the pilots support this expectation and demonstrate that the manual is an effective tool for streamlining the RI/FS process for municipal landfills.

¹ Municipal landfill sites typically contain a combination of principally municipal and to a lesser extent hazardous wastes.

Since the manual's development, the expectation to contain wastes at municipal landfills has evolved into a presumptive remedy for these sites.² Implementation of the streamlining principles outlined in the manual at the four pilot sites helped to highlight issues requiring further clarification, such as the degree to which risk assessments can be streamlined for source areas and the characterization and remediation of hot spots. The pilots also demonstrated the value of focusing streamlining efforts at the scoping stage, recognizing that the biggest savings in time and money can be realized if streamlining is incorporated at the beginning of the RI/FS process. Accordingly, this directive addresses those issues identified during the pilots and highlights streamlining opportunities to be considered during the scoping component of the RI/FS.

² See EPA Publication 9203.1-02I, SACM Bulletins, *Presumptive Remedies for Municipal Landfill Sites*, April 1992, Vol. 1, No. 1, and February 1993, Vol. 2, No. 1, and SACM Bulletin *Presumptive Remedies*, August 1992, Vol. 1, No. 3.

Finally, while the primary focus of the municipal landfill manual is on streamlining the RI/FS, Superfund's goal under SACM is to accelerate the entire clean-up process. Other guidance issued under the municipal landfill presumptive remedy initiative identifies design data that may be collected during the RI/FS to streamline the overall response process for these sites (see Publication No. 9355.3-18FS, *Presumptive Remedies: CERCLA Landfill Caps Data Collection Guide*, to be published in October 1993).

CONTAINMENT AS A PRESUMPTIVE REMEDY

Section 300.430(a)(iii)(B) of the NCP contains the expectation that engineering controls, such as containment, will be used for waste that poses a relatively low long-term threat where treatment is impracticable. The preamble to the NCP identifies municipal landfills as a type of site where treatment of the waste may be impracticable because of the size and heterogeneity of the contents (55 FR 8704). Waste in CERCLA landfills usually is present in large volumes and is a heterogeneous mixture of municipal waste frequently co-disposed with industrial and/or hazardous waste. Because treatment usually is impracticable, EPA generally considers containment to be the appropriate response action, or the "presumptive remedy," for the source areas of municipal landfill sites.

The presumptive remedy for CERCLA municipal landfill sites relates primarily to containment of the landfill mass and collection and/or treatment of landfill gas. In addition, measures to control landfill leachate, affected ground water at the perimeter of the landfill, and/or upgradient ground-water that is causing saturation of the landfill mass may be implemented as part of the presumptive remedy.

The presumptive remedy does not address exposure pathways outside the source area (landfill), nor does it include the long-term ground-water response action. Additional RI/FS activities, including a risk assessment, will need to be performed, as appropriate, to address those exposure pathways outside the source area. It is expected that RI/FS activities addressing exposure pathways outside the source generally will be reconducted concurrently with the streamlined RI/FS for the landfill source presumptive remedy. A response action for exposure pathways outside the source (if any) may be selected together with the presumptive remedy (thereby developing a comprehensive site response), or as an operable unit separate from the presumptive remedy.

Highlight 1 identifies the components of the presumptive remedy. Response actions selected for individual sites will include only those components that are necessary, based on site-specific conditions.

Highlight 1: Components of the Presumptive Remedy: Source Containment

- Landfill cap;
- Source area ground-water control to contain plume;
- Leachate collection and treatment;
- Landfill gas collection and treatment; and/or
- Institutional controls to supplement engineering controls.

The EPA (or State) site manager will make the initial decision of whether a particular municipal landfill site is suitable for the presumptive remedy or whether a more comprehensive RI/FS is required. Generally, this determination will depend on whether the site is suitable for a streamlined risk evaluation, as described on page 4. The community, state, and potentially responsible parties (PRPs) should be notified that a presumptive remedy is being considered for the site before work on the RI/FS work plan is initiated. The notification may take the form of a fact sheet, a notice in a local newspaper, and/or a public meeting.

Use of the presumptive remedy eliminates the need for the initial identification and screening of alternatives during the feasibility study (FS). Section 300.430(e)(1) of the NCP states that, "... the lead agency shall include an alternatives screening step, when needed, (emphasis added) to select a reasonable number of alternatives for detailed analysis."

EPA conducted an analysis of potentially available technologies for municipal landfills and found that certain technologies are routinely and appropriately screened out on the basis of effectiveness, feasibility, or cost (NCP Section 300.430(e)(7)). (See Appendix A to this directive and "Feasibility Study Analysis for CERCLA Municipal Landfills," September 1993 available at EPA Headquarters and Regional Offices.) Based on this analysis, the universe of alternatives that will be analyzed in detail may be limited to the components of the containment remedy identified in Highlight 1, unless site-specific conditions dictate otherwise or alternatives are considered that were not addressed in the FS analysis. The FS analysis document, together with this directive, must be included in the administrative record for each municipal landfill presumptive remedy site to support elimination of the initial identification and screening of site-specific alternatives. Further detailed and comprehensive

supporting materials (e.g., FS reports included in analysis, technical reports) can be provided by Headquarters, as needed.

While the universe of alternatives to address the landfill source will be limited to those components identified in Highlight 1, potential alternatives that may exist for each component or combinations of components may be evaluated in the detailed analysis. For example, one component of the presumptive remedy is source area ground-water control. If appropriate, this component may be accomplished in a number of ways, including pump and treat, slurry walls, etc. These potential alternatives may then be combined with other components of the presumptive remedy to develop a range of containment alternatives suitable for site-specific conditions. Response alternatives must then be evaluated in detail against the nine criteria identified in Section 300.430(e)(g) of the NCP. The detailed analysis will identify site-specific ARARs and develop costs on the basis of the particular size and volume of the landfill.

EARLY ACTION AT MUNICIPAL LANDFILLS

EPA has identified the presumptive remedy site categories as good candidates for early action under SACM. At municipal landfills, the upfront knowledge that the source area will be contained may facilitate such early actions as installation of a landfill cap or a ground-water containment system. Depending on the circumstances, early actions may be accomplished using either removal authority (e.g., non-time-critical removal actions) or remedial authority. In some cases, it may be appropriate for an Engineering Evaluation/Cost Analysis to replace part or all of the RI/FS if the source control component will be a non-time-critical removal action. Some factors may affect whether a specific response action would be better accomplished as a removal or remedial action including the size of the action, the associated state cost share, and/or the scope of O&M. A discussion of these factors is contained in *Early Action and Long-term Action Under SACM - Interim Guidance*, Publication No. 9203.1-05I, December 1992.

SCOPING A STREAMLINED RI/FS UNDER THE PRESUMPTIVE REMEDY FRAMEWORK

The goal of an RI/FS is to provide the information necessary to: (1) adequately characterize the site; (2) define site dynamics; (3) define risks; and (4) develop the response action. As discussed in the following sections, the process for achieving each of these goals can be streamlined for CERCLA municipal landfill sites because of the upfront presumption that landfill contents will be contained. The strategy for streamlining each of these

areas should be developed early (i.e., during the scoping phase of the RI/FS).

1. Characterizing the Site

The use of existing data is especially important in conducting a streamlined RI/FS for municipal landfills. Characterization of a landfill's contents is not necessary or appropriate for selecting a response action for these sites except in limited cases; rather, existing data are used to determine whether the containment presumption is appropriate. Subsequent sampling efforts should focus on characterizing areas where contaminant migration is suspected, such as leachate discharge areas or areas where surface water runoff has caused erosion. It is important to note that the decision to characterize hot spots should also be based on existing information, such as reliable anecdotal information, documentation, and/or physical evidence (see page 6).

In those limited cases where no information is available for a site, it may not be advisable to initiate use of the presumptive remedy until some data are collected. For example, if there is extensive migration of contaminants from a site located in an area with several sources, it will be necessary to have some information about the landfill source in order to make an association between on-site and off-site contamination.

Sources of information of particular interest during scoping include records of previous ownership, state files, closure plans, etc., which may help to determine types and sources of hazardous materials present. In addition, a site visit is appropriate for several reasons, including the verification of existing data, the identification of existing site remediation systems, and to visually characterize wastes (e.g., leachate seeps). Specific information to be collected is provided in Sections 2.1 through 2.4 of the municipal landfill manual.

2. Defining Site Dynamics

The collected data are used to develop a conceptual site model, which is the key component of a streamlined RI/FS. The conceptual site model is an effective tool for defining the site dynamics, streamlining the risk evaluation, and developing the response action. Highlight 2 presents a generic conceptual site model for municipal landfill. The model is developed before any RI field activities are conducted, and its purpose is to aid in understanding and describing the site and to present hypotheses regarding:

- The suspected sources and types of contaminants present;
- Contaminant release and transport mechanisms;

exceedances were located with the portion of the PCB Hot Spot Area that extends into the Landfill Area. This finding is expected because potential risk at these locations was driven by samples collected either at 2 feet bgs (at the interface between the soil cover and underlying solid waste) or deeper than 2 feet bgs (into the solid waste). Similar to the HHRA conclusions, the data distribution within the Landfill Area is considered adequate to evaluate potential ecological risks, and areas with no data may contain chemical concentrations that would result in risks of the same relative magnitude as found elsewhere in the Landfill Area.

8.2.3. Conclusions for Solid Waste and Soil in Landfill Area

As discussed in [Section 1.4](#), the EPA has developed a specialized RI/FS process for municipal landfill sites (EPA, 1991a, 1993a, 1993b, and 1994) that, provided that certain conditions are met, supports selection of a containment presumptive remedy. Use of the specialized process is intended to improve and accelerate the site characterization and remedy evaluation process and to ensure consistent evaluation of remedial actions at similar sites. Use of this specialized process is considered appropriate for the Landfill Area. Therefore, the following conclusions about the site characterization efforts (Sections 8.2.3.1 and 8.2.3.2) and risk evaluations ([Section 8.2.3.3](#)) are discussed in the context of the presumptive remedy framework for CERCLA landfills. The validity of applying the presumptive remedy to the solid waste and soil in the Landfill Area is discussed in [Section 8.2.3.4](#).

8.2.3.1. Conclusions for Overall Landfill Characterization

The nature and extent of solid waste and chemicals in soil within the Landfill Area is adequately characterized to evaluate a focused set of remedial alternatives in the FS. This determination is based in large part on EPA presumptive remedy guidance for CERCLA landfills (EPA, 1993a, 1993b, 1994 and 1996). As discussed in [Section 8.2.1](#), characterization of solid waste is not necessary or appropriate for selecting a response action for the Landfill Area. Instead, existing data were used to answer two questions outlined in EPA guidance for military landfills (EPA, 1996):

- Do landfill contents meet municipal landfill-type waste definition?
- Are military-specific wastes present?

Adequate data exist to answer these questions, as presented in the following paragraphs.

Do landfill contents meet municipal-type waste definition?

The landfill contents meet the municipal-type waste definition, as outlined in EPA guidance, based on the following lines of evidence:

- Risks are low-level (except for potential hot spots): Results of the HHRA indicated that, for both the recreational user and construction worker exposure scenarios, cancer risks are within the acceptable risk range of 10^{-6} to 10^{-4} specified in the NCP (55 Federal Register 8848, March 8, 1990).
- Treatment is impractical due to the volume and heterogeneity of the waste: The landfill covers 22 acres and has an estimated solid waste volume of 473,000 cubic yards (excluding the surrounding soil fill). The solid waste is a heterogeneous mixture of municipal-type waste, construction debris, and industrial waste.
- Waste types include household, commercial, nonhazardous sludge, and industrial solid waste: The predominant constituents of the solid waste are household and commercial refuse and construction debris. Other waste types, found in lower proportion, include industrial solid waste (such as sandblast waste) and waste oils and may include asbestos-containing debris, paint sludge, and solvents.
- Lesser quantities of hazardous wastes are present as compared with municipal wastes: Based on an evaluation of 333 soil samples collected from the intermittent soil fill mixed within the solid waste, nearly all of the hazardous substances detected in Landfill Area soil were of a limited extent relative to the overall waste volume. Several chemicals, such as SVOCs and PCBs, were detected throughout the Landfill Area at concentrations above the RIEC but were not indicative of hot spots.
- Land application units, surface impoundments, injection wells, and waste piles are not included: None of these features are present at the Parcel E-2 Landfill.

Are military-specific wastes present?

Based on the findings of the HRA ([NAVSEA, 2004](#)), LLRW may be present in and around the Parcel E-2 Landfill. These wastes consist primarily of buried radioluminescent devices (i.e., devices or instruments covered with paint containing radium-226), but may also include sandblast waste used to decontaminate ships used in atomic testing. As discussed in the radiological addendum to this RI/FS Report, historical records suggest that the volume and activity of LLRW potentially disposed of in the Landfill Area were relatively low ([ERRG and Radiological Survey and Remedial Services, LLC, 2011](#)). Information from the removal action at the PCB Hot Spot Area (which extends partially into the Landfill Area) confirmed that LLRW is found in low proportion relative to other waste types. According to EPA guidance, LLRW is considered “low-hazard military-specific wastes” and “generally are no more hazardous than some wastes found in municipal landfills” ([EPA, 1996](#)).

Other types of “low-hazard” military-specific wastes include decontamination kits and munitions hardware⁸. Forty-one pieces of MPPEH were encountered in the PCB Hot Spot Area excavation, out of a total excavation volume of 44,500 cubic yards, consisting primarily of expended cartridge casings of various calibers and protective caps, but also included an empty 5-inch practice projectile and a 3-pound

⁸ Munitions hardware, as identified in the EPA 1996 guidance, is considered part of the broader munitions debris category used by the U.S. Department of Defense.

practice bomb (TtECI, 2010). Of the 41 MPPEH items discovered in the removal area, 20 items were verified to not present an explosive hazard and were reclassified as MDAS. The remaining 21 MPPEH items appeared to have been subject to previous demilitarization actions and could not be completely inspected by UXO technicians for possible explosive hazards. Although the type, age, and condition of these 21 MPPEH items did not suggest a high potential for residual energetic material, the Navy, as a precautionary measure, properly handled, transported, and disposed of these items as either material documented as an explosive hazard (MDEH) (20 items consisting of expended cartridge casings of various calibers) or munitions and explosives of concern (MEC) (1 item. 3-pound practice bomb) (TtECI, 2010). The only reported munitions storage was at Building S-807 (located in the former Parcel A). This building was a bunker like concrete structure approximately 10 feet wide, 3 feet deep, and 5 feet high that was reportedly used by the Navy to store small caliber munitions for hand-held weapons (AFA and Golder, 1996). Based on this information, decontamination kits and munitions hardware, if present at all, likely would only be found in low proportion relative to other waste types and would be no more hazardous than some wastes found in municipal landfills.

The “low-hazard” military-specific wastes discussed above are distinct from “high-hazard” military-specific wastes, which include chemical warfare agents, artillery, bombs, and other military chemicals. Such high-hazard military-specific wastes may possess unique safety, risk, and toxicity characteristics that require special consideration (EPA, 1996). No anecdotal information, documentation, or physical evidence has been identified that such high-hazard military-specific wastes were ever used at HPS. Further, the shipyard’s primary mission of fleet repair and maintenance did not include weapons storage.

8.2.3.2. Conclusions for Characterization of Potential Hot Spots

Existing data are used to identify hot spots within a landfill and to determine if additional characterization and treatment of these hot spots is warranted. EPA guidance poses four specific questions for determining whether or not hot spots require characterization and treatment. If all of the questions can be answered in the affirmative, it is likely that characterization and treatment of hot spots is warranted (EPA, 1993a). The four questions outlined below include the Navy’s answers on the potential hot spots in the northern and central portions of the Landfill Area.

Does evidence exist to indicate the presence and approximate location of waste?: Yes. PCBs, 1,4-DCB, and naphthalene have been detected at concentrations greater than 100 times the RIEC at several locations within the Landfill Area.

Is the hot spot known to be a principal threat waste?: No. According to EPA guidance entitled “A Guide to Principal Threat and Low Level Threat Wastes” (EPA, 1991b), principal threat wastes are those source materials considered to be highly toxic or highly mobile that generally cannot be reliably contained or would present a significant risk to human health or the environment should exposure occur. The potential

14	Potential source of contamination to Parcel F	Section 2.3.3	Draft Parcels E and E-2 Shoreline Characterization Technical Memorandum, Hunters Point Shipyard, San Francisco, California. SulTech. June 2007. Pages 24 and 25. <i>(note: this document was accepted as final and was provided as Appendix G to the Final Remedial Investigation/Feasibility Study Report for Parcel E-2; Record No. 4237)</i>
----	--	---------------	---

6.0 CONCLUSIONS AND RECOMMENDATIONS

The purpose of the shoreline investigation was to evaluate if contamination along the Parcels E and E-2 shoreline has migrated (or has the potential to migrate) to sediments in adjacent Parcel F (offshore) and to identify areas within the shoreline that pose an unacceptable ecological risk.

Concentrations of copper and lead in sediments along the Parcels E and E-2 shoreline are a potential source of contamination to Parcel F in all areas except the Panhandle Area and IR-02 Southeast. Aroclors should be evaluated as a potential source of contamination in the Landfill Area and IR-02-Northwest, where the average concentrations of Aroclors exceeded the ambient concentration for nearshore sediment in San Francisco Bay (Water Board 2003).

Evaluation of PCB data showed that a definitive connection between onshore sources and offshore sediments could not be established, even though the congener patterns in onshore and offshore sediments were consistent. The geochemical assessment to evaluate the inter-element correlations between metals located in sediments of the shoreline and offshore area was not particularly diagnostic for linking contaminant sources and sinks, although contaminant distribution patterns in Parcel F are highly suggestive of contaminants originating from the shoreline along Area X of the South Basin. Additionally, although erosion and overland transport of contaminants from Parcels E and E-2 may be minor compared with the sediment load from San Francisco Bay, some influx of metals from the Parcels E and E-2 shoreline to Parcel F is likely.

Groundwater discharge was evaluated as a potential pathway for migration of metals and PCBs from Parcels E and E-2 to Parcel F. However, groundwater in contact with contaminated soils at depth in Parcels E and E-2 is unlikely to contribute to metals contamination in offshore sediments because of the limited solubility of metals in site groundwater. Review of metals data for groundwater samples collected from nearshore wells confirmed the low concentrations (10 micrograms per liter) of dissolved metals in site groundwater. Likewise, transport of PCBs by the groundwater pathway is severely limited by their chemical and physical properties.

Benthic invertebrates, birds, and mammals are at risk from exposure to PCBs in surface and subsurface sediment along the Parcels E and E-2 shoreline. Benthic invertebrates in surface and subsurface sediment may be adversely affected by exposure to copper, lead, zinc, and DDTs. In subsurface sediment, mercury may pose an additional risk to benthic invertebrates. Ingestion of sediment and prey that contain cadmium, copper, molybdenum, zinc, and PCBs may pose a risk to the house mouse.

Based on the results of the technical memorandum, the following recommendations are made for the Parcels E and E-2 shoreline:

- Source control measures are warranted along the Parcels E and E-2 shoreline, particularly in the metal slag area of the Panhandle Area, the Landfill Area, and IR-02 Northwest.
- Ecological risk to invertebrates, birds, and mammals in the shoreline warrants the evaluation of remedial alternatives for the intertidal sediments along the entire Parcels E and E-2 shoreline.

15	Landfill gas characterization	Section 2.3.4	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 4.2.3, pages 4-16 through 4-22. Record No. 4237
----	-------------------------------	---------------	---

4.2.2.2. Vertical Extent of Solid Waste

Figures 2-3 through 2-8 show the vertical extent of solid waste at the Parcel E-2 Landfill, along with the locations of the test pits and soil borings used in the extent evaluation. The vertical boundaries of the solid waste are discussed below.

Soil boring data confirm that the bottom of the solid waste is usually deeper than the test pit excavation depths. As a result, soil borings were drilled at most test pit locations to determine the depth of solid waste. Data from the test pits and historic soil borings were used to construct geologic cross sections that show the depth and extent of waste at the landfill (Figures 2-3 through 2-8).

The waste is generally located between 21 feet above and 14 feet below msl. The waste generally varies from 10 to 25 feet thick. The solid waste lies atop Bay Mud clays in the southern and eastern portions of the landfill and atop B-aquifer sands in the northwestern area of the landfill. In other areas, solid waste is bounded by fill (construction debris, sand, and gravel). In most borings, solid waste is located both above and below the water table. The only area where solid waste is located above the water table is in the northwest corner of the landfill.

4.2.3. Landfill Gas

This subsection discusses the nature and extent of landfill gas at Parcel E-2. The evaluation methods were discussed in Section 4.1.2. The results of relevant landfill gas investigations are summarized below, including those related to the landfill gas characterization study (Appendix A) and the landfill gas TCRA (Appendix F). This subsection also presents a description of the ongoing landfill gas activities, based on the Interim Landfill Gas Monitoring and Control Plan (TtEMI and ITSI, 2004c).

4.2.3.1. Landfill Gas Characterization

As discussed in Sections 3.2 and 4.1.2, the landfill gas characterization investigation was conducted in 2002 as part of the NDGI to define the nature and extent of landfill gas within and immediately adjacent to the Parcel E-2 Landfill. Section 3.2 discusses field activities and the report associated with this investigation. Data evaluation and results for the main components of the investigation are described below and include (1) outdoor air monitoring and building atmosphere surveys, (2) a subsurface soil gas survey, and (3) GMP installation and monitoring. Unless otherwise indicated, all information in this subsection is from the Landfill Gas Characterization Report (provided in Appendix A of this report). Figure 3-1 shows the locations of the soil gas survey locations and GMPs at Parcel E-2. Outdoor air and building surveys locations are shown on Figure 3-4.

Outdoor Air Monitoring and Building Atmosphere Surveys

Data from outdoor air monitoring and building atmosphere surveys were evaluated to assess whether methane (the main component of landfill gas) was present in outdoor air, buildings, or subterranean structures within 300 feet of the Parcel E-2 Landfill at concentrations exceeding the 27 CCR regulatory limit of 1.25 percent by volume in air (25 percent of the LEL). [Figure 4-2](#) shows the air monitoring locations within 300 feet of the landfill. Air monitoring data were also evaluated to assess whether NMOCs were present at concentrations exceeding EPA Region 9 PRGs for ambient air (EPA, 2004).

Results of the outdoor air survey indicated that landfill gas is not present in the breathing zone within the Landfill Area; in building atmospheres within 300 feet of the Landfill Area; or within surveyed, accessible buildings outside the 300-foot perimeter. Methane was not detected at locations to the east, south, or west of the landfill during the outdoor air survey. Methane was detected at several locations north of the landfill as summarized below.

- Methane exceeded the LEL at the ground surface around the light pole near the southwestern corner of the UCSF compound (Location F, subsequently referred to as simply the “light pole”).
- Methane detections were between 5 and 18 percent of the LEL at two locations along a suspected utility corridor along the fence between the landfill and the UCSF compound (Locations A and C).
- Methane exceeded 25 percent of the LEL at a location on the basketball court on the UCSF compound, just west of the Building 830 crawlspace (Location B).

During additional outdoor air monitoring performed using field instruments within a month of the initial outdoor air survey during spring 2002, methane was not detected at Locations A, B, C, or F. Air samples were collected and analyzed at three locations around the light pole and four locations within the Building 830 crawlspace. Methane was detected at a maximum concentration of 0.6 percent of the LEL in one light pole sample; all gas samples from within the Building 830 crawlspace were less than 1 percent of the LEL. Based on these results, the concentrations of methane in outdoor air around the landfill were considered negligible. Outdoor air at the light pole and Locations A and B were monitored on a monthly basis for more than 2 years following the removal action to verify that methane concentrations remained less than 1 percent (TtEMI and ITSI, 2004c). Monitoring at these locations was discontinued in August 2006 after methane and NMOC concentrations were shown to consistently be less than action levels. The Navy’s decision to discontinue monitoring at these locations was consistent with the rationale presented in the Interim Landfill Gas Monitoring and Control Plan (TtEMI and ITSI, 2004c).

Outdoor air monitoring performed on the landfill surface (consisting of breathing zone measurements at cap penetrations and a surface transect over and around the cap surface) did not detect methane at concentrations exceeding 25 percent of the LEL. Methane was detected at concentrations exceeding 25 percent or more of the LEL at several wells (shown on [Figure 4-2](#)); however, these measurements were

taken at the top of the well casing, with the wells open to the atmosphere, and were not representative of outdoor air within the Landfill Area. Based on these results, the amount of landfill gas in outdoor air within the landfill limits was considered to be negligible. Methane results from the outdoor air survey are shown on [Figure 4-2](#), and the outdoor air field data are presented in Table 3 in [Appendix A](#).

Laboratory results (presented in Table 4 in [Appendix A](#)) indicated that certain NMOCs were present in outdoor air at concentrations exceeding their respective PRGs at two locations, as summarized below.

- At the light pole near the southwestern corner of the UCSF compound ([Figure 4-2](#)), 1,1,2,2-tetrachloroethane, 1,3,5-trimethylbenzene, benzene, and PCE exceeded the 2004 PRGs for ambient air. Chloromethane and ethylbenzene concentrations exceeded the 2002 PRGs for ambient air; however, changes reflected in the 2004 PRGs resulted in these compounds no longer exceeding the established risk-based criteria.
- In the Building 830 crawlspace, benzene and PCE exceeded the 2004 PRGs for ambient air. Chloromethane concentrations exceeded the 2002 PRGs for ambient air; however, changes reflected in the 2004 PRGs resulted in chloromethane no longer exceeding the established risk-based criteria.

No NMOCs were detected at concentrations greater than PRGs in samples collected at these locations in November 2002. The November 2002 monitoring was performed after the gas control system was installed and active gas extraction was initiated from the extraction wells within the UCSF compound, as part of the landfill gas TCRA.

Subsurface Soil Gas Survey

Data from the subsurface soil gas survey were evaluated to assess the nature and extent of methane and other landfill gas components (such as NMOCs) in the vadose zone at the Parcel E-2 Landfill. Data were evaluated to identify subsurface locations where methane exceeded 25 percent of the LEL (1.25 percent by volume) and where NMOCs exceeded a screening criterion of 5 ppmv above background concentrations, as measured at a location upwind from the sampling locations. Field screening data and laboratory results corresponded well to one another. The main findings of the data evaluation are summarized below.

- Methane was detected at concentrations exceeding 25 percent of the LEL along the northern side of the landfill, where solid waste extends up to the boundary of the UCSF compound. NMOCs were also detected in this area at concentrations exceeding 5 ppmv above background.
- Methane was detected on the UCSF compound at concentrations exceeding the LEL, indicating that methane had migrated north of the landfill beneath the UCSF compound.
- No methane was detected north of the UCSF compound on Crisp Avenue. Thus, methane had not migrated beyond the UCSF compound beneath non-Navy property north of Crisp Avenue (former Parcel A).

- Methane concentrations were not detected at levels exceeding 25 percent of the LEL along the east, south, and west sides of the landfill. Thus, methane dissipated quickly with distance from the landfill in these directions.
- During field screening, NMOCs were detected at 11 soil gas locations at concentrations exceeding 5 ppmv above background.
- At one location (SG12) east of the delineated extent of waste, near IR04MW13A, laboratory analysis detected PCE, TCE, and their degradation products at concentrations above the shallow soil gas screening levels for evaluation of potential vapor intrusions.

Figure 4-3 shows the extent of landfill gas based on the results of the subsurface soil gas survey. Tables 5 and 7 in Appendix A present field screening and laboratory analytical results of the soil gas survey, respectively. As discussed in Section 3.9, the Navy performed an interim removal action to remove landfill gas that had migrated beneath the UCSF compound and to control future migration north of the solid waste boundary.

The soil gas survey identified the nature and approximate lateral extent of landfill gas prior to the landfill gas removal action. The nature and extent delineation was further refined during several rounds of sampling conducted at GMPs installed in 2002, as discussed in the following subsection. The landfill gas barrier wall installed to control landfill gas migration is shown on Figure 4-3 and represents the current northern extent of landfill gas above 25 percent of the LEL.

Gas Monitoring Probe Installation and Monitoring

Data from GMPs installed in 2002 were evaluated to monitor the presence of landfill gas at Parcel E-2, the UCSF compound, and along Crisp Avenue. Monitoring was conducted on a weekly basis using field instruments. Four rounds of sampling were conducted between April and November 2002. Methane concentrations were compared with 27 CCR limits. NMOC concentrations were not compared with any specific criteria; rather, their concentrations were monitored over time during four rounds of sampling conducted in 2002. Table 4-2 lists the detection frequencies and range of results for NMOCs collected from GMPs during this time period. Findings of the data evaluation are summarized below.

During the first three rounds of monitoring from April to July 2002, methane concentrations exceeded the LEL (5 percent by volume) in GMP01A through GMP12; these GMPs are all located along the fence line on the northern edge of the Parcel E-2 Landfill. Methane was not detected in any of the GMPs located along Crisp Avenue (GMP13 through GMP19). Methane was also not detected in GMPs 20 and 21 located on the western edge of the landfill.

The fourth round of monitoring was conducted in November 2002, after the initiation of active gas extraction within the UCSF compound. Methane concentrations decreased to less than the LEL in all GMPs along the northern edge of the Parcel E-2 Landfill except at GMP08A, which is located on the northeastern side of the landfill. Results measured during this round also indicated that methane

concentrations in the UCSF compound GMPs were all less than the LEL for methane. As during previous sampling rounds, methane was not detected in the GMPs on Crisp Avenue (GMP13 through GMP19). This finding further supported the conclusion that methane had not migrated beyond the UCSF compound beneath non-Navy property north of Crisp Avenue (former Parcel A).

Several NMOCs were detected during GMP monitoring, with the highest concentrations detected in GMPs around the perimeter of the Parcel E-2 Landfill and within the UCSF compound. NMOC concentrations were detected in the GMPs located along Crisp Avenue, but at lower concentrations than concentrations detected at the GMPs along the fence line and within the UCSF compound. NMOC concentrations at all GMPs decreased after the landfill gas extraction system became operational in October 2002.

A risk assessment was conducted prior to operation of the gas extraction system to evaluate potential human health risks resulting from the low levels of NMOCs detected in GMPs along Crisp Avenue. An additional risk assessment was performed on NMOC data from GMPs within the UCSF compound. As discussed in [Section 4.1.2.2](#), the assessments concluded that NMOC concentrations do not pose an unacceptable risk to human health.

4.2.3.2. Landfill Gas Removal Action

Based on the results of the landfill gas characterization investigation, the Navy initiated a TCRA to (1) remove landfill gas and reduce subsurface methane concentrations at the UCSF compound to less than the LEL (5 percent by volume in air); and (2) control future landfill gas migration to off-site areas. The TCRA consisted of active landfill gas extraction, post-extraction monitoring, and a response action to address potential methane migration pathways through the landfill gas control system. The results of each of these TCRA components are described in the following paragraphs. Unless otherwise indicated, all information in this subsection was derived from the Landfill Gas TCRA Closeout Report ([TtEMI, 2004a; Appendix F](#)).

Active Landfill Gas Extraction

The goals of the active extraction phase of the TCRA were to (1) reduce methane to concentrations equal to or less than 0.5 percent by volume in air in all extraction wells (EX-1 through EX-10); and (2) to reduce methane to concentrations equal to or less than 1 percent by volume in air in all GMPs within the UCSF compound (GMP22 through GMP26). Two cycles of active extraction were planned but not needed at all wells to achieve these goals. The active extraction phase of the TCRA was conducted from October 4, 2002, to January 20, 2003, when the TCRA goals for reducing the concentrations of methane were achieved. From January 2003 to present, active landfill gas extraction is conducted as necessary to ensure landfill gas concentrations do not exceed action levels.

Post-Extraction Monitoring

The landfill gas control system consists of an HDPE barrier wall, a gas collection trench sealed (on top) with bentonite, a horizontal perforated gas collection pipe, five gas vents, and a mobile active extraction unit to assist venting when necessary. Construction of the landfill gas control system was completed on October 3, 2002. After active gas extraction was halted on January 20, 2003, methane concentrations were monitored in extraction wells and GMPs, weekly for 4 weeks and then monthly for 4 months. At the end of each monitoring period (weekly and monthly), gas samples were collected in Summa™ canisters from GMP22 through GMP26 (located within the UCSF compound) and analyzed at an off-site stationary laboratory to confirm the field monitoring results. GMP analytical results are shown in [Appendix J1](#).

During the first 2 weeks of monitoring, the landfill gas control system was operated passively. However, methane levels at GMP01A began to rise within 1 week after extraction was halted, with corresponding increases in adjacent GMPs to the east (GMP02A) and west (GMP12). To address these methane increases, the landfill gas control system was switched from passive to active mode on February 5, 2003, by extracting gas through passive vent (PV)-01 at a low-flow rate. Laboratory analysis of GMPs ([Appendix J1](#)) demonstrates that gas migration is effectively controlled through operation of the landfill gas control system. The activities of the TCRA have successfully controlled the migration of landfill gas beneath non-Navy property.

Methane Migration Response Action

During active gas extraction and subsequent monitoring, increases in methane concentrations were observed that were consistent with a physical problem with the landfill gas control system that allowed methane to migrate beyond the barrier wall. A detailed evaluation was conducted to determine the cause of the methane increases and to identify appropriate mitigative measures; the evaluation is documented in Appendix K to the Landfill Gas Removal Action Closeout Report (provided in [Appendix F](#) to this report) and briefly summarized below.

Data collected from temporary gas probes installed along the gas collection trench indicated that methane was migrating in two locations either through a tear in the barrier or over the barrier through the bentonite seal.

The following response actions were taken to address methane migration:

- A grout curtain was installed in the gas collection trench on the north (UCSF) side of the HDPE barrier wall to control the migration of methane gas through the barrier wall. The grout curtain was installed in June 2003 using pressure grouting to fill voids in gravel and soil along the northern side of the barrier wall and to seal any tears or separated seams. [Figure 1-3](#) shows the grout curtain location.

- The bentonite cover was rehydrated to control the migration of methane gas above the barrier wall. Trenches were excavated to the top of the barrier wall in areas where temporary gas probe monitoring results indicated methane migration was occurring. Inspection of these trenches indicated several areas of inadequate hydration of the bentonite cover, with bentonite pellets clearly visible. The entire length of the bentonite cover was rehydrated by injecting water into the cover using a water jet constructed of perforated PVC pipe.
- A fifth PV (-05) was added to increase the venting capability of the trench. The vent was created by converting one of the risers connected to the main pipe of the barrier trench to a vent and connecting it to a treatment unit. The new passive vent was connected between PV-01 and PV-02, in the area of the observed methane increases. [Figure 3-6](#) shows all the passive vent locations.

Based on subsequent monitoring, these response actions have reduced gas migration beneath the UCSF compound. Ongoing landfill gas monitoring and control system operation, in accordance with the Interim Landfill Gas Monitoring and Control Plan ([TtEMI and ITSI, 2004c](#)), is performed to control gas migration beneath the UCSF compound.

4.2.3.3. Ongoing Landfill Gas Activities

The ongoing landfill gas monitoring and control system operation is based on the Interim Landfill Gas Monitoring and Control Plan ([TtEMI and ITSI, 2004c](#)). Monitoring is conducted to verify that hazardous levels of landfill gas are not migrating beyond the fence line of the landfill and onto the UCSF compound. The monitoring locations include 32 GMPs and 5 PVs, 4 groundwater wells on the landfill cap, and outdoor air and subterranean structure locations both on Parcel E-2 and within the UCSF compound ([Figure 3-6](#)). As discussed in [Section 3.9](#), regular monitoring is being conducted at GMPs and along the gas control system. In addition, the gas control system is inspected and maintained on a regular basis. The gas monitoring reports present results of the landfill gas monitoring, the status of the gas extraction system (active operation and passive operation), maintenance observations on the gas control system, and meteorological data ([ITSI, 2004a through 2004g, 2005a through 2005n, 2006a through 2006g, 2006i through 2006m, 2007a through 2007c, 2007e through 2007g, 2008a through 2008c, 2008e, 2009a through 2009d, and 2010a through 2010c](#)).

4.2.4. Chemicals Detected in Soil

Soil data within the Landfill Area is presented in a similar manner as for the Panhandle Area and East Adjacent Area for consistency purposes. However, as discussed in [Section 4.1.3.4](#), chemical data in Landfill Area soil are used only to assess (1) the general magnitude of chemical concentrations relative to the RIEC and (2) the general extent of RIEC exceedances relative to the landfill waste volume. In addition, potential soil hot spots are identified at locations containing chemical concentrations 100 times greater than the corresponding RIEC. EPA recommends that hot spots in municipal landfills be identified and evaluated to decide if more extensive characterization and development of remedial alternatives is

16	Groundwater contaminants	Section 2.3.5	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 5.8.1, pages 5-38 through 5-40. Record No. 4237
----	---------------------------------	-------------------------------	---

5.8. SUMMARY OF FINDINGS

All groundwater data collected to date (from early 1990 to October 2007) were included to accurately evaluate the nature and extent of groundwater contamination in Parcel E-2. Concentrations of metals in groundwater were compared with ambient concentrations (HGALs) to eliminate those metals not introduced by the landfill or its surrounding source areas. The data were then evaluated by comparing detected chemicals with evaluation criteria (RIECs) to establish whether they are likely to be present at concentrations that could negatively affect human health or the environment. To identify the subset of detected chemicals on which to focus the evaluation, the data were compared with the selected RIECs for each aquifer. The RIECs are composed of regulatory groundwater and drinking water limits and standards and aquatic criteria, as well as background levels (in the case of metals only). To identify and select the criteria that apply to each aquifer at Parcel E-2, a beneficial use evaluation was conducted, followed by a criteria selection process based on the results of that evaluation.

Further evaluation was performed for chemicals found to exceed the selected RIECs. Data maps were created to depict the spatial and temporal distribution and magnitude of the detections and the samples that exceeded the RIEC for each chemical in each aquifer.

The information presented above was used to determine if the problem statements defined for Parcel E-2 groundwater have been answered and if the DQOs have been met. The following subsections summarize the results of the nature and extent evaluation and address the resolution of DQOs and the responses to the problem statements guiding the data collection at Parcel E-2.

5.8.1. Summary of Lateral and Vertical Extent

As stated in [Section 5.1](#), the goal of this section is to present an evaluation of all existing groundwater data to support the risk assessment and remedial alternatives portions of the RI/FS process. This nature and extent evaluation is meant to document that an adequate amount of data, of sufficient quality, exist to support the HHRA and SLERA, to provide a strong basis for the RAOs, and to support the evaluation of a focused set of remedial alternatives for Parcel E-2.

The findings and the areas of concern with respect to groundwater contamination at Parcel E-2 are summarized below.

- Cyanide was detected at elevated concentrations throughout the A- and B-aquifer perimeter wells in Parcel E-2; however, the highest concentrations of cyanide were in samples collected from wells within the Landfill Area. Recent elevated concentrations (exceeding RIEC) and, in some cases, persistent concentrations of cyanide in groundwater wells located along the perimeter of the parcel indicate that the extent of cyanide is not adequately delineated.
- Ammonia was detected at elevated concentrations throughout the A- and B-aquifers in the Landfill Area. These concentrations are indicative of the decomposition of natural organic matter and organic waste material in the landfill. Elevated concentrations (exceeding the RIEC) of un-ionized ammonia are also present in wells located along the bay shoreline and further inland in the northern portion of the Panhandle Area, adjacent to the Landfill Area. Upon contact with bay water, un-ionized ammonia is oxidized to nitrite, then nitrate. The oxidation of ammonia reduces the dissolved oxygen in the bay water and may be harmful to aquatic life.
- Nitrate concentrations exceeding the RIEC are persistent at well IR01MW53B, located along the northern shoreline of the Panhandle Area. The extent of nitrate is not adequately delineated in the B-aquifer at this shoreline location.
- Sulfide was detected at elevated concentrations in monitoring wells throughout Parcel E-2. In particular, wells near the shoreline display elevated and persistent concentrations of sulfide in groundwater that may migrate to San Francisco Bay. The extent of sulfide is not adequately delineated.
- Recently detected concentrations of antimony, chromium, lead, and zinc exceeded their respective RIECs in groundwater where the Landfill Area meets the PCB Hot Spot Area. Concentrations in groundwater may be attenuating as a result of the removal action at the PCB Hot Spot Area, but this hypothesis can only be confirmed through ongoing monitoring in this area. Until this data gap is addressed, the extent of these metals is not considered adequately delineated in the northern portion of the PCB Hot Spot Area, along the shoreline.
- Persistent barium concentrations exceeding the RIEC (504 µg/L) exist in A-aquifer groundwater in the southern portion of the Panhandle Area and along the Landfill Area shoreline. Because the extent of barium beyond the Parcel E-2 shoreline is unknown, groundwater with barium concentrations exceeding the RIEC is potentially migrating toward San Francisco Bay.
- Recently detected concentrations of copper, lead, and zinc exceeded the A-aquifer RIEC in groundwater along the northern shoreline of the Panhandle Area, where these dissolved metals are potentially migrating to San Francisco Bay. Ongoing monitoring in this area may be used to further delineate the extent of metals in groundwater at this location and may be used to make recommendations on future remedial actions.
- For metals in groundwater, ambient concentrations are a contributing factor for the wide variety of detections in the A-aquifer; however, past site activities at Parcel E-2, which include disposal of industrial wastes, also contribute to the metals reported in groundwater. Metals concentrations slightly exceeding HGALs were treated and delineated as RIEC exceedances in this evaluation, but they may be due to natural variations in background concentrations.

- Concentrations of total PCBs consistently exceed the RIEC in A-aquifer wells located near the sheet-pile wall, along the shoreline in the Landfill Area. Historical data indicated that PCB concentrations generally decreased over time at the site. In addition, the removal action that was performed in the PCB Hot Spot Area along the Parcel E-2 shoreline removed the soil source and is likely to result in reduced dissolved concentrations in Parcel E-2 aquifers. The removal action performed at the PCB Hot Spot Area will also probably reduce source concentrations of other chemicals (e.g., SVOCs) detected in the area. Data collected from temporary and replacement wells in the vicinity of the PCB Hot Spot Area, although not extensive, suggest that attenuation is occurring.
- Historical total TPH concentrations in groundwater in wells IR01MW43A and IR01MWI-3 exceeded the TPH criterion in samples collected between 1991 and 2005. Total TPH concentrations in IR01MW43A and IR01MWI-3 continued to exceed their respective RIECs (4,839 µg/L and 2,092 µg/L) through 2005. Total TPH, as well as other chemical concentrations, in soil will likely be reduced as a result of the soil removal action that was conducted in the collocated PCB Hot Spot Area; however additional monitoring is required to confirm whether the removal action has reduced TPH concentrations in groundwater. Concentrations of total TPH in samples collected from temporary monitoring wells within 150 feet of the Parcel E-2 shoreline in the Landfill Area and northern Panhandle Area exceed A-aquifer RIECs. Total TPH is not adequately delineated in these areas.

Table 5-15 includes a list of all the wells from which the extent of certain chemicals could not be adequately delineated based on the available data. Although these are potential areas of concern and may not have all been identified as such in the bulleted list above, the information available is adequate for the evaluation of remedial alternatives for Parcel E-2. Section 5.8.4 provides more information on how the nature and extent analysis presented in this section will be strengthened by future data.

5.8.2. Resolution of Data Quality Objectives

A DQO question was presented in the BGMP SAP (TtEMI, 2004e) that directly addressed the nature and extent of contamination in basewide groundwater, including groundwater affected by the landfill at Parcel E-2. The problem statements, decision question, and answer to the decision question are presented below.

5.8.2.1. Problem Statements

The BGMP SAP (TtEMI, 2004e) lists the following two problem statements for groundwater monitoring at the landfill at Parcel E-2:

Historical groundwater data show that chemicals have been detected in groundwater downgradient of the Parcel E-2 Landfill. Additional monitoring is necessary to determine trends in chemical concentrations and to help evaluate potential remedial alternatives.

17	Radiological investigations	Section 2.3.6	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRs. March 2011. Section 3.1, pages 3-1 through 3-10. Record No. 4260.
----	-----------------------------	---------------	--

Section 3. Radiological Investigations and Removal Actions

Multiple radiological investigations have been conducted at Parcel E-2⁴, beginning in 1988. The investigations included basewide investigations (such as the site reconnaissance), investigations performed throughout Parcel E (which was later subdivided into Parcels E and E-2), and focused investigations within Parcel E-2. In addition, the Navy has performed several interim removal actions at Parcel E-2 that have involved excavation and off-site disposal of LLRW. The following sections describe the previous radiological investigations and removal actions performed at Parcel E-2.

3.1. RADIOLOGICAL INVESTIGATIONS

Numerous investigations of potential radiological contamination have been performed throughout HPS, including Parcel E-2. Radiological investigations performed at Parcel E-2 include:

- Site Reconnaissance (1988 to 1989)
- Phase I Radiological Investigation (1991)
- Phase II Radiological Investigation (1993)
- Interim Parcel E Radiation Risk Assessment (1997)
- Interim Investigation between Phase IV and Phase V Radiological Investigations (2001)
- Phase V Radiological Investigation (2002 to 2003)
- Radiological Groundwater Investigation (2002)
- Characterization of the Metal Slag Area (2004)
- Radiological Groundwater Investigation (2008)

A brief summary of radiological investigations performed at Parcel E-2 is provided in the following sections. For each investigation, the methods used to evaluate the ROCs and associated release criteria were current at the time of the survey. Unless otherwise indicated, the information presented in each section is derived from the HRA (NAVSEA, 2004). Specific soil and groundwater characterization data from these investigations are presented in Sections 4 and 5, respectively.

⁴ In September 2004, the Navy divided Parcel E into two parcels (E and E-2). Discussions within this report that reference documents published prior to September 2004 refer to the portion of Parcel E that became Parcel E-2.

3.1.1. Site Reconnaissance (1988 to 1989)

In 1988, Harding Lawson Associates conducted a preliminary surface radiation survey to determine if radioactivity levels at HPS posed unacceptable exposure risks to RI fieldworkers. Project activities included a scintillation survey for radiation at surface locations at Parcel E-2. The surface gamma survey was conducted at grid points over the entire Landfill Area. The average gamma count rate was determined to be significantly below the mean of the background values measured at HPS in conjunction with this survey (6,411 counts per minute [cpm]). Surface gamma counts at one location in the landfill exceeded the average level at the landfill, but were close to the mean of the HPS background values (Harding Lawson Associates, 1990).

3.1.2. Phase I Radiological Investigation (1991)

In 1991, the Navy began radiation investigations at HPS in four main phases as part of the RI program. Phases I and II involved field investigations at several HPS locations, including Parcel E-2, while Phases III and IV were performed elsewhere at HPS (outside of Parcel E-2). Also during this period, an interim radiation risk assessment and a shoreline characterization survey were performed at Parcels E and E-2.

The portion of the Phase I radiological investigation at Parcel E-2 included air monitoring and a surface confirmation radiation survey (SCRS). Phase I particulate air monitoring was conducted in 1991 to determine the background airborne particulate alpha and beta radioactivity levels at several locations, including Parcel E-2. The gross alpha and gross beta airborne particulate concentrations were well within safety standards for airborne concentrations of general radioactive materials in outdoor air (PRC Environmental Management, Inc. [PRC], 1992).

The Phase I SCRS was initiated in 1992 to determine and confirm the nature and surficial extent of radium-bearing devices in several disposal areas at HPS, including Parcel E-2. A local grid coordinate system was developed for the Phase I SCRS to map and relocate radioactive material detected during the surface walkover survey. Each grid section was 300 feet by 300 feet square, with each section further subdivided into 30-foot by 30-foot subgrids. During the Phase I SCRS, gamma readings exceeding two times the background level were considered potential radioactive point source anomalies associated with buried radium-containing devices (PRC, 1992).

When elevated gamma readings were observed, the location, gamma measurements, and exposure measurements were recorded and a “biased” soil sample was collected to identify the radioisotopes (PRC, 1992). To provide additional characterization information, “systematic” soil samples were also collected at random, “unbiased” locations at a frequency of one sample per 2 acres. All soil samples were analyzed at an off-site laboratory using gamma spectroscopy to identify and quantify gamma-emitting radioisotopes. During the surface walkover survey in Parcel E-2, a cluster of seven radioactive point

source anomalies associated with radium-containing devices were observed in the vicinity of the Metal Slag Area; two additional anomalies were observed in the Panhandle Area northeast of the Metal Slag Area (PRC, 1992). The locations of the point source anomalies and where soil samples (both biased and systematic) were collected are shown on Figure 4. The point source anomalies were removed in 2005 and 2006 as part of an interim cleanup that targeted metal slag and debris within the area (see Section 3.2.1). Soil sample results from the Phase I SCRS are discussed further in Section 4. Based on the results of the Phase I SCRS, a recommendation was made for further investigation.

In addition to the soil sampling, a total of 207 radon flux canister samples was collected at ground surface locations at or near selected radioactive anomalies and other areas with elevated gamma activity. Flux canister samples were analyzed for radon gas, a radioactive gas emitted into soil from the decay of ^{226}Ra . The analytical results were quantified as a radon flux rate value in picocuries per square meter per second ($\text{pCi}/\text{m}^2\text{-s}$). Analytical results for the 207 radon flux canister samples collected at Parcel E-2 are summarized below.

- Nineteen samples had no detectable levels of radon gas, with radon flux rates quantified as zero $\text{pCi}/\text{m}^2\text{-s}$
- One hundred-twenty samples exhibited very low levels of radon gas at or below the average background radon flux rate ($0.17 \text{ pCi}/\text{m}^2\text{-s}$)
- Fifty-five samples exhibited low levels of radon gas within twice the average background flux rate, with radon flux rates ranging from 0.18 to $0.34 \text{ pCi}/\text{m}^2\text{-s}$
- Nine samples exhibited slightly elevated levels of radon gas within three times the average background flux rate, with radon flux rates ranging from 0.35 to $0.45 \text{ pCi}/\text{m}^2\text{-s}$
- Three samples exhibited elevated levels of radon gas greater than three times the average background flux rate, with radon flux rates ranging from 0.57 to $8.97 \text{ pCi}/\text{m}^2\text{-s}$

The three samples with elevated levels of radon gas were collected directly above areas with elevated gamma activity and were surrounded by nearby canister samples with very low or low levels of radon gas. The average radon flux rate ($0.19 \text{ pCi}/\text{m}^2\text{-s}$) measured at Parcel E-2 during the Phase I investigation is comparable with the measured background flux rate ($0.17 \text{ pCi}/\text{m}^2\text{-s}$). In addition, the range of measured radon flux rates are well below the threshold for radon emissions ($20 \text{ pCi}/\text{m}^2\text{-s}$) specified in the Uranium Mill Tailings Radiation Control Act (40 CFR Section § 192.02[b][1]).

3.1.3. Phase II Radiological Investigation (1993)

The Phase II radiological investigation was conducted in 1993 in an attempt to delineate the subsurface distribution of radium-containing devices at several locations, including Parcel E-2 (PRC, 1996). Six 15-foot-long test pits were excavated in the Panhandle Area at locations where point source anomalies were found during the Phase I SCRS. The test pits were excavated until Bay Mud or groundwater was

encountered, or until the walls of the excavation became unstable. Trench and test pit depths ranged from 2.5 to 10.5 feet below ground surface (bgs), with an average depth of about 8 feet bgs.

The walls of each test pit, as well as the excavated soil, were scanned for gamma-emitting radioactive material. If elevated gamma readings were observed, the location, gamma measurements, and exposure measurements were recorded. During the Phase II investigation, gamma count rates exceeding one and one-half times the background level were considered radioactive point source anomalies associated with buried radium-containing devices (PRC, 1996). If radioactive point source anomalies were found, they were further investigated by excavation and soil samples were collected for analysis at an off-site laboratory using gamma spectroscopy to identify the radioisotopes (PRC, 1996).

No elevated gamma count rates were measured in the test pits or trenches installed within Parcel E-2; as a result, no additional soil samples were collected at Parcel E-2 for gamma spectroscopy analysis. However, test pits and trenches installed at IR Site 02, in close proximity to Parcel E-2, contained gamma-emitting anomalies associated with radium-containing devices and firebrick. Soil samples collected in IR Site 02 assisted in delineating an area containing a concentration of radium-containing devices that was subsequently removed during an interim removal action (TtECI, 2007c). As discussed in Section 2.3.3, this area is located entirely within the current boundary of Parcel E.

3.1.4. Interim Parcel E Radiation Risk Assessment (1997)

As part of the Parcel E RI, TtEMI performed a radiation risk assessment to evaluate potential risks associated with human exposure (for residential and industrial scenarios) to radionuclides detected in what is now Parcels E and E-2 (TtEMI, LFR, and U&A, 1997). ^{226}Ra and its radioactive daughter products (lead-210 [^{210}Pb] and radon-222 [^{222}Rn]) were identified as radionuclides of potential concern. Risks were quantified for exposure to ^{226}Ra in soil and to ^{222}Rn in indoor air because there is only risk from ^{222}Rn if buildings are constructed in a radiologically impacted area. The planned reuse for Parcel E-2 is open space. Therefore, an industrial exposure scenario was considered a more conservative risk assessment that likely over estimated the risk to future site occupants. For exposure to ^{226}Ra in the industrial exposure scenario, several exposure areas identified in the risk assessment had calculated excess lifetime cancer risks between 1E-06 and 1E-05 for the reasonable maximum exposure (RME) case. Risks to ^{222}Rn were not considered relevant for the Parcel E-2 area because no buildings were constructed in the area. The assessment report concluded that health risks for exposure to ^{226}Ra in soil were not considered significant (TtEMI, LFR, and U&A, 1997). Please refer to additional information presented in Sections 4 and 7 regarding updated soil characterization and risk analyses.

3.1.5. Interim Investigation between Phase IV and Phase V Radiological Investigations (2001)

A characterization survey of the shoreline of what is now Parcels E and E-2 was performed in 2001. Gamma scans were conducted over pre-positioned grids within approximately 50 feet of the mean tide

line. Approximately 900 areas in Parcel E and E-2 were noted during the survey that exceeded twice the background gamma radiation levels; the highest measurements were identified in the area known as the “metal reef” within Parcel E. Samples collected from those locations identified ^{226}Ra as the contaminant.

3.1.6. Phase V Radiological Investigation (2002 to 2003)

The Phase V radiological investigation began in January 2002 prior to issuance of the HRA. The purpose was to support the release of buildings or areas that had been identified as areas where radioactive materials had been used or areas where previous removal actions to remove known contamination had occurred. The Phase V investigation of what is now Parcel E-2 was performed in 2002 and 2003, and the results were not available for inclusion in the HPS HRA (NAVSEA, 2004); therefore, the Phase V investigation results are presented for the first time in this radiological addendum. The scoping survey was of the surface only and was designed to meet the requirements of a Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) Class 1 Final Status Survey if contamination was not found (U.S. Department of Defense et al., 2000). The object of the Phase V investigation at Parcel E-2 was to demonstrate whether residual radioactivity on the surface met the predetermined release criterion as summarized below.

- ^{226}Ra : 1 picocurie per gram (pCi/g) greater than background not to exceed 2 pCi/g⁵
- ^{90}Sr : 10.8 pCi/g
- ^{137}Cs : 0.13 pCi/g⁶
- ^{60}Co : 0.060 pCi/g

These release criteria were considered equivalent to EPA preliminary remediation goals (PRGs) for outdoor worker exposure to soil, based on agreements with EPA. For ^{226}Ra and ^{137}Cs , the outdoor worker release criteria are identical to the release criteria for future residents. In contrast, the outdoor worker release criterion for ^{90}Sr (10.8 pCi/g) is greater than the residential release criterion (0.331 pCi/g). Similarly, the outdoor worker release criterion for ^{60}Co (0.0602 pCi/g) is greater than the residential release criterion (0.0361 pCi/g).

The investigation area was divided into 73 Class 1 survey units measuring 40 by 50 meters (2,000 square meters, or 21,528 square feet) each. Each survey unit was assigned an alphabetic designation. Sixteen systematic sample locations were established in each grid approximately 11 meters apart. Figure 5 provides a layout of the survey units and the systematic sample locations. Reference (background) readings consisted of 16 1-minute static gamma readings taken on the hillside of Parcel A and 16 samples collected at various areas within Parcels B, C, D, and E.

⁵ The ^{226}Ra release criterion was 5 pCi/g when the Phase V investigation was started but was subsequently reduced to 1 pCi/g above background; the uncertainty related to this change in criterion is discussed in Section 7.3.

⁶ The ^{137}Cs release criterion applied to this survey when conducted in 2002 is slightly higher than the one used today (0.113 pCi/g); however, this change does not directly impact the results of this survey.

The Phase V investigation consisted of the following steps:

- Gamma scans of 100 percent of the surface area
- Sixteen systematic static gamma measurements in each survey unit
- Biased static measurements in areas where high gamma readings were measured
- Exposure rate measurements from the systematic static measurement locations
- Collection of soil samples at static and biased measurement locations
- Analysis of the soil samples by gamma spectroscopy at the on-site laboratory to quantify activity levels of a suite of 17 radionuclides, including ^{137}Cs and ^{226}Ra

A total of 1,168 systematic and 24 biased soil samples were collected during the Phase V investigation. Gamma scan measurements typically ranged from 4,500 to 8,000 cpm, with occasional scan measurements identified as being in excess of 10,000 cpm. Sample results identified residual radioactivity exceeding the release criteria for ^{137}Cs and ^{226}Ra in each survey unit. The elevated levels appeared to be consistent over the surface of the area, including the landfill cap, and there is a direct correlation between gamma static readings and gamma spectroscopy results. Results for samples from the reference areas indicated mean background activity level of 0.049 pCi/g for ^{137}Cs and 0.82 pCi/g for ^{226}Ra . These background activity levels are consistent with the background activity levels used for the interim removal actions at Parcels E and E-2 (TtECI, 2007a, 2007b, and 2007c). The analytical results from the systematic and biased soil samples are provided in Table A-2 of Appendix A, and the complete laboratory reports for the Phase V investigation are provided as an attachment to Appendix A. Figures 6 and 7 show the sample locations across Parcel E-2 where ^{226}Ra and ^{137}Cs exceeded the release criteria (1.82 pCi/g for ^{226}Ra and 0.113 pCi/g for ^{137}Cs ; as stated previously, these release criteria are identical for outdoor worker and residential exposure scenarios). Figure 8 shows the sample locations where ^{60}Co exceeded the residential release criterion (0.0361 pCi/g; the outdoor worker release criterion is 0.0602 pCi/g). Only the Phase V survey units in the vicinity of the Experimental Ship-Shielding Area are presented on Figure 8, because ^{60}Co was the only ROC in this area of Parcel E-2.

Based on the sample results, every survey unit had activity levels of ^{226}Ra exceeding the release criterion and 46 of the survey units had activity levels of ^{137}Cs exceeding the release criterion. All of the eight survey units within the vicinity of the Experimental Ship-Shielding Area had activity levels of ^{60}Co exceeding the residential release criterion; however, only three of the eight survey units had activity levels of ^{60}Co exceeding the outdoor worker release criterion. Ten percent of the samples were sent to an off-site laboratory for quality assurance and ^{90}Sr analysis because the on-site laboratory did not analyze directly for ^{90}Sr . Results from the quality assurance laboratory were within the range of results from the on-site laboratory (based on a normal distribution of results). The average ratio of ^{90}Sr to ^{137}Cs results

from the off-site laboratory (3.626) was used to estimate ^{90}Sr activity levels. The estimated ^{90}Sr activity levels for each sample were calculated by multiplying the corresponding ^{137}Cs activity level by 3.626. This methodology was used to estimate potential ^{90}Sr activity levels for all samples collected during the Phase V investigation in Parcel E-2, and to compare the calculated ^{90}Sr activity levels with the outdoor worker release criterion. Although the correlation of ^{90}Sr and ^{137}Cs activity levels may not account for potential radiological devices containing ^{90}Sr , which could contain higher ^{90}Sr activity levels, the comparison using the calculated ^{90}Sr activity levels is adequately conservative because: (1) available direct measurements of ^{90}Sr (10 percent of the systematic samples, with a maximum activity level 0.908 pCi/g; presented in Table A-3 in Appendix A) did not report any ^{90}Sr activity levels within or close to the outdoor worker release criterion (10.8 pCi/g); and (2) the maximum ^{90}Sr activity level reported from the off-site laboratory (0.908 pCi/g) was much less than the maximum ^{90}Sr activity level calculated based on the correlation with ^{137}Cs (9.09 pCi/g). None of the survey units had calculated activity levels of ^{90}Sr exceeding the outdoor worker release criterion (10.8 pCi/g); however, 66 of the survey units had calculated activity levels of ^{90}Sr exceeding the residential release criterion (0.331 pCi/g). Soil sample results from the Phase V investigation are discussed further in [Section 4](#).

The Phase V investigation of Parcel E-2 was conducted as a scoping survey to determine what additional action, if any, would be required. Based on the results of the Phase V investigation, in particular the consistent low activity levels of ^{226}Ra (3 to 4 pCi/g) throughout the survey units, this radiological addendum recommends development and evaluation of remedial alternatives for soil throughout the radiologically impacted portions of Parcel E-2. In addition, the results of the Phase V investigation were not used to eliminate further evaluation of ROCs identified in the HRA. For example, the relative lack of ^{90}Sr exceeding the outdoor worker release criterion is not adequate to eliminate consideration of this ROC, and ^{90}Sr will remain an ROC throughout the cleanup process at Parcel E-2 to ensure that potential ^{90}Sr contamination is addressed. The conclusions and recommendations are further detailed in [Section 8](#). The remedial alternatives are developed and evaluated in [Sections 11 through 14](#).

3.1.7. Radiological Groundwater Investigation (2002)

In 2002, a groundwater data gaps investigation was performed at various sites in Parcels E, E-2, and G to collect isotope-specific data for “radionuclides of interest,” defined as species that may be site-related or may be present in the environment as natural or anthropogenic background as known at the time (prior to issuance of the HRA). The investigation was intended to supplement data collected during previous investigations for radiological indicator parameters (gross alpha and gross beta) because the nonspecific results for gross alpha and gross beta did not allow the Navy to distinguish between natural and potentially site-related components of radioactivity in shallow groundwater (within what is referred to as the “A-aquifer”). ^{226}Ra was considered the primary radionuclide of interest at Parcel E-2 because debris disposed of at the landfill may have contained radium dials; however, groundwater samples collected from seven A-aquifer monitoring wells within and immediately adjacent to the Landfill Area were

analyzed for 47 specific isotopes. [Figure 9](#) identifies the A-aquifer monitoring wells sampled during the 2002 groundwater investigation. Wells were sampled twice between July and October 2002. Well IR01MW07A was sampled in July 2002, but was decommissioned shortly thereafter during construction of the landfill gas control system for the Landfill Area. Replacement well IR01MW10A was subsequently installed and sampled in October 2002.

The analytical data were evaluated by simple (non-statistical) threshold comparisons to a fixed standard (such as drinking water standards⁷) and by statistical tests comparing the site data with background data (two-sample statistical tests) and with fixed standards (one-sample statistical tests). Statistical testing comparing A-aquifer groundwater data from Parcel E-2 for radionuclides with drinking water or other standards (one-sample t-test) showed that no standards were statistically exceeded at the 95 percent confidence level. Statistical testing comparing A-aquifer groundwater data from Parcel E-2 and background areas (parametric and nonparametric two-sample tests) indicated that differences between background and site data sets for potassium-40 (⁴⁰K), ²²⁶Ra, and ⁹⁰Sr are statistically significant in at least one of the tests. Other radionuclides that were detected infrequently in A-aquifer groundwater samples from Parcel E-2 did not exceed background activity levels ([TtEMI, 2004](#)).

The investigation concluded that naturally occurring ⁴⁰K in seawater was the main contributor to beta emissions measured in A-aquifer groundwater samples from nearshore monitoring wells. The gross beta values historically reported for samples collected from nearshore wells were dominated by beta emissions from natural ⁴⁰K in seawater, not beta emissions from radium isotopes. Background seawater contains the highest average activity level of ⁴⁰K (280 picocuries per liter [pCi/L], beta) of all data groups, followed by nearshore IR sites where saltwater intrusion has resulted in brackish groundwater conditions. This intrusion has altered the composition of nearshore groundwater, with corresponding changes in the radiological quality (especially gross beta emissions). The results of the radiological groundwater investigation are detailed in the Parcel E Groundwater Summary Report ([TtEMI, 2004](#)). [Section 5](#) of this addendum further discusses the groundwater data for the ROCs at IR Site 01/21 (¹³⁷Cs, ²²⁶Ra, and ⁹⁰Sr).

3.1.8. Characterization of the Metal Slag Area (2004)

In support of the removal action at the Metal Slag Area, site characterization was performed to further define the vertical and horizontal extent of metal slag. The characterization activities were conducted from June through September 2004 and included (1) topographic and bathymetric surveys, (2) marine geophysics surveys, (3) landside geophysics surveys, (4) environmental resources surveys, (5) vibracoring and sonic drilling, and (6) sampling activities. The metal slag layer was found to range from 1.5 to 6 feet thick over an area of approximately 0.9 acre. Site characterization activities involved collecting samples from offshore and onshore borings and analyzing the samples for radioactive and nonradioactive

⁷ Maximum contaminant levels, as outlined in Title 40 Code of Federal Regulations Part 141, were used as drinking water standards in the evaluation. For radionuclides other than radium and uranium, the drinking water comparison standard was calculated from the dose standard of 4 millirems per year.

chemicals. Elevated activity levels of ^{137}Cs and elevated concentrations of metals, PCBs, and pesticides were identified at the Metal Slag Area (Tetra Tech FW, Inc., 2005). The metal slag and debris within the area were removed in 2005 and 2006 (see Section 3.2.1).

3.1.9. Radiological Groundwater Investigation (2008)

As part of a groundwater investigation at Parcel E-2, groundwater samples were collected in June 2008 from 61 temporary wells and 7 existing piezometers and submitted to an off-site laboratory for radionuclide analyses. The sampling event provided data to evaluate whether A-aquifer groundwater within and hydraulically downgradient of radiologically impacted sites at Parcel E-2 contained elevated activity levels of ROCs. Samples were collected and submitted to the on-site laboratory, where they were subsequently filtered, acidified, and submitted to an off-site laboratory, TestAmerica, for analysis of ^{226}Ra and ^{90}Sr . In addition, a subset of samples from seven sampling locations was submitted to an off-site laboratory, Eberline Services, for confirmation analysis of ^{137}Cs , ^{226}Ra , and ^{90}Sr . Figure 9 identifies the A-aquifer monitoring wells sampled during the 2008 groundwater investigation. Sampling information from the groundwater investigation is presented in Appendix J of the Final Technical Memorandum for Groundwater Investigation at Parcel E-2 (CE2-Kleinfelder JV, 2009a).

Also in June 2008, groundwater samples were collected from six existing monitoring wells (five in the A-aquifer and one in the deeper B-aquifer; all within or in close proximity to the Landfill Area) and submitted to an off-site laboratory for radionuclide analyses. These wells are regularly sampled for nonradioactive chemical analysis under the basewide groundwater monitoring program (BGMP). The analyses for radioactive chemicals (^{137}Cs , ^{226}Ra , and ^{90}Sr) at these wells was performed as a one-time supplement to the BGMP, to provide additional data to evaluate whether the groundwater within and hydraulically downgradient of the Landfill Area contain elevated activity levels of ROCs. Figure 9 identifies the A-aquifer monitoring wells sampled during the 2008 supplemental BGMP monitoring. Sampling information from the supplemental BGMP monitoring is presented in the Semiannual Groundwater Monitoring Report for April to September 2008 (CE2-Kleinfelder JV, 2009b).

The radionuclide groundwater data collected in June 2008 were compiled as part of this radiological addendum and were evaluated, similar to the 2002 investigation, by simple (non-statistical) threshold comparisons of the maximum reported activity level to a fixed standard (such as drinking water standards) and by statistical tests comparing the site mean data to fixed standards (one-sample statistical tests), in the event the maximum activity level exceeds the fixed standard. The simple threshold comparison with drinking water standards revealed no exceedances for ^{137}Cs out of 13 samples analyzed, or for ^{90}Sr out of 74 samples analyzed. For ^{226}Ra , the drinking water standard (5 pCi/L, combined for ^{226}Ra and radium-228 [^{228}Ra]) was exceeded in 2 out of 74 samples analyzed. The two ^{226}Ra exceedances were reported at temporary wells TW004 and TW011, with ^{226}Ra activity levels of 11.0 pCi/L and 6.08 pCi/L, respectively.

As shown on [Figure 9](#), temporary wells TW004 and TW011 are surrounded by numerous other temporary wells that were also sampled in June 2008 and did not contain ^{226}Ra activity levels exceeding the drinking water standard. In addition, statistical testing comparing the 2008 groundwater data with drinking water standards (one-sample t-test) showed that the mean ^{226}Ra activity level did not exceed the drinking water standard, nor did the 95th percent upper confidence limit on the mean (95 UCL) exceed the drinking water standard. [Section 5](#) of this addendum further discusses the radionuclide groundwater data collected in June 2008.

3.2. RADIOLOGICAL REMOVAL ACTIONS

The Navy has performed two interim removal actions at Parcel E-2 that have involved excavation and off-site disposal of LLRW. The following sections briefly describe these two removal actions.

3.2.1. Metal Slag Area (2005 to 2007)

The removal action at the Metal Slag Area was performed in conjunction with the removal of the Metal Debris Reef located in the southeast portion of Parcel E. The removal action was designed to remove metal slag and debris containing LLRW, as well as nonradiological contamination incidental to removal of the area. Site characterization was performed to delineate the vertical and lateral extents of the metal debris and slag prior to excavation (as discussed in [Section 3.1.8](#)). The excavation was performed in a series of 12-inch lifts to maximum depths ranging between 3 and 6 feet bgs. After the initial excavation was completed, trenches were extended beyond the excavation perimeter to confirm the extent of metal debris and slag. Additional metal debris was found at the northern, southern, and southwestern edges of the excavation; as a result, the excavation boundaries were extended to remove this material ([TtECI, 2007b](#)).

Approximately 8,200 cubic yards of soil, metal slag, and debris was removed and disposed of off site as part of this removal action ([TtECI, 2007b](#)). Out of this total volume, approximately 74 cubic yards of soil and sediment was segregated as radiologically impacted. Also, 32 radiological devices, 15 cubic yards of radiological debris (primarily fire bricks), and approximately 30 cubic yards of metal debris were identified within the removal area ([Navy, 2006b and 2006c; TtECI, 2007b](#)). In addition to this radiologically impacted debris, six waste drums were recovered from the removal area and were characterized prior to off-site disposal. Five of the six drums contained soil and debris contaminated with PCBs; the sixth drum contained soil and debris with elevated activity levels of ^{226}Ra ([TtECI, 2007b](#)).

Post-excavation soil samples were collected from the removal area and analyzed at the on-site laboratory for ^{137}Cs and ^{226}Ra . Ten percent of the samples were sent to an off-site laboratory for quality assurance and ^{90}Sr analysis because the on-site laboratory did not analyze directly for ^{90}Sr . Analytical results for 174 of the 185 post-excavation soil samples met the specified radiological remedial objectives (RROs) of 0.113 pCi/g for ^{137}Cs and 1.8 pCi/g for ^{226}Ra . The RRO for ^{137}Cs was exceeded in 11 of the

18	ROCs in surface soil	Section 2.3.6	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRS. March 2011. Section 4.3, pages 4-7 and 4-8. Record No. 4260.
----	----------------------	---------------	---

4.3. RADIONUCLIDES DETECTED IN SURFACE SOIL

The following paragraphs briefly discuss the detections of ^{137}Cs , ^{226}Ra , ^{90}Sr , and ^{60}Co in surface soil at Parcel E-2. [Table 2](#) presents a statistical summary for the ROCs reported within surface soil at Parcel E-2. For evaluation purposes, the 95 UCL of the mean activity level (95 UCL activity level) within each survey unit is compared against the release criteria for a resident and outdoor worker. For ^{137}Cs and ^{226}Ra , the release criteria are identical for the residential and outdoor worker scenarios. The 95 UCL activity level represents the RME within each survey unit, and a comparison of the 95 UCL with the release criteria provides a general assessment of the distribution of the ROCs in surface soil at Parcel E-2. Because of the lack of subsurface soil data, this general assessment is not intended to eliminate consideration of individual ROCs identified in radiologically impacted portions of Parcel E-2. The HRA determined that, based on historical information, subsurface soil is likely to contain radioactive contamination ([Table 5](#); [NAVSEA, 2004](#)). Uncertainties related to the nature and extent evaluation are discussed in [Section 8](#). [Section 8](#) discusses the extent to which these uncertainties affect the risk management decisions for Parcel E-2 and provides recommendations for the remedial option analysis.

^{137}Cs was reported in 1,109 of the 1,140 samples in the current post-excavation data set. As shown in [Table 2](#), the 95 UCL activity level exceeded the release criterion (0.113 pCi/g) in 16 out of 72 survey units. The maximum activity level for ^{137}Cs (2.51 pCi/g) was detected in a biased sample collected in Phase V survey unit ACH, and was associated with a radioactive point source anomaly that was subsequently removed. For systematic samples collected during the Phase V investigation, the maximum activity level for ^{137}Cs was 0.988 pCi/g, which was reported in Phase V survey unit ABG. Based on this information, the extent of ^{137}Cs in surface soil exceeding the release criterion is moderately extensive. The widespread ^{137}Cs activity levels exceeding the release criterion are most likely attributed to site contamination and are consistent with the conclusions of the HRA, which identified the potential presence of LLRW throughout IR Site 01/21 ([NAVSEA, 2004](#)).

^{226}Ra was reported in 1,133 of the 1,140 samples in the current post-excavation data set. As shown in [Table 2](#), the 95 UCL activity level exceeded the release criterion (1.82 pCi/g) in 69 out of 73 survey units. The maximum activity level for ^{226}Ra (1,024 pCi/g) was detected in a biased sample collected in Phase V survey unit AKL and was associated with a radioactive point source anomaly that was subsequently removed. For systematic samples collected during the Phase V investigation, the maximum activity level for ^{226}Ra was 57.6 pCi/g, which was reported in Phase V survey unit ABD. The portion of survey unit ABD containing the systematic sample with the highest activity levels for ^{226}Ra was subsequently excavated in its entirety during the removal action at the Metal Slag Area ([Figure 5](#)). Based on this information, the extent of ^{226}Ra in surface soil exceeding the release criterion is widespread. The widespread ^{226}Ra activity levels exceeding the release criterion are most likely attributed to site contamination and are consistent with the conclusions of the HRA, which identified the potential presence of LLRW throughout IR Site 01/21 ([NAVSEA, 2004](#)).

^{90}Sr was reported in 1,101 of 1,116 samples in the Phase V data set, which is calculated based upon a correlation with ^{137}Cs results (see Section 4.1); ^{90}Sr was not analyzed during the Phase I SCRS investigation. As shown in Table 2, the 95 UCL activity level did not exceed the release criterion for outdoor workers (10.8 pCi/g) in any of 72 survey units; the 95 UCL activity level exceeded the release criterion for residents (0.331 pCi/g) in 37 of the survey units. The maximum activity level for ^{90}Sr (9.09 pCi/g) was detected in a biased sample collected in Phase V survey unit ACH and was associated with a radioactive point source anomaly that was subsequently removed. For systematic samples collected during the Phase V investigation, the maximum activity level for ^{90}Sr was 3.58 pCi/g, which was reported in Phase V survey unit ABG. Based on this information, ^{90}Sr is not present in surface soil at activity levels exceeding the release criterion for an outdoor worker, but the extent of ^{90}Sr in surface soil at activity levels exceeding the residential release criterion is moderately extensive.

^{60}Co was reported in 102 of the 124 samples collected within the vicinity of the Experimental Ship-Shielding Area. As shown in Table 2, the 95 UCL exceeded the release criterion for an outdoor worker (0.0602 pCi/g) in three of the eight survey units located in the vicinity of the Experimental Ship-Shielding Area; the 95 UCL activity level exceeded the release criterion for residents (0.0361 pCi/g) in all eight of the survey units. The maximum activity level for ^{60}Co was 0.0933 pCi/g, which was reported in Phase V survey unit AAE. Based on this information, the extent of ^{60}Co in surface soil at activity levels exceeding the residential release criterion is extensive in the vicinity of the Experimental Ship-Shielding Area.

4.4. FATE AND TRANSPORT OF RADIOACTIVE CHEMICALS

Radioactive chemicals, also referred to as radionuclides, are unstable and undergo spontaneous transformations at a constant rate by releasing energy until a stable state is reached. This transformation process is known as radioactive decay and is accompanied by the emission of at least one or more charged particles (e.g., alpha and beta particles) or gamma rays. Alpha particles can travel only short distances and cannot penetrate human skin; the risks from alpha particles are from internal exposure of the particle from either inhalation or ingestion. Beta particles are generally absorbed in the skin and do not pass through the entire body, but in high enough quantities can cause cataracts to the lens of the eye. Gamma ray radiation can penetrate the human body with enough energy for the photon to interact with the body's cells. The table below lists the ROCs, their half-lives, and major radiations emitted when decaying (NAVSEA, 2004). The radionuclides potentially present in Parcel E-2 were either (1) buried along with excavated fill materials while increasing the footprint of HPS; (2) residue from decontamination of ships or workers; (3) residual contamination as a result of NRDL experiments or tests in structures or land areas; (4) residual contamination from shipyard operations; or (5) released into the sanitary sewers and storm drains.

Appendix C

SUBJECT: Release Criterion for Cobalt-60 at Parcel E-2, Hunters Point Naval Shipyard, San Francisco, California, May 21, 2012

SUMMARY

The purpose of this document is to provide the basis for the revised radiological volumetric release criterion for cobalt-60 (⁶⁰Co) at Experimental Ship Shielding Range, Parcel E-2, Hunters Point Naval Shipyard (HPNS). The previous ⁶⁰Co release criterion was 0.0361 picocurie/gram (pCi/g).

A revised release criterion is provided to support efficient laboratory gamma spectroscopy analysis of soil samples. This revised release criterion maintains morbidity risks within the U.S. Environmental Protection Agency (EPA) defined acceptable range and permits an exposure level that does not increase the risk of cancer from a potential exposure to ⁶⁰Co.

The calculated revised release criterion for ⁶⁰Co is 0.252 pCi/g.

This calculation is based on a revised release criterion, which ensures that regulatory guidance is maintained for the following reasons:

- Residual radioactivity within the Experimental Ship Shielding Range is reduced and/or verified to be at levels that are as low as reasonable achievable
- Residual radioactivity that is distinguishable from background radiation results in a total effective dose equivalent that does not exceed 5 millirem per year (mrem/yr)

This calculation method utilizes a maximum dose rate of 6.624 mrem/yr per pCi/g of ⁶⁰Co to a resident farmer, which is a conservative scenario considering the proposed use for the area is wetland/open space. The basis and calculation methods are described below.

BASIS FOR COBALT-60 RELEASE CRITERION

The revised release criterion was calculated assuming a maximum allowed dose rate of 5 mrem/yr to hypothetical future land user. Selecting a resident farmer as the land user for a future scenario is a conservative measure since the proposed use for the area is wetland/open space.

The ⁶⁰Co is assumed to be uniformly distributed in the top 0.1524 meters (6 inches) of soil. The maximum dose occurs at the first year post closure. At every year post closure greater than 99 percent of the dose is from the external exposure pathways. The dose was calculated using the RESRAD code version 6.5 (Yu et al., 2001). RESRAD input included the following:

- San Francisco-specific meteorology
- Screening Yard Pad specific depth to groundwater
- EPA recommended values for lifestyle (EPA, 2000 and 2004)
- RESRAD default inhalation rate
- EPA recommended produce and inadvertent soil ingestion rate (EPA, 2000 and 2004)
- Contamination distributed uniformly in a 0.1524 meters thick contamination layer over 929 m² with no cover
- RESRAD default values are assumed for input parameters not addressed by the EPA (EPA, 2000 and 2004)

Table C.1 presents a summary of the RESRAD calculated doses and equivalent release criterion levels. The total effective dose equivalent at year zero post closure is 6.624 mrem/yr per pCi/g. The release criterion can then be calculated for any specific dose limit. The dose limit, in units of mrem/yr, divided by the total effective dose equivalent in units of mrem/yr per pCi/g, results in the release criterion in units of pCi/g. For example, assuming a dose limit of 5 mrem/yr based on the dose at year zero, the release criterion is 5 mrem/yr divided by 6.624 mrem/yr per pCi/g which equals 0.755 pCi/g. The more protective release criterion of 0.252 pCi/g was selected; 0.252 pCi/g ⁶⁰Co will result in a dose of 1.67 mrem/yr.

Table C.1
Doses and Revised Release Criterion for ⁶⁰Co at the HPNS Ship Shielding Range and Radiological Screening Yard

Years Post Closure	External Dose (mrem)	Inhalation Dose (mrem)	Plant Ingestion Dose (mrem)	Meat Ingestion Dose (mrem)	Milk Ingestion Dose (mrem)	Soil Ingestion Dose (mrem)	Total Effective Dose Equivalent (mrem)	Release Criterion Calculation (pCi/g)
0	6.597	1.996E-6	2.296E-2	2.236E-3	2.860E-4	1.050E-3	6.624	0.755 ¹
1	5.772	1.750E-6	2.00E-2	1.952E-3	2.497E-4	9.206E-4	5.795	0.863
3	4.415	1.335E-6	1.517E-2	1.483E-3	1.899E-4	7.024E-4	4.433	1.12
10	1.724	5.063E-7	5.752E-3	5.626E-4	7.201E-5	2.664E-4	1.731	2.89
30	1.163E-1	3.127E-8	3.552E-4	3.475E-5	4.447E-6	1.645E-5	1.167E-1	4.28
100	7.685E-3	1.879E-9	2.135E-5	2.089E-6	2.673E-7	9.886E-7	7.708E-3	649

Note:

The Navy and the Base Closure Team members selected the even more protective criteria of 0.252pCi/g for ⁶⁰Co

Attachment 1 lists the RESRAD input parameter values, units, and the reference for input parameter values that are not RESRAD default values. In addition, parameter input values listed in Attachment 1 that are not RESRAD default values have a yellow-shaded background. Attachment 2 lists all RESRAD input and output values for the risk calculation.

Based on the risk to concentration calculation methodology in Federal Guidance Report (FGR) No. 13, Health Risk from Low-Level Environmental Exposure to Radionuclides (EPA, 1998), a ^{60}Co concentration of 0.252 pCi/g results in a lifetime morbidity increase of 1.0 E-5. The EPA has stated that the acceptable range for morbidity risk is 1.0 E-4 to 1.0 E-6 (2000). The morbidity calculations are listed in Attachment 2.

The release criterion for ^{60}Co at the HPNS Radiological Screening Yard is 0.252 pCi/g. This concentration is conservative for the following assumptions:

- The land use scenario is a resident farmer. This land use is not anticipated but the calculated dose to the resident farmer will be a conservative upper bound to any realistic future land use
- Risk coefficients in FGR 13 are based on a linear relationship between dose and risk and are extrapolated from high-dose/high dose rate data under the assumption that there is no threshold. Studies of human populations exposed to low doses are inadequate to demonstrate any increase in risk
- Committee on Interagency Radiation Research and Policy Coordination (CIRRPC) states there is scientific uncertainty about cancer risk in the low-dose region and the possibility of no risk cannot be excluded (CIRRPC, 1992).

20	Radionuclide groundwater data	Section 2.3.6	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRS. March 2011. Sections 5.1 through 5.3, pages 5-1 through 5-4. Record No. 4260.
----	-------------------------------	---------------	--

Section 5. Nature and Extent of Radionuclides in Groundwater

The groundwater data derived from the 2002 and 2008 radiological investigations, as discussed in [Section 3](#), was used to evaluate the nature and extent of ROCs in groundwater at Parcel E-2. The nature and extent evaluation presented in this section documents that an adequate amount of data exist to determine whether or not groundwater contains radionuclides at activity levels that warrant further analysis in this radiological addendum. Additional information on the nature and extent of nonradioactive chemicals in groundwater at Parcel E-2 is presented in the Final RI/FS Report ([ERRG and Shaw, 2011](#)).

5.1. SUMMARY OF 2002 GROUNDWATER INVESTIGATION

The radiological groundwater investigation performed in 2002 collected isotope-specific data from seven A-aquifer monitoring wells within and immediately adjacent to the Landfill Area. The investigation was intended to supplement data collected during previous investigations for radiological indicator parameters (gross alpha and gross beta) because the nonspecific results for gross alpha and gross beta did not allow the Navy to distinguish between natural and potentially site-related components of radioactivity in shallow groundwater (within what is referred to as the “A-aquifer”). [Figure 9](#) identifies the A-aquifer monitoring wells sampled during the 2002 groundwater investigation. [Table A-4](#) in [Appendix A](#) summarizes the radiological data from the 2002 groundwater investigation.

The analytical data were evaluated by simple (nonstatistical) threshold comparisons to a fixed standard and by statistical tests comparing the site data with background data (two-sample statistical tests) and with fixed standards (one-sample statistical tests) ([TtEMI, 2004](#)). The statistical test results are presented in the Parcel E Groundwater Summary Report ([TtEMI, 2004](#)), and are briefly summarized as follows:

- Statistical testing comparing groundwater data from the Landfill Area for radionuclides with drinking water¹⁰ or other standards (one-sample t-test) showed that no standards were statistically exceeded at the 95 percent confidence level.
- Statistical testing comparing groundwater data from the Landfill Area and background areas, excluding bay samples, indicated that the site data sets for ⁴⁰K and ²²⁶Ra statistically exceeded the background data sets using a parametric statistical test (two-sample t-test).

¹⁰ Maximum contaminant levels, as outlined in Title 40 Code of Federal Regulations Part 141, were used as drinking water standards in the evaluation. For radionuclides other than radium and uranium, the drinking water comparison standard was calculated from the dose standard of 4 millirems per year.

- Statistical testing comparing groundwater data from the Landfill Area and background areas, excluding bay samples, indicated that the site data sets for ^{226}Ra and ^{90}Sr statistically exceeded the background data sets using a nonparametric statistical test (Wilcoxon rank sum test).
- The site mean activity level of 0.472 pCi/L for ^{226}Ra is far below the drinking water standard of 5 pCi/L.
- Beta emissions from naturally occurring ^{40}K exceeded the screening criterion of 50 pCi/L for gross beta activity. ^{40}K activity occurs naturally in seawater at about 300 pCi/L, as beta emissions. Bay water samples collected for this investigation produced an average of 280 pCi/L for ^{40}K .
- Other radionuclides that were detected infrequently in groundwater samples from the Landfill Area monitoring wells did not exceed background activity levels. These data included two results for actinium-228 (a naturally occurring radioisotope) near the detection limit, one qualified result at the detection limit for americium-241 (alpha scan result), one result for lead-214 near the detection limit, four detections of uranium-234, and three detections of uranium-238.

The investigation concluded that naturally occurring ^{40}K in seawater is the main contributor to beta emissions measured in groundwater samples from nearshore monitoring wells within Parcel E-2. The gross beta values historically reported for samples collected from nearshore wells were dominated by beta emissions from natural ^{40}K in seawater, not beta emissions from radium isotopes. Background seawater contains the highest average activity level of ^{40}K (280 pCi/L, beta) of all data groups, followed by nearshore IR sites where saltwater intrusion has resulted in brackish groundwater conditions. This intrusion has altered the composition of nearshore groundwater, with corresponding changes in the radiological quality (especially gross beta emissions). The results of the radiological groundwater investigation are detailed in the Parcel E Groundwater Summary Report (TtEMI, 2004).

5.2. SUMMARY OF 2008 GROUNDWATER INVESTIGATION

Groundwater samples were collected in June 2008 from 61 temporary wells and 7 existing piezometers to evaluate whether A-aquifer groundwater within and hydraulically downgradient of radiologically impacted sites at Parcel E-2 contain elevated activity levels of ROCs. In addition to these 68 samples, groundwater samples were collected from six existing monitoring wells in June 2008 (five in the A-aquifer and one in the deeper B-aquifer; all within or in close proximity to the Landfill Area) as a one-time supplement to the BGMP. Figure 9 identifies the A-aquifer monitoring wells sampled during the 2008 groundwater investigation.

The radionuclide groundwater data collected in June 2008 were compiled as part of this radiological addendum and were evaluated, similar to the 2002 investigation, by simple (non-statistical) threshold comparisons to a fixed standard (such as drinking water standards) and by statistical tests comparing the site data to fixed standards (one-sample statistical tests). The 2008 data is evaluated for the first time in this radiological addendum; therefore, the evaluation methodology, although similar to the 2002 investigation, is detailed within this section. To evaluate whether radionuclide activity levels exceeded

drinking water standards, a tiered approach was used. Initially, the data were compiled and compared against drinking water standards using a simple threshold comparison. If the maximum activity level in any of the samples exceeded the drinking water standard, a one-sample statistical test (t-test) was conducted to evaluate if the mean radionuclide activity levels statistically exceeded the drinking water standard.

The data set used for the analysis consisted of all of the ^{226}Ra , and ^{90}Sr data collected during both of the 2008 investigations, as well as the confirmation samples collected from the temporary groundwater monitoring wells, which were analyzed at an off-site laboratory because they were the only samples analyzed using EPA-approved methods and validated accordingly. As a result, the data set consisted of 74 samples analyzed for ^{90}Sr and ^{226}Ra and 13 samples analyzed for ^{137}Cs . For cases where duplicate samples were collected to evaluate laboratory precision, the following decision rules were applied to determine which value was used in the data set:

- If one result was detected and the other was not detected (below the MDA), the detected value was used.
- If both results were detected, the higher of the two detected results was used.
- If both results were not detected, the higher of the MDA reporting limit was used.

The simple threshold comparison with drinking water standards revealed no exceedances for ^{90}Sr and ^{137}Cs of the drinking water standards of 8 and 80 pCi/L, respectively. For ^{226}Ra , the drinking water standard (5 pCi/L, combined for ^{226}Ra and ^{228}Ra) was exceeded in 2 of 74 samples analyzed. The two ^{226}Ra exceedances were reported at temporary wells TW004 and TW011, with ^{226}Ra activity levels of 11.0 pCi/L and 6.08 pCi/L, respectively. As shown on [Figure 9](#), temporary wells TW004 and TW011 are surrounded by numerous other temporary wells that were also sampled in June 2008 and did not contain ^{226}Ra activity levels exceeding the drinking water standard.

Because ^{226}Ra exceeded the drinking water standard, the one-sample t-test was conducted to evaluate whether the mean activity level for ^{226}Ra exceeded the drinking water standard of 5 pCi/L. Based upon the one-sample t-test, the mean activity level of ^{226}Ra in groundwater does not statistically exceed the standard at the 95 percent confidence level. The summary statistics and results of the t-test are presented in [Table 6](#).

5.3. CONCLUSIONS FROM GROUNDWATER INVESTIGATIONS

The reported activity levels for radionuclides from the 2002 and 2008 groundwater sampling events do not exceed drinking water standards at a statistically significant level (95 percent confidence level). In addition, the comparison of radionuclide data from A-aquifer groundwater with drinking water standards is a conservative evaluation performed because of the lack of alternative comparison criteria. This conservative evaluation is not representative of potential exposures to future site users because, as

documented in Section 2 and Appendix I of the RI/FS Report, A-aquifer groundwater is not a potential source of drinking water.

As a result, groundwater does not appear to have been impacted by radionuclides at activity levels that warrant further evaluation in this radiological addendum. This finding is consistent with the HRA that, as summarized in [Table 3](#), determined that there was a low potential for radioactive contamination in Parcel E-2 groundwater based on historical information ([NAVSEA, 2004](#)). However, the RI/FS Report concluded that nonradioactive chemicals in groundwater within and in close proximity to the Landfill Area require remedial option analysis. The RI/FS Report evaluates remedial alternatives for groundwater that include monitoring, institutional controls, source removal, and containment.

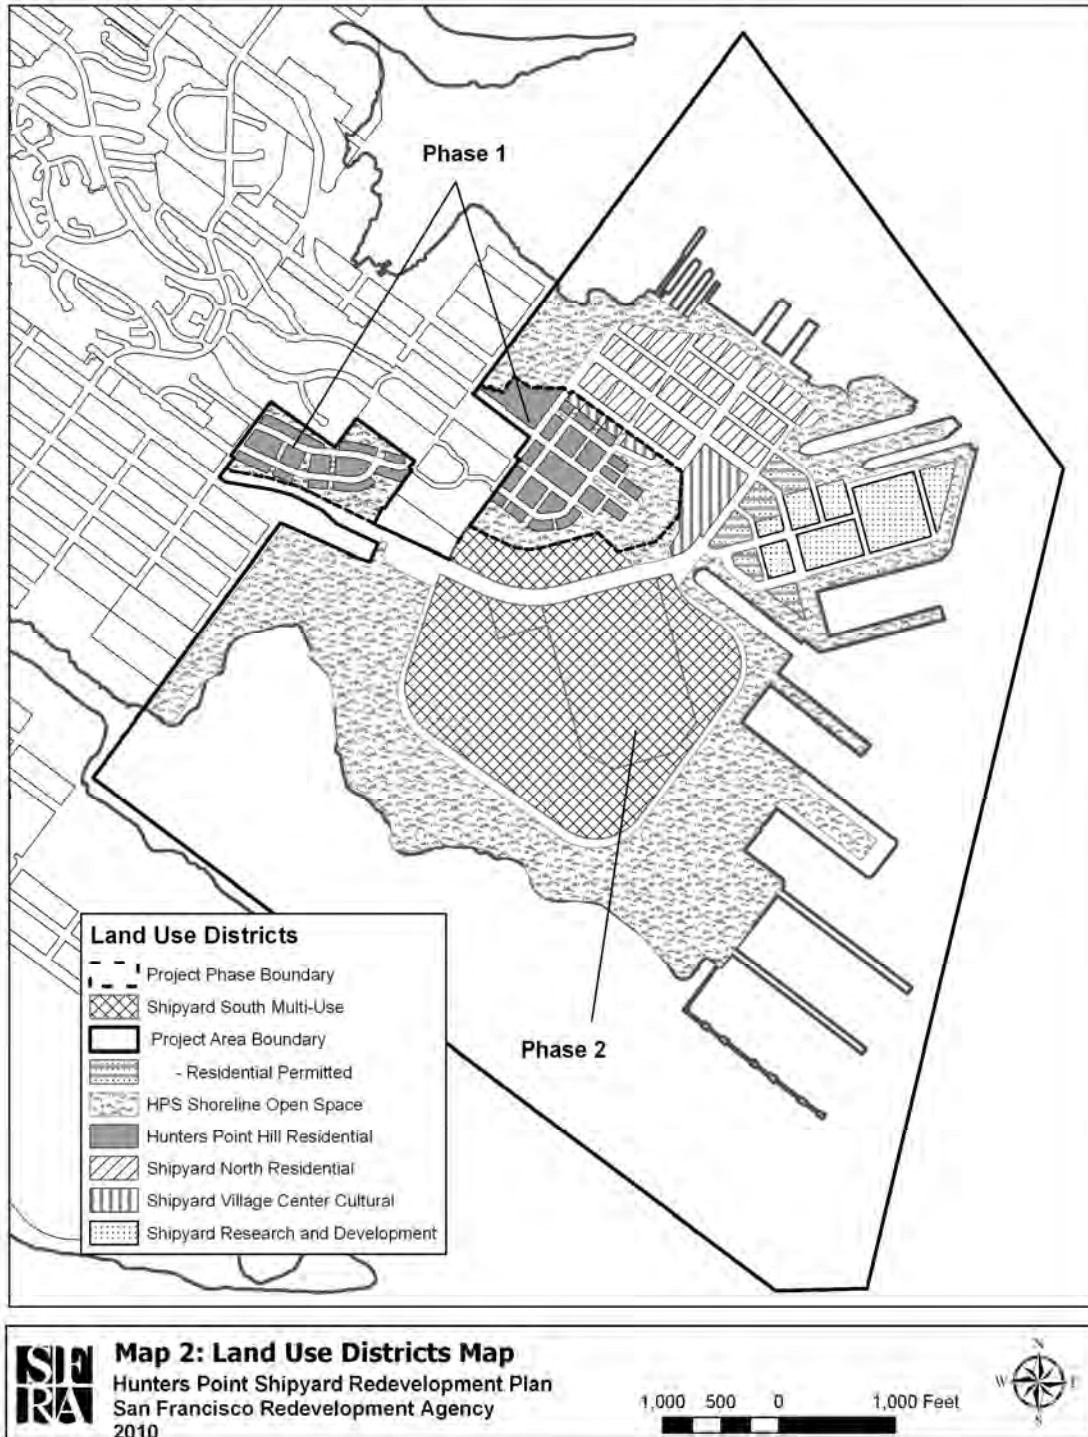

21	Future reuse	Section 2.4	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 1.15, page 1-17. Record No. 4237.
----	--------------	-------------	---

1.8. FUTURE SITE REUSE

The data analysis, risk evaluations, and remedial alternatives presented in this RI/FS Report assume that the future reuse of Parcel E-2 will be open space. This assumption was developed in consultation with the City and County of San Francisco (CCSF) based on the 1997 “Hunters Point Shipyard Redevelopment Plan,” and was documented in the previous versions of the RI/FS Report published in 2007 and 2009. Pursuant to the CCSF’s 2010 amended “Hunters Point Shipyard Redevelopment Plan,” a small area (about 0.42 acres) in the East Adjacent Area is part of the “Shipyard South Multi-Use District,” and may be used for recreational, industrial, and residential purposes (SFRA, 2010). The proposed remedial alternatives will allow for potential residential use in this 0.42-acre area if it is demonstrated that soil contaminants do not exceed levels established elsewhere at HPS for residential reuse, or if any contaminants that exceed those established levels are addressed by the remedial alternatives.

Figure 1-15 shows the designated reuse of Parcel E-2 according to the SFRA Redevelopment Plan (SFRA, 2010).

23	Boundary change between Parcels E and E-2	Section 2.4	Boundary Change for Parcels E and E-2, Hunters Point Naval Shipyard, San Francisco, California. Letter from Navy to EPA, DTSC, and Water Board. August 28, 2012. Record No. 4487.
----	--	-------------	---

Dear BCT members:

This letter documents the Navy's decision to make a change to the boundary between Parcels E and E-2. Data analysis, risk evaluations, and remedial alternatives presented in the Parcel E-2 Remedial Investigation/Feasibility Study (RI/FS) Report assumed that the future reuse of Parcel E-2 would be open space. This assumption was developed in consultation with the City and County of San Francisco based on the 1997 Hunters Point Shipyard Redevelopment Plan. Pursuant to the City and County of San Francisco's 2010 amended Redevelopment Plan, two small areas (totaling 0.98 acres) in the East Adjacent Area were designated as part of the "Shipyard South Multi-Use District" and an adjacent roadway.

According to the amended Redevelopment Plan, the Shipyard South Multi-Use District may be used for recreational, industrial, and residential purposes. None of these potential land uses was anticipated during preparation of the RI/FS Report. Therefore, the Navy, in consultation with the EPA, DTSC, the Water Board, and the City and County of San Francisco, determined that a boundary change between Parcels E and E-2 was the most effective way to resolve this discrepancy. Figure 1 presents the planned reuses within Parcel E-2 and identifies the boundary change between Parcels E and E-2. The revised boundary results in the Shipyard South Multi-Use District no longer being located in Parcel E-2, and the planned reuse for Parcel E-2 is now limited to open space.

5090
Ser BPMOW.11u/0526
AUG 28 2012

The revised boundary can be described as follows:

Beginning at "Point A" of the existing Parcel E/E-2 boundary (latitude 7d43'29.964" N, longitude 122d22'26.575" W;NAD83), 231.19' S63d13'48"E, then 535.77' S21d37'12"W, then 117.13' S42d24'36"W, then 38.71' S54d45'0"E, then 124.39' S3d10'48"W, then 389.89' S45d40'48"W to "Point G" of the existing Parcel E/E-2 boundary (latitude 37d43'18.276" N, longitude 122d22'29.776" W; NAD83).

The boundary changes have been incorporated into the Final Parcel E Feasibility Study (FS), which will be issued on August 31, 2012. The Final Parcel E FS includes a residential risk assessment for the additional 0.98 acres.

If you have any questions or concerns with this matter, please contact Lara Urizar at (619) 532-0960, or me at (619) 532-0913.

Sincerely

----	-------------------	---------------	---

As recommended by Cal/EPA (1993), data for specific total petroleum hydrocarbon (TPH) indicator chemicals (for example, benzene, toluene, and benzo[a]pyrene) were used to assess potential human health risk from TPH contamination. Non-chemical-specific data for TPH should be excluded from evaluation in the risk assessment because they are considered to be inadequate and insufficient to evaluate risk from TPH contamination (Cal/EPA 1993); therefore, non-specific TPH compounds were not identified as COPCs for this HHRA.

Tables K1-1 and K1-2 of Attachment K1 present analytical data summary statistics for each total risk COPC. Tables K2-1 and K2-2 of Attachment K2 present analytical data summary statistics for each incremental risk COPC. In these tables, statistics are developed separately for each grid with analytical data. Tables K3-1 through K3-3 of Attachment K3 lists the COPCs for groundwater and present analytical data summary statistics for each groundwater COPC.

K5.0 EXPOSURE ASSESSMENT

An exposure assessment identifies potential human receptors that could be exposed to site-related chemicals, as well as the routes, magnitude, frequency, and duration of the potential exposures. The principal objective of this evaluation is to identify reasonable maximum exposures (RME). As defined by EPA (1989), the RME is the maximum exposure that is reasonably expected to occur at a site. The potential human receptors and potentially complete exposure pathways for the identified receptors were presented in Section K3.0, Conceptual Site Model. The remainder of this section describes the process used to estimate EPCs and to quantify pathway-specific RME chemical intakes for each receptor. Central tendency exposures were not evaluated in this revised baseline HHRA.

K5.1 EXPOSURE POINTS AND EXPOSURE POINT CONCENTRATIONS

Potential exposure points are identified based on anticipated population activity patterns and the relationship of the activities to the presence of contaminated media. A location is identified as an exposure point if a human might contact (for example, ingest) a contaminated medium (for example, soil) at that location. For evaluation of exposures to soil, each open space grid was considered a separate exposure point for this baseline HHRA. For evaluation of exposure to groundwater, the entirety each aquifer at Parcel E-2 (that is, A-aquifer and B-aquifer) was considered a single groundwater exposure point. As discussed in Section K3.5.2, for the domestic use evaluation, the B-aquifer included data from the A-aquifer to address potential hydraulic communication between the two aquifers. Potential exposure to COPCs is assumed to occur uniformly throughout each exposure point. Exposure from domestic use was also evaluated solely using B-aquifer data, to reflect current groundwater conditions.

The concentration in the medium (for example, subsurface soil) that a receptor may be exposed to is called the EPC. EPCs were calculated for all COPCs in all media sampled: surface soils (0 to 2 feet bgs), subsurface soils (0 to 10 feet bgs), A-aquifer groundwater, B-aquifer groundwater combined with A-aquifer data, and B-aquifer groundwater. The methods used to calculate EPCs for soil and groundwater are described below in [Sections K5.1.1 and K5.1.2](#).

As shown in the conceptual site model (see [Figure K-1](#)), chemicals in soil may be transferred to outdoor air from wind erosion or volatilization. Chemicals in groundwater may be transferred to outdoor air in a construction trench from volatilization, or indoor air from volatilization of groundwater during domestic use. Sample data for outdoor and indoor air were not available for Parcel E-2. EPCs in outdoor air (from volatile and particulate chemicals in soil), outdoor air in a construction trench (from volatile chemicals in groundwater), and indoor air (from volatilization during domestic use) were estimated using the methods described in [Section K5.1.3](#).

K5.1.1 EPCs for Soil

The 95 percent upper confidence limit (95 UCL) of the arithmetic mean was used as the EPC for each soil COPC, unless the maximum value was less than the 95 UCL, in which case, the maximum concentration was used as the EPC. The 95 UCL for each soil COPC in each grid was calculated using the following methodology. This methodology is consistent with the approach used for the soil HHRA in the draft final RI report for Parcel E ([PRC, LFR, and U&A 1997](#)), and follows the methodology recently reestablished for soil HHRA for HPS ([Tetra Tech 2003; Navy 2004](#)):

- Statistical testing was conducted to determine data distribution for sample sizes with a minimum of four samples and four detections. For samples sizes less than 50 with at least four detections, the Shapiro-Wilk W-test was used to determine the distribution of the data. For sample sizes greater than or equal to 50 with at least four detections, the D'Agostino test was used to determine the distribution of the data.
- For data found to be normally or lognormally distributed, 95 UCLs were calculated using [EPA \(1992\)](#) guidance.
- If distribution testing showed that data follow a non-parametric distribution, then a 95 UCL was calculated for both a normal and lognormal distribution following EPA guidance ([EPA 1992](#)) and the higher of the two 95 UCL values was selected as the representative 95 UCL. Nondetected results for COPCs were incorporated into the calculation of 95 UCL concentrations by using one-half of the sample quantitation limit as a proxy concentration for nondetected results ([EPA 1989](#)).
- For samples sizes with less than four samples, distribution testing was not conducted and the maximum concentration was used as the EPC.

EPCs for each total risk assessment COPC in surface soil and subsurface soil are shown in [Tables K1-1, K1-2, K1-3, and K1-4](#) of [Attachment K1](#). EPCs for each incremental risk assessment COPC in surface soil and subsurface soil are shown in [Tables K2-1, K2-2, K2-3, and K2-4](#) of [Attachment K2](#). These tables also present the results of the distribution testing for each COPC and the calculated 95 UCLs.

Although more recent guidance regarding calculation of EPCs is available (see [Section K5.1.2](#)), the previous guidance provided by [EPA \(1992\)](#) was used to calculate EPCs for soil in this HHRA in accordance with the recent methodology established for soil HHRA for HPS ([Tetra Tech 2003](#); [Navy 2004](#)). In many cases, because of the relatively few sample points and detections for each grid (that is, less than four samples and four detected results), the maximum concentration is used as the EPC, resulting in a conservative estimate of potential risks.

K5.1.2 EPCs for Groundwater

EPCs were calculated for COPCs in the A-aquifer (to evaluate construction worker trench exposure), B-aquifer (to evaluate domestic use exposure), and for both aquifers combined (to evaluate domestic use exposure based on hydraulic communication between the two aquifers). EPCs were calculated following methods recommended in EPA guidance ([EPA 2002a, 2006, 2007a, 2007b](#)), as well as standard texts on environmental statistics ([Gilbert 1987](#)) and more specialized sources dealing with the treatment of censored (nondetected or below detection limit) data ([Helsel 2005a, 2005b](#)).

EPA's approach for selecting an optimal method for calculating a one-sided 95 UCL of the mean is based on evaluation of the relative sample size, detection frequency, degree of skewness, and underlying distribution for individual chemicals ([EPA 2006, 2007a](#)). Decision rules for selecting distribution-specific UCL methods follow recommendations in the technical documentation for EPA's ProUCL 4 software package ([EPA 2007b](#)); summaries of the decision rules for gamma, lognormal, and nonparametric distributions are provided in [Tables K3-1 through K3-3](#) of [Attachment K3](#). Calculations for normal distributions were performed using Student's *t* statistic for detected data, and the Kaplan-Meier product limit method with Student's *t* cutoff for chemicals with one or more censored results ([EPA 2006, 2007a, 2007b](#)).

The steps used to calculate EPCs for groundwater are summarized below.

1. Detection frequencies were calculated for each chemical; chemicals with no detected results were excluded from analysis. For chemicals with fewer than six detected results, the EPC defaulted to the maximum detected result.
2. Censored results in each data set that exceeded the maximum detected result were excluded from the calculations. The number of excluded censored results is shown in [Tables K3-1 through K3-3](#).

3. Formal goodness-of-fit (GOF) tests were used to determine the underlying distribution for each chemical. The Shapiro-Wilk W test was used for normal and lognormal distributions, and the Cramer von Mises W^2 test was used for gamma distributions. GOF testing was only performed for chemicals with at least six detected results. For chemicals with censored results, testing was conducted using the detected data only. Distributions for chemicals not following a normal, lognormal, or gamma distribution, or having fewer than six detected results, were treated as nonparametric. All GOF tests were evaluated at the 0.05 (5 percent) significance level.
4. For chemicals with all detected results, 95 UCLs were calculated using one of the following parametric or nonparametric methods, following the decision rules summarized in Tables K3-1 through K3-3.

Parametric Methods	Nonparametric Methods
Student's t UCL	Chebyshev inequality UCL
Approximate gamma UCL	Bootstrap t UCL
Adjusted gamma UCL	Hall's bootstrap UCL
Land's H-UCL	
MVUE Chebyshev UCL	

Notes:

MVUE Minimum variance unbiased estimator

UCL Upper confidence limit

5. For chemicals with one or more censored results, mean concentrations were calculated using the nonparametric Kaplan-Meier product limit estimator. The 95 UCL was estimated using the Kaplan-Meier mean and one of the methods listed below, following the decision rules summarized in Tables K3-1 through K3-3:
 - Student's t cutoff
 - Chebyshev theorem
 - Percentile bootstrap
 - Bias corrected accelerated bootstrap

The EPC selected was the lesser of the 95 UCL and the maximum detected result. It should be noted that in accordance with EPA (2002, 2004b, 2006, 2007a, 2007b), the 95 UCL will not provide 95 percent coverage for the mean in all cases (that is, especially for small sample sizes or highly skewed distributions). For this reason, the 97.5 UCL or 99 UCL was used instead of the 95 UCL in selected cases to ensure coverage is at least 95 percent (EPA 2002, 2004b, 2006, 2007a, 2007b).

K5.1.3 Exposure Point Concentrations for Media Not Sampled

As discussed in [Sections K3.0 and K5.1](#), COPCs in soil and groundwater may be transferred to outdoor air and indoor air from the following transfer mechanisms:

- Wind erosion of particulate chemicals from soil to outdoor air
- Volatilization from soil to outdoor air
- Volatilization from groundwater to indoor air during domestic use
- Volatilization from groundwater to outdoor air in a construction trench

As discussed in Subsection 3.7 and 6.2.3 of the RI/FS Report, previous outdoor air monitoring activities performed at Parcel E-2 have indicated that air contaminant concentrations at Parcel E-2 are similar to Bay Area regional air quality monitoring results, with only minor differences observed for most analytes investigated. The most notable exceptions are past detections of PCBs in the southeast portion of Parcel E-2. These detections of PCBs were associated with dust generated during past construction activities; specifically, the sandblast waste fixation project and landfill cap construction. As an additional precaution, the HHRA methodology evaluates potential outdoor air exposure via several transfer mechanisms. Models were used to estimate EPCs in outdoor air as a result of the above transfer mechanisms. These models are discussed below. EPCs for indoor air as a result of volatilization from domestic use of groundwater were not calculated because a risk-based screening assessment was used to quantify risks from exposure to COPCs in groundwater (see [Section K7.2](#)).

K5.1.3.1 Outdoor Air – Particulate COPCs Released from Soil

EPCs of particulates released from soil to outdoor air were estimated using soil EPCs as the source term and the methodology provided by EPA Region 9 in its memorandum describing the derivation of PRGs ([EPA 2004a](#)). To derive the EPCs in outdoor air, the EPC for soil was multiplied by the reciprocal of the [EPA \(2004a\)](#) default particulate emission factor of 1.316E+09 cubic meters per kilogram, which is a non-chemical-specific value that relates chemical concentrations in soil to airborne concentrations that may be inhaled.

K5.1.3.2 Outdoor Air – Volatile COPCs Released from Soil

Chemical-specific volatilization factors, which relate concentrations of volatile chemicals in soil to airborne concentrations that may be inhaled, were used to estimate concentrations in outdoor air from volatile COPCs in soil. Volatilization factors were taken from the EPA Region 9 guidance ([EPA 2004a](#)) and are summarized in [Table K-2](#). To estimate EPCs in outdoor air, the soil EPC was multiplied by the reciprocal of the volatilization factor.

K5.1.3.3 Indoor Air – Volatilization of COPCs in Groundwater during Domestic Use

Volatilization of volatile COPCs in groundwater into household air during domestic use of groundwater was evaluated for the residential exposure scenario, based on groundwater EPCs developed for the B-aquifer. A risk-based screening assessment was used to calculate risks from domestic use of groundwater, based on groundwater EPCs and PRGs for tap water developed by EPA Region 9 (EPA 2004a). Section K7.2 provides further details on this approach. Because a risk-based screening assessment approach was used to evaluate risks from domestic use of groundwater, EPCs were not developed for indoor air based on volatilization of COPCs in groundwater during domestic use.

K5.1.3.4 Outdoor Air – Volatile COPCs Released from Groundwater in a Construction Trench

Chemical-specific volatilization factors that relate concentrations of volatile chemicals in groundwater accumulated in a construction trench to airborne concentrations that may be inhaled by construction workers were used to estimate EPCs from volatile COPCs in groundwater. Calculation of the volatilization factors for this scenario were based on guidance from Virginia Department of Environmental Quality (2005), which provides a combination of a vadose zone model to estimate volatilization of gaseous COPCs from groundwater into a trench, and a box model to estimate dispersion of the COPCs from the air inside the trench into aboveground air. A full description of the models used to estimate volatilization into a construction trench is provided in Attachment K4 to this appendix.

K5.2 CHEMICAL INTAKE ESTIMATES

Estimates of exposure are based on the EPCs (as described in Section K5.1) and scenario-specific assumptions and intake parameters. Consistent with EPA guidance (EPA 1995), exposure estimates (intakes) were calculated for an RME scenario for each receptor and exposure pathway and are expressed in terms of milligrams of chemical per kilogram body weight per day (mg/kg-day). The RME represents the highest exposure reasonably expected to occur and is calculated using the 95 UCL and the RME exposure parameters.

EPA-derived exposure algorithms were used to estimate the chemical intakes for each route of exposure. Equation K-1 is a generic equation for calculating chemical intake as follows (EPA 1989):

$$I = \frac{C \times CR \times EF \times ED}{BW \times AT} \quad (K-1)$$

where

I	=	Intake: the amount of chemical at the exchange boundary (mg/kg-day)
C	=	Chemical concentration: the EPC (for example, mg/kg for soil)
CR	=	Contact rate: the amount of contaminated medium contacted per unit of time or event; may be the ingestion rate, inhalation rate, or dermal contact rate (for example, milligram per day for the ingestion rate of soil)
EF	=	Exposure frequency: how often the exposure occurs (days per year)
ED	=	Exposure duration: the number of years in which a receptor comes in contact with the contaminated medium (years)
BW	=	Body weight: the average body weight of the receptor over the exposure period (kilograms)
AT	=	Averaging time: the period over which exposure is averaged (days); for carcinogens, the averaging time is 25,550 days on the basis of a lifetime exposure of 70 years (average life expectancy), and for noncarcinogens, the averaging time is equal to the exposure duration multiplied by the number of days in a year (365 days)

Pathway-specific variations of Equation K-1 were used to calculate intakes of COPCs in soil for recreational and construction worker receptors, and COPCs in groundwater for construction worker receptors. [Tables K-3 through K-7](#) present the pathway-specific equations and receptor-specific exposure assumptions used to calculate intakes. The calculation of chemical intake for the dermal contact with soil exposure pathway (all receptors) requires chemical-specific dermal absorption factors; these factors are shown in [Table K-2](#). The calculation of chemical intake for the dermal contact with groundwater exposure pathway (construction worker) requires chemical-specific permeability constants; these factors are shown in [Table K-8](#).

Chemical intakes from groundwater exposure pathways for residential receptors (ingestion and inhalation during household use) were not calculated because a risk-based screening assessment was used to quantify risks from exposure to COPCs in groundwater for these receptors (see [Section K7.2](#)).

K6.0 TOXICITY ASSESSMENT

The toxicity assessment identifies toxicity values used to quantify potential adverse health effects associated with exposure to COPCs at Parcel E-2. These toxicity values include reference doses (RfD) for noncancer health effects and slope factors (SF) for estimating cancer risks. An RfD represents an estimated daily intake of a COPC that is expected to pose no appreciable risk of harmful effects to human health, including sensitive populations, over a lifetime. RfDs are specific to each chemical and exposure route such as inhalation or ingestion.

Section B5. Exposure Assessment

An exposure assessment identified potential human receptors that could come into contact with radiologically impacted areas, as well as the exposure routes, magnitude, frequency, and duration of the potential exposures. The principal objective of this evaluation is to identify reasonable maximum exposures (RMEs). As defined by EPA (1989), the RME is the maximum exposure that is reasonably expected to occur at a site. The potential human receptors and potentially complete exposure pathways for the identified receptors were presented in Section B3, Conceptual Site Model. The remainder of this section describes the process used to estimate exposure point concentrations (EPCs) and to quantify pathway-specific RME radiological exposures for each receptor.

The nonradiological HHRA provides both total and incremental risk associated with nonradioactive chemical constituents (ERRG and Shaw, 2011). To combine nonradiological risk and radiological risk, the same approach used in the RI/FS to calculate nonradiological risk must be taken; namely, calculating total risk from ROCs inclusive of background and calculating incremental risk from the ROCs present at levels that do not include background. Consistent with EPA and Navy guidance, both total and incremental radiological risk were evaluated.

B5.1 EXPOSURE POINTS AND EXPOSURE POINT CONCENTRATIONS

Similar to the nonradiological HHRA, exposure points are identified based on anticipated population activity patterns and the relationship of the activities to the presence of contaminated media. For this radiological HHRA, each of the 73 Class I survey units evaluated during the Phase V investigation was considered a separate exposure point. Soil radiological data from each of the survey units collected during the Phase V investigation, along with data collected during the Phase I investigation, were grouped into individual data sets.

A statistical summary of the combined Phase I and V investigation data set is presented in Table B-4. The statistical summary presented in Table B-4 includes separate rows for survey units containing either biased samples, which are typically associated with radioactive point source anomalies that were removed, or sample locations that were physically removed during the removal actions at the Metal Slag Area and PCB Hot Spot Area. The first set of summary statistics is presented for samples that remain at the parcel (excluding biased samples and samples located in the Metal Slag Area and PCB Hot Spot Area excavation boundaries). The second set of summary statistics is presented for all samples collected and provides information to document conditions prior to the removal actions at the Metal Slag Area and PCB

Hot Spot Area. The current post-excavation data set consists of 1,098 systematic samples and 18 biased samples from the Phase V investigation and 24 samples from the Phase I investigation. One entire Phase V survey unit was removed during the removal actions, resulting in data from 72 of the original 73 Phase V survey units remaining.

As discussed in Section 7.2 of the Radiological Addendum, the biased soil samples with elevated activities at Phase V survey units ACH and AKL were collocated with radioactive point source anomalies that were subsequently removed. Therefore, the Navy believes that the systematic samples collected within survey units ACH and AKL (exclusive of the biased sample results) are most representative of current site conditions.

Once the data sets were compiled, statistical testing was conducted to determine the data distribution for the survey units and to calculate the 95 percent upper confidence limit (95 UCL) of the arithmetic mean. The 95 UCL was used as the EPC for each radionuclide for data sets with greater than four samples. The 95 UCL for each radionuclide in each survey unit was calculated using the following methodology, which is consistent with the approach used for the nonradiological HHRA ([ERRG and Shaw, 2011](#)).

The one-sided UCL on the mean were calculated for radionuclide data sets with at least six samples. Recommendations in [Singh, Singh, and Maichle \(2009\)](#) are based on three properties measured for individual samples: (1) best-fit distribution, (2) relative degree of skewness, and (3) relative sample size. The recommendations for calculating an EPC for normal, gamma, lognormal, and nonparametric distributions are provided by the ProUCL software ([EPA, 2009](#)). The 95 UCLs were then calculated based upon the method recommended by the ProUCL software. For data sets with six or fewer samples, the maximum detected activity was used as the EPC. The summary statistics for the individual data sets are presented in [Table B-4](#).

B5.2. RESRAD

Radiological dose and risk were estimated for each of the 72 Class I survey units identified in the Phase V investigation. Given the large number of survey units, it was not feasible to conduct RESRAD modeling runs for each individual survey unit and for each receptor evaluated. Rather, dose and risk estimates were calculated using a ratiometric approach. Using a ratiometric approach, dose and risk were initially calculated using RESRAD for the individual ROCs at the proposed remediation goals listed in [Table B-3](#). [Table B-5](#) presents the initial modeled dose and risk estimates for the receptors at the release criteria. The RESRAD modeling runs are presented in [Attachment B1](#).

After dose and risk were estimated for the three ROCs at the cleanup goals, dose and risk estimates were back calculated for the survey units based upon the ratio of the measured activity and the associated risk. This approach greatly reduces the time and effort required to estimate dose and risk for a large number of survey units, with a precision comparable to that of using RESRAD for each survey unit. [Table B-6](#)

presents the dose and risk estimates for all the survey units on the site, using the ratiometric approach. The dose and risk calculations, detailing the contribution from each ROC and each individual exposure pathway, are presented in [Attachment B1](#).

To estimate the incremental risk from impacted soil areas, background concentrations of the ROCs were subtracted from the calculated 95 UCL values. As indicated in [Section B4](#), sample results from the reference areas indicated mean background levels of 0.049 pCi/g for ^{137}Cs , 0.82 pCi/g for ^{226}Ra , and 0.18 pCi/g for ^{90}Sr . To estimate the total radiological risk, the calculated 95 UCL values were used as the EPC, without subtracting the background values. Background values were not calculated for ^{60}Co ; therefore, the incremental radiological risk is the same as the total radiological risk.

[Table B-7](#) presents the combined nonradiological and radiological risk at the three primary study areas at Parcel E-2 (Landfill Area, Panhandle Area, and East Adjacent Area; these study areas are impacted by both radioactive and nonradioactive chemicals). The nonradiological and radiological risk presented in [Table B-7](#) represents the maximum risk associated with an exposure area within the Landfill Area, Panhandle Area, and East Adjacent Area. Since the exposure areas and associated grids used in the nonradiological and radiological risk analyses were different, the grids with the maximum nonradiological and radiological risk may not necessarily be collocated. Accordingly, the total risk presented in [Table B-7](#) is an upper-bound estimate of risk.

The combined risk from the residential exposure scenario is not included in [Table B-7](#) because this exposure scenario was not evaluated in the RI/FS. The combined risk from the Shoreline Area was not included in [Table B-7](#) because limited soil samples were collected from the Shoreline Area and the resulting data were inadequate to estimate potential radiological risks.

B5.2.1. Critical Exposure Scenario Evaluation

An evaluation was performed to identify the critical exposure scenario based on the exposure scenarios identified in [Section B2](#). The critical exposure scenario results presented in [Table B-8](#) represent the range of radiological risks estimated for each receptor. Modeling results indicated that the residential exposure scenario is the critical exposure scenario ([Table B-8](#)). As indicated in [Section B2](#), the residential exposure scenario is not anticipated in the future at Parcel E-2; however, the residential exposure scenario was evaluated because it represents the highest potential for exposure and resulting radiological risk.

An evaluation was performed to identify the critical exposure pathway based on the pathways (external radiation, soil ingestion, and inhalation) identified in [Section B3](#). Evaluation results are shown in [Table B-8](#). The critical exposure pathway results presented in [Table B-8](#) are based upon the range of radiological risks estimated for each receptor. As indicated in [Table B-8](#), external exposure accounts for over 99 percent of all radiological risks, which is nearly all of the radiological risk for each receptor.

B5.2.2. Critical Isotope Evaluation

An evaluation was performed to identify the critical isotopes based on the exposure scenarios identified in [Section B2](#). The critical isotope results presented in [Table B-9](#) represent the range of the contribution of each individual isotope to the overall risk for each receptor. As indicated in [Table B-9](#), ^{226}Ra accounts for 95 to 99 percent of all radiological risk, which is nearly all of the radiological risk.

B5.2.3. Cover Depth

Because the external radiation pathway is the critical pathway, an analysis of the cover depth was performed. The cover depth is the thickness of nonimpacted material (e.g., soil, asphalt, etc.) that is placed over the impacted soil area. The RESRAD default cover depth is zero, meaning that the receptor is directly exposed to impacted soil. As the cover depth increases, the resulting risk to the receptor is reduced. For the purpose of this analysis, a soil cover depth was modeled at thicknesses of 0 inches and 24 inches. The 24-inch cover thickness was selected based on information in the Parcel E-2 RI/FS Report ([ERRG and Shaw, 2011](#)). Additionally, the RESRAD default cover erosion rate was set to zero (e.g., cover depth maintained) to account for the institutional controls, consisting of land use and activity restrictions, that would be utilized to prevent exposure to potential residual radioactivity in the soil left in place and preserve the integrity of the soil cap.

The modeling results are presented in [Table B-10](#) and show that, at a cover depth of 2 feet, both the total and incremental radiological risks are reduced by approximately two orders of magnitude. For the reasonably anticipated future receptors (recreational and construction worker), the overall radiological risk is reduced to below the 1E-06 level.

The RESRAD modeling output reports are provided in [Attachment B1](#).

K7.0 RISK CHARACTERIZATION METHODS

The final step in this revised baseline HHRA is the characterization of the potential risks associated with exposure to COPCs. Risks from exposure to soil for all receptors and from construction worker exposure to groundwater were characterized using the methodology provided in EPA (1989); Section K7.1 details this methodology. Risks from domestic use of groundwater were characterized using a risk-based screening assessment approach; Section K7.2 presents this methodology. Section K7.3 discusses interpretation of hazard and risk levels. Section K7.4 discusses the risk characterization approach for lead. The results of the risk characterization for Parcel E-2 are presented in Section K8.0.

K7.1 RISK CHARACTERIZATION FOR SOIL EXPOSURES AND CONSTRUCTION WORKER EXPOSURE TO GROUNDWATER

The general methodology for estimating cancer risks and HIs for soil exposures for all receptors and construction worker exposure to groundwater follows the methodology provided in EPA (1989) and is presented in Section K7.1.1 for cancer risks and in Section K7.1.2 for noncancer health hazards. This methodology is applicable to both the total and incremental risk evaluations for soil and the total risk evaluation for groundwater. As discussed in Section K4.4, incremental risks were not evaluated for exposure to groundwater.

K7.1.1 Characterization of Cancer Risks

Risks associated with exposure to chemicals classified as carcinogens are estimated as the incremental probability that an individual will develop cancer over a lifetime as a direct result of an exposure (EPA 1989). The estimated risk is expressed as a unitless probability.

Three steps are used in estimating cancer risks for chemicals classified as carcinogens. First, the chemical intake is multiplied by the chemical-specific SF to derive a cancer risk estimate for a single chemical and pathway. The calculation is based on the following relationship:

$$\text{Chemical-Specific Cancer Risk} = \text{Intake (mg/kg-day)} \times \text{SF (mg/kg-day)}^{-1} \quad (\text{K-2})$$

Second, the individual chemical cancer risks are assumed to be additive to estimate the cancer risk associated with exposure to multiple carcinogens for a single exposure pathway, as follows:

$$\text{Pathway-Specific Cancer Risk} = \sum \text{Chemical-Specific Cancer Risk} \quad (\text{K-3})$$

Third, pathway-specific risks are summed for each receptor to estimate the total cancer risk. For exposures scenarios for which both an adult and child receptor are evaluated (that is, recreational), the estimated cancer risk is based on the sum of the risk estimated for the adult receptor plus the child receptor. Hence, for the recreational receptor, the estimated cancer risk is

based on the sum of the risk estimated for the adult recreational user and the child recreational user.

K7.1.2 Characterization of Noncancer Hazards

The potential for exposure that may result in adverse health effects other than cancer is evaluated by comparing the intake with an RfD for chemicals that are not classified as carcinogens and for those carcinogens known to cause adverse health effects other than cancer. A three-step approach is used as described below:

Calculate a chemical-specific hazard quotient (HQ) based on the following equation:

$$\text{Hazard Quotient} = \frac{\text{Intake (mg/kg-day)}}{\text{RfD (mg/kg-day)}} \quad (\text{K-4})$$

Next, sum the HQs for all chemicals to evaluate the potential for noncancer health effects from simultaneous exposure to multiple chemicals, yielding an HI as follows:

$$\text{Hazard Index} = \sum \text{HQ} \quad (\text{K-5})$$

Third, sum pathway-specific HIs to estimate a total HI for each receptor.

The total noncancer HI for the recreational receptor is based on the total HI estimated for the child receptor because the intake for children of soil, groundwater, and air per unit body mass is higher (hence, noncancer HIs for a child receptor are always higher than noncancer HIs for an adult receptor for similar exposures).

K7.2 RISK CHARACTERIZATION FOR DOMESTIC USE OF GROUNDWATER

The risks from domestic use of groundwater were evaluated in this baseline HHRA. Based on meetings between EPA, DTSC, and the Navy in 2003 and 2004, the assessment of risks from these exposure pathways is based on a risk-based screening assessment.

The risk-based screening assessment is a streamlined approach that uses the ratio of EPCs to risk-based screening levels (RBSL). For this baseline HHRA, the EPA Region 9 PRGs for tap water were used as RBSLs to calculate cancer risks and noncancer HIs from domestic use of B-aquifer groundwater (EPA 2004a). The EPA tap water PRGs are risk-based concentrations that correspond to a cancer risk of 1×10^{-6} or an HI of 1 based on standardized equations that combine standard exposure assumptions and EPA toxicity values.

The risk estimates developed using the risk-based screening approach represent the risk for all exposure pathways evaluated by the RBSLs (that is, the tap water PRGs). These risk estimates

are numerically equivalent to risk estimates obtained using the EPA (1989) “forward calculation methodology,” which involves calculating risks using contaminant concentrations, exposure assumptions, and toxicity values (see Section K6.0), if the exposure pathways and assumptions used to derive the RBSLs are the same as those used in the forward calculations.

The EPA tap water PRGs were used as RBSLs in this HHRA to evaluate domestic use of groundwater (EPA 2004a). The tap water PRGs are used to evaluate ingestion of groundwater and from inhalation of VOCs released from groundwater to indoor air during household use. The PRGs do not account for exposure from dermal contact with groundwater; Section K9.3 addresses the uncertainties associated with exclusion of this exposure pathway on the risk results.

Section K6.0 discusses the hierarchy toxicity criteria used in the HHRA; Tables K-9 and K-10 list the toxicity criteria for each COPC. The EPA (2004a) Region 9 PRGs for tap water were recalculated for this HHRA to be based on the same toxicity criteria listed in these tables; methodologies provided by EPA (2004a) were used for the calculations. Table K-11 lists the groundwater RBSLs used for this HHRA.

Cancer risks and noncancer hazards were calculated by comparing site EPCs of each COPC to the corresponding RBSL, as detailed in the following text.

K7.2.1 Characterization of Cancer Risks

For COPCs that are carcinogens, the cancer risk associated with exposure to a single chemical is calculated as follows:

$$\text{Cancer risk} = (EPC/RBSL) \times 10^{-6} \quad (\text{K-6})$$

where:

EPC = Exposure point concentration ($\mu\text{g/L}$)

RBSL = Risk-based screening level ($\mu\text{g/L}$)

At a given site, individuals may be exposed to more than one chemical. The total risk from exposure to multiple chemicals is calculated using the following equation:

$$\text{Total risk} = 10^{-6} \times \{EPC_1/RBSL_1 + EPC_2/RBSL_2 + \dots + EPC_n/RBSL_n\} \quad (\text{K-7})$$

where:

Total risk = Total carcinogenic risk from exposure to all chemicals (unitless)

EPC_n = Exposure point concentration of chemical n ($\mu\text{g/L}$)

$RBSL_n$ = RBSL for chemical n ($\mu\text{g/L}$)

K7.2.2 Characterization of Noncancer Hazards

For COPCs not classified as carcinogens and for carcinogens known to cause adverse health effects other than cancer, the potential for receptors to develop adverse health effects is evaluated by comparing EPCs with noncancer RBSLs as follows:

$$\text{Hazard quotient} = \text{EPC/RBSL} \quad (\text{K-8})$$

where

EPC = Exposure point concentration ($\mu\text{g/L}$)

RBSL = Risk-based screening level ($\mu\text{g/L}$)

To evaluate the potential for noncancer effects from exposure to multiple chemicals, the HQs for all chemicals are summed, yielding an HI as follows:

$$\text{Hazard index} = \text{EPC}_1/\text{RBSL}_1 + \text{EPC}_2/\text{RBSL}_2 + \dots + \text{EPC}_n/\text{RBSL}_n \quad (\text{K-9})$$

where:

EPC_n = Exposure point concentration of chemical n ($\mu\text{g/L}$)

RBSL_n = RBSL for chemical n ($\mu\text{g/L}$)

K7.3 INTERPRETATION OF HAZARD AND RISK LEVELS

EPA guidance on exposure levels considered protective of human health is presented to aid in the interpretation of the results of the risk assessment. In the National Oil and Hazardous Substances Pollution Contingency Plan, EPA defined general remedial action goals for sites on the National Priorities List (Title 40 of the *Code of Federal Regulations* Part 300.430). The goals include a range for residual cancer risk, which is “an excess upper-bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6} ,” or 1 in 10,000 to 1 in 1,000,000. The goals set out in the National Oil and Hazardous Substances Pollution Contingency Plan are applied once a decision to remediate a site has been made. A more recent EPA directive provides additional guidance on the role of the HHRA in supporting risk management decisions, and in particular, determining if remedial action is necessary (EPA 1991). Specifically, the guidance states: “Where cumulative carcinogenic risk to an individual based on reasonable maximum exposure for both current and future land use is less than 10^{-4} , and the noncancer HQ is less than 1, action generally is not warranted unless there are adverse environmental impacts.” EPA Region 9 has stated, however, that action may be taken to address risks between 10^{-4} and 10^{-6} . In addition, DTSC has stated that it considers 1×10^{-6} as the point of departure for risk management decisions. To be protective of human health, the BCT has chosen to use 10^{-6} , the lower end of

the residual 10^{-4} to 10^{-6} risk range set out in the National Oil and Hazardous Substances Pollution Contingency Plan, as a threshold level for cancer risks for HPS.

An HI of less than 1 indicates that adverse noncancer health effects are not expected. In accordance with EPA guidance (EPA 1989), the HHRA further evaluated exposure areas with total HIs that exceeded 1. Noncancer health effects associated with exposure to multiple COPCs may not be cumulative if the COPCs affect different target organs or systems within the body. Therefore, for exposure areas with HI results that exceeded 1 based on the summed HIs from multiple COPCs, the HHRA segregates the HI by target organ or system and assumes that the potential for noncancer health effects exists only if the highest total segregated HI for a target organ or system exceeded 1. Table K-12 identifies the target organs affected by each COPC for Parcel E-2; this information was used, as necessary, to segregate HIs by target organ. Information on target organs was obtained from Integrated Risk Information System (EPA 2008), Health Effects Assessment Summary Tables (EPA 1997), Provisional Peer Reviewed Toxicity Values for Superfund database (EPA 2004c), and the Agency for Toxic Substances and Disease Registry (2005). Tables in this appendix that summarize the HHRA results show both the total HI (summed for all COPCs associated with noncancer effects, regardless of target organ or system) and the highest segregated HI (segregated by target organ or system) for each exposure area.

K7.4 EVALUATION OF LEAD

The HHRA evaluated the potential for human health effects from exposure to lead in soil by comparing EPCs for lead with an HPS-specific risk-based concentration for lead (155 mg/kg) for recreational receptors and the EPA (2004a) Region 9 industrial PRG for lead (800 mg/kg) for construction worker receptors. The HPS risk-based concentration for lead was developed using the Cal/EPA (1999b) LeadSpread model and EPA's Integrated Exposure Uptake Biokinetic model. The methodology for development of the HPS risk-based concentration for lead is presented in Attachment K5 to this appendix. The Region 9 industrial PRG for lead was developed by EPA using EPA's adult lead model (EPA 1996). These models are designed to predict the soil lead concentration associated with a target blood lead level of 10 micrograms per deciliter, the EPA threshold level of concern (EPA 1994a). Adverse health effects are not expected to occur from exposure to lead below the risk-based concentration or PRG.

The HHRA evaluated exposure lead in groundwater by comparing EPCs for lead in groundwater with the California Regulatory Action Level of 15 µg/L. The regulatory action level is not a risk-based concentration, but rather the concentration which, if exceeded, triggers treatment or other requirements (see Section K6.4). The evaluation of lead in groundwater is presented in Table K3-7 of Attachment K3.

27	Total and incremental risks	Section 2.5.1	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Sections 7.1.2.1 and 7.1.2.2, pages 7-5 through 7-8. Record No. 4237. Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRS. Section 7.2, pages 7-2 through 7-4. Record No. 4260.
----	------------------------------------	---------------	--

Both total and incremental risks were evaluated for exposure to surface and subsurface soil at Parcel E-2. For the total risk evaluation, all chemicals detected or estimated (J-qualified) in one or more samples of surface and subsurface soil were included as COPCs regardless of concentration, except for the essential nutrients calcium, magnesium, potassium, and sodium. The total risk evaluation provides an estimate of the risks posed by all chemicals at the site, including those present at concentrations at or below background levels. For the incremental risk evaluation, the essential nutrients and metals with maximum measured concentrations below HPALs were excluded as COPCs. The incremental risk evaluation provides an estimate of risks posed by all chemicals at the site, except those that do not exceed background levels.

Nondetected results for COPCs in soil were incorporated in the total and incremental risk evaluations by use of a proxy concentration. Details on this approach are provided in Section K4.0 of [Appendix K](#). [Appendix K](#) also discusses the potential effect on the HHRA of the methods used to treat nondetected results.

7.1.2. Human Health Risk Assessment Results

This subsection summarizes the results of the total and incremental risk evaluations for soil.

7.1.2.1. HHRA Results for Recreational Exposure Scenario

For the recreational exposure scenario, risks from exposure to COPCs in soil were assessed for surface soil (0 to 2 feet bgs). [Figure 7-1](#) summarizes the grid-specific total risk results for surface soil, based on the reasonably anticipated reuse of Parcel E-2 as open space. [Figure 7-2](#) summarizes the grid-specific incremental risk results for surface soil. In both [Figures 7-1 and 7-2](#), the results for each grid are shown relative to the cancer risk threshold of 1E-06, highest “segregated” noncancer hazard index (HI) threshold of 1, and HPS RBC for lead (155 mg/kg) for recreational receptors. The “segregated” HI identifies the value as it relates to a specific target organ or systems. For the recreational exposure scenario (0 to 2 feet bgs), the specific calculated total and incremental cancer risk and noncancer HI results for each grid are listed in [Tables 7-2 and 7-3](#), respectively.

Sixty-seven grids at Parcel E-2 have sampling data for surface soil. Of these 67 grids, the total recreational risk for 63 of the grids exceeds the cancer risk threshold of 1E-06, and the highest segregated HI for 16 of the grids exceeds the threshold HI of 1. Based on the results of the incremental risk evaluation for recreational visitors, 39 grids at Parcel E-2 exceed the cancer risk threshold of 1E-06, and 16 grids exceed the noncancer threshold HI of 1. Under both the total and incremental risk evaluations, 26 grids exceed the RBC for lead for recreational visitors.

Tables 7-4 and 7-5 present a risk characterization analysis of total and incremental risk for the recreational scenario, respectively, of the grids for which the cancer risk exceeds 1E-06, the highest segregated HI exceeds 1, or the exposure point concentration (EPC) for lead exceeds the recreational RBC for lead. For each of these grids, the tables identify the COCs and present their contribution to the calculated total risks and hazards for each potentially complete exposure pathway.

Grids AK29 and AK30 are located in the 0.42-acre area in the East Adjacent Area designated as part of the Shipyard South Multi-Use District. As shown on Figures 7-1 and 7-2, the total and incremental risk estimates at grids AK29 and AK30 (1) exceed the cancer risk threshold of 1E-06, (2) exceed the noncancer threshold HI of 1, and (3) exceed the RBC for lead for recreational visitors. Accordingly, the FS portion of this report evaluates remedial actions to address this potential risk to future recreational users. Because a risk evaluation using more conservative exposure factors associated with potential residential reuse would have reached the same conclusion, no updates to the risk assessment were required to make an informed risk management decision in the 0.42-acre area in the East Adjacent Area designated as part of the Shipyard South Multi-Use District.

Both total and segregated noncancer HI results are shown in Tables 7-2 through 7-5. The total HI represents the cumulative HI, regardless of the specific target organs or systems within the body affected by the COCs. However, noncancer health effects may not be cumulative if the COCs affect different target organs or systems within the body. Therefore, the HHRA segregates the HI by target organ or system; the potential for noncancer health effects exists only if the highest total segregated HI for a target organ or system exceeds 1. For each exposure area, the highest calculated segregated HI is shown in Tables 7-2 through 7-5.

The chemicals listed in the table on the following page were identified as COCs in at least one grid, based on the results of the total and incremental risk evaluation for soil for the recreational exposure scenario. As shown in the table on the following page, the COCs for the recreational scenario are the same between the total and incremental risk evaluations.

7.1.2.2. HHRA Results for Construction Worker Exposure Scenario

For the construction worker exposure scenario, risks from exposure to COCs in soil were assessed for subsurface soil (0 to 10 feet bgs). Figure 7-3 summarizes the grid-specific total risk results for subsurface soil for the construction worker. Figure 7-4 summarizes the grid-specific incremental risk results for subsurface soil. The results for each grid are shown relative to the cancer risk threshold of 1E-06, highest segregated noncancer HI threshold of 1, and HPS RBC for lead (800 mg/kg) for construction workers. For the construction worker exposure scenario (0 to 10 feet bgs), Tables 7-6 and 7-7, respectively, present the specific calculated total and incremental cancer risk and noncancer HI results for each grid.

Exposure Scenario	Chemicals of Concern	
	Surface Soil (0 to 2 feet bgs), Total Risk	Surface Soil (0 to 2 feet bgs), Incremental Risk
Recreational ^a	Antimony	Antimony
	Aroclor-1242	Aroclor-1242
	Aroclor-1248	Aroclor-1248
	Aroclor-1254	Aroclor-1254
	Aroclor-1260	Aroclor-1260
	Arsenic	Arsenic
	Benzo(a)anthracene	Benzo(a)anthracene
	Benzo(a)pyrene	Benzo(a)pyrene
	Benzo(b)fluoranthene	Benzo(b)fluoranthene
	Benzo(k)fluoranthene	Benzo(k)fluoranthene
	Dieldrin	Dieldrin
	Heptachlor epoxide	Heptachlor epoxide
	Indeno(1,2,3-cd)pyrene	Indeno(1,2,3-cd)pyrene
	Lead	Lead
	Total PCBs (non-dioxin)	Total PCBs (non-dioxin)

Note:

a COCs identified for this exposure scenario are based on the reasonably anticipated reuse for Parcel E-2 as open space.

Eighty-two grids at Parcel E-2 have sampling data for subsurface soil. Of these 82 grids, the total construction worker risk for 78 of the grids exceeds the cancer risk threshold of 1E-06, and the highest segregated HI for 37 of the grids exceeds the threshold HI of 1. Based on the results of the incremental risk evaluation, 49 grids at Parcel E-2 exceed the cancer risk threshold of 1E-06, and 36 grids exceed the noncancer threshold HI of 1. Under both the total and incremental risk evaluations, 20 grids exceed the RBC for lead for the construction worker.

Table 7-8 summarizes the risk analysis results from exposure to A-aquifer groundwater for construction workers in a trench. Incremental risks were not assessed for groundwater for the construction worker scenario because this scenario is not associated with a specific planned reuse for Parcel E-2. For the construction worker exposure scenario (0 to 10 feet bgs), Tables 7-9 and 7-10 present the total and incremental risk characterization analyses, respectively, for the grids in which the cancer risk exceeds 1E-06, the highest segregated HI exceeds 1, or the EPC for lead exceeds the construction worker RBC for lead. For each of these grids, the tables identify the COCs and present their contribution to the calculated total risks and hazards for each potentially complete exposure pathway.

Similar to the approach used to assess noncancer hazards for the recreational scenario (see Section 7.1.2.1), Tables 7-6 through 7-10 present both total and segregated noncancer HI results for the construction worker scenario for each exposure area. These tables show the highest segregated HI by

target organ or system; the potential for noncancer health effects exists only if the highest total segregated HI for a target organ or system exceeds 1.

The chemicals listed in the table below were identified as COCs for soil in at least one grid, based on the results of the total and incremental risk evaluation for soil for the construction worker exposure scenario or were identified as COCs for the A-aquifer. As shown in the table on the following page, the soil COCs for the construction worker scenario are the same between the total and incremental risk evaluations.

Exposure Scenario	Chemicals of Concern		
	Subsurface Soil (0 to 10 feet bgs), Total Risk	Subsurface Soil (0 to 10 feet bgs), Incremental Risk	Groundwater, A-aquifer
Construction Worker ^a	4,4-DDT Antimony Aroclor-1016 Aroclor-1242 Aroclor-1248 Aroclor-1254 Aroclor-1260 Arsenic Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Cadmium Copper Dibenz(a,h)anthracene Dieldrin Dioxin (TEQ) Heptachlor epoxide Indeno(1,2,3-cd)pyrene Iron Lead Manganese Naphthalene Total PCBs (non-dioxin) Vanadium	4,4-DDT Antimony Aroclor-1016 Aroclor-1242 Aroclor-1248 Aroclor-1254 Aroclor-1260 Arsenic Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Cadmium Copper Dibenz(a,h)anthracene Dieldrin Dioxin (TEQ) Heptachlor epoxide Indeno(1,2,3-cd)pyrene Iron Lead Manganese Naphthalene Total PCBs (non-dioxin) Vanadium	Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Dibenz(a,h)anthracene Indeno(1,2,3-cd)pyrene Lead

Notes:

a The construction worker exposure scenario is not associated with a specific planned reuse for Parcel E-2.

TEQ Toxicity equivalent quotient

7.1.2.3. HHRA Results for Domestic Use of Groundwater

As discussed in [Section 7.1.1.1](#), domestic use of groundwater was evaluated for the B-aquifer. As a conservative approach, only total risks were assessed for exposure to groundwater. Similar to the approach used for the total risk evaluation for soil, all chemicals detected or estimated (J-qualified) in one

For this reason, the following receptors were selected for evaluation based on the planned reuse for Parcel E-2.

- Recreational User (adult and child)
- Construction Worker (adult)

These receptors are consistent with those evaluated in the nonradiological HHRA in the RI/FS Report. To evaluate future unrestricted reuse and to evaluate the highest potential for exposure at the parcel, a residential scenario was also evaluated. While residential reuse of Parcel E-2 is not anticipated, the residential exposure scenario presents an upper-bound estimation of risk from exposure to ROCs at the parcel.

Both direct exposure pathways (external radiation) and indirect exposure pathways (inhalation and soil ingestion) are evaluated.

The goal of the RESRAD risk modeling approach was to be as consistent as possible with assumptions and inputs used in the nonradiological HHRA in the RI/FS Report. To achieve this goal, development of representative parameters for receptor scenarios other than the RESRAD default was required. This development was achieved by following guidance from EPA; specifically, “Exposure Factors Handbook” and the “Risk Assessment Guidance for Superfund” (EPA, 1989 and 1997b). The guidance was also used to develop input parameters for the RI/FS nonradiological HHRA. Receptor-specific RESRAD values were selected from the guidance for residents, recreational users, and construction workers. To achieve the best correlation with site-specific agreements, it was necessary to adjust each of the parameters based on receptor-specific information. The parameters used in the RESRAD modeling, along with the basis for each, are discussed in detail in [Appendix B](#).

7.2. TOTAL AND INCREMENTAL DOSE AND RISK CALCULATION METHODOLOGY AND RESULTS

Radiological dose and risk were estimated for each of the 72 2,000-square meter Class I survey units identified in the Phase V investigation, as discussed in [Section 4](#). Given the large number of survey units, it was not feasible to conduct RESRAD modeling runs for each individual survey unit and for each receptor evaluated. Rather, dose and risk estimates were calculated using a ratiometric approach, since radiological dose and risk estimates are linear based upon activity. Using a ratiometric approach, dose and risk were initially calculated using RESRAD for the individual ROCs at the proposed residential RGs (see [Section 9](#)). The ratiometric risk calculation was performed using the following formula:

$$Risk_{UCL} = \frac{Risk_{RG}}{RG} \times UCL$$

where:

- RG = remediation goal (in picocuries per gram, pCi/g; as noted below, both outdoor worker and residential RGs are used)
- Risk_{RG} = human health risk for the individual ROCs at the proposed RGs¹¹ (as noted below both outdoor worker and residential RGs are used)
- Risk_{UCL} = human health risk, specific to the given exposure scenario (i.e., recreational, residential, or construction worker), associated with upper confidence limit of mean (in pCi/g)
- UCL = 95th percentile upper confidence limit of mean (in pCi/g) in an individual Phase V survey unit (see Table 2)

After dose and risk were estimated for the four ROCs (⁶⁰Co, ¹³⁷Cs, ²²⁶Ra, and ⁹⁰Sr) at the proposed RGs, dose and risk estimates were back calculated for the survey units based upon the ratio of the measured activity level and the associated risk. This approach greatly reduces the time and effort required to estimate dose and risk for a large number of survey units, with a precision comparable to that of using RESRAD for each survey unit.

To estimate the incremental radiological risk from impacted soil areas, background activity levels of the ROCs were subtracted from the calculated 95 UCL values. As indicated in [Section 3.1.6](#), sample results from the reference areas indicated mean background activity levels of 0.049 pCi/g for ¹³⁷Cs, 0.82 pCi/g for ²²⁶Ra, and 0.18 pCi/g for ⁹⁰Sr. Background activity levels were not calculated for ⁶⁰Co. A mean background activity level of 0.18 was calculated for ⁹⁰Sr based upon the average ratio of ⁹⁰Sr to ¹³⁷Cs results from the off-site laboratory; this value was used to calculate the EPCs for ⁹⁰Sr. To estimate the total radiological risk, the calculated 95 UCL values were used as the exposure point concentration, without subtracting the background values.

RESRAD incremental risk estimates for radionuclides exceed 1E-05 for future recreational users and exceed 1E-06 for future construction workers. In addition, RESRAD incremental risk estimates for a residential exposure scenario exceed 1E-04; as stated in [Section 7.1](#), the residential exposure scenario is not associated with the reasonably anticipated reuse but provides an upper-bound estimation of risk from exposure to ROCs at the parcel. These results indicate that concentrations of radioactive chemicals in soil pose a potential unacceptable risk to future site users and remedial alternatives should be evaluated to address these potential risks. Although the extent of radioactive contamination in subsurface soil has not been defined, this radiological addendum conservatively assumes, consistent with the findings of the HRA ([Table 3](#); [NAVSEA, 2004](#)), that potential radioactive chemicals (specifically, ⁶⁰Co, ¹³⁷Cs, ²²⁶Ra, and

¹¹ The residential RG is used to estimate risk for the recreational and residential exposure scenarios, and the outdoor worker RG is used to estimate risk for the construction worker exposure scenario.

⁹⁰Sr) may be present in subsurface soil at Parcel E-2 and will therefore require analysis of remedial alternatives. In addition, the RI/FS Report concluded that subsurface soil throughout Parcel E-2 contains nonradioactive chemicals that require analysis of remedial alternatives. As a result, the remedial alternatives evaluated in the RI/FS Report and this radiological addendum address the potential radioactive and nonradioactive chemicals in subsurface soil at Parcel E-2.

The highest total and incremental risk results for the primary Parcel E-2 study areas (Landfill Area, Panhandle Area, and East Adjacent Area) are presented in [Table 7](#). As noted in [Table 7](#), RESRAD incremental risk estimates at Phase V survey units ACH and AKL were affected by anomalous biased samples with reported activity levels that were two to three orders of magnitude greater than the activity levels reported in the 16 systematic samples collected within the same survey unit. The biased soil samples at survey units ACH and AKL were collocated with radioactive point source anomalies that were subsequently removed. Therefore, the Navy believes that the RESRAD risk estimates using only the systematic samples collected within survey units ACH and AKL (exclusive of the biased sample results) are most representative of current site conditions. However, the anomalous biased sample results were retained in separate RESRAD risk estimates for survey units ACH and AKL to conservatively account for the possibility of residual contamination left at the individual survey unit.

7.3. COMBINED RADIOLOGICAL AND NONRADIOLOGICAL RISK

Estimates of the lifetime risk of cancer to exposed individuals resulting from radiological and nonradiological risk assessments may be summed to determine the overall potential human health hazard associated with a site (EPA, 1989). To combine the nonradiological risk and radiological risk, the same approach used in the Parcel E-2 RI/FS to calculate nonradiological risk must be taken; namely, calculating total risk from ROCs inclusive of background and calculating incremental risk from the ROCs present at activity levels that do not include background.

[Table 7](#) presents the combined nonradiological and radiological risk at the primary Parcel E-2 study areas (Landfill Area, Panhandle Area, and East Adjacent Area). The nonradiological and radiological risk presented in [Table 7](#) represents the maximum risk associated with an exposure area within the Landfill Area, Panhandle Area, and East Adjacent Area. Since the exposure areas and associated grids used in the nonradiological and radiological risk analyses were different, the grids with the maximum nonradiological and radiological risk may not necessarily be collocated. Accordingly, the total risk presented in [Table 7](#) is an upper-bound estimate of risk. The combined risk from the Shoreline Area was not included in [Table 7](#) because limited soil samples were collected from the Shoreline Area and the resulting data were inadequate to estimate potential radiological risks; however, as discussed in [Section 3.1.5](#), gamma scans performed along the shoreline identified potential anomalies that require analysis of remedial alternatives in the FS.

Table 7. Combined Risk for Parcel E-2 Study Areas (continued)

Notes:

- a The risk results presented in the table represent the highest risk for an individual exposure area within a study area. The residential exposure scenario is not presented since the nonradiological risk for a residential receptor was not evaluated in the RI/FS Report. The Shoreline Area is not presented since the nonradiological risk was not evaluated for this area in the RI/FS Report.
- b Total excess lifetime cancer risk. The radiological risk included results for samples that were physically removed during the TCRAs conducted at the Metal Slag Area and PCB Hot Spot Area, with the exception of survey unit ABD (discussed in further detail in footnote h, below). The estimated radiological risk is therefore biased high because it includes sample results that are no longer present at Parcel E-2.
- c Nonradiological risk was taken from RI/FS Report, Tables 7-2 and 7-3 (recreational exposure scenario), and Tables 7-6 and 7-7 (construction worker scenario).
- d Consistent with EPA HHRA guidance, cancer risk results are presented to one significant figure. Accordingly, the combined risk results presented in the table may not equal the sum of the previous two columns; however, the results presented are an accurate representation of the sum of radiological and nonradiological risk.
- e The value presented first excludes two anomalous biased samples collected during the Phase V investigation in survey unit AKL; the value presented in parentheses includes the anomalous biased samples. The biased soil samples at survey unit AKL were collocated with radioactive point sources that were subsequently removed. Therefore, the Navy believes that the radiological risk estimate using only the systematic samples collected within survey unit AKL (exclusive of the biased sample results) is most representative of current site conditions. However, the anomalous biased samples were retained in a separate risk estimate for survey unit AKL to conservatively account for the possibility of residual contamination.
- f The residential exposure scenario was not evaluated in the RI/FS Report for Parcel E-2. Accordingly, the combined radiological and chemical risk cannot be calculated.
- g The value presented first excludes one anomalous sample collected during the Phase V investigation in survey unit ACH; the value presented in parentheses includes the anomaly. The biased soil sample at survey unit ACH was collocated with a radioactive point source that was subsequently removed. Therefore, the Navy believes that the radiological risk estimate using only the systematic samples collected within survey unit ACH (exclusive of the biased sample result) is most representative of current site conditions. However, the anomalous biased sample was retained in a separate risk estimate for survey unit ACH to conservatively account for the possibility of residual contamination.
- h The value presented in parentheses does not include survey grid ABD. The radiological risk results for survey grid ABD are biased high by results for samples located within the Metal Slag Area TCRA boundaries that were subsequently removed. For the residential receptor, the radiological risk values exceed unity (1E+00) and are therefore not considered valid.

EPA = U.S. Environmental Protection Agency

HHRA = human health risk assessment

Navy = Department of the Navy

PCB = Polychlorinated Biphenyl

RI/FS = Remedial Investigation and Feasibility Study

TCRA = time-critical removal action

----	-----------------------	---------------	--

along Crisp Avenue, the 13 Crisp Avenue GMPs are included in the monitoring network to ensure that landfill gas is not migrating north toward non-Navy property (former Parcel A) (TtEMI and ITSI, 2004c).

The landfill gas monitoring network was designed, in accordance with 27 CCR, to ensure that any landfill gas is not allowed to accumulate above action levels. The perimeter GMPs are monitored on a regular basis to ensure that methane gas does not exceed 5 percent by volume at the boundary, as specified in the Interim Landfill Gas Monitoring and Control Plan (TtEMI and ITSI, 2004c). GMPs on the UCSF compound and along Crisp Avenue act as secondary and tertiary lines of monitoring at increasing distances from the Parcel E-2 Landfill (TtEMI and ITSI, 2004c). The methane action level at all GMPs is set at 2.5 percent by volume in air to minimize the likelihood of exceeding the 27 CCR limit of 5 percent. All of the GMP locations are presented on Figure 3-6.

4.1.2.2. Nonmethane Organic Compounds

With regard to NMOCs at closed landfills, 27 CCR § 20921 states that trace gases should be controlled to prevent adverse acute and chronic exposure to toxic and cancer-causing chemicals. The evaluation methods for NMOCs involved comparing outdoor air data against the EPA Region 9 PRGs for outdoor air (EPA, 2004) and performing risk assessments on soil gas data collected from permanent GMPs. NMOC data collected from temporary soil gas probes installed during the landfill gas characterization were not evaluated, because site conditions had changed following implementation of the landfill gas TCRA.

To evaluate compliance with 27 CCR, the Navy has conducted several risk assessments to evaluate whether trace gases from the Parcel E-2 Landfill pose a potential risk to human health. The risk assessments were performed using the Johnson and Ettinger vapor intrusion model (EPA, 2003). Field data, analytical data, and risk assessment results for GMPs along Crisp Avenue (GMP13 through GMP16, GMP18, and GMP19) are presented in the Landfill Gas Characterization Report (Appendix A to this report). Field data, analytical data, and risk assessment results for GMP22 through GMP26 on the UCSF compound are presented in Appendices E, F, and G, respectively, of the Landfill Gas TCRA Closeout Report (Appendix F to this report). ELCR calculations for GMPs along Crisp Avenue, using the laboratory results, ranged from 6.4×10^{-7} to 2.0×10^{-8} for a residential exposure scenario. ELCR calculations for the GMPs on the UCSF compound ranged from 4.0×10^{-7} to 8.8×10^{-9} for an industrial

exposure scenario (TtEMI and ITSI, 2004c). These risk ranges are an order of magnitude below the NCP point of departure of 10^{-6} [40 CFR § 300.430(e)(2)(i)(A)(2); 55 Federal Register 8848 (1990)].

Field measurements for NMOCs, collected during the same time frame as the laboratory analytical data, ranged from 0 part per million by volume (ppmv) to 51 ppmv. Assuming that NMOCs remain at the same proportions in the landfill gas, the ELCR is directly proportionate to the total NMOC concentration. Thus, recognizing that a 10-fold increase in the ELCR would require a 10-fold increase in the NMOC measurements, 500 ppmv was selected as the action level for NMOCs detected at GMPs included in the monitoring network. If the concentration of total NMOCs increased from the 50-ppmv range to greater than 500 ppmv, then additional sampling and analysis for NMOCs and further evaluation of risk to human health is warranted in accordance with the interim Landfill Gas Monitoring and Control Plan (TtEMI and ITSI, 2004c).

4.1.3. Soil Evaluation

Due to the quantity of soil data evaluated in this RI, the nature and extent evaluation of soil was focused to discuss chemicals that were detected at concentrations greater than the laboratory reporting limits (LRLs), exceeding outdoor levels or human health risk-based criteria developed for the RI. The development of the criteria is discussed in [Section 4.1.3.2](#). All soil data, except for soil physically removed during interim actions, is summarized in [Appendix J1](#) and is included in the HHRA and SLERA presented in this report.

Because the removal actions were performed concurrent with the Draft RI/FS Report, the nature and extent evaluation and risk assessments presented in this Draft Final RI/FS Report incorporate post-excavation soil samples from the removal action areas. At both the Metal Slag Area and PCB Hot Spot Area, post-excavation soil samples contained chemical concentrations that warrant further analysis in this Draft Final RI/FS Report. This analysis is presented in [Sections 4.2.4](#), [4.3.2](#), and [4.4.2](#) of this RI/FS Report.

As discussed in [Section 3](#), the Parcel E-2 soil data set consists of 1,113 samples analyzed for a wide variety of inorganic and organic chemicals. To facilitate review of the large data set, the evaluation was performed separately for each of the three study areas at Parcel E-2: the Landfill Area, the Panhandle Area, and the East Adjacent Area. The data set was further subdivided into three separate depth ranges (0 to 2 feet bgs, 2 to 10 feet bgs, and greater than 10 feet bgs) for consistency with the depth ranges evaluated in the HHRA.

Comprehensive data summary tables are presented in [Appendix J1](#) by chemical category (i.e., metals, pesticides, PCBs, SVOCs, VOCs, and petroleum hydrocarbons) for each study area and depth interval. Each table presents a series of summary statistics of the data for each chemical, such as the number of samples collected; number of results that exceed the detection limit; minimum and maximum

31	Assumptions and uncertainties	Section 2.5.1	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and Shaw. May 2011. Appendix K, Section K9.0, pages K-34 through K-36. Record No. 4237. Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and RSRS. Appendix B, Section B6, pages B-14 and B-15. Record No. 4260.
----	-------------------------------	---------------	---

Varying degrees of uncertainty at each stage of the HHRA arise from assumptions made in the risk assessment and the limitations of the data used to calculate risks. Uncertainty and variability are also inherent in the exposure assessment, toxicity values, and risk characterization. [Table K-18](#) lists both general and site-specific uncertainties associated with this HHRA.

The effect of uncertainties is overestimation or underestimation of the actual cancer risk or HI. In general, the risk assessment process is based on use of conservative (health-protective) assumptions that when combined, are intended to overestimate the actual risk. However, a small possibility exists that risks were underestimated.

The remainder of this discussion focuses on the following uncertainties specific to this HHRA:

- The influence of metals in soil at or below ambient levels on this HHRA
- Use of an SF for TCE developed by Cal/EPA, rather than the EPA provisional SF for TCE
- Dermal contact with groundwater for the residential exposure scenario
- Detection limits for soil and groundwater data

K9.1 METALS IN SOIL BELOW AMBIENT LEVELS

To account for the contribution of naturally occurring concentrations of metals at HPS, both total risks and incremental risks were assessed for exposure to soil. The total risk evaluation for soil included all chemicals regardless of concentration, except for the essential nutrients calcium, magnesium, potassium, and sodium. For the incremental risk evaluation, the above essential nutrients and metals with maximum measured concentrations below HPALs were excluded as COPCs.

The differences in risk and hazard results between the total risk evaluation and the incremental risk evaluation are attributed to the risks and hazards associated with ambient levels of metals at HPS. At ambient concentrations (that is, HPALs), some metals at HPS are associated with cancer risks exceeding 1E-06 and noncancer hazards exceeding 1.0. [Table K-19](#) presents the cancer risks and noncancer hazards associated with exposure to metals at concentrations equal to HPALs; risks and hazards are presented in this table for the recreational exposure scenario, which is the only exposure scenario associated with the planned reuse of Parcel E-2. As shown in [Table K-19](#), the contribution of ambient levels of metals to cancer risk and HI estimates is significant. For example, the cancer risk associated with recreational exposure to arsenic at a concentration equal to the HPAL for arsenic (11.1 mg/kg) is 3E-05. Collectively, all metals at ambient levels contribute to a cancer risk of 3E-05 for recreational receptors. For noncancer hazards, metals at ambient levels collectively contribute to an HI of 0.7 for recreational receptors.

This evaluation of risks and hazards associated with metals at HPALs shows that the total risk evaluation, which includes metals present at concentrations at or below HPALs, likely overestimates risks and hazards associated with Navy releases of chemicals, as concentrations of metals are at or below HPALs in many exposure areas at Parcel E-2. While the incremental risk evaluation excludes risks and hazards from metals for which maximum concentrations do not exceed HPALs, the results of the incremental evaluation should be considered with the information contained in [Table K-19](#), as the contribution of ambient levels to risks and hazards at HPS is significant for some metals.

K9.2 SLOPE FACTOR FOR TRICHLOROETHENE

As discussed in [Section K6.0](#), the provisional cancer SFs derived by [EPA \(2001\)](#) for TCE, although more conservative than the SFs derived by Cal/EPA, were not used in the HHRA. The draft risk assessment that is the basis for the provisional EPA SFs for TCE is being reviewed currently by the National Academy of Sciences, and as such, does not represent EPA policy. For this HHRA, the SFs developed by Cal/EPA were used to evaluate cancer risks from exposure to TCE. Uncertainties specific to the provisional cancer SFs for TCE were analyzed in this HHRA because the difference between the provisional SFs for TCE and the Cal/EPA SFs for TCE is significant, and can affect the risk results. [Attachment K6](#) contains a detailed discussion of the uncertainties associated with the SFs for TCE.

K9.3 DERMAL CONTACT WITH GROUNDWATER FOR RESIDENTIAL SCENARIO

As discussed in [Section K7.2](#), tap water PRGs were used in this HHRA to evaluate domestic use of groundwater. The tap water PRGs are used to evaluate domestic use of groundwater from ingestion and from inhalation of VOCs released from groundwater to indoor air during household use. The tap water PRGs are limited to an assessment of exposure to groundwater from the oral and inhalation exposure pathways, and do not account for exposure from the dermal exposure pathway.

To address the uncertainties associated with exclusion of the dermal exposure pathway on the risk results for domestic use of groundwater, the potential for intake of COPCs from the dermal exposure pathway relative to intake of COPCs from the oral exposure pathway was evaluated using information provided in the guidance from [EPA \(2004d\)](#) on the relative percentage of dermal exposure compared to oral exposures for non-volatile COPCs. This information is presented in [Table K-20](#) for the non-volatile COPCs identified for the B-aquifer. In this table, exposure from the oral route is represented by ingestion of two liters of water per day ([EPA 2004d](#)). Although volatile COPCs were identified for the B-aquifer, partitioning risks between oral and dermal exposures for volatile COPCs is not necessary because the tap water PRGs account for the inhalation route of exposure.

This evaluation shows that risks from domestic use of groundwater in the B-aquifer, which were calculated using a risk-based screening assessment and EPA Region 9 tap water PRGs that exclude the dermal exposure pathway, may be slightly to highly underestimated for some chemicals in the B-aquifer (from 0.52 for thallium to 3,388 percent for dibenz[a,h]anthracene). However, the overall effect of this underestimate is not significant because the overall cancer

risk and noncancer HI for domestic use of groundwater in the B-aquifer were found to exceed the risk and hazards thresholds of 1E-06 and 1.0, respectively.

K9.4 DETECTION LIMITS FOR SOIL AND GROUNDWATER DATA

In some cases, detection limits (that is, sample quantitation limits) for soil and groundwater monitoring data exceeded risk-based screening concentrations for human health (for example, EPA [2004a] Region 9 PRGs). [Tables K1-1 and K1-2](#) and [Tables K3-1 through K3-3](#) summarize the soil and groundwater data evaluated in the HHRA for Parcel E-2. The data summaries presented in these tables include information on chemical detection frequencies and the range of detection limits for nondetected results (that is U- and UJ-qualified data).

For each exposure area evaluated in the HHRA (grids for surface and subsurface soil; parcel-wide for A- and B-aquifer groundwater), chemicals for which all results are nondetected are not included as COPCs in the HHRA. If results for a chemical are nondetected in all samples, but the detection limit for the chemical consistently exceeds a risk-based screening concentration, then it is possible that the chemical may be present at concentrations associated with health risks, but was not identified as a COPC for evaluation in the HHRA. In these cases, a small possibility exists that the exclusion of these chemicals as COPCs may result in an underestimation of potential risks. However, the overall HHRA process is based on use of conservative, health-protective assumptions that, when combined, are intended to overestimate the actual risk.

Section B6. Uncertainty Analysis

Any comprehensive risk analysis must also consider the effects of uncertainty on input parameters. This analysis is no different; however, rather than perform explicit uncertainty analyses, which would have required countless additional RESRAD runs, an approach was taken that minimized the need for additional modeling computations. The uncertainty analysis was based on a probabilistic analysis of the RESRAD code (ANL, 2000).

The probabilistic analysis studied the effect of various parameter distributions on the final results of RESRAD analyses. As part of the ANL study, multiple RESRAD runs were conducted for selected isotopes while varying a single parameter (ANL, 2000).

The RESRAD modeling is based on the radiological data collected during the Phase I and Phase V investigations. The data collected during these investigations were analyzed to meet acceptance criteria (such as minimum detectable activity levels) that were based on the release criteria current at the time the investigations were performed; however, the current release criteria for certain ROCs are more conservative. The most notable example is ^{226}Ra , for which the release criterion at the time of the Phase V investigation was 5 pCi/g. The current release criterion for ^{226}Ra is 1 pCi/g above background (the background ^{226}Ra level for the Phase V investigation was 0.82 pCi/g). Because of the differences in release criteria, the accuracy of the data for certain ROCs may not meet current acceptance criteria and results in some degree of uncertainty for the risk screening analysis. However, the degree of uncertainty is acceptable for the risk screening analysis because the analysis was only intended to provide a general estimate of radiological risks for ROCs that, in the case of ^{226}Ra , were known to consistently exceed current release criteria and warrant analysis of remedial alternatives in the FS.

Since the isotopes included in the ANL study cover most of the ROCs at Hunters Point Shipyard, it was determined that the conclusions of the ANL study could be used as the basis for the uncertainty analysis for the modeling done as part of the radiological addendum. The uncertainty considerations for each affected ROC are discussed separately below.

B6.1. STRONTIUM-90

The most critical parameter affecting dose and subsequent risk from ^{90}Sr used in these analyses is the contaminated zone thickness. No other parameters used in this analysis had the potential to have any substantial impact on the results. As previously mentioned, the contaminated zone was dependent on the

particular scenario being modeled. In all cases, however, the thickness was selected to be very conservative, and it is fully expected that the results presented in this analysis bound the actual case. It is therefore concluded that the conservatism built into this analysis eliminates the need to run additional uncertainty cases for ^{90}Sr .

B6.2. CESIUM-137

Dose and subsequent risk from ^{137}Cs is primarily due to the external radiation pathway. The density and thickness of the cover material are the key parameters used in the RESRAD analysis that affect the risk associated with ^{137}Cs . Changes to the external gamma shielding factor also can affect the results to a lesser extent.

The RESRAD default cover material density was used for all analyses performed. The default was designed to be representative of the body of soil types. In some cases, an asphalt cover was modeled with the same default soil density. In reality, asphalt would have a greater density than the default soil value. The specific density is dependent upon the asphalt-laying process. By underestimating the density of asphalt, a certain measure of conservatism has been built into the results presented in this appendix. It is therefore reasonable to assume that any uncertainty associated with the cover material density is minimal and a full uncertainty analysis for a range of cover material densities is not necessary.

The 24-inch cover thickness was selected based on information in the Parcel E-2 RI/FS Report (ERRG and Shaw, 2011). No additional runs are required to evaluate the uncertainty with this parameter.

The external gamma-shielding factor is a measure of how much shielding is offered by the building structures for a site receptor. None of the potential receptor scenarios assumed that the receptor would spend any period of time indoors; therefore, the external gamma-shielding factor is immaterial to this analysis.

B6.3. RADIUM-226

^{226}Ra is another nuclide with the majority of dose (for this analysis) resulting from the external radiation pathway. ^{226}Ra has a relatively long half-life of 1,600 years. Because of its longevity, the most important parameters affecting dose from ^{226}Ra , in order from highest to lowest, are thickness and density of the contaminated zone.

As noted for ^{90}Sr , the contaminated zone thickness has conservatism built in and thus does not require further uncertainty analysis. The density of the contaminated zone was modeled as the RESRAD default. All RESRAD default values are selected to provide conservative but reasonable estimates to a wider range of analyses. There is no added benefit to conducting more detailed uncertainty calculations for the ^{226}Ra dose-based risk with varying contaminated zone densities.

32	Screening-level ecological risk assessment	Section 2.5.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 7.2, pages 7-11 through 7-15; Appendix L, Table L-7. Record No. 4237. Draft Parcels E and E-2 Shoreline Characterization Technical Memorandum, Hunters Point Shipyard, San Francisco, California. SulTech. June 2007. Appendix G, Table G-18. <i>(note: this document was accepted as final and was provided as Appendix G to the Final Remedial Investigation/Feasibility Study Report for Parcel E-2; Record No. 4237)</i>
----	---	---------------	---

For organic COCs, the chemical-specific ARAR is used as the remediation goal, if applicable, and when available. In the absence of chemical-specific ARARs, the chemical-specific RBC is used as the remediation goal for organic COCs. However, the remediation goal defaults to the laboratory PQL if the ARAR- or RBC-based concentration is lower than the PQL, because the ARAR or RBC would not be detectable at concentrations below the PQL. For inorganic chemicals, this same hierarchy applies for selection of remediation goals, except that the HGAL (metals only) is selected as the remediation goal if it exceeds either the chemical-specific ARAR or the RBC and is greater than the laboratory PQL. HGALs for two inorganic COCs (arsenic and thallium) in the B-aquifer exceed their respective RBCs. These exceedances show that domestic use exposure to ambient levels of arsenic and thallium in the B-aquifer is associated with a cancer risk that exceeds 1E-06 and a noncancer HI that exceeds 1, respectively. However, MCLs are available for both of these chemicals; therefore, remediation goals for arsenic and thallium are based on MCLs.

7.1.4. Sample Locations with Chemical Concentrations Exceeding Remediation Goals

A list of soil sampling locations with chemical concentrations exceeding remediation goals was compiled to identify the locations at Parcel E-2 for which remedial action is required, based on its reasonably anticipated reuse as open space. [Table 7-16](#) shows the soil sampling locations with concentrations of COCs exceeding remediation goals for surface soil.

7.2. SCREENING-LEVEL ECOLOGICAL RISK ASSESSMENTS

A SLERA was conducted to update the previous ecological assessments at Parcel E-2. A summary of the Parcel E-2 SLERA (also referred to as the “onshore” SLERA) is presented in Section 7.2.1. A separate SLERA was performed to evaluate potential risk to aquatic wildlife exposed to intertidal sediment within the Shoreline Area of Parcel E-2. The shoreline SLERA is presented in [Appendix G](#) and is summarized in [Section 7.2.2](#).

7.2.1. Onshore Screening-Level Ecological Risk Assessment

The SLERA was necessitated by the collection of additional data during the SDGI which resulted in the identification of new COPECs and calculation of corresponding PSCs. The objective of the SLERA is to determine the potential for significant risk to terrestrial receptors exposed to soil from 0 to 3 feet bgs at Parcel E-2 within the onshore area.

This subsection provides an overview of the findings of the onshore SLERA. A complete copy of the assessment is provided in [Appendix L](#). The SLERA was performed in accordance with the EPA and Navy guidance (EPA, 1997; Navy, 1999).

7.2.1.1. Summary of SLERA Process

EPA guidance separates the ERA process into eight steps, three of which apply to the current ecological assessment at Parcel E-2:

- Step 1: Screening-level problem formulation and evaluation of ecological effects
- Step 2: Screening-level preliminary exposure estimate and risk calculation
- Step 3: BERA problem formulation

The substantive elements of Steps 1 and 2 constitute the SLERA. The onshore SLERA extends into the initial phase of Step 3, which corresponds to Step 3a “Refinement of Conservative Exposure Assumptions” of the Navy’s ERA process. Step 3a focuses on refining the list of COPECs based on comparison with HPALs. Further refinement of the ecological risks, using food chain modeling for birds and mammals, was not considered necessary given several factors:

- The onshore environment at Parcel E-2 has undergone several phases of ecological risk assessment, including a baseline ERA (1997) and a validation study (1999). These past studies are discussed in [Section 3.5](#) of this RI/FS Report. As discussed in Section L1 of [Appendix L](#), this SLERA was necessitated by the collection of additional data during a soil data gaps investigation in 2002, which resulted in the identification of new COPECs and the calculation of corresponding PSCs.
- The purpose of including quantitative risk assessments in the Parcel E-2 RI/FS was, as discussed in [Section 1.4](#), to identify areas that require remedial action to protect human health and the environment.
- The site conceptual model, as discussed in [Sections 6.2.1 and 6.3.1](#), identifies solid waste throughout the Landfill Area and heterogeneous soil contamination throughout the Panhandle and East Adjacent Areas, as posing a potential risk to terrestrial ecological receptors.

The SLERA performed for Parcel E-2 (through Step 3a) conservatively depicts the potential ecological risk in the onshore environment at Parcel E-2. Considering the heterogeneous contaminant distribution within the Landfill, Panhandle, and East Adjacent Areas, this conservative evaluation meets the overall goal of the RI/FS process and, when coupled with the results of the human health risk assessment, provides an adequate basis for developing a focused set of remedial alternatives for Parcel E-2.

As described in detail in [Appendix L](#), the Parcel E-2 onshore SLERA characterizes the risk to terrestrial ecological receptors exposed to near-surface soil at Parcel E-2, inland of the narrow “intertidal zone” along the Parcel E-2 shoreline. The intertidal zone is the area that is marked between the low- and high-

water lines. The onshore SLERA focused on birds and mammals that were identified in previous ecological studies at Parcel E and E-2.

The onshore SLERA performed for this report used all soil data collected from 0 to 3 feet bgs from all locations within Parcel E-2. A simple HQ approach was used to determine if any COPECs, on a sample-by-sample basis, present a potential risk at the site. The HQ is the ratio of the maximum detected soil concentration for a given COPEC to its calculated PSC. The HQ approach is typical of Step 2 of a SLERA and has been used in other HPS ERAs. Any HQ greater than 1.0 is considered to indicate potential risk. In the risk characterization step, chemicals were also compared with HPALs, where appropriate.

7.2.1.2. Onshore SLERA Results

The estimation of potential risk to terrestrial receptors exposed to COPECs was calculated for each of the three subareas (the Landfill Area, East Adjacent Area, and Panhandle Area) of Parcel E-2. In these areas, some potentially toxic chemicals were detected at concentrations exceeding HPALs and PSCs, indicating a potentially significant risk to terrestrial receptors. Based on concentrations exceeding PSCs (HQ greater than 1) and HPALs, the following chemicals (or groups of chemicals) pose a potential threat to birds and mammals exposed to soil in one or more onshore study areas of Parcel E-2:

- Metals: cadmium, copper, lead, manganese, mercury, nickel, vanadium, and zinc;
- Total DDT: sum of detected concentrations of 2,4'-DDT and 4,4'-DDT;
- Total PCBs: sum of detected concentrations of all Aroclor compounds; and
- Total high molecular weight (HMW) polycyclic aromatic hydrocarbons (PAHs): sum of detected concentrations of benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, and pyrene.

Figure 7-5 shows the locations where soil concentrations exceeded PSCs for any chemical within Parcel E-2. Table 7-17 presents a statistical summary of samples analyzed as part of the SLERA. HPALs, PSCs, maximum concentrations in soil, and the number of samples exceeding respective PSCs are shown in Table 7-17.

7.2.2. Shoreline Screening-Level Ecological Risk Assessment

A shoreline investigation was performed in 2002 as part of the SDGI, because the Parcel F validation study hypothesized that metals and PCBs along the shoreline were a source of contamination to Parcel F sediments. Intertidal sediment data collected during the shoreline investigation were evaluated in the Shoreline Characterization Technical Memorandum (Appendix G to this report), which included a shoreline SLERA. The objective of the shoreline SLERA was to evaluate whether contamination at

suspected source areas along the shoreline of Parcel E-2 poses an unacceptable risk to ecological receptors exposed to sediment at the Shoreline Area.

This subsection provides an overview of the findings of the shoreline SLERA. A complete copy of the shoreline SLERA is provided as [Appendix G](#) to this report. The SLERA was performed in accordance with the EPA and Navy guidance ([EPA, 1997](#); [Navy, 1999](#)).

7.2.2.1. Summary of Shoreline SLERA Process

The shoreline SLERA characterized risk to ecological receptors exposed to the narrow intertidal zone of Parcels E and E-2. The intertidal zone is the area that is marked between the low- and high-water lines. The SLERA focuses on benthic invertebrates, birds, and mammals that forage along the Parcels E and E-2 shoreline in the intertidal zone. To meet the objective of the SLERA, concentrations of chemicals in surface and subsurface sediment samples collected from the Parcels E and E-2 shoreline were screened against toxicological benchmarks for invertebrates, birds, and mammals.

The shoreline SLERA evaluated surface shoreline sediment samples (collected from 0 to 0.5 feet bgs) and subsurface sediment samples (collected from 2.0 to 2.5 feet bgs). All chemicals detected in sediment samples from the shoreline area were screened to identify COPECs, except for essential mineral nutrients such as sodium, chloride, potassium, phosphorous, magnesium, and calcium. COPECs for benthic invertebrates were identified as those chemicals with concentrations exceeding their effects range-median (ER-M) values ([Long and Morgan, 1991](#); [National Oceanic and Atmospheric Administration, 1993](#)).

In the evaluation of birds and mammals, chemicals were screened using food chain modeling against TRV. Selected COPECs also were compared against HPALs ([PRC, 1995a](#)) and ambient sediment concentrations of selected chemicals in San Francisco Bay ([RWQCB, 1998 and 2003a](#)). Similar to the onshore SLERA, HQs were calculated on a sample-by-sample basis for each COPEC. In the shoreline SLERA, the HQ is defined as the ratio of EPCs in surface sediment to ER-M values. All detected inorganic and organic chemicals in surface and subsurface sediment were evaluated in the toxicological screen by evaluating the HQ. Chemicals with HQs greater than 1.0 were considered COPECs for benthic invertebrates.

7.2.2.2. Shoreline SLERA Results for Benthic Invertebrates

Benthic invertebrates are at risk from exposure to PCBs in surface and subsurface sediment along the Parcels E and E-2 shoreline. Benthic invertebrates in surface and subsurface sediment may be adversely affected by exposure to copper, lead, zinc, and DDTs. In subsurface sediment, mercury may pose an additional risk to benthic invertebrates. [Appendix G](#) of this RI/FS Report presents the complete results for benthic invertebrates in the shoreline SLERA.

7.2.2.3. Shoreline SLERA Results for Birds and Mammals

Significant risk to birds is indicated only for the willet exposed to PCBs. No significant risk to either the surf scoter or the red-tailed hawk was indicated by the food-chain modeling. Other chemicals for which potential risk to birds is suggested included cadmium, copper, lead, mercury, PCBs, total DDTs, and dieldrin.

Birds and mammals are at risk from exposure to PCBs in surface and subsurface sediment along the Parcels E and E-2 shoreline. Ingestion of sediment and prey that contain cadmium, copper, molybdenum, zinc, and PCBs may pose a risk to the house mouse. The greatest significant risk (high TRV HQ) for mammals was indicated for PCBs ingested by the house mouse. [Appendix G](#) of this RI/FS Report presents the complete results for birds and mammals in the shoreline SLERA.

7.3. ECOLOGICAL RISK ASSESSMENT FOR EXPOSURE TO GROUNDWATER

A screening-level assessment of ecological risk to aquatic wildlife exposed to potentially contaminated groundwater at Parcel E-2 is provided in [Appendix M](#). The assessment consists of the following general steps:

- Aquatic evaluation criteria were selected based on surface water quality criteria (Basin Plan Table 3-3; California Toxics Rule [CTR]; National Recommended Water Quality Criteria [NRWQC]; and National Ambient Water Quality Criteria [NAWQC]). All of these standards apply to surface water; none of them applies to groundwater. Therefore, these potential ARARs for surface water would be applied to the surface water at the interface of the A-aquifer groundwater, but would not be used to set cleanup standards for in-situ A-aquifer groundwater at Parcel E-2.
- The Navy developed trigger levels for various inland locations to ensure surface water quality criteria are not exceeded if groundwater at Parcel E-2 discharges to the Bay. The trigger levels are intended to serve as conservative comparison values for groundwater to indicate when additional evaluation may be necessary. The development of the trigger levels was initially performed in the Parcel D FS, and has also been applied at HPS Parcels B and D (now referred to as Parcels D-1, D-2, G, and UC-1). The development of the trigger levels is discussed in Attachment M-1.
- Chemical concentrations in groundwater were screened against the assigned aquatic evaluation criteria, mainly comprised of saltwater aquatic criteria, to identify COPECs for surface water quality.
- Site-specific data for select COPECs were then evaluated against trigger levels, where appropriate, to confirm if the COPECs posed a potential risk to aquatic receptors requiring remedial option analysis.

Table L-7. Hazard Quotients for Birds and Mammals at Parcel E-2

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Table L-7. Hazard Quotients for Birds and Mammals at Parcel E-2 (continued)
 Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Notes:

a The hazard quotient for each Parcel E-2 subarea is calculated by dividing the maximum soil concentration for each chemical by the respective PSC.

4

Bold font indicates a hazard quotient greater than 1.0, which identifies site-related chemicals that may pose risks to receptors present at Parcel E-2

DDT	Dichlorodiphenyltrichloroethane
HMW	high-molecular-weight
HPAL	Hunters Point ambient level
LMW	low-molecular-weight
mg/kg	milligrams per kilogram
NA	not applicable
ND	nondetected
PAHs	polycyclic aromatic hydrocarbons
PCBs	polychlorinated biphenyls
PSC	protective soil concentration
SS	sample specific

33	Risks to aquatic wildlife	Section 2.5.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and Shaw. May 2011. Section 7.3, pages 7-15 and 7-16; Table 7-18. Record No. 4237.
----	---------------------------	---------------	---

7.2.2.3. Shoreline SLERA Results for Birds and Mammals

Significant risk to birds is indicated only for the willet exposed to PCBs. No significant risk to either the surf scoter or the red-tailed hawk was indicated by the food-chain modeling. Other chemicals for which potential risk to birds is suggested included cadmium, copper, lead, mercury, PCBs, total DDTs, and dieldrin.

Birds and mammals are at risk from exposure to PCBs in surface and subsurface sediment along the Parcels E and E-2 shoreline. Ingestion of sediment and prey that contain cadmium, copper, molybdenum, zinc, and PCBs may pose a risk to the house mouse. The greatest significant risk (high TRV HQ) for mammals was indicated for PCBs ingested by the house mouse. [Appendix G](#) of this RI/FS Report presents the complete results for birds and mammals in the shoreline SLERA.

7.3. ECOLOGICAL RISK ASSESSMENT FOR EXPOSURE TO GROUNDWATER

A screening-level assessment of ecological risk to aquatic wildlife exposed to potentially contaminated groundwater at Parcel E-2 is provided in [Appendix M](#). The assessment consists of the following general steps:

- Aquatic evaluation criteria were selected based on surface water quality criteria (Basin Plan Table 3-3; California Toxics Rule [CTR]; National Recommended Water Quality Criteria [NRWQC]; and National Ambient Water Quality Criteria [NAWQC]). All of these standards apply to surface water; none of them applies to groundwater. Therefore, these potential ARARs for surface water would be applied to the surface water at the interface of the A-aquifer groundwater, but would not be used to set cleanup standards for in-situ A-aquifer groundwater at Parcel E-2.
- The Navy developed trigger levels for various inland locations to ensure surface water quality criteria are not exceeded if groundwater at Parcel E-2 discharges to the Bay. The trigger levels are intended to serve as conservative comparison values for groundwater to indicate when additional evaluation may be necessary. The development of the trigger levels was initially performed in the Parcel D FS, and has also been applied at HPS Parcels B and D (now referred to as Parcels D-1, D-2, G, and UC-1). The development of the trigger levels is discussed in Attachment M-1.
- Chemical concentrations in groundwater were screened against the assigned aquatic evaluation criteria, mainly comprised of saltwater aquatic criteria, to identify COPECs for surface water quality.
- Site-specific data for select COPECs were then evaluated against trigger levels, where appropriate, to confirm if the COPECs posed a potential risk to aquatic receptors requiring remedial option analysis.

Based on concentrations exceeding trigger levels (as adjusted based on HGALs), the following chemicals (or groups of chemicals) pose a potential threat to aquatic wildlife through exposure to surface water impacted by contaminated groundwater at Parcel E-2:

- Metals: copper, lead, and zinc;
- Anions: un-ionized ammonia, sulfide, and cyanide;
- Total PCBs: sum of detected concentrations of all Aroclor compounds; and
- Total TPH: sum of detected concentrations of all TPH ranges (gasoline-range, diesel-range, and motor-oil range).

[Figure 7-6](#) shows the locations where groundwater concentrations exceeded their respective trigger levels. [Table 7-18](#) summarizes the specific COPECs at the locations identified on [Figure 7-6](#).

34	Trigger levels	Section 2.5.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Appendix M, Section M2.5, pages M-2-5 through M-2-8. Record No. 4237.
----	----------------	---------------	---

wells. All A-aquifer wells, except well IR01MWI-9, within the TIZ are part of the well network used in the BGMP (Shaw Environmental, Inc., 2007).

The data evaluation was supplemented by data from a group of temporary wells and piezometers that were installed mainly within the TIZ, as well and in the northern inland portion of the Panhandle Area, adjacent to the western side of the Landfill Area (Figure M-1). These temporary wells were installed and sampled in early 2008 as part of a data gaps investigation conducted along the Parcel E-2 shoreline. Samples from the temporary wells were analyzed for un-ionized ammonia, metals, PCBs, and TPH.

The screening evaluation provided in Section M3 conservatively identifies COPECs that warrant further evaluation and monitoring to assess the potential effects on San Francisco Bay. For COPECs with apparently persistent and definable source areas, additional screening was performed against trigger levels developed for HPS to further evaluate the potential effects on the bay.

M2.5. TRIGGER LEVEL EVALUATION

The nearest surface water body to Parcel E-2, where CTR is applicable, is San Francisco Bay. Elevated concentrations of chemicals in groundwater at Parcel E-2 could affect surface water quality as contaminated groundwater migrates and discharges to the bay.

To address the potential effects of groundwater discharging to the bay, the Navy developed trigger levels for various inland locations to ensure surface water quality criteria are not exceeded where groundwater at Parcel E-2 discharges to the bay. The trigger levels are intended to serve as conservative comparison values for groundwater to indicate when additional evaluation may be necessary. The development of trigger levels was initially performed for Parcel D evaluations (Parcel D FS; SulTech, 2007). The trigger level evaluation methodology has also been applied at Parcel C (Parcel C FS; SulTech, 2008). The development of the trigger levels is discussed in Attachment M1.

Site-specific data for select COPECs were evaluated against trigger levels, where appropriate, to determine the need to address these COPECs in the remedial design. The trigger level evaluation was originally developed to evaluate inland plume source areas. No definable plumes, however, are present at Parcel E-2, thus the trigger level evaluation was applied to chemicals exhibiting definable source areas with potentially persistent concentrations.

The trigger level evaluation, including the theoretical assumptions behind the evaluation and the evaluation methodology, are described in the following subsections.

M2.5.1. Trigger Level Evaluation Theory

At HPS, attenuation of chemical and metal concentrations occurs in groundwater as it migrates through three different zones: (1) the area of groundwater transport to the TMZ, which includes the TIZ, (2) the TMZ, and (3) the bay discharge zone.

As chemicals migrate from an inland source area through soil and groundwater, they are subjected to physical, chemical, and biological processes that tend to reduce their concentrations. These processes include sorption of chemicals to soil particles, volatilization, hydrodynamic dispersion and molecular diffusion, and chemical and biological transformations. The magnitudes by which chemical concentrations are reduced depend on a number of physical, chemical, and biological factors, including groundwater flow gradients, which may vary across Parcel E-2. For example, as groundwater moves through the TIZ and approaches the TMZ, the tidal influence would be expected to decrease the groundwater flow gradient, and consequently increase the residence time during which chemical concentrations would be reduced through physical, chemical, and biological processes. For simplicity and conservatism, the trigger level evaluation presented herein does not account for potential reductions in groundwater flow gradients within the TIZ and further study would be needed to evaluate its potential effect. Such studies are not needed to support the Parcel E-2 RI/FS, but may be considered during the remedial design.

Additional reduction in chemical concentrations takes place in the TMZ near the shoreline. The TMZ is where bay waters move inland through the aquifer, mixing with groundwater. The net discharge of groundwater may not be changed by tidal influence, but rising tides introduce surface water into the aquifer so that concentrations of chemicals in groundwater that discharge during low tide are reduced by mixing of bay water and groundwater in the aquifer in this zone.

Finally, as groundwater discharges to the bay, concentrations of chemicals are further reduced due to dilution with bay water.

The processes described above needed to be accounted for to compare groundwater concentrations originating from inland source areas with aquatic evaluation criteria. To make this comparison, the Navy developed HPS-specific trigger levels. The development of trigger levels takes an extremely conservative approach because it does not account for attenuation in the TMZ or attenuation from discharge to the surface water body. Only hydrodynamic dispersion in the inland contaminant transport zone is used to establish attenuation factors (AFs), which are used to calculate the trigger levels. Therefore, the resulting trigger levels likely overestimate the potential for effects from COPECs migrating in groundwater to San Francisco Bay.

For the purposes of this evaluation, and to maintain consistency with past HPS trigger level evaluations (Parcels D and C), the AFs for the TMZ and for the bay discharge zone were assumed to be 1 (no attenuation). These assumptions provide a highly conservative approach that conforms to agreements made with regulatory agencies.

As part of the development of the Revised Parcel D FS Report ([SulTech, 2007](#)), the Navy developed a modeling approach to provide conservative estimates of the maximum concentrations in groundwater expected at the point of discharge (San Francisco Bay). The analytical solute transport model BIOSCREEN ([EPA, 1997](#)) was used to predict these maximum discharge concentrations and to then

calculate AFs. The summary of the modeling evaluation from the Revised Parcel D FS is included as [Attachment M1](#).

The modeling confirmed that the amount of attenuation caused by hydrodynamic dispersion during groundwater transport can be significant at HPS, and that the greater the travel distance to the ecological receptor, the greater the AF. Results of the groundwater modeling effort were nomographs ([Attachment M1](#), Figure G-1) that assign specific AFs for any chemical or metal found in HPS groundwater based on plume width and distance to the aquatic wildlife in San Francisco Bay. The nomograph information presented in [Attachment M1](#) was used to assign AFs and calculate trigger levels for this evaluation.

M2.5.2. Trigger Level Evaluation Methodology

The approach for assigning AFs and trigger levels and evaluating COPEC against trigger levels for Parcel E-2 is presented below.

1. As established in the nature and extent evaluation for groundwater at HPS (Section 5 of the RI/FS Report), most contamination in Parcel E-2 groundwater is not predictably distributed, contiguous, or temporally consistent. This conclusion is especially true in the Landfill Area, where discrete sources of contamination can be widespread, and where concentrations of chemicals at a single location can fluctuate significantly over time. For the Landfill Area, chemical data within A-aquifer wells located inland of the TIZ and other nearshore areas within 250 feet of the shoreline ([Figure M-1](#)) were not considered during selection of AFs for calculation of aquatic trigger levels. This decision was made because the landfill is a known source of a variety of inconsistently distributed chemicals; as a result, an assessment of attenuation within the landfill waste would make the evaluation complex and unreliable. Additionally, the trigger level evaluation was not meant to be applied to migration of groundwater chemicals through waste. The nomographs developed to estimate AFs for groundwater at HPS were based on groundwater flow and chemical transport through HPS soils (uniform porous media), not landfill waste.

For these reasons, the Landfill Area evaluation was focused on the TIZ wells (and other wells within 250 feet of the shoreline) because they are more indicative of potential chemical migration to the bay than inland wells. Within the TIZ and other nearshore areas, the nomographs specify AFs of 1 at small distances from the shoreline (less than 250 feet), so the evaluation performed during the initial screening evaluation (against saltwater aquatic evaluation criteria) remains unchanged. In other words, results for trigger level evaluation of the nearshore areas match the screening evaluation results because little to no attenuation is assumed within 250 feet of the shoreline, based on the assumed attenuation dynamics along the shoreline.

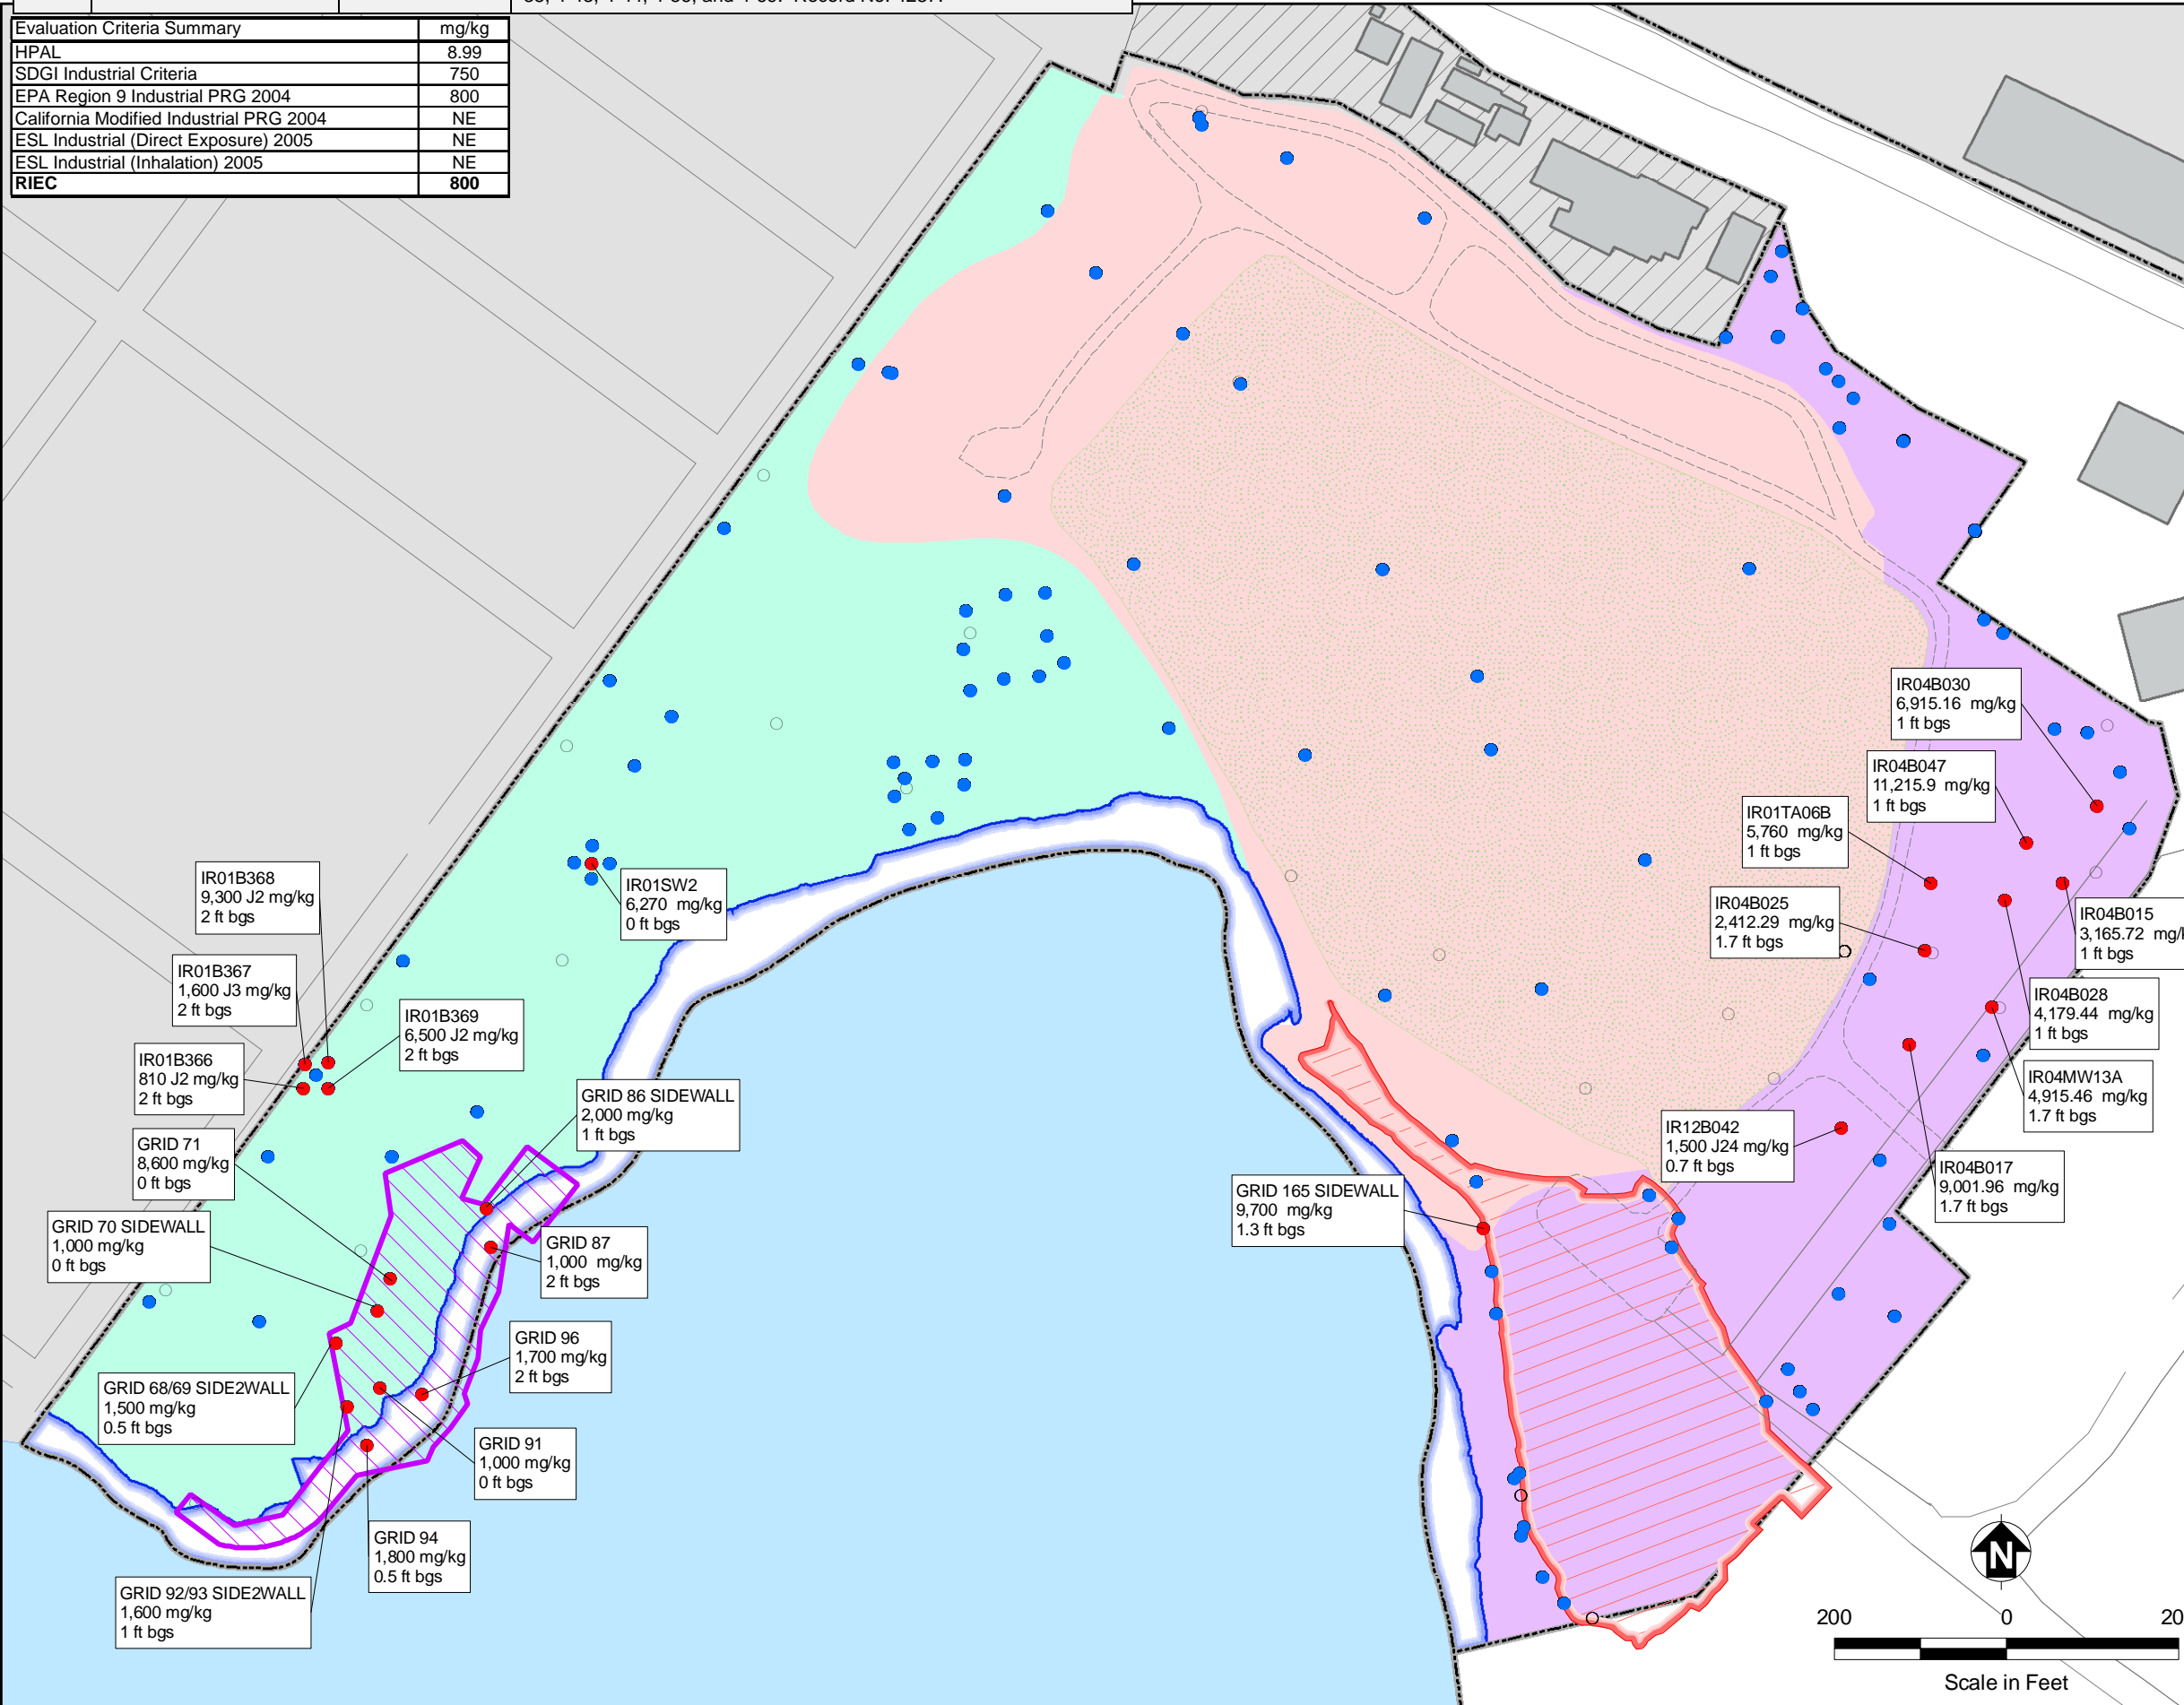

2. In the Panhandle and East Adjacent Areas, chemical data within all A-aquifer wells were considered during selection of AFs for calculation of aquatic trigger levels. As with the Landfill Area, chemical data within the TIZ and other nearshore areas within 250 feet of the shoreline were not reevaluated because the nomographs specify AFs of 1 for small distances from the shoreline, which produces an evaluation corresponding to the initial screening evaluation (aquatic evaluation criteria). For chemical data farther inland than the TIZ and other nearshore areas, AFs were assigned to groundwater concentrations measured in areas where detections are persistent and constitute a definable source area.

3. Because no discrete contamination plumes are present in Parcel E-2 groundwater, the source area width for each chemical was estimated using the following methodology:
 - a. If contamination is persistent and limited to a single well, the plume width was assumed to be 40 feet (the narrowest plume width represented by the nomographs). Also, the centerline of the plume was assumed to be perpendicular to the shoreline and passing through the center of the well.
 - b. If contamination is present in multiple adjacent wells extending a long distance (greater than 360 feet) along the shoreline, the plume width was assumed to be 360 feet, which corresponds to the widest plume width represented by the nomographs. Also, the center of the plume was assumed to be perpendicular to the shoreline and passing through the well with the highest and most persistent detected concentrations.
 - c. If contamination is present in multiple wells (more than one) adjacent to each other, but is limited to a source area width of less than 360 feet, then the plume width is assumed to be the distance between the wells at the edges of the contamination, plus an additional 20 feet on either side. Also, the center of the plume was assumed to be perpendicular to the shoreline and passing through the well with the highest and most persistent detected concentrations.
4. The chemical migration distance was measured as the distance from the source area to the TMZ, which was conservatively assumed to be located 50 feet inland from the shoreline. As stated above, an AF of 1 was assumed for the area between the TMZ boundary and the bay shoreline; therefore, that distance was not included in the measurement of the transport zone, where attenuation is assumed to occur.
5. Using the nomograph curve for the chosen source area width, the AF was selected by finding the intercept of the migration distance along the curve and reading off the associated AF along the y (vertical) axis.
6. Once the AF was determined, it was rounded down to the nearest whole number to produce a conservative usable AF.
7. The trigger level for each defined chemical or metal source area was then calculated by multiplying the AF by the applicable aquatic evaluation criterion.
8. Groundwater data in the identified source area were then rescreened against the associated trigger level, and results were evaluated to determine if the source area could potentially pose negative effects to surface water quality and aquatic wildlife.

The approach for assigning attenuation factors described above is consistent with the approach used to evaluate other parcels at HPS, but it has been adapted for use with Parcel E-2 data. The only notable adaptation to the previously applied HPS trigger level methodology is that a qualitative method was used for assigning source area widths for Parcel E-2, whereas at other parcels defined plume widths were used.

The trigger level evaluation is considered overly conservative because trigger levels only account for hydrodynamic dispersion in groundwater transport and ignore attenuation in the TMZ or attenuation from discharge to the surface water body. For this reason, trigger levels are only intended to serve as comparison values for groundwater to COPECs in groundwater that may pose a risk to aquatic organisms. During future remedial design efforts for Parcel E-2, the Navy may choose to perform more quantitative analyses and modeling to refine the identification of COPECs and specify risk-based remediation goals for groundwater affecting surface water.

Notes:

^a Post- excavation boundaries in PCB Hot Spot Area and Metal Slag Area are consistent with information presented in final removal action completion reports (Tetra Tech EC Inc., 2007a and 2007b).

Results are shown for locations where data have exceeded the RIEC.
Where results are shown as non-detect (<), the reporting limit follows.

EPA = Environmental Protection Agency
ESL = environmental screening level
ft bgs = feet below ground surface
HPAL = Hunters Point ambient level
mg/kg = milligram per kilogram
NE = not established
PCB = polychlorinated biphenyl
PRG = preliminary remediation goal
RIEC = Remedial Investigation Evaluation Criterion
SDGI = Standard Data Gaps Investigation
UCSF = University of California, San Francisco

Notes:

^a Post- excavation boundaries in PCB Hot Spot Area and Metal Slag Area are consistent with information presented in final removal action completion reports (Tetra Tech EC Inc., 2007a and 2007b). Soil removal in these areas (up to depths of 14 feet bgs) are expected to reduce groundwater concentrations (to be verified by ongoing monitoring).

Results are shown for locations where data has exceeded the RIEC. Red text indicates results that exceed the RIEC. Where results are shown as non-detect (<), the reporting limit follows.

bgs = below ground surface
 Conc. = concentration
 ESL = environmental screening level
 HGAL = Hunters Point groundwater ambient level
 J = estimated
 MCL = Maximum Contaminant Level
 NE = not established
 PCB = polychlorinated biphenyl
 RIEC = Remedial Investigation Evaluation Criterion
 U = value was not detected above the reporting limit
 UCSF = University of California, San Francisco
 UJ = Analyte is considered not present above the level of the associated value; the associated value is considered quantitatively estimated.
 µg/L = microgram per liter

Numbers associated with qualifiers are further defined in Appendix J.

40	Remediation goals	Section 2.5.3	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 7.1.3.1, page 7-10; Table 7-13. Record No. 4237.
----	-------------------	---------------	--

HGALs have been developed for groundwater in the A-aquifer at HPS and are likely applicable for groundwater in the B-aquifer. However, data for inorganic chemicals in the B-aquifer were not compared with HGALs in the HHRA as a conservative approach and incremental risks were not assessed for the groundwater domestic use evaluation.

7.1.3. Remediation Goals

Remediation goals were developed for the COCs identified for soil and groundwater, using the methodology described in the subsections below. The development of remediation goals for soil was limited to COCs identified for soil based on the incremental risk evaluation results, which excludes the risks posed by metals at concentrations below ambient levels, in accordance with EPA guidance.

7.1.3.1. Soil

Remediation goals for COCs in soil were selected based on a comparison of the COC-specific RBC, laboratory practical quantitation limit (PQL) based on standard EPA analytical methods, and HPAL (inorganic chemicals only). For each COC, the highest of these three concentrations was selected as the remediation goal. With the exception of lead, exposure scenario-specific RBCs were calculated based on a target cancer risk level of 1E-06 and target noncancer HI of 1. This is consistent with the exposure pathways and assumptions described in Appendix K that were used to assess human health risks. For lead, the exposure scenario-specific RBCs were based on modeled blood lead concentrations, as discussed in Section K7.4 of Appendix K. Table 7-13 presents the remediation goals for COCs in soil.

Remediation goals for recreational visitors and construction workers for one inorganic chemical (arsenic) were based on the HPAL for arsenic. Comparison of the HPAL for arsenic with the RBCs for arsenic for recreational visitors and construction workers shows that the ambient level for arsenic in soil exceeds the respective RBCs. Section K9.1 of Appendix K addresses the risks and hazards associated with exposure to metals in soil at ambient levels at HPS.

7.1.3.2. Groundwater

Remediation goals for COCs in groundwater in the A- and B-aquifers, as identified by the HHRA, are shown in Tables 7-14 and 7-15. Development of the remediation goals for groundwater was based on consideration of chemical-specific ARARs (that is, state of California and federal MCLs), exposure-scenario-specific RBCs, laboratory PQLs, and HGALs (for metals only). Chemical-specific ARARs are discussed further and identified in Section 10.1.1. Chemical-specific ARARs were only considered in the development of the remediation goals for the B-aquifer; no ARARs are available to address the construction worker scenario assessed for the A-aquifer. When available, project-required quantitation limits from the BGMP (CE2-Kleinfelder Joint Venture, 2009c) were used as PQLs; otherwise, PQLs were based on standard EPA analytical methods. Exposure scenario-specific concentrations based on a target

41	Hot spots	Section 2.5.3	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 12.1.6, pages 12-10 through 12-13; Figures 12-7 through 12-9. Record No. 4237.
----	-----------	---------------	--

The CCSF proposed, as part of the environmental impact report for the Phase II development at HPS and Candlestick Point, building a roadway along the western portion of Parcel E-2 (SFRA, 2009). The footprint of the proposed roadway is adjacent to the proposed wetlands restoration areas, as shown on Figures 12-1 and 12-12. The proposed roadway is designated as a “local street” in the SFRA’s 2010 amended Redevelopment Plan and is subject to adjustment based on detailed engineering studies prior to actual physical development (SFRA, 2010). Based upon the available information, the Navy does not believe that the proposed roadway is fundamentally incompatible with the excavation or restoration plans for this portion of Parcel E-2. As a result, the Navy has not adjusted the proposed excavation or restoration plans in this portion of Parcel E-2. The Navy recognizes that pertinent elements of the RD (such as surface water drainage) will need to be integrated with future infrastructure along the western property boundary; however, the Navy anticipates that this design integration process would only result in minor refinements of the conceptual designs presented on Figures 12-1 and 12-12 and would not alter the fundamental components of the remedial action.

12.1.5.3. Offshore Feasibility Study

An FS was prepared for Parcel F to evaluate remediation alternatives for the contaminated sediment offshore of Parcel E-2 (Barajas & Associates, Inc., 2008a). As described in the Parcel F FS Report, the remedial alternatives evaluated for Parcel E-2 constitute source control measures for offshore contamination at Areas IX and X because contaminated sediment along the Parcel E-2 shoreline has been a source of contamination to the offshore Areas IX and X. In addition, the Parcel F FS Report notes that source control measures at Parcel E-2 should be completed before or simultaneously with any remediation work at Areas IX and X, which are located offshore of Parcel E-2 (Barajas & Associates, Inc., 2008a). During the RD, the selected shoreline remediation approach for Parcel E-2 will be refined, as needed, to integrate with the remediation approach for Parcel F and the overall site restoration plans. For example, the current alignment of the shoreline protection system for Alternatives 3, 4, and 5 (Figure 12-1) does not contain all contaminated sediment within the Shoreline Area. This alignment was selected to follow the existing shoreline and minimize filling of the bay. Alternatives 3, 4 and 5 assume that the remediation approach selected for the Parcel F FS will be used in the Shoreline Area not currently covered by the shoreline protection system.

12.1.6. Hot Spot Removal in the Panhandle, East Adjacent, and Shoreline Areas

Alternatives 2, 3, 4, and 5 would involve, to varying degrees, removal of identified hot spots in the Panhandle, East Adjacent, and Shoreline Areas. Although hot spot removal is not required to achieve the RAOs for soil, sediment, and solid waste, it constitutes removal of known or likely sources to groundwater contamination; therefore, it contributes to the remedial performance relative to the RAOs for groundwater. Hot spots were identified using existing soil and groundwater data (evaluated in Sections 4 and 5), as well as field observations from recent removal actions (for example, exploratory potholes

excavated between the PCB Hot Spot Area excavation and the bay identified oil staining and free-phase product). Based on this information, the Navy assessed the benefit of hot spot removal (that is, enhancing the performance of a remedial alternative relative to the RAOs) based on the following factors:

- The potential for soil hot spots to be a continuing source to groundwater contamination (e.g., chemicals that were identified in both soil and groundwater at concentrations exceeding RIECs)
- The magnitude of soil concentrations relative to RIECs (or alternative ecological risk-based criteria)
- The proximity of the potential hot spot relative to San Francisco Bay (which increases the likelihood of its affect on aquatic wildlife)

Based on these factors, the Navy identified five tiers of hot spots for removal at Parcel E-2 (Figure 12-7) that are discussed below.

- Tier 1 hot spots consist of nearshore locations (within the TIZ) where soil concentrations are greater than 10 times the RIECs (or alternative ecological risk-based criteria) and corresponding groundwater concentrations in monitoring wells consistently exceed aquatic evaluation criteria. As shown on Figure 12-7, Tier 1 hot spots were identified at the shoreline portion of the PCB Hot Spot Area. Proposed excavation boundaries, with estimated depths and volumes, for the Tier 1 hot spots are shown on Figure 12-8.
- Tier 2 hot spots consist of nearshore locations (within the TIZ) where soil concentrations are greater than 10 times the RIEC (or alternative ecological risk-based criteria) and corresponding groundwater concentrations in temporary wells exceeded aquatic evaluation criteria. As shown on Figure 12-7, Tier 2 hot spots were identified at the Metal Slag Area and northwest of the PCB Hot Spot Area. Proposed excavation boundaries, with estimated depths and volumes, for the Tier 2 hot spots are shown on Figures 12-8 and 12-9.
- Tier 3 hot spots consist of locations (inland of the TIZ) where soil concentrations are greater than 100 times the RIECs. Tier 3 hot spots were identified along the northern sidewall of the PCB Hot Spot Area excavation and in the central portion of the East Adjacent Area (Figure 12-7). Proposed excavation boundaries, with estimated depths and volumes, for the Tier 3 hot spots are shown on Figure 12-8.
- Tier 4 hot spots consist of nearshore locations (within the TIZ) where groundwater concentrations in temporary wells exceeded aquatic evaluation criteria and no corresponding soil data were available. Tier 4 hot spots were identified in the northern portion of the Panhandle Area (Figure 12-7). Proposed excavation boundaries, with estimated depths and volumes, for the Tier 4 hot spots are shown on Figure 12-9.

- Tier 5 hot spots consist of locations (inland the TIZ) where soil concentrations are greater than 10 times the RIECs (or alternative ecological risk-based criteria) and corresponding groundwater concentrations in downgradient temporary wells exceeded aquatic evaluation criteria. Tier 5 hot spots were identified in the southern portion of the Panhandle Area (Figure 12-7). Additional Tier 5 hot spots were identified in the East Adjacent Area as part of a 2009 investigation (associated with a groundwater treatability study at Parcel E [Shaw, 2009a]) and were incorporated into an interim removal action at Parcel E-2 (Navy, 2010); these two locations (IR12B029 and IR04MW13A) contain elevated VOC concentrations that pose a risk to future site occupants (via the vapor intrusion pathway) in the adjoining Parcel E. Proposed excavation boundaries, with estimated depths and volumes, for the Tier 5 hot spots are shown on Figures 12-8 and 12-9.

Tier 1 and 2 hot spots are considered most important to enhancing the performance of a remedial alternative relative to the RAOs. As a result, removal of Tier 1 and 2 hot spots are included under Alternatives 2, 3, 4, and 5. Tier 3, 4, and 5 hot spots are considered less important to enhancing the performance of a remedial alternative relative to the RAOs; these hot spots are included only in Alternatives 2, 4, and 5. The Tier 4 hot spots, located primarily along the northern portion of the Panhandle Area between temporary well locations TW013 to TW047, pose a potential risk to aquatic wildlife in the bay because of their location within the TIZ. However, the Tier 4 hot spots were not included in Alternative 3 because of uncertainty related to whether source removal at the locations is necessary to protect aquatic wildlife in the bay. The following factors contributed to the uncertainty: (1) no collocated soil data were available to verify that residual concentrations exceeded the identified hot spot goals; (2) the magnitude of most exceedances (metals and petroleum hydrocarbons) was less than two times the corresponding surface water criteria; and (3) the fate and transport properties of PCBs (which exceed the corresponding surface water criteria by more than eight times) result in very slow contaminant transport rates (IT, 2001). As described in Section 12.1.3, Alternative 3 includes the following actions in close proximity to the Tier 4 hot spots that will minimize potential impact to aquatic wildlife in the bay: (1) excavation of nearshore sediment and soil prior to construction of the shoreline revetment, and (2) installation of a geosynthetic liner under the rock revetment wall.

The lateral and vertical extent of hot spots would be refined through pre-excavation characterization to be performed during the RD. This characterization effort would be guided by specific DQOs to better delineate hot spot contamination. This report assumes that individual hot spots would be excavated to meet the chemical-specific goals presented in Table 12-2; however, the RD may refine these goals to more accurately define the soil concentrations that could leach to groundwater at concentrations exceeding aquatic evaluation criteria. Refined goals, if deemed necessary, would be supported with technical information (such as modeling or site-specific leaching analyses) in the RD.

For Alternative 2, the hot spot removal would consist of extending the planned excavation deeper, as needed, to remove the hot spot contamination. Additional information on the planned hot spot removal under Alternative 2 is provided in [Section 12.2.2.4](#). As discussed in [Section 12.2.2](#), all material excavated under Alternative 2, including the hot spot removal, would be characterized and disposed of off site, following screening for and segregation of radiologically impacted material (which would also be disposed of off site). Any industrial debris (such as drums and associated liquid wastes) and MDAS (such as empty shell casings) would be disposed of off site with LLRW and soil containing chemicals at concentrations exceeding hot spot goals.

For Alternatives 3, 4, and 5, the hot spot removal would consist of targeted excavations and would be implemented as part of the grading process prior to capping. Removal of Tier 1 and 2 hot spots, which are located within or close to the Shoreline Area, would be implemented with the shoreline excavation process described in [Section 12.1.3](#). Additional information on the planned hot spot removal under Alternatives 3, 4, and 5 is provided in [Sections 12.2.3.3 and 12.2.4.1](#). As discussed in [Section 12.2.3](#), following screening for and segregation of radiologically contaminated material (which would be disposed of off site), hot spots would be excavated and disposed of off site; material excavated as part of the overall grading process would be incorporated into the landfill under the new cap extension.

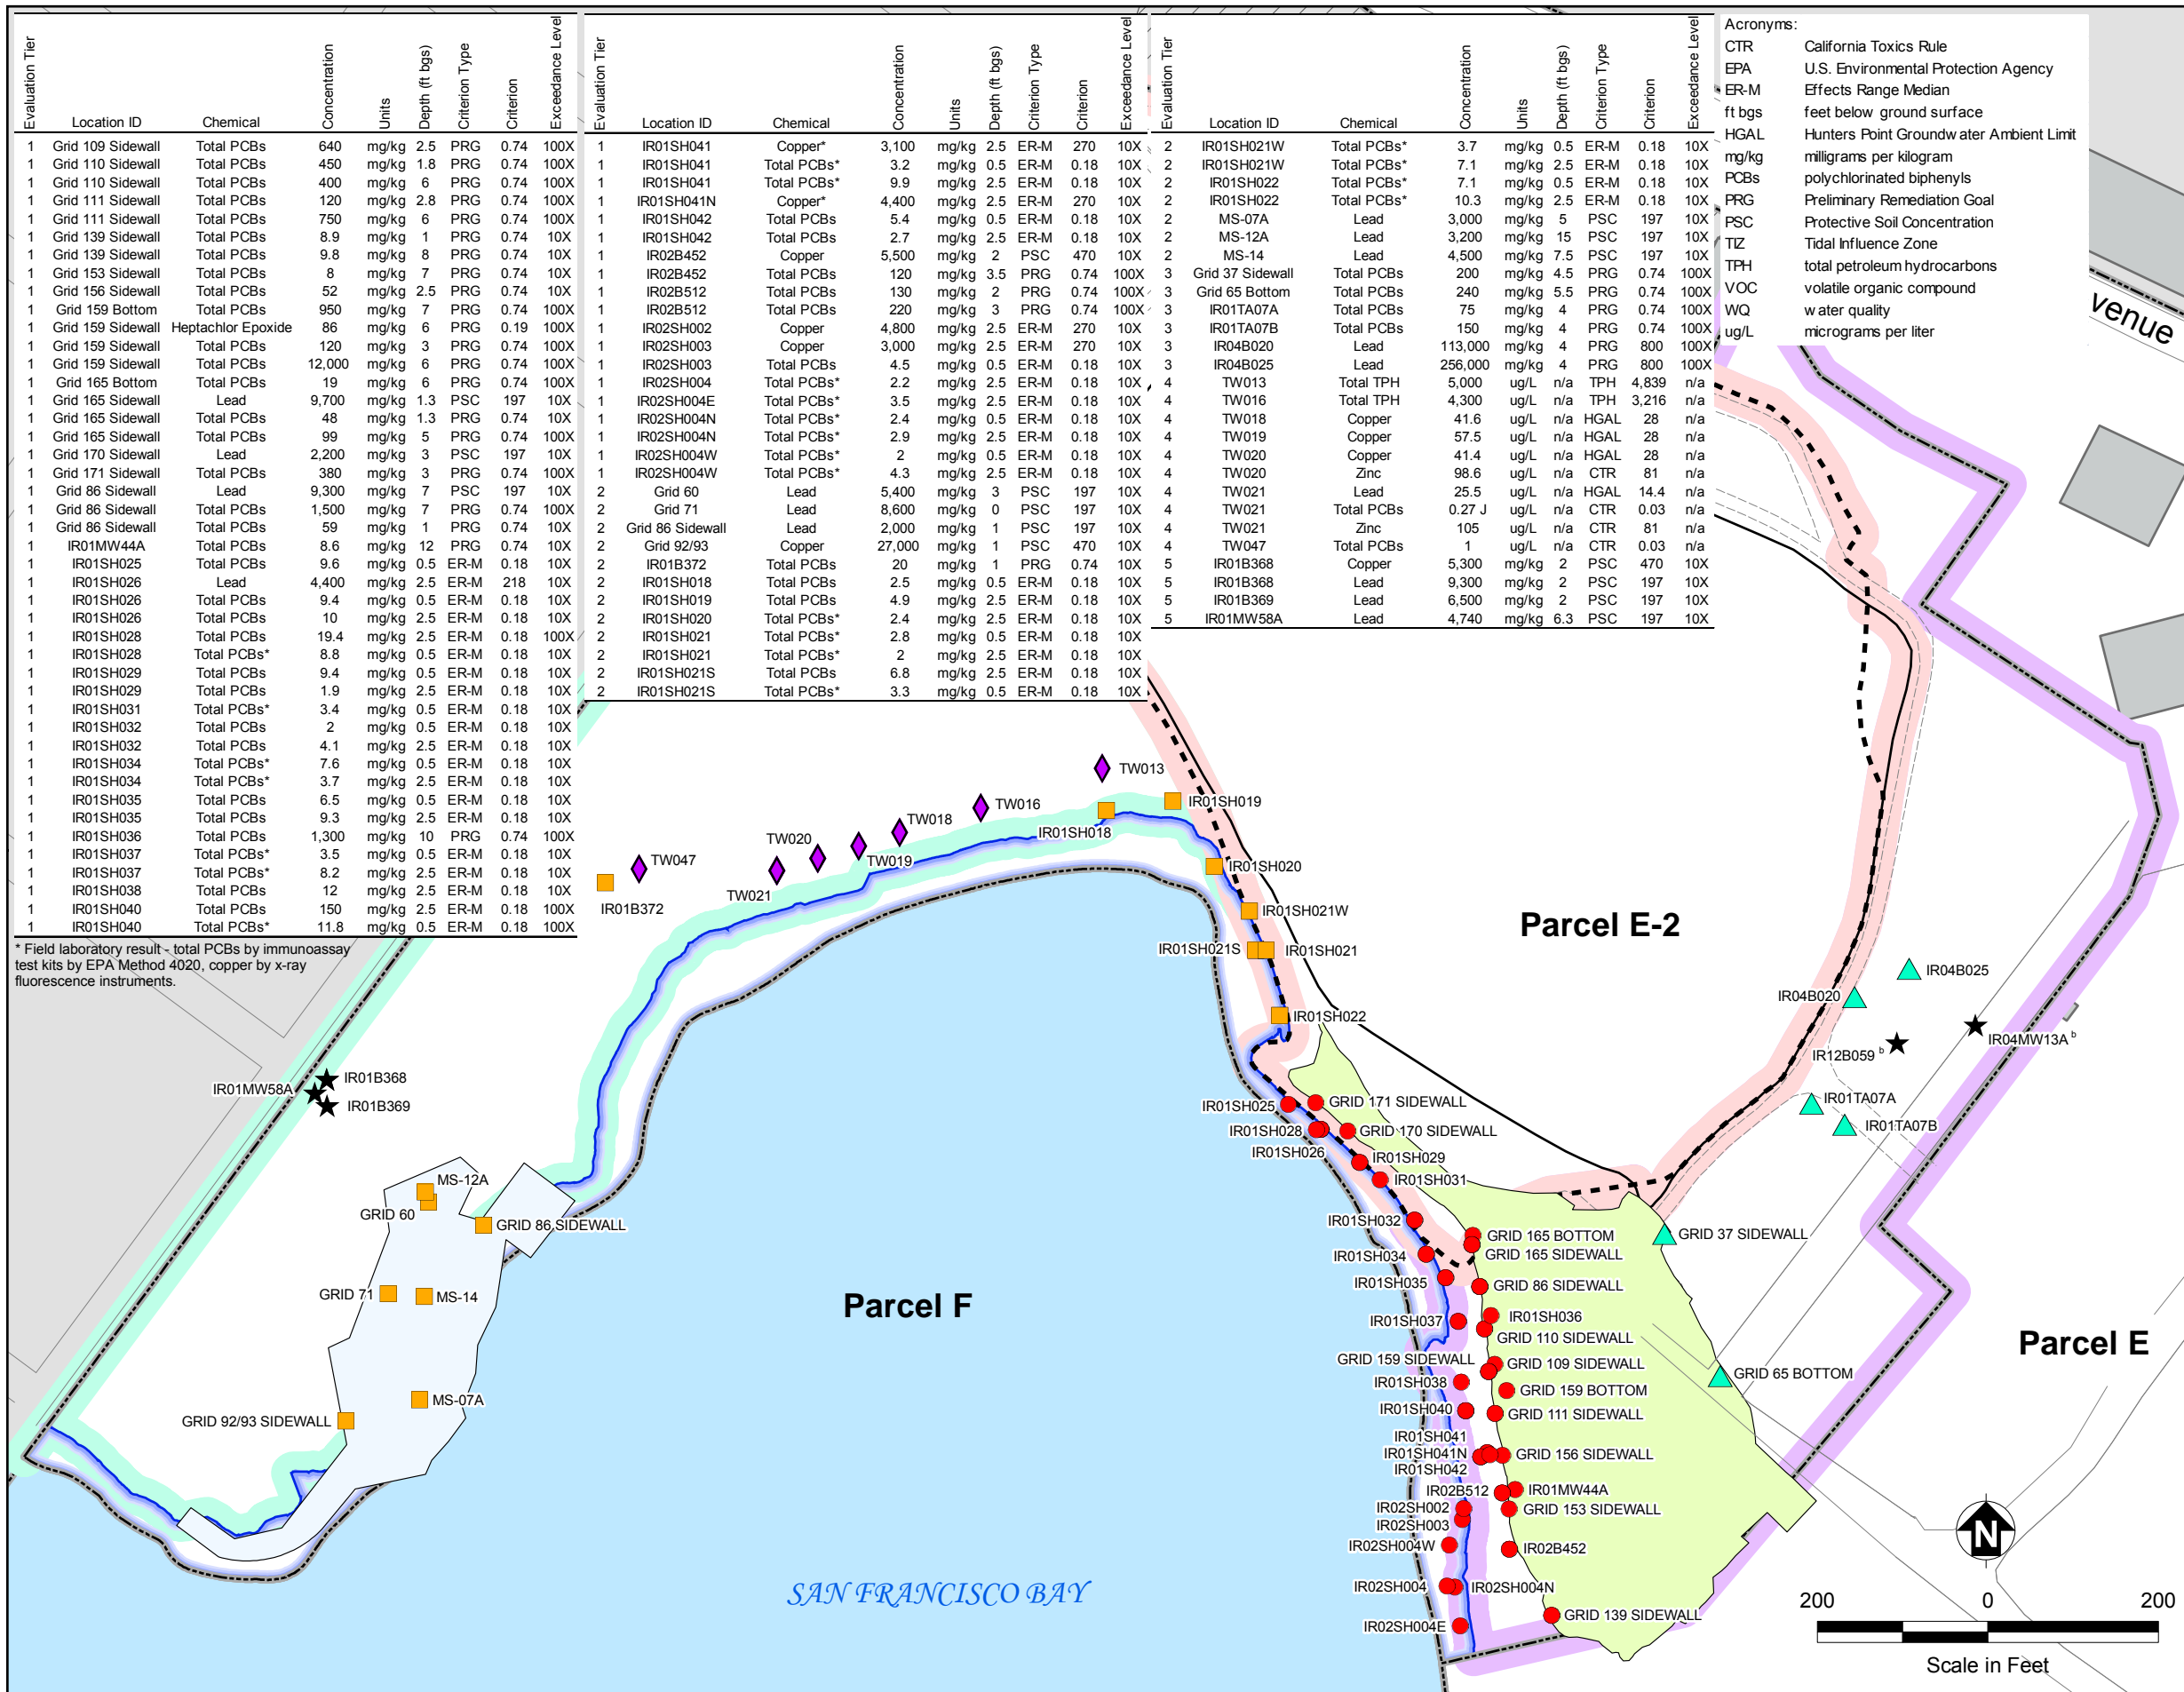

For Alternatives 2, 3, 4, and 5, post-excavation confirmation samples would be collected for analysis to verify that residual chemical concentrations were less than the hot spot goals. Upon receipt of acceptable confirmation sampling results, the excavations would be backfilled with clean imported soil in accordance with the final grading plan (discussed in [Sections 12.2.2.6 and 12.2.3.4](#)).

12.2. REMEDIAL ALTERNATIVES DEVELOPED FOR PARCEL E-2

This section describes each of the remedial alternatives selected for Parcel E-2. Common components for each alternative are discussed in [Section 12.1](#), and are only referred to in the following sections as appropriate. [Appendix R](#) of this report contains the cost estimates associated with each alternative.

12.2.1. Alternative 1: No Action

For this alternative, no remedial action would be taken. Solid waste, soil, sediment, surface water, and groundwater would be left in place without implementation of any response actions (including monitoring, institutional controls, containment, removal, treatment, or other mitigating actions). The no action alternative is included throughout the FS process as required by the NCP to provide a baseline for comparison with and evaluation of other alternatives.

Evaluation Tier	Location ID	Chemical	Concentration	Units	Depth (ft bgs)	Criterion Type	Criterion	Exceedance Level

with municipal wastes, which is one evaluation factor outlined in EPA presumptive remedy guidance (provided in [Appendix H](#) of this report). Based on the information presented in [Section 4.2.4](#), nearly all of the hazardous substances detected in Landfill Area soil were of a limited extent relative to the overall waste volume. Several SVOCs and PCBs, such as benzo(a)pyrene and total high risk PCBs, were detected throughout a large portion of the Landfill Area at concentrations exceeding the RIEC but at concentrations that were not indicative of hot spots. These findings demonstrate that lesser quantities of hazardous wastes are present in the landfill as compared with municipal-type waste and construction debris.

4.5.3.1. Identification of Potential Hot Spots

As discussed in [Section 4.1.3.4](#), soil hot spots are defined as locations containing chemical concentrations 100 times greater than the corresponding RIEC. Based on the information presented in [Sections 4.2.4](#), [4.3.2](#), and [4.4.2](#), the following potential hot spots were identified at Parcel E-2:

- Edges of PCB Hot Spot Area excavation within Landfill and East Adjacent Areas (0 to 10 feet bgs): 19 samples (18 locations) contained total high risk PCBs at concentrations greater than 100 times the RIEC (0.74 mg/kg). The majority of these locations were along the western and southwestern sidewall of the PCB Hot Spot Area excavation. As discussed in [Section 3.8.8](#), oil-stained soil and free-phase product were observed along and adjacent to this sidewall during the removal action. In addition, one of these 18 locations (Grid 159 sidewall) also contained heptachlor epoxide at a concentration greater than 100 times the RIEC (0.19 mg/kg).
- East Adjacent Area (2 to 10 feet bgs): Two samples (IR01TA07A and IR01TA07B, 4 feet bgs) contained total high risk PCBs at concentrations greater than 100 times the RIEC (0.74 mg/kg). IR01TA07A and IR01TA07B are located about 50 feet apart. Also, two samples (IR04B020 and IR04B025; both at a depth of 4 feet bgs) contained lead at concentrations greater than 100 times the RIEC (800 mg/kg). IR04B020 and IR04B025 are located about 70 feet apart.
- Landfill Area (2 to 10 feet bgs): One sample (IR01MW05A, 8 feet bgs) contained total high risk PCBs at a concentration greater than 100 times the RIEC (0.74 mg/kg). In addition, one sample (IR01MW02B, 9 feet bgs) contained 1,4-DCB at a concentration greater than 100 times the RIEC (0.13 mg/kg). Also, one sample (IR01B021A, 9 feet bgs) contained naphthalene at a concentration greater than 100 times the RIEC (1.5 mg/kg). These locations are over 300 feet apart.
- Landfill Area (greater than 10 feet bgs): Three samples (IR01MW17B, 11 feet bgs; IR01B012, 17 feet bgs; IR01B019, 16 feet bgs) contained total high risk PCBs at concentrations greater than 100 times the RIEC (0.74 mg/kg). These locations are more than 400 feet apart from each other.

The potential hot spots within the Landfill Area will be analyzed in further detail in [Section 8.2.3.2](#). The potential hot spots within the East Adjacent Area, as well as the western and southwestern sidewall of the PCB Hot Spot Area excavation, will be further evaluated in the FS portions of this report ([Sections 11 through 14](#)). Because of the inadequate delineation of most RIEC exceedances in the East Adjacent Area, additional characterization may be required for potential hot spots considered for removal in the FS.

practice bomb (TtECI, 2010). Of the 41 MPPEH items discovered in the removal area, 20 items were verified to not present an explosive hazard and were reclassified as MDAS. The remaining 21 MPPEH items appeared to have been subject to previous demilitarization actions and could not be completely inspected by UXO technicians for possible explosive hazards. Although the type, age, and condition of these 21 MPPEH items did not suggest a high potential for residual energetic material, the Navy, as a precautionary measure, properly handled, transported, and disposed of these items as either material documented as an explosive hazard (MDEH) (20 items consisting of expended cartridge casings of various calibers) or munitions and explosives of concern (MEC) (1 item. 3-pound practice bomb) (TtECI, 2010). The only reported munitions storage was at Building S-807 (located in the former Parcel A). This building was a bunker like concrete structure approximately 10 feet wide, 3 feet deep, and 5 feet high that was reportedly used by the Navy to store small caliber munitions for hand-held weapons (AFA and Golder, 1996). Based on this information, decontamination kits and munitions hardware, if present at all, likely would only be found in low proportion relative to other waste types and would be no more hazardous than some wastes found in municipal landfills.

The “low-hazard” military-specific wastes discussed above are distinct from “high-hazard” military-specific wastes, which include chemical warfare agents, artillery, bombs, and other military chemicals. Such high-hazard military-specific wastes may possess unique safety, risk, and toxicity characteristics that require special consideration (EPA, 1996). No anecdotal information, documentation, or physical evidence has been identified that such high-hazard military-specific wastes were ever used at HPS. Further, the shipyard’s primary mission of fleet repair and maintenance did not include weapons storage.

8.2.3.2. Conclusions for Characterization of Potential Hot Spots

Existing data are used to identify hot spots within a landfill and to determine if additional characterization and treatment of these hot spots is warranted. EPA guidance poses four specific questions for determining whether or not hot spots require characterization and treatment. If all of the questions can be answered in the affirmative, it is likely that characterization and treatment of hot spots is warranted (EPA, 1993a). The four questions outlined below include the Navy’s answers on the potential hot spots in the northern and central portions of the Landfill Area.

Does evidence exist to indicate the presence and approximate location of waste?: Yes. PCBs, 1,4-DCB, and naphthalene have been detected at concentrations greater than 100 times the RIEC at several locations within the Landfill Area.

Is the hot spot known to be a principal threat waste?: No. According to EPA guidance entitled “A Guide to Principal Threat and Low Level Threat Wastes” (EPA, 1991b), principal threat wastes are those source materials considered to be highly toxic or highly mobile that generally cannot be reliably contained or would present a significant risk to human health or the environment should exposure occur. The potential

hot spots identified within the northern and central portions of the Landfill Area were found to (1) be located at relatively deep depths (8 to 17 feet bgs); (2) not have migrated to A- or B-aquifer groundwater; (3) be located far from the Parcel E-2 shoreline (390 to 780 feet); and (4) not be connected with the PCB Hot Spot Area (where post-excavation conditions will prompt further analysis as recommended in the FS portions of this report). Based on this information, these potential hot spots are not highly mobile and can be reliably contained based on their depth and relative distance from the shoreline.

Is the waste in a discrete, accessible part of the landfill?: No. The potential hot spots in the northern and central portions of the Landfill Area are located at relatively deep depths (8 to 17 feet bgs) and within the solid waste (rather than at the edge of the waste).

Is the hot spot known to be large enough that its remediation will reduce the threat posed by the overall site, but small enough to consider removal?: No. Based on soil and groundwater data from surrounding areas, the potential hot spots in the northern and central portions of the Landfill Area are not considered large enough that remediation will reduce the potential risk posed by the Landfill Area. Further, these potential hot spots do not drive risk to human health or the environment because of their depth and lack of migration to groundwater.

These findings demonstrate that characterization and treatment of the potential hot spots within the northern and central portions of the Landfill Area is not warranted.

8.2.3.3. Conclusions for Risk Evaluations in Landfill Area

The quantitative HHRA and onshore SLERA determined that several locations in the Landfill Area contain chemical concentrations in soil that result in unacceptable levels of risk to human and ecological receptors. However, most of these areas (excluding the potential hot spots discussed in [Section 8.2.3.2](#)) contain chemical concentrations that are low relative to their corresponding risk-based thresholds (such as, human-health RBCs or ecological PSCs). In addition, areas with no data may contain chemical concentrations that would result in risks of the same relative magnitude as found elsewhere in the Landfill Area. Therefore, the solid waste and soil throughout the Landfill Area warrants analysis in the FS but this analysis can be focused, consistent with EPA's RI/FS process for CERCLA landfills, which includes guidance specific to military landfills ([EPA, 1996](#)).

As discussed in [Section 8.2.1.3](#), there are portions of the PCB Hot Spot Area that after the TCRA (1) extend into the Landfill Area and contain PCB concentrations in soil greater than 100 times the RIEC, (2) are in close proximity to San Francisco Bay, and (3) have affected groundwater conditions. Based on this information, conditions within the PCB Hot Spot Area are recommended for further analysis in the FS portions of this report. This evaluation may include hot spot removal and waste consolidation actions.

43	Remedial action objectives	Section 2.7	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 9, page 9-1. Record No. 4237.
----	----------------------------	-------------	---

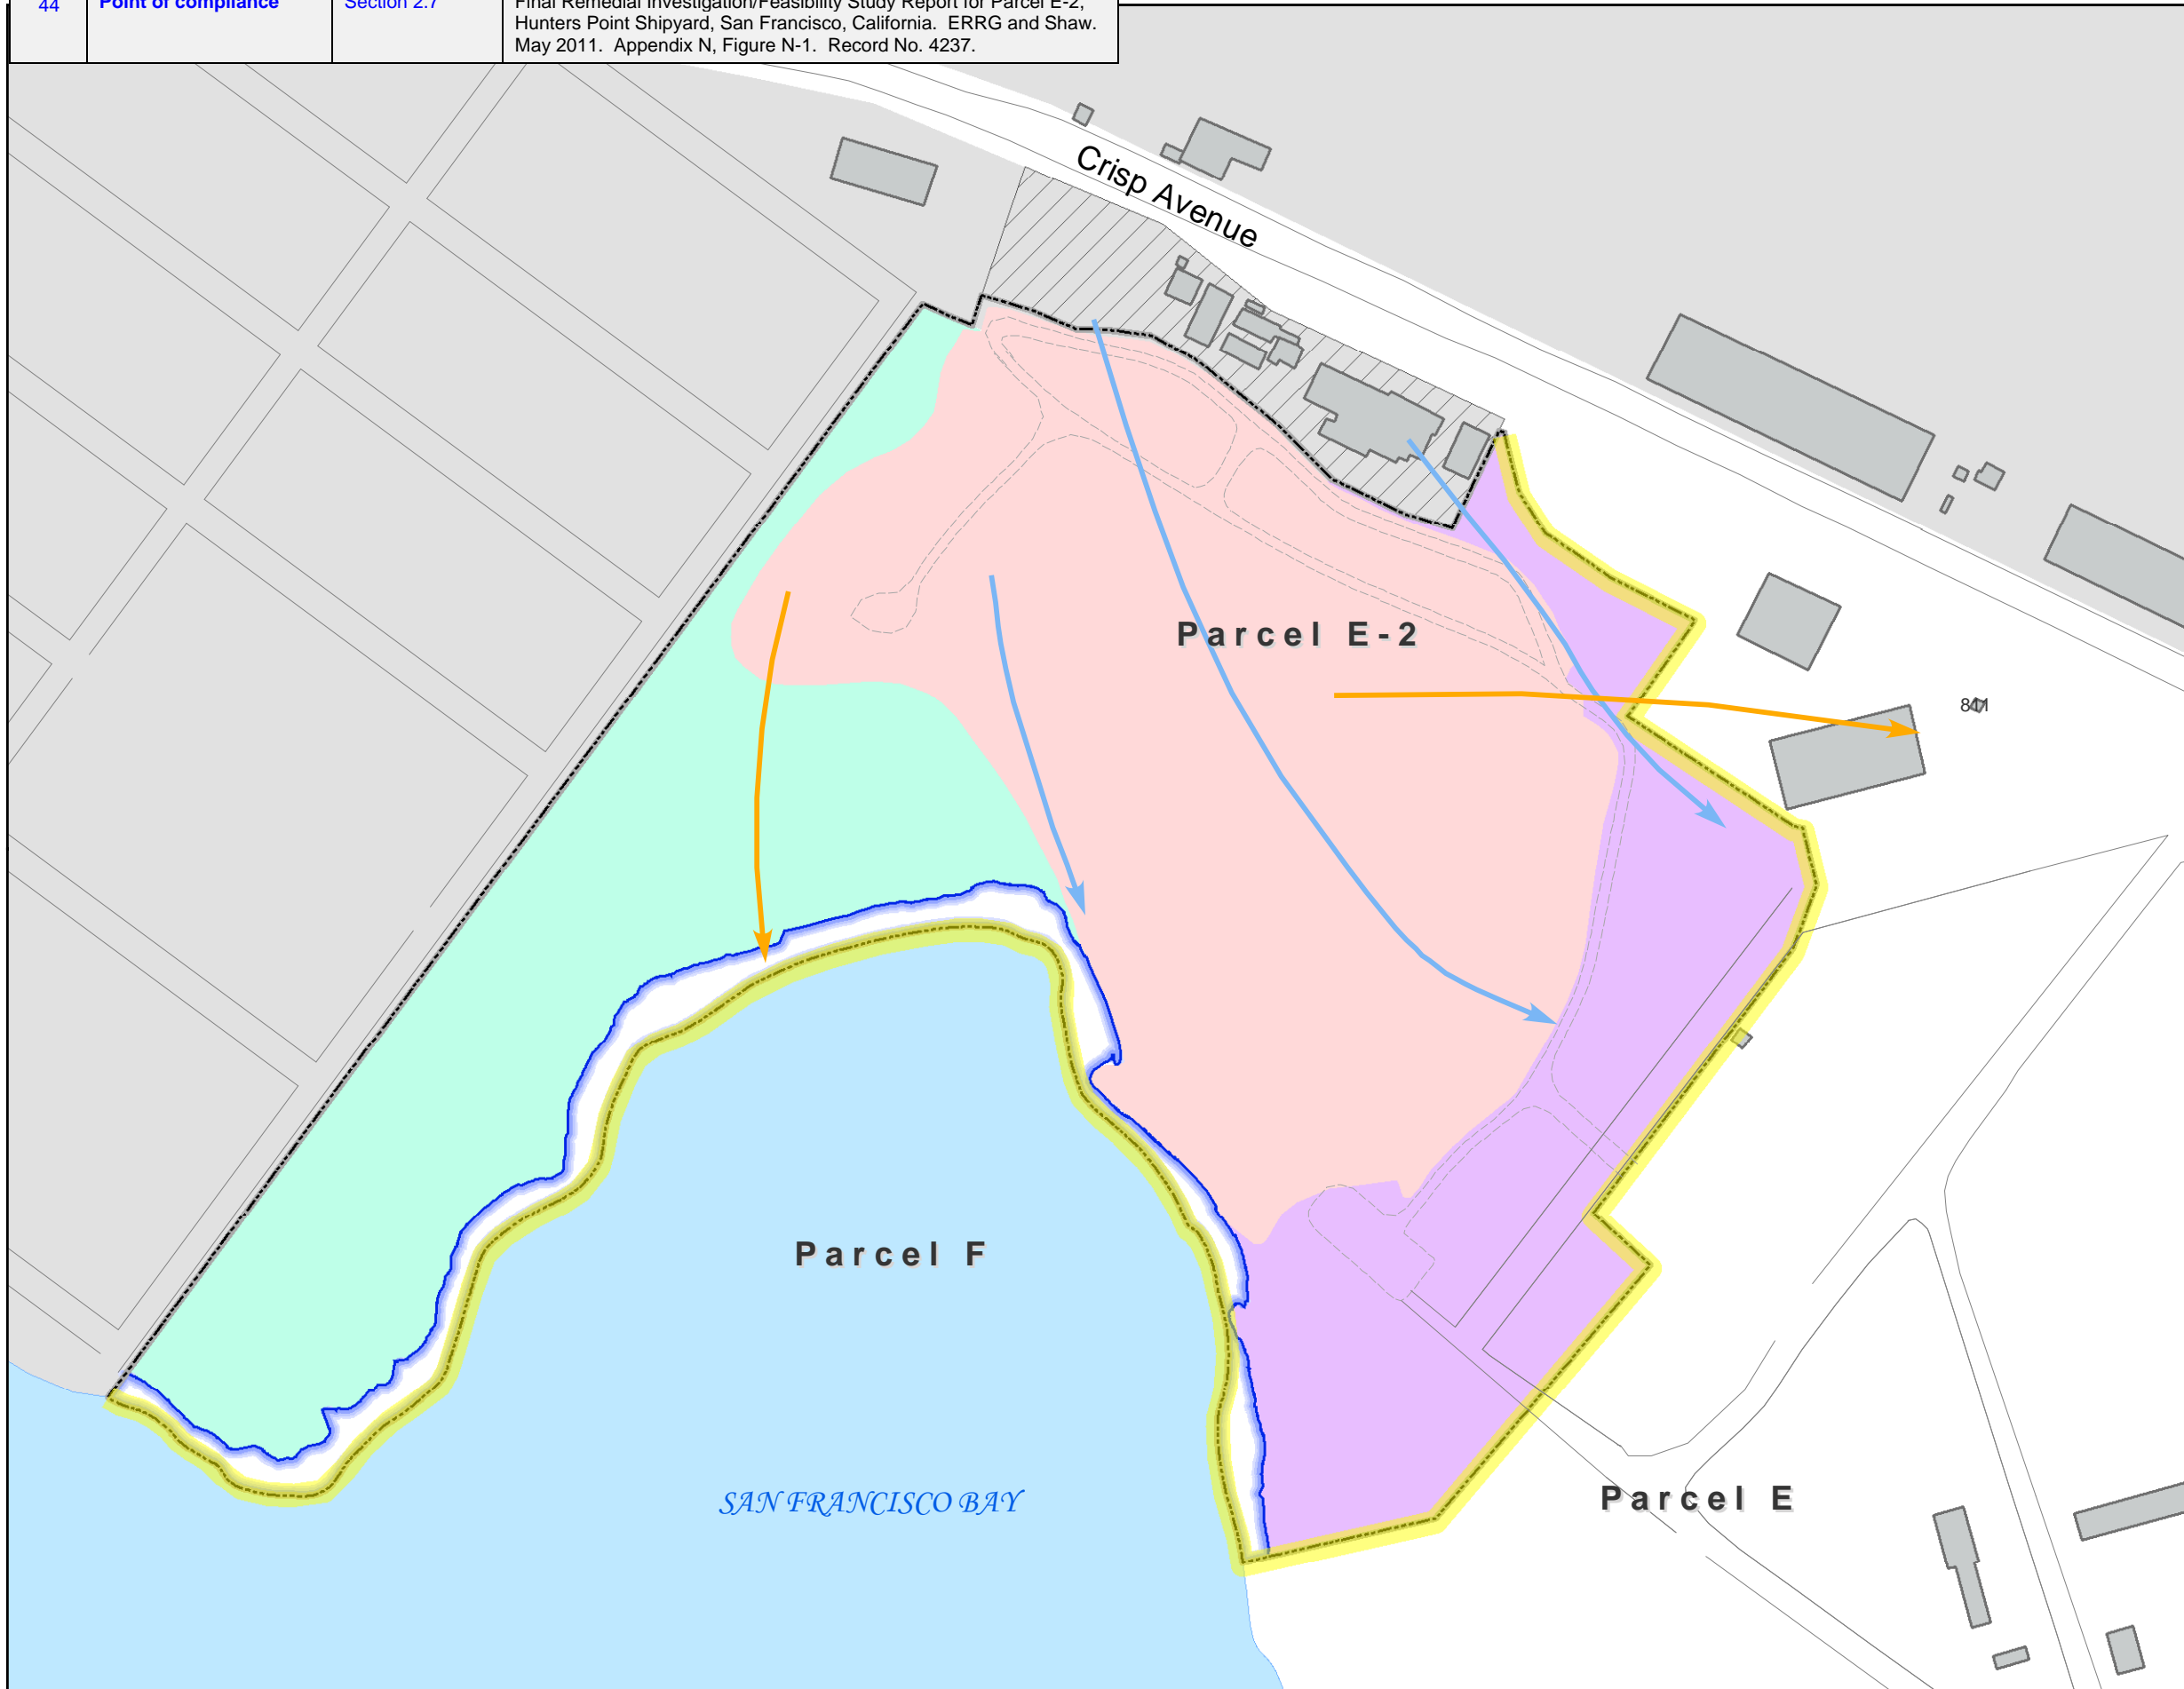

Section 9. Remedial Action Objectives

This section identifies RAOs for contaminated media at Parcel E-2, as identified in [Section 8](#), that will satisfy the remedial action goals for protecting human health and the environment. RAOs are medium-specific goals that specify (1) the COCs, (2) the exposure route(s) and receptor(s), and (3) an acceptable chemical concentration or range of concentrations for each exposure pathway and medium. RAOs include both an exposure pathway and a chemical concentration for a given medium because protectiveness can be achieved by either limiting (or eliminating) the pathway or by reducing (or eliminating) the chemical.

The RAO evaluation for Parcel E-2 is based on information from the RI field activities, subsequent environmental investigations, and risk assessments for human health and the environment. The NCP details the expectations for remedy selection in 40 CFR § 300.430 (a)(1)(iii). These expectations were used to evaluate RAOs for Parcel E-2. In addition, the U.S. Department of Defense integrates these NCP expectations with BRAC program objectives for expediting the transfer of U.S. Department of Defense property for reuse and development.

An important component of developing RAOs is the determination of future land use. According to EPA's land use directive ([EPA, 1995a](#)), RAOs "...should reflect the reasonably anticipated future land use or uses..." thereby allowing for the development of "alternatives that would achieve cleanup levels associated with the reasonably anticipated future land use..." of the site. The EPA land use directive states that "in cases where future land use is relatively certain, the RAOs generally should reflect this land use..." and "...need not include alternative land use scenarios..." ([EPA, 1995a](#)).

RAOs developed for Parcel E-2 are based on the city's reasonably anticipated future use of the property as described in the HHRA. According to the 2010 amended Redevelopment Plan, most of the planned reuse for Parcel E-2 is open space; however, a small area (about 0.42 acres) in the East Adjacent Area is designated as part of the Shipyard South Multi-Use District, which includes potential recreational, industrial, and residential reuse ([SFRA, 2010](#)). As discussed in [Section 1.8](#) and documented in the previous versions of the RI/FS Report published in 2007 and 2009, land uses other than open space were not anticipated prior to publication of the 2010 amended Redevelopment Plan. Based on the risk assessment results discussed in [Section 7.1.2.1](#), contamination is present in the 0.42-acre area at concentrations that pose an unacceptable risk for future recreational users, and a risk evaluation using more conservative exposure factors associated with potential residential reuse would have reached the same conclusion. Accordingly, this report evaluates remedial actions to address this potential risk.

- A-Aquifer Flow Direction (June 2004)
- B-Aquifer Flow Direction (February 2002)
- Groundwater Point of Compliance (A- and B-Aquifers)
- Parcel Boundary
- Landfill Area
- East Adjacent Area
- Panhandle Area
- Shoreline Area
- Non-Navy Property
- UCSF Compound
- Building
- Road
- Gravel Road

Notes:
 1. Point of compliance is the vertical surface located at the hydraulically downgradient limit of Parcel E-2 that extends through the B-aquifer.
 2. In areas where the point of compliance is located in an area with tidal mixing (e.g. A-aquifer areas at Parcel E-2 shoreline), the point of monitoring will be adjusted to ensure that groundwater quality is accurately monitored.

e From "Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (CTR) (EPA 2000) and "Water Quality Control Plan, San Francisco Bay Basin Region" (RWQCB 2007a). The most appropriate criteria were used.

f Criterion made more suitably protective by means of standard convention of lowering acute values by 80 percent and instantaneous values by 90 percent to make them more appropriate for use under chronic exposure scenarios.

g An acute criterion (EPA identified as Criteria Maximum Concentration [CMC]) is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed briefly without resulting in an unacceptable effect. The chronic concentration (EPA identified as Criterion Continuous Concentration [CCC]) is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed indefinitely without resulting in an unacceptable effect. The CMC and CCC are just two of the six parts of an aquatic life criterion; the other four parts are the acute averaging period, chronic averaging period, acute frequency of allowed exceedence, and chronic frequency of allowed exceedence. Because 304(a) aquatic life criteria are national guidance, they are intended to be protective of the vast majority of the aquatic communities in the United States.

h EPA National "AWQC Lowest Observed Effect Level (Chronic)" (RWQCB 2007b)

i EPA National "AWQC Lowest Observed Effect Level (Acute)" (RWQCB 2007b)

j EPA National "AWQC Lowest Observed Effect Level (Other)" (RWQCB 2007b)

k From "National Recommended Water Quality Criteria" (EPA 2006), unless otherwise noted.

l From "Final Technical Memorandum Estimation of Ambient Concentrations of Metals in Groundwater" (TiEMI 2001)

m In instances where criteria from "Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (EPA 2000) refer to the "Water Quality Control Plan, San Francisco Bay Basin Region" (RWQCB 2006), RWQCB 2006 criteria were used.

o Detailed application of this toxicity criterion may require the review and/or summation of analyte isomer, congener, or speciation results, as applicable. Please see applicable regulatory agency source document for additional detail.

Table M-1. Surface Water Screening Criteria *(continued)*
Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard

Footnotes (Continued):

The following lettered footnotes are derived from EPA "National Recommended Water Quality Criteria" (EPA 2006), Table 1 - Priority Toxic Pollutants (unless otherwise noted):

- A This recommended water quality criterion was derived from data for arsenic (III), but is applied here to total arsenic, which might imply that arsenic (III) and arsenic (V) are equally toxic to aquatic life and that their toxicities are additive. In the arsenic criteria document (EPA 440/5-84-033, January 1985), Species Mean Acute Values are given for both arsenic (III) and arsenic (V) for five species and the ratios of the SMAVs for each species range from 0.6 to 1.7. Chronic values are available for both arsenic (III) and arsenic (V) for one species; for the fathead minnow, the chronic value for arsenic (V) is 0.29 times the chronic value for arsenic (III). No data are known to be available concerning whether the toxicities of the forms of arsenic to aquatic organisms are additive.
- B This criterion has been revised to reflect The Environmental Protection Agency's q1* or RfD (Reference Dose), as contained in the Integrated Risk Information System (IRIS) as of May 17, 2002. The fish tissue bioconcentration factor (BCF) from the 1980 Am
- C This criterion is based on carcinogenicity of 10⁻⁶ risk. Alternate risk levels may be obtained by moving the decimal point (e.g., for a risk level of 10⁻⁵, move the decimal point in the recommended criterion one place to the right).
- D Freshwater and saltwater criteria for metals are expressed in terms of the dissolved metal in the water column. The recommended water quality criteria value was calculated by using the previous 304(a) aquatic life criteria expressed in terms of total recoverable metal, and multiplying it by a conversion factor (CF). The term "Conversion Factor" (CF) represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column. (Conversion Factors for saltwater CCCs are not currently available. Conversion factors derived for saltwater CMCs have been used for both saltwater CMCs and CCCs). See "Office of Water Policy and Technical Guidance on Interpretation and Implementation of Aquatic Life Metals Criteria," October 1, 1993, by Martha G. Prothro, Acting Assistant Administrator for Water, available from the Water Resource center, USEPA, 401 M St., SW, mail code RC4100, Washington, DC 20460; and 40CFR 131.36(b)(1). Conversion Factors applied in the table can be found in Appendix A to the Preamble- Conversion Factors for Dissolved Metals.
- F Freshwater aquatic life values for pentachlorophenol are expressed as a function of pH, and are calculated as follows: CMC = exp(1.005(pH)-4.869); CCC = exp(1.005(pH)-5.134). Values displayed in table correspond to a pH of 7.8.
- G This Criterion is based on 304(a) aquatic life criterion issued in 1980, and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endosulfan (EPA 440/5-80-046), Endrin (EPA 440/5-80-047), Heptachlor (EPA 440/5-80-052), Hexachlorocyclohexane (EPA 440/5-80-054), Silver (EPA 440/5-80-071). The Minimum Data Requirements and derivation procedures were different in the 1980 Guidelines than in the 1985 Guidelines. For example, a CMC derived using the 1980 Guidelines was derived to be used as an instantaneous maximum. If assessment is to be done using an averaging period, the values given should be divided by 2 to obtain a value that is more comparable to a CMC derived using the 1985 Guidelines.
- N This criterion applies to total polychlorinated biphenyls (e.g. the sum of all congener or all isomer or homolog or Aroclor analyses.)
- Q This recommended water quality criterion is expressed as mg free cyanide (as CN)/L.
- S This recommended water quality criterion for arsenic refers to the inorganic form only.
- U The organoleptic effect criterion is more stringent than the value for priority toxic pollutants.
- V This value was derived from data for heptachlor, and the criteria document provides insufficient data to estimate the relative toxicities of heptachlor and heptachlor epoxide.
- Y This value was derived from data for endosulfan and is most appropriately applied to the sum of alpha-endosulfan and beta-endosulfan.
- aa This criterion is based on a 304(a) aquatic life criterion issued in 1980 or 1986, and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endrin (EPA 440/5-80-047), Heptachlor (EPA 440/5-80-052), Polychlorinated biphenyls (EPA 440/5-80-068), Toxaphene (EPA 440/5-86-006). This CCC is currently based on the Final Residue Value (FRV) procedure. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60FR15393-15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria. Therefore, the Agency anticipates that future revisions of this CCC will not be based on the FRV procedure.
- bb This water quality criterion is based on a 304(a) aquatic life criterion that was derived using the 1985 Guidelines (Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses, PB85-227049, January 1985) and was issued in one of the following criteria documents: Arsenic (EPA 440/5-84-033), Cadmium (EPA-822-R-01-001), Chromium (EPA 440/5-84-029), Copper (EPA 440/5-84-031), Cyanide (EPA 440/5-84-028), Lead (EPA 440/5-84-027), Nickel (EPA 440/5-86-004), Pentachlorophenol (EPA 440/5-86-009), Toxaphene, (EPA 440/5-86-006), Zinc (EPA 440/5-87-003).
- cc When the concentration of dissolved organic carbon is elevated, copper is substantially less toxic, and use of Water-Effect Ratios might be appropriate.
- dd The selenium criteria document (EPA 440/5-87-006, September 1987) provides that if selenium is as toxic to saltwater fishes in the field as it is to freshwater fishes in the field, the status of the fish community should be monitored whenever the concentration of selenium exceeds 5.0 Fg/L in salt water because the saltwater CCC does not take into account uptake via the food chain.
- ee This recommended water quality criterion was derived on page 43 of the mercury criteria document (EPA 440/5-84-026, January 1985). The saltwater CCC of 0.025 ug/L given on page 23 of the criteria document is based on the Final Residue Value procedure in the 1985 Guidelines. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60FR15393-15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria.
- ff This recommended water quality criterion was derived in *Ambient Water Quality Criteria Saltwater Copper Addendum* (draft, April 14, 1995) and was promulgated in the Interim final National Toxics Rule (60 FR 22228-22237, May 4, 1995).
- gg EPA is actively working on this criterion, and so this recommended water quality criterion may change substantially in the near future.
- hh This recommended water quality criterion was derived from data for inorganic mercury (II), but is applied here to total mercury. If a substantial portion of the mercury in the water column is methylmercury, this criterion will probably be under protective. In addition, even though inorganic mercury is converted to methylmercury and methylmercury bioaccumulates to a great extent, this criterion does not account for uptake via the food chain because sufficient data were not available when the criterion was derived.
- ii This criterion applies to DDT and its metabolites (that is, the total concentration of DDT and its metabolites should not exceed this value.)

The following lettered footnotes are derived from EPA "Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (EPA 2000).

- jj Criteria revised to reflect the EPA q1* or RfD, as contained in the Integrated Risk of RID, as contained in the IRIS as of October 1, 1996. The fish tissue bioconcentration factor (BCF) from the 1980 documents was retained in each case (originally footnote c in the CTR)
- kk Criteria are based on carcinogenicity of 10⁻⁶ risk. (Originally footnote c in CTR)
- ll This criterion is based on 304(a) aquatic life criterion issued in 1980, and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endosulfan (EPA 440/5-80-046), Endrin (EPA 440/5-80-047), Heptachlor (440/5-80-052), Hexachlorocyclohexane (EPA 440/5-80-054), Silver (EPA 440/5-80-071). The Minimum Data Requirements and derivation procedures were different in the 1980 Guidelines than in the 1985 Guidelines. For example, a "CMC" derived using the 1980 Guidelines was derived to be used as an instantaneous maximum. If assessment is to be done using an averaging period, the values given should be divided by 2 to obtain a value that is more comparable to a CMC derived using the 1985 Guidelines (originally footnote g in the CTR).
- mm Criteria for these metals are expressed as a function of the water-effect ratio (WER) (originally footnote i in the CTR).
- nn No criterion for protection of human health from consumption of aquatic organisms (excluding water) was presented in the 1980 criteria document or in the 1986 Quality Criteria for Water. Nevertheless, sufficient information was presented in the 1980 document to allow a calculation of a criterion, even though the results of such a calculation were not shown in the document (originally footnote j in the CTR).
- oo These freshwater and saltwater criteria for metals are expressed in terms of the dissolved fraction of the metal in the water column. Criterion values were calculated by using EPA's Clean Water Act 304(a) guidance values (described in the total recoverable fraction) and then applying the conversion factors in § 131.36(b)(1) and (2) (originally footnote m in the CTR).
- pp These criteria were promulgated for specific waters in California in the National Toxics Rule ("NTR"), at § 131.36. The specific waters to which the NTR criteria apply include: Waters of the State defined as bays or estuaries and waters of the State defined as inland, i.e., all surface waters of the State not ocean waters. These waters specifically include the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. This section does not apply instead of the NTR for this criterion (originally footnote o in the CTR).
- qq These criteria were promulgated for specific waters in California in the NTR. The specific waters to which the NTR criteria apply included: Waters of the State defined as bays or estuaries including the San Francisco Bay upstream to and including Suisun
- rr PCBs are a class of chemicals that include Aroclors 1242,1254,1221,1232,1248,1260, and 1016. The aquatic life criteria apply to the sum of this set of seven Aroclors (originally footnote u in the CTR).
- ss This criterion has been recalculated pursuant of all congener or isomer or homolog or Aroclor analyses.

The following numbered footnotes are derived from "A Compilation of Water Quality Goals" (RWQCB 2007b). These footnotes directly correlate with the source document.

- 1 Expressed as dissolved
- 2 Expressed as total recoverable.

- 29 For dichloropropenes
- 38 Toxicity to algae occurs
- 45 For sum of phthalate esters
- 48 For chlorinated naphthalenes
- 51 From U.S. Environmental Protection Agency, *Quality Criteria for Water* (1976) "The Red Book," and also appears in current list of recommended criteria.
- 52 For polynuclear aromatic hydrocarbons
- 53 For dinitrotoluenes
- 56 For nitrosamines
- 68 Draft / tentative / provisional; applies only to second value if two separate values are listed; applies to range if a range of values is listed.
- 82 A decrease in the number of algal cells occurs.
- 83 Adverse effects on a fish species exposed for 168 days.
- 88 For nitrophenols
- 95 For the pentavalent form
- 113 Based on carcinogenicity at 1-in-a-million risk level.
- 114 Developed as 24-hour average using 1980 EPA guidelines, but applied as 4-day average in the National Toxics Rule.

Table M-1. Surface Water Screening Criteria *(continued)*
Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard

Footnotes (Continued):

115	Criterion most appropriately applied to the sum of alpha-endosulfan and beta-endosulfan.
116	Applies separately to Aroclors 1242, 1254, 1221, 1232, 1248, 1260, and 1016; based on carcinogenicity at 1-in-a-million risk level.
136	Draft Chronic Criterion: The concentration of selenium in whole-body fish tissue should not exceed 7.91 ug/g dw (dry weight). In addition, if whole-body fish tissue concentrations exceed 5.85 ug/g dw during summer or fall, fish tissue should be monitored during the winter to determine whether the selenium concentration exceeds 7.91 ug/g dw.
137	Expressed as free cyanide (as CN).
140	Criterion derived from data for inorganic mercury (II), but is applied to total mercury. It will probably be underprotective if a substantial portion of mercury in the water column is methylmercury. Derivation of criterion did not consider exposure through the diet, which is probably important for aquatic life occupying upper trophic levels.
142	Criteria do not apply to waters subject to water quality objectives in Tables III-2A and III-2B of the San Francisco Bay Regional Water Quality Control Board's 1986 Basin Plan.
143	These criteria were promulgated for specific California waters in the National Toxics Rule.
144	The ambient level was set at or below the minimum reported detection limit.
145	The ambient concentration represents the 95th percentile of the distribution. Additionally, the 95th percentile of the distribution was calculated using distribution dependent formulae. For normal and lognormal distributions, the 95th percentile calcula

46	General response actions and remedial technologies	Section 2.8	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Sections 11.1 and 11.2, pages 11-3 through 11-6; Figure 11-1. Record No. 4237.
----	---	-------------	--

In the Application of the CERCLA Municipal Presumptive Remedy to Military Landfills (provided in [Appendix H](#) to this RI/FS Report), EPA examined 31 RODs that document the remedial decisions for 51 landfills at military installations (EPA, 1996). Of the 51 landfills, only 41 required remedial action. Of the 41 landfills, containment was the remedy at 23 landfills (56 percent of the sites). At the 18 landfills where other remedies were selected, institutional controls were implemented at 3 sites, excavation and on-site consolidation was selected for 4 sites, and excavation and off-site disposal was selected for 11 sites. The military also reports that, of the 41 landfill sites evaluated, 27 were greater than 1 acre in size and of those 27 sites, containment was recommended for 23 sites (85 percent). This information suggests that the size of the landfill is an important factor in determining whether containment is implemented.

As presented in [Section 8.8](#), the Parcel E-2 Landfill meets all of the criteria specified in EPA guidance (EPA, 1996) for application of the containment presumptive remedy. However, the Navy has agreed to evaluate excavation of the landfill as part of this report to provide information to support the community's review of potential remedial alternatives for Parcel E-2. Therefore, the remedial technologies and process options identified and screened in this section are limited to those related to the containment and removal GRAs.

Evaluation of the containment GRA also includes addressing groundwater in Parcel E-2 and leachate emanating from the Parcel E-2 Landfill. This evaluation is provided for completeness, despite the uncertainty of the risk to humans and wildlife from exposure to groundwater, and as a formal evaluation of the current GES in the southeast portion of Parcel E-2 (that was installed as part of an interim action).

11.1. APPLICABLE GENERAL RESPONSE ACTIONS

This subsection describes the GRAs to be evaluated for achieving the Parcel E-2 RAOs ([Section 9](#)). The RAOs were established to address potential exposure pathways that could affect human health and the environment from affected media at Parcel E-2. The GRAs presented on the following page have been selected for Parcel E-2 media.

As shown in the table on the following page, all affected media are evaluated for both the institutional action and containment action GRAs, except for surface water. As discussed in [Section 6.2.5](#), surface water runoff (including runoff from freshwater wetlands located in the Panhandle Area) can be contaminated through surface erosion and could result in unacceptable exposures to aquatic life in the San Francisco Bay. However, this potential exposure can be effectively controlled by management (through implementation of BMPs), and monitoring of surface water runoff should be evaluated as part of any remedial alternative that leaves contaminated soil in place. Therefore, only institutional actions are evaluated for potentially affected surface water at Parcel E-2.

GRA	General Description	Applicable Media
No Action	No-action GRA is required by the NCP; used as a baseline for comparison	Solid waste, soil, sediment, landfill gas, groundwater, and surface water
Institutional Actions	Includes institutional controls, engineering controls, and site monitoring	Solid waste, soil, sediment, landfill gas, groundwater, and surface water
Containment Actions (with or without collection, treatment, and/or disposal)	Includes technologies that isolate media to reduce or eliminate exposure to, and off-site migration of surface and subsurface contaminants	Solid waste, soil, sediment, landfill gas, and groundwater
Removal Actions	Includes removal of contaminated media for treatment and/or disposal on or off site; exposure risk and migration potential are diminished by eliminating or reducing the contaminant source	Solid waste, soil, and sediment

The following subsections describe the GRAs appropriate for addressing contaminated media at Parcel E-2 in more detail.

11.1.1. No Action

Consideration of the no action GRA is required by the NCP and is used as a baseline against which other remedial actions are compared.

11.1.2. Institutional Actions

Actions that can be taken to limit exposure to hazardous chemicals in media at Parcel E-2 include both institutional and engineering controls. In addition, site monitoring can be used to track the effectiveness of the remedy alternative or to verify that hazardous chemicals in media at the site do not migrate and affect human or ecological receptors.

Institutional controls, as defined by the U.S. Department of Defense (DoD) (2001), are nonengineering measures limiting potential exposures to a site or medium of concern or ensuring that engineering measures designed to remediate a site, or limit access to a site, remain in place. Similarly, EPA defines institutional controls as “non-engineering measures designed to prevent or limit exposure to hazardous substances left in place at a site, or assure effectiveness of a selected remedy” (EPA, 2000c).

Engineering controls are implemented technologies that serve to reduce exposure to chemicals in media. Examples of engineering controls include fencing and other physical barriers, which can be effective in limiting access to contaminated media.

Under CERCLA, site monitoring is a required component for any site remedy. Short-term monitoring is conducted to ensure that potential risks to human health and the environment are controlled while a site remedy is being implemented. Long-term monitoring can be used to track site chemicals after an active remedial technology has been used or to ensure that hazardous chemicals are not migrating off site at concentrations that might affect humans or the environment.

11.1.3. Containment Actions (With or Without Collection, Treatment, and Disposal)

Containment actions include technologies that isolate contaminated media from humans and wildlife. For contaminated solid waste, soil, and sediment, containment technologies are meant to minimize disturbance to the surfaces of those media and to reduce or eliminate off-site migration of surface and subsurface chemicals. These actions are effective at preventing direct contact with these media, as well as their migration by surface water, air (wind erosion), subsurface air (landfill gas), or groundwater.

Containment technologies for unlined landfill waste and soil typically include surface controls, such as runoff controls, erosion controls, and capping. Process options include the various types of caps, shoreline protection options, and drainage enhancements.

Containment of landfill gas is typically achieved by collection and treatment of landfill gas through a gas control system, which can minimize or prevent off-site subsurface migration and accumulation of the gas above explosive concentrations. Process options include passive gas venting and active gas collection.

Containment actions for groundwater refer to actions that isolate the chemical source or affected groundwater from downgradient areas to prevent further migration of chemicals. Technologies typically used for groundwater containment include physical barriers (such as sheet pile or slurry walls), hydraulic barriers (groundwater flow diversion structures or such as extraction wells), and reactive walls (such as permeable reactive barriers [PRB]). Depending on the chemical concentrations present, groundwater collected with hydraulic barriers can be disposed of off site, discharged to the surface, discharged to a publicly owned treatment facility for additional treatment, or reinjected into the ground after treatment. Numerous technologies are used for water treatment, most of which are chemical- and site-specific.

11.1.4. Removal Actions

Removal actions refer to removing contaminated media from a site to significantly reduce or eliminate the risk of exposure to humans and wildlife. Removal actions for contaminated solid waste, soil, and sediment would require excavation and disposal at an off-site facility approved to receive the waste, or consolidation with the existing on-site waste.

11.2. EVALUATION CRITERIA FOR TECHNOLOGIES AND PROCESS OPTIONS

Technologies and associated process options selected for this evaluation were screened using the following three criteria:

- **Effectiveness:** Effectiveness is a judgment regarding the potential for the technology and process options to address the area and volume of contaminated media adequately and reliably. It also identifies any effects to human health and the environment caused by implementation of the technology.
- **Implementability:** Implementability is an evaluation of the technical appropriateness and the administrative implementability of the technology for the contaminated media.
- **Cost:** Cost is an approximation of the dollar value of the project; it is neither a bid cost nor an engineer's estimate and, in some cases, is a relative cost (high, medium, or low) rather than a quantified value.

Two issues in evaluating effectiveness and implementability of all of the technologies and process options are future land use and local climate. According to the 2010 amended Redevelopment Plan, most of the planned reuse for Parcel E-2 is open space. A small area (about 0.42 acres) in the East Adjacent Area is designated as part of the Shipyard South Multi-Use District, which includes potential recreational, industrial, and residential reuse (SFRA, 2010).

The following subsections describe remedial technologies and process options under each GRA that are appropriate for addressing solid waste, soil, sediment, landfill gas, groundwater, and surface water at Parcel E-2. The GRAs evaluated are no action (Section 11.3), institutional actions (Section 11.4), containment (with or without collection, treatment, and disposal) (Section 11.5), and removal (Section 11.6). Each process option within the GRA is discussed for each media if applicable. The evaluation of the remedial technologies and process options is presented on Figure 11-1.

11.3. NO ACTION

As discussed above, the NCP requires evaluation of the no action response for all media to provide a baseline for comparison with other response actions. Under this GRA, no additional action would be taken to address:

- Contaminated solid waste and soil in the Landfill Area and isolated solid waste, soil, and sediment in the Panhandle Area, East Adjacent Area, and Shoreline Area (as described in Section 2, a portion of the Landfill Area has been capped with an engineered multilayer cap, and the remainder has been covered with an approximately 2-foot-thick layer of soil)
- Landfill gas
- Groundwater
- Surface water

Medium	General Response Action	Remedial Technology	Process Options	Description	Comments	Effectiveness	Implementability	Cost	Retained for Analysis?		
Solid Waste and Soil in Landfill, Panhandle, and East Adjacent Areas Sediment in Shoreline Area	No Action	None	None	No additional action would be taken to address solid waste and soil in the Landfill Area, Panhandle Area or East Adjacent Area, or sediment in the Shoreline Area.	Required by the NCP and is used as a baseline against which other response actions are compared - would not meet RAOs.	Low	High	No Cost	Yes		
			Institutional Actions	Institutional Controls	Legal Mechanisms (Restrictive Covenants, Negative Easements, Deed Notifications)	Legal and administrative mechanisms used in combination to enforce various land use restrictions such as: <ul style="list-style-type: none"> Restrict the use of the parcel to open space Require maintenance of control systems Maintain the integrity of covers (or access restrictions where covers are not present) Require development of a soil and groundwater management plan to be implemented during all intrusive site activities (such as, subsurface construction) 	Institutional controls would be integral to and highly effective at maintaining the integrity of any final remedy, and are likely to be included as a part of any alternative that leaves landfill solid waste or other hazardous substances in place.	High	High	Low	Yes
					Administrative Mechanisms (Land Use Plans, Soil & Groundwater Procedures & Policies, Construction Permitting, Public Notices & Educational Materials)						
	Engineering Controls (i.e. to limit/restrict access)	Signs (Warning & No Trespassing)	Engineering controls are physical mechanisms that serve to restrict access and potential exposure to contaminated media. Process options include warning and no trespassing signs, engineered barriers to vehicular traffic and perimeter fencing to reduce the potential for direct human contact with contaminated media.	Access restrictions conflict with future open space reuse; to be used during implementation of other remedial technologies.	Low (if used as part of a permanent remedy) High (if used during implementation of an active remediation technology)	Low (if used as part of a permanent remedy) High (if used during implementation of an active remediation technology)	Low	No (not effective as part of permanent remedy; conflicts with planned open space reuse)			
		Traffic Barriers & Perimeter Fencing									
	Site Monitoring	Short-Term Monitoring	Short-term monitoring involves outdoor air monitoring during construction that may disturb contaminated solid waste, soil, or sediment. Long-term monitoring includes operation and maintenance of control systems (such as, inspection and maintenance of caps/covers).	Although monitoring alone would not achieve RAOs, short-term and long-term monitoring would be integral components in any remedial alternative implemented at Parcel E-2.	Low	High	Low	Yes			
		Long-Term Monitoring									
	Containment	Caps/Covers	Low-Permeability Soil Cap	The low-permeability soil cap system (Title 27 cover, prescriptive standard) includes a low-permeability soil layer (such as clay) at least 12 inches thick with a maximum permeability of 1×10^{-9} cm/sec or equal to the hydraulic conductivity of the base liner system.	Limited local sources of low-permeability soil; costly to purchase and import large volumes of suitable low-permeability soils.	High	Moderate-High	Moderate-High	Yes (for potential focused application at freshwater wetlands)		
			Geosynthetic Cap	The geosynthetic cap system (Title 27 cover, engineered alternative) would include a 60-mil-thick HDPE geomembrane in place of the low-permeability soil layer (typical permeability is 1×10^{-13} cm/sec)	Highly effective and implementable with proper QA/QC, skilled labor, and appropriate supplies and equipment.	High	High	Moderate	Yes		
			Multilayer Geosynthetic Cap	The multilayer geosynthetic cap system includes a composite low-permeability layer consisting of an HDPE geomembrane at least 60 mils thick over a GCL (typical permeability of GCL is 5×10^{-9} cm/sec)	Already installed over a portion of the waste area; highly effective and implementable with proper QA/QC, skilled labor, and appropriate supplies and equipment.	High	High	Moderate-High	Yes		
			Evapotranspiration Cap	An evapotranspiration cap is typically a 4- to 6-foot-thick soil layer over a soil foundation layer; it acts to store moisture within the cap thickness, while minimizing infiltration, until the moisture is removed through vegetative uptake or evaporation.	Diminished effectiveness in temperate climates; ideal in arid or semi-arid climates; would require importation of a significant amount of cover soil and may encroach on neighboring property.	Moderate	Low	Moderate to High	No (not implementable given limited space and temperate climate)		
			Shoreline Protection *	Armoring	Armoring includes seawalls, bulkheads, and protective revetments.	Armoring would protect the containment systems from erosion, and allow freshwater wetlands to be established in the Panhandle Area.	High	High	High	Yes	
				Shoreline Stabilization	Shoreline stabilization includes man-made structures (such as nearshore breakwaters and reefs) or natural material (such as vegetation or sand fill) used to moderate the coastal sediment transport processes and reduce the local erosion rate.	Shoreline stabilization would be effective in areas planned for tidal wetlands restoration.	Moderate	High	Moderate to High	Yes	
				Shoreline Nourishment	Shoreline nourishment can include berms, dunes, feeder beach, nearshore berm, dune stabilization, or structural stabilization.	Inadequate area for proper implementation; would not prevent erosion.	Low	Low	Moderate	No (not implementable within narrow Shoreline Area)	
	Removal	Excavation	Excavation/Off-Site Disposal 1. Landfill Area 2. Soil in adjacent areas	Excavation and off-site disposal of all solid waste and contaminated soil in the Landfill Area, and contaminated soil/sediment in Panhandle, East Adjacent, and Shoreline Areas that may pose a risk to human health and the environment	Multiple issues associated with excavation and transport of such a large volume of landfill solid waste and soil. Primary hot spots consist of liquid and highly toxic wastes in the PCB Hot Spot shoreline; additional removal at other locations in the Panhandle and East Adjacent Areas to enhance performance of remedy..	Moderate-High	Low-Moderate	Very High	Yes (to support community review of potential remedies)		
Excavation/Off-Site Disposal 1. Hot spots in adjacent areas 2. Incidental LLRW			Excavation and off-site disposal of hot spots in Panhandle, East Adjacent, and Shoreline Areas (including LLRW encountered during hot spot excavation activities)	Hot spots are not mobile and planned leachate collection/treatment system is considered adequate but not as robust as off-site disposal facilities	High	High	Moderate to High	Yes			
Excavation/On-Site Consolidation of hot spots in adjacent areas (with off-site disposal of incidental LLRW)			Excavation of hot spots in Panhandle, East Adjacent, and Shoreline Areas with off-site disposal of LLRW and on-site consolidation of non-radiological hot spot material	Specific hot spot removal areas include surface soils in the Metal Slag Area, soils along the PCB Hot Spot shoreline, soils along the Landfill Area Shoreline, and soils from various inland locations in the Panhandle and East Adjacent Areas.	Moderate	Moderate	Moderate	No (potential issues with administrative implementability)			
Excavation/On-Site Consolidation of contaminated material in adjacent areas (with off-site disposal of incidental LLRW)			Excavation of solid waste and contaminated soil/sediment in Panhandle, East Adjacent, and Shoreline Areas, as needed to meet design requirements of a containment process option (for example, stable slopes along shoreline and altered topography to support wetlands restoration), with off-site disposal of LLRW and on-site consolidation of non-radiological material		High	High	Moderate	Yes

 Results of Remedial Technologies and
 Process Options Evaluation

Remedial Investigation/Feasibility Study for Parcel E-2

Medium	General Response Action	Remedial Technology	Process Options	Description	Comments	Effectiveness	Implementability	Cost	Retained for Analysis?	
Landfill Gas in Parcel E-2	No Action	None	None	No additional action would be taken to remove or treat landfill gas.	Required by the NCP and is used as a baseline against which other response actions are compared – would not meet RAOs.	Low	High	No Cost	Yes	
			Institutional Actions	Institutional Controls	Legal Mechanisms (Restrictive Covenants, Negative Easements, Deed Notifications)	Legal and administrative mechanisms used in combination to enforce various land use restrictions such as: • Require maintenance of control systems • Ensure compliance with 27 CCR requirements for construction within 1,000 feet of a landfill, such as the requirement for gas control systems on any installed subsurface structures or other areas in which landfill gas may accumulate	High	High	Low	Yes
					Administrative Mechanisms (Land Use Plans, Soil & Groundwater Procedures & Policies, Construction Permitting, Public Notices & Educational Materials)					
	Engineering Controls (i.e. to limit/restrict access)	Signs (Warning & No Trespassing)	Engineering controls are physical mechanisms that serve to restrict access and potential exposure to contaminated media. Process options include warning and no trespassing signs, engineered barriers to vehicular traffic and perimeter fencing to reduce the potential for direct human contact with contaminated media.	Access restrictions conflict with future open space reuse; to be used during implementation of other remedial technologies.	Low (if used as part of a permanent remedy) High (if used during implementation of an active remediation technology)	Low (if used as part of a permanent remedy) High (if used during implementation of an active remediation technology)	Low	No (not effective as part of permanent remedy; conflicts with planned open space reuse)		
		Traffic Barriers & Perimeter Fencing								
	Site Monitoring	Short-Term Monitoring	Short-term monitoring involves outdoor air monitoring during construction that may affect landfill gas migration.	Although monitoring alone would not achieve RAOs, short-term and long-term monitoring would be integral components in any remedial alternative implemented at Parcel E-2.	Low	High	Low	Yes		
		Long-Term Monitoring								
	Containment	Landfill Gas Collection	Passive Venting	A passive system at Parcel E-2 would include a series of venting wells extending from below the historic low water table elevation through the cap and discharging to the atmosphere above the surface of the cap.	Diminished effectiveness at landfills with no bottom and sidewall liner system, or landfills with insufficient buffer space between the edge of waste and the compliance points; if NMOC treatment is required at the discharge points, the required treatment systems could restrict landfill gas venting, rendering venting less effective.	Moderate	High	Low	Yes	
			Active Collection	Active landfill gas collection uses vacuum blowers to extract landfill gas through vertical extraction wells installed and plumbed together; gases are drawn to a central collection point to create an inward pressure gradient to prevent outward landfill gas migration.	More effective with geosynthetic caps in shallow landfills because geosynthetic materials offer a better barrier against vacuum short-circuiting to the surface.	High	High	Moderate	Yes	
	Treatment (gas treatment and/or destruction) *	Adsorption (via GAC and Hydrosil®)	GAC	GAC would remove SVOCs and most VOCs; could be used with either passive or active collection systems.	Treatment units could restrict the airflow of passive venting systems, rendering them less effective.	High	High	Low (if NMOC concentrations are low) High (if NMOC concentrations are high, following capping of the entire landfill)	Yes	
			Hydrosil® (permanganate-impregnated zeolite medium)	Hydrosil® would remove lighter VOCs such as vinyl chloride; could be used with either passive or active collection systems.						
		Destruction (via combustion)	Enclosed Flare	An enclosed flare would destroy landfill gas, including NMOCs and methane, through combustion; primary chemical by-products from flares are carbon dioxide and nitrogen oxide compounds.	Operating conditions would reduce the possibility of dioxin formation by promoting the destruction of organics, operating at temperatures above those that would allow dioxin formation followed by rapid quenching, and extending the combustion residence time.	High	Moderate to High	Low to Moderate	Yes	
			Open Flare	Eliminated from consideration due to poor system controls (relative to enclosed flares).		N/A	N/A	N/A	N/A	
			Internal Combustion Engine	Eliminated from consideration because volume of gas generated by the Parcel E-2 Landfill is not anticipated to be sufficient to support the cost-effective implementation of internal combustion engines.		N/A	N/A	N/A	N/A	
Destruction (via non-combustion processes)		Energy Recovery	Energy recovery technologies, such as fuel cells, use landfill gas to produce energy directly.	Effectiveness of energy recovery and gas-to-product systems at Parcel E-2 is unknown due to the lack of information on gas concentration generation rates (assumed moderate to high, depending on implementability).	Likely Low (assumed moderate to high, if implementable at Parcel E-2)	Likely Low (site-specific conditions need to be better defined)	High	Yes		
	Gas-to-Product	Gas-to-product conversion technologies focus on converting landfill gas into commercial products, such as compressed natural gas, methanol, purified carbon dioxide and methane, or liquefied natural gas.

Results of Remedial Technologies and Process Options Evaluation
 Remedial Investigation/Feasibility Study for Parcel E-2

Medium	General Response Action	Remedial Technology	Process Options	Description	Comments	Effectiveness	Implementability	Cost	Retained for Analysis?	
Groundwater in Parcel E-2	No Action	None	None	No action would be taken to remove, contain or treat groundwater; no institutional controls would be established to prevent exposure, and no monitoring would be required.	Required by the NCP and is used as a baseline against which other response actions are compared – would not meet RAOs.	Low	High	No Cost	Yes	
			Institutional Actions	Institutional Controls	Legal Mechanisms (Restrictive Covenants, Negative Easements, Deed Notifications)	Legal and administrative mechanisms used in combination to enforce various land use restrictions such as: • Require development of a soil and groundwater management plan to be implemented during all intrusive site activities (such as subsurface construction) • Restrict the use of groundwater within the Parcel E-2 boundaries • Prohibit the installation of wells that have the potential to affect the migration of contaminated groundwater within Parcel E-2.	High	High	Low	Yes
					Administrative Mechanisms (Land Use Plans, Soil & Groundwater Procedures & Policies, Construction Permitting, Public Notices & Educational Materials)					
	Engineering Controls (i.e. to limit/restrict access)	Signs (Warning & No Trespassing)	Engineering controls are physical mechanisms that serve to restrict access and potential exposure to contaminated media. Process options include warning and no trespassing signs, engineered barriers to vehicular traffic and perimeter fencing to reduce the potential for direct human contact with contaminated media.	Access restrictions conflict with future open space reuse; to be used during implementation of other remedial technologies.	Low (if used as part of a permanent remedy)	Low (if used as part of a permanent remedy)	Low	No (not effective as part of permanent remedy; conflicts with planned open space reuse)		
		Traffic Barriers & Perimeter Fencing								
	Site Monitoring	Short-Term Monitoring	Short-term monitoring involves outdoor air monitoring during construction of groundwater control systems.	Although monitoring alone would not achieve RAOs, short-term and long-term monitoring would be integral components in any remedial alternative implemented at Parcel E-2.	Low	High	Low	Yes		
		Long-Term Monitoring								
	Containment	Physical Barrier	Slurry Wall	Physical barrier would be installed to cut off and/or redirect groundwater flow.	Physical barrier may need to be complemented with hydraulic barrier to prevent excessive groundwater mounding.	Moderate to High	Moderate to High	Moderate to High	Yes	
				Grout Curtain	Physical barrier would be installed to cut off and/or redirect groundwater flow.	Site-specific conditions limit the implementability of these options.	Moderate to High	Low to Moderate	Moderate to High	No (not implementable given site-specific conditions)
				Vertical Geomembrane	Physical barrier would be installed to cut off and/or redirect groundwater flow.	Physical barrier may need to be complemented with a hydraulic barrier to prevent excessive groundwater mounding. Corrosion potential limits effectiveness and presence of large debris limits implementability.	Moderate	Moderate	Moderate to High	No (issues regarding effectiveness and implementability)
			Sheet Pile Wall	Physical barrier would be installed to cut off and/or redirect groundwater flow.	Physical barrier may need to be complemented with a hydraulic barrier to prevent excessive groundwater mounding. Corrosion potential limits effectiveness and presence of large debris limits implementability.	Moderate	Moderate	Moderate to High	No (issues regarding effectiveness and implementability)	
			Flow Diversion Drain	Flow diversion drain coupled with a physical barrier would be installed on the upgradient side of the landfill to reduce groundwater flow through the waste. Drain would divert flow to reduce groundwater mounding behind the physical barrier.	Flow diversion drain is a passive technology requiring no operation, and minimal maintenance after installation.	Moderate to High	High	Low	Yes	
Hydraulic Barrier			Extraction from Wells & Off-Site Discharge	System would extract groundwater through pumping wells to contain groundwater and achieve RAOs at compliance points; extracted groundwater could be discharged to the sanitary sewer system, treated and reinjected, or treated and discharged to the Bay.	Groundwater modeling would be required to optimize extraction well placement and pumping rates, and to minimize the volume of water pumped from the Parcel E-2 aquifers; the required level of treatment would greatly influence cost.	Moderate to High	High	High	Yes	
			Phytoremediation / Phytohydraulics	Phytohydraulics would use of plants to control rainfall infiltration and groundwater levels and movement; plants would remove water through evapotranspiration. In addition to hydraulic control, phytoremediation could potentially help reduce chemical concentrations in subsurface soils and groundwater.	Further studies would be required to identify plant species that could tolerate brackish groundwater, determine required planting area size and plant density. Space requirements may be incompatible with site conditions.	Moderate to High	Low	Low to Moderate	No (issues regarding implementability)	
Treatment	Reactive Barrier	Permeable Reactive Barrier	Permeable reactive barrier would be installed along the shoreline to breakdown contaminants in groundwater flowing off site.	Permeable reactive barrier is a passive technology that may require periodic reinjection of reagent to maintain effectiveness. Technology is unproven for treatment of landfill leachate in a tidal environment.	Undetermined in the short term; Low in the long term	Low	High	No (issues regarding effectiveness, implementability, and cost)

Results of Remedial Technologies and Process Options Evaluation

Remedial Investigation/Feasibility Study for Parcel E-2

47	Presumptive remedy guidance	Section 2.8	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 8.2.3.4, pages 8-17 through 8-19. Record No. 4237.
----	-----------------------------	-------------	--

8.2.3.4. Application of the Containment Presumptive Remedy

As discussed in Section 1.4.1, the EPA has developed a specialized RI/FS process for landfill sites (EPA, 1991a, 1993a, 1993b, 1994, and 1996) that, provided certain conditions are met, supports selection of a containment presumptive remedy. EPA guidance includes a decision framework for evaluating the applicability of the containment presumptive remedy to military landfills (EPA, 1996). The six-step process includes the following considerations:

- What information should be collected?
- How may land reuse affect remedy selection?
- Do landfill contents meet municipal landfill-type waste definition? (discussed in Section 8.2.3.1)
- Are military-specific wastes present? (discussed in Section 8.2.3.1)
- Is excavation of contents practical?
- Can the presumptive remedy be used?

The following paragraphs present the Navy’s assessment of the applicability of the containment presumptive remedy relative to the above six steps. The results of the assessment are presented graphically on Figure 8-1.

Step 1 – What information should be collected?

Available information on the waste types, operating history, and estimated size and volume of the Parcel E-2 Landfill were compiled and are summarized in Section 8.2.1.

Step 2 – How may land reuse affect remedy selection?

According to the 2010 amended Redevelopment Plan, most of the planned reuse for Parcel E-2 is open space, including all of the Parcel E-2 Landfill. Therefore, the planned reuse of the Parcel E-2 Landfill is compatible with the containment presumption.

Step 3 – Do landfill contents meet municipal-type waste definition?

The landfill contents meet the municipal-type waste definition, as summarized in Section 8.2.3.1. Although wastes within the Parcel E-2 Landfill meet the municipal-type waste definition outlined in EPA guidance, the presence of military-specific wastes warrants an additional evaluation step, which is discussed below.

Step 4 – Are military-specific wastes present?

As discussed in Section 8.2.3.1, military-specific wastes present (or potentially present) in and around the Parcel E-2 Landfill are considered “low-hazard military-specific wastes,” that is “generally are no more hazardous than some wastes found in municipal landfills” (EPA, 1996). As shown on Figure 8-1, EPA

guidance supports the application of the containment presumptive remedy when such low-hazard military-specific wastes are present.

Step 5 – Is excavation of contents practical?

The effectiveness, implementability, and cost of excavating the Parcel E-2 Landfill was evaluated, consistent with EPA guidance (1996) and the NCP (55 Federal Register 8849, March 8, 1990), in order to answer this question. The estimated excavation volume of 1,008,250 cubic yards, includes the solid waste volume (473,000 cubic yards), the volume of overlying soil cover (393,500 cubic yards), and the volume of the soil below the solid waste (as deep as 13 feet below msl) that would be removed to support “clean closure” of the waste disposal unit (141,750 cubic yards). Experience from removal actions in Parcel E-2 has provided useful information for evaluating potential waste excavation, including field production rates, types of wastes encountered, and level of effort to implement site-specific requirements (e.g., the requirement to screen all material excavated in Parcel E-2 for radioactivity). However, the volume of the Parcel E-2 Landfill and surrounding soil fill is nearly 20 times the total volume of material removed at the Metal Slag Area and PCB Hot Spot Area (52,700 cubic yards).

Excavation is possible but may be very difficult to implement because of the depth of waste at the landfill, the proximity to surface water (the bay), and the proximity to adjacent non-Navy property. Difficulties associated with the removal of solid waste and soil from the landfill include:

- Slope stability during excavation
- Surface water control to prevent inundation resulting from tides or stormwater
- Groundwater inflow control for excavation below the water table
- Radiological screening, characterization, and confirmation sampling of all soil and debris transported from the site (for disposal and treatment) and to the site (for backfill and restoration)
- Locating and importing multiple, large-volume sources of backfill material that are free of contamination and do not contain metals concentrations in excess of existing ambient levels
- Control of potential releases of chemicals from waste and soil during removal and transport through the surrounding neighborhood

The implementation issues cited above also reflect issues regarding the short-term effectiveness of excavating the Parcel E-2 Landfill. For example, worker safety could be affected detrimentally by any problems in maintaining a stable excavation and controlling water inflow, considering the proximity of the deep excavations (down to 13 feet below msl) to the bay. In addition, excavation of the landfill would likely require multiple years of continuous construction to complete, and the resulting traffic, noise, and emissions from heavy equipment operation would affect the local population. Also, these implementation issues directly correspond to the high projected costs. The primary factors that result in the high costs of excavation and disposal are:

- Large volume of solid waste, soil, and sediment to be excavated and disposed of off site
- Large volume of solid waste, soil, and sediment to be screened for radiological contamination, sampled for characterization, and transported and treated or disposed of off site
- Extensive controls required to minimize, manage, treat (if necessary), and dispose of contaminated water during excavation and waste segregation processes
- Large volume of imported clean fill required for backfill to restore the site

Overall, the issues regarding the short-term effectiveness, implementation, and cost of excavating the Parcel E-2 Landfill do not offset the long-term effectiveness of such an action. This assessment is supported by EPA guidance (EPA, 1996), which states that “although no set excavation volume limit exists, landfills with a content of more than 100,000 cubic yards (approximately 2 acres, 30 feet deep) would normally not be considered for excavation.”

Step 6 – Can the presumptive remedy be used?

Based on the information outlined in the paragraphs above, the containment presumptive remedy meets all of the criteria specified in EPA guidance; therefore, it is well-suited to prevent exposure to solid waste and soil in the Landfill Area. In addition, the containment presumption also can be applied to landfill gas and contaminated A-aquifer groundwater or leachate emanating from the landfill.

Some members of the local community have expressed a strong desire for the Navy to thoroughly evaluate excavation of the landfill. To provide information to support the community’s review of potential remedial alternatives for Parcel E-2, the Navy has agreed to evaluate excavation of the landfill as part of this report.

8.3. LANDFILL GAS

The following subsections summarize the nature and extent of landfill gas (Sections 8.3.1 and 8.3.2), the results of the landfill gas risk evaluations (Section 8.3.3), and the overall RI conclusions for the landfill gas (Section 8.3.4).

8.3.1. Landfill Gas Characterization

The initial landfill gas characterization, consisting of temporary soil gas borings and 21 permanent GMPs, determined that methane was present at concentrations exceeding 25 percent of the LEL along the northern side of the Parcel E-2 Landfill. Methane was also detected on the UCSF compound, located north of the landfill, at concentrations exceeding the LEL. Methane was not detected at concentrations exceeding 25 percent of the LEL in locations along Crisp Avenue (north of the UCSF compound) or to the east, south, and west of the Landfill.

	Design Subtotal = \$			20,244,425			
Design assumed to be 6% of construction cost (including permitting)				\$ 20,244,425	0-1	Includes: Remedial Design, Design Basis Report, HandS Plan, Contingency Plan, QA/QC Plan, QAPP, and Cost Estimates; consistent with EPA guidance (pp. 5-13, EPA, 2000)	
TOTAL PROJECT CAPITAL COST	TOTAL PROJECT CAPITAL COST = \$			357,651,507			
Total Construction Cost				\$ 337,407,082			
Total Design Cost				\$ 20,244,425			
	TOTAL COST PER CY OF SOIL EXCAVATED = \$			306			

General Assumptions:

Four-year project duration
 Work will be performed in Level D PPE
 Temporary sheet piling will be installed around entire perimeter of landfill (extent of waste)
 Sheet pile will be keyed in at 2/3 of total depth (approx. 60 ft.)
 Excavation dewatering will be implemented as needed using a skid-mounted pump through dewatering points
 Water from decontamination and dewatering activities will require treatment and discharge to a sanitary sewer line, or to San Francisco Bay under NPDES permit
 Dewatering and treatment volume estimates provided in worksheet "DEWATER"
 Waste excavation will include removal of approximately 3 to 5 feet of clay or sand below waste
 Waste fractions estimated based on PCB Hotspot TCRA and Metal Slag TCRA data
 Contaminated water quality assumed to be average of samples obtained from wells IR01MW63A, 43A, 13A, 38A, 03A and IR01MWI-5
 Carbon usage rate based on removal of 1,1-DCE and 1,1-DCA
 Stripped landfill cap can be used as fill material
 Finish grade will slope evenly from north to south in Landfill Area; backfill volume estimated by proposed grading plan, and includes a 20% contingency and a 20% fluff factor to account for compaction and consolidation
 Assumed soil density of 1.4 ton/cy

Table R-4. Alternative 2 - Operation and Maintenance Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	20% Contingency	Cost Including 20%		Remarks
						Contingency		
Groundwater Monitoring (30 years)	ls	1	\$ 1,650,125	\$ 1,650,125	\$ 330,025	\$ 1,980,150		For details, see "LONG-TERM GW MONITORING" worksheet
Institutional Controls (30 years)	ls	1	\$ 1,080,000	\$ 1,080,000	\$ 216,000	\$ 1,296,000		Includes monitoring, enforcement, and reporting
Stormwater Monitoring (5 years)	ls	1	\$ 299,650	\$ 299,650	\$ 59,930	\$ 359,580		For details, see "LONG-TERM SW MONITORING" worksheet
Wetlands Monitoring (5 years)	ls	1	\$ 163,420	\$ 163,420	\$ 32,684	\$ 196,104		For details, see "LONG-TERM WL MONITORING" worksheet
Totals				\$ 3,193,195	\$ 638,639	\$ 3,831,834		

Notes:

⁽¹⁾ O&M present value is based on 3% discount rate for 30 years for groundwater monitoring and 5 years for stormwater and wetland monitoring.

Table R-6. Alternative 2 - Excavation Volume Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Area Name	Area (sf)	Avg Depth (feet)	Volume (cy)
Estimated Excavation Volumes - Landfill, Panhandle, East Adjacent, and Shoreline Areas

49	\$5.5M for radiological actions	Table 8	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRS. Appendix D, Section D4, pages D-4 and D-5. Record No. 4260.
----	--	---------	--

Section D4. Cost Estimate Assumptions

This section identifies the assumptions and parameters used in developing cost estimates in support of the radiological addendum to the Final RI/FS Report for Parcel E-2. Alternatives 2, 3, 4, and 5 were developed to address nonradioactive chemical contamination throughout Parcel E-2, and proposed varying amounts intrusive work within radiologically impacted areas. As a result, Alternatives 2, 3, 4, and 5, as presented in the Final RI/FS Report, specify radiological control procedures to properly screen, segregate, characterize, and dispose of radioactive materials. The remedial alternatives evaluated in this radiological addendum are consistent with the remedial alternatives evaluated in the RI/FS Report, but also identify additional components of these alternatives that are needed to meet the remedial action objective for radioactively contaminated media. These additional components are:

- Removal and remediation of sanitary sewer, storm drain, and septic sewer lines that may contain radioactive contamination
- Removal and remediation of the ship-shielding berm in the Panhandle Area
- Final status surveys of the excavated subgrade of Parcel E-2 prior to backfilling with soil meeting the radiological acceptance criteria

These radiological-specific tasks are common to Alternatives 2, 3, 4, and 5, and the estimated level of effort to perform these tasks is independent of the extent of other remediation proposed under Alternatives 2, 3, 4, and 5. The cost estimate components and specific assumptions are presented for the three radiological-specific tasks are common to Alternatives 2, 3, 4, and 5. The cost to properly screen, segregate, characterize, and dispose of radioactive materials encountered during intrusive activities associated with the capping and excavation tasks were incorporated into Alternatives 2, 3, 4, and 5 and were presented in the Final RI/FS Report; these costs are not repeated in this radiological addendum.

The following assumptions apply to the radiological-specific tasks common to Alternatives 2, 3, 4, and 5:

1. Removal of the Parcel E-2 sewer and storm drain systems (approximately 1,500 linear feet excluding portions within the Landfill Area that will not be removed) is estimated to result in 5,000 cubic yards (cy) of material to be excavated at an estimated cost of \$330 per cy of material excavated. This results in a total excavation cost of \$1,650,000.

2. The ship-shielding berm has an estimated volume of 3,700 cy of soil. Assuming the excavation cost, \$330 per cy, will be similar to those of the storm drain systems excavations, the total excavation cost is estimated to be \$1,221,000.
3. The radiological surface survey of Parcel E-2 areas not excavated and postexcavation survey of excavated areas is assumed to cover the entire 47.4 acres of Parcel E-2. Parcel E-2 will be divided into 1,000 square-meter survey units, resulting in approximately 192 survey units. The cost of performing the survey in each survey unit is assumed to be \$6,500, resulting in a survey cost of \$1,248,000. Each survey unit is assumed to have two elevated areas resulting in the generation of 10 cubic feet (ft³) of radiologically impacted soil from each survey unit. The total volume of radiologically impacted soil is estimated to be 1,920 ft³ (71 cy). The cost of disposal is assumed to be \$11,880 per bin, and based on 14 cy of soil per bin, the total disposal cost is estimated to be \$59,400. The total cost for survey and waste disposal is estimated to be \$1,307,400.

The table below provides a breakdown of the estimated cost for the radiological-specific tasks common to Alternatives 2, 3, 4, and 5.

Sewer, Storm Drain, and Septic System Drain Lines Removal and Survey	\$1,650,000
Ship-Shielding Berm Removal	\$1,221,000
Parcel E-2 Radiological Surface Survey and Anomaly Removal	\$1,307,400
Design, Oversight, Management, and Administrative Cost (10%)	\$417,840
Subtotal Costs:	\$4,596,240
20% Contingency:	\$919,248
Total Estimated Cost:	\$5,515,000*

Note: * = Total estimated cost has been rounded to the nearest thousand.

50	Capital Cost: \$62.4M	Table 8	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Appendix R, Tables R-17, R-19, R-20, R-23, and R-24. Record No. 4237.
----	------------------------------	---------	---

Table R-17. Cost Estimate Summary for Alternative 3 ^(1,2,3)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Alternative 3A

- Cap the Landfill and Adjacent Areas*
- Install an active Gas Control and Collection System (GCCS) and treat landfill gas with a flare unit*
- Close northern landfill gas control system*
- Remove hot spots in adjacent areas*
- Install surface water control*
- Restore wetlands*
- Install groundwater relief and diversion systems*

Items	Estimated Cost
Capital Cost	\$57,723,835
Inspection, Maintenance, and GCCS operation and maintenance (O&M)	\$21,714,480
Groundwater Monitoring Cost	\$1,980,150
Periodic Cost	\$675,298
Total Cost for Alternative 3A (Flare Unit)	\$82,093,763
Present Value for Alternative 3A (Flare Unit)⁽³⁾	\$72,243,536

Alternative 3B

- Cap the Landfill and Adjacent Areas*
- Install an active GCCS and treat the landfill gas with a GAC/KMnO4 adsorption unit*
- Close northern landfill gas control system*
- Remove hot spots in adjacent areas*
- Install surface water control*
- Restore wetlands*
- Install groundwater relief and diversion systems*

Items	Estimated Cost
Capital Cost	\$56,904,200
Inspection, Maintenance, and GCCS O&M	\$23,982,480
Groundwater Monitoring Cost	\$1,980,150
Periodic Cost	\$675,298
Total Cost for Alternative 3B (Adsorption)	\$83,542,127
Present Value for Alternative 3B (Adsorption)⁽³⁾	\$72,925,647

Notes:

⁽¹⁾ Appended tables summarize backup calculations for all cost estimates provided

⁽²⁾ Period of analysis is 32 years, which includes 2 years of engineering, permitting and construction periods, and 30 years of long-term monitoring.

⁽³⁾ Based on a 2.8% discount factor, as specified for federal facility sites in Appendix C of Office of Management and Budget Circular A-94 (effective January 2008, http://www.whitehouse.gov/omb/circulars/a094/a94_appx-c.html)

Table R-19. Alternative 3A - Backup Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
General					
Mobilization and Demobilization	ls	1	\$ 2,172,000.00	\$ 2,172,000.00	Based on 5% of construction cost excluding CQA, permitting, H&S, and SWPPP implementation costs
Health and Safety	ls	1	\$ 50,000.00	\$ 50,000.00	
Engineering and Regulatory Compliance	ls	1	\$ 1,303,400.00	\$ 1,303,400.00	Includes preparation of construction documents, construction certification report, regulatory coordination, and local permits
Temporary Erosion Control and SWPPP Implementation	ls	1	\$ 30,000.00	\$ 30,000.00	
Demolition					
Remove existing drainage structures	ls	1	\$ 10,000.00	\$ 10,000.00	Dispose of spoils on site at northwest area of IR-01/21
Remove concrete rubble, riprap, bricks, etc.	cy	9,921	\$ 10.00	\$ 99,210.00	Existing shoreline protection along the southern boundary of the Landfill and East Adjacent Areas and Panhandle Area; dispose of spoils on site at IR-01/21
Temporary Works					
Sheet-pile installation	lf	3,360	\$ 1,495.00	\$ 5,023,200.00	Along Landfill and Panhandle Areas shoreline
Dewatering	days	120	\$ 5,640.00	\$ 676,800.00	
Air Monitoring					
Ambient air monitors	mo	4	\$ 10,614.00	\$ 42,456.00	
Portable ambient air analyzer	mo	4	\$ 1,952.00	\$ 7,808.00	
Portable combustible gas/oxygen indicator	mo	4	\$ 464.00	\$ 1,856.00	
Landfill IR-01/21					Includes the north, west, and southeast section of IR-01/21
Earthwork					
Excavated waste, existing ground and debris consolidation	cy	78,471	\$ 30.00	\$ 2,354,130.00	Stripped soil, waste, and concrete rubble excavation along the southern limit of the Landfill and Adjacent Areas bordering San Francisco Bay minus chemical hot spots and LLRW; place excavated material on site at IR-01/21
Earthfill	cy	11,916	\$ 5.00	\$ 59,578.85	Moisture condition and compact
Import soil	cy	84,949	\$ 25.00	\$ 2,123,724.74	Purchase and site delivery; includes fluff factor
Geosynthetic cover subgrade preparation	sf	395,686	\$ 0.10	\$ 39,568.58	Remove rock protrusions and level ground surface prior to geosynthetics placement
2.0' foundation layer	cy	29,066	\$ 5.00	\$ 145,328.66	Moisture condition and compact
2.0' vegetative soil cover	cy	29,809	\$ 5.00	\$ 149,046.61	Moisture condition and compact
Final grading	ac	22	\$ 2,000.00	\$ 44,400.00	Track walk prior to hydroseeding
Geosynthetic Final Cover					
Geosynthetic clay liner (GCL)	sf	405,278	\$ 0.85	\$ 344,486.17	Includes additional landfill closure area only
60-mil HDPE geomembrane	sf	417,125	\$ 0.60	\$ 250,274.91	Includes additional landfill closure area only
Drainage geocomposite	sf	403,530	\$ 0.80	\$ 322,823.88	Includes additional landfill closure area only
Demarcation layer	sf	405,278	\$ 0.20	\$ 81,055.60	
4"perforated HDPE pipe, SDR 11, including pipe fittings, and geotextile wrap	lf	3,440	\$ 12.00	\$ 41,280.00	
Toe of slope gravel fill	cy	382	\$ 30.00	\$ 11,466.67	Includes geotextile filter fabric
Gravel blanket drain	lf	700	\$ 100.00	\$ 70,000.00	Blanket drain for groundwater relief system

Table R-19. Alternative 3A - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Landfill IR-01/21 (continued)					Includes the north, west, and southeast section of IR-01/21
Geosynthetic Termination and Tie-ins					
North and west perimeter final cover termination	lf	1,570	\$ 12.00	\$ 18,840.00	
South perimeter final cover termination	lf	700	\$ 15.00	\$ 10,500.00	
North and west tie-ins to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
South tie-in to existing geosynthetic cover	lf	300	\$ 20.00	\$ 6,000.00	Same as above
Surface Water Drainage System					
ECM/grass-lined swale	lf	700	\$ 14.00	\$ 9,800.00	Install at north finish grade tie-in
Top deck diversion berm with ECM/grass-lined ditch	lf	1,210	\$ 10.00	\$ 12,100.00	Install at deck area of landfill
ECM/grass-lined ditch	lf	300	\$ 14.00	\$ 4,200.00	Install at northwest perimeter of landfill
Concrete-lined ditch	lf	700	\$ 30.00	\$ 21,000.00	Install at toe of slope at south landfill perimeter
Rock-lined downchute	ea	1	\$ 20,000.00	\$ 20,000.00	Remove and reestablish existing rock gabion drainage swale and downchute lining
Pipe downdrain	lf	180	\$ 50.00	\$ 9,000.00	Install at sideslope areas
Pipe crossdrain	lf	100	\$ 70.00	\$ 7,000.00	Install across south perimeter access road
Drainage Inlet	ea	2	\$ 3,000.00	\$ 6,000.00	Install at south perimeter access road
East Adjacent Area					Includes PCB remediation area
Earthwork					
Earthfill	cy	31,641	\$ 5.00	\$ 158,205.00	Moisture condition and compact
Import soil	cy	99,038	\$ 25.00	\$ 2,475,939.72	Purchase and site delivery. Includes fluff factor.
1.0' foundation layer	cy	16,210	\$ 5.00	\$ 81,051.82	Moisture condition and compact
2.0' vegetative soil cover	cy	33,983	\$ 5.00	\$ 169,915.00	Moisture condition and compact
Geosynthetic subgrade preparation	sf	474,782	\$ 0.10	\$ 47,478.18	Remove rock protrusions and level ground surface prior to geosynthetics placement
Final grading	ac	9.7	\$ 2,000.00	\$ 19,320.00	Track walk prior to hydroseeding
Geosynthetic Final Cap					
60-mil HDPE geomembrane	sf	474,782	\$ 0.60	\$ 284,869.09	
Drainage geocomposite	sf	466,957	\$ 0.80	\$ 373,565.60	
Demarcation layer	sf	466,957	\$ 0.20	\$ 93,391.40	
North and east final cover termination	lf	2,285	\$ 12.00	\$ 27,420.00	4" perforated HDPE pipe, SDR 11, including pipe fittings, and geotextile wrap
South perimeter final cover termination	lf	500	\$ 15.00	\$ 7,500.00	
Final cover tie-in to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
Surface Water Drainage System					
ECM/Grass-lined ditch	lf	2,260	\$ 14.00	\$ 31,640.00	Install at north and east boundary
Concrete-lined ditch	lf	450	\$ 30.00	\$ 13,500.00	Install at north and east boundary
Pipe downdrain	lf	200	\$ 50.00	\$ 10,000.00	Install across access road
Pipe culvert	lf	50	\$ 75.00	\$ 3,750.00	Install across access road
Drainage inlet	ea	2	\$ 3,000.00	\$ 6,000.00	Install across access road
Ditch outlet	ls	1	\$ 5,000.00	\$ 5,000.00	Perimeter ditch outlet to San Francisco Bay

Description	Unit	Quantity	Unit Price	Cost	Remarks
Excavation and Radiation Screening/Disposal (continued)					
Includes Adjacent Areas and Shoreline excavation					
Pre-excavation screening	days	108	\$ 11,888.00	\$ 1,288,360.00	Based on 50'x50' grid at 16 grids per day production rate (~1,734 equivalent grids)
Excavation	days	108	\$ 20,095.00	\$ 2,177,800.00	Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping; number of days based on 1,488-cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	123	\$ 5,616.00	\$ 690,770.00	Based on 1,500-cy/day production rate
Soil confirmation sampling	ea	898	\$ 572.00	\$ 513,460.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	38	\$ 11,888.00	\$ 455,460.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	12,385	\$ 153.50	\$ 1,901,050.00	10% of clear, grub, stripped materials and 5% of additional excavation
Additional LLRW Anomalies Removal					
Pre-clearing, grubbing, and stripping screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Clearing, grubbing, and stripping	days	15	\$ 20,095.00	\$ 292,630.00	For quantity estimate, depth of stripping is assumed 1'; number of days based on 1,488-cy/day production rate, or rad screening rate, whichever is greater
Pre-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Excavation	days	15	\$ 20,095.00	\$ 292,630.00	Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping; number of days based on 1,488-cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	30	\$ 5,616.00	\$ 166,010.00	Based on 1,500-cy/day production rate
Soil confirmation sampling	ea	288	\$ 572.00	\$ 164,930.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	3,617	\$ 153.50	\$ 555,210.00	10% of clear, grub, stripped materials, and 5% of additional excavation
Construction Quality Assurance					
Landfill and Adjacent Areas	days	327	\$ 3,000.00	\$ 981,000.00	CQA services for landfill closure and adjacent areas remediation based on 320 working days construction schedule.
LFG well field and flare unit	days	120	\$ 1,000.00	\$ 120,000.00	CQA services for gas field and flare unit based on 120 working days construction schedule.
Subtotal Capital Cost				\$ 48,103,196.19	
20% Contingency				\$ 9,620,639.24	
Total Capital Cost				\$ 57,723,835.42	

Table R-19. Alternative 3A - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Notes:

1. Capital cost is in 2008 dollars.
2. Cost estimates for LFG control system, groundwater monitoring system, and wetlands restoration were obtained from backup spreadsheets.
3. Assumes infrastructure and building demolition will be completed (by others) prior to final cover installation for Adjacent Area at the east side of the Landfill.
4. Cost for other construction items were obtained from vendor quotes and similar landfill closure and/or remedial projects.

AB = aggregate base

ac = acres

CQA = Construction Quality Assurance

cy = cubic yard

ea = each

GCL = geosynthetic clay liner

HDPE = high-density polyethylene

H&S = Health and Safety

lf = linear feet

LFG = landfill gas

LLRW = low-level radioactive waste

ls = lump sum

mo = months

PCB = polychlorinated biphenyl

RC = reinforced concrete

sf = square feet

SWPPP = Storm Water Pollution Prevention Plan

Table R-20. Alternative 3A - Operation and Maintenance Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Final Cover	lump sum (ls)	1	\$ 69,000.00	\$ 69,000.00	Repair of final cover due to settlement, slope failure, or erosion
Vegetation	ls	1	\$ 12,600.00	\$ 12,600.00	Maintenance of vegetation
LFG System - Option 3A	ls	1	\$ 262,500.00	\$ 262,500.00	For details, see BKUP LFG-3A worksheet
Stormwater Monitoring	ls	1	\$ 60,980.00	\$ 60,980.00	For details, see BKUP SW worksheet
LFG Condensate Disposal	ls	1	\$ 55,800.00	\$ 55,800.00	Assumes 60 gpd condensate, off-site disposal to Class I facility
Groundwater Relief System	ls	1	\$ 67,700.00	\$ 67,700.00	Assumes 20-gpm extraction rate for discharge to POTW via transmission pipeline; includes monthly inspection and reporting and pump replacement every 3 years
Drainage	ls	1	\$ 5,000.00	\$ 5,000.00	Maintenance of drainage control system, including clearing of materials blocking drainage conveyances
Site Security	ls	1	\$ 9,600.00	\$ 9,600.00	Periodic inspection of point of access to the landfill and environmental control systems
Emergency Response	ls	1	\$ 5,000.00	\$ 5,000.00	Includes landfill inspection after major earthquake, storm, or fire that may exceed site design that could require emergency response actions
Periodic Inspection, Documentation, Reporting, and Regulatory Compliance	ls	1	\$ 19,000.00	\$ 19,000.00	Includes preparation of iso-settlement maps and 5-year site review
Institutional Control	ls	1	\$ 36,000.00	\$ 36,000.00	Includes monitoring, enforcement, and reporting
Subtotal O&M Cost				\$ 603,180.00	
20% Contingency				\$ 120,636.00	
Annual Average O&M Cost				\$ 723,816.00	
30 Year O&M Present Value				\$ 12,205,099.68	

Table R-23. Alternative 3B - Backup Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
General					
Mobilization and Demobilization	ls	1	\$ 2,141,000.00	\$ 2,141,000.00	Based on 5% of construction cost, excluding CQA, Permitting, H&S, and SWPPP implementation costs
Health and Safety	ls	1	\$ 50,000.00	\$ 50,000.00	
Engineering and Regulatory Compliance	ls	1	\$ 1,284,400.00	\$ 1,284,400.00	Includes preparation of construction documents, construction certification report, regulatory coordination, and local permits
Temporary Erosion Control and SWPPP Implementation	ls	1	\$ 30,000.00	\$ 30,000.00	
Demolition					
Remove existing drainage structures	ls	1	\$ 10,000.00	\$ 10,000.00	Dispose of spoils on site at northwest area of IR-01/21
Remove concrete rubble, riprap, bricks, etc.	cy	9,921	\$ 10.00	\$ 99,210.00	Existing shoreline protection along the southern boundary of the Landfill and East Adjacent Areas and Panhandle Area; dispose of spoils on site at IR-01/21
Temporary Works					
Sheet-pile installation	lf	3,360	\$ 1,495.00	\$ 5,023,200.00	Along Landfill and Panhandle Areas shoreline
Dewatering	days	120	\$ 5,640.00	\$ 676,800.00	
Air Monitoring					
Ambient air monitors	mo	4	\$ 10,614.00	\$ 42,456.00	
Portable ambient air analyzer	mo	4	\$ 1,952.00	\$ 7,808.00	
Portable combustible gas/oxygen indicator	mo	4	\$ 464.00	\$ 1,856.00	
Landfill IR-01/21					Includes the north, west, and southeast section of IR-01/21
Earthwork					
Excavated waste and debris consolidation	cy	72,991	\$ 30.00	\$ 2,189,718.89	Stripped soil, waste, and concrete rubble excavation along the southern limit of the Landfill and Adjacent Areas bordering San Francisco Bay minus chemical hot spots and LLRW; place excavated material on site at IR-01/21
Earthfill	cy	11,916	\$ 5.00	\$ 59,578.85	Moisture condition and compact
Import soil	cy	84,949	\$ 25.00	\$ 2,123,724.74	Purchase and site delivery; includes fluff factor
Geosynthetic cover subgrade preparation	sf	395,686	\$ 0.10	\$ 39,568.58	Remove rock protrusions and level ground surface prior to geosynthetics placement
2.0' foundation layer	cy	29,066	\$ 5.00	\$ 145,328.66	Moisture condition and compact
2.0' vegetative soil cover	cy	29,809	\$ 5.00	\$ 149,046.61	Moisture condition and compact
Final grading	ac	22	\$ 2,000.00	\$ 44,400.00	Track walk prior to hydroseeding
Geosynthetic Final Cover					
Geosynthetic clay liner (GCL)	sf	405,278	\$ 0.85	\$ 344,486.17	Includes additional landfill closure area only
60-mil HDPE geomembrane	sf	417,125	\$ 0.60	\$ 250,274.91	Includes additional landfill closure area only
Drainage geocomposite	sf	403,530	\$ 0.80	\$ 322,823.88	Includes additional landfill closure area only
Demarcation layer	sf	360,422	\$ 0.20	\$ 72,084.40	
4"perforated HDPE pipe, SDR 11, including pipe fittings,	lf	3,440	\$ 12.00	\$ 41,280.00	
Toe of slope gravel fill	cy	382	\$ 30.00	\$ 11,466.67	Includes geotextile filter fabric
Gravel blanket drain	lf	700	\$ 100.00	\$ 70,000.00	Blanket drain for groundwater relief system

Table R-23. Alternative 3B - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Landfill IR-01/21 (continued)					Includes the north, west, and southeast section of IR-01/21
Geosynthetic Termination and Tie-ins					
North and west perimeter final cover termination	lf	1,570	\$ 12.00	\$ 18,840.00	
South perimeter final cover termination	lf	700	\$ 15.00	\$ 10,500.00	
North and west tie-ins to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
South tie-in to existing geosynthetic cover	lf	300	\$ 20.00	\$ 6,000.00	Same as above
Surface Water Drainage System					
ECM/grass-lined swale	lf	700	\$ 14.00	\$ 9,800.00	Install at north finish grade tie-in
Top deck diversion berm with ECM/grass-lined ditch	lf	1,210	\$ 10.00	\$ 12,100.00	Install at deck area of landfill
ECM/grass-lined ditch	lf	300	\$ 14.00	\$ 4,200.00	Install at northwest perimeter of landfill
Concrete-lined ditch	lf	700	\$ 30.00	\$ 21,000.00	Install at toe of slope at south landfill perimeter
Rock-lined downchute	ea	1	\$ 20,000.00	\$ 20,000.00	Remove and reestablish existing rock gabion drainage swale and downchute lining
Pipe downdrain	lf	180	\$ 50.00	\$ 9,000.00	Install at sideslope areas
Pipe crossdrain	lf	100	\$ 70.00	\$ 7,000.00	Install across south perimeter access road
Drainage Inlet	ea	2	\$ 3,000.00	\$ 6,000.00	Install at south perimeter access road
East Adjacent Area					Includes PCB remediation area
Earthwork					
Earthfill	cy	31,641	\$ 5.00	\$ 158,205.00	Moisture condition and compact
Import soil	cy	99,038	\$ 25.00	\$ 2,475,939.72	Purchase and site delivery; includes fluff factor
1.0' foundation layer	cy	16,210	\$ 5.00	\$ 81,051.82	Moisture condition and compact
2.0' vegetative soil cover	cy	33,983	\$ 5.00	\$ 169,915.00	Moisture condition and compact
Geosynthetic subgrade preparation	sf	474,782	\$ 0.10	\$ 47,478.18	Remove rock protrusions and level ground surface prior to geosynthetics placement
Final grading	ac	9.7	\$ 2,000.00	\$ 19,320.00	Track walk prior to hydroseeding
Geosynthetic Final Cap					
60-mil HDPE geomembrane	sf	474,782	\$ 0.60	\$ 284,869.09	
Drainage geocomposite	sf	466,957	\$ 0.80	\$ 373,565.60	
Demarcation layer	sf	466,957	\$ 0.20	\$ 93,391.40	
North and east final cover termination	lf	2,285	\$ 12.00	\$ 27,420.00	4"-perforated HDPE pipe, SDR 11, including pipe fittings, and geotextile wrap
South perimeter final cover termination	lf	500	\$ 15.00	\$ 7,500.00	
Final cover tie-in to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
Surface Water Drainage System					
ECM/grass-lined ditch	lf	2,260	\$ 14.00	\$ 31,640.00	Install at north and east boundary
Concrete-lined ditch	lf	450	\$ 30.00	\$ 13,500.00	Install at north and east boundary
Pipe downdrain	lf	200	\$ 50.00	\$ 10,000.00	Install across access road

Table R-23. Alternative 3B - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price		Cost	Remarks	
East Adjacent Area (continued)							
						Includes PCB remediation area	
Pipe culvert	lf	50	\$	75.00	\$	3,750.00	Install across access road
Drainage inlet	ea	2	\$	3,000.00	\$	6,000.00	Install across access road
Ditch outlet	ls	1	\$	5,000.00	\$	5,000.00	Perimeter ditch outlet to San Francisco Bay
Panhandle Area							
Earthwork							
Earthfill	cy	18,752	\$	5.00	\$	93,760.00	Moisture condition and compact
Import soil	cy	63,144	\$	25.00	\$	1,578,600.00	Purchase and site delivery; includes fluff factor
Import hydric soil	cy	26,547	\$	35.00	\$	929,155.50	Purchase and site delivery; includes fluff factor
2.0' upland soil layer	cy	20,177	\$	5.00	\$	100,885.00	Moisture condition and compact
Hydric soil layer	cy	20,421	\$	6.00	\$	122,526.00	Moisture condition and compact
2.0' bridge soil layer	cy	13,691	\$	5.00	\$	68,455.00	Moisture condition and compact
Geosynthetic subgrade preparation	sf	216,792	\$	0.10	\$	21,679.20	Remove rock protrusions and level ground surface prior to geosynthetics placement
Final grading	ac	9.0	\$	2,000.00	\$	18,060.00	Track walk prior to hydroseeding
Geosynthetic Cap							
Clay import	cy	2,881.0	\$	30.00	\$	86,430.00	For cap within wetlands area
Clay placement	cy	2,505.0	\$	5.00	\$	12,525.00	Cap within wetlands area
60-mil HDPE geomembrane	sf	216,792	\$	0.60	\$	130,075.20	
Final cover termination (west boundary)	lf	1,355	\$	8.00	\$	10,840.00	Geosynthetic cap termination, trench excavation, and backfill
North tie-in to existing and new Landfill geosynthetics	lf	450	\$	20.00	\$	9,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
Surface Water Control System							
ECM/grass-lined ditch	lf	1,355	\$	14.00	\$	18,970.00	Drainage ditch west side of west perimeter access road
Pipe culvert	lf	100	\$	75.00	\$	7,500.00	West perimeter ditch inlet to freshwater wetland
Drainage ditch outlet	ls	1	\$	5,000.00	\$	5,000.00	West perimeter ditch outlet to San Francisco Bay
Wetlands Outlet Structures							
Freshwater wetland outlet structure	ls	1	\$	60,800.00	\$	60,800.00	Remove and replace existing outlet structure; for details, see Outlet worksheet
Wetlands Restoration	ls	1	\$	616,798.00	\$	616,800.00	For details, See BKUP Wetlands worksheet
Shoreline Protection							
Rock riprap	tons	41,518	\$	100.00	\$	4,151,761.19	Shoreline protection along the south perimeter of the Landfill and Adjacent Areas
Earthfill	cy	9,663	\$	4.50	\$	43,483.50	Soil backfill along the southern perimeter of the Landfill and Adjacent Areas; moisture condition and compact
Import soil	cy	11,596	\$	25.00	\$	289,890.00	Purchase and deliver soil for earthfill; includes fluff factor
Geosynthetic subgrade preparation	sf	53,043	\$	0.10	\$	5,304.30	Remove rock protrusions and level ground surface prior to geosynthetics placement
60-mil HDPE	sf	53,043	\$	0.50	\$	26,521.50	Protective cover for soil backing

Table R-23. Alternative 3B - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price		Cost	Remarks
Shoreline Protection (continued)						
Cushion geotextile (12 oz/sy)	sf	53,043	\$	0.20	\$ 10,608.60	Cushion fabric between rock riprap and HDPE protective cover
Geogrid	sf	28,380	\$	2.00	\$ 56,760.00	For soil reinforcement
Access Road						
Class 2 aggregate base	cy	3,920	\$	25.00	\$ 98,007.41	12"-thick AB; includes service road for the Landfill and Adjacent Areas
Revegetation						
Hydroseeding	ac	32	\$	2,000.00	\$ 63,080.00	Includes Landfill and Adjacent Areas
Temporary Fence	lf	2,400	\$	24.00	\$ 57,600.00	Based on \$4/lf per month rental
Hotspot Excavation						
Hotspot soil excavation (Tier 1)	cy	8,673	\$	30.00	\$ 260,177.92	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	13,182	\$	135.50	\$ 1,786,208.12	Cost includes transportation, disposal, and TSCA tax
Hotspot soil excavation (Tier 2)	cy	13,603	\$	30.00	\$ 408,090.00	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	20,677	\$	143.55	\$ 2,968,120.19	Cost includes transportation, disposal, and TSCA tax
PCB-impacted groundwater	ls	1	\$	153,374.48	\$ 153,374.48	Disposal option based on previous PCB TCRA; cost includes groundwater pre-treatment system maintenance, temporary pipeline to discharge point and disposal fee to POTW Includes wetlands excavation at Panhandle Area
Dewatering						
Disposal cost	gal	6,011,280	\$	0.006	\$ 36,070.00	
Equipment rental	mo	4	\$	17,000.00	\$ 68,000.00	Based on 4 months equipment rental; includes settling tanks, filtration system, pumps, and pipeline to sewer manhole
Floating Barrier	ls	1	\$	174,000.00	\$ 174,000.00	Floating barrier with skimmer on San Francisco Bay; includes material, deployment, and operation for 90 days
Decontamination Pad	ea	3	\$	19,000.00	\$ 57,000.00	Includes sump pump and discharge pipe to settling tank
Groundwater Monitoring						
Existing well abandonment	ls	1	\$	40,360.00	\$ 40,360.00	For details, see BKUP GW worksheet
New well installation	ls	1	\$	46,414.00	\$ 46,410.00	Same as above
Landfill Gas (LFG) System - Option 3B						
LFG active system with GAC	ls	1	\$	756,000.00	\$ 756,000.00	For details, see BKUP LFG-Option B worksheet
Groundwater Relief System						
Transmission pipeline	lf	2,100	\$	50.00	\$ 105,000.00	Along south perimeter to sewer manhole tie-in
Force main tie-in to existing sewer manhole	ls	1	\$	20,000.00	\$ 20,000.00	Manhole tie-in near northwest corner of landfill
Pumps and electrical	ls	1	\$	70,000.00	\$ 70,000.00	Includes submersible pumps, control panels, and electrical
Groundwater treatment	ls	1	\$	200,000.00	\$ 200,000.00	Design build contingency for groundwater treatment package unit.
Groundwater Diversion System						
Slurry wall (soil/bentonite)	ls	1	\$	1,050,500.00	\$ 1,050,500.00	Proposed at west perimeter of Landfill Area For details, see BKUP GW Diversion worksheet

Table R-23. Alternative 3B - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Excavation and Radiation Screening/Disposal					Includes Adjacent Area and Shoreline excavation
Pre-Containment LLRW Surface Anomalies Removal					
Pre-clearing, grubbing, and stripping screening	days	38	\$ 11,888.00	\$ 455,460.00	Based on 50'x50' grid at 16 grids per day production rate (~613 equivalent grids)
Clearing, grubbing, and stripping	days	38	\$ 20,095.00	\$ 766,260.00	For quantity estimate, depth of stripping is assumed 1'; number of days based on 1,488-cy/day production rate, or rad screening rate, whichever is greater
Pre-excavation screening	days	108	\$ 11,888.00	\$ 1,288,360.00	Based on 50'x50' grid at 16 grids per day production rate (~1,734 equivalent grids)
Excavation	days	108	\$ 20,095.00	\$ 2,177,800.00	Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping. Number of days based on 1,488-cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	120	\$ 5,616.00	\$ 673,660.00	Based on 1,500-cy/day production rate
Soil confirmation sampling	ea	898	\$ 572.00	\$ 513,460.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	38	\$ 11,888.00	\$ 455,460.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	12,385	\$ 153.50	\$ 1,901,050.00	10% of clear, grub, stripped materials, and 5% of additional excavation
Additional LLRW Anomalies Removal					
Pre-clearing, grubbing, and stripping screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Clearing, grubbing, and stripping	days	15	\$ 20,095.00	\$ 292,630.00	For quantity estimate, depth of stripping is assumed 1'; number of days based on 1,488-cy/day production rate, or rad screening rate, whichever is greater
Pre-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Excavation	days	15	\$ 20,095.00	\$ 292,630.00	Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping; number of days based on 1,488-cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	30	\$ 5,616.00	\$ 166,010.00	Based on 1,500-cy/day production rate
Soil confirmation sampling	ea	288	\$ 572.00	\$ 164,930.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	3,617	\$ 153.50	\$ 555,210.00	10% of clear, grub, stripped materials, and 5% of additional excavation

Table R-23. Alternative 3B - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price		Cost	Remarks	
Construction Quality Assurance							
Landfill and Adjacent Areas	days	327	\$	3,000.00	\$	981,000.00	CQA services for landfill closure and adjacent areas remediation based on 320 working days construction schedule
LFG well field and flare unit	days	120	\$	1,000.00	\$	120,000.00	CQA services for gas field and flare unit based on 120 working days construction schedule
Subtotal Capital Cost					\$	47,420,166.27	
20% Contingency					\$	9,484,033.25	
Total Capital Cost					\$	56,904,199.53	

Notes:

1. Capital cost is in 2008 dollars.
2. Cost estimates for LFG control system, groundwater monitoring system, and wetlands restoration were obtained from backup spreadsheets.
3. Assumes infrastructure and building demolition will be completed (by others) prior to final cover installation for Adjacent Area at the east side of the Landfill Area.
4. Cost for other construction items were obtained from vendor quotes and similar landfill closure and remedial projects.

AB = aggregate base

ac = acres

CQA = Construction Quality Assurance

cy = cubic yard

ea = each

GCL = geosynthetic clay liner

HDPE = high density polyethylene

H&S = Health and Safety

lf = linear feet

LFG = landfill gas

LLRW = low-level radioactive waste

ls = lump sum

mo = months

PCB = polychlorinated biphenyl

RC = reinforced concrete

sf = square feet

SWPPP = Storm Water Pollution Prevention Plan

WET = waste extraction test

Table R-24. Alternative 3B - Operation and Maintenance Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Final Cover	lump sum (ls)	1	\$ 69,000.00	\$ 69,000.00	Repair of final cover due to settlement, slope failure, or erosion
Vegetation	ls	1	\$ 12,600.00	\$ 12,600.00	Maintenance of vegetation
LFG System - Option 3B	ls	1	\$ 325,500.00	\$ 325,500.00	For details, see BKUP LFG-3B worksheet
Stormwater Monitoring	ls	1	\$ 60,980.00	\$ 60,980.00	For details, see BKUP SW worksheet
LFG Condensate Disposal	ls	1	\$ 55,800.00	\$ 55,800.00	Assumes 60 gpd condensate, off-site disposal to Class I facility
Groundwater Relief System	ls	1	\$ 67,700.00	\$ 67,700.00	Groundwater relief system based on 20 gpm discharge to POTW via transmission pipeline; includes monthly inspection and reporting; assumed pump replacement every 3 years
Drainage	ls	1	\$ 5,000.00	\$ 5,000.00	Maintenance of drainage control system, including clearing of materials blocking drainage conveyances
Site Security	ls	1	\$ 9,600.00	\$ 9,600.00	Periodic inspection of point of access to the landfill and environmental control systems
Emergency Response	ls	1	\$ 5,000.00	\$ 5,000.00	Includes landfill inspection after major earthquake, storm, or fire that may exceed site design, which could require emergency response actions
Periodic Inspection, Documentation, Reporting and Regulatory Compliance	ls	1	\$ 19,000.00	\$ 19,000.00	Includes preparation of iso-settlement maps and 5-year site review
Institutional Control	ls	1	\$ 36,000.00	\$ 36,000.00	Includes monitoring, enforcement, and reporting
Subtotal O&M Cost				\$ 666,180.00	
20% Contingency				\$ 133,236.00	
Annual Average O&M Cost				\$ 799,416.00	
30 Year O&M Present Value				\$ 12,205,099.68	

51	Capital Cost: \$70.8M	Table 8	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Appendix R, Tables R-33, R-35, R-36, R-39, and R-40. Record No. 4237.
----	------------------------------	---------	---

Table R-33. Cost Estimate Summary for Alternative 4 ^(1,2)
Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Alternative 4A

Cap the Landfill and Adjacent Areas
Install an active Gas Control and Collection System (GCCS) and treat the landfill gas with a flare unit
Close northern landfill gas control system
Remove hot spots in adjacent areas
Install surface water control
Restore wetlands
Install groundwater relief, diversion, and containment systems

Items	Estimated Cost
Capital Cost	\$65,603,596
Inspection, Maintenance, and GCCS O&M	\$21,714,480
Groundwater Monitoring Cost	\$1,980,150
Periodic Cost	\$675,298
Total Cost for Alternative 4A (Flare Unit)	\$89,973,524
Present Value for Alternative 4A (Flare Unit)	\$79,914,634

Alternative 4B

Cap the Landfill and Adjacent Areas
Install an active GCCS and treat the landfill gas with a GAC/KMnO4 adsorption unit
Close northern landfill gas control system
Remove hot spots in adjacent areas
Install surface water control
Restore wetlands
Install groundwater relief, diversion, and containment systems

Items	Estimated Cost
Capital Cost	\$65,325,916
Inspection, Maintenance, and GCCS O&M	\$23,982,480
Groundwater Monitoring Cost	\$1,980,150
Periodic Cost	\$675,298
Total Cost for Alternative 4B (Adsorption)	\$91,963,844
Present Value for Alternative 4B (Adsorption)	\$81,123,731

Notes:

- (1) Appended tables summarize backup calculations for all cost estimates provided.
- (2) Period of analysis is 32 years, which includes 2 years of engineering, permitting and construction periods, and 30 years of long-term monitoring.
- (3) Based on a 2.8% discount factor, as specified for Federal facility sites in Appendix C of Office of Management and Budget Circular A-94 (effective January 2008, http://www.whitehouse.gov/omb/circulars/a094/a94_appx-c.html).

Table R-35. Alternative 4A - Backup Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
General					
Mobilization and Demobilization	ls	1	\$ 2,476,000.00	\$ 2,476,000.00	Based on 5% of construction cost, excluding CQA, permitting, H&S, and SWPPP implementation costs
Health and Safety	ls	1	\$ 50,000.00	\$ 50,000.00	
Engineering and Regulatory Compliance	ls	1	\$ 1,485,800.00	\$ 1,485,800.00	Includes preparation of construction documents, construction certification report, regulatory coordination, and local permits
Temporary Erosion Control and SWPPP Implementation	ls	1	\$ 30,000.00	\$ 30,000.00	
Demolition					
Remove existing drainage structures	ls	1	\$ 10,000.00	\$ 10,000.00	Dispose of spoils on site northwest area of IR-01/21
Remove concrete rubble, riprap, bricks, etc.	cy	9,921	\$ 10.00	\$ 99,210.00	Existing shoreline protection along the southern boundary of the Landfill and East Adjacent Areas and Panhandle Area; dispose of spoils on site at IR-01/21
Temporary Works					
Sheet-pile installation	lf	3,360	\$ 1,495.00	\$ 5,023,200.00	Along Landfill and Panhandle shoreline
Dewatering	days	120	\$ 5,640.00	\$ 676,800.00	
Air Monitoring					
Ambient air monitors	mo	4	\$ 10,614.00	\$ 42,456.00	
Portable ambient air analyzer	mo	4	\$ 1,952.00	\$ 7,808.00	
Portable combustible gas/oxygen indicator	mo	4	\$ 464.00	\$ 1,856.00	
Landfill IR-01/21					Includes the north, west, and southeast section of IR-01/21
Earthwork					
Excavated waste, existing ground, and debris consolidation	cy	67,786	\$ 30.00	\$ 2,033,586.50	Stripped soil, waste, and concrete rubble excavation along the southern limit of the Landfill and Adjacent Areas bordering San Francisco Bay, minus chemical hot spots and LLRW; place excavated material on site at IR-01/21
Earthfill	cy	11,916	\$ 5.00	\$ 59,578.85	Moisture condition and compact
Import soil	cy	84,949	\$ 25.00	\$ 2,123,724.74	Purchase and site delivery; includes fluff factor
Geosynthetic cover subgrade preparation	sf	395,686	\$ 0.10	\$ 39,568.58	Remove rock protrusions and level ground surface prior to geosynthetics placement
2.0' foundation layer	cy	29,066	\$ 5.00	\$ 145,328.66	Moisture condition and compact
2.0' vegetative soil cover	cy	29,809	\$ 5.00	\$ 149,046.61	Moisture condition and compact
Final grading	ac	22	\$ 2,000.00	\$ 44,400.00	Track walk prior to hydroseeding
Geosynthetic Final Cover					
Geosynthetic clay liner (GCL)	sf	405,278	\$ 0.85	\$ 344,486.17	Includes additional landfill closure area only
60-mil HDPE geomembrane	sf	417,125	\$ 0.60	\$ 250,274.91	Includes additional landfill closure area only
Drainage geocomposite	sf	403,530	\$ 0.80	\$ 322,823.88	Includes additional landfill closure area only
Demarcation layer	sf	360,422	\$ 0.20	\$ 72,084.40	
4" perforated HDPE pipe, SDR 11, including pipe fittings, and geotextile wrap	lf	3,440	\$ 12.00	\$ 41,280.00	
Toe of slope gravel fill	cy	382	\$ 30.00	\$ 11,466.67	Includes geotextile filter fabric
Gravel blanket drain	lf	700	\$ 100.00	\$ 70,000.00	Blanket drain for groundwater relief system

Table R-35. Alternative 4A - Backup Cost Estimate (continued)
 Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Landfill IR-01/21 (continued)					
					Includes the north, west, and southeast section of IR-01/21
Geosynthetic Termination and Tie-ins					
North and west perimeter final cover termination	lf	1,570	\$ 12.00	\$ 18,840.00	
South perimeter final cover termination	lf	700	\$ 15.00	\$ 10,500.00	
North and west tie-ins to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
South tie-in to existing geosynthetic cover	lf	300	\$ 20.00	\$ 6,000.00	Same as above
Surface Water Drainage System					
ECM/grass-lined swale	lf	700	\$ 14.00	\$ 9,800.00	Install at north finish grade tie-in
Top deck diversion berm with ECM/grass-lined ditch	lf	1,210	\$ 10.00	\$ 12,100.00	Install at deck area of landfill
ECM/grass-lined ditch	lf	300	\$ 14.00	\$ 4,200.00	Install at northwest perimeter of landfill
Concrete-lined ditch	lf	700	\$ 30.00	\$ 21,000.00	Install at toe of slope at south landfill perimeter
Rock-lined downchute	ea	1	\$ 20,000.00	\$ 20,000.00	Remove and reestablish existing rock gabion drainage swale and downchute lining
Pipe downdrain	lf	180	\$ 50.00	\$ 9,000.00	Install at sideslope areas
Pipe crossdrain	lf	100	\$ 70.00	\$ 7,000.00	Install across south perimeter access road
Drainage inlet	ea	2	\$ 3,000.00	\$ 6,000.00	Install at south perimeter access road
East Adjacent Area					Includes PCB removal area
Earthwork					
Earthfill	cy	31,641	\$ 5.00	\$ 158,205.00	Moisture condition and compact
Import soil	cy	99,038	\$ 25.00	\$ 2,475,939.72	Purchase and site delivery; includes fluff factor
1.0' foundation layer	cy	16,210	\$ 5.00	\$ 81,051.82	Moisture condition and compact
2.0' vegetative soil cover	cy	33,983	\$ 5.00	\$ 169,915.00	Moisture condition and compact
Geosynthetic subgrade preparation	sf	474,782	\$ 0.10	\$ 47,478.18	Remove rock protrusions and level ground surface prior to geosynthetics placement
Final grading	ac	9.7	\$ 2,000.00	\$ 19,320.00	Track walk prior to hydroseeding
Geosynthetic Final Cap					
60-mil HDPE geomembrane	sf	474,782	\$ 0.60	\$ 284,869.09	
Drainage geocomposite	sf	466,957	\$ 0.80	\$ 373,565.60	
Demarcation layer	sf	466,957	\$ 0.20	\$ 93,391.40	
North and east final cover termination	lf	2,285	\$ 12.00	\$ 27,420.00	4" perforated HDPE pipe, SDR 11, including pipe fittings, and geotextile wrap
South perimeter final cover termination	lf	500	\$ 15.00	\$ 7,500.00	
Final cover tie-in to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
Surface Water Drainage System					
ECM/grass-lined ditch	lf	2,260	\$ 14.00	\$ 31,640.00	Install at north and east boundary
Concrete-lined ditch	lf	450	\$ 30.00	\$ 13,500.00	Install at north and east boundary
Pipe downdrain	lf	200	\$ 50.00	\$ 10,000.00	Install across access road
Pipe culvert	lf	50	\$ 75.00	\$ 3,750.00	Install across access road
Drainage inlet	ea	2	\$ 3,000.00	\$ 6,000.00	Install across access road
Ditch outlet	ls	1	\$ 5,000.00	\$ 5,000.00	Perimeter ditch outlet to San Francisco Bay

Table R-35. Alternative 4A - Backup Cost Estimate (continued)
Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Panhandle Area					
Earthwork					
Earthfill	cy	18,752	\$ 5.00	\$ 93,760.00	Moisture condition and compact
Import soil	cy	63,144	\$ 25.00	\$ 1,578,600.00	Purchase and site delivery; includes fluff factor
Import hydric soil	cy	26,547	\$ 35.00	\$ 929,155.50	Purchase and site delivery; includes fluff factor
2.0' upland soil layer	cy	20,177	\$ 5.00	\$ 100,885.00	Moisture condition and compact
Hydric soil layer	cy	20,421	\$ 6.00	\$ 122,526.00	Moisture condition and compact
2.0' bridge soil layer	cy	13,691	\$ 5.00	\$ 68,455.00	Moisture condition and compact
Geosynthetic subgrade preparation	sf	216,792	\$ 0.10	\$ 21,679.20	Remove rock protrusions and level ground surface prior to geosynthetics placement
Final grading	ac	9.0	\$ 2,000.00	\$ 18,060.00	Track walk prior to hydroseeding
Geosynthetic Cap					
Drainage geocomposite	sf	284,422	\$ 0.80	\$ 227,537.60	
Clay import	cy	2,881	\$ 30.00	\$ 86,430.00	For cap within wetlands area
Clay placement	cy	2,505	\$ 5.00	\$ 12,525.00	Cap within wetlands area
60-mil HDPE geomembrane	sf	216,792	\$ 0.60	\$ 130,075.20	
Final cover termination (west boundary)	lf	1,355	\$ 8.00	\$ 10,840.00	Geosynthetic cap termination, trench excavation, and backfill
North tie-in to existing and new landfill geosynthetics	lf	450	\$ 20.00	\$ 9,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
Surface Water Control System					
ECM/grass-lined ditch	lf	1,355	\$ 14.00	\$ 18,970.00	Drainage ditch west side of west perimeter access road
Pipe culvert	lf	100	\$ 75.00	\$ 7,500.00	West perimeter ditch inlet to freshwater wetland
Drainage ditch outlet	ls	1	\$ 5,000.00	\$ 5,000.00	West perimeter ditch outlet to San Francisco Bay
Wetlands Outlet Structures					
Freshwater wetland outlet structure	ls	1	\$ 60,800.00	\$ 60,800.00	Remove and replace existing outlet structure; for details, see Outlet worksheet
Wetlands Restoration					
	ls	1	\$ 616,798.00	\$ 616,800.00	For details, see BKUP Wetlands worksheet
Shoreline Protection					
Rock riprap	tons	41,518	\$ 100.00	\$ 4,151,761.19	Shoreline protection along the south perimeter of the Landfill and Adjacent Areas
Earthfill	cy	9,663	\$ 4.50	\$ 43,483.50	Soil backfill along the southern perimeter of the Landfill and Adjacent Area; moisture condition and compact
Import soil	cy	11,596	\$ 25.00	\$ 289,890.00	Purchase and site delivery; includes fluff factor
Geosynthetic subgrade preparation	sf	53,043	\$ 0.10	\$ 5,304.30	Remove rock protrusions and level ground surface prior to geosynthetics placement
60-mil HDPE	sf	53,043	\$ 0.50	\$ 26,521.50	Protective cover for soil backing
Cushion geotextile (12 oz/sy)	sf	53,043	\$ 0.20	\$ 10,608.60	Cushion fabric between rock riprap and HDPE protective cover
Geogrid	sf	28,380	\$ 2.00	\$ 56,760.00	For soil reinforcement
Access Road					
Class 2 aggregate base	cy	3,920	\$ 25.00	\$ 98,007.41	12" thick AB; includes service road for the Landfill and Adjacent Areas

Table R-35. Alternative 4A - Backup Cost Estimate (continued)
Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Shoreline Protection (continued)					
Revegetation					
Hydroseeding	ac	32	\$ 2,000.00	\$ 63,080.00	Includes Landfill and Adjacent Areas
Temporary Fence	lf	2,400	\$ 24.00	\$ 57,600.00	Based on \$4/lf per month rental
Hot Spot Excavation					
Hot spot soil excavation (Tier 1)	cy	9,753	\$ 30.00	\$ 292,580.69	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	14,824	\$ 136.50	\$ 2,023,488.08	Cost includes transportation, disposal, and TSCA tax
Hot spot soil excavation (Tier 2 through 4)	cy	23,036	\$ 30.00	\$ 691,070.00	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	35,014	\$ 156.09	\$ 5,465,368.56	Cost includes transportation, disposal, and TSCA tax
Hot spot soil excavation (Tier 5)	cy	6,822	\$ 30.00	\$ 204,653.33	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	10,369	\$ 181.00	\$ 1,876,807.50	Cost includes transportation, disposal, and TSCA tax
PCB-impacted groundwater	ls	1	\$ 153,374.48	\$ 153,374.48	Disposal option based on previous PCB TCRA; cost includes groundwater pretreatment system maintenance, temporary pipeline to discharge point, and disposal fee to POTW
Dewatering					
Disposal cost	gal	6,011,280	\$ 0.006	\$ 36,070.00	Includes wetlands excavation at Panhandle Area
Equipment rental	mo	4	\$ 17,000.00	\$ 68,000.00	Based on 4 months equipment rental; includes settling tanks, filtration system, pumps, and pipeline to sewer manhole
Floating Barrier	ls	1	\$ 174,000.00	\$ 174,000.00	Floating barrier with skimmer on San Francisco Bay; includes material, deployment, and operation for 90 days
Decontamination Pad	ea	3	\$ 19,000.00	\$ 57,000.00	Includes sump pump and discharge pipe to settling tank
Groundwater Monitoring					
Existing well abandonment	ls	1	\$ 40,360.00	\$ 40,360.00	For details, see BKUP GW rolled-up worksheet
New well installation	ls	1	\$ 46,414.00	\$ 46,410.00	Same as above
Landfill Gas (LFG) System - Option 4A					
LFG active system with flare unit	ls	1	\$ 971,000.00	\$ 971,000.00	For details, see BKUP LFG-4A worksheet
Groundwater Relief System					
Proposed at south perimeter of Landfill					
Transmission pipeline	lf	2,100	\$ 50.00	\$ 105,000.00	Along south perimeter to sewer manhole tie-in
Force main tie-in to existing sewer manhole	ls	1	\$ 20,000.00	\$ 20,000.00	Manhole tie-in near northwest corner of landfill
Pumps and electrical	ls	1	\$ 70,000.00	\$ 70,000.00	Includes submersible pumps, control panels, and electrical works
Groundwater treatment	ls	1	\$ 200,000.00	\$ 200,000.00	Design build contingency for groundwater treatment package unit
Groundwater Containment System					
Proposed at south and west perimeter of Landfill					
Slurry wall (soil/bentonite)	ls	1	\$ 2,264,580.00	\$ 2,264,580.00	For details, see BKUP GW Containment System worksheet
Excavation and Radiation Screening/Disposal					
Includes Adjacent Areas and Shoreline excavation					
Pre-Containment LLRW Surface Anomalies Removal					
Pre-clearing, grubbing, and stripping screening	days	38	\$ 11,888.00	\$ 455,460.00	Based on 50'x50' grid at 16 grids per day production rate (~613 equivalent grids)
Clearing, grubbing, and stripping	days	38	\$ 20,095.00	\$ 766,260.00	For quantity estimate, depth of stripping is assumed 1'; number of days based on 1,488-cy/day production rate, or rad screening rate, whichever is greater
Pre-excavation screening	days	108	\$ 11,888.00	\$ 1,288,360.00	Based on 50'x50' grid at 16 grids per day production rate (~1,734 equivalent grids)

Table R-35. Alternative 4A - Backup Cost Estimate (continued)
 Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Excavation and Radiation Screening/Disposal (continued)					
Excavation	days	108	\$ 20,095.00	\$ 2,177,800.00	Includes Adjacent Areas and Shoreline excavation Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping; number of days based on 1488cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	123	\$ 5,616.00	\$ 690,770.00	Based on 1,500-cy/day production rate
Soil confirmation sampling	ea	898	\$ 572.00	\$ 513,460.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	38	\$ 11,888.00	\$ 455,460.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	12,802	\$ 153.50	\$ 1,965,180.00	10% of clear, grub, stripped materials, and 5% of additional excavation
Additional LLRW Anomalies Removal					
Pre-clearing, grubbing, and stripping screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Clearing, grubbing, and stripping	days	15	\$ 20,095.00	\$ 292,630.00	For quantity estimate, depth of stripping is assumed 1'; number of days based on 1,488-cy/day production rate, or rad screening rate, whichever is greater
Pre-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Excavation	days	15	\$ 20,095.00	\$ 292,630.00	Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping; number of days based on 1,488-cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	30	\$ 5,616.00	\$ 166,010.00	Based on 1,500-cy/day production rate
Soil confirmation sampling	ea	288	\$ 572.00	\$ 164,930.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	3,617	\$ 153.50	\$ 555,210.00	10% of clear, grub, stripped materials and 5% of additional excavation
Construction Quality Assurance					
Landfill and Adjacent Areas	days	327	\$ 3,000.00	\$ 981,000.00	CQA services for landfill closure and adjacent areas remediation based on 320 working days construction schedule
LFG well field and flare unit	days	120	\$ 1,000.00	\$ 120,000.00	CQA services for gas field and flare unit based on 120 working days construction schedule
Subtotal Capital Cost				\$ 54,669,663.43	
20% Contingency				\$ 10,933,932.69	
Total Capital Cost				\$ 65,603,596.11	

Notes:

- Capital cost is in 2008 dollars.
- Cost estimates for LFG control system, groundwater monitoring system, and wetlands restoration were obtained from backup spreadsheets.
- Assumes infrastructure and building demolition will be completed (by others) prior to final cover installation for Adjacent Area at the east side of the Landfill.
- Cost for other construction items were obtained from vendor quotes and similar landfill closure and/or remedial projects.

AB = aggregate base	H&S = Health and Safety	PCB = polychlorinated biphenyl
ac = acres	lf = linear feet	RC = reinforced concrete
CQA = Construction Quality Assurance	LFG = landfill gas	sf = square feet
cy = cubic yard	LLRW = low-level radioactive waste	SWPPP = Storm Water Pollution Prevention Plan
ea = each	ls = lump sum	TAL = Target Analyte List
GCL = geosynthetic clay liner	mo = months	WET = Waste Extraction Test
HDPE = high-density polyethylene		

Table R-36. Alternative 4A - Operation and Maintenance Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price		Cost	Remarks
Final Cover	lump sum (ls)	1	\$	69,000.00	\$ 69,000.00	Repair of final cover due to settlement, slope failure, or erosion
Vegetation	ls	1	\$	12,600.00	\$ 12,600.00	Maintenance of vegetation
LFG System - Option 3A	ls	1	\$	262,500.00	\$ 262,500.00	For details, see BKUP LFG-3A worksheet
Stormwater Monitoring	ls	1	\$	60,980.00	\$ 60,980.00	For details, see BKUP SW worksheet
LFG Condensate Disposal	ls	1	\$	55,800.00	\$ 55,800.00	Assumes 60-gpd condensate, off-site disposal to Class I facility
Groundwater Relief System	ls	1	\$	67,700.00	\$ 67,700.00	Assumes 20-gpm extraction rate for discharge to POTW via transmission pipeline; includes monthly inspection and reporting and pump replacement every 3 years
Drainage	ls	1	\$	5,000.00	\$ 5,000.00	Maintenance of drainage control system, including clearing of materials blocking drainage conveyances
Site Security	ls	1	\$	9,600.00	\$ 9,600.00	Periodic inspection of point of access to the landfill and environmental control systems
Emergency Response	ls	1	\$	5,000.00	\$ 5,000.00	Includes landfill inspection after major earthquake, storm, or fire that may exceed site design, which could require emergency response actions
Periodic Inspection, Documentation, Reporting and Regulatory Compliance	ls	1	\$	19,000.00	\$ 19,000.00	Includes preparation of iso-settlement maps and 5-year site review
Institutional Control	ls	1	\$	36,000.00	\$ 36,000.00	Includes monitoring, enforcement, and reporting
Subtotal O&M Cost					\$ 603,180.00	
20% Contingency					\$ 120,636.00	
Annual Average O&M Cost					\$ 723,816.00	
30 Year O&M Present Value					\$ 12,205,099.68	

Table R-39. Alternative 4B - Backup Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
General					
Mobilization and Demobilization	ls	1	\$ 2,466,000.00	\$ 2,466,000.00	Based on 5% of construction cost excluding CQA, Permitting, H&S, and SWPPP implementation costs
Health and Safety	ls	1	\$ 50,000.00	\$ 50,000.00	
Engineering and Regulatory Compliance	ls	1	\$ 1,479,400.00	\$ 1,479,400.00	Includes preparation of construction documents, construction certification report, regulatory coordination, and local permits
Temporary Erosion Control and SWPPP Implementatio	ls	1	\$ 30,000.00	\$ 30,000.00	
Demolition					
Remove existing drainage structures	ls	1	\$ 10,000.00	\$ 10,000.00	Dispose of spoils on site at northeast area of IR-01/21
Remove existing concrete rubble, riprap, bricks, etc.	cy	9,921	\$ 10.00	\$ 99,210.00	Existing shoreline protection along the southern boundary of the Landfill and East Adjacent Area and Panhandle Area; dispose of spoils on site at IR-01/21
Temporary Works					
Sheet-pile installation	lf	3,360	\$ 1,495.00	\$ 5,023,200.00	Along Landfill and Panhandle shoreline
Dewatering	days	120	\$ 5,640.00	\$ 676,800.00	
Air Monitoring					
Ambient air monitors	mo	4	\$ 10,614.00	\$ 42,456.00	
Portable ambient air analyzer	mo	4	\$ 1,952.00	\$ 7,808.00	
Portable combustible gas/oxygen indicator	mo	4	\$ 464.00	\$ 1,856.00	
Landfill IR-01/21 Includes the north, west, and southeast section of IR-01/21					
Earthwork					
Excavated waste and debris consolidation	cy	67,786	\$ 30.00	\$ 2,033,586.50	Stripped soils, waste, and concrete rubble excavation along the southern limit of the Landfill and Adjacent Areas bordering San Francisco Bay minus chemical hot spots and LLRW; place excavated material on site at IR-01/21
Earthfill	cy	11,916	\$ 5.00	\$ 59,578.85	Moisture condition and compact
Import soil	cy	84,949	\$ 25.00	\$ 2,123,724.74	Purchase and site delivery; includes fluff factor
Geosynthetic cover subgrade preparation	sf	395,686	\$ 0.10	\$ 39,568.58	Remove rock protrusions and level ground surface prior to geosynthetics placement
2.0' foundation layer	cy	29,066	\$ 5.00	\$ 145,328.66	Moisture condition and compact
2.0' vegetative soil cover	cy	29,809	\$ 5.00	\$ 149,046.61	Moisture condition and compact
Final grading	ac	22	\$ 2,000.00	\$ 44,400.00	Track walk prior to hydroseeding
Geosynthetic Final Cover					
Geosynthetic clay liner (GCL)	sf	405,278	\$ 0.85	\$ 344,486.17	Includes additional landfill closure area only
60-mil HDPE geomembrane	sf	417,125	\$ 0.60	\$ 250,274.91	Includes additional landfill closure area only
Drainage geocomposite	sf	403,530	\$ 0.80	\$ 322,823.88	Includes additional landfill closure area only
Demarcation layer	sf	360,422	\$ 0.20	\$ 72,084.40	
4"-perforated HDPE pipe, SDR 11, including pipe fittings,	lf	3,440	\$ 12.00	\$ 41,280.00	
Toe of slope gravel fill	cy	382	\$ 30.00	\$ 11,466.67	Includes geotextile filter fabric
Gravel blanket drain	lf	700	\$ 100.00	\$ 70,000.00	Blanket drain for groundwater relief system
Geosynthetic Termination and Tie-ins					
North and west perimeter final cover termination	lf	1,570	\$ 12.00	\$ 18,840.00	
South perimeter final cover termination	lf	700	\$ 15.00	\$ 10,500.00	

Table R-39. Alternative 4B - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Landfill IR-01/21 (continued)					
Includes the north, west, and southeast section of IR-01/21					
North and west tie-ins to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
South tie-in to existing geosynthetic cover	lf	300	\$ 20.00	\$ 6,000.00	Same as above
Surface Water Drainage System					
ECM/grass-lined swale	lf	700	\$ 14.00	\$ 9,800.00	Install at north finish grade tie-in
Top deck diversion berm with ECM/grass-lined ditch	lf	1,210	\$ 10.00	\$ 12,100.00	Install at deck area of landfill
ECM/grass-lined ditch	lf	300	\$ 14.00	\$ 4,200.00	Install at northwest perimeter of landfill
Concrete-lined ditch	lf	700	\$ 30.00	\$ 21,000.00	Install at toe of slope at south landfill perimeter
Rock-lined downchute	ea	1	\$ 20,000.00	\$ 20,000.00	Remove and reestablish existing rock gabion drainage swale and downchute lining
Pipe downdrain	lf	180	\$ 50.00	\$ 9,000.00	Install at sideslope areas
Pipe crossdrain	lf	100	\$ 70.00	\$ 7,000.00	Install across south perimeter access road
Drainage inlet	ea	2	\$ 3,000.00	\$ 6,000.00	Install at south perimeter access road
East Adjacent Area					
Includes PCB remediation area					
Earthwork					
Earthfill	cy	31,641	\$ 5.00	\$ 158,205.00	Moisture condition and compact
Import soil	cy	99,038	\$ 25.00	\$ 2,475,939.72	Purchase and site delivery; includes fluff factor
1.0' foundation layer	cy	16,210	\$ 5.00	\$ 81,051.82	Moisture condition and compact
2.0' vegetative soil cover	cy	33,983	\$ 5.00	\$ 169,915.00	Moisture condition and compact
Geosynthetic subgrade preparation	sf	474,782	\$ 0.10	\$ 47,478.18	Remove rock protrusions and level ground surface prior to geosynthetics placement
Final grading	ac	9.7	\$ 2,000.00	\$ 19,320.00	Track walk prior to hydroseeding
Geosynthetic Final Cap					
60-mil HDPE geomembrane	sf	474,782	\$ 0.60	\$ 284,869.09	
Drainage geocomposite	sf	466,957	\$ 0.80	\$ 373,565.60	
Demarcation layer	sf	466,957	\$ 0.20	\$ 93,391.40	
North and east final cover termination	lf	2,285	\$ 12.00	\$ 27,420.00	4"-perforated HDPE pipe, SDR 11, including pipe fittings, and geotextile wrap
South perimeter final cover termination	lf	500	\$ 15.00	\$ 7,500.00	
Final cover tie-in to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
Surface Water Drainage System					
ECM/grass-lined ditch	lf	2,260	\$ 14.00	\$ 31,640.00	Install at north and east boundary
Concrete-lined ditch	lf	450	\$ 30.00	\$ 13,500.00	Install at north and east boundary
Pipe downdrain	lf	200	\$ 50.00	\$ 10,000.00	Install across access road
Pipe culvert	lf	50	\$ 75.00	\$ 3,750.00	Install across access road
Drainage inlet	ea	2	\$ 3,000.00	\$ 6,000.00	Install across access road
Ditch outlet	ls	1	\$ 5,000.00	\$ 5,000.00	Perimeter ditch outlet to San Francisco Bay
Panhandle Area					
Earthwork					
Earthfill	cy	18,752	\$ 5.00	\$ 93,760.00	Moisture condition and compact
Import soil	cy	63,144	\$ 25.00	\$ 1,578,600.00	Purchase and site delivery; includes fluff factor
Import hydric soil	cy	26,547	\$ 35.00	\$ 929,155.50	Purchase and site delivery; includes fluff factor

Table R-39. Alternative 4B - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Panhandle Area (continued)					
2.0' upland soil layer	cy	20,177	\$ 5.00	\$ 100,885.00	Moisture condition and compact
Hydric soil layer	cy	20,421	\$ 6.00	\$ 122,526.00	Moisture condition and compact
2.0' bridge soil layer	cy	13,691	\$ 5.00	\$ 68,455.00	Moisture condition and compact
Geosynthetic subgrade preparation	sf	216,792	\$ 0.10	\$ 21,679.20	Remove rock protrusions and level ground surface prior to geosynthetics placement
Final grading	ac	9.0	\$ 2,000.00	\$ 18,060.00	Track walk prior to hydroseeding
Geosynthetic Cap					
Drainage geocomposite	sf	284,422	\$ 0.80	\$ 227,537.60	
Clay import	cy	2,881	\$ 30.00	\$ 86,430.00	For cap within wetlands area
Clay placement	cy	2,505	\$ 5.00	\$ 12,525.00	Cap within wetlands area
60-mil HDPE geomembrane	sf	216,792	\$ 0.60	\$ 130,075.20	
Final cover termination (west boundary)	lf	1,355	\$ 8.00	\$ 10,840.00	Geosynthetic cap termination, trench excavation, and backfill
North tie-in to existing and new landfill geosynthetics	lf	450	\$ 20.00	\$ 9,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
Surface Water Control System					
ECM/grass-lined ditch	lf	1,355	\$ 14.00	\$ 18,970.00	Drainage ditch west side of west perimeter access road
Pipe culvert	lf	100	\$ 75.00	\$ 7,500.00	West perimeter ditch inlet to freshwater wetland
Drainage ditch outlet	ls	1	\$ 5,000.00	\$ 5,000.00	West perimeter ditch outlet to San Francisco Bay
Wetlands Outlet Structures					
Freshwater wetland outlet structure	ls	1	\$ 60,800.00	\$ 60,800.00	Remove and replace existing outlet structure; for details, see Outlet worksheet
Wetlands Restoration					
	ls	1	\$ 616,798.00	\$ 616,800.00	For details, see BKUP Wetlands worksheet
Shoreline Protection					
Rock riprap	tons	41,518	\$ 100.00	\$ 4,151,761.19	Shoreline protection along the south perimeter of the Landfill and Adjacent Areas
Earthfill	cy	9,663	\$ 4.50	\$ 43,483.50	Soil backing along the southern perimeter of the Landfill and Adjacent Area; moisture condition and compact
Import soil	cy	11,596	\$ 25.00	\$ 289,890.00	Purchase and site delivery; includes fluff factor
Geosynthetic subgrade preparation	sf	53,043	\$ 0.10	\$ 5,304.30	Remove rock protrusions and level ground surface prior to geosynthetics placement
60-mil HDPE	sf	53,043	\$ 0.50	\$ 26,521.50	Protective cover for soil backing
Cushion geotextile (12 oz/sy)	sf	53,043	\$ 0.20	\$ 10,608.60	Cushion fabric between rock riprap and HDPE protective cover
Geogrid	sf	28,380	\$ 2.00	\$ 56,760.00	For soil reinforcement
Access Road					
Class 2 aggregate base	cy	3,920	\$ 25.00	\$ 98,007.41	12"-thick AB; includes service road for the Landfill and Adjacent Areas
Revegetation					
Hydroseeding	ac	32	\$ 2,000.00	\$ 63,080.00	Includes Landfill and Adjacent Areas
Temporary Fence					
	lf	2,400	\$ 24.00	\$ 57,600.00	Based on \$4/lf per month rental
Hot Spot Excavation					
Hot spot soil excavation (Tier 1)	cy	9,753	\$ 30.00	\$ 292,580.69	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	14,824	\$ 136.50	\$ 2,023,488.08	Cost includes transportation, disposal, and TSCA tax
Hot spot soil excavation (Tier 2 through 4)	cy	23,036	\$ 30.00	\$ 691,070.00	Direct to dump truck to LLRW screening pad

Table R-39. Alternative 4B - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Shoreline Protection (continued)					
Off-site disposal	tons	35,014	\$ 156.09	\$ 5,465,368.56	Cost includes transportation, disposal, and TSCA tax
Hot spot soil excavation (Tier 5)	cy	6,822	\$ 30.00	\$ 204,653.33	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	10,369	\$ 181.00	\$ 1,876,807.50	Cost includes transportation, disposal, and TSCA tax
PCB-impacted groundwater	ls	1	\$ 153,374.48	\$ 153,374.48	Disposal option based on previous PCB TCRA; cost includes groundwater pretreatment system maintenance, temporary pipeline to discharge point, and disposal fee to POTW
Dewatering					
Disposal cost	gal	6,011,280	\$ 0.006	\$ 36,070.00	Includes wetlands excavation at Panhandle Area
Equipment rental	mo	4	\$ 17,000.00	\$ 68,000.00	Based on 4 months equipment rental; includes settling tanks, filtration system, pumps, and pipeline to sewer manhole
Floating Barrier	ls	1	\$ 174,000.00	\$ 174,000.00	Floating barrier with skimmer on San Francisco Bay; includes material, deployment, and operation for 90 days
Decontamination Pad	ea	3	\$ 19,000.00	\$ 57,000.00	Includes sump pump and discharge pipe to settling tank
Groundwater Monitoring					
Existing well abandonment	ls	1	\$ 40,360.00	\$ 40,360.00	For details, see BKUP GW worksheet
New well installation	ls	1	\$ 46,414.00	\$ 46,410.00	Same as above
Landfill Gas (LFG) System - Option 4B					
LFG active system with GAC	ls	1	\$ 756,000.00	\$ 756,000.00	For details, see BKUP LFG-4B worksheet
Groundwater Relief System					
Proposed at south perimeter of landfill					
Transmission pipeline	lf	2,100	\$ 50.00	\$ 105,000.00	Along south perimeter to sewer manhole tie-in
Force main tie-in to existing sewer manhole	ls	1	\$ 20,000.00	\$ 20,000.00	Manhole tie-in near northwest corner of landfill
Pumps and electrical	ls	1	\$ 70,000.00	\$ 70,000.00	Includes submersible pumps, control panels, and electrical works
Groundwater treatment	ls	1	\$ 200,000.00	\$ 200,000.00	Design build contingency for groundwater treatment package unit
Groundwater Containment System					
Proposed at south and west perimeter of landfill					
Slurry wall (soil/bentonite)	ls	1	\$ 2,264,580.00	\$ 2,264,580.00	For details, see BKUP GW Containment System worksheet
Excavation and Radiation Screening/Disposal					
Includes Adjacent Areas and Shoreline excavation					
Pre-Containment LLRW Surface Anomalies Removal					
Pre-clearing, grubbing, and stripping screening	days	38	\$ 11,888.00	\$ 455,460.00	Based on 50'x50' grid at 16 grids per day production rate (~613 equivalent grids)
Clearing, grubbing, and stripping	days	38	\$ 20,095.00	\$ 766,260.00	For quantity estimate, depth of stripping is assumed 1'; number of days based on 1,488-cy/day production rate, or rad screening rate, whichever is greater
Pre-excavation screening	days	108	\$ 11,888.00	\$ 1,288,360.00	Based on 50'x50' grid at 16 grids per day production rate (~1,734 equivalent grids)
Excavation	days	108	\$ 20,095.00	\$ 2,177,800.00	Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping; number of days based on 1,488-cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	123	\$ 5,616.00	\$ 690,770.00	Based on 1,500-cy/day production rate
Soil confirmation sampling	ea	898	\$ 572.00	\$ 513,460.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	38	\$ 11,888.00	\$ 455,460.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	12,802	\$ 153.50	\$ 1,965,180.00	10% of clear, grub, stripped materials and 5% of additional excavation

Table R-39. Alternative 4B - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Excavation and Radiation Screening/Disposal					
Additional LLRW Anomalies Removal					
Pre-Clearing, grubbing, and stripping screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Clearing, grubbing, and stripping	days	15	\$ 20,095.00	\$ 292,630.00	For quantity estimate, depth of stripping is assumed 1'; number of days based on 1,488-cy/day production rate, or rad screening rate, whichever is greater
Pre-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Excavation	days	15	\$ 20,095.00	\$ 292,630.00	Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping; number of days based on 1,488-cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	30	\$ 5,616.00	\$ 166,010.00	Based on 1,500-cy/day production rate
Soil confirmation sampling	ea	288	\$ 572.00	\$ 164,930.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	3,617	\$ 153.50	\$ 555,210.00	10% of clear, grub, stripped materials, and 5% of additional excavation
Construction Quality Assurance					
Landfill and Adjacent Areas	days	327	\$ 3,000.00	\$ 981,000.00	CQA services for landfill closure and Adjacent Area remediation based on 320 working days construction schedule
LFG well field and flare unit	days	120	\$ 1,000.00	\$ 120,000.00	CQA services for gas field and flare unit based on 120 working days construction schedule
Subtotal Capital Cost				\$ 54,438,263.43	
20% Contingency				\$ 10,887,652.69	
Total Capital Cost				\$ 65,325,916.11	

Notes:

- Capital cost is in 2008 dollars.
- Cost estimates for LFG control system, groundwater monitoring system, and wetlands restoration were obtained from backup spreadsheets.
- Assumes infrastructure and building demolition will be completed (by others) prior to final cover installation for Adjacent Area at the east side of the Landfill.
- Cost for other construction items were obtained from vendor quotes and similar landfill closure and/or remedial projects.

AB = aggregate base

ac = acres

CQA = Construction Quality Assurance

cy = cubic yard

ea = each

GCL = geosynthetic clay liner

HDPE = high-density polyethylene

H&S = Health and Safety

lf = linear feet

LFG = landfill gas

LLRW = low-level radioactive waste

ls = lump sum

mo = months

PCB = polychlorinated biphenyl

RC = reinforced concrete

sf = square feet

SWPPP = Stormwater Pollution Prevention Plan

WET = Waste Extraction Test

Table R-40. Alternative 4B - Operation and Maintenance Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Final Cover	lump sum (ls)	1	\$ 69,000.00	\$ 69,000.00	Repair of final cover due to settlement, slope failure, or erosion
Vegetation	ls	1	\$ 12,600.00	\$ 12,600.00	Maintenance of vegetation
LFG System - Option 3B	ls	1	\$ 325,500.00	\$ 325,500.00	For details, see BKUP LFG-3B worksheet
Stormwater Monitoring	ls	1	\$ 60,980.00	\$ 60,980.00	For details, see BKUP SW worksheet
LFG Condensate Disposal	ls	1	\$ 55,800.00	\$ 55,800.00	Assumes 60-gpd condensate, off-site disposal to Class I facility
Groundwater Relief System	ls	1	\$ 67,700.00	\$ 67,700.00	Groundwater relief system based on 20-gpm discharge to POTW via transmission pipeline; includes monthly inspection and reporting; assumed pump replacement every 3 years
Drainage	ls	1	\$ 5,000.00	\$ 5,000.00	Maintenance of drainage control system, including clearing of materials blocking drainage conveyances
Site Security	ls	1	\$ 9,600.00	\$ 9,600.00	Periodic inspection of point of access to the landfill and environmental control systems
Emergency Response	ls	1	\$ 5,000.00	\$ 5,000.00	Includes landfill inspection after major earthquake, storm, or fire that may exceed site design, which could require emergency response actions
Periodic Inspection, Documentation, Reporting, and Regulatory Compliance	ls	1	\$ 19,000.00	\$ 19,000.00	Includes preparation of iso-settlement maps and 5-year site review
Institutional Control	ls	1	\$ 36,000.00	\$ 36,000.00	Includes monitoring, enforcement, and reporting
Subtotal O&M Cost				\$ 666,180.00	
20% Contingency				\$ 133,236.00	
Annual Average O&M Cost				\$ 799,416.00	
30 Year O&M Present Value				\$ 12,205,099.68	

52	Capital Cost: \$70.9M	Table 8	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Appendix R, Tables R-49, R-51, R-52, R-55, and R-56. Record No. 4237.
----	------------------------------	---------	---

Table R-49. Cost Estimate Summary for Alternative 5^(1,2)
Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Alternative 5A

Cap the Landfill and Adjacent Areas
Install an active Gas Control and Collection System (GCCS) and treat the landfill gas with a flare unit
Close northern landfill gas control system
Remove hot spots in adjacent areas
Install surface water control
Restore wetlands
Install groundwater relief, diversion, and containment systems

Items	Estimated Cost
Capital Cost	\$65,643,139
Inspection, Maintenance, and GCCS O&M	\$21,714,480
Groundwater Monitoring Cost	\$1,980,150
Periodic Cost	\$675,298
Total Cost for Alternative 5A (Flare Unit)	\$90,013,067
Present Value for Alternative 5A (Flare Unit)	\$79,953,130

Alternative 5B

Cap the Landfill and Adjacent Areas
Install an active GCCS and treat the landfill gas with a GAC/KMnO4 adsorption unit
Close northern landfill gas control system
Remove hot spots in adjacent areas
Install surface water control
Restore wetlands
Install groundwater relief, diversion, and containment systems

Items	Estimated Cost
Capital Cost	\$65,364,259
Inspection, Maintenance, and GCCS O&M	\$23,982,480
Groundwater Monitoring Cost	\$1,980,150
Periodic Cost	\$675,298
Total Cost for Alternative 5B (Adsorption)	\$92,002,187
Present Value for Alternative 5B (Adsorption)	\$81,161,059

Notes:

- (1) Appended tables summarize backup calculations for all cost estimates provided.
- (2) Period of analysis is 32 years, which includes 2 years of engineering, permitting, and construction periods and 30 years of long-term monitoring.
- (3) Based on a 2.8% discount factor, as specified for Federal facility sites in Appendix C of Office of Management and Budget Circular A-94 (effective January 2008, http://www.whitehouse.gov/omb/circulars/a094/a94_appx-c.html).

Table R-51. Alternative 5A - Backup Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
General					
Mobilization and Demobilization	ls	1	\$ 2,478,000.00	\$ 2,478,000.00	Based on 5% of construction cost excluding CQA, permitting, H&S, and SWPPP implementation costs
Health and Safety	ls	1	\$ 50,000.00	\$ 50,000.00	
Engineering and Regulatory Compliance	ls	1	\$ 1,486,700.00	\$ 1,486,700.00	Includes preparation of construction documents, construction certification report, regulatory coordination, and local permits
Temporary Erosion Control and SWPPP Implementation	ls	1	\$ 30,000.00	\$ 30,000.00	
Demolition					
Remove existing drainage structures	ls	1	\$ 10,000.00	\$ 10,000.00	Dispose of spoils on site northwest area of IR01/21
Remove concrete rubble, riprap, bricks, etc.	cy	9,921	\$ 10.00	\$ 99,210.00	Existing shoreline protection along the southern boundary of the Landfill and East Adjacent Areas and Panhandle Area; dispose of spoils on site at IR-01/21
Temporary Works					
Sheet-pile installation	lf	3,360	\$ 1,495.00	\$ 5,023,200.00	Along Landfill and Panhandle shoreline
Dewatering	days	120	\$ 5,640.00	\$ 676,800.00	
Air Monitoring					
Ambient air monitors	mo	4	\$ 10,614.00	\$ 42,456.00	
Portable ambient air analyzer	mo	4	\$ 1,952.00	\$ 7,808.00	
Portable combustible gas/oxygen indicator	mo	4	\$ 464.00	\$ 1,856.00	
Landfill IR-01/21					Includes the north, west, and southeast section of IR-01/21
Earthwork					
Excavated waste, existing ground, and debris consolidation	cy	67,786	\$ 30.00	\$ 2,033,586.50	Stripped soil, waste, and concrete rubble excavation along the southern limit of the Landfill and Adjacent Areas bordering San Francisco Bay minus chemical hot spots and LLRW; place excavated material on site at IR-01/21
Earthfill	cy	11,916	\$ 5.00	\$ 59,578.85	Moisture condition and compact
Import soil	cy	84,949	\$ 25.00	\$ 2,123,724.74	Purchase and site delivery; includes fluff factor
Geosynthetic cover subgrade preparation	sf	395,686	\$ 0.10	\$ 39,568.58	Remove rock protrusions and level ground surface prior to geosynthetics placement
2.0' foundation layer	cy	29,066	\$ 5.00	\$ 145,328.66	Moisture condition and compact
2.0' vegetative soil cover	cy	29,809	\$ 5.00	\$ 149,046.61	Moisture condition and compact
Final grading	ac	22	\$ 2,000.00	\$ 44,400.00	Track walk prior to hydroseeding
Geosynthetic Final Cover					
Geosynthetic clay liner (GCL)	sf	405,278	\$ 0.85	\$ 344,486.17	Includes additional landfill closure area only
60-mil HDPE geomembrane	sf	417,125	\$ 0.60	\$ 250,274.91	Includes additional landfill closure area only
Drainage geocomposite	sf	403,530	\$ 0.80	\$ 322,823.88	Includes additional landfill closure area only
Demarcation layer	sf	360,422	\$ 0.20	\$ 72,084.40	
4"-perforated HDPE pipe, SDR 11, including pipe fittings, and geotextile wrap	lf	3,440	\$ 12.00	\$ 41,280.00	
Toe of slope gravel fill	cy	382	\$ 30.00	\$ 11,466.67	Includes geotextile filter fabric
Gravel blanket drain	lf	700	\$ 100.00	\$ 70,000.00	Blanket drain for groundwater relief system

Table R-51. Alternative 5A - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Landfill IR-01/21 (continued)					
					Includes the north, west, and southeast section of IR-01/21
Geosynthetic Termination and Tie-ins					
North and west perimeter final cover termination	lf	1,570	\$ 12.00	\$ 18,840.00	
South perimeter final cover termination	lf	700	\$ 15.00	\$ 10,500.00	
North and west tie-ins to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing and cleaning of existing geosynthetic cover material
South tie-in to existing geosynthetic cover	lf	300	\$ 20.00	\$ 6,000.00	Same as above
Surface Water Drainage System					
ECM/grass-lined swale	lf	700	\$ 14.00	\$ 9,800.00	Install at north finish grade tie-in
Top deck diversion berm with ECM/grass-lined ditch	lf	1,210	\$ 10.00	\$ 12,100.00	Install at deck area of landfill
ECM/grass-lined ditch	lf	300	\$ 14.00	\$ 4,200.00	Install at northwest perimeter of landfill
Concrete-lined ditch	lf	700	\$ 30.00	\$ 21,000.00	Install at toe of slope at south landfill perimeter
Rock-lined downchute	ea	1	\$ 20,000.00	\$ 20,000.00	Remove and reestablish existing rock gabion drainage swale and downchute lining
Pipe downdrain	lf	180	\$ 50.00	\$ 9,000.00	Install at sideslope areas
Pipe crossdrain	lf	100	\$ 70.00	\$ 7,000.00	Install across south perimeter access road
Drainage Inlet	ea	2	\$ 3,000.00	\$ 6,000.00	Install at south perimeter access road
East Adjacent Area					Includes PCB removal area
Earthwork					
Earthfill	cy	31,641	\$ 5.00	\$ 158,205.00	Moisture condition and compact
Import soil	cy	99,038	\$ 25.00	\$ 2,475,939.72	Purchase and site delivery; includes fluff factor
1.0' foundation layer	cy	16,210	\$ 5.00	\$ 81,051.82	Moisture condition and compact
2.0' vegetative soil cover	cy	33,983	\$ 5.00	\$ 169,915.00	Moisture condition and compact
Geosynthetic subgrade preparation	sf	474,782	\$ 0.10	\$ 47,478.18	Remove rock protrusions and level ground surface prior to geosynthetics placement
Final grading	ac	9.7	\$ 2,000.00	\$ 19,320.00	Track walk prior to hydroseeding
Geosynthetic Final Cap					
60-mil HDPE geomembrane	sf	474,782	\$ 0.60	\$ 284,869.09	
Drainage geocomposite	sf	466,957	\$ 0.80	\$ 373,565.60	
Demarcation layer	sf	466,957	\$ 0.20	\$ 93,391.40	
North and east final cover termination	lf	2,285	\$ 12.00	\$ 27,420.00	4" perforated HDPE pipe, SDR 11, including pipe fittings, and geotextile wrap
South perimeter final cover termination	lf	500	\$ 15.00	\$ 7,500.00	
Final cover tie-in to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing and cleaning of existing geosynthetic cover material
Surface Water Drainage System					
ECM/grass-lined ditch	lf	2,260	\$ 14.00	\$ 31,640.00	Install at north and east boundary
Concrete-lined ditch	lf	450	\$ 30.00	\$ 13,500.00	Install at north and east boundary
Pipe downdrain	lf	200	\$ 50.00	\$ 10,000.00	Install across access road
Pipe culvert	lf	50	\$ 75.00	\$ 3,750.00	Install across access road
Drainage inlet	ea	2	\$ 3,000.00	\$ 6,000.00	Install across access road
Ditch outlet	ls	1	\$ 5,000.00	\$ 5,000.00	Perimeter ditch outlet to San Francisco Bay

Table R-51. Alternative 5A - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Panhandle Area					
Earthwork					
Earthfill	cy	18,752	\$ 5.00	\$ 93,760.00	Moisture condition and compact
Import soil	cy	63,144	\$ 25.00	\$ 1,578,600.00	Purchase and site delivery; includes fluff factor
Import hydric soil	cy	29,804	\$ 35.00	\$ 1,043,133.00	Purchase and site delivery; includes fluff factor
2.0' upland soil layer	cy	20,177	\$ 5.00	\$ 100,885.00	Moisture condition and compact
3.0' hydric soil layer	cy	22,926	\$ 6.00	\$ 137,556.00	Moisture condition and compact
2.0' bridge soil layer	cy	13,691	\$ 5.00	\$ 68,455.00	Moisture condition and compact
Geosynthetic subgrade preparation	sf	216,792	\$ 0.10	\$ 21,679.20	Remove rock protrusions and level ground surface prior to geosynthetics placement
Final grading	ac	9.0	\$ 2,000.00	\$ 18,060.00	Track walk prior to hydroseeding
Geosynthetic Cap					
Drainage geocomposite	sf	284,422	\$ 0.80	\$ 227,537.60	
60-mil HDPE geomembrane	sf	216,792	\$ 0.60	\$ 130,075.20	
Final cover termination (west boundary)	lf	1,355	\$ 8.00	\$ 10,840.00	Geosynthetic cap termination, trench excavation, and backfill
North tie-in to existing and new landfill geosynthetics	lf	450	\$ 20.00	\$ 9,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
Surface Water Control System					
ECM/grass-lined ditch	lf	1,355	\$ 14.00	\$ 18,970.00	Drainage ditch west side of west perimeter access road
Pipe culvert	lf	100	\$ 75.00	\$ 7,500.00	West perimeter ditch inlet to freshwater wetland
Drainage ditch outlet	ls	1	\$ 5,000.00	\$ 5,000.00	West perimeter ditch outlet to San Francisco Bay
Wetlands Outlet Structures					
Freshwater wetland outlet structure	ls	1	\$ 60,800.00	\$ 60,800.00	Remove and replace existing outlet structure; for details, see Outlet worksheet
Wetlands Restoration					
	ls	1	\$ 616,798.00	\$ 616,800.00	For details, see BKUP Wetlands worksheet
Shoreline Protection					
Rock riprap	tons	41,518	\$ 100.00	\$ 4,151,761.19	Shoreline protection along the south perimeter of the Landfill and Adjacent Areas
Earthfill	cy	9,663	\$ 4.50	\$ 43,483.50	Soil backfill along the southern perimeter of the Landfill and Adjacent Area; moisture condition and compact
Import soil	cy	11,596	\$ 25.00	\$ 289,890.00	Purchase and site delivery; includes fluff factor
Geosynthetic subgrade preparation	sf	53,043	\$ 0.10	\$ 5,304.30	Remove rock protrusions and level ground surface prior to geosynthetics placement
60-mil HDPE	sf	53,043	\$ 0.50	\$ 26,521.50	Protective cover for soil backing
Cushion geotextile (12 oz/sy)	sf	53,043	\$ 0.20	\$ 10,608.60	Cushion fabric between rock riprap and HDPE protective cover
Geogrid	sf	28,380	\$ 2.00	\$ 56,760.00	For soil reinforcement
Access Road					
Class 2 aggregate base	cy	3,920	\$ 25.00	\$ 98,007.41	12" thick AB; includes service road for the Landfill and Adjacent Areas
Revegetation					
Hydroseeding	ac	32	\$ 2,000.00	\$ 63,080.00	Includes Landfill and Adjacent Areas

Table R-51. Alternative 5A - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Shoreline Protection (continued)					
Temporary Fence	lf	2,400	\$ 24.00	\$ 57,600.00	Based on \$4/lf per month rental
Hot Spot Excavation					
Hot spot soil excavation (Tier 1)	cy	9,753	\$ 30.00	\$ 292,580.69	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	14,824	\$ 136.50	\$ 2,023,488.08	Cost includes transportation, disposal, and TSCA tax
Hot spot soil excavation (Tier 2 through 4)	cy	23,036	\$ 30.00	\$ 691,070.00	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	35,014	\$ 156.09	\$ 5,465,368.56	Cost includes transportation, disposal, and TSCA tax
Hot spot soil excavation (Tier 5)	cy	6,822	\$ 30.00	\$ 204,653.33	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	10,369	\$ 181.00	\$ 1,876,807.50	Cost includes transportation, disposal, and TSCA tax
PCB-impacted groundwater	ls	1	\$ 153,374.48	\$ 153,374.48	Disposal option based on previous PCB TCRA; cost includes groundwater pretreatment system maintenance, temporary pipeline to discharge point, and disposal fee to POTW Includes wetlands excavation at Panhandle Area
Dewatering					
Disposal cost	gal	6,011,280	\$ 0.006	\$ 36,070.00	
Equipment rental	mo	4	\$ 17,000.00	\$ 68,000.00	Based on 4 months equipment rental; includes settling tanks, filtration system, pumps, and pipeline to sewer manhole
Floating Barrier	ls	1	\$ 174,000.00	\$ 174,000.00	Floating barrier with skimmer on San Francisco Bay; includes material, deployment, and operation for 90 days
Decontamination Pad	ea	3	\$ 19,000.00	\$ 57,000.00	Includes sump pump and discharge pipe to settling tank
Groundwater Monitoring					
Existing well abandonment	ls	1	\$ 40,360.00	\$ 40,360.00	For details, see BKUP GW rolled-up worksheet
New well installation	ls	1	\$ 46,414.00	\$ 46,410.00	Same as above
Landfill Gas (LFG) System - Option 4A					
LFG active system with flare unit	ls	1	\$ 971,000.00	\$ 971,000.00	For details, see BKUP LFG-4A worksheet
Groundwater Relief System					
Proposed at south perimeter of Landfill					
Transmission pipeline	lf	2,100	\$ 50.00	\$ 105,000.00	Along south perimeter to sewer manhole tie-in
Force main tie-in to existing sewer manhole	ls	1	\$ 20,000.00	\$ 20,000.00	Manhole tie-in near northwest corner of landfill
Pumps and electrical	ls	1	\$ 70,000.00	\$ 70,000.00	Includes submersible pumps, control panels, and electrical works
Groundwater treatment	ls	1	\$ 200,000.00	\$ 200,000.00	Design build contingency for groundwater treatment package unit
Groundwater Containment System					
Proposed at south and west perimeter of Landfill					
Slurry wall (soil/bentonite)	ls	1	\$ 2,264,580.00	\$ 2,264,580.00	For details, see BKUP GW Containment System worksheet
Excavation and Radiation Screening/Disposal					
Includes Adjacent Areas and Shoreline excavation					
Pre-Containment LLRW Surface Anomalies Removal					
Pre-clearing, grubbing, and stripping screening	days	38	\$ 11,888.00	\$ 455,460.00	Based on 50'x50' grid at 16 grids per day production rate (~613 equivalent grids)
Clearing, grubbing, and stripping	days	38	\$ 20,095.00	\$ 766,260.00	For quantity estimate, depth of stripping is assumed 1'; number of days based on 1,488-cy/day production rate, or rad screening rate, whichever is greater
Pre-excavation screening	days	108	\$ 11,888.00	\$ 1,288,360.00	Based on 50'x50' grid at 16 grids per day production rate (~1,734 equivalent grids)

Table R-51. Alternative 5A - Backup Cost Estimate (continued)
Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Excavation and Radiation Screening/Disposal(continued)					
Excavation	days	108	\$ 20,095.00	\$ 2,177,800.00	Includes Adjacent Areas and Shoreline excavation Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping; number of days based on 1,488-cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	123	\$ 5,616.00	\$ 690,770.00	Based on 1,500-cy/day production rate
Soil confirmation sampling	ea	898	\$ 572.00	\$ 513,460.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	38	\$ 11,888.00	\$ 455,460.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	12,802	\$ 153.50	\$ 1,965,180.00	10% of clear, grub, stripped materials, and 5% of additional excavation
Additional LLRW Anomalies Removal					
Pre-clearing, grubbing, and stripping screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Clearing, grubbing, and stripping	days	15	\$ 20,095.00	\$ 292,630.00	For quantity estimate, depth of stripping is assumed 1'; number of days based on 1,488-cy/day production rate, or rad screening rate, whichever is greater
Pre-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Excavation	days	15	\$ 20,095.00	\$ 292,630.00	Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping; number of days based on 1,488-cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	30	\$ 5,616.00	\$ 166,010.00	Based on 1,500-cy/day production rate
Soil confirmation sampling	ea	288	\$ 572.00	\$ 164,930.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	3,617	\$ 153.50	\$ 555,210.00	10% of clear, grub, stripped materials, and 5% of additional excavation
Construction Quality Assurance					
Landfill and Adjacent Areas	days	327	\$ 3,000.00	\$ 981,000.00	CQA services for landfill closure and adjacent areas remediation based on 320 working days construction schedule
LFG well field and flare unit	days	120	\$ 1,000.00	\$ 120,000.00	CQA services for gas field and flare unit based on 120 working days construction schedule
Subtotal Capital Cost				\$ 54,702,615.93	
20% Contingency				\$ 10,940,523.19	
Total Capital Cost				\$ 65,643,139.11	

Notes:

- Capital cost is in 2008 dollars.
- Cost estimates for LFG control system, groundwater monitoring system, and wetlands restoration were obtained from backup spreadsheets.
- Assumes infrastructure and building demolition will be completed (by others) prior to final cover installation for Adjacent Area at the east side of the Landfill.
- Cost for other construction items were obtained from vendor quotes and similar landfill closure and/or remedial projects.

AB = aggregate base	H&S = Health and Safety	PCB = polychlorinated biphenyl
ac = acres	lf = linear feet	RC = reinforced concrete
CQA = Construction Quality Assurance	LFG = landfill gas	sf = square feet
cy = cubic yard	LLRW = low-level radioactive waste	SWPPP = Stormwater Pollution Prevention Plan
ea = each	ls = lump sum	TAL = Target Analyte List
GCL = geosynthetic clay liner	mo = months	WET = Waste Extraction Test
HDPE = high-density polyethylene		

Table R-52. Alternative 5A - Operation and Maintenance Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Final Cover	lump sum (ls)	1	\$ 69,000.00	\$ 69,000.00	Repair of final cover due to settlement, slope failure, or erosion
Vegetation	ls	1	\$ 12,600.00	\$ 12,600.00	Maintenance of vegetation
LFG System - Option 3A	ls	1	\$ 262,500.00	\$ 262,500.00	For details, see BKUP LFG-3A worksheet
Stormwater Monitoring	ls	1	\$ 60,980.00	\$ 60,980.00	For details, see BKUP SW worksheet
LFG Condensate Disposal	ls	1	\$ 55,800.00	\$ 55,800.00	Assumes 60-gpd condensate, off-site disposal to Class I facility
Groundwater Relief System	ls	1	\$ 67,700.00	\$ 67,700.00	Assumes 20-gpm extraction rate for discharge to POTW via transmission pipeline; includes monthly inspection and reporting and pump replacement every 3 years
Drainage	ls	1	\$ 5,000.00	\$ 5,000.00	Maintenance of drainage control system, including clearing of materials blocking drainage conveyances
Site Security	ls	1	\$ 9,600.00	\$ 9,600.00	Periodic inspection of point of access to the landfill and environmental control systems
Emergency Response	ls	1	\$ 5,000.00	\$ 5,000.00	Includes landfill inspection after major earthquake, storm, or fire that may exceed site design, which could require emergency response actions
Periodic Inspection, Documentation, Reporting, and Regulatory Compliance	ls	1	\$ 19,000.00	\$ 19,000.00	Includes preparation of iso-settlement maps and 5-year site review
Institutional Control	ls	1	\$ 36,000.00	\$ 36,000.00	Includes monitoring, enforcement, and reporting
Subtotal O&M Cost				\$ 603,180.00	
20% Contingency				\$ 120,636.00	
Annual Average O&M Cost				\$ 723,816.00	
30-Year O&M Present Value				\$ 12,205,099.68	

Table R-55. Alternative 5B - Backup Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
General					
Mobilization and Demobilization	ls	1	\$ 2,467,000.00	\$ 2,467,000.00	Based on 5% of construction cost excluding CQA, permitting, H&S, and SWPPP implementation costs
Health and Safety	ls	1	\$ 50,000.00	\$ 50,000.00	
Engineering and Regulatory Compliance	ls	1	\$ 1,480,300.00	\$ 1,480,300.00	Includes preparation of construction documents, construction certification report, regulatory coordination, and local permits
Temporary Erosion Control and SWPPP Implementation	ls	1	\$ 30,000.00	\$ 30,000.00	
Demolition					
Remove existing drainage structures	ls	1	\$ 10,000.00	\$ 10,000.00	Dispose of spoils on site at northeast area of IR-01/21
Remove existing concrete rubble, riprap, bricks, etc.	cy	9,921	\$ 10.00	\$ 99,210.00	Existing shoreline protection along the southern boundary of the Landfill and East Adjacent Area and Panhandle Area; dispose of spoils on site at IR-01/21
Temporary Works					
Sheet-pile installation	lf	3,360	\$ 1,495.00	\$ 5,023,200.00	Along Landfill and Panhandle shoreline
Dewatering	days	120	\$ 5,640.00	\$ 676,800.00	
Air Monitoring					
Ambient air monitors	mo	4	\$ 10,614.00	\$ 42,456.00	
Portable ambient air analyzer	mo	4	\$ 1,952.00	\$ 7,808.00	
Portable combustible gas/oxygen indicator	mo	4	\$ 464.00	\$ 1,856.00	
Landfill IR-01/21					Includes the north, west, and southeast section of IR-01/21
Earthwork					
Excavated waste and debris consolidation	cy	67,786	\$ 30.00	\$ 2,033,586.50	Stripped soils, waste, and concrete rubble excavation along the southern limit of the Landfill and adjacent areas bordering San Francisco Bay, minus chemical hot spots and LLRW; place excavated material on site at IR-01/21
Earthfill	cy	11,916	\$ 5.00	\$ 59,578.85	Moisture condition and compact
Import soil	cy	84,949	\$ 25.00	\$ 2,123,724.74	Purchase and site delivery; includes fluff factor
Geosynthetic cover subgrade preparation	sf	395,686	\$ 0.10	\$ 39,568.58	Remove rock protrusions and level ground surface prior to geosynthetics placement
2.0' foundation layer	cy	29,066	\$ 5.00	\$ 145,328.66	Moisture condition and compact
2.0' vegetative soil cover	cy	29,809	\$ 5.00	\$ 149,046.61	Moisture condition and compact
Final grading	ac	22	\$ 2,000.00	\$ 44,400.00	Track walk prior to hydroseeding
Geosynthetic Final Cover					
Geosynthetic clay liner (GCL)	sf	405,278	\$ 0.85	\$ 344,486.17	Includes additional landfill closure area only
60-mil HDPE geomembrane	sf	417,125	\$ 0.60	\$ 250,274.91	Includes additional landfill closure area only
Drainage geocomposite	sf	403,530	\$ 0.80	\$ 322,823.88	Includes additional landfill closure area only
Demarcation layer	sf	360,422	\$ 0.20	\$ 72,084.40	
4"perforated HDPE pipe, SDR 11, including pipe fittings, and geotextile wrap	lf	3,440	\$ 12.00	\$ 41,280.00	
Toe of slope gravel fill	cy	382	\$ 30.00	\$ 11,466.67	Includes geotextile filter fabric
Gravel blanket drain	lf	700	\$ 100.00	\$ 70,000.00	Blanket drain for groundwater relief system

Table R-55. Alternative 5B - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Landfill IR-01/21 (continued)					Includes the north, west, and southeast section of IR-01/21
Geosynthetic Termination and Tie-ins					
North and west perimeter final cover termination	lf	1,570	\$ 12.00	\$ 18,840.00	
South perimeter final cover termination	lf	700	\$ 15.00	\$ 10,500.00	
North and west tie-ins to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
South tie-in to existing geosynthetic cover	lf	300	\$ 20.00	\$ 6,000.00	Same as above
Surface Water Drainage System					
ECM/grass-lined swale	lf	700	\$ 14.00	\$ 9,800.00	Install at north finish grade tie-in
Top deck diversion berm with ECM/grass-lined ditch	lf	1,210	\$ 10.00	\$ 12,100.00	Install at deck area of landfill
ECM/grass-lined ditch	lf	300	\$ 14.00	\$ 4,200.00	Install at northwest perimeter of landfill
Concrete-lined ditch	lf	700	\$ 30.00	\$ 21,000.00	Install at toe of slope at south landfill perimeter
Rock-lined downchute	ea	1	\$ 20,000.00	\$ 20,000.00	Remove and reestablish existing rock gabion drainage swale and downchute lining
Pipe downdrain	lf	180	\$ 50.00	\$ 9,000.00	Install at sideslope areas
Pipe crossdrain	lf	100	\$ 70.00	\$ 7,000.00	Install across south perimeter access road
Drainage inlet	ea	2	\$ 3,000.00	\$ 6,000.00	Install at south perimeter access road
East Adjacent Area					Includes PCB remediation area
Earthwork					
Earthfill	cy	31,641	\$ 5.00	\$ 158,205.00	Moisture condition and compact
Import soil	cy	99,038	\$ 25.00	\$ 2,475,939.72	Purchase and site delivery; includes fluff factor
1.0' foundation layer	cy	16,210	\$ 5.00	\$ 81,051.82	Moisture condition and compact
2.0' vegetative soil cover	cy	33,983	\$ 5.00	\$ 169,915.00	Moisture condition and compact
Geosynthetic subgrade preparation	sf	474,782	\$ 0.10	\$ 47,478.18	Remove rock protrusions and level ground surface prior to geosynthetics placement
Final grading	ac	9.7	\$ 2,000.00	\$ 19,320.00	Track walk prior to hydroseeding
Geosynthetic Final Cap					
60-mil HDPE geomembrane	sf	474,782	\$ 0.60	\$ 284,869.09	
Drainage geocomposite	sf	466,957	\$ 0.80	\$ 373,565.60	
Demarcation layer	sf	466,957	\$ 0.20	\$ 93,391.40	
North and east final cover termination	lf	2,285	\$ 12.00	\$ 27,420.00	4" perforated HDPE pipe, SDR 11, including pipe fittings, and geotextile wrap
South perimeter final cover termination	lf	500	\$ 15.00	\$ 7,500.00	
Final cover tie-in to existing geosynthetic cover	lf	1,000	\$ 20.00	\$ 20,000.00	Includes potholing, exposing, and cleaning of existing geosynthetic cover material
Surface Water Drainage System					
ECM/grass-lined ditch	lf	2,260	\$ 14.00	\$ 31,640.00	Install at north and east boundary
Concrete-lined ditch	lf	450	\$ 30.00	\$ 13,500.00	Install at north and east boundary
Pipe downdrain	lf	200	\$ 50.00	\$ 10,000.00	Install across access road
Pipe culvert	lf	50	\$ 75.00	\$ 3,750.00	Install across access road
Drainage inlet	ea	2	\$ 3,000.00	\$ 6,000.00	Install across access road
Ditch outlet	ls	1	\$ 5,000.00	\$ 5,000.00	Perimeter ditch outlet to San Francisco Bay

Shoreline Protection (continued)					
Hot Spot Excavation					
Hot spot soil excavation (Tier 1)	cy	9,753	\$ 30.00	\$ 292,580.69	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	14,824	\$ 136.50	\$ 2,023,488.08	Cost includes transportation, disposal, and TSCA tax
Hot spot soil excavation (Tier 2 through 4)	cy	23,036	\$ 30.00	\$ 691,070.00	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	35,014	\$ 156.09	\$ 5,465,368.56	Cost includes transportation, disposal, and TSCA tax
Hot spot soil excavation (Tier 5)	cy	6,822	\$ 30.00	\$ 204,653.33	Direct to dump truck to LLRW screening pad
Off-site disposal	tons	10,369	\$ 181.00	\$ 1,876,807.50	Cost includes transportation, disposal, and TSCA tax
PCB-impacted groundwater	ls	1	\$ 153,374.48	\$ 153,374.48	Disposal option based on previous PCB TCRA; cost includes groundwater pretreatment system maintenance, temporary pipeline to discharge point, and disposal fee to POTW
Dewatering					
Disposal cost	gal	6,011,280	\$ 0.006	\$ 36,070.00	Includes wetlands excavation at Panhandle Area
Equipment rental	mo	4	\$ 17,000.00	\$ 68,000.00	Based on 4 months equipment rental; includes settling tanks, filtration system, pumps, and pipeline to sewer manhole
Floating Barrier					
	ls	1	\$ 174,000.00	\$ 174,000.00	Floating barrier with skimmer on San Francisco Bay; includes material, deployment, and operation for 90 days
Decontamination Pad					
	ea	3	\$ 19,000.00	\$ 57,000.00	Includes sump pump and discharge pipe to settling tank
Groundwater Monitoring					
Existing well abandonment	ls	1	\$ 40,360.00	\$ 40,360.00	For details, see BKUP GW worksheet
New well installation	ls	1	\$ 46,414.00	\$ 46,410.00	Same as above
Landfill Gas (LFG) System - Option 4B					
LFG active system with GAC	ls	1	\$ 756,000.00	\$ 756,000.00	For details, see BKUP LFG-4B worksheet
Groundwater Relief System					
Proposed at south perimeter of landfill					
Transmission pipeline	lf	2,100	\$ 50.00	\$ 105,000.00	Along south perimeter to sewer manhole tie-in
Force main tie-in to existing sewer manhole	ls	1	\$ 20,000.00	\$ 20,000.00	Manhole tie-in near northwest corner of landfill
Pumps and electrical	ls	1	\$ 70,000.00	\$ 70,000.00	Includes submersible pumps, control panels, and electrical works
Groundwater treatment	ls	1	\$ 200,000.00	\$ 200,000.00	Design build contingency for groundwater treatment package unit
Groundwater Containment System					
Proposed at south and west perimeter of landfill					
Slurry wall (soil/bentonite)	ls	1	\$ 2,264,580.00	\$ 2,264,580.00	For details, see BKUP GW Containment System worksheet
Excavation and Radiation Screening/Disposal					
Includes Adjacent Areas and Shoreline excavation					
Pre-Containment LLRW Surface Anomalies Removal					
Pre-clearing, grubbing, and stripping screening	days	38	\$ 11,888.00	\$ 455,460.00	Based on 50'x50' grid at 16 grids per day production rate (~613 equivalent grids)
Clearing, grubbing, and stripping	days	38	\$ 20,095.00	\$ 766,260.00	For quantity estimate, depth of stripping is assumed 1'; number of days based on 1,488-cy/day production rate, or rad screening rate, whichever is greater
Pre-excavation screening	days	108	\$ 11,888.00	\$ 1,288,360.00	Based on 50'x50' grid at 16 grids per day production rate (~1,734 equivalent grids)
Excavation	days	108	\$ 20,095.00	\$ 2,177,800.00	Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping; number of days based on 1,488-cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	123	\$ 5,616.00	\$ 690,770.00	Based on 1,500-cy/day production rate

Table R-55. Alternative 5B - Backup Cost Estimate (continued)

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Excavation and Radiation Screening/Disposal (continued)					
Includes Adjacent Areas and Shoreline excavation					
Soil confirmation sampling	ea	898	\$ 572.00	\$ 513,460.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	38	\$ 11,888.00	\$ 455,460.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	12,802	\$ 153.50	\$ 1,965,180.00	10% of clear, grub, stripped materials, and 5% of additional excavation
Additional LLRW Anomalies Removal					
Pre-clearing, grubbing, and stripping screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Clearing, grubbing, and stripping	days	15	\$ 20,095.00	\$ 292,630.00	For quantity estimate, depth of stripping is assumed 1'; number of days based on 1,488-cy/day production rate, or rad screening rate, whichever is greater
Pre-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate (~233 equivalent grids)
Excavation	days	15	\$ 20,095.00	\$ 292,630.00	Excavation includes soil, waste, concrete rubble after clearing, grubbing, and stripping; number of days based on 1,488-cy/day production rate or rad screening rate, whichever is greater
Secondary radiation screening	days	30	\$ 5,616.00	\$ 166,010.00	Based on 1,500-cy/day production rate
Soil confirmation sampling	ea	288	\$ 572.00	\$ 164,930.00	One sample per grid plus 10% QC sample; analytical includes TAL and WET testing
Post-excavation screening	days	15	\$ 11,888.00	\$ 173,120.00	Based on 50'x50' grid at 16 grids per day production rate
Disposal of LLRW	cy	3,617	\$ 153.50	\$ 555,210.00	10% of clear, grub, stripped materials, and 5% of additional excavation
Construction Quality Assurance					
Landfill and Adjacent Areas	days	327	\$ 3,000.00	\$ 981,000.00	CQA services for landfill closure and adjacent areas remediation based on 320 working days construction schedule
LFG well field and flare unit	days	120	\$ 1,000.00	\$ 120,000.00	CQA services for gas field and flare unit based on 120 working days construction schedule
Subtotal Capital Cost				\$ 54,470,215.93	
20% Contingency				\$ 10,894,043.19	
Total Capital Cost				\$ 65,364,259.11	

Notes:

- Capital cost is in 2008 dollars.
- Cost estimates for LFG control system, groundwater monitoring system, and wetlands restoration were obtained from backup spreadsheets.
- Assumes infrastructure and building demolition will be completed (by others) prior to final cover installation for Adjacent Area at the east side of the Landfill.
- Cost for other construction items were obtained from vendor quotes and similar landfill closure and/or remedial projects.

AB = aggregate base
 ac = acres
 CQA = Construction Quality Assurance
 cy = cubic yard
 ea = each
 GCL = geosynthetic clay liner

HDPE = high-density polyethylene
 H&S = Health and Safety
 lf = linear feet
 LFG = landfill gas
 LLRW = low-level radioactive waste
 ls = lump sum

mo = months
 PCB = polychlorinated biphenyl
 RC = reinforced concrete
 sf = square feet
 SWPPP = Stormwater Pollution Prevention Plan
 WET = Waste Extraction Test

Table R-56. Alternative 5B - Operation and Maintenance Cost Estimate

Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California

Description	Unit	Quantity	Unit Price	Cost	Remarks
Final Cover	lump sum	1	\$ 69,000.00	\$ 69,000.00	Repair of final cover due to settlement, slope failure, or erosion
Vegetation	ls	1	\$ 12,600.00	\$ 12,600.00	Maintenance of vegetation
LFG System - Option 3B	ls	1	\$ 325,500.00	\$ 325,500.00	For details, see BKUP LFG-3B worksheet
Stormwater Monitoring	ls	1	\$ 60,980.00	\$ 60,980.00	For details, see BKUP SW worksheet
LFG Condensate Disposal	ls	1	\$ 55,800.00	\$ 55,800.00	Assumes 60-gpd condensate, off-site disposal to Class I facility
Groundwater Relief System	ls	1	\$ 67,700.00	\$ 67,700.00	Groundwater relief system based on 20-gpm discharge to POTW via transmission pipeline; includes monthly inspection and reporting; assumed pump replacement every 3 years
Drainage	ls	1	\$ 5,000.00	\$ 5,000.00	Maintenance of drainage control system, including clearing of materials blocking drainage conveyances
Site Security	ls	1	\$ 9,600.00	\$ 9,600.00	Periodic inspection of point of access to the landfill and environmental control systems
Emergency Response	ls	1	\$ 5,000.00	\$ 5,000.00	Includes landfill inspection after major earthquake, storm, or fire that may exceed site design, which could require emergency response actions
Periodic Inspection, Documentation, Reporting, and Regulatory Compliance	ls	1	\$ 19,000.00	\$ 19,000.00	Includes preparation of iso-settlement maps and 5-year site review
Institutional Control	ls	1	\$ 36,000.00	\$ 36,000.00	Includes monitoring, enforcement, and reporting
Subtotal O&M Cost				\$ 666,180.00	
20% Contingency				\$ 133,236.00	
Annual Average O&M Cost				\$ 799,416.00	
30-Year O&M Present Value				\$ 12,205,099.68	

53	Nine evaluation criteria	Section 2.8.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 13, pages 13-1 through 13-3. Record No. 4237.
----	--------------------------	---------------	---

Section 13. Detailed Analysis of Remedial Alternatives

NCP § 300.430(e) and the guidance for conducting RI/FS activities under CERCLA (EPA, 1988a) requires a remedial alternative evaluation based on nine criteria. This section evaluates each alternative described in Section 12 against the nine criteria, which are summarized below.

1. Overall Protection of Human Health and the Environment. This criterion provides an overall assessment of whether the alternative provides adequate protection of human health and the environment. The overall protection assessment draws upon other evaluation criteria, especially compliance with ARARs, long-term effectiveness and permanence, and short-term effectiveness. The protectiveness evaluation focuses on how site risks would be reduced or eliminated by the alternative, specifically how effectively an alternative meets the RAOs. This criterion is considered a threshold criterion and must be met by the selected alternative to be considered for use at Parcel E-2.

2. Compliance with ARARs. This criterion is used to determine whether the alternative will meet all identified federal and state ARARs and, if not, whether justification exists for waiving one or more of the ARARs. This criterion is also a threshold criterion that must be met by the selected alternative to be considered for use at Parcel E-2. Section 10 summarizes potential chemical-, location-, and action-specific ARARs associated with the remedial alternatives for Parcel E-2.

3. Long-Term Effectiveness and Permanence. The alternative is evaluated in terms of risk remaining at a site after RAOs have been met. The primary focus of this evaluation is the extent and effectiveness of controls used to manage the risk posed by treatment residuals or untreated wastes. The following factors are considered under this criterion:

- Adequacy of mitigation controls
- Reliability of mitigation controls
- Magnitude of the residual risk

4. Reduction in Toxicity, Mobility, or Volume through Treatment. This criterion addresses the statutory preference for treatment options that permanently and significantly reduce the toxicity, mobility, or volume of chemicals. This preference is satisfied when treatment reduces the principal threats through the following:

- Destruction of toxic chemicals
- Reduction in chemical mobility
- Reduction of the total mass of toxic chemicals
- Reduction of total volume of contaminated media

5. Short-Term Effectiveness. This criterion addresses the effects of the alternative during the implementation and construction phase until RAOs are met. Under this criterion, the alternative is evaluated with respect to its effects on human health and the environment during implementation of the remedial action. The following factors are considered:

- Exposure of the community during implementation
- Exposure of workers during construction
- Environmental effects
- Time required to achieve RAOs

6. Implementability. This criterion addresses the technical and administrative feasibility of implementing the alternative and the availability of various services and materials required during its implementation. The following factors are considered:

- Ability to construct the technology
- Reliability of the technology
- Monitoring considerations
- Availability of equipment and specialists
- Ability to obtain approvals from regulatory agencies

7. Cost. This criterion is based on estimates of capital and O&M costs for the alternative. Capital costs consist of direct and indirect costs. Direct costs include equipment, labor, and materials purchased as necessary to implement the alternative. Indirect costs include engineering, financial, and other services such as testing and monitoring. Annual O&M costs for each alternative include operating labor, maintenance materials and labor, auxiliary materials, and energy costs.

The cost estimate for each alternative is projected to range from 50 percent above to 30 percent below the actual cost. For estimating purposes, the post-closure O&M period is assumed to be 30 years based on landfill post-closure requirements. All costs are converted to a present value cost to allow comparison between alternatives with varying cash flow requirements over time.

8. State Acceptance. State acceptance is a modifying criterion used to evaluate technical and administrative issues and concerns of the state regarding the alternative. This criterion will be addressed in the ROD following comments on the RI/FS Report and the proposed plan.

9. Community Acceptance. Community acceptance is a modifying criterion used to evaluate technical and administrative issues and public concerns associated with the alternative. This criterion will be addressed in the ROD following comment on the RI/FS Report and the proposed plan.

The subsections below evaluate each alternative against these nine criteria. [Table 13-1](#) provides a cost comparison of all the alternatives, and [Appendix R](#) provides detailed cost estimates and assumptions for each alternative.

13.1. ALTERNATIVE 1: NO ACTION

Under the no action alternative, no remedial action would take place. Solid waste, soil, and sediment would be left in place; groundwater and surface water would not be contained or treated. The no action alternative would not involve any response actions (e.g., monitoring, institutional controls, containment, removal, treatment, or other mitigating actions). The no action alternative is included throughout the FS process as required by the NCP to provide a baseline for comparison with and evaluation of other alternatives.

13.1.1. Overall Protection of Human Health and the Environment

This alternative would not provide adequate protection of human health and the environment because solid waste, soil, and sediment contributing risks to humans and wildlife would not be removed, contained, or treated. Migration of soil contamination to off-site locations through stormwater erosion would be possible. In addition, erosion could expose additional solid waste, increasing potential risks to humans and wildlife through direct contact. The potential for generation of leachate and migration from infiltration would not change from existing conditions under this alternative. The lack of institutional controls would provide no means of implementing various land use restrictions needed to control unacceptable exposure to the known COCs and COECs at the site. Furthermore, this alternative does not provide any mechanisms for monitoring potential migration of chemicals in landfill gas, surface water, or groundwater. Therefore, the no action alternative does not meet this threshold criterion.

13.1.2. Compliance with ARARs

There is no need to identify ARARs for the no action alternative because ARARs apply to “any removal or remedial action conducted entirely on-site” and “no action” is not a removal or remedial action. CERCLA § 121 (42 USC § 9621) cleanup standards for selection of a Superfund remedy, including the requirements to meet ARARs, are not triggered by the no action alternative ([EPA, 1991a](#)). Therefore, a discussion of compliance with ARARs is not appropriate for this alternative.

54	Further developed in the RD	Section 2.9.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Table 12-3. Record No. 4237.

Table 12-3. Actions to be Addressed in Remedial Design for Parcel E-2
Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard

Alternatives	Action
2, 3, 4, and 5	Evaluation of measures for protection of special-status species (American peregrine falcon [<i>Falco peregrinus anatum</i>] is only special-status species at Parcel E-2).
2, 3, 4, and 5	Verification of the potential presence of utilities in the eastern portion of the Landfill Area, and evaluation of utilities as a preferential pathway for landfill gas migration.
2, 3, 4, and 5	Potential refinement of the method for comparing groundwater data with aquatic criteria to account for chemical attenuation and the nearshore mixing process to further assess the downgradient effect of groundwater contamination from the Shoreline Area on San Francisco Bay (if needed to supplement current trigger level approach).
2, 3, 4, and 5	Potential development of specific monitoring criteria for A-aquifer groundwater addressing potential risk to aquatic wildlife in San Francisco Bay using more refined fate and transport modeling (if needed to supplement current trigger level approach).
2, 3, 4, and 5	Further evaluation of the shoreline protection system relative to factors such as the potential rise in sea level.
2, 3, 4, and 5	Further groundwater delineation and augmentation of the groundwater data set using additional BGMP data.
2, 3, 4, and 5	Refinement of the preliminary groundwater monitoring plan using additional BGMP data.
2, 3, 4, and 5	Specification of best management practices for stormwater discharge to ensure surface water discharges do not present a threat to aquatic wildlife in San Francisco Bay.
2, 3, 4, and 5	Potential refinement of shoreline remediation approach to maximize efficiencies with the remediation approach for Parcel F.
2, 3, 4, and 5	Pre-design characterization of the lateral and vertical extent of hot spots, and possible refinement of remediation goals through measures such as refined modeling or site-specific leaching analysis.
3, 4, and 5	Quantitative slope stability analysis for the toe berm to ensure stability of the proposed cap.
3, 4, and 5	Further evaluation of the quality of groundwater for proposed groundwater diversion system.
3, 4, and 5	Refined modeling to evaluate interaction between surface water in freshwater wetlands, groundwater from proposed diversion system, and groundwater underlying freshwater wetlands.
3, 4, and 5	Investigation of soil gas in the Panhandle, East Adjacent, and Shoreline Areas to evaluate if gas collection and control is required.

Table 12-3. Actions to be Addressed in Remedial Design for Parcel E-2 (continued)
 Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard

Alternatives	Action
3, 4, and 5	Evaluation of landfill gas collected from the Landfill Area to determine the appropriate treatment technology.
4 and 5	Evaluation of the need to extend the slurry wall south into the PCB Hot Spot Area; evaluation will use updated groundwater monitoring data from wells in and around the PCB Hot Spot Area.

----	--------------	---------------	--

using field instruments and will include, to the extent practical, comparisons of regularly collected field instrument data for NMOCs with periodic laboratory sample analysis for NMOCs. The data will be used to verify that, in accordance with 27 CCR § 20921, exposure to residual NMOCs does not pose an unacceptable risk to future site users. The anticipated minimum monitoring period is 30 years, or until it is demonstrated that landfill gas no longer poses a threat to human health or the environment.

Several general assumptions were made to develop the FS costs for the landfill gas monitoring component. Landfill gas will not migrate below the groundwater table, which is between 6 and 20 feet bgs, so GMPs would not be screened below the water table; rather, GMPs would be screened from 5 feet bgs (above the historic high groundwater elevation at Parcel E-2) to the historic low groundwater elevation, which varies across Parcel E-2 to a maximum depth of 16 feet bgs (north of landfill). Existing GMPs are located approximately 150 feet apart on the Parcel E-2 boundary north of the landfill and would continue to be used under Alternative 3. Under Alternative 3, it is assumed that additional GMPs would be installed at 150-foot intervals along the western Parcel E-2 boundary and along the eastern edge of the existing multilayer geosynthetic cap. Along the southern boundary of Parcel E-2, the landfill is bounded by San Francisco Bay; thus, landfill gas migration cannot occur in this direction and GMPs would not be required.

In addition, the cap across Parcel E-2 would be inspected and maintained to ensure the integrity of the cap and the vegetative layer. Inspection and maintenance procedures will be detailed in the post-closure maintenance plan for Parcel E-2, consistent with requirements as provided in 27 CCR, and submitted for regulatory agency review in conjunction with the RD. The inspection and maintenance procedures will be developed based upon the Navy's experience to date in maintaining the interim cover at the Parcel E-2 Landfill, as well as at similar sites in the San Francisco Bay area. Inspection procedures would involve checking various site conditions, including searching for evidence of burrowing animals. Maintenance actions would include prompt repair of any damage and use of animal control measures to control burrowing animals. Low-impact control measures, such as the installation of raptor perches, would be preferable as opposed to higher impact control measures, such as the use of poisons, to control burrowing animals at Parcel E-2. Similar inspection and maintenance procedures, coupled with low-impact animal control measures, are being implemented at the Site 1 Landfill at the former Naval Air Station Moffett Field and have been demonstrated to be effective in protecting human health and the environment (EPA, 2009).

12.2.3.11. Wetlands Restoration

Tidal wetlands would be restored along the shoreline of the Panhandle Area and made ecologically contiguous with the tidal wetlands being restored at the adjacent property (Yosemite Slough restoration project). Tidal water would be allowed to flow freely across the shoreline in the Panhandle Area to create a tidal wetland. Any potential scouring of the mudflat would be controlled through design features,

including shallow slopes and installation of vegetation. Freshwater wetlands would be restored at a similar location as the existing freshwater wetlands (which will be destroyed during the remedial action), would be underlain by hydric soil and a clay liner, as shown on [Figures 12-13 and 12-14](#). Existing surface drainage that provides hydrologic support for the freshwater wetland would be maintained, and the freshwater supply would be supplemented by the groundwater diversion system ([Section 12.2.3.7](#)). It is anticipated that sufficient water would be available to replace the existing freshwater wetland at the selected 1:1 ratio ([Appendix O](#)). The freshwater wetlands would include a surface outfall to the drainage ditch along the western Parcel E-2 boundary that would be designed to minimize flooding during storm events.

Wetlands vegetation used for restoration would meet the requirements for the vegetative layer (for example, capable of sustained growth, root depth can be designed not to exceed the top of the low hydraulic conductivity layer, compatible with post-closure land use, and can tolerate soil conditions). Wetlands vegetation is resistant to adverse conditions of climate, disease, and pests; is self propagating; has a high percentage of surface area coverage; and minimizes the need for irrigation and maintenance. However, sustained freshwater and tidal wetlands are dependent on water and the seasonal freshwater wetland requires saturation within 12 inches of the surface to sustain the wetland vegetation.

Stormwater flowing toward Parcel E-2 from the UCSF compound would be intercepted by a drainage ditch north of the new cap, and either diverted to the existing storm sewer system north of Parcel E-2 or conveyed to a discharge point into the freshwater wetlands. Most of the stormwater flowing from the cap would flow south toward San Francisco Bay and be collected in perimeter ditches. The ditches would flow toward inlets located on the southern perimeter of the final cap for discharge to the bay through culverts or for discharge to the freshwater wetlands. Wetlands would be maintained and monitored in accordance with the wetlands mitigation and monitoring plan ([Shaw, 2009b](#)).

12.2.4. Alternative 4: Contain Solid Waste, Soil, Sediment, and Groundwater with Hot Spot Removal (including monitoring, institutional controls, and lined freshwater wetlands)

Alternative 4 involves all of the components of Alternative 3, but also includes (1) excavation and off-site disposal of Tier 3, 4, and 5 hot spots (in addition to Tier 1 and 2 hot spots; see [Section 12.1.6](#)); (2) containment of contaminated groundwater with a nearshore slurry wall in areas where the landfill waste is within 100 feet of San Francisco Bay; and (3) the contingency to extend the nearshore slurry wall south into the PCB Hot Spot Area. The need for extending the nearshore slurry wall will be assessed in the RD using updated groundwater monitoring data from wells in and around the excavated portion of the PCB Hot Spot Area, which is currently being collected under the BGMP. The groundwater diversion system (consisting of an upgradient slurry wall and subsurface drain) along the west side of the landfill, as proposed under Alternative 3, would minimize hydraulic head buildup behind the nearshore slurry wall.

56	Removal of the sanitary sewer, storm drain, and septic sewer lines	Section 2.9.2	Final Radiological Addendum to the Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and RSRS. Section 12.1, pages 12-2 and 12-3. Record No. 4260.
----	--	---------------	--

Alternatives 2, 3, 4, and 5. The radiological-specific tasks common to Alternatives 2, 3, 4, and 5 are described in [Section 12.1](#). Alternatives 1, 2, 3, 4, and 5 are briefly summarized in [Sections 12.2, 12.3, 12.4, 12.5, and 12.6](#), respectively, to provide the reader a better understanding of how the proposed remedial alternatives, as presented in the Final RI/FS Report, will satisfy the RAO specified for radionuclides at Parcel E-2. Additional detail on Alternatives 2, 3, 4, and 5 is provided in Section 12 of the Final Parcel E-2 RI/FS Report.

For Alternatives 3 and 4, a geosynthetic liner underlying the proposed freshwater wetlands was previously proposed in the Draft Final RI/FS Report. The regulatory agencies raised the following two key technical concerns regarding the geosynthetic liner in their comments on the Draft Final RI/FS Report: (1) the potential for reduced effectiveness of a geosynthetic liner underlying the freshwater wetlands, and (2) the potential for reduced ecological function of freshwater wetlands that does not allow surface water to percolate into shallow groundwater. To address the concern regarding the effectiveness of the geosynthetic cap, the Navy revised Alternatives 3 and 4 to include a 1-foot-thick compacted clay liner underlying the proposed freshwater wetlands in place of the geosynthetic cap. To address the concern regarding the ecological function of the freshwater wetlands, the Navy developed Alternative 5 that eliminated the compacted clay liner; this revision consisted of simply increasing the thickness of the hydric soil layer to 3 feet and did not alter the radiological protectiveness of the containment remedy. Therefore, a detailed evaluation of a fifth alternative, as it relates to differentiating its performance relative to the other remedial alternatives, is presented only in the Final RI/FS Report.

12.1. RADIOLOGICAL-SPECIFIC TASKS COMMON TO ALTERNATIVES 2, 3, 4, AND 5

Three radiological-specific tasks will be performed to satisfy the RAO specified for radionuclides at Parcel E-2. The first task involves removal of the sanitary sewer, storm drain, and septic sewer lines that extend into the East Adjacent Area but are located outside of the IR Site 01/21 site boundary ([Figure 3](#)), and removal of radioactive contamination exceeding the RGs within these trenches. Soil and debris from these areas (an estimated 10,000 cubic yards) would be excavated and transported to a screening yard, where the material would be screened for radioactivity and properly segregated, characterized and disposed of off site. Post-excavation gamma scans would be performed and soil samples would be collected to verify that residual radioactivity in the trenches does not exceed the RGs. Remaining sections of sanitary sewer, storm drain, and septic sewer lines that extend into the IR Site 01/21 site boundary would not be removed because the potential radioactivity within these lines is similar to that potentially present in subsurface soil throughout IR Site 01/21 which, as described in [Section 11.3](#), requires containment and institutional controls to achieve the radiological RAOs. Remaining sections of sanitary sewer, storm drain, and septic sewer lines that extend into the IR Site 01/21 site boundary would be cut and capped (with an appropriate cement-based grout).

The second task involves removal of the ship-shielding berm in the Panhandle Area. Similar to the sewer and storm drain removal process, soil and debris from the area (an estimated 3,700 cubic yards) would be

- Post-construction monitoring of groundwater and stormwater (discussed in [Sections 12.1.2 and 12.1.4](#), respectively)
- Construction (and subsequent monitoring) of freshwater and tidal wetlands in the Panhandle Area (discussed in [Section 12.2.3.11](#))
- Construction of a groundwater containment system (nearshore slurry wall) to prevent the discharge of contaminated groundwater to the bay (discussed in [Section 12.2.4.2](#))
- Post-construction monitoring of groundwater and stormwater (discussed in [Sections 12.1.2 and 12.1.4](#), respectively)

The subsequent subsections discuss the unique components of this alternative in further detail.

12.2.4.1. Removal of Tiers 1, 2, 3, 4, and 5 Hot Spots

As part of this alternative, Tiers 1, 2, 3, 4, and 5 hot spots would be removed, as shown on [Figure 12-20](#), in conjunction with the shoreline excavation and grading processes described in [Sections 12.1.3 and 12.2.3.4](#), respectively. Following screening for and segregation of radiologically impacted material (which would be disposed of off site), hot spots would be excavated and disposed of off-site; material excavated as part of the overall grading process would be incorporated into the landfill under the new cap extension. The Tier 1 through 5 hot spot excavations entail the removal and off-site disposal of approximately 33,500 cubic yards of contaminated material. Additional information on the identification of Tier 1 through 5 hot spots is provided in [Section 12.1.6](#).

12.2.4.2. Groundwater Containment System

Alternative 4 would involve construction of a groundwater containment system consisting of (1) a nearshore slurry wall hydraulically downgradient of the landfill where wastes are within 100 feet of San Francisco Bay; (2) a groundwater diversion system (consisting of an upgradient slurry wall and subsurface drain) along the west side of the landfill to minimize hydraulic head buildup behind the nearshore slurry wall; and (3) a contingency to extend the nearshore slurry wall into the East Adjacent Area (hydraulically downgradient of the PCB Hot Spot Area). The need to extend the nearshore slurry wall will be assessed in the RD using updated groundwater monitoring data, which are currently being collected under the BGMP from wells in and around the excavated portion of the PCB Hot Spot Area. While the subsurface drainage system and associated groundwater extraction components meet the leachate collection and control requirements at 22 CCR § 66264.310(b)(2), the groundwater containment system is included in Alternative 4 to thoroughly evaluate the potential options needed to prevent discharge of COECs in groundwater at concentrations exceeding the chemical-specific ARARs for surface water (described in [Section 10.1.2](#)). As discussed in [Section 9.3](#), the identified chemicals in groundwater that may pose a risk to aquatic wildlife in the bay ([Appendix M](#)) are considered COECs (that is, of chemicals of ecological concern) given the conservative nature of the risk analysis performed for that pathway.

57	Landfill gas controls	Section 2.9.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 12.2.3.9, pages 12-28 and 12-29. Record No. 4237.
----	-----------------------	---------------	---

Data from two groundwater monitoring wells (IR01MW403A and IR01MW403B, located within 100 feet of the proposed subsurface drain, Figure M-1) were reviewed to preliminarily assess the quality of groundwater proposed for diversion to the freshwater wetlands; the RD will refine this assessment, as appropriate. Maps presented in [Appendix M](#) indicate that most chemical concentrations at wells IR01MW403A and IR01MW403B do not exceed aquatic evaluation criteria. Low concentrations of several chemicals (cyanide, 4,4'-DDD, and dieldrin) were sporadically detected below laboratory reporting limits but greater than aquatic evaluation criteria; these trends do not suggest that cyanide, 4,4'-DDD, or dieldrin are COECs for the freshwater wetlands. Un-ionized ammonia and sulfide have been consistently detected at concentrations exceeding aquatic evaluation criteria and are considered COECs for the freshwater wetlands. As discussed in [Appendix M](#), both of these anions readily transform to non-toxic compounds upon discharge to oxygenated surface water. The subsurface drain will be designed to ensure that groundwater flow is sufficiently aerated prior to discharge into the freshwater wetlands.

12.2.3.8. Subsurface Drainage System along Southern Perimeter of Landfill Area

Groundwater flow modeling was performed to determine the pumping rate that would be required to prevent head buildup against the proposed shoreline protection along the southern perimeter of the Landfill Area. Based on the groundwater modeling results, a 1-foot thick subdrain gravel blanket and a 6-inch drain pipe would prevent hydraulic build-up against the toe berm underlying the shoreline protection system ([Figure 12-4](#)). The drainage system and associated groundwater extraction components would meet leachate collection and control requirements at 22 CCR § 66264.310(b)(2).

The subsurface drainage system would be designed to handle the expected flow rate from groundwater upgradient flow recharge. The system would be equipped with riser pipes, submersible pumps, and a transmission pipeline for discharge to an on-site sanitary sewer manhole ([Figure 12-16](#)). A permit to discharge to a publicly owned treatment plant (POTW) would be prepared and submitted prior to construction. A contingency plan for installing a groundwater treatment system unit near Parcel E-2 would also be considered in the event that discharge to the POTW is required to meet pre-treatment standards (outlined in 40 CFR § 403); however, this is considered unlikely considering that, based on over 6 years of operational data, no pre-treatment of extracted groundwater was required for the former GES at the PCB Hot Spot Area (see [Section 3.8.3](#)).

12.2.3.9. Landfill Gas Control

Future landfill gas generated within the Landfill Area would be controlled by an active landfill gas collection system that would prevent landfill gas from exceeding regulatory thresholds at compliance points. In the adjacent areas (Panhandle, East Adjacent, and Shoreline Areas), landfill gas is not expected to be generated to a degree that requires collection; however, an investigation will be conducted during

the RD to more thoroughly evaluate soil gas concentrations in the Panhandle, East Adjacent, and Shoreline Areas to determine if gas collection and control (such as passive subsurface venting) is required. Further, it should be noted that wetlands and bay mud are natural sources of methane, hydrogen sulfide, and other gases similar in composition to landfill gases; if not attributed to in-place waste, these gases would not be subject to gas collection requirements.

As stated above, a landfill gas collection system would be installed to actively collect landfill gas from the Landfill Area. The appropriate landfill gas treatment technology, if necessary, will be determined during the RD based on landfill gas data collected from within the landfill. Landfill gas treatment by flare is assumed for costing and evaluating Alternative 3A, and GAC and potassium permanganate treatment is assumed for Alternative 3B. Figure 12-19 shows the conceptual landfill gas collection system. This system would draw landfill gas from the landfill and away from the landfill perimeter to control gas migration. The system would consist of a series of vertical extraction wells spaced sufficiently close together to ensure removal of landfill gas from all solid waste areas, especially near the landfill perimeter. The vertical extraction wells would be connected to a header pipe that would tie the wells together. A blower assembly would create a vacuum in the header pipe that would draw gas to the central collection point located in the southeast corner of the landfill. The collected gas would then be conveyed to the flare or GAC and potassium permanganate treatment system for destruction or treatment, respectively. The header pipe would be installed underground, and all extraction wells would be terminated flush with the ground and have vaults with lockable covers at the surface to discourage vandalism. The subgrade collection header pipe would daylight inside the collection and treatment compound. The area around the gas treatment system would be fenced to restrict public access.

12.2.3.10. Monitoring, Operation, and Maintenance

Landfill gas monitoring is required to meet the RAOs and to demonstrate compliance with 27 CCR §§ 20917 through 20934, “Gas Monitoring and Control at Active and Closed Disposal Sites.” The specific landfill gas monitoring program will be determined during the RD and included as part of the Parcel E-2 closure plan. The gas monitoring program will be designed to account for:

- Local soil, rock, and hydrogeological conditions
- Locations of buildings and structures relative to the waste disposal area
- Adjacent land use and inhabitable structures within 1,000 feet of the landfill
- Manmade underground structures, such as vaults
- The nature and age of waste and its potential to generate landfill gas

At a minimum, monitoring would be quarterly for methane and NMOCs at wells around the perimeter of the landfill and at on-site structures, such as buildings, subsurface vaults, utilities, and any other areas where potential gas buildup can occur. The landfill gas monitoring program will primarily be performed

58	Below-ground barrier and drain along western boundary	Section 2.9.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 12.2.3.7, pages 12-27 and 12-28. Record No. 4237.
----	---	---------------	---

As discussed above, a geocomposite drainage layer is part of both types of geosynthetic caps for Alternative 3. In addition to providing a drainage path for water infiltrating through the vegetative layer, the geocomposite drainage layer would also deter burrowing animals from penetrating the HDPE geomembrane. The potential for burrowing animals to penetrate a geosynthetic cap is generally considered low by experts in the waste containment industry (Sharma and Lewis, 1992; Karr et al., 1992; Gee and Ward, 1997; AFCEE, 1999); however, this potential cannot be entirely dismissed, thus the geocomposite drainage layer is proposed as an additional deterrent to burrowing animals (to supplement post-closure inspection, maintenance, and animal control measures; see Section 12.2.3.10). The proposed use of a geocomposite drainage layer as an additional deterrent to burrowing animals is similar to approved final designs at several San Francisco Bay area landfill sites (TtEMI, 2005d; IT, 2000; U.S. Department of Energy, 2001). One of the sites, the Site 1 Landfill at the former Naval Air Station Moffett Field, uses regular inspection, maintenance, and low-impact control measures (raptor perches) to effectively manage burrowing animals. The cap at the Site 1 Landfill at the former Naval Air Station Moffett Field has been in place since November 1998 and continues to be protective of human health and the environment (EPA, 2009).

In the restored freshwater wetlands within the Panhandle Area, a 1-foot-thick low-permeability clay liner is proposed to limit potential intrusion of shallow groundwater, which contains chemicals that may be harmful to aquatic wildlife. The clay liner was selected to replace the geosynthetic liner, as proposed in the Draft Final RI/FS Report, because of its improved effectiveness in the presence of shallow groundwater. The geosynthetic cap adjacent to the freshwater wetlands would be keyed into the clay liner to form a continuous low-permeability layer within this portion of the Panhandle Area (Figure 12-2). No cap is proposed for the tidal wetlands area because additional excavation in this area will completely remove contaminated material from 0 to 3 feet bgs, thereby eliminating the exposure pathway for aquatic and terrestrial wildlife and significantly reducing the potential sources to groundwater contamination while integrating the tidal wetlands with the adjoining Yosemite Slough restoration project.

12.2.3.7. Groundwater Diversion System along Western Boundary of Landfill Area

To reduce groundwater flow through the landfill waste, a groundwater diversion system (consisting of an upgradient slurry wall and subsurface drain) would be installed along the western boundary of the Landfill Area, the predominant upgradient source of groundwater entering the landfill. Off-site groundwater would be prevented from flowing directly into the landfill waste by the upgradient slurry wall and would be diverted by the subsurface drain, consisting of a 6-inch-diameter collector pipe buried in a gravel- or sand-filled trench (Figure 12-5). The diverted off-site groundwater would drain by gravity to the newly constructed freshwater wetlands (Figure 12-1). Based on results of preliminary groundwater modeling (Appendix P), the subsurface drain would be placed at approximately 6 feet msl and would drain into the freshwater wetlands, with bottom elevations ranging from 4 to 5 feet msl.

Data from two groundwater monitoring wells (IR01MW403A and IR01MW403B, located within 100 feet of the proposed subsurface drain, Figure M-1) were reviewed to preliminarily assess the quality of groundwater proposed for diversion to the freshwater wetlands; the RD will refine this assessment, as appropriate. Maps presented in [Appendix M](#) indicate that most chemical concentrations at wells IR01MW403A and IR01MW403B do not exceed aquatic evaluation criteria. Low concentrations of several chemicals (cyanide, 4,4'-DDD, and dieldrin) were sporadically detected below laboratory reporting limits but greater than aquatic evaluation criteria; these trends do not suggest that cyanide, 4,4'-DDD, or dieldrin are COECs for the freshwater wetlands. Un-ionized ammonia and sulfide have been consistently detected at concentrations exceeding aquatic evaluation criteria and are considered COECs for the freshwater wetlands. As discussed in [Appendix M](#), both of these anions readily transform to non-toxic compounds upon discharge to oxygenated surface water. The subsurface drain will be designed to ensure that groundwater flow is sufficiently aerated prior to discharge into the freshwater wetlands.

12.2.3.8. Subsurface Drainage System along Southern Perimeter of Landfill Area

Groundwater flow modeling was performed to determine the pumping rate that would be required to prevent head buildup against the proposed shoreline protection along the southern perimeter of the Landfill Area. Based on the groundwater modeling results, a 1-foot thick subdrain gravel blanket and a 6-inch drain pipe would prevent hydraulic build-up against the toe berm underlying the shoreline protection system ([Figure 12-4](#)). The drainage system and associated groundwater extraction components would meet leachate collection and control requirements at 22 CCR § 66264.310(b)(2).

The subsurface drainage system would be designed to handle the expected flow rate from groundwater upgradient flow recharge. The system would be equipped with riser pipes, submersible pumps, and a transmission pipeline for discharge to an on-site sanitary sewer manhole ([Figure 12-16](#)). A permit to discharge to a publicly owned treatment plant (POTW) would be prepared and submitted prior to construction. A contingency plan for installing a groundwater treatment system unit near Parcel E-2 would also be considered in the event that discharge to the POTW is required to meet pre-treatment standards (outlined in 40 CFR § 403); however, this is considered unlikely considering that, based on over 6 years of operational data, no pre-treatment of extracted groundwater was required for the former GES at the PCB Hot Spot Area (see [Section 3.8.3](#)).

12.2.3.9. Landfill Gas Control

Future landfill gas generated within the Landfill Area would be controlled by an active landfill gas collection system that would prevent landfill gas from exceeding regulatory thresholds at compliance points. In the adjacent areas (Panhandle, East Adjacent, and Shoreline Areas), landfill gas is not expected to be generated to a degree that requires collection; however, an investigation will be conducted during

59	Below-ground barrier would be installed near the shoreline	Section 2.9.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 12.2.4.2, pages 12-33 and 12-34. Record No. 4237.
----	---	---------------	---

- Post-construction monitoring of groundwater and stormwater (discussed in [Sections 12.1.2 and 12.1.4](#), respectively)
- Construction (and subsequent monitoring) of freshwater and tidal wetlands in the Panhandle Area (discussed in [Section 12.2.3.11](#))
- Construction of a groundwater containment system (nearshore slurry wall) to prevent the discharge of contaminated groundwater to the bay (discussed in [Section 12.2.4.2](#))
- Post-construction monitoring of groundwater and stormwater (discussed in [Sections 12.1.2 and 12.1.4](#), respectively)

The subsequent subsections discuss the unique components of this alternative in further detail.

12.2.4.1. Removal of Tiers 1, 2, 3, 4, and 5 Hot Spots

As part of this alternative, Tiers 1, 2, 3, 4, and 5 hot spots would be removed, as shown on [Figure 12-20](#), in conjunction with the shoreline excavation and grading processes described in [Sections 12.1.3 and 12.2.3.4](#), respectively. Following screening for and segregation of radiologically impacted material (which would be disposed of off site), hot spots would be excavated and disposed of off-site; material excavated as part of the overall grading process would be incorporated into the landfill under the new cap extension. The Tier 1 through 5 hot spot excavations entail the removal and off-site disposal of approximately 33,500 cubic yards of contaminated material. Additional information on the identification of Tier 1 through 5 hot spots is provided in [Section 12.1.6](#).

12.2.4.2. Groundwater Containment System

Alternative 4 would involve construction of a groundwater containment system consisting of (1) a nearshore slurry wall hydraulically downgradient of the landfill where wastes are within 100 feet of San Francisco Bay; (2) a groundwater diversion system (consisting of an upgradient slurry wall and subsurface drain) along the west side of the landfill to minimize hydraulic head buildup behind the nearshore slurry wall; and (3) a contingency to extend the nearshore slurry wall into the East Adjacent Area (hydraulically downgradient of the PCB Hot Spot Area). The need to extend the nearshore slurry wall will be assessed in the RD using updated groundwater monitoring data, which are currently being collected under the BGMP from wells in and around the excavated portion of the PCB Hot Spot Area. While the subsurface drainage system and associated groundwater extraction components meet the leachate collection and control requirements at 22 CCR § 66264.310(b)(2), the groundwater containment system is included in Alternative 4 to thoroughly evaluate the potential options needed to prevent discharge of COECs in groundwater at concentrations exceeding the chemical-specific ARARs for surface water (described in [Section 10.1.2](#)). As discussed in [Section 9.3](#), the identified chemicals in groundwater that may pose a risk to aquatic wildlife in the bay ([Appendix M](#)) are considered COECs (that is, of chemicals of ecological concern) given the conservative nature of the risk analysis performed for that pathway.

The conceptual design for the groundwater containment system is shown on [Figure 12-20](#). The location of the nearshore slurry wall downgradient of the landfill waste is shown, relative to other components of the containment system, on [Figure 12-2](#) (Section B). The location of the contingency nearshore slurry wall downgradient of the PCB Hot Spot Area is shown on [Figure 12-2](#) (Section A). As discussed in [Section 12.2.3.7](#), the groundwater diversion system would consist of an upgradient slurry wall designed to impede upgradient groundwater flowing from off-site and a subsurface drain that would direct the off-site groundwater to the newly constructed freshwater wetlands.

Installation of the slurry walls would require trenching 10 to 15 feet below the groundwater table to key the barrier into the Bay Mud aquitard. The slurry walls could be installed in saturated conditions without extensive dewatering; however, installation would need to account for the potential presence of large debris and irregular subsurface voids by contingency planning; for example, performing pre-design studies to identify subsurface irregularities, planning for potential realignment of the wall if large debris is encountered, and providing surplus slurry material to account for irregular subsurface voids. Such techniques were previously used at Parcel E-2 during construction of the GES and the interim gas control system.

12.2.5. Alternative 5: Contain Solid Waste, Soil, Sediment, and Groundwater with Hot Spot Removal (including monitoring, institutional controls, and unlined freshwater wetlands)

Alternative 5 involves all of the components of Alternative 4, but eliminates the 1-foot-thick clay liner within the proposed freshwater wetland and replaces it with an additional 1 foot of hydric soil ([Figures 12-14 and 12-21](#)). Alternative 5 was developed to evaluate the relative advantages of unlined freshwater wetlands as compared with the lined freshwater wetlands proposed under Alternatives 3 and 4. This alternative would provide a comprehensive closure strategy for Parcel E-2 similar to Alternative 4, but would promote a more natural hydrological function within the freshwater wetland (i.e., allowing interaction between surface water and underlying groundwater).

[Figures 12-1 and 12-21](#) show the conceptual grading and excavation plans, respectively, for Alternative 5. The grading of solid waste, soil, and sediment would be required to create stable slopes in the Shoreline Area and allow for wetland creation in the Panhandle Area.

Two variations of Alternative 5 (5A and 5B) are presented in the evaluation and cost tables in [Appendix R](#). Alternatives 5A and 5B are identical to Alternatives 3A and 3B presented in Alternative 3 and, as described in [Section 12.2.3](#), describe two landfill gas treatment options: destruction by flare (Alternative 5A) and adsorption by GAC and a potassium permanganate medium (Alternative 5B).

60	Groundwater would be hydraulically controlled if necessary	Section 2.9.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERG and Shaw. May 2011. Section 12.2.3.8, page 12-28. Record No. 4237.
----	--	---------------	---

Data from two groundwater monitoring wells (IR01MW403A and IR01MW403B, located within 100 feet of the proposed subsurface drain, Figure M-1) were reviewed to preliminarily assess the quality of groundwater proposed for diversion to the freshwater wetlands; the RD will refine this assessment, as appropriate. Maps presented in [Appendix M](#) indicate that most chemical concentrations at wells IR01MW403A and IR01MW403B do not exceed aquatic evaluation criteria. Low concentrations of several chemicals (cyanide, 4,4'-DDD, and dieldrin) were sporadically detected below laboratory reporting limits but greater than aquatic evaluation criteria; these trends do not suggest that cyanide, 4,4'-DDD, or dieldrin are COECs for the freshwater wetlands. Un-ionized ammonia and sulfide have been consistently detected at concentrations exceeding aquatic evaluation criteria and are considered COECs for the freshwater wetlands. As discussed in [Appendix M](#), both of these anions readily transform to non-toxic compounds upon discharge to oxygenated surface water. The subsurface drain will be designed to ensure that groundwater flow is sufficiently aerated prior to discharge into the freshwater wetlands.

12.2.3.8. Subsurface Drainage System along Southern Perimeter of Landfill Area

Groundwater flow modeling was performed to determine the pumping rate that would be required to prevent head buildup against the proposed shoreline protection along the southern perimeter of the Landfill Area. Based on the groundwater modeling results, a 1-foot thick subdrain gravel blanket and a 6-inch drain pipe would prevent hydraulic build-up against the toe berm underlying the shoreline protection system ([Figure 12-4](#)). The drainage system and associated groundwater extraction components would meet leachate collection and control requirements at 22 CCR § 66264.310(b)(2).

The subsurface drainage system would be designed to handle the expected flow rate from groundwater upgradient flow recharge. The system would be equipped with riser pipes, submersible pumps, and a transmission pipeline for discharge to an on-site sanitary sewer manhole ([Figure 12-16](#)). A permit to discharge to a publicly owned treatment plant (POTW) would be prepared and submitted prior to construction. A contingency plan for installing a groundwater treatment system unit near Parcel E-2 would also be considered in the event that discharge to the POTW is required to meet pre-treatment standards (outlined in 40 CFR § 403); however, this is considered unlikely considering that, based on over 6 years of operational data, no pre-treatment of extracted groundwater was required for the former GES at the PCB Hot Spot Area (see [Section 3.8.3](#)).

12.2.3.9. Landfill Gas Control

Future landfill gas generated within the Landfill Area would be controlled by an active landfill gas collection system that would prevent landfill gas from exceeding regulatory thresholds at compliance points. In the adjacent areas (Panhandle, East Adjacent, and Shoreline Areas), landfill gas is not expected to be generated to a degree that requires collection; however, an investigation will be conducted during

61	Control soil movement during maximum probable earthquake	Section 2.9.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 12.2.3.1, page 12-23. Record No. 4237.
----	---	---------------	--

- Decommissioning of the existing gas control system and installation (and subsequent maintenance) of an active gas collection system with treatment using a flare (Alternative 3A) or GAC and potassium permanganate (Alternative 3B)
- Installation of stormwater and erosion controls (discussed in [Section 12.1.4](#))
- Post-construction landfill cap inspection and maintenance, and monitoring of landfill gas
- Post-construction monitoring of groundwater and stormwater (discussed in [Sections 12.1.2 and 12.1.4](#), respectively)
- Construction (and subsequent monitoring) of freshwater and tidal wetlands in the Panhandle Area

The subsequent subsections discuss the various components of this alternative in further detail.

12.2.3.1. Seismic Design of Containment System

The seismic design of the containment system planned for Alternative 3 will use information from (1) the 2002 liquefaction potential study at Parcel E-2 ([Appendix C](#) to this report), and (2) the qualitative slope stability analyses performed as part of this RI/FS Report ([Appendix Q](#)). Alternative 3 includes construction of a toe berm along the southern perimeter of the Landfill Area to stabilize the proposed cap ([Figure 12-4](#)). As presented in [Appendix C](#), the potential exists for liquefaction of sand and silt fill materials underlying the perimeter of the Landfill Area during the maximum probable earthquake (a magnitude 7.9 earthquake on the San Andreas Fault Peninsula Segment, centered 12 kilometers from Parcel E-2; see [Appendix C](#)). Such liquefaction could affect the stability of the proposed toe berm, which in turn could affect the stability of the proposed cap; therefore, a qualitative slope stability analysis was performed for the toe berm based on residual shear strength within sand and silt fill resulting from liquefaction ([Appendix Q](#)).

Results of an iterative slope stability analysis determined that a Tensar® UX1500HS or equivalent geogrid with a long-term design tensile strength of 3,100 pounds per foot should be placed under the proposed toe berm, and should extend upslope to an appropriate anchor point within the proposed landfill cap; this conceptual design would meet or exceed design standards prescribed in EPA guidance ([EPA, 1995b](#)). This geogrid layer was added under the toe berm proposed for Alternative 3 ([Figure 12-4](#)). Because the analyses presented in [Appendix Q](#) are a qualitative assessment of the proposed toe berm evaluated in the FS, a quantitative slope stability analysis will be performed as part of the RD. The Navy plans to collect soil samples along the base of the proposed toe berm and to perform shear strength tests (and other appropriate geotechnical analyses) to support the quantitative slope stability analysis in the RD. The proposed sampling and geotechnical analyses would be detailed in a work plan to be reviewed by the regulatory agencies prior to implementation.

62	Potential rise in sea level	Section 2.9.2	Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California. ERRG and Shaw. May 2011. Section 12.1.3, pages 12-5 through 12-7. Record No. 4237.
----	-----------------------------	---------------	---

suite of monitoring parameters will be made in consultation with the regulatory agencies during either the annual evaluations or the CERCLA 5-year reviews.

For the purposes of costing and evaluating alternatives in this FS, it is assumed that 13 A-aquifer and 3 B-aquifer monitoring wells located in and around the Landfill Area will require long-term monitoring and will be sampled for the same parameters as specified in the current monitoring plan. In addition, it is assumed that 22 A-aquifer and 7 B-aquifer wells in the adjacent areas will require long-term monitoring, and will be sampled for analysis of chemical parameters specific to the area of concern (e.g., metals, PCBs, SVOCs, and TPH). For evaluation purposes, the monitoring frequency is assumed as semiannually for 5 years and annually for 25 years; this assumption would allow for changes to the monitoring frequency to be integrated with the CERCLA 5-year reviews. The 30-year monitoring period was selected based on the assumed post-closure monitoring period; however, this monitoring period may be adjusted, as appropriate, to account for pre-closure monitoring. In addition, groundwater monitoring results for the PCB Hot Spot Area will be evaluated in the RD to determine if the groundwater containment structure needs to be extended south to prevent discharge to the bay.

12.1.3. Completion of the Shoreline Protection (with Removal of Solid Waste, Soil, and Sediment)

Shoreline protection will be required under Alternatives 2, 3, 4, and 5 to control erosion from tidal and wave action from San Francisco Bay. In areas proposed for tidal wetlands restoration (under Alternatives 2, 3, 4, and 5), shoreline protection would consist of a combination of wetland vegetation and low-profile rock structures with the objective of maintaining the integrity of the restored surfaces following remediation. For Alternative 2, which involves extensive excavation throughout Parcel E-2, these shoreline protection measures would be implemented along the entire Shoreline Area. For Alternatives 3, 4, and 5, these shoreline protection measures would be implemented at the southern portion of the Panhandle Area (and adjoining portions of the Shoreline Area), where expanded excavation would be performed to facilitate construction of tidal wetlands.

In areas not proposed for tidal wetlands restoration, Alternatives 3, 4, and 5 include a more extensive shoreline protection system, consisting of rock revetment underlain by compacted soil and a geosynthetic cap, to maintain the integrity of the containment systems (see [Figure 12-1](#)). Also, existing solid waste, soil, and sediment along the shoreline would be removed and consolidated on site prior to construction of the shoreline protection system or, in the case of the southern portion of the Panhandle Area, prior to construction of the tidal wetlands. The excavation depths along the shoreline would vary between approximately 2 and 5 feet, as shown on [Figures 12-2 and 12-3](#).

At the southeastern portion of the Landfill Area, solid waste along the shoreline would be removed and consolidated on site prior to construction of the shoreline protection system. The geosynthetic cap

underlying the rock revetment and soil would be tied into the geosynthetic cap to be installed in the Landfill Area, East Adjacent Area, and the portions of the Panhandle Area outside of the tidal wetlands. [Figure 12-4](#) depicts the tie-in of the multilayer geosynthetic cap in the Landfill Area with the shoreline protection system. [Figure 12-2](#) depicts the tie-in of the geosynthetic cap in the Panhandle Area and East Adjacent Area with the shoreline protection system. The toe of the new landfill slope would generally be inward of the existing slope to allow placement of the shoreline protection and minimize filling of the bay. The landfill slope would be reconstructed at a 3:1 (horizontal:vertical) slope extending upward to where it intersects a future perimeter road ([Figure 12-1](#)). A 12- to 15-foot-wide bench would be provided for the future perimeter road that will dually serve as a maintenance access road and pedestrian walkway as a connection to the Bay Trail from the adjacent Yosemite Slough Restoration Project. South of the future perimeter road, the slope would be constructed to a 3:1 slope down to existing ground along the bay shoreline in that portion of Parcel E-2. Excavated material from this area would be placed at the northern portion of the landfill before a multilayer cap is installed.

Shoreline protection for Alternatives 3, 4, and 5 would include compacted soil and rock revetment, on the outer face of the soil, to an elevation above the highest observed water level in the bay (approximately 8.16 feet above the mean lower low water; 5.04 feet above msl). As shown on [Figure 12-2](#), the top elevation of the shoreline protection system is approximately 15 feet above msl, or about 12 feet above the mean high tide level. This design provides an adequate level of shoreline protection, which based on the most recent estimates from the Intergovernmental Panel on Climate Change (IPCC) can reasonably accommodate rising sea levels over the next 100 years. The following excerpt from [Church et al. \(2008\)](#) summarizes the most recent IPCC estimates of global sea level rise: “The IPCC provides the most authoritative information on projected sea-level change. The IPCC Third Assessment Report of 2001 ([Church et al., 2001](#)) projected a global-averaged sea-level rise of between 20 and 70 centimeters (cm) between 1990 and 2100 using the full range of IPCC greenhouse gas scenarios and a range of climate models. When an additional uncertainty for land-ice changes was included, the full range of projected sea-level rise was 9–88 cm. For the IPCC’s Fourth Assessment Report ([Meehl et al., 2007](#)), the range of sea-level projections, using a larger range of models, is 18–59 cm (90% confidence limits) over the period from 1980–1999 to 2090–2099 ([Meehl et al., 2007](#)).” Based on the IPCC estimates, the estimated maximum sea level rise in 2100 (88 centimeters or 2.9 feet) is much lower than the 11 to 12 vertical feet of shoreline protection provided in the preliminary FS design. The shoreline protection system will be further evaluated in the RD relative to several factors including, but not limited to, potential rise in sea level.

The toe of the shoreline protection system would generally match the existing toe to minimize filling of the bay. The design would also include sufficient soil fill to provide buttress support to the solid waste along the perimeter. The shoreline protection would be designed for stability under static loading

conditions and during earthquakes. Seismic design considerations for Alternatives 3 and 4 are discussed in [Section 12.2.3.1](#).

12.1.4. Stormwater Discharge Management and Monitoring

Existing stormwater discharge from Parcel E-2 is subject to the requirements of the SWDMP ([MARRS and MACTEC, 2009b](#)). This plan specifies implementation of BMPs and monitoring to ensure that surface water discharges from the Parcel E-2 Landfill do not pose an unacceptable risk to aquatic life in San Francisco Bay. The SWDMP is updated annually based on site inspection and monitoring results. Under Alternatives 2, 3, 4, and 5, this process is anticipated to continue through remedial action implementation and long-term operation and maintenance.

Additional short-term considerations would be required during the construction phase of Alternatives 2, 3, 4, and 5, in accordance with the substantive provisions of SWRCB Order 99-08 entitled “Stormwater Discharge Associated with Construction Activities” ([SWRCB, 1999](#)). These provisions include implementation of BMPs to prevent stormwater from contacting construction pollutants and prevent erosion products from migrating off site. The BMPs likely to be used during construction include minimization of bare soil areas; use of topsoil conservation; placement of straw bale and straw waddle; mulching; seeding; slope cultivation; stabilization of construction entrances; and use of temporary crushed rock roads, temporary berms, filter screens, and sedimentation basins. The specific measures to be used will be determined as part of the RD and associated planning documents (e.g., a stormwater pollution prevention plan).

For Alternative 2, erosion protection in the Shoreline Area was described in [Section 12.1.3](#). Erosion protection and stormwater controls in the Landfill, Panhandle, and East Adjacent Areas include vegetative cover and mats to maintain the integrity of the restored surfaces following remediation. These controls are considered adequate because the final slopes for Alternative 2 would be designed to eliminate areas with steep slopes, thereby minimizing erosion potential.

For Alternatives 3, 4, and 5, stormwater and erosion controls are required for the closed landfill under 27 CCR § 20365(c) and (d), which requires that diversion and drainage facilities be designed, constructed, and maintained to accommodate the anticipated volume of precipitation and peak flows. Solid waste would not be exposed to stormwater in capped areas, and erosion controls would be used to maintain the integrity of the containment structures and prevent sediment discharge above allowable limits. These goals would primarily be accomplished through vegetation and site grading to control stormwater overland flow velocities (slower flow velocities generally have less erosion potential). The final Parcel E-2 grades would be designed to prevent stormwater run-on onto the cap from surrounding areas and to prevent ponding (except in wetland areas) and erosion in other areas. Drainage from capped areas would be directed to designated locations that discharge into the newly constructed freshwater

Executive Summary

An executive summary gives a brief snapshot of what the full document contains. If you have limited time to read a document, especially a long technical document, try focusing on the executive summary first.

An important part of the Department of the Navy's environmental cleanup program at former Hunters Point Shipyard (HPS) includes informing and involving the community in cleanup discussions. This Community Involvement Plan (CIP) presents the Navy's plans to inform and involve the community in the environmental cleanup program moving forward based on feedback obtained from the HPS community about past communication and community involvement program activities. The activities presented in the CIP for HPS go beyond the minimum requirements for community involvement set forth in the National Oil and Hazardous Substances Pollution Contingency Plan (known as the National Contingency Plan, or **NCP**). The CIP adheres to the applicable regulatory guidance from the Navy and United States Environmental Protection Agency (**U.S. EPA**). The CIP is also a resource for general information on the Navy's cleanup and whom to contact for further information.

From 1994 through 2009, the primary means of community involvement was the Navy's Restoration Advisory Board (**RAB**). Although the RAB was dissolved in December 2009 because it was no longer fulfilling its purpose, the Navy continues to involve the community in the details of the HPS environmental cleanup program. The Navy believes this CIP presents communication and community involvement program activities that will meet the specific needs and desires of the HPS community.

Executive Summary (continued)

Overview of Community Interviews and Feedback

During the summer of 2010, the Navy interviewed 73 members of the HPS community, defined as ZIP codes 94107, 94124, and 94134. Historically, these ZIP codes have been used to define the HPS community for the purpose of local contracting and community involvement efforts, such as establishing a mailing list. These three ZIP codes were used to define the HPS community because they comprise the majority of District 10 in the City and County of San Francisco and are served by one Supervisor. In addition, the Navy is attempting to reach out to as many people impacted by environmental conditions as possible, and these three ZIP codes are nearest to the shipyard.

The Navy went to significant lengths to ensure the most comprehensive survey practicable. The interviews focused on gathering feedback about the community's cleanup interests and concerns, as well as communication needs and preferences to help design this CIP to be more effective for the HPS community. The following six recurring themes surfaced during the interviews:

- Theme 1.** The Navy's communication with the HPS community about the environmental cleanup program has not been effective.
- Theme 2.** General information about the Navy's environmental cleanup program at HPS is lacking.
- Theme 3.** The HPS community is diverse, resulting in varied concerns, communication preferences, and needs.
- Theme 4.** The difference between the Navy's HPS environmental cleanup program and the San Francisco Redevelopment Agency's (SFRA's) redevelopment of HPS has not been made clear.
- Theme 5.** Health is a primary concern for most segments of the community.
- Theme 6.** Coordinating with established community members to conduct involvement may be a good way to reach all sectors of the community.

Overview of the Navy's Community Involvement Program Actions and Activities

Prior to developing a plan of action, the Navy considered the themes in the community feedback, reviewed applicable Navy and U.S. EPA guidance for community involvement, and evaluated what works well for other similar environmental cleanup programs. The Navy has developed a plan of action to ensure the success of the CIP for the HPS community. The Navy's objectives in its community involvement activities include the following:

- Work with the community to communicate information in a way that is transparent and in a way that the community wants to receive it
- Get information out early, and make sure it is easy to understand and translated as needed
- Respond to the community's concerns, ideas, and information and show how they are used in making decisions about the environmental cleanup

Executive Summary (continued)

The Navy will track action items at meetings and respond to questions and comments. Frequently asked questions (**FAQs**) and responses will be posted on the Navy's Web site and brought to meetings as a handout, if appropriate. If written formal comments are received on any document, the Navy will respond to those comments in writing and include the responses in the next version of the document that also contains the applicable revisions.

Some of the actions and activities in this updated CIP for improving community involvement in the HPS cleanup include:

- Preparing short fact sheets with general information, such as the status of cleanup, and distributing them on the Internet, in the mail, and by having community members give them to their neighbors
- Conducting regularly scheduled community meetings
- Giving presentations at small group meetings (such as tenant associations and churches)
- Working with established community members to spread information and invite community members to participate in the HPS environmental cleanup discussions (referred to as "grassroots outreach")
- Participating in local radio shows, including multi lingual shows, and answering questions from call in listeners
- Providing tours of HPS for those who are curious about what the property currently looks like and to see any ongoing environmental cleanup work
- Using a Web site and social media outlets such as Facebook to reach people who are online regularly and prefer electronic communication
- Publishing a calendar of community involvement program activities so community members can plan ahead to participate
- Providing a telephone hotline with a recorded update of activities, and also allow callers to leave a message

The Navy will seek feedback during community involvement events about whether community members are getting the engagement they need. The goals for each activity will be evaluated on a yearly basis by the Navy's Community Involvement Manager to ensure that they are being met. The Navy will also distribute a survey to the mailing list to evaluate the community involvement program every two years. The findings of this survey will be documented in a memorandum that will be included in the Administrative Record for HPS. The survey and documentation will comply with 32 Code of Federal Regulations (CFR) 202.10. The Navy will periodically review this CIP and update it accordingly.

Overview of the Navy's Environmental Cleanup Program at HPS and Opportunities for Public Involvement

A general understanding of the Navy's environmental cleanup program is helpful to the HPS community when providing input on the cleanup. To help the HPS community understand the Navy's cleanup process, this CIP includes a chapter that discusses the historical operations at HPS that resulted in contamination. The Navy is actively conducting environmental investigations and cleanup at HPS to

Executive Summary (continued)

protect human health and the environment and to prepare the property to be transferred to the SFRA. The shipyard is divided into parcels that are in various stages of environmental investigation and cleanup. The cleanup status at these parcels is often discussed during meetings and presented in technical reports.

Overview of Environmental Cleanup Roles and Responsibilities

The Navy is responsible for the environmental cleanup at HPS; however, government agencies oversee the regulations for the cleanup process. These agencies are collectively referred to as “the regulatory agencies,” and are important resources for the HPS community. The responsibility of the regulatory agencies is to review the Navy’s plans and work at HPS to make sure regulations are followed. The primary regulatory agencies actively involved at HPS include the following:

- U.S. EPA
- California Environmental Protection Agency, Department of Toxic Substances Control (DTSC)
- San Francisco Bay Regional Water Quality Control Board (**Water Board**)

In addition, the SFRA is responsible for redeveloping HPS. The San Francisco Department of Public Health (**SFDPH**) is another agency providing input to the Navy’s cleanup of HPS.

The HPS community plays an active role in the Navy’s environmental cleanup program by providing input to the regulatory agencies and the Navy on cleanup alternatives and selection of remedies. When it comes to concerns and interests related to the current or future redevelopment of the property, the community is responsible for communicating directly with the SFRA.

Chapter 1: Introduction

The Department of the Navy and United States Environmental Protection Agency (**U.S. EPA**) recognize that Americans have the right to be involved in government decisions that affect their lives. Public involvement in the cleanup process results in a better outcome and a more robust cleanup. In addition to meeting the minimum requirements for community involvement set forth in the National Oil and Hazardous Substances Pollution Contingency Plan (known as the National Contingency Plan, or **NCP**), the primary purpose of this Hunters Point Shipyard (**HPS**) Community Involvement Plan (**CIP**) includes the following:

- Summarize concerns found through the community interview process
- Outline the actions that the Navy will use to achieve the community involvement program
- Incorporate community issues and concerns more effectively into cleanup decisions
- Serve as a resource for general information on the HPS environmental cleanup and provide guidance on where to obtain more information

“Environmental justice” is the fair treatment and meaningful involvement of all people in the development, implementation, and enforcement of environmental laws, regulations, and policies. Race, economic status and social status should not be barriers to becoming involved. The Navy is mindful of the diverse community representing numerous racial, economic and social groups that immediately surrounds HPS and takes steps to reach and engage all segments of the community. Demographic information for the HPS community is provided in [Appendix D](#).

At HPS, the Navy has incorporated the principles of environmental justice into the planning and preparation of this Community

Involvement Plan. The Navy is addressing environmental justice through its outreach efforts, public participation process, and by providing access to information in a variety of ways. This includes providing information, as needed, in other languages.

Community members are encouraged to be involved in the cleanup process by providing feedback and information on an ongoing basis. The Navy acknowledges that community members, especially long time residents, have knowledge about HPS activities which may assist the cleanup activities.

From 1994 until 2009, the Navy maintained a Restoration Advisory Board (**RAB**) at HPS. The purpose of the RAB was to (1) provide an expanded opportunity for community involvement in the environmental cleanup process, (2) act as a forum for the discussion and exchange of information about the environmental cleanup program, and (3) provide RAB members an opportunity to review progress and participate in discussions about the environmental cleanup with the cleanup decision makers. At one time, the RAB was a main component of the Navy’s community involvement program. On a voluntary basis, RAB members contributed their time and energy to improving the Navy’s environmental cleanup program at HPS.

In December 2009, the Navy, in consultation with the government agencies responsible for overseeing the cleanup process at HPS (which include the U.S. EPA, the California Department of Toxic Substances Control [**DTSC**], and the San Francisco Bay Regional Water Quality Control Board [**Water Board**], referred to in this CIP as “the regulatory agencies”) determined that the RAB was no longer fulfilling its purpose, and the RAB was dissolved (for more information on the

Chapter 1: Introduction (continued)

dissolution of the RAB, see [Appendix E](#)). The Navy Installation Commander is required by the RAB Rule to assess community interest every 24 months to determine (1) if the cause for dissolution has been resolved, and (2) if there is community interest in reestablishing a RAB per the RAB Rule Handbook (2007). This new CIP meets this initial requirement in assessing community interest (for a list of community involvement program actions since the RAB was dissolved, see [Appendix E](#)).

The Navy is committed to keeping the community engaged in the environmental cleanup program at HPS. Part of that commitment includes preparing this CIP to plan the path forward for community involvement at HPS. This CIP presents communication and community involvement program activities to meet the specific needs of the HPS community.

The Navy will seek feedback during community involvement events about whether community members are getting the engagement they need. The goals for each activity will be evaluated on a yearly basis by the Navy's Community Involvement Manager to ensure that they are being met. The Navy will also distribute a survey to the HPS community involvement program mailing list to evaluate the program every two years. The findings of this survey will be documented in a memorandum that is included in the Administrative Record for HPS. The survey and documentation will comply with 32 CFR 202.10. The Navy will periodically review this CIP and update it accordingly.

<#> of this document describes the issues and concerns identified during the community interview process that the Navy conducted in 2010. <#> outlines the Navy's plans for the community involvement program, including

specific activities to be conducted. <#> provides a history and timeline of HPS and also describes the status of the Navy's environmental cleanup program; it includes maps and a table of planned environmental milestones and related community involvement program activities. <#> describes the roles and responsibilities of the agencies involved in the environmental cleanup at HPS, including the transfer process. <#> presents the references cited in this plan.

- <#> provides various resources for health related concerns. <#> provides contact information so you can directly contact Navy and regulatory agency members working on the HPS project as well as other government officials. <#> provides a list of all the organizations interviewed, the questions they were asked, and selected statements made by interviewees. <#> provides census data on the population, race, age, education, average income, employment, and housing for the HPS community. <#> provides information on the Navy's former RAB, and the details of the dissolution of the RAB.
- <#> provides a list of recent community involvement activities conducted by the Navy.
- <#> provides a list and some details about the regulations and guidance for conducting community involvement.
- <#> = provides a list of media useful to reach the HPS community, as well as locations for holding meetings and posting flyers about involvement activities. <#> defines the acronyms and abbreviations used in this document. <#> provides the Navy's responses to the regulatory agency and public comments received on the draft version of this document. When applicable, the response also provides information on how this CIP was revised to incorporate the comment.

Chapter 2: Community Interviews and Feedback

Community interviews help the Navy to better understand the community's issues and concerns. The Navy went to significant lengths to gather interview candidates for this CIP, mailed postcards to residents, and contacted interested stakeholders to ensure that they had the most comprehensive interview list practicable.

The Navy conducted 73 interviews in 2010 with people who live in, work in, or serve the HPS community—defined as ZIP codes 94107, 94124, and 94134. [Appendix C](#) includes a breakdown of the interviewees by ZIP code.

Historically, these ZIP codes have been used to define the HPS community for the purpose of local contracting and community involvement efforts such as establishing a mailing list. These three ZIP codes were used to define the HPS community because they comprise the majority of District 10 in the City and County of San Francisco and are served by one Supervisor. In addition, the Navy is attempting to reach out to as many people impacted by environmental conditions as possible, and these three ZIP codes are nearest to the shipyard.

Interviewees were asked approximately 29 questions from a questionnaire that was created in advance with input from the regulatory agencies. The interviews were conducted in a discussion format. Each interviewee was encouraged to discuss his or her interests, concerns, and ideas, and some questions were occasionally unanswered as a result. A Navy representative and a contractor responsible for taking notes were present at each interview. At least one and up to four regulatory agency representatives were also present during all but one of the 73 interviews. For a list of all of the organizations interviewed and the full list of questions, see [Appendix C](#).

The community wants the cleanup to be completed in a way that protects the current community and all future users and neighbors of HPS. The Navy and regulators share this goal with the community and are committed to involving the community in the cleanup process. The team will work with the community to ensure that the cleanup results are protective for current and future inhabitants and neighbors. The following six themes summarize the community concerns and opinions about public participation in the cleanup process that were revealed in the

Overview of Interviewees

73 interviews conducted from June 15 to September 9, 2010:

10 interviews by phone

63 interviews in person

Average time interviewees have lived or worked in the HPS community area:

20 years

Self-described knowledge of the cleanup program:

A little bit: 37

A lot: 26

Nothing/No response: 10

35 interviewees had attended Navy events or provided input to the Navy on the cleanup program.

Categories of Interviewees:

Civic Groups/Clubs and Organizations: 34

Local Residents: 31

*Environmental Groups/
Activists: 15*

Former RAB Members: 12

Local Business: 11

Educators/Childcare: 6

Media: 3

Health Providers: 2

Elected Official: 1

(Some interviewees represented multiple categories; therefore, total is greater than 73.)

Chapter 2: Community Interviews and Feedback (continued)

interviews. The Navy's plan to address these themes is discussed in [Chapter 3](#) –Community Involvement Actions and Activities.

- Theme 1.** **The Navy's communication with the HPS community about the environmental cleanup program has not been effective.** The majority of interviewees said they think the Navy's communication has not been effective; many people said they do not know what is going on at HPS.
- Theme 2.** **General information about the Navy's environmental cleanup program at HPS is lacking.** Most interviewees said they would like general information about the cleanup at HPS but do not know where to find it. General information includes an overview of the program, the responsibilities of the people working on the cleanup, a timeline, and the status of work.
- Theme 3.** **The HPS community is diverse, resulting in varied concerns, communication preferences, and needs.** No single involvement method exists to communicate with all of the stakeholders in the HPS community. Various segments of the community include those who:
- a. Have Internet access, and those who do not
 - b. Do not speak English
 - c. Want general information, and those who want technical details
 - d. Live right next to the Base, and those who live in the outlying community
 - e. Prefer discussions and two way information, and those who just want an update
- Theme 4.** **The difference between the Navy's HPS environmental cleanup program and the San Francisco Redevelopment Agency's (SFRA's) redevelopment of HPS has not been made clear.** Many interviewees did not know that the Navy is still doing work on HPS; others thought the Navy is conducting the current redevelopment on a transferred parcel (known as Parcel A), when in fact it is the SFRA that now owns and controls development of Parcel A. In addition, confusion exists about the Navy's role in the selection of the SFRA's master developer.
- Theme 5.** **Health is a primary concern for most segments of the community.** Interviewees were concerned that contamination at HPS is affecting their health, and they noted high rates of cancer and asthma in the area. Interviewees were also concerned that contamination at HPS will have negative health effects in the future, especially for people who will live on former HPS property.
- Theme 6.** **Coordinating with established community members to conduct involvement activities may be a good way to reach all sectors of the community.** Some interviewees felt that the HPS community distrusts the Navy. It was suggested that the Navy work more closely with members from various sectors of the community who can relay information about the cleanup directly to their neighborhoods. This communication method was identified as the best way to inform members of every part of the community.

Chapter 2: Community Interviews and Feedback (continued)

The following subsections present a summary of the questions asked of the interviewees. Each interviewee was encouraged to discuss his or her interests, concerns, and ideas; some questions were occasionally unanswered as a result.

Effectiveness of the Navy's Communication

Interviewees were asked if they think the Navy's communication about the environmental cleanup program has been effective. The following chart presents the percentages of interviewees responses. The chart confirms that most interviewees felt the Navy did not effectively communicate with the public in the past.

Chapter 2: Community Interviews and Feedback (continued)

Confidence in the Navy, Regulatory Agencies, and the City of San Francisco

Interviewees were asked if they have confidence in the Navy’s ability to conduct the environmental cleanup at HPS. They were also asked if they have confidence in U.S. EPA, DTSC, the Water Board, and the City of San Francisco to oversee the Navy’s environmental cleanup (to understand more about these agencies and their responsibilities in the HPS cleanup, see Chapter 5). The following graphic represents the results.

Note:

*"Cleanup agencies" includes the regulatory agencies responsible for oversight of the cleanup. See Chapter 5 for more information about the cleanup agencies.

The "Undecided" category includes responses such as "somewhat" and "depends," as well as the response that an interviewee was not familiar enough with a particular agency to have an opinion. "Number Who Did Not Respond" indicates the number of interviewees who declined to answer that question.

Chapter 2: Community Interviews and Feedback (continued)

Interests and Concerns

Interviewees were asked an open ended question about whether they have concerns or interests related to the base and the cleanup program, and what all of their concerns and interests might be. The following table represents concerns, listed in order of how frequently they were cited.

Interests and Concerns Listed by Frequency of Response	Number of Responses
Health	54
Redevelopment*	49
Quality or completeness of cleanup	43
Jobs/economics	35
Air quality/dust	30
Schedule and general status of the cleanup	28
Parcel E2 landfill	19
Lack of information going to the community	15
Navy responsibility in the future	<5
Shipyard history, having a museum about shipyard history and cleanup	<5
Politics related to cleanup	<5
Protection of the bay and wildlife	<5
Distrust for the Navy	<5
Budget for cleanup	<5
Yosemite Slough	<5
Concern that there is no RAB	<5
Confusion about cleanup versus redevelopment	<5
Shoreline access	<5
Note:	
* Although the question was about environmental cleanup, many people voiced concerns about redevelopment.	

Community Rating of Navy Communication Methods

A list of nine communication methods the Navy has used in the past was provided during the interview. Interviewees were asked to give their opinions about whether any of these past methods would be useful in the future. People were also asked for other ideas that were not included on the list provided.

Chapter 2: Community Interviews and Feedback (continued)

The following chart represents the preferences for established communication methods. The table describes each method and includes some of the reasons people said that a particular method may or may not be effective.

Note: Interviewees were asked to give their opinions about whether any of the nine communication methods the Navy has used in the past would be useful in the future. Some interviewees noted multiple methods in their answer.

Description of the Navy's Standard Involvement Activities and Interviewees' Concerns

Communication Method	Description	Pros and Cons Noted by Interviewees
1. Fact Sheets	One- or two-page mailers typically focused on one topic or site. Hardcopies are distributed via the mail, handed out, and placed at businesses. Electronic copies are distributed by posting on a Web site and e-mailing.	Pro: Easy to read; reaches people with and without e-mail. Con: People do not have time to read them; they are too technical.
2. Bus Tour of Site	Navy staff discusses activities at sites while community members see the sites in person. Typically, the Navy provides the bus; a map or other handout also may be provided.	Pro: People who have never been on the site get to see it; may be more interesting than just a meeting. Con: There is nothing to see; it is dangerous to be at the shipyard.

Chapter 2: Community Interviews and Feedback (continued)

Description of the Navy’s Standard Involvement Activities and Interviewees’ Concerns

Communication Method	Description	Pros and Cons Noted by Interviewees
3. Public Meeting	An at-large, community-wide meeting advertised to the greater community and held at a large venue. Examples include the current Navy community technical meetings, the former RAB, and Proposed Plan meetings (formal public meetings held per the NCP to obtain public comments on a proposed remedy).	<p>Pro: Many people are informed at once.</p> <p>Con: Many members of the community feel intimidated at a large, centralized meeting. It was stated that it is difficult to have individual questions addressed; there is no single venue where everyone in the community feels comfortable.</p>
4. E-mail	An e-mail message is sent to everyone who has submitted an e-mail address for the Navy’s list. E-mail can include an announcement, an attached fact sheet or newsletter, or a link to a Web site containing more information.	<p>Pro: Quick delivery, inexpensive, good way to reach people who check e-mail often.</p> <p>Con: Not everyone has access to e-mail.</p>
5. Organization or Community Group Meeting	The Navy has been added to the agenda of an already-established meeting and presents an update on the environmental cleanup program. Attendees can then ask questions about specific interests. Groups have included or could include homeowners or tenant associations, churches, business groups, parent-teacher associations, and related organizations. Meetings were not open to the public unless the established group meeting was already open to the public.	<p>Pro: Target information for just the interests of that group, more likely to get attendance when combined with a meeting people already attend.</p> <p>Con: Different groups may get different or conflicting messages; may reach fewer people or require too great of an effort on the part of the Navy.</p>
6. Newsletters	Four- to eight-page packet usually on general topics related to cleanup, providing overviews and language that is not overly technical. Hardcopies are distributed via the mail, handed out, and placed at businesses. Electronic copies are distributed by posting on a Web site and e-mailing.	<p>Pro: Familiarize people with various aspects of cleanup, does not need overly technical language.</p> <p>Con: They are too long; people do not have time to read them.</p>

Chapter 2: Community Interviews and Feedback (continued)

Description of the Navy's Standard Involvement Activities and Interviewees' Concerns

Communication Method	Description	Pros and Cons Noted by Interviewees
7. Hardcopy Flyers and Announcements	One-page or smaller, meant to announce an upcoming meeting or document for review and provide contact information. They are usually handed out at community meetings, posted in businesses, mailed, and e-mailed.	<p>Pro: Short, easy to produce quickly to announce meetings in a timely manner. Can be posted in community.</p> <p>Con: May be ignored unless someone from the community discusses the content with whoever receives the flyer.</p>
8. Navy's Web Site	A public Web site that the community can access to review various information about the environmental cleanup program.	<p>Pro: Convenient for Web-savvy community members, people can seek out various information and documents without having to keep track of hardcopy information.</p> <p>Con: Navy's Web site is not up-to-date; not everyone has access; easier to talk to a person.</p>
9. Open House	Multiple poster board stations set up with staff at each location to allow people to drop in any time during open hours and ask questions about topics of interest to them.	<p>Pro: Informal setting makes some people feel more comfortable; people can stay long enough to ask their questions and then leave without having to attend a long meeting.</p> <p>Con: Not everyone hears the same information; there is no single venue where everyone in the community feels comfortable.</p>

Additional Community-Suggested Communication Methods

Interviewees provided many different suggestions for different communication methods, not all of which will end up as part of the Navy's program. Some of the common suggestions provided by interviewees are listed as follows (a complete table of all suggestions made by interviewees is provided in [Appendix C](#)):

- Work with churches to share information
- Reestablish the RAB or a similar advisory board
- Give cleanup information on radio talk shows that allow listeners to call in and ask questions
- Collaborate with established community members to convey cleanup information
- Attend established community events and host a booth
- Create social media pages for HPS (Facebook and Twitter)

Chapter 2: Community Interviews and Feedback (continued)

- Hold a community forum or town hall type of meeting
- Distribute a calendar of Navy involvement events
- Use food or free school supplies as incentive for community members to attend meetings or take information handouts
- Use a public relations firm to engage the community with well crafted messages and graphics

The interviews were successful with gathering feedback about the community's cleanup interests and concerns, as well as communication needs and preferences. The information obtained during the interviews was used to help design this CIP to be more effective for the HPS community, as discussed in the following chapter.

Chapter 2: Community Interviews and Feedback (continued)

This page intentionally left blank.

Chapter 3: Community Involvement—Actions and Activities

The most important part of this CIP identifies the Navy's community involvement program actions and activities. The Navy used numerous resources to prepare the community involvement program actions, including community interview feedback, community census information, Navy and regulatory agency community involvement guidance, and CIPs from various environmental cleanup sites, including Fort Ord, McClellan Air Force Base, and Iron King Mine Site. The Navy considered what works well for other similar environmental cleanup programs; however, the Navy has developed a plan of action to specifically address the needs of the HPS community. The Navy's objectives in conducting activities include the following:

- Work with the community to communicate information in a way that is transparent and how the community wants to receive it
- Get information out early, make sure it is easy to understand, and translated as needed
- Share how community input is used in the cleanup process
- Respond to and show how community's concerns, ideas, and information is used in making decisions about the environmental cleanup

Community Involvement Program Actions and Activities

The following community involvement program activities are designed to meet the communication needs, concerns, and preferences of the various HPS stakeholders in the HPS community. The actions are designed to link with Community Themes 1 through 6 found on Page 8. It is important to also note that the Navy will have to balance its resources and staff to appropriately plan and implement any of these activities.

Feedback from the HPS community on the Navy's environmental cleanup program will be considered and used by the Navy and regulatory agencies. The Navy will track action items at meetings and respond to questions and comments. Frequently asked questions (FAQs) and responses will be posted on the Navy's Web site and brought to meetings as a handout, if applicable. If written formal comments are received on any document, the Navy will respond to those comments in writing and include the responses in the next version of the document that also contains the applicable revisions.

Chapter 3: Community Involvement—Actions and Activities (continued)

Linking Interview Feedback Themes With Community Involvement Program Actions

THEME 1: THE NAVY'S COMMUNICATION WITH THE HPS COMMUNITY ABOUT THE ENVIRONMENTAL CLEANUP PROGRAM HAS NOT BEEN EFFECTIVE.

The goal for these actions is to make the Navy's communication with the community more effective. This goal will be measured based on feedback from the community and the regulatory agencies.

Actions to address this theme:

1. **Distribute this CIP**
 - Draft CIP was made available for public comment on March 8, 2011. Comments received on the Draft CIP and the Navy's responses are included in [Appendix J](#).
 - Final copy will be on the Navy's Web site, in the information repositories, and available on request. It will include how the Navy addressed comments received during the public comment period.
2. **Prepare a Calendar of Outreach Events**
 - The event calendar will be created annually and distributed in December for the next year.
 - It will be prominently displayed on the Navy's Web site.
 - The calendar will be designed to show forethought and commitment to activities and to help the public plan community involvement program activities into their schedules.
 - The calendar is intended for wide distribution by mail and e mail; distribution at community meetings, the Web site, and social media outlets (Facebook); and posted in select neighborhood locations, including churches.
 - At meetings, an updated calendar of events and documents to be released will be distributed for the next 3 months.
3. **Prepare Topic Specific Fact Sheets**
 - Prepare and distribute fact sheets on specific topics as requested by the community, including topics to address the top interests and concerns noted during the interviews, found on [Page 11](#).
4. **Use a Community Involvement Manager**
 - The Navy will designate a full time Navy contractor to be the Community Involvement Manager and assist the Base Realignment and Closure (BRAC) Environmental Coordinator with the implementation of this CIP.
 - The Community Involvement Manager will be the main contact for the HPS community, making it easier to communicate with the Navy.
 - The Community Involvement Manager will work with the regulatory agencies to gather feedback to assess the success of this updated involvement program. This could include feedback forms, a community survey every two years, and anecdotal feedback.

*Chapter 3: Community Involvement—Actions and Activities (continued)***Linking Interview Feedback Themes With Community Involvement Program Actions****THEME 2: GENERAL INFORMATION ABOUT THE NAVY'S ENVIRONMENTAL CLEANUP PROGRAM AT HPS IS LACKING.**

The goal for these actions is to make general information about HPS more available to the community. This goal will be measured by obtaining feedback from the community and the regulatory agencies.

Actions to address this theme:**1. Prepare a General Fact Sheet**

- The fact sheet will include HPS history, basic overview of cleanup activities and timeline, how human health is evaluated and addressed, agency roles and responsibilities, FAQs, contact information, and repository locations.
- The fact sheet will be updated annually.
- The fact sheet will be distributed at community meetings, posted on Web site and social media outlets (Facebook), and posted in select neighborhood locations (community centers, churches, and local businesses).
- The fact sheet will be translated into Chinese (Cantonese) and Spanish (other languages to be considered based on need). Based on information provided by the Chinese American community, Cantonese is the primary Chinese dialect spoken in San Francisco.

2. Hold Regularly Scheduled Community Meetings

- Meetings will be held bimonthly (every other month), or more frequently if deemed appropriate; possibly in various locations so people that live in different parts of the community can attend.
- Meeting will be facilitated and the agenda will consist of Navy presentations, regulatory agency update, discussion of action items from previous meetings, and public question and answer period. The Navy will solicit community input for future agenda items at each meeting.
- Meetings will have a facilitator, summary notes sent to the e mail list and placed on the Web site, and a translation provided, if needed.
- The meeting will be an opportunity for two way communication between the Navy, regulatory agencies, and the community.

3. Prepare Progress Reports

- Progress reports will be created quarterly, and will be distributed via mail and e mail, at community meetings, posted on the Web site and social media outlets (Facebook), posted in select neighborhood locations, and handed out by established community members.
- The reports will be about two pages long, with an update on recent activities and future public comment opportunities.
- The reports will be translated into Chinese (Cantonese) and Spanish (other languages to be considered based on need). Based on information provided by the Chinese American community, Cantonese is the primary Chinese dialect spoken in San Francisco.

*Chapter 3: Community Involvement—Actions and Activities (continued)***Linking Interview Feedback Themes With Community Involvement Program Actions****THEME 3: THE HPS COMMUNITY IS DIVERSE, RESULTING IN VARIED CONCERNS, COMMUNICATION PREFERENCES, AND NEEDS.**

The goal for these actions is to communicate with broader segments of the community, include those with and without computer access, those who do not speak English, those who prefer meetings, and those who prefer written materials. This goal will be measured by obtaining feedback from the community and the regulatory agencies.

Actions to address this theme:

- 1. Participate in Local Radio Shows – multi lingual**
 - Give a presentation and/or answer questions during call in shows; translation will be provided as necessary
- 2. Provide a Telephone Hotline**
 - A recorded message will provide an update of monthly HPS activities such as meeting times and locations. Additional information on specific cleanup actions may also be provided, if timely.
 - Callers will be able to hear the message in English Spanish, or Cantonese
 - Callers will also be able to leave a message if they have a specific question and their call will be returned.
- 3. Create a New Web Site**
 - Community members specifically said the current Web site is difficult to use.
 - New Web site will be enhanced for better usability and functionality. The current Web site cannot be enhanced because of Department of Defense restrictions, so a new Web site must be created.
 - The Web site will be updated at least monthly (i.e., when technical documents are released, notices of upcoming community involvement opportunities, etc.).
 - The Web site will have a searchable FAQ of cleanup and site information.
- 4. Maintain a Social Media (Facebook) Page**
 - Intended to give quick access to information, and will direct viewers to the new Web site. Those who follow the page will be able to send questions and comments to the Navy.
 - Regularly updated with information on cleanup activities, cleanup photos, and meeting notices.
 - Noted as a good way to reach the younger segments of the community.
- 5. Update Mailing and Email Lists**
 - An updated mailing list to reach the full community will be purchased.
 - Anyone can sign up at meetings or on the Web site to be added.
 - The mailing list will be updated after each mailing with any returns; addresses for elected officials and businesses will be checked annually.
 - An email distribution list will be maintained and updated similar to the mailing list.
- 6. Print Newspaper Editorial**
 - In interview feedback, use of a newspaper was suggested as a good way to reach the Chinese American segments of the community, specifically using Sing Tao Daily newspaper.
 - For required public notices, hardcopy newspapers that were highly recommended include the following: *San Francisco Examiner*, *Sing Tao Daily*, *The Potrero View*, and *Visitacion Valley Grapevine* (Note: this newspaper is not currently being published; however, it may be used if publishing resumes)

Chapter 3: Community Involvement—Actions and Activities (continued)**Linking Interview Feedback Themes With Community Involvement Program Actions****THEME 4: THE DIFFERENCE BETWEEN THE NAVY'S HPS ENVIRONMENTAL CLEANUP PROGRAM AND THE SFRA'S REDEVELOPMENT OF HPS HAS NOT BEEN MADE CLEAR.**

The goal for these actions is to explain the transfer process and clarify who community members can talk with about cleanup concerns versus redevelopment concerns.

Actions to address this theme:**1. Hold Bus Tours**

- Bus tours will be held for the larger community by advanced registration twice a year. Tours will show participants the environmental cleanup progress, provide an understanding of what belongs to the Navy and what belongs to SFRA, and provide an opportunity for dialogue.
- Tours will be advertised through the active community members, on the Web site, and at meetings, as well as posted on the calendar.

2. Distribute Topic specific Fact Sheets

- Created bimonthly, these fact sheets will focus on one specific technical topic. The topic of the fact sheet will coincide with the community meetings.
- Technical fact sheets will not be mailed to the full mailing list. They will be distributed at community meetings, posted on the Web site, e mailed, and made available at the information repository and by request.
- The fact sheet will be translated into Chinese (Cantonese) and Spanish (other languages to be considered based on need). Based on information provided by the Chinese American community, Cantonese is the primary Chinese dialect spoken in San Francisco.

THEME 5: HEALTH IS A PRIMARY CONCERN FOR MOST SEGMENTS OF THE COMMUNITY.

The goal for these actions is to provide the community with the resources to have their health concerns addressed. It is also to communicate the ways the environmental cleanup is intended to be protective of human health.

Actions to address this theme:**1. Provide Health Contact Information in this CIP**

- This CIP includes information regarding how health is addressed during a cleanup, a summary of the common health concerns, how the Navy protects the workers and community during active cleanup work, and health officials to contact for more information and assistance. See [Appendix A](#), Health Related Information, Resources and Contacts.

2. Use HPS Project Web site

- Include health information in FAQ

3. Hold Regularly Scheduled Community Meetings

- The Navy will provide time, as needed, in meeting agendas for presentations by professional health organizations such as the Asthma Task Force for asthma education.

4. Distribute Topic specific Fact Sheets

- Include health information in a general fact sheet that will be posted on the Web site and available at Navy events.

*Chapter 3: Community Involvement—Actions and Activities (continued)***Linking Interview Feedback Themes With Community Involvement Program Actions****THEME 6: COORDINATING WITH ESTABLISHED COMMUNITY MEMBERS TO CONDUCT INVOLVEMENT MAY BE A GOOD WAY TO REACH ALL SECTORS OF THE COMMUNITY.**

The goal for these actions is to use community expertise and work together to communicate with the HPS community.

Actions to address this theme:**1. Use Grassroots Outreach**

- Activities will include having residents in the HPS community and community members hand out flyers, post meeting notices on community bulletin boards and at businesses, help improve the site mailing list, and share community feedback with the Navy and regulatory agencies.
- Grassroots outreach will be timed to coincide with distribution of flyers, fact sheets, or quarterly progress reports and/or the community meetings.

2. Navy Presentations at Established Community Organized Meetings

- As invited, the Navy and regulators will give the “General Environmental Presentation” or other updates at an established group’s meetings. Advertisements for the meeting and the agenda would be the responsibility of the community group.
- Presentation will consist of general information with time for questions and answers and will focus on the interests of the specific group addressed.
- The presentation will be intended to reach specific audiences that can then disseminate information through expanded group. Groups could include Parent Teacher Associations, tenants’ associations, Board of Supervisors, and business associations.
- Regular updates could be given to the San Francisco Citizens Advisory Committee (CAC) and the Project Area Committee (PAC) meetings.
- To be more transparent, the Navy will develop a FAQs list that will be updated after each meeting and shared as a handout at each event, in newsletters and on the Web site.

Note: Many actions address more than one theme. See the following table for a complete listing of all themes that an action is designed to address.

The purpose of these activities is to inform the community and engage them in cleanup decisions. The Navy will also distribute a survey to the mailing list to evaluate the program every two years. The findings of this survey will be documented in a memorandum that is included in the Administrative Record for HPS. The survey and documentation will comply with 32 CFR 202.10. The Navy will periodically review this CIP and update it accordingly. The goals for the activities will be evaluated on a yearly basis by the Navy’s Community Involvement Manager to ensure that they are being met.

Chapter 3: Community Involvement—Actions and Activities (continued)

Table of Navy’s Updated Community Involvement Actions and Activities

Actions and Activities	Delivered By	Interview Theme Addressed					
		1. Communication Not Effective	2. Available General Information about the Environmental Cleanup Program Lacking	3. Varied Concerns, Communication Preferences, and Needs among Diverse Community	4. Difference between the Navy’s Environmental Cleanup Program and the SFRA Redevelopment has Not Been Made Clear	5. Health is a Primary Concern	6. Coordination with Established Community Members to Conduct Involvement May be A Good Way To Reach All Sectors of the Community
Calendar of Outreach Events, multi lingual: Publish in January for calendar year ahead	Mail, email, post hardcopy, Web site	X	X	X			
Community Involvement Manager: Use a Navy staff member to focus solely on community involvement program activities	N/A	X	X	X	X		X
General Fact Sheet, multi lingual: Overview of environmental cleanup program, roles and responsibilities, and schedule formatted into brief fact sheet	Mail, e mail, post hardcopy, Web site	X	X	X	X		
Regularly Scheduled Community Meetings: Held every other month, technical presentations and updates from Navy and regulatory agencies (held at various locations)	In person at Navy coordinated venue	X	X	X	X	X	
Progress Reports: Quarterly update on recent activities and upcoming opportunities to comment	Mail, e mail, post hardcopy, post on Web site	X	X	X	X		
HPS Project Web Site: Searchable, with FAQ	Online	X	X	X	X	X	X
Facebook Page: Public relations firm creates and manages HPS page with regular updates on activities, cleanup photos, meetings, and responses to questions	Web site, put links on fact sheets	X	X	X	X	X	
Mailing List Update: Current hardcopy mail and e mail distribution lists will be reviewed for accuracy	E mail, hardcopy	X	X	X			X
Newspaper Notices and Editorial Column: Public notices will be created to meet regulatory requirements and to announce community meetings; editorial columns will educate diverse community groups about the environmental cleanup progress	Hardcopy and online newspapers		X	X			
Bus Tours: Community wide on a larger bus and for smaller groups with a van	In person at HPS	X	X	X	X		X
Topic Specific Fact Sheets, multi lingual: Brief update on a technical topic, meant to reach those who already know the basics about the project and want specific details	E mail, hardcopy handout, not mailed to full list			X	X	X	
Presentations to Existing Groups: Attend an established group meeting and give an update relevant to their members (could include a church, homeowners association, civic group, school, etc.)	Face to face presentation	X	X	X	X		X
Grassroots Outreach: Work with community members to hand out outreach materials, post flyers, and give basic information	Face to face interaction to promote trust between the community and Navy	X	X	X	X		X
Local Radio Shows, multi lingual: Give a presentation and/or answer questions during call in shows.	Radio, internet via podcast if available	X	X	X	X		X
Telephone Hotline: Give a recorded update of activities, and allow callers to leave a message	Telephone	X	X	X			
General Environmental Presentation, multi lingual: Overview of environmental cleanup program in a 20 minute PowerPoint® presentation with time for questions and answers; appropriate for established community groups (this will also include an FAQ handout)	In person at group meetings	X	X	X	X		X

Chapter 3: Community Involvement—Actions and Activities (continued)

This page intentionally left blank

Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard

To help the community understand the cleanup process at HPS better, this chapter discusses historical operations at HPS that resulted in contamination, presents a timeline of these past activities, and describes the current status of the Navy's environmental cleanup program at HPS. Maps of HPS and its various parcels are also provided. The Navy will take requests for presentations about documents and cleanup actions. Providing these presentations will educate the community about topics of their interest, and will help the community to comment on the related documents.

HPS Timeline

HPS is located in southeastern San Francisco on a peninsula that extends east into the San Francisco Bay. The timeline to the right and paragraphs that follow provide an overview of the history of HPS since the mid 1800s.

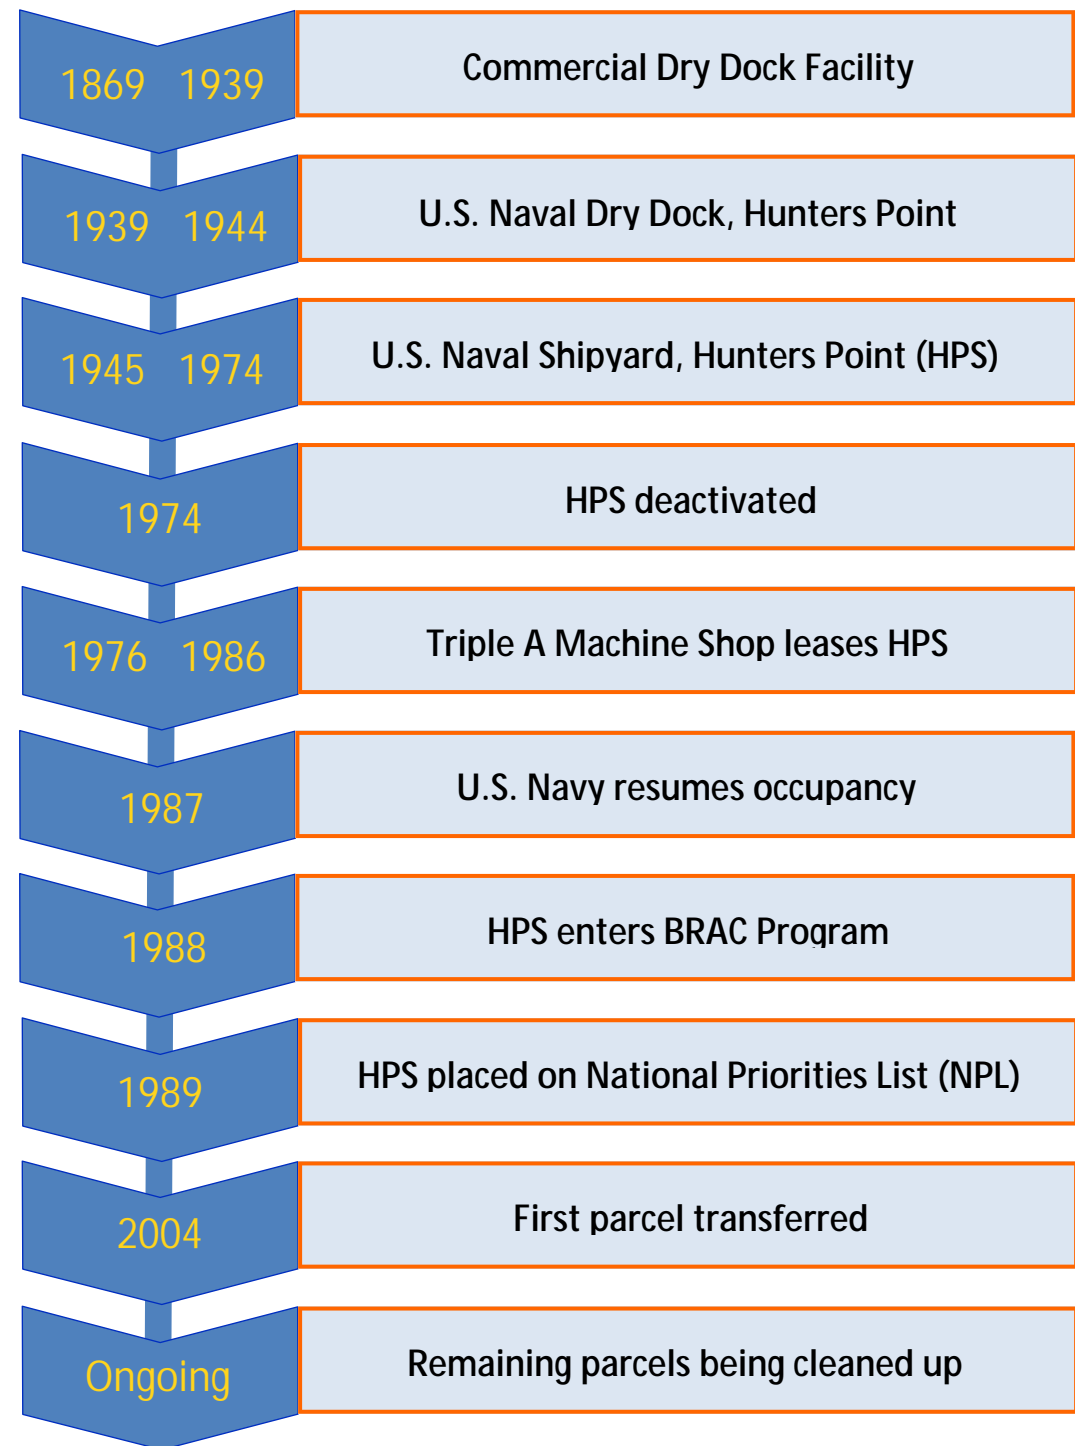

From the mid 1800s until 1938, HPS was used as a commercial dry dock. In 1939, the Navy purchased the property. From 1945 to 1974, the Navy was one of the largest employers of the HPS community. HPS was mostly used as a repair facility for Navy ships and submarines, and was partially occupied by the Naval Radiological Defense Laboratory (NRDL) from 1948 to 1969. In 1974, the Navy ceased shipyard operations at HPS.

From 1976 until 1986, Triple A Machine Shop, Inc. leased 98 percent of HPS. Triple A Machine Shop was a private ship repair company that used the facility to repair commercial and naval vessels. It also subleased portions of the property to various other businesses for warehousing distribution centers and light industry.

HPS entered the BRAC Program in 1988 (which is the Navy's program for cleaning up and transferring Navy properties that are no longer needed). The 934 acres at HPS were subsequently divided into parcels (see map on [Page 30](#)) as a way to organize the environmental investigation and cleanup. In 1989, HPS was evaluated by U.S. EPA and placed on its National Priorities List (NPL) based on the presence of hazardous materials from past Navy and private operations at the shipyard. NPL sites, also known as Superfund sites, are sites with hazardous contamination that are prioritized for long term environmental study and cleanup supervised by U.S. EPA.

In 2004, environmental cleanup on one of the parcels, known as Parcel A, met all the necessary cleanup requirements for residential use and was successfully transferred to the San Francisco Redevelopment Agency. Since the transfer was completed, the SFRA has been responsible for redevelopment of Parcel A.

More information on the current status of other individual parcels and of the overall status of the environmental cleanup program at HPS begins on the following page.

USS Providence at HPS,
June 24, 1965

This page intentionally left blank.

Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)

Status of the Environmental Cleanup at HPS

The parcels at HPS are in various stages of environmental cleanup. During community interviews, several interviewees asked why HPS is being cleaned up in various stages instead of cleaning up the entire shipyard and then transferring it all at once. The HPS property, some of which is offshore (underwater), has various types and levels of contamination at various locations. The Navy has taken this large cleanup project and divided it into smaller, more manageable tasks. This helps the Navy set priorities and focus on cleanup of sites when timing, regulatory approval, and funding are available to move forward. The Navy is working to prepare land for transfer as soon as possible to allow the SFRA to reuse the property for the benefit of the community (land is ready for transfer when it has been through the required environmental studies and cleanup activities, and has been approved by the Navy and the regulatory agencies as suitable for transfer). By completing the cleanup in stages, the Navy can transfer parts of HPS sooner than waiting for all areas to be done.

The environmental investigation and cleanup underway at HPS on the remaining parcels is grouped into the following three programs:

1. Residual Fuels Program: Focuses on spills and leaks of fuels (diesel and gasoline) and motor oil from former fuel distribution lines and storage tanks.
2. Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)¹ Program regulated Chemicals: The chemicals regulated under CERCLA include solvents, pesticides, metals (such as mercury and lead), and other chemicals listed on the table on the following page.
3. Radiological Program: Addresses a variety of low level residual radiological (meaning radioactive) materials, including areas that contain buried World War II era luminescent (glow in the dark) dials and buttons, sewer and storm drain lines from buildings used for radiological research or maintenance, and these buildings themselves.

A site is placed in a particular environmental cleanup program based on the contaminants found at that location. Following is a table of some common contaminants and uses found at HPS. For more health related information about these contaminants, go to www.atsdr.cdc.gov/toxfaqs/index.asp or call 1 800 CDC INFO (232 4636). The link and number are the contacts for the Agency for Toxic Substances and Disease Registry (ATSDR), which is a federal government public health agency. Additional information on contaminants is also available from the U.S. EPA at www.epa.gov/wastes/topics.htm.

¹ See the diagram in [Appendix G](#) for an explanation of how the CERCLA process, which is also known as the Superfund process, works.

*Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)**Common Contaminants in Soil and Groundwater at HPS*

Contaminant	Description
Metals	Includes arsenic, chromium, copper, lead, manganese, zinc, and others. These metals can occur naturally in the soil and rock at HPS. Metals are also often present because of the ships that were repaired or cleaned at HPS.
Pesticides	Chemicals designed to kill pests (rodents, insects, or unwanted plants). They may have been sprayed to control pests or weeds on the site.
Polychlorinated Biphenyls (PCBs)	A liquid used to cool or lubricate in electrical equipment because it does not burn easily and is a good insulator. The manufacture of PCBs was stopped in the U.S. in 1977 because of evidence they build up in the environment and can cause harmful health effects. Electrical equipment (such as transformers) used before 1977 may have used PCBs.
Polycyclic Aromatic Hydrocarbons (PAHs)	Chemicals that are formed when items are burned, such as oil, gasoline, garbage, wood, or coal. Tar and asphalt also contain PAHs.
Radionuclides	A radioactive element, human made or from natural sources, including radium, cesium, and strontium. Often occurring naturally in the soil in some areas, at HPS they may be present from paint that contained radionuclides so it would glow.
Semi volatile Organic Compounds (SVOCs)	Organic chemicals that do not evaporate as easily as VOCs (see below) and become liquid or solid at low temperatures. Kerosene is an example of an SVOC.
Total Petroleum Hydrocarbons (TPH)	TPH is a mixture of chemicals, but they are all made mainly from hydrogen and carbon, called hydrocarbons. These chemicals originally come from crude oil and can be found in gasoline, kerosene, fuel oil, mineral oil, and asphalt.
Volatile Organic Compounds (VOCs)	Organic chemicals that easily evaporate into the air and are often easy to smell. Common VOCs are paint thinners and automotive gasoline.

Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)

Following is a map of the region, followed by a map of the entire HPS showing its various parcel boundaries. The following pages provide an overview of the historical use, contamination, and current environmental investigations at each parcel.

Regional Map

Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)

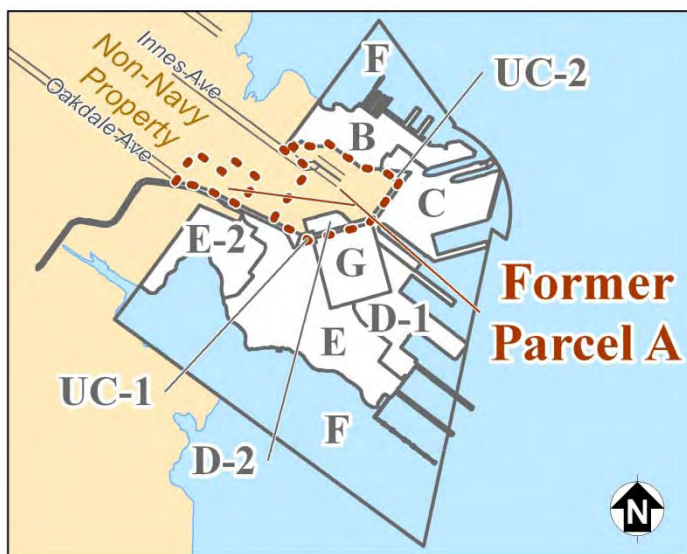

Hunters Point Shipyard Map

Chapter 4: Navy’s Cleanup Program at Hunters Point Shipyard (continued)

Parcel A

Historical use (possible source of contamination)	Residential housing
Contaminants at the site	Low levels of residual fuels
Status of the cleanup	The Navy completed the cleanup to residential standards and transferred the property to the SFRA in December 2004.
Next steps at this site	<i>Parcel A is no longer Navy property.</i> The SFRA is working with developers selected by the SFRA to build housing, create parks, and have commercial uses at the former Parcel A location. The redevelopment must comply with standard City and State of California construction and dust control requirements.

Location of Former Parcel A. For a detailed satellite view, see [Page 30](#).

Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)

Parcel B

<p>Historical use (possible source of contamination)</p>	<p>Shipping, repair, and maintenance</p>
<p>Contaminants at the site</p>	<p>Metals, VOCs, SVOC, pesticides, PCBs, and radionuclides</p>
<p>Status of the cleanup</p>	<p>The Navy has completed the investigations and chosen the cleanup remedy with public input and agency concurrence. The remedy includes removing soil contamination and disposing off site, placing cover material (e.g., clean soil or asphalt) over specified areas, cleaning up the groundwater plumes, and placing restrictions called land use controls. The land use controls make sure the remedy remains protective of human health and the environment.</p> <p>Over the years, the Navy has removed tens of thousands of cubic yards of contaminated soil and hauled that soil off HPS for disposal at landfill sites. The Navy built a protective wall along the shoreline to hold sediment in place and a protective soil cover has also been placed over a portion of the Parcel. The storm and sewer lines that had the potential to be contaminated with low levels of radiation have been removed and sent off site for disposal. Buildings have also been surveyed and any radiological contamination has been removed.</p>
<p>Next steps at this site</p>	<p>Most of Parcel B is proposed for early transfer to the SFRA in 2011 and SFRA will complete the cleanup. The Navy is completing the cleanup of a smaller portion of Parcel B (IR 07/18) and transferring this portion to SFRA in 2011. The proposed reuse includes educational/cultural use, mixed use (residential and industrial), open space, and research and development.</p>

Location of Former Parcel B. For a detailed satellite view, see [Page 30](#).

Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)

Parcel C

<p>Historical use (possible source of contamination)</p>	<p>Ship repair, foundry, power plant, machine shops, paint shops, and radiological research</p>
<p>Contaminants at the site</p>	<p>Metals, PAHs, PCBs, SVOCs, VOCs, pesticides, and radionuclides</p>
<p>Status of the cleanup</p>	<p>The Navy has completed the investigations and chosen the cleanup remedy with public input and agency concurrence. The remedy includes removing soil contamination and disposing offsite, placing cover material over the entire parcel, cleaning up the groundwater plumes, and placing land use controls. The land use controls make sure the remedy remains protective of human health and the environment.</p> <p>The Navy is in the process of developing the remedial design and remedial work plan and treating the groundwater contamination, and is in the process of removing storm and sewer lines that have the potential to be contaminated with low levels of radiation. The Navy will survey the buildings and remove any radiological contamination.</p>
<p>Next steps at this site</p>	<p>The Navy anticipates the transfer of Parcel C to SFRA in 2013. The proposed reuse includes educational/cultural use, maritime/industrial, mixed use (residential and industrial), open space, and research and development.</p>

Location of Former Parcel C. For a detailed satellite view, see [Page 30](#).

Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)

Parcel D-1

<p>Historical use (possible source of contamination)</p>	<p>Shipbuilding, repair, and maintenance and radiological research</p>
<p>Contaminants at the site</p>	<p>Metals, PAHs, VOCs, and radionuclides</p>
<p>Status of the cleanup</p>	<p>The Navy has completed the investigations and chosen the cleanup remedy with public input and agency concurrence. The remedy includes removing soil contamination and disposing offsite, placing cover material over the entire parcel, cleaning up the groundwater plumes and placing land use controls. The land use controls make sure the remedy remains protective of human health and the environment.</p> <p>The Navy removed the soil contamination and disposed of it offsite and has treated the contaminated groundwater. The Navy is finalizing the remedial design and is in the process of removing storm and sewer lines that have the potential to be contaminated with low levels of radiation. The Navy is also cleaning up the piers from potential low level radiation.</p>
<p>Next steps at this site</p>	<p>The Navy anticipates the transfer of Parcel D 1 to SFRA in 2012. The proposed reuse includes mixed use (residential and industrial) and industrial.</p>

Location of Former Parcel D 1. For a detailed satellite view, see [Page 30](#).

Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)

Parcel D-2

Historical use (possible source of contamination)	Radiological laboratory and former underground storage tank
Contaminants at the site	Radionuclides
Status of the cleanup	The Navy has completed the investigations and with public input and agency concurrence determined that no further action is necessary. Portions of the combined storm and sanitary sewers were removed between 2006 and 2009. After final review of the status of the cleanup, the Navy and agencies concluded that there are no unacceptable risks from hazardous substances or radiological material in this parcel.
Next steps at this site	The Navy anticipates the transfer of Parcel D 2 to SFRA in 2011. The proposed reuse includes residential along with research and development.

Location of Former Parcel D 2. For a detailed satellite view, see [Page 30](#).

Chapter 4: Navy’s Cleanup Program at Hunters Point Shipyard (continued)

Parcel E

Historical use (possible source of contamination)	Ship repair and industrial operations
Contaminants at the site	Metals, VOCs, PCBs, TPH, pesticides, and radionuclides
Status of the cleanup	The Navy has completed the investigations and is in the process of completing the feasibility study. The feasibility study evaluates remedies specific to Parcel E. The Navy is also treating the groundwater in specific locations on Parcel E while performing studies on groundwater treatment methods.
Next steps at this site	The Navy will choose the cleanup remedy with agency concurrence and input from the public. The Navy anticipates the transfer of Parcel E to SFRA in 2014. The proposed reuse includes research and development and open space.

Location of Former Parcel E. For a detailed satellite view, see [Page 30](#).

Chapter 4: Navy’s Cleanup Program at Hunters Point Shipyard (continued)

Parcel E-2

Historical use (possible source of contamination)	Landfill for HPS industrial operations and construction activities
Contaminants at the site	Metals, VOCs, PCBs, TPH, pesticides, and radionuclides
Status of the cleanup	The remedial investigation and feasibility study is being finalized. The remedial investigation evaluates the contamination and potential risk to human health and the environment. The feasibility study evaluates remedies specific to Parcel E 2. The Navy is also currently removing contaminated soil and debris along the shoreline.
Next steps at this site	The Navy will choose the cleanup remedy with agency concurrence and input from the public. The Navy anticipates the transfer of Parcel E 2 to SFRA in 2017. The proposed reuse includes research and development and open space.

Location of Former Parcel E 2. For a detailed satellite view, see [Page 30](#).

Chapter 4: Navy’s Cleanup Program at Hunters Point Shipyard (continued)

Parcel F

Historical use (possible source of contamination)	Historical industrial operations (offshore areas)
Contaminants at the site	Metals, PCBs, and radionuclides
Status of the cleanup	The investigation and feasibility study have been completed to address chemical contamination in the sediment. An investigation for evaluating the potential for low level radiation in Parcel F is being conducted. Piers that pose a navigational hazard are in the process of being removed.
Next steps at this site	Once the radiological evaluation is completed, the Navy will choose the cleanup remedy with agencies’ concurrence and input from the public. The Navy anticipates the transfer of Parcel F to SFRA in 2017.

Location of Former Parcel F. For a detailed satellite view, see [Page 30](#).

Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)

Parcel G

<p>Historical use (possible source of contamination)</p>	<p>Shipbuilding, repair, and maintenance</p>
<p>Contaminants at the site</p>	<p>Metals, PAHs, VOCs, and radionuclides</p>
<p>Status of the cleanup</p>	<p>The Navy has completed the investigations and has chosen the remedy with public input and agency concurrence. The remedy consists of removing soil contamination and taking the soil off HPS for disposal at landfill sites, placing cover material over specified areas, monitoring the groundwater, and placing restrictions called land use controls. The land use controls make sure the remedy remains protective of human health and the environment.</p> <p>The storm and sewer lines that had the potential to be contaminated with low levels of radiation have been removed and sent offsite for disposal. Buildings have also been surveyed and any radiological contamination has been removed.</p>
<p>Next steps at this site</p>	<p>Parcel G is proposed for early transfer to the SFRA in 2011 and SFRA will complete the cleanup. The proposed reuse includes education/cultural, industrial and mixed use (residential and industrial) and open space.</p>

Location of Former Parcel G. For a detailed satellite view, see [Page 30](#).

Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)

Parcel UC-1

Historical use (possible source of contamination)	Storm sewer and sanitary sewer
Contaminants at the site	Metals and radionuclides
Status of the cleanup	The Navy has completed the investigations and has chosen the remedy with public input and agency concurrence. The remedy consists of placing a cover over the entire parcel. Land use controls are also included to make sure the remedy remains protective of human health and the environment. The Navy is finalizing the remedial design and radiological remediation is complete.
Next steps at this site	The Navy anticipates the transfer of Parcel UC 1 to SFRA in 2011. The proposed reuse includes mixed use (residential and industrial) and industrial.

Location of Former Parcel UC 1. For a detailed satellite view, see [Page 30](#).

Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)

Parcel UC-2

Historical use (possible source of contamination)	Storm sewer and sanitary sewer
Contaminants at the site	Metals, VOCs, and radionuclides
Status of the cleanup	The Navy has completed the investigations and has chosen the remedy with public input and agency concurrence. The remedy consists of placing a cover over the entire parcel and groundwater monitoring to evaluate natural reduction of the contaminants in the groundwater. Land use controls are also included to make sure the remedy remains protective of human health and the environment. The Navy is finalizing the remedial design and radiological remediation is complete.
Next steps at this site	The Navy anticipates the transfer of Parcel UC 2 to SFRA in 2011. The proposed reuse includes mixed use (residential and industrial) and industrial.

Location of Former Parcel UC 2. For a detailed satellite view, see [Page 30](#).

*Chapter 4: Navy's Cleanup Program at Hunters Point Shipyard (continued)***Opportunities for Public Involvement at HPS**

In order to manage the multi year environmental cleanup for the parcels at HPS, the Navy created a schedule of activities that includes the environmental investigations, remediation, and the delivery of technical documents. Below is the estimated schedule of activities and technical documents for each parcel. Opportunities for community involvement throughout these investigations will be announced through community meetings, fact sheets, public notices, and/or the Navy's Web site. Note that some documents have a required formal public review period during which the public can provide comments and input on the document, as per NCP requirements. Others are not required by the NCP to have a public comment period, but the Navy will provide that opportunity upon request.

Schedule of Reports for Cleanup Activities at Each Parcel

Name of Report ^a	Issue Date	Opportunities for Public Involvement
Basewide		
Groundwater Monitoring Program Semiannual Report	Spring 2011	Available upon request for public review and comment
Final Supplemental Environmental Impact Statement	Summer 2011	Available upon request for public review and comment
Groundwater Monitoring Program Semiannual Report	Fall 2011	Available upon request for public review and comment
Groundwater Monitoring Program Semiannual Reports	Two times per year	Available upon request for public review and comment
PARCELS B, D 1, G, UC 2		
Draft Soil Vapor Intrusion ^b Technical Memorandum	Summer 2011	Available upon request for public review and comment
Final Soil Vapor Intrusion ^b Technical Memorandum	Fall 2011	Available upon request for public review and comment
PARCELS C and E		
Draft Work Plan for Soil Vapor Intrusion Survey Parcels C and E	Summer 2011	Available upon request for public review and comment
Final Work Plan for Soil Vapor Intrusion Survey Parcels C and E	Summer 2011	Available upon request for public review and comment
Draft Soil Vapor Intrusion Technical Memorandum Parcels C and E	Fall 2011	Available upon request for public review and comment
Final Soil Vapor Intrusion Technical Memorandum Parcels C and E	Winter 2011	Available upon request for public review and comment
PARCELS B, D 1, G		
Draft Remedial Action Completion Report for Parcels B, D 1, and G Hot Spots	Summer 2011	Available upon request for public review and comment

Notes:

- ^a Name of Report: A description of typical CERCLA reports is provided in [Appendix G](#).
- ^b Vapor Intrusion: When chemicals in soil or groundwater move into indoor air in buildings.
- ^c Bioremediation: Removing contamination by having microorganisms (such as bacteria) consume it. *In situ* means treating the contaminated material in place at the site, while *ex situ* means the contaminated material is removed and treated elsewhere.
- ^d Shipshielding: A former practice at the shipyard where the Navy tried various ways to shield ships from radiation.

Chapter 5: Cleanup Roles and Responsibilities

The environmental cleanup of HPS is a complex process involving several key state and federal agencies. The state and federal regulatory agencies provide oversight to make sure the Navy's cleanup complies with existing laws and regulations (for more information on the laws and regulations, see [Appendix G](#)). This section describes the roles and responsibilities of the Navy, the regulatory agencies, and the key stakeholders involved with the environmental cleanup at HPS. To contact the Navy or any of the regulatory agencies for more information, see the contact list in [Appendix B](#).

Roles and Responsibilities of the Navy

Navy

- Lead federal agency
- Responsible for environmental cleanup
- Primary decision maker

The Navy is the lead federal agency responsible for the environmental cleanup and community involvement program at HPS and is therefore the primary decision maker. The regulatory agencies oversee all key decisions about cleanup and community involvement to ensure that the activities are meeting cleanup laws and regulations.

The Navy's environmental cleanup program at HPS is ongoing. The Navy's ultimate goal of the HPS environmental cleanup program is to make property available for reuse by the San Francisco Redevelopment Authority. Once the Navy has completed cleanup at a parcel and the regulatory agencies have decided that cleanup meets the requirements to protect human health and the environment, the Navy can transfer the land to another landowner, such as the SFRA. The Navy's cleanup program is implemented in accordance with the SFRA's redevelopment plan for HPS. That plan designates the type of reuse planned – areas of residential, commercial, or recreational use – and the cleanup levels meet that reuse plan.

Once land transfer is complete, the Navy is no longer in control of activities on that property. Redevelopment of transferred land, including hiring a land developer, is the responsibility of the new landowner, the SFRA.

For example, in 2004, the Navy transferred Parcel A to SFRA. After the land was transferred, the Navy was no longer in control of activities on that property. Redevelopment of transferred land, including hiring a land developer, is then the responsibility of the new landowner; for Parcel A, it is the responsibility of the SFRA.

Sometimes property can be transferred prior to the completion of all environmental cleanup activities. As part of the Early Transfer process the Navy will prepare a Finding of Suitability for Early Transfer (FOSET), which will first be reviewed by U.S. EPA and the state regulators, and then made available to

Chapter 5: Cleanup Roles and Responsibilities (continued)

the public for a 30 day comment period. The purpose of the FOSET is to present the Navy and regulatory agency findings that a parcel is environmentally suitable for transfer prior to completing all remedial action, pursuant to the deferral provisions of CERCLA Section 120(h)(3)(C) (for a graphic of the CERCLA process with early transfer, see [Appendix G](#)).

The FOSET will do the following:

- 1) Describe the remedial actions taken by the Navy, including excavation of “hotspots” of contamination and the treatment of the groundwater
- 2) Document regulatory approval of the Navy’s completion of the excavation of all radiation associated with storm and sanitary sewer lines
- 3) Document the “free release” of all buildings where radiological contamination was identified, or which were suspected of having radiological contamination (Note: the Navy must meet the requirements of free release prior to issuing the FOSET as it is a condition of transfer)
- 4) Describe the proposed transfer and the mechanisms to ensure that the remaining elements of the remedial action are properly conducted
- 5) Describe the Administrative Order on Consent (**AOC**) under which U.S. EPA and the State of California will oversee the remaining remediation
- 6) Describe the restrictions which will be established to assure protection of human health and the environment during and after the redevelopment

After the public has commented on the FOSET, the Navy will revise the FOSET in response to comments received before formally presenting it to U.S. EPA and the State as part of the package officially requesting approval of the Early Transfer. The Early Transfer package is called the Covenant Deferral Request (**CDR**). The CDR must be approved by U.S. EPA and by the Governor of the State of California before title to the property can be transferred to the SFRA. See [Page 52](#) for an explanation of the SFRA’s responsibilities.

*Chapter 5: Cleanup Roles and Responsibilities (continued)***Roles and Responsibilities of the Regulatory Agencies****BRAC Cleanup Team (BCT)**

- Composed of the Navy and members from the regulatory agencies
- Responsible for reviewing specific cleanup activities
- Oversees the Federal Facility Agreement (FFA) for HPS
- Can recommend additional actions for cleanup

Several regulatory agencies provide oversight of the Navy's environmental cleanup at HPS. In 1988, HPS entered the BRAC Program, which designated HPS for environmental cleanup and closure. The BCT is made up of Navy staff and several regulatory agencies. The BCT oversees specific environmental cleanup program activities and the environmental closeout process at HPS, which includes meeting legal requirements and regulations designed to protect human health and the environment. In addition to overseeing the environmental cleanup, the BCT ensures that the cleanup meets the legal requirements for public participation.

The primary regulatory agencies (and members of the BCT) actively involved at HPS, as well as their primary responsibilities, are as follows:

- U.S. EPA is the lead regulator agency and provides federal oversight for the environmental cleanup at HPS.
- DTSC is the lead state agency and provides oversight for the environmental cleanup at HPS.
- The Water Board supports DTSC and provides oversight for cleanup activities that affect water and the petroleum program.

The BCT signed a legal document, called the FFA, with the Navy that provides the enforcement mechanisms to do the following:

1. Ensure that the Navy has thoroughly investigated environmental impacts from past and current site activities.
2. Ensure that the Navy takes appropriate response action (such as cleanup activities) needed to protect public health, welfare, and the environment.
3. Ensure that the response actions comply with applicable laws and regulations.
4. Set up a framework and schedule for response actions.
5. Facilitate cooperation, exchange of information, and participation between the Navy and the regulatory agencies.

Chapter 5: Cleanup Roles and Responsibilities (continued)

Other agencies are involved in the environmental cleanup process when cleanup affects resources they regulate. Those agencies include the California Department of Public Health, the California Department of Fish and Game, the U.S. Fish and Wildlife Service, the San Francisco Department of Public Health (SFDPH), and the San Francisco Bay Conservation and Development Commission.

Roles and Responsibilities of the San Francisco Redevelopment Agency

San Francisco Redevelopment Agency (SFRA)

- Becomes landowner once cleanup is complete
- Is responsible for redevelopment

The San Francisco Redevelopment Agency, or its successors, is primarily responsible for redeveloping HPS. In 1997, after an extensive multi year community planning effort, the SFRA adopted the Hunters Point Shipyard Redevelopment Plan. An amendment to the plan was adopted in August 2010.

According to the SFRA Web site, the City selected Lennar/Bayview Hunters Point (BVHP) Partners (now known as "HPS Development Co., LP") as the master developer for HPS in March of 1999 (www.sfredevelopment.org/index.aspx?page=57).

Once a parcel meets the cleanup requirements, or an agreement for Early Transfer has been reached, it is transferred from the Navy to the SFRA (refer to the Navy's responsibilities on [Pages 49 50](#) for more details about Early Transfer). After the piece of property has been transferred, the SFRA is fully responsible for redevelopment of the site, including selecting a developer and deciding how the land will be developed.

Roles and Responsibilities of the City and County of San Francisco

City and County of San Francisco

- Provides input during cleanup as needed

SFDPH is one of the agencies providing input to the Navy's environmental cleanup of HPS. The City is also able to provide input during the cleanup process if it determines that the cleanup activities will be detrimental to the property or in violation of City laws and codes. The City has several mechanisms in place that will require anyone who disturbs soil or other ground cover at HPS to comply with

Chapter 5: Cleanup Roles and Responsibilities (continued)

requirements in the San Francisco Municipal Codes, specifically Health, Building and Public Works Codes. The City also will regulate the construction of new development through its Subdivision Code, which will require construction of public improvements in conjunction with subdivision of land for private development. The City and the SFRA have a formal process to confirm that the improvements were constructed as required by the permits. The City also has a process in its Building Code to confirm that structures are constructed to code. Permitted activities involving the disturbance of soil require the permit applicant to go through a special process set out under Article 31 of the Health Code. The Applicant is required to obtain approval of various plans under Article 31 from SFDPH to assure that environmental restrictions and conditions are appropriately taken into account during the permitted activities. Once the Applicant receives approval of the required plans and meets all other permit requirements the Applicant will receive approval for the building, grading or other permit and can begin grading or construction.

Roles and Responsibilities of the Community

HPS Community

- Active participant in HPS cleanup process
- Provides input regarding human health and environmental concerns
- Provides input into preparation and revision of the CIP

One of the ways the HPS community plays an active role in the Navy's environmental cleanup program is by providing input to the BCT on cleanup alternatives and selection of the remedy. The community fulfills these roles by doing the following:

- Reviewing documents
- Providing comments
- Participating in meetings and other community involvement program activities
- Providing advice and solutions that can be incorporated into the cleanup process and decisions

In addition to any interested stakeholders being involved in the cleanup process through the various community involvement activities, U.S. EPA also offers a Technical Assistance Grant (**TAG**) Program. The U.S. EPA TAG Program awards one grant per site to an eligible citizen group that lives near a Superfund site. This group contracts with an independent technical advisor to help the community interpret and comment on site related information. In August 2009, a 3 year, \$50,000 TAG was awarded to the India Basin Neighborhood Association (**IBNA**). IBNA recently contracted with Arc Ecology, Inc. as its technical advisor. The TAG grant administrator is Alex Lantsberg who can be contacted at (415) 938 6170. The U.S. EPA TAG project officer is Jackie Lane at (415) 972 3236 or e mail lane.jackie@epa.gov.

Chapter 5: Cleanup Roles and Responsibilities (continued)

The Navy's community involvement program activities, designed to engage the community, are described in [Chapter 3](#) of this document. The Navy plans to involve the IBNA and its technical advisor under the TAG Program in the cleanup process in the following ways:

- Technical advisors, as directed by IBNA, participate at Navy cleanup meetings with the regulators.
- The Navy will respond to technical advisor comments on Navy documents.
- The Navy will provide time on community meeting agendas for TAG updates and to make announcements. Technical advisor presentations can be arranged for when needed.

When it comes to concerns and interests related to the current or future redevelopment of property, the community can communicate directly with the SFRA. The City has set up several methods for doing this, including the Citizens Advisory Committee (CAC), which is made up of community members selected by the mayor to provide input to the redevelopment process, and the Project Area Committee (PAC), a community based organization providing recommendations to SFRA. For contact information, see [Appendix B](#).

Conclusion

The Navy is committed to providing information and listening to community concerns about the environmental cleanup plans and activities at HPS. Community review comments are incorporated into HPS cleanup related documents and have had an impact on cleanup activities, such as looking into alternate technologies, increasing air monitoring, adjusting work hours, and varying truck routes.

This CIP is a resource for enabling the Navy to engage with the community better, as well as a tool for the community to use to get information on the environmental cleanup program and get involved in the process. The CIP contains resources for the community, including more detailed information listed in the appendices that follow. Every two years, the Navy will evaluate its community involvement program, and the need for a RAB, including distributing a survey to the community, to ensure that the actions that are implemented continue to meet the needs of the HPS community.

Appendix A: Health-Related Information, Resources, and Contacts

Health Resources

Most of the people interviewed for this Community Involvement Plan (CIP)—at least 54 of 73—were concerned about health issues. They mentioned concerns for health of former workers, former and current residents who live near the site, and future residents who will live on the site. Many interviewees mentioned high rates of asthma and cancer in the Hunters Point Shipyard (HPS) community and their concern that the shipyard may affect these rates. A number of those interviewed have health problems and are curious whether the site caused or contributed to their compromised health.

The Department of the Navy recognizes that health is primary concern for the Bayview community and wants to help address this issue as best it can in this document. The Superfund Law driving the cleanup at HPS does not address health of individuals; but rather, it focuses narrowly on cleaning up contamination to levels that are no longer a threat to human health or the environment. Assistance for individual health concerns is provided through public health agencies and organizations whose missions are health based. Nevertheless, to better assist the community, the Navy and regulators compiled pertinent health resource information that includes contact name, roles, and mission focus (see table below beginning on [page A 3](#)). Other ways the Navy protects present and future public health are described below.

Health in the Environmental Cleanup Decision-Making Process

According to the U.S. EPA Superfund Law, the Navy is required to consider a number of factors when selecting environmental cleanup program actions to ensure the protection of human health and environment from the effects of contamination at the site. One of those factors is conducting a risk assessment to analyze contamination data from the site and develop a scientific estimate of the level of risk for people who might be exposed to these substances (present exposure and future land use). The risk assessment determines if these levels pose an unacceptable risk that could affect a person's health as defined by regulatory standards and requirements. This information is used to determine the types of environmental cleanup program actions that will reduce that risk. Conservative safety margins are built into this analysis; therefore, people will not necessarily become sick even if they are exposed to materials at higher dose levels than those estimated by the risk assessment. The most vulnerable people (e.g., children and the elderly) are carefully considered to make sure all members of the public will be protected.

Dust Control at the Site

Interviewees also stated they are concerned specifically about dust control. The Navy has an approved Dust Control Plan in place to ensure the safety of workers and the HPS Community. Dust control is important to prevent people being exposed to dust that may contain contaminants of concern. Dust issues are addressed through the following methods:

- (1) To prevent dust, work sites and roadways are sprayed with water.
- (2) Stockpiles of soil are coated with a substance that works like glue to control windblown dust.

Appendix A: Health-Related Information, Resources, and Contacts (continued)

- (3) Trucks carrying soil are covered before leaving the shipyard.
- (4) A 15 mile per hour speed limit is required for all vehicles on site, and a 5 mile per hour speed limit is required in work areas.
- (5) Air monitoring is done at HPS on a continuous basis during normal business hours and dust levels are monitored in real time—if dust is detected above approved concentrations, operations are immediately shut down and mitigation measures, such as spraying water, are promptly used.

Air Monitoring and Air Quality at the Site

The Navy will continue to monitor air quality (both dust and contaminant levels) during the cleanup process. Should additional health information about air quality issues at HPS become available, the Navy will compile another fact sheet and be prepared to make presentations to the local community about this issue.

You can review air quality data for HPS on the Navy's Web site:

- Go to www.bracpmo.navy.mil
- Click on the Installations Map (on the right)
- Click on the state of California (on the map)
- Click on the label "NSY Hunters Point" (on the map). Now you are on the HPS specific Web page.
- Scroll down to "Air Monitoring Data". Click the "Air Monitoring Data" to expand the list. From there you can click on the link to view air data for various time periods.

Local and federal agencies can answer your questions or give information about health or environmental conditions. See the following table for contacts related to health and asthma specifically, air quality, and health resources in the area.

Online Information

The Navy's Hunters Point Shipyard (HPS) Web site:

www.bracpmo.navy.mil/basepage.aspx?baseid=45&state=California&name=hps

The following information is available on this Web site:

- A brief history of HPS and the environmental restoration program
- Updated information on the status of the environmental restoration program
- Access to Navy reference documents and links to related cleanup Web sites
- Fact sheets and quarterly newsletters regarding various topics for the environmental restoration program at HPS
- Recently published documents that are currently available for public review

Note: This is not the new HPS Web site that the Navy will create to involve the community, as discussed in the Actions and Activities section ([Chapter 3](#)). A new improved Web site will be created as part of the implementation of this CIP.

Administrative Record Locations

The Administrative Record contains all documents considered or relied on during the process of making environmental cleanup decisions. Due to the large volume of documents required for the Administrative Record and space issues associated with the local Information Repositories, the Bayview/Anna E. Waden Branch Library and the San Francisco Main Public Library only contain the Administrative Records indexes and other pertinent documents for public view (see [Pages H 13](#) and [H 14](#) for addresses). The Bayview/Anna E. Waden Branch Library was closed in April 2011; however, a temporary location for the Information Repository has been established at the HPS Site Trailer, located across the street from the security entrance to the Shipyard.

The complete Administrative Record for HPS is maintained at the Naval Facilities Engineering Command offices in San Diego, California. Copies of documents located at the Information Repository are available for review by appointment only by contacting the Administrative Record Administrator:

Diane Silva, NAVFAC SWDIV Code EV33

NBSD Bldg 3519

Appendix C: Community Interview Process and Summary

Interview Process

Conducting community interviews is a key part of preparing an updated Community Involvement Plan (CIP). The Department of the Navy began the interview process by compiling a large list of Hunters Point Shipyard (HPS) community stakeholders, who were contacted and invited to be interviewed. The Navy also hosted a community meeting in February 2010 to discuss a new CIP. During the meeting, the Navy received comments from the community on a proposed table of contents for the CIP and the interview questionnaire. Approximately 35 community members attended the meeting to discuss the CIP.

The Navy mailed a postcard to reach interested stakeholders, inviting all members of the community to participate in the interview process. The postcard was mailed on June 14, 2010, to more than 2,200 people within the HPS community. Those who responded were added to the list of potential interviews. The list also contained the following:

- Existing Navy and United States Environmental Protection Agency (U.S. EPA) distribution lists
- Web research conducted to locate appropriate groups
- Suggestions from other interviewees (each interviewee was asked who else they thought should be interviewed)

In total, from June 15 through September 9, 2010, the Navy conducted 73 interviews with people who live in, work in, or serve the HPS community—defined as ZIP codes 94107, 94124, and 94134 (see map in [Appendix D](#)). The Navy conducted 40 interviews for the previous HPS CIP, prepared in 2004. The Navy went to significant lengths in 2010 to ensure the most comprehensive survey practicable. Ten of the interviews were conducted via telephone and the rest were conducted in person. Although 73 people were interviewed, not every interviewee responded to every question. In addition, more than one response was offered for some questions; therefore, answers summarized in the following list do not always total 73 responses.

A Navy representative and a contractor who took notes were present at each interview. In all but one of the 73 interviews, at least one but as many as four regulatory agency representatives were also present.

Categories of stakeholders interviewed, and the number from each group is listed as follows:

- | | |
|--|---|
| • Civic Groups/ Clubs and Organizations – 34 | • Local Businesses – 11 |
| • Local Residents – 31 | • Education and Childcare Providers – 6 |
| • Environmental Groups/Activists – 15 | • Media – 3 |
| • Former Restoration Advisory Board (RAB) Members – 12 | • Elected Officials – 1 |
| | • Health Care Providers – 2 |

Many interviewees represented more than one of the abovementioned groups; therefore, the total representation is greater than 73 individuals interviewed.

Appendix C: Community Interview Process and Summary (continued)

The Navy tried to interview stakeholders from all segments of the community. The following chart represents the breakdown of the 73 interviewees that work or reside in the 94124, 94107, and 94134 ZIP code areas.

For **Other ZIP code** designation, the physical address is outside of the 3 HPS community ZIP codes. However, the organizations service the 3 HPS ZIP codes. Of these, 7 are civic organizations, 5 are environmental organizations, 4 are media, and 3 are government or elected officials.

The table on the following page lists all of the affiliations of those interviewed, as noted by the interviewee. Some interviewees requested that their organization not be listed specifically by name. Note that most interviewees had numerous affiliations, so the total is more than 73.

Interview Questionnaire and Responses

Interviewees were asked approximately 29 questions that were created in advance with input from the regulatory agencies and community. The interviews were conducted in a discussion format. Each interviewee was encouraged to discuss his or her interests, concerns, and ideas during the interview, and so some questions were not answered. The interviewees were not handed the questionnaire to fill out; instead, questions were read by the interviewers and a contractor took notes to capture responses. Following are the questions that were asked.

HUNTERS POINT SHIPYARD COMMUNITY INVOLVEMENT PLAN (CIP)
INTERVIEW QUESTIONNAIRE

Background of Interviewee

1. Do you work or live in the 94124, 94134, 94107, or in the Bayview Hunters Point area?
 - a. If yes, how long?
2. Do you belong to a community organization or group?
 - a. If so, which one(s)?
3. Have you given input or attended Navy/community outreach events for the environmental program at Hunters Point Shipyard?

General Knowledge about Hunters Point Shipyard

4. How much would you say you know about the Hunters Point Shipyard Environmental Restoration Program:
 - a. Nothing; a little bit, a lot

Appendix C: Community Interview Process and Summary (continued)

- 5. If you know a little bit or a lot, how did you get most of the information you know about Hunters Point Shipyard?
- 6. Do you have any interests or concerns regarding the base and the cleanup program?
 - a. If yes what are they?

Your Information Needs and Resources

- 7. Are you on the Navy’s E mail or mailing list?
 - a. Would you like to be?
- 8. Do you get Navy newsletters and/or fact sheets?
- 9. What topics are you most interested in receiving information and updates from the Navy about?
- 10. The Navy has provided information in various ways.
 - a. Have you gotten information by any of these means?
 - b. How do you like to receive information?

Choose all that apply or add your own:

Outreach Method:	Yes I have received info this way	Yes I would like to receive info this way
Newsletters (4–8 pages on general topics)		
Fact Sheets (2–4 pages on one specific topic or site)		
Attend a public meeting		
Attend an open house		
Attend a Navy presentation at a group meeting (i.e., Homeowners Association meeting, Rotary Club meeting, etc.)		
Visit a Web site to download information		
Hardcopy announcements		
E mail announcements		
Bus Tour		
Other		

- 11. Do you prefer to receive items (such as fact sheets) by E mail or hardcopy mail?
- 12. What is the best way for the Navy to provide information about environmental activities at Hunters Point Shipyard? (Something from the list above, or another idea)
 - a. How often should it be provided?
- 13. Have you contacted elected officials, the Navy, regulatory agencies, or community groups about the cleanup activities at Hunters Point Shipyard?
 - a. If so, what information were you trying to get?
 - b. What kind of response did you receive and was it helpful?
- 14. If you wanted to contact the Navy about an environmental cleanup question you have, would you know who to contact and how to reach them?
 - a. What is your preferred method for contacting the Navy? (E mail/phone/in person)

Appendix C: Community Interview Process and Summary (continued)

15. Are there local civic or service clubs that the Navy should contact to provide information to or speak with?
16. What newspaper(s) do you prefer to read for local information and/or news about Hunters Point Shipyard?
17. What websites do you look at for local information and/or news about Hunters Point Shipyard?

The Community

18. What do you think are the issues and concerns of the community, related to environmental cleanup?
19. Do you think the community has the information they need, or know where to get it?
 - a. If not, how can the Navy make information available to the community?
20. Are there other organizations providing answers to questions or providing information about Hunters Point Shipyard?

Feedback

21. How effective has the Navy's communication about the cleanup program been? (very effective/somewhat effective/not effective)
22. Do you have confidence in the Navy to adequately cleanup Hunters Point Shipyard?
 - a. Why or Why not?
 - b. If not, how can the Navy gain your confidence?
23. Do you have confidence in the U.S. Environmental Protection Agency (federal agency) to provide effective oversight of the cleanup activities?
 - a. Why or Why not?
 - b. If not, how can they gain your confidence?
24. Do you have confidence in the State of California Department of Toxic Substances Control (California EPA) to provide effective oversight of the cleanup activities?
 - a. Why or Why not?
 - b. If not, how could they gain your confidence?
25. Do you have confidence in the State of California San Francisco Bay Regional Water Quality Control Board to provide effective oversight of the cleanup activities?
 - a. Why or Why not?
 - b. If not, how could they gain your confidence?
26. Do you have confidence in the City of San Francisco to provide effective oversight of the cleanup activities?
 - a. Why or Why not?
 - b. If not, how could they gain your confidence?

Thank You and Wrap up

27. Is there anything you would like to add about how the Navy can improve their environmental cleanup program and related community outreach?
28. Who else should we contact for an interview?

Appendix C: Community Interview Process and Summary (continued)

29. May we identify you as an interview respondent with the understanding that your name will be kept separate from your answers and comments?

Interview Summary

Overall, interviewees felt the Navy's communication about the environmental cleanup has not been effective. See [Chapter 2](#), Community Interviews and Feedback, for additional summary information.

Selected Interviewee Statements

To protect privacy, names and specific affiliations of the participants in the interviews are not published. Some selected statements, intended to show the general tone and variety of responses given during the interviews, are presented in the following subsections. They are not direct quotes, but instead represent a synopsis written during the interview. The category of the interviewee making the statement is included after the statement.

Health

- "If you are doing outreach to the community, they have to know that you care about their health. You will have to address health concerns." —Local Resident, Church Representative, Education Provider
- "My grandkids have had headaches and nosebleeds, their mother died at 28 of cancer. I have concerns about the health of everyone in Hunters Point. Asthma is also a problem." —Local Resident, Environmental Activist
- "People attribute health problems in the community with the shipyard. There are numerous problem sites in areas like Brownfields, but everyone points to the shipyard. It's complex, and hard to say what the Navy is responsible for. You need to clarify that for the community." —Former RAB Member, Education Provider

Quality or Completeness of Cleanup

- "As a resident and environmental engineer, I want to make sure it is cleaned to best possible standards. I want the property cleaned so future use is not constrained too much. Have the land available for the best possible use beyond what is defined by the redevelopment authority." —Former RAB Member, Local Business Owner
- "I'm concerned with how thoroughly it is cleaned. Parcel E 2 is the most crucial; I am interested in how it is cleaned and then developed and re used." —Former RAB Member, Local Resident
- "Did the Navy really clean it and how would the people in this community know? We have to take your word for it." —Local Resident, Local Business Owner

Appendix C: Community Interview Process and Summary (continued)

Redevelopment

- “I’m concerned about property being transferred to a developer because they aren’t having a vested interest in the cleanup of contamination.” —Media
- “If the Navy had done better outreach to the community overall to explain the cleanup, people would be more comfortable with the idea of redevelopment.”
— Civic Organizations/Group or Club

Jobs/Economics

- “You may be doing a good job on paper, but I do not see efforts of the Navy to use local businesses and incorporate local contractors more in the cleanup. Have the right people in place to get contractors from the community who do not undermine the program. There are people who can make local contracting programs work, you need to engage them. There are good, strong companies in this area who will do a good job.” —Resident, Local Business

Meetings and Getting Out Information

- “I like public meetings, but it depends on the atmosphere of the meeting. The last meeting I went to was so angry and confrontational that I haven’t been back.” —Shipyard Artist
- “Promote positive information; talk about all the milestones (minor and major) to the community.” —Education Provider
- “Sometimes the information that is provided is too technical and just not sufficient.” —Former RAB Member, Resident, Local Business
- “Figure out some way to have scheduled, uninterrupted presentations, followed by questions and answers. Then have a detailed technical meeting at a later date that is smaller, gets more into the ‘nitty gritty.’” —Former RAB Member, Local Business, Environmentalist
- “I only hear that the Navy is dragging their feet. I don’t hear directly from the Navy.” —Local Union Representative
- “To reach people, talk to people who already have a connection to those you are trying to reach.” —Local Business
- “Recreate the RAB; that is what the people want in the community. They value dialogue. A new format for the RAB is structured presentation, questions and answers, dialogue. Take dialogue when it is given. Need to reformat the RAB so information can get out there. Make sure people chosen for new RAB have open minds and can work within a new structure. This will build confidence in the community and get the Navy to the finish line faster.” —Environmental Activist
- “After the RAB dissolved, there were less newsletters and fact sheets coming out. The meetings are stacked with who’s running the meeting. The community could not really discuss what was happening. I got tired of the meetings. Whoever runs the meeting, they need to have the respect of the community.” —Media, Resident
- “Establish some kind of group, even if it’s just five people from the community. Does not have to be a RAB. I would be on that group. Have some meetings just with the group, then a larger

Appendix C: Community Interview Process and Summary (continued)

group meeting. Have the group of five rotate, be in the group for awhile, and then get five new people.” —Resident, Local Business

- “Informality equals unaccountability. Keep a structure for and records of each meeting. The community should be able to say we do or don't like something or have certain concerns and have that be recorded. It's good to have one big meeting for a decision making meeting specifically. Do not do that in smaller meetings.” —Environmental Activist

General

- “This feedback from us will go into a report and never be addressed or considered again. We are real people who have been affected. We want action, to hold you accountable, and if we feel you are doing good, then we can advocate for you.” —Resident, Education Provider
