| 27.<br>(cont.)                                                                                            | <i>(see above)</i> | <p>maintenance period beyond 30 years does not substantially change the calculated present values for Alternatives 3A or 3B. Specifically, the percent differences between a 30-year and 120-year post-closure maintenance period are less than 14 percent, or well within the accuracy prescribed in EPA guidance (+50/-30 percent) (EPA, 1988). This conclusion can be explained by the present value analysis used in the cost estimate. As explained in EPA guidance for FS cost estimates (EPA, 2000): <i>“This standard methodology allows for cost comparisons of different remedial alternatives on the basis of a single cost figure for each alternative. This single number, referred to as the present value, is the amount needed to be set aside at the initial point in time (base year) to assure that funds will be available in the future as they are needed, assuming certain economic conditions.”</i> The Navy believes that a 30-year post-closure maintenance period is a reasonable basis to evaluate the remedial alternatives in accordance with the NCP and EPA guidance based on (1) the results of this sensitivity analysis, (2) the prescribed accuracy for FS cost estimates (+50/-30 percent), and (3) the absence of data to predict how long wastes will pose a threat to water quality.</p> |

|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.          | <p>The San Francisco Department of Public Health and its consultants, Treadwell and Rollo, have closely monitored the Regulatory Agencies' oversight and the Navy's investigation and cleanup of the Hunters Point Shipyard including Parcel E-2 for the past 19 years. We have reviewed many technical documents written about Parcel E-2. Based on our review and involvement in this process, it is our opinion that the Navy has adequately studied and understands the nature and extent of the contamination on Parcel E-2 and that the selected combination of remedial alternatives listed in the Parcel E-2 draft Record of Decision are, in our technical judgment, feasible and follow accepted scientific understanding and industry standards for remediating the contamination at Parcel E-2. We also support the Navy's evaluation of the nine CERCLA criteria, including community acceptance, and, as described in their responsiveness summary, we believe the Navy has adequately assessed and evaluated the chosen combination of remedies against those criteria.</p>                                                                                                                          | Comment acknowledged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 2.          | <p><b>Section 2.4, Page 2-15, third sentence</b> states "The selected remedy will allow for potential residential use in this 0.42-acre area if it is demonstrated that soil contaminants do not exceed levels established elsewhere at HPNS for residential reuse, or if any contaminants that exceed those established levels are properly contained by the remedy." And then <b>Section 2.9.2, Land Use Restrictions, Pages 2-43 and 2-44</b> states:</p> <p><i>"A small area (about 0.42 acres) in the East Adjacent Area is designated as part of the Shipyard South Multi-Use District, which includes potential recreational, industrial, and residential reuse. Parcel E-2 shall be restricted to open space and recreational uses, unless written approval for other uses is granted by the FFA signatories. In addition, the following land uses are specifically prohibited in all Parcel E-2 areas, unless written approval for such uses is granted by the FFA signatories (e.g., in the small area designated as Shipyard South Multi-Use District), in accordance with the Covenant(s) to Restrict Use of the Property, Quitclaim Deed(s), LUC RD report, and Parcel E-2 RMP, if applicable:</i></p> | <p>In response to EPA specific comment 10a, as well as this additional comment received from CCSF, the Navy has decided to change the boundary between Parcels E and E-2 so that the Shipyard South Multi-Use District is no longer located in Parcel E-2, thereby ensuring that the planned reuse for Parcel E-2 will be limited to open space. As a result, Sections 2.4 and 2.9.2 (and other locations in the ROD) were revised to eliminate reference to potential residential use in Parcel E-2.</p> |

|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.<br>(cont.) | <p>a. A residence, including any mobile home or factory built housing, (see above) constructed or installed for use as residential human habitation.</p> <p>b. A hospital for humans.</p> <p>c. A school for persons under 21 years of age.</p> <p>d. A daycare facility for children.</p> <p>e. Any permanently occupied human habitation, including those used for commercial or industrial purposes.</p> | <p><i>For the small area designated as part of the Shipyard South Multi-Use District, any deviation from the restricted land uses specified above shall be described in writing and reference the appropriate engineering and institutional controls that will be relied upon to protect human health and the environment. This document must be submitted to and approved in writing by the FFA signatories in accordance with procedures (including dispute resolution procedures) and timeframes that will be set forth in the OMP and LUC RD report.”</i></p> <p>And then, as we noted in our previous comment letter dated May 20, 2012 on this subject, <b>Section 2.9.2, Page 2-39 bottom and top of Page 2-40</b> contain a detailed description of how modifications can be made in the Remedial Design so that the remedy can accommodate the intended future residential or industrial uses.</p> <p>We note that the Navy is responsible for the Remedial Design and implementation of the remedy to support the intended future uses at the site and they have described in detail how the modifications can be made during the design process to accommodate the intended future uses. We also note under the terms of the Conveyance Agreement that the Navy is responsible for offering the property to the City, as the successor agency to the San Francisco Redevelopment Agency, in a condition suitable for its intended use. Therefore, we request that the Navy, over the next several years of writing their Remedial Design and Remedial Action Work Plan documents and subsequent installation of the remedy, undertake the necessary steps and additional documentation to remove these use restrictions on the 0.42 acre</p> |

| 2.<br>(cont.)      | area of the Shipyard South Multi-Use District. We understand if the Navy needs to keep the wording on these restrictions in the ROD in order to complete their ROD in a timely manner. However, we are making this request for the Navy: 1) to conduct the additional work; 2) write the appropriate documents; and 3) obtain Regulatory Agency approval; to remove the residential use restrictions in this small 0.42 acre area concurrent with the several years of work needed to design and install the remedies. | (see above)     |

| <i>Introduction</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| --                  | <p>Let me begin by both acknowledging and thanking the Navy and the US Environmental Protection Agency for their support and cooperation in providing an extension for the preparation of our Parcel E2 Draft ROD comments. I would like to especially acknowledge the Navy's cooperation with regard to providing a site visit for our contractors this coming Thursday May 17, with a tour of the Hunters Point Shipyard's Parcel E2. This is most helpful.</p> <p>Records of Decision under CERCLA are considered to be both technical as well as legal documents. Thus Arc Ecology would be remiss were we not to provide commentary on both aspects of the document. Arc Ecology has received numerous inquiries from Bayview Hunters Point (BVHP) community members regarding the issues of the Presumptive Remedy discussed in the ROD and Environmental Justice as it pertains to the ROD. To address those questions we asked our legal counsel Lippe Gaffney Wagner LLP (LGW) to review the ROD in light of those two specific concerns.</p> <p>Attached herein is a copy of LGW's review and report to Arc Ecology. I have also attached a public record comment on the Parcel E2 Remedial Investigation and Feasibility Study from Michael Lozeau from 2007. Mr. Lozeau is currently in practice in Oakland at the law firm of Lozeau Drury. He is the former Executive Director of San Francisco Baykeeper and the former Director of the Stanford University Environmental Law and Justice Clinic. His comments, as you had seen previously, echo the concerns raised by LGW and is included to demonstrate that the analysis we present is shared by others.</p> <p>I would like to state for the record that these are not "lawyer letters" in the colloquial meaning. We are providing this material to the Navy in a friendly fashion to provide feedback on the use of the Presumptive Remedy and the inclusion of Environmental Justice to inform the production of the future final ROD, and the remedial program to follow.</p> | <p>Regarding the 2007 comments from Mr. Lozeau, the Navy prepared written responses to each of Mr. Lozeau's comments on the Draft RI/FS<sup>5</sup> Report and associated Radiological Addendum. These responses are provided in Appendix S of the Final RI/FS Report and Appendix E of the Radiological Addendum to the RI/FS Report.</p> <p>The Navy has prepared written responses to comments provided by Arc Ecology's legal counsel (Lippe Gaffney Wagner LLP), and these responses are provided on the following pages. In developing these responses, the Navy determined that many of the concerns raised in the current letter from Lippe Gaffney Wagner LLP are identical to those raised by Mr. Lozeau in his comments on the Draft RI/FS Report and associated Radiological Addendum. As a result, the Navy relied upon the previous responses to Mr. Lozeau in responding to the current comments from Lippe Gaffney Wagner LLP where appropriate.</p> <p>As described in the response to EPA general comment 1, the Navy understands and supports EPA's decision to solicit input from the HPNS TAG reviewers. The Navy has received and agreed to a request from EPA to delay the submittal of the Draft Final ROD until September 10, 2012. The delay will allow time for the Navy to address comments and incorporate input received from the HPNS TAG reviewers (which are anticipated to be received by August 10, 2012).</p> |

| 1. | <p>As per your request, this letter provides the summary of LGW's review of the Draft Record of Decision (ROD) for Parcel E-2, Hunters Point Naval Shipyard as regards the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and respective Environmental Justice Guidances.</p> <p>Summary of Comments</p> <p>For the reasons explained further below, we believe the ROD suffers from the following deficiencies:</p> <ol style="list-style-type: none"> <li data-bbox="306 1036 1125 1092">1. The Navy did not adequately characterize the waste in the Parcel E-2 landfill in a manner consistent with the requirements of CERCLA.</li> <li data-bbox="306 1105 1125 1247">2. The ROD did not adequately describe how its proposed remedy is cost-effective as the Navy did not take into account the actual costs of maintenance and monitoring of the landfill cap for as long as necessary to protect human health and the environment in a manner consistent with the requirements of CERCLA and other applicable regulations.</li> <li data-bbox="306 1260 1125 1313">3. The Navy did not adequately address environmental justice concerns during the remedy selection process.</li> </ol> | <p>The Navy does not agree with the reviewer's assertions that the ROD for Parcel E-2 is deficient, and believes that the information contained in the administrative record adequately supports the Navy's findings as presented in the Draft ROD. Please refer to the responses to Lippe Gaffney Wagner LLP's specific comments on the Draft ROD. Specifically:</p> <ul style="list-style-type: none"> <li data-bbox="1150 930 1997 987">• The Navy's response to Lippe Gaffney Wagner LLP's specific comment 2 addresses concerns regarding landfill characterization.</li> <li data-bbox="1150 1000 1997 1057">• The Navy's response to Lippe Gaffney Wagner LLP's specific comment 3 addresses concerns regarding the cost-effectiveness of the selected remedy.</li> <li data-bbox="1150 1070 1997 1117">• The Navy's response to Lippe Gaffney Wagner LLP's specific comment 4 addresses concerns regarding environmental justice.</li> </ul> |

| 2.          | <p data-bbox="306 370 1125 427">II. The Navy Did Not Adequately Characterize the Waste in the Parcel E-2 Landfill.</p> <p data-bbox="306 440 1125 800">Based upon our review, since placing the Hunters Point Naval Shipyard on the National Priorities List (NPL) under CERCLA, the Navy appears to have been predisposed to capping the landfill portion of Parcel E-2 in lieu of complete excavation and offsite disposal of the waste contained therein. The Navy's strong preference for capping the landfill seems to have ultimately led to its selection of containment as the proposed final, permanent remedy. ROD, pg. 2-36. However, the Navy's remedy selection process and the ROD documenting the remedy selection are flawed because the Navy did not adequately characterize the waste in the Parcel E-2 landfill, which is a legal prerequisite to selecting the remedy under CERCLA, the National Contingency Plan (NCP), and EPA's "Guidance for Conducting Remedial Investigations and Feasibility Studies Under CERCLA."</p> <p data-bbox="306 813 583 837">a. Applicable Law</p> <p data-bbox="306 850 1125 1029">Pursuant to CERCLA section 105, the NCP establishes procedures and standards for responding to releases of hazardous substances, pollutants, and contaminants. Based on the NCP, the Remedial Investigation/Feasibility Study process is comprised of the following phases: (1) Scoping, (2) Site characterization, (3) Development and screening of alternatives, and (4) Treatability investigations. See 40 C.F.R. § 300.430(d)-(e).</p> <p data-bbox="306 1042 1125 1312">Site characterization is comprised of four activities: (1) conducting field investigation, (2) defining the nature and extent of contamination (waste types, concentrations, distributions), (3) identifying federal/state chemical and location specific applicable or relevant and appropriate requirements (ARARs) and (4) conducting baseline risk assessment. See 40 C.F.R. § 300.430(d)(2). Thus, the NCP requires that the Navy conduct a site characterization which assesses the general characteristics of the waste, including quantities, state, concentration, toxicity, propensity to bioaccumulate, persistence, and mobility. 40 C.F.R. § 300.430(d)(2)(iii).</p> | <p data-bbox="1150 370 1990 914">The Navy believes that the information contained in the administrative record demonstrates that the Parcel E-2 Landfill was adequately characterized to support an informed risk management decision in accordance with the NCP and pertinent EPA guidance. Further, the Navy believes that it has properly developed and evaluated the remedial alternatives for Parcel E-2 in accordance with the NCP and pertinent EPA guidance. The reviewer has identified several of the general legal requirements in CERCLA and the NCP that apply to site characterization and the evaluation and selection of remedial actions. The Navy has complied with them as documented in the RI/FS, Proposed Plan, and ROD. However, the reviewer fails to address the important role that EPA's presumptive remedy guidance (EPA, 1996) plays in evaluating site characterization at military landfills. As described in EPA's directive titled "Presumptive Remedies: Policy and Procedures" (EPA, 1993), which is another pertinent guidance for evaluating the presumptive remedy at landfills, presumptive remedy approaches are designed to accommodate a wide range of site-specific circumstances; and the overall goal of the presumptive remedy approach is to focus data collection efforts and reduce the technology evaluation phase for certain categories of sites.</p> <p data-bbox="1150 927 1990 1320">Section 3 of the RI/FS Report (ERRG and Shaw, 2011) details the previous environmental investigations performed in and around the Parcel E-2 Landfill including (1) preliminary assessment and investigation in 1984 and 1987, respectively; (2) two separate phases of an RI from 1988 to 1996; and (3) three supplemental data gaps investigations in 2002. During these investigations, the Navy installed 28 soil borings and 18 monitoring wells and excavated 25 test pits within the Parcel E-2 Landfill to evaluate the nature and extent of contamination. The previous environmental investigations were developed in consultation with the EPA, DTSC, Water Board, and CCSF DPH. As demonstrated by the approval of the Final RI/FS Report by the EPA, DTSC, Water Board, and CCSF DPH, the investigations at Parcel E-2 have satisfied the regulatory stakeholders and have provided adequate data to support an informed risk management decision.</p> <p data-bbox="1150 1333 1990 1386">When the Navy began preparing the RI/FS Report in 2004, the first step involved evaluating existing site data and reviewing pertinent EPA guidance</p> |

| 2.<br>(cont.) | <p>The EPA's Guidance for Conducting Remedial Investigations and Feasibility Studies Under CERCLA reiterates the same requirements as the NCP. The guidance document requires that data on source characteristics be analyzed to describe the source location; the type and integrity of any existing waste containment; and the types, quantities, chemical and physical properties, and concentrations of hazardous substances found. U.S. Environmental Protection Agency (EPA), 1988. "Guidance for Conducting Remedial Investigations and Feasibility Studies Under CERCLA." Office of Solid Waste and Emergency Response (OSWER) Directive 9355.3-01 and -02. EPA/540G89/004. The guidance document also requires that the actual and potential magnitude of releases from the source, as well as the mobility and persistence of source contaminants, be evaluated. Id.</p> <p>In sum, CERCLA, the NCP, and the EPA guidance document all require that waste in the Parcel E-2 landfill be characterized to determine quantities, state, concentration, toxicity, propensity to bioaccumulate, persistence, and mobility. By using the information gained from the site characterization, the ROD must also describe how the selected remedy is protective of human health and the environment, explaining how the remedy eliminates, reduces, or controls exposures to human and environmental receptors. 40 C.F.R. § 300.430(f)(5)(ii)(A).</p> <p>b. The ROD's Remedy Selection Relies on Inadequate Characterization of the Waste in the Parcel E-2 Landfill.</p> <p>In spite of the requirements set forth above in Part II.a., the Navy did not <u>fully</u> characterize the waste in the Parcel E-2 landfill to determine quantities, state, concentration, toxicity, propensity to bioaccumulate, persistence, and mobility. The ROD confirms this conclusion stating that a full characterization was not necessary or appropriate for selecting a remedy for the Parcel E-2 landfill:</p> <p><i>Based on previous investigations and removal actions, the sources and extent of the remaining contamination in soil, sediment, landfill gas, and groundwater have been characterized adequately to select an appropriate remedy. This determination is consistent</i></p> | <p>to develop a preliminary list of remedial alternatives for Parcel E-2. Based on the review, the Navy determined that (1) conditions at the Parcel E-2 Landfill support use of the presumptive containment remedy (EPA, 1996), and (2) conditions at the Panhandle Area, East Adjacent Area, and Shoreline Area do not support use of the presumptive containment remedy but, consistent with the streamlined approach outlined in the NCP preamble (55 Fed. Reg. 8704-8705, March 8, 1990) and in EPA RI/FS guidance (EPA, 1988), support evaluation of remedial alternatives focused on containment and excavation. The Navy consulted with the EPA, DTSC, Water Board, and CCSF DPH during this initial stage and, based on their input and input from the community, determined that complete removal of the Parcel E-2 Landfill should also be evaluated as one of the remedial alternatives (in addition to one or more containment alternatives).</p> <p>This approach is consistent with EPA's directive regarding presumptive remedies (EPA, 1993), which states that "<i>there may be unusual circumstances (such as, complex contaminant mixtures, soil conditions, or extraordinary State and community concerns) that may require the site manager to look beyond the presumptive remedies for additional (perhaps more innovative) technologies or remedial approaches.</i>" The information contained in the RI/FS Report demonstrates that Parcel E-2 is characterized adequately to support an evaluation of the focused set of remedial alternatives developed in consultation with EPA, DTSC, Water Board, and CCSF DPH. In addition, information contained in the RI/FS Report supports the use of the presumptive containment remedy for the Parcel E-2 Landfill and explains the relative risks of that option compared to complete excavation.</p> <p>The Navy considered and addressed concerns raised about the site characterization and remedial alternatives in the draft and draft final versions of the RI/FS Report, public review and comment upon those reports, and Navy responses to those comments. For example, the Navy solicited input from community groups, including Arc Ecology, throughout its preparation of the RI/FS Report. In comments submitted on the draft and draft final versions of the RI/FS Report, Arc Ecology did not express concerns with the adequacy of the Navy's characterization efforts at Parcel E-2.</p> |

| 2.<br>(cont.) | <p><i>with EPA guidance for CERCLA landfills, which presents a specialized RI/FS process intended to improve and accelerate the site characterization and remedy evaluation process and to ensure consistent evaluation of remedial alternatives at similar sites. This process, which was applied to the Parcel E-2 Landfill, is based on the rationale that the unique characteristics of landfills (such as the presence of large volumes of municipal wastes frequently co-disposed with industrial wastes) limit the selection of practicable remedial alternatives. Consistent with EPA guidance, further characterization of solid waste is not necessary or appropriate for selecting a remedy for the Parcel E-2 Landfill. In addition, characterization efforts in the East Adjacent, Panhandle, and Shoreline Areas have provided sufficient data to evaluate potential risks to humans and wildlife because past sampling locations have focused on the most likely contaminant sources (based on a comprehensive review of historic aerial photographs and any visual evidence of contamination), to the extent practical. ROD, pg. 2-12 [emphasis added].</i></p>                         | <p>To the contrary, Arc Ecology’s first comment on the draft RI/FS Report stated that the “<i>study is well organized with copious information provided in the tables, figures, appendices, and list of references that thoroughly document the results so far of the remedial investigation.</i>” Comments received from the law office of Mr. Lozeau on the Draft RI/FS Report and associated Radiological Addendum expressed numerous concerns regarding site characterization and the remedial alternatives which were very similar to those posed in these comments. The Navy addressed each comment posed by Mr. Lozeau and these previous responses are contained in the CERCLA administrative record for Parcel E-2. The Navy’s responses to Mr. Lozeau’s comments on these issues in the RI/FS report are hereby incorporated by reference into this response. Appendix S of the RI/FS Report provides all comments received on the RI/FS report and the Navy’s associated responses.</p>                                                                                                                                                                                                                            |
|               | <p>The Navy’s approach to characterizing the waste in the Parcel E-2 landfill is perplexing, especially in light of the historical disposal of a variety of military, industrial, and unknown hazardous wastes. The Navy operated the Hunters Point Annex as a shipbuilding and repair facility from 1941 until 1976. During that time, the Navy disposed of various shipyard wastes in the landfill, including radioluminescent devices (primarily containing radium-226) and wastes from decontamination of ships used in atomic testing. Final Remedial Investigation/Feasibility Study (RI/FS), p. 8-6. Additionally, between 1976 and 1986, the Navy leased most of the shipyard to Triple A, a private ship-repair company. Triple A allegedly disposed of industrial debris, sandblast waste, oily industrial sand, and asphalt over an area of approximately 5 acres along the shoreline of Parcel E-2. RI/FS, p. 8-7, 8-8. In addition, Triple A allegedly stored unlabeled, deteriorating, uncovered drums (with their contents exposed to the elements) on Parcel E-2. Id. Also, waste fuel and waste oil containing PCBs were used at the Parcel E-2 landfill as dust suppressants. Id.</p> | <p>As described in the cited passage, and detailed further in the RI/FS Report, the Navy relied upon and complied with CERCLA, the NCP, and pertinent EPA guidance to evaluate the nature and extent of contamination at the Parcel E-2 Landfill and to develop an appropriate range of remedial alternatives. For example, EPA established a decision framework for determining whether the containment presumptive remedy applies to a specific military landfill (EPA, 1996). The Navy evaluated the Parcel E-2 Landfill relative to this decision framework in Section 8.2.3 of the RI/FS Report and determined that the containment presumptive remedy applies to the Parcel E-2 Landfill. The reviewer did not comment on the specific findings of the analysis in Section 8.2.3 of the RI/FS Report, which concludes that the contents of the Parcel E-2 Landfill meet the municipal-type waste definition and that no “high hazard” military wastes are present. The information contained in the RI/FS Report demonstrates that Parcel E-2 is characterized adequately to support an evaluation of the focused set of remedial alternatives developed in consultation with EPA, DTSC, Water Board, and CCSF DPH.</p> |

|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.<br>(cont.) | <p>Moreover, in August 2000, a surface brush fire of unknown origin occurred on the Parcel E-2 landfill. The fire was thought to have been extinguished the same day, but subsurface fire continued for many weeks. In order to fully extinguish the subsurface fire, the Navy placed a temporary cap over the landfill (completed in early 2001). In 2002, the Navy detected migration of landfill gas, comprised of methane and volatile organic compounds (VOCs). In response, the Navy built a barrier wall and trench to prevent offsite migration and installed an active extraction system to extract and treat methane and VOCs. The experience of the 2000 fire highlights the danger posed by hazardous, volatile wastes that remain under the current temporary cap, much of which will continue to remain under a more “permanent” cap in perpetuity. Without an adequate characterization of the waste in the Parcel E-2 landfill, there remains the possibility of another fire which poses further threats to human health and the environment, especially to the nearby Bayview-Hunters Point community.</p>                | <p>Table 1 in the Draft ROD briefly describes the construction of the interim landfill cap and landfill gas control system, and more detailed information regarding these actions is presented in the RI/FS Report. The available information demonstrates, contrary to the reviewer’s assertion, that (1) the interim landfill cap limits oxygen from entering the landfill, thereby preventing more fires from occurring under the capped area, and (2) the interim landfill gas control system is properly controlling potentially hazardous concentrations of landfill gas. The Navy’s selected cover remedial action will continue to prevent oxygen from entering the landfill and prevent more fires.</p>                                                                                                                                                                                             |
| c.            | <p>It is our opinion that the Navy and Regulators engaged in compiling the ROD incorrectly applied the EPA’s Guidance Applicable to Municipal-Type Landfills to the Parcel E2 landfill.</p> <p>As discussed in full in Part II.b., the ROD confirms that the Navy did not conduct a full characterization of the waste in the landfill by relying on the EPA’s guidance on “Application of the CERCLA Municipal Presumptive Remedy to Military Landfills.” U.S. EPA, 1996, “Application of the CERCLA Municipal Presumptive Remedy to Military Landfills,” OSWER Directive 9355.067FS, EPA/540/F-96/020 (EPA Presumptive Application). EPA Presumptive Application provides that the EPA’s presumptive remedy for a typical military landfill is containment. Id. The ROD then concludes that (1) the Parcel E-2 landfill meets all of the criteria specified in the EPA’s presumptive remedy guidance, (2) the presumptive remedy for the Parcel E-2 landfill is containment, and (3) further characterization of solid waste is not necessary or appropriate for selecting a remedy for the Parcel E-2 landfill. ROD, pg. 2-12, 2-30.</p> | <p>The Navy strongly disagrees with the reviewer’s assertion that EPA guidance was incorrectly applied to the Parcel E-2 Landfill, and believes that this assertion is based on an incomplete review of the available information. As previously discussed, EPA established a decision framework for determining whether the containment presumptive remedy applies to a specific military landfill (EPA, 1996). The Navy evaluated the Parcel E-2 Landfill relative to this decision framework in Section 8.2.3 of the RI/FS Report and determined that the containment presumptive remedy applies to the Parcel E-2 Landfill. The reviewer did not comment on the specific findings of the analysis in Section 8.2.3 of the RI/FS Report, which concludes that the contents of the Parcel E-2 Landfill meet the municipal-type waste definition and that no “high hazard” military wastes are present.</p> |

| 2.<br>(cont.) | <p>However the ROD's own description of the site contradicts the conclusion that the Parcel E-2 landfill is a run-of-the-mill military landfill. Therefore, the Navy should not apply the presumptive containment remedy the EPA has designed for municipal-type landfills for this primarily industrial, hazardous waste landfill. The EPA's presumptive remedy was intended to apply to landfills which typically contain a combination of principally municipal, and to a lesser extent hazardous waste, and <u>not those which contain primarily industrial, military and hazardous waste.</u> Based on the historical disposal of a variety of military, industrial, and unknown hazardous wastes to the Parcel E-2 landfill (see Part II.b.), Parcel E2 clearly does not conform to the specific criteria established by the EPA in its guidelines for applying its presumptive remedy standard. The Navy therefore incorrectly concluded that this landfill should be treated as a municipal-type landfill. ROD, pg. 2-12, 2-30. As a result it is our view that the Navy should not have relied upon the EPA Presumptive Remedy Application to limit the scope of its characterization of the Parcel E2 landfill.</p> <p>In fact, the EPA Presumptive Application <u>distinguishes</u> certain military landfills from typical military landfills by recognizing the potential for a site like Parcel E-2 to contain a high percentage of industrial and hazardous waste: "some military facilities (e.g. weapons fabrication or testing, <u>shipbuilding, major aircraft or equipment repair depots</u>) have a high level of industrial activity compared to overall site activities. In these cases, there may be a higher proportion and wider distribution of industrial (i.e. potentially hazardous) wastes present than at other less industrial facilities." EPA Presumptive Application, pg. 3. This is precisely the case for classifying Parcel E-2 -it primarily consists of a landfill where industrial and potentially hazardous waste have been discarded from a variety of past industrial activities. Thus, the evidence shows that the Parcel E-2 landfill is not a typical municipal-type military landfill for which the presumptive remedy of containment is appropriate.</p> | <p>(see responses on pages 68 through 70)</p> <p>The subject comment referenced a general observation about characteristics of military landfills in the introductory portion of the guidance that begins with the statement "<i>most military landfills present only low-level threats with pockets of some high-hazard waste...</i>" (p. 3, EPA, 1996). The reviewer did not acknowledge this part of the sentence and, as previously described, did not review or comment upon the specific findings of the analysis in Section 8.2.3 of the RI/FS Report, which concludes that the contents of the Parcel E-2 Landfill meet the municipal-type waste definition and that no "high hazard" military wastes are present. The determination was made in accordance with a decision framework provided in the same EPA guidance document.</p> |

| 2.<br>(cont.) | <p>Furthermore, the unique site-specific characteristics of Parcel E-2 also support the unsuitability of applying the presumptive remedy of containment. EPA Presumptive Application states that “[s]ite-specific circumstances dictate whether a presumptive remedy is appropriate at a given site.” EPA Presumptive Application, pg. 1. In this case, the Parcel E-2 landfill’s proximity to the Bay, its high water table, its location in a highly seismically-active area susceptible to liquefaction, rising sea levels, and its hazardous contents are all significant site-specific circumstances that preclude the application of the presumptive remedy of containment. According to EPA Presumptive Application, the presence of high water tables, wetlands and other sensitive environments can limit the use of the containment presumptive remedy at a military landfill. EPA Presumptive Application, pg. 3. The ROD and the administrative record, however, do not account for these unique site-specific characteristics of the Parcel E-2 landfill - which render the presumptive remedy of containment both inappropriate and ineffective to fully protect the human health and environment from the environmental hazards posed by the waste in the landfill.</p> <p>Based on the foregoing, a full, comprehensive characterization of the nature of, and threat posed by, the wastes at the Parcel E-2 landfill should have been conducted. The characterization must thoroughly assess the general characteristics of the waste, including quantities, state, concentration, toxicity, propensity to bioaccumulate, persistence, and mobility 40 C.F.R. § 300.430(d)(2)(iii). Such characterization is necessary to assess the extent to which the release poses a threat to human health or the environment and to accurately determine the effectiveness of each alternative. Without a full characterization, the remedy selection in the ROD is problematic and is inconsistent with the requirements of CERCLA, the NCP, and the EPA guidance documents.</p> | <p>The Navy disagrees with the reviewer’s assertion that the proximity of the Landfill Area to San Francisco Bay, among other noted site conditions, invalidates application of containment presumption. The presence of sensitive environments is identified in the EPA guidance as a practical consideration for the remedy evaluation process (see “Sensitive Environments” heading on page 3, <a href="#">EPA, 1996</a>). The selected remedy for the Parcel E-2 Landfill addresses these practical considerations by:</p> <ul style="list-style-type: none"> <li>• Removing and disposing of contaminated soil in selected “hot spot” areas that contain high concentrations of non-radioactive chemicals.</li> <li>• Installing below-ground barriers to limit groundwater flow from the landfill to San Francisco Bay.</li> <li>• Building a soil cover and shoreline revetment that address potential hazards related to seismic activity and sea level rise.</li> <li>• Build new wetlands to replace the degraded wetlands that will be lost during the soil cover and shoreline revetment</li> <li>• Removing and treating landfill gas to prevent it from moving beyond the Parcel E-2 boundary.</li> </ul> <p>Section 2.9.2 of the ROD summarizes these proposed actions, which are described and evaluated in the Final RI/FS Report and addressed in comments on that document.</p> <p>In summary, the Navy believes that the information contained in the administrative record demonstrates that the Parcel E-2 Landfill was adequately characterized to support an informed risk management decision in accordance with the NCP and pertinent EPA guidance. Further, the Navy believes that it has properly developed and evaluated the remedial alternatives for Parcel E-2 in accordance with the NCP and pertinent EPA guidance.</p> |

|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|
| 3.          | <p data-bbox="306 370 1125 423">III. The ROD Fails to Adequately Analyze the Cost-Effectiveness of the Selected Remedy (Alternative 5)</p> <p data-bbox="306 435 1125 662">As specified in the NCP, the cost-effectiveness of a remedy is determined in two steps. First, the overall effectiveness of a remedial alternative is determined by evaluating the following three of the five balancing criteria: (1) long-term effectiveness and permanence; (2) reduction in toxicity, mobility, or volume through treatment; and (3) short-term effectiveness. 40 C.F.R. § 300.430 (f)(ii)(D). The overall effectiveness is then compared to cost in order to determine whether a remedy is cost effective. Id. A remedy is cost-effective if its costs are proportional to its overall effectiveness. Id.</p> <p data-bbox="306 673 1125 1047">In assessing alternative remedial actions, various factors must be taken into account, including long-term maintenance costs. 42 U.S.C. § 9621(b)(1)(E). The NCP also requires that where, as here, a remedial action is selected which results in hazardous substances, pollutants, or contaminants remaining at the site, the remedial action must be reviewed no less often than each 5 years after the initiation of such remedial action to assure that human health and the environment are being protected by the remedial action being implemented. 42 U.S.C. § 9621(c). Furthermore, the potential for future remedial action costs - if the alternative remedial action in question were to fail must be taken into account. 42 U.S.C. § 9621(b)(1)(F). Finally, the NCP requires that the ROD describe how the remedy is cost-effective, i.e., explain how the remedy provides overall effectiveness proportional to its costs. 40 C.F.R. § 300.430(f)(5)(ii)(D).</p> <p data-bbox="306 1058 1125 1172">The ROD asserts that the projected costs of Alternative 5 include the costs of maintaining the integrity of the landfill cap. ROD, pg. 2-41-46. The ROD incorporates the following measures to ensure that the selected remedy will continue to protect human health and the environment:</p> <ol data-bbox="359 1183 1125 1339" style="list-style-type: none"> <li>1. Implementation and maintenance actions for institutional controls, including periodic inspections and reporting requirements. ROD pg. 2-41, 2-43.</li> <li>2. Land use restrictions and enforcing them. ROD pg. 2-43.</li> <li>3. General activity restrictions and enforcing them. ROD pg. 2-44.</li> </ol> | <i>(see the response on the following page)</i> |

General long-term monitoring and maintenance of the cover to ensure continued protection of human health and the environment. ROD pg. 2-46.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>The Navy has responded to numerous comments on the RI/FS Report that questioned the post-closure period used in developing the cost estimates for Alternatives 2, 3, 4, and 5. Comments were received from the law office of Mr. Lozeau that were very similar to those received in this letter. The Navy addressed each comment posed by Mr. Lozeau and these previous responses are contained in the administrative record. The cost estimates are detailed in Appendix R of the RI/FS Report, and the responses to comments are included in Appendix S of the RI/FS Report. Attachment 4 identifies several requirements pertinent to the question of post-closure duration:</p> <ul style="list-style-type: none"> <li>• Post-closure water entry: Cal. Code Regs., tit. 22 § 66264.310(a)(1). This section requires that the final cover be designed to prevent the downward entry of water into the closed landfill throughout a period of at least 100 years.</li> <li>• Post-closure care: Cal. Code Regs., tit. 22 § 66264.310(b)(1). This section requires that the integrity and effectiveness of the final cover be maintained throughout the post-closure period. This section also incorporates by reference Cal. Code Regs., tit. 22 § 66264.117(b)(2)(B), which requires that the post-closure care period be extended if necessary to protect human health and the environment.</li> <li>• Post-closure care period: Cal. Code Regs., tit. 27 § 20950(a). This section requires that the post-closure maintenance period shall extend as long as the wastes pose a threat to water quality.</li> </ul> |
|               | <p>The ROD then concludes that the selected remedy (Alternative 5) is cost effective: The selected remedy will provide high overall effectiveness proportional to its costs, as demonstrated by the improved overall effectiveness of Alternative 5 relative to Alternative 3 for a modest (approximately 10 percent) incremental cost increase. Therefore, the selected remedy is considered cost-effective. In contrast, Alternative 2 is not considered cost effective because its lower overall effectiveness (relative to Alternative 5) is accompanied by a significant incremental cost increase (over 300 percent relative to Alternatives 3, 4, and 5). ROD, pg. 2-47.</p> <p>Before concluding that a selected remedy is cost effective, the cost estimates for each alternative must accurately reflect the cost analysis requirements under the NCP. While the ROD asserts that the costs of long-term monitoring and maintenance are factored into the cost analysis, we question the decision to limit the estimate to a 32-year time frame. ROD pg. 2-32. From the review of the ROD and the administrative record, it is unclear how the Navy arrived at a 32-year time frame as the basis for calculating cost estimates for Alternative 5, while acknowledging that the implementation of Alternatives 5 would include monitoring and maintenance that would be performed <u>as long as is necessary to protect human health and the environment</u>. ROD pg. 2-31. Because under Alternative 5 the landfill would be capped with the hazardous waste remaining, the landfill will require perpetual monitoring and maintenance in order to protect human health and environment. It would seem appropriate therefore that the length of time be somehow linked to the estimated period contaminants of concern for the site will remain toxic.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 3.<br>(cont.) | <p>For example, Radium painted equipment is one of the possible contaminants within the landfill. The half life of Radium 226 is in excess of 1,600 years. While we are not suggesting that it is possible or reasonable to calculate such costs over a millennia, this example does call into question the efficacy of the 32year time frame chosen to calculate the costs of Alternative 5. Another way to look at this question is that the Hunters Point Naval Shipyard was added to the National Priorities List in 1989, the expected close out date for this site is sometime before 2018. It seems somehow odd that the estimate for the ongoing maintenance of the cap is based on a period just four years longer than the amount of time the Navy needed to characterize, plan, and construct its proposed remedy. As a result, it seems the metric used is arbitrary and does not accurately reflect the <u>actual</u> costs of implementing and maintaining this remedy. Moreover, it is unclear whether the estimated cost of implementing and maintaining the selected remedy takes into account the costs of satisfying the statutory five-year review requirement for as long as it may be necessary. ROD, pg. 2-48.</p> <p>Additionally, the ROD's analysis of the cost-effectiveness of each alternative appears flawed as well because the ROD relies on an inadequate site characterization of the Parcel E-2 landfill. As discussed in full in Part II.b., the Navy did not fully characterize the waste contained in the Parcel E-2 landfill. For that reason, the ROD cannot with reasonable confidence conclude that the selected remedy is effective, let alone cost-effective, when it is unknown what type and extent of waste the proposed remedy will be effective against.</p> <p>Based on the foregoing, the ROD cannot adequately describe how the remedy is cost- effective. The Navy did not take into account the actual costs of maintenance and monitoring of the landfill cap for <u>as long as is necessary to protect human health and the environment.</u></p> | <ul style="list-style-type: none"> <li>• Post-closure maintenance: Cal. Code Regs., tit. 27 § 21180(a). This section requires post-closure maintenance and monitoring of the landfill for no less than 30 years following closure.</li> </ul> <p>The 30-year post-closure maintenance period, as identified in Cal. Code Regs., tit. 27 § 21180(a) and EPA guidance for FS cost estimates (EPA, 2000), was used for cost-estimating purposes in the RI/FS Report. Per Cal. Code Regs., tit. 27 § 20950(a) and tit. 22 § 66264.117(b)(2)(B), the Navy will maintain and monitor the remedy for as long as the wastes pose a threat to water quality and as long as necessary to protect human health and the environment. In the absence of site-specific modeling to predict reductions in chemical concentrations in groundwater over time, the Navy analyzed the sensitivity of the cost estimate against varying lengths of the post-closure maintenance period. The results of the sensitivity analysis (for Alternatives 3A and 3B) were presented in Appendix S of the RI/FS Report (Exhibit A to the responses to comments provided by the law office of Michael Lozeau), and show that extending the post-closure maintenance period beyond 30 years does not substantially change the calculated present values for Alternatives 3A or 3B. Specifically, the percent differences between a 30-year and 120-year post-closure maintenance period are less than 14 percent, or well within the accuracy prescribed in EPA guidance (+50/-30 percent) (EPA, 1988). This conclusion can be explained by the present value analysis used in the cost estimate. As explained in EPA guidance for FS cost estimates (EPA, 2000): <i>“This standard methodology allows for cost comparisons of different remedial alternatives on the basis of a single cost figure for each alternative. This single number, referred to as the present value, is the amount needed to be set aside at the initial point in time (base year) to assure that funds will be available in the future as they are needed, assuming certain economic conditions.”</i> The Navy believes that a 30-year post-closure maintenance period is a reasonable basis to evaluate the remedial alternatives in accordance with the NCP and EPA guidance based on (1) the results of this sensitivity analysis, (2) the prescribed accuracy for FS cost estimates (+50/-30 percent), and (3) the absence of data to predict how long wastes will pose a threat to water quality.</p> |

| 4.          | <p>IV. The Navy and the EPA Failed to Assess and Consider Environmental Justice Concerns During the Remedy Selection Process.</p> <p>a. Executive Order 12898 on Environmental Justice and Agency Guidance Documents</p> <p>In 1994, Executive Order 12898 (“EO 12898”) “Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations,” directed all federal agencies to implement environmental justice policies. Exec. Order No. 12898, 59 Fed. Reg. 32 (Feb. 16, 1994). These policies were designed to address the disproportionate environmental effects of federal programs and policies on minority and low-income populations. EO 12898 imposes the following requirements on all federal agencies:</p> <ol style="list-style-type: none"> <li>1. A Federal agency must, where practicable and appropriate, collect, maintain, and analyze information assessing and comparing environmental and human health risks borne by populations identified by race, national origin, or income, and</li> <li>2. To the extent practicable and appropriate, Federal agencies must then use this information to determine whether their activities have disproportionately high and adverse human health or environmental effects on minority populations and low-income populations.</li> </ol> <p><i>Exec. Order No. 12898, 59 Fed. Reg. 32 (Feb. 16, 1994).</i></p> <p>The EPA’s guidance on environmental justice provides a roadmap on how the EPA can incorporate environmental justice concerns into the decision making process. In July 2010, the EPA released “EPA’s Action Development Process: Interim Guidance on Considering Environmental Justice in the Development of an Action,” which provides ways to incorporate the needs of overburdened neighborhoods into decision-making, scientific analysis, and rule development. U.S. EPA, 2010, “EPA’s Action Development Process: Interim Guidance on Considering Environmental Justice in the Development of an Action.” (“EJ in Rulemaking Guidance”). Since the EPA and the Navy jointly selected the remedy for Parcel E-2, the</p> | <p>The Navy and the EPA acknowledge that the E.O., directs the agencies to consider environmental justice concerns in implementing our obligations at HPNS. However, we disagree with the reviewer’s assertion regarding our “failure to assess and consider environmental justice concerns during the remedy selection process.” We believe that environmental justice considerations have been factored in the remedy selection process, and that the decision is consistent with the E.O. and with the legal requirements under CERCLA and the NCP. As noted in both the E.O. and EPA guidance, compliance with statutory requirements is a key element for achieving environmental justice objectives.</p> <p>CERCLA § 117(a) provides for public participation before EPA’s adoption of any plan for remedial action. This is consistent with the environmental justice goal of ensuring meaningful participation by communities in decisions that affect them. CERCLA § 117(e)(1) also provides EPA the discretionary authority to provide TAGs to affected groups or individuals to help them interpret information about Superfund sites. The Navy and the EPA have used these statutory measures fully and have revised public participation procedures to enhance opportunities for participation of minority, low-income communities in the remedy selection and increase their ability to participate in the decision-making process.</p> <p>In evaluating remedial alternatives, the Navy and the EPA have considered nine criteria, as specified in the NCP (40 CFR § 300.430[e][9][iii]), many of which (including “overall protectiveness of human health and the environment” and “community acceptance”) have accommodated environmental justice considerations relating to impacts on, and participation by minority, low-income, and indigenous populations. For example, the NCP (specifically 40 CFR § 300.430[d][2][vii]) states that the Superfund site investigation should assess “<i>factors, such as sensitive populations, that pertain to the characterization of the site or support the analysis of potential remedial action alternatives.</i>” The NCP (specifically 40 CFR § 300.430[e][2][i]) states that “<i>Remediation goals shall establish acceptable exposure levels that are protective of human health and the environment and shall be developed by considering the following:</i></p> |

| 4.<br>(cont.) | <p>agencies were required to consider the environmental justice policies provided in the EPA's EJ in Rulemaking Guidance.</p> <p>In the guidance document, the EPA defines "environmental justice" as the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies:</p> <p>Fair Treatment means that no group of people should bear a disproportionate burden of environmental harms and risks, including those resulting from the negative environmental consequences of industrial, governmental, and commercial operations or programs and policies.</p> <p>Meaningful Involvement means that: 1) potentially affected community members have an appropriate opportunity to participate in decisions about a proposed activity that will affect their environment and/or health; 2) the public's contribution can influence the regulatory agency's decision; 3) the concerns of all participants involved will be considered in the decision-making process; and 4) the decision-makers seek out and facilitate the involvement of those potentially affected.</p> <p><i>EJ in Rulemaking Guidance, at pg. 3.</i></p> <p>The EPA has recognized certain factors in assessing whether disproportionate impacts on minority, low-income, or indigenous populations exist prior to, or are created by, the agency's action: (1) Proximity and exposure to environmental hazards, (2) Susceptible populations, (3) Unique exposure pathways, (4) Multiple and cumulative effects, (5) Ability to participate in the decision-making process, and (6) Physical infrastructure. EJ in Rulemaking Guidance, at pg. 7-9. Of particular concern to the community near Parcel E-2 is the first factor, proximity and exposure to environmental hazards (disproportionate public health and environmental effects can be related to a community's or population's differential proximity and exposure to environmental hazards) and the fourth factor, multiple and</p> | <p><i>"(1) For systemic toxicants, acceptable exposure levels shall represent concentration levels to which the human population, including sensitive subgroups, may be exposed without adverse effect during a lifetime or part of a lifetime, incorporating an adequate margin of safety; (2) For known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10<sup>-4</sup> and 10<sup>-6</sup> using information on the relationship between dose and response. The 10<sup>-6</sup> risk level shall be used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure."</i></p> <p>The selection of Alternative 5 for the Parcel E-2 remedy closely followed the CERCLA, NCP, and appropriate Superfund guidance to ensure environmental justice concerns that are related to the site, under the CERCLA authority, have been considered, to the maximum extent possible. For example, the site risk assessments/characterizations addressed multiple contaminants and considered community specific exposure pathways. The Navy and EPA have considered the sensitive populations that are experiencing disproportionate health impacts and environmental impacts in our risk evaluation. The site cleanup levels were derived based on conservative assumptions, including a margin of safety to ensure protection of the community. The selected remedy requires long-term monitoring to ensure the protectiveness of the remedy. As described in the ROD, the long-term monitoring program includes groundwater monitoring, landfill gas monitoring, stormwater erosion controls, stormwater discharge monitoring, and inspection and maintenance of the cover. In addition, the community has also benefited from jobs created through the cleanup program at HPNS.</p> <p>As described in the responsiveness summary to the ROD, the Navy and EPA are firmly committed to achieving the goals identified in the Executive Order on Environmental Justice (E.O. 12898) at HPNS. Both agencies are dedicated to consistent, fair treatment and meaningful participation in environmental decision-making for minority, low-income, and indigenous populations that are disproportionately impacted by pollution. The Navy and EPA agree that the Bayview/Hunters Point neighborhood is an environmental justice</p> |

| 4.<br>(cont.) | <p>cumulative effects (minority, low-income, and indigenous populations are likely to suffer from multiple environmental hazards, including industrial facilities, landfills, transportation-related air pollution, poor housing, leaking underground tanks, pesticides, and incompatible land uses.) Id.</p> <p>The Navy is also required to take environmental justice issues into account under both EO 12898 and the Department of Defense (DoD) manuals and policies. Recently, on March 9, 2012, the Acting under Secretary of Defense signed DoD Manual (DoDM) 4715.20, Defense Environmental Restoration Program (DERP) Management. The Manual implements policy, assigns responsibilities, and provides guidance and procedures for conducting environmental restoration at DoD facilities and managing the DERP. DoDM 4715.20, at p. 1. Most relevantly, the Manual implements EO 12898 by requiring community relations plan (CRP) (40 C.F.R. 300.430(c)(2)(ii)) to address applicable requirements of EO 12898. Id. at p. 82.</p> <p>In sum, pursuant to EO 12898 and the applicable guidance documents, the Navy and the EPA are required to assess and consider the disproportionate impacts of the selected remedy on the low income and minority populations near Parcel E-2. However, as discussed below, the ROD and the administrative record provide no evidence that the Navy or the EPA assessed and/or considered the disproportionate impacts to this environmental justice community of choosing Alternative 5 as the proposed remedy for Parcel E-2.</p> <p>b. The Hunters Point Shipyard Community is an Environmental Justice Community Which Suffers from its Proximity to Multiple Environmental Hazards.</p> <p>Parcel E-2 is located immediately adjacent to the Hunters Point Shipyard (HPS) community, which is a part of the larger Bayview Hunters Point (BHP) Community in San Francisco, California. According to the Navy's assessment of the community background, the majority of residents within the HPS community (which includes ZIP Code 94124, the area closest to the Hunters Point Naval Shipyard) are low-income minorities and suffer from</p> | <p>community with a history of disproportional pollution burdens compared with the rest of San Francisco. The Navy and EPA, in performing environmental cleanup work at HPNS with support from DTSC and the Water Board, have worked together to achieve the environmental justice goals of fully protective cleanup actions, fair and equal treatment, and meaningful involvement for all people in the Bayview-Hunters Point community. Our efforts to satisfy these goals, which are detailed in the responsiveness summary to the ROD, include:</p> <ul style="list-style-type: none"> <li>• Substantial regulatory review and oversight of all Navy cleanup activities</li> <li>• Substantial financial commitment from the Navy to HPNS cleanup</li> <li>• EPA's Technical Assistance Grants to the Community</li> <li>• Meaningful community engagement under the Navy's updated Community Involvement Plan (CIP)</li> <li>• Commitment that cleanup actions selected at the HPNS do not contribute to a disproportional impact to the Bayview-Hunters Point community</li> <li>• Employment of community members to assist in the cleanup program</li> <li>• Commitment to fully protective cleanup actions</li> </ul> <p>Consistent with the NCP and pertinent EPA guidance, the Navy evaluated the Parcel E-2 and remedial alternatives for Parcel E-2 relative to the nine criteria specified in the NCP, and demonstrated that the selected remedy would be protective of human health and the environment. We believe that Alternative 5 is protective of sensitive populations in the Bayview-Hunters Point community. In addition, our remedial approach at Parcel E-2 is consistent with E.O. 12898 and EPA's July 2010 interim guidance on environmental justice (EPA, 2010), which states that: <i>"The application of existing statutory and regulatory authorities is a critical part of EPA's efforts to prevent and address the disproportionately high and adverse effects that are the focus of E.O. 12898. This Guide uses the term 'EJ concern'...which aligns with the E.O.'s focus on disproportionate impacts. It is important, however, to recognize that the Agency's statutory and regulatory authorities provide a broader basis for protecting human health and the environment and do not require a demonstration of disproportionate impacts in order to protect the health or environment of any population, including minority, low-income, and</i></p> |

| 4.<br>(cont.) | <p>high unemployment rates. Final Hunters Point Shipyard Community Involvement Plan (“HPS CIP”), Department of Navy, May 2011, Appendix D, pg. D-1 - D-9. Additionally, the HPS community encompasses the low-income Oakdale public housing development and the low-income affordable development of Mariners Village. Thus, especially due to the close proximity to Parcel E-2, the selection of remedy for the cleanup of Parcel E-2 directly affects the low-income and minority populations that reside in the HPS community.</p> <p>Based on the high number of low-income minority residents, the HPS community is an environmental justice community which has suffered and continue to suffer from the potentially disproportionate impacts of (1) the proximity and exposure to environmental hazards, mainly the Hunters Point Naval Shipyard Superfund site (particularly the Parcel E-2 landfill) and numerous industrial facilities, and (2) multiple and cumulative effects of residing near numerous environmental hazards, including industrial facilities, landfills, transportation-related air pollution, poor housing, leaking underground tanks, pesticides, and incompatible land uses. See EJ in Rulemaking Guidance, at pg. 7-9.</p> <p>The existence of multiple generators of hazardous waste as defined under the Resource Conservation and Recovery Act (RCRA), underground storage tanks, and soil and groundwater contamination within the HPS community is direct evidence of the multiple environmental hazards and industrial pollution borne by its residents. The following industrial facilities and underground tanks are located within the HPS community and near Parcel E-2:</p> <ul style="list-style-type: none"> <li>3 underground storage tanks located at 996 Innes Ave. of unknown contents which may be leaking.</li> <li>895 Innes Ave. in Zone NE07 – Chemicals detected in soil and groundwater include lead, total xylenes, methyl tert-butyl ether, ethylbenzene, TPH, toluene, and benzene.</li> </ul> | <p><i>indigenous populations. Thus, consistent with its mission, the Agency may address adverse impacts in the context of developing an action without the need for showing that the impacts are disproportionate.”</i></p> <p>As described in the responsiveness summary to the ROD, the Navy, EPA, and State of California jointly believe that safely isolating and capping the Parcel E-2 Landfill (as specified in Alternative 5) presents less overall risk to the adjacent community when compared with the risks of other cleanup alternatives evaluated, including complete removal of the Parcel E-2 Landfill (in Alternative 2). The combination of removal and containment proposed under Alternative 5 reduces risk sooner, is easier and safer to implement, and is much more cost-effective as compared with Alternative 2. In addition, Alternative 5 provides additional risk reduction as compared with Alternatives 3 and 4. Therefore, based on the evaluation of the remedial alternatives for Parcel E-2 relative to the nine criteria specified in the NCP, the Navy believes that the administrative record provides adequate evidence that the selected remedy (Alternative 5) is fully and equally protective of all members of the public, including the HPNS community. The Navy’s evaluation process was performed in accordance with the NCP, and is consistent with E.O. 12898 and the July 2010 interim guidance (EPA, 2010).</p> <p>As described in the responsiveness summary, the Navy updated their CIP (which satisfies the requirements specified in the NCP and the DERP Management Guide) in 2011 to present the communication and community involvement program activities that were designed to meet the specific needs and desires of the HPNS community (Navy, 2011a). The Navy conducts specific community outreach efforts in accordance with the CIP and consistent with goals of E.O. 12898 and the July 2010 interim guidance (EPA, 2010). The Navy’s achievements toward meaningful community involvement over the past several years include:</p> <ul style="list-style-type: none"> <li>• Holding regularly scheduled community meetings to a variety of existing groups, as well as to the greater community</li> <li>• Publishing fact sheets on important technical topics specific to Parcel E-2</li> </ul> |

| 4.<br>(cont.) | <p>around the HPS community. Nonetheless, this list is illustrative of the multiple environmental hazards that have been and continue to plague the HPS community. Based on this information, the Navy and the EPA were required to assess and consider disproportionate impacts of environmental hazards to the HPS community from both the proximity to these environmental hazards and the multiple and cumulative effects of such environmental hazards.</p> <p>c. The Navy and the EPA Failed to Assess and Consider Disproportionate Environmental Impacts on the Low Income and Minority Populations Near Parcel E-2 During its Remedy Selection Process.</p> <p>Despite the availability of evidence that the HPS community is already overburdened with environmental hazards, the Navy and the EPA did not adequately consider whether each alternative remedy poses disproportionately high and adverse human health and environmental effects to these populations. Rather, the extent of the Navy's discussion of environmental justice issues at Parcel E-2 was limited only to the public participation component during the remedy selection process:</p> <p style="padding-left: 40px;">At Hunter's Point Shipyard, the Navy has incorporated the principles of environmental justice into the planning and preparation of this Community Involvement Plan. The Navy is addressing environmental justice through its outreach efforts, public participation process, and by providing access to information in a variety of ways. This includes providing information, as needed, in other languages. Community members are encouraged to be involved in the cleanup process by providing feedback and information on an ongoing basis. The Navy acknowledges that community members, especially long-time residents, have knowledge about HPS activities which may assist the cleanup activities.</p> <p style="padding-left: 40px;"><i>HPS CIP, at pg. 5.</i></p> | <p>As described on pages 77 and 78, the Navy and EPA are firmly committed to achieving the goals identified in E.O. 12898 at HPNS. Both agencies agree that Bayview-Hunters Point community has environmental justice concerns, and we are dedicated to consistent, fair treatment, and meaningful participation in environmental decision-making for minority, low-income, and indigenous populations that are disproportionately impacted by pollution. The Navy and EPA, in performing environmental cleanup work at HPNS with support from DTSC and the Water Board, have worked together to achieve the environmental justice goals of fully protective cleanup actions, fair and equal treatment, and meaningful involvement for all people in the Bayview-Hunters Point community. The efforts of Navy and EPA to satisfy these goals are summarized on page 70 and are detailed in the responsiveness summary to the ROD. As documented in the RI/FS Report and ROD, the Navy evaluated the remedial alternatives for Parcel E-2 relative to the nine criteria specified in the NCP, and demonstrated that the selected remedy is fully and equally protective of all members of the public, including the HPNS community. The Navy's evaluation process was performed in accordance with the NCP, and is consistent with E.O. 12898 and the July 2010 interim guidance (EPA, 2010). As described in the responsiveness summary to the ROD, the Navy, EPA, and State of California jointly believe that safely isolating and capping the Parcel E-2 Landfill (as specified in Alternative 5) presents less overall risk to the adjacent community when compared with the risks of other cleanup alternatives evaluated, including complete removal of the Parcel E-2 Landfill (in Alternative 2). The combination of removal and containment proposed under Alternative 5 reduces risk sooner, is easier and safer to implement, and is much more cost-effective as compared with Alternative 2. We also believe</p> |

|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4.<br>(cont.) | <p>Additionally, although the Responsiveness Summary of the Draft ROD reports to have taken environmental justice issues into consideration, it appears that all the Navy did was carry out its preexisting duties under CERCLA in discussing the following points:</p> <ol style="list-style-type: none"> <li>1. Substantial regulatory review and oversight of all Navy cleanup activities,</li> <li>2. Substantial financial commitment from the Navy to HPNS cleanup,</li> <li>3. EPA's Technical Assistance Grants to the community for community groups to review and provide independent input on the Navy's plans and reports,</li> <li>4. Community engagement under the Navy's updated Community Involvement Plan,</li> <li>5. Employment of community members in assisting with the cleanup program, and</li> <li>6. Commitment to protective cleanup actions.</li> </ol> <p><i>Responsiveness Summary, Attachment 3 of Draft ROD, pg. 2-3.</i></p> <p>Incorporating environmental justice policies into the remedy selection process must be distinguishable from merely focusing on community involvement and the "protectiveness" of the cleanup action. Unfortunately, based on our review of the Draft ROD and HPS CIP, what the Navy purports is "consideration" of environmental justice issues clearly falls far from the mark. Based on our review of the ROD and CIP we can only conclude that the Navy and the EPA have failed to assess how selecting Alternative 5 (capping the landfill portion) as opposed to Alternative 2 (complete removal of the Parcel E-2 Landfill) would <u>disproportionately impact</u> low-income and minority populations that reside in close proximity to Parcel E-2, especially in light of (1) the historical disposal of a variety of military, industrial, and unknown hazardous wastes in the Parcel E-2 landfill, (2) the inadequate characterization of the wastes contained therein (see Part II), and (3) the disproportionate impacts of environmental hazardous currently suffered by the BVHP community from numerous, existing industrial facilities, hazardous</p> | <p>that Alternative 5 is the best alternative to ensure that the remedial action does not contribute to disproportional impacts to low income and minority communities.</p> <p><i>(see response on pages 76 through 80)</i></p> |

| 4.<br>(cont.) | <p>waste generators, underground tanks and soil and groundwater contaminations. See EO 12898 and EJ in Rulemaking Guidance.</p> <p>In order to fulfill the environmental justice policies set forth in EO 12898 and the EPA and DoD guidance documents, the Navy and the EPA would have needed to assess and consider whether each alternative remedy poses disproportionately high and adverse human health and environmental effects to the HPS community during the remedy selection process under CERCLA. Based upon our review this did not occur.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <i>(see response on pages 76 through 80)</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5.            | <p>V. Conclusion</p> <p>As demonstrated above, the Navy did not (1) adequately and consistently with the applicable laws and guidances characterize the waste contained in the Parcel E-2 landfill, (2) adequately and consistently with the applicable laws and guidances analyze the cost-effectiveness of the selected remedy and (3) adequately and consistently with the applicable laws and guidances address environmental justice concerns during the remedy selection process.</p> <p>Recommendation to Arc Ecology</p> <p>It is Lippe Gaffney Wagner's recommendation to Arc Ecology that it inform the Navy and the EPA of the results of our review of the Parcel E2 Draft Record of Decision and share with these agencies and the public our identifications of the flaws within their analysis. We recommend that Arc Ecology request that the Navy and the EPA (1) conduct a full characterization of the waste in the Parcel E-2 landfill, (2) revise its cost analysis for Alternative 5 to reflect the long-term maintenance costs of containment of the landfill for as long as it is necessary, (3) assess and consider whether each alternative remedy could have a disproportionate impact on the environmental justice community near Parcel E-2, giving full and fair consideration to the deficiencies raised in the foregoing comments, and (4) reconsider each alternative prior to issuing a Final Draft ROD.</p> | <p>As previously discussed, the Navy strongly disagrees with the reviewer's assertions. The Navy believes that the information contained in the administrative record demonstrates that the Parcel E-2 Landfill was adequately characterized to support an informed risk management decision in accordance with the NCP and pertinent EPA guidance and the selected remedy is fully and equally protective of all members of the public, including the HPNS community. Further, the Navy believes that it has properly developed and evaluated the remedial alternatives for Parcel E-2 in accordance with the NCP and pertinent EPA guidance. Please refer to the responses to Lippe Gaffney Wagner LLP's specific comments on the Draft ROD for more detailed information in support of the Navy's position.</p> |

| 1.          | <p>The following comments on the Draft Record of Decision for Parcel E-2 of the Hunters Point Naval Shipyard are submitted on behalf of People Organized to Win Empowerment Rights (POWER) and Stop Lennar Action Movement (SLAM).</p> <p>A large quantity of contaminated soil will remain on site at Parcel E-2. Five-year reviews are scheduled to be performed at Parcel E-2 because contaminants will remain on site above concentrations that allow for unrestricted use and unlimited exposure. Due to the substantial quantity of contaminated soil to remain on site after the remedy is completed, reviews of the effectiveness of the remedy should be required more frequently than every five years. Annual reviews of the effectiveness of the remedy would be more appropriate. In addition, the condition of the cap/cover should be evaluated on a quarterly basis to insure its integrity.</p> | <p>The Navy wishes to clarify that the five-year reviews of the Parcel E-2 remedy would be performed to satisfy a CERCLA<sup>6</sup> statutory requirement, and these reviews do not replace the regular inspections, maintenance, and monitoring that would occur. As described in the response to comment 5 on the Proposed Plan, the selected remedy includes the following monitoring and maintenance activities that would be performed on a regular schedule and for as long as necessary to protect human health and the environment and to comply with pertinent state and federal ARARs:</p> <ul style="list-style-type: none"> <li>• Groundwater monitoring will be performed, consistent with the requirements of Cal. Code Regs., tit. 22 § 66264.100(d) and § 66264.310(b)(3), to verify that chemical concentrations in groundwater do not exceed concentrations designated by the RAOs at the compliance boundary.</li> <li>• Landfill gas monitoring will be performed to demonstrate compliance with Cal. Code Regs., tit. 27 § 20917 through § 20934.</li> <li>• Stormwater and erosion controls will be installed and maintained as required under Cal. Code Regs., tit. 27 § 20365(c) and (d), and stormwater discharges will be monitored as required under Title 22 Cal. Code Regs. § 66264.97(c)(1) and (c)(2)(B).</li> <li>• The cover will be inspected and maintained to ensure its integrity as required under Cal. Code Regs., tit. 27 § 21180(a).</li> </ul> <p>The long-term monitoring and maintenance program will be detailed in the post-closure operation and maintenance plan for Parcel E-2, consistent with content requirements as provided in Cal. Code Regs., tit. 27 § 21800(c), and submitted for review and approval by EPA, DTSC, and the Water Board in conjunction with the RD. Regulatory oversight will continue during long-term operation and maintenance of the selected remedy.</p> |

|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.          | <p>The Navy based the remedy selection process on community support from the San Francisco Redevelopment Agency, the Mayor's Hunters Point Shipyard Citizens Advisory Committee and a number of engaged citizens living in close proximity to Hunters Point Naval Shipyard. The Navy ignored the input from a large segment of the community that provided input in opposition to Alternative 5 as the preferred remedy. The Navy stated that the information presented by members of the community that did not support Alternative 5 does not justify modification of Alternative 5, or selection of a different alternative, based on community acceptance criteria. The Navy selected which portion of the community they would associate with as the portion of the community that agreed with their selection alternative. The Navy failed to make any effort to address the concerns of the other portion of the community that raised legitimate concerns regarding the selected preferred remedy alternative. The Navy basically developed the draft ROD based on the Proposed Plan and failed to consider the comments submitted on behalf of the portions of the community that did not concur with the Navy's Proposed Plan.</p> | <p>The Navy disagrees with the reviewer's assertion that community input expressing concern regarding the selected remedy was ignored. The Navy prepared a responsiveness summary (Attachment 3 to the ROD) that provides detailed responses to each community comment received on the Proposed Plan. The comments received on the Proposed Plan identified a range of concerns, each of which were addressed in the responsiveness summary. In addition, Section 2.8.2 in the Draft ROD describes the Navy's evaluation of the community acceptance criterion: <i>"In general, public comments expressed a preference for Alternative 2 and concerns regarding the long-term effectiveness of Alternatives 3, 4, and 5. However, segments of the community, represented by the San Francisco Redevelopment Agency and the Mayor's Hunters Point Shipyard Citizens Advisory Committee, as well as a number of engaged citizens who live in close proximity to HPNS, have expressed their support of Alternatives 4 and 5."</i> The Navy believes that this description accurately describes the input received and supports the rating of each remedial alternative relative to the community acceptance criterion.</p> <p>As described in the responsiveness summary, the remedial alternatives for Parcel E-2 were evaluated relative to nine CERCLA remedy selection criteria identified in the federal regulation called the NCP. Criteria 1 and 2 (protection of human health and the environment and compliance with ARARs) are threshold criteria that each alternative must meet to be eligible for selection. Criteria 3, 4, 5, 6, and 7 are balancing criteria used to weigh major tradeoffs in the benefits and limitations among alternatives. Criteria 8 and 9 (state acceptance and community acceptance) are modifying criteria considered in the ROD. The preferred alternative published in the Proposed Plan (Alternative 5) complies with the two threshold criteria and provides the best balance of tradeoffs with respect to the five balancing criteria. The Navy's evaluation of the two modifying criteria (including community acceptance) did not warrant changes to the preferred alternative. In summary, the Navy believes that the Draft ROD, including supporting information contained in the administrative record, adequately demonstrates that safely isolating and capping the Parcel E-2 Landfill (as specified in Alternative 5) presents less overall risk to the adjacent community when compared with the risks of other cleanup alternatives evaluated, including complete removal of the Parcel E-2 Landfill (in Alternative 2).</p> |

| 1.          | <p>Your responses to my previous public comments on your "Proposed Plan for cleanup of Parcel E-2, which includes a landfill along the shoreline at Hunters Point Naval Shipyard in San Francisco, California" are in adequate and essentially non-responsive.</p> <p>My comments and your responses can be read in the attached "Draft_E-2_Respon-Summ-1" from pages 99-106.</p> <p>Your responses are inadequate and non-responsive as follows:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>The Navy's responses to the additional comments are provided on the following pages.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2.          | <p>SEA LEVEL RISE (Pages 99-102):</p> <p>Your response gives no credible argument for your claim that the worst case 5 meter sea level rise scenario predicted by NASA climate scientist James Hansen, should not be considered in the cleanup plan. Furthermore, it is now known that an earthquake in Alaska of similar character to the March 2011 earthquake off of Japan, could cause a catastrophic tsunami similar to that which was created by the Japan earthquake. Such a tsunami originating in Alaska has the potential to generate a flood surge of at least 8 feet in the Parcel E-2 cleanup area. Such a flood surge, in addition to even the potential sea level rise prediction of 2 meters cited in my previous comments referencing "The Copenhagen Diagnosis" would, at best, leave an unacceptable zero margin for error in the sea rise remedies that you have cited, and in the case of Hansen's 5 meter sea level rise prediction, your cited remedies would fail to adequately protect the Parcel E-2 cleanup area in the case of the combined impact of a maximum 5 meter sea level rise and an 8 foot tsunami flood surge.</p> | <p>As stated in the response to the original comment, the Navy does not agree with the reviewer's assertion that the selected remedy must account for a worst-case scenario of a 5 meter rise in sea level. The reviewer's original comment acknowledged the speculative nature of the cited report from Mr. Hansen, but requested that it be considered in developing the cleanup plan for Parcel E-2 because "<i>there is absolutely no reason whatsoever to doubt Hansen's predictions; especially in light of the fact that Hansen's past predictions have consistently proved to be correct.</i>" The Navy does not find this rationale to be adequately justified and notes that none of the regulatory agencies who oversee the Navy's cleanup program have put forth a similar recommendation (nor was Mr. Hansen's worst-case scenario repeated in the "Copenhagen Diagnosis" document cited in the original comment).</p> <p>As stated in the response to the original comment, the revetment structure will be further evaluated in the RD<sup>7</sup> relative to the most current IPCC estimates for a rise in sea level. In addition, the selected remedy will be subject to statutory reviews every 5 years (pursuant to CERCLA) to ensure that it remains protective of human health and the environment. The five-year reviews will consider multiple technical factors, including but not limited to potential rise in sea level.</p> |

| 3.          | <p>SEA LEVEL RISE INTERACTION WITH LIQUEFACTION AND HAZARDOUS MATERIALS (pages 102-103):</p> <p>Your assertions that; "The Navy studied soil in and around the Parcel E-2 Landfill and found that most soil would not liquefy even during the maximum probable earthquake, and the soil layers that might liquefy would be controlled through proper design and construction of the final cover using methods that are well established for sites in the San Francisco Bay area.", "In addition, the Navy's previous study revealed that the potentially liquefiable soil layers in and around the Parcel E-2 Landfill are located 10 feet or deeper below the ground surface, meaning that these soil layers are already saturated with groundwater and the degree of saturation would not be significantly affected by rising water levels.", and "As described on page 17 of the Proposed Plan, the preferred alternative also includes the following elements to control potential leaching of chemicals from the Parcel E-2 Landfill: (1) the protective liner would limit infiltration from the ground surface into the landfill waste;..." are dramatically inadequate.</p> <p>The problem with your proposed remedies is that, regardless of saturation, a long term infusion of sea waters into the Parcel E-2 cleanup area will enhance the probability of escape of hazardous materials, and your contention that "most" soil would not liquefy patently fails to address the dangers of -any- of the soil liquefying. Furthermore, protective liners as that which you have described almost inevitably develop small holes, and even a 2 millimeter hole in such a liner has the potential to allow tens of thousands of gallons per year of water from rainfall to flush outside of the liner.</p> <p>Since any leaching of any amount of hazardous material in these scenarios could simply be avoided by removing -all- such hazardous material from the cleanup area, a cleanup plan which does not remove -all- hazardous materials from Parcel E-2 is not sufficiently protective, and therefore unacceptable.</p> | <p>As stated in the response to the original comment, the Navy does not believe there is a sufficient technical basis to support the reviewer's request to remove the Parcel E-2 Landfill because of concerns regarding potential sea level rise, liquefaction, and release of hazardous materials. The Navy noted the following technical deficiencies in the reviewer's recommendations:</p> <ul style="list-style-type: none"> <li>• The reviewer's assertion of a "long term infusion of sea waters into the Parcel E-2 cleanup area" appears to be predicated on the worst-case scenario of a 5-meter rise in sea level that, as discussed in the previous response, is based on speculative conclusions. As stated in the response to the original comment, the selected remedy would provide an adequate level of shoreline protection that can reasonably accommodate rising sea levels over the next 100 years and will be subject to statutory reviews every 5 years (pursuant to CERCLA) to ensure that it remains protective of human health and the environment. The five-year reviews will consider multiple technical factors, including but not limited to potential rise in sea level.</li> <li>• The reviewer's concern regarding the "dangers of -any- of the soil liquefying" does not acknowledge that the purpose of evaluating liquefaction potential at landfill sites is to quantify the potential vertical and horizontal displacement of soil during an earthquake and to assess whether an appropriate engineered approach can be developed to mitigate potentially unacceptable displacement. Therefore, the reviewer's implication that "any" liquefaction is unacceptable is not consistent with widely accepted engineering practice.</li> <li>• The reviewer's assertion that "even a 2 millimeter hole in such a liner has the potential to allow tens of thousands of gallons per year of water from rainfall to flush outside of the liner" does not acknowledge that landfill liners are typically designed to attain a hydraulic conductivity (such as <math>1 \times 10^{-6}</math> centimeters per second) that is very low but provides tolerable limits for potential infiltration. Further, as stated in Section 12.2.3.6 of the Final RI/FS Report: "Any additional leachate generated by infiltration through defects in the geosynthetic cap would have no significant effect on overall effectiveness of the remedy compared to its current condition, where uncapped landfilled wastes are exposed to infiltration through the existing soil cover."</li> </ul> |

| 4.          | <p>FAILURE TO MEET THE LEGAL PRECAUTIONARY PRINCIPLE ESTABLISHED BY ORDINANCE IN THE SAN FRANCISCO, CALIFORNIA, ENVIRONMENT CODE CHAPTER 1: PRECAUTIONARY PRINCIPLE POLICY STATEMENT (pages 104-105):</p> <p>Your response completely fails to address my citing of the San Francisco Precautionary Principle Ordinance and its relationship to the various hazardous materials which I cited in my comments in this section of the response document, which have no safe level of exposure.</p> <p>Instead, you stated "In addition, the preferred alternative is generally consistent with Proposition P, as explained in the responses to comments from Arc Ecology (see pages 8 and 9 of this responsiveness summary)."</p> <p>Since Proposition P as you cite it, is an entirely different policy which has little or nothing to do with the San Francisco Precautionary Principle Ordinance, your responses in this section are wholly inadequate and do not confirm that your preferred alternative is acceptable. The San Francisco Precautionary Principle Ordinance is clear, and must be strictly followed by the Navy in its cleanup of Parcel E-2.</p> <p>Therefore only a complete removal of all hazardous materials from the cleanup area is acceptable.</p> | <p>The Navy's previous response focused on the substantive portions of the subject comment, which related to potential exposure to chrysotile asbestos, ionizing radiation, and other hazardous materials. As stated in the previous response, the information contained in the administrative record, which includes pertinent regulatory guidance and site-specific input from various stakeholders, demonstrates that the selected remedy for Parcel E-2 would be protective of human health and the environment and comply with all pertinent federal and state ARARs.</p> <p>The Navy wishes to clarify that the precautionary principle, incorporated as a policy statement in Chapter 1 of the San Francisco Environment Code, is a local governmental policy and is not a federal or state statute or promulgated regulation. Therefore, the precautionary principle is not a CERCLA federal or state ARAR for purposes of CERCLA remedy selection in Parcel E-2. In addition, the precautionary principle policy statement, as reflected in Chapter 1 of the San Francisco Environment Code, contains no substantive provisions that would pertain to evaluation and selection of a CERCLA remedial action. The Navy believes that the nine NCP evaluation criteria, which were used to evaluate each remedial alternative for Parcel E-2, adequately capture the elements described in the CCSF's policy statement. Further, the Navy believes that nothing in the cited precautionary principle policy statement would mandate "<i>complete removal of all hazardous materials,</i>" as suggested by the reviewer.</p> |

| <i>Introduction</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                            |
| 1.                  | <p>Arc Ecology, as the community technical advisor to the India Basin Neighborhood Association under their US EPA Technical Assistance Grant (TAG), hired three technical experts, Mark Wheeler (Landfill Expert) Steve Bump, (Radiation Specialist), and Greg Brorby, Toxicologist (Risk Assessment)) to conduct an independent technical review of Parcel E2. Parcel E2 is considered by many to be the most contaminated and controversial parcel in the Navy's Hunter Point Shipyard Cleanup Program.</p> <p>The goal of an "independent" review is to provide an unbiased assessment of the data quality and compliance with "state of the practice" methodology without influence of other parties. It is important to keep in mind that this independent review could only review the Navy's evaluations using existing approved standards of practice, guidances and regulations. The review panel could not conduct independent sampling of soil, water and air, nor could it revise the methods used for assessing remedial risks for Superfund sites. Finally, while members of the review panel were able to analyze the adequacy and recommendations regarding the Navy's Parcel E2 Draft Record of Decision, neither they nor Arc Ecology have any authority to require changes or further actions. Arc Ecology is not a governmental agency.</p> <p>The scope of this work included hiring these technical experts to review relevant Navy documents relating to Parcel E2 (Remedial Investigation/Feasibility Study, Draft Record of Decision, and the Radiological Addendum to the RI/FS). In addition, these three technical experts visited the Parcel E2 site during their technical review of the Navy's documents. Arc Ecology conducted a rigorous due diligence process in hiring these technical experts to ensure a fair and unbiased technical review of the Navy's documents for Parcel E2.</p> <p>Arc Ecology held two community meetings: the first meeting was held on July 10, 2012 at the Bayview Opera House to introduce the technical experts to the community and to also give the community an opportunity to voice their concerns about Parcel E2. The second meeting was again held at the Bayview Opera House on August 8th. At this meeting, the technical experts presented their findings after their in depth review of the Navy's documents</p> | Please refer to the responses to comments provided by Arc Ecology and the independent technical reviewers. |

| 1.<br><i>(cont.)</i>            | for Parcel E2 and identified several recommendations as the Navy moves forward into the Remedial Design/Remedial Action phase for this parcel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <i>(see above)</i>                                                                                                                                                                                               |
| 2.                              | <p>Below is a summary of the technical expert's findings and recommendations, and some responses to community concerns. The technical experts' comment letters can be found at Arc Ecology's website or upon request, Arc Ecology can mail copies of the comment letters to interested parties.</p> <p><b>Landfill (Mark Wheeler)</b></p> <ul style="list-style-type: none"> <li>• Based upon the data collected by the Navy, sufficient knowledge of the nature and extent of contamination supports the proposed remedy of capping and containment.</li> <li>• The capping and containment approach, using an engineering cap and institutional controls, is the most widely used and accepted practice for landfills of this size and general composition of Parcel E2 landfill.</li> <li>• The selected remedy should be capable in providing levels of protection for human health and the environment that meet or exceed environmental regulatory standards.</li> </ul> <p><b>Radiological (Steve Bump)</b></p> <ul style="list-style-type: none"> <li>• The landfill surface has been characterized from a radiological perspective and the proposed remedy is adequately designed to clean up any radiological anomalies at or near the surface.</li> <li>• The interim (current) cap was constructed following the 2000 landfill fire from imported fill which primarily came from a BART excavation and other sources in the Bay Area. Elevated levels above background of radium 226, strontium-90 and Cesium-137 were detected in the imported fill.</li> <li>• Radiological risk is based upon exposure to the radioactive material. The proposed remedy reduces the risk from surface radioactive material by removing all material and then applying a barrier and clean fill. This prevents direct contact with any residual material and provides significant shielding to reduce exposure to radiation from the remaining material.</li> </ul> | The Navy acknowledges the input provided by Arc Ecology and the independent technical reviewers. Please refer to the responses to comments provided by the specific reviewers (provided on the following pages). |

| 4.                              | <p data-bbox="306 412 1121 464"><b>The Technical Experts responding to some of the community concerns about Parcel E2</b></p> <p data-bbox="306 475 942 500"><b>LANDFILL CHARACTERIZATION OF PARCEL E2:</b></p> <ul data-bbox="306 511 1121 1411" style="list-style-type: none"> <li data-bbox="306 511 1121 914">• <b>Is it really municipal waste?</b> Based on the descriptions within the Navy’s Draft ROD and supporting documents, the contents do appear to meet US EPA guidelines for municipal waste and military landfills closed under municipal waste guidance. The Navy reports the landfill waste consists primarily of wood, paper, plastic, metal, glass, nails, foam, copper wire, cloth, rubber, plywood, ceramics, asphalt, concrete, and bricks, which are mixed with sand, clay, and gravel fill. And in addition to municipal-type wastes and construction debris, industrial and military wastes were also disposed of, including sandblast waste, radio luminescent devices, asbestos-containing debris, paint sludge, solvents, and waste oils. The data indicates that the amount of industrial and hazardous waste is less than amount of municipal-type waste and construction debris. As a result the review of data concluded that the Parcel E-2 landfill qualified as a municipal landfill.</li> <li data-bbox="306 922 1121 1149">• <b>Did the Navy adequately assess the effects of earthquake shaking and liquefaction?</b> Based on observations at other landfills in California, engineered landfills can perform as designed during an earthquake. There was only minor damage to Bay Area landfills following Loma Prieta magnitude 6.9 earthquake in 1989. According to the Navy’s reports there was minor cracking of cover soils, no failure of landfill cap resulting in release of landfill materials at Parcel E2 after the 1989 earthquake.</li> <li data-bbox="306 1157 1121 1411">• <b>The Navy only sampled the interim cap, not the landfill. Does this bound the radiological risk?</b> While it is correct that the Navy only scanned the cap of the landfill for radiation, which meant they did not scan survey the interior of the fill, the review finds the Navy nevertheless completed adequate characterization of this landfill. The Navy’s documents indicate 1,000 soil samples taken to assess radiological contamination. There is an adequate historical record and the evidence from early removal actions to confirm the historical records. It also appears unlikely that radioactive debris from the Pacific</li> </ul> | <p data-bbox="1150 412 1990 496">The Navy acknowledges the input provided by Arc Ecology and the independent technical reviewers. | 4.<br>(cont.) | Nuclear Testing program found its way into the E2 landfill as the photographic and record evidence indicates the site was opened for disposal a decade after the US halted the program. The radiological goal for radium the Navy has proposed is very conservative, as it is 5 times lower than the EPA recommended standard.                                                                                                                                               | <i>(see above)</i>                                                                                                                                                                                                                                                                                              |
| 5.            | <b>Next Steps</b><br>The next steps include: <ul style="list-style-type: none"> <li>• Arc Ecology will be submitting the technical experts' written comments to the US EPA on August 10th.</li> <li>• We anticipate that the Navy will be releasing the draft final ROD mid-September 2012 and there will be a 30 day public review period.</li> <li>• The Navy anticipates that they release their remedial design document to the public in the Summer of 2013.</li> </ul> | The Navy welcomes additional input from Arc Ecology and other interested stakeholders as it works to finalize the ROD <sup>8</sup> for Parcel E-2 and prepare the RD document.                                                                                                                                  |
| 6.            | <b>Conclusion</b><br>Again, this is a brief summary of the results of this independent review. The Navy still needs to go through the Remedial Design and Remedial Action process for the Parcel E2 landfill and have stated that they will be conducting public meetings in the Bayview Hunters Point community during this process.                                                                                                                                        | As it does for all cleanup documents for the shipyard, the Navy will make future documents related to the Parcel E-2 cleanup available for public review and comment. The Navy will also continue to engage the local community regarding its cleanup plans for Parcel E-2 (and other parcels at the shipyard). |

| <i>Introduction (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                       |
| --                              | <p>Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California, March 2011 (see above)</p> <ul style="list-style-type: none"> <li>• Draft Record of Decision for Parcel E-2, Hunters Point Naval Shipyard, San Francisco, California, March 2012</li> </ul> <p>The scope of work also included a tour of Parcel E-2 with Martha Walters of Arc Ecology on May 17, 2012. We were accompanied and briefed by representatives of the Navy and their environmental engineering contractor ERRG.</p> <p>My review focused on the following areas of expertise:</p> <ul style="list-style-type: none"> <li>• Nature and extent of landfill waste</li> <li>• Nature and extent of contamination in landfill materials, soils, groundwater, surface water, and groundwater</li> <li>• Geologic and hydrogeologic investigations</li> <li>• Remedial investigation/remedial action methods and results</li> <li>• Landfill and waste site closure, monitoring, and postclosure maintenance programs</li> <li>• Evaluation of remediation alternatives</li> </ul> <p>Third-party technical reviews focused on the health risk and radiological assessments are being provided by two other technical reviewers contracted by Arc Ecology. We shared and discussed our individual findings and comments during the course of the third-party review process. The conclusions of my review were made with consideration of their comments on the health risk and radiological aspects of the project.</p> |                       |
| <i>Summary of Findings</i>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                       |
| 1.                              | The data collected through numerous state-of-the practice investigations and interim remedial actions provide sufficient knowledge of the nature and extent of contamination of the E-2 Parcel to support the evaluation and selection of remedial approaches for the site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Comment acknowledged. |
| 2.                              | The remedial approach selected in the RI/FS and draft ROD is considered to be an appropriate approach for site remediation and is consistent with remedial approaches for similar sites.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Comment acknowledged. |

| <i>Summary of Findings (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                         |
| 3.                                     | The selected remedy should be capable of providing levels of protection for human health and the environment that meet or exceed regulatory standards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Comment acknowledged.                                                                                                                                                                                                                   |
| 4.                                     | Data gaps have been identified that will need to be addressed with supplemental studies during the final remedial design process for the selected remedial approach but these data gaps do not prevent selection of the overall remedial approach.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Comment acknowledged. The Navy is currently developing and implementing plans to address the data gaps necessary to support the RD.                                                                                                     |
| 5.                                     | Capping and containment, using an engineered cap and institutional controls, is the most widely used and accepted practice for landfills of the size and general composition of the Parcel E-2 landfill. The overall plan for capping and containment and the proposed measures to be put in place to protect the ongoing integrity of the cap are generally consistent with industry practice and regulatory requirements. Some specific design elements would require special attention during the final remedial design process and these are noted herein.                                                                                                                                                                                                                            | Comment acknowledged. The Navy has recently performed a geotechnical investigation that will provide information in support of the stability analysis for the landfill.                                                                 |
| 6.                                     | The capping and containment approach has been used at a number of other bay margin disposal sites in the San Francisco Bay Area, where wastes were originally placed directly on tidal marshlands or Bay Mud sediments and where significant portions of the waste fill are now below the elevation of the shallow water table. These disposal sites include the West Contra Costa Class I Hazardous Waste Management Facility in Richmond, the City of Berkeley Landfill, the City of Alameda Landfill, the Westport Landfill in Redwood City, the Oyster Point Landfill in South San Francisco, the Sierra Point Landfill in Brisbane, the West Winton Landfill in Hayward, the City of Palo Alto Landfill, the Highway 237 Landfill in Alviso, and the City of Mountain View Landfill. | Comment acknowledged. The reviewer has identified a number of landfill sites throughout the San Francisco Bay Area that share similar characteristics with the Parcel E-2 Landfill, including the site conditions and closure strategy. |

| <i>Summary of Findings (continued)</i>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                       |
| 7.                                           | <p>Excavation and off-site disposal of the Parcel E-2 landfill, as considered under Alternative 2, would present significant technical and engineering challenges as well as potential health risks during implementation. Excavation and off-site disposal of the landfill under Alternative 2 would present a significantly higher potential risk of exposure of contaminants to site workers, the community, and the environment during implementation than a capping and containment approach. Using the approach described for Alternative 2, it should be technically feasible to excavate and remove most of the landfill materials. However, due to the challenges involved with removing debris and soils from deep excavations in saturated, soft Bay Muds and loose fine-grained sands, it would be very difficult, and possibly not technically feasible, to remove all contaminated debris and soil at and beneath the bottom of the landfill and to be able to reliably demonstrate complete removal. A particular concern would be the ability to drive sheet piles to provide shoring support for the walls of the excavations and limit groundwater infiltration during excavation. Concrete and other landfill debris could obstruct the ability to drive the sheet piles to the required depth for excavation stability.</p> | Comment acknowledged. The Navy agrees with the reviewer's assessment. |
| <i>Specific Comments and Recommendations</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                       |
| 1.                                           | <p><b>Stability Analyses to Support Design of Landfill Capping and Containment Systems</b></p> <p>The Navy studies have provided assessments of (1) the potential for liquefaction and lateral spreading in native sediments beneath the landfill and (2) static and seismic slope stability for the toe berm of the proposed landfill cover for Alternatives 3 - 5. And the Navy has stated that it specifically plans to perform a quantitative slope stability analysis for the toe berm during the final remedial design process:</p> <p>Results of an iterative slope stability analysis determined that a Tensar® UX1500HS or equivalent geogrid with a long-term design tensile strength of 3,100 pounds per foot should be placed under the proposed toe berm, and should extend upslope to an appropriate anchor point within the proposed landfill cap; this conceptual design</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Please see page 99 for the response to this specific comment.         |

| 1.<br>(cont.)                                            | <p>would meet or exceed design standards prescribed in EPA guidance (EPA, 1995b). This geogrid layer was added under the toe berm proposed for Alternative 3 (Figure 12-4). Because the analyses presented in Appendix Q are a qualitative assessment of the proposed toe berm evaluated in the FS, a quantitative slope stability analysis will be performed as part of the RD. The Navy plans to collect soil samples along the base of the proposed toe berm and to perform shear strength tests (and other appropriate geotechnical analyses) to support the quantitative slope stability analysis in the RD. The proposed sampling and geotechnical analyses would be detailed in a work plan to be reviewed by the regulatory agencies prior to implementation (<i>Draft ROD, Section 12.2.3.1, Seismic Design of Containment System</i>).</p> <p>The Navy has made a general indication, in regard to addressing the potential for liquefaction of soils beneath the landfill, that:</p> <p style="padding-left: 40px;">The Navy will further evaluate, including consulting with other technical experts, this very important part of the design to make sure that the final cover is built to withstand the appropriate design earthquake and comply with numerous other regulatory requirements for landfill covers (<i>Draft ROD, p. 2-39</i>).</p> <p>In the responses to comments in the 2004 Landfill Liquefaction Potential report (Conducted by Tetra Tech EM Inc. for the Navy; presented in Appendix C of the RI/FS), there are indications that the overall stability of the landfill and its containment systems, including the sheet pile wall and groundwater barrier/drain system, would be analyzed in the RI/FS (e.g., “It is recognized that the landfill cover is only one component of the closure system. The Landfill RI/FS report will address each element of the closure system,” and “Overall stability of the Landfill will be evaluated by analyzing slope stability analysis. Results of the analysis of slope stability will be presented in the Landfill RI/FS”). Also, the Conclusions section of the report states, “If containment is selected as a remediation measure, response of the Landfill cap, overall stability of the Landfill site, slope stability analysis, and other closure features to prevent lateral movement will be assessed. Results will be presented in the Landfill RI/FS Report.”</p> | Please see page 99 for the response to this specific comment. |

| <i>Specific Comments and Recommendations (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 1.<br><i>(cont.)</i>                                     | <p>However, I have not been able to find indications by the Navy in the Draft ROD or RI/FS that the Navy has specifically evaluated to date, or will evaluate in the final remedial design process, as required by California Code of Regulations (CCR) Title 27 for Class III landfills:</p> <ol style="list-style-type: none"> <li>1. The engineering properties of the waste materials.</li> <li>2. The stability of the landfill waste materials and potential displacement or settlement of waste materials within the landfill prism during earthquake shaking.</li> <li>3. The overall behavior of the landfill and underlying materials during earthquake shaking – the combined effects of potential movement in sediments beneath the landfill and in the landfill materials.</li> <li>4. A stability analysis of the landfill and its existing and proposed containment systems under both static and dynamic conditions.</li> </ol> <p>In order to be consistent with state-of-the-practice procedures conducted for landfill capping and containment in California, the Navy should commit to addressing the four topics listed above, along with other CCR Title 27 Section 21750(f)(5) requirements for stability analyses, during the final remedial design process.</p> | <p>The Navy will perform, as part of the RD, a comprehensive static and seismic slope stability evaluation for the Parcel E-2 Landfill to ensure that the proposed design can, consistent with the requirements of Cal. Code Regs., tit. 22 § 66264.310(a)(5), accommodate the inertial forces generated by the maximum credible earthquake while maintaining the integrity of the landfill and the cover system. This evaluation will address the four technical factors identified by the reviewer in this comment, and will be consistent with state-of-the-practice for landfill cover designs in California. The Navy wishes to clarify that, consistent with the evaluation presented in Appendix N of the Final RI/FS Report, Cal. Code Regs., tit. 22 § 66264.310(a)(5) was identified as the controlling ARAR for seismic design and therefore Cal. Code Regs., tit. 27 § 21750(f)(5) is not an ARAR for the selected remedy. However, in as much as the detailed requirements at Cal. Code Regs., tit. 27 § 21750(f)(5) serve to inform landfill cover designs at other California landfills, the Navy will consider these requirements in performing the comprehensive stability evaluation for the Parcel E-2 Landfill.</p> |
| 2.                                                       | <p><b>Assessment of Ability to Mitigate Potential Seismic Damage to Landfill Capping and Containment Systems</b></p> <p>The RI/FS and Draft ROD do not adequately assess the potential magnitude or effects of a release of landfill materials caused by failure of the various components of the proposed containment system. As noted above, analyses were performed of the stability and potential movement of subsurface soils, but not of the landfill materials. Comments were made regarding the ability of an engineered cover system to accommodate settlement of subsurface soils<sup>1</sup> and of the potential to prevent failure of the toe berm during liquefaction by incorporating a geogrid layer.<sup>2</sup> However, a scenario addressing potential failure of the cover system due to the overall stability of subsurface soils and landfill materials during seismic shaking was not evaluated.</p>                                                                                                                                                                                                                                                                                                                                                             | <p>As described in the response to specific comment 1, the Navy will perform, as part of the RD, a comprehensive slope stability evaluation for the Parcel E-2 Landfill. This evaluation will address the four technical factors identified by the reviewer in specific comment 1, and will be consistent with state-of-the-practice for landfill cover designs in California.</p> <p>The Navy wishes to clarify that the stability evaluation provided in the Final RI/FS Report for the toe berm was preliminary and focused on what the Navy believes to be the most critical slope (where the landfill abuts San Francisco Bay). The Navy has recently performed a geotechnical investigation in this area to provide data to support the RD, which will be incorporated into the comprehensive slope stability evaluation (including the results of additional liquefaction analyses). The Navy has previously, as part of previous investigations summarized in the Final RI/FS Report, collected sufficient data in other areas surrounding and underlying the Parcel E-2 Landfill.</p>                                                                                                                                          |

| <i>Specific Comments and Recommendations (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 2.<br>(cont.)                                            | <p>The ability of a containment approach to successfully prevent exposure of waste materials in the E-2 landfill to the community and the environment is one of the main concerns expressed by the community. The RI/FS and draft ROD indicate that the Navy will do appropriate additional studies and that the design of the cover and other features of the containment system will be addressed during final remedial design. These studies should be performed in conjunction with the stability analyses recommended in the preceding comment and should assess the nature of potential failures to the capping and containment caused by the predicted movement of the subsurface soils and landfill materials. The final cover and other components of the containment system should be designed to withstand the combined effects of liquefaction in subsurface soils and lateral movement and settlement of the overlying landfill materials.</p> <p><sup>1</sup> (Conclusions section of the 2004 Landfill Liquefaction Potential report, presented in Appendix C of the RI/FS)</p> <p><sup>2</sup> (Conclusions and Recommendations section of the Qualitative Slope Stability Evaluation, presented in Appendix Q of the RI/FS)</p> | <i>(see above)</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 3.                                                       | <p><b>Design Earthquake for Final Quantitative Slope Stability Analysis to be Performed</b></p> <p>The design earthquake to be used in the final quantitative slope stability analysis to be performed during the final remedial design process should be the Maximum Credible Earthquake (MCE) rather than the Maximum Probable Earthquake (MPE), which was used in the 2004 Landfill Liquefaction Potential study. Use of the MCE for cover design was determined to be “Relevant and appropriate” in the determination of Applicable or Relevant and Appropriate Requirements (ARARs), as stated in the Draft ROD, Attachment 4. (p. 15) and in Section 10.3.1 of the RI/FS.</p> <p>The determination for the requirement that “The final cover shall accommodate lateral and vertical shear forces generated by the maximum credible earthquake so that the integrity of the cover is maintained” cited California Code of Regulations, Title 22 §66264.310(a)(5), which is under Division 4.5. Environmental Health Standards for the Management of</p>                                                                                                                                                                                     | <p>As described in the response to specific comment 1, the Navy will perform, as part of the RD, a comprehensive static and seismic slope stability evaluation for the Parcel E-2 Landfill to ensure that the proposed design can, consistent with the requirements of Cal. Code Regs., tit. 22 § 66264.310(a)(5), accommodate the inertial forces generated by the MCE while maintaining the integrity of the landfill and the cover system. The Navy will perform a seismic hazard evaluation to estimate the ground motion parameters associated with the MCE.</p> <p>The Navy wishes to clarify that the Draft ROD referred to the MPE to ensure consistency with the terms used in the 2004 report that evaluated liquefaction potential at the Parcel E-2 Landfill. As described in that report, and repeated in this comment, “the maximum credible earthquake (MCE) and MPE would yield the same results.” Specifically, for design earthquakes on the San Andreas Fault near San Francisco, there is not usually a significant difference between the MPE and the MCE because (1) the 1906 San Francisco Earthquake was approximately the MCE of the controlling portion of the San</p> |

| 3.<br>(cont.)                                            | <p>Hazardous Waste, Chapter 14. Standards for Owners and Operators of Hazardous Waste Transfer, Treatment, Storage, and Disposal Facilities, Article 14. Landfills.</p> <p>The MCE is the maximum earthquake that appears capable of occurring under the presently known geologic framework whereas the MPE is the maximum earthquake that is likely to occur during a 100 year interval. [Use of the MPE is required for landfill stability analyses and cover design by Title 27 regulations for Class III (nonhazardous) landfills, but this requirement is superseded by the ARAR to use the MCE per Title 22 §66264.310(a)(5), as noted above].</p> <p>In the response to comments appendix of the 2004 Landfill Liquefaction Potential study, the study cited the Title 27 Class III landfill regulations as the regulatory requirement for using the MPE rather than the MCE. However, the responses also stated that for Parcel E-2, the MCE and the MPE are the same. The responses stated that: “The M7.9 1906 San Francisco earthquake was selected as the MPE. This M7.9 earthquake was the largest historical earthquake recorded,” and that “the maximum credible earthquake (MCE) and MPE would yield the same results.”</p> <p>So, while the study indicated that the MPE and the MCE are the same, the final quantitative slope stability analysis to be performed during the final remedial design process should be MCE, not the MPE, in order to address the ARAR determination.</p> | <p>Andreas Fault, and (2) requirements for calculating the MPE require that the largest historical earthquake be used (in lieu of the calculated MPE) if it is larger than the calculated MPE.</p> <p>As stated previously, the Navy will perform a comprehensive static and seismic slope stability evaluation for the Parcel E-2 Landfill to ensure that the proposed design can, consistent with the requirements of Cal. Code Regs., tit. 22 § 66264.310(a)(5), accommodate the inertial forces generated by the MCE.</p> |
| 4.                                                       | <p><b>Characterization of the Landfill Waste as Primarily Municipal-Type Waste and Construction Debris</b></p> <p>The Navy and its consultants have stated the following:</p> <p>The Navy installed 28 soil borings and 18 monitoring wells and excavated 25 test pits within the Parcel E-2 Landfill to evaluate the nature and extent of contamination. Based on these investigations, the Navy determined that contiguous solid waste in the Parcel E-2 Landfill is composed primarily of municipal-type waste and construction debris. In addition to municipal-type waste and construction debris, historic information indicates that industrial wastes were also disposed</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Comment acknowledged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <i>Specific Comments and Recommendations (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                    |
| 4.<br>(cont.)                                            | <p>of in or around the Parcel E-2 Landfill, including sandblast waste, radioluminescent devices, asbestos-containing debris, paint sludge, solvents, and waste oils. The characterization data suggest that the quantity of industrial waste within the Parcel E-2 Landfill is less than the quantity of municipal-type waste and construction debris (<i>Draft ROD, Section 2.3.1. Solid Waste and Soil in the Parcel E-2 Landfill</i>).</p> <p>Based on data from 26 soil borings, 12 monitoring wells, and 25 test pits extended within the Landfill Area, solid waste in the landfill is primarily municipal-type waste and construction debris. The solid waste includes wood, paper, plastic, metal, glass, asphalt, concrete, and bricks that are mixed with sand, clay, and gravel fill. Historic information indicates that industrial wastes, including sandblast waste, radioluminescent devices, asbestos-containing debris, paint sludge, solvents, and waste oils, were also disposed of in or around the Landfill Area...(<i>RI/FS, Section 2.1.1. Landfill Area</i>).</p> <p>The nature and extent of solid waste at the Parcel E-2 Landfill was evaluated based on the physical presence of contiguous industrial or municipal-type wastes. Based on a review of soil borings drilled in the central portion of the landfill from 1988 to 1992, landfill waste consists of wood, paper, plastic, metal, glass, nails, foam, copper wire, cloth, rubber, plywood, ceramics, asphalt, concrete, and bricks, which are mixed with sand, clay, and gravel fill. The waste is usually brown to black. In many areas within the landfill, the waste is mixed with construction debris (<i>RI/FS, Section 4.2.1. Fill and Solid Waste Characteristics</i>).</p> <p>Direct evidence of deposition of military waste in the E-2 Landfill was also obtained, as discussed below.</p> <p>Information on the waste types encountered within the Landfill Area was obtained during remediation activities within the PCB Hot Spot Area, which extended into a small portion the Landfill Area (see Figure 1-3). Out of a total excavation volume of 44,500 cubic yards, 533 cubic yards of soil and fire brick was segregated as radiologically impacted. Also, 40 radiological devices, 78 cubic yards of metal</p> | <i>(see above)</i> |

| 4.<br>(cont.)                                            | <p>debris, and 19 pieces of other radioactively contaminated debris were identified within the removal area (TtECI, 2007a). In addition, 41 pieces of MPPEH were encountered in the excavation area, consisting primarily of expended cartridge casings of various calibers and protective caps, but also included an empty 5-inch practice projectile and a 3-pound practice bomb (TtECI, 2010) (<i>RI/FS, Section 4.2.1. Fill and Solid Waste Characteristics</i>).</p> <p>For this review, the descriptions of waste materials encountered in borings and test pits in the E-2 landfill and in other waste disposal areas in Parcel E-2 were compiled (see Attachment A) and reviewed. The descriptions of the waste encountered support the statements and conclusions cited above. As defined by USEPA<sup>3</sup>, most of the waste materials described in the logs of the Parcel E-2 borings and test pits can be considered municipal-type waste and construction debris. Municipal waste may include industrial wastes as well as household and commercial wastes.</p> <p><sup>3</sup> <a href="http://www.epa.gov/reg3wcmd/solidwastesummary.htm#waste">http://www.epa.gov/reg3wcmd/solidwastesummary.htm#waste</a></p> | <i>(see above)</i>    |
| 5.                                                       | <p><b>Application of the Presumptive Remedy for CERCLA Landfills</b></p> <p>The Navy’s proposed remedial measure for the Parcel E-2 Landfill is based on specific criteria established in the USEPA directive “Presumptive Remedy for CERLCA Municipal Landfill Sites,” which establishes containment as the presumptive remedy for CERCLA municipal landfills. The USEPA directive, “Application of the CERCLA Municipal Landfill Presumptive Remedy to Military Landfills,” clarifies when the application of the containment presumptive remedy is appropriate for landfills found at military installations. Based on my review of these USEPA directives and the rationale presented by the Navy in following these directives, selection of containment as the remedial measure for the Parcel E-2 Landfill is consistent with the USEPA guidance.</p>                                                                                                                                                                                                                                                                                                                                                                       | Comment acknowledged. |

| 6.                                                       | <p><b>Biointrusion Deterrence for the Proposed Landfill Cap</b></p> <p>To address the question of whether or not the proposed landfill cap design provides adequate deterrence to penetration by burrowing animals, the Navy should provide a summary of the performance to date of the existing geocomposite landfill cap that was constructed in 2000-2001. This performance summary should describe the experience with any burrowing animals and should answer the questions:</p> <ul style="list-style-type: none"> <li>• Have there been any penetrations of the surface soil by burrowing animals over the last 11 years?</li> <li>• If so, did any of these burrows penetrate the geocomposite drainage layer, the HDPE membrane liner, or the geosynthetic clay liner?</li> <li>• If there were penetrations of the geocomposite layer, is there documentation of the repairs made?</li> </ul> <p>If animal burrow penetrations into the vegetative soil layer were observed, but it was not determined whether the geocomposite layers were penetrated, the Navy should investigate those areas and determine if there was damage to the geocomposite layers.</p> | <p>As described in Section 3.9.4 of the Final RI/FS Report, the Navy performs regular inspection and maintenance of the interim landfill cover, in accordance with a 2003 O&amp;M Plan (Tetra Tech EM Inc., 2003), and prepares annual reports to document the results of the ongoing inspections and maintenance. Results to date indicate that the landfill cap is being properly maintained in accordance with the O&amp;M Plan. Animal burrows have been noted near the ground surface during previous inspections and, consistent with the O&amp;M Plan, have been addressed as follows:</p> <ul style="list-style-type: none"> <li>• First, the disturbed areas are visually inspected to assess whether the animal burrows extend to a depth where the geomembrane could be damaged (18 inches bgs) and to note any exposed geomembrane material. Based on the inspection results to date, there have been no observed instances when animal burrows have extended to a depth where the geomembrane could be damaged, and there have been no noted observations of exposed geomembrane material.</li> <li>• Second, the burrow is filled with surrounding soil and the existing sonic devices (designed to deter burrowing animals) are inspected and, if necessary, repositioned. Based on the inspection results to date, these actions have been generally successful in controlling, but not eliminating, the number of animal burrows near the ground surface.</li> </ul> <p>In August 2012, the Navy performed a supplemental field inspection to excavate areas with animal burrows near the ground surface. The intrusive inspection determined that the animal burrows did not extend deeper than 7 inches bgs, which corresponds to the depth of more loosely compacted topsoil on the interim landfill cover (with the underlying 11 inches of the vegetative soil layer being more firmly compacted and more difficult for animals to burrow through). The findings from the supplemental field inspection are consistent with the previous visual inspections, performed in accordance with the 2003 O&amp;M Plan, and indicate that the animal burrows have not extended to a depth that could result in damage to the geomembrane.</p> |

| <i>Specific Comments and Recommendations (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 7.                                                       | <p><b>Monitoring and Maintenance Program for the Landfill Cap</b></p> <p>The final monitoring and maintenance program developed for the landfill cap should be based on experience to date with biointrusion issues, and any other issues noted in the performance. Specifically, the determination of the frequency of landfill cover inspections should consider the interval of time necessary to observe and prevent biointrusion of the geocomposite layers from exposing soil and waste materials beneath these layers.</p> | <p>The Navy will prepare a post-closure operation and maintenance plan (in conjunction with the RD) that will identify the pertinent inspection and maintenance actions, including those related to animal burrows. The Navy will use their experience to date in maintaining the interim landfill cover to develop a comprehensive set of inspection and maintenance procedures for the final landfill cover. The post-closure operation and maintenance plan will be submitted for review and approval by the EPA, DTSC, and the Water Board in conjunction with the RD.</p> |
| 8.                                                       | <p><b>On-Going Third Party Review</b></p> <p>I recommend that the Navy provide for third-party technical review during the final remedial design process in order to provide the community with assurances that the technical issues are being appropriately addressed and that adequate safeguards to protect public health and the environment are incorporated in the design.</p>                                                                                                                                              | <p>Comment acknowledged. The Navy welcomes additional input from community members and other interested stakeholders, in addition to the technical input received from the EPA, DTSC, Water Board, and the CCSF. As with all HPNS cleanup documents, the RD will be made available for public review through the local information repositories (at the San Francisco main library and the HPNS project trailer on Hudson Street), and will be submitted to Arc Ecology's technical representative.</p>                                                                        |

| <i>Introduction</i>     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| --                      | <p>This letter presents the results of my review of specific sections of the <i>Draft Record of Decision for Parcel E-2, Hunters Point Naval Shipyard, San Francisco, California</i> (Draft ROD), dated March 2012, and the <i>Final Remedial Investigation/Feasibility Study Report for Parcel E-2, Hunters Point Shipyard, San Francisco, California</i> (Final RI/FS), dated May 2011. These reports were prepared on behalf of the U.S. Navy (the Navy) by Engineering/Remediation Resources Group, Inc (ERRG). Specifically, my review focused on sections pertaining to human health risk (i.e., Sections 2.5, 2.7, 2.8, and portions of 2.9 of the Draft ROD, and Section 7, portions of Sections 8-10, and 12-14, and Appendixes A and K of the Final RI/FS). In addition, I reviewed other sections of the reports that pertain to the human health risk assessments, as indicated below. It should be noted that this review did not include a rigorous assessment of the information presented in the tables, or any verification of the risk assessment calculations. To the extent that I noticed discrepancies between information presented in the text versus information presented in the tables during my review, these discrepancies are indicated below.</p> | <p>Please refer to the following pages for responses to comments provided by ToxStrategies.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 1.                      | <p>The human health risk assessment (HHRA) conducted as part of the RI was done in general accordance with regulatory guidelines and the current state of the practice. Excess cancer risks and noncancer hazard indexes were estimated for a future recreational user (exposure to soil), construction worker (exposure to soil and groundwater), and resident (domestic use of groundwater). Several comments regarding the risk assessment methodology or assumptions are provided below; however, the most significant comment is that the fish ingestion pathway was not included in the risk assessment even though the conceptual model presented in the RI identifies this as a “primary” exposure pathway.” Given the current nature and extent of groundwater contamination and the likelihood that contaminated groundwater is migrating toward the San Francisco Bay,</p>                                                                                                                                                                                                                                                                                                                                                                                            | <p>Please refer to the responses to specific comments on the Draft ROD<sup>9</sup> and Final RI/FS Report. Regarding the general comment regarding the “fish ingestion pathway,” the Navy wishes to clarify the following points:</p> <ul style="list-style-type: none"> <li>The reviewer refers to the generalized conceptual site model presented in Section 6, but does not refer to the more detailed information presented in Section 7 regarding the HHRA methodology and results. Consistent with information on page 6-1 of the Final RI/FS Report, Figure 6-3 is a generic flow chart of potential migration pathways and human and ecological receptors. This generic flow chart is based on information presented in EPA RI/FS guidance for CERCLA landfills (EPA, 1991a). This generic flow chart was not intended to identify the potentially complete exposure</li> </ul> |

| <i>General Comments (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1.<br>(cont.)                       | this pathway should have been quantitatively evaluated in the HHRA, or the exclusion of this pathway more fully justified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>pathways for the Parcel E-2 HHRA (which is presented in Table 7-1 of the Final RI/FS Report).</p> <ul style="list-style-type: none"> <li>• The Parcel E-2 HHRA focused on potentially complete exposure pathways to soil and groundwater at Parcel E-2. The evaluation of potential exposures in the property offshore of Parcel E-2, which is owned by the Navy and is referred to as Area X in Parcel F, was performed separately. Specifically, Area X in Parcel F was previously investigated by the Navy, and included an evaluation of potential risks to humans and wildlife. The Navy summarized the characterization and risk assessment results in a Validation Study Report (Battelle and others, 2001), and evaluated remedial alternatives in an FS Report (Barajas &amp; Associates, Inc., 2008). The Validation Study Report included a HHRA that identified potentially unacceptable risks from consumption of shellfish in Area X in Parcel F.</li> <li>• The Navy performed a screening-level assessment of potential ecological risk to aquatic wildlife exposed to potentially contaminated groundwater at Parcel E-2. This evaluation, which used conservative fate and transport modeling and compared the results against promulgated surface water quality standards, was presented in Appendix M of the Final RI/FS Report.</li> </ul> <p>The Navy believes that the previous evaluations provide an adequate basis upon which to develop RAOs, evaluate remedial alternatives, and select a final remedy for Parcel E-2.</p> |
| 2.                                  | The FS includes an assessment of the long-term and short-term effectiveness of the proposed remedial alternatives. While these assessments are generally qualitative in nature, it is still incumbent on the Navy to provide sufficient information such that the potential human health risks associated with each alternative can be adequately compared. In this case, the information presented regarding the short-term effectiveness of the various alternatives is inadequate, particularly for Alternative 2, which entails excavation of the entire landfill at Parcel E-2. The Navy acknowledges that there is significant uncertainty in the waste types that could be encountered during such a large excavation, yet provides | <p>The Navy does not agree with the reviewer's assertion that the information presented regarding short-term effectiveness is inadequate. The Final RI/FS Report properly evaluated the short-term effectiveness of each remedial alternative consistent with the requirements specified in the NCP. Specifically, Title 40 CFR § 300.430(e)(9)(iii)(E) requires that the short-term effectiveness of each remedial alternative be assessed considering the following:</p> <ul style="list-style-type: none"> <li>• Short-term risks that might be posed to the community during implementation of an alternative;</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <i>General Comments (continued)</i>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 2.<br>(cont.)                                        | <p>very little discussion regarding the potential short-term risks to workers and the surrounding community. In fact, there is no mention in this section of the 1997 incident when pressurized gas was released during installation of a sheet pile wall in the Landfill Area. It is unclear from the information provided whether there is sufficient data to adequately assess the short-term risks associated with this alternative.</p>                                                                                                                                                                                                                 | <ul style="list-style-type: none"> <li>• Potential impacts on workers during remedial action and the effectiveness and reliability of protective measures</li> <li>• Potential environmental impacts of the remedial action and the effectiveness and reliability of mitigative measures during implementation; and</li> <li>• Time until protection is achieved</li> </ul> <p>Section 13.2.5 of the Final RI/FS Report evaluates the short-term effectiveness of Alternative 2, and includes a narrative description of the available information relative to the factors specified in the NCP. Specifically, Section 13.2.5 includes the following statement: “<i>The proposed removal of all solid waste and soil within the Parcel E-2 Landfill presents the most acute risk to site workers relative to other actions proposed under Alternative 2.</i>” The Navy believes that this statement, which is supported with additional information in Section 13.2.5, adequately summarizes the potential short-term risks of Alternative 2. In addition, Section 4.2.1 provides the available information regarding the release of pressurized gas during the installation of the sheet-pile wall at Parcel E-2. The available information identifies an isolated instance where a potential hazard to site workers was identified and properly mitigated in the field. While this instance provides context for the Navy’s determination of potential “acute risk to site workers” during implementation of Alternative 2, the Navy does not believe that it is necessary to repeat this previous description in Section 13.2.5 of the Final RI/FS Report.</p> |
| <i>Specific Comments on Draft Record of Decision</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 1.                                                   | <p>Section 2.5.1, p. 2-19 – As shown in Table 3, the estimated cancer risk associated with vapor intrusion of landfill gas under a residential scenario is 6 in 10 million (or 0.6 in 1 million). The non-methane organic chemicals (NMOC) action level of 500 parts per million by volume (ppmv) is purportedly intended to ensure that the cancer risks remain less than 1 in 1 million. However, as discussed in Section 8.3.3 of the Final RI/FS, at the time this value was developed, field measurements for NMOCs ranged up to 51 ppmv, and thus a 10-fold increase in NMOC concentrations (to 500 ppmv) could theoretically be associated with a</p> | <p>Section 4.1.2.2 of the Final RI/FS Report describes the field and laboratory data (and associated risk evaluation results) used to develop the 500 ppmv action level for NMOCs in soil gas. This information was briefly summarized in Section 2.5.1 and Table 3 of the Draft ROD; however, in the process of summarizing the available information, some important details were omitted. Specifically, Section 4.1.2.2 of the Final RI/FS Report states that:</p> <ul style="list-style-type: none"> <li>• For laboratory results from GMPs along Crisp Avenue, ELCRs ranged from <math>6.4 \times 10^{-7}</math> to <math>2.0 \times 10^{-8}</math> for a residential exposure scenario.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <i>Specific Comments on Draft Record of Decision (continued)</i> |                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 1.<br><i>(cont.)</i>                                             | cancer risk of 6 in 1 million, not less than 1 in 1 million. Please provide additional rationale for the 500 ppmv action level.                                                                                                                        | <ul style="list-style-type: none"> <li>• For laboratory results from GMPs in the UCSF compound, ELCRs ranged from <math>4.0 \times 10^{-7}</math> to <math>8.8 \times 10^{-9}</math> for an industrial exposure scenario.</li> <li>• These estimated risks are an order of magnitude below the NCP point of departure of <math>10^{-6}</math> [Title 40 CFR § 300.430(e)(2)(i)(A)(2); 55 Federal Register 8848 (1990)].</li> </ul> <p>Section 2.5.1 and Table 3 of the ROD were revised to (1) identify the maximum estimated cancer risks for NMOCs in soil gas based on both residential and industrial exposure scenarios, and (2) clarify that the 500-ppmv action level for NMOCs in soil gas helps ensure that cancer risks and noncancer hazards remain within acceptable limits (such as the NCP point of departure of <math>10^{-6}</math>). The Navy believes that this information is adequate to describe the basis for the 500 ppmv action level for NMOCs in soil gas, which is consistent with the action level used since January 2004 as part of the interim landfill gas monitoring program for Parcel E-2. Further, the Navy wishes to clarify that (1) the 500 ppmv action level for NMOCs has not been exceeded during monthly monitoring performed since January 2004, and (2) the selected remedy includes active landfill gas extraction and treatment, which will be more robust than the current interim gas control system and will ensure that methane and NMOCs emanating from the landfill continue to be properly controlled. In addition, the Navy has initiated a pre-design investigation that will include collection and laboratory analysis of gas samples from the Parcel E-2 Landfill, the East Adjacent Area, and the Panhandle Area. The laboratory data will be correlated with field measurements for NMOCs and will help verify the adequacy of the 500 ppmv action level for NMOCs.</p> |
| 2.                                                               | Section 2.5.3, p. 2-21 – What is the basis for defining hot spot goals at 10 or 100 times the remediation goals for near shore and upland hot spots, respectively (as opposed to 3 and 10, or other multiplying factors, times the remediation goals)? | The Final RI/FS Report, consistent with EPA 1991 guidance, defined hot spots as highly toxic or highly mobile material that may present a principal threat to human health or the environment (EPA, 1991c). Section 4.1.3.4 of the Final RI/FS Report presented the following rationale for the hot spot criteria (greater than 100 times the RIEC) used in the nature and extent evaluation: (1) for most carcinogenic chemicals, the RIEC corresponds to an approximate ELCR of $1 \times 10^{-6}$ ; (2) a concentration that is 100 times the RIEC would correspond to an approximate ELCR of $1 \times 10^{-4}$ ; and (3) concentrations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <i>Specific Comments on Draft Record of Decision (continued)</i> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2.<br>(cont.)                                                    | <i>(see above)</i> | <p>greater than 100 times the RIEC would be considered outside of the acceptable risk range and, by extension, are a reasonable basis for assessing “highly toxic” material.</p> <p>The RIEC used in the nature and extent evaluation were generally consistent with the risk-based concentrations used to develop the remediation goals for Parcel E-2. Accordingly, the Navy developed hot spot goals using a similar rationale for identifying areas with “highly toxic” material. In addition, the hot spot goals considered the following two factors, described in Section 12.1.6 of the Final RI/FS Report, to identify “highly mobile” material: (1) the potential for soil hot spots to be a continuing source to groundwater contamination (e.g., chemicals that were identified in both soil and groundwater at concentrations exceeding RIECs); and (2) the proximity of the potential hot spot relative to San Francisco Bay (which increases the likelihood of its effect on aquatic wildlife).</p> <p>In order to conservatively identify areas where “highly mobile” material was potentially present, the Navy developed hot spot goals that were an order of magnitude lower than the hot spot criteria used to identify “highly toxic” material (i.e., 10 times the remediation goal instead of 100 times the remediation goal). Section 12.1.6 of the Final RI/FS Report, which was included as an electronic reference to the Draft ROD, further describes the process of identifying nearshore hot spots (referred to in the Final RI/FS Report as either Tier 1, Tier 2, or Tier 4 hot spots) and inland hot spots (referred to in the Final RI/FS Report as either Tier 3 or Tier 5 hot spots).</p> <p>Upon completion of excavation and achievement of the hot spot goals pursuant to the ROD, the Navy will construct the cover pursuant to the remedy selected in the ROD in order to achieve the final remediation goals through breaking the pathway of potential exposure. Institutional controls, consisting of land use and activity restrictions, would also be implemented to prevent exposure to potential residual contamination in soil left in place and to preserve the integrity of the soil cap. These actions will ensure the protection of human health and the environment.</p> |

| <i>Specific Comments on Draft Record of Decision (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 3.                                                               | Section 2.5.3, p. 2-23, Table 4 – Why is a terrestrial remediation goal used as the basis for the upland hot spot goal for lead when the value based on the recreational scenario is lower (see Table 5 on p. 2-27)?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | As described in Attachment K5 of the Final RI/FS Report, and acknowledged in specific comment 20 on the Final RI/FS Report, the risk-based concentration of 155 mg/kg corresponds to a residential exposure scenario that was conservatively used to evaluate the recreational exposure scenario. This conservative assumption was developed and applied to HHRAs throughout HPNS, but does not correspond to the future recreational use of Parcel E-2. Accordingly, in developing the hot spot goals for lead, the Navy considered the remediation goals for terrestrial wildlife (197 mg/kg for onshore soil) and aquatic wildlife (218 mg/kg for shoreline sediment) as more appropriate bases for the hot spot goals. |
| 4.                                                               | Section 2.7, p. 2-26 – What is the basis of the 5 ppmv remedial action objective (RAO) for NMOCs in the breathing zone of on-site workers and visitors?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | The 5 ppmv action level for NMOCs in the breathing zone of site workers and visitors is consistent with health and safety criteria identified in the Interim Landfill Gas Monitoring and Control Plan (TtEMI and ITSI, 2004). These existing monitoring criteria were also discussed in Table 4-23 of the Final RI/FS Report, and were subsequently used in developing an RAO that will inform the long-term monitoring program at Parcel E-2.                                                                                                                                                                                                                                                                             |
| 5.                                                               | Section 2.8.2 – p. 2-34 – Insufficient information is provided to assess the relative short-term effectiveness of the remedial alternatives. While it is noted that Alternative 2 could result in increased exposure to dust, noise, and construction traffic and take twice as long as other alternatives, no information is provided as to the risks, if known, of excavating the material in the landfill relative to leaving it in place. Some additional information along these lines was provided in the Final RI/FS; however, as noted below, this additional information is still fairly limited and insufficient to fully evaluate the remedial alternatives. The release of pressurized gas during installation of the sheet-pile wall in the Landfill Area in 1997 is a good example as to the type of information that should be discussed as part of this analysis (see Section 4.2.1 of the Final RI/FS). | As described in the response to general comment 2, the Navy does not agree with the reviewer's assertion that the information presented regarding short-term effectiveness is insufficient. The Final RI/FS Report properly evaluated the short-term effectiveness of each remedial alternative consistent with the requirements specified in the NCP. Please see the response to general comment 2 for further information in support of the Navy's position.                                                                                                                                                                                                                                                             |

| <i>Miscellaneous Comments on Draft Record of Decision</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1.                                                        | Section 2.5.1, p. 2-17 – Please add a reference to Appendix A of the RI/FS report, which is where the vapor intrusion portion of the HHRA is documented.                                                                                                                                                                                                                                                                                                           | Section 2.5.1 (specifically, page 2-19) of the Draft ROD already includes an electronic reference to Section 4.1.2.2 of the Final RI/FS Report, which describes the risk assessment results for NMOCs in soil gas. This electronic reference also provides details on where additional information can be found (specifically, in Appendices A and F of the Final RI/FS Report).                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 2.                                                        | Section 2.5.1, p. 2-19 – Footnote b to Table 3 states that there are no complete exposure pathways for planned open space reuse. While that may be true for direct contact with groundwater, it is theoretically possible that future recreational users could be exposed to landfill gas or vapors from groundwater emanating into outdoor air (analogous to the evaluation of soil-to-outdoor air pathway included in the risk assessment of chemicals in soil). | Table 7-1 in the Final RI/FS Report identifies the potentially complete exposure pathways evaluated in the HHRA. This table indicates that inhalation of volatile chemicals in subsurface soil and groundwater is not a complete exposure pathway for future recreational users. This assumption is consistent with other HHRAs performed at HPNS. This assumption would also apply to potential exposures to NMOCs in soil gas for future recreational users; however, as described in the response to specific comment 1 on the Draft ROD, the Navy has developed a 500 ppmv action level for NMOCs in soil gas, which will ensure that potential exposure to NMOCs emanating from the landfill is properly controlled (for both future recreational users of Parcel E-2 and users of property adjacent to Parcel E-2). |
| 3.                                                        | Section 2.5.3, p. 2-21 – The text states, “An area was identified that appears to be a continuing source of VOCs to groundwater. Although this source area does not pose a risk to future recreational users at Parcel E-2...” What is the basis for this latter statement given that, as noted above, the groundwater to outdoor air pathway was not evaluated in the HHRA?                                                                                       | As described in the above response, inhalation of volatile chemicals in groundwater is not a complete exposure pathway for future recreational users. This assumption is specified in Table 7-1 in the Final RI/FS Report and is consistent with other HHRAs performed at HPNS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <i>Specific Comments on Final RI/FS</i> |                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 1.                                      | Section 3.6.6, p. 3-20 – Although another expert is reviewing the historical radiological assessment (HRA) in more detail, some discussion as to why elevated levels of radioactivity were measured over the surface of the entire area, including the landfill cap, seems warranted.                                                                                                           | <p>Please refer to the responses to comments provided by Dade Moeller (the technical reviewer who focused on radiological issues).</p> <p>Regarding the request to modify the Final RI/FS Report, the Navy wishes to clarify that it has responded to all comments received on the draft and draft final versions of the RI/FS Report, and the document was finalized in May 2011, in accordance with Section 7.9 of the HPNS FFA (Navy, DTSC, and Water Board, 1991). As described in Section 7.10 of the FFA, there are specific technical requirements for any request by an FFA signatory (which includes EPA, DTSC, and the Water Board) to modify a final primary document (such as the RI/FS Report for Parcel E-2). The Navy has not received any such requests from an FFA signatory endorsing and requesting modifications of the Final RI/FS Report. In addition, the Navy has published a Proposed Plan identifying the preferred alternative for Parcel E-2 based on the information presented in the Final RI/FS Report. No comments were received on the Proposed Plan that warranted reevaluation of the information in the Final RI/FS Report. Accordingly, the Navy will not make any adjustments to the Final RI/FS Report based on this comment.</p> |
| 2.                                      | Section 3.8.8, p. 3-32 – The description of the PCB Hot Spot Area suggests that this area was also a “landfill” (e.g., fire brick, 100 drums, 537 assorted waste containers), albeit much smaller than the main landfill at Parcel E-2 (but seemingly too big to be considered an area of “isolated waste”). Why isn’t this area also evaluated as a landfill for purposes of remedy selection? | <p>The Final RI/FS Report presents adequate information to support the delineation of the contiguous solid waste that distinguishes the Parcel E-2 Landfill from the isolated solid waste found in the PCB Hot Spot Area (and elsewhere in the East Adjacent Area, Panhandle Area, and Shoreline Area). Section 4.1.1 of the Final RI/FS Report describes the specific data indicating that solid waste in the Panhandle, East Adjacent, and Shoreline Areas was isolated and not contiguous with the Parcel E-2 Landfill. This information includes Figure 4-1 that identifies specific borings and test pits in the Panhandle, East Adjacent, and Shoreline Areas.</p> <p>As discussed in the response to specific comment 1 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment because (1) the Navy has not received any requests from an FFA signatory endorsing and requesting modifications of the Final RI/FS Report which, per the requirements of Section 7.10 of the HPNS FFA (Navy,</p>                                                                                                                                                                                                        |

| <i>Specific Comments on Final RI/FS (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 2.<br>(cont.)                                       | <i>(see above)</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | DTSC, and Water Board, 1991), is the only mechanism by which a final primary document can be modified, and (2) no comments were received on the Proposed Plan that warranted reevaluation of the information in the Final RI/FS Report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3.                                                  | Section 4.1.2.2, p. 4-7 – See Draft ROD Specific Comment #1 regarding the adequacy of the 500 ppmv action level for NMOCs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Please refer to the response to specific comment 1 on the Draft ROD. As discussed in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 4.                                                  | Section 4.1.3.4, p. 4-12 – The rationale for defining hot spots based on chemical concentrations greater than 100 times the corresponding remedial investigation evaluation criteria (RIEC) is applicable to carcinogens, but not to non-carcinogens, for which there is no such thing as an acceptable risk range. What is the basis for applying the same rationale to non-carcinogenic chemicals? Further, hot spots are more traditionally defined based on clustering of samples with concentrations elevated relative to the surrounding area rather than simply exceeding an arbitrary metric. | Please refer to the response to specific comment 2 on the Draft ROD for a description of the rationale used to define hot spots. Regarding the specific question about defining hot spots for non-carcinogenic chemicals, the Navy wishes to clarify that, based on Table 7-5 in the Final RI/FS Report, nearly all of the COCs for the recreational exposure scenario (which corresponds to the reasonably anticipated reuse) were carcinogens. The only exceptions were lead and antimony. The rationale for identifying hot spots for lead is discussed in the response to specific comment 3 on the Draft ROD. It was not necessary to develop an alternative strategy for identifying hot spots for antimony because this COC was identified in only one exposure area and had a relatively small segregated hazard index (approximately 2). The Navy believes that the RI/FS Report properly identified hot spots at Parcel E-2. As discussed in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment. As discussed in the response to specific comment 2 on the Draft ROD, the Navy will, upon completion of excavation and achievement of the hot spot goals pursuant to the ROD, construct the cover pursuant to the remedy selected in the ROD in order to achieve the final remediation goals through breaking the pathway of potential exposure. |

| 5.                                                  | Section 4.2.2.1, p. 4-15 – A more thorough discussion regarding the eastern edge of the solid waste, including specific boring logs, aerial photographs, and maps, should be provided to substantiate the conclusion that the lateral extent of solid waste ends about 10 feet before the eastern edge of the cap (similar to the specific borings/test pits identified for the northern edge of the solid waste).                                                                                                                                                                                                                                                                                                                                                                                               | <p>The following information contained in the Final RI/FS Report is adequate to explain how the eastern limit of the Parcel E-2 Landfill was delineated:</p> <ul style="list-style-type: none"> <li>• Section 4.2.2 references the Landfill Lateral Extent Evaluation Report (Appendix B to the Final RI/FS Report). Section 3.2.2 of Appendix B identifies the specific borings used to delineate the eastern limit of the Parcel E-2 Landfill.</li> <li>• Figures 1-6 and 1-7 present aerial photographs prior to landfilling operations, and provide an indication of the eastern limit of the Parcel E-2 Landfill.</li> <li>• Figures 3-1 and 3-2 identify the borings, test pits, and monitoring wells installed in and around the Parcel E-2 Landfill (including the locations cited in Section 3.2.2 of Appendix B).</li> </ul> <p>Further, the Navy wishes to clarify that, as shown on Figure 1-2 of the Final RI/FS Report, the Parcel E-2 Landfill encompasses the entire area covered by the interim landfill cap. This conservative assumption served as a basis for the remedial alternatives evaluated for the Parcel E-2 Landfill. As discussed in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment.</p> |
| 6.                                                  | Section 7.1.1.1, p. 7-3, including Table 7-1 (and Figure K-1) – There are several differences between the exposure pathways identified in Section 6.3 (and Figure 6-3) and the exposure pathways actually evaluated in the HHRA. For example, people swimming in surface water and people consuming fish were both identified as “primary” exposure pathways (highlighted in yellow in Figure 6-3) yet neither was evaluated (or even mentioned) in the HHRA. On the other hand, some exposure pathways in Figure 6-3 that were not considered “primary” were evaluated (e.g., soil ingestion by future site users and workers). The differences between the two conceptual site models need to be reconciled, and the exclusion of the fish ingestion pathway from the quantitative HHRA needs to be justified. | <p>As discussed in the response to general comment 1:</p> <ul style="list-style-type: none"> <li>• Figure 6-3 is a generic flow chart of potential migration pathways and human and ecological receptors. This generic flow chart is based on information presented in EPA RI/FS guidance for CERCLA landfills (EPA, 1991a). This generic flow chart was not intended to identify the potentially complete exposure pathways for the Parcel E-2 HHRA (which is presented in Table 7-1 of the Final RI/FS Report).</li> <li>• The Parcel E-2 HHRA focused on potentially complete exposure pathways to soil and groundwater at Parcel E-2. The evaluation of potential exposures in the property offshore of Parcel E-2, which is</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <i>Specific Comments on Final RI/FS (continued)</i> |                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 6.<br>(cont.)                                       | <i>(see above)</i>                                                                                                                                                                                                                                                                                              | <p>owned by the Navy and is referred to as Area X in Parcel F, was performed separately.</p> <ul style="list-style-type: none"> <li>The Navy performed a screening-level assessment of potential ecological risk to aquatic wildlife exposed to potentially contaminated groundwater at Parcel E-2. This evaluation, which used conservative fate and transport modeling and compared the results against promulgated surface water quality standards, was presented in Appendix M of the Final RI/FS Report.</li> </ul> <p>The Navy believes that the previous evaluations provide an adequate basis upon which to develop RAOs, evaluate remedial alternatives, and select a final remedy for Parcel E-2. Please refer to the response to general comment 1 for further information. As discussed in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment.</p> |
| 7.                                                  | Section 7.1.4, p. 7-11, and Table 7-16 – How did this analysis account for multiple noncarcinogenic compounds (i.e., if no individual hazard index [HI] was greater than 1, but in combination, the total HI for the grid was greater than 1, were all of the contributing chemicals identified in Table 7-16)? | As described in Section 7.1.4 of the Final RI/FS Report, Table 7-16 was developed to identify specific sampling locations where remediation goals (for the recreational exposure scenario) were exceeded. The requested information is provided in Section 7.1.2 of the Final RI/FS Report. This section describes the results of the risk assessment, and includes references to Tables 7-4 and 7-5. These tables provide a risk characterization analysis of the total and incremental risk for the recreational exposure scenario, and identify the COCs that drive risk in each exposure unit.                                                                                                                                                                                                                                                                                                                                                                       |
| 8.                                                  | Section 8.1.2, p. 8-3 – The table is confusing because it represents only a portion of the information in Figure 6-3 and is inconsistent with what was actually evaluated in the HHRA.                                                                                                                          | Section 8.1.2 of the Final RI/FS Report summarizes information presented in Section 6 of that same document. As discussed in the response to general comment 1, Figure 6-3 is a generic flow chart of potential migration pathways and human and ecological receptors. This generic flow chart is based on information presented in EPA RI/FS guidance for CERCLA landfills (EPA, 1991a). This generic flow chart was not intended to identify the potentially complete exposure pathways for the Parcel E-2 HHRA (which is presented in Table 7-1 of the Final RI/FS Report). Please refer to the response to general comment 1 for further information. As discussed in the responses to specific                                                                                                                                                                                                                                                                      |

| <i>Specific Comments on Final RI/FS (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 8.<br>(cont.)                                       | <i>(see above)</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 9.                                                  | Section 8.2.3.3, p. 8-16 – The text states, “In addition, areas with no data may contain chemical concentrations that would result in risks of the same relative magnitude as found elsewhere in the Landfill Area.” What is the basis for this statement? In the absence of information, the risks could be the same, higher or lower relative to sampled areas.                                                                                                                                                       | <p>The reviewer appears to have taken the subject sentence out of context. The overall message conveyed in the subject paragraph in Section 8.2.3.3 of the Final RI/FS Report is that:</p> <ul style="list-style-type: none"> <li>• The chemical concentrations in soil within the Parcel E-2 Landfill regularly exceed risk-based thresholds and therefore the entire landfill warrants analysis in the FS, and</li> <li>• The available data indicates that most soil concentrations do not significantly exceed the risk-based thresholds (with the exception of several potential hot spots) and therefore the analysis in the FS can be streamlined in accordance with EPA guidance for military landfills.</li> </ul> <p>Within this context, the cited sentence simply clarifies that exposure areas within the Parcel E-2 Landfill that have no associated soil data are assumed to require analysis in the FS, based on the presumption of conditions similar to other portions of the Parcel E-2 Landfill. The Navy believes this to be a reasonable assumption.</p> |
| 10.                                                 | Section 8.3.3, p. 8-21 – It would be helpful to the reader to know that the risk assessment of NMOCs detected in GMPs along Crisp Avenue was based on data collected in 2002, prior to implementation of the landfill gas removal action whereas the assessment of NMOCs detected in GMPs on the UCSF property was based on data collected in 2003, during and after active landfill gas extraction. See also Draft ROD Specific Comments #1 and #4 regarding the 500 ppmv and 5 ppmv NMOC action levels, respectively. | <p>The Navy does not believe that such a clarification is needed because, as described in Section 4.2.3.1 of the Final RI/FS Report, NMOC concentrations in GMPs along Crisp Avenue were lower after initiation of active gas extraction in October 2002. Therefore, the use of higher NMOC concentrations (from before the extraction began) would result in more conservative risk estimates. As discussed in the response to specific comment 1 on the Draft ROD, the higher NMOC concentrations from GMPs along Crisp Avenue corresponded to ELCRs ranging from <math>6.4 \times 10^{-7}</math> to <math>2.0 \times 10^{-8}</math> for a residential exposure scenario. Please refer to the responses to specific comments 1 and 4 on the Draft ROD for information regarding the 500 ppmv and 5 ppmv NMOC action levels. As described in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment.</p>                                                                |

| <i>Specific Comments on Final RI/FS (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 11.                                                 | Section 8.4.4, p. 8-30 – Given the large number of drums and laboratory containers found in the PCB Hot Spot Area, the conclusion that “The isolated solid waste locations in the Panhandle and East Adjacent Areas were found to consist primarily of construction debris” does not appear to be supportable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Section 4.1.1 and Figure 4-1 of the Final RI/FS Report present adequate information to support this general statement regarding the isolated solid waste found in the Panhandle and East Adjacent Areas. Specifically, Figure 4-1 indicates that the drums and laboratory containers were found in a portion of the PCB Hot Spot Area that is small relative to the remainder of the Panhandle and East Adjacent Areas.                                                                                                                                                  |
| 12.                                                 | Section 12.1.3, p. 12-5 – Where would existing solid waste, soil, and sediment along the shoreline be consolidated?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | The subject paragraph briefly describes the proposed shoreline under Alternatives 3, 4, and 5. Section 12.2.3.4 of the Final RI/FS Report describes the proposed grading for Alternatives 3, 4, and 5 in more detail. Specifically, Section 12.2.3.4 states that: “As shown on Figure 12-13, most of the excavated material would be consolidated in the northern portion of the Landfill Area...Smaller volumes of excavated material would be consolidated in the East Adjacent Area and portions of the Panhandle Area surrounding the proposed freshwater wetlands.” |
| 13.                                                 | Section 13.2.5, p. 13-7 – This section presents a cursory discussion of the potential risks to workers and the surrounding community associated with complete excavation of the Parcel E-2 landfill. However, this discussion is insufficient to truly evaluate these risks, particularly given the fact that the Navy acknowledges the uncertainty in the waste types found in the landfill. It is thus unclear from the information presented whether there is sufficient data to adequately characterize the short-term risks associated with this alternative. Without a more thorough evaluation, it is impossible to properly compare the short-term risks associated with excavating the landfill to the short-term risks associated with leaving the waste material in place. | As described in the response to general comment 2, the Navy does not agree with the reviewer’s assertion that the information presented regarding short-term effectiveness is insufficient. The RI/FS Report properly evaluated the short-term effectiveness of each remedial alternative consistent with the requirements specified in the NCP. Please see the response to general comment 2 for further information in support of the Navy’s position.                                                                                                                 |
| 14.                                                 | Section 13.3.5, p. 12-14 – This section presents an even more cursory discussion of the potential risks to workers and the surrounding community associated with this alternative, which is inadequate to support the conclusion that Alternative 3 has moderate to high short-term effectiveness.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | As described in the response to general comment 2, the Navy does not agree with the reviewer’s assertion that the information presented regarding short-term effectiveness is inadequate. The Final RI/FS Report properly evaluated the short-term effectiveness of each remedial alternative consistent with the requirements specified in the NCP. Please see the response to general comment 2 for further information in support of the Navy’s position.                                                                                                             |

| <i>Specific Comments on Final RI/FS (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 15.                                                 | Section 13.4.5, p. 13-18 – How can Alternative 4 also have moderate to high short- term effectiveness when this alternative includes excavation of nearly twice as much soil (33,500 cubic yards vs. 17,300 cubic yards for Alternative 3)? A more quantitative assessment based on data available for the hot spot areas would allow for a more rigorous comparison between the various alternatives. | <p>The Navy wishes to clarify that the short-term effectiveness ratings consider the potential risks from implementing multiple activities, which are common to both Alternatives 3 and 4, including:</p> <ul style="list-style-type: none"> <li>• Grading and onsite consolidation of approximately 80,000 cubic yards of material</li> <li>• Construction of a soil cover across Parcel E-2 (about 47 acres)</li> <li>• Construction of a slurry wall along the western boundary (about 900 linear feet excavated to about 25 feet bgs)</li> <li>• Installing numerous gas extraction wells within the landfill waste (the conceptual design included 40 wells)</li> </ul> <p>Given the overall magnitude of the above-listed activities, the increased hot spot excavation volume between Alternatives 3 and 4 (16,200 cubic yards) is not considered significant enough to warrant a different short-term effectiveness rating. As described in the response to general comment 2, the Final RI/FS Report properly evaluated the short-term effectiveness of each remedial alternative consistent with the requirements specified in the NCP.</p> |
| 16.                                                 | Section K5.1.1, p. K-13 – Was the methodology used to calculate soil exposure point concentrations (EPCs) consistent with EPA’s ProUCL software?                                                                                                                                                                                                                                                       | <p>No, the EPCs for soil were calculated using a different software program (RISKASSE) developed and used by the Navy’s risk assessment contractor (TtEMI). The EPC calculations generated by this program were based on EPA’s 1992 guidance, “Supplemental Guidance to RAGS: Calculating the Concentration Term.” As described in Appendix K of the Final RI/FS Report (specifically Section K2.0), the Navy developed the HHRA methodology in consultation with EPA and DTSC, and finalized the approach (for use at all HPNS parcels) in 2004. All HHRA’s for HPNS used the same software program to calculate EPCs for soil, and these documents were reviewed and concurred upon by EPA and DTSC.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 17.                                                 | Section K5.1.2, p. K-14 – Was EPA’s ProUCL software used to calculate groundwater EPCs?                                                                                                                                                                                                                                                                                                                | <p>Yes, the EPCs for groundwater were calculated using ProUCL, and were selected based on the decision rules outlined in the associated guidance. The decision rules for the EPC calculations were based on EPA’s 2002 guidance, “Calculating Exposure Point Concentrations at Hazardous Waste Sites.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <i>Specific Comments on Final RI/FS (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 18.                                                 | Section K5.1.3.1, p. K-15 – The EPA default particulate emission factor (PEF) for a residential scenario was used to estimate dust concentrations in air for both the recreational and construction worker scenarios. This assumption will underestimate the exposure to construction workers, potentially to a significant degree, especially during excavation activities (the Cal-EPA default PEF for construction workers would result in dust concentrations nearly 1000-fold higher). However, this assumption is balanced by the soil ingestion rate of 330 mg/day, which means that the ingestion pathway will be the driving pathway for most chemicals. It is noted that this potential underestimation is acknowledged in the Uncertainty Analysis.                                                                                                                                                                                                                                                                                                                       | Comment acknowledged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 19.                                                 | Section K6.0, p. K-18 – In Section 4.1.3.2, the Navy acknowledges that the soil RIECs were based on criteria (EPA Region IX preliminary remediation goals [PRGs]) that are no longer current. The Navy compared the soil REICs to more current values (EPA regional screening levels [RSLs] and California Regional Water Quality Control Board [RWQCB] environmental screening levels [ESLs]) and ascertained that most of the RIECs were more conservative. For those that were less conservative, the nature and extent evaluation was affected for only one chemical, ethylbenzene. Thus, the nature and extent evaluation for ethylbenzene was updated using the more current criteria. There is no similar discussion in this section even though the same issue likely applies, i.e., the toxicity criteria have been updated for some chemicals since the HHRA calculations were completed. This is certainly the case for ethylbenzene, which is now considered to be a carcinogen. This issue should be addressed in this section, as well as in the Uncertainty Analysis. | The noted difference in ethylbenzene toxicity criteria does not affect the risk assessment findings and this information does not affect the Navy's determination that the remedial action selected in the ROD is adequately protective of human health and the environment. Specifically, the information presented in Section 4 indicates that the more conservative ethylbenzene screening criterion was not exceeded in soil from 0 to 2 feet bgs, which corresponds to the exposure depth for the recreational exposure scenario (the reasonably anticipated reuse for Parcel E-2). In addition, Figure 4-37 shows that there is only one location in deeper soil (from 2 to 10 feet bgs) where the ethylbenzene concentration exceeded the EPA regional screening level. As described in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment. |
| 20.                                                 | Section K6.4, p. K-21 – As shown in Attachment K5, the value of 155 mg/kg for lead is actually based on a residential scenario, including the ingestion of homegrown produce; therefore, it may be useful to point out here and in other sections of the RI/FS that this value is overly conservative for a recreational scenario.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | The Navy acknowledges that this risk-based criterion is conservative and, as discussed in the response to specific comment 3 on the Draft ROD, this conservative assumption was developed and applied to HHRA throughout HPNS. As described in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <i>Specific Comments on Final RI/FS (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 21.                                                 | <p>Section K.7.1.1, p. K-23 – It does not appear that the Navy incorporated EPA’s guidance regarding evaluation of risk from early-life exposure for carcinogenic chemicals with a mutagenic mode of action.<sup>1</sup> This guidance should be followed or the uncertainty associated with not incorporating this guidance should be addressed in the Uncertainty Analysis.</p> <p><sup>1</sup> EPA. 2005. “Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens.” Risk Assessment Forum. EPA/630/R-03/003F. March.</p> | <p>As described in Appendix K of the Final RI/FS Report (specifically Section K2.0), the Navy developed the HHRA methodology in consultation with EPA and DTSC, and finalized the approach (for use at all HPNS parcels) in 2004. The referenced guidance was not finalized at the time the HHRA methodology was agreed upon, and it was not identified by any stakeholders as a significant technical issue requiring discussion in the subsequent HHRAs performed over the next several years or raised as a public comment during the public comment period on the Proposed Plan. As described in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment. The information in the referenced guidance does not affect the Navy’s determination that the remedial action selected in the ROD is adequately protective of human health and the environment.</p> |
| 22.                                                 | <p>Table K-3 – The adult and child soil ingestion rates of 16 mg/day and 32 mg/day (based on Navy guidance) are lower than the standard default values of 100 mg/day and 200 mg/day for a resident (there are no default values for a recreational scenario); however, the assumption that a recreational user is present at the site 250 days per year for a total of 30 years is likely an overestimate.</p>                                                                                                                                                  | <p>Comment acknowledged.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <i>Miscellaneous Comments on Final RI/FS</i>        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 1.                                                  | <p>Section ES.3.1, p. ES-9 –“Incompatibility” of other land uses is not discussed in Section ES.1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>This comment identifies a minor discrepancy that does not substantively affect the content of the Final RI/FS Report. Consistent with the reasons stated in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 2.                                                  | <p>Section ES.5.1, p. ES-13 – The discussion regarding groundwater remediation goals is confusing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>This comment does not provide new information that would substantively affect the content of the Final RI/FS Report. Consistent with the reasons stated in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Comment No.                                              | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Miscellaneous Comments on Final RI/FS (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 3.                                                       | Section 3.9.2, p. 3-35 – The text states, “Several subsurface utilities associated with the GES were removed in summer 2005 during implementation of the removal action at the PCB Hot Spot Area and were not available for monitoring.” Is this statement referring to the groundwater extraction system as opposed to the landfill gas extraction system, given that the former was located in the same general area whereas the landfill gas system is located on the other side of Parcel E-2? | The subsurface utility vaults associated with the former groundwater extraction system (near the PCB Hot Spot Area) were periodically monitored for landfill gas (in accordance with the interim landfill monitoring and control plan). When the groundwater extraction system was deactivated and removed in 2005, these subsurface vaults were no longer available for monitoring.                                                                                                                                                                                                                                                                                                           |
| 4.                                                       | Section 4.4.2.2, p. 4-59 – It is curious that the maximum detected lead concentration is not mentioned in this section given that (1) the maximum detected concentration is provided for nearly every other chemical in this and similar sections on nature and extent and (2) it is a remarkable 255,684 mg/kg (25% lead). Some discussion of this extraordinarily high value is warranted (e.g., was there metal or paint visible in the sample?).                                               | The last sentence in this subject paragraph indicates that the sample location in question (IR04B025) is indicative of a hot spot, and the concentration is identified on the Figure 4-19. In addition, this area was identified as a hot spot excavation area in Section 12 and, based on this information, the Navy decided to perform an early cleanup action in this area in conjunction with the Phase 2 TCRA at the PCB Hot Spot Area. The Phase 2 TCRA at the PCB Hot Spot Area was recently completed and the findings from the excavation activities in that area will be documented in an upcoming completion report.                                                                |
| 5.                                                       | Table 7-16, p. 2 of 5, Grid AC42 – How is it possible that no samples exceed the remediation goal for lead when this compound was detected in all five samples collected from this grid and the listed EPC for the reasonable maximum exposure (RME) scenario is 257 mg/kg as compared to the listed remediation goal of 155 mg/kg? See also Aroclor 1260 in Grid AG34 on page 3 of 5.                                                                                                             | The noted discrepancies in Table 7-16 is the result of shoreline sediment samples (summarized in Appendix G of the Final RI/FS Report) being included in the HHRA calculations, but the sampling information not being tabulated in Table 7-16. These minor discrepancies do not substantively affect the content of the Final RI/FS Report because this risk assessment conclusion is conservative and consistent with the subsequent decision to evaluate remedial alternatives throughout the Shoreline Area. As described in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment. |
| 6.                                                       | Section 12.2.2.6, p. 12-19/12-20 – Section 11.6.1 (p. 11-52) states that nearly 700,000 cubic yards of clean imported soil is required for this alternative vs. 400,000 cubic yard stated in this section. Which is correct?                                                                                                                                                                                                                                                                       | These two quantities were estimated and presented for different purposes in the FS, and are therefore not directly comparable. Section 11.6.1 describes a general approach involving excavation of contaminated soil throughout Parcel E-2, and was provided to support an initial screening of this option based on effectiveness, implementability, and cost. Although this evaluation provided adequate information to eliminate this option from further analysis, the Navy                                                                                                                                                                                                                |

| <i>Miscellaneous Comments on Final RI/FS (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 6.<br>(cont.)                                            | <i>(see above)</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | decided to develop Alternative 2 and evaluate this alternative in more detail. In developing Alternative 2 in Section 12.2, the Navy determined that the final surface topography could be modified so that the total backfill volume could be reduced to approximately 400,000 cubic yards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 7.                                                       | Table 12-2, p. 1 of 2 – The Tier 1 hot spot goal for heptachlor epoxide should be 2.1 mg/kg (not 1.9 mg/kg) based on the remediation goal (RG) of 0.21 mg/kg presented in Section 9. In addition, why is the Tier 1, 2, 4, and 5 hot spot goal for lead 1,970 mg/kg and the Tier 3 hot spot goal for lead 19,700 mg/kg based on the RG for terrestrial wildlife (197 mg/kg) when the values would be 1,550 and 15,500 mg/kg based on the RG for the recreational user (155 mg/kg)? | The noted discrepancy for heptachlor epoxide is the result of a minor difference between the 2004 EPA preliminary remediation goal (0.19 mg/kg), which was used as the RIEC identified in Section 4, and the risk-based concentrations developed in the HHRA (0.21 mg/kg), which was used as the remediation goal identified in Section 9. This minor discrepancy does not substantively affect the content of the Final RI/FS Report because these two criteria are very similar and the resulting hot spot goal for heptachlor epoxide is slightly conservative (1.9 mg/kg instead of 2.1 mg/kg).<br><br>Please refer to the response to specific comment 3 on the Draft ROD for information regarding the selection of the hot spot goal for lead. As described in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment. |
| 8.                                                       | Section K3.4, p. K-4 – Section 1.8 of the RI/FS report does not state that land uses other than open space are incompatible with the landfill area.                                                                                                                                                                                                                                                                                                                                | This comment identifies a minor discrepancy that does not substantively affect the content of the Final RI/FS Report. Consistent with the reasons stated in the responses to specific comments 1 and 2 on the Final RI/FS Report, the Navy will not make any adjustments to the Final RI/FS Report based on this comment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 9.                                                       | Section K3.5.2, p. K-6 – As discussed in previous comments, it is unclear why fish ingestion was not evaluated given that contaminated groundwater is potentially migrating toward San Francisco Bay.                                                                                                                                                                                                                                                                              | Please refer to the responses to general comment 1 and specific comment 6 on the Final RI/FS Report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <i>Miscellaneous Comments on Final RI/FS (continued)</i> |                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 10.                                                      | Section K.6.5, p. K-22 – Why isn't PCB-189 listed in the table? This congener is listed as being detected earlier in this section.      | The toxic equivalence factor for PCB-189 was inadvertently omitted from the table on page K-22, but the reported concentrations of this dioxin-like congener were used in the HHRA calculations. Specifically, the PCB-189 concentrations were multiplied by the World Health Organization's toxic equivalence factor of 0.00003 to calculate the dioxin toxic equivalence quotient in the HHRA. This minor discrepancy does not substantively affect the HHRA. |
| 11.                                                      | Tables K-3 through K-5 – Why include parameters for residents and industrial workers when these scenarios are not included in the HHRA? | Exposure parameters for residents and industrial workers were inadvertently included in Tables K-3 through K-5; however, as stated in Section K3.4, the HHRA did not evaluate these exposure scenarios. This minor discrepancy does not substantively affect the HHRA.                                                                                                                                                                                          |
| 12.                                                      | Table K-9 – Why are there sources in some cases where there are no values (e.g., oral CSF for tin)?                                     | The noted discrepancies in Table K-9 pertain to infrequently reported chemicals for which there are no slope factors. For these chemicals, text was erroneously placed into the "source" column in Table K-9. These minor errors do not substantively affect the HHRA.                                                                                                                                                                                          |

| <i>Introduction</i>     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| --                      | <p>At [Arc Ecology's] request, I performed an independent radiological review of the Navy's Draft Record of Decision (ROD) regarding the proposed remedy for parcel E2 at the Hunter's Point Naval Shipyard. The documents reviewed, besides the draft ROD itself, included the Remedial Investigation/Feasibility Study (RI/FS) prepared by Engineering/Remediation Resources Group, Inc and the Radiological Addendum to the RI/FS; and the Historical Radiological Site Assessment (HRA) performed by the Navy in 2004 as it is referenced as a key resource for the Radiological Addendum.</p> <p>I performed this review from the perspective of best practices in the area of radiation protection of workers at Hunter's Point, the public around the facility, and the environment. My analysis and comments below are largely related only to the landfill. The panhandle area, the shoreline, and the adjacent areas will all be remediated and surveyed as part of the Navy's proposed remedy. Essentially all radioactive material above the remedial action goals has been or will be removed from these areas prior to any capping or any other restoration activities taking place. These actions are appropriate in my opinion and need no further review or comment.</p> | Please refer to the following pages for responses to comments provided by Dade Moeller.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>General Comments</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 1.                      | <p>In general, it is considered a poor practice to leave a waste site sitting in groundwater. From discussion with the independent review team's landfill expert, there are many such sites (approximately 15) around San Francisco Bay. From a radiological perspective, there does not appear to be an issue at this time since no radioactive material above background levels is currently being detected in the groundwater monitoring system. It should be noted that radium is highly mobile in salt water. Detection of radium in the groundwater above the current background levels should be investigated since it could indicate degradation of the radium contaminated articles buried in the landfill.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Comment acknowledged. As stated in Section 2.3.6 of the Draft ROD<sup>10</sup>, future groundwater monitoring will include analysis for radionuclides to verify the Navy's finding, as detailed in the radiological addendum to the RI/FS Report, that groundwater has not been impacted by radionuclides at activity levels that warrant remedial action. Further, the Navy wishes to clarify that, as stated in Section 5 of the radiological addendum to the RI/FS Report:</p> <ul style="list-style-type: none"> <li>The reported activity levels for radionuclides from the 2002 and 2008 groundwater sampling events do not exceed drinking water standards at a statistically significant level (95 percent confidence level).</li> </ul> |

| 1.<br>(cont.)                       | <i>(see above)</i>                                                                                                                                                                                                                                                                                                                                                                                                                                     | <ul style="list-style-type: none"> <li>• During the 2008 investigation, groundwater samples were collected in 74 different wells at Parcel E-2 and analyzed for the ROCs at Parcel E-2. Radium-226 was the only ROC detected at activity levels exceeding the drinking water standard (5 pCi/L, combined for radium-226 and radium-228), and was exceeded in two isolated areas surrounded by numerous other wells that did not contain radium-226 activity levels exceeding the drinking water standard. These findings indicate that, in addition to the radium-226 exceedances not being statistically significant, there is no indication of radium-226 migrating in groundwater at Parcel E-2.</li> <li>• The comparison of radionuclide data from A-aquifer groundwater with drinking water standards is a conservative evaluation performed because of the lack of alternative comparison criteria.</li> </ul> <p>The Navy believes that this information is adequate to support the conclusions in the ROD, which include future monitoring for radionuclides at existing wells, and verify that no further investigation is necessary for radionuclides in groundwater at Parcel E-2.</p> |
| 2.                                  | There is a discrepancy between the RI/FS Radiological Addendum and the Draft ROD on the remedial action goals. The Radiological Addendum shows the remedial action goal for Radium-226 as 1pCi/gm above background. The ROD shows the remedial action goal as 1 pCi/gm and does not include the footnote showing that remedial action goal is above background. It may not be possible for the Navy to find soil that is below 1 pCi/gm of Radium-226. | Table 6 in the ROD was revised to include the footnote clarifying that the remediation goal for radium-226 is 1 pCi/g above background.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 1.<br>(cont.)                        | <p data-bbox="354 412 783 440">with industrial and/or hazardous waste.”</p> <p data-bbox="306 451 1125 704">Based on my review of the information presented in the RI/FS, the Radiological Addendum to the RI/FS, and the Historical Radiological Assessment (HRA), there was no indication of any material disposed of in the landfill that would not fit in the definition of a CERCLA landfill. Radiological Waste is not excluded from these landfills, and in fact highlight 3 of the guidance document specifically mentions low level radioactive waste in military landfills as being no more hazardous than other types of waste disposed in these landfills. Only low level radioactive waste was mentioned as being disposed of in the landfill in any of the documents.</p> <p data-bbox="306 716 1125 886">There was a mention of sandblast waste from decontamination of ships used in nuclear weapons testing in the Pacific. However, this testing was largely completed before the landfill was in full operation as shown by the 1955 aerial photo. Most sandblast waste generated after this period would have been for removal of contaminants, such as biological and rust, rather than radiological.</p> <p data-bbox="306 898 1125 951"><b>Conclusion:</b> The application of the presumptive remedy is a technically defensible conclusion based on the information provided.</p> | <i>(see above)</i>                                             |
| 2.                                   | <p data-bbox="306 971 1079 998">Adequacy of the landfill characterization from a radiological perspective</p> <p data-bbox="306 1010 1125 1206">This determination must be made in light of the presumptive remedy. The guidance document (Section 1) specifically limits characterization to those areas where migration is expected such as leachate or erosion. As such, the Navy has concentrated the characterization on the surface of the parcel and on the groundwater in and around the landfill. The Navy admits that the subsurface waste has not been characterized and relies on the information in the HRA to show that the waste is low level and in limited volume.</p> <p data-bbox="306 1218 1125 1390">The surface characterization data is extensive. However, it was performed after the interim cap was placed following the landfill fire in 2000. This cap was constructed from imported fill material. This fill material has Radium-226, Cesium-137, and Strontium-90 contamination that exceed the remedial action goals as published by EPA and quoted by the Navy for this area. The source of this material has been identified as coming from various</p>                                                                                                                                                                                                                  | Please see page 128 for the response to this specific comment. |

| 2.<br>(cont.)                        | <p>excavations around the Bay area. None of the excavations would be expected to have radioactive material at levels exceeding background. Although this cap is well characterized, it does not give any information as to the waste underneath the surface. Given that the levels and extent of the radium contamination is extensive and consistent across the interim cap and in all soil samples collected, it is likely that the entire cap will need to be removed in order to meet the proposed remedial action goals. The cesium contamination would also be considered extensive as it shows up in 46 samples across the entire E2 parcel. Since the cesium contamination appears randomly throughout the cap, it is likely to be randomly detected in the remainder of the cap as well. The strontium cannot be directly measured and is a calculated value based on the cesium contamination detected. It is also likely that strontium contamination is present throughout the parcel and the interim cap.</p> <p>The Navy has proposed removal of the top foot of the interim cap, followed by a resurvey of the remaining six inches of the interim cap and the top six inches of the landfill surface. This proposed remedy requires remediation of any areas exceeding the remedial action goals. Based on the sample data shown above, it is unlikely that the remaining six inches of the cap will be any different and will <del>not</del> need to be removed as well. This will allow a good characterization of the landfill surface.</p> <p>As noted, the Navy has not performed any subsurface characterization of the landfill itself. Credit has been taken for radiological material found in other excavations when performing early removal actions for chemical contamination and when digging test pits to determine waste extent. The Navy has also quoted the HRA for the landfill as follows from 8.3.5.28:</p> <p>Former Uses: Landfill used from 1940s to 1974 for disposal of industrial and solid wastes; domestic wastes and refuse; building construction and demolition wastes; dredge spoil materials; sandblast waste; shop industrial, chemical, and solvent wastes; ship solid and liquid wastes from repair activities; and radioluminescent devices, primarily containing Ra-226. Potentially used for disposal of wastes from decontamination of OPERATION CROSSROADS ships.</p> | <p>As described in the radiological addendum to the RI/FS Report, the proposed remediation approach for Parcel E-2 includes removal of potential radioactive contamination (exceeding the remediation goals) within the upper foot of the excavated subgrade, prior to placing 2 feet of clean imported soil underlain by a demarcation layer. For the existing interim landfill cover, the conceptual design described in the radiological addendum assumes that soil below the existing geosynthetic cap can be screened for potential radioactive contamination without completely removing the cap material. The RD will further evaluate this approach and provide a more detailed work process to ensure that the radiological cleanup approach is properly implemented and that existing cap material, if left in place, functions properly. In addition, the Navy wishes to clarify that, as shown in Figure 13 of the radiological addendum to the RI/FS Report, the landfill waste is currently covered by about 5 feet of soil (for the 14.5-acre capped portion of the landfill, this includes about 3.5 feet placed in 1974 during interim closure and 1.5 feet placed in 2000 during construction of the interim cap). As a result, the proposed cap construction activities will not expose the landfill waste.</p> |

| 2.<br>(cont.)                        | <p>The known information regarding subsurface contamination was extensively discussed in the RI/FS Radiological Addendum (Section 4). The Navy's discussion can be summarized as there is known subsurface contamination, primarily contaminated devices, contaminated industrial debris such as firebrick, contaminated laboratory waste, and other low level radioactive waste.</p> <p><b>Conclusion:</b> The surface of parcel E2 is well characterized from a radiological perspective and the proposed remedy is adequately designed to address and remediate any radiological anomalies at or near the surface. In particular, the interim cap will likely need to be removed in its entirety and the surface of the landfill be resurveyed and characterized (and anomalies remediated) prior to placing of the final cap.</p> <p>The subsurface of parcel E2 has not been characterized. However, in accordance with the guidance provided with the presumptive remedy, complete characterization is not required. Based on the information provided, I can conclude that the following types of contamination are likely present:</p> <ul style="list-style-type: none"> <li>• Contaminated articles such as ships instruments and artifacts containing both Radium-226 and Strontium-90. Both isotopes are in solid form and would not be expected to be mobile, or if the article was damaged, would only be expected to have limited local soil contamination. This has been noted in early removal efforts for chemical contamination where these articles have been encountered.</li> <li>• Contaminated industrial debris such as firebrick. Firebrick has been encountered in early removal efforts for chemical contamination. Firebrick contamination would not spread and is comprised of naturally occurring radioactive material, primarily uranium and thorium.</li> <li>• Contaminated laboratory waste, likely what would be considered dry active waste such as gloves, smear material, paper, lab supplies, etc. There may be localized contamination from contaminated sewer and storm drains. These drain lines are being removed and remediated as part of a separate removal action. Based on the HRA and Addendum,</li> </ul> | Please refer to the response on page 128. |

| 2.<br>(cont.)                        | <p>contaminated animal carcasses are not expected; however, it is likely that animal carcasses were disposed of in the landfill.</p> <ul style="list-style-type: none"> <li>Sandblast waste from Operation Crossroads is not expected to be present. This effort ended in 1951, well before the landfill began accepting significant volumes of waste as referenced by the 1955 aerial photograph. Sandblast waste is expected to be found, but is expected to have little if any radiological contamination based on the records presented.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <i>(see above)</i>    |
| 3.                                   | <p>Adequacy of the Radiological Characterization with Regards to Radiological Risk</p> <p>Radiological risk is based on exposure to the radioactive material. Unlike chemical exposure, exposure to radioactive material does not have to occur through inhalation, ingestion, or absorption. Radioactive material also emits radiation which can be a direct exposure hazard.</p> <p>The Navy's proposed remedy reduces the risk from surface radioactive material by removing all material above the remedial action goals and then providing for the application of a barrier and clean fill material. This prevents direct contact with any residual material and provides significant shielding to reduce exposure to radiation from remaining material.</p> <p>The proposed remedy also reduces the risk from subsurface radioactive material as it provides for additional clean shielding material. It should be noted that in 1991, a surface survey of the landfill noted that there were no areas above background on the landfill. This would indicate that there were no anomalies in the landfill that were emitting any significant radiation fields at that time. The landfill stopped accepting waste in 1974, and no other intrusive activities other than removal have been documented since the landfill closed. With no radiation fields on the surface, there is no radiation exposure, and the clean fill prevents any direct contact with any residual radioactive material.</p> <p>The Navy has calculated a risk of <math>2 \times 10^{-8}</math> once the proposed remedy is in place. This risk is well below the EPA threshold of <math>1 \times 10^{-6}</math> of being acceptable and <math>1 \times 10^{-4}</math> for when action is required.</p> | Comment acknowledged. |

| 3.<br>(cont.)                        | <b>Conclusion:</b> The proposed remedy bounds the radiological risk regardless of whether the characterization of the landfill is adequate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Comment acknowledged.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 4.                                   | <p data-bbox="306 488 579 513"><b>Risk of Landfill Removal</b></p> <p data-bbox="306 526 1121 639">From a radiological standpoint there are two aspects of risk, to the workers, and to the public from transportation. Risk from disposal of the radioactive material at a licensed disposal facility is not addressed as those risks have already been addressed as part of the siting and licensing of the facility.</p> <p data-bbox="306 652 1121 790">There is an inherent difficulty in performing a detailed risk assessment from a radiological perspective. The landfill has not been characterized below the surface and as such, it is impossible to quantify the exact hazards that may be encountered. However, given the bounding conditions as described in the HRA and the addendum, assumptions of relative risk can be made.</p> <p data-bbox="306 803 1121 1175">Radiological risk to workers is expected to be low based on the types of waste expected. Contaminated articles such as ships instruments do not have significant dose rates. Contaminated debris such as fire brick do not exhibit removable contamination that would be difficult to contain. Contaminated dirt is dealt with on a daily basis at many DOE sites and other remediation sites and does not represent a significant hazard to the workers. Standard worker protective equipment would be required, but would likely be required in order to protect the workers from the chemical contamination anyway. Any radioactive material that is wet would require impermeable clothing, but that would also be required when dealing with much of the chemical contamination. Based on my experience, this would be standard radiological work practices at many remediation sites and would not present any unusual or difficult radiological hazards.</p> <p data-bbox="306 1188 1121 1386">Radiological risk to the public during transportation of the waste can be mitigated through a number of means. First, given the types of waste expected to be encountered, the actual risk during transportation is expected to be very low. Direct exposure from a truck passing through a neighborhood would be literally undetectable as the radiation emitted from the radioactive material is expected to be very low. The dust from the trucks is easily controlled by using complete containment systems similar to the</p> | <p data-bbox="1150 488 1990 667">Comment acknowledged. The Navy wishes to clarify that, based on the evaluation of Alternative 2 (as described in the Final RI/FS Report), complete excavation of the landfill poses numerous short-term risks and implementation challenges, and borders on being technically infeasible. This conclusion is consistent with the findings from the technical reviewer from Crawford Consulting (see "Summary of Findings" No. 7 on page 97).</p> |

| 4.<br>(cont.)                        | <p>ones in use at the Hanford site. The waste sites at Hanford ship hundreds of trucks per day with no dust emitted. Hanford is a very arid site and dust control is a major issue. The trucks at Hanford are lined and the waste is completely enclosed before it is shipped. There is also the option of shipping the radiological waste by rail car.</p> <p>There was a concern raised about dust control during the remediation of the landfill. This can be accomplished using engineering controls and standard excavation and sorting practices. As mentioned above, dust control at Hanford is a major concern, and some high hazard remediation has been accomplished using dust controls. There is also the option of using a large containment tent over the site to control all emissions. This technology has been used successfully at the DOE site in Idaho.</p> <p>Dust control will be a significant issue during removal and remediation of the interim cap. Engineering controls will need to be in place to ensure the emissions are kept as low as possible.</p> <p><b>Conclusion:</b> Although there is a risk to any remediation activity, the radiological risk from removal of the landfill is able to be mitigated and controlled to an acceptable level should removal of the landfill be chosen as an option.</p> | <i>(see above)</i>    |
| <i>Summary</i>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                       |
| --                                   | <p>In summary, in my opinion, the proposed remedy as outlined in the draft record of decision is technically defensible and is protective of the workers, the public and the environment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Comment acknowledged. |

| 1.          | <p>We are submitting comments on the draft Record of Decision (ROD) issued in March 2012 for CERCLA remediation of Parcel E-2 at the former Hunters Point Shipyard (HPS) located in the City and County of San Francisco. The ROD describes remediation work involving activities within the San Francisco Bay Conservation and Development Commission's (Commission) 100-foot shoreline band jurisdiction and, possibly within the Commission's Bay jurisdiction. The Commission has not reviewed the document but its staff has and is providing the comments below. Our comments identify important applicable or relevant and appropriate regulations (ARARs) of the Commission for inclusion in the Draft Final ROD (DFROD), which is scheduled for release in the Fall, and should assist the BRAC team in assessing and ensuring that the remediation of Parcel E-2 will be consistent with the Commission's laws and policies.</p> | <p>The Navy wishes to clarify that it has previously undertaken the following activities to solicit and address input from BCDC<sup>11</sup> regarding the CERCLA cleanup for Parcel E-2:</p> <ul style="list-style-type: none"> <li>• Technical documents regarding the CERCLA cleanup at Parcel E-2 are submitted to interested federal and state agencies, including BCDC, for review and comment. Technical documents previously submitted to BCDC for review include the Proposed Plan and the draft, draft final, and final previous versions of the RI/FS Report.</li> <li>• The Navy responded to a BCDC inquiry, dated March 26, 2010, regarding the HPNS CERCLA cleanup program and compliance with BCDC's Bay Plan. The Navy's response to BCDC's inquiry, dated on June 10, 2010, described the means by which it would demonstrate compliance with the substantive provisions of BCDC's Bay Plan.</li> <li>• The Navy held several meetings with BCDC staff in 2010 and 2011 to discuss the CERCLA cleanup for HPNS, and specifically discuss the proposed remedial alternatives for Parcel E-2. These meetings include a site visit on April 8, 2010 and a BCT meeting on February 24, 2011.</li> <li>• The Navy prepared Appendix O to the Final RI/FS Report to evaluate the proposed remedial alternatives for Parcel E-2 relative to the pertinent federal and state ARARs regarding shoreline construction. This evaluation identified the substantive provisions of BCDC's Bay Plan (as it pertains to the CERCLA cleanup of Parcel E-2), and described how the proposed remedial alternatives comply with these provisions. A preliminary version of Appendix O was submitted in February 2011 for regulatory agency review. BCDC provided comments on this preliminary version on March 4, 2011, and the Navy met with BCDC staff on March 25, 2011 to discuss Appendix O and the path forward to finalizing the RI/FS Report. The Navy submitted the Final RI/FS Report in May 2011, which included formal responses to BCDC's comments (in Attachment O1 to Appendix O).</li> </ul> |

| 1.<br>(cont.) | <i>(see above)</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | The Navy believes that these past activities have adequately demonstrated how the selected remedy (Alternative 5) will comply with the substantive provisions of BCDC's Bay Plan. The Navy has prepared responses to BCDC's specific comments on the Draft ROD; however, these responses refer back to information contained in Appendix O of the Final RI/FS Report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 2.            | <b>Proposed Shoreline Protection Design.</b> According to the ROD (p. 2-39), as part of Parcel E-2 remediation, a revetment system composed of large rocks is proposed for the shoreline. The document further explains that the proposed revetment system is intended to protect people and wildlife from exposure to residual contamination at the site, would be high enough to prevent flooding from future sea level rise, and would include a public trail along the crest of the protection structure. The ROD indicates that, in carrying out its remediation plans for Parcel E-2, the Navy intends to comply with the Commission's San Francisco Bay Plan (Bay Plan) to the maximum extent practicable.                                                                                                                                                                                             | Comment acknowledged. The Navy wishes to clarify that, as stated in Attachment 4 of the Draft ROD, the selected remedy would comply with the substantive provisions of the BCDC Bay Plan. Attachment 4 in the Draft ROD identifies, consistent with Appendix O of the Final RI/FS Report, the substantive provisions of the BCDC Bay Plan that pertain to the proposed shoreline construction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3.            | <b>Bay Fill.</b> The ROD (p. 2-39) states that the proposed shoreline protection system would "stop near the mean tide line." The boundary of the Commission's Bay jurisdiction is the Mean High Water line unless wetland vegetation is present, in which case the boundary extends up to +5 feet Mean Sea Level. The DFROD should clarify whether the proposed shoreline protection system would be located in the Commission's Bay jurisdiction and, if so, should assess whether fill associated with the project would be consistent with standards for allowable fill contained in Section 66605 of the McAteer-Petris Act. Particularly, the DFROD should explain whether proposed Bay fill: (1) would constitute the minimum necessary to achieve the project purpose; (2) have no upland alternative; and (3) would adversely impact Bay resources and, if so, measures for mitigating such impacts. | Appendix O in the Final RI/FS Report provides the requested information. Specifically, Appendix O provides a detailed description of the proposed shoreline construction activities, including a figure identifying the activities relative to the boundaries specified in the McAteer-Petris Act, and a detailed evaluation of how the proposed construction would comply with the substantive provisions of the BCDC Bay Plan.<br><br>The Navy wishes to clarify that detailed information presented in the RI/FS Report is not repeated in the ROD, but key information is summarized and provided on electronic references (in Attachment 2). This approach is based on EPA guidance from September 2011 (titled " <i>Toolkit for Preparing CERCLA Records of Decision</i> ") and developed in collaboration with the Navy), and is consistent with similar RODs prepared for other HPNS parcels. |

| Comment No. | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4.          | <p><b>Public Access.</b> As stated in the ROD, current planning efforts for Parcel E-2 involve the future development of a public park and restored wetlands-a concept which would be generally consistent with the Commission's laws and policies. The Commission staff is concerned that the development of a proposed rock revetment at Parcel E-2 would impede future public access along the shoreline and directly to the Bay, and prevent the preservation of a natural shoreline setting and resources at the site.</p> <p>The ROD considers public access issues for the site but does not provide, as specific Commission ARARs, the following Bay Plan policies regarding public access:</p> <p>Policy No. 1 states, in part: <i>A proposed fill project should increase public access to the Bay to the maximum extent feasible...</i></p> <p>Policy No.2 states, in part: <i>...maximum feasible access to and along the waterfront and on any permitted fills should be provided in and through every new development in the Bay or on the shoreline, whether it be for housing, industry, port, airport, public facility, wildlife area, or other use, except in cases where public access would be clearly inconsistent with the project because of public safety considerations or significant use conflicts, including unavoidable, significant adverse effects on Bay natural resources. In these cases, in lieu access at another location preferably near the project should be provided.</i></p> <p>Policy No.9 states: <i>Access to and along the waterfront should be provided by walkways, trails, or other appropriate means and connect to the nearest public thoroughfare where convenient parking or public transportation may be available. Diverse and interesting public access experiences should be provided which would encourage users to remain in the designated access areas to avoid or minimize potential adverse effects on wildlife and their habitat.</i></p> <p>Policy No. 11 states, in part: <i>Federal, state, regional, and local jurisdictions ...and the Commission should cooperate to provide appropriately sited, designed and managed public access, especially to link the entire series of shoreline parks, regional trail systems (such as the San Francisco Bay Trail) and existing public access areas to the extent feasible without additional Bay filling and without significant adverse effects on Bay natural resources ....</i></p> | <p>The Navy's CERCLA remedy for Parcel E-2 is designed to protect humans and wildlife from contamination. Accordingly, the selected remedy includes various features (such as a soil cover and shoreline revetment) that will properly contain the contaminated material left in place. These features are compatible with the future open space use for Parcel E-2, but the specific features that will provide public access (such as trails) are not part of the Navy's CERCLA remedy. Rather, public access features will be part of the redevelopment process following transfer of Parcel E-2 from the Navy to CCSF. Accordingly, the Navy does not consider the Bay Plan requirements regarding public access to be potential ARARs for the CERCLA cleanup of Parcel E-2.</p> <p>However, consistent with previous correspondence with BCDC (see Attachment O1 in the Final RI/FS Report) the Navy wishes to clarify several points regarding the manner in which the cleanup at Parcel E-2 will consider recreation and public access:</p> <ul style="list-style-type: none"> <li>• There are no existing recreational opportunities to preserve because the Parcel E-2 shoreline has no current recreational value. Access to the shoreline is restricted because the site is located within a former naval base undergoing cleanup pursuant to CERCLA. Furthermore, the Parcel E-2 shoreline is not unique and has no cultural value because it is manmade and situated on artificial fill.</li> <li>• The Navy evaluated shoreline protection options for Parcel E-2 in a focused manner because the distribution of chemical contamination and solid waste throughout Parcel E-2 limits the types of response actions that are potentially applicable. This focused evaluation was provided in Section 11.5.2 of the Final RI/FS Report, and identified the rock revetment and natural stabilization options that were incorporated into the selected remedy. The selected remedy for Parcel E-2 provides for shoreline access consistent with CCSF's planned open space reuse. Although pedestrian access to the shoreline would be inhibited in the areas covered with rock revetment, the access relative to existing conditions would be improved and the existing sight lines would be maintained.</li> </ul> |

| 4.<br>(cont.) | <p>The DFROD should include the above-cited Bay Plan Public Access policies, and address whether a rock revetment shoreline protection system at Parcel E-2 would be consistent with such policies. The document should also discuss the feasibility of preparing and implementing an alternative shoreline protection design which would create an unencumbered and unobstructed shoreline and sandy beach and, hence, facilitate maximum public use of and access to the Bay following remediation. Alternatively, the DFROD could evaluate whether ramps, stairs, or alternative safe paths could be incorporated into the revetment to facilitate access to the beach.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <ul style="list-style-type: none"> <li>The Navy prepared a detailed evaluation of shoreline protection options for adjoining Parcel E. The site conditions at Parcel E provide for a greater degree of flexibility in developing shoreline protection options. Accordingly, the Navy's evaluation at Parcel E identified natural or hybrid stabilization options that can be implemented in many portions of the Parcel E shoreline. The Navy's evaluation was published in the Draft Final FS Report for Parcel E, which was submitted in July 2011; this document was finalized in August 2012.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 5.            | <p><b>Shoreline Protection.</b> The DFROD should also cite as specific Commission ARARs, the Bay Plan Shoreline Protection Policy No. 4 which states:</p> <p><i>Whenever feasible and appropriate, shoreline protection projects should include provisions for nonstructural methods such as marsh vegetation and integrate shoreline protection and Bay ecosystem enhancement, using adaptive management. Along shorelines that support marsh vegetation, or where marsh establishment has a reasonable chance of success, the Commission should require that the design of authorized protection projects include provisions for establishing marsh and transitional upland vegetation as part of the protective structure, wherever feasible.</i></p> <p>The DFROD should discuss the feasibility of preparing and implementing a shoreline protection design that allows for natural accretion of sediment and the establishment of marsh vegetation along the Parcel E-2 shoreline. The Draft ROD (Attachment 3, p. 72) indicates that in assessing alternatives: "The [Navy's] evaluation will consider ways to enhance the recreational uses and aesthetics of the shoreline while maintaining a similar level of long-term effectiveness, implementability, and cost compared to rock revetment." The Commission staff encourages the Navy to consider design alternatives that result in a more natural shoreline appearance. While the Commission's policies favor nonstructural methods of shoreline protection wherever possible, revetments have been designed to incorporate marsh vegetation in some situations where some structural protection was determined to be necessary.</p> | <p>As described in the response to comment 4, the Navy's focused evaluation of shoreline protection options was provided in Section 11.5.2 of the Final RI/FS Report, and identified the rock revetment and natural stabilization options that were incorporated into the selected remedy. Consistent with information contained in the Final RI/FS Report (including correspondence with BCDC provided in Attachment O1), the rock revetment is needed along the portions of the shoreline to ensure that the selected remedy is protective of human health and the environment. Specifically, the proper containment of the Parcel E-2 Landfill and the adjoining Panhandle Area and East Adjacent Area require protection of relatively steep and narrow shoreline slopes and, as discussed in Section 11.5.2 of the Final RI/FS Report, rock revetment is the most appropriate protection option for such areas to ensure protectiveness in the long-term. The rock revetment would be designed to satisfy the requirements of BCDC's shoreline protection policies. The selected remedy also includes natural shoreline stabilization in portions of the Panhandle Area where tidal wetlands will be restored (to mitigate for tidal wetlands lost as part of the cleanup process at HPNS Parcels B, E, and E-2). The Navy believes that its evaluation of shoreline protection options, as provided in the Final RI/FS Report, adequately supports the selected remedy and is consistent with BCDC's Bay Plan to the maximum extent practicable. Further, the Navy wishes to clarify that the rock revetment design provided in the Final RI/FS Report is conceptual, and will be refined in the RD. The Navy looks forward to working with BCDC on the CERCLA cleanup of Parcel E-2, and will make its staff available to facilitate future consultation with BCDC.</p> |

| <i>Comments on Navy Responses to EPA Comments on Draft Record of Decision</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                |
| 1.                                                                            | Response to General Comment 2: EPA understands that the current removal action at the Ship Shielding Time Critical Removal Action (TCRA) Site was focused on potential Cobalt-60 (Co-60) releases. However, other radionuclides such as Radium-226, Cesium-137, and Strontium-90 may also be present at this site. The TCRA Work Plan said that the other radioactive contaminants and any anomalies that were not removed during the TCRA (e.g., along the excavation edges or in the excavation bottom) would be addressed in the ROD. Therefore, please edit the text in Section 2.9.2 of the ROD (bottom of Page 2-37) so all potential radionuclide contaminants of concern are addressed in the final remedial action at this site. | The subject text in Section 2.9.2 was revised as requested.                                                                                                                                                                                                    |
| 2.                                                                            | Response to Specific Comment (SC) 3.c: The response appears to address the comment, but the reference to IR Site 02 from the response was not included in the fourth bullet on page 2-4 of the Draft Final ROD (i.e., only IR Site 01/21 is referenced). Please revise the fourth bullet on page 2-4 to add IR Site 02 to the text.                                                                                                                                                                                                                                                                                                                                                                                                       | The subject bullet item on page 2-4 was revised as requested.                                                                                                                                                                                                  |
| 3.                                                                            | Response to SC 15: The response partially addresses the comment, but does not address the EPA request for a note stating that calculation of the Radium-226 background level for Parcel E-2 is subject to Regulatory Agency approval. Please revise the RTC and Note c to Table 6 to include this statement.                                                                                                                                                                                                                                                                                                                                                                                                                              | The response to the subject comment on the Draft ROD, as well as Table 6, was revised to include the following statement: <i>“The background levels for radium-226 may be reevaluated in the Parcel E-2 RD and are subject to regulatory agency approval.”</i> |
| <i>Additional Comments on Draft Final Record of Decision</i>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                |
| 1.                                                                            | Section 1, Declaration, Page 1-1. Please edit the third sentence on this page to read as follows: “This decision is based on the Administrative Record file for this site. The Administrative Record Index is included in the CD version of the ROD as Attachment 1.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | The subject text on page 1-1 was revised as requested.                                                                                                                                                                                                         |
| 2.                                                                            | Section 1.1, Selected Remedy, Page 1-2. Please replace the term "preferred alternative" with "selected remedy" in the seventh bullet of the middle paragraph on this page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | The subject bullet item on page 1-2 was revised as requested.                                                                                                                                                                                                  |

| <i>Additional Comments on Draft Final Record of Decision (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                          |
| 3.                                                                       | Section 1.2, Statutory Determinations, Page 1-2. In the second sentence of this section, please delete “because” and start new sentence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | The subject text on page 1-2 was revised as requested.                                                                                                                                                                                                                                                                                                                   |
| 4.                                                                       | Section 2.2, Page 2-5. Groundwater Flow Patterns. Items (3) and (4) are presented in reverse order in the text. Please edit as appropriate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | The subject text on page 2-5 was revised to present Items (3) and (4) in the correct sequence.                                                                                                                                                                                                                                                                           |
| 5.                                                                       | Table 1. Page 2-11. For the last two removal actions in Table 1, please update the last sentences to state that the field work associated with these removal actions has been completed.                                                                                                                                                                                                                                                                                                                                                                                                                         | The subject sentences in Table 1 were revised as requested.                                                                                                                                                                                                                                                                                                              |
| 6.                                                                       | Figure 7. Page 2-8. It appears that too many gas monitoring probes (GMPs) are depicted along Crisp Avenue on Figure 7. Most of these probes were abandoned during the Parcel UC-3 radiological removal action and fewer GMPs were installed to replace them. Please verify the number and location of the GMPs along Crisp Avenue and modify Figure 7 accordingly.                                                                                                                                                                                                                                               | Figure 7 was revised to remove the abandoned GMPs in Crisp Avenue and identify only the existing GMPs.                                                                                                                                                                                                                                                                   |
| 7.                                                                       | Section 2.3.6. Page 2-14, 3rd Bullet. If appropriate, please move the phrase indicating that Cobalt-60 was detected only in the vicinity of the ESSA site to the beginning of the first sentence. As currently written, detects of the Co-60 in Parcel E-2 could be interpreted to be similar in quantity and scope as with Cs-137. Also, Section 2.9.5 (not Table 1) describes the Navy’s recommendation to change the remediation goal to 0.252 pCi/g.                                                                                                                                                         | The first sentence of the subject bullet item in Section 2.3.6 was revised to clarify that cobalt-60 is an ROC in the Ship-Shielding Area at Parcel E-2. In addition, the last sentence of the subject bullet item in Section 2.3.6 was revised to clarify that the change to the remediation goal for cobalt-60 is further discussed in <a href="#">Section 2.9.5</a> . |
| 8.                                                                       | Section 2.9.2, Description of the Selected Remedy, Page 2-37. There is a minor typo at the end of first full paragraph on Page 2-37. It should read “Upon completion of excavation and achievement of the hot spot goals pursuant to the TCRA Action Memorandum and the ROD...”                                                                                                                                                                                                                                                                                                                                  | The subject text in Section 2.9.2 was revised as requested.                                                                                                                                                                                                                                                                                                              |
| 9.                                                                       | Section 2.9.2, Description of the Selected Remedy, Page 2-38. Please clarify how radiological soil contamination will be addressed under the selected remedy. The current paragraph under Figure 13 (on Page 2-38) is not clear as currently written. Specifically, the overall protectiveness goal, the trigger criteria for excavating and removing radiological contamination, and limits on depth of excavation (if any) need to be more clearly spelled out. Clarify if the remedial approach for radiological contamination discovered in the cover soil on 14-acre interim landfill cap is different than | Section 2.9.2 was revised to better describe the approach for identifying and removing potential radiological contamination at Parcel E-2. The radiological remediation approach is fully consistent with the remedial action objective for radionuclides.                                                                                                               |

| <i>Additional Comments on Draft Final Record of Decision (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 9.<br>(cont.)                                                            | elsewhere in Parcel E-2. Please ensure that the protectiveness goal identified here is fully consistent with the Remedial Action Objective #4 regarding radionuclides of concern for soil and sediment in Section 2.7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <i>(see above)</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 10.                                                                      | Section 2.9.2. Description of the Selected Remedy, Page 2-39. Please delete the last sentence of the second paragraph on Page 2-39. This sentence states that landfill gas collection system will control landfill gas in accordance with ARARs (Attachment 4). Although true, the emphasis of this sentence inadvertently implies that other portions of the remedial action may not be in accordance with ARARs which is not the case. Section 2.9.4 already confirms that the entire remedial action will comply with ARARs listed in Attachment 4. If the Navy wishes to emphasize ARAR compliance in Section 2.9.2, it should be in reference to the entire remedial action (as stated in Section 2.9.4), not just a component of the remedial action. | The subject sentence on page 2-39 was deleted as requested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 11.                                                                      | Section 2.9.2. Description of the Selected Remedy, Page 2-42. In the last paragraph before Sub-Section on Access, use of the terms “seek to access” and “and potentially controlling use” regarding the portion of the Parcel E-2 Landfill extending onto UCSF property is inadequate. Please strengthen this text so the ROD is clear that the selected remedy will be implemented on both Navy and Non-Navy property.                                                                                                                                                                                                                                                                                                                                     | The subject text on page 2-42 was revised as follows (additions in bold text, deletions in strikethrough text): “ <i>The Navy will also <del>seek to access</del> the portion of the Parcel E-2 Landfill extending onto UCSF property (as identified on <a href="#">Figure 8</a>) to perform the remedial action pursuant to easements, or another appropriate legal mechanism, entered into with UCSF. In addition, the Navy <b>and regulatory agencies</b> <del>may</del> will also <del>seek to control</del> use, through easements or another appropriate legal mechanism <b>entered into with UCSF</b>, of the portion of the Parcel E-2 Landfill extending onto UCSF property to ensure that its future use is compatible with the selected remedy. Specific requirements for accessing or <del>potentially</del> controlling use of the portion of the Parcel E-2 Landfill extending onto UCSF property will be specified in the LUC RD report.”</i> |
| 12.                                                                      | Section 2.9.5. Documentation of Significant Changes. Thank you for adding this section to the ROD. After editing the text in Section 2.9.2 regarding the remedial approach for radiological contamination (and other aspects of the selected remedy), please consider adding a bullet(s) in this section if additional significant change(s), as defined in the EPA ROD guidance, is indicated. If any element of the selected remedy, as ultimately                                                                                                                                                                                                                                                                                                        | As described in the response to EPA comment 9, Section 2.9.2 was revised to better explain the approach for identifying and removing potential radiological contamination at Parcel E-2. The information added to Section 2.9.2 is consistent with information previously presented in the Final RI/FS Report (specifically, Sections 12.2.3.2 through 12.2.3.5) and the Final Radiological Addendum to the RI/FS Report (specifically, Sections 12.1 and 12.4). For                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 14.                                                                      | General Comment on the Remedial Design Process. Assuming that the Final ROD for Parcel E-2 is approved by the Navy and Regulatory Agencies in accordance with the Federal Facility Agreement for HPNS, EPA suggests the Navy conduct workshops on the remedial design to help facilitate agreement on several important decisions to be made during the remedial design process. These important decisions include, but are not limited to, the continuation of hot spot removal work, design of landfill gas collection system, selection and design of the landfill gas treatment technology, protocols and technologies for parcel wide radiological surveys and radiological contamination removal program, integration of the interim landfill cover into the design for the final landfill cover, wetland design criteria, performance criteria for the protection of San Francisco Bay, etc. The first design workshop should be conducted prior to Navy submittal of the draft remedial design document, perhaps in conjunction with an upcoming BCT meeting. At this workshop, preliminary key design criteria and assumptions on the major remedy components would be discussed in detail with the goal of reaching consensus on the path forward for key elements in the draft remedial design. Based on the general consensus reached with the Regulatory agencies, at a subsequent design workshop (perhaps at approximately the 30% draft design stage), the Navy should present its preliminary recommendations on key design elements at a Navy public meeting so the general public can be informed and provide input on these key elements and the general direction of the remedy design prior to design finalization. | The Navy agrees with EPA’s suggestion and will conduct working meetings to facilitate agreement of important elements of the RD.                                                                                                                                                                                               |

|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.          | DTSC has completed its review of the Navy's Draft Final Record of Decision for Parcel E-2, Hunters Point Naval Shipyard; San Francisco, California dated September 2012 (Draft Final ROD). All of DTSC's comments on the Draft ROD were addressed by the Response-to-Comments (RTCs) and appropriate revisions made were in the Draft Final ROD.                                                                                                                                                                                | Comment acknowledged.                                                                                                                                                                                                                                                      |
| 2.          | <p>The following new editorial comment is provided for updating Attachment 4 (ARARs) in the Draft Final ROD as our governor signed a trailer bill that changed some of the IC statutory numbering:</p> <p>All of page 36 in Attachment 4 needs to be updated: Delete section 25232 completely since it's been repealed. Section 25233(c) has been repealed and replaced with section 25223, section 25234 has been repealed and replaced with section 25224, and section 25222.1 has been repealed and replaced with 25221.</p> | Attachment 4 was revised as requested. The Navy wishes to clarify that the substantive provisions formerly included in Section 25233(c) are now located in Section 25223(c); therefore, the cited reference to the new section includes the reference to Section 25223(c). |

| 1.          | <p>EMB reviewed the Record of Decision (ROD) for Parcel E-2 and concluded that Parcel E-2 is radiologically impacted, and that the Department of Navy (DON) determined that the preferred remedy is a radiological restricted release. As previously indicated in an EMB memorandum dated May 7, 2012 a draft version of this ROD of March 2012, EMB cannot grant “radiological unrestricted release recommendation” (RURR) as described in “Section 2.2 Site Characteristics”. EMB cannot grant a RURR for Parcel E-2 based on the statement that the “NRDL radiological waste is potentially disposed in around the Parcel E-2 as relatively low and radiologically characterized a foot below the surface of the soil”. And that, DON plans to “Install a soil cover over all of Parcel E-2, with a protective liner” and then “Use institutional controls to restrict specific land uses”. The decision in the ROD for the selected remedy cannot transfer Parcel E-2 for future human uses with a RURR instead must transfer Parcel E-2 from federal to non-federal jurisdiction via radiological restricted release (RRR) through the Radiological Health Branch of the CDPH.</p> | The Navy acknowledges CDPH’s comment. |

| 1.          | <b>Listing of groundwater contaminants:</b> The list of groundwater contaminants in Section 1.1 (p. 1-2) and Section 2.3.5 (p. 2-14) differ. Please revise the lists to be consistent, or explain why they are different.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | The list of groundwater contaminants in Section 1.1 was revised as follows (additions in bold text, deletions in strikethrough text): “ <i>metals (arsenic, chromium VI, iron, lead, and thallium), radionuclides (<sup>226</sup>Ra, <sup>137</sup>Cs, and <sup>90</sup>Sr), pesticides, PCBs, SVOCs, <del>PAHs</del>, <del>TPH</del>, <del>and</del> <del>VOCs</del>, and anions (such as ammonia and cyanide)”</i>                                                                                                                                                                                                                                                                                                                                |
| 2.          | <b>Section 2.7 Remedial Action Objectives:</b> The last paragraph of this section (p. 2-26) states “The need to refine the fate and transport modeling and develop specific monitoring criteria for A-aquifer groundwater will be evaluated further in the RD [Remedial Design]”. Please revise this sentence to state “The Navy, with input from regulatory agencies, will develop specific monitoring criteria for A- aquifer groundwater and refine the fate and transport modeling as needed to support development of the monitoring criteria, during the RD phase.” As written, it seems the “need” to perform these actions will be evaluated in the RD, rather than that the actions will occur.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | The subject text was revised as requested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 3.          | <b>Section 2.9.2 Description of Selected Remedy:</b> This section (p. 2-39) states that water entering the freshwater wetlands will be monitored to ensure compliance with the surface water remedial action objective (RAO), which is linked to water quality criteria. The water quality criteria refer to Table M-1 from the Remedial Investigation/Feasibility Study, which is comprised mostly of saltwater criteria. While these criteria are appropriate for evaluating discharges to San Francisco Bay, water (groundwater diverted from the western boundary) entering the freshwater wetlands likely need to be evaluated against freshwater criteria. The applicable criteria depend on the salinity. Freshwaters, as defined in the Basin Plan, are those in which the salinity is equal to or less than 1 part per thousand 95% of the time. The Basin Plan’s Table 3-4 <i>Freshwater Water Quality Objectives for Toxic Pollutants for Surface Waters</i> are applicable if the freshwater wetland meets this definition. Marine water quality objectives are applicable in waters in which the salinity is equal to or greater than 10 parts per thousand 95% of the time. For waters in which the salinity is between 1 and 10 parts per thousand, the applicable objectives are the more stringent of the marine (Table 3-3) and freshwater (Table 3-4) objectives. | The subject text in Section 2.9.2 was revised as requested. In addition, the chemical-specific ARARs identified in Attachment 4 were revised to include Table 3-4 from the Basin Plan (in addition to Table 3-3, which was already identified). This determination was based on the TDS data for Parcel E-2 (as shown in Figure 2-20 of the Final RI/FS Report). Specifically, Figure 2-20 shows that the only areas with TDS concentrations exceeding 10,000 mg/L (equivalent to a salinity of 10 parts per thousand) are located immediately adjacent to the Parcel E-2 shoreline. Accordingly, the groundwater to be diverted into the freshwater wetland would be subject to the freshwater criteria identified in Table 3-4 of the Basin Plan. |

| 3.<br>(cont.) | Please revise the third sentence of the third paragraph on page 2-39 to state “Water entering the freshwater wetlands <del>would</del> <u>will</u> be monitored to ensure compliance with the surface water RAO specified in Section 2.7, <u>as well as applicable freshwater water quality objectives.</u> ”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | (see above)                                                                                                                      |
| 4.            | <b>Actions to be Addressed in Remedial Design:</b> Please incorporate <i>Table 12-3 Actions to be Addressed in Remedial Design for Parcel E-2</i> from the Remedial Investigation/Feasibility Study (RI/FS) into the ROD, either by referencing via hyperlink, or incorporating the table into the basic ROD. While we agree that the actions listed in Table 12-3 are not necessary to complete the ROD, the actions are important to achieving successful design and implementation of the remedy. Therefore, the ROD should document the items the Navy has committed to addressing during remedial design. One of these items is “Refined modeling to evaluate interaction between surface water in freshwater wetlands, groundwater from proposed diversion system, and groundwater underlying freshwater wetlands.” Appendix P3 of the RI/FS indicates that preliminary modeling suggests that the freshwater wetlands would receive negligible flow from surrounding groundwater that contains chemicals that may be detrimental to aquatic wildlife. Please note that Water Board staff understands that the ROD intends that groundwater entering the freshwater wetlands will not be detrimental to aquatic life. | Section 2.9.2 was revised to include a hyperlinked reference to Table 12-3 from the Final RI/FS Report.                          |
| 5.            | <b>Remedial Design Process:</b> Water Board staff concurs with U.S. EPA’s suggestion that the Navy conduct workshops on the remedial design to help facilitate agreement on key decisions to be made during the remedial design process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | The Navy agrees with EPA’s suggestion and will conduct working meetings to facilitate agreement of important elements of the RD. |

| Comment No. | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.          | <p><b>Section 2.5.3 (Basis for Response Action)</b>, page 2-20; last paragraph, page 2-21; first paragraph and bullet points; Table 4: The use of the term “hot spot goals” is confusing. We understand the use of the term “hot spot” and how hot spot areas are defined for additional removal. We recommend using the term “areas requiring removal” in place of the term “hot spot goals” on page 2-21 and in Table 4. If the intent is to leave in place soil underneath a durable cover that contains COCs or COECs below the hot spot criteria but above Remediation Goals, the document would benefit from a more clear statement as to this effect.</p> | <p>The term “hot spot goals” refers to numeric criteria that were established in the Final RI/FS Report. The hot spot goals were used to identify hot spot areas requiring removal, but these numeric criteria (as identified in Table 4) are not synonymous with the hot spots areas identified in Figure 10. Accordingly, the term “hot spot goals” cannot be replaced with the phrase “areas requiring removal” without causing more confusion to the reader. Further, the Navy wishes to clarify that, during review of the Draft ROD, the BCT members requested that the Navy revise the ROD to more clearly discuss hot spots goals and their role in guiding the hot removal portion of the remedy (see responses to EPA general comment 2, DTSC comment 10, and Water Board comment 2). The document was not changed in response to this comment.</p> |
| 2.          | <p><b>Section 2.9.2 (Description of Selected Remedy)</b>, page 2-42, third paragraph from the bottom of the page, last sentence: Please remove the phrase “by the CCSF” and modify the sentence to “A risk management plan (RMP) may be prepared and approved by the FFA Signatories that may set forth certain requirements and protocols used to consider restricted activities.” Given that the anticipated transfer of this parcel is at least six years away, let’s leave the concept of a RMP intact but the details of who writes it vague to provide the most flexibility for those who might do this work.</p>                                          | <p>The subject text was not revised as requested because the RMP is not required by CERCLA and is not a required deliverable under the FFA. The existing ROD language acknowledges that CCSF may elect to prepare an RMP in the future and acknowledges CCSF’s discretion to decide whether or not to prepare an RMP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3.          | <p><b>Section 2.9.2 (Description of Selected Remedy)</b>, page 2-43, Land Use and Activity Restrictions that Apply throughout Parcel E-2, Land Use Restrictions, first sentence: Please replace the reference to the “City and County of San Francisco” with “The Successor Agency to the San Francisco Redevelopment Agency” and add a reference to the SFRA’s 2010 Land Use Plan as the guiding document that defines future land use.</p>                                                                                                                                                                                                                     | <p>The subject text was revised as follows (additions in bold text, deletions in strikethrough text): “<i>The <b>Successor Agency to the San Francisco Redevelopment Agency</b> <del>City and County of San Francisco</del> has designated HPNS Parcel E-2 for open space reuse, <b>consistent with the 2010 amended Redevelopment Plan</b><sup>(22)</sup>.” The subject text incorporates reference number 22 (initially introduced in Section 2.4 of the ROD).</i></p>                                                                                                                                                                                                                                                                                                                                                                                      |

| Comment No. | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4.          | <b>Section 2.9.2 (Description of Selected Remedy), page 2-45, item a), second sentence:</b> Please modify the sentence to read “Any proposed land-disturbing activity <u>below the demarcation layer</u> within the ARIC for radionuclides...” This will add clarity that all of the subsequently listed requirements are only for the soil below the demarcation layer.                                                                                                                                                                  | The subject text was not revised as requested because, consistent with the LUC RD for Parcel B Sites 7 and 18, the installation of utility lines within the soil cover constructed by the Navy (and above the demarcation layer to be installed by the Navy at the bottom of the soil cover) would constitute a restricted land-disturbing activity. The agreements made for Parcel B Sites 7 and 18 provide flexibility for future property owners to install utility lines above the soil cover constructed by the Navy, provided that the property owner demarcates the interface between the Navy’s cover and any new imported soil. As described in the response to comment 5 below, the Navy has revised Section 2.9.2 to provide this same flexibility for Parcel E-2. In addition, the Navy has revised Section 2.9.2 to clarify, consistent with the agreements made for Parcel B Sites 7 and 18, that the placement of additional clean, imported fill on top of the Navy’s cover does not constitute a restricted land-disturbing activity. |
| 5.          | <b>Section 2.9.2 (Description of Selected Remedy), page 2-45, item c):</b> Consistent with the wording for the radiological ARIC for IR7/18, please add the following sentence at the end of this paragraph:<br><br>Installation of water lines, storm drains, or sanitary sewers in any additional clean, imported fill placed on top of the soil cover that the Navy will construct at the Property is not intended to be restricted if the property owner demarcates the interface between the Navy’s cover and any new imported soil. | The subject text was revised as requested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 6.          | <b>Section 2.3 (Previous Investigations and Removal Actions), Figure 5 – Previous Sampling Locations for Nonradioactive Chemicals:</b> The legend includes colored patterns for the previous Metal Slag Area and PCB Hot Spot Area excavations, but these are not shown on this figure. We recommend simply striking these two items from the legend for this figure, as these excavations are shown on Figure 7 (Removal Actions), which seems to be the appropriate figure for that information.                                        | Figure 5 was revised as recommended.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 1.          | <p>We are providing comments on the Draft Final Record of Decision (DFROD) of September 2012 for CERCLA remediation of Parcel E-2 at the Hunters Point Shipyard (HPS) located in the City and County of San Francisco. The DFROD describes remediation work at Parcel E-2 involving activities within the San Francisco Bay Conservation and Development Commission's (Commission) Bay and the 100-foot shoreline band jurisdictions. Our comments below are based on staff-and not the Commission's-review of the DFROD and discuss, among other things, the applicable or relevant and appropriate regulations (ARARs) of the Commission.<sup>1</sup></p> <p><sup>1</sup> The Department of the Navy acknowledges as an ARAR the substantive requirement that the Coastal Zone Management Act (CZMA) imposes on federal agencies to be consistent to the maximum extent practicable with the enforceable policies of the Commission's federally-approved Coastal Management Program. However, the CZMA also imposes the procedural requirement of a consistency review process (CZMA, §307(c)(1)(C)). The Commission previously outlined in a letter to the Environmental Protection Agency dated May 3, 2010, the legal basis for its view that in conducting onsite remediation activities under the CERCLA, the Department of the Navy is subject to both the substantive and the procedural requirements of the CZMA.</p> | <p>As stated in the response to BCDC's comments on the Draft ROD, the Navy responded to a BCDC inquiry, dated March 26, 2010, regarding the HPNS CERCLA cleanup program and compliance with BCDC's Bay Plan. The Navy's response to BCDC's inquiry, dated June 10, 2010, described the means by which it would demonstrate compliance with the substantive provisions of BCDC's Bay Plan. The Navy's June 2010 letter also responded to BCDC's request for a CZMA consistency determination with the following information:</p> <ul style="list-style-type: none"> <li>• The Navy is selecting and conducting environmental cleanup response actions at HPNS in accordance with the CERCLA (Title 42 United States Code §§ 9601 et. seq.) and the NCP (Title 40 CFR Part 300) and pursuant to an FFA entered into between the Navy, EPA, DTSC, and the Water Board in 1991.</li> <li>• CERCLA and the NCP provide that remedies selected by the Navy must comply with federal and state ARARs unless waived under CERCLA. CERCLA ARARs consist only of the substantive provisions of laws and regulations and do not include procedural provisions. The preamble to the NCP (at 55 Fed. Reg. 8756, March 8, 1990) notes that CERCLA § 121(e)(1) and other CERCLA provisions "<i>reflect Congress' judgment that CERCLA actions should not be delayed by time-consuming and duplicative administrative requirements such as permitting, although remedies should achieve the substantive standards of applicable or relevant and appropriate laws... EPA's approach is wholly consistent with the overall goal of the Superfund program, to achieve expeditious cleanups, and reflects an understanding of the uniqueness of the CERCLA program, which impacts more than one medium (and thus overlaps with a number of other regulatory and statutory programs). Accordingly, it would be inappropriate to subject CERCLA response actions to the multitude of administrative requirements of other Federal and State offices and agencies.</i>"</li> </ul> |

| 1.<br>(cont.) | (see above)                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <ul style="list-style-type: none"> <li>• The Navy has identified the substantive provisions of CZMA at Title 16 United States Code § 1456(c)(1)(A), the CZMA's implementing regulation at Title 15 CFR § 930, the McAteer-Petris Act, and the <i>San Francisco Bay Plan</i> as "relevant and appropriate" ARARs for several on-site cleanup actions at HPNS. The Navy values BCDC's expertise and perspective, and has provided BCDC with copies of many CERCLA reports over the past several years and requested BCDC comments upon them.</li> <li>• In accordance with EPA's <i>CERCLA Compliance with Other Laws Manual</i> (EPA, 1989b), the Navy will continue to provide information similar to that which would support a CZMA consistency determination in order to facilitate consultation with BCDC and verify that the substantive provisions of the CZMA and the <i>San Francisco Bay Plan</i> will be met during these on-site cleanup actions. The Navy asserts that the ongoing consultation process with BCDC should continue to follow the administrative and procedural framework established by CERCLA and the NCP, rather than the nonsubstantive permit-equivalent review process presented in the <i>San Francisco Bay Plan</i>.</li> </ul> <p>The Navy believes that the information provided in their June 2010 letter (as summarized above) adequately describes the consultation process it has followed for the CERCLA response action at Parcel E-2.</p> |
| 2.            | <p>The DFROD (Attachment 5) responds to our comments on the Draft Record of Decision (DROD of March 2012) in the letter dated August 10, 2012 by stating, in part, that the selected shoreline protection system for Parcel E-2 would "comply with the substantive provisions of the BCDC [<i>San Francisco Bay Plan</i>]." To ensure compliance, the Commission staff recommends that the BRAC team address and/or include the following information in the Final ROD (FROD):</p> | (see the responses on the following pages)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.<br>(cont.) | 1. <b>A revised estimate of the volume and square footage of fill associated with the selected shoreline system located below the Mean High Water line (MHW).</b> We understand that a version of this information was provided in Appendix O of the Final RI/FS. However, it appears that the information provided in that document identified the Commission's Bay jurisdictional line as Mean Higher High Water whereas the correct tidal line is MHW. Including the corrected information in the DFROD is important since the subject of Bay fill is one of the substantive provisions of the Bay Plan and in the Commission's founding legislation, the McAteer-Petris Act (Section 66605). | 1. The Navy wishes to clarify several points regarding the area and volume estimates requested by BCDC. <ol style="list-style-type: none"> <li>a. Appendix O of the Final RI/FS Report provided preliminary estimates of the area and volume of bay fill required to implement the conceptual design for Alternative 5 (which is the selected remedy for Parcel E-2). The estimates were preliminary in nature because they were developed based on the conceptual design that will be refined in the RD.</li> <li>b. The preliminary estimates of the area and volume of bay fill were made relative to the mean higher high water level (3.61 feet above msl using NGVD 29). The resulting estimates of the area and volume of bay fill were more conservative than if those estimates were made relative to the mean high water level (2.98 feet above msl using NGVD 29). The area and volume estimates will be revised in the RD based on the final design elevations relative to the mean high water elevation. However, the revised estimates will not change the Navy's previous finding, as presented in Appendix O, that the area and volume of bay fill (required to construct the revetment wall) are smaller than the area and volume of bay created by constructing the new tidal wetlands.</li> <li>c. The RD is the most appropriate location to provide the revised area and volume estimates requested by BCDC. The ROD is not the appropriate location to present this information because: (1) the revised area and volume estimates will not change the Navy's previous finding presented in Appendix O of the Final RI/FS Report, and (2) the ROD was streamlined, in accordance with EPA guidance, using a format that summarizes key information and provides electronic references (embedded within the document) to more detailed technical information contained in the administrative record.</li> <li>d. The timing of BCDC's request to include revised area and volume estimates in the Final ROD is problematic and would unnecessarily delay publication of the Final ROD. The initial area and volume</li> </ol> |

|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.<br>(cont.) | <p>2. <b>An assessment of the consistency of the selected shoreline system with the Commission's laws and policies</b> (cited in our letter of August 10, 2012) <b>regarding public access.</b> The DFROD (Attachment 5) provides that “the Navy does not consider the Bay Plan requirements regarding public access to be potential ARARs for the CERCLA cleanup of Parcel E-2.” The above-referenced policies of the Bay Plan, however, certainly fall within the Bay Plan’s “substantive provisions,” as do sections of the McAteer-Petris Act (Section 66602), which states, in part, the “Legislature further finds and declares that...existing public access to the shoreline and waters of the San Francisco Bay is inadequate and that maximum feasible public access, consistent with a project, should be provided.”</p> <p>The DFROD also implies that the selected plan not need consider the Commission’s public access policies in part because the site “has no current recreational value,” and “is not unique and has no cultural value because it is manmade and situated on artificial fill,” and states further that public access would be addressed following site transfer through site redevelopment planning and implementation phases. It should be noted that the Commission’s Bay Plan Public Access Policy No.1 states, in part, “A proposed fill project should <i>increase</i> [emphasis added] public access to the bay to the maximum extent feasible...” Therefore, the intention of the policy is for <i>all</i> development to provide</p> | <p>estimates were submitted to BCDC (as part of the Final RI/FS Report) in May 2011, and the Navy has since submitted both the Proposed Plan (in late 2011) and Draft ROD (in March 2012) to BCDC for review and comment. Although BCDC did provide written comments on the Proposed Plan and Draft ROD, those comments did not include the specific technical requests that were made in their most recent letter. The Navy welcomes BCDC’s input on the CERCLA cleanup process for Parcel E-2, but respectfully requests that their input be provided in a timely manner so that unnecessary delays can be avoided.</p> <p>2. The Navy wishes to reiterate several points, as stated in the Navy’s previous responses, regarding BCDC’s assertion that the public access provisions in the Bay Plan are ARARs for the Navy’s CERCLA remedy for Parcel E-2.</p> <p>a. The Navy’s CERCLA remedy for Parcel E-2 is designed to protect humans and wildlife from contamination. Accordingly, the selected remedy includes various features (such as a soil cover and shoreline revetment) that will properly contain the contaminated material left in place. These features are compatible with the future open space use for Parcel E-2, but the specific features that will provide public access (such as trails) are not part of the Navy’s CERCLA remedy. Rather, public access features will be part of the redevelopment process following transfer of Parcel E-2 from the Navy to CCSF.</p> <p>b. There are no existing recreational opportunities to preserve because the Parcel E-2 shoreline has no current recreational value. Access to the shoreline is restricted because the site is located within a former naval base undergoing cleanup pursuant to CERCLA. The Navy’s CERCLA cleanup will allow for future public access but, as stated above, the specific public access features will be part of the redevelopment process following transfer of Parcel E-2 from the Navy to CCSF.</p> |

|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.<br>(cont.) | <p>improved or new access thereby building upon current conditions including where access is not presently available. Additionally, the BRAC team should note that the Commission's laws and policies regarding access apply to all sites in San Francisco Bay treating them all as "unique" and making no particular distinction between those free of human disturbance or activity and others created artificially. Lastly, the Commission staff appreciates and looks forward to participating in public access planning and implementation following property transfer by the U.S. Department of Navy. In order to ensure that maximum future access opportunities at the site, the Commission staff believes that it is critical and necessary for the BRAC team to design remediation plans in a manner that allows for such opportunities to ultimately occur.</p> <p>Therefore, the Commission staff requests that the BRAC team consider and the FROD include an assessment of the consistency of the selected shoreline system with the Commission's laws and policies regarding public access, as previously cited in our letter dated August 10, 2012.</p> | <p>In addition, the Navy wishes to clarify that the Navy's evaluation of potential ARARs for the CERCLA remedy at Parcel E-2 followed the procedures identified in the NCP (specifically Title 40 CFR § 300.400[g]). Appendices N and O of the Final RI/FS Report evaluated the Bay Plan and identified the substantive provisions of the following policies as potential "relevant and appropriate" ARARs: (1) Tidal Marshes and Tidal Flats around the Bay, (2) Safety of Fills in the Bay, (3) Shoreline Protection around the Bay, (4) Fills in Accord with the Bay Plan, and (5) Mitigation. These potential ARARs were determined to be "relevant and appropriate" based on the criteria identified in the NCP.</p> <p>The Bay Plan policies concerning public access were not considered potential "relevant and appropriate" ARARs because they pertain to development activity that is not sufficiently similar to the circumstances of the CERCLA response action. Specifically, the activity addressed by the public access policies in the Bay Plan can be distinguished from the selected remedy for Parcel E-2 on a number of bases, including the respective purposes of the requirements, type of action and activity regulated, and type of place regulated (see 40 CFR Subsections 300.400[g][2][i], [iv], and [vi]). As previously stated, the Navy's CERCLA remedy for Parcel E-2 is designed to protect humans and wildlife from contamination. The CERCLA remedy will allow for future public access but, as previously stated, the specific public access features will be part of the redevelopment process following transfer of Parcel E-2 from the Navy to CCSF.</p> <p>The Navy welcomes further discussion with BCDC and CCSF to ensure that, following redevelopment, public access to Parcel E-2 is consistent with the policies in the Bay Plan. However, the Navy continues to assert that the Bay Plan requirements regarding public access are not potential ARARs for the CERCLA cleanup of Parcel E-2.</p> |

| Comment No.   | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.<br>(cont.) | 3. <b>A figure illustrating the potential future alignment of a pedestrian path/walkway at Parcel E-2.</b> The DROD for Parcel E-2 (March 2012) stated that the top of the shoreline revetment structure would not obstruct pedestrian's views of the Bay and the placement of a pedestrian path or trail would be "at about the same height of the top of the revetment." The Commission staff believes that the construction of a protection system, which ultimately facilitates development of a trail at the revetment crest would maximize public access opportunities at the site due to the proximity of the Bay, visually and physically. Moreover, the Commission staff believes that solely locating a public pathway at the northern boundary of the landfill (as shown in Figure 12-1 of the Remedial Investigation/Feasibility Study for Parcel E-2) would not be consistent with the Commission's laws and policies regarding public access to the Bay and its shoreline. | 3. The Navy wishes to reiterate several points, as stated in the Navy's previous responses: <ol style="list-style-type: none"> <li>a. Figure 12-1 in the Final RI/FS Report presents a conceptual grading plan for the selected remedy at Parcel E-2. This conceptual plan will be refined in the RD and is not intended to identify the final layout of roads, paths, or walkways.</li> <li>b. The selected remedy includes various features (such as a soil cover and shoreline revetment) that will properly contain the contaminated material left in place. These features are compatible with the future open space use for Parcel E-2, but the specific features that will provide public access (such as trails) are not part of the Navy's CERCLA remedy. Rather, public access features will be part of the redevelopment process following transfer of Parcel E-2 from the Navy to CCSF.</li> <li>c. The Navy welcomes further discussion with BCDC and CCSF to ensure that, following redevelopment, public access to Parcel E-2 is consistent with the policies in the Bay Plan. However, the Navy continues to assert that the Bay Plan requirements regarding public access are not potential ARARs for the CERCLA cleanup of Parcel E-2.</li> </ol> |

| Comment No.   | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.<br>(cont.) | 4. <b>An explanation about the necessity for extending the proposed revetment system to the northwest and southeast</b> and, presumably, <b>beyond the boundaries of the landfill</b> to ensure future containment of residual contaminants. If the extended revetment is not essential for containment, the Commission staff requests that the FROD discuss whether these particular areas could remain unarmored or perhaps protected with a reduced armoring system and, thereby, maximize future public access at the site. | 4. The Navy wishes to reiterate several points, as stated in the Navy's previous responses: <ol style="list-style-type: none"> <li>a. The Navy evaluated shoreline protection options for Parcel E-2 in a focused manner because the distribution of chemical contamination and solid waste throughout Parcel E-2 limits the types of response actions that are potentially applicable. This focused evaluation was provided in Section 11.5.2 of the Final RI/FS Report, and identified the rock revetment and natural stabilization options that were incorporated into the selected remedy.</li> <li>b. The selected remedy involves excavation and on-site consolidation of soil in portions of the Panhandle Area planned for wetlands restoration (both tidal and freshwater) and sediment throughout the Shoreline Area. Following on-site consolidation, the remaining contamination at all Parcel E-2 areas, except the proposed tidal and freshwater wetlands, would be properly contained with a low-permeability cover for onshore soil and supplemented with a rock revetment structure for shoreline sediment. The proposed tidal wetlands would be protected primarily with natural materials (soil and vegetation).</li> <li>c. Consistent with information contained in the Final RI/FS Report (including correspondence with BCDC provided in Attachment O1), the rock revetment is needed along the portions of the shoreline to ensure that the selected remedy is protective of human health and the environment. Specifically, the proper containment of the Parcel E-2 Landfill and the adjoining Panhandle Area and East Adjacent Area require protection of relatively steep and narrow shoreline slopes and, as discussed in Section 11.5.2 of the Final RI/FS Report, rock revetment is the most appropriate protection option for such areas to ensure protectiveness in the long term.</li> </ol> |

|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.<br>(cont.) | 5. <b>A discussion regarding the potential for constructing a shoreline protection system whose width is narrower than 50 feet</b> , as shown in earlier remediation documents. Unless the 50-foot-wide system is essential for containing the landfill, the Commission staff believes that a narrower system would maximize public access at the site and to the water of the Bay. If a narrower revetment is infeasible, the BRAC team could also consider incorporating a feature (e.g., ramps or stairs) that provides vertical access to the Bay. | 5. The width of the shoreline revetment will be determined in the RD based on the following technical factors: <ol style="list-style-type: none"> <li>a. <b>Elevation at the base of the revetment wall.</b> The elevation at the base of the revetment wall will be designed at about the mean tide level. This design constraint will minimize the area and volume of bay fill (consistent with the information provided in the Final RI/FS Report and summarized previously in these responses).</li> <li>b. <b>Elevation at the upland edge of Parcel E-2.</b> The elevation at the upland edge of Parcel E-2 (where it joins the intertidal shoreline zone) will be based on the final grading plan. The grading plan will include a higher future elevation of the upland edge (relative to the existing topography) because on-site soil (generated from excavation for the future wetlands and shoreline revetment) will be consolidated at the Parcel E-2 Landfill and nearby portions of the Panhandle Area and East Adjacent Area. A conceptual grading plan was presented in Figure 12-1 of the Final RI/FS Report, and this grading plan will be refined in the RD.</li> <li>c. <b>Slope of the shoreline revetment.</b> The slope of the shoreline revetment will be designed to ensure the long-term stability of the containment remedy (which includes the shoreline revetment and soil cover). The Navy will perform, as part of the RD, a comprehensive static and seismic slope stability evaluation for the Parcel E-2 Landfill to ensure that the proposed design can, consistent with the requirements of Cal. Code Regs., tit. 22 § 66264.310(a)(5), accommodate the inertial forces generated by the MCE while maintaining the integrity of the landfill and the cover system. The conceptual design of the shoreline revetment (which, as shown in Figure 12-4 of the Final RI/FS Report is 1 foot of vertical rise for each 3 feet of horizontal distance) may be refined based on the results of this evaluation.</li> </ol> <p>Based on these technical factors, the current conceptual design identifies a shoreline revetment (horizontal) width ranging from 36 to 45 feet. As described above, the conceptual design will be refined in the RD.</p> |

| <i>Introduction</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| --                  | <p>The California Department of Fish and Game, Office of Spill Prevention and Response (DFG-OSPR) has completed its review of the subject document, received on September 24, 2012. The comments that follow are provided as part of our role as a natural resource Trustee for the State of California's fish and wildlife, and their habitats. DFG-OSPR's review focused on the ecological risk assessment and biological resource related sections of the document. The DFG is the State's Trustee for fish and wildlife resources pursuant to Fish and Game Code Section 711.7. The DFG is also designated as a Trustee for natural resources pursuant to Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Section 107 (f)(2)(B).</p> <p>Hunters Point Naval Shipyard (HPNS), located in southeast San Francisco on a peninsula that extends east into San Francisco Bay, was identified for closure during the Base Realignment and Closure process of 1991. The shipyard is approximately 936 acres in size, 443 acres of which are on land with the remaining acreage under water (Tetra Tech, 2000). HPNS is bounded on the north and east by San Francisco Bay and on the south and west by the Hunters Point district of San Francisco, which consists of public and private housing and commercial &amp; industrial buildings. The north and east shores of HPNS are developed for ship repair with dry docks and berths; there are no shipping facilities on the southwest shore.</p> <p>HPNS was operated as a commercial dry dock facility from 1869 until 1939. In 1940, the Navy obtained ownership of the shipyard for ship building, repair, and maintenance activities. Activities shifted from ship repair to submarine servicing and testing after World War II. HPNS was deactivated in 1974 and remained relatively unused until 1976. Between 1976 and 1986, the Navy leased most of the property to a privately-owned ship repair firm. In 1986, the Navy again occupied the shipyard and began a program to investigate and clean up contamination resulting from past activities (Engineering/Remediation Resources, 2009).</p> | <p>The Navy finds that CDFG's comments on the Draft Final ROD reiterate concerns previously expressed during their review of the Proposed Plan and Draft ROD for Parcel E-2. The Navy has previously responded to CDFG comments on the Proposed Plan (comments and responses contained in Attachment 3) and the Draft ROD (comments and responses on pages 28 through 49 of this attachment). The Navy believes that the previous responses adequately convey the Navy's position on the concerns expressed by CDFG and that no further response is necessary.</p> |

| <i>Introduction (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                              |
| --                              | <p>HPNS is divided into six parcels (A through F). Parcel E-2 is approximately 48 acres in size and is located in the southwestern part of HPS, adjacent to San Francisco Bay. It includes former portions of Parcel E, including Installation Restoration (IR)-01/21, the Panhandle Area, a small area of IR-02 Northwest, and the area east of IR-01/21 that does not have an IR site designation. Habitats in Parcel E-2 include ruderal, non-native annual grassland, intertidal and saline emergent wetlands, and a seasonal freshwater wetland. Base habitats that include upland, tidal wetlands, and offshore habitats are used by numerous wildlife species representing the many different trophic levels of the food chain. The planned reuse for Parcel E-2 is open space, except for a small area in the East Adjacent Area, which is designated to be part of the Shipyard South Multi-Use District.</p> <p>In a memorandum dated July 26, 1999, DFG-OSPR provided comments on the Draft Validation Study Report, Parcel E, HPNS (Chernoff, 1999). DFG-OSPR commented on the Draft Wetlands Mitigation and Monitoring Plan, Metal Debris Reef and Metal Slag Areas Parcels E and E-2, HPNS (Gray, 2007a) and on the Draft Parcel E-2 Remedial Investigation/Feasibility Study (RI/FS) (Gray and Huang, 2007). DFG-OSPR provided Applicable or Relevant and Appropriate Requirements (ARARs) for the Parcel E-2 Feasibility Study in a memorandum dated September 7, 2007 (Gray, 2007b). DFG-OSPR commented on the Draft Final Wetlands Mitigation and Monitoring Plan (WMMP), Metal Debris Reef and Metal Slag Areas Parcels B, E and E-2 (Huang and Nakahara, 2009) and on the Draft Final RI/FS for Parcel E-2 (Nakahara et al, 2009). DFG-OSPR also commented on the Final WMMP, Metal Debris Reef and Metal Slag Areas Parcels B, E and E-2 (Nakahara, 2010). DFG-OSPR provided ARARs for the Time-Critical Removal Action (TCRA) at the Experimental Ship Shielding Range (ESSR), Parcel E-2 and commented on the Proposed Plan (PP) for Parcel E-2, and the Draft Action Memorandum for the TCRA ESSR, Parcel E-2 in memoranda dated July 27, 2011 (Nakahara, 2011), November 18, 2011 (Huang and Nakahara, 2011), and February 22, 2012 (Huang and Nakahara,</p> | <i>(please see the response on page 157)</i> |

DFG-OSPR commented on the Parcel E-2 Draft Record of Decision (ROD) in a memorandum dated May 14, 2012 (Huang and Nakahara, 2012b).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <i>(please see the response on page 157)</i> |
| <i>DFG-OSPR's response to the Navy's comments on the Introduction Section in DFG-OSPR's Draft ROD Memorandum</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                              |
| 1.                                                                                                               | The Navy states, " <i>As acknowledged in this comment, CDFG [California Department of Fish and Game] provided comments on the Draft and Draft Final versions of the RI/FS Report for Parcel E-2. The Navy responded to all CDFG comments, and the document was finalized in May 2011, in accordance with Section 7.9 of the HPNS FFA [Federal Facilities Agreement]</i> ". Although the Navy responded to all DFG-OSPR comments, they did not resolve all of DFG-OSPR's concerns, but finalized these documents without adequately addressing DFG-OSPR's concerns. Finalizing a document does not absolve the Navy of complying with DFG ARARs despite whether the document was finalized in accordance with the HPNS FFA. DFG-OSPR has not approved the take of any State special status species as the result of any CERCLA activities at Hunters Point. If the Navy has take of any special status species protected by DFG ARARs, including incidental take, the Navy may be in violation of relevant and appropriate ARARS. DFG-OSPR commented on numerous CERCLA documents (Gray and Huang, 2007; Huang and Nakahara, 2009; Nakahara, et al., 2009; Huang and Nakahara, 2011; Huang and Nakahara, 2012b) and provided information on the best ways for the Navy to avoid take, such as installing a biotic barrier to prevent damage to the landfill cap from burrowing animals, rather than using pesticides that may kill non-target special status species. The Navy has repeatedly chosen to disregard DFG-OSPR's comments and proceeded to implement a remedy which DFG-OSPR, as a natural resource Trustee for the State of California, believes is not adequately protective of the environment and will have negative impacts on special status species. This is particularly relevant at Parcel E-2, which is designated for future reuse as open space and includes wetland restoration which will provide habitat for many State and Federal special status species. | <i>(please see the response on page 157)</i> |

| <i>DFG-OSPR's response to the Navy's comments on the Introduction Section in DFG-OSPR's Draft ROD Memorandum (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                              |
| 2.                                                                                                                           | <p>The Navy states, "As described in Section 7.10 of the FFA, there are specific technical requirements for any request by an FFA signatory (which, for the State of California, includes only DTSC and the Water Board) to modify a final primary document (such as the RI/FS Report for Parcel E-2), or otherwise request additional work for sites addressed in a final primary document." DFG-OSPR would like to clarify that we did not request the Navy modify a primary document after it was finalized. We did however, repeatedly request the Navy modify a primary document before it was finalized (i.e., install a biotic barrier in the Draft Final RI/FS [Nakahara, et al., 2009], Draft Final WMMP [Huang and Nakahara, 2009], and Draft ROD [Huang and Nakahara, 2012b]). However, the Navy finalized all these documents without addressing our concerns to DFG-OSPR's satisfaction. In regards to the PP, the Navy did not submit the Draft and Draft Final versions of the PP to DFG-OSPR for review before the PP was finalized, thus DFG-OSPR was not provided the opportunity to comment during the regulatory agency review period. Instead, the Navy sent a finalized copy of the PP to DFG-OSPR for review during the public comment period.</p> | <i>(please see the response on page 157)</i> |
| 3.                                                                                                                           | <p>The Navy states, "In addition, CDFG's comments on the RI/FS Report, Proposed Plan, and Draft ROD request that the Navy incorporate a biotic barrier consisting of cobbles. CDFG's comments imply that a final cover without a biotic barrier consisting of cobbles would require significant long-term maintenance (to repair damage from burrowing animals). As detailed in the following responses (as well as in previous responses to CDFG comments on the RI/FS Report and Proposed Plan), the CDFG has not presented sufficient technical information to support its assertions. Further, CDFG's comments fail to acknowledge the potentially significant geotechnical issues that could arise by incorporating a cobble layer (up to 3 feet thick) with an overlying vegetative layer (up to 2 feet thick). The Navy finds that a cobble layer is unnecessary and that incorporation of such a layer could potentially affect the stability and long-term performance of the final cover." The following OFG-OSPR responses detail (as have previous</p>                                                                                                                                                                                                        | <i>(please see the response on page 157)</i> |

| <i>DFG-OSPR's response to the Navy's comments on the Introduction Section in DFG-OSPR's Draft ROD Memorandum (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                              |
| 3.<br>(cont.)                                                                                                                | DFG-OSPR responses to Navy comments on the RI/FS, Proposed Plan, and Draft ROD), that the Navy has not presented sufficient technical information to support its assertions that a geomembrane would deter or control animals from burrowing under the landfill cover. Furthermore, this is the first time the Navy has asserted that potentially significant geotechnical issues could arise by incorporating a cobble layer into the final cover. The Navy has not provided sufficient technical information to support its assertions that a cobble layer is unnecessary and that incorporation of such a layer could potentially affect the stability and long-term performance of the final cover. | <i>(please see the response on page 157)</i> |
| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's General Comments on the PP</i>                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                              |
| 1.                                                                                                                           | This review focused on whether DFG-OSPR's comments in the memo of March 14, 2012 were adequately addressed. The responses to comments, contained in Attachment 5, did not accurately reflect the written comments from DFG-OSPR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <i>(please see the response on page 157)</i> |
| 2.                                                                                                                           | DFG-OSPR commented " <i>Please see DFG-OSPR's responses below on the PP Specific Comment 2a1-5 and 2b1 regarding biotic barriers and damage to geomembranes from burrowing animals</i> " (Huang and Nakahara, 2012b). The Navy responded, " <i>Please refer to the responses to CDFG comment 2 below (on the Navy's Responses to Specific Comments on the Proposed Plan for Parcel E-2).</i><br><br><i>Please see DFG-OSPR's responses below on PP Specific Comments 2a1-5 and 2b1-6.</i>                                                                                                                                                                                                               | <i>(please see the response on page 157)</i> |
| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP</i>                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                              |
| 1.                                                                                                                           | Specific Comment No. 1. Navy's response is noted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <i>(please see the response on page 157)</i> |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                              |
| 2.                                                                                                             | <p>Page 17, Section "Summary of the Preferred Alternative". The PP states, "<i>The liner will minimize water seeping into the contaminated material, control animals from burrowing under the cover, and serve as a visual marker for the bottom of the cover.</i>"</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <i>(please see the response on page 157)</i> |
| a.                                                                                                             | <p>DFG-OSPR commented that "<i>Geosynthetic caps, consisting of a geocomposite drainage layer (e.g., geonet) and a geomembrane, are designed to reduce stormwater infiltration into the contaminated material. Geosynthetic caps are not designed to function as biotic barriers to "control animals from burrowing under the cover" and exposing contaminants. There is various information in the literature that supports this view</i>" (Huang and Nakahara, 2012b). The Navy responded, "<i>The cited statement in the Responsiveness Summary is consistent with more detailed information presented in Section 11.5.1.2 of the Final RI/FS Report, which identifies several other landfills in the San Francisco Bay area where the selected CERCLA remedies included geocomposite drainage material to both provide a drainage path for infiltration and to deter burrowing animals.</i>"</p> |                                              |
|                                                                                                                | <p>It is inappropriate to use geocomposite drainage material for a purpose these materials were not designed for (i.e., deterring or controlling burrowing animals), nor demonstrated to adequately function as (i.e., biotic barrier). DFG-OSPR attempted to locate documentation or research results to confirm that the geomembrane is an effective biotic barrier against burrowing animals and requested the landfill cover manufacturer (GSE Lining Technology, Inc.), provide such documentation if it exists (Huang and Nakahara, 2011). Neither the manufacturer nor the Navy has provided this information to date.</p>                                                                                                                                                                                                                                                                    |                                              |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                              |
| 2.<br>(cont.)                                                                                                  | 1. DFG-OSPR commented (Huang and Nakahara, 2012b) that according to Dr. John Scheirs, a polymer technologist with ExcelPias Geomembrane Testing Services, "Burrowing animals are a real threat to geomembranes. There are a number of documented cases of animals breaching the liners by gnawing or cutting. These include: ... <ul style="list-style-type: none"> <li>• rodents gnawing through liners;</li> <li>• pecking damage by bird beaks;</li> <li>• gophers (prairie dogs) burrowing through pond liners..." (Scheirs, 2009)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <i>(please see the response on page 157)</i> |
|                                                                                                                | <p>Furthermore, Dr. Scheirs states, "The potential for penetration into the geomembrane by burrowing animals is far greater for unconsolidated, fine-grained sand/soils than for gravel and rock. A biotic barrier (BB) can therefore be installed to reduce potential intrusion by burrowing animals (for instance into landfill liners). A BB of 70 cm consisting of cobbles overlain with 30 cm of gravel can deter burrowing animals" (Scheirs, 2009). The Navy responded, "The Navy has reviewed the subject document and finds that CDFG staff has presented the quoted statements out of context. Specifically, the quoted statements are included in a section titled "Failure Modes of Exposed Geomembranes": indicating that the noted performance issues pertain to geomembranes exposed directly to the environment. As described in the response to CDFG specific comment 2 on the Proposed Plan, covered geomembranes are used in all landfill liner and cover applications. Further, the subject document is a 600-page technical reference manual that covers a variety of topics related to landfill liners, and is not a focused study on the performance of existing landfill covers."</p> |                                              |
|                                                                                                                | <p>DFG-OSPR did not present the quoted statements out of context. Although the quoted statements are included in a section titled "Failure Modes of Exposed Geomembranes", the statements pertain specifically to the penetration of geomembranes by burrowing animals, regardless</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                              |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                              |
| 2.<br>(cont.)                                                                                                  | <p>of whether the geomembranes are exposed, covered, or used in liner or cover applications. Dr Scheirs states, "<i>Burrowing animals are a real threat to geomembranes</i>", not "<i>Burrowing animals are a real threat to exposed geomembranes</i>." In fact, Dr. Scheirs goes on to state, "<i>The potential for penetration into the geomembrane by burrowing animals is far greater for unconsolidated, fine-grained sand/soils than for gravel and rock</i>", which indicates that even when the geomembrane is covered by "<i>unconsolidated, fine-grained sand/soils</i>", the potential for burrowing animals to penetrate the geomembrane is far greater than when the geomembrane is covered by gravel and rock (i.e., a biotic barrier). The fact that the subject document covers topics related to landfill liners and is not a focused study on the performance of landfill covers is irrelevant. The Navy specifically asserted the geomembrane "<i>liner</i>" would "<i>control animals from burrowing under the cover</i>". The cited reference provides documentation of instances where geomembranes failed to control burrowing animals. For the Navy to imply that burrowing animals would be able to penetrate a geomembrane in a landfill liner but not penetrate a geomembrane in a landfill cover is unsubstantiated.</p> <p>The Navy also responded, "<i>In addition, the author (Dr. Scheirs) draws upon experience from landfills in other countries (most notably Australia) where site conditions may differ from those in the United States. For example, the author cites 'crab damage on Nauru island' and 'kangaroo paws' as documented cases of animals damaging exposed geomembranes. CDFG excluded these statements from their quoted excerpt, and the Navy finds CDFG's quoted statement potentially misleading because the unusual examples excluded from CDFG's quoted statement immediately precede and follow the examples cited by CDFG. For these reasons, the Navy does not believe that the cited reference provides pertinent information on the potential for burrowing animals to affect the performance of the covered geomembrane proposed for Parcel E-2.</i>"</p> | <i>(please see the response on page 157)</i> |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                              |
| 2.<br>(cont.)                                                                                                  | <p>Although Dr. Scheirs draws upon experience from landfills in other countries where site conditions may differ from those in the United States, he provides specific instances of documented cases where various types of animals breached the geomembrane liners. DFG-OSPR did not include irrelevant examples of animal damage from species that would not be found on naval bases in coastal California so as not to imply that these animals would also cause damage at Hunters Point. However, DFG-OSPR did include relevant examples of documented cases of damage to geomembranes from rodents, birds, and gophers. All of these types of animals occur at Hunters Point (SFRA, 2009). In fact, Norway rats, which have been documented to occur at Hunters Point (SFRA, 2009), occur on all continents except Antarctica. For the Navy to imply that rodents, birds, and gophers in other countries can breach a geomembrane but rodents, birds, and gophers at Hunters Point cannot breach a geomembrane is unsubstantiated. Therefore, for these reasons, DFG-OSPR believes the cited reference provides pertinent information on the potential for burrowing animals to affect the performance of the covered geomembrane proposed for Parcel E-2.</p> | <i>(please see the response on page 157)</i> |
| 2.                                                                                                             | <p>DFG-OSPR commented (Huang and Nakahara, 2012b) that the U.S. National Research Council states, <i>"Where burrowing animals might damage the geomembrane/low-hydraulic conductivity soil layer, a biotic barrier layer of large-sized aggregate will be needed above if"</i> (National Research Council, 1997). The Navy responded, <i>"The Navy has reviewed the subject document and finds that CDFG staff has not properly identified the context of the cited study. Specifically, the document summarizes the findings from a 1-day workshop on engineered barriers that might be used for "remediation of radioactive and mixed waste located in the U.S. Department of Energy (DOE) nuclear weapons complex". The Navy does not believe that the low level radioactive material potentially present at Parcel E-2 is comparable to wastes located in the Department of Energy's nuclear</i></p>                                                                                                                                                                                                                                                                                                                                                            |                                              |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                              |
| 2.<br>(cont.)                                                                                                  | <p><i>weapons complex. For this reason, the Navy does not believe that the cited reference provides pertinent information on the potential for burrowing animals to affect the performance of the covered geomembrane proposed for Parcel E-2."</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <i>(please see the response on page 157)</i> |
|                                                                                                                | <p>The context of the cited study has no bearing on the performance of a geomembrane. The relevant information in the study pertains to the need for a biotic barrier where burrowing animals might damage the geomembrane. The study did not state that a biotic barrier is only necessary for remediating radioactive wastes at DOE nuclear weapons complexes and not other types of wastes such as low radioactive material. For the Navy to imply that burrowing animals will only damage a geomembrane over radioactive nuclear waste but not a geomembrane over low level radioactive materials is unsubstantiated. For this reason, DFG-OSPR believes that the cited reference provides pertinent information on the potential for burrowing animals to affect the performance of the covered geomembrane proposed for Parcel E-2.</p> |                                              |
|                                                                                                                | <p>3. DFG-OSPR commented (Huang and Nakahara, 2012b) that the U.S. Environmental Protection Agency (USEPA) has also discussed the use of biotic barriers in landfill caps as a method to protect geomembranes from damage by burrowing animals in several of their publications (USEPA, 1989a; USEPA, 1989b; USEPA, 1992; USEPA, 1993). According to the USEPA, "A <i>Biotic barrier is used in the cap of a waste containment system to prevent small burrowing animals and plant roots from penetrating the drainage layer or the low permeability layer</i>" (USEPA, 1992).</p>                                                                                                                                                                                                                                                            |                                              |
|                                                                                                                | <p>The Navy responded, "<i>The design-related elements of the 1992 guidance are abbreviated and do not compare with more detailed information presented in a 1991 EPA guidance document titled 'Design and Construction of RCRA/CERCLA Final Covers' (EPA, 1991b). Specifically, the 1991 EPA guidance identifies a biotic barrier consisting of cobbles as an optional layer that 'may stop the penetration</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                          |                                              |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                              |
| 2.<br>(cont.)                                                                                                  | <p><i>of some deep-rooted plants and the invasion of burrowing animals.' The 1991 EPA guidance also states that '[M]ost research on biotic barriers has been done in, and is applicable to, arid areas.' This information indicates that biotic barriers are not typical for landfill covers in temperate climates such as San Francisco. Because of its limited scope, the Navy does not believe that the 1992 guidance cited by CDFG provides pertinent information on the potential for burrowing animals to affect the performance of the covered geomembrane proposed for Parcel E-2."</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <i>(please see the response on page 157)</i> |
|                                                                                                                | <p>DFG-OSPR finds the Navy's statement, "<i>This information indicates that biotic barriers are not typical for landfill covers in temperate climates such as San Francisco</i>", incorrect and misleading. The statement in the 1991 USEPA guidance that "<i>[M]ost research on biotic barriers has been done in, and is applicable to, arid areas</i>" indicates that most research has been done in arid climates and little research has been done in other types of climates, including temperate climates. Therefore, research done in arid climates would be applicable to arid areas and not other types of climates. However, the Navy cannot infer that just because little research has been done in other types of climates that "<i>This information indicates that biotic barriers are not typical for landfill covers in temperate climates such as San Francisco.</i>" One can only infer that more research needs to be conducted on biotic barriers in temperate climates to determine their use in temperate climates. Although the USEPA may identify a biotic barrier as an optional layer, DFG-OSPR believes that all of the cited USEPA publications provide pertinent supporting information on the potential for burrowing animals to affect the performance of the covered geomembrane proposed for Parcel E-2.</p> |                                              |
| 4.                                                                                                             | <p>DFG-OSPR commented (Huang and Nakahara, 2012b) that the Post-Closure Operation and Maintenance Plan for landfills at Ford Ord, California states, "<i>Another mechanism for damaging the geomembrane</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                              |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                              |
| 2.<br>(cont.)                                                                                                  | <p><i>is burrowing animals, which are common on the landfill. The problems burrowing animals pose are twofold:</i></p> <ul style="list-style-type: none"> <li>• <i>Burrows destabilize the vegetation layer which is then exposed to erosion</i></li> <li>• <i>Burrowing animals with sharp claws could directly damage the geomembrane as they excavate their burrows.</i></li> </ul> <p><i>Although there has been only one case documented of geomembrane damage caused by burrowing animals (Steiniger, 1968), the potential for damage to the geomembrane still exists and should be monitored" (IT Corporation, 2000). The Navy responded, "Four of the landfill covers were completed in 1998 and the fifth landfill cover was completed in 2002. As documented in the five- year review reports from 2002 and 2007 (Army, 2002 and 2007), the Operable Unit 2 landfill covers are functioning as designed and no performance issues related to the geomembrane liners were noted."</i></p> <p><i>Fourteen years and ten years, respectively, of maintenance and monitoring are relatively short periods in the life of landfills that are supposed to function and be maintained in perpetuity. Although no performance issues related to geomembranes have yet been noted, according to the cited reference, burrowing animals could directly damage the geomembrane, indicating that for potential for damage to the geomembrane from burrowing animals still exists. For these reasons, DFG-OSPR believes that the cited reference provides pertinent information on the potential for burrowing animals to affect the performance of the covered geomembrane proposed for Parcel E-2.</i></p> | <i>(please see the response on page 157)</i> |
| 5.                                                                                                             | <p><i>DFG-OSPR commented (Huang and Nakahara, 2012b) that the Navy also published a document entitled "Installation Restoration: Navy Landfills and EPA Cover Guidance", which recommends the use of biotic barriers to protect the geomembrane from damage by burrowing animals (Karr et al., 1992). According to the Navy's publication, "The biotic barrier consists of a gravel and rock layer designed to prevent</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                              |

| 2.<br>(cont.)                                                                                                  | <p><i>the intrusion of burrowing animals. This protection is primarily necessary around the cap but, in some cases, may also be needed at the bottom of the liner. Although animals cannot generally penetrate the flexible membrane cap (FMC), they can widen an existing hole or tear through wrinkled material. The proposed 1-meter thickness should effectively prevent penetration by all but the smallest insects" (Karr et al., 1992).</i></p> <ul style="list-style-type: none"> <li>The Navy responded, <i>"The Navy wishes to clarify that the subject document, which was referenced in Section 11.5.1.2 of the RI/FS Report, does not 'recommend' the use of biotic barriers. Rather, the subject document describes required and optional layers for landfill covers, as specified in 1989 EPA guidance titled 'Technical Guidance Document: Final Covers on Hazardous Waste Landfills and Surface Impoundments'."</i></li> </ul> <p>Although the subject document may describe a biotic barrier as an optional layer for landfill covers, the use of the words <i>"necessary"</i> and <i>"needed"</i> in the statement, <i>"This protection is primarily necessary around the cap but, in some cases, may also be needed at the bottom of the liner"</i>, indicates these are also recommendations. Regardless, the document still acknowledges that burrowing animals <i>"can widen an existing hole or tear through wrinkled material."</i> The document does not state that biotic barriers are not necessary because geomembranes will deter or control animals from burrowing under the cover. Therefore, this document also provides pertinent information that biotic barriers are necessary to prevent the intrusion of burrowing animals around the landfill cap.</p> <ul style="list-style-type: none"> <li>The Navy also responded that <i>"previously cited EPA 1991 guidance states that [M]ost research on biotic barriers has been done in, and is applicable to, arid areas.' In contrast, the subject document states that 'Most Navy landfills are located in coastal</i></li> </ul> | <i>(please see the response on page 157)</i> |

| 2.<br>(cont.)                                                                                                  | <p><i>areas which contributes to increased penetration by water subsurfaceally, or in areas of high precipitation, creating high infiltration and runoff."</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <i>(please see the response on page 157)</i> |
|                                                                                                                | <p>Please see DFG-OSPR's response to Specific Comment 2a3. Burrowing animals are present in coastal areas as well as arid areas and have been documented to <i>occur</i> at Hunters Point (SFRA, 2009). The Navy's reference to hydrologic conditions in coastal areas is irrelevant to the discussion of whether burrowing animals can damage a geomembrane.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                              |
|                                                                                                                | <ul style="list-style-type: none"> <li>The Navy also responded <i>"the subject document evaluated conditions at 229 Navy landfills and identified the potential generation of landfill leachate and landfill gas as the primary performance issues requiring careful evaluation and further study."</i></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                              |
|                                                                                                                | <p>The Navy has presented this information out of context. The Navy's statement that potential generation of landfill leachate and landfill gas were identified as the primary performance issues was based on another study conducted specifically on the treatment of landfill leachate contaminated with low levels of priority pollutants (NCEL,1991). This study did not examine the effects of burrowing animals on geomembranes. According to the subject document, <i>"A study by NCEL [Naval Civil Engineering Laboratory] was conducted on the treatment of landfill leachate contaminated with low levels of priority pollutants (Ref 5). This study recommends further work in selecting and conducting treatment train laboratory studies on leachates. It also points out potential problems associated with the gases generated from the landfills and the residual solids generated from the treatment processes"</i> (Karr et. al., 1992). A study that does not examine the effects of burrowing animals on geomembranes, cannot be used to assert or deny that damage to geomembranes by burrowing animals is not a</p> |                                              |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                              |
| 2.<br>(cont.)                                                                                                  | <p>concern at any of the 229 Navy landfills evaluated in the subject document. A lack of data documenting damage to geomembranes by burrowing animals does not indicate that damage does not exist or will not occur.</p> <ul style="list-style-type: none"> <li>The Navy further stated, <i>"In summary, the Navy finds that CDFG has presented the additional information provided in this comment out of context. The Navy continues to assert its belief, as stated in previous responses to CDFG's comments on the Proposed Plan, that CDFG has not presented sufficient technical information to support its assertion that burrowing animals would cause significant damage to the geomembrane liner over time, or cause unacceptable exposure of contaminated waste. CDFG repeated comments on this topic imply a direct connection between the presence of burrowing animals at any landfill site and corresponding damage to an underlying geomembrane liner that is not supported by adequate evidence."</i></li> </ul> <p>The Navy has presented information in their response to DFG-OSPR Specific Comment 2a5 out of context. The Navy has not presented sufficient technical information to support its assertions that a geomembrane would deter or control animals from burrowing under the landfill cover. In contrast, DFG-OSPR has provided information from various literature sources describing the use of biotic barriers to prevent burrowing animals from damaging or penetrating the geomembrane. The Navy has yet to provide a citation from a valid research study stating biotic barriers are not necessary for preventing burrowing animals from damaging or penetrating a geomembrane, that burrowing animals cannot damage or penetrate a geomembrane, or that geomembranes alone will deter or control animals from burrowing under the cover.</p> <ul style="list-style-type: none"> <li>The Navy goes on to cite two studies which they assert <i>"have evaluated the performance of landfill covers nationwide and</i></li> </ul> | <i>(please see the response on page 157)</i> |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                              |
| 2.<br>(cont.)                                                                                                  | <p data-bbox="401 412 1129 532"><i>provide more pertinent information to evaluate the potential significance of burrowing animals at existing landfill covers. Neither of these studies identified burrowing animals as a significant performance problem for geomembrane liners."</i></p> <p data-bbox="401 548 1129 971">a) <i>"Assessment of the Performance of Engineered Waste Containment Barriers" (National Research Council, 2007). The Air Force states, "This study, prepared at the request of numerous federal agencies (EPA, NRC, NSF, and DOE), assessed the effectiveness of existing engineered barriers over the long term. The report concluded that "Based on as much as 20 years of observations, the committee concluded that most engineered waste containment barrier systems that have been designed, constructed, operated, and maintained in accordance with current statutory regulations and requirements have thus far provided environmental protection at or above specified levels." The report did not identify burrowing animals as a significant performance problem for geomembrane liners."</i></p> <p data-bbox="449 979 1129 1378">The Navy has presented the information above incorrectly and out of context. The document states, <i>"At the request of the Environmental Protection Agency (EPA), Department of Energy (DOE), National Science Foundation (NSF), and Nuclear Regulatory Commission (USNRC), the National Academies Committee to Assess the Performance of Engineered Barriers was established to provide a technical assessment of the available information on engineered barrier performance over time."</i> The document further states, <i>"Because engineered barrier systems constructed in compliance with current regulatory requirements have been operating for only a few decades at most, the assessment necessarily focuses on short- and medium-term performance."</i></p> | <i>(please see the response on page 157)</i> |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                              |
| 2.<br>(cont.)                                                                                                  | <p>Therefore, the assessment only focuses on short and medium-term performance and not on long-term performance as the Navy asserts.</p> <p>The document states, <i>"The performance of many engineered barriers is monitored indirectly, usually through evidence of contaminant migration outside the waste containment system. The absence of direct monitoring data introduces uncertainties about how well the individual elements of the overall containment system are working."</i> Although the report did not identify burrowing animals as a significant performance problem for geomembrane liners, absence of direct monitoring data makes it uncertain whether burrowing animals are a significant problem. The document further states, <i>"Many barrier systems are intended to function for tens to thousands of years. Because most regulated sites have been in operation less than 30 years, it is not possible to make unequivocal conclusions about the actual long-term performance of these systems."</i> As DFG-OSPR has stated before, a lack of data documenting damage to geomembranes by burrowing animals does not indicate that damage does not exist or will not occur. Therefore, the conclusions the Navy cites above were presented out of context.</p> <p>b) <i>"Assessment and Recommendations for Improving the Performance of Waste Containment Systems"</i> (Bonaparte et al., 2002). The Air Force states, <i>"Problems identified for landfill covers consisted of cover system slope failure during construction, cover system slope failure after rainfall or a thaw, and soil cover damage due to earthquakes. The study noted that 'the number of facilities with identified problems is relatively small in comparison to the total number of modern facilities nationwide.' Overall, the study concluded that 'environmentally safe and effective containment of waste is</i></p> | <i>(please see the response on page 157)</i> |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                              |
| 2.<br>(cont.)                                                                                                  | <p><i>attainable.' The report did not provide any specific examples of locations where geomembrane liners were damaged by burrowing animals."</i></p> <p>The Navy has presented the information above out of context. The document states, "Conclusions are: (1) the number of facilities with identified problems is relatively small in comparison to the total number of modern facilities nationwide; however, the search for problems was by no means exhaustive; (2) the investigation focused on landfill facilities: 94% of the identified problems described herein occurred at landfills; (3) among the landfill problems, 70% were liner system related and 30% were cover system related; however, the ratio of liner system problems to cover system problems is probably exaggerated by the fact that a number of the facilities surveyed were active and did not have a cover system; ..." According to the study, the search for problems was not exhaustive. As a result, landfills with problems caused by burrowing animals, may not have been identified in this study. In addition, problems were identified only for landfill covers on closed landfills since active landfills did not have cover systems and have not yet needed to address cover problems or cover problems associated with burrowing animals. There are data gaps in this study, which make the Navy's assertion that damage to geomembrane liners by burrowing animals is not a problem for landfills nationwide, premature, incorrect, and misleading. A lack of data documenting damage to geomembranes by burrowing animals does not indicate that damage does not exist or will not occur.</p> <p>DFG-OSPR summarized for Specific Comments 2a1-5 that, "Although other landfill sites have chosen not to install a biotic barrier, this does not mean that their geocomposite drainage layer would prevent</p> | <i>(please see the response on page 157)</i> |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                              |
| 2.<br>(cont.)                                                                                                  | <p data-bbox="354 412 1125 623"><i>burrowing animals from damaging the geomembrane in these landfill caps. Based on the information in the literature, DFG-OSPR requests the Navy remove any references to the geomembrane, geocomposite drainage layer, or geocomposite cap that state these components will "control animals from burrowing under the cover" or imply that these components will perform the function of a biotic barrier' (Huang and Nakahara, 2012b).</i></p> <p data-bbox="354 639 1125 850"><i>The Navy responded, "Specifically, CDFG has not presented any significant new information or demonstrated that their primary recommendation following review of the RI/FS Report and Proposed Plan (to include a biotic barrier consisting of cobbles) is necessary to protect human health or the environment. ... The language in the Draft ROD, which is consistent with the Final RI/FS Report, will not be revised in response to CDFG's comment."</i></p> <p data-bbox="354 867 1125 1378"><i>DFG-OSPR has provided information from various literature sources describing the use of biotic barriers to prevent burrowing animals from damaging or penetrating the geomembrane, in order to prevent contaminants from becoming exposed. The Navy has not presented sufficient technical information to support its assertions that a geomembrane would deter or control animals from burrowing under the landfill cover. Designing a landfill cap to only meet the <u>minimum</u> regulatory requirements for a landfill cover does not guarantee it will be effective against damage from burrowing animals in perpetuity. The Navy has installed landfill covers without biotic barriers at other locations in California (i.e., Port Hueneme Site 14 and Moffett Field Site 1). As a result of inadequate cover design at these locations, the Navy has resorted to poisoning gophers in perpetuity to prevent these animals from damaging the landfill cap. DFG-OSPR does not believe that a remedy that proposes to clean up one type of chemicals of ecological concern (COEC) (i.e., lead and mercury) only to substitute them with another type of COEC (i.e., pesticides), complies with</i></p> | <i>(please see the response on page 157)</i> |

| 2.<br>(cont.)                                                                                                  | CERCLA and the requirement that the remedy be protective of the environment. Furthermore, take of any special status species protected by DFG ARARs, including incidental take by pesticides, may also result in the Navy's non-compliance with those ARARs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <i>(please see the response on page 157)</i> |
|                                                                                                                | b. DFG-OSPR commented on the Draft Final Remedial Investigation/Feasibility Study Report for Parcel E-2 and asked the Navy to explain why a biotic barrier was not incorporated into the design of the landfill cover since gophers can dig up to six feet deep, which exceeds the depth of the proposed 2-foot soil cover (Nakahara et al., 2009).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                              |
|                                                                                                                | 1) DFG-OSPR commented (Huang and Nakahara, 2012b) that as a result of the ineffectiveness of the gopher trapping at former Naval Air Station Moffett Field Site 1 Landfill, the Navy is now evaluating other alternatives, such as the use of Fumitoxin (OTIE, 2011). Based on the " <i>demonstrated performance of the cover at Site 1</i> ", which the Navy is using to evaluate the efficacy of the proposed cover at Parcel E- 2, there is the potential for gopher burrowing to be an issue at Parcel E-2. DFG-OSPR does not support the use of pesticides for landfill maintenance because of their ability to kill non-target species, including State and Federal special status species. If the Navy has take of State and Federal special status species during landfill maintenance activities, they may be in violation of State and Federal ARARs. |                                              |
|                                                                                                                | The Navy responded, " <i>The Navy continues to assert their belief, as stated in previous responses to CDFG's comments on the RI/FS Report and Proposed Plan, that the information in the RI/FS Report for Parcel E-2 adequately demonstrates that the proposed covers, which will be regularly inspected and maintained (with animal control measures implemented as necessary), will be protective of human health and the environment. Section 12.2.3.10 of the Final RI/FS Report specifies the preference for low impact measures (such as raptor perches), as compared to higher impact</i>                                                                                                                                                                                                                                                               |                                              |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                              |
| 2.<br>(cont.)                                                                                                  | <p data-bbox="401 412 1125 654"><i>measures (such as raptor perches), as compared to higher impact control measures (such as poisons), to control burrowing animals at Parcel E-2. The Navy also continues to assert its belief, as stated in previous responses to CDFG's comments on the Proposed Plan, that CDFG has not presented sufficient technical information to support its assertion that burrowing animals would cause significant damage to the geomembrane liner over time, or cause unacceptable exposure of contaminated waste."</i></p> <p data-bbox="401 667 1125 1240">The Navy's response is inadequate. DFG-OSPR does not believe that <i>"the information in the RI/FS Report for Parcel E-2 adequately demonstrates that the proposed covers, which will be regularly inspected and maintained (with animal control measures implemented as necessary), will be protective of human health and the environment."</i> As DFG-OSPR previously commented, low impact measures such backfilling and compacting the soil back into the burrows, trapping, and raptor perches do not appear to be effective methods for controlling gophers at Moffett Field Site 1 (Huang and Nakahara, 2012b). Pesticides such as Fumitoxin have the ability to kill non-target species, including State and Federal special status species. The Navy at Moffett Field Site 1 and Port Hueneme Site 14 has not adequately monitored its use of Fumitoxin, nor provided documentation to indicate that there have been no impacts to special status species. Furthermore, the Navy has not presented sufficient technical information to support its assertions that a geomembrane alone would deter or control animals from burrowing under the landfill cover. Please see DFG-OSPR's Specific Comments 2a1-5.</p> <p data-bbox="401 1253 1125 1375">DFG-OSPR commented that the White Paper on the Geomembrane Lifetime Prediction published by the Geosynthetic Institute (Koerner, et al., 2011), which the Navy referenced, only discusses degradation mechanisms such as oxidation, chemical, and</p> | <i>(please see the response on page 157)</i> |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                              |
| 2.<br>(cont.)                                                                                                  | <p>compressive stress (Huang and Nakahara, 2012b). This paper does not discuss the effects of burrowing animals on geomembranes (Huang and Nakahara, 2012b). The Navy responded, "(see response on pages 30 through 36)."</p> <p>The Navy's response is inadequate. The Navy's responses on pages 30 through 36 do not specifically address this comment on the White Paper. A lack of data documenting damage to geomembranes by burrowing animals does not indicate that damage does not exist or will not occur.</p> <p>2) DFG-OSPR commented, "Please see DFG-OSPR's responses above on the PP Specific Comment 2a1-5 and 2b regarding biotic barriers and damage to geomembranes from burrowing animals" (Huang and Nakahara, 2012b). The Navy responded, "(see response on pages 30 through 36)."</p> <p>Please see DFG-OSPR's response to Specific Comments 2a1-5 and 2b1-6.</p> <p>3) DFG-OSPR commented, "Please see DFG-OSPR's responses above on the PP Specific Comment 2a1-5 and 2b1 regarding biotic barriers and damage to geomembranes from burrowing animals" (Huang and Nakahara, 2012b). The Navy responded, " (see response on pages 30 through 36)."</p> <p>Please see DFG-OSPR's response to Specific Comments 2a1-5 and 2b1-6.</p> <p>4) DFG-OSPR commented, "DFG-OSPR will not approve the use of pesticides, such as Fumitoxin, in areas where there are State special status species such as Burrowing Owls. If the Navy has take of State and Federal special status species during landfill maintenance activities, they may be in violation of State and Federal ARARs. Please see DFG-OSPR's response above on the PP Specific Comment 2b1 regarding control of burrowing animals</p> | <i>(please see the response on page 157)</i> |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                              |
| 2.<br>(cont.)                                                                                                  | <p>at Site 1" (Huang and Nakahara, 2012b). The Navy responded, "(see response on pages 30 through 36)."</p> <p>The Navy's response is inadequate. The Navy's responses on pages 30 through 36 do not specifically address how the Navy will prevent impacts to special status species if pesticides are used to control burrowing animals in perpetuity at Parcel E-2. Please see DFG-OSPR's response to Specific Comments 2a5 and 2b1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <i>(please see the response on page 157)</i> |
| 5)                                                                                                             | <p>DFG-OSPR commented on the Parcel E-2 PP, "If the number of burrowing animals increase at Parcel E-2 in the future, how will the Navy adequately prevent these animals from damaging the landfill cap" (Huang and Nakahara, 2011)? The Navy responded in the Parcel E-2 Draft ROD, "The Navy believes that the information in the RI/FS Report (ERRG and Shaw, 2011) adequately demonstrates that the proposed cover, which will be regularly inspected and maintained (with animal control measures implemented as necessary), will be protective of human health and the environment" (DON, 2012). DFG-OSPR responded, "The Navy did not provide an adequate response to DFG-OSPR's question. DFG-OSPR disagrees that the information in the RI/FS Report adequately demonstrates that the proposed cover will be protective of the environment. Please see DFG-OSPR's responses above on the PP Specific Comment 2a1-5 and 2b1 regarding biotic barriers and damage to geomembranes from burrowing animals" (Huang and Nakahara, 2012b). The Navy responded, "(see response on pages 30 through 36)."</p> <p>The Navy's response is inadequate. The Navy's responses on pages 30 through 36 do not specifically address the question. DFG-OSPR requests the Navy provide, as contingency options, additional control methods to be considered should the number of burrowing animals increase, thereby increasing the risk of damage to the landfill cap.</p> |                                              |

| <i>DFG-OSPR's Response to the Navy's Second Response to DFG-OSPR's Specific Comments on the PP (continued)</i>                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                              |
| 2.<br>(cont.)                                                                                                                                                               | <p>6) DFG-OSPR commented on the Parcel E-2 PP, "Please provide more information in the ROD regarding how the Navy will adequately maintain, and detect and repair damage to the geomembrane in perpetuity. The general information provided in the PP is not sufficient to determine if the proposed remedial alternative will be adequate to protect ecological receptors. Please also explain how the Navy will deal with the geomembrane once it is damaged (by burrowing animals) or degrades to the point where it no longer functions properly" (Huang and Nakahara, 2011). The Navy responded in the Parcel E-2 Draft ROD, "The Navy believes that the information in the RI/FS Report adequately demonstrates that the proposed cover, which will be regularly inspected and maintained (with animal control measures implemented as necessary), will be protective of human health and the environment. The Navy does not believe that CDFG has presented a sufficient technical basis to support their requests for a thicker soil cover or a biointrusion barrier, or their assertions that burrowing animals will damage the geomembrane or the geomembrane will require replacement because of degradation" (DON, 2012). DFG-OSPR responded, "The Navy did not provide an adequate response to DFG-OSPR's questions. DFG-OSPR disagrees that the information in the RI/FS Report adequately demonstrates that the proposed cover will be protective of the environment. Please see DFG-OSPR's responses above on the PP Specific Comment 2a1-5 and 2b1 regarding the need for biotic barriers to prevent damage to geomembranes from burrowing animals" (Huang and Nakahara, 2012b). The Navy responded, "(see response on pages 30 through 36)."</p> | <i>(please see the response on page 157)</i> |
| <p>The Navy has still not provided an adequate response to DFG-OSPR's questions. The Navy's responses on pages 30 through 36 do not specifically address the questions.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                              |

| a.                                                                                                             | <p>DFG-OSPR commented that special status fish species such as green sturgeon, Central California Coast Steelhead, spring-run Chinook salmon, winter-run Chinook salmon, and longfin smelt may occur within the HPNS area (Huang and Nakahara, 2012b). The Navy responded, "...the selected remedy would not involve placement of fill within tidal flats and shoreline construction at higher elevations would be performed in a manner that would not significantly affect the aquatic ecosystem offshore of Parcel E-2. Therefore, the previous evaluations regarding the potential presence of certain fish species (from the SFRA's 2009 EIR and TtEC's work plan) have no bearing on the selected remedy for Parcel E-2."</p> <p>The Navy's assertion that previous evaluations regarding the potential presence of certain fish species have no bearing on the selected remedy for Parcel E-2 is incorrect. If remedial activities at Parcel E-2 impact special status species offshore of Parcel E-2 (i.e., through runoff of contaminated sediments), the Navy may be in violation of State and Federal regulations. Any special status fish species observed to be impacted by remedial activities at Parcel E-2 in the future will be significant new information and DFG-OSPR will seek a ROD amendment (Explanation of Significant Differences) to include appropriate DFG ARARs, per the FFA.</p> |                                              |
| b.                                                                                                             | <p>DFG-OSPR commented that the site-specific studies the Navy cites in Section 2.4 of the RI/FS Report were conducted in 1997, 2001, 2002, and 2004 and the plant surveys in the San Francisco Redevelopment Agency's (SFRA) Environmental Impact Report (EIR) were conducted at HPNS in 2004, 2006, 2007, and 2008. These studies were conducted four or more years ago and we believe that they are outdated because species composition at the site may have changed over the years. In addition, according to the SFRA EIR (SFRA, 2009), the August 2007,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                              |

| 4.<br>(cont.)                                                                                                  | <p>May 2008, and July 2008 surveys were conducted when most plant species were dormant or had already died leaving only dried plant parts for identification. It is possible that special status plant species may not have been evident and identifiable during these surveys in light of the timing of the survey. Although special status plant species were not observed at HPNS in the past, potential habitat for these species occurs at HPNS. DFG-OSPR continues to believe that Fish and Game Code section 1908 (native plant protection) is relevant and appropriate for Parcel E-2 (Huang and Nakahara, 2012b).</p> <p>The Navy responded, "...CDFG has not presented any significant new information or demonstrated that their recommendations are necessary to protect human health or the environment. Accordingly, the Navy does not agree that CDFG's technical concerns, as identified in these comments, require reconsideration of previous conclusions presented in the Final RI/FS Report and summarized in the Draft ROD. The language in the Draft ROD, which is consistent with the Final RI/FS Report, will not be revised in response to CDFG's comment."</p> <p>The Navy stated in their response to Specific Comment 4a that they "will perform a focused biological survey, in conjunction with the RD [Remedial Design], to determine the extent to which the future wetlands at Yosemite Slough may have attracted endangered species to Parcel E-2." The Navy should survey for plants during these biological surveys. Any special status plant species observed at Parcel E-2 in the future will be significant new information and DFG-OSPR will seek a ROD amendment to include Fish and Game Code section 1908 as an ARAR per the FFA.</p> | <i>(please see the response on page 157)</i> |
| c.                                                                                                             | The Navy's comment is noted in regards to California Fish and Game Code section 4700.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                              |
| d.                                                                                                             | The Navy's comment is noted in regards to California Fish and Game Code section 5050.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                              |

| <i>DFG-OSPR's Response to the Navy's Response to DFG-OSPR's Specific Comments on the Draft Record of Decision</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                              |
| 1.                                                                                                                | Specific Comment No. 1. Navy's response is noted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <i>(please see the response on page 157)</i> |
| 2.                                                                                                                | <p><i>Attachment 4, page 11, Federal Location-Specific ARARs and page 12, State Location-Specific ARARs. DFG-OSPR commented, "The Navy has accepted the Federal Migratory Bird Treaty Act and F&amp;GC section 3511 as ARARs. The Navy will need to consult with the USFWS [U.S. Fish and Wildlife Service] and DFG-OSPR to determine the appropriate avoidance, minimization, and mitigation measures to implement to prevent impacts to special status species from remedial activities" (Huang and Nakahara, 2012b). The Navy responded, "The Navy wishes to clarify that the administrative and procedural requirements for preparing biological assessment and biological opinion documents (which would evaluate avoidance, minimization, and mitigation measures) are not ARARs for the on-site CERCLA remedial action being selected in the ROD."</i></p> <p>The Navy is required to substantively comply with State and Federal biological ARARs. Documents such as biological opinions generally contain the appropriate avoidance, minimization, and mitigation measures the Navy must implement in order to substantively comply with ARARs. The Navy cannot obtain necessary protective measures which are routinely identified in the biological assessments and opinions without consulting with DFG-OSPR and the USFWS.</p> | <i>(please see the response on page 157)</i> |

| <b>Clean Water Act of 1977, as Amended (33 USC, ch. 26, §§ 1313–1314)<sup>c</sup></b>                                                                                  |                                           |                                                                                               |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Surface water quality standards                                                                                                                                        | Discharges to waters of the United States | 40 CFR § 131.38                                                                               | Applicable         | These standards, known as the CTR, are applicable surface water ARARs. The Navy has identified the CTR as ARARs for HPNS Parcel E-2 because groundwater and surface water bodies (i.e., new tidal and freshwater wetlands) discharge to San Francisco Bay. The Navy will meet these ARARs for chemicals that do not have a promulgated standard in Tables 3-3 or 3-4 of the Basin Plan at the interface of the A-aquifer (or surface water bodies) and the bay. These ARARs will also be applied to discharges to new tidal and freshwater wetlands at HPNS Parcel E-2. The Navy has identified MCLs as ARARs for the B-aquifer, which will be protective of the discharge of B-aquifer groundwater to the bay. Therefore, these are not ARARs for the interface of the B-aquifer and the bay. |

| <b>Resource Conservation and Recovery Act (42 USC, ch. 82, §§ 6901 through 6991[i])<sup>c</sup></b>                                                                    |                                           |                                                                                               |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| This requirement defines RCRA hazardous waste. Solid wastes are characterized as toxic based on the TCLP results if the wastes exceed the TCLP maximum concentrations. | Waste                                     | Cal. Code Regs, tit. 22, §§ 66261.21, 66261.22(a)(1), 66261.23, 66261.24(a)(1), and 66261.100 | Applicable         | These regulations are applicable to activities that generate waste. The selected remedy includes excavation and off-site disposal of solid waste, soil, and sediment. The Navy will determine if excavated solid waste, soil, and sediment meet the definition of non-RCRA hazardous waste when it is generated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Uranium Mill Tailings Radiation Control Act (42 USC, ch. 88, § 192.02, 192.12(a,b), and 192.42)<sup>c</sup></b>                                                                                                                                                                                                                                                                                                                                                                                                                                       |              |                                         |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Standards for cleanup of land and buildings contaminated with radium-226, radium-228, and thorium from inactive uranium processing sites.<br>As a result of residual radioactive materials from any designated processing site:<br>(a) The concentration of radium-226 in land averaged over any area of 100 square meters shall not exceed the background level by more than:<br>(1) 5 pCi/g, averaged over the first 15 cm of soil below the surface, and<br>(2) 15 pCi/g, averaged over 15-cm-thick layers of soil more than 15 cm below the surface. | UMTRCA sites | 40 C.F.R. §§ 192.12(a) and 192.32(b)(2) | Relevant and appropriate | Not applicable because Parcel E-2 is not an UMTRCA site, but is relevant and appropriate for sites with soil contaminated with radioactive waste. The surface and subsurface concentration of 5 pCi/g is relevant and appropriate only for areas with sanitary sewer, storm drain, or septic sewer lines that do not extend into another radiologically impacted area. These areas, following remediation of ROCs exceeding the proposed RGs, will not require land use restrictions regarding exposure to radioactivity. Not an ARAR for radiologically impacted areas that will be transferred with engineering and institutional controls for radioactive chemicals. |
| In any occupied or habitable building, the objective of the remedial action shall be, and reasonable effort shall be made to achieve, an annual average (or equivalent) radon decay product concentration (including background) not to exceed 0.02 WL. In any case, the radon decay product concentration (including background) shall not exceed 0.03 WL. Provisions applicable to radon-222 shall also apply to radon-220.                                                                                                                            | UMTRCA sites | 40 C.F.R. §§ 192.12(b)(1) and 192.41(b) | Relevant and appropriate | Not applicable because Parcel E-2 is not an UMTRCA site. Relevant and appropriate because the selected remedy will result in excavation of material with radiological contamination that may produce this level of dose.                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Uranium Mill Tailings Radiation Control Act (42 USC, ch. 88, § 192.02, 192.12(a,b), and 192.42)<sup>c</sup></b>                                                                                                                                                                                                                                                                            |                            |                          |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Concentration limits for cleanup of gamma radiation in buildings at inactive uranium processing sites designated for remedial action.<br><br>In any occupied or habitable building, the level of gamma radiation shall not exceed the background level by more than 20 microroentgens per hour.                                                                                               | UMTRCA sites               | 40 C.F.R. § 192.12(b)(2) | Relevant and appropriate | Not applicable because Parcel E-2 is not an UMTRCA site. Relevant and appropriate because the selected remedy will result in excavation of material with radiological contamination that may produce this level of dose.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Radiological Criteria for License Termination</b>                                                                                                                                                                                                                                                                                                                                          |                            |                          |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| A site will be considered acceptable for unrestricted use if residual radioactivity that is distinguishable from background radiation results in a TEDE to an average member of the critical group that does not exceed 25 mrem/y, including that from groundwater sources of drinking water, and that the residual radioactivity has been reduced to ALARA.                                  | Existing NRC-licensed site | 10 C.F.R. § 20.1402      | Relevant and appropriate | Not applicable because Parcel E-2 is not an NRC-licensed site. This ARAR is relevant and appropriate only for areas with sanitary sewer, storm drain, or septic sewer lines that do not extend into another radiologically impacted area. These areas, following remediation of ROCs exceeding the proposed RGs, will not require land use restrictions regarding exposure to radioactivity. EPA does not believe this NRC regulation is protective of human health and the environment, and believes the proposed RGs are more protective.<br><br>Not an ARAR for radiologically impacted areas that will be transferred with engineering and institutional controls for radioactive chemicals. |
| Requires that the TEDE to individual members of public not exceed 0.1 rem from licensed operation, construction, operation, and decommissioning of commercial reactors and fuel cycle facilities; possession, use, processing, exporting, and certain aspects of transporting nuclear materials and waste; and siting, design, construction, operations, and closure of waste disposal sites. | Existing NRC-licensed site | 10 C.F.R. § 20.1301      | Relevant and appropriate | Not applicable because Parcel E-2 is not an NRC-licensed site. Relevant and appropriate because the proposed remedial selected remedy will leave potential radiological contamination on site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Performance objectives for the land disposal of LLRW. Concentrations of radioactive material that may be released to the general environment must not result in an annual dose exceeding 25 mrem to the body or any organ of a member of the general public.                                                                                                                                                                                                                   | Existing NRC-licensed LLRW disposal site                                                                           | 10 C.F.R. § 61.41                   | Relevant and appropriate | Not applicable because Parcel E-2 is not an NRC-licensed site. Relevant and appropriate for all radiologically impacted areas at Parcel E-2, except for sanitary sewer, storm drain, and septic sewer lines that do not extend into another radiologically impacted area, and that will be transferred with engineering and institutional controls for radioactive chemicals.                                                                                                                                                 |
| <b>Air</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                    |                                     |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>NESHAPs under CAA that Apply to Radionuclides</b>                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                    |                                     |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Emissions of radionuclides to ambient air from DOE facilities shall not exceed those amounts that would cause any member of the public to receive in any year an effective dose equivalent of 10 mrem/y.                                                                                                                                                                                                                                                                       | Facility owned or operated by the DOE that emits any radionuclide other than radon-222 and radon-220 into the air. | 40 C.F.R. pt. 61, subpt. H, § 61.92 | Relevant and appropriate | Not applicable because Parcel E-2 is not a DOE site, but is relevant and appropriate if there is the potential for airborne emissions of radionuclides other than radon. Only an ARAR until cleanup action is completed. Not an ARAR for residual contamination after cleanup.                                                                                                                                                                                                                                                |
| Emissions of radionuclides, including iodine, to ambient air from a facility regulated under this subpart shall not exceed those amounts that would cause any member of the public to receive in any year an effective dose equivalent of 10 mrem/y. Emissions of iodine to ambient air from a facility regulated under this subpart shall not exceed those amounts that would cause any member of the public to receive in any year an effective dose equivalent of 3 mrem/y. | Facilities owned or operated by any federal agency other than the DOE and not licensed by the NRC.                 | 40 C.F.R. pt. 61 subpt. I, § 61.102 | Applicable               | The requirements are applicable because fugitive dust may be generated during implementation of the remedial action at Parcel E-2. Exposure to the public from remedial action operations at Parcel E-2 is not likely to exceed 10 mrem/y because of the following reasons:<br>(1) the concentrations of any radionuclide in dust are relatively low as previously measured in air samples, and<br>(2) the concentration of any radionuclide in dust will be reduced by use of engineering controls such as wetting of soils. |

 Record of Decision for Parcel E-2, Hunters Point Naval Shipyard, San Francisco, California

Notes:

- a Many action-specific ARARs contain chemical-specific limitations and are addressed in the action-specific ARAR tables
- b Only the substantive provisions of the requirements cited in this table are ARARs.
- c Statutes and policies and their citations are provided as headings to identify general categories of ARARs for the convenience of the reader; listing the statutes and policies does not indicate that the Navy accepts the entire statutes or policies as ARARs; specific ARARs are addressed in the table below each general heading; only pertinent substantive requirements of the specific citations are considered ARARs.
- d EPA. 1986. "Guidelines for Groundwater Classification Under the EPA Groundwater Protection Strategy, Final Draft." November.

| <b>State and Regional Water Quality Control Boards <sup>c</sup></b>                                                                                                                                                                                                                                                                                                                                                                |                          |                                                                                                                                                                                   |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Authorizes SWRCB and RWQCB to establish, in water quality control plans, beneficial uses and numerical and narrative standards to protect both surface water and groundwater quality.                                                                                                                                                                                                                                              | Waters of the state      | California Water Code, div. 7, §§ 13241, 13243, 13263(a), 13269, and 13360                                                                                                        | Applicable               | The Navy accepts the substantive provisions of these sections of the California Water Code as enabling legislation, as implemented through the beneficial uses, WQOs, waste discharge requirement, and promulgated policies of the San Francisco Basin Plan as ARARs.                                                                                                                                                                                                                             |
| Describes the water basins in the San Francisco Region, establishes beneficial uses of groundwater and surface water, and establishes WQOs, including narrative and numerical standards.                                                                                                                                                                                                                                           | Waters of the state      | Comprehensive Water Quality Control Plan for the San Francisco Region (Basin Plan) Chapters 2 and 3 (California Water Code § 13240), except the MUN designation for the A-aquifer | Applicable               | The substantive groundwater provisions of Chapters 2 and 3 of the Basin Plan, except the MUN designation, are ARARs. According to the Basin Plan, which incorporates SWRCB Resolution 88-63, A-aquifer groundwater at HPNS Parcel E-2 is not a potential drinking water source. The only beneficial use of A-aquifer groundwater is freshwater replenishment of San Francisco Bay. B-aquifer groundwater has a moderate potential for use as a drinking water source.                             |
| Designates all groundwater and surface waters of the state as drinking water, except where total dissolved solids are greater than 3,000 ppm, the well yield is less than 200 gpd from a single well, the water is a geothermal resource or in a water conveyance facility, or the water cannot reasonably be treated for domestic use using either best management practices or best economically achievable treatment practices. | Waters of the state      | SWRCB Resolution 88-63                                                                                                                                                            | Applicable               | The Navy has evaluated the groundwater characteristics in the A-aquifer and B-aquifer at HPNS Parcel E-2 against the criteria listed in SWRCB Resolution 88-63. The Navy has determined that groundwater in the A-aquifer is not a potential source of drinking water and groundwater in the B-aquifer has a moderate potential for use as a drinking water source. RWQCB has concurred with the Navy's determination that groundwater in the A-aquifer is not a potential drinking water source. |

Code Regs. tit. 22, § 64449(a)                                                                    | Relevant and appropriate | State secondary MCLs are ARARs for the containment of in-place waste within the Parcel E-2 Landfill and adjacent areas (Panhandle, East Adjacent, and Shoreline Areas), for which MCLs are state ARARs for groundwater in portions of the B-aquifer downgradient of the POC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Establishes the policy that high quality waters of the state “shall be maintained to the maximum extent possible” consistent with the “maximum benefit to the people of the State.” It provides that whenever the existing quality of water is better than that required by applicable water quality policies, such existing high quality water will be maintained until it has been demonstrated to the state that any change will be consistent with maximum benefit to the people of the state, will not unreasonably affect present and anticipated beneficial use of such water, and will not result in water quality less than that prescribed in the policies. It also states that any activity that produces or may produce a waste or increased volume or concentration of waste and that discharges or proposes to discharge to existing high-quality waters will be required to meet waste discharge requirements that will result in the best practicable treatment or control of the discharge. | High quality waters of the state | Statement of Policy With Respect to Maintaining High Quality of Waters in California, SWRCB Res. 68-16 | Not an ARAR              | <p>SWRCB Res. 68-16 is not a chemical-specific ARAR because it is not more stringent than the federal Cal. Code Regs. tit. 22 groundwater protection standard [Cal. Code Regs. tit. 22, § 66264.94(a)(1) and (3),(c), (d), and (e)]. SWRCB Res. 68-16 is also not an action-specific ARAR because the selected remedy does not include discharge of treated groundwater to surface water. The Navy has determined that further migration of contaminants through groundwater is not a discharge governed by the language in Res. 68-16. More specifically, the language of SWRCB Res. 68-16 indicates that it is prospective in intent, applying to new discharges in order to maintain existing high-quality waters. It is not intended to apply to restoration of waters that are already degraded.</p> <p>The state does not agree with the Navy’s determination that SWRCB Res. 92-49 and 68-16 are not ARARs for this response action. SWRCB has interpreted the term “discharges” in the <i>California Water Code</i> to include the movement of waste from soils to groundwater and from contaminated to uncontaminated water (SWRCB 1994). However, the state agrees that the proposed action would comply with SWRCB Res. 92-49 and 68-16. The state does not intend to dispute the ROD, but reserves its rights if implementation of the provisions at Cal. Code Regs. tit. 22 is not as stringent as state implementation of the provisions at Cal. Code Regs. tit. 23. Because Cal. Code Regs. tit. 22 regulation is part of the state’s authorized hazardous waste control program, it is also the state’s position that Cal. Code Regs. tit. 22, § 66264.94 is a state ARAR and not a federal ARAR (<i>United States v. State of Colorado</i>, 990 F.2d 1565 [1993]).</p> |

| Describes requirements for RWQCB oversight of investigation and cleanup and abatement activities resulting from discharges of hazardous substances. RWQCB may decide on cleanup and abatement goals and objectives for the protection of water quality and beneficial uses of water within each region. Establishes criteria for "containment zones" where cleanup to established water quality goals is not economically or technically practicable. | Discharge of hazardous substance into waters of the state                                                                                                                          | Policies and procedures for investigation and cleanup and abatement of discharges under California Water Code § 13304, SWRCB Res. 92-49 | Not an ARAR        | SWRCB Res. 92-49 is not an ARAR because it is not more stringent than the federal Cal. Code Regs. tit. 22 monitoring requirements [Cal. Code Regs. tit. 22, § 66264.94(a)(1) and (3),(c), (d), and (e)].<br>The state does not agree with the Navy's determination that SWRCB Res. 92-49 and 68-16 are not ARARs for this response action. SWRCB has interpreted the term "discharges" in the <i>California Water Code</i> to include the movement of waste from soils to groundwater and from contaminated to uncontaminated water (SWRCB 1994). However, the state agrees that the proposed action would comply with SWRCB Res. 92-49 and 68-16. The state does not intend to dispute the ROD, but reserves its rights if implementation of the provisions at Cal. Code Regs. tit. 22 is not as stringent as state implementation of the provisions at Cal. Code Regs. tit. 23. Because Cal. Code Regs. tit. 22 regulation is part of the state's authorized hazardous waste control program, it is also the state's position that Cal. Code Regs. tit. 22, § 66264.94 is a state ARAR and not a federal ARAR ( <i>United States v. State of Colorado</i> , 990 F.2d 1565 [1993]). |
| <b>Surface Water</b>                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                    |                                                                                                                                         |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>State Water Resources Control Board <sup>c</sup></b>                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                    |                                                                                                                                         |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Surface water quality standards.                                                                                                                                                                                                                                                                                                                                                                                                                      | Marine water with salinities equal to or greater than 10 parts per thousand (Table 3-3)<br><br>Fresh water with salinities less than 1 parts per thousand (Table 3-4) <sup>d</sup> | Basin Plan Tables 3-3 and 3-4                                                                                                           | Applicable         | These standards are applicable are applicable surface water ARARs. The Navy has identified Tables 3-3 and 3-4 as ARARs for HPNS Parcel E-2 because groundwater and surface water bodies (i.e., new tidal and freshwater wetlands) discharge to the bay. The Navy will meet these ARARs in the Bay, the interface of the A-aquifer (or surface water bodies) and the bay. These ARARs will also be applied to discharges to new tidal and freshwater wetlands at HPNS Parcel E-2. The Navy has identified MCLs as ARARs for the B-aquifer, which will be protective of any discharge of B-aquifer groundwater to the permeable zones underlying the bay. Therefore, these are not ARARs for the interface of the B-aquifer and the permeable zones underlying the bay.                                                                                                                                                                                                                                                                                                                                                                                                                |

| Definition of non-RCRA hazardous waste.                                                                                                                    | Waste                            | Cal. Code Regs, tit. 22, §§ 66261.22(a)(3) and (a)(4), 66261.24(a)(2)-(a)(8), 66261.101, 66261.3(a)(2)(C) and (a)(2)(F) | Applicable         | These regulations are applicable to activities that generate waste. The selected remedy includes excavation and off-site disposal of solid waste, soil, and sediment. The Navy will determine if excavated solid waste, soil, or sediment meets the definition of non-RCRA hazardous waste when it is generated.          |
| Definition of designated waste and nonhazardous waste.                                                                                                     | Waste                            | Cal. Code Regs, tit. 27, §§ 20210 and 20220                                                                             | Applicable         | These regulations are applicable to activities that generate waste. The selected remedy includes excavation and off-site disposal of solid waste, soil, and sediment. The Navy will determine if excavated solid waste, soil, or sediment meets these definitions when it is generated.                                   |
| This requirement controls release of methane.                                                                                                              | Release of methane from landfill | Cal. Code Regs, tit. 27, § 20921(a)                                                                                     | Applicable         | Provides that methane must not exceed 1.25 percent by volume in air within on-site structures, and concentrations of methane migrating from the Parcel E-2 Landfill must not exceed 5 percent by volume in air at the property boundary (or an alternative boundary) in accordance with Cal. Code Regs, tit. 27, § 20925. |

Notes:

- a Many action-specific ARARs contain chemical-specific limitations and are addressed in the action-specific ARAR tables.
- b Only the substantive provisions of the requirements cited in this table are ARARs.
- c Statutes and policies and their citations are provided as headings to identify general categories of ARARs for the convenience of the reader; listing the statutes and policies does not indicate that the Navy accepts the entire statutes or policies as ARARs; specific ARARs are addressed in the table below each general heading; only pertinent substantive requirements of the specific citations are considered ARARs.
- d For waters in which the salinity is between 1 and 10 parts per thousand, the applicable objectives are the more stringent of the marine (Table 3-3) and freshwater (Table 3-4) objectives specified in the Basin Plan.

| <b>McAteer-Petris Act (California Government Code §§ 66600 through 66661) <sup>b</sup></b> |                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                    |                                                             |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Within the San Francisco Bay coastal zone                                                  | Reduce fill and disposal of dredged material in San Francisco Bay, maintain marshes and mudflats to the fullest extent possible to conserve wildlife, abate pollution, and protect the beneficial uses of the San Francisco Bay.                                                                                                                                                                                          | Activities affecting the San Francisco Bay and 100 feet landward of the shoreline. | Bay Plan at Cal. Code Regs, tit. 14, §§ 10110 through 11990 | Relevant and appropriate | The Bay Plan, developed under the authority of the McAteer-Petris Act, is an approved state coastal zone management program. The selected remedy will affect San Francisco Bay and will occur within 100 feet landward of the shoreline, and therefore will be consistent with the enforceable policies of the Bay Plan to the maximum extent practicable. See action-specific ARARs table for the substantive provisions of the Bay Plan that pertain to the selected remedy.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>California Department of Fish and Game (Cal. Fish &amp; Game Code) <sup>b</sup></b>     |                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                    |                                                             |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Fully protected birds                                                                      | Fully protected birds or parts thereof may not be taken or possessed at any time. The following are fully protected birds: American Peregrine Falcon, California Brown Pelican, California Black Rail, California Clapper Rail, California Condor, California Least Tern, Golden Eagle, Greater Sandhill Crane, Light-footed Clapper Rail, Southern Bald Eagle, Trumpeter Swan, White-tailed Kite, and Yuma Clapper Rail. | A fully protected species must be potentially affected.                            | Cal. Fish & Game Code § 3511                                | Relevant and appropriate | Cal. Fish & Game Code § 3511 is not applicable because the United States of America has not waived sovereign immunity in the FESA for this State of California requirement. The American peregrine falcon is protected under Cal. Fish & Game Code § 3511. The substantive provisions of Cal. Fish & Game Code § 3511 meet the pertinent NCP criteria under 40 CFR § 300.400(g)(2)(viii) and are “relevant and appropriate” because the American peregrine falcon is present at the site and protection of this vulnerable resource allows it to be “used” in the sense that it continues to provide its unique value to the State of California. The Navy accepts Cal. Fish & Game Code § 3511 as a state ARAR subject to the following conditions. The State of California, through CDFG-OSPR, concurs that this statute addresses prohibited conduct but does not provide for or prescribe affirmative measures to avoid a “taking.” |

Fish &amp; Game Code) <sup>b</sup> (continued)</b> |                                                                                                                                 |                                                                                                                                |                                               |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Fully protected birds<br>(continued)                                                               | (see above)                                                                                                                     | (see above)                                                                                                                    | (see above)                                   | (see above)              | Notwithstanding the absence of specific affirmative measures in the statute, the Navy will implement reasonable measures to ensure adequate protection of ecological receptors during response action construction following issuance of a CERCLA decision document pursuant to the Navy's obligations under CERCLA to select removal or remedial actions that are protective of human health and the environment (see Section 121[b][1] of CERCLA). The Navy will coordinate with the State, through CDFG-OSPR, prior to implementation of such reasonable measures. The Navy understands that the State of California reserves the right to conduct periodic site visits during removal or remedial activities to confirm implementation of avoidance measures. |
| Waters of the state                                                                                | Prohibits the passage of enumerated substances or materials into waters of the state deleterious to fish, plant life, or birds. | Not authorized under Cal. Water Code § 13263 or a waiver issued pursuant to subdivision (a) of § 13269 of the Cal. Water Code. | Cal. Fish & Game Code § 5650(a), (b), and (c) | Relevant and appropriate | Cal. Fish & Game Code § 5650 is not applicable because the United States of America has not waived sovereign immunity for this state of California requirement. While no direct deposition of material is expected to enter into or affect waters of the states, the substantive portions of this standard will be complied with as an ARAR. The selected remedy will be conducted in such a way as to ensure that materials dug up along the shoreline will not be released into the water column.                                                                                                                                                                                                                                                               |

## Attachment 5. State Location-Specific ARARs *(continued)*

Record of Decision for Parcel E-2, Hunters Point Naval Shipyard, San Francisco, California

### Notes:

- a Only the substantive provisions of the requirements cited in this table are ARARs.
  - b Statutes and policies and their citations are provided as headings to identify general categories of ARARs for the convenience of the reader; listing the statutes and policies does not indicate that the Navy accepts the entire statute or policy as a ARAR; specific ARARs follow each general heading; only substantive requirements of the specific citations are considered ARARs.
- 
- ARAR Applicable or relevant and appropriate requirement
  - Bay Plan San Francisco Bay Plan
  - Cal. California
  - CERCLA Comprehensive Environmental Response, Compensation, and Liability Act

| <b>Clean Water Act, as Amended, § 404 (Title 33 USC § 1344) <sup>b</sup></b> |                                                                                                                                                                                                                       |                             |                                                                                     |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Perform construction in shoreline zone                                       | These sections describe specific restrictions on the discharge of dredged or fill material into waters of the United States, and require that appropriate and practicable steps be taken to minimize adverse impacts. | Waters of the United States | 40 CFR §§ 230.10; 230.70 through 230.77                                             | Applicable         | Compliance with 40 CFR § 230.10 is evaluated using factual determinations, per 40 CFR § 230.11, for the proposed action. Potential actions to minimize adverse impacts are identified at 40 CFR §§ 230.70 through 230.77. The shoreline construction proposed under the selected remedy will comply with the specified discharge restrictions and will incorporate appropriate steps to minimize adverse impacts to waters of the United States. Appendix O in the RI/FS Report provides an evaluation relative to these requirements. |
| Perform construction in shoreline zone                                       | These sections identify specific information to be included in factual determinations for proposed actions involving discharge of dredged or fill material into waters of the United States.                          | Waters of the United States | 40 CFR §§ 230.11; 230.20 through 230.25; 230.31; 230.32; 230.41; 230.42; and 230.53 | Applicable         | Appendix O in the RI/FS Report provides a factual determination for the shoreline construction proposed under the selected remedy.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Perform construction in shoreline zone                                       | This section identifies general requirements for compensatory mitigation to offset losses from unavoidable impacts to waters of the United States.                                                                    | Waters of the United States | 40 CFR § 230.93                                                                     | Applicable         | The selected remedy includes shoreline construction that would result in the discharge of fill material into a wetland, the loss for which would be mitigated by the Navy in accordance with the substantive provisions of 40 CFR § 230.93. Appendix O in the RI/FS Report identifies a specific mitigation approach that will be developed further in the remedial design.                                                                                                                                                            |
| Perform construction in shoreline zone                                       | This section identifies the required content for mitigation plans.                                                                                                                                                    | Waters of the United States | 40 CFR § 230.94(c)                                                                  | To Be Considered   | Requirements are procedural and not substantive; however, these requirements will be used as TBCs in developing site-specific mitigation plans for Parcel E-2.                                                                                                                                                                                                                                                                                                                                                                         |

| Excavation and grading activities                                                                  | Construction that disturbs at least 1 acre must use best management practices to control stormwater discharges.                                                                                                                                                                                                        | Construction activities at least 1 acre in size. | Clean Water Act § 402<br>40 CFR § 122.44(k)(2) and (4)  | Applicable               | The selected remedy will disturb more than 1 acre. The Navy will implement the substantive provisions of state general stormwater discharge permit, Orders 09-09-DWQ and 10-14-DWQ (adopted pursuant to Clean Water Act § 402), to comply with the federal Clean Water Act ARARs and water quality state ARARs for discharge to surface water. The federal and state ARARs require implementing best management practices and meeting the substantive numeric effluent limit and action level requirements. Although procedural requirements do not qualify as CERCLA ARARs, the Navy shall voluntarily prepare a CERCLA storm water plan as a component of CERCLA remedial design in order to address the substantive provisions. |

Code Regs. tit. 22, § 66264.13 (a) and (b)              | Applicable               | These regulations are applicable to any operation that generates waste. The selected remedy will generate waste to be disposed of off site. The Navy will decide whether the waste is RCRA hazardous waste when it is generated.                                         |
| <b>Excavation and Off-Site Disposal</b>                                                                |                                                                                                                                                                                      |                                                               |                                                              |                          |                                                                                                                                                                                                                                                                          |
| <b>Resource Conservation and Recovery Act (Title 42 USC, Chapter 82, §§ 6901-6991[i]) <sup>b</sup></b> |                                                                                                                                                                                      |                                                               |                                                              |                          |                                                                                                                                                                                                                                                                          |
| Stockpiling soil for off-site disposal                                                                 | Allows generators to accumulate solid remediation waste in an EPA-designated pile for storage only up to 2 years during remedial operations without triggering LDRs.                 | RCRA hazardous waste temporarily stored in piles.             | 40 CFR, § 264.554(a), (d), (g), (h), (i), (j), and (k)       | Relevant and appropriate | The Navy will temporarily stockpile soil in staging piles for off-site disposal. The Navy does not anticipate that all soil will be RCRA hazardous waste; however, the Navy has determined that these requirements are relevant and appropriate for all stockpiled soil. |
| Temporary units                                                                                        | Alternative requirements that are protective of human health or the environment may replace design, operating, or closure standards for temporary tanks and container storage areas. | Temporary units may be used and are not subject to RCRA LDRs. | Cal. Code Regs. tit. 22, §§ 66264.553 (b), (d), (e), and (f) | Applicable               | The substantive portions are applicable for treatment of groundwater on site during excavation.                                                                                                                                                                          |

## Attachment 5. Federal Action-Specific ARARs (continued)

Record of Decision for Parcel E-2, Hunters Point Naval Shipyard, San Francisco, California

### Notes:

- a Only the substantive provisions of the requirements cited in this table are ARARs.
- b Statutes and policies and their citations are provided as headings to identify general categories of ARARs for the convenience of the reader. Listing the statutes and policies does not indicate that the Navy accepts the entire statutes or policies as ARARs; specific ARARs are addressed in the table below each general heading; only substantive requirements of specific citations are considered ARARs.

| Capping permeability                                                                                   | Hydraulic conductivities will be evaluated primarily through laboratory methods and will be confirmed by appropriate field testing. Earthen materials used in containment structures will consist of a clay mixture and other suitable fine-grained soils that have specific characteristics and that, in combination, can be compacted to attain the required hydraulic conductivity when installed. | Cal. Code Regs. tit. 27, requirements are only applicable for waste discharged after July 18, 1997 (the effective date of the consolidated regulations), unless otherwise noted. | Cal. Code Regs. tit. 27, § 20320 (c) and (d)                 | Relevant and appropriate | Relevant and appropriate for the containment actions at the Parcel E-2 Landfill. Not an ARAR for containment actions at the Panhandle, East Adjacent, or Shoreline Areas because the type of site regulated by Cal. Code Regs. tit. 27 does not match the site conditions at these Parcel E-2 areas. |
| Erosion control                                                                                        | Diversion and drainage facilities will be designed, constructed, and maintained to accommodate the anticipated volume of precipitation and peak flows. In addition, erosion and related damage of the final cover due to drainage must be prevented throughout the post-closure maintenance period.                                                                                                   | Cal. Code Regs. tit. 27, requirements are only applicable for waste discharged after July 18, 1997 (the effective date of the consolidated regulations), unless otherwise noted. | Cal. Code Regs. tit. 27, §§ 20365(c) and (d) and 21090(c)(4) | Relevant and appropriate | Relevant and appropriate; a cover will be designed to prevent erosion, slope failure, washout, and overtopping.                                                                                                                                                                                      |
| Post-closure care                                                                                      | § 20950(a): The post-closure maintenance period shall extend as long as the wastes pose a threat to water quality.<br>§ 21180(a): The landfill shall be maintained and monitored for a period of not less than 30 years after closure of the entire solid waste landfill.                                                                                                                             | Cal. | <b>State Water Resources Control Board / California Integrated Waste Management Board <sup>b</sup></b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                  |                                        |                          |                                                                                                                                                                                                                                                                                                      |
| Final grading                                                                                          | The final cover of closed landfills will be designed, graded, and maintained to prevent ponding and to prevent site erosion caused by high runoff velocities. Slopes should be at least 3 percent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Cal. Code Regs. tit. 27, requirements are only applicable for waste discharged after July 18, 1997 (the effective date of the consolidated regulations), unless otherwise noted. | Cal. Code Regs. tit. 27, § 21090(b)(1) | Relevant and appropriate | Relevant and appropriate for the containment actions at the Parcel E-2 Landfill. Not an ARAR for containment actions at the Panhandle, East Adjacent, or Shoreline Areas because the type of site regulated by Cal. Code Regs. tit. 27 does not match the site conditions at these Parcel E-2 areas. |
| Foundation layer                                                                                       | Closed landfills shall be provided with not less than 2 feet of appropriate materials as a foundation layer for the final cover. These materials may be soil, contaminated soil, incinerator ash, or other waste materials, provided that such materials have appropriate engineering properties to be used for a foundation layer.<br><br>The foundation layer shall be compacted to the maximum density obtainable at optimum moisture content using methods that are in accordance with accepted civil engineering practice. A lesser thickness may be allowed for units if the differential settlement of waste and ultimate land use will not affect the structural integrity of the final cover. | Cal. Code Regs. tit. 27, requirements are only applicable for waste discharged after July 18, 1997 (the effective date of the consolidated regulations), unless otherwise noted. | Cal. Code Regs. tit. 27, § 21090(a)(1) | Relevant and appropriate | Relevant and appropriate.                                                                                                                                                                                                                                                                            |

| <b>State Water Resources Control Board / California Integrated Waste Management Board <sup>b</sup></b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                  |                                                                   |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Post-closure land use                                                                                  | Subsection (a) requires proposed post-closure land uses be designed and maintained to protect health and safety; prevent contact with waste, landfill gas, and leachate; and prevent gas explosions. Subsection (b) specifies that the site closure design shall show one or more proposed uses of the closed site or show development that is compatible with open space. Subsection (c) specifies that approval is required if proposed post-closure land uses involve structures within 1,000 feet of the disposal area, structures on top of waste, modification of the low permeability layer, or irrigation over waste. Subsections (d) through (g) set forth conditions for construction of on-site structures. | Cal. Code Regs. tit. 27, requirements are only applicable for waste discharged after July 18, 1997 (the effective date of the consolidated regulations), unless otherwise noted. | Cal. Code Regs. tit. 27, §§ 21190(a), (b), (d), (e), (f), and (g) | Relevant and appropriate | The substantive portions of Subsections (a), (b), (d), (e), (f), and (g) are relevant and appropriate. Even though no waste was discharged after July 18, 1997, this section is relevant and appropriate because it is a closure/post-closure requirement in Cal. Code Regs. tit. 27, Division 2, Subchapter 5, Article 2, which applies to "disposal sites that did not complete closure prior to November 18, 1990, in accordance with all applicable requirements" (Cal. Code Regs. tit. 27, § 21100). Subsection (c) specifies nonsubstantive requirements, and is therefore not an ARAR. The substantive provisions of Subsection (g) are relevant and appropriate for future construction within the Parcel E-2 boundary, including the portion of the Parcel E-2 Landfill that extends onto UCSF property, because Parcel E-2 may be affected by subsurface gas emanating from the Parcel E-2 Landfill. However, these provisions are not relevant and appropriate to future off-site construction beyond the Parcel E-2 boundary because these areas are not affected by subsurface gas emanating from the Parcel E-2 Landfill. |

| Construction or grading in soil containing asbestos, serpentine, or ultramafic rock | This regulation sets forth requirements for road construction and maintenance, and for construction and grading operations in soil containing naturally occurring asbestos, serpentine, or ultramafic rock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Soil containing naturally occurring asbestos, serpentine, or ultramafic rock.           | Cal. Code Regs. tit. 17, § 93105   | Applicable               | This regulation is applicable for construction and grading activities if they will occur in areas containing asbestos, serpentine, or ultramafic rock. |
| <b>State Water Resources Control Board <sup>b</sup></b>                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                         |                                    |                          |                                                                                                                                                        |
| Remediation activities                                                              | Actions taken by or at the direction of public agencies to clean up or abate conditions of pollution or nuisance resulting from unintentional or unauthorized releases of waste or pollutants to the environment are exempt from the Cal. Code Regs. tit. 27 requirements identified in Cal. Code Regs. tit 27, div. 2, subdiv. 1, provided that wastes, pollutants, or contaminated materials removed from the immediate place of release shall be discharged according to the SWRCB-promulgated sections of div. 2, subdiv. 1, ch. 3, subch. 2 and further provided that remedial actions intended to contain such wastes at the place of release shall implement applicable SWRCB-promulgated provisions of div. 2 to the extent feasible. | Action taken by or at the direction of a public agency to cleanup release of pollutant. | Cal. Code Regs, tit. 27 § 20090(d) | Relevant and appropriate | The substantive provisions of this regulation are relevant and appropriate.                                                                            |

| <b>McAteer-Petris Act (California Government Code §§ 66600 through 66661) <sup>b</sup></b> |                                                                                                                                                                                                                                                                                                                                                                            |                                             |                                                                                                                        |                          |                                                                                                                                                                                                                 |
| Tidal marshes and tidal flats in the San Francisco Bay coastal zone                        | Tidal marshes and tidal flats should be conserved to the fullest possible extent. Projects harming tidal marshes and tidal flats should be allowed only for purposes providing substantial public benefits and only if there is no feasible alternative. Restoration projects should include a monitoring program with biological and physical goals and success criteria. | Activities affecting the San Francisco Bay. | Part III of Bay Plan (Findings and Policies Concerning Tidal Marshes and Tidal Flats around the Bay, Policies 1 and 5) | Relevant and appropriate | The selected remedy for Parcel E-2 would destroy on-site tidal marshes, the loss of which would be mitigated by the Navy. Appendix O in the RI/FS Report provides an evaluation relative to these requirements. |
| Fills in the San Francisco Bay coastal zone                                                | To prevent damage by flooding, shoreline structures should be designed to consider future sea level rise and subsidence for the expected life of the project.                                                                                                                                                                                                              | Activities affecting the San Francisco Bay. | Part IV of Bay Plan (Findings and Policies Concerning Safety of Fills in the Bay, Policies 4 and 5)                    | Relevant and appropriate | Shoreline protection features will be installed to prevent erosion and protect the integrity of the remedial action. Appendix O in the RI/FS Report provides an evaluation relative to these requirements.      |
| Shoreline protection in the San Francisco Bay coastal zone                                 | Riprap revetments should be constructed of properly sized and placed material. Protective projects should be maintained to ensure that the shoreline will be protected from tidal erosion. Protective projects should include nonstructural methods such as marsh vegetation where feasible.                                                                               | Activities affecting the San Francisco Bay. | Part IV of Bay Plan (Findings and Policies Concerning Shoreline Protection around the Bay, Policies 2, 3, and 4)       | Relevant and appropriate | Shoreline protection features will be installed to prevent erosion and protect the integrity of the remedial action. Appendix O in the RI/FS Report provides an evaluation relative to these requirements.      |

| <b>Shoreline Construction (continued)</b>                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                             |                                                                                                    |                          |                                                                                                                                                                                                                                                                                                                                                    |
| <b>McAteer-Petris Act (California Government Code §§ 66600 through 66661) <sup>b</sup></b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                             |                                                                                                    |                          |                                                                                                                                                                                                                                                                                                                                                    |
| Fills in the San Francisco Bay coastal zone                                                | Fills in accord with the Bay Plan should be the minimum necessary to achieve its purpose and meet one of the following criteria outlined in Bay Plan policies: (a) filling supports bay-related purposes (e.g., ports, water-related recreation, etc.); (b) filling is needed for infrastructure for which there is no other alternative (e.g., airports, roads, etc.); or (c) filling is minor and needed to improve shoreline appearance or public access.                                                                                                                                                                                  | Activities affecting the San Francisco Bay. | Part IV of Bay Plan (Findings and Policies Concerning Fills in Accord with the Bay Plan, Policy 1) | Relevant and appropriate | The selected remedy involves varying degrees of excavation of contaminated sediment in order to protect human health and the environment that require minor filling of on-site tidal marshes, the loss of which would be mitigated by the Navy, and the bay. Appendix O in the RI/FS Report provides an evaluation relative to these requirements. |
| Fills in the San Francisco Bay coastal zone                                                | Minor fill to improve shoreline appearance is permissible if (1) the fill is necessary because the present appearance adversely affects the enjoyment of the bay and its shoreline; (2) it is either physically impractical or economically infeasible to improve the appearance without filling; (3) the amount of filling is the minimum necessary to improve shoreline appearance; (4) the proposed project would improve the shoreline appearance; and (5) the fill would not adversely affect enjoyment of the bay and its shoreline, and the fill will not have any adverse effect on present or future use designated in the Bay Plan. | Activities affecting the San Francisco Bay. | Cal. Code Regs, tit. 14, § 10700                                                                   | Relevant and appropriate | The selected remedy requires minor filling of on-site tidal marshes, the loss of which would be mitigated by the Navy, and the bay. Appendix O in the RI/FS Report provides an evaluation relative to these requirements.                                                                                                                          |

| <b>Shoreline Construction (continued)</b>                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                  |                                                                                                   |                          |                                                                                                                                                                                                                                                                                                                                            |
| <b>McAteer-Petris Act (California Government Code §§ 66600 through 66661) <sup>b</sup></b>             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                  |                                                                                                   |                          |                                                                                                                                                                                                                                                                                                                                            |
| Fills in the San Francisco Bay coastal zone                                                            | Measures to compensate for unavoidable adverse impacts to natural resources of the bay should be required. Mitigation projects should be sited as close to the impact site as practicable. The amount and type of mitigation should be based on an analysis of the probability of success of the mitigation project, the expected delay between the impact and the functioning mitigation site, and the type and quality of ecological functions of the mitigation site compared with the impacted site. | Activities affecting the San Francisco Bay.                                                                                                                                      | Part IV of Bay Plan (Findings and Policies Concerning Mitigation, Policies 1, 2, and 4 through 7) | Relevant and appropriate | The selected remedy would result in the discharge of fill material into a wetland, the loss for which would be mitigated by the Navy in accordance with the substantive provisions of Part IV of Bay Plan. Appendix O in the RI/FS Report identifies a specific mitigation approach that will be developed further in the remedial design. |

| Land use controls                                     | Provides conditions under which land use restrictions will apply to successive owners of land.                                | Transfer of property from the federal government to a nonfederal agency. | California Civil Code § 1471                | Relevant and appropriate | Generally, Cal. Civil Code § 1471 allows an owner of land to make a covenant to restrict the use of land for the benefit of a covenantee. The covenant runs with the land to bind successive owners, and the restrictions must be reasonably necessary to protect present or future human health or safety or the environment as a result of the presence on the land of hazardous materials, as defined in Cal. Health & Safety Code § 25260. Substantive provisions are the following general narrative standard: "Each act that the owner or grantee will do or refrain from doing relates to the use of land and each act is reasonably necessary to protect present or future human health or safety or the environment as a result of the presence on the land of hazardous materials, as defined in Section 25260 of the California Health and Safety Code." This narrative standard would be implemented through incorporation of restrictive covenants in the deed and Environmental Restriction and Covenant Agreement at the time of transfer. |

| Land use controls                                     | Provides processes and criteria for obtaining written variances from a land use restriction and for removal of the land use restrictions. | Transfer of property from the federal government to a nonfederal agency. | California Health & Safety Code §§ 25223(c) and 25224         | Relevant and appropriate | Cal. Health & Safety Code § 25223(c) sets forth “relevant and appropriate” substantive criteria for granting variances based upon specified environmental and health criteria.” Cal. Health & Safety Code § 25224 sets forth the following “relevant and appropriate” substantive criteria for the removal of a land use restriction on the grounds that “...the waste no longer creates a significant existing or potential hazard to present or future public health or safety.” |
| Land use controls                                     | Provides a streamlined process to be used to enter into an agreement to restrict specific use of property.                                | Transfer of property from federal government to a nonfederal agency.     | California Health & Safety Code §§ 25221 and 25355.5(a)(1)(C) | Relevant and appropriate | Generally, Cal. Health & Safety Code §§ 25221 and 25355.5(a)(1)(C) provide the authority for DTSC to enter into voluntary agreements with land owners to restrict the use of property. The agreements run with the land restricting present and future uses of the land.                                                                                                                                                                                                           |

| Land use controls<br>(continued)                      | (see above)                                                                                                                                                                                                                                                                                                                                                                                     | (see above)                                                          | (see above)                        | (see above)              | <p>The substantive requirements of the following Cal. Health &amp; Safety Code § 25221 provisions are “relevant and appropriate”: (1) the general narrative standard: “restricting specified uses of the property...” and (2) “...the agreement is irrevocable, and shall be recorded by the owner, ...as a hazardous waste easement, covenant, restriction, or servitude, or any combination of those servitudes, as appropriate, upon the present and future uses of the land.”</p> <p>The substantive requirements of the following Cal. Health &amp; Safety Code § 25355.5(a)(1)(C) provisions are “relevant and appropriate”: “...execution and recording of a written instrument that imposes an easement, covenant, restriction, or servitude, or combination thereof, as appropriate, upon the present and future uses of the site.”</p> |
| Land use covenants                                    | A land use covenant imposing appropriate limitations on land use shall be executed and recorded when facility closure, corrective action, remedial or removal action, or other response actions are undertaken and hazardous materials, hazardous wastes or constituents, or hazardous substances will remain at the property at levels that are not suitable for unrestricted use of the land. | Transfer of property from federal government to a nonfederal agency. | Cal. Code Regs. tit. 22, § 67391.1 | Relevant and appropriate | The Navy is evaluating ICs for soil and groundwater. These requirements are ARARs for those ICs. EPA agrees that the substantive portions of the regulations referenced are ARARs. EPA specifically considers sections (a), (d), and (e) of Cal. Code Regs. tit. 22 § 67391.1, to be ARARs for this ROD. DTSC’s position is that all of the state regulation is an ARAR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Attachment 5. State Action-Specific ARARs (continued)**

Record of Decision for Parcel E-2, Hunters Point Naval Shipyard, San Francisco, California

Notes:

- a Only the substantive provisions of the requirements cited in this table are ARARs.
- b Statutes and policies and their citations are provided as headings to identify general categories of ARARs for the convenience of the reader. Listing the statutes and policies does not indicate that the Navy accepts the entire statutes or policies as ARARs; specific ARARs are addressed in the table below each general heading; only substantive requirements of specific citations are considered ARARs.

|                 |                                                    |         |                                          |
